broken by the ripples I have made into polygonal figures like the fragments of a most wonderfully painted mirror. These fragments drift and turn about, apparently, as stiffly on the surface as if they were as thick and strong as glass. The colors are in many places sharply defined in fine lines, making unaccountable figures, as if they were produced by a sudden crystallization. How much color or expression can reside in so thin a substance! With such accompaniments does a sucker die and mix his juices with the river. This beauty like the rainbow and sunset sky marks the spot where his body has mingled with the elements. A somewhat similar beauty reappears painted on the clam's shell. Even a dead sucker suggests a beauty and so a glory of its own. I leaned over the edge of my boat and admired it as much as ever I did a rainbow or sunset sky. The colors were not faint, but strong and fiery, if not angry.

Found a young turtle about two inches long of a flat roundish form, with scales as rough as usual, but a dull reddish or yellowish spot in middle of each scale, and edges beneath were also a pinkish red. Can it be a young yellow-spot?

I have not noticed a tree sparrow since December!

A *Sylvia Americana*, — parti-colored warbler, — in the Holden Wood, sings a, tshrea tshrea tshrea, tshre' tshritty tshrit'.

One low *Kalmia glauca*, before any rhodora thereabouts. Several kalmias, no doubt, to-morrow. The rhodora there maybe to-morrow. Elsewhere I find it (on Hubbard's meadow) to-day.

The swamp is all alive with warblers about the hoary expanding buds of oaks, maples, etc., and amid the pine and spruce. They swarm like gnats now. They fill the air with their little tshree tshree sprayey notes. I see close by, hopping close up to the main stem of young white pines, what you would call a Maryland yellow-throat, but less chubby, yellow throat, beneath, and vent, and dark under tail, black side; but hear no note. Also another clear pure white beneath, and vent, and side-head; black above, finely marked with yellow; yellow bars on wings; and golden crown; black bill and legs; with a clear, sweet warble like tche tche tche, tchut tchutter we. Can this be a chestnut-sided warbler, and I not see the chestnut? Hopping amid oak twigs? I think I hear a yellow-throated vireo. Hear a tree-toad.

Sailed back on Hubbard's redstart path, and there saw a mud turtle draw in his head, of which I saw the half, about eight rods off. Pushed to the spot, where the water was about a foot deep, and at length detected him spread out on the bottom, his monstrous head and tail and legs outspread, probably directly under where he had appeared. At first, I suspect, I mistook him for a rock, for he was thickly covered with a short green moss-like conferva (?), — a venerable object, a true son of the meadow, suggesting what vigor! what naturalness! Perchance to make the moss grow on your back without injuring your health! How many things can he sustain on his shell where the mosses grow? He looked like an antediluvian under that green, shaggy shell, tougher than the rock you mistake it for. No wonder the Indian revered him as a god. Think of the time when he was an infant. There is your native American, who was before Columbus, perchance. Grown, not gray, but green with the lapse of ages. Living with the life of

the meadow. I took off my coat, stripped up my shirt-sleeve, and caught him by his great rough tail. He snapped at me and my paddle, striking his snout against the side of the boat till he made it bleed. Though I held him down with an oar for a lever and my foot on it, he would suddenly lift all together, or run out his head and knock the oar and my leg aside. He held up his head to me and, with his mouth wide open, hissed in his breathing like a locomotive for a quarter of an hour, and I could look straight down his monstrous gullet ten inches. The only way to hold him and paddle too was to turn him on his back, then, putting the end of a paddle under a seat, slant it over his sternum and press my foot on the other end. He was fourteen and one half inches long by twelve at the broadest places, and weighed twenty-five pounds and three ounces. The claws were an inch and a quarter long beyond the skin, and very stout. You had to exert yourself to turn him over on a plane surface, he held down so firmly with his claws, as if grown to it. He took my hand into his shell with his tail and took the skin off it. The sternum is broadest forward. This turtle was not roundish like the shell I have, but nearly an oblong square; nearly as long as that, but much less wide. The usual number of scallops behind.

I know of a young lady who, when riding, came across one in the road, which not wishing to run over, she got out and tried to drive it out of the way with her whip, but it "screamed" at and terrified her. A caravan could not make him budge under those circumstances.

E. Emerson finds half a dozen yellow violets. A hair-bird's nest building. I hear whip-poor-wills about R. W. E.'s.

May 19. Thick fog in the morning, which lasted late in the forenoon and left behind it rainy clouds for the afternoon.

P. M. — To Cedar Swamp.

Landed at Island Neck, and saw a small striped snake in the act of swallowing a *Rana palustris*, within three feet of the water. The snake, being frightened, released his hold, and the frog hopped off to the water. Hear and see a yellow-throated vireo, which methinks I have heard before. Going and coming, he is in the top of the same swamp white oak and singing indolently, ullia — eelyay and sometimes varied to eelyee. The tanager is now heard plainly and frequently.

I see running along the water's edge on the Island Neck, amid the twigs, a new bird, slender and somewhat warbler-like, but plainly a *Turdus*, with a deep, dark chocolate-brown back (apparently uniformly), apparently cream-colored beneath, handsomely and abundantly spotted with dark brown, vent white, light flesh-colored legs, yellowish or cream-colored line over eyes. Methinks it teetered or wagged its tail. Flew soon and was quite shy. I think it must have been the *Turdus aquations* from its dark chocolate-brown back and running along the water's edge. Feel pretty sure, yet that is said to have white (?) over eye. I lost it before I had examined fully. Quite a discovery. Vide golden-crowned thrush carefully.

Apple in bloom; some, no doubt, earlier. Nighthawk's squeak. Red-wing's nest made, and apparently a kingbird's (?), on black willow four feet above water.

As I sail up the reach of the Assabet above Dove Rock with a fair wind, a traveller riding along the highway is watching my sail while he hums a tune. How inspiring and elysian it is to hear when the traveller or the laborer from a call to his horse or the murmur of ordinary conversation rises into song! It paints the landscape suddenly as no agriculture, no flowery crop that can be raised. It is at once another land, the abode of poetry. I am always thus affected when I hear in the fields any singing or instrumental music at the end of the day. It implies a different life and pursuits than the ordinary. As he looked at my sail, I listened to his singing. Perchance they were equally poetic, and we repaid each other. Why will not men oftener advertise me of musical thoughts? The singer is in the attitude of one inviting the muse, — aspiring.

The Maryland yellow-throat amid the alders sings now, whit-we-chee whit-we-chee whit-we-chee whit-whit, the last two fast, or whit alone, or none. Wood pewee. Woolly aphides on alder.

The *Smilacina trifolia* will apparently bloom to-morrow or next day.

Returning, stopped at Barrett's sawmill while it rained a little. Was also attracted by the music of his saw. He was sawing a white oak log; was about to saw a very ugly and knotty white oak log into drag plank, making an angle. Said that about as many logs were brought to his mill as ten years ago, — he did not perceive the difference, — but they were not so large, and perhaps they went further for them. I observed that he was not grinding. No, he said, it was the first day he had not had a grist, though he had plenty of water; probably because the farmers were busy planting. There [were] white oak, pine, maple, and walnut logs waiting to be sawed.

A bullfrog, sluggish, by my boat's place.

On the 13th I saw washed up to the edge of the meadow, this side of Clamshell, portions of one or two large bluish-white eggs, apparently a size larger than hens' eggs, which may have been laid last year by some wild fowl in the meadow.

If my friend would take a quarter part the pains to show me himself that he does to show me a piece of roast beef, I should feel myself irresistibly invited. He says, —

“Come and see

Roast beef and me.”

I find the beef fat and well done, but him rare.

May 20. Fir-balsam (ours in grove) apparently two or three days, for it [is] almost entirely effete; cones white, one inch long nearly.

Was awaked and put into sounder sleep than ever early this morning by the distant crashing of thunder, and now, —

P. M. (to Beck Stow's), —

I hear it in mid-afternoon, muttering, crashing in the muggy air in mid-heaven, a little south of the village as I go through it, Hke the tumbHng down of piles of boards, and get a few sprinkles in the sun. Nature has found her hoarse summer voice again, Hke the lowing of a cow let out to pasture. It is Nature's rutting season. Even as the birds sing tumultuously and glance by with fresh and brilliant plumage, so now is Nature's grandest voice heard, and her sharpest flashes seen. The air has resumed its

voice, and the lightning, Hke a yellow spring flower, illumines the dark banks of the clouds. All the pregnant earth is bursting into Hfe Hke a mildew, accompanied with noise and fire and tumult. Some oestrus stings her that she dashes headlong against the steeples and bellows hollowly, making the earth tremble. She comes dropping rain Hke a cow with overflowing udder. The winds drive her; the dry fields milk her. It is the famiHar note of another warbler, just arrived, echoing amid the roofs.

I see, on a locust in the locust \sic\ burying-ground, the *Sylvia striata*, or black-poll warbler, busily picking about the locust buds and twigs. Black head and above, with olive (green) wings and two white bars; white all beneath, with a very distinct black line from throat to shoulders; flesh-colored legs; bill, dark above, light beneath. Hear no note. Saw it well.

At Moore's Swamp on Bedford road, myriads of pollywogs half an inch long darken or blacken the shore, chiefly head as yet. Bank swallows are very lively about the low sand-bank just beyond, in which are fifty holes.

I now see distinctly the chestnut-sided warbler (of the 18th and 17th), by Beck Stow's. It is very lively on the maples, birches, etc., over the edge [of] the swamp. Sings eech eech eech \ wichy wichy \ tchea or itch itch itch | witty witty | tchea. Yet this note I represented on the 18th by tche tche tche | tchut tchutter we.

The andromeda has apparently been out several days, but no buck-bean there yet, nor will for a day or two.

See and hear a stake-driver in the swamp. It took one short pull at its pump and stopped. Two marsh hawks, male and female, flew about me a long time, screaming, the female largest, with ragged wings, as I stood on the neck of the peninsula. This induced me to climb four pines, but I tore my clothes, got pitched all over, and found only squirrel; yet they have, no doubt, a nest thereabouts.

Haynes the carpenter calls that large glaucous puff that grows on the *Andromeda paniculata*, swamp-apple; says he has eaten as much as three bushels (!) of them when he was a boy, and likes them. That is what he was raised on.

After I got him home, I observed a large leech on the upper shell of my great turtle. He stoutly resisted being turned over, by sinking his claws into the ground; was aware that that was his weak side, and, when turned, would instantly run out his head and turn himself back. No wonder the Orientals rested the world on such a broad back. Such broad health and strength underlies Nature.

May 21. Wednesday. P. M. — To Saw Mill Brook.

*Chelidonium*. *Rubus triflorus* abundantly out at the Saw Mill Brook; how long? A robin's nest without mud, on a young white oak in woods, with three eggs. Saw two splendid rose-breasted grosbeaks with females in the young wood in Emerson's lot. What strong-colored fellows, black, white, and fiery rose-red breasts! Strong-natured, too, with their stout bills. A clear, sweet singer, like a tanager but hoarse somewhat, and not shy. The redstarts are inquisitive and hop near. The *Polygonatum pubescens* there, in shade, almost out; perhaps elsewhere already.

At the trough near Turnpike, near Hosmer's Spring, the (perhaps) *Stellaria borealis* of the 15th. I am still in doubt whether it is a *stellaria* or *cerastium*. This is quite smooth, four to five inches high, spreading and forking, with a single flower each fork, on a long peduncle; square-stemmed, oblong-lanceolate leaves, slightly ciliate and connate: ten stamens, five long, five short. Aspect of a smooth *cerastium*, but this has four to seven styles, oftenest perhaps five, all apetalous, except one petal shorter than the calyx; leaves one-nerved, sepals three-nerved! The bare and small plants are reddishstemmed. Can it be *Stellaria longipes*?

The buck-bean in Everett's Pool abundantly out, say four or five days. It is earlier than at B. Stow's. *Myosotis laxa* by Turnpike, near Hosmer Spring, may have been out several days; two or three at least.

May 22. P. M. — To *Viola Muhlenbergii*, which is abundantly out; how long? A small pale-blue flower growing in dense bunches, but in spots a little drier than the *V. cucullata* and *blanda*. *Veronica peregrina*, apparently several days. A yellow butterfly over the middle of the flooded meadow. *Polygonatum pubescens* at rock. *Aralia nudicaulis*, apparently a day or two where heat is reflected from the rock on Island. Chokecherry and *cratægus* there in a day or two. The *Cornus florida* does not bloom this year. Hemlock and creeping juniper, not quite yet. The red and cream-colored cone-shaped staminate buds of the black spruce will apparently shed pollen in one to three days? They are nearly half an inch long.

I see beds anemones amid or under clumps of hazels, of this form a mass of their pretty leaves and flowers, five or six feet in diameter. I see a common *Vaccinium vacillans* (?), with a leaf much like that of the *V. Pennsylvanicum*, also the common *V. vacillans* with more rounded glaucous leaves.

I noticed a cobweb the other day, between the tholepins of my boat, which was perfectly black with those little fuzzy gnats which fly at that height and take shelter from wind in boats and the hke.

A little clammy hairy *cerastium* (?) (like a *Cerastium viscosum*, slender and erect), about three inches high, will open in a day or two on the rock near the bass.

May 23. P. M. — To Heywood Spring.

Sorrel well open on west side of railroad causeway against H. Wheeler's land. Noticed the earliest willow catkins turned to masses of cotton yesterday; also a little of the mouse-ear down begins to be loose. Hear often and distinctly, apparently from H. Wheeler's black spruce wood-lot, the phe phee-ar of the new muscicapa. Red-eye and wood thrush. *Houstonias* whiten the fields, and looked yesterday like snow, a sugaring of snow, on the side of Lee's Hill. Heard partridges drum yesterday and to-day. Observed the pads yesterday just begun to spread out on the surface with wrinkled edges and here and there a bullet-like bud; the red white lily pads still more rare as yet.

The *stellaria* at Heywood Spring must be the same with that near the E. Hosmer Spring, though the former has commonly fewer styles and rather slenderer leaves. It appears to be the *S. borealis*, though the leaves are narrowly lanceolate; has three to

seven styles; a few petals (cleft almost to the bottom) or none; pods, some larger than the calyx and apparently ten-ribbed; petals, now about the length of the sepals.

After sunset on river.

A warm summer-like night. A bullfrog trumps once. A large devil's-needle goes by after sundown. The ring of toads is loud and incessant. It seems more prolonged than it is. I think it not more than two seconds in each case. At the same time I hear a low, stertorous, dry, but hard-cored note from some frog in the meadows and along the riverside; often heard in past years but not accounted for. Is it a *Rana palustris*?

Dor-bugs hum in the yard, — and were heard against the windows some nights ago. The cat is springing into the air for them.

May 24. Pratt gave me the wing of a sparrow (?) hawk which he shot some months ago. He was coming from his house to his shop early in the morning when he saw this small hawk, which looked like a pigeon, fly past him over the Common with a sparrow in his clutches, and alight about six feet up the south buttonwood in front of Tolman's. Having a small Maynard's revolver in his pocket, loaded with a ball size of a pea, he followed, and, standing twenty-two paces from the tree in the road, aimed and brought down both hawk and sparrow at a distance of about six rods, cutting off the wing of the former with the ball. This he confessed he could not do again if he should try a hundred times. It must be a sparrow hawk, according to Wilson and Nuttall, for the inner vanes of the primaries and secondaries are thickly spotted with brownish white.

Humphrey Buttrick says that he hears the note of the woodcock from the village in April and early in May (too late now); that there were some this year breeding or singing by the riverside in front of Abel Heywood's. He says that when you see one spring right up straight into the air, you may go to the spot, and he will surely come down again after some minutes to within a few feet of the same spot and of you. Has known a partridge to fly at once from one to two miles after being wounded (tracked them by the blood) without alighting. Says he has caught as many as a dozen partridges in his hands. He lies right down on them, or where he knows them to be, then passes his hands back and forth under his body till he feels them. You must not lift your body at all or they will surely squeeze out, and when you feel one must be sure you get hold of their legs or head, and not feathers merely.

To-day is suddenly overpoweringly warm. Thermometer at 1 p m., 94° in the shade! but in the afternoon it suddenly fell to 56, and it continued cold the next two days.

May 25. 10 a m. — To Fair Haven Pond with Blake and Brown.

I found five arrowheads at Clamshell Hill. Saw, just before, on the flat meadow on the right, feeding on the edge of the meadow just left bare, along with the peewees, a bird a size larger with an apparently light-brown back, a ring or crescent of black on its breast and side of neck, and a black patch including the eye. Can it be the *Charadrius semipalmatus*? or else *Wilsonius*? It looks like the latter in Wilson's larger plates. It reminded me of the piping plover, but was not so white; and of the killdeer, but was not so large.

Pyrus on side of Fair Haven Hill, yesterday at least. Huckleberry there, yesterday also at least. On the Cliffs, orobanche; Veronica arvensis, the little one on the rocks there, well out. Also low blackberry on the rocks a day or two. Blackburnian warbler and rosebreasted grosbeak.

Lupines, apparently yesterday. Young phoebes in the Baker house. The bird flitted out as we entered. I reached to an old shelf and felt the warm but callow young. Azalea nudiflora in garden. Polygala, fringed, by path beyond Hubbard Grove; how long?

May 27. To Kalmia Swamp with Sanborn.

Fringüla melodia's nest in midst of swamp, with four eggs, made partly of usnea; two stories, i.e. upon an old nest, elevated one foot above the water; eggs with very dark blotches. Kalmia in prime, and rhodora. Apparently the oldest-blossomed kalmia the palest. Saw probably a deer mouse jumping off by the side of the swamp; short leaps of apparently ten inches. The pyrus (smooth-leaved) out apparently a day or two. See men fishing, one or two, and often perceived the meadow fragrance.

My three kinds of birch sap have now become more acid, especially the white and canoe birch. The black birch is milder and more agreeable. With sugar it is an agreeable drink. I prefer it to cream-o'-tartar water. This is the real birch wine.

May 28. Rainy.

To Painted-Cup Meadow.

Potentilla argentea, maybe several days. Trifolium pratense.

A seringo or yellow-browed (??) sparrow's nest about ten or twelve rods southwest of house-leek rock, between two rocks which are several rods apart northwest and southeast; four eggs. The nest of coarse grass stubble, lined with fine grass, and is two thirds at least covered by a jutting sod. Egg, bluish-white ground, thickly blotched with brown, yet most like a small groundbird's egg, rather broad at one end, pretty fresh.

A cricket creaks. Hypoxis erecta, maybe a day or two. Thalictrum dioicum abundantly out, apparently in prime, male and female, some effete, perhaps a week, near wall in Painted-Cup Meadow, fifteen to eighteen inches high.

I think it was a mass of young Thalictrum Comuti leaves which had that rank, dog-like scent. Painted-cup pollen a good while ago. Saw, under an apple tree, nearly half a pint of some white grub with a light-reddish head, like a small potato-worm, one inch long, and part of a snake-skin, making the greater part of the fæces of some animal, — chiefly the grubs, — a formless soft mass. Skunk?

May 29. P. M. — Ride to Painted-Cup Meadow.

Two Arethusa bulbosa at Hubbard's Close apparently a day or two. Golden senecio there, a day or two, at least. White clover. Ranunculus repens (sepals not recurved and leaves a spotted look), apparently a day.

Geum rivale, well out. Common cratægus, apparently some days. Juniperus communis, a day or two at least, probably more.

To return to Painted-Cup Meadow, I do not perceive the rank odor of Thalictrum Comuti expanding leaves to-day. How more than fugacious it is! Evidently this odor is

emitted only at particular times. A cuckoo's note, loud and hollow, from a wood-side. Found a painted-cup with more yellow than usual in it, and at length Edith found one perfectly yellow. What a flowery place, a vale of Enna, is that meadow! Painted-cup, *Erigeron bellidifolius*, *Thalictrum dioicum*, *Viola Muhlenbergii* fringed polygala, buck-bean, *pedicularis*, orobanche, etc., etc. Where you find a rare flower, expect to find more rare ones. Saw sanicle well flower-budded. Cherry-birds on the apple trees. Blue-eyed grass, probably to-morrow.

May 30. P. M. — To Linnæa Wood-lot.

Apparently this flower does not bloom there this year.

The lady's-slipper in pitch pine wood-side near J. Hosmer's Desert, probably about the 27th. That desert, small as it now is (for it is partly reclaimed by using pine boughs as a salve), is scored with circles (like that of Provincetown) made by the dry *Polygonum articulatum* blown about. It is but a lesser Sahara, and I cannot see it without being reminded that, in some parts of the globe, sand prevails like an ocean. What are those black masses of fibrous roots mixed with smaller dark-gray, cone-like tubers, on the sand?

Return via Clamshell. Yellow clover abundantly out, though the heads are small yet. Are they quite open? *Comandra umbellata*, apparently a day or two.

Frank Harding caught five good-sized chivin this cold and windy day from the new stone bridge. The biggest one was quite red or coppery; the others but slightly, except the head. Is it a peculiarity of age?

May 31. P. M. — To Clintonia Swamp (Hubbard's) Grove.

A ground-bird's nest (melodia or graminea?), with six of those oblong narrow gray [eggs] speckled with much brown at end. When I looked again half an hour after, one egg was hatched. The bird would steal out through the grass when I came within a rod, and then, after running a rod or two, take to wing. Tied a string about a low pyrus a rod or so to right of entrance to Hubbard's Pyrus Swamp and two feet west of a pitch pine stump, and pressed a twig of it. Clintonia. *Nuphar advena* first noticed; may have been out some time in some places, but just out in river. Pink, common wild, maybe two or three days.

Sundown. — To Hill and Island.

Have noticed within a week, from time to time, the water-line on the bushes along the shore — the water going down — unusually distinct, for while the exposed parts have leaved out, the lower are quite bare and black.

Hemlock and creeping juniper, where had not bloomed the 22d, are now entirely out of bloom on the hill. How short their flower lasts!

*Ranunculus Purshii*, probably earlier in some places, but water high. That little cerastium on the rock at the Island, noticed the 22d, which probably opened about that time, is now out of bloom. It is about three inches high and has long pods, more than twice the length of the calyx, which turn upward. I have seen no petals. It seems to be the *C. nutans* (?), from size, erectness, and form of pods and leaves. It has viscid

hairs or with glands at end. The red oak is so forward, compared with the rest, that it is more difficult to get a sprig in flower small enough (its leaves) to press.

As I return in the dusk, many nighthawks, with their great spotted wings, are circling low over the river, as the swallows were when I went out. They skim within a rod of me. After dusk these greater swallows come forth, and circle and play about over the water like those lesser ones, or perhaps making a larger circuit, also uttering a louder note. It would not be safe for such great birds to fly so near and familiarly by day. It has been very cold for two or three days, and to-night a frost is feared. The telegraph says it snowed in Bangor to-day. The hickory leaves are blackened by blowing in the cold wind.

## JUNE, 1856

June 1. Horse-radish in yard, to-morrow.

Picked up an entire stemothærus shell yesterday, without scales. In the upper shell there appear to be six small segments of shell wholly dorsal, seventeen wholly lateral (nine in front), and twenty-two marginal, forty-five in all. The ribs, in this case spreading out and uniting to form a sharp and tight roof, suggest that ribs were the first rafters. So we turn our backs to the storm and shelter ourselves under this roof. The scales upon the shell answer to the shingles on the roof, breaking joints.

Saw the shell of another turtle, apparently a young painted turtle, one inch long, curiously wrinkled and turned up, like that found in Middleborough. This had been washed up on to meadow some weeks ago, apparently.

P. M. — To Walden.

Somewhat warmer at last, after several very cold, as well as windy and rainy, days. Was soothed and cheered by I knew not what at first, but soon detected the now more general creak of crickets. A striped yellow bug in fields. Most of the leaves of the *Polygonatum pubescens* which I gathered yesterday at Island had been eaten up by some creature.

A chewink's nest a rod and a half south of Walden road, opposite Goose Pond path, under a young oak, covered by overarching dry sedge; four eggs, pretty fresh. I am pretty sure the bird uttered the unusual hoarse and distressed note while I was looking at them.

*Linaria Canadensis* on Emerson Cliff. Rock-rose, a day or two there. Whiteweed by railroad at pond to-morrow. Cotton-grass, several days before the 29th May. Heard a quail whistle May 30th. The late *cratægus* on hill, about May 31st.

June 2. *Carum*, i.e. caraway, in garden. Saw most hummingbirds when cherries were in bloom, — on them.

P. M. — With R. W. E. to Perez Blood's auction.

Telescope sold for fifty-five dollars; cost ninety-five plus ten. See Camilla on rye, undulating light and shade; not 19th of April. Returned by bridle-road. *Myrica cerifera*,

possibly yesterday. Very few buds shed pollen yet; more, probably, to-day. Leaves nearly an inch long, and shoot and all no more. English hawthorn will open apparently in two days.

Agassiz tells his class that the intestinal worms in the mouse are not developed except in the stomach of the cat.

30 — p m. — To *Azalea nudiflora*, which is in prime. *Ranunculus recurvatus* the same; how long? White maple keys conspicuous.

In the first volume of Brewster's "Life of Newton" I read that with one of the early telescopes they could read the "Philosophical Transactions" at five hundred feet distance.

June 3. Tuesday. Surveying for John Hosmer beyond pail-factory.

Hosmer says that seedling white birches do not grow larger than your arm, but cut them down and they spring up again and grow larger.

While clearing a line through shrub oak, which put his eyes out, he asked, "What is shrub oak made for?" R. Hoar, I believe, bought that (formerly) pine lot of Loring's which is now coming up shrub oak. Hosmer says that he will not see any decent wood there as long as he lives. H. says he had a lot of pine in Sudbury, which being cut, shrub oak came up. He cut and burned and raised rye, and the next year (it being surrounded by pine woods on three sides) a dense growth of pine sprang up.

As I have said before, it seems to me that the squirrels, etc., disperse the acorns, etc., amid the pines, they being a covert for them to lurk in, and when the pines are cut the fuzzy shrub oaks, etc., have the start. If you cut the shrub oak soon, probably pines or birches, maples, or other trees which have light seeds will spring next, because squirrels, etc., will not be likely to carry acorns into open land. If the pine wood had been surrounded by white oak, probably that would have come up after the pine.

While running a line in the woods, close to the water, on the southwest side of Loring's Pond, I observed a chickadee sitting quietly within a few feet. Suspecting a nest, I looked and found it in a small hollow maple stump which was about five inches in diameter and two feet high. I looked down about a foot and could just discern the eggs. Breaking off a little, I managed to get my hand in and took out some eggs. There were seven, making by their number an unusual figure as they lay in the nest, a sort of egg rosette, a circle around with one (or more) in the middle. In the meanwhile the bird sat silent, though rather restless, within three feet. The nest was very thick and warm, of average depth, and made of the bluish-slate rabbit's (?) fur. The eggs were a perfect oval, five eighths inch long, white with small reddish-brown or rusty spots, especially about larger end, partly developed. The bird sat on the remaining eggs next day. I called off the boy in another direction that he might not find it.

Plucked a white lily pad with rounded sinus and lobes in Loring's Pond, a variety.

Picked up a young wood tortoise, about an inch and a half long, but very orbicular. Its scales very distinct, and as usual very finely and distinctly sculptured, but there was no orange on it, only buff or leather-color on the sides beneath. So the one of

similar rounded form and size and with distinct scales but faint yellow spots on back must have been a young spotted turtle, I think, after all.

June 4. Surveying for J. Hosmer.

Very warm.

While running a line on the west edge of Loring's Pond, south of the brook, found, on a hummock in the open swamp, in the midst of bushes, at the foot of a pitch pine, a nest about ten inches over, made of dry sedge and moss. I think it must have been a duck's nest. This pond and its islets, half flooded and inaccessible, afford excellent places.

Anthony Wright says that he used to get slippery elm bark from a place southwest of Wetherbee's Mill, about ten rods south of the brook. He says there was once a house at head of hollow next beyond Clamshell. Pointed out the site of "Perch" Hosmer's house in the small field south of road this side of Cozzens's; all smooth now. Dr. Heywood worked over him a fortnight, while the perch was dissolving in his throat. He got little compassion generally, and the nickname "Perch" into the bargain. Think of going to sleep for fourteen nights with a perch, his fins set and his scales (!), dissolving in your throat!! What dreams! What waking thoughts! Also showed where one Shaw, whom he could just remember, used to live, in the low field north of Dennis's bam, and also another family in another house by, him.

English hawthorn from Poplar Hill blossoms in house.

June 5. Thursday. P. M. — To Indian Ditch.

*Achillea Millefolium*. Black cherry, apparently yesterday. The *Muscicapa Cooperi* sings pe pe pe', sitting on the top of a pine, and shows white rump (?), etc., unlike kingbird.

Return by J. Hosmer Desert.

Everywhere now in dry pitch pine woods stand the red lady's-slippers over the red pine leaves on the forest floor, rejoicing in June, with their two broad curving green leaves, — some even in swamps. Uphold their rich, striped red, drooping sack. This while rye begins to wave richly in the fields.

A brown thrasher's nest with four eggs considerably developed, under a small white pine on the old north edge of the desert, lined with root-fibres. The bird utters its peculiar tchuck near by.

Pitch pine out, the first noticed on low land, maybe a day or two. Froth on pitch pine.

A blue jay's nest on a white pine, eight feet from ground, next to the stem, of twigs lined with root-fibres; three fresh eggs, dark dull greenish, with dusky spots equally distributed all over, in Hosmer (?) pines twenty-seven paces east of wall and fifty-seven from factory road by wall. Jay screams as usual. Sat till I got within ten feet at first.

A cuckoo's nest with three light bluish-green eggs partly developed, short with rounded ends, nearly of a size; in the thicket up railroad this side high wood, in a black cherry that had been lopped three feet from ground, amid the thick sprouts; a nest of nearly average depth (?), of twigs lined with green leaves, pine-needles, etc.,

and edged with some dry, branchy weeds. The bird stole off silently at first. Five rods south of railroad.

I must call that cerastium of May 22d *C. nutans* (?? ), at least for the present, though I do not see grooves in stem. Oakes, in his catalogue in Thompson's "History of Vermont," says it is not found in northeast out of that State. The pods of the common one also turn upward. It is about four flowered; no petals; pods, which have formed in tumbler, more than twice but not thrice as long as calyx, bent down nearly at right angles with peduncles and then curving upward. The common cerastium is in tufts, spreading, a darker green and much larger, hairy but not glutinous, pods but little longer than calyx (as yet) and upright.

June 6. P. M. — To Andromeda Ponds.

Cold mizzling weather.

In the large circular hole or cellar at the turntable on the railroad, which they are repairing, I see a starnosed mole endeavoring in vain to bury himself in the sandy and gravelly bottom. Some inhuman fellow has cut off his tail. It is blue-black with much fur, a very thick, plump animal, apparently some four inches long, but he occasionally shortens himself a third or more. Looks as fat as a fat hog. His fore feet are large and set sidewise or on their edges, and with these he shovels the earth aside, while his large, long, starred snout is feeling the way and breaking ground. I see deep indentations in his fur where his eyes are situated, and once I saw distinctly his eye open, a dull blue (? ) black bead, not so very small, and he very plainly noticed my movements two feet off. He was using his eye as plainly as any creature that I ever saw. Yet Emmons says it is a question whether their eyes are not merely rudimentary. I suppose this was the *Condylura macroura*, since that is most common, but only an inch of its tail was left, and that was quite stout. I carried him along to plowed ground, where he buried himself in a minute or two.

Still see cherry-birds in flocks of five or six. A catbird-nest on shore of Andromeda and in shrub oak, three feet high, twigs and bark shreds lined with root-fibres; three eggs. Those nests in the andromeda are blackbird's. Many sound the alarm while I am wading through the swamp. Noticed one with three eggs.

That willow, male and female, opposite to Trillium Woods on the railroad, I find to be the *Salix rostrata*, or long-beaked willow, one of the ochre-flowered (I had remarked the peculiar yellow of its flowers) willows (*fulvæ*) of Barratt. It is now just beginning to open its long beaks. The *S. cordata* is another of the ochre-flowered ones.

How well suited the lining of a bird's nest, not only for the comfort of the young, but to keep the eggs from breaking! Fine elastic grass stems or root-fibres, pine-needles, or hair, or the like. These tender and brittle things which you can hardly carry in cotton lie there without harm.

J. Hosmer, who is prosecuting Warner for flowing his land, says that the trees are not only broken off when young by weight of ice, but, being rubbed and barked by it, become warty or bulge out there.

June 8. We have had six days either rain-threatening or rainy, the last two somewhat rainy or mizzling.

P. M. — To Cedar Swamp.

Pulled up a yellow lily root, four feet long and branching, two and a half inches [in] diameter and about same size at each end where it had broken off, tree-like. Broken off, it floats. Great white rootlets put out all along it.

I find no *Andromeda racemosa* in flower. It is dead at top and slightly leafed below. Was it the severe winter, or cutting off the protecting evergreens? It grows four or five rods from knoll near a sawed stump between two large red maple clumps. The three-leaved Solomon's-seal has almost entirely done, while the two leaved is quite abundant. *Stellaria longifolia* opposite Barbarea Shore not yet out. It is obviously different from what I call *S. borealis*, much more tall (one foot high) and upright, with branches ascending (not spreading) (the other grows in a dense mass at Comer Spring); leaves longer and more linear, and not at all ciliate like the other; stem much sharper-angled, almost winged; flower-buds more long and slender; and grows in high grass and is later.

I observe in a mass of damp shavings and leaves and sand there, in the shade, a little prostrate willow just coming into flower, perhaps a black willow. Pulling it up, I find it to be a twig about sixteen inches long, two thirds buried in the damp mass. This was probably broken off by the ice, brought down, washed up, and buried like a layer there; and now, for two thirds its length, it has put out rootlets an inch or two long abundantly, and leaves and catkins from the part above ground. So vivacious is the willow, availing itself of every accident to spread along the river's bank. The ice that strips it only disperses it the more widely. It never says die. May I be as vivacious as a willow. Some species are so brittle at the base of the twigs that they break on the least touch, but they are as tough above as tender at base, and these twigs are only thus shed like seeds which float away and plant themselves in the first bank on which they lodge. I commonly litter my boat with a shower of these black willow twigs whenever I run into them.

A kingbird's nest on a black cherry, above Barbarea Shore, loosely constructed, with some long white rags dangling; one egg. At Cedar Swamp, saw the pe-pe catching flies like a wood pewee, darting from its perch on a dead cedar twig from time to time and returning to it. It appeared to have a black crown with some crest, yellowish (?) bill, gray-brown back, black tail, two faint whitish bars on wings, a dirty cream-white throat, and a gray or ash white breast and beneath, whitest in middle.

I had noticed when coming up the river two or three dead suckers, one with a remarkable redness about the anal fins; and this reminded me of the ephemerae. It was the 2d of June, 1854, that I observed them in such numbers. When I returned to my boat, about five, the weather being mizzling enough to require an umbrella, with an easterly wind and dark for the hour, my boat being by chance at the same place where it was in '54, I noticed a great flight of ephemerae over the water, though not so great as that. The greater part were flying down-stream against the wind, but if you watched one long enough you would see him suddenly turn at length and fly swiftly

back up the stream. They advanced against the wind faster than I floated along. They were not coupled nor coupling, — I only noticed two coupled, — but flew, most of them, with their bodies curved, or more, and from time to time each one descended to the water and touched it, or rested on it a second or two, sometimes several minutes. They were generally able to rise, but very often before it arose, or not being able to rise, it was seized by a fish. While some are flying down they are met by others coming up. The water was dimpled with the leaping fish. They reach about ten or fifteen feet high over the water, and I also saw a stream of them about as thick over a narrow meadow a dozen rods from the water in the woods. The weather was evidently unfavorable, what with the wind and the rain, and they were more or less confined to the shore, hovering high over the bushes and trees, where the wind was strong over the river. I had not noticed any on leaves. At one place, against Dodge's Brook, where they were driven back by a strong head wind at a bend, more than usual were wrecked on the water and the fishes were leaping more numerous than elsewhere. The river was quite alive with them, and I had not thought there were so many in it, — great black heads and tails continually thrust up on all sides of my boat. You had only to keep your eye on a floating fly a minute to see some fishy monster rise and swallow it with more or less skill and plashing. Some skillfully seized their prey without much plashing, rising in a low curve and just showing their backs; others rose up perpendicularly, half their length out of water, showing their black backs or white bellies or gleaming sides; others made a noisy rush at their prey and leaped entirely out of water, falling with a loud splash. You saw twenty black points at once. They seemed to be suckers; large fish, at any rate, and probably various kinds. What a sudden surfeit the fishes must have!

They are of various sizes, but generally their solid bodies about three quarters of an inch long or less, yellowish tinge, transparent, with rows of brown spots; wings gauze-like, with a few opaque brown spots.

June 9. P. M. — To Comer Spring.

Without an umbrella, thinking the weather settled at last. There are some large cumuli with glowing downy cheeks floating about. Now I notice where an elm is in the shadow of a cloud, — the black elm-tops and shadows of June. It is a dark eyelash which suggests a flashing eye beneath. It suggests houses that lie under the shade, the repose and siesta of summer noons, the thunder-cloud, bathing, and all that belongs to summer. These veils are now spread here and there over the village. It suggests also the creak of crickets, a June sound now fairly begun, inducing contemplation and philosophic thoughts, — the sultry hum of insects.

A yellowbird's nest in a poplar on Hubbard's Bridge causeway; four fresh eggs; ten feet high, three rods beyond fence. *Veronica scutellata* (how long?) at Comer Spring. Compelled to squat under a bank and stand under a wood-pile through a shower.

6.30 p m. — Up Assabet.

Again, about seven, the ephemeræ came out, in numbers as many as last night, now many of them coupled, even tripled; and the fishes leap as before.

A young robin abroad.

June 10. 8 a m. — Getting lily pads opposite Badger's.

Already the pads are much eaten before they are grown, and underneath, on the under side of almost every one, are the eggs of various species of insect, some so minute as to escape detection at first, in close, flat, straight-sided nests.

The yellow lily and kalmiana are abundantly out. The under sides of the pads, their stems, and the *Ranunculus Purshii* and other water-plants are thickly covered and defiled with the sloughs, perhaps of those little fuzzy gnats (in their first state) which have so swarmed over the river. It is quite difficult to clean your specimens of them.

P. M. — To Dugan Desert.

*Comus alternifolia* a day or two, up railroad; maybe longer elsewhere. *Spergularia rubra* by railroad, it having been dug up last year, and so delayed.

The cuckoo of June 5th has deserted her nest, and I find the fragments of egg-shells in it; probably because I found it.

*Oxalis* freshly out; how long? Apparently but two or three days. I find some *linnæa* well out, after all, within a rod of the top of the hill, apparently two or three days. If it flowered more abundantly, probably it would be earlier. Chewink's nest with four young in the dry sprout-land of Loring's thick wood that was, under a completely overarching tuft of dry sedge grass. I hear the huckleberry-bird now add to its usual strain a-tea tea tea tea tea.

A painted tortoise laying her eggs ten feet from the wheel-track on the Marlborough road. She paused at first, but I sat down within two feet, and she soon resumed her work. Had excavated a hollow about five inches wide and six long in the moistened sand, and cautiously, with long intervals, she continued her work, resting always on the same spot her fore feet, and never looking round, her eye shut all but a narrow slit. Whenever I moved, perhaps to brush off a mosquito, she paused. A wagon approached, rumbling afar off, and then there was a pause, till it had passed and long, long after, a tedious, *naturlangsam* pause of the slow-blooded creature, a sacrifice of time such as those animals are up to which slumber half a year and live for centuries. It was twenty minutes before I discovered that she was not making the hole but filling it up slowly, having laid her eggs. She drew the moistened sand under herself, scraping it along from behind with both feet brought together, the claws turned inward. In the long pauses the ants troubled her (as mosquitoes me) by running over her eyes, which made her snap or dart out her head suddenly, striking the shell. She did not dance on the sand, nor finish covering the hollow quite so carefully as the one observed last year. She went off suddenly (and quickly at first), with a slow but sure instinct through the wood toward the swamp.

The clustered blackberry of Dugan Desert not yet out, nor apparently for two or three days. Sweet viburnum apparently two or three days at most, by Warren Miles's, Nut Meadow Pond.

In a hollow apple tree, hole eighteen inches deep, young pigeon woodpeckers, large and well feathered. They utter their squeaking hiss whenever I cover the hole with my

hand, apparently taking it for the approach of the mother. A strong, rank fetid smell issues from the hole.

Ripe strawberries, even in a meadow on sand thrown out of a ditch, hard at first to detect amid the red radical leaves.

The flower-buds of late there have now that rank smell. Lambkill out, at Clamshell. The *Cratcegus Crus-Galli* is out of bloom. *Arenaria serpyllifolia* is out of bloom at Clamshell.

Side-flowering sandwort abundantly out this side of Dugan Spring. *Solanum* well out, by Wood's Bridge.

June 11. P. M. — To Flint's Pond.

The locust in graveyard shows but few blossoms yet. It is very hot this afternoon, and that peculiar stillness of summer noons now reigns in the woods. I observe and appreciate the shade, as it were the shadow of each particular leaf on the ground. I think that this peculiar darkness of the shade, or of the foliage as seen between you and the sky, is not accounted for merely by saying that we have not yet got accustomed to clothed trees, but the leaves are rapidly acquiring a darker green, are more and more opaque, and, besides, the sky is lit with the intensest light. It reminds me of the thunder-cloud and the dark eyelash of summer. Great cumuli are slowly drifting in the intensely blue sky, with glowing white borders. The red-eye sings incessant, and the more indolent yellow-throat vireo, and the creeper, and perhaps the redstart? or else it is the parti-colored warbler.

I perceive that scent from the young sweet-fern shoots and withered blossoms which made the first settlers of Concord to faint on their journey.

Saw yesterday a great yellow butterfly with black marks.

See under an apple tree, at entrance of Goose Pond Path from Walden road, a great fungus with hollow white stem, eight or nine inches high, whose black funereal top has melted this morning, leaving a black centre with thin white scales on it. All the cistuses are shut now that I see, and also the veiny-leaved hieracium with one leaf on its stem, not long open. I notice no white lily pads near the bathing-rock in Flint's Pond. See a bream's nest two and a quarter feet [in] diameter, laboriously scooped out, and the surrounding bottom for a diameter of eight feet (!) comparatively white and clean, while all beyond is mud and leaves, etc., and a very large green and cupreous bream with a red spot on the operculum is poised over the centre, while half a dozen shiners are hovering about, apparently watching a chance to steal the spawn.

A partridge with young in the Saw Mill Brook path. Could hardly tell what kind of creature it was at first, it made such a noise and fluttering amid the weeds and bushes. Finally ran off with its body flat and wings somewhat spread.

*Utricularia vulgaris* very abundant in Everett's Pool. A beautiful grass-green snake about fifteen inches long, light beneath, with a yellow space under the eyes along the edge of the upper jaw.

The *Rubus triflorus* apparently out of bloom at Saw Mill, before the high blackberry has begun.

Rice tells me he found a turtle dove's nest on an apple tree near his farm in Sudbury two years ago, with white eggs; so thin a bottom you could see the eggs through.

June 12. P. M. — To Conantum on foot.

Sophia has sent me, in a letter from Worcester, part of an orchis in bloom, apparently *Platanthera Hookeri* (?), or smaller round-leafed orchis, from the Hermitage Wood, so called, northeast of the town; but the two leaves are elliptical. *Utricularia vulgaris* was abundantly out yesterday in Everett's Pool; how long? Sidesaddle-flower numerously out now. Apparently a small pewee nest on apple in Miles's meadow. Bird on, and not to be frightened off, though I throw sticks and climb the tree to near her.

June 13. Friday. To Worcester.

See the common iris in meadow in Acton. Brown shows me from his window the word "guano" written on the grass in a field near the hospital, say three quarters of a mile distant. It was one of the lions of Worcester last year, and I can now read some of the letters distinctly, so permanent are the effects of the guano. The letters may be two or more rods long, and the green is darker and more luxuriant. (On the side of a hill.)

June 14. Walk to Hermitage Woods with Sophia and aunts. *Uvularia perfoliata* very common there; now out of bloom. *Rhamnus cathartica*, common buckthorn, naturalized in those woods, now going out of bloom. It is dioecious, twelve feet high, north side. Maple-leaved viburnum out a day or more there apparently. Mallows abundantly out in street.

June 15. Mrs. Brown reads a letter from John Downs in Philadelphia to Mr. Brown, in which he remembers his early youth in Shrewsbury and the pout accompanied by her young. A Miss Martha Le Barron describes to me a phosphorescence on the beach at night in Narragansett Bay. They wrote their names with some minute creatures on the sand.

P. M. — To some woods southwest of Worcester.

The moist bass bark just stripped from a sapling swells very like a cucumber. All three of us were struck by it. A night-flowering cereus opens three or four times at a Mrs. Newton's while I am there. Once it opened at about 9 p. m., and closed and drooped and came to an end like a wet rag wrung out, at daylight. Transient as my mushroom. Was about a foot in diameter, but an ordinary stem, like the turkey's feet. *Diervilla* well out.

June 16. Saw at the Natural History Rooms a shell labelled *Haliotis splendens*, apparently same with mine from Ricketson's son, with holes and green reflections.

To Purgatory in Sutton: by railroad to Wilkinsonville in the northeast corner of Sutton (thirty cents) and by buggy four or five miles to Purgatory in the south or southeast part of the town, some twelve miles from Worcester.

The stream rising from the bottom of it must empty into the Blackstone, perhaps through the Mumford River. Sutton is much wooded. The woman at the last house told [of] an animal seen in the neighborhood last year. Well, she "had no doubt that there had been a bad animal about." A Mr. Somebody, who could be relied on, between

there and Sutton Centre, had been aroused by [a] noise early one morning, and, looking out, saw this animal near a wood-pile in his yard, as big as a good-sized dog. He soon made off, making nothing of the walls and fences, before he and his sons got their guns ready. They raised part of the town, a body of shoemakers, and surrounded a swamp into which it was supposed to have entered, but they did not dare to go into it. Also a strange large track was seen where it crossed the road.

Found at the very bottom of this Purgatory, where it was dark and damp, on the steep moss and fern covered side of a rock which had fallen into it, a wood thrush's nest. Scarcely a doubt of the bird, though I saw not its breast fairly. Heard the note around, and the eggs (one of which I have) correspond. Nest of fine moss from the rock (*hypnum?*), and lined with pine-needles; three eggs, fresh.

Found in the Purgatory the panicked elder (*Sambucm pubens*), partly gone to ribbed seed, but some in flower, new to me; *Polygonum cilinode* (?), not yet in flower; moose-wood or striped maple; and also, close by above, *Actœa alba*, out of bloom; and a chestnut oak common. Cow-wheat numerously out. Heard around, from within the Purgatory, not only Wilson's thrush, but evergreen-forest note and tanager; and saw chip-squirrels within it.

June 17. Go to Blake's.

Indigo-bird on his trees.

A. M. — Ride with him and Brown and Sophia round a part of Quinsigamond Pond into Shrewsbury.

The southerly end of the pond covered for a great distance with pads of yellow and white lily. Measured one of the last: nine and seven eighths inches long by nine and six eighths, with sharp lobes, etc., and a reddish petiole. Small primrose well out; how long? The cedar swamp, source of Assabet, must be partly in Grafton, as well as Westboro near railroad, according to a farmer in Shrewsbury.

P. M. — Went to Rev. Horace James's reptiles (Orthodox).

He had, set up, a barred owl, without horns and a little less than the cat owl. Also a large lobe-footed bird which I think must have been a large grebe, killed in Fitchburg. He distinguished the *Rana halecina* in the alcohol by more squarish (?) spots. Showed me the horned frog (?), (or toad?); also alive in bottle, with moss and water, the violet-colored salamander (*S. venenosa*) with yellow spots (five or six inches long), probably same I found in stump at Walden; and, in spirits, smaller, the *S. erythronota*, with a conspicuous red back. What looked like mine, or the common one in springs here, was *Triton niger*. I think he said Holbrook made the water ones tritons and land ones salamanders. Another small one, all red, with spots; another with a line of red spots on each side; and others. He finds a variety of *Emys guttata* with striated scales (mentioned by Holbrook and Storer). Saw a common box turtle shell with initials in sternum. One thought that whatever was cut in the scale was renewed in the new scale. Saw, in spirits, the *Heterodon platyrhinus* from Smithfield, R. I., fiat-snouted, somewhat like a striped snake; and a very small brown snake. James gave me some of the spawn of a shellfish from a string of them a foot long.

At Natural History Rooms, a great cone from a southern pine and a monstrous nutshell from the East Indies (?); seed of the *Lodoicea Sechellarurum* Seychelles Islands.

June 18. Hale says the tiarella grows here, and showed it me pressed; also *Kalmia glauca* formerly, hobble-bush still, and yellow lady's-slipper near the Quarry.

June 19. Looked at a collection of the rarer plants made by Higginson and placed at the Natural History Rooms. Among which noticed: —

*Ranunculus Purshii* varieties a and b, with no difference apparent, unless in upper leaves being more or less divided.

*Ribes lacustre*, or swamp gooseberry, with a loose raceme such as I have not seen, from White Mountains.

A *circæa*, or enchanter's-nightshade, with a very large raceme and with longer branchlets than I have seen, methinks.

*Calla palustris*, very different from the *Peltandra Virginica*.

*Cerastium arvense*, with linear leaves, quite new to me.

*Smilacina stellata*, from Dr. Harris, very different from the *racemosa*, being simple.

*Ledum latifolium*, from White Mountains, rather broader-leafed than mine from Maine.

*Barbarea sativa*, from Cambridge, apparently like my *B. vulgaris*.

Is the *Smilacina racemosa* with such long lower branchlets peculiar, there in Worcester? I saw several in woods.

On way to Concord see mountain laurel out in Lancaster. Had seen none out in Worcester.

June 20. Friday. A. M. — To Baker Farm with Ricketson.

A very hot day.

Two *Sternotherus odoratus* by heap in Sanborn's garden, one making a hole for its eggs, the rear of its shell partly covered. See a great many of these out to-day on ground and on willows.

Swamp-pink out apparently two or three days at Clamshell Ditch. Late *thalictrum* apparently a day or two there. *Archangelica* apparently two or three days.

A phœbe nest, second time, with four cream-white eggs. Got one. The second brood in the same nest. Saw a snap-turtle out in sun on tussock opposite Bittern Cliff. Probably the water was too warm for him. They had at Middlesex House, yesterday, snuff flavored with ground or pulverized black birch bark.

Walking under an apple tree in the little Baker Farm peach orchard, heard an incessant shrill musical twitter or peeping, as from young birds, over my head, and, looking up, saw a hole in an upright dead bough, some fifteen feet from ground. Climbed up and, finding that the shrill twitter came from it, guessed it to be the nest of a downy woodpecker, which proved to be the case, — for it reminded me of the hissing squeak or squeaking hiss of young pigeon woodpeckers, but this was more musical or bird-like. The bough was about four and a half inches in diameter, and the hole perfectly circular, about an inch and a quarter in diameter. Apparently nests had been in holes above, now broken out, higher up. When I put my fingers in it, the young breathed their

shrill twitter louder than ever. Anon the old appeared, and came quite near, while I stood in the tree, keeping up an incessant loud and shrill scolding note, and also after I descended; not to be relieved.

*Potentilla Norvegica*; apparently petals blown away. Five young phcebes in a nest, apparently upon a swallow-nest, in Conant's old house, just ready to fly. *Rudbeckia hirta* budded.

June 21. P. M. — To Walden.

Much pine pollen is washed up on the northwest side of the pond. Must it not have come from pines at a distance? Very hot day, as was yesterday, — 98° at 2 p m., 99° at 3, and 128° in sun. Nighthawks numerously squeak at 5 p m. and boom. Saw them fly low and touch the water like swallows over Walden. Find a dozen of the *hydropeltis* out, apparently several days. My canoe birch wine smells and tastes like mead considerably. All my birch wines are now more acid and very good indeed with sugar. Am surprised to see it effervesce, all white with white sugar only, like a soda-water.

June 22. Sunday. P. M. — To Walden.

Ricketson says that they say at New Bedford that the song sparrow says, Maids, maids, maids, — hang on your tea-kettle-ettle-ettle-ettle.

R. W. E. imitates the wood thrush by he willy willy — ha willy willy — O willy O. The woods still resound with the note of my tweezer-bird, or *Sylvia Americana*.

June 23. To New Bedford with Ricketson.

In R.'s mowing, apparently lucerne, out some days. His son Walton showed me one of four perfectly white eggs taken from a hole in an apple tree eight feet from ground. I examined the hole. He had seen a bluebird there, and I saw a blue feather in it and apparently a bluebird's nest. Were not these the eggs of a downy woodpecker laid in a bluebird's nest? They were all gone now.

Bay-wings sang morning and evening about R.'s house, often sitting on a bean-pole and dropping down and running and singing on the bare ground amid the potatoes. Its note somewhat like Come, here here, there there,

29 — quick quick quick (fast), — or I'm gone.

*Prinos lœvigatus* common and just begun to bloom behind R.'s house.

June 24. To Sassacowen Pond and to Long Pond.

Common yellow thistle abundant about R.'s; open a good while. Maryland yellow-throats very common in bushes behind his house; nest with young. American holly now in prime. The light-colored masses of mountain laurel were visible across Sassacowen. A kingbird's nest just completed in an apple tree.

Lunched by the spring on the Brady farm in Freetown, and there it occurred to me how to get clear water from a spring when the surface is covered with dust or insects. Thrust your dipper down deep in the middle of the spring and lift it up quickly straight and square. This will heap up the water in the middle so that the scum will run off.

We were surrounded by whiteweed. The week before I had seen it equally abundant in Worcester (in many fields the flowers placed in one plane would more than cover the surface), and here as there each flower had a dark ring of small black insects on

its disk. Think of the many dense white fields between here and there, aye and for a thousand miles around, and then calculate the amount of insect life of one obscure species!

Went off to Nelson's Island (now Briggs's) in Long Pond by a long, very narrow bar (fifty rods as I paced it), in some places the water over shoes and the sand commonly only three or four feet wide. This is a noble island, maybe of eight or ten acres, some thirty feet high and just enough wooded, with grass ground and grassy hollows. There was a beech wood at the west end, where R.'s son Walton found an arrowhead when they were here before, and the hemlocks resounded with the note of the tweezer-bird (*Sylvia Americana*). There were many ephemerae half dead on the bushes. R. dreams of residing here.

June 25. An abundance of the handsome corncockle (*Lychnis*), apparently in prime, in midst of a rye-field, together with morning-glories by the Acushnet shore. Black-grass in bloom, partly done. A kind of rush (?) with terete leaves and a long spike of flowers, one to two feet high, somewhat like a loose plantain spike. It inclines to grow in circles a foot or more in diameter. Seaside plantain and rosemary, not long out. *Veronica arvensis* one foot high (!) on the shore there. *Spergularia rubra* var *marina*.

P. M. — Called at Thomas A. Greene's in New Bedford, said to be best acquainted with the botany of this vicinity (also acquainted with shells, and somewhat with geology). In answer to my question what were the rare or peculiar plants thereabouts, he looked over his botany deliberately and named the *Aletris farinosa*, or star-grass; the *Hydrocotyle vulgaris* (probably *interrupta* of Gray), which he thought was now gone; *Proserpinaca pectinacea*, at the shallow pond in Westport where I went last fall with Ricketson; *Panax trifolium*. That chenopodium-like plant on the salt-marsh shore, with hastate leaves, mealy under sides, is *Atriplex patula*, not yet out.

Brewer, in a communication to Audubon (as I read in his hundred(?)-dollar edition), makes two kinds of song sparrows, and says that Audubon has represented one, the most common about houses, with a spot in the centre of the breast, and Wilson the other, more universally spotted on the breast. The latter's nest will be two feet high in a bush and sometimes covered over and with an arched entrance and with six eggs (while the other has not more than five), larger and less pointed than the former's and apparently almost wholly rusty-brown. This builds further from houses.

June 26. Thursday. In Loudon's "Encyclopaedia of Agriculture" far (of the Romans) is translated Indian corn or *zea*!

According to Audubon's and Wilson's plates, the *Fringilla passerina* has a for the most part clear yellowish-white breast, but the Savannah sparrow no conspicuous yellow on shoulder, a yellow brow, and white crown line. Rode to Sconticut Neck or Point in Fair Haven, five or six miles, and saw, apparently, the *F. savanna* near their nests (my seringo note), restlessly flitting about me from rock to rock within a rod. Distinctly yellow-browed and spotted breast, not like plate of *passerina*. Audubon says that the eggs of the Savannah sparrow "are of a pale bluish color, softly mottled with purplish brown," and those of the yellow-winged sparrow are "of a dingy white, sprinkled with

brown spots.” The former is apparently my seringo’s egg of May 28th. Is not Nuttall mistaken when he describes the notes of the Savannah sparrow in March in Georgia as “very long, piping, and elevated” and says that they sometimes have a note like a cricket? Audubon refers to the last note only.

Saw a farmer on the Neck with one of Palmer’s patent wooden legs. He went but little lame and said that he did his own mowing and most of his ordinary farm work, though plowing in the present state of his limb, which had not yet healed, wrenched him some. He had lost a leg just below the knee, and was supported mainly on his thigh above the stump.

The older houses about New Bedford, as on this neck (and one a hundred years old is an old one), have commonly stone chimneys, which are agreeable to my eye and built with more taste than brick ordinarily, i.e. more elaborately. Yet they are now pulled down and brick substituted, or else concealed with a coat of mortar!

This neck, like the New Bedford country generally, is very flat to my eye, even as far inland as Middleborough. When R. decided to take another road home from the latter place, because it was less hilly, I said I had not observed a hill in all our ride. I found on the rocky and rather desolate extremity of this point the common *Oxalis stricta* on the seashore, abundant, going to seed; apparently carrots (?) naturalized; atriplex not yet out; beach pea, still out and going to seed. An abundance of the small iris in the field near by. It was thick weather, after a drizzling forenoon, and we could just see across Buzzard’s Bay from the point to Falmouth. Mattapoisett was the point next above on this side. I had been expecting to find the aletris about New Bedford, and when taking our luncheon on this neck what should I see rising above the luncheon-box, between me and R., but what I knew must be the *Aletris farinosa*; not yet out, but one near by would open apparently in two or three days.

I was struck by the number of quails thereabouts, and elsewhere in this vicinity. They keep up an incessant whistling these days, as also about R.’s house, within a stone’s throw of it; and I several times saw them in the middle of the road in front of his house, in coveys, and on the road fence there. Also saw cow-birds in flocks on the road there. Around R.’s shanty was heard an incessant whistling of quails, and, morning and evening, the strain of the bay-wing, and some rather feeble purple finches, young males without the purple, dark-colored.

Talked with a farmer by name of Slocum, hoeing on the Neck, a rather dull and countrified fellow for our neighborhood, I should have said. Asked him, by chance, about getting to Cuttyhunk, if it was safe to cross the bay in a whale-boat. Yes, or “Ye-e-s,” his boat was only some twelve feet long and went over two or three times a year. His relations lived there. Perhaps he understood navigating here. Well, he’d been round the world considerably. “Have you been master of a whaler?” Yes; he’d been to most all parts of the world.

Heard of, and sought out, the hut of Martha Simons, the only pure-blooded Indian left about New Bedford. She lives alone on the narrowest point of the Neck, near the shore, in sight of New Bedford. Her hut stands some twenty-five rods from the road on

a small tract of Indian land, now wholly hers. It was formerly exchanged by a white man for some better land, then occupied by Indians, at Westport, which he wanted. So said a Quaker minister, her neighbor. The squaw was not at home when we first called. It was a little hut not so big as mine. Vide sketch by R., with the bay not far behind it. No garden; only some lettuce amid the thin grass in front, and a great white pile of clam and quahog shells one side. She ere long came in from the seaside, and we called again. We knocked and walked in, and she asked us to sit down. She had half an acre of the real tawny Indian face, broad with high cheek-bones, black eyes, and straight hair, originally black but now a little gray, parted in the middle. Her hands were several shades darker than her face. She had a peculiarly vacant expression, perhaps characteristic of the Indian, and answered our questions listlessly, without being interested or implicated, mostly in monosyllables, as if hardly present there. To judge from her physiognomy, she might have been King Philip's own daughter. Yet she could not speak a word of Indian, and knew nothing of her race. Said she had lived with the whites, gone out to service to them when seven years old. Had lived part of her life at Squaw Betty's Neck, Assawampsett Pond. Did she know Sampson's? She'd ought to; she'd done work enough there. She said she was sixty years old, but was probably nearer seventy. She sat with her elbows on her knees and her face in her hands and that peculiar vacant stare, perhaps looking out the window between us, not repelling us in the least, but perfectly indifferent to our presence.

She was born on that spot. Her grandfather also lived on the same spot, though not in the same house. He was the last of her race who could speak Indian. She had heard him pray in Indian, but could only understand "Jesus Christ." Her only companion was a miserable tortoise-shell kitten which took no notice of us. She had a stone chimney, a small cooking-stove without fore legs, set up on bricks within it, and a bed covered with dirty bed-clothes. Said she hired out her field as pasture; better for her than to cultivate it. There were two young heifers in it. The question she answered with most interest was, "What do you call that plant?" and I reached her the aletris from my hat. She took it, looked at it a moment, and said, "That's husk-root. It's good to put into bitters for a weak stomach." The last year's light-colored and withered leaves surround the present green star like a husk. This must be the origin of the name. Its root is described as intensely bitter. I ought to have had my hat full of plants.

A conceited old Quaker minister, her neighbor, told me with a sanctified air, "I think that the Indians were human beings; dost thee not think so?" He only convinced me of his doubt and narrowness.

June 27. P. M. — Went with R. and his boys in the Steamer Eagle's Wing, with a crowd and band of music, to the northeast end of Naushon, "Woods Hole," some fifteen miles from New Bedford; about two hours going. Talked with a Mr. Congdon, cashier of a bank and a vegetarian. Saw all the Elizabeth Isles, going and coming. They are mostly bare, except the east end of Naushon. This island is some seven miles long, by one to two wide. I had some two and a half hours there. I was surprised to find such a noble primitive wood, chiefly beech, such as the English poets celebrate, and oak

(black oak, I think), large and spreading like pasture oaks with us, though in a wood. The ground under the beeches was covered with the withered leaves and peculiarly free from vegetation. On the edge of a swamp I saw great tupelos running up particularly tall, without lower branches, two or three feet in diameter, with a rough light-colored bark. Noticed a thorn, perhaps cockspur, with an undivided leaf, gooseberries, stag-horn sumach, not in bloom. Most of the passengers expected to find strawberries. Saw a common wild grape-vine running over a beech, which was apparently flattened out by it, which vine measured, at six feet from ground, twenty-three inches in circumference. It was large below, where it had already forked. At five feet from ground it divided into three great branches. It did not rise directly, but with a great half-spiral sweep or anguish. No sight could be more primeval. It was partly or chiefly dead. This was in the midst of the woods, by a path-side. Just beyond we started up two deer.

I suppose the white gull I saw and heard (somewhat like the sound of the small mackerel gull of the Cape) at Naushon was the *Sterna hirundo*, or great tern, with long forked tail. A Mr. Wall, artist, at New Bedford, told me of a high pine wood or swamp some miles down Naushon with "storks' nests" (!) in the pines. Were they blue herons?

Naushon is said to be part of the township of Chilmark, Martha's Vineyard, and to belong to Mr. Swain of New Bedford and Forbes of Boston; some say to Swain alone.

Walton Ricketson went down in a schooner the next day again, and found the pond near Swain's well stocked with pickerel, of which he caught many in a few hours.

Returning, I caught sight of Gay Head and its lighthouse with my glass, between Pasque and Nashawena. This lighthouse, according to Congdon, who says he measured it trigonometrically, is not more than one hundred and fifty feet above the sea. The passages between the islands are called "holes." Quick's is one. Cuttyhunk was very plain. Congdon said that he was there about thirty years ago, but could see no traces of Gosnold there, and does not believe there are any. Captain Slocum (of the day before), who has relations there, never saw any. Mr. Wall said that there was one old gentleman still alive, a Mr. Howland, who went on there with Belknap, who could tell all about it. The island is cultivated.

June 28. *Lamium amplexicaule* still out behind R.'s shanty. I picked up two arrow-heads amid oyster and clam shells by a rock at the head of the creek opposite R.'s. One was of peculiar — form, quite blunt and small, of quartz, apparently to knock over small game without breaking the skin.

P. M. — I paddled up the Acushnet, about a mile above the paper-mill, as far as the ruined mill, in Walton's skiff with Arthur R. (Walton was named from I. Walton, the angler, and Arthur from Dana's hero in "Sun not set yet," etc.) I never saw such an abundance of peltandra as borders that sluggish and narrow stream, in bunches alternating with pickerel-weed; leaves of very various forms and sizes.

June 29. Sunday. P. M. — Bathed in the creek, which swarms with terrapins, as the boys called them. I find no account of them in Storer!! They put their heads out and floated about just like the *Emys picta*, and often approached and played (?) with

each other. Some were apparently seven or eight inches long and of a yellowish color. A man by the riverside told us that he had two young ducks which he let out to seek their food along the riverside at low tide that morning. At length he noticed that one remained stationary amid the grass or salt weeds and something prevented its following the other. He went to its rescue and found its foot shut tightly in a quahog's shell amid the grass which the tide had left. He took up all together, carried to his house, and his wife opened the shell with a knife, released the duck, and cooked the quahog. Bathed again near Dogfish Bar. It was warm and dirty water, muddy bottom. I probably found an Indian's bone at Throgg's Point, where their bodies have been dug up.

June 30. Monday. A. M. — To Middleborough ponds in the new town of Lakeville (some three years old). What a miserable name! It should have been Assawampsett or, perchance, Sanacus, if that was the name of the Christian Indian killed on the pond. By the roadside, Long Plain, North Fairhaven, observed a tupelo seven feet high with a rounded top, shaped like an umbrella, eight feet [in] diameter, spreading over the wall, and the main stem divided suddenly at two feet only below the top, where it was six inches in diameter!

On the right hand in the old orchard near the Quitticus Ponds, heard and at last saw my tweezer-bird, which is extremely restless, flitting from bough to bough and apple tree to apple tree. Its note like ah, zre zre zre, zritter zritter zrit'. *Sylvia Americana*, parti-colored warbler, with golden-green reflections on the back, two white bars on wings, all beneath white, large orange mark on breast, bordered broadly with lemon yellow, and yellow throat. These were making the woods ring in Concord when I left and are very common hereabouts.

Saw a haymaker with his suspenders crossed before as well as behind. A valuable hint, which I think I shall improve upon, since I am much troubled by mine slipping off my shoulders.

Borrowed Roberts's boat, shaped like a pumpkin-seed, for we wished to paddle on Great Quitticus. We landed and lunched on Haskell's Island, which contains some twenty-five or thirty acres. Just beyond this was Reed's Island, which was formerly cultivated, the cattle being swum across, or taken over in a scow. A man praised the soil to me and said that rye enough had been raised on it to cover it six inches deep. At one end of Haskell's Island was apparently a piece of primitive wood, — beech, hemlock, etc. Under the first I found some low, dry brown plants, perhaps beech-drops and the like, two species, but saw none of this year. One who formerly owned Reed's Island said that a man once lived on Haskell's Island and had a hennery there. The tweezer-birds were lively in the hemlocks.

Rode on to the old Pond Meeting-house, whence there is a fine view of Assawampsett. It is probably the broadest lake in the State. Uriah (?) Sampson told me it was about eight or ten feet deep in the middle, but somewhat deeper about the sides. The main outlet of these ponds is northeast, by Taunton River, though there is some connection

with the Mattapoissett River, and Assonet River drains the neighborhood of Long Pond on the west.

Two men spoke of loon's eggs on a rocky isle in Little Quitticus. I saw the *Lobelia Dortmanna* in bloom in the last.

A southwest breeze springs up every afternoon at this season, comparatively cool and refreshing from the sea.

As we were returning, a Mr. Sampson was catching perch at the outlet from Long Pond, where it emptied into Assawampsett with a swift current. The surface of the rippling water there was all alive with yellow perch and white ones, "whole schools showing their snouts or tails as they rose for the young alewives which appeared to be passing out of the brook. These, some of which I have in spirits, were about an inch and a half long. Sampson fished with these for bait, trailing or jerking it along the surface exactly as for pickerel, and the perch bit very fast. He showed me one white perch. It was a broader fish than the yellow, but much softer-scaled and generally preferred. He said they would not take the hook after a certain season. He swept out some young alewives (herring) with a stick on to the shore, and among them were young yellow perch also an inch and a half long, with the transverse bands perfectly distinct. I have some in spirit. The large ones were devouring these, no doubt, together with the alewives. Is not June the month when most of our freshwater fish are spawned?

## JULY, 1856

July 1. P. M. — Paddled on the Acushnet.

Passed through some schools of fishes which were rippling the surface about us in midstream.

The back fins, very long and sharp, projected two or three inches above water. Walton said afterward that they were menhaden.

July 2. Return to Concord.

Looked at the birds in the Natural History Rooms in Boston. Observed no white spots on the sparrow hawk's wing, or on the pigeon or sharp-shinned hawk's. Indeed they were so closed that I could not have seen them. Am uncertain to which my wing belongs. May I not have seen the white-crowned sparrow in company with the white-throated? They are much alike. Yet Wilson says they rarely associate. The hemlock and pine warbler are much alike. Is it possible I have confounded them?

July 3. P. M. — To Assabet River.

In the main stream, at the Rock, I am surprised to see flags and pads, laying the foundation of an islet in the middle, where I had thought it deep before. Apparently a hummock lifted by ice sunk there in the spring, and this may be the way in which many an island has been formed in the river.

I scare up one or two woodcocks in different places by the shore, where they are feeding, and in a meadow. They go off with a whistling flight. Can see where their bills have probed the mud.

See a stemothærus on a small stump two feet over water. I approach and take hold of it, but cannot easily remove it. It appears to be shrunk on, withering away and dying there. It barely moves its head and eyes slightly, and its flippers look very much shrunken, yet it tumbles off after I leave. Apparently a male. I notice afterward, on succeeding days, many of them resting thus sluggishly, and find that I can approach and handle them and leave them as I found them. They appear much more sluggish than the other kinds now, though they were active enough in the spring. The tortoises improve every rock, and willow slanting over the water, and every floating board and rail. You will see one on the summit of a black willow stump several feet high, and two or more part way up. Some tumble from a height of five or six feet into the water before you. Even the great snap-turtle puts his head out and climbs up a rock on the bank with the rest.

July 5. A. M. — To Loring's Pond.

Pink-colored yarrow. *Epilobium coloratum*, a day or more. Young partridges (with the old bird), as big as robins, make haste into the woods from off the railroad. Plucked some large luscious purple pyrus berries. *Lactuca* some days out.

Borrowed Witherell's boat and paddled over Loring's Pond. A kingbird's nest in fork of a button-bush five feet high on shore (not saddled on); three young just hatched and one egg.

Much of this pond is now very shallow and muddy and crowded with pads, etc. I can hardly push through them. Yet I can see no more white lily pads shaped as that appears to have been which I found here a few weeks since. Many pickerel dart away from amidst the pads, and in one place I see one or two great snap-turtles.

I notice two varieties (?), perhaps, of *Asclepias Cornuti* now out, one on the railroad meadow this side the Brooks Crossing, the other beyond the first mile-post above. The last has broader leaves and blunter and more decidedly mucronate, and pedicels and peduncles quite downy, the former little more than twice the length of the petals. The other has narrower and mote pointed leaves, peduncles and pedicels but little downy comparatively, the latter more than three times the length of the petals and not so numerous as in the other. Vide their pods, if spiny, by and by.

The *Spergularia rubra* was not open in the morning when I passed up, at 8 or 9 a m., but was opened when I returned at noon, but closed again at 5 P. m.

The notes of bam swallows, perhaps with their young, are particularly loud now and almost metallic, like that of a mackerel gull.

The large evening-primrose below the foot of our garden does not open till some time between 6.0 and 8 p. M. or sundown. It was not open when I went to bathe, but freshly out in the cool of the evening at sundown, as if enjoying the serenity of the hour.

July 6. P. M. — To Assabet Bath.

*Campanula aparinoides* roadside opposite *centaurea*, several days. Early low blueberries ripe.

Crossed the river at bath place. On the sandy bank opposite, saw a wood tortoise voraciously eating sorrel leaves, under my face. In A. Hosmer's ice-bared meadow south of Turnpike, hear the distressed or anxious peet of a peetweet, and see it hovering over its young, half grown, which runs beneath and suddenly hides securely in the grass when but few feet from me. White avens, evidently Bigelow's *Geum album* (which Gray makes only a variety of *G. Virginianum*) a good while, very rough and so much earlier than the *G. Virginianum* that only one flower remains. The heads have attained their full size, with twisted tails to the awns, while the other will not open for some days. I think Bigelow must be right. *Lysimachia lanceolata*, a day or two. *Rhus typhina* in our yard; how long? Did not see it out in New Bedford ten days ago. There is a young red mulberry in the lower hedge beneath the celtis.

G. Emerson says the sweet-briar was doubtless introduced, yet, according to Bancroft, Gosnold found it on the Elizabeth Isles.

July 7. I see a difference now between the alder leaves near Island and edge of meadow westward, on Hill; the former slightly downy beneath, the latter (apparently *Alnus serrulata*) green and smooth but yet not pointed at base. Do I not see a taller kind of wool-grass in that birch meadow east of Hill?

P. M. — To Gowing's Swamp.

The purple finch still sings over the street. The *sagittaria*, large form, is out, roadside, Moore's Swamp. The *Vaccinium Oxycoccus* is almost entirely out of bloom, and the berries are as big as small huckleberries (while the *V. macrocarpon* is in full bloom, and no berries appear on it). It must therefore have begun about the 1st of June. Saw the *Kalmia glauca* by the small cranberry, betrayed by its two-edged twig. The snake-head *arethusa* is now abundant amid the cranberries there.

July 8. 3 P. m. — To Baker Farm by boat.

River down to lower side of long rock.

When I landed on Hosmer flat shore, started a large water adder, apparently running on the bank. It ran at once into the river and was lost under the pads. *Ranunculus reptans* is abundantly out at mouth of brook, Baker shore. Is that small *sparganium* there, now abundantly out, about eighteen inches high, with leaves narrow and convex below, concave above, the same species with the larger? Some in press.

Got the downy woodpecker's nest, some days empty.

Find several large and coarse *Potentilla arguta*, two and a half feet high and more, at Bittern Cliff, nearly out of bloom. Flowers in crowded corymbs. They are white, not yellow, as Gray calls them. In the side-

hill wood-lot (or spring wood-lot) behind, where the wood was cut last winter, poke-leaved milkweed (*Asclepias phytolaccoides*), apparently a day or two, and *Circœa alpina*, some days, a foot high with opaque leaves and bracts (in press). This I find to be the same with the small, also bracted, one at Corner Spring (whose leaves were perhaps more transparent when in shade, but which now grows larger in sun).

Sophia saw this afternoon two great snap-turtles fighting near the new stone bridge, making a great commotion in the river and not regarding the spectators, she and another, and a teamster who stopped his team to observe them.

Sam Wheeler, who did not know there were snap-turtles here, says he saw opposite to his boardinghouse, on the sidewalk, in New York, the other day, a green turtle which weighed seven hundred and twenty pounds, which in a short time dropped eggs enough to fill a vessel some feet in diameter. He partook of some of the soup made of it, and there were several eggs in it, which were luscious.

After Jules Gerard, the lion-killer, had hunted lions for some time, and run great risk of losing his life, though he struck the lions in the right place with several balls, the lions steadily advancing upon him even though they had got a death-wound, he discovered that it was not enough to be brave and take good aim, — that his balls, which were of lead, lacked penetration and were flattened against the lions' bones; and accordingly he sent to France and obtained balls which were pointed with steel and went through and through both shoulder-blades. So I should say that the weapons or balls which the Republican Party uses lacked penetration, and their foe steadily advances nevertheless, to tear them in pieces, with their well-aimed balls flattened on his forehead.

In Gerard's book I find, according to a Mohammedan tradition, "when the lion roars, he says, 'Ya rabbi, ma tecallot mi a la ed-dâbèome,' which signifies 'Seignior, deliver to my power the wicked only, and let the good go free.'"

July 10. Yesterday a heavy rain.

A. M. — To Laurel Glen.

*Chenopodium album*, by railroad. *Succory* a week or more, by railroad causeway. *Stackys aspera* well out two or three days, low ground. *Chimaphila umbellata*, some days. *Pyrola elliptica*, how long? *P. chlorantha* done, near part of Cut woods. *P. rotundifolia* (how long?), Cut woods hollow. *Galium triflorum* of Bigelow (?), prostrate, from one centre, Laurel Glen hillside; how long? But the branches are not three-flowered, but have three pedicels and one, two, or all of them (commonly but one) are subdivided into two. Also *G. circœzans* gone to seed. I have pressed apparently *Galium lanceolatum*. *Sericocarpus conyzoides*, Deep Cut path.

*Asclepias obtusifolia*, which was out well on the 5th, has a bloom, and the curved horns are elevated above the flower..

See and hear young bam swallows about.

5 p. M. — Up Assabet.

As I was bathing under the swamp white oaks at 9 — P. M., heard a suppressed sound often repeated, like, perhaps, the working of beer through a bung-hole, which I already suspected to [be] produced by owls. I was uncertain whether it was far or near. Proceeding a dozen rods up-stream on the south side, toward where a catbird was incessantly mewing, I found myself suddenly within a rod of a gray screech owl sitting on an alder bough with horns erect, turning its head from side to side and up and down, and peering at me in that same ludicrously solemn and complacent way

that I had noticed in one in captivity. Another, more red, also homed, repeated the same warning sound, or apparently call to its young, about the same distance off, in another direction, on an alder. When they took to flight they made some noise with their wings. With their short tails and squat figures they looked very clumsy, all head and shoulders. Hearing a fluttering under the alders, I drew near and found a young owl, a third smaller than the old, all gray, without obvious horns, only four or five feet distant. It flitted along two rods, and I followed it. I saw at least two or more young. All this was close by that thick hemlock grove, and they perched on alders and an apple tree in the thicket there. These birds kept opening their eyes when I moved, as if to get clearer sight of me. The young were very quick to notice any motion of the old, and so betrayed their return by looking in that direction when they returned, though I had not heard it. Though they permitted me to come so near with so much noise, as if bereft of half their senses, they at [once] noticed the coming and going of the old birds, even when I did not. There were four or five owls in all. I have heard a somewhat similar note, further off and louder, in the night.

I find (July 14th) (and it has been out some days), at Muhlenbergii Brook, circæas which are distinctly branched and with large leaf-like bracts, some nearly two feet high. Yet they are evidently the same species that I have found before, and I think that there is but one hereabouts, say *C. alpina*, which, however, is poorly described by Gray and inadequately by Bigelow. It is from four or five (in shade) to, as here, about two feet high (in sun); is never pubescent, but quite smooth, round-stemmed, swelling at the joints, more or less branched, in large specimens sometimes very much so (vide pressed one), with bracts quite small and slender in small ones, and very large and leaf-like (two on a common axillary branch) in large plants; leaves opaque in open places, heart-shaped, rather slightly and distantly toothed, of the large specimens, at least, not shining.

July 11. A. M. — To Tarbell Swamp Hill all day with W. E. C.

Landed at path end, Great Meadows. No haying there yet. In the now isolated ditches, etc., there [are] thousands of little pouts about one inch long, more or less. The water is muddy, and I see no old ones. They are rather difficult to catch (like minnows generally, but less so), but I got two and have them in spirit. I scare up several apparent snipes (?), which go off with a crack. They are rather heavy-looking, like woodcocks, but have gray breasts. Are probing the meadow. Quite numerous there. The *Ludwigia sphærocarpa*, which had been out apparently a week on the 6th of August, 1855, shows hardly a sign of a flower yet. So it will hardly open before August 1st. The grass on the islets in those pools is much flattened in many places by the turtles, which lie out sunning on it. They tumble in before me, and by the sound and marks of one I suspect it a snap-turtle. They are commonly *E. picta*.

Bathed and lunched under the oak at Tarbell's first shore. It is about as cool a place as you can find, where you get the southwest breeze from over the broad meadow, for it draws through the valley behind. While sitting there, saw, some twenty-five rods up-stream, amid the pads on the south side, where we had passed, several apparently

young ducks, which soon disappeared again in the meadow-grass. Saw them hereabouts August 6th last year. They regularly breed hereabouts, and the broad meadow affords lurking-places. The meadow is so broad and level that you see shadows of clouds on it as on the sea. A great snap-turtle floated by us with his head out, in midstream, reconnoitring us. Rambled over the hill at angle. Allium out some time on the shore. I have only seen it here, methinks, and on the Assabet shores.

Hear now the link of bobolinks, and see quite a flock of red-wing blackbirds and young (?). The water milkweed, or *Asclepias pulchra*.

July 12. P. M. — Down Turnpike to Red Lily Meadow.

Hear the plaintive note of young bluebirds, a reviving and gleaming of their blue ray. In Moore's meadow by Turnpike, see the vetch in purple patches weighing down the grass, as if a purple tinge were reflected there. White vervain. Smooth sumach, apparently yesterday. Rue is beginning now to whiten the meadows on all hands. The *Ranunculus aquatilis* appears to be about done, though it may have been submerged by the rain of yesterday. I see hardly one freshly open, and it [is] quite moist and lowering yet. By the myosotis ditch there, is an abundance of *Galium trifidum* (apparently *obtusum* or *latifolium*, in press). It is densely massed and quite prickly, with three corolla-lobes. As yet I think I have observed only two varieties of *G. trifidum*, smooth and rough. *Lactuca sanguinea*, some time, with dark-purple stem, widely branched. *Pycnanthemum muticum* and the narrow-leaved, not long.

In the still wet road on the hill, just beyond Lincoln bound, a short-tailed shrew (*Sorex brevicaudus* of Say), dead after the rain. I have found them thus three or four times before. It is  $4\frac{1}{2}$  inches long; tail 1 +; head and snout, 1 +. Roundish body. Lead-color above, somewhat lighter beneath, with a long snout,  $\frac{3}{8}$ - inch beyond lower jaw, incisors black, delicate light-colored (almost silvery) mustachial bristles, and also from lower lip; nose emarginate; nails long and slender a purple bar across each; ears white and concealed in the fur; the nostrils plainly perforated, though Emmons says that in the specimens of *Sorex* he had seen he could detect no perforations with a microscope. It has a peculiar but not very strong muskiness. There was an insect-wing in its mouth. Its numerous teeth distinct. Have I not commonly noticed them dead after rain? I am surprised to read in Emmons that it was first observed in Missouri, and that he has "not been able to meet with it" and doubts its existence in the State; retains it on the authority of former catalogues; says it nests on the surface and is familiar with water. In spirits.

Red lilies in prime, single upright fiery flowers, their throats how splendidly and variously spotted, hardly two of quite the same hue and not two spotted alike, — leopard-spotted, — averaging a foot or more in height, amid the huckleberry and lambkill, etc., in the moist, meadowy pasture.

Apparently a bluebird's egg in a woodpecker's hole in an apple tree, second brood, just laid. In collection. Parsnip at Bent's orchard; how long? Also on July 5th, almost out. Agrimony well out. Chestnut in prime. See *Lysimachia quadrifolia* with from

three to five (or six?) leaves in a whorl. *Iberis umbellata*, candytuft, roadside, Tuttle's, naturalized; how long? New plant.

July 13. P. M. — To Comer Spring.

*Orchis lacera*, apparently several days, lower part of spike, willow-row, Hubbard side, opposite Wheildon's land. See quite a large flock of chattering red-wings, the flight of first broods. Thimble-berries are now fairly ripe and abundant along walls, to be strung on herd's-grass, but not much flavor to them; honest and wholesome. See where the mowers have plucked them. Gather the large black and blackening ones. No drought has shrivelled them this year.

Heard yesterday a sharp and loud ker-pheet, I think from a surprised woodchuck, amid bushes, — the *sif-fleur*. Reminds me somewhat of a peetweet, and also of the squeak of a rabbit, but much louder and sharper. And all is still.

Hubbard's meadow — or I will call it early meadow 30 — aster, some days, now rather slender and small-bushed. *Drosera longifolia* and also *rotundifolia*, some time. *Polygala sanguinea*, some time, Hubbard's Meadow Path; say meadow-paths and banks. Saw and heard two or three redstarts at Redstart Woods, where they probably have nests. Have noticed bright-red geranium and pyrus leaves a week or more.

In Hubbard's euphorbia pasture, cow blackbirds about cows. At first the cows were resting and ruminating in the shade, and no birds were seen. Then one after another got up and went to feeding, straggling into the midst of the field. With a chattering appeared a cowbird, and, with a long slanting flight, lit close to a cow's nose, within the shadow of it, and watched for insects, the cow still eating along and almost hitting it, taking no notice of it. Soon it is joined by two or three more birds.

An abundance of spurry in the half-grown oats adjoining, apparently some time out. Yellow lily, how long? Am surprised to see an *Aster lœvis*, out a day or two, in road on sandy bank. Goldfinches twitter over. *Hydrocotyle*, some time.

July 14. P. M. — To Muhlenbergii Brook.

Anthony Wright found a lark's nest with fresh eggs on the 12th in E. Hubbard's meadow by ash tree, — two nests, probably one a second brood. *Nasturtium hispidum* (?), apparently three or four days. See and hear martins twittering on the elms by riverside. Bass out about two days at Island. There is a pyrus twenty feet high with small fruit at Assabet Spring.

*Noli-me-tangere* already springs at Muhlenbergii Brook, some days. Saw apparently my little ruby (? ) crested wren (?) on the weeds there. *Senecio* long gone to seed and dispersed. Canada thistle some time on Huckleberry Pasture-side beyond. *Ceratophyllum* with a dense whorl of twelve little oval red-dotted apparent flower-buds (?) in an axil.

While drinking at Assabet Spring in woods, noticed a cherry-stone on the bottom. A bird that came to drink must have brought it half a mile. So the tree gets planted!

July 15. P. M. — To Hubbard's Close and Walden.

Carrots by railroad, how long? I notice the froth concealing a grub, not only on trees and bushes, but on *Potentilla Norvegica*, *Lechea* (great-fruited), etc., etc., *Pyc-*

nanthemum muticum, even Lobelia inflata, red clover, Aster puniceus. This spots my clothes when going through bushes. Both small hypericums, Cana-dense and mutilum, apparently some days at least by Stow's ditch. Bobolinks are heard — their link, link — above and amid the tall rue which now whitens the meadows. Checkerberry, a day or two. Spiranthes gracilis well out, in dry, slender grass by roadside. I do not notice the krigia out in my afternoon walks, and so it is not known by many, but in the morning its disk is very commonly seen.

When I crossed the entrance to the pond meadow on a stick, a pout ran ashore and was lodged so that I caught it in the grass, apparently frightened. While I held it, I noticed another, very large one approach the shore very boldly within a few feet of me. Going in to bathe, I caught a pout on the bottom within a couple of rods of the shore. It seemed sick. Then, wading into the shallow entrance of the meadow, I saw a school of a thousand little pouts about three quarters of an inch long without any attending pout, and now have no doubt that the pout I had caught (but let go again) was tending them, and the large one was the father, apparently further off. The mother had perhaps gone into deep water to recruit after her air-bath. The young were pretty shy; kept in shallow water, and were taking pretty good care of themselves. If the water should suddenly fall, they might be caught in the meadow.

Ludvrigia altemifolia not quite; in a day or two.

Amid the high grass or rushes by that meadow-side started a water adder. It was about three feet long, but large round in proportion, with about one hundred and forty abdominal plates and a long, slender tail. It was black above, with indistinct transverse brown bands. Under its head white; first half of belly white, with triangular or conical dark brown-red marks on sides; the white gradually becomes more narrow and yellowish for the latter half of the abdomen, bordered by more numerous and still darker reddish marks, becoming confluent and alternating with silvery ones, giving a handsome regularly mottled or spotted look. The silvery thus across the belly: The barred part dark-reddish. Under the tail no reddish. CORYLUS ROSTRATA differs from — common in the twig being smooth and not glandular-hairy. Scutellaria galericulataf some time. Polygonum sagittatum, almost.

That green sponge plant gathered yesterday is remarkably slow to dry; though it has been many hours exposed to the sun and wiped with many papers and has been a whole day exposed to the air, it is far from dry yet. It is more pungent and strong-scented than ever and sickens me to stay in the room with a little of it.

July 16. Sium out not long. I see many young shiners (? ) (they have the longitudinal bar), one to two and a half inches long, and young breams two or three inches long and quite broad. Geum Virginianum, apparently two or three days.

See several bullfrogs lying fully out on pads at 5 p m. They trump well these nights.

It is remarkable how a copious rain, raising the river a little, flattens down the heart-leaf and other weeds at bathing-places.

July 17. Found a great many insects in white lilies which opened in pan this forenoon, which had never opened before. What regular and handsome petals! regularly concave toward the inside, and calyx hooked at tip.

P. M. — To Water Dock Meadow and Linnæa Hillside..

Hear a new note from bank swallows when going over the Hosmer pastures, a sort of screep screep, shrill and like what I have referred to the bam swallow. They are probably out with young.

*Ludwigia palustris* and *ilysanthes* have been out apparently some time on the flat Hosmer shore or meadow, where the surface has been laid bare by the ice. There, too, the *Hypericum Sarothra* has pushed up abundantly. I see many young toads hopping about on that bared ground amid the thin weeds, not more than five eighths to three quarters of an inch long; also young frogs a little larger. Horse-mint out at Clamshell, apparently two or three days.

Bathed at Clamshell. See great schools of minnows, apparently shiners, hovering in the clear shallow next the shore. They seem to choose such places for security. They take pretty good care of themselves and are harder to catch with the hands than you expect, darting out of the way at last quite swiftly. Caught three, however, between my hands. They have brighter golden irides, all the abdomen conspicuously pale-golden, the back and half down the sides pale-brown, a broad, distinct black band along sides (which methinks marks the shiner), and comparatively transparent beneath behind vent. When the water is gone I am surprised to see how they can skip or spring from side to side in my cup-shaped two hands for a long time. This to enable them to get off floating planks or pads on the shore when in fright they may have leaped on to them. But they are very tender, and the sun and air soon kill them. If there is any water in your hand they will pass out through the smallest crack between your fingers. They are about three quarters of an inch long generally, though of various sizes.

Half a dozen big bream come quite up to me, as I stand in the water. They are not easily scared in such a case.

The large skunk-cabbage fruit looks quite black now where the haymakers have passed. Stooping to drink at the Hosmer Spring, I saw a hundred caddis-cases, of light-colored pebbles, at the bottom, and a dozen or twenty crawled half-way up the side of the tub, apparently on their way out to become perfect insects.

Cows in their pasture, going to water or elsewhere, make a track four or five inches deep and frequently not more than ten inches wide.

The great water dock has been out some days at least. Its valves are quite small at first, but lower leaves pointed. I hear in the meadow there a faint incessant z-ing sound, as of small locusts in the meadow-grass. Under the oak in Brown's moraine pasture, by Water Dock Meadow, a great arum more than three feet high, like a tropical plant, in open land, with leaflets more than a foot long. There is rich-weed there, apparently not quite out.

Going up the hillside, between J. P. Brown's and rough-cast house, am surprised to see great plump ripe low blackberries. How important their acid (as well as currants) this warm weather! It is 5 p. m. The wood thrush begins to sing.

A very warm afternoon. Thermometer at 97° at the Hosmer Desert. I hear the early locust. I have come to collect birds' nests. The thrasher's is apparently made partly beneath the surface, some dirt making its sides. I find the nests by withered twigs and leaves broken off in the spring, but commonly nearly concealed by the recent growth. The jay's nest had been filled with white oak leaves. Not one could have been blown into it. On Linnæa Hill many thimble-berries and some raspberries.

Evening by river to Ed. Hosmer's. Hear at distance the hum of bees from the bass with its drooping flowers at the Island, a few minutes only before sunset. It sounds like the rumbling of a distant train of cars. Returning after ten, by moonlight, see the bullfrogs lying at full length on the pads where they trump.

July 18. P. M. — To Wheeler meadow to look at willows.

Again scare up a woodcock, apparently seated or sheltered in shadow of ferns in the meadow on the cool mud in the hot afternoon. Rosa Carolina, some time, at edge of Wheeler meadow near Island Neck.

You see almost everywhere on the muddy river bottom, rising toward the surface, first, the coarse multifid leaves of the *Ranunculus Purshii*, now much the worse for the wear; second, perhaps, in coarseness, the *ceratophyllum*, standing upright; third, perhaps, the *Bidens Beckii*, with its leaflets at top; then the *Utricularia vulgaris*, with its black or green bladders, and the two lesser *utricularias* in many places.

July 19. P. M. — Marlborough Road via railroad and Dugan wood-lot.

A box tortoise, killed a good while, on the railroad, at Dogwood Swamp; quite dry now. This the fourth I have ever found: first one, alive, in Truro; second one, dead, on shore of Long Pond, Lakeville; third one, alive, under Fair Haven Hill; and fourth, this. This appeared to have been run over, but both upper and under shells were broken into several pieces each, in no case on the fine of the serrations or of the edges of the scales (proving that they are as strong one way as the other), but at various angles across them, which, I think, proves it to have been broken while the animal was alive or fresh and the shell not dry. I picked up only the after half or two thirds and one foot. The upper shell was at the widest place four and three eighths inches. It was broken irregularly across the back, from about the middle of the second lateral scale from the front on the left to the middle of the third lateral on the right, and was, at the angle of the marginal scales, about sixteen fortieths to seventeen fortieths of an inch thick, measured horizontally. The sides under the lateral scales and half the dorsal were from four to five fortieths of an inch thick. The thinnest part was about three eighths of an inch from middle of back on each side, directly between the spring of the sides [? ], where it was but little more than two fortieths thick. So nature makes an arch. I have about half the sternum, the rear of it at one point reaching to the hinge. It is thickest vertically just at the side hinges, where it is one fourth thick; thinnest three eighths from this each side, where it is one eighth thick; and thence thickens to the

middle of the sternum, where it [is] seven and a half fortieths thick. The upper shell in this case (vide May 17, 1856) is neither pointed nor notched behind, but quite straight. The sternum and the lower parts of the marginal scales are chiefly dark-brown. The marking above is sufficiently like that of the Cape Cod specimen, with a still greater proportion of yellow, now faded to a yellowish brown.

On Linnæa Hills, sarsaparilla berries. *Lobelia inflata*, perhaps several days; little white glands (?) on the edges of the leaves. On the under side of a *Lobelia spicata* leaf, a sort of loose-spun cocoon, about five eighths of an inch long, of golden-brown silk, beneath which silky mist a hundred young spiders swam.

Examined painted tortoise eggs of June 10th. One of those great spider(? )-holes made there since then, close to the eggs. The eggs are large and rather pointed, me-thinks at the larger end. The young are half developed. Fleets of yellow butterflies on road. Small white rough-coated puffballs (?) in pastures. Appear not to have two coats like that of Potter's Path, q v.

As I come by the apple tree on J. P. B.'s land, where I heard the young woodpeckers hiss a month or so ago, I now see that they have flown, for there is a cobweb over the hole.

Plucked a handful of gooseberries at J. P. B.'s bush, probably ripe some time. It is of fair size, red-purple and greenish, and apparently like the first in garden, except it is not slightly bristly like that, nor has so much flavor and agreeable tartness. Also the stalk is not so prickly, but for the most part has one small prickle where ours has three stout ones. Our second gooseberry is more purple (or dark-purple with bloom) and the twig less prickly than the wild. Its flavor is insipid and in taste like the wild.

It is the *Hypericum ellipticum* and *Canadense* (linearleaved) whose red pods are noticed now.

On the sand thrown out by the money-diggers, I found the first ripe blackberries thereabouts. The heat reflected from the sand had ripened them earlier than elsewhere. It did not at first occur to me what sand it was, nor that I was indebted to the money-diggers, or their Moll Pitcher who sent them hither, for these blackberries. I am probably the only one who has got any fruit out of that hole. It's an ill wind that blows nobody any good. Looking up, I observed that they had dug another hole a rod higher up the hill last spring (for the blackberries had not yet spread over it), and had partly filled it up again. So the result of some idler's folly and some spiritualist's nonsense is that I get my blackberries a few days the earlier.

The downy woodpecker's nest which I got July 8th was in a dead and partly rotten upright apple bough four and three quarters inches [in] diameter. Hole perfectly elliptical (or oval) one and two sixteenths by one and five sixteenths inches; whole depth below it eight inches. It is excavated directly inward about three and a half inches, with a conical roof, also arching at back, with a recess in one side on level with the hole, where the bird turns. Judging from an old hole in the same bough, directly above, it enlarges directly to a diameter of two and one fourth to two and one half inches, not in this case descending exactly in the middle of the bough, but leaving one side not a

quarter of an inch thick. At the hole it is left one inch thick. At the nest it is about two and three eighths inches [in] diameter. I find nothing in the first but bits of rotten wood, remains of insects, etc., when I tip it up, — for I cannot see the bottom, — yet in the old one there is also quite a nest of fine stubble (?), bark shred (?), etc., mixed with the bits of rotten wood.

July 20. P. M. — Up Assabet.

Button-bush, apparently two or three days.

I suspect that those very variously formed leaves in and about woods which come to naught — like the sium in deep water — are of the nabalus.

Caught a middle-sized copper-colored devil's-needle (with darker spots on wings), sluggish, on a grass stem, with many dark-colored elliptical eggs packed closely to outside, under its breast.

July 21. P. M. — To A. Wheeler's grape meadow.

Mimulus, not long. Hypericum corymbosum, a day or two. Rusty cotton-grass, how long?

The small hypericums are open only in the forenoon. Pursley, also, in our garden opens now not till 8 a m., and shuts up before 12 m.

The flat euphorbia is now in prime on the sandy path beyond Potter's Desert, five-finger fungus path.

Plucked a handful of huckleberries from one bush! The *Vactinium vacillans* thick enough to go picking, and probably for a day or two in some places. Low blackberries thick enough to pick in some places, three or four days. Thimble-berries about the 12th, and *V. Pennsylvanicum* much longer.

These hot afternoons I go panting through the close sprout-lands and copses, as now from Cliff Brook to Wheeler meadow, and occasionally come to sandy places a few feet in diameter where the partridges have dusted themselves. Gerard, the lion-killer of Algiers, speaks of seeing similar spots when tracking or patiently waiting the lion there, and his truth in this particular is a confirmation of the rest of his story. But his pursuit dwarfs this fact and makes it seem trivial. Shall not my pursuit also contrast with the trivialness of the partridges' dusting? It is interesting to find that the same phenomena, however simple, occur in different parts of the globe. I have found an arrowhead or two in such places even. Far in warm, sandy woods in hot weather, when not a breath of air is stirring, I come upon these still sandier and warmer spots where the partridges have dusted themselves, now all still and deserted, and am not relieved, yet pleased to find that I have been preceded, by any creature.

Grapes ready to stew.

Mr. Russell writes me to-day that he visited the locality of the *Magnolia glauca* the 18th, on Cape Ann, and saw lingering still a few flowers and flower-buds.

It is quite open and rising above the bushes.

The brook cress might be called river cress, for it is very abundant rising above the surface in all the shallower parts of the river.

*Verbena hastata*, apparently several days.

Sonchus, some time.

This has been a peculiarly fine afternoon. When I looked about casually, was surprised at the fairness of the landscape. Though warm, it is clear and fresh, and the air imparts to all surfaces a peculiar fine glaucous color, full of light, without mistiness, like the under side of the *Salix lucida* (?) leaves at present. Not only the under sides of the leaves, but the very afternoon landscape, has become glaucous. Now, when the fashionable world goes to Saratoga, Nahant, and Newport, we frequent our oldest haunts with new love and reverence and sail into new ports with each fresh varnish of the air.

July 23. 9 A. m. — Up river for *Nuphar Kalmiana* with Russell.

Pasture thistle, not long. *Hypericum Sarothra*, not long, or perhaps some days. *Antennaria margaritacea*. *Scutellaria lateriflora*, apparently some days.

R. says that my five-finger fungus is the *Lycoperdon stellatum* and can be found now. I find it in some places. (It is different from the white rough-coated puffball now found.) It was exhibited lately in Boston as the “resurrection plant”(!!) to compete with the one imported from Palestine. That what I have called fresh-water sponge is such, *Spongia fluviatilis*, and, like the marine, is uncertain whether vegetable or animal. When burned it leaves a mass of white spicula which have been mistaken for infusoria! Thinks the dry brown last-year’s plant I brought from Haskell’s Island, Lakeville, the *Epiphegus*. That the *Rubus Canadensis*, low blackberry, is not found far west of us. That there is described — he thinks in Hooker’s English Flora — a certain massing up of a conferva similar to that of my *eriocaulon* balls. Has seen a Mexican species, allied to the potato, cultivated hereabouts, which became a weed, — would not become larger than a walnut. Speaks of the young pouts with their bladders attached, accompanied by the old. That the berries of the *celtis* are pleasant to taste, those of the *sassafras* abominable. Showed me the *Dulichium spathaceum*, leaves in three ranks, so common along river, now in bloom; also the *Carex lupulina* (?) or *retrorsa* (?), hop sedge, with the inflated perigynia. Said that those reddish clusters of buds on a rush or *carex* were enlarged by disease. That the two white cotton-grasses (*Eriophorum*) were probably but one species, taller and shorter; also the two wool-grasses *Scirpus* — *Trichophorum* [sic] were probably but one species, the tall and short. That there was an account of the *lecheas* by Tuckerman in Silli-man’s Journal.

P. M. — To Walden for *hydropeltis*.

A young *stemothærus* which R. picked up recently dead, on the shore of the pond, was one and one sixteenth inches long, — the upper shell, — probably therefore a last year’s one, or not yet one year old. Very high and sharp back, but broader than old. No hook to upper bill.

That fern leaf on my coal (?) is probably the *Neuropteris* as figured in Richardson’s Botany.

Saw at *Hydropeltis* Meadow a small bullfrog in the act of swallowing a young but pretty sizable apparently *Rana palustris*, such as now hop about, an inch and a half long. He took it down head foremost, and as the legs were slowly taken in, — stuffing

himself, — for the legs were often straightened out, — I wondered what satisfaction it could be to the larger to have that cold slimy fellow, entire, lying head to tail within him! I sprang to make him disgorge, but it was too late to save him. Though I tossed the bullfrog out of the water, the palustris was entombed. So little while had he been in the light when he fell into that recess! Bathing in Walden, I find the water considerably colder at the bottom while I stand up to my chin, but the sandy bottom much warmer to my feet than the water. The heat passes through the water with[out] being absorbed by it much. The hydropeltis leaves so crowded they cannot lie flat, but their edges show (a good part [of] the under side) as if blown up by wind.

The water adder killed on the 15th and left hanging on a twig has decayed wonderfully. I perceive no odor, and it is already falling to pieces. I can see most of its ribs and through and through in many directions!! It is already mere skin and skeleton, as empty as [a] flute. I can count the bare ribs, and it [is] inoffensive to the smell.

See apparently young goldfinches about, very freshly bright golden and black.

The small potamogeton, heterophyllus (?) or hybridus (?), out some time. *Ludwigia altemifolia*, five or six days.

July 24. P. M. — To Flint's Pond.

*Solidago stricta*, Ingraham Path, well out, some days. *Ghimaphila maculata*, three flowers, apparently but few days, while the *umbellata* is quite done there. Leaves just shooting up. See those light-bordered dark spots on tall and other goldenrod leaves (*fungi* (?) says Russell). In the low Flint's Pond Path, beyond Britton's, the tall rough goldenrod makes a thicket higher than my head. Many hazelnut burs now look rough and reddish about the base. Tobacco-pipe much blackened, out a long time.

I find, at the shallow stone wharf shore, three balls in good condition, walking about half the length of that shore. Methinks it was about a week earlier than this that they were found last year. There is on the surface of the water, washed up and floating about, a good deal of the *eriocaulon*, loosened up, perhaps, by pouts or other creatures, and also some other fine weeds with it. Yet the *eriocaulon* has but just begun to bloom! So also the *vallisneria* has washed up some time in river. There is also a very fine rush (?) on the bottom there like hair. Is that a little submerged kind of *utricularia* or *ranunculus* on the sandy bottom in shallow water there, looking thin and dissolving from above, like a *conferva*? — like little regular green masses of *conferva*?

The red lilies are completely out of bloom now at Smith's meadow pasture, but the yellow ones are still very abundant in the meadows. The *Ranunculus Purshii* is now very hard to meet with. Saw one double flower with sixteen petals (at least) in two rows. Time to get seeds of it. Hardhack well out, how long? The small purple fringed orchis, apparently three or four days at least. The fall has already come to skunk-cabbage and hellebore. Their yellow and black decaying leaves and stems now cover the floor of the swamps which they recently clothed in early green. The *Lobelia Dortmanna* still, but no full spikes. It is apparently the worse for the wear. The oldest stems of it are covered here and there with apparently the red ova of some insect. Some *Gnaphalium uliginosum* going to seed; how long?

July 25. Friday. A. M. — Up river to see hypericums out.

*Lycopus Virginicus*, with its runners, perhaps some days, in Hosmer Flat Meadow. Whorled *utricularia* very abundantly out, apparently in its prime. *Lysimachia ciliata* some days. The *Hieracium Canadense* grows by the road fence in Potter's hydrocotyle field, some seven or eight inches high, in dense tufts!

The haymakers getting in the hay from Hubbard's meadow tell me the cock says we are going to have a long spell of dry weather or else very wet. "Well, there's some difference between them," I answer; "how do you know it?"

"I just heard a cock crow at noon, and that's a sure sign it will either be very dry or very wet."

The *Hypericum perforatum*, *corymbosum*, and *ellipticum* are not open this forenoon, but the *angulosum*, *Canadense*, *mutilum*, and *Sarothra* are partly curled up (their petals) even by 9 A.M.; perhaps because it is very warm, for day before yesterday, methinks, I saw the *mutilum* and *Sarothra* open later.

The street is now strewn with bark under the buttonwood at the brick house. Has not the hot weather taken the bark off?

The air begins to be thick and almost smoky.

July 26. Saturday. 5 A. M. — Up Assabet.

The sun's disk is seen round and red for a long distance above the horizon, through the thick but cloudless atmosphere, threatening heat, — hot, dry weather.

At five the lilies had not opened, but began about 5.5 and were abundantly out at six.

Arranged the hypericums in bottles this morning and watched their opening.

The *H. angulosum* (?) has a pod one-celled (with three parietal placentae), conical, oblong, acute, at length longer than the sepals, purple. (The *Canadense* has from three to five (!) placentae and the *mutilum* three to four (!), as I find, notwithstanding Gray.) Styles three, short, distinct, and spreading; stamens twenty, more or less, obscurely clustered. Petals oblong. (Do not see the single lateral tooth mentioned by Eaton.) Corolla twelve to fourteen fortieths of an inch in diameter. It is strict, slender, ten to twenty inches high; stem sharply four-angled, like *Canadense*, and cyme as naked or more so. The large ones make a singularly compact (flat-topped) corymb, of many narrow pods at last. Leaves oblong-lanceolate or linear-lanceolate, commonly blunt, but often gradually tapering and acute, broadest near the base and clasping, one to one and a half inches long by one eighth to three eighths wide, black-dotted beneath. Ground neither very dry nor very moist. It differs from *Canadense*, which it resembles, in being a larger plant every way, narrower in proportion to height, having more stamens, and in the form of its leaves.

Corolla of *mutilum* nine to eleven fortieths of an inch in diameter; *Canadense* twelve to thirteen fortieths; *corymbosum* eighteen fortieths.

The *corymbosum* in chamber shut up at night. All but *Sarothra*, which may not be advanced enough, (I have no elodea), opened by 5 a m., *corymbosum* and *angulo-sum* very fairly; but *mutilum*, *Canadense*, and *angulo-sum* curled and shut up by 9 a m.!!

The corymbosum shut up in afternoon. The 'perforatum and ellipticum alone were open all day. The four lesser ones are very shy to open and remain open very little while, this weather at least. I suspect that in the fields, also, they are open only very early or on cloudy days. H. Canadense and mutilum are often fifteen inches high.

The largest and most conspicuous purple pods are those of the ellipticum. Those of the angulosum and Canadense are smaller and more pointed; are also purple, and the mutilum perhaps duller purple and less conspicuous.

The pod of the ellipticum, when cut, smells like a bee. The united styles arm it like a beak or spine. This appears to be the most nearly out of bloom of all. I am surprised that Gray says it is somewhat fourangled. It is distinctly two-angled and round between.

The Hubbard aster may be the A. Tradescanti.

The large potamogeton off Dodd's seems to be the natans, from size of nutlets, etc. Then there is the second, off Clamshell, a long time out. And the third, heterophyllus (?), or what I have called hybridus, also long out.

Drank up the last of my birch wine. It is an exceedingly grateful drink now, especially the aromatic, meadlike, apparently checkerberry-flavored one, which on the whole I think must be the black birch. It is a surprisingly high-flavored drink, thus easily obtained, and considering that it had so little taste at first. Perhaps it would have continued to improve.

P. M. — To Poorhouse Pasture.

Nettle, some time. Ambrosia botrys, apparently a few days. A. Radula, ditch by pasture, several days apparently. Lycopus sinuatus, some time.

I see young larks fly pretty well before me.

Smaller bur-reed (Sparganium Americanum), judging from form of stigma (ovate and oblique), yet the leaves are almost entirely concave (!), Stow's ditch. Is this the same with that in river? How long?

It is very still and sultry this afternoon, at 6 p. M. even. I cannot even sit down in the pasture for want of air, but must keep up and moving, else I should suffocate. Thermometer ninety-seven and ninety-eight to-day. The pig pants and melts in his pen, and water must be cast on him.

Agassiz says he has discovered that the haddock, a deep-sea FISHY is viviparous.

July 27. Lobelia cardinalis, three or four days, with similar white glands (?) on edges of leaves as in L. spicata. Why is not this noticed? Comus sericea about done.

As I was paddling by Dodge's Brook, a great devil's-needle lit on my paddle, between my hands. It was about three inches long and three and a half in spread of wings, without spots, black and yellow, with green eyes (? ). It kept its place within a few inches of my eyes, while I was paddling some twenty-five rods against a strong wind, clinging closely. Perhaps it chose that place for coolness this hot day.

To-day, as yesterday, it is more comfortable to be walking or paddling at 2 and 3 P. m., when there is wind, but at five the wind goes down and it is very still and suffocating.

I afterward saw other great devil's-needles, the forward part of their bodies light-blue and very stout.

The *Stellaria longifolia* is out of bloom and drying up. Vide some of this date pressed.

At Bath Place, above, many yellow lily pads are left high and dry for a long time, in the zizania hollow, a foot or more above the dry sand, yet with very firm and healthy green leaves, almost the only ones not eaten by insects now.

This river is quite low. The yellow lilies stand up seven or eight inches above the water, and, opposite to Merriam's, the rocks show their brown backs very thick (though some are concealed), like sheep and oxen lying down and chewing the cud in a meadow. I frequently run on to one — glad when it's the smooth side — and am tilted up this way or that, or spin round as on a central pivot. They bear the red or blue paint from many a boat, and here their moss has been rubbed off.

*Ceratophyllum* is now apparently in bloom commonly, with its crimson-dotted involucre.

I am surprised to find kalmiana lilies scattered thinly all along the Assabet, a few small, commonly reddish pads in middle of river, but I see no flowers. It is their great bluish waved (some green) radical leaves which I had mistaken for those of the heart-leaf, the floating leaves being so small. These and *vallisneria* washed up some time. The radical leaves of the heart-leaf are very small and rather triangular.

I see, on a rock in midstream, a peetweet within a foot of a turtle, both eyeing me anxiously within two rods, but not minding each other.

*Zizania* scarce out some days at least.

July 28. At 1.0 a thunder-shower, which was much needed, the com having rolled and trees suffered.

3. — p. M. — To Climbing Fern.

Virgin's-bower, apparently two or three days. *Nabalus albus*, a day or two.

Sand cherry ripe. The fruit droops in umble-like clusters, two to four peduncles together, on each side the axil of a branchlet or a leaf. Emerson and Gray call it dark-red. It is black when ripe. Emerson, Gray, and Bigelow speak of it as rare in this State! It is common enough here. I have seen it as abundant as anywhere on Weir (or Ware) Hill in Sudbury, Bigelow's own town. Cherry three eighths of an inch [in] diameter, peduncle seven sixteenths long. Emerson calls it eatable! On Linnæa Hill. By factory road clearing, the small rough sunflower, two or three days. *Gerardia flava*, apparently several days. *Cicuta bulbosa*, several days. Richweed at Brown's oak, several days (since 16th; say 22d).

July 29. *Rhexia*. Probably would be earlier if not mowed down. What I have called *Hieracium Gronovii*, with three cauline leaves and without veins, has achenia like *H. venosum*; so I will give it up. Its radical leaves are very hairy beneath, especially along midrib. Another smart rain, with lightning.

Pratt gave me a chimney swallow's nest, which he says fell down Wesson's chimney with young in it two or three days ago. As it comes to me, it is in the form of the segment of the circumference of a sphere whose diameter is three and a half inches, the

segment being two plus wide, one side, of course, longer than the other. It bears a little soot on the inner side. It may have been placed against a slanting part of the chimney, or perhaps some of the outer edge is broken off. It is composed wholly of stout twigs, one to two inches long, one sixteenth to one eighth inch [in] diameter, held quasi cob' fashion, so as to form a sort of basketwork one third to one half inch thick, without any lining, at least in this, but very open to the air. These twigs, which are quite knobby, seem to be of the apple, elm, and the like, and are firmly fastened together by a very conspicuous whitish semi-transparent glue, which is laid on pretty copiously, sometimes extending continuously one inch. It reminds me of the edible nests of the Chinese swallow. Who knows but their edibility is due to a similar glue secreted by the bird and used still more profusely in building its nests? The chimney swallow is said to break off the twigs as it flies.

Pratt says he one day walked out with Wesson, with their rifles, as far as Hunt's Bridge. Looking downstream, he saw a swallow sitting on a bush very far off, at which he took aim and fired with ball. He was surprised to see that he had touched the swallow, for it flew directly across the river toward Simon Brown's barn, always descending toward the earth or water, not being able to maintain itself; but what surprised him most was to see a second swallow come flying behind and repeatedly strike the other with all his force beneath, so as to toss him up as often as he approached the ground and enable him to continue his flight, and thus he continued to do till they were out of sight. Pratt said he resolved that he would never fire at a swallow again.

Looked at a Sharp's rifle, a Colt's revolver, a Maynard's, and a Thurber's revolver. The last fires fastest (by a steady pull), but not so smartly, and is not much esteemed.

July 30. P. M. — To *Rudbeckia laciniata* via Assabet.

*Amaranthus hybridus* and *albus*, both some days at least; first apparently longest.

This is a perfect dog-day. The atmosphere thick, mildewy, cloudy. It is difficult to dry anything. The sun is obscured, yet we expect no rain. Bad hay weather. The streams are raised by the showers of yesterday and day before, and I see the farmers turning their black-looking hay in the flooded meadows with a fork. The water is suddenly clear, as if clarified by the white of an egg or lime. I think it must be because the light is reflected downward from the overarching dog-day sky. It assists me very much as I go looking for the cerato-phyllum, potamogetons, etc. All the secrets of the river bottom are revealed. I look down into sunny depths which before were dark. The wonderful clearness of the water, enabling you to explore the river bottom and many of its secrets now, exactly as if the water had been clarified. This is our compensation for a heaven concealed. The air is close and still. Some days ago, before this weather, I saw haymakers at work dressed simply in a straw hat, boots, shirt, and pantaloons, the shirt worn like a frock over their pants. The laborer cannot endure the contact with his clothes.

I am struck with the splendid crimson-red under sides of the white lily pads where my boat has turned them, at my bath place near the Hemlocks. For these pads, i.e. the white ones, are but little eaten yet.

*Rudbeckia laciniata*, perhaps a week. When I have just rowed about the Island a green bittern crosses in my rear with heavy flapping flight, its legs dangling, not observing me. It looks deep slate-blue above, yellow legs, whitish streak along throat and breast, and slowly plows the air with its prominent breast-bone, like the stake-driver.

July 31. Thursday. P. M. — To Decodon Pond.

*Erigeron Canadensis*, some time. *Alisma* mostly gone to seed. Thoroughwort, several days. *Penthorum*, a good while. *Trichostema* has now for some time been springing up in the fields, giving out its aromatic scent when bruised, and I see one ready to open.

For a morning or two I have noticed dense crowds of little tender whitish parasol toadstools, one inch or more in diameter, and two inches high or more, with simple plaited wheels, about the pump platform; first fruit of this dog-day weather.

Measured a *Rudbeckia hirta* flower; more than three inches and three eighths in diameter.

As I am going across to Bear Garden Hill, I see much white *Polygala sanguinea* with the red in A. Wheeler's meadow (next to Potter's). Also much of the *Bartonia tenella*, which has been out some days at least, five rods from ditch, and three from Potter's fence.

Went through Potter's Aster *Radula* swamp this dog-day afternoon. As I make my way amid rank weeds still wet with the dew, the air filled with a decaying musty scent and the z-ing of small locusts, I hear the distant sound of a flail, and thoughts of autumn occupy my mind, and the memory of past years. Some late rue leaves on a broken twig have turned all a uniform clear purple.

How thick the berries — low blackberries, *Vaccinium vacillans*, and huckleberries — on the side of Fair Haven Hill! The berries are large, for no drought has shrunk them. They are very abundant this year to compensate for the want of them the last. The children should grow rich if they can get eight cents a quart for blackberries, as they do.

Again I am attracted by the hoary, as it were misty morning light on the base of the upper leaves of the velvety *Pycnanthemum incanum*. It is the most interesting of this genus here. The smooth sumach is pretty generally crimson-berried on the Knoll, and its lower leaves are scarlet-tipped (though there are some blossoms yet), but the *Rhus copallina* there is not yet out. See dense fields of the great *epilobium* now in its prime, like soldiers in the meadow, resounding with the hum of bees. The butterflies are seen on the pearly everlasting, etc., etc. *Hieracium paniculatum* by *Gerardia quercifolia* path in woods under Cliffs, two or three days. *Elodea* two and a half feet high, how long? The flowers at 3 P. in nearly shut, cloudy as it is. Yet the next day, later, I saw some open, I think.

Another short-tailed shrew dead in the wood-path. Near Well Meadow, hear the distant scream of a hawk, apparently anxious about her young, and soon a large apparent hen-hawk (?) comes and alights on the very top of the highest pine there,

within gunshot, and utters its angry scream. This a sound of the season when they probably are taking their first (?) flights.

See yellow Bethlehem-star still.

As I look out through the woods westward there, I see, sleeping and gleaming through the stagnant, misty, glaucous dog-day air, i.e. blue mist, the smooth silvery surface of Fair Haven Pond. There is a singular charm about it in this setting. The surface has a dull, gleaming polish on it, though draped in this glaucous mist.

The *Solidago gigantea* (?), three-ribbed, out a long time at Walden shore by railroad, more perfectly out than any *solidago* I have seen. I will call this *S. gigantea*, yet it has a yellowish-green stem, slightly pubescent above, and leaves slightly rough to touch above, rays small, about fifteen.

Mine must be the *Aster Radula* (if any) of Gray, yet the scales of the involucre are not appressed, but rather sub-squamose, nor is it rare. Pursh describes it, or the *Radula*, as white-flowered, and mentions several closely allied species.

Waded through the northernmost Andromeda Pond. *Decodon* not nearly out there.

Did I not see some kind of sparrow about the shore, with yellow beneath?

Mountain cranberries apparently full grown, many at least.

## AUGUST, 1856

Aug. 1. To *Ludwigia sphærocarpa*.

Burdock, several days at least. *Erechthites*, apparently two or three days, by Peter's Path, end of Cemetery, the middle flowers first. *Crotalaria* in fine lechea field, how long? Still out, and some pods fully grown. *Liatris* will apparently open in a day or two. *Diplopappus umbellatus* at Peter's wall. *Desmodium Canadense*, some time; several great stems five feet high, a little spreading.

Since July 30th, inclusive, we have had perfect dog-days without interruption. The earth has suddenly [become] invested with a thick musty mist. The sky has become a mere fungus. A thick blue musty veil of mist is drawn before the sun. The sun has not been visible, except for a moment or two once or twice a day, all this time, nor the stars by night. Moisture reigns. You cannot dry a napkin at the window, nor press flowers without their mildewing. You imbibe so much moisture from the atmosphere that you are not so thirsty, nor is bathing so grateful as a week ago. The burning heat is tempered, but as you lose sight of the sky and imbibe the musty, misty air, you exist as a vegetable, a fungus. Unfortunate those who have not got their hay. I see them wading in overflowed meadows and pitching the black and mouldy swaths about in vain that they may dry. In the meanwhile, vegetation is becoming rank, vines of all kinds are rampant. Squashes and melons are said to grow a foot in a night. But weeds grow as fast. The com unrolls. Berries abound and attain their full size. Once or twice in the day there is an imperfect gleam of yellow sunlight for a moment through some thinner part of the veil, reminding us that we have not seen the sun so long, but no

blue sky is revealed. The earth is completely invested with cloudlike wreaths of vapor (yet fear no rain and need no veil), beneath which flies buzz hollowly and torment, and mosquitoes hum and sting as if they were born of such an air. The drooping spirits of mosquitoes revive, and they whet their stings anew. Legions of buzzing flies blacken the furniture. (For a week at least have heard that snapping sound under pads.) We have a dense fog every night, which lifts itself but a short distance during the day. At sundown I see it curling up from the river and meadows. However, I love this moisture in its season. I believe it is good to breathe, wholesome as a vapor bath. Toadstools shoot up in the yards and paths.

The Great Meadows being a little wet, — hardly so much as usual, — I took off my shoes and went barefoot some two miles through the cut-grass, from Peter's to *Sphærocarpa* Pools and backward by river. Very little grass cut there yet. The cut-grass is bad for tender feet, and you must be careful not to let it draw through your hands, for it will cut like a fine saw.

I was surprised to see dense beds of *rhexia* in full bloom there, apparently on hummocks a rod in diameter left by the ice, or in long ridges mixed with ferns and some *Lysimachia lanceolata* arrowhead, etc. They make a splendid show, these brilliant rose-colored patches, especially in the neighborhood of Copan. It is about the richest color to be seen now. Yet few ever see them in this perfection, unless the haymaker who levels them, or the birds that fly over the meadow. Far in the broad wet meadows, on the hummocks and ridges, these bright beds of *rhexia* turn their faces to the heavens, seen only by the bitterns and other meadow birds that fly over. We, dwelling and walking on the dry upland, do not suspect their existence. How obvious and gay to those creatures that fly over the meadow! Seen only by birds and mowers. These gay standards otherwise unfurled in vain.

Snake-head *arethusa* still in the meadow there. *Ludwigia sphærocarpa* apparently a week out, a foot and a half to two feet high.

Aug. 2. P. M. — To Hill.

A green bittern comes, noiselessly flapping, with stealthy and inquisitive looking to this side the stream and then that, thirty feet above the water. This antediluvian bird, creature of the night, is a fit emblem of a dead stream like this Musketicook. This especially is the bird of the river. There is a sympathy between its sluggish flight and the sluggish flow of the stream, 8. — its slowly lapsing flight, even like the rills of Musketicook and my own pulse sometimes.

Very common now are the few green emerald leaflets of the *Bidens Bechii*, which will ere long yellow the shallow parts.

*Acalypha*, apparently not long. Dodder, not long (not out 27th of July at railroad bridge), say four or five days. A three-ribbed goldenrod by small apple, by wall at foot east side of Hill (*S. gigantea*? or one of the two preceding), not nearly out. It differs from my *gigantea* apparently only in the leaves being perfectly smooth above and the stem smooth and pink [? ] glaucous (excepting a little pubescence near the top). Very tall. Vide it by and by.

The lower leaves of some catnep are now of that delicate lake or claret color. Some waxwork leaves have felt the heat and slight drought. Their green is spotted with yellow, distinct yellow and green; others a very delicate clear yellow; others faded quite white.

Aug. 3. Sunday. P. M. — To Lee's Cliff by river.

Landing at flat shore. The sium and sarothra apparently now in prime. The central umbel of the sium going or gone to seed. The whorled utricularia is open all day. The *Hypericum ellipticum* is apparently out of bloom, there at least.

At length from July 30th inclusive the cloud-like wreaths of mist of these dog-days lift somewhat, and the sun shines out more or less, a short time, at 3 p. M.

The sun coming out when I am off Clamshell, the abundant small dragon-flies of different colors, bright-blue and lighter, looped along the floating vallisneria, make a very lively and gay appearance. I fancy these bright loops adorn or set forth the river like triumphal arches for my procession, stretching from side to side. The floating vallisneria is very thick at the shallow bends. I see many of its narrow, erect, spoon-shaped tops.

*Comus altemifolia* berries ripe, as I go from Holden Swamp shore to Miles Swamp. They are in open cymes, dull-blue, somewhat depressed globular, tipped with the persistent styles, yet already, as usual, mostly fallen. But handsomer far are the pretty (bare) red peduncles and pedicels, like fairy fingers spread. They make a show at a distance of a dozen rods even. Something light and open about this tree, but a sort of witch's tree nevertheless.

The purple utricularia abundant, but I did not chance to notice it July 25th. At Bittern Cliff again lucky enough to find *Polygonum tenue*, apparently out but a short time, say one week at most. Have marked the spot by a stone from the wall; further north than formerly. *Selaginella rupestris* (?) shows yellow fruit now at Bittern Cliff. *Gerardia quercifolia*, three to four feet high, out there, apparently two or three days. Yet none of the leaves I have are twice pinnatifid. Pennyroyal there, apparently some days. *Diplopappus corni-folius*, some time. *Desmodium acuminatum* a long time out and also gone to seed. *Lespedeza hirta*, Blackberry Steep, how long? High blackberries beginning; a few ripe. *Parietaria* a foot high, some time, under the slippery elm.

What is that tall (four feet), long-bearded grass, now nearly ripe, under this end of Lee's Cliff?

I see blackened haycocks on the meadows. Think what the farmer gets with his hay, — what his river-meadow hay consists of, — how much of fern and osier and sweet-gale and *Polygonum hydropiperoides* and rhexia (I trust the cattle love the scent of it as well as I) and *lysimachia*, etc., etc., and rue, and sium and *cicuta*. In a meadow now being mown I see that the ferns and small osiers are as thick as the grass. If modern farmers do not collect elm and other leaves for their cattle, they do thus mow and cure the willows, etc., etc., to a considerable extent, so that they come to large bushes or trees only on the edge of the meadow.

Two small ducks (probably wood ducks) flying south. Already grown, and at least looking south!! It reminds me of the swift revolution of the seasons.

Our river is so sluggish and smooth that sometimes I can trace a boat that has passed half an hour before, by the bubbles on its surface, which have not burst. I have known thus which stream another party had gone up long before. A swift stream soon blots out such traces.

*Cirsium lanceolatum* at Lee's Cliff, apparently some days. Its leaves are long-pointed and a much darker green than those of the pasture thistle. On the under sides of its leaves I noticed very large ants attending peculiar large dark-colored aphides, for their milch cows.

The prevailing willow off Holden Swamp is sericea-like, but the leaf is narrow, more shining above, and merely glaucous beneath, longer-petioled, the serratures not so much bent toward the point. The twigs not nearly so brittle at the base, but bringing away strings of bark. Stipules probably fallen or inconspicuous. Can it be *S. petiolaris*? and is it the same with that above Hemlocks, north side? Or is it *S. lueida*? Vide in press.

Edge of grain-field next Bittern Cliff Wood, common spurge; and, with it, apparently the same, half ascendant and covered or spotted with a minute fungus.

Aug. 4. P. M. — Carried party a-berrying to Conantum in boat.

*Lespedeza violacea*, perhaps the largest-leafed variety, leaflets one inch by one third inch, petioled, well out on side of Blackberry Steep.

Scare up a young apparently summer duck, floating amid the pads, and the same again, coming within gunshot. I think it young because it is not very shy.

Have heard the alder cricket some days. The turning-point is reached.

Conantum hillside is now literally black with berries. What a profusion of this kind of food Nature provides, as if to compensate for the scarcity last year! Fortunate that these cows in their pasture do not love them, but pass them by. The blackberries are already softening, and of all kinds there are many, many more than any or all creatures can gather. They are literally five or six species deep. First, away down in the shade under all you find, still fresh, the great very light blue (i e with a very thick blue bloom) *Vaccinium Pennsylvanicum* in heavy clusters, that early ambrosial fruit, delicate-flavored, thin-skinned, and cool, — Olympian fruit; then, next above, the still denser bunches and clusters of *V. vacillans*, of various varieties, firm and sweet, solid food; and, rising above these, large blue and also shining black huckleberries (*Gaylussacia resinosa*) of various flavors and qualities; and over all runs rampant the low blackberry (*Rubus Canadensis*), weighing down the thicket with its wreaths of black fruit. Also here and there the high blackberry, just beginning, towers over all. You go daintily wading through this thicket, picking, perchance, only the biggest of the blackberries — as big as your thumb — and clutching here and there a handful of huckleberries or blueberries, but never, perchance, suspecting the delicious cool blue-bloomed ones under all. This favorable moist weather has expanded some of the huckleberries to the size of bullets. Each patch, each bush, seems fuller and blacker than the last. Such a profusion, yet you see neither birds nor beasts eating them, unless ants and the huckleberry-bug! I carried my hands full of bushes to the boat, and, returning,

the two ladies picked fully three pints from these alone, casting the bare bushes into the stream.

Aug. 5. A. M. — On river.

Mikania a day or two. Polygonum amphibium in water, slightly hairy, well out. Polygonum orientale, how long?

P. M. — To house-leek via Assabet Bath.

Trichostema, maybe several days in some places. Nightshade berries, how long?

When I crossed the new stone bridge a great water adder lay on it, full five feet long and nearly as big round as my arm. It turned and ran along, with a coarse grating rustle, to the end of the railing, and then dropped deliberately head foremost from the last abutment, full nine feet, to the gravelly ground, amid the osiers, making a loud sound when he struck; at once took to the water, and showed his head amid the pads. I also saw another similar one at House-leek Rock.

Centaurea well out, how long? Aster dumosus, apparently a day or two, with its large conspicuous flower-buds at the end of the branchlets and linear-spatulate involucre scales.

A[t] haunted house site, as at Bittern Cliff grain-field, I see much apparent Euphorbia maculata semi-erect in the grass. Eupatorium pubescens, by Pear Path.

I now find an abundance of the clustered rubus ripe. It is not large and has a clammy, subacid taste, but some are very sweet. Clusters generally drooping.

Now, at 4 p. m. this dog-day, cloudy weather, the Hypericum mutilum is abundantly open in the Solidago lanceolata path, sometimes fifteen inches high, while the Canadense and angulatum are shut. S. lanceolata, some days. S. nemoralis, two or three days.

Choke-cherries near House-leek Rock begin to be ripe, though still red. They are scarcely edible, but their beauty atones for it. See those handsome racemes of ten or twelve cherries each, dark glossy red, semitransparent. You love them not the less because they are not quite palatable. Along fences or hedgerows.

To my surprise one house-leek (apparently Semper-vivum tectorum of Dewey) has shot up twenty-two inches high and is apparently nearly out, though the petals are erect, not spread. The stem is clothed with the same thick leaves, only smaller and lessening upward and forming a column about one and a half inches in diameter (with the leaves). The top is a broad raceme (?), about eight inches wide and two thirds as long, of eleven long, spreading, and recurved branches, lined with flowers on the upper side only. These consist of twelve to thirteen lanceolate calyx-segments and as many still longer dull-purple petals and about twenty pistils within and short stamens around them. It is a strange but rather stately cactus-like plant. The children call the pretty clusters of radical leaves hen and chickens. In this case the radical leaves are withered, and a fusiform root sustains the flower. This one is not on the bare rock, but lower amid the huckleberry bushes.

At the Assabet stone bridge, apparently freshly in flower, — though it may have been out nearly as long as the androsæmifolium, — apparently the Apocynum

cannabinum var hypericifolium (? ). The tallest is four feet high. The flowers very small (hardly more than an eighth of an inch in diameter), the segments of the corolla not revolute but nearly erect. There are twenty to thirty flowers at end of a branch. The divisions of the calyx are longer than in the common, long ovate. Yet it differs from Gray's hypericifolium in having flowers rose-streaked within like the common, the cymes not shorter than the leaves, and the tube of the corolla rather longer than the divisions of the calyx. The leaves are hardly more downy or heart-shaped below than the common. Hypericifolium is a separate species in Pursh and some others. And the branches are less ascending than the common, making an angle of about 62° with the stem (the four lower), while three of the lower of a common one make an angle of 44°.

Aug. 6. Copious and continuous rain in the night, deluging, soaking rain, with thunder and lightning, beating down the crops; and this morning it is cooler and clearer and windier.

P. M. — To Walden.

The wind, or motion of the air, makes it much cooler on the railroad causeway or hills, but in the woods it is as close and melting as before. Solidago altissima, a small specimen, a day or two. Apios tuberosa, some days. Rubus hispidus ripe. Middle umbels of the bristly aralia ripe. Desmodium nudiflorum, some timé out at Peak. It is sometimes three feet high! Holly berries ripe. Clethra, how long? Some anychia shows green seed. Desmodium rotundifolium, some days at least. Cynoglossum Morisoni mostly gone to seed, roadside, at grape-vine just beyond my bean-field. Some is five feet high. Aster maerophyllus, apparently two or three days, at hillside, under beaked hazel. Eupatorium purpureum at Stow's Pool, apparently several days, but more common there the tall hollow one, whorled to top, also out. Hear a nuthatch. Hieracium scabrum.

Artificial, denaturalized persons cannot handle nature without being poisoned. If city-bred girls visit their country cousins, — go a-berrying with them, — they are sure to return covered with blueberry bumps at least. They exhaust all the lotions of the country apothecary for a week after. Unnamable poisons infect the air, as if they were pursued by imps. I have known those who forbade their children going into the woods at all.

Aug. 7. Kemp, perhaps a week.

Heard this forenoon what I thought at first to be children playing on pumpkin stems in the next yard, but it turned out to be the new steam-whistle music, what they call the Calliope (!) in the next town. It sounded still more like the pumpkin stem near at hand, only a good deal louder. Again I mistook it for an instrument in the house or at the door, when it was a quarter of a mile off, from habit locating it by its loudness. At Acton, six miles off, it sounded like some new seraphim in the next house with the blinds closed. All the milkmen and their horses stood still to hear it. The horses stood it remarkably well. It was not so musical as the ordinary whistle.

P. M. — With a berry party, ride to Conantum.

At Blackberry Steep, apparently an early broad-leafed variety of *Desmodium paniculatum*, two or three days. This and similar plants are common there and may almost name the place. The *D. rotundifolium* is there abundant; also, beside, *Lespedeza hirta* and *capitata*, the elliptic-oblong *L. violacea* and the angustata, as also at Heywood Peak. All these plants seem to love a dry open hillside, a steep one. Are rarely upright, but spreading, wand-like. *Aster patens*, a day or more. *Inula*, some time. *Mulgedium*, perhaps a fortnight. *Eupatorium sessilifolium*, apparently about August 5th. I suspect that I see but one species of smooth-stemmed grape as yet.

I must contrast the *Galium circoezans* and *pilosum* (?) more carefully. Vide if the first ever has purple flowers. The only difference, perhaps, that I yet notice is that the leaves of the latter are scarcely three-nerved and are more rounded or obovate, and it is a later plant.

I see that common gall on goldenrods now on an *S. cæsia*.

The river has been raised by the rain, and water stands still in low grass ground. The leaves in low land, as of the *mulgedium*, are white with mildew, owing [to] the continued dampness of dog-days. One *mulgedium* at Comer Spring is at least ten feet high and hollow all the way.

Those who have weak eyes complain of the darkness of the late dog-days.

Aug. 8. Rain, lightning, and thunder all day long in torrents. The ground was already saturated on the night of the 5th, and now it fills all gutters and low grounds. No sooner has one thunder-shower swept over and the sky begun to light up a little, than another darkens the west. We were told that lightning cleared the air and so cleared itself, but now we lose our faith in that theory, for we have thunder[-shower] after thunder-shower and lightning is become a drug. Nature finds it just as easy to lighten the last time as at first, and we cannot believe that the air was so very impure.

5. — P. M. — When I came forth, thinking to empty my boat and go a-meditating along the river, — for the full ditches and drenched grass forbade other routes, except the highway, — and this is one advantage of a boat, — I learned to my chagrin that Father's pig was gone. He had leaped out of the pen some time since his breakfast, but his dinner was untouched. Here was an ugly duty not to be shirked, — a wild shoat that weighed but ninety to be tracked, caught, and penned, — an afternoon's work, at least (if I were lucky enough to accomplish it so soon), prepared for me, quite different from what I had anticipated. I felt chagrined, it is true, but I could not ignore the fact nor shirk the duty that lay so near to me. Do the duty that lies nearest to thee. I proposed to Father to sell the pig as he was running (somewhere) to a neighbor who had talked of buying him, making a considerable reduction. But my suggestion was not acted on, and the responsibilities of the case all devolved on me, for I could run faster than Father. Father looked to me, and I ceased to look to the river. Well, let us see if we can track him. Yes, this is the corner where he got out, making a step of his trough. Thanks to the rain, his tracks are quite distinct. Here he went along the edge of the garden over the water and muskmelons, then through the beans and potatoes, and even along the front-yard walk I detect the print of his divided hoof, his

two sharp toes (ungulæ). It's a wonder we did not see him. And here he passed out under the gate, across the road, — how naked he must have felt! — into a grassy ditch, and whither next? Is it of any use to go hunting him up unless you have devised some mode of catching him when you have found? Of what avail to know where he has been, even where he is? He was so shy the little while we had him, of course he will never come back; he cannot be tempted by a swillpail. Who knows how many miles off he is! Perhaps he has taken the back track and gone to Brighton, or Ohio! At most, probably we shall only have the satisfaction of glimpsing the nimble beast at a distance, from time to time, as he trots swiftly through the green meadows and corn-fields. But, now I speak, what is that I see pacing deliberately up the middle of the street forty rods off? It is he. As if to tantalize, to tempt us to waste our afternoon without further hesitation, he thus offers himself. He roots a foot or two and then lies down on his belly in the middle of the street. But think not to catch him a-napping. He has his eyes about, and his ears too. He has already been chased. He gives that wagon a wide berth, and now, seeing me, he turns and trots back down the street. He turns into a front yard. Now if I can only close that gate upon him ninety-nine hundredths of the work is done, but ah! he hears me coming afar off, he foresees the danger, and, with swinish cunning and speed, he scampers out. My neighbor in the street tries to head him; he jumps to this side the road, then to that, before him; but the third time the pig was there first and went by. "Whose is it?" he shouts. "It's ours." He bolts into that neighbor's yard and so across his premises. He has been twice there before, it seems; he knows the road; see what work he has made in his flower-garden! He must be fond of bulbs. Our neighbor picks up one tall flower with its bulb attached, holds it out at arm's length. He is excited about the pig; it is a subject he is interested in. But where is [he] gone now? The last glimpse I had of him was as he went through the cow-yard; here are his tracks again in this corn-field, but they are lost in the grass. We lose him; we beat the bushes in vain; he may be far away. But hark! I heard a grunt. Nevertheless for half an hour I do not see him that grunted. At last I find fresh tracks along the river, and again lose them. Each neighbor whose garden I traverse tells me some anecdote of losing pigs, or the attempt to drive them, by which I am not encouraged. Once more he crosses our first neighbor's garden and is said to be in the road. But I am not there yet; it is a good way off. At length my eyes rest on him again, after three quarters of an hour's separation. There he trots with the whole road to himself, and now again drops on his belly in a puddle. Now he starts again, seeing me twenty rods [off], deliberates, considers which way I want him to go, and goes the other. There was some chance of driving him along the sidewalk, or letting him go rather, till he slipped under our gate again, but of what avail would that be? How corner and catch him who keeps twenty rods off? He never lets the open side of the triangle be less than half a dozen rods wide. There was one place where a narrower street turned off at right angles with the main one, just this side our yard, but I could not drive him past that. Twice he ran up the narrow street, for he knew I did not wish it, but though the main street was broad and open and no traveller in sight, when I tried to drive him past this opening

he invariably turned his piggish head toward me, dodged from side to side, and finally ran up the narrow street or down the main one, as if there were a high barrier erected before him. But really he is no more obstinate than I. I cannot but respect his tactics and his independence. He will be he, and I may be I. He is not unreasonable because he thwarts me, but only the more reasonable. He has a strong will. He stands upon his idea. There is a wall across the path not where a man bars the way, but where he is resolved not to travel. Is he not superior to man therein? Once more he glides down the narrow street, deliberates at a corner, chooses wisely for him, and disappears through an openwork fence eastward. He has gone to fresh gardens and pastures new. Other neighbors stand in the doorways but half sympathizing, only observing, "Ugly thing to catch."

"You have a job on your hands." I lose sight of him, but hear that he is far ahead in a large field. And there we try to let him alone a while, giving him a wide berth.

At this stage an Irishman was engaged to assist. "I can catch him," says he, with Buonapartean confidence. He thinks him a family Irish pig. His wife is with him, bareheaded; and his little flibbertigibbet of a boy, seven years old. "Here, Johnny, do you run right off there" (at the broadest possible angle with his own course). "Oh, but he can't do anything."

"Oh, but I only want him to tell me where he is, — to keep sight of him." Michael soon discovers that he is not an Irish pig, and his wife and Johnny's occupation are soon gone. Ten minutes afterward I am patiently tracking him step by step through a corn-field, a near-sighted man helping me, and then into garden after garden far eastward, and finally into the highway, at the graveyard; but hear and see nothing. One suggests a dog to track him. Father is meanwhile selling him to the blacksmith, who also is trying to get sight of him. After fifteen minutes since he disappeared eastward, I hear that he has been to the river twice far on [? ] the north, through the first neighbor's premises. I wend that way. He crosses the street far ahead, Michael behind; he dodges up an avenue. I stand in the gap there, Michael at the other end, and now he tries to corner him. But it is a vain hope to corner him in a yard. I see a carriage-manufactory door open. "Let him go in there, Flannery." For once the pig and I are of one mind; he bolts in, and the door is closed. Now for a rope. It is a large barn, crowded with carriages. The rope is at length obtained; the windows are barred with carriages lest he bolt through. He is resting quietly on his belly in the further corner, thinking unutterable things.

Now the course recommences within narrower limits. Bump, bump, bump he goes, against wheels and shafts. We get no hold yet. He is all ear and eye. Small boys are sent under the carriages to drive him out. He froths at the mouth and deters them. At length he is stuck for an instant between the spokes of a wheel, and I am securely attached to his hind leg. He squeals deafeningly, and is silent. The rope is attached to a hind leg. The door is opened, and the driving commences. Roll an egg as well. You may drag him, but you" cannot drive him. But he is in the road, and now another thunder-shower greets us. I leave Michael with the rope in one hand and a switch in

the other and go home. He seems to be gaining a little westward. But, after long delay, I look out and find that he makes but doubtful progress. A boy is made to face him with a stick, and it is only when the pig springs at him savagely that progress is made homeward. He will be killed before he is driven home. I get a wheelbarrow and go to the rescue. Michael is alarmed. The pig is rabid, snaps at him. We drag him across the barrow, hold him down, and so, at last, get him home.

If a wild shoat like this gets loose, first track him if you can, or otherwise discover where he is. Do not scare him more than you can help. Think of some yard or building or other inclosure that will hold him and, by showing your forces — yet as if uninterested parties 9. — fifteen or twenty rods off, let him of his own accord enter it. Then slightly shut the gate. Now corner and tie him and put him into a cart or barrow.

All progress in driving at last was made by facing and endeavoring to switch him from home. He rushed upon you and made a few feet in the desired direction. When I approached with the barrow he advanced to meet it with determination.

So I get home at dark, wet through and supperless, covered with mud and wheel-grease, without any rare flowers.

To the eyes of men there is something tragic in death. We hear of the death of any member of the human family with something more than regret, — not without a slight shudder and feeling of commiseration. The churchyard is a grave place.

Aug. 9. Saturday. Notwithstanding the very copious rain, with lightning, on the night of August 5th and the deluge which fell yesterday, raising the river still higher, it rained again and again with very vivid lightning, more copiously than ever, last night, and without long intervals all this day. Few, if any, can remember such a succession of thunder-storms merged into one long thunder-storm, lasting almost continuously (the storm does) two nights and two days. We are surprised to see that it can lighten just as vividly, thunder just as loud, rain just as copiously at last as at first.

P. M. — Up Assabet.

The river is raised about two feet! My boat is nearly even full, though under the willows. The water stands nearly a foot over the highest part of the large flat rock by Island. There is more current. The pads are drowned; hardly one to be seen afloat; the utmost length of their tethers does not permit them to come within a foot or ten inches of the surface. They lay smoothly on the top before, with considerable spare coil beneath; now they strain in vain toward the surface. All the *Bidens Beckii* is drowned too, and will be delayed, if not exterminated for this year. The water is cool to the bather after so much rain.

The notes of the wood pewee and warbling vireo are more prominent of late, and of the goldfinch twittering over. Does the last always utter his twitter when ascending? These are already feeding on the thistle seeds.

Again I am surprised to see the *Apocynum cannabinum* close to the rock at the Island, several plants, apparently not more than ten days out; say July 25th, including the ones I saw before. The flowers of this are white, with divisions of the corolla erect or nearly so, corolla not one eighth of an inch wide, calyx-segments lanceolate, pointed,

as long as the tube of the corolla. I now notice that all the branches are about equally upright, and hence the upper ones are much more upright than the upper ones of the *A. androsæmifolium*. The plant is inclined to be taller and narrower than that, perhaps because it grows by water. The leaves are more oblong or lanceolate and pointed, the downiness and petioles about the same with that of the common; in this case, none heart-shaped. The one found the 5th was between this and the common, a rose-streaked one, in fact colored like the common; this, a white one with still longer calyx-segments and no heart-shaped leaves. This is rather smooth. Say, then, for that of the 5th and this, they are varieties of the *A. cannabinum*.

I scare up a couple of wood ducks separately, undoubtedly birds bred and dispersed about here. The rise of the river attracts them.

What I have called *Aster corymbosus* out a day, above Hemlocks. It has eight to twelve white rays, smaller than those of the *macrophyllus*, and a dull-red stem commonly. It differs from Gray's *corymbosus* in the achenia being apparently not slender, not opening in July, and there being no need of distinguishing it from *A. macrophyllus*; from his *cordifolius* in the rays not being numerous, nor the paniced heads very numerous (sometimes pretty numerous), and the rays not pale-blue. Perhaps I must call it *A. cordifolius*, yet the lower and principal petioles are naked (Gray makes them so commonly!), not at all winged, though the upper are. Found one individual at Miles Swamp whose lower petioles were winged. Its petioles (the lower) are only sometimes winged here. The flowers of *A. macrophyllus* are white with a very slight bluish tinge, in a coarse flat-topped corymb. Flowers nine to ten eighths of an inch in diameter. *A. cordifolius* flowers six eighths of an inch [in] diameter.

Aug. 10. Sunday. The weather is fair and clear at last. The dog-days over at present, which have lasted since July 30th.

P. M. — To Fair Haven Hill and Walden.

Fragrant everlasting, maybe some days.

*Rhus copallina* not yet for two or three days. The *Pycnanthemum incanum*, the handsomest of the *pycnanthemums*, grows also at the west end [of] the Knoll with the *R. copallina*. All the upper leaves are equally hoary there in the light. The corymbs are an inch across, and the flowers large and very prettily purple-spotted. They are swarming with great wasps of different kinds, and bees.

Hear the wood thrush still.

I go across lots like a hunting dog. With what tireless energy and abandonment they dash through the brush and up the sides of hills! I meet two white foxhounds, led by an old red one. How full of it they are! How their tails work! They are not tied to paths; they burst forth from the thickest shrub oak lot, and immediately dive into another as the fox did.

There are more varieties of blackberries between the low and the high than I take notice of. Vide that kind in the Well Meadow Field.

The fine (early sedge?) grass in the frosty hollows about Walden (where no bushes have sprung up) looks like an unkempt head.

Vernonia, how long?

The river has been rising all day. It is between two and a half and three feet higher than ten days ago. Even the white umbels of the sium are drowned, except here and there where they stand over the water. It is within nine and a half inches of the top of Hoar's wall at 6 p. M. The meadows have quite a springlike look, yet the grass conceals the extent of the flood. It appears chiefly where it is mown. Yet a quarter part as much rain would have raised the river more in the spring, so much of it was soaked up by the thirsty earth.

Aug. 11. This morning the river is an inch and a half higher, or within eight inches of the top of Hoar's wall.

The other evening, returning down the river, I think I detected the convexity of the earth within a short distance. I saw the western landscape and horizon, reflected in the water fifty rods behind me, all lit up with the reflected sky, though it was a narrow [?] picture. A stroke of my oar and the dark intervening water was interposed like a dark, opaque wall. Moving my head a few inches up or down produced the same effect; i.e., by raising my head three inches I could partially oversee the plane of the water at that point, which was otherwise concealed by the slightest convexity.

P. M. — Walk to Conantum with Mr. Bradford. He gives me a sprig of *Cassia Marilandica*, wild senna, found by Minot Pratt just below Leighton's by the roadside. How long? P. thought it in prime August 10th. Aster 'puniceus a day or more. A new sunflower at Wheeler's Bank, this side Corner Spring, which I will call the tall rough sunflower; opened say August 1st (?). (I saw it out the 7th.) It does not correspond exactly to any described. Stem three to six feet high, branched at top, purple with a bloom, roughish, especially the peduncles. Leaves opposite, except a few small ones amid the branches, thick, ovate or ovate-lanceolate, taper-pointed, three-nerved, obscurely and remotely toothed, rough above, smooth and whitish below, abruptly contracted into margined petioles. Scales of the involucre lanceolate, taper-pointed, subequal, exceeding the disk, ciliate; rays eight or nine, one and a half or more inches long, chaff black. Edge of meadow.

Measured a mulgedium, eight feet three inches long and hollow all the way. Some boy had fixed an archangelica stem so as to conduct the water at the spring close by. Elder-berries in a day or two. I see some *Hypericum angulosum* turned a delicate clear purple. *Polygonum dumetorum* at Bittern Cliff, one flower gone to seed (!); say day or two.

7 P. m. — The river has risen about two inches today, and is now within six inches of the top of Hoar's wall.

Aug. 12. 11 a. m. — To Hill.

The *Hypericum mutilum* is well out at this hour. The river is now at a standstill, some three feet above its usual level. The pickerel-weed is all covered, and lilies, and much of the button-bush and mikania. It is as great an accident as can befall these flowers.

It is novel to behold this great, full tide in which you perceive some current by the eddies, in which no snarl of weeds is seen. So different from that Potamogeton River, where you caught a crab at every stroke of the oar, and farmers drove their hay-carts across. Instead of watery gleaming fields of potamogetons in which the boatman was entangled, and drifting vallisneria on which the dragon-flies alighted, I see a deep full river on which vessels may float, and I feel at a distance from terra firma when on its bosom.

P. M. — To Moore's Swamp.

*Gerardia purpurea*, two or three days. The *mula gedium* in that swamp is very abundant and a very stately plant, so erect and soldier-like, in large companies, rising above all else, with its very regular long, sharp, elliptic head and bluish-white flowers.

Again I examine that very strict *solidago*, which perhaps I must call wand-stemmed. Perhaps it is only a swamp variety of *S. stricta*, yet the leaves are thicker and darker(?) -green, and the upper commonly broader, often elliptic, pointed, less recurved and not wavy. Stem and head is now commonly much more strict and branches more erect, and racemes less one-sided, but in larger and maturer ones they are at length recurving and forming a pyramid like *S. stricta*. Rays are fewer and broader, five or six; stem reddish, with apparently more branchlets or leaflets in axils.

Am surprised to see still a third species or variety of *helianthus* (which may have opened near August 1st, say only a week). Only the first flowers out. At edge of the last clearing south of spring. I cannot identify it. It has very short but not margined petioles; leaves narrower than yesterday's, and rough beneath as well as above. The outer scales of involucre a little the longest; but I think this of little importance, for the involucre of the *H. divaricatus* is very variable, hardly two alike; rays about ten. In some respects it is most like *H. strumosus*, but not downy beneath.

The bruised leaves of these *helianthus*es are rather fragrant.

It is thick, smoky, dog-day weather again. Bradford speaks of the dog's-tooth violet as a plant which disappears early.

The *Aster patens* is very handsome by the side of Moore's Swamp on the bank, — large flowers, more or less purplish or violet, each commonly (four or five) at the end of a long peduncle, three to six inches long, at right angles with the stem, giving it an open look. Snake-head, or *chelone*. On the edge of the ditch opposite the spring, *Epilobium coloratum*, and also what I must call *E. palustre* of Willdenow and Pursh and Eaton. It is smooth or smoothish, leaves somewhat toothed or subdenticulate, peduncle one inch long, flowers white.

The most interesting domes I behold are not those of Oriental temples and palaces, but of the toadstools. On this knoll in the swamp they are little pyramids of Cheops or Cholula, which also stand on the plain, very delicately shaded off. They have burst their brown tunics as they expanded, leaving only a clear-brown apex, and on every side these swelling roofs or domes are patched and shingled with the fragments, delicately shaded off thus into every tint of brown to the edge. As if this creation of a night would thus imitate the weather-stains of centuries. Toads' temples. So charming is gradation!

*Gerardia pedicularia*, how long?

What a wilderness of weeds is Moore's Swamp now!

Tall rough goldenrods, *erecthites*, poke, *Aster Radula*, dogwood, etc., etc. It looks as if the potatoes which grew there would be poisonous.

An arrowhead in Peter's Path. How many times I have found an arrowhead by that path, as if that had been an Indian trail! Perchance it was, for some of the paths we travel are much older than we think, especially some which the colored race in our midst still use, for they are nearest to the Indian trails. The Emerson children say that *Aralia nudicaulis* berries are good to eat.

The leaves of *Sericocarpus conyzoides* are fragrant when bruised. Black cherries ripe.

Labor Lost. — For one of this generation to talk with a man of the old school. You might have done a solid work the meanwhile with a contemporary. I thought of this when I saw Neighbor B., the worthy man! and thought of my interviews with him. If I could only get the parish clerk to read what I have to say to him!

Saw the primrose open at sundown. The corolla burst part way open and unfolded rapidly; the sepals flew back with a smart spring. In a minute or two the corolla was opened flat and seemed to rejoice in the cool, serene light and air.

*Lespedeza capitata*, not long.

The *sarothra* — as well as small *hypericums* generally 10. — has a lemon scent.

The late rains have tried the roofs severely. Tenants have complained to their landlords, and now I see carpenters setting up their staging and preparing to shingle on various sides.

Aug. 13. P. M. — To Conantum.

Beck says of the small *circæa* (*G. alpina*), "Many botanists consider this a mere variety of the preceding." I am not sure but it is more deeply toothed than the large. Its leaves are of the same color with those of the large at Bittern Cliff, but more decidedly toothed; q v. Why does it not grow larger at Comer Spring?

The root of the *Polygala verticillata* also has the checkerberry odor.

In Bittern Cliff Woods that (apparently) very oblong elliptical leafed *Lespedeza violacea* (?), growing very loose and open on a few long petioles, one foot high by four or five inches wide. Is this because it grows in woods? It is not in bloom.

Is there not now a prevalence of aromatic herbs in prime? — The *polygala* roots, blue-curly, wormwood, pennyroyal, *Solidago odor a*, rough sunflowers, horse-mint, etc., etc. Does not the season require this tonic?

I stripped off a shred of Indian hemp bark and could not break it. It is as strong as anything of the kind I know.

Aug. 14. P. M. — To Flint's Pond via Saw Mill Brook.

*Aster Tradescanti*, apparently a day or two. *Hypopitys*, just beyond the last large (two-stemmed) chestnut at Saw Mill Brook, about done. Apparently a funguslike plant. It erects itself in seed. *Gymnadenia* nearer the brook, how long? Is that slender erect shrub near oak stump at Saw Mill *Comus circinata*?

*Solidago odora* abundantly out.

The low wood-paths are strewn with toadstools now, and I begin to perceive their musty scent, — great *tumbae*, or, as R. W. E. says, *tuguria*, — crowding one another by the path-side when there was not a fellow in sight; great towers that have fallen and made the plain shake; ponderous wheels that have lost their fellows, broken their axles, abandoned by the toady or swampy teamsters. Some whose eaves have been nibbled apparently by turtles. Ricketson says he saw a turtle eating a toadstool once. Some great dull-yellow towers, — towers of strength, to judge from their mighty columns, — like the South African honey-birds' (?) nests.

The recent heavy rains have caused many leaves to fall, especially chestnut. They already spot the ground, rapidly yellowing and very handsomely spotted. I never weary of their colors. I see those eye-spots on the low hickory leaves also. All the Flint's Pond wood-paths are strewn with these gay-spotted chestnut leaves, and the changing sarsaparilla leaves begin to yellow the forest floor.

*Sedum Telephium*, some time. Flowering blackberry still. A short elliptic-leaved *Lespedeza violacea*, loose and open in Veery Nest Path, at Flint's Pond. In press.

On roadside heap at Emerson's, a *portulaca* with leaves one inch wide and seven petals (!) instead of five.

Meet a little boy with six young blind mice in his hat, which Horatio Watts has given [him]. He did not find them till he came to fork over and turn the hay. There were six of these little brown blind meadow mice (I suppose *Arvicola hirsutus?*), with short tails and blunt muzzles and great heads, looking like little bulldogs. The nest was open on the surface amid the roots of the grass; of dried grass, like a bird's, three and a half inches [in] diameter, with a gallery or two leading from it. Watts said these were the kind that clung to the mother! But why did they not? Sometimes find nine of them.

Aug. 15. Friday. P. M. — To Minot Pratt's.

Pratt is collecting his parsnip seed. This the second or third cutting. It takes three cuttings, the central umbellets ripening first. It takes a sharp knife not to shake out the seeds, and, as it is, enough to seed ten times the ground is lost. Almost every one is poisoned, says P., by this work. The skin comes off the back of the hand, making tanned hands look white-spotted. This from handling the parsnip in its second year only. Great rank poisonous-looking and really poisonous parsnips gone to seed. It is not quite time to cut the carrot seed.

Aug. 16. What a variety of old garden herbs — mints, etc. — are naturalized along an old settled road, like this to Boston which the British travelled! And then there is the site, apparently, of an old garden by the tan-yard, where the spearmint grows so rankly. I am intoxicated with the fragrance. Though I find only one new plant (the cassia), yet old acquaintances grow so rankly, and the spearmint intoxicates me so, that I am bewildered, as it were by a variety of new things. An infinite novelty. All the roadside is the site of an old garden where fragrant herbs have become naturalized, — hounds-tongue, bergamot, spearmint, elecampane, etc. I see even the tiger lily, with

its bulbs, growing by the roadside far from houses (near Leighton's graveyard). I think I have found many new plants, and am surprised when I can reckon but one. A little distance from my ordinary walk and a little variety in the growth or luxuriance will produce this illusion. By the discovery of one new plant all bounds seem to be infinitely removed.

Am frequently surprised to find how imperfectly water-plants are known. Even good shore botanists are out of their element on the water. I would suggest to young botanists to get not only a botany-box but a boat, and know the water-plants not so much from the shore as from the water side.

My plants in press are in a sad condition; mildew has invaded them during the late damp weather, even those that were nearly dry. I find more and other plants than I counted on. Very bad weather of late for pressing plants. Give me the dry heat of July. Even growing leaves out of doors are spotted with fungi now, much more than mine in press.

Aug. 25. The farmers commonly say that the spring floods, being of cold water, do not injure the grass like later ones when the water is warm, but I suspect it is not so much owing to the warmth of the water as to the age and condition of the grass and whatever else is exposed to them. They say that if you let the water rise and stand some time over the roots of trees in warm weather it will kill them. This, then, may be the value of these occasional freshets in August: they steam and kill the shrubs and trees which had crept into the river meadows, and so keep them open perpetually, which, perchance, the spring floods alone might not do. It is commonly supposed that our river meadows were much drier than now originally, or when the town was settled. They were probably drier before the dam was built at Billerica, but if they were much or at all drier than now originally, I ask what prevented their being converted into maple swamps? Maples, alders, birches, etc., are creeping into them quite fast on many sides at present. If they had been so dry as is supposed they would not have been open meadows. It seems to be true that high water in mid-summer, when perchance the trees and shrubs are in a more tender state, kills them. It "steams" them, as it does the grass; and maybe the river thus asserts its rights, and possibly it would still to great extent, though the meadows should be considerably raised. Yet, I ask, why do maples, alders, etc., at present border the stream, though they do not spring up to any extent in the open meadow? Is it because the immediate bank is commonly more firm as well as higher (their seeds also are more liable to be caught there), and where it is low they are protected by willows and button-bushes, which can bear the flood? Not even willows and button-bushes prevail in the Great Meadows, — though many of the former, at least, spring up there, — except on the most elevated parts or hummocks. The reason for this cannot be solely in the fact that the water stands over them there a part of the year, because they are still more exposed to the water in many places on the shore of the river where yet they thrive. Is it then owing to the soft character of the ground in the meadow and the ice tearing up the meadow so extensively? On the immediate bank of the river that kind of sod and soil is not commonly formed which

the ice lifts up. Why is the black willow so strictly confined to the bank of the river? What is the use, in Nature's economy, of these occasional floods in August? Is it not partly to preserve the meadows open?

I was suggesting yesterday, as I have often before, that the town should provide a stone monument to be placed in the river, so as to be surrounded by water at its lowest stage, and a dozen feet high, so as to rise above it at its highest stage; on this feet and inches to be permanently marked; and it be made some one's duty to record each high or low stage of the water. Now, when we have a remarkable freshet, we cannot tell surely whether it is higher than the one thirty or sixty years ago or not. It would be not merely interesting, but often practically valuable, to know this. Reuben Rice was telling me to-night that the great freshet of two or three years ago came, according to his brother Israel, within two inches of one that occurred about forty years ago. I asked how he knew. He said that the former one took place early (February?), and the surface froze so that boys skated on it, and the ice marked a particular apple tree, girdled it, so that it is seen to this day. But we wish to speak more confidently than this allows. It is important when building a causeway, or a bridge, or a house even, in some situations, to know exactly how high the river has ever risen. It would need to be a very large stone or pile of stones, which the ice could not move or break. Perhaps one corner of a bridge abutment would do.

Aug. 26. Tuesday. More wind and quite cold this morning, but very bright and sparkling, autumn-like air, reminding of frosts to be apprehended, also tempting abroad to adventure. The fall cricket — or is it alder locust? — sings the praises of the day.

So about 9 A.M. up river to Fair Haven Pond.

I rest and take my lunch on Lee's Cliff, looking toward Baker Farm. What is a New England landscape this sunny August day? A weather-painted house and barn, with an orchard by its side, in midst of a sandy field surrounded by green woods, with a small blue lake on one side. A sympathy between the color of the weather-painted house and that of the lake and sky. I speak not of a country road between its fences, for this house lies off one, nor do I commonly approach them from this side. The weather-painted house. This is the New England color, homely but fit as that of a toadstool.

Aug. 28. I open the painted tortoise nest of June 10th, and find a young turtle partly out of his shell. He is already wonderfully strong and precocious. Though those eyes never saw the light before, he watches me very warily, even at a distance. With what vigor he crawls out of the hole I have made, over opposing weeds! He struggles in my fingers with great strength; has none of the tenderness of infancy. His whole snout is convex, and curved like a beak. Having attained the surface, he pauses and warily watches me.

Meanwhile a striped squirrel sits on the wall across the road under a pine, eyeing me, with his cheek-pouches stuffed with nuts and puffed out ludicrously, as if he had the mumps, while the wall is strewn with the dry brown husks of hazelnuts he has stripped. A bird, perhaps a thrasher, in the pine close above him is hopping restlessly and scolding at him.

June, July, and August, the tortoise eggs are hatching a few inches beneath the surface in sandy fields. You tell of active labors, of works of art, and wars the past summer; meanwhile the tortoise eggs underlie this turmoil. What events have transpired on the lit and airy surface three inches above them! Summer knocked down; Kansas living an age of suspense. Think what is a summer to them! June, July, and August, — the livelong summer, — what are they with their heats and fevers but sufficient to hatch a tortoise in. Be not in haste; mind your private affairs. Consider the turtle. Perchance you have worried yourself, despaired of the world, meditated the end of life, and all things seemed rushing to destruction; but nature has steadily and serenely advanced with a turtle's pace. Has not the tortoise also learned the true value of time?

Aug. 30. I have come out this afternoon a-cranberrying, chiefly to gather some of the small cranberry, *Vaccinium Oxycoccus*, which Emerson says is the common cranberry of the north of Europe. This was a small object, yet not to be postponed, on account of imminent frosts, i.e., if I would know this year the flavor of the European cranberry as compared with our larger kind. I thought I should like to have a dish of this sauce on the table at Thanksgiving of my own gathering. I could hardly make up my mind to come this way, it seemed so poor an object to spend the afternoon on. I kept foreseeing a lame conclusion, — how I should cross the Great Fields, look into Beck Stow's, and then retrace my steps no richer than before. In fact, I expected little of this walk, yet it did pass through the side of my mind that somehow, on this very account (my small expectation), it would turn out well, as also the advantage of having some purpose, however small, to be accomplished, — of letting your deliberate wisdom and foresight in the house to some extent direct and control your steps. If you would really take a position outside the street and daily life of men, you must have deliberately planned your course, you must have business which is not your neighbors' business, which they cannot understand. For only absorbing employment prevails, succeeds, takes up space, occupies territory, determines the future of individuals and states, drives Kansas out of your head, and actually and permanently occupies the only desirable and free Kansas against all border ruffians. The attitude of resistance is one of weakness, inasmuch as it only faces an enemy; it has its back to all that is truly attractive. You shall have your affairs, I will have mine. You will spend this afternoon in setting up your neighbor's stove, and be paid for it; I will spend it in gathering the few berries of the *Vaccinium Oxycoccus* which Nature produces here, before it is too late, and be paid for it also after another fashion. I have always reaped unexpected and incalculable advantages from carrying out at last, however tardily, any little enterprise which my genius suggested to me long ago as a thing to be done, — some step to be taken, however slight, out of the usual course.

How many schools I have thought of which I might go to but did not go to! expecting foolishly that some greater advantage or schooling would come to me! It is these comparatively cheap and private expeditions that substantiate our existence and bat-ten our lives, as, where a vine touches the earth in its undulating course, it puts forth roots and thickens its stock. Our employment generally is tinkering, mending the old

worn-out teapot of society. Our stock in trade is solder. Better for me, says my genius, to go cranberrying this afternoon for the *Vaccinium Oxycoccus* in Gowing's Swamp, to get but a pocketful and learn its peculiar flavor, aye, and the flavor of Gowing's Swamp and of life in New England, than to go consul to Liverpool [as Nathaniel Hawthorne had done] and get I don't know how many thousand dollars for it, with no such flavor. Many of our days should be spent, not in vain expectations and lying on our oars, but in carrying out deliberately and faithfully the hundred little purposes which every man's genius must have suggested to him. Let not your life be wholly without an object, though it be only to ascertain the flavor of a cranberry, for it will not be only the quality of an insignificant berry that you will have tasted, but the flavor of your life to that extent, and it will be such a sauce as no wealth can buy.

Both a conscious and an unconscious life are good. Neither is good exclusively, for both have the same source. The wisely conscious life springs out of an unconscious suggestion. I have found my account in travelling in having prepared beforehand a list of questions which I would get answered, not trusting to my interest at the moment, and can then travel with the most profit. Indeed, it is by obeying the suggestions of a higher light within you that you escape from yourself and, in the transit, as it were see with the unworn sides of your eye, travel totally new paths. What is that pretended life that does not take up a claim, that does not occupy ground, that cannot build a causeway to its objects, that sits on a bank looking over a bog, singing its desires?

However, it was not with such blasting expectations as these that I entered the swamp. I saw bags of cranberries, just gathered and tied up, on the banks of Beck Stow's Swamp. They must have been raked out of the water, now so high, before they should rot. I left my shoes and stockings on the bank far off and waded bare-legged through rigid andromeda and other bushes a long way, to the soft open sphagnous centre of the swamp.

I found these cunning little cranberries lying high and dry on the firm uneven tops of the sphagnum, — their weak vine considerably on one side, — sparsely scattered about the drier edges of the swamp, or sometimes more thickly occupying some little valley a foot or two over, between two mountains of sphagnum. They were of two varieties, judging from the fruit. The one, apparently the ripest, colored most like the common cranberry but more scarlet, i.e. yellowish-green, blotched or checked with dark scarlet-red, commonly pear-shaped; the other, also pear-shaped, or more bulged out in the middle, thickly and finely dark-spotted or peppered on yellowish-green or straw-colored or pearly ground, and with a tinge of purple. A singular difference. The grayish speckled variety was particularly novel and pretty, though not easy to detect. It lay here and there snugly sunk in the sphagnum, whose drier parts it exactly resembled in color, just like some kind of swamp sparrows' eggs in their nest. I was obliged with my finger carefully to trace the slender pedicel through the moss to its vine, when I would pluck the whole together. Like jewels worn on, or set in, these sphagnous breasts of the swamp, — swamp pearls, call them.

I waded quite round the swamp for an hour, my bare feet in the cold water beneath, and it was a relief to place them on the warmer surface of the sphagnum. I filled one pocket with each variety, but sometimes, being confused, crossed hands and put them into the wrong pocket.

I enjoyed this cranberrying very much, notwithstanding the wet and cold, and the swamp seemed to be yielding its crop to me alone, for there are none else to pluck it or to value it. I told the proprietor once that they grew here, but he, learning that they were not abundant enough to be gathered for the market, has probably never thought of them since. I am the only person in the township who regards them or knows of them, and I do not regard them in the light of their pecuniary value. I have no doubt I felt richer wading there with my two pockets full, treading on wonders at every step, than any farmer going to market with a hundred bushels which he has raked, or hired to be raked. I got further and further away from the town every moment, and my good genius seemed to have smiled on me, leading me hither, and then the sun suddenly came out clear and bright, but it did not warm my feet. I would gladly share my gains, take one, or twenty, into partnership and get this swamp with them, but I do not know an individual whom this berry cheers and nourishes as it does me. When I exhibit it to them I perceive that they take but a momentary interest in it and commonly dismiss it from their thoughts with the consideration that it cannot be profitably cultivated. You could not get a pint at one haul of a rake, and Slocum would not give you much for them. But I love it the better partly for that reason even. I fill a basket with them and keep it several days by my side. If anybody else — any farmer, at least — should spend an hour thus wading about here in this secluded swamp, barelegged, intent on the sphagnum, filling his pocket only, with no rake in his hand and no bag or bushel on the bank, he would be pronounced insane and have a guardian put over him; but if he 'll spend his time skimming and watering his milk and selling his small potatoes for large ones, or generally in skinning flints, he will probably be made guardian of somebody else.

I noticed also a few small peculiar-looking huckle-berries hanging on bushes amid the sphagnum, and, tasting, perceived that they were hispid, a new kind to me. *Gaylussacia dumosa* var. *hirtella* (perhaps just after *resinosa*), though Gray refers it to a “sandy low soil” and says nothing of the hispid fruit. Has a small black hairy or hispid berry, shining but insipid and inedible, with a tough, hairy skin left in the mouth; has very prominent calyx-lobes.

I seemed to have reached a new world, so wild a place that the very huckleberries grew hairy and were inedible. What's the need of visiting far-off mountains and bogs, if a half-hour's walk will carry me into such wildness and novelty? But why should not as wild plants grow here as in Berkshire, as in Labrador? Is Nature so easily tamed? Is she not as primitive and vigorous here as anywhere? How does this particular acre of secluded, unfrequented, useless (?) quaking bog differ from an acre in Labrador? Has any white man ever settled on it? Does any now frequent it? Not even the Indian comes here now. I see that there are some square rods within twenty miles of Boston just

as wild and primitive and unfrequented as a square rod in Labrador, as unaltered by man. Here grows the hairy huckleberry as it did in Squaw Sachem's day and a thousand years before, and concerns me perchance more than it did her. I have no doubt that for a moment I experience exactly the same sensations as if I were alone in a bog in Rupert's Land, and it saves me the trouble of going there; for what in any case makes the difference between being here and being there but many such little differences of flavor and roughness put together? Rupert's Land is recognized as much by one sense as another. I felt a shock, a thrill, an agreeable surprise in one instant, for, no doubt, all the possible inferences were at once drawn, with a rush, in my mind, — I could be in Rupert's Land and supping at home within the hour! This beat the railroad. That wild hairy huckleberry, inedible as it was, was equal to a domain secured to me and reaching to the South Sea. That was an unexpected harvest. I hope you have gathered as much, neighbor, from your corn and potato fields. I have got in my huckleberries. I shall be ready for Thanksgiving. It is in vain to dream of a wildness distant from ourselves. There is none such. It is the bog in our brain and bowels, the primitive vigor of Nature in us, that inspires that dream. I shall never find in the wilds of Labrador any greater wildness than in some recess in Concord, i.e. than I import into it. A little more manhood or virtue will make the surface of the globe anywhere thrillingly novel and wild. That alone will provide and pay the fiddler; it will convert the district road into an untrodden cranberry bog, for it restores all things to their original primitive flourishing and promising state.

A cold white horizon sky in the north, forerunner of the fall of the year. I go to bed and dream of cranberry-pickers far in the cold north. With windows partly closed, with continent concentrated thoughts, I dream. I get my new experiences still.

Better it is to go a-cranberrying than to go a-huckleberrying. For that is cold and bracing, leading your thoughts beyond the earth, and you do not surfeit on crude or terrene berries. It feeds your spirit, now in the season of white twilights, when frosts are apprehended, when edible berries are mostly gone.

Those small gray sparrow-egg cranberries lay so prettily in the recesses of the sphagnum, I could wade for hours in the cold water gazing at them, with a swarm of mosquitoes hovering about my bare legs, — but at each step the friendly sphagnum in which I sank protected my legs like a buckler, — not a crevice by which my foes could enter.

I see that all is not garden and cultivated field and crops, that there are little oases of wildness in the desert of our civilization, wild as a square rod on the moon, supposing it to be uninhabited. I believe almost in the personality of such planetary matter, feel something akin to reverence for it, can even worship it as terrene, titanic matter extant in my day. We are so different we admire each other, we healthily attract one another. I love it as a maiden. These spots are meteoric, aerolitic, and such matter has in all ages been worshipped. Aye, when we are lifted out of the slime and film of our habitual life, we see the whole globe to be an aerolite, and reverence it as such, and make pilgrimages to it, far off as it is. How happens it that we reverence the stones

which fall from another planet, and not the stones which belong to this, — another globe, not this, — heaven, and not earth?

If I could, I would worship the parings of my nails. I would fain improve every opportunity to wonder and worship, as a sunflower welcomes the light. The more thrilling, wonderful, divine objects I behold in a day, the more expanded and immortal I become.

Aug. 31. Sunday. P.M. — To Hubbard Bath Swamp by boat.

There sits one by the shore who wishes to go with me, but I cannot think of it. I must be fancy-free. I would rather attend to him earnestly for half an hour, on shore or elsewhere, and then dismiss him. He thinks I could merely take him into my boat and then not mind him. He does not realize that I should by the same act take him into my mind, where there is no room for him, and my bark would surely founder in such a voyage as I was contemplating. I know very well that I should never reach that expansion of the river I have in my mind, with him aboard with his broad terrene qualities. He would sink my bark (not to another sea) and never know it. I could better carry a heaped load of meadow mud and sit on the thole-pins. There would be more room for me, and I should reach that expansion of the river nevertheless.

I could better afford to take him into bed with me, for then I might, perhaps, abandon him in my dreams. Ah! you are a heavy fellow, but I am well disposed. If you could go without going, then you might go. It is because I trust that I shall ere long depart from your thoughts, and so you from mine, that I am encouraged to set sail at all. I make haste to put several meanders and some hills between us.

What is getting into a man's carriage when it is full, compared with putting your foot in his mouth and popping right into his mind without considering whether it is occupied or not?

The *Viburnum nudum* berries are now in prime, a handsome rose-purple. I brought home a bunch of fifty-three berries, all of this color, and the next morning thirty were turned dark purple. In this state they are soft and just edible, having somewhat of a cherry flavor, not a large stone.

A painted tortoise shedding its scales.

Sept. 1. P.M. — With R.W.E. to Saw Mill and *Solidago odora*.

He has just had four of his fir trees next his house cut, they shaded his windows so. They were set out by Coolidge, E. thinks twenty-eight years ago.

We go admiring the pure and delicate tints of fungi on the surface of the damp swamp there, following up along the north side of the brook past the right of the old camp. There are many very beautiful lemon-yellow ones of various forms, some shaped like buttons, some becoming finely scalloped on the edge, some club-shaped and hollow, of the most delicate and rare but decided tints, contrasting well with the decaying leaves about them. There are others also pure white, others a wholesome red, others brown, and some even a light indigo-blue above and beneath and throughout. When colors come to be taught in the schools, as they should be, both the prism (or the rainbow) and these fungi should be used by way of illustration, and if the pupil

does not learn colors, he may learn fungi, which perhaps is better. You almost envy the wood frogs and toads that hop amid such gems.

I think it stands about thus with asters and golden-rods now: —

The early meadow aster is either quite withered or much the worse for the wear, partly on account of the freshet.

*Diplopappus cornifolius*, not seen of late.

*D. umbellatus*, perhaps in prime or approaching it, but not much seen.

*A. patens*, apparently now in prime and the most abundant of the larger asters.

[Etc. — 23 more, plus footnotes and cross-references, with long follow-up lists on Sept. 24 and Oct. 8.]

Sept. 2. Clear bright days of late, with a peculiar sheen on the leaves, — light reflected from the surface of each one, for they are grown and worn and washed smooth at last, no infantile downiness on them. A sheeny light reflected from the burnished leaves as so many polished shields, and a steady creak from the locusts these days. Frank Harding has caught a dog-day locust which lit on the bottom of my boat, in which he was sitting, and z-ed there. When you hear him you have got to the end of the alphabet and may imagine the &. It has a mark somewhat like a small writing w on the top of its thorax.

I think we may detect that some sort of preparation and faint expectation preceded every discovery we have made. We blunder into no discovery but it will appear that we have prayed and disciplined ourselves for it. Some years ago I sought for Indian hemp (*Apocynum cannabinum*) hereabouts in vain, and concluded that it did not grow here. A month or two ago I read again, as many times before, that its blossoms were very small, scarcely a third as large as those of the common species, and for some unaccountable reason this distinction kept recurring to me, and I regarded the size of the flowers I saw, though I did not believe that it grew here; and in a day or two my eyes fell on it, aye, in three different places, and different varieties of it. Also, a short time ago, I was satisfied that there was but one kind of sunflower (*divaricatus*) indigenous here. Hearing that one had found another kind, it occurred to me that I had seen a taller one than usual lately, but not so distinctly did I remember this as to name it to him or even fully remember it myself. (I rather remembered it afterward.) But within that hour my genius conducted me to where I had seen the tall plants, and it was the other man's new kind. The next day I found a third kind, miles from there, and, a few days after, a fourth in another direction.

It commonly chances that I make my most interesting botanical discoveries when I am in a thrilled and expectant mood, perhaps wading in some remote swamp where I have just found something novel and feel more than usually remote from the town. Or some rare plant which for some reason has occupied a strangely prominent place in my thoughts for some time will present itself. My expectation ripens to discovery. I am prepared for strange things.

The botanist refers you, for wild and we presume wild plants, further inland or westward to so many miles from Boston, as if Nature or the Indians had any such

preferences. Perchance the ocean seemed wilder to them than the woods. As if there were primarily and essentially any more wildness in a western acre than an eastern one!

Sept. 4. Butterflies in road a day or two. The crackling flight of grasshoppers. The grass also is all alive with them, and they trouble me by getting into my shoes, which are loose, and obliging me to empty them occasionally.

I believe it was this morning there was quite a fog.

We see no effects of frost yet in garden, but hear a rumor of a little somewhere. First muskmelon gathered.

Sept. 10. When the water is lowest, the river is contracted to sixteen feet here, and Peters's, an old history of Connecticut, says it was so condensed that you could not thrust a crowbar into it. It did me good to read his wholesale hearty statements, — strong, living, human speech, so much better than the emasculated modern histories, like Bancroft's and the rest, cursed with a style. I would rather read such histories, though every sentence were a falsehood, than our dull emasculated reports which bear the name of histories. The former, having a human breath and interest behind them, are nearer to nature and to truth, after all. The historian is required to feel a human interest in his subject and to so express it.

Sept. 15. Monday. Sophia says, bringing company into my sanctum, by way of apology, that I regard the dust on my furniture like the bloom on fruits, not to be swept off.

Sept. 21. Find, for first time in Concord, *Solanum nigrum*, berries apparently just ripe, by a rock northwest of *corydalis*. Thus I have within a week found in Concord two of the new plants I found up-country. Such is the advantage of going abroad, — to enable you to detect your own plants. I detected them first abroad, because there I was looking for the strange.

Sept. 22. A rainy day. Tried some pennyroyal tea, but found it too medicinal for my taste. Yet I collect these herbs, biding the time when their use shall be discovered.

SEPT. 23. Rainy day.

Sept. 29. I can hardly clamber along the grape cliff now without getting my clothes covered with *desmodium* ticks. Though you were running for your life, they would have time to catch and cling to your clothes. You pause at a convenient place and spend a long time picking them off, which it took so short a time to attach. They will even cling to your hand as you go by. They cling like babes to the mother's breast, by instinct. These almost invisible nets, as it were, are spread for us, and whole covneys of *desmodium* and *bidens* seeds and burs steal transportation out of us. I have found myself often covered, and had to spend a quarter of an hour or more picking them off at some convenient place; and so they got just what they wanted, deposited in another place.

Oct. 2. I am amused to see four little Irish boys only five or six years old getting a horse in a pasture, for their father apparently, who is at work in a neighboring field. They have all in a row got hold of a very long halter and are leading him. All wish

to have a hand in it. It is surprising that he obeys such small specimens of humanity, but he seems to be very docile, a real family horse. At length, by dint of pulling and shouting, they get him into a run down a hill, and though he moves very deliberately, scarcely faster than a walk, all but the one at the end of the line soon cut and run to right and left, without having looked behind, expecting him to be upon them. They haul up at last at the bars, which are down, and then the family puppy, a brown pointer (?), about two-thirds grown, comes bounding to join them and assist. He is as youthful and about as knowing as any of them. The horse marches gravely behind, obeying the faint tug at the halter, or honestly stands still from time to time, as if not aware that they are pulling at all, though they are all together straining every nerve to start him. It is interesting to behold this faithful beast, the oldest and wisest of the company, thus implicitly obeying the lead of the youngest and weakest.

Oct. 5. It is well to find your employment and amusement in simple and homely things. These wear best and yield most. I think I would rather watch the motions of these cows in their pasture for a day, which I now see all headed one way and slowly advancing, — watch them and project their course carefully on a chart, and report all their behavior faithfully, — than wander to Europe or Asia and watch other motions there; for it is only ourselves that we report in either case, and perchance we shall report a more restless and worthless self in the latter case than in the first.

Oct. 14. A sudden change in the weather after remarkably warm and pleasant weather. Rained in the night, and finger-cold to-day. Your hands instinctively find their way to your pockets. Leaves are fast falling, and they are already past their brightness, perhaps earlier than usual on account of wet. Any flowers seen now may be called late ones. I see perfectly fresh succory, not to speak of yarrow, a *Viola ovata*, some *Polygala sanguinea*, autumnal dandelion, tansy, etc., etc.

Oct. 16. Found amid the sphagnum on the dry bank on the south side of the Turnpike, just below Everett's meadow, a rare and remarkable fungus, such as I have heard of but never seen before. The whole height six and three quarters inches, two thirds of it being buried in the sphagnum. It may be divided into three parts, pileus, stem, and base, — or scrotum, for it is a perfect phallus. One of those fungi named *impudicus*, I think. In all respects a most disgusting object, yet very suggestive. It is hollow from top to bottom, the form of the hollow answering to that of the outside. The color of the outside white excepting the pileus, which is olive-colored and somewhat coarsely corrugated, with an oblong mouth at tip about one eighth of an inch long, or, measuring the white lips, half an inch. Longest diameter at base one and a half inches, at top (on edge of pileus) fifteen sixteenths of an inch. Short diameters in both cases about two thirds as much. It is a delicate white cylinder of a finely honeycombed and crispy material about three sixteenths of an inch thick, or more, the whole very straight and regular. The base, or scrotum, is of an irregular bag form, about one inch by two in the extremes, consisting of a thick trembling gelatinous mass surrounding the bottom of the stem and covered with a tough white skin of a darker tint than the stem. The whole plant rather frail and trembling. There was at first a very thin

delicate white collar (or volva?) about the base of the stem above the scrotum. It was as offensive to the eye as to the scent, the cap rapidly melting and defiling what it touched with a fetid, olivaceous, semiliquid matter. In an hour or two the plant scented the whole house wherever placed, so that it could not be endured. I was afraid to sleep in my chamber where it had lain until the room had been well ventilated. It smelled like a dead rat in the ceiling, in all the ceilings of the house. Pray, what was Nature thinking of when she made this? She almost puts herself on a level with those who draw in privies.

Oct. 17. Frost has now within three or four days turned almost all flowers to woolly heads, — their November aspect.

Some trees, as small hickories, appear to have dropped their leaves instantaneously, as at a signal, as a soldier grounds arms. The ground under such reflects a blaze of light from now crisped yellow leaves. Down they have come on all sides, as if touched by fairy fingers. Boys are raking leaves in the street, if only for the pleasure of dealing with such clean, crisp substances.

Oct. 19. I have often noticed the inquisitiveness of birds, as the other day of a sparrow, whose motions I should not have supposed to have any reference to me, if I had not watched it from first to last. I stood on the edge of a pine and birch wood. It flitted from seven or eight rods distant to a pine within a rod of me, where it hopped about stealthily and chirped awhile, then flew as many rods the other side and hopped about there a spell, then back to the pine again, as near me as it dared, and again to its first position, very restless all the while. Generally I should have supposed that there was more than one bird, or that it was altogether accidental, — that the chipping of this sparrow eight or ten rods away had no reference to me, — for I could see nothing peculiar about it. But when I brought my glass to bear on it, I found that it was almost steadily eying me and was all alive with excitement.

DEC. 1. P.M. — By path around Walden.

With this little snow of the 29th there is yet pretty good sledding, for it lies solid.

I see the old pale-faced farmer out again on his sled now for the five-thousandth time, — Cyrus Hubbard, a man of a certain New England probity and worth, immortal and natural, like a natural product, like the sweetness of a nut, like the toughness of hickory. He, too, is a redeemer for me. How superior actually to the faith he professes! He is not an office-seeker. What an institution, what a revelation is a man! We are wont foolishly to think that the creed which a man professes is more significant than the fact he is. It matters not how hard the conditions seemed, how mean the world, for a man is a prevalent force and a new law himself. He is a system whose law is to be observed. The old farmer condescends to countenance still this nature and order of things. It is a great encouragement that an honest man makes this world his abode. He rides on the sled drawn by oxen, world-wise, yet comparatively so young, as if they had seen scores of winters. The farmer spoke to me, I can swear, clean, cold, moderate as the snow. He does not melt the snow where he treads. Yet what a faint impression that encounter may make on me after all! Moderate, natural, true, as if he were made

of earth, stone, wood, snow. I thus meet in this universe kindred of mine, composed of these elements. I see men like frogs; their peeping I partially understand.

I go by Hayden's and take A. Wheeler's wood-path to railroad.

Slate-colored snowbirds flit before me in the path, feeding on the seeds on the snow, the countless little brown seeds that begin to be scattered over the snow, so much the more obvious to bird and beast. A hundred kinds of indigenous grain are harvested now, broad-cast upon the surface of the snow. Thus at a critical season these seeds are shaken down on to a clean white napkin, unmixed with dirt and rubbish, and off this the little pensioners pick them. Their clean table is thus spread a few inches or feet above the ground. Will wonder become extinct in me? Shall I become insensible as a fungus?

A ridge of earth, with the red cockscomb lichen on it, peeps out still at the rut's edge. The dear wholesome color of shrub oak leaves, so clean and firm, not decaying, but which have put on a kind of immortality, not wrinkled and thin like the white oak leaves, but full-veined and plump, as nearer earth. Well-tanned leather on the one side, sun-tanned, color of colors, color of the cow and the deer, silver-downy beneath, turned toward the late bleached and russet fields. What are acanthus leaves and the rest to this? Emblem of my winter condition. I love and could embrace the shrub oak with its scanty garment of leaves rising above the snow, lowly whispering to me, akin to winter thoughts, and sunsets, and to all virtue. Covert which the hare and the partridge seek, and I too seek. What cousin of mine is the shrub oak? How can any man suffer long? For a sense of want is a prayer, and all prayers are answered. Rigid as iron, clean as the atmosphere, hardy as virtue, innocent and sweet as a maiden is the shrub oak. In proportion as I know and love it, I am natural and sound as a partridge. I felt a positive yearning toward one bush this afternoon. There was a match found for me at last. I fell in love with a shrub oak. Tenacious of its leaves, which shrivel not but retain a certain wintry life in them, firm shields, painted in fast colors a rich brown. The deer mouse, too, knows the shrub oak and has its hole in the snow by the shrub oak's stem.

Now, too, I remark in many places ridges and fields of fine russet or straw-colored grass rising above the snow, and beds of empty straw-colored heads of ever-lasting and ragged-looking Roman wormwood.

The blue-curls' chalice stand empty, and waiting evidently to be filled with ice.

I see great thimble-berry bushes rising above the snow, with still a rich, rank bloom on them, as in July. Hypæthral mildew, elysian fungus! To see the bloom on a thimble-berry stem lasting into midwinter! What a salve that would make, collected and boxed!

No, I am a stranger in your towns. I am not at home at French's, or Lovejoy's, or Savery's. I can winter more to my mind amid the shrub oaks. I have made arrangements to stay with them.

The shrub oak, lowly, loving the earth and spreading over it, tough, thick-leaved; leaves firm and sound in winter and rustling like leather shields; leaves fair and wholesome to the eye, clean and smooth to the touch. Tough to support the snow, not broken

down by it. Well-nigh useless to man. A sturdy phalanx, hard to break through. Product of New England's surface. Bearing many striped acorns.

I have seen more chestnuts in the streets of New York than anywhere else this year, large and plump ones, roasting in the street, roasting and popping on the steps of banks and exchanges. Was surprised to see that the citizens made as much of the nuts of the wild-wood as the squirrels. Not only the country boys, all New York goes a-nutting. Chestnuts for cabmen and newsboys, for not only are squirrels to be fed.

Well named shrub oak. Low, robust, hardy, indigenous. Well known to the striped squirrel and the partridge and rabbit. The squirrel nibbles its nuts sitting upon an old stump of its larger cousins. What is Peruvian bark to your bark? How many rents I owe to you! how many eyes put out! how many bleeding fingers! How many shrub oak patches I have been through, stooping, winding my way, bending the twigs aside, guiding myself by the sun, over hills and valleys and plains, resting in clear grassy spaces! I love to go through a patch of shrub oak in a bee-line, where you tear your clothes and put your eyes out.

Dec. 2. P.M. — Got in my boat, which before I had got out and turned up on the bank. It made me sweat to wheel it home through the snow, I am so unused to the work of late.

Then walked up the railroad. The clear straw-colored grass and some weeds contrasting with the snow it rises above. Saw little in this walk. Saw Melvin's lank bluish-white black-spotted hound, and Melvin with his gun near, going home at eve. He follows hunting, praise be to him, as regularly in our tame fields as the farmers follow farming. Persistent Genius! How I respect him and thank him for him! I trust the Lord will provide us with another Melvin when he is gone. How good in him to follow his own bent, and not continue at the Sabbath-school all his days! What a wealth he thus becomes in the neighborhood! Few know how to take the census. I thank my stars for Melvin. I think of him with gratitude when I am going to sleep, grateful that he exists, — that Melvin who is such a trial to his mother. Yet he is agreeable to me as a tinge of russet on the hillside. I would fain give thanks morning and evening for my blessings. Awkward, gawky, loose-hung, dragging his legs after him. He is my contemporary and neighbor. He is one tribe, I am another, and we are not at war.

I saw but little in my walk. Saw no bird, only a crow's track in the snow.

As for the sensuality in Whitman's "Leaves of Grass," I do not so much wish that it was not written, as that men and women were so pure that they could read it without harm.

Dec. 3. Mizzles and rains all day, making sloshy walking which sends us all to the shoemaker's. Bought me a pair of cowhide boots, to be prepared for winter walks. The shoemaker praised them because they were made a year ago. I feel like an armed man now. The man who has bought his boots feels like him who has got in his winter's wood. There they stand beside me in the chamber, expectant, dreaming of far woods and woodpaths, of frost-bound or sloshy roads, or of being bound with skate-straps and clogged with ice-dust.

How I love the simple, reserved countrymen, my neighbors, who mind their own business and let me alone, who never waylaid nor shot at me, to my knowledge, when I crossed their fields, though each one has a gun in his house! For nearly twoscore years I have known, at a distance, these long-suffering men, whom I never spoke to, who never spoke to me, and now feel a certain tenderness for them, as if this long probation were but the prelude to an eternal friendship. What a long trial we have withstood, and how much more admirable we are to each other, perchance, than if we had been bedfellows! I am not only grateful because Veias, and Homer, and Christ, and Shakespeare have lived, but I am grateful for Minott, and Rice, and Melvin, and Goodwin, and Puffer even. I see Melvin all alone filling his sphere, in russet suit, which no other could fill or suggest. He takes up as much room in nature as the most famous.

Six weeks ago I noticed the advent of chickadees and their winter habits. As you walk along a wood-side, a restless little flock of them, whose notes you hear at a distance, will seem to say, "Oh, there he goes! Let's pay our respects to him." And they will flit after and close to you, and naïvely peck at the nearest twig to you, as if they were minding their own business all the while without any reference to you.

Dec. 4. Saw and heard cheep faintly one little tree sparrow, the neat chestnut crowned and winged and white-barred bird, perched on a large and solitary white birch. So clean and tough, made to withstand the winter. This color reminds me of the upper side of the shrub oak leaf. I love the few homely colors of Nature at this season, — her strong wholesome browns, her sober and primeval grays, her celestial blue, her vivacious green, her pure, cold, snowy white.

In the sprout-land by the road, in the woods this side of C. Miles's, much gray goldenrod is mixed with the shrub oak. It reminds me of the color of the rabbits which run there. Thus Nature feeds her children chiefly with color. I have no doubt that it is an important relief to the eyes which have long rested on snow, to rest on brown oak leaves and the bark of trees. We want the greatest variety within the smallest compass, and yet without glaring diversity, and we have it in the colors of the withered oak leaves. The white, so curled and shrivelled and pale; the black (?), more flat and glossy and darker brown; the red, much like the black, but perhaps less dark, and less deeply cut. The scarlet still occasionally retains some blood in its veins.

Sophia says that just before I came home Min caught a mouse and was playing with it in the yard. It had got away from her once or twice, and she had caught it again; and now it was stealing off again, as she lay complacently watching it with her paws tucked under her, when her friend Riordan's stout but solitary cock stepped up inquisitively, looked down at it with one eye, turning his head, then picked it up by the tail and gave it two or three whacks on the ground, and giving it a dexterous toss into the air, caught it in its open mouth, and it went head foremost and alive down his capacious throat in the twinkling of an eye, never again to be seen in this world, Min, all the while, with paws comfortably tucked under her, looking on unconcerned. What matters it one mouse more or less to her? The cock walked off amid the currant bushes, stretched his neck up, and gulped once or twice, and the deed was accomplished, and

then he crowed lustily in celebration of the exploit. Min sits composedly sentinel, with paws tucked under her, a good part of her days at present, by some ridiculous little hole, the possible entryway of a mouse. She has a habit of stretching or sharpening her claws on all smooth hair-bottomed chairs and sofas, greatly to my mother's vexation.

When I bought my boots yesterday, Hastings ran over his usual rigmarole. Had he any stout old-fashioned cowhide boots? Yes, he thought he could suit me. "There's something that 'll turn water about as well as anything. Billings had a pair just like them the other day, and he said they kept his feet as dry as a bone. But what's more than that, they were made above a year ago upon honor. They are just the thing, you may depend on it. I had an eye to you when I was making them." "But they are too soft and thin for me. I want them to be thick and stand out from my foot." "Well, there is another pair, maybe a little thicker. I'll tell you what it is, these were made of dry hide."

Both were warranted single leather and not split. I took the last. But after wearing them round this cold day I found that the little snow which rested on them and melted wet the upper leather through like paper and wet my feet, and I told H. of it, that he might have an offset to Billings's experience. "Well, you can't expect a new pair of boots to turn water at first. I tell the farmers that the time to buy boots is at midsummer, or when they are hoeing their potatoes, and the pores have a chance to get filled with dirt."

My first botany, as I remember, was Bigelow's "Plants of Boston and Vicinity," which I began to use about twenty years ago, looking chiefly for the popular names and the short references to the localities of plants, even without any regard to the plant. I also learned the names of many, but without using any system, and forgot them soon. I was not inclined to pluck flowers; preferred to leave them where they were, liked them best there. I was never in the least interested in plants in the house. But from year to year we look at Nature with new eyes. About half a dozen years ago I found myself again attending to plants with more method, looking out the name of each one and remembering it. I began to bring them home in my hat, a straw one with a scaffold lining to it, which I called my botany-box. I never used any other, and when some whom I visited were evidently surprised at its dilapidated look, as I deposited it on their front entry table, I assured them it was not so much my hat as my botany-box. I remember gazing with interest at the swamps about those days and wondering if I could ever attain to such familiarity with plants that I should know the species of every twig and leaf in them, that I should be acquainted with every plant (excepting grasses and cryptogamous ones), summer and winter, that I saw. Though I knew most of the flowers, and there were not in any particular swamp more than half a dozen shrubs that I did not know, yet these made it seem like a maze to me, of a thousand strange species, and I even thought of commencing at one end and looking it faithfully and laboriously through till I knew it all. I little thought that in a year or two I should have attained to that knowledge without all that labor. Still I never studied botany, and do not to-day systematically, the most natural system is still so artificial. I wanted to

know my neighbors, if possible, — to get a little nearer to them. I soon found myself observing when plants first blossomed and leafed, and I followed it up early and late, far and near, several years in succession, running to different sides of the town and into the neighboring towns, often between twenty and thirty miles in a day. I often visited a particular plant four or five miles distant, half a dozen times within a fortnight, that I might know exactly when it opened, beside attending to a great many others in different directions and some of them equally distant, at the same time. At the same time I had an eye for birds and whatever else might offer.

Dec. 5. It is a perfectly cloudless and simple winter sky. A white moon, half full, in the pale or dull blue heaven and a whiteness like the reflection of the snow, extending up from the horizon all around a quarter the way up to the zenith. This at 4 P.M. About the sun it is only whiter than elsewhere, or there is only the faintest possible tinge of yellow there.

There are a great many walnuts on the trees, seen black against the sky, and the wind has scattered many over the snow-crust. It would be easier gathering them now than ever.

My themes shall not be far-fetched. I will tell of homely every-day phenomena and adventures. Friends! Society! It seems to me that I have an abundance of it, there is so much that I rejoice and sympathize with, and men, too, that I never speak to but only know and think of. What you call bareness and poverty is to me simplicity. God could not be unkind to me if he should try. I love the winter, with its imprisonment and its cold, for it compels the prisoner to try new fields and resources. I love best to have each thing in its season only, and enjoy doing without it at all other times. It is the greatest of all advantages to enjoy no advantage at all. I find it invariably true, the poorer I am, the richer I am. I have never got over my surprise that I should have been born into the most estimable place in all the world, and in the very nick of time, too.

Dec. 6. On all sides, in swamps and about their edges and in the woods, the bare shrubs are sprinkled with buds, more or less noticeable and pretty, their little gemmæ or gems, their most vital and attractive parts now, almost all the greenness and color left, greens and salads for the birds and rabbits. Our eyes go searching along the stems for what is most vivacious and characteristic, the concentrated summer gone into winter quarters. For we are hunters pursuing the summer on snow-shoes and skates, all winter long. There is really but one season in our hearts.

Dec. 7. Sunday. P.M. — Take my first skate to Fair Haven Pond.

It takes my feet a few moments to get used to the skates. I see the track of one skater who has preceded me this morning. This is the first skating. I keep mostly to the smooth ice about a rod wide next the shore commonly, where there was an overflow a day or two ago. Now I go shaking over hobbly places, now shoot over a bridge of ice only a foot wide between the water and the shore at a bend, — Hubbard Bath, — always so at first there. I am confined to a very narrow edging of ice in the meadow, gliding with unexpected ease through withered sedge, but slipping sometimes on a twig; again

taking to the snow to reach the next ice, but this rests my feet; straddling the bare black willows, winding between the button-bushes, and following narrow threadings of ice amid the sedge, which bring me out to clear fields unexpectedly. Occasionally I am obliged to take a few strokes over black and thin-looking ice, where the neighboring bank is springy, and am slow to acquire confidence in it, but, returning, how bold I am! Where the meadow seemed only sedge and snow, I find a complete ice connection.

At Cardinal Shore, as usual, there is a great crescent of hobbly ice, where, two or three days ago, the north-west wind drove the waves back up-stream and broke up the edge of the ice. This crescent is eight or ten rods wide and twice as many long. It is like skating over so many rails, or the edges of saws.

That grand old poem called Winter is round again without any connivance of mine. I see with surprise the pond a dumb white surface of ice speckled with snow, just as so many winters before, where so lately were lapsing waves or smooth reflecting water. It seemed as if winter had come without any interval since midsummer, and I was prepared to see it flit away by the time I again looked over my shoulder. It was as if I had dreamed it. But I see that the farmers have had time to gather their harvests as usual, and the seasons have revolved as slowly as in the first autumn of my life. The winters come now as fast as snowflakes. It is wonderful that old men do not lose their reckoning. It was summer, and now again it is winter. Nature loves this rhyme so well that she never tires of repeating it. So sweet and wholesome is the winter, so simple and moderate, so satisfactory and perfect, that her children will never weary of it. What a poem! an epic in blank verse, enriched with a million tinkling rhymes. It is solid beauty. It has been subjected to the vicissitudes of millions of years of the gods, and not a single superfluous ornament remains. The severest and coldest of the immortal critics have shot their arrows at and pruned it till it cannot be amended.

DEC. 8. Thermometer at 8 A.M. 8° above zero. Probably the coldest day yet.

Bradford, in his "History of the Plymouth Plantation," remembering the condition of the Pilgrims on their arrival in Cape Cod Bay the 11th of November, 1620, Old Style (page 79): "Which way soever they turned their eyes (save upward to the heavens) they could have little solace or content in respect of any outward objects. For summer being done, all things stand upon them with a weather-beaten face; and the whole country, full of woods and thickets, represented a wild and savage hue." Such was a New England November in 1620 to Bradford's eyes, and such, no doubt, it would be to his eyes in the country still. However, it required no little courage to found a colony here at that season of the year.

The earliest mention of anything like a glaze in New England that I remember is in Bradford's "History of the Plymouth Plantation," page 83, where he describes the second expedition with the shallop from Cape Cod Harbor in search of a settlement, the 6th of December, O.S. "The weather was very cold, and it froze so hard as the spray of the sea lighting on their coats, they were as if they had been glazed." Bradford was one of the ten principal ones. That same night they reached the bottom of the Bay and saw the Indians cutting up a blackfish. Nature has not changed one iota.

Dec. 9. The northwest wind, meeting the current in an exposed place, produces that hobbly ice which I described at Cardinal Shore day before yesterday. This is the case in this place every year, and no doubt this same phenomenon occurred annually at this point on this river a thousand years before America was discovered. This regularity and permanence make these phenomena more interesting to me.

Dec. 10. It is remarkable how suggestive the slightest drawing as a memento of things seen. For a few years past I have been accustomed to make a rude sketch in my journal of plants, ice, and various natural phenomena, and though the fullest accompanying description may fail to recall my experience, these rude outline drawings do not fail to carry me back to that time and scene. It is as if I saw the same thing again, and I may again attempt to describe it in words if I choose.

It has been a warm, clear, glorious winter day, the air full of that peculiar vapor. How short the afternoons! I hardly get out a couple of miles before the sun is setting. The nights are light on account of the snow, and, there being a moon, there is no distinct interval between the day and night.

Bradford, in his "History of the Plymouth Plantation," written between 1630 and 1650, uses, on page 235, the word "kilter," speaking of guns being out of kilter, proving that this is an old word; yet it is not in my dictionaries.

Dec. 15. I still recall to mind that characteristic winter eve of December 9th; the cold, dry, and wholesome diet my mind and senses necessarily fed on, — oak leaves, bleached and withered weeds that rose above the snow, the now dark green of the pines, and perchance the faint metallic chip of a single tree sparrow; the hushed stillness of the wood at sundown, aye, all the winter day; the short boreal twilight; the smooth serenity and the reflections of the pond, still alone free from ice; the melodious hooting of the owl, heard at the same time with the yet more distant whistle of a locomotive, more aboriginal, and perchance more enduring here than that, heard above the voices of all the wise men of Concord, as if they were not (how little he is Anglicized!); the last strokes of the woodchopper, who presently bends his steps homeward; the gilded bar of cloud across the apparent outlet of the pond, conducting my thoughts into the eternal west; the deepening horizon glow; and the hasty walk homeward to enjoy the long winter evening. The hooting of the owl! That is a sound which my red predecessors heard here more than a thousand years ago. It rings far and wide, occupying the spaces rightfully, — grand, primeval, aboriginal sound. There is no whisper in it of the Buckleys, the Flints, the Hosmers who recently squatted here, nor of the first parish, nor of Concord Fight, nor of the last town meeting.

Mrs. Moody very properly calls eating nuts "a mouse-like employment." It is quite too absorbing; you can't read at the same time, as when you are eating an apple.

Dec. 17. When I returned from the South the other day, I was greeted by withered shrub oak leaves which I had not seen there. It was the most homely and agreeable object that met me. I found that I had no such friend as the shrub oak hereabouts. A farmer once asked me what shrub oaks were made for, not knowing any use they

served. But I can tell him that they do me good. They never did any man harm that I know.

Dec. 18. 12 M. Start for Amherst, N.H.

A very cold day. Thermometer at 8 A.M.  $-8^{\circ}$ .

At my lecture, the audience attended to me closely, and I was satisfied; that is all I ask or expect generally. Not one spoke to me afterward, nor needed they. I have no doubt that they liked it, in the main, though few of them would have dared say so, provided they were conscious of it. Generally, if I can only get the ears of an audience, I do not care whether they say they like my lecture or not. I think I know as well as they can tell. At any rate, it is none of my business, and it would be impertinent for me to inquire. The stupidity of most of these country towns, not to include the cities, is in its innocence infantile. Lectured in basement (vestry) of the orthodox church, and I trust helped to undermine it.

Dec. 19. Withered leaves! this is our frugal winter diet, instead of the juicy salads of spring and summer. I think I could write a lecture on "Dry Leaves," carrying a specimen of each kind that hangs on in the winter into the lecture-room as the heads of my discourse. They have long hung to some extent in vain, and have not found their poet yet. The pine has been sung, but not, to my knowledge, the shrub oak. Most think it is useless. The citizen who has just bought a sprout-land on which shrub oaks alone come up only curses it. But it serves a higher use than they know.

Dec. 24. More snow in the night and to-day, making nine or ten inches.

P.M. — To Walden and Baker Farm with Ricketson, it still snowing a little.

It was very pleasant walking thus before the storm was over, in the soft, subdued light.

Dec. 25. Take long walks in stormy weather or through deep snows in the fields and woods, if you would keep your spirits up. Deal with brute nature. Be cold and hungry and weary.

Dec. 28. I thrive best on solitude. If I have had a companion only one day in a week, unless it were one or two I could name, I find that the value of the week to me has been seriously affected. It dissipates my days, and often it takes me another week to get over it.

Dec. 29. We must go out and re-ally ourselves to Nature every day. We must make root, send out some little fibre at least, even every winter day. I am sensible that I am imbibing health when I open my mouth to the wind. Staying in the house breeds a sort of insanity always. Every house is in this sense a hospital. A night and a forenoon is as much confinement to those wards as I can stand. I am aware that I recover some sanity which I had lost almost the instant that I come abroad.

## 1857

Jan. 4. After spending four or five days surveying and drawing a plan incessantly, I especially feel the necessity of putting myself in communication with nature again, to recover my tone, to withdraw out of the wearying and unprofitable world of affairs. The things I have been doing have but a fleeting and accidental importance, however much men are immersed in them, and yield very little valuable fruit. I would fain have been wading through the woods and fields and conversing with the sane snow. I thus from time to time break off my connection with eternal truths and go with the shallow stream of human affairs, grinding at the mill of the Philistines; but when my task is done, with never-failing confidence I devote myself to the infinite again. It would be sweet to deal with men more, I can imagine, but where dwell they? Not in the fields which I traverse.

Jan. 7. I should not be ashamed to have a shrub oak for my coat-of-arms.

It is bitter cold, with a cutting northwest wind. The pond is now a plain snow-field, but there are no tracks of fishers on it. It is too cold for them. The surface of the snow there is finely waved and grained, giving it a sort of slaty fracture, the appearance which hard, dry blown snow assumes. All animate things are reduced to their lowest terms. This is the fifth day of cold, blowing weather.

There is nothing so sanative, so poetic, as a walk in the woods and fields even now, when I meet none abroad for pleasure. In the street and in society I am almost invariably cheap and dissipated, my life is unspeakably mean. No amount of gold or respectability would in the least redeem it, — dining with the Governor or a member of Congress!! But alone in distant woods or fields, I come to myself, I once more feel myself grandly related, and that cold and solitude are friends of mine. I suppose that this value, in my case, is equivalent to what others get by churchgoing and prayer. I thus dispose of the superfluous and see things as they are, grand and beautiful. I have told many that I walk every day about half the daylight, but I think they do not believe it. I wish to get the Concord, the Massachusetts, the America, out of my head and be sane a part of every day. If there are missionaries for the heathen, why not send them to me? I wish to know something; I wish to be made better. I wish to forget, a considerable part of every day, all mean, narrow, trivial men (and this requires usually to forego and forget all personal relations so long), and therefore I come out to these solitudes, where the problem of existence is simplified. I enter some glade in the woods, perchance, where a few weeds and dry leaves alone lift themselves above the surface of the snow, and it is as if I had come to an open window. I see out and around myself. Our skylights are thus far away from the ordinary resorts of men. I am not satisfied with ordinary windows. I must have a true skylight. My true sky light is on the outside of the village. It is as if I always met in those places some grand, serene, immortal, infinitely encouraging, though invisible, companion, and walked with him. There at last my nerves are steadied, my senses and my mind do their office. I am aware that most of my neighbors would think it a hardship to be compelled to linger here one

hour, especially this bleak day, and yet I receive this sweet and ineffable compensation for it. It is the most agreeable thing I do. Truly, my coins are uncurrent with them.

I love and celebrate nature, even in detail, merely because I love the scenery of these interviews and translations. I love to remember every creature that was at this club. I thus get off a certain social scurf and scaliness. I do not consider the other animals brutes in the common sense. I am attracted toward them undoubtedly because I never heard any nonsense from them. I have not convicted them of folly, or vanity, or pomposity, or stupidity, in dealing with me. Their vices, at any rate, do not interfere with me. My fairies invariably take to flight when a man appears upon the scene. In a caucus, a meeting-house, a lyceum, a club-room, there is nothing like it in my experience. But away out of the town, on Brown's scrub oak lot, which was sold the other day for six dollars an acre, I have company such as England cannot buy, nor afford. This society is what I live, what I survey, for. I subscribe generously to this — all that I have and am.

There, in that Well Meadow Field, perhaps, I feel in my element again, as when a fish is put back into the water. I wash off all my chagrins. All things go smoothly as the axle of the universe. I can remember that when I was very young I used to have a dream night after night, over and over again, which might have been named Rough and Smooth. All existence, all satisfaction and dissatisfaction, all event was symbolized in this way. Now I seemed to be lying and tossing, perchance, on a horrible, a fatal rough surface, which must soon, indeed, put an end to my existence, though even in the dream I knew it to be the symbol merely of my misery; and then again, suddenly, I was lying on a delicious smooth surface, as of a summer sea, as of gossamer or down or softest plush, and life was such a luxury to live. My waking experience always has been and is such an alternate Rough and Smooth. In other words it is Insanity and Sanity.

This snow which fell last Saturday so moist and heavy is now surprisingly dry and light and powdery. In the wood-path between the Well Meadow Field and the Cliff, it is all scored with the tracks of leaves that have scurried over it. Some might not suspect the cause of these fine and delicate traces, for the cause is no longer obvious. Here and there is but a leaf or two to be seen in the snow-covered path. The myriads which scampered here are now at rest perhaps far on one side. I have listened to the whispering of the dry leaves so long that whatever meaning it has for my ears, I think that I must have heard it.

Going down path to the spring, I see where some fox (apparently) has passed down it, and though the rest of the broad path is else perfectly unspotted white, each track of the fox has proved a trap which has caught from three or four to eight or ten leaves each, snugly packed; and thus it is reprinted.

Jan. 8. Miss Minott tells me that she does not think her brother George has ever been to Boston more than once (though she tells me he says he has been twice), and certainly not since 1812. He was born in the Casey house, i.e. the same in which C. lived. Casey was a Guinea negro. Casey used to weep in his latter days when he thought

of his wife and two children in Africa from whom he was kidnapped. The house he now lives in is about sixty years old, was moved from beside Casey's to where it now stands before it was roofed. Minott says he has lived where he now does as much as sixty years. He has not been up in town for three years, on account of his rheumatism. Does nothing whatever in the house but read the newspapers and few old books they have, the Almanac especially, and hold the cats, and very little indeed out of the house. Is just able to saw and split the wood.

Jan. 11. Began snowing yesterday afternoon, and it is still snowing this forenoon.

The other day a man came "just to get me to run a line in the woods." This is the usual request. "Do you know where one end of it is?" I asked. (It was the Stratton lot.) "No," said he, "I don't know either end; that is what I want to find." "Do you know either of the next sides of the lot?" Thinking a moment, he answered, "No." "Well, do you know any one side of the whole lot, or any corner?" After a little hesitation he said that he did not. Here, then, was a wood-lot of half a dozen acres, well enough described in a deed dated 1777, courses and distances given, but he could not tell exactly in what part of the universe any particular part of it was, but he expected me to find out. This was what he understood by "running." On the strength of this deed he had forbidden a man to chop wood somewhere.

Frequently, when my employer does not know where his land lies, and has put into my hands an ancient and tattered piece of paper called his deed, which throws no light at all on the question, he turns away, saying, "I want you to make it all right. Give me all that belongs to me."

There was wit and even poetry in the negro's answer to the man who tried to persuade him that the slaves would not be obliged to work in heaven. "Oh, you g' way, Massa. I know better. If dere 's no work for cullud folks up dar, dey 'll make some fur 'em, and if dere 's nuffin better to do, dey 'll make 'em shub de clouds along. You can't fool this chile, Massa."

I was describing the other day my success in solitary and distant woodland walking outside the town. I do not go there to get my dinner, but to get that sustenance which dinners only preserve me to enjoy, without which dinners are a vain repetition. But how little men can help me in this! only by having a kindred experience. Of what use to tell them of my happiness?

Jan. 20. At R.W.E.'s this evening, at about 6 P.M., I was called out to see Eddy's cave in the snow. It was a hole about two and a half feet wide and six feet long, into a drift, a little winding, and he had got a lamp at the inner extremity. I observed, as I approached in a course at right angles with the length of the cave, that the mouth of the cave was lit as if the light were close to it, so that I did not suspect its depth. Indeed, the light of this lamp was remarkably reflected and distributed. The snowy walls were one universal reflector with countless facets. I think that one lamp would light sufficiently a hall built of this material. The snow about the mouth of the cave within had the yellow color of the flame to one approaching, as if the lamp were close to it. We afterward buried the lamp in a little crypt in this snow-drift and walled it

in, and found that its light was visible, even in this twilight, through fifteen inches' thickness of snow. The snow was all aglow with it. If it had been darker, probably it would have been visible through a much greater thickness. But, what was most surprising to me, when Eddy crawled into the extremity of his cave and shouted at the top of his voice, it sounded ridiculously faint, as if he were a quarter of a mile off, and at first I could not believe that he spoke loud, but we all of us crawled in by turns, and though our heads were only six feet from those outside, our loudest shouting only amused and surprised them. Apparently the porous snow drank up all the sound. The voice was, in fact, muffled by the surrounding snow walls, and I saw that we might lie in that hole screaming for assistance in vain, while travellers were passing along twenty feet distant. It had the effect of ventriloquism. So you only need make a snow house in your yard and pass an hour in it, to realize a good deal of Esquimau life.

Jan. 22. I never knew it to make such a business of snowing and bring so little to pass. The air is filled, so that you cannot see far against it, i.e. looking north-northwest, yet but an inch or two falls all day.

I asked Minott about the Cold Friday. He said, "It was plaguy cold; it stung like a wasp." He remembers seeing them toss up water in a shoemaker's shop, usually a very warm place, and when it struck the floor it was frozen and rattled like so many shot. Old John Nutting used to say, "When it is cold it is a sign it's going to be warm," and "When it's warm it's a sign it's going to be cold."

Jan. 23. The coldest day that I remember recording, clear and bright, but very high wind, blowing the snow. Ink froze. Had to break the ice in my pail with a hammer. Thermometer at 6.45 A.M.,  $-18^{\circ}$ ; at 10.30,  $-14^{\circ}$  (Smith's,  $-20^{\circ}$ ; Wilds',  $-7^{\circ}$ , the last being in a more sheltered place); at 12.45,  $-9^{\circ}$ ; at 4 P.M.,  $-5\frac{1}{2}^{\circ}$ ; at 7.30 P.M.,  $-8^{\circ}$ . I may safely say that  $-5^{\circ}$  has been the highest temperature to-day by our thermometer.

Walking this afternoon, I notice that the face inclines to stiffen, and the hands and feet get cold soon. On first coming out in very cold weather, I find that I breathe fast, though without walking faster or exerting myself any more than usual.

Jan. 24. Thermometer about 6.30 A.M. in the bulb!! Would have stood at  $-26^{\circ}$  if the thermometer had been long enough.

Feb. 3. To Fitchburg to lecture.

Though the snow was not deep, I noticed that an unbroken snow-crust stretched around Fitchburg, and its several thousand inhabitants had been confined so long to the narrow streets, some of them a track only six feet wide. Hardly one individual had anywhere departed from this narrow walk and struck out into the surrounding fields and hills. If I had had my cowhide boots, I should not have confined myself to those narrow limits, but have climbed some of the hills. It is surprising to go into a New England town in midwinter and find its five thousand inhabitants all living thus on the limits, confined at most to their narrow moose-yard in the snow. Scarcely here and there has a citizen stepped aside one foot to let a sled pass. And almost as circumscribed is their summer life, going only from house to shop and back to house again. It is as if some vigilance committee had given notice that if any should transgress those narrow

limits he should be outlawed and his blood should be upon his own head. You don't see where the inhabitants get sufficient exercise, unless they swing dumb-bells down cellar.

Feb. 4. Yet along that sled-track (vide the 3d) they will have their schools and lyceums and churches, like the snow-heaps crowded up by the furrow, and consider themselves liberally educated, notwithstanding their narrow views and range. And the bare track that leads to the next town and seaboard, only six inches' breadth of iron rails! and a one-eighth-inch wire in the air!

Sometimes when, in conversation or a lecture, I have been grasping at, or even standing and reclining upon, the serene and everlasting truths that underlie and support our vacillating life, I have seen my auditors standing on their terra firma, the quaking earth, crowded together on their Lisbon Quay, and compassionately or timidly watching my motions as if they were the antics of a rope-dancer or mountebank pretending to walk on air; or here and there one creeping out upon an overhanging but cracking bough, unwilling to drop to the adamantine floor beneath, or perchance even venturing out a step or two, as if it were a dangerous kittly-bender, timorously sounding as he goes. So the other day, as I stood on Walden, drinking at a puddle on the ice, which was probably two feet thick, and thinking how lucky I was that I had not got to cut through all that thickness, I was amused to see an Irish laborer on the railroad, who had come down to drink, timidly tiptoeing toward me in his cowhide boots, lifting them nearly two feet at each step and fairly trembling with fear, as if the ice were already bending beneath his ponderous body and he were about to be engulfed. "Why, my man," I called out to him, "this ice will bear a loaded train, half a dozen locomotives side by side, a whole herd of oxen," suggesting whatever would be a weighty argument with him. And so at last he fairly straightened up and quenched his thirst. It was very ludicrous to me, who was thinking, by chance, what a labor it would be to get at the water with an axe there and that I was lucky to find some on the surface.

Though the farmer has been all winter teaming wood along the river, the timid citizen that buys it, but who has not stepped out of the road, thinks it all kittly-benders there and warns his boys not to go near it.

Feb. 6. One who has seen them tells me that a covey of thirteen quails daily visits Hayden's yard and barn, where he feeds them and can almost put his hands on them.

Thermometer at noon 52°.

Winckelmann says in his "History of Ancient Art," vol. i, page 95: "I am now past forty, and therefore at an age when one can no longer sport freely with life. I perceive, also, that a certain delicate spirit begins to evaporate, with which I raised myself, by powerful soarings, to the contemplation of the beautiful."

Feb. 8. I see one of those great ash-colored puffballs with a tinge of purple, open like a cup, four inches in diameter. Though it is but just brought to light from beneath the deep snow, and the last two days have been misty or rainy without sun, it is just as dry and dusty as ever, and the drops of water rest on it, at first undetected, being coated with its dust, looking like unground pearls. I brought it home and held it in a

basin of water. To my surprise, when held under water it looked like a mass of silver or melted lead, it was so coated with air, and when I suffered it to rise, — for it had to be kept down by force, — instead of being heavy like a sponge which has soaked water, it was as light as a feather, and its surface perfectly dry, and when touched it gave out its dust the same as ever. It was impossible to wet. It seems to be encased in a silvery coat of air which is water-tight. The water did not penetrate into it at all, and running off as you lifted it up, it was just as dry as before, and on the least jar floating in dust above your head.

And now another friendship is ended. I do not know what has made my friend doubt me, but I know that in love there is no mistake, and that every estrangement is well founded. But my destiny is not narrowed, but if possible the broader for it. The heavens withdraw and arch themselves higher. I am sensible not only of a moral, but even a grand physical pain, such as gods may feel, about my head and breast, a certain ache and fullness. My life is like a stream that is suddenly dammed and has no outlet; but it rises the higher up the hills that shut it in, and will become a deep and silent lake. Perchance there is none beside who knows us for a god, and none whom we know for such. Each man and woman is a veritable god or goddess, but to the mass of their fellows disguised. There is only one in each case who sees through the disguise. That one who does not stand so near to any man as to see the divinity in him is truly alone.

Feb. 18. Another remarkably warm and pleasant day. The snow is nearly all gone, and it is so warm and springlike that I walk over to the hill, listening for the note of the bluebird or other comer. The very grain of the air seems to have undergone a change and is ready to split into the form of the bluebird's warble. Methinks if it were visible, or I could cast up some fine dust which would betray it, it would take a corresponding shape. The bluebird does not come till the air consents and his wedge will enter easily. The air over these fields is a foundry full of moulds for casting bluebirds' warbles. Any sound uttered now would take that form, not of the harsh, vibrating, rending scream of the jay, but a softer, flowing, curling warble, like a purling stream or the lobes of flowing sand and clay.

What a poem is this of spring, so often repeated! I am thrilled when I hear it spoken of, — as the spring of such a year, that fytte of the glorious epic.

Feb. 20. What is the relation between a bird and the ear that appreciates its melody, to whom, perchance, it is more charming and significant than to any else? Certainly they are intimately related, and the one was made for the other. It is a natural fact. If I were to discover that a certain kind of stone by the pond-shore was affected, say partially disintegrated, by a particular natural sound, as of a bird or insect, I see that one could not be completely described without describing the other. I am that rock by the pond-side.

What is hope, what is expectation, but a seed-time whose harvest cannot fail, an irresistible expedition of the mind, at length to be victorious?

March 18. I meet Goodwin paddling up the still, dark river on his first voyage to Fair Haven for the season, looking for muskrats and from time to time picking drift-

wood — logs and boards, etc. — out of the water and laying it up to dry on the bank, to eke out his wood-pile with. Says that when you hear a woodpecker's rat-tat-tat-tat on a dead tree it is a sign of rain. While Emerson sits writing in his study this still, overcast, moist day, Goodwin is paddling up the still, dark river. Emerson burns twenty-five cords of wood and fourteen (?) tons of coal; Goodwin perhaps a cord and a half, much of which he picks out of the river. He says he'd rather have a boat leak some for fishing.

March 24. If you are describing any occurrence, or a man, make two or more distinct reports at different times. Though you may think you have said all, you will to-morrow remember a whole new class of facts which perhaps interested most of all at the time, but did not present themselves to be reported. If we have recently met and talked with a man, and would report our experience, we commonly make a very partial report at first, failing to seize the most significant, picturesque, and dramatic points; we describe only what we have had time to digest and dispose of in our minds, without being conscious that there were other things really more novel and interesting to us, which will not fail to recur to us and impress us suitably at last. How little that occurs to us in any way are we prepared at once to appreciate! We discriminate at first only a few features, and we need to reconsider our experience from many points of view and in various moods, to preserve the whole fruit of it.

March 26. Stopped at Farrar's little stithy. He is making two nuts to mend a mop with, and when at length he has forged and filed them and cut the thread, he remarks that it is a puttering job and worth a good deal more than he can charge. He has sickness in the house, a daughter in consumption, which he says is a flattering disease, up one day and down the next. Seeing a monstrous horseshoe nailed against his shop inside, with a little one within it, I asked what that was for. He said that he made the big one when he was an apprentice (of three months' standing) for a sign, and he picked up the little one the other day in the road and put it within it for the contrast. But he thought that the big one was hardly too big for one of the fore feet of the horse Columbus, which he had seen.

The first croaking frogs, the hyla, the white maple blossoms, the skunk-cabbage, and the alder's catkins are observed about the same time.

Farrar spoke of horses driven "tantrum."

Are not March and November gray months?

Men will hardly believe me when I tell them of the thickness of snow and ice at this time last year.

March 27. I would fain make two reports in my Journal, first the incidents and observations of to-day; and by to-morrow I review the same and record what was omitted before, which will often be the most significant and poetic part. I do not know at first what it is that charms me. The men and things of to-day are wont to lie fairer and truer in to-morrow's memory.

I saw quail-tracks some two months ago, much like smaller partridge-tracks.

Men talk to me about society as if I had none and they had some, as if it were only to be got by going to the sociable or to Boston.

March 28. Often I can give the truest and most interesting account of any adventure I have had after years have elapsed, for then I am not confused, only the most significant facts surviving in my memory. Indeed, all that continues to interest me after such a lapse of time is sure to be pertinent, and I may safely record all that I remember.

No.

This is very similar to if not the same with that represented in London's Encyclopædia and called "Phallus impudicus, Stinking Morel, very fetid."

He since tells me once.

April 23. I saw at Ricketson's a young woman, Miss Kate Brady, twenty years old, her father an Irishman, a worthless fellow, her mother a smart Yankee. The daughter formerly did sewing, but now keeps school for a livelihood. She was born at the Brady house, I think in Freetown, where she lived till twelve years old and helped her father in the field. There she rode horse to plow and was knocked off the horse by apple tree boughs, kept sheep, caught fish, etc., etc. I never heard a girl or woman express so strong a love for nature. She purposes to return to that lonely ruin, and dwell there alone, since her mother and sister will not accompany her; says that she knows all about farming and keeping sheep and spinning and weaving, though it would puzzle her to shingle the old house. There she thinks she can "live free." I was pleased to hear of her plans, because they were quite cheerful and original, not professedly reformatory, but growing out of her love for "Squire's Brook and the Middleborough ponds." A strong love for outward nature is singularly rare among both men and women. The scenery immediately about her homestead is quite ordinary, yet she appreciates and can use that part of the universe as no other being can. Her own sex, so tamely bred, only jeer at her for entertaining such an idea, but she has a strong head and a love for good reading, which may carry her through. I would by no means discourage, nor yet particularly encourage her, for I would have her so strong as to succeed in spite of all ordinary discouragements.

It is very rare that I hear one express a strong and imperishable attachment to a particular scenery, or to the whole of nature, — I mean such as will control their whole lives and characters. They alone are naturalized, but most are tender and callow creatures that wear a house as their outmost shell and must get their lives insured when they step abroad from it. They are lathed and plastered in from all natural influences, and their delicate lives are a long battle with the dyspepsia. The others are fairly rooted in the soil, and are the noblest plant it bears, more hardy and natural than sorrel. Children of the Golden Age. Hospitals and almshouses are not their destiny. When I hear of such an attachment in a reasonable, a divine, creature to a particular portion of the earth, it seems as if then first the earth succeeded and rejoiced, as if it had been made and existed only for such a use. How rarely a man's love for nature becomes a ruling principle with him, like a youth's affection for a maiden, but more

enduring! All nature is my bride. That nature which to one is a stark and ghastly solitude is a sweet, tender, and genial society to another.

April 24. Scudding over the Great Meadows, I see the now red crescents of the red maples in their prime round about, above the gray stems. The willow osiers require to be seen endwise the rows, to get an intense color. The clouds are handsome this afternoon: on the north, some dark, windy clouds, with rain falling thus beneath: — but it is chiefly wind; southward, those summer clouds in numerous isles, light above and dark-barred beneath. Now the sun comes out and shines on the pine hill west of Ball's Hill, lighting up the light-green pitch pines and the sand and russet-brown lichen-clad hill. That is a very New England landscape. Buttrick's yellow farmhouse near by is in harmony with it.

April 25. It is cool and windy this afternoon. Some sleet falls, but as we sit on the east side of Smith's chestnut grove, the wood, though so open and leafless, makes a perfect lee for us, apparently by breaking the force of the wind. A dense but bare grove of slender chestnut trunks a dozen rods wide is a perfect protection against this violent wind, and makes a perfectly calm lee.

I find that I can very easily make a convenient box of the birch bark, at this season at least, when the sap is running, to carry a moss or other thing in safely. I have only to make three cuts and strip off a piece from a clear space some ten inches long, and then, rolling it up wrong side outward, as it naturally curls backward as soon as taken off (the dry side shrinking, the moist swelling) and so keeps its place, I bend or fold the ends back on it, as if it were paper, and so close them, and, if I please, tie it round with a string of the same bark. This is resilient or elastic, and stands out from a plant, and also is not injured by moisture like paper. This box dries yellow or straw-colored, with large clouds of green derived from the inner bark.

The dense, green, rounded beds of mosses in springs and old water-troughs are very handsome now, — intensely cold green cushions.

April 26. P.M. — Up Assabet to White Cedar Swamp.

See on the water over the meadow, north of the boat's place, twenty rods from the nearest shore and twice as much from the opposite shore, a very large striped snake swimming. It swims with great ease, and lifts its head a foot above the water, darting its tongue at us. A snake thus met with on the water appears far more monstrous, not to say awful and venomous, than on the land. It is always something startling and memorable to meet with a serpent in the midst of a broad water, careering over it. But why had this one taken to the water? Is it possible that snakes ever hibernate in meadows which are subject to be overflowed? This one when we approached swam toward the boat, apparently to rest on it, and when I put out my paddle, at once coiled itself partly around it and allowed itself to be taken on board. It did not hang down from the paddle like a dead snake, but stiffened and curved its body in a loose coil about it.

This snake was two feet and eleven inches long; the tail alone, seven and a quarter. There were one hundred and forty-five large abdominal plates, besides the three smaller

under the head, and sixty-five pairs of caudal scales. The central stripe on the back was not bright-yellow, as Storer describes, but a pale brown or clay-color. Beneath the tail in centre, a dark, somewhat greenish line.

This snake was killed about 2 P.M.; i.e., the head was perfectly killed then; yet the posterior half of the body was apparently quite alive and would curl strongly around the hand at 7 P.M. It had been hanging on a tree in the meanwhile.

I have the same objection to killing a snake that I have to the killing of any other animal, yet the most humane man that I know never omits to kill one.

I see a great many beetles, etc., floating and struggling on the flood.

We sit on the shore at Wheeler's fence, opposite Merriam's. At this season still we go seeking the sunniest, most sheltered, and warmest place. C. says this is the warmest place he has been in this year. We are in this like snakes that lie out on banks. By and by we shall seek the shadiest and coolest place. How well adapted we are to our climate! In the winter we sit by fires in the house; in spring and fall, in sunny and sheltered nooks; in the summer, in shady and cool groves, or over water where the breeze circulates. Thus the average temperature of the year just suits us.

A great part of our troubles are literally domestic or originate in the house and from living indoors. I could write an essay to be entitled "Out of Doors," — undertake a crusade against houses. What a different thing Christianity preached to the house-bred and to a party who lived out of doors! Also a sermon is needed on economy of fuel. What right has my neighbor to burn ten cords of wood, when I burn only one? Thus robbing our half-naked town of this precious covering. Is he so much colder than I? It is expensive to maintain him in our midst. One man makes a little of the driftwood of the river or of the dead and refuse (unmarketable!) of the forest suffice, and Nature rejoices in him. Another, Herod-like, requires ten cords of the best of young white oak or hickory, and he is commonly esteemed a virtuous man. He who burns the most wood on his hearth is the least warmed by the sight of it growing. Leave the trim wood-lots to widows and orphan girls. Let men tread gently through nature.

May 3. Sunday. A remarkably warm and pleasant morning.

Now, thinks many a one, is the time to paddle or push gently far up or down the river. It will be a grand forenoon for a cruise, to explore these meadow shores and inundated maple swamps which we have never explored. Now we shall be recompensed for the week's confinement to shop or garden.

Up and down the town, men and boys that are under subjection are polishing their shoes and brushing their go-to-meeting clothes. I, a descendant of Northmen who worshipped Thor, spend my time worshipping neither Thor nor Christ; a descendant of Northmen who sacrificed men and horses, sacrifice neither men nor horses. I care not for Thor nor for the Jews. I sympathize not to-day with those who go to church in newest clothes and sit quietly in straight-backed pews. I sympathize rather with the boy who has none to look after him, who borrows a boat and paddle and in common clothes sets out to explore these temporary vernal lakes. I meet such a boy paddling along under a sunny bank, with bare feet and his pants rolled up above his knees,

ready to leap into the water at a moment's warning. Better for him to read "Robinson Crusoe" than Baxter's "Saints' Rest."

May 4. Perhaps the most generally interesting event at present is a perfectly warm and pleasant day. It affects the greatest number, the well out of doors and the sick in chambers. No wonder the weather is the universal theme of conversation.

A warm rain; and the ring of the toads is heard all through it.

May 8. Within a week I have had made a pair of corduroy pants, which cost when done \$1.60. They are of that peculiar clay-color, reflecting the light from portions of their surface. They have this advantage, that, beside being very strong, they will look about as well three months hence as now, — or as ill, some would say. Most of my friends are disturbed by my wearing them. I can get four or five pairs for what one ordinary pair would cost in Boston, and each of the former will last two or three times as long under the same circumstances. The tailor said that the stuff was not made in this country; that it was worn by the Irish at home, and now they would not look at it, but others would not wear it, durable and cheap as it is, because it is worn by the Irish. Moreover, I like the color on other accounts. Anything but black clothes. The birds and beasts are not afraid of me now. A mink came within twenty feet of me the other day as soon as my companion had left me, and if I had had my gray sack on as well as my corduroys, it would perhaps have come quite up to me.

May 21. Rains still, more or less, all day.

I saw yesterday a parrot exceedingly frightened in its cage at a window. It rushed to the bars and struggled to get out. A piece of board had been thrown from the window above to the ground, which probably the parrot's instinct had mistaken for a hawk. Their eyes are very open to danger from above.

May 23. Tortoises out again abundantly. Each particularly warm and sunny day brings them out on to every floating rail and stump. I count a dozen within three or four feet on a rail. It is a tortoise day.

The first goldfinch twitters over, and at evening I hear the spark of a nighthawk.

May 26. My mother was telling to-night of the sounds which she used to hear summer nights when she was young and lived on the Virginia Road, — the lowing of cows, or cackling of geese, or the beating of a drum as far off as Hildreth's, but above all Joe Merriam whistling to his team, for he was an admirable whistler. Says she used to get up at midnight and go and sit on the door-step when all in the house were asleep, and she could hear nothing in the world but the ticking of the clock in the house behind her.

May 29. The sun came out an hour or more ago, rapidly drying the foliage, and for the first time this year I noticed the little shades produced by the foliage which had expanded in the rain, and long narrow dark lines of shade along the hedges or willow-rows. It was like the first bright flashings of an eye from under dark eyelashes after shedding warm tears.

Soon I hear the low all-pervading hum of an approaching hummingbird circling above the rock, which afterward I mistake several times for the gruff voices of men

approaching, unlike as these sounds are in some respects, and I perceive the resemblance even when I know better. Now I am sure it is a hummingbird, and now that it is two farmers approaching. But presently the hum becomes more sharp and thrilling, and the little fellow suddenly perches on an ash twig within a rod of me, and plumes himself while the rain is fairly beginning. He is quite out of proportion to the size of his perch. It does not acknowledge his weight.

With all this opportunity, this comedy and tragedy, how near all men come to doing nothing! It is strange that they did not make us more intense and emphatic, that they do not goad us into some action. Generally, with all our desires and restlessness, we are no more likely to embark in any enterprise than a tree is to walk to a more favorable locality. The seaboard swarms with adventurous and rowdy fellows, but how unaccountably they train and are held in check! They are as likely to be policemen as anything. The Americans are very busy and adventurous sailors, but all in somebody's employ, — as hired men. I have not heard of one setting out in his own bark, if only to run down our own coast on a voyage of adventure or observation, on his own account.

May 31. That central meadow and pool in Gowing's Swamp is its very navel, omphalos, where the umbilical cord was cut that bound it to creation's womb. Methinks every swamp tends to have or suggests such an interior tender spot. The sphagnous crust that surrounds the pool is pliant and quaking, like the skin or muscles of the abdomen; you seem to be slumping into the very bowels of the swamp.

June 5. I am interested in each contemporary plant in my vicinity, and have attained to a certain acquaintance with the larger ones. They are cohabitants with me of this part of the planet, and they bear familiar names. Yet how essentially wild they are! as wild, really, as those strange fossil plants whose impressions I see on my coal. Yet I can imagine that some race gathered those too with as much admiration, and knew them as intimately as I do these, that even they served for a language of the sentiments. *Stigmaria* stood for a human sentiment in that race's flower language. Chickweed, or a pine tree, is but little less wild. I assume to be acquainted with these, but what ages between me and the tree whose shade I enjoy! It is as if it stood substantially in a remote geological period.

June 6. This is June, the month of grass and leaves. The deciduous trees are investing the evergreens and revealing how dark they are. Already the aspens are trembling again, and a new summer is offered me. I feel a little fluttered in my thoughts, as if I might be too late. Each season is but an infinitesimal point. It no sooner comes than it is gone. It has no duration. It simply gives a tone and hue to my thought. Each annual phenomenon is a reminiscence and prompting. Our thoughts and sentiments answer to the revolutions of the seasons, as two cog-wheels fit into each other. We are conversant with only one point of contact at a time, from which we receive a prompting and impulse and instantly pass to a new season or point of contact. A year is made up of a certain series and number of sensations and thoughts which have their language in nature. Now I am ice, now I am sorrel. Each experience reduces itself to a mood of the mind. I see a man grafting, for instance. What this imports chiefly is not apples

to the owner or bread to the grafter, but a certain mood or train of thought to my mind. That is what this grafting is to me. Whether it is anything at all, even apples or bread, to anybody else, I cannot swear, for it would be worse than swearing through glass. For I only see those other facts as through a glass darkly.

Cratægus Crus-Galli, maybe a day. Early iris. Viburnum Lentago, a day or more. Krigias, with their somewhat orange yellow, spot the dry hills all the forenoon and are very common, but as they are closed in the afternoon, they are but rarely noticed by walkers.

June 8. Mother was saying to-day that she bought no new clothes for John until he went away into a store, but made them of his father's old clothes, which made me say that country boys could get enough cloth for their clothes by robbing the scarecrows. So little it need cost to live.

June 10. In Julius Smith's yard, a striped snake (so called) was running about this forenoon, and in the afternoon it was found to have shed its slough, leaving it halfway out a hole, which probably it used to confine it in. It was about in its new skin. Many creatures — devil's-needles, etc., etc. — cast their sloughs now. Can't I?

June 12. Friday. 8.30 A.M. — Set out for CAPE COD.

June 18. Thursday. From Traveller's Home to Small's in Truro.

A mizzling and rainy day with thick driving fog; a drizzling rain, or "drisk," as one called it.

June 20. This was the third foggy day. It is a serious objection to visiting or living on the Cape that you lose so many days by fog. From time to time the sun almost or quite shines, and you can see half a mile, or to Provincetown even, and then, against all your rules, it thickens up again. An inlander would think it was going to clear up twenty times when it may last a week. I have now visited the Cape four times in as many different years, once in October, twice in June, and once in July, having spent in all about one month there, and about one third the days were foggy, with or without rain. According to Alden (in Massachusetts Historical Collections, vol. v, First Series, page 57), Nantucket was discovered by a famous old Indian giant named Maushop, who waded the sea to it, and there filling his pipe with "poke," his smoke made fog. Whence that island is so much in the fog, and the aborigines on the opposite portion of the Cape, seeing a fog over the water at a distance, would say, "There comes old Maushop's smoke."

The Cape people with whom I talked very generally denied that it was a phenomenon in any degree peculiar to the Cape. They said that it was just such weather at Boston. Indeed, some denied that it was fog at all. They said with some asperity that it was rain. Yet more rain would have fallen in a smart shower in the country in twenty minutes than in these five days on the Cape. When I got home I found that there had been an abundance of cloudy weather and rain within a week, but not one foggy day in Concord.

July 2. *Calla palustris* (with its convolute point like the cultivated) at the south end of Gowing's Swamp. Having found this in one place, I now find it in another. Many an

object is not seen, though it falls within the range of our visual ray, because it does not come within the range of our intellectual ray, i.e., we are not looking for it. So, in the largest sense, we find only the world we look for.

July 11. I see more berries than usual of the *Rubus triflorus* in the open meadow near the southeast corner of the Hubbard meadow blueberry swamp. Call it, perhaps, Cymbidium Meadow. They are dark shining red and, when ripe, of a very agreeable flavor and somewhat of the raspberry's spirit.

Thermometer at 93°+ this afternoon.

July 12. I drink at every cooler spring in my walk these afternoons and love to eye the bottom there, with perchance a luxurious frog cooling himself next my nose. Sometimes the farmer, foreseeing haying, has been prudent enough to sink a tub in one, which secures a clear deep space. It would be worth the while, methinks, to make a map of the town with all the good springs on it, indicating whether they were cool, perennial, copious, pleasantly located, etc. The farmer is wont to celebrate the virtues of some one on his own farm above all others. Some cool rills in the meadows should be remembered also, for some such in deep, cold, grassy meadows are as cold as springs. I have sometimes drank warm or foul water, not knowing such cold streams were at hand. By many a spring I know where to look for the dipper or glass which some mower has left. When a spring has been allowed to fill up, to be muddied by cattle, or, being exposed to the sun by cutting down the trees and bushes, to dry up, it affects me sadly, like an institution going to decay. Sometimes I see, on one side the tub, — the tub overhung with various wild plants and flowers, its edge almost completely concealed even from the searching eye, — the white sand freshly cast up where the spring is bubbling in. Often I sit patiently by the spring I have cleaned out and deepened with my hands, and see the foul water rapidly dissipated like a curling vapor and giving place to the cool and clear. Sometimes I can look a yard or more into a crevice under a rock, toward the sources of a spring in a hillside, and see it come cool and copious with incessant murmuring down to the light. There are few more refreshing sights in hot weather.

I find many strawberries deep in the grass of the meadow near this Hosmer Spring; then proceed on my way with reddened and fragrant fingers, till it gets washed off at new springs. It is exceedingly sultry this afternoon, and few men are abroad. The cows stand up to their bellies in the river, lashing their sides with their tails from time to time.

July 13. I sometimes awake in the night and think of friendship and its possibilities, a new life and relation to me, which perhaps I had not experienced for many months. Such transient thoughts have been my nearest approach to realization of it, thoughts which I know of no one to communicate to. I suddenly erect myself in my thoughts, or find myself erected, infinite degrees above the possibility of ordinary endeavors, and see for what grand stakes the game of life may be played. I catch an echo of the great strain of Friendship played somewhere, and feel compensated for months and years

of commonplace. It is as if I were serenaded, and the highest and truest compliments were paid me. The universe gives me three cheers.

Friendship is the fruit which the year should bear; it lends its fragrance to the flowers, and it is in vain if we get only a large crop of apples without it.

July 15. When I entered the woods there, I was at once pursued by a swarm of those wood flies which gyrate around your head and strike your hat like rain-drops. As usual, they kept up with me as I walked, and gyrated about me still, as if I were stationary, advancing at the same time and receiving reinforcements from time to time. Though I switched them smartly for half a mile with some indigo-weed, they did not mind it in the least, but though I knocked down many of them, they soon picked themselves up and came on again. They had a large black spot on their wings and some yellowish rings about their abdomens. They keep up a smart buzzing all the while. They did not once sting, though they endeavored sometimes to alight on my face. What they got by their perseverance I do not know, — unless it were a switching.

Aug. 10. How meanly and miserably we live for the most part! We escape fate continually by the skin of our teeth, as the saying is. We are practically desperate. What kind of gift is life unless we have spirits to enjoy it and taste its true flavor? if, in respect to spirits, we are to be forever cramped and in debt? Have the gods sent us into this world, — to this muster, — to do chores, hold horses, and the like, and not given us any spending money?

I heard some ladies the other day laughing about some one of their help who had helped herself to a real hoop from off a hogshead for her gown. I laughed too, but which party do you think I laughed at? Is n't hogshead as good a word as crinoline?

Sept. 9. The cones are now all flowing with pitch, and my hands are soon so covered with it that I cannot easily cast down the cones where I would, they stick to my hands so. I cannot touch the basket, but carry it on my arm; nor can I pick up my coat, which I have taken off, unless with my teeth, or else I kick it up and catch it on my arm. Thus I go from tree to tree, from time to time rubbing my hands in brooks and mud-holes, in the hope of finding something that will remove pitch like grease, but in vain. It is the stickiest work I ever did. I do not see how the squirrels that gnaw them off and then open them scale by scale keep their paws and whiskers clean. They must know of, or possess, some remedy for pitch that we know nothing of. How fast I could collect cones, if I could only contract with a family of squirrels to cut them off for me! The cones collected in my chamber have a strong spirituous scent, almost rummy, or like a molasses hogshead, agreeable to some.

Sept. 12. Saturday. P.M. — To Owl Swamp.

In an open part of the swamp, started a very large wood frog, which gave one leap and squatted still. I put down my finger, and, though it shrank a little at first, it permitted me to stroke it as long as I pleased. Having passed, it occurred to me to return and cultivate its acquaintance. To my surprise, it allowed me to slide my hand under it and lift it up, while it squatted cold and moist on the middle of my palm, panting naturally. I brought it close to my eye and examined it. It was very beautiful

seen thus nearly, not the dull dead-leaf color which I had imagined, but its back was like burnished bronze armor defined by a varied line on each side, where, as it seemed, the plates of armor united. It had four or five dusky bars which matched exactly when the legs were folded, showing that the painter applied his brush to the animal when in that position, and reddish-orange soles to its delicate feet. There was a conspicuous dark-brown patch along the side of the head, whose upper edge passed directly through the eye horizontally, just above its centre, so that the pupil and all below were dark and the upper portion of the iris golden. I have since taken up another in the same way.

Sept. 18. Friday. P.M. — Round Walden with C. We started a pack of grouse, which went off with a whir like cannon-balls.

Sept. 24. Thursday. I saw a red squirrel run along the bank under the hemlocks with a nut in its mouth. He stopped near the foot of a hemlock, and, hastily pawing a hole with his fore feet, dropped the nut, covered it up, and retreated part way up the trunk of the tree, all in a few moments. I approached the shore to examine the deposit, and he, descending betrayed no little anxiety for his treasure and made two or three motions to recover the nut before he retreated. Digging there, I found two pignuts joined together, with their green shells on, buried about an inch and a half in the soil, under the red hemlock leaves. This, then, is the way forests are planted. This nut must have been brought twenty rods at least and was buried at just the right depth. If the squirrel is killed, or neglects its deposit, a hickory springs up.

P.M. — I walked to that very dense and handsome white pine grove east of Beck Stow's Swamp. It is about fifteen rods square, the trees large, ten to twenty inches in diameter. It is separated by a wall from another pine wood with a few oaks in it on the southeast, and about thirty rods north and west are other pine and oak woods. Standing on the edge of the wood and looking through it, — for it is quite level and free from underwood, mostly bare, red-carpeted ground, — you would have said that there was not a hardwood tree in it, young or old, though I afterward found on one edge a middling-sized sassafras, a birch, a small tupelo, and two little scarlet oaks, but, what was more interesting, I found, on looking closely over its floor, that, alternating with thin ferns and small blueberry bushes, there was, as often as every five feet, a little oak, three to twelve inches high, and in one place I found a green acorn dropped by the base of a tree. I was surprised, I confess, to find my own theory so perfectly proved. These oaks, apparently, find such a locality unfavorable to their growth as long as the pines stand.

Sept. 25. The red maple has fairly begun to blush in some places by the river. I see one, by the canal behind Barrett's mill, all aglow against the sun. These first trees that change are most interesting, since they are seen against others still freshly green, — such brilliant red on green. I go half a mile out of my way to examine such a red banner.

As I came round the island, I took notice of that little ash tree on the opposite shore. It has been cut or broken off about two feet from the ground, and seven small

branches have shot up from its circumference, all together forming a perfectly regular oval head about twenty-five feet high and very beautiful. With what harmony they work and carry out the idea of the tree, one twig not straying farther on this side than its fellow on that! That the tree thus has its idea to be lived up to, and, as it were, fills an invisible mould in the air, is the more evident, because if you should cut away one or all but one, the remaining branch or branches would still in time form a head in the main similar to this.

Brought home my first boat-load of wood.

Sept. 28. I planted six seeds sent from the Patent Office and labelled, I think, "Poitrine jaune grosse" (large yellow pumpkin (or squash?)).

Two came up, and one bore a squash which weighs 123½lbs.

the other bore four, 1 weighing 72¾ 2d weighing 54 3d weighing 37¾ 4th weighing 21¾ 309¾ Who would have believed that there was 310 pounds of poitrine jaune grosse in that corner of our garden? Yet that little seed found it.

Sept. 30. According to the Upanishads, "As water, when rained down on elevated ground, runs scattered off in the valleys, so ever runs after difference a person who beholds attributes different (from the soul)."

"As pure water, which is thrown down on pure ground, remains alike, so also, O Gautama, is the soul of the thinker who knows."

Minott says he is seventy-five years old.

He says that that tall clock which still ticks in the corner belonged to old John Beatton, who died before he was born; thought it was two hundred years old!! Some of the rest of the furniture came from the same source. I read on John Beatton's tombstone near the powder-house that he died in 1776, aged seventy-four.

Oct. 3. How much more agreeable to sit in the midst of old furniture like Minott's clock and secretary and looking-glass, which have come down from other generations, than in that which was just brought from the cabinet-maker's and smells of varnish, like a coffin! To sit under the face of an old clock that has been ticking one hundred and fifty years, — there is something mortal, not to say immortal, about it! A clock that began to tick when Massachusetts was a province. Meanwhile John Beatton's heavy tombstone is cracked quite across and widely opened.

Oct. 5. P.M. — To Yellow Birch Swamp.

I hear the alarum of a small red squirrel. I see him running by fits and starts along a chestnut bough toward me. His head looks disproportionately large for his body, like a bulldog's, perhaps because he has his chaps full of nuts. He chirrup and vibrates his tail, holds himself in, and scratches along a foot as if it were a mile. He finds noise and activity for both of us. It is evident that all this ado does not proceed from fear. There is at the bottom, no doubt, an excess of inquisitiveness and caution, but the greater part is make-believe and a love of the marvellous. He can hardly keep it up till I am gone, however, but takes out his nut and tastes it in the midst of his agitation. "See there, see there," says he, "who's that? O dear, what shall I do?" and makes believe run off, but does n't get along an inch, — lets it all pass off by flashes through his tail,

while he clings to the bark as if he were holding in a race-horse. He gets down the trunk at last on to a projecting knot, head downward, within a rod of you, and chirrups and chatters louder than ever. Tries to work himself into a fright. The hind part of his body is urging the forward part along, snapping the tail over it like a whip-lash, but the fore part, for the most part, clings fast to the bark with desperate energy. Squirr, "to throw with a jerk," seems to have quite as much to do with the name as the Greek *skia oura*, shadow and tail.

Oct. 6. Think what a change, unperceived by many, has within a month come over the landscape! Then the general, the universal, hue was green. Now see those brilliant scarlet and glowing yellow trees in the lowlands a mile off! Or see that crowd in the swamp half a mile through, all vying with one another, a blaze of glory. We are not prepared to believe that the earth is now so particolored, and would present to a bird's eye such distinct masses of bright color. A great painter is at work. The very pumpkins yellowing in the fields become a feature in the landscape, and thus they have shone, maybe, for a thousand years here.

I have just read Ruskin's "Modern Painters." I am disappointed in not finding it a more out-of-door book, for I have heard that such was its character, but its title might have warned me. He does not describe Nature as Nature, but as Turner painted her, and though the work betrays that he has given a close attention to Nature, it appears to have been with an artist's and critic's design. How much is written about Nature as somebody has portrayed her, how little about Nature as she is, and chiefly concerns us, i.e. how much prose, how little poetry!

Oct. 7. I do not see what the Puritans did at that season when the maples blazed out in scarlet. They certainly could not have worshipped in groves then. Perhaps that is what they built meeting-houses and surrounded them with horse-sheds for.

It is the reign of crickets now. You see them gliding busily about over all sunny surfaces. They sometimes get into my shoes; but oftener I have to empty out the seeds of various shrubs and weeds which I have been compelled to transport.

When I turn round half-way up Fair Haven Hill, by the orchard wall, and look northwest, I am surprised for the thousandth time at the beauty of the landscape, and I sit down to behold it at my leisure. I think that Concord affords no better view. It is always incredibly fair, but ordinarily we are mere objects in it, and not witnesses of it.

I do not know how to entertain one who can't take long walks. The first thing that suggests itself is to get a horse to draw them, and that brings us at once into contact with stablers and dirty harness, and I do not get over my ride for a long time. I give up my forenoon to them and get along pretty well, the very elasticity of the air and promise of the day abetting me, but they are as heavy as dumplings by mid-afternoon. If they can't walk, why won't they take an honest nap and let me go in the afternoon? But, come two o'clock, they alarm me by an evident disposition to sit. In the midst of the most glorious Indian-summer afternoon, there they sit, breaking your chairs and

wearing out the house, with their backs to the light, taking no note of the lapse of time.

As I sat on the high bank at the east end of Walden this afternoon, at five o'clock, I saw, by a peculiar intention or dividing of the eye, a very striking subaqueous rainbow-like phenomenon. A passer-by might, perhaps would, have noticed that the bright-tinted shrubs about the high shore on the sunny side were reflected from the water; but, unless on the alert for such effects, he would have failed to perceive the full beauty of the phenomenon. Unless you look for reflections, you commonly will not find them. Those brilliant shrubs, which were from three to a dozen feet in height, were all reflected, dimly so far as the details of leaves, etc., were concerned, but brightly as to color, and, of course, in the order in which they stood, — scarlet, yellow, green, etc.; but, there being a slight ripple on the surface, these reflections were not true to their height though true to their breadth, but were extended downward with mathematical perpendicularity, three or four times too far, forming sharp pyramids of the several colors, gradually reduced to mere dusky points. The effect of this prolongation of the reflection was a very pleasing softening and blending of the colors, especially when a small bush of one bright tint stood directly before another of a contrary and equally bright tint. It was just as if you were to brush firmly aside with your hand or a brush a fresh line of paint of various colors, or so many lumps of friable colored powders. There was, accordingly, a sort of belt, as wide as the whole height of the hill, extending downward along the whole north or sunny side of the pond, composed of exceedingly short and narrow inverted pyramids of the most brilliant colors intermixed. I have seen, indeed, similar inverted pyramids in the old drawings of tattooing about the waists of the aborigines of this country. Walden, too, like an Indian maiden, wears this broad rainbow-like belt of brilliant-colored points or cones round her waist in October. The color seems to be reflected and re-reflected from ripple to ripple, losing brightness each time by the softest possible gradation, and tapering toward the beholder, since he occupies a mere point of view. This is one of the prettiest effects of the autumnal change.

Oct. 9. It has come to this, — that the lover of art is one, and the lover of nature another, though true art is but the expression of our love of nature. It is monstrous when one cares but little about trees but much about Corinthian columns, and yet this is exceedingly common.

Oct. 10. You see now in sprout-lands young scarlet oaks of every degree of brightness from green to dark scarlet. It is a beautifully formed leaf, with its broad, free, open sinuses, — worthy to be copied in sculpture. A very agreeable form, a bold, deep scallop, as if the material were cheap. Like tracery.

Oct. 11. This is the seventh day of glorious weather. Perhaps these might be called Harvest Days. Within the week most of the apples have been gathered; potatoes are being dug; corn is still left in the fields, though the stalks are being carried in. Others are ditching and getting out mud and cutting up bushes along fences, — what is called “brushing up,” — burning brush, etc.

These are cricket days.

Oct. 12. I see a very distant mountain house in a direction a little to the west of Carlisle, and two elms in the horizon on the right of it. Measuring carefully on the map of the county, I think it must be the Baptist Church in North Tewksbury, within a small fraction of fourteen miles from me. I think that this is the greatest distance at which I have seen an elm without a glass. There is another elm in the horizon nearly north, but not so far. It looks very much larger than it is. Perhaps it looms a little. The elm, I think can be distinguished further than any other tree.

This was what those scamps did in California. The trees were so grand and venerable that they could not afford to let them grow a hair's breadth bigger, or live a moment longer to reproach themselves. They were so big that they resolved they should never be bigger. They were so venerable that they cut them right down. It was not for the sake of the wood; it was only because they were very grand and venerable.

Oct. 14. P.M. — To White Pond.

Another, the tenth of these memorable days. We have had some fog the last two or three nights, and this forenoon it was slow to disperse, dog-day-like, but this afternoon it is warmer even than yesterday. I should like it better if it were not so warm. I am glad to reach the shade of Hubbard's Grove; the coolness is refreshing. It is indeed a golden autumn. These ten days are enough to make the reputation of any climate. A tradition of these days might be handed down to posterity. They deserve a notice in history, in the history of Concord. All kinds of crudities have a chance to get ripe this year. Was there ever such an autumn? And yet there was never such a panic and hard times in the commercial world. The merchants and banks are suspending and failing all the country over, but not the sand-banks, solid and warm, and streaked with bloody blackberry vines. You may run upon them as much as you please, — even as the crickets do, and find their account in it. They are the stockholders in these banks, and I hear them creaking their content. In these banks, too, and such as these, are my funds deposited, a fund of health and enjoyment. Their (the crickets) prosperity and happiness and, I trust, mine do not depend on whether the New York banks suspend or no. Invest, I say, in these country banks. Let your capital be simplicity and contentment. Withered goldenrod (*Solidago nemoralis*) is no failure, like a broken bank, and yet in its most golden season nobody counterfeits it. Nature needs no counterfeit-detector. I have no compassion for, nor sympathy with, this miserable state of things. Banks built of granite, after some Grecian or Roman style, with their porticoes and their safes of iron, are not so permanent, and cannot give me so good security for capital invested in them, as the heads of withered hardhack in the meadow. I do not suspect the solvency of these. I know who is their president and cashier.

I take all these walks to every point of the compass, and it is always harvest-time with me. I am always gathering my crop from these woods and fields and waters, and no man is in my way or interferes with me. My crop is not their crop. I am not gathering beans and corn. Do they think there are no fruits but such as these? I am a reaper; I am not a gleaner.

On the causeway I pass by maples here and there which are bare and smoke-like, having lost their brilliant clothing; but there it lies, nearly as bright as ever, on one side on the ground, making nearly as regular a figure as lately on the tree. I should rather say that I first observed the trees thus flat on the ground like a permanent colored and substantial shadow, and they alone suggested to look for the trees that had borne them.

Looking now toward the north side of the pond, I perceive that the reflection of the hillside seen from an opposite hill is not so broad as the hillside itself appears, owing to the different angle at which it is seen. The reflection exhibits such an aspect of the hill, apparently, as you would get if your eye were placed at that part of the surface of the pond where the reflection seems to be. In this instance, too, then, Nature avoids repeating herself. Not even reflections in still water are like their substances as seen by us. Is the reflection of a hillside, however, such an aspect of it as can be obtained by the eye directed to the hill itself from any single point of view? If not, then the reflection is never a true copy or repetition of its substance, but a new composition, and this may be the source of its novelty and attractiveness, and of this nature, too, may be the charm of an echo. I doubt if you can ever get Nature to repeat herself exactly.

Oct. 15. Rain at last, and end of the remarkable days. The springs and rivers have been very low.

Our staghorn sumach has just become a very rich scarlet. So, apparently, has the large one at Mrs. Simmonds's. They are later than the others; a yellower scarlet, almost orange.

It is another example of the oddity of the Orientals that yellow "is in the east a regal color, more especially so in China, where it is exclusively royal." (Field on Colors, 139.) Further west it was purple, regal and imperial.

The river lower this morning than before this year. Concord Bank has suspended.

Oct. 16. I see a delicate pale brown-bronze wood frog. I think I can always take them up in my hand. They, too, vary in color, like the leaves of many species of plants at present, having now more yellow, now more red; and perhaps for the same reason.

What is acorn-color! Is it not as good as chestnut?

Oct. 18. I should say that the autumnal change and brightness of foliage began fairly with the red maples (not to speak of a very few premature trees in water) September 25th, and ends this year, say generally October 22d, or maybe two or three days earlier. The fall of the leaf, in like way, began fairly with the fall of the red maple leaves, October 13th, and ended at least as early as when the pitch pines had generally fallen, November 5th (the larches are about a week later). The red maples are now fairly bare, though you may occasionally see one full of leaves.

So gradually the leaves fall, after all, — though individuals will be completely stripped in one short windy rain-storm, — that you scarcely miss them out of the landscape; but the earth grows more bare, and the fields more hoary, and the heavy shadows that began in June take their departure, November being at hand.

Oct. 20. P.M. — To the Easterbrooks Country.

I had gone but little way on the old Carlisle road when I saw Brooks Clark, who is now about eighty and bent like a bow, hastening along the road, barefooted, as usual, with an axe in his hand; was in haste perhaps on account of the cold wind on his bare feet. When he got up to me, I saw that besides the axe in one hand, he had his shoes in the other, filled with knurly apples and a dead robin. He stopped and talked with me a few moments; said that we had had a noble autumn and might now expect some cold weather. I asked if he had found the robin dead. No, he said, he found it with its wing broken and killed it. He also added that he had found some apples in the woods, and as he had n't anything to carry them in, he put 'em in his shoes. They were queer-looking trays to carry fruit in. How many he got in along toward the toes, I don't know. I noticed, too, that his pockets were stuffed with them. His old tattered frock coat was hanging in strips about the skirts, as were his pantaloons about his naked feet. He appeared to have been out on a scout this gusty afternoon, to see what he could find, as the youngest boy might. It pleased me to see this cheery old man, with such a feeble hold on life, bent almost double, thus enjoying the evening of his days. Far be it from me to call it avarice or penury, this childlike delight in finding something in the woods or fields and carrying it home in the October evening, as a trophy to be added to his winter's store. Oh, no; he was happy to be Nature's pensioner still, and birdlike to pick up his living. Better his robin than your turkey, his shoes full of apples than your barrels full; they will be sweeter and suggest a better tale. Like an old squirrel shuffling to his hole with a nut.

This old man's cheeriness was worth a thousand of the church's sacraments and memento mori's. It was better than a prayerful mood. It proves to me old age as tolerable, as happy, as infancy. I was glad of an occasion to suspect that this afternoon he had not been at "work" but living somewhat after my own fashion (though he did not explain the axe), — had been out to see what nature had for him, and now was hastening home to a burrow he knew, where he could warm his old feet. If he had been a young man, he would probably have thrown away his apples and put on his shoes when he saw me coming, for shame. But old age is manlier; it has learned to live, makes fewer apologies, like infancy. This seems a very manly man. I have known him within a few years building stone wall by himself, barefooted.

Warren Brown, who owns the Easterbrooks place, the west side the road, is picking barberries. Allows that the soil thereabouts is excellent for fruit, but it is so rocky that he has not patience to plow it. That is the reason this tract is not cultivated.

There was Melvin, too, a-barberrying and nutting. He had got two baskets, one in each hand, and his game-bag, which hung from his neck, all full of nuts and barberries, and his mouth full of tobacco. Trust him to find where the nuts and berries grow. He is hunting all the year and he marks the bushes and the trees which are fullest, and when the time comes, for once leaves his gun, though not his dog, at home, and takes his baskets to the spot.

What a wild and rich domain that Easterbrooks Country! Not a cultivated, hardly a cultivatable field in it, and yet it delights all natural persons, and feeds more still. Such great rocky and moist tracts, which daunt the farmer, are reckoned as unimproved land, and therefore worth but little; but think of the miles of huckleberries, and of barberries, and of wild apples, so fair, both in flower and fruit, resorted to by men and beasts; Clark, Brown, Melvin, and the robins, these, at least, were attracted thither this afternoon.

Wesson is so gouty that he rarely comes out-of-doors, and is a spectacle in the street; but he loves to tell his old stories still! How, when he was stealing along to get a shot at his ducks, and was just upon them, a red squirrel sounded the alarm, chickaree chickaree chickaree, and off they went; but he turned his gun upon the squirrel to avenge himself.

Oct. 21. I see a robin eating prinus berries. Is not the robin the principal berry-eating bird nowadays? There must be more about the barberry bushes in Melvin's Preserve than anywhere.

It is pitiful to see a man of sixty, a philosopher, perchance, inquiring for a bearing apple orchard for sale. If he must have one, why did he not set it out when he was thirty? How mean and lazy, to be plucking the fruit of another man's labor. The old man I saw yesterday lives on peaches and milk in their season, but then he planted them.

Is not the poet bound to write his own biography? Is there any other work for him but a good journal? We do not wish to know how his imaginary hero, but how he, the actual hero, lived from day to day.

That big swamp white oak limb or tree which I found prostrate in the swamp was longer than my boat and tipped it well. These old stumps stand like anchorites and yogees, putting off their earthy garments, more and more sublimed from year to year, ready to be translated, and then they are ripe for my fire. I administer the last sacrament and purification.

Oct. 22. Ground pretty white with frost. The stiffened and frosted weeds and grass have an aggrieved look. The lately free-flowing blades of grass look now like mourning tresses sculptured stiffly in marble; they lie stiff and dishevelled. A very narrow strip of ice has formed along the riverside, in which I see a pad or two, wearing the same aggrieved look, like the face of the child that cried for spilt milk, its summer irrevocably gone.

P.M. — As I go through the woods now, so many oak and other leaves have fallen the rustling noise somewhat disturbs my musing. However, Nature in this may have intended some kindness to the ducks, which are now loitering hereabouts on their migration southward, mostly young and inexperienced birds, for, as they are feeding in Goose Pond, for instance, the rustling of the leaves betrays the approach of the sportsman and his dog, or other foe; so perhaps the leaves on the ground protect them more than when on the trees.

What a perfect chest the chestnut is packed in! With such wonderful care Nature has secluded and defended these nuts, as if they were her most precious fruits, while diamonds are left to take care of themselves. First it bristles all over with sharp green prickles, some nearly half an inch long, like a hedgehog rolled into a ball; these rest on a thick, stiff, bark-like rind, one sixteenth to one eighth of an inch thick, which, again, is most daintily lined with a kind of silvery fur or velvet plush one sixteenth of an inch thick, even rising in a ridge between the nuts, like the lining of a casket in which the most precious commodities are kept. The chest is packed quite full; half-developed nuts are the waste paper used in the packing, to fill the vacancies. At last Frost comes to unlock this chest; it alone holds the true key.

Such is the cradle, thus daintily lined, in which they have been rocked in their infancy. See how tenderly it has been reared before its green and tender skin hardened into a shell. The October air comes in, and the light too, and proceed to paint the nuts that clear, handsome reddish (?) brown which we call chestnut. Nowadays the brush that paints chestnuts is very active. It is entering into every open bur over the stretching forests' tops for hundreds of miles, without horse or ladder, and putting on rapid coats of this wholesome color. Otherwise the boys would not think they had got perfect nuts. And that this may be further protected, perchance, both within the bur and afterward, the nuts themselves are partly covered toward the top, where they are first exposed, with that same soft velvety down. And then Nature drops it on the rustling leaves, a done nut, prepared to begin a chestnut's course again. Within itself, again, each individual nut is lined with a reddish velvet, as if to preserve the seed from jar and injury in falling and, perchance, from sudden damp and cold, and, within that, a thin white skin enwraps the germ. Thus it is lining within lining and unwearied care, — not to count closely, six coverings at least before you reach the contents!

But it is a barbarous way to jar the tree, and I trust I do repent of it. Gently shake it only, or let the wind shake it for you. You are gratified to find a nut that has in it no bitterness, altogether palatable.

Oct. 23. Sal Cummings, a thorough countrywoman, conversant with nuts and berries, calls the soapwort gentian "blue vengeance," mistaking the word. A masculine wild-eyed woman of the fields. Somebody has her daguerreotype. When Mr. — was to lecture on Kansas, she was sure "she wa'n't going to hear him. None of her folks had ever had any."

Oct. 24. P.M. — To Smith's chestnut grove.

I get a couple of quarts of chestnuts by patiently brushing the thick beds of leaves aside with my hand in successive concentric circles till I reach the trunk; more than half under one tree. I believe I get more by resolving, where they are reasonably thick, to pick all under one tree first. Begin at the tree and brush the leaves with your right hand in toward the stump, while your left holds the basket, and so go round and round it in concentric circles, each time laying bare about two feet in width, till you get as far as the boughs extend. You may presume that you have got about all then. It is

best to reduce it to a system. Of course you will shake the tree first, if there are any on it. The nuts lie commonly two or three together, as they fell.

I find one of those small, hard, dark-brown millipede worms partly crawled into a hole in a chestnut.

I find my account in this long-continued monotonous labor of picking chestnuts all the afternoon, brushing the leaves aside without looking up, absorbed in that, and forgetting better things awhile. My eye is educated to discover anything on the ground, as chestnuts, etc. It is probably wholesomer to look at the ground much than at the heavens. As I go stooping and brushing the leaves aside by the hour, I am not thinking of chestnuts merely, but I find myself humming a thought of more significance. This occupation affords a certain broad pause and opportunity to start again afterward, — turn over a new leaf.

I hear the dull thump of heavy stones against the trees from far through the rustling wood, where boys are ranging for nuts.

Oct. 26. Hard rain in the night and almost steady rain through the day, the second day.

A driving east or northeast storm. I can see through the drisk only a mile. The river is getting partly over the meadows at last, and my spirits rise with it. Methinks this rise of the waters must affect every thought and deed in the town. It qualifies my sentence and life. I trust there will appear in this Journal some flow, some gradual filling of the springs and raising of the streams, that the accumulating grists may be ground. I see two great fish hawks (possibly blue herons) slowly beating northeast against the storm, by what a curious tie circling ever near each other and in the same direction, as if you might expect to find the very notes in the air to be paired; two long undulating wings conveying a feathered body through the misty atmosphere, and this inseparably associated with another planet of the same species I can just glimpse their undulating lines. Damon and Pythias they must be. The waves beneath, which are of kindred form, are still more social, multitudinous, énÆriymon. Where is my mate, beating against the storm with me?

These regular phenomena of the seasons get at last to be — they were at first, of course — simply and plainly phenomena or phases of my life. The seasons and all their changes are in me. I see not a dead eel or floating snake, or a gull, but it rounds my life and is like a line or accent in its poem. Almost I believe the Concord would not rise and overflow its banks again, were I not here. After a while I learn what my moods and seasons are. I would have nothing subtracted. I can imagine nothing added. My moods are thus periodical, not two days in my year alike. The perfect correspondence of Nature to man, so that he is at home in her!

At the hewing-place on the flat above, many sparrows are flitting past amid the birches and sallows. They are chiefly *Fringilla hyemalis*. How often they may be seen thus flitting along in a straggling manner from bush to bush, so that the hedgerow will be all alive with them, each uttering a faint chip from time to time, as if to keep together, bewildering you so that you know not if the greater part are gone by or still

to come. One rests but a moment on the tree before you and is gone again. You wonder if they know whither they are bound, and how their leader is appointed.

Those sparrows, too, are thoughts I have. They come and go; they flit by quickly on their migrations, uttering only a faint chip, I know not whither or why exactly. One will not rest upon its twig for me to scrutinize it. The whole copse will be alive with my rambling thoughts, bewildering me by their very multitude, but they will be all gone directly without leaving me a feather.

Spring is brown; summer, green; autumn, yellow; winter, white; November, gray.

Oct. 27. The third day of steady rain; wind northeast.

I go up the river as far as Hubbard's Second Grove, in order to share the general commotion and excitement of the elements, — wind and waves and rain. I sailed swiftly, standing up and tipping my boat to make a keel of its side, though at first it was hard to keep off a lee shore. I looked for cranberries drifted up on the lee side of the meadows, but saw few. It was exciting to feel myself tossed by the dark waves and hear them surge about me. The reign of water now begins, and how it gambols and revels! Waves are its leaves, foam its blossoms. How they run and leap in great droves, deriving new excitement from each other! Schools of porpoises and blackfish are only more animated waves and have acquired the gait and game of the sea itself.

The fall (strictly speaking) is approaching an end in this probably annual northeast storm. Thus the summer winds up its accounts. The winter's wood is bargained for and being hauled. This storm reminds men to put things on a winter footing. There is not much more for the farmer to do in the fields.

The real facts of a poet's life would be of more value to us than any work of his art. Shakespeare has left us his fancies and imaginings, but the truth of his life, with its becoming circumstances, we know nothing about. The writer is reported, the liver not at all. But we want the basis of fact, of an actual life, to complete our Shakespeare, as much as a statue wants its pedestal.

Oct. 28. I look up and see a male marsh hawk with his clean-cut wings, that has just skimmed past above my head, — not at all disturbed, only tilting his body a little, now twenty rods off, with demi-semi-quaver of his wings. He is a very neat flyer. Steady as a planet in its orbit, with his head bent down, but on second thought that small sprout-land seems worthy of a longer scrutiny, and he gives one circle backward over it. His scream is somewhat like the whinnering of a horse, if it is not rather a split squeal. It is a hoarse, tremulous breathing forth of his winged energy. But why is it so regularly repeated at that height? Is it to scare his prey, that he may see by its motion where it is, or to inform its mate or companion of its whereabouts? Now he crosses the at present broad river steadily, deserving to have one or two rabbits at least to swing about him. What majesty there is in this small bird's flight! The hawks are large-souled.

Oct. 29. There is a large square-sided black rock, say five or six feet high, eight long, and five wide, on Mrs. Ripley's shore, wedged close between two small elms, and your first thought on seeing it is that it has according to some law occupied that space

between the trees, not reflecting that it is more ancient than the trees by a geological period, and that the latter have but recently sprung up under its protection. I thought the rock had been accurately fitted into that space.

There are some things of which I cannot at once tell whether I have dreamed them or they are real; as if they were just, perchance, establishing, or else losing, a real basis in my world. This is especially the case in the early morning hours, when there is a gradual transition from dreams to waking thoughts, from illusions to actualities, as from darkness, or perchance moon and star light, to sunlight. Dreams are real, as is the light of the stars and moon, and theirs is said to be a dreamy light. Such early morning thoughts as I speak of occupy a debatable ground between dreams and waking thoughts. They are a sort of permanent dream in my mind. At least, until we have for some time changed our position from prostrate to erect, and commenced or faced some of the duties of the day, we cannot tell what we have dreamed from what we have actually experienced.

This morning, for instance, for the twentieth time at least, I thought of that mountain in the easterly part of our town (where no high hill actually is) which once or twice I had ascended, and often allowed my thoughts alone to climb. I now contemplate it in my mind as a familiar thought which I have surely had for many years from time to time, but whether anything could have reminded me of it in the middle of yesterday, whether I ever before remembered it in broad daylight, I doubt. I can now eke out the vision I had of it this morning with my old and yesterday forgotten dreams.

My way up used to lie through a dark and unfrequented wood at its base, — I cannot now tell exactly, it was so long ago, under what circumstances I first ascended, only that I shuddered as I went along (I have an indistinct remembrance of having been out overnight alone), — and then I steadily ascended along a rocky ridge half clad with stunted trees, where wild beasts haunted, till I lost myself quite in the upper air and clouds, seeming to pass an imaginary line which separates a hill, mere earth heaped up, from a mountain, into a superterranean grandeur and sublimity. What distinguishes that summit above the earthy line, is that it is unhandselled, awful, grand. It can never become familiar; you are lost the moment you set foot there. You know no path, but wander, thrilled, over the bare and pathless rock, as if it were solidified air and cloud. That rocky, misty summit, secreted in the clouds, was far more thrillingly awful and sublime than the crater of a volcano spouting fire.

This is a business we can partly understand. The perfect mountain height is already thoroughly purified. It is as if you trod with awe the face of a god turned up, unwittingly but helplessly, yielding to the laws of gravity. And are there not such mountains, east or west, from which you may look down on Concord in your thought, and on all the world? In dreams I am shown this height from time to time, and I seem to have asked my fellow once to climb there with me, and yet I am constrained to believe that I never actually ascended it. It chances, now I think of it, that it rises in my mind where lies the Burying-Hill. You might go through its gate to enter that dark wood, but that hill and its graves are so concealed and obliterated by the awful mountain that I never

thought of them as underlying it. Might not the graveyards of the just always be hills, ways by which we ascend and overlook the plain?

But my old way down was different, and, indeed, this was another way up, though I never so ascended. I came out, as I descended, breathing the thicker air. I came out the belt of wood into a familiar pasture, and along down by a wall. Often, as I go along the low side of this pasture, I let my thoughts ascend toward the mount, gradually entering the stunted wood (Nature subdued) and the thinner air, and drape themselves with mists. There are ever two ways up: one is through the dark wood, the other through the sunny pasture. That is, I reach and discover the mountain only through the dark wood, but I see to my surprise, when I look off between the mists from its summit, how it is ever adjacent to my native fields, nay, imminent over them, and accessible through a sunny pasture. Why is it that in the lives of men we hear more of the dark wood than of the sunny pasture?

A hard-featured god reposing, whose breath hangs about his forehead.

Oct. 30. There's a very large and complete circle round the moon this evening, which part way round is a faint rainbow. It is a clear circular space, sharply and mathematically cut out of a thin mackerel sky. You see no mist within it, large as it is, nor even a star.

Oct. 31. In the Lee farm swamp, by the old Sam Barrett mill site, I see two kinds of ferns still green and much in fruit, apparently the *Aspidium spinulosum* (?) and *cristatum* (?). They are also common in other swamps now. You are inclined to approach and raise each frond in succession, moist, trembling, fragile greenness. What means this persistent vitality, invulnerable to frost and wet? They stay as if to keep up the spirits of the cold-blooded frogs which have not yet gone into the mud; that the summer may die with decent and graceful moderation, gradually. Even in them I feel an argument for immortality. Death is so far from being universal. The same destroyer does not destroy all. How valuable they are (with the lycopodiums) for cheerfulness. Greenness at the end of the year, after the fall of the leaf, as in a hale old age. What virtue is theirs that enables them to resist the frost?

If you are afflicted with melancholy at this season, go to the swamp and see the brave spears of skunk-cabbage buds already advanced toward a new year. Their gravestones are not bespoken yet. Is it the winter of their discontent? Do they seem to have lain down to die, despairing of skunk-cabbagedom? "Up and at 'em," "Give it to 'em," "Excelsior," "Put it through," — these are their mottoes. Mortal human creatures must take a little respite in this fall of the year; their spirits do flag a little. There is a little questioning of destiny, and thinking to go like cowards to where the "weary shall be at rest." But not so with the skunk-cabbage. Are these false prophets? Is it a lie or a vain boast underneath the skunk-cabbage bud, pushing it upward and lifting the dead leaves with it? They rest with spears advanced; they rest to shoot!

I say it is good for me to be here, slumping in the mud, a trap covered with withered leaves. See those green cabbage buds lifting the dry leaves in that watery and muddy

place. There is no can't nor cant to them. They see over the brow of winter's hill. They see another summer ahead.

Nov. 2. P.M. — To Bateman's Pond.

Row up Assabet as far as the Pokelogan, thence on foot. It is very pleasant and cheerful nowadays, when the brown and withered leaves strew the ground and almost every plant is fallen or withered, to come upon a patch of polypody on some rocky hillside in the woods, where, in the midst of the dry and rustling leaves, defying frost, it stands so freshly green and full of life. The mere greenness, which was not remarkable in the summer, is positively interesting now. My thoughts are with the polypody a long time after my body has passed. Why is not this form copied by our sculptors instead of the foreign acanthus leaves and bays? The sight of this unwithering green leaf excites me like red at some seasons. Are not the wood frogs the philosophers who walk (?) in these groves? Methinks I imbibe a cool, composed, frog-like philosophy when I behold them. I don't care for acanthus leaves; they are far-fetched. I do love this form, however, and would like to see it painted or sculptured, whether on your marble or my butter. How fit for a tuft about the base of a column!

How contagious are boys' games! A short time ago they were spinning tops, as I saw and heard, all the country over. Now every boy has a stick curved at the end, a hawkie (?), in his hand, whether in yards or in distant lanes I meet them.

The form of the polypody is strangely interesting; it is even outlandish. Some forms, though common in our midst, are thus perennially foreign as the growths of other latitudes; there being a greater interval between us and their kind than usual. We all feel the ferns to be further from us, essentially and sympathetically, than the phænogamous plants, the roses and weeds, for instance. It needs no geology nor botany to assure us of that. We feel it, and told them of it first. It is a fabulous, mythological form, such as prevailed when the earth and air and water were inhabited by those extinct fossil creatures that we find. It is contemporary with them, and affects as the sight of them.

Nov. 5. Sometimes I would rather get a transient glimpse or side view of a thing than stand fronting to it, — as those polypodies. The object I caught a glimpse of as I went by haunts my thoughts a long time, is infinitely suggestive, and I do not care to front it and scrutinize it, for I know that the thing that really concerns me is not there, but in my relation to that. That is a mere reflecting surface. It is not the polypody in my pitcher or herbarium, or which I may possibly persuade to grow on a bank in my yard, or which is described in botanies, that interests me, but the one that I pass by in my walks a little distance off, when in the right mood. Its influence is sporadic, wafted through the air to me. Do you imagine its fruit to stick to the back of the leaf all winter? At this season polypody is in the air. It is worth the while to walk in swamps now, to bathe your eyes with greenness. The terminal shield fern is the handsomest and glossiest green.

I think that the man of science makes this mistake, and the mass of mankind along with him: that you should coolly give your chief attention to the phenomenon which

excites you as something independent on you, and not as it is related to you. The important fact is its effect on me. He thinks that I have no business to see anything else but just what he defines the rainbow to be, but I care not whether my vision of truth is a waking thought or dream remembered, whether it is seen in the light or in the dark. It is the subject of the vision, the truth alone, that concerns me. The philosopher for whom rainbows, etc., can be explained away never saw them. With regard to such objects, I find that it is not they themselves (with which the men of science deal) that concern me; the point of interest is somewhere between me and them (i.e. the objects).

Nov. 6. Very warm but rather cloudy weather, after rain in the night. Wind southwest. Thermometer on north of the house 70° at 12 M. Indian summer. The cocks crow in the soft air. They are very sensitive to atmospheric changes.

Nov. 7. P.M. — To Bateman's Pond with R.W.E.

Stedman Buttrick, speaking of R.W.E.'s cow that was killed by lightning and not found for some days, said that they heard a "bellering" of the cows some days before they found her, and they found the ground much trampled about the dead cow; that that was the way with cows in such cases; if such an accident happened to one of their number, they would have spells of gathering around her and "bellering."

Minott adorns whatever part of nature he touches; whichever way he walks he transfigures the earth for me. If a common man speaks of Walden Pond to me, I see only a shallow, dull-colored body of water without reflections or peculiar color, but if Minott speaks of it, I see the green water and reflected hills at once, for he has been there. I hear the rustle of the leaves from woods which he goes through.

Nov. 8. About 10 A.M. a long flock of geese are going over from northeast to southwest, or parallel with the general direction of the coast and great mountain-ranges. The sonorous, quavering sounds of the geese are the voice of this cloudy air, — a sound that comes from directly between us and the sky, an aerial sound, and yet so distinct, heavy, and sonorous, a clanking chain drawn through the heavy air. I saw through my window some children looking up and pointing their tiny bows into the heavens, and I knew at once that the geese were in the air. It is always an exciting event. The children, instinctively aware of its importance, rushed into the house to tell their parents. These travellers are revealed to you by the upward-turned gaze of men.

P.M. — I have no doubt that a good farmer, who, of course, loves his work, takes exactly the same kind of pleasure in draining a swamp, seeing the water flow out in his newly cut ditch, that a child does in its mud dikes and water-wheels. Both alike love to play with the natural forces.

Ah, my friends, I know you better than you think, and love you better, too. The day after never, we will have an explanation.

Nov. 9. Surveying for Stedman Buttrick and Mr. Gordon.

Jacob Farmer tells me that one Sunday he went to his barn, having nothing to do, and thought he would watch the swallows, republican swallows. The old bird was feeding her young, and he sat within fifteen feet, overlooking them. There were five

young, and he was curious to know how each received its share; and as often as the bird came with a fly, the one at the door (or opening) took it, and then they all hitched round one notch, so that a new one was presented at the door, who received the next fly; and this was the invariable order, the same one never receiving two flies in succession. At last the old bird brought a very small fly, and the young one that swallowed it did not desert his ground but waited to receive the next, but when the bird came with another, of the usual size, she commenced a loud and long scolding at the little one, till it resigned its place, and the next in succession received the fly.

Nov. 14. This morning it was considerably colder than for a long time, and by noon very much colder than heretofore, with a pretty strong northerly wind. I find my hands stiffened and involuntarily finding their way to my pockets. No wonder that the weather is a standing subject of conversation, since we are so sensitive. If we had not gone through several winters, we might well be alarmed at the approach of cold weather. With this keener blast from the north, my hands suddenly fail to fulfill their office, as it were begin to die. What a story to tell an inhabitant of the tropics, — perchance that you went to walk, after many months of warmth, when suddenly the air became so cold and hostile to your nature, that it benumbed you so that you lost the use of some of your limbs, could not untie your shoe-strings or unbutton your clothes!

Such is the first freezing day. Such are the first advances of winter. The thermometer is 27° at 6 P.M. The mud in the street is stiffened under my feet this evening.

Nov. 18. The sunlight is a peculiarly thin and clear yellow, falling on the pale-brown bleaching herbage of the fields at this season. There is no redness in it. This is November sunlight. Much cold, slate-colored cloud, bare twigs seen gleaming toward the light like gossamer, pure green of pines whose old leaves have fallen, reddish or yellowish brown oak leaves rustling on the hillsides, very pale brown, bleaching, almost hoary fine grass or hay in the fields, akin to the frost which has killed it, and flakes of clear yellow sunlight falling on it here and there, — such is November.

In one light, these are old and worn-out fields that I ramble over, and men have gone to law about them long before I was born, but I trust that I ramble over them in a new fashion and redeem them.

In sickness all is deranged. I had yesterday a kink in my back and a general cold, and as usual it amounted to a cessation of life. I lost for the time my rapport or relation to nature. Sympathy with nature is an evidence of perfect health. You cannot perceive beauty but with a serene mind. The cheaper your amusements, the safer and saner. They who think much of theatres, operas, and the like, are beside themselves. Each man's necessary path, though as obscure and apparently uneventful as that of a beetle in the grass, is the way to the deepest joys he is susceptible of; though he converses only with moles and fungi and disgraces his relatives, it is no matter if he knows what is steel to his flint.

Nov. 20. In books, that which is most generally interesting is what comes home to the most cherished private experience of the greatest number. It is not the book of him

who has travelled the farthest over the surface of the globe, but of him who has lived the deepest and been the most at home. If an equal emotion is excited by a familiar homely phenomenon as by the Pyramids, there is no advantage in seeing the Pyramids. It is on the whole better, as it is simpler, to use the common language. The poet has made the best roots in his native soil of any man, and is the hardest to transplant. If a man is rich and strong anywhere, it must be on his native soil. Here I have been these forty years learning the language of these fields that I may the better express myself. If I should travel to the prairies, I should much less understand them, and my past life would serve me but ill to describe them. Many a weed here stands for more of life to me than the big trees of California would if I should go there. We only need travel enough to give our intellects an airing. In spite of Malthus and the rest, there will be plenty of room in this world, if every man will mind his own business. I have not heard of any planet running against another yet.

I observed this afternoon how some bullocks had a little sportiveness forced upon them. They were running down a steep declivity to water, when, feeling themselves unusually impelled by gravity downward, they took the hint even as boys do, flourished round gratuitously, tossing their hind quarters into the air and shaking their heads at each other, but what increases the ludicrousness of it to me is the fact that such capers are never accompanied by a smile. Who does not believe that their step is less elastic, their movement more awkward, for their long domesticity?

Nov. 24. P.M. — To Andromeda Ponds.

Cold Thanksgiving weather again, the pools freezing.

Nov. 25. A clear, cold, windy afternoon. The cat crackles with electricity when you stroke her, and the fur rises up to your touch.

This is November of the hardest kind, — bare frozen ground covered with pale-brown or straw-colored herbage, a strong, cold, cutting northwest wind which makes me seek to cover my ears, a perfectly clear and cloudless sky. The cattle in the fields have a cold, shrunken, shaggy look, their hair standing out every way, as if with electricity, like the cat's. Ditches and pools are fast skimming over, and a few slate-colored snowbirds, with thick, shuffling twitter, and fine-chipping tree sparrows flit from bush to bush in the otherwise deserted pastures. This month taxes a walker's resources more than any. For my part, I should sooner think of going into quarters in November than in the winter. If you do feel any fire at this season out of doors, you may depend upon it, it is your own. It is but a short time, these afternoons, before the night cometh, in which no man can walk. November Eat-heart, — is that the name of it? Not only the fingers cease to do their office, but there is often a benumbing of the faculties generally. You can hardly screw up your courage to take a walk when all is thus tightly locked or frozen up and so little is to be seen in field or wood. Nature has herself become like the few fruits which she still affords, a very thick-shelled nut with a shrunken meat within. I am obliged to go abroad willfully and against my inclinations at first. The prospect looks so barren, so many springs are frozen up, not a flower perchance and but few birds left, not a companion abroad in all these fields for me, I am slow to

go forth. I seem to anticipate a fruitless walk. I think to myself hesitatingly, Shall I go there, or there, or there? and cannot make up my mind to any route, all seem so unpromising, mere surface walking and fronting the cold wind, so that I have to force myself to it often and at random. But then I am often unexpectedly compensated, and the thinnest yellow light of November is more warming and exhilarating than any wine they tell of; and then the mite which November contributes becomes equal in value to the bounty of July. I may meet with something which interests me, and immediately it is as warm as in July.

Pools under the north sides of hills are frozen pretty thick. That cold one of Stow's is nearly an inch and a half thick. The roar of the wind in the trees over my head sounds as cold as the wind feels.

I shiver about awhile on Pine Hill, waiting for the sun to set. Methinks the air is dusky soon after four these days. The landscape looks darker than at any season, — like arctic scenery.

Indeed they can generally be treated so. Some are reddish, as burnished copper.

These nuts were there Oct. 8th. Gone Nov. 21st.

Begins now ten days of perfect Indian summer without rain; and the eleventh and twelfth days equally warm, though rainy.

Now first think of it, at this stage of my description, which makes it the more singularly symbolical. The interlineations on the last page were made before this.

Perchance that was the grave.

Nov. 27. Standing before Stacy's large glass windows this morning, I saw that they were gloriously ground by the frost. I never saw such beautiful feather and firlike frosting. His windows are filled with fancy articles and toys for Christmas and New-Year's presents, but this delicate and graceful outside frosting surpassed them all infinitely. I saw countless feathers with very distinct midribs and fine pinnæ. Other crystals looked like pine plumes the size of life. If glass could be ground to look like this, how glorious it would be!

You can tell which shopman has the hottest fire within by the frost being melted off. I was never so struck by the gracefulness of the curves in vegetation, and wonder that Ruskin does not refer to frostwork.

Dec. 2. I find that, according to the deed of Duncan Ingraham to John Richardson in 1797, my old bean-field on Walden Pond then belonged to George Minott. (Minott thinks he bought it of an Allen.) This was Deacon George Minott, who lived in the house next below the East Quarter schoolhouse, and was a brother of my grandfather-in-law. He was directly descended from Thomas Minott, who, according to Shattuck, was secretary of the Abbot of Walden (!) in Essex and whose son George was born at Saffron Walden (!) and afterwards was one of the early settlers of Dorchester.

Dec. 7. Running the long northwest side of Richardson's Fair Haven lot. It is a fair, sunny, and warm day in the woods for the season. We eat our dinners on the middle of the line, amid the young oaks in a sheltered and very unfrequented place. I cut some leafy shrub oaks and cast them down for a dry and springy seat. As I sit there amid

the sweet-fern, talking with my man Briney, I observe that the recent shoots of the sweet-fern — which, like many larger bushes and trees, have a few leaves in a tuft still at their extremities — toward the sun are densely covered with a bright, warm, silvery down, which looks like frost, so thick and white. Looking the other way, I see none of it, but the bare reddish twigs. Even this is a cheering and compensating discovery in my otherwise barren work. I get thus a few positive values, answering to the bread and cheese which make my dinner. I owe thus to my weeks at surveying a few such slight but positive discoveries.

Dec. 8. Staples says he came to Concord some twenty-four years ago a poor boy with a dollar and three cents in his pocket, and he spent the three cents for drink at Bigelow's tavern, and now he's worth "twenty hundred dollars clear." He remembers many who inherited wealth whom he can buy out to-day. I told him that he had done better than I in a pecuniary respect, for I had only earned my living. "Well," said he, "that's all I've done, and I don't know as I've got much better clothes than you." I was particularly poorly clad then, in the woods; my hat, pants, boots, rubbers, and gloves would not have brought four-pence, and I told the Irishman that it was n't everybody could afford to have a fringe round his legs, as I had, my corduroys not preserving a selvage.

Dec. 27. One while we do not wonder that so many commit suicide, life is so barren and worthless; we only live on by an effort of the will. Suddenly our condition is ameliorated, and even the barking of a dog is a pleasure to us. So closely is our happiness bound up with our physical condition, and one reacts on the other.

I am disappointed by most essays and lectures. I find that I had expected the authors would have some life, some very private experience, to report, which would make it comparatively unimportant in what style they expressed themselves, but commonly they have only a talent to exhibit. The new magazine which all have been expecting may contain only another love story as naturally told as the last, perchance, but without the slightest novelty in it. It may be a mere vehicle for Yankee phrases.

## 1858

Jan. 1. There are many words which are genuine and indigenous and have their root in our natures, not made by scholars, and as well understood by the illiterate as others. There are also a great many words which are spurious and artificial, and can only be used in a bad sense, since the thing they signify is not fair and substantial, — such as the church, the judiciary, to impeach, etc., etc. They who use them do not stand on solid ground. It is in vain to try to preserve them by attaching other words to them as the true church, etc. It is like towing a sinking ship with a canoe.

I have lately been surveying the Walden woods so extensively and minutely that I now see it mapped in my mind's eye — as, indeed, on paper — as so many men's wood-lots, and am aware when I walk there that I am at a given moment passing from

such a one's wood-lot to such another's. I fear this particular dry knowledge may affect my imagination and fancy, that it will not be easy to see so much wildness and native vigor there as formerly. No thicket will seem so unexplored now that I know that a stake and stones may be found in it. In these respects those Maine woods differed essentially from ours. There you are never reminded that the wilderness which you are threading is, after all, some villager's familiar wood-lot from which his ancestors have sledded their fuel for generations, or some widow's thirds, minutely described in some old deed, which is recorded, of which the owner has got a plan, too, and old bound marks may be found every forty rods if you will search. What a history this Concord wilderness which I affect so much may have had! How many old deeds describe it, — some particular wild spot, — how it passed from Cole to Robinson, and Robinson to Jones, and Jones finally to Smith, in course of years! Some have cut it over three times during their lives, and some burned it and sowed it with rye, and built walls and made a pasture of it, perchance. All have renewed the bounds and reblazed the trees many times. Here you are not reminded of these things. 'T is true the map informs you that you stand on land granted by the State to such an academy, or on Bingham's Purchase, but these names do not impose on you, for you see nothing to remind you of the academy or of Bingham.

Jan. 3. About, in his lively "Greece and the Greeks," says, "These are the most exquisite delights to be found in Greece, next to, or perhaps before, the pleasure of admiring the masterpieces of art, — a little cool water under a genial sun." I have no doubt that this is true. Why, then, travel so far when the same pleasures may be found near home?

Going to the Andromeda Ponds, I was greeted by the warm brown-red glow of the *Andromeda calyculata* toward the sun. I see where I have been through, the more reddish under sides apparently being turned up. It is long since a human friend has met me with such a glow.

Jan. 6. I derive a certain excitement, not to be refused, even from going through Dennis's Swamp on the opposite side of the railroad, where the poison-dogwood abounds. It impresses me as the most fruitful shrub thereabouts. I cannot refrain from plucking it and bringing home some pretty sprigs.

I was feeling very cheap, nevertheless, reduced to make the most of dry dogwood berries. Very little evidence of God or man did I see just then, and life not as rich and inviting an enterprise as it should be, when my attention was caught by a snowflake on my coat-sleeve. It was one of those perfect, crystalline, star-shaped ones, six-rayed, like a flat wheel with six spokes, only the spokes were perfect little pine trees in shape, arranged around a central spangle. This little object, which, with many of its fellows, rested unmelting on my coat, so perfect and beautiful, reminded me that Nature had not lost her pristine vigor yet, and why should man lose heart? This was at mid-afternoon, and it has not quite ceased snowing yet (at 10 P.M.). We are rained and snowed on with gems. I confess that I was a little encouraged, for I was beginning to

believe that Nature was poor and mean, and I was now convinced that she turned off as good work as ever. What a world we live in!

Jan. 11. Monday. Rain, rain — washes off almost every vestige of snow.

Jan. 23. Saturday. The wonderfully mild and pleasant weather continues. The ground has been bare since the 11th. There has been but little use for gloves this winter, though I have been surveying a great deal for three months. The sun, and cockcrowing, bare ground, etc., etc., remind me of March.

It is in vain to write on the seasons unless you have the seasons in you.

Jan. 24. Sunday. The river is broadly open, as usual this winter. But I do not quite like this warm weather and bare ground at this season. What is a winter without snow and ice in this latitude? The bare earth is unsightly. This winter is but unburied summer.

At Nut Meadow Brook the small-sized water-bugs are as abundant and active as in summer. I see forty or fifty circling together in the smooth and sunny bays all along the brook. This is something new to me. What must they think of this winter? It is like a child waked up and set to playing at midnight. At night, of course, they dive to the bottom and bury themselves, and if in the morning they perceive no curtain of ice drawn over their sky, and the pleasant weather continues, they gladly rise again and resume their gyrations in some sunny bay amid the alders and the stubble. But I fear for their nervous systems, lest this be too much activity, too much excitement. What a funny way they have of going to bed! They do not take a light and retire up-stairs; they go below. Suddenly it is heels up and heads down, and they go down to their muddy bed and let the unresting stream flow over them in their dreams. They go to bed in another element. What a deep slumber must be theirs, and what dreams, down in the mud there! So the insect life is not withdrawn far off, but a warm sun would soon entice it forth. Suppose you were to plot the course of one for a day; what kind of a figure would it make? Probably this feat too will one day be performed by science, that maid of all work. I see one chasing a mote, and the wave the creature makes always causes the mote to float away from it. I would like to know what it is they communicate to one another, they who appear to value each other's society so much. How many water-bugs make a quorum? How many hundreds does their Fourier think it takes to make a complete bug? Where did they get their backs polished so? They will have occasion to remember this year, that winter when we were waked out of our annual sleep! What is their precise hour for retiring?

Jan. 27. Time never passes so quickly and unaccountably as when I am engaged in composition, i.e. in writing down my thoughts. Clocks seem to have been put forward.

Jan. 29. Found some splendid fungi on old aspens used for a fence; quite firm; reddish-white above and bright-vermilion beneath, or perhaps more scarlet, reflecting various shades as it is turned. It is remarkable that the upper side of this fungus, which must, as here, commonly be low on decaying wood, so that we look down on it, is not bright-colored nor handsome, and it was only when I had broken it off and turned it over that I was surprised by its brilliant color. This intense vermilion (?) face, which

would be known to every boy in the town if it were turned upward, faces the earth and is discovered only by the curious naturalist. Its ear is turned down, listening to the honest praises of the earth. It is like a light-red velvet or damask.

Feb. 4. P.M. — To C. Miles Swamp.

There are many small spruce thereabouts, with small twigs and leaves, an abnormal growth, reminding one of strange species of evergreen from California, China, etc. I brought some home and had a cup of tea made, which, in spite of a slight piny or turpentine flavor, I thought unexpectedly good.

Feb. 18. George Minott tells me that he, when young, used often to go to a store by the side of where Bigelow's tavern was and kept by Ephraim Jones, — the Goodnow store. That was probably the one kept by my old trader. Told me how Casey, who was a slave to a man — Whitney — who lived where Hawthorne owns, — the same house, — before the Revolution, ran off one Sunday, was pursued by the neighbors, and hid himself in the river up to his neck till nightfall, just across the Great Meadows. He ran through Gowing's Swamp and came back that night to a Mrs. Cogswell, who lived where Charles Davis does, and got something to eat; then cleared far away, enlisted, and was freed as a soldier after the war. Whitney's boy threw snowballs at him the day before, and finally C., who was chopping in the yard, threw his axe at him, and W. said he was an ugly nigger and he must put him in jail. He may have been twenty years old when stolen from Africa; left a wife and one child there. Used to say that he went home to Africa in the night and came back again in the morning; i.e., he dreamed of home. Lived to be old. Called Thanksgiving "Tom Kiver."

Feb. 20. Snows all day. The most wintry day of the winter; yet not more than three inches on a level is fallen.

We hear the names of the worthies of Concord, — Squire Cuming and the rest, — but the poor slave Casey seems to have lived a more adventurous life than any of them. Squire Cuming probably never had to run for his life on the plains of Concord.

March 4. Thermometer 14° this morning, and this makes decent sleighing of the otherwise soft snow.

Father Rasle's dictionary of the Abenaki language amounts to a very concentrated and trustworthy natural history of that people, though it was not completed. What they have a word for, they have a thing for. A traveller may tell us that he thinks they used a pavement, or built their cabins in a certain form, or soaked their seed corn in water, or had no beard, etc., etc.; but when one gives us the word for these things, the question is settled, — that is a clincher. Let us know what words they had and how they used them, and we can infer almost all the rest. The lexicographer not only says that a certain people have or do a certain thing, but, being evidently a disinterested party, it may be allowed that he brings sufficient evidence to prove it. He does not so much assert as exhibit. He has no transient or private purpose to serve.

March 16. How conversant the Indian who lived out of doors, who lay on the ground, must have been with mouse-ear leaves, pine-needles, mosses, and lichens, which form

the crust of the earth. No doubt he had names accordingly for many things for which we have no popular names.

I walk in muddy fields, hearing the tinkling of newborn rills. Where the melted snow has made a swift rill in the rut of a cart-path, flowing over an icy bottom and between icy banks, I see, just below a little fall of one inch, a circular mass of foam or white bubbles nearly two inches in diameter, slowly revolving but never moving off. The swift stream at the fall appears to strike one side, as it might the side of a water-wheel, and so cause it to revolve, but in the angle between this and the fall, and half an inch distant, is another circle of bubbles, individually larger and more evanescent, only half an inch in diameter, revolving very rapidly in the opposite direction. The laws, perchance, by which the world was made, and according to which the systems revolve, are seen in full operation in a rill of melted snow.

March 18. 7 A.M. — By river.

How much more habitable a few birds make the fields! The note of the first bluebird in the air answers to the purling rill of melted snow beneath. It is eminently soft and soothing, and, as surely as the thermometer, indicates a higher temperature. It is the accent of the south wind, its vernacular. The song sparrow is more sprightly, mingling its notes with the rustling of the brash along the watersides, but it is at the same time more terrene than the bluebird. The first woodpecker comes screaming into the empty house and throws open doors and windows wide, calling out each of them to let the neighbors know of its return. I was not aware that the capacity to hear the woodpecker had slumbered within me so long. When the blackbird gets to a conqueeree he seems to be dreaming of the sprays that are to be and on which he is to perch. The robin does not come singing, but utters a somewhat anxious or inquisitive peep at first. The song sparrow is immediately most at home of any that I have named. I see this afternoon as many as a dozen bluebirds on the warm side of a wood.

Each new year is a surprise to us. We find that we had virtually forgotten the note of each bird, and when we hear it again it is remembered like a dream, reminding us of a previous state of existence. How happens it that the associations it awakens are always pleasing, never saddening; reminiscences of our sanest hours? The voice of nature is always encouraging.

I sit on the Cliff, and look toward Sudbury. How circumscribed are our walks, after all! With the utmost industry we cannot expect to know well an area more than six miles square, and yet we pretend to be travellers, to be acquainted with Siberia and Africa!

March 19. Another pleasant and warm day. Painted my boat this afternoon. These spring impressions are not repeated the same year, at least not with the same force, for the next day the same phenomenon does not surprise us. Our appetite has lost its edge. The other day the face of the meadow wore a peculiar appearance, as if it were beginning to wake up under the influence of the southwest wind and the warm sun, but it cannot again this year present precisely that appearance to me. I have taken

a step forward to a new position and must see something else. You perceive, and are affected by, changes too subtle to be described.

March 20. In the sluiceway of Pole Brook, by the road just beyond, I found another kind of Indian pot. It was an eel-pot (?) or creel, a wattled basket or wickerwork, made of willow osiers with the bark on, very artfully. It was about four feet long and shaped thus: About a dozen (or more) willow sticks, as big as one's finger or larger, being set small end down in a circle, in a thin round board which made the bottom, and then smaller osiers interwoven at right angles with them, close and firm. Another funnel-shaped basket was secured within this, extending about half-way down it, as represented by the dotted lines, with an opening hardly two inches wide at the bottom, where only a dozen sharpened sticks approached each other. There was a square door in the board bottom, by which the fishes could be taken out. This was set in that sluiceway, with the mouth or broad end down-stream, all sunk beneath the surface, the fishes being now evidently running up the brooks from the river and ponds, the ice being mostly gone out of the meadows and brooks. We raised this and found eight or ten small pickerel in it, the biggest a foot long, and one good-sized perch. It was pleasant to find that any were practicing such cunning art in the outskirts. I am not sure whether this invention is Indian or derived from our own ancestors. "Creel" appears to be an old English word. But I have no doubt that the Indians used something very like this. How much more we might have learned of the aborigines if they had not been so reserved! Suppose they had generally become the laboring class among the whites, that my father had been a farmer and had an Indian for his hired man, how many aboriginal ways we children should have learned from them! It was very pleasant to meet with this kind of textile or basket in our walk, to know that some had leisure for other things than farming and town meeting, and that they felt the spring influence in their way. That man was not fitting for the State prison when he was weaving that creel. He was meditating a small poem in his way. It was equal to a successful stanza whose subject was spring.

We, too, are out, obeying the same law with all nature. Not less important are the observers of the birds than the birds themselves.

March 21. Warm rain, April-like, the first of the season, holding up from time to time, though always completely overcast.

This first spring rain is very agreeable. I love to hear the pattering of the drops on my umbrella, and I love also the wet scent of the umbrella.

March 29. By a pool southeast of Nathan Barrett's, see five or six painted turtles in the sun, — probably some were out yesterday, — and afterward, along a ditch just east of the pine hill near the river, a great many more, as many as twenty within a rod. I must have disturbed this afternoon one hundred at least. They have crawled out on to the grass on the sunny side of the ditches where there is a sheltering bank. Some have very broad yellow lines on the back; others are almost uniformly dark above. They hurry and tumble into the water at your approach, but several soon rise to the surface and just put their heads out to reconnoitre. Each trifling weed or clod is a

serious impediment in their path, catching their flippers and causing them to tumble back. They never lightly skip over it. But then they have patience and perseverance, and plenty of time. The narrow edges of the ditches are almost paved in some places with their black and muddy backs.

March 30. The frogs are now heard leaping into the ditches on your approach, and their dimple is seen. I find a smallish bullfrog (?) under my boat. I do not remember that I ever hear this frog in the river or ponds. They seem to be an early frog, peculiar to pools and small ponds in the woods and fields.

March 31. C. says he saw a great many wood turtles on the bank of the Assabet today. The painted and wood turtles have seemed to be out in surprising abundance at an unusually early date this year, but I think I can account for it. The river is remarkably low, almost at summer level. I am not sure that I remember it so low at this season. Now, probably, these tortoises would always lie out in the sun at this season, if there were any bank at hand to lie on. Ordinarily at this season, the meadows being flooded, together with the pools and ditches in which the painted turtles lie, there is no bank exposed near their winter quarters for them to come out on, and I first noticed them under water on the meadow. But this year it is but a step for them to the sunny bank, and the shores of the Assabet and of ditches are lined with them.

April 8. Surveying Kettell farm.

Polly Houghton comes along and says, half believing it, of my compass, "This is what regulates the moon and stars."

April 15. Having stood quite still on the edge of the ditch close to the north edge of the maple swamp some time, and heard a slight rustling near me from time to time, I looked round and saw a mink under the bushes within a few feet. It was pure reddish-brown above, with a blackish and somewhat bushy tail, a blunt nose, and somewhat innocent-looking head. It crept along toward me and around me, within two feet, in a semicircle, snuffing the air, and pausing to look at me several times. Part of its course when nearest me was in the water of the ditch. It then crawled slowly away, and I saw by the ripple where it had taken to the ditch again. Perhaps it was after a frog, like myself.

The naturalist accomplishes a great deal by patience, more perhaps than by activity. He must take his position, and then wait and watch. It is equally true of quadrupeds and reptiles. Sit still in the midst of their haunts.

April 18. Frogs are strange creatures. One would describe them as peculiarly wary and timid, another as equally bold and imperturbable. All that is required in studying them is patience. You will sometimes walk a long way along a ditch and hear twenty or more leap in one after another before you, and see where they rippled the water, without getting sight of one of them. You sit down on the brink and wait patiently for his reappearance. After a quarter of an hour or more he is sure to rise to the surface and put out his nose quietly without making a ripple, eyeing you steadily. At length he becomes as curious about you as you can be about him. He suddenly hops straight toward you, pausing within a foot, and takes a near and leisurely view of you.

Perchance you may now scratch its nose with your finger and examine it to your heart's content, for it is become as imperturbable as it was shy before. You conquer them by superior patience and immovableness; not by quickness, but by slowness; not by heat, but by coldness.

April 19. Spend the day hunting for my boat, which was stolen. As I go up the riverside, I see a male marsh hawk hunting. He skims along exactly over the edge of the water, on the meadowy side, not more than three or four feet from the ground and winding with the shore, looking for frogs, for in such a tortuous line do the frogs sit. They probably know about what time to expect his visits, being regularly decimated. Particular hawks farm particular meadows. It must be easy for him to get a breakfast. Far as I can see with a glass, he is still tilting this way and that over the water-line.

May 1. The old *Salix sericea* is now all alive with the hum of honey-bees. This would show that it is in bloom. I see and hear one humblebee among them, inaugurating summer with his deep bass. May it be such a summer to me as it suggests. It sounds a little like mockery, however, to cheat me again with the promise of such tropical opportunities. I have learned to suspect him, as I do all fortune-tellers. But no sound so brings round the summer again. It is like the drum of May training.

May 2. If I were to be a frog hawk for a month I should soon know some things about the frogs. How patiently they skim the meadows, occasionally alighting, and fluttering as if it were difficult ever to stand still on the ground. I have seen more of them than usual since I too have been looking for frogs.

May 4. I find hopping in the meadow a *Rana halecina*, much brighter than any I have seen this year. There is not only a vivid green halo about each spot, but the back is vivid light-green between the spots. I think this was not the case with any of the hundreds I saw a month ago!! Why??

Coming back, I talk with Witherell at William Wheeler's landing. He comes pushing Wheeler's square-ended boat down-stream with a fish-spear. Says he caught a snapping turtle in the river May 1st. He sits on the side of my boat by the shore a little while, talking with me. There is a hole in the knee of his pants as big as your hand, and he keeps passing his hand over this slowly, to hide his bare skin, which is sunburnt and the color of his face, though the latter is reddened by rum, of which his breath smells. But how intimate he is with mud and its inhabitants.

May 6. About 9 P.M. I went to the edge of the river to hear the frogs. Each shore of the river now for its whole length is all alive with this stertorous purring. In the mornings now, I hear no *R. palustris* and no *hylodes*, but a few toads still, but now, at night, all ring together, the toads ringing through the day, the *hylodes* beginning in earnest toward night and the *palustris* at evening. I think that the different epochs in the revolution of the seasons may perhaps be best marked by the notes of reptiles. They express, as it were, the very feelings of the earth or nature. They are perfect thermometers, hygrometers, and barometers.

No exercise implies more real manhood and vigor than joining thought to thought. How few men can tell what they have thought! I hardly know half a dozen who are

not too lazy for this. They cannot get over some difficulty, and therefore they are on the long way round. You conquer fate by thought. If you think the fatal thought of men and institutions, you need never pull the trigger. The consequences of thinking inevitably follow. There is no more Herculean task than to think a thought about this life and then get it expressed.

May 7. Plant melons.

I see a wood tortoise by the river there, half covered with the old withered leaves. Taking it up, I find that it must have lain perfectly still there for some weeks, for though the grass is all green about it, when I take it up, it leaves just such a bare cavity, in which are seen the compressed white roots of the grass only, as when you take up a stone. This shows how sluggish these creatures are. It lets the season slide.

May 9. A dandelion perfectly gone to seed, a complete globe, a system in itself.

May 12. Saw some unusually broad chestnut planks, just sawed, at the mill. Barrett said that they came from Lincoln; whereupon I said that I guessed I knew where they came from, judging by their size alone, and it turned out that I was right. I had often gathered the nuts of those very trees and had observed within a year that they were cut down. So it appears that we have come to this, that if I see any peculiarly large chestnuts at the sawmill, I can guess where they came from, even know them in the log.

May 14. 5.30 A.M. — Up railroad.

I discovered this morning that a large rock three feet in diameter was partially hollow, and broke into it at length with a stone in order to reach some large black crystals which I could partly see. I found that it had been the retreat of a squirrel, and it had left many nuts there. It had entered a small hole bristling with crystals, and there found a chamber or grotto a foot long at least, surrounded on all sides by crystals.

Celandine by cemetery.

May 16. A hummingbird yesterday came into the next house and was caught. Flew about our parlor to-day and tasted Sophia's flowers. In some lights you saw none of the colors of its throat. In others, in the shade the throat was a clear bright scarlet, but in the sun it glowed with splendid metallic, fiery reflections about the neck and throat. It uttered from time to time, as it flew, a faint squeaking chirp or chirrup. The hum sounded more hollow when it approached a flower. Its wings fanned the air so forcibly that you felt the cool wind they raised a foot off, and nearer it was very remarkable. Does not this very motion of the wings keep a bird cool in hot weather?

P.M. — To Flint's Pond.

Sat down in the sun but soon, hearing a slight rustling, I looked round and saw a very large black snake about five feet long on the dry leaves, about a rod off. When I moved, it vibrated its tail very rapidly and smartly, which made quite a loud rustling or rattling sound, reminding me of the rattlesnake, as if many snakes obeyed the same instinct as the rattlesnake when they vibrate their tails. Once I thought I heard a low hiss. Suddenly, as it moved along, it erected itself half its length, and when I thought it

was preparing to strike at me, to my surprise it glided up a slender oak sapling about an inch in diameter at the ground and ten feet high. It moved up in a somewhat zigzag manner, availing itself of the branches, yet also in part spirally about the main stem. It finds a rest (or hold if necessary) for its neck or forward part of its body, moving crosswise the small twigs, then draws up the rest of its body. From the top of this little oak it passed into the top of a white pine of the same height an inch and a half in diameter at the ground and two feet off; from this into another oak, fifteen feet high and three feet from the pine; from this to another oak, three feet from the last and about the same height; from this to a large oak about four feet off and three or four inches in diameter, in which it was about fourteen feet from the ground; thence through two more oaks, a little lower, at intervals of four feet, and so into a white pine; and at last into a smaller white pine and thence to the ground. It moved quite deliberately for the most part, choosing its course from tree to tree with great skill, and resting from time to time while it watched me, only my approach compelling it to move again. It surprised me very much to see it cross from tree to tree exactly like a squirrel, where there appeared little or no support for such a body. It would glide down the proper twig, its body resting at intervals of a foot or two, on the smaller side twigs, perchance, and then would easily cross an interval of two feet, sometimes in an ascending, sometimes a descending, direction. If the latter, its weight at last bent the first twig down nearer to the opposite one. It would extend its neck very much, as I could see by the increased width of the scales exposed, till its neck rested across the opposite twig, hold on all the while tightly to some part of the last twig by the very tip of its tail, which was curled round it just like a monkey's. I have hardly seen a squirrel rest on such slight twigs as it would rest on in mid-air, while its body stretched clear a foot at least between two trees. It was not at all like creeping over a coarse basketwork, but suggested long practice and skill, like the ropedancer's. There were no limbs for it to use comparable for size with its own body, and you hardly noticed the few slight twigs it rested on, as it glided through the air. When its neck rested on the opposite twig, it was, as it were, glued to it. It helped itself over or up them as surely as if it grasped with a hand. There were, no doubt, rigid kinks in its body when they were needed for support. It is a sort of endless hook, and, by its ability to bend its body in every direction, it finds some support on every side. Perhaps the edges of its scales give it a hold also. It is evident that it can take the young birds out of a sapling of any height, and no twigs are so small and pliant as to prevent it. I have no doubt that this snake could have reached many of the oriole-nests which I have seen. I noticed that in its anger its rigid neck was very much flattened or compressed vertically. At length it coiled itself upon itself as if to strike, and, I presenting a stick, it struck it smartly and then darted away, running swiftly down the hill toward the pond.

Yellow butterflies. Nabalus leaves are already up and coming up in the wood-paths.

May 17. When the hummingbird flew about the room yesterday, his body and tail hung in a singular manner between the wings, swinging back and forth with a sort of

oscillating motion, not hanging directly down, but yet pulsating or teetering up and down.

I see a chewink flit low across the road with its peculiar flirting, undulating motion.

It is remarkable how little way most men get in their account of the mysteries of nature. Puffer, after describing the habits of a snake or turtle, — some peculiarity which struck him in its behavior, — would say with a remarkable air as if he were communicating or suggesting something, possibly explaining something, “Now I take it that is Nature; Nature did that.”

May 24. Monday. To New York by railroad.

In the evening, looked at the aquarium at Barnum’s. The glass boxes with nothing but water (labelled fresh or salt) and pebbles seemed sufficiently interesting. The sea-anemones were new and interesting to me. The ferns, etc., under glass a fine parlor ornament.

May 25. Visited the Egyptian Museum.

The chariot wheel might have been picked out of a ditch in Carlisle, and the infant’s shoe have been found with it.

June 2. 8.30 A.M. — Start for Monadnock. Blake joins me at Fitchburg. Arrived at Troy Station at 11.5 and shouldered our knapsacks, steering northeast to the mountain, some four miles off, — its top.

Almost without interruption we had the mountain in sight before us, — its sublime gray mass — that antique, brownish-gray, Ararat color. Probably these crests of the earth are for the most part of one color in all lands, that gray color of antiquity, which nature loves; color of unpainted wood, weather-stain, time-stain; not glaring nor gaudy; the color of all roofs, the color of things that endure, and the color that wears well; color of Egyptian ruins, of mummies and all antiquity; baked in the sun, done brown; not scarlet, like the crest of the bragging cock, but that hard, enduring gray; a terrene sky-color; solidified air with a tinge of earth.

Notwithstanding the newspaper and egg-shell left by visitors, these parts of nature are still peculiarly unhandselled and untracked. One, who was probably a blacksmith, had sculptured the emblems of his craft, an anvil and hammer, beneath his name. Apparently a part of the regular outfit of mountain-climbers is a hammer and cold-chisel. It reminds what kinds of steeps do climb the false pretenders to fame, whose chief exploit is the carriage of the tools with which to inscribe their names. For speaking epitaphs they are, and the mere name is a sufficient revelation of the character. They are all of one trade, — stone-cutters, defacers of mountain-tops. “Charles & Lizzie!” Charles carried the sledge-hammer, and Lizzie the cold-chisel. Some have carried up a paint-pot, and painted their names on the rocks.

[16 pages of nature notes on this trip, covering birds, flowers, rocks, bogs, toad spawn, spruce trees, lichens, pools, views, sandy or gravelly scars, and clouds (their height, their shadows).]

Minott has known them to be set for musquash, and sometimes the musquash gnaw out, if not drowned.

[A Concord farmer's perspective: "Why, one morning I went out in my field across there to the river, and there, beside that little old mud pond, was standing Da-a-vid Henry, and he wasn't doin' nothin' but just standin' there — lookin' at that pond, and when I came back at noon, there he was standin' with his hands behind him just lookin' down into that pond, and after dinner when I come back again if there wasn't Da-a-vid standin' there just like as if he had been there all day, gazin' down into that pond, and I stopped and looked at him and I says, 'Da-a-vid Henry, what air you a-doin'?' And he didn't turn his head and he didn't look at me. He kept on lookin' down at that pond, and he said, as if he was thinkin' about the stars in the heavens, 'Mr. Murray, I'm a-studyin' — the habits — of the bullfrog!' And there that darned fool had been standin' — the livelong day — a-studyin' — the habits — of the bull-frog!" (Quoted in Mrs. Daniel Chester French, *Memories of a Sculptor's Wife*, 1928.)]

June 7. I sit in my boat in the twilight by the edge of the river. Toads are now in full blast along the river. Some sit quite out at the edge of the pads, and hold up their heads so high when they ring, and make such a large bubble, that they look as if they would tumble over backward. Bullfrogs now are in full blast. I do not hear other frogs; their notes are probably drowned. I perceive that this generally is the rhythm of the bullfrog: er | er-r | er-r-r | (growing fuller and fuller and more tremendous) and then doubling, er, er | er, err | er, er, er | er, er, er | and finally er, er, er, er | er, er, er, er. Or I might write it oorar | oorar | oorar | oorar-hah | oorar-hah hah | oorar hah hah hah. What lungs, what health, what terrenity (if not serenity) it suggests! Seeing a large head, with its prominent eyes, projecting above the middle of the river, I found it was a bullfrog coming across. It swam under water a rod or two, and then came up to see where it was, or its way. It is thus they cross when sounds or sights attract them to more desirable shores.

Fireflies pretty numerous over the river, though we have had no thunder-showers of late. Mosquitoes quite troublesome here.

JUNE 12. Rains all day. Much water falls.

June 18. Coming across the level pasture west of E. Hubbard's swamp, toward Emerson's, I find a young *Emys insculpta*, apparently going to lay, though she had not dug a hole. It was four and a quarter inches long by three and a half wide, and altogether the handsomest turtle of this species, if not of any, that I have ever seen. It was quite fresh and perfect, without wound or imperfection; its claws quite sharp and slender, and the annual striæ so distinct on all the scales above and below that I could count them with ease. It was nine years old, though it would be like an infant among turtles, the successive striæ being perfectly parallel at equal distances apart. The sternum, with a large black spot on the rear angle of each scale and elsewhere a rich brown color, even reminded me of the turtle-shell of commerce. While its upper shell was of a uniform wholesome brown, very prettily marked indeed, not only by the outlines of the scales, but more distinctly by the lines of prominences raying out from the starting-point of each scale, perfectly preserved in each year's growth, a most elaborate coat of mail, worthy the lifelong labor of some reptilian Vulcan. This must

have been a belle among the *E. insculpta*. Nevertheless I did discover that all the claws but one of one hind foot were gone! Had not a bird pecked them off? So liable are they to injury in their long lives. Then they are so well-behaved; can be taken up and brought home in your pocket, and make no unseemly efforts to escape. The upper shell was remarkably spreading and curving upward on the rear edges.

June 20. I notice that when turtles are floating dead their necks and legs are stretched out. What kills them?

June 29. P.M. — To Walden.

Bathing in the cove by railroad. When I hold my head near the surface and look down, in two or three feet of water, the bottom appears concave, just as the sky does.

July 2. A.M. — Start for White Mountains in a private carriage with Edward Hoar.

Spent the noon close by the old Dunstable graveyard, by a small stream north of it.

Walked to and along the river and bathed in it.

What a relief and expansion of my thoughts when I come out to this broad river's shore! This vista was incredible there. Suddenly I see a broad reach of blue beneath, with its curves and headlands, liberating me from the more terrene earth. What a difference it makes whether I spend my four hours' nooning between the hills by yonder roadside, or on the brink of this fair river, within a quarter of a mile of that! This current allies me to all the world. Be careful to sit in an elevating and inspiring place. It is equal to a different season and country and creates a different mood. There is something in the scenery of a broad river equivalent to culture and civilization. Its channel conducts our thoughts as well as bodies to classic and famous ports, and allies us to all that is fair and great. I like to remember that at the end of half a day's walk I can stand on the bank of the Merrimack. It is just wide enough to interrupt the land and lead my eye and thoughts down its channel to the sea. A river is superior to a lake in its liberating influence. It has motion and indefinite length. A river touching the back of a town is like a wing, it may be unused as yet, but ready to waft it over the world. With its rapid current it is a slightly fluttering wing. River towns are winged towns.

[This trip takes up 57 pages in the Journal, including Mt. Washington and Mt. Lafayette, treacherous fog, a badly sprained ankle, accidentally starting a scrub fire, "the grandest mountain view I ever got," and speculation about why peaks seem pyramidal from a distance, along with pages of botanical observation and reading notes.]

July 18. Sunday. A marked difference when we enter Massachusetts, in roads, farms, houses, trees, fences, etc., — a great improvement, showing an older-settled country. In New Hampshire there is a greater want of shade trees, but long bleak or sunny roads from which there is no escape. What barbarians we are!

July 19. Get home at noon.

For such an excursion as the above, carry and wear: —

Three strong check shirts.

Two pairs socks.

Neck ribbon and handkerchief.  
 Three pocket-handkerchiefs.  
 One thick waistcoat.  
 One thin (or half-thick) coat.  
 One thick coat (for mountain).  
 A large, broad india-rubber knapsack, with a broad flap.  
 A flannel shirt.  
 India-rubber coat.  
 Three bosoms (to go and come in).  
 A napkin.  
 Pins, needles, thread.  
 A blanket.  
 A cap to lie in at night.  
 Tent (or a large simple piece of india-rubber cloth for the mountain tops?).  
 Veil and gloves (or enough millinet to cover all at night).  
 Map and compass.  
 Plant book and paper.  
 Paper and stamps.  
 Botany, spy-glass, microscope.  
 Tape, insect-boxes.  
 Jack-knife and clasp-knife.  
 Fish-line and hooks.  
 Matches.  
 Soap and dish-cloths.  
 Waste-paper and twine.  
 Iron spoon.  
 Pint dipper with a pail-handle added (not to put out the fire), and perhaps a bag to carry water in.  
 Frying-pan, only if you ride.  
 Hatchet (sharp), if you ride, and perhaps in any case on mountain, with a sheath to it.  
 Hard-bread (sweet crackers good); a moist, sweet plum cake very good and lasting; pork, corned beef or tongue, sugar, tea or coffee, and a little salt.  
 It is surprising how much more bewildering is a mountain-top than a level area of the same extent. Its ridges and shelves and ravines add greatly to its apparent extent and diversity. You may be separated from your party by only stepping a rod or two out of the path.  
 July 29. In the Chinese novel "Ju-Kiao-Li, or The Two Fair Cousins," I find in a motto to a chapter (quoted): "He who aims at success should be continually on his guard against a thousand accidents. How many preparations are necessary before the sour plum begins to sweeten!... But if supreme happiness was to be attained in the

space of an hour, of what use would be in life the noblest sentiments?" (Page 227.)  
Also these verses on page 230: —

"Nourished by the study of ten thousand different works,  
The pen in hand, one is equal to the gods.

Let not humility take its rank amongst virtues:  
Genius never yields the palm that belongs to it."

Again, page 22, vol. ii: —

"If the spring did not announce its reign by the return of the leaves,  
The moss, with its greenish tints, would find favor in men's eyes."

Aug. 6. I think that I speak impartially when I say that I have never met with a stream so suitable for boating and botanizing as the Concord, and fortunately nobody knows it. I know of reaches which a single country-seat would spoil beyond remedy, but there has not been any important change here since I can remember. The willows slumber along its shore, piled in light but low masses, even like the cumuli clouds above. We pass haymakers in every meadow, who may think that we are idlers. But Nature takes care that every nook and crevice is explored by some one. While they look after the open meadows, we farm the tract between the river's brinks and behold the shores from that side. We, too, are harvesting an annual crop with our eyes, and think you Nature is not glad to display her beauty to us?

This is pure summer; no signs of fall in this, though I have seen some maples, as above the Assabet Spring, already prematurely reddening, owing to the water.

Every board and chip cast into the river is soon occupied by one or more turtles of various sizes. The sternothærus oftenest climbs up the black willows, even three or more feet.

I hear of pickers ordered out of the huckleberry-fields, and I see stakes set up with written notices forbidding any to pick there. Some let their fields, or allow so much for the picking. Sic transit gloria ruris. We are not grateful enough that we have lived part of our lives before these evil days came. What becomes of the true value of country life? What if you must go to market for it? Shall things come to such a pass that the butcher commonly brings round huckleberries in his cart? It is as if the hangman were to perform the marriage ceremony, or were to preside at the communion table. Such is the inevitable tendency of our civilization, — to reduce huckleberries to a level with beef-steak.

Aug. 7. Saturday. P.M. — Up Assabet.

The most luxuriant groves of black willow, as I recall them, are on the inside curves, or on sandy capes between the river and a bay, or sandy banks parallel with the firmer shore. They also grow on both sides sometimes, where the river runs straight through stagnant meadows or swamps, — e.g. above Hollowell Bridge, — or on one side, though straight, along the edge of a swamp, — as above Assabet Spring, — but rarely ever against a firm bank or hillside, the positive male shore. Measured the two largest of three below Dove Rock.

The *Sternothærus odoratus* knows them well, for it climbs highest up their stems, three or four feet or more nowadays, sometimes seven or eight along the slanting branches, and is frequently caught and hung by the neck in its forks. They do not so much jump as tumble off when disturbed by a passer. They will climb four feet up a stem not more than two inches in diameter, and yet undo all their work in an instant by tumbling off when your boat goes by. The trunk is covered with coarse, long, and thick upraised scales. It is this turtle's castle and path to heaven. He is on the upward road along the stem of the willow, and by its dark stem it is partially concealed.

How long will it be after we have passed before the mud tortoise has climbed to its perch again?

The author of the Chinese novel "Ju-Kiao-Li," some eight hundred years ago, appears to have appreciated the beauty of willows. Pe, his principal character, moved out of the city late in life, to a stream bordered with willows, about twenty miles distant, in order to spend the rest of his days drinking wine and writing verses there. He describes the eyebrow of his heroine as like a willow leaf floating on the surface of the water.

Aug. 8. Looking north from Hubbard's Bridge about 4 P.M., the wind being south-easterly, I am struck by the varied lights of the river. The wind, which is a considerable breeze, strikes the water by a very irregular serrated edge about mid-channel, and then abruptly leaves it on a distinct and regular meandering line, about eight feet from the outer edge of the pads on the west side. The rippled portion of the river is blue, the rest smooth, silvery. Thus to my eye the river is divided into five portions, — first the weedy and padded borders, then a smooth, silvery stripe, eight or ten feet wide, and next the blue rippled portion, succeeded by the broader silver, and the pads of the eastern side. How many aspects the river wears, depending on the height of the water, the season of the year and state of vegetation, the wind, the position of the sun and condition of the heavens, etc., etc.! Apparently such is the angle at which the wind strikes the river from over the bushes that it falls about mid-channel, and then it is either obliged to leave it at a nearly similar angle on account of the opposite shore and bushes, or, perchance, the smoothing influence of the pads is felt to some distance beyond their edges. The line which separates the smooth from the rippled portion is as distinct and continuous as that which marks the edge of the pads. I think that there is more oily matter floating on the stiller sides of the river, and this too may have something to do with the above phenomenon. Then there is the watered appearance of the surface in a shower.

Aug. 11. The great bullfrogs, of various colors from dark brown to greenish yellow, lie out on the surface of these slimy pools or in the shallow water by the shore, motionless and philosophic. Toss a chip to one, and he will instantly leap and seize and drop it as quick. Motionless and indifferent as they appear, they are ready to leap upon their prey at any instant.

Aug. 12. When I came down-stairs this morning, it raining hard and steadily, I found an Irishman sitting with his coat on his arm in the kitchen, waiting to see me.

He wanted to inquire what I thought the weather would be to-day! I sometimes ask my aunt, and she consults the almanac. So we shirk the responsibility.

It clears up before noon and is now very warm and clear. When I look at the sparrows on the fences, yellow-browed and bay-wings, they all have their bills open and are panting with heat. Apparently the end of the very wet weather we have had about a fortnight.

Aug. 13. As I am paddling up the north side above the Hemlocks, I am attracted by the singular shadows of the white lily pads on the rich-brown muddy bottom. It is remarkable how light tends to prevail over shadow there. It steals in under the densest curtain of pads and illustrates the bottom. The shadows of these pads, seen (now at 3 P.M.) a little one side, where the water is eighteen inches or two feet deep, are rarely orbicular or entire-edged or resembling the leaf, but are more or less perfect rosettes, generally of an oval form, with five to fifteen or more regularly rounded petals, open half-way to the centre: or You cannot commonly re-fer the shadow to its substance but by touching the leaf with your paddle. Light knows a thousand tricks by which it prevails. Light is the rule, shadow the exception. The leaf fails to cast a shadow equal in area to itself. While it is a regular and almost solid disk, the shadow is a rosette or palmate, as if the sun, in its haste to illustrate every nook, shone round the shortest corner. Generally the two sharp angles of the pad are almost entirely eroded in the shadow. The shadows, too, have a slight halo about them. Such endless and varied play of light and shadow is on the river bottom! It is protean and somewhat weird even. The shadow of the leaf might be mistaken for that of the flower. The sun playing with a lily leaf draws the outline of a lily on the bottom with its shadow.

I landed in the Lee Wood. Perhaps those woods might be called Mantatukwet's, for he says he lived at the foot of Nawshawtuct about fifty years before 1684.

Aug. 14. Suggesting to C. an Indian name for one of our localities, he thought it had too many syllables for a place so near the middle of the town, — as if the more distant and less frequented place might have a longer name, less understood and less alive in its syllables.

To speak from recollection, the birds which I have chanced to hear of late are (running over the whole list): —

The squealing notes of young hawks.

Occasionally a red-wing's tchuck.

The link of bobolinks.

The chickadee and phebe note of the chickadees, five or six together occasionally.

The fine note of the cherry-bird, pretty often.

The twitter of the kingbird, pretty often.

The wood pewee, with its young, peculiarly common and prominent.

Only the peep of the robin.

The pine warbler, occasionally.

The bay-wing, pretty often.

The seringo, pretty often.

The song sparrow, often.

The field sparrow, often.

The goldfinch, a prevailing note, with variations into a fine song.

The ground-robin, once of late.

The flicker's cackle, once of late.

The nighthawk, as usual.

I have not been out early nor late, nor attended particularly to the birds. The more characteristic notes would appear to be the wood pewee's and the goldfinch's, with the squeal of young hawks. These might be called the pewee-days.

Aug. 15. Rain in the night and dog-day weather again, after two clear days. I do not like the name "dog-days." Can we not have a new name for this season? It is the season of mould and mildew, and foggy, muggy, often rainy weather.

The black willows are already being imbrowned. It must be the effect of the water, for we have had no drought.

Might not the potamogeton be called waving weed?

Aug. 16. In my boating of late I have several times scared up a couple of summer ducks of this year, bred in our meadows. They allowed me to come quite near, and helped to people the river. I have not seen them for some days. Would you know the end of our intercourse? Goodwin shot them, and Mrs. ———, who never sailed on the river, ate them. Of course, she knows not what she did. What if I should eat her canary? Thus we share each other's sins as well as burdens. The lady who watches admiringly the matador shares his deed. They belonged to me, as much as to any one, when they were alive, but it was considered of more importance that Mrs. ——— should taste the flavor of them dead than that I should enjoy the beauty of them alive.

Talked with Minott, who sits in his wood-shed, having, as I notice, several seats there for visitors, — one a block on the sawhorse, another a patchwork mat on a wheelbarrow, etc., etc. His half-grown chickens which roost overhead, perch on his shoulder or knee. He tells me some of his hunting stories again. He always lays a good deal of stress on the kind of gun he used, as if he had bought a new one every year, when probably he never had more than two or three in his life. In this case it was a "half-stocked" one, a little "cocking-piece," and whenever he finished his game he used the word "gavel," I think in this way, "gave him gavel," i.e. made him bite the dust, or settled him. He used to love to hear the goldfinches sing on the hemp which grew near his gate.

Aug. 17. Minott has only lately been reading Shattuck's "History of Concord," and he says that his account is not right by a jugful, that he does not come within half a mile of the truth, not as he has heard tell.

Aug. 18. Having left my note-book at home, I strip off a piece of birch bark for paper. It begins at once to curl up, yellow side out, but I hold that side to the sun, and as soon as it is dry it gives me no more trouble.

Heard a nuthatch.

Last evening one of our neighbors, who has just completed a costly house and front yard, the most showy in the village, illuminated in honor of the Atlantic telegraph. I read in great letters before the house the sentence "Glory to God in the highest." But it seemed to me that that was not a sentiment to be illuminated, but to keep dark about. A simple and genuine sentiment of reverence would not emblazon these words as on a signboard in the streets. They were exploding countless crackers beneath it, and gay company, passing in and out, made it a kind of housewarming. I felt a kind of shame for it, and was inclined to pass quickly by, the ideas of indecent exposure and cant being suggested. What is religion? That which is never spoken.

Aug. 22. P.M. — I have spliced my old sail to a new one, and now go out to try it in a sail to Baker Farm. It is a "square sail," some five feet by six. I like it much. It pulls like an ox, and makes me think there's more wind abroad than there is. The yard goes about with a pleasant force, almost enough, I would fain imagine, to knock me overboard. How sturdily it pulls, shooting us along, catching more wind than I knew to be wandering in this river valley! It suggests a new power in the sail, like a Grecian god. I can even worship it, after a heathen fashion. And then, how it becomes my boat and the river, — a simple homely square sail, all for use not show, so low and broad! The boat is like a plow drawn by a winged bull. If I had had this a dozen years ago, my voyages would have been performed more quickly and easily. But then probably I should have lived less in them. I land on a remote shore at an unexpectedly early hour, and have time for a long walk there.

As for the beauty of the river's brim: now that the mikania begins to prevail the button-bush has done, the pontederia is waning, and the willows are already somewhat crisped and imbrowned (though the last may be none the worse for it); lilies, too, are as good as gone. So perhaps I should say that the brim of the river was in its prime about the 1st of August this year, when the pontederia and button-bush and white lilies were in their glory. The cyperus now yellows edges of pools and half-bare low grounds.

See one or two blue herons every day now, driving them far up or down the river before me.

Aug. 23. Cooler than ever. Some must have fires, and I close my window.

Everywhere in woods and swamps I am already reminded of the fall. I see the spotted sarsaparilla leaves and brakes, and, in swamps, the withering and blackened skunk-cabbage and hellebore, and, by the river, the already blackening pontederias and pipes. There is no plateau on which Nature rests at midsummer, but she instantly commences the descent to winter.

High blackberries now in their prime, their great racemes of shining black fruit, mixed with red and green, bent over amid the sweet-fern and sumach on sunny hillsides, or growing more rankly with larger fruit by rich roadsides and in lower ground.

Smooth sumach berries all turned crimson.

Emerson says that he and Agassiz and Company broke some dozens of ale-bottles, one after another, with their bullets, in the Adirondack country, using them for marks!

It sounds rather Cockneyish. He says that he shot a peetweet for Agassiz, and this, I think he said, was the first game he ever bagged. He carried a double-barrelled gun, — rifle and shotgun, — which he bought for the purpose, which he says received much commendation, — all parties thought it a very pretty piece. Think of Emerson shooting a peetweet (with shot) for Agassiz, and cracking an ale-bottle (after emptying it) with his rifle at six rods! They cut several pounds of lead out of the tree. It is just what Mike Saunders, the merchant's clerk, did when he was there.

Aug. 24. It is a strong but fitful northwest wind, stronger than before. Under my new sail, the boat dashes off like a horse with the bits in his teeth. Coming into the main stream below the island, a sudden flaw strikes me, and in my efforts to keep the channel I run one side under, and so am compelled to beach my boat there and bail it.

I am flattered because my stub sail frightens a haymakers' horse tied under a maple while his masters are loading. His nostrils dilate; he snorts and tries to break loose. He eyes with terror this white wind steed. No wonder he is alarmed at my introducing such a competitor into the river meadows.

Now and of late we remember hazel bushes, — we become aware of such a fruit-bearing bush. They have their turn, and every clump and hedge seems composed of them.

Aug. 28. Soaking rain last night, straight down. Especially the scarlet leaves of the cultivated cherry are seen to have fallen. When, as I go to the post-office this morning, I see these bright leaves strewing the moist ground on one side of the tree and blown several rods from it into a neighboring yard, I am reminded that I have crossed the summit ridge of the year and have begun to descend the other slope. The prospect is now toward winter. These are among the first-fruits of the leafy harvest.

Aug. 29. Has not the mind, too, its harvest? Do not some scarlet leaves of thought come scatteringly down, though it may be prematurely, some which, perchance, the summer's drought has ripened, and the rain loosened?

How hard one must work in order to acquire his language, — words by which to express himself! I have known a particular rush, for instance, for at least twenty years, but have ever been prevented from describing some of its peculiarities, because I did not know its name nor any one in the neighborhood who could tell me it. With the knowledge of the name comes a distincter recognition and knowledge of the thing. That shore is now more describable, and poetic even. My knowledge was cramped and confined before, and grew rusty because not used, — for it could not be used. My knowledge now becomes communicable and grows by communication. I can now learn what others know about the same thing.

Sept. 6. On the hillside above Clamshell Ditch, grows that handsome grass of Sept. 1st (vide September 4th), evidently *Sorghum nutans* (*Andropogon* of Bigelow), chestnut beard grass, Indian grass, wood grass. It is much larger than what I saw before; is still abundantly in flower; four and a half feet high. It is a very handsome, wild-looking grass, well enough called Indian grass, and I should have named it with the

other andropogons, August 26th. It stands like an Indian chief taking a last look at his beloved hunting-grounds. The expression of this grass haunted me for a week after I first passed and noticed it, like the glance of an eye.

Sept. 7. I turn Anthony's corner. It is an early September afternoon, melting warm and sunny; the thousands of grasshoppers leaping before you reflect gleams of light; a little distance off the field is yellowed with a Xerxean army of *Solidago nemoralis* between me and the sun; the earth-song of the cricket comes up through all; and ever and anon the hot z-ing of the locust is heard. (Poultry is now fattening on grasshoppers.) The dry deserted fields are one mass of yellow, like a color shoved to one side on Nature's palette. You literally wade in yellow flowers knee-deep.

What a contrast to sink your head so as to cover your ears with water, and hear only the confused noise of the rushing river, and then to raise your ears above water and hear the steady creaking of crickets in the aerial universe!

Sept. 9. It requires a different intention of the eye in the same locality to see different plants, as, for example, *Juncaceæ* and *Gramineæ* even; i.e., I find that when I am looking for the former, I do not see the latter in their midst. How much more, then, it requires different intentions of the eye and of the mind to attend to different departments of knowledge! How differently the poet and the naturalist look at objects! A man sees only what concerns him. A botanist absorbed in the pursuit of grasses does not distinguish the grandest pasture oaks. He as it were tramples down oaks unwittingly in his walk.

Sept. 29. Two blue herons, or "herns," as Goodwin calls them, fly sluggishly up the stream. Interesting even is a stake, with its reflection, left standing in the still river by some fisherman.

Again we have smooth waters, yellow foliage, and faint warbling birds, etc., as in spring. The year thus repeats itself.

Oct. 2. The garden is alive with migrating sparrows these mornings. The cat comes in from an early walk amid the weeds. She is full of sparrows and wants no more breakfast this morning, unless it be a saucer of milk, the dear creature. I saw her studying ornithology between the corn-rows.

Oct. 18. Let us have willows for spring, elms for summer, maples and walnuts and tupelos for autumn, evergreens for winter, and oaks for all seasons. What is a gallery in a house to a gallery in the streets! An avenue of elms as large as our largest, and three miles long, would seem to lead to some admirable place, though only Concord were at the end of it.

Oct. 19. A remarkably warm day. The thermometer says 74° at 1 P.M. This must be Indian summer.

P.M. — Ride to Sam Barrett's mill.

Am pleased again to see the cobweb drapery of the mill. Each fine line hanging in festoons from the timbers overhead and on the sides, and on the discarded machinery lying about, is covered and greatly enlarged by a coating of meal, by which its curve is revealed, like the twigs under their ridges of snow in winter. It is like the tassels

and tapestry of counterpane and dimity in a lady's bedchamber, and I pray that the cobwebs may not have been brushed away from the mills which I visit. All things in the mill wear the same livery or drapery, down to the miller's hat and coat. I knew Barrett forty rods off in the cranberry meadow by the meal on his hat.

Barrett's apprentice, it seems, makes trays of black birch and of red maple, in a dark room under the mill. I was pleased to see this work done here, a wooden tray is so handsome. You could count the circles of growth on the end of the tray, and the dark heart of the tree was seen at each end above, producing a semicircular ornament. To see the tree reappear on the table, instead of going to the fire or some equally coarse use, is some compensation for having it cut down.

Standing on Hunt's Bridge at 5 o'clock, the sun just ready to set, I notice that its light on my note-book is quite rosy or purple, though the sun itself and its halo are merely yellow, and there is no purple in the western sky. Perhaps I might have detected a purple tinge already in the eastern sky, had I looked, and I was exactly at that distance this side the sunset where the foremost of the rosy waves of light roll in the wake of the sun, and the white page was the most suitable surface to reflect it.

I was the more pleased with the sight of the trays because the tools used were so simple, and they were made by hand, not by machinery. They may make equally good pails, and cheaper as well as faster, at the pail-factory with the home-made ones, but that interests me less, because the man is turned partly into a machine there himself. In this case, the workman's relation to his work is more poetic, he also shows more dexterity and is more of a man. You come away from the great factory saddened, as if the chief end of man were to make pails; but, in the case of the countryman who makes a few by hand, rainy days, the relative importance of human life and of pails is preserved, and you come away thinking of the simple and helpful life of the man, — you do not turn pale at the thought, — and would fain go to making pails yourself.

Oct. 22. I can see the red of young oaks as far as the horizon on some sides.

I see, from the Cliffs, that color has run through the shrub oak plain like a fire or a wave, not omitting a single tree, though I had not expected it, — large oaks do not turn so completely, — and now is for the most part burnt out for want of fuel, i.e. excepting the scarlet ones. The brown and chocolate colors prevail there.

These bright leaves are not the exception but the rule, for I believe that all leaves, even grasses, etc., etc., — *Panicum clandestinum*, — and mosses, as sphagnum, under favorable circumstances acquire brighter colors just before their fall. When you come to observe faithfully the changes of each humblest plant, you find, it may be unexpectedly, that each has sooner or later its peculiar autumnal tint or tints, though it may be rare and unobserved, as many a plant is at all seasons.

Oct. 24. A northeast storm, though not much rain falls to-day, but a fine driving mizzle or "drisk." This, as usual, brings the geese, and at 2.30 P.M. I see two flocks go over.

P.M. — To Woodis Park over Hill.

The brilliant autumnal colors are red and yellow and the various tints, hues, and shades of these. Blue is reserved to be the color of the sky, but yellow and red are the colors of the earth flower. Every fruit, on ripening, and just before its fall, acquires a bright tint. So do the leaves; so the sky before the end of the day, and the year near its setting. October is the red sunset sky, November the later twilight. Color stands for all ripeness and success. We have dreamed that the hero should carry his color aloft, as a symbol of the ripeness of his virtue.

That large hornets' nest which I saw on the 4th is now deserted, and I bring it home. But in the evening, warmed by my fire, two or three come forth and crawl over it, and I make haste to throw it out the window.

Oct. 26. Minott remembers how he used to chop beech wood. He says that when frozen it is hard and brittle just like glass, and you must look out for the chips, for, if they strike you in the face, they will cut like a knife.

He says that some call the stake-driver "belcher-squelcher," and some, "wollerker-toot." I used to call them "pump-er-gor." Some say "slug-toot."

I wear a thicker coat, my single thick fall coat, at last, and begin to feel my fingers cool early and late.

One shopkeeper has hung out woollen gloves and even thick buckskin mittens by his door, foreseeing what his customers will want as soon as it is finger-cold, and determined to get the start of his fellows.

Oct. 27. The bayonet rush has partly changed, and now, the river being perhaps lower than before this season, shows its rainbow colors, though dull. I distinguish four colors now, perfectly horizontal and parallel bars, as it were, six or eight inches wide as you look at the side of a dense patch along the shallow shore. The lowest is a dull red, the next clear green, then dull yellowish, and then dark brown. These colors, though never brilliant, are yet noticeable, and, when you look at a long and dense patch, have a rainbow-like effect. The red (or pinkish) is that part which has been recently submerged; the green, that which has not withered; the yellowish, what has changed; and the brown, the withered extremity, since it dies downward gradually from the tip to the bottom. The amount of it is that it decays gradually, beginning at the top, and, moreover, the whole being of a uniform height, a particular color in one plant corresponds exactly to the same in another, and so, though a single stalk would not attract attention, when seen in the mass they have this singular effect. I call it, therefore, the rainbow rush. When, moreover, you see it reflected in the water, the effect is very much increased.

We have a cool, white sunset, Novemberish, and no redness to warm our thoughts.

It is impossible to describe the infinite variety of hues, tints, and shades, for the language affords no names for them, and we must apply the same term monotonously to twenty different things. If I could exhibit so many different trees, or only leaves, the effect would be different. When the tints are the same they differ so much in purity and delicacy that language, to describe them truly, would have not only to be greatly enriched, but as it were dyed to the same colors herself, and speak to the eye as well

as to the ear. And it is these subtle differences which especially attract and charm our eyes. To describe these colored leaves you must use colored words. Who will undertake to describe in words the difference in tint between two neighboring leaves on the same tree? or of two thousand? — for by so many the eye is addressed in a glance. In describing the richly spotted leaves, for instance, how often we find ourselves using ineffectually words which merely indicate faintly our good intentions, giving them in our despair a terminal twist toward our mark, — such as reddish, yellowish, purplish, etc. We cannot make a hue of words, for they are not to be compounded like colors, and hence we are obliged to use such ineffectual expressions as reddish brown, etc. They need to be ground together.

Oct. 29. Nature now, like an athlete, begins to strip herself in earnest for her contest with her great antagonist Winter. In the bare trees and twigs what a display of muscle!

Apple trees, though many are thick-leaved, are in the midst of their fall. Our English cherry has fallen. The silvery abele is still densely leaved, and green, or at most a yellowish green. The lilac still thickly leaved; a yellowish green or greenish yellow as the case may be. Privet thickly leaved, yellowish-green.

If these plants acquire brighter tints in Europe, then one would say that they did not fully ripen their leaves here before they were killed. The orchard trees are not for beauty, but use. English plants have English habits here: they are not yet acclimated; they are early or late as if ours were an English spring or autumn; and no doubt in course of time a change will be produced in their constitutions similar to that which is observed in the English man here.

Nov. 1. As the afternoons grow shorter, and the early evening drives us home to complete our chores, we are reminded of the shortness of life, and become more pensive, at least in this twilight of the year. We are prompted to make haste and finish our work before the night comes. I leaned over a rail in the twilight on the Walden road, waiting for the evening mail to be distributed, when such thoughts visited me. I seemed to recognize the November evening as a familiar thing come round again, and yet I could hardly tell whether I had ever known it or only divined it. The November twilights just begun! It appeared like a part of a panorama at which I sat spectator, a part with which I was perfectly familiar just coming into view, and I foresaw how it would look and roll along, and prepared to be pleased. We are independent on all that we see. The hangman whom I have seen cannot hang me. The earth which I have seen cannot bury me. Such doubleness and distance does sight prove. Only the rich and such as are troubled with ennui are implicated in the maze of phenomena. You cannot see anything until you are clear of it. The dark bank of clouds in the horizon long after sunset, the villagers crowding to the post-office, and the hastening home to supper by candle-light, had I not seen all this before! What new sweet was I to extract from it? Truly they mean that we shall learn our lesson well. Nature gets thumbed like an old spelling-book. I was no nearer, methinks, nor further off from my friends. Yet I sat the bench with perfect contentment, unwilling to exchange the familiar vision that was to be unrolled for any treasure or heaven that could be imagined. It was as if I was

promised the greatest novelty the world has ever seen or shall see, though the utmost possible novelty would be the difference between me and myself a year ago. This alone encouraged me, and was my fuel for the approaching winter. That we may behold the panorama with this slight improvement or change, this is what we sustain life for with so much effort from year to year.

And yet there is no more tempting novelty than this new November. No going to Europe or another world is to be named with it. Give me the old familiar walk, post-office and all, with this ever new self, with this infinite expectation and faith, which does not know when it is beaten. We'll go nutting once more. We'll pluck the nut of the world, and crack it in the winter evenings. Theatres and all other sightseeing are puppet-shows in comparison. I will take another walk to the Cliff, another row on the river, another skate on the meadow, be out in the first snow, and associate with the winter birds. Here I am at home. In the bare and bleached crust of the earth I recognize my friend.

Pray, am I altogether a bachelor, or am I a widower, that I should go away and leave my bride? This Morrow that is ever knocking with irresistible force at our door, there is no such guest as that. I will stay at home and receive company.

Think of the consummate folly of attempting to go away from here! When the constant endeavor should be to get nearer and nearer here. Here are all the friends I ever had or shall have, and as friendly as ever. How many things can you go away from? They see the comet from the northwest coast just as plainly as we do, and the same stars through its tail. Take the shortest way round and stay at home. A man dwells in his native valley like a corolla in its calyx, like an acorn in its cup. Here, of course, is all that you love, all that you expect, all that you are. Here is your bride elect, as close to you as she can be got. Here is all the best and all the worst you can imagine. What more do you want? Foolish people imagine that what they imagine is somewhere else. That stuff is not made in any factory but their own.

Nov. 3. Colder weather, true November weather, comes again to-night, and I must rekindle my fire, which I had done without of late. I must walk briskly in order to keep warm in my thin coat.

By fall I mean literally the falling of the leaves, though some mean by it the changing or the acquisition of a brighter color. This I call the autumnal tint, the ripening to the fall.

Nothing makes me so dejected as to have met my friends, for they make me doubt if it is possible to have any friends. I feel what a fool I am. I cannot conceive of persons more strange to me than they actually are; not thinking, not believing, not doing as I do; interrupted by me. My only distinction must be that I am the greatest bore they ever had. Not in a single thought agreed; regularly balking one another. But when I get far away, my thoughts return to them. That is the way I can visit them. Thus I am taught that my friend is not an actual person. When I have withdrawn and am alone, I forget the actual person and remember only my ideal. Then I have a friend again. I am not so ready to perceive the illusion that is in Nature. I certainly come nearer, to

say the least, to an actual and joyful intercourse with her. Every day I have more or less communion with her, as I think. At least, I do not feel as if I must withdraw out of nature. I feel like a welcome guest. Yet, strictly speaking, the same must be true of nature and of man; our ideal is the only real. It is not the finite and temporal that satisfies or concerns us in either case.

Nov. 4. A rainy day.

Called to C. from the outside of his house the other afternoon in the rain. At length he put his head out the attic window, and I inquired if he didn't want to take a walk, but he excused himself, saying that he had a cold. "But," added he, "you can take so much the longer walk. Double it."

If, about the last of October, you ascend any hill in the outskirts of the town and look over the forest, you will see, amid the brown of other oaks, which are now withered, and the green of the pines, the bright-red tops or crescents of the scarlet oaks, very equally and thickly distributed on all sides, even to the horizon. All this you will see, and much more, if you are prepared to see it, — if you look for it. Otherwise, regular and universal as this phenomenon is, you will think for threescore years and ten that all the wood is at this season sere and brown. Objects are concealed from our view not so much because they are out of the course of our visual ray as because there is no intention of the mind and eye toward them. We do not realize how far and widely, or how near and narrowly, we are to look. The greater part of the phenomena of nature are for this reason concealed to us all our lives. Here, too, as in political economy, the supply answers to the demand. Nature does not cast pearls before swine. There is just as much beauty visible to us in the landscape as we are prepared to appreciate, — not a grain more. The actual objects which one person will see from a particular hilltop are just as different from those which another will see as the persons are different. The scarlet oak must, in a sense, be in your eye when you go forth. We cannot see anything until we are possessed with the idea of it, and then we can hardly see anything else. In my botanical rambles I find that first the idea, or image, of a plant occupies my thoughts, though it may at first seem very foreign to this locality, and for some weeks or months I go thinking of it and expecting it unconsciously, and at length I surely see it, and it is henceforth an actual neighbor of mine. This is the history of my finding a score or more of rare plants which I could name.

Nov. 6. I guessed at Goodwin's age on the 1st. He is hale and stout and looks younger than he is, and I took care to set him high enough. I guessed he was fifty-five, and he said that if he lived two or three months longer he would be fifty-six. He then guessed at my age, thought I was forty. He thought that Emerson was a very young-looking man for his age, "But," said he, "he has not been out o' nights as much as you have."

Nov. 8. Goodwin, laying wall at Miss Ripley's, observed to me going by, "Well, it seems that Puffer thought that he had lived long enough." He committed suicide within a week, at his sister's house in Sudbury. A boy slept in the chamber with him, and, hearing a noise, got up and found P. on the floor with both his jugular veins cut, but

his windpipe whole. He said to the boy, "Take the razor and cut deeper," but the boy ran, and P. died, and Garfield said it was about time, for P., in revenge for being sent to the house of correction, had set fire to a pile of wood of his, that long pile by the roadside beyond William Wheeler's, that I stood under in a rain once. P. probably burned Witherell's house too, and perhaps Boynton's stable.

The red osier at Mrs. Simmons's is quite bare; how long? Her hawthorn is still quite leafy and pretty, yellow-brown, dotted. A thorn at Hall's fence is dark scarlet and pretty.

Those trees and bushes which grow in dense masses and have many fine twigs, being bare, make an agreeable misty impression where there are a myriad retreating points to receive the eye, not a hard, abrupt wall; just as, in the sky, the visual ray is cushioned on clouds, unless it is launched into the illimitable ether. The eye is less worn and wearied, not to say wounded, by looking at these mazes where the seer is not often conscious of seeing anything. It is well that the eye is so rarely caught and detained by any object in one whole hemisphere of its range, i.e. the sky. It enjoys everlasting holiday on this side. Only the formless clouds and the objectless ether are presented to it. For they are nervous who see many faces in the clouds. Corresponding to the clouds in the sky are those mazes now on the earth. Nature disposes of her naked stems so softly as not to put our eyes out. She makes them a smoke, or stationary cloud, on this side or that, of whose objective existence we rarely take cognizance. She does not expect us to notice them.

Nature has many scenes to exhibit, and constantly draws a curtain over this part or that. She is constantly repainting the landscape and all surfaces, dressing up some scene for our entertainment. Lately we had a leafy wilderness, now bare twigs begin to prevail, and soon she will surprise us with a mantle of snow. Some green she thinks so good for our eyes, like blue, that she never banishes it entirely, but has created evergreens.

It is remarkable how little any but a lichenist will observe on the bark of trees. The mass of men have but the vaguest and most indefinite notion of mosses, as a sort of shreds and fringes, and the world in which the lichenist dwells is much further from theirs than one side of this earth from the other. They see bark as if they saw it not. These objects which, though constantly visible, are rarely looked at are a sort of eye-brush.

Each phase of nature, while not invisible, is yet not too distinct and obtrusive. It is there to be found when we look for it, but not demanding our attention. It is like a silent but sympathizing companion in whose company we retain most of the advantages of solitude, with whom we can walk and talk, or be silent, naturally, without the necessity of talking in a strain foreign to the place.

Animals generally see things in the vacant way I have described. They rarely see anything but their food, or some real or imaginary foe. I never saw but one cow looking into the sky.

Lichens as they affect the scenery, as picturesque objects described by Gilpin or others, are one thing; as they concern the lichenist, quite another.

And a week later. Not heard since spring.

Vide Sept. 24, 1851.

I read that snow fell two or three inches deep in Bangor yesterday morning.

Nov. 10. I look out westward across Fair Haven Pond. The warmer colors are now rare. A cool and silvery light is the prevailing one; dark-blue or slate-colored clouds in the west, and the sun going down in them. All the light of November may be called an afterglow.

Aphides on alder.

Sap still flows in scarlet oak.

Returned by Spanish Brook Path. Notice the glaucous white bloom on the thimbleberry of late, as there are fewer things to notice. So many objects are white or light, preparing us for winter.

Nov. 12. It is much the coldest day yet, and the ground is a little frozen and resounds under my tread. All people move the brisker for the cold, yet are braced and a little elated by it. They love to say, "Cold day, sir." Though the days are shorter, you get more work out of a hired man than before, for he must work to keep warm.

Now for a brisk and energetic walk, with a will and a purpose. Have done with sauntering, in the idle sense. You must rush to the assault of winter. Make haste into the outskirts, climb the ramparts of the town, be on the alert and let nothing escape your observation.

I think that the change to some higher color in a leaf is an evidence that it has arrived at a late and more perfect and final maturity, answering to the maturity of fruits, and not to that of green leaves, etc., etc., which merely serve a purpose. The word "ripe" is thought by some to be derived from the verb "to reap," according to which that is ripe which is ready to be reaped. The fall of the leaf is preceded by a ripe old age.

Nov. 14. It is very cold and windy; thermometer 26. I walk to Walden and Andromeda Ponds. This strong and cutting northwest wind makes the oak leaves rustle dryly enough to set your heart on edge.

Now, while the frosty air begins to nip your fingers and your nose, the frozen ground rapidly wears away the soles of your shoes, as sandpaper might; the old she wolf is nibbling at your very extremities. The frozen ground eating away the soles of your shoes is only typical of the vulture that gnaws your heart this month.

Nov. 17. Leaving my boat, I walk through the low wood west of Dove Rock, toward the scarlet oak. The very sunlight on the pale-brown bleached fields is an interesting object these cold days. I naturally look toward it as to a wood-fire. Not only different objects are presented to our attention at different seasons of the year, but we are in a frame of body and of mind to appreciate different objects at different seasons. I see one thing when it is cold and another when it is warm.

We are interested at this season by the manifold ways in which the light is reflected to us. Ascending a little knoll covered with sweet-fern, shortly after, the sun appearing but a point above the sweet-fern, its light was reflected from a dense mass of the bare downy twigs of this plant in a surprising manner which would not be believed if described. It was quite like the sunlight reflected from grass and weeds covered with hoar frost. A myriad of surfaces are now prepared to reflect the light. This is one of the hundred silvery lights of November. The setting sun, too, is reflected from windows more brightly than at any other season. "November Lights" would be a theme for me.

Nature is moderate and loves degrees. Winter is not all white and sere. Some trees are evergreen to cheer us, and on the forest floor our eyes do not fall on sere brown leaves alone, but some evergreen shrubs are placed there to relieve the eye. Mountain laurel, lambkill, checkerberry, wintergreen, etc., etc., etc., and a few evergreen ferns scattered about keep up the semblance of summer still.

Nov. 19. P.M. — Mocker-nutting, to Conantum.

Those long mocker-nuts appear not to have got well ripe this year. They do not shed their husks, and the meat is mostly skinny and soft and flabby. Perhaps the season has been too cold. I shook the trees. It is just the time to get them. How hard they rattle down, like stones! There is a harmony between this stony fruit and these hard, tough limbs which bear it. I did not think at first why these nuts had not been gathered, but I suspect it may be because Puffer, who probably used to get them, has committed suicide.

Nov. 24. Here is an author who contrasts love for "the beauties of the person" with that for "excellences of the mind," as if these were the alternatives. I must say that it is for neither of these that I should feel the strongest affection. I love that one with whom I sympathize, be she "beautiful" or otherwise, of excellent mind or not.

Nov. 25. While most keep close to their parlor fires this cold and blustering Thanksgiving afternoon, and think with compassion of those who are abroad, I find the sunny south side of this swamp as warm as their parlors, and warmer to my spirit. Aye, there is a serenity and warmth here which the parlor does not suggest, enhanced by the sound of the wind roaring on the northwest side of the swamp a dozen or so rods off. What a wholesome and inspiring warmth is this!

Nov. 26. Walden is very low, compared with itself for some years. There is a shore at least six feet wide inside the alders at my old shore, and what is remarkable, I find that not only Goose Pond also has fallen correspondingly within a month, but even the smaller pond-holes only four or five rods over, such as Little Goose Pond, shallow as they are. I begin to suspect, therefore, that this rise and fall extending through a long series of years is not peculiar to the Walden system of ponds, but is true of ponds generally, and perhaps of rivers, though in their case it may be more difficult to detect. The Pout's Nest, also, has lost ten feet on all sides.

Those pouts' nests which I discovered in the spring are high and dry six feet from the water. I overhauled one, ripping up the frozen roof with my hands. The roof was only three inches thick, then a cavity and a bottom of wet mud. In this mud I found

two small frogs. They were quite sluggish and had evidently gone into winter quarters there, but probably some mink would have got them.

Looking more attentively, I detected also a great many minnows about one inch long either floating dead there or frozen into the ice, — at least fifty of them. They were shaped like bream, but had the transverse bars of perch.

Examining those minnows by day, I find that they are one and one sixth inches long by two fifths of an inch wide (this my largest); in form like a bream; of a very pale golden like a perch, or more bluish. Have but one dorsal fin and, as near as I can count, rays, dorsal 19 (first, 9 stouter and stiff and more distinctly pointed, then 10 longer and flexible, whole fin about three times as long as average height), caudal 19, anal 13 or 14, ventral 6, pectoral 10 (?). They have about seven transverse dusky bars like a perch (!). Yet, from their form and single dorsal fin, I think they are breams. Are they not a new species? Have young breams transverse bars? A little narrower than this.

Nov. 27. I got seventeen more of those little bream of yesterday. As I now count, the dorsal fin-rays are 9–10 (Girard says 9–11), caudal 17 (with apparently 4 short on each side), anal 3–11, pectoral 11, ventral 1–5. They have about seven transverse dark bars, a vertical dark mark under eye, and a dark spot on edge of operculum. They appear to be the young of the *Pomotis obesus*, described by Charles Girard to the Natural History Society in April, '54, obtained by Baird in fresh water about Hingham and in Charles River in Holliston. They are exceedingly pretty seen floating dead on their sides in a bowl of water, with all their fins spread out. From their size and form and position they cannot fail to remind you of coins in the basin.

[Pasted-in newspaper clipping, from a report of the proceedings of the Boston Society of Natural History: "Specimens of *Pomotis* and *Esox*, and of amphibians, were presented by Mr. H.D. Thoreau, from Concord, Mass. Mr. Putnam was of opinion that one of the *Pomotis* would prove a new species. There are with us two varieties of pickrel commonly known as the long or shovel-nosed, and the short or trout-nosed; these specimens were of the latter. Mr. Putnam was inclined to think these were distinct species, unless the differences should prove to be sexual. Drs. D.H. and H.R. Storer considered them varieties of the same species; Messrs. Baird and Girard think them (*Esox reticulatus* and *E. ornatus*) distinct."

Another clipping: "Mr. F.W. Putnam at a previous meeting stated that possibly the young *Pomotis* presented by Mr. Thoreau were the *P. obesus* of Girard. He had since then examined Girard's original specimens, and he finds that they are the same. The *P. guttatus* recently described in the Proceedings of the Academy of Natural Sciences at Philadelphia is identical with *P. obesus*. Having teeth on the palatines, and consequently belonging to the genus *Bryttus*, the proper name for the species is *B. obesus* (Putnam). He had also satisfied himself that the *Esox ornatus* of Girard is the same as the *E. fasciatus* of De Kay."

How much more remote the newly discovered species seems to dwell than the old and familiar ones, though both inhabit the same pond! Where the *Pomotis obesus* swims must be a new country, unexplored by science. The seashore may be settled,

but aborigines dwell unseen only thus far inland. This country is so new that species of fishes and birds and quadrupeds inhabit it which science has not yet detected. The water which such a fish swims in must still have a primitive forest decaying in it.

Nov. 28. A gray, overcast, still day, and more small birds — tree sparrows and chickadees — than usual about the house. There have been a very few fine snowflakes falling for many hours, and now, by 2 P.M., a regular snow-storm has commenced, fine flakes falling steadily, and rapidly whitening all the landscape. In half an hour the russet earth is painted white even to the horizon. Do we know of any other so silent and sudden a change?

And all the years that I have known Walden these striped breams have skulked in it without my knowledge! How many new thoughts, then, may I have?

Nov. 30. P.M. — To Walden with Channing, and Fair Haven Hill.

It is a pleasant day and the snow melting considerably.

I cannot but see still in my mind's eye those little striped breams poised in Walden's glaucous water. They balance all the rest of the world in my estimation at present, for this is the bream that I have just found, and for the time I neglect all its brethren and am ready to kill the fatted calf on its account. For more than two centuries have men fished here and have not distinguished this permanent settler of the township. When my eyes first rested on Walden the striped bream was poised in it, though I did not see it, and when Tahatawan paddled his canoe there. How wild it makes the pond and the township to find a new fish in it! America renews her youth here. But in my account of this bream I cannot go a hair's breadth beyond the mere statement that it exists, — the miracle of its existence, my contemporary and neighbor, yet so different from me! I can only poise my thought there by its side and try to think like a bream for a moment. I can only think of precious jewels, of music, poetry, beauty, and the mystery of life. I only see the bream in its orbit, as I see a star, but I care not to measure its distance or weight. The bream, appreciated, floats in the pond as the centre of the system, another image of God. Its life no man can explain more than he can his own. I want you to perceive the mystery of the bream. I have a contemporary in Walden. It has fins where I have legs and arms. I have a friend among the fishes, at least a new acquaintance. Its character will interest me, I trust, not its clothes and anatomy. I do not want it to eat. Acquaintance with it is to make my life more rich and eventful. It is as if a poet or an anchorite had moved into the town, whom I can see from time to time and think of yet oftener. Perhaps there are a thousand of these striped bream which no one had thought of in that pond, — not their mere impressions in stone, but in the full tide of the bream life.

Though science may sometimes compare herself to a child picking up pebbles on the seashore, that is a rare mood with her; ordinarily her practical belief is that it is only a few pebbles which are not known, weighed and measured. A new species of fish signifies hardly more than a new name. See what is contributed in the scientific reports. One counts the fin-rays, another measures the intestines, a third daguerreotypes a scale, etc., etc.; otherwise there's nothing to be said. As if all but this were done, and these were

very rich and generous contributions to science. Her votaries may be seen wandering along the shore of the ocean of truth, with their backs to that ocean, ready to seize on the shells which are cast up. You would say that the scientific bodies were terribly put to it for objects and subjects. A dead specimen of an animal, if it is only well preserved in alcohol, is just as good for science as a living one preserved in its native element.

What is the amount of my discovery to me? It is not that I have got one in a bottle, that it has got a name in a book, but that I have a little fishy friend in the pond. How was it when the youth first discovered fishes? Was it the number of their fin-rays or their arrangement, or the place of the fish in some system that made the boy dream of them? Is it these things that interest mankind in the fish, the inhabitant of the water? No, but a faint recognition of a living contemporary, a provoking mystery. One boy thinks of fishes and goes a-fishing from the same motive that his brother searches the poets for rare lines. It is the poetry of fishes which is their chief use; their flesh is their lowest use. The beauty of the fish, that is what it is best worth the while to measure. Its place in our systems is of comparatively little importance. Generally the boy loses some of his perception and his interest in the fish; he degenerates into a fisherman or an ichthyologist.

Dec. 3. The largest of the four breams (vide November 26th) two and nine twentieths inches long, by one inch broad and nine twentieths thick. The back, sides forward, tail, and anal fin black or blackish or very dark; the transverse dark bars few and indistinct except in middle of fish; sides toward tail yellowish-olive. Rear of abdomen has violet reflections (and about base of anal fin). Operculums tinged, streaked, and spotted with golden, coppery, greenish, and violet reflections. A vertical dark mark or line, corresponding to the stripes, through the eye. Iris copper-color or darker. [Etc.]

Dec. 11. P.M. — To Walden. An overcast afternoon and rather warm. The snow on the ground in pastures brings out the warm red in leafy oak woodlands by contrast. These are what Thomson calls "the tawny copse." So that they suggest both shelter and warmth. All browns, indeed, are warmer now than a week ago. How much warmer our woodlands look and are for these withered leaves that still hang on! Without them the woods would be dreary, bleak, and wintry indeed.

A "swirl," applied to leaves suddenly caught up by a sort of whirlwind, is a good word enough, methinks.

Some, being offended, think sharp and satirical things, which yet they are not prepared consciously to utter. But in some unguarded moment these things escape from them, when they are as it were unconscious. They betray their thoughts, as it were by talking in their sleep, for the truth will out, under whatever veil of civility.

Dec. 12. P.M. — Up river on ice to Fair Haven Hill.

Crossing the fields, I see an immense flock of snow buntings, I think the largest that I ever saw. There must be a thousand or two at least. Flying from you, in some positions, you see only or chiefly the black part of their bodies, and then, as they wheel, the white comes into view, contrasted prettily with the former, and in all together at the same time. Seen flying higher against a cloudy sky they look like large snowflakes. When

they rise all together their note is like the rattling of nuts in a bag, as if a whole binful were rolled from side to side. They also utter from time to time — i.e., individuals do — a clear rippling note, perhaps of alarm, or a call. Suddenly the pioneers (or a part not foremost) will change their course when in full career, and when at length they know it, the rushing flock on the other side will be fetched about as it were with an undulating jerk, as in the boys' game of snap-the-whip, and those that occupy the place of the snapper are gradually off after their leaders on the new tack. As far as I observe, they confine themselves to upland, not alighting in the meadows. Like a snow-storm they come rushing down from the north.

I should like to know where all those snowbirds will roost to-night, for they will probably roost together. And what havoc an owl might make among them!

Dec. 26. Call at a farmer's this Sunday afternoon, where I surprise the well-to-do masters of the house lounging in very ragged clothes (for which they think it necessary to apologize), and one of them is busy laying the supper-table (at which he invites me to sit down at last), bringing up cold meat from the cellar and a lump of butter on the end of his knife, and making the tea by the time his mother gets home from church. Thus sincere and homely, as I am glad to know, is the actual life of these New England men, wearing rags indoors there which would disgrace a beggar (and are not beggars and paupers they who could be disgraced so?) and doing the indispensable work, however humble. I am glad to find that our New England life has a genuine humane core to it; that inside, after all, there is so little pretense and brag.

Dec. 28. Aunt Jane says that she was born on Christmas Day, and they called her a Christmas gift, and she remembers hearing that her Aunt Hannah Orrock was so disconcerted by the event that she threw all the spoons outdoors, when she had washed them, or with the dishwater.

Father says that he and his sisters (except Elizabeth) were born in Richmond Street, Boston, between Salem and Hanover Streets, on the spot where a bethel now stands, on the left hand going from Hanover Street. They had milk of a neighbor, who used to drive his cows to and from the Common every day.

## 1859

Jan. 2. P.M. — To Cliffs and Walden.

Going up the hill through Stow's young oak woodland, I listen to the sharp, dry rustle of the withered oak leaves. This is the voice of the wood now. Just as the inhabitant of Cape Cod hears the surf ever breaking on its shores, so we countrymen hear this kindred surf on the leaves of the forest. Regarded as a voice, — though it is not articulate, — as our articulate sounds are divided into vowels (but this is nearer a consonant sound), labials, dentals, palatals, sibilants, mutes, aspirate, etc., so this may be called folial or frondal, produced by air driven against the leaves, and comes nearest to our sibilants or aspirate.

Why do young oaks retain their leaves while old ones shed them? Why do they die on the stem, having some life at the base in the one case, while they wither through at the base in the other case? Is it because in the former case they have more sap and vigor?

When I hear the hypercritical quarrelling about grammar and style, the position of the particles, etc., etc., stretching or contracting every speaker to certain rules of theirs, — Mr. Webster, perhaps, not having spoken according to Mr. Kirkham's rule, — I see that they forget that the first requisite and rule is that expression shall be vital and natural, as much as the voice of a brute or an interjection: first of all, mother tongue; and last of all, artificial or father tongue. Essentially your truest poetic sentence is as free and lawless as a lamb's bleat. The grammarian is often one who can neither cry nor laugh, yet thinks that he can express human emotions. So the posture-masters tell you how you shall walk, — turning your toes out, perhaps, excessively, — but so the beautiful walkers are not made.

Mediæval, or law, Latin seems to have invented the word "forest," not being satisfied with *silva*, *nemus*, etc. Webster makes it from the same root with "L. *foris*, Fr. *hors*, and the Saxon *faran*, to go, to depart." The allied words "all express distance from cities and civilization, and are from roots expressing departure or wandering," — as if this newer term were needed to describe those strange, wild woods furthest from the centres of civilization.

Jan. 4. A northeast snow-storm, or rather a north snow-storm, very hard to face. P.M. to Walden in it. It snows very hard, driving along almost horizontally, falling but a foot or two in a rod. Nobody is in the street, or thinks of going out far except on important business. Most roads are trackless. The snow may be now fifteen to eighteen inches deep.

The pitch pines near Thrush Alley are the most interesting objects, for they hold much more snow. The snow lodges on their plumes, and, bending them down, it accumulates more and more on the angle generally at the base of the several plumes, in little conical heaps shaped or somewhat like this: — differing according to the number and position of the plumes. They look as if a child had stuck up its elbow under a white sheet. Some small ones stand stiffly up-right like a soldier's plume. At the same time the lowermost small black and dead horizontal limbs near the ground, where there is least wind and jar, — these almost exclusively, — say for six or eight feet up, are covered with upright walls of snow five or six times their own height and zigzagging with them like the Wall of China; or like great white caterpillars they lie along them, these snowy sloths; or rather it is a labyrinth, a sort of cobweb, of broad white belts in the air. Only a dim twilight struggles through to this lower region, and the sight of these snowy walls or labyrinths suggests a rare stillness, freedom from wind and jar. If you try to stoop and wind your way there, you get your neck and ears full of snow. I can't draw it. That is, for each dead pine branch you have a thin flat branch of snow resting on it, an exaggeration of the former.

Your breath causes the snow to turn to ice in your beard; a shaggy mass of icicles it becomes, which makes you look like a man from the extreme north.

Jan. 13. The cold spell is over, and here this morning is a fog or mist; the wind, if there is any, I think, northerly; and there is built out horizontally on the north side of every twig and other surface a very remarkable sort of hoar frost, the crystallized fog, which is still increasing. It is quite rare here, at least on this scale. The mist lasts all this day, though it is far from warm (+11° at 8 A.M.), and till noon of the 14th, when it becomes rain, and all this time there is exceedingly little if any wind.

I go to the river this morning and walk up it to see the trees and bushes along it. As the frostwork (which is not thin and transparent like ice, but white and snow-like, or between the distinctly leaf with veins and a mere aggregation of snow, though you easily distinguish the distinct leaves) is built out northward from each surface, spreading at an angle of about forty-five degrees, i.e. some twenty-odd each side of the north, you must stand on the north side and look south at the trees, etc., when they appear, except the large limbs and trunk, wholly of snow or frostwork, mere ghosts of trees, seen softly against the mist for a background. It is mist on mist. The outline and character of each tree is more distinctly exhibited, being exaggerated, and you notice any peculiarity in the disposition of the twigs. Some elm twigs, thus enlarged into snowy fingers, are strikingly regular and handsome, thus: In the case of most evergreens, it amounts to a very rich sugaring, being so firmly attached. The weeping willow seems to weep with more remarkable and regular curve than ever, and stands still and white with thickened twigs, as if carved in white marble or alabaster. Those trees, like alders, which have not grown much the past year — which have short and angular twigs — are the richest in effect.

Jan. 14. The fog turns to a fine rain at noon, and in the evening and night it produces a glaze, which this morning, —

Jan. 15, — is quite handsome. Instead of that soft, white, faery-like mantle of down with which the trees were thickly powdered, they are now cased in a coat of mail, of icy mail, built out in many cases about as far from the twig with icy prominences. Birches, tree-tops, and especially slender-twigged willows or osiers are bent over by it, as they were not by the snow-white and light frost of yesterday and the day before, so that the character or expression of many trees and shrubs is wholly altered. I might not guess what the pollard willow row at Merrick's shore, with twigs one or two years old, was, — instead of

Jan. 18. That wonderful frostwork of the 13th and 14th was too rare to be neglected, — succeeded as it was, also, by two days of glaze, — but, having company, I lost half the advantage of it. It was remarkable to have a fog for four days in midwinter without wind. Apparently as the fog was coarser and far more abundant, it was whiter, less delicate to examine, and of far greater depth than a frostwork formed of dew. We did not have an opportunity to see how it would look in the sun, but seen against the mist or fog it was too fair to be remembered. The trees were the ghosts of trees appearing in their winding-sheets, an intenser white against the comparatively dusky ground of

the fog. I learn from the papers that this phenomenon prevailed all over this part of the country and attracted the admiration of all. The trees on Boston Common were clad in the same snow-white livery with our Musketaquid trees.

That glaze! I know what it was by my own experience; it was the frozen breath of the earth upon its beard.

Take the most rigid tree, the whole effect is peculiarly soft and spirit-like, for there is no marked edge or outline. How could you draw the outline of these snowy fingers seen against the fog, without exaggeration? There is no more a boundary-line or circumference that can be drawn, than a diameter. Hardly could the New England farmer drive to market under these trees without feeling that his sense of beauty was addressed. He would be aware that the phenomenon called beauty was become visible, if one were at leisure or had had the right culture to appreciate it. A miller with whom I rode actually remarked on the beauty of the trees; and a farmer told me in all sincerity that, having occasion to go into Walden Woods in his sleigh, he thought he never saw anything so beautiful in all his life, and if there had been men there who knew how to write about it, it would have been a great occasion for them.

Many times I thought that if the particular tree, commonly an elm, under which I was walking or riding were the only one like it in the country, it would be worth a journey across the continent to see it. Indeed, I have no doubt that such journeys would be undertaken on hearing a true account of it. But, instead of being confined to a single tree, this wonder was as cheap and common as the air itself. Every man's wood-lot was a miracle and surprise to him, and for those who could not go so far there were the trees in the street and the weeds in the yard.

In some moods you might suspect that it was the work of enchantment. Some magician had put your village into a crucible and it had crystallized thus.

Jan. 19. I noticed last night, just after sunset, a sheet of mackerel sky far in the west horizon, very finely imbricated and reflecting a coppery glow, and again I saw still more of it in the east this morning at sunrise, and now, at 3.30 P.M., looking up, I perceive that almost the entire heavens are covered with a very beautiful mackerel sky. This indicates a peculiar state of the atmosphere. The sky is most wonderfully and beautifully mottled with evenly distributed cloudlets, of indescribable variety yet regularity in their form, suggesting fishes' scales, with perhaps small fish-bones thrown in here and there. It is white in the midst, or most prominent part, of the scales, passing into blue in the crannies. Something like this blue and white mottling, methinks, is seen on a mackerel, and has suggested the name. Is not the peculiar propriety of this term lost sight of by the meteorologists? It is a luxury for the eye to rest on it. What curtains, what tapestry to our halls!

The form of these cloudlets is, by the way, like or akin to that of waves, of ripple-marks on sand, of small drifts, wave-like, on the surface of snow, and to the first small openings in the ice of the midstream.

Jan. 20. The green of the ice and water begins to be visible about half an hour before sunset. Is it produced by the reflected blue of the sky mingling with the yellow or pink of the setting sun?

Jan. 27. When you have been deprived of your usual quantity of sleep for several nights, you sleep much more soundly for it, and wake up suddenly like a bullet that strikes a wall.

Feb. 3. Five minutes before 3 P.M. Father died.

After a sickness of some two years, going down-town in pleasant weather, doing a little business from time to time, hoeing a little in the garden, etc., Father took to his chamber January 13th, and did not come down again. Most of the time previously he had coughed and expectorated a great deal. Latterly he did not cough, but continued to raise. He continued to sit up in his chamber till within a week before he died. He sat up for a little while on the Sunday four days before he died. Generally he was very silent for many months. He was quite conscious to the last, and his death was so easy that we should not have been aware that he was dying, though we were sitting around his bed, if we had not watched very closely.

I have touched a body which was flexible and warm, yet tenantless, — warmed by what fire? When the spirit that animated some matter has left it, who else, what else, can animate it?

How enduring are our bodies, after all! The forms of our brothers and sisters, our parents and children and wives, lie still in the hills and fields round about us, not to mention those of our remoter ancestors, and the matter which composed the body of our first human father still exists under another name.

When in sickness the body is emaciated, and the expression of the face in various ways is changed, you perceive unexpected resemblances to other members of the same family; as if within the same family there was a greater general similarity in the framework of the face than in its filling up and clothing.

Father first came to this town to live with his father about the end of the last century, when he was about twelve years old. (His father died in 1801.) Afterward he went to the Lexington Academy (Parker's?) a short time, perhaps a year, then into Deacon White's store as clerk; then learned the dry-goods business in a store in Salem. (Aunt J. shows me a letter from him directly after his going there, dated 1807.) Was with a Hathaway. When about twenty-one, opened a store for himself on the corner where the town house stands of late years, a yellow building, now moved and altered into John Keyes's house. He did so well there that Isaac Hurd went into partnership with him, to his injury. They soon dissolved, but could not settle without going to law, when my father gained the case, bringing his books into court. Then, I think, he went to Bangor and set up with Billings, selling to Indians (among others); married; lived in Boston; writes thence to aunts at Bangor in 1815 with John on his knee; moved to Concord (where I was born), then to Chelmsford, to Boston, to Concord again, and here remained. Mother first came to Concord about the same age that father did, but a little before him.

As far as I know, Father, when he died, was not only one of the oldest men in the middle of Concord, but the one perhaps best acquainted with the inhabitants, and the local, social, and street history of the middle of the town, for the last fifty years. He belonged in a peculiar sense to the village street; loved to sit in the shops or at the post-office and read the daily papers. I think that he remembered more about the worthies (and unworthies) of Concord village forty years ago, both from dealing as a trader and from familiar intercourse with them, than any one else. Our other neighbors, now living or very recently dead, have either come to the town more recently than he, or have lived more aloof from the mass of the inhabitants.

Some have spoken slightly of the Indians, as a race possessing so little skill and wit, so low in the scale of humanity, and so brutish that they hardly deserved to be remembered, — using only the terms “miserable,” “wretched,” “pitiful,” and the like. In writing their histories of this country they have so hastily disposed of this refuse of humanity (as they might have called it) which littered and defiled the shore and the interior. But even the indigenous animals are inexhaustibly interesting to us. How much more, then, the indigenous man of America! If wild men, so much more like ourselves than they are unlike, have inhabited these shores before us, we wish to know particularly what manner of men they were, how they lived here, their relation to nature, their arts and their customs, their fancies and superstitions. They paddled over these waters, they wandered in these woods, and they had their fancies and beliefs connected with the sea and the forest, which concern us quite as much as the fables of Oriental nations do. It frequently happens that the historian, though he professes more humanity than the trapper, mountain man, or gold-digger, who shoots one as a wild beast, really exhibits and practices a similar inhumanity to him, wielding a pen instead of a rifle.

One tells you with more contempt than pity that the Indian had no religion, holding up both hands, and this to all the shallow-brained and bigoted seems to mean something important, but it is commonly a distinction without a difference. Pray, how much more religion has the historian? If Henry Ward Beecher knows so much more about God than another, if he has made some discovery of truth in this direction, I would thank him to publish it in Silliman’s Journal, with as few flourishes as possible.

It is the spirit of humanity, that which animates both so-called savages and civilized nations, working through a man, and not the man expressing himself, that interests us most. The thought of a so-called savage tribe is generally far more just than that of a single civilized man.

I perceive that we partially die ourselves through sympathy at the death of each of our friends or near relatives. Each such experience is an assault on our vital force. It becomes a source of wonder that they who have lost many friends still live. After long watching around the sick-bed of a friend, we, too, partially give up the ghost with him, and are the less to be identified with this state of things.

The writer must to some extent inspire himself. Most of his sentences may at first lie dead in his essay, but when all are arranged, some life and color will be reflected

on them from the mature and successful lines; they will appear to pulsate with fresh life, and he will be enabled to eke out their slumbering sense, and make them worthy of their neighborhood. In his first essay on a given theme, he produces scarcely more than a frame and groundwork for his sentiment and poetry. Each clear thought that he attains to draws in its train many divided thoughts or perceptions. The writer has much to do even to create a theme for himself. Most that is first written on any subject is a mere groping after it, mere rubble-stone and foundation. It is only when many observations of different periods have been brought together that he begins to grasp his subject and can make one pertinent and just observation.

Feb. 5. When we have experienced many disappointments, such as the loss of friends, the notes of birds cease to affect us as they did.

I see another butcher-bird on the top of a young tree by the pond.

Feb. 7. Going along the Nut Meadow or Jimmy Miles road, when I see the sulphur lichens on the rails brightening with the moisture I feel like studying them again as a relisher or tonic, to make life go down and digest well, as we use pepper and vinegar and salads. They are a sort of winter greens which we gather and assimilate with our eyes. That's the true use of the study of lichens. I expect that the lichenist will have the keenest relish for Nature in her every-day mood and dress. To study lichens is to get a taste of earth and health, to go gnawing the rails and rocks. The lichenist extracts nutriment from the very crust of the earth. A taste for this study is an evidence of titanic health, a sane earthiness. It fits a man to deal with the barrenest and rockiest experience. A little moisture, a fog, or rain, or melted snow makes his wilderness to blossom like the rose. A lichenist fairs where others starve. His provender never fails.

Feb. 13. The old ice is covered with a dry, powdery snow about one inch deep, from which, as I walk toward the sun, this perfectly clear, bright afternoon, at 3.30 o'clock, the colors of the rainbow are reflected from a myriad fine facets. It is as if the dust of diamonds and other precious stones were spread all around. The blue and red predominate. Though I distinguish these colors everywhere toward the sun, they are so much more abundantly reflected to me from two particular directions that I see two distant rays, or arms, so to call them, of this rainbow-like dust, one on each side of the sun, stretching away from me and about half a dozen feet wide, the two arms including an angle of about sixty degrees. When I look from the sun, I see merely dazzling white points. Yet I might easily, and commonly do, overlook all this.

Sometimes in our prosaic moods, life appears to us but a certain number more of days like those which we have lived, to be cheered not by more friends and friendship but probably fewer and less. As, perchance, we anticipate the end of this day before it is done, close the shutters, and with a cheerless resignation commence the barren evening whose fruitless end we clearly see, we despondingly think that all of life that is left is only this experience repeated a certain number of times. And so it would be, if it were not for the faculty of imagination.

A transient acquaintance with any phenomenon is not sufficient to make it completely the subject of your muse. You must be so conversant with it as to remember

it and be reminded of it long afterward, while it lies remotely fair and elysian in the horizon, approachable only by the imagination.

Feb. 15. P.M. — Up river to Fair Haven Pond.

I thought, by the peculiar moaning sound of the wind about the dining-room at noon, that we should have a rain-storm. I heard only one blast through some crack, but no doubt that betrayed a pluvius breath.

Against Bittern Cliff I feel the first drop strike the right slope of my nose and run down the ravine there. Such is the origin of rivers. Not till half a mile further my doubting companion feels another on his nose also, and I get one in my eye, and soon after I see the countless dimples in the puddles on the ice. So measured and deliberate is Nature always. Then the gentle, spring-like rain begins, and we turn about.

The sound of it pattering on the dry oak leaves, where young oaks thickly cover a hillside, is just like that of wind stirring them, when first heard, but is steady and monotonous and so betrayed. We rejoice to be wetted, and the very smell of wet woollen clothes exhilarates us.

Feb. 20. In the composition it is the greatest art to find out as quickly as possible which are the best passages you have written, and tear the rest away to come at them. Even the poorest parts will be most effective when they serve these, as pediments to the column.

How much the writer lives and endures in coming before the public so often! A few years or books are with him equal to a long life of experience, suffering, etc. It is well if he does not become hardened. He learns how to bear contempt and to despise himself. He makes, as it were, post-mortem examinations of himself before he is dead. Such is art.

P.M. — The rain ceases, and it clears up at 5 P.M. It is a warm west wind and a remarkably soft sky, like plush; perhaps a lingering moisture there. What a revelation the blue and the bright tints in the west again, after the storm and darkness! It is the opening of the windows of heaven after the flood!

Feb. 22. Go to Worcester to lecture in a parlor.

Feb. 25. All the criticism which I got on my lecture on Autumnal Tints at Worcester on the 22d was that I assumed that my audience had not seen so much of them as they had. But after reading it I am more than ever convinced that they have not seen much of them, — that there are very few persons who do see much of nature.

March 2. As I go through the Cassandra Ponds, I look round on the young oak woods still clad with rustling leaves as in winter, with a feeling as if it were their last rustle before the spring, but then I reflect how far away still is the time when the new buds swelling will cause these leaves to fall. We thus commonly antedate the spring more than any other season, for we look forward to it with more longing. We talk about spring as at hand before the end of February, and yet it will be two good months, one sixth part of the whole year, before we can go a-maying. There may be a whole month of solid and uninterrupted winter yet, plenty of ice and good sleighing. We may not even see the bare ground, and hardly the water, and yet we sit down and warm our

spirits annually with this distant prospect of spring. As if a man were to warm his hands by stretching them toward the rising sun and rubbing them.

March 3. Going by the solidago oak at Clamshell Hill bank, I heard a faint rippling note and, looking up, saw about fifteen snow buntings sitting in the top of the oak, all with their breasts toward me, — sitting so still and quite white, seen against the white cloudy sky, they did not look like birds but the ghosts of birds, and their boldness, allowing me to come quite near, enhanced this impression. These were almost as white as snowballs, and from time to time I heard a low, soft rippling note from them. I could see no features, but only the general outline of plump birds in white. It was a very spectral sight, and after I had watched them for several minutes, I can hardly say that I was prepared to see them fly away like ordinary buntings when I advanced further. At first they were almost concealed by being almost the same color with the cloudy sky.

Talk about reading! — a good reader! It depends on how he is heard. It takes two at least for this game, as for love, and they must coöperate. I saw some men unloading molasses-hogsheads from a truck at a depot the other day, rolling them up an inclined plane. The truckman stood behind and shoved, after putting a couple of ropes one round each end of the hogshead, while two men standing in the depot steadily pulled at the ropes. The first man was the lecturer, the last was the audience. It is the duty of the lecturer to team his hogshead of sweets to the depot, or Lyceum, place the horse, arrange the ropes, and shove; and it is the duty of the audience to take hold of the ropes and pull with all their might.

Read well! Did you ever suck cider through a straw? Did you ever know the cider to push out of the straw when you were not sucking, — unless it chanced to be in a complete ferment? An audience will draw out of a lecture, or enable a lecturer to read, only such parts of his lecture as they like. If it is pronounced good, it is partly to the credit of the hearers; if bad, it is partly their fault. Sometimes a lazy audience refuses to cooperate and pull on the ropes with a will, simply because the hogshead is full and therefore heavy, when if it were empty, or had only a little sugar adhering to it, they would whisk it up the slope in a jiffy.

March 7. The mystery of the life of plants is kindred with that of our own lives, and the physiologist must not presume to explain their growth according to mechanical laws, or as he might explain some machinery of his own making. We must not expect to probe with our fingers the sanctuary of any life, whether animal or vegetable. If we do, we shall discover nothing but surface still. The ultimate expression or fruit of any created thing is a fine effluence which only the most ingenuous worshipper perceives at a reverent distance from its surface even. Only that intellect makes any progress toward conceiving of the essence which at the same time perceives the effluence.

Accordingly, I reject Carpenter's explanation of the fact that a potato vine in a cellar grows toward the light, when he says, "The reason obviously is, that, in consequence of the loss of fluid from the tissue of the stem on the side on which the light falls, it is contracted, whilst that of the other side remains turgid with fluid; the stem makes

a bend, therefore, until its growing point becomes opposite to the light, and then increases in that direction." (C.'s "Vegetable Physiology," page 174.)

There is no ripeness which is not, so to speak, something ultimate in itself, and not merely a perfected means to a higher end. In order to be ripe it must serve a transcendent use. The ripeness of a leaf, being perfected, leaves the tree at that point and never returns to it. It has nothing to do with any other fruit which the tree may bear, and only the genius of the poet can pluck it.

The fruit of a tree is neither in the seed nor the timber, — the full-grown tree, — but it is simply the highest use to which it can be put.

March 8. A rainy day.

P.M. — To Hill in rain.

To us snow and cold seem a mere delaying of the spring. How far we are from understanding the value of these things in the economy of Nature!

The earth is still mostly covered with ice and snow. As usual, I notice large pools of greenish water in the fields, on an icy bottom, which cannot owe their greenness to the reflected blue mingled with the yellowish light at sundown, as I supposed in the case of the green ice and water in clear winter days, for I see the former now at midday and in a rain-storm, when no sky is visible. I think that these green pools over an icy bottom must be produced by the yellow or common earth-stain in the water mingling with the blue which is reflected from the ice. Many pools have so large a proportion of this yellow tinge as not to look green but yellow. The stain, the tea, of withered vegetation — grass and leaves — and of the soil supplies the yellow tint.

But perhaps those patches of emerald sky, sky just tinged with green, which we sometimes see, far in the horizon or near it, are produced in the same way as I thought the green ice was, — some yellow glow reflected from a cloud mingled with the blue of the atmosphere.

One might say that the yellow of the earth mingled with the blue of the sky to make the green of vegetation.

Men of science, when they pause to contemplate "the power, wisdom, and goodness" of God, or, as they sometimes call him, "the Almighty Designer," speak of him as a total stranger whom it is necessary to treat with the highest consideration. They seem suddenly to have lost their wits.

March 11. P.M. — To Hunt house.

I go to get one more sight of the old house which Hosmer is pulling down, but I am too late to see much of it. The chimney is gone and little more than the oblong square frame stands. E. Hosmer and Nathan Hosmer are employed taking it down. The latter draws all the nails, however crooked, and puts them in his pockets, for, being wrought ones, he says it is worth the while.

On the chimney was the date 1703 (?), — I think that was it, — and if this was the date of the chimney, it would appear that the old part belonged to the Winthrops, and it may go back to near the settlement of the town. The timbers of the old part had been cased and the joists plastered over at some time, and, now that they were

uncovered, you saw many old memorandums and scores in chalk on them, as "May ye 4th," "Ephraim Brown," "0 — 3s — 4d," "oxen," — so they kept their score or tally, — such as the butcher and baker sometimes make. Perhaps the occupant had let his neighbor have the use of his oxen so many days. I asked if they had found any old coins. N. Hosmer answered, Yes, he had, and showed it me, — took it out of his pocket. It was about as big as a quarter of a dollar, with "Britain," etc., legible, "Geo II," and date "1742," but it was of lead. But there was no manuscript, — not a copy of verses, only these chalk records of butter and cheese, oxen and bacon, and a counterfeit coin, out of the smoky recesses.

My mother says that she has been to the charitable society there. One old jester of the town used to call it "the chattable society."

Mrs. A. takes on dolefully on account of the solitude in which she lives, but she gets little consolation. Mrs. B. says she envies her that retirement. Mrs. A. is aware that she does, and says it is as if a thirsty man should envy another the river in which he is drowning. So goes the world. It is either this extreme or that. Of solitude one gets too much and another not enough.

E. Hosmer says that a man told him that he had seen my uncle Charles take a twelve-foot ladder, set it up straight, and then run up and down the other side, kicking it from behind him as he went down. E.H. told of seeing him often at the tavern toss his hat to the ceiling, twirling it over, and catch it on his head every time.

Large flocks of blackbirds to-day in the elm-tops and other trees. These are the first conspicuous large flocks of birds. J. Farmer says he saw ducks this morning and has seen larks some days. Channing saw geese to-day.

Find out as soon as possible what are the best things in your composition, and then shape the rest to fit them. The former will be the midrib and veins of the leaf.

There is always some accident in the best things, whether thoughts or expressions or deeds. The memorable thought, the happy expression, the admirable deed are only partly ours. The thought came to us because we were in a fit mood; also we were unconscious and did not know that we had said or done a good thing. We must walk consciously only part way toward our goal, and then leap in the dark to our success. What we do best or most perfectly is what we have most thoroughly learned by the longest practice, and at length it falls from us without our notice, as a leaf from a tree. It is the last time we shall do it, — our unconscious leavings.

March 12. It is a regular spring rain, such as I remember walking in, — windy but warm. It alternately rains hard and then holds up a little. A similar alternation we see in the waves of water and all undulating surfaces, — in snow and sand and the clouds (the mackerel sky). Now you walk in a comparative lull, anticipating fair weather, with but a slight drizzling, and anon the wind blows and the rain drives down harder than ever. In one of these lulls, as I passed the Joe Hosmer (rough-cast) house, I thought I never saw any bank so handsome as the russet hillside behind it. It is a very barren, exhausted soil, where the cladonia lichens abound, and the lower side is a flowing sand, but this russet grass with its weeds, being saturated with moisture, was in this light

the richest brown, methought, that I ever saw. A peculiar and unaccountable light seemed to fall on that bank or hillside, though it was thick storm all around. A sort of Newfoundland sun seemed to be shining on it. It was a prospect to excite a reindeer. These tints of brown were as softly and richly fair and sufficing as the most brilliant autumnal tints. This kind of light, the air being full of rain and all vegetation dripping with it, brings out the browns wonderfully.

March 13. I see a small flock of blackbirds flying over, some rising, others falling, yet all advancing together, one flock but many birds, some silent, others tchucking, — incessant alternation. This harmonious movement as in a dance, this agreeing to differ, makes the charm of the spectacle to me. One bird looks fractional, naked, like a single thread or ravelling from the web to which it belongs. Alternation! Alternation! Heaven and hell! Here again in the flight of a bird, its ricochet motion, is that undulation observed in so many materials, as in the mackerel sky.

I cannot easily forget the beauty of those terrestrial browns in the rain yesterday. The withered grass was not of that very pale hoary brown that it is to-day, now that it is dry and lifeless, but, being perfectly saturated and dripping with the rain, the whole hillside seemed to reflect a certain yellowish light, so that you looked around for the sun in the midst of the storm. All the yellow and red and leather-color in the fawn-colored weeds was more intense than at any other season. The withered ferns which fell last fall — pinweeds, sarothra, etc. — were actually a glowing brown for the same reason, being all dripping wet. The very bare sand slopes, with only here and there a thin crusting of mosses, was a richer color than ever it is.

In short, in these early spring rains, the withered herbage, thus saturated, and reflecting its brightest withered tint, seems in a certain degree to have revived, and sympathizes with the fresh greenish or yellowish or brownish lichens in its midst, which also seem to have withered. It seemed to me — and I think it may be the truth — that the abundant moisture, bringing out the highest color in the brown surface of the earth, generated a certain degree of light, which, when the rain held up a little, reminded you of the sun shining through a thick mist.

The barrenest surfaces, perhaps, are the most interesting in such weather as yesterday, when the most terrene colors are seen. The wet earth and sand, and especially subsoil, are very invigorating sights.

The Hunt house, to draw from memory, — though I have given its measures within two years in my Journal, — looked like this: —

This is only generally correct, without a scale.

March 14. P.M. — To Hunt house.

I thought from the above drawing that the original door must have been in the middle of the old part and not at one end, and that I should detect it in the manner in which the studs were set in. I really did so and found some other traces of the old door (where I have dotted it) when I got there. Some of the chalkmarks which have been preserved under the casing of the timbers so long have been completely washed off in yesterday's rain, as the frame stood bare. Also read in chalk on a chamber floor

joist (which had been plastered over beneath) “enfine Brown,” so many s. and d., and what most read for “Feb 1666,” but, being written over a rough knot, it is doubtful. “Hides 3.”

March 16. I look down over Tarbell’s Bay, just north of Ball’s Hill. Not only meadows but potato and rye fields are buried deep, and you see there, sheltered by the hills on the northwest, a placid blue bay having the russet hills for shores. This kind of bay, or lake, made by the freshet — these deep and narrow “fiords” — can only be seen along such a stream as this, liable to an annual freshet. The water rests as gently as a dewdrop on a leaf, laving its tender temporary shores. It has no strand, leaves no permanent water-mark, but though you look at it a quarter of a mile off, you know that the rising flood is gently overflowing a myriad withered green blades there in succession. There is the magic of lakes that come and go. The lake or bay is not an institution, but a phenomenon. You plainly see that it is so much water poured into the hollows of the earth.

March 17. 6.30 A.M. — River risen still higher.

I realize how water predominates on the surface of the globe. I am surprised to see new and unexpected water-lines, drawn by the level edge of the flood about knolls in the meadows and in the woods, — waving lines, rarely if ever recognized or thought of by the walker or any, which mark the boundary of a possible or probable freshet any spring. Even if the highest water-mark were indicated at one point, the surveyor could not, with any labor short of infinite, draw these lines for us which wind about every elevation of earth or rock. Yet, though this slight difference of level which the water so simply and effectually points out, is so unobservable by us ordinarily, no doubt Nature never forgets it for a moment, but plants grow and insects, etc., breed in conformity to it. Many a kingdom of nature has its boundaries parallel with this waving line. By these freshets, the relation of some field, usually far from the stream, to future or past deluge is suggested. I am surprised and amused, at least, to walk in such a field and observe the nice distinctions which the great water-level makes there. So plants and animals and thoughts have their commonly unseen shores, and many portions of the earth are, with reference to them, islands or peninsulas or capes, shores or mountains.

We are stiff and set in our geography because the level of water is comparatively, or within short periods, unchangeable. We look only in the sea for islands and continents and their varieties. But there are more subtle and invisible and fluctuating floods which island this or that part of the earth whose geography has never been mapped. For instance, here is Mantatuket Rock, commonly a rocky peninsula with a low or swampy neck and all covered with wood. It is now a small rocky island, and not only the swampy neck but a considerable portion of the upland is blotted out by the flood, covered and concealed under water; and what surprises me is that the water should so instantly know and select its own shore on the upland, though I could not have told with my eye whether it would be thirty feet this way or as many that. A distinction is made for me by the water in this case which I had never thought of, revealing the relation of this surface to the flood ordinarily far from it, and which I now begin to

perceive that every tree and shrub and herbaceous plant growing there knew, if I did not.

How different to-day from yesterday! Yesterday was a cool, bright day, the earth just washed bare by the rain, and a strong northwest wind raised respectable billows on our vernal seas and imparted remarkable life and spirit to the scene. To-day it is perfectly still and warm; but, seen through this air, though many might not notice the difference, the russet surface of the earth does not shine, is not bright. The air is comparatively dead when I attend to it, and it is as if there were the veil of a fine mist over all objects, dulling their edges. Yet this would be called a clear day. These aerial differences in the days are not commonly appreciated, though they affect our spirits.

As I float by the Rock, I hear rustling amid the oak leaves above that new water-line, and, there being no wind, I know it to be a striped squirrel, and soon see its long-unseen striped sides flirting about the instep of an oak. Its lateral stripes, alternate black and yellowish, are a type which I have not seen for a long time, or rather a punctuation-mark, the character to indicate where a new paragraph commences in the revolution of the seasons. Double lines.

March 18. Consider how I discovered where the Winthrop family in this town placed their front door some two hundred years ago, without any verbal or written or ocular evidence. I, with others, saw by the frame of the old Hunt house that an addition had been made to its west end in 1703. This brought the front door, which was in the middle of the present, near one end of the original or Winthrop house. I, sitting at home, said to myself, having an occult sympathy with the Winthrops of that date, "The front door must originally have been in the middle of the old house, for symmetry and convenience required it, and if it was, I shall find traces of it; I shall find there where studs have been set into the frame in a different manner from the rest." I went to the house and looked where the door should have been, and I found precisely the evidence I sought, and, beside, where the timber above had been cut out just the width of the door.

March 19. All sorts of lumber is afloat. Rails, planks, and timber, etc., which the unthrifty neglected to secure now change hands. Much railroad lumber is floated off. While one end rests on the land, it is the railroad's, but as soon as it is afloat it is made the property of him who saves it. I see some poor neighbors as earnest as the railroad employees are negligent, to secure it. It blows so hard that you walk aslant against the wind. Your very beard, if you wear a full one, is a serious cause of detention.

The meadows are all in commotion. The ducks are now concealed by the waves, if there are any floating there. The wind makes such a din about your ears that conversation is difficult; your words are blown away and do not strike the ear they were aimed at. If you walk by the water, the tumult of the waves confuses you. If you go by a tree or enter the woods, the din is yet greater. Nevertheless this universal commotion is very interesting and exciting.

We are interested in the phenomena of Nature mainly as children are, or as we are in games of chance. They are more or less exciting. Our appetite for novelty is

insatiable. We do not attend to ordinary things, though they are most important, but to extraordinary ones. While it is only moderately hot or cold, or wet or dry, nobody attends to it, but when Nature goes to an extreme in any of these directions we are all on the alert with excitement. Not that we care about the philosophy or the effects of this phenomenon. E.g., when I went to Boston in the early train the coldest morning of last winter, two topics mainly occupied the attention of the passengers, Morphy's chess victories and Nature's victorious cold that morning. The inhabitants of various towns were comparing notes, and that one whose door opened upon a greater degree of cold than any of his neighbors' doors chuckled not a little. Almost every one I met asked me almost before our salutations were over "how the glass stood" at my house or in my town, — the librarian of the college, the registrar of deeds at Cambridgeport, — a total stranger to me, whose form of inquiry made me think of another sort of glass, — and each rubbed his hands with pretended horror but real delight if I named a higher figure than he had yet heard. It was plain that one object which the cold was given us for was our amusement, a passing excitement. It would be perfectly consistent and American to bet on the coldness of our respective towns, of the morning that is to come. Thus a greater degree of cold may be said to warm us more than a less one. We hear with ill-concealed disgust the figures reported from some localities, where they never enjoy the luxury of severe cold. This is a perfectly legitimate amusement, only we should know that each day is peculiar and has its kindred excitements.

March 23. The qualities of the land that are most attractive to our eyes now are dryness and firmness. It is not the rich black soil, but warm and sandy hills and plains which tempt our steps. We love to sit on and walk over sandy tracts in the spring like cicindelas. These tongues of russet land tapering and sloping into the flood do almost speak to one. They are alternately in sun and shade. When the cloud is passed, and they reflect their pale-brown light to me, I am tempted to go to them.

The loud peep (?) of a pigeon woodpecker is heard in our sea, and anon the prolonged loud and shrill cackle, calling the thin-wooded hillsides and pastures to life. It is like the note of an alarm-clock set last fall so as to wake Nature up at exactly this date. Up up up up up up up up!

It is suggested that the blue is darkest when reflected from the most agitated water, because of the shadow (occasioned by the inequalities) mingled with it.

Some Indians of the north have but one word for blue and black, and blue is with us considered the darkest color, though it is the color of the sky or air. Light, I should say, was white; the absence of it, black. Hold up to the light a perfectly opaque body and you get black, but hold up to it the least opaque body, such as air, and you get blue. Hence you may say that blue is light seen through a veil.

March 25. Again I walk in the rain and see the rich yellowish browns of the moist banks. Surely russet is not the name which describes the fields and hillsides now, whether wet or dry. There is not red enough in it. I do not know a better name for this (when wet) yellowish brown than "tawny." On the south side of these warm hills, it may perhaps be called one of the fawn-colors, i.e. brown inclining to green. Much

of this peculiar yellowish color on the surface of the Clamshell plain is due to a little curled sedge or grass growing at short intervals, loosely covering the ground (with green mosses intermixed) in little tufts like curled hair.

Day before yesterday, in clear, dry weather, we had pale-brown or fawn-colored earth, i.e., a dry, withered grass blade; to-day, a more yellow brown or tawny, the same being wet. The wet brings out an agreeable yellow light, as if the sun were shining through a mist on it. The earth is more truly russet in November, when there is more redness left in the withered and withering vegetation. Such is the change in the color of the bare portions of the earth (i.e. bare of trees and bushes) produced by rain. Also the oak leaves are much redder. In fair weather the light color of these objects was simply a light reflected from them, originating in the sun and sky; now it is a more proper and inward light, which attracts and confines our attention to moist sward itself.

A snipe flies away from the moist Clamshell shore, uttering its cr-a-ack c-r-r-rack.

I thought the other day, How we enjoy a warm and pleasant day at this season! We dance like gnats in the sun.

The color of spring hitherto, — I should say that in dry weather it was fawn-colored, in wet more yellowish or tawny. When wet, the green of the fawn is supplied by the lichens and the mosses.

March 28. P.M. — Paddle to the Bedford line.

It is now high time to look for arrowheads, etc. I spend many hours every spring gathering the crop which the melting snow and rain have washed bare. It is one of the regular pursuits of the spring.

I have not decided whether I had better publish my experience in searching for arrowheads in three volumes, with plates and an index, or try to compress it into one. These durable implements seem to have been suggested to the Indian mechanic with a view to my entertainment in a succeeding period. After all the labor expended on it, the bolt may have been shot but once perchance, and the shaft which was devoted to it decayed, and there lay the arrowhead, sinking into the ground, awaiting me. They lie all over the hills with like expectation, and in due time the husbandman is sent, and, tempted by the promise of corn or rye, he plows the land and turns them up to my view. Many as I have found, methinks the last one gives me about the same delight that the first did. Some time or other, you would say, it had rained arrowheads, for they lie all over the surface of America. You cannot tell the third-hand ones (for they are all second-hand) from the others, such is their persistent out-of-door durability; for they were chiefly made to be lost. They are sown, like a grain that is slow to germinate, broadcast over the earth. Like the dragon's teeth which bore a crop of soldiers, these bear crops of philosophers and poets, and the same seed is just as good to plant again. It is a stone fruit. Each one yields me a thought. I come nearer to the maker of it than if I found his bones. His bones would not prove any wit that wielded them, such as this work of his bones does. It is humanity inscribed on the face of the earth, patent to my eyes as soon as the snow goes off, not hidden away in some crypt or grave or

under a pyramid. No disgusting mummy, but a clean stone, the best symbol or letter that could have been transmitted to me.

The Red Man, his mark

At every step I see it, and I can easily supply the “Tahatawan” or “Mantatuket” that might have been written if he had had a clerk. It is no single inscription on a particular rock, but a footprint — rather a mindprint — left everywhere, and altogether illegible.

Time will soon destroy the works of famous painters and sculptors, but the Indian arrowhead will balk his efforts and Eternity will have to come to his aid. They are not fossil bones, but, as it were, fossil thoughts, forever reminding me of the mind that shaped them. I would fain know that I am treading in the tracks of human game, — that I am on the trail of mind, — and these little reminders never fail to set me right.

It is a recommendation that they are so inobvious, — that they occur only to the eye and thought that chances to be directed toward them. When you pick up an arrowhead and put it in your pocket, it may say: “Eh, you think you have got me, do you? But I shall wear a hole in your pocket at last, or if you put me in your cabinet, your heir or great-grandson will forget me or throw me out the window directly, or when the house falls I shall drop into the cellar, and there I shall lie quite at home again. Ready to be found again, eh? Perhaps some new red man that is to come will fit me to a shaft and make me do his bidding for a bow-shot. What reck I?”

I suspect it will be found that there is really some advantage in large birds of passage flying in the wedge form and cleaving their way through the air, — that they really do overcome its resistance best in this way, — and perchance the direction and strength of the wind determine the comparative length of the two sides.

The great gulls fly generally up or down the river valley, cutting off the bends of the river, and so do these geese. These fly sympathizing with the river, — a stream in the air, soon lost in the distant sky.

We see these geese swimming and flying at midday and when it is perfectly fair.

If you scan the horizon at this season of the year you are very likely to detect a small flock of dark ducks moving with rapid wing athwart the sky, or see the undulating line of migrating geese against the sky.

How charming the contrast of land and water, especially a temporary island in the flood, with its new and tender shores of waving outline, so withdrawn yet habitable, above all if it rises into a hill high above the water and contrasting with it the more, and if that hill is wooded, suggesting wildness! Our vernal lakes have a beauty to my mind which they would not possess if they were more permanent. But this particular phase of beauty is fleeting. In a few days, perchance, these lakes will have all run away to the sea. In many arrangements there is a wearisome monotony. We know too well what we shall have for our Saturday’s dinner, but each day’s feast in Nature’s year is a surprise to us and adapted to our appetite and spirits. Her motive is not economy but satisfaction.

March 31. It will show how our prejudices interfere with our perception of color, to state that yesterday morning, after making a fire in the kitchen cooking-stove, as I sat

over it I thought I saw a little bit of red or scarlet flannel on a chink near a bolt-head on the stove, and I tried to pick it out, — while I was a little surprised that I did not smell it burning. It was merely the reflection of the flame of the fire through a chink, on the dark stove. This showed me what the true color of the flame was, but when I knew what this was, it was not very easy to perceive it again. It appeared now more yellowish. I think that my senses made the truest report the first time.

It is a very windy afternoon, wind northwest, and at length a dark cloud rises on that side, evidently of a windy structure, a dusky mass with lighter intervals, like a parcel of brushes lying side by side, — a parcel of “mare’s-tails” perhaps. It winds up with a flurry of rain.

April 3. Men’s minds run so much on work and money that the mass instantly associate all literary labor with a pecuniary reward. They are mainly curious to know how much money the lecturer or author gets for his work. They think that the naturalist takes so much pains to collect plants or animals because he is paid for it. An Irishman who saw me in the fields making a minute in my note-book took it for granted that I was casting up my wages and actually inquired what they came to, as if he had never dreamed of any other use for writing. I might have quoted to him that the wages of sin is death, as the most pertinent answer. “What do you get for lecturing now?” I am occasionally asked. It is the more amusing since I only lecture about once a year out of my native town, often not at all; so that I might as well, if my objects were merely pecuniary, give up the business. or

Vide.

Vide Dec. 3.

Melvin tells me that he saw a thousand feeding a long time in the Great Meadows, — he thinks on the seeds of the wool-grass (!!), — about same time.

April 12. I look again at the meadow-crust carried off by the ice. There is one by the railroad bridge, say three rods by one, covered with button-bushes and willows. Another, some five rods by three, at the south end of Potter Swamp Meadow, also covered densely with button-bushes, etc. It is far from the river, by the edge of the wood. Another, and the most interesting one, lies up high some thirty rods north of this near the wood-side and fifteen rods from the river. I measure it with a tape. It is rudely triangular and about four rods on a side, though the sides are longer on the convex line. As well as the other, it is from one to three feet thick and very densely covered with button-bushes, with a few black and other willows and late roses from four to seven feet high. As dense and impassable as any kind of thicket that we have, and there are, besides, countless great yellow and white lily and pontederia roots in it. It is a large and densely bushy island in the meadow. It would surprise any one to behold it. Suppose that you were to find in the morning such a slice of the earth’s crust with its vegetation dropped in your front yard, if it could contain it. I think we should not soon hear the last of it. It is an island such as might almost satisfy Sancho Panza’s desires. It is a forest, in short, and not a very small one either. It is Birnam wood come to Dunsinane. It contained at least eight square rods.

Such revolutions can take place and none but the proprietor of the meadow notice it, for the traveller passing within sight does not begin to suspect that the bushy island which he sees in the meadow has floated from elsewhere, or if he saw it when on its voyage, he would not know it for a voyager. In one year all the raw edge is concealed, and the vegetation thus transplanted does not appear to find it out. These must have been carried off about the 16th of March or when the river broke up, perhaps in that strong southwest wind of the 19th. The ice, being eighteen or twenty inches thick and having ten thousand strong handles to take hold by, aided too often by the lightness of the frozen meadow, can easily lift these masses, and if there were rocks imbedded in them, would move them also.

The present islands, bushy or wooded, in the meadow have no doubt commonly had this origin. The soil is there doubled, and so elevated, and the plants set out at the same time. When the flood comes with icy hands you have got a mighty lifter at work. Black willows ten feet high and these four or five rods of button-bushes are all taken up together with their soil and carried upright and without jarring to a new locality half a mile or more distant.

April 15. The bay-wing now sings — the first I have been able to hear. It comes to revive with its song the dry uplands and pastures and grass-fields about the skirts of villages. If you yield for a moment to the impressions of sense, you hear some bird giving expression to its happiness in a pleasant strain. We are provided with singing birds and with ears to hear them. What an institution that!

Consider how much is annually spent on the farmer's life: the beauty of his abode, which has inspired poets since the world was made; the hundreds of delicate and beautiful flowers scattered profusely under his feet and all around him, as he walks or drives his team afield, — he cannot put his spade into uncultivated, nor into much cultivated, ground without disturbing some of them; a hundred or two of equally beautiful birds to sing to him morning and evening, and some at noonday, a good part of the year; a perfect sky arched over him, a perfect carpet spread under him, etc., etc.!

April 17. The air which was so lately void and silent begins to resound as it were with the breathing of a myriad fellow-creatures, and even the unhappy man, on the principle that misery loves company, is soothed by this infinite din of neighbors. I have listened for the notes of various birds, and now, in this faint hum of bees, I hear as it were the first twittering of the bird Summer.

A wood tortoise on bank; first seen, water so high.

April 21. Setting pines all day in R.W.E.'s Wyman lot. This makes two and a half days, with two men and a horse and cart to help me. We have set some four hundred trees at fifteen feet apart diamondwise, covering some two acres. I set every one with my own hand, while another digs the holes where I indicate, and occasionally helps the other dig up the trees. We prefer bushy pines only one foot high which grow in open or pasture land, yellow-looking trees which are used to the sun, instead of the spindling dark-green ones from the shade of the woods. There are a great many more

of these plants to be had along the edges and in the midst of any white pine wood than one would suppose.

Got about one hundred and twenty from George Heywood's land and the rest from the Brister lot and this Wyman lot itself.

R.W.E. has bought a quarter of a pound of white pine seed at \$4.00 per pound.

We could not dig up pines on the north side of the wood on the Brister lot to-day on account of frost! Though we had quite forgotten it, and put the winter so far behind us.

April 22. When setting the pines at Walden the last three days, wandering thoughts visited me, which I have now forgotten. My senses were busily suggesting them, though I was unconscious of their origin. E.g., I first consciously found myself entertaining the thought of a carriage on the road, and directly after I was aware that I heard it. No doubt I had heard it before, or rather my ears had, but I was quite unconscious of it, — it was not a fact of my then state of existence; yet such was the force of habit, it affected my thoughts nevertheless, so double, if not treble, even, are we. Sometimes the senses bring us information quicker than we can receive it. Perhaps these thoughts which run in ruts by themselves while we are engaged in some routine may be called automatic. I distinctly entertained the idea of a carriage, without the slightest suspicion how it had originated or been suggested to my mind. I have no doubt at all that my ears had heard it, but my mind, just then preoccupied, had refused to attend to it. This suggests that most, if not all, indeed, of our ideas may be due some sort of sensuous impression of which we may or may not be conscious.

April 24. There is a season for everything, and we do not notice a given phenomenon except at that season, if, indeed, it can be called the same phenomenon at any other season. There is a time to watch the ripples on Ripple Lake, to look for arrowheads, to study the rocks and lichens, a time to walk on sandy deserts; and the observer of nature must improve these seasons as much as the farmer his. So boys fly kites and play ball or hawkie at particular times all over the State. A wise man will know what game to play to-day, and play it. We must not be governed by rigid rules, as by the almanac, but let the season rule us. The moods and thoughts of man are revolving just as steadily and incessantly as nature's. Nothing must be postponed. Take time by the forelock. Now or never! You must live in the present, launch yourself on every wave, find your eternity in each moment. Take any other course, and life will be a succession of regrets. There is no world for the penitent and regretful.

Dr. B. asked me what I found that was new these days, if I was still looking after the beautiful. I told him yes, and that I wished to hire two or three good observers.

April 29. 7 A.M. — To Walden, and set one hundred larch trees from England, all two years from seed, about nine inches high, just begun to leaf.

May 1. We accuse savages of worshipping only the bad spirit, or devil, though they may distinguish both a good and a bad; but they regard only that one which they fear and worship the devil only. We too are savages in this, doing precisely the same thing. This occurred to me yesterday as I sat in the woods admiring the beauty of the blue

butterfly. We are not chiefly interested in birds and insects, for example, as they are ornamental to the earth and cheering to man, but we spare the lives of the former only on condition that they eat more grubs than they do cherries, and the only account of the insects which the State encourages is of the "Insects Injurious to Vegetation." We too admit both a good and a bad spirit, but we worship chiefly the bad spirit, whom we fear. We do not think first of the good but of the harm things will do us.

The catechism says that the chief end of man is to glorify God and enjoy him forever, which of course is applicable mainly to God as seen in his works. Yet the only account of its beautiful insects — butterflies, etc. — which God has made and set before us which the State ever thinks of spending any money on is the account of those which are injurious to vegetation! This is the way we glorify God and enjoy him forever. Come out here and behold a thousand painted butterflies and other beautiful insects which people the air, then go to the libraries and see what kind of prayer and glorification of God is there recorded.

Science is inhuman. Things seen with a microscope begin to be insignificant. So described, they are as monstrous as if they should be magnified a thousand diameters. Suppose I should see and describe men and houses and trees and birds as if they were a thousand times larger than they are!

Very warm. See hundreds of turtles. All up and down our river meadows their backs are shining in the sun to-day. It is a turtle day.

As we sat on the steep hillside south of Nut Meadow Brook Crossing, we noticed a remarkable whirlwind on a small scale, which carried up the oak leaves from that Island copse in the meadow. The oak leaves now hang thinly and are very dry and light, and these small whirlwinds, which seem to be occasioned by the sudden hot and calm weather (like whirlpools or dimples in a smooth stream), wrench them off, and up they go, somewhat spirally, in countless flocks like birds, with a rustling sound; and higher and higher into the clear blue deeps they rise above our heads, till they are fairly lost to sight, looking, when last seen, mere light specks against the blue, like stars by day, in fact. I could distinguish some, I have no doubt, five or six hundred feet high at least, but if I looked aside a moment they were lost. The largest oak leaves looked not bigger than a five-cent-piece. These were drifting eastward, — to descend where? Methought that, instead of decaying on the earth or being consumed by fire, these were being translated and would soon be taken in at the windows of heaven. I had never observed this phenomenon so remarkable. The flight of the leaves. This was quite local, and it was comparatively still where we sat a few rods on one side. Thousands went up together in a rustling flock.

May 4. Wednesday. P.M. — To Lee's Cliff on foot.

This the fourth warm day. Looking up through this soft and warm southwest wind, I notice the conspicuous shadow of Middle Conantum Cliff, now at 3 P.M., and elsewhere the shade of a few apple trees, — their trunks and boughs. It is remarkable that shadow should only be noticed now when decidedly warm weather comes, though before the leaves have expanded, i.e., when it begins to be grateful to our senses. This first shadow

is as noticeable and memorable as a flower. I observe annually the first shadow of this cliff. When we begin to pass from sunshine into shade for our refreshment; when we look on shade with yearning as on a friend. That cliff and its shade suggests dark eyes and eyelashes and overhanging brows. Few things are more suggestive of heat than this first shade, though now we see only the tracery of tree-boughs on the greening grass and the sandy street. This I notice at the same time with the first bumblebee, when the *Rana palustris* purrs in the meadow generally, the white willow and aspen display their tender green full of yellow light, the particolored warbler is first heard over the swamp, the woodchuck, who loves warmth, is out on the hillsides in numbers, the jingle of the chip-bird is incessantly heard, the thrasher sings incessantly, the first cricket is heard in a warm rocky place, and that scent of vernal flowers is in the air.

Life out of doors begins.

May 5. Thursday. Red-wings fly in flocks yet. Near the oak beyond Jarvis land, a yellow butterfly, — how hot! this meteor dancing through the air. Also see a scalloped-edge dark-colored butterfly resting on the trunk of a tree, where, both by its form and color, its wings being closed, it resembles a bit of bark, or rather a lichen. Evidently their forms and colors, especially of the under sides of their wings, are designed to conceal them when at rest with their wings closed.

The wilderness, in the eyes of our forefathers, was a vast and howling place or space, where a man might roam naked of house and most other defense, exposed to wild beasts and wilder men. They who went to war with the Indians and French were said to have been “out,” and the wounded and missing who at length returned after a fight were said to have “got in.”

June 3. Friday. P.M. — Up Assabet.

A large yellow butterfly (somewhat *Harris Papilio Asterias* like but not black-winged) three and a half to four inches in expanse. Pale-yellow, the front wings crossed by three or four black bars; rear, or outer edge, of all wings widely bordered with black, and some yellow behind it; a short black tail to each hind one, with two blue spots in front of two red-brown ones on the tail.

Nighthawk, two eggs, fresh. Quail heard.

June 24. The 22d, 23d, and 24th, I have been surveying the bridges and river from Heard's Bridge to the Billerica dam.

The testimony of the farmers, etc., is that the river thirty to fifty years ago was much lower in the summer than now. Deacon Richard Heard spoke of playing when a boy on the river side of the bushes where the pads are, and of wading with great ease at Heard's Bridge, and I hear that one Rice (of Wayland or Sudbury), an old man, remembers galloping his horse through the meadows to the edge of the river. The meadow just above the causeway on the Wayland side was spoken of as particularly valuable. Colonel David Heard, who accompanied me and is best acquainted of any with the details of the controversy, — has worked at clearing out the river (I think about 1820), — said that he did not know of a rock in the river from the falls near the Framingham line to perhaps the rear of Hubbard's in Concord.

July 4. P.M. — To Fair Haven Pond, measuring depth of river.

As you walk beside a ditch or brook, you see the frogs which you alarm launching themselves from a considerable distance into the brook. They spring considerably upward, so as to clear all intervening obstacles, and seem to know pretty well where the brook is. Yet no doubt they often strike, to their chagrin and perhaps sorrow, on a pebbly shore or rock. Their noses must be peculiarly organized to resist accidents of this kind, and allow them to cast themselves thus heedlessly into the air, trusting to fall into the water, for they come down nose foremost. A frog reckons that he knows where the brook is. I shudder for them when I see their soft, unshielded proboscis falling thus heedlessly on whatever may be beneath.

July 7. I learn from measuring on Baldwin's second map that the river (i.e. speaking of that part below Framingham) is much the straightest in the lower part of its course, or from Ball's Hill to the Dam.

It winds most in the broad meadows. The greatest meander is in the Sudbury meadows.

From upper end of Sudbury Canal to Sherman's Bridge direct is 558 rods (1 mile 238 rods); by thread of river, 1000 rods (3 miles 40 rods), or nearly twice as far.

But, though meandering, it is straighter in its general course than would be believed. These nearly twenty-three miles in length (or 16 + direct) are contained within a breadth of two miles twenty-six rods; i.e., so much it takes to meander in. It can be plotted by the scale of one thousand feet to an inch on a sheet of paper seven feet one and one quarter inches long by eleven inches wide.

July 9. I see, at length, where the floated meadow (on Hubbard's meadow) came from last spring, — from opposite Bittern Cliff, and some below. There is a pond created in the meadow there, some five rods by four and three to three and a half feet deep, water being eleven and a half inches above summer level. So much of the meadow which has been mowed is thus converted into a pool.

We are accustomed to refer changes in the shore and the channel to the very gradual influence of the current washing away and depositing matter which was held in suspension, but certainly in many parts of our river the ice which moves these masses of bushes and meadow is a much more important agent. It will alter the map of the river in one year. The whole shore for forty rods on the east side below Bittern Cliff was stripped of its button-bushes and willows, etc., etc., last spring, and as I floated over the river there to-day, I could not at first account for the remarkable breadth of the river there, like a bay. I got a very novel impression of the size of the river, though it is now low water. In fact the width of the river has been increased fully three or four rods for more than forty rods in length, and is three to four feet deep on that side now. You cannot tell, of any clump or row of button-bushes, whether it grew up where it stands or was thus set out there.

July 11. The position of the button-bushes determines the width of the river, no less than the width or depth of the water determines the position of the button-bushes. We call that all river between the button-bushes, though sometimes they may have landed

or sprung up in a regular brink fashion three or four rods further from, or nearer to, the channel.

That mass (described on the 9th, seen the 10th) in the Wayland meadows above Sherman's Bridge was, I think, the largest mass drifted or growing at all on that great meadow. So this transplantation is not on an insignificant scale when compared with the whole body that grows by our river.

I hear that Mr. and Mrs. Such-a-one are "going to the beach" for six weeks. What a failure and defeat this suggests their lives to be! Here they live, perchance, the rest of the year, trying to do as they would be done by and to exercise charity of all kinds, and now at last, the parents not having realized their aspirations in the married state, and the misses now begun to be old maids without having found any match at all, succumb and slope to the beach for six weeks. Yet, so far from being felt to be a proof of failure in the lives of these Christians, it is thought to be the culminating-point of their activity. At length their season of activity is arrived, and they go to the beach, they energetically keep cool. They bathe daily and are blown on by the sea-breeze. This keeps their courage up for the labors of the year. This recess which the Sabbath-school teachers take!

July 22. For the last mile above the Falls the river becomes rocky, the rocks gradually increasing in number, until at the Falls its bed is crowded with them. Some of the rocks are curiously water-worn. They are, as usual in our black river, almost as black as ink, — the parts much submerged, — and I notice that bricks and white crockery on the bottom acquire the same color from the water, as if painted black. The water of this river is a black paint-brush which coats all things with fast colors. Rocks half a dozen feet in diameter which were originally of the usual lumpish form are worn thus by the friction of the pebbles, etc., washed against them by the stream at high water. Several of them have this peculiar sheaf-like form; and black as ink. But, though evidently worn into this form by the rush of water, they are by no means worn smooth, but are as rough as a grater, such being their composition.

I was surprised to see on the rocks, densely covering them, though only in the midst of the fall, where was the swiftest water, a regular seaweed, growing just like rockweed and of the same olive-green color, — "*Podostemon Ceratophyllum*, River-weed," — still in bloom, though chiefly gone to seed. Gray says it is "attached to loose stones," and Torrey says it "adheres to pebbles," but here it covered the rocks under water in the swiftest place only, and was partly uncovered by the fall of the water. I found, in what I gathered, a little pout which had taken refuge in it. Though the botanist, in obedience to his rules, puts it among phænogamous plants, I should not hesitate to associate it with the rockweed. It is the rockweed of our river. I have never seen it elsewhere in the river, though possibly it grows at the factory or other swift places. It seemed as if our river had there for a moment anticipated the sea, suffered a sea-change, mimicked the great ocean stream. I did not see it a few rods above or below, where the water is more sluggish. So far as I know, then, it grows only in the swiftest water, and there is only one place, and that the Falls, in Concord River where it can grow. A careless observer

might confound it with the rockweed of the sea. It covers the rocks in exactly the same manner, and when I tore it off, it brought more or less of the thin, scaly surface of the rocks with it. It is a foretaste of the sea. It is very interesting and remarkable that at this one point we have in our river a plant which so perfectly represents the rockweed of the seashore. This is from four to eight or nine inches long. It has the peculiar strong fresh-water scent.

It is a question if the river has as much created the shoal places as found them.

The presence or absence of weeds at a given shallowness is a good gauge of the rapidity of the current. At the Fordway they do not grow where it is only two feet on an average, owing to the swiftness of the current (as well as stoniness), and in the very swiftest and narrowest part of the Falls occurs one species, the podostemon, which I have not found in any other part of the river.

It is remarkable how the river, even from its very source to its mouth, runs with great bends or zigzags regularly recurring and including many smaller ones, first northerly, then northeasterly, growing more and more simple and direct as it descends, like a tree; as if a mighty current had once filled the valley of the river, and meandered in it according to the same law that this small stream does in its own meadows.

A river of this character can hardly be said to fall at all: it rather runs over the extremity of its trough, being filled to overflowing. If, after flowing twenty miles, all the water has got to rise as high as it was when it started, or rather if it has got to pass over a bottom which is as high as that was where it started, it cannot be said to have gained anything or have fallen at all. It has not got down to a lower level. You do not produce a fall in the channel or bottom of a trough by cutting a notch in its edge. The bottom may lose as much as the surface gains.

If our river had been dry a thousand years, it would be difficult to guess even where its channel had been without a spirit level. I should expect to find waterworn stones and a few muddy pools and small swamps.

July 23. P.M. — To Walden.

Going through Thrush Alley and beyond, I am pestered by flies about my head, — not till now (though I may have said so before). They are perfect imps, for they gain nothing for their pains and only pester me. They do not for the most part attempt to settle on me, never sting me. Yet they seriously interfere with walking in the wood. Though I may keep a leafy twig constantly revolving about my head, they too constantly revolve, nevertheless, and appear to avoid it successfully. They seem to do it for devilry and sport.

July 28. The black willows are the children of the river. They do not grow far from the water, not on the steep banks which the river is wearing into, not on the unconverted shore, but on the bars and banks which the river has made. A bank may soon get to be too high for it. It grows and thrives on the river-made shores and banks, and is a servant which the river uses to build up and defend its banks and isles. It is married to the river.

July 30. A.M. — On river to ascertain the rate of the current.

I see more moss(?) -covered rocks on the bottom and some rising quite near the surface, revealed in the sunny water, and little suspected before. They are so completely covered with moss-like weeds or tresses that you do not see them, — like the heads of mermaids. They sleep there concealed under these long tresses on the bottom, suggesting a new kind of antiquity. There is nothing to wear on and polish them there. They do not bear the paint rubbed off from any boat. Though unsuspected by the oldest fisher, they have eyed Concord for centuries through their watery veil without ever parting their tresses to look at her.

Trying the current there, there being a very faint, chiefly side, wind, commonly not enough to be felt on the cheek or to ripple the water, — what would be called by most a calm, — my bottle floats about seventy-five feet in forty minutes, and then, a very faint breeze beginning to drive it back, I cannot wait to see when it will go a hundred. It is, in short, an exceedingly feeble current, almost a complete standstill. My boat is altogether blown up-stream, even by this imperceptible breath. Indeed, you can in such a case feel the pulse of our river only in the shallowest places, where it preserves some slight passage between the weeds. It faints and gives up the ghost in deeper places on the least adverse wind, and you would presume it dead a thousand times, if you did not apply the nicest tests, such as a feather to the nostrils of a drowned man. It is a mere string of lakes which have not made up their minds to be rivers. As near as possible to a standstill.

Yet by sinking a strawberry box beneath the surface I found that there was a slight positive current there, that when a chip went pretty fast up-stream in this air, the same with the box sunk one foot and tied to it went slowly down, at three feet deep or more went faster than when the box was sunk only one foot. The water flowed faster down at three feet depth than at one, there where it was about seven feet deep, and though the surface for several inches deep may be flowing up in the wind, the weeds at bottom will all be slanted down. Indeed, I suspect that at four or five feet depth the weeds will be slanted downward in the strongest wind that blows up, in that the current is always creeping along downward underneath.

Yet the river in the middle of Concord is swifter than above or below, and if Concord people are slow in consequence of their river's influence, the people of Sudbury and Carlisle should be slower still.

Aug. 3. Since our river is so easily affected by wind, the fact that its general course is northeast and that the prevailing winds in summer are southwest is very favorable to its rapid drainage at that season.

If by fall you mean a swifter place occasioned by the bottom below for a considerable distance being lower than the bottom above for a considerable distance, I do not know of any such between Pelham Pond and the Falls. These swifter places are produced by a contraction of the stream, — chiefly by the elevation of the bottom at that point, — also by the narrowing of the stream.

The depths are very slight compared with the lengths. The average depth of this twenty-five miles is about one seventeen thousandth the length; so that if this portion

of the river were laid down on a map four feet long the depth would be about equal to the thickness of ordinary letter paper, of which it takes three hundred and fifty to an inch. Double the thickness of the letter paper, and it will contain the deep holes which are so unfathomed and mysterious, not to say bottomless, to the swimmers and fishermen.

The haymakers are quite busy on the Great Meadows, it being drier than usual. It being remote from public view, some of them work in their shirts or half naked.

AUG. 5. See many yellowed peach leaves and butternut leaves, which have fallen in the wind yesterday and the rain to-day.

The lowest dark-colored rocks near the water at the stone bridge (i.e. part of the bridge) are prettily marked with (apparently) mosses, which have adhered to them at higher water and now withered and bleached on, — in fact are transferred, — and by their whitish color are seen very distinctly on the dark stone and have a very pretty effect. They are quite like sea-mosses in their delicacy, though not equally fine with many. These are very permanently and closely fastened to the rock. This is a phenomenon of low water. Also see them transferred to wood, as pieces of bridges.

Aug. 9. Minott says that some used to wonder much at the windings of the Mill Brook and could not succeed in accounting for them, but his Uncle Ben Prescott settled the difficulty by saying that a great eel came out of Flint's Pond and rooted its way through to the river and so made the channel of the Mill Brook.

Aug. 14. When I reached the upper end of this weedy bar, at about 3 P.M., this warm day, I noticed some light-colored object in mid-river, near the other end of the bar. At first I thought of some large stake or board standing amid the weeds there, then of a fisherman in a brown holland sack, referring him to the shore beyond. Supposing it the last, I floated nearer and nearer till I saw plainly enough the motions of the person, whoever it was, and that it was no stake. Looking through my glass thirty or forty rods off, I thought certainly that I saw C., who had just bathed, making signals to me with his towel, for I referred the object to the shore twenty rods further. I saw his motions as he wiped himself, — the movements of his elbows and his towel. Then I saw that the person was nearer and therefore smaller, that it stood on the sand-bar in mid-stream in shallow water and must be some maiden in a bathing-dress, — for it was the color of brown holland web, — and a very peculiar kind of dress it seemed. But about this time I discovered with my naked eye that it was a blue heron standing in very shallow water amid the weeds of the bar and pluming itself. I had not noticed its legs at all, and its head, neck, and wings, being constantly moving, I had mistaken for arms, elbows, and towel of a bather, and when it stood stiller its shapely body looked like a peculiar bathing-dress.

Suddenly comes a second, flying low, and alights on the bar yet nearer to me, almost high and dry. Adjutant they were to my idea of the river, these two winged men.

You have not seen our weedy river, you do not know the significance of its weedy bars, until you have seen the blue heron wading and pluming itself on it. I see that it was made for these shallows, and they for it. Now the heron is gone from the weedy

shoal, the scene appears incomplete. Of course, the heron has sounded the depth of the water on every bar of the river that is fordable to it. The water there is not so many feet deep, but so many heron's tibiae. Instead of a foot rule you should use a heron's leg for a measure. If you would know the depth of the water on these few shoalest places of Musketaquid, ask the blue heron that wades and fishes there. In some places a heron can wade across.

How long we may have gazed on a particular scenery and think that we have seen and known it, when, at length, some bird or quadruped comes and takes possession of it before our eyes, and imparts to it a wholly new character. The heron uses these shallows as I cannot. I give them up to him.

By a gauge set in the river I can tell about what time the millers on the stream and its tributaries go to work in the morning and leave off at night, and also can distinguish the Sundays, since it is the day on which the river does not rise, but falls. If I had lost the day of the week, I could recover it by a careful examination of the river. It lies by in the various mill-ponds on Sunday and keeps the Sabbath. What its persuasion is, is another question.

Aug. 26. The first fall rain is a memorable occasion, when the river is raised and cooled, and the first crop of sere and yellow leaves falls. The air is cleared; the dogdays are over; sun-sparkles are seen on water; crickets sound more distinct; saw-grass reveals its spikes in the shorn fields; sparrows and bobolinks fly in flocks more and more. Farmers feel encouraged about their late potatoes and corn. Mill-wheels that have rested for want of water begin to revolve again. Meadow-haying is over.

The first significant event (for a long time) was the frost of the 17th. That was the beginning of winter, the first summons to summer. Some of her forces succumbed to it. The second event was the rain of yesterday.

Aug. 27. I was telling Jonas Potter of my lameness yesterday, whereat he says that he "broke" both his feet when he was young, — I imagined how they looked through his wrinkled cowhides, — and he did not get over it for four years, nay, even now he sometimes felt pains in them before a storm.

All our life, i.e. the living part of it, is a persistent dreaming awake. The boy does not camp in his father's yard. That would not be adventurous enough, there are too many sights and sounds to disturb the illusion; so he marches off twenty or thirty miles and there pitches his tent, where stranger inhabitants are tamely sleeping in their beds just like his father at home, and camps in their yard, perchance. But then he dreams uninterruptedly that he is anywhere but where he is.

I often see yarrow with a delicate pink tint, very distinct from the common pure-white ones.

The first notice I have that grapes are ripening is by the rich scent at evening from my own native vine against the house, when I go to the pump, though I thought there were none on it.

The children have done bringing huckleberries to sell for nearly a week.

Aug. 28. P.M. — To Walden.

A cool day; wind northwest. Need a half-thick coat. Thus gradually we withdraw into winter quarters. It is a clear, flashing air, and the shorn fields now look bright and yellowish and cool. You feel the less inclined to bathing this weather, and bathe from principle, when boys, who bathe for fun, omit it.

I saw a month or more ago where pine-needles which had fallen (old ones) stood erect on low leaves of the forest floor, having stuck in, or passed through, them. They stuck up as a fork which falls from the table. Yet you would not think that they fell with sufficient force.

Aug. 31. P.M. — To Fair Haven Hill.

Was caught in five successive showers, and took refuge in Hayden's barn, under the cliffs, and under a tree.

There was another shower in the night (at 9 P.M.), making the sixth after 1.30 P.M. It was evidently one cloud thus broken into six parts, with some broad intervals of clear sky and fair weather. It would have been convenient for us, if it had been printed on the first cloud, "Five more to come!" Such a shower has a history which has never been written. One would like to know how and where the cloud first gathered, what lands and water it passed over and watered, and where and when it ceased to rain and was finally dissipated.

Sept. 1. If you would study the birds now, go where their food is, i.e. the berries, especially to the wild black cherries, elder-berries, poke berries, mountain-ash berries, and ere long the barberries, and for pigeons the acorns. We sit near the tree and listen to the now unusual sounds of these birds, and from time to time one or two come dashing from out the sky toward this tree, till, seeing us, they whirl, disappointed, and perhaps alight on some neighboring twigs and wait till we are gone. The cherry-birds and robins seem to know the locality of every wild cherry in the town. You are as sure to find them on them now, as bees and butterflies on the thistles. If we stay long, they go off with a fling, to some other cherry tree, which they know of but we do not.

Bought a pair of shoes the other day, and, observing that as usual they were only wooden-pegged at the toes, I required the seller to put in an extra row of iron pegs there while I waited for them. So he called to his boy to bring those zinc pegs, but I insisted on iron pegs and no zinc ones. He gave me considerable advice on the subject of shoes, but I suggested that even the wearer of shoes, of whom I was one, had an opportunity to learn some of their qualities. I have learned to respect my own opinion in this matter. As I do not use blacking and the seller often throws in a box of blacking when I buy a pair of shoes, they accumulate on my hands.

You must be careful not to eat too many nuts. I one winter met a young man whose face was broken out into large pimples and sores, and when I inquired what was the matter, he answered that he and his wife were fond of shagbarks, and therefore he had bought a bushel of them, and they spent their winter evenings eating them, and this was the consequence.

SEPT. 3. A strong wind, which blows down much fruit. R.W.E. sits surrounded by choice windfall pears.

Sept. 8. The 7th, 8th, and 9th, the State muster is held here. The only observation I have to make is that Concord is fuller of dust and more uninhabitable than I ever knew it to be before. Not only the walls, fences, and houses are thickly covered with dust, but the fields and meadows and bushes; and the pads in the river for half a mile from the village are white with it. From a mile or two distant you see a cloud of dust over the town and extending thence to the muster-field. I went to the store the other day to buy a bolt for our front door, for, as I told the storekeeper, the Governor was coming here. "Aye," said he, "and the Legislature too." "Then I will take two bolts," said I. He said that there had been a steady demand for bolts and locks of late, for our protectors were coming.

Sept. 13. I remember my earliest going a-graping. (It was a wonder that we ever hit upon the ripe season.) There was more fun in finding and eying the big purple clusters high on the trees and climbing to them than in eating them. We used to take care not to chew the skins long lest they should make our mouths sore.

Some haws of the scarlet thorn are really a splendid fruit to look at now and far from inedible. They are not only large, but their beauty is enhanced by the persistent calyx relieving the clear scarlet of the fruit.

There are various degrees of living out-of-doors. You must be outdoors long, early and late, and travel far and earnestly, in order to perceive the phenomena of the day. Even then much will escape you. Few live so far outdoors as to hear the first geese go over.

Sept. 16. Grasshoppers have been very abundant in dry fields for two or three weeks. Sophia walked through the Depot Field a fortnight ago, and when she got home picked fifty or sixty from her skirts, — for she wore hoops and crinoline. Would not this be a good way to clear a field of them, — to send a bevy of fashionably dressed ladies across a field and leave them to clean their skirts when they get home? It would supplant anything at the patent office, and the motive power is cheap.

I am invited to take some party of ladies or gentlemen on an excursion, — to walk or sail, or the like, — but by all kinds of evasions I omit it, and am thought to be rude and unaccommodating therefore. They do not consider that the wood-path and the boat are my studio, where I maintain a sacred solitude and cannot admit promiscuous company. I will see them occasionally in an evening or at the table, however. They do not think of taking a child away from its school to go a-huckleberrying with them. Why should not I, then, have my school and school hours to be respected? Ask me for a certain number of dollars if you will, but do not ask me for my afternoons.

Sept. 18. Dr. Bartlett handed me a paper to-day, desiring me to subscribe for a statue to Horace Mann. I declined, and said that I thought a man ought not any more to take up room in the world after he was dead. We shall lose one advantage of a man's dying if we are to have a statue of him forthwith. This is probably meant to be an opposition statue to that of Webster. At this rate they will crowd the streets with them. A man will have to add a clause to his will, "No statue to be made of me." It is very offensive to my imagination to see the dying stiffen into statues at this rate. We

should wait till their bones begin to crumble — and then avoid too near a likeness to the living.

Sept. 19. See many yellow butterflies in the road this very pleasant day after the rain of yesterday. One flutters across between the horse and the wagon safely enough, though it looks as if it would be run down.

P. Turnus?

Sept. 24. I have many affairs to attend to, and feel hurried these days. Great works of art have endless leisure for a background, as the universe has space. Time stands still while they are created. The artist cannot be in hurry. The earth moves round the sun with inconceivable rapidity, and yet the surface of the lake is not ruffled by it. It is not by a compromise, it is not by a timid and feeble repentance, that a man will save his soul and live, at last. He has got to conquer a clear field, letting Repentance & Co. go. That's a well-meaning but weak firm that has assumed the debts of an old and worthless one. You are to fight in a field where no allowances will be made, no courteous bowing to one-handed knights. You are expected to do your duty, not in spite of every thing but one, but in spite of everything.

A man must attend to Nature closely for many years to know when, as well as where, to look for his objects, since he must always anticipate her a little. Young men have not learned the phases of Nature; they do not know what constitutes a year, or that one year is like another. I would know when in the year to expect certain thoughts and moods, as the sportsman knows when to look for plover.

Sept. 25. P.M. — To Emerson's Cliff.

Holding a white pine needle in my hand, and turning it in a favorable light, as I sit upon this cliff, I perceive that each of its three edges is notched or serrated with minute forward-pointing bristles. So much does Nature avoid an unbroken line that even this slender leaf is serrated; though, to my surprise, neither Gray nor Bigelow mention it. Loudon, however, says, "Scabrous and inconspicuously serrated on the margin; spreading in summer, but in winter contracted, and lying close to the branches." Fine and smooth as it looks, it is serrated after all. This is its concealed wildness, by which it connects itself with the wilder oaks.

Prinos berries are fairly ripe for a few days. Moles work in meadows.

Sept. 26. How feeble women, or rather ladies, are! They cannot bear to be shined on, but generally carry a parasol to keep off the sun.

Oct. 13. The swamp amelanchier is leafing again, as usual. What a pleasing phenomenon, perhaps an Indian-summer growth, an anticipation of the spring, like the notes of birds and frogs, etc., an evidence of warmth and genialness. Its buds are annually awakened by the October sun as if it were spring. The shad-bush is leafing again by the sunny swamp-side. It is like a youthful or poetic thought in old age. Several times I have been cheered by this sight when surveying in former years. In the fall I will take this for my coat-of-arms. It seems to detain the sun that expands it. These twigs are so full of life that they can hardly contain themselves. They ignore winter.

They anticipate spring. What faith! In my latter years, let me have some shad-bush thoughts.

Oct. 14. I hear a man laughed at because he went to Europe twice in search of an imaginary wife who, he thought, was there, though he had never seen nor heard of her. But the majority have gone further while they stayed in America, have actually allied themselves to one whom they thought their wife and found out their mistake too late to mend it. It would be cruel to laugh at these.

Oct. 15. A cold northwest wind. I go along the east edge of Poplar Hill. This very cold and windy day, now that so many leaves have fallen, I begin to notice the silveriness of willows blown up in the wind, — a November sight.

This is a cold fall.

Oct. 16. Sunday. P.M. — Paddle to Puffer's and thence walk to Ledum Swamp and Conant's Wood.

A cold, clear, Novemberish day. The wind goes down and we do not sail. The button-bushes are just bare, and the black willows partly so, and the mikania all fairly gray now. I have not been on the river for some time, and it is the more novel to me this cool day.

When I get to Willow Bay I see the new musquash-houses erected, conspicuous on the now nearly leafless shores. To me this is an important and suggestive sight, as, perchance, in some countries new haystacks in the yards; as to the Esquimaux the erection of winter houses. I remember this phenomenon annually for thirty years. A more constant phenomenon here than the new haystacks in the yard, for they were erected here probably before man dwelt here and may still be erected here when man has departed. For thirty years I have annually observed, about this time or earlier, the freshly erected winter lodges of the musquash along the riverside, reminding us that, if we have no gypsies, we have a more indigenous race of furry, quadrupedal men maintaining their ground in our midst still. This may not be an annual phenomenon to you. It may not be in the Greenwich almanac or ephemeris, but it has an important place in my Kalendar. So surely as the sun appears to be in Libra or Scorpio, I see the conical winter lodges of the musquash rising above the withered pontederia and flags. There will be some reference to it, by way of parable or otherwise, in my New Testament. Surely, it is a defect in our Bible that it is not truly ours, but a Hebrew Bible. The most pertinent illustrations for us are to be drawn, not from Egypt or Babylonia, but from New England.

Talk about learning our letters and being literate! Why, the roots of letters are things. Natural objects and phenomena are the original symbols or types which express our thoughts and feelings, and yet American scholars, having little or no root in the soil, commonly strive with all their might to confine themselves to the imported symbols alone. All the true growth and experience, the living speech, they would fain reject as "Americanisms." It is the old error, which the church, the state, the school ever commit, choosing darkness rather than light, holding fast to the old and to tradition. A more intimate knowledge, a deeper experience, will surely originate a word. When I really

know that our river pursues a serpentine course to the Merrimack, shall I continue to describe it by referring to some other river no older than itself which is like it, and call it a meander? It is no more meandering than the Meander is musketaquidding. As well sing of the nightingale here as the Meander. What if there were a tariff on words, on language, for the encouragement of home manufactures? Have we not the genius to coin our own? Let the schoolmaster distinguish the true from the counterfeit.

They go on publishing the “chronological cycles” and “movable festivals of the Church” and the like from mere habit, but how insignificant are these compared with the annual phenomena of your life, which fall within your experience! The signs of the zodiac are not nearly of that significance to me that the sight of a dead sucker in the spring is. That is the occasion for an immovable festival in my church. Another kind of Lent then begins in my thoughts than you wot of. I am satisfied then to live on fish alone for a season.

The phenomena of our year are one thing, those of the almanac another. For October, for instance, instead of making the sun enter the sign of the scorpion, I would much sooner make him enter a musquash-house. Astronomy is a fashionable study, patronized by princes, but not fungi. “Royal Astronomer.” The snapping turtle, too, must find a place among the constellations, though it may have to supplant some doubtful characters already there. If there is no place for him overhead, he can serve us bravely underneath, supporting the earth.

When we emerged from the pleasant footpath through the birches into Witherell Glade, looking along it toward the westering sun, the glittering white tufts of the *Andropogon scoparius*, lit up by the sun, were affectingly fair and cheering to behold. It was already a cheerful Novemberish scene. A thousand such tufts now catch up the sun and send to us its light but not heat. His heat is being steadily withdrawn from us. Light without heat is getting to be the prevailing phenomenon of the day now.

The ledum smells like a bee, — that peculiar scent they have.

I remark how still it is to-day, really Sabbath-like. This day, at least, we do not hear the rattle of cars nor the whistle. I cannot realize that the country was often as still as this twenty years ago.

The weeds are dressed in their frost jackets, naked down to their close-fitting downy or flannel shirts. Like athletes they challenge the winter, these bare twigs.

The cool, placid, silver-plated waters at even coolly await the frost. The musquash is steadily adding to his winter lodge. There is no need of supposing a peculiar instinct telling him how high to build his cabin. He has had a longer experience in this river-valley than we.

Your hands begin to be cool, rowing, now. At many a place in sprout-lands, where the sedge is peculiarly flat and white or hoary, I put down my hand to feel if there is frost on it. It must be the trace of frost.

Each ball of the button-bush reflected in the silvery water by the riverside appears to me as distinct and important as a star in the heavens viewed through “optic glass.” This, too, deserves its Kepler and Galileo.

Oct. 19. It galls me to listen to the remarks of craven-hearted neighbors who speak disparagingly of John Brown because he resorted to violence, resisted the government, threw his life away! — what way have they thrown their lives, pray? — neighbors who would praise a man for attacking singly an ordinary band of thieves or murderers. Such minds are not equal to the occasion. They preserve the so-called peace of their community by deeds of petty violence every day.

The remarks of my neighbors upon Brown's death and supposed fate, with very few exceptions, are, "He is undoubtedly insane," "Died as the fool dieth," "Served him right;" and so they proceed to live their sane, and wise, and altogether admirable lives, reading their Plutarch a little.

A government that pretends to be Christian and crucifies a million Christs every day!

Our foes are in our midst and all about us. Hardly a house but is divided against itself. For our foe is the all but universal woodenness (both of head and heart).

Some eighteen hundred years ago Christ was crucified; this morning, perhaps, John Brown was hung. These are the two ends of a chain which I rejoice to know is not without its links.

Oct. 21. It is very cold and blustering to-day. It is the breath of winter, which is encamped not far off to the north.

A great many shrub oak acorns hold on, and are a darker brown than ever.

Insane! A father and seven sons, and several more men besides, — as many, at least, as twelve disciples, — all struck with insanity at once; while the sane tyrant holds with a firmer gripe than ever his four millions of slaves, and a thousand sane editors, his abettors, are saving their country and their bacon! Ask the tyrant who is his most dangerous foe, the sane man or the insane.

Oct. 22. I see now that it was necessary that the bravest and humanest man in all the country should be hung. Perhaps he saw it himself. If any leniency were shown him, any compromise made with him, any treating with him at all, by the government, he might be suspected.

I rejoice that I live in this age, that I was his contemporary.

I do not wish to kill or to be killed, but I can foresee circumstances in which both of these things would be by me unavoidable.

This event advertises me that there is such a fact as death, — the possibility of a man's dying. It seems as if no man had ever died in America; for in order to die you must first have lived.

It is the best news that America has ever heard.

It has already quickened the public pulse of the North; it has infused more, and more generous, blood into her veins and heart than any number of years of what is called commercial and political prosperity could. How many a man who was lately contemplating suicide has now something to live for!

Nov. 9. A fine Indian-summer day. Have had pleasant weather about a week.

Nov. 10. Rain; warm.

Nov. 12. The first sprinkling of snow, which for a short time whitens the ground in spots.

I do not know how to distinguish between our waking life and a dream. Are we not always living the life that we imagine we are? Fear creates danger, and courage dispels it.

There was a remarkable sunset, I think the 25th of October. The sunset sky reached quite from west to east, and it was the most varied in its forms and colors of any that I remember to have seen. At one time the clouds were most softly and delicately rippled, like the ripple-marks on sand. But it was hard for me to see its beauty then, when my mind was filled with Captain Brown. So great a wrong as his fate implied overshadowed all beauty in the world.

Dec. 5. Rather hard walking in the snow. There is a slight mist in the air and accordingly some glaze on the twigs and leaves, and thus suddenly we have passed from Indian summer to winter. It is as if you had stepped from a withered garden into the yard of a sculptor or worker in marble, crowded with delicate works, rich and rare.

Dec. 6. Came upon a round bed of tansy, half a dozen feet in diameter, which was withered quite black, as seen above the snow, — blacker than any plant I remember. This reminded me that its name was by some thought to be from *ἀθανασία*, or immortality, from its not withering early, but in this case it suggested its funereal reputation.

The death of Irving, which at any other time would have attracted universal attention, having occurred while these things were transpiring, goes almost unobserved. Literary gentlemen, editors, and critics think that they know how to write because they have studied grammar and rhetoric; but the art of composition is as simple as the discharge of a bullet from a rifle, and its masterpieces imply an infinitely greater force behind it. This unlettered man's speaking and writing is standard English. Some words and phrases deemed vulgarisms and Americanisms before, he has made standard American. "It will pay." It suggests that the one great rule of composition — and if I were a professor of rhetoric I should insist on this — is to speak the truth. This first, this second, this third.

Dec. 8. Two hundred years ago is about as great an antiquity as we can comprehend or often have to deal with. It is nearly as good as two thousand to our imaginations. It carries us back to the days of aborigines and the Pilgrims; beyond the limits of oral testimony, to history which begins already to be enamelled with a gloss of fable, and we do not quite believe what we read; to a strange style of writing and spelling and of expression; to those ancestors whose names we do not know, and to whom we are related only as we are to the race generally. It is the age of our very oldest houses and cultivated trees. Nor is New England very peculiar in this. In England also, a house two hundred years old, especially if it be a wooden one, is pointed out as an interesting relic of the past.

When we read the history of the world, centuries look cheap to us and we find that we had doubted if the hundred years preceding the life of Herodotus seemed as

great an antiquity to him as a hundred years does to us. We are inclined to think of all Romans who lived within five hundred years B.C. as contemporaries to each other. Yet Time moved at the same deliberate pace then as now. Pliny the Elder, who died in the 79th year of the Christian era, speaking of the paper made of papyrus which was then used, — how carefully it was made, — says, just as we might say, as if it were something remarkable: “There are, thus, ancient memorials in the handwriting of Caius and Tiberius Gracchus, almost two hundred years old, which I have seen in the possession of Pomponius Secundus the poet, a very illustrious citizen. As for the handwriting of Cicero, Augustus, and Virgil, we very often meet with it still.”

How is it that what is actually present and transpiring is commonly perceived by the common sense and understanding only, is bare and bald, without halo or the blue enamel of intervening air? But let it be past or to come, and it is at once idealized. It is not simply the understanding now, but the imagination, that takes cognizance of it. The imagination requires a long range. It is the faculty of the poet to see present things as if, in this sense, also past and future, as if distant or universally significant.

Dec. 13. P.M. — On river to Fair Haven Pond.

My first true winter walk is perhaps that which I take on the river, or where I cannot go in the summer. It is the walk peculiar to winter, and now first I take it.

What a spectacle the subtle vapors that have their habitation in the sky present these winter days! You have not only ever-varying forms of a given type of cloud, but various types at different heights or hours. It is a scene, for variety, for beauty and grandeur, out of all proportion to the attention it gets. Who watched the forms of the clouds over this part of the earth a thousand years ago? Who watches them to-day?

Now that the river is frozen we have a sky under our feet also. Going over black ice three or four inches thick, only reassured by seeing the thickness at the cracks, I see it richly marked internally with large whitish figures suggesting rosettes of ostrich-feathers or coral. These at first appear to be a dust on the surface, but, looking closely, are found to be at various angles with it internally, in the grain. The work of crystallization.

DEC. 14. At 2 P.M. begins to snow again. I walk to Walden.

Snow-storms might be classified. This is a fine, dry snow, drifting nearly horizontally from the north, so that it is quite blinding to face, almost as much so as sand. It is cold also. It is drifting but not accumulating fast. I can see the woods about a quarter of a mile distant through it. That of the 11th was a still storm, of large flakes falling gently in the quiet air, like so many white feathers descending in different directions when seen against a wood-side, — the regular snow-storm such as is painted. A myriad falling flakes weaving a coarse garment by which the eye is amused. The snow was a little moist and the weather rather mild. Also I remember the perfectly crystalline or star snows, when each flake is a perfect six(?)-rayed wheel. This must be the chef-d’œuvre of the Genius of the storm. Also there is the pellet or shot snow, which consists of little dry spherical pellets the size of robin-shot. This, I think, belongs to cold weather. Probably never have much of it. Also there is sleet, which is half snow, half rain.

The *Juncus tenuis*, with its conspicuous acheniums, is very noticeable now, rising above the snow in the wood-paths, commonly aslant.

Dec. 15. Philosophy is a Greek word by good rights, and it stands almost for a Greek thing. Yet some rumor of it has reached the commonest mind. M. Miles, who came to collect his wood bill to-day, said, when I objected to the small size of his wood, that it was necessary to split wood fine in order to cure it well, that he had found that wood that was more than four inches in diameter would not dry, and moreover a good deal depended on the manner in which it was corded up in the woods. He piled his high and tightly. If this were not well done the stakes would spread and the wood lie loosely, and so the rain and snow find their way into it. And he added, "I have handled a good deal of wood, and I think that I understand the philosophy of it."

DEC. 16. A.M. — To Cambridge, where I read in Gerard's Herbal. His admirable though quaint descriptions are, to my mind, greatly superior to the modern more scientific ones. He describes not according to rule but to his natural delight in the plants. He brings them vividly before you, as one who has seen and delighted in them. It is almost as good as to see the plants themselves. It suggests that we cannot too often get rid of the barren assumption that is in our science. His leaves are leaves; his flowers, flowers; his fruit, fruit. They are green and colored and fragrant. It is a man's knowledge added to a child's delight. Modern botanical descriptions approach ever nearer to the dryness of an algebraic formula, as if  $x + y$  were = to a love-letter. It is the keen joy and discrimination of the child who has just seen a flower for the first time and comes running in with it to its friends. How much better to describe your object in fresh English words rather than in these conventional Latinisms! He has really seen, and smelt, and tasted, and reports his sensations.

Bought a book at Little & Brown's, paying a nine-pence more on a volume than it was offered me for elsewhere. The customer thus pays for the more elegant style of the store.

Dec. 17. Under the hill, on the southeast side of R.W.E.'s lot, where the hemlock stands, I see many tracks of squirrels (I am not sure whether they are red or gray or both, for I see none) leading straight from the base of one tree to that of another, thus leaving untrodden triangles, squares, and polygons of every form, bounded by much trodden highways. One, two, three, and the track is lost on the upright bole of a pine, — as if they had played at base-running from goal to goal, while pine cones were thrown at them on the way. You come thus on the tracks of these frisky and volatile (semivolitant) creatures in the midst of perfect stillness and solitude, as you might stand in a hall half an hour after the dancers had departed.

Dec. 22. Another fine winter day.

P.M. — To Flint's Pond.

We pause and gaze into the Mill Brook on the Turnpike bridge. C. says that in Persia they call the ripple-marks on sandy bottoms "chains" or "chain-work." I see a good deal of cress there, on the bottom, for a rod or two, the only green thing to be seen. No more slimy than it usually is beneath the water in summer. Is not this the

plant which most, or most conspicuously, preserves its greenness in the winter? Is it not now most completely in its summer state of any plant? So far as the water and the mud and the cress go, it is a summer scene. It is green as ever, and waving in the stream as in summer.

How nicely is Nature adjusted! The least disturbance of her equilibrium is betrayed and corrects itself. As I looked down on the surface of the brook, I was surprised to see a leaf floating, as I thought, up the stream, but I was mistaken. The motion of a particle of dust on the surface of any brook far inland shows which way the earth declines toward the sea, which way lies the constantly descending route, and the only one.

The fisherman stands erect and still on the ice, awaiting our approach, as usual forward to say that he has had no luck. He has been here since early morning, and for some reason or other the fishes won't bite. You won't catch him here again in a hurry. They all tell the same story. The amount of it is he has had "fisherman's luck," and if you walk that way you may find him at his old post to-morrow. It is hard, to be sure, — four little fishes to be divided between three men, and two and a half miles to walk; and you have only got a more ravenous appetite for the supper which you have not earned. However, the pond floor is not a bad place to spend a winter day.

Dec. 25. You may think that you need take no care to preserve your woodland, but every tree comes either from the stump of another tree or from a seed. With the present management, will there always be a fresh stump, or a nut in the soil, think you? Will not the nobler kinds of trees, which bear comparatively few seeds, grow more and more scarce? What is become of our chestnut wood? There are but few stumps for sprouts to spring from, and, as for the chestnuts, there are not enough for the squirrels, and nobody is planting them.

How different are men and women, e.g. in respect to the adornment of their heads! Do you ever see an old or jammed bonnet on the head of a woman at a public meeting? But look at any assembly of men with their hats on; how large a proportion of the hats will be old, weather-beaten, and indented, but I think so much the more picturesque and interesting! One farmer rides by my door in a hat which it does me good to see, there is so much character in it, — so much independence to begin with, and then affection for his old friends, etc., etc. I should not wonder if there were lichens on it. Think of painting a hero in a bran-new hat! But go to a lyceum and look at the bonnets and various other headgear of the women and girls, — who, by the way, keep their hats on, it being too dangerous and expensive to take them off!! Why, every one looks as fragile as a butterfly's wings, having just come out of a bandbox, — as it will go into a bandbox again when the lyceum is over. Men wear their hats for use; women theirs for ornament.

Again, what an ado women make about trifles! Here is one tells me that she cannot possibly wear india-rubber boots in sloshy weather, because they have heels. Men have been wearing boots with heels from time immemorial; little boys soon learn the art, and are eager to try the experiment. The woodchoppers and teamsters, and the merchants

and lawyers, go and come quietly the livelong day, and though they may meet with many accidents, I do not remember any that originated in the heels of their boots. But not so with women; they bolt at once, recklessly as runaway horses, the moment they get the boots on, before they have learned the wonderful art of wearing them. My informant tells me of a friend who has got a white swelling from coming down-stairs imprudently in boots, and of another seriously injured on the meeting-house steps, — for when you deal with steps, then comes the rub, — and of a third who involuntarily dashed down the front stairs, knocked a hat-tree through the side-lights, and broke I do not know how many ribs. Indeed, that quarter-inch obstruction about the heels seems to be an insuperable one to the women.

Dec. 29. When I went to walk it was about  $10^{\circ}$  above zero, and when I returned,  $1^{\circ}$ . I did not notice any vapor rising from the open places, as I did in the morning, when it was  $-16^{\circ}$  and also  $-6^{\circ}$ . Therefore the cold must be between  $+1^{\circ}$  and  $-6^{\circ}$  in order that vapor may rise from these places. It takes a greater degree of cold to show the breath of the river than that of man. Apparently, the river is not enough warmer than the air to permit of its rising into it, i.e., evaporating, unless the air is of a very low temperature. When the air is say four or five degrees below, the water being  $+32^{\circ}$ , then there is a visible evaporation. Is there the same difference, or some  $40^{\circ}$ , between the heat of the human breath and that air in which the moisture in the breath becomes visible in vapor? This has to do with the dew-point. Next, what makes the water of those open places thus warm? and is it any warmer than elsewhere? There is considerable heat reflected from a sandy bottom where the water is shallow, and at these places it is always sandy and shallow, but I doubt if this actually makes the water warmer, though it may melt the more opaque ice which absorbs it. The fact that Holt Bend, which is deep, is late to freeze, being narrow, seems to prove it to be the swiftness of the water and not reflected heat that prevents freezing.

Taking the river in Concord in its present condition, it is, with one exception, only the shallowest places that are open; and the shallowest place in all in Concord is the latest of all to freeze, e.g. at the junction. So, if you get into the river at this season, it is most likely to be at the shallowest places, they being either open or most thinly frozen over. That is one consolation for you.

Dec. 30. Those who depend on skylights found theirs but a dim, religious light this forenoon and hitherto, owing to the thickness of snow resting on them. Also cellar windows are covered, and cellars are accordingly darkened.

## 1860

Jan. 4. See that long meandering track where a deer mouse hopped over the soft snow last night, scarcely making any impression. What if you could witness with owls' eyes the revelry of the wood mice some night, frisking about the wood like so many

little kangaroos? Here is such populousness as commonly only the imagination dreams of.

A man receives only what he is ready to receive, whether physically or intellectually or morally, as animals conceive at certain seasons their kind only. We hear and apprehend only what we already half know. If there is something which does not concern me, which is out of my line, which by experience or by genius my attention is not drawn to, however novel and remarkable it may be, if it is spoken, we hear it not, if it is written, we read it not, or if we read it, it does not detain us. Every man thus tracks himself through life, in all his hearing and reading and observation and travelling. His observations make a chain. The phenomenon or fact that cannot in any wise be linked with the rest which he has observed, he does not observe. By and by we may be ready to receive what we cannot receive now. I find, for example, in Aristotle something about the spawning, etc., of the pout and perch, because I know something about it already and have my attention aroused; but I do not discover till very late that he has made other equally important observations on the spawning of other fishes, because I am not interested in those fishes.

Jan. 18. 2 P.M. — To Fair Haven Pond, on river. Thermometer 46; sky mostly overcast.

The temperature of the air and the clearness or serenity of the sky are indispensable to a knowledge of a day, so entirely do we sympathize with the moods of nature. It is important to know of a day that is past whether it was warm or cold, clear or cloudy, calm or windy, etc.

They are very different seasons in the winter when the ice of the river and meadows and ponds is bare, — blue or green, a vast glittering crystal, — and when it is all covered with snow or slush; and our moods correspond. The former may be called a crystalline winter.

Jan. 25. In keeping a journal of one's walks and thoughts it seems to be worth the while to record those phenomena which are most interesting to us at the time. Such is the weather. It makes a material difference whether it is foul or fair, affecting surely our mood and thoughts. Then there are various degrees and kinds of foulness and fairness. It may be cloudless, or there may be sailing clouds which threaten no storm, or it may be partially overcast. On the other hand it may rain, or snow, or hail, with various degrees of intensity. It may be a transient thunder-storm, or a shower, or a flurry of snow, or it may be a prolonged storm of rain or snow. Or the sky may be overcast or rain-threatening. So with regard to temperature. It may be warm or cold. Above 40° is warm for winter. One day, at 38 even, I walk dry and it is good sleighing; the next day it may have risen to 48, and the snow is rapidly changed to slush. It may be calm or windy. The finest winter day is a cold but clear and glittering one. There is a remarkable life in the air then, and birds and other creatures appear to feel it, to be excited and invigorated by it. Also warm and melting days in winter are inspiring, though less characteristic.

I will call the weather fair, if it does not threaten rain or snow or hail; foul, if it rains or snows or hails, or is so overcast that we expect one or the other from hour to hour. To-day it is fair, though the sky is slightly overcast, but there are sailing clouds in the south-west.

Jan. 27. Fair and hardly a cloud to be seen. Thermometer 28. (But it is overcast from the northwest before sunset.)

Now I see, as I am on the ice by Hubbard's meadow, some wisps of vapor in the west and southwest advancing. They are of a fine, white, thready grain, curved like skates at the end. Have we not more finely divided clouds in winter than in summer? flame-shaped, asbestos-like? I doubt if the clouds show as fine a grain in warm weather. They are wrung dry now. They are not expanded but contracted, like spiculæ. What hieroglyphics in the winter sky!

As I go along the edge of Hubbard's Wood, on the ice, it is very warm in the sun — and calm there. There are certain spots I could name, by hill and wood sides, which are always thus sunny and warm in fair weather, and have been, for aught I know, since the world was made. What a distinction they enjoy!

How many memorable localities in a river walk! Here is the warm wood-side; next, the good fishing bay; and next, where the old settler was drowned when crossing on the ice a hundred years ago. It is all storied.

When you think that your walk is profitless and a failure, and you can hardly persuade yourself not to return, it is on the point of being a success, for then you are in that subdued and knocking mood to which Nature never fails to open.

Feb. 2. 6° below at about 8 A.M.

Clock has stopped. Teams squeak.

2 P.M. — To Fair Haven Pond.

The river, which was breaking up, is frozen over again. The new ice over the channel is of a yellow tinge, and is covered with handsome rosettes two or three inches in diameter where the vapor which rose through froze and crystallized. This new ice for forty rods together is thickly covered with these rosettes, often as thick as snow, an inch deep, and sometimes in ridges like frozen froth three inches high. Sometimes they are in a straight line along a crack. The frozen breath of the river at a myriad breathing-holes.

It blowed considerably yesterday, though it is very still to-day, and the light, dry snow, especially on the meadow ice and the river, was remarkably plowed and drifted by it, and now presents a very wild and arctic scene. Indeed, no part of our scenery is ever more arctic than the river and its meadows now, though the snow was only some three inches deep on a level. It is cold and perfectly still, and you walk over a level snowy tract. It is a sea of white waves of nearly uniform shape and size. Each drift is a low, sharp promontory directed toward the northwest, and showing which way the wind blowed with occasional small patches of bare ice amid them. It is exactly as if you walked over a solid sea where the waves rose about two feet high. These promontories

have a general resemblance to one another. Many of them are perfect tongues of snow more or less curving and sharp.

One hour you have bare ice; the next, a level counterpane of snow; and the next, the wind has tossed and sculptured it into these endless and varied forms. I go sliding over the few bare spots, getting a foothold for my run on the very thin sloping and ridged snow.

I frequently see where oak leaves, absorbing the heat of the sun, have sunk into the ice an inch in depth and afterward been blown out, leaving a perfect type of the leaf with its petiole and lobes sharply cut, with perfectly upright sides, so that I can easily tell the species of oak that made it. Sometimes these moulds have been evenly filled with snow while the ice is dark, and you have the figure of the leaf in white.

Feb. 5. Coming home last night in the twilight, I recognized a neighbor a dozen rods off by his walk or carriage, though it was so dark that I could not see a single feature of his person. Indeed, his person was all covered up excepting his face and hands, and I could not possibly have distinguished these at this distance from another man's. Nor was it owing to any peculiarity in his dress, for I should have known him though he had had on a perfectly new suit. It was because the man within the clothes moved them in a peculiar manner that I knew him thus at once at a distance and in the twilight. He made a certain figure in any clothes he might wear, and moved in it in a peculiar manner. Indeed, we have a very intimate knowledge of one another; we see through thick and thin; spirit meets spirit. A man hangs out innumerable signs by which we may know him. So, last summer, I knew another neighbor half a mile off up the river, though I did not see him, by the manner in which the breath from his lungs and mouth, i.e. his voice, made the air strike my ear. In that manner he communicated himself to all his acquaintance within a diameter of one mile (if it were all up and down the river). So I remember to have been sure once in a very dark night who was preceding me on the sidewalk, — though I could not see him, — by the sound of his tread. I was surprised to find that I knew it.

And to-day, seeing a peculiar very long track of a man in the snow, who has been along up the river this morning, I guessed that it was George Melvin, because it was accompanied by a hound's track. There was a thin snow on the ice, and I observed that he not only furrowed the snow for a foot before he completed his step, but that the (toe) of his track was always indefinite, as if his boot had been worn out and prolonged at the toe. I noticed that I and my companion made a clear and distinct track at the toe, but when I experimented, and tried to make a track like this by not lifting my feet but gliding and partly scuffing along, I found myself walking just like Melvin, and that perfectly convinced me that it was he.

We have no occasion to wonder at the instinct of a dog. In these last two instances I surpassed the instinct of the dog.

It may always be a question how much or how little of a man goes to any particular act. It is not merely by taking time and by a conscious effort that he betrays himself. A man is revealed, and a man is concealed, in a myriad unexpected ways; e. g., I can

hardly think of a more effectual way of disguising neighbors to one another than by stripping them naked.

Feb. 8. 2 P.M. — Up river to Fair Haven Hill.

Thermometer 43. 40° and upward may be called a warm day in the winter.

We have had much of this weather for a month past, reminding us of spring. February may be called earine (springlike). There is a peculiarity in the air when the temperature is thus high and the weather fair, at this season, which makes sounds more clear and pervading, as if they trusted themselves abroad further in this genial state of the air. A different sound comes to my ear now from iron rails which are struck, as from the cawing crows, etc. Sound is not abrupt, piercing, or rending, but softly sweet and musical. It will take a yet more genial and milder air before the bluebird's warble can be heard.

Walking over Hubbard's broad meadow on the softened ice, I admire the markings in it. The more interesting and prevailing ones now appearing ingrained and giving it a more or less marbled look, — one, what you may call checkered marbling (?), consisting of small polygonal figures three quarters in diameter, bounded by whitish lines more or less curved within the ice, and apparently covered with an entire thin surface ice, and so on for rods (these when five or six inches wide make a mackerel-sky ice); the other apparently passing from this into a sort of fibrous structure of waving lines, hair-like or rather flame-like, — call it phlogistic: — only far more regular and beautiful than I can draw. Sometimes like perhaps a cassowary's feathers, the branches being very long and fine. This fibrous or phlogistic structure is evidently connected with the flow of the surface water, for I see some old holes, now smoothly frozen over, where these rays have flowed from all sides into the hole in the midst of the checked ice, making a circular figure which reminded me of a jellyfish: only far more beautiful than this. The whitish lines which bound these figures and form the parallel fibres are apparently lines of fine bubbles more dense than elsewhere. I am not sure that these markings always imply a double or triple ice, i.e. a thinner surface ice, which contains them.

The ice is thus marked under my feet somewhat as the heavens overhead; there is both the mackerel sky and the fibrous flame or asbestos-like form in both. The mackerel spotted or marked ice is very common, and also reminds me of the reticulations of the pickerel.

Then there is occasionally, where puddles on the ice have frozen, that triangular rib-work of crystals, — a beautiful casting in alto-relievo of low crystal prisms with one edge up, — so meeting and crossing as to form triangular and other figures. Shining splinters in the sun. Giving a rough hold to the feet. One would think that the forms of ice-crystals must include all others.

The proper color of water is perhaps best seen when it overflows white ice.

Feb. 12. I walk over a smooth green sea, or aequor, amid thousands of these flat isles as purple as the petals of a flower. It would not be more enchanting to walk amid the purple clouds of the sunset sky. And, by the way, this is but a sunset sky under our

feet, produced by the same law, the same slanting rays and twilight. Here the clouds are these patches of snow or frozen vapor, and the ice is the greenish sky between them. Thus all of heaven is realized on earth. You have seen those purple fortunate isles in the sunset heavens, and that green and amber sky between them. Would you believe that you could ever walk amid those isles? You can on many a winter evening. I have done so a hundred times. The ice is a solid crystalline sky under our feet.

Whatever aid is to be derived from the use of a scientific term, we can never begin to see anything as it is so long as we remember the scientific term which always our ignorance has imposed on it. Natural objects and phenomena are in this sense forever wild and unnamed by us.

Thus the sky and the earth sympathize, and are subject to the same laws, and in the horizon they, as it were, meet and are seen to be one.

I have walked in such a place and found it hard as marble.

Not only the earth but the heavens are made our footstool. That is what the phenomenon of ice means. The earth is annually inverted and we walk upon the sky. The ice reflects the blue of the sky. The waters become solid and make a sky below. The clouds grow heavy and fall to earth, and we walk on them. We live and walk on solidified fluids.

We have such a habit of looking away that we see not what is around us. These snow-clad hills answer to the rosy isles in the west. The winter is coming when I shall walk the sky. The ice is a solid sky on which we walk. It is the inverted year. There is an annual light in the darkness of the winter night. The shadows are blue, as the sky is forever blue. In winter we are purified and translated. The earth does not absorb our thoughts. It becomes a Valhalla.

Feb. 13. 2 P.M. — Down river.

Thermometer 38°. Warm; a cloud just appearing in the west.

That hard meadow just below the boys' bathing-place below the North Bridge is another elfin burial-ground. It would be a bad place to walk in a dark night. The mounds are often in ridges, even as if turned up by the plow.

Water overflowing the ice at an opening in the river, and mixing with thin snow, saturating it, seen now on one side at right angles with the sun's direction, is as black as black cloth. It is surprising what a variety of distinct colors the winter can show us, using but few pigments, so to call them. The principal charm of a winter walk over ice is perhaps the peculiar and pure colors exhibited.

There is the red of the sunset sky, and of the snow at evening, and in rainbow flocks during the day, and in sun-dogs.

The blue of the sky, and of the ice and water reflected, and of shadows on snow.

The yellow of the sun and the morning and evening sky, and of the sedge (or straw-color, bright when lit on edge of ice at evening), and all three in hoar frost crystals.

Then, for the secondary, there is the purple of the snow in drifts or on hills, of the mountains, and clouds at evening.

The green of evergreen woods, of the sky, and of the ice and water toward evening.

The orange of the sky at evening.

The white of snow and clouds, and the black of clouds, of water agitated, and water saturating thin snow on ice.

The russet and brown and gray, etc., of deciduous woods.

The tawny of the bare earth.

I suspect that the green and rose (or purple) are not noticed on ice and snow unless it is pretty cold, and perhaps there is less greenness of the ice now than in December, when the days were shorter. The ice may now be too old and white.

Those horn, knob, and rake icicles on the southeast sides of all open places — or that were open on the 10th near enough to the bushes — are suddenly softening and turning white on one side to-day, so that they remind me of the alabaster (?) or plaster images on an Italian's board. All along the ice belt or shelf — for the river has fallen more than a foot — countless white figures stand crowded, their minute cores of sedge or twigs being concealed. Some are like beaks of birds, — cranes or herons. Having seen this phenomenon in one place, I know with certainty in just how many places and where, throughout the town, — four or five, — I shall find these icicles, on the southeast sides of the larger open places which approached near enough to a bushy or reedy shore.

The grass comes very nearly being completely encrusted in some places, but commonly rounded knobs stand up.

The ground being bare, I pick up two or three arrowheads in Tarbell's field near Ball's Hill.

There is nothing more affecting and beautiful to man, a child of the earth, than the sight of the naked soil in the spring. I feel a kindredship with it.

The sun being in a cloud, partly obscured, I see a very dark purple tinge on the flat drifts on the ice earlier than usual, and when afterward the sun comes out below the cloud, I see no purple nor rose. Hence it seems that the twilight has as much or more to do with this phenomenon, supposing the sun to be low, than the slight angle of its rays with the horizon.

Always you have to contend with the stupidity of men. It is like a stiff soil, a hard-pan. If you go deeper than usual, you are sure to meet with a pan made harder even by the superficial cultivation. The stupid you have always with you. Men are more obedient at first to words than ideas. They mind names more than things. Read to them a lecture on "Education," naming that subject, and they will think that they have heard something important, but call it "Transcendentalism," and they will think it moonshine. Or halve your lecture, and put a psalm at the beginning and a prayer at the end of it and read it from a pulpit, and they will pronounce it good without thinking.

The Scripture rule, "Unto him that hath shall be given," is true of composition. The more you have thought and written on a given theme, the more you can still write. Thought breeds thought. It grows under your hands.

Vide extracts from preface made in October, 1859.

I told him of it afterward, and he gave a corresponding account of himself.

Feb. 15. As in the expression of moral truths we admire any closeness to the physical fact which in all language is the symbol of the spiritual, so, finally, when natural objects are described, it is an advantage if words derived originally from nature, it is true, but which have been turned (tropes) from their primary signification to a moral sense, are used, i.e., if the object is personified. The one who loves and understands a thing the best will incline to use the personal pronouns in speaking of it. To him there is no neuter gender. Many of the words of the old naturalists were in this sense doubly tropes.

P.M. — About 30° at 2 P.M. Skated to Bound Rock.

Feb. 17. We cannot spare the very lively and lifelike descriptions of some of the old naturalists. They sympathize with the creatures which they describe. Edward Topsell in his translation of Conrad Gesner, in 1607, called "The History of Four-footed Beasts," says of the antelopes that "they are bred in India and Syria, near the river Euphrates," and then — which enables you to realize the living creature and its habitat — he adds, "and delight much to drink of the cold water thereof." The beasts which most modern naturalists describe do not delight in anything, and their water is neither hot nor cold. Reading the above makes you want to go and drink of the Euphrates yourself, if it is warm weather. I do not know how much of his spirit he owes to Gesner, but he proceeds in his translation to say that "they have horns growing forth of the crown of their head, which are very long and sharp; so that Alexander affirmed they pierced through the shields of his soldiers, and fought with them very irefully: at which time his company slew as he travelled to India, eight thousand five hundred and fifty, which great slaughter may be the occasion why they are so rare and seldom seen to this day."

Now here something is described at any rate; it is a real account, whether of a real animal or not. You can plainly see the horns which "grew forth" from their crowns, and how well that word "irefully" describes a beast's fighting! And then for the number which Alexander's men slew "as he travelled to India," — and what a travelling was that, my hearers! — eight thousand five hundred and fifty, just the number you would have guessed after the thousands were given, and an easy one to remember too. He goes on to say that "their horns are great and made like a saw, and they with them can cut asunder the branches of osier or small trees, whereby it cometh to pass that many times their necks are taken in the twists of the falling boughs, whereat the beast with repining cry, bewrayeth himself to the hunters, and so is taken." The artist too has done his part equally well, for you are presented with a drawing of the beast with serrated horns, the tail of a lion, a cheek tooth (canine?) as big as a boar's, a stout front, and an exceedingly "ireful" look, as if he were facing all Alexander's army.

Though some beasts are described in this book which have no existence as I can learn but in the imagination of the writers, they really have an existence there, which is saying not a little, for most of our modern authors have not imagined the actual beasts which they presume to describe. The very frontispiece is a figure of "the gorgon," which looks sufficiently like a hungry beast covered with scales, which you may have

dreamed of, apparently just fallen on the track of you, the reader, and snuffing the odor with greediness.

These men had an adequate idea of a beast, or what a beast should be, a very bellua (the translator makes the word bestia to be "a vastando"); and they will describe and will draw you a cat with four strokes, more beastly or beast-like to look at than Mr. Ruskin's favorite artist draws a tiger. They had an adequate idea of the wildness of beasts and of men, and in their descriptions and drawings they did not always fail when they surpassed nature.

Gesner says of apes that "they are held for a subtil, ironical, ridiculous and unprofitable beast, whose flesh is not good for meat as a sheep, neither his back for burthen as an asses, nor yet commodious to keep a house like a dog, but of the Grecians termed gelotopios, made for laughter."

Feb. 18. A snow-storm, falling all day; wind northeast.

The snow is fine and drives low; is composed of granulated masses one sixteenth to one twentieth of an inch in diameter. Not in flakes at all. I think it is not those large-flaked snow-storms that are the worst for the traveller, or the deepest.

Gesner (unless we owe it to the translator) has a livelier conception of an animal which has no existence, or of an action which was never performed, than most naturalists have of what passes before their eyes. The ability to report a thing as if it had occurred, whether it did or not, is surely important to a describer. They do not half tell a thing because you might expect them to but half believe it. I feel, of course, very ignorant in a museum. I know nothing about the things which they have there, — no more than I should know my friends in the tomb. I walk amid those jars of bloated creatures which they label frogs, a total stranger, without the least froggy thought being suggested. Not one of them can croak. They leave behind all life they that enter there, both frogs and men.

Sometimes, when I go forth at 2 P.M., there is scarcely a cloud in the sky, but soon one will appear in the west and steadily advance and expand itself, and so change the whole character of the afternoon and of my thoughts. The history of the sky for that afternoon will be but the development of that cloud.

I think that the most important requisite in describing an animal, is to be sure and give its character and spirit, for in that you have, without error, the sum and effect of all its parts, known and unknown. You must tell what it is to man. Surely the most important part of an animal is its anima, its vital spirit, on which is based its character and all the peculiarities by which it most concerns us. Yet most scientific books which treat of animals leave this out altogether, and what they describe are as if were phenomena of dead matter. What is most interesting in a dog, for example, is his attachment to his master, his intelligence, courage, and the like, and not his anatomical structure or even many habits which affect us less.

If you have undertaken to write the biography of an animal, you will have to present to us the living creature, i.e., a result which no man can understand, but only in his degree report the impression made on him.

Science in many departments of natural history does not pretend to go beyond the shell; i.e., it does not get to animated nature at all. A history of animated nature must itself be animated.

The ancients, one would say, with their gorgons, sphinxes, satyrs, mantichora, etc., could imagine more than existed, while the moderns cannot imagine so much as exists.

In describing brutes, as in describing men, we shall naturally dwell most on those particulars in which they are most like ourselves, — in which we have most sympathy with them.

We are as often injured as benefited by our systems, for, to speak the truth, no human system is a true one, and a name is at most a mere convenience and carries no information with it. As soon as I begin to be aware of the life of any creature, I at once forget its name. To know the names of creatures is only a convenience to us at first, but so soon as we have learned to distinguish them, the sooner we forget their names the better, so far as any true appreciation of them is concerned. I think, therefore, that the best and most harmless names are those which are an imitation of the voice or note of an animal, or the most poetic ones. But the name adheres only to the accepted and conventional bird or quadruped, never an instant to the real one. There is always something ridiculous in the name of a great man, — as if he were named John Smith. The name is convenient in communicating with others, but it is not to be remembered when I communicate with myself.

If you look over a list of medicinal recipes in vogue in the last century, how foolish and useless they are seen to be! And yet we use equally absurd ones with faith to-day.

When the ancients had not found an animal wild and strange enough to suit them, they created one by the mingled traits of the most savage already known, — as hyenas, lionesses, pards, panthers, etc., etc., — one with another. Their beasts were thus of wildness and savageness all compact, and more ferine and terrible than any of an unmixed breed could be. They allowed nature great license in these directions. The most strange and fearful beasts were by them supposed to be the off-spring of two different savage kinds. So fertile were their imaginations, and such fertility did they assign to nature. In the modern account the fabulous part will be omitted, it is true, but the portrait of the real and living creature also.

The old writers have left a more lively and lifelike account of the gorgon than modern writers give us of real animals.

Feb. 20. P.M. — I see directly in front of the Depot Ice house, on the only piece of bare ground I see hereabouts, a large flock of lesser redpolls feeding. They must be picking up earth, sand, or the withered grass. They are so intent on it that they allow me to come quite near. This, then, is one use for the drifting of snow which lays bare some spots, however deep it may be elsewhere, — so that the birds, etc., can come at the earth.

Feb. 21. It was their very admiration of nature that made the ancients attribute those magnanimous qualities which are rarely to be found in man to the lion as her

masterpiece, and it is only by a readiness, or rather preparedness, to see more than appears in a creature that one can appreciate what is manifest.

It is remarkable how many berries are the food of birds, mice, etc. Perhaps I may say that all are, however hard or bitter. This I am inclined to say, judging of what I do not know from what I do.

Feb. 23. 2 P.M. — Thermometer 56°. Wind south.

3 P.M. — Thermometer 58° and snow almost gone. River rising. We have not had such a warm day since the beginning of December (which was remarkably warm).

The words “pardall” and “libbard,” applied by Gesner to the same animal, express as much of the wild beast as any.

I read in Brand’s “Popular Antiquities” that “Bishop Stillingfleet observes, that among the Saxons of the northern nations, the Feast of the New Year was observed with more than ordinary jollity: thence, as Olaus Wormius and Scheffer observe, they reckoned their age by so many Iolas.” (Iola, to make merry. — Gothic.) So may we measure our lives by our joys. We have lived, not in proportion to the number of years that we have spent on the earth, but in proportion as we have enjoyed.

A fact stated barely is dry. It must be the vehicle of some humanity in order to interest us. It is like giving a man a stone when he asks you for bread. Ultimately the moral is all in all, and we do not mind it if inferior truth is sacrificed to superior, as when the moralist fables and makes animals speak and act like men. It must be warm, moist, incarnated, — have been breathed on at least. A man has not seen a thing who has not felt it.

Feb. 24. 2 P.M. — Thermometer 42. A very spring-like day, so much sparkling light in the air.

The clouds reflecting a dazzling brightness from their edges, and though it is rather warm (the wind raw) there are many, finely divided, in a stream southwest to northeast all the afternoon, and some most brilliant mother-o’-pearl. I never saw the green in it more distinct.

Feb. 28. Looking from Hubbard’s Bridge, I see a great water-bug even on the river, so forward is the season.

I take up a handsomely spread (or blossomed) pitch pine cone, but I find that a squirrel has begun to strip it first, having gnawed off a few of the scales at the base. The squirrel always begins to gnaw a cone thus at the base, as if it were a stringent law among the squirrel people, — as if the old squirrels taught the young ones a few simple rules like this.

C. saw a dozen robins to-day on the ground on Ebby Hubbard’s hill by the Yellow Birch Swamp.

March 2. Notice the brightness of a row of osiers this morning. This phenomenon, whether referable to a change in the condition of the twig or to the spring air and light, or even to our imaginations, is not the less a real phenomenon, affecting us annually at this season. This is one compensation for having them lopped so often along the causeways, that it is only these new and vigorous growths which shine thus.

March 8. 2.30 P.M. — 50°. To Cliffs and Walden.

See a small flock of grackles on the willow-row above railroad bridge. How they sit and make a business of chattering! for it cannot be called singing, and no improvement from age to age perhaps. Yet, as nature is a becoming, their notes may become melodious at last. At length, on my very near approach, they flit suspiciously away, uttering a few subdued notes as they hurry off.

March 9. Snows this forenoon, whitening the ground again.

I have seen three or four pieces of coral in the fields of Concord, and Mr. Pratt has found three or four on his farm. How shall they be accounted for? Who brought them here? and when?

March 14. 2 P.M. — Thermometer 39. Overcast, with a flurry of snow and a little rain, till 4.30 P.M. To Walden and Cliffs.

I am surprised to find Walden almost entirely open. I have not observed it to open before before the 23d of March. However, it is clear enough why Walden has broken up thus early this year. It does not ordinarily freeze till near the end of December (average of twelve observations, December 25th), while Fair Haven Pond freezes about December 2d. But this past winter our cold weather was mostly confined to December, which was remarkable for its uniform cold, while January and February were very open and pleasant. So that Fair Haven Pond, having more than three weeks the start, and that being almost all the cold weather that we had, froze much the thickest. Walden did not freeze so thick as usual. If we have an average winter up to January, but a particularly warm one afterward, Walden will break up early, not having had any chance to freeze thick.

As I stand there, I see some dark ripples already drop and sweep over the surface of the pond, as they will ere long over Ripple Lake and other pools in the wood. No sooner has the ice of Walden melted than the wind begins to play in dark ripples over the surface of the virgin water. It is affecting to see Nature so tender, however old, and wearing none of the wrinkles of age. Ice dissolved is the next moment as perfect water as if it had been melted a million years. To see that which was lately so hard and immovable now so soft and impressible! What if our moods could dissolve thus completely? It seems as if it must rejoice in its own newly acquired fluidity, as it affects the beholder with joy. Often the March winds have no chance to ripple its face at all.

I see on the peak several young English cherry trees six or eight feet high, evidently planted by birds and growing well. These grew nearly a foot last year and look quite healthy. The bird must have brought the stone far to this locality.

Every craftsman looks at his own objects with peculiar eyes. I thought of this on seeing these young cherry trees and remembering how I used to distinguish the erect and lusty shoots when I cultivated a small nursery, for budding. One eye will mark how much the twigs grew last year, another the lichens on the trunk.

March 15. A hen-hawk sails away from the wood southward. I get a very fair sight of it sailing overhead. What a perfectly regular and neat outline it presents! an easily recognized figure anywhere. Yet I never see it represented in any books. The exact

correspondence of the marks on one side to those on the other, as the black or dark tip of one wing to the other, and the dark line midway the wing. I have no idea that one can get as correct an idea of the form and color of the under sides of a hen-hawk's wings by spreading those of a dead specimen in his study as by looking up at a free and living hawk soaring above him in the fields. The penalty for obtaining a petty knowledge thus dishonestly is that it is less interesting to men generally, as it is less significant. What is an eagle in captivity! — screaming in a courtyard! I am not the wiser respecting eagles for having seen one there. I do not wish to know the length of its entrails.

March 18. Sunday. 2 P.M. — Thermometer 56. Wind south, but soon changes to southeast, making the air fresh and hazy and rippling the before smooth water.

All along under that bank I heard the hum of honey-bees in the air, attracted by this flower. What a remarkable instinct it is that leads them to this flower! This bee is said to have been introduced by the white man, but how much it has learned!

You see a fly come forth from its hibernaculum in your yard, stretch its wings in the sun, and set forth on its flowery journey. You little think that it knows the locality of early flowers better than you. You have not dreamed of them yet. It knows a spot a mile off under a warm bank-side where the skunk-cabbage is in bloom. No doubt this flower, too, has learned to expect its winged visitor knocking at its door in the spring.

Pratt says that his bees come out in a pleasant day at any time in the winter; that of late they have come out and eased themselves, the ground being covered around the hives with their yellow droppings. Were not these the little yellow pellets I saw in a skunk-cabbage flower some years ago? He says they come home now all yellow. I tell him it is skunk-cabbage pollen. I think there would be no surer way to tell when this flower had bloomed than to keep bees and watch when they first returned laden with pollen. Let them search for you, — a swarm of bees. Probably with a microscope you could tell exactly when each of the bee-frequented flowers began to bloom throughout the year.

March 22. The phenomena of an average March are increasing warmth, melting the snow and ice and, gradually, the frost in the ground; cold and blustering weather, with high, commonly northwest winds for many days together; misty and other rains taking out frost, and whitenings of snow, and winter often back again, both its cold and snow; bare ground and open waters, and more or less of a freshet; some calm and pleasant days reminding us of summer, with a blue haze or a thicker mist wreathing the woods at last, in which, perchance, we take off our coats awhile and sit without a fire a day; ways getting settled, and some greenness appearing on south bank; April-like rains, after the frost is chiefly out; plowing and planting of peas, etc., just beginning, and the old leaves getting dry in the woods.

Vegetation fairly begins, — conferva and mosses, grass and carex, etc., — and gradually many early herbaceous plants start, and noticed radical leaves; *Stellaria media* and shepherd's-purse bloom; maple and buttonwood sap (6th) flow; spiræas start, cladonias flush, and bæomyces handsome; willow catkins become silvery, aspens

downy; osiers, etc., look bright, white maple and elm buds expand and open, oak woods thin-leaved; alder and hazel catkins become relaxed and elongated. First perceptible greenness on south banks, 22d. The skunk-cabbage begins to bloom (23d); plant peas, etc., 26th; spring rye, wheat, lettuce; maple swamps red-tinged (?) 28th, and lake grass; and perchance the gooseberry and lilac begin to show a little green. That is, one indigenous native flower blooms. (Vide if the early sedge does.)

About twenty-nine migratory birds arrive (including hawks and crows), and two or three more utter their spring notes and sounds, as nuthatch and chickadee, turkeys, and woodpecker tapping, while apparently the snow bunting, lesser redpoll, shrike, and doubtless several more — as owls, crossbills (?) — leave us, and woodcocks and hawks begin to lay.

Many insects and worms come forth and are active, — and the perla insects still about ice and water, — as tipula, grubs, and fuzzy caterpillars, minute hoppers on grass at springs; gnats, large and small, dance in air; the common and the green fly buzz outdoors; the gyrinus, large and small, on brooks, etc., and skaters; spiders shoot their webs, and at last gossamer floats; the honey-bee visits the skunk-cabbage; fishworms come up, sow-bugs, wireworms, etc.; various larvæ are seen in pools; small green and also brown grasshoppers begin to hop, small ants to stir (25th); Vanessa Antiopa out 29th; cicindelas run on sand; and small reddish butterflies are seen in wood-paths, etc., etc., etc.

Skunks are active and frolic; woodchucks and ground squirrels come forth; moles root; musquash are commonly drowned out and shot, and sometimes erect a new house, and at length are smelled; and foxes have young (?).

As for fishes, etc., trout glance in the brooks, brook minnows are seen; see furrows on sandy bottoms, and small shell snails copulate; dead suckers, etc., are seen floating on meadows; pickerel and perch are running up brooks, and suckers (24th) and pickerel begin to dart in shallows.

And for reptiles, not only salamanders and pollywogs are more commonly seen, and also those little frogs (*sylvatica* males?) at spring-holes and ditches, the yellow-spot turtle and wood turtle, *Rana fontinalis*, and painted tortoise come forth, and the *Rana sylvatica* croaks.

Our river opened in 1851, much before February 25; 1852, March 14 at least; 1853, say March 8 at least; 1854, say March 9; average March 5. Hudson River opened, according to Patent Office Reports, 1854, page 435: 1851, February 25; 1852, March 28; 1853, March 23; 1854, March 17; average March 16. According to which our river opens some eleven days the soonest. Perhaps this is owing partly to the fact that our river is nearer the ocean and that it rises southward instead of northward.

March 23. It will be seen by the annexed scrap that March is the fourth coldest month, or about midway between December and November. The same appears from the fifteen years' observation at Mendon. ("American Almanac," page 86.) The descent to extreme cold occupies seven months and is therefore more gradual (though a part of it is more rapid) than the ascent to extreme heat, which takes only five months.

The mean average temperature of the coldest month (February) being 23.25, and of the warmest (July) being 72.35, the whole ascent from extreme cold to extreme heat is 49.10°, and in March (32.73) we have accomplished 8.48°, or a little less than one sixth the ascent. (According to the Mendon fifteen years' average the whole ascent is 47.5, and in March we have advanced 9.2, a little more than one fifth.) It appears (from the scrap) that December, January, and February, the three winter months, differ very little in temperature, and the three summer months and September are next most alike, though they differ considerably more. (Same from Mendon tables.) The greatest or abruptest change is from November to December (in Mendon tables from September to October), the next most abrupt from April to May (in Mendon tables from March to April). The least change (according to the above tables) is from December to January. (According to Mendon tables, the same from December to January as from January to February.) The three spring months, and also October and November, are transition months, in which the temperature rapidly changes.

March 24. According to a table in the "American Almanac" for '49, page 84, made at Cambridge, from May, '47, to May, '48, the monthly mean force of the wind for March, April, and May were equal, and were inferior to July and June; for quantity of clouds March and May were equal, and were preceded by December, November, September, January, June, and August. For depth of rain, [etc.].

March 25. To speak of the general phenomena of March: When March arrives, a tolerably calm, clear, sunny, spring-like day, the snow is so far gone that sleighing ends and our compassion is excited by the sight of horses laboriously dragging wheeled vehicles through mud and water and slosh. We shall no longer hear the jingling of sleigh-bells. The sleigh is housed, or, perchance, converted into a wheeled vehicle by the travelling peddler caught far from home. The wood-sled is perhaps abandoned by the roadside, where the snow ended, with two sticks put under its runners, — there to rest, it may be, while the grass springs up green around it, till another winter comes round. Even the boy's sled gets put away by degrees, or when it is found to be in the way, and his thoughts are directed gradually to more earthy games. There are now water privileges for him by every roadside.

The boy's sled gets put away in the barn or shed or garret, and there lies dormant all summer, like a woodchuck in the winter. It goes into its burrow just before woodchucks come out, so that you may say a woodchuck never sees a sled, nor a sled a woodchuck, — unless it were a prematurely risen woodchuck or a belated and unseasonable sled. Before the woodchuck comes out the sled goes in. They dwell at the antipodes of each other. Before sleds rise woodchucks have set. The ground squirrel too shares the privileges and misfortunes of the woodchuck. The sun now passes from the constellation of the sled into that of the woodchuck.

The sleighing, the sledding, or sliding, is gone. We now begin to wheel or roll ourselves and commodities along, which requires more tractile power. The high-set chaise, the lumbering coach like wasps and gnats and bees come humming forth.

The traveller, when he returns the hired horse to his stable, concludes at last that it is worse sleighing than wheeling. To be sure, there was one reach where he slid along pretty well under the north side of a wood, but for the most part he cut through, as when the cook cuts edgings of dough for her pies, and the grating on the gravel set his teeth on edge.

To proceed with March: Frost comes out of warm sand-banks exposed to the sun, and the sand flows down in the form of foliage. But I see still adhering to the bridges the great chandelier icicles formed in yesterday's cold and windy weather.

By the 2d, ice suddenly softens and skating ends. This warmer and springlike day, the inexperienced eagerly revisit the pond where yesterday they found hard and glassy ice, and are surprised and disappointed to find it soft and rotten. Skates, then, have become useless tools and follow sleds to their winter quarters. They are ungratefully parted with, not like old friends surely. They and the thoughts of them are shuffled out of the way, and you will probably have to hunt long before you find them next December.

The air is springlike. The milkman closes his ice-house doors against the milder air. By the 3d, [etc., day by day through March 31].

March 26. Tried by various tests, this season fluctuates more or less. For example, we may have absolutely no sleighing during the year. There was none in the winter months of '58 (only from March 4 to 14). '52-'53 was an open winter. Or it may continue uninterrupted from the beginning of winter to the 3d of April, as in '56, and the dependent phenomena be equally late. The river may be either only transiently closed, as in '52-'53 and '57-'58, or it may not be open entirely (up to pond) till April 4th.

As for cold, some years we may have as cold days in March as in any winter month. March 4, 1858, it was -14, and on the 29th, 1854, the pump froze so as to require thawing.

The river may be quite high in March or at summer level.

Fair Haven Pond may be open by the 20th of March, as this year, or not till April 13 as in '56, or twenty-three days later.

Tried by the skunk-cabbage, this may flower March 2 ('60) or April 6 or 8 (as in '55 and '54), or some five weeks later, — say thirty-six days.

The bluebird may be seen February 24, as in '50, '57, and '60, or not till March 24, as in '56, — say twenty-eight days.

The yellow-spotted tortoise may be seen February 23, as in '57, or not till March 28, as in '55, — thirty-three days.

The wood frog may be heard March 15, as this year, or not till April 13, as in '56, — twenty-nine days.

That is, tried by the last four phenomena, there may be about a month's fluctuation, so that March may be said to have receded half-way into February or advanced half-way into April, i.e., it borrows half of February or half of April.

April 1. Warm, with the thick haze still concealing the sun.

Our gooseberry begins to show a little green, but not our currant.

The fruit a thinker bears is sentences, — statements or opinions. He seeks to affirm something as true. I am surprised that my affirmations or utterances come to me ready-made, — not fore-thought, — so that I occasionally awake in the night simply to let fall ripe a statement which I had never consciously considered before, and as surprising and novel and agreeable to me as anything can be. As if we only thought by sympathy with the universal mind, which thought while we were asleep. There is such a necessity to make a definite statement that our minds at length do it without our consciousness, just as we carry our food to our mouths. This occurred to me last night, but I was so surprised by the fact which I have just endeavored to report that I have entirely forgotten what the particular observation was.

April 20. Moore tells me that last fall his men, digging sand in that hollow just up the hill, dug up a parcel of snakes half torpid. They were both striped and black together. The men killed them, and laid them all in a line on the ground, and they measured several hundred feet. This seems to be the common practice when such collections are found; they are at once killed and stretched out in a line, and the sum of their lengths measured and related.

May 3. To Cambridge and Boston.

I see at the Aquarium many of my little striped or barred breams, now labelled *Bryttus obesus*. Compared with the common, they have rounded tails, larger dorsal and anal fins, and are fuller or heavier forward. I observe that they incline to stand on their heads more.

May 12. Celandine. Very hot.

2.30 P.M. — 81°.

We seek the shade to sit in for a day or two.

The sugar maple blossoms on the Common resound with bees.

First bathe in the river. Quite warm enough.

May 17. Standing in the meadow near the early aspen at the island, I hear the first fluttering of leaves, — a peculiar sound, at first unaccountable to me. The breeze causes the now fully expanded aspen leaves there to rustle with a pattering sound, striking on one another. It is much like a gentle surge breaking on a shore, or the rippling of waves. This is the first softer music which the wind draws from the forest, the woods generally being comparatively bare and just bursting into leaf. It was delicious to behold that dark mass and hear that soft rippling sound.

Hear of a hummingbird on the 12th.

Hear the first bullfrog's trump.

May 23. Critchicrotches some two or three days; now tender to eat.

How agreeable and surprising the peculiar fragrance of the sweet flag when bruised! That this plant alone should have extracted this odor surely for so many ages each summer from the moist earth!

The quarter-grown red oak leaves between you and the sun, how yellow-green!

June 4. The clear brightness of June was well represented yesterday by the buttercups (*Ranunculus bulbosus*) along the roadside. Their yellow so glossy and varnished within; but not without. Surely there is no reason why the new butter should not be yellow now.

One asks me to-day when it is that the leaves are fully expanded, so that the trees and woods look dark and heavy with leaves. I answered that there were leaves on many if not on most trees already fully expanded, but that there were not many on a tree, the shoots having grown only some three inches, but by and by they will have grown a foot or two and there will be ten times as many leaves. Each tree (or most trees) now holds out many little twigs, some three inches long, with two or three fully expanded leaves on it, between us and the sun, making already a grateful but thin shade, like a coarse sieve, so open that we see the fluttering of each leaf in its shadow; but in a week or more the twigs will have so extended themselves, and the number of fully expanded leaves be so increased, that the trees will look heavy and dark with foliage and the shadow be dark and opaque, — a gelid shade.

You may say that now, when most trees have fully expanded leaves and the black ash fairly shows green, the leafy season has fairly commenced. (I see that I so called it May 31 and 27, 1853.)

June 7. The peculiarities of the new leaves, or young ones, are to be observed. As I now remember, there is the whitish shoot of the white pine; the reddish brown of the pitch pine, giving a new tinge to its tops; the bead-work of the hemlock; the now just conspicuous bursting lighter glaucous-green buds of the black spruce in cold swamps; the frizzly-looking glaucous-green shoots and leaflets of the fir (and fragrant now or soon); the thin and delicate foliage of the larch; the inconspicuous and fragrant arborvitæ; the bead-work of the *Juniperus repens* (red cedar inconspicuous); [etc. — 24 more].

June 8. 2 P.M. — To Well Meadow via Walden.

Within a day or two has begun that season of summer when you see afternoon showers, maybe with thunder, or the threat of them, dark in the horizon, and are uncertain whether to venture far away or without an umbrella. I noticed the very first such cloud on the 25th of May, — the dark iris of June.

As I look at the mountains in the horizon, I am struck by the fact that they are all pyramidal — pyramids, more or less low — and have a peak. Why have the mountains usually a peak? This is not the common form of hills. They do not so impress us at least.

June 16. It appears to me that these phenomena occur simultaneously, say June 12th, viz.: —

Heat about 85° at 2 P.M. True summer.

Hylodes cease to peep.

Purring frogs (*Rana palustris*) cease.

Lightning-bugs first seen.

Bullfrogs trump generally.

Mosquitoes begin to be really troublesome.

Afternoon thunder-showers almost regular.

Sleep with open window (10th), and wear thin coat and ribbon on neck.

Turtles fairly and generally begun to lay.

June 21. Having noticed the pine pollen washed up on the shore of three or four ponds in the woods lately and at Ripple Lake, a dozen rods from the nearest pine, also having seen the pollen carried off visibly half a dozen rods from a pitch pine which I had jarred, and rising all the while when there was very little wind, it suggested to me that the air must be full of this fine dust at this season, that it must be carried to great distances, when dry, and falling at night perhaps, or with a change in the atmosphere, its presence might be detected remote from pines by examining the edges of pretty large bodies of water, where it would be collected to one side by the wind and waves from a large area.

So I thought over all the small ponds in the township in order to select one or more most remote from the woods or pines, whose shores I might examine and so test my theory. I could think of none more favorable than this little pond only four rods in diameter, a watering-place in John Brown's pasture, which has but few pads in it. It is a small round pond at the bottom of a hollow in the midst of a perfectly bare, dry pasture. The nearest wood of any kind is just thirty-nine rods distant northward, and across a road from the edge of the pond. Any other wood in other directions is five or six times as far. I knew it was a bad time to try my experiment, — just after such heavy rains and when the pines are effete, — a little too late. The wind was now blowing quite strong from the northeast, whereas all the pollen that I had seen hitherto had been collected on the northeast sides of ponds by a southwest wind. I approached the pond from the northeast and, looking over it and carefully along the shore there, could detect no pollen. I then proceeded to walk round it, but still could detect none. I then said to myself, If there was any here before the rain and northeast wind, it must have been on the northeast side and then have been washed over and now up high quite at or on the shore. I looked there carefully, stooping down, and was gratified to find, after all, a distinct yellow line of pollen dust about half an inch in width — or washing off to two or three times that width — quite on the edge, and some dead twigs which I took up from the wet shore were completely coated with it, as with sulphur. This yellow line reached half a rod along the southwest side, and I then detected a little of the dust slightly graying the surface for two or three feet out there.

When I thought I had failed, I was much pleased to detect, after all, this distinct yellow line, revealing unmistakably the presence of pines in the neighborhood and thus confirming my theory. As chemists detect the presence of ozone in the atmosphere by exposing to it a delicately prepared paper, so the lakes detect for us thus the presence of the pine pollen in the atmosphere. They are our pollinometers. How much of this invisible dust must be floating in the atmosphere, and be inhaled and drunk by us at this season!! Who knows but the pollen of some plants may be unwholesome to inhale, and produce the diseases of the season?

Of course a large pond will collect the most, and you will find most at the bottom of long deep bays into which the wind blows.

I did not expect to find any pollen, the pond was so small and distant from any wood, but I thought that I would examine. Who knows but the pollen of various kinds floating through the air at this season may be the source of some of the peculiar perfumes which are not traceable to their sources?

June 27. Farmer says that he found on the 24th a black snake laying her eggs on the side of the hill between his peach-orchard and the ledge in the woods. Was close by where his uncle (?) tried to dig through to the other side of the world. Dug more or less for three years. Used to dig nights, as long as one candle lasted. Left a stone just between him and the other side, not to be removed till he was ready to marry Washington's sister. The foxes now occupy his hole.

June 28. This month, it must be 85° at 2 P.M. and still to make hot weather. 80° with wind is quite comfortable. June-grass is now generally browned atop, its spikes being out of bloom and old. Herd's-grass out, two or three days.

Farmer said yesterday that he thought foxes did not live so much in the depth of the woods as on open hillsides, where they lay out and overlooked the operations of men, — studied their ways, — which made them so cunning.

JUNE 29. Dogdayish and showery, with thunder.

At 6 P.M. 91°, the hottest yet, though a thunder-shower has passed northeast and grazed us, and, in consequence, at 6.30 or 7, another thunder-shower comes up from the southwest and there is a sudden burst from it with a remarkably strong, gusty wind, and the rain for fifteen minutes falls in a blinding deluge. I think I never saw it rain so hard. The roof of the depot shed is taken off, many trees torn to pieces, the garden flooded at once, corn and potatoes, etc., beaten flat. You could not see distinctly many rods through the rain. It was the very strong gusts added to the weight of the rain that did the mischief. There was little or no wind before the shower; it belonged wholly to it. Thus our most violent thunder-shower followed the hottest hour of the month.

July 3. Looked for the marsh hawk's nest in the Great Meadows. We had much difficulty in finding it again, but at last nearly stumbled on to a young hawk with a great head, staring eyes, and open gaping or panting mouth, yet mere down, grayish-white down, as yet; but I detected another which had crawled a foot one side amid the bushes for shade or safety, more than half as large again, with small feathers and a yet more angry, hawk-like look. How naturally anger sits on the young hawk's head! June is an up-country month, when our air and landscape is most like that of a more mountainous region, full of freshness.

July 7. June 30th, July 3d, 4th, 6th, and 7th, I carried round a thermometer in the afternoon and ascertained the temperature of the springs, brooks, etc. [Eight pages of data, averaged and analyzed, on 18 springs, 11 brooks, 15 river temperatures, and 6 other local bodies of water.]

I should say, then, that a spring colder than 48° was remarkably cold; 48° to 50°, inclusive, quite cold, a very good cold spring; above 50° and not above 54°, cold; above

that and not above 58°, tolerable merely. Or, I should rather say that only 50° and below was cold for a spring; say below 48°, remarkably cold; between that and 50°, inclusive, cold; 50° to 54°, inclusive, pretty cold; thence to 58°, inclusive, merely tolerable to drink.

It appears that in a cold day at present the water of the river at 6 A.M. will be ten to fourteen degrees warmer than the air, and accordingly feels warm to the touch. In the translation into English of Cranz's "Greenland" from High Dutch (1767) I find "an elve or mountain spring," and again "Salmon elves, or the little streams from the hills."

July 13. 2 P.M. — To Little Truro.

You now especially notice some very red fields where the red-top grass grows luxuriantly and is now in full bloom, — a red purple, passing into brown, looking at a distance like a red-sandstone soil. The different cultivated fields are thus like so many different-colored checkers on a checker-board. First we had the June-grass reddish-brown, and the sorrel red, of June; now the red-top red of July. For a week — and if you look very closely, for a fortnight or more — past, the season has had a more advanced look, from the reddening, imbecoming, or yellowing, and ripening of many grasses, as the sweet-scented vernal (for some time generally withered) and the June-grass, and some grain, — rye, wheat, etc., — so that the fields and hillsides present a less liquid green than they did. The vernal freshness of June is passed.

July 17. 2 P.M. — To Walden.

The soft sand on the bottom of Walden, as deep as I can wade, feels very warm to my feet, while the water feels cold. This may be partly a mere sensation, but I suspect that the sand is really much warmer than the water and that some creatures take refuge in it accordingly, that much heat passes through the water and is absorbed in the sand. Yet when I let a thermometer lie on the bottom and draw it up quickly I detect no difference between the temperature of the bottom and of the water at the surface. Probably it would have been different if the thermometer had been buried in the sand.

July 19. The rich crimson under sides (with their regularly branching veins) of some white lily pads surpasses the color of most flowers. No wonder the spiders are red that swim beneath; and think of the fishes that swim beneath this crimson canopy, — beneath a crimson sky. I can frequently trace the passage of a boat, a pickerel-fisher, perhaps, by the crimson under sides of the pads upturned.

The pads crowd and overlap each other in most amicable fashion. Sometimes one lobe of a yellow lily pad is above its neighbor, while the other is beneath. The pads are rapidly consumed, but fresh ones are all the while pushing up and unrolling. They push up and spread out in the least crevice that offers.

July 22. Yesterday having been a rainy day, the air is now remarkably clear and cool and you rarely see the horizon so distinct. The surface of the earth, especially looking westward, — grass grounds, pastures, and meadows, — is remarkably beautiful. I stand in Heywood's pasture west of the leek and, leaning over the wall, look westward. All things — grass, etc. — are peculiarly fresh this season on account of the copious rains.

The next field on the west slopes gently from both east and west to a meadow in the middle. So, as I look over the wall, it is first dark-green, where white clover has been cut (still showing a myriad low white heads which resound with the hum of bees); next, along the edge of the bottom or meadow, is a strip or belt three or four rods wide of red-top, uncut, perfectly distinct; then the cheerful bright-yellow sedge of the meadow, yellow almost as gamboge; then a corresponding belt of red-top on its upper edge, quite straight and rectilinear like the first; then a glaucous-green field of grain still quite low; and, in the further corner of the field, a much darker square of green than any yet, all brilliant in this wonderful light. You thus have a sort of terrestrial rainbow, thus: —

The farmer accustomed to look at his crops from a mercenary point of view is not aware how beautiful they are. This prospect was really exciting, even as a rainbow is.

March 19, 1856, it was twenty-six inches thick!!

No, for Farmer says the former are liquid.

15th, 16th, 17th.

Vide June 20 and 22, 1858.

There was the same sudden and remarkably violent storm about two hours earlier all up and down the Hudson, and it struck the Great Eastern at her moorings in New York and caused some damage.

July 23. I saw the other day where the lightning on the 12th or 13th had struck the telegraph-posts at Walden Pond. It had shattered five posts in succession, they being a dozen rods apart, spoiling them entirely; though all of them stood but one, yet they were a mere wrack of splinters through which you could look. It had omitted a great many more posts and struck half a dozen more at a great distance from these on each side. And at the same time there was a smart shock, an explosion, at the operating office at the depot, two miles off from the furthest point. I should think, speaking from memory, that the posts struck were the oldest and dampest, or most rotten. At one or two posts it had plainly entered the ground and plowed toward the railroad-track, slightly injuring it. It struck a pitch pine standing within four or five feet of the wire, leaving a white seam down one side of it, also two large oaks a little further off. This was where the telegraph ran parallel to, and a few feet only from, a wood. It also struck a small oak on the opposite side of the track. The lightning struck for two miles (!! ) at least.

So far as leaves are concerned, one of the most noticeable phenomena of this green-leaf season is the conspicuous reflection of light in clear breezy days from the silvery under sides of some.

All trees and shrubs which have light-colored or silvery under sides to their leaves, but especially the swamp white oak and the red maple, are now very bright and conspicuous in the strong wind after the rain of the morning. To be sure, most, if not all leaves, not to mention grasses, are a paler green beneath, and hence the oaks and other trees behind show various shades of green, which would be more observed if it were not for these stronger contrasts. Though the wind may not be very strong nor

incessant, you appear to see only the under sides of those first named, and they make a uniform impression, as if their leaves, having been turned up, were permanently held so. Before the wind arose, the wooded shore and hillsides were an almost uniform green, but now the whole outline of the swamp white oaks and maples is revealed by the wind — a sort of magic, a “presto change” — distinctly against trees whose leaves are nearly of the same color with the upper sides of these.

In a maple swamp every maple-top stands now distinguished thus from the birches in their midst. Before they were confounded, but a wind comes and lifts their leaves, showing their lighter under sides, and suddenly, as by magic, the maple stands out from the birch. There is a great deal of life in this landscape. What an airing the leaves get! Perchance it is necessary that their under sides be thus exposed to the light and air in order that they may be hardened and darkened by it.

I read of the Amazon that its current, indeed, is strong, but the wind always blows up the stream. This sounds too good to be true.

July 31. Before it rained hardest I could see in the midst of the dark and smoother water a lighter-colored and rougher surface, generally in oblong patches, which moved steadily down the stream, and this, I think, was the new water from above welling up and making its way downward amid the old. The water or currents of a river are thus not homogeneous, but the surface is seen to be of two shades, the smoother and darker water which already fills its bed and the fresh influx of lighter-colored and rougher, probably more rapid, currents which spot it here and there; i.e., some water seems to occupy it as a lake to some extent, other is passing through it as a stream, — the lacustrine and the fluviatile water. These lighter reaches without reflections (?) are, as it were, water wrong side up. But do I ever see these except when it rains? And are they not the rain-water which has not yet mingled with the water of the river?

## AUGUST, 1860

Aug. 1. P. M. — To Cliffs.

The earliest corn has shed its pollen, say a week or ten days. Rye, wheat, and oats and barley have bloomed, say a month.

I stand at the wall-end on the Cliffs and look over the Miles meadow on Conantum. It is an unusually clear day after yesterday's rain.

How much of beauty — of color, as well as form — on which our eyes daily rest goes unperceived by us! No one but a botanist is likely to distinguish nicely the different shades of green with which the open surface of the earth is clothed, — not even a landscape-painter if he does not know the species of sedges and grasses which paint it. With respect to the color of grass, most of those even who attend peculiarly to the aspects of Nature only observe that it is more or less dark or light, green or brown, or velvety, fresh or parched, etc. But if you are studying grasses you look for another and

different beauty, and you find it, in the wonderful variety of color, etc., presented by the various species.

Take the bare, unwooded earth now, and consider the beautiful variety of shades (or tints?) of green that clothe it under a bright sun. The pastured hills of Conantum, now just imbrowned (probably by the few now stale flowering tops of the red-top which the cows have avoided as too wiry), present a hard and solid green or greenish brown, just touched here and there delicately with light patches of sheep's fescue (though it may be only its radical leaves left), as if a dew lay on it there, — and this has some of the effect of a watered surface, — and the whole is dotted with a thousand little shades of projecting rocks and shrubs. Then, looking lower at the meadow in Miles's field, that is seen as a bright-yellow and sunny stream (yet with a slight tinge of glaucous) between the dark-green potato-fields, flowing onward with windings and expansions, and, as it were, with rips and waterfalls, to the river meadows.

Again, I sit on the brow of the orchard, and look northwest down the river valley (at mid-afternoon). There flows, or rests, the calm blue winding river, lakelike, with its smooth silver-plated sides, and wherever weeds extend across it, there too the silver plate bridges it, like a spirit's bridge across the Styx; but the rippled portions are blue as the sky. This river reposes in the midst of a broad brilliant yellow valley amid green fields and hills and woods, as if, like the Nanking or Yang-ho (or what-not), it flowed through an Oriental Chinese meadow where yellow is the imperial color. The immediate and raised edge of the river, with its willows and button-bushes and polygonums, is a light green, but the immediately adjacent low meadows, where the sedge prevails, is a brilliant and cheerful yellow, intensely, incredibly bright, such color as you never see in pictures; yellow of various tints, in the lowest and sedgiest parts deepening to so much color as if gamboge had been rubbed into the meadow there; the most cheering color in all the landscape; shaded with little darker isles of green in the midst of this yellow sea of sedge. Yet it is the bright and cheerful yellow, as of spring, and with nothing in the least autumnal in it. How this contrasts with the adjacent fields of red-top, now fast falling before the scythe!

When your attention has been drawn to them, nothing is more charming than the common colors of the earth's surface. See yonder flashing field of corn through the shimmering air. (This was said day before yesterday.)

The deciduous woods generally have now and for a long time been nearly as dark as the pines, though, unlike the pines, they show a general silveriness.

For some days have seen stigmas of what I have called *Cyperus dentatus*, but it is evidently later than the diandrus.

See a berry (not ripe) of the two-leaved Solomon's-seal dropped at the mouth of a mouse or squirrel's hole, and observe that many are gone from these plants, as if plucked by mice.

The sphagnum shows little black-balled drumsticks now. The nuthatch is active now. Meadow-haying commenced. *Cinna arundinacea* (?) almost.

Looked in two red maple swamps to find the young plants. If you look carefully through a dense red maple swamp now, you find many little maples a couple of inches high which have sprung up chiefly on certain spots alone, especially where the seed has fallen on little beds of sphagnum, which apparently have concealed the seed at the same time that they supplied the necessary moisture. There you find the little tree already deeply rooted, while the now useless winged seed lies empty near by, with its fragile wing half wasted away, as if wholly unrelated to that plant, — not visibly attached, but lying empty on one side. But so far as I look, I see only one maple to a seed, but, indeed, I see only a single seed at a time. You do not find dense groves of them generally, as you might expect from the abundance of seed that falls.

Nevertheless, you will be surprised, on looking through a large maple swamp which two months ago was red with maple seed falling in showers around, at the very small number of maple seeds to be found there, and probably every one of these will be empty. The little maples appear oftenest to have sprung from such as fell into crevices in the moss or leaves and so escaped. Indeed, almost every seed that falls to the earth is picked up by some animal or other whose favorite and perhaps peculiar food it is. They are daily busy about it in the season, and the few seeds which escape are exceptions. There is at least a squirrel or mouse to a tree. If you postpone your search but for a short time, you find yourself only gleaning after them. You may find several of their holes under every tree, if not within it. They ransack the woods. Though the seed may be almost microscopic, it is nuts to them; and this apparently is one of the principal ends which these seeds were intended to serve.

Look under a nut tree a month after the nuts have fallen, and see what proportion of sound nuts to the abortive ones and shells you will find ordinarily. They have been dispersed, and many effectually planted, far and wide by animals. You have come, you would say, after the feast was over, and are presented with shells only. It looks like a platform before a grocery. These little creatures must live, and, pray, what are they to eat if not the fruits of the earth? — i.e. the graminivorous [sic] ones.

Aug. 2. The wing of the sugar maples is dry and ripe to look at, but the seed end and seed are quite green. I find, as Michaux did, one seed always abortive.

P. M. — Up Assabet.

The young red maples have sprung up chiefly on the sandy and muddy shores, especially where there is a bay or eddy.

At 2 p. M. the river is twelve and seven eighths above summer level, higher than for a long time, on account of the rain of the 31st. Seed of hop-hornbeam not ripe. The button-bush is about in prime, and white lilies considerably past prime. Mikania begun, and now, perhaps, the river's brink is at its height. The black willow down is even yet still seen here and there on the water.

The river, being raised three or four inches, looks quite full, and the bur-reed, etc., is floating off in considerable masses. See those round white patches of eggs on the upright sides of dark rocks.

There is now and of late a very thin, in some lights purplish, scum on the water, outside of coarser drift that has lodged, — a brown scum, somewhat gossamerlike as it lies, and browner still on your finger when you take it up. What is it? The pollen of some plant?

As we rest in our boat under a tree, we hear from time to time the loud snap of a wood pewee's bill overhead, which is incessantly diving to this side and that after an insect and returning to its perch on a dead twig. We hear the sound of its bill when it catches one.

In huckle-berry fields I see the seeds of berries recently left on the rocks where birds have perched. How many of these small fruits they may thus disseminate!

Aug. 3. The knotty-rooted cyperus out some days at least.

Aug. 4. 8.30 a m. — Start for Monadnock.

Begins to rain at 9 a m., and rains from time to time thereafter all day, the mountain-top being constantly enveloped in clouds.

Notice in Troy much of the cyperinus variety of wool-grass, now done, of various heights. Also, by roadside, the *Ribes Cynosbati*, with its prickly berries now partly reddened but hardly ripe. Am exhilarated by the peculiar raspberry scent by the roadside this wet day — and of the dicksonia fern. Raspberries still quite common, though late. The high blackberries, the mulberry kind, all still green and red; and also on the 9th, except one berry on a rock.

There was a little sunshine on our way to the mountain, but the cloud extended far down its sides all day, so that one while we mistook Gap Monadnock for the true mountain, which was more to the north.

According to the guide-board it is two and one fourth miles from Troy to the first fork in the road near the little pond and schoolhouse, and I should say it was near two miles from there to the summit, — all the way uphill from the meadow.

We crossed the immense rocky and springy pastures, containing at first raspberries, but much more hard-hack in flower, reddening them afar, where cattle and horses collected about us, sometimes came running to us, as we thought for society, but probably not. I told Bent of it, — how they gathered about us, they were so glad to see a human being, — but he said I might put it in my book so, it would do no harm, but then the fact was they came about me for salt. "Well," said I, "it was probably because I had so much salt in my constitution." Said he, "If you had had a little salt with you [you] could hardly have got away from them."

"Well," said I, "[I] had some salt in my pocket."

"That's what they smelt," said he. Cattle, young and old, with horns in all stages of growth, — young heifers with budding horns, — and horses with a weak [?] Sleepy-David look, though sleek and handsome. They gathered around us while we took shelter under a black spruce from the rain.

We were wet up to our knees before reaching the woods or steep ascent where we entered the cloud. It was quite dark and wet in the woods, from which we emerged into

the lighter cloud about 3 P. M., and proceeded to construct our camp, in the cloud occasionally amounting to rain, where I camped some two years ago.

Choosing a place where the spruce was thick in this sunken rock yard, I cut out with a little hatchet a space for a camp in their midst, leaving two stout ones six feet apart to rest my ridge-pole on, and such limbs of these as would best form the gable ends. I then cut four spruces as rafters for the gable ends, leaving the stub ends of the branches to rest the cross-beams or girders on, of which there were two or three to each slope; and I made the roof very steep. Then cut an abundance of large flat spruce limbs, four or five feet long, and laid them on, shingle-fashion, beginning at the ground and covering the stub ends. This made a foundation for two or three similar layers of smaller twigs. Then made a bed of the same, closed up the ends somewhat, and all was done. All these twigs and boughs, of course, were dripping wet, and we were wet through up to our middles. But we made a good fire at the door, and in an hour or two were completely dried.

The most thickly leaved and flattest limbs of the spruce are such as spread flat over the rocks far and wide (while the upper ones were more bushy and less flat); not the very lowest, which were often partly under the surface and but meagrely leafed, but those close above them.

Standing and sitting before the fire which we kindled under a shelving rock, we could dry us much quicker than at any fireside below, for, what with stoves and reduced fireplaces, they could not have furnished such blaze or heat in any inn's [?] kitchen or parlor. This fire was exactly on the site of my old camp, and we burned a hole deep into the withered remains of its roof and bed.

It began to clear up and a star appeared at 8 P. M. Lightning was seen far in the south. Cloud, drifting cloud, alternated with moonlight all the rest of the night. At 11.30 p. M. I heard a nighthawk. Maybe it hunted then because prevented by the cloud at evening.

I heard from time to time through the night a distant sound like thunder or a falling of a pile of lumber, and I suspect that this may have been the booming of night-hawks at a distance.

Aug. 5. The wind changed to northerly toward morning, falling down from over the summit and sweeping through our camp, open on that side, and we found it rather cold!

About an hour before sunrise we heard again the nighthawk; also the robin, chewink, song sparrow, *Fringilla hyemalis*; and the wood thrush from the woods below.

Had a grand view of the summit on the north now, it being clear. I set my watch each morning by sunrise, and this morning the lichens on the rocks of the southernmost summit (south of us), just lit by the rising sun, presented a peculiar yellowish or reddish brown light (being wet) which they did not any morning afterward. The rocks of the main summit were olive-brown, and C. called it the Mount of Olives.

I had gone out before sunrise to gather blueberries, — fresh, dewy (because wet with yesterday's rain), almost crispy blueberries, just in prime, much cooler and more

grateful at this hour, — and was surprised to hear the voice of people rushing up the mountain for berries in the wet, even at this hour. These alternated with bright light-scarlet bunchberries not quite in prime.

The sides and angles of the cliffs, and their rounded brows (but especially their southeast angles, for I saw very little afterward on the north side; indeed, the cliffs or precipices are not on that side), were clothed with these now lively olive-brown lichens (*umbilicaria*), alike in sun and shade, becoming afterward and generally dark olive-brown when dry. Vide my specimens. Many of the names inscribed on the summit were produced by merely rubbing off the lichens, and they are thus distinct for years.

At 7.30 A. M. for the most part in cloud here, but the country below in sunshine. We soon after set out to walk to the lower southern spur of the mountain. It is chiefly a bare gray and extremely diversified rocky surface, with here and there a spruce or other small tree or bush, or patches of them, or a little shallow marsh on the rock; and the whole mountain-top for two miles was covered, on countless little shelves and in hollows between the rocks, with low blueberries of two or more species or varieties, just in their prime. They are said to be later here than below. Beside the kinds (black and blue *Pennsylvanicum*) common with us, there was the downy *Vaccinium Canadense* and a form or forms intermediate between this and the former, i.e. of like form but less hairy. The *Vaccinium Canadense* has a larger leaf and more recurved and undulating on its surface, and generally a lighter green than the common. There were the blue with a copious bloom, others simply black (not shiny, as ours commonly) and bn largish bushes, and others of a peculiar blue, as if with a skim-coat of blue, hard and thin, as if glazed, such as we also have. The black are scarce as with us.

These blueberries grew and bore abundantly almost wherever anything else grew on the rocky part of the mountain, — except perhaps the very wettest of the little swamps and the thickest of the little thickets, — quite up to the summit, and at least thirty or forty people came up from the surrounding country this Sunday to gather them. When we behold this summit at this season of the year, far away and blue in the horizon, we may think of the blueberries as blending their color with the general blueness of the mountain. They grow alike in the midst of the *cladonia* lichens and of the lambkill and moss of the little swamps. No shelf amid the piled rocks is too high or dry for them, for everywhere they enjoy the cool and moist air of the mountain. They are evidently a little later than in Concord, — say a week or ten days later. Blueberries of every degree of blueness and of bloom. There seemed to be fewer of them on the more abrupt and cold westerly and northwesterly sides of the summit, and most in the hollows and shelves of the plateau just southeast of the summit.

Perhaps the prettiest berry, certainly the most novel and interesting to me, was the mountain cranberry, now grown but yet hard and with only its upper cheek red. They are quite local, even on the mountain. The vine is most common close to the summit, but we saw very little fruit there; but some twenty rods north of the brow of this low southern spur we found a pretty little dense patch of them between the rocks, where we gathered a pint in order to make a sauce of them. They here formed a dense

low flat bed, covering the rocks for a rod or two, some lichens, green mosses, and the mountain potentilla mingled with them; and they rose scarcely more than one inch above the ground. These vines were only an inch and a half long, clothed with small, thick, glossy leaves, with two or three berries together, about as big as huckleberries, on the recurved end, with a red cheek uppermost and the other light-colored. It was thus a dense, firm sward [? ] of glossy little leaves dotted with bright-red berries. They were very easy to collect, for you only made incessant dabs at them with all your fingers together and the twigs and leaves were so rigid that you brought away only berries and no leaves.

I noticed two other patches where the berries were thick, viz one a few rods north of the little rain-water lake of the rocks, at the first, or small, meadow (source of Contoocook) at northeast end of the mountain, and another not more than fifty rods northwest of the summit, where the vines were much ranker and the berries larger. Here the plants were four or five inches high, and there were three or four berries of pretty large huckleberry size at the end of each, and they branched like little bushes. In each case they occupied almost exclusively a little sloping shelf between the rocks, and the vines and berries were especially large and thick where they lay up against the sloping sunny side of the rock.

We stewed these berries for our breakfast the next morning, and thought them the best berry on the mountain, though, not being quite ripe, the berry was a little bitterish — but not the juice of it. It is such an acid as the camper-out craves. They are, then, somewhat earlier than the common cranberry. I do not know that they are ever gathered hereabouts. At present they are very firm berries, of a deep, dark, glossy red. Doubtless there are many more such patches on the mountain.

We heard the voices of many berry-pickers and visitors to the summit, but neither this nor the camp we built afterward was seen by any one.

P. M. — Walked to the wild swamp at the northeast spur. That part is perhaps the most interesting for the wild confusion of its variously formed rocks, and is the least, if at all, frequented. We found the skull and jaws of a large rodent, probably a hedgehog, — larger than a woodchuck's, — a considerable quantity of dry and hard dark-brown droppings, of an elliptical form, like very large rat-droppings, somewhat of a similar character but darker than the rabbit's, and I suspect that these were the porcupine's.

Returned over the top at 5 P. M., after the visitors, men and women, had descended, and so to camp.

Aug. 6. The last was a clear, cool night. At 4 A. M. see local lake-like fogs in some valleys below, but there is none here.

This forenoon, after a breakfast on cranberries, leaving, as usual, our luggage concealed under a large rock, with other rocks placed over the hole, we moved about a quarter of a mile along the edge of the plateau eastward and built a new camp there. It was [a] place which I had noticed the day before, where, sheltered by a perpendicular ledge some seven feet high and close to the brow of the mountain, grew five spruce trees. Two of these stood four feet from the rock and six or more apart; so, clearing

away the superfluous branches, I rested stout rafters from the rock-edge to limbs of the two spruces and placed a plate beam across, and, with two or three cross-beams or girders, soon had a roof which I could climb and shingle. After filling the inequalities with rocks and rubbish, I soon had a sloping floor on which to make our bed. Lying there on that shelf just on the edge of the steep declivity of the mountain, we could look all over the south and southeast world without raising our heads. The rock running east and west was our shelter on the north.

Our huts, being built of spruce entirely, were not noticeable two or three rods off, for we did [not] cut the spruce amid which they were built more than necessary, bending aside their boughs in order to enter. My companion, returning from a short walk, was lost when within two or three rods, the different rocks and clumps of spruce looked so much alike, and in the moonlight we were liable to mistake some dark recess between two neighboring spruce ten feet off for the entrance to our house. We heard this afternoon the tread of a blueberry-picker on the rocks two or three rods north of us, and saw another as near, south, and, stealing out, we came round from another side and had some conversation with them, — two men and a boy, — but they never discovered our house nor suspected it. The surface is so uneven that ten steps will often suffice to conceal the ground you lately stood on, and yet the different shelves and hollows are so much alike that you cannot tell if one is new or not. It is somewhat like travelling over a huge fan. When in a valley the nearest ridge conceals all the others and you cannot tell one from another.

This afternoon, again walked to the larger northeast swamp, going directly, i.e. east of the promontories or part way down the slopes. Bathed in the small rocky basin above the smaller meadow. These two swamps are about the wildest part of the mountain and most interesting to me. The smaller occurs on the northeast side of the main mountain, i.e. at the northeast end of the plateau. It is a little roundish meadow a few rods over, with cotton-grass in it, the shallow bottom of a basin of rock, and out the east side there trickles a very slight stream, just moistening the rock at present and collecting enough in one cavity to afford you a drink. This is evidently a source of the Contoocook, the one I noticed two years ago as such.

The larger swamp is considerably lower and more northerly, separating the northeast spur from the main mountain, probably not far from the line of Dublin. It extends northwest and southeast some thirty or forty rods, and probably leaked out now under the rocks at the northwest end, — though I found water only half a dozen rods below, — and so was a source probably of the Ashuelot. The prevailing grass or sedge in it, growing in tufts in the green moss and sphagnum between the fallen dead spruce timber, was the *Eriophorum vaginatum* (long done) and the *E. gracile*. Also the *Epilobium palustre*, apparently in prime in it, and common wool-grass (*Scirpus Eriophorum*). Around its edge grew the *Cheloneglabra* (not yet out), meadow-sweet in bloom, black choke-berry just ripening, red elder (its fruit in prime), mountain-ash, *Carex trisperma* and *Deweyana* (small and slender), and the fetid currant in fruit (in a torrent of rocks at the east end), etc., etc.

I noticed a third, yet smaller, quite small, swamp, yet more southerly, on the edge of the plateau, evidently another source of a river, where the snows melt.

At 5 p. M. we went to our first camp for our remaining baggage. From this point at this hour the rocks of the precipitous summit (under whose south side that camp is placed), lit by the declining sun, were a very light gray, with reddish-tawny touches from the now drying *Aira flexuosa* on the inaccessible shelves and along the seams. Returned to enjoy the evening at the second camp.

Evening and morning were the most interesting seasons, especially the evening. Each day, about an hour before sunset, I got sight, as it were accidentally, of an elysium beneath me. The smoky haze of the day, suggesting a furnace-like heat, a trivial dustiness, gave place to a clear transparent enamel, through which houses, woods, farms, and lakes were seen as in [a] picture indescribably fair and expressly made to be looked at. At any hour of the day, to be sure, the surrounding country looks flatter than it is. Even the great steep, furrowed, and rocky pastures, red with hardhack and raspberries, which creep so high up the mountain amid the woods, in which you think already that you are halfway up, perchance, seen from the top or brow of the mountain are not for a long time distinguished for elevation above the surrounding country, but they look smooth and tolerably level, and the cattle in them are not noticed or distinguished from rocks unless you search very particularly. At length you notice how the houses and bams keep a respectful, and at first unaccountable, distance from these near pastures and woods, though they are seemingly flat, that there is a broad neutral ground between the roads and the mountain; and yet when the truth flashes upon you, you have to imagine the long, ascending path through them.

To speak of the landscape generally, the open or cleared land looks like a thousand little swells or tops of low rounded hills, — tent-like or like a low hay-cap spread, — tawny or green amid the woods. As you look down on this landscape you little think of the hills where the traveller walks his horse. The woods have not this swelling look. The most common color of open land (from apex at 5 P. M.) is tawny brown, the woods dark green. At midday the darker green of evergreens amid the hardwoods is quite discernible half a dozen miles off. But, as the most interesting view is at sunset, so it is the part of [the] landscape nearest to you and most immediately beneath the mountain, where, as usual, there is that invisible gelid haze to glass it.

The nearest house to the mountain which we saw from our camp — one on the Jaffrey road — was in the shadow even of the low southern spur of the mountain which we called the Old South, just an hour before the sun set, while a neighbor on a hill within a quarter of a mile eastward enjoyed the sunlight at least half an hour longer. So much shorter are their days, and so much more artificial light and heat must they obtain, at the former house. It would be a serious loss, methinks, one hour of sunlight every day. We saw the sun so much longer. Of course the labors of the day were brought to an end, the sheep began to bleat, the doors were closed, the lamps were lit, and preparations for the night were made there, so much the earlier.

The landscape is shown to be not flat, but hilly, when the sun is half an hour high, by the shadows of the hills.

But, above all, from half an hour to two hours before sunset many western mountain-ranges are revealed, as the sun declines, one behind another, by their dark outlines and the intervening haze; i.e., the ridges are dark lines, while the intervening valleys are a cloudlike haze. It was so, at least, from 6 to 6.30 p. M. on the 6th; and, at 5 p. M. on the 8th, it being very hazy still, I could count in the direction of Saddleback Mountain eight distinct ranges, revealed by the darker lines of the ridges rising above this cloud-like haze. And I might have added the ridge of Monadnock itself within a quarter of a mile of me.

Of course, the last half of these mountain-ridges appeared successively higher and seemed higher, all of them (i.e. the last half), than the mountain we were on, as if you had climbed to the heights of the sky by a succession of stupendous terraces reaching as far as you could see from north to south. The Connecticut Valley was one broad gulf of haze which you were soon over. They were the Green Mountains that we saw, but there was no greenness, only a bluish mistiness, in what we saw; and all of Vermont that lay between us and their summit was but a succession of parallel ranges of mountains. Of course, almost all that we mean commercially and agriculturally by Vermont was concealed in those long and narrow haze-filled valleys. I never saw a mountain that looked so high and so melted away at last cloud-like into the sky, as Saddleback this eve, when your eye had clomb to it by these eight successive terraces. You had to begin at this end and ascend step by step to recognize it for a mountain at all. If you had first rested your eye on it, you would have seen it for a cloud, it was so incredibly high in the sky.

After sunset the ponds are white and distinct. Earlier we could distinguish the reflections of the woods perfectly in ponds three miles off.

I heard a cock crow very shrilly and distinctly early in the evening of the 8th. This was the most distinct sound from the lower world that I heard up there at any time, not excepting even the railroad whistle, which was louder. It reached my ear perfectly, to each note and curl, — from some submontane cock. We also heard at this hour an occasional bleat from a sheep in some mountain pasture, and a lowing of a cow. And at last we saw a light here and there in a farmhouse window. We heard no sound of man except the railroad whistle and, on Sunday, a church-bell. Heard no dog that I remember. Therefore I should say that, of all the sounds of the farmhouse, the crowing of the cock could be heard furthest or most distinctly under these circumstances. It seemed to wind its way through the layers of air as a sharp gimlet through soft wood, and reached our ears with amusing distinctness.

Aug. 7. Morning — dawn and sunrise — was another interesting season. I rose always by four or half past four to observe the signs of it and to correct my watch. From our first camp I could not see the sun rise, but only when its first light (yellowish or, rather, pinkish) was reflected from the lichen-clad rocks of the southern spur. But here, by going eastward some forty rods, I could see the sun rise, though there was

invariably a low stratum or bar of cloud in the horizon. The sun rose about five. The tawny or yellowish pastures about the mountain (below the woods; what was the grass?) reflected the auroral light at 4.20 A. M. remarkably, and they were at least as distinct as at any hour.

There was every morning more or less solid white fog to be seen on the earth, though none on the mountain. I was struck by the localness of these fogs. For five mornings they occupied the same place and were about the same in extent. It was obvious that certain portions of New Hampshire and Massachusetts were at this season commonly invested with fog in the morning, while others, or the larger part, were free from it. The fog lay on the lower parts only. From our point of view the largest lake of fog lay in Rindge and southward; and southeast of Fitzwilliam, i.e. about Winchendon, very large there. In short, the fog lay in great spidery lakes and streams answering to the lakes, streams, and meadows beneath, especially over the sources of Miller's River and the region of primitive wood thereabouts; but it did [not] rest on lakes always, i.e., where they were elevated, as now some in Jaffrey were quite clear. It suggested that there was an important difference, so far as the health and spirits of the inhabitants were concerned, between the town where there was this regular morning fog and that where there was none. I shall always remember the inhabitants of State Line as dwellers in the fog. The geography and statistics of fog have not been ascertained. If we awake into a fog, it does not occur to us that the inhabitants of a neighboring town which lies higher may have none, neither do they, being ignorant of this happiness, inform us of it. Yet, when you come to look down thus on the country every morning, you see that here this thick white veil of fog is spread and not there. It was often several hundred feet thick, soon rising, breaking up, and drifting off, or rather seeming to drift away, as it evaporated. There was commonly such a risen fog drifting through the interval between this mountain and Gap Monadnock.

One morning I noticed clouds as high as the Peterboro Hills, — a lifted fog, — ever drifting easterly but making no progress, being dissipated. Also long rolls and ant-eaters of cloud, at last reduced by the sun to mere vertebrae. That morning (the 8th) the great and general cloud and apparently fog combined over the lowest land running southwest from Rindge was apparently five hundred or more feet deep, but our mountain was above all.

This forenoon I cut and measured a spruce on the north side the mountain, and afterward visited the ' summit, where one of the coast surveyors had been signalling, as I was told, to a mountain in Laconia, some fifty-five miles off, with a glass reflector.

After dinner, descended into the gulf and swamp beneath our camp. At noon every roof in the southern country sloping toward the north was distinctly revealed, — a lit gray.

In the afternoon, walked to the Great Gulf and meadow, in the midst of the plateau just east of and under the summit.

Aug. 8. Wednesday. 8.30 a. m. Walk round the west side of the summit. Bathe in the rocky pool there, collect mountain cranberries on the northwest side, return over the summit, and take the bearings of the different spurs, etc. Return to camp at noon.

Toward night, walk to east edge of the plateau.

Aug. 9. At 6 a. m., leave camp for Troy, where we arrive, after long pauses, by 9 a. m., and take the cars at 10.5.

I observed these plants on the rocky summit of the mountain, above the forest: —

Raspberry, not common.

Low blueberries of two or three varieties.

Bunchberry.

Solidago thyrsoidea.

Fetid currant, common; leaves beginning to be scarlet; grows amid loose fallen rocks.

Red cherry, some ripe, and handsome.

Black choke-berry.

Potentilla tridentata, still lingering in bloom.

Aralia hispida, still lingering in bloom.

Cow-wheat, common, still in bloom.

Mountain cranberry, not generally abundant; full grown earlier than lowland ditto.

Black spruce.

Lambkill, lingering in flower in cool and moist places.

Aster acuminatus, abundant; not generally open, but fairly begun to bloom.

Red elder, ripe, apparently in prime, not uncommon.

Arenaria Groenlandica, still pretty common in flower.

Solidago lanceolata, not uncommon; just fairly begun. Epilobium angustijolium, in bloom; not common, however. Epilobium palustre, some time, common in mosses, small and slender.

Wild holly, common; berries not quite ripe.

Viburnum nudum, common; berries green.

White pine; saw three or four only, mostly very small. Mountain-ash, abundant; berries not ripe; generally very small, largest in swamps.

Diervilla, not uncommon, still.

Rhodora, abundant; low, i.e. short.

Meadow-sweet, abundant, apparently in prime.

Hemlocks; two little ones with rounded tops.

Chelone glabra, not yet; at northeast swamp-side.

Yarrow.

Canoe birch, very small.

Clintonia borealis, with fruit.

Checkerberry.

Gold-thread.

One three-ribbed goldenrod, northwest side (not Canadense).

Tall rough goldenrod, not yet; not uncommon.

*Populus tremidiformis*, not very common.

*Polygonum cilinode*, in bloom.

Yellow birch, small.

Fir, a little; four or five trees noticed.

Willows, not uncommon, four or five feet high.

Red maple, a very little, small.

Water andromeda, common about the bogs.

*Trientalis*.

Pearly everlasting, out.

*Diplopappus umbellatus*, in bloom, not common (?); northeast swamp-side, also northwest side of mountain.

*Juncus trifidus*.

Some *Juncus paradoxus*? ) about edge of marshes Some *Juncus acuminatus*? )

#### CYPERACEÆ

*Eriophorum gracile*, abundant, whitening the little swamps. *Eriophorum vaginatum*, abundant, little swamps, long done, (this the coarse grass in tufts, in marshes).

Wool-grass, not uncommon, (common kind).

*Carex trisperma* (?) or *Deweyana*, with large seeds, slender and drooping, by side of northeast swamp. Vide press.

*Carex scoparia*? or *straminea*? a little.

*C. debilis*.

*Carex*, small, rather close-spiked, *C. canescens*-like (?), common. A fine grass-like plant very common, perhaps *Eleocharis tenuis*; now without heads, but marks of them.

#### GRASSES

*Aira flexuosa*.

*Glyceria elongata*, with appressed branches (some purplish), in swamp.

Blue-joint, apparently in prime, one place.

*Festuca ovina*, one place.

*Cinna arundinacea*, one place.

*Agrostis scabra* (?), at our spring, q v.

#### FERNS AND LICHENS, ETC.

A large greenish lichen flat on rocks, of a peculiarly concentric growth, q v.

Some common sulphur lichen.

The very bright handsome crustaceous yellow lichen, as on White Mts., q v.

Two or three umbilicaria lichens, q v., giving the dark brown to the rocks.

A little, in one place, of the old hat umbilicaria, as at Flint's Pond Rock.

Green moss and sphagnum in the marshes.

Two common cladonias, white and greenish.

*Stereocaulon*.

*Lycopodium complanatum*, one place.

*Lycopodium annotinum*, not very common.

Common polypody.

Dicksonia fern, q v.

Sensitive fern, and various other common ones.

I see that in my last visit, in June, '58, I also saw here Labrador tea (on the north side), two-leaved Solomon's-seal, Amelanchier Canadensis var oligocarpa and var oblongifolia, one or two or three kinds of willows, a little mayflower, and chiogenes, and Lycopodium clavatum.

The prevailing trees and shrubs of the mountain-top are, in order of commonness, etc., low blueberry, black spruce, lambkill, black choke-berry, wild holly, Viburnum nudum, mountain-ash, meadow-sweet, rhodora, red cherry, canoe birch, water andromeda, fetid currant.

The prevailing and characteristic smaller plants, excepting grasses, cryptogamie, etc.: Potentilla tridentata, Solidago thyrsoidea, bunchberry, cow-wheat, Aster acuminatus, Arenaria Grœnlandica, mountain cranberry, Juncus trifidus, Clintonia borealis, Epilobium palustre, Aralia hispida.

Of Cyperaceœ the most common and noticeable now were Eriophorum gracile and vaginatum, a few sedges, and perhaps the grass-like Eleocharis tenuis.

The grass of the mountain now was the Aira flexuosa, large and abundant, now somewhat dry and withered, on all shelves and along the seams, quite to the top; a pinkish tawny now. Most would not have noticed or detected any other. The other kinds named were not common. You would say it was a true mountain grass. The only grass that a careless observer would notice. There was nothing like a sod on the mountain-top. The tufts of J. trifidus, perhaps, came the nearest to it.

The black spruce is the prevailing tree, commonly six or eight feet high; but very few, and those only in the most sheltered places, as hollows and swamps, are of regular outline, on account of the strong and cold winds with which they have to contend. Fifteen feet high would be unusually large. They cannot grow here without some kind of lee to start with. They commonly consist of numerous flat branches close above one another for the first foot or two, spreading close over the surface and filling and concealing the hollows between the rocks; but exactly at a level with the top of the rock which shelters them they cease to have any limbs on the north side, but all their limbs now are included within a quadrant between southeast and southwest, while the stem, which is always perfectly perpendicular, is bare and smooth on the north side; yet it is led onward at the top by a tuft of tender branches a foot in length and spreading every way as usual, but the northern part of these successively die and disappear. They thus remind you often of masts of vessels with sails set on one side, and sometimes one of these almost bare masts is seen to have been broken short off at ten feet from the ground, such is the violence of the wind there. I saw a spruce, healthy and straight, full sixteen feet without a limb or the trace of a limb on the north side. When building my camp, in order to get rafters six feet long and an inch and a half in diameter at the small end, I was obliged to cut down spruce at least five inches in diameter at one foot from the ground. So stout and tapering do they grow. They spread so close to the rocks that the lower branches are often half worn away for a foot in length by their

rubbing on the rocks in the wind, and I sometimes mistook the creaking of such a limb for the note of a bird, for it is just such a note as you would expect to hear there. The two spruce which formed the sides of my second camp had their lower branches behind the rock so thick and close, and, on the outsides of the quadrant, so directly above one another perpendicularly, that they made two upright side walls, as it were, very convenient to interlace and make weather-tight.

I selected a spruce growing on the highest part of the plateau east of the summit, on its north slope, about as high as any tree of its size, to cut and count its rings. It was five feet five inches high. As usual, all its limbs except some of the leading twigs extended toward the south. One of the lowermost limbs, so close to the ground that I thought its green extremity was a distinct tree, was ten feet long. There were ten similar limbs (though not so long) almost directly above one another, within two feet of the ground, the largest two inches thick at the butt. I cut off this tree at one foot from the ground. It was there five inches in diameter and had forty-four rings, but four inches of its growth was on the south side the centre and only one inch on the north side. I cut it off again nineteen inches higher and there there were thirty-five rings.

Our fuel was the dead spruce — apparently that which escaped the fire some forty years ago!! — which lies spread over the rocks in considerable quantity still, especially at the northeast spur. It makes very good dry fuel, and some of it is quite fat and sound. The spruce twigs were our bed. I observed that, being laid bottom upward in a hot sun, as at the foot of our bed, the leaves turned pale-brown, as if boiled, and fell off very soon.

The black spruce is certainly a very wild tree, and loves a primitive soil just made out of disintegrated granite.

After the low blueberry I should say that the lamb-kill was the commonest shrub. The black choke-berry also was very common, but this and the rhodora were both dwarfish. Though the meadow-sweet was very common, I did not notice any hardhack; yet it was exceedingly prevalent in the pastures below.

The *Solidago thyrsoidea* was the goldenrod of the mountain-top, from the woods quite to the summit. Any other goldenrod was comparatively scarce. It was from two inches to two feet high. It grew both in small swamps and in the seams of the rocks everywhere, and was now in its prime.

The bunchberry strikes one from these parts as much as any, — about a dozen berries in a dense cluster, a lively scarlet on a green ground.

Spruce was the prevailing tree; blueberry, the berry; *S. thyrsoidea*, the goldenrod; *A. acuminatus*, the aster (the only one I saw, and very common); *Juncus trifidus*, the juncus; and *Aira flexuosa*, the grass, of the mountain-top.

The two cotton-grasses named were very common and conspicuous in and about the little meadows.

The *Juncus trifidus* was the common grass (or grasslike plant) of the very highest part of the mountain, — the peak and for thirty rods downward, — growing on the shelves and especially on the edges of the scars rankly, and on this part of the mountain

almost alone had it fruited, — for I think that I saw it occasionally lower and elsewhere on the rocky portion without fruit.

The apparently common green and white cladonias, together with yet whiter stereocaulon, grew all over the flat rocks in profusion, and the apparently common greenish rock lichen (q v. in box) grew concentricwise in large circles on the slopes of rocks also, not to mention the common small umbilicaria (q v.) of one or two kinds which covered the brows and angles of the rocks.

The berries now ripe were: blueberries, bunchberries, fetid currant, red cherry, black choke-berry (some of them), mountain cranberry (red-cheeked and good cooked), red elder (quite showy), *Clintonia borealis*, raspberry (not common). And berries yet green were: *Aralia hispida* (ripe in Concord, much of it), wild holly (turning), *Viburnum nudum* (green), mountain-ash.

The birds which I noticed were: robins, chewinks, *F. hyemalis*, song sparrow, nighthawk, swallow (a few, probably barn swallow, one flying over the extreme summit), crows (sometimes flew over, though mostly heard in the woods below), wood thrush (heard from woods below); and saw a warbler with a dark-marked breast and yellowish angle to wing and white throat, and heard a note once like a very large and powerful nuthatch. Some small hawks.

The bird peculiar to the mountain was the *F. hyemalis* and perhaps the most common, flitting over the rocks, unless the robin and chewink were as common. These, with the song sparrow and wood thrush, were heard regularly each morning. I saw a robin's nest in one of the little swamps. The wood thrush was regularly heard late in the afternoon, its strain coming up from the woods below as the shadows were lengthening.

But, above all, this was an excellent place to observe the habits of the nighthawks. They were heard and seen regularly at sunset, — one night it was at 7.10, or exactly at sunset, — coming upward from the lower and more shaded portion of the rocky surface below our camp, with their spark spark, soon answered by a companion, for they seemed always to hunt in pairs, — yet both would dive and boom and, according to Wilson, only the male utters this sound. They pursued their game thus a short distance apart and some sixty or one hundred feet above the gray rocky surface, in the twilight, and the constant spark spark seemed to be a sort of call-note to advertise each other of their neighborhood. Suddenly one would hover and flutter more stationarily for a moment, somewhat like a kingfisher, and then dive almost perpendicularly downward with a rush, for fifty feet, frequently within three or four rods of us, and the loud booming sound or rip was made just at the curve, as it ceased to fall, but whether voluntarily or involuntarily I know not. They appeared to be diving for their insect prey. What eyes they must have to be able to discern it beneath them against the rocks in the twilight! As I was walking about the camp, one flew low, within two feet of the surface, about me, and lit on the rock within three rods of me, and uttered a harsh note like c-o-w, c-o-w, — hard and gritty and allied to their common notes, — which I thought expressive of anxiety, or to alarm me, or for its mate.

I suspect that their booming on a distant part of the mountain was the sound which I heard the first night which was like very distant thunder, or the fall of a pile of lumber.

They did not fly or boom when there was a cloud or fog, and ceased pretty early in the night. They came up from the same quarter — the shaded rocks below — each night, two of them, and left off booming about 8 o'clock. Whether they then ceased hunting or withdrew to another part of the mountain, I know not. Yet I heard one the first night at 11.30 p. M., but, as it had been a rainy day and did not clear up here till some time late in the night, it may have been compelled to do its hunting then. They began to boom again at 4 a. M. (other birds about 4.30) and ceased about 4.20. By their color they are related to the gray rocks over which they flit and circle.

As for quadrupeds, we saw none on the summit and only one small gray rabbit at the base of the mountain, but we saw the droppings of rabbits all over the mountain, and they must be the prevailing large animal, and we heard the motions probably of a mouse about our camp at night. We also found the skull of a rodent larger than a woodchuck or gray rabbit, and the tail-bones (maybe of the same) some half-dozen inches long, and saw a large quantity of dark-brown oval droppings (q v., preserved). I think that this was a porcupine, and I hear that they are found on the mountain. Mr. Wild saw one recently dead near the spring some sixteen years ago. I saw the ordure of some large quadruped, probably this, on the rocks in the pastures beneath the wood, composed chiefly of raspberry seeds.

As for insects: There were countless ants, large and middle-sized, which ran over our bed and inside our clothes. They swarmed all over the mountain. Had young in the dead spruce which we burned. Saw but half a dozen mosquitoes. Saw two or three common yellow butterflies and some larger red-brown ones, and moths. There were great flies, as big as horse-flies, with shining black abdomens and buff-colored bases to their wings. Disturbed a swarm of bees in a dead spruce on the ground, but they disappeared before I ascertained what kind they were. On the summit one noon, i.e. on the very apex, I was pestered by great swarms of small black wasps or winged ants about a quarter of an inch long, which fluttered about and settled on my head and face. Heard a fine (in the sod) cricket, a dog-day locust once or twice, and a creaking grasshopper.

Saw two or three frogs, — one large *Rana fontinalis* in that rocky pool on the southwest side, where I saw the large spawn which I supposed to be bullfrog spawn two years ago, but now think must have been *R. fontinalis* spawn; and there was a dark pollywog one inch long. This frog had a raised line on each side of back and was as large as a common bullfrog. I also heard the note once of some familiar large frog. The one or two smaller frogs which I saw elsewhere were perhaps the same.

There were a great many visitors to the summit, both by the south and north, i.e. the Jaffrey and Dublin paths, but they did not turn off from the beaten track. One noon, when I was on the top, I counted forty men, women, and children around me, and more were constantly arriving while others were going. Certainly more than one

hundred ascended in a day. When you got within thirty rods you saw them seated in a row along the gray parapets, like the inhabitants of a castle on a gala-day; and when you behold Monadnock's blue summit fifty miles off in the horizon, you may imagine it covered with men, women, and children in dresses of all colors, like an observatory on a muster-field. They appeared to be chiefly mechanics and farmers' boys and girls from the neighboring towns. The young men sat in rows with their legs dangling over the precipice, squinting through spy-glasses and shouting and hallooing to each new party that issued from the woods below. Some were playing cards; others were trying to see their house or their neighbor's. Children were running about and playing as usual. Indeed, this peak in pleasant weather is the most trivial place in New England. There are probably more arrivals daily than at any of the White Mountain houses. Several were busily engraving their names on the rocks with cold-chisels, whose incessant clink you heard, and they had but little leisure to look off. The mountain was not free of them from sunrise to sunset, though most of them left about 5 p. M. At almost any hour of the day they were seen wending their way single file in various garb up or down the shelving rocks of the peak. These figures on the summit, seen in relief against the sky (from our camp), looked taller than life. I saw some that camped there, by moonlight, one night. On Sunday, twenty or thirty, at least, in addition to the visitors to the peak, came up to pick blueberries, and we heard on all sides the rattling of dishes and their frequent calls to each other.

The rocky area — or summit of the mountain above the forest — which I am describing is of an irregular form from a mile and a half to two miles long, north and south, by three quarters to a mile wide at the widest part, in proportion as you descend lower on the rocks.

There are three main spurs, viz the northeast, or chief, one, toward Monadnock Pond and the village of Dublin; the southerly, to Swan's [?]; and the northerly, over which the Dublin path runs. These afford the three longest walks. The first is the longest, wildest, and least-frequented, and rises to the greatest height at a distance from the central peak. The second affords the broadest and smoothest walk. The third is the highest of all at first, but falls off directly. There are also two lesser and lower spurs, on the westerly side, — one quite short, toward Troy, by which you might come up from that side, the other yet lower, but longer, from north 75° west. But above all, for walking, there is an elevated rocky plateau, so to call it, extending to half a mile east of the summit, or about a hundred rods east of the ravine. This slopes gently toward the south and east by successive terraces of rock, and affords the most amusing walking of any part of the mountain.

The most interesting precipices are on the south side of the peak. The greatest abruptness of descent (from top to bottom) is on the west side between the two lesser ravines.

The northeast spur (of two principal summits beyond the swamp) has the most dead spruce on it.

The handsome ponds near the mountain are a long pond chiefly in Jaffrey, close under the mountain on the east, with a greatly swelling knoll extending into it on the east side; Monadnock Pond in Dublin, said to be very deep, about north-northeast (between the northeast spur and Dublin village); a large pond with a very white beach much further off in Nelson, about north (one called it Breed's?); Stone Pond, north-westerly, about as near as Monadnock Pond. Also large ponds in Jaffrey, Rindge, Troy; and many more further off.

The basis of my map was the distance from the summit to the second camp, measured very rudely by casting a stone before. Pacing the distance of an easy cast, I found it about ten rods, and thirteen such stone's throws, or one hundred and thirty rods, carried me to the camp. As I had the course, from the summit and from the camp, of the principal points, I could tell the rest nearly enough. It was about fifty rods from the summit to the ravine and eighty more to the camp.

It was undoubtedly Saddleback Mountain which I saw about S. 85° W. What was that elevated part of the Green Mountains about N. 50° W., which one called falsely Camel's Hump? — the next elevated summit north of Saddleback.

It would evidently be a noble walk from Watatic to Goffstown perchance, over the Peterboro mountains, along the very backbone of this part of New Hampshire, — the most novel and interesting walk that I can think of in these parts.

They who simply climb to the peak of Monadnock have seen but little of the mountain. I came not to look off from it, but to look at it. The view of the pinnacle itself from the plateau below surpasses any view which you get from the summit. It is indispensable to see the top itself and the sierra of its outline from one side. The great charm is not to look off from a height but to walk over this novel and wonderful rocky surface. Moreover, if you would enjoy the prospect, it is, methinks, most interesting when you look from the edge of the plateau immediately down into the valleys, or where the edge of the lichen-clad rocks, only two or three rods from you, is seen as the lower frame of a picture of green fields, lakes, and woods, suggesting a more stupendous precipice than exists. There are much more surprising effects of this nature along the edge of the plateau than on the summit. It is remarkable what haste the visitors make to get to the top of the mountain and then look away from it.

Northward you see Ascutney and Kearsarge Mountains, and faintly the White Mountains, and others more northeast; but above all, toward night, the Green Mountains.

But what a study for rocks does this mountain-top afford! The rocks of the pinnacle have many regular nearly rightangled slants to the southeast, covered with the dark-brown (or olivaceous) umbilicaria. The rocks which you walk over are often not only worn smooth and slippery, but grooved out, as if with some huge rounded tool, — or they are much oftener convex:

You see huge buttresses or walls — put up by Titans, with true joints, only recently loosened by an earthquake as if ready to topple down. Some of the lichen-clad rocks are of a rude brick-loaf form or small cottage form: You see large boulders, left just on the edge of the steep descent of the plateau,— ‘ commonly resting on a few

small stones, as if the Titans were in the very act of transporting them when they were interrupted; some left standing on their ends, and almost the only convenient rocks in whose shade you can sit sometimes. Often you come to a long, thin rock, two or three rods long, which has the appearance of having just been split into underpinning-stone, — perfectly straight-edged and parallel pieces, and lying as it fell, ready for use, just as the mason leaves it. Post-stones, door-stones, etc. There were evidences of recent motion as well as ancient.

I saw on the flat sloping surface of rock a fresher white space exactly the size and form of a rock which was lying by it and which had lately covered it. What had upset it? There were many of these whitish marks where the dead spruce had lain but was now decayed or gone.

The rocks were not only coarsely grooved but finely scratched from northwest to southeast, commonly about S.  $10^{\circ}$  E. (but between  $5^{\circ}$  and  $20^{\circ}$  east, or, by the true meridian, more yet). I could have steered myself in a fog by them.

Piles of stones left as they were split ready for the builder. I saw one perfect triangular hog-trough — except that it wanted one end — and which would have been quite portable and convenient in a farmer's yard. The core, four or five feet long, lay one side.

The rocks are very commonly in terraces with a smooth rounded edge to each. The most remarkable of these terraces that I noticed was between the second camp and the summit, say some forty rods from the camp. These terraces were some six rods long and six to ten feet wide, but the top slanting considerably back into the mountain, and they were about four or five feet high each. There were four such in succession here, running S.  $30^{\circ}$  E. The edges of these terraces, here and commonly, were rounded and grooved like the rocks at a waterfall, as if water and gravel had long washed over them.

Some rocks were like huge doughnuts: — The edges of cliffs were frequently lumpishly rounded, covered with lichens, so that you could not stand near the edge. The extreme east and northeast parts of the plateau, especially near the little meadow, are the most interesting for the forms of rocks. Sometimes you see where a huge oblong square stone has been taken out from the edge of a terrace, leaving a space which looks like a giant's grave unoccupied.

On the west side the summit the strata ran north and south and dipped to east about  $60^{\circ}$  with the horizon. There were broad veins of white quartz (sometimes one foot wide) running directly many rods.

Near the camp there was a succession of great rocks, their corners rounded semicircularly and grooved at the same time like the capital of a column reversed. The most rugged walking is on the steep westerly slope.

We had a grand view, especially after sunset, as it grew dark, of the sierra of the summit's outline west of us, — the teeth of the sierra often turned back toward the summit, — when the rocks were uniformly black in the shade and seen against the twilight.

In Morse's Gazetteer (1797) it is said, "Its base is five miles in diameter north to south, and three from east to west... Its summit is a bald rock." By the summit he meant the very topmost part, which, it seems, was always a "bald rock."

There were all over the rocky summit peculiar yellowish gravelly spots which I called scars, commonly of an oval form, not in low but elevated places, and looking as if a little mound had been cut off there.

The edges of these, on the very pinnacle of the mountain, were formed of the *Juncus trifidus*, now gone to seed. If they had been in hollows, you would have said that they were the bottom of little pools, now dried up, where the gravel and stones had been washed bare. I am not certain about their origin. They suggested some force which had suddenly cut off and washed or blown away the surface there, like a thunder-spout [sic], or lightning, or a hurricane. Such spots were very numerous, and had the appearance of a fresh scar.

Much, if not most, of the rock appears to be what Hitchcock describes and represents as graphic granite (vide his book, page 681).

Hitchcock says (page 389) that he learns from his assistant, Abraham Jenkins, Jr., that "on the sides of and around this mountain [Monadnock] diluvial grooves and scratches are common; having a direction about N. 10° W. and S. 10° E. The summit of the mountain, which rises in an insulated manner to the height of 3250 feet, is a naked rock of gneiss of several acres in extent, and this is thoroughly grooved and scored. One groove measured fourteen feet in width, and two feet deep; and others are scarcely of less size. Their direction at the summit, by a mean of nearly thirty measurements with a compass, is nearly north and south."

According to Heywood's Gazetteer, the mountain is "talc, mica, slate, distinctly stratified," and is 3718 feet high.

Though there is little or no soil upon the rocks, owing apparently to the coolness, if not moisture, you have rather the vegetation of a swamp than that of sterile rocky ground below. For example, of the six prevailing trees and shrubs — low blueberry, black spruce, lambkill, black choke-berry, wild holly, and *Viburnum nudum* — all but the first are characteristic of swampy and low ground, to say nothing of the commonness of wet mosses, the two species of cotton-grass, and some other plants of the swamp and meadow. Little meadows and swamps are scattered all over the mountain upon and amid the rocks. You are continually struck with the proximity of gray and lichen-clad rock and mossy bog. You tread alternately on wet moss, into which you sink, and dry, lichen-covered rocks. You will be surprised to see the vegetation of a swamp on a little shelf only a foot or two over, — a bog a foot wide with cotton-grass waving over it in the midst of *cladonia* lichens so dry as to burn like tinder. The edges of the little swamps — if not their middle — are commonly white with cotton-grass. The *Arenaria Groenlandica* often belies its name here, growing in wet places as often as in dry ones, together with *eriphorum*.

One of the grandest views of the summit is from the east side of the central meadow of the plateau, which I called the Gulf, just beneath the pinnacle on the east, with the meadow in the foreground.

Water stands in shallow pools on almost every rocky shelf. The largest pool of open water which I found was on the southwest side of the summit, and was four rods long by fifteen to twenty feet in width and a foot deep. Wool-and cotton-grass grew around it, and there was a dark green moss and some mud at the bottom. There was a smoother similar pool on the next shelf above it. These were about the same size in June and in August, and apparently never dry up. There was also the one in which I bathed, near the northeast little meadow. I had a delicious bath there, though the water was warm, but there was a pleasant strong and drying wind blowing over the ridge, and when I had bathed, the rock felt like plush to my feet.

The cladonia lichens were so dry at midday, even the day after rain, that they served as tinder to kindle our fire, — indeed, we were somewhat troubled to prevent the fire from spreading amid them, — yet at night, even before sundown, and morning, when we got our supper and breakfast, they would not burn thus, having absorbed moisture. They had then a cool and slightly damp feeling.

Every evening, excepting, perhaps, the Sunday evening after the rain of the day before, we saw not long after sundown a slight scud or mist begin to strike the summit above us, though it was perfectly fair weather generally and there were no clouds over the lower country.

First, perhaps, looking up, we would see a small scud not more than a rod in diameter drifting just over the apex of the mountain. In a few minutes more a somewhat larger one would suddenly make its appearance, and perhaps strike the topmost rocks and invest them for a moment, but as rapidly drift off northeast and disappear. Looking into the southwest sky, which was clear, we would see all at once a small cloud or scud a rod in diameter beginning to form half a mile from the summit, and as it came on it rapidly grew in a mysterious manner, till it was fifty rods or more in diameter, and draped and concealed for a few moments all the summit above us, and then passed off and disappeared northeastward just as it had come on. So that it appeared as if the clouds had been attracted by the summit. They also seemed to rise a little as they approached it, and endeavor to go over without striking. I gave this account of it to myself. They were not attracted to the summit, but simply generated there and not elsewhere. There would be a warm southwest wind blowing which was full of moisture, alike over the mountain and all the rest of the country. The summit of the mountain being cool, this warm air began to feel its influence at half a mile distance, and its moisture was rapidly condensed into a small cloud, which expanded as it advanced, and evaporated again as it left the summit. This would go on, apparently, as the coolness of the mountain increased, and generally the cloud or mist reached down as low as our camp from time to time, in the night.

One evening, as I was watching these small clouds forming and dissolving about the summit of our mountain, the sun having just set, I cast my eyes toward the dim

bluish outline of the Green Mountains in the clear red evening sky, and, to my delight, I detected exactly over the summit of Saddleback Mountain, some sixty miles distant, its own little cloud, shaped like a parasol and answering to that which capped our mountain, though in this case it did not rest on the mountain, but was considerably above it, and all the rest of the west horizon for forty miles was cloudless.

I was convinced that it was the local cloud of that mountain because it was directly over the summit, was of small size and of umbrella form answering to the summit, and there was no other cloud to be seen in that horizon. It was a beautiful and serene object, a sort of fortunate isle, — like any other cloud in the sunset sky.

That the summit of this mountain is cool appears from the fact that the days which we spent there were remarkably warm ones in the country below, and were the common subject of conversation when we came down, yet we had known nothing about it, and went warmly clad with comfort all the while, as we had not done immediately before and did not after we descended. We immediately perceived the difference as we descended. It was warm enough for us on the summit, and often, in the sheltered southeast hollows, too warm, as we happened to be clad, but on the summits and ridges it chanced that there was always wind, and in this wind it was commonly cooler than we liked. Also our water, which was evidently rain-water caught in the rocks and retained by the moss, was cool enough if it were only in a little crevice under the shelter of a rock, i.e. out of the sun.

Yet, though it was thus cool, and there was this scud or mist on the top more or less every night, there was, as we should say, no dew on the summit any morning. The lichens, blueberry bushes, etc., did not feel wet, nor did they wet you in the least, however early you walked in them. I rose [? ] to observe the sunrise and picked blueberries every morning before sunrise, and saw no dew, only once some minute dewdrops on some low grass-tips, and that was amid the wet moss of a little bog, but the lambkill and blueberry bushes above it were not wet. Yet the Thursday when we left, we found that though there was no dew on the summit there was a very heavy dew in the pastures below, and our feet and clothes were completely wet with it, as much as if we had stood in water.

I should say that there were no true springs (?) on the summit, but simply rain-water caught in the hollows of the rocks or retained by the moss. I observed that the well which we made for washing — by digging up the moss with our hands — half dried up in the sun by day, but filled up again at night.

The principal stream on the summit, — if not the only one, — in the rocky portion described, was on the southeast side, between our two camps, though it did not distinctly show itself at present except a little below our elevation. For the most part you could only see that water had flowed there between and under the rocks.

I fancied once or twice that it was warmer at 10 p. M. than it was immediately after sunset.

The voices of those climbing the summit were heard remarkably far. We heard much of the ordinary conversation of those climbing the peak above us a hundred rods off,

and we could hear those on the summit, or a hundred and thirty rods off, when they shouted. I heard a party of ladies and gentlemen laughing and talking there in the night (they were camping there), though I did not hear what they said. We heard, or imagined that we heard, from time to time, as we lay in our camp by day, an occasional chinking or clinking sound as if made by one stone on another.

In clear weather, in going from one part of the summit to another it would be most convenient to steer by distant objects, as towns or mountains or lakes, rather than by features of the summit itself, since the former are most easily recognized and almost always in sight.

I saw what I took to be a thistle-down going low over the summit, and might have caught it, though I saw no thistle on the mountain-top nor any other plant from which this could have come. (I have no doubt it was a thistle by its appearance and its season.) It had evidently come up from the country below. This shows that it may carry its seeds to higher regions than it inhabits, and it suggests how the seeds of some mountain plants, as the *Solidago thyrsoidea*, may be conveyed from mountain to mountain, also other *solidagos*, *asters*, *epilobiums*, *willows*, etc.

The descent through the woods from our first camp to the site of the shanty is from a third to half a mile. You then come to the raspberry and fern scented region. There were some raspberries still left, but they were fast dropping off.

There was a good view of the mountain from just above the pond, some two miles from Troy. The varying outline of a mountain is due to the crest of different spurs, as seen from different sides. Even a small spur, if you are near, may conceal a much larger one and give its own outline to the mountain, and at the same time one which extends directly toward you is not noticed at all, however important, though, as you travel round the mountain, this may gradually come into view and finally its crest may be one half or more of the outline presented. It may partly account for the peaked or pyramidal form of mountains that one crest may be seen through the gaps of another and so fill up the line.

Think I saw leersia or cut-grass in bloom in Troy.

I carried on this excursion the following articles (beside what I wore), viz.: —

One shirt.

One pair socks.

Two pocket-handkerchiefs.

One thick waistcoat.

One flannel shirt (had no occasion to use it).

India-rubber coat.

Three bosoms.

Towel and soap.

Pins, needles, thread.

A blanket (would have been more convenient if stitched up in the form of a bag).

Cap for the night.

Map and compass.

Spy-glass and microscope and tape.

Saw and hatchet.

Plant-book and blotting-paper.

Paper and stamps.

Botany.

Insect and lichen boxes. —

Jack-knife.

Matches.

Waste paper and twine.

Iron spoon and pint dipper with handle.

All in a knapsack.

Umbrella.

N. B. — Add to the above next time a small bag, which may be stuffed with moss or the like for a pillow.

For provision for one, six days, carried: —

2 1/2 lbs of salt beef and tongue. Take only salt beef next time, 1 — to 3 lbs.

18 hard-boiled eggs. — Omit eggs.

2 1/2 lbs sugar and a little salt. 2 lbs of sugar would have done. About 1/4 lb of tea. — 2/3 as much would have done.

2 lbs hard-bread. — The right amount of bread, 1/2 loaf home-made bread and but might have taken more a piece of cake. — home-made and more solid sweet cake.

N. B. — Carry salt (or some of it) in a wafer-box. Also some sugar in a small box.

N. B. — Observe next time: the source of the stream which crosses the path; what species of swallow flies over mountain; what the grass which gives the pastures a yellowish color seen from the summit.

The morning would probably never be ushered in there by the chipping of the chip-bird, but that of the *F. hyemalis* instead, — a dry, hard occasional chirp, more in harmony with the rocks. There you do not hear the link of the bobolink, the chatter of red-wings and crow blackbirds, the wood pewee, the twitter of the kingbird, the half [sic] strains of the vireo, the passing goldfinch, or the occasional plaintive note of the bluebird, all which are now commonly heard in the lowlands.

That area is literally a chaos, an example of what the earth was before it was finished.

Do I not hear the mole cricket at night?

Aug. 10. 2 p m. — Air, 84°; Boiling Spring this afternoon., 46°; Brister's, 49°; or where there is little or no surface water the same as in spring. Walden is at surface 80° (air over it 76).

*Aster dumosus* and pennyroyal out; how long? Sand cherry is well ripe — some of it — and tolerable, better than the red cherry or choke-cherry. *Juncus paradoxus*, that large and late juncus (tailed), as in Hubbard's Close and on island above monument and in Great Meadows, say ten days.

Saw yesterday in Fitzwilliam from the railroad a pond covered with white lilies uniformly about half the size of ours!

Saw this evening, behind a picture in R. W. E.'s dining-room, the hoary bat. First heard it fluttering at dusk, it having hung there all day. Its rear parts covered with a fine hoary down.

Aug. 11. *Panicum capillare*; how long? *Cyperus strigosus*; how long?

Aug. 12. The river-bank is past height. The button-bush is not common now, though the clethra is in prime. The black willow hardly ceases to shed its down when it looks yellowish. *Setaria glauca*, some days. *Elymus Virginicus*, some days. *Andropogon furcatus* (in meadow); how long? Probably before *scoparius*. *Zizania* several days.

River at 5 p. M. three and three quarters inches below summer level.

*Panicum glabrum* (not *sanguinale*? — our common); how long? The upper glume equals the flower, yet it has many spikes.

Aug. 13. P. M. — To Great Meadows and Gowing's Swamp.

Purple grass (*Eragrostis pectinacea*), two or three days. *E. capillar* is, say as much. *Andropogon scoparius*, a day or two. *Calamagrostis coarctata*, not quite. *Glyceria obtusa*, well out; say several days.

Some of the little cranberries at Gowing's Swamp appear to have been frost-bitten. Also the blue-eyed grass, which is now black-topped.

Hear the steady shrill of the alder locust.

Rain this forenoon; windy in afternoon.

Aug. 14. Heavy rain.

Aug. 15. Fair weather.

See a blue heron.

Aug. 16. 2 p. M. — River about ten and a half inches above summer level.

Apparently the Canada plum began to be ripe about the 10th.

Aug. 17. We have cooler nights of late.

See at Pout's Nest two solitary tattlers, as I have seen them about the muddy shore of Gourgas Pond-hole and in the Great Meadow pools. They seem to like a muddier shore than the peetweet.

Hear a whip-poor-will sing to-night.

Aug. 18. The note of the wood pewee sounds prominent of late.

Aug. 19. Examine now more at length that smooth, turnip-scented brassica which is a pest in some grain-fields. Formerly in Stow's land; this year in Warren's, on the Walden road. To-day I see it in Minot Pratt's, with the wild radish, which is a paler yellow and a rougher plant. I thought it before the *B. campestris*, but Persoon puts that under brassicas with *siliquis tetraedris*, which this is not, but, for aught that appears, it agrees with his *B. Napus*, closely allied, i.e. wild rape. Elliot speaks of this as introduced here. Vide Patent Office Report for 1853 and "Vegetable Kingdom," page 179. The *B. campestris* also is called rape.

*Leersia* (cut-grass) abundantly out, apparently several days.

Aug. 21. Soaking rains, and in the night.

A few fireflies still at night.

Aug. 22. P. M. — Row to Bittern Cliff.

Now, when the mikania is conspicuous, the bank is past prime, for lilies are far gone, the pontederia is past prime, willows and button-bushes begin to look the worse for the wear thus early, — the lower or older leaves of the willows are turned yellow and decaying, — and many of the meadows are shorn. Yet now is the time for the cardinal-flower. The already, methinks, yellowing willows and button-bushes, the half-shorn meadows, the higher water on their edges, with wool-grass standing over it, with the notes of flitting bobolinks and redwings of this year, in rustling flocks, all tell of the fall.

I hear two or three times behind me the loud creaking note of a wood duck which I have scared up, which goes to settle in a new place.

Some deciduous trees are now at least as dark as evergreens, the aldèrs are darker than white pines, and as dark as pitch, as I now see them.

I try the temperature of the river at Bittern Cliff, the deep place. The air over river at 4.30 is 81°; the water at the top, 78°; poured from a bottle (into a dipper) which I let lie on the bottom half an hour, 73°, — or 5° difference. When I merely sunk the thermometer and pulled it up rapidly it stood 73j, though not in exactly the same place, — say two rods off.

When I used to pick the berries for dinner on the East Quarter hills I did not eat one till I had done, for going a-berrying implies more things than eating the berries. They at home got only the pudding: I got the forenoon out of doors, and the appetite for the pudding.

It is true, as is said, that we have as good a right to make berries private property as to make grass and trees such; but what I chiefly regret is the, in effect, dog-in-the-manger result, for at the same time that we exclude mankind from gathering berries in our field, we exclude them from gathering health and happiness and inspiration and a hundred other far finer and nobler fruits than berries, which yet we shall not gather ourselves there, nor even carry to market. We strike only one more blow at a simple and wholesome relation to nature. As long as the berries are free to all comers they are beautiful, though they may be few and small, but tell me that is a blueberry swamp which somebody has hired, and I shall not want even to look at it. In laying claim for the first time to the spontaneous fruit of our pastures we are, accordingly, aware of a little meanness inevitably, and the gay berry party whom we turn away naturally look down on and despise us. If it were left to the berries to say who should have them, is it not likely that they would prefer to be gathered by the party of children in the hay-rigging, who have come to have a good time merely?

I do not see clearly that these successive losses are ever quite made up to us. This is one of the taxes which we pay for having a railroad. Almost all our improvements, so called, tend to convert the country into the town.

This suggests what origin and foundation many of our laws and institutions have, and I do not say this by way of complaining of this particular custom. Not that I love Cæsar less, but Rome more.

Yes, and a potato-field is a rich sight to me, even when the vines are half decayed and blackened and their decaying scent fills the air, though unsightly to many; for it speaks then more loudly and distinctly of potatoes than ever. I see their weather-beaten brows peeping out of the hills here and there, for the earth cannot contain them, when the creak of the cricket and the shrilling of the locust prevail more and more, in the sunny end of summer. There the confident husbandman lets them lie for the present, even as if he knew not of them, or as if that property were insured, so carelessly rich he is. He relaxes now his labors somewhat, seeing to their successful end, and takes long mornings, perchance, stretched in the shade of his ancestral elms.

Returning down the river, when I get to Clamshell I see great flocks of the young red-wings and some crow blackbirds on the trees and the ground. They are not very shy, but only timid, as inexperienced birds are. I do not know what they find to eat on this half bare, half grassy bank, but there they hop about by hundreds, while as many more are perched on the neighboring trees; and from time to time they all rise from the earth and wheel and withdraw to the trees, but soon return to the ground again. The red-wings are almost reddish about the throat. The crow blackbirds have some notes now just like the first croaks of the wood frog in the spring.

*Sorghum nutans* well out (behind the birch); how long? *Paspalum* ditto.

The recent heavy rains have washed away the bank here considerably, and it looks and smells more mouldy with human relics than ever. I therefore find myself inevitably exploring it. On the edge of the ravine whose beginning I witnessed, one foot beneath the surface and just over a layer some three inches thick of pure shells and ashes, — a gray-white line on the face of the cliff. — I find several pieces of Indian pottery with a rude ornament on it, not much more red than the earth itself. Looking farther, I find more fragments, which have been washed down the sandy slope in a stream, as far as ten feet. I find in all thirty-one pieces, averaging an inch in diameter and about a third of an inch thick. Several of them made part of the upper edge of the vessel, and have a rude ornament encircling them in three rows, as if pricked with a stick in the soft clay, and also another line on the narrow edge itself. At first I thought to match the pieces again, like a geographical puzzle, but I did not find that any I [got] belonged together. The vessel must have been quite large, and I have not got nearly all of it. It appears to have been an impure clay with much sand and gravel in it, and I think a little pounded shell. It is [of] very unequal thickness, some of the unadorned pieces (probably the bottom) being half an inch thick, while near the edge it is not more than a quarter of an inch thick. There was under this spot and under the layer of shells a manifest hollowness in the ground, not yet filled up. I find many small pieces of bone in the soil of this bank, probably of animals the Indians ate.

In another — bank, in the midst of a much larger heap of shells which has been exposed, found a delicate stone tool of this form and size of a soft slate-stone. It is

very thin and sharp on each side edge, and in the middle is not more than an eighth of an inch thick. I suspect that this was used to open clams with. It is curious at I expected to find I as much as this, and in this very spot too, before I reached it mean the pot). Indeed, I never find a remarkable Indian relic — and I find a good many — but I have first divined its existence, and planned the discovery of it. Frequently I have told myself distinctly what it was to be before I found it.

The river is fifteen and three quarters inches above summer level.

Aug. 24. This and yesterday very foggy, dogdayish days. Yesterday the fog lasted till nine or ten, and to-day, in the afternoon, it amounts to a considerable drizzling rain.

P. M. — To Walden to get its temperature. The air is only 66 (in the mizzling rain the 23d it was 78); the water at top, 75° (the 23d also 75). What I had sunk to the bottom in the middle, where a hundred feet deep by my line, left there half an hour, then pulled up and poured into a quart dipper, stood at 53°. I tried the same experiment yesterday, but then in my haste was uncertain whether it was not 51°; certain that a little later it was 54°. So 53° it must be for the present. I may have been two or more minutes pulling up the line so as to prevent its snarling. Therefore I think the water must have acquired a temperature two or three degrees higher than it had at the bottom by the time I tried it. So it appears that the' bottom of Walden has, in fact, the temperature of a genuine and cold spring, or probably is of the same temperature with the average mean temperature of the earth, and, I suspect, the same all the year. This shows that springs need not come from a very great depth in order to be cold. What various temperatures, then, the fishes of this pond can enjoy! They require no other refrigerator than their deeps afford. They can in a few moments sink to winter or rise to summer. Walden, then, must be included among the springs, but it is one which has no outlet, — is a well rather. It reaches down to where the temperature of the earth is unchanging. It is not a superficial pond, — not in the mere skin of the earth. It goes deeper. How much this varied temperature must have to do with the distribution of the fishes in it! The few trout must oftenest go down below in summer.

At the bottom of the deep cove I see much black birch and red maple just sprung up, and their seeds have evidently been drifted to this shore. The little birches are already fragrant.

Aug. 25. 2 P. M. — To Clamshell.

See a large hen-hawk sailing over Hubbard's meadow and Clamshell, soaring at last very high and toward the north. At last it returns southward, at that height impelling itself steadily and — swiftly forward with ts wings set in this wise: i.e. more curved, or, is it were, trailing behind, without apparent motion. It thus moves half a mile directly.

The front-rank polygonum is apparently in prime; now, solid, of a pinkish rose-color. Notice the small aptrycliium's leaf.

As I row by, see a green bittern near by standing erect on Monroe's boat. Finding that it is observed, it draws on its head and stoops to conceal itself. When it flies it

seems to have no tail. It allowed me to approach so near, apparently being deceived by some tame ducks there.

Aug. 26. 2 P. M. — To White Pond.

The leersia or cut-grass in the old pad ditch by path beyond Hubbard's Grove.

As I cross the upland sprout-land south of Ledum Swamp, I see that the fine sedge there is half withered and brown, and it is too late for that cheerful yellow gleam.

Thread my way through the blueberry swamp in front of Martial Miles's. The high blueberries far above your head in the shade of the swamp retain their freshness and coolness a long time. Little blue sacks full of swampy nectar and ambrosia commingled, like schnapps or what-not, that you break with your teeth. Is not this the origin of the German name as given by Gerard? But there is far the greatest show of choke-berries there, rich to see. I wade and press my way through endless thickets of these untasted berries, their lower leaves now fast reddening. Yet they have an agreeable juice, — though the pulp may be rejected, — and perhaps they might be made into wine.

The shrilling of the alder locust is the solder that welds these autumn days together. All bushes (arbusta) resound with their song, and you wade up to your ears in it. Methinks the burden of their song is the countless harvests of the year, — berries, grain, and other fruits.

I am interested by the little ridge or cliff of foam which the breeze has raised along the White Pond shore, the westerly breeze causing the wavelets to lapse on the shore and mix the water with the air gradually. Though this is named White Pond from the whiteness of its sandy shore, the line of foam is infinitely whiter, far whiter than any sand. This reminds me how far a white pond-shore, i.e. the sand, may be seen. I saw from Monadnock the north shore of a large pond in Nelson which was some eight miles north by the map, very distinct to every one who looked that way. Perhaps in such cases a stronger light is reflected from the water on to the shore. The highest ridge of foam is where it is held or retained and so built up gradually behind some brush or log on the shore, by additions below, into a little cliff, like a sponge. In other places it is rolled like a muff. It is all light and trembling in the air.

Thus we are amused with foam, a hybrid between two elements. A breeze comes and gradually mingles some of the water with the air. It is, as it were, the aspiration of the pond to soar into the air. The debatable ground between two oceans, the earth, or shore, being only the point of resistance, where they are held to mingle.

See nowadays the pretty little Castile-soap galls on the shrub oaks. Their figure is like the Indian girdle of triangular points. Also other galls, yellowish and red on different sides.

The pussy clover heads were most interesting, large, and puffy, say ten days ago.

I notice milkweed in a hollow in the field by the cove at White Pond, as if the seed had settled there, owing to the lull of the wind.

It is remarkable how commonly you see the thistledown sailing just over water (as I do after this — the 2d of September — at Walden). I see there, i.e. at Walden, at 5 p. M., September 2d, many seedless thistle-downs sailing about a foot above the water,

and some in it, as if there was a current just above the surface which prevented their falling or rising. They are probably wafted to the water because there is more air over water.

Aug. 27. P. M. — To Ministerial Swamp.

Clear weather within a day or two after the thick dog-days. The nights have been cooler of late, but the heat of the sun by day has been more local and palpable, as it were. It is as if the sun touched your shoulder with a hot hand while there are cool veins in the air. That is, I am from time to time surprised and oppressed by a melting heat on my back in the sun, though I am sure of a greater general coolness. The heat is less like that of an apartment equably warmed, and more like that [of] a red-hot iron carried about and which you occasionally come near.

See one of the shrilling green alder locusts on the under side of a grape leaf. Its body is about three quarters of an inch or less in length; antennæ and all, two inches. Its wings are at first perpendicular above its shoulders, it apparently having just ceased shrilling. Transparent, with lines crossing them.

Notice now that sour-tasting white (creamy, for consistence) incrustation between and on the berries of the smooth sumach, like frostwork. Is it not an exudation? or produced by the bite of an insect?

*Calamagrostis coarctata* grass by Harrington's Pool, Ministerial Swamp, say one week (not in prime).

*Muhlenbergia glomerata*, same place, say ten days, or past prime.

Gather some of those large and late low blackberries (as at Thrush Alley) which run over the thin herbage, green moss, etc., in open pitch pine woods.

Aug. 28. About 6.20 p. M. paddled on Walden. Near the shore I see at least one little skater to a foot, further off one to a yard, and in middle not more than one to a rod; but I see no gyrenid at all here to-night.

At first the sky was completely overcast, but, just before setting, the sun came out into a clear space in the horizon and fell on the east end of the pond and the hillside, and this sudden blaze of light on the still very fresh green leaves was a wonderful contrast with the previous and still surrounding darkness. Indeed, the bright sunlight was at this angle reflected from the water at the east end — while I in the middle was in the shade of the east woods — up under the verdure of the bushes and trees on the shore and on Pine Hill, especially to the tender under sides and to the lower leaves not often lit up. Thus a double amount of light fell on them, and the most vivid and varied shades of green were revealed. I never saw such a green glow before. The outline of each shrub and tree was a more or less distinct downy or silvery crescent, where the light was reflected from the under side of the most downy, or newest, leaves, — as I should not have seen it at midday, — either because the light fell more on the under sides of the leaves, being so horizontal and also reflected upward, or because the leaves stood more erect at this hour and after a cloudy day, or for both reasons. The lit water at the east end was invisible to me, or no more than a line, but the shore itself was a very distinct whitish line. When the sun fell lower, and the sunlight no longer fell on

the pond, the green blaze of the hillside was at once very much diminished, because the light was no longer reflected upward to it.

At sunset the air over the pond is 62 +; the water at the top, 74°; poured from a stoppered bottle which lay at the bottom where one hundred feet deep, twenty or thirty minutes, 55° (and the same when drawn up in an open bottle which lay five minutes at the bottom); in an open bottle drawn up from about fifty feet depth (there) or more, after staying there five minutes, 63°. This about half the whole difference between the top and bottom, so that the temperature seems to fall regularly as you descend, at the rate of about one degree to five feet. When I let the stoppered bottle down quickly, the cork was forced out before it got to the bottom, when [? ] the water drawn up stood at 66°. Hence it seemed to be owing to the rising of the warmer water and air in the bottle. Five minutes with the open bottle at the bottom was as good as twenty with it stoppered.

I found it 2° warmer than the 24th, though the air was then 4° warmer than now. Possibly, comparing one day with the next, it is warmer at the bottom in a cold day and colder in a warm day, because when the surface is cooled it mixes more with the bottom, while the average temperature is very slightly changed.

The *Lycopodium inundatum* common by Harrington's mud-hole, Ministerial Swamp.

Hear the night-warbler and whip-poor-will.

There was no prolonged melody of birds on the summit of Monadnock. They for the most part emitted sounds there more in harmony with the silent rocks, — a faint chipping or chinking, often somewhat as of two stones struck together.

Aug. 30. Surveying Minott's land.

Am surprised to find on his hard land, where he once raised potatoes, the hairy huckleberry, which before I had seen in swamps only. Here, too, they are more edible, not so insipid, yet not quite edible generally. They are improved, you would say, by the firmer ground. The berries are in longer racemes or clusters than any of our huckleberries. They are the prevailing berry all over this field. They are oblong and black, and the thick, shaggy-feeling coats left in the mouth are far from agreeable to the palate. Are now in prime.

Also find, in one of his ditches where peat was dug (or mud), the *Lemna polyrhiza*; not found in Concord before, and said not to blossom in this country. I found it at Pushaw. Also the *Muhlenbergia glomerata* near the lemna, or southeast of it.

The hairy huckleberry and *muhlenbergia*, I think, grow here still because Minott is an old-fashioned man and has not scrubbed up and improved his land as many, or most, have. It is in a wilder and more primitive condition. The very huckleberries are shaggy there. There was only one straight side to his land, and that I cut through a dense swamp. The fences are all meandering, just as they were at least in 1746, when it was described.

The lemna reminds me strongly of that greenish or yellowish scum which I see mantling some bam-yard pools. It makes the same impression on the eye at a little

distance. You would say it was the next higher stage of vegetation. The smallest of pads, one sixth of an inch in diameter and, like the white lily pad, crimson beneath. It completely covers two or three ditches under the edge of the wood there, except where a frog has jumped in and revealed the dark water, — and maybe there rests, his green snout concealed amid it; but it soon closes over him again when he has dived. These minute green scales completely cover some ditches, except where a careless frog has leapt in or swam across, and rent the veil.

There is also, floating in little masses, a small ranunculus-like plant, flattish-stemmed with small forks, some of it made into minute caddis-cases. Perhaps it was cut up by some creature at the bottom. Vide press.

## SEPTEMBER, 1860

Sept. 1. P. M. — To Walden.

Saw a fish hawk yesterday up the Assabet. In one position it flew just like a swallow; of the same form as it flew.

We could not judge correctly of distances on the mountain, but greatly exaggerated them. That surface was so novel, — suggested so many thoughts, — and also so uneven, a few steps sufficing to conceal the least ground, as if it were half a mile away, that we would have an impression as if we had travelled a mile when we had come only forty rods. We no longer thought and reasoned as in the plain.

Now see many birds about E. Hubbard's elder hedge, — bobolinks, kingbirds, pigeon woodpeckers, — and not elsewhere.

Many pine stipules fallen yesterday. Also see them on Walden to-day.

Hear that F. Hayden saw and heard geese a fortnight ago!

I see within an oak stump on the shore of Walden tomato plants six or eight inches high, as I found them formerly about this pond in a different place. Since they do not bear fruit the seed must be annually brought here by birds, yet I do not see them pecking the tomatoes in our gardens, and this is a mile and a half from the village and half a mile from the nearest house in Lincoln.

River about eight inches above summer level yesterday.

We are so accustomed to see another forest spring up immediately as a matter of course, whether from the stump or from the seed, when a forest is cut down, never troubling about the succession, that we hardly associate the seed with the tree, and do not anticipate the time when this regular succession will cease and we shall be obliged to plant, as they do in all old countries. The planters of Europe must have a very different, a much correcter, notion of the value of the seed of forest trees than we. To speak generally, they know that the forest trees spring from seeds, as we do of apples and pears, but we know only that they come out of the earth.

See how artfully the seed of a cherry is placed in order that a bird may be compelled to transport it. It is placed in the very midst of a tempting pericarp, so that the creature

that would devour a cherry must take a stone into its mouth. The bird is bribed with the pericarp to take the stone with it and do this little service for Nature. Cherries are especially birds' food, and many kinds are called birds' cherry, and unless we plant the seeds occasionally, I shall think the birds have the best right to them. Thus a bird's wing is added to the cherry-stone which was wingless, and it does not wait for winds to transport it. If you ever ate a cherry, and did not make two bites of it, you must have perceived it. There it is, right in the midst of the luscious morsel, an earthy residuum left on the tongue. And some wild men and children instinctively swallow it, like the birds, as the shortest way to get rid of it. And the consequence is that cherries not only grow here but there, and I know of some handsome young English cherries growing naturally in our woods, which I think of transplanting back again to my garden. If the seed had been placed in a leaf, or at the root, it would not have got transported thus. Consider how many seeds of plants we take into our mouths. Even stones as big as peas, a dozen at once.

The treatment of forests is a very different question to us and to the English. There is a great difference between replanting the cleared land from the superabundance of seed which is produced in the forest around it, which will soon be done by nature alone if we do not interfere, and the planting of land the greater part of which has been cleared for more than a thousand years.

Sept. 2. P. M. — To Annursnaek.

*Solidago nemoralis* apparently in prime, and *S. stricta*. The former covers A. Hosmer's secluded turtle field near the bridge, together with johnswort, now merely lingering.

Sept. 3. P. M. — To Bateman's Pond.

2 — p. m. — River six and seven eighths above [summer level].

Here is a beautiful, and perhaps first decidedly autumnal, day, — a cloudless sky, a clear air, with, maybe, veins of coolness. As you look toward the sun, the [sic] shines more than in the spring. The dense fresh green grass which has sprung up since it was mowed, on most ground, reflects a blaze of light, as if it were morning all the day. The meads and slopes are enamelled with it, for there has been no drought nor withering. We see the smokes of burnings on various sides. The farmers are thus clearing up their pastures, — some, it may be, in preparation for plowing. Though it is warm enough, I notice again the swarms of fuzzy gnats dancing in the cooler air, which also is decidedly autumnal.

See on the two pear trees by the Boze cellar ripe pears, some ripe several days. Most are bitter, others mealy, but one was quite sweet and good, of middling size, and prettier than most cultivated ones. It had a few faint streaks of red and was exceeding wax-like.

Sept. 4. P. M. — To Conantum.

At my Swamp Brook crossing at Willow Bay, I see where a great many little red maples have sprung up in a potato-field, apparently since the last plowing or cultivating this year. They extend more or less thickly as much as eleven rods in a northwest

direction from a small tree, the only red maple in that neighborhood. And it is evidently owing to the land having been cultivated this year that the seed vegetated there; otherwise there would now be no evidence that any such seeds had fallen here. Last year and for many years it has been a pasture. It is evident that land may be kept as a pasture and covered with grass any number of years, and though there are maples adjacent to it, none of the seed will catch in it; but at last it is plowed, and this year the seed which falls on it germinates, and if it chances not to be plowed again, and cattle are kept out, you soon have a maple wood there. So of other light-seeded trees.

It is cooler these days and nights, and I move into an eastern chamber in the morning, that I may sit in the sun. The water, too, is cooler when I bathe in it, and I am reminded that this recreation has its period. I feel like a melon or other fruit laid in the sun to ripen. I grow, not gray, but yellow.

Saw flocks of pigeons the 2d and 3d. I see and hear on Conantum an upland plover. The goldfinch is very busy pulling the thistle to pieces.

What I have called *Muhlenbergia sobolifera* is in prime (say a week); the *M. Mexicana* not quite (say in two or three days).

Sept. 5. P. M. — To Ball's Hill.

The brink of the river is still quite interesting in some respects, and to some eyes more interesting than ever. Though the willows and button-bushes have already assumed an autumnal hue, and the *pontederia* is extensively crisped and blackened, the dense masses of *mikania*, now, it may be, paler than before, are perhaps more remarkable than ever. I see some masses of it, overhanging the deep water and completely concealing the bush that supports them, which are as rich a sight as any flower we have, — little terraces of contiguous corymbs, like *mignonette* (? ). Also the dodder is more revealed, also draping the brink over the water. The *mikania* is sometimes looped seven or eight feet high to a tree above the bushes, — a manifest vine, with its light-colored corymbs at intervals.

See the little dippers back. Did I not see a marsh hawk in imperfect plumage? Quite brown, with some white midway the wings, and tips of wings black?

What further adds to the beauty of the bank is the hibiscus, in prime, and the great *bidens*., Having walked through a quantity of *desmodium* under Ball's Hill, by the shore there (*Marilandicum* or *rigidum*), we found our pants covered with its seeds to a remarkable and amusing degree. These green scales closely covering and greening my legs reminded me of the *lemna* on a ditch. It amounted to a kind of coat of mail. It was the event of our walk, and we were proud to wear this badge, as if he were the most distinguished who had the most on his clothes. My companion expressed a certain superstitious feeling about it, for he said he thought it would not be right to walk intentionally amid the *desmodium* so as to get more of the ticks on us, nor yet to pick them off, but they must be carried about till they are rubbed off accidentally. I saw that Nature's design was furthered even by his superstition.

Sept. 6. The willows and button-bushes have very rapidly yellowed since I noticed them August 22d. I think it was the 25th of August that I found the lower or older

leaves of the willow twigs decidedly and rapidly yellowing and decaying on a near inspection. Now the change is conspicuous at a distance.

Sept. 7. P. M. — To Cardinal Shore.

I see many seedling shrub oaks springing up in Potter's field by the swamp-side, some (of last year) in the open pasture, but many more in the birch wood half a dozen rods west from the shrub oaks by the path. The former were dropped by the way. They plant in birch woods as in pines. This small birch wood has been a retreat for squirrels and birds. When I examine the little oaks in the open land there is always an effete acorn with them.

Common rose hips as handsome as ever.

Sept. 8. To Lowell via Boston.

Rainy day.

Pursh's [sic] *Brassica Napus* is "radice caulescente fusiformi, fol laevibus, superioribus cordato-lanceolatis amplexicaulibus, inferioribus lyratis dentatis." Frequently found wild. The lower leaves of mine are considerably bristly. Sowerby's *Botany at Cambridge* says of *B. campestris*, "Pods upright, cylindrical, or very obscurely quadrangular, veiny, the seeds slightly projecting, the beak awl-shaped, striated, square at its base." *B. Napus*, — "Pod on a slender stalk, spreading, round, beaded, with an angular point." Mine is apparently *B. Napus*, judging from pods, for the lower leaves are all eaten. Vide young plants in spring.

Sept. 9. In Lowell. — My host says that the thermometer was at 80° yesterday morning, and this morning is at 52°. Sudden coolness.

Clears up in afternoon, and I walk down the Merrimack on the north bank. I see very large plants of the lanceolate thistle, four feet high and very branching. Also *Aster cordata* with the corymbosus.

Concord River has a high and hard bank at its mouth, maybe thirty feet high on the east side; and my host thinks it was originally about as high on the west side, where now it is much lower and flat, having been dug down. There is a small isle in the middle of the mouth. There are rips in the Merrimack just below the mouth of the Concord. There is a fall and dam in the Concord at what was Hurd's factory, — the principal fall on the Concord, in Lowell, — one at a bleachery above, and at Whipple's, — three in all below Billerica dam.

Sept. 10. Lowell to Boston and Concord.

There was a frost this morning, as my host, who keeps a market, informed me.

Leaving Lowell at 7 A. M. in the cars, I observed and admired the dew on a fine grass in the meadows, which was almost as white and silvery as frost when the rays of the newly risen sun fell on it. Some of it was probably the frost of the morning melted. I saw that this phenomenon was confined to one species of grass, which grew in narrow curving lines and small patches along the edges of the meadows or lowest ground, — a grass with very fine stems and branches, which held the dew; in short, that it was what I had falsely called *Eragrostis capillaris*, but which is probably the *Sporobolus serotinus*, almost the only, if not the only, grass there in its prime. And thus this plant

has its day. Owing to the number of its very fine branches, now in their prime, it holds the dew like a cobweb, — a clear drop at the end and lesser drops or beads all along the fine branches and stems. It grows on the higher parts of the meadows, where other herbage is thin, and is the less apt to be cut; and, seen toward the sun not long after sunrise, it is very conspicuous and bright a quarter of a mile off, like frostwork. Call it dew-grass. I find its hyaline seed.

Almost every plant, however humble, has thus its day, and sooner or later becomes the characteristic feature of some part of the landscape or other.

Almost all other grasses are now either cut or withering, and are, beside, so coarse comparatively that they can never present this phenomenon. It is only a grass that is in its full vigor, as well as fine-branched (capillary), that can thus attract and uphold the dew. This is noticed about the time the first frosts come.

If you sit at an open attic window almost anywhere, about the 20th of September, you will see many a milkweed down go sailing by on a level with you, — though commonly it has lost its freight, — notwithstanding that you may not know of any of these plants growing in your neighborhood.

My host, yesterday, told me that he was accustomed once to chase a black fox from Lowell over this way and lost him at Chelmsford. Had heard of him within about six years. A Carlisle man also tells me since that this fox used to turn off and run northwest from Chelmsford, but that he would soon after return.

Sept. 11. George Melvin came to tell me this forenoon that a strange animal was killed on Sunday, the 9th, near the north line of the town, and it was not known certainly what it was. From his description I judged it to be a Canada lynx. In the afternoon I went to see it. It was killed on Sunday morning by John Quincy Adams, who lives in Carlisle about half a mile (or less) from the Concord line, on the Carlisle road.

Some weeks ago a little girl named Buttrick, who was huckleberrying near where the lynx was killed, was frightened by a wild animal leaping out of the bushes near her — over her, as she said — and bounding off. But no one then regarded her story. Also a Mr. Grimes, who lives in Concord just on the line, tells me that some month ago he heard from his house the loud cry of an animal in the woods northward, and told his wife that if he were in Canada he should say it was a bob-tailed cat. He had lived seven years in Canada and seen a number of this kind of animal. Also a neighbor of his, riding home in the night, had heard a similar cry. Jacob Farmer saw a strange animal at Bateman's Pond a year ago, which he thinks was this.

Adams had lost some of his hens, and had referred it to a fox or the like. He being out, his son told me that on Sunday he went out with his gun to look after the depredator, and some forty or fifty rods from his house northwesterly (on Dr. Jones's lot, which I surveyed) in the woods, this animal suddenly dropped within two feet of him, so near that he could not fire. He had heard a loud hiss, but did not mind it. He accordingly struck it with the butt of his gun, and it then bounded off fifteen feet or more, turned about, and faced him, whereupon he fired directly into its eyes, putting them out. His

gun was loaded with small shot, No. 9. The creature then bounded out of sight, and he had a chance to reload, by which time it appeared again, crawling toward him on its belly, fiercely seeking him. He fired again, and, it still facing him, he fired a third time also, and finally finished it with the butt of his gun.

It was now skinned and the skin stuffed with hay, and the skull had been boiled, in order to be put into the head.

I measured the stuffed skin carefully. From the forehead (the nose pointing down) to end of tail, 3 feet [inches]. Tail stout and black at the abrupt end, 5 inches. Extreme length from fore paws to hind paws, 4 — feet 8 inches, when stretched out, the skin being stiff. (They said it measured 5 feet before it was skinned, which is quite likely.) Forehead to extremity of hind feet, 50 1/2 inches. It stood, as nearly as I could measure, holding it up, 19 to 20 inches high from ground to shoulder. From midway between the legs beneath, the hind legs measured 19 inches, within; the fore legs, 16 inches, within. From skull to end of tuft on ear, 4 1/2 inches; tuft on ear (black and thin), 1 1/2 inches. The width of fore paw gently pressed was 3 1/2 inches; would have made a track perhaps four inches wide in snow. There was a small bare brown tubercle of flesh to each toe, and also a larger one for the sole, amid the grayish-white hair. A principal claw was 3/4 inch long measured directly, but it was very curving.

For color: It was, above, brownish-gray, with a dark-brown or black line down the middle of the back. Sides gray, with small dark-brown spots, more or less within the hair. Beneath, lighter, hoary, and long-haired. Legs gray, like the sides, but more reddish-brown behind, especially the hind legs, and these, like the belly and sides, were indistinctly spotted with dark brown, having the effect more of a dark-brown tinge at a little distance than of spots. General aspect brownish-hoary. Tail, above, more reddish than rest of back, much, and conspicuously black at end. Did not notice any white at tip. Throat pretty white. Ears, without, broadly edged with black half an inch or more wide, the rest being a triangular white. There was but a small muffer, chiefly a triangular whitish and blackish tuft on the sides of the face or neck, not noticeably under the chin. It weighed, by their account, nineteen pounds. This was a female, and Farmer judged from his examination of the mammæ — two or more of them being enlarged, and the hair worn off around them — that it had suckled young this year. The fur was good for nothing now.

I cannot doubt that this is a Canada lynx; yet I am somewhat puzzled by the descriptions of the two lynxes. Emmons says of the Canada lynx that it has “no naked spots or tubercles [on the soles of its feet] like the other species of the feline race;” and Audubon says, “Soles, hairy;” but of the *Lynx rufus*, “Soles... naked.” It is Audubon’s *L. rufus* in the naked soles, also in “ears, outer surface, a triangular spot of dull white,... bordered with brownish-black,” not described in his *Canadensis*. It is his *L. Canadensis* in size, in color generally, in length of ear-tuft (his *L. rufus* tufts being only half an inch), in “upper surface of the tail, to within an inch of the tip, and exterior portion of the thighs, rufous,” in tail being stout, not “slender” like *rufus*. Audubon says that the *L. rufus* is easily distinguished from small specimens of the female *L. Canadensis* by

“the larger feet and more tufted ears of the latter,... as well as its grayer color.” This is four inches longer than his smaller Canada lynx and exactly as long as his larger one, — both his being males. Emmons’s one is also just 37 inches, or the same length. Emmons’s largest *L. rufus* is, thus measured, only 29 inches long and Audubon’s “fine specimen” only 30 inches.

Grimes, who had lived seven years in Canada, called this a “bob-tailed cat,” and said that the Canada lynx was as dark as his dog, which would be called a black dog, though somewhat brownish.

They told me there that a boy had seen another, supposed to be its mate, this morning, and that they were going out to hunt it toward night.

The water is cold to-day, and bathing begins to be questionable.

The turtles, painted and sternothærus, are certainly less timid than in the spring. I see a row of half a dozen or more painted turtles on a slanting black willow, so close together that two or three of them actually have their fore feet on the shells of their predecessors, somewhat like a row of bricks that is falling. The scales of some are curled up and just falling.

Sept. 12. Very heavy rain to-day (equinoctial), raising the river suddenly. I have said, within a week, that the river would rise this fall because it did not at all in the spring, and now it rises. A very dark and stormy night (after it); shops but half open. Where the fence is not painted white I can see nothing, and go whistling for fear I run against some one, though there is little danger that any one will be out. I come against a stone post and bruise my knees; then stumble over a bridge, — being in the gutter. You walk with your hands out to feel the fences and trees. There is no vehicle in the street to-night.

The thermometer at 4 p m. was 54°.

There was pretty high wind in the night.

Sept. 13. I go early to pick up my windfalls. Some of them are half buried in the soil, the rain having spattered the dirt over them.

The river this morning, about 7 a m., is already twenty-eight and a half inches above summer level, and more than twenty inches of this is owing to the rain of yesterday and last night!! By 1.30 p m., when it has risen two or three inches more, I can just cross the meadow in a straight line to the Rock. I see a snake swimming on the middle of the tide, far from shore, washed out of the meadow, and myriads of grasshoppers and beetles, etc., are wrecked or clinging to the weeds and stubble that rises above the flood. At evening the river is five inches higher than in the morning.

There is very little current at my boat’s place this evening, yet a chip floats down (and next morning, the 14th, I see that a large limb has been carried up-stream during the night, from where it lay at evening, some twenty rods above the junction, to a place thirty rods above the junction). Yet, when I try the current (in the evening of the 13th) with a chip, it goes down at Heron Rock, but the limb was large and irregular, and sank very deep in the water; so I think that the Assabet water was running up beneath while the Musketaquid flowed down over it slowly.

A Carlisle man tells me of a coon he killed in Carlisle which weighed twenty-three and a half pounds and dressed fourteen pounds. He frequently sees and hears them at present.

On the 13th I go to J. Q. Adams's again to see the lynx. Farmer said that if the skin was tainted the hair would come off.

The tail is black at extremity for one inch, and no white at tip; the rest of it above is rust-color (beneath it is white), with the slightest possible suggestion of white rings, i.e. a few white hairs noticed. When stretched or spread the fore foot measured just 5 inches in width, the hind foot scarcely less than 6 inches. The black border on the ear was broadest on the inner (i.e. toward the other ear) and forward side, — 1/2 inch and more. The tufts on the ears only about 1/8 + inch wide.

Adams went to show me the carcass. It was quite sweet still (13th, in afternoon), only a little fly-blown. No quadruped or bird had touched it. Remarkably long and slender, made for jumping. The muscles of the thigh were proportionately very large. I thought the thigh would measure now 9 inches in circumference. I had heard that there was nothing in its stomach, but we opened the paunch and found it full of rabbits' fur. I cut off a fore leg.

He said that he had lost two or three hens only, and apparently did not think much of that. The first he knew the animal was within three feet of him, so that he could hardly turn his gun to strike him. He did not know where he came from, — whether from over the wall, to which he was near, or from a chestnut, for he was in the midst of the woods of Jones's lot, not cut. He felt somewhat frightened. Struck him with the butt of his gun, but did not hurt him much, he was so quick. He jumped at once thirty feet, turned round, and faced him. He then fired, about thirty feet, at his eyes, and destroyed one, — perhaps put out the other, too. He then bounded out of sight. When he had loaded he found him crawling toward him on his belly as if to spring upon him; fired again, and thinks he mortally wounded him then. After loading, approached, and the lynx faced him, all alive. He then fired, and the lynx leapt up fifteen feet, fell, and died. Either at the second or last shot leapt within ten feet of him. He was much impressed by his eyes and the ruff standing out on the sides of his neck.

This was about one hundred and thirty rods easterly from his house.

The skinned tail measured 5 inches. I boiled the leg on the 14th (five days after it was killed) for the bone. It smelled and looked like very good meat, like mutton.

Vide Salem lynxes, September 23d, 1858.

It is remarkable how slow people are to believe that there are any wild animals in their neighborhood. They who have seen this generally suppose that it got out of a menagerie; others that it strayed down from far north. At most they call it Canada lynx. In Willey's White Mountain book the same animal is spoken of as a terror to the hunter and called the "Siberian Lynx." What they call it I know not.

I do not think it necessary even to suppose it a straggler, but only very rare hereabouts. I have seen two lynxes that were killed between here and Salem since '27. Have heard of another killed in or near Andover. There may have been many more killed as

near within thirty years and I not have heard of it, for they who kill one commonly do not know what it is. They are nocturnal in their habits, and therefore are the more rarely seen, yet a strange animal is seen in this town by somebody about every year, or its track. I have heard of two or three such within a year, and of half a dozen within fifteen years. Such an animal might range fifteen to twenty miles back and forth from Acton to Tewksbury and find more woodland than in the southern part of New Hampshire generally.

Farmer says that a farmer in Tewksbury told him two or three years ago that he had seen deer lately on the pine plain thereabouts.

Adams got a neighbor to help him skin the lynx, a middle-aged man; but he was "so nervous" and unwilling to touch even the dead beast, when he came to see it, that he gave him but little assistance.

Dr. Reynolds tells me of a lynx killed in Andover, in a swamp near Haggerty's Pond, one winter when he kept school in Tewksbury, about 1820. At first it was seen crossing the Merrimack into Tewksbury, and there was accordingly a story of an animal about that was ten feet long. They turned out, all the hunters of the neighborhood, and tracked it in the snow, across Tewksbury to the swamp in Andover and back again to Tewksbury. One old hunter bet something that they could not show him a track which he did not know, but when they showed him this he gave up. Finally they tracked it to the Andover swamp, and a boy shot it on a tree, though it leapt and fell within a few feet of him when shot.

Rice tells of a common wildcat killed in Sudbury some forty years ago, resting on some ice as it was crossing the Sudbury meadows amid ice and water.

Mr. Boutwell of Groton tells me that a lynx was killed in Dunstable within two or three years. Thinks it is in the State Museum.

This makes five that I have heard of (and seen three) killed within some fifteen or eighteen miles of Concord within thirty years past, and no doubt there have been three times as many of them killed here.

Sept. 14. A. M. — River still rising; at 4 p. M. one and an eighth inches higher than in morning.

Sept. 15. In morning river is three feet two and a half plus inches above summer level. 6 p m., river is slightly higher than in morning, or at height. Thus it reached its height the third day after the rain; had risen on the morning of the third day about thirty inches on account of the rain of one day (the 12th).

Joe Smith's man brings me this forenoon a fish hawk which was shot on George Brooks's pigeon-stand last evening. It is evidently a female of this year, full grown. Length 23 inches; alar extent 5 feet 6 1/2 inches. It probably lit there merely for a perch.

Looked at Mr. Davis's museum. Miss Lydia Hosmer (the surviving maiden lady) has given him some relics which belonged to her (the Hosmer) family. A small lead or pewter sun-dial, which she told him was brought over by her ancestors and which has the date 1626 scratched on it. Also some stone weights in an ancient linen bag, said to

have been brought from England. They were oval stones or pebbles from the shore, — or might have been picked up at Walden. There was a pound, a half-pound, a quarter, a two-ounce, and several one-ounce weights, now all rather dark and ancient to look at, like the bag. This was to me the most interesting relic in his collection. I love to see anything that implies a simpler mode of life and greater nearness to the earth.

Sept. 16. 7 a. m. — River fallen one and a half inches. Is three feet and seven eighths of an inch above summer level, i.e. at notch on tree. I mark a willow eight feet above summer level.

See no zizania seed ripe, or black, yet, but almost all is fallen.

Sept. 17. 6.30 a. m. — River thirty-four and an eighth above summer level, or fallen about four inches since evening of 15th. It flows now (a sunk bottle) one hundred feet in two minutes at boat's place, there being no wind.

P. M. — Up river.

Pontederia seeds falling.

See a flock of eight or ten wood ducks on the Grindstone Meadow, with glass, some twenty-five rods off, — several drakes very handsome. They utter a creaking scream as they sail there, — being alarmed, — from time to time, shrill and loud, very unlike the black duck. At last one sails off, calling the others by a short creaking note.

Sept. 18. According to all accounts, very little com is fit to grind before October 1st (though I have one kind ripe and fit to grind September 1st). It becomes hard and dry enough in the husk in the field by that time, much of it. But long before this, or say by the 1st of September, it begins to glaze (or harden on the surface), when it begins to be too hard to boil.

P. M. — To beeches.

This is a beautiful day, warm but not too warm, a harvest day (I am going down the railroad causeway), the first unquestionable and conspicuous autumnal day, when the willows and button-bushes are a yellowed bower in parallel lines along the swollen and shining stream. The first autumnal tints (of red maples) are now generally noticed. The shrilling of the alder locust fills the air. A brightness as of spring is reflected from the green shorn fields. Both sky and earth are bright. The first clear blue and shining white (of clouds). Cornstalk-tops are stacked about the fields; potatoes are being dug; smokes are seen in the horizon. It is the season of agricultural fairs. If you are not happy to-day you will hardly be so to-morrow.

Leaving Lowell on the morning of the 10th, after the rain of the day before, I passed some heaps of brush in an opening in the woods, — a pasture surrounded by woods, — to which the owner was just setting fire, wet as they were, it being the safest time to burn them. Hence they make so much smoke sometimes. Some farmer, perhaps, wishes to plow this fall there, and sow rye perchance, or merely to keep his pasture clear. Hence the smokes in the horizon at this season. The rattle-pod (in Deep Cut) has begun to turn black and rattle for three or four days.

Notice some green pods of lady's-slipper still, full of chaffy seed.

The beechnut burs are browned but not falling. They open directly in my chamber. The nuts are all empty.

White pine cones (a small crop), and all open that I see.

The toadstools in wood-paths are perforated (almost like pepper-boxes) by flattish slippery insects, bronze and black, which are beneath and within it. Or you see their heads projecting and the dust (or exuviæ) they make like a curb about the holes.

Smooth sumach berries are about past their beauty and the white creamy incrustation mostly dried up.

I see in the Walden road two dead shrews and some fox-dung by them. They look as if bitten and flatted by the fox. Were they not dropped there by him? Perhaps they will not eat one.

Sept. 19. 4 p. M. — River fallen about one foot.

Sept. 20. Cattle-Show.

Rainy in forenoon.

Sept. 21. Hard rain last night. About one and seven eighths inches fallen since yesterday morning, and river rising again.

See, at Reynolds's, Hungarian millet raised by Everett. It is smaller and more purple than what is commonly raised here.

P. M. — To Easterbrooks Country.

The fever-bush berries have begun some time, — say one week; are not yet in prime. Taste almost exactly like lemon-peel. But few bushes bear any.

The bayberries are perhaps ripe, but not so light a gray and so rough, or wrinkled, as they will be.

The pods of the broom are nearly half of them open. I perceive that one, just ready to open, opens with a slight spring on being touched, and the pods at once twist and curl a little. I suspect that such seeds as these, which the winds do not transport, will turn out to be more sought after by birds, etc., and so transported by them than those lighter ones which are furnished with a pappus and are accordingly transported by the wind; i.e., that those which the wind takes are less generally the food of birds and quadrupeds than the heavier and wingless seeds.

*Muhlenbergia Mexicana* by wall between E. Hosmer and Simon Brown, some time. Some large thorn bushes quite bare.

Sept. 22. P. M. — To Clamshell by boat.

Find more pieces of that Indian pot. Have now thirty-eight in all.

Evidently the recent rise of the river has caused the lower leaves of the button-bush to fall. A perfectly level line on these bushes marks the height to which the water rose, many or most of the leaves so high having fallen. —

The clematis yesterday was but just beginning to be feathered, but its feathers make no show. Feathers out next day in house.

See a large flock of crows.

The sweet-gale fruit is yet quite green, but perhaps it is ripe. The button-bush balls are hardly reddened.

Moreover the beach plum appears to prefer a sandy place, however far inland, and one of our patches grows on the only desert which we have.

Some of the early botanists, like Gerard, were prompted and compelled to describe their plants, but most nowadays only measure them, as it were. The former is affected by what he sees and so inspired to portray it; the latter merely fills out a schedule prepared for him, — makes a description pour servir. I am constantly assisted by the books in identifying a particular plant and learning some of its humbler uses, but I rarely read a sentence in a botany which reminds me of flowers or living plants. Very few indeed write as if they had seen the thing which they pretend to describe.

Sept. 23. P. M. — To Cliffs.

Some small botrychium ripe.

I see on the top of the Cliffs to-day the dung of a fox, consisting of fur, with part of the jaw and one of the long rodent teeth of a woodchuck in it, and the rest of it huckleberry seeds with some whole berries. I saw exactly the same beyond Goose Pond a few days ago, on a rock, — except that the tooth (a curved rodent) was much smaller, probably of a mouse. It is evident, then, that the fox eats huckleberries and so contributes very much to the dispersion of this shrub, for there were a number of entire berries in its dung, — in both the last two I chanced to notice. To spread these seeds, Nature employs not only a great many birds but this restless ranger the fox. Like ourselves, he likes two courses, rabbit and huckleberries.

I see everywhere in the shady yew wood those pretty round-eyed fungus-spots on the upper leaves of the blue-stemmed goldenrod (vide press), contrasting with the few bright-yellow flowers above them, — yellowish-white rings (with a slate-colored centre), surrounded by green and then dark.

Red pine-sap by north side of Yew Path some ten rods east of yew, not long done. The root of the freshest has a decided checkerberry scent, and for a long time — a week after — in my chamber, the bruised plant has a very pleasant earthy sweetness.

I hear that a large owl, probably a cat owl, killed and carried off a full-grown turkey in Carlisle a few days ago.

Sept. 24. P. M. — To Flint's Pond via Smith's chestnut grove.

See a dead shrew in road on Turnpike Hill. (Had hard rain the night of the 20th.) Vide back, 18th.

It is remarkable how persistently Nature endeavors to keep the earth clothed with wood of some kind, — how much vitality there is in the stumps and roots of some trees, though small and young. For example, examined the little hickories on the bare slope of Smith's Hill. I have observed them endeavoring to cover that slope for a dozen years past, and have wondered how the seed came there, planted on a bare pasture hillside, but I now see that the nuts were probably planted just before the pine wood (the stumps of which remain) was cut down, and, having sprung up about that time, have since been repeatedly cut down to keep the pasture clear, till now they are quite feeble or dying, though many are six feet high. When a part of the hill has been plowed and cultivated I examine the roots which have been turned out, and find that they

are two inches thick at the ground though only one to three feet high above. I fudge that it is fifteen years since the pine wood was cut, and if the hickories had not been cut down and cattle been kept out, there would have been a dense hickory wood there now fifteen to twenty feet high at least. You see on an otherwise perfectly bare hillside or pasture where pines were cut, say fifteen years before, remote from any hickories, countless little hickories a foot high or little more springing up every few feet, and you wonder how they came there, but the fact that they preserve their vitality, though cut down so often and so long, accounts for them.

This shows how heedlessly wood-lots are managed at present, and suggests that when one is cut (if not before) a provident husbandman will carefully examine the ground and ascertain what kind of wood is about to take the place of the old and how abundantly, in order that he may act understandingly and determine if it is best to clear the land or not. I have seen many a field perfectly barren for fifteen or twenty years, which, if properly managed, or only let alone, would naturally have yielded a crop of birch trees within that time.

In Wood Thrush Path at Flint's Pond, a great many of the geiropodium fungus now shed their dust. When closed it is [a] roundish or conical orange-colored fungus three quarters of an inch in diameter, covered with a mucilaginous matter. The thick outer skin of many (it is pink-red inside) had already curled back (it splits into segments and curls parallel to the axis of the plant) and revealed the pinkish fawn-colored puffball capped with a red dimple or crown. This is a hollow bag, which, when you touch it, spurts forth a yellowish-white powder three or four inches through its orifice.

See two very handsome butterflies on the Flint's Pond road in the woods at Gourgas lot, which C. had not seen before. I find that they are quite like the *Vanessa Atalanta*, or red admiral, of England.

1 — p. M. — The river risen about thirty-three inches above summer level.

Sept. 25. Hard, gusty rain (with thunder and lightning) in afternoon. About seven eighths of an inch falls.

Sept. 26. P. M. — Round Walden and Pleasant Meadow.

Small oaks in hollows (as under Emerson Cliff) have fairly begun to change.

The taller grass and sedge is now generally withered and brown, and reveals the little pines in it.

I see that acorns — white oak, etc. — have fallen after the rain and wind, just as leaves and fruit have.

I see, just up, the large light-orange toadstools with white spots, — at first: then:

Sept. 27. A. M. — Sawing up my raft by river.

River about thirty-five inches above summer level, and goes no higher this time.

Monroe's tame ducks sail along and feed close to me as I am working there. Looking up, I see a little dipper, about one half their size, in the middle of the river, evidently attracted by these tame ducks, as to a place of security. I sit down and watch it. The tame ducks have paddled four or five rods down-stream along the shore. They soon detect the dipper three or four rods off, and betray alarm by a tittering note,

especially when it dives, as it does continually. At last, when it is two or three rods off and approaching them by diving, they all rush to the shore and come out on it in their fear, but the dipper shows itself close to the shore, and when they enter the water again joins them within two feet, still diving from time to time and threatening to come up in their midst. They return up-stream, more or less alarmed, and pursued in this wise by the dipper, who does not know what to make of their fears, and soon the dipper is thus tolled along to within twenty feet of where I sit, and I can watch it at my leisure. It has a dark bill and considerable white on the sides of the head or neck, with black between it, no tufts, and no observable white on back or tail. When at last disturbed by me, it suddenly sinks low (all its body) in the water without diving.

Thus it can float at various heights. (So on the 30th I saw one suddenly dash along the surface from the meadow ten rods before me to the middle of the river, and then dive, and though I watched fifteen minutes and examined the tufts of grass, I could see no more of it).

Sept. 28. Butternuts still on tree and falling, as all September.

This morning we had a very severe frost, the first to kill our vines, etc., in garden; what you may call a black frost, — making things look black. Also ice under pump.

Sept. 29. Another hard frost and a very cold day.

Sept. 30. Frost and ice.

## OCTOBER, 1860

Oct. 1. Remarkable frost and ice this morning; quite a wintry prospect. The leaves of trees stiff and white at 7 A. M. I hear it was 21° this morning early. I do not remember such cold at this season. This is about the full of the moon (it full at 9 p. M. the 29th) in clear, bright moonlight nights. We have fine and bright but cold days after it. One man tells me that he regretted that he had not taken his mittens with him when he went to his morning's work, — mowing in a meadow, — and when he went to a spring at 11 A. M., found the dipper with two inches of ice in it frozen solid.

P. M. — Rain again.

Button-bush balls were fairly reddened yesterday, and the *Andropogon scoparius* looked silvery in sun. Gossamer was pretty thick on the meadows, and noticed the round green leafy buds of the *utricularia* in the clear, cold, smooth water. Water was prepared for ice, and C. saw the first *Vanessa Antiopa* since spring.

Oct. 3. See *Vanessa Antiopa*.

The hard frost of September 28th, 29th, and 30th, and especially of October 1st, has suddenly killed, crisped, and caused to fall a great many leaves of ash, hickory, etc., etc. These (and the locusts, generally) look shrivelled and hoary, and of course they will not ripen or be bright. They are killed and withered green, — all the more tender leaves. Has killed all the burdock flowers and no doubt many others.

Sam Barrett says that last May he waded across the Assabet River on the old dam in front of his house without going over his india-rubber boots, which are sixteen and a half inches high. I do not believe you could have done better than this a hundred years ago, or before the canal dam was built.

Bay-wings about.

I have seen and heard sparrows in flocks, more as if flitting by, within a week, or since the frosts began.

Gathered to-day my apples at the Texas house. I set out the trees, fourteen of them fourteen years ago and five of them several years later, and I now get between ten and eleven barrels of apples from them.

Oct. 5. Rain, more or less, yesterday afternoon and this forenoon.

P. M. — To Walden.

The frosts have this year killed all of Stow's artichokes before one of them had blossomed, but those in Alcott's garden had bloomed probably a fortnight ago. This suggests that this plant could not have grown much further north than this. I see a great many young hickories fifteen feet high killed, turned brown, almost black, and withering in the woods, as I do not remember to have seen them before. Indeed, the woods have a strong decaying scent in consequence. Also much indigo-weed is killed and turned black and broken off, as well as ferns generally. The butternut is also killed, turned dark-brown, and the leaves mostly fallen, — not turning yellow at all. The maples generally are what Gerard would have called an "over-worn" scarlet color.

About 4 p. M. it is fast clearing up, the clouds withdrawing, with a little dusky scud beyond their western edges against the blue. We came out on the east shore of Walden. The water is tolerably smooth. The smooth parts are dark and dimpled by many rising fishes. Where it is rippled it is light-colored, and the surface thus presents three or four alternate light and dark bars. I see a fish hawk, skimming low over it, suddenly dive or stoop for one of those little fishes that rise to the surface so abundantly at this season. He then sits on a bare limb over the water, ready to swoop down again on his finny prey, presenting, as he sits erect, a long white breast and belly and a white head. No doubt he well knows the habits of these little fishes which dimple the surface of Walden at this season, and I doubt if there is any better fishing-ground for him to resort to. He can easily find a perch overlooking the lake and discern his prey in the clear water.

The sporobolus grass in the meadows is now full of rain (as erst of dew) and would wet you through if you walked there.

Apparently all the celtis and horse-chestnut leaves are killed, turned dark-brown and withering, before changing or ripening, so severe has been the frost, and, looking from hills over huckleberry-fields, the sweet-fern patches are turned a dark brown, almost black (mulberry black) amid the crimson blueberry and huckleberry, so that the surface is paraded black and scarlet from the same cause.

Oct 6. P. M. — Over hill to Woodis Park.

I see not one hemlock cone of this year at the Hemlocks, but very many of last year holding on. Apparently they bore so abundantly last year that they do not bear at all this year.

I hear that the late cold of September 29 and 30 and October 1 froze all Bull's grapes (papers say some fifty bushels), the thermometer going down to 20°.

As I go over the hill, I see a large flock of crows on the dead white oak and on the ground under the living one. I find the ground strewn with white oak acorns, and many of these have just been broken in two, and their broken shells are strewn about, so that I suppose the crows have been eating them. Some are merely scratched, as if they had been pecked at without being pierced; also there are two of the large swamp white oak acorn-cups joined together dropped under this oak, perhaps by a crow, maybe a quarter of a mile from its tree, and that probably across the river. Probably a crow had transported one or more swamp white oak acorns this distance. They must have been too heavy for a jay.

The crow, methinks, is our only large bird that hovers and circles about in flocks in an irregular and straggling manner, filling the air over your head and sporting in it as if at home here. They often burst up above the woods where they were perching, like the black fragments of a powder-mill just exploded.

One crow lingers on a limb of the dead oak till I am within a dozen rods. There is strong and blustering northwest wind, and when it launches off to follow its comrades it is blown up and backward still nearer to me, and it is obliged to tack four or five times just like a vessel, a dozen rods or more each way, very deliberately, first to the right, then to the left, before it can get off; for as often as it tries to fly directly forward against the wind, it is blown upward and backward within gunshot, and it only advances directly forward at last by stooping very low within a few feet of the ground where the trees keep off the wind. Yet the wind is not remarkably strong.

Horace Mann tells me that he saw a painted turtle in this town eating a unio, in our river, in the shell, it evidently having just caught and opened it. He has been collecting shells in Ohio recently, and was obliged to wade at least knee-deep into the streams for mussels, the hogs, which run at large there, having got them all in the shallower water.

Oct. 7. P. M. — To Hubbard's Bath and Grove.

Now and for a week the chip-birds in flocks; the withered grass and weeds, etc., alive with them.

Rice says that when a boy, playing with darts with his brother Israel, one of them sent up his dart when a flock of crows was going over. One of the crows followed it down to the earth, picked it up, and flew off with it a quarter of a mile before it dropped it. He has observed that young wood ducks swim faster than the old, which is a fortunate provision, for they can thus retreat and hide in the weeds while their parents fly off. He says that you must shoot the little dipper as soon as it comes up, — before the water is fairly off its eyes, — else it will dive at the flash.

I see one small but spreading white oak full of acorns just falling and ready to fall. When I strike a limb, great numbers fall to the ground. They are a very dark hazel, looking black amid the still green leaves, — a singular contrast. Some that have fallen have already split and sprouted, an eighth of an inch. This when, on some trees, far the greater part have not yet fallen.

Probably the blueberry and huckleberry, ame-lanchier, and other bushes which spring up immediately when the woods are cut have been already planted and started annually, as the little oaks have. Nature thus keeps a supply of these plants in her nursery (i.e. under the larger wood), always ready for casualties, as fires, windfalls, and clearings by man. Birds and foxes, etc., are annually conveying the seed into the woods.

Rice reminds me that when the maples in a blueberry swamp have got up high, the blueberries die, and you have at length a maple wood clear of underwood.

Remarking to old Mr. B — the other day on the abundance of the apples, “Yes,” says he, “and fair as dollars too.” That’s the kind of beauty they see in apples.

Looked over Hayden’s farm and granary. He now takes pleasure in his field of com just ready for harvesting, — the rather small ears fully filled out and rounded at the end, setting low and many on one stalk. He loves to estimate the number of bushels he will have; has already calculated the number of hills, — some forty thousand in this field, — and he shows some one the ear in his granary. Also his rye in barrels and his seed-corn tucked into the mow as he was husking, — the larger and fuller ears picked out, with the husk on. But all this com will be given to his pigs and other stock. Three great hogs weighing twelve hundredweight lie asleep under his bam already sold. Hears of one man who sold his fat hog for \$75.00. He has two high and very spreading apple trees, looking like one, they are so close together, from which he gathered one year twenty-one barrels of sound Hubbardston’s nonesuch and five barrels of windfalls, grafted on to it within a few years.

If we have not attended to the subject, we may think that the activity of the animals is not enough to account for the annual planting of such extensive tracts; just as we wonder where all the flies and other insects come from in the spring, because we have not followed them into their winter quarters and counted them there. Yet nature does preserve and multiply the race of flies while we are inattentive and sleeping.

Many people have a foolish way of talking about small things, and apologize for themselves or another having attended to a small thing, having neglected their ordinary business and amused or instructed themselves by attending to a small thing; when, if the truth were known, their ordinary business was the small thing, and almost their whole lives were misspent, but they were such fools as not to know it.

Oct. 8. P. M. — To Damon’s wood-lot, part of the burnt district of the spring.

Am surprised to see how green the forest floor and the sprout-land north of Damon’s lot are already again, though it was a very severe burn. In the wood-lot the trees are apparently killed for twenty feet up, especially the smaller, then six or ten feet of green top, while very vigorous sprouts have shot up from the base below the influence of the

fire. This shows that they will die, I think. The top has merely lived for the season while the growth has been in their sprouts around the base. This is the case with oaks, maples, cherry, etc. Also the blueberry (*Vaccinium vacillans*) has sent up very abundant and vigorous shoots all over the wood from the now more open and cleaned ground. These are evidently from stocks which were comparatively puny before. The adjacent oak sprout-land has already sprung up so high that it makes on me about the same impression that it did before, though it [was] from six to ten feet high and was generally killed to the ground. The fresh shoots from the roots are very abundant and three to five feet high, or half as high as before. So vivacious are the roots and so rapidly does Nature recover herself. You see myriads of little shrub oaks and others in the woods which look as if they had just sprung from the seed, but on pulling one up you find it to spring from a long horizontal root which has survived perhaps several burnings or cuttings. Thus the stumps and roots of young oak, chestnut, hickory, maple, and many other trees retain their vitality a very long time and after many accidents, and produce thrifty trees at last.

In the midst of the wood, I noticed in some places, where the brush had been more completely burned and the ground laid bare, some fire-weed (*Senecio*), golden-rods, and ferns.

Standing by a pigeon-place on the north edge [of] Damon's lot, I saw on the dead top of a white pine four or five rods off — which had been stripped for fifteen feet downward that it might die and afford with its branches a perch for the pigeons about the place, like the more artificial ones that were set up — two woodpeckers that were new to me. They uttered a peculiar sharp kek kek on alighting (not so sharp as that of the hairy or downy woodpecker) and appeared to be about the size of the hairy woodpecker, or between that and the golden-winged. I had a good view of them with my glass as long as I desired. With the back to me, they were clear black all above, as well as their feet and bills, and each had a yellow or orange (or possibly orange-scarlet?) front (the anterior part of the head at the base of the upper mandible). A long white line along the side of the head to the neck, with a black one below it. The breast, as near as I could see, was gray specked with white, and the under side of the wing expanded was also gray, with small white spots. The throat white and vent also white or whitish. Is this the arctic three-toed? Probably many trees dying on this large burnt tract will attract many woodpeckers to it.

I find a great many white oak acorns already sprouted, although they are but half fallen, and can easily believe that they sometimes sprout before they fall. It is a good year for them. It is remarkable how soon and unaccountably they decay. Many which I cut open, though they look sound without, are discolored and decaying on one side or throughout within, though there is no worm in them. Perhaps they are very sensitive to moisture. Those which I see to-day are merely hazel and not nearly so black as what I saw yesterday. Trees that stand by themselves without the wood bear the most.

The sugar maple seeds are now browned — the seed end as well as wing — and are ripe. The severe frosts about the first of the month ripened them.

Oct. 9. P. M. — Up Assabet.

See one crow chasing two marsh hawks over E. Hosmer's meadow. Occasionally a hawk dives at the crow, but the crow perseveres in pestering them. Can it now have anything to do with the hawk's habit of catching young birds? In like manner smaller birds pursue crows. The crow is at length joined by another.

See several squirrels' nests of leaves formed in the maples lately.

Though the red maples have not their common brilliancy on account of the very severe frost about the end of September, some are very interesting. You cannot judge a tree by seeing it from one side only. As you go round or away from it, it may overcome you with its mass of glowing scarlet or yellow light. You need to stand where the greatest number of leaves will transmit or reflect to you most favorably. The tree which looked comparatively lifeless, cold, and merely parti-colored, seen in a more favorable light as you are floating away from it, may affect you wonderfully as a warm, glowing drapery. I now see one small red maple which is all a pure yellow within and a bright red scarlet on its outer surface and prominences. It is a remarkably distinct painting of scarlet on a yellow ground. It is an indescribably beautiful contrast of scarlet and yellow. Another is yellow and green where this was scarlet and yellow, and in this case the bright and liquid green, now getting to be rare, is by contrast as charming a color as the scarlet.

I met in the street afterward a young lady who rowed up the river after me, and I could tell exactly where she plucked the maple twig which she held in her hand. It was the one so conspicuous for a quarter of a mile in one reach of the river.

I wonder that the very cows and the dogs in the street do not manifest a recognition of the bright tints about and above them. I saw a terrier dog glance up and down the painted street before he turned in at his master's gate, and I wondered what he thought of those lit trees, — if they did not touch his philosophy or spirits, — but I fear he had only his common doggish thoughts after all. He trotted down the yard as if it were a matter of course after all, or else as if he deserved it all.

Wood ducks are about now, amid the painted leaves.

For two or more nights past we have had remarkable glittering golden sunsets as I came home from the postoffice, it being cold and cloudy just above the horizon. There was the most intensely bright golden light in the west end of the street, extending under the elms, and the very dust a quarter of a mile off was like gold-dust. I wondered how a child could stand quietly in that light, as if it had been a furnace.

This haste to kill a bird or quadruped and make a skeleton of it, which many young men and some old ones exhibit, reminds me of the fable of the man who killed the hen that laid golden eggs, and so got no more gold. It is a perfectly parallel case. Such is the knowledge which you may get from the anatomy as compared with the knowledge you get from the living creature. Every fowl lays golden eggs for him who can find them, or can detect alloy and base metal.

Oct. 10. In August,'55, I levelled for the artificial pond at Sleepy Hollow. They dug gradually for three or four years and completed the pond last year,'59. It is now

about a dozen rods long by five or six wide and two or three deep, and is supplied by copious springs in the meadow. There is a long ditch leading into it, in which no water now flows, nor has since winter at least, and a short ditch leading out of it into the brook. It is about sixty rods from the very source of the brook. Well, in this pond thus dug in the midst of a meadow a year or two ago and supplied by springs in the meadow, I find to-day several small patches of the large yellow and the kalmiana lily already established. Thus in the midst of death we are in life. The water is otherwise apparently clear of weeds. The river, where these abound, is about half a mile distant down the little brook near which this pond lies, though there may be a few pads in the ditched part of it at half that distance. How, then, did the seed get here? I learned last winter (vide December 23, 1859) that many small pouts and some sizable pickerel had been caught here, though the connection with the brook is a very slight and shallow ditch. I think, therefore, that the lily seeds have been conveyed into this pond from the river immediately, or perchance from the meadow between, either by fishes, reptiles, or birds which fed on them, and that the seeds were not lying dormant in the mud. You have only to dig a pond anywhere in the fields hereabouts, and you will soon have not only water-fowl, reptiles, and fishes in it, but also the usual water-plants, as lilies, etc. You will no sooner have got your pond dug than nature will begin to stock it. I suspect that turtles eat these seeds, for I often see them eating the decayed lily leaves. If there is any water communication, perhaps fishes arrive first, and then the water-plants for their food and shelter.

Horace Mann shows me the skeleton of a blue heron. The neck is remarkably strong, and the bill. The latter is 5 — + inches long to the feathers above and  $6\frac{1}{2}$  to the gape. A stake-driver which he has, freshly killed, has a bill 3 inches long above and to the gape and between  $\frac{5}{8}$  and  $\frac{6}{8}$  deep vertically at the base. This bird weighs a little over two pounds, being quite large and fat. Its nails are longer and less curved than those of the heron. The sharp bill of the heron, like a stout pick, wielded by that long and stout neck, would be a very dangerous weapon to encounter. He has made a skeleton of the fish hawk which was brought to me within a month. I remark the great eye-sockets, and the claws, and perhaps the deep, sharp breast-bone. Including its strong hooked bill it is clawed at both ends, harpy-like.

P. M. — Went to a fire — or smoke — at Mrs. Hoar's. There is a slight blaze and more smoke. Two or three hundred men rush to the house, cut large holes in the roof, throw many hogsheads of water into it, — when a few pails full well directed would suffice, — and then they run off again, leaving your attic three inches deep with water, which is rapidly descending through the ceiling to the basement and spoiling all that can be spoiled, while a torrent is running down the stairways. They were very forward to put out the [fire], but they take no pains to put out the water, which does far more damage. The first was amusement; the last would be mere work and utility. Why is there not a little machine invented to throw the water out of a house?

They are hopelessly cockneys everywhere who learn to swim with a machine. They take neither disease nor health, nay, nor life itself, the natural way. I see dumbbells in

the minister's study, and some of their dumbness gets into his sermons. Some travellers carry them round the world in their carpetbags. Can he be said to travel who requires still this exercise? A party of school-children had a picnic at the Easterbrooks Country the other [day], and they carried bags of beans from their gymnasium to exercise with there. I cannot be interested in these extremely artificial amusements. The traveller is no longer a wayfarer, with his staff and pack and dusty coat. He is not a pilgrim, but he travels in a saloon, and carries dumb-bells to exercise with in the intervals of his journey.

Oct. (10 and) 11. P. M. — To Sleepy Hollow and north of M. Pratt's.

There is a remarkably abundant crop of white oak acorns this fall, also a fair crop of red oak acorns; but not of scarlet and black, very few of them. Which is as well for the squirrel. The acorns are now in the very midst of their fall. The white oak acorn is about the prettiest of ours. They are a glossy hazel (while the red and black are more or less downy at first) and of various forms, — some nearly spherical but commonly oblong and pointed, some more slender oval or elliptical; and of various shades of brown, — some almost black, but generally a wholesome hazel. Those which have fallen longest, and been exposed to the severe frosts on the ground, are partly bleached there. The white oak acorns are found chiefly on trees growing in the open or on the edge of the wood, and on the most exposed side of these trees. They grow either singly or in twos and threes.

This afternoon (11th) the strong wind which arose at noon has strewn the ground with them. I could gather many bushels in a short time. This year is as good for white oak acorns as for apples and pears. What pleasant picking on the firm, green pasture sod which is browned with this glossy fruit! The worms are already at work in them, — sometimes three or four in one, — and some are already decayed and decaying on the tree without a worm. The fibery [sic] inner bark of the nut appears to retain moisture and hasten rot, especially when the fruit has once been swollen by the wet. The best time to gather these nuts is now, when a strong wind has arisen suddenly in the day, before the squirrels have preceded you; and so of chestnuts.

Of red oak acorns, some are short and broad, others longer. I see some pretty shrub oak acorns longitudinally striped. Chestnuts also are frequently striped, but before they have been exposed to the light, and are completely ripe.

The season is as favorable for pears as for apples. R. W. E.'s garden is strewn with them. They are not so handsome as apples, — are of more earthy and homely colors, — yet they are of a wholesome color enough. Many, inclining to a rough russet or even ferruginous, both to touch (rusty) and eye, look as if they were proof against frost. After all, the few varieties of wild pears here have more color and are handsomer than the many celebrated varieties that are cultivated. The cultivated are commonly of so dull a color that it is hard to distinguish them from the leaves, and if there are but two or three left you do not see them revealing themselves distinctly at a distance amid the leaves, as apples do, but I see that the gatherer has overlooked half a dozen large ones on this small tree, which were concealed by their perfect resemblance to the leaves, —

a yellowish green, spotted with darker-green rust or fungi (? ). Yet some have a fair cheek, and, generally, in their form they are true pendants, as if shaped expressly to hang from the trees.

They are a more aristocratic fruit. How much more attention they get from the proprietor! The hired man gathers the apples and barrels them. The proprietor plucks the pears at odd hours for a pastime, and his daughter wraps them each in its paper. They are, perchance, put up in the midst of a barrel of Baldwins as if something more precious than these. They are spread on the floor of the best room. They are a gift to the most distinguished guest. Judges and ex-judges and honorables are connoisseurs of pears, and discourse of them at length between sessions. I hold in my hand a Bonne Louise which is covered with minute brown specks or dots one twelfth to one sixteenth [of an inch] apart, largest and most developed on the sunny side, quite regular and handsome, as if they were the termination or operculum of pores which had burst in the very thin pellicle of the fruit, producing a slight roughness to the touch. Each of these little ruptures, so to call them, is in form a perfect star with five rays; so that, if the apple is higher-colored, reflecting the sun, on the duller surface of this pear the whole firmament with its stars shines forth. They whisper of the happy stars under whose influence they have grown and matured. It is not the case with all of them, but only the more perfect specimens.

Pears, it is truly said, are less poetic than apples. They have neither the beauty nor the fragrance of apples, but their excellence is in their flavor, which speaks to a grosser sense. They are glouts-morceaux. Hence, while children dream of apples, ex-judges realize pears. They are named after emperors and kings and queens and dukes and duchesses. I fear I shall have to wait till we get to pears with American names, which a republican can swallow.

Looking through a more powerful glass, those little brown dots are stars with from four to six rays, — commonly five, — where a little wart-like prominence (perhaps the end of a pore or a thread) appears to have burst through the very thin pellicle and burst it into so many rays.

Oct. 13. P. M. — Up river.

I find no new cones on Monroe's larch by the river, but many old ones (the same was the case with the hemlocks on Assabet), unless those imperfect ones with a twig growing from their extremity were this year's, — but I think they were last year's. Last year both white pine, hemlock, and larches bore abundantly and there were very few white oak acorns. This year, so far as I observe, there are scarcely any white pine cones (were there any?) or hemlock or larch, and a great abundance of white oak acorns in all parts of the town. So far as I have observed, if pines or oaks bear abundantly one year they bear little or nothing the next year. This is a white oak year, not a pine year. It is also an apple and a potato year. I should think that there might be a bushel or two of acorns on and under some single trees. There are but few in the woods. Those spreading trees that stand in open pastures fully exposed to the light and air are the most fertile ones. I rejoice when the white oaks bear an abundant crop. I speak of it

to many whom I meet, but I find few to sympathize with me. They seem to care much more for potatoes. The Indians say that many acorns are a sign of a cold winter. It is a cold fall at any rate.

The shore at Clamshell is greened with *pontederia* seed which has floated up and been left there, with some button-bush seed and some of those slender bulbs of the *lysimachia* and those round green leaf-buds of the *Utricularia vulgaris*. Thus, probably, are all these dispersed. I also see large masses of the last-named weed lodged against the bridges, etc., with the conspicuous greener leaf-buds attached. I find no yellow lily seeds, only a few white lily seed-pods. These are full of seeds the color of apple seeds and but a quarter as big. They sink in water as soon as the slimy matter which invests them is washed off. I see a white lily stem coiled up with many whorls like a wire spring. They are almost only white lily pads that are left now.

There is some of the fresh-water sponge in this the main stream too.

The *F. hyemalis* back, and I think I see and hear the shore larks.

The shrub oaks on J. Hosmer's hillside this side of Hollowell place have already passed the height of their beauty. Is it not early on account of frost?

At Holden Swamp. — Now, as soon as the frost strips the maples, and their leaves strew the swamp floor and conceal the pools, the note of the chickadee sounds cheerfully wintryish.

I see many pine and oak tree tops in the woods that were blown off last spring. They lie many rods from their trunks, so that I have to look a little while to tell where they came from. Moreover, the butt of the piece over which I stand looks so large compared with the broken shaft up there so high that I at first feel sure it did not come from there, — which [?] it did, — and so am puzzled to locate it.

The lentago fruit is quite sweet and reminds me of dates in their somewhat mealy pulp. It has large flat black seeds, somewhat like watermelon seeds, but not so long.

The scientific differs from the poetic or lively description somewhat as the photographs, which we so weary of viewing, from paintings and sketches, though this comparison is too favorable to science. All science is only a makeshift, a means to an end which is never attained. After all, the truest description, and that by which another living man can most readily recognize a flower, is the unmeasured and eloquent one which the sight of it inspires. No scientific description will supply the want of this, though you should count and measure and analyze every atom that seems to compose it.

Surely poetry and eloquence are a more universal language than that Latin which is confessedly dead. In science, I should say, all description is postponed till we know the whole, but then science itself will be cast aside. But unconsidered expressions of our delight which any natural object draws from us are something complete and final in themselves, since all nature is to be regarded as it concerns man; and who knows how near to absolute truth such unconscious affirmations may come? Which are the truest, the sublime conceptions of Hebrew poets and seers, or the guarded statements of modern geologists, which we must modify or unlearn so fast?

As they who were present early at the discovery of gold in California, and observed the sudden fall in its value, have most truly described that state of things, so it is commonly the old naturalists who first received American plants that describe them best. A scientific description is such as you would get if you should send out the scholars of the polytechnic school with all sorts of metres made and patented to take the measures for you of any natural object. In a sense you have got nothing new thus, for every object that we see mechanically is mechanically daguerretyped on our eyes, but a true description growing out [of ] the perception and appreciation of it is itself a new fact, never to be daguerretyped, indicating the highest quality of the plant, — its relation to man, — of far more importance than any merely medicinal quality that it may possess, or be thought to-day to possess. There is a certainty and permanence about this kind of observation, too, that does not belong to the other, for every flower and weed has its day in the medical pharmacopoeia, but the beauty of flowers is perennial in the taste of men.

Truly this is a world of vain delights. We think that men have a substratum of common sense but sometimes are peculiarly frivolous. But consider what a value is seriously and permanently attached to gold and so-called precious stones almost universally. Day and night, summer and winter, sick or well, in war and in peace, men speak of and believe in gold as a great treasure. By a thousand comparisons they prove their devotion to it. If wise men or true philosophers bore any considerable proportion to the whole number of men, gold would be treated with no such distinction. Men seriously and, if possible, religiously believe in and worship gold. They hope to earn golden opinions, to celebrate their golden wedding. They dream of the golden age. Now it is not its intrinsic beauty or value, but its rarity and arbitrarily attached value, that distinguishes gold. You would think it was the reign of shams.

The one description interests those chiefly who have not seen the thing; the other chiefly interests those who have seen it and are most familiar with it, and brings it home to the reader. We like to read a good description of no thing so well as of that which we already know the best, as our friend, or ourselves even. In proportion as we get and are near to our object, we do without the measured or scientific account, which is like the measure they take, or the description they write, of a man when he leaves his country, and insert in his passport for the use of the detective police of other countries. The men of science merely look at the object with sinister eye, to see if [it] corresponds with the passport, and merely visé or make some trifling additional mark on its passport and let it go; but the real acquaintances and friends which it may have in foreign parts do not ask to see nor think of its passport.

Gerard has not only heard of and seen and raised a plant, but felt and smelled and tasted it, applying all his senses to it. You are not distracted from the thing to the system or arrangement. In the true natural order the order or system is not insisted on. Each is first, and each last. That which presents itself to us this moment occupies the whole of the present and rests on the very topmost point of the sphere, under the zenith. The species and individuals of all the natural kingdoms ask our attention

and admiration in a round robin. We make straight lines, putting a captain at their head and a lieutenant at their tails, with sergeants and corporals all along the line and a flourish of trumpets near the beginning, insisting on a particular uniformity where Nature has made curves to which belongs their own sphere-music. It is indispensable for us to square her circles, and we offer our rewards to him who will do it.

Who [sic] describes the most familiar object with a zest and vividness of imagery as if he saw it for the first time, the novelty consisting not in the strangeness of the object, but in the new and clearer perception of it.

Oct. 14. This year, on account of the very severe frosts, the trees change and fall early, or fall before fairly changing. The willows have the bleached look of November. Consider how many leaves there are to fall each year and how much they must add to the soil. Coultas (in "What may be Learned from a Tree") finds that a single beech twig twenty-seven inches and three lines long and six years old was "the leaf-labor of one hundred and fifty-five leaves," and quotes from Asa Gray's "First Lessons in Botany" that "the Washington Elm at Cambridge — a tree of no extraordinary size — was some years ago estimated to produce a crop of seven millions of leaves, exposing a surface of 200,000 square feet, or about five acres, of foliage." Supposing this to be true, and that the horizontal spread of this (like other the largest elms) is one hundred feet, then, if all its leaves should be spread evenly on the ground directly under it, there would be about twenty-five thicknesses. An ordinary forest would probably cover the ground as thickly as this tree would. Supposing a leaf to be of the same thickness with an ordinary sheet of letter-paper, and that the mass is compressed as much as paper packed in a ream, the twenty-five would be about one sixteenth of an inch thick. This is a rude calculation.

We have had a remarkably fertile year. Let us see now if we have a cold winter after it.

P. M. — Up Groton Turnpike.

If you examine a wood-lot after numerous fires and cuttings, you will be surprised to find how extremely vivacious are the roots of oaks, chestnuts, hickories, birches, cherries, etc. The little trees which look like seedlings of the year will be found commonly to spring from an older root or horizontal shoot or a stump. Those layers which you may have selected to transplant will be found to have too much of old stump and root underground to be removed. They have commonly met with accidents and seen a good deal of the world already. They have learned to endure and bide their time. When you see an oak fully grown and of fair proportions, you little suspect what difficulties it may have encountered in its early youth, what sores it has overgrown, how for years it was a feeble layer lurking under the leaves and scarcely daring to show its head above them, burnt and cut, and browsed by rabbits. Driven back to earth again twenty times, — as often as it aspires to the heavens. The soil of the forest is crowded with a mass of these old and tough fibres, annually sending up their shoots here and there. The underground part survives and holds its own, though the top meets with countless accidents; so that, although seeds were not to be supplied for many years, there would

still spring up shoots enough to stock it. So with the old and feeble huckleberry roots. Nay, even the sedge (*Carex Pennsylvanica*) is already rooted in most woods, and at once begins to spread and prevail when the wood is cut, especially if a frost or fire keeps down the new wood.

I examine the John Hosmer wood-lot (sprout-land) cut off last winter on the north side at Colburn Hill. Next to the conspicuous sprouts from the large stumps (of which the white birch have here grown the most, — commonly four or five feet) you notice an increased growth of weeds, as goldenrods (especially *S. puberula*), the two fire-weeds, asters, everlasting (fragrant), hawkweeds, yarrow, low blackberry, cinquefoil, etc. All of these, I believe, except the erechthites, are perennials, and those which blossomed this year (with this exception) must have sprung up before the wood was cut. The others were probably planted last fall or in the winter, unless their seed endures in the soil. I see, for example, what I consider seedling goldenrods, everlasting, and yarrow, i.e. mere radical leaves without any stem, which will bloom next year. The seedling trees of this year, of course, will be scarcely noticed among the sprouts and weeds. I chance to see none. I see, however, many young black cherry trees, three to six inches high, which are just three years old, with roots partly coiled up (as if they had met with difficulties in their upward growth) and much larger than their stems. These, then, were planted in the midst of this pine and oak and birch wood at least two years before it was cut, though the tree they came from is so far off that I know not where it is, and they have not effectually risen above the surface till this year. If you look through a sprout-land you will find no tree, not strictly speaking a forest tree, and which at the same time did not attain to its growth there before, so common as these little black cherries, the birds having conveyed the stones into the midst of the woods and dropped them there; i.e. they are planted chiefly before the wood is cut. These cherry trees are, however, short-lived. They live a few years and bear large and pleasant-tasted fruit, but when the forest trees have grown up around them they die.

I see that a great part of the club-moss (*Lycopodium complanatum*) which was so abundant in the lower part of this wood has already been killed, and is completely withered and bleached white, probably by the cold last winter, if not also by exposure to the light and heat of the summer.

This lot is thickly covered with the rubbish or tops. I suspect that it is, on the whole, better to leave this than to clear the ground, — that when it is not too thick (as masses of pine-tops) it is an important protection to the seedling trees (gardeners find that seedling pines require shade in their nurseries), and of course the soil is enriched by its decay.

Under one white oak where, on the 8th, the ground was strewn with acorns, I find but a single sound one left to-day, and under another, though many acorns are left, all of them are decayed, so rapidly are they gathered by the squirrels. I take them from the tree already decayed without a worm in them. Far the greater part that you find destroyed (this does not include those eaten by animals) have thus decayed, and I think that the cause was the severe frost of about October 1st, which especially injured

those on the ground. It is surprising that any escape the winter. I am not sure that white oak acorns do (as I am that many scarlet and red oak, etc., do). These are not protected by any downiness, and their shoots and leaves I know are the most tender in the spring. Probably almost all the white oak acorns would be destroyed by frost if left on the surface in pastures, and so it may be that more escape because the squirrels carry them off and bury them, or leave them under the shelter of the woods and leaves, though they consume so many, than would if they were not disturbed. Also I find many full-grown worms in them, and the acorn all powder, on the tree.

Do I not see yellow-crowned warblers? Much yellow on shoulders or sides, and white in wings when they fly.

Acorns that fall in open pastures decay so fast that you might wonder how any survived the winter, but the fact is that they are not suffered to lie long, but are picked up and carried off by animals, and either deposited in holes or buried under the leaves in the forest, or consumed; and so, probably, more of these survive than would if they were not carried off.

Oct. 16. P. M. — To White Pond and neighborhood. As a consequence of the different manner in which trees which have winged seeds and those which have not are planted, — the [former] being blown together in one direction by the wind, the latter being dispersed irregularly by animals, — I observe that the former, as pines (which (the white) are said in the primitive wood to grow in communities), white birches, red maples, alders, etc., often grow in more or less regular rounded or oval or conical patches, as the seeds fell, while oaks, chestnuts, hickories, etc., simply form woods of greater or less extent whether by themselves or mixed; i.e., they do not naturally spring up in an oval form (or elliptical) unless they derive it from the pines under which they were planted.

For example, take this young white pine wood half a dozen years old, which has sprung up in a pasture adjacent to a wood of oaks and pines mixed. It has the form of a broad crescent, or half-moon, with its diameter resting on the old wood near where a large white pine stood. It is true most such groves are early squared by our plows and fences, for we square these circles every day in our rude practice. And in the same manner often they fall in a sprout-land amid oaks, and I, looking from a hilltop, can distinguish in distant old woods still, of pine and oak mixed, these more exclusive and regular communities of pine, a dozen or more rods wide, while it is the oak commonly that fills up the irregular crevices, beside occupying extensive spaces itself. So it happens that, as the pines themselves and their fruit have a more regularly conical outline than deciduous trees, the groves they form also have.

Our wood-lots, of course, have a history, and we may often recover it for a hundred years back, though we do not. A small pine lot may be a side of such an oval, or a half, or a square in the inside with all the curving sides cut off by fences. Yet if we attended more to the history of our lots we should manage them more wisely.

Looking round, I observe at a distance an oak wood-lot some twenty years old, with a dense narrow edging of pitch pines about a rod and a half wide and twenty-five or

thirty years old along its whole southern side, which is straight and thirty or forty rods long, and, next to it, an open field or pasture. It presents a very singular appearance, because the oak wood is broad and has no pines within it, while the narrow edging is perfectly straight and dense, and pure pine. It is the more remarkable at this season because the oak is all red and yellow and the pine all green. I understand it and read its history easily before I get to it. I find, as I expected, a fence separating the pines from the oaks, or that they belong to different owners. I also find, as I expected, that eighteen or twenty years ago a pitch pine wood had stood where the oaks are, and was then cut down, for there are their old stumps. But before they were cut, their seeds were blown into the neighbor's field, and the little pines came up all along its edge, and they grew so thickly and so fast that that neighbor refrained at last from plowing them up or cutting them off, for just this rod and a half in width, where they were thickest, and moreover, though there are no sizable oaks mixed with these pines, the whole surface even of this narrow strip is as usual completely stocked with little seedling oaks less than a foot high. But I ask, if the neighbor so often lets this narrow edging grow up, why not often, by the same rule, let them spread over the whole of his field? When at length he sees how they have grown, does he not often regret that he did not do so? Or why be dependent, even to this extent, on these windfalls from our neighbors' trees, or an accident? Why not control our own woods and destiny more? (This was north from the lane beyond Conant's handsome wood.) There are many such problems in forest geometry to be solved.

Again, I read still further back a more varied story. Take the line between Rice and Conant (?) or Garfield (?). Here is a green strip of dense pitch and white pine some thirty or forty rods long by four wide and thirty years old. On the east side is a large red and yellow [sic] oak wood-lot, the nearest part of it some dozen or more years old, and on the west a strip three rods wide of little white and pitch pines four to ten feet high that have sprung up in the open land, and next to these is an open field occasionally cultivated.

Given these facts, to find the wall. If you think a moment you will know without my telling you that it is between the pine wood and the oak. Some dozen or more years ago there was a large pine wood extending up to the wall on the west, and then an open field belonging to another man. But, as before, the pine seed had blown over the wall and taken so well that for four rods in width it was suffered to grow, or rather may be said to have defended itself and crowded the farmer back (no thanks to him). But when, some fifteen years ago, the old pine wood was cut by its owner, the other was not ready to cut his younger one. This is now about thirty years old and for many years it has been endeavoring to spread into the open land by its side, as its parents did, but for a long time the proprietor, not taking the hint, blind to his own interests, plowed quite up to the edge of the wood, as I noticed, — and got a few beans for his pains. But the pines (which he did not plant) grew while he slept, and at length, one spring, he gave up the contest and concluded at last to plow only within three rods of the wood, the little pines were so thick and promising. He concluded not to cut his own

fingers any more, i.e. not further than up to the last joint, and hence this second row of little pines. They would have covered the half or perhaps the whole of his barren field before this if he had let them.

I examined these pine lots. The strip of little pines contained also a little white birch, much sweet-fern, and thin open sod, but scarcely one oak, and that very small. The strip of large pines contained countless oaks of various kinds, — white, red, black, and shrub oak, — which had come from the young oak lot, many little pines of both kinds, and little wild cherry, — white [sic], — and some hazel and high blueberry. (It was rather elevated as well as dry soil.)

I dug up some of the little oaks to see how old they were and how they had fared. The largest in the lot were about one foot high. First, a red or scarlet oak, apparently four years old. The acorn was about one inch below the surface of the pine leaves. It rose five inches above the leaves, and the root extended about one foot below the surface. It had died down once.

The second was a black oak which rose six inches above the leaves (or eight, measured along the stem). It was apparently four years old. It was much branched, and its tops had been cut off by rabbits last year. The root ran straight down about one inch, then nearly horizontally five or six inches, and when I pulled it up it broke off where less than one eighth inch thick, at sixteen inches below the surface. This tree was one fourth of an inch in diameter at the surface and nearly three fourths of an inch in diameter at five inches below (along the root). At the same height above the surface it was hardly one fifth of an inch in diameter.

The third was a white oak ten inches high, apparently seven years old. It also had been browsed by a rabbit and put out a new shoot accordingly. Two years' growth was buried in the leaves. The root was very similar, both in direction and form, to the last, only not quite so thick.

Fourth, a shrub oak also quite similar, though less thick still and with two or more shoots from one stock.

In all these cases, or especially the first three [? ], there was one main, and an unexpectedly great, fusiform root, altogether out of proportion to the top, you would say, tapering both ways, but of course largest and sharpest downward, with many fine stringy fibres extending on every side from it perhaps a foot. Just as a biennial plant devotes its energies the first year to producing a stock on which it can feed the next, so these little oaks in their earliest years are forming great fusiform vigorous roots on which they can draw when they are suddenly left to seek their fortunes in a sprout-land.

Thus this double forest was advancing to conquer new (or old) land, sending forward their children on the wings of the wind, while already the oak seedlings from the oak wood behind had established themselves beneath the old pines ready to supplant them. The pines were the vanguard. They stood up to fire with their children before them, while the little oaks kneeled behind and between them. The pine is the pioneer, the

oak the more permanent settler who lays out his improvements. Pines are by some considered lower in the scale of trees — in the order of development — than oaks.

While the pines were blowing into the pasture from this narrow edging, the animals were planting the acorns under the pines. Even the small pine woods are thus perfectly equipped.

There was even under these dark, dense pines, thirty years old, a pretty thick bed of blueberry and huckleberry bushes next the wall, ten feet wide, the relics of a still denser and higher one that grew there when it was an open field. The former had thus been driven back three times, first by the blueberry hedge, then by the pines of thirty years ago, and lastly by the young pines that sprang from them. Thus a wood-lot had been forced upon him, and yet perhaps he will talk of it as a creation of his own.

I have come up here this afternoon to see— 's dense white pine lot beyond the pond, that was cut off last winter, to know how the little oaks look in it. To my surprise and chagrin, I find that the fellow who calls himself its owner has burned it all over and sowed winter-rye here. He, no doubt, means to let it grow up again in a year or two, but he thought it would be clear gain if he could extract a little rye from it in the meanwhile. What a fool! Here nature had got everything ready for this emergency, and kept them ready for many years, — oaks half a dozen years old or more, with fusiform roots full charged and tops already pointing skyward, only waiting to be touched off by the sun, — and he thought he knew better, and would get a little rye out of it first, which he could feel at once between his fingers, and so he burned it, and dragged his harrow over it. As if oaks would bide his time or come at his bidding. Or as if he preferred to have a pine or a birch wood here possibly half a century hence — for the land is “pine sick” — rather than an oak wood at once. So he trifles with nature. I am chagrined for him. That he should call himself an agriculturalist! He needs to have a guardian placed over him. A forest-warden should be appointed by the town. Overseers of poor husbandmen.

He has got his dollars for the pine timber, and now he wishes to get his bushels of grain and finger the dollars that they will bring; and then, Nature, you may have your way again. Let us purchase a mass for his soul. A greediness that defeats its own ends.

I examined a little lot of his about a dozen rods square just this side, cut off last winter, apparently two thirds white pine and one third white oak. Last year the white pine seed was very abundant, but there was little or no white oak seed. Accordingly I noticed twenty or more seedling white pines of this year on the barest spots, but not a single seedling oak. This suggests how much the species of the succeeding forest may depend on whether the trees were fertile the year before they were cut, or not.

I see a very large white oak acorn which has a double meat with a skin between. There is a very young grub in it.

They appear to be last year's hemlock and larch cones that still hold on in great numbers!

As time elapses, and the resources from which our forests have been supplied fail, we shall of necessity be more and more convinced of the significance of the seed.

I see in a thick pitch pine wood half a dozen stout pine twigs five eighths of an inch thick that have been gnawed off with their plumes. Why?

Hear the alder locust still. Robins apparently more numerous than a month ago. See grackles in cornfields in two places to-day.

It chanced that here were two proprietors within half a mile who had done exactly the same, i.e., accepted part of a wood-lot that was forced on them, and I have no doubt that there are several more exactly similar cases within that half-mile diameter.

The history of a wood-lot is often, if not commonly, here, a history of cross-purposes, — of steady and consistent endeavor on the part of Nature, of interference and blundering with a glimmering of intelligence at the eleventh hour on the part of the proprietor. The proprietor of wood-lots commonly treats Nature as an Irishman drives a horse, — by standing before him and beating him in the face all the way across a field.

If I find any starved pasture in the midst of our woods, — and I remember many such, and they are the least valuable tracts we have, — I know that it has commonly had such a history as this wood-lot (above). It was burned over when cut, and perhaps cultivated a year or two, often because the owner thought it was what the soil needed in order that it might produce trees. In some cases there may be sense in such a course if he can afford to wait a century instead of a third of that time for a crop. It depends on what the trees are, the locality, etc. But commonly the owner who adopts this course makes a move in the dark and in ninety-nine cases in a hundred [an indecipherable word] his own fingers.

The time will soon come, if it has not already, when we shall have to take special pains to secure and encourage the growth of white oaks, as we already must that of chestnuts for the most part. These oaks will become so scattered that there will be not seed enough to seed the ground rapidly and completely.

Horace Mann tells me that he found in the crop or inside of the stake-driver killed the other day one grasshopper, several thousand-legs one to one and a half inches long, and not much else.

It commonly happens in settled countries like this that the new community of pines, sprung from seeds blown off from an older one, is very youthful compared with the trees it sprang from because many successive crops of trees or seeds have been plowed up or cut before the owner allowed Nature to take her course. Naturally the pines spread more steadily and with no such abrupt descents. In the wildwood at least there are commonly only fires and insects or blight, and not the axe and plow and the cattle, to interrupt the regular progress of things.

Oct. 17. P. M. — To Walden Woods.

The trees which with us grow in masses, i.e. not merely scattering, are: —

1, 2. White and pitch pine 3. — Oaks 4. — White birch 5. — Red maple 6. — Chestnut 7. — Hickory Alder Hemlock, spruce, and larch Cedar (white and red) Willow Locust Apple Red cherry (in neighboring towns) W. [sic]  
Sugar maple (rare)

Of these only white and pitch pine, oaks, white birch, and red maple are now both important and abundant. (Chestnut and hickory have become rare.)

It is an interesting inquiry what determines which species of these shall grow on a given tract. It is evident that the soil determines this to some extent, as of the oaks only the swamp white stands in our meadows, and, so far as these seven trees are concerned, swamps will be composed only of red maples, swamp white oaks, white birch, and white pine. By removing to upland we get rid of the swamp white oak and red maples in masses, and are reduced to white and pitch pine, oaks, and white birch only, i.e. of those that are abundant and important.

Secondly, ownership, and a corresponding difference of treatment of the land as to time of cutting, etc., decides the species.

Third, age, as, if the trees are one hundred years old, they may be chestnut, but if sprout-land are less likely to be; etc., etc., etc.

The noblest trees and those which it took the longest to produce, and which are the longest-lived, as chestnuts, hickories (?), oaks, are the first to become extinct under our present system and the hardest to reproduce, and their place is taken by pines and birches, of feebler growth than the primitive pines and birches, for want of a change of soil.

There is many a tract now bearing a poor and decaying crop of birches, or perhaps of oaks, dying when a quarter grown and covered with fungi and excrescences, where two hundred years ago grew oaks or chestnuts of the largest size.

I look through a lot of young oaks twenty or twenty-five years old (Warren's, east of the Deep Cut, exclusively oak, the eastern part). There are plenty of little oaks from a few inches to a foot in height, but on examination I find fewer seedlings in proportion to the whole (i.e. manifestly seedlings) and they have much older and larger and poorer or more decayed roots than the oaks in dense pine woods. Oftenest they are shoots from the end of a horizontal twig running several feet under the leaves and leading to an old stump [?] under the surface. But I must examine again and further.

Looking through this wood and seeking very carefully for oak seedlings and anything else of the kind, I am surprised to see where the wood was chiefly oak a cluster of little chestnuts six inches high and close together. Working my hand underneath, I easily lift them up with all their roots, — four little chestnuts two years old, which partially died down the first year, — and to my surprise I find still attached four great chestnuts from which they sprang and four acorns which have also sent up puny little trees beneath the chestnuts. These eight nuts all lay within a diameter of two inches about an inch and a half beneath the present leafy surface, in a very loose soil of but [?] half decayed leaves in the midst of this young oak wood. If I had not been looking for something of the kind, I should never have seen either the oaks or the chestnuts. Such is the difference between looking for a thing and waiting for it to attract your attention. In the last case you will probably never see it [at] all. They were evidently planted there two or three years ago by a squirrel or mouse. I was surprised at the sight of these chestnuts, for there are not to my knowledge any chestnut trees — none, at

least, nearly large enough to bear nuts — within about half a mile of that spot, and I should about as soon have expected to find chestnuts in the artificial pine grove in my yard. The chestnut trees old enough to bear fruit are near the Lincoln line about half a mile east of this through the woods and over hill and dale. No one acquainted with these woods — not the proprietor — would have believed that a chestnut lay under the leaves in that wood or within a quarter of a mile of it, and yet from what I saw then and afterward I have no doubt that there were hundreds, which were placed there by quadrupeds and birds. This wood lies on the south of the village, separated from it by a mile of open fields and meadows. It is the northern part of an extensive pine and oak forest which half a mile eastward, near the Lincoln line, begins to contain a few chestnuts. These little chestnuts were growing well, but the oaks appeared to be dead and dying.

It is well known that the chestnut timber of this vicinity has rapidly disappeared within fifteen years, having been used for railroad sleepers, for rails, and for planks, so that there is danger that this part of our forest will become extinct.

The last chestnut tracts of any size were on the side of Lincoln. As I advanced further through the woods toward Lincoln, I was surprised to see how many little chestnuts there were, mostly two or three years old and some even ten feet high, scattered through them and also under the dense pines, as oaks are. I should say there was one every half-dozen rods, made more distinct by their yellow leaves on the brown ground, which surprised me because I had not attended to the spread of the chestnut, and it is certain that every one of these came from a chestnut placed there by a quadruped or bird which had brought it from further east, where alone it grew.

You would say that the squirrels, etc., went further for chestnuts than for acorns in proportion as they were a greater rarity. I suspect that a squirrel may convey them sometimes a quarter or a half a mile even, and no doubt as soon as a young chestnut fifteen or twenty feet high, far advanced beyond the chestnut woods, bears a single bur, which no man discovers, a squirrel or bird is almost sure to gather it and plant it in that neighborhood or still further forward. A squirrel goes a-chest-nutting perhaps as far as the boys do, and when he gets there he does not have to shake or club the tree or wait for frost to open the burs; he walks [?] up to the bur and cuts it off, and strews the ground with them before they have opened. And the fewer they are in the wood the more certain it is that he will appropriate every one, for it is no transient afternoon's picnic with him, but the pursuit of his life, a harvest that he gets as surely as the farmer his com.

Now it is important that the owners of these wood-lots should know what is going on here and treat them and the squirrels accordingly. They little dream of what the squirrels are about; know only that they get their seed-corn in the adjacent fields, and encourage their boys to shoot them every day, supplying them with powder and shot for this purpose. In newer parts of the country they have squirrel-hunts on a large scale and kill many thousands in a few hours, and all the neighborhood rejoices.

Thus it appears that by a judicious letting Nature alone merely we might recover our chestnut wood in the course of a century.

This also suggests that you cannot raise one kind of wood alone in a country unless you are willing to plant it yourself. If no oaks grow within miles of your pines, the ground under the pines will not be filled with little oaks, and you will have to plant them. Better have your wood of different kinds in narrow lots of fifty acres, and not one kind covering a township.

I took up a red oak seedling of this year five inches high. In this case the top is larger, putting length and breadth together, than the root, and the great acorn is still perfectly sound, lying on its side, and the plant this first year evidently derives a great part of its nourishment from it. The root is abruptly curved back under the acorn, and I find that seedling or young oaks generally have roots which slant off more or less horizontally from where the acorn lay two to five or six inches, and then, having acquired their greatest thickness, descend straight downward. To this irregularity is sometimes added a half-turn or spiral in the upper part of the root: or, looking down on it:

The acorn is still so sound that I think it must continue to furnish nourishment to the plant a part of next year.

Apparently the pine woods are a natural nursery of oaks, from whence we might easily transplant them to our grounds, and thus save some of those which annually decay, while we let the pines stand. Experience has proved, at any rate, that these oaks will bear exposure to the light. It is remarkable that for the most part there are no seedling oaks in the open grassy fields and pastures. The acorns are little likely to succeed if dropped there. Those springing up in such places appear to have been dropped or buried by animals when on their way with them to another covert.

I examine under the pitch pines by Thrush Alley to see how long the oaks live under dense pines. The oldest oaks there are about eight or ten years old. I see none older under these and other dense pines, even when the pines are thirty or more years old, though I have no doubt that oaks began to grow there more than twenty years ago. Hence they must have died, and I suppose I could find their great roots in the soil if I should dig for them. I should say that they survived under a very dense pine wood only from six to ten years. This corresponds exactly with the experience of the English planters, who begin to shred the branches of the nursing pines when the oaks are six or seven years old and to remove the pines altogether when the oaks are eight to ten years old.

But in openings amid the pines, though only a rod in diameter, or where the pines are thin, and also on their edges, the oaks shoot up higher and become trees, and this shows how mixed woods of pine and oak are produced. If the pines are quite small or grow but thinly, fewer acorns will be planted amid them, it is true, but more will come to trees, and so you have a mixed wood. Or when you thin out a pine wood, the oaks spring up here and there; or when you thin an oak wood, the pines plant themselves and grow up in like manner.

It is surprising how many accidents these seedling oaks will survive. We have seen [?] that they commonly survive six to ten years under the thickest pines and acquire stout and succulent roots. Not only they bear the sudden exposure to the light when the pines are cut, but, in case of a more natural succession, when a fire runs over the lot and kills pines and birches and maples, and oaks twenty feet high, these little oaks are scarcely injured at all, and they will still be just as high the next year, if not in the fall of the same year if the fire happens early in the spring. Or if in the natural course of events a fire does not occur nor a hurricane, the soil may at last be exhausted for pines, but there are always the oaks ready to take advantage of the least feebleness and yielding of the pines.

Hereabouts a pine wood, or even a birch wood, is no sooner established than the squirrels and birds begin to plant acorns in it. First the pines, then the oaks; and coniferous trees, geologists tell us, are older, as they are lower in the order of development, — were created before oaks. —

I observe to-day a great many pitch pine plumes cut off by squirrels and strewn under the trees, as I did yesterday.

I count the rings of a great white pine sawed off in Laurel Glen a few years ago, — about one hundred and thirty. This, probably, was really of the second growth, at least, but probably now even the second growth is all gone in this town. We may presume that any forest tree here a hundred and thirty years old belongs to the second growth, at least. We may say that all pines and oaks of this age or growth are now extinct in this town, and the present generation are not acquainted with large trees of these species.

A month ago I saw the smoke of many burnings in the horizon (even now see one occasionally), and now in my walks I occasionally come to a field of winter-rye already greening the ground in the woods where such a fire was then kindled.

If any one presumes that, after all, there cannot be so many nuts planted as we see oaks spring up at once when the pines are cut, he must consider that according to the above calculation (two pages back) there are some ten years for the animals to plant the oak wood in; so that, if the tract is ten rods square or contains one hundred square rods, it would only be necessary that they should plant ten acorns in a year which should not be disturbed, in order that there might be one oak to every square rod at the end of ten years. This, or anything like this, does not imply any very great activity among the squirrels. A striped squirrel could carry enough in his cheeks at one trip.

While the man that killed my lynx (and many others) thinks it came out of a menagerie, and the naturalists call it the Canada lynx, and at the White Mountains they call it the Siberian lynx, — in each case forgetting, or ignoring, that it belongs here, — I call it the Concord lynx.

Oct. 18. P. M. — To Merriam's white pine grove.

I often see amid or beside a pitch or white pine grove, though thirty years old, a few yet larger and older trees, from which they came, rising above them, like patriarchs surrounded by their children.

Early cinquefoil again.

I find fair-looking white oak acorns, which abound on the trees near Beck Stow's, to be decayed on the tree. Wishing to see what proportion were decayed I pull down a bough, and pluck forty-one acorns, which I cut open successively with my knife. Every one is soft and spoiled, turned black or dark-brown within, though there is not a single worm in them. Indeed, abundant and beautiful as the crop is, they are all decayed on that and the neighboring trees, and I only find one sound one after long search. This is probably the reason why they hold on still so numerous, and beside the squirrels do not disturb them. I suspect that they were killed by the severe frost of about October 1st. Abundant as the crop is, perhaps half of them have already been destroyed thus. Those that were touched first and most severely are paler-brown on one or both sides. Here, or on these trees, is a whole crop destroyed before it fell, though remarkably abundant. How many thousand bushels there must be in this state in this town!

See how an acorn is planted by a squirrel, just under a loose covering of moist leaves where it is shaded and concealed, and lies on its side on the soil, ready to send down its radicle next year.

If there are not so many oak seedlings in a deciduous wood as in a pine one, it may be because both oaks (and acorns) and squirrels love warmth. The ground does not freeze nearly so hard under dense pines as in a deciduous wood.

Look through an oak wood, say twenty-five or thirty years old, north of the Sherman grove on the road. It appeared to me that there were fewer seedling oaks under this than under pines, and the roots of the other little ones that looked like seedlings were old and decaying, and the shoots slender, feeble, and more or less prostrate under the leaves. You will find seedling oaks under oaks, it is true, but I think that you will not find a great many of them. You will not find, as under pines, a great many of these little oaks one to eight or ten years old, with great fat, or fusiform, roots, all ready to spring up when the pines are cut.

If it were true that the little oaks under oaks steadily grew and came to trees there, then even that would be a reason why the soil would not be so well stocked with them when the wood was cut as when a pine wood is cut, for there would be only ten trees in the first case to one hundred in the last (according to our calculation before).

Most of the little oaks here were little or dwarfed, apparently because they were shoots from poor and diseased rootstocks, which were common in the ground.

But I think that neither pines nor oaks do well under older trees.

Methinks you do not see numerous oaks of all ages and sizes in an old oak wood, but commonly large trees of about the same age and little ones like huckleberry bushes under your feet; and so commonly with pine woods. In either case, if the woods are well grown and dense, all the trees in them appear to have been planted at the same time.

For aught that I know, I would much rather have a young oak wood which has succeeded to pines than one that has succeeded to oaks, for they will make better trees, not only because the soil is new to them, but because they are all seedlings,

while in the other case far the greater part are sprouts; just as I would prefer apple trees five or six years from the seed for my orchard to suckers from those which have come to maturity or decayed. Otherwise your young oaks will soon, when half grown, have the diseases of old trees, — warts and decay.

I find that Merriam's white pine grove is on the site of an oak wood, the old oak stumps being still very common. The pines appear to be some forty years old. The soil of pine leaves is an inch to an inch and a half thick. The oldest little oaks here are five years old and six inches high.

Am surprised to see that the pasture west of this, where the little pitch pines were cut down last year, is now even more generally green with pines than two years ago.

What shall we say to that management that halts between two courses, — does neither this nor that, but botches both? I see many a pasture on which the pitch or white pines are spreading, where the bush-whack is from time to time used with a show of vigor, and I despair of my trees, — I say mine, for the farmer evidently does not mean they shall be his, — and yet this questionable work is so poorly done that those very fields grow steadily greener and more forest-like from year to year in spite of cows and bush-whack, till at length the farmer gives up the contest from sheer weariness, and finds himself the owner of a wood-lot. Now whether wood-lots or pastures are most profitable for him I will not undertake to say, but I am certain that a wood-lot and pasture combined is not profitable.

I see spatter-dock pads and pontederia in that little pool at south end of Beck Stow's. How did they get there? There is no stream in this case? It was perhaps rather reptiles and birds than fishes, then. Indeed we might as well ask how they got anywhere, for all the pools and fields have been stocked thus, and we are not to suppose as many new creations as pools. This suggests to inquire how any plant came where it is, — how, for instance, the pools which were stocked with lilies before we were born or this town was settled, and ages ago, were so stocked, as well as those which we dug. I think that we are warranted only in supposing that the former was stocked in the same way as the latter, and that there was not a sudden new creation, — at least since the first; yet I have no doubt that peculiarities more or less considerable have thus been gradually produced in the lilies thus planted in various pools, in consequence of their various conditions, though they all came originally from one seed.

We find ourselves in a world that is already planted, but is also still being planted as at first. We say of some plants that they grow in wet places and of others that they grow in desert places. The truth is that their seeds are scattered almost everywhere, but here only do they succeed. Unless you can show me the pool where the lily was created, I shall believe that the oldest fossil lilies which the geologist has detected (if this is found fossil) originated in that locality in a similar manner to these of Beck Stow's. We see thus how the fossil lilies which the geologist has detected are dispersed, as well as these which we carry in our hands to church.

The development theory implies a greater vital force in nature, because it is more flexible and accommodating, and equivalent to a sort of constant new creation.

Mr. Alcott tells me that the red squirrels which live in his elms go off to the woods (pitch pines behind his house) about June, and return in September, when the butter-nuts, etc., are ripe. Do they not go off for hazelnuts and pine seed? No doubt they are to be found where their food is.

Young oaks, especially white oaks, in open woodland hollows and on plains [are] almost annually killed down by frost, they are so tender. Large tracts in this town are bare for this reason. Hence it is very important that the little oaks, when they are tenderest, should have the shelter of pines and other trees as long as they can bear it, or perhaps till they get above the level of the frosts. I know of extensive open areas in the woods where it would be of no use to sow acorns or to set seedling oaks, for every one would be killed by the frost, as they have already been; but if you were to plant pines thinly there, or thickly at first and then thin them out, you could easily raise oaks, for often you have only got to protect them till they are five or six feet high, that they may be out of the way of ordinary frosts, whose surface is as level as that of a lake.

According to Loudon (vide Emerson on oaks), the best authorities say plant some two hundred and fifty acorns to an acre (i.e. some from three hundred to five hundred, others from sixty to one hundred), or about one and one half acorns to a rod, or two hundred and forty to an acre.

In my walk in Walden Woods yesterday I found that the seedling oaks and chestnuts were most common under the fullest and densest white pines, as that of Brister Spring.

Oct. 19. P. M. — To Conantum.

Indian-summer-like and gossamer.

That white oak in Hubbard Grove which on the 7th was full of those glossy black acorns is still hanging full, to my surprise. Suspecting the cause, I proceed to cut them open, and find that they are all decayed or decaying. Even if not black within, they are already sour and softened. Yet Rice told me that he collected from this tree about a week ago some thousands of acorns and planted them in Sudbury. I can tell him that probably not more than half a dozen of them were alive, though they may then have looked well, as they do now externally. First, then, I was surprised at the abundance of the crop this year. Secondly, by the time I had got accustomed to that fact I was surprised at the vast proportion that were killed, apparently by frost. The squirrels are wiser than to gather these, but I see where they have gathered many black oak acorns, the ground beneath being strewn with their cups, which have each a piece bitten out in order to get out the acorn. I suspect that black and red oak acorns are not so easily injured by frost. Indeed, I find this to be the case as far as I look.

Sophia tells me that the large swamp white oak acorns in their cups, which she gathered a fortnight ago, are now all mouldy about the cups, or base of the acorn.

It is a remarkable fact, and looks like a glaring imperfection in Nature, that the labor of the oaks for the year should be lost to this extent. The softening or freezing of cranberries, the rotting of potatoes, etc., etc., seem trifling in comparison. The

pigeons, jays, squirrels, and woodlands are thus impoverished. It is hard to say what great purpose is served by this seeming waste.

I frequently see an old and tall pine wood standing in the midst of a younger but more extensive oak wood, it being merely a remnant of an extensive pine wood which once occupied the whole tract, but, having a different owner, or for some other reason, it has not been cut. Sometimes, also, I see these pines of the same age reappear at half a mile distant, the intermediate pines having been cut for thirty or forty years, and oaks having taken their place. Or the distant second growth of pines, especially if they stand on the land of another than he who owns the oaks, may, as we have seen, be a generation smaller and have sprung from the pines that stood where the oaks do. Two or three pines will run swiftly forward a quarter of a mile into a plain, which is their favorite field of battle, taking advantage of the least shelter, as a rock, or fence, that may be there, and intrench themselves behind it, and if you look sharp, you may see their plumes waving there. Or, as I have said, they will cross a broad river without a bridge, and as swiftly climb and permanently occupy a steep hill beyond.

At this season of the year, when each leaf acquires its peculiar color, Nature prints this history distinctly, as it were an illuminated edition. Every oak and hickory and birch and aspen sprinkled amid the pines tells its tale a mile off, and you have not to go laboriously through the wood examining the bark and leaves. These facts would be best illustrated by colors, — green, yellow, red, etc.

Pines take the first and longest strides. Oaks march deliberately in the rear.

The pines are the light infantry, voltigeurs, supplying the scouts and skirmishers; the oaks are the grenadiers, heavy-paced and strong, that form the solid phalanx.

It is evident to any who attend to the matter that pines are here the natural nurses of the oaks, and therefore they grow together. By the way, how nearly identical is the range of our pines with the range of our oaks? Perhaps oaks extend beyond them southward, where there is less danger of frost.

The new woodlands, i.e., forests that spring up where there were no trees before, are pine (or birch or maple), and accordingly you may see spaces of bare pasture sod between the trees for many years. But oaks, in masses, are not seen springing up thus with old sod between them. They form a sprout-land, or stand amid the stumps of a recent pine lot.

It will be worth the while to compare seedling oaks with sprout-lands, to see which thrive best.

I see, on the side of Fair Haven Hill, pines which have spread, apparently from the north, one hundred rods, and the hillside begins to wear the appearance of woodland, though there are many cows feeding amid the pines. The custom with us is to let the pines spread thus into the pasture, and at the same time to let the cattle wander there and contend with the former for the possession of the ground, from time to time coming to the aid of the cattle with a bush-whack. But when, after some fifteen or twenty years, the pines have fairly prevailed over us both, though they have suffered terribly and the ground is strewn with their dead, we then suddenly turn about, coming to the aid

of the pines with a whip, and drive the cattle out. They shall no longer be allowed to scratch their heads on them, and we fence them in. This is the actual history of a great many of our wood-lots. While the English have taken great pains to learn how to create forests, this is peculiarly our mode. It is plain that we have thus both poor pastures and poor forests.

I examine that oak lot of Rice's next to the pine strip of the 16th. The oaks (at the southern end) are about a dozen years old. As I expected, I find the stumps of the pines which stood there before quite fresh and distinct, not much decayed, and I find by their rings that they were about forty years old when cut, while the pines which sprang from [them] are now about twenty-five or thirty. But further, and unexpectedly, I find the stumps, in great numbers, now much decayed, of an oak wood which stood there more than sixty years ago. They are mostly shells, the sap-wood rotted off and the inside turned to mould. Thus I distinguished four successions of trees.

Thus I can easily find in countless numbers in our forests, frequently in the third succession, the stumps of the oaks which were cut near the end of the last century. Perhaps I can recover thus generally the oak woods of the beginning of the last century, if the land has remained woodland. I have an advantage over the geologist, for I can not only detect the order of events but the time during which they elapsed, by counting the rings on the stumps. Thus you can unroll the rotten papyrus on which the history of the Concord forest is written.

It is easier far to recover the history of the trees which stood here a century or more ago than it is to recover the history of the men who walked beneath them. How much do we know — how little more can we know — of these two centuries of Concord life?

Go into a young oak wood, and commonly, if the oaks are not sprouts, then they were preceded by pines.

Of course, the gradual manner in which many wood-lots are cut — often only thinned out — must affect the truth of my statements in numerous instances. The regularity of the succession will be interfered with, and what is true of one end of a lot will not be true of the other.

If the ground chances to be broken or burned over or cleared the same year that a good crop of pine seed falls, then expect pines; not otherwise.

I examined the huckleberry bushes next the wall in that same dense pitch and white pine strip. I found that the oldest bushes were about two feet high and some eight or ten years old, and digging with spade and hands, I found that their roots did not go deep, but that they spread by a vigorous shoot which forked several times, running just under the leaves or in the surface soil, so that they could be easily pulled up. One ran seven feet before it broke, and was probably ten feet or more in length. And three or four bushes stood on this shoot, and though these bushes after a few years did not grow more than an inch in a year, these subterranean shoots had grown six to twelve inches at the end, and there seemed to be all the vigor of the plant. The largest bushes preserved still a trace of their origin from a subterranean shoot, the limbs being one-sided and the brash aslant. It is very likely, then, if not certain, that these roots

are as old as the pine wood which overshadows them; or it is so long since the seedling huckleberry came up there. The pines were thirty years old, but some of the separate huckleberry bushes were ten, and were sending up new vigorous shoots still. The same was the case with the *Vaccinium vacillans* and the *Pennsylvanicum*, the last one, of course, on a smaller scale. You could see the *V. vacillans* growing in rows for several feet above the subterranean shoots, indicating where it was. The shoot turns up to make a bush thus:

Thus the roots of huckleberries may survive till the woods are cut again. They certainly will here. A huckleberry bush is apparently in its prime at five to seven years, and the oldest are ten to twelve years. Plants of this order (*Ericaceæ*) are said to be among the earlier ones among fossil plants, and they are likely to be among the last.

The oldest oak, fairly speaking, in this wood was a black, thirteen years old. Its root, as usual, ran not straight down but with a half-turn or twist (as well as to one side), which would make it harder to pull up at any rate.

The white oak acorn has very little bitterness and is quite agreeable to eat. When chestnuts are away I am inclined to think them as good as they. At any rate it braces my thought more, and does me more good to eat them, than it does to eat chestnuts. I feel the stronger even before I have swallowed one. It gives me heart and back of oak.

I found that the squirrels, or possibly mice, which have their holes about those old oak stumps ran along in various directions through the roots, whose insides are rotted away, leaving a wall of thin bark which prevents the earth falling in. Such are their highways underground. The holes above led to them.

On the monuments of the old settlers of this town, if they can be found, are recorded their names and ages and the time of their death, and so much can be read on these monuments of the oaks, with some additional reliable information, as where they lived, and how healthily, and what trees succeeded them, etc., etc.

Looking at Sophia's large collection of acorns from Sleepy Hollow and elsewhere, I cannot find a sound white oak one (i.e. not decayed and blackened), but the black and shrub oaks at least are sound. This suggests that the very fertile shrub oaks are more sure of succeeding and spreading, while the noblest oak of all may fail.

First, by examining the twigs (vide Coultas) you tell the age and the number of shoots and the leaves and the various accidents of the tree for half a dozen years past, — can read its history very minutely; and at length, when it is cut down, you read its ancient and general history on its stump.

If you would know the age of a young oak lot, look round for a sprout, — for there will commonly be some to be found even in a seedling wood, — cut, and count the rings. But if you have to count the rings of a seedling, begin about six inches from the ground, for it was probably so high when the previous wood was cut.

Oct 20. E. Hosmer tells me to-day that while digging mud at the Pokelogan the other day he found several fresh acorns planted an inch or two deep under the grass just outside the oaks and bushes there. Almost every observant farmer finds one such deposit each year.

If that Merriam lot is fifteen rods square, then, instead of there being no oaks in it, there are some twenty-five hundred oaks in it, or far more oaks than pines, — say five times as many, for there are probably not nearly five hundred pines in the lot. This is only one of the thousand cases in which the proprietor and woodchopper tell you that there is not a single oak in the lot. So the tables were turned, and, so far as numbers were concerned, it would have been truer to say that this was an exclusively oak wood and that there were no pines in it. Truly appearances are deceptive.

P. M. — To Walden Woods to examine old stumps.

In Trillium Wood the trees are chiefly pine, and I judge them to be forty to fifty years old, though there are not a few oaks, etc. Beneath them I find some old pitch pine stumps and one white pine. They would not be seen by a careless observer; they are indistinct mounds and preserve no form nor marks of the axe. This is low ground. Part of the cores, etc., of the stumps are, nevertheless, preserved by fat.

I then look at Farrar's [?] hill lot east of the Deep Cut. This is oak, cut, as I remember, some twenty-five years ago, the trees say five to eight inches [in] diameter. I find beneath the oaks innumerable pitch pine stumps, well preserved, or rather, distinct, some of them two feet and more in diameter, with bark nearly three inches thick at the ground, but generally fifteen inches in diameter. Though apparently thoroughly rotten and of a rough (crumbly) conical form and more or less covered with fine moss (hypnum), they were firm within on account of the fat in flakes on the whole core, and frequently showed the trace of the axe in the middle. I could get cartloads of fat pine there now, often lifting out with my hands the whole core, a clear mass of yellow fat. When the stump was almost a mere mound mossed over, breaking off an inch or two deep of the crust, with the moss, I could still trace on one side the straight edge made by the axe. There were also, especially on the lower, or northern, side, some large oak stumps, no doubt of the same age.

These were much better preserved than the pines, — at least the part above ground. The whole shape and almost every stroke of the axe apparent sometimes, as in a fresh stump. I counted from seventy to seventy-five rings on one. The present wood appears to be chiefly from the seed, with some sprouts. The latter two or more close together, with the old stump more or less overgrown. The sprouts, I think, were from small trees. (Methinks you do not see trees which have sprouted from old or large stumps two or three feet in diameter. I doubt if a very old wood, like E. Hubbard's, would send up sprouts from the stump.) I saw one large oak stump so much decayed that it may have belonged to a generation further back.

I next examined Ebby Hubbard's old oak and pine wood. The trees may be a hundred years old. The older or decaying trees have been cut out from time to time, neglecting these more recent stumps. The very oldest evidences of a tree were a hollow three or four feet across, in which you often slumped, — a hollow place in which squirrels have their holes covered with many layers of leaves, and perhaps with young oaks springing up in it, for the acorns rolled into it. But if you dug there, from under the moss (there was commonly a little green moss around it) and leaves and soil, in

the midst of the virgin mould which the tree had turned to, you pulled up flakes and shoulder-blades of wood that might still be recognized for oak, portions preserved by some quality which they concentrated, like the fat leaves or veins of the pine, — the oak of oak. But for the most part it was but the mould and mildew of the grave, — the grave of a tree which was cut or died eighty or a hundred years ago there. It is with the graves of trees as with those of men, — at first an upright stump (for a monument), in course of time a mere mound, and finally, when the corpse has decayed and shrunk, a depression in the soil. In such a hollow it is better to plant a pine than an oak. The only other ancient traces of trees were perhaps the semiconical mounds which had been heaved up by trees which fell in some hurricane.

I saw where Ebby had tried a pitch pine with his axe, though there was not a green twig on it, and the woodpeckers had bored it from top to bottom, — effectually proved it, if he had not been blind.

Looked at that pitch and white pine wood just east of Close at Brister Spring, which I remember as pasture some thirty years ago. The pasture is still betrayed under the pines by the firmer, sward-like surface, there being fewer leaves and less of leafy mould formed, — less virgin soil, — and by the patches of green (pine) moss and white *cladonia* peeping out here and there.

Young chestnuts (I dig up three or four) have not the large roots that oaks have.

I see the acorn after the tree is five or six years old.

*Brassica Napus*, or rape, a second crop, is blooming now, especially where grain has been cut and the field laid down to grass and clover. It has there little slender plants; rough, or bristly, lower leaves.

1st. There is the primitive wood, woodland which was woodland when the township was settled, and which has not been cut at all. Of this I know of none in Concord. Where is the nearest? There is, perhaps, a large tract in Winchendon.

2d. Second growth, the woodland which has been cut but once, — true second growth. This country has been so recently settled that a large part of the older States is covered now with this second growth, and the same name is occasionally still applied, though falsely, to those wood-lots which have been cut twice or many more times. Of this second growth I think that we have considerable left, and I remember much more. These are our forests which contain the largest and oldest trees, — shingle pines (very few indeed left) and oak timber.

3d. Primitive woodland, i.e., which has always been woodland, never cultivated or converted into pasture or grain-field, nor burned over intentionally. Of two kinds, first, that which has only been thinned from time to time, and secondly, that which has been cut clean many times over. A larger copsewood.

4th. Woodland which has been cleared one or more times, enough to raise a crop of grain on it, burned over and perhaps harrowed or even plowed, and suffered to grow up again in a year or two. Call this “interrupted woodland” or “tamed.”

5th. New woods, or which have sprung up de novo on land which has been cultivated or cleared long enough to kill all the roots in it. (The 3d, 4th, and 5th are a kind of copsewood.)

6th. Artificial woods, or those which have been set out or raised from the seed, artificially.

It happens that we have not begun to set out and plant till all the primitive wood is gone. All the new woods ( or 5th kind) whose beginning I can (now) remember are pine or birch (maple, etc., I have not noticed enough). I suspect that the greater part (?) of our woodland is the 3d kind, or primitive woodland, never burned over intentionally nor plowed, though much of it is the 4th kind. Probably almost all the large wood cut ten or fifteen years ago (and since) here was second growth, and most that we had left was cut then.

Of the new woods I remember the beginning of E. Hubbard's east of Brister Spring; Bear Garden, pitch pine; Wheeler's pigeon-place, pitch pine; also his blackberry-field, pitch pine and a few white; West Fair Haven Spring woods, pitch pine and white; E. Hubbard's Close Mound, pitch pine; Conantum-top, pitch pine; Mason's pasture (?), white pine; behind Baker's (?), pitch pine; my field at Walden, pitch pine; Kettle Hill, pitch pine; Moore's com-hill, pitch pine, cut say '59; behind Moore's house (??), pitch pine (was it new?); front of Sleepy Hollow, poplars, pitch pine; E. Wood's, front of Colburn place (??), pitch pine, not new wood; John Hosmer's, beyond house (?), pitch pine; Fair Haven Hill-side, white pine, just begun; Merriam's pasture, beyond Beck Stow's, just begun, pitch pine; old coast behind Heywood's, pitch pine; Conant's white pine crescent in front of W. Wheeler's; J. P. Brown pasture, white pine; at Hemlocks, pitch pine; northwest of Assabet stone bridge, pitch pine; Tarbell's pitch pines; Baker's, above beech, pitch pine; Henry Shattuck's, pitch pine; northwest of Farmer's, pitch pine; William Brown's, pitch pine; north of H. Shattuck's, pitch pine; white and pitch pine south of Rice's lot; pitch pine northwest of old Corner schoolhouse, pitch pine southeast of new Comer schoolhouse; large pitch pine hill behind Hagar's in Lincoln.

In several of these new woods — pitch pine and birches — can see the old corn-hills still.

The woods within my recollection have gradually withdrawn further from the village, and woody capes which jutted from the forest toward the town are now cut off and separated by cleared land behind. The Irish have also made irruptions into our woods in several places, and cleared land.

Edmund Hosmer tells me of a gray squirrel which he kept in his old (Everett) house; that he would go off to the woods every summer, and in the winter come back and into his cage, where he whirled the wire cylinder. He would be surprised to see it take a whole and large ear of com and run out a broken window and up over the roof of the com-bam with it, and also up the elms.

We have a kitten a third grown which often carries its tail almost flat on its back like a squirrel.

Oct. 22. P. M. — To Walden Woods.

See in the yard many chip-birds, but methinks the chestnut crown is not so distinct as in the spring, — has a pale line in middle of it, — and many, maybe females or young, have no chestnut at all. I do not find them so described.

Are not maples inclined to die in a white pine wood? There was the one in Merriam's grove and the sickly ones in our grove in the yard.

I notice that the first shrubs and trees to spring up in the sand on railroad cuts in the woods are sweet-fern, birches, willows, and aspens, and pines, white and pitch; but all but the last two chiefly disappear in the thick wood that follows. The former are the pioneers. Such sandy places, the edges of meadows, and sprout-lands are almost the only localities of willows with us.

In the Deep Cut big wood (Stow's), pines and oaks, there are thousands of little white pines as well as many oaks. After a mixed wood like this you may have a mixed wood, but after dense pines, commonly oak chiefly, yet not always; for, to my surprise, I find that in the pretty dense pitch pine wood of Wheeler's blackberry-field, where there are only several white pines old enough to bear, and accordingly more than a thousand pitch pine seeds to one white pine one, yet there are countless white pines springing up under the pitch pines (as well as many oaks), and very few or scarcely any little pitch pines, and they sickly, or a thousand white pine seedlings to one pitch pine, — the same proportion reversed (in inverse proportion). It is the same in the pigeon-place lot east of this. So if you should cut these pitch pines you would have next a white pine wood with some oaks in it, the pines taking the lead. Indeed, these white pines bid fair to supplant the pitch pines at last, for they grow well and steadily. This reminds me that, though I often see little white pines under pines and under oaks, I rarely if ever (unless I am mistaken) see many young pitch pines there. How is it? Do the pitch pines require more light and air?

You may conveniently tell the age of a pine, especially white pine, by cutting off the lowest branch that is still growing and counting its rings. Then estimate or count the rings of a pine growing near in an opening, of the same height as to that branch, and add the two sums together.

I found in the midst of this pitch pine wood a white oak some eight feet high and an inch and a half thick at ground, which had borne a great many — say sixty or a hundred — large oak-balls, and the ground beneath and near by was strewn with the fragments of fifty of them, which some creature, probably a squirrel, — for a bird could hardly have opened the hard nut-like kernel within, — had opened, no doubt for their living contents, and all the inside was gone. They looked like egg-shells strewn about. Opening one, I found within the hard kernel a humpbacked black fly nearly half an inch long, body and wings, with a very large or full shining black abdomen and two small black spots on each wing. The only two that I open have flies in them. Harris says that this fly is the *Cynips confluens*, and that the grub becomes a chrysalis in the autumn and not, commonly, a fly till spring, though he has known this gall-fly

to come out in October. It must have been squirrels (or mice) that opened them, for birds could not break into the hard kernel.

Counted the rings of a white pine stump in Hubbard's owl wood by railroad. Ninety-four years. So this was probably second growth.

Swamps are, of course, least changed with us, — are nearest to their primitive state of any woodland. Commonly they have only been cut, not redeemed.

I see how meadows were primitively kept in the state of meadow by the aid of water, — and even fire and wind. For example, Heywood's meadow, though it may have been flowed a hundred years ago by the dam below, has been bare almost ever since in the midst of the wood. Trees have not grown over it. Maples, alders, birches, pitch and white pines are slow to spread into it. I have named them in the order of their slowness. The last are the foremost, — furthest into the meadow, — but they are sickly-looking. You may say that it takes a geological change to make a wood-lot there.

Looked at stumps in J. Hosmer's lot, hillside south of first Heywood meadow, cut eleven (?) years ago. One white pine perfect in shape, forty-one rings; two large oak stumps, each one hundred and nine rings; and a large pitch pine, probably same age. These stumps are all well preserved. The whole outline and the rings can for most part be counted; but they are successive ridges, and the bark is ready to fall off, and they are more or less mossed over with cockscomb moss. The main part of this lot north of this hole is apparently oak sprouts next railroad.

I next look through Emerson's lot (half-burned and cut last spring). The last year's growth (and present) chiefly oak, with a little pine. The stumps are chiefly oak and pitch pine, with apparently some hemlock (?) and chestnut and a little white pine. (So it seems the pitch pine and hemlock did not survive the old cutting; the pitch pine did not come up under itself.) The pitch pine stumps are all decayed but the core and the bark, and hardly in any instance show a trace of the axe. They are low rounded mounds, yet the inmost parts are solid fat, and the bark edge is very plain. The oak stumps are very much better preserved, — have half or two thirds their form, and show that proportion of the cutting, — yet the sap-wood is often gone (with the bark), and as often the inmost heart. You can partially count rings even. Yet some of these are as decayed as the pines, and all flaky, and, turned up, look like stumps of old teeth with their prongs. They (the oaks) are all loose to the foot, yet you will see the white bark lying about a white oak stump when all the rest is about gone. Most of the old stumps, both oaks and pines, can easily be found now, but the rings of not one oak even can be wholly counted, or nearly. I could not be sure about the hemlock and chestnut, only that there was some of both. There was little moss on these stumps, either pine or oak; the latter too crumbly.

The southeast part of this lot, beyond the deep cove, is apparently an oak sproutland and good part pine. I see what were sprouts from a scarlet oak stump eighteen or more inches in diameter and from white oaks one foot in diameter; yet in the other lot, though there were so many large oak stumps, I did not notice that trees had ever

sprung from them. You find plenty of old oak stumps without their trees in the woods, which (if nothing else) shows that there is an end to this mode of propagation.

I could tell a white pine here when it was for the most part a mere rotten mound, by the regularity crosswise of the long knots a foot from the ground in the top of the rotten core, representing the peculiarly regular branches of the little white pine and the best preserved as the hardest and pitchiest part.

It is apparent that fires often hasten the destruction of these stumps. They are very apt to be charred.

I dug in the hollow where an oak had been, and though it was so completely decayed that I found not a particle that looked like decayed wood or even bark and my spade met with no resistance, yet there were perfectly open channels raying out from this hollow with the pellicle of the root for a wall still, which for a hundred years the earth had learned to respect. Indeed, these stumps, both of this age and more recent, are the very metropolis of the squirrels and mice. Such are their runways.

Yet what is the character of our gratitude to these squirrels, these planters of forests? We regard them as vermin, and annually shoot and destroy them in great numbers, because — if we have any excuse — they sometimes devour a little of our Indian com, while, perhaps, they are planting the nobler oak-com (acorn) in its place. In various parts of the country an army of grown-up boys assembles for a squirrel hunt. They choose sides, and the side that kills the greatest number of thousands enjoys a supper at the expense of the other side, and the whole neighborhood rejoices. Would it [not] be far more civilized and humane, not to say godlike, to recognize once in the year by some significant symbolical ceremony the part which the squirrel plays, the great service it performs, in the economy of the universe?

The Walden side of Emerson's main wood-lot is oak (except a few pines in the oaks at the northwest or railroad end), and the oaks are chiefly sprouts, some thirty years old. Yet, not to mention the pitch pine stumps, there are a great many oak stumps without sprouts, and yet not larger stumps than the others. How does this happen? They are all of the same age, i.e. cut at the same time.

Sometimes, evidently, when you see oak stumps from which no trees have sprung in the midst of a pine or birch wood, it may be because the land was cleared and burned over and cultivated after the oaks were cut.

Oct. 23. Anthony Wright tells me that he cut a pitch pine on Damon's land between the Peter Haynes road and his old farm, about '41, in which he counted two hundred and seventeen rings, which was therefore older than Concord, and one of the primitive forest. He tells me of a noted large and so-called primitive wood, Inches Wood, between the Harvard turnpike and Stow, sometimes called Stow Woods, in Boxboro and Stow. Also speaks of the wood north of Wetherbee's mill near Annursnack and belonging to W., as large and old, if not cut.

Melvin thinks that a fox would not on an average weigh more than ten pounds. Says that he saw a flock of brant yesterday by day. (Rarely seen by day or even by

night here.) He says that Hildreth collects moss (probably *cladonia*) from the rocks for kindling.

There is no such mortality in nobler seeds — seeds of living creatures, as eggs of birds, for instance — as I have noticed in white oak acorns. What if the eggs of any species of bird should be addled to this extent, so that it should be hard to find a sound one? In Egypt, where they hatch eggs artificially in an oven, they can afford to return one chicken for every two eggs they receive (and do so) and yet find it profitable. It is true one third of human infants are said to die before they are five years old, but even this is a far less mortality than that of the acorns. The oak is a scarce bearer, yet it lasts a good while.

More or less rain to-day and yesterday.

Oct. 24. P. M. — To Walden Woods.

See three little checkered adders lying in the sun by a stump on the sandy slope of the Deep Cut; yet sluggish. They are seven or eight inches long. The dark blotches or checkers are not so brown as in large ones. There is a transverse dark mark on the snout and a forked light space on the back part [of] the head. —

Examine again Emerson's pond lot, to learn its age by the stumps cut last spring. I judge from them that they were some five (?) years cutting over the part next the water, for I count the rings of many stumps and they vary in number from twenty-four or five to thirty, though twenty-six, seven, and eight are commonest, as near as I can count. It is hard to distinguish the very first ring, and often one or more beside before you reach the circumference. But, these being almost all sprouts, I know that they were pretty large the first year. I repeatedly see beside the new tree (cut last spring) the now well-rotted stump from which it sprang. But I do not see the stump from which the last sprang. I should like to know how long they may continue to spring from the stump. Here are shoots of this year which have sprung vigorously from stumps cut in the spring, which had sprung in like manner some twenty-eight or thirty years ago from a stump which is still very plain by their sides. I see that some of these thirty-year trees are sprouts from a white oak stump twenty inches in diameter, — four from one in one case. Sometimes, when a white pine stump is all crumbling beside, there is a broad shingle-like flake left from the centre to the circumference, the old ridge of the stump, only a quarter of an inch thick, and this betrays the axe in a straight inclined surface.

The southeast part of Emerson's lot, next the pond, is yet more exclusively oak sprouts, or oak from oak, with fewer pine stumps. I examine an oak seedling in this. There are two very slender shoots rising ten or more inches above the ground, which, traced downward, conduct to a little stub, which I mistook for a very old root or part of a larger tree, but, digging it up, I found it to be a true seedling. This seedling had died down to the ground six years ago, and then these two slender shoots, such as you commonly see in oak woods, had started. The root was a regular seedling root (fusiform if straightened), at least seven eighths of an inch thick, while the largest shoot was only one eighth of an inch thick, though six years old and ten inches high.

The root was probably ten years old when the seedling first died down, and is now some sixteen years old. Yet, as I say, the oak is only ten inches high. This shows how it endures and gradually pines and dies. As you look down on it, it has two turns, — and three as you look from the side, so firmly is it rooted. Any one will be surprised on digging up some of these lusty oaken carrots.

Look at stumps in Heywood's lot, southeast side pond, from Emerson's to the swimming-place. They are white pine, oak, pitch pine, etc. I count rings of three white pine (from sixty to seventy). There are a few quite large white pine stumps; on one, ninety rings. One oak gives one hundred and sixteen rings. A pitch pine some fifteen or sixteen inches over gives about one hundred and thirty-five. All these are very easy, if not easier than ever, to count. The pores of the pines are distinct ridges, and the pitch is worn off. (Many white and pitch pines elsewhere cut this year cannot be counted, they are so covered with pitch.) I remember this as a particularly dense and good-sized wood, mixed pine and oak.

Mrs. Heywood's pitch pines by the shore, judging from some cut two or three years ago, are about eighty-five years old. As far as I have noticed, the pitch pine is the slowest-growing tree (of pines and oaks) and gives the most rings in the smallest diameter. —

Then there are the countless downy seeds (thistle-like) of the goldenrods, so fine that we do not notice them in the air. They cover our clothes like dust. No wonder they spread over all fields and far into the woods.

I see those narrow pointed yellow buds now laid bare so thickly along the slender twigs of the *Salix discolor*, which is almost bare of leaves.

Oct 25. P. M. — To Eb. Hubbard's wood and Sleepy Hollow.

See a little reddish-brown snake (bright-red beneath) in the path; probably *Coluber amamus*.

Cut one of the largest of the lilacs at the Nutting wall, eighteen inches from the ground. It there measures one and five sixteenths inches and has twenty distinct rings from centre, then about twelve very fine, not thicker than previous three; equals thirty-two in all. It evidently dies down many times, and yet lives and sends up fresh shoots from the root.

Jarvis's hill lot is oak, pitch pine, and some white, and quite old. There are a great many little white pines springing up under it, but I see no pitch. Yet the large pitch are much more common than the large white. Nevertheless the small white have come on much faster and more densely in the hollows just outside the large wood on the south.

E. Hubbard's mound of pitch pines contains not one seed-bearing white pine, yet there are under these pines many little white pines (whose seed must have blown some distance), but scarcely one pitch pine. The latter, however, are seen along its edge and in the larger openings. So at Moore's pitch pine promontory south of the Foley house, cut off lately by Walcott. Where the large pines had stood are no little ones, but in the open pasture northward quite a little grove, which had spread from them. Yet from

a hasty look at the south end of the Sleepy Hollow Cut pitch pines, it appeared that small pitch pines were abundant under them. Vide again.

I have seen an abundance of white oak acorns this year, and, as far as I looked, swamp white oak acorns were pretty numerous. Red oak acorns are also pretty common. Black and scarlet oak I find also, but not very abundant. I have seen but few shrub oak, comparatively. Of the above, only the white oak have decayed so remarkably. The others are generally sound, or a few wormy. The red oak, as far as I notice, are remarkably sound. The scarlet oak I cut this afternoon are some of them decaying, but not like the white oak. Only the white have sprouted at all, as far as I perceive.

I find some scarlet oak acorns on the back side northeast end of Sleepy Hollow which are rounder than usual, considerably like a filbert out of the shell. They are indistinctly marked with meridional lines and thus betray a relation to the black and black shrub oak.

I see an immense quantity of asparagus seed in the mist of its dead branches, on Moore's great field of it, near Hawthorne's. There must be a great many bushels of the seed, and the sight suggested how extensively the birds must spread it. I saw, accordingly, on Hawthorne's hillside, a dozen rods north of it, many plants (with their own seed) two or three feet high. It is planted in the remotest swamps in the town.

Saw in E. Hubbard's clintonia swamp a large spider with a great golden-colored abdomen as big as a hazelnut, on the wet leaves. There was a figure in brown lines on the back, in the form of a pagoda with its stories successively smaller. The legs were pale or whitish, with dark or brown bars.

Find many of those pale-brown roughish fungi (it looks like Loudon's plate of *Scleroderma*, perhaps *verrucosum*), two to three inches in diameter. Those which are ripe are so softened at the top as to admit the rain through the skin (as well as after it opens), and the interior is shaking like a jelly, and if you open it you see what looks like a yellowish gum or jelly amid the dark fuscous dust, but it is this water colored by the dust; yet when they are half full of water they emit dust nevertheless. They are in various states, from a firm, hard and dry unopen[ed] to a half-empty and flabby moist cup.

See the yellow butterfly still and great devil's-needles.

Dug up and brought home last night three English cherry trees from Heywood's Peak by Walden. There are a dozen or more there, and several are as handsome as any that you will find in a nursery. They remind me of some much larger which used to stand above the cliffs. This species too comes up in sprout-lands like the wild rum cherry. The amount of it is that such a tree, whose fruit is a favorite with birds, will spring up far and wide and wherever the earth is bared of trees, but since the forest overpowers and destroys them, and also cultivation, they are only found young in sprout-lands or grown up along fences. It looks as if this species preferred a hilltop. Whether the birds are more inclined to convey the seeds there or they find the light and exposure and the soil there which they prefer. These have each one great root,

somewhat like a long straight horn, making a right angle with the stem and running far off one side close to the surface.

The thistles which I now see have their heads recurved, which at least saves their down from so great a soaking. But when I pull out the down, the seed is for the most part left in the receptacle (?), in regular order there, like the pricks in a thimble. A slightly convex surface. The seeds set like cartridges in a circular cartridge-box, in hollow cylinders which look like circles crowded into more or less of a diamond, pentagonal, or hexagonal form. The perfectly dry and bristly involucre which hedges them round, so repulsive externally, is very neat and attractive within, — as smooth and tender toward its charge as it is rough and prickly externally toward the foes that might do it injury. It is a hedge of imbricated thin and narrow leaflets of a light-brown color, beautifully glossy like silk, a most fit receptacle for the delicate downy parachutes of the seed, a cradle lined with silk or satin. The latter are kept dry under this unsuspected silky or satiny ceiling, whose old and weather-worn and rough outside alone we see, like a mossy roof, little suspecting the delicate and glossy lining. I know of no object more unsightly to a careless glance than an empty thistle-head, yet, if you examine it closely, it may remind you of the silk-lined cradle in which a prince was rocked. Thus that which seemed a mere brown and worn-out relic of the summer, sinking into the earth by the roadside, turns out to be a precious casket.

I notice in the pitch pine wood behind Moore's the common pinweed (*Lechea major* or the next) growing on the top of a pitch pine stump which is yet quite in shape and firm, one foot from the ground, with its roots firmly set in it, reaching an inch or two deep. Probably the seed was blown there, perhaps over the snow when it was on a level with the stump.

Oct. 26. P. M. — To Baker's old chestnut lot near Flint's Pond.

As I go through what was formerly the dense pitch pine lot on Thrush Alley (G. Hubbard's), I observe that the present growth is scrub oak, birch, oaks of various kinds, white pines, pitch pines, willows, and poplars. Apparently, the birch, oaks, and pitch pines are the oldest of the trees. From the number of small white pines in the neighboring pitch pine wood, I should have expected to find larger and also more white pines here. It will finally become a mixed wood of oak and white and pitch pine. There is much *cladonia* in the lot.

Observed yesterday that the row of white pines set along the fence on the west side of Sleepy Hollow had grown very fast, apparently from about the time they were set out, or the last three years. Several had made about seven feet within the three years. Do they not grow the fastest at just this age, or after they get to be about five feet high?

I see to-day sprouts from chestnut stumps which are two and a half feet in diameter (i.e. the stumps). One of these large stumps is cut quite low and hollowing, so as to hold water as well as leaves, and the leaves prevent the water from drying up. It is evident that in such a case the stump rots sooner than if high and rooflike.

I remember that there were a great many hickories with R. W. E.'s pitch pines when I lived there, but now there are but few comparatively, and they appear to have died down several times and come up again from the root. I suppose it is mainly on account of frosts, though perhaps the fires have done part of it. Are not hickories most commonly found on hills? There are a few hickories in the open land which I once cultivated there, and these may have been planted there by birds or squirrels. It must be more than thirty-five years since there was wood there.

I find little white pines under the pitch pines (of E.), near the pond end, and few or no little pitch pines, but between here and the road about as many of one as of the other, but the old pines are much less dense that way, or not dense at all.

This is the season of the fall when the leaves are whirled through the air like flocks of birds, the season of birch spangles, when you see afar a few clear-yellow leaves left on the tops of the birches.

It was a mistake for Britton to treat that Fox Hollow lot as he did. I remember a large old pine and chestnut wood there some, twenty years ago. He came and cut it off and burned it over, and ever since it has been good for nothing. I mean that acre at the bottom of the hollow. It is now one of those frosty hollows so common in Walden Woods, where little grows, sheep's fescue grass, sweet-fern, hazelnut bushes, and oak scrubs whose dead tops are two or three feet high, while the still living shoots are not more than half as high at their base. They have lingered so long and died down annually. At length I see a few birches and pines creeping into it, which at this rate in the course of a dozen years more will suggest a forest there. Was this wise?

Examined the stumps in the Baker chestnut lot which was cut when I surveyed it in the spring of '52. They were when cut commonly from fifty to sixty years old (some older, some younger). The sprouts from them are from three to six inches thick, and may average — the largest — four inches, and eighteen feet high. The wood is perhaps near half oak sprouts, and these are one and a half to four inches thick, or average two and a half, and not so high as the chestnut. Some of the largest chestnut stumps have sent up no sprout, yet others equally large and very much more decayed have sent up sprouts. Can this be owing to the different time when they were cut? The cutting was after April. The largest sprouts I chanced to notice were from a small stump in low ground. Some hemlock stumps there had a hundred rings.

Was overtaken by a sudden thunder-shower.

Cut a chestnut sprout two years old. It grew about five and a half feet the first year and three and a half the next, and was an inch in diameter. The tops of these sprouts, the last few inches, had died in the winter, so that a side bud continued them, and this made a slight curve in the sprout, thus: — There was on a cross-section, of course, but one ring of pores within the wood, just outside the large pith, the diameter of the first year's growth being just half an inch, radius a fourth of an inch. The thickness of the second year's growth was the same, or one fourth, but it was distinctly marked to the naked eye with about seven concentric lighter lines, which, I suppose, marked so many successive growths or waves of growth, or seasons in its year. These were not visible

through a microscope of considerable power, but best to the naked eye. Probably you could tell a seedling chestnut from a vigorous sprout, however old or large, provided the heart were perfectly sound to the pith, by the much more rapid growth of the last the first half-dozen years of its existence.

There are scarcely any chestnuts this year near Britton's, but I find as many as usual east of Flint's Pond.

Oct. 27. Emerson planted his lot with acorns (chiefly white oak) pretty generally the other day. There were a few scarlet oak acorns planted there on the south side in spring of '59. There is on the Lee farm, west of hill, a small wood-lot of oak and hickory, the south end chiefly hickory.

I have come out this afternoon to get ten seedling oaks out of a purely oak wood, and as many out of a purely pine wood, and then compare them. I look for trees one foot or less in height, and convenient to dig up. I could not find one in the last-named wood. I then searched in the large Wood's Park, the most oaken parts of it, wood some twenty-five or thirty years old, but I found only three. There were many shrub oaks and others three or four feet high, but no more of the kind described. Two of these three had singularly old large and irregular roots, mere gnarled oblong knobs, as it were, with slender shoots, having died down many times. After searching here more than half an hour I went into the new pitch and white pine lot just southwest, toward the old Lee cellar, and there were thousands of the seedling oaks only a foot high and less, quite reddening the ground now in some places, and these had perfectly good roots, though not so large as those near the Comer Spring (next to Rice's wall).

Here is a new but quite open pitch and white pine wood (with birches on south) on clodonia ground. It is so open that many pitch pines are springing up.

E. Wood's dense pitch (and white) pine wood in front of Lee house site conforms to the rule of few or no little pitch pines within it, but many white pines (though not many far within), while the pitch pines are springing up with white pines on the edge and even further toward the road.

The white pine wood southeast of this and not far north of railroad, against Wood's open land, is a new wood.

As I am coming out of this, looking for seedling oaks, I see a jay, which was screaming at me, fly to a white oak eight or ten rods from the wood in the pasture and directly alight on the ground, pick up an acorn, and fly back into the woods with it. This was one, perhaps the most effectual, way in which this wood was stocked with the numerous little oaks which I saw under that dense white pine grove. Where will you look for a jay sooner than in a dense pine thicket? It is there they commonly live, and build.

By looking to see what oaks grow in the open land near by or along the edge where the wood is extensively pine, I can tell surely what kinds of oaks I shall find under the pines.

What if the oaks are far off? Think how quickly a jay can come and go, and how many times in a day!

Swamp white oak acorns are pretty thick on the ground by the bridge, and all sound that I try. They have no more bitterness than the white oak acorns.

I have now examined many dense pine woods, both pitch and white, and several oak woods, in order to see how many and what kind of oak seedlings there were springing up in them, and I do not hesitate to say that seedlings under one foot high are very much more abundant under the pines than under the oaks. They prevail and are countless under the pines, while they are hard to find under the oaks, and what you do find have commonly — for whatever reason — very old and decayed roots and feeble shoots from them.

If you expect oaks to succeed a dense and purely oak wood you must depend almost entirely on sprouts, but they will succeed abundantly to pine where there is not an oak stump for them to sprout from. Notwithstanding that the acorns are produced only by oaks and not by pines, the fact is that there are comparatively few seedling oaks a foot or less in height under the oaks but thousands under the pines. I would not undertake to get a hundred oaks of this size suitable to transplant under a dense and pure oak wood, but I could easily get thousands from under pines. What are the reasons for this? First it is certain that, generally speaking, the soil under old oaks is more exhausted for oaks than under old pines. Second, seedling oaks under oaks would be less protected from frosts in the spring just after leafing, yet the sprouts prevail. Third, squirrels and jays resort to evergreens with their forage, and the oaks may not bear so many acorns but that the squirrels may carry off nearly all the sound ones. These are some of the reasons that occur to me.

To be more minute: —

I dug up three oak seedlings in the Woodis Park oaks, nine in the small open pitch and white pine and adjoining on southwest, and ten in the pitch and white pine of wood between road and railroad.

Woodis Park is oak and pine some twenty-five years old (the oak). I chose the oaken parts, but there was always a pine within a rod or two. I looked here till I was discouraged, finding only three in three quarters of an hour. One was like those in pine woods; the other two had singular gnarled and twisted great roots. You would think you had come upon a dead but buried stump. The largest, for instance, was perhaps a red oak nine inches high by one eighth inch at ground and apparently three years old, a slender shoot. The root broke off at about eighteen inches depth, where it was one eighth inch thick, and at three inches below the surface it was one and three eighths inches thick by one inch (being flattish). Two or three of the side or horizontal fibres had developed into stout roots which ran quite horizontally twenty inches and then broke off, and were apparently as long as the tap-root. One of these at three inches below surface was about half an inch thick and perfectly horizontal. It was thus fixed very firmly in the ground. I counted the dead bases or stubs of shoots (beside the present one) and several two or three times as large as this, which had formerly died down, being now perfectly decayed. If there was but one at a time and they decayed successively after living each three years only, — and they probably lived twice as long,

— then the root would be thirty years old. But supposing there were one and a half shoots at a time, it would then be some twenty years old. I think that this root may be as old as the large oaks around, or some twenty-five years, more or less.

My next nine oaks, from the pines southwest, may be put with the ten from the E. Wood pines (leaving out one which was twice the required height). Their average age, i.e. of the present shoot, was four years, and average height seven inches. (This includes white oak, shrub oak, black, and apparently red oak.) The roots averaged about ten inches long by three eighths thick at thickest part. Quite a number were shrub oak, which partly accounts for their slenderness. But the rest were not so thick as those near Rice's wall. Of all the above roots, or the whole twenty-two, none ran directly and perpendicularly downward, but they turned to one side (just under the acorn) and ran more or less horizontally or aslant one to five inches, or say three inches on an average. —

Of the last nineteen, more than half had died down once at least, so that they were really considerably older than at first appeared. There are, in all cases, at the surface of the ground or head of the root, a ring of dormant buds, ready to shoot up when an injury happens to the original shoot. One shoot at least had been cut off, and so killed, by a rabbit.

See a very large flock of crows.

To speak from recollection of pines and oaks, I should say that our woods were chiefly pine and oak mixed, but we have also (to speak of the large growth, or trees) pure pine and pure oak woods. How are these three produced? Are not the pure pine woods commonly new woods, i.e. pioneers? After oaks have once got established, it must be hard to get them out without clearing the land. A pure oak wood may be obtained by cutting off at once and clean a pure and dense pine wood, and again sometimes by cutting the same oak wood. But pines are continually stealing into oaks, and oaks into pines, where respectively they are not too dense, as where they are burned or otherwise thinned, and so mixed woods may arise.

Oct. 28. In a pine wood are the little oak seedlings which I have described, also, in the more open parts, little oaks three to six feet high, but unnoticed, and perhaps some other hardwood trees. The pines are cut, and the oaks, etc., soon fill the space, for there is nothing else ready to grow there.

Are not the most exclusively pine woods new woods, i.e., those which have recently sprung up in open land, where oaks do not begin a forest? It may be that where evergreens most prevail in our woods, there at the date of their springing up the earth was most bare.

P. M. — To Lincoln.

Do I not see tree sparrows?

I see little larches two to six feet high in the meadow on the north side the Turnpike, six to twelve rods from Everett's seed-bearing ones. The seed was evidently blown from these.

There is quite a dense birch wood in the field north of the Cut on the Turnpike hill.

See much cat-tail whose down has recently burst and shows white on the south side of the heads. The *Polygonum aviculare* is in bloom as freshly and abundantly in some places as ever I saw it. Those great tufts of sedge in the meadows are quite brown and withered. I suppose they have been so since the beginning of the month.

Smith's black walnuts are about half of them fallen.

Measure the chestnut stump near the brook northeast of the old Brooks Tavern on Asa White's land. Its height from the ground will average but twenty inches. Measured one way, its diameter is six feet nine inches, and at right angles with this, eight feet five inches. Its average diameter seven feet seven inches. You might add three to four feet more for the whole stump above ground. Beginning at the outside, I count one hundred and two rings distinctly and am then fifteen inches from the apparent centre of the tree, for the middle is mostly rotted and gone. Measuring back fifteen inches and counting the rings, I get thirty-nine, which, added to one hundred and two, equals one hundred and forty-one for the probable age of the tree. This tree had grown very fast till the last fifty years of its existence, but since comparatively slowly. It had grown nine inches in the last forty-nine years, or one seventh [sic] of an inch in a year, but fifteen inches in the previous forty, or three eighths of an inch in a year. There may possibly have been two shoots or trees grown together, yet I think not. I measured this June 1st, 1852, and it had then been cut, as I remember, but a short time, — a winter, perhaps two winters, before. This would carry its origin back to about 1710. Probably chestnuts did not grow so large in the primitive woods, and this was a forest tree, which, as it stood near the edge of the meadow, was left standing. Another much smaller was cut apparently at the same time near by. Having light and air and room, it grew larger than it would have done if its neighbors had not been cut.

I also measured the stumps of the two great chestnuts which were cut on Weston's land south of the pond some five or six years ago.

They are cut low, some eight or nine inches above ground. The southeasternmost one measures four feet in diameter and has about eighty rings only (I estimate the first five or six, the heart or core being gone). The other is four and five twelfths feet in diameter and has seventy-three rings only. Or, putting both together, you have an average growth of about a third of an inch in a year. These were as large as any I know standing hereabouts except the Strawberry Hill one, and yet it seems they [were] only some eighty years old. Another, half a mile east of there, cut perhaps some dozen years ago, was twenty-three inches in diameter and had sixty-three rings, and I saw one which had grown faster than any of the above. Yet another stump near the last on the high woodland near the pond was but just two feet in diameter and had one hundred and one rings distinct to the very core, and so fine there I think it was a seedling. From this sprouts had grown some fifteen years ago and [had been] cut last winter on account of a fire, and fresh shoots several feet high had put out from the last. The one that had grown slowly was soundest at the core. None of the three largest stumps described had sprouts from them. Is not the very rapid growth and the hollow or rotten core one sign of a sprout? We make a great noise going through the fallen

leaves in the woods and wood-paths now, so that we cannot hear other sounds, as of birds or other people. It reminds me of the tumult of the waves dashing against each other or your boat. This is the dash we hear as we sail the woods.

Cut a limb of a cedar (near the Irishman's shanty-site at Flint's Pond) some two inches thick and three and a half feet from the ground. It had about forty-one rings. Adding ten, you have say fifty years for the age of the tree. It was one foot in diameter at one foot above ground and twenty or more feet high, standing in the young wood. A little cedar five feet high near it had some fifteen to seventeen rings. See a great many chestnut sprouts full six feet high and more and an inch or more thick the first year.

Aaron's-rod has minute chaffy seeds, now ripe, which by their very lightness could be blown along the highways.

Oct. 29. P. M. — To Eb. Hubbard's old black birch hill.

Henry Shattuck's is a new pitch pine wood, say thirty years old. The western, or greater, part contains not a single seed-bearing white pine. It is a remarkable proof of my theory, for it contains thousands of little white pines but scarcely one little pitch pine. It is also well stocked with minute oak seedlings. It is a dense wood, say a dozen rods wide by three or four times as long, running east and west, with an oak wood on the north, from which the squirrels brought the acorns. A strip of nearly the same width of the pitch pine was cut apparently within a year on the south (a part of the above), and has just been harrowed and sown with rye, and still it is all dotted over with the little oak seedlings between the [stumps], which are perhaps unnoticed by Shattuck, but if he would keep his plow and fire out he would still have a pretty green patch there by next fall. A thousand little red flags (changed oak leaves) already wave over the green rye amid the stumps. The farmer stumbles over these in his walk, and sweats while he endeavors to clear the land of them, and yet wonders how oaks ever succeed to pines, as if he did not consider what these are. Where these pines are dense they are slender and tall. On the edge or in open land they are more stout and spreading.

Again, as day before yesterday, sitting on the edge of a pine wood, I see a jay fly to a white oak half a dozen rods off in the pasture, and, gathering an acorn from the ground, hammer away at it under its foot on a limb of the oak, with an awkward and rapid seesaw or teetering motion, it has to lift its head so high to acquire the requisite momentum. The jays scold about almost every white oak tree, since we hinder their coming to it.

At some of the white oaks visited on the 11th, where the acorns were so thick on the ground and trees, I now find them perhaps nearly half picked up, yet perhaps little more than two thirds spoiled. The good appear to be all sprouted now. There are certainly many more sound ones here than at Beck Stow's and Hubbard's Grove, and it looks as if the injury had been done by frost, but perhaps some of it was done by the very heavy rains of September alone.

Yesterday and to-day I have walked rapidly through extensive chestnut woods without seeing what I thought was a seedling chestnut, yet I can soon find them in our

Concord pines a quarter or half a mile from the chestnut woods. Several have expressed their surprise to me that they cannot find a seedling chestnut to transplant. I think that [it] is with them precisely as with the oaks; not only a seedling is more difficult to distinguish in a chestnut wood, but it is really far more rare there than in the adjacent pine, mixed, and oak woods. After considerable experience in searching for these and seedling oaks, I have learned to neglect the chestnut and oak woods and go only to the neighboring woods of a different species for them. Only that course will pay.

On the side of E. Hubbard's hill I see an old chestnut stump some two feet in diameter and nearly two feet high, and its outside and form well kept, yet all the inside gone; and from this shot up four sprouts in a square around it, which were cut down seven or eight years ago. Their rings number forty-six, and they are quite sound, so that the old stump was cut some fifty-three years ago. This is the oldest stump of whose age I am certain. Hence I have no doubt that there are many stumps left in this town which were cut in the last century. I am surprised to find on this hill (cut some seven or eight years ago) many remarkably old stumps wonderfully preserved, especially on the north side the hill, — walnuts, white oak and other oaks, and black birch. One white oak is eighteen and a half inches in diameter and has one hundred and forty-three rings. This is very one-sided in its growth, the centre being just four inches from the north side, or thirty-six rings to an inch. Of course I counted the other side. Another, close by, gave one hundred and forty-one rings, another white oak fifteen and a half inches in diameter had one hundred and fifty-five rings. It has so smooth (sawed off) and solid, almost a polished or marble-like, surface that I could not at first tell what kind of wood it was. Another white oak the same as last in rings, i.e. one hundred and fifty-five, twenty-four inches [in] diameter. All these were sound to the very core, so that I could see the first circles, and I suspect that they were seedlings.

The smaller, but oldest ones had grown very slowly at first, and yet more slowly at last, but after some sixty-five years they had then grown much faster for about fifteen years, and then grew slower and slower to the last. The rings were exceedingly close together near the outside, yet not proportionably difficult to count. For aught that appeared, they might have continued to grow a century longer. The stumps are far apart, so that this formed an open grove, and that probably made the wood sounder and more durable. On the south slope many white pines had been cut about forty-six years ago, or when the chestnut was, amid the oaks. I suppose that these were seedlings, and perhaps the hill was cleared soon after the settlement of the town, and after a while pines sprang up in the open land, and seedling oaks under the pines, and, the latter being cut near the end of the seventeenth century, those oaks sprang up, with or without pines, but all but these were cut down when they were about sixty years old.

If these are seedlings, then seedlings make much the best timber. I should say that the pasture oaks generally must be seedlings on account of their age, being part of the primitive wood.

I suspect that sprouts, like the chestnut, for example, may grow very rapidly, and make large trees in comparatively few years, but they will be decaying [?] as fast at

the core as they are growing at the circumference. The stumps of chestnuts, especially sprouts, are very shaky. It is with men as with trees; you must grow slowly to last long. The oldest of these oaks began their existence about 1697.

I doubt if there were any as old trees in our primitive wood as stood in this town fifty years ago. The healthiest of the primitive wood, having at length more room, light, and air, probably grew larger than its ancestors.

Some of the black birch stumps gave about One hundred rings.

The pasture oak which Sted Buttrick cut some seven or eight years ago, northeast of this, was, as near as I could tell, — one third was calculation, — some one hundred years old only, though larger than any of these.

The fine chips which are left on the centre of a large stump preserve it moist there, and rapidly hasten its decay.

The site of the last-named pasture oak was easily discovered, by a very large open grass-sward where no sweet-fern, lambkill, huckleberry, and brakes grew, as they did almost everywhere else. This may be because of the cattle assembling under the oak, and so killing the bushes and at the same time manuring the ground for grass.

There is more chestnut in the northern part of the town than I was aware of. The first large wood north of Ponkawtasset is oak and chestnut. East of my house.

Oct. 30. P. M. — To Tarbell pitch pines, etc.

Quite a sultry, cloudy afternoon, — hot walking in woods and lowland where there is no air.

J. Hosmer cut off the northernmost part of his pitch pine between roads, i.e. next the factory road, last winter. Here was a remarkable example of little white pines under pitch pines with scarcely any little pitch pines. He has accordingly cut off all the pitch pines — and they are some thirty-five years old — and left the white pines, now on an average five to eight feet high and forming already a pretty dense wood (E. Wood is doing the same thing now opposite the Colburn place), a valuable and salable woodland, while a great many little oaks, birches, black cherries, etc., are springing up in their midst; so that it may finally be a mixed wood, if the pines do not overshadow it too quickly. Yet there were only three or four seed-bearing white pines in the grove, — or as big as the pitch pines were. The white pines left are as thick as the pitch pines were under which they sprang up; quite dense enough to grow. I am more and more struck by the commonness of this phenomenon of seedling white pines under older pitch pines and the rareness with which pitch pines spring up under older pitch pines. Yet, going to the open land on east side of the wood, I find that it is mainly the little pitch pines that are spreading into the field there and extending the wood, some a dozen rods from its edge in the grass; and their relative proportion is reversed, i.e. there are fifty to one hundred little pitch pines here to one white pine. He had also cut off some, a few, birches, and their sprouts had come up, as well as seedlings.

The oak seedlings between the young pitch pines were manifestly springing up with new vigor, though many may finally be choked by the white pines. Omitting such as were of the character of sprouts, though not cut (i.e., had shot up from old roots to

three feet high merely on account of the influx of light and air), I measured this year's growth of the first four which were under a foot high, here where the pitch pines had been cut, and found it to average five and a half inches. The growth of [the] first four in the adjacent pitch pine wood not cut averaged seven and a half. As may be seen, this was not nearly fair enough to the partially cleared part, for I should have included the higher shoots.

The higher parts of this lot are cladonia land. I measured the diameter of several of the pitch pine stumps and counted the rings, with this result: —

Diameter (exclusive of bark) — Rings 7 1/2 inches — 29

7 1/2 — 33

6 — 40

6 1/2 — 33

6 — 40

— 7 — 30

7)48 3/4 — 7)240

7 — 34

That is, they averaged seven inches in diameter (or eight with bark) and were thirty-four years old. Had grown (68)7.0(.10) about one tenth of an inch a year from the centre.

White pines will find their way up between pitch pines if they are not very large and exceedingly dense, but pitch pines will not grow up under pitch pines.

I see nowadays in the pitch pine woods countless white toadstools which have recently been devoured and broken in pieces and left on the ground and occasionally on the branches or forks of trees, no doubt by the squirrels. They appear to make a considerable part of their food at this season.

See a small copper butterfly.

In what I have called the Loring lot, next west of Hosmer's pitch pine on the back road, though far the greater part numerically is still shrub oak, there is now a considerable growth of young oaks rising above the shrub oaks. These oaks, as far as I observe, are almost, if not quite, all sprouts from small stumps which were unnoticed at first, and there are also a very few seedling white and other oaks no higher than the shrub oaks; i.e., though you may think his oak sprout-land all shrub oak, it probably is not, as will appear when the other kinds rise above the shrubs. Probably the shrub oaks can bear exposure when young better than the nobler oaks, and if the squirrels plant other acorns under them, — which may be doubted, — then it will turn out that they serve as nurses to the others.

I measure amid these young oaks a white pine stump.

Diameter (exclusive of bark) — Rings 13 1/2 inches — 85

Another 28 — 52

24 — 46

3)65 1/2 — 133

22 — “

Average growth one half inch a year at the level at which stumps are sawed.

This lot is now as exclusively oak as it was pines before. You must search to find a few little white pines scattered in it. But why, if there are so many little white pines under the adjacent pitch pines, which are left when the pitch pines are cut, were there no more to be left under the pitch pine part (along the road) of this lot? I think of no reason, unless the pitch pines on this lot were too old and dense. Again, I notice that Hosmer's pitch pines have not spread west at all into this clearing, but only east into the grass ground.

Into this Loring lot years ago the squirrels brought acorns, and hence the oaks which now cover it. Also the wind blew its own seeds into an open strip across the road, and a dense pitch and white pine wood sprang up there. Already, the Loring lot having been cut seven or eight years, the squirrels are carrying the shrub oak acorns from it into that pine strip, and the pine seed from the most forward of that strip is blowing back into the shrub oak land.

Another advantage the shrub oak has over other oaks [is] that it gets to fruit so quickly — certainly in three or four years after the pines are cut — and then bears so profusely.

See a great flock of blackbirds, probably grackles.

Examine Tarbell's pitch pine grove. This is all of one age and very dense. The largest trees on the north side, as estimated by sawing a branch, are twenty-eight to thirty years old. Tarbell says this grove came up in 1826 on land which had been burnt over, — in fact open land. It is so dense that, though it has been thoroughly trimmed up and is only a dozen or fifteen rods wide, you cannot see through it in some directions.

About as dense a pitch pine grove as I know. It is twenty rods from the nearest wood on one side and five times as far from any other, and yet it is well planted with seedling oaks. Looking hastily to where they are most numerous, I counted ten within fifteen square feet, but only five pitch pines within any equal area; i.e. there were twice as many oaks as large pines there.

This wood also proves my theory of little white pines in large pitch pines. There is not a seed-bearing white pine, or one six feet high, in the wood, nor less than twenty rods from it, and yet there is a thriving little white pine some two feet high at every rod or two within this wood, and though not very numerous, they are conspicuously more numerous and thriving than the pitch pines, yet on the edge the little pitch pines were as much more numerous than the white.

Having seen this fall a great many pitch pine twigs which had been cut off and dropped under the trees by squirrels, I tried the other night while in bed to account for it. I began by referring it to their necessities, and, remembering my own experience, I said then it was done either for food, shelter, clothing, or fuel, but throwing out the last two, which they do not use, it was either for food or shelter. But I never see these twigs used in their nests. Hence I presume it was for food, and as all that I know them to eat on the pitch pine is its seeds, my swift conclusion was that they cut off these twigs in order to come at the cones and also to make them more portable. I am to-day

convinced of this, — for I have been looking after it for a day or two. As usual, the ground under this grove is quite strewn with the twigs, but here is one eleven inches long and nearly half an inch thick cut off close below two closed cones, one cone-stem also being partly cut. Also, three or four rods west from this grove, in open land, I see three twigs which have been dropped close together. One is just two feet long and cut off where half an inch thick and more than one foot below three cones (two on one branch and one on another), and the cones are left. Another is still larger, and the other smaller, but their cones are gone. The greater part of the twigs have been cut off above the cones, — mere plumes.

So even the squirrels carry and spread the pine seed far over the fields. I suspect that they bury these cones like nuts. I have seen the cones collected ready to be carried off, where they did not live. It is remarkable to consider how rudely they strip and spoil the trees. It is remarkable how they carried some of these great twigs with their burden of cones.

The fact that the lower limbs of pines growing within a wood always die shows how much they depend on light and air. They are only a green spiring top.

Measure one of Tarbell's black birch stumps: 23 inches [in] diameter (exclusive of bark), 60 rings. A log from a different one: 21 inches, 71 (?) rings. A white oak stump near by: 15 inches, 90 rings (on brow of bank). A black (?) oak stump: 32 inches [in] diameter, 84 rings.

Examine a dozen white pines in a field, and conclude from these that they begin to grow faster the fifth or sixth year, counting by the whorls of branches.

J. Hosmer cut off his little pitch pine grove west of Clamshell, and left the single large old pine which seeded it to do him the same service again; and here now, where for the second time (since) he has sown winter-rye, I see the ineffectual oak sprouts uplifting a few colored leaves still and blushing for him.

The squirrels have no notion of starving in a hard winter, and therefore they are unceasingly employed in the fall in foraging. Every thick wood, especially evergreens, is their storehouse against necessity, and they pack it as thickly as they can with nuts and seeds of all kinds. The squirrel which you see at this season running so glibly along the fence with his tail waving over his head, with frequent pauses on a post or stone, which you watch, perhaps, for twenty or thirty rods, has probably a nut or two in his mouth which he is conveying to yonder thicket.

Evidently a great deal depends on the locality and other conditions of a stump to affect its durability. The oak stump at Clamshell cut some twenty years since barely shows a trace of the axe, while the chestnut stump on Hubbard's hill, cut more than fifty years ago, is much better preserved.

Oct. 31. P. M. — To Wheeler's artificial pine wood.

Exclusive and dense white pine woods are not nearly so common in this town as the same kind of pitch pine woods. They are more likely to have oaks in them. There is a dense birch wood in Witherell Vale.

Among old stumps I have not named those white pine ones used as fences with their roots. I think that some of these must be older than any left in the ground. I remember some on the Comer road, which apparently have not changed for more than thirty years, and are said to be ninety years old. Lying thus high and dry, they are almost indestructible, and I can still easily count the rings of many of these. I count one hundred and twenty-six rings on one this afternoon, and who knows but it is a hundred years since it was cut? They decay much faster left upright in the ground than lying on their sides on the surface, supposing it open land in both cases.

Perhaps these great pine roots which grew in a swamp were provided with some peculiar quality by which to resist the influence of moisture and so endure the changes of the weather.

Yes, these dense and stretching oak forests, whose withered leaves now redden and rustle on the hills for many a New England mile, were all planted by the labor of animals. For after some weeks of close scrutiny I cannot avoid the conclusion that our modern oak woods sooner or later spring up from an acorn, not where it has fallen from its tree, for that is the exception, but where it has been dropped or placed by an animal. Consider what a vast work these forest-planters are doing!

I do not state the facts exactly in the order in which they were observed, but select out of very numerous observations extended over a series of years the most important ones, and describe them in their natural order.

So far as our noblest hardwood forests are concerned, the animals, especially squirrels and jays, are our greatest and almost only benefactors. It is to them that we owe this gift. It is not in vain that the squirrels live in or about every forest tree, or hollow log, and every wall and heap of stones.

Looked at the white pine grove set out by the father of Francis Wheeler some twenty-two or three years ago southwest of his house. They are in three or four irregular rows some eighteen rods long by four wide, — some one hundred trees, covering half an acre of sandy hillside. Probably not so many trees as Emerson's, but making more show. They are trimmed up. There are neither small white nor pitch pines beneath them, but I see that the seeds of the pitch pines which grow below them have been blown through this grove and come up thickly along its outer edge.

Look at a pure strip of old white pine wood on the hillside west of this. There are no little white pines coming up under them, but plenty of them in the open hollows around and under its edge. This I commonly notice. White pines, it is true, may come up in the more open parts of any wood, whether a pine or oak or mixed wood, in more open places caused by cutting, for instance; but the pitch pine requires much more of an opening.

I see by the road east of White Pond a large white pine wood with some oaks in it. There are no little white pines where it is dense, but one rod off across the road eastward there is a dense row concealing the lower rail (many quite under it) for many rods, — the only place where they are allowed to grow there.

Many a man's field has a dense border of pitch pines which strayed into it when the adjacent woods were of that species, though they are now hardwood.

Consider what a demand for arrowheads there must be, that the surface of the earth should be thus sprinkled with them, — the arrowhead and all the disposition it implies toward both man and brute. There they lie, pointed still, making part of the sands of almost every field.

I cut two shrub oaks (in different places) which have respectively ten and twenty rings. The last was a large and old one in a hedge.

I first noticed the pitch pine twigs cut off by squirrels the 16th. Think how busy they were about that time in every pitch pine grove all over the State, cutting off the twigs and collecting the cones! While the farmer is digging his potatoes and gathering his com he little thinks of this harvest of pine cones which the squirrel is gathering in the neighboring woods still more sedulously than himself.

I saw on the 28th, close by the stump of the easternmost big chestnut at Flint's Pond, the *Phallus impudicus*.

I hear the sound of the flail in M. Miles's bam, and gradually draw near to it from the woods, thinking many things. I find that the thresher is a Haynes of Sudbury, and he complains of the hard work and a lame back. Indeed, he cannot stand up straight. So all is not gold that glitters. This sound is not so musical after I have withdrawn. It was as well to have heard this music afar off. He complains also that the weather is not fit for his work, — that it is so muggy that he cannot dry the sheaves, and the grain will not fly out when struck. The floor, too, is uneven, and he pointed out one board more prominent on which he had broken two or three swingles.

He thought that there were larger trees in Sudbury, on what was John Hunt's land, now occupied by Thompson, near the old store, than in Inches Woods. Said there was a tree by the roadside on the farm of the late William Read in West Acton which nobody thereabouts knew the name of, but he had been South, and knew it to be a China-berry tree planted by a robin, for they are very fond of its fruit.

## NOVEMBER, 1860

Nov. 1. 2 p. M. — To Tommy Wheeler wood-lot.

A perfect Indian-summer day, and wonderfully warm. 72 + at 1 P. M. and probably warmer at two.

The butterflies are out again, — probably some new broods. I see the common yellow and two *Vanessa Antiopa*, and yellow-winged grasshoppers with blackish edges.

A striped snake basks in the sun amid dry leaves. Very much gossamer on the withered grass is shimmering in the fields, and flocks of it are sailing in the air.

Measure some pine stumps on Tommy Wheeler's land, about that now frosty hollow, cut as I judge from sprouts four years ago.

First the pitch pine: —

That is, they all together averaged in growth from first to last about a fifteenth of an inch in a year. But they grew very slowly indeed for the last fifty or more years. They did nearly half (?) their growing in the first third of their existence. For example, (I measure now on that side where I counted, i.e. the broadest, so that my figures are not absolutely but relatively true), —

The 7th grew only something less than three inches (which was all of the sap) in the last sixty-seven or eight years, or one twenty-second of an inch a year only. Indeed, in one case, the 6th, the outside had grown only one and one fourth inches in sixty-four years, or about one fiftieth of an inch in a year, just one inch in the last fifty-three years, or one fifty-third of an inch a year, — equal to the finest scales. I should say that they averaged but one thirty-sixth part of an inch the third or last fifty years.

That is, their rate of growth the three successive periods of fifty years diminishes in geometrical progression, the quotient being two.

The seven pitch pine stumps measured on the 30th averaged thirty-four years and had grown a tenth of an inch in a year. This is a perfect and remarkable agreement, and quite unlooked for. They were a mile apart, and I was not reminded of those previous measurements until I chanced to compare them afterward.

I may therefore take this to be [the] average growth of a pitch pine for the first fifty years. But I have not yet taken into the account the fact that, though the thickness of the layer is less, its superficies, or extent, is greater, as the diameter of the tree increases. Let us compare the three portions of wood.

If the diameter at the end of the first fifty years is four, the second fifty, six, and the third fifty, seven, then the amount of wood added each term will be (to omit very minute fractions) twelve and a half, fifteen and a half, and ten respectively. So that, though in the second fifty the rings are twice as near together, yet considerably more wood is produced than in the first, but in the third fifty the tree is evidently enfeebled, and it probably is not profitable (so far as bulk is concerned) to let it grow any more.

The very oldest trees whose rings I have counted (i.e. these pitch pines and the oaks on Eb. Hubbard's hill) grew thus slowly at last, which I think indicates that a tree has a definite age after which it grows more languidly or feebly, and thus gradually ceases to grow at all, — dies and decays. I should say that these pitch pines flourished till they were about a hundred years old, and that they then began to grow with less vigor, though their old age (in this sense) might be a third or more of their whole life. Two or three more were dead or nearly dead when sawed four years ago, and I saw the rotted stumps of some others.

There were twenty or thirty of the pitch pines, — though I measured the largest of them, — and they were all but one or two perfectly sound to the core, and the inmost rings were the plainest. The sap was only from one and three quarters to three inches thick, and was the most decayed. (It was one and three quarters inches thick in No. 6.) The bark was generally from two to two and three quarters inches thick. This would

have added four and three quarters to the average diameter of the trees, or made it twenty-four and three quarters. That is, where sawed off, which was rather low, or say eight to ten inches above ground.

There were also as many or more large white pines mixed with them. One of 24 inches diameter had 78 rings; second, 31 inches, 96 rings. Also one hemlock 21 inches, 81 rings. This had grown with remarkable equality throughout and was very easy to count. An oak (probably black), 14 inches, 94 rings.

About a hundred and fifty years ago, then, there came up in and around this hollow in the woods a grove of pitch pines. Perhaps some came up twenty or thirty years earlier, which have now died and decayed. When the first had grown for about sixty years, many white pines sprang up amid and under them, as we see happen to-day.

I occasionally (or frequently) see white pines springing up in a sprout-land when other trees have failed to fill it up for some years.

No. 6, having 164 rings and having been cut four years, sprang up at least one hundred and sixty-eight years ago, or about the year 1692, or fifty-seven years after the settlement, 1635.

In another case I counted fifteen rings (with a microscope) within the last quarter of an inch, which was at the rate of one sixtieth of an inch in a year, — equal, I think, to the finest scales ordinarily used.

#### WHITE PINE WOODS

The small dense grove of Clark's (?), north of Boze's [sic] Meadow.

Near road, southwest of Tarbell's.

Abel Hosmer's, north and northwest of house.

Mason's pasture (south of this, younger white pine with cedars intermixed). —

The Holden Swamp woods as seen from north (except southwest part).

Northeast part of Baker Farm, quite young.

Behind Martial Miles's, southwest of cold pond-hole.

East side Second Division Brook, very extensive.

I have seen that a great many pitch pine cones have been cut off this fall, but it chances that I have not seen where they were eaten or stripped. I conclude, therefore, that they must be collected into some hole in a tree or in the earth, — there can hardly be a doubt of this, — and possibly some are buried as nuts are. What stores of them there must be collected in some places now!

#### PITCH PINE WOODS

Young, north of Loring's Pond.

Just beyond Concord bound on right hand, this side Wetherbee's, extensive and large. (Tarbell says that when he came to town in '26 these were just about as large as his now. Sixty to seventy years old, then.)

Heywood's small grove southeast of Peter's.

Large, southeast Copan.

Beyond Nathan Barrett's, both sides road, large.

Hill behind Abner Buttrick's.

Lane south of second Garfield house.  
Southwest of Brooks's Pigeon-Place.  
North G. M. Barrett's, by College Road.  
Northeast of Sam Barrett's mill.

Northwest of Sam Barrett's mill, west of pond.

Nov. 2. P. M. — To D. Wetherbee's old oak lot. As several days past, it has been cloudy and misty in the morning and fairer and warmer, if not Indian summer, in the afternoon; yet the mist lingers in drops on the cobwebs and grass until night.

#### HARDWOOD LOTS

Saw off a very large and old-looking shrub oak on a pitch pine plain, twelve or more feet in height and three and one half inches in diameter (the wood) at one foot from the ground, where it has just twenty-seven rings. The first fourteen rings occupied one and a quarter inches from the centre, where the whole radius was but one and three quarters. It evidently began to grow more slowly when fifteen years old.

Wetherbee's oak lot may contain four or five acres. The trees are white, red, scarlet, and swamp white oaks, maple, white pine, and ash. They are unusually large and old. Indeed, I doubt if there is another hereabouts of oaks as large. It is said that Wetherbee left them for the sake of mast for pigeons.

I measure a white oak at three feet from the ground, — eight feet four and one half inches in circumference. Another white oak at same height is six and three quarters in circumference; a red oak is six feet two inches in circumference; another, eight and a half; another, seven and four twelfths; and the scarlet oaks are of the same character, though the above were the largest, or among the largest. These oaks, though they form a wood, are some of them about as spreading as a pasture oak (i.e. one or two white ones near the outside), but generally they rise much higher before they branch. The white oaks have peculiarly smooth tawny-white boles for eight or ten feet up, the coarser flakes of the bark having scaled off so far. The red oaks, as well as scarlet, have a coarser and rougher, more deeply furrowed bark, and the trees rise higher before branching (commonly). One not very large had no limb for thirty feet or more, standing aslant. In the lowest part, on the brook, they were swamp white oaks and maples. The maples, being old, had a rough, dark, scaly bark. There were a few white pines straggling into this wood (only one large one).

Many of the oaks have been cut, and I counted about one hundred and ten rings on one small white oak, from which I should infer that the trees would average much more than that, perhaps between a hundred and fifty and two hundred years. Such a wood has got to be very rare in this neighborhood. Even the gray brushy tops of this attract your attention at a distance.

As you approach the wood, and even walk through it, the trees do not affect you as large, but as surely as you go quite up to one you are surprised. The very lichens and mosses which cover the rocks under these trees seem, and probably are in some

respects, peculiar. Such a wood, at the same time that it suggests antiquity, imparts an unusual dignity to the earth.

It is pleasing to see under the trees great rocks covered with polypody, which has caught a great crop of shining brown oak leaves to contrast with its green. This oak wood is now bare and the leaves just fairly fallen.

This is probably one of those woods, like Ebby Hubbard's, which was never cut off but only cut out of.

I think it would be worth the while to introduce a school of children to such a grove, that they may get an idea of the primitive oaks before they are all gone, instead of hiring botanists to lecture to them when it is too late. Why, you do not now often meet with a respectable oak stump even, for they too have decayed.

I see a this year's sound red oak acorn tucked into a crevice in the bark of a white oak a foot or more from the ground.

Even in this old oak wood there is to be observed a resemblance to the primitive woods. The ground, never having been cleared nor cultivated, has a more primitive look; there are more ferns on it, and the rocks are far greener, with these and with lichens, never having been burned and bleached white by sun and fire.

Lee of the Corner speaks of an oak lot of his in Sudbury, which he bought in '31 and cut off (last and all of it last winter), but from the older stumps no sprouts have come up, but good ones from the younger.

You see the tufts of indigo now broken off and dropped exactly bottom up in the pastures, as if an industrious farmer had been collecting it by handfuls, which he had dropped thus.

It would be just as sensible for them to treat their young orchards or nurseries of apple trees in the same way, i.e., to burn them over and raise rye there a year or two, thinking to do them good.

As for the *Vaccinia*, I am disposed to agree with those who derive the name from *bacca*, a berry, for one species or another of this large family is the berry of berries in most northern parts of the world. They form an under-shrub, or sort of lower forest, even throughout our woodlands generally, to say nothing of open fields and hills. They form a humble and more or less dormant, but yet vivacious forest under a forest, which bides its time.

This wonderful activity of the squirrels in collecting and dispersing and planting nuts and acorns, etc., etc., every autumn is the more necessary since the trees on whose fruit they mainly live are not annual plants like the wheat which supplies our staff of life. If the wheat crop fails this year, we have only to sow more the next year, and reap a speedy harvest, but if the forests were to be planted only at intervals equal to the age of the trees, there would be danger, what with fires and blight and insects, of a sudden failure and famine. It is important that there be countless trees in every stage of growth, — that there be an annual planting, as of wheat. Consider the amount of work they have to do, the area to be planted!

More or less rainy to-day.

I hear that geese went over to-day, alighted in Walden.

Nov. 4. P. M. — To Tommy Wheeler's lot.

As I go over John Hosmer's High Level, there being considerable wind, I notice for the first time that peculiar blueness of the river agitated by the wind and contrasting with the tawny fields, a fall phenomenon. Tarbell's white pine grove northwest of the Irishman's, in the swamp, and some thirty to forty years old, is so dense that there is no growth under it, only a tawny carpet of pine-needles.

In the Tommy Wheeler lot south of the old pitch pine hollow, I see the stumps of many white pines and oaks which were cut some four years ago, and no fire has been set there. These oak stumps have generally fifty-three or fifty-four rings, though some pitch pines and oaks are much older; but I scarcely see a stump of this age even which has sent up any shoots. I notice one. The sprouts are from a much younger growth. It is evident that all the larger stumps were too old and effete, young as they were. In two or three cases I notice these stumps of oaks cut some four years ago and having fifty-three or four rings (from which no shoot has put forth), two together, half inclosing in a semicircle a very old and almost completely decayed stump, which, of course, was cut some fifty-eight years ago. These sprouts are rarely sound quite to the core. Perhaps the rest are sprouts whose stumps have quite disappeared, and this, i.e. the great age of the roots, may account for its sending up no more sprouts. I see, then, that the stumps of trees which were cut sixty years ago are still very common to be seen in our woods.

I have but little doubt that if Wetherbee's old oak lot should now be cut no sprouts would come up from the stumps. It is by seeds that oaks would have to be renewed there, if at all; but rather it is time for a different growth, i.e. for pines, and if he contemplates the removal of these oaks he should be considering how to favor the growth of pines there. They are already appearing thinly on various sides within that wood.

I frequently notice the seeds of small fruits and weeds left on stumps by birds and mice and even foxes (in their excrement).

There is primitive wood which has never been touched by the civilized man. We have none of this.

Then there is primitive woodland, i.e., which has never been cut clean off, and which in age now is mostly second growth.

Then there is primitive copsewood, i.e., which has been cut clean off but suffered to grow up again without further clearing or burning.

Then copsewood of other kinds.

Sophia brings me the drawer which held her acorns (almost all red oak). It is seventeen and a half inches by twelve and a half and two inches deep, and I count, crawling about on the bottom, one hundred and seventy-three great full-grown grubs with brown heads, which have come out of the acorns by a hole, oftenest at the edge of the cup on one side. And many of the grubs had been thrown away, and probably some had crawled away within a month, and no doubt more are still to come out. Also the bot-

tom of this box is covered with four or five times as many minute pink grubs which may be the progeny of the former: here are at least eight hundred and sixty-five (or say one thousand) grubs to about four quarts of acorns with their cups (the box was hardly more than half full). I find that sixty red oak acorns with their cups make one pint. There were, therefore, about five hundred acorns to one hundred and seventy-three large grubs already out in the box, to say nothing of those that have been thrown and have crawled away, nor of the seven or eight hundred young grubs and probably more yet to be produced. Not quite half of the acorns, then, have grubs in them. Now add the squirrels, jays, crows, and other birds and quadrupeds that feed on them, and the effect of the winter's cold and rain, and how many of the acorns of this year will be fit to plant next spring?

It appears that nearly half of these red oaks have already manifestly been destroyed by worms. It is evident that there will be at least two grubs to one of these acorns, though of course the grubs will not always be with the acorn. This is one of the nut weevils, and since they come from eggs laid by a beetle, it would seem that many eggs must have been recently laid.

White birch seed has but recently begun to fall. I see a quarter of an inch of many catkins bare. May have begun for a week. To-day also I see distinctly the tree sparrows, and probably saw them, as supposed, some days ago. Perhaps they feed on the birch seed as the linarias do. Thus the birch begins to shed its seed about the time our winter birds arrive from the north.

Nov. 5. P. M. — To Blood's oak lot.

Measure the great white oak near the bars of the bridle-road just beyond the north-east corner of the Holden (?) farm. At the ground it is about nineteen feet in circumference. At three feet from the ground it is eleven feet and seven inches in circumference, and the same at five feet and apparently more above this. It is about sixteen feet to the lowest limb. The whole trunk standing aslant. It has a black and quite rough bark, not at all like that of the white oaks of Wetherbee's and Blood's lots. There is a large open space amid the huckleberry bushes beneath it, covered with a short and peculiarly green sward, and this I see is the case with other oaks a quarter of a mile off.

There is a large chestnut in the lot east of this, and I observe that its top is composed of many small branches and twigs disposed very regularly and densely, brush-wise, with a firm, distinct, more than semicircular edge against the horizon, very unlike the irregular, open, and more scraggy-twigged oak.

Blood's oak lot may contain about a dozen acres. It consists of red, black, white, and swamp white oaks, and a very little maple. The following are some of the largest that I saw. I measured one black oak which was, at three feet high, four feet eight inches in circumference; another, five feet six inches; and another the same. A red oak was six feet three inches; another, seven feet four inches; another, seven feet four inches; another, seven feet. One swamp white oak was six feet four inches. A white oak was seven feet seven inches, and another the same. The diameter of a third at one foot from ground (sawed off) was thirty-one and a half inches average.

This is quite a dense wood-lot, even without considering the size of the trees, and I was rather surprised to see how much spread there was to the tops of the trees in it, especially to the white oaks. The trees here rise far higher before branching, however, than in open land; some black oaks (if not others) were very straight and thirty to forty feet high without a limb. I think that there was not so much difference in color between the trunks of black and red oaks as commonly. The red oaks were oftener smooth, or smoothish, the largest of them. I saw very little decay. Considering their number and closeness, the trees were on the whole larger than I should have expected, though of course not nearly so large as the largest pasture oaks, — one to two and a half feet in diameter, or say generally (the sizable trees) a foot and a half in diameter. This will probably do for a specimen of a primitive oak forest hereabouts. Such probably was the size and aspect of the trees.

As for its age, I saw the stump of a white oak (not quite so large as those I measured) which had been sawed off at about one foot from the ground within four or five years, perfectly level and sound to the core, and thirty-one and a half inches in diameter. The first thirty-three (?) rings were so close and indistinct as to be impossible to count exactly (occupying three quarters of an inch of the centre); the rest was perfectly distinct. In all one hundred and forty-seven rings; or, by inches from middle, thirty-nine, nine, six, seven, five, eleven, six, four, four, five, six, nine, ten, twelve, and then three quarters of an inch left. From which it appears that it grew much the fastest at about the age of eighty-nine years and very much the slowest for the first thirty-three years.

I am struck by the fact that the more slowly trees grow at first, the sounder they are at the core, and I think that the same is true of human beings. We do not wish to see children precocious, making great strides in their early years like sprouts, producing a soft and perishable timber, but better if they expand slowly at first, as if contending with difficulties, and so are solidified and perfected. Such trees continue to expand with nearly equal rapidity to an extreme old age.

Another white oak stump, not so large but somewhat decayed, had one hundred and sixty and more rings. So that you may say this wood is a hundred to a hundred and sixty years old.

I was struck by the orderly arrangement of the trees, as if each knew its own place; and it was just so at Wetherbee's lot. This being an oak wood, and like that, somewhat meadow [sic] in the midst, the swamp white oaks with a very few maples occupied that part, and I think it likely that a similar selection of the ground might have been detected often in the case of the other oaks, as the white compared with the red. As if in the natural state of things, when sufficient time is given, trees will be found occupying the places most suitable to each, but when they are interfered with, some are prompted to grow where they do not belong and a certain degree of confusion is produced. That is, our forest generally is in a transition state to a settled and normal condition.

Many young white pines — the largest twenty years old — are distributed through this wood, and I have no doubt that if let alone this would in a hundred years look more like a pine wood than an oak one.

Hence we see that the white pine may introduce itself into a primitive oak wood of average density.

The only sounds which I heard were the notes of the jays, evidently attracted by the acorns, and the only animal seen was a red squirrel, while there were the nests of several gray squirrels in the trees.

Last evening, the weather being cooler, there was an arch of northern lights in the north, with some redness. Thus our winter is heralded.

It is evident that the pasture oaks are commonly the survivors or relics of old oak woods, — not having been set out of course, nor springing up often in the bare pasture, except sometimes along fences. I see that on the outskirts of Wetherbee's and Blood's lots are some larger, more spreading and straggling trees, which are not to be distinguished from those. Such trees are often found as stragglers beyond a fence in an adjacent lot. Or, as an old oak wood is very gradually thinned out, it becomes open, grassy, and park-like, and very many owners are inclined to respect a few larger trees on account of old associations, until at length they begin to value them for shade for their cattle. These are oftenest white oaks. I think that they grow the largest and are the hardiest. This final arrangement is in obedience to the demand of the cow. She says, looking at the oak woods: "Your tender twigs are good, but grass is better. Give me a few at intervals for shade and shelter in storms, and let the grass grow far and wide between them."

No doubt most of those white pines in pastures which branch close to the ground, their branches curving out and upward harpwise without one erect leading shoot, were broken down when young by cows. The cow does not value the pine, but rubs it out by scratching her head on it.

Nov. 6. Sawed off half of an old pitch pine stump at Tommy Wheeler's hollow. I found that, though the surface was entire and apparently sound except one or two small worm-holes, and the sap was evidently decaying, yet within, or just under the surface, it was extensively honeycombed by worms, which did not eat out to the surface. Those rings included in the outmost four or five inches were the most decayed, — including the sap-wood.

Nov. 7. To Cambridge and Boston.

Nov. 8. 2 P. M. — To Mt. Misery via sugar maples and Lee's Bridge.

The white oak near the English cress at three feet is nine feet and one twelfth in circumference and has a rough and dark bark. By its branching so low, it suggests that it may have stood in comparatively open ground most of its life, or such as the outmost oaks in Blood's wood toward his house.

I notice along the Corner road, beyond Abiel Wheeler's, quite a number of little white pines springing up against the south wall, whose seed must have been blown from Hubbard's Grove some fifty rods east. They extend along a quarter of a mile at

least. Also a wet and brushy meadow some forty rods in front of Garfield's is being rapidly filled with white pines whose seeds must have been blown an equal distance.

We need not be surprised at these results when we consider how persevering Nature is, and how much time she has to work in, though she works slowly. A great pine wood may drop many millions of seeds in one year, and if only half a dozen are conveyed a quarter of a mile and lodge against some fence, and only one comes, up and lives there, yet in the course of fifteen or twenty years there are fifteen or twenty young trees there, and they begin to make a show and betray their origin. It does not imply any remarkable rapidity or success in Nature's operations.

In the wood north of the sugar maples a hickory but two feet in circumference has eighty-six rings. A white oak twenty-six inches [in] diameter has one hundred and twenty-eight rings.

The sugar maples occupy, together with oaks of the same size, about thirty rods, or say ten rods by three. The largest about five inches [in] diameter, but generally quite small. They have sprung from quite small stumps, commonly not bigger than themselves at most. They are peculiar among maples in retaining yet a part of their leaves, — a delicate fawn(?) -color, pale brown.

There is quite a pitch pine wood on the lane beyond the second Garfields, but though there are very few little white pines under it (no large ones), these are under the densest part, and there are no little pitch pines, though they are common in the more open parts. Seed-bearing pines are distant here. I observe on the trunk of one of the largest of these pitch pines (which may be forty years old), standing on the outside the wood, minute or short branches, commonly mere tufts of needles in rings around the trunk, — reminding you even of the branches of the horse-tail, they are in this case so regular, — perfectly horizontal and six to twelve inches apart. Some are two or three years old, but only three to six inches long. These seem to represent the old whorls of branches. Perhaps, the tree growing slowly at the top, the dormant buds here are stimulated. I afterward see in another wood an outside pitch pine, a tall one, on which some of these tufts had apparently developed into branches four or five feet long, in imperfect whorls, the top being partly dead.

A white oak stump, roadside west of Abel Minott house site, nineteen and one half inches [in] diameter (wood), sixty-five rings. A pitch pine standing on opposite side more westerly is five and nine twelfths feet in circumference at three feet.

I observe on the west side of Mt. Misery, cut off apparently last winter, mulleins, very tall, sprung up, — as well as fire-weed and goldenrods. I saw an abundance of mulleins in a young wood-lot with much bare ground, burnt over a year or so ago, behind Mason's on the bridle-road, on the 5th, so that the mullein too might be called a fire-weed. But I notice that those plants so called, as the epilobium and senecio, and which are supposed to owe their origin to the fire, generally spring up on a surface made bare by whatever cause. They are the first weeds after a clearing or cutting.

On this same Mt. Misery (cut last winter), an oak stump (apparently black) eleven and one half inches [in] diameter, sixty-one rings; a white oak, thirteen inches, fifty-

eight rings. I count four or more of these stumps, — which are as plain as usual, — and make from fifty-four to sixty-one rings, say average fifty-eight years. Yet in several of these instances they were manifestly sprouts, and there was the old stump cut 58+1 years ago. These stumps did not show any trace of the axe, but there was one which lay on its side, apparently of the same date, but from which no sprout had come, which was much better preserved and did show the traces of the axe plainly. These recent stumps, though only some sixty years old, had in no case sprouted again, and I think that this is because they are sprouts, and that the vitality of the stock was so nearly exhausted. These old stumps are frequently half inclosed in the recent stump. I think that I readily detected the sprout also by the greater breadth of the rings the first few years.

The stumps of trees which were cut in the last century — oaks at least — must be not uncommon in our woods.

Looking from this hill, I think that I see considerably more oak than pine wood.

Edward Hoar's pitch pine and white pine lot on the south side of this hill is evidently a new wood. You see the green moss, the cladonia, and birches (which I think do not spring up within an old wood), and even feel with your feet an old cow-path and see an old apple tree inclosed in the wood. Are not birches interspersed with pines a sign of a new wood?

When a pitch pine wood is cut, that fringe or edging of little pitch pines which commonly surrounds it may remain to grow up and in a measure represent it. Also, apparently, when for any reason, as from frost, land where the wood has been cut remains comparatively bare for several years and becomes only grassy, pitch pines (as well as white pines) may catch there thickly.

I constantly meet now with those tufts of indigo-weed (turned black) now broken off and dropped exactly bottom up, as it were dropped by a careful hand in woodland paths or in pastures, as if an industrious fanner or a simpler had been collecting it by handfuls and had dropped his parcels thus. The fact is that they grow up many stems close together, and their branches are so interlaced as not to be easily separated; so that the wind operates the more powerfully and breaks them all off together at the ground, and then, on account of their form, these parcels are deposited exactly bottom up commonly, and you see three or four to fifteen or more stems within a diameter of four or five inches, looking just as if somebody had plucked them and laid them together. I also see the fly-away grass going over a wall or rock from time to time.

The *Salix sericea* has just blackened the ground with its leaves.

These are annual phenomena.

Dr. (?) Manasseh Cutler, in the first volume of the Boston Academy's Reports for 1785, speaks of whortleberries only in the half-converted or disparaging way in which the English do, — and have reason to, — saying that children love to eat them in milk. His eyes had not been opened to their significance; they were without honor in their native country. But I have no doubt that he ate them himself in secret.

Nov. 9. 12 M. — To Inches' Woods in Boxboro.

This wood is some one and three quarters miles from West Acton, whither we went by railroad. It is in the east part of Boxboro, on both sides of the Harvard turnpike. We walked mostly across lots from West Acton to a part of the wood about half a mile north of the turnpike, — and the woods appeared to reach as much further north. We then walked in the midst of the wood in a southwesterly by west direction, about three quarters of a mile, crossing the turnpike west of the maple swamp and the brook, and thence south by east nearly as much more, — all the way in the woods, and chiefly old oak wood. The old oak wood, as we saw from the bare hill at the south end, extends a great deal further west and northwest, as well as north, than we went, and must be at least a mile and a half from north to south by a mile to a mile and a quarter possibly from east to west. Or there may be a thousand acres of old oak wood. The large wood is chiefly oak, and that white oak, though black, red, and scarlet oak are also common. White pine is in considerable quantity, and large pitch pine is scattered here and there, and saw some chestnut at the south end. Saw no hemlock or birch to speak of.

Beginning at the north end of our walk, the trees which I measured were (all at three feet from ground except when otherwise stated): a black oak, ten feet [in] circumference, trunk tall and of regular form; scarlet oak, seven feet three inches, by Guggins Brook; white oak, eight feet; white oak, ten feet, forks at ten feet; white oak, fifteen feet (at two and a half feet, bulging very much near ground; trunk of a pyramidal form; first branch at sixteen feet; this just north of turnpike and near Guggins Brook); white oak, nine feet four inches (divides to two at five feet); white oak, nine feet six inches (divides to two at five feet); red oak, eight feet (south of road); white pine, nine feet; a scarlet or red oak stump cut, twenty and a half inches [in] diameter, one hundred and sixty rings.

I was pleased to find that the largest of the white oaks, growing thus in a dense wood, often with a pine or other tree within two or three feet, were of pasture oak size and even form, the largest commonly branching low. Very many divide to two trunks at four or five feet only from the ground. You see some white oaks and even some others in the midst of the wood nearly as spreading as in open land.

Looking from the high bare hill at the south end, the limits of the old oak wood (so far as we could overlook it) were very distinct, its tops being a mass of gray brush, — contorted and intertwined twigs and boughs, — while the younger oak wood around it, or bounding it, though still of respectable size, was still densely clothed with the reddish-brown leaves.

This famous oak lot — like Blood's and Wetherbee's — is a place of resort for those who hunt the gray squirrel. They have their leafy nests in the oak-tops.

It is an endless maze of gray oak trunks and boughs stretching far around. The great mass of individual trunks which you stand near is very impressive.

Many sturdy trunks (they commonly stand a little aslant) are remarkably straight and round, and have so much regularity in their roughness as to suggest smoothness. The older or largest white oaks were of a rougher and darker bark than Wetherbee's

and Blood's, though often betraying the same tendency to smoothness, as if a rough layer had been stripped off near the ground.

I noticed that a great many trunks (the bark) had been gnawed near the ground, — different kinds of oak and chestnut, — perhaps by squirrels.

Nov. 10. Cheney gives me a little history of the Inches Woods. He says it was a grant to Jekil (John (?) Jekil) by the crown, and that it amounted to half of Boxboro as well as much of Stow and Acton. That Jekil had a summer house where Squire Hosmer's house stands in Stow, before the Revolution, but at that time withdrew into Boston. It was a great event when he used to come out to Stow in the summer. Boxboro was a part of Stow then. Mr. Hosmer had charge of the lands for Inches, and the kitchen of his house was partly the old summer house of Jekil, and he also remembered an old negro named York, who had been a slave of Jekil, and he, the negro, said that twenty of the thirty acres bought of Inches by Hosmer, behind his house, was once fenced in with a paling or picket fence ten or fifteen feet high, and formed a park in which Jekil kept deer. The neighbors used to come and peep through the paling at the deer. Henderson Inches, hearing of these lands about the time of the Revolution, went to the heirs of Jekil and purchased the whole tract quite cheap, and they had been a fortune to the family since. Many farms have been made of parts of the wood, and thousands of dollars' worth of wood have been sold at a time.

Had realized maybe \$150,000 from it. Cheney had heard that there were about four hundred acres of the Inches lands left. Henderson Inches died two or three years ago, and now his heirs wished to sell, but would not divide it, but sell in one body. Ruggles, Nourse, and Mason wished to buy, but not the whole. Except what has been sold, or generally, Inches would not have it cut. He was sharp and stood out for his price, and also liked to keep it. Hence it is a primitive oak wood and said to be the most of one in Massachusetts.

Collier tells me that his sunflower-head (now dried) measures just twenty-one and a half inches [in] diameter, — the solid part.

Most think that Inches Wood was worth more twenty or thirty years ago, — that the oaks are now decayed within. Some have suggested that it would be much for the benefit of Boxboro to have it cut off and made into farms, but Boxboro people answer no, that they get a good deal more in taxes from it now than they would then.

How little there is on an ordinary map! How little, I mean, that concerns the walker and the lover of nature. Between those lines indicating roads is a plain blank space in the form of a square or triangle or polygon or segment of a circle, and there is naught to distinguish this from another area of similar size and form. Yet the one may be covered, in fact, with a primitive oak wood, like that of Boxboro, waving and creaking in the wind, such as may make the reputation of a county, while the other is a stretching plain with scarcely a tree on it. The waving woods, the dells and glades and green banks and smiling fields, the huge boulders, etc., etc., are not on the map, nor to be inferred from the map.

That grand old oak wood is just the most remarkable and memorable thing in Boxboro, and yet if there is a history of this town written anywhere, the history or even mention of this is probably altogether omitted, while that of the first (and may be last) parish is enlarged on.

What sort of cultivation, or civilization and improvement, is ours to boast of, if it turns out that, as in this instance, unhandselled nature is worth more even by our modes of valuation than our improvements are, — if we leave the land poorer than we found it? Is it good economy, to try it by the lowest standards, to cut down all our forests, if a forest will pay into the town treasury a greater tax than the farms which may supplant it, — if the oaks by steadily growing according to their nature leave our improvements in the rear?

How little we insist on truly grand and beautiful natural features! How many have ever heard of the Boxboro oak woods? How many have ever explored them? I have lived so long in this neighborhood and but just heard of this noble forest, — probably as fine an oak wood as there is in New England, only eight miles west of me.

I noticed young white pines springing up in the more open places and dells. There were considerable tracts of large white pine wood and also pine and oak mixed, especially on the hills. So I see that the character of a primitive wood may gradually change, as from oak to pine, the oaks at last decaying and not being replaced by oaks.

Though a great many of those white oaks of the Inches Wood branch quite as low and are nearly as spreading as pasture oaks, yet generally they rise up in stately columns thirty or forty or fifty feet, diminishing very little. The black and red and scarlet oaks are especially columnar and tall, without branches for a long distance, and these trees are shaped more in their trunks like an elm than a pasture oak. They commonly stand aslant at various angles. When, in the midst of this great oak wood, you look around, you are struck by the great mass of gray-barked wood that fills the air. The leaves of these old oaks are now fairly fallen, and the ground is densely covered with their rustling reddish-brown scales.

A peculiarity of this, as compared with much younger woods, is that there is little or no underwood and you walk freely in every direction, though in the midst of a dense wood. You walk, in fact, under the wood.

The wood not having been cut to any extent, and the adjacent country being very little occupied, I did not notice a single cart-path where a wheel-track was visible, — at most a slight vista, and one footpath. I knew that I was near the southwest edge by the crowing of a cock.

This wood is said to have been a great resort for pigeons. We saw one large pigeon-place on the top of the hill where we first entered it. Now used.

Seeing this, I can realize how this country appeared when it was discovered. Such were the oak woods which the Indian threaded hereabouts.

Such a wood must have a peculiar fauna to some extent. Warblers must at least pass through it in the spring, which we do not see here.

We have but a faint conception of a full-grown oak forest stretching uninterrupted for miles, consisting of sturdy trees from one to three and even four feet in diameter, whose interlacing branches form a complete and uninterrupted canopy. Many trunks old and hollow, in which wild beasts den. Hawks nesting in the dense tops, and deer glancing between the trunks, and occasionally the Indian with a face the color of the faded oak leaf.

Grimes said that he could almost clasp the loins of my lynx as it hung up by the heels before it was skinned; it was so slender there that a man with a large hand could have done it.

Richardson in his "Fauna Boreali-Americana," which I consulted at Cambridge on the 7th, says that the French-Canadians call the Canada lynx indifferently *Le Chat* or *Le Peeshoo*, and Charlevoix falsely calls it *Carcajou*, which is the wolverene, and hence much confusion and error among naturalists. "Seven to nine thousand are annually procured by the Hudson's Bay Company. It is found on the Mackenzie River as far north as latitude 66°." Easily killed by a stroke with a small stick on the back! (?) Breeds once a year and has two young. Never attacks man. A poor runner, but a good swimmer. Audubon and Bachman repeat Richardson. According to Pennant, Lawson and Catesby repeat the falsehoods about its dropping from trees on deer, etc.

Observed in the dropping of a fox the other day, with fur, some quarter-shaped (or triangular segments) seeds, and roughish, which may have been seeds of rose hips. They were white. So are the sweet-briar hips, but the common wild rose hips are brownish. Were they prinos seeds? If rose hips, then the fox enjoys what Manasseh Cutler in 1785 called "the conserve of hepps of the London dispensatory" without the sugar.

Elijah Wood, senior, tells me that about 1814 (or before 1815, in which year he was married, and while he still lived at his father's on Carlisle road), as he was riding to town on horseback in the evening alone to singing to prepare for Thanksgiving, he stopped to let his horse drink at the brook beyond Winn's, when he heard a cry from some wild beast just across the river. It affected him so that he did not stop to let his horse drink much. When he returned later, — now with others, — they all heard it, as if answering to their shouts, somewhat further up the river. It was also heard by some teamsters, and also an animal supposed to be the same was said to have been seen by a woman crossing the road just west of where Wood now lives. It was thought to be a wolverene.

I have now measured in all eight pitch pine stumps at the Tommy Wheeler hollow, sawed off within a foot of the ground.

I measured the longest diameter, and then at right angles with that, and took the average, and then selected that side of the stump on which the radius was of average length and counted the number of rings in each inch, beginning at the centre, thus: —

Of these eight, average growth about one seventeenth of an inch per year.

Calling the smallest number of rings in an inch in each tree 1, the comparative slowness of growth of the inches is thus expressed, viz.: —

From the line x I calculate the average rate of growth in diameter (or radius) each successive ten years thus (in decimals of an inch): —

Of course the error is great in proportion as the in number of rings in an inch exceeds ten.

They grew in the first decade more than in any decade after their fiftieth year, and continued to grow with pretty regularly accelerated growth up to about the end of the third decade, or say about the twenty-ninth year, when they were increasing fastest in diameter, — 1.92 inches in ten years. They continued to grow at nearly the same rate through the fourth decade, and then their rate of growth very suddenly decreased, — i.e., in fifth decade, or from the fortieth to the fiftieth years, when they grew only about the same as in the first decade. In the sixth and seventh decades the rate of growth steadily decreased as fast as it had increased in the first three decades, and it continued to decrease through the eighth, ninth, and tenth decades, though much more slowly. In the eleventh and twelfth decades, or from one hundred to one hundred and twenty years, the rate was accelerated, or they grew faster than from eighty to one hundred, but after the twelfth decade the rate of growth steadily decreased to the last, when it was less than one third what it was in the third decade. When growing fastest, or between the twentieth and thirtieth year, the radius often was not increased one inch in ten years. But after they were one hundred and sixty years old they did not grow four tenths of an inch in ten years — or one twenty-fifth of an inch in one year. On an average, by accurate observation these eight trees were gaining the most in diameter at about the thirtieth year, and least (with one exception) in the last ten years of their existence.

Many have inferred that it is most profitable to cut pitch pine when about thirty (or forty) years old, but they seem to forget that the most rapid increase in diameter when the tree is only ten or fifteen years old does not indicate so great bulk of wood added to the tree, as a much less increase in diameter when it is fifty or one hundred years old. Indeed these trees, slowly as they appeared to grow at last, increased in bulk far more rapidly in the last twenty years than in the first twenty, — or as thirty-six to ten.

The absolute area of the annual rings (which is in the same proportion as the bulk of wood formed) each ten years is (calculated from the measurement on the third page back): —

According to the above, most wood is made in the fourth decade, though there is but little decrease in amount afterward.

There is a loss of time if you cut at thirty or even forty years, for, supposing that a new pitch pine were at once to take the place of the old one, at the end of forty years more you would only have got  $(2.6 + 7.4 + 15.5 + 22.9 = )$  48.5 of wood more, instead of  $(21.7 + 20.8 + 19.5 + 19.2 = )$  81.2 more, which you would have had by this time if you had let the tree stand. Or if you had cut it at eighty years, you would only have

129.7 of wood after eighty years more, instead of the 155.9 that might have grown. Or even if you should cut every forty years, you would after one hundred and sixty years have got only 194 of wood to 285.6 that you might have had. From which I infer that the greater bulk of wood made in the third and fourth decade is so little more than that made in any succeeding ten years of the tree's age, and so much more than that made in the previous ten years, that if you want this kind of wood it is best to let the tree stand as long as it is sound and growing.

To be sure, the above calculation supposes the tree to increase in height in proportion to its age — which is hardly the case — and also that the same number of large trees can stand on the same area as of small ones. But even after these deductions, when we consider the proportionally greater value of large timber of this kind, it must be best to let it grow as long as it will.

The same is true until the last forty years makes less wood than the first forty. The first forty makes 48.5; the last, 76.8. However, the time of cutting may depend partly on the number of trees that stand on a given area and also on whether they are wanted for fuel or for lumber, many small being about as good for the former use as a few large; i.e., these trees made more wood any other forty years than the first. Why, then, employ them then only?

Nov. 10 and 11 were rainy, raising the river considerably on to the meadows.

Nov. 13. P. M. — To Mt. Misery.

A white birch (*Betula alba*) west edge of Trillium Wood, two feet seven inches [in] circumference at three feet.

On the Moore and Hosmer lot, cut in '52 (I think), west of railroad, south of Heywood's meadow, an oak stump fifteen and a half inches [in] diameter, ninety-three rings; another, white oak, fourteen and a half inches [in] diameter, ninety-four rings. In the first case there were two stumps of same age, evidently sprouts from an older stock, they curving around it, but I observed only a slight hollow where apparently the old stump had been. In the second case there was but one stump, but that rather concave on one side where there was a deep hollow in the earth. In both of these cases the tenacious mould, covered slightly with a fine greenish lichen, appeared heaved up about where the old stump had been. It was a good hundred years since that old stump was cut. The inmost rings of the recent stumps were coarse, as with sprouts.

Near these apparently a black (?) oak, or maybe a chestnut (?), twenty inches [in] diameter and seventy-four rings, but the centre was within four inches of the westerly side.

A white oak standing by the fence west of Spanish Brook dam on Morse's lot, circumference six feet and two twelfths at three feet. Near by a hornbeam a foot and a half [in] circumference at three feet.

J. Baker's pitch pines south of upper wood-path north of his house abundantly confirm the rule of young white pines under pitch pines. That fine young white pine wood west of this is partly of these which were left when the pitch pines were cut.

Baker's hill between farm and Pleasant Meadow, oak (apparently a black), diameter twenty-six, seventy-one rings. The stumps here were cut some five or six years ago and have fifty to sixty rings. Commonly no sprouts from those of this age here.

On top of Mt. Misery, looked again at those old stumps (of the 8th). There are three or four quite plain, just showing themselves above the surface, with rounded, flaky, decaying and crumbling edge, close to the recent stump of the shoot or shoots which sprang from them and which were cut last winter. One of these recent stumps, counted to-night, gives sixty years, but the first two or three are uncertain. Hence this old stump is as old as the century.

There are several perfectly dry and exposed stumps on bare rocky shelves, or else lying on rocks on their sides, quite well preserved and showing the marks of the axe, which I have but little doubt are of the same age, preserved by being tipped out of the earth many years ago.

Am surprised at the very slow growth of some hickory (stumps) along the wall on the top of this hill, — so fine I did not count quite accurately.

I think that the oak stumps have lasted unusually long on this hill, on account of their having originally grown slowly here and since been so much exposed to the light and air over and amid the rocks.

Nov. 14. River two feet four inches above summer level (and at height) on account of rain of 10th and 11th and 12th.

The red maple on south edge of Trillium Wood is six feet three inches in circumference at three feet.

Yellow butterflies still.

Almost all holes in and about stumps have nutshells or nuts in them.

Nov. 16. This and yesterday Indian-summer days.

P. M. — To Inches Woods.

Walked over these woods again, — first from Harvard turnpike at where Guggins Brook leaves it, which is the east edge of the old wood, due north along near the edge of the wood, and at last more northwest along edge to the cross-road, a strong mile.

I observe that the black, red, and scarlet oaks are generally much more straight and perpendicular than the white, and not branched below. The white oak is much oftener branched below and is more irregular, — curved or knobby.

The first large erect black oak measured on the 9th was by the path at foot of hill southeast of pigeon-place. Another, more north, is (all at three feet when not otherwise stated) ten and a half [feet] in circumference.

There is not only a difference between most of the white oaks within Blood's wood and the pasture oaks without, — the former having a very finely divided and comparatively soft tawnyish bark, and the latter a very coarse rugged and dark-colored bark, — but there is here a similar difference within this wood; i.e., some of the white oaks have a hard, rugged bark, in very regular oblong squares or checkers (an agreeably

regular roughness like a coat of mail), while others have a comparatively finely divided and soft bark.

I see one white oak shaped like this: —

It happens oftenest here, I think, that the very largest white oaks have the most horizontal branches and branch nearest the ground, which would at first suggest that these trees were a different variety from the more upright and rather smaller ones, but it may be that these are older, and for that reason had more light and room and so temptation to spread when young.

The last one grows close against a rock (some three feet high), and it has grown over the top and sides of this rock to the breadth of twelve and eighteen inches in a thin, close-fitting, saddle-like manner, very remarkable and showing great vigor in the tree.

Here, too, coming to water, I see the swamp white oak rising out of it, elm-like in its bark and trunk. Red maples also appear here with them. It is interesting to see thus how surely the character of the ground determines the growth. It is evident that in a wood that has been let alone for the longest period the greatest regularity and harmony in the disposition of the trees will be observed, while in our ordinary woods man has often interfered and favored the growth of other kinds than are best fitted to grow there naturally. To some, which he does not want, he allows no place at all.

Hickories occasionally occur, — sometimes scaly-barked, if not shagbarks, — also black birch and a few little sugar maples.

Still going north, a white pine nine feet [in] circumference.

The wood at the extreme north end (along the road) is considerably smaller. After proceeding west along the road, we next went west by south through a maple and yellow birch swamp, in which a black oak eight feet and four twelfths [in] circumference, a red maple six feet and a half, a black birch seven feet, a black birch eight feet. And in the extreme northwesterly part of the wood, close to the road, are many large chestnuts, — one eleven and three quarters feet [in] circumference with many great knobs or excrescences, another twelve and seven twelfths.

We next walked across the open land by the road to the high hill northeast of Boxboro Centre. In this neighborhood are many very large chestnuts, of course related to the chestnut wood just named. 1st, along this road just over the north wall, beyond a new house, one 13  $\frac{11}{12}$  feet in circumference; 2d, 16, a few rods more west by the wall; then, perhaps fifty or sixty rods more west and maybe eight or ten rods north from the road, along a wall, the 3d, 15  $\frac{2}{12}$ ; and then, near the road, southwest from this, the 4th, 15  $\frac{4}{12}$ ; and some rods further north, toward hill and house of O. and J. Wetherbee, the 5th, 13  $\frac{7}{12}$ ; then northeast, in lower ground (?), the 6th, 16 feet, at ground 21  $\frac{2}{3}$ ; then, near base of hill, beyond house, the 7th, 16  $\frac{2}{12}$  at two feet from ground; next, some rods west of the hill, the 8th, 17  $\frac{8}{12}$  at three feet, at ground 23  $\frac{1}{2}$ ; and then, a considerable distance north and further down the hill, the 9th,

13 4/12 (There [were] also four other good-sized chestnuts on this hillside, with the last three.) Or these nine trees averaged about 15 1/4 feet in circumference. The 3d tree had a limb four or five feet from the ground, which extended horizontally for a rod toward the south, declining a little toward the earth, and this was nine feet in circumference about eighteen inches from the tree. The 7th had a large limb broken off at one foot above the ground on the side, whose stump prevented measuring at the ordinary height. As I remember, the 8th was the finest tree.

These nine (or thirteen) trees are evidently the relics of one chestnut wood of which a part remains and makes the northwest part of Inches Wood, and the trees are all within about a quarter of a mile southeast and northwest, the first two being by themselves at the southeast.

The chestnut is remarkable for branching low, occasionally so low that you cannot pass under the lower limb. In several instances a large limb had fallen out on one side. Commonly, you see great rugged strips of bark, like straps or iron clamps made to bind the tree together, three or four inches wide and as many feet long, running more or less diagonally across the trunk and suggesting a very twisted grain, while the grain of the recent bark beneath them may be perpendicular. Perhaps this may be owing to old portions of the bark which still adhere, being wrenched aside by the unequal growth of the wood. I think that all these old trunks show this.

Frank Brown tells me of a chestnut in his neighborhood nineteen feet and eight(?) inches in circumference at three feet.

White oaks within a wood commonly, at Wetherbee's and Blood's woods, have lost the outside rough and rugged bark near the base, like a jacket or vest cast off, revealing that peculiar smooth tawny-white inner garment or shirt. Probably the moisture and shade of a wood softens the bark and causes it to scale off. Apparently outside trees do not lose this outer bark, but it becomes far more rugged and dark exposed to the light and air, forming a strong coat of mail such as they need.

Most of the white oaks in Inches Wood are of a slight ashy tinge and have a rather loose, scaly bark, but the larger, losing this below, become tawny-white.

Having returned into Inches Wood, not far west of the meadow (which is west of the brook), at the angle made by the open land, a black oak stump recently cut, about one foot high and twenty-one inches in diameter, had only one hundred and six rings. A white oak only nine inches in diameter near by had eighty rings. I suspect that the smaller white oaks are much older comparatively (with the large) than their size would indicate, as well as sounder and harder wood. A white oak at three feet, six and one half in circumference. A black oak had been recently cut into at the west base of Pigeon Hill, and I counted about eighty-five rings in the outside three inches. The tree (wood only) was some twenty-three inches in diameter.

Looking at this wood from the Boxboro hill, the white pines appeared to be confined chiefly to the higher land, forming a ridge from north to south. Young white pines have very generally come in (a good many being twenty feet high or more), though in some places much more abundantly than in others, all over this oak wood, though not high

enough to be seen at a distance or from hills (except the first-named larger trees); but though there are very many large pitch pines in this wood, especially on the hills or moraines, young pitch pines are scarcely to be seen. I saw some only in a dell on the south side the turnpike. If these oaks were cut off with care, there would very soon be a dense white pine wood there. The white pines are not now densely planted, except in some more open places, but come up stragglingly every two or three rods. The natural succession is rapidly going on here, and as fast as an oak falls, its place is supplied by a pine or two. I have no doubt that, if entirely let alone, this which is now an oak wood would have become a white pine wood.

Measured on the map, this old woodland is fully a mile and a half long from north to south — one mile being north [of] the turnpike — and will average half a mile from east to west. Its extreme width, measuring due east and west, is from Guggins Brook on the turnpike to the first church. (It runs considerably further southeast, however, on to the high hill.) There is a considerable tract on the small road south [of] the turnpike covered with second growth. There is, therefore, some four hundred acres of this old wood.

There is a very little beech and hemlock and yellow birch in this wood. Many large black birches at the northwest end. Chestnuts at the northwest and southeast ends.

The bark of the oaks is very frequently gnawed near the base by a squirrel or other animal.

Guggins Brook unites with Heather Meadow Brook, and then with Fort Pond Brook just this side of West Acton, and thus the water of this old oak wood comes into the Assabet and flows by our North Bridge. The seeds of whatever trees water will transport, provided they grow there, may thus be planted along our river.

I crossed the brook in the midst of the wood where there was no path, but four or five large stones had evidently been placed by man at convenient intervals for stepping-stones, and possibly this was an old Indian trail.

You occasionally see a massive old oak prostrate and decaying, rapidly sinking into the earth, and its place is evidently supplied by a pine rather than an oak.

There is now remarkably little life to be seen there. In my two walks I saw only one squirrel and a chickadee. Not a hawk or a jay. Yet at the base of very many oaks were acorn-shells left by the squirrels. In a perfectly round hole made by a woodpecker in a small dead oak five feet from the ground, were three good white oak acorns placed.

In the midst of the wood, west of the brook, is a natural meadow, — i.e. in a natural state, — a narrow strip without trees, yet not very wet. Evidently swamp white oaks and maples might grow there. The greater part of this wood is strewn with large rocks, more or less flat or table-like, very handsomely clothed with moss and polypody. The surface of the ground is finely diversified, there being hills, dells, moraines, meadows, swamps, and a fine brook in the midst of all. Some parts are very thickly strewn with rocks (as at the northwest), others quite free from them. Nowhere any monotony.

It is very pleasant, as you walk in the shade below, to see the cheerful sunlight reflected from the maze of oak boughs above. They would be a fine sight after one of those sticking snows in the winter.

On the north end, also, the first evidence we had that we were coming out of the wood — approaching its border — was the crowing of a cock.

Nov. 17. P. M. — To Blood's woods.

Sawed off a branch of creeping juniper two inches [in] diameter with fifteen rings.

On one square of nine rods in Blood's wood, which seemed more dense than the average, are thirteen sizable trees. This would give about two hundred and thirty to an acre, but probably there are not more than one hundred and eighty to an acre, take the wood through. This is but little more than one to a square rod. Yet this is a quite dense wood. That very solid white oak stump recently sawed in this wood was evidently a seedling, the growth was so extremely slow at first. If I found the case to be the same with the other oaks here, I should feel sure that these were all seedlings and therefore had been preceded by pines or at least some dense evergreens, or possibly birches. When I find a dense oak wood, whether sprouts or seedlings, I affirm that evergreens once stood [there] and, if man does not prevent, will grow again. This I must believe until I find a dense oak wood planted under itself or in open land.

Minot Pratt's elm is sixteen and a quarter feet [in] circumference at three feet.

These tawny-white oaks are thus by their color and character the lions among trees, or rather, not to compare them with a foreign animal, they are the cougars or panthers — the American lions — among the trees, for nearly such is that of the cougar which walks beneath and amid or springs upon them. There is plainly this harmony between the color of our chief wild beast of the cat kind and our chief tree.

How they do things in West Acton. As we were walking through West Acton the other afternoon, a few rods only west of the centre, on the main road, the Harvard turnpike, we saw a rock larger than a man could lift, lying in the road, exactly in the wheel-track, and were puzzled to tell how it came there, but supposed it had slipped off a drag, — yet we noticed that it was peculiarly black. Returning the same way in the twilight, when we had got within four or five rods of this very spot, looking up, we saw a man in the field, three or four rods on one side of that spot, running off as fast as he could. By the time he had got out of sight over the hill it occurred to us that he was blasting rocks and had just touched one off; so, at the eleventh hour, we turned about and ran the other way, and when we had gone a few rods, off went two blasts, but fortunately none of the rocks struck us. Some time after we had passed we saw the men returning. They looked out for themselves, but for nobody else. This is the way they do things in West Acton. We now understood that the big stone was blackened by powder.

Silas Hosmer tells me how — and — sold the Heywood lot between the railroad and Fair Haven. They lotted it off in this wise:

i.e. in triangles, and, carrying plenty of liquor, they first treated all round, and then proceeded to sell at auction, but the purchasers, excited with liquor, were not aware

when the stakes were pointed out that the lots were not as broad in the rear as in front, and the wood standing cost them as much as it should have done delivered at the door.

I frequently see the heads of teasel, called fuller's thistle, floating on our river, having come from factories above, and thus the factories which use it may distribute its seeds by means of the streams which turn their machinery, from one to another. The one who first cultivated the teasel extensively in this town is said to have obtained the seed when it was not to be purchased — the culture being monopolized — by sweeping a wagon which he had loaned to a teasel-raiser.

The growth of very old trees, as appears by calculating the bulk of wood formed, is feebler at last than when in middle age, or say in pitch pine at one hundred and sixty than at forty or fifty, especially when you consider the increased number of leaves, and this, together with the fact that old stumps send up no shoots, shows that trees are not indefinitely long-lived.

I have a section of a chestnut sprout — and not at all a rank one — which has 6 rings in the first inch, or 4 rings in five eighths of an inch, but a section of a chestnut seedling has 10 rings in five eighths of an inch.

A section of a white oak sprout, far from rank, has 4 rings in first five eighths of an inch; of a seedling ditto, 16 or 17 in first five eighths of an inch; of a seedling ditto, 8 — in first five eighths of an inch; of a very slow-grown sprout, 6 — in first five eighths of an inch. Or in the white oaks the proportion is as five to twelve.

The first seedling oak has the rough and tawny light-brown bark of an old tree, while the first sprout is quite smooth-barked.

A seedling white birch has 10 rings in first seven eighths of an inch.

A sprout white birch has 5 rings in first seven eighths of an inch. The first has the white bark of an old tree; the second, a smooth and reddish bark.

When a stump is sound to the pith I can commonly tell whether it was a seedling or a sprout by the rapidity of the growth at first. A seedling, it is true, may have died down many times till it is fifteen or twenty years old, and so at last send up a more vigorous shoot than at first, but generally the difference is very marked.

Nov. 19. P. M. — To Mt. Misery.

Saw off a hickory stump which is scarcely six and a half inches in diameter and has nearly a hundred rings. (It is the one of November 13th, and then called about 115 (??). Counting it now in the evening, I make 92.) It is surprising how quickly this wood decays. This tree was cut last winter, and then evidently was perfectly sound, as appears from the surface, but on sawing it off three inches lower I find that it is rotted entirely through and is soft and no part sound, so that I cannot count it on the new face. In less than one year this stump is worthless, even for fuel!

I look again at the old oak stumps on this hill. One evidently, i.e. surely, a sprout (the older stump beside it), a white oak, grew nearly 12 inches in the first twelve years; another oak, a sprout (with older stump), 11 inches in the first eleven or twelve years; a white oak (without an older stump), 12 inches in the first twelve years; probably the

last a sprout also, for, as seen on last page, a white oak seedling grows only  $\frac{5}{8}$  of an inch in twelve years. There was also a hickory sprout stump of the same age with the others, though of course the old stump was long since gone. It was plainly seen to be a sprout by the very rapid growth at first and the concave form of one side.

My rule of small white pines under pitch pines is so true of E. Hoar's land that he very easily got a hundred white pines there to set by his house.

Mr. Bradshaw says that he got a little auk in Wayland last week, and heard of two more, one in Weston and the other in Natick. Thinks they came with the storm of the 10th and 11th.

He tells me of a small oak wood of old trees called More's, half a mile east of Wayland, behind the graveyard.

Nov. 20. P. M. — To R. W. E.'s hill.

I see a pitch pine several years old on the west slope of the railroad embankment, sixty rods by pacing from the nearest pitch pine, which was in Trillium Wood. I have seen several such. This tree would soon sow itself in our yards if they were neglected.

In the Moore and Hosmer lot which I surveyed in '49-'50, beyond Heywood meadow, a white oak stump ten inches [in] diameter with seventy rings (cut in winter of '49-'50), evidently a sprout, though the old stump appears to have been entirely overgrown and so concealed.

I see, on the southwest or railroad side, near top, of Emerson's hill, a great many oak stumps (which were sprouts) with the older stump still very plain.

(This last old stump being small and almost overgrown between the stumps of the sprouts and seen — a sliver of it — in a hole between them.) Also lower down-hill, toward railroad, old chestnut stumps with the stumps of sprouts of R. W. E.'s cutting twenty-five to thirty and odd years old, cut some dozen years ago; stumps, then, some forty years old.

Also, on the pond end of the hilltop, amid the piles of stones, where I suppose was a pasture once, I see oak stumps cut just thirty-eight years ago beside the stumps of their sprouts cut last winter, and here are many sprouts coming up the second time; but on the other end [of] the hill I notice no sprouts the second time. There were many oaks where these piles of stone are, some seventy or eighty years ago, then, at least, and I think that if this ever was a pasture they must have been preceded by pines. These oak stumps, cut about thirty-eight years ago, are quite fresh, especially the white oak on the top of this rocky hill. So at Mt. Misery. Such is evidently a favorable locality for their preservation. Indeed, it is very common to see oak stumps forty years old in such places. They are the rule here.

Decidedly finger-cold to-night.

Nov. 21. If you cut a dense mixed wood of pine and oak in which no little pines have sown themselves, it is evident that a wood exclusively of oak sprouts may succeed, as I see is the case with part of R. W. E.'s hillside toward the pond.

I see a little pitch pine which bore a cone at twenty-two inches from the ground when it was only seven or eight years old. It is now a dozen years old and has borne two more since, and scattered the seed.

P. M. — To Fair Haven Hill.

On what was Stow's lot, southwest the Boiling Spring, adjacent to Wheeler's field, I count the rings of four oak stumps which are from eighteen to twenty-two inches in diameter. They are all about 120, and the oaks are evidently all from the seed. This was both a pine and oak wood, and I suspect that about one hundred and twenty years [ago] pines were cut or burned or blown down or decayed there and these oaks succeeded. These stumps are now in the very best condition for counting, having been cut nine or ten years ago. But not so with the pitch pine stumps (one is twenty-three inches in diameter) cut about a year later on what was R. Brown's, higher up. Their sap and more is covered with green and red cockspur lichens so thickly you cannot see the rings. On this lot (now open Wheeler lot) are not only these old pitch pine stumps (a few), but the stumps of oak sprouts forty-four years old, with the older stumps by their side, or half overgrown, yet quite plain, which last there were cut ( $44 + 9 =$ ) 53 years ago. No sprouts from them.

In early times probably less wood was cut at once; commonly only the winter's wood for the owners' use. This Brown lot was variously treated apparently.

See young beeches near the upper edge of Stow's, about midway on Wheeler, near where some stones have been hauled into Stow's from Wheeler's land.

Another finger-cold evening, which I improve in pulling my turnips — the usual amusement of such weather — before they shall be frozen in. It is worth the while to see how green and lusty they are yet, still adding to their stock of nutriment for another year; and between the green and also withering leaves it does me good to see their great crimson round or scalloped tops, sometimes quite above ground, they are so bold. They remind you of rosy cheeks in cool weather, and indeed there is a relationship. All kinds of harvestry, even pulling turnips when the first cold weather numbs your fingers, are interesting, if you have been the sower, and have not sown too many.

Got a section to-day of a white cedar railroad sleeper which I am told came from the eastward and was brought up from Charlestown. First count gives 254 rings; second, on opposite side, where the centre is less plain, 246 rings; average, 250. Its diameter is  $16 \frac{1}{4}$  inches, or nearly 31 rings to an inch. This is the oldest, as well as slowest-growing, tree that I have counted the rings of. I see other sleepers nearly as old. Some smaller, or say  $10 \frac{1}{2}$  inches in diameter, had 125 rings in the first three inches and then grew much faster; as if they were at first part of a very dense thicket and grew very slowly, but afterward, prevailing over the rest, grew faster. This sleeper had, of course, been cut a year at least. It may not have been the butt end of the log, or at any rate it must have been several years old before it reached the height at which it was cut, so that it must have begun to exist before the settlement of Jamestown. It was a flourishing young cedar of at least some fifteen summers when the Pilgrims came over.

Thus the cars on our railroad, and all their passengers, roll over the trunks of trees sleeping beneath them which were planted years before the first white man settled in New England.

Nov. 22. P. M. — To northwest part of Sudbury.

The *Linaria Canadensis* is still freshly blooming. It is the freshest flower I notice now.

Considerable ice, lasting all day, on the river meadows and cold pools.

I measure the stump of that white pine which I used to see on the Marlborough road. It is thirty inches in diameter and has 85 rings.

There are two small clumps of laurel close to the left side this road, by the woods, just this side the Sudbury line, going to Maynard's.

Here is a dense oak wood. I see many little white pines sprung up along its edge in the road, but scarcely one within the wood. They, too, want light and air, though not so much as the pitch pine.

All the sound white oak acorns that I see now have sprouted, and many have sent a root down into the earth. This is often four inches long. But I see no black nor scarlet nor red oak acorns sprouted, though I find sound ones. The white are evidently very much more sensitive and tender than they.

This is a very beautiful November day, — a cool but clear, crystalline air, through which even the white pines with their silvery sheen are an affecting sight. It is a day to behold and to ramble over the hard (stiffening) and withered surface of the tawny earth. Every plant's down glitters with a silvery light along the Marlborough road, — the sweet-fern, the lespedeza, and bare blueberry twigs, to say nothing of the weatherworn tufts of *Andropogon scoparius*. A thousand bare twigs gleam like cobwebs in the sun. I rejoice in the bare, bleak, hard, and barren-looking surface of the tawny pastures, the firm outline of the hills, so convenient to walk over, and the air so bracing and wholesome. Though you are finger-cold toward night, and you cast a stone on to your first ice, and see the unmelted crystals under every bank, it is glorious November weather, and only November fruits are out. On some hickories you see a thousand black nuts against the sky.

There is quite a white cedar swamp behind the old tavern south of Maynard's.

You walk fast and far, and every apple left out is grateful to your invigorated taste. You enjoy not only the bracing coolness, but all the heat and sunlight that there is, reflected back to you from the earth. The sandy road itself, lit by the November sun, is beautiful. Shrub oaks and young oaks generally, and hazel bushes and other hardy shrubs, now more or less bare, are your companions, as if it were an iron age, yet in simplicity, innocence, and strength a golden one.

(Day before yesterday the rustling of the withered oak leaves in the wind reminded me of the similar sound produced by snow falling on them.)

It is glorious to consider how independent man is of all enervating luxuries; and the poorer he is in respect to them, the richer he is. Summer is gone with all its infinite wealth, and still nature is genial to man. Though he no longer bathes in the stream, or

reclines on the bank, or plucks berries on the hills, still he beholds the same inaccessible beauty around him. What though he has no juice of the grape stored up for him in cellars; the air itself is wine of an older vintage, and far more sanely exhilarating, than any cellar affords. It is ever some gouty senior and not a blithe child that drinks, or cares for, that so famous wine.

Though so many phenomena which we lately admired have now vanished, others are more remarkable and interesting than before. The smokes from distant chimneys, not only greater because more fire is required, but more distinct in the cooler atmosphere, are a very pleasing sight, and conduct our thoughts quickly to the roof and hearth and family beneath, revealing the homes of men.

Maynard's yard and frontage, and all his bams and fences, are singularly neat and substantial, and the highroad is in effect converted into a private way through his grounds. It suggests unspeakable peace and happiness. Yet, strange to tell, I noticed that he had a tiger instead of a cock for a vane on his bam, and he himself looked overworked. He had allowed the surviving forest trees to grow into ancestral trees about his premises, and so attach themselves to him as if he had planted them. The dusty highway was so subdued that it seemed as if it were lost there. He had all but stretched a bar across it. Each traveller must have felt some misgivings, as if he were trespassing.

However, the farmer's life expresses only such content as an ox in his yard chewing the cud.

What though your hands are numb with cold, your sense of enjoyment is not benumbed. You cannot now find an apple but it is sweet to taste.

Simply to see to a distant horizon through a clear air, — the fine outline of a distant hill or a blue mountain-top through some new vista, — this is wealth enough for one afternoon.

We journeyed into the foreign land of Sudbury to see how the Sudbury men — the Hayneses, and the Puffers, and the Brighams — live. We traversed their pastures and their wood-lots, and were home again at night.

Nov. 23. George Minott tells me that sixty years ago wood was only two or three dollars a cord here — and some of that hickory. Remembers when Peter Wheeler, sixty or more years ago, cut off all at once over a hundred acres of wood stretching from Flint's Pond to Goose Pond, — since cut again in part by Britton, and owned now partly by the Stows.

Most of us are still related to our native fields as the navigator to undiscovered islands in the sea. We can any autumn discover a new fruit there which will surprise us by its beauty or sweetness. So long as I saw one or two kinds of berries in my walks whose names I did not know, the proportion of the unknown seemed indefinitely if not infinitely great.

Famous fruits imported from the tropics and sold in our markets — as oranges, lemons, pineapples, and bananas — do not concern me so much as many an unnoticed

wild berry whose beauty annually lends a new charm to some wild walk, or which I have found to be palatable to an outdoor taste.

The tropical fruits are for those who dwell within the tropics; their fairest and sweetest parts cannot be exported nor imported. Brought here, they chiefly concern those whose walks are through the market-place. It is not the orange of Cuba, but the checkerberry of the neighboring pasture, that most delights the eye and the palate of the New England child. What if the Concord Social Club, instead of eating oranges from Havana, should spend an hour in admiring the beauty of some wild berry from their own fields which they never attended to before? It is not the foreignness or size or nutritive qualities of a fruit that determine its absolute value.

It is not those far-fetched fruits which the speculator imports that concerns us chiefly, but rather those which you have fetched yourself in your basket from some far hill or swamp, journeying all the long afternoon in the hold of a basket, consigned to your friends at home, the first of the season.

We cultivate imported shrubs in our front yards for the beauty of their berries, when yet more beautiful berries grow unregarded by us in the surrounding fields.

As some beautiful or palatable fruit is perhaps the noblest gift of nature to man, so is a fruit with which a man has in some measure identified himself by cultivating or collecting it one of the most suitable presents to a friend. It was some compensation for Commodore Porter, who may have introduced some cannon-balls and bombshells into ports where they were not wanted, to have introduced the Valparaiso squash into the United States. I think that this eclipses his military glory.

As I sail the unexplored sea of Concord, many a dell and swamp and wooded hill is my Ceram and Amboyna.

At first, perchance, there would be an abundant crop of rank garden weeds and grasses in the cultivated land, — and rankest of all in the cellar-holes, — and of pinweed, hardhack, sumach, blackberry, thimble-berry, raspberry, etc., in the fields and pastures. Elm, ash, maples, etc., would grow vigorously along old garden limits and main streets. Garden weeds and grasses would soon disappear. Huckleberry and blueberry bushes, lambkill, hazel, sweet-fern, barberry, elder, also shad-bush, chokeberry, andromeda, and thorns, etc., would rapidly prevail in the deserted pastures. At the same time the wild cherries, birch, poplar, willows, checkerberry would reestablish themselves. Finally the pines, hemlock, spruce, larch, shrub oak, oaks, chestnut, beech, and walnuts would occupy the site of Concord once more. The apple and perhaps all exotic trees and shrubs and a great part of the indigenous ones named above would have disappeared, and the laurel and yew would to some extent be an underwood here, and perchance the red man once more thread his way through the mossy, swamp-like, primitive wood.

Nov. 24. P. M. — To Easterbrooks's.

Under the two white oaks by the second wall southeast of my house, on the east side the wall, I am surprised to find a great many sound acorns still, though every one is sprouted, — frequently more than a dozen on the short sward within a square foot,

each with its radicle two inches long penetrated into the earth. But many have had their radicle broken or eaten off, and many have it now dead and withered. So far as my observation goes there, by far the greatest number of white oak acorns were destroyed by decaying (whether in consequence of frost or wet), both before and soon after falling. Not nearly so many have been carried off by squirrels and birds or consumed by grubs, though the number of acorns of all kinds lying under the trees is now comparatively small to what it was early in October.

It is true these two trees are exceptions and I do not find sound ones nearly as numerous under others.

Nevertheless, the sound white oak acorns are not so generally and entirely picked up as I supposed. However, there are a great many more shells or cups than acorns under the trees; even under these two trees, I think, there are not more than a third as many of any kind — sound or hollow — as there were, and generally those that remain are a very small fraction of what there were. It will be worth the while to see how many of these sprouted acorns are left and are sound in the spring. It is remarkable that all sound white oak acorns (and many which are not now sound) are sprouted, and that I have noticed no other kind sprouted, — though I have not seen the chestnut oak and little chinquapin at all. It remains to be seen how many of the above will be picked up by squirrels, etc., or destroyed by frost and grubs in the winter.

The first spitting of snow — a flurry or squall — from out a gray or slate-colored cloud that came up from the west. This consisted almost entirely of pellets an eighth of an inch or less in diameter. These drove along almost horizontally, or curving upward like the outline of a breaker, before the strong and chilling wind. The plowed fields were for a short time whitened with them. The green moss about the bases of trees was very prettily spotted white with them, and also the large beds of cladonia in the pastures. They come to contrast with the red cockscur lichens on the stumps, which you had not noticed before. Striking against the trunks of the trees on the west side they fell and accumulated in a white line at the base. Though a slight touch, this was the first wintry scene of the season. The air was so filled with these snow pellets that we could not see a hill half a mile off for an hour. The hands seek the warmth of the pockets, and fingers are so benumbed that you cannot open your jack-knife. The rabbits in the swamps enjoy it, as well as you. Methinks the winter gives them more liberty, like a night. I see where a boy has set a box trap and baited it with half an apple, and, a mile off, come across a snare set for a rabbit or partridge in a cow-path in a pitch pine wood near where the rabbits have nibbled the apples which strew the wet ground. How pitiable that the most that many see of a rabbit should be the snare that some boy has set for one! —

The bitter-sweet of a white oak acorn which you nibble in a bleak November walk over the tawny earth is more to me than a slice of imported pineapple. We do not think much of table-fruits. They are especially for aldermen and epicures. They do not feed the imagination. That would starve on them. These wild fruits, whether eaten or not,

are a dessert for the imagination. The south may keep her pineapples, and we will be content with our strawberries.

Nov. 25. I count the rings in a spruce plank from the railroad bridge, which extend five and a half inches from the centre of the tree, and make them 146, —  $1/26$  + to a ring. This is slower growth than I find in a black spruce to-day at —

Ministerial Swamp, P. M. — It is  $10\frac{1}{2}$  feet high,  $2\frac{1}{2}$  inches [in] diameter just above ground, and has 21 rings,  $1/17$  inch to a ring. A larch near by is 21 feet high, inches [in] diameter, and has 20 rings, which makes + to a ring. The larch has made nearly twice as much wood as the spruce in the same time.

The cones of the spruce which I see are still closed. A few sugar maple seeds still hang on.

Last night and to-day are very cold and blustering. Winter weather has come suddenly this year. The house was shaken by wind last night, and there was a general deficiency of bedclothes. This morning some windows were as handsomely covered with frost as ever in winter. I wear mittens or gloves and my greatcoat. There is much ice on the meadows now, the broken edges shining in the sun. Now for the phenomena of winter, — the red buds of the high blueberry and the purple berries of the smilax.

As I go up the meadow-side toward Clamshell, I see a very great collection of crows far and wide on the meadows, evidently gathered by this cold and blustering weather. Probably the moist meadows where they feed are frozen up against them. They flit before me in countless numbers, flying very low on account of the strong northwest wind that comes over the hill, and a cold gleam is reflected from the back and wings of each, as from a weather-stained shingle. Some perch within three or four rods of me, and seem weary. I see where they have been pecking the apples by the meadow-side. An immense cohort of cawing crows which sudden winter has driven near to the habitations of man. When I return after sunset I see them collecting and hovering over and settling in the dense pine woods west of E. Wood's, as if about to roost there. Yesterday I saw one flying over the house, its wings so curved by the wind that I thought it a black hawk.

How is any scientific discovery made? Why, the discoverer takes it into his head first. He must all but see it.

I see several little white pines in Hosmer's meadow just beyond Lupine Hill, which must have sprung from seed which came some fifty rods, — probably blown so far in the fall. There are also a few in the road beyond Dennis's, which probably were blown from his swamp wood. So that there is nothing to prevent their springing up all over the village in a very few years — but our own plows and spades. They have also come up quite numerously in the young woodland north of J. P. B.'s Cold Pool (probably blown from the wood south of the pond), though they are evidently half a dozen years younger than the oaks there. I look at this large white pine wood by the pool to see if little ones come up under it. What was recently pasture comes up within a rod of this high wood on the north side, and, though the fence is gone, the different condition and history of the ground is very apparent by the different aspect of the little pines.

There the old white pines are dense, and there are no little ones under them, but only a rod north they are very abundant, forming a dense thicket only two or three feet high bounded by a straight line on the south (or east and west), where the edge of the open land was within a rod of the great pines. Here they sprang up abundantly in the open land close by, but not at all under the pines. Yet within the great wood, wherever it is more open from any cause, I see a great many little pines springing up. Though they are thin and feeble comparatively, yet most of them will evidently come to be trees. White pines will spring up in the more open parts of a white pine wood, even under pines, though they are thin and feeble just in proportion to the density of the larger pines, and, where the large trees are quite dense, they will not spring up at all.

How commonly you see pitch pines, white pines, and birches filling up a pasture, and, when they are a dozen or fifteen years old, shrub and other oaks beginning to show themselves, inclosing apple trees and walls and fences gradually and so changing the whole aspect of the region. These trees do not cover the whole surface equally at present, but are grouped very agreeably after natural laws which they obey. You remember, perhaps, that fifteen years ago there was not a single tree in this pasture, — not a germinating seed of one, — and now it is a pretty dense forest ten feet high. I confess that I love to be convinced of this inextinguishable vitality in Nature. I would rather that my body should be buried in a soil thus wide-awake than in a mere inert and dead earth. The cow-paths, the hollows where I slid in the winter, the rocks, are fast being enveloped and becoming rabbit-walks and hollows and rocks in the woods.

How often you make a man richer in spirit in proportion as you rob him of earthly luxuries and comforts!

I see much oak wood cut at thirty years of age, — sprout wood.

Many stumps which have only twenty-five or thirty rings send up no shoots, because they are the sprouts from old stumps, which you may still see by their sides, and so are really old trees and exhausted. The chopper should foresee this when he cuts down a wood.

The bass by Dugan's cut a year ago. It is hard to count, so indistinct its rings, but I make 46 to 50 in a diameter of some twenty inches. The sprouts are quite peculiar, so light an ash-color with red tips and large blunt red buds.

The old pitch pines (vide back two or three weeks) one hundred and sixty years old, that stood on the south side of the Tommy Wheeler hollow, were twenty-three in number on a space about twelve rods by three (or thirty-six rods), with half a dozen white pines and as many oaks, the last two say twenty to fifty years younger than the pitch pines. Probably some of the pitch pines have died and left no trees, so that it may originally have been a pretty dense grove of pitch pines. There were as many more pitch pines (not to mention the oaks and white pines) on the other side of the hollow. These were on a slope toward the north. Now, four years after they were cut, this hillside is covered with hazel bushes, huckleberries, young oaks, red maples, *Viburnum nudum*, and a few little white pines, but the hollow below them has little beside grass

(fine sedge) in it. It will be long before anything catches there. It is remarkable that no pitch pines grew there before, nor oaks, and very few white pines, which were the only trees there.

Some pitch pines have shed their seeds.

Nov. 26. P. M. — To E. Hubbard's Wood.

I see in the open field east of Trillium Wood a few pitch pines springing up, from seeds blown from the wood a dozen or fifteen rods off. Here is one just noticeable on the sod — though by most it would be mistaken for a single sprig of moss — which came from the seed this year. It is, as it were, a little green star with many rays, half an inch in diameter, lifted an inch and a half above the ground on a slender stem. What a feeble beginning for so long-lived a tree! By the next fall it will be a star of greater magnitude, and in a few years, if not disturbed, these seedlings will alter the face of nature here. How significant, how ominous, the presence of these green moss-like stars is to the grass, heralding its doom! Thus from pasture this portion of the earth's surface becomes forest. These which are now mistaken for mosses in the grass may become lofty trees which will endure two hundred years, under which no vestige of this grass will be left.

In Hubbard's Wood at north end I measure the stump of either a red or black oak: 21 inches [in] diameter and 141 rings.

I examine quite a number of oak stumps thereabouts and find them all seedlings. This, of course, must be the case with old forests generally, for in the beginning the trees were not cut.

Some of the white oaks have a very loose scaly bark, commencing half a dozen feet from the ground. I see pitch pine bark four to five inches thick at the ground. There are in this wood many little groves of white pines two to four feet high, quite dense and green, but these are in more open spaces, and are vigorous just in proportion to the openness. There are also seedling oaks and chestnuts ten to thirty years old, yet not nearly so numerous as the pines. The large wood is mixed oak and pine, — more oak at the north and more pine, especially pitch pine, at the south. The prospect is that in course of time the white pines will very greatly prevail over all other trees here. This is also the case with Inches', Blood's, and Wetherbee's woods.

If I am not mistaken, an evidence of more openness where the little pines are is to be found in the greater prevalence of *pyrola* and *lycopodiums* there. There are even some healthy *Juniperus repens* in the midst of these woods. Though the pitch pines are the prevailing trees at the south end, I see no young pitch pines under them.

Perhaps this is the way that a natural succession takes place. Perhaps oak seedlings do not so readily spring up and thrive within a mixed white pine and oak wood as pines do, — in the more open parts, — and thus, as the oaks decay, they are replaced by pines rather than by oaks.

But where did the pitch pines stand originally? Who cleared the land for its seedlings to spring up in? It is commonly referred to very poor and sandy land, yet I find it

growing on the best land also. The expression "a pitch pine plain" is but another name for a poor and sandy level. It grows both on the sand and [in] the swamp, and the fact that it grows on the sand chiefly is not so much evidence that it prefers it as that other trees have excluded it from better soil. If you cut down the pines on the pitch pine plain, oaks will come up there too. Who knows but the fires or clearings of the Indians may have to do with the presence of these trees there? They regularly cleared extensive tracts for cultivation, and these were always level tracts where the soil was light — such as they could turn over with their rude hoes. Such was the land which they are known to have cultivated extensively in this town, as the Great Fields and the rear of Mr. Dennis's, — sandy plains. It is in such places chiefly that you find their relics in any part of the county. They did not cultivate such soil as our maple swamps occupy, or such a succession of hills and dales as this oak wood covers. Other trees will grow where the pitch pine does, but the former will maintain its ground there the best. I know of no tree so likely to spread rapidly over such areas when abandoned by the aborigines as the pitch pines — and next birches and white pines.

While I am walking in the oak wood or counting the rings of a stump, I hear the faint note of a nuthatch like the creak of a limb, and detect [it] on the trunk of an oak much nearer than I suspected, and its mate or companion not far off. This is a constant phenomenon of the late fall or early winter; for we do not hear them in summer that I remember. I heard one not long since in the street.

I see one of those common birch fungi on the side of a birch stake which has been used to bound a lot sold at auction, three feet or more from the ground, and its face is toward the earth as usual, though the birch is bottom up.

I saw that nuthatch to-day pick out from a crevice in the bark of an oak trunk, where it was perpendicular, something white once or twice and pretty large. May it not have been the meat of an acorn? Yet commonly they are steadily hopping about the trunks in search of insect food. Possibly some of those acorn-shells I see about the base of trees may have been dropped from the crevices in the bark above by birds — nuthatch or jay — as well as left by squirrels.

Mother says that Lidy Bay, an Indian woman (so considered), used to live in the house beyond Cæsar's and made baskets, which she brought to town to sell, with a ribbon about her hat. She had a husband.

The value of these wild fruits is not in the mere possession or eating of them, but in the sight or enjoyment of them. The very derivation of the word "fruit" would suggest this. It is from the Latin *fructus*, meaning that which is used or enjoyed. If it were not so, then going a-berrying and going to market would be nearly synonymous expressions. Of course it is the spirit in which you do a thing which makes it interesting, whether it is sweeping a room or pulling turnips. Peaches are unquestionably a very beautiful and palatable fruit, but the gathering of them for the market is not nearly so interesting as the gathering of huckleberries for your own use.

A man fits out a ship at a great expense and sends it to the West Indies with a crew of men and boys, and after six months or a year it comes back with a load of

pineapples. Now, if no more gets accomplished than the speculator commonly aims at, — if it simply turns out what is called a successful venture, — I am less interested in this expedition than in some child's first excursion a-huckleberrying, in which it is introduced into a new world, experiences a new development, though it brings home only a gill of huckleberries in its basket. I know that the newspapers and the politicians declare otherwise, but they do not alter the fact. Then, I think that the fruit of the latter expedition was finer than that of the former. It was a more fruitful expedition. The value of any experience is measured, of course, not by the amount of money, but the amount of development we get out of it. If a New England boy's dealings with oranges and pineapples have had more to do with his development than picking huckleberries or pulling turnips have, then he rightly and naturally thinks more of the former; otherwise not.

Do not think that the fruits of New England are mean and insignificant, while those of some foreign land are noble and memorable. Our own, whatever they may be, are far more important to us than any others can be. They educate us, and fit us to live in New England. Better for us is the wild strawberry than the pineapple, the wild apple than the orange, the hazelnut or pignut than the cocoanut or almond, and not on account of their flavor merely, but the part they play in our education.

In the Massachusetts Historical Collections, First Series, volume x, Rev. John Gardner of Stow furnishes a brief historical notice of that town in a letter dated 1767. He says, "The Indian names of this place were Pompociticut and Shabbukin, from two notable hills."

I anticipated the other day that if anybody should write the history of Boxboro, once a part of Stow, he would be pretty sure to omit to notice the most interesting thing in it — its forest — and lay all the stress on the history of its parish; and I find that I had conjectured rightly, for Mr. Gardner, after telling us who was his predecessor in the ministry and where he himself was settled, goes on to say: "As for any remarkables, I am of the mind there have been the fewest of any town of our standing in the Province... I can't call to mind above one thing worthy of publick notice, and that is the grave of Mr. John Green," who, it appears, "was made... clerk of the exchequer" by Cromwell. "Whether he was excluded the Act of Oblivion or not I cannot tell," says Mr. Gardner. At any rate he tells us that he returned to New England, "lived and died, and lies buried in this place." I can assure Mr. Gardner that he was not excluded from the act of oblivion.

However, Boxboro was less peculiar for its woods a hundred years ago.

I have been surprised when a young man who had undertaken to write the history of a country town, — his native place, — the very name of which suggested a hundred things to me, referred to it, as the crowning fact of his story, that that town was the residence of General So-and-so and the family mansion was still standing.

Nov. 28. P. M. — To Annursnack.

Looking from the hilltop, I should say that there was more oak woodland than pine to be seen, especially in the north and northeast, but it is somewhat difficult to

distinguish all in the gleaming sunlight of midafternoon. Most of the oak, however, is quite young. As for pines, I cannot say surely which kind is most prevalent, not being certain about the most distant woods. The white pine is much the most dispersed, and grows oftener in low ground than the pitch pine does. It oftenest forms mixed woods with oak, etc., growing in straight or meandering lines, occasionally swelling into a dense grove. The pitch pines commonly occupy a dry soil — a plain or brow of a hill, often the site of an old grain-field or pasture — and are much the most seclusive, for, being a new wood, oaks, etc., have had no opportunity to grow up there, if they could. I look down now on the top of a pitch pine wood southwest of Brooks's Pigeon-place, and its top, so nearly level, has a peculiarly rich and crispy look in the sun. Its limbs are short and its plumes stout as compared with the white pine and are of a yellowish green.

There are many handsome young walnuts ten or twelve feet high scattered over the southeast side of Annurnsack, or above the orchard. How came they there? Were they planted before a wood was cut? It is remarkable how this tree loves a hillside.

Behind G. M. Barrett's bam a scarlet oak stump 18 1/2 inches [in] diameter and about 94 rings, which has sent up a sprout two or three years since. On the plain just north of the east end of G. M. B.'s oaks, many oaks were sawed off about a year ago. Those I look at are seedlings and very sound and rings very distinct and handsome. Generally no sprouts from them, though one white oak sprout had been killed by frost. One white oak, 17 inches [in] diameter, has 100 rings. A second, 16 1/2 "“also 100”

The last has two centres which coalesced at the thirtieth ring, which went round them both including old bark between them. This was an instance of natural grafting.

Many seem to be so constituted that they can respect only somebody who is dead or something which is distant.

The less you get, the happier and the richer you are. The rich man's son gets cocoanuts, and the poor man's, pignuts; but the worst of it is that the former never goes a-cocoanutting, and so he never gets the cream of the cocoanut as the latter does the cream of the pignut.

That on which commerce seizes is always the very coarsest part of a fruit, — the mere husk and rind, in fact, — for her hands are very clumsy. This is what fills the holds of ships, is exported and imported, pays duties, and is finally sold at the shops.

It is a grand fact that you cannot make the finer fruits or parts of fruits matter of commerce. You may buy a servant or slave, in short, but you cannot buy a friend. You can't buy the finer part of any fruit — i.e. the highest use and enjoyment of it. You cannot buy the pleasure which it yields to him who truly plucks it; you can't buy a good appetite even.

What are all the oranges imported into England to the hips and haws in her hedges? She could easily spare the one, but not the others. Ask Wordsworth, or any of her poets, which is the most to him.

The mass of men are very easily imposed on. They have their runways in which they always travel, and are sure to fall into any pit or box trap set therein. Whatever

a great many grown-up boys are seriously engaged in is considered great and good, and, as such, is sure of the recognition of the churchman and statesman. What, for instance, are the blue juniper berries in the pasture, which the cowboy remembers so far as they are beautiful merely, to church or state? Mere trifles which deserve and get no protection. As an object of beauty, though significant to all who really live in the country, they do not receive the protection of any community. Anybody may grub up all that exist. But as an article of commerce they command the attention of the civilized world. I read that "several hundred tons of them are imported annually from the continent" into England to flavor gin with; "but even this quantity," says my author, "is quite insufficient to meet the enormous consumption of the fiery liquid, and the deficiency is made up by spirits of turpentine." Go to the English Government, which, of course, is representative of the people, and ask, What is the use of juniper berries? The answer is, To flavor gin with. This is the gross abuse of juniper berries, with which an enlightened Government —— if ever there shall be one — will have nothing to do.

Let us make distinctions, call things by the right names.

Nov. 29. Get up my boat, 7 A. M. Thin ice of the night is floating down the river. I hear that some boys went on to Goose Pond on the 26th and skated. It must have been thin.

P. M. — To Fair Haven Hill.

The pitch pine twigs have been so generally cut off by the squirrels for the sake of the cones that I easily detect the fertile trees, when going through a pitch pine wood, by seeing the green twigs strewn on the ground beneath. But few of the trees bear, and these are the ones.

The Bear Garden pitch pines are so generally open that young pitch pines of all sizes are intermixed with the others. There are many small white pines beside, but few if any seed-bearing ones.

I proceed through Potter's young wood south of this grove (toward Fair Haven Hill-side) and here I find by the stumps what I remember, — that a pitch pine wood was cut, some ten or twelve years ago, judging from the state of the stumps. It was for density, apparently, such a grove as now stands northward of this. It is a very poor soil. Shrub oaks chiefly appear to have succeeded to the pines, and now the growth consists of oaks, shrub and others (the latter four to six feet high), pitch pines two to ten feet high, and white birches. The soil is but poorly clad, owing to its barrenness and the prevalence of shrub oak at first. Probably the largest of these young pitch pines were such as stood in the open wood when it was cut — as they now do northward; but apparently the majority have been sown since, as others are still being sown by the large pitch pines there are left here and there quite numerous, the ground is still so open and bare on account of the feeble growth of the oaks. The white birches have as yet done the best, the pines next. It will ere long be a mixed oak and pitch pine wood, the pines not standing so dense as in new woods, though pretty thick in spots. This shows how a mixed wood of this character may arise, owing first to the existence of

young pitch pines under the old when cut, — the latter being so open as to admit of their growth, — and secondly to the barren soil and shrub oaks, which fail to cover it for a long time, so that even after six or eight years pitch pines may catch there from seed-bearing trees which are left.

I am pleased to find an evidence that the pitch pine wood cut down here a dozen years ago was just such a new wood as that now standing on [the] north. It is this. Along the southwest edge of this portion of the lot, where the almost abrupt descent begins, I see many stones which were cast over the edge of the bank in great heaps when it was cultivated.

The small pitch pine grove above the western Fair Haven spring fully proves my theory of white pines in pitch pine, though there is hardly a seed-bearing white pine there. Young white pines are rapidly spreading up Fair Haven Hill-side, though the nearest seed-bearing white pines are across the river, thirty to sixty rods off.

I remember when this hillside above the spring was clear of wood. In fact, I was here when this field was cleared and the brush burned, some thirty-five years ago. Yet I now see a good many hickories both within and without the pines, five feet high, more or less. I feel about sure that these are not from stumps or old roots which have existed in the ground so long. How then did they come here? The[y] even keep in advance of the pines on some sides a rod or two further into the open land. I am constrained to believe that they were planted there by quadrupeds or birds. If so, the walnut differs from the oak in the mode of its spreading; for I do not see oaks anywhere thus springing up in groves in grass ground, in advance of pines. It will be worth the while to ascertain the age of these exactly.

It is remarkable that the walnut loves a hillside so. I saw such a grove yesterday on Annursnack. Here is another of still larger trees a little lower down the hill; and there is a much more extensive one on the similar slope of Smith's Hill. Are animals more likely to plant walnuts in open land than acorns? or is it that walnuts are more likely to live there when planted? What a lover of the hills is this tree! I may be mistaken about those on Smith's Hill, after all.

Fair Haven Pond is skimmed over, all but the channel.

Can that be the skeleton of a raccoon which I find (killed not long since) on the Cliff Hill? Measured by my book it — the body from shoulder to tail — is 15} inches long; tail, 13 1/2; hind leg, 14 1/2. Vide skull and foot.

If a man has spent all his days about some business, by which he has merely got to be rich, as it is called, i.e., has got much money, many houses and barns and wood-lots, then his life has been a failure, I think; but if he has been trying to better his condition in a higher sense than this, has been trying to invent something, to be somebody, — i.e., to invent and get a patent for himself, — so that all may see his originality, though he should never get above board, — and great inventors, you know, commonly die poor, — I shall think him comparatively successful.

From the Cliff I see more oak than pine.

Every interest, as the codfish and the mackerel, gets represented but the huckleberry interest. The first discoverers and explorers of the land make report of this fruit, but the last make comparatively little account of them.

You would say that some men had been tempted to live in this world at all only by the offer of a bounty by the general government — a bounty on living — to any one who will consent to be out at this era of the world, the object of the governors being to create a nursery for their navy. I told such a man the other day that I had got a Canada lynx here in Concord, and his instant question was, “Have you got the reward for him?” What reward? Why, the ten dollars which the State offers. As long as I saw him he neither said nor thought anything about the lynx, but only about this reward. “Yes,” said he, “this State offers ten dollars reward.” You might have inferred that ten dollars was something rarer in his neighborhood than a lynx even, and he was anxious to see it on that account. I have thought that a lynx was a bright-eyed, four-legged, furry beast of the cat kind, very current, indeed, though its natural gait is by leaps. But he knew it to be a draught drawn by the cashier of the wildcat bank on the State treasury, payable at sight. Then I reflected that the first money was of leather, or a whole creature (whence pecunia, from pecus, a herd), and, since leather was at first furry, I easily understood the connection between a lynx and ten dollars, and found that all money was traceable right back to the original wildcat bank. But the fact was that, instead of receiving ten dollars for the lynx which I had got, I had paid away some dollars in order to get him. So, you see, I was away back in a gray antiquity behind the institution of money, — further than history goes.

This reminded me that I once saw a cougar recently killed at the Adirondacks which had had its ears clipped. This was a ten-dollar cougar.

Yet, though money can buy no fine fruit whatever, and we are never made truly rich by the possession of it, the value of things generally is commonly estimated by the amount of money they will fetch. A thing is not valuable — e g. a fine situation for a house — until it is convertible into so much money, that is, can cease to be what it is and become something else which you prefer. So you will see that all prosaic people who possess only the commonest sense, who believe strictly in this kind of wealth, are speculators in fancy stocks and continually cheat themselves, but poets and all discerning people, who have an object in life and know what they want, speculate in real values. The mean and low values of anything depend on it[s] convertibility into something else — i.e. have nothing to do with its intrinsic value.

This world and our life have practically a similar value only to most. The value of life is what anybody will give you for living. A man has his price at the South, is worth so many dollars, and so he has at the North. Many a man here sets out by saying, ‘I will make so many dollars by such a time, or before I die, and that is his price, as much as if he were knocked off for it by a Southern auctioneer.

We hear a good deal said about moonshine by so-called practical people, and the next day, perchance, we hear of their failure, they having been dealing in fancy stocks; but there really never is any moonshine of this kind in the practice of poets and

philosophers; there never are any hard times or failures with them, for they deal with permanent values.

## DECEMBER, 1860

Dec. 1. P. M. — To Fair Haven Hill.

Yesterday, rain, raising river somewhat. Examined the young hickories on Fair Haven Hill slope to see how old they are. I sawed off three at two or three inches below the surface, and also higher up. These were about three feet high. The rings are very hard to discern, but I judge the smallest of them (which is about one inch in diameter and three feet high) to be seven years old. The other two are probably older, yet not nearly so old as the pines whose beginning I remember. It therefore must be that these hickories have sprung up from nuts within seven to twenty-five years past. They are most numerous in openings four or five rods over amid the pines, and are also found many rods from the pines in the open pasture, and also especially along walls, though yet very far from other trees of any kind. I infer, therefore, that animals plant them, and perhaps their growing along walls may be accounted for in part by the fact that the squirrels with nuts oftenest take that road. What is most remarkable is that they should be planted so often in open land, on a bare hillside, where oaks rarely are. I do not know of a grove of oaks springing up in this manner, — with broad intervals of bare sward between them, and away from pines.

How is this to be accounted for? Yet I did notice oak seedlings coming up in this manner in Potter's open field beyond Bear Garden.

It is wonderful how much these hickories have endured and prevailed over. Though I searched the whole hillside, not only for the smallest, but the most perpendicular and soundest, each of the three that I sawed off had died down once at least, years ago. Though it might not betray any scar above ground, on digging I found it an inch below the surface.

Most of these small ones consist of several stems from one root, and they are often of such fantastic forms and so diseased that they seem to be wholly dead at a little distance, and yet evidently many of them make erect, smooth, and sound trees at last, all defects smoothed over or obliterated. Some which have thus died down and sprung up again are in the form of rude harps and the like. These had great tap-roots considerably larger just beneath the surface than the stock above, and they were so firmly set in the ground that, though the tree was scarcely an inch in diameter and you had dug around it to the depth of three or four inches, it was impossible to pull one up; yet I did not notice any side roots, so high. They are iron trees, so rigid and so firm set are they. It may be that they are more persistent at the root than oaks, and so at last succeed in becoming trees in these localities where oaks fail. They may be more persevering. Perhaps, also, cattle do not browse them, but do oaks. It will be

very suggestive to a novice just to go and dig up a dozen seedling oaks and hickories and see what they have had to contend with. Theirs is like the early career of genius.

Measured a great red maple near the south end of E. Hubbard's swamp, dividing in two at the ground, the largest trunk 7 feet and 10 inches at three feet and draped for three or four feet up with the pulmonaria (?) lichen. This the largest I know. Another is 5 1/2 feet, a third 5 1/4, a fourth in open land just south of turnpike 6 1/6.

Dec. 2. P. M. — To Smith's Hickory Hill-side.

I come via Britton's to see if I can find a seedling hickory under half a dozen years old. After searching long amid the very numerous young hickories at Britton's shanty and Smith's Hill I fail to find one so recently planted. I find many at the last place only one or two feet, but they invariably have great roots, and old stubs which have died down are visible at or beneath the surface of the ground. It is very common — almost the rule — to find from one to three from one root each one inch in diameter and two or three feet high, while the common stock beneath the ground is two inches in diameter. Pulling at one at Britton's, which was two feet and a quarter in height, it came up easily, to my surprise, and I found that it had broken off at just one foot below the surface, being quite decayed there. It was three quarters of an inch in diameter at the surface, and increased regularly for five or six inches downward till it was one inch in diameter. There was the stub of an old shoot, and the root was suddenly enlarged to about one and a half inches in diameter and held about the same to where it broke off, at a foot below the surface. There was another stub about three inches above the ground, and the more recent growth above this was the work of about four years. This last had died, and this year two shoots had put out at six and eight inches above the ground and had grown two and four inches respectively. Here were evident, then, at the very least, four efforts to rise to a tree.

This little hickory, two feet and a quarter high and three quarters of an inch in diameter, standing in open land, was then at least eleven years old. What more the root would have revealed if I had dug deeper, I do not know. The fact that the lowest observed stub was nearly six inches below the surface, showing plainly to the eye that the earth had been heaped up about, was significant and suggested that this root might have survived in the ground through clearing and burning and subsequent cultivation. I remember well when the field was cultivated, I should think within ten or twelve years. It must be seventeen or eighteen years since the woods were cut here; since which time a peach orchard (which I selected) has been raised, a premium obtained for it, and the trees died and gone some years ago, also an apple orchard. The hickories are on the site and in the midst of these; and what makes it the more likely that these hickories may be from roots of young seedlings left in the ground is the fact that there are sprouts from several large chestnut stumps in the midst of the orchard, which, by their size, have probably been cut down once or twice since the tree was cut, and yet survived. What is true of these chestnut sprouts may be true of the hickories.

On Smith's Hill I selected a large and healthy-looking one (hickory), sawed it off, and found it nearly dead. It was four years old. It had been cut down before to a stub, which showed five years more. I did not look beneath the surface. The leading shoot was perfectly withered and dead. The same was very commonly the case, except when the tree had got above a certain height. I do not think that a single hickory has been planted in either of these places for some years at least. Indeed, why should squirrels bring the nuts to these particular localities where other hickories already stood? which they must do, supposing them to be planted still, and not to be all of one age.

They seem to be able to resist fire, cultivation, and frost. The last is apparently their great enemy at present. It is astonishing how many efforts they make, how persistent they are. Thus much is certain, at least.

In surrounding young wood they are common, and have got up three or four times as high. It may be that when pine and oaks and hickories, young and old, are cut off and the land cleared, the two former are exterminated but the hickories are tough and stubborn and do not give up the ground. I cannot as yet account for their existence in these two localities otherwise. Yet I still think that some must have been planted on Fair Haven Hill without the pines in a manner in which oaks are not, within a dozen years. Or perchance, if the oaks are so planted, they fail to come up?

In Stow's wood at Saw Mill Brook an old chestnut stump. Two sprouts from this were cut three years ago and have forty-two rings. From the stumps of the sprouts, other sprouts three years old have grown. The old stump was cut there forty-five years ago. The centre of the stumps of each of these sprouts is hollow for one and a half inches in diameter. See a chestnut stump, a seedling sawed off, with seventy-five rings and no sprout from it. Commonly the sprouts stand in a circle around the stump, — often a dozen or more of them.

Dec. 3. P. M. — To Hill.

The hickory which was blown down by the wall has been cut up into lengths. The end of one some twelve feet from ground apparently is sixteen inches in diameter and has 112 rings distinct, the first 50 within five and three quarters inches. The bark is one inch thick.

Measured the three white oaks on the southeast side of hill.

The northernmost at three feet is 10 feet in circumference.

“southeastemmost “““““10 1/3 “— “

“southwestemmost “““““11 1/2 “— “

I find no young hickories springing up on the open hillside. Yet, if they do so elsewhere, why should they not here, where nuts are abundant? But, under and about the hickory which stands near the white oak (under the north side of the hill), there are many small hickories two to four feet high amid the birches and pines, — the largest of which birches and pines have been lately cut off.

I am inclined to think now that both oaks and hickories are occasionally planted in open land a rod or two or more beyond the edge of a pine or other wood, but that the

hickory roots are more persistent under these circumstances and hence oftener succeed there.

As for the planting of acorns, it is to be observed that they do not require to be buried but merely transported and dropped on the surface in a suitable place. All the sound white oak acorns that I can find have now sent down their radicle under these circumstances, though, no doubt, far the greatest part of them will be killed this winter.

Talking with Walcott and Staples to-day, they declared that John Brown did wrong. When I said that I thought he was right, they agreed in asserting that he did wrong because he threw his life away, and that no man had a right to undertake anything which he knew would cost him his life. I inquired if Christ did not foresee that he would be crucified if he preached such doctrines as he did, but they both, though as if it was their only escape, asserted that they did not believe that he did. Upon which a third party threw in, "You do not think that he had so much foresight as Brown." Of course, they as good as said that, if Christ had foreseen that he would be crucified, he would have "backed out." Such are the principles and the logic of the mass of men.

It is to be remembered that by good deeds or words you encourage yourself, who always have need to witness or hear them.

Dec. 4. The first snow, four or five inches, this evening.

Talk about slavery! It is not the peculiar institution of the South. It exists wherever men are bought and sold, wherever a man allows himself to be made a mere thing or a tool, and surrenders his inalienable rights of reason and conscience. Indeed, this slavery is more complete than that which enslaves the body alone. It exists in the Northern States, and I am reminded by what I find in the newspapers that it exists in Canada. I never yet met with, or heard of, a judge who was not a slave of this kind, and so the finest and most unfailing weapon of injustice. He fetches a slightly higher price than the black man only because he is a more valuable slave.

It appears that a colored man killed his would-be kidnapper in Missouri and fled to Canada. The bloodhounds have tracked him to Toronto and now demand him of her judges. From all that I can learn, they are playing their parts like judges. They are servile, while the poor fugitive in their jail is free in spirit at least.

This is what a Canadian writes to the New York Tribune: "Our judges may be compelled to render a judgment adverse to the prisoner. Depend upon it, they will not do it unless compelled [his italics]. And then the poor fellow will be taken back, and probably burned to death by the brutes of the South." Compelled! By whom? Does God compel them? or is it some other master whom they serve? Can't they hold out a little longer against the tremendous pressure? If they are fairly represented, I would n't trust their courage to defend a setting hen of mine against a weasel. Will this excuse avail them when the real day of judgment comes? They have not to fear the slightest bodily harm: no one stands over them with a stick or a knife even [?]. They have at the worst only to resign their places and not a mouse will squeak about it. And yet they are likely to assist in tying this victim to the stake! Would that his example might

teach them to break their own fetters! They appear not to know what kind of justice that is which is to be done though the heavens fall. Better that the British Empire be destroyed than that it should help to reënslave this man!

This correspondent suggests that the “good people” of New York may rescue him as he is being carried back. There, then, is the only resort of justice, — not where the judges are, but where the mob is, where human hearts are beating, and hands move in obedience to their impulses. Perhaps his fellow-fugitives in Torontomay not feel compelled to surrender him. Justice, departing from the Canadian soil, leaves her last traces among these.

What is called the religious world very generally deny virtue to all who have not received the Gospel. They accept no god as genuine but the one that bears a Hebrew name. The Greenlander’s Pirksoma [?] (he that is above), or any the like, is always the name of a false god to them.

C. says that Walden was first frozen over on the 16th December.

Dec. 22. This evening and night, the second important snow, there having been sleighing since the 4th, and now, —

Dec. 23, — there is seven or eight inches of snow at least. Larks were about our house the middle of this month.

Dec. 26. Melvin sent to me yesterday a perfect *Strix asio*, or red owl of Wilson, — not at all gray. This is now generally made the same with the *nœvia*, but, while some consider the red the old, others consider the red the young. This is, as Wilson says, a bright “nut brown” like a hazelnut or dried hazel bur (not hazel). It is twenty-three inches [in] alar extent by about eleven long. Feet extend one inch beyond tail. Cabot makes the old bird red; Audubon, the young. How well fitted these and other owls to withstand the winter! a mere core in the midst of such a muff of feathers! Then the feet of this are feathered finely to the claws, looking like the feet of a furry quadruped. Accordingly owls are common here in winter; hawks, scarce.

It is no worse, I allow, than almost every other practice which custom has sanctioned, but that is the worst of it, for it shows how bad the rest are. To such a pass our civilization and division of labor has come that A, a professional huckleberry-picker, has hired B’s field and, we will suppose, is now gathering the crop, perhaps with the aid of a patented machine; C, a professed cook, is superintending the cooking of a pudding made of some of the berries; while Professor D, for whom the pudding is intended, sits in his library writing a book, — a work on the *Vacciniæ*, of course. And now the result of this downward course will be seen in that book, which should be the ultimate fruit of the huckleberry-field and account for the existence of the two professors who come between D and A. It will be worthless. There will be none of the spirit of the huckleberry in it. The reading of it will be a weariness to the flesh. To use a homely illustration, this is to save at the spile but waste at the bung. I believe in a different kind of division of labor, and that Professor D should divide himself between the library and the huckleberry-field.

Dec. 30. Sunday. I saw the crows a week ago perched on the swamp white oaks over the road just beyond Wood's Bridge, and many acorns and bits of bark and moss, evidently dropped or knocked off by them, lay on the snow beneath. One sat within twenty feet over my head with what looked like a piece of acorn in his bill.

To-day I see that they have carried these same white oak acorns, cups and all, to the ash tree by the riverside, some thirty rods southeast, and dropped them there. Perhaps they find some grubs in the acorns, when they do not find meat. The crows now and of late frequent thus the large trees by the river, especially swamp white oak, and the snow beneath is strewn with bits of bark and moss and with acorns (commonly worthless). They are foraging. Under the first swamp white oak in Hubbard's great meadow (Cyanean) I see a little snap-turtle (shell some one and a quarter inches in diameter — on his second year, then) on its back on the ice — shell, legs, and tail perfect, but head pulled off, and most of the inwards with it by the same hole (where the neck was). What is left smells quite fresh, and this head must have been tom off to-day — or within a day or two. I see two crows on the next swamp white oak westward, and I can scarcely doubt that they did it. Probably one found the young turtle at an open and springy place in the meadow, or by the river, where they are constantly preying, and flew with it to this tree. Yet it is possible (?) that it was frozen to death when they found it.

I also saw under the oak where the crows were one of those large brown cocoons of the *Attacus Cecropia*, which no doubt they had tom off.

Eben Conant's sons tell me that there has been a turtle dove associating with their tame doves and feeding in the yard from time to time for a fortnight past. They saw it to-day.

The traveller Burton says that the word Doab, "which means the land embraced by the bifurcation of two streams, has no English equivalent." ("Lake Regions of Central Africa," page 72.)

It is remarkable how universally, as it respects soil and exposure, the whortleberry family is distributed with us, one kind or another (of those of which I am speaking) flourishing in every soil and locality, — the Pennsylvania and Canada blueberries especially in elevated cool and airy places — on hills and mountains, and in openings in the woods and in sprout-lands; the high blueberry in swamps, and the second low blueberry in intermediate places, or almost anywhere but in swamps hereabouts; while we have two kinds confined to the Alpine tops of our highest mountains. The family thus ranges from the highest mountain-tops to the lowest swamps and forms the prevailing small shrubs of a great part of New England. Not only is this true of the family, but hereabouts of the genus *Gaylussacia*, or the huckleberries proper, alone. I do not know of a spot where any shrub grows in this neighborhood but one or another species or variety of the *Gaylussacia* may also grow there. It is stated in Loudon (page 1076) that all the plants of this order "require a peat soil, or a soil of a close cohesive nature," but this is not the case with the huckleberry. The huckleberry grows on the tops of our highest hills; no pasture is too rocky or barren for it; it grows in such deserts as

we have, standing in pure sand; and, at the same time, it flourishes in the strongest and most fertile soil. One variety is peculiar to quaking bogs where there can hardly be said to be any soil beneath, not to mention another but unpalatable species, the hairy huckleberry, which is found in bogs. It extends through all our woods more or less thinly, and a distinct species, the dangle-berry, belongs especially to moist woods and the edges of swamps.

Such care has nature taken to furnish to birds and quadrupeds, and to men, a palatable berry of this kind, slightly modified by soil and climate, wherever the consumer may chance to be. Com and potatoes, apples and pears, have comparatively a narrow range, but we can fill our basket with whortleberries on the summit of Mt. Washington, above almost all the shrubs with which we are familiar, — the same kind which they have in Greenland, — and again, when we get home, with another species in Beck Stow's Swamp.

I find that in Bomare's "Dictionnaire Raisonné" the *Vitis Idœa* (of many kinds) is called "raisin des bois." Our word "berry," according to lexicographers, is from the Saxon *beria*, a grape or cluster of grapes; but it must acquire a new significance here, if a new word is not substituted for it.

According to Father Rasies' Dictionary, the Abenaki word for bluets was, fresh, *satar* (in another place *sate*, tar); dry, *sakisatar*.

First there is the early dwarf blueberry, the smallest of the whortleberry shrubs with us, and the first to ripen its fruit, not commonly an erect shrub, but more or less reclined and drooping, often covering the earth with a sort of dense matting. The twigs are green, the flowers commonly white. Both the shrub and its fruit are the most tender and delicate of any that we have.

The *Vaccinium Canadense* may be considered a more northern form of the same.

Some ten days later comes the high blueberry, or swamp blueberry, the commonest stout shrub of our swamps, of which I have been obliged to cut down not a few when running lines as a surveyor through the low woods. They are a pretty sure indication of water, and, when I see their dense curving tops ahead, I prepare to wade, or for a wet foot. The flowers have an agreeable sweet and berry-promising fragrance, and a handful of them plucked and eaten have a subacid taste agreeable to some palates.

At the same time with the last the common low blueberry is ripe. This is an upright slender shrub with a few long wand-like branches, with green bark and pink-colored recent shoots and glaucous-green leaves. The flowers have a considerable rosy tinge, of a delicate tint.

The last two more densely flowered than the others.

The huckleberry, as you know, is an upright shrub, more or less stout depending on the exposure to the sun and air, with a spreading, bushy top, a dark-brown bark, and red recent shoots, with thick leaves. The flowers are much more red than those of the others.

As in old times they who dwelt on the heath remote from towns were backward to adopt the doctrines which prevailed there, and were therefore called heathen in a

bad sense, so we dwellers in the huckleberry pastures, which are our heath lands, are slow to adopt the notions of large towns and cities and may perchance be nicknamed huckleberry people. But the worst of it is that the emissaries of the towns care more for our berries than for our salvation.

In those days the very race had got a bad name, and ethnics was only another name for heathen.

All our hills are or have been huckleberry hills, the three hills of Boston and, no doubt, Bunker Hill among the rest.

In May and June all our hills and fields are adorned with a profusion of the pretty little more or less bellshaped flowers of this family, commonly turned toward the earth and more or less tinged with red or pink and resounding with the hum of insects, each one the forerunner of a berry the most natural, wholesome, palatable that the soil can produce.

The early low blueberry, which I will call "bluet," adopting the name from the Canadians, is probably the prevailing kind of whortleberry in New England, for the high blueberry and huckleberry are unknown in many sections. In many New Hampshire towns a neighboring mountain-top is the common berry-field of many villages, and in the berry season such a summit will be swarming with pickers. A hundred at once will rush thither from all the surrounding villages, with pails and buckets of all descriptions, especially on a Sunday, which is their leisure day. When camping on such ground, thinking myself quite out of the world, I have had my solitude very unexpectedly interrupted by such an advent, and found that the week-days were the only Sabbath-days there.

For a mile or more on such a rocky mountain-top this will be the prevailing shrub, occupying every little shelf from several rods down to a few inches only in width, and then the berries droop in short wreaths over the rocks, sometimes the thickest and largest along a seam in a shelving rock, — either that light mealy-blue, or a shining black, or an intermediate blue, without bloom. When, at that season, I look from Concord toward the blue mountain-tops in the horizon, I am reminded that near at hand they are equally blue with berries.

The mountain-tops of New England, often lifted above the clouds, are thus covered with this beautiful blue fruit, in greater profusion than in any garden.

What though the woods be cut down, this emergency was long ago foreseen and provided for by Nature, and the interregnum is not allowed to be a barren one. She is full of resources: she not only begins instantly to heal that scar, but she consoles (compensates?) and refreshes us with fruits such as the forest did not produce. To console us she heaps our baskets with berries.

The timid or ill-shod confine themselves to the land side, where they get comparatively few berries and many scratches, but the more adventurous, making their way through the open swamp, which the bushes overhang, wading amid the water andromeda and sphagnum, where the surface quakes for a rod around, obtain access to those great drooping clusters of berries which no hand has disturbed. There is no

wilder and richer sight than is afforded from such a point of view, of the edge of a blueberry swamp where various wild berries are intermixed.

As the sandalwood is said to diffuse its perfume around the woodman who cuts it, so in this case Nature rewards with unexpected fruits the hand that lays her waste.

## 1861

Jan. 3. The third considerable snow-storm.

The berries which I celebrate appear to have a range — most of them — very nearly coterminous with what has been called the Algonquin Family of Indians, whose territories are now occupied by the Eastern, Middle, and Northwestern States and the Canadas, and completely surrounded those of the Iroquois, who occupied what is now the State of New York. These were the small fruits of the Algonquin and Iroquois families. The Algonquins appear to have described this kind of fruits generally by words ending in the syllables meenar.

It is true we have in the Northern States a few wild plums and inedible crab-apples, a few palatable grapes and nuts, but I think that our various species of berries are our wild fruits to be compared with the more celebrated ones of the tropics, and that, taking all things into consideration, New England will bear comparison with the West India Islands. I have not heard of any similar amusement there superior to huckleberrying here, the object not being merely to get a shipload of something which you can eat or sell.

Why should the Ornamental Tree Society confine its labors to the highway only? An Englishman laying out his ground does not regard simply the avenues and walks. Does not the landscape deserve attention?

What are the natural features which make a township handsome? A river, with its waterfalls and meadows, a lake, a hill, a cliff or individual rocks, a forest, and ancient trees standing singly. Such things are beautiful; they have a high use which dollars and cents never represent. If the inhabitants of a town were wise, they would seek to preserve these things, though at a considerable expense; for such things educate far more than any hired teachers or preachers, or any at present recognized system of school education. I do not think him fit to be the founder of a state or even of a town who does not foresee the use of these things, but legislates chiefly for oxen, as it were.

Far the handsomest thing I saw in Boxboro was its noble oak wood. I doubt if there is a finer one in Massachusetts. Let her keep it a century longer, and men will make pilgrimages to it from all parts of the country; and yet it would be very like the rest of New England if Boxboro were ashamed of that woodland.

I have since heard, however, that she is contented to have that forest stand instead of the houses and farms that might supplant [it], because the land pays a much larger tax to the town now than it would then.

I said to myself, if the history of this town is written, the chief stress is probably laid on its parish and there is not a word about this forest in it.

It would be worth the while if in each town there were a committee appointed to see that the beauty of the town received no detriment. If we have the largest boulder in the county, then it should not belong to an individual, nor be made into door-steps.

As in many countries precious metals belong to the crown, so here more precious natural objects of rare beauty should belong to the public.

Not only the channel but one or both banks of every river should be a public highway. The only use of a river is not to float on it.

Think of a mountain-top in the township — even to the minds of the Indians a sacred place — only accessible through private grounds! a temple, as it were, which you cannot enter except by trespassing and at the risk of letting out or letting in somebody's cattle! in fact the temple itself in this case private property and standing in a man's cow-yard, — for such is commonly the case!

New Hampshire courts have lately been deciding — as if it was for them to decide — whether the top of Mt. Washington belonged to A or to B; and, it being decided in favor of B, as I hear, he went up one winter with the proper officer and took formal possession of it. But I think that the top of Mt. Washington should not be private property; it should be left unappropriated for modesty and reverence's sake, or if only to suggest that earth has higher uses than we put her to. I know it is a mere figure of speech to talk about temples nowadays, when men recognize none, and, indeed, associate the word with heathenism.

It is true we as yet take liberties and go across lots, and steal, or "hook," a good many things, but we naturally take fewer and fewer liberties every year, as we meet with more resistance. In old countries, as England, going across lots is out of the question. You must walk in some beaten path or other, though it may [be] a narrow one. We are tending to the same state of things here, when practically a few will have grounds of their own, but most will have none to walk over but what the few allow them.

Thus we behave like oxen in a flower-garden. The true fruit of Nature can only be plucked with a delicate hand not bribed by any earthly reward, and a fluttering heart. No hired man can help us to gather this crop.

How few ever get beyond feeding, clothing, sheltering, and warming themselves in this world, and begin to treat themselves as human beings, — as intellectual and moral beings! Most seem not to see any further, — not to see over the ridge-pole of their bams, — or to be exhausted and accomplish nothing more than a full bam, though it may be accompanied by an empty head. They venture a little, run some risks, when it is a question of a larger crop of com or potatoes; but they are commonly timid and count their coppers, when the question is whether their children shall be educated. He who has the reputation of being the thriftiest farmer and making the best bargains is really the most thriftless and makes the worst. It is safest to invest in knowledge, for the probability is that you can carry that with you wherever you go.

But most men, it seems to me, do not care for Nature and would sell their share in all her beauty, as long as they may live, for a stated sum — many for a glass of mm. Thank God, men cannot as yet fly, and lay waste the sky as well as the earth! We are safe on that side for the present. It is for the very reason that some do not care for those things that we need to continue to protect all from the vandalism of a few.

We cut down the few old oaks which witnessed the transfer of the township from the Indian to the white man, and commence our museum with a cartridge-box taken from a British soldier in 1775!

He pauses at the end of his four or five thousand dollars, and then only fears that he has not got enough to carry him through, — that is, merely to pay for what he will eat and wear and burn and for his lodging for the rest of his life. But, pray, what does he stay here for? Suicide would be cheaper. Indeed, it would be nobler to found some good institution with the money and then cut your throat. If such is the whole upshot of their living, I think that it would be most profitable for all such to be carried or put through by being discharged from the mouth of a cannon as fast as they attained to years of such discretion.

As boys are sometimes required to show an excuse for being absent from school, so it seems to me that men should show some excuse for being here. Move along; you may come upon the town, sir.

I noticed a week or two ago that one of my white pines, some six feet high with a thick top, was bent under a great burden of very moist snow, almost to the point of breaking, so that an ounce more of weight would surely have broken it. As I was confined to the house by sickness, and the tree had already been four or five days in that position, I despaired of its ever recovering itself; but, greatly to my surprise, when, a few days after, the snow had melted off, I saw the tree almost perfectly upright again.

It is evident that trees will bear to be bent by this cause and at this season much more than by the hand of man. Probably the less harm is done in the first place by the weight being so gradually applied, and perhaps the tree is better able to bear it at this season of the year.

Jan. 8. Trees, etc., covered with a dense hoar frost. It is not leaf-like, but composed of large spiculæ — spearlike — on the northeast sides of the twigs, the side from which the mist was blown. All trees are bristling with these spiculæ on that side, especially firs and arbor-vitæ.

They taught us not only the use of com and how to plant it, but also of whortleberries and how to dry them for winter, and made us baskets to put them in. We should have hesitated long to eat some kinds, if they had not set us the example, knowing by old experience that they were not only harmless but salutary. I have added a few to my number of edible berries by walking behind an Indian in Maine, who ate such as I never thought of tasting before. Of course they made a much greater account of wild fruits than we do.

It appears from the above evidence that the Indians used their dried berries commonly in the form of huckleberry cake, and also of huckleberry porridge or pudding.

What we call huckleberry cake, made of Indian meal and huckleberries, was evidently the principal cake of the aborigines, and was generally known and used by them all over this part of North America, as much or more than plum-cake by us. They enjoyed it all alone ages before our ancestors heard of Indian meal or huckleberries.

We have no national cake so universal and well known as this was in all parts of the country where com and huckleberries grew.

If you had travelled here a thousand years ago, it would probably have been offered you alike on the Connecticut, the Potomac, the Niagara, the Ottawa, and the Mississippi.

Botanists have long been inclined to associate this family in some way with Mt. Ida, and, according to Toumefort arrange [sic] whortleberries were what the ancients meant by the vine of Mt. Ida, and the common English raspberry is called *Rubus Idæus* from the old Greek name. The truth of it seems to be that blueberries and raspberries flourish best in cool and airy situations on hills and mountains, and I can easily believe that something like them, at least, grows on Mt. Ida. But Mt. Monadnock is as good as Mt. Ida, and probably better for blueberries, though it does not [sic] mean “bad rock,” — but the worst rocks are the best for blueberries and for poets.

Jan. 11. Horace Mann brings me the contents of a crow’s stomach in alcohol. It was killed in the village within a day or two. It is quite a mass of frozen-thawed apple, — pulp and skin, — with a good many pieces of skunk-cabbage berries one fourth inch or less in diameter, and commonly showing the pale-brown or blackish outside, interspersed, looking like bits of acorns, — never a whole or even half a berry, — and two little bones as of frogs (?) or mice (?) or tadpoles; also a street pebble a quarter of an inch in diameter, hard to be distinguished in appearance from the cabbage seeds.

I presume that every one of my audience knows what a huckleberry is, — has seen a huckleberry, gathered a huckleberry, and, finally, has tasted a huckleberry, — and, that being the case, I think that I need offer no apology if I make huckleberries my theme this evening.

What more encouraging sight at the end of a long ramble than the endless successive patches of green bushes, — perhaps in some rocky pasture, — fairly blackened with the profusion of fresh and glossy berries?

There are so many of these berries in their season that most do not perceive that birds and quadrupeds make any use of them, since they are not felt to rob us; yet they are more important to them than to us. We do not notice the robin when it plucks a berry, as when it visits our favorite cherry tree, and the fox pays his visits to the field when we are not there.

Jan. 14. Coldest morning yet; 20° (?).

Pliny says, “*In minimis Natura praestat*” (Nature excels in the least things). The *Wellingtonia gigantea*, the famous California tree, is a great thing; the seed from which it sprang, a little thing; and so are all seeds or origins of things.

Richard Porson said: "We all speak in metaphors. Those who appear not to do it, only use those which are worn out, and are overlooked as metaphors. The original fellow is therefore regarded as only witty; and the dull are consulted as the wise." He might have said that the former spoke a dead language.

John Home Tooke is reported in "Recollections" by Samuel Rogers as having said: "Read few books well. We forget names and dates; and reproach our memory. They are of little consequence. We feel our limbs enlarge and strengthen; yet cannot tell the dinner or dish that caused the alteration. Our minds improve though we cannot name the author, and have forgotten the particulars." I think that the opposite would be the truer statement, books differ so immensely in their nutritive qualities, and good ones are so rare.

Gosse, in his "Letters from Alabama," says that he thinks he saw a large dragon-fly (*Æslona*), which was hawking over a brook, catch and devour some minnows about one inch long, and says it is known that "the larvæ of the greater water-beetles (*Dyticidœ*) devour fish."

It is the discovery of science that stupendous changes in the earth's surface, such as are referred to the Deluge, for instance, are the result of causes still in operation, which have been at work for an incalculable period. There has not been a sudden reformation, or, as it were, new creation of the world, but a steady progress according to existing laws. The same is true in detail also. It is a vulgar prejudice that some plants are "spontaneously generated," but science knows that they come from seeds, i.e. are the result of causes still in operation, however slow and unobserved. It is a common saying that "little strokes fall great oaks," and it does not imply much wisdom in him who originated it. The sound of the axe invites our attention to such a catastrophe; we can easily count each stroke as it is given, and all the neighborhood is informed by a loud crash when the deed is consummated. But such, too, is the rise of the oak; little strokes of a different kind and often repeated raise great oaks, but scarcely a traveller hears these or turns aside to converse with Nature, who is dealing them the while.

Nature is slow but sure; she works no faster than need be; she is the tortoise that wins the race by her perseverance; she knows that seeds have many other uses than to reproduce their kind. In raising oaks and pines, she works with a leisureliness and security answering to the age and strength of the trees. If every acorn of this year's crop is destroyed, never fear! she has more years to come. It is not necessary that a pine or an oak should bear fruit every year, as it is that a pea-vine should. So, botanically, the greatest changes in the landscape are produced more gradually than we expected. If Nature has a pine or an oak wood to produce, she manifests no haste about it.

Thus we should say that oak forests are produced by a kind of accident, i.e. by the failure of animals to reap the fruit of their labors. Yet who shall say that they have not a fair knowledge of the value of their labors — that the squirrel when it plants an acorn, or the jay when it lets one slip from under its foot, has not a transient thought for its posterity?

Possibly here, a thousand years hence, every oak will know the human hand that planted it.

How many of the botanist's arts and inventions are thus but the rediscovery of a lost art, i.e. lost to him here or elsewhere!

Horace Mann told me some days ago that he found, near the shore in that muddy bay by the willows in the rear of Mrs. Ripley's, a great many of the *Sternotherus odoratus*, assembled, he supposed, at their breedingtime, or, rather, about to come out to lay their eggs. He waded in [and] collected — I think he said — about a hundred and fifty of them for Agassiz!

I see in the Boston Journal an account of robins in numbers on the savin trees in that neighborhood, feeding on their berries. This suggests that they may plant its berries as well as the crows.

Jan. 15. More snow last night, and still the first that fell remains on the ground. Rice thinks that it is two feet deep on a level now. We have had no thaw yet.

Rice tells me that he baits the "seedees" and the jays and crows to his door nowadays with com. He thinks he has seen one of these jays stow away somewhere, without swallowing, as many as a dozen grains of com, for, after picking it up, it will fly up into a tree near by and deposit so many successively in different crevices before it descends.

Speaking of Roman wormwood springing up abundantly when a field which has been in grass for twenty years or more is plowed, Rice says that, if you carefully examine such a field before it is plowed, you will find very short and stunted specimens of wormwood and pigweed there, — and remarkably full of seed too!

Feb. 5. Horace Mann brings me a screech owl, which was caught in Hastings's bam on the meeting-house avenue. It had killed a dove there. This is a decidedly gray owl, with none of the reddish or nut brown of the specimen of December 26, though it is about the same size, and answers exactly to Wilson's mottled owl.

Rice brings me an oak stick with a woodpecker's hole in it by which it reached a pupa.

The first slight rain and thaw of this winter was February 2d.

Feb. 8. Coldest day yet; — 22° at least (all we can read), at 8 A. M., and, [so far] as I can learn, not above — 6° all day.

Feb. 15. A little thunder and lightning late in the afternoon. I see two flashes and hear two claps.

A kitten is so flexible that she is almost double; the hind parts are equivalent to another kitten with which the fore part plays. She does not discover that her tail belongs to her till you tread upon it.

How eloquent she can be with her tail! Its sudden swellings and vibrations! She jumps into a chair and then stands on her hind legs to look out the window; looks steadily at objects far and near, first turning her gaze to this side then to that, for she loves to look out a window as much as any gossip. Ever and anon she bends back her ears to hear what is going on within the room, and all the while her eloquent tail

is reporting the progress and success of her survey by speaking gestures which betray her interest in what she sees.

Then what a delicate hint she can give with her tail! passing perhaps underneath, as you sit at table, and letting the tip of her tail just touch your legs, as much as to say, I am here and ready for that milk or meat, though she may not be so forward as to look round at you when she emerges.

Only skin-deep lies the feral nature of the cat, unchanged still. I just had the misfortune to rock on to our cat's leg, as she was lying playfully spread out under my chair. Imagine the sound that arose, and which was excusable; but what will you say to the fierce growls and flashing eyes with which she met me for a quarter of an hour thereafter? No tiger in its jungle could have been savager.

Feb. 21. I have just read a book called "Carolina Sports by Land and Water; including Incidents of Devil-Fishing, Wild-cat, Deer and Bear Hunting, Etc. By the Hon. Wm. Elliott."

The writer is evidently a regular sportsman, and describes his sporting with great zest. He was withal the inventor and institutor of devil-fishing, which consists in harpooning a monstrous salt-water fish, and represents himself in a plate harpooning him. His motive, however, was not profit or a subsistence, but sport.

However, I should have found nothing peculiar in the book, if it did not contain, near the end, so good an example of human inconsistency. I quote some sentences in the order in which they occur, only omitting the intermediate pages. After having described at length his own sporting exploits, using such words as these, for instance. Being in pursuit of a wildcat, he says (page 163): —

"It was at this moment that Dash, espying something in motion in the leafy top of a bay-tree, cracked off his Joe Manton with such good effect, that presently we heard a heavy body come tumbling through the limbs until it splashed into the water. Then came a stunning burst from the hounds — a clash from the whole orchestra in full chorus! — a growl from the assailed, with an occasional squeak on the part of the assailants, which showed that the game was not all on one side. We were compelled, all the while, to be delighted ear-witnesses only of the strife, which resulted in the victory of the hounds." This proved to be a raccoon, though they thought it the wildcat. —

Again (page 168), being in pursuit of another cat, which had baffled them a long time with great cunning, he says: "The cat, with huge leaps, clambered up a tree; and now he had reached the very pinnacle, and as he gathered himself up to take a flying leap for a neighboring tree, I caught up my gun, and let slip at him in mid-flight. The arrowy posture in which he made his pitch, was suddenly changed, as the shot struck him to the heart; and doubling himself up, after one or two wild gyrations, into a heap, he fell dead, from a height of full fifty feet, into the very jaws of the dogs!"

Again (page 178), being [in] pursuit of a deer, which he had wounded, and his gun being discharged, he tried to run him down with his horse, but, as he tells us, "the noble animal refused to trample on his fellow quadruped," so he made up for it by kicking the deer in the side of the head with his spurred boot. The deer enters a thicket and he

is compelled to pursue the panting animal on foot. "A large fallen oak lies across his path; he gathers himself up for the leap, and falls exhausted directly across it. Before he could recover his legs, and while he lay thus poised on the tree, I fling myself at full length upon the body of the struggling deer — my left hand clasps his neck, while my right detaches the knife; whose fatal blade, in another moment, is buried in his throat. There he lay in his blood, and I remained sole occupant of the field." Opposite is a plate which represents him in the act of stabbing the deer.

Page 267. — He tells us that his uncle once had a young wildcat, — a mere kitten, — but that, to prevent its worrying the poultry, "a cord was fastened round his neck, and a clog attached to the end." Still he would endeavor to catch the fowls.

"My uncle one day invited several of his friends, to witness this development of natural propensity in his savage pet. The kitten, with his clog attached, was let out of the box; and it was curious to observe with what stealthy pace he approached the spot where the poultry were feeding. They scarcely seemed to notice the diminutive thing that was creeping toward them; when, crouching low, and measuring exactly the distance which separated them, he sprang upon the back of the old rooster, and hung on by claw and teeth to the feathers, while the frightened bird dragged him, clog and all, over the yard. After several revolutions had been made, the cat let go his hold on the back of the fowl, and, with the quickness of lightning, caught the head in his mouth, clinched his teeth, shut his eyes, stiffened his legs, and hung on with the most desperate resolution, while the fowl, rolling over in agony, buffeted him with his wings. All in vain! In a few seconds more he was dead, and we looked with abhorrence on the savage animal, that had just taken his first degree in blood. In this case, there could have been no teaching — no imitation. It was the undoubted instinct of a cruel nature! We wondered that this young beast of prey should have known, from this instinct, the vital part of its victim I — and we wondered still more, that in the providence of God, he had seen fit to create an animal with an instinct so murderous. Philosophy is ready with her explanation, and our abhorrence may be misplaced, since from his very organization, he is compelled to destroy life in order to live! Yet, knowing this, our abhorrence still continues; whence we may draw the consolatory conclusion — that the instincts of a man naturally differ from those of a wild-cat."

A few pages further (page 282) in a chapter called "Random Thoughts on Hunting," which is altogether a eulogy on that pursuit, he praises it because it develops or cultivates among other qualities "the observation, that familiarizes itself with the nature and habits of the quarry — the sagacity that anticipates its projects of escape — and the promptitude that defeats them! — the rapid glance, the steady aim, the quick perception, the ready execution; these are among the faculties and qualities continually called into pleasing exercise."

Physician, heal thyself!

This plucking and stripping a pine cone is a business which he and his family understand perfectly. That is their forte. I doubt if you could suggest any improvement. After ages of experiment their instinct has settled on the same method that our rea-

son would finally, if we had to open a pine cone with our teeth; and they were thus accomplished before our race knew that a pine cone contained any seed.

He does not prick his fingers, nor pitch his whiskers, nor gnaw the solid core any more than is necessary. Having sheared off the twigs and needles that may be in his way, — for like a skillful woodchopper he first secures room and verge enough, — he neatly cuts off the stout stem of the cone with a few strokes of his chisels, and it is his. To be sure, he may let it fall to the ground and look down at it for a moment curiously, as if it were not his; but he is taking note where it lies and adding it to a heap of a hundred more like it in his mind, and it now is only so much the more his for his seeming carelessness. And, when the hour comes to open it, observe how he proceeds. He holds it in his hands, — a solid embossed cone, so hard it almost rings at the touch of his teeth. He pauses for a moment perhaps, — but not because he does not know how to begin, — he only listens to hear what is in the wind, not being in a hurry.

He knows better than try to cut off the tip and work his way downward against a chevaux-de-frise of advanced scales and prickles, or to gnaw into the side for three quarters of an inch in the face of many armed shields. But he does not have to think of what he knows, having heard the latest æolian rumor. If there ever was an age of the world when the squirrels opened their cones wrong end foremost, it was not the golden age at any rate. He whirls the cone bottom upward in a twinkling, where the scales are smallest and the prickles slight or none and the short stem is cut so close as not to be in his way, and then he proceeds to cut through the thin and tender bases of the scales, and each stroke tells, laying bare at once a couple of seeds. And then he strips it as easily as if its scales were chaff, and so rapidly, twirling it as he advances, that you cannot tell how he does it till you drive him off and inspect his unfinished work.

Feb. 27. 2 P. M. — It is very pleasant and warm, and the ground half bare. As I am walking down the Boston road under the hill this side Clark's, it occurs to me that I have just heard the twitter of a bluebird. (C. heard one the 26th.) I stop and listen to hear it again, but cannot tell whether it comes from the buttonwoods high over my head or from the lower trees on the hilltop. It is not the complete bluebird warble, but the twitter only. And now it seems to come from Pratt's house, where the window is open, and I am not sure but it is a caged bird. I walk that way, and now think that I distinguish the minstrel in a black speck in the top of a great elm on the Common. Messer is shingling Clark's bam; so, to make sure, I cross over and ask him if he has heard a bluebird to-day, and he says he has several times. When I get to the elm near Minott's I hear one warble distinctly. Miss Minott and Miss Potter have both died within a fortnight past, and the cottage on the hillside seems strangely deserted; but the first bluebird comes to warble there as usual.

Mother hears a robin to-day.

Buttonwood sap flows fast from wounds made last fall.

Feb. 28. P. M. — Down Boston road under the hill.

Air full of bluebirds as yesterday. The sidewalk is bare and almost dry the whole distance under the hill.

Turn in at the gate this side of Moore's and sit on the yellow stones rolled down in the bay of a digging, and examine the radical leaves, etc., etc.

Where the edges of grassy banks have caved I see the fine fibrous roots of the grass which have been washed bare during the winter extending straight downward two feet (and how much further within the earth I know not), — a pretty dense grayish mass.

The buttonwood seed has apparently scarcely begun to fall yet, — only two balls under one tree, but they loose and broken.

March 3. Sunday. Hear that there was a flock of geese in the river last night. See and hear song sparrows to-day; probably here for several days.

It is an exceedingly warm and pleasant day. The snow is suddenly all gone except heels, and — what is more remarkable — the frost is generally out of the ground, e. g. in our garden, for the reason that it has not been in it. The snow came December 4th, before the ground was frozen to any depth, has been unusually deep, and the ground has not been again exposed till now. Hence, though we have had a little very cold weather and a good deal of steady cold, the ground generally has not been frozen.

March 8. I just heard peculiar faint sounds made by the air escaping from a stick which I had just put into my stove. It sounded to my ear exactly like the peeping of the hylodes in a distant pool, a cool and breezy spring evening, — as if it were designed to remind me of that season.

Saw the F. hyemalis March 4th.

To continue subject of March 3d, —

It is remarkable that, though in ordinary winters, when the ground is alternately bare and covered with snow several times, or is not covered till after it is frozen, it may be frozen a foot or more in depth generally, yet, if it is kept covered with snow, though only a thin coating, from first to last, it will not be frozen at all.

For example, the ground was half bare on the 27th, the walk under the Boston road hills pretty fair on the 28th, and the 3d, after rain, the earth was bare, the ways were about settled, the melted snow and rain having been soaked up at once by the thirsty and open ground. There was probably no frost on level ground except where the earth had of late been partly exposed in the middle of the road. The recent rain and melting accordingly raised the river less than it otherwise would. There has been no breaking up of the frost on roads, — no bad travelling as usual, — but as soon as the snow is gone, the ways are settled.

In short, Nature uses all sorts of conveyances, from the rudest drag to a balloon, but she will get her seeds along in due season.

Is it not possible that Loudon is right as it respects the primitive distribution of the birch? Are not the dense patches always such as have sprung up in open land (commonly old fields cleared by man), as is the case with the pitch pine? It disappears at length from a dense oak or pine wood. Perhaps originally it formed dense woods only where a space had been cleared for it by a burning, as now at the eastward. Perhaps

only the oaks and white pines could (originally) possess the soil here against all comers, maple succeeding because it does not mind a wet foot.

Suppose one were to take such a boxful of birch seed as I have described into the meeting-house belfry in the fall, and let some of it drop in every wind, but always more in proportion as the wind was stronger, and yet so husband it that there should be some left for every gale even till far into spring; so that this seed might be blown toward every point of the compass and to various distances in each direction. Would not this represent a single birch tree on a hill? Of which trees (though only a part on hills) we have perhaps a million. And yet some feel compelled to suppose that the birch trees which spring up after a burning are spontaneously generated — for want of seed! It is true [it] does not come up in great quantities at the distance I have spoken of, but, if only one comes up there this year, you may have a million seeds matured there a few years hence.

It is true that the greater part of these seeds fall near the trees which bore them, and comparatively few germinate; yet, when the surface is in a favorable condition, they may spring up in very unexpected places.

A lady tells me that she met Deacon S. of Lincoln with a load of hay, and she, noticing that as he drove under the apple trees by the side of the road a considerable part of the hay was raked off by their boughs, informed him of it. But he answered, "It is not mine yet. I am going to the scales with it and intend to come back this way."

March 11. C. says that Walden is almost entirely open to-day, so that the lines on my map would not strike any ice, but that there is ice in the deep cove. It will be open then the 12th or 13th. This is earlier than I ever knew it to open. Fair Haven was solid ice two or three days ago, and probably is still, and Goose Pond is to-day all ice. Why, then, should Walden have broken up thus early? for it froze over early and the winter was steadily cold up to February at least. I think it must have been because the ice was uncommonly covered with snow, just as the earth was, and so, as there was little or no frost in the earth, the ice also was thin, and it did not increase upward with snow ice as much as usual because there was no thaw or rain at all till February 2d, and then very little. According to all accounts there has been no skating on Walden the past winter on account of the snow. It was unusually covered with snow. This shows how many things are to be taken into account in judging of such a pond. I have not been able to go to the pond the past winter. I infer that, if it has broken up thus early, it must be because the ice was thin, and that it was thin not for want of cold generally, but because of the abundance of snow which lay on it.

The water is now high on the meadows and there is no ice there, owing to the recent heavy rains. Yet C. thinks it has been higher a few weeks since.

C. observes where mice (?) have gnawed the pitch pines the past winter. Is not this a phenomenon of a winter of deep snow only? as that when I lived at Walden, — a hard winter for them. I do not commonly observe it on a large scale.

My Aunt Sophia, now in her eightieth year, says that when she was a little girl my grandmother, who lived in Keene, N. H., eighty miles from Boston, went to Nova

Scotia, and, in spite of all she could do, her dog Bob, a little black dog with his tail cut off, followed her to Boston, where she went aboard a vessel. Directly after, however, Bob returned to Keene. One day, Bob, lying as usual under his mistress's bed in Keene, the window being open, heard a dog bark in the street, and instantly, forgetting that he was in the second story, he sprang up and jumped out the chamber window. He came down squarely on all fours, but it surprised or shocked him so that he did not run an inch, — which greatly amused the children, — my mother and aunts.

The seed of the willow is exceedingly minute, — as I measure, from one twentieth to one twelfth of an inch in length by one fourth as much in width, — and is surrounded at base by a tuft of cotton-like hairs about one fourth of an inch long rising around and above it, forming a kind of parachute. These render it the most buoyant of the seeds of any of our trees, and it is borne the furthest horizontally with the least wind. It falls very slowly even in the still air of a chamber, and rapidly ascends over a stove. It floats the most like a mote of any, — in a meandering manner, — and, being enveloped in this tuft of cotton, the seed is hard to detect.

Each of the numerous little pods, more or less ovate and beaked, which form the fertile catkin is closely packed with down and seeds. At maturity these pods open their beaks, which curve back, and gradually discharge their burden like the milkweed. It would take a delicate gin indeed to separate these seeds from their cotton.

If you lay bare any spot in our woods, however sandy, — as by a railroad cut, — no shrub or tree is surer to plant itself there sooner or later than a willow (commonly *S. humilis* or *tristis*) or poplar.

We have many kinds, but each is confined to its own habitat. I am not aware that the *S. nigra* has ever strayed from the river's brink. Though many of the *S. alba* have been set along our causeways, very few have sprung up and maintained their ground elsewhere.

The principal habitat of most of our species, such as love the water, is the river's bank and the adjacent river meadows, and when certain kinds spring up in an inland meadow where they were not known before, I feel pretty certain that they come from the river meadows. I have but little doubt that the seed of four of those that grow along the railroad causeway was blown from the river meadows, viz. *S. pedicellaris*, *lucida*, *Torreyana*, and *petiolaris*.

The barren and fertile flowers are usually on separate plants. I observe [? ] that the greater part of the white willows set out on our causeways are sterile ones. You can easily distinguish the fertile ones at a distance when the pods are bursting. And it is said that no sterile weeping willows have been introduced into this country, so that it cannot be raised from the seed. Of two of the indigenous willows common along the brink of our river I have detected but one sex.

The seeds of the willow thus annually fill the air with their lint, being wafted to all parts of the country, and, though apparently not more than one in many millions gets to be a shrub, yet so lavish and persevering is Nature that her purpose is completely answered.

March 16. A severe, blocking-up snow-storm.

March 18. Tree sparrows have warbled faintly for a week.

When I pass by a twig of willow, though of the slenderest kind, rising above the sedge in some dry hollow early in December, or in midwinter above the snow, my spirits rise as if it were an oasis in the desert. The very name "sallow" (salix, from the Celtic sal-lis, near water) suggests that there is some natural sap or blood flowing there. It is a divining wand that has not failed, but stands with its root in the fountain.

The fertile willow catkins are those green caterpillarlike ones, commonly an inch or more in length, which develop themselves rapidly after the sterile yellow ones which we had so admired are fallen or effete. Arranged around the bare twigs, they often form green wands eight to eighteen inches long. A single catkin consists of from twenty-five to a hundred little pods, more or less ovate and beaked, each of which is closely packed with cotton, in which are numerous seeds so small that they are scarcely discernible by ordinary eyes.

I do not know what they mean who call this the emblem of despairing love! "The willow, worn by forlorn paramour!" It is rather the emblem of love and sympathy with all nature. It may droop, — it is so lithe, supple, and pliant, — but it never weeps. The willow of Babylon blooms not the less hopefully with us, though its other half is not in the New World at all, and never has been. It droops, not to represent David's tears, but rather to snatch the crown from Alexander's head. (Nor were poplars ever the weeping sisters of Phaëton, for nothing rejoices them more than the sight of the Sun's chariot, and little reck they who drives it.)

Ah, willow! willow! Would that I always possessed thy good spirits.

No wonder its wood was anciently in demand for bucklers, for, take the whole tree, it is not only soft and pliant but tough and resilient (as Pliny says?), not splitting at the first blow, but closing its wounds at once and refusing to transmit its hurts.

I know of one foreign species which introduced itself into Concord as [a] withe used to tie up a bundle of trees. A gardener stuck it in the ground, and it lived, and has its descendants.

Herodotus says that the Scythians divined by the help of willow rods. I do not know any better twigs for this purpose.

How various are the habits of men! Mother says that her father-in-law, Captain Minott, not only used to roast and eat a long row of little wild apples, reaching in a semicircle from jamb to jamb under the andirons on the reddened hearth (I used to buy many a pound of Spanish brown at the stores for mother to redden the jambs and hearth with), but he had a quart of new milk regularly placed at the head of his bed, which he drank at many draughts in the course of the night. It was so the night he died, and my grandmother discovered that he was dying, by his not turning over to reach his milk. I asked what he died of, and mother answered apoplexy! at which I did not wonder. Still this habit may not have caused it.

I have a cousin, also, who regularly eats his bowl of bread and milk just before going to bed, however late. He is a very stirring man.

You can't read any genuine history — as that of Herodotus or the Venerable Bede — without perceiving that our interest depends not on the subject but on the man, — on the manner in which he treats the subject and the importance he gives it. A feeble writer and without genius must have what he thinks a great theme, which we are already interested in through the accounts of others, but a genius — a Shakespeare, for instance — would make the history of his parish more interesting than another's history of the world.

Wherever men have lived there is a story to be told, and it depends chiefly on the story-teller or historian whether that is interesting or not. You are simply a witness on the stand to tell what you know about your neighbors and neighborhood. Your account of foreign parts which you have never seen should by good rights be less interesting.

March 22. A driving northeast snow-storm yesterday and last night, and to-day the drifts are high over the fences and the trains stopped. The Boston train due at 8.30 A. M. did not reach here till five this afternoon. One side of all the houses this morning was one color, — i.e. white with the moist snow plastered over them, — so that you could not tell whether they had blinds or not.

When we consider how soon some plants which spread rapidly, by seeds or roots, would cover an area equal to the surface of the globe, how soon some species of trees, as the white willow, for instance, would equal in mass the earth itself, if all their seeds became full-grown trees, how soon some fishes would fill the ocean if all their ova became full-grown fishes, we are tempted to say that every organism, whether animal or vegetable, is contending for the possession of the planet, and, if any one were sufficiently favored, supposing it still possible to grow, as at first, it would at length convert the entire mass of the globe into its own substance. Nature opposes to this many obstacles, as climate, myriads of brute and also human foes, and of competitors which may preoccupy the ground. Each suggests an immense and wonderful greediness and tenacity of life (I speak of the species, not individual), as if bent on taking entire possession of the globe wherever the climate and soil will permit. And each prevails as much as it does, because of the ample preparations it has made for the contest, — it has secured a myriad chances, — because it never depends on spontaneous generation to save it.

A writer in the Tribune speaks of cherries as one of the trees which come up numerously when the forest is cut or burned, though not known there before. This may be true because there was no one knowing in these matters in that neighborhood. But I assert that it was there before, nevertheless; just as the little oaks are in the pine woods, but never grow up to trees till the pines are cleared off. Scarcely any plant is more sure to come up in a sprout-land here than the wild black cherry, and yet, though only a few inches high at the end of the first year after the cutting, it is commonly several years old, having maintained a feeble growth there so long. There is where the birds have dropped the stones, and it is doubtful if those dropped in pastures and open land are as likely to germinate. Yet the former rarely if ever get to be trees.

Rice told me a month ago that when the earth became bare the jays, though they still came round the house, no longer picked up the corn he had scattered for them. I suggested that it was because they were now able to vary their diet.

Of course natural successions are taking place where a swamp is gradually filling up with sphagnum and bushes and at length trees, i.e., where the soil is changing.

Botanists talk about the possibility and impossibility of plants being naturalized here or there. But what plants have not been naturalized? Of course only those which grow to-day exactly where the original plant of the species was created. It is true we do not know whether one or many plants of a given kind were originally created, but I think it is the most reasonable and simple to suppose that only one was, — to suppose as little departure as possible from the existing order of things. They commenced to spread themselves at once and by whatever means they possessed as far as they could, and they are still doing so. Many were common to Europe and America at the period of the discovery of the latter country, and I have no doubt that they had naturalized themselves in one or the other country. This is more philosophical than to suppose that they were independently created in each.

I suppose that most have seen — at any rate I can show them — English cherry trees, so called, coming up not uncommonly in our woods and under favorable circumstances becoming full-grown trees. Now I think that they will not pretend that they came up there in the same manner before this country was discovered by the whites. But, if cherry trees come up by spontaneous generation, why should they not have sprung up there in that way a thousand years ago as well as now?

If the pine seed is spontaneously generated, why is it not so produced in the Old World as well as in America? I have no doubt that it can be raised from the seed in corresponding situations there, and that it will seem to spring up just as mysteriously there as it does here. Yet, if it will grow so after the seed has been carried thither, why should it not before, if the seed is unnecessary to its production?

The above-mentioned cherry trees come up, though they are comparatively few, just like the red cherry, and, no doubt, the same persons would consider them as spontaneously generated. But why did Nature defer raising that species here by spontaneous generation, until we had raised it from the stones?

It is evident that Nature's designs would not be accomplished if seeds, having been matured, were simply dropped and so planted directly beneath their parent stems, as many will always be in any case. The next consideration with her, then, after determining to create a seed, must have been how to get it transported, though to never so little distance, — the width of the plant, or less, will often be sufficient, — even as the eagle drives her young at last from the neighborhood of her eyrie, — for their own good, since there is not food enough there for all, — without depending on botanists, patent offices, and seedsmen. It is not enough to have matured a seed which will reproduce its kind under favorable conditions, but she must also secure it those favorable conditions. Nature has left nothing to the mercy of man. She has taken care

that a sufficient number of every kind of seeds, from a cocoa-nut to those which are invisible, shall be transported and planted in a suitable place.

A seed, which is a plant or tree in embryo, which has the principle of growth, of life, in it, is more important in my eyes, and in the economy of Nature, than the diamond of Kohinoor.

When we hear of an excellent fruit or a beautiful flower, the first question is if any man has got the seeds in his pocket; but men's pockets are only one of the means of conveyances which Nature has provided.

March 30. High water, — up to sixth slat (or gap) above Smith's second post. It is said to have been some nine inches higher about a month ago, when the snow first went off.

R. W. E. lately found a Norway pine cut down in Stow's wood by Saw Mill Brook.

According to Channing's account, Walden must have skimmed nearly, if not entirely, over again once since the 11th or 12th, or after it had been some time completely clear. It seems, then, that in some years it may thaw and freeze again.

April 2. A drifting snow-storm, perhaps a foot deep on an average.

Pratt thought the cowslip was out the 4th.

April 6. Am surprised to find the river fallen some nine inches notwithstanding the melted snow. But I read in Blodget that the equivalent in water is about one tenth. Say one ninth in this case, and you have one and one third inches, and this falling on an unfrozen surface, the river at the same time falling from a height, shows why it was no more retarded (far from being absolutely raised).

There is now scarcely a button-ball to be seen on Moore's tree, where there were many a month ago or more. The balls have not fallen entire, but been decomposed and the seed dispersed gradually, leaving long, stringy stems and their cores dangling still. It is the storms of February and March that disperse them.

The (are they cinnamon?) sparrows are the finest singers I have heard yet, especially in Monroe's garden, where I see no tree sparrows. Similar but more prolonged and remarkable and loud.

April 7. Sunday. Round the two-mile square.

I see where the common great tufted sedge (*Carex stricta*) has started under the water on the meadows, now April 22. It was high water again about a week ago, — Mann thinks with[in] three or four inches as high as at end of winter.

He obtained to-day the buffle-headed duck, diving in the river near the Nine-Acre Comer bridge. I identify it at sight as my bird seen on Walden.

I hear a chip-bird.

April 23. Think I hear bay-wings. Toads ring.

April 25. Horace Mann brings me apparently a pigeon hawk. The two middle tail-feathers are not tipped with white and are pointed almost as a woodpecker's.

May 1. Water in our neighbors' cellars quite generally. May it not be partly owing to the fact that the ground was not frozen the last winter to any depth, and so the melted snow as well as rain has been chiefly absorbed by it?

May 4. H. Mann brings me two small pewees, but not yellowish about eye and bill, and bill is all black. Also a white-throat sparrow, Wilson's thrush, and myrtle-bird.

May 5. Hear the seringo note.

May 11. A boy brings me a salamander from S. Mason's. Sent it to Mann. What kind?

Set out for Minnesota via Worcester.

May 12. Sunday. In Worcester.

Rode to east side of Quinsigamond Pond with Blake and Brown and a dry humorist, a gentleman who has been a sportsman and was well acquainted with dogs. He said that he once went by water to St. John, N. B., on a sporting excursion, taking his dog with him; but the latter had such a remarkable sense of decency that, seeing no suitable place aboard the vessel, he did not yield to the pressing demands of nature and, as the voyage lasted several days, swelled up very much. At length his master, by taking him aside and setting him the example, persuaded him to make water only. When at length he reached St. John, and was leading his dog by a rope up a long hill there which led to the town, he was compelled to stop repeatedly for his dog to empty himself and was the observed of all observers. This suggested that a dog could be educated to be far more cleanly in some respects than men are.

He also states that a fox does not regard all dogs, — or, rather, avoid them, — but only hunting dogs. He one day heard the voices of hounds in pursuit of a fox and soon after saw the fox come trotting along a path in which he himself was walking. Secreting himself behind a wall he watched the motions of the fox, wishing to get a shot at him, but at that moment his dog, a spaniel, leapt out into the path and advanced to meet the fox, which stood still without fear to receive him. They smelled of one another like dogs, and the sportsman was prevented from shooting the fox for fear of hitting his dog. So he suddenly showed himself in the path, hoping thus to separate them and get a shot. The fox immediately cantered backward in the path, but his dog ran after him so directly in a line with the fox that he was afraid to fire for fear of killing the dog.

May 13. Worcester to Albany.

The latter part of the day rainy. The hills come near the railroad between Westfield and Chester Village. Thereafter in Massachusetts they may be as high or higher, but are somewhat further off.

The leafing is decidedly more advanced in western Massachusetts than in eastern. Apple trees are greenish. Red elder-berry is apparently just beginning to bloom.

Put up at the Delavan House. Not so good as costly.

May 14. Albany to Suspension Bridge.

Albany to Schenectady a level pitch pine plain with also white pine, white birch, and shad-bush in bloom, with hills at last. No houses; only two or three huts on the edge of woods without any road. These were the last pitch pines that I saw on my westward journey.

It is amusing to observe how a kitten regards the attic, kitchen, or shed where it was bred as its castle to resort to in time of danger. It loves best to sleep on some

elevated place, as a shelf or chair, and for many months does not venture far from the back door where it first saw the light. Two rods is a great range for it, but so far it is tempted, when the dew is off, by the motions of grasshoppers and crickets and other such small game, sufficiently novel and surprising to it. They frequently have a wheezing cough, which some refer to grasshoppers' wings across their windpipes. The kitten has been eating grasshoppers.

If some member of the household with whom they are familiar — their mistress or master — goes forth into the garden, they are then encouraged to take a wider range, and for a short season explore the more distant bean and cabbage rows, or, if several of the family go forth at once, — as it were a reconnaissance in force, — the kitten does a transient scout duty outside, but yet on the slightest alarm they are seen bounding back with great leaps over the grass toward the castle, where they stand panting on the door-step, with their small lower jaws fallen, until they fill up with courage again. A cat looks down with complacency on the strange dog from the corn-bam window.

The kitten when it is two or three months old is full of play. Ever and anon she takes up her plaything in her mouth and carries it to another place, — a distant corner of the room or some other nook, as under a rocker, — or perchance drops it at your feet, seeming to delight in the mere carriage of it, as if it were her prey — tiger-like. In proportion to her animal spirits are her quick motions and sudden whirlings about on the carpet or in the air. She may make a great show of scratching and biting, but let her have your hand and she will presently lick it instead.

They are so naturally stealthy, skulking and creeping about, affecting holes and darkness, that they will enter a shed rather by some hole under the door-sill than go over the sill through the open door.

Though able to bear cold, few creatures love warmth more or sooner find out where the fire is. The cat, whether she comes home wet or dry, directly squeezes herself under the cooking-stove, and stews her brain there, if permitted. If the cat is in the kitchen, she is most likely to be found under the stove.

This (October 5) is a rainy or drizzling day at last, and the robins and sparrows are more numerous in the yard and about the house than ever. They swarm on the ground where stood the heap of weeds which was burned yesterday, picking up the seeds which rattled from it. Why should these birds be so much more numerous about the house such a day as this? I think of no other reason than because it is darker and fewer people are moving about to frighten them. Our little mountain-ash is all alive with them. A dozen robins on it at once busily reaching after and plucking the berries, actually make the whole tree shake. There are also some little birds (I think purple finches) with them. A robin will swallow half a dozen berries, at least, in rapid succession before it goes off, and apparently it soon comes back for more.

The reason why naturalists make so little account of color is because it is so insignificant to them; they do not understand it. But the lover of flowers or animals makes very much of color. To a fancier of cats it is not indifferent whether one be black or gray, for the color expresses character.

Prescott is not inclined to go to the wars again (October, '61), and so Concord has no company to represent her at present. Cyrus Warren thinks that Derby, the first lieutenant (and butcher that was), would do for captain as well as Prescott, and adds, as his principal qualification, "There is n't one in the company can cut up a crittur like him."

Henry Mitchell of the Coast Survey (page 317) has invented a new kind of pile, to be made of some heavy and strong wood and "so cut that the lower portion of it, for a space of six or eight feet, presents the appearance of a number of inverted frustums of cones, placed one above another." When this is swayed to and fro by the waves, instead of being loosened and washed out, it sinks deeper and deeper. This, as Professor Bache (in Coast Survey Report for 1859, page 30) says, "is a device borrowed from nature, he [Mitchell] having observed that certain seed vessels, by virtue of their forms, bury themselves in the earth when agitated by wind or water." No seeds are named, but they must be similar to the seed of the porcupine grass of the West.

Young Macey, who has been camping on Monadnock this summer, tells me that he found one of my spruce huts made last year in August, and that as many as eighteen, reshingling it, had camped in it while he was there.

See a large hornets' nest on a maple (September 29), the half immersed leaves turned scarlet.

Four little kittens just born; lay like stuffed skins of kittens in a heap, with pink feet; so flimsy and helpless they lie, yet blind, without any stiffness or ability to stand.

Edward Lord Herbert says in his autobiography, "It is well known to those that wait in my chamber, that the shirts, waistcoats, and other garments I wear next my body, are sweet, beyond what either easily can be believed, or hath been observed in any else, which sweetness also was found to be in my breath above others, before I used to take tobacco."

The kitten can already spit at a fortnight old, and it can mew from the first, though it often makes the motion of mewling without uttering any sound.

The cat about to bring forth seeks out some dark and secret place for the purpose, not frequented by other cats.

The kittens' ears are at first nearly concealed in the fur, and at a fortnight old they are mere broad-based triangles with a side foremost. But the old cat is ears for them at present, and comes running hastily to their aid when she hears them mew and licks them into contentment again. Even at three weeks the kitten cannot fairly walk, but only creeps feebly with outspread legs. But thenceforth its ears visibly though gradually lift and sharpen themselves.

At three weeks old the kitten begins to walk in a staggering and creeping manner and even to play a little with its mother, and, if you put your ear close, you may hear it purr. It is remarkable that it will not wander far from the dark corner where the cat has left it, but will instinctively find its way back to it, probably by the sense of touch, and will rest nowhere else. Also it is careful not to venture too near the edge of a precipice, and its claws are ever extended to save itself in such places. It washes

itself somewhat, and assumes many of the attitudes of an old cat at this age. By the disproportionate size of its feet and head and legs now it reminds you [of] a lion.

I saw it scratch its ear to-day, probably for the first time; yet it lifted one of its hind legs and scratched its ear as effectually as an old cat does. So this is instinctive, and you may say that, when a kitten's ear first itches, Providence comes to the rescue and lifts its hind leg for it. You would say that this little creature was as perfectly protected by its instinct in its infancy as an old man can be by his wisdom. I observed when she first noticed the figures on the carpet, and also put up her paws to touch or play with surfaces a foot off. By the same instinct that they find the mother's teat before they can see they scratch their ears and guard against falling.

After a violent easterly storm in the night, which clears up at noon (November 3, 1861), I notice that the surface of the railroad causeway, composed of gravel, is singularly marked, as if stratified like some slate rocks, on their edges, so that I can tell within a small fraction of a degree from what quarter the rain came. These lines, as it were of stratification, are perfectly parallel, and straight as a ruler, diagonally across the flat surface of the causeway for its whole length. Behind each little pebble, as a protecting boulder, an eighth or a tenth of an inch in diameter, extends northwest a ridge of sand an inch or more, which it has protected from being washed away, while the heavy drops driven almost horizontally have washed out a furrow on each side, and on all sides are these ridges, half an inch apart and perfectly parallel.

All this is perfectly distinct to an observant eye, and yet could easily pass unnoticed by most. Thus each wind is self-registering.

# The Criticism

# HENRY DAVID THOREAU: HIS CHARACTER AND OPINIONS

by Robert Louis Stevenson

## I

Thoreau's thin, penetrating, big-nosed face, even in a bad woodcut, conveys some hint of the limitations of his mind and character. With his almost acid sharpness of insight, with his almost animal dexterity in act, there went none of that large, unconscious geniality of the world's heroes. He was not easy, not ample, not urbane, not even kind; his enjoyment was hardly smiling, or the smile was not broad enough to be convincing; he had no waste lands nor kitchen-midden in his nature, but was all improved and sharpened to a point. "He was bred to no profession," says Emerson; "he never married; he lived alone; he never went to church; he never voted; he refused to pay a tax to the State; he ate no flesh, he drank no wine, he never knew the use of tobacco; and, though a naturalist, he used neither trap nor gun. When asked at dinner what dish he preferred, he answered, 'the nearest.'" So many negative superiorities begin to smack a little of the prig. From his later works he was in the habit of cutting out the humorous passages, under the impression that they were beneath the dignity of his moral muse; and there we see the prig stand public and confessed. It was "much easier," says Emerson acutely, much easier for Thoreau to say no than yes; and that is a characteristic which depicts the man. It is a useful accomplishment to be able to say no, but surely it is the essence of amiability <sup>2</sup> to prefer to say yes where it is possible. There is something wanting in the man who does not hate himself whenever he is constrained to say no. And there was a great deal wanting in this born dissenter. He was almost shockingly devoid of weaknesses; he had not enough of them to be truly polar with humanity; whether you call him demi-god or demi-man, he was at least not altogether one of us, for he was not touched with a feeling of our infirmities. The world's heroes have room for all positive qualities, even those which are disreputable, in the capacious theatre of their dispositions. Such can live many lives; while a Thoreau can live but one, and that only with perpetual foresight.

He was no ascetic, rather an Epicurean of the nobler sort; and he had this one great merit, that he succeeded so far as to be happy. "I love my fate to the core and rind," he wrote once; and even while he lay dying, here is what he dictated (for it seems he was

already too feeble to control the pen): “You ask particularly after my health. I suppose that I have not many months to live, but of course know nothing about it. I may say that I am enjoying existence as much as ever, and regret nothing.” It is not given to all to bear so clear a testimony to the sweetness of their fate, nor to any without courage and wisdom; for this world in itself is but a painful and uneasy place of residence, and lasting happiness, at least to the self-conscious, comes only from within. Now Thoreau’s content and ecstasy in living was, we may say, like a plant that he had watered and tended with womanish solicitude; for there is apt to be something unmanly, something almost dastardly, in a life that does not move with dash and freedom, and that fears the bracing contact of the world. In one word, Thoreau was a skulker. He did not wish virtue to go out of him among his fellow-men, but slunk into a corner to hoard it for himself. He left all for the sake of certain virtuous self-indulgences. It is true that his tastes were noble; that his ruling passion was to keep himself 3 unspotted from the world; and that his luxuries were all of the same healthy order as cold tubs and early rising. But a man may be both coldly cruel in the pursuit of goodness, and morbid even in the pursuit of health. I cannot lay my hands on the passage in which he explains his abstinence from tea and coffee, but I am sure I have the meaning correctly. It is this: He thought it bad economy and worthy of no true virtuoso to spoil the natural rapture of the morning with such muddy stimulants; let him but see the sun rise, and he was already sufficiently inspired for the labours of the day. That may be reason good enough to abstain from tea; but when we go on to find the same man, on the same or similar grounds, abstain from nearly everything that his neighbours innocently and pleasurably use, and from the rubs and trials of human society itself into the bargain, we recognise that valetudinarian healthfulness which is more delicate than sickness itself. We need have no respect for a state of artificial training. True health is to be able to do without it. Shakespeare, we can imagine, might begin the day upon a quart of ale, and yet enjoy the sunrise to the full as much as Thoreau, and commemorate his enjoyment in vastly better verses. A man who must separate himself from his neighbours’ habits in order to be happy, is in much the same case with one who requires to take opium for the same purpose. What we want to see is one who can breast into the world, do a man’s work, and still preserve his first and pure enjoyment of existence.

Thoreau’s faculties were of a piece with his moral shyness; for they were all delicacies. He could guide himself about the woods on the darkest night by the touch of his feet. He could pick up at once an exact dozen of pencils by the feeling, pace distances with accuracy, and gauge cubic contents by the eye. His smell was so dainty that he could perceive the foetor of dwelling-houses as he passed them by at night; his palate so unsophisticated that, like a child, he disliked the taste of wine — or perhaps, living in 4 America, had never tasted any that was good; and his knowledge of nature was so complete and curious that he could have told the time of year, within a day or so, by the aspect of the plants. In his dealings with animals he was the original of Hawthorne’s Donatello. He pulled the woodchuck out of its hole by the tail; the hunted fox came to

him for protection; wild squirrels have been seen to nestle in his waistcoat; he would thrust his arm into a pool and bring forth a bright, panting fish, lying undismayed in the palm of his hand. There were few things that he could not do. He could make a house, a boat, a pencil, or a book. He was a surveyor, a scholar, a natural historian. He could run, walk, climb, skate, swim, and manage a boat. The smallest occasion served to display his physical accomplishment; and a manufacturer, from merely observing his dexterity with the window of a railway carriage, offered him a situation on the spot. "The only fruit of much living," he observes, "is the ability to do some slight thing better." But such was the exactitude of his senses, so alive was he in every fibre, that it seems as if the maxim should be changed in his case, for he could do most things with unusual perfection. And perhaps he had an approving eye to himself when he wrote: "Though the youth at last grows indifferent, the laws of the universe are not indifferent, but are for ever on the side of the most sensitive."

## II

Thoreau had decided, it would seem, from the very first to lead a life of self-improvement: the needle did not tremble as with richer natures, but pointed steadily north; and as he saw duty and inclination in one, he turned all his strength in that direction. He was met upon the threshold by a common difficulty. In this world, in spite of its many agreeable features, even the most sensitive must undergo some drudgery to live. It is not possible to devote your time to study and meditation without what are quaintly but happily denominated private means; these absent, a man must contrive to earn his bread by some service to the public such as the public cares to pay him for; or, as Thoreau loved to put it, Apollo must serve Admetus. This was to Thoreau even a sourer necessity than it is to most; there was a love of freedom, a strain of the wild man, in his nature, that rebelled with violence against the yoke of custom; and he was so eager to cultivate himself and to be happy in his own society, that he could consent with difficulty even to the interruptions of friendship. "Such are my engagements to myself that I dare not promise," he once wrote in answer to an invitation; and the italics are his own. Marcus Aurelius found time to study virtue, and between whiles to conduct the imperial affairs of Rome; but Thoreau is so busy improving himself that he must think twice about a morning call. And now imagine him condemned for eight hours a day to some uncongenial and unmeaning business! He shrank from the very look of the mechanical in life; all should, if possible, be sweetly spontaneous and swimmingly progressive. Thus he learned to make lead-pencils, and, when he had gained the best certificate, and his friends began to congratulate him on his establishment in life, calmly announced that he should never make another. "Why should I?" said he; "I would not do again what I have done once." For when a thing has once been done as well as it wants to be, it is of no further interest to the self-improver. Yet in after

years, and when it became needful to support his family, he returned patiently to this mechanical art — a step more than worthy of himself.

The pencils seem to have been Apollo's first experiment in the service of Admetus; but others followed. "I have thoroughly tried school-keeping," he writes, "and found that my expenses were in proportion, or rather out of proportion, to my income; for I was obliged to dress and train, not to say, think and believe, accordingly, and 6 I lost my time into the bargain. As I did not teach for the benefit of my fellow-men, but simply for a livelihood, this was a failure. I have tried trade, but I found that it would take ten years to get under way in that, and that then I should probably be on my way to the devil." Nothing, indeed, can surpass his scorn for all so-called business. Upon that subject gall squirts from him at a touch. "The whole enterprise of this nation is not illustrated by a thought," he writes; "it is not warmed by a sentiment; there is nothing in it for which a man should lay down his life, nor even his gloves." And again: "If our merchants did not most of them fail, and the banks too, my faith in the old laws of this world would be staggered. The statement that ninety-six in a hundred doing such business surely break down is perhaps the sweetest fact that statistics have revealed." The wish was probably father to the figures; but there is something enlivening in a hatred of so genuine a brand, hot as Corsican revenge, and sneering like Voltaire.

Pencils, school-keeping, and trade being thus discarded one after another, Thoreau, with a stroke of strategy, turned the position. He saw his way to get his board and lodging for practically nothing; and Admetus never got less work out of any servant since the world began. It was his ambition to be an Oriental philosopher; but he was always a very Yankee sort of Oriental. Even in the peculiar attitude in which he stood to money, his system of personal economics, as we may call it, he displayed a vast amount of truly down-East calculation, and he adopted poverty like a piece of business. Yet his system is based on one or two ideas which, I believe, come naturally to all thoughtful youths, and are only pounded out of them by city uncles. Indeed, something essentially youthful distinguishes all Thoreau's knock-down blows at current opinion. Like the posers of a child, they leave the orthodox in a kind of speechless agony. These know the thing is nonsense. They are sure there must be an answer, yet 7 somehow cannot find it. So it is with his system of economy. He cuts through the subject on so new a plane that the accepted arguments apply no longer; he attacks it in a new dialect where there are no catch-words ready made for the defender; after you have been boxing for years on a polite, gladiatorial convention, here is an assailant who does not scruple to hit below the belt.

"The cost of a thing," says he, "is the amount of what I will call life which is required to be exchanged for it, immediately or in the long run." I have been accustomed to put it to myself, perhaps more clearly, that the price we have to pay for money is paid in liberty. Between these two ways of it, at least, the reader will probably not fail to find a third definition of his own; and it follows, on one or other, that a man may pay too dearly for his livelihood, by giving, in Thoreau's terms, his whole life for it, or, in mine, bartering for it the whole of his available liberty, and becoming a slave till

death. There are two questions to be considered — the quality of what we buy, and the price we have to pay for it. Do you want a thousand a year, a two thousand a year, or a ten thousand a year livelihood? and can you afford the one you want? It is a matter of taste; it is not in the least degree a question of duty, though commonly supposed so. But there is no authority for that view anywhere. It is nowhere in the Bible. It is true that we might do a vast amount of good if we were wealthy, but it is also highly improbable; not many do; and the art of growing rich is not only quite distinct from that of doing good, but the practice of the one does not at all train a man for practising the other. “Money might be of great service to me,” writes Thoreau; “but the difficulty now is that I do not improve my opportunities, and therefore I am not prepared to have my opportunities increased.” It is a mere illusion that, above a certain income, the personal desires will be satisfied and leave a wider margin for the generous impulse. It is as difficult to be generous, or anything else except perhaps a member 8 of Parliament, on thirty thousand as on two hundred a year.

Now Thoreau’s tastes were well defined. He loved to be free, to be master of his times and seasons, to indulge the mind rather than the body; he preferred long rambles to rich dinners, his own reflections to the consideration of society, and an easy, calm, unfettered, active life among green trees to dull toiling at the counter of a bank. And such being his inclination he determined to gratify it. A poor man must save off something; he determined to save off his livelihood. “When a man has attained those things which are necessary to life,” he writes, “there is another alternative than to obtain the superfluities; he may adventure on life now, his vacation from humbler toil having commenced.” Thoreau would get shelter, some kind of covering for his body, and necessary daily bread; even these he should get as cheaply as possible; and then, his vacation from humbler toil having commenced, devote himself to Oriental philosophers, the study of nature, and the work of self-improvement.

Prudence, which bids us all go to the ant for wisdom and hoard against the day of sickness, was not a favourite with Thoreau. He preferred that other, whose name is so much misappropriated: Faith. When he had secured the necessaries of the moment, he would not reckon up possible accidents or torment himself with trouble for the future. He had no toleration for the man “who ventures to live only by the aid of the mutual insurance company, which has promised to bury him decently.” He would trust himself a little to the world. “We may safely trust a good deal more than we do,” says he. “How much is not done by us! or what if we had been taken sick?” And then, with a stab of satire, he describes contemporary mankind in a phrase: “All the day long on the alert, at night we unwillingly say our prayers and commit ourselves to uncertainties.” It is not likely that the public will be much affected by Thoreau, when they blink the direct injunctions 9 of the religion they profess; and yet, whether we will or no, we make the same hazardous ventures; we back our own health and the honesty of our neighbours for all that we are worth; and it is chilling to think how many must lose their wager.

In , twenty-eight years old, an age by which the liveliest have usually declined into some conformity with the world, Thoreau, with a capital of something less than

five pounds and a borrowed axe, walked forth into the woods by Walden Pond, and began his new experiment in life. He built himself a dwelling, and returned the axe, he says with characteristic and workmanlike pride, sharper than when he borrowed it; he reclaimed a patch, where he cultivated beans, peas, potatoes, and sweet corn; he had his bread to bake, his farm to dig, and for the matter of six weeks in the summer he worked at surveying, carpentry, or some other of his numerous dexterities, for hire. For more than five years this was all that he required to do for his support, and he had the winter and most of the summer at his entire disposal. For six weeks of occupation, a little cooking and a little gentle hygienic gardening, the man, you may say, had as good as stolen his livelihood. Or we must rather allow that he had done far better; for the thief himself is continually and busily occupied; and even one born to inherit a million will have more calls upon his time than Thoreau. Well might he say, "What old people tell you you cannot do, you try and find you can." And how surprising is his conclusion: "I am convinced that to maintain oneself on this earth is not a hardship, but a pastime, if we will live simply and wisely; as the pursuits of simpler nations are still the sports of the more artificial."

When he had enough of that kind of life, he showed the same simplicity in giving it up as in beginning it. There are some who could have done the one, but, vanity forbidding, not the other; and that is perhaps the story of the hermits; but Thoreau made no fetish of his own example, and did what he wanted squarely. And five years is long enough for an experiment, and to prove the success of transcendental Yankeeism. It is not his frugality which is worthy of note; for, to begin with, that was inborn, and therefore inimitable by others who are differently constituted; and again, it was no new thing, but has often been equalled by poor Scotch students at the universities. The point is the sanity of his view of life, and the insight with which he recognised the position of money, and thought out for himself the problem of riches and a livelihood. Apart from his eccentricities, he had perceived, and was acting on, a truth of universal application. For money enters in two different characters into the scheme of life. A certain amount, varying with the number and empire of our desires, is a true necessary to each one of us in the present order of society; but beyond that amount, money is a commodity to be bought or not to be bought, a luxury in which we may either indulge or stint ourselves, like any other. And there are many luxuries that we may legitimately prefer to it, such as a grateful conscience, a country life, or the woman of our inclination. Trite, flat, and obvious as this conclusion may appear, we have only to look round us in society to see how scantily it has been recognised; and perhaps even ourselves, after a little reflection, may decide to spend a trifle less for money, and indulge ourselves a trifle more in the article of freedom.

### III

"To have done anything by which you earned money merely," says Thoreau, "is to be" (have been, he means) "idle and worse." There are two passages in his letters, both, oddly enough, relating to firewood, which must be brought together to be rightly understood. So taken, they contain between them the marrow of all good sense on

the subject of work in its relation to something broader than mere livelihood. Here is the first: "I suppose I have burned up a good-sized tree to-night — and for what? I settled with Mr. Tarbell for it the other day; but that wasn't the final settlement. I got off cheaply from him. At last one will say: 'Let us see, how much wood did you burn, sir?' And I shall shudder to think that the next question will be, 'What did you do while you were warm?'" Even after we have settled with Admetus in the person of Mr. Tarbell, there comes, you see, a further question. It is not enough to have earned our livelihood. Either the earning itself should have been serviceable to mankind, or something else must follow. To live is sometimes very difficult, but it is never meritorious in itself; and we must have a reason to allege to our own conscience why we should continue to exist upon this crowded earth. If Thoreau had simply dwelt in his house at Walden, a lover of trees, birds, and fishes, and the open air and virtue, a reader of wise books, an idle, selfish self-improver, he would have managed to cheat Admetus, but, to cling to metaphor, the devil would have had him in the end. Those who can avoid toil altogether and dwell in the Arcadia of private means, and even those who can, by abstinence, reduce the necessary amount of it to some six weeks a year, having the more liberty, have only the higher moral obligation to be up and doing in the interest of man.

The second passage is this: "There is a far more important and warming heat, commonly lost, which precedes the burning of the wood. It is the smoke of industry, which is incense. I had been so thoroughly warmed in body and spirit, that when at length my fuel was housed, I came near selling it to the ashman, as if I had extracted all its heat." Industry is, in itself and when properly chosen, delightful and profitable to the worker; and when your toil has been a pleasure, you have not, as Thoreau says, "earned money merely," but money, health, delight, and moral profit, all in one. "We must heap up a great pile of doing for a small diameter of being," he says in another place; and then exclaims, "How admirably the artist is made to accomplish his self-culture by devotion to his art!" We may escape uncongenial toil, only to devote ourselves to that which is congenial. It is only to transact some higher business that even Apollo dare play the truant from Admetus. We must all work for the sake of work; we must all work, as Thoreau says again, in any "absorbing pursuit — it does not much matter what, so it be honest"; but the most profitable work is that which combines into one continued effort the largest proportion of the powers and desires of a man's nature; that into which he will plunge with ardour, and from which he will desist with reluctance; in which he will know the weariness of fatigue, but not that of satiety; and which will be ever fresh, pleasing, and stimulating to his taste. Such work holds a man together, braced at all points; it does not suffer him to doze or wander; it keeps him actively conscious of himself, yet raised among superior interests; it gives him the profit of industry with the pleasures of a pastime. This is what his art should be to the true artist, and that to a degree unknown in other and less intimate pursuits. For other professions stand apart from the human business of life; but an art has its seat at the centre of the artist's doings and sufferings, deals directly with his experiences,

teaches him the lessons of his own fortunes and mishaps, and becomes a part of his biography. So says Goethe:

“Spät erklingt was früh erklang;  
Glück und Unglück wird Gesang.”

Now Thoreau's art was literature; and it was one of which he had conceived most ambitiously. He loved and believed in good books. He said well, “Life is not habitually seen from any common platform so truly and unexaggerated as in the light of literature.” But the literature he loved was of the heroic order. “Books, not which afford us a cowering enjoyment, but in which each thought is of unusual daring; such as an idle man cannot read, and a timid one would not be entertained by, which even make us dangerous to existing institutions — such I call good books.” He did not think them easy to be read. “The heroic books,” he says, “even if printed in the character of our mother-tongue, will always be in a language dead to degenerate times; and we must laboriously seek the meaning of each word and line, conjecturing a larger sense than common use permits out of what wisdom and valour and generosity we have.” Nor does he suppose that such books are easily written. “Great prose, of equal elevation, commands our respect more than great verse,” says he, “since it implies a more permanent and level height, a life more pervaded with the grandeur of the thought. The poet often only makes an irruption, like the Parthian, and is off again, shooting while he retreats; but the prose writer has conquered like a Roman and settled colonies.” We may ask ourselves, almost with dismay, whether such works exist at all but in the imagination of the student. For the bulk of the best of books is apt to be made up with ballast; and those in which energy of thought is combined with any stateliness of utterance may be almost counted on the fingers. Looking round in English for a book that should answer Thoreau's two demands of a style like poetry and sense that shall be both original and inspiring, I come to Milton's “Areopagitica,” and can name no other instance for the moment. Two things at least are plain: that if a man will condescend to nothing more commonplace in the way of reading, he must not look to have a large library; and that if he proposes himself to write in a similar vein, he will find his work cut out for him.

Thoreau composed seemingly while he walked, or at least exercise and composition were with him intimately connected; for we are told that “the length of his walk uniformly made the length of his writing.” He speaks in one place of “plainness and vigour, the ornaments of style,” which is rather too paradoxical to be comprehensively true. In another he remarks: “As for style of writing, if one has anything to say it drops from him simply as a stone falls to the ground.” We must conjecture a very large sense indeed for the phrase “if one has anything to say.” When truth flows from a man, fittingly clothed in style and without conscious effort, it is because the effort has been made and the work practically completed before he sat down to write. It is only out of fulness of thinking that expression drops perfect like a ripe fruit; and when Thoreau wrote so nonchalantly at his desk, it was because he had been vigorously active during his walk. For neither clearness, compression, nor beauty of language, come to any living creature till after a busy and prolonged acquaintance with the subject on

hand. Easy writers are those who, like Walter Scott, choose to remain contented with a less degree of perfection than is legitimately within the compass of their powers. We hear of Shakespeare and his clean manuscript; but in face of the evidence of the style itself and of the various editions of Hamlet, this merely proves that Messrs. Hemming and Condell were unacquainted with the common enough phenomenon called a fair copy. He who would recast a tragedy already given to the world must frequently and earnestly have revised details in the study. Thoreau himself, and in spite of his protestations, is an instance of even extreme research in one direction; and his effort after heroic utterance is proved not only by the occasional finish, but by the determined exaggeration of his style. "I trust you realise what an exaggerator I am — that I lay myself out to exaggerate," he writes. And again, hinting at the explanation: "Who that has heard a strain of music feared lest he should speak extravagantly any more for ever?" And yet once more, in his essay on Carlyle, and this time with his meaning well in hand: "No truth, we think, was ever expressed but with this sort of emphasis, that for the time there seemed to be no other." Thus Thoreau was an exaggerative and a parabolical writer, not because he loved the literature of the East, but from a desire that people should understand and realise what he was writing. He was near the truth upon the general question; but in his own particular method, it appears to me, he wandered. Literature is not less a conventional art than painting or sculpture; and it is the least striking, as it is the most comprehensive of the three. To hear a strain of music, to see a beautiful woman, a river, a great city, or a starry night, is to make a man despair of his Lilliputian arts in language. Now, to gain that emphasis which seems denied to us by the very nature of the medium, the proper method of literature is by selection, which is a kind of negative exaggeration. It is the right of the literary artist, as Thoreau was on the point of seeing, to leave out whatever does not suit his purpose. Thus we extract the pure gold; and thus the well-written story of a noble life becomes, by its very omissions, more thrilling to the reader. But to go beyond this, like Thoreau, and to exaggerate directly, is to leave the saner classical tradition, and to put the reader on his guard. And when you write the whole for the half, you do not express your thought more forcibly, but only express a different thought which is not yours.

Thoreau's true subject was the pursuit of self-improvement combined with an unfriendly criticism of life as it goes on in our societies; it is there that he best displays the freshness and surprising trenchancy of his intellect; it is there that his style becomes plain and vigorous, and therefore, according to his own formula, ornamental. Yet he did not care to follow this vein singly, but must drop into it by the way in books of a different purport. "Walden, or Life in the Woods"; "A Week on the Concord and Merrimack Rivers"; "The Maine Woods," — such are the titles he affects. He was probably reminded by his delicate critical perception that the true business of literature is with narrative; in reasoned narrative, and there alone, that art enjoys all its advantages, and suffers least from its defects. Dry precept and disembodied disquisition, as they can only be read with an effort of abstraction, can never convey a perfectly complete

or a perfectly natural impression. Truth, even in literature, must be clothed with flesh and blood, or it cannot tell its whole story to the reader. Hence the effect of anecdote on simple minds; and hence good biographies and works of high, imaginative art, are not only far more entertaining, but far more edifying, than books of theory or precept. Now Thoreau could not clothe his opinions in the garment of art, for that was not his talent; but he sought to gain the same elbow-room for himself, and to afford a similar relief to his readers, by mingling his thoughts with a record of experience.

Again, he was a lover of nature. The quality which we should call mystery in a painting, and which belongs so particularly to the aspect of the external world and to its influence upon our feelings, was one which he was never weary of attempting to reproduce in his books. The seeming significance of nature's appearances, their unchanging strangeness to the senses, and the thrilling response which they waken in the mind of man, continued to surprise and stimulate his spirits. It appeared to him, I think, that if we could only write near enough to the facts, and yet with no pedestrian calm, but ardently, we might transfer the glamour of reality direct upon our pages; and that, if it were once thus captured and expressed, a new and instructive relation might appear between men's thoughts and the phenomena of nature. This was the eagle that he pursued all his life long, like a schoolboy with a butterfly net. Hear him to a friend: "Let me suggest a theme for you — to state to yourself precisely and completely what that walk over the mountains amounted to for you, returning to this essay again and again until you are satisfied that all that was important in your experience is in it. Don't suppose that you can tell it precisely the first dozen times you try, but at 'em again; especially when, after a sufficient pause, you suspect that you are touching the heart or summit of the matter, reiterate your blows there, and account for the mountain to yourself. Not that the story need be long, 7 but it will take a long while to make it short." Such was the method, not consistent for a man whose meanings were to "drop from him as a stone falls to the ground." Perhaps the most successful work that Thoreau ever accomplished in this direction is to be found in the passages relating to fish in the "Week." These are remarkable for a vivid truth of impression and a happy suitability of language, not frequently surpassed.

Whatever Thoreau tried to do was tried in fair, square prose, with sentences solidly built, and no help from bastard rhythms. Moreover, there is a progression — I cannot call it a progress — in his work towards a more and more strictly prosaic level, until at last he sinks into the bathos of the prosy. Emerson mentions having once remarked to Thoreau: "Who would not like to write something which all can read, like 'Robinson Crusoe'? and who does not see with regret that his page is not solid with a right materialistic treatment which delights everybody?" I must say in passing, that it is not the right materialistic treatment which delights the world in "Robinson," but the romantic and philosophic interest of the fable. The same treatment does quite the reverse of delighting us when it is applied, in "Colonel Jack," to the management of a plantation. But I cannot help suspecting Thoreau to have been influenced either by this identical remark or by some other closely similar in meaning. He began to fall more

and more into a detailed materialistic treatment; he went into the business doggedly, as one who should make a guide-book; he not only chronicled what had been important in his own experience, but whatever might have been important in the experience of anybody else; not only what had affected him, but all that he saw or heard. His ardour had grown less, or perhaps it was inconsistent with a right materialistic treatment to display such emotions as he felt; and, to complete the eventful change, he chose, from a sense of moral dignity, to gut these later works of the saving quality of humour. He was not one of those authors who I have learned, in his own words, "to leave out their dulness." He inflicts his full quantity upon the reader in such books as "Cape Cod," or "The Yankee in Canada." Of the latter he confessed that he had not managed to get much of himself into it. Heaven knows he had not, nor yet much of Canada, we may hope. "Nothing," he says somewhere, "can shock a brave man but dulness." Well, there are few spots more shocking to the brave than the pages of "The Yankee in Canada."

There are but three books of his that will be read with much pleasure: the "Week," "Walden," and the collected letters. As to his poetry, Emerson's word shall suffice for us, it is so accurate and so prettily said: "The thyme and marjoram are not yet honey." In this, as in his prose, he relied greatly on the goodwill of the reader, and wrote throughout in faith. It was an exercise of faith to suppose that many would understand the sense of his best work, or that any could be exhilarated by the dreary chronicling of his worst. "But," as he says, "the gods do not hear any rude or discordant sound, as we learn from the echo; and I know that the nature towards which I launch these sounds is so rich that it will modulate anew and wonderfully improve my rudest strain."

## IV

"What means the fact," he cries, "that a soul which has lost all hope for itself can inspire in another listening soul such an infinite confidence in it, even while it is expressing its despair?" The question is an echo and an illustration of the words last quoted; and it forms the key-note of his thoughts on friendship. No one else, to my knowledge, has spoken in so high and just a spirit of the kindly relations; and I doubt whether it be a drawback that these lessons should come from one in many ways so unfitted to be a teacher in this branch. The very coldness and egoism<sup>9</sup> of his own intercourse gave him a clearer insight into the intellectual basis of our warm, mutual tolerations; and testimony to their worth comes with added force from one who was solitary and disobliging, and of whom a friend remarked, with equal wit and wisdom, "I love Henry, but I cannot like him."

He can hardly be persuaded to make any distinction between love and friendship; in such rarefied and freezing air, upon the mountain-tops of meditation, had he taught himself to breathe. He was, indeed, too accurate an observer not to have remarked that "there exists already a natural disinterestedness and liberality" between men and

women; yet, he thought, "friendship is no respecter of sex." Perhaps there is a sense in which the words are true; but they were spoken in ignorance; and perhaps we shall have put the matter most correctly, if we call love a foundation for a nearer and freer degree of friendship than can be possible without it. For there are delicacies, eternal between persons of the same sex, which are melted and disappear in the warmth of love.

To both, if they are to be right, he attributes the same nature and condition. "We are not what we are," says he, "nor do we treat or esteem each other for such, but for what we are capable of being." "A friend is one who incessantly pays us the compliment of expecting all the virtues from us, and who can appreciate them in us." "The friend asks no return but that his friend will religiously accept and wear and not disgrace his apotheosis of him." "It is the merit and preservation of friendship that it takes place on a level higher than the actual characters of the parties would seem to warrant." This is to put friendship on a pedestal indeed; and yet the root of the matter is there; and the last sentence, in particular, is like a light in a dark place, and makes many mysteries plain. We are different with different friends; yet if we look closely we shall find that every such relation reposes on some particular apotheosis of oneself; with each friend, although we could not distinguish it in words from any other, we have at least one special reputation to preserve: and it is thus that we run, when mortified, to our friend or the woman that we love, not to hear ourselves called better, but to be better men in point of fact. We seek this society to flatter ourselves with our own good conduct. And hence any falsehood in the relation, any incomplete or perverted understanding, will spoil even the pleasure of these visits. Thus says Thoreau again: "Only lovers know the value of truth." And yet again: "They ask for words and deeds, when a true relation is word and deed."

But it follows that since they are neither of them so good as the other hopes, and each is, in a very honest manner, playing a part above his powers, such an intercourse must often be disappointing to both. "We may bid farewell sooner than complain," says Thoreau, "for our complaint is too well grounded to be uttered." "We have not so good a right to hate any as our friend."

"It were treason to our love  
And a sin to God above,  
One iota to abate  
Of a pure, impartial hate."

Love is not blind, nor yet forgiving. "O yes, believe me," as the song says, "Love has eyes!" The nearer the intimacy, the more cuttingly do we feel the unworthiness of those we love; and because you love one, and would die for that love to-morrow, you have not forgiven, and you never will forgive, that friend's misconduct. If you want a person's faults, go to those who love him. They will not tell you, but they know. And herein lies the magnanimous courage of love, that it endures this knowledge without change.

It required a cold, distant personality like that of Thoreau, perhaps, to recognise and certainly to utter this truth; for a more human love makes it a point of honour not to acknowledge those faults of which it is most conscious. But his point of view is both high and dry. He has no illusions; he does not give way to love any more than to hatred, but preserves them both with care like valuable curiosities. A more bald-headed picture of life, if I may so express myself, has seldom been presented. He is an egoist; he does not remember, or does not think it worth while to remark, that, in these near intimacies, we are ninety-nine times disappointed in our beggarly selves for once that we are disappointed in our friend; that it is we who seem most frequently undeserving of the love that unites us; and that it is by our friend's conduct that we are continually rebuked and yet strengthened for a fresh endeavour. Thoreau is dry, priggish, and selfish. It is profit he is after in these intimacies; moral profit, certainly; but still profit to himself. If you will be the sort of friend I want, he remarks naively, "my education cannot dispense with your society." His education! as though a friend were a dictionary. And with all this, not one word about pleasure, or laughter, or kisses, or any quality of flesh and blood. It was not inappropriate, surely, that he had such close relations with the fish. We can understand the friend already quoted, when he cried: "As for taking his arm, I would as soon think of taking the arm of an elm-tree!"

As a matter of fact he experienced but a broken enjoyment in his intimacies. He says he has been perpetually on the brink of the sort of intercourse he wanted, and yet never completely attained it. And what else had he to expect when he would not, in a happy phrase of Carlyle's, "nestle down into it"? Truly, so it will be always if you only stroll in upon your friends as you might stroll in to see a cricket match; and even then not simply for the pleasure of the thing, but with some afterthought of self-improvement, as though you had come to the cricket match to bet. It was his theory that people saw each other too frequently, so that their curiosity was not properly whetted, nor had they anything fresh to communicate; but friendship must be something else than a society for mutual improvement — indeed, it must only be that by the way, and to some extent unconsciously; and if Thoreau had been a man instead of a manner of elm-tree, he would have felt that he saw his friends too seldom, and have reaped benefits unknown to his philosophy from a more sustained and easy intercourse. We might remind him of his own words about love: "We should have no reserve; we should give the whole of ourselves to that business. But commonly men have not imagination enough to be thus employed about a human being, but must be cooping a barrel, forsooth." Ay, or reading Oriental philosophers. It is not the nature of the rival occupation, it is the fact that you suffer it to be a rival, that renders loving intimacy impossible. Nothing is given for nothing in this world; there can be no true love even on your own side, without devotion; devotion is the exercise of love, by which it grows; but if you will give enough of that, if you will pay the price in a sufficient "amount of what you call life," why then, indeed, whether with wife or comrade, you may have months and even years of such easy, natural, pleasurable, and yet improving intercourse as shall make time a moment and kindness a delight.

The secret of his retirement lies not in misanthropy, of which he had no tincture, but part in his engrossing design of self-improvement and part in the real deficiencies of social intercourse. He was not so much difficult about his fellow human beings as he could not tolerate the terms of their association. He could take to a man for any genuine qualities, as we see by his admirable sketch of the Canadian woodcutter in "Walden"; but he would not consent, in his own words, to "feebly tabulate and paddle in the social slush." It seemed to him, I think, that society is precisely the reverse of friendship, in that it takes place on a lower level than the characters of any of the parties would warrant us to expect. The society talk of even the most brilliant man is of greatly less account than what you will get from him in (as the French say) a little committee. And Thoreau wanted geniality; he had not enough of the 3 superficial, even at command; he could not swoop into a parlour and, in the naval phrase, "cut out" a human being from that dreary port; nor had he inclination for the task. I suspect he loved books and nature as well and near as warmly as he loved his fellow-creatures, — a melancholy, lean degeneration of the human character.

"As for the dispute about solitude and society," he thus sums up: "Any comparison is impertinent. It is an idling down on the plain at the base of the mountain instead of climbing steadily to its top. Of course you will be glad of all the society you can get to go up with. Will you go to glory with me? is the burden of the song. It is not that we love to be alone, but that we love to soar, and when we do soar the company grows thinner and thinner till there is none at all. It is either the tribune on the plain, a sermon on the mount, or a very private ecstasy still higher up. Use all the society that will abet you." But surely it is no very extravagant opinion that it is better to give than to receive, to serve than to use our companions; and above all, where there is no question of service upon either side, that it is good to enjoy their company like a natural man. It is curious and in some ways dispiriting that a writer may be always best corrected out of his own mouth; and so, to conclude, here is another passage from Thoreau which seems aimed directly at himself: "Do not be too moral; you may cheat yourself out of much life so... All fables, indeed, have their morals; but the innocent enjoy the story."

## V

"The only obligation," says he, "which I have a right to assume is to do at any time what I think right." "Why should we ever go abroad, even across the way, to ask a neighbour's advice?" "There is a nearer neighbour within, who is incessantly telling us how we should behave. But we wait for the neighbour without to tell us of some false, 4 easier way." "The greater part of what my neighbours call good I believe in my soul to be bad." To be what we are, and to become what we are capable of becoming, is the only end of life. It is "when we fall behind ourselves" that "we are cursed with duties and the neglect of duties." "I love the wild," he says, "not less than the good." And again:

“The life of a good man will hardly improve us more than the life of a freebooter, for the inevitable laws appear as plainly in the infringement as in the observance, and” (mark this) “our lives are sustained by a nearly equal expense of virtue of some kind.” Even although he were a prig, it will be owned he could announce a startling doctrine. “As for doing good,” he writes elsewhere, “that is one of the professions that are full. Moreover, I have tried it fairly, and, strange as it may seem, am satisfied that it does not agree with my constitution. Probably I should not conscientiously and deliberately forsake my particular calling to do the good which society demands of me, to save the universe from annihilation; and I believe that a like but infinitely greater steadfastness elsewhere is all that now preserves it. If you should ever be betrayed into any of these philanthropies, do not let your left hand know what your right hand does, for it is not worth knowing.” Elsewhere he returns upon the subject, and explains his meaning thus: “If I ever did a man any good in their sense, of course it was something exceptional and insignificant compared with the good or evil I am constantly doing by being what I am.”

There is a rude nobility, like that of a barbarian king, in this unshaken confidence in himself and indifference to the wants, thoughts, or sufferings of others. In his whole works I find no trace of pity. This was partly the result of theory, for he held the world too mysterious to be criticised, and asks conclusively: “What right have I to grieve who have not ceased to wonder?” But it sprang still more from constitutional indifference and superiority; and he grew up healthy, composed, and unconscious from 5 among life’s horrors, like a green bay-tree from a field of battle. It was from this lack in himself that he failed to do justice to the spirit of Christ; for while he could glean more meaning from individual precepts than any score of Christians, yet he conceived life in such a different hope, and viewed it with such contrary emotions, that the sense and purport of the doctrine as a whole seems to have passed him by or left him unimpressed. He could understand the idealism of the Christian view, but he was himself so unaffectedly unhuman that he did not recognise the human intention and essence of that teaching. Hence he complained that Christ did not leave us a rule that was proper and sufficient for this world, not having conceived the nature of the rule that was laid down; for things of that character that are sufficiently unacceptable become positively non-existent to the mind. But perhaps we shall best appreciate the defect in Thoreau by seeing it supplied in the case of Whitman. For the one, I feel confident, is the disciple of the other; it is what Thoreau clearly whispered that Whitman so uproariously bawls; it is the same doctrine, but with how immense a difference! the same argument, but used to what a new conclusion! Thoreau had plenty of humour until he tutored himself out of it, and so forfeited that best birthright of a sensible man; Whitman, in that respect, seems to have been sent into the world naked and unashamed; and yet by a strange consummation, it is the theory of the former that is arid, abstract, and claustral. Of these two philosophies, so nearly identical at bottom, the one pursues Self-improvement — a churlish, mangy dog; the other is up with the morning, in the best of health, and following the nymph Happiness, buxom, blithe, and

debonair. Happiness, at least, is not solitary; it joys to communicate; it loves others, for it depends on them for its existence; it sanctions and encourages to all delights that are not unkind in themselves; if it lived to a thousand, it would not make excision of a single humorous passage; and while the self-improver dwindles towards the prig, and, if he be not of an excellent constitution, may even grow deformed into an Obermann, the very name and appearance of a happy man breathe of good-nature, and help the rest of us to live.

In the case of Thoreau, so great a show of doctrine demands some outcome in the field of action. If nothing were to be done but build a shanty beside Walden Pond, we have heard altogether too much of these declarations of independence. That the man wrote some books is nothing to the purpose, for the same has been done in a suburban villa. That he kept himself happy is perhaps a sufficient excuse, but it is disappointing to the reader. We may be unjust, but when a man despises commerce and philanthropy alike, and has views of good so soaring that he must take himself apart from mankind for their cultivation, we will not be content without some striking act. It was not Thoreau's fault if he were not martyred; had the occasion come, he would have made a noble ending. As it is, he did once seek to interfere in the world's course; he made one practical appearance on the stage of affairs; and a strange one it was, and strangely characteristic of the nobility and the eccentricity of the man. It was forced on him by his calm but radical opposition to negro slavery. "Voting for the right is doing nothing for it," he saw; "it is only expressing to men feebly your desire that it should prevail." For his part, he would not "for an instant recognise that political organisation for his government which is the slave's government also." "I do not hesitate to say," he adds, "that those who call themselves Abolitionists should at once effectually withdraw their support, both in person and property, from the government of Massachusetts." That is what he did: in he ceased to pay the poll-tax. The highway-tax he paid, for he said he was as desirous to be a good neighbour as to be a bad subject; but no more poll-tax to the State of Massachusetts. Thoreau had now seceded, and was a polity unto himself; or, as he explains it with admirable sense, "In fact, I quietly declare war with the State after my fashion, though I will still make what use and get what advantage of her I can, as is usual in such cases." He was put in prison; but that was a part of his design. "Under a government which imprisons any unjustly, the true place for a just man is also a prison. I know this well, that if one thousand, if one hundred, if ten men whom I could name — ay, if one HONEST man, in this State of Massachusetts, ceasing to hold slaves, were actually to withdraw from this copartnership, and be locked up in the county gaol therefor, it would be the abolition of slavery in America. For it matters not how small the beginning may seem to be; what is once well done is done for ever." Such was his theory of civil disobedience.

And the upshot? A friend paid the tax for him; continued year by year to pay it in the sequel; and Thoreau was free to walk the woods unmolested. It was a fiasco, but to me it does not seem laughable; even those who joined in the laughter at the moment would be insensibly affected by this quaint instance of a good man's horror for injustice.

We may compute the worth of that one night's imprisonment as outweighing half a hundred voters at some subsequent election; and if Thoreau had possessed as great a power of persuasion as (let us say) Falstaff, if he had counted a party however small, if his example had been followed by a hundred or by thirty of his fellows, I cannot but believe it would have greatly precipitated the era of freedom and justice. We feel the misdeeds of our country with so little fervour, for we are not witnesses to the suffering they cause; but when we see them wake an active horror in our fellow-man, when we see a neighbour prefer to lie in prison rather than be so much as passively implicated in their perpetration, even the dullest of us will begin to realise them with a quicker pulse.

Not far from twenty years later, when Captain John Brown was taken at Harper's Ferry, Thoreau was the first to come forward in his defence. The committees wrote 8 to him unanimously that his action was premature. "I did not send to you for advice," said he, "but to announce that I was to speak." I have used the word "defence"; in truth he did not seek to defend him, even declared it would be better for the good cause that he should die; but he praised his action as I think Brown would have liked to hear it praised.

Thus this singularly eccentric and independent mind, wedded to a character of so much strength, singleness, and purity, pursued its own path of self-improvement for more than half a century, part gymnosophist, part backwoodsman; and thus did it come twice, though in a subaltern attitude, into the field of political history.

Note. — For many facts in the above essay, among which I may mention the incident of the squirrel, I am indebted to "Thoreau: His Life and Aims," by H. A. Page, i.e., as is well known, Dr Japp.

# BROOK FARM AND CONCORD

## by Henry James

A Chapter from 'Hawthorne'

The history of the little industrial and intellectual association which formed itself at this time in one of the suburbs of Boston has not, to my knowledge, been written; though it is assuredly a curious and interesting chapter in the domestic annals of New England. It would of course be easy to overrate the importance of this ingenious attempt of a few speculative persons to improve the outlook of mankind. The experiment came and went very rapidly and quietly, leaving very few traces behind it. It became simply a charming personal reminiscence for the small number of amiable enthusiasts who had had a hand in it. There were degrees of enthusiasm, and I suppose there were degrees of amiability; but a certain generous brightness of hope and freshness of conviction pervaded the whole undertaking and rendered it, morally speaking, important to an extent of which any heed that the world in general ever gave to it is an insufficient measure. Of course it would be a great mistake to represent the episode of Brook Farm as directly related to the manners and morals of the New England world in general — and in especial to those of the prosperous, opulent, comfortable part of it. The thing was the experiment of a coterie — it was unusual, unfashionable, unsuccessful. It was, as would then have been said, an amusement of the Transcendentalists — a harmless effusion of Radicalism. The Transcendentalists were not, after all, very numerous; and the Radicals were by no means of the vivid tinge of those of our own day. I have said that the Brook Farm community left no traces behind it that the world in general can appreciate; I should rather say that the only trace is a short novel, of which the principal merits reside in its qualities of difference from the affair itself. The Blithedale Romance is the main result of Brook Farm; but The Blithedale Romance was very properly never recognised by the Brook Farmers as an accurate portrait of their little colony.

Nevertheless, in a society as to which the more frequent complaint is that it is monotonous, that it lacks variety of incident and of type, the episode, our own business with which is simply that it was the cause of Hawthorne's writing an admirable tale, might be welcomed as a picturesque variation. At the same time, if we do not exaggerate its proportions, it may seem to contain a fund of illustration as to that phase of human life with which our author's own history mingled itself. The most graceful account of the origin of Brook Farm is probably to be found in these words of one of the

biographers of Margaret Fuller: "In Boston and its vicinity, several friends, for whose character Margaret felt the highest-honour, were earnestly considering the possibility of making such industrial, social, and educational arrangements as would simplify economies, combine leisure for study with healthful and honest toil, avert unjust collisions of caste, equalise refinements, awaken generous affections, diffuse courtesy, and sweeten and sanctify life as a whole." The reader will perceive that this was a liberal scheme, and that if the experiment failed, the greater was the pity. The writer goes on to say that a gentleman, who afterwards distinguished himself in literature (he had begun by being a clergyman), "convinced by his experience in a faithful ministry that the need was urgent for a thorough application of the professed principles of Fraternity to actual relations, was about staking his all of fortune, reputation, and influence, in an attempt to organize a joint-stock company at Brook Farm." As Margaret Fuller passes for having suggested to Hawthorne the figure of Zenobia in *The Blithedale Romance*, and as she is probably, with one exception, the person connected with the affair who, after Hawthorne, offered most of what is called a personality to the world, I may venture to quote a few more passages from her *Memoirs* — a curious, in some points of view almost a grotesque, and yet, on the whole, as I have said, an extremely interesting book. It was a strange history and a strange destiny, that of this brilliant, restless, and unhappy woman — this ardent New Englander, this impassioned Yankee, who occupied so large a place in the thoughts, the lives, the affections, of an intelligent and appreciative society, and yet left behind her nothing but the memory of a memory. Her function, her reputation, were singular, and not altogether reassuring: she was a talker, she was the talker, she was the genius of talk. She had a magnificent, though by no means an unmitigated, egotism; and in some of her utterances it is difficult to say whether pride or humility prevails — as for instance when she writes that she feels "that there is plenty of room in the Universe for my faults, and as if I could not spend time in thinking of them when so many things interest me more." She has left the same sort of reputation as a great actress. Some of her writing has extreme beauty, almost all of it has a real interest, but her value, her activity, her sway (I am not sure that one can say her charm), were personal and practical. She went to Europe, expanded to new desires and interests, and, very poor herself, married an impoverished Italian nobleman. Then, with her husband and child, she embarked to return to her own country, and was lost at sea in a terrible storm, within sight of its coasts. Her tragical death combined with many of the elements of her life to convert her memory into a sort of legend, so that the people who had known her well, grew at last to be envied by later comers. Hawthorne does not appear to have been intimate with her; on the contrary, I find such an entry as this in the *American Note-Books* in 1841: "I was invited to dine at Mr. Bancroft's yesterday, with Miss Margaret Fuller; but Providence had given me some business to do; for which I was very thankful!" It is true that, later, the lady is the subject of one or two allusions of a gentler cast. One of them indeed is so pretty as to be worth quoting: —

“After leaving the book at Mr. Emerson’s, I returned through the woods, and, entering Sleepy Hollow, I perceived a lady reclining near the path which bends along its verge. It was Margaret herself. She had been there the whole afternoon, meditating or reading, for she had a book in her hand with some strange title which I did not understand and have forgotten. She said that nobody had broken her solitude, and was just giving utterance to a theory that no inhabitant of Concord ever visited Sleepy Hollow, when we saw a group of people entering the sacred precincts. Most of them followed a path which led them away from us; but an old man passed near us, and smiled to see Margaret reclining on the ground and me standing by her side. He made some remark upon the beauty of the afternoon, and withdrew himself into the shadow of the wood. Then we talked about autumn, and about the pleasures of being lost in the woods, and about the crows, whose voices Margaret had heard; and about the experiences of early childhood, whose influence remains upon the character after the recollection of them has passed away; and about the sight of mountains from a distance, and the view from their summits; and about other matters of high and low philosophy.”

It is safe to assume that Hawthorne could not on the whole have had a high relish for the very positive personality of this accomplished and argumentative woman, in whose intellect high noon seemed ever to reign, as twilight did in his own. He must have been struck with the glare of her understanding, and, mentally speaking, have scowled and blinked a good deal in conversation with her. But it is tolerably manifest, nevertheless, that she was, in his imagination, the starting-point of the figure of Zenobia; and Zenobia is, to my sense, his only very definite attempt at the representation of a character. The portrait is full of alteration and embellishment; but it has a greater reality, a greater abundance of detail, than any of his other figures, and the reality was a memory of the lady whom he had encountered in the Roxbury pastoral or among the wood-walks of Concord, with strange books in her hand and eloquent discourse on her lips. The *Blithedale Romance* was written just after her unhappy death, when the reverberation of her talk would lose much of its harshness. In fact, however, very much the same qualities that made Hawthorne a Democrat in politics — his contemplative turn and absence of a keen perception of abuses, his taste for old ideals, and loitering paces, and muffled tones — would operate to keep him out of active sympathy with a woman of the so-called progressive type. We may be sure that in women his taste was conservative.

It seems odd, as his biographer says, “that the least gregarious of men should have been drawn into a socialistic community;” but although it is apparent that Hawthorne went to Brook Farm without any great Transcendental fervour, yet he had various good reasons for casting his lot in this would-be happy family. He was as yet unable to marry, but he naturally wished to do so as speedily as possible, and there was a prospect that Brook Farm would prove an economical residence. And then it is only fair to believe that Hawthorne was interested in the experiment, and that though he was not a Transcendentalist, an Abolitionist, or a Fourierite, as his companions were in some degree or other likely to be, he was willing, as a generous and unoccupied young man, to lend a hand in any reasonable scheme for helping people to live together on better

terms than the common. The Brook Farm scheme was, as such things go, a reasonable one; it was devised and carried out by shrewd and sober-minded New Englanders, who were careful to place economy first and idealism afterwards, and who were not afflicted with a Gallic passion for completeness of theory. There were no formulas, doctrines, dogmas; there was no interference whatever with private life or individual habits, and not the faintest adumbration of a rearrangement of that difficult business known as the relations of the sexes. The relations of the sexes were neither more nor less than what they usually are in American life, excellent; and in such particulars the scheme was thoroughly conservative and irreproachable. Its main characteristic was that each individual concerned in it should do a part of the work necessary for keeping the whole machine going. He could choose his work and he could live as he liked; it was hoped, but it was by no means demanded, that he would make himself agreeable, like a gentleman invited to a dinner-party. Allowing, however, for everything that was a concession to worldly traditions and to the laxity of man's nature, there must have been in the enterprise a good deal of a certain freshness and purity of spirit, of a certain noble credulity and faith in the perfectibility of man, which it would have been easier to find in Boston in the year 1840, than in London five-and-thirty years later. If that was the era of Transcendentalism, Transcendentalism could only have sprouted in the soil peculiar to the general locality of which I speak — the soil of the old New England morality, gently raked and refreshed by an imported culture. The Transcendentalists read a great deal of French and German, made themselves intimate with George Sand and Goethe, and many other writers; but the strong and deep New England conscience accompanied them on all their intellectual excursions, and there never was a so-called "movement" that embodied itself, on the whole, in fewer eccentricities of conduct, or that borrowed a smaller licence in private deportment. Henry Thoreau, a delightful writer, went to live in the woods; but Henry Thoreau was essentially a sylvan personage and would not have been, however the fashion of his time might have turned, a man about town. The brothers and sisters at Brook Farm ploughed the fields and milked the cows; but I think that an observer from another clime and society would have been much more struck with their spirit of conformity than with their *déréglements*. Their ardour was a moral ardour, and the lightest breath of scandal never rested upon them, or upon any phase of Transcendentalism.

A biographer of Hawthorne might well regret that his hero had not been more mixed up with the reforming and free-thinking class, so that he might find a pretext for writing a chapter upon the state of Boston society forty years ago. A needful warrant for such regret should be, properly, that the biographer's own personal reminiscences should stretch back to that period and to the persons who animated it. This would be a guarantee of fulness of knowledge and, presumably, of kindness of tone. It is difficult to see, indeed, how the generation of which Hawthorne has given us, in *Blithedale*, a few portraits, should not at this time of day be spoken of very tenderly and sympathetically. If irony enter into the allusion, it should be of the lightest and gentlest. Certainly, for a brief and imperfect chronicler of these things, a writer just touching

them as he passes, and who has not the advantage of having been a contemporary, there is only one possible tone. The compiler of these pages, though his recollections date only from a later period, has a memory of a certain number of persons who had been intimately connected, as Hawthorne was not, with the agitations of that interesting time. Something of its interest adhered to them still — something of its aroma clung to their garments; there was something about them which seemed to say that when they were young and enthusiastic, they had been initiated into moral mysteries, they had played at a wonderful game. Their usual mark (it is true I can think of exceptions) was that they seemed excellently good. They appeared unstained by the world, unfamiliar with worldly desires and standards, and with those various forms of human depravity which flourish in some high phases of civilisation; inclined to simple and democratic ways, destitute of pretensions and affectations, of jealousies, of cynicism, of snobbishness. This little epoch of fermentation has three or four drawbacks for the critic — drawbacks, however, that may be overlooked by a person for whom it has an interest of association. It bore, intellectually, the stamp of provincialism; it was a beginning without a fruition, a dawn without a noon; and it produced, with a single exception, no great talents. It produced a great deal of writing, but (always putting Hawthorne aside, as a contemporary but not a sharer) only one writer in whom the world at large has interested itself. The situation was summed up and transfigured in the admirable and exquisite Emerson. He expressed all that it contained, and a good deal more, doubtless, besides; he was the man of genius of the moment; he was the Transcendentalist par excellence. Emerson expressed, before all things, as was extremely natural at the hour and in the place, the value and importance of the individual, the duty of making the most of one's self, of living by one's own personal light and carrying out one's own disposition. He reflected with beautiful irony upon the exquisite impudence of those institutions which claim to have appropriated the truth and to dole it out, in proportionate morsels, in exchange for a subscription. He talked about the beauty and dignity of life, and about every one who is born into the world being born to the whole, having an interest and a stake in the whole. He said "all that is clearly due to-day is not to lie," and a great many other things which it would be still easier to present in a ridiculous light. He insisted upon sincerity and independence and spontaneity, upon acting in harmony with one's nature, and not conforming and compromising for the sake of being more comfortable. He urged that a man should await his call, his finding the thing to do which he should really believe in doing, and not be urged by the world's opinion to do simply the world's work. "If no call should come for years, for centuries, then I know that the want of the Universe is the attestation of faith by my abstinence... If I cannot work, at least I need not lie." The doctrine of the supremacy of the individual to himself, of his originality and, as regards his own character, unique quality, must have had a great charm for people living in a society in which introspection, thanks to the want of other entertainment, played almost the part of a social resource.

In the United States, in those days, there were no great things to look out at (save forests and rivers); life was not in the least spectacular; society was not brilliant; the country was given up to a great material prosperity, a homely bourgeois activity, a diffusion of primary education and the common luxuries. There was therefore, among the cultivated classes, much relish for the utterances of a writer who would help one to take a picturesque view of one's internal possibilities, and to find in the landscape of the soul all sorts of fine sunrise and moonlight effects. "Meantime, while the doors of the temple stand open, night and day, before every man, and the oracles of this truth cease never, it is guarded by one stern condition; this, namely — it is an intuition. It cannot be received at second hand. Truly speaking, it is not instruction but provocation that I can receive from another soul." To make one's self so much more interesting would help to make life interesting, and life was probably, to many of this aspiring congregation, a dream of freedom and fortitude. There were faulty parts in the Emersonian philosophy; but the general tone was magnificent; and I can easily believe that, coming when it did and where it did, it should have been drunk in by a great many fine moral appetites with a sense of intoxication. One envies, even, I will not say the illusions, of that keenly sentient period, but the convictions and interests — the moral passion. One certainly envies the privilege of having heard the finest of Emerson's orations poured forth in their early newness. They were the most poetical, the most beautiful productions of the American mind, and they were thoroughly local and national. They had a music and a magic, and when one remembers the remarkable charm of the speaker, the beautiful modulation of his utterance, one regrets in especial that one might not have been present on a certain occasion which made a sensation, an era — the delivery of an address to the Divinity School of Harvard University, on a summer evening in 1838. In the light, fresh American air, unthickened and undarkened by customs and institutions established, these things, as the phrase is, told.

Hawthorne appears, like his own Miles Coverdale, to have arrived at Brook Farm in the midst of one of those April snow-storms which, during the New England spring, occasionally diversify the inaction of the vernal process. Miles Coverdale, in *The Blithedale Romance*, is evidently as much Hawthorne as he is any one else in particular. He is indeed not very markedly any one, unless it be the spectator, the observer; his chief identity lies in his success in looking at things objectively and spinning uncommunicated fancies about them. This indeed was the part that Hawthorne played socially in the little community at West Roxbury. His biographer describes him as sitting "silently, hour after hour, in the broad old-fashioned hall of the house, where he could listen almost unseen to the chat and merriment of the young people, himself almost always holding a book before him, but seldom turning the leaves." He put his hand to the plough and supported himself and the community, as they were all supposed to do, by his labour; but he contributed little to the hum of voices. Some of his companions, either then or afterwards, took, I believe, rather a gruesome view of his want of articulate enthusiasm, and accused him of coming to the place as a sort of intellectual vampire, for purely psychological purposes. He sat in a corner, they declared,

and watched the inmates when they were off their guard, analysing their characters, and dissecting the amiable ardour, the magnanimous illusions, which he was too cold-blooded to share. In so far as this account of Hawthorne's attitude was a complaint, it was a singularly childish one. If he was at Brook Farm without being of it, this is a very fortunate circumstance from the point of view of posterity, who would have preserved but a slender memory of the affair if our author's fine novel had not kept the topic open. The complaint is indeed almost so ungrateful a one as to make us regret that the author's fellow-communists came off so easily. They certainly would not have done so if the author of *Blithedale* had been more of a satirist. Certainly, if Hawthorne was an observer, he was a very harmless one; and when one thinks of the queer specimens of the reforming genus with which he must have been surrounded, one almost wishes that, for our entertainment, he had given his old companions something to complain of in earnest. There is no satire whatever in the *Romance*; the quality is almost conspicuous by its absence. Of portraits there are only two; there is no sketching of odd figures — no reproduction of strange types of radicalism; the human background is left vague. Hawthorne was not a satirist, and if at Brook Farm he was, according to his habit, a good deal of a mild sceptic, his scepticism was exercised much more in the interest of fancy than in that of reality.

There must have been something pleasantly bucolic and pastoral in the habits of the place during the fine New England summer; but we have no retrospective envy of the denizens of Brook Farm in that other season which, as Hawthorne somewhere says, leaves in those regions, "so large a blank — so melancholy a deathspot — in lives so brief that they ought to be all summer-time." "Of a summer night, when the moon was full," says Mr. Lathrop, "they lit no lamps, but sat grouped in the light and shadow, while sundry of the younger men sang old ballads, or joined Tom Moore's songs to operatic airs. On other nights there would be an original essay or poem read aloud, or else a play of Shakspeare, with the parts distributed to different members; and these amusements failing, some interesting discussion was likely to take their place. Occasionally, in the dramatic season, large delegations from the farm would drive into Boston, in carriages and waggons, to the opera or the play. Sometimes, too, the young women sang as they washed the dishes in the Hive; and the youthful yeomen of the society came in and helped them with their work. The men wore blouses of a checked or plaided stuff, belted at the waist, with a broad collar folding down about the throat, and rough straw hats; the women, usually, simple calico gowns and hats." All this sounds delightfully Arcadian and innocent, and it is certain that there was something peculiar to the clime and race in some of the features of such a life; in the free, frank, and stainless companionship of young men and maidens, in the mixture of manual labour and intellectual flights — dish-washing and æsthetics, wood-chopping and philosophy. Wordsworth's "plain living and high thinking" were made actual. Some passages in Margaret Fuller's journals throw plenty of light on this. (It must be premised that she was at Brook Farm as an occasional visitor; not as a labourer in the Hive.)

“All Saturday I was off in the woods. In the evening we had a general conversation, opened by me, upon Education, in its largest sense, and on what we can do for ourselves and others. I took my usual ground: — The aim is perfection; patience the road. Our lives should be considered as a tendency, an approximation only... Mr. R. spoke admirably on the nature of loyalty. The people showed a good deal of the sans-culotte tendency in their manners, throwing themselves on the floor, yawning, and going out when they had heard enough. Yet as the majority differ with me, to begin with — that being the reason this subject was chosen — they showed on the whole more interest and deference than I had expected. As I am accustomed to deference, however, and need it for the boldness and animation which my part requires, I did not speak with as much force as usual... Sunday. — A glorious day; the woods full of perfume; I was out all the morning. In the afternoon Mrs. R. and I had a talk. I said my position would be too uncertain here, as I could not work. — said ‘they would all like to work for a person of genius.’ ... ‘Yes,’ I told her; ‘but where would be my repose when they were always to be judging whether I was worth it or not?... Each day you must prove yourself anew.’ ... We talked of the principles of the community. I said I had not a right to come, because all the confidence I had in it was as an experiment worth trying, and that it was part of the great wave of inspired thought... We had valuable discussion on these points. All Monday morning in the woods again. Afternoon, out with the drawing party; I felt the evils of the want of conventional refinement, in the impudence with which one of the girls treated me. She has since thought of it with regret, I notice; and by every day’s observation of me will see that she ought not to have done it. In the evening a husking in the barn ... a most picturesque scene... I stayed and helped about half an hour, and then took a long walk beneath the stars. Wednesday... In the evening a conversation on Impulse... I defended nature, as I always do; — the spirit ascending through, not superseding, nature. But in the scale of Sense, Intellect, Spirit, I advocated the claims of Intellect, because those present were rather disposed to postpone them. On the nature of Beauty we had good talk. — seemed in a much more reverent humour than the other night, and enjoyed the large plans of the universe which were unrolled... Saturday, — Well, good-bye, Brook Farm. I know more about this place than I did when I came; but the only way to be qualified for a judge of such an experiment would be to become an active, though unimpassioned, associate in trying it... The girl who was so rude to me stood waiting, with a timid air, to bid me good-bye.”

The young girl in question cannot have been Hawthorne’s charming Priscilla; nor yet another young lady, of a most humble spirit, who communicated to Margaret’s biographers her recollections of this remarkable woman’s visits to Brook Farm; concluding with the assurance that “after a while she seemed to lose sight of my more prominent and disagreeable peculiarities, and treated me with affectionate regard.”

Hawthorne’s farewell to the place appears to have been accompanied with some reflections of a cast similar to those indicated by Miss Fuller; in so far at least as we may attribute to Hawthorne himself some of the observations that he fathers upon Miles

Coverdale. His biographer justly quotes two or three sentences from *The Blithedale Romance*, as striking the note of the author's feeling about the place. "No sagacious man," says Coverdale, "will long retain his sagacity if he live exclusively among reformers and progressive people, without periodically returning to the settled system of things, to correct himself by a new observation from that old standpoint." And he remarks elsewhere that "it struck me as rather odd that one of the first questions raised, after our separation from the greedy, struggling, self-seeking world, should relate to the possibility of getting the advantage over the outside barbarians in their own field of labour. But to tell the truth, I very soon became sensible that, as regarded society at large, we stood in a position of new hostility rather than new brotherhood." He was doubtless oppressed by the "sultry heat of society," as he calls it in one of the jottings in the *Note-Books*. "What would a man do if he were compelled to live always in the sultry heat of society, and could never bathe himself in cool solitude?" His biographer relates that one of the other Brook Farmers, wandering afield one summer's day, discovered Hawthorne stretched at his length upon a grassy hillside, with his hat pulled over his face, and every appearance, in his attitude, of the desire to escape detection. On his asking him whether he had any particular reason for this shyness of posture—"Too much of a party up there!" Hawthorne contented himself with replying, with a nod in the direction of the Hive. He had nevertheless for a time looked forward to remaining indefinitely in the community; he meant to marry as soon as possible and bring his wife there to live. Some sixty pages of the second volume of the *American Note-Books* are occupied with extracts from his letters to his future wife and from his journal (which appears however at this time to have been only intermittent), consisting almost exclusively of descriptions of the simple scenery of the neighbourhood, and of the state of the woods and fields and weather. Hawthorne's fondness for all the common things of nature was deep and constant, and there is always something charming in his verbal touch, as we may call it, when he talks to himself about them. "Oh," he breaks out, of an October afternoon, "the beauty of grassy slopes, and the hollow ways of paths winding between hills, and the intervals between the road and wood-lots, where Summer lingers and sits down, strewing dandelions of gold and blue asters as her parting gifts and memorials!" He was but a single summer at Brook Farm; the rest of his residence had the winter-quality.

But if he returned to solitude, it was henceforth to be as the French say, a solitude à deux. He was married in July 1842, and betook himself immediately to the ancient village of Concord, near Boston, where he occupied the so-called Manse which has given the title to one of his collections of tales, and upon which this work, in turn, has conferred a permanent distinction. I use the epithets "ancient" and "near" in the foregoing sentence, according to the American measurement of time and distance. Concord is some twenty miles from Boston, and even to day, upwards of forty years after the date of Hawthorne's removal thither, it is a very fresh and well-preserved looking town. It had already a local history when, a hundred years ago, the larger current of human affairs flowed for a moment around it. Concord has the honour of being the first spot in

which blood was shed in the war of the Revolution; here occurred the first exchange of musket-shots between the King's troops and the American insurgents. Here, as Emerson says in the little hymn which he contributed in 1836 to the dedication of a small monument commemorating this circumstance —

“Here once the embattled farmers stood,  
And fired the shot heard round the world.”

The battle was a small one, and the farmers were not destined individually to emerge from obscurity; but the memory of these things has kept the reputation of Concord green, and it has been watered, moreover, so to speak, by the life-long presence there of one of the most honoured of American men of letters — the poet from whom I just quoted two lines. Concord is indeed in itself decidedly verdant, and is an excellent specimen of a New England village of the riper sort. At the time of Hawthorne's first going there it must have been an even better specimen than to-day — more homogeneous, more indigenous, more absolutely democratic. Forty years ago the tide of foreign immigration had scarcely begun to break upon the rural strongholds of the New England race; it had at most begun to splash them with the salt Hibernian spray. It is very possible, however, that at this period there was not an Irishman in Concord; the place would have been a village community operating in excellent conditions. Such a village community was not the least honourable item in the sum of New England civilisation. Its spreading elms and plain white houses, its generous summers and ponderous winters, its immediate background of promiscuous field and forest, would have been part of the composition. For the rest, there were the selectmen and the town-meetings, the town-schools and the self-governing spirit, the rigid morality, the friendly and familiar manners, the perfect competence of the little society to manage its affairs itself. In the delightful introduction to the Mosses, Hawthorne has given an account of his dwelling, of his simple occupations and recreations, and of some of the characteristics of the place. The Manse is a large, square wooden house, to the surface of which — even in the dry New England air, so unfriendly to mosses and lichens and weather-stains, and the other elements of a picturesque complexion — a hundred and fifty years of exposure have imparted a kind of tone, standing just above the slow-flowing Concord river, and approached by a short avenue of over-arching trees. It had been the dwelling-place of generations of Presbyterian ministers, ancestors of the celebrated Emerson, who had himself spent his early manhood and written some of his most beautiful essays there. “He used,” as Hawthorne says, “to watch the Assyrian dawn, and Paphian sunset and moonrise, from the summit of our eastern hill.” From its clerical occupants the place had inherited a mild mustiness of theological association — a vague reverberation of old Calvinistic sermons, which served to deepen its extra-mundane and somnolent quality. The three years that Hawthorne passed here were, I should suppose, among the happiest of his life. The future was indeed not in any special manner assured; but the present was sufficiently genial. In the American Note-Books there is a charming passage (too long to quote) descriptive of the entertainment the new couple found in renovating and re-furnishing the old parsonage, which, at the time of their going into

it, was given up to ghosts and cobwebs. Of the little drawing-room, which had been most completely reclaimed, he writes that "the shade of our departed host will never haunt it; for its aspect has been as completely changed as the scenery of a theatre. Probably the ghost gave one peep into it, uttered a groan, and vanished for ever." This departed host was a certain Doctor Ripley, a venerable scholar, who left behind him a reputation of learning and sanctity which was reproduced in one of the ladies of his family, long the most distinguished woman in the little Concord circle. Doctor Ripley's predecessor had been, I believe, the last of the line of the Emerson ministers — an old gentleman who, in the earlier years of his pastorate, stood at the window of his study (the same in which Hawthorne handled a more irresponsible quill) watching, with his hands under his long coat-tails, the progress of Concord fight. It is not by any means related, however, I should add, that he waited for the conclusion to make up his mind which was the righteous cause.

Hawthorne had a little society (as much, we may infer, as he desired), and it was excellent in quality. But the pages in the Note-Books which relate to his life at the Manse, and the introduction to the Mosses, make more of his relations with vegetable nature, and of his customary contemplation of the incidents of wood-path and way-side, than of the human elements of the scene; though these also are gracefully touched upon. These pages treat largely of the pleasures of a kitchen-garden, of the beauty of summer-squashes, and of the mysteries of apple-raising. With the wholesome aroma of apples (as is indeed almost necessarily the case in any realistic record of New England rural life) they are especially pervaded; and with many other homely and domestic emanations; all of which derive a sweetness from the medium of our author's colloquial style. Hawthorne was silent with his lips; but he talked with his pen. The tone of his writing is often that of charming talk — ingenious, fanciful, slow-flowing, with all the lightness of gossip, and none of its vulgarity. In the preface to the tales written at the Manse he talks of many things and just touches upon some of the members of his circle — especially upon that odd genius, his fellow-villager, Henry Thoreau. I said a little way back that the New England Transcendental movement had suffered in the estimation of the world at large from not having (putting Emerson aside) produced any superior talents. But any reference to it would be ungenerous which should omit to pay a tribute in passing to the author of *Walden*. Whatever question there may be of his talent, there can be none, I think, of his genius. It was a slim and crooked one; but it was eminently personal. He was imperfect, unfinished, inartistic; he was worse than provincial — he was parochial; it is only at his best that he is readable. But at his best he has an extreme natural charm, and he must always be mentioned after those Americans — Emerson, Hawthorne, Longfellow, Lowell, Motley — who have written originally. He was Emerson's independent moral man made flesh — living for the ages, and not for Saturday and Sunday; for the Universe, and not for Concord. In fact, however, Thoreau lived for Concord very effectually, and by his remarkable genius for the observation of the phenomena of woods and streams, of plants and trees, and beasts and fishes, and for flinging a kind of spiritual interest over these

things, he did more than he perhaps intended toward consolidating the fame of his accidental human sojourn. He was as shy and ungregarious as Hawthorne; but he and the latter appear to have been sociably disposed towards each other, and there are some charming touches in the preface to the Mosses in regard to the hours they spent in boating together on the large, quiet Concord river. Thoreau was a great voyager, in a canoe which he had constructed himself, and which he eventually made over to Hawthorne, and as expert in the use of the paddle as the Red men who had once haunted the same silent stream. The most frequent of Hawthorne's companions on these excursions appears, however, to have been a local celebrity — as well as Thoreau a high Transcendentalist — Mr. Ellery Channing, whom I may mention, since he is mentioned very explicitly in the preface to the Mosses, and also because no account of the little Concord world would be complete which should omit him. He was the son of the distinguished Unitarian moralist, and, I believe, the intimate friend of Thoreau, whom he resembled in having produced literary compositions more esteemed by the few than by the many. He and Hawthorne were both fishermen, and the two used to set themselves afloat in the summer afternoons. "Strange and happy times were those," exclaims the more distinguished of the two writers, "when we cast aside all irksome forms and strait-laced habitudes, and delivered ourselves up to the free air, to live like the Indians or any less conventional race, during one bright semicircle of the sun. Rowing our boat against the current, between wide meadows, we turned aside into the Assabeth. A more lovely stream than this, for a mile above its junction with the Concord, has never flowed on earth — nowhere indeed except to lave the interior regions of a poet's imagination... It comes flowing softly through the midmost privacy and deepest heart of a wood which whispers it to be quiet; while the stream whispers back again from its sedgy borders, as if river and wood were hushing one another to sleep. Yes; the river sleeps along its course and dreams of the sky and the clustering foliage..." While Hawthorne was looking at these beautiful things, or, for that matter, was writing them, he was well out of the way of a certain class of visitants whom he alludes to in one of the closing passages of this long Introduction. "Never was a poor little country village infested with such a variety of queer, strangely-dressed, oddly-behaved mortals, most of whom took upon themselves to be important agents of the world's destiny, yet were simply bores of a very intense character." "These hobgoblins of flesh and blood," he says in a preceding paragraph, "were attracted thither by the wide-spreading influence of a great original thinker who had his earthly abode at the opposite extremity of our village... People that had lighted on a new thought or a thought they fancied new, came to Emerson, as the finder of a glittering gem hastens to a lapidary, to ascertain its quality and value." And Hawthorne enumerates some of the categories of pilgrims to the shrine of the mystic counsellor, who as a general thing was probably far from abounding in their own sense (when this sense was perverted), but gave them a due measure of plain practical advice. The whole passage is interesting, and it suggests that little Concord had not been ill-treated by the fates — with "a great original thinker" at one end of the village, an exquisite teller of tales at the

other, and the rows of New England elms between. It contains moreover an admirable sentence about Hawthorne's pilgrim-haunted neighbour, with whom, "being happy," as he says, and feeling therefore "as if there were no question to be put," he was not in metaphysical communion. "It was good nevertheless to meet him in the wood-paths, or sometimes in our avenue, with that pure intellectual gleam diffused about his presence, like the garment of a shining one; and he so quiet, so simple, so without pretension, encountering each man alive as if expecting to receive more than he could impart!" One may without indiscretion risk the surmise that Hawthorne's perception, of the "shining" element in his distinguished friend was more intense than his friend's appreciation of whatever luminous property might reside within the somewhat dusky envelope of our hero's identity as a collector of "mosses." Emerson, as a sort of spiritual sun-worshipper, could have attached but a moderate value to Hawthorne's cat-like faculty of seeing in the dark.

"As to the daily coarse of our life," the latter writes in the spring of 1843, "I have written with pretty commendable diligence, averaging from two to four hours a day; and the result is seen in various magazines. I might have written more if it had seemed worth while, but I was content to earn only so much gold as might suffice for our immediate wants, having prospect of official station and emolument which would do away with the necessity of writing for bread. These prospects have not yet had their fulfilment; and we are well content to wait, for an office would inevitably remove us from our present happy home — at least from an outward home; for there is an inner one that will accompany us wherever we go. Meantime, the magazine people do not pay their debts; so that we taste some of the inconveniences of poverty. It is an annoyance, not a trouble." And he goes on to give some account of his usual habits. (The passage is from his *Journal*, and the account is given to himself, as it were, with that odd, unfamiliar explicitness which marks the tone of this record throughout.) "Every day I trudge through snow and slosh to the village, look into the post-office, and spend an hour at the reading-room; and then return home, generally without having spoken a word to any human being... In the way of exercise I saw and split wood, and physically I was never in a better condition than now." He adds a mention of an absence he had lately made. "I went alone to Salem, where I resumed all my bachelor habits for nearly a fortnight, leading the same life in which ten years of my youth flitted away like a dream. But how much changed was I! At last I had got hold of a reality which never could be taken from me. It was good thus to get apart from my happiness for the sake of contemplating it."

These compositions, which were so unpunctually paid for, appeared in the *Democratic Review*, a periodical published at Washington, and having, as our author's biographer says, "considerable pretensions to a national character." It is to be regretted that the practice of keeping its creditors waiting should, on the part of the magazine in question, have been thought compatible with these pretensions. The foregoing lines are a description of a very monotonous but a very contented life, and Mr. Lathrop justly remarks upon the dissonance of tone of the tales Hawthorne produced under

these happy circumstances. It is indeed not a little of an anomaly. The episode of the Manse was one of the most agreeable he had known, and yet the best of the Mosses (though not the greater number of them) are singularly dismal compositions. They are redolent of M. Montégut's pessimism. "The reality of sin, the pervasiveness of evil," says Mr. Lathrop, "had been but slightly insisted upon in the earlier tales: in this series the idea bursts up like a long-buried fire, with earth-shaking strength, and the pits of hell seem yawning beneath us." This is very true (allowing for Mr. Lathrop's rather too emphatic way of putting it); but the anomaly is, I think, on the whole, only superficial. Our writer's imagination, as has been abundantly conceded, was a gloomy one; the old Puritan sense of sin, of penalties to be paid, of the darkness and wickedness of life, had, as I have already suggested, passed into it. It had not passed into the parts of Hawthorne's nature corresponding to those occupied by the same horrible vision of things in his ancestors; but it had still been determined to claim this later comer as its own, and since his heart and his happiness were to escape, it insisted on setting its mark upon his genius — upon his most beautiful organ, his admirable fancy. It may be said that when his fancy was strongest and keenest, when it was most itself, then the dark Puritan tinge showed in it most richly; and there cannot be a better proof that he was not the man of a sombre parti-pris whom M. Montégut describes, than the fact that these duskiest flowers of his invention sprang straight from the soil of his happiest days. This surely indicates that there was but little direct connection between the products of his fancy and the state of his affections. When he was lightest at heart, he was most creative, and when he was most creative, the moral picturesqueness of the old secret of mankind in general and of the Puritans in particular, most appealed to him — the secret that we are really not by any means so good as a well-regulated society requires us to appear. It is not too much to say, even, that the very condition of production of some of these unamiable tales would be that they should be superficial, and, as it were, insincere. The magnificent little romance of *Young Goodman Brown*, for instance, evidently means nothing as regards Hawthorne's own state of mind, his conviction of human depravity and his consequent melancholy; for the simple reason that if it meant anything, it would mean too much. Mr. Lathrop speaks of it as a "terrible and lurid parable;" but this, it seems to me, is just what it is not. It is not a parable, but a picture, which is a very different thing. What does M. Montégut make, one would ask, from the point of view of Hawthorne's pessimism, of the singularly objective and unpreoccupied tone of the Introduction to the *Old Manse*, in which the author speaks from himself, and in which the cry of metaphysical despair is not even faintly sounded?

We have seen that when he went into the village he often came home without having spoken a word to a human being. There is a touching entry made a little later, bearing upon his mild taciturnity. "A cloudy veil stretches across the abyss of my nature. I have, however, no love of secrecy and darkness. I am glad to think that God sees through my heart, and if any angel has power to penetrate into it, he is welcome to know everything that is there. Yes, and so may any mortal who is capable

of full sympathy, and therefore worthy to come into my depths. But he must find his own way there; I can neither guide nor enlighten him." It must be acknowledged, however, that if he was not able to open the gate of conversation, it was sometimes because he was disposed to slide the bolt himself. "I had a purpose," he writes, shortly before the entry last quoted, "if circumstances would permit, of passing the whole term of my wife's absence without speaking a word to any human being." He beguiled these incommunicative periods by studying German, in Tieck and Bürger, without apparently making much progress; also in reading French, in Voltaire and Rabelais. "Just now," he writes, one October noon, "I heard a sharp tapping at the window of my study, and, looking up from my book (a volume of Rabelais), behold, the head of a little bird, who seemed to demand admittance." It was a quiet life, of course, in which these diminutive incidents seemed noteworthy; and what is noteworthy here to the observer of Hawthorne's contemplative simplicity, is the fact that though he finds a good deal to say about the little bird (he devotes several lines more to it) he makes no remark upon Rabelais. He had other visitors than little birds, however, and their demands were also not Rabelaisian. Thoreau comes to see him, and they talk "upon the spiritual advantages of change of place, and upon the Dial, and upon Mr. Alcott, and other kindred or concatenated subjects." Mr. Alcott was an arch-transcendentalist, living in Concord, and the Dial was a periodical to which the illuminated spirits of Boston and its neighbourhood used to contribute. Another visitor comes and talks "of Margaret Fuller, who, he says, has risen perceptibly into a higher state since their last meeting." There is probably a great deal of Concord five-and-thirty years ago in that little sentence!

Extracts from AMERICAN NOTEBOOKS by Nathaniel Hawthorne

September 1, 1842. Mr. Thoreau dined with us yesterday. He is a singular character — a young man with much of wild original nature still remaining in him; and so far as he is sophisticated, it is in a way and method of his own. He is as ugly as sin, long-nosed, queer-mouthed, and with uncouth and rustic, though courteous manners, corresponding very well with such an exterior. But his ugliness is of an honest and agreeable fashion, and becomes him much better than beauty. He was educated, I believe, at Cambridge, and formerly kept school in this town; but for two or three years back, he has repudiated all regular modes of getting a living, and seems inclined to lead a sort of Indian life among civilized men — an Indian life, I mean, as respects the absence of any systematic effort for a livelihood. He has been for some time an inmate of Mr. Emerson's family; and, in requital, he labors in the garden, and performs such other offices as may suit him — being entertained by Mr. Emerson for the sake of what true manhood there is in him.

Mr. Thoreau is a keen and delicate observer of nature — a genuine observer — which, I suspect, is almost as rare a character as even an original poet; and Nature, in return for his love, seems to adopt him as her especial child, and shows him secrets which few others are allowed to witness. He is familiar with beast, fish, fowl, and

reptile, and has strange stories to tell of adventures, and friendly passages with these lower brethren of mortality. Herb and flower, likewise, wherever they grow, whether in garden or wildwood, are his familiar friends. He is also on intimate terms with the clouds, and can tell the portents of storms. It is a characteristic trait that he has a great regard for the memory of the Indian tribes, whose wild life would have suited him so well; and strange to say, he seldom walks over a ploughed field without picking up an arrow-point, a spearhead, or other relic of the red men — as if their spirits willed him to be the inheritor of their simple wealth.

With all this he has more than a tincture of literature, — a deep and true taste for poetry, especially for the elder poets, and he is a good writer, — at least he has written a good article, a rambling disquisition on Natural History, in the last Dial, which, he says, was chiefly made up from journals of his own observations. Methinks this article gives a very fair image of his mind and character, — so true, innate, and literal in observation, yet giving the spirit as well as letter of what he sees, even as a lake reflects its wooded banks, showing every leaf, yet giving the wild beauty of the whole scene. Then there are in the article passages of cloudy and dreamy metaphysics, and also passages where his thoughts seem to measure and attune themselves into spontaneous verse, as they rightfully may, since there is real poetry in them. There is a basis of good sense and of moral truth, too, throughout the article, which also is a reflection of his character; for he is not unwise to think and feel, and I find him a healthy and wholesome man to know.

After dinner (at which we cut the first watermelon and muskmelon that our garden has ripened) Mr. Thoreau and I walked up the bank of the river; and, at a certain point, he shouted for his boat. Forthwith, a young man paddled it across the river, and Mr. Thoreau and I voyaged farther up the stream, which soon became more beautiful than any picture, with its dark and quiet sheet of water, half shaded, half sunny, between high and wooded banks. The late rains have swollen the stream so much that many trees are standing up to their knees, as it were, in the water, and boughs, which lately swung high in air, now dip and drink deep of the passing wave. As to the poor cardinals which glowed upon the bank a few days since, I could see only a few of their scarlet hats, peeping above the tide. Mr. Thoreau managed the boat so perfectly, either with two paddles or with one, that it seemed instinct with his own will, and to require no physical effort to guide it. He said that, when some Indians visited Concord a few years since, he found that he had acquired, without a teacher, their precise method of propelling and steering a canoe. Nevertheless he was desirous of selling the boat of which he is so fit a pilot, and which was built by his own hands; so I agreed to take it, and accordingly became possessor of the Musketaquid. I wish I could acquire the aquatic skill of the original owner.

THE FORESTER by Amos Bronson Alcott

Alcott's tribute to Thoreau was first published in the Atlantic Monthly in April, 1862.

Then bless thy secret growth, nor catch  
At noise, hut thrive unseen and dumb,  
Keep clean, hear fruit, earn life, and watch  
Till the white-winged reapers come. — HENRY VAUGHAN.

I HAD never thought of knowing a man so thoroughly of the country as this friend of mine, and so purely a son of Nature. Perhaps he has the profoundest passion for it of any one living; and had the human sentiment been as tender from the first, and as pervading, we might have had pastorals of which Virgil and Theocritus would have envied him the authorship, had they chanced to be his contemporaries. As it is, he has come nearer the antique spirit than any of our native poets, and touched the fields and groves and streams of his native town with a classic interest that shall not fade. Some of his verses are suffused with an elegiac tenderness, as if the woods and fields bewailed the absence of their forester, and murmured their griefs meanwhile to one another, — responsive like idyls. Living in close companionship with Nature, his Muse breathes the spirit and voice of poetry; his excellence lying herein: for when the heart is once divorced from the senses and all sympathy with common things, then poetry has fled, and the love that sings.

The most welcome of companions, this plain countryman. One shall not meet with thoughts invigorating like his often: coming so scented of mountain and field breezes and rippling springs, so like a luxuriant clod from under forest-leaves, moist and mossy with earth-spirits. His presence is tonic, like ice-water in dog-days to the parched citizen pent in chambers and under brazen ceilings. Welcome as the gurgle of brooks, the dripping of pitchers, then drink and be cool! He seems one with things, of Nature's essence and core, knit of strong timbers, most like a wood and its inhabitants. There are in him sod and shade, woods and waters manifold, the mould and mist of earth and sky. Self-poised and sagacious as any denizen of the elements, he has the key to every animals brain, every plant, every shrub and were an Indian to flower forth, and reveal the secrets hidden in his cranium, it would not be more surprising than the speech of our Sylvanus. He must belong to the Homeric age, — is older than pastures and gardens, as if he were of the race of heroes, and one with the elements. He, of all men, seems to be the native New-Englander, as much so as the oak, the granite ledge, our best sample of an indigenous American, untouched by the Old Country, unless he came down from Thor, the Northman; as yet unfathered by any, and a nondescript in the books of natural history.

A peripatetic philosopher, and out of doors for the best parts of his days and nights, he has manifold weather and seasons in him, and the manners of an animal of probity and virtues unstained. Of our moralists he seems the wholesomest; and the best republican citizen in the world, — always at home, and minding his own affairs. Perhaps a little over-confident sometimes, and stiffly individual, dropping society clean out of his theories, while standing friendly in his strict sense of friendship, there is in him an integrity and sense of justice that make possible and actual the virtues of Sparta and the Stoics, and all the more welcome to us in these times of shuffling and

of pusillanimity. Plutarch would have made him immortal in his pages, had he lived before his day. Nor have we any so modern as he, — his own and ours; too purely so to be appreciated at once. A scholar by birthright, and an author, his fame has not yet travelled far from the banks of the rivers he has described in his books; but I hazard only the truth in affirming of his prose, that in substance and sense it surpasses that of any naturalist of his time, and that he is sure of a reading in the future. There are fairer fishes in his pages than any now swimming in our streams, and some sleep of his on the banks of the Merrimack by moonlight that Egypt never rivalled; a morning of which Memnon might have envied the music, and a greyhound that was meant for Adonis; some frogs, too, better than any of Aristophanes. Perhaps we have had no eyes like his since Pliny's time. His senses seem double, giving him access to secrets not easily read by other men: his sagacity resembling that of the beaver and the bee, the dog and the deer; an instinct for seeing and judging, as by some other or seventh sense, dealing with objects as if they were shooting forth from his own mind mythologically, thus completing Nature all round to his senses, and a creation of his at the moment. I am sure he knows the animals, one by one, and everything else knowable in our town, and has named them rightly as Adam did in Paradise, if he be not that ancestor himself. His works are pieces of exquisite sense, celebrations of Nature's virginity, exemplified by rare learning and original observations. Persistently independent and manly, he criticizes men and times largely, urging and defending his opinions with the spirit and pertinacity befitting a descendant of him of the Hammer. A head of mixed genealogy like his, Franco-Norman crossed by Scottish and New-England descent, may be forgiven a few characteristic peculiarities and trenchant traits of thinking, amidst his great common sense and fidelity to the core of natural things. Seldom has a head circumscribed so much of the sense of Cosmos as this footed intelligence, — nothing less than all out-of-doors sufficing his genius and scopes, and, day by day, through all weeks and seasons, the year round.

If one would find the wealth of wit there is in this plain man, the information, the sagacity, the poetry, the piety, let him take a walk with him, say of a winters afternoon, to the Blue Water, or anywhere about the outskirts of his village-residence. Pagan as he shall outwardly appear, yet he soon shall be seen to be the hearty worshipper of whatsoever is sound and wholesome in Nature, — a piece of russet probity and sound sense that she delights to own and honor. His talk shall be suggestive, subtile, and sincere, under as many masks and mimicries as the shows he passes, and as significant, — Nature choosing to speak through her chosen mouth-piece, — cynically, perhaps, sometimes, and searching into the marrows of men and times he chances to speak of; to his discomfort mostly, and avoidance. Nature, poetry, life, — not politics, not strict science, not society as it is, — are his preferred themes: the new Pantheon, probably, before he gets far, to the naming of the gods some coming Angelo, some Pliny, is to paint and describe. The world is holy, the things seen symbolizing the Unseen, and worthy of worship so, the Zoroastrian rites most becoming a nature so fine as ours in this thin newness, this worship being so sensible, so promotive of possible pieties, —

calling us out of doors and under the firmament, where health and wholesomeness are finely insinuated into our souls, — not as idolaters, but as idealists, the seekers of the Unseen through images of the Invisible.

I think his religion of the most primitive type, and inclusive of all natural creatures and things, even to “the sparrow that falls to the ground,” — though never by shot of his, — and, for whatsoever is manly in man, his worship may compare with that of the priests and heroes of pagan times. Nor is he false to these traits under any guise, — worshipping at unbloody altars, a favorite of the Unseen, Wisest, and Best. Certainly he is better poised and more nearly self-reliant than other men.

Perhaps he deals best with matter, properly, though very adroitly with mind, with persons, as he knows them best, and sees them from Nature's circle, wherein he dwells habitually. I should say he inspired the sentiment of love, if, indeed, the sentiment he awakens did not seem to partake of a yet purer sentiment, were that possible, — but nameless from its excellency. Friendly he is, and holds his friends by bearings as strict in their tenderness and consideration as are the laws of his thinking, — as prompt and kindly equitable, — neighborly always, and as apt for occasions as he is strenuous against meddling with others in things not his.

I know of nothing more creditable to his greatness than the thoughtful regard, approaching to reverence, by which he has held for many years some of the best persons of his time, living at a distance, and wont to make their annual pilgrimage, usually on foot, to the master, — a devotion very rare in these times of personal indifference, if not of confessed unbelief in persons and ideas.

He has been less of a housekeeper than most, has harvested more wind and storm, sun and sky; abroad night and day with his leash of keen scents, hounding any game stirring, and running it down, for certain, to be spread on the dresser of his page, and served as a feast to the sound intelligences, before he has done with it. We have been accustomed to consider him the salt of things so long that they must lose their savor without his to season them. And when he goes hence, then Pan is dead, and Nature ailing throughout.

His friend sings him thus, with the advantages of his Walden to show him in Nature:

—  
“It is not far beyond the Village church,  
After we pass the wood that skirts the road,  
A Lake, — the blue-eyed Walden, that doth smile  
Most tenderly upon its neighbor Pines;  
And they, as if to recompense this love,  
In double beauty spread their branches forth.  
This Lake has tranquil loveliness and breadth  
And, of late years, has added to its charms;  
For one attracted to its pleasant edge  
Has built himself a little hermitage,  
Where with much piety he passes life.

“More fitting place I cannot fancy now,  
For such a man to let the line run off  
The mortal reel, — such patience hath the Lake  
Such gratitude and cheer is in the Pines.  
But more than either lake or forests depths  
This man has in himself: a tranquil man,  
With sunny sides where well the fruit is ripe,  
Good front and resolute bearing to this life,  
And some serener virtues, which control  
This rich exterior prudence, — virtues high,  
That in the principles of Things are set,  
Great by their nature, and consigned to him,  
Who, like a faithful Merchant does account  
To God for what he spends, and in what way.  
Thrice happy art thou, Walden, in thyself!  
Such purity is in thy limpid springs, —  
In those green shores which do reflect in thee,  
And in this man who dwells upon thy edge,  
A holy man within a Hermitage.  
May all good showers fall gently into thee,  
May thy surrounding forests long be spared,  
And may the Dweller on thy tranquil marge  
There lead a life of deep tranquillity,  
Pure as thy Waters, handsome as thy Shores,  
And with those virtues which are like the Stars!”

# A FABLE FOR CRITICS by James Russell Lowell

“There comes —— , for instance; to see him’s a rare sport,  
Tread in Emerson’s tracks with legs painfully short;  
How he jumps, how he strains, and gets red in the face,  
To keep step with the mystagogue’s natural pace!  
He follows as close as a stick to a rocket,  
His fingers exploring the prophet’s each pocket.  
Fie, for shame, brother bard; with good fruit of your own,  
Can’t you let Neighbor Emerson’s orchards alone?  
Besides, ‘tis no use, you’ll not find e’en a core, —  
—— has picked up all the windfalls before.  
They might stirp every tree, and E. never would catch ‘em,  
His Hesperides have no rude dragon to watch ‘em;  
When they send him a dishful, and ask him to try ‘em,  
He never suspects how the sly rogues came by ‘em;  
He wonders why ‘tis there are none such his trees on,  
And thinks ‘em the best he has tasted this season.  
1848

# HENRY D. THOREAU by Elbert Hubbard

Seeing how all the world's ways came to nought,  
And how Death's one decree merged all degrees,  
He chose to pass his time with birds and trees,  
Reduced his life to sane necessities:  
Plain meat and drink and sleep and noble thought.  
And the plump kine which waded to the knees  
Through the lush grass, knowing the luxuries  
Of succulent mouthfuls, had our gold-disease  
As much as he, who only Nature sought.

Who gives up much the gods give more in turn:  
The music of the spheres for dross of gold;  
For o'er-officious cares, flame-songs that burn  
Their pathway through the years and never old.  
And he who shunned vain cares and vainer strife  
Found an eternity in one short life.

## HENRY THOREAU

As a rule, the man who can do all things equally well is a very mediocre individual. Those who stand out before a groping world as beacon-lights were men of great faults and unequal performances. It is quite needless to add that they do not live on account of their faults or imperfections, but in spite of them.

Henry David Thoreau's place in the common heart of humanity grows firmer and more secure as the seasons pass; his life proves for us again the paradoxical fact that the only men who really succeed are those who fail.

Thoreau's obscurity, his poverty, his lack of public recognition in life, either as a writer or lecturer, his rejection as a lover, his failure in business, and his early death, form a combination of calamities that make him as immortal as a martyr. Especially does an early death sanctify all and make the record complete, but the death of a naturalist while right at the height of his ability to see and enjoy — death from tuberculosis of a man who lived most of the time in the open air — these things array us on the side of the man 'gainst unkind Fate, and cement our sympathy and love.

Nature's care forever is for the species, and the individual is sacrificed without ruth that the race may live and progress. This dumb indifference of Nature to the individual — this apparent contempt for the man — seems to prove that the individual is only a phenomenon. Man is merely a manifestation, a symptom, a symbol, and his quick passing proves that he isn't the Thing. Nature does not care for him — she produces a million beings in order to get one who has thoughts — all are swept into the dustpan of oblivion but the one who thinks; he alone lives, embalmed in the memories of generations unborn.

One of the most insistent errors ever put out was that statement of Rousseau, paraphrased in part by T. Jefferson, that all men are born free and equal. No man was ever born free, and none are equal, and would not remain so an hour, even if Jove, through caprice, should make them so.

The Thoreau race is dead. In Sleepy Hollow Cemetery at Concord there is a monument marking a row of mounds where a half-dozen Thoreaus rest. The inscriptions are all of one size, but the name of one alone lives, and he lives because he had thoughts and expressed them. If any of the tribe of Thoreau gets into Elysium, it will be by tagging close to the only man among them who glorified his Maker by using his reason.

Nothing should be claimed as truth that can not be demonstrated, but as a hypothesis (borrowed from Henry Thoreau) I give you this: Man is only the tool or vehicle — Mind alone is immortal — Thought is the Thing.

Heredity does not account for the evolution of Henry Thoreau. His father was of French descent — a plain, stolid, little man who settled in Concord with his parents when a child; later he tried business in Boston, but the march of commerce resolved itself into a double-quick, and John Thoreau dropped out of line, and turned to the country village of Concord, where he hoped that between making lead-pencils and gardening he might secure a living.

He moved better than he knew.

John Thoreau's wife was Cynthia Dunbar, a tall and handsome woman, with a ready tongue and nimble wit. Her attentions were largely occupied in looking after the affairs of the neighbors, and as the years went by her voice took on the good old metallic twang of the person who discusses people, not principles.

Henry Thoreau was the third child in the family of seven. He was born in an old house on the Virginia Road, Concord, about a mile and a half from the village. This house was the home of Mrs. Thoreau's mother, but the Thoreaus had taken refuge there, temporarily, to escape a financial blizzard which seems to have hit no one else but themselves.

John Thoreau was assisted in the pencil-making by the whole family. The Thoreaus used to sell their pencils down at Cambridge, fifteen miles away, and Harvard professors, for the most part, used the Concord article in jotting down their sublime thoughts. At ten years of age, Thoreau had a furtive eye on Harvard, directed thither, they say, by his mother. All the best people in Concord, who had sons, sent them to Harvard — why shouldn't the Thoreaus? The spirit of emulation and family pride were at work.

Henry was educated principally because he wasn't very strong, nor was he on good terms with work, and these are classic reasons for imparting classical education to youth, aspiring or otherwise.

The Concord Academy prepared Henry for college, and when he was sixteen, he trudged off to Cambridge and was duly entered in the Harvard Class of Eighteen Hundred Thirty-seven. At Harvard, his cosmos seemed to be of such a slaty gray that no one said, "Go to — we will observe this youth and write anecdotes about him, for he is going to be a great man." The very few in his class who remembered him wrote their reminiscences long years afterward, with memories refreshed by magazine accounts written by pious pilgrims from Michigan.

In college pranks and popular amusements he took no part, neither was he a "grind," for he impressed himself on no teacher or professor so that they opened their mouths and made prophecies.

Once safely through college, and standing on the threshold (I trust I use the right expression), Henry Thoreau refused to accept his diploma and pay five dollars for it — he said it wasn't worth the money.

In his "Walden," Thoreau expresses his opinion of college training this way: "If I wished a boy to know something about the arts and sciences I would not pursue the common course, which is merely to send him into the neighborhood of some professor, where everything is professed and practised but the art of life. To my astonishment, I was informed when I left college that I had studied navigation! Why, if I had taken one turn down the harbor I would have known more about it."

It is well to remember, however, that Thoreau had no ambitions to become a navigator. His mission was simply to paddle his own canoe on Walden Pond and Concord River. The men who really launched him on his voyage of discovery were Ellery Channing and Ralph Waldo Emerson — both Harvard men. Had he not been a college man, it is quite probable he would never have caught the speaker's eye. His efforts in working his way through college, assisted by his poverty-stricken parents, proved his quality. And as for his life in a shanty on the shores of Walden Pond, the occurrence is too commonplace to mention, were it not for the fact that the solitary occupant of the shanty was a Harvard graduate who used no tobacco.

Harvard prepares a youth for life — but here is a man who, having prepared for life, deliberately turns his back on life and lives in the woods.

A genuine woodsman is no curiosity, but a civilized woodsman is. The tendency of colleges is to turn men from Nature to books; from bonfires to stoves, steam-heat and cash-registers; but Thoreau, by reversing all rules, suddenly found himself, and others, explaining his position in print.

Harvard supplied him the alternating current; he influenced the people in his environment, and he was influenced by his environment.

But without Harvard there would have been no Thoreau. Having earned his diploma, he had the privilege of declining it; and having gone to college, it was his right to affirm

the emptiness of the classics. Only the man with a goodly bank-balance can wear rags with impunity.

John Thoreau made his lead-pencils and peddled them out, and we hear of his saying, "Pencils, I fear, are going out of fashion — people are buying nothing but these miserable new-fangled steel pens." When called upon to surrender, Paul Jones replied, "We haven't yet begun to fight." The truth was, the people had not really begun to use pencils. Pencils weren't going out of fashion, but John Thoreau was. The poor man moved here and there, evicted by rapacious landlords and taken in by his relatives, who didn't care whether he was a stranger or not. If he owed them ten dollars, they took fifty dollars' worth of pencils and called it square.

Then they undersold John one-half, and he said times were scarce.

This, it need not be explained, was in Massachusetts.

A hundred years ago, these men who whittled useful things out of wood during the long winter days were everywhere in New England. The sons of these men invented machines to make the same things, and thus were started the New England manufacturing. It was brains against hands, cleverness against skill, initiative against plodding industry. And the man who can tell of the sorrow and suffering of all those industrious sparrows that were caught and wound around flying shuttles, or stamped beneath the swift presses of invention, hadn't yet been born. God doesn't seem to care for sparrows — three-fourths of all that are hatched die in the nest or fall fluttering to the ground and perish, Grant Allen says.

Comparatively few persons can adjust themselves happily to new conditions: the rest are pushed and broken and bent — and die.

When Dixon and Faber invented machines that could be fed automatically, and turn out more pencils in a day than John Thoreau could in a year, John was out of the game.

John had brought up his children to work, and Henry became an expert pencil-maker. Henry, we say, should have found employment with Faber and Company, as foreman, or else evaded their patents and made a pencil-machine of his own. Instead, however, he settled down and made pencils just like his father used to make, and in the same way. He peddled out a few to his friends, but his business instinct was shown in that he himself tells how one year he made a thousand dollars' worth of pencils, but was obliged to sacrifice them all to cancel a debt of one hundred dollars.

And yet there are people who declare that genius is not transmissible.

John Thoreau failed at pencil-making, but Henry Thoreau failed because he played the flute morning, noon and night, and went singing the immunity of Pan. He fished, and tramped the woods and fields, looking, listening, dreaming and thinking.

At Keswick, where the water comes down at Lodore, there is a pencil-factory that has been there since the days of William the Conqueror. The wife of Coleridge used to work there and get money that supported her philosopher-husband and their children. Southey lived near, and became Poet Laureate of England through the right exercise of Keswick pencils; Wordsworth lived only a few miles away, and once he brought over

Charles and Mary Lamb, and bought pencils for both, with their names stamped on them. The good old man who now keeps the pencil-factory explained these things to me, and also explained the direct relationship of good lead-pencils to literature, but I do not remember what it was.

If Henry Thoreau had held on a few years, until the pilgrims began to arrive at Concord, he could have gotten rich selling souvenir pencils. But he just dozed and dreamed and tramped and philosophized; and when he wrote he used an eagle's quill, with ink he himself distilled from elderberries, and at first, birch-bark sufficed for paper. "Wild men and wild things are the only ones that have life in abundance," he used to say.

Brook Farm was a serious, sober experiment inaugurated by the Reverend George Ripley with intent to live the ideal life — the life of useful effort, direct honesty, simplicity and high thinking.

But Thoreau could not be induced to join the community — he thought too much of his liberty to entrust it to a committee. He was interested in the experiment, but not enough to visit the experimenters. Emerson looked in on them, remained one night, and went back home to continue his essay on Idealism.

Hawthorne remained long enough to get material for his "Blithedale Romance." Margaret Fuller secured good copy and the cordial and lifelong dislike of Hawthorne, all through misprized love, alas! George William Curtis and Charles Dana graduated out of Brook Farm, and went down to New York to make goodly successes in the great game of life.

At Brook Farm they succeeded in the high thinking all right, but the entrepreneur is quite as necessary as the poet — and a little more so. Brook Farm had no business head, and things unfit fall into natural dissolution. But the enterprise did not fail, any more than a rotting log fails when it nourishes a bank of violets. The net results of Brook Farm's high thinking have passed into the world's treasury, smelted largely by Emerson and Thoreau, who were not there.

Immanuel Kant has been called the father of modern Transcendentalists: but Socrates and his pupil Plato, so far as we know, were the first of the race.

Neither buzzing bluebottles nor the fall of dynasties disturbed them. "The soul is everything," said Plato. "The soul knows all things," says Emerson.

In every century a few men have lived who knew the value of plain living and high thinking, and very often the men who reversed the maxim have passed them the hemlock.

All those sects known as Primitive Christians represent variations of the idea — Quakers, Mennonites, Communists, Shakers and Dunkards!

A Transcendentalist is a Dukhobortsi with a college education. A Quaker with an artistic bias becomes a Preraphaelite, and lo! we have News from Nowhere, a Dream of John Ball, Merton Abbey, Kelmscott, and half a world is touched and tinted by the simplicity, sterling honesty and genuineness of one man.

George Ripley, Bronson Alcott, and Ralph Waldo Emerson evolved New England Transcendentalism, and very early Henry Thoreau added a few bars of harmonious discords to the symphony. Horace Greeley once contended in a "Tribune" editorial that Sam Staples, the bum bailiff who locked Thoreau behind the bars, was an important factor in the New England renaissance, and as such should be immortalized by a statue made of punk, set up on Boston Common for the delectation of bean-eaters. I fear me Horace was a joker.

California quail are quite different from the quail of New York State, and naturalists tell us that this is caused by a difference in environment — quail being a product of soil and climate.

And man is a product of soil and climate — for only in a certain soil can you produce a certain type of man. As a whole, this world is better adapted for the production of fish than genius — most of the really good climate falls on the sea. Christian Scientists are Transcendentalists whose distinguishing point is that they secrete millinery — California quail with rainbow tints and topknots, Balboaic instincts well defined.

Let this fact stand: it was Emerson who made Concord. He saw it first — he was on the ground, and the place was his by right of discovery, the title strengthened by the fact that four of his ancestors had been Concord clergymen, and the most excellent and venerable Doctor Ripley, a near kinsman.

Concord and Emerson, as early as Eighteen Hundred Forty, when Emerson was thirty-seven years old, were synonymous. He had defied the traditions of Harvard, been excommunicated by his Alma Mater, published his pantheistic Essay on Nature, and his thin little books and sermons had been placed on the Boston Theological Index Expurgatorius.

Through it all he had remained gentle, smiling, sympathetic, unresentful.

The world can never spare the man who does his work and holds his peace. Emerson was being lifted up, and souls were being drawn unto him.

In Eighteen Hundred Forty, Bronson Alcott, the American Socrates, with his interesting family, moved to Concord, drawn thither by the magnet of Emerson's personality. Louisa wore short dresses, and used to pick wild blackberries and sell them to the Emersons and get goodly reward in silver, and kindly smiles, and pats on her brown head by the hand that wrote "Compensation."

Alcott was a great, honest, sincere soul, and a true anarchist, for he took his own wherever he saw it. He used to run his wheelbarrow into Emerson's garden and load it up with potatoes, cabbages or turnips, and once in response to a hint that the vegetables were private property, the old man somewhat petulantly exclaimed, "I need them! — I need them!"

And that was all: anything that any man needed was his by divine right. And the consistency of Alcott's philosophy was shown in that he never took anything or any more than he needed, and if he had something that you needed, you were certainly welcome to it. If Alcott helped himself to the thrifty Emerson's vegetables, both Emerson and Thoreau helped themselves to Alcott's ideas.

Once a wagonload of wood broke down in front of Alcott's house, and the farmer unhitched his horses and went on to the village to procure a new wheel. Before he got back, Alcott had carried every stick of the combustibles into his own wood-shed. "Providence remembers us!" he said. His faith was sublime.

When all the world reaches the Alcott stage, there will be no need of soldiers, policemen, night-watchmen, or bolts, bars and locks.

In Eighteen Hundred Forty, Nathaniel Hawthorne came to Concord from Salem, where he had resigned his clerkship in the custom-house, that he might devote all his time to literature. He moved into the Old Manse, which had just been vacated by Doctor Ripley, who had gone a-Brook-Farming — the Old Manse where Emerson himself once lived. Elizabeth Peabody, the talented sister of Hawthorne's wife, lived at a convenient distance, and to her Hawthorne read most of his manuscript, for I need not explain that literature is not literature until it is read aloud and reflected back by a sympathetic, discerning mind. Literature is a collaboration between the reader and the listener.

Margaret Fuller, with her tragic life-story still unwound, lived hard by, and Hawthorne had already worked her up into copy as "Zenobia." Margaret's sister Ellen had married Ellery Channing, the closest, warmest friend that Henry Thoreau ever knew. The gossips arranged a doublewedding, with Henry and Margaret as the other principals; but when interviewed on the theme, Henry had merely shaken his head and said, "In the first place, Margaret Fuller is not fool enough to marry me; and second, I am not fool enough to marry her."

An Irishman who saw Thoreau in the field making a minute in his notebook took it for granted that he was casting up his wages, and inquired what they came to. It was a peculiar farmhand who cared more for ideas than for wages.

George William Curtis was also a farmhand out on the Lowell Road, but came into town Saturday evenings — taking a swim in the river on the way — to attend the philosophical conferences at Emerson's house, and then went off and made gentle fun of them.

Little Doctor Holmes occasionally drove out from Boston to Concord in a one-horse chaise; James Russell Lowell had walked over from Cambridge; and Longfellow had invited all hands to a birthday fete on his lawn at Cambridge, but Thoreau had declined for himself, saying he had to look after his pond-lilies and the field-mice on Bedford flats.

Thoreau, at this time, was a member of Emerson's household, and in a letter Emerson says, "He has his board for what labor he chooses to do; he is a great benefactor and physician to me, for he is an indefatigable and skilful laborer, besides being a scholar and a poet, and as full of promise as a young apple-tree."

And again, in a letter to Carlyle: "One reader and friend of yours dwells in my household, Henry Thoreau, a poet whom you may one day be proud of — a noble, manly youth, full of melodies and invention. We work together day by day in my garden, and I grow well and strong."

To work and talk is the true way to acquire an education. All of our best things are done incidentally — not in cold blood. Hawthorne says in his Journal that most of Emerson's and Thoreau's farming was done leaning on the hoe-handles, while Alcott sat on the fence and explained the Whyness of the Wherefore.

But we must remember that in Hawthorne's ink-bottle there was a goodly dash of tincture of iron. In his Journal of September First, Eighteen Hundred Forty-two, he writes: "Mr. Thoreau dined with us yesterday. He is a singular character — a young man with much of wild, original nature still remaining in him; and so far as he is sophisticated, it is in a way and method of his own. He is as ugly as sin, long-nosed, queer-mouthed, and with uncouth and somewhat rustic ways, though his courteous manner corresponds very well with such an exterior. But his ugliness is of an honest character and really becomes him better than beauty." Little did Hawthorne's guests imagine they were being basted, roasted, or fricasseed for the edification of posterity.

Prosperity at this time had just begun to smile on Hawthorne, and among other extravagances in which he indulged was a boat, bought from Thoreau — made by the hands of this expert Yankee whittler. Hawthorne quotes a little transcendental advice given to him by the maker of the boat: "In paddling a canoe, all you have to do is to will that your boat shall go in any particular direction, and she will immediately take the course, as if imbued with the spirit of the steersman." Hawthorne then adds this sober postscript: "It may be so with you, but it is certainly not so with me."

Admiration for Thoreau gradually grew very strong with Hawthorne, and he quotes Emerson, who called Thoreau "the young god Pan." And this lends much semblance to the statement that Thoreau served Hawthorne as a model for Donatello, the mysterious wood-sprite in the "Marble Faun."

As to the transformation of Thoreau himself, one of his classmates records this:

Meeting Mr. Emerson one day, I inquired if he saw much of my classmate, Henry D. Thoreau, who was then living in Concord. "Of Thoreau?" replied Mr. Emerson, his face lighting up with a smile of enthusiasm. "Oh, yes, we could not do without him. When Carlyle comes to America, I expect to introduce Thoreau to him as the man of Concord," and I was greatly surprised at these words. They set an estimate on Thoreau which seemed to be extravagant... Not long after I happened to meet Thoreau in Mr. Emerson's study at Concord — the first time we had come together after leaving college. I was quite startled by the transformation that had taken place in him. His short figure and general cast of countenance were, of course, unchanged; but in his manners, in the tones of his voice, in his modes of expression, even in the hesitations and pauses of his speech, he had become the counterpart of Mr. Emerson. Thoreau's college voice bore no resemblance to Mr. Emerson's, and was so familiar to my ear that I could have readily identified him by it in the dark. I was so much struck by the change that I took the opportunity, as they sat near together talking, of listening with closed eyes, and I was unable to determine with certainty which was speaking. I do not know to what subtle influences to ascribe it, but after conversing with Mr. Emerson

for even a brief time, I always found myself able and inclined to adopt his voice and manner of speaking.

Thoreau had tried schoolteaching, but he had to give up his position because he would not exercise the birch and ferule. "If the scholars once find out the teacher is not goin' to sting 'em up when they need it, that is an end to the skule," said one of the directors, and he spat violently at a fly, ten feet away. The others agreeing with him, Thoreau was asked to resign.

William Emerson, a brother of Ralph Waldo's, a prosperous New York merchant, had lured Ralph Waldo's hired man away from him and taken him down to Staten Island, New York. Here Thoreau acted as private tutor, and imparted the mysteries of woodcraft to boys who cared more for marbles.

Staten Island was about two hundred miles too far from Concord to suit Thoreau.

His loneliness in New York City made Concord and the pine-trees of Walden woods seem paradise enow. There is no heart desolation equal to that which can come to one in a throng.

Margaret Fuller was now in New York City, working for Greeley on the editorial staff of the "Tribune." Greeley was so much pleased with Thoreau that he offered to set him to work as reporter, for Greeley had guessed the truth that the best city reporters are country boys. They observe and hear — all is curious and wonderful to them: by and by they will become blase — sophisticated — that is, blind and deaf.

Greeley was a great talker, and he had a way of getting others to talk also. He got Thoreau to talking about communal life and life in the woods, and then Horace worked Henry's words up into copy — for that is the way all good newspaper-writers evolve their original ideas.

Thoreau was amazed to pick up a number of the daily "Tribune" and find his conversation of the day before, with Greeley, skilfully transformed into a leader.

Fourierism had been the theme — the Phalanstery versus Individual Housekeeping. Greeley had prophesied that the phalanstery, with one kitchen for forty families, instead of forty kitchens for forty families, would soon come about. Greeley's prophetic vision did not quite anticipate the modern apartment-house, which perhaps is a transitional expedient, moving toward the phalanstery, but he quoted Thoreau by saying, "A woman enslaved by her housekeeping is just as much a chattel as if owned by a man."

This was in Eighteen Hundred Forty-five, and Thoreau was now twenty-eight years of age. He was homesick for the dim pine-woods with their ceaseless lullaby, the winding and placid river, and the great, massive, sullen, self-sufficient boulders of Concord.

He was resolved to follow the example of Brook Farm, and start a community of his own in opposition. His community would be on the shores of Walden Pond, and the only member of the genus homo who would be eligible to membership would be himself; the other members would be the birds and squirrels and bees, and the trees would make up the rest. Brook Farm was a retreat for transcendentalists — a place to meditate, dream and work — a place where one could exist close to Nature, and live a simple, hardy and healthful life.

Thoreau's retreat would be the same, with the disadvantage of personal contact eliminated.

It was in March, Eighteen Hundred Forty-five, that Thoreau began building his shanty. The spot was in a dense woods, on a hillside that gently sloped down to the clear, cold, deep water of Walden Pond. The land belonged to Emerson, who obligingly gave Thoreau the use of it, rent free, with no conditions. Alcott helped in the carpenter work, and discussed betimes of the Wherefore, and when it came to the raising, a couple of neighboring farmers were hailed and pressed into service. The cabin was twelve by fifteen, and cost — furnished — the sum of twenty-eight dollars, good money, not counting labor, which Thoreau did not calculate as worth anything, since he had had the fun of the thing — something for which men often pay high.

The furniture consisted of a table, a chair, and a bed, all made by the owner. For bedclothes and dishes the Emerson household was put under contribution. On the door was a latch, but no lock.

And Thoreau looked upon his work and pronounced it good.

Stripped of the fact that a man of culture and education built the shanty and lived in it, the incident is scarcely worth noting. Boys passing through the shanty stage, all build shanties, and forage through their mothers' pantries for provender, which they carry off to their robbers' roost. Thoreau was an example of shanty-arrested development.

But as the import of every sentence depends upon who wrote it, and the worth of advice hinges upon who gave it, so does the value of every act depend upon who did it. Thus when a man, who was in degree an inspiration of Emerson, takes to the woods, it is worth our while to follow him afield and see what he does.

Thoreau set to work to clean up two acres of blackberry brambles for a garden-patch. He did not work except when he felt like it. His plan was to go to bed at dusk, with window and door open, and get up at five o'clock in the morning. After a plunge in the lake he would dress and prepare his simple breakfast. Then he would work in his garden, or if the mood struck him, he would sit in the door of his shanty and meditate, or else write. In the arrangement of his home he followed no system or rule, merely allowing the passing inclination to lead.

His provisions were gotten of friends in the village, and were paid for in labor. It was part of Thoreau's philosophy that to accept something for nothing was theft, and that the giving or acceptance of presents was immoral. For all he received he conscientiously gave an equivalent in labor; and as for ideas, he always considered himself a learner; if he had thoughts they belonged to anybody who could annex them. And that Emerson and Horace Greeley were alike in their capacity to absorb, digest and regurgitate, is everywhere acknowledged. To paraphrase Emerson's famous remark concerning Plato: Say what you will, you will find everything mentioned by Emerson hinted at somewhere in Thoreau. The younger man had as much mind as the elder, but he lacked the capacity for patient effort that works steadily, persistently, and weighs, sifts, decides, classifies and arranges. The voice was the voice of Jacob, but the hand

was the hand of Esau. That is to say, Thoreau lacked business instinct. During the Winter at Walden Pond, all the work Thoreau had to do was to gather firewood. There was plenty of time to think and write, and here the better part of “Walden” and “A Week on the Concord and Merrimac Rivers” were written. He had no neighbors, no pets, no domesticated animals — only the squirrels on the roof, a woodchuck under the floor, the scolding blue jays in the pines overhead, the wild ducks on the pond, and the hooting owls that sat on the ridgepole at night.

Thoreau loved solitude more because he prized society — the society of simple men who could talk and tell things. Thoreau was no hermit — at least twice a week he would go to the village and meander along the street, gossiping with all or any. Often he would accept invitations to supper, but on principle refused all invitations to remain overnight, no matter what the weather. Indeed, as Hawthorne hints, there is a trace of the theatrical in the man who leaves a warm fireside at nine or ten o’clock at night and trudges off through the darkness, storm and sleet, feeling his way through the blackness of the woods to a cold and cheerless shanty which he with unconscious humor calls home. Hawthorne hints that Thoreau was a delightful poseur — he posed so naturally that he deceived even himself. On one particular visit to the village, however, he did not go back home for the night. It seems that he had been called upon by the local taxgatherer for his poll-tax, a matter of a dollar and a quarter. Thoreau argued the question at length, and among other things, said, “I will not give money to buy a musket, and hire a man to use this musket to shoot another.” And also, “The best government is not that which governs least, but that which governs not at all.”

“But what shall I do?” said the patient publican.

“Resign,” said the philosopher.

Thoreau seemed to forget that officeholders seldom die and never resign. In the argument the publican was worsted, but he was not without resource. He went back to town and told the other officials what had happened. Their dignity was at stake. Alcott had been guilty of a like defiance some time before, and now it was the belief that he was putting the younger man up to insurrection.

The next time Thoreau came over to the village for his mail he was arrested and lodged in the local bastille.

Emerson, hearing of the trouble, hastened to the jail, and reaching the presence of the prisoner asked sternly, “Henry, why are you here?”

And the answer was, “Waldo, why are you not here?” Emerson had no use for such finespun theories of duty, and the matter was too near home for a joke, so he turned away and let the culprit spend the night in limbo. The next morning Thoreau was released, the tax having been paid by some unknown person — Emerson, undoubtedly. This was a tame enough ending to what was rather an interesting affair — the hope of the best citizens being that Thoreau would get a goodly sentence for vagrancy. The townfolk looked upon Thoreau and Alcott with suspicious eyes. They both came in for much well-deserved censure, and Emerson did not go unsmirched, since he was guilty of harboring and encouraging these ne’er-do-wells.

Thoreau's cabin-life continued for two Summers and Winters. He had proved that two hours' manual work each day was sufficient to keep a man — twenty cents a day would suffice.

The last year in the woods he had many callers: Agassiz had been to see him, Emerson had often called, Ellery Channing was a frequent visitor, and picnickers were constant. Lowell had made a few cutting remarks to the effect that "as compared with shanty-life, the tub of Diogenes was preferable, as it had a much sounder bottom," and Hawthorne had written of "the beauties of conspicuous solitude."

Thoreau felt that he was attracting too much attention, and that perhaps Hawthorne was right: a recluse who holds receptions is becoming the thing he pretends to despise. Besides that, there was plenty of precedent for quitting — Brook Farm had gone by the board, and was but a memory.

Thoreau's shanty was turned over to a utilitarian Scotchman with red hair. Later the immortal shanty was a useful granary. Thoreau went back to the village to live in a garret and work at odd jobs of boat-building and gardening.

Now only a pile of boulders marks the place where the cabin stood. For some years, each visitor to the spot threw a stone upon the heap, but recently the proposition has been reversed, and each visitor takes a stone away, which reveals not a reversal in the sentiment toward the memory of Thoreau, but a change in the quality of the Concord pilgrim.

Thoreau's early death was the direct result of his reckless lack of common prudence. That which made him live, in a literary way, curtailed his years. The man was improperly and imperfectly nourished, physically. Men who live alone do not cook any more than they have to: men and women, both, cook for emulation. That is to say, we work for each other, and we succeed only as we help each other.

Thoreau was such a pronounced individualist that he cared for no one but himself, and he cared for himself not at all. It is wife, children and home that teach a man prudence, and make him bank against the storm. "At Walden no one bothered me but the State," said Thoreau. If Thoreau had had a family and treated his household as he treated himself, that scorned thing, the State, would have stepped in and sent him to the workhouse, and his children to the Home for the Friendless.

If he had treated dumb animals as he treated himself, the Society for the Prevention of Cruelty to Animals would have interfered. The absence of social ties and of all responsibilities fixed in his peculiar temperament an indifference to hunger, heat, cold, wet, damp, and all bodily discomfort that classes the man with the flagellants. He tells of whole days when he ate nothing but berries and drank only cold water; and at other times of how he walked all day in a soaking rain and went to bed at night, supperless, under a pine-tree. Emerson records the fact that on long tramps Thoreau would carry only a chunk of plum-cake for food, because it was rich and contained condensed nutriment.

The question is sometimes asked, "How can one eat his cake and keep it too?" but this does not refer to plum-cake.

A few years of plum-cake, cold mince-pie and continual wet feet will put the petard under even the stoutest constitution.

During his shanty-life Thoreau was imperfectly nourished, and for the victim of malassimilation, tuberculosis hunts and needs no spyglass.

It is absurd for a man to make a god of his digestive apparatus, but it is just as bad to forget that the belly is as much the gift of God as the brain.

In childhood, Thoreau was frail and weak. Outdoor life gradually developed on his slight frame a splendid strength and a power to do and endure. He could outrun, outrow, outwalk any of his townsmen. In him developed the confidence of the athlete — the confidence of the athlete who dies young. Thoreau was an athlete, and he died as the athlete dieth. Irregular diet and continued exposure did their work — the vital powers became reduced, the man “caught cold,” bronchitis followed, and the tuberculæ laughed.

During Thoreau’s life he published but two volumes, and these met with scanty sale. Since his death ten volumes have been issued from his manuscripts and letters, and his fame has steadily increased.

Boston had no recognition for Thoreau as long as he was alive. Among the most popular writers of the time, feted and feasted, invited and exalted, were George S. Hillard, N. P. Willis, Caroline Kirkland, George W. Green, Parke Godwin and Charles F. Briggs. These writers, who had the run of the magazines, would have smiled in derision if told that the name and fame of uncouth Thoreau would outlive them all. They wrote for the people who bought their books, but Thoreau dedicated his work to time. He wrote what he thought, but they wrote what they thought other people thought.

In the publication of “The Dial,” Thoreau took a hearty interest, and was a frequent contributor. The official organ of the transcendentalists, however, paid no honorariums — it was both sincere and serious, and died in due time of too much dignity. The “Atlantic Monthly” accepted one article by Thoreau, and paid for it, but as James Russell Lowell, the editor, used his blue pencil a trifle, without first consulting the author, he never got an opportunity to do so again.

Horace Greeley had interested himself in Thoreau’s writings and gotten several articles accepted by Graham’s and also Putnam’s Magazine. “The Week” had been published on the author’s guaranty that enough copies would be sold the first year to cover the cost. After four years, of the edition of one thousand copies only three hundred were disposed of, and these were mostly given away. To pay the publisher for the expense incurred, Thoreau buckled down and worked hard at surveying for a year.

The only man he ever knew, of whom he stood a little in awe, was Walt Whitman. In a letter to Blake he says:

Nineteenth November, Eighteen Hundred Fifty-six. — Alcott has been here, and last Sunday I went with him to Greeley’s farm, thirty-six miles north of New York. The next day Alcott and I heard Beecher preach; and what was more, we visited Whitman the next morning, and we were much interested and provoked. He is apparently the

greatest democrat the world has seen, kings and aristocracy go by the board at once, as they have long deserved to. A remarkably strong though coarse nature, of a sweet disposition, and much prized by his friends. Though peculiar and rough in his exterior, he is essentially a gentleman. I am still somewhat in a quandary about him — feel that he is essentially strange to me, at any rate; but I am surprised by the sight of him. He is very broad, but, as I have said, not fine.

Seventh December, Eighteen Hundred Fifty-six. — That Walt Whitman, of whom I wrote you, is the most interesting fact to me at present. I have just read his second edition (which he gave me), and it has done me more good than any reading for a long time. Perhaps I remember best the poem of “Walt Whitman an American” and the “Sundown” poem. There are two or three pieces in the book which are disagreeable, to say the least, simply sensual... As for its sensuality — and it may turn out to be less sensual than it appears — I do not so much wish that those parts were not written, as that men and women were so pure that they could read them without harm.

On the whole, it sounds to me very brave and American, after whatever deductions. I do not believe that all the sermons, so called, that have been preached in this land, put together, are equal to it for preaching. We ought greatly to rejoice in him. He occasionally suggests something a little more than human. You can't confound him with the other inhabitants of Brooklyn. How they must shudder when they read him!

To be sure, I sometimes feel a little imposed on. By his heartiness and broad generalities he puts me into a liberal frame of mind, prepared to see wonders — as it were, sets me upon a hill or in the midst of a plain — stirs me well up, and then — throws in a thousand of brick. Though rude and sometimes ineffectual, it is a great primitive poem, an alarum or trumpet-note ringing through the American camp. Wonderfully like the Orientals, too, considering that, when I asked him if he had read them, he answered, “No; tell me about them.”

Since I have seen him, I find that I am not disturbed by any brag or egoism in his book. He may turn out the least of a braggart of all, having a better right to be confident. Walt is a great fellow.

A lady once asked John Burroughs this question: “What would become of this world if everybody in it patterned after Henry Thoreau?” And Ol' John replied, “It would be much improved.”

But your Uncle John is a humorist — he knows that Henry Ward Beecher was right when he said, “God never made but one Thoreau — that was enough, but we are grateful for the one.”

Thoreau was a poet-naturalist, and the lesson he taught us is that this is the most beautiful world to know anything about, and there are enough curious and wonderful things right under our feet, and over our heads, and all around us, to amuse, divert, interest and instruct us for a lifetime. We need only a little.

Use your eyes!

“How do you manage to find so many Indian relics?” a friend asked Thoreau. “Just like this,” he replied, and stooping over, he picked up an arrowhead under the friend's

foot. At dinner once at a neighbor's he was asked what dish he preferred, and his answer was, "The nearest." To him, everything was good — he uttered no complaints and made no demands.

When asked by a clergyman why he did not go to church, he said, "It is the rafters — I can't stand them — when I look up, I want to gaze straight into the blue sky." Then he turned the tables and asked the interrogator a question: "Did you ever happen, accidentally, to say anything while you were preaching?" Yet preachers of brains were always attracted to him: Harrison Blake, to whom he wrote more letters than to any one else, was a Congregational preacher. And when Horace Greeley took Thoreau to Plymouth Church, Beecher invited him to sit on the platform and quoted him as one who saw God in autumn's every burning bush.

The wit of the man — his direct speech, and all of his beautiful indifference for the good opinion of those whom others follow after and lie in wait for — was sublime. Meanness, hypocrisy, secrecy and subterfuge had no place in Thoreau's nature.

He wanted nothing — nothing but liberty — he did not even ask for your applause or approval. When walking on country roads, laborers would hail him and ask for tobacco — seeing in him only one of their own kind. Farmers would stop and gossip with him about the weather. Children ran to him on the village streets and would cling to his hands and clutch his coat, and ask where the berries grew, or the first spring flowers were to be found. With children he was particularly patient and kind. With them he would converse as freely as did George Francis Train with the children in Madison Square. The children recognized in him something very much akin to themselves — he would play upon his flute for them and whittle out toy boats, regardless of the flight of time.

Imbeciles and mental defectives from the almshouse used occasionally to wander over to his cabin in the woods, and he would treat them with gentle consideration, and accompany them back home.

His lack of worldly prudence, Blake thought, tokened a courage which under certain conditions would have made him as formidable as John Brown. Blake tells this: Once on a lonely road, two miles from Concord, two loafers stopped a girl who was picking berries, and began to bother her. Thoreau just then happened along, and seeing the young woman's distress, he collared the rogues and marched them into the village, turning them over to that redoubtable transcendentalist, Sam Staples, who locked them up. Thoreau's hook nose and features could be transformed in rare instances into a look of command that no man dare question — it was the look of the fatalist — the benign fanatic — the look of Marat — the look of a man who has nothing but his life to lose, and places small store on that. "A little more ambition, and a trifle less sympathy, and the world would have had a Cæsar to deal with," says Blake.

Cowardice is only caution carried to an extreme. Thoreau exercised no prudence in making money, securing fame, preserving his health, holding his friends or making new ones. This Spartan-like quality, that counts not the cost, is essentially heroic.

But Thoreau was not given to strife; for the most part, he was non-resistant. The chief thing he prized was equanimity, and this you can not secure through struggle and strife. His game was all captured with the spyglass, or carried home in his botanists' drum. For worldly wealth and what we call progress, he had small appreciation — this marks his limitations. But his reasons are surely good literature:

They make a great ado nowadays about hard times; but I think that the community generally, ministers and all, take a wrong view of the matter. This general failure, both private and public, is rather occasion for rejoicing, as reminding us whom we have at the helm — that justice is always done. If our merchants did not most of them fail, and the banks too, my faith in the old laws of the world would be staggered. The statement that ninety-six in a hundred doing such business surely break down, is perhaps the sweetest fact that statistics have revealed — exhilarating as the fragrance of the flowers in the Spring. Does it not say somewhere, "The Lord reigneth, let the earth rejoice"? If thousands are thrown out of employment, it suggests that they were not well employed. Why don't they take the hint? It is not enough to be industrious; so are the ants. What are you industrious about?

The merchants and company have long laughed at transcendentalism, higher law, etc., crying, "None of your moonshine," as if they were anchored to something not only definite, but sure and permanent. If there were any institution which was presumed to rest on a solid and secure basis, and more than any other, represented this boasted commonsense, prudence, and practical talent, it was the bank; and now these very banks are found to be mere reeds shaken by the wind.

Scarcely one in the land has kept its promise. Not merely the Brook Farm and Fourierite communities, but now the community generally has failed. But there is the moonshine still, serene, beneficent and unchanged.

Thoreau was no pessimist. He complained neither of men nor of destiny — he felt that he was getting out of life all that was his due. His remarks might be sharp and his words sarcastic, but in them there was no bitterness. He made life for none more difficult — he added to no one's burdens. Sympathy with Nature, pride, buoyancy, self-sufficiency, were his prevailing traits. The habit of his mind was hopeful.

His wit and good-nature were his to the last, and when asked if he had made his peace with God, he replied, "I have never quarreled with Him."

He died, aged forty-four, in the modest home of his mother. The village school was dismissed that the scholars might attend the funeral, and three hundred children walked in the procession to Sleepy Hollow. Emerson made an address at the grave; Alcott read selections from Thoreau's own writings; and Louisa Alcott read this poem, composed for the occasion:

We sighing said, "Our Pan is dead;  
His pipe hangs mute beside the river,  
Around it wistful sunbeams quiver,  
But Music's airy voice is fled.  
Spring mourns as for untimely frost:  
The bluebird chants a requiem;  
The willow-blossom waits for him; —  
The Genius of the wood is lost."

Then from the flute, untouched by hands,  
There came a low, harmonious breath:  
"For such as he there is no death;  
His life the eternal life commands;  
Above man's aims his nature rose.  
The wisdom of a just content  
Made one small spot a continent,  
And turned to poetry life's prose.

"To him no vain regrets belong,  
Whose soul, that finer instrument,  
Gave to the world no poor lament,  
But wood-notes ever sweet and strong.  
O lonely friend! he still will be  
A potent presence, though unseen —  
Steadfast, sagacious, and serene;  
Seek not for him — he is with thee."

# THOREAU by Virginia Woolf

A hundred years ago, on July 12th, 1817, was born Henry David Thoreau, the son of a pencil maker in Concord, Massachusetts. He has been lucky in his biographers, who have been attracted to him not by his fame so much as by their sympathy with his views, but they have not been able to tell us a great deal about him that we shall not find in the books themselves. His life was not eventful; he had, as he says, 'a real genius for staying at home'. His mother was quick and voluble, and so fond of solitary rambling that one of her children narrowly escaped coming into the world in an open field. The father, on the other hand, was a 'small, quiet, plodding man', with a faculty for making the best lead pencils in America, thanks to a secret of his own for mixing levigated plumbago with fuller's earth and water, rolling it into sheets, cutting it into strips, and burning it. He could at any rate afford, with much economy and a little help, to send his son to Harvard, although Thoreau himself did not attach much importance to this expensive opportunity. It is at Harvard, however, that he first becomes visible to us. A classmate saw much in him as a boy that we recognize later in the grown man, so that instead of a portrait we will quote what was visible about the year 1837 to the penetrating eye of the Rev. John Weiss:

He was cold and unimpressible. The touch of his hand was moist and indifferent, as if he had taken up something when he saw your hand coming, and caught your grasp on it. How the prominent grey-blue eyes seemed to rove down the path, just in advance of his feet, as his grave Indian stride carried him down to University Hall. He did not care for people; his class-mates seemed very remote. This reverie hung always about him, and not so loosely as the odd garments which the pious household care furnished. Thought had not yet awakened his countenance; it was serene, but rather dull, rather plodding. The lips were not yet firm; there was almost a look of smug satisfaction lurking round their corners. It is plain now that he was preparing to hold his future views with great setness and personal appreciation of their importance. The nose was prominent, but its curve fell forward without firmness over the upper lip, and we remember him as looking very much like some Egyptian sculpture of faces, large-featured, but brooding, immobile, fixed in a mystic egoism. Yet his eyes were sometimes searching, as if he had dropped, or expected to find, something. In fact his eyes seldom left the ground, even in his most earnest conversations with you ...

He goes on to speak of the 'reserve and inaptness' of Thoreau's life at college.

Clearly the young man thus depicted, whose physical pleasures took the form of walking and camping out, who smoked nothing but 'dried lily stems', who venerated

Indian relics as much as Greek classics, who in early youth had formed the habit of 'settling accounts' with his own mind in a diary, where his thoughts, feelings, studies, and experiences had daily to be passed under review by that Egyptian face and searching eye - clearly this young man was destined to disappoint both parents and teachers and all who wished him to cut a figure in the world and become a person of importance. His first attempt to earn his living in the ordinary way by becoming a schoolmaster was brought to an end by the necessity of flogging his pupils. He proposed to talk morals to them instead. When the committee pointed out that the school would suffer from this 'undue leniency' Thoreau solemnly beat six pupils and then resigned, saying that school-keeping 'interfered with his arrangements'. The arrangements that the penniless young man wished to carry out were probably assignations with certain pine trees, pools, wild animals, and Indian arrowheads in the neighbourhood, which had already laid their commands upon him.

But for a time he was to live in the world of men, at least in that very remarkable section of the world of which Emerson was the centre and which professed the Transcendentalist doctrines. Thoreau took up his lodgings in Emerson's house and very soon became, so his friends said, almost indistinguishable from the prophet himself. If you listened to them both talking with your eyes shut you could not be certain where Emerson left off and Thoreau began .. in his manners, in the tones of his voice, in his modes of expression, even in the hesitations and pauses of his speech, he had become the counterpart of Mr Emerson'. This may well have been so. The strongest natures, when they are influenced, submit the most unreservedly: it is perhaps a sign of their strength. But that Thoreau lost any of his own force in the process, or took on permanently any colours not natural to himself the readers of his books will certainly deny.

The Transcendentalist movement, like most movements of vigour, represented the effort of one or two remarkable people to shake off the old clothes which had become uncomfortable to them and fit themselves more closely to what now appeared to them to be the realities. The desire for readjustment had, as Lowell has recorded and the Memoirs of Margaret Fuller bear witness, its ridiculous symptoms and its grotesque disciples. But of all the men and women who lived in an age when thought was remoulded in common, we feel that Thoreau was the one who had least to adapt himself, who was by nature most in harmony with the new spirit. He was by birth among those people, as Emerson expresses it, who have 'silently given in their several adherence to a new hope, and in all companies do dignify a greater trust in the nature and resources of man than the laws of the popular opinion will well allow'. There were two ways of life which seemed to the leaders of the movement to give scope for the attainment of these new hopes; one in some co-operative community, such as Brook Farm; the other in solitude with nature. When the time came to make his choice Thoreau decided emphatically in favour of the second. 'As for the communities,' he wrote in his journal, 'I think I had rather keep bachelor's quarters in hell than go to board in heaven.' Whatever the theory might be, there was deep in his nature 'a singular yearning to

all wildness' which would have led him to some such experiment as that recorded in 'Walden', whether it seemed good to others or not. In truth he was to put in practice the doctrines of the Transcendentalists more thoroughly than any one of them, and to prove what the resources of man are by putting his entire trust in them. Thus, having reached the age of twenty-seven, he chose a piece of land in a wood on the brink of the clear deep green waters of Walden Pond, built a hut with his own hands, reluctantly borrowing an axe for some part of the work, and settled down, as he puts it, 'to front only the essential facts of life, and see if I could not learn what it had to teach, and not, when I came to die, discover that I had not lived'.

And now we have a chance of getting to know Thoreau as few people are known, even by their friends. Few people, it is safe to say, take such an interest in themselves as Thoreau took in himself; for if we are gifted with an intense egoism we do our best to suffocate it in order to live on decent terms with our neighbours. We are not sufficiently sure of ourselves to break completely with the established order. This was Thoreau's adventure; his books are the record of that experiment and its results. He did everything he could to intensify his own understanding of himself, to foster whatever was peculiar, to isolate himself from contact with any force that might interfere with his immensely valuable gift of personality. It was his sacred duty, not to himself alone but to the world; and a man is scarcely an egoist who is an egoist on so grand a scale. When we read 'Walden', the record of his two years in the woods, we have a sense of beholding life through a very powerful magnifying glass. To walk, to eat, to cut up logs, to read a little, to watch the bird on the bough, to cook one's dinner - all these occupations when scraped clean and felt afresh prove wonderfully large and bright. The common things are so strange, the usual sensations so astonishing that to confuse or waste them by living with the herd and adopting habits that suit the greater number is a sin - an act of sacrilege. What has civilization to give, how can luxury improve upon these simple facts? 'Simplicity, simplicity, simplicity!' is his cry. 'Instead of three meals a day, if it be necessary eat but one; instead of a hundred dishes, five; and reduce other things in proportion.'

But the reader may ask, what is the value of simplicity? Is Thoreau's simplicity simplicity for its own sake, and not rather a method of intensification, a way of setting free the delicate and complicated machinery of the soul, so that its results are the reverse of simple? The most remarkable men tend to discard luxury because they find that it hampers the play of what is much more valuable to them. Thoreau himself was an extremely complex human being, and he certainly did not achieve simplicity by living for two years in a hut and cooking his own dinner. His achievement was rather to lay bare what was within him - to let life take its own way unfettered by artificial constraints. 'I did not wish to live what was not life, living is so dear; nor did I wish to practice resignation, unless it was quite necessary. I wanted to live deep and suck out all the marrow of life ...' 'Walden' - all his books, indeed - are packed with subtle, conflicting, and very fruitful discoveries. They are not written to prove something in the end. They are written as the Indians turn down twigs to mark their path through

the forest. He cuts his way through life as if no one had ever taken that road before, leaving these signs for those who come after, should they care to see which way he went. But he did not wish to leave ruts behind him, and to follow is not an easy process. We can never lull our attention asleep in reading Thoreau by the certainty that we have now grasped his theme and can trust our guide to be consistent. We must always be ready to try something fresh; we must always be prepared for the shock of facing one of those thoughts in the original which we have known all our lives in reproductions. 'All health and success does me good, however far off and withdrawn it may appear; all disease and failure helps to make me sad and do me evil, however much sympathy it may have with me or I with it.' 'Distrust all enterprises that require new clothes.' 'You must have a genius for charity as well as for anything else.' That is a handful, plucked almost at random, and of course there are plenty of wholesome platitudes.

As he walked his woods, or sat for hours almost motionless like the sphinx of college days upon a rock watching the birds, Thoreau defined his own position to the world not only with unflinching honesty, but with a glow of rapture at his heart. He seems to hug his own happiness. Those years were full of revelations - so independent of other men did he find himself, so perfectly equipped by nature not only to keep himself housed, fed, and clothed, but also superbly entertained without any help from society. Society suffered a good many blows from his hand. He sets down his complaints so squarely that we cannot help suspecting that society might one of these days have come to terms with so noble a rebel. He did not want churches or armies, post-offices or newspapers, and very consistently he refused to pay his tithes and went into prison rather than pay his poll tax. All getting together in crowds for doing good or procuring pleasure was an intolerable infliction to him. Philanthropy was one of the sacrifices, he said, that he had made to a sense of duty. Politics seemed to him 'unreal, incredible, insignificant', and most revolutions not so important as the drying up of a river or the death of a pine. He wanted only to be left alone tramping the woods in his suit of Vermont grey, unhampered even by those two pieces of limestone which lay upon his desk until they proved guilty of collecting the dust, and were at once thrown out of the window.

And yet this egoist was the man who sheltered runaway slaves in his hut; this hermit was the first man to speak out in public in defence of John Brown; this self-centred solitary could neither sleep nor think when Brown lay in prison. The truth is that anyone who reflects as much and as deeply as Thoreau reflected about life and conduct is possessed of an abnormal sense of responsibility to his kind, whether he chooses to live in a wood or to become President of the Republic. Thirty volumes of diaries which he would condense from time to time with infinite care into little books prove, moreover, that the independent man who professed to care so little for his fellows was possessed with an intense desire to communicate with them. 'I would fain,' he writes, 'communicate the wealth of my life to men, would really give them what is most precious in my gift ... I have no private good unless it be my peculiar ability to serve the public ... I wish to communicate those parts of my life which I

would gladly live again.' No one can read him and remain unaware of this wish. And yet it is a question whether he ever succeeded in imparting his wealth, in sharing his life. When we have read his strong and noble books, in which every word is sincere, every sentence wrought as well as the writer knows how, we are left with a strange feeling of distance; here is a man who is trying to communicate but who cannot do it. His eyes are on the ground or perhaps on the horizon. He is never speaking directly to us; he is speaking partly to himself and partly to something mystic beyond our sight. 'Says I to myself,' he writes, 'should be the motto to my journal', and all his books are journals. Other men and women were wonderful and very beautiful, but they were distant; they were different; he found it very hard to understand their ways. They were as 'curious to him as if they had been prairie dogs'. All human intercourse was infinitely difficult; the distance between one friend and another was unfathomable; human relationships were very precarious and terribly apt to end in disappointment. But, although concerned and willing to do what he could short of lowering his ideals, Thoreau was aware that the difficulty was one that could not be overcome by taking pains. He was made differently from other people. 'If a man does not keep pace with his companions, perhaps it is because he hears a different drummer. Let him step to the music which he hears, however measured or far away.' He was a wild man, and he would never submit to be a tame one. And for us here lies his peculiar charm. He hears a different drummer. He is a man into whom nature has breathed other instincts than ours, to whom she has whispered, one may guess, some of her secrets.

'It appears to be a law,' he says, 'that you cannot have a deep sympathy with both man and nature. Those qualities which bring you near to the one estrange you from the other.' Perhaps that is true. The greatest passion of his life was his passion for nature. It was more than a passion, indeed; it was an affinity; and in this he differs from men like White and Jefferies. He was gifted, we are told, with an extraordinary keenness of the senses; he could see and hear what other men could not; his touch was so delicate that he could pick up a dozen pencils accurately from a box holding a bushel; he could find his way alone through thick woods at night. He could lift a fish out of the stream with his hands; he could charm a wild squirrel to nestle in his coat; he could sit so still that the animals went on with their play round him. He knew the look of the country so intimately that if he had waked in a meadow he could have told the time of year within a day or two from the flowers at his feet. Nature had made it easy for him to pick up a living without effort. He was so skilled with his hands that by labouring forty days he could live at leisure for the rest of the year. We scarcely know whether to call him the last of an older race of men, or the first of one that is to come. He had the toughness, the stoicism, the unspoilt senses of an Indian, combined with the self-consciousness, the exacting discontent, the susceptibility of the most modern. At times he seems to reach beyond our human powers in what he perceives upon the horizon of humanity. No philanthropist ever hoped more of mankind, or set higher and nobler tasks before him, and those whose ideal of passion and of service is the loftiest are those who have the greatest capacities for giving, although life may not ask of them

all that they can give, and forces them to hold in reserve rather than to lavish. However much Thoreau had been able to do, he would still have seen possibilities beyond; he would always have remained, in one sense, unsatisfied. That is one of the reasons why he is able to be the companion of a younger generation.

He died when he was in the full tide of life, and had to endure long illness within doors. But from nature he had learnt both silence and stoicism. He had never spoken of the things that had moved him most in his private fortunes. But from nature, too, he had learnt to be content, not thoughtlessly or selfishly content, and certainly not with resignation, but with a healthy trust in the wisdom of nature, and in nature, as he says, there is no sadness. 'I am enjoying existence as much as ever,' he wrote from his deathbed, 'and regret nothing.' He was talking to himself of moose and Indian when, without a struggle, he died.

# ANOTHER WORD ON THOREAU by John Burroughs

## I

After Emerson, the name of no New England man of letters keeps greener and fresher than that of Thoreau. A severe censor of his countrymen, and with few elements of popularity, yet the quality of his thought, the sincerity of his life, and the nearness and perennial interest of his themes, as well as his rare powers of literary expression, win recruits from each generation of readers. He does not grow stale any more than Walden Pond itself grows stale. He is an obstinate fact there in New England life and literature, and at the end of his first centennial his fame is more alive than ever.

Thoreau was born in Concord, Massachusetts, July, 1817, and passed most of his life of forty-five years in his native town, minding his own business, as he would say, which consisted, for the most part, in spending at least the half of each day in the open air, winter and summer, rain and shine, and in keeping tab upon all the doings of wild nature about him and recording his observations in his Journal.

The two race strains that met in Thoreau, the Scottish and the French, come out strongly in his life and character. To the French he owes his vivacity, his lucidity, his sense of style, and his passion for the wild; for the French, with all their urbanity and love of art, turn to nature very easily. To the Scot he is indebted more for his character than for his intellect. From this source come his contrariness, his combativeness, his grudging acquiescence, and his pronounced mysticism. Thence also comes his genius for solitude. The man who in his cabin in the woods has a good deal of company "especially the mornings when nobody calls," is French only in the felicity of his expression. But there is much in Thoreau that is neither Gallic nor Scottish, but pure Thoreau.

The most point-blank and authoritative criticism within my knowledge that Thoreau has received at the hands of his countrymen came from the pen of Lowell about 1864, and was included in "My Study Windows." It has all the professional smartness and scholarly qualities which usually characterize Lowell's critical essays. Thoreau was vulnerable, both as an observer and as a literary craftsman, and Lowell lets him off pretty easily — too easily — on both counts.

The flaws he found in his nature lore were very inconsiderable: "Till he built his Walden shack he did not know that the hickory grew near Concord. Till he went to Maine he had never seen phosphorescent wood — a phenomenon early familiar to most country boys. At forty he spoke of the seeding [i. e., flowering] of the pine as a new

discovery, though one should have thought that its gold-dust of blowing pollen might have earlier caught his eye.”

See “Walking” in *Excursions*. He was under thirty-three when he made these observations (June, 1850).

As regards his literary craftsmanship, Lowell charges him only with having revived the age of concetti while he fancied himself going back to a preclassical nature, basing the charge on such a far-fetched comparison as that in which Thoreau declares his preference for “the dry wit of decayed cranberry-vines and the fresh Attic salt of the moss-beds” over the wit of the Greek sages as it comes to us in the “Banquet” of Xenophon — a kind of perversity of comparison all too frequent with Thoreau.

But though Lowell lets Thoreau off easily on these specific counts, he more than makes up by his sweeping criticism, on more general grounds, of his life and character. Here one feels that he overdoes the matter.

It is not true, in the sense which Lowell implies, that Thoreau’s whole life was a search for the doctor. It was such a search in no other sense than that we are all in search of the doctor when we take a walk, or flee to the mountains or to the seashore, or seek to bring our minds and spirits in contact with “Nature’s primal sanities.” His search for the doctor turns out to be an escape from the conditions that make a doctor necessary. His wonderful activity, those long walks in all weathers, in all seasons, by night as well as by day, drenched by rain and chilled by frost, suggest a reckless kind of health. A doctor might wisely have cautioned him against such exposures. Nor was Thoreau a valetudinarian in his physical, moral, or intellectual fiber.

It is not true, as Lowell charges, that it was his indolence that stood in the way of his taking part in the industrial activities in which his friends and neighbors engaged, or that it was his lack of persistence and purpose that hindered him. It is not true that he was poor because he looked upon money as an unmixed evil. Thoreau’s purpose was like adamant, and his industry in his own proper pursuits was tireless. He knew the true value of money, and he knew also that the best things in life are to be had without money and without price. When he had need of money, he earned it. He turned his hand to many things — land-surveying, lecturing, magazine-writing, growing white beans, doing odd jobs at carpentering, whitewashing, fence-building, plastering, and brick-laying.

Lowell’s criticism amounts almost to a diatribe. He was naturally antagonistic to the Thoreau type of mind. Coming from a man near his own age, and a neighbor, Thoreau’s criticism of life was an affront to the smug respectability and scholarly attainments of the class to which Lowell belonged. Thoreau went his own way, with an air of defiance and contempt which, no doubt, his contemporaries were more inclined to resent than we are at our distance. Shall this man in his hut on the shores of Walden Pond assume to lay down the law and the gospel to his elders and betters, and pass unrebuked, no matter on what intimate terms he claims to be with the gods of the woods and mountains? This seems to be Lowell’s spirit.

“Thoreau’s experiment,” says Lowell, “actually presupposed all that complicated civilization which it theoretically abjured. He squatted on another man’s land; he borrows an axe; his boards, his nails, his bricks, his mortar, his books, his lamp, his fish-hooks, his plough, his hoe, all turn state’s evidence against him as an accomplice in the sin of that artificial civilization which rendered it possible that such a person as Henry D. Thoreau should exist at all.” Very clever, but what of it? Of course Thoreau was a product of the civilization he decried. He was a product of his country and his times. He was born in Concord and early came under the influence of Emerson; he was a graduate of Harvard University and all his life availed himself, more or less, of the accumulated benefits of state and social organizations. When he took a train to Boston, or dropped a letter in, or received one through, the post office, or read a book, or visited a library, or looked in a newspaper, he was a sharer in these benefits. He made no claims to living independently of the rest of mankind. His only aim in his Walden experiment was to reduce life to its lowest terms, to drive it into a corner, as he said, and question and cross-question it, and see, if he could, what it really meant. And he probably came as near cornering it there in his hut on Walden Pond as any man ever did anywhere, certainly in a way more pleasing to contemplate than did the old hermits in the desert, or than did Diogenes in his tub, though Lowell says the tub of the old Greek had a sounder bottom.

Lowell seemed to discredit Thoreau by attacking his philosophy and pointing out the contradictions and inconsistencies of a man who abjures the civilization of which he is the product, overlooking the fact that man’s theories and speculations may be very wide of the truth as we view it, and yet his life be noble and inspiring. Now Thoreau did not give us a philosophy, but a life. He gave us fresh and beautiful literature, he gave us our first and probably only nature classic, he gave us an example of plain living and high thinking that is always in season, and he took upon himself that kind of noble poverty that carries the suggestion of wealth of soul.

No matter how much Thoreau abjured our civilization, he certainly made good use of the weapons it gave him. No matter whose lands he squatted on, or whose saw he borrowed, or to whom or what he was indebted for the tools and utensils that made his life at Walden possible, — these things were the mere accidents of his environment, — he left a record of his life and thoughts there which is a precious heritage to his countrymen. The best in his books ranks with the best in the literature of his times. One could wish that he had shown more tolerance for the things other men live for, but this must not make us overlook the value of the things he himself lived for, though with some of his readers his intolerance doubtless has this effect. We cannot all take to the woods and swamps as Thoreau did. He had a genius for that kind of a life; the most of us must stick to our farms and desks and shops and professions.

Thoreau retired to Walden for study and contemplation, and because, as he said, he had a little private business with himself. He found that by working about six weeks in the year he could meet all his living expenses, and then have all his winter and most of his summers free and clear for study. He found that to maintain one’s self on this

earth is not a hardship, but a pastime, if one will live simply and wisely. He said, "It is not necessary that a man should earn his living by the sweat of his brow unless he sweats easier than I do." Was not his experiment worth while?

"Walden" is a wonderful and delightful piece of brag, but it is much more than that. It is literature; it is a Gospel of the Wild. It made a small Massachusetts pond famous, and the Mecca of many devout pilgrims.

Lowell says that Thoreau had no humor, but there are many pages in "Walden" that are steeped in a quiet but most delicious humor. His humor brings that inward smile which is the badge of art's felicity. His "Bean-Field" is full of it. I venture to say that never before had a hermit so much fun with a field of white beans.

Both by training and by temperament Lowell was disqualified from entering into Thoreau's character and aims. Lowell's passion for books and academic accomplishments was as strong as was Thoreau's passion for the wild and for the religion of Nature. When Lowell went to Nature for a theme, as in his "Good Word for Winter," his "My Garden Acquaintance," and the "Moosehead Journal," his use of it was mainly to unlock the treasures of his literary and scholarly attainments; he bedecked and bejeweled Nature with gems from all the literatures of the world. In the "Journal" we get more of the flavor of libraries than of the Maine woods and waters. No reader of Lowell can doubt that he was a nature-lover, nor can he doubt that he loved books and libraries more. In all his nature writings the poverty of the substance and the wealth of the treatment are striking. The final truth about Lowell's contributions is that his mind was essentially a prose mind, even when he writes poetry. Emerson said justly that his tone was always that of prose. What is his "Cathedral" but versified prose? Like so many cultivated men, he showed a talent for poetry, but not genius; as, on the other hand, one may say of Emerson that he showed more genius for poetry than talent, his inspiration surpassed his technical skill.

One is not surprised when he finds that John Brown was one of Thoreau's heroes; he was a sort of John Brown himself in another sphere; but one is surprised when one finds him so heartily approving of Walt Whitman and traveling to Brooklyn to look upon him and hear his voice. He recognized at once the tremendous significance of Whitman and the power of his poetry. He called him the greatest democrat which the world had yet seen. With all his asceticism and his idealism, he was not troubled at all with those things in Whitman that are a stumbling-block to so many persons. Evidently his long intercourse with Nature had prepared him for the primitive and elemental character of Whitman's work. No doubt also his familiarity with the great poems and sacred books of the East helped him. At any rate, in this respect, his endorsement of Whitman adds greatly to our conception of the mental and spiritual stature of Thoreau.

I can hold my criticism in the back of my head while I say with my forehead that all our other nature writers seem tame and insipid beside Thoreau. He was so much more than a mere student and observer of nature; and it is this surplusage which gives the extra weight and value to his nature writing. He was a critic of life, he was a literary force that made for plain living and high thinking. His nature lore was an aside; he

gathered it as the meditative saunterer gathers a leaf, or a flower, or a shell on the beach, while he ponders on higher things. He had other business with the gods of the woods than taking an inventory of their wares. He was a dreamer, an idealist, a fervid ethical teacher, seeking inspiration in the fields and woods. The hound, the turtle-dove, and the bay horse which he said he had lost, and for whose trail he was constantly seeking, typified his interest in wild nature. The natural history in his books is quite secondary. The natural or supernatural history of his own thought absorbed him more than the exact facts about the wild life around him. He brings us a gospel more than he brings us a history. His science is only the handmaid of his ethics; his wood-lore is the foil of his moral and intellectual teachings. His observations are frequently at fault, or wholly wide of the mark; but the flower or specimen that he brings you always "comes laden with a thought." There is a tang and a pungency to nearly everything he published; the personal quality which flavors it is like the formic acid which the bee infuses into the nectar he gets from the flower, and which makes it honey.

I feel that some such statement about Thoreau should precede or go along with any criticism of him as a writer or as an observer. He was, first and last, a moral force speaking in the terms of the literary naturalist.

Thoreau's prayer in one of his poems — that he might greatly disappoint his friends — seems to have been answered. While his acquaintances went into trade or the professions, he cast about to see what he could do to earn his living and still be true to the call of his genius. In his Journal of 1851 he says: "While formerly I was looking about to see what I could do for a living, some sad experiences in conforming to the wishes of friends being fresh in my mind to tax my ingenuity, I thought often and seriously of picking huckleberries; that surely I could do, and its small profits might suffice, so little capital is required, so little distraction from my wonted thoughts." He could range the hills in summer and still look after the flocks of King Admetus. He also dreamed that he might gather the wild herbs and carry evergreens to such villagers as loved to be reminded of the woods. But he soon learned that trade cursed everything, and that "though you trade in messages from heaven, the whole curse of trade attaches to the business." The nearest his conscience would allow him to approach any kind of trade was to offer himself to his townsmen as a land-surveyor. This would take him to the places where he liked to be; he could still walk in the fields and woods and swamps and earn his living thereby. The chain and compass became him well, quite as well as his bean-field at Walden, and the little money they brought him was not entirely sordid.

In one of his happy moods in "Walden" he sets down in a half-facetious, half-mystical, but wholly delightful way, his various avocations, such as his self-appointment as inspector of snow-storms and rain-storms, and surveyor of forest paths and all across-lot routes, and herdsman of the wild stock of the town. He is never more enjoyable than in such passages. His account of going into business at Walden Pond is in the same happy vein. As his fellow citizens were slow in offering him any opening in which he could earn a living, he turned to the woods, where he was better known, and determined to go into business at once without waiting to acquire the usual capital. He expected

to open trade with the Celestial Empire, and Walden was just the place to start the venture. He thought his strict business habits acquired through years of keeping tab on wild Nature's doings, his winter days spent outside the town, trying to hear what was in the wind, and his early spring mornings before his neighbors were astir to hear the croak of the first frog, all the training necessary to ensure success in business with the Celestial Empire. He admits, it is true, that he never assisted the sun materially in his rising, but doubted not that it was of the last importance only to be present at it. All such fooling as this is truly delightful. When he goes about his sylvan business with his tongue in his cheek and a quizzical, good-humored look upon his face in this way, and advertises the hound, the bay horse, and the turtle-dove he lost so long ago, he is the true Thoreau, and we take him to our hearts.

One also enjoys the way in which he magnifies his petty occupations. His brag over his bean-field is delightful. He makes one want to hoe beans with him:

When my hoe tinkled against the stones, that music echoed to the woods and the sky and was an accompaniment to my labor which yielded an instant and immeasurable crop. It was no longer beans that I hoed, nor I that hoed beans; and I remembered with as much pity as pride, if I remembered at all, my acquaintances who had gone to the city to attend the oratorios. The nighthawk circled overhead in the sunny afternoons — for I sometimes made a day of it — like a mote in the eye, or in heaven's eye, falling from time to time with a swoop and a sound as if the heavens were rent, torn at last to very rags and tatters, and yet a seamless cope remained; small imps that fill the air and lay their eggs on the ground on bare sand or rocks on the top of hills, where few have found them; graceful and slender like ripples caught up from the pond, as leaves are raised by the wind to float in the heavens; such kindredship is in nature. The hawk is aerial brother of the wave which he sails over and surveys, those his perfect air-inflated wings answering to the elemental unfledged pinions of the sea. Or sometimes I watched a pair of hen-hawks circling high in the sky, alternately soaring and descending, approaching and leaving one another, as if they were the embodiment of my own thoughts. Or I was attracted by the passage of wild pigeons from this wood to that, with a slight quivering winnowing sound and carrier haste; or from under a rotten stump my hoe turned up a sluggish portentous and outlandish salamander, a trace of Egypt and the Nile, yet our contemporary. When I paused to lean on my hoe, these sounds and sights I heard and saw anywhere in the row, a part of the inexhaustible entertainment which the country offers.

All this is in his best style. Who, after reading it, does not long for a bean-field? In planting it, too what music attends him!

Near at hand, upon the topmost spray of a birch, sings the brown thrasher — or red mavis, as some love to call him — all the morning, glad of your society, that would find out another farmer's field if yours were not here. While you are planting the seed he cries, — "Drop it, drop it, — cover it up, cover it up, — pull it up, pull it up, pull it up." But this was not corn, and so it was safe from such enemies as he. You may wonder what his rigmarole, his amateur Paganini performances on one string or on

twenty, have to do with your planting, and yet prefer it to leached ashes or plaster. It was a cheap sort of top dressing in which I had entire faith.

What lessons he got in botany in the hoeing!

Consider the intimate and curious acquaintance one makes with various kinds of weeds, — it will bear some iteration in the account, for there was no little iteration in the labor, — disturbing their delicate organizations so ruthlessly, and making such invidious distinctions with his hoe, levelling whole ranks of one species, and sedulously cultivating another. That's Roman worm-wood, — that's pigweed, — that's sorrel, — that's pipergrass, — have at him, chop him up, turn his roots upward to the sun, don't let him have a fibre in the shade, if you do he'll turn himself t' other side up and be as green as a leek in two days. A long war, not with cranes, but with weeds, those Trojans who had sun and rain and dews on their side. Daily the beans saw me come to their rescue armed with a hoe, and thin the ranks of their enemies, filling up the trenches with weedy dead. Many a lusty crest-waving Hector, that towered a whole foot above his crowding comrades, fell before my weapon and rolled in the dust.

I have occasional visits in the long winter evenings, when the snow falls fast and the wind howls in the wood, from an old settler and original proprietor, who is reported to have dug Walden Pond, and stoned it, and fringed it with pine woods; who tells me stories of old time and of new eternity; and between us we manage to pass a cheerful evening with social mirth and pleasant views of things, even without apples or cider, — a most wise and humorous friend, whom I love much, who keeps himself more secret than ever did Goffe or Whalley; and though he is thought to be dead, none can show where he is buried. An elderly dame, too, dwells in my neighborhood, invisible to most persons, in whose odorous herb garden I love to stroll sometimes, gathering simples and listening to her fables; for she has a genius of unequalled fertility, and her memory runs back farther than mythology, and she can tell me the original of every fable, and on what fact every one is founded, for the incidents occurred when she was young. A ruddy and lusty old dame, who delights in all weathers and seasons, and is likely to outlive all her children yet.

Thoreau taxed himself to find words and images strong enough to express his aversion to the lives of the men who were “engaged” in the various industrial fields about him. Everywhere in shops and offices and fields it appeared to him that his neighbors were doing penance in a thousand remarkable ways:

What I have heard of Bramins sitting exposed to four fires and looking in the face of the sun; or hanging suspended, with their heads downward, over flames; or looking at the heavens over their shoulders “until it becomes impossible for them to resume their natural position, while from the twist of the neck nothing but liquids can pass into the stomach”; or dwelling, chained for life, at the foot of a tree; or measuring with their bodies, like caterpillars, the breadth of vast empires; or standing on one leg on the tops of pillars, — even these forms of conscious penance are hardly more incredible and astonishing than the scenes which I daily witness... I see young men, my

townsmen, whose misfortune it is to have inherited farms, houses, barns, cattle, and farming tools; for these are more easily acquired than got rid of.

Surely this disciple of the Gospel of the Wild must have disappointed his friends. It was this audacious gift which Thoreau had for making worldly possessions seem ignoble, that gives the tang to many pages of his writings.

Thoreau became a great traveler — in Concord, as he says — and made Walden Pond famous in our literature by spending two or more years in the woods upon its shore, and writing an account of his sojourn there which has become a nature classic. He was a poet-naturalist, as his friend Channing aptly called him, of untiring industry, and the country in a radius of seven or eight miles about Concord was threaded by him in all seasons as probably no other section of New England was ever threaded and scrutinized by any one man. Walking in the fields and woods, and recording what he saw and heard and thought in his Journal, became the business of his life. He went over the same ground endlessly, but always brought back new facts, or new impressions, because he was so sensitive to all the changing features of the day and the season in the landscape about him.

Once he extended his walking as far as Quebec, Canada, and once he took in the whole of Cape Cod; three or four times he made excursions to the Maine woods, the result of which gave the name to one of his most characteristic volumes; but as habitually as the coming of the day was he a walker about Concord, in all seasons, primarily for companionship with untamed Nature, and secondarily as a gleaner in the fields of natural history.

## II

Thoreau was not a great philosopher, he was not a great naturalist, he was not a great poet, but as a nature-writer and an original character he is unique in our literature. His philosophy begins and ends with himself, or is entirely subjective, and is frequently fantastic, and nearly always illogical. His poetry is of the oracular kind, and is only now and then worth attention. There are crudities in his writings that make the conscientious literary craftsman shudder; there are mistakes of observation that make the serious naturalist wonder; and there is often an expression of contempt for his fellow countrymen, and the rest of mankind, and their aims in life, that makes the judicious grieve. But at his best there is a gay symbolism, a felicity of description, and a freshness of observation that delight all readers.

As a person he gave himself to others reluctantly; he was, in truth, a recluse. He stood for character more than for intellect, and for intuition more than for reason. He was often contrary and inconsistent. There was more crust than crumb in the loaf he gave us.

He went about the business of living with his head in the clouds, or with an absolute devotion to the ideal that is certainly rare in our literary history. He declared that he aimed to crow like chanticleer in the morning, if only to wake his neighbors up. Much of his writings have this chanticleerian character; they are a call to wake up, to rub the film from one's eyes, and see the real values of life. To this end he prods with

paradoxes, he belabors with hyperboles, he teases with irony, he startles with the unexpected. He finds poverty more attractive than riches, solitude more welcome than society, a sphagnum swamp more to be desired than a flowered field.

Thoreau is suggestive of those antibodies which modern science makes so much of. He tends to fortify us against the dry rot of business, the seductions of social pleasures, the pride of wealth and position. He is antitoxic; he is a literary germicide of peculiar power. He is too religious to go to church, too patriotic to pay his taxes, too fervent a humanist to interest himself in the social welfare of his neighborhood.

Thoreau called himself a mystic, and a transcendentalist, and a natural philosopher to boot. But the least of these was the natural philosopher. He did not have the philosophic mind, nor the scientific mind; he did not inquire into the reason of things, nor the meaning of things; in fact, had no disinterested interest in the universe apart from himself. He was too personal and illogical for a philosopher. The scientific interpretation of things did not interest him at all. He was interested in things only so far as they related to Henry Thoreau. He interpreted Nature entirely in the light of his own idiosyncrasies.

Science goes its own way in spite of our likes and dislikes, but Thoreau's likes and dislikes determined everything for him. He was stoical, but not philosophical. His intellect had no free play outside his individual predilection. Truth as philosophers use the term, was not his quest but truth made in Concord.

Thoreau writes that when he was once asked by the Association for the Advancement of Science what branch of science he was especially interested in, he did not reply because he did not want to make himself the laughing-stock of the scientific community, which did not believe in a science which deals with the higher law — his higher law, which bears the stamp of Henry Thoreau.

He was an individualist of the most pronounced type. The penalty of this type of mind is narrowness; the advantage is the personal flavor imparted to the written page. Thoreau's books contain plenty of the pepper and salt of character and contrariness; even their savor of whim and prejudice adds to their literary tang. When his individualism becomes aggressive egotism, as often happens, it is irritating; but when it gives only that pungent and personal flavor which pervades much of "Walden," it is very welcome.

Thoreau's critics justly aver that he severely arraigns his countrymen because they are not all Thoreaus — that they do not desert their farms and desks and shops and take to the woods. What unmeasured contempt he pours out upon the lives and ambitions of most of them! Need a nature-lover, it is urged, necessarily be a man-hater? Is not man a part of nature? — averaging up quite as good as the total scheme of things out of which he came? Cannot his vices and shortcomings be matched by a thousand cruel and abortive things in the fields and the woods? The fountain cannot rise above its source, and man is as good as is the nature out of which he came, and of which he is a part. Most of Thoreau's harsh judgments upon his neighbors and countrymen are only his extreme individualism gone to seed.

An extremist he always was. Extreme views commended themselves to him because they were extreme. His aim in writing was usually "to make an extreme statement." He left the middle ground to the school committees and trustees. He had in him the stuff of which martyrs and heroes are made. In John Brown he recognized a kindred soul. But his literary bent led him to take his own revolutionary impulses out in words. The closest he came to imitation of the hero of Harper's Ferry and to defying the Government was on one occasion when he refused to pay his poll-tax and thus got himself locked in jail overnight. It all seems a petty and ignoble ending of his fierce denunciation of politics and government, but it no doubt helped to satisfy his imagination, which so tyrannized over him throughout life. He could endure offenses against his heart and conscience and reason easier than against his imagination.

He presents that curious phenomenon of a man who is an extreme product of culture and civilization, and yet who so hungers and thirsts for the wild and the primitive that he is unfair to the forces and conditions out of which he came, and by which he is at all times nourished and upheld. He made his excursions into the Maine wilderness and lived in his hut by Walden Pond as a scholar and philosopher, and not at all in the spirit of the lumbermen and sportsmen whose wildness he so much admired. It was from his vantage-ground of culture and of Concord transcendentalism that he appraised all these types. It was from a community built up and sustained by the common industries and the love of gain that he decried all these things. It was from a town and a civilization that owed much to the pine tree that he launched his diatribe against the lumbermen in the Maine woods: "The pine is no more lumber than man is; and to be made into boards and houses no more its true and highest use than the truest use of man is to be cut down and made into manure." Not a happy comparison, but no matter. If the pine tree had not been cut down and made into lumber, it is quite certain that Thoreau would never have got to the Maine woods to utter this protest, just as it is equally certain that had he not been a member of a thrifty and industrious community, and kept his hold upon it, he could not have made his Walden experiment of toying and coquetting with the wild and the non-industrial. His occupations as land-surveyor, lyceum lecturer, and magazine writer attest how much he owed to the civilization he was so fond of decrying. This is Thoreau's weakness — the half-truths in which he plumes himself, as if they were the whole law and gospel. His Walden bean-field was only a pretty piece of play-acting; he cared more for the ringing of his hoe upon the stones than for the beans. Had his living really depended upon the product, the sound would not have pleased him so, and the botany of the weeds he hoed under would not have so interested him.

Thoreau's half-truths titillate and amuse the mind. We do not nod over his page. We enjoy his art while experiencing an undercurrent of protest against his unfairness. We could have wished him to have shown himself in his writings as somewhat sweeter and more tolerant toward the rest of the world, broader in outlook, and more just and charitable in disposition — more like his great prototype, Emerson, who could do full justice to the wild and the spontaneous without doing an injustice to their

opposites; who could see the beauty of the pine tree, yet sing the praises of the pine-tree State House; who could arraign the Government, yet pay his taxes; who could cherish Thoreau, and yet see all his limitations. Emerson affirmed more than he denied, and his charity was as broad as his judgment. He set Thoreau a good example in bragging, but he bragged to a better purpose. He exalted the present moment, the universal fact, the omnipotence of the moral law, the sacredness of private judgment; he pitted the man of to-day against all the saints and heroes of history; and, although he decried traveling, he was yet considerable of a traveler, and never tried to persuade himself that Concord was an epitome of the world. Emerson comes much nearer being a national figure than does Thoreau, and yet Thoreau, by reason of his very narrowness and perversity, and by his intense local character, united to the penetrating character of his genius, has made an enduring impression upon our literature.

### III

Thoreau's life was a search for the wild. He was the great disciple of the Gospel of Walking. He elevated walking into a religious exercise. One of his most significant and entertaining chapters is on "Walking." No other writer that I recall has set forth the Gospel of Walking so eloquently and so stimulatingly. Thoreau's religion and his philosophy are all in this chapter. It is his most mature, his most complete and comprehensive statement. He says:

I have met with but one or two persons in the course of my life who understood the art of Walking, that is, of taking walks — who had a genius, so to speak, for sauntering, which word is beautifully derived "from idle people who roved about the country, in the Middle Ages, and asked charity, under pretence of going à la Sainte Terre," to the Holy Land, till the children exclaimed, "There goes a Sainte-Terrer," — a Saunterer, a Holy-Lander. They who never go to the Holy Land in their walks, as they pretend, are indeed mere idlers and vagabonds; but they who do go there are saunterers in the good sense, such as I mean... For every walk is a sort of crusade, preached by some Peter the Hermit in us, to go forth and reconquer this Holy Land from the hands of the Infidels.

Thoreau was the first man in this country, or in any other, so far as I know, who made a religion of walking — the first to announce a Gospel of the Wild. That he went forth into wild nature in much the same spirit that the old hermits went into the desert, and was as devout in his way as they were in theirs, is revealed by numerous passages in his Journal. He would make his life a sacrament; he discarded the old religious terms and ideas, and struck out new ones of his own:

What more glorious condition of being can we imagine than from impure to become pure? May I not forget that I am impure and vicious! May I not cease to love purity! May I go to my slumbers as expecting to arise to a new and more perfect day! May I so live and refine my life as fitting myself for a society ever higher than I actually enjoy!

To watch for and describe all the divine features which I detect in nature! My profession is to be always on the alert to find God in nature, to know his lurking-place, to attend all the oratorios, the operas, in nature.

Ah! I would walk, I would sit, and sleep, with natural piety. What if I could pray aloud or to myself as I went along the brooksides a cheerful prayer like the birds? For joy I could embrace the earth. I shall delight to be buried in it.

I do not deserve anything. I am unworthy the least regard, and yet I am made to rejoice. I am impure and worthless, and yet the world is gilded for my delight and holidays are prepared for me, and my path is strewn with flowers. But I cannot thank the Giver; I cannot even whisper my thanks to the human friends I have.

In the essay on "Walking," Thoreau says that the art of walking "comes only by the grace of God. It requires a direct dispensation from Heaven to become a walker. You must be born into the family of the Walkers." "I think that I cannot preserve my health and spirits, unless I spend four hours a day at least, — it is commonly more than that, — sauntering through the woods and over the hills and fields, absolutely free from all worldly engagements."

Thoreau made good his boast. He was a new kind of walker, a Holy-Lander. His walks yielded him mainly spiritual and ideal results. The fourteen published volumes of his Journal are mainly a record of his mental reactions to the passing seasons and to the landscape he sauntered through. There is a modicum of natural history, but mostly he reaps the intangible harvest of the poet, the saunterer, the mystic, the super-sportsman.

With his usual love of paradox Thoreau says that the fastest way to travel is to go afoot, because, one may add, the walker is constantly arriving at his destination; all places are alike to him, his harvest grows all along the road and beside every path, in every field and wood and on every hilltop.

All of Thoreau's books belong to the literature of Walking, and are as true in spirit in Paris or London as in Concord. His natural history, for which he had a passion, is the natural history of the walker, not always accurate, as I have pointed out, but always graphic and interesting.

Wordsworth was about the first poet-walker — a man of letters who made a business of walking, and whose study was really the open air. But he was not a Holy-Lander in the Thoreau sense. He did not walk to get away from people as Thoreau did, but to see a greater variety of them, and to gather suggestions for his poems. Not so much the wild as the human and the morally significant were the objects of Wordsworth's quest. He haunted waterfalls and fells and rocky heights and lonely tarns, but he was not averse to footpaths and highways, and the rustic, half-domesticated nature of rural England. He was a nature-lover; he even calls himself a nature-worshiper; and he appears to have walked as many, or more, hours each day, in all seasons, as did Thoreau; but he was hunting for no lost paradise of the wild; nor waging a war against the arts and customs of civilization. Man and life were at the bottom of his interest in Nature.

Wordsworth never knew the wild as we know it in this country — the pitilessly savage and rebellious; and, on the other hand, he never knew the wonderfully delicate and furtive and elusive nature that we know; but he knew the sylvan, the pastoral, the rustic-human, as we cannot know them. British birds have nothing plaintive in their songs; and British woods and fells but little that is disorderly and cruel in their expression, or violent in their contrasts.

Wordsworth gathered his finest poetic harvest from common nature and common humanity about him — the wayside birds and flowers and waterfalls, and the wayside people. Though he called himself a worshiper of Nature, it was Nature in her half-human moods that he adored — Nature that knows no extremes, and that has long been under the influence of man — a soft, humid, fertile, docile Nature, that suggests a domesticity as old and as permanent as that of cattle and sheep. His poetry reflects these features, reflects the high moral and historic significance of the European landscape, while the poetry of Emerson, and of Thoreau, is born of the wildness and elusiveness of our more capricious and unkempt Nature.

The walker has no axe to grind; he sniffs the air for new adventure; he loiters in old scenes, he gleans in old fields. He only seeks intimacy with Nature to surprise her preoccupied with her own affairs. He seeks her in the woods, the swamps, on the hills, along the streams, by night and by day, in season and out of season. He skims the fields and hillsides as the swallow skims the air, and what he gets is intangible to most persons. He sees much with his eyes, but he sees more with his heart and imagination. He bathes in Nature as in a sea. He is alert for the beauty that waves in the trees, that ripples in the grass and grain, that flows in the streams, that drifts in the clouds, that sparkles in the dew and rain. The hammer of the geologist, the notebook of the naturalist, the box of the herbalist, the net of the entomologist, are not for him. He drives no sharp bargains with Nature, he reads no sermons in stones, no books in running brooks, but he does see good in everything. The book he reads he reads through all his senses — through his eyes, his ears, his nose, and also through his feet and hands — and its pages are open everywhere; the rocks speak of more than geology to him, the birds of more than ornithology, the flowers of more than botany, the stars of more than astronomy, the wild creatures of more than zoölogy.

The average walker is out for exercise and the exhilarations of the road, he reaps health and strength; but Thoreau evidently impaired his health by his needless exposure and inadequate food. He was a Holy-Lander who falls and dies in the Holy Land. He ridiculed walking for exercise — taking a walk as the sick take medicine; the walk itself was to be the “enterprise and adventure of the day.” And “you must walk like a camel, which is said to be the only beast which ruminates while walking.”

#### IV

Thoreau’s friends and neighbors seem to have persuaded themselves that his natural-history lore was infallible, and, moreover, that he possessed some mysterious power over the wild creatures about him that other men did not possess. I recall how Emerson fairly bristled up when on one occasion while in conversation with him I told

him I thought Thoreau in his trips to the Maine woods had confounded the hermit thrush with the wood thrush, as the latter was rarely or never found in Maine. As for Thoreau's influence over the wild creatures, Emerson voiced this superstition when he said, "Snakes coiled round his leg, the fishes swam into his hand, and he took them from the water; he pulled the woodchuck out of its hole by the tail, and took the foxes under his protection from the hunters." Of course Thoreau could do nothing with the wild creatures that you or I could not do under the same conditions. A snake will coil around any man's leg if he steps on its tail, but it will not be an embrace of affection; and a fish will swim into his hands under the same conditions that it will into Thoreau's. As for pulling a woodchuck out of its hole by the tail, the only trouble is to get hold of the tail. The 'chuck is pretty careful to keep his tail behind him, but many a farm boy, aided by his dog, has pulled one out of the stone wall by the tail, much against the 'chuck's will. If Thoreau's friends were to claim that he could carry *Mephitis mephitica* by the tail with impunity, I can say I have done the same thing, and had my photograph taken in the act. The skunk is no respecter of persons, and here again the trouble is to get hold of the tail at the right moment — and, I may add, to let go of it at the right moment.

Thoreau's influence over the wild creatures is what every man possesses who is alike gentle in his approach to them. Bradford Torrey succeeded, after a few experiments, in so dispelling the fears of an incubating red-eyed vireo that she would take insect food from his hand, and I have known several persons to become so familiar with the chickadees that they would feed from the hand, and in some instances even take food from between the lips. If you have a chipmunk for a neighbor, you may soon become on such intimate terms with him that he will search your pockets for nuts and sit on your knee and shoulder and eat them. But why keep alive and circulate as truth these animal legends of the prescientific ages?

Thoreau was not a born naturalist, but a born supernaturalist. He was too intent upon the bird behind the bird always to take careful note of the bird itself. He notes the birds, but not too closely. He was at times a little too careless in this respect to be a safe guide to the bird-student. Even the saunterer to the Holy Land ought to know the indigo bunting from the black-throated blue warbler, with its languid, midsummery, "Zee, zee, zee-eu."

Many of his most interesting natural-history notes Thoreau got from his farmer friends — Melvin, Minott, Miles, Hubbard, Wheeler. Their eyes were more single to the life around them than were his; none of them had lost a hound, a turtle-dove, and a bay horse, whose trail they were daily in quest of.

A haunter of swamps and river marshes all his life, he had never yet observed how the night bittern made its booming or pumping sound, but accepted the explanation of one of his neighbors that it was produced by the bird thrusting its bill in water, sucking up as much as it could hold, and then pumping it out again with four or five heaves of the neck, throwing the water two or three feet — in fact, turning itself into a veritable pump! I have stood within a few yards of the bird when it made the sound,

and seen the convulsive movement of the neck and body, and the lifting of the head as the sound escaped. The bird seems literally to vomit up its notes, but it does not likewise emit water.

Every farmer and fox-hunter would smile if he read Thoreau's statement, made in his paper on the natural history of Massachusetts, that "when the snow lies light and but five or six inches deep, you may give chase and come up with the fox on foot." Evidently Thoreau had never tried it. With a foot and a half, or two feet of snow on the ground, and traveling on snowshoes, you might force a fox to take to his hole, but you would not come up to him. In four or five feet of soft snow hunters come up with the deer, and ride on their backs for amusement, but I doubt if a red fox ever ventures out in such a depth of snow. In one of his May walks in 1860, Thoreau sees the trail of the musquash in the mud along the river-bottoms, and he is taken by the fancy that, as our roads and city streets often follow the early tracks of the cow, so "rivers in another period follow the trail of the musquash." As if the river was not there before the musquash was!

Again, his mysterious "night warbler," to which he so often alludes, was one of our common everyday birds which most school-children know, namely, the oven-bird, or wood-accentor, yet to Thoreau it was a sort of phantom bird upon which his imagination loved to dwell. Emerson told him he must beware of finding and booking it, lest life should have nothing more to show him. But how such a haunter of woods escaped identifying the bird is a puzzle.

In his walks in the Maine woods Thoreau failed to discriminate the song of the hermit thrush from that of the wood thrush. The melody, no doubt, went to his heart, and that was enough. Though he sauntered through orchards and rested under apple trees, he never observed that the rings of small holes in the bark were usually made by the yellow-bellied woodpecker, instead of by Downy, and that the bird was not searching for grubs or insects, but was feeding upon the milky cambium layer of the inner bark.

But Thoreau's little slips of the kind I have called attention to count as nothing against the rich harvest of natural-history notes with which his work abounds. He could describe bird-songs and animal behavior and give these things their right emphasis in the life of the landscape as no other New England writer has done. His account of the battle of the ants in Walden atones an hundred-fold for the lapses I have mentioned.

One wonders just what Thoreau means when he says in "Walden," in telling of his visit to "Baker Farm": "Once it chanced that I stood in the very abutment of a rainbow's arch, which filled the lower stratum of the atmosphere, tinging the grass and leaves around, and dazzling me as if I looked through colored crystal." Is it possible, then, to reach the end of the rainbow? Why did he not dig for the pot of gold that is buried there? How he could be aware that he was standing at the foot of one leg of the glowing arch is to me a mystery. When I see a rainbow, it is always immediately in front of me. I am standing exactly between the highest point of the arch and the sun, and the laws of optics ordain that it can be seen in no other way. You can never see a rainbow at an

angle. It always faces you squarely. Hence no two persons see exactly the same bow, because no two persons can occupy exactly the same place at the same time. The bow you see is directed to you alone. Move to the right or the left, and it moves as fast as you do. You cannot flank it or reach its end. It is about the most subtle and significant phenomenon that everyday Nature presents to us. Unapproachable as a spirit, like a visitant from another world, yet the creation of the familiar sun and rain!

How Thoreau found himself standing in the bow's abutment will always remain a puzzle to me. Observers standing on high mountains with the sun low in the west have seen the bow as a complete circle. This one can understand.

We can point many a moral and adorn many a tale with Thoreau's shortcomings and failures in his treatment of nature themes. Channing quotes him as saying that sometimes "you must see with the inside of your eye." I think that Thoreau saw, or tried to see, with the inside of his eye too often. He does not always see correctly, and many times he sees more of Thoreau than he does of the nature he assumes to be looking at. Truly it is "needless to travel for wonders," but the wonderful is not one with the fantastic or the far-fetched. Forcible expression, as I have said, was his ruling passion as a writer. Only when he is free from its thrall, which in his best moments he surely is, does he write well. When he can forget Thoreau and remember only nature, we get those delightful descriptions and reflections in "Walden." When he goes to the Maine woods or to Cape Cod or to Canada, he leaves all his fantastic rhetoric behind him and gives us sane and refreshing books. In his walks with Channing one suspects he often let himself go to all lengths, did his best to turn the world inside out, as he did at times in his Journals, for his own edification and that of his wondering disciple.

To see analogies and resemblances everywhere is the gift of genius, but to see a resemblance to volcanoes in the hubs or gnarls on birch or beech trees, or cathedral windows in the dead leaves of the andromeda in January, or a suggestion of Teneriffe in a stone-heap, does not indicate genius. To see the great in the little, or the whole of Nature in any of her parts, is the poet's gift, but to ask, after seeing the andropogon grass, "Are there no purple reflections from the culms of thought in my mind?" — a remark which Channing quotes as very significant — is not to be poetical. Thoreau is full of these impossible and fantastic comparisons, thinking only of striking expressions and not at all about the truth. "The flowing of the sap under the dull rind of the trees" is suggestive, but what suggestion is there in the remark, "May I ever be in as good spirits as a willow"? The mood of the scrub oak was more habitual with him.

Thoreau was in no sense an interpreter of nature; he did not draw out its meanings or seize upon and develop its more significant phases. Seldom does he relate what he sees or thinks to the universal human heart and mind. He has rare power of description, but is very limited in his power to translate the facts and movements of nature into human emotion. His passage on the northern lights, which Channing quotes from the Journals, is a good sample of his failure in this respect:

Now the fire in the north increases wonderfully, not shooting up so much as creeping along, like a fire on the mountains of the north seen afar in the night. The Hyperborean

gods are burning brush, and it spread, and all the hoes in heaven couldn't stop it. It spread from west to east over the crescent hill. Like a vast fiery worm it lay across the northern sky, broken into many pieces; and each piece, with rainbow colors skirting it, strove to advance itself toward the east, worm-like, on its own annular muscles. It has spread into their choicest wood-lots. Now it shoots up like a single solitary watch-fire or burning bush, or where it ran up a pine tree like powder, and still it continues to gleam here and there like a fat stump in the burning, and is reflected in the water. And now I see the gods by great exertions have got it under, and the stars have come out without fear, in peace.

I get no impression of the mysterious almost supernatural character of the aurora from such a description in terms of a burning wood-lot or a hay-stack; it is no more like a conflagration than an apparition is like solid flesh and blood. Its wonderful, I almost said its spiritual, beauty, its sudden vanishings and returnings, its spectral, evanescent character — why, it startles and awes one as if it were the draperies around the throne of the Eternal. And then his mixed metaphor — the Hyperborean gods turned farmers and busy at burning brush, then a fiery worm, and then the burning wood-lots! But this is Thoreau — inspired with the heavenly elixir one moment, and drunk with the brew in his own cellar the next.

#### V

Thoreau's faults as a writer are as obvious as his merits. Emerson hit upon one of them when he said, "The trick of his rhetoric is soon learned; it consists in substituting for the obvious word and thought, its diametrical antagonist." He praises wild mountains and winter forests for their domestic air, snow and ice for their warmth, and so on. (Yet Emerson in one of his poems makes frost burn and fire freeze.) One frequently comes upon such sentences as these: "If I were sadder, I should be happier"; "The longer I have forgotten you, the more I remember you." It may give a moment's pleasure when a writer takes two opposites and rubs their ears together in that way, but one may easily get too much of it. Words really mean nothing when used in such a manner. When Emerson told Channing that if he (Emerson) could write as well as he did, he would write a great deal better, one readily sees what he means. And when Thoreau says of one of his callers, "I like his looks and the sound of his silence," the contradiction pleases one. But when he tells his friend that hate is the substratum of his love for him, words seem to have lost their meaning. Now and then he is guilty of sheer bragging, as when he says, "I would not go around the corner to see the world blow up."

He often defies all our sense of fitness and proportion by the degree in which he magnifies the little and belittles the big. He says of the singing of a cricket which he heard under the border of some rock on the hillside one mid-May day, that it "makes the finest singing of birds outward and insignificant." "It is not so wildly melodious, but it is wiser and more mature than that of the wood thrush." His forced and meaningless analogies come out in such a comparison as this: "Most poems, like the fruits, are sweetest toward the blossom end." Which is the blossom end of a poem?

Thoreau advised one of his correspondents when he made garden to plant some Giant Regrets — they were good for sauce. It is certain that he himself planted some Giant Exaggerations and had a good yield. His exaggeration was deliberate. “Walden” is from first to last a most delightful sample of his talent. He belittles everything that goes on in the world outside his bean-field. Business, politics, institutions, governments, wars and rumors of wars, were not so much to him as the humming of a mosquito in his hut at Walden: “I am as much affected by the faint hum of a mosquito making its invisible and unimaginable tour through my apartment at earliest dawn, when I was sitting with door and windows open, as I could be by any trumpet that ever sang of fame. It was Homer’s requiem; itself an Iliad and Odyssey in the air, singing its own wrath and wanderings. There was something cosmical about it.” One wonders what he would have made of a blow-fly buzzing on the pane.

He made Walden Pond famous because he made it the center of the universe and found life rich and full without many of the things that others deem necessary. There is a stream of pilgrims to Walden at all seasons, curious to see where so much came out of so little — where a man had lived who preferred poverty to riches, and solitude to society, who boasted that he could do without the post office, the newspapers, the telegraph, and who had little use for the railroad, though he thought mankind had become a little more punctual since its invention.

Another conspicuous fault as a writer is his frequent use of false analogies, or his comparison of things which have no ground of relationship, as when he says: “A day passed in the society of those Greek sages, such as described in the Banquet of Xenophon, would not be comparable with the dry wit of decayed cranberry-vines, and the fresh Attic salt of the moss-beds.” The word “wit” has no meaning when thus used. Or again where he says: “All great enterprises are self-supporting. The poet, for instance, must sustain his body by his poetry, as a steam planing-mill feeds its boilers with the shavings it makes.” Was there ever a more inept and untruthful comparison? To find any ground of comparison between the two things he compared, he must make his poet sustain his body by the scraps and lines of his poem which he rejects, or else the steam planing-mill consume its finished product.

“Let all things give way to the impulse of expression,” he says, and he assuredly practiced what he had preached.

One of his tricks of self-justification was to compare himself with inanimate objects, which is usually as inept as to compare colors with sounds or perfumes: “My acquaintances sometimes imply that I am too cold,” he writes, “but each thing is warm enough of its kind. Is the stone too cold which absorbs the heat of the summer sun and does not part with it during the night? Crystals, though they be of ice are not too cold to melt... Crystal does not complain of crystal any more than the dove of its mate.”

He strikes the same false note when, in discussing the question of solitude at Walden he compares himself to the wild animals around him, and to inanimate objects, and says he was no more lonely than the loons on the pond, or than Walden itself: “I am no more lonely than a single mullein or dandelion in a pasture, or a bean leaf, or a

sorrel, or a house-fly, or a humble-bee. I am no more lonely than the Mill Brook, or a weather-cock, or the North Star, or the South Wind, or an April Shower, or a January Thaw, or the first spider in a new house.” Did he imagine that any of these things were ever lonely? Man does get lonely, but Mill Brook and the North Star probably do not.

If he sees anything unusual in nature, like galls on trees and plants, he must needs draw some moral from it, usually at the expense of the truth. For instance, he implies that the beauty of the oak galls is something that was meant to bloom in the flower, that the galls are the scarlet sins of the tree, the tree’s Ode to Dejection, yet he must have known that they are the work of an insect and are as healthy a growth as is the regular leaf. The insect gives the magical touch that transforms the leaf into a nursery for its young. Why deceive ourselves by believing that fiction is more interesting than fact? But Thoreau is full of this sort of thing; he must have his analogy, true or false.

He says that when a certain philosophical neighbor came to visit him in his hut at Walden, their discourse expanded and racked the little house: “I should not dare to say how many pounds’ weight there was above the atmospheric pressure on every circular inch; it opened its seams so that they had to be calked with much dulness thereafter to stop the consequent leak — but I had enough of that kind of oakum already picked.” At the beginning of the paragraph he says that he and his philosopher sat down each with “some shingles of thoughts well dried,” which they whittled, trying their knives and admiring the clear yellowish grain of the pumpkin pine. In a twinkling the three shingles of thought are transformed into fishes of thought in a stream into which the hermit and the philosopher gently and reverently wade, without scaring or disturbing them. Then, presto! the fish become a force, like the pressure of a tornado that nearly wrecks his cabin! Surely this is tipsy rhetoric, and the work that can stand much of it, as “Walden” does, has a plus vitality that is rarely equaled.

## VI

In “Walden” Thoreau, in playfully naming his various occupations, says, “For a long time I was reporter to a journal, of no very wide circulation, whose editor has never yet seen fit to print the bulk of my contributions, and, as is too common with writers, I got only my labor for my pains. However, in this case my pains were their own reward.” If he were to come back now, he would, I think, open his eyes in astonishment, perhaps with irritation, to see the whole bulk of them at last in print.

His Journal was the repository of all his writings, and was drawn upon during his lifetime for all the material he printed in books and contributed to the magazines. The fourteen volumes, I venture to say, form a record of the most minute and painstaking details of what one man saw and heard on his walks in field and wood, in a single township, that can be found in any literature.

It seems as though a man who keeps a Journal soon becomes its victim; at least that seems to have been the case with Thoreau. He lived for that Journal, he read for it, he walked for it; it was like a hungry, omnivorous monster that constantly called for more. He transcribed to its pages from the books he read, he filled it with interminable accounts of the commonplace things he saw in his walks, tedious and

minute descriptions of everything in wood, field, and swamp. There are whole pages of the Latin names of the common weeds and flowers. Often he could not wait till he got home to write out his notes. He walked by day and night, in cold and heat, in storm and sunshine, all for his Journal. All was fish that came to that net; nothing was too insignificant to go in. He did not stop to make literature of it, or did not try, and it is rarely the raw material of literature. Its human interest is slight, its natural history interest slight also. For upwards of twenty-five years Thoreau seemed to have lived for this Journal. It swelled to many volumes. It is a drag-net that nothing escapes. The general reader reads Thoreau's Journal as he does the book of Nature, just to cull out the significant things here and there. The vast mass of the matter is merely negative, like the things that we disregard in our walk. Here and there we see a flower, or a tree, or a prospect, or a bird, that arrests attention, but how much we pass by or over without giving it a thought! And yet, just as the real nature-lover will scan eagerly the fine print in Nature's book, so will the student and enthusiast of Thoreau welcome all that is recorded in his Journals.

Thoreau says that Channing in their walks together sometimes took out his notebook and tried to write as he did, but all in vain. "He soon puts it up again, or contents himself with scrawling some sketch of the landscape. Observing me still scribbling, he will say that he confines himself to the ideal, purely ideal remarks; he leaves the facts to me. Sometimes, too, he will say, a little petulantly, 'I am universal; I have nothing to do with the particular and definite.'" The truth was Channing had no Journal calling, "More, more!" and was not so inordinately fond of composition. "I, too," says Thoreau, "would fain set down something beside facts. Facts should only be as the frame to my pictures; they should be material to the mythology which I am writing." But only rarely are his facts significant, or capable of an ideal interpretation. Felicitous strokes like that in which he says, "No tree has so fair a bole and so handsome an instep as the birch," are rare.

Thoreau evidently had a certain companionship with his Journal. It was like a home-staying body to whom he told everything on his return from a walk. He loved to write it up. He made notes of his observations as he went along, night or day. One time he forgot his notebook and so substituted a piece of birch-bark. He must bring back something gathered on the spot. He skimmed the same country over and over; the cream he was after rose every day and all day, and in all seasons.

He evidently loved to see the pages of his Journal sprinkled with the Latin names of the plants and animals that he saw in his walk. A common weed with a long Latin name acquired new dignity. Occasionally he fills whole pages with the scientific names of the common trees and plants. He loved also a sprinkling of Latin quotations and allusions to old and little known authors. The pride of scholarship was strong in him. Suggestions from what we call the heathen world seemed to accord with his Gospel of the Wild.

Thoreau loved to write as well as John Muir loved to talk. It was his ruling passion. He said time never passed so quickly as when he was writing. It seemed as if the clock

had been set back. He evidently went to Walden for subject-matter for his pen; and the remarkable thing about it all is that he was always keyed up to the writing pitch. The fever of expression was always upon him. Day and night, winter and summer, it raged in his blood. He paused in his walks and wrote elaborately. The writing of his Journal must have taken as much time as his walking.

Only Thoreau's constant and unquenchable thirst for intellectual activity, and to supply material for that all-devouring Journal, can, to me, account for his main occupation during the greater part of the last two years of his life, which consisted in traversing the woods and measuring the trees and stumps and counting their rings. Apparently not a stump escaped him — pine, oak, birch, chestnut, maple, old or new, in the pasture or in the woods; he must take its measure and know its age. He must get the girth of every tree he passed and some hint of all the local conditions that had influenced its growth. Over two hundred pages of his Journal are taken up with barren details of this kind. He cross-questions the stumps and trees as if searching for the clue to some important problem, but no such problem is disclosed. He ends where he begins. His vast mass of facts and figures was incapable of being generalized or systematized. His elaborate tables of figures, so carefully arranged, absolutely accurate, no doubt, are void of interest, because no valuable inferences can be drawn from them.

"I have measured in all eight pitch pine stumps at the Tommy Wheeler hollow, sawed off within a foot of the ground. I measured the longest diameter and then at right angles with that, and took the average, and then selected the side of the stump on which the radius was of average length, and counted the number of rings in each inch, beginning at the center, thus:" And then follows a table of figures filling a page. "Of those eight, average growth about one seventh of an inch per year. Calling the smallest number of rings in an inch in each tree one, the comparative slowness of growth of the inches is thus expressed." Then follows another carefully prepared table of figures. Before one is done with these pages one fairly suspects the writer is mad, the results are so useless, and so utterly fail to add to our knowledge of the woods. Would counting the leaves and branches in the forest, and making a pattern of each, and tabulating the whole mass of figures be any addition to our knowledge? I attribute the whole procedure, as I have said, to his uncontrollable intellectual activity, and the imaginary demands of this Journal, which continued to the end of his life. The very last pages of his Journal, a year previous to his death, are filled with minute accounts of the ordinary behavior of kittens, not one item novel or unusual, or throwing any light on the kitten. But it kept his mind busy, and added a page or two to the Journal.

In his winter walks he usually carried a four-foot stick, marked in inches, and would measure the depth of the snow over large areas, every tenth step, and then construct pages of elaborate tables showing the variations according to locality, and then work out the average — an abnormal craving for exact but useless facts. Thirty-four measurements on Walden disclosed the important fact that the snow averaged five and one sixth inches deep. He analyzes a pensile nest which he found in the woods — doubtless one of the vireo's — and fills ten pages with a minute description of the different mate-

rials which it contained. Then he analyzes a yellow-bird's nest, filling two pages. That Journal shall not go hungry, even if there is nothing to give it but the dry material of a bird's nest.

## VII

The craving for literary expression in Thoreau was strong and constant, but, as he confesses, he could not always select a theme. "I am prepared not so much for contemplation as for forceful expression." No matter what the occasion, "forceful expression" was the aim. No meditation, or thinking, but sallies of the mind. All his paradoxes and false analogies and inconsistencies come from this craving for a forceful expression. He apparently brought to bear all the skill he possessed of this kind on all occasions. One must regard him, not as a great thinker, nor as a disinterested seeker after the truth, but as a master in the art of vigorous and picturesque expression. To startle, to wake up, to communicate to his reader a little wholesome shock, is his aim. Not the novelty and freshness of his subject-matter concerns him but the novelty and unhackneyed character of his literary style. That throughout the years a man should keep up the habit of walking, by night as well as by day, and bring such constant intellectual pressure to bear upon everything he saw, or heard, or felt, is remarkable. No evidence of relaxation, or of abandonment to the mere pleasure of the light and air and of green things growing, or of sauntering without thoughts of his Journal. He is as keyed up and strenuous in his commerce with the Celestial Empire as any tradesman in world goods that ever amassed a fortune. He sometimes wrote as he walked, and expanded and elaborated the same as in his study. On one occasion he dropped his pencil and could not find it, but he managed to complete the record. One night on his way to Conantum he speculates for nearly ten printed pages on the secret of being able to state a fact simply and adequately, or of making one's self the free organ of truth — a subtle and ingenious discussion with the habitual craving for forceful expression. In vain I try to put myself in the place of a man who goes forth into wild nature with malice prepense to give free swing to his passion for forcible expression. I suppose all nature-writers go forth on their walks or strolls to the fields and woods with minds open to all of Nature's genial influences and significant facts and incidents, but rarely, I think, with the strenuousness of Thoreau — grinding the grist as they go along.

Thoreau compares himself to the bee that goes forth in quest of honey for the hive: "How to extract honey from the flower of the world. That is my everyday business. I am as busy as the bee about it. I ramble over all fields on that errand and am never so happy as when I feel myself heavy with honey and wax." To get material for his Journal was as much his business as it was the bee's to get honey for his comb. He apparently did not know that the bee does not get honey nor wax directly from the flowers, but only nectar, or sweet water. The bee, as I have often said, makes the honey and the wax after she gets home to the swarm. She puts the nectar through a process of her own, adds a drop of her own secretion to it, namely, formic acid, the water evaporates, and lo! the tang and pungency of honey!

## VIII

There can be little doubt that in his practical daily life we may credit Thoreau with the friendliness and neighborliness that his friend Dr. Edward W. Emerson claims for him. In a recent letter to me, Dr. Emerson writes: "He carried the old New England undemonstrativeness very far. He was also, I believe, really shy, prospered only in monologue, except in a walk in the woods with one companion, and his difficulties increased to impossibility in a room full of people." Dr. Emerson admits that Thoreau is himself to blame for giving his readers the impression that he held his kind in contempt, but says that in reality he had neighborliness, was dutiful to parents and sisters, showed courtesy to women and children and an open, friendly side to many a simple, uncultivated townsman.

This practical helpfulness and friendliness in Thoreau's case seems to go along with the secret contempt he felt and expressed in his Journal toward his fellow townsmen. At one time he was chosen among the selectmen to perambulate the town lines — an old annual custom. One day they perambulated the Lincoln line, the next day the Bedford line, the next day the Carlisle line, and so on, and kept on their rounds for a week. Thoreau felt soiled and humiliated. "A fatal coarseness is the result of mixing in the trivial affairs of men. Though I have been associating even with the select men of this and adjoining towns, I feel inexpressibly begrimed." How fragile his self-respect was! Yet he had friends among the surrounding farmers, whose society and conversation he greatly valued.

That Thoreau gave the impression of being what country folk call a crusty person — curt and forbidding in manner — seems pretty well established. His friend Alcott says he was deficient in the human sentiments. Emerson, who, on the whole, loved and admired him, says: "Thoreau sometimes appears only as a gendarme, good to knock down a cockney with, but without that power to cheer and establish which makes the value of a friend." Again he says: "If I knew only Thoreau, I should think coöperation of good men impossible. Must we always talk for victory, and never once for truth, for comfort, and joy? Centrality he has, and penetration, strong understanding, and the higher gifts, — the insight of the real, or from the real, and the moral rectitude that belongs to it; but all this and all his resources of wit and invention are lost to me, in every experiment, year after year, that I make, to hold intercourse with his mind. Always some weary captious paradox to fight you with, and the time and temper wasted." "It is curious," he again says, "that Thoreau goes to a house to say with little preface what he has just read or observed, delivers it in a lump, is quite inattentive to any comment or thought which any of the company offer on the matter, nay, is merely interrupted by it, and when he has finished his report departs with precipitation."

It is interesting in this connection to put along-side of these rather caustic criticisms a remark in kind recorded by Thoreau in his Journal concerning Emerson: "Talked, or tried to talk, with R. W. E. Lost my time — nay, almost my identity. He, assuming a false opposition where there was no difference of opinion, talked to the wind — told me what I knew — and I lost my time trying to imagine myself somebody else to oppose him."

Evidently Concord philosophers were not always in concord.

More characteristic of Emerson is the incident Thoreau relates of his driving his own calf, which had just come in with the cows, out of the yard, thinking it belonged to a drove that was then going by. From all accounts Emerson was as slow to recognize his own thoughts when Alcott and Channing aired them before him as he was to recognize his own calf.

“I have got a load of great hardwood stumps,” writes Thoreau, and then, as though following out a thought suggested by them, he adds: “For sympathy with my neighbors I might about as well live in China. They are to me barbarians with their committee works and gregariousness.”

Probably the stumps were from trees that grew on his neighbors' farms and were a gift to him. Let us hope the farmers did not deliver them to him free of charge. He complained that the thousand and one gentlemen that he met were all alike; he was not cheered by the hope of any rudeness from them: “A cross man, a coarse man, an eccentric man, a silent man who does not drill well — of him there is some hope,” he declares. Herein we get a glimpse of the Thoreau ideal which led his friend Alcott to complain that he lacked the human sentiment. He may or may not have been a “cross man,” but he certainly did not “drill well,” for which his readers have reason to be thankful. Although Thoreau upholds the cross and the coarse man, one would really like to know with what grace he would have put up with gratuitous discourtesy or insult. I remember an entry in his Journal in which he tells of feeling a little cheapened when a neighbor asked him to take some handbills and leave them at a certain place as he passed on his walk.

A great deal of the piquancy and novelty in Thoreau come from the unexpected turn he gives to things, upsetting all our preconceived notions. His trick of exaggeration he rather brags of: “Expect no trivial truth from me,” he says, “unless I am on the witness stand.” He even exaggerates his own tendency to exaggeration. It is all a part of his scheme to startle and wake people up. He exaggerates his likes, and he exaggerates his dislikes, and he exaggerates his indifference. It is a way he has of bragging. The moment he puts pen to paper the imp of exaggeration seizes it. He lived to see the beginning of the Civil War, and in a letter to a friend expressed his indifference in regard to Fort Sumter and “Old Abe,” and all that, yet Mr. Sanborn says he was as zealous about the war as any soldier. The John Brown tragedy made him sick, and the war so worked upon his feelings that in his failing state of health he said he could never get well while it lasted. His passion for Nature and the wild carried him to the extent of looking with suspicion, if not with positive dislike, upon all of man's doings and institutions. All civil and political and social organizations received scant justice at his hands. He instantly espoused the cause of John Brown and championed him in the most public manner because he (Brown) defied the iniquitous laws and fell a martyr to the cause of justice and right. If he had lived in our times, one would have expected him, in his letters to friends, to pooh-pooh the World War that has drenched

Europe with blood, while in his heart he would probably have been as deeply moved about it as any of us were.

Thoreau must be a stoic, he must be an egotist, he must be illogical, whenever he puts pen to paper. This does not mean that he was a hypocrite, but it means that on his practical human side he did not differ so much from the rest of us, but that in his mental and spiritual life he pursued ideal ends with a seriousness that few of us are equal to. He loved to take an air-line. In his trips about the country to visit distant parts, he usually took the roads and paths or means of conveyance that other persons took, but now and then he would lay down his ruler on the map, draw a straight line to the point he proposed to visit, and follow that, going through the meadows and gardens and door-yards of the owners of the property in his line of march. There is a tradition that he and Channing once went through a house where the front and back door stood open. In his mental flights and excursions he follows this plan almost entirely; the hard facts and experiences of life trouble him very little. He can always ignore them or sail serenely above them.

How is one to reconcile such an expression as this with what his friends report of his actual life: "My countrymen are to me foreigners. I have but little more sympathy with them than with the mobs of India or China"? Or this about his Concord neighbors, as he looks down upon them from a near-by hill: "On whatever side I look off, I am reminded of the mean and narrow-minded men whom I have lately met there. What can be uglier than a country occupied by grovelling, coarse, and low-minded men? — no scenery can redeem it. Hornets, hyenas, and baboons are not so great a curse to a country as men of a similar character." Tried by his ideal standards, his neighbors and his countrymen generally were, of course, found wanting, yet he went about among them helpful and sympathetic and enjoyed his life to the last gasp. These things reveal to us what a gulf there may be between a man's actual life and the high altitudes in which he disports himself when he lets go his imagination.

## IX

In his paper called "Life without Principle," his radical idealism comes out: To work for money, or for subsistence alone, is life without principle. A man must work for the love of the work. Get a man to work for you who is actuated by love for you or for the work alone. Find some one to beat your rugs and carpets and clean out your well, or weed your onion-patch, who is not influenced by any money consideration. This were ideal, indeed; this suggests paradise. Thoreau probably loved his lecturing, and his surveying, and his magazine writing, and the money these avocations brought him did not seem unworthy, but could the business and industrial world safely adopt that principle?

So far as I understand him, we all live without principle when we do anything that goes against the grain, or for money, or for bread alone. "To have done anything by which you earned money is to have been truly idle or worse." "If you would get money as a writer or lecturer, you must be popular, which is to go down perpendicularly." Yet his neighbor Emerson was in much demand as a lecturer, and earned a good deal

of money in that way. Truly idealists like Thoreau are hard to satisfy. Agassiz said he could not afford to give his time to making money, but how many Agassiz are there in the world at any one time? Such a man as our own Edison is influenced very little by the commercial value of his inventions. This is as it should be, but only a small fraction of mankind do or can live to ideal ends. Those who work for love are certainly the lucky ones, and are exceptionally endowed. It is love of the sport that usually sends one a-fishing or a-hunting, and this gives it the sanction of the Gospel according to Thoreau. Bradford Torrey saw a man sitting on a log down in Florida who told him, when he asked about his occupation, that he had no time to work! It is to be hoped that Thoreau enjoyed his surveying, as he probably did, especially when it took him through sphagnum swamps or scrub-oak thickets or a tangle of briers and thorns. The more difficult the way, the more he could summon his philosophy. "You must get your living by loving." It is a hard saying, but it is a part of his gospel. But as he on one occasion worked seventy-six days surveying, for only one dollar a day, the money he received should not be laid up against him.

As a matter of fact we find Thoreau frequently engaging in manual labor to earn a little money. He relates in his Journal of 1857 that while he was living in the woods he did various jobs about town — fence-building, painting, gardening, carpentering:

One day a man came from the east edge of the town and said that he wanted to get me to brick up a fireplace, etc., etc., for him. I told him that I was not a mason, but he knew that I had built my own house entirely and would not take no for an answer. So I went.

It was three miles off, and I walked back and forth each day, arriving early and working as late as if I were living there. The man was gone away most of the time, but had left some sand dug up in his cow-yard for me to make mortar with. I bricked up a fireplace, papered a chamber, but my principal work was whitewashing ceilings. Some were so dirty that many coats would not conceal the dirt. In the kitchen I finally resorted to yellow-wash to cover the dirt. I took my meals there, sitting down with my employer (when he got home) and his hired men. I remember the awful condition of the sink, at which I washed one day, and when I came to look at what was called the towel I passed it by and wiped my hands on the air, and thereafter I resorted to the pump. I worked there hard three days, charging only a dollar a day.

About the same time I also contracted to build a wood-shed of no mean size, for, I think, exactly six dollars, and cleared about half of it by a close calculation and swift working. The tenant wanted me to throw in a gutter and latch, but I carried off the board that was left and gave him no latch but a button. It stands yet, — behind the Kettle house. I broke up Johnny Kettle's old "trow," in which he kneaded his bread, for material. Going home with what nails were left in a flower [sic!] bucket on my arm, in a rain, I was about getting into a hay-rigging, when my umbrella frightened the horse, and he kicked at me over the fills, smashed the bucket on my arm, and stretched me on my back; but while I lay on my back, his leg being caught under the shaft, I got up, to see him sprawling on the other side. This accident, the sudden bending of my body

backwards, sprained my stomach so that I did not get quite strong there for several years, but had to give up some fence-building and other work which I had undertaken from time to time.

I built the common slat fence for \$1.50 per rod, or worked for \$1.00 per day. I built six fences.

These homely and laborious occupations show the dreamer and transcendentalist of Walden in a very interesting light. In his practical life he was a ready and resourceful man and could set his neighbors a good example, and no doubt give them good advice. But what fun he had with his correspondents when they wrote him for practical advice about the conduct of their lives! One of them had evidently been vexing his soul over the problem of Church and State: "Why not make a very large mud pie and bake it in the sun? Only put no Church nor State into it, nor upset any other pepper box that way. Dig out a woodchuck — for that has nothing to do with rotting institutions. Go ahead."

Dear, old-fashioned Wilson Flagg, who wrote pleasantly, but rather tamely, about New England birds and seasons, could not profit much from Thoreau's criticism: "He wants stirring up with a pole. He should practice turning a series of summer-sets rapidly, or jump up and see how many times he can strike his feet together before coming down. Let him make the earth turn round now the other way, and whet his wits on it as on a grindstone; in short, see how many ideas he can entertain at once."

Expect no Poor Richard maxims or counsel from Thoreau. He would tell you to invest your savings in the bonds of the Celestial Empire, or plant your garden with a crop of Giant Regrets. He says these are excellent for sauce. He encourages one of his correspondents with the statement that he "never yet knew the sun to be knocked down and rolled through a mud puddle; he comes out honor bright from behind every storm."

## X

All Thoreau's apparent inconsistencies and contradictions come from his radical idealism. In all his judgments upon men and things, and upon himself, he is an uncompromising idealist. All fall short. Add his habit of exaggeration and you have him saying that the pigs in the street in New York (in 1843) are the most respectable part of the population. The pigs, I suppose, lived up to the pig standard, but the people did not live up to the best human standards. Wherever the ideal leads him, there he follows. After his brother John's death he said he did not wish ever to see John again, but only the ideal John — that other John of whom he was but the imperfect representative. Yet the loss of the real John was a great blow to him, probably the severest in his life. But he never allows himself to go on record as showing any human weakness.

"Comparatively," he says, "we can excuse any offense against the heart, but not against the imagination." Thoreau probably lived in his heart as much as most other persons, but his peculiar gospel is the work of his imagination. He could turn his idealism to practical account. A man who had been camping with him told me that on such expeditions he carried a small piece of cake carefully wrapped up in his pocket

and that after he had eaten his dinner he would take a small pinch of this cake. His imagination seemed to do the rest.

The most unpromising subject would often kindle the imagination of Thoreau. His imagination fairly runs riot over poor Bill Wheeler, a cripple and a sot who stumped along on two clumps for feet, and who earned his grog by doing chores here and there. One day Thoreau found him asleep in the woods in a low shelter which consisted of meadow hay cast over a rude frame. It was a rare find to Thoreau. A man who could turn his back upon the town and civilization like that must be some great philosopher, greater than Socrates or Diogenes, living perhaps "from a deep principle," "simplifying life, returning to nature," having put off many things,— "luxuries, comforts, human society, even his feet, — wrestling with his thoughts." He outdid himself. He out-Thoreaued Thoreau: "Who knows but in his solitary meadow-hay bunk he indulges, in thought, only in triumphant satires on men? [More severe than those of the Walden hermit?] I was not sure for a moment but here was a philosopher who had left far behind him the philosophers of Greece and India, and I envied him his advantageous point of view— " with much more to the same effect.

Thoreau's reaction from the ordinary humdrum, respectable, and comfortable country life was so intense, and his ideal of the free and austere life he would live so vivid, that he could thus see in this besotted vagabond a career and a degree of wisdom that he loved to contemplate.

One catches eagerly at any evidence of tender human emotions in Thoreau, his stoical indifference is so habitual with him: "I laughed at myself the other day to think that I cried while reading a pathetic story." And he excuses himself by saying, "It is not I, but Nature in me, which was stronger than I."

It was hard for Thoreau to get interested in young women. He once went to an evening party of thirty or forty of them, "in a small room, warm and noisy." He was introduced to two of them, but could not hear what they said, there was such a cackling. He concludes by saying: "The society of young women is the most unprofitable I have ever tried. They are so light and flighty that you can never be sure whether they are there or not."

## XI

As a philosopher or expositor and interpreter of a principle, Thoreau is often simply grotesque. His passion for strong and striking figures usually gets the best of him. In discussing the relation that exists between the speaker or lecturer and his audience he says, "The lecturer will read best those parts of his lecture which are best heard," as if the reading did not precede the hearing! Then comes this grotesque analogy: "I saw some men unloading molasses-hogsheads from a truck at a depot the other day, rolling them up an inclined plane. The truckman stood behind and shoved, after putting a couple of ropes, one round each end of the hogshead, while two men standing in the depot steadily pulled at the ropes. The first man was the lecturer, the last was the audience." I suppose the hogshead stands for the big thoughts of the speaker which he cannot manage at all without the active coöperation of the audience. The truth is,

people assemble in a lecture hall in a passive but expectant frame of mind. They are ready to be pleased or displeased. They are there like an instrument to be played upon by the orator. He may work his will with them. Without their sympathy his success will not be great, but the triumph of his art is to win their sympathy. Those who went to scoff when the Great Preacher spoke, remained to pray. No man could speak as eloquently to empty seats, or to a dummy audience, as to a hall filled with intelligent people, yet Thoreau's ropes and hogsheads and pulling and pushing truckmen absurdly misrepresent the true relation that exists between a speaker and his hearers. Of course a speaker finds it uphill work if his audience is not with him, but that it is not with him is usually his own fault.

Thoreau's merits as a man and a writer are so many and so great that I have not hesitated to make much of his defects. Indeed, I have with malice aforethought ransacked his works to find them. But after they are all charged up against him, the balance that remains on the credit side of the account is so great that they do not disturb us.

There has been but one Thoreau, and we should devoutly thank the gods of New England for the precious gift. Thoreau's work lives and will continue to live because, in the first place, the world loves a writer who can flout it and turn his back upon it and yet make good; and again because the books which he gave to the world have many and very high literary and ethical values. They are fresh, original, and stimulating. He drew a gospel out of the wild; he brought messages from the wood gods to men; he made a lonely pond in Massachusetts a fountain of the purest and most elevating thoughts, and, with his great neighbor Emerson, added new luster to a town over which the muse of our colonial history had long loved to dwell.

# The Biography

Thoreau, 1856

# THOREAU: BIOGRAPHICAL SKETCH by Ralph Waldo Emerson

HENRY DAVID THOREAU was the last male descendant of a French ancestor who came to this country from the Isle of Guernsey. His character exhibited occasional traits drawn from this blood in singular combination with a very strong Saxon genius.

He was born in Concord, Massachusetts, on the 12th of July, 1817. He was graduated at Harvard College in 1837, but without any literary distinction. An iconoclast in literature, he seldom thanked colleges for their service to him, holding them in small esteem, whilst yet his debt to them was important. After leaving the University, he joined his brother in teaching a private school, which he soon renounced. His father was a manufacturer of lead-pencils, and Henry applied himself for a time to this craft, believing he could make a better pencil than was then in use. After completing his experiments, he exhibited his work to chemists and artists in Boston, and having obtained their certificates to its excellence and to its equality with the best London manufacture, he returned home contented. His friends congratulated him that he had now opened his way to fortune. But he replied, that he should never make another pencil. "Why should I? I would not do again what I have done once." He resumed his endless walks and miscellaneous studies, making every day some new acquaintance with Nature, though as yet never speaking of zoölogy or botany, since, though very studious of natural facts, he was incurious of technical and textual science.

At this time, a strong, healthy youth, fresh from college, whilst all his companions were choosing their profession, or eager to begin some lucrative employment, it was inevitable that his thoughts should be exercised on the same question, and it required rare decision to refuse all the accustomed paths, and keep his solitary freedom at the cost of disappointing the natural expectations of his family and friends: all the more difficult that he had a perfect probity, was exact in securing his own independence, and in holding every man to the like duty. But Thoreau never faltered. He was a born protestant. He declined to give up his large ambition of knowledge and action for any narrow craft or profession, aiming at a much more comprehensive calling, the art of living well. If he slighted and defied the opinions of others, it was only that he was more intent to reconcile his practice with his own belief. Never idle or self-indulgent, he preferred, when he wanted money, earning it by some piece of manual labor agreeable to him, as building a boat or a fence, planting, grafting, surveying, or other short work, to any long engagements. With his hardy habits and few wants, his skill in wood-craft,

and his powerful arithmetic, he was very competent to live in any part of the world. It would cost him less time to supply his wants than another. He was therefore secure of his leisure.

A natural skill for mensuration, growing out of his mathematical knowledge, and his habit of ascertaining the measures and distances of objects which interested him, the size of trees, the depth and extent of ponds and rivers, the height of mountains, and the air-line distance of his favorite summits, — this, and his intimate knowledge of the territory about Concord, made him drift into the profession of land-surveyor. It had the advantage for him that it led him continually into new and secluded grounds, and helped his studies of Nature. His accuracy and skill in this work were readily appreciated, and he found all the employment he wanted.

He could easily solve the problems of the surveyor, but he was daily beset with graver questions, which he manfully confronted. He interrogated every custom, and wished to settle all his practice on an ideal foundation. He was a protestant à l'outrance, and few lives contain so many renunciations. He was bred to no profession; he never married; he lived alone; he never went to church; he never voted; he refused to pay a tax to the State: he ate no flesh, he drank no wine, he never knew the use of tobacco; and, though a naturalist, he used neither trap nor gun. He chose, wisely, no doubt, for himself, to be the bachelor of thought and Nature. He had no talent for wealth, and knew how to be poor without the least hint of squalor or inelegance. Perhaps he fell into his way of living without forecasting it much, but approved it with later wisdom.

"I am often reminded," he wrote in his journal, "that, if I had bestowed on me the wealth of Croesus, my aims must be still the same, and my means essentially the same." He had no temptations to fight against, — no appetites, no passions, no taste for elegant trifles. A fine house, dress, the manners and talk of highly cultivated people were all thrown away on him. He much preferred a good Indian, and considered these refinements as impediments to conversation, wishing to meet his companion on the simplest terms. He declined invitations to dinner-parties, because there each was in every one's way, and he could not meet the individuals to any purpose. "They make their pride," he said, "in making their dinner cost much; I make my pride in making my dinner cost little." When asked at table what dish he preferred, he answered, "The nearest." He did not like the taste of wine, and never had a vice in his life. He said,— "I have a faint recollection of pleasure derived from smoking dried lily-stems, before I was a man. I had commonly a supply of these. I have never smoked anything more noxious."

He chose to be rich by making his wants few, and supplying them himself. In his travels, he used the railroad only to get over so much country as was unimportant to the present purpose, walking hundreds of miles, avoiding taverns, buying a lodging in farmers' and fishermen's houses, as cheaper, and more agreeable to him, and because there he could better find the men and the information he wanted.

There was somewhat military in his nature not to be subdued, always manly and able, but rarely tender, as if he did not feel himself except in opposition. He wanted

a fallacy to expose, a blunder to pillory, I may say required a little sense of victory, a roll of the drum, to call his powers into full exercise. It cost him nothing to say No; indeed, he found it much easier than to say Yes. It seemed as if his first instinct on hearing a proposition was to controvert it, so impatient was he of the limitations of our daily thought. This habit, of course, is a little chilling to the social affections; and though the companion would in the end acquit him of any malice or untruth, yet it mars conversation. Hence, no equal companion stood in affectionate relations with one so pure and guileless. "I love Henry," said one of his friends, "but I cannot like him; and as for taking his arm, I should as soon think of taking the arm of an elm-tree."

Yet, hermit and stoic as he was, he was really fond of sympathy, and threw himself heartily and childlike into the company of young people whom he loved, and whom he delighted to entertain, as he only could, with the varied and endless anecdotes of his experiences by field and river. And he was always ready to lead a huckleberry party or a search for chestnuts or grapes. Talking, one day, of a public discourse, Henry remarked, that whatever succeeded with the audience was bad. I said, "Who would not like to write something which all can read, like 'Robinson Crusoe'? and who does not see with regret that his page is not solid with a right materialistic treatment, which delights everybody?" Henry objected, of course, and vaunted the better lectures which reached only a few persons. But, at supper, a young girl, understanding that he was to lecture at the Lyceum, sharply asked him, "whether his lecture would be a nice, interesting story, such as she wished to hear, or whether it was one of those old philosophical things that she did not care about." Henry turned to her, and bethought himself, and, I saw, was trying to believe that he had matter that might fit her and her brother, who were to sit up and go to the lecture, if it was a good one for them.

He was a speaker and actor of the truth, — born such, — and was ever running into dramatic situations from this cause. In any circumstance, it interested all bystanders to know what part Henry would take, and what he would say; and he did not disappoint expectation, but used an original judgment on each emergency. In 1845 he built himself a small framed house on the shores of Walden Pond, and lived there two years alone, a life of labor and study. This action was quite native and fit for him. No one who knew him would tax him with affectation. He was more unlike his neighbors in his thought than in his action. As soon as he had exhausted the advantages of that solitude, he abandoned it. In 1847, not approving some uses to which the public expenditure was applied, he refused to pay his town tax, and was put in jail. A friend paid the tax for him, and he was released. The like annoyance was threatened the next year. But, as his friends paid the tax, notwithstanding his protest, I believe he ceased to resist. No opposition or ridicule had any weight with him. He coldly and fully stated his opinion without affecting to believe that it was the opinion of the company. It was of no consequence, if every one present held the opposite opinion. On one occasion he went to the University Library to procure some books. The librarian refused to lend them. Mr. Thoreau repaired to the President, who stated to him the rules and usages, which permitted the loan of books to resident graduates, to clergymen who were alumni,

and to some others resident within a circle of ten miles' radius from the College. Mr. Thoreau explained to the President that the railroad had destroyed the old scale of distances, — that the library was useless, yes, and President and College useless, on the terms of his rules, — that the one benefit he owed to the College was its library, — that, at this moment, not only his want of books was imperative, but he wanted a large number of books, and assured him that he, Thoreau, and not the librarian, was the proper custodian of these. In short, the President found the petitioner so formidable, and the rules getting to look so ridiculous, that he ended by giving him a privilege which in his hands proved unlimited thereafter.

No truer American existed than Thoreau. His preference of his country and condition was genuine, and his aversion from English and European manners and tastes almost reached contempt. He listened impatiently to news or bon mots gleaned from London circles; and though he tried to be civil, these anecdotes fatigued him. The men were all imitating each other, and on a small mould. Why can they not live as far apart as possible, and each be a man by himself? What he sought was the most energetic nature; and he wished to go to Oregon, not to London. "In every part of Great Britain," he wrote in his diary, "are discovered traces of the Romans, their funereal urns, their camps, their roads, their dwellings. But New England, at least, is not based on any Roman ruins. We have not to lay the foundations of our houses on the ashes of a former civilization."

But, idealist as he was, standing for abolition of slavery, abolition of tariffs, almost for abolition of government, it is needless to say he found himself not only unrepresented in actual politics, but almost equally opposed to every class of reformers. Yet he paid the tribute of his uniform respect to the Anti-Slavery Party. One man, whose personal acquaintance he had formed, he honored with exceptional regard. Before the first friendly word had been spoken for Captain John Brown, after the arrest, he sent notices to most houses in Concord, that he would speak in a public hall on the condition and character of John Brown, on Sunday evening, and invited all people to come. The Republican Committee, the Abolitionist Committee, sent him word that it was premature and not advisable. He replied,— "I did not send to you for advice, but to announce that I am to speak." The hall was filled at an early hour by people of all parties, and his earnest eulogy of the hero was heard by all respectfully, by many with a sympathy that surprised themselves.

It was said of Plotinus that he was ashamed of his body, and 'tis very likely he had good reason for it, — that his body was a bad servant, and he had not skill in dealing with the material world, as happens often to men of abstract intellect. But Mr. Thoreau was equipped with a most adapted and serviceable body. He was of short stature, firmly built, of light complexion, with strong, serious blue eyes, and a grave aspect, — his face covered in the late years with a becoming beard. His senses were acute, his frame well-knit and hardy, his hands strong and skilful in the use of tools. And there was a wonderful fitness of body and mind. He could pace sixteen rods more accurately than another man could measure them with rod and chain. He could find his

path in the woods at night, he said, better by his feet than his eyes. He could estimate the measure of a tree very well by his eyes; he could estimate the weight of a calf or a pig, like a dealer. From a box containing a bushel or more of loose pencils, he could take up with his hands fast enough just a dozen pencils at every grasp. He was a good swimmer, runner, skater, boatman, and would probably outwalk most countrymen in a day's journey. And the relation of body to mind was still finer than we have indicated. He said he wanted every stride his legs made. The length of his walk uniformly made the length of his writing. If shut up in the house, he did not write at all.

He had a strong common sense, like that which Rose Flammock, the weaver's daughter, in Scott's romance, commends in her father, as resembling a yardstick, which, whilst it measures dowlas and diaper, can equally well measure tapestry and cloth of gold. He had always a new resource. When I was planting forest-trees, and had procured half a peck of acorns, he said that only a small portion of them would be sound, and proceeded to examine them, and select the sound ones. But finding this took time, he said, "I think, if you put them all into water, the good ones will sink;" which experiment we tried with success. He could plan a garden, or a house, or a barn; would have been competent to lead a "Pacific Exploring Expedition"; could give judicious counsel in the gravest private or public affairs.

He lived for the day, not cumbered and mortified by his memory. If he brought you yesterday a new proposition, he would bring you to-day another not less revolutionary. A very industrious man, and setting, like all highly organized men, a high value on his time, he seemed the only man of leisure in town, always ready for any excursion that promised well, or for conversation prolonged into late hours. His trenchant sense was never stopped by his rules of daily prudence, but was always up to the new occasion. He liked and used the simplest food, yet, when some one urged a vegetable diet, Thoreau thought all diets a very small matter, saying that "the man who shoots the buffalo lives better than the man who boards at the Graham House." He said,— "You can sleep near the railroad, and never be disturbed: Nature knows very well what sounds are worth attending to, and has made up her mind not to hear the railroad-whistle. But things respect the devout mind, and a mental ecstasy was never interrupted." He noted, what repeatedly befell him, that, after receiving from a distance a rare plant, he would presently find the same in his own haunts. And those pieces of luck which happen only to good players happened to him. One day, walking with a stranger, who inquired where Indian arrow-heads could be found, he replied, "Everywhere," and, stooping forward, picked one on the instant from the ground. At Mount Washington, in Tuckerman's Ravine, Thoreau had a bad fall, and sprained his foot. As he was in the act of getting up from his fall, he saw for the first time the leaves of the *Arnica mollis*.

His robust common sense, armed with stout hands, keen perceptions, and strong will, cannot yet account for the superiority which shone in his simple and hidden life. I must add the cardinal fact, that there was an excellent wisdom in him, proper to a rare class of men, which showed him the material world as a means and symbol. This discovery,

which sometimes yields to poets a certain casual and interrupted light, serving for the ornament of their writing, was in him an unsleeping insight; and whatever faults or obstructions of temperament might cloud it, he was not disobedient to the heavenly vision. In his youth, he said, one day, "The other world is all my art: my pencils will draw no other; my jack-knife will cut nothing else; I do not use it as a means." This was the muse and genius that ruled his opinions, conversation, studies, work, and course of life. This made him a searching judge of men. At first glance he measured his companion, and, though insensible to some fine traits of culture, could very well report his weight and calibre. And this made the impression of genius which his conversation often gave.

He understood the matter in hand at a glance, and saw the limitations and poverty of those he talked with, so that nothing seemed concealed from such terrible eyes. I have repeatedly known young men of sensibility converted in a moment to the belief that this was the man they were in search of, the man of men, who could tell them all they should do. His own dealing with them was never affectionate, but superior, didactic, — scorning their petty ways, — very slowly conceding, or not conceding at all, the promise of his society at their houses, or even at his own. "Would he not walk with them?" "He did not know. There was nothing so important to him as his walk; he had no walks to throw away on company." Visits were offered him from respectful parties, but he declined them. Admiring friends offered to carry him at their own cost to the Yellow-Stone River, — to the West Indies, — to South America. But though nothing could be more grave or considered than his refusals, they remind one in quite new relations of that fop Brummel's reply to the gentleman who offered him his carriage in a shower, "But where will you ride, then?" — and what accusing silences, and what searching and irresistible speeches, battering down all defences, his companions can remember!

Mr. Thoreau dedicated his genius with such entire love to the fields, hills, and waters of his native town, that he made them known and interesting to all reading Americans, and to people over the sea. The river on whose banks he was born and died he knew from its springs to its confluence with the Merrimack. He had made summer and winter observations on it for many years, and at every hour of the day and the night. The result of the recent survey of the Water Commissioners appointed by the State of Massachusetts he had reached by his private experiments, several years earlier. Every fact which occurs in the bed, on the banks, or in the air over it; the fishes, and their spawning and nests, their manners, their food; the shad-flies which fill the air on a certain evening once a year, and which are snapped at by the fishes so ravenously that many of these die of repletion; the conical heaps of small stones on the river-shallows, one of which heaps will sometimes overflow a cart, — these heaps the huge nests of small fishes; the birds which frequent the stream, heron, duck, sheldrake, loon, osprey; the snake, musk-rat, otter, woodchuck, and fox, on the banks; the turtle, frog, hyla, and cricket, which make the banks vocal, — were all known to him, and, as it were, townsmen and fellow-creatures; so that he felt an absurdity or violence in

any narrative of one of these by itself apart, and still more of its dimensions on an inch-rule, or in the exhibition of its skeleton, or the specimen of a squirrel or a bird in brandy. He liked to speak of the manners of the river, as itself a lawful creature, yet with exactness, and always to an observed fact. As he knew the river, so the ponds in this region.

One of the weapons he used, more important than microscope or alcohol-receiver to other investigators, was a whim which grew on him by indulgence, yet appeared in gravest statement, namely, of extolling his own town and neighborhood as the most favored centre for natural observation. He remarked that the Flora of Massachusetts embraced almost all the important plants of America, — most of the oaks, most of the willows, the best pines, the ash, the maple, the beech, the nuts. He returned Kane's "Arctic Voyage" to a friend of whom he had borrowed it, with the remark, that "most of the phenomena noted might be observed in Concord." He seemed a little envious of the Pole, for the coincident sunrise and sunset, or five minutes' day after six months: a splendid fact, which Annursnuc had never afforded him. He found red snow in one of his walks, and told me that he expected to find yet the *Victoria regia* in Concord. He was the attorney of the indigenous plants, and owned to a preference of the weeds to the imported plants, as of the Indian to the civilized man, — and noticed, with pleasure, that the willow bean-poles of his neighbor had grown more than his beans. "See these weeds," he said, "which have been hoed at by a million farmers all spring and summer, and yet have prevailed, and just now come out triumphant over all lanes, pastures, fields, and gardens, such is their vigor. We have insulted them with low names, too, — as Pigweed, Wormwood, Chickweed, Shad-Blossom." He says, "They have brave names, too, — *Ambrosia*, *Stellaria*, *Amelanchia*, *Amaranth*, etc."

I think his fancy for referring everything to the meridian of Concord did not grow out of any ignorance or depreciation of other longitudes or latitudes, but was rather a playful expression of his conviction of the indifferency of all places, and that the best place for each is where he stands. He expressed it once in this wise:— "I think nothing is to be hoped from you, if this bit of mould under your feet is not sweeter to you to eat than any other in this world, or in any world."

The other weapon with which he conquered all obstacles in science was patience. He knew how to sit immovable, a part of the rock he rested on, until the bird, the reptile, the fish, which had retired from him, should come back, and resume its habits, nay, moved by curiosity, should come to him and watch him.

It was a pleasure and a privilege to walk with him. He knew the country like a fox or a bird, and passed through it as freely by paths of his own. He knew every track in the snow or on the ground, and what creature had taken this path before him. One must submit abjectly to such a guide, and the reward was great. Under his arm he carried an old music-book to press plants; in his pocket, his diary and pencil, a spy-glass for birds, microscope, jack-knife, and twine. He wore straw hat, stout shoes, strong gray trousers, to brave shrub-oaks and smilax, and to climb a tree for a hawk's or a squirrel's nest. He waded into the pool for the water-plants, and his strong legs were no insignificant

part of his armor. On the day I speak of he looked for the *Menyanthes*, detected it across the wide pool, and, on examination of the florets, decided that it had been in flower five days. He drew out of his breast-pocket his diary, and read the names of all the plants that should bloom on this day, whereof he kept account as a banker when his notes fall due. The *Cypripedium* not due till to-morrow. He thought, that, if waked up from a trance, in this swamp, he could tell by the plants what time of the year it was within two days. The redstart was flying about, and presently the fine grosbeaks, whose brilliant scarlet makes the rash gazer wipe his eye, and whose fine clear note Thoreau compared to that of a tanager which has got rid of its hoarseness. Presently he heard a note which he called that of the night-warbler, a bird he had never identified, had been in search of twelve years, which always, when he saw it, was in the act of diving down into a tree or bush, and which it was vain to seek; the only bird that sings indifferently by night and by day. I told him he must beware of finding and booking it, lest life should have nothing more to show him. He said, "What you seek in vain for, half your life, one day you come full upon all the family at dinner. You seek it like a dream, and as soon as you find it you become its prey."

His interest in the flower or the bird lay very deep in his mind, was connected with Nature, — and the meaning of Nature was never attempted to be defined by him. He would not offer a memoir of his observations to the Natural History Society. "Why should I? To detach the description from its connections in my mind would make it no longer true or valuable to me: and they do not wish what belongs to it." His power of observation seemed to indicate additional senses. He saw as with microscope, heard as with ear-trumpet, and his memory was a photographic register of all he saw and heard. And yet none knew better than he that it is not the fact that imports, but the impression or effect of the fact on your mind. Every fact lay in glory in his mind, a type of the order and beauty of the whole. His determination on Natural History was organic. He confessed that he sometimes felt like a hound or a panther, and, if born among Indians, would have been a fell hunter. But, restrained by his Massachusetts culture, he played out the game in this mild form of botany and ichthyology. His intimacy with animals suggested what Thomas Fuller records of Butler the apiologist, that "either he had told the bees things or the bees had told him." Snakes coiled round his leg; the fishes swam into his hand, and he took them out of the water; he pulled the woodchuck out of its hole by the tail, and took the foxes under his protection from the hunters. Our naturalist had perfect magnanimity; he had no secrets: he would carry you to the heron's haunt, or even to his most prized botanical swamp, — possibly knowing that you could never find it again, yet willing to take his risks.

No college ever offered him a diploma, or a professor's chair; no academy made him its corresponding secretary, its discoverer, or even its member. Whether these learned bodies feared the satire of his presence. Yet so much knowledge of Nature's secret and genius few others possessed, none in a more large and religious synthesis. For not a particle of respect had he to the opinions of any man or body of men, but homage solely to the truth itself; and as he discovered everywhere among doctors some leaning

of courtesy, it discredited them. He grew to be revered and admired by his townsmen, who had at first known him only as an oddity. The farmers who employed him as a surveyor soon discovered his rare accuracy and skill, his knowledge of their lands, of trees, of birds, of Indian remains, and the like, which enabled him to tell every farmer more than he knew before of his own farm; so that he began to feel as if Mr. Thoreau had better rights in his land than he. They felt, too, the superiority of character which addressed all men with a native authority.

Indian relics abound in Concord, — arrow-heads, stone chisels, pestles, and fragments of pottery; and on the river-bank, large heaps of clam-shells and ashes mark spots which the savages frequented. These, and every circumstance touching the Indian, were important in his eyes. His visits to Maine were chiefly for love of the Indian. He had the satisfaction of seeing the manufacture of the bark-canoe, as well as of trying his hand in its management on the rapids. He was inquisitive about the making of the stone arrow-head, and in his last days charged a youth setting out for the Rocky Mountains to find an Indian who could tell him that: "It was well worth a visit to California to learn it." Occasionally, a small party of Penobscot Indians would visit Concord, and pitch their tents for a few weeks in summer on the river-bank. He failed not to make acquaintance with the best of them; though he well knew that asking questions of Indians is like catechizing beavers and rabbits. In his last visit to Maine he had great satisfaction from Joseph Polis, an intelligent Indian of Oldtown, who was his guide for some weeks.

He was equally interested in every natural fact. The depth of his perception found likeness of law throughout Nature, and I know not any genius who so swiftly inferred universal law from the single fact. He was no pedant of a department. His eye was open to beauty, and his ear to music. He found these, not in rare conditions, but wheresoever he went. He thought the best of music was in single strains; and he found poetic suggestion in the humming of the telegraph-wire.

His poetry might be bad or good; he no doubt wanted a lyric facility and technical skill; but he had the source of poetry in his spiritual perception. He was a good reader and critic, and his judgment on poetry was to the ground of it. He could not be deceived as to the presence or absence of the poetic element in any composition, and his thirst for this made him negligent and perhaps scornful of superficial graces. He would pass by many delicate rhythms, but he would have detected every live stanza or line in a volume, and knew very well where to find an equal poetic charm in prose. He was so enamored of the spiritual beauty that he held all actual written poems in very light esteem in the comparison. He admired Aeschylus and Pindar; but, when some one was commending them, he said that "Aeschylus and the Greeks, in describing Apollo and Orpheus, had given no song, or no good one. They ought not to have moved trees, but to have chanted to the gods such a hymn as would have sung all their old ideas out of their heads, and new ones in." His own verses are often rude and defective. The gold does not yet run pure, is drossy and crude. The thyme and marjoram are not yet honey. But if he want lyric fineness and technical merits, if he have not the poetic

temperament, he never lacks the causal thought, showing that his genius was better than his talent. He knew the worth of the Imagination for the uplifting and consolation of human life, and liked to throw every thought into a symbol. The fact you tell is of no value, but only the impression. For this reason his presence was poetic, always piqued the curiosity to know more deeply the secrets of his mind. He had many reserves, an unwillingness to exhibit to profane eyes what was still sacred in his own, and knew well how to throw a poetic veil over his experience. All readers of "Walden" will remember his mythical record of his disappointments: —

"I long ago lost a hound, a bay horse, and a turtledove, and am still on their trail. Many are the travellers I have spoken concerning them, describing their tracks, and what calls they answered to. I have met one or two who had heard the hound, and the tramp of the horse, and even seen the dove disappear behind a cloud; and they seemed as anxious to recover them as if they had lost them themselves." ["Walden" p.20]

His riddles were worth the reading, and I confide, that, if at any time I do not understand the expression, it is yet just. Such was the wealth of his truth that it was not worth his while to use words in vain. His poem entitled "Sympathy" reveals the tenderness under that triple steel of stoicism, and the intellectual subtilty it could animate. His classic poem on "Smoke" suggests Simonides, but is better than any poem of Simonides. His biography is in his verses. His habitual thought makes all his poetry a hymn to the Cause of causes, the Spirit which vivifies and controls his own.

"I hearing get, who had but ears,  
And sight, who had but eyes before;  
I moments live, who lived but years,  
And truth discern, who knew but learning's lore."

And still more in these religious lines: —

"Now chiefly is my natal hour,  
And only now my prime of life;  
I will not doubt the love untold,  
Which not my worth or want hath bought,  
Which wooed me young, and woos me old,  
And to this evening hath me brought."

Whilst he used in his writings a certain petulance of remark in reference to churches or churchmen, he was a person of a rare, tender, and absolute religion, a person incapable of any profanation, by act or by thought. Of course, the same isolation which belonged to his original thinking and living detached him from the social religious forms. This is neither to be censured nor regretted. Aristotle long ago explained it, when he said, "One who surpasses his fellow-citizens in virtue is no longer a part of the city. Their law is not for him, since he is a law to himself."

Thoreau was sincerity itself, and might fortify the convictions of prophets in the ethical laws by his holy living. It was an affirmative experience which refused to be set aside. A truth-speaker he, capable of the most deep and strict conversation; a physician to the wounds of any soul; a friend, knowing not only the secret of friendship, but almost

worshipped by those few persons who resorted to him as their confessor and prophet, and knew the deep value of his mind and great heart. He thought that without religion or devotion of some kind nothing great was ever accomplished: and he thought that the bigoted sectarian had better bear this in mind.

His virtues, of course, sometimes ran into extremes. It was easy to trace to the inexorable demand on all for exact truth that austerity which made this willing hermit more solitary even than he wished. Himself of a perfect probity, he required not less of others. He had a disgust at crime, and no worldly success could cover it. He detected paltering as readily in dignified and prosperous persons as in beggars, and with equal scorn. Such dangerous frankness was in his dealing that his admirers called him "that terrible Thoreau," as if he spoke when silent, and was still present when he had departed. I think the severity of his ideal interfered to deprive him of a healthy sufficiency of human society.

The habit of a realist to find things the reverse of their appearance inclined him to put every statement in a paradox. A certain habit of antagonism defaced his earlier writings, — a trick of rhetoric not quite outgrown in his later, of substituting for the obvious word and thought its diametrical opposite. He praised wild mountains and winter forests for their domestic air, in snow and ice he would find sultriness, and commended the wilderness for resembling Rome and Paris. "It was so dry, that you might call it wet."

The tendency to magnify the moment, to read all the laws of Nature in the one object or one combination under your eye, is of course comic to those who do not share the philosopher's perception of identity. To him there was no such thing as size. The pond was a small ocean; the Atlantic, a large Walden Pond. He referred every minute fact to cosmical laws. Though he meant to be just, he seemed haunted by a certain chronic assumption that the science of the day pretended completeness, and he had just found out that the savans had neglected to discriminate a particular botanical variety, had failed to describe the seeds or count the sepals. "That is to say," we replied, "the blockheads were not born in Concord; but who said they were? It was their unspeakable misfortune to be born in London, or Paris, or Rome; but, poor fellows, they did what they could, considering that they never saw Bateman's Pond, or Nine-Acre Corner, or Becky-Stow's Swamp. Besides, what were you sent into the world for, but to add this observation?"

Had his genius been only contemplative, he had been fitted to his life, but with his energy and practical ability he seemed born for great enterprise and for command; and I so much regret the loss of his rare powers of action, that I cannot help counting it a fault in him that he had no ambition. Wanting this, instead of engineering for all America, he was the captain of a huckleberry party. Pounding beans is good to the end of pounding empires one of these days; but if, at the end of years, it is still only beans!

But these foibles, real or apparent, were fast vanishing in the incessant growth of a spirit so robust and wise, and which effaced its defeats with new triumphs. His study

of Nature was a perpetual ornament to him, and inspired his friends with curiosity to see the world through his eyes, and to hear his adventures. They possessed every kind of interest.

He had many elegances of his own, whilst he scoffed at conventional elegance. Thus, he could not bear to hear the sound of his own steps, the grit of gravel; and therefore never willingly walked in the road, but in the grass, on mountains and in woods. His senses were acute, and he remarked that by night every dwelling-house gives out bad air, like a slaughter-house. He liked the pure fragrance of melilot. He honored certain plants with special regard, and, over all, the pond-lily, — then, the gentian, and the Mikania scandens, and “life-everlasting,” and a bass-tree which he visited every year when it bloomed, in the middle of July. He thought the scent a more oracular inquisition than the sight, — more oracular and trustworthy. The scent, of course, reveals what is concealed from the other senses. By it he detected earthiness. He delighted in echoes, and said they were almost the only kind of kindred voices that he heard. He loved Nature so well, was so happy in her solitude, that he became very jealous of cities, and the sad work which their refinements and artifices made with man and his dwelling. The axe was always destroying his forest. “Thank God,” he said, “they cannot cut down the clouds!” “All kinds of figures are drawn on the blue ground with this fibrous white paint.”

I subjoin a few sentences taken from his unpublished manuscripts, not only as records of his thought and feeling, but for their power of description and literary excellence.

“Some circumstantial evidence is very strong, as when you find a trout in the milk.”

“The chub is a soft fish, and tastes like boiled brown paper salted.”

“The youth gets together his materials to build a bridge to the moon, or, perchance, a palace or temple on the earth, and at length the middle-aged man concludes to built a wood-shed with them.”

“The locust z-ing.”

“Devil’s-needles zigzagging along the Nut-Meadow brook.”

“Sugar is not so sweet to the palate as sound to the healthy ear.”

“I put on some hemlock-boughs, and the rich salt crackling of their leaves was like mustard to the ear, the crackling of uncountable regiments. Dead trees love the fire.”

“The bluebird carries the sky on his back.”

“The tanager flies through the green foliage as if it would ignite the leaves.”

“If I wish for a horse-hair for my compass-sight, I must go to the stable; but the hair-bird, with her sharp eyes, goes to the road.”

“Immortal water, alive even to the superficies.”

“Fire is the most tolerable third party.”

“Nature made ferns for pure leaves, to show what she could do in that line.”

“No tree has so fair a bole and so handsome an instep as the beech.”

“How did these beautiful rainbow-tints get into the shell of the fresh-water clam, buried in the mud at the bottom of our dark river?”

“Hard are the times when the infant’s shoes are second-foot.”

“We are strictly confined to our men to whom we give liberty.”

“Nothing is so much to be feared as fear. Atheism may comparatively be popular with God himself.”

“Of what significance the things you can forget? A little thought is sexton to all the world.”

“How can we expect a harvest of thought who have not had a seed-time of character?”

“Only he can be trusted with gifts who can present a face of bronze to expectations.”

“I ask to be melted. You can only ask of the metals that they be tender to the fire that melts them. To nought else can they be tender.”

\* \* \* \* \*

There is a flower known to botanists, one of the same genus with our summer plant called “Life-Everlasting,” a *Gnaphalium* like that, which grows on the most inaccessible cliffs of the Tyrolese mountains, where the chamois dare hardly venture, and which the hunter, tempted by its beauty, and by his love, (for it is immensely valued by the Swiss maidens,) climbs the cliffs to gather, and is sometimes found dead at the foot, with the flower in his hand. It is called by botanists the *Gnaphalium leontopodium*, but by the Swiss *Edelweisse*, which signifies Noble Purity. Thoreau seemed to me living in the hope to gather this plant, which belonged to him of right. The scale on which his studies proceeded was so large as to require longevity, and we were the less prepared for his sudden disappearance. The country knows not yet, or in the least part, how great a son it has lost. It seems an injury that he should leave in the midst his broken task, which none else can finish, — a kind of indignity to so noble a soul, that it should depart out of Nature before yet he has been really shown to his peers for what he is. But he, at least, is content. His soul was made for the noblest society; he had in a short life exhausted the capabilities of this world; wherever there is knowledge, wherever there is virtue, wherever there is beauty, he will find a home.

Sleepy Hollow Cemetery, Concord, Massachusetts — Thoreau’s final resting place

The Thoreau family gravesite. The small gravestones are, from left, Father (John), Henry, Sophia, Mother (Cynthia); not visible are Henry’s siblings Helen and John.

A critique of his ideas & actions.
