The Channing you have seen and described is the real Simon Pure. You have seen him. Many a good ramble may you have together! You will see in him still more of the same kind to attract and to puzzle you. How to serve him most effectually has long been a problem with his friends. Perhaps it is left for you to solve it. I suspect that the most that you or any one can do for him is to appreciate his genius, — to buy and read, and cause others to buy and read his poems. That is the hand which he has put forth to the world, — take hold of that. Review them if you can, — perhaps take the risk of publishing something more which he may write. Your knowledge of Cowper will help you to know Channing. He will accept sympathy and aid, but he will not bear questioning, unless the aspects of the sky are particularly auspicious. He will ever be “reserved and enigmatic,” and you must deal with him at arm’s length. I have no secrets to tell you concerning him, and do not wish to call obvious excellences and defects by far-fetched names. Nor need I suggest how witty and poetic he is, and what an inexhaustible fund of good fellowship you will find in him.

## TO HARRISON BLAKE (AT WORCESTER).

Concord, MARCH 13, 1856.

MR. BLAKE, — It is high time I sent you a word. I have not heard from Harrisburg since offering to go there, and have not been invited to lecture anywhere else the past winter. So you see I am fast growing rich. This is quite right, for such is my relation to the lecture-goers, I should be surprised and alarmed if there were any great call for me.

I confess that I am considerably alarmed even when I hear that an individual wishes to meet me, for my experience teaches me that we shall thus only be made certain of a mutual strangeness, which otherwise we might never have been aware of.

I have not yet recovered strength enough for such a walk as you propose, though pretty well again for circumscribed rambles and chamber work. Even now, I am probably the greatest walker in Concord, — to its disgrace be it said. I remember our walks and talks and sailing in the past with great satisfaction, and trust that we shall have more of them ere long, — have more woodings-up, — for even in the spring we must still seek “fuel to maintain our fires.”

As you suggest, we would fain value one another for what we are absolutely, rather than relatively. How will this do for a symbol of sympathy?

As for compliments, even the stars praise me, and I praise them. They and I sometimes belong to a mutual admiration society. Is it not so with you? I know you of old. Are you not tough and earnest to be talked at, praised, or blamed? Must you go out of the room because you are the subject of conversation? Where will you go to, pray? Shall we look into the “Letter Writer” to see what compliments are admissible? I am not afraid of praise, for I have practiced it on myself. As for my deserts, I never took an account of that stock, and in this connection care not whether I am deserving or not. When I hear praise coming, do I not elevate and arch myself to hear it like the sky, and as impersonally? Think I appropriate any of it to my weak legs? No. Praise away till all is blue.

I see by the newspapers that the season for making sugar is at hand. Now is the time, whether you be rock, or white-maple, or hickory. I trust that you have prepared a store of sap-tubs and sumach-spouts, and invested largely in kettles. Early the first frosty morning, tap your maples, — the sap will not run in summer, you know. It matters not how little juice you get, if you get all you can, and boil it down. I made just one crystal of sugar once, one twentieth of an inch cube, out of a pumpkin, and it sufficed. Though the yield be no greater than that, this is not less the season for it, and it will be not the less sweet, nay, it will be infinitely the sweeter.

Shall, then, the maple yield sugar, and not man? Shall the farmer be thus active, and surely have so much sugar to show for it, before this very March is gone, — while I read the newspaper? While he works in his sugar-camp let me work in mine, — for sweetness is in me, and to sugar it shall come, — it shall not all go to leaves and wood. Am I not a sugar-maple man, then? Boil down the sweet sap which the spring causes to flow within you. Stop not at syrup, — go on to sugar, though you present the world with but a single crystal, — a crystal not made from trees in your yard, but from the new life that stirs in your pores. Cheerfully skim your kettle, and watch it set and crystallize, making a holiday of it if you will. Heaven will be propitious to you as to him.

Say to the farmer, There is your crop; here is mine. Mine is a sugar to sweeten sugar with. If you will listen to me, I will sweeten your whole load, — your whole life.

Then will the callers ask, Where is Blake? He is in his sugar-camp on the mountain-side. Let the world await him. Then will the little boys bless you, and the great boys too, for such sugar is the origin of many condiments, — Blakians in the shops of Worcester, of new form, with their mottoes wrapped up in them. Shall men taste only the sweetness of the maple and the cane the coming year?

A walk over the crust to Asnybumskit, standing there in its inviting simplicity, is tempting to think of, — making a fire on the snow under some rock! The very poverty of outward nature implies an inward wealth in the walker. What a Golconda is he conversant with, thawing his fingers over such a blaze! But — but —

Have you read the new poem, “The Angel in the House”? Perhaps you will find it good for you.

## TO HARRISON BLAKE (AT WORCESTER).

CONCORD, May 21, 1856.

Mr. Blake, — I have not for a long time been putting such thoughts together as I should like to read to the company you speak of. I have enough of that sort to say, or even read, but not time now to arrange it. Something I have prepared might prove for their entertainment or refreshment perchance; but I would not like to have a hat carried round for it. I have just been reading some papers to see if they would do for your company; but though I thought pretty well of them as long as I read them to myself, when I got an auditor to try them on, I felt that they would not answer. How could I let you drum up a company to hear them? In fine, what I have is either too scattered or loosely arranged, or too light, or else is too scientific and matter of fact (I run a good deal into that of late) for so hungry a company.

I am still a learner, not a teacher, feeding somewhat omnivorously, browsing both stalk and leaves; but I shall perhaps be enabled to speak with the more precision and authority by and by, — if philosophy and sentiment are not buried under a multitude of details.

I do not refuse, but accept your invitation, only changing the time. I consider myself invited to Worcester once for all, and many thanks to the inviter. As for the Harvard excursion, will you let me suggest another? Do you and

1 This was the town of Harvard, not the college. Perhaps the excursion was to visit Fruitlands, where Alcott and Lane had established their short-lived community, in a beautiful spot near Still River, an affluent of the Nashua, and half way from Concord to Wachusett. “Asnebumskit,” mentioned in a former letter, is the highest hill near Worcester, as “Nobscot” is the highest near Concord. Both have Indian names.

Brown come to Concord on Saturday, if the weather promises well, and spend the Sunday here on the river or hills, or both. So we shall save some of our money (which is of next importance to our souls), and lose — I do not know what. You say you talked of coming here before; now do it. I do not propose this because I think that I

am worth your spending time with, but because I hope that we may prove flint and steel to one another. It is at most only an hour's ride farther, and you can at any rate do what you please when you get here.

Then we will see if we have any apology to offer for our existence. So come to Concord, — come to Concord, — come to Concord! or — your suit shall be defaulted.

As for the dispute about solitude and society, any comparison is impertinent. It is an idling down on the plain at the base of a mountain, instead of climbing steadily to its top. Of course you will be glad of all the society you can get to go up with. Will you go to glory with me? is the burden of the song. I love society so much that I swallowed it all at a gulp, — that is, all that came in my way. It is not that we love to be alone, but that we love to soar, and when we do soar, the company grows thinner and thinner till there is none at all. It is either the Tribune<sup>1</sup> on

<sup>1</sup> The New York newspaper.

the plain, a sermon on the mount, or a very private ecstasy still higher up. We are not the less to aim at the summits, though the multitude does not ascend them. Use all the society that will abet you. But perhaps I do not enter into the spirit of your talk.

In the spring of 1856, Mr. Alcott, then living in Walpole, N. H., visited Concord, and while there suggested to Thoreau that the upper valley of the Connecticut, in which Walpole lies, was good walking-ground, and that he would be glad to see him there. When autumn began to hover in the distance, Thoreau recalled this invitation, and sent the letter below.

## TO BRONSON ALCOTT (AT WALPOLE, N. H.).

CONCORD, September 1, 1856.

Mr. Alcott, — I remember that, in the spring, you invited me to visit you. I feel inclined to spend a day or two with you and on your hills at this season, returning, perhaps, by way of Brattleboro. What if I should take the cars for Walpole next Friday morning? Are you at home? And will it be convenient and agreeable to you to see me then? I will await an answer.

I am but poor company, and it will not be worth the while to put yourself out on my account; yet from time to time I have some thoughts which would be the better for an airing. I also wish to get some hints from September on the Connecticut to help me understand that season on the Concord; to snuff the musty fragrance of the decaying year in the primitive woods. There is considerable cellar-room in my nature for such stores; a whole row of bins waiting to be filled, before I can celebrate my Thanksgiving. Mould is the richest of soils, yet I am not mould. It will always be found that one flourishing institution exists and battens on another mouldering one. The Present itself is parasitic to this extent.

Your fellow-traveler,

HENRY D. THOREAU.

As fortune would have it, Mr. Alcott was then making his arrangements for a conversational tour in the vicinity of New York; but he renewed the invitation for himself, while repeating it in the name of Mrs. Alcott and his daughters. Thoreau made the visit, I believe, and some weeks later, at the suggestion of Mr. Alcott, he was asked by Marcus Spring of New York to read lectures and survey their estate for a community at Perth Amboy, N. J., in which Mr. Spring and his friends, the Birneys, Welds, Grimkés, etc., had united for social and educational purposes. It was a colony of radical opinions and old-fashioned culture; the Grimkés having been bred in Charleston, S. C., which they left by reason of their opposition to negro slavery, and the elder Birney having held slaves in Alabama until his conscience bade him emancipate them, after which he, too, could have no secure home among slaveholders. He was the first presidential candidate of the voting Abolitionists, as Lincoln was the last; and his friend, Theodore Weld, who married Miss Grimké, had been one of the early apostles of emancipation in Ohio. Their circle at Eagleswood appealed to Thoreau's sense of humor, and is described by him in the next letter.

In October, 1856, Mr. Spring, whom Mr. Alcott was then visiting, wrote to Thoreau inviting him to come to Eagleswood, give lectures, and survey two hundred acres of land belonging to the community, laying out streets and making a map of the proposed village. Thoreau accepted the proposal, and soon after wrote the following letter, which Miss Thoreau submitted to Mr. Emerson for publication, with other letters, in the volume of 1865; but he returned it, inscribed "Not printable at present." The lapse of time has removed this objection.

## TO SOPHIA THOREAU.

[Direct] EAGLES WOOD, PERTH AMBOY, N. J.,  
Saturday eve, November 1, 1856.

Dear Sophia, — I have hardly had time and repose enough to write to you before. I spent the afternoon of Friday (it seems some months ago) in Worcester, but failed to see [Harrison] Blake, he having "gone to the horse-race" in Boston; to atone for which I have just received a letter from him, asking me to stop at Worcester and lecture on my return. I called on [Theo.] Brown and [T. W.] Higginson; in the evening came by way of Norwich to New York in the steamer Commonwealth, and, though it was so windy inland, had a perfectly smooth passage, and about as good a sleep as usually at home. Reached New York about seven A. M., too late for the John Potter (there wasn't any Jonas), so I spent the forenoon there, called on Greeley (who was not in), met [F. A. T.] Bellew in Broadway and walked into his workshop, read at the Astor Library, etc. I arrived here, about thirty miles from New York, about five p. M. Saturday, in company with Miss E. Peabody, who was returning in the same covered wagon from the Landing to Eagleswood, which last place she has just left for the winter.

This is a queer place. There is one large long stone building, which cost some forty thousand dollars, in which I do not know exactly who or how many work (one or two familiar faces and more familiar names have turned up), a few shops and offices, an old farmhouse, and Mr. Spring's perfectly private residence, within twenty rods of the main building. The city of Perth Amboy is about as big as Concord, and Eagleswood is one and a quarter miles southwest of it, on the Bay side. The central fact here is evidently Mr. [Theodore] Weld's school, recently established, around which various other things revolve. Saturday evening I went to the schoolroom, hall, or what not, to see the children and their teachers and patrons dance. Mr. Weld, a kind-looking man with a long white beard, danced with them, and Mr. [E. J.] Cutler, his assistant (lately from Cambridge, who is acquainted with Sanborn), Mr. Spring, and others. This Saturday evening dance is a regular thing, and it is thought something strange if you don't attend. They take it for granted that you want society!

Sunday forenoon I attended a sort of Quaker meeting at the same place (the Quaker aspect and spirit prevail here, — Mrs. Spring says, "Does thee not?"), where it was expected that the Spirit would move me (I having been previously spoken to about it); and it, or something else, did, — an inch or so. I said just enough to set them a little by the ears and make it lively. I had excused myself by saying that I could not adapt myself to a particular audience; for all the speaking and lecturing here have reference to the children, who are far the greater part of the audience, and they are not so bright as New England children. Imagine them sitting close to the wall, all around a hall, with old Quaker-looking men and women here and there. There sat Mrs. Weld [Grimke] and her sister, two elderly gray-headed ladies, the former in extreme Bloomer costume, which was what you may call remarkable; Mr. Arnold Buffum, with broad face and a great white beard, looking like a pier-head made of the cork-tree with the bark on, as if he could buffet a considerable wave; James G. Birney, formerly candidate for the presidency, with another particularly white head and beard; Edward Palmer, the anti-money man (for whom communities were made), with his ample beard somewhat grayish. Some of them, I suspect, are very worthy people. Of course you are wondering to what extent all these make one family, and to what extent twenty. Mrs. Kirkland<sup>1</sup> (and this a name only to me) I saw. She has just bought a lot here. They all know

<sup>1</sup> Mrs. Caroline Kirkland, wife of Prof. William Kirkland, then of New York, — a writer of wit and fame at that time.

more about your neighbors and acquaintances than you suspected.

On Monday evening I read the Moose story to the children, to their satisfaction. Ever since I have been constantly engaged in surveying Eagleswood, — through woods, salt marshes, and along the shore, dodging the tide, through bushes, mud, and beggar ticks, having no time to look up or think where I am. (It takes ten or fifteen minutes before each meal to pick the beggar ticks out of my clothes; burrs and the rest are left, and rents mended at the first convenient opportunity.) I shall be engaged perhaps as much longer. Mr. Spring wants me to help him about setting out an orchard and vineyard, Mr. Birney asks me to survey a small piece for him, and Mr. Alcott, who has

just come down here for the third Sunday, says that Greeley (I left my name for him) invites him and me to go to his home with him next Saturday morning and spend the Sunday.

It seems a twelvemonth since I was not here, but I hope to get settled deep into my den again ere long. The hardest thing to find here is solitude — and Concord. I am at Mr. Spring's house.. Both he and she and their family are quite agreeable.

I want you to write to me immediately (just left off to talk French with the servant man), and let father and mother put in a word. To them and to Aunts, love from — HENRY.

The date of this visit to Eagleswood is worthy of note, because in that November Thoreau made the acquaintance of the late Walt Whitman, in whom he ever after took a deep interest. Accompanied by Mr. Alcott, he called on Whitman, then living at Brooklyn; and I remember the calm enthusiasm with which they both spoke of Whitman upon their return to Concord. "Three men," said Emerson, in his funeral eulogy of Thoreau, "have of late years strongly impressed Mr. Thoreau, — John Brown, his Indian guide in Maine, Joe Polis, and a third person, not known to this audience." This last was Whitman, who has since become well known to a larger audience.

## TO HARRISON BLAKE (AT WORCESTER).

EAGLESWOOD, N. J., November 19, 1856.

Mr. Blake, — I have been here much longer than I expected, but have deferred answering you, because I could not foresee when I should return. I do not know yet within three or four days. This uncertainty makes it impossible for me to appoint a day to meet you, until it shall be too late to hear from you again. I think, therefore, that I must go straight home. I feel some objection to reading that "What shall it profit" lecture again in Worcester; but if you are quite sure that it will be worth the while (it is a grave consideration), I will even make an independent journey from Concord for that purpose. I have read three of my old lectures (that included) to the Eagleswood people, and, unexpectedly, with rare success, — i e., I was aware that what I was saying was silently taken in by their ears.

You must excuse me if I write mainly a business letter now, for I am sold for the time, — am merely Thoreau the surveyor here, — and solitude is scarcely obtainable in these parts.

Alcott has been here three times, and, Saturday before last, I went with him and Greeley, by invitation of the last, to G.'s farm, thirty-six miles north of New York. The next day A. and I heard Beecher preach; and what was more, we visited Whitman the next morning (A. had already seen him), and were much interested and provoked. He is apparently the greatest democrat the world has seen. Kings and aristocracy go by the board at once, as they have long deserved to. A remarkably strong though coarse nature, of a sweet disposition, and much prized by his friends. Though peculiar and

rough in his exterior, his skin (all over (?)) red, he is essentially a gentleman. I am still somewhat in a quandary about him, — feel that he is essentially strange to me, at any rate; but I am surprised by the sight of him. He is very broad, but, as I have said, not fine. He said that I misapprehended him. I am not quite sure that I do. He told us that he loved to ride up and down Broadway all day on an omnibus, sitting beside the driver, listening to the roar of the carts, and sometimes gesticulating and declaiming Homer at the top of his voice. He has long been an editor and writer for the newspapers, — was editor of the “New Orleans Crescent” once; but now has no employment but to read and write in the forenoon, and walk in the afternoon, like all the rest of the scribbling gentry.

I shall probably be in Concord next week; so you can direct to me there.

## **TO HARRISON BLAKE (AT WORCESTER).**

CONCORD, December 6, 1856.

Mr. Blake, — I trust that you got a note from me at Eagleswood, about a fortnight ago. I passed through Worcester on the morning of the 25th of November, and spent several hours (from 3.30 to 6.20) in the travelers’ room at the depot, as in a dream, it now seems. As the first Harlem train unexpectedly connected with the he is essentially a gentleman. I am still somewhat in a quandary about him, — feel that he is essentially strange to me, at any rate; but I am surprised by the sight of him. He is very broad, but, as I have said, not fine. He said that I misapprehended him. I am not quite sure that I do. He told us that he loved to ride up and down Broadway all day on an omnibus, sitting beside the driver, listening to the roar of the carts, and sometimes gesticulating and declaiming Homer at the top of his voice. He has long been an editor and writer for the newspapers, — was editor of the “New Orleans Crescent” once; but now has no employment but to read and write in the forenoon, and walk in the afternoon, like all the rest of the scribbling gentry.

I shall probably be in Concord next week; so you can direct to me there.

## **TO HARRISON BLAKE (AT WORCESTER).**

CONCORD, December 6, 1856.

MR. BLAKE, — I trust that you got a note from me at Eagleswood, about a fortnight ago. I passed through Worcester on the morning of the 25th of November, and spent several hours (from 3.30 to 6.20) in the travelers’ room at the depot, as in a dream, it now seems. As the first Harlem train unexpectedly connected with the first from Fitchburg, I did not spend the forenoon with you as I had anticipated, on account of baggage, etc. If it had been a seasonable hour, I should have seen you, — i e., if you had not gone to a horse-race. But think of making a call at half past three

in the morning! (would it not have implied a three o'clock in the morning courage in both you and me?) as it were, ignoring the fact that mankind are really not at home, — are not out, but so deeply in that they cannot be seen, — nearly half their hours at this season of the year.

I walked up and down the main street, at half past five, in the dark, and paused long in front of Brown's store, trying to distinguish its features; considering whether I might safely leave his "Putnam" in the door-handle, but concluded not to risk it. Meanwhile a watchman (?) seemed to be watching me, and I moved off. Took another turn round there, and had the very earliest offer of the Transcript<sup>1</sup> from an urchin behind, whom I actually could not see, it was so dark. So I withdrew, wondering if you and B. would know if I had been there. You little dream who is occupying Worcester when you are all asleep. Several things occurred there that night which I will venture to say were not put into the Transcript. A cat caught a

<sup>1</sup> A Worcester newspaper.

mouse at the depot, and gave it to her kitten to play with. So that world-famous tragedy goes on by night as well as by day, and nature is emphatically wrong. Also I saw a young Irishman kneel before his mother, as if in prayer, while she wiped a cinder out of his eye with her tongue; and I found that it was never too late (or early?) to learn something. These things transpired while you and B. were, to all practical purposes, nowhere, and good for nothing, — not even for society, — not for horse-races, — nor the taking back of a "Putnam's Magazine." It is true, I might have recalled you to life, but it would have been a cruel act, considering the kind of life you would have come back to.

However, I would fain write to you now by broad daylight, and report to you some of my life, such as it is, and recall you to your life, which is not always lived by you, even by daylight. Blake! Brown! are you awake? are you aware what an ever-glorious morning this is, — what long-expected, never-to-be-repeated opportunity is now offered to get life and knowledge?

For my part, I am trying to wake up, — to wring slumber out of my pores; for, generally, I take events as unconcernedly as a fence post, <sup>13</sup> — absorb wet and cold like it, and am pleasantly tickled with lichens slowly spreading over me.

Could I not be content, then, to be a cedar post, which lasts twenty-five years? Would I not rather be that than the farmer that set it? or he that preaches to the farmer? and go to the heaven of posts at last? I think I should like that as well as any would like it. But I should not care if I sprouted into a living tree, put forth leaves and flowers, and bore fruit.

I am grateful for what I am and have. My thanksgiving is perpetual. It is surprising how contented one can be with nothing definite, — only a sense of existence. Well, anything for variety. I am ready to try this for the next ten thousand years, and exhaust it. How sweet to think of! my extremities well charred, and my intellectual part too, so that there is no danger of worm or rot for a long while. My breath is sweet

to me. O how I laugh when I think of my vague, indefinite riches. No run on my bank can drain it, for my wealth is not possession but enjoyment.

What are all these years made for? and now another winter comes, so much like the last? Can't we satisfy the beggars once for all?

Have you got in your wood for this winter? What else have you got in? Of what use a great fire on the hearth, and a confounded little fire in the heart? Are you prepared to make a decisive campaign, — to pay for your costly tuition, — to pay for the suns of past summers, — for happiness and unhappiness lavished upon you?

Does not Time go by swifter than the swiftest equine trotter or racker?

Stir up Brown. Remind him of his duties, which outrun the date and span of Worcester's years past and to come. Tell him to be sure that he is on the main street, however narrow it may be, and to have a lit sign, visible by night as well as by day.

Are they not patient waiters, — they who wait for us? But even they shall not be losers.

December 7.

That Walt Whitman, of whom I wrote to you, is the most interesting fact to me at present. I have just read his second edition (which he gave me), and it has done me more good than any reading for a long time. Perhaps I remember best the poem of Walt Whitman, an American, and the Sun-Down Poem. There are two or three pieces in the book which are disagreeable, to say the least; simply sensual. He does not celebrate love at all. It is as if the beasts spoke. I think that men have not been ashamed of themselves without reason. No doubt there have always been dens where such deeds were unblushingly recited, and it is no merit to compete with their inhabitants. But even on this side he has spoken more truth than any American or modern that I know. I have found his poem exhilarating, encouraging. As for its sensuality, — and it may turn out to be less sensual than it appears, — I do not so much wish that those parts were not written, as that men and women were so pure that they could read them without harm, that is, without understanding them. One woman told me that no woman could read it, — as if a man could read what a woman could not. Of course Walt Whitman can communicate to us no experience, and if we are shocked, whose experience is it that we are reminded of?

On the whole, it sounds to me very brave and American, after whatever deductions. I do not believe that all the sermons, so called, that have been preached in this land put together are equal to it for preaching.

We ought to rejoice greatly in him. He occasionally suggests something a little more than human. You can't confound him with the other inhabitants of Brooklyn or New York. How they must shudder when they read him! He is awfully good.

To be sure I sometimes feel a little imposed on. By his heartiness and broad generalities he puts me into a liberal frame of mind prepared to see wonders, — as it were, sets me upon a hill or in the midst of a plain, — stirs me well up, and then — throws in a thousand of brick. Though rude, and sometimes ineffectual, it is a great primitive poem, — an alarum or trumpet-note ringing through the American camp.

Wonderfully like the Orientals, too, considering that when I asked him if he had read them, he answered, "No: tell me about them."

I did not get far in conversation with him, — two more being present, — and among the few things which I chanced to say, I remember that one was, in answer to him as representing America, that I did not think much of America or of politics, and so on, which may have been somewhat of a damper to him.

Since I have seen him, I find that I am not disturbed by any brag or egoism in his book. He may turn out the least of a braggart of all, having a better right to be confident.

He is a great fellow.

There is in Alcott's diary an account of this interview with Whitman, and the Sunday morning in Ward Beecher's Brooklyn church, from which a few passages may be taken. Hardly any person met by either of these Concord friends in their later years made so deep an impression on both as did this then almost unknown poet and thinker, concerning whom Cholmondelev wrote to Thoreau in 1857: "Is there actually such a man as Whitman? Has any one seen or handled him? His is a tongue 'not understood' of the English people. I find the gentleman altogether left out of the book. It is the first book I have ever seen which I should call a 'new book.'"

Mr. Alcott writes under date of November 7, 1847 — in New York: "Henry Thoreau arrives from Eagleswood, and sees Swinton, a wise young Scotchman, and Walt Whitman's friend, at my room (15 Laight Street), — Thoreau declining to accompany me to Mrs. Botta's parlors, as invited by her. He sleeps here. (November 8.) We find Greeley at the Harlem station, and ride with him to his farm, where we pass the day, and return to sleep in the city, — Greeley coming in with us; Alice Cary, the authoress, accompanying us also. (Sunday, November 9.) We cross the ferry to Brooklyn, and hear Ward Beecher at the Plymouth Church. It was a spectacle, 14 — and himself the Preacher, if preacher there be anywhere now in pulpits. His auditors had to weep, had to laugh, under his potent magnetism, while his doctrine of justice to all men, bond and free, was grand. House, entries, aisles, galleries, all were crowded. Thoreau called it pagan, but I pronounced it good, very good, — the best I had witnessed for many a day, and hopeful for the coming time. At dinner at Mrs. Mannings Miss M. S. was there, curious to see Thoreau. After dinner we called on Walt Whitman (Thoreau and I), but finding him out, we got all we could from his mother, a stately, sensible matron, believing absolutely in Walter, and telling us how good he was, and how wise when a boy; and how his four brothers and two sisters loved him, and still take counsel of the great man he has grown to be. We engaged to call again early in the morning, when she said Walt would be glad to see us. (Monday, 10th.) Mrs. Tyndale of Philadelphia goes with us to see Walt, — Walt the satyr, the Bacchus, the very god Pan. We sat with him for two hours, and much to our delight; he promising to call on us at the International at ten in the morning to-morrow, and there have the rest of it." Whitman failed to call at his hour the next day.

## TO B. B. WILEY (AT CHICAGO).

Concord, December 12, 1856.

MR. WILEY,<sup>1</sup> — It is refreshing to hear of your earnest purpose with respect to your culture, and I can send you no better wish than that

1 B. B. Wiley, then of Providence, since of Chicago, had written to Thoreau, September 4, for a copy of the *Week*, which the author was then selling<sup>1</sup> on his own account, having bought back the unsalable first edition from his publisher, Munroe. In a letter of October 31, to which the above is a reply, he mentions taking a walk with Charles Newcomb, then of Providence, now of London, — one of the *Dial* contributors, and a special friend of Emerson; then inquires about Confucius, the Hindoo philosophers, and Swedenborg.

you may not be thwarted by the cares and temptations of life. Depend on it, now is the accepted time, and probably you will never find yourself better disposed or freer to attend to your culture than at this moment. When They who inspire us with the idea are ready, shall not we be ready also?

I do not remember anything which Confucius has said directly respecting man's "origin, purpose, and destiny." He was more practical than that. He is full of wisdom applied to human relations, — to the private life, — the family, — government, etc. It is remarkable that, according to his own account, the sum and substance of his teaching is, as you know, to do as you would be done by.

He also said (I translate from the French), "Conduct yourself suitably towards the persons of your family, then you will be able to instruct and to direct a nation of men."

"To nourish one's self with a little rice, to drink water, to have only his bended arm to support his head, is a state which has also its satisfaction. To be rich and honored by iniquitous means is for me as the floating cloud which passes."

"As soon as a child is born he must respect its faculties: the knowledge which will come to it by and by does not resemble at all its present state. If it arrive at the age of forty or fifty years without having learned anything, it is no more worthy of any respect." This last, I think, will speak to your condition.

But at this rate I might fill many letters.

Our acquaintance with the ancient Hindoos is not at all personal. The full names that can be relied upon are very shadowy. It is, however, tangible works that we know. The best I think of are the *Bhagvat Geeta* (an episode in an ancient heroic poem called the *Mahabarat*), the *Yedas*, the *Yishnu Purana*, the *Institutes of Menu*, etc.

I cannot say that Swedenborg has been directly and practically valuable to me, for I have not been a reader of him, except to a slight extent; but I have the highest regard for him, and trust that I shall read his works in some world or other. He had a wonderful knowledge of our interior and spiritual life, though his illuminations are occasionally blurred by trivialities. He comes nearer to answering, or attempting to answer, literally, your questions concerning man's origin, purpose, and destiny, than any of the worthies I have referred to. But I think that that is not altogether a recommendation; since such

an answer to these questions cannot be discovered any more than perpetual motion, for which no reward is now offered. The noblest man it is, methinks, that knows, and by his life suggests, the most about these things. Crack away at these nuts, however, as long as you can, — the very exercise will ennoble you, and you may get something better than the answer you expect.

## TO B. B. WILEY (AT CHICAGO).

Concord, April 20, 1857.

MR. WILEY, — I see that you are turning a broad furrow among the books, but I trust that some very private journal all the while holds its own through their midst. Books can only reveal us to ourselves, and as often as they do us this service we lay them aside. I should say, read Goethe's Autobiography, by all means, also Gibbon's, Haydon the Painter's, and our Franklin's of course; perhaps also Alfieri's, Benvenuto Cellini's, and De Quincey's "Confessions of an Opium-Eater," — since you like autobiography. I think you must read Coleridge again, and further, skipping all his theology, i e., if you value precise definitions and a discriminating use of language. By the way, read De Quincey's Reminiscences of Coleridge and Wordsworth.

How shall we account for our pursuits, if they are original? We get the language with which to describe our various lives out of a common mint. If others have their losses which they are busy repairing, so have I mine, and their hound and horse may perhaps be the symbols of some of them.<sup>1</sup> But also I have lost, or am in danger of losing, a far finer and more ethereal treasure, which commonly no loss, of which they are conscious, will symbolize. This I answer hastily and with some hesitation, according as I now understand my words...

Methinks a certain polygamy with its troubles is the fate of almost all men. They are married to two wives: their genius (a celestial muse),

<sup>1</sup> When in 1855 or 1856 Thoreau started to wade across from Duxbury to Clark's Island, and was picked up by a fishing-boat in the deep water, and landed on the "backside" of the island (see letter to Mr. Watson of April 25, 1858), Edward Watson ("Uncle Ed"), was "saggin' round" to see that everything was right alongshore, and encountered the unexpected visitor. "How did you come here?"

"Oh, from Duxbury," said Thoreau, and they walked to the old Watson house together. "You say in one of your books," said Uncle Ed, "that you once lost a horse and a hound and a dove, — now I should like to know what you meant by that?"

"Why, everybody has met with losses, haven't they?"

"H'm, — pretty way to answer a fellow!" said Mr. Watson; but it seems this was the usual answer. In the long dining-room of the old house that night he sat by the window and told the story of the Norse voyagers to New England, — perhaps to that very island and the Gurnet near by, — as Morton fancies in his review of Thoreau in the Harvard Magazine (January, 1855).

and also to some fair daughter of the earth. Unless these two were fast friends before marriage, and so are afterward, there will be but little peace in the house.

## TO HARRISON BLAKE (AT WORCESTER).

CONCORD, December 31, 1856.

MR. BLAKE, — I think it will not be worth the while for me to come to Worcester to lecture at all this year. It will be better to wait till I am — perhaps unfortunately — more in that line. My writing has not taken the shape of lectures, and therefore I should be obliged to read one of three or four old lectures, the best of which I have read to some of your auditors before. I carried that one which I call “Walking, or the Wild,” to Amherst, N. H., the evening of that cold Thursday,<sup>1</sup> and I am to read another at Fitchburg, February 3. I am simply their hired man. This will probably be the extent of my lecturing hereabouts.

I must depend on meeting Mr. Wasson some other time.

Perhaps it always costs me more than it comes to to lecture before a promiscuous audience. It

<sup>1</sup> This was when he spoke in the vestry of the Calvinistic church, and said, on his return to Concord, “that he hoped he had done something to upheave and demolish the structure above,” — the vestry being beneath the church.

is an irreparable injury done to my modesty even, <sup>15</sup> — I become so indurated.

—— solitude! obscurity! meanness! I never triumph so as when I have the least success in my neighbor’s eyes. The lecturer gets fifty dollars a night; but what becomes of his winter? What consolation will it be hereafter to have fifty thousand dollars for living in the world? I should like not to exchange any of my life for money.

These, you may think, are reasons for not lecturing, when you have no great opportunity. It is even so, perhaps. I could lecture on dry oak leaves; I could, but who could hear me? If I were to try it on any large audience, I fear it would be no gain to them, and a positive loss to me. I should have behaved rudely toward my rustling friends.

I am surveying, instead of lecturing, at present. Let me have a skimming from your “pan of unwrinkled cream.”

## TO DANIEL RICKETSON (AT NEW BEDFORD).

Concord, April 1, 1857.

DEAR RICKETSON, — I got your note of welcome night before last. I expect, if the weather is favorable, to take the 4.30 train from Boston to-morrow, Thursday, P. M., for I hear of no noon train, and shall be glad to find your wagon at Tarkiln Hill, for I see it will be rather late for going across lots.

I have seen all the spring signs you mention, and a few more, even here. Nay, I heard one frog peep nearly a week ago, — methinks the very first one in all this region. I wish that there were a few more signs of spring in myself; however, I take it that there are as many within us as we think we hear without us. I am decent for a steady pace, but not yet for a race. I have a little cold at present, and you speak of rheumatism about the head and shoulders. Your frost is not quite out. I suppose that the earth itself has a little cold and rheumatism about these times; but all these things together produce a very fair general result. In a concert, you know, we must sing our parts feebly sometimes, that we may not injure the general effect.

I shouldn't wonder if my two-year-old invalidity had been a positively charming feature to some amateurs favorably located. Why not a blasted man as well as a blasted tree, on your lawn?

If you should happen not to see me by the train named, do not go again, but wait at home for me, or a note from yours, HENRY D. THOREAU.

## TO HARRISON BLAKE (AT WORCESTER).

Concord, April 17, 1857.

MR. BLAKE, — I returned from New Bedford night before last. I met Alcott there, and learned from him that probably you had gone to Concord. I am very sorry that I missed you. I had expected you earlier, and at last thought that I should get back before you came; but I ought to have notified you of my absence. However, it would have been too late, after I had made up my mind to go. I hope you lost nothing by going a little round.

I took out the celtis seeds at your request, at the time we spoke of them, and left them in the chamber on some shelf or other. If you have found them, very well; if you have not found them, very well; but tell Hale 1 of it, if you see

1 Rev. Edward E. Hale, then pastor at Worcester. Others mentioned in the letter are Rev. David A. Wasson and Dr. Seth Rogers, — the latter a physician with whom Mr. Wasson was living in Worcester.

him. My mother says that you and Brown and Rogers and Wasson (titles left behind) talk of coming down on me some day. Do not fail to come, one and all, and within a week or two, if possible; else I may be gone again. Give me a short notice, and then come and spend a day on Concord River, — or say that you will come if it is fair, unless you are confident of bringing fair weather with you. Come and be Concord, as I have been Worcestered.

Perhaps you came nearer to me for not finding me at home; for trains of thought the more connect when trains of cars do not. If I had actually met you, you would have gone again; but now I have not yet dismissed you. I hear what you say about personal relations with joy. It is as if you had said, "I value the best and finest part of you, and

not the worst. I can even endure your very near and real approach, and prefer it to a shake of the hand." This intercourse is not subject to time or distance.

I have a very long new and faithful letter from Cholmondeley, which I wish to show you. He speaks of sending me more books!!

If I were with you now, I could tell you much of Ricketson, and my visit to New Bedford; but I do not know how it will be by and by. I should like to have you meet R., who is the frankest man I know. Alcott and he get along very well together. Channing has returned to Concord with me, — probably for a short visit only.

Consider this a business letter, which you know counts nothing in the game we play. Remember me particularly to Brown.

## **TO HARRISON BLAKE (AT WORCESTER).**

CONCORD, June 6, 1857, 3 p. M.

MR. BLAKE, — I have just got your note, but I am sorry to say that this very morning I sent a note to Channing, stating that I would go with him to Cape Cod next week on an excursion which we have been talking of for some time. If there were time to communicate with you, I should ask you to come to Concord on Monday, before I go; but as it is, I must wait till I come back, which I think will be about ten days hence. I do not like this delay, but there seems to be a fate in it. Perhaps Mr. Wasson will be well enough to come by that time. I will notify you of my return, and shall depend on seeing you all.'

June 23d. I returned from Cape Cod last evening, and now take the first opportunity to invite you men of Worcester to this quiet Mediterranean shore. Can you come this week on Friday, or next Monday? I mention the earliest days on which I suppose you can be ready.

If more convenient, name some other time within ten days. I shall be rejoiced to see you, and to act the part of skipper in the contemplated voyage. I have just got another letter from Cholmondeley, which may interest you somewhat.

## **TO MARSTON WATSON (AT PLYMOUTH).**

CONCORD, August 17, 1857.

MR. WATSON, — I am much indebted to you for your glowing communication of July 20th. I had that very day left Concord for the wilds of Maine; but when I returned, August 8th, two out of the six worms remained nearly, if not quite, as bright as at first, I was assured. In their best estate they had excited the admiration of many of the inhabitants of Concord. It was a singular coincidence that I should find these worms awaiting me, for my mind was full of a phosphorescence which I had seen in the woods. I have waited to learn something more about them before acknowledging

the receipt of them. I have frequently met with glow-worms in my night walks, but am not sure they were the same kind with these. Dr. Harris once described to me a larger kind than I had found, "nearly as big as your little finger but he does not name them in his report.

The only authorities on Glow-worms which I chance to have (and I am pretty well provided), are Kirby and Spence (the fullest), Knapp ("Journal of a Naturalist"), "The Library of Entertaining Knowledge" (Rennie), a French work, etc., etc.; but there is no minute, scientific description in any of these. This is apparently a female of the genus *Lampyris*; but Kirby and Spence say that there are nearly two hundred species of this genus alone. The one commonly referred to by English writers is the *Lampyris noctiluea*; but judging from Kirby and Spence's description, and from the description and plate in the French work, this is not that one, for, besides other differences, both say that the light proceeds from the abdomen. Perhaps the worms exhibited by Durkee (whose statement to the Boston Society of Natural History, second July meeting, in the "Traveller" of August 12, 1857, I send you) were the same with these. I do not see how they could be the *L. noctiluca*, as he states.

I expect to go to Cambridge before long, and if I get any more light on this subject I will inform you. The two worms are still alive.

I shall be glad to receive the *Drosera* at any time, if you chance to come across it. I am looking over Loudon's "Arboretum," which we have added to our Library, and it occurs to me that it was written expressly for you, and that you cannot avoid placing it on your own shelves. — I should have been glad to see the whale, and might perhaps have done so, if I had not at that time been seeing "the elephant" (or moose) in the Maine woods. I have been associating for about a month with one Joseph Polis, the chief man of the Penobscot tribe of Indians, and have learned a great deal from him, which I should like to tell you sometime.

## TO MARSTON WATSON (AT PLYMOUTH).

Concord, April 25, 1858.

DEAR SIR, — Your unexpected gift of pear-trees reached me yesterday in good condition, and I spent the afternoon in giving them a good setting out; but I fear that this cold weather may hurt them. However, I am inclined to think they are insured, since you have looked on them. It makes one's mouth water to read their names only. From what I hear of the extent of your bounty, if a reasonable part of the trees succeed, this transplanting will make a new era for Concord to date from.

Mine must be a lucky star, for day before yesterday I received a box of Mayflowers from Brattleboro, and yesterday morning your pear-trees, and at evening a humming-bird's nest from Worcester. This looks like fairy housekeeping.

I discovered two new plants in Concord last winter, the Labrador Tea (*Ledum latifolium*), and Yew (*Taxis baccata*), —

By the way, in January I communicated with Dr. Durkee, whose report on Glow-worms I sent you, and it appeared, as I expected, that he (and by his account, Agassiz, Gould, Jackson, and others to whom he showed them) did not consider them a distinct species, but a variety of the common, or *Lampyrus noctiluca*, some of which you got in Lincoln. Durkee, at least, has never seen the last. I told him that I had no doubt about their being a distinct species. His, however, were luminous throughout every part of the body, as those which you sent me were not, while I had them.

Is nature as full of vigor to your eyes as ever, or do you detect some falling off at last? Is the mystery of the hog's bristle cleared up, and with it that of our life? It is the question, to the exclusion of every other interest.

I am sorry to hear of the burning of your woods, but, thank Heaven, your great ponds and your sea cannot be burnt. I love to think of your warm, sandy wood-roads, and your breezy island out in the sea. What a prospect you can get every morning from the hilltop east of your house! I think that even the heathen that I am could say, or sing, or dance, morning prayers there of some kind.

Please remember me to Mrs. Watson, and to the rest of your family who are helping the sun shine yonder.

1 Marston Watson, whose uncle, Edward Watson, with his nephews, owned the "breezy island" where Thoreau had visited his friends (Clark's Island, the only one in Plymouth Bay), had built his own house, "Hillside," on the slope of one of the hills above Plymouth town, and there laid out a fine park and garden, which Thoreau surveyed for him in the autumn of 1854, Alcott and Mr. Watson carrying the chain. For a description of Hillside, see Channing's *Wanderer* (Boston, 1871) and Alcott's *Sonnets and Canzonets* (Boston: Roberts, 1882). It was a villa much visited by Emerson, Alcott, Channing, Thoreau, George Bradford, and the Transcendentalists generally. Mr. Watson graduated at Harvard two years after Thoreau, and in an old diary says: "I remember Thoreau in the college yard (1836) with downcast thoughtful look intent, as if he were searching for something; always in a green coat, — green because the authorities required black, I suppose." In a letter he says: "I have always heard the 'Maiden in the East' was Mrs. Watson, — Mary Russell Watson, — and I suppose there is no doubt of it. I may be prejudiced, but I have always thought it one of his best things, — and I have highly valued his lines. I find in my *Dial*, No. 6, I have written six new stanzas in the margin of *Friendship*, and they are numbered to show how they should run. I think Mrs. Brown gave them to me."

## TO DANIEL RICKETSON (AT NEW BEDFORD).

CONCORD, August 18, 1857.

Dear Sir, — Your Wilson Flagg 1 seems a serious person, and it is encouraging to hear

1 A writer on scenery and natural history, who outlived Thoreau, and never forgave him for the remark about “stirring up with a pole,” which really might have been less graphic.

of a contemporary who recognizes Nature so squarely, and selects such a theme as “Barns.” (I would rather “Mount Auburn” were omitted.) But he is not alert enough. He wants stirring up with a pole. He should practice turning a series of somersets rapidly, or jump up and see how many times he can strike his feet together before coming down. Let him make the earth turn round now the other way, and whet his wits on it, whichever way it goes, as on a grindstone; in short, see how many ideas he can entertain at once.

His style, as I remember, is singularly vague (I refer to the book), and, before I got to the end of the sentences, I was off the track. If you indulge in long periods, you must be sure to have a snapper at the end. As for style of writing, if one has anything to say, it drops from him simply and directly, as a stone falls to the ground. There are no two ways about it, but down it comes, and he may stick in the points and stops wherever he can get a chance. New ideas come into this world somewhat like falling meteors, with a flash and an explosion, and perhaps somebody’s castle-roof perforated. To try to polish the stone in its descent, to give it a peculiar turn, and make it whistle a tune, perchance, would be of no use, if it were possible. Your polished stuff turns out not to be meteoric, but of this earth. However, there is plenty of time, and Nature is an admirable schoolmistress.

Speaking of correspondence, you ask me if I “cannot turn over a new leaf in that line.” I certainly could if I were to receive it; but just then I looked up and saw that your page was dated “May 10,” though mailed in August, and it occurred to me that I had seen you since that date this year. Looking again, it appeared that your note was written in ’56!! However, it was a new leaf to me, and I turned it over with as much interest as if it had been written the day before. Perhaps you kept it so long in order that the manuscript and subject-matter might be more in keeping with the old-fashioned paper on which it was written.

I traveled the length of Cape Cod on foot, soon after you were here, and, within a few days, have returned from the wilds of Maine, where I have made a journey of three hundred and twenty-five miles with a canoe and an Indian, and a single white companion, — Edward Hoar Esq., of this town, lately from California, — traversing the headwaters of the Kennebec, Penobscot, and St. John’s.

Can’t you extract any advantage out of that depression of spirits you refer to? It suggests to me cider-mills, wine-presses, etc., etc. All kinds of pressure or power should be used and made to turn some kind of machinery.

Channing was just leaving Concord for Plymouth when I arrived, but said he should be here again in two or three days.

Please remember me to your family, and say that I have at length learned to sing Tom Bowlin according to the notes.

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, September 9, 1857.

FRIEND RICKETSON, — I thank you for your kind invitation to visit you, but I have taken so many vacations this year, — at New Bedford, Cape Cod, and Maine, — that any more relaxation — call it rather dissipation — will cover me with shame and disgrace. I have not earned what I have already enjoyed. As some heads cannot carry much wine, so it would seem that I cannot bear so much society as you can. I have an immense appetite for solitude, like an infant for sleep, and if I don't get enough of it this year, I shall cry all the next.

My mother's house is full at present; but if it were not, I would have no right to invite you hither, while entertaining such designs as I have hinted at. However, if you care to storm the town, I will engage to take some afternoon walks with you, — retiring into profoundest solitude the most sacred part of the day.

## **TO HARRISON BLAKE (AT WORCESTER).**

Concord, August 18, 1857.

ME. BLAKE, — Fifteenthly. It seems to me that you need some absorbing pursuit. It does not matter much what it is, so it be honest. Such employment will be favorable to your development in more characteristic and important directions. You know there must be impulse enough for steerage way, though it be not toward your port, to prevent your drifting helplessly on to rocks or shoals. Some sails are set for this purpose only. There is the large fleet of scholars and men of science, for instance, always to be seen standing off and on every coast, and saved thus from running on to reefs, who will at last run into their proper haven, we trust.

It is a pity you were not here with Brown and Wiley. I think that in this case, for a rarity, the more the merrier.

You perceived that I did not entertain the idea of our going together to Maine on such an excursion as I had planned. The more I thought of it, the more imprudent it appeared to me. I did think to have written to you before going, though not to propose your going also; but I went at last very suddenly, and could only have written a business letter, if I had tried, when there was no business to be accomplished. I have now returned, and think I have had a quite profitable journey, chiefly from associating with an intelligent Indian. My companion, Edward Hoar, also found his account in it, though he suffered considerably from being obliged to carry unusual loads over wet and

rough “carries,” — in one instance five miles through a swamp, where the water was frequently up to our knees, and the fallen timber higher than our heads. He went over the ground three times, not being able to carry all his load at once. This prevented his ascending Ktaadn. Our best nights were those when it rained the hardest, on account of the mosquitoes. I speak of these things, which were not unexpected, merely to account for my not inviting you.

Having returned, I flatter myself that the world appears in some respects a little larger, and not, as usual, smaller and shallower, for having extended my range. I have made a short excursion into the new world which the Indian dwells in, or is. He begins where we leave off. It is worth the while to detect new faculties in man, — he is so much the more divine; and anything that fairly excites our admiration expands us. The Indian, who can find his way so wonderfully in the woods, possesses so much intelligence which the white man does not, — and it increases my own capacity, as well as faith, to observe it. I rejoice to find that intelligence flows in other channels than I knew. It redeems for me portions of what seemed brutish before.

It is a great satisfaction to find that your oldest convictions are permanent. With regard to essentials, I have never had occasion to change my mind. The aspect of the world varies from year to year, as the landscape is differently clothed, but I find that the truth is still true, and I never regret any emphasis which it may have inspired. Ktaadn is there still, but much more surely my old conviction is there, resting with more than mountain breadth and weight on the world, the source still of fertilizing streams, and affording glorious views from its summit, if I can get up to it again. As the mountains still stand on the plain, and far more unchangeable and permanent, — stand still grouped around, farther or nearer to my maturer eye, the ideas which I have entertained, 16 — the everlasting teats from which we draw our nourishment.

## **TO HARRISON BLAKE (AT WORCESTER).**

CONCORD, November 16, 1857.

MR. BLAKE, — You have got the start again. It was I that owed you a letter or two, if I mistake not.

They make a great ado nowadays about hard times;<sup>1</sup> but I think that the community generally, ministers and all, take a wrong view of the matter, though some of the ministers preaching according to a formula may pretend to take a right one. This general failure, both private and public, is rather occasion for rejoicing, as reminding us whom we have at the helm, — that justice is always done. If our merchants did not most of them fail, and the banks too, my faith in the old laws of the world would be staggered. The statement that ninety-six in a hundred doing such business surely break down is perhaps the sweetest fact that statistics have revealed, — exhilarating as the fragrance of fallows in spring. Does it not say somewhere, “The Lord reigneth, let the earth rejoice”? If thousands are thrown out of employment, it suggests that

they were not well employed. Why don't they take the hint? It is not enough to be industrious; so are the ants. What are you industrious about?

The merchants and company have long laughed

1 The panic of 1857, — the worst since 1837.

at transcendentalism, higher laws, etc., crying, "None of your moonshine," as if they were anchored to something not only definite, but sure and permanent. If there was any institution which was presumed to rest on a solid and secure basis, and more than any other represented this boasted common sense, prudence, and practical talent, it was the bank; and now those very banks are found to be mere reeds shaken by the wind. Scarcely one in the land has kept its promise. It would seem as if you only need live forty years in any age of this world, to see its most promising government become the government of Kansas, and banks nowhere. Not merely the Brook Farm and Fourierite communities, but now the community generally has failed. But there is the moonshine still, serene, beneficent, and unchanged. Hard times, I say, have this value, among others, that they show us what such promises are worth, — where the sure banks are. I heard some merchant praised the other day because he had paid some of his debts, though it took nearly all he had (why, I've done as much as that myself many times, and a little more), and then gone to board. What if he has? I hope he's got a good boarding-place, and can "pay for it. It's not everybody that can. However, in my opinion, it is cheaper to keep house, 17 — i e., if you don't keep too big a one.

Men will tell you sometimes that "money's hard." That shows it was not made to eat, I say. Only think of a man in this new world, in his log cabin, in the midst of a corn and potato patch, with a sheepfold on one side, talking about money being hard! So are flints hard; there is no alloy in them. What has that to do with his raising his food, cutting his wood (or breaking it), keeping in-doors when it rains, and, if need be, spinning and weaving his clothes? Some of those who sank with the steamer the other day found out that money was heavy too. Think of a man's priding himself on this kind of wealth, as if it greatly enriched him. As if one struggling in mid-ocean with a bag of gold on his back should gasp out, "I am worth a hundred thousand dollars." I see them struggling just as ineffectually on dry land, nay, even more hopelessly, for, in the former case, rather than sink, they will finally let the bag go; but in the latter they are pretty sure to hold and go down with it. I see them swimming about in their great-coats, collecting their rents, really getting their dues, drinking bitter draughts which only increase their thirst, becoming more and more water-logged, till finally they sink plumb down to the bottom. But enough of this.

Have you ever read Ruskin's books? If not, I would recommend you to try the second and third volumes (not parts) of his "Modern Painters." I am now reading the fourth, and have read most of his other books lately. They are singularly good and encouraging, though not without crudeness and bigotry. The themes in the volumes referred to are Infinity, Beauty, Imagination, Love of Nature, etc., — all treated in a very living manner. I am rather surprised by them. It is remarkable that these things should be said with reference to painting chiefly, rather than literature. The "Seven

Lamps of Architecture," too, is made of good stuff: but, as I remember, there is too much about art in it for me and the Hottentots. We want to know about matters and things in general. Our house is as yet a hut.

You must have been enriched by your solitary walk over the mountains. I suppose that I feel the same awe when on their summits that many do on entering a church. To see what kind of earth that is on which you have a house and garden somewhere, perchance! It is equal to the lapse of many years. You must ascend a mountain to learn your relation to matter, and so to your own body, for it is at home there, though you are not. It might have been composed there, and will have no farther to go to return to dust there, than in your garden; but your spirit inevitably comes away, and brings your body with it, if it lives. Just as awful really, and as glorious, is your garden. See how I can play with my fingers! They are the funniest companions I have ever found. Where did they come from? What strange control I have over them! Who am I? What are they? — those little peaks — call them Madison, Jefferson, Lafayette. What is the matter? My fingers ten, I say. Why, ere long, they may form the topmost crystal of Mount Washington. I go up there to see my body's cousins. There are some fingers, toes, bowels, etc., that I take an interest in, and therefore I am interested in all their relations.

Let me suggest a theme for you: to state to yourself precisely and completely what that walk over the mountains amounted to for you, — returning to this essay again and again, until you are satisfied that all that was important in your experience is in it. Give this good reason to yourself for having gone over the mountains, for mankind is ever going over a mountain. Don't suppose that you can tell it precisely the first dozen times you try, but at 'em again, especially when, after a sufficient pause, you suspect that you are touching the heart or summit of the matter, reiterate your blows there, and account for the mountain to yourself. Not that the story need be long, but it will take a long while to make it short. It did not take very long to get over the mountain, you thought; but have you got over it indeed? If you have been to the top of Mount Washington, let me ask, what did you find there? That is the way they prove witnesses, you know. Going up there and being blown on is nothing. We never do much climbing while we are there, but we eat our luncheon, etc., very much as at home. It is after we get home that we really go over the mountain, if ever. What did the mountain say? What did the mountain do?

I keep a mountain anchored off eastward a little way, which I ascend in my dreams both awake and asleep. Its broad base spreads over a village or two, which do not know it; neither does it know them, nor do I when I ascend it. I can see its general outline as plainly now in my mind as that of Wachusett. I do not invent in the least, but state exactly what I see. I find that I go up it when I am light-footed and earnest. It ever smokes like an altar with its sacrifice. I am not aware that a single villager frequents it or knows of it. I keep this mountain to ride instead of a horse.

Do you not mistake about seeing Moosehead Lake from Mount Washington? That must be about one hundred and twenty miles distant, or nearly twice as far as the Atlantic, which last some doubt if they can see thence. Was it not Umbagog?

Dr. Solger has been lecturing in the vestry in this town on Geography, to Sanborn's scholars, for several months past, at five P. M. Emerson and Alcott have been to hear him. I was surprised when the former asked me, the other day, if I was not going to hear Dr. Solger. What, to be sitting in a meeting-house cellar at that time of day, when you might possibly be out-doors! I never thought of such a thing. What was the sun made for? If he does not prize daylight, I do. Let him lecture to owls and dormice. He must be a wonderful lecturer indeed who can keep me indoors at such an hour, when the night is coming in which no man can walk.

Are you in want of amusement nowadays? Then play a little at the game of getting a living. There never was anything equal to it. Do it temperately, though, and don't sweat. Don't let this secret out, for I have a design against the Opera. OPERA!! Pass along the exclamations, devil.<sup>1</sup>

Now is the time to become conversant with your wood-pile (this comes under Work for the Month), and be sure you put some warmth into it by your mode of getting it. Do not consent to be passively warmed. An intense degree of that is the hotness that is threatened. But a positive warmth within can withstand the fiery furnace, as the vital heat of a living man can withstand the heat that cooks meat.

After returning from the last of his three expeditions to the Maine woods (in 1846, 1853, and 1857), Thoreau was appealed to by his friend Higginson, then living in Worcester, for information concerning a proposed excursion from Worcester into Maine and Canada, then but little visited by tourists, who now go there in droves. He replied in this long letter, with its minute instructions and historical references. The Arnold mentioned is General Benedict Arnold, who in 1775-76 made a toilsome march through the Maine forest with a small New England army for the conquest of Canada, while young John Thoreau, Henry's grandfather, was establishing himself as a merchant in Boston (not yet evacuated by British troops), previous to his marriage with Jane Burns.

<sup>1</sup> Exclamation points and printer's devil.

## TO T. W. HIGGINSON (AT WORCESTER).

Concord, January 28, 1858.

DEAR SIR, — It would be perfectly practicable to go to the Madawaska the way you propose. As for the route to Quebec, I do not find the Sugar Loaf Mountains on my maps. The most direct and regular way, as you know, is substantially Montresor's and Arnold's and the younger John Smith's — by the Chaudière; but this is less wild. If your object is to see the St. Lawrence River below Quebec, you will probably strike it at the Riviere du Loup. ( Vide Hodge's account of his excursion thither via the

Allegash, — I believe it is in the second Report on the Geology of the Public Lands of Maine and Massachusetts in '37.) I think that our Indian last summer, when we talked of going to the St. Lawrence, named another route, near the Madawaska, — perhaps the St. Francis, — which would save the long portage which Hodge made.

I do not know whether you think of ascending the St. Lawrence in a canoe; but if you should, you might be delayed not only by the current, but by the waves, which frequently run too high for a canoe on such a mighty stream. It would be a grand excursion to go to Quebec by the Chaudière, descend the St. Lawrence to the Rivière du Loup, and return by the Madawaska and St. John's to Frederickton, or farther, — almost all the way down stream — a very important consideration.

I went to Moosehead in company with a party of four who were going a-hunting down the Allegash and St. John's, and thence by some other stream over into the Restigouche, and down that to the Bay of Chaleur, — to be gone six weeks. Our northern terminus was an island in Heron Lake on the Allegash. ( Vide Colton's railroad and township map of Maine.)

The Indian proposed that we should return to Bangor by the St. John's and Great Schoodic Lake, which we had thought of ourselves; and he showed us on the map where we should be each night. It was then noon, and the next day night, continuing down the Allegash, we should have been at the Madawaska settlements, having made only one or two portages; and thereafter, on the St. John's there would be but one or two more falls, with short carries; and if there was not too much wind, we could go down that stream one hundred miles a day. It is settled all the way below Madawaska. He knew the route well. He even said that this was easier, and would take but little more time, though much farther, than the route we decided on, — i e., by Webster Stream, the East Branch, and main Penobscot to Oldtown; but he may have wanted a longer job. We preferred the latter, not only because it was shorter, but because, as he said, it was wilder.

We went about three hundred and twenty-five miles with the canoe (including sixty miles of stage between Bangor and Oldtown); were out twelve nights, and spent about \$40 apiece, — which was more than was necessary. We paid the Indian, who was a very good one, \$1.50 per day and 50 cents a week for his canoe. This is enough in ordinary seasons. I had formerly paid \$2 for an Indian and for white batteauxmen.

If you go to Madawaska in a leisurely manner, supposing no delay on account of rain or the violence of the wind, you may reach Mt. Kineo by noon, and have the afternoon to explore it. The next day you may get to the head of the lake before noon, make the portage of two and a half miles over a wooden railroad, and drop down the Penobscot half a dozen miles. The third morning you will perhaps walk half a mile about Pine Stream Falls, while the Indian runs down, — cross the head of Chesuncook, reach the junction of the Caucomgomock and Umbazookskus by noon, and ascend the latter to Umbazookskus Lake that night. If it is low water, you may have to walk and carry a little on the Umbazookskus before entering the lake.

The fourth morning you will make the carry of two miles to Mud Pond (Allegash Water), — and a very wet carry it is, — and reach Chamberlain Lake by noon, and Heron Lake, perhaps, that night, after a couple of very short carries at the outlet of Chamberlain. At the end of two days more you will probably be at Madawaska. Of course the Indian can paddle twice as far in a day as he commonly does.

Perhaps you would like a few more details. We used (three of us) exactly twenty-six pounds of hard bread, fourteen pounds of pork, three pounds of coffee, twelve pounds of sugar (and could have used more), besides a little tea, Indian meal, and rice, — and plenty of berries and moose-meat. This was faring very luxuriously. I had not formerly carried coffee, sugar, or rice. But for solid food, I decide that it is not worth the while to carry anything but hard bread and pork, whatever your tastes and habits may be. These wear best, and you have no time nor dishes in which to cook anything else. Of course you will take a little Indian meal to fry fish in; and half a dozen lemons also, if you have sugar, will be very refreshing, — for the water is warm.

To save time, the sugar, coffee, tea, salt, etc., should be in separate watertight bags, labeled, and tied with a leathern string; and all the provisions and blankets should be put into two large India-rubber bags, if you can find them watertight. Ours were not. A four-quart tin pail makes a good kettle for all purposes, and tin plates are portable and convenient. Don't forget an India-rubber knapsack, with a large flap, — plenty of dish-cloths, old newspapers, strings, and twenty-five feet of strong cord. Of India-rubber clothing, the most you can wear, if any, is a very light coat, — and that you cannot work in. I could be more particular, — but perhaps have been too much so already.

Of his habits in mountain-climbing, Channing says:!" He ascended such hills as Monadnoc by his own path; would lay down his map on the summit and draw a line to the point he proposed to visit below, — perhaps forty miles away on the landscape, and set off bravely to make the ' short-cut.' The lowland people wondered to

—— Thoreau, the Poet-Naturalist, pp. 36-38.

see him scaling the heights as if he had lost his way, or at his jumping over their cow-yard fences, — asking if he had fallen from the clouds. In a walk like this he always carried his umbrella; and on this Monadnoc trip, when about a mile from the station (in Troy, N. H.), a torrent of rain came down; without the umbrella his books, blankets, maps, and provisions would all have been spoiled, or the morning lost by delay. On the mountain there being a thick, soaking fog, the first object was to camp and make tea. He spent five nights in camp, having built another hut, to get varied views. Flowers, birds, lichens, and the rocks were carefully examined, all parts of the mountain were visited, and as accurate a map as could be made by pocket compass was carefully sketched and drawn out, in the five days spent there, — with notes of the striking aerial phenomena, incidents of travel and natural history. The outlook across the valley over to Wachusett, with its thunder-storms and battles in the cloud; the farmers' backyards in Jaffrey, where the family cotton can be seen bleaching on the grass, but no trace of the pigmy family; the dry, soft air all night, the lack of dew in

the morning; the want of water, 18 — a pint being a good deal, — these, and similar things make up some part of such an excursion.”

The Monadnoc excursion above mentioned began June 3d, and continued three days. It inspired Thoreau to take a longer mountain tour with his neighbor and friend, Edward Hoar, to which these letters relate, giving the ways and means of the journey, — a memorable one to all concerned.

## **TO HARRISON BLAKE (AT WORCESTER).**

CONCORD, June 29, 1858, 8 A. M.

MR. BLAKE, — Edward Hoar and I propose to start for the White Mountains in a covered wagon, with one horse, on the morning of Thursday the 1st of July, intending to explore the mountain tops botanically, and camp on them at least several times. Will you take a seat in the wagon with us? Mr. Hoar prefers to hire the horse and wagon himself. Let us hear by express, as soon as you can, whether you will join us here by the earliest train Thursday morning, or Wednesday night. Bring your map of the mountains, and as much provision for the road as you can, — hard bread, sugar, tea, meat, etc., — for we intend to live like gipsies; also, a blanket and some thick clothes for the mountain top.

July 1st. Last Monday evening Mr. Edward Hoar said that he thought of going to the White Mountains. I remarked casually that I should like to go well enough if I could afford it. Whereupon he declared that if I would go with him, he would hire a horse and wagon, so that the ride would cost me nothing, and we would explore the mountain tops botanically, camping on them many nights. The next morning I suggested you and Brown's accompanying us in another wagon, and we could all camp and cook, gipsy-like, along the way, — or, perhaps, if the horse could draw us, you would like to bear half the expense of the horse and wagon, and take a seat with us. He liked either proposition, but said, that if you would take a seat with us, he would prefer to hire the horse and wagon himself. You could contribute something else if you pleased. Supposing that Brown would be confined, I wrote to you accordingly, by express on Tuesday morning, via Boston, stating that we should start to-day, suggesting provision, thick clothes, etc., and asking for an answer; but I have not received one. I have just heard that you may be at Sterling, and now write to say that we shall still be glad if you will join us at Senter Harbor, where we expect to be next Monday morning. In any case, will you please direct a letter to us there at once?

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, June 30, 1858.

FRIEND RICKETSON, — I am on the point of starting for the White Mountains in a wagon with my neighbor Edward Hoar, and I write to you now rather to apologize for not writing, than to answer worthily your three notes. I thank you heartily for them. You will not care for a little delay in acknowledging them, since your date shows that you can afford to wait. Indeed, my head has been so full of company, etc., that I could not reply to you fitly before, nor can I now.

As for preaching to men these days in the Walden strain, is it of any consequence to preach to an audience of men who can fail, or who can be revived? There are few beside. Is it any success to interest these parties? If a man has speculated and failed, he will probably do these things again, in spite of you or me. I confess that it is rare that I rise to sentiment in my relations to men, — ordinarily to a mere patient, or may be wholesome, good-will. I can imagine something more, but the truth compels me to regard the ideal and the actual as two things.

Channing has come, and as suddenly gone, and left a short poem, "Near Home," published (?) or printed by Munroe, which I have hardly had time to glance at. As you may guess, I learn nothing of you from him.

You already foresee my answer to your invitation to make you a summer visit: I am bound for the mountains. But I trust that you have vanquished, ere this, those dusky demons that seem to lurk around the Head of the River.<sup>1</sup> You know that this warfare is nothing but a kind of nightmare, and it is our thoughts alone which give those unworthies any body or existence.

— made an excursion with Blake, of Worcester, to Monadnoc, a few weeks since. We took our blankets and food, spent two nights on the mountain, and did not go into a house.

Alcott has been very busy for a long time repairing an old shell of a house, and I have seen very little of him.<sup>2</sup> I have looked more at the houses which birds build. Watson made us all very generous presents from his nursery in the spring. Especially did he remember Alcott.

Excuse me for not writing any more at present, and remember me to your family.

— Near which, at New Bedford, Mr. Ricketson lived.

— This was the "Orchard House," near Hawthorne's "Wayside." The estate on which it stands, now owned by Dr. W. T. Harris, was surveyed for Mr. Alcott by Thoreau in October, 1857.

In July, 1858, as mentioned in this letter to Mr. Ricketson, Thoreau journeyed from Concord to the White Mountains, first visited with his brother John in 1839. His later companion was Edward Hoar, a botanist and lover of nature, who had been a magistrate in California, and in boyhood a comrade of Thoreau in shooting excursions on the Concord meadows. They journeyed in a wagon and Thoreau disliked the loss of independence in choice of camping-places involved in the care of a horse. He complained also of the magnificent inns ("mountain houses") that had sprung up in the passes and on the plateaus since his first visit. "Give me," he said, "a spruce house made in the rain," such as he and Channing afterward (1860) made on Monadnoc in his last trip to

that mountain. The chief exploit in the White Mountain trip was a visit to Tuckerman's Ravine on Mt. Washington, of which Mr. Hoar, some years before his death (in 1893), gave me an account, containing the true anecdote of Thoreau's finding the arnica plant when he needed it.

On their way to this rather inaccessible chasm, Thoreau and his comrade went first to what was then but a small tavern on the "tip-top" of Mt. Washington. It was a foggy day; and when the landlord was asked if he could furnish a guide to Tuckerman's Ravine, he replied: "Yes, my brother is the guide; but if he went to-day he could never find his way back in this fog."

"Well," said Thoreau, "if we cannot have a guide we will find it ourselves;" and he at once produced a map he had made the day before at a roadside inn, where he had found a wall map of the mountain region, and climbed on a table to copy that portion he needed. With this map and his pocket-compass he "struck a bee-line," said Mr. Hoar, for the ravine, and soon came to it, about a mile away. They went safely down the steep stairs into the chasm, where they found the midsummer iceberg they wished to see. But as they walked down the bed of the Peabody River, flowing from this ravine, over bowlders five or six feet high, the heavy packs on their shoulders weighed them down, and finally, Thoreau's foot slipping, he fell and sprained his ankle. He rose, but had not limped five steps from the place where he fell, when he said, "Here is the arnica, anyhow," — reached out his hand and plucked the *Arnica mollis*, which he had not before found anywhere. Before reaching the mountains they had marked in their botany books forty-six species of plants they hoped to find there, and before they came away they had found forty-two of them.

When they reached their camping-place, farther down, Thoreau was so lame he could not move about, and lay there in the camp several days, eating the pork and other supplies they had in their packs, Mr. Hoar going each day to the inn at the mountain summit. This camp was in a thicket of dwarf firs at the foot of the ravine, where, just before his accident, by carelessness in lighting a fire, some acres of the mountain woodland had been set on fire; but this proved to be the signal for which Thoreau had told his Worcester friends to watch, if they wished to join him on the mountain. "I had told Blake," says Thoreau in his journal, to look out for a smoke and a white tent. We had made a smoke sure enough. We slept five in the tent that night, and found it quite warm." Mr. Hoar added: "In this journey Thoreau insisted on our carrying heavy packs, and rather despised persons who complained of the burden. He was chagrined, in the Maine woods, to find his Indian, Joe Polis (whom, on the whole, he admired), excited and tremulous at sight of a moose, so that he could scarcely load his gun properly. Joe, who was a good Catholic, wanted us to stop traveling on Sunday and hold a meeting; and when we insisted on going forward, the Indian withdrew into the woods to say his prayers, — then came back and picked up the breakfast things, and we paddled on. As to Thoreau's courage and manliness, nobody who had seen him among the Penobscot rocks and rapids — the Indian trusting his life and his canoe to Henry's skill, promptitude, and nerve — would ever doubt it."

Channing says:<sup>1</sup> “In his later journeys, if his companion was footsore or loitered, he steadily pursued his road. Once, when a follower was done up with headache and incapable of motion, hoping his associate would comfort him and perhaps afford him a sip of tea, he said, ‘ There are people who are sick in that way every morning, and go about their affairs,’ and then marched off about his. In such limits, so inevitable, was he compacted... This tone of mind grew out of no insensibility; or, if he sometimes looked coldly on the suffering of more tender natures, he sympathized with their afflictions, but could do nothing to admire them. He would not injure a plant unnecessarily. At the time of the John Brown tragedy, Thoreau was driven sick. So

<sup>1</sup> Channing’s THOREAU, pp. 3, 8, 9. Channing himself was, no doubt, the “follower” and “companion” here mentioned; no person so frequently walked with Thoreau in his long excursions. They were together in New Boston, N. H., when the minister mentioned in the WEEK reproved Thoreau for not going to meeting on Sunday. When I first lived in Concord (March, 1855), and asked the innkeeper what Sunday services the village held, he replied: “There ‘s the Orthodox, an’ the Unitarian, an’ th’ Walden Pond Association,” — meaning by the last what Emerson called “the Walkers,” — those who rambled in the Walden woods on Sundays.

the country’s misfortunes in the Union war acted on his feelings with great force: he used to say he ‘could never recover while the war lasted.’” Hawthorne had an experience somewhat similar, though he, too, was of stern stuff when need was, and had much of the old Salem sea-captains in his sensitive nature.

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, NOVEMBER 6, 1858.

Friend Ricketson, — I was much pleased with your lively and lifelike account of your voyage. You were more than repaid for your trouble after all. The coast of Nova Scotia, which you sailed along from Windsor westward, is particularly interesting to the historian of this country, having been settled earlier than Plymouth. Your “Isle of Haut” is properly “Isle Haute,” or the High Island of Champlain’s map. There is another off the coast of Maine. By the way, the American elk, of American authors ( *Cervus Canadensis*), is a distinct animal from the moose ( *Cervus alecs*’), though the latter is called elk by many.

You drew a very vivid portrait of the Australian, — short and stout, with a pipe in his mouth, and his book inspired by beer, Pot First, Pot Second, etc. I suspect that he must be potbellied withal. Methinks I see the smoke going up from him as from a cottage on the moor. If he does not quench his genius with his beer, it may burst into a clear flame at last. However, perhaps he intentionally adopts the low style.

What do you mean by that ado about smoking, and my "purer tastes"? I should like his pipe as well as his beer, at least. Neither of them is so bad as to be "highly connected," which you say he is, unfortunately. No! I expect nothing but pleasure in "smoke from your pipe."

You and the Australian must have put your heads together when you concocted those titles, — with pipes in your mouths over a pot of beer. I suppose that your chapters are, Whiff the First, Whiff the Second, etc. But of course it is a more modest expression for "Fire from my Genius."

You must have been very busy since you came back, or before you sailed, to have brought out your History, of whose publication I had not heard. I suppose that I have read it in the "Mercury." Yet I am curious to see how it looks in a volume, with your name on the title-page.

I am more curious still about the poems. Pray put some sketches into the book: your shanty for frontispiece; Arthur and Walton's boat (if you can) running for Cuttyhunk in a tremendous gale; not forgetting "Be honest boys," etc., near by; the Middleborough Ponds, with a certain island looming in the distance; the Quaker meeting-house, and the Brady House, if you like; the villagers catching smelts with dip-nets in the twilight, at the Head of the River, etc., etc. Let it be a local and villageous book as much as possible. Let some one make a characteristic selection of mottoes from your shanty walls, and sprinkle them in an irregular manner, at all angles, over the fly-leaves and margins, as a man stamps his name in a hurry; and also canes, pipes, and jackknives, of all your patterns, about the frontispiece. I can think of plenty of devices for tail-pieces. Indeed, I should like to see a hair-pillow, accurately drawn, for one; a cat, with a bell on, for another; the old horse, with his age printed in the hollow of his back; half a cocoanut shell by a spring; a sheet of blotted paper; a settle occupied by a settler at full length, etc., etc., etc. Call all the arts to your aid.

Don't wait for the Indian Summer, but bring it with you.

P. S. — Let me ask a favor. I am trying to write something about the autumnal tints, and I wish to know how much our trees differ from English and European ones in this respect. Will you observe, or learn for me, what English or European trees, if any, still retain their leaves in Mr. Arnold's garden (the gardener will supply the true names); and also if the foliage of any (and what) European or foreign trees there have been brilliant the past month. If you will do this you will greatly oblige me. I return the newspaper with this.

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

Concord, November 28, 1858.

Friend Eicketson, — I thank you for your "History."<sup>1</sup> Though I have not yet read it again, I have looked far enough to see that I like the homeliness of it; that is, the good, old-fashioned way of writing, as if you actually lived where you wrote. A man's interest in a single bluebird is worth more than a complete but dry list of the fauna and flora of a town. It is also a considerable advantage to be able to say at any time, "If R. is not here, here is his book." Alcott being here, and inquiring after you (whom he has been expecting), I lent the book to him almost immediately. He talks of going West the latter part of this week. Channing is here again, as I am told, but I have not seen him.

I thank you also for the account of the trees.

<sup>1</sup> Of New Bedford, first published in the Mercury of that city, while Channing was one of the editors, and afterwards in a volume.

It was to my purpose, and I hope you got something out of it too. I suppose that the cold weather prevented your coming here. Suppose you try a winter walk on skates. Please remember me to your family.

Late in November, 1858, Cholmondeley, who had not written for a year and six months, suddenly notified Thoreau from Montreal that he was in Canada, and would visit Concord the next week. Accordingly he arrived early in December, and urged his friend to go with him to the West Indies. John Thoreau, the father, was then in his last illness, and for that and other reasons Thoreau could not accept the invitation; but he detained Cholmondeley in Concord some days, and took him to New Bedford, December 8th, having first written this note to Mr. Ricketson: —

"Thomas Cholmondeley, my English acquaintance, is here, on his way to the West Indies. He wants to see New Bedford, a whaling town. I tell him I would like to introduce him to you there, — thinking more of his seeing you than New Bedford. So we propose to come your way to-morrow. Excuse this short notice, for the time is short. If on any account it is inconvenient to see us, you will treat us accord-

Of this visit and his English visitor, Mr. Ricketson wrote in his journal the next day: —

"We were all much pleased with Mr. Cholmondeley. He is a tall spare man, thirty-five years of age, of fair and fresh complexion, blue eyes, light brown and fine hair, nose small and Roman, beard light and worn full, with a mustache. A man of fine culture and refinement of manners, educated at Oriel College, Oxford, of an old Cheshire family by his father, a clergyman. He wore a black velvet sack coat, and lighter colored trousers, — a sort of genteel traveling suit; perhaps a cap, but by no means a fashionable 'castor.' He reminded me of our dear friend, George William Curtis." Few greater compliments could this diarist give than to compare a visitor to Curtis, the lamented.

Mr. Cholmondeley left Concord for the South, going as far as to Virginia, in December and January; then came back to Concord the 20th of January, 1859, and after a few days returned to Canada, and thence to England by way of Jamaica. He was in London when Theodore Parker reached there from Santa Cruz, in June, and called on him, with offers of service; but does not seem to have heard of Parker's death till

I wrote him in May, 1861. At my parting with him in Concord, he gave me money with which to buy grapes for the invalid father of Thoreau, — an instance of his constant consideration for others; the Thoreaus hardly affording such luxuries as hothouse grapes for the sick. Sophia Thoreau, who perhaps was more appreciative of him than her more stoical brother, said after his death, “We have always had the truest regard for him, as a person of rare integrity, great benevolence, and the sincerest friendliness.” This well describes the man whose every-day guise was literally set down by Mr. Ricketson.

## TO HARRISON BLAKE (AT WORCESTER).

CONCORD, January 1, 1859.

Mr. Blake, — It may interest you to hear that Cholmondeley has been this way again, via Montreal and Lake Huron, going to the West Indies, or rather to Weissnicht-wo, whither he urges me to accompany him. He is rather more demonstrative than before, and, on the whole, what would be called “a good fellow,” — is a man of principle, and quite reliable, but very peculiar. I have been to New Bedford with him, to show him a whaling town and Ricketson. I was glad to hear that you had called on R. How did you like him? I suspect that you did not see one another fairly.

I have lately got back to that glorious society called Solitude, where we meet our friends continually, and can imagine the outside world also to be peopled. Yet some of my acquaintance would fain hustle me into the almshouse for the sake of society, as if I were pining for that diet, when I seem to myself a most befriended man, and find constant employment. However, they do not believe a word I say. They have got a club, the handle of which is in the Parker House at Boston, and with this they beat me from time to time, expecting to make me tender or minced meat, so fit for a club to dine off.

“Hercules with his club The Dragon did drub;  
But More of More Hall,  
With nothing at all,  
He slew the Dragon of Wantley.”

Ah! that More of More Hall knew what fair play was. Channing, who wrote to me about it once, brandishing the club vigorously (being set on by another, probably), says now, seriously, that he is sorry to find by my letters that I am “absorbed in politics,” and adds, begging my pardon for his plainness, “Beware of an extraneous life!” and so he does his duty, and washes his hands of me. I tell him that it is as if he should say to the sloth, that fellow that creeps so slowly along a tree, and cries ai from time to time, “Beware of dancing!”

The doctors are all agreed that I am suffering for want of society. Was never a case like it. First, I did not know that I was suffering at all. Secondly, as an Irishman might say, I had thought it was indigestion of the society I got.

As for the Parker House, I went there once, when the Club was away, but I found it hard to see through the cigar smoke, and men were deposited about in chairs over the marble floor, as thick as legs of bacon in a smoke-house. It was all smoke, and no salt, Attic or other. The only room in Boston which I visit with alacrity is the Gentlemen's Room at the Fitchburg Depot, where I wait for the cars, sometimes for two hours, in order to get out of town. It is a paradise to the Parker House, for no smoking is allowed, and there is far more retirement. A large and respectable club of us hire it (Town and Country Club), and I am pretty sure to find some one there whose face is set the same way as my own.

My last essay, on which I am still engaged, is called *Autumnal Tints*. I do not know how readable (i e., by me to others) it will be.

I met Mr. James the other night at Emerson's, at an Alcottian conversation, at which, however, Alcott did not talk much, being disturbed by James's opposition. The latter is a hearty man enough, with whom you can differ very satisfactorily, on account of both his doctrines and his good temper. He utters quasi philanthropic dogmas in a metaphysic dress; but they are for all practical purposes very crude. He charges society with all the crime committed, and praises the criminal for committing it. But I think that all the remedies he suggests out of his head — for he goes no farther, hearty as he is — would leave us about where we are now. For, of course, it is not by a gift of turkeys on Thanksgiving Day that he proposes to convert the criminal, but by a true sympathy with each one, — with him, among the rest, who lyingly tells the world from the gallows that he has never been treated kindly by a single mortal since he was born. But it is not so easy a thing to sympathize with another, though you may have the best disposition to do it. There is Dobson over the hill. Have not you and I and all the world been trying, ever since he was born, to sympathize with him? (as doubtless he with us), and yet we have got no farther than to send him to the House of Correction once at least; and he, on the other hand, as I hear, has sent us to another place several times. This is the real state of things, as I understand it, as least so far as James's remedies go. We are now, alas! exercising what charity we actually have, and new laws would not give us any more. But, perchance, we might make some improvements in the House of Correction. You and I are Dobson; what will James do for us?

Have you found at last in your wanderings a place where the solitude is sweet?

What mountain are you camping on nowadays? Though I had a good time at the mountains, I confess that the journey did not bear any fruit that I know of. I did not expect it would. The mode of it was not simple and adventurous enough. You must first have made an infinite demand, and not unreasonably, but after a corresponding outlay, have an all-absorbing purpose, and at the same time that your feet bear you hither and thither, travel much more in imagination. — .

To let the mountains slide, — live at home like a traveler. It should not be in vain that these things are shown us from day to day. Is not each withered leaf that I see in my walks something which I have traveled to find? — traveled, who can tell how far? What a fool he must be who thinks that his *El Dorado* is anywhere but where he lives!

We are always, methinks, in some kind of ravine, though our bodies may walk the smooth streets of Worcester. Our souls (I use this word for want of a better) are ever perched on its rocky sides, overlooking that lowland. (What a more than Tuckerman's Ravine is the body itself, in which the "soul" is encamped, when you come to look into it! However, eagles always have chosen such places for their eyries.)

Thus is it ever with your fair cities of the plain. Their streets may be paved with silver and gold, and six carriages roll abreast in them, but the real homes of the citizens are in the Tuckerman's Ravines which ray out from that centre into the mountains round about, one for each man, woman, and child. The masters of life have so ordered it. That is their beau-ideal of a country seat. There is no danger of being tuckered out before you get to it.

So we live in Worcester and in Concord, each man taking his exercise regularly in his ravine, like a lion in his cage, and sometimes spraining his ankle there. We have very few clear days, and a great many small plagues which keep us busy. Sometimes, I suppose, you hear a neighbor halloo (Brown, may be) and think it is a bear. Nevertheless, on the whole, we think it very grand and exhilarating, this ravine life. It is a capital advantage withal, living so high, the excellent drainage of that city of God. Routine is but a shallow and insignificant sort of ravine, such as the ruts are, the conduits of puddles. But these ravines are the source of mighty streams, precipitous, icy, savage, as they are, haunted by bears and loup-cerviers; there are born not only Sacos and Amazons, but prophets who will redeem the world. The at last smooth and fertilizing water at which nations drink and navies supply themselves begins with melted glaciers, and burst thunder-spouts. Let us pray that, if we are not flowing through some Mississippi valley which we fertilize, — and it is not likely we are, — we may know ourselves shut in between grim and mighty mountain walls amid the clouds, falling a thousand feet in a mile, through dwarfed fir and spruce, over the rocky insteps of slides, being exercised in our minds, and so developed.

CONCORD, January 19, 1859.

Mr. Blake, — If I could have given a favorable report as to the skating, I should have answered you earlier. About a week before you wrote there was good skating; there is now none. As for the lecture, I shall be glad to come. I cannot now say when, but I will let you know, I think within a week or ten days at most, and will then leave you a week clear to make the arrangements in. I will bring something else than "What shall it profit a Man?" My father is very sick, and has been for a long time, so that there is the more need of me at home. This occurs to me, even when contemplating so short an excursion as to Worcester.

I want very much to see or hear your account of your adventures in the Ravine, and I trust I shall do so when I come to Worcester. Cholmondeley has been here again, returning from Virginia (for he went no farther south) to Canada; and will go thence to Europe, he thinks, in the spring, and never ramble any more. (January 29.) I am expecting daily that my father will die, therefore I cannot leave home at present. I will write you again within ten days.

The death of John Thoreau (who was born October 8, 1787) occurred February 3d, and Thoreau gave his lecture on "Autumnal Tints" at Worcester, February 22, 1859. Mrs. Thoreau survived all her children except Sophia, and died in 1872. In a letter to Mr. Ricketson, Thoreau gave a just sketch of his father's character.

1 This was Tuckerman's Ravine at the White Mountains, where Thoreau met with his mishap in the preceding July.

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, 12th February, 1859.

Friend Ricketson, — I thank you for your kind letter. I sent you the notice of my father's death as much because you knew him as because you knew me. I can hardly realize that he is dead. He had been sick about two years, and at last declined rather rapidly, though steadily. Till within a week or ten days before he died he was hoping to see another spring, but he then discovered that this was a vain expectation, and, thinking that he was dying, he took his leave of us several times within a week before his departure. Once or twice he expressed a slight impatience at the delay. He was quite conscious to the last, and his death was so easy that, though we had all been sitting around the bed for an hour or more expecting that event (as we had sat before), he was gone at last, almost before we were aware of it.

I am glad to read what you say of his social nature. I think I may say that he was wholly unpretending; and there was this peculiarity in his aim, that though he had pecuniary difficulties to contend with the greater part of his life, he always studied how to make a good article, pencil or other (for he practiced various arts), and was never satisfied with what he had produced. Nor was he ever disposed in the least to put off a poor one for the sake of pecuniary gain, — as if he labored for a higher end.

Though he was not very old, and was not a native of Concord, I think that he was, on the whole, more identified with Concord street than any man now alive, having come here when he was about twelve years old, and set up for himself as a merchant here, at the age of twenty-one, fifty years ago. As I sat in a circle the other evening with my mother and sister, my mother's two sisters, and my father's two sisters, it occurred to me that my father, though seventy-one, belonged to the youngest four of the eight who recently composed our family.

How swiftly at last, but unnoticed, a generation passes away! Three years ago I was called with my father to be a witness to the signing of our neighbor Mr. Frost's will. Mr. Samuel Hoar, who was there writing it, also signed it. I was lately required to go to Cambridge to testify to the genuineness of the will, being the only one of the four who could be there, and now I am the only one alive.

My mother and sister thank you heartily for your sympathy. The latter, in particular, agrees with you in thinking that it is communion with still living and healthy nature alone which can restore to sane and cheerful views. I thank you for your invitation to New Bedford, but I feel somewhat confined here for the present.

I did not know but we should see you the day after Alger was here. It is not too late for a winter walk in Concord. It does me good to hear of spring birds, and singing ones too, — for spring seems far away from Concord yet. I am going to Worcester to read a parlor lecture on the 22d, and shall see Blake and Brown. What if you were to meet me there, or go with me from here? You would see them to good advantage. Cholmondeley has been here again, after going as far south as Virginia, and left for Canada about three weeks ago. He is a good soul, and I am afraid I did not sufficiently recognize him.

Please remember me to Mrs. Ricketson, and to the rest of your family.

## **TO HARRISON BLAKE (AT WORCESTER).**

CONCORD, September 26, 1859.

MR. BLAKE, — I am not sure that I am in a fit mood to write to you, for I feel and think rather too much like a business man, having some very irksome affairs to attend to these months and years on account of my family.<sup>1</sup> This is the way I am serving King Admetus, confound him! If it were not for my relations, I would let the wolves prey on his flocks to their bellies' content. Such fellows you have to deal with! herdsmen of some other king, or of the same, who tell no tale, but in the sense of counting their flocks, and then lie drunk under a hedge. How is your grist ground? Not by some murmuring stream, while you lie dreaming on the bank; but, it seems, you must take hold with your hands, and shove the wheel round. You can't depend on streams, poor feeble things! You can't depend on worlds, left to themselves; but you've got to oil them and goad them along. In short, you've got to carry on two farms at once, — the farm on the earth and the farm in your mind. Those Crimean and Italian battles were mere boys' play, — they are the scrapes into which truants get. But what a battle a man must fight everywhere to maintain his standing army of thoughts, and march with them in orderly array through the always hostile coun-

<sup>1</sup> He was looking after the manufacture of fine plumbago for the electrotypers, which was the family business after pencil-making grew unprofitable. The Thoreaus had a grinding mill in Acton, and a packing shop attached to their Concord house. "Parker's society," mentioned at the close of the letter, was the congregation of Theodore Parker, then in Italy, where he died in May, 1860.

try! How many enemies there are to sane thinking! Every soldier has succumbed to them before he enlists for those other battles. Men may sit in chambers, seemingly safe and sound, and yet despair, and turn out at last only hollowness and dust within, like a Dead Sea apple. A standing army of numerous, brave, and well-disciplined thoughts,

and you at the head of them, marching straight to your goal, — how to bring this about is the problem, and Scott's Tactics will not help you to it. Think of a poor fellow begirt only with a sword-belt, and no such staff of athletic thoughts! his brains rattling as he walks and talks! These are your praetorian guard. It is easy enough to maintain a family, or a state, but it is hard to maintain these children of your brain (or say, rather, these guests that trust to enjoy your hospitality), they make such great demands; and yet, he who does only the former, and loses the power to think originally, or as only he ever can, fails miserably. Keep up the fires of thought, and all will go well.

Zouaves? — pish! How you can overrun a country, climb any rampart, and carry any fortress, with an army of alert thoughts! — thoughts that send their bullets home to heaven's door, — with which you can take the whole world, without paying for it, or robbing anybody. See, the conquering hero comes! You fail in your thoughts, or you prevail in your thoughts only. Provided you think well, the heavens falling, or the earth gaping, will be music for you to march by. No foe can ever see you, or you him; you cannot so much as think of him. Swords have no edges, bullets no penetration, for such a contest. In your mind must be a liquor which will dissolve the world whenever it is dropt in it. There is no universal solvent but this, and all things together cannot saturate it. It will hold the universe in solution, and yet be as translucent as ever. The vast machine may indeed roll over our toes, and we not know it, but it would rebound and be staved to pieces like an empty barrel, if it should strike fair and square on the smallest and least angular of a man's thoughts.

You seem not to have taken Cape Cod the right way. I think that you should have persevered in walking on the beach and on the bank, even to the land's end, however soft, and so, by long knocking at Ocean's gate, have gained admittance at last, — better, if separately, and in a storm, not knowing where you would sleep by night, or eat by day. Then you should have given a day to the sand behind Provincetown, and ascended the hills there, and been blown on considerably. I hope that you like to remember the journey better than you did to make it.

I have been confined at home all this year, but I am not aware that I have grown any rustier than was to be expected. One while I explored the bottom of the river pretty extensively. I have engaged to read a lecture to Parker's society on the 9th of October next.

I am off — a barberrying.

## **TO HARRISON BLAKE (AT WORCESTER).**

CONCORD, October 31, 1859.

Mr. Blake, — I spoke to my townsmen last evening on "The Character of Captain Brown, now in the clutches of the slaveholder." I should like to speak to any company at Worcester who may wish to hear me; and will come if only my expenses are paid. I

think we should express ourselves at once, while Brown is alive. The sooner the better. Perhaps Higginson may like to have a meeting. Wednesday evening would be a good time. The people here are deeply interested in the matter. Let me have an answer as soon as may be.

P. S. — I may be engaged toward the end of the week.

Henry D. Thoreau.

This address on John Brown was one of the first public utterances in favor of that hero; it was made up mainly from the entries in Thoreau's journals, since I had introduced Brown to him, and he to Emerson, in March, 1857; and specially from those pages that Thoreau had written after the news of Brown's capture in Virginia had reached him. It was first given in the vestry of the old parish church in Concord (where, in 1774, the Provincial Congress of Massachusetts had met to prepare for armed resistance to British tyranny); was repeated at Worcester the same week, and before a great audience in Boston, the following Sunday, — after which it was published in the newspapers, and had a wide reading. Mr. Alcott in his diary mentions it under date of Sunday, October 30, thus: "Thoreau reads a paper on John Brown, his virtues, spirit, and deeds, this evening, and to the delight of his company, — the best that could be gathered at short notice, — and among them Emerson. (November 4.) Thoreau calls and reports about the reading of his lecture on Brown at Boston and Worcester. He has been the first to speak and celebrate the hero's courage and magnanimity; it is these that he discerns and praises. The men have much in common, — the sturdy manliness, straightforwardness, and independence. (November 5.) Ricketson from New Bedford arrives; he and Thoreau take supper with us. Thoreau talks freely and enthusiastically about Brown, — denouncing the Union, the President, the States, and Virginia particularly; wishes to publish his late speech, and has seen Boston publishers, but failed to find any to print it for him." It was soon after published, along with Emerson's two speeches in favor of Brown, by a new Boston publishing house (Thayer & Eldridge), in a volume called, "Echoes of Harper's Ferry," edited by the late James Redpath, Brown's first biographer. In the following summer, Thoreau sent a second paper on Brown (written soon after his execution) to be read at a commemoration of the martyr, beside his grave among the Adirondae Mountains. This is mentioned in his letter to Sophia Thoreau, July 8, 1860. He took an active part in arranging for the funeral service in honor of Brown, at Concord, the day of his death, December 2, 1859.

## TO HARRISON BLAKE (AT WORCESTER).

CONCORD, May 20, 1860.

Mr. Blake, — I must endeavor to pay some of my debts to you. To begin where we left off, then.

The presumption is that we are always the same; our opportunities, and Nature herself, fluctuating. Look at mankind. No great difference between two, apparently; perhaps the same height, and breadth, and weight; and yet, to the man who sits most east, this life is a weariness, routine, dust and ashes, and he drowns his imaginary cares (!) (a sort of friction among his vital organs) in a bowl. But to the man who sits most west, his contemporary (!), it is a field for all noble endeavors, an elysium, the dwelling-place of heroes and demigods. The former complains that he has a thousand affairs to attend to; but he does not realize that his affairs (though they may be a thousand) and he are one.

Men and boys are learning all kinds of trades but how to make men of themselves. They learn to make houses; but they are not so well housed, they are not so contented in their houses, as the woodchucks in their holes. What is the use of a house if you haven't got a tolerable planet to put it on? — if you cannot tolerate the planet it is on? Grade the ground first. If a man believes and expects great things of himself, it makes no odds where you put him, or what you show him (of course you cannot put him anywhere, nor show him anything), he will be surrounded by grandeur. He is in the condition of a healthy and hungry man, who says to himself, — How sweet this crust is! If he despairs of himself, then Tophet is his dwelling-place, and he is in the condition of a sick man who is disgusted with the fruits of finest flavor.

Whether he sleeps or wakes, — whether he runs or walks, — whether he uses a microscope or a telescope, or his naked eye, — a man never discovers anything, never overtakes anything, or leaves anything behind, but himself. Whatever he says or does, he merely reports himself. If he is in love, he loves; if he is in heaven, he enjoys; if he is in hell, he suffers. It is his condition that determines his locality.

The principal, the only thing a man makes, is his condition of fate. Though commonly he does not know it, nor put up a sign to this effect, "My own destiny made and mended here." [Not yours.] He is a master-workman in the business. He works twenty-four hours a day at it, and gets it done. Whatever else he neglects or botches, no man was ever known to neglect this work. A great many pretend to make shoes chiefly, and would scout the idea that they make the hard times which they experience.

Each reaching and aspiration is an instinct with which all nature consists and co-operates, and therefore it is not in vain. But alas! each relaxing and desperation is an instinct too. To be active, well, happy, implies rare courage. To be ready to fight in a duel or a battle implies desperation, or that you hold your life cheap.

If you take this life to be simply what old religious folks pretend (I mean the effete, gone to seed in a drought, mere human galls stung by the devil once), then all your joy and serenity is reduced to grinning and bearing it. The fact is, you have got to take the world on your shoulders like Atlas, and "put along" with it. You will do this for an idea's sake, and your success will be in proportion to your devotion to ideas. It may make your back ache occasionally, but you will have the satisfaction of hanging it or twirling it to suit yourself. Cowards suffer, heroes enjoy. After a long day's walk with it, pitch it into a hollow place, sit down and eat your luncheon. Unexpectedly, by

some immortal thoughts, you will be compensated. The bank whereon you sit will be a fragrant and flowery one, and your world in the hollow a sleek and light gazelle.

Where is the “unexplored land” but in our own untried enterprises? To an adventurous spirit any place — London, New York, Worcester, or his own yard — is “unexplored land,” to seek which Fremont and Kane travel so far. To a sluggish and defeated spirit even the Great Basin and the Polaris are trivial places. If they can get there (and, indeed, they are there now), they will want to sleep, and give it up, just as they always do. These are the regions of the Known and of the Unknown. What is the use of going right over the old track again? There is an adder in the path which your own feet have worn. You must make tracks into the Unknown. That is what you have your board and clothes for. Why do you ever mend your clothes, unless that, wearing them, you may mend your ways? Let us sing.

## TO SOPHIA THOREAU (AT CAMPTON, N. H.).

CONCORD, July 8, 1860.

Dear Sophia, — Mother reminds me that I must write to you, if only a few lines, though I have sprained my thumb, so that it is questionable whether I can write legibly, if at all. I can’t “bear on” much. What is worse, I believe that I have sprained my brain too — that is, it sympathizes with my thumb. But that is no excuse, I suppose, for writing a letter in such a case, is like sending a newspaper, only a hint to let you know that “all is well,” — but my thumb.

I hope that you begin to derive some benefit from that more mountainous air which you are breathing. Have you had a distinct view of the Franconia Notch Mountains (blue peaks in the northern horizon)? which I told you you could get from the road in Campton, probably from some other points nearer. Such a view of the mountains is more memorable than any other. Have you been to Squam Lake or overlooked it? I should think that you could make an excursion to some mountain in that direction from which you could see the lake and mountains generally. Is there no friend of N. P. Rogers who can tell you where the “lions” are?

Of course I did not go to North Elba,<sup>1</sup> but I sent some reminiscences of last fall. I hear that John Brown, Jr., has now come to Boston for a few days. Mr. Sanborn’s case, it is said, will come on after some murder cases have been disposed of here.

I have just been invited formally to be present at the annual picnic of Theodore Parker’s society (that was), at Waverley, next Wednesday, and to make some remarks. But that is wholly out of my line. I do not go to picnics, even in Concord, you know.

Mother and Aunt Sophia rode to Acton in time yesterday. I suppose that you have heard that Mr. Hawthorne has come home. I went to meet him the other evening and found that he has not altered, except that he was looking quite

<sup>1</sup> He was invited to a gathering of John Brown’s friends at the grave in the Adirondac woods. “Mr. Sanborn’s case” was an indictment and civil suit against Silas Carleton et

als for an attempt to kidnap F. B. Sanborn, who had refused to accept the invitation of the Senate at Washington to testify in the John Brown investigation.

brown after his voyage. He is as simple and childlike as ever.

I believe that I have fairly scared the kittens away, at last, by my pretended fierceness, which was. I will consider my thumb — and your eyes.

Henry.

## TO HARRISON BLAKE (AT WORCESTER).

CONCORD, August 3, 1860.

Mr. Blake, — I some time ago asked Channing if he would not spend a week with me on Monadnoc; but he did not answer decidedly. Lately he has talked of an excursion somewhere, but I said that now I must wait till my sister returned from Plymouth, N. H. She has returned, — and accordingly, on receiving your note this morning, I made known its contents to Channing, in order to see how far I was engaged with him. The result is that he decides to go to Monadnoc to-morrow morning;<sup>1</sup> so I must defer

<sup>1</sup> This is the excursion described by Thoreau in a subsequent letter, — lasting six days, and the first that Channing had made which involved “camping out.” It was also Thoreau’s last visit to this favorite mountain; but Channing continued to go there after the death of his friend; and some of these visits are recorded in his poem, “The Wanderer.” The last one was in September, 1869, when I accompanied him, and we again spent five nights on the plateau where he had camped with Thoreau. At that time, one of the “two good spruce houses, half a mile apart,” mentioned by Thoreau, was still standing-, in ruins, — the place called by Channing “Henry’s Camp,” and thus described: —

We built our fortress where you see  
On group of spruce-trees, sidewise on the line  
Where the horizon to the eastward bounds, —  
A point selected by sagacious art,  
Where all at once we viewed the Vermont hills,  
And the long outline of the mountain-ridge,  
Ever renewing, changeful every hour.  
See *The Wanderer* (Boston, 1871), p. 61.

making an excursion with you and Brown to another season. Perhaps you will call as you pass the mountain. I send this by the earliest mail.

P. S. — That was a very insufficient visit you made here the last time. My mother is better, though far from well; and if you should chance along here any time after your journey, I trust that we shall all do better.

The mention by Thoreau of John Brown and my “case” recalls to me an incident of those excited days which followed the attack by Brown on slavery in Virginia. The day after Brown’s death, but before the execution of his comrades, I received a message

from the late Dr. David Thayer of Boston, implying, as I thought, that a son of Brown was at his house, whither I hurried to meet him. Instead, I found young F. J. Merriam of Boston, who had escaped with Owen Brown from Harper's Ferry, and was now in Boston to raise another party against the slaveholders. He was unfit to lead or even join in such a desperate undertaking, and we insisted he should return to safety in Canada, — a large reward being offered for his seizure. He agreed to go back to Canada that night by the Fitchburg Railroad; but in his hotheaded way he took the wrong train, which ran no farther than Concord, — and found himself in the early evening at my house, where my sister received him, but insisted that I should not see him, lest I might be questioned about my guest. While he had supper and went to bed, I posted down to Mr. Emerson's and engaged his horse and covered wagon, to be ready at sunrise, — he asking no questions. In the same way I engaged Mr. Thoreau to drive his friend's horse to South Acton the next morning, and there put on board the first Canadian train a Mr. Lockwood, whom he would find at my house. Thoreau readily consented, asked no questions, walked to the Emerson stable the next morning, found the horse ready, drove him to my door, and took up Merriam, under the name of Lockwood, — neither knowing who the other was. Merriam was so flighty that, though he had agreed to go to Montreal, and knew that his life might depend on getting there early, he declared he must see Mr. Emerson, to lay before him his plan for invading the South, and consult him about some moral questions that troubled his mind. His companion listened gravely, — and hurried the horse towards Acton. Merriam grew more positive and suspicious, — “Perhaps you are Mr. Emerson; you look somewhat like him.”

“No, I am not,” said Thoreau, and drove steadily away from Concord. “Well, then, I am going back,” said the youth, and flung himself out of the wagon. How Thoreau got him in again, he never told me; but I suspected some judicious force, accompanying the grave persuasive speech natural to our friend. At any rate, he took his man to Acton, saw him safe on the train, and reported to me that “Mr. Lockwood had taken passage for Canada,” where he arrived that night. Nothing more passed between us until, more than two years after, he inquired one day, in his last illness, who my fugitive was. Merriam was then out of danger in that way, and had been for months a soldier in the Union army, where he died. I therefore said that “Lockwood” was the grandson of his mother's old friend, Francis Jackson, and had escaped from Maryland. In return he gave me the odd incidents of their drive, and mentioned that he had spoken of the affair to his mother only since his illness. So reticent and practically useful could he be; as Channing says, “He made no useless professions, never asked one of those questions which destroy all relation; but he was on the spot at the time, he meant friendship, and meant nothing else, and stood by it without the slightest abatement.”

## TO DANIEL RICKETSON (AT NEW BEDFORD).

CONCORD, November 4, 1860.

Friend Ricketson, — I thank you for the verses. They are quite too good to apply to me. However, I know what a poet's license is, and will not get in the way.

But what do you mean by that prose? Why will you waste so many regards on me, and not know what to think of my silence? Infer from it what you might from the silence of a dense pine wood. It is its natural condition, except when the winds blow, and the jays scream, and the chickadee winds up his clock. My silence is just as inhuman as that, and no more. You know that I never promised to correspond with you, and so, when I do, I do more than I promised.

Such are my pursuits and habits, that I rarely go abroad; and it is quite a habit with me to decline invitations to do so. Not that I could not enjoy such visits, if I were not otherwise occupied. I have enjoyed very much my visits to you, and my rides in your neighborhood, and am sorry that I cannot enjoy such things oftener; but life is short, and there are other things also to be done. I admit that you are more social than I am, and far more attentive to "the common courtesies of life;" but this is partly for the reason that you have fewer or less exacting private pursuits.

Not to have written a note for a year is with me a very venial offense. I think that I do not correspond with any one so often as once in six months.

I have a faint recollection of your invitation referred to; but I suppose that I had no new nor particular reason for declining, and so made no new statement. I have felt that you would be glad to see me almost whenever I got ready to come; but I only offer myself as a rare visitor, and a still rarer correspondent.

I am very busy, after my fashion, little as there is to show for it, and feel as if I could not spend many days nor dollars in traveling; for the shortest visit must have a fair margin to it, and the days thus affect the weeks, you know. Nevertheless, we cannot forego these luxuries altogether. You must not regard me as a regular diet, but at most only as acorns, which, too, are not to be despised, — which, at least, we love to think are edible in a bracing walk. We have got along pretty well together in several directions, though we are such strangers in others.

I hardly know what to say in answer to your letter. Some are accustomed to write many letters, others very few. I am one of the last. At any rate, we are pretty sure, if we write at all, to send those thoughts which we cherish, to that one who, we believe, will most religiously attend to them.

This life is not for complaint, but for satisfaction. I do not feel addressed by this letter of yours. It suggests only misunderstanding. Intercourse may be good; but of what use are complaints and apologies? Any complaint I have to make is too serious to be uttered, for the evil cannot be mended.

Turn over a new leaf.

My out-door harvest this fall has been one Canada lynx, a fierce-looking fellow, which, it seems, we have hereabouts; eleven barrels of apples from trees of my own planting; and a large crop of white-oak acorns, which I did not raise.

Please remember me to your family. I have a very pleasant recollection of your fireside, and I trust that I shall revisit it; — also of your shanty and the surrounding regions.

## TO HARRISON BLAKE (AT WORCESTER).

CONCORD, November 4, 1860.

Mr. Blake, — I am glad to hear any particulars of your excursion. As for myself, I looked out for you somewhat on that Monday, when, it appears, you passed Monadnoc; turned my glass upon several parties that were ascending the mountain half a mile on one side of us. In short, I came as near to seeing you as you to seeing me. I have no doubt that we should have had a good time if you had come, for I had, all ready, two good spruce houses, in which you could stand up, complete in all respects, half a mile apart, and you and B. could have lodged by yourselves in one, if not with us.

We made an excellent beginning of our mountain life. You may remember that the Saturday previous was a stormy day. Well, we went up in the rain, — wet through, — and found ourselves in a cloud there at mid-afternoon, in no situation to look about for the best place for a camp. So I proceeded at once, through the cloud, to that memorable stone, “chunk yard,” in which we made our humble camp once, and there, after putting our packs under a rock, having a good hatchet, I proceeded to build a substantial house, which Channing declared the handsomest he ever saw. (He never camped out before, and was, no doubt, prejudiced in its favor.) This was done about dark, and by that time we were nearly as wet as if we had stood in a hogshead of water. We then built a fire before the door, directly on the site of our little camp of two years ago, and it took a long time to burn through its remains to the earth beneath. Standing before this, and turning round slowly, like meat that is roasting, we were as dry, if not drier, than ever, after a few hours, and so at last, we “turned in.”

This was a great deal better than going up there in fair weather, and having no adventure (not knowing how to appreciate either fair weather or foul) but dull, commonplace sleep in a useless house, and before a comparatively useless fire, — such as we get every night. Of course we thanked our stars, when we saw them, which was about midnight, that they had seemingly withdrawn for a season. We had the mountain all to ourselves that afternoon and night. There was nobody going up that day to engrave his name on the summit, nor to gather blueberries. The genius of the mountains saw us starting from Concord, and it said, There come two of our folks. Let us get ready for them.

Get up a serious storm, that will send a-packing these holiday guests. (They may have their say another time.) Let us receive them with true mountain hospitality, —

kill the fatted cloud. Let them know the value of a spruce roof, and of a fire of dead spruce stumps. Every bush dripped tears of joy at our advent. Fire did its best, and received our thanks. What could fire have done in fair weather? Spruce roof got its share of our blessings. And then, such a view of the wet rocks, with the wet lichens on them, as we had the next morning, but did not get again!

We and the mountain had a sound season, as the saying is. How glad we were to be wet, in order that we might be dried! How glad we were of the storm which made our house seem like a new home to us! This day's experience was indeed lucky, for we did not have a thundershower during all our stay. Perhaps our host reserved this attention in order to tempt us to come again.

Our next house was more substantial still. One side was rock, good for durability; the floor the same; and the roof which I made would have upheld a horse. I stood on it to do the shingling.

I noticed, when I was at the White Mountains last, several nuisances which render traveling thereabouts unpleasant. The chief of these was the mountain houses. I might have supposed that the main attraction of that region, even to citizens, lay in its wildness and unlikeness to the city, and yet they make it as much like the city as they can afford to. I heard that the Crawford House was lighted with gas, and had a large saloon, with its band of music, for dancing. But give me a spruce house made in the rain.

An old Concord farmer tells me that he ascended Monadnoc once, and danced on the top. How did that happen? Why, he being up there, a party of young men and women came up, bringing boards and a fiddler; and, having laid down the boards, they made a level floor, on which they danced to the music of the fiddle. I suppose the tune was "Excelsior." This reminds me of the fellow who climbed to the top of a very high spire, stood upright on the ball, and hurraed for — what? Why, for Harrison and Tyler. That's the kind of sound which most ambitious people emit when they culminate. They are wont to be singularly frivolous in the thin atmosphere; they can't contain themselves, though our comfort and their safety require it; it takes the pressure of many atmospheres to do this; and hence they helplessly evaporate there. It would seem that as they ascend, they breathe shorter and shorter, and, at each expiration, some of their wits leave them, till, when they reach the pinnacle, they are so light-headed as to be fit only to show how the wind sits. I suspect that Emerson's criticism called "Monadnoc" was inspired, not by remembering the inhabitants of New Hampshire as they are in the valleys, so much as by meeting some of them on the mountain top.

After several nights' experience, Channing came to the conclusion that he was "lying outdoors," and inquired what was the largest beast that might nibble his legs there. I fear that he did not improve all the night, as he might have done, to sleep. I had asked him to go and spend a week there. We spent five nights, being gone six days, for C. suggested that six working days made a week, and I saw that he was ready to decamp. However, he found his account in it as well as I.

We were seen to go up in the rain, grim and silent, like two genii of the storm, by Fassett's men or boys; but we were never identified afterward, though we were the subject of some conversation which we overheard. Five hundred persons at least came on to the mountain while we were there, but not one found our camp. We saw one party of three ladies and two gentlemen spread their blankets and spend the night on the top, and heard them converse; but they did not know that they had neighbors who were comparatively old settlers. We spared them the chagrin which that knowledge would have caused them, and let them print their story in a newspaper accordingly.

Yes, to meet men on an honest and simple footing, meet with rebuffs, suffer from sore feet, as you did, — ay, and from a sore heart, as perhaps you also did, — all that is excellent. What a pity that that young prince could not enjoy a little of the legitimate experience of traveling — be dealt with simply and truly, though rudely. He might have been invited to some hospitable house in the country, had his bowl of bread and milk set before him, with a clean pinafore; been told that there were the punt and the fishing-rod, and he could amuse himself as he chose; might have swung a few birches, dug out a woodchuck, and had a regular good time, and finally been sent to bed with the boys, — and so never have been introduced to Mr. Everett at all. I have no doubt that this would have been a far more memorable and valuable experience than he got.

The snow-clad summit of Mount Washington must have been a very interesting sight from Wachusett. How wholesome winter is, seen far

1 The Prince of Wales, then visiting America with the Duke of Newcastle.

or near; how good, above all mere sentimental, warm-blooded, short-lived, soft-hearted, moral goodness, commonly so-called. Give me the goodness which has forgotten its own deeds, — which God has seen to be good, and let be. None of your just made perfect, — pickled eels! All that will save them will be their picturesqueness, as with blasted trees. Whatever is, and is not ashamed to be, is good. I value no moral goodness or greatness unless it is good or great, even as that snowy peak is. Pray, how could thirty feet of bowels improve it? Nature is goodness crystallized. You looked into the land of promise. Whatever beauty we behold, the more it is distant, serene, and cold, the purer and more durable it is. It is better to warm ourselves with ice than with fire.

Tell Brown that he sent me more than the price of the book, viz., a word from himself, for which I am greatly his debtor.

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, March 22, 1861.

Friend Ricketson, — The bluebird was here the 26th of February, at least, which is one day earlier than you date; but I have not heard of larks nor pigeon-woodpeckers. To tell the truth, I am not on the alert for the signs of spring, not having had any winter yet. I took a severe cold about the 3d of December, which at length resulted in a kind of bronchitis, so that I have been confined to the house ever since, excepting a very few experimental trips as far as the post-office in some particularly fine noons. My health otherwise has not been affected in the least, nor my spirits. I have simply been imprisoned for so long, and it has not prevented my doing a good deal of reading and the like.

Channing has looked after me very faithfully; says he has made a study of my case, and knows me better than I know myself, etc., etc. Of course, if I knew how it began, I should know better how it would end. I trust that when warm weather comes I shall begin to pick up my crumbs. I thank you for your invitation to come to New Bedford, and will bear it in mind; but at present my health will not permit my leaving home.

The day I received your letter, Blake and Brown arrived here, having walked from Worcester in two days, though Alcott, who happened in soon after, could not understand what pleasure they found in walking across the country in this season, when the ways were so unsettled. I had a solid talk with them for a day and a half — though my pipes were not in good order — and they went their way again.

You may be interested to hear that Alcott is at present, perhaps, the most successful man in the town. He had his second annual exhibition of all the schools in the town, at the Town Hall last Saturday; at which all the masters and misses did themselves great credit, as I hear, and of course reflected some on their teachers and parents. They were making their little speeches from one till six o'clock P. M., to a large audience, which patiently listened to the end. In the mean while, the children made Mr. Alcott an unexpected present of a fine edition of "Pilgrim's Progress" and "Herbert's Poems," which, of course, overcame all parties. I inclose an Order of Exercises.<sup>1</sup>

We had, last night, an old-fashioned northeast snow-storm, far worse than anything in the winter; and the drifts are now very high above the fences. The inhabitants are pretty much confined to their houses, as I was already. All houses are one color, white, with the snow plas-

<sup>1</sup> In April, 1859, Mr. Alcott was chosen superintendent of the public schools of Concord, by a school committee of which Mr. Bull, the creator of the Concord grape, and Mr. Sanborn, were members, and for some years he directed the studies of the younger pupils, to their great benefit and delight. At the yearly "exhibitions," songs were sung composed by Louisa Alcott and others, and the whole town assembled to see and hear. The stress of civil war gradually checked this idyllic movement, and Mr. Alcott returned to his garden and library. It was two years after this that Miss Alcott had her severe experience as hospital nurse at Washington.

tered over them, and you cannot tell whether they have blinds or not. Our pump has another pump, its ghost, as thick as itself, sticking to one side of it. The town has sent out teams of eight oxen each, to break out the roads; and the train due from

Boston at 8 1/2 A. in has not arrived yet (4 p. M.). All the passing has been a train from above at 12 M., which also was due at 8 1/2 A. M. Where are the bluebirds now, think you? I suppose that you have not so much snow at New Bedford, if any.

## TO PARKER PILLSBURY (AT CONCORD, N. H.).

Concord, April 10, 1861.

Friend Pillsbury, — I am sorry to say that I have not a copy of “Walden” which I can spare; and know of none, unless possibly Ticknor & Fields may have one. I send, nevertheless, a copy of “The Week,” the price of which is one dollar and twenty-five cents, which you can pay at your convenience.

As for your friend, my prospective reader, I hope he ignores Fort Sumter, and “Old Abe,” and all that; for that is just the most fatal, and, indeed, the only fatal weapon you can direct against evil, ever; for, as long as you know of it, you are *particeps criminis*. What business have you, if you are “an angel of light,” to be pondering over the deeds of darkness, reading the “New York Herald,” and the like?

I do not so much regret the present condition of things in this country (provided I regret it at all), as I do that I ever heard of it. I know one or two, who have this year, for the first time, read a President’s Message; but they do not see that this implies a fall in themselves, rather than a rise in the President. Blessed were the days before you read a President’s Message. Blessed are the young, for they do not read the President’s Message. Blessed are they who never read a newspaper, for they shall see Nature, and, through her, God.

But, alas! I have heard of Sumter and Pickens, and even of Buchanan (though I did not read his Message). I also read the “New York Tribune;” but then, I am reading Herodotus and Strabo, and Blodget’s “Climatology,” and “Six Years in the Desert of North America,” as hard as I can, to counterbalance it.

By the way, Alcott is at present our most popular and successful man, and has just published a volume in size, in the shape of the Annual School Report, which I presume he has sent to you.

Yours, for remembering all good things,

HENRY D. THOREAU.

Parker Pillsbury, to whom this letter went, was an old friend of the Thoreau family, with whom he became intimate in the anti-slavery agitation, wherein they took part, while he was a famous orator, celebrated by Emerson in one of his Essays. Mr. Pillsbury visited Thoreau in his last illness, when he could scarcely speak above a whisper, and, having made to him some remark concerning the future life, Thoreau replied, “My friend, one world at a time.” His petulant words in this letter concerning national affairs would hardly have been said a few days later, when, at the call of Abraham

Lincoln, the people rose to protect their government, and every President's Message became of thrilling interest, even to Thoreau.

Arrangements were now making for the invalid, about whose health his friends had been anxious for some years, to travel for a better climate than the New England spring affords, and early in May Thoreau set out for the upper Mississippi. He thus missed the last letter sent to him by his English friend Cholmondeley, which I answered, and then forwarded to him at Redwing, in Minnesota. It is of interest enough to be given here.

## **T. CHOLMONDELEY TO THOREAU (IN MINNESOTA).**

Shrewsbury [England], April 23, 1861.

My dear Thoreau, — It is now some time since I wrote to you or heard from you, but do not suppose that I have forgotten you, or shall ever cease to cherish in my mind those days at dear old Concord. The last I heard about you all was from Morton, who was in England about a year ago; and I hope that he has got over his difficulties and is now in his own country again. I think he has seen rather more of English country life than most Yankee tourists; and appeared to find it curious, though I fear he was dulled by our ways; for he was too full of ceremony and compliments and bows, which is a mistake here; though very well in Spain. I am afraid he was rather on pins and needles; but he made a splendid speech at a volunteer supper, and indeed the very best, some said, ever heard in this part of the country.

We are here in a state of alarm and apprehension, the world being so troubled in East and West and everywhere. Last year the harvest was bad and scanty. This year our trade is beginning to feel the events in America. In reply to the northern tariff, of course we are going to smuggle as much as we can. The supply of cotton being such a necessity to us, we must work up India and South Africa a little better. There is war even in old New Zealand, but not in the same island where my people are! Besides, we are certainly on the eve of a continental blaze, **SO WE ARE MAKING MERRY AND LIVING WHILE WE CAN**; not being sure where we shall be this time a year.

Give my affectionate regards to your father, mother, and sister, and to Mr. Emerson and his family, and to Channing, Sanborn, Ricketson, Blake, and Morton and Alcott and Parker. A thought arises in my mind whether I may not be enumerating some dead men! Perhaps Parker is!

These rumors of wars make me wish that we had got done with this brutal stupidity of war altogether; and I believe, Thoreau, that the human race will at last get rid of it, though perhaps not in a creditable way; but such **POWERS** will be brought to bear that it will become monstrous even to the French. Dundonald declared to the

last that he possessed secrets which from their tremendous character would make war impossible. So peace may be begotten from the machinations of evil.

Have you heard of any good books lately? I think "Burnt Njal" good, and believe it to be genuine. "Hast thou not heard" (says Steinrora to Thangbrand) "how Thor challenged Christ to single combat, and how he did not dare to fight with Thor?" When Gunnar brandishes his sword, three swords are seen in air. The account of Ospah and Brodir and Brian's battle is the only historical account of that engagement, which the Irish talk so much of; for I place little trust in O'Halloran's authority, though the outline is the same in both.

Darwin's "Origin of Species" may be fanciful, but it is a move in the right direction. Emerson's "Conduct of Life" has done me good; but it will not go down in England for a generation or so. But THESE are some of them already a year or two old. The book of the season is Du Chaillu's "Central Africa," with accounts of the Gorilla, of which you are aware that you have had a skeleton at Boston for many years. There is also one in the British Museum; but they have now several stuffed specimens at the Geographical Society's rooms in Town. I suppose you will have seen Sir Emerson Tennent's "Ceylon," which is perhaps as complete a book as ever was published; and a better monument to a governor's residence in a great province was never made.

We have been lately astonished by a foreign Hamlet, a supposed impossibility; but Mr. Fechter does real wonders. No doubt he will visit America, and then you may see the best actor in the world. He has carried out Goethe's idea of Hamlet as given in the "Wilhelm Meister," showing him forth as a fair-haired and fat man. I suppose you are not got fat yet?

Yours ever truly, Thos. Cholmondeley.<sup>1</sup>

<sup>1</sup> A word may be said of the after life of this magnanimous Englishman, who did not long-survive his Concord correspondent. In March, 1863, being then in command of a battalion of Shropshire Volunteers, which he had raised, he inherited Condover Hall and the large estate adjacent, and took the name of Owen as a condition of the inheritance. A year later he married Miss Victoria Cotes, daughter of John and Lady Louisa Cotes (Co. Salop), a godchild of the Queen, and went to Italy for his wedding-tour. In Florence he was seized with a malignant fever, April 10, 1864, and died there April 20, — not quite two years after Thoreau's death. His brother Reginald, who had met him in Florence, carried back his remains to England, and he is buried in Condover churchyard. Writing to an American friend, Mr. R. Cholmondeley said: "The whole county mourned for one who had made himself greatly beloved. During his illness his thoughts went back very much to America and her great sufferings. His large heart felt for your country as if it were his own." It seems that he did not go to New Zealand with the "Canterbury Pilgrims," as suggested in the ATLANTIC MONTHLY (December, 1893), but in the first of Lord Lyttelton's ships (the Charlotte Jane), having joined in Lord L.'s scheme for colonizing the island, where he remained only six months, near Christchurch.

## TO HARRISON BLAKE (AT WORCESTER).

Concord, May 3, 1861.

MR. BLAKE, — I am still as much an invalid as when you and Brown were here, if not more of one, and at this rate there is danger that the cold weather may come again, before I get over my bronchitis. The doctor accordingly tells me that I must “clear out” to the West Indies, or elsewhere, — he does not seem to care much where. But I decide against the West Indies, on account of their muggy heat in the summer, and the South of Europe, on account of the expense of time and money, and have at last concluded that it will be most expedient for me to try the air of Minnesota, say somewhere about St. Paul’s. I am only waiting to be well enough to start. Hope to get off within a week or ten days.

The inland air may help me at once, or it may not. At any rate, I am so much of an invalid, that I shall have to study my comfort in traveling to a remarkable degree, — stopping to rest, etc., etc., if need be. I think to get a through ticket to Chicago, with liberty to stop frequently on the way, making my first stop of consequence at Niagara Falls, several days or a week, at a private boarding-house; then a night or day at Detroit; and as much at Chicago as my health may require. At Chicago I can decide at what point (Fulton, Dunleith, or another) to strike the Mississippi, and take a boat to St. Paul’s.

I trust to find a private boarding-house in one or various agreeable places in that region, and spend my time there. I expect, and shall be prepared, to be gone three months; and I would like to return by a different route, — perhaps Mackinaw and Montreal.

I have thought of finding a companion, of course, yet not seriously, because I had no right to offer myself as a companion to anybody, having such a peculiarly private and all-absorbing but miserable business as my health, and not altogether his, to attend to, causing me to stop here and go there, etc., etc., unaccountably.

Nevertheless, I have just now decided to let you know of my intention, thinking it barely possible that you might like to make a part or the whole of this journey at the same time, and that perhaps your own health may be such as to be benefited by it.

Pray let me know if such a statement offers any temptations to you. I write in great haste for the mail, and must omit all the moral.

## TO F. B. SANBORN (AT CONCORD).

REDWING, Minnesota, June 26, 1861.

Mr. Sanborn, — I was very glad to find awaiting me, on my arrival here on Sunday afternoon, a letter from you. I have performed this journey in a very dead and alive manner, but nothing has come so near waking me up as the receipt of letters from Concord. I read yours, and one from my sister (and Horace Mann, his four), near the

top of a remarkable isolated bluff here, called Barn Bluff, or the Grange, or Redwing Bluff, some four hundred and fifty feet high, and half a mile long, — a bit of the main bluff or bank standing alone. The top, as you know, rises to the general level of the surrounding country, the river having eaten out so much. Yet the valley just above and below this (we are at the head of Lake Pepin) must be three or four miles wide.

I am not even so well informed as to the progress of the war as you suppose. I have seen but one Eastern paper (that, by the way, WAS the “Tribune”) for five weeks. I have not taken much pains to get them; but, necessarily, I have not seen any paper at all for more than a week at a time. The people of Minnesota have SEEMED to me more cold, — to feel less implicated in this war than the people of Massachusetts. It is apparent that Massachusetts, for one State at least, is doing much more than her share in carrying it on. However, I have dealt partly with those of Southern birth, and have seen but little way beneath the surface. I was glad to be told yesterday that there was a good deal of weeping here at Redwing the other day, when the volunteers stationed at Fort Snelling followed the regulars to the seat of the war. They do not weep when their children go UP the river to occupy the deserted forts, though they MAY have to fight the Indians there.

I do not even know what the attitude of England is at present.

The grand feature hereabouts is, of course, the Mississippi River. Too much can hardly be said of its grandeur, and of the beauty of this portion of it (from Dunleith, and probably from Rock Island to this place). St. Paul is a dozen miles below the Falls of St. Anthony, or near the head of uninterrupted navigation on the main stream, about two thousand miles from its mouth. There is not a “rip” below that, and the river is almost as wide in the upper as the lower part of its course. Steamers go up to the Sauk Rapids, above the Falls, near a hundred miles farther, and then you are fairly in the pine-woods and lumbering country. Thus it flows from the pine to the palm.

The lumber, as you know, is sawed chiefly at the Falls of St. Anthony (what is not rafted in the log to ports far below), having given rise to the towns of St. Anthony, Minneapolis, etc., etc. In coming up the river from Dunleith, you meet with great rafts of sawed lumber and of logs, twenty rods or more in length, by five or six wide, floating down, all from the pine region above the Falls. An old Maine lumberer, who has followed the same business here, tells me that the sources of the Mississippi were comparatively free from rocks and rapids, making easy work for them; but he thought that the timber was more knotty here than in Maine.

It has chanced that about half the men whom I have spoken with in Minnesota, whether travelers or settlers, were from Massachusetts.

After spending some three weeks in and about St. Paul, St. Anthony, and Minneapolis, we made an excursion in a steamer, some three hundred or more miles up the Minnesota (St. Peter’s) River, to Redwood, or the Lower Sioux Agency, in order to see the plains, and the Sioux, who were to receive their annual payment there. This is eminently the river of Minnesota (for she shares the Mississippi with Wisconsin), and it is of incalculable value to her. It flows through a very fertile country, destined

to be famous for its wheat; but it is a remarkably winding stream, so that Redwood is only half as far from its mouth by land as by water. There was not a straight reach a mile in length as far as we went, — generally you could not see a quarter of a mile of water, and the boat was steadily turning this way or that. At the greater bends, as the Traverse des Sioux, some of the passengers were landed, and walked across to be taken in on the other side. Two or three times you could have thrown a stone across the neck of the isthmus, while it was from one to three miles around it. It was a very novel kind of navigation to me. The boat was perhaps the largest that had been up so high, and the water was rather low (it had been about fifteen feet higher). In making a short turn, we repeatedly and designedly ran square into the steep and soft bank, taking in a cart-load of earth, — this being more effectual than the rudder to fetch us about again; or the deeper water was so narrow and close to the shore, that we were obliged to run into and break down at least fifty trees which overhung the water, when we did not cut them off, repeatedly losing a part of our outworks, though the most exposed had been taken in. I could pluck almost any plant on the bank from the boat. We very frequently got aground, and then drew ourselves along with a windlass and a cable fastened to a tree, or we swung round in the current, and completely blocked up and blockaded the river, one end of the boat resting on each shore. And yet we would haul ourselves round again with the windlass and cable in an hour or two, though the boat was about one hundred and sixty feet long, and drew some three feet of water, or, often, water and sand. It was one consolation to know that in such a case we were all the while damming the river, and so raising it. We once ran fairly on to a concealed rock, with a shock that aroused all the passengers, and rested there, and the mate went below with a lamp, expecting to find a hole, but he did not. Snags and sawyers were so common that I forgot to mention them. The sound of the boat rumbling over one was the ordinary music. However, as long as the boiler did not burst, we knew that no serious accident was likely to happen. Yet this was a singularly navigable river, more so than the Mississippi above the Falls, and it is owing to its very crookedness. Ditch it straight, and it would not only be very swift, but soon run out. It was from ten to fifteen rods wide near the mouth, and from eight to ten or twelve at Redwood. Though the current was swift, I did not see a “rip” on it, and only three or four rocks. For three months in the year I am told that it can be navigated by small steamers about twice as far as we went, or to its source in Big Stone Lake; and a former Indian agent told me that at high water it was thought that such a steamer might pass into the Red River.

In short, this river proved so very LONG and navigable, that I was reminded of the last letter or two in the voyage of the Baron la Hontan (written near the end of the seventeenth century, THINK), in which he states, that, after reaching the Mississippi (by the Illinois or Wisconsin), the limit of previous exploration westward, he voyaged up it with his Indians, and at length turned up a great river coming in from the west, which he called “La Riviere Longue;” and he relates various improbable things about the country and its inhabitants, so that this letter has been regarded as pure fiction,

or, more properly speaking, a lie. But I am somewhat inclined now to reconsider the matter.

The Governor of Minnesota (Ramsay), the superintendent of Indian affairs in this quarter, and the newly-appointed Indian agent were on board; also a German band from St. Paul, a small cannon for salutes, and the money for the Indians (ay, and the gamblers, it was said, who were to bring it back in another boat). There were about one hundred passengers, chiefly from St. Paul, and more or less recently from the northeastern States; also half a dozen young educated Englishmen. Chancing to speak with one who sat next to me, when the voyage was nearly half over, I found that he was the son of the Rev. Samuel May,<sup>1</sup> and a classmate of yours, and had been looking for us at St. Anthony.

The last of the little settlements on the river was New Ulm, about one hundred miles this side of Redwood. It consists wholly of Germans. We left them one hundred barrels of salt, which will be worth something more, when the water is lowest, than at present.

<sup>1</sup> Rev. Joseph May, a cousin of Louisa Alcott.

Redwood is a mere locality, — scarcely an Indian village, — where there is a store, and some houses have been built for them. We were now fairly on the great plains, and looking south; and, after walking that way three miles, could see no tree in that horizon. The buffalo was said to be feeding within twenty-five or thirty miles.

A regular council was held with the Indians, who had come in on their ponies, and speeches were made on both sides through an interpreter, quite in the described mode, — the Indians, as usual, having the advantage in point of truth and earnestness, and therefore of eloquence. The most prominent chief was named Little Crow. They were quite dissatisfied with the white man's treatment of them, and probably have reason to be so. This council was to be continued for two or three days, — the payment to be made the second day; and another payment to other bands a little higher up, on the Yellow Medicine (a tributary of the Minnesota), a few days thereafter.

In the afternoon, the half-naked Indians performed a dance, at the request of the Governor, for our amusement and their own benefit; and then we took leave of them, and of the officials who had come to treat with them.

Excuse these pencil marks, but my inkstand is unscrewable, and I can only direct my letter at the bar. I could tell you more, and perhaps more interesting things, if I had time. I am considerably better than when I left home, but still far from well.

Our faces are already set toward home. Will you please let my sister know that we shall PROBABLY start for Milwaukee and Mackinaw in a day or two (or as soon as we hear from home) VIA PRAIRIE DU CHIEN, and not La Crosse.

I am glad to hear that you have written to Cholmondeley,<sup>1</sup> as it relieves me of some RESPONSIBILITY.

The tour described in this long letter was the first and last that Thoreau ever made west of the Mohawk Valley, though his friend Channing had early visited the great prairies, and lived in log cabins of Illinois, or sailed on the chain of great lakes, by

which Thoreau made a part of this journey. It was proposed that Channing should accompany him this time, as he had in the tour through Lower Canada, and along Cape Cod, as well as in the journeys through the Berkshire and Catskill mountains, and down the Hudson; but some misunderstanding or temporary inconvenience prevented. The actual comrade was

1 I had answered T. Cholraondeley's last letter, explaining that Thoreau was ill and absent.

young Horace Mann, eldest son of the school-reformer and statesman of that name, — a silent, earnest, devoted naturalist, who died early. The place where his party met the Indians — only a few months before the Minnesota massacre of 1862 — was in the county of Redwood, in the southwest of the State, where now is a thriving village of 1,500 people, and no buffaloes within five hundred miles. Redwing, whence the letter was written, is below St. Paul, on the Mississippi, and was even then a considerable town, — now a city of 7,000 people. The civil war had lately begun, and the whole North was in the first flush of its uprising in defense of the Union, — for which Thoreau, in spite of his earlier defiance of government (for its alliance with slavery) was as zealous as any soldier. He returned in July, little benefited by the journey, of which he did not take his usual sufficiency of notes, and to which there is little allusion in his books. Nor does it seem that he visited on the way his correspondent since January, 1856, — C. H. Green, of Rochester, Michigan, who had never seen him in Concord. The opinion of Thoreau himself concerning this journey will be found in his next letter to Daniel Ricketson.

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, August 15, 1861.

FRIEND RICKETSON, — When your last letter was written I was away in the far Northwest, in search of health. My cold turned to bronchitis, which made me a close prisoner almost up to the moment of my starting on that journey, early in May. As I had an incessant cough, my doctor told me that I must "clear out," — to the West Indies, or elsewhere, — so I selected Minnesota. I returned a few weeks ago, after a good deal of steady traveling, considerably, yet not essentially, better; my cough still continuing. If I don't mend very quickly, I shall be obliged to go to another climate again very soon.

My ordinary pursuits, both indoors and out, have been for the most part omitted, or seriously interrupted, — walking, boating, scribbling, etc. Indeed, I have been sick so long that I have almost forgotten what it is to be well; and yet I feel that it is in all respects only my envelope. Channing and Emerson are as well as usual; but Alcott, I am sorry to say, has for some time been more or less confined by a lameness, perhaps

of a neuralgic character, occasioned by carrying too great a weight on his back while gardening.

On returning home, I found various letters awaiting me; among others, one from Cholmondeley, and one from yourself.

Of course I am sufficiently surprised to hear of your conversion;<sup>1</sup> yet I scarcely know what to say about it, unless that, judging by your account, it appears to me a change which concerns yourself peculiarly, and will not make you more valuable to mankind. However, perhaps I must see you before I can judge.

Remembering your numerous invitations, I write this short note now, chiefly to say that, if you are to be at home, and it will be quite agreeable to you, I will pay you a visit next week, and take such rides or sauntering walks with you as an invalid may.

The visit was made, and we owe to it the preservation of the latest portraiture of Thoreau, who, at his friend's urgency, sat to a photographer in New Bedford; and thus we have the full-bearded likeness of August, 1861; from which, also, and from personal recollection, Mr. Walter Ricketson made the fine profile medallion engraved for this volume.

1 A return to religious Quakerism, of which his friend had written enthusiastically.

## **TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, October 14, 1861.

Friend Ricketson, — I think that, on the whole, my health is better than when you were here; but my faith in the doctors has not increased. I thank you all for your invitation to come to New Bedford, but I suspect that it must still be warmer here than there; that, indeed, New Bedford is warmer than Concord only in the winter, and so I abide by Concord.

September was pleasanter and much better for me than August, and October has thus far been quite tolerable. Instead of riding on horseback, I ride in a wagon about every other day. My neighbor, Mr. E. R. Hoar, has two horses, and he, being away for the most part this fall, has generously offered me the use of one of them; and, as I notice, the dog throws himself in, and does scouting duty.

I am glad to hear that you no longer chew, but eschew, sugar-plums. One of the worst effects of sickness is, that it may get one into the HABIT of taking a little something — his bitters, or sweets, as if for his bodily good — from time to time, when he does not need it. However, there is no danger of this if you do not dose even when you are sick.

I went with a Mr. Rodman, a young man of your town, here the other day, or week, looking at farms for sale, and rumor says that he is inclined to buy a particular one. Channing says that he received his book, but has not got any of yours.

It is easy to talk, but hard to write.

From the worst of all correspondents, HENRY D. THOREAU.

No later letter than this was written by Thoreau's own hand; for he was occupied all the winter of 1861-62, when he could write, in preparing his manuscripts for the press. Nothing appeared before his death, but in June, 1862, Mr. Fields, then editing the "Atlantic," printed "Walking," — the first of three essays which came out in that magazine the same year. Nothing of Thoreau's had been accepted for the "Atlantic" since 1858, when he withdrew the rest of "Chesuncook," then coming out in its pages, because the editor (Mr. Lowell) had made alterations in the manuscript. In April, just before his death, the "Atlantic" printed a short and characteristic sketch of Thoreau by Bronson Alcott, and in August, Emerson's funeral oration, given in the parish church of Concord. During the last six months of his illness, his sister and his friends wrote letters for him, as will be seen by the two that follow.

## **SOPHIA THOREAU TO DANIEL RICKETSON (AT NEW BEDFORD).**

CONCORD, December 19, 1861.

Mr. Ricketson:

Dear Sir, — Thank you for your friendly interest in my dear brother. I wish that I could report more favorably in regard to his health. Soon after your visit to Concord, Henry commenced riding, and almost every day he introduced me to some of his familiar haunts, far away in the thick woods, or by the ponds; all very new and delightful to me. The air and exercise which he enjoyed during the fine autumn days were a benefit to him; he seemed stronger, had a good appetite, and was able to attend somewhat to his writing; but since the cold weather has come, his cough has increased, and he is able to go out but seldom. Just now he is suffering from an attack of pleurisy, which confines him wholly to the house. His spirits do not fail him; he continues in his usual serene mood, which is very pleasant for his friends as well as himself. I am hoping for a short winter and early spring, that the invalid may again be out of doors.

I am sorry to hear of your indisposition, and trust that you will be well again soon. It would give me pleasure to see some of your newspaper articles, since you possess a hopeful spirit. My patience is nearly exhausted. The times look VERY dark. I think the next soldier who is shot for sleeping on his post should be Gen. McClellan. Why does he not do something in the way of fighting? I despair of ever living under the reign of Sumner or Phillips.

## BRONSON ALCOTT TO DANIEL RICKETSON (AT NEW BEDFORD).

CONCORD, January 10, 1862.

Dear Friend, — You have not been informed of Henry's condition this winter, and will be sorry to hear that he grows feebler day by day, and is evidently failing and fading from our sight. He gets some sleep, has a pretty good appetite, reads at intervals, takes notes of his readings, and likes to see his friends, conversing, however, with difficulty, as his voice partakes of his general debility. We had thought this oldest inhabitant of our Planet would have chosen to stay and see it fairly dismissed into the Chaos (out of which he has brought such precious jewels, — gifts to friends, to mankind generally, diadems for fame to coming followers, forgetful of his own claims to the honors) before he chose simply to withdraw from the spaces and times he has adorned with the truth of his genius. But the masterly work is nearly done for us here. And our woods and fields are sorrowing, though not in sombre, but in robes of white, so becoming to the piety and probity they have known so long, and soon are to miss. There has been none such since Pliny, and it will be long before there comes his like; the most sagacious and wonderful Worthy of his time, and a marvel to coming ones.

I write at the suggestion of his sister, who thought his friends would like to be informed of his condition to the latest date.

Ever yours and respectfully,

A. BRONSON ALCOTT.

The last letter of Henry Thoreau, written by the hand of his sister, was sent to Myron Benton, a young literary man then living in Dutchess County, New York, who had written a grateful letter to the author of "Walden" (January 6, 1862), though quite unacquainted with him. Mr. Benton said that the news of Thoreau's illness had affected him as if it were that "of a personal friend whom I had known a long time," and added: "The secret of the influence by which your writings charm me is altogether as intangible, though real, as the attraction of Nature herself. I read and re-read your books with ever fresh delight. Nor is it pleasure alone; there is a singular spiritual healthiness with which they seem imbued, the expression of a soul essentially sound, so free from any morbid tendency." After mentioning that his own home was in a pleasant valley, once the hunting-ground of the Indians, Mr. Benton said: —

"I was in hope to read something more from your pen in Mr. Conway's 'Dial,'<sup>1</sup> but only recognized that fine pair of Walden twinlets. Of your two books, I perhaps prefer the 'Week,' — but after all, 'Walden' is but little less a favorite. In the former, I like especially those little snatches of poetry interspersed throughout. I would like to ask what progress you have made in a work some way connected with natural history, — I think it was on Botany, — which Mr. Emerson told me something about in a short interview I had with him two years ago at Poughkeepsie... If you should feel perfectly

able at any time to drop me a few lines, I would like much to know what your state of health is, and if there is, as I cannot but hope, a prospect of your speedy recovery.”

Two months and more passed before Thoreau replied; but his habit of performing every duty,

1 This was a short-lived monthly, edited at Cincinnati (1861-62) by Moncure D. Conway, since distinguished as an author, who had resided for a time in Concord, after leaving his native Virginia. He wrote asking Thoreau and all his Concord friends to contribute to this new DIAL, and several of them did so.

whether of business or courtesy, would not excuse him from an answer, which was this: —

## **TO MYRON B. BENTON (AT LEEDSVILLE, N. Y.).**

CONCORD, March 21, 1862.

Dear Sir, — I thank you for your very kind letter, which, ever since I received it, I have intended to answer before I died, however briefly. I am encouraged to know, that, so far as you are concerned, I have not written my books in vain. I was particularly gratified, some years ago, when one of my friends and neighbors said, “I wish you would write another book, — write it for me.” He is actually more familiar with what I have written than I am myself.

The verses you refer to in Conway’s “Dial,” were written by F. B. Sanborn of this town. I never wrote for that journal.

I am pleased when you say that in “The Week” you like especially “those little snatches of poetry interspersed through the book,” for these, I suppose, are the least attractive to most readers. I have not been engaged in any particular work, on Botany, or the like, though, if I were to live, I should have much to report on Natural History generally.

You ask particularly after my health. I suppose that I have not many months to live; but, of course, I know nothing about it. I may add that I am enjoying existence as much as ever, and regret nothing.

Yours truly,

HENRY D. THOREAU, by SOPHIA E. THOREAU.

He died May 6, 1862; his mother died March 12, 1872, and his sister Sophia, October, 1876. With the death of his aunt, Maria Thoreau, nearly twenty years after her beloved nephew, the last person of the name in America (or perhaps in England) passed away.

# **The Journals**

255 Main Street in Concord, Massachusetts — Thoreau's last home. The author moved here in 1850 with his family and they stayed here until his death on May 6, 1862. Interestingly, several years later the author Louisa May Alcott purchased the home for her sister Anna Alcott Pratt, though she moved there as well along with her father Amos Bronson Alcott.

# THOREAU'S JOURNALS

Thoreau's friend and literary supporter Ralph Waldo Emerson urged him to contribute essays and poems to the quarterly periodical *The Dial* in July 1840, and at the same time he encouraged the younger man to begin keeping a journal. This was to become a life long commitment for Thoreau, who would in time record thousands of pages on hundreds of topics that affected his daily life and happenings until shortly before his death. The first journal entry on October 22, 1837, reads, "What are you doing now?" he asked. "Do you keep a journal?" So I make my first entry to-day."

Thoreau was a philosopher of nature and its relation to the human condition. In his early years he followed Transcendentalism, a loose and eclectic idealist philosophy advocated by Emerson, Fuller and Alcott. They believed that an ideal spiritual state transcends the physical and empirical and that one achieves that insight via personal intuition rather than religious doctrine. In their view, Nature is the outward sign of inward spirit, expressing the "radical correspondence of visible things and human thoughts," as Emerson wrote in *Nature*. Thoreau's early journals particularly expand on these theories in great depth, revealing the influence of Emerson and the other Transcendentalists.

From 1837 to 1861, Thoreau kept his handwritten journals, firstly as a conventional record of ideas, which later grew into a writer's notebook, finally evolving as the principal imaginative work of his literary career. The source of much of his published work found life in the journals, serving as a record of both his interior life and his monumental studies of the natural history in his home in Concord, Massachusetts. At the time of his death, Thoreau's journals filled forty-seven manuscript volumes. The Delphi Classics edition offers over 2,000 pages of the journals, with the first ten years complete (1837-1847), a comprehensive sample of a middle journal (1855-1856) and the last year's entries (1860-1861), as well as providing a generous selection of the years in between.

Thoreau, 1861

Ralph Waldo Emerson, who initially inspired Thoreau to keep a journal

## INTRODUCTION by Bradford Torrey

Thoreau was a man of his own kind. Many things may be said of him, favorable and unfavorable, but this must surely be said first, — that, taken for all in all, he was like nobody else. Taken for all in all, be it remarked. Other men have despised common sense; other men have chosen to be poor, and, as between physical comfort and better things, have made light of physical comfort; other men, whether to their credit or discredit, have held and expressed a contemptuous opinion of their neighbors and all their neighbors' doings; others, a smaller number, believing in an absolute goodness and in a wisdom transcending human knowledge, have distrusted the world as evil, accounting its influence degrading, its prudence no better than cowardice, its wisdom a kind of folly, its morality a compromise, its religion a bargain, its possessions a defilement and a hindrance, and so judging of the world, have striven at all cost to live above it and apart. And some, no doubt, have loved Nature as a mistress, fleeing to her from less congenial company, and devoting a lifetime to the observation and enjoyment of her ways. In no one of these particulars was the hermit of Walden without forerunners; but taken for all that he was, poet, idealist, stoic, cynic, naturalist, spiritualist, lover of purity, seeker of perfection, panegyrist of friendship and dweller in a hermitage, freethinker and saint, where shall we look to find his fellow? It seems but the plainest statement of fact to say that, as there was none before him, so there is scanty prospect of any to come after him.

His profession was literature; as to that there is no sign that he was ever in doubt; and he understood from the first that for a writing man nothing could take the place of practice, partly because that is the one means of acquiring ease of expression, and partly because a man often has no suspicion of his own thoughts until his pen discovers them; and almost from the first — a friend (Emerson or another) having given him the hint — he had come to feel that no practice is better or readier than the keeping of a journal, a daily record of things thought, seen, and felt. Such a record he began soon after leaving college, and (being one of a thousand in this respect as in others) he continued it to the end. By good fortune he left it behind him, and, to complete the good fortune,

it is at last printed, no longer in selections, but as a whole; and if a man is curious to know what such an original, plain-spoken, perfection-seeking, convention-despising, dogma-disbelieving, wisdom-loving, sham-hating, Nature-worshipping, poverty-proud genius was in the habit of confiding to so patient a listener at the close of the day, he has only to read the book.

The man himself is there. Something of him, indeed, is to be discovered, one half imagines, in the outward aspect of the thirty-nine manuscript volumes: ordinary "blank-books" of the sort furnished by country shopkeepers fifty or sixty years ago, larger or smaller as might happen, and of varying shapes (a customer seeking such wares must not be too particular; one remembers Thoreau's complaint that the universal preoccupation with questions of money rendered it difficult for him to find a blank-book that was not ruled for dollars and cents), still neatly packed in the strong wooden box which their owner, a workman needing not to be ashamed, made with his own hands on purpose to hold them.

A pretty full result of a short life they seem to be, as one takes up volume after volume (the largest are found to contain about a hundred thousand words) and turns the leaves: the handwriting strong and rapid, leaning well forward in its haste, none too legible, slow reading at the best, with here and there a word that is almost past making out; the orthography that of a naturally good speller setting down his thoughts at full speed and leaving his mistakes behind him; and the punctuation, to call it such, no better than a makeshift, — after the model of Sterne's, if one chooses to say so: a spattering of dashes, and little else.

As for the matter, it is more carefully considered, less strictly improvised, than is customary with diarists. It is evident, in fact, from references here and there, that many of the entries were copied from an earlier pencilled draft, made presumably in the field, "with the eye on the object," while the work as a whole has been more or less carefully revised, with erasures, emendations, and suggested alternative readings.

As we have said, if a man wishes to know Thoreau as he was, let him read the book. One thing he may be sure of: he will find himself in clean, self-respecting company, with no call to blush, as if he were playing the eavesdropper. Of confessions, indeed, in the spicy sense of the word, Thoreau had none to make. He was no Montaigne, no Rousseau, no Samuel Pepys. How should he be? He was a Puritan of Massachusetts, though he kept no Sabbath, was seen in no church, — being very different from Mr. Pepys in more ways than one, — and esteemed the Hebrew scriptures as a good book like any other. Once, indeed, when he was thirty-four years old, he went to a "party." For anything we know, that (with a little sowing of wild oats in the matter of smoking dried lily-stems when a boy) was as near as he ever came to dissipation. And he did not like it. "It is a bad place to go to," he says, — "thirty or forty persons, mostly young women, in a small room, warm and noisy." One of the young women was reputed to be "pretty-looking;" but he scarcely looked at her, though he was "introduced," and he could not hear what she said, because there was "such a clacking."

“I could imagine better places for conversation,” he goes on, “where there should be a certain degree of silence surrounding you, and less than forty talking at once. Why, this afternoon, even, I did better. There was old Mr. Joseph Hosmer and I ate our luncheon of cracker and cheese together in the woods. I heard all he said, though it was not much, to be sure, and he could hear me. And then he talked out of such a glorious repose, taking a leisurely bite at the cracker and cheese between his words; and so some of him was communicated to me, and some of me to him, I trust.”

He entertains a shrewd suspicion that assemblies of this kind are got up with a view to matrimonial alliances among the young people! For his part, at all events, he doesn't understand “the use of going to see people whom yet you never see, and who never see you.” Some of his friends make a singular blunder. They go out of their way to talk to pretty young women as such. Their prettiness may be a reason for looking at them, so much he will concede, — for the sake of the antithesis, if for nothing else, — but why is it any reason for talking to them? For himself, though he may be “lacking a sense in this respect,” he derives “no pleasure from talking with a young woman half an hour simply because she has regular features.”

How crabbed is divine philosophy! After this we are not surprised when he concludes by saying: “The society of young women is the most unprofitable I have ever tried.” No, no; he was nothing like Mr. Samuel Pepys.

The sect of young women, we may add, need not feel deeply affronted by this ungallant mention. It is perhaps the only one of its kind in the journal (by its nature restricted to matters interesting to the author), while there are multitudes of passages to prove that Thoreau's aversion to the society of older people taken as they run, men and women alike, was hardly less pronounced. In truth (and it is nothing of necessity against him), he was not made for “parties,” nor for clubs, nor even for general companionship. “I am all without and in sight,” said Montaigne, “born for society and friendship.” So was not Thoreau. He was all within, born for contemplation and solitude. And what we are born for, that let us be, — and so the will of God be done. Such, for good or ill, was Thoreau's philosophy. “We are constantly invited to be what we are,” he said. It is one of his memorable sentences; an admirable summary of Emerson's essay on Self-Reliance.

His fellow mortals, as a rule, did not recommend themselves to him. His thoughts were none the better for their company, as they almost always were for the company of the pine tree and the meadow. Inspiration, a refreshing of the spiritual faculties, as indispensable to him as daily bread, that his fellow mortals did not furnish him. For this state of things he sometimes (once or twice at least) mildly reproaches himself. It may be that he is to blame for so commonly skipping humanity and its affairs; he will seek to amend the fault, he promises. But even at such a moment of exceptional humility, his pen, reversing Balaam's rôle, runs into left-handed compliments that are worse, if anything, than the original offense. Hear him: “I will not avoid to go by where those men are repairing the stone bridge. I will see if I cannot see poetry in that, if that will not yield me a reflection. It is narrow to be confined to woods and fields and

grand aspects of nature only... Why not see men standing in the sun and casting a shadow, even as trees?... I will try to enjoy them as animals, at least."

This is in 1851. A year afterward we find him concerned with the same theme, but in a less hesitating mood. Now he is on his high horse, with apologies to nobody. "It appears to me," he begins, "that to one standing on the heights of philosophy mankind and the works of man will have sunk out of sight altogether." Man, in his opinion, is "too much insisted upon."

"The poet says, 'The proper study of mankind is man.' I say, Study to forget all that. Take wider views of the universe... What is the village, city, state, nation, aye, the civilized world, that it should concern a man so much? The thought of them affects me, in my wisest hours, as when I pass a woodchuck's hole."

A high horse, indeed! But his comparison is really by no means so disparaging as it sounds; for Thoreau took a deep and lasting interest in woodchucks. At one time and another he wrote many good pages about them; for their reappearance in the spring he watched as for the return of a friend, and once, at least, he devoted an hour to digging out a burrow and recording with painstaking minuteness the course and length of its ramifications. A novelist, describing his heroine's boudoir, could hardly have been more strict with himself. In fact, to have said that one of Thoreau's human neighbors was as interesting to him as a woodchuck would have been to pay that neighbor a rather handsome compliment. None of the brute animals, so called, — we have it on his own authority, — ever vexed his ears with pomposity or nonsense.

But we have interrupted his discourse midway. "I do not value any view of the universe into which man and the institutions of man enter very largely," he continues... "Man is a past phenomenon to philosophy." Then he descends a little to particulars. "Some rarely go outdoors, most are always at home at night," — Concord people being uncommonly well brought up, it would appear, — "very few indeed have stayed out all night once in their lives; fewer still have gone behind the world of humanity and seen its institutions like toadstools by the wayside."

And then, having, with this good bit of philosophical "tall talk," brushed aside humanity as a very little thing, he proceeds to chronicle the really essential facts of the day: that he landed that afternoon on Tail's Island, and to his disappointment found the weather not cold or windy enough for the meadow to make "its most serious impression;" also, that the staddles from which the hay had been removed were found to stand a foot or two above the water; besides which, he saw cranberries on the bottom (although he forgot to mention them in their proper place), and noticed that the steam of the engine looked very white that morning against the hillside.

All which setting of ordinary valuations topsy-turvy, the lords of creation below the beasts that perish, may lead an innocent reader to exclaim with one of old, "Lord, what is man, that thou art mindful of him? and the son of man, that thou visitest him?"

Nevertheless, we must not treat the matter too lightly, easily as it lends itself to persiflage. Even in this extreme instance it is not to be assumed that Thoreau was

talking for the sake of talking, or merely keeping his hand in with his favorite rhetorical weapon, a paradox. That desiderated “serious impression,” at all events, was no laughing matter; rather it was to have been the chief event of the day; of more account to Thoreau than dinner and supper both were likely to be to his farmer neighbor. As for the woodchuck, its comparative rank in the scale of animal existence, be it higher or lower, is nothing to the purpose. For Thoreau it was simple truth that, on some days, and in some states of mind, he found the society of such a cave-dweller more acceptable, or less unacceptable, than that of any number of his highly civilized townsmen. Nor is the statement one to be nervously concerned about. Any inveterate stroller, the most matter-of-fact man alive (though matter-of-fact men are not apt to be strollers), might say the same, in all soberness, with no thought of writing himself down a misanthrope, or of setting himself up as a philosopher.

For one thing, the woodchuck is sure to be less intrusive, less distracting, than the ordinary human specimen; he fits in better with solitude and the solitary feeling. He is never in the way. Moreover, you can say to a woodchuck anything that comes into your head, without fear of giving offense; a less important consideration than the other, no doubt, woodchucks as a class not being remarkably conversable, but still worthy of mention. For, naturally enough, an outspoken freethinker like Thoreau found the greater number of men not so very different from “ministers,” of whom he said, in a tone of innocent surprise, that they “could not bear all kinds of opinions,”— “as if any sincere thought were not the best sort of truth!”

He walked one afternoon with Alcott, and spent an agreeable hour, though for the most part he preferred having the woods and fields to himself. Alcott was an ineffectual genius, he remarks, “forever feeling about vainly in his speech, and touching nothing” (one thinks of Arnold’s characterization of Shelley as a “beautiful and ineffectual angel, beating in the void his luminous wings in vain,” which, in its turn, may call to mind Lowell’s comparison of Shelley’s genius to a St. Elmo’s fire, “playing in ineffectual flame about the points of his thought”), but after all, he was good company; not quite so good as none, of course, but on the whole, as men go, rather better than most. At least, he would listen to what you had to offer. He was open-minded; he wasn’t shut up in a creed; an honest man’s thought would not shock him. You could talk to him without running up against “some institution.” In a word, — though Thoreau doesn’t say it, — he was something like a woodchuck.

With all his passion for “that glorious society called solitude,” and with all his feeling that mankind, as a “past phenomenon,” thought far too highly of itself, it is abundantly in evidence that Thoreau, in his own time and on his own terms, was capable of a really human delight in familiar intercourse with his fellows. Channing, who should have known, speaks, a little vaguely, to be sure, of his “fine social qualities.”

“Always a genial and hospitable entertainer,” he calls him. And Mr. Ricketson, who also should have known, assures us that “no man could hold a finer relationship with his family than he.” But of this aspect of his character, it must be acknowledged, there is comparatively little in the journal. What is very constant and emphatic there —

emphatic sometimes to the point of painfulness — is the hermit's hunger and thirst after friendship; a friendship the sweets of which, so far as appears, he was very sparingly to enjoy. For if he was at home in the family group and in huckleberry excursions with children, if he relished to the full a talk with a stray fisherman, a racy-tongued woodchopper, or a good Indian, something very different seems to have been habitual with him when it came to intercourse with equals and friends.

Here, even more than elsewhere, he was an uncompromising idealist. His craving was for a friendship more than human, friendship such as it was beyond any one about him to furnish, if it was not, as may fairly be suspected, beyond his own capacity to receive. In respect to outward things, his wealth, he truly said, was to want little. In respect to friendship, his poverty was to want the unattainable. It might have been retorted upon him in his own words, that he was like a man who should complain of hard times because he could not afford to buy himself a crown. But the retort would perhaps have been rather smart than fair. He, at least, would never have acquiesced in it. He confided to his journal again and again that he asked nothing of his friends but honesty, sincerity, a grain of real appreciation, "an opportunity once in a year to speak the truth;" but in the end it came always to this, that he insisted upon perfection, and, not finding it, went on his way hungry. Probably it is true — one seems to divine a reason for it — that idealists, claimers of the absolute, have commonly found their fellow men a disappointment.

In Thoreau's case it was his best friends who most severely tried his patience. They invite him to see them, he complains, and then "do not show themselves." He "pines and starves near them." All is useless. They treat him so that he "feels a thousand miles off."

"I leave my friends early. I go away to cherish my idea of friendship." Surely there is no sentence in all Thoreau's books that is more, thoroughly characteristic than that. And how neatly it is turned! Listen also to this, which is equally bitter, and almost equally perfect in the phrasing: "No fields are so barren to me as the men of whom I expect everything, but get nothing. In their neighborhood I experience a painful yearning for society."

It is all a mystery to him. "How happens it," he exclaims, "that I find myself making such an enormous demand on men, and so constantly disappointed? Are my friends aware how disappointed I am? Is it all my fault? Am I incapable of expansion and generosity? I shall accuse myself of anything else sooner." And again he goes away sorrowful, consoling himself, as best he can, with his own paradox, —

"I might have loved him, had I loved him less."

Strange that he should have suffered in this way, many will think, with Emerson himself for a friend and neighbor! Well, the two men were friends, but neither was in this relation quite impeccable (which is as much as to say that both were human), and to judge by such hints as are gatherable on either side, their case was not entirely unlike that of Bridget Elia and her cousin,— "generally in harmony, with occasional bickerings, as it should be among near relations;" though "bickerings" is no doubt an

undignified term for use in this connection. It is interesting, some may deem it amusing, to put side by side the statements of the two men upon this very point; Emerson's communicated to the public shortly after his friend's death, Thoreau's intrusted nine years before to the privacy of his journal.

Emerson's speech is the more guarded, as, for more reasons than one, it might have been expected to be. His friend, he confesses, "was somewhat military in his nature... always manly and able, but rarely tender, as if he did not feel himself except in opposition. He wanted a fallacy to expose, a blunder to pillory, I may say required a little sense of victory, a roll of the drum, to call his powers into full exercise... It seemed as if his first instinct on hearing a proposition was to controvert it, so impatient was he of the limitations of our daily thought. This habit, of course, is a little chilling to the social affections; and though the companion would in the end acquit him of any malice or untruth, yet it mars conversation. Hence no equal companion stood in affectionate relations with one so pure and guileless." Thoreau's entry is dated May 24, 1853. "Talked, or tried to talk, with R. W. E. Lost my time, nay, almost my identity. He, assuming a false opposition where there was no difference of opinion, talked to the wind, told me what I knew, and I lost my time trying to imagine myself somebody else to oppose him."

It is the very same picture, drawn by another pencil, with a different placing of the shadows; and since the two sketches were made so many years apart and yet seem to be descriptive of the same thing, it is perhaps fair to conclude that this particular interview, which appears to have degenerated into something like a dispute about nothing (a very frequent subject of disputes, by the way), was not exceptional, but rather typical. Without doubt this was one of the occasions when Thoreau felt himself treated as if he were "a thousand miles off," and went home early to "cherish his idea of friendship." Let us hope that he lost nothing else along with his time and identity.

But here, again, we are in danger of an unseasonable lightness. Friendship, according to Thoreau's apprehension of it, was a thing infinitely sacred. A friend might move him to petulance, as the best of friends sometimes will; but friendship, the ideal state shown to him in dreams, for speech concerning that there was nowhere in English, nor anywhere else, a word sufficiently noble and unsoiled. And even his friends he loved, although, tongue-tied New-Englander that he was, he could never tell them so. He loved them best (and this, likewise, was no singularity) when they were farthest away. In company, even in their company, he could never utter his truest thought. So it is with us all. It was a greater than Thoreau who said, "We descend to meet;" and a greater still, perhaps (and he also a Concord man), who confessed at fifty odd: "I doubt whether I have ever really talked with half a dozen persons in my life."

As for Thoreau, he knew at times, and owned as much to himself, that his absorption in nature tended to unfit him for human society. But so it was; he loved to be alone. And in this respect he had no thought of change, — no thought nor wish. Whatever happened, he would still belong to no club but the true "country club," which dined "at the sign of the Shrub Oak." The fields and the woods, the old road, the river, and the

pond, these were his real neighbors. Year in and year out, how near they were to him! — a nearness unspeakable; till sometimes it seemed as if their being and his were not two, but one and the same. With them was no frivolity, no vulgarity, no changeableness, no prejudice. With them he had no misunderstandings, no meaningless disputes, no disappointments. They knew him, and were known of him. In their society he felt himself renewed. There he lived, and loved his life. There, if anywhere, the Spirit of the Lord came upon him. Hear him, on a cool morning in August, with the wind in the branches and the crickets in the grass, and think of him, if you can, as a being too cold for friendship!

“My heart leaps out of my mouth at the sound of the wind in the woods. I, whose life was but yesterday so desultory and shallow, suddenly recover my spirits, my spirituality, through my hearing... Ah! if I could so live that there should be no desultory moments... I would walk, I would sit and sleep, with natural piety. What if I could pray aloud, or to myself, as I went along by the brookside, a cheerful prayer, like the birds! For joy I could embrace the earth. I shall delight to be buried in it. And then, to think of those I love among men, who will know that I love them, though I tell them not... I thank you, God. I do not deserve anything; I am unworthy of the least regard; and yet the world is gilded for my delight, and holidays are prepared for me, and my path is strewn with flowers... O keep my senses pure!”

Highly characteristic is that concluding ejaculation. For Thoreau the five senses were not organs or means of sensuous gratification, but the five gateways of the soul. He would have them open and undefiled. Upon that point no man was ever more insistent. Above all, no sense must be pampered; else it would lose its native freshness and delicacy, and so its diviner use. That way lay perdition. When a woman came to Concord to lecture, and Thoreau carried her manuscript to the hall for her, wrapped in its owner's handkerchief, he complained twenty-four hours afterward that his pocket “still exhaled cologne.” Faint, elusive outdoor odors were not only a continual delight to him, but a positive means of grace.

So, too, he would rather not see any of the scenic wonders of the world. Only let his sense of beauty remain uncorrupted, and he could trust his Musketaquid meadows, and the low hills round about, to feed and satisfy him forever.

Because of his jealousy in this regard, partly, — and partly from ignorance, it may be, just as some of his respectable village acquaintances would have found the Iliad, of which he talked so much, duller than death in comparison with the works of Mr. Sylvanus Cobb, — he often spoke in slighting terms of operas and all the more elaborate forms of music. The ear, he thought, if it were kept innocent, would find satisfaction in the very simplest of musical sounds. For himself, there was no language extravagant enough to express his rapturous delight in them. Now “all the romance of his youthfulest moment” came flooding back upon him, and anon he was carried away till he “looked under the lids of Time,” — all by the humming of telegraph-wires or, at night especially, by the distant baying of a hound.

To the modern "musical person" certain of his confessions under this head are of a character to excite mirth. He is "much indebted," for instance, to a neighbor "who will now and then, in the intervals of his work, draw forth a few strains from his accordion." The neighbor is only a learner, but, says Thoreau, "I find when his strains cease that I have been elevated." His daily philosophy is all of a piece, one perceives: plain fare, plain clothes, plain company, a hut in the woods, an old book, — and for inspiration the notes of a neighbor's accordion.

More than once, too, he acknowledges his obligation to that famous rural entertainer and civilizer, the hand-organ. "All Vienna" could not do more for him, he ventures to think. "It is perhaps the best instrumental music that we have," he observes; which can hardly have been true, even in Concord, one prefers to believe, while admitting the possibility. If it is heard far enough away, he goes on, so that the creaking of the machinery is lost, "it serves the grandest use for me, — it deepens my existence."

We smile, of course, as in duty bound, at so artless an avowal; but, having smiled, we are bound also to render our opinion that the most blase concert-goer, if he be a man of native sensibility, will readily enough discern what Thoreau has in mind, and with equal readiness will concede to it a measure of reasonableness; for he will have the witness in himself that the effect of music upon the soul depends as much upon the temper of the soul as upon the perfection of the instrument. One day a simple air, simply sung or played, will land him in heaven; and another day the best efforts of the full symphony orchestra will leave him in the mire. And after all, it is possibly better, albeit in "poorer taste," to be transported by the wheezing of an accordion than to be bored by finer music. As for Thoreau, he studied to be a master of the art of living; and in the practice of that art, as of any other, it is the glory of the artist to achieve extraordinary results by ordinary means. To have one's existence deepened — there cannot be many things more desirable than that; and as between our unsophisticated recluse and the average "musical person" aforesaid, the case is perhaps not so one-sided as at first sight it looks; or, if it be, the odds are possibly not always on the side of what seems the greater opportunity.

His life, the quality of his life, that for Thoreau was the paramount concern. To the furthering of that end all things must be held subservient. Nature, man, books, music, all for him had the same use. This one thing he did, — he cultivated himself. If any, because of his so doing, accused him of selfishness, preaching to him of philanthropy, almsgiving, and what not, his answer was already in his mouth. Mankind, he was prepared to maintain, was very well off without such helps, which oftener than not did as much harm as good (though the concrete case at his elbow — half-clad Johnny Riordan, a fugitive slave, an Irishman who wished to bring his family over — appealed to him as quickly as to most, one is glad to notice); and, however that might be, the world needed a thousand times more than any so-called charity the sight of a man here and there living for higher ends than the world itself knows of. His own course, at any rate, was clear before him: "What I am, I am, and say not. Being is the great explainer."

His life, his own life, that he must live; and he must be in earnest about it. He was no indifferent, no little-carer, no skeptic, as if truth and a lie were but varying shades of the same color, and virtue, according to the old phrase, "a mean between vices." You would never catch him sighing, "Oh, well!" or "Who knows?" Qualifications, reconciliations, rapprochements, the two sides of the shield, and all that, — these were considerations not in his line. Before everything else he was a believer, — an idealist, that is, — the last person in the world to put up with half-truths or half-way measures. If "existing things" were thus and so, that was no reason why, with the sect of the Sadducees, he should make the best of them. What if there were no best of them? What if they were all bad? And anyhow, why not begin new? It was conceivable, was it not, that a man should set his own example, and follow his own copy. General opinion, — what was that? Was a thing better established because ten thousand fools believed it? Did folly become wisdom by being raised to a higher power? And antiquity, tradition, — what were they? Could a blind man of fifteen centuries ago see farther than a blind man of the present time? And if the blind led the blind, then or now, would not both fall into the ditch?

Yes, he was undoubtedly peculiar. As to that there could never be anything but agreement among practical people. In a world where shiftiness and hesitation are the rule, nothing looks so eccentric as a straight course. It must be acknowledged, too, that a man whose goodness has a strong infusion of the bitter, and whose opinions turn out of the way for nobody, is not apt to be the most comfortable kind of neighbor. We were not greatly surprised, lately, to hear an excellent lady remark of Thoreau that, from all she had read about him, she thought he must have been "a very disagreeable gentleman." It could hardly be said of him, as Mr. Birrell says of Matthew Arnold, who was himself a pretty serious person, and, after a way of his own, a preacher of righteousness, that he "conspired and contrived to make things pleasant."

Being a consistent idealist, he was of course an extremist, falling in that respect little behind the man out of Nazareth, whose hard sayings, by all accounts, were sometimes less acceptable than they might have been, and of whom Thoreau asserted, in his emphatic way, that if his words were really read from any pulpit in the land, "there would not be left one stone of that meeting-house upon another." Thoreau worshipped purity, and the every-day ethical standards of the street were to him an abomination. "There are certain current expressions and blasphemous moods of viewing things," he declares, "as when we say 'he is doing a good business,' more profane than cursing and swearing. There is death and sin in such words. Let not the children hear them." That innocent-sounding phrase about "a good business" — as if a business might be taken for granted as good because it brought in money — was as abhorrent to him as the outrageous worldly philosophy of an old castaway like Major Pendennis is to the ordinarily sensitive reader.

He was constitutionally earnest. There are pages of the journal, indeed, which make one feel that perhaps he was in danger of being too much so for his own profit. Possibly it is not quite wholesome, possibly, if one dares to say it, it begets a something

like priggishness, for the soul to be keyed up continually to so strenuous a pitch. In Thoreau's case, at all events, one is glad for every sign of a slackening of the tension. "Set the red hen to-day;"

"Got green grapes to stew;"

"Painted the bottom of my boat;" trivialities like these, too far apart (one is tempted to colloquialize, and call them "precious few," finding them so infrequent and so welcome), strike the reader with a sudden sensation of relief, as if he had been wading to the chin, and all at once his feet had touched a shallow.

So, too, one is thankful to come upon a really amusing dissertation about the tying of shoe-strings, or rather about their too easy untying; a matter with which, it appears, Thoreau had for years experienced "a great deal of trouble." His walking companion (Channing, presumably) and himself had often compared notes about it, concluding after experiments that the duration of a shoe-tie might be made to serve as a reasonably accurate unit of measure, as accurate, say, as a stadium or a league. Channing, indeed, would sometimes go without shoe-strings, rather than be plagued so incessantly by their dissolute behavior. Finally Thoreau, being then thirty-six years old, and always exceptionally clever with his hands, set his wits seriously at work upon knots, and by a stroke of good fortune (or a stroke of genius) hit upon one which answered his end; only to be told, on communicating his discovery to a third party, that he had all his life been tying "granny knots," never having learned, at school or elsewhere, the secret of a square one! It might be well, he concludes, if all children were "taught the accomplishment." Verily, as Hosea Biglow did not say, they didn't know everything down in Concord.

More refreshing still are entries describing hours of serene communion with nature, hours in which, as in an instance already cited, the Spirit of the Lord blessed him, and he forgot even to be good. These entries, likewise, are less numerous than could be wished, though perhaps as frequent as could fairly be expected; since ecstasies, like feasts, must in the nature of things be somewhat broadly spaced; and it is interesting, not to say surprising, to see how frankly he looks upon them afterward as subjects on which to try his pen. In these "seasons when our genius reigns we may be powerless for expression," he remarks; but in calmer hours, when talent is again active, "the memory of those rarer moods comes to color our picture, and is the permanent paint-pot, as it were, into which we dip our brush." But, in truth, the whole journal, some volumes of which are carefully indexed in his own hand, is quite undisguisedly a collection of thoughts, feelings, and observations, out of which copy is to be extracted. In it, he says, "I wish to set down such choice experiences that my own writings may inspire me, and at last I may make wholes of parts... Each thought that is welcomed and recorded is a nest-egg by the side of which more will be laid."

A born writer, he is "greedy of occasions to express" himself. He counts it "wise to write on many subjects, that so he may find the right and inspiring one."

“There are innumerable avenues to a perception of the truth,” he tells himself. “Improve the suggestion of each object, however humble, however slight and transient the provocation. What else is there to be improved?”

The literary diarist, like the husbandman, knows not which shall prosper. Morning and evening, he can only sow the seed. So it was with Thoreau. “A strange and unaccountable thing,” he pronounces his journal. “It will allow nothing to be predicated of it; its good is not good, nor its bad bad. If I make a huge effort to expose my innermost and richest wares to light, my counter seems cluttered with the meanest homemade stuffs; but after months or years I may discover the wealth of India, and whatever rarity is brought overland from Cathay, in that confused heap, and what seemed a festoon of dried apple or pumpkin will prove a string of Brazilian diamonds, or pearls from Coromandel.”

Well, we make sure that whoever tumbles the heap over now, more than forty years after the last object was laid upon it, will be rewarded with many and many a jewel. Here, for his encouragement, are half a dozen out of the goodly number that one customer has lately turned up, in a hasty rummaging of the counter: —

“When a dog runs at you, whistle for him.”

“We must be at the helm at least once a day; we must feel the tiller rope in our hands, and know that if we sail, we steer.”

“In composition I miss the hue of the mind.”

“After the era of youth is past, the knowledge of ourselves is an alloy that spoils our satisfactions.”

“How vain it is to sit down to write when you have not stood up to live.”

“Silence is of various depths and fertility, like soil.”

“Praise should be spoken as simply and naturally as a flower emits its fragrance.”

Here, again, is a mere nothing, a momentary impression caught, in ball-players’ language, on the fly; nothing like a pearl from Coromandel, if you will, but at the worst a toothsome bite out of a wild New England apple. It is winter. “I saw a team come out of a path in the woods,” says Thoreau, “as though it had never gone in, but belonged there, and only came out like Elisha’s bears.” There will be few country-bred Yankee boys, we imagine, who will not remember to have experienced something precisely like that, under precisely the same circumstances, though it never occurred to them to put the feeling into words, much less to preserve it in a drop of ink. That is one of the good things that a writer does for us. And our country-bred boy, if we mistake not, is likely to consider this one careless sentence of Thoreau, which adds not a cent’s worth to the sum of what is called human knowledge, as of more value than any dozen pages of his painstaking botanical records.

Thoreau the naturalist appears in the journal, not as a master, but as a learner. It could hardly be otherwise, of course, a journal being what it is. There we see him conning by himself his daily lesson, correcting yesterday by to-day, and to-day by to-morrow, progressing, like every scholar, over the stepping-stones of his own mistakes. Of the branches he pursued, as far as the present writer can presume to judge, he

was strongest in botany; certainly it was to plants that he most persistently devoted himself; but even there he had as many uncertainties as discoveries to set down; and he set them down with unflagging zeal and unrestrained particularity. The daily account is running over with question-marks. His patience was admirable; the more so as he worked entirely by himself, with few of the helps that in this better-furnished time almost belie the old proverb, and make even the beginner's path a kind of royal road to learning. The day of "How-to-Know" handbooks had not yet dawned.

Of his bird-studies it would be interesting, if there were room, to speak at greater length. Here, even more than in botany, if that were possible, he suffered for lack of assistance, and even in his later entries leaves the present-day reader wondering how so eager a scholar could have spent so many years in learning so comparatively little. The mystery is partly cleared, however, when it is found that until 1854 — say for more than a dozen years — he studied without a glass. He does not buy things, he explains, with characteristic self-satisfaction, till long after he begins to want them, so that when he does get them he is "prepared to make a perfect use of them." It was wasteful economy. He might as well have botanized without a pocket-lens.

But glass or no glass, how could an ornithological observer, whose power — so Emerson said— "seemed to indicate additional senses," be in the field daily for ten or fifteen years before setting eyes upon his first rosebreasted grosbeak? — which memorable event happened to Thoreau on the 13th of June, 1853! How could a man who had made it his business for at least a dozen years to "name all the birds without a gun," stand for a long time within a few feet of a large bird, so busy that it could not be scared far away, and then go home uncertain whether he had been looking at a woodcock or a snipe? How could he, when thirty-five years old, see a flock of sparrows, and hear them sing, and not be sure whether or not they were chipping sparrows? And how could a man so strong in times and seasons, always marking dates with an almanac's exactness, how could he, so late as '52, inquire concerning the downy woodpecker, one of the more familiar and constant of year-round birds, "Do we see him in the winter?" and again, a year later, be found asking whether he, the same downy woodpecker, is not the first of our woodland birds to arrive in the spring? At thirty-six he is amazed to the extent of double exclamation points by the sight of a flicker so early as March 29.

It fills one with astonishment to hear him (May 4, 1853) describing what he takes to be an indigo-bird after this fashion: "Dark throat and light beneath, and white spot on wings," with hoarse, rapid notes, a kind of twee, twee, twee, not musical. The stranger may have been — most likely it was — a black-throated blue warbler; which is as much like an indigo-bird as a bluebird is like a blue jay, — or a yellow apple like an orange. And the indigo-bird, it should be said, is a common New-Englander, such as one of our modern schoolboy bird-gazers would have no difficulty in getting into his "list" any summer day in Concord; while the warbler in question, though nothing but a migrant, and somewhat seclusive in its habits, is so regular in its passage and

so unmistakably marked (no bird more so), that it seems marvellous how Thoreau, prowling about everywhere with his eyes open, should year after year have missed it.

The truth appears to be that even of the commoner sorts of birds that breed in eastern Massachusetts or migrate through it, Thoreau — during the greater part of his life, at least — knew by sight and name only a small proportion, wonderful as his knowledge seemed to those who, like Emerson, knew practically nothing.

Not that the journal is likely to prove less interesting to bird-loving readers on this account. On the contrary, it may rather be more so, as showing them the means and methods of an ornithological amateur fifty years ago, and, especially, as providing for them a desirable store of ornithological nuts to crack on winter evenings. Some such reader, by a careful collation of the data which the publication of the journal as a whole puts at his disposal, will perhaps succeed in settling the identity of the famous “night-warbler;” a bird which some, we believe, have suspected to be nothing rarer than the almost superabundant oven-bird, but which, so far as we ourselves know, may have been almost any one (or any two or three) of our smaller common birds that are given to occasional ecstatic song-flights. Whatever it was, it was of use to Thoreau for the quickening of his imagination, and for literary purposes; and Emerson was well advised in warning him to beware of booking it, lest life henceforth should have so much the less to show him.

It must be said, however, that Thoreau stood in slight need of such a caution. He cherished for himself a pretty favorable opinion of a certain kind and measure of ignorance. With regard to some of his ornithological mysteries, for example, — the night-warbler, the seringo-bird (which with something like certainty we may conjecture to have been the savanna sparrow), and others, — he flatters himself that his good genius had withheld their names from him that he might the better learn their character, — whatever such an expression may be supposed to mean.

He maintained stoutly, from beginning to end, that he was not of the ordinary school of naturalists, but “a mystic, a transcendentalist, and a natural philosopher in one;” though he believed himself, in his own words, “by constitution as good an observer as most.” He will not be one of those who seek facts as facts, studying nature as a dead language. He studies her for purposes of his own, in search of the “raw material of tropes and figures.”

“I pray for such experience as will make nature significant,” he declares; and then, with the same penful of ink, he asks: “Is that the swamp gooseberry of Gray now just beginning to blossom at Saw-Mill Brook? It has a divided style and stamens, etc., as yet not longer than the calyx, though my slip has no thorns nor prickles,” and so on, and so on. Pages on pages of the journal are choke-full, literally, of this kind of botanical interrogation, till the unsympathetic reader will be in danger of surmising that the mystical searcher after tropes and symbols is sometimes not so utterly unlike the student of the dead language of fact. But then, it is one of the virtues of a journal that it is not a work of art, that it has no form, no fashion (and so does not go out of fashion), and is always at liberty to contradict itself. As Thoreau said, he tumbled

his goods upon the counter; no single customer is bound to be pleased with them all; different men, different tastes; let each select from the pile the things that suit his fancy.

For our own part, we acknowledge, — and the shrewd reader may already have remarked the fact, — we have not been disinclined to choose here and there a bit of some less rare and costly stuff. The man is so sternly virtuous, so inexorably in earnest, so heart-set upon perfection, that we almost like him best when for a moment he betrays something that suggests a touch of human frailty. We prick up our ears when he speaks of a woman he once in a while goes to see, who tells him to his face that she thinks him self-conceited. Now, then, we whisper to ourselves, how will this man who despises flattery, and, boasting himself a “commoner,” professes that for him “there is something devilish in manners,”

how will this candor-loving, truth-speaking, truth-appreciating man enjoy the rebuke of so unmannered a mentor? And we smile and say Aha! when he adds that the lady wonders why he does not visit her oftener.

We smile, too, when he brags, in early February, that he has not yet put on his winter clothing, amusing himself the while over the muffs and furs of his less hardy neighbors, his own “simple diet” making him so tough in the fibre that he “flourishes like a tree;” and then, a week later, writes with unbroken equanimity that he is down with bronchitis, contenting himself to spend his days cuddled in a warm corner by the stove.

Trifles of this kind encourage a pleasant feeling of brotherly relationship. He is one of us, after all, with like passions. But of course we really like him best when he is at his best, — as in some outpouring of his love for things natural and wild. Let us have one more such quotation: “Now I yearn for one of those old, meandering, dry, uninhabited roads, which lead away from towns, which lead us away from temptation, which conduct us to the outside of earth, over its uppermost crust; where you may forget in what country you are travelling; where your head is more in heaven than your feet are on earth; where you can pace when your breast is full, and cherish your moodiness... There I can walk and recover the lost child that I am without any ringing of a bell.”

For real warmth, when once the fire burns, who can exceed our stoic?

We like, also, his bits of prettiness, things in which he is second to nobody, though prettiness, again, is not supposed to be the stoic’s “note;” and they are all the prettier, as well as ten times more welcome, because he has the grace — and the sound literary sense — to drop them here and there, as it were casually, upon a ground of simple, unaffected prose. Here, now, is a sentence that by itself is worth a deal of ornithology: “The song sparrow is heard in fields and pastures, setting the midsummer day to music, — as if it were the music of a mossy rail or fence-post.” Of dragon-flies he says: “How lavishly they are painted! How cheap was the paint! How free was the fancy of their Creator!” In early June, when woods are putting forth leaves, “the summer is pitching its tent.” He finds the dainty fringed polygala (whose ordinary color is a lovely rose-

purple) sporting white blossoms, and remarks: "Thus many flowers have their nun sisters, dressed in white." Soaring hawks are "kites without strings;" and when he and his companion are travelling across country, keeping out of the sight of houses, yet compelled to traverse here and there a farmer's field, they "shut every window with an apple tree."

Gems like these one need not be a connoisseur to appreciate, and they are common upon his counter. It was a good name that Charming gave him: "The Poet-Naturalist."

But there are better things than flowers and jewels to be found in Thoreau's stock. There are cordials and tonics there, to brace a man when he is weary; eyewashes, to cleanse his vision till he sees the heights above him and repents the lowness of his aims and the vulgarity of his satisfactions; blisters and irritant plasters in large variety and of warranted strength; but little or nothing, so far as the present customer has noticed, in the line of anodynes and sleeping-powders. There we may buy moral wisdom, which is not only the "foundation and source of good writing," as one of the ancients said, but of the arts in general, especially the art of life. If the world is too much with us, if wealth attracts and the "rust of copper" has begun to eat into the soul, if we are in danger of selling our years for things that perish with the using, here we may find correctives, and go away thankful, rejoicing henceforth to be rich in a better coinage than any that bears the world's stamp. The very exaggerations of the master — if we call them such — may do us good like a medicine; for there are diseased conditions which yield to nothing so quickly as to a shock.

As for Thoreau himself, life might have been smoother for him had he been less exacting in his idealism, more tolerant of imperfection in others and in himself; had he taken his studies, and even his spiritual aspirations, a grain or two less seriously. A bit of boyish play now and then, the bow quite unbent, or a dose of novel-reading of the love-making, humanizing (Trollopean) sort, could one imagine it, with a more temperate cherishing of his moodiness, might have done him no harm. It would have been for his comfort, so much may confidently be said, whether for his happiness is another question, had he been one of those gentler humorists who can sometimes see themselves, as all humorists have the gift of seeing other people, funny side out. But then, had these things been so, had his natural scope been wider, his genius, so to say, more tropical, richer, freer, more expansive, more various and flexible, more like the spreading banyan and less like the soaring, sky-pointing spruce, — why, then he would no longer have been Thoreau; for better or worse, his speech would have lost its distinctive tang; and in the long run the world, which likes a touch of bitter and a touch of sour, would almost certainly have found the man himself less interesting, and his books less rememberable. And made as he was, "born to his own affairs," what else could he do but stick to himself? "We are constantly invited to be what we are," he said. The words might fittingly have been cut upon his gravestone.

B. T.

# HENRY D. THOREAU

GLEANINGS  
OR WHAT TIME  
HAS NOT REAPED  
OF MY  
JOURNAL

The small manuscript volume bearing on its first fly-leaf the legend printed on the preceding page is evidently a transcript of unused passages in the early journals, and this is also the case with several succeeding small volumes. The following mottoes occupy the next three pages of the book.

“By all means use sometimes to be alone.  
Salute thyself: see what thy soul doth wear.  
Dare to look in thy chest; for ‘t is thine own:  
And tumble up and down what thou find’st there.  
Who cannot rest till he good fellows find,  
He breaks up house, turns out of doors his mind.”

HERBERT, The Church Porch.

“Friends and companions, get you gone!  
‘T is my desire to be alone;  
Ne’er well, but when my thoughts and I  
Do domineer in privacy.”

BURTON, Anatomy of Melancholy.

“Two Paradises are in one,  
To live in Paradise alone.” —

MARVELL, The Garden.

## THE JOURNAL OF HENRY DAVID THOREAU

### 1837

Oct. 22. “What are you doing now?” he asked. “Do you keep a journal?” So I make my first entry to-day.

SOLITUDE

To be alone I find it necessary to escape the present, — I avoid myself. How could I be alone in the Roman emperor’s chamber of mirrors? I seek a garret. The spiders must not be disturbed, nor the floor swept, nor the lumber arranged.

The Germans say, “Es ist ailes wahr wodurch du besser wirst.”

THE MOULD OUR DEEDS LEAVE

Oct. 24. Every part of nature teaches that the passing away of one life is the making room for another. The oak dies down to the ground, leaving within its rind a rich virgin

mould, which will impart a vigorous life to an infant forest. The pine leaves a sandy and sterile soil, the harder woods a strong and fruitful mould.

So this constant abrasion and decay makes the soil of my future growth. As I live now so shall I reap. If I grow pines and birches, my virgin mould will not sustain the oak; but pines and birches, or, perchance, weeds and brambles, will constitute my second growth.

#### SPRING

Oct. 25. She appears, and we are once more children; we commence again our course with the new year. Let the maiden no more return, and men will become poets for very grief. No sooner has winter left us time to regret her smiles, than we yield to the advances of poetic frenzy. "The flowers look kindly at us from the beds with their child eyes, and in the horizon the snow of the far mountains dissolves into light vapor."

GOETHE, Torquato Tasso.

#### THE POET

"He seems to avoid — even to flee from us, —

To seek something which we know not, And perhaps he himself after all knows not."

— Ibid.

Oct. 26.

"His eye hardly rests upon the earth;

His ear hears the one-clang of nature;

What history records, — what life gives, —

Directly and gladly his genius takes it up:

His mind collects the widely dispersed,

And his feeling animates the inanimate.

Often he ennobles what appeared to us common,

And the prized is as nothing to him.

In his own magic circle wanders

The wonderful man, and draws us

With him to wander, and take part in it:

He seems to draw near to us, and remains afar from us:

He seems to be looking at us, and spirits, forsooth,

Appear to him strangely in our places." — Ibid.

#### HOW MAN GROWS

"A noble man has not to thank a private circle for his culture. Fatherland and world must work upon him. Fame and infamy must he learn to endure. He will be constrained to know himself and others. Solitude shall no more lull him with her flattery. The foe will not, the friend dares not, spare him. Then, striving, the youth puts forth his strength, feels what he is, and feels himself soon a man."

"A talent is builded in solitude,

A character in the stream of the world."

"He only fears man who knows him not, and he who avoids him will soonest misapprehend him." — Ibid.

## ARIOSTO

“As nature decks her inward rich breast in a green variegated dress, so clothes he all that can make men honorable in the blooming garb of the fable... The well of superfluity bubbles near, and lets us see variegated wonder-fishes. The air is filled with rare birds, the meads and copses with strange herds, wit lurks half concealed in the verdure, and wisdom from time to time lets sound from a golden cloud sustained words, while frenzy wildly seems to sweep the well-toned lute, yet holds itself measured in perfect time.”

## BEAUTY

“That beauty is transitory which alone you seem to honor.” — GOETHE, Torquato Tasso.

## THE FOG

Oct. 21. The prospect is limited to Nobscot and Annursnack. The trees stand with boughs downcast like pilgrims beaten by a storm, and the whole landscape wears a sombre aspect.

So when thick vapors cloud the soul, it strives in vain to escape from its humble working-day valley, and pierce the dense fog which shuts out from view the blue peaks in its horizon, but must be content to scan its near and homely hills.

## DUCKS AT GOOSE POND

Oct. 29. Two ducks, of the summer or wood species, which were merrily dabbling in their favorite basin, struck up a retreat on my approach, and seemed disposed to take French leave, paddling off with swan-like majesty. They are first-rate swimmers, beating me at a round pace, and — what was to me a new trait in the duck character — dove every minute or two and swam several feet under water, in order to escape our attention. Just before immersion they, seemed to give each other a significant nod, and then, as if by a common understanding, ‘t was heels up and head down in the shaking of a duck’s wing. When they reappeared, it was amusing to observe with what a self-satisfied, darn-it-how-he-nicks-’em air they paddled off to repeat the experiment.

## THE ARROWHEAD

A curious incident happened some four or six weeks ago which I think it worth the while to record. John and I had been searching for Indian relics, and been successful enough to find two arrowheads and a pestle, when, of a Sunday evening, with our heads full of the past and its remains, we strolled to the mouth of Swamp Bridge Brook. As we neared the brow of the hill forming the bank of the river, inspired by my theme, I broke forth into an extravagant eulogy on those savage times, using most violent gesticulations by way of illustration. “Thereon Nawshawtuct,” said I, “was their lodge, the rendezvous of the tribe, and yonder, on Clamshell Hill, their feasting ground. This was, no doubt, a favorite haunt; here on this brow was an eligible lookout post. How often have they stood on this very spot, at this very hour, when the sun was sinking behind yonder woods and gilding with his last rays the waters of the Musketaquid, and pondered the day’s success and the morrow’s prospects, or communed with the spirit of their fathers gone before them to the land of shades!

“Here,” I exclaimed, “stood Tahatawan; and there” (to complete the period) “is Tahatawan’s arrowhead.”

We instantly proceeded to sit down on the spot I had pointed to, and I, to carry out the joke, to lay bare an ordinary stone which my whim had selected, when lo! the first I laid hands on, the grubbing stone that was to be, proved a most perfect arrowhead, as sharp as if just from the hands of the Indian fabricator!!!

#### SUNRISE

Oct. 30. First we have the gray twilight of the poets, with dark and barry clouds diverging to the zenith. Then glows the intruding cloud in the east, as if it bore a precious jewel in its bosom; a deep round gulf of golden gray indenting its upper edge, while slender rules of fleecy vapor, radiating from the common centre, like light-armed troops, fall regularly into their places.

#### SAILING WITH AND AGAINST THE STREAM

Nov. 3. If one would reflect, let him embark on some placid stream, and float with the current. He cannot resist the Muse. As we ascend the stream, plying the paddle with might and main, snatched and impetuous thoughts course through the brain. We dream of conflict, power, and grandeur. But turn the prow down stream, and rock, tree, kine, knoll, assuming new and varying positions, as wind and water shift the scene, favor the liquid lapse of thought, far-reaching and sublime, but ever calm and gently undulating.

#### TRUTH

Nov. 5. Truth strikes us from behind, and in the dark, as well as from before and in broad daylight.

#### STILL STREAMS RUN DEEPEST

Nov. 9. It is the rill whose “silver sands and pebbles sing eternal ditties with the spring.” The early frosts bridge its narrow channel, and its querulous note is hushed. Only the flickering sunlight on its sandy bottom attracts the beholder. But there are souls whose depths are never fathomed, — on whose bottom the sun never shines. We get a distant view from the precipitous banks, but never a draught from their mid-channels. Only a sunken rock or fallen oak can provoke a murmur, and their surface is a stranger to the icy fetters which bind fast a thousand contributory rills.

#### DISCIPLINE

Nov. 12. I yet lack discernment to distinguish the whole lesson of to-day; but it is not lost, — it will come to me at last. My desire is to know what I have lived, that I may know how to live henceforth.

#### SIN DESTROYS THE PERCEPTION OF THE BEAUTIFUL

Nov. 13. This shall be the test of innocence — if I can hear a taunt, and look out on this friendly moon, pacing the heavens in queen-like majesty, with the accustomed yearning.

#### TRUTH

Truth is ever returning into herself. I glimpse one feature to-day, another to-morrow; and the next day they are blended.

## GOETHE

Nov. 15. "And now that it is evening, a few clouds in the mild atmosphere rest upon the mountains, more stand still than move in the heavens, and immediately after sunset the chirping of crickets begins to increase; then feels one once more at home in the world, and not as an alien, — an exile. I am contented as though I had been born and brought up here, and now returned from a Greenland or whaling voyage. Even the dust of my Fatherland, as it is whirled about the wagon, which for so long a time I had not seen, is welcome. The clock-and-bell jingling of the crickets is very agreeable, penetrating, and not without a meaning. Pleasant is it when roguish boys whistle in emulation of a field of such songstresses. One imagines that they really enhance each other. The evening is perfectly mild as the day. Should an inhabitant of the south, coming from the south, hear of my rapture, he would deem me very childish. Alas! what I here express have I long felt under an unpropitious heaven. And now this joy is to me an exception, which I am henceforth to enjoy, — a necessity of my nature." — *Italianische Reise*.

## PONKAWTASSETT

Nov. 16. There goes the river, or rather is, "in serpent error wandering," the jugular vein of Musketaquid. Who knows how much of the proverbial moderation of the inhabitants was caught from its dull circulation?

The snow gives the landscape a washing-day appearance, — here a streak of white, there a streak of dark; it is spread like a napkin over the hills and meadows. This must be a rare drying day, to judge from the vapor that floats over the vast clothes-yard.

A hundred guns are firing and a flag flying in the village in celebration of the whig victory. Now a short dull report, — the mere disk of a sound, shorn of its beams, — and then a puff of smoke rises in the horizon to join its misty relatives in the skies.

## GOETHE

He gives such a glowing description of the old tower, that they who had been born and brought up in the neighborhood must needs look over their shoulders, "that they might behold with their eyes, what I had praised to their ears... and I added nothing, not even the ivy which for centuries had decorated the walls." — *Italianische Reise*.

## SUNRISE

Nov. 17. Now the king of day plays at bo-peep round the world's corner, and every cottage window smiles a golden smile, — a very picture of glee. I see the water glistening in the eye. The smothered breathings of awakening day strike the ear with an undulating motion; over hill and dale, pasture and woodland, come they to me, and I am at home in the world.

## THE SKY

If there is nothing new on earth, still there is something new in the heavens. We have always a resource in the skies. They are constantly turning a new page to view. The wind sets the types in this blue ground, and the inquiring may always read a new truth.

## VIRGIL

Nov. 18. "Pulsae referunt ad sidera valles" is such a line as would save an epic; and how finely he concludes his "agrestem musam," now that Silenus has done, and the stars have heard his story, —

"Cogere donec oves stabulis, numerumque referre Jussit, et invito processit Vesper Olympo."

#### HARMONY

Nature makes no noise. The howling storm, the rustling leaf, the pattering rain are no disturbance, there is an essential and unexplored harmony in them. Why is it that thought flows with so deep and sparkling a current when the sound of distant music strikes the ear? When I would muse I complain not of a rattling tune on the piano — a Battle of Prague even — if it be harmony, but an irregular, discordant drumming is intolerable.

#### SHADOWS

When a shadow flits across the landscape of the soul, where is the substance? Has it always its origin in sin? and is that sin in me?

#### VIRGIL

Nov. 20. I would read Virgil, if only that I might be reminded of the identity of human nature in all ages. I take satisfaction in "jam laeto turgent in palmitum gemmae," or "Strata jacent passim sua quaeque sub arbore poma." It was the same world, and the same men inhabited it.

#### NAWSHAWTUCT

Nov. 21. One must needs climb a hill to know what a world he inhabits. In the midst of this Indian summer I am perched on the topmost rock of Nawshawtucl, a velvet wind blowing from the southwest. I seem to feel the atoms as they strike my cheek. Hills, mountains, steeples stand out in bold relief in the horizon, while I am resting on the rounded boss of an enormous shield, the river like a vein of silver encircling its edge, and thence the shield gradually rises to its rim, the horizon. Not a cloud is to be seen, but villages, villas, forests, mountains, one above another, till they are swallowed up in the heavens. The atmosphere is such that, as I look abroad upon the length and breadth of the land, it recedes from my eye, and I seem to be looking for the threads of the velvet.

Thus I admire the grandeur of my emerald carriage, with its border of blue, in which I am rolling through space.

#### THOUGHTS

Nov. 26. I look around for thoughts when I am overflowing myself. While I live on, thought is still in embryo, — it stirs not within me. Anon it begins to assume shape and comeliness, and I deliver it, and clothe it in its garment of language. But alas! how often when thoughts choke me do I resort to a spat on the back, or swallow a crust, or do anything but expectorate them!

#### HOAR FROST AND GREEN RIVER

Nov. 28. Every tree, fence, and spire of grass that could raise its head above the snow was this morning covered with a dense hoar frost. The trees looked like airy

creatures of darkness caught napping. On this side they were huddled together, their gray hairs streaming, in a secluded valley which the sun had not yet penetrated, and on that they went hurrying off in Indian file by hedgerows and watercourses, while the shrubs and grasses, like elves and fairies of the night, sought to hide their diminished heads in the snow.

The branches and taller grasses were covered with a wonderful ice-foliage, answering leaf for leaf to their summer dress. The centre, diverging, and even more minute fibres were perfectly distinct and the edges regularly indented.

These leaves were on the side of the twig or stubble opposite to the sun (when it was not bent toward the east), meeting it for the most part at right angles, and there were others standing out at all possible angles upon these, and upon one another.

It struck me that these ghost leaves and the green ones whose forms they assume were the creatures of the same law. It could not be in obedience to two several laws that the vegetable juices swelled gradually into the perfect leaf on the one hand, and the crystalline particles trooped to their standard in the same admirable order on the other.

The river, viewed from the bank above, appeared of a yellowish-green color, but on a nearer approach this phenomenon vanished; and yet the landscape was covered with snow.

#### ICE-HARP

Dec. 5. My friend tells me he has discovered a new note in nature, which he calls the Ice-Harp. Chancing to throw a handful of pebbles upon the pond where there was an air chamber under the ice, it discoursed a pleasant music to him.

Herein resides a tenth muse, and as he was the man to discover it probably the extra melody is in him.

#### GOETHE

Dec. 8. He is generally satisfied with giving an exact description of objects as they appear to him, and his genius is exhibited in the points he seizes upon and illustrates. His description of Venice and her environs as seen from the Marcusthurm is that of an unconcerned spectator, whose object is faithfully to describe what he sees, and that, too, for the most part, in the order in which he saw it. It is this trait which is chiefly to be prized in the book; even the reflections of the author do not interfere with his descriptions.

It would thus be possible for inferior minds to produce invaluable books.

#### MEASURE

Dec. 10. Not the carpenter alone carries his rule in his pocket. Space is quite subdued to us. The meanest peasant finds in a hair of his head, or the white crescent upon his nail, the unit of measure for the distance of the fixed stars. His middle finger measures how many digits into space; he extends a few times his thumb and finger, and the continent is spanned; he stretches out his arms, and the sea is fathomed.

#### THOUGHT

Dec. 12. There are times when thought elbows her way through the underwood of words to the clear blue beyond;

“O’er bog, or steep, through strait, rough, dense, or rare,  
With head, hands, wings, or feet, pursues her way,  
And swims, or sinks, or wades, or creeps, or flies;...”

but let her don her cumbersome working-day garment, and each sparkling dewdrop will seem a “slough of despond.”

#### PECULIARITY

When we speak of a peculiarity in a man or a nation, we think to describe only one part, a mere mathematical point; but it is not so. It pervades all. Some parts may be further removed than others from this centre, but not a particle so remote as not to be either shined on or shaded by it.

#### THORNS

No faculty in man was created with a useless or sinister intent; in no respect can he be wholly bad, but the worst passions have their root in the best, — as anger, for instance, may be only a perverted sense of wrong which yet retains some traces of its origin. So a spine is proved to be only an abortive branch, “which, notwithstanding, even as a spine, bears leaves, and, in *Euphorbia heptagona*, sometimes flowers and fruit.”

#### JACK FROST

Dec. 15. As further confirmation of the fact that vegetation is a kind of crystallization, I observe that upon the edge of the melting frost on the windows, Jack is playing singular freaks, — now bundling together his needle-shaped leaves so as to resemble fields waving with grain, or shocks of wheat rising here and there from the stubble. On one side the vegetation of the torrid zone is presented you, — high-towering palms, and widespread banyans, such as we see in pictures of Oriental scenery; on the other are arctic pines, stiff-frozen, with branches downcast, like the arms of tender men in frosty weather. In some instances the panes are covered with little feathery flocks, where the particles radiate from a common centre, the number of radii varying from three to seven or eight. The crystalline particles are partial to the creases and flaws in the glass, and, when these extend from sash to sash, form complete hedgerows, or miniature watercourses, where dense masses of crystal foliage “high over-arched imbower.”

#### FROZEN MIST

Dec. 16. The woods were this morning covered with thin bars of vapor, — the evaporation of the leaves according to Sprengel, — which seemed to have been suddenly stiffened by the cold. In some places it was spread out like gauze over the tops of the trees, forming extended lawns, where elves and fairies held high tournament;

“before each van

Prick forth the aery knights, and couch their spears,  
Till thickest legions close.”

The east was glowing with a narrow but ill-defined crescent of light, the blue of the zenith mingling in all possible proportions with the salmon-color of the horizon. And

now the neighboring hilltops telegraph to us poor crawlers of the plain the Monarch's golden ensign in the east, and anon his "long levelled rules" fall sector-wise, and humblest cottage windows greet their lord.

#### FACTS

How indispensable to a correct study of Nature is a perception of her true meaning. The fact will one day flower out into a truth. The season will mature and fructify what the understanding had cultivated. Mere accumulators of facts — collectors of materials for the master-workmen — are like those plants growing in dark forests, which "put forth only leaves instead of blossoms."

#### DRUIDS

Dec. 17. In all ages and nations we observe a leaning towards a right state of things. This may especially be seen in the history of the priest, whose life approaches most nearly to that of the ideal man. The Druids paid no taxes, and "were allowed exemption from warfare and all other things." The clergy are even now a privileged class.

In the last stage of civilization Poetry, Religion, and Philosophy will be one; and this truth is glimpsed in the first. The druidical order was divided into Druids, Bards, and Ouates. "The Bards were the poets and musicians, of whom some were satirists, and some encomiasts. The Ouates sacrificed, divined, and contemplated the nature of things. The Druids cultivated physiology and moral philosophy; or, as Diodorus says, were their philosophers and theologians."

#### GOETHE

Dec. 18. He required that his heroine, Iphigenia, should say nothing which might not be uttered by the holy Agathe, whose picture he contemplated.

#### IMMORTALITY POST

The nations assert an immortality post as well as ante. The Athenians wore a golden grasshopper as an emblem that they sprang from the earth, and the Arcadians pretended that they were 'proselenoi' or before the moon.

The Platos do not seem to have considered this back-reaching tendency of the human mind.

#### THE PRIDE OF ANCESTRY

Men are pleased to be called the sons of their fathers, — so little truth suffices them, — and whoever addresses them by this or a similar title is termed a poet. The orator appeals to the sons of Greece, of Britannia, of France, or of Poland; and our fathers' homely name acquires some interest from the fact that Sakai-suna means sons-of-the-Sakai (Saxons).

#### HELL

Dec. 19. Hell itself may be contained within the compass of a spark.

#### SAXONS

The fact seems at first an anomalous one that the less a people have to contend for the more tenacious they are of their rights. The Saxons of Ditmarsia contended for a principle, not for their sterile sands and uncultivated marshes.

We are on the whole the same Saxons that our fathers were, when it was said of them, "They are emulous in hospitality, because to plunder and to lavish is the glory of an Holsatian; not to be versed in the science of depredation is, in his opinion, to be stupid and base."

The French are the same Franks of whom it is written, "Francis familiare est ridendo fidem frangere;"

"Gens Francorum infidelis est. Si perjeret Francus quid novi faciet, qui perjuriam ipsam sermonis genus putat esse non criminis."

#### CRYSTALS

I observed this morning that the ice at Swamp Bridge was checkered with a kind of mosaic-work of white creases or channels; and when I examined the under side, I found it to be covered with a mass of crystallizations from three to five inches deep, standing, or rather depending, at right angles to the true ice, which was about an eighth of an inch thick. There was a yet older ice six or eight inches below this. The crystals were for the most part triangular prisms with the lower end open, though, in some cases, they had run into each other so as to form four or five sided prisms. When the ice was laid upon its smooth side, they resembled the roofs and steeples of a Gothic city, or the vessels of a crowded haven under a press of canvas.

I noticed also that where the ice in the road had melted and left the mud bare, the latter, as if crystallized, discovered countless rectilinear fissures, an inch or more in length — a continuation, as it were, of the checkered ice.

Dec. 22. About a year ago, having set aside a bowl which had contained some rhubarb grated in water, without wiping it, I was astonished to find, a few days afterward, that the rhubarb had crystallized, covering the bottom of the bowl with perfect cubes, of the color and consistency of glue, and a tenth of an inch in diameter.

#### CRYSTALS

Dec. 23. Crossed the river to-day on the ice. Though the weather is raw and wintry and the ground covered with snow, I noticed a solitary robin, who looked as if he needed to have his services to the Babes in the Woods speedily required.

In the side of the high bank by the Leaning Hemlocks, there were some curious crystallizations. Wherever the water, or other causes, had formed a hole in the bank, its throat and outer edge, like the entrance to a citadel of the olden time, bristled with a glistening ice armor. In one place you might see minute ostrich feathers, which seemed the waving plumes of the warriors filing into the fortress, in another the glancing fan-shaped banners of the Lilliputian host, and in another the needle-shaped particles, collected into bundles resembling the plumes of the pine, might pass for a phalanx of spears. The whole hill was like an immense quartz rock, with minute crystals sparkling from innumerable crannies. I tried to fancy that there was a disposition in these crystallizations to take the forms of the contiguous foliage.

#### REVOLUTIONS

Dec. 27. Revolutions are never sudden. Not one man, nor many men, in a few years or generations, suffice to regulate events and dispose mankind for the revolutionary

movement. The hero is but the crowning stone of the pyramid, — the keystone of the arch. Who was Romulus or Remus, Hengist or Horsa, that we should attribute to them Rome or England? They are famous or infamous because the progress of events has chosen to make them its stepping-stones. But we would know where the avalanche commenced, or the hollow in the rock whence springs the Amazon. The most important is apt to be some silent and unobtrusive fact in history. In 449 three Saxon cyules arrived on the British coast,— “Three scipen gode comen mid than flode, three hundred cnihten.” The pirate of the British coast was no more the founder of a state than the scourge of the German shore.

#### HEROES

The real heroes of minstrelsy have been ideal, even when the names of actual heroes have been perpetuated.

The real Arthur, who “not only excelled the experienced past, but also the possible future,” of whom it was affirmed for many centuries that he was not dead, but “had withdrawn from the world into some magical region; from which at a future crisis he was to reappear, and lead the Cymri in triumph through the island,” whose character and actions were the theme of the bards of Bretagne and the foundation of their interminable romances, was only an ideal impersonation.

Men claim for the ideal an actual existence also, but do not often expand the actual into the ideal. “If you do not believe me, go into Bretagne, and mention in the streets or villages, that Arthur is really dead like other men; you will not escape with impunity; you will be either hooted with the curses of your hearers, or stoned to death.”

#### HOMESICKNESS

The most remarkable instance of homesickness is that of the colony of Franks transplanted by the Romans from the German Ocean to the Euxine, who at length resolving to a man to abandon the country, seized the vessels which carried them out, and reached at last their native shores, after innumerable difficulties and dangers upon the Mediterranean and Atlantic.

#### THE INTERESTING FACTS IN HISTORY

How cheering is it, after toiling through the darker pages of history, — the heartless and fluctuating crust of human rest and unrest, — to alight on the solid earth where the sun shines, or rest in the checkered shade. The fact that Edwin of Northumbria “caused stakes to be fixed in the highways where he had seen a clear spring,” and that “brazen dishes were chained to them, to refresh the weary sojourner, whose fatigues Edwin had himself experienced,” is worth all Arthur’s twelve battles. The sun again shines along the highway, the landscape presents us sunny glades and occasional cultivated patches as well as dark primeval forests, and it is merry England after all.

Dec. 31. As the least drop of wine tinges the whole goblet, so the least particle of truth colors our whole life. It is never isolated, or simply added as treasure to our stock. When any real progress is made, we unlearn and learn anew what we thought we knew before. We go picking up from year to year and laying side by side the *disjecta membra*

of truth, as he who picked up one by one a row of a hundred stones, and returned with each separately to his basket.

## 1838

### HEAVEN ON EARTH

Jan. 6. As a child looks forward to the coming of the summer, so could we contemplate with quiet joy the circle of the seasons returning without fail eternally. As the spring came round during so many years of the gods, we could go out to admire and adorn anew our Eden, and yet never tire.

### SAXONS

Jan. 15. After all that has been said in praise of the Saxon race, we must allow that our blue-eyed and fairhaired ancestors were originally an ungodly and reckless crew.

### WE MAKE OUR OWN FORTUNE

Jan. 16. Man is like a cork which no tempest can sink, but it will float securely to its haven at last. The world is never the less beautiful though viewed through a chink or knot-hole.

Jan. 21. Man is the artificer of his own happiness. Let him beware how he complains of the disposition of circumstances, for it is his own disposition he blames. If this is sour, or that rough, or the other steep, let him think if it be not his work. If his look curdles all hearts, let him not complain of a sour reception; if he hobble in his gait, let him not grumble at the roughness of the way; if he is weak in the knees, let him not call the hill steep. This was the pith of the inscription on the wall of the Swedish inn: "You will find at Trolhate excellent bread, meat, and wine, provided you bring them with you!"

### HOAR FROST

Every leaf and twig was this morning covered with a sparkling ice armor; even the grasses in exposed fields were hung with innumerable diamond pendants, which jingled merrily when brushed by the foot of the traveller. It was literally the wreck of jewels and the crash of gems. It was as though some superincumbent stratum of the earth had been removed in the night, exposing to light a bed of untarnished crystals. The scene changed at every step, or as the head was inclined to the right or the left. There were the opal and sapphire and emerald and jasper and beryl and topaz and ruby.

Such is beauty ever, — neither here nor there, now nor then, — neither in Rome nor in Athens, but wherever there is a soul to admire. If I seek her elsewhere because I do not find her at home, my search will prove a fruitless one.

### ZENO

Feb. 7. Zeno, the Stoic, stood in precisely the same relation to the world that I do now. He is, forsooth, bred a merchant — as how many still! — and can trade and barter, and perchance higgler, and moreover he can be shipwrecked and cast ashore at the Piræus, like one of your Johns or Thomases.

He strolls into a shop and is charmed by a book by Xenophon — and straightway he becomes a philosopher. The sun of a new life's day rises to him, — serene and unclouded, — which looks over stoa. And still the fleshly Zeno sails on, shipwrecked, buffeted, tempest-tossed; but the true Zeno sails ever a placid sea. Play high, play low, — rain, sleet, or snow, — it 's all the same with the Stoic. "Propriety and decorum" were his Palinurus, — not the base progeny of fashion, but the suggestions of an experienced taste.

When evening comes he sits down unwearied to the review of his day, — what's done that's to be undone, — what not done at all still to be done. Himself Truth's unconcerned helpmate. Another system of book-keeping this than that the Cyprian trader to Phoenicia practiced!

This was he who said to a certain garrulous young man, "On this account have we two ears and but one mouth, that we may hear more, and speak less."

That he had talked concerned not our philosopher, but his audience; and herein we may see how it is more noble to hear than to speak. The wisest may apologize that he only said so to hear himself talk, for if he heard not, as well for him had he never spoken. What is all this gabble to the gabbler? Only the silent reap the profit of it.

#### SOCIETY

Feb. 9. It is wholesome advice,— "to be a man amongst folks." Go into society if you will, or if you are unwilling, and take a human interest in its affairs.

If you mistake these Messieurs and Mesdames for so many men and women, it is but erring on the safe side, — or, rather, it is their error and not yours. Armed with a manly sincerity, you shall not be trifled with, but drive this business of life. It matters not how many men are to be addressed, — rebuked, — provided one man rebuke them.

#### SMALL TALK

To manage the small talk of a party is to make an effort to do what was at first done, admirably because naturally, at your fireside.

#### INFLUENCE

Feb. 13. It is hard to subject ourselves to an influence. It must steal upon us when we expect it not, and its work be all done ere we are aware of it. If we make advances, it is shy; if, when we feel its presence, we presume to pry into its free-masonry, it vanishes and leaves us alone in our folly, — brimful but stagnant, — a full channel, it may be, but no inclination.

#### FEAR

All fear of the world or consequences is swallowed up in a manly anxiety to do Truth justice.

#### OLD BOOKS

Feb. 15. The true student will cleave ever to the good, recognizing no Past, no Present; but wherever he emerges from the bosom of time, his course is not with the sun, — eastward or westward, — but ever towards the seashore. Day and night pursues he his devious way, lingering by how many a Pierian spring, how many an Academus

grove, how many a sculptured portico! — all which — spring, grove, and portico — lie not so wide but he may take them conveniently in his way.

#### GREECE

Feb. 16. In imagination I hie me to Greece as to enchanted ground. No storms vex her coasts, no clouds encircle her Helicon or Olympus, no tempests sweep the peaceful Tempe or ruffle the bosom of the placid Ægean; but always the beams of the summer's sun gleam along the entablature of the Acropolis, or are reflected through the mellow atmosphere from a thousand consecrated groves and fountains; always her seagirt isles are dallying with their zephyr guests, and the low of kine is heard along the meads, and the landscape sleeps — valley and hill and woodland — a dreamy sleep. Each of her sons created a new heaven and a new earth for Greece.

#### SUNDAY

Feb. 18. Rightly named Suna-day, or day of the sun. One is satisfied in some angle by wood-house and garden fence to bask in his beams — to exist barely — the livelong day.

#### SPRING

I had not been out long to-day when it seemed that a new Spring was already born, — not quite weaned, it is true, but verily entered upon existence. Nature struck up “the same old song in the grass,” despite eighteen inches of snow, and I contrived to smuggle away a grin of satisfaction by a smothered “Pshaw! and is that all?”

Feb. 19. Each summer sound Is a summer round.

#### GOETHE

Feb. 27. He jogs along at a snail's pace, but ever mindful that the earth is beneath and the heavens above him. His Italy is not merely the fatherland of lazzaroni and maccaroni but a solid turf-clad soil, daily illumined by a genial sun and nightly gleaming in the still moonshine, — to say nothing of the frequent showers which are so faithfully recorded. That sail to Palermo was literally a plowing through of the waves from Naples to Trinacria, — the sky overhead, and the sea with its isles on either hand.

His hearty good-will to all men is most amiable; not one cross word has he spoken, but on one occasion, the post boy snivelling, “Signore, perdonate! quésta è la mia patria,” he confesses, “to me poor northerner came something tear-like into the eyes.”

#### SPRING

March 1. March fans it, April christens it, and May puts on its jacket and trousers. It never grows up, but Alexandrian-like “drags its slow length along,” ever springing, bud following close upon leaf, and when winter comes it is not annihilated, but creeps on molelike under the snow, showing its face nevertheless occasionally by fuming springs and watercourses.

So let it be with man, — let his manhood be a more advanced and still advancing youth, bud following hard upon leaf. By the side of the ripening corn let's have a second or third crop of peas and turnips, decking the fields in a new green. So amid clumps of sere herd's-grass sometimes flower the violet and buttercup spring-born.

#### HOMER

March 3. Three thousand years and the world so little changed! The Iliad seems like a natural sound which has reverberated to our days. Whatever in it is still freshest in the memories of men was most childlike in the poet. It is the problem of old age, — a second childhood exhibited in the life of the world. Phoebus Apollo went like night, — This either refers to the gross atmosphere of the plague darkening the sun, or to the crescent of night rising solemn and stately in the east while the sun is setting in the west.

Then Agamemnon darkly lowers on Calchas, prophet of evil, — — such a fireeyed Agamemnon as you may see at town meetings and elections, as well here as in Troy neighborhood.

#### A SUNDAY SCENE

March 4. Here at my elbow sit five notable, or at least noteworthy, representatives of this nineteenth century, — of the gender feminine. One a sedate, indefatigable knitter, not spinster, of the old school, who had the supreme felicity to be born in days that tried men's souls, who can, and not unfrequently does, say with Nestor, another of the old school: "But you are younger than I. For time was when I conversed with greater men than you. For not at any time have I seen such men, nor shall see them, as Perithous, and Dryas, and ," or, in one word, sole "shepherd of the people," Washington.

And when Apollo has now six times rolled westward, or seemed to roll, and now for the seventh time shows his face in the east, eyes well-nigh glazed, long glassed, which have fluctuated only between lamb's wool and worsted, explore ceaseless some good sermon book. For six days shalt thou labor and do all thy knitting, but on the seventh, forsooth, thy reading.

Opposite, across this stone hearth, sits one of no school, but rather one who schools, a spinster who spins not, with elbow resting on the book of books, but with eyes turned towards the vain trumpery of that shelf, — trumpery of sere leaves, blossoms, and waxwork, built on sand, that presumes to look quite as gay, smell quite as earthy, as though this were not by good rights the sun's day. I marked how she spurned that innocent every-day book, "Germany by De Staël," as though a viper had stung her; — better to rest the elbow on The Book than the eye on such a page. Poor book! this is thy last chance.

Happy I who can bask in this warm spring sun which illumines all creatures, as well when they rest as when they toil, not without a feeling of gratitude! whose life is as blameless — how blameworthy soever it be — on the Lord's Mona-day as on his Suna-day!

Thus much at least a man may do: he may not impose on his fellows, — perhaps not on himself. Thus much let a man do: confidently and heartily live up to his thought; for its error, if there be any, will soonest appear in practice, and if there be none, so much he may reckon as actual progress in the way of living.

HOMER

The poet does not leap, even in imagination, from Asia to Greece through mid-air, neglectful of the fair sea and still fairer land beneath him, but jogs on humanly observant over the intervening segment of a sphere, —

for there are very many Shady mountains, and resounding seas between.

March 5. How often, when Achilles like one whether to retaliate or suppress his wrath, has his good Genius, like Pallas Athene, gliding down from heaven, , stood behind him, and whispered peace in his ear!

Men may dispute about the fact whether a goddess did actually come down from heaven, calling it a poet's fancy, but was it not, considering the stuff that gods are made of, a very truth?

#### THE AGE OF HONEY

“And to them rose up the sweet-worded Nestor, the shrill orator of the Pylians, And words sweeter than honey flowed from his tongue.”

E'en in old Homer's day was honey sweet, — not yet is sour, — tickling the palate of the blind old man, forsooth, with fresher sweet; then, as now, whene'er from leaky jar or drivelling lips it daubed the festive board, proving a baneful lure to swarms of parasites, Homer's cotemporaries, but alas! like Phthian hero, vulnerable in heel.

#### WHAT TO DO

But what does all this scribbling amount to? What is now scribbled in the heat of the moment one can contemplate with somewhat of satisfaction, but alas! to-morrow — aye, to-night — it is stale, flat, and unprofitable, — in fine, is not, only its shell remains, like some red parboiled lobster-shell which, kicked aside never so often, still stares at you in the path.

What may a man do and not be ashamed of it? He may not do nothing surely, for straightway he is dubbed Dolittle — aye! christens himself first — and reasonably, for he was first to duck. But let him do something, is he the less a Dolittle? Is it actually something done, or not rather something undone; or, if done, is it not badly done, or at most well done comparatively?

Such is man, — toiling, heaving, struggling ant-like to shoulder some stray unappropriated crumb and deposit it in his granary; then runs out, complacent, gazes heavenward, earthward (for even pismires can look down), heaven and earth meanwhile looking downward, upward; there seen of men, world-seen, deed-delivered, vanishes into all-grasping night. And is he doomed ever to run the same course? Can he not, wriggling, screwing, self-exhorting, self-constraining, wriggle or screw out something that shall live, — respected, intact, intangible, not to be sneezed at?

March 6. How can a man sit down and quietly pare his nails, while the earth goes gyrating ahead amid such a din of sphere music, whirling him along about her axis some twenty-four thousand miles between sun and sun, but mainly in a circle some two millions of miles actual progress? And then such a hurly-burly on the surface — wind always blowing — now a zephyr, now a hurricane — tides never idle, ever fluctuating — no rest for Niagara, but perpetual ran-tan on those limestone rocks ——

and then that summer simmering which our ears are used to, which would otherwise be christened confusion worse confounded, but is now ironically called “silence audible,” and above all the incessant tinkering named “hum of industry,” the hurrying to and fro and confused jabbering of men. Can man do less than get up and shake himself?

#### COMPOSITION

March 7. We should not endeavor coolly to analyze our thoughts, but, keeping the pen even and parallel with the current, make an accurate transcript of them. Impulse is, after all, the best linguist, and for his logic, if not conformable to Aristotle, it cannot fail to be most convincing. The nearer we approach to a complete but simple transcript of our thought the more tolerable will be the piece, for we can endure to consider ourselves in a state of passivity or in involuntary action, but rarely our efforts, and least of all our rare efforts.

#### SCRAPS FROM A LECTURE ON “SOCIETY” WRITTEN MARCH 14TH, 1838, DELIVERED BEFORE OUR LYCEUM, APRIL 11TH

Every proverb in the newspapers originally stood for a truth. Thus the proverb that man was made for society, so long as it was not allowed to conflict with another important truth, deceived no one; but, now that the same words have come to stand for another thing, it may be for a lie, we are obliged, in order to preserve its significance, to write it anew, so that properly it will read, Society was made for man.

Man is not at once born into society, — hardly into the world. The world that he is hides for a time the world that he inhabits.

That which properly constitutes the life of every man is a profound secret. Yet this is what every one would give most to know, but is himself most backward to impart.

Hardly a rood of land but can show its fresh wound or indelible scar, in proof that earlier or later man has been there.

The mass never comes up to the standard of its best member, but on the contrary degrades itself to a level with the lowest. As the reformers say, it is a levelling down, not up. Hence the mass is only another name for the mob. The inhabitants of the earth assembled in one place would constitute the greatest mob. The mob is spoken of as an insane and blinded animal; magistrates say it must be humored; they apprehend it may incline this way or that, as villagers dread an inundation, not knowing whose land may be flooded, nor how many bridges carried away.

One goes to a cattle-show expecting to find many men and women assembled, and beholds only working oxen and neat cattle. He goes to a commencement thinking that there at least he may find the men of the country; but such, if there were any, are completely merged in the day, and have become so many walking commencements, so that he is fain to take himself out of sight and hearing of the orator, lest he lose his own identity in the nonentities around him.

But you are getting all the while further and further from true society. Your silence was an approach to it, but your conversation is only a refuge from the encounter of men; as though men were to be satisfied with a meeting of heels, and not heads.

Nor is it better with private assemblies, or meetings together, with a sociable design, of acquaintances so called, — that is to say of men and women who are familiar with the lineaments of each other's countenances, who eat, drink, sleep, and transact the business of living within the circuit of a mile.

With a beating heart he fares him forth, by the light of the stars, to this meeting of gods. But the illusion speedily vanishes; what at first seemed to him nectar and ambrosia, is discovered to be plain bohea and short gingerbread.

Then with what speed does he throw off his strait-jacket of a godship, and play the one-eared, twomouthed mortal, thus proving his title to the epithet applied to him of old by Homer of , or that possesses an articulating voice. But unfortunately we have as yet invented no rule by which the stranger may know when he has culminated. We read that among the Finlanders when one "has succeeded in rendering himself agreeable, it is a custom at an assemblage for all the women present to give him on the back a sudden slap, when it is least expected; and the compliment is in proportion to the weight of the blow."

It is provoking, when one sits waiting the assembling together of his neighbors around his hearth, to behold merely their clay houses, for the most part newly shingled and clapboarded, and not unfrequently with a fresh coat of paint, trundled to his door. He has but to knock slightly at the outer gate of one of these shingle palaces, to be assured that the master or mistress is not at home.

After all, the field of battle possesses 'many advantages over the drawing-room. There at least is no room for pretension or excessive ceremony, no shaking of hands or rubbing of noses, which make one doubt your sincerity, but hearty as well as hard hand-play. It at least exhibits one of the faces of humanity, the former only a mask.

The utmost nearness to which men approach each other amounts barely to a mechanical contact. As when you rub two stones together, though they emit an audible sound, yet do they not actually touch each other.

In obedience to an instinct of their nature men have pitched their cabins and planted corn and potatoes within speaking distance of one another, and so formed towns and villages, but they have not associated, they have only assembled, and society has signified only a convention of men.

When I think of a playhouse, it is as if we had not time to appreciate the follies of the day in detail as they occur, and so devoted an hour of our evening to laughing or crying at them in the lump. Despairing of a more perfect intercourse, or perhaps never dreaming that such is desirable, or at least possible, we are contented to act our part in what deserves to be called the great farce, not drama, of life, like pitiful and mercenary stock actors whose business it is to keep up the semblance of a stage.

Our least deed, like the young of the land crab, wends its way to the sea of cause and effect as soon as born, and makes a drop there to eternity.

Let ours be like the meeting of two planets, not hastening to confound their jarring spheres, but drawn together by the influence of a subtile attraction, soon to roll diverse in their respective orbits, from this their perigee, or point of nearest approach.

If thy neighbor hail thee to inquire how goes the world, feel thyself put to thy trumps to return a true and explicit answer. Plant the feet firmly, and, will he nill he, dole out to him with strict and conscientious impartiality his modicum of a response.

Let not society be the element in which you swim, or are tossed about at the mercy of the waves, but be rather a strip of firm land running out into the sea, whose base is daily washed by the tide, but whose summit only the spring tide can reach.

But after all, such a morsel of society as this will not satisfy a man. But like those women of Malamocco and Pelestrina, who when their husbands are fishing at sea, repair to the shore and sing their shrill songs at evening, till they hear the voices of their husbands in reply borne to them over the water, so go we about indefatigably, chanting our stanza of the lay, and awaiting the response of a kindred soul out of the distance. \*

#### THE INDIAN AXE

April 1. The Indian must have possessed no small share of vital energy to have rubbed industriously stone upon stone for long months till at length he had rubbed out an axe or pestle, — as though he had said in the face of the constant flux of things, I at least will live an enduring life.

#### April 8. — FRIENDSHIP

Sole meat and sweetest drink,  
And close connecting link  
'Tween heaven and earth.

I only know it is, not how or why,  
My greatest happiness;  
However hard I try,  
Not if I were to die,  
Can I explain.

I fain would ask my friend how it can be,  
But, when the time arrives,  
Then Love is more lovely  
Than anything to me,  
And so I'm dumb.  
For, if the truth were known, Love cannot speak,  
But only thinks and does;  
Though surely out't will leak  
Without the help of Greek,  
Or any tongue.

A man may love the truth and practice it,  
Beauty he may admire,  
And goodness not omit,  
As much as may befit  
To reverence.  
But only when these three together meet,

As they always incline,  
 And make one soul the seat  
 And favorite retreat  
 Of loveliness;  
 When under kindred shape, like loves and hates  
 And a kindred nature,  
 Proclaim us to be mates,  
 Exposed to equal fates  
 Eternally;  
 And each may other help, and service do,  
 Drawing Love's bands more tight,  
 Service he ne'er shall rue  
 While one and one make two,  
 And two are one;  
 In such case only doth man fully prove,  
 Fully as man can do,  
 What power there is in Love  
 His inmost soul to move  
 Resistlessly.  
 Two sturdy oaks I mean, which side by side  
 Withstand the winter's storm,  
 And, spite of wind and tide,  
 Grow up the meadow's pride,  
 For both are strong.  
 Above they barely touch, but, undermined  
 Down to their deepest source,  
 Admiring you shall find  
 Their roots are intertwined  
 Insep'raftly.

CONVERSATION April 15. Thomas Fuller relates that "in Merionethshire, in Wales, there are high mountains, whose hanging tops come so close together that shepherds on the tops of several hills may audibly talk together, yet will it be a day's journey for their bodies to meet, so vast is the hollowness of the valleys betwixt them." As much may be said in a moral sense of our intercourse in the plains, for, though we may audibly converse together, yet is there so vast a gulf of hollowness between that we are actually many days' journey from a veritable communication.

#### STEAMSHIPS

April 24. Men have been contriving new means and modes of motion. Steamships have been westering during these late days and nights on the Atlantic waves, — the fuglers of a new evolution to this generation. Meanwhile plants spring silently by the brooksides, and the grim woods wave indifferent; the earth emits no howl, pot on fire simmers and seethes, and men go about their business.

April 26.

THE BLUEBIRDS

In the midst of the poplar that stands by our door  
We planted a bluebird box,  
And we hoped before the summer was o'er  
A transient pair to coax.  
One warm summer's day the bluebirds came  
And lighted on our tree,  
But at first the wand'ers were not so tame  
But they were afraid of me.  
They seemed to come from the distant south,  
Just over the Walden wood,  
And they skimmed it along with open mouth  
Close by where the bellows stood.  
Warbling they swept round the distant cliff,  
And they warbled it over the lea,  
And over the blacksmith's shop in a jiff  
Did they come warbling to me.  
They came and sat on the box's top  
Without looking into the hole,  
And only from this side to that did they hop,  
As't were a common well-pole.  
Methinks I had never seen them before,  
Nor indeed had they seen me,  
Till I chanced to stand by our back door,  
And they came to the poplar tree.  
In course of time they built their nest  
And reared a happy brood,  
And every morn they piped their best  
As they flew away to the wood.  
Thus wore the summer hours away  
To the bluebirds and to me,  
And every hour was a summer's day,  
So pleasantly lived we.  
They were a world within themselves,  
And I a world in me,  
Up in the tree — the little elves —  
With their callow family.  
One morn the wind blowed cold and strong,  
And the leaves went whirling away;  
The birds prepared for their journey long  
That raw and gusty day.

Boreas came blust'ring down from the north,  
 And ruffled their azure smocks,  
 So they launched them forth, though somewhat loth,  
 By way of the old Cliff rocks.  
 Meanwhile the earth jogged steadily on  
 In her mantle of purest white,  
 And anon another spring was born  
 When winter was vanished quite.  
 And I wandered forth o'er the steamy earth,  
 And gazed at the mellow sky,  
 But never before from the hour of my birth  
 Had I wandered so thoughtfully.  
 For never before was the earth so still,  
 And never so mild was the sky,  
 The river, the fields, the woods, and the hill  
 Seemed to heave an audible sigh.  
 I felt that the heavens were all around,  
 And the earth was all below,  
 As when in the ears there rushes a sound  
 Which thrills you from top to toe.  
 I dreamed that I was a waking thought,  
 A something I hardly knew,  
 Not a solid piece, nor an empty nought,  
 But a drop of morning dew.  
 'T was the world and I at a game of bo-peep,  
 As a man would dodge his shadow,  
 An idea becalmed in eternity's deep,  
 'Tween Lima and Segraddo.  
 Anon a faintly warbled note  
 From out the azure deep  
 Into my ears did gently float  
 As is the approach of sleep.  
 It thrilled but startled not my soul;  
 Across my mind strange mem'ries gleamed,  
 As often distant scenes unroll  
 When we have lately dreamed.  
 The bluebird had come from the distant South  
 To his box in the poplar tree,  
 And he opened wide his slender mouth  
 On purpose to sing to me.  
 JOURNEY TO MAINE  
 May 3-4. Boston to Portland.

What, indeed, is this earth to us of New England but a field for Yankee speculation? The Nantucket whaler goes a-fishing round it, and so knows it, — what it is, how long, how broad, and that no tortoise sustains it. He who has visited the confines of his real estate, looking out on all sides into space, will feel a new inducement to be the lord of creation.

We must all pay a small tribute to Neptune; the chief engineer must once have been seasick.

Midnight — head over the boat's side — between sleeping and waking — with glimpses of one or more lights in the vicinity of Cape Ann. Bright moonlight — the effect heightened by seasickness. Beyond that light yonder have my lines hitherto been cast, but now I know that there lies not the whole world, for I can say it is there and not here.

May 4. Portland. There is a proper and only right way to enter a city, as well as to make advances to a strange person; neither will allow of the least forwardness nor bustle. A sensitive person can hardly elbow his way boldly, laughing and talking, into a strange town, without experiencing some twinges of conscience, as when he has treated a stranger with too much familiarity.

May 5. Portland to Bath via Brunswick; Bath to Brunswick.

Each one's world is but a clearing in the forest, so much open and inclosed ground. When the mail coach rumbles into one of these, the villagers gaze after you with a compassionate look, as much as to say: "Where have you been all this time, that you make your *début* in the world at this late hour? Nevertheless, here we are; come and study us, that you may learn men and manners."

May 6. Brunswick to Augusta via Gardiner and Hallowell.

May 7. We occasionally meet an individual of a character and disposition so entirely the reverse of our own that we wonder if he can indeed be another man like ourselves. We doubt if we ever could draw any nearer to him, and understand him. Such was the old English gentleman whom I met with to-day in H. Though I peered in at his eyes I could not discern myself reflected therein. The chief wonder was how we could ever arrive at so fair-seeming an intercourse upon so small ground of sympathy. He walked and fluttered like a strange bird at my side, prying into and making a handle of the least circumstance. The bustle and rapidity of our communication were astonishing; we skated in our conversation. All at once he would stop short in the path, and, in an abstracted air, query whether the steamboat had reached Bath or Portland, addressing me from time to time as his familiar genius, who could understand what was passing in his mind without the necessity of uninterrupted oral communication.

May 8. Augusta to Bangor via China.

May 10. Bangor to Oldtown.

The railroad from Bangor to Oldtown is civilization shooting off in a tangent into the forest. I had much conversation with an old Indian at the latter place, who sat dreaming upon a scow at the waterside and striking his deer-skin moccasins against the planks, while his arms hung listlessly by his side. He was the most communicative

man I had met. Talked of hunting and fishing, old times and new times. Pointing up the Penobscot, he observed, "Two or three mile up the river one beautiful country!" and then, as if he would come as far to meet me as I had gone to meet him, he exclaimed, "Ugh! one very hard time!" But he had mistaken his man.

May 11. Bangor to Belfast via Saturday Cove.

May 12. Belfast.

May 13. To Castine by sailboat "Cinderilla [sic]." May 14. Castine to Belfast by packet, Captain Skinner. Found the Poems of Burns and an odd volume of the "Spectator" in the cabin.

May 15. Belfast to Bath via Thomaston.

May 16. To Portland.

May 17. To Boston and Concord.

May 21.

MAY MORNING

The school-boy loitered on his way to school,  
Scorning to live so rare a day by rule.  
So mild the air a pleasure't was to breathe,  
For what seems heaven above was earth beneath.  
Soured neighbors chatted by the garden pale,  
Nor quarrelled who should drive the needed nail;  
The most unsocial made new friends that day,  
As when the sun shines husbandmen make hay.  
How long I slept I know not, but at last  
I felt my consciousness returning fast,  
For Zephyr rustled past with leafy tread,  
And heedlessly with one heel grazed my head.  
My eyelids opened on a field of blue,  
For close above a nodding violet grew;  
A part of heaven it seemed, which one could scent,  
Its blue commingling with the firmament.

June 3.

WALDEN

True, our converse a stranger is to speech;  
Only the practiced ear can catch the surging words  
That break and die upon thy pebbled lips.  
Thy flow of thought is noiseless as the lapse of thy own waters,  
Wafted as is the morning mist up from thy surface,  
So that the passive Soul doth breathe it in,  
And is infected with the truth thou wouldst express.  
E'en the remotest stars have come in troops  
And stooped low to catch the benediction  
Of thy countenance. Oft as the day came round,

Impartial has the sun exhibited himself  
Before thy narrow skylight; nor has the moon  
For cycles failed to roll this way  
As oft as elsewhere, and tell thee of the night.  
No cloud so rare but hitherward it stalked,  
And in thy face looked doubly beautiful.  
O ! tell me what the winds have writ for the last thousand years  
On the blue vault that spans thy flood,  
Or sun transferred and delicately reprinted  
For thy own private reading. Somewhat  
Within these latter days I've read,  
But surely there was much that would have thrilled the Soul,  
Which human eye saw not.  
I would give much to read that first bright page,  
Wet from a virgin press, when Eurus, Boreas,  
And the host of airy quill-drivers  
First dipped their pens in mist.

June 14.

Truth, Goodness, Beauty, — those celestial thrins,  
Continually are born; e'en now the Universe,  
With thousand throats, and eke with greener smiles,  
Its joy confesses at their recent birth.  
Strange that so many fickle gods, as fickle as the weather,  
Throughout Dame Nature's provinces should always pull together.

June 16.

In the busy streets, domains of trade,  
Man is a surly porter, or a vain and hectoring bully,  
Who can claim no nearer kindredship with me  
Than brotherhood by law.

July 8.

CLIFFS

The loudest sound that burdens here the breeze  
Is the wood's whisper; 't is, when we choose to list,  
Audible sound, and when we list not,  
It is calm profound. Tongues were provided  
But to vex the ear with superficial thoughts.  
When deeper thoughts upswell, the jarring discord  
Of harsh speech is hushed, and senses seem  
As little as may be to share the ecstasy.

July 8.

CLIFFS

The loudest sound that burdens here the breeze Is the wood's whisper; 't is, when we choose to list, Audible sound, and when we list not, It is calm profound. Tongues were provided But to vex the ear with superficial thoughts.

When deeper thoughts upswell, the jarring discord Of harsh speech is hushed, and senses seem As little as may be to share the ecstasy.

#### HEROISM

July 13. What a hero one can be without moving a finger! The world is not a field worthy of us, nor can we be satisfied with the plains of Troy. A glorious strife seems waging within us, yet so noiselessly that we but just catch the sound of the clarion ringing of victory, borne to us on the breeze. There are in each the seeds of a heroic ardor, which need only to be stirred in with the soil where they lie, by an inspired voice or pen, to bear fruit of a divine flavor.

#### SUSPICION

July 15. What though friends misinterpret your conduct, if it is right in sight of God and Nature. The wrong, if there be any, pertains only to the wrongdoer, nor is the integrity of your relations to the universe affected, but you may gather encouragement from their mistrust. If the friend withhold his favor, yet does greater float gratuitous on the zephyr.

#### TRUTH

Aug. 4. Whatever of past or present wisdom has published itself to the world, is palpable falsehood till it come and utter itself by my side.

#### SPHERE MUSIC

Aug. 5. Some sounds seem to reverberate along the plain, and then settle to earth again like dust; such are Noise, Discord, Jargon. But such only as spring heavenward, and I may catch from steeples and hilltops in their upward course, which are the more refined parts of the former, are the true sphere music, — pure, unmixed music, — in which no wail mingles.

#### DIVINE SERVICE IN THE ACADEMY HALL

In dark places and dungeons these words might perhaps strike root and grow, but utter them in the daylight and their dusky hues are apparent. From this window I can compare the written with the preached word: within is weeping, and wailing, and gnashing of teeth; without, grain fields and grasshoppers, which give those the lie direct.

#### THE TIME OF THE UNIVERSE

Aug. 10. Nor can all the vanities that so vex the world alter one whit the measure that night has chosen, but ever it must be short particular metre. The human soul is a silent harp in God's quire, whose strings need only to be swept by the divine breath to chime in with the harmonies of creation. Every pulse-beat is in exact time with the cricket's chant, and the tickings of the death-watch in the wall. Alternate with these if you can.

#### CONSCIOUSNESS

Aug. 13. If with closed ears and eyes I consult consciousness for a moment, immediately are all walls and barriers dissipated, earth rolls from under me, and I float, by the impetus derived from the earth and the system, a subjective, heavily laden thought, in the midst of an unknown and infinite sea, or else heave and swell like a vast ocean of thought, without rock or headland, where are all riddles solved, all straight lines making there their two ends to meet, eternity and space gambolling familiarly through my depths. I am from the beginning, knowing no end, no aim. No sun illumines me, for I dissolve all lesser lights in my own intenser and steadier light. I am a restful kernel in the magazine of the universe.

#### RESOURCE

Men are constantly dinging in my ears their fair theories and plausible solutions of the universe, but ever there is no help, and I return again to my shoreless, islandless ocean, and fathom unceasingly for a bottom that will hold an anchor, that it may not drag.

#### SABBATH BELL

Aug. 19. The sound of the sabbath bell, whose farthest waves are at this instant breaking on these cliffs, does not awaken pleasing associations alone. Its muse is wonderfully condescending and philanthropic. One involuntarily leans on his staff to humor the unusually meditative mood. It is as the sound of many catechisms and religious books twanging a canting peal round the world, and seems to issue from some Egyptian temple, and echo along the shore of the Nile, right opposite to Pharaoh's palace and Moses in the bulrushes, startling a multitude of storks and alligators basking in the sun. Not so these larks and pewees of Musketaquid. One is sick at heart of this pagoda worship. It is like the beating of gongs in a Hindoo subterranean temple.

#### HOLY WAR

Aug. 21. Passion and appetite are always an unholy land in which one may wage most holy war. Let him steadfastly follow the banner of his faith till it is planted on the enemy's citadel. Nor shall he lack fields to display his valor in, nor straits worthy of him. For when he has blown his blast, and smote those within reach, invisible enemies will not cease to torment him, who yet may be starved out in the garrisons where they lie.

#### SCRIPTURE

Aug. 22. How thrilling a noble sentiment in the oldest books, — in Homer, the Zendavesta, or Confucius! It is a strain of music wafted down to us on the breeze of time, through the aisles of innumerable ages. By its very nobleness it is made near and audible to us.

#### EVENING SOUNDS

Aug. 26. How strangely sounds of revelry strike the ear from over cultivated fields by the woodside, while the sun is declining in the west. It is a world we had not known before. We listen and are capable of no mean act or thought. We tread on Olympus and participate in the councils of the gods.

#### HOMER

It does one's heart good if Homer but say the sun sets, — or, "As when beautiful stars accompany the bright moon through the serene heavens; and the woody hills and cliffs are discerned through the mild light, and each star is visible, and the shepherd rejoices in his heart."

#### THE LOSS OF A TOOTH

Aug. 27. Verily I am the creature of circumstances. Here I have swallowed an indispensable tooth, and so am no whole man, but a lame and halting piece of manhood. I am conscious of no gap in my soul, but it would seem that, now the entrance to the oracle has been enlarged, the more rare and commonplace the responses that issue from it. I have felt cheap, and hardly dared hold up my head among men, ever since this accident happened. Nothing can I do as well and freely as before; nothing do I undertake but I am hindered and balked by this circumstance. What a great matter a little spark kindleth! I believe if I were called at this moment to rush into the thickest of the fight, I should halt for lack of so insignificant a piece of armor as a tooth. Virtue and Truth go undefended, and Falsehood and Affectation are thrown in my teeth, — though I am toothless. One does not need that the earth quake for the sake of excitement, when so slight a crack proves such an impassable moat. But let the lame man shake his leg, and match himself with the fleetest in the race. So shall he do what is in him to do. But let him who has lost a tooth open his mouth wide and gabble, lisp, and sputter never so resolutely.

#### DEFORMITY

Aug. 29. Here at the top of Nawshawtuct, this mild August afternoon, I can discern no deformed thing. The prophane hay-makers in yonder meadow are yet the hay-makers of poetry, — forsooth Faustus and Amyntas. Yonder schoolhouse of brick, than which, near at hand, nothing can be more mote-like to my eye, serves even to heighten the picturesqueness of the scene. Barns and outbuildings, which in the nearness mar by their presence the loveliness of nature, are not only enduring, but, observed where they lie by some waving field of grain or patch of woodland, prove a very cynosure to the pensive eye. Let man after infinite hammering and din of crows uprear a deformity in the plain, yet will Nature have her revenge on the hilltop. Retire a stone's throw and she will have changed his base metal into gold.

#### CRICKETS

The crackling flight of grasshoppers is a luxury; and pleasant is it when summer has once more followed in the steps of winter to hear scald cricket piping a Nibelungenlied in the grass. It is the most infinite of singers. Wiselier had the Greeks chosen a golden cricket, and let the grasshopper eat grass. One opens both his ears to the invisible, incessant quire, and doubts if it be not earth herself chanting for all time.

GENII In the vulgar daylight of our self-conceit, good genii are still overlooking and conducting us; as the stars look down on us by day as by night — and we observe them not.

#### SPHERE MUSIC

Sept. 2. The cocks chant a strain of which we never tire. Some there are who find pleasure in the melody of birds and chirping of crickets, — aye, even the peeping of frogs. Such faint sounds as these are for the most part heard above the weeping and wailing and gnashing of teeth which so unhallow the Sabbath among us. The moan the earth makes is after all a very faint sound, infinitely inferior in volume to its creakings of joy and gleeful murmurs; so that we may expect the next balloonist will rise above the utmost range of discordant sounds into the region of pure melody. Never so loud was the wail but it seemed to taper off into a piercing melody and note of joy, which lingered not amid the clods of the valley.

#### CREEDS

Sept. 3. The only faith that men recognize is a creed. But the true creed which we unconsciously live by, and which rather adopts us than we it, is quite different from the written or preached one. Men anxiously hold fast to their creed, as to a straw, thinking this does them good service because their sheet anchor does not drag.

#### RIVERS

Sept. 5. For the first time it occurred to me this afternoon what a piece of wonder a river is, — a huge volume of matter ceaselessly rolling through the fields and meadows of this substantial earth, making haste from the high places, by stable dwellings of men and Egyptian Pyramids, to its restless reservoir. One would think that, by a very natural impulse, the dwellers upon the headwaters of the Mississippi and Amazon would follow in the trail of their waters to see the end of the matter.

#### HOMER

Sept. 7. When Homer's messengers repair to the tent of Achilles, we do not have to wonder how they get there, but step by step accompany them along the shore of the resounding sea.

#### FLOW OF SPIRITS IN YOUTH

Sept. 15. How unaccountable the flow of spirits in youth. You may throw sticks and dirt into the current, and it will only rise the higher. Dam it up you may, but dry it up you may not, for you cannot reach its source. If you stop up this avenue or that, anon it will come gurgling out where you least expected and wash away all fixtures. Youth grasps at happiness as an inalienable right. The tear does no sooner gush than glisten. Who shall say when the tear that sprung of sorrow first sparkled with joy?

ALMA NATURA Sept. 20. It is a luxury to muse by a wall-side in the sunshine of a September afternoon, — to cuddle down under a gray stone, and hearken to the siren song of the cricket. Day and night seem henceforth but accidents, and the time is always a still eventide, and as the close of a happy day. Parched fields and mulleins gilded with the slanting rays are my diet. I know of no word so fit to express this disposition of Nature as *Alma Natura*.

Sept. 23. If we will be quiet and ready enough, we shall find compensation in every disappointment. If a shower drives us for shelter to the maple grove or the trailing branches of the pine, yet in their recesses with microscopic eye we discover some new wonder in the bark, or the leaves, or the fungi at our feet. We are interested by some

new resource of insect economy, or the chickadee is more than usually familiar. We can study Nature's nooks and corners then.

Oct. 16. — MY BOOTS

Anon with gaping fearlessness they quaff The dewy nectar with a natural thirst,  
Or wet their leathern lungs where cranberries lurk, With sweeter wine than Chian,  
Lesbian, or Falernian far.

Theirs was the inward lustre that bespeaks An open sole — unknowing to exclude  
The cheerful day — a worthier glory far Than that which gilds the outmost rind with  
darkness visible —

Virtues that fast abide through lapse of years, Rather rubbed in than off.

HOMER

Oct. 21. Hector hurrying from rank to rank is likened to the moon wading in majesty  
from cloud to cloud. We are reminded of the hour of the day by the fact that the  
woodcutter spreads now his morning meal in the recesses of the mountains, having  
already laid his axe at the root of many lofty trees.

Oct. 23. Nestor's simple repast after the rescue of Machaon is a fit subject for poetry.  
The woodcutter may sit down to his cold victuals, the hero to soldier's fare, and the  
wild Arab to his dried dates and figs, without offense; but not so a modern gentleman  
to his dinner.

Oct. 24. It matters not whether these strains originate there in the grass or float  
thitherward like atoms of light from the minstrel days of Greece.

"The snowflakes fall thick and fast on a winter's day. The winds are lulled, and the  
snow falls incessant, covering the tops of the mountains, and the hills, and the plains  
where the lotus tree grows, and the cultivated fields. And they are falling by the inlets  
and shores of the foaming sea, but are silently dissolved by the waves."

SPECULATION

Dec. 7. We may believe it, but never do we live a quiet, free life, such as Adam's,  
but are enveloped in an invisible network of speculations. Our progress is only from  
one such speculation to another, and only at rare intervals do we perceive that it is  
no progress. Could we for a moment drop this by-play, and simply wonder, without  
reference or inference!

BYRON

Dec. 8. Nothing in nature is sneaking or chapfallen, as somewhat maltreated and  
slighted, but each is satisfied with its being, and so is as lavender and balm. If skunk-  
cabbage is offensive to the nostrils of men, still has it not drooped in consequence, but  
trustfully unfolded its leaf of two hands' breadth. What was it to Lord Byron whether  
England owned or disowned him, whether he smelled sour and was skunk-cabbage to  
the English nostril or violet-like, the pride of the land and ornament of every lady's  
boudoir? Let not the oyster grieve that he has lost the race; he has gained as an oyster.

Dec. 15.

FAIR HAVEN

When winter fringes every bough

With his fantastic wreath,  
And puts the seal of silence now  
Upon the leaves beneath;  
When every stream in its penthouse  
Goes gurgling on its way,  
And in his gallery the mouse  
Nibbleth the meadow hay;  
Methinks the summer still is nigh,  
And lurketh there below,  
As that same meadow mouse doth lie  
Snug underneath the snow.  
And if perchance the chickadee  
Lisp a faint note anon,  
The snow is summer's canopy,  
Which she herself put on.  
Rare blossoms deck the cheerful trees,  
And dazzling fruits depend,  
The north wind sighs a summer breeze,  
The nipping frosts to fend,  
Bringing glad tidings unto me,  
While that I stand all ear,  
Of a serene eternity,  
That need not winter fear.  
Out on the silent pond straightway  
The restless ice doth crack,  
And pond sprites merry gambols play  
Amid the deaf'ning rack.  
Eager I press me to the vale  
As I had heard brave news,  
How nature held high festival,  
Which it were hard to lose.  
I crack me with my neighbor ice,  
And sympathizing quake,  
As each new rent darts in a trice  
Across the gladsome lake.  
One with the cricket in the ground,  
And fuel on the hearth,  
Resounds the rare domestic sound  
Along the forest path.  
Fair Haven is my huge tea-um  
That seethes and sings to me,  
And eke the crackling fagots burn, —

A homebred minstrelsy.

SOME SCRAPS FROM AN ESSAY ON "SOUND AND SILENCE" WRITTEN IN THE LATTER HALF OF THIS MONTH, — DECEMBER, 1838

As the truest society approaches always nearer to solitude, so the most excellent speech finally falls into silence. We go about to find Solitude and Silence, as though they dwelt only in distant glens and the depths of the forest, venturing out from these fastnesses at midnight. Silence was, say we, before ever the world was, as if creation had displaced her, and were not her visible framework and foil. It is only favorite dells that she deigns to frequent, and we dream not that she is then imported into them when we wend thither, as Selden's butcher busied himself with looking after his knife, when he had it in his mouth. For where man is, there is Silence.

Silence is the communing of a conscious soul with itself. If the soul attend for a moment to its own infinity, then and there is silence. She is audible to all men, at all times, in all places, and if we will we may always hearken to her admonitions.

Silence is ever less strange than noise, lurking amid the boughs of the hemlock or pine just in proportion as we find ourselves there. The nuthatch, tapping the upright trunks by our side, is only a partial spokesman for the solemn stillness.

She is always at hand with her wisdom, by roadsides and street corners; lurking in belfries, the cannon's mouth, and the wake of the earthquake; gathering up and fondling their puny din in her ample bosom.

Those divine sounds which are uttered to our inward ear — which are breathed in with the zephyr or reflected from the lake — come to us noiselessly, bathing the temples of the soul, as we stand motionless amid the rocks.

The halloo is the creature of walls and mason work; the whisper is fittest in the depths of the wood, or by the shore of the lake; but silence is best adapted to the acoustics of space.

All sounds are her servants and purveyors, proclaiming not only that their mistress is, but is a rare mistress, and earnestly to be sought after. Behind the most distinct and significant hovers always a more significant silence which floats it. The thunder is only our signal gun, that we may know what communion awaits us. Not its dull sound, but the infinite expansion of our being which ensues, we praise and unanimously name sublime.

All sound is nearly akin to Silence; it is a bubble on her surface which straightway bursts, an emblem of the strength and prolificness of the undercurrent. It is a faint utterance of Silence, and then only agreeable to our auditory nerves when it contrasts itself with the former. In proportion as it does this, and is a heightener and intensifier of the Silence, it is harmony and purest melody.

Every melodious sound is the ally of Silence, — a help and not a hindrance to abstraction.

Certain sounds more than others have found favor with the poets only as foils to silence.

ANACREON'S ODE TO THE CICADA

We pronounce thee happy, cicada,  
 For on the tops of the trees,  
 Sipping a little dew,  
 Like any king thou singest,  
 For thine are they all,  
 Whatever thou seest in the fields,  
 And whatever the woods bear.  
 Thou art the friend of the husbandmen,  
 In no respect injuring any one;  
 And thou art honored among men,  
 Sweet prophet of summer.  
 The Muses love thee,  
 And Phoebus himself loves thee,  
 And has given thee a shrill song;  
 Age does not wrack thee,  
 Thou skillful, earth-born, song-loving,  
 Unsuffering, bloodless one;  
 Almost thou art like the gods.

Silence is the universal refuge, the sequel of all dry discourses and all foolish acts, as balm to our every chagrin, as welcome after satiety as [after] disappointment; that background which the painter may not daub, be he master or bungler, and which, however awkward a figure he may have made in the foreground, remains ever our inviolable asylum.

With what equanimity does the silent consider how his world goes, settles the awards of virtue and justice, is slandered and buffeted never so much and views it all as a phenomenon. He is one with Truth, Goodness, Beauty. No indignity can assail him, no personality disturb him.

The orator puts off his individuality, and is then most eloquent when most silent. He listens while he speaks, and is a hearer along with his audience.

Who has not hearkened to her infinite din? She is Truth's speaking trumpet, which every man carries slung over his shoulder, and when he will may apply to his ear. She is the sole oracle, the true Delphi and Dodona, which kings and courtiers would do well to consult, nor will they be balked by an ambiguous answer. Through her have all revelations been made. Just as far as men have consulted her oracle, they have obtained a clear insight, and their age been marked for an enlightened one. But as often as they have gone gadding abroad to a strange Delphi and her mad priestess, they have been benighted, and their age Dark or Leaden. — These are garrulous and noisy eras, which no longer yield any sound; but the Grecian, or silent and melodious, Era is ever sounding on the ears of men.

A good book is the plectrum with which our silent lyres are struck. In all epics, when, after breathless attention, we come to the significant words "He said," then especially our inmost man is addressed. We not unfrequently refer the interest which belongs

to our own unwritten sequel to the written and comparatively lifeless page. Of all valuable books this same sequel makes an indispensable part. It is the author's aim to say once and emphatically, "He said." This is the most the bookmaker can attain to. If he make his volume a foil whereon the waves of silence may break, it is well. It is not so much the sighing of the blast as that pause, as Gray expresses it, "when the gust is recollecting itself," that thrills us, and is infinitely grander than the importunate howlings of the storm.

At evening Silence sends many emissaries to me, some navigating the subsiding waves which the village murmur has agitated.

It were vain for me to interpret the Silence. She cannot be done into English. For six thousand years have men translated her, with what fidelity belonged to each; still is she little better than a sealed book. A man may run on confidently for a time, thinking he has her under his thumb, and shall one day exhaust her, but he too must at last be silent, and men remark only how brave a beginning he made; for, when he at length dives into her, so vast is the disproportion of the told to the untold that the former will seem but the bubble on the surface where he disappeared.

Nevertheless will we go on, like those Chinese cliff swallows, feathering our nests with the froth, so they may one day be bread of life to such as dwell by the seashore.

#### ANACREONTICS

##### Dec. 23. — RETURN OF SPRING

Behold, how, spring appearing,  
The Graces send forth roses;  
Behold, how the wave of the sea  
Is made smooth by the calm;  
Behold, how the duck dives;  
Behold, how the crane travels;  
And Titan shines constantly bright.  
The shadows of the clouds are moving;  
The works of man shine;  
The earth puts forth fruits;  
The fruit of the olive puts forth.  
The cup of Bacchus is crowned.  
Along the leaves, along the branches,  
The fruit, bending them down, flourishes.

#### CUPID WOUNDED

Love once among roses  
A sleeping bee  
Did not see, but was stung;  
And, being wounded in the finger  
Of his hand, cried for pain.  
Running as well as flying  
To the beautiful Venus,

I am killed, mother, said he,  
I am killed, and I die.  
A little serpent has stung me,  
Winged, which they call  
A bee, — the husbandmen.  
And she said, If the sting  
Of a bee afflicts you,  
How, think you, are they afflicted,  
Love, whom you smite?

[Dated only 1838.] Sometimes I hear the veery's silver clarion, or the brazen note of the impatient jay, or in secluded woods the chickadee doles out her scanty notes, which sing the praise of heroes, and set forth the loveliness of virtue evermore. — Phe-be.

## 1839

Jan. 11. THE THAW

I saw the civil sun drying earth's tears,  
Her tears of joy, that only faster flowed.  
Fain would I stretch me by the highway-side,  
To thaw and trickle with the melting snow,  
That, mingled soul and body with the tide,  
I too may through the pores of nature flow.  
But I, alas, nor trickle can nor fume,  
One jot to forward the great work of Time,  
'T is mine to hearken while these ply the loom,  
So shall my silence with their music chime.

THE DREAM VALLEY

Jan. 20. The prospect of our river valley from Tahatawan Cliff appeared to me again in my dreams.

Last night, as I lay gazing with shut eyes  
Into the golden land of dreams,  
I thought I gazed adown a quiet reach  
Of land and water prospect,  
Whose low beach  
Was peopled with the now subsiding hum  
Of happy industry, whose work is done.  
And as I turned me on my pillow o'er,  
I heard the lapse of waves upon the shore,  
Distinct as it had been at broad noonday,  
And I were wandering at Rockaway.

LOVE

We two that planets erst had been  
Are now a double star,  
And in the heavens may be seen,  
Where that we fixed are.  
Yet, whirled with subtle power along,  
Into new space we enter,  
And evermore with spherul song  
Revolve about one centre.

Feb. 3.

The deeds of king and meanest hedger  
Stand side by side in heaven's ledger.  
'T will soon appear if we but look  
At evening into earth's day-book,  
Which way the great account doth stand  
Between the heavens and the land.

#### THE EVENING WIND

The eastern mail comes lumbering in,  
With outmost waves of Europe's din;  
The western sighs adown the slope,  
Or 'mid the rustling leaves doth grope,  
Laden with news from Califom',  
Whate'er transpired hath since morn,  
How wags the world by brier and brake,  
From hence to Athabasca lake. POETIZING

Feb. 8. When the poetic frenzy seizes us, we run and scratch with our pen, delighting, like the cock, in the dust we make, but do not detect where the jewel lies, which perhaps we have in the meantime cast to a distance, or quite covered up again.

Feb. 9. It takes a man to make a room silent.

#### Feb. 10. THE PEAL OF THE BELLS

When the world grows old by the chimney-side,  
Then forth to the youngling rocks I glide,  
Where over the water, and over the land,  
The bells are booming on either hand.  
Now up they go ding, then down again dong,  
And awhile they swing to the same old song,  
And the metal goes round at a single bound,  
A-lulling the fields with its measured sound,  
Till the tired tongue falls with a lengthened boom  
As solemn and loud as the crack of doom.  
Then changed is their measure to tone upon tone,  
And seldom it is that one sound comes alone,  
For they ring out their peals in a mingled throng,

And the breezes waft the loud ding-dong along.  
When the echo has reached me in this lone vale,  
I am straightway a hero in coat of mail,  
I tug at my belt and I march on my post,  
And feel myself more than a match for a host.  
I am on the alert for some wonderful Thing  
Which somewhere's a-taking place;  
'T is perchance the salute which our planet doth ring  
When it meeteth another in space.

Feb. 25. — THE SHRIKE

Hark! hark! from out the thickest fog  
Warbles with might and main  
The fearless shrike, as all agog  
To find in fog his gain.  
His steady sails he never furls  
At any time o' year,  
And, perched now on Winter's curls,  
He whistles in his ear.

THE POET

March 3. He must be something more than natural, — even supernatural. Nature will not speak through but along with him. His voice will not proceed from her midst, but, breathing on her, will make her the expression of his thought. He then poetizes when he takes a fact out of nature into spirit. He speaks without reference to time or place. His thought is one world, hers another. He is another Nature, — Nature's brother. Kindly offices do they perform for one another. Each publishes the other's truth.

MORNING

April 4. The atmosphere of morning gives a healthy hue to our prospects. Disease is a sluggard that overtakes, never encounters, us. We have the start each day, and may fairly distance him before the dew is off; but if we recline in the bowers of noon, he will come up with us after all. The morning dew breeds no cold. We enjoy a diurnal reprieve in the beginning of each day's creation. In the morning we do not believe in expediency; we will start afresh, and have no patching, no temporary fixtures. The afternoon man has an interest in the past; his eye is divided, and he sees indifferently well either way.

DRIFTING

Drifting in a sultry day on the sluggish waters of the pond, I almost cease to live and begin to be. A boatman stretched on the deck of his craft and dallying with the noon would be as apt an emblem of eternity for me as the serpent with his tail in his mouth. I am never so prone to lose my identity. I am dissolved in the haze.

DISAPPOINTMENT

April 7. Sunday. The tediousness and detail of execution never occur to the genius projecting; it always antedates the completion of its work. It condescends to give time a few hours to do its bidding in.

#### RESOLVE

Most have sufficient contempt for what is mean to resolve that they will abstain from it, and a few virtue enough to abide by their resolution, but not often does one attain to such lofty contempt as to require no resolution to be made.

#### THE TEAMSTER

April 8. There goes a six-horse team, and a man by its side. He has rolled out of his cradle into a Tom-and-Jerry, and goes about his business while Nature goes about hers, without standing agape at his condition. As though sixty years were not enough for these things! What have death, and the cholera, and the immortal destiny of man, to do with the shipping interests? There is an unexplained bravery in this. What with bare astonishment one would think that man had his hands full for so short a term. But this is no drawback on the lace-working and cap-making interests. Some attain to such a degree of sang-froid and nonchalance as to be weavers of toilet cushions and manufacturers of pinheads, without once flinching or the slightest affection of the nerves, for the period of a natural life.

#### FAT PINE FOR SPEARING

April 9. Fat roots of pine lying in rich veins as of gold or silver, even in old pastures where you would least expect it, make you realize that you live in the youth of the world, and you begin to know the wealth of the planet. Human nature is still in its prime, then. Bring axe, pickaxe, and shovel, and tap the earth here where there is most sap. The marrowy store gleams like some vigorous sinew, and you feel a new suppleness in your own limbs. These are the traits that conciliate man's moroseness, and make him civil to his fellows; every such pine root is a pledge of suavity. If he can discover absolute barrenness in any direction there will be some excuse for peevishness.

#### SOCIETY

April 14. There is a terra firma in society as well as in geography, some whose ports you may make by dead reckoning in all weather. All the rest are but floating and fabulous Atlantides which sometimes skirt the western horizon of our intercourse. They impose only on seasick mariners who have put into some Canary Island on the frontiers of society.

#### CIRCUMSTANCES

April 24. Why should we concern ourselves with what has happened to us, and the unaccountable fickleness of events, and not rather [with] how we have happened to the universe, and it has demeaned itself in consequence? Let us record in each case the judgment we have awarded to circumstances.

#### ACQUAINTANCE

Cheap persons will stand upon ceremony, because there is no other ground; but to the great of the earth we need no introduction, nor do they need any to us.

#### THE KINGDOMS OF THE EARTH

April 25. If we see the reality in things, of what moment is the superficial and apparent? Take the earth and all the interests it has known, — what are they beside one deep surmise that pierces and scatters them? The independent beggar disposes of all with one hearty, significant curse by the roadside. ‘Tis true they are not worth a “tinker’s damn.”

#### PICTURE

April 30. Of some illuminated pictures which I saw last evening, one representing the plain of Babylon, with only a heap of brick-dust in the centre, and an uninterrupted horizon bounding the desert, struck me most. I would see painted a boundless expanse of desert, prairie, or sea, without other object than the horizon. The heavens and the earth, — the first and last painting, — where is the artist who shall undertake it?

May 11. The farmer keeps pace with his crops and the revolutions of the seasons, but the merchant with the fluctuations of trade. Observe how differently they walk in the streets.

#### VICE AND VIRTUE

May 16. Virtue is the very heart and lungs of vice: it cannot stand up but it lean on virtue.

Who has not admired the twelve labors? And yet nobody thinks if Hercules had sufficient motive for racking his bones to that degree. Men are not so much virtuous as patrons of virtue, and every one knows that it is easier to deal with the real possessor of a thing than the temporary guardian of it.

#### THE FORM OF STRENGTH

May 17. We say justly that the weak person is flat; for, like all flat substances, he does not stand in the direction of his strength, that is on his edge, but affords a convenient surface to put upon. He slides all the way through life. Most things are strong in one direction, — a straw longitudinally, a board in the direction of its edge, a knee transversely to its grain, — but the brave man is a perfect sphere, which cannot fall on its flat side, and is equally strong every way. The coward is wretchedly spheroidal at best, too much educated or drawn out on one side commonly and depressed on the other; or he may be likened to a hollow sphere, whose disposition of matter is best when the greatest bulk is intended.

#### SELF-CULTURE

May 21. Who knows how incessant a surveillance a strong man may maintain over himself, — how far subject passion and appetite to reason, and lead the life his imagination paints? Well has the poet said, —

“By manly mind Not e’en in sleep is will resigned.”

By a strong effort may he not command even his brute body in unconscious moments?

#### MY ATTIC

June 4. I sit here this fourth of June, looking out on men and nature from this that I call my perspective window, through which all things are seen in their true relations. This is my upper empire, bounded by four walls, viz., three of boards yellow-washed,

facing the north, west, and south, respectively, and the fourth of plaster, likewise yellow-washed, fronting the sunrise, — to say nothing of the purlieus and outlying provinces, unexplored as yet but by rats.

The words of some men are thrown forcibly against you and adhere like burs.

#### RENCOUNTER

June 22. Saturday. I have within the last few days come into contact with a pure, uncompromising spirit, that is somewhere wandering in the atmosphere, but settles not positively anywhere. Some persons carry about them the air and conviction of virtue, though they themselves are unconscious of it, and are even backward to appreciate it in others. Such it is impossible not to love; still is their loveliness, as it were, independent of them, so that you seem not to lose it when they are absent, for when they are near it is like an invisible presence which attends you.

That virtue we appreciate is as much ours as another's. We see so much only as we possess.

#### June 24. — SYMPATHY

Lately, alas, I knew a gentle boy,  
Whose features all were cast in Virtue's mould,  
As one she had designed for Beauty's toy,  
But after manned him for her own stronghold.  
On every side he open was as day,  
That you might see no lack of strength within,  
For walls and ports do only serve always  
For a pretense to febleness and sin.  
Say not that Cæsar was victorious,  
With toil and strife who stormed the House of Fame;  
In other sense this youth was glorious,  
Himself a kingdom wheresoe'er he came.  
No strength went out to get him victory,  
When all was income of its own accord;  
For where he went none other was to see,  
But all were parcel of their noble lord.  
He forayed like the subtle haze of summer,  
That stilly shows fresh landscapes to our eyes,  
And revolutions works without a murmur,  
Or rustling of a leaf beneath the skies.  
So was I taken unawares by this,  
I quite forgot my homage to confess;  
Yet now am forced to know, though hard it is,  
I might have loved him, had I loved him less.  
Each moment, as we nearer drew to each,  
A stern respect withheld us farther yet,  
So that we seemed beyond each other's reach,

And less acquainted than when first we met.  
We two were one while we did sympathize,  
So could we not the simplest bargain drive;  
And what avails it now that we are wise,  
If absence doth this doubleness contrive?  
Eternity may not the chance repeat,  
But I must tread my single way alone,  
In sad remembrance that we once did meet,  
And know that bliss irrevocably gone.  
The spheres henceforth my elegy shall sing,  
For elegy has other subject none;  
Each strain of music in my ears shall ring  
Knell of departure from that other one.  
Make haste and celebrate my tragedy;  
With fitting strain resound, ye woods and fields;  
Sorrow is dearer in such case to me  
Than all the joys other occasion yields.  
Is't then too late the damage to repair?  
Distance, forsooth, from my weak grasp hath reft  
The empty husk, and clutched the useless tare,  
But in my hands the wheat and kernel left.  
If I but love that virtue which he is,  
Though it be scented in the morning air,  
Still shall we be truest acquaintances,  
Nor mortals know a sympathy more rare.

July 4. THE "BOOK OF GEMS"

With cunning plates the polished leaves were decked,  
Each one a window to the poet's world,  
So rich a prospect that you might suspect  
In that small space all paradise unfurled.  
It was a right delightful road to go,  
Marching through pastures of such fair herbage,  
O'er hill and dale it led, and to and fro,  
From bard to bard, making an easy stage;  
Where ever and anon I slaked my thirst  
Like a tired traveller at some poet's well,  
Which from the teeming ground did bubbling burst,  
And tinkling thence adown the page it fell.  
Still through the leaves its music you might hear,  
Till other springs fell faintly on the ear.

ANNURSNACK

July 11. At length we leave the river and take to the road which leads to the hilltop, if by any means we may spy out what manner of earth we inhabit. East, west, north, and south, it is farm and parish, this world of ours. One may see how at convenient, eternal intervals men have settled themselves, without thought for the universe. How little matters it all they have built and delved there in the valley! It is after all but a feature in the landscape. Still the vast impulse of nature breathes over all. The eternal winds sweep across the interval to-day, bringing mist and haze to shut out their works. Still the crow caws from Nawshawtuct to Annursnack, as no feeble tradesman nor smith may do. And in all swamps the hum of mosquitoes drowns this modem hum of industry.

#### EVERY MAN IS A ROMAN FORUM

All things are up and down, east and west, to me. In me is the forum out of which go the Appian and Sacred ways, and a thousand beside, to the ends of the world. If I forget my centralness, and say a bean winds with or against the sun, and not right or left, it will not be true south of the equator.

July 18.

#### THE ASSABET

Up this pleasant stream let's row  
For the livelong summer's day,  
Sprinkling foam where'er we go  
In wreaths as white as driven snow.  
Ply the oars! away! away!  
Now we glide along the shore,  
Chuckling lilies as we go,  
While the yellow-sanded floor  
Doggedly resists the oar,  
Like some turtle dull and slow.  
Now we stem the middle tide,  
Plowing through the deepest soil;  
Ridges pile on either side,  
While we through the furrow glide,  
Reaping bubbles for our toil.  
Dew before and drought behind,  
Onward all doth seem to fly;  
Naught contents the eager mind,  
Only rapids now are kind,  
Forward are the earth and sky.  
Sudden music strikes the ear,  
Leaking out from yonder bank,  
Fit such voyagers to cheer.  
Sure there must be Naiads here,  
Who have kindly played this prank.

There I know the cunning pack  
Where yon self-sufficient rill  
All its telltale hath kept back,  
Through the meadows held its clack,  
And now bubbleth its fill.  
Silent flows the parent stream,  
And if rocks do lie below  
Smothers with her waves the din,  
As it were a youthful sin,  
Just as still and just as slow.  
But this gleeful little rill, — .  
Purling round its storied pebble,  
Tinkles to the selfsame tune  
From December until June,  
Nor doth any drought enfeeble.  
See the sun behind the willows,  
Rising through the golden haze,  
How he gleams along the billows,  
Their white crests the easy pillows  
Of his dew-besprinkled rays.  
Forward press we to the dawning,  
For Aurora leads the way,  
Sultry noon and twilight scorning;  
In each dewdrop of the morning  
Lies the promise of a day.  
Rivers from the sun do flow,  
Springing with the dewy morn;  
Voyageurs 'gainst time do row,  
Idle noon nor sunset know,  
Ever even with the dawn.  
Since that first "Away! away!"  
Many a lengthy league we've rowed,  
Still the sparrow on the spray  
Hastes to usher in the day  
With her simple stanza'd ode.  
July 20.

#### THE BREEZE'S INVITATION

Come let's roam the breezy pastures,  
Where the freest zephyrs blow,  
Batten on the oak tree's rustle,  
And the pleasant insect bustle,  
Dripping with the streamlet's flow.

What if I no wings do wear,  
Thro' this solid-seeming air  
I can skim like any swallow;  
Whoso dareth let her follow,  
And we'll be a jovial pair.  
Like two careless swifts let's sail,  
Zephyrus shall think for me;  
Over hill and over dale,  
Riding on the easy gale,  
We will scan the earth and sea.  
Yonder see that willow tree  
Winnowing the buxom air;  
You a gnat and I a bee.  
With our merry minstrelsy  
We will make a concert there.  
One green leaf shall be our screen,  
Till the sun doth go to bed,  
I the king and you the queen  
Of that peaceful little green,  
Without any subject's aid.  
To our music Time will linger,  
And earth open wide her ear,  
Nor shall any need to tarry  
To immortal verse to marry  
Such sweet music as he'll hear.  
July 24.

Nature doth have her dawn each day,  
But mine are far between;  
Content, I cry, for, sooth to say,  
Mine brightest are, I ween.  
For when my sun doth deign to rise,  
Though it be her noontide,  
Her fairest field in shadow lies,  
Nor can my light abide.  
Sometimes I bask me in her day,  
Conversing with my mate;  
But if we interchange one ray,  
Forthwith her heats abate.  
Through his discourse I climb and see,  
As from some eastern hill,  
A brighter morrow rise to me  
Than lieth in her skill.

As't were two summer days in one,  
Two Sundays come together,  
Our rays united make one sun,  
With fairest summer weather.

July 25. There is no remedy for love but to love more.

Aug. 31. Made seven miles, and moored our boat on the west side of a little rising ground which in the spring forms an island in the river, the sun going down on one hand, and our eminence contributing its shadow to the night on the other. In the twilight so elastic is the air that the sky seems to tinkle [sic] over farmhouse and wood. Scrambling up the bank of our terra incognita we fall on huckleberries, which have slowly ripened here, husbanding the juices which the months have distilled, for our peculiar use this night. If they had been rank poison, the entire simplicity and confidence with which we plucked them would have insured their wholesomeness. The devout attitude of the hour asked a blessing on that repast. It was fit for the setting sun to rest on.

From our tent here on the hillside, through that isosceles door, I see our lonely mast on the shore, it may be as an eternity fixture, to be seen in landscapes henceforth, or as the most temporary standstill of time, the boat just come to anchor, and the mast still rocking to find its balance.

No human life is in night, — the woods, the boat, the shore, — yet is it lifelike. The warm pulse of a young life beats steadily underneath all. This slight wind is where one artery approaches the surface and is skin deep.

While I write here, I hear the foxes trotting about me over the dead leaves, and now gently over the grass, as if not to disturb the dew which is falling. Why should we not cultivate neighborly relations with the foxes? As if to improve upon our seeming advances, comes one to greet us nosewise under our tent-curtain. Nor do we rudely repulse him. Is man powder and the fox flint and steel? Has not the time come when men and foxes shall lie down together?

Hist! there, the musquash by the boat is taking toll of potatoes and melons. Is not this the age of a community of goods? His presumption kindles in me a brotherly feeling. Nevertheless. I get up to reconnoitre, and tread stealthily along the shore to make acquaintance with him. But on the riverside I can see only the stars reflected in the water, and now, by some ripple ruffling the disk of a star, I discover him.

In the silence of the night the sound of a distant alarm bell is borne to these woods. Even now men have fires and extinguish them, and, with distant horizon blazings and barking of dogs, enact the manifold drama of life.

We begin to have an interest in sun, moon, and stars. What time riseth Orion? Which side the pole gropeth the bear? East, West, North, and South, — where are they? What clock shall tell the hours for us? — Billerica, midnight.

Sept. 1. Sunday. Under an oak on the bank of the canal in Chelmsford.

From Ball's Hill to Billerica meeting-house the river is a noble stream of water, flowing between gentle hills and occasional cliffs, and well wooded all the way. It can

hardly be said to flow at all, but rests in the lap of the hills like a quiet lake. The boatmen call it a dead stream. For many long reaches you can see nothing to indicate that men inhabit its banks. Nature seems to hold a sabbath herself to-day, — a still warm sun on river and wood, and not breeze enough to ruffle the water. Cattle stand up to their bellies in the river, and you think Rembrandt should be here.

Camped under some oaks in Tyngsboro, on the east bank of the Merrimack, just below the ferry.

Sept. 2. Camped in Merrimack, on the west bank, by a deep ravine.

Sept. 3. In Bedford, on the west bank, opposite a large rock, above Coos Falls.

Sept. 4. Wednesday. Hooksett, east bank, two or three miles below the village, opposite Mr. Mitchel's.

Sept. 5. Walked to Concord [N. H.], 10 miles.

Sept. 6. By stage to Plymouth, 40 miles, and on foot to Tilton's inn, Thornton. The scenery commences on Sanbornton Square, whence the White Mountains are first visible. In Campton it is decidedly mountainous.

Sept. 7. Walked from Thornton through Peeling and Lincoln to Franconia. In Lincoln visited Stone Flume and Basin, and in Franconia the Notch, and saw the Old Man of the Mountain.

Sept. 8. Walked from Franconia to Thomas J. Crawford's.

Sept. 9. At Crawford's.

Sept. 10. Ascended the mountain and rode to Conway.

Sept. 11. Rode to Concord.

Sept. 12. Rode to Hooksett and rowed to Bedford, N. H., or rather to the northern part of Merrimack, near the ferry, by a large island, near which we camped.

Sept. 13. Rowed and sailed to Concord, about 50 miles.

#### THE WISE REST

Sept. 17. Nature never makes haste; her systems revolve at an even pace. The bud swells imperceptibly, without hurry or confusion, as though the short spring days were an eternity. All her operations seem separately, for the time, the single object for which all things tarry. Why, then, should man hasten as if anything less than eternity were allotted for the least deed? Let him consume never so many æons, so that he go about the meanest task well, though it be but the paring of his nails. If the setting sun seems to hurry him to improve the day while it lasts, the chant of the crickets fails not to reassure him, even-measured as of old, teaching him to take his own time henceforth forever. The wise man is restful, never restless or impatient. He each moment abides there where he is, as some walkers actually rest the whole body at each step, while others never relax the muscles of the leg till the accumulated fatigue obliges them to stop short.

As the wise is not anxious that time wait for him, neither does he wait for it.

Oct. 22. Nature will bear the closest inspection. She invites us to lay our eye level with her smallest leaf, and take an insect view of its plain.

ÆSCHYLUS

Nov. 5. There was one man lived his own healthy Attic life in those days. The words that have come down to us evidence that their speaker was a seer in his day and generation. At this day they owe nothing to their dramatic form, nothing to stage machinery, and the fact that they were spoken under these or those circumstances. All display of art for the gratification of a factitious taste is silently passed by to come at the least particle of absolute and genuine thought they contain. The reader will be disappointed, however, who looks for traits of a rare wisdom or eloquence, and will have to solace himself, for the most part, with the poet's humanity and what it was in him to say. He will discover that, like every genius, he was a solitary liver and worker in his day.

We are accustomed to say that the common sense of this age belonged to the seer of the last, — as if time gave him any vantage ground. But not so: I see not but Genius must ever take an equal start, and all the generations of men are virtually at a standstill for it to come and consider of them. Common sense is not so familiar with any truth but Genius will represent it in a strange light to it. Let the seer bring down his broad eye to the most stale and trivial fact, and he will make you believe it a new planet in the sky.

As to criticism, man has never to make allowance to man; there is naught to excuse, naught to bear in mind.

All the past is here present to be tried; let it approve itself if it can.

#### GROWTH

We are not apt to remember that we grow. It is curious to reflect how the maiden waiteth patiently, confiding as the unripe houstonia of the meadow, for the slow moving years to work their will with her, — perfect and ripen her, — like it to be fanned by the wind, watered by the rain, and receive her education at the hands of nature.

These young buds of manhood in the streets are like buttercups in the meadows, — surrendered to nature as they.

Nov. 7. I was not aware till to-day of a rising and risen generation. Children appear to me as raw as the fresh fungi on a fence rail. By what degrees of consanguinity is this succulent and rank-growing slip of manhood related to me? What is it but another herb, ranging all the kingdoms of nature, drawing in sustenance by a thousand roots and fibres from all soils.

#### LACONICISM

Nov. 8. Prometheus' answer to Io's question, who has bound him to the rock, is a good instance: —

(The will indeed of Zeus, of Vulcan the hand.)

Also: —

(Such naked speech is the standing aside of words to make room for thoughts.)

#### REGRET

Nov. 13. Make the most of your regrets; never smother your sorrow, but tend and cherish it till it come to have a separate and integral interest. To regret deeply is to live afresh. By so doing you will be astonished to find yourself restored once more to all your emoluments.

#### DESPONDENCY

Nov. 14. There is nowhere any apology for despondency. Always there is life which, rightly lived, implies a divine satisfaction. I am soothed by the rain-drops on the door-sill; every globule that pitches thus confidently from the eaves to the ground is my life insurance. Disease and a rain-drop cannot coexist. The east wind is not itself consumptive, but has enjoyed a rare health from of old. If a fork or brand stand erect, good is portended by it. They are the warrant of universal innocence.

#### Nov. 19. — FAREWELL

Light-hearted, thoughtless, shall I take my way,  
When I to thee this being have resigned,  
Well knowing where, upon a future day,  
With us'rer's craft more than myself to find.

#### LINNÆUS

Nov. 22. Linnæus, setting out for Lapland, surveys his "comb" and "spare shirt," "leather breeches," and "gauze cap to keep off gnats," with as much complacency as Buonaparte would a park of artillery to be used in the Russian Campaign. His eye is to take in

fish, flower, and bird, quadruped and biped. The quiet bravery of the man is admirable. These facts have even a novel interest.

Nov. 29. Many brave men have there been, thank  
Fortune, but I shall never grow brave by comparison.  
When I remember myself I shall forget them.

#### BRAVERY

Dec. 2. A rare landscape immediately suggests a suitable inhabitant, whose breath shall be its wind, whose moods its seasons, and to whom it will always be fair. To be chafed and worried, and not as serene as Nature, does not become one whose nature is as steadfast as she. We do all stand in the front ranks of the battle every moment of our lives; where there is a brave man there is the thickest of the fight, there the post of honor. Not he who procures a substitute to go to Florida is exempt from service; he gathers his laurels in another field. Waterloo is not the only battle-ground: as many and fatal guns are pointed at my breast now as are contained in the English arsenals.

[Undated.] — NOON

[Undated.] — NOON

Straightway dissolved,

Like to the morning mists — or rather like the subtler mists of noon —

Stretched I far up the neighboring mountain's sides,

Adown the valleys, through the nether air,

Bathing, with fond expansiveness of soul,

The tiniest blade as the sublimest cloud.  
What time the bittern, solitary bird,  
Hides now her head amid the whispering fern,  
And not a paddock vexes all the shore,  
Nor feather ruffles the incumbent air,  
Save where the wagtail interrupts the noon.

FROM A CHAPTER ON BRAVERY. — Script

Dec. Bravery deals not so much in resolute action, as in healthy and assured rest. Its palmy state is a staying at home, and compelling alliance in all directions.

The brave man never heareth the din of war; he is trustful and unsuspecting, so observant of the least trait of good or beautiful that, if you turn toward him the dark side of anything, he will still see only the bright.

One moment of serene and confident life is more glorious than a whole campaign of daring. We should be ready for all issues, not daring to die but daring to live. To the brave even danger is an ally.

In their unconscious daily life all are braver than they know. Man slumbers and wakes in his twilight with the confidence of noonday; he is not palsied nor struck dumb by the inexplicable riddle of the universe. A mere surveyor's report or clause in a preemption bill contains matter of quite extraneous interest, of a subdued but confident tone, evincing such a steadiness in the writer as would have done wonders at Bunker's Hill or Marathon. Where there is the collected eye, there will not fail the effective hand; .

Science is always brave, for to know is to know good; doubt and danger quail before her eye. What the coward overlooks in his hurry, she calmly scrutinizes, breaking ground like a pioneer for the array of arts in her train. Cowardice is unscientific, for there cannot be a science of ignorance. There may be a science of war for that advances, but a retreat is rarely well conducted; if it is, then is it an orderly advance in the face of circumstances.

If his fortune deserts him, the brave man in pity still abides by her. Samuel Johnson and his friend Savage, compelled by poverty to pass the night in the streets, resolve that they will stand by their country.

The state of complete manhood is virtue, and virtue and bravery are one. This truth has long been in the languages. All the relations of the subject are hinted at in the derivation and analogies of the Latin words *vir* and *virtus*, and the Greek *agathos* and *aristos*. Language in its settled form is the record of men's second thoughts, a more faithful utterance than they can mentally give. What men say is so sifted and obliged to approve itself as answering to a common want, that nothing absolutely frivolous obtains currency in the language. The analogies of words are never whimsical and meaningless, but stand for real likenesses. Only the ethics of mankind, and not of any particular man, give point and vigor to our speech.

The coward was born one day too late, for he has never overtaken the present hour. He is the younger son of creation, who now waiteth till the elder decease. He does not

dwell on the earth as though he had a deed of the land in his pocket, — not as another lump of nature, as imperturbable an occupant as the stones in the field. He has only rented a few acres of time and space, and thinks that every accident portends the expiration of his lease. He is a non-proprietor, a serf, in his moral economy nomadic, having no fixed abode. When danger appears, he goes abroad and clings to straws.

Bravery and Cowardice are kindred correlatives with Knowledge and Ignorance, Light and Darkness, Good and Evil.

If you let a single ray of light through the shutter, it will go on diffusing itself without limit till it enlighten the world, but the shadow that was never so wide at first as rapidly contracts till it comes to naught. The shadow of the moon when it passes nearest the sun is lost in space ere it can reach our earth to eclipse it. Always the system shines with uninterrupted light, for, as the sun is so much larger than any planet, no shadow can travel far into space. We may bask always in the light of the system, always may step back out of the shade. No man's shadow is as large as his body, if the rays make a right angle with the reflecting surface. Let our lives be passed under the equator, with the sun in the meridian.

There is no ill which may not be dissipated like the dark, if you let in a stronger light upon it. Overcome evil with good. Practice no such narrow economy as they whose bravery amounts to no more light than a farthing candle, before which most objects cast a shadow wider than themselves.

It was a conceit of Plutarch, accounting for the preferences given to signs observed on the left hand, that men may have thought "things terrestrial and mortal directly over against heavenly and divine things, and do conjecture that the things which to us are on the left hand, the gods send down from their right hand." If we are not blind, we shall see how a right hand is stretched over all, as well the unlucky as lucky, and that the ordering soul is only right-handed, distributing with one palm all our fates.

Men have made war from a deeper instinct than peace. War is but the compelling of peace.

When the world is declared under martial law, every Esau retakes his birthright, and what there is in him does not fail to appear. He wipes off all old scores and commences a new account. The world is interested to know how any soul will demean itself in so novel a position. But when war too, like commerce and husbandry, gets to be a routine, and men go about it as indented apprentices, the hero degenerates into a marine, and the standing army into a standing jest.

No pains are spared to do honor to the brave soldier. All guilds and corporations are taxed to provide him with fit harness and equipment. His coat must be red as the sunset, or blue as the heavens. Gold or silver, pinchbeck or copper, solid or superficial, mark him for fortune's favorite. The skill of a city enchases and tempers his sword-blade; the Tyrian dye confounds him with emperors and kings. Wherever he goes, music precedes and prepares the way for him. His life is a holiday, and the contagion of his example unhinges the universe. The world puts by work and comes out to stare. He is the one only man. He recognizes no time-honored casts and conventions, no fixtures

but transfixtures, no governments at length settled on a permanent basis. One tap of the drum sets the political and moral harmonies all ajar. His ethics may well bear comparison with the priest's. He may rally, charge, retreat in an orderly manner, but never flee nor flinch.

Each more melodious note I hear  
Brings sad reproach to me,  
That I alone afford the ear,  
Who would the music be.

The brave man is the sole patron of music; he recognizes it for his mother-tongue, — a more mellifluous and articulate language than words, in comparison with which speech is recent and temporary. It is his voice. His language must have the same majestic movement and cadence that philosophy assigns to the heavenly bodies. The steady flux of his thought constitutes time in music. The universe falls in and keeps pace with it, which before proceeded singly and discordant. Hence are poetry and song. When Bravery first grew afraid and went to war, it took music along with it. The soul delighted still to hear the echo of its own voice. Especially the soldier insists on agreement and harmony always. Indeed, it is that friendship there is in war that makes it chivalrous and heroic. It was the dim sentiment of a noble friendship for the purest soul the world has seen, that gave to Europe a crusading era.

The day of tilts and tournaments has gone by, but no herald summons us to the tournament of love. one's virtue is bravery, the other's bravery virtue. Mankind still pay to the soldier the honors due only to the hero. They delight to do him honor. He is adorned with silver and gold and the colors of the rainbow, invested with outward splendor; music is for him especially, and his life is a holiday.

The brave warrior must have harmony if not melody at any sacrifice. Consider what shifts he makes. There are the bagpipe, the gong, the trumpet, the drum, — either the primitive central African or Indian, or the brass European. Ever since Jericho fell down before a blast of rams' horns, the martial and musical have gone hand in hand. If the soldier marches to the sack of a town, he must be preceded by drum and trumpet, which shall as it were identify his cause with the accordant universe. All woods and walls echo back his own spirit, and the hostile territory is then preoccupied for him. He is no longer insulated, but infinitely related and familiar. The roll-call musters for him all the forces of nature.

All sounds, and more than all, silence, do fife and drum for us. The least creaking doth whet all our senses and emit a tremulous light, like the aurora borealis, over things. As polishing expresses the vein in marble and the grain in wood, so music brings out what of heroic lurks anywhere.

To the sensitive soul, the universe has its own fixed measure, which is its measure also, and, as a regular pulse is inseparable from a healthy body, so is its healthiness dependent on the regularity of its rhythm. In all sounds the soul recognizes its own rhythm, and seeks to express its sympathy by a correspondent movement of the limbs.

When the body marches to the measure of the soul, then is true courage and invincible strength.

The coward would reduce this thrilling sphere music to a universal wail, this melodious chant to a nasal cant. He thinks to conciliate all hostile influences by compelling his neighborhood into a partial concord with himself, but his music is no better than a jingle which is akin to a jar, — jars regularly recurring.

He blows a feeble blast of slender melody, because nature can have no more sympathy with such a soul than it has of cheerful melody in itself. Hence hears he no accordant note in the universe, and is a coward, or consciously outcast and deserted man. But the brave man, without drum or trumpet, compels concord everywhere by the universality and tunefulness of his soul.

“Take a metallic plate,” says Coleridge, “and strew sand on it; sound a harmonic chord over the sand, and the grains will whirl about in circles, and other geometrical figures, all, as it were, depending on some point relatively at rest. Sound a discord, and every grain will whisk about without any order at all, in no figures, and with no points of rest.” The brave man is such a point of relative rest, over which the soul sounds ever a harmonic chord.

Music is either a sedative or a tonic to the soul. I read that “Plato thinks the gods never gave men music, the science of melody and harmony, for mere delectation or to tickle the ear; but that the discordant parts of the circulations and beauteous fabric of the soul, and that of it that roves about the body, and many times, for want of tune and air, breaks forth into many extravagances and excesses, might be sweetly recalled and artfully wound up to their former consent and agreement.

By dint of wind and stringed instruments the coward endeavors to put the best face on the matter, — whistles to keep his courage up.

There are some brave traits related by Plutarch; e g.: “Homer acquaints us how Ajax, being to engage in a single combat with Hector, bade the Grecians pray to the gods for him; and while they were at their devotions, he was putting on his armor.”

On another occasion, a storm arises, “which as soon as the pilot sees, he falls to his prayers, and invokes his tutelær dæmons, but neglects not in the meantime to hold to the rudder and let down the main yard.”

“Homer directs his husbandman, before he either plow or sow, to pray to the terrestrial Jove and the venerable Ceres, but with his hand upon the plow-tail.”

(Verily, to be brave is the beginning of victory.)

The Romans “made Fortune surname to Fortitude,” for fortitude is that alchemy that turns all things to good fortune. The man of fortitude, whom the Latins called *jortis*, is no other than that lucky person whom *fors* favors, or *vir summae fortis*. If we will, every bark may “carry Cæsar and Cæsar’s fortune.” The brave man stays at home. For an impenetrable shield, stand inside yourself; he was an arrant coward who first made shields of brass. For armor of proof, *mea virtute me involvo* (I wrap myself in my virtue);

“Tumble me down, and I will sit  
Upon my ruins, smiling yet.”

The bravest deed, which for the most part is left quite out of history, which alone wants the staleness of a deed done and the uncertainty of a deed doing, is the life of a great man. To perform exploits is to be temporarily bold, as becomes a courage that ebbs and flows, the soul quite vanquished by its own deed subsiding into indifference and cowardice; but the exploit of a brave life consists in its momentary completeness.

#### FRIENDSHIP

Fall of 1839. Then first I conceive of a true friendship, when some rare specimen of manhood presents itself. It seems the mission of such to commend virtue to mankind, not by any imperfect preaching of her word, but by their own carriage and conduct. We may then worship moral beauty without the formality of a religion.

They are some fresher wind that blows, some new fragrance that breathes. They make the landscape and the sky for us.

The rules of other intercourse are all inapplicable to this.

We are one virtue, one truth, one beauty. All nature is our satellite, whose light is dull and reflected. She is subaltern to us, — an episode to our poem; but we are primary, and radiate light and heat to the system.

I am only introduced once again to myself.

Conversation, contact, familiarity are the steps to it and instruments of it, but it is most perfect when these are done, and distance and time oppose no barrier.

I need not ask any man to be my friend, more than the sun the earth to be attracted by him. It is not his to give, nor mine to receive. I cannot pardon my enemy; let him pardon himself.

Commonly we degrade Love and Friendship by presenting them under the aspect of a trivial dualism.

What matter a few words more or less with my friend, — with all mankind; — they will still be my friends in spite of themselves. Let them stand aloof if they can! As though the most formidable distance could rob me of any real sympathy or advantage! No, when such interests are at stake, time, and distance, and difference fall into their own places.

But alas! to be actually separated from that parcel of heaven we call our friend, with the suspicion that we shall no more meet in nature, is source enough for all the elegies that ever were written. But the true remedy will be to recover our friend again piecemeal, wherever we can find a feature, as Æetes gathered up the members of his son, which Medea had strewn in her path.

The more complete our sympathy, the more our senses are struck dumb, and we are repressed by a delicate respect, so that to indifferent eyes we are least his friend, because no vulgar symbols pass between us. On after thought, perhaps, we come to fear that we have been the losers by such seeming indifference, but in truth that which withholds us is the bond between us.

My friend will be as much better than myself as my aspiration is above my performance.

This is most serene autumn weather. The chirp of crickets may be heard at noon over all the land. As in summer they are heard only at nightfall, so now by their incessant chirp they usher in the evening of the year. The lively decay of autumn promises as infinite duration and freshness as the green leaves of spring.

## 1840

Jan. 10. — THE FISHER'S SON

THE FISHER'S SON

I know the world where land and water meet,  
By yonder hill abutting on the main;  
One while I hear the waves incessant beat,  
Then, turning round, survey the land again.  
Within a humble cot that looks to sea,  
Daily I breathe this curious warm life;  
Beneath a friendly haven's sheltering lee  
My noiseless day with myst'ry still is rife.  
'Tis here, they say, my simple life began;  
And easy credit to the tale I lend,  
For well I know't is here I am a man.  
But who will simply tell me of the end?  
These eyes, fresh opened, spied the far-off Sea,  
Which like a silent godfather did stand,  
Nor uttered one explaining word to me,  
But introduced straight Godmother Land.  
And yonder still stretches that silent main,  
With many glancing ships besprinkled o'er;  
And earnest still I gaze and gaze again  
Upon the selfsame waves and friendly shore,  
Till like a watery humor on the eye  
It still appears whichever way I turn,  
Its silent waste and mute o'erarching sky  
With close-shut eyes I clearly still discern.  
And yet with lingering doubt I haste each mom  
To see if ocean still my gaze will greet,  
And with each day once more to life am born,  
And tread once more the earth with infant feet.  
My years are like a stroll upon the beach,  
As near the ocean's edge as I can go;

My tardy steps its waves do oft o'erreach,  
Sometimes I stay to let them overflow.  
Infinite work my hands find there to do,  
Gathering the relics which the waves upcast;  
Each storm doth scour the deep for something new,  
And every time the strangest is the last.  
My sole employment't is, and scrupulous care,  
To place my gains beyond the reach of tides,  
Each smoother pebble, and each shell more rare,  
Which ocean kindly to my hand confides.  
I have no fellow-laborer on the shore;  
They scorn the strand who sail upon the sea;  
Sometimes I think the ocean they've sailed o'er  
Is deeper known upon the strand to me.  
The middle sea can show no crimson dulse,  
Its deeper waves cast up no pearls to view,  
Along the shore my hand is on its pulse,  
Whose feeble beat is elsewhere felt by few.  
My neighbors come sometimes with lumb'ring carts.  
As it would seem my pleasant toil to share,  
But straightway take their loads to distant marts,  
For only weeds and ballast are their care.  
'T is by some strange coincidence, if I  
Make common cause with ocean when he storms,  
Who can so well support a separate sky,  
And people it with multitude of forms.  
Oft in the stillness of the night I hear  
Some restless bird presage the coming din,  
And distant murmurs faintly strike my ear  
From some bold bluff projecting far within.  
My stillest depths straightway do inly heave  
More genially than rests the summer's calm;  
The howling winds through my soul's cordage grieve,  
Till every shelf and ledge gives the alarm.  
Far from the shore the swelling billows rise,  
And gathering strength come rolling to the land,  
And, as each wave retires, and murmur dies,  
I straight pursue upon the streaming sand,  
Till the returning surge with gathered strength  
Compels once more the backward way to take,  
And, creeping up the beach a cable's length,  
In many a thirsty hollow leaves a lake.

Oft as some ruling star my tide has swelled  
The sea can scarcely brag more wrecks than I;  
Ere other influence my waves has quelled,  
The stanchest bark that floats is high and dry.

Jan. 19.

By a strong liking we prevail  
Against the stoutest fort;  
At length the fiercest heart will quail,  
And our alliance court.

#### FRIENDS

Jan. 26. They are like air bubbles on water, hastening to flow together.

History tells of Orestes and Pylades, Damon and Pythias, but why should not we put to shame those old reserved worthies by a community of such?

Constantly, as it were through a remote skylight, I have glimpses of a serene friendship-land, and know the better why brooks murmur and violets grow.

This conjunction of souls, like waves which meet and break, subsides also backward over things, and gives all a fresh aspect. I would live henceforth with some gentle soul such a life as may be conceived, double for variety, single for harmony, — two, only that we might admire at our oneness, — one, because indivisible. Such community to be a pledge of holy living. How could aught unworthy be admitted into our society? To listen with one ear to each summer sound, to behold with one eye each summer scene, our visual rays so to meet and mingle with the object as to be one bent and doubled; with two tongues to be wearied, and thought to spring ceaselessly from a double fountain.

#### POETRY

Jan. No definition of poetry is adequate unless it be poetry itself. The most accurate analysis by the rarest wisdom is yet insufficient, and the poet will instantly prove it false by setting aside its requisitions. It is indeed all that we do not know.

The poet does not need to see how meadows are something else than earth, grass, and water, but how they are thus much. He does not need discover that potato blows are as beautiful as violets, as the farmer thinks, but only how good potato blows are.

The poem is drawn out from under the feet of the poet, his whole weight has rested on this ground.

It has a logic more severe than the logician's.

You might as well think to go in pursuit of the rainbow, and embrace it on the next hill, as to embrace the whole of poetry even in thought. The best book is only an advertisement of it, such as is sometimes sewed in with its cover.

Its eccentric and unexplored orbit embraces the system.

Jan. 27. What a tame life we are living! How little heroic it is! Let us devise never so perfect a system of living, and straightway the soul leaves it to shuffle along its own way alone. It is easy enough to establish a durable and harmonious routine; immediately all parts of nature consent to it. The sun-dial still points to the noon mark, and the

sun rises and sets for it. The neighbors are never fatally obstinate when such a scheme is to be instituted; but forthwith all lend a hand, and ring the bell, and bring fuel and lights, and put by work and don their best garments, with an earnest conformity which matches the operations of nature. There is always a present and extant life which all combine to uphold, though its insufficiency is manifest enough. Still the sing-song goes on.

Jan. 29. A friend in history looks like some premature soul. The nearest approach to a community of love in these days is like the distant breaking of waves on the seashore. An ocean there must be, for it washes our beach.

This alone do all men sail for, trade for, plow for, preach for, fight for.

#### ÆSCHYLUS

The Greeks, as the Southern generally, expressed themselves with more facility than we in distinct and lively images, and as to the grace and completeness with which they treated the subjects suited to their genius they must be allowed to retain their ancient supremacy. But a rugged and uncouth array of thought, though never so modern, may rout them at any moment. It remains for other than Greeks to write the literature of the next century.

Æschylus had a clear eye for the commonest things. His genius was only an enlarged common sense. He adverts with chaste severity to all natural facts. His sublimity is Greek sincerity and simpleness, naked wonder which mythology had not helped to explain.

Tydeus' shield had for device

“An artificial heaven blazing with stars;

A bright full moon in the midst of the shield,

Eldest of stars, eye of night, is prominent.”

The Greeks were stem but simple children in their literature. We have gained nothing by the few ages which we have the start of them. This universal wondering at those old men is as if a matured grown person should discover that the aspirations of his youth argued a diviner life than the contented wisdom of his manhood.

He is competent to express any of the common manly feelings. If his hero is to make a boast, it does not lack fullness, it is as boastful as could be desired; he has a flexible mouth, and can fill it readily with strong, round words, so that you will say the man's speech wants nothing, he has left nothing unsaid, but he has actually wiped his lips of it.

Whatever the common eye sees at all and expresses as best it may, he sees uncommonly and describes with rare completeness. The multitude that thronged the theatre could no doubt go along with him to the end. The Greeks had no transcendent geniuses like Milton and Shakespeare, whose merit only posterity could fully appreciate.

The social condition of genius is the same in all ages. Æschylus was undoubtedly alone and without sympathy in his simple reverence for the mystery of the universe.

Feb. 10. CRITICISM ON AULUS PERSIUS FLACCUS

Feb. 11. "Truth," says Lord Bacon, "may perhaps come to the price of a pearl, that sheweth best by day; but it will not rise to the price of a diamond or carbuncle, which sheweth best in varied lights." Like the pearl, truth shines with a steady but pale light which invites to introspection; it is intrinsically bright, not accidentally as the diamond. We seem to behold its rear always, as though it were not coming toward us but retiring from us. Its light is not reflected this way, but we see the sombre and wrong side of its rays. As the dust in his beams makes known that the sun shines.

Falsehoods that glare and dazzle are sloped toward us, reflecting full in our faces even the light of the sun. Wait till sunset, or go round them, and the falsity will be apparent.

It is never enough that our life is an easy one. We must live on the stretch; not be satisfied with a tame and undisturbed round of weeks and days, but retire to our rest like soldiers on the eve of a battle, looking forward with ardor to the strenuous sortie of the morrow. "Sit not down in the popular seats and common level of virtues, but endeavor to make them heroical. Offer not only peace offerings but holocausts unto God." To the brave soldier the rust and leisure of peace are harder than the fatigues of war. As our bodies court physical encounters, and languish in the mild and even climate of the tropics, so our souls thrive best on unrest and discontent.

He enjoys true leisure who has time to improve his soul's estate.

Feb. 12. Opposition is often so strong a likeness as to remind us of the difference.

Truth has properly no opponent, for nothing gets so far up on the other side as to be opposite. She looks broadcast over the field and sees no opponent.

The ring-leader of the mob will soonest be admitted into the councils of state.

Knavery is more foolish than folly, for that, half knowing its own foolishness, it still persists. The knave has reduced folly to a system, is the prudent, common-sense fool. The witling has the simplicity and directness of genius, is the inspired fool. His incomprehensible ravings become the creed of the dishonest of a succeeding era.

Feb. 13. An act of integrity is to an act of duty what the French verb *être* is to *devoir*. Duty is *ce que devrait être*.

Duty belongs to the understanding, but genius is not dutiful, the highest talent is dutiful. Goodness results from the wisest use of talent.

The perfect man has both genius and talent. The one is his head, the other his foot; by one he is, by the other he lives.

The unconsciousness of man is the consciousness of God, the end of the world.

The very thrills of genius are disorganizing. The body is never quite acclimated to its atmosphere, but how often succumbs and goes into a decline!

Feb. 14. Beauty lives by rhymes. Double a deformity is a beauty. Draw this blunt quill over the paper, and fold it once transversely to the line, pressing it suddenly before the ink dries, and a delicately shaded and regular figure is the result, which art cannot surpass.

A very meagre natural history suffices to make me a child. Only their names and genealogy make me love fishes. I would know even the number of their finrays, and

how many scales compose the lateral line. I fancy I am amphibious and swim in all the brooks and pools in the neighborhood, with the perch and bream, or doze under the pads of our river amid the winding aisles and corridors formed by their stems, with the stately pickerel. I am the wiser in respect to all knowledges, and the better qualified for all fortunes, for knowing that there is a minnow in the brook. Methinks I have need even of his sympathy, and to be his fellow in a degree. I do like him sometimes when he balances himself for an hour over the yellow floor of his basin.

Feb. 15. The good seem to inhale a more generous atmosphere and be bathed in a more precious light than other men. Accordingly Virgil describes the *sedes beatas* thus: —

“Largior hie campos aether et lumine vestit Purpureo: Solemque suum, sua sidera nôrunt.”

Feb. 16. Divination is prospective memory.

There is a kindred principle at the bottom of all affinities. The magnet cultivates a steady friendship with the pole, all bodies with all others. The friendliness of nature is that goddess Ceres who presides over every sowing and harvest, and we bless the same in sun and rain. The seed in the ground tarries for a season with its genial friends there; all the earths and grasses and minerals are its hosts, who entertain it hospitably, and plenteous crops and teeming wagons are the result.

Feb. 18. All romance is grounded on friendship. What is this rural, this pastoral, this poetical life but its invention? Does not the moon shine for Endymion? Smooth pastures and mild airs are for some Corydon and Phyllis. Paradise belongs to Adam and Eve. Plato's republic is governed by Platonic love.

Feb. 20. The coward's hope is suspicion, the hero's doubt a sort of hope. The gods neither hope nor doubt.

Feb. 22. The river is unusually high, owing to the melting of the snow. Men go in boats over their gardens and potato-fields, and all the children of the village are on tiptoe to see whose fence will be carried away next. Great numbers of muskrats, which have been driven out of their holes by the water, are killed by the sportsmen.

They are to us instead of the beaver. The wind from over the meadows is laden with a strong scent of musk, and by its racy freshness advertises us of an unexplored wildness. Those backwoods are not far off. I am affected by the sight of their cabins of mud and grass, raised four or five feet, along the river, as when I read of the Pyramids, or the barrows of Asia.

People step brisker in the street for this unusual movement of the waters. You seem to hear the roar of a waterfall and the din of factories where the river breaks over the road.

Who would have thought that a few feet might not have been spared from the trunks of most trees? Such as grow in the meadows, and are now surrounded by that depth of water, have a dwarfish appearance. No matter whether they are longer or shorter, they are now equally out of proportion.

Feb. 24.

## THE FRESHET

A stir is on the Worcester hills,  
And Nobscot too the valley fills;  
Where scarce you'd fill an acorn cup  
In summer when the sun was up,  
No more you'll find a cup at all,  
But in its place a waterfall.  
O that the moon were in conjunction  
To the dry land's extremest unction,  
Till every dike and pier were flooded,  
And all the land with islands studded,  
For once to teach all human kind,  
Both those that plow and those that grind,  
There is no fixture in the land,  
But all unstable is as sand.  
The river swelleth more and more,  
Like some sweet influence stealing o'er  
The passive town; and for a while  
Each tussock makes a tiny isle,  
Where, on some friendly Ararat,  
Resteth the weary water-rat.  
No ripple shows Musketaquid,  
Her very current e'en is hid,  
As deepest souls do calmest rest  
When thoughts are swelling in the breast;  
And she, that in the summer's drought  
Doth make a rippling and a rout,  
Sleeps from Nawshawtuct to the Cliff,  
Unruffled by a single skiff;  
So like a deep and placid mind  
Whose currents underneath it wind,  
For by a thousand distant hills  
The louder roar a thousand rills,  
And many a spring which now is dumb,  
And many a stream with smothered hum,  
Doth faster well and swifter glide,  
Though buried deep beneath the tide.  
Our village shows a rural Venice,  
Its broad lagunes where yonder fen is,  
Far lovelier than the Bay of Naples  
Yon placid cove amid the maples,  
And in my neighbor's field of corn

I recognize the Golden Horn.  
Here Nature taught from year to year,  
When only red men came to hear,  
Methinks't was in this school of art  
Venice and Naples learned their part,  
But still their mistress, to my mind,  
Her young disciples leaves behind.

Feb. 26. The most important events make no stir on their first taking place, nor indeed in their effects directly. They seem hedged about by secrecy. It is concussion, or the rushing together of air to fill a vacuum, which makes a noise. The great events to which all things consent, and for which they have prepared the way, produce no explosion, for they are gradual, and create no vacuum which requires to be suddenly filled; as a birth takes place in silence, and is whispered about the neighborhood, but an assassination, which is at war with the constitution of things, creates a tumult immediately.

Com grows in the night.

Feb. 27. Some geniuses seem to hover in the horizon, like heat lightning, which is not accompanied with fertilizing rain to us, but we are obliged to rest contented with the belief that it is purifying the air somewhere. Others make known their presence by their effects, like that vivid lightning which is accompanied by copious rain and thunder and, though it clears our atmosphere, sometimes destroys our lives. Others still impart a steady and harmless light at once to large tracts, as the aurora borealis; and this phenomenon is hardest to be accounted for, some thinking it to be a reflection of the polar splendor, others a subtle fluid which pervades all things and tends always to the zenith. All are agreed that these are equally electrical phenomena, as some clever persons have shown by drawing a spark with their knuckles. Modern philosophy thinks it has drawn down lightning from the clouds.

Feb. 28. On the death of a friend, we should consider that the fates through confidence have devolved on us the task of a double living, that we have henceforth to fulfill the promise of our friend's life also, in our own, to the world.

Feb. 29. A friend advises by his whole behavior, and never condescends to particulars; another chides away a fault, he loves it away. While he sees the other's error, he is silently conscious of it, and only the more loves truth himself, and assists his friend in loving it, till the fault is expelled and gently extinguished.

March 2. Love is the burden of all Nature's odes. The song of the birds is an epithalamium, a hymeneal. The marriage of the flowers spots the meadows and fringes the hedges with pearls and diamonds. In the deep water, in the high air, in woods and pastures, and the bowels of the earth, this is the employment and condition of all things.

March 4. I learned to-day that my ornithology had done me no service. The birds I heard, which fortunately did not come within the scope of my science, sung as freshly

as if it had been the first morning of creation, and had for background to their song an untrodden wilderness, stretching through many a Carolina and Mexico of the soul.

March 6. There is no delay in answering great questions; for them all things have an answer ready. The Pythian priestess gave her answers instantly, and oft-times before the questions were fairly propounded. Great topics do not wait for past or future to be determined, but the state of the crops or Brighton market no bird concerns itself about.

March 8. The wind shifts from northeast and east to northwest and south, and every icicle which has tinkled on the meadow grass so long trickles down its stem and seeks its water level unerringly with a million comrades. In the ponds the ice cracks with a busy and inspiriting din and down the larger streams is whirled, grating hoarsely and crashing its way along, which was so lately a firm field for the woodman's team and the fox, sometimes with the tracks of the skaters still fresh upon it, and the holes cut for pickerel. Town committees inspect the bridges and causeways, as if by mere eye-force to intercede with the ice and save the treasury.

In the brooks the slight grating sound of small cakes of ice, floating with various speed, is full of content and promise, and where the water gurgles under a natural bridge, you may hear these hasty rafts hold conversation in an undertone. Every rill is a channel for the juices of the meadow. Last year's grasses and flower-stalks have been steeped in rain and snow, and now the brooks flow with meadow tea, — thoroughwort, mint, flagroot, and pennyroyal, all at one draught.

In the ponds the sun makes incroachments around the edges first, as ice melts in a kettle on the fire, darting his rays through this crevice, and preparing the deep water to act simultaneously on the under side.

Two years and twenty now have flown;  
Their meanness time away has flung;  
These limbs to man's estate have grown,  
But cannot claim a manly tongue.  
Amidst such boundless wealth without  
I only still am poor within;  
The birds have sung their summer out,  
But still my spring does not begin.  
In vain I see the morning rise,  
In vain observe the western blaze,  
Who idly look to other skies,  
Expecting life by other ways.  
The sparrow sings at earliest dawn,  
Building her nest without delay;  
All things are ripe to hear her song,  
And now arrives the perfect day.  
Shall I then wait the autumn wind,  
Compelled to seek a milder ray,

And leave no empty nest behind,  
No wood still echoing to my lay?

March 16. The cabins of the settlers are the points whence radiate these rays of green and yellow and russet over the landscape; out of these go the axes and spades with which the landscape is painted. How much is the Indian summer and the budding of spring related to the cottage? Have not the flight of the crow and the gyrations of the hawk a reference to that roof?

The ducks alight at this season on the windward side of the river, in the smooth water, and swim about by twos and threes, pluming themselves and diving to peck at the root of the lily and the cranberries which the frost has not loosened. It is impossible to approach them within gunshot when they are accompanied by the gull, which rises sooner and makes them restless. They fly to windward first, in order to get under weigh, and are more easily reached by the shot if approached on that side. When preparing to fly, they swim about with their heads erect, and then, gliding along a few feet with their bodies just touching the surface, rise heavily with much splashing and fly low at first, if not suddenly aroused, but otherwise rise directly to survey the danger. The cunning sportsman is not in haste to desert his position, but waits to ascertain if, having got themselves into flying trim, they will not return over the ground in their course to a new resting-place.

March 20. In society all the inspiration of my lonely hours seems to flow back on me, and then first have expression.

Love never degrades its votaries, but lifts them up to higher walks of being. They over-look one another. All other charities are swallowed up in this; it is gift and reward both.

We will have no vulgar Cupid for a go-between, to make us the playthings of each other, but rather cultivate an irreconcilable hatred instead of this.

March 21. The world is a fit theatre to-day in which any part may be acted. There is this moment proposed to me every kind of life that men lead anywhere, or that imagination can paint. By another spring I may be a mail-carrier in Peru, or a South African planter, or a Siberian exile, or a Greenland whaler, or a settler on the Columbia River, or a Canton merchant, or a soldier in Florida, or a mackerel-fisher off Cape Sable, or a Robinson Crusoe in the Pacific, or a silent navigator of any sea. So wide is the choice of parts, what a pity if the part of Hamlet be left out!

I am freer than any planet; no complaint reaches round the world. I can move away from public opinion, from government, from religion, from education, from society. Shall I be reckoned a ratable poll in the county of Middlesex, or be rated at one spear under the palm trees of Guinea? Shall I raise corn and potatoes in Massachusetts, or figs and olives in Asia Minor? sit out the day in my office in State Street, or ride it out on the steppes of Tartary? For my Brobdingnag I may sail to Patagonia; for my Lilliput, to Lapland. In Arabia and Persia, my day's adventures may surpass the Arabian Nights' Entertainments. I may be a logger on the head waters of the Penobscot, to be recorded in fable hereafter as an amphibious river-god, by as sounding a name

as Triton or Proteus; carry furs from Nootka to China, and so be more renowned than Jason and his golden fleece; or go on a South Sea exploring expedition, to be hereafter recounted along with the periplus of Hanno. I may repeat the adventures of Marco Polo or Mandeville.

These are but few of my chances, and how many more things may I do with which there are none to be compared!

Thank Fortune, we are not rooted to the soil, and here is not all the world. The buckeye does not grow in New England; the mockingbird is rarely heard here. Why not keep pace with the day, and not allow of a sunset nor fall behind the summer and the migration of birds? Shall we not compete with the buffalo, who keeps pace with the seasons, cropping the pastures of the Colorado till a greener and sweeter grass awaits him by the Yellowstone? The wild goose is more a cosmopolite than we; he breaks his fast in Canada, takes a luncheon in the Susquehanna, and plumes himself for the night in a Louisiana bayou. The pigeon carries an acorn in his crop from the King of Holland's to Mason and Dixon's line. Yet we think if rail fences are pulled down and stone walls set up on our farms, bounds are henceforth set to our lives and our fates decided. If you are chosen town clerk, forsooth, you can't go to Tierra del Fuego this summer.

But what of all this? A man may gather his limbs snugly within the shell of a mammoth squash, with his back to the northeastern boundary, and not be unusually straitened after all. Our limbs, indeed, have room enough, but it is our souls that rust in a corner. Let us migrate interiorly without intermission, and pitch our tent each day nearer the western horizon. The really fertile soils and luxuriant prairies lie on this side the Alleghanies. There has been no Hanno of the affections. Their domain is untravelled ground, to the Mogul's dominions.

March 22. While I bask in the sun on the shores of Walden Pond, by this heat and this rustle I am absolved from all obligation to the past. The council of nations may reconsider their votes; the grating of a pebble annuls them.

March 27. How many are now standing on the European coast whom another spring will find located on the Red River, or Wisconsin! To-day we live an antediluvian life on our quiet homesteads, and to-morrow are transported to the turmoil and bustle of a crusading era.

Think how finite after all the known world is. Money coined at Philadelphia is a legal tender over how much of it! You may carry ship biscuit, beef, and pork quite round to the place you set out from. England sends her felons to the other side for safe keeping and convenience.

March 30. Pray, what things interest me at present? A long, soaking rain, the drops trickling down the stubble, while I lay drenched on a last year's bed of wild oats, by the side of some bare hill, ruminating. These things are of moment. To watch this crystal globe just sent from heaven to associate with me. While these clouds and this sombre drizzling weather shut all in, we two draw nearer and know one another. The gathering in of the clouds with the last rush and dying breath of the wind, and then the regular

dripping of twigs and leaves the country o'er, the impression of inward comfort and sociableness, the drenched stubble and trees that drop beads on you as you pass, their dim outline seen through the rain on all sides drooping in sympathy with yourself. These are my undisputed territory. This is Nature's English comfort. The birds draw closer and are more familiar under the thick foliage, composing new strains on their roosts against the sunshine.

April 4. We look to windward for fair weather.

April 8. How shall I help myself? By withdrawing into the garret, and associating with spiders and mice, determining to meet myself face to face sooner or later. Completely silent and attentive I will be this hour, and the next, and forever. The most positive life that history notices has been a constant retiring out of life, a wiping one's hands of it, seeing how mean it is, and having nothing to do with it.

April 9. I read in Cudworth how "Origen determines that the stars do not make but signify; and that the heavens are a kind of divine volume, in whose characters they that are skilled may read or spell out human events." Nothing can be truer, and yet astrology is possible. Men seem to be just on the point of discerning a truth when the imposition is greatest.

April 17. Farewell, etiquette! My neighbor inhabits a hollow sycamore, and I a beech tree. What then becomes of morning calls with cards, and deference paid to door-knockers and front entries, and presiding at one's own table?

April 19. The infinite bustle of Nature of a summer's noon, or her infinite silence of a summer's night, gives utterance to no dogma. They do not say to us even with a seer's assurance, that this or that law is immutable and so ever and only can the universe exist. But they are the indifferent occasion for all things and the annulment of all laws.

April 20. The universe will not wait to be explained. Whoever seriously attempts a theory of it is already behind his age. His yea has reserved no nay for the morrow.

The wisest solution is no better than dissolution. Already the seer whispers his convictions to bare walls; no audience in the land can attend to them.

An early morning walk is a blessing for the whole day. To my neighbors who have risen in mist and rain I tell of a clear sunrise and the singing of birds as some traditional mythus. I look back to those fresh but now remote hours as to the old dawn of time, when a solid and blooming health reigned and every deed was simple and heroic.

April 22. Thales was the first of the Greeks who taught that souls are immortal, and it takes equal wisdom to discern this old fact to-day. What the first philosopher taught, the last will have to repeat. The world makes no progress.

I cannot turn on my heel in a carpeted room. What a gap in the morning is a breakfast! A supper supersedes the sunset.

Methinks I hear the ranz des vaches and shall soon be tempted to desert.

Will not one thick garment suffice for three thin ones? Then I shall be less compound, and can lay my hand on myself in the dark.

May 14. A kind act or gift lays us under obligation not so much to the giver as to Truth and Love. We must then be truer and kinder ourselves. Just in proportion to our sense of the kindness, and pleasure at it, is the debt paid. What is it to be grateful but to be gratified, — to be pleased? The nobly poor will dissolve all obligations by nobly accepting a kindness.

If we are not sensible of kindness, then indeed we incur a debt. Not to be pleased by generous deeds at any time, though done to another, but to sit crabbedly silent in a comer, what is it but a voluntary imprisonment for debt? It is to see the world through a grating. Not to let the light of virtuous actions shine on us at all times, through every crevice, is to live in a dungeon.

War is the sympathy of concussion. We would fain rub one against another. Its rub may be friction merely, but it would rather be titillation. We discover in the quietest scenes how faithfully war has copied the moods of peace. Men do not peep into heaven but they see embattled hosts there. Milton's heaven was a camp. When the sun bursts through the morning fog I seem to hear the din of war louder than when his chariot thundered on the plains of Troy. Every man is a warrior when he aspires. He marches on his post. The soldier is the practical idealist; he has no sympathy with matter, he revels in the annihilation of it. So do we all at times. When a freshet destroys the works of man, or a fire consumes them, or a Lisbon earthquake shakes them down, our sympathy with persons is swallowed up in a wider sympathy with the universe. A crash is apt to grate agreeably on our ears.

Let not the faithful sorrow that he has no ear for the more fickle harmonies of creation, if he is awake to the slower measure of virtue and truth. If his pulse does not beat in unison with the musician's quips and turns, it accords with the pulse-beat of the ages.

June 11. We had appointed Saturday, August 31st, 1839, for the commencement of our White Mountain expedition. We awake to a warm, drizzling rain which threatens delay to our plans, but at length the leaves and grass are dried, and it comes out a mild afternoon, of such a sober serenity and freshness that Nature herself seems maturing some greater scheme of her own. All things wear the aspect of a fertile idleness. It is the eventide of the soul. After this long dripping and oozing from every pore Nature begins to respire again more healthily than ever. So with a vigorous shove we launch our boat from the bank, while the flags and bulrushes curtsy a God-speed, and drop silently down the stream. As if we had launched our bark in the sluggish current of our thoughts, and were bound nowhither.

Gradually the village murmur subsides, as when one falls into a placid dream and on its Lethe tide is floated from the past into the future, or as silently as fresh thoughts awaken us to new morning or evening light.

Our boat was built like a fisherman's dory, with thole-pins for four oars. Below it was green with a border of blue, as if out of courtesy [to] the green sea and the blue heavens. It was well calculated for service, but of consequence difficult to be dragged over shoal places or carried round falls.

A boat should have a sort of life and independence of its own. It is a sort of amphibious animal, a creature of two elements, a fish to swim and a bird to fly, related by one half of its structure to some swift and shapely fish and by the other to some strong-winged and graceful bird. The fins of the fish will tell where to set the oars, and the tail give some hint for the form and position of the rudder. And so may we learn where there should be the greatest breadth of beam and depth in the hold. The bird will show how to rig and trim the sails, and what form to give to the prow, that it may balance the boat and divide the air and water best.

The boat took to the water; from of old there had been a tacit league struck between these two, and now it gladly availed itself of the old law that the heavier shall float the lighter.

Two masts we had provided, one to serve for a tent-pole at night, and likewise other slender poles, that we might exchange the tedium of rowing for poling in shallow reaches. At night we lay on a buffalo-skin under a tent of drilled cotton eight feet high and as many in diameter, which effectually defended from dampness, so short a step is it from tiled roofs to drilled cotton, from carpeted floors to a buffalo-skin.

There were a few berries left still on the hills, hanging with brave content by the slenderest threads.

As the night stole over, such a freshness stole across the meadow that every blade of cut-grass seemed to teem with life.

We stole noiselessly down the stream, occasionally driving a pickerel from the covert of the pads, or a bream from her nest, and the small green bittern would now and then sail away on sluggish wings from some recess of the shore. With its patient study by rocks and sandy capes, has it wrested the whole of her secret from Nature yet? It has looked out from its dull eye for so long, standing on one leg, on moon and stars sparkling through silence and dark, and now what a rich experience is its! What says it of stagnant pools, and reeds, and damp night fogs? It would be worth while to look in the eye which has been open and seeing at such hours and in such solitudes. When I beheld that dull yellowish green, I wonder if my own soul is not a bright, invisible green. I would fain lay my eye side by side with its and learn of it.

End of my Journal of 546 pages.

June 14.

“The right Reason is in part divine, in part human; the second can be expressed, but no language can translate the first.” — EMPEDOCLES.

“In glory and in joy,

Behind his plough, upon the mountain-side!”

I seemed to see the woods wave on a hundred mountains, as I read these lines, and the distant rustling of their leaves reached my ear.

June 15. I stood by the river to-day considering the forms of the elms reflected in the water. For every oak and birch, too, growing on the hilltop, as well as for elms and

willows, there is a graceful ethereal tree making down from the roots, as it were the original idea of the tree, and sometimes Nature in high tides brings her mirror to its foot and makes it visible. Anxious Nature sometimes reflects from pools and puddles the objects which our grovelling senses may fail to see relieved against the sky with the pure ether for background.

It would be well if we saw ourselves as in perspective always, impressed with distinct outline on the sky, side by side with the shrubs on the river's brim. So let our life stand to heaven as some fair, sunlit tree against the western horizon, and by sunrise be planted on some eastern hill to glisten in the first rays of the dawn.

Why always insist that men incline to the moral side of their being? Our life is not all moral. Surely, its actual phenomena deserve to be studied impartially. The science of Human Nature has never been attempted, as the science of Nature has. The dry light has never shone on it. Neither physics nor metaphysics have touched it.

We have not yet met with a sonnet, genial and affectionate, to prophane swearing, breaking on the still night air, perhaps, like the hoarse croak of some bird. Noxious weeds and stagnant waters have their lovers, and the utterer of oaths must have honed lips, and be another Attic bee after a fashion, for only prevalent and essential harmony and beauty can employ the laws of sound and of light.

June 16. The river down which we glided for that long afternoon was like a clear drop of dew with the heavens and the landscape reflected in it. And as evening drew on, faint purple clouds began to be reflected in its water, and the cow-bells tinkled louder and more incessantly on the banks, and like shy water-rats we stole along near the shore, looking out for a place to pitch our camp.

It seems insensibly to grow lighter as night shuts in; the furthest hamlet begins to be revealed, which before lurked in the shade of the noon. It twinkles now through the trees like some fair evening star darting its ray across valley and wood.

Would it not be a luxury to stand up to one's chin in some retired swamp for a whole summer's day, scenting the sweet-fern and bilberry blows, and lulled by the minstrelsy of gnats and mosquitoes? A day passed in the society of those Greek sages, such as described in the "Banquet" of Xenophon, would not be comparable with the dry wit of decayed cranberry vines, and the fresh Attic salt of the moss beds. Say twelve hours of genial and familiar converse with the leopard frog. The sun to rise behind alder and dogwood, and climb buoyantly to his meridian of three hands' breadth, and finally sink to rest behind some bold western hummock. To hear the evening chant of the mosquito from a thousand green chapels, and the bittern begin to boom from his concealed fort like a sunset gun! Surely, one may as profitably be soaked in the juices of a marsh for one day, as pick his way dry-shod over sand. Cold and damp, — are they not as rich experience as warmth and dryness?

So is not shade as good as sunshine, night as day? Why be eagles and thrushes always, and owls and whip-poor-wills never?

I am pleased to see the landscape through the bottom of a tumbler, it is clothed in such a mild, quiet light, and the barns and fences checker and partition it with new

regularity. These rough and uneven fields stretch away with lawn-like smoothness to the horizon. The clouds are finely distinct and picturesque, the light-blue sky contrasting with their feathery whiteness. They are fit drapery to hang over Persia. The smith's shop, resting in such a Grecian light, is worthy to stand beside the Parthenon. The potato and grain fields are such gardens as he imagines who has schemes of ornamental husbandry.

If I were to write of the dignity of the farmer's life, I would behold his farms and crops through a tumbler. All the occupations of men are ennobled so.

Our eyes, too, are convex lenses, but we do not learn with the eyes; they introduce us, and we learn after by converse with things.

June 17. Our lives will not attain to be spherical by lying on one or the other side forever; but only by resigning ourselves to the law of gravity in us, will our axis become coincident with the celestial axis, and [only] by revolving incessantly through all circles, shall we acquire a perfect sphericity.

Men are inclined to lay the chief stress on likeness and not on difference. We seek to know how a thing is related to us, and not if it is strange. We call those bodies warm whose temperature is many degrees below our own, and never those cold which are warmer than we. There are many degrees of warmth below blood heat, but none of cold above it.

Even the motto "Business before friends" admits of a high interpretation. No interval of time can avail to defer friendship. The concerns of time must be attended to in time. I need not make haste to explore the whole secret of a star; if it were vanished quite out of the firmament, so that no telescope could longer discover it, I should not despair of knowing it entirely one day.

We meet our friend with a certain awe, as if he had just lighted on the earth, and yet as if we had some title to be acquainted with him by our old familiarity with sun and moon.

June 18. I should be pleased to meet man in the woods. I wish he were to be encountered like wild caribous and moose. I am startled when I consider how little I am actually concerned about the things I write in my journal.

Think of the Universal History, and then tell me, — when did burdock and plantain sprout first?

A fair land, indeed, do books spread open to us, from the Genesis down; but alas! men do not take them up kindly into their own being, and breathe into them a fresh beauty, knowing that the grimmest of them belongs to such warm sunshine and still moonlight as the present.

Of what consequence whether I stand on London bridge for the next century, or look into the depths of this bubbling spring which I have laid open with my hoe?

June 19. The other day I rowed in my boat a free, even lovely young lady, and, as I plied the oars, she sat in the stern, and there was nothing but she between me and the sky. So might all our lives be picturesque if they were free enough, but mean relations

and prejudices intervene to shut out the sky, and we never see a man as simple and distinct as the man-weathercock on a steeple.

The faint bugle notes which I hear in the west seem to flash on the horizon like heat lightning. Cows low in the street more friendly than ever, and the note of the whip-poor-will, borne over the fields, is the voice with which the woods and moonlight woo me. I shall not soon forget the sounds which lulled me when falling asleep on the banks of the Merrimack.

Far into night I hear some tyro beating a drum incessantly with a view to some country muster, and am thrilled by an infinite sweetness as of a music which the breeze drew from the sinews of war. I think of the line, —

“When the drum beat at dead of night.”

How I wish it would wake the whole world to march to its melody, but still it drums on alone in the silence and the dark. Cease not, thou drummer of the night, thou too shalt have thy reward. The stars and the firmament hear thee, and their aisles shall echo thy beat till its call is answered, and the forces are mustered. The universe is attentive as a little child to thy sound, and trembles as if each stroke bounded against an elastic vibrating firmament. I should be contented if the night never ended, for in the darkness heroism will not be deferred, and I see fields where no hero has couched his lance.

June 20. Perfect sincerity and transparency make a great part of beauty, as in dewdrops, lakes, and diamonds. A spring is a cynosure in the fields. All Muscovy glitters in the minute particles of mica on its bottom, and the ripples cast their shadows flickeringly on the white sand, as the clouds which flit across the landscape.

Something like the woodland sounds will be heard to echo through the leaves of a good book. Sometimes I hear the fresh emphatic note of the oven-bird, and am tempted to turn many pages; sometimes the hurried chuckling sound of the squirrel when he dives into the wall.

If we only see clearly enough how mean our lives are, they will be splendid enough. Let us remember not to strive upwards too long, but sometimes drop plumb down the other way, and wallow in meanness. From the deepest pit we may see the stars, if not the sun. Let us have presence of mind enough to sink when we can't swim. At any rate, a carcass had better lie on the bottom than float an offense to all nostrils. It will not be falling, for we shall ride wide of the earth's gravity as a star, and always be drawn upward still, — *semper cadendo nunquam cadit*, — and so, by yielding to universal gravity, at length become fixed stars.

Praise begins when things are seen partially. We begin to praise when we begin to see that a thing needs our assistance.

When the heavens are obscured to us, and nothing noble or heroic appears, but we are oppressed by imperfection and shortcoming on all hands, we are apt to suck our thumbs and decry our fates. As if nothing were to be done in cloudy weather, or, if heaven were not accessible by the upper road, men would not find out a lower. Sometimes I feel so cheap that I am inspired, and could write a poem about it, — but

straightway I cannot, for I am no longer mean. Let me know that I am ailing, and I am well. We should not always beat off the impression of trivialness, but make haste to welcome and cherish it. Water the weed till it blossoms; with cultivation it will bear fruit. There are two ways to victory, — to strive bravely, or to yield. How much pain the last will save we have not yet learned.

June 21. I shall not soon forget my first night in a tent, — how the distant barking of dogs for so many still hours revealed to me the riches of the night. Who would not be a dog and bay the moon?

I never feel that I am inspired unless my body is also. It too spurns a tame and commonplace life. They are fatally mistaken who think, while they strive with their minds, that they may suffer their bodies to stagnate in luxury or sloth. The body is the first proselyte the Soul makes. Our life is but the Soul made known by its fruits, the body. The whole duty of man may be expressed in one line, — Make to yourself a perfect body.

June 22. What a man knows, that he does.

It is odd that people will wonder how Shakespeare could write as he did without knowing Latin, or Greek, or geography, as if these were of more consequence than to know how to whistle. They are not backward to recognize Genius, — how it dispenses with those furtherances which others require, leaps where they crawl, — and yet they never cease to marvel that so it was, — that it was Genius, and helped itself.

Nothing can shock a truly brave man but dullness. One can tolerate many things. What mean these sly, suspicious looks, as if you were an odd fish, a piece of crockery-ware to be tenderly handled? Surely people forget how many rebuffs every man has experienced in his day, — perhaps has fallen into a horsepond, eaten freshwater clams, or worn one shirt for a week without washing. Cannot a man be as calmly tolerant as a potato field in the sun, whose equanimity is not disturbed by Scotch thistles over the wall, but there it smiles and waxes till the harvest, let thistles mount never so high? You cannot receive a shock, unless you have an electric affinity for that which shocks you. Have no affinity for what is shocking.

Do not present a gleaming edge to ward off harm, for that will oftenest attract the lightning, but rather be the all-pervading ether which the lightning does not strike but purify. Then will the rudeness or profanity of your companion be like a flash across the face of your sky, lighting up and revealing its serene depths. Earth cannot shock the heavens; but its dull vapor and foul smoke make a bright cloud spot in the ether, and anon the sun, like a cunning artificer, will cut and paint it, and set it for a jewel in the breast of the sky.

When we are shocked at vice we express a lingering sympathy with it. Dry rot, rust, and mildew shock no man, for none is subject to them.

June 23. We Yankees are not so far from right, who answer one question by asking another. Yes and No are lies. A true answer will not aim to establish anything, but rather to set all well afloat. All answers are in the future, and day answereth to day. Do we think we can anticipate them?

In Latin, to respond is to pledge one's self before the gods to do faithfully and honorably, as a man should, in any case. This is good.

Music soothes the din of philosophy and lightens incessantly over the heads of sages.

How can the language of the poet be more expressive than nature? He is content that what he has already read in simple characters, or indifferently in all, be translated into the same again.

He is the true artist whose life is his material; every stroke of the chisel must enter his own flesh and bone and not grate dully on marble.

The Springs. — What is any man's discourse to me if I am not sensible of something in it as steady and cheery as the creak of the crickets? In it the woods must be relieved against the sky. Men tire me when I am not constantly greeted and cheered in their discourse, as it were by the flux of sparkling streams.

I cannot see the bottom of the sky, because I cannot see to the bottom of myself. It is the symbol of my own infinity. My eye penetrates as far into the ether as that depth is inward from which my contemporary thought springs.

Not by constraint or severity shall you have access to true wisdom, but by abandonment, and childlike mirthfulness. If you would know aught, be gay before it.

June 24. When I read Cudworth I find I can tolerate all, — atomists, pneumatologists, atheists, and theists, — Plato, Aristotle, Leucippus, Democritus, and Pythagoras. It is the attitude of these men, more than any communication, which charms me. It is so rare to find a man musing. But between them and their commentators there is an endless dispute. But if it come to that, that you compare notes, then you are all wrong. As it is, each takes me up into the serene heavens, and paints earth and sky. Any sincere thought is irresistible; it lifts us to the zenith, whither the smallest bubble rises as surely as the largest.

Dr. Cudworth does not consider that the belief in a deity is as great a heresy as exists. Epicurus held that the gods were "of human form, yet were so thin and subtile, as that, comparatively with our terrestrial bodies, they might be called incorporeal; they having not so much *carnem* as quasi-*carnem*, nor *sanguinem* as quasi-*sanguinem*, a certain kind of aerial or ethereal flesh and blood." This, which Cudworth pronounces "romantical," is plainly as good doctrine as his own. As if any sincere thought were not the best sort of truth!

There is no doubt but the highest morality in the books is rhymed or measured, — is, in form as well as substance, poetry. Such is the scripture of all nations. If I were to compile a volume to contain the condensed wisdom of mankind, I should quote no rhythmless line.

Not all the wit of a college can avail to make one harmonious line. It never happens. It may get so as to jingle, but a jingle is akin to a jar, — jars regularly recurring.

So delicious is plain speech to my ears, as if I were to be more delighted by the whistling of the shot than frightened by the flying of the splinters, I am content, I — fear, to be quite battered down and made a ruin of. I outgeneral myself when I direct the enemy to my vulnerable points.

The loftiest utterance of Love is, perhaps, sublimely satirical. Sympathy with what is sound makes sport of what is unsound.

Cliffs. Evening. — Though the sun set a quarter of an hour ago, his rays are still visible, darting half-way to the zenith. That glowing morrow in the west flashes on me like a faint presentiment of morning when I am falling asleep. A dull mist comes rolling from the west, as if it were the dust which day has raised. A column of smoke is rising from the woods yonder, to uphold heaven's roof till the light comes again. The landscape, by its patient resting there, teaches me that all good remains with him that waiteth, and that I shall sooner overtake the dawn by remaining here, than by hurrying over the hills of the west.

Morning and evening are as like as brother and sister. The sparrow and thrush sing and the frogs peep for both.

The woods breathe louder and louder behind me. With what hurry-skurry night takes place! The wagon rattling over yonder bridge is the messenger which day sends back to night; but the dispatches are sealed. In its rattle the village seems to say, This one sound, and I have done.

Red, then, is Day's color; at least it is the color of his heel. He is 'stepping westward.' We only notice him when he comes and when he goes.

With noble perseverance the dog bays the stars yonder. I too, like thee, walk alone in this strange, familiar night, my voice, like thine, beating against its friendly concave; and barking I hear only my own voice. 10 o'clock.

June 25. Let me see no other conflict but with prosperity. If my path run on before me level and smooth, it is all a mirage; in reality it is steep and arduous as a chamois pass. I will not let the years roll over me like a Juggernaut car.

We will warm us at each other's fire. Friendship is not such a cold refining process as a double sieve, but a glowing furnace in which all impurities are consumed.

Men have learned to touch before they scrutinize, — to shake hands, and not to stare.

June 26. The best poetry has never been written, for 'when it might have been, the poet forgot it, and when it was too late remembered it; or when it might have been, the poet remembered it, and when it was too late forgot it.

The highest condition of art is artlessness.

Truth is always paradoxical.

He will get to the goal first who stands stillest.

There is one let better than any help, and that is, — Let-alone.

By sufferance you may escape suffering.

He who resists not at all will never surrender.

When a dog runs at you, whistle for him.

Say, Not so, and you will outcircle the philosophers.

Stand outside the wall, and no harm can reach you. The danger is that you be walled in with it.

June 27. I am living this 27th of June, 1840, a dull, cloudy day and no sun shining. The clink of the smith's hammer sounds feebly over the roofs, and the wind is sighing gently, as if dreaming of cheerfuler days. The farmer is plowing in yonder field, craftsmen are busy in the shops, the trader stands behind the counter, and all works go steadily forward. But I will have nothing to do; I will tell fortune that I play no game with her, and she may reach me in my Asia of serenity and indolence if she can.

For an impenetrable shield, stand inside yourself.

He was no artist, but an artisan, who first made shields of brass.

Unless we meet religiously, we prophane one another. What was the consecrated ground round the temple, we have used as no better than a domestic court.

Our friend's is as holy a shrine as any God's, to be approached with sacred love and awe. Veneration is the measure of Love. Our friend answers ambiguously, and sometimes before the question is propounded, like the oracle of Delphi. He forbears to ask explanation, but doubts and surmises darkly with full faith, as we silently ponder our fates.

In no presence are we so susceptible to shame. Our hour is a sabbath, our abode a temple, our gifts peace offerings, our conversation a communion, our silence a prayer. In prophanity we are absent, in holiness near, in sin estranged, in innocence reconciled.

June 28. The prophane never hear music; the holy ever hear it. It is God's voice, the divine breath audible. Where it is heard, there is a sabbath. It is omnipotent; all things obey it as they obey virtue. It is the herald of virtue. It passes by sorrow, for grief hangs its harp on the willows.

June 29. Of all phenomena, my own race are the most mysterious and undiscoverable. For how many years have I striven to meet one, even on common manly ground, and have not succeeded!

June 30. I sailed from Fair Haven last evening as gently and steadily as the clouds sail through the atmosphere. The wind came blowing blithely from the southwest fields, and stepped into the folds of our sail like a winged horse, pulling with a strong and steady impulse. The sail bends gently to the breeze, as swells some generous impulse of the heart, and anon flutters and flaps with a kind of human suspense. I could watch the motions of a sail forever, they are so rich and full of meaning. I watch the play of its pulse, as if it were my own blood beating there. The varying temperature of distant atmospheres is graduated on its scale. It is a free, buoyant creature, the bauble of the heavens and the earth. A gay pastime the air plays with it. If it swells and tugs, it is because the sun lays his windy finger on it. The breeze it plays with has been outdoors so long. So thin is it, and yet so full of life; so noiseless when it labors hardest, so noisy and impatient when least serviceable. So am I blown on by God's breath, so flutter and flap, and fill gently out with the breeze.

In this fresh evening each blade and leaf looks as if it had been dipped in an icy liquid greenness. Let eyes that ache come here and look, — the sight will be a sovereign eyewater, — or else wait and bathe them in the dark.

We go forth into the fields, and there the wind blows freshly onward, and still on, and we must make new efforts not to be left behind. What does the dogged wind intend, that, like a willful cur, it will not let me turn aside to rest or content? Must it always reprove and provoke me, and never welcome me as an equal?

The truth shall prevail and falsehood discover itself, as long as the wind blows on the hills.

A man's life should be a stately march to a sweet but unheard music, and when to his fellows it shall seem irregular and inharmonious, he will only be stepping to a livelier measure, or his nicer ear hurry him into a thousand symphonies and concordant variations. There will be no halt ever, but at most a marching on his post, or such a pause as is richer than any sound, when the melody runs into such depth and wildness as to be no longer heard, but implicitly consented to with the whole life and being. He will take a false step never, even in the most arduous times, for then the music will not fail to swell into greater sweetness and volume, and itself rule the movement it inspired.

I have a deep sympathy with war, it so apes the gait and bearing of the soul.

Value and effort are as much coincident as weight and a tendency to fall. In a very wide but true sense, effort is the deed itself, and it is only when these sensible stuffs intervene, that our attention is distracted from the deed to the accident. It is never the deed men praise, but some marble or canvas which are only a staging to the real work.

July 1. To be a man is to do a man's work; always our resource is to endeavor. We may well say, Success to our endeavors. Effort is the prerogative of virtue.

The true laborer is recompensed by his labor, not by his employer. Industry is its own wages. Let us not suffer our hands to lose one jot of their handiness by looking behind to a mean recompense, knowing that our true endeavor cannot be thwarted, nor we be cheated of our earnings unless by not earning them.

The true poem is not that which the public read. There is always a poem not printed on paper, coincident with the production of this, which is stereotyped in the poet's life, is what he has become through his work. Some symbol of value may shape itself to the senses in wood, or marble, or verse, but this is fluctuating as the laborer's hire, which may or may not be withheld. His very material is not material but supernatural. Perhaps the hugest and most effective deed may have no sensible result at all on earth, but paint itself in the heavens in new stars and constellations. Its very material lies out of nature. When, in rare moments, we strive wholly with one consent, which we call a yearning, we may not hope that our work will stand in any artist's gallery.

Let not the artist expect that his true work will stand in any prince's gallery.

July 2. I am not taken up, like Moses, upon a mountain to learn the law, but lifted up in my seat here, in the warm sunshine and genial light.

They who are ready to go are already invited.

Neither men nor things have any true mode of invitation but to be inviting.

Can that be a task which all things abet, and to postpone which is to strive against nature?

July 3. When Alexander appears, the Hercynian and Dodonean woods seem to wave a welcome to him.

Do not thoughts and men's lives enrich the earth and change the aspect of things as much as a new growth of wood?

What are Godfrey and Gonsalvo unless we breathe a life into them, and reenact their exploits as a prelude to our own? The past is only so heroic as we see it; it is the canvas on which our conception of heroism is painted, the dim prospectus of our future field. We are dreaming of what we are to do.

The last sunrise I witnessed seemed to outshine the splendor of all preceding ones, and I was convinced that it behooved man to dawn as freshly, and with equal promise and steadiness advance into the career of life, with as lofty and serene a countenance to move onward through his midday to a yet fairer and more promising setting. Has the day grown old when it sets? and shall man wear out sooner than the sun? In the crimson colors of the west I discern the budding hues of dawn. To my western brother it is rising pure and bright as it did to me, but the evening exhibits in the still rear of day the beauty which through morning and noon escaped me. When we are oppressed by the heat and turmoil of the noon, let us remember that the sun which scorches us with brazen beams is gilding the hills of morning and awaking the woodland quires for other men.

We will have a dawn, and noon, and serene sunset in ourselves.

What we call the gross atmosphere of evening is the accumulated deed of the day, which absorbs the rays of beauty, and shows more richly than the naked promise of the dawn. By earnest toil in the heat of the noon, let us get ready a rich western blaze against the evening of our lives.

Low-thoughted, plodding men have come and camped in my neighbor's field to-night, with camp music and bustle. Their bugle instantly finds a sounding board in the heavens, though mean lips blow it. The sky is delighted with strains which the connoisseur rejects. It seems to say, Now is this my own earth.

In music are the centripetal and centrifugal forces. The universe needed only to hear a divine harmony that every star might fall into its proper place and assume a true sphericity.

July 4. 4 o'clock, A. M. The Townsend Light Infantry encamped last night in my neighbor's inclosure.

The night still breathes slumberously over field and wood, when a few soldiers gather about one tent in the twilight, and their band plays an old Scotch air, with bugle and drum and fife attempered to the season. It seems like the morning hymn of creation. The first sounds of the awakening camp, mingled with the chastened strains which so sweetly salute the dawn, impress me as the morning prayer of an army.

And now the morning gun fires. The soldier awakening to creation and awakening it. I am sure none are cowards now. These strains are the roving dreams which steal

from tent to tent, and break forth into distinct melody. They are the soldier's morning thought. Each man awakes himself with lofty emotions, and would do some heroic deed. You need preach no homily to him; he is the stuff they are made of.

The whole course of our lives should be analogous to one day of the soldier's. His Genius seems to whisper in his ear what demeanor is befitting, and in his bravery and his march he yields a blind and partial obedience.

The fresher breeze which accompanies the dawn rustles the oaks and birches, and the earth respire calmly with the creaking of crickets. Some hazel leaf stirs gently, as if anxious not to awake the day too abruptly, while the time is hastening to the distinct line between darkness and light. And soldiers issue from their dewy tents, and as if in answer to expectant nature, sing a sweet and far-echoing hymn.

We may well neglect many things, provided we overlook them.

When to-day I saw the "Great Ball" rolled majestically along, it seemed a shame that man could not move like it. All dignity and grandeur has something of the undulatoriness of the sphere. It is the secret of majesty in the rolling gait of the elephant, and of all grace in action and in art. The line of beauty is a curve. Each man seems striving to imitate its gait, and keep pace with it, but it moves on regardless and conquers the multitude with its majesty. What shame that our lives, which should be the source of planetary motion and sanction the order of the spheres, are full of abruptness and angularity, so as not to roll, nor move majestically.

July 5. Go where we will, we discover infinite change in particulars only, not in generals.

You cannot rob a man of anything which he will miss.

July 6. All this worldly wisdom was once the unamiable heresy of some wise man.

I observe a truly wise practice on every hand, in education, in religion, and the morals of society, — enough embodied wisdom to have set up many an ancient philosopher.

This society, if it were a person to be met face to face, would not only be tolerated but courted, with its so impressive experience and admirable acquaintance with things.

Consider society at any epoch, and who does not see that heresy has already prevailed in it?

Have no mean hours, but be grateful for every hour, and accept what it brings. The reality will make any sincere record respectable. No day will have been wholly misspent, if one sincere, thoughtful page has been written. of Concord, in that summer [1840],... turning out to roll a huge ball, emblematic of the popular movement against President Van Buren, from the battle-ground of Concord to that of Bunker Hill, singing as they rolled: —

'It is the Ball a-rolling on For Tippecanoe and Tyler too.'

Let the daily tide leave some deposit on these pages, as it leaves sand and shells on the shore. So much increase of terra firma. This may be a calendar of the ebbs and flows of the soul; and on these sheets as a beach, the waves may cast up pearls and seaweed.

July 7. I have experienced such simple joy in the trivial matters of fishing and sporting, formerly, as might inspire the muse of Homer and Shakespeare. And now, when I turn over the pages and ponder the plates of the "Angler's Souvenir," I exclaim with the poet, —

"Can such things be, And overcome us like a summer's cloud?"

When I hear a sudden burst from a horn, I am startled, as if one had provoked such wildness as he could not rule nor tame. He dares to wake the echoes which he cannot put to rest.

July 8. Doubt and falsehood are yet good preachers. They affirm roundly, while they deny partially.

I am pleased to learn that Thales was up and stirring by night not unfrequently, as his astronomical discoveries prove.

It was a saying of Solon that "it is necessary to observe a medium in all things."

The golden mean, in ethics as in physics, is the centre of the system, and that about which all revolve; and though, to a distant and plodding planet, it is the uttermost extreme, yet, when that planet's year is complete, it will be found central. They who are alarmed lest virtue run into extreme good, have not yet wholly embraced her, but described only a slight arc about her, and from so small a curvature you can calculate no centre whatever; but their mean is no better than meanness, nor their medium than mediocrity.

The brave man, while he observes strictly this golden mean, seems to run through all extremes with impunity; like the sun, which now appears in the zenith, now in the horizon, and again is faintly reflected from the moon's disk, and has the credit of describing an entire great circle, crossing the equinoctial and solstitial colures, without detriment to his steadfastness or mediocrity.

Every planet asserts its own to be the centre of the system.

Only meanness is mediocre, moderate; but the true medium is not contained within any bounds, but is as wide as the ends it connects.

When Solon endeavored to prove that Salamis had formerly belonged to the Athenians and not to the Megarians, he caused the tombs to be opened, and showed that the inhabitants of Salamis turned the faces of their dead to the same side with the Athenians, but the Megarians to the opposite side.

So does each part bear witness to all, and the history of all the past may be read in a single grain of its ashes.

July 9. In most men's religion the ligature which should be its muscle and sinew is rather like that thread which the accomplices of Cylon held in their hands, when they went abroad from the temple of Minerva, the other end being attached to the statue of the goddess. But frequently, as in their case, the thread breaks, being stretched, and they are left without an asylum.

The value of many traits in Grecian history depends not so much on their importance as history, as [on] the readiness with which they accept a wide interpretation, and illustrate the poetry and ethics of mankind. When they announce no particular

truth, they are yet central to all truth. They are like those examples by which we improve, but of which we never formally extract the moral. Even the isolated and unexplained facts are like the ruins of the temples which in imagination we restore, and ascribe to some Phidias, or other master.

The Greeks were boys in the sunshine, the Romans were men in the field, the Persians women in the house, the Egyptians old men in the dark.

He who receives an injury is an accomplice of the wrong-doer.

July 10. To myself I am as pliant as osier, and my courses seem not so easy to be calculated as Encke's comet; but I am powerless to bend the character of another; he is like iron in my hands. I could tame a hyena more easily than my friend. I contemplate Him as a granite boulder. He is material which no tool of mine will work. A naked savage will fell an oak with a firebrand, and wear a hatchet out of the rock, but I cannot hew the smallest chip out of my fellow. There is a character in every one which no art can reach to beautify or deform.

Nothing was ever so unfamiliar and startling to me as my own thoughts.

We know men through their eyes. You might say that the eye was always original and unlike another. It is the feature of the individual, and not of the family, — in twins still different. All a man's privacy is in his eye, and its expression he cannot alter more than he can alter his character. So long as we look a man in the eye, it seems to rule the other features, and make them, too, original. When I have mistaken one person for another, observing only his form, and carriage, and inferior features, the unlikeness seemed of the least consequence; but when I caught his eye, and my doubts were removed, it seemed to pervade every feature.

The eye revolves on an independent pivot which we can no more control than our own will. Its axle is the axle of the soul, as the axis of the earth is coincident with the axis of the heavens.

July 11. The true art is not merely a sublime consolation and holiday labor which the gods have given to sickly mortals, to be wrought at in parlors, and not in stithies amid soot and smoke, but such a masterpiece as you may imagine a dweller on the table-lands of Central Asia might produce, with threescore and ten years for canvas, and the faculties of a man for tools, — a human life, wherein you might hope to discover more than the freshness of Guido's Aurora, or the mild light of Titian's landscapes; not a bald imitation or rival of Nature, but the restored original of which she is the reflection. For such a work as this, whole galleries of Greece and Italy are a mere mixing of colors and preparatory quarrying of marble.

Not how is the idea expressed in stone or on canvas, is the question, but how far it has obtained form and expression in the life of the artist.

There is much covert truth in the old mythology which makes Vulcan a brawny and deformed smith, who sweat more than the other gods. His stithy was not like a modern studio.

Let us not wait any longer, but step down from the mountains on to the plain of earth. Let our delay be like the sun's, when he lingers on the dividing line of day and

night a brief space when the world is grateful for his light. We will make such haste as the morning and such delay as the evening.

It concerns us rather to be something here present than to leave something behind us.

It is the man determines what is said, not the words. If a mean person uses a wise maxim, I bethink me how it can be interpreted so as to commend itself to his meanness; but if a wise man makes a commonplace remark, I consider what wider construction it will admit. When Pittacus says, "It is necessary to accommodate one's self to the time and take advantage of the occasion," I assent. He might have considered that to accommodate one's self to all times, and take advantage of all occasions, was really to be independent, and make our own opportunity.

July 12. What first suggested that necessity was grim, and made fate so fatal? The strongest is always the least violent. Necessity is a sort of Eastern cushion on which I recline. I contemplate its mild, inflexible countenance, as the haze in October days. When I am vexed I only ask to be left alone with it. Leave me to my fate. It is the bosom of time and the lap of eternity; since to be necessary is to be needful, it is only another name for inflexibility of good. How I welcome my grim fellow and aspire to be such a necessity as he! He is so flexible, and yields to me as the air to my body! I leap and dance in his midst, and play with his beard till he smiles. I greet thee, my elder brother, who with thy touch ennoblest all things. Must it be so, then is it good. Thou commendest even petty ills by thy countenance.

Over Greece hangs the divine necessity, ever a mellow heaven of itself, whose light too gilds the Acropolis and a thousand fanes and groves.

Pittacus said there was no better course than to endeavor to do well what you are doing at any moment.

Go where he will, the wise man is proprietor of all things. Everything bears a similar inscription, if we could but read it, to that on the vase found in the stomach of a fish in old times,— "To the most wise."

When his impious fellow-passengers invoked the gods in a storm, Bias cried, "Hist! hist! lest the gods perceive that you are here, for we should all be lost."

A wise man will always have his duds picked up, and be ready for whatever may happen, as the prudent merchant, notwithstanding the lavish display of his wares, will yet have them packed or easy to be removed in emergencies. In this sense there is something sluttish in all finery. When I see a fine lady or gentleman dressed to the top of the fashion, I wonder what they would do if an earthquake should happen, or a fire suddenly break out, for they seem to have counted only on fair weather, and that things will go on smoothly and without jostling. Those curls and jewels, so nicely adjusted, expect an unusual deference from the elements.

Our dress should be such as will hang conveniently about us, and fit equally well in good and in bad fortune; such as will approve itself of the right fashion and fabric, whether for the cotillion or the earthquake. In the sack of Priene, when the inhabitants with much hurry and bustle were carrying their effects to a place of safety, some one

asked Bias, who remained tranquil amid the confusion, why he was not thinking how he should save something, as the others were. "I do so," said Bias, "for I carry all my effects with me."

July 14. Our discourse should be *ex tempore*, but not *pro tempore*.

July 16. We are as much refreshed by sounds as by sights, or scents, or flavors, — as the barking of a dog heard in the woods at midnight, or the tinklings which attend the dawn.

As I picked blackberries this morning, by starlight, the distant yelping of a dog fell on my inward ear, as the cool breeze on my cheek.

July 19. These two days that I have not written in my Journal, set down in the calendar as the 17th and 18th of July, have been really an æon in which a Syrian empire might rise and fall. How many Persias have been lost and won in the interim? Night is spangled with fresh stars.

July 26. When I consider how, after sunset, the stars come out gradually in troops from behind the hills and woods, I confess that I could not have contrived a more curious and inspiring night.

July 27. Some men, like some buildings, are bulky but not great. The Pyramids any traveller may measure with his line, but the dimensions of the Parthenon in feet and inches will seem to dangle from its entablature like an elastic drapery.

Much credit is due to a brave man's eye. It is the focus in which all rays are collected. It sees from within, or from the centre, just as we scan the whole concave of the heavens at a glance, but can compass only one side of the pebble at our feet.

The grandeur of these stupendous masses of clouds, tossed into such irregular greatness across the sky, seems thrown away on the meanness of my employment. The drapery seems altogether too rich for such poor acting.

In vain the sun challenges man to equal greatness in his career. We look in vain over earth for a Roman greatness to answer the eternal provocation.

We look up to the gilded battlements of the eternal city, and are contented to be suburban dwellers outside the walls.

By the last breath of the May air I inhale I am reminded that the ages never got so far down as this before. The wood thrush is a more modern philosopher than Plato and Aristotle. They are now a dogma, but he preaches the doctrine of this hour.

This systole-diastole of the heart, the circulation of the blood from the centre to the extremities, the chyfication which is constantly going on in our bodies are a sort of military evolution, a struggle to outgeneral the decay of time by the skillfulest tactics.

When bravery is worsted, it joins the peace society.

A word is wiser than any man, than any series of words. In its present received sense it may be false, but in its inner sense by descent and analogy it approves itself. Language is the most perfect work of art in the world. The chisel of a thousand years retouches it.

Nature refuses to sympathize with our sorrow. She seems not to have provided for, but by a thousand contrivances against, it. She has bevelled the margins of the eyelids that the tears may not overflow on the cheek.

We can conceive of a Bravery so wide that nothing can meet to befall it, so omnipresent that nothing can lie in wait for it, so permanent that no obstinacy can reduce it. The stars are its silent sentries by night, and the sun its pioneer by day. From its abundant cheerfulness spring flowers and the rainbow, and its infinite humor and wantonness produce corn and vines.

## 1841

Jan. 23. A day is lapsing. I hear cockerels crowing in the yard, and see them stalking among the chips in the sun. I hear busy feet on the floors, and the whole house jars with industry. Surely the day is well spent, and the time is full to overflowing. Mankind is as busy as the flowers in summer, which make haste to unfold themselves in the forenoon, and close their petals in the afternoon.

The momentous topics of human life are always of secondary importance to the business in hand, just as carpenters discuss politics between the strokes of the hammer while they are shingling a roof.

The squeaking of the pump sounds as necessary as the music of the spheres.

The solidity and apparent necessity of this routine insensibly recommend it to me. It is like a cane or a cushion for the infirm, and in view of it all are infirm. If there were but one erect and solid-standing tree in the woods, all creatures would go to rub against it and make sure of their footing. Routine is a ground to stand on, a wall to retreat to; we cannot draw on our boots without bracing ourselves against it. It is the fence over which neighbors lean when they talk. All this cockcrowing, and hawing and geeing, and business in the streets, is like the spring-board on which tumblers perform and develop their elasticity. Our health requires that we should recline on it from time to time. When we are in it, the hand stands still on the face of the clock, and we grow like corn in the genial dankness and silence of the night. Our weakness wants it, but our strength uses it. Good for the body is the work of the body, good for the soul the work of the soul, and good for either the work of the other. Let them not call hard names, nor know a divided interest.

When I detect a beauty in any of the recesses of nature, I am reminded, by the serene and retired spirit in which it requires to be contemplated, of the inexpressible privacy of a life, — how silent and unambitious it is. The beauty there is in mosses will have to be considered from the holiest, quietest nook.

The gods delight in stillness; they say, 'St— 'st. My truest, serenest moments are too still for emotion; they have woollen feet. In all our lives we live under the hill, and if we are not gone we live there still.

Jan. 24. Sunday. I almost shrink from the arduousness of meeting men erectly day by day.

Be resolutely and faithfully what you are; be humbly what you aspire to be. Be sure you give men the best of your wares, though they be poor enough, and the gods will help you to lay up a better store for the future.

Man's noblest gift to man is his sincerity, for it embraces his integrity also. Let him not dole out of himself anxiously, to suit their weaker or stronger stomachs, but make a clean gift of himself, and empty his coffers at once. I would be in society as in the landscape; in the presence of nature there is no reserve, nor effrontery.

Coleridge says of the "ideas spoken out everywhere in the Old and New Testament," that they "resemble the fixed stars, which appear of the same size to the naked as to the armed eye; the magnitude of which the telescope may rather seem to diminish than to increase."

It is more proper for a spiritual fact to have suggested an analogous natural one, than for the natural fact to have preceded the spiritual in our minds.

By spells seriousness will be forced to cut capers, and drink a deep and refreshing draught of silliness; to turn this sedate day of Lucifer's and Apollo's, into an all fools' day for Harlequin and Cornwallis. The sun does not grudge his rays to either, but they are alike patronized by the gods. Like overtaken schoolboys, all my members and nerves and sinews petition Thought for a recess, and my very thigh-bones itch to slip away from under me, and run and join the mêlée. I exult in stark inanity, leering on nature and the soul. We think the gods reveal themselves only to sedate and musing gentlemen. But not so; the buffoon in the midst of his antics catches unobserved glimpses, which he treasures for the lonely hour. When I have been playing tomfool, I have been driven to exchange the old for a more liberal and catholic philosophy.

Jan. 25. Monday. To-day I feel the migratory instinct strong in me, and all my members and humors anticipate the breaking up of winter. If I yielded to this impulse, it would surely guide me to summer haunts. This indefinite restlessness and fluttering on the perch do, no doubt, prophesy the final migration of souls out of nature to a serene summer, in long harrows and waving lines in the spring weather, over what fair uplands and fertile Elysian meadows winging their way at evening and seeking a resting-place with loud cackling and uproar!

Wealth, no less than knowledge, is power. Among the Bedouins the richest man is the sheik, among savages he who has most iron and wampum is chief, and in England and America he is the merchant prince.

We should strengthen, and beautify, and industriously mould our bodies to be fit companions of the soul, — assist them to grow up like trees, and be agreeable and wholesome objects in nature. I think if I had had the disposal of this soul of man, I should have bestowed it sooner on some antelope of the plains than upon this sickly and sluggish body.

Jan. 26. Tuesday. I have as much property as I can command and use. If by a fault in my character I do not derive my just revenues, there is virtually a mortgage on my

inheritance. A man's wealth is never entered in the registrar's office. Wealth does not come in along the great thoroughfares, it does not float on the Erie or Pennsylvania canal, but is imported by a solitary track without bustle or competition, from a brave industry to a quiet mind.

I had a dream last night which had reference to an act in my life in which I had been most disinterested and true to my highest instinct but completely failed in realizing my hopes; and now, after so many months, in the stillness of sleep, complete justice was rendered me. It was a divine remuneration. In my waking hours I could not have conceived of such retribution; the presumption of desert would have damned the whole. But now I was permitted to be not so much a subject as a partner to that retribution. It was the award of divine justice, which will at length be and is even now accomplished.

Good writing as well as good acting will be obedience to conscience. There must not be a particle of will or whim mixed with it. If we can listen, we shall hear. By reverently listening to the inner voice, we may reinstate ourselves on the pinnacle of humanity.

Jan. 27. Wednesday. In the compensation of the dream, there was no implied loss to any, but immeasurable advantage to all.

The punishment of sin is not positive, as is the reward of virtue.

For a flower, I like the name pansy, or pensée, best of any.

Jan. 28. No innocence can quite stand up under suspicion, if it is conscious of being suspected. In the company of one who puts a wrong construction upon your actions, they are apt really to deserve a mean construction. While in that society I can never retrieve myself. Attribute to me a great motive, and I shall not fail to have one; but a mean one, and the fountain of virtue will be poisoned by the suspicion. Show men unlimited faith as the coin with which you will deal with them, and they will invariably exhibit the best wares they have. I would meet men as the friends of all their virtue, and the foes of all their vice, for no man is the partner of his guilt. If you suspect me you will never see me, but all our intercourse will be the politest leave-taking; I shall constantly defer and apologize, and postpone myself in your presence. The self-defender is accursed in the sight of gods and men; he is a superfluous knight, who serves no lady in the land. He will find in the end that he has been fighting windmills, and battered his mace to no purpose. The injured man with querulous tone resisting his fate is like a tree struck by lightning, which rustles its sere leaves the winter through, not having vigor enough [to] cast them off.

As for apologies, I must be off with the dew and the frost, and leave mankind to repair the damage with their gauze screens and straw.

Resistance is a very wholesome and delicious morsel at times. When Venus advanced against the Greeks with resistless valor, it was by far the most natural attitude into which the poet could throw his hero to make him resist heroically. To a devil one might yield gracefully, but a god would be a worthy foe, and would pardon the affront.

It would be worth while, once for all, fairly and cleanly to tell how we are to be used, as vendors of lucifer matches send directions in the envelope, both how light may be readily procured and no accident happen to the user.

Let your mood determine the form of salutation, and approach the creature with a natural nonchalance, as though he were anything but what he is, and you were anything but what you are, — as though he were he, and you were you; in short, as though he were so insignificant that it did not signify, and so important that it did not import. Depend upon it, the timber is well seasoned and tough, and will bear rough usage; and if it should crack, there is plenty more where it came from. I am no piece of china-ware that cannot be jostled against my neighbor, without danger of rupture from the collision, and must needs ring a scannel strain to the end of my days when once I am cracked; but rather one of the old-fashioned wooden trenchers, which one while stands at the head of the table, and at another is a milking-stool, and at another a seat for children, and finally goes down to its grave not unadorned with honorable scars, and does not die till it is worn out. Use me, for I am useful in my way. I stand as one of many petitioners, from toadstool and henbane up to dahlia and violet, supplicating to be put to my use, if by any means ye may find me serviceable; whether for a medicated drink or bath, as balm and lavender; or for fragrance, as verbena and geranium; or for sight, as cactus; or for thoughts, as pansy.

Jan. 29. There is something proudly thrilling in the thought that this obedience to conscience and trust in God, which is so solemnly preached in extremities and arduous circumstances, is only to retreat to one's self, and rely on our own strength. In trivial circumstances I find myself sufficient to myself, and in the most momentous I have no ally but myself, and must silently put by their harm by my own strength, as I did the former. As my own hand bent aside the willow in my path, so must my single arm put to flight the devil and his angels. God is not our ally when we shrink, and neuter when we are bold. If by trusting in God you lose any particle of your vigor, trust in Him no longer. When you trust, do not lay aside your armor, but put it on and buckle it tighter. If by reliance on the gods I have disbanded one of my forces, then was it poor policy. I had better have retained the most inexperienced tyro who had straggled into the camp, and let go the heavenly alliance. I cannot afford to relax discipline because God is on my side, for He is on the side of discipline. And if the gods were only the heavens I fought under, I would not care if they stormed or were calm. I do not want a countenance, but a help. And there is more of God and divine help in a man's little finger than in idle prayer and trust.

The best and bravest deed is that which the whole man — heart, lungs, hands, fingers, and toes — at any time prompts. Each hanger-on in the purlieu of the camp, must strike his standard at the signal from the Prætorian tent, and fall into the line of march; but if a single sutler delay to make up his pack, then suspect the fates and consult the omens again. This is the meaning of integrity; this is to be an integer, and not a fraction. Be even for all virtuous ends, but odd for all vice. Be a perfect power, so that any of your roots multiplied into itself may give the whole again.

Beauty is compared, not measured, for it is the creature of proportions, not of size. Size must be subdued to it. It is hard for a tall or a short person to be beautiful.

To graft the Persian lilac on the ash, is as if you were to splice the thigh-bones of the Venus de Medici.

Friends will have to be introduced each time they meet. They will be eternally strange to one another, and when they have mutually appropriated their value for the last hour, they will go and gather a new measure of strangeness for the next. They are like two boughs crossed in the wood, which play backwards and forwards upon one another in the wind, and only wear into each other, but never the sap of the one flows into the pores of the other, for then the wind would no more draw from them those strains which enchanted the wood. They are not two united, but rather one divided.

Of all strange and unaccountable things this journalizing is the strangest. It will allow nothing to be predicated of it; its good is not good, nor its bad bad. If I make a huge effort to expose my innermost and richest wares to light, my counter seems cluttered with the meanest homemade stuffs; but after months or years I may discover the wealth of India, and whatever rarity is brought overland from Cathay, in that confused heap, and what perhaps seemed a festoon of dried apple or pumpkin will prove a string of Brazilian diamonds, or pearls from Coromandel.

Men lie behind the barrier of a relation as effectually concealed as the landscape by a mist; and when at length some unforeseen accident throws me into a new attitude to them, I am astounded, as if for the first time I saw the sun on the hillside. They lie out before me like a new order of things. As, when the master meets his pupil as a man, then first do we stand under the same heavens, and master and pupil alike go down the resistless ocean stream together.

Jan. 30. Saturday. Far over the fields, between the tops of yonder wood, I see a slight cloud not larger than the vapor from a kettle, drifting by its own inward purpose in a direction contrary to the planet. As it flits across the dells and defiles of the tree-tops, now seen, then lost beyond a pine, I am curious to know wherein its will resides, for to my eye it has no heart, nor lungs, nor brain, nor any interior and private chamber which it may inhabit.

Its motion reminds me of those lines of Milton: —

“As when far off at sea a fleet descried  
Hangs in the clouds, by equinoctial winds  
Close sailing from Bengala, or the isles  
Of Ternate and Tidore, whence merchants bring  
Their spicy drugs; they on the trading flood,  
Ply stemming nightly toward the pole.”

The snow collects upon the plumes of the pitch pine in the form of a pineapple, which if you divide in the middle will expose three red kernels like the tamarind-stone. So does winter with his mock harvest jeer at the sincerity of summer. The tropical fruits, which will not bear the rawness of our summer, are imitated in a thousand fantastic shapes by the whimsical genius of winter.

In winter the warmth comes directly from the sun, and is not radiated from the earth. In summer I forget to bless the sun for his heat; but when I feel his beams on my back as I thread some snowy dale, I am grateful as for a special kindness which would not be weary of well doing but had pursued me even into that by-place.

When the wind blows, the fine snow comes filtering down through all the aisles of the wood in a golden cloud.

The trees covered with snow admit a very plain and clean light, but not brilliant, as if through windows of ground glass; a sort of white darkness it is, all of the sun's splendor that can be retained.

The fashions of the wood are more fluctuating than those of Paris; snow, rime, ice, green and dry leaves incessantly make new patterns. There are all the shapes and hues of the kaleidoscope and the designs and ciphers of books of heraldry in the outlines of the trees. Every time I see a nodding pine-top, it seems as if a new fashion of wearing plumes had come into vogue.

I saw a team come out of a path in the woods, as though it had never gone in, but belonged there, and only came out like Elisha's bears. It was wholly of the village, and not at all of the wood.

These particles of snow which the early wind shakes down are what is stirring, or the morning news of the wood. Sometimes it is blown up above the trees, like the sand of the desert.

You glance up these paths, closely imbowered by bent trees, as through the side aisles of a cathedral, and expect to hear a choir chanting from their depths. You are never so far in them as they are far before you.

Their secret is where you are not and where your feet can never carry you.

I tread in the tracks of the fox which has gone before me by some hours, or which perhaps I have started, with such a tiptoe of expectation as if I were on the trail of the Spirit itself which resides in these woods, and expected soon to catch it in its lair.

The snow falls on no two trees alike, but the forms it assumes are as various as those of the twigs and leaves which receive it. They are, as it were, predetermined by the genius of the tree. So one divine spirit descends alike on all, but bears a peculiar fruit in each. The divinity subsides on all men, as the snowflakes settle on the fields and ledges and takes the form of the various clefts and surfaces on which it lodges.

Here is the distinct trail of a fox stretching [a] quarter of a mile across the pond. Now I am curious to know what has determined its graceful curvatures, its greater or less spaces and distinctness, and how surely they were coincident with the fluctuations of some mind, why they now lead me two steps to the right, and then three to the left. If these things are not to be called up and accounted for in the Lamb's Book of Life, I shall set them down for careless accountants. Here was one expression of the divine mind this morning. The pond was his journal, and last night's snow made a tabula rasa for him. I know which way a mind wended this morning, what horizon it faced, by the setting of these tracks; whether it moved slowly or rapidly, by the greater or less intervals and distinctness, for the swiftest step leaves yet a lasting trace.

Sometimes I come out suddenly upon a high plain, which seems to be the upper level and true surface of the earth, and by its very baldness aspires and lies up nearer to the stars, — a place where a decalogue might be let down or a saint translated.

I take a horse and oxen, standing among the woodpiles in the forest, for one of them, and when at length the horse pricks his ears, and I give him another name, where's the difference? I am startled by the possibility of such errors, and the indifference with [which] they are allowed to occur.

Fair Haven Pond is scored with the trails of foxes, and you may see where they have gambolled and gone through a hundred evolutions, which testify to a singular listlessness and leisure in nature.

Suddenly, looking down the river, I saw a fox some sixty rods off, making across to the hills on my left. As the snow lay five inches deep, he made but slow progress, but it was no impediment to me. So, yielding to the instinct of the chase, I tossed my head aloft and bounded away, snuffing the air like a fox-hound, and spurning the world and the Humane Society at each bound. It seemed the woods rang with the hunter's horn, and Diana and all the satyrs joined in the chase and cheered me on. Olympian and Elean youths were waving palms on the hills. In the meanwhile I gained rapidly on the fox; but he showed a remarkable presence of mind, for, instead of keeping up the face of the hill, which was steep and unwooded in that part, he kept along the slope in the direction of the forest, though he lost ground by it. Notwithstanding his fright, he took no step which was not beautiful. The course on his part was a series of most graceful curves. It was a sort of leopard canter, I should say, as if he were nowise impeded by the snow, but were husbanding his strength all the while. When he doubled I wheeled and cut him off, bounding with fresh vigor, and Antæus-like, recovering my strength each time I touched the snow. Having got near enough for a fair view, just as he was slipping into the wood, I gracefully yielded him the palm. He ran as though there were not a bone in his back, occasionally dropping his muzzle to the snow for a rod or two, and then tossing his head aloft when satisfied of his course. When he came to a declivity he put his fore feet together and slid down it like a cat. He trod so softly that you could not have heard it from any nearness, and yet with such expression that it would not have been quite inaudible at any distance. So, hoping this experience would prove a useful lesson to him, I returned to the village by the highway of the river.

There is all the romance of my youthfulest moment in music. Heaven lies about us, as in our infancy. There is nothing so wild and extravagant that it does not make true. It makes a dream my only real experience, and prompts faith to such elasticity that only the incredible can satisfy it. It tells me again to trust the remotest and finest, as the divinest, instinct. All that I have imagined of heroism, it reminds and reassures me of. It is a life un-lived, a life beyond life, where at length my years will pass. I look under the lids of Time.

Jan. 31. Sunday. At each step man measures himself against the system. If he cannot actually bely the sun and make it fast to this planet, yet the British man alone spins a yarn in one year which will reach fifty-one times the distance from the earth to the

sun. So, having his cable ready twisted and coiled, the fixed stars are virtually within his grasp. He carries his lasso coiled at his saddle bow, but is never forced to cast it.

All things are subdued to me by virtue of that coiled lasso I carry, and I lead them without the trouble of a cast. It is the rope that lies coiled on the deck, which moors my ship, and I have never to bend a cable.

In God's hall hang cables of infinite length, and in His entries stand bars of infinite strength; but those cables were never bent, nor those bars ever poised, for all things have been subdued to the divinity from the first, and these are the seals of His power.

The guilty never escape, for a steed stands ever ready saddled and bridled at God's door, and the sinner surrenders at last.

End of my Journal of 396 pages.

Feb. 2. Tuesday. It is easy to repeat, but hard to originate. Nature is readily made to repeat herself in a thousand forms, and in the daguerreotype her own light is amanuensis, and the picture too has more than a surface significance, — a depth equal to the prospect, — so that the microscope may be applied to the one as the spy-glass to the other. Thus we may easily multiply the forms of the outward; but to give the within outwardness, that is not easy.

That an impression may be taken, perfect stillness, though but for an instant, is necessary. There is something analogous in the birth of all rhymes.

Our sympathy is a gift whose value we can never know, nor when we impart it. The instant of communion is when, for the least point of time, we cease to oscillate, and coincide in rest by as fine a point as a star pierces the firmament.

The stars are the mountain peaks of celestial countries.

A child asked its father what became of the old moon, and he said it was cut up into stars.

There is always a single ear in the audience, to which we address ourselves.

How much does it concern you, the good opinion of your friend? Therein is the measure of fame. For the herd of men multiplied many times will never come up to the value of one friend. In this society there is no fame but love; for as our name may be on the lips of men, so are we in each other's hearts. There is no ambition but virtue; for why should we go round about, who may go direct?

All those contingences which the philanthropist, statesman, and housekeeper write so many books to meet are simply and quietly settled in the intercourse of friends.

For our aspirations there is no expression as yet, but if we obey steadily, by another year we shall have learned the language of last year's aspirations.

When I read the other day the weight of some of the generals of the Revolution, it seemed no unimportant fact in their biography. It is at least one other means of comparing ourselves with them. Tell me how much Milton or Shakespeare weighed, and I will get weighed myself, that I may know better what they are to me.

Weight has something very imposing in it, for we cannot get rid of it. Once in the scales we must weigh. And are we not always in the scales, and weighing just our due, though we kick the beam, and do all we can to heavy or lighten ourselves?

Feb. 3. Wednesday. The present seems never to get its due; it is the least obvious, — neither before, nor behind, but within us. All the past plays into this moment, and we are what we are. My aspiration is one thing, my reflection another, but, over all, myself and condition is and does. To men and nature I am each moment a finished tool, — a spade, a barrow, or a pickaxe. This immense promise is no efficient quality. For all practical purposes I am done.

When we do a service to our neighbor, we serve our next neighbor.

We are constantly invited to be what we are; as to something worthy and noble. I never waited but for myself to come round; none ever detained me, but I lagged or tagged after myself.

It steads us to be as true to children and boors as to God himself. It is the only attitude which will suit all occasions; it only will make the earth yield her increase, and by it do we effectually expostulate with the wind. If I run against a post, this is the remedy. I would meet the morning and evening on very sincere ground. When the sun introduces me to a new day, I silently say to myself, "Let us be faithful all round; we will do justice and receive it." Something like this is the secret charm of Nature's demeanor toward us, strict conscientiousness [?] and disregard of us when we have ceased to have regard for ourselves. So she can never offend us. How true she is! — and never swerves. In her most genial moment her laws are as steadfastly and relentlessly fulfilled — though the decalogue is rhymed and set to sweetest music — as in her sternest.

Any exhibition of affection — as an inadvertent word, or act, or look — seems premature, as if the time were not ripe for it; like the buds which the warm days near the end of winter cause to push out and unfold before the frosts are yet gone.

My life must seem as if it were passing at a higher level than that which I occupy. It must possess a dignity which will not allow me to be familiar.

The unpretending truth of a simile implies sometimes such distinctness in the conception as only experience could have supplied. Homer could not improve the simile of a soldier who was careful enough to tell the truth. If he knows what it was, he will know what it was like.

As the ancient Britons were exhibited in Rome in their native costume, and the Dacian came to display his swordsmanship in the arena, so Tyrolese peasants have come farther yet, even from the neighborhood of Rome to Concord, for our entertainment this night.

Feb. 4. Thursday. When you are once comfortably seated at a public meeting, there is something unmanly in the sitting on tiptoe and qui vive attitude, — the involuntarily rising into your throat, as if gravity had ceased to operate, — when a lady approaches, with quite godlike presumption, to elicit the miracle of a seat where none is.

Music will make the most nervous chord vibrate healthily.

Such a state of unrest becomes only a fluttered virtue. When once I have learned my place in the sphere, I will fill it once for all, rather like a fixed star than a planet. I will rest as the mountains do, so that your ladies might as well walk into the midst

of the Tyrol, and look for Nature to spread them a green lawn for their disport in the midst of those solemn fastnesses, as that I should fly out of my orbit at their approach and go about eccentric, like a comet, to endanger other systems. No, be true to your instincts, and sit; wait till you can be genuinely polite, if it be till doomsday, and not lose your chance everlastingly by a cowardly yielding to young etiquette. By your look say unto them, The lines have fallen to me in pleasant places, and I will fill that station God has assigned me. As well Miss Cassiopeia up there might ask the brazen-fronted Taurus to draw in his horns, that she might shine in his stead. No, no! not till my cycle is completed.

How is it that motion will always find space to move in, and rest a seat? Men hate antagonism, and the weaker will always yield to the stronger. If a stranger enter with sufficient determination into a crowded assembly, as if commissioned by the gods to find a seat there, as the falling stone by a divine impulse seeks a resting-place, each one will rise without thinking to offer his place. Now we have only to be commissioned to sit, and depend upon it the gods will not balk their own work. Ye came one day too late, as did the poet after the world had been divided, and so returned to dwell with the god that sent him. When presumptuous womanhood demands to surrender my position, I bide my time, — though it be with misgiving, — and yield to no mortal shove, but expect a divine impulse. Produce your warrant, and I will retire; for not now can I give you a clear seat, but must leave part of my manhood behind and wander a diminished man, who at length will not have length and breadth enough to fill any seat at all. It was very kind in the gods who gave us a now condition, or condition of rest, in which we might unhurriedly deliberate before taking a step. When I give up my now and here without having secured my then and there, I am the prodigal son of a kind father and deserve no better than the husks which the swine eat, nor that the fatted calf be killed for me.

Rest forever. When instinct comes to the rescue of your politeness, it will seat you securely still, though it be to hang by a rail or poise yourself on a stick. To do otherwise is to be polite only as the soldier who runs away when the enemy demands his post. Politeness is rather when the generals interchange civilities before the fight, not when one returns a sword after the victory.

Not only in his cunning hand and brain, but when he speaks, too, does man assert his superiority. He conquers the spaces with his voice, as well as the lion. The voice of a strong man modulated to the cadence of some tune is more imposing than any natural sound. The keeper's is the most commanding, and is heard over all the din of the menagerie. A strong, musical voice imposes a new order and harmony upon nature; from it as a centre the law is promulgated to the universe. What it lacks in volume and loudness may always be made up in musical expression and distinctness. The brute growls to secure obedience; he threatens. The man speaks as though obedience were already secured.

Brave speaking is the most entire and richest sacrifice to the gods.

Feb. 5. Friday. Only on rare occasions am I reminded that man too has a voice, as well as birds and quadrupeds, which breaks on the stillness of nature with its peculiar accent. The least sound pervades and subdues all space to it as long as it fills my ear. Contrasted single with the silence, it is as wide as it. Music is the crystallization of sound. There is something in the effect of a harmonious voice upon the disposition of its neighborhood analogous to the law of crystals; it centralizes itself and sounds like the published law of things. If the law of the universe were to be audibly promulgated, no mortal lawgiver would suspect it, for it would be a finer melody than his ears ever attended to. It would be sphere music.

When by tutoring their voices singers enhance one another's performance, the harmony is more complete and essential than is heard. The quire is one family held together by a very close bond. Hence the romance we associate with Gypsies and circus companies and strolling musicians. The idea of brotherhood is so strong in them. Their society is ideal for that one end.

There is something in this brotherhood — this feeling of kind, or kindness — which insensibly elevates the subjects of it in our eyes. However poor or mean, they have something which counterbalances our contempt. This is that in the strolling pauper family which does not court our charity but can even bless and smile on us and make the kindness reciprocal. It sanctifies the place and the hour.

These Rainers, if they are not brothers and sisters, must be uncles and cousins at least. These Swiss who have come to sing to us, we have no doubt are the flower of the Tyrol. Such is the instinctive kindness with which the foreigner is always received, that he is ever presumed to be the fairest and noblest of his race. The traveller finds that it is not easy to move away from his friends, after all, but all people whom he visits are anxious to supply the place to him of his parents and brothers and sisters. To these Swiss I find that I have attributed all Tell's patriotism and the devotion of Arnold Winkelried and whatever goodness or greatness belongs to the nation.

All costume off a man, when not simply doffed, is grotesque. There must be a heart inside it. When these Swiss appear before me in gaiters and high-crowned hats with feathers, I am disposed to laugh, but soon I see that their serious eye becomes these and they it. It is the sincere life passed within it which consecrates the costume of any people. A sufficiently sober eye will retrieve itself and subordinate any grotesqueness. Let Harlequin be taken with a fit of the colic in the midst of his buffoonery, and his trappings and finery will serve that mood too and with their drooping sympathy enhance the sincerity of his misfortune. When the soldier is hit by a cannon-ball, rags are as becoming as purple. So soon as a man engages to eat, drink, sleep, walk, and sit, and meet all the contingencies of life therein, his costume is hallowed and a theme for poetry, whether it be a bear's skin or ermine, a beaver hat or a Turkish turban. He will not wear anything because it is blue, or black, or round, or square, but from a necessity which cannot be superseded.

I look into the face and manners for something familiar and homely even, to be assured that the costume of the foreigner is not whimsical or finical.

In all emergencies there is always one step which you may take on firm ground where gravity will assure you footing. So you hold a draft on Fate payable at sight.

Feb. 6. Saturday. One may discover a new side to his most intimate friend when for the first time he hears him speak in public. He will be stranger to him as he is more familiar to the audience. The longest intimacy could not foretell how he would behave then. When I observe my friend's conduct toward others, then chiefly I learn the traits in his character, and in each case I am unprepared for the issue.

When one gets up to address briefly a strange audience, in that little he may have opportunity to say he will not quite do himself injustice. For he will instantly and instinctively average himself to his audience, and while he is true to his own character still, he will in a few moments make that impression which a series of months and years would but expand. Before he answers, his thought like lightning runs round the whole compass of his experiences, and he is scrupulous to speak from that which he is and with a more entire truthfulness than usual. How little do we know each other then! Who can tell how his friend would behave on any occasion?

As for those Swiss, I think of the fields their hands have plowed and reaped, and respect their costume as the memorial or rather cotemporary and witness of this. What is there in a toga but a Roman? What but a Quaker in a broad-brimmed hat? He who describes the dress of a Janizary going to war does me a similar service as when he paints the scenery of the battle-field. It helps make his exploit picturesque.

Costume is not determined by whim, not even the tattooing and paint of the savage. Sun, wind, rain, and the form of our bodies shape our hats and coats for us, more even than taste. Good taste secures the utmost gratification without sacrificing any conveniences. If all nations derived their fashions from Paris or London, the world would seem like a Vanity Fair or all fools' day, and the Tartar and Bedouin ride in it like jesters in a circus, and the Pawnee and Esquimau hunt in masquerade. What I am must make you forget what I wear. The fashionable world is content to be eclipsed by its dress, and never will bear the contrast. Only industry will reform their dress. They are idle, — exostrious, building without.

The value of the recess in any public entertainment consists in the opportunity for self-recovery which it offers. We who have been swayed as one heart, expanding and contracting with the common pulse, find ourselves in the interim, and set us up again, and feel our own hearts beating in our breasts. We are always a little astonished to see a man walking across the room, through an attentive audience, with any degree of selfpossession. He makes himself strange to us. He is a little stubborn withal, and seems to say, "I am selfsustained and independent as well as the performer, and am not to be swallowed up in the common enthusiasm. No, no, there are two of us, and John's as good as Thomas." In the recess the audience is cut up into a hundred little coteries, and as soon as each individual life has recovered its tone and the purposes of health have been answered, it is time for the performances to commence again.

In a public performer, the simplest actions, which at other times are left to unconscious nature, as the ascending a few steps in front of an audience, acquire a fatal importance and become arduous deeds.

When I select one here and another there, and strive to join sundered thoughts, I make but a partial heap after all. Nature strews her nuts and flowers broadcast, and never collects them into heaps. A man does not tell us all he has thought upon truth or beauty at a sitting, but, from his last thought on the subject, wanders through a varied scenery of upland, meadow, and woodland to his next. Sometimes a single and casual thought rises naturally and inevitably with a queenly majesty and escort, like the stars in the east. Fate has surely enshrined it in this hour and circumstances for some purpose. What she has joined together, let not man put asunder. Shall I transplant the primrose by the river's brim, to set it beside its sister on the mountain? This was the soil it grew in, this the hour it bloomed in. If sun, wind, and rain came here to cherish and expand it, shall not we come here to pluck it? Shall we require it to grow in a conservatory for our convenience?

I feel slightly complimented when Nature condescends to make use of me without my knowledge, as when I help scatter her seeds in my walk, or carry burs and cockles on my clothes from field to field. I feel as though I had done something for the commonweal, and were entitled to board and lodging. I take such airs upon me as the boy who holds a horse for the circus company, whom all the spectators envy.

"Lu ral lu ral lu" may be more impressively sung than very respectable wisdom talked. It is well-timed, as wisdom is not always.

All things prophesy but the prophet. In augury and divination nature is put to the torture. In Ben Jonson's tragedy of "Catiline," Lentulus makes answer to Catiline, who has bribed the augurs to say that he is that third Cornelius who is to be king of Rome, "All prophecies, you know, suffer the torture." He who inspects the entrails is always bribed, but they are unbribable. He who seeks to know the future by unlawful means has unavoidably subjected the oracle to the torture of private and partial interests. The oracles of God serve the public interest without fee. To the just and benevolent mind nature declares, as the sun lights the world.

Feb. 7. Sunday. Without greatcoat or drawers I have advanced thus far into the snow-banks of the winter, without thought and with impunity. When I meet my neighbors in muffs and furs and tippetts, they look as if they had retreated into the interior fastnesses from some foe invisible to me. They remind me that this is the season of winter, in which it becomes a man to be cold. For feeling, I am a piece of clean wood of this shape, which will do service till it rots, and though the cold has its physical effect on me, it is a kindly one, for it "finds its acquaintance there." My diet is so little stimulating, and my body in consequence so little heated, as to excite no antagonism in nature, but flourishes like a tree, which finds even the winter genial to its expansion and the secretion of sap. May not the body defend itself against cold by its very nakedness, and its elements be so simple and single that they cannot congeal? Frost does not affect one but several. My body now affords no more pasture for cold than a leafless twig. I

call it a protestant warmth. My limbs do not tire as formerly, but I use myself as any other piece of nature, and from mere indifference and thoughtlessness may break the timber.

It is the vice of the last season which compels us to arm ourselves for the next. If man always conformed to Nature, he would not have to defend himself against her, but find her his constant nurse and friend, as do plants and quadrupeds.

In the sunshine and the crowing of cocks I feel an illimitable holiness, which makes me bless God and myself. The warm sun casts his incessant gift at my feet as I walk along, unfolding his yellow worlds. Yonder sexton with a few cheap sounds makes me richer than these who mind his summons. The true gift is as wide as my gratitude, and as frequent, and the donor is as grateful as the recipient. There would be a New Year's gift indeed, if we would bestow on each other our sincerity. We should communicate our wealth, and not purchase that which does not belong to us for a sign. Why give each other a sign to keep? If we gave the thing itself, there would be no need of a sign. I am not sure I should find out a really great person soon. He would be simple Thomas or Oliver for some centuries first. The lesser eminences would hide the higher, and I should at last reach his top by a gentle acclivity. I felt it would be necessary to remain some weeks at the Notch to be impressed by the grandeur of the scenery. We do not expect that Alexander will conquer Asia the first time we are introduced to him. A great man accepts the occasion the fates offer him. Let us not be disappointed. We stand at first upon the pampas which surround him. It is these mountains round about which make the valleys here below. He is not a dead level, so many feet above low-water mark. Greatness is in the ascent. But there is no accounting for the little men.

“They must sweat no less

To fit their properties, than t' express their parts.”

Or the line before this: —

“Would you have

Such an Herculean actor in the scene,

And not his hydra?” — Jonson.

The eaves are innning on the south side of the house; the titmouse lisps in the poplar; the bells are ringing for church; while the sun presides over all and makes his simple warmth more obvious than all else. What shall I do with this hour, so like time and yet so fit for eternity? Where in me are these russet patches of ground, and scattered logs and chips in the yard? I do not feel cluttered. I have some notion what the John'swort and life-everlasting may be thinking about when the sun shines on me as on them and turns my prompt thought into just such a seething shimmer. I lie out indistinct as a heath at noonday. I am evaporating and ascending into the sun.

Nothing stands in the way to success, but to failure. To victory is all the way up hill; to defeat the simplest wight that weighs may soon slide down. Cowards would not have victory but the fruits of victory; but she it is that sweetens all the spoil. Thus, by a just fate, the booty cannot fall to him who did not win it. There is victory in

every effort. In the least swing of the arm, in indignant thought, in stern content, we conquer our foes.

Great thoughts make great men. Without these no heraldry nor blood will avail.

The blood circulates to the feet and hands, but the thought never descends from the head.

The most I can do for my friend is simply to be his friend. I have no wealth to bestow on him. If he knows that I am happy in loving him, he will want no other reward. Is not Friendship divine in this?

I have myself to respect, but to myself I am not amiable; but my friend is my amiableness personified.

And yet we walk the stage indifferent actors, not thinking what a sublime drama we might enact if we would be joint workers and a mutual material. Why go to the woods to cut timber to display our art upon, when here are men as trees walking? The world has never learned what men can build each other up to be, when both master and pupil work in love.

He that comes as a stranger to my house will have to stay as a stranger. He has made his own reception. But persevering love was never yet refused.

“The vicious count their years, virtuous their acts.”

JONSON.

The former consider the length of their service, the latter its quality.

Wait not till I invite thee, but observe I'm glad to see thee when thou com'st.

The most ardent lover holds yet a private court, and his love can never be so strong or ethereal that there will not be danger that judgment may be rendered against the beloved.

I would have men make a greater use of me. Now I must belittle myself to have dealings with them. My friend will show such a noble confidence that I shall aspire to the society of his good opinion. Never presume men less that you may make them more. So far as we respond to our ideal estimate of each other do we have profitable intercourse.

A brave man always knows the way, no matter how intricate the roads.

Feb. 8. All we have experienced is so much gone within us, and there lies. It is the company we keep. One day, in health or sickness, it will come out and be remembered. Neither body nor soul forgets anything. The twig always remembers the wind that shook it, and the stone the cuff it received. Ask the old tree and the sand.

To be of most service to my brother I must meet him on the most equal and even ground, the platform on which our lives are passing. But how often does politeness permit this?

I seek a man who will appeal to me when I am in fault. We will treat as gods settling the affairs of men. In his intercourse I shall be always a god to-day, who was a man yesterday. He will never confound me with my guilt, but let me be immaculate and hold up my skirts. Differences he will make haste to clear up, but leave agreements unsettled the while.

As time is measured by the lapse of ideas, we may grow of our own force, as the mussel adds new circles to its shell. My thoughts secrete the lime. We may grow old with the vigor of youth. Are we not always in youth so long as we face heaven? We may always live in the morning of our days. To him who seeks early, the sun never gets over the edge of the hill, but his rays fall slanting forever. His wise sayings are like the chopping of wood and crowing of cocks in the dawn.

My Journal is that of me which would else spill over and run to waste, gleanings from the field which in action I reap. I must not live for it, but in it for the gods.

They are my correspondent, to whom daily I send off this sheet postpaid. I am clerk in their counting-room, and at evening transfer the account from day-book to ledger. It is as a leaf which hangs over my head in the path. I bend the twig and write my prayers on it; then letting it go, the bough springs up and shows the scrawl to heaven. As if it were not kept shut in my desk, but were as public a leaf as any in nature. It is papyrus by the riverside; it is vellum in the pastures; it is parchment on the hills. I find it everywhere as free as the leaves which troop along the lanes in autumn. The crow, the goose, the eagle carry my quill, and the wind blows the leaves as far as I go. Or, if my imagination does not soar, but gropes in slime and mud, then I write with a reed.

It is always a chance scrawl, and commemorates some accident, — as great as earthquake or eclipse. Like the sere leaves in yonder vase, these have been gathered far and wide. Upland and lowland, forest and field have been ransacked.

In our holiest moment our devil with a leer stands close at hand. He is a very busy devil. It gains vice some respect, I must confess, thus to be reminded how indefatigable it is. It has at least the merit of industriousness. When I go forth with zeal to some good work, my devil is sure to get his robe tucked up the first and arrives there as soon as I, with a look of sincere earnestness which puts to shame my best intent. He is as forward as I to a good work, and as disinterested. He has a winning way of recommending himself by making himself useful. How readily he comes into my best project, and does his work with a quiet and steady cheerfulness which even virtue may take pattern from.

I never was so rapid in my virtue but my vice kept up with me. It always came in by a hand, and never panting, but with a curried coolness halted, as if halting were the beginning not the end of the course. It only runs the swifter because it has no rider. It never was behind me but when I turned to look and so fell behind myself. I never did a charitable thing but there he stood, scarce in the rear, with hat in hand, partner on the same errand, ready to share the smile of gratitude. Though I shut the door never so quick and tell it to stay at home like a good dog, it will out with me, for I shut in my own legs so, and it escapes in the meanwhile and is ready to back and reinforce me in most virtuous deeds. And if I turn and say, "Get thee behind me," he then indeed turns too and takes the lead, though he seems to retire with a pensive and compassionate look, as much as to say, "Ye know not what ye do."

Just as active as I become to virtue, just so active is my remaining vice. Every time we teach our virtue a new nobleness, we teach our vice a new cunning. When we sharpen the blade it will stab better as well as whittle. The scythe that cuts will cut our legs. We are double-edged blades, and every time we whet our virtue the return stroke straps our vice. And when we cut a clear descending blow, our vice on tother edge rips up the work. Where is the skillful swordsman that can draw his blade straight back out of the wound?

Every man proposes fairly, and does not willfully take the devil for his guide; as our shadows never fall between us and the sun. Go towards the sun and your shadow will fall behind you.

Feb. 9. Tuesday.

“Cato. Good Marcus Tullius (which is more than great),  
Thou hadst thy education with the gods.”

JONSON.

Better be defamed than overpraised. Thou canst then justly praise thyself. What notoriety art thou that can be defamed? Who can be praised for what they are not deserve rather to be damned for what they are. It is hard to wear a dress that is too long and loose without stumbling.

“Whoe’er is raised, For wealth he has not, he is tax’d, not prais’d,”

says Jonson. If you mind the flatterer, you rob yourself and still cheat him. The fates never exaggerate; men pass for what they are. The state never fails to get a revenue out of you without a direct tax. Flattery would lay a direct tax. What I am praised for what I am not I put to the account of the gods. It needs a skillful eye to distinguish between their coin and my own. But however there can be no loss either way, for what meed I have earned is equally theirs. Let neither fame nor infamy hit you, but the one go as far beyond as the other falls behind. Let the one glance past you to the gods, and the other wallow where it was engendered. The home thrusts are at helmets upon blocks, and my worst foes but stab an armor through.

My life at this moment is like a summer morning when birds are singing. Yet that is false, for nature’s is an idle pleasure in comparison: my hour has a more solid serenity. I have been breaking silence these twenty-three years and have hardly made a rent in it. Silence has no end; speech is but the beginning of it. My friend thinks I keep silence, who am only choked with letting it out so fast. Does he forget that new mines of secrecy are constantly opening in me?

If any scorn your love, let them see plainly that you serve not them but another. If these bars are up, go your way to other of God’s pastures, and browse there the while. When your host shuts his door on you he incloses you in the dwelling of nature. He thrusts you over the threshold of the world. My foes restore me to my friends.

I might say friendship had no ears as love has no eyes, for no word is evidence in its court. The least act fulfills more than all words profess. The most gracious speech is but partial kindness, but the least genuine deed takes the whole man. If we had waited till doomsday it could never have been uttered.

Feb. 10. Wednesday. That was fine praise which Ben Jonson gave to Thomas, Lord Chancellor: —

“Whilst thou art certain to thy words, once gone, As is thy conscience, which is always one.”

Words do not lose their truth by time or misinterpretation, but stand unscathed longer than he who spoke them.

Let our words be such as we may unblushingly behold sculptured in granite on the walls to the least syllable. Our thoughts and actions may be very private for a long time, for they demand a more catholic publicity to be displayed in than the world can afford. Our best deeds shun the narrow walks of men, and are not ambitious of the faint light the world can shed on them, but delight to unfold themselves in that public ground between God and conscience.

Truth has for audience and spectator all the world. Within, where I resolve and deal with principles, there is more space and room than anywhere without, where my hands execute. Men should hear of your virtue only as they hear the creaking of the earth's axle and the music of the spheres. It will fall into the course of nature and be effectually concealed by publicness.

I asked a man to-day if he would rent me some land, and he said he had four acres as good soil “as any outdoors.” It was a true poet's account of it. He and I, and all the world, went outdoors to breathe the free air and stretch ourselves. For the world is but outdoors, — and we duck behind a panel.

Feb. 11. True help, for the most part, implies a greatness in him who is to be helped as well as in the helper. It takes a god to be helped even. A great person, though unconsciously, will constantly give you great opportunities to serve him, but a mean one will quite preclude all active benevolence. It needs but simply and greatly to want it for once, that all true men may contend who shall be foremost to render aid. My neighbor's state must pray to heaven so devoutly yet disinterestedly as he never prayed in words, before my ears can hear. It must ask divinely. But men so cobble and botch their request, that you must stoop as low as they to give them aid. Their meanness would drag down your deed to be a compromise with conscience, and not leave it to be done on the high table-land of the benevolent soul. They would have you doff your bright and knightly armor and drudge for them, — serve them and not God. But if I am to serve them I must not serve the devil.

What is called charity is no charity, but the interference of a third person. Shall I interfere with fate? Shall I defraud man of the opportunities which God gave him, and so take away his life? Beggars and silent poor cry — how often!— “Get between me and my god.” I will not stay to cobble and patch God's rents, but do clean, new work when he has given me my hands full. This almshouse charity is like putting new wine into old bottles, when so many tuns in God's cellars stand empty. We go about mending the times, when we should be building the eternity.

I must serve a strong master, not a weak one. Help implies a sympathy of energy and effort, else no alleviation will avail.

Feb. 12. Friday. Those great men who are unknown to their own generation are already famous in the society of the great who have gone before them. All worldly fame but subsides from their high estimate beyond the stars. We may still keep pace with those who have gone out of nature, for we run on as smooth ground as they.

The early and the latter saints are separated by no eternal interval.

The child may soon stand face to face with the best father.

Feb. 13. By the truthfulness of our story to-day we help explain ourselves for all our life henceforth. How we hamper and belay ourselves by the least exaggeration! The truth is God's concern; He will sustain it; but who can afford to maintain a lie? We have taken away one of the Pillars of Hercules, and must support the world on our shoulders, who might have walked freely upon it.

My neighbor says that his hill-farm is poor stuff and "only fit to hold the world together." He deserves that God should give him better for so brave a treating of his gifts, instead of humbly putting up therewith. It is a sort of stay, or gore, or gusset, and he will not be blinded by modesty or gratitude, but sees it for what it is; knowing his neighbor's fertile land, he calls his by its right name. But perhaps my farmer forgets that his lean soil has sharpened his wits. This is a crop it was good for. And beside, you see the heavens at a lesser angle from the hill than from the vale.

We have nothing to fear from our foes; God keeps a standing army for that service; but we have no ally against our friends, those ruthless vandals whose kind intent is a subtler poison than the Colchian, a more fatal shaft than the Lydian.

Feb. 14. Sunday. I am confined to the house by bronchitis, and so seek to content myself with that quiet and serene life there is in a warm corner by the fireside, and see the sky through the chimney-top. Sickness should not be allowed to extend further than the body. We need only to retreat further within us to preserve uninterrupted the continuity of serene hours to the end of our lives.

As soon as I find my chest is not of tempered steel, and heart of adamant, I bid good-by to these and look out a new nature. I will be liable to no accidents.

I shall never be poor while I can command a still hour in which to take leave of my sin.

The jingling team which is creaking past reminds me of that verse in the Bible which speaks of God being heard in the bells of the horses.

Feb. 15. There is elevation in every hour. No part of the earth is so low and withdrawn that the heavens cannot be seen from it, but every part supports the sky. We have only to stand on the eminence of the hour, and look out thence into the empyrean, allowing no pinnacle above us, to command an uninterrupted horizon. The moments will lie outspread around us like a blue expanse of mountain and valley, while we stand on the summit of our hour as if we had descended on eagle's wings. For the eagle has stooped to his perch on the highest cliff and has never climbed the rock; he stands by his wings more than by his feet. We shall not want a foothold, but wings will sprout from our shoulders, and we shall walk securely, self-sustained.

For how slight an accident shall two noble souls wait to bring them together!

Feb. 17. Our work should be fitted to and lead on the time, as bud, flower, and fruit lead the circle of the seasons.

The mechanic works no longer than his labor will pay for lights, fuel, and shop rent. Would it not be well for us to consider if our deed will warrant the expense of nature? Will it maintain the sun's light?

Our actions do not use time independently, as the bud does. They should constitute its lapse. It is their room. But they shuffle after and serve the hour.

Feb. 18. Thursday. I do not judge men by anything they can do. Their greatest deed is the impression they make on me. Some serene, inactive men can do everything. Talent only indicates a depth of character in some direction. We do not acquire the ability to do new deeds, but a new capacity for all deeds. My recent growth does not appear in any visible new talent, but its deed will enter into my gaze when I look into the sky, or vacancy. It will help me to consider ferns and everlasting. Man is like a tree which is limited to no age, but grows as long as it has its root in the ground. We have only to live in the alburnum and not in the old wood. The gnarled stump has as tender a bud as the sapling.

Sometimes I find that I have frequented a higher society during sleep, and my thoughts and actions proceed on a higher level in the morning.

A man is the hydrostatic paradox, the counterpoise of the system. You have studied flowers and birds cheaply enough, but you must lay yourself out to buy him.

Feb. 19. A truly good book attracts very little favor to itself. It is so true that it teaches me better than to read it. I must soon lay it down and commence living on its hint. I do not see how any can be written more, but this is the last effusion of genius. When I read an indifferent book, it seems the best thing I can do, but the inspiring volume hardly leaves me leisure to finish its latter pages. It is slipping out of my fingers while I read. It creates no atmosphere in which it may be perused, but one in which its teachings may be practiced. It confers on me such wealth that I lay it down with the least regret. What I began by reading I must finish by acting. So I cannot stay to hear a good sermon and applaud at the conclusion, but shall be half-way to Thermopylæ before that.

When any joke or hoax traverses the Union in the newspapers it apprises me of a fact which no geography or guide-book contains, of a certain leisure and nonchalance pervading society. It is a piece of information from over the Alleghanies, which I know how to prize, though I did not expect it. And it is just so in Nature. I sometimes observe in her a strange trifling, almost listlessness, which conducts to beauty and grace, — the fantastic and whimsical forms of snow and ice, the unaccountable freaks which the tracks of rabbits exhibit. I know now why all those busy speculators do not die of fever and ague.

Coleridge observed the "landscapes made by damp on a whitewashed wall," and so have I.

We seem but to linger in manhood to tell the dreams of our childhood, and they vanish out of memory ere we learn the language.

It is the unexplored grandeur of the storm which keeps up the spirits of the traveller. When I contemplate a hard and bare life in the woods, I find my last consolation in its untrivialness. Shipwreck is less distressing because the breakers do not trifle with us. We are resigned as long as we recognize the sober and solemn mystery of nature. The dripping mariner finds consolation and sympathy in the infinite sublimity of the storm. It is a moral force as well as he. With courage he can lay down his life on the strand, for it never turned a deaf ear to him, nor has he ever exhausted its sympathy.

In the love of narrow souls I make many short voyages, but in vain; I find no sea-room. But in great souls I sail before the wind without a watch, and never reach the shore.

You demand that I be less your friend than you may know it.

Nothing will reconcile friends but love. They make a fatal mistake when they go about like foes to explain and treat with one another. It is a mutual mistake. None are so unmanageable.

Feb. 20. Saturday. I suspect the moral discrimination of the oldest and best authors. I doubt if Milton distinguished greatly between his Satan and his Raphael. In Homer and Æschylus and Dante I miss a nice discrimination of the important shades of character.

When I am going out for an evening I arrange the fire in my stove so that I do not fail to find a good one when I return, though it would have engaged my frequent attention present. So that, when I know I am to be at home, I sometimes make believe that I may go out, to save trouble. And this is the art of living, too, — to leave our life in a condition to go alone, and not to require a constant supervision. We will then sit down serenely to live, as by the side of a stove.

When I sit in earnest, nothing must stand, all must be sedentary with me.

I hear the faint sound of a viol and voices from the neighboring cottage, and think to myself, "I will believe the Muse only for evermore." It assures me that no gleam which comes over the serene soul is deceptive. It warns me of a reality and substance, of which the best that I see is but the phantom and shadow. O music, thou tellest me of things of which memory takes no heed; thy strains are whispered aside from memory's ear.

This is the noblest plain of earth, over which these sounds are borne, the plain of Troy or Eleusis.

Thou openest all my senses to catch thy least hint, and givest me no thought. It would be good to sit at my door of summer evenings forever and hear thy strains. Thou makest me to toy with speech, or walk content without it, not regretting its absence. I am pleased to think how ignorant and shiftless the wisest are. My imperfect sympathies with my friend are cheerful, glimmering light in the valley.

Feb. 21. Sunday. It is hard to preserve equanimity and greatness on that debatable ground between love and esteem. There is nothing so stable and unfluctuating as love. The waves beat steadfast on its shore forever, and its tide has no ebb. It is a resource in all extremities, and a refuge even from itself. And yet love will not be leaned on.

Feb. 22. Love is the tenderest mood of that which is tough — and the toughest mood of that which is tender. It may be roughly handled as the nettle, or gently as the violet. It has its holidays, but is not made for them.

The whole of the day should not be daytime, nor of the night night-time, but some portion be rescued from time to oversee time in. All our hours must not be current; all our time must not lapse. There must be one hour at least which the day did not bring forth, — of ancient parentage and long-established nobility, — which will be a serene and lofty platform overlooking the rest. We should make our notch every day on our characters, as Robinson Crusoe on his stick. We must be at the helm at least once a day; we must feel the tiller-rope in our hands, and know that if we sail, we steer.

Friends will be much apart; they will respect more each other's privacy than their communion, for therein is the fulfillment of our high aims and the conclusion of our arguments. That we know and would associate with not only has high intents, but goes on high errands, and has much private business. The hours he devotes to me were snatched from higher society. He is hardly a gift level to me, but I have to reach up to take it. My imagination always assigns him a nobler employment in my absence than ever I find him engaged in.

We have to go into retirement religiously, and enhance our meeting by rarity and a degree of unfamiliarity. Would you know why I see thee so seldom, my friend? In solitude I have been making up a packet for thee.

The actions which grow out of some common but natural relations affect me strangely, as sometimes the behavior of a mother to her children. So quiet and noiseless an action often moves me more than many sounding exploits.

Feb. 23. Tuesday. Let all our stores and munitions be provided for the lone state.

The care of the body is the highest exercise of prudence. If I have brought this weakness on my lungs, I will consider calmly and disinterestedly how the thing came about, that I may find out the truth and render justice. Then, after patience, I shall be a wiser man than before!

Let us apply all our wit to the repair of our bodies, as we would mend a harrow, for the body will be dealt plainly and implicitly with. We want no moonshine nor surmises about it. This matter of health and sickness has no fatality in it, but is a subject for the merest prudence. If I know not what ails me, I may resort to amulets and charms and, moonstruck, die of dysentery.

We do wrong to slight our sickness and feel so ready to desert our posts when we are harassed. So much the more should we rise above our condition, and make the most of it, for the fruit of disease may be as good as that of health.

There is a subtle elixir in society which makes it a fountain of health to the sick. We want no consolation which is not the overflow of our friend's health. We will have no condolence who are not dolent ourselves. We would have our friend come and respire healthily before us, with the fragrance of many meadows and heaths in his breath, and we will inhabit his body while our own recruits.

Nothing is so good medicine in sickness as to witness some nobleness in another which will advertise us of health. In sickness it is our faith that ails, and noble deeds reassure us. —

That anybody has thought of you on some indifferent occasion frequently implies more good will than you had reason to expect. You have henceforth a higher motive for conduct. We do not know how many amiable thoughts are current.

Feb. 26. Friday. My prickles or smoothness are as much a quality of your hand as of myself. I cannot tell you what I am, more than a ray of the summer's sun. What I am I am, and say not. Being is the great explainer. In the attempt to explain, shall I plane away all the spines, till it is no thistle, but a cornstalk?

If my world is not sufficient without thee, my friend, I will wait till it is and then call thee. You shall come to a palace, not to an almshouse.

My homeliest thought, like the diamond brought from farthest within the mine, will shine with the purest lustre.

Though I write every day, yet when I say a good thing it seems as if I wrote but rarely.

To be great, we do as if we would be tall merely, be longer than we are broad, stretch ourselves and stand on tiptoe. But greatness is well proportioned, unstrained, and stands on the soles of the feet.

How many are waiting for health and warm weather! But they wait for none.

In composition I miss the hue of the mind. As if we could be satisfied with the dews of the morning and evening without their colors, or the heavens without their azure.

This good book helps the sun shine in my chamber. The rays fall on its page as if to explain and illustrate it. I who have been sick hear cattle low in the street, with such a healthy ear as prophesies my cure. These sounds lay a finger on my pulse to some purpose. A fragrance comes in at all my senses which proclaims that I am still of Nature the child. The threshing in yonder barn and the tinkling of the anvil come from the same side of Styx with me. If I were a physician I would try my patients thus. I would wheel them to a window and let Nature feel their pulse. It will soon appear if their sensuous existence is sound. These sounds are but the throbbing of some pulse in me.

Nature seems to have given me these hours to pry into her private drawers. I watch the shadow of the insensible perspiration rising from my coat or hand on the wall. I go and feel my pulse in all the recesses of the house and see if I am of force to carry a homely life and comfort into them.

Feb. 21. Saturday. Life looks as fair at this moment as a summer's sea, or a blond dress in a saffron light, with its sun and grass and walled towns so bright and chaste, as fair as my own virtue which would adventure therein. Like a Persian city or hanging gardens in the distance, so washed in light, so untried, only to be thridded by clean thoughts. All its flags are flowing, and tassels streaming, and drapery flapping, like some gay pavilion. The heavens hang over it like some low screen, and seem to undulate in the breeze.

Through this pure, unwiped hour, as through a crystal glass, I look out upon the future, as a smooth lawn for my virtue to disport in. It shows from afar as unrepulsive as the sunshine upon walls and cities, over which the passing life moves as gently as a shadow. I see the course of my life, like some retired road, wind on without obstruction into a country maze.

I am attired for the future so, as the sun setting presumes all men at leisure and in contemplative mood, — and am thankful that it is thus presented blank and indistinct. It still o’ertops my hope. My future deeds bestir themselves within me and move grandly towards a consummation, as ships go down the Thames. A steady onward motion I feel in me, as still as that, or like some vast, snowy cloud, whose shadow first is seen across the fields. It is the material of all things loose and set afloat that makes my sea.

These various words are not without various meanings. The combined voice of the race makes nicer distinctions than any individual. There are the words “diversion” and “amusement.” It takes more to amuse than to divert. We must be surrendered to our amusements, but only turned aside to our diversions. We have no will in the former, but oversee the latter. We are oftenest diverted in the street, but amused in our chambers. We are diverted from our engagements, but amused when we are listless. We may be diverted from an amusement, and amused by a diversion. It often happens that a diversion becomes our amusement, and our amusement our employment.

Feb. 28. Nothing goes by luck in composition. It allows of no tricks. The best you can write will be the best you are. Every sentence is the result of a long probation. The author’s character is read from title-page to end. Of this he never corrects the proofs. We read it as the essential character of a handwriting without regard to the flourishes. And so of the rest of our actions; it runs as straight as a ruled line through them all, no matter how many curvets about it. Our whole life is taxed for the least thing well done; it is its net result. How we eat, drink, sleep, and use our desultory hours, now in these indifferent days, with no eye to observe and no occasion [to] excite us, determines our authority and capacity for the time to come.

March 3. I hear a man blowing a horn this still evening, and it sounds like the plaint of nature in these times. In this, which I refer to some man, there is something greater than any man. It is as if the earth spoke. It adds a great remoteness to the horizon, and its very distance is grand, as when one draws back the head to speak. That which I now hear in the west seems like an invitation to the east. It runs round the earth as a whisper gallery. It is the spirit of the West calling to the spirit of the East, or else it is the rattling of some team lagging in Day’s train. Coming to me through the darkness and silence, all things great seem transpiring there. It is friendly as a distant hermit’s taper. When it is trilled, or undulates, the heavens are crumpled into time, and successive waves flow across them.

It is a strangely healthy sound for these disjointed times. It is a rare soundness when cow-bells and horns are heard from over the fields. And now I see the beauty and full meaning of that word “sound.” Nature always possesses a certain sonorousness, as in

the hum of insects, the booming of ice, the crowing of cocks in the morning, and the barking of dogs in the night, which indicates her sound state. God's voice is but a clear bell sound. I drink in a wonderful health, a cordial, in sound. The effect of the slightest tinkling in the horizon measures my own soundness. I thank God for sound; it always mounts, and makes me mount. I think I will not trouble myself for any wealth, when I can be so cheaply enriched. Here I contemplate to drudge that I may own a farm — and may have such a limitless estate for the listening. All good things are cheap: all bad are very dear.

As for these communities, I think I had rather keep bachelor's hall in hell than go to board in heaven. Do you think your virtue will be boarded with you? It will never live on the interest of your money, depend upon it. The boarder has no home. In heaven I hope to bake my own bread and clean my own linen. The tomb is the only boarding-house in which a hundred are served at once. In the catacomb we may dwell together and prop one another without loss.

March 4. Ben Jonson says in his epigrams, —

“He makes himself a thorough-fare of Vice.”

This is true, for by vice the substance of a man is not changed, but all his pores, and cavities, and avenues are prophaned by being made the thoroughfares of vice. He is the highway of his vice. The searching devil courses through and through him. His flesh and blood and bones are cheapened. He is all trivial, a place where three highways of sin meet. So is another the thoroughfare of virtue, and virtue circulates through all his aisles like a wind, and he is hallowed.

We reprove each other unconsciously by our own behavior. Our very carriage and demeanor in the streets should be a reprimand that will go to the conscience of every beholder. An infusion of love from a great soul gives a color to our faults, which will discover them, as lunar caustic detects impurities in water.

The best will not seem to go contrary to others, but, as if they could afford to travel the same way, they go a parallel but higher course, a sort of upper road. Jonson says,

—  
“That to the vulgar canst thyself apply, Treading a better path not contrary.”

Their way is a mountain slope, a river valley's course, a tide which mingles a myriad lesser currents.

March 5. Friday. How can our love increase, unless our loveliness increase also? We must securely love each other as we love God, with no more danger that our love be unrequited or ill-bestowed. There is that in my friend before which I must first decay and prove untrue. Love is the least moral and the most. Are the best good in their love? or the worst, bad?

March 6. An honest misunderstanding is often the ground of future intercourse.

#### THE SPHINX

(An interpretation of Emerson's poem - the numbers refer to stanzas)

March 7,8,9,10. The Sphinx is man's insatiable and questioning spirit, which still, as of old, stands by the roadside in us and proposes the riddle of life to every passer.

The ancients represented this by a monster who was a riddle of herself, having a body composed of various creatures, as if to hint that she had no individual existence, but was nearly allied to and brooded ‘ over all. They made her devour those who were unable to explain her enigmas, as we are devoured by doubt, and struggle towards the light, as if to be assured of our lives. For we live by confidence, and our bravery is in some moment when we are certain to that degree that our certainty cannot be increased; as, when a ray bursts through a gap in a cloud, it darts as far, and reaches the earth as surely, as the whole sun would have done.

1. — In the first four lines is described the mood in which the Sphinx bestirs herself in us. We must look on the world with a drowsy and half-shut eye, that it may not be too much in our eye, and rather stand aloof from than within it. When we are awake to the real world, we are asleep to the actual. The sinful drowse to eternity, the virtuous to time. Menu says that the “supreme omnipresent intelligence” is “a spirit which can only be conceived by a mind slumbering.” Wisdom and holiness always slumber; they are never active in the ways of the world. As in our night-dreams we are nearest to awakening, so in our day-dreams we are nearest to a supernatural awakening, and the plain and flat satisfactoriness of life becomes so significant as to be questioned.

The Sphinx hints that in the ages her secret is kept, but in the annihilation of ages alone is it revealed. So far from solving the problem of life, Time only serves to propose and keep it in. Time waits but for its solution to become eternity. Its lapse is measured by the successive failures to answer the incessant question, and the generations of men are the unskillful passengers devoured.

2. — She hints generally at man’s mystery. He knows only that he is, not what, nor whence. Not only is he curiously and wonderfully wrought, but with Dædalian intricacy. He is lost in himself as a labyrinth and has no clue to get out by. If he could get out of his humanity, he would have got out of nature. “Dædalian” expresses both the skill and the inscrutable design of the builder.

The insolubleness of the riddle is only more forcibly expressed by the lines, —

“Out of sleeping a waking,

Out of waking a sleep.”

They express the complete uncertainty and renunciation of knowledge of the propounder.

3, — 4, 5, 6. In these verses is described the integrity of all animate and inanimate things but man, — how each is a problem of itself and not the solution of one and presides over and uses the mystery of the universe as unhesitatingly as if it were the partner of God; how, by a sort of essential and practical faith, each understands all, for to see that we understand is to know that we misunderstand. Each natural object is an end to itself. A brave, undoubting life do they all live, and are content to be a part of the mystery which is God, and throw the responsibility on man of explaining them and himself too.

3. — The outlines of the trees are as correct as if ruled by God on the sky. The motions of quadrupeds and birds Nature never thinks to mend, but they are a last copy and the flourishes of His hand.

4. — The waves lapse with such a melody on the shore as shows that they have long been at one with Nature. Theirs is as perfect play as if the heavens and earth were not. They meet with a sweet difference and independently, as old playfellows. Nothing do they lack more than the world. The ripple is proud to be a ripple and balances the sea. The atoms, which are in such a continual flux, notwithstanding their minuteness, have a certain essential valor and independence. They have the integrity of worlds, and attract and repel firmly as such. The least has more manhood than Democritus.

5. — So also in Nature the perfection of the whole is the perfection of the parts, and what is itself perfect serves to adorn and set off all the rest. Her distinctions are but reliefs. Night veileth the morning for the morning's sake, and the vapor adds a new attraction to the hill. Nature looks like a conspiracy for the advantage of all her parts; when one feature shines, all the rest seem suborned to heighten its charm. In her circle each gladly gives precedence to the other. Day gladly alternates with night. Behind these the vapor atones to the hill for its interference, and this harmonious scene is the effect of that at-one-ment.

6. — In a sense the babe takes its departure from Nature as the grown man his departure out of her, and so during its nonage is at one with her, and as a part of herself. It is indeed the very flower and blossom of Nature. —

“Shines the peace of all being  
Without cloud, in its eyes;  
And the sum of the world  
In soft miniature lies.”

To the charming consistency of the palm and thrush, this universal and serene beauty is added, as all the leaves of the tree flower in the blossom.

7. — But alas, the fruit to be matured in these petals is fated to break the stem which holds it to universal consistency. It passes through Nature to manhood, and becomes unnatural, without being as yet quite supernatural. Man's most approved life is but conformity, not a simple and independent consistency, which would make all things conform to it. His actions do not adorn Nature nor one another, nor does she exist in harmony but in contrast with them. She is not their willing scenery. We conceive that if a true action were to be performed it would be assisted by Nature, and perhaps be fondled and reflected many times as the rainbow. The sun is a true light for the trees in a picture, but not for the actions of men. They will not bear so strong a light as the stubble; the universe has little sympathy with them, and sooner or later they rebound hollowly on the memory. The April shower should be as reviving to our life as to the garden and the grove, and the scenery in which we live reflect our own beauty, as the dew-drop the flower. It is the actual man, not the actual Nature, that hurts the romance of the landscape. “He poisons the ground.” The haymakers must be lost in the grass of the meadow. They may be Faustus and Amyntas here, but near

at hand they are Reuben and Jonas. The woodcutter must not be better than the wood, lest he be worse. Neither will bear to be considered as a distinct feature. Man's works must lie in the bosom of Nature, cottages be buried in trees, or under vines and moss, like rocks, that they may not outrage the landscape. The hunter must be dressed in Lincoln green, with a plume of eagle's feathers, to imbosom him in Nature. So the skillful painter secures the distinctness of the whole by the indistinctness of the parts. We can endure best to consider our repose and silence. Only when the city, the hamlet, or the cottage is viewed from a distance does man's life seem in harmony with the universe; but seen closely his actions have no eagle's feathers or Lincoln green to redeem them. The sunlight on cities at a distance is a deceptive beauty, but foretells the final harmony of man with Nature.

Man as he is, is not the subject of any art, strictly speaking. The naturalist pursues his study with love, but the moralist persecutes his with hate. In man is the material of a picture, with a design partly sketched, but Nature is such a picture drawn and colored. He is a studio, Nature a gallery. If men were not idealists, no sonnets to beautiful persons nor eulogies on worthy ones would ever be written. We wait for the preacher to express such love for his congregation as the botanist for his herbarium.

8. — Man, however, detects something in the lingering ineradicable sympathy of Nature which seems to side with him against the stern decrees of the soul. Her essential friendliness is only the more apparent to his waywardness, for disease and sorrow are but a rupture with her. In proportion as he renounces his will, she repairs his hurts, and, if she burns, does oftener warm, if she freezes, oftener refreshes. This is the motherliness which the poet personifies, and the Sphinx, or wisely inquiring man, makes express a real concern for him. Nature shows us a stem kindness, and only we are unkind. She endures long with us, and though the severity of her law is unrelaxed, yet its evenness and impartiality look relenting, and almost sympathize with our fault.

9, — 10, 11, 12, 13, 14. But to the poet there are no riddles. They are "pleasant songs" to him; his faith solves the enigmas which recurring wisdom does not fail to repeat. Poetry is the only solution time can offer. But the poet is soonest a pilgrim from his own faith. Our brave moments may still be distinguished from our wise. Though the problem is always solved for the soul, still does it remain to be solved by the intellect. Almost faith puts the question, for only in her light can it be answered. However true the answer, it does not prevent the question; for the best answer is but plausible, and man can only tell his relation to truth, but render no account of truth to herself.

9. — Believe, and ask not, says the poet.

"Deep love lieth under  
These pictures of time;  
They fade in the light of  
Their meaning sublime."  
Nothing is plain but love.

10, — 11, 12, 13. Man comes short, because he seeks perfection. He adorns no world, while he is seeking to adorn a better. His best actions have no reference to their

actual scenery. For when our actions become of that worth that they might confer a grace on Nature, they pass out of her into a higher arena, where they are still mean and awkward. So that the world beholds only the rear of great deeds, and mistakes them often for inconsistencies, not knowing with what higher they consist. Nature is beautiful as in repose, not promising a higher beauty to-morrow. Her actions are level to one another, and so are never unfit or inconsistent. Shame and remorse, which are so unsightly to her, have a prospective beauty and fitness which redeem them. We would have our lover to be nobler than we, and do not fear to sacrifice our love to his greater nobleness. Better the disagreement of noble lovers than the agreement of base ones. In friendship each will be nobler than the other, and so avoid the cheapness of a level and idle harmony. Love will have its chromatic strains, — discordant yearnings for higher chords, — as well as symphonies. Let us expect no finite satisfaction.

13. — Who looks in the sun will see no light else; but also he will see no shadow. Our life revolves unceasingly, but the centre is ever the same, and the wise will regard only the seasons of the soul.

14. — The poet concludes with the same trust he began with, and jeers at the blindness which could inquire. But our sphinx is so wise as to put no riddle that can be answered. It is a great presumption to answer conclusively a question which any sincerity has put. The wise answer no questions, — nor do they ask them. She silences his jeers with the conviction that she is the eye-beam of his eye. Our proper eye never quails before an answer. To rest in a reply, as a response of the oracle, that is error; but to suspect time's reply, because we would not degrade one of God's meanings to be intelligible to us, that is wisdom. We shall never arrive at his meaning, but it will ceaselessly arrive to us. The truth we seek with ardor and devotion will not reward us with a cheap acquisition. We run unhesitatingly in our career, not fearing to pass any goal of truth in our haste. We career toward her eternally. A truth rested in stands for all the vice of an age, and revolution comes kindly to restore health.

16. The cunning Sphinx, who had been hushed into stony silence and repose in us, arouses herself and detects a mystery in all things, — in infancy, the moon, fire, flowers, sea, mountain, — and, (17) in the spirit of the old fable, declares proudly, —

“Who telleth one of my meanings Is master of all I am.”

When some (Edipus has solved one of her enigmas, she will go dash her head against a rock.

You may find this as enigmatical as the Sphinx's riddle. Indeed, I doubt if she could solve it herself.

March 11. Thursday. Every man understands why a fool sings.

March 13. Saturday. There is a sort of homely truth and naturalness in some books, which is very rare to find, and yet looks quite cheap. There may be nothing lofty in the sentiment, or polished in the expression, but it is careless, countrified talk. The scholar rarely writes as well as the farmer talks. Homeliness is a great merit in a book; it is next to beauty and a high art. Some have this merit only. A few homely expressions redeem them. Rusticity is pastoral, but affectation merely civil. The scholar does not

make his most familiar experience come gracefully to the aid of his expression, and hence, though he live in it, his books contain no tolerable pictures of the country and simple life. Very few men can speak of Nature with any truth. They confer no favor; they do not speak a good word for her. Most cry better than they speak. You can get more nature out of them by pinching than by addressing them. It is naturalness, and not simply good nature, that interests. I like better the surliness with which the woodchopper speaks of his woods, handling them as indifferently as his axe, than the mealy-mouthed enthusiasm of the lover of nature. Better that the primrose by the river's brim be a yellow primrose and nothing more, than the victim of his bouquet or herbarium, to shine with the flickering dull light of his imagination, and not the golden gleam of a star.

Aubrey relates of Thomas Fuller that his was "a very working head, in so much, that walking and meditating before dinner, he would eat up a penny loaf, not knowing that he did it. His natural memory was very great, to which he added the art of memory. He would repeat to you forwards and backwards all the signs from Ludgate to Charing-cross." These are very good and wholesome facts to know of a man, as copious as some modern volumes.

He also says of Mr. John Hales, that, "he loved Canarie" and was buried "under an altar monument of black marble... with a too long epitaph;" of Edmund Hailey, that he "at sixteen could make a dial, and then he said he thought himself a brave fellow;" of William Holder, who wrote a book upon his curing one Popham, who was deaf and dumb, "He was beholding to no author; did only consult with nature." For the most part an author but consults with all who have written before upon any subject, and his book is but the advice of so many. But a true book will never have been forestalled, but the topic itself will be new, and, by consulting with nature, it will consult not only with those who have gone before, but with those who may come after. There is always room and occasion enough for a true book on any subject, as there is room for more light the brightest day, and more rays will not interfere with the first.

How alone must our life be lived! We dwell on the seashore, and none between us and the sea. Men are my merry companions, my fellow-pilgrims, who beguile the way but leave me at the first turn in the road, for none are travelling one road so far as myself.

Each one marches in the van. The weakest child is exposed to the fates henceforth as barely as its parents. Parents and relations but entertain the youth; they cannot stand between him and his destiny. This is the one bare side of every man. There is no fence; it is clear before him to the bounds of space.

What is fame to a living man? If he live aright, the sound of no man's voice will resound through the aisles of his secluded life. His life is a hallowed silence, a fane. The loudest sounds have to thank my little ear that they are heard.

March 15. When I have access to a man's barrel of sermons, which were written from week to week, as his life lapsed, though I now know him to live cheerfully and bravely enough, still I cannot conceive what interval there was for laughter and smiles

in the midst of so much sadness. Almost in proportion to the sincerity and earnestness of the life will be the sadness of the record. When I reflect that twice a week for so many years he pondered and preached such a sermon, I think he must have been a splenetic and melancholy man, and wonder if his food digested well. It seems as if the fruit of virtue was never a careless happiness.

A great cheerfulness have all great wits possessed, almost a prophane levity to such as understood them not, but their religion had the broader basis in proportion as it was less prominent. The religion I love is very laic. The clergy are as diseased, and as much possessed with a devil, as the reformers. They make their topic as offensive as the politician, for our religion is as unpublic and incommunicable as our poetical vein, and to be approached with as much love and tenderness.

March 17. Wednesday. The stars go up and down before my only eye. Seasons come round to me alone. I cannot lean so hard on any arm as on a sunbeam. So solid men are not to my sincerity as is the shimmer of the fields.

March 19. Friday. No true and brave person will be content to live on such a footing with his fellow and himself as the laws of every household now require. The house is the very haunt and lair of our vice. I am impatient to withdraw myself from under its roof as an unclean spot. There is no circulation there; it is full of stagnant and mephitic vapors.

March 20. Even the wisest and best are apt to use their lives as the occasion to do something else in than to live greatly. But we should hang as fondly over this work as the finishing and embellishment of a poem.

It is a great relief when for a few moments in the day we can retire to our chamber and be completely true to ourselves. It leavens the rest of our hours. In that moment I will be nakedly as vicious as I am; this false life of mine shall have a being at length.

March 21. Sunday. To be associated with others by my friend's generosity when he bestows a gift is an additional favor to be grateful for.

March 27. Saturday. Magnanimity, though it look expensive for a short course, is always economy in the long run. Be generous in your poverty, if you would be rich. To make up a great action there are no subordinate mean ones. We can never afford to postpone a true life to-day to any future and anticipated nobleness. We think if by tight economy we can manage to arrive at independence, then indeed we will begin to be generous without stay. We sacrifice all nobleness to a little present meanness. If a man charges you eight hundred pay him eight hundred and fifty, and it will leave a clean edge to the sum. It will be like nature, overflowing and rounded like the bank of a river, not close and precise like a drain or ditch.

It is always a short step to peace — of mind.

Under this line there is or has been life; as, when I see the mole's raised gallery in the meadow, I know that he has passed underneath. I must not lose any of my freedom by being a farmer and landholder. Most who enter on any profession are doomed men. The world might as well sing a dirge over them forthwith. The farmer's muscles are rigid. He can do one thing long, not many well. His pace seems determined henceforth;

he never quickens it. A very rigid Nemesis is his fate. When the right wind blows or a star calls, I can leave this arable and grass ground, without making a will or settling my estate. I would buy a farm as freely as a silken streamer. Let me not think my front windows must face east henceforth because a particular hill slopes that way. My life must undulate still. I will not feel that my wings are clipped when once I have settled on ground which the law calls my own, but find new pinions grown to the old, and talaria to my feet beside.

March 30. Tuesday. I find my life growing slovenly when it does not exercise a constant supervision over itself. Its duds accumulate. Next to having lived a day well is a clear and calm overlooking of all our days.

#### FRIENDSHIP

Now we are partners in such legal trade,  
We'll look to the beginnings, not the ends,  
Nor to pay-day, knowing true wealth is made  
For current stock and not for dividends.

I am amused when I read how Ben Jonson engaged that the ridiculous masks with which the royal family and nobility were to be entertained should be "grounded upon antiquity and solid learning."

April 1. ON THE SUN COMING OUT IN THE AFTERNOON Methinks all things have travelled since you shined, But only Time, and clouds, Time's team, have moved; Again foul weather shall not change my mind, But in the shade I will believe what in the sun I loved.

In reading a work on agriculture, I skip the author's moral reflections, and the words "Providence" and "He" scattered along the page, to come at the profitable level of what he has to say. There is no science in men's religion; it does not teach me so much as the report of the committee on swine. My author shows he has dealt in corn and turnips and can worship God with the hoe and spade, but spare me his morality.

April 3. Friends will not only live in harmony, but in melody.

April 4. Sunday. The rattling of the tea-kettle below stairs reminds me of the cow-bells I used to hear when berrying in the Great Fields many years ago, sounding distant and deep amid the birches. That cheap piece of tinkling brass which the farmer hangs about his cow's neck has been more to me than the tons of metal which are swung in the belfry.

They who prepare my evening meal below  
Carelessly hit the kettle as they go,  
With tongs or shovel,  
And, ringing round and round,  
Out of this hovel  
It makes an Eastern temple by the sound.  
At first I thought a cow-bell, right at hand  
'Mid birches, sounded o'er the open land,  
Where I plucked flowers

Many years ago,  
Speeding midsummer hours

With such secure delight they hardly seemed to flow.

April 5. This long series of desultory mornings does not tarnish the brightness of the prospective days. Surely faith is not dead. Wood, water, earth, air are essentially what they were; only society has degenerated. This lament for a golden age is only a lament for golden men.

I only ask a clean seat. I will build my lodge on the southern slope of some hill, and take there the life the gods send me. Will it not be employment enough to accept gratefully all that is yielded me between sun and sun? Even the fox digs his own burrow. If my jacket and trousers, my boots and shoes, are fit to worship God in, they will do. Won't they, Deacon Spaulding?

April 7. Wednesday. My life will wait for nobody, but is being matured still irresistibly while I go about the streets and chaffer with this man and that to secure it a living. It will cut its own channel, like the mountain stream, which by the longest ridges and by level prairies is not kept from the sea finally. So flows a man's life, and will reach the sea water, if not by an earthy channel, yet in dew and rain, overleaping all barriers, with rainbows to announce its victory. It can wind as cunningly and unerringly as water that seeks its level; and shall I complain if the gods make it meander? This staying to buy me a farm is as if the Mississippi should stop to chaffer with a clamshell.

What have I to do with plows? I cut another furrow than you see. Where the off ox treads, there is it not, it is farther off; where the nigh ox walks, it will not be, it is nigher still. If corn fails, my crop fails not. What of drought? What of rain? Is not my sand well clayed, my peat well sanded? Is it not underdrained and watered?

My ground is high,  
But 't is not dry,  
What you call dew  
Comes filtering through;  
Though in the sky,  
It still is nigh;  
Its soil is blue  
And virgin too.  
If from your price ye will not swerve,  
Why, then I'll think the gods reserve  
A greater bargain there above,  
Out of their sup'rabundant love  
Have meantime better for me cared,  
And so will get my stock prepared,  
Plows of new pattern, hoes the same,  
Designed a different soil to tame,  
And sow my seed broadcast in air,

Certain to reap my harvest there.

April 8. Friends are the ancient and honorable of the earth. The oldest men did not begin friendship. It is older than Hindostan and the Chinese Empire. How long has it been cultivated, and is still the staple article! It is a divine league struck forever. Warm, serene days only bring it out to the surface. There is a friendliness between the sun and the earth in pleasant weather; the gray content of the land is its color.

You can tell what another's suspicions are by what you feel forced to become. You will wear a new character, like a strange habit, in their presence.

April 9. Friday. It would not be hard for some quiet brave man to leap into the saddle to-day and eclipse Napoleon's career by a grander, — show men at length the meaning of war. One reproaches himself with supineness, that he too has sat quiet in his chamber, and not treated the world to the sound of the trumpet; that the indignation which has so long rankled in his breast does not take to horse and to the field. The bravest warrior will have to fight his battles in his dreams, and no earthly war note can arouse him. There are who would not run with Leonidas. Only the third-rate Napoleons and Alexanders does history tell of. The brave man does not mind the call of the trumpet nor hear the idle clashing of swords without, for the infinite din within. War is but a training, compared with the active service of his peace. Is he not at war? Does he not resist the ocean swell within him, and walk as gently as the summer's sea? Would you have him parade in uniform, and manoeuvre men, whose equanimity is his uniform and who is himself manoeuvred?

The times have no heart. The true reform can be undertaken any morning before unbarring our doors. It calls no convention. I can do two thirds the reform of the world myself. When two neighbors begin to eat com bread, who before ate wheat, then the gods smile from ear to ear, for it is very pleasant to them. When an individual takes a sincere step, then all the gods attend, and his single deed is sweet.

April 10. Saturday. I don't know but we should make life all too tame if we had our own way, and should miss these impulses in a happier time.

How much virtue there is in simply seeing! We may almost say that the hero has striven in vain for his preeminency, if the student oversees him. The woman who sits in the house and sees is a match for a stirring captain. Those still, piercing eyes, as faithfully exercised on their talent, will keep her even with Alexander or Shakespeare. They may go to Asia with parade, or to fairyland, but not beyond her ray. We are as much as we see. Faith is sight and knowledge. The hands only serve the eyes. The farthest blue streak in the horizon I can see, I may reach before many sunsets. What I saw alters not; in my night, when I wander, it is still steadfast as the star which the sailor steers by.

Whoever has had one thought quite lonely, and could contentedly digest that in solitude, knowing that none could accept it, may rise to the height of humanity, and overlook all living men as from a pinnacle.

Speech never made man master of men, but the eloquently refraining from it.

April 11. Sunday. A greater baldness my life seeks, as the crest of some bare hill, which towns and cities do not afford. I want a directer relation with the sun.

#### FRIENDSHIP'S STEADFASTNESS

True friendship is so firm a league  
That's maintenance falls into the even tenor  
Of our lives, and is no tie,  
But the continuance of our life's thread.  
If I would safely keep this new-got pelf,  
I have no care henceforth but watch myself,  
For lo! it goes untended from my sight,  
Waxes and wanes secure with the safe star of night.  
See with what liberal step it makes its way,  
As we could well afford to let it stray  
Throughout the universe, with the sun and moon,  
Which would dissolve allegiance as soon.  
Shall I concern myself for fickleness,  
And undertake to make my friends more sure,  
When the great gods out of sheer kindness,  
Gave me this office for a sinecure?  
Death cannot come too soon  
Where it can come at all,  
But always is too late  
Unless the fates it call.

April 15. Thursday. The gods are of no sect; they side with no man. When I imagine that Nature inclined rather to some few earnest and faithful souls, and specially existed for them, I go to see an obscure individual who lives under the hill, letting both gods and men alone, and find that strawberries and tomatoes grow for him too in his garden there, and the sun lodges kindly under his hillside, and am compelled to acknowledge the unbribable charity of the gods.

Any simple, unquestioned mode of life is alluring to men. The man who picks peas steadily for a living is more than respectable. He is to be envied by his neighbors.

April 16. I have been inspecting my neighbors' farms to-day and chaffering with the landholders, and I must confess I am startled to find everywhere the old system of things so grim and assured. Wherever I go the farms are run out, and there they lie, and the youth must buy old land and bring it to. Everywhere the relentless opponents of reform are a few old maids and bachelors, who sit round the kitchen fire, listening to the singing of the tea-kettle and munching cheese-rinds.

April 18. Sunday. We need pine for no office for the sake of a certain culture, for all valuable experience lies in the way of a man's duty. My necessities of late have compelled me to study Nature as she is related to the farmer, — as she simply satisfies a want of the body. Some interests have got a footing on the earth which I have not

made sufficient allowance for. That which built these barns and cleared the land thus had some valor.

We take little steps, and venture small stakes, as if our actions were very fatal and irretrievable. There is no swing to our deeds. But our life is only a retired valley where we rest on our packs awhile. Between us and our end there is room for any delay. It is not a short and easy southern way, but we must go over snowcapped mountains to reach the sun.

April 20. You can't beat down your virtue; so much goodness it must have.

When a room is furnished, comfort is not furnished.

Great thoughts hallow any labor. To-day I earned seventy-five cents heaving manure out of a pen, and made a good bargain of it. If the ditcher muses the while how he may live uprightly, the ditching spade and turf knife may be engraved on the coat-of-arms of his posterity.

There are certain current expressions and blasphemous moods of viewing things, as when we say "he is doing a good business," more prophane than cursing and swearing. There is death and sin in such words. Let not the children hear them.

April 22. Thursday. There are two classes of authors: the one write the history of their times, the other their biography.

April 23. Friday. Any greatness is not to be mistaken. Who shall cavil at it? It stands once for all on a level with the heroes of history. It is not to be patronized. It goes alone.

When I hear music, I flutter, and am the scene of life, as a fleet of merchantmen when the wind rises.

April 24. Music is the sound of the circulation in nature's veins. It is the flux which melts nature. Men dance to it, glasses ring and vibrate, and the fields seem to undulate. The healthy ear always hears it, nearer or more remote.

It has been a cloudy, drizzling day, with occasional brightenings in the mist, when the trill of the tree sparrow seemed to be ushering in sunny hours.

April 25. A momentous silence reigns always in the woods, and their meaning seems just ripening into expression. But alas! they make no haste. The rush sparrow, Nature's minstrel of serene hours, sings of an immense leisure and duration.

When I hear a robin sing at sunset, I cannot help contrasting the equanimity of Nature with the bustle and impatience of man. We return from the lyceum and caucus with such stir and excitement, as if a crisis were at hand; but no natural scene or sound sympathizes with us, for Nature is always silent and unpretending as at the break of day. She but rubs her eyelids.

I am struck with the pleasing friendships and unanimities of nature in the woods, as when the moss on the trees takes the form of their leaves.

There is all of civilized life in the woods. Their wildest scenes have an air of domesticity and homeliness, and when the flicker's cackle is heard in the clearings, the musing hunter is reminded that civilization has imported nothing into them. The ball-room

is represented by the catkins of the alder at this season, which hang gracefully like a lady's ear-drops.

All the discoveries of science are equally true in their deepest recesses; nature there, too, obeys the same laws. Fair weather and foul concern the little red bug upon a pine stump; for him the wind goes round the right way and the sun breaks through the clouds.

April 26. Monday. At R. W. E.'s.

The charm of the Indian to me is that he stands free and unconstrained in Nature, is her inhabitant and not her guest, and wears her easily and gracefully. But the civilized man has the habits of the house. His house is a prison, in which he finds himself oppressed and confined, not sheltered and protected. He walks as if he sustained the roof; he carries his arms as if the walls would fall in and crush him, and his feet remember the cellar beneath. His muscles are never relaxed. It is rare that he overcomes the house, and learns to sit at home in it, and roof and floor and walls support themselves, as the sky and trees and earth.

It is a great art to saunter.

April 27. It is only by a sort of voluntary blindness, and omitting to see, that we know ourselves, as when we see stars with the side of the eye. The nearest approach to discovering what we are is in dreams. It is as hard to see one's self as to look backwards without turning round. And foolish are they that look in glasses with that intent.

The porters have a hard time, but not so hard as he that carries his own shoulders. That beats the Smyrna Turks. Some men's broad shoulders are load enough. Even a light frame can stand under a great burden, if it does not have to support itself. Virtue is buoyant and elastic; it stands without effort and does not feel gravity; but sin plods and shuffles. Newton needed not to wait for an apple to fall to discover the attraction of gravitation; it was implied in the fall of man.

April 28. Wednesday. We falsely attribute to men a determined character; putting together all their yesterdays and averaging them, we presume we know them. Pity the man who has a character to support. It is worse than a large family. He is silent poor indeed. But in fact character is never explored, nor does it get developed in time, but eternity is its development, time its envelope. In view of this distinction, a sort of divine politeness and heavenly good breeding suggests itself, to address always the enveloped character of a man. I approach a great nature with infinite expectation and uncertainty, not knowing what I may meet. It lies as broad and unexplored before me as a scraggy hillside or pasture. I may hear a fox bark, or a partridge drum, or some bird new to these localities may fly up. It lies out there as old, and yet as new. The aspect of the woods varies every day, what with their growth and the changes of the seasons and the influence of the elements, so that the eye of the forester never twice rests upon the same prospect. Much more does a character show newly and variedly, if directly seen. It is the highest compliment to suppose that in the intervals of conversation your companion has expanded and grown. It may be a deference which he will not understand, but the nature which underlies him will understand it, and

your influence will be shed as finely on him as the dust in the sun settles on our clothes. By such politeness we may educate one another to some purpose. So have I felt myself educated sometimes; I am expanded and enlarged.

April 29. Birds and quadrupeds pass freely through nature, without prop or stilt. But man very naturally carries a stick in his hand, seeking to ally himself by many points to nature, as a warrior stands by his horse's side with his hand on his mane. We walk the gracefulest for a cane, as the juggler uses a leaded pole to balance him when he dances on a slack wire.

Better a monosyllabic life than a ragged and muttered one; let its report be short and round like a rifle, so that it may hear its own echo in the surrounding silence.

April 30. Where shall we look for standard English but to the words of any man who has a depth of feeling in him? Not in any smooth and leisurely essay. From the gentlemanly windows of the country-seat no sincere eyes are directed upon nature, but from the peasant's horn windows a true glance and greeting occasionally. "For summer being ended, all things," said the Pilgrim, "stood in appearance with a weather-beaten face, and the whole country full of woods and thickets represented a wild and savage hue." Compare this with the agricultural report.

May 1. Saturday. Life in gardens and parlors is unpalatable to me. It wants rudeness and necessity to give it relish. I would at least strike my spade into the earth with as good will as the woodpecker his bill into a tree.

May 2.

WACHUSETT

Especial I remember thee,  
Wachusett, who like me  
Standest alone without society.  
Thy far blue eye,  
A remnant of the sky,  
Seen through the clearing or the gorge,  
Or from the windows of the forge,  
Doth leaven all it passes by.  
Nothing is true  
But stands 'tween me and you,  
Thou western pioneer,  
Who know'st not shame nor fear,  
By venturous spirit driven  
Under the eaves of heaven;  
And canst expand thee there,  
And breathe enough of air?  
Upholding heaven, holding down earth,  
Thy pastime from thy birth,  
Not steadied by the one, nor leaning on the other;  
May I approve myself thy worthy brother!

May 3. Monday. We are all pilots of the most intricate Bahama channels. Beauty may be the sky overhead, but Duty is the water underneath. When I see a man with serene countenance in the sunshine of summer, drinking in peace in the garden or parlor, it looks like a great inward leisure that he enjoys; but in reality he sails on no summer's sea, but this steady sailing comes of a heavy hand on the tiller. We do not attend to larks and bluebirds so leisurely but that conscience is as erect as the attitude of the listener. The man of principle gets never a holiday. Our true character silently underlies all our words and actions, as the granite underlies the other strata. Its steady pulse does not cease for any deed of ours, as the sap is still ascending in the stalk of the fairest flower.

May 6. Thursday. The fickle person is he that does not know what is true or right absolutely, — who has not an ancient wisdom for a lifetime, but a new prudence for every hour. We must sail by a sort of dead reckoning on this course of life, not speak any vessel nor spy any headland, but, in spite of all phenomena, come steadily to port at last. In general we must have a catholic and universal wisdom, wiser than any particular, and be prudent enough to defer to it always. We are literally wiser than we know. Men do not fail for want of knowledge, but for want of prudence to give wisdom the preference. These low weathercocks on barns and fences show not which way the general and steady current of the wind sets, — which brings fair weather or foul, — but the vane on the steeple, high up in another stratum of atmosphere, tells that. What we need to know in any case is very simple. I shall not mistake the direction of my life; if I but know the high land and the main, — on this side the Cordilleras, on that the Pacific, — I shall know how to run. If a ridge intervene, I have but to seek, or make, a gap to the sea.

May 9. Sunday. The pine stands in the woods like an Indian, — untamed, with a fantastic wildness about it, even in the clearings. If an Indian warrior were well painted, with pines in the background, he would seem to blend with the trees, and make a harmonious expression. The pitch pines are the ghosts of Philip and Massasoit. The white pine has the smoother features of the squaw.

The poet speaks only those thoughts that come unbidden, like the wind that stirs the trees, and men cannot help but listen. He is not listened to, but heard. The weathercock might as well dally with the wind as a man pretend to resist eloquence. The breath that inspires the poet has traversed a whole Campagna, and this new climate here indicates that other latitudes are chilled or heated.

Speak to men as to gods and you will not be insincere.

WESTWARD, HO!

The needles of the pine

All to the west incline.

THE ECHO OF THE SABBATH BELL HEARD IN THE WOODS

Dong, sounds the brass in the east,

As if for a civic feast,

But I like that sound the best

Out of the fluttering west.  
The steeple rings a knell,  
But the fairies' silvery bell  
Is the voice of that gentle folk,  
Or else the horizon that spoke.  
Its metal is not of brass,  
But air, and water, and glass,  
And under a cloud it is swung,  
And by the wind is rung,  
With a slim silver tongue.  
When the steeple tolls the noon,  
It soundeth not so soon,  
Yet it rings an earlier hour,  
And the sun has not reached its tower.

May 10. Monday. A good warning to the restless tourists of these days is contained in the last verses of Claudian's "Old Man of Verona."

"Erret, et extremos alter scrutetur Iberos.

Plus habet hie vitae, plus habet ille viae."

May 23. Sunday. Barn. — The distant woods are but the tassels of my eye.

Books are to be attended to as new sounds merely. Most would be put to a sore trial if the reader should assume the attitude of a listener. They are but a new note in the forest. To our lonely, sober thought the earth is a wild unexplored. Wildness as of the jay and muskrat reigns over the great part of nature. The oven-bird and plover are heard in the horizon. Here is a new book of heroes, come to me like the note of the chewink from over the fen, only over a deeper and wider fen. The pines are unrelenting sifters of thought; nothing petty leaks through them. Let me put my ear close, and hear the sough of this book, that I may know if any inspiration yet haunts it. There is always a later edition of every book than the printer wots of, no matter how recently it was published. All nature is a new impression every instant.

The aspects of the most simple object are as various as the aspects of the most compound. Observe the same sheet of water from different eminences. When I have travelled a few miles I do not recognize the profile of the hills of my native village.

May 27. Thursday. I sit in my boat on Walden, playing the flute this evening, and see the perch, which I seem to have charmed, hovering around me, and the moon travelling over the bottom, which is strewn with the wrecks of the forest, and feel that nothing but the wildest imagination can conceive of the manner of life we are living. Nature is a wizard. The Concord nights are stranger than the Arabian nights.

We not only want elbow-room, but eye-room in this gray air which shrouds all the fields. Sometimes my eyes see over the county road by daylight to the tops of yonder birches on the hill, as at others by moonlight.

Heaven lies above, because the air is deep.

In all my life hitherto I have left nothing behind.

May 31. Monday. That title, "The Laws of Menu with the Gloss of Culluca," comes to me with such a volume of sound as if it had swept unobstructed over the plains of Hindostan; and when my eye rests on yonder birches, or the sun in the water, or the shadows of the trees, it seems to signify the laws of them all. They are the laws of you and me, a fragrance wafted down from those old times, and no more to be refuted than the wind.

When my imagination travels eastward and backward to those remote years of the gods, I seem to draw near to the habitation of the morning, and the dawn at length has a place. I remember the book as an hour before sunrise.

We are height and depth both, a calm sea at the foot of a promontory. Do we not overlook our own depths?

June 1. To have seen a man out of the East or West is sufficient to establish their reality and locality. I have seen a Mr. Wattles to-day, from Vermont, and now know where that is and that it is; a reformer, with two soldier's eyes and shoulders, who began to belabor the world at ten years, a ragged mountain boy, as fifer of a company, with set purpose to remould it from those first years.

The great person never wants an opportunity to be great, but makes occasion for all about him.

June 2. Wednesday. I am brought into the near neighborhood and am become a silent observer of the moon's paces to-night, by means of a glass, while the frogs are peeping all around me on the earth, and the sound of the accordion seems to come from some bright saloon yonder. I am sure the moon floats in a human atmosphere. It is but a distant scene of the world's drama. It is a wide theatre the gods have given us, and our actions must befit it. More sea and land, mountain and valley, here is, — a further West, a freshness and wildness in reserve when all the land shall be cleared.

I see three little lakes between the hills near its edge, reflecting the sun's rays. The light glimmers as on the water in a tumbler. So far off do the laws of reflection hold. I seem to see the ribs of the creature. This is the aspect of their day, its outside, — their heaven above their heads, towards which they breathe their prayers. So much is between me and them. It is noon there, perchance, and ships are at anchor in the havens or sailing on the seas, and there is a din in the streets, and in this light or that shade some leisurely soul contemplates.

But now dor-bugs fly over its disk and bring me back to earth and night.

June 7. Monday. The inhabitants of those Eastern plains seem to possess a natural and hereditary right to be conservative and magnify forms and traditions. "Immemorial custom is transcendent law," says Menu. That is, it was the custom of gods before men used it. The fault of our New England custom is that it is memorial. What is morality but immemorial custom? It is not manner but character, and the conservative conscience sustains it.

We are accustomed to exaggerate the immobility and stagnation of those eras, as of the waters which levelled the steppes; but those slow revolving "years of the gods" were as rapid to all the needs of virtue as these bustling and hasty seasons. Man stands

to revere, he kneels to pray. Methinks history will have to be tried by new tests to show what centuries were rapid and what slow. Corn grows in the night. Will this bustling era detain the future reader longer? Will the earth seem to have conversed more with the heavens during these times? Who is writing better Vedas? How science and art spread and flourished, how trivial conveniences were multiplied, that which is the gossip of the world is not recorded in them; and if they are left out of our scripture, too, what will remain?

Since the Battle of Bunker Hill we think the world has not been at a standstill.

When I remember the treachery of memory and the manifold accidents to which tradition is liable, how soon the vista of the past closes behind, — as near as night's crescent to the setting day, — and the dazzling brightness of noon is reduced to the faint glimmer of the evening star, I feel as if it were by a rare indulgence of the fates that any traces of the past are left us, — that my ears which do not hear across the interval over which a crow caws should chance to hear this far-travelled sound. With how little cooperation of the societies, after all, is the past remembered!

I know of no book which comes to us with grander pretensions than the "Laws of Menu;" and this immense presumption is so impersonal and sincere that it is never offensive or ridiculous. Observe the modes in which modern literature is advertised, and then consider this Hindoo prospectus. Think what a reading public it addresses, what criticism it expects. What wonder if the times were not ripe for it?

June 8. Having but one chair, I am obliged to receive my visitors standing, and, now I think of it, those old sages and heroes must always have met erectly.

July 10 to 12. This town, too, lies out under the sky, a port of entry and departure for souls to and from heaven.

A slight sound at evening lifts me up by the ears, and makes life seem inexpressibly serene and grand. It may be in Uranus, or it may be in the shutter. It is the original sound of which all literature is but the echo. It makes all fear superfluous. Bravery comes from further than the sources of fear.

Aug. 1. Sunday. I never met a man who cast a free and healthy glance over life, but the best live in a sort of Sabbath light, a Jewish gloom. The best thought is not only without sombreness, but even without morality. The universe lies outspread in floods of white light to it. The moral aspect of nature is a jaundice reflected from man. To the innocent there are no cherubim nor angels. Occasionally we rise above the necessity of virtue into an unchangeable morning light, in which we have not to choose in a dilemma between right and wrong, but simply to live right on and breathe the circumambient air. There is no name for this life unless it be the very vitality of vita. Silent is the preacher about this, and silent must ever be, for he who knows it will not preach.

Aug. 4. Wednesday. My pen is a lever which, in proportion as the near end stirs me further within, the further end reaches to a greater depth in the reader.

Nawshawtuct. — Far in the east I read Nature's Com Law Rhymes. Here, in sight of Wachusett and these rivers and woods, my mind goes singing to itself of other themes

than taxation. The rush sparrow sings still unintelligible, as from beyond a depth in me which I have not fathomed, where my future lies folded up. I hear several faint notes, quite outside me, which populate the waste.

This is such fresh and flowing weather, as if the waves of the morning had subsided over the day.

Aug. 6. If I am well, then I see well. The bulletins of health are twirled along my visual rays, like pasteboards on a kite string.

I cannot read a sentence in the book of the Hindoos without being elevated as upon the table-land of the Ghauts. It has such a rhythm as the winds of the desert, such a tide as the Ganges, and seems as superior to criticism as the Himmaleh Mounts. Even at this late hour, unworn by time, with a native and inherent dignity it wears the English dress as indifferently as the Sanscrit. The great tone of the book is of such fibre and such severe tension that no time nor accident can relax it. The great thought is never found in a mean dress, but is of virtue to ennoble any language. Let it issue from the lips of the Wolofs, or from the forum of Rome, the nine Muses will seem to have been purveyors for it. Its education is always liberal; it has all the graces of oratory and of poetry. The lofty tone which is its indispensable breath is grace to the eye and music to the ear. It can endow a college.

So supremely religious a book imposes with authority on the latest age. The very simplicity of style of the ancient lawgiver, implying all in the omission of all, proves an habitual elevation of thought, which the multiplied glosses of later days strive in vain to slope up to. The whole book by noble gestures and inclinations seems to render words unnecessary. The abbreviated sentence points to the thing for explanation. As the sublimest thought is most faithfully printed in the face, and needs the fewest interpreting words. The page nods toward the fact and is silent.

As I walk across the yard from the bam to the house through the fog, with a lamp in my hand, I am reminded of the Merrimack nights, and seem to see the sod between tent-ropes. The trees, seen dimly through the mist, suggest things which do not at all belong to the past, but are peculiar to my fresh New England life. It is as novel as green peas. The dew hangs everywhere upon the grass, and I breathe the rich, damp air in slices.

Aug. 7. Saturday. The impression which those sublime sentences made on me last night has awakened me before any cockcrowing. Their influence lingers around me like a fragrance, or as the fog hangs over the earth late into the day.

The very locusts and crickets of a summer day are but later or older glosses on the Dherma Sâstra of the Hindoos, a continuation of the sacred code.

Aug. 9. It is vain to try to write unless you feel strong in the knees.

Any book of great authority and genius seems to our imagination to permeate and pervade all space. Its spirit, like a more subtle ether, sweeps along with the prevailing winds of the country. Its influence conveys a new gloss to the meadows and the depths of the wood, and bathes the huckleberries on the hills, as sometimes a new influence

in the sky washes in waves over the fields and seems to break on some invisible beach in the air. All things confirm it. It spends the mornings and the evenings.

Everywhere the speech of Menu demands the widest apprehension and proceeds from the loftiest plateau of the soul. It is spoken unbendingly to its own level, and does not imply any contemporaneous speaker.

I read history as little critically as I consider the landscape, and am more interested in the atmospheric tints and various lights and shades which the intervening spaces create than in its groundwork and composition. It is the morning now turned evening and seen in the west, — the same sun, but a new light and atmosphere. Its beauty is like the sunset; not a fresco painting on a wall, flat and bounded, but atmospheric and roving, or free. But, in reality, history fluctuates as the face of the landscape from morning to evening. What is of moment in it is its hue and color. Time hides no treasures; we want not its then, but its now. We do not complain that the mountains in the horizon are blue and indistinct; they are the more like the heavens.

Of what moment are facts that can be lost, — which need to be commemorated? The monument of death will outlast the memory of the dead. The Pyramids do not tell the tale confided to them. The living fact commemorates itself. Why look in the dark for light? Look in the light rather. Strictly speaking, the Societies have not recovered one fact from oblivion, but they themselves are instead of the fact that is lost. The researcher is more memorable than the researched. The crowd stood admiring the mist and the dim outline of the trees seen through it, and when one of their number advanced to explore the phenomenon, with fresh admiration all eyes were turned on his dimly retreating figure. Critical acumen is exerted in vain to uncover the past; the past cannot be presented; we cannot know what we are not. But one veil hangs over past, present, and future, and it is the province of the historian to find out, not what was, but what is. Where a battle has been fought, you will find nothing but the bones of men and beasts; where a battle is being fought, there are hearts beating. We will sit on a mound and muse, and not try to make these skeletons stand on their legs again. Does Nature remember, think you, that they were men, or not rather that they are bones?

Ancient history has an air of antiquity. It should be more modern. It is written as if the spectator should be thinking of the back side of the picture on the wall, as if the author expected the dead would be his readers, and wished to detail to them their own experience. Men seem anxious to accomplish an orderly retreat through the centuries, earnestly rebuilding the works behind, as they are battered down by the incroachments of time; but while they loiter, they and their works both fall a prey to the enemy.

Biography is liable to the same objection; it should be autobiography. Let us not leave ourselves empty that, so vexing our bowels, we may go abroad and be somebody else to explain him. If I am not I, who will be? As if it were to dispense justice to all. But the time has not come for that.

Aug. 12. We take pleasure in beholding the form of a mountain in the horizon, as if by retiring to this distance we had then first conquered it by our vision, and were made

privity to the design of the architect; so when we behold the shadow of our earth on the moon's disk. When we climb a mountain and observe the lesser irregularities, we do not give credit to the comprehensive and general intelligence which shaped them; but when we see the outline in the horizon, we confess that the hand which moulded those opposite slopes, making one balance the other, worked round a deep centre, and was privy to the plan of the universe. The smallest of nature's works fits the farthest and widest view, as if it had been referred in its bearings to every point in space. It harmonizes with the horizon line and the orbits of the planets.

Aug. 13. Friday. I have been in the swamp by Charles Miles's this afternoon, and found it so bosky and sylvan that Art would never have freedom or courage to imitate it. It can never match the luxury and superfluity of Nature. In Art all is seen; she cannot afford concealed wealth, and in consequence is niggardly; but Nature, even when she is scant and thin outwardly, contents us still by the assurance of a certain generosity at the roots. Surely no stinted hand has been at work here for these centuries to produce these particular tints this summer. The double spruce attracts me here, which I had hardly noticed in the gardens, and now I understand why men try to make them grow about their houses.

Nature has her luxurious and florid style as well as Art. Having a pilgrim's cup to make, she gives to the whole — stem, bowl, handle, and nose — some fantastic shape, as if it were to be the car of a fabulous marine deity, — a Nereus or Triton. She is mythical and mystical always, and spends her whole genius upon the least work.

Aug. 16. There is a double virtue in the sound that can wake an echo, as in the lowing of the cows this morning. Far out in the horizon that sound travels quite round the town, and invades each recess of the wood, advancing at a grand pace and with a sounding Eastern pomp.

Aug. 18. I sailed on the North River last night with my flute, and my music was a tinkling stream which meandered with the river, and fell from note to note as a brook from rock to rock. I did not hear the strains after they had issued from the flute, but before they were breathed into it, for the original strain precedes the sound by as much as the echo follows after, and the rest is the perquisite of the rocks and trees and beasts. Unpremeditated music is the true gauge which measures the current of our thoughts, the very undertow of our life's stream.

Of all the duties of life it is hardest to be in earnest; it implies a good deal both before and behind. I sit here in the bam this flowing afternoon weather, while the school bell is ringing in the village, and find that all the things immediate to be done are very trivial. I could postpone them to hear this locust sing. The cockerels crow and the hens cluck in the yard as if time were dog-cheap. It seems something worth detaining time, — the laying of an egg. Cannot man do something to comfort the gods, and not let the world prove such a piddling concern? No doubt they would be glad to sell their shares at a large discount by this time. Eastern Railroad stock promises a better dividend.

The best poets, after all, exhibit only a tame and civil side of nature. They have not seen the west side of any mountain.

Day and night, mountain and wood, are visible from the wilderness as well as the village. They have their primeval aspects, sterner, savager than any poet has sung. It is only the white man's poetry. We want the Indian's report. Wordsworth is too tame for the Chippeway.

The landscape contains a thousand dials which indicate the natural divisions of time; the shadows of a thousand styles point to the hour. The afternoon is now far advanced, and a fresh and leisurely wind is blowing on the river, causing long reaches of serene ripples. It has done its stent, and seems not to flow but lie at its length reflecting the light. The haze over the woods seems like the breath of all nature, rising from a myriad pores into the attenuated atmosphere. It is sun smoke, the woof he has woven, his day's toil displayed.

If I were awaked from a deep sleep, I should know which side the meridian the sun might be by the chirping of the crickets. Night has already insidiously set her foot in the valley in many places, where the shadows of the shrubs and fences begin to darken the landscape. There is a deeper shading in the colors of the afternoon landscape. Perhaps the forenoon is brighter than the afternoon, not only because of the greater transparency of the atmosphere then, but because we naturally look most into the west, — as we look forward into the day, — and so in the forenoon see the sunny side of things, but in the afternoon the shadow of every tree.

What a drama of light and shadow from morning to night! Soon as the sun is over the meridian, in deep ravines under the east side of the cliffs night forwardly plants her foot, and, as day retreats, steps into his trenches, till at length she sits in his citadel. For long time she skulks behind the needles of the pine, before she dares draw out her forces into the plain. Sun, moon, wind, and stars are the allies of one side or the other.

How much will some officious men give to preserve an old book, of which perchance only a single [copy] exists, while a wise God is already giving, and will still give, infinitely more to get it destroyed!

Aug. 20. Friday. It seems as if no cock lived so far in the horizon but a faint vibration reached me here, spread the wider over earth as the more distant.

In the morning the crickets snore, in the afternoon they chirp, at midnight they dream.

Aug. 24. Let us wander where we will, the universe is built round about us, and we are central still. By reason of this, if we look into the heavens, they are concave, and if we were to look into a gulf as bottomless, it would be concave also. The sky is curved downward to the earth in the horizon, because I stand in the plain. I draw down its skirts. The stars so low there seem loth to go away from me, but by a circuitous path to be remembering and returning to me.

Aug. 28. Saturday. A great poet will write for his peers alone, and indite no line to an inferior. He will remember only that he saw truth and beauty from his position,

and calmly expect the time when a vision as broad shall overlook the same field as freely.

Johnson can no more criticise Milton than the naked eye can criticise Herschel's map of the sun.

The art which only gilds the surface and demands merely a superficial polish, without reaching to the core, is but varnish and filigree. But the work of genius is rough-hewn from the first, because it anticipates the lapse of time and has an ingrained polish, which still appears when fragments are broken off, an essential quality of its substance. Its beauty is its strength. It breaks with a lustre, and splits in cubes and diamonds. Like the diamond, it has only to be cut to be polished, and its surface is a window to its interior splendors.

True verses are not counted on the poet's fingers, but on his heart-strings.

My life hath been the poem I would have writ, But I could not both live and live to utter it.

In the Hindoo scripture the idea of man is quite illimitable and sublime. There is nowhere a loftier conception of his destiny. He is at length lost in Brahma himself, "the divine male." Indeed, the distinction of races in this life is only the commencement of a series of degrees which ends in Brahma.

The veneration in which the Vedas are held is itself a remarkable fact. Their code embraced the whole moral life of the Hindoo, and in such a case there is no other truth than sincerity. Truth is such by reference to the heart of man within, not to any standard without. There is no creed so false but faith can make it true.

In inquiring into the origin and genuineness of this scripture it is impossible to tell when the divine agency in its composition ceased, and the human began. "From fire, from air, and from the sun" was it "milked out."

There is no grander conception of creation anywhere. It is peaceful as a dream, and so is the annihilation of the world. It is such a beginning and ending as the morning and evening, for they had learned that God's methods are not violent. It was such an awakening as might have been heralded by the faint dreaming chirp of the crickets before the dawn.

The very indistinctness of its theogony implies a sublime truth. It does not allow the reader to rest in any supreme first cause, but directly hints of a supreamer still which created the last. The creator is still behind, increate. The divinity is so fleeting that its attributes are never expressed.

Aug. 30. What is a day, if the day's work be not done? What are the divisions of time to them who have nothing to do? What is the present or the future to him who has no occasion for them, who does not create them by his industry?

It is now easy to apply to this ancient scripture such a catholic criticism as it will become the part of some future age to apply to the Christian, — wherein the design and idea which underlies it is considered, and not the narrow and partial fulfillment.

These verses are so eminently textual, that it seems as if those old sages had concentrated all their wisdom in little fascicles, of which future times were to be the

commentary; as the light of this lower world is only the dissipated rays of the sun and stars. They seem to have been uttered with a sober morning prescience, in the dawn of time. There is a sort of holding back, or withdrawal of the full meaning, that the ages may follow after and explore the whole. The sentence opens unexpensively and almost unmeaningly, as the petals of a flower.

To our nearsightedness this mere outward life seems a constituent part of us, and we do not realize that as our soul expands it will cast off the shell of routine and convention, which afterward will only be an object for the cabinets of the curious. But of this people the temples are now crumbled away, and we are introduced to the very hearth of Hindoo life and to the primeval conventicle where how to eat and to drink and to sleep were the questions to be decided.

The simple life herein described confers on us a degree of freedom even in the perusal. We throw down our packs and go on our way unencumbered. Wants so easily and gracefully satisfied that they seem like a more refined pleasure and repleteness.

Sept. 1. Wednesday. When I observe the effeminate taste of some of my contemporaries in this matter of poetry, and how hardly they bear with certain incongruities, I think if this age were consulted it would not choose granite to be the backbone of the world, but Bristol spar or Brazilian diamonds. But the verses which have consulted the refinements even of a golden age will be found weak and nerveless for an iron one.

The poet is always such a Cincinnatus in literature as with republican simplicity to raise all to the chiefest honors of the state.

Each generation thinks to inhabit only a west end of the world, and have intercourse with a refined and civilized Nature, not conceiving of her broad equality and republicanism. They think her aristocratic and exclusive because their own estates are narrow. But the sun indifferently selects his rhymes, and with a liberal taste weaves into his verse the planet and the stubble.

Let us know and conform only to the fashions of eternity.

The very austerity of these Hindoos is tempting to the devotional as a more refined and nobler luxury. They seem to have indulged themselves with a certain moderation and temperance in the severities which their code requires, as divine exercises not to be excessively used as yet. One may discover the root of a Hindoo religion in his own private history, when, in the silent intervals of the day or the night, he does sometimes inflict on himself like austerities with a stem satisfaction.

The "Laws of Menu" are a manual of private devotion, so private and domestic and yet so public and universal a word as is not spoken in the parlor or pulpit in these days. It is so impersonal that it exercises our sincerity more than any other. It goes with us into the yard and into the chamber, and is yet later spoken than the advice of our mother and sisters.

Sept. 2. Thursday. There is but one obligation, and that is the obligation to obey the highest dictate. None can lay me under another which will supersede this. The gods have given me these years without any incumbrance; society has no mortgage on them. If any man assist me in the way of the world, let him derive satisfaction from

the deed itself, for I think I never shall have dissolved my prior obligations to God. Kindness repaid is thereby annulled. I would let his deed lie as fair and generous as it was intended. The truly beneficent never relapses into a creditor; his great kindness is still extended to me and is never done. Of those noble deeds which have me for their object I am only the most fortunate spectator, and would rather be the abettor of their nobleness than stay their tide with the obstructions of impatient gratitude. As true as action and reaction are equal, that nobleness which was as wide as the universe will rebound not on him the individual, but on the world. If any have been kind to me, what more do they want? I cannot make them richer than they are. If they have not been kind, they cannot take from me the privilege which they have not improved. My obligations will be my lightest load, for that gratitude which is of kindred stuff in me, expanding every pore, will easily sustain the pressure. We walk the freest through the air we breathe.

The sublime sentences of Menu carry us back to a time when purification and sacrifice and self-devotion had a place in the faith of men, and were not as now a superstition. They contain a subtle and refined philosophy also, such as in these times is not accompanied with so lofty and pure a devotion.

I saw a green meadow in the midst of the woods to-day which looked as if Dame Nature had set her foot there, and it had bloomed in consequence. It was the print of her moccasin.

Sometimes my thought rustles in midsummer as if ripe for the fall. I anticipate the russet hues and the dry scent of autumn, as the feverish man dreams of balm and sage.

I was informed to-day that no Hindoo tyranny presided at the framing of the world, — that I am a freeman of the universe, and not sentenced to any caste.

When I write verses I serve my thoughts as I do tumblers; I rap them to see if they will ring.

Sept. 3. Friday. Next to Nature, it seems as if man's actions were the most natural, they so gently accord with her. The small seines of flax or hemp stretched across the shallow and transparent parts of the river are no more intrusion than the cobweb in the sun. It is very slight and refined outrage at most. I stay my boat in mid-current and look down in the running water to see the civil meshes of his nets, and wonder how the blustering people of the town could have done this elvish work. The twine looks like a new river-weed and is to the river like a beautiful memento of man, man's presence in nature discovered as silently and delicately as Robinson discovered that there [were] savages on his island by a footprint in the sand.

Moonlight is the best restorer of antiquity. The houses in the village have a classical elegance as of the best days of Greece, and this half-finished church reminds me of the Parthenon, or whatever is most famous and excellent in art. So serene it stands, reflecting the moon, and intercepting the stars with its rafters, as if it were refreshed by the dews of the night equally with me. By day Mr. Hosmer, but by night Vitruvius rather. If it were always to stand in this mild and sombre light it would be finished already. It is in progress by day but completed by night, and already its designer is

an old master. The projecting rafter so carelessly left on the tower, holding its single way through the sky, is quite architectural, and in the unnecessary length of the joists and flooring of the staging around the walls there is an artistic superfluity and grace. In these fantastic lines described upon the sky there is no trifling or conceit. Indeed, the staging for the most part is the only genuine native architecture and deserves to stand longer than the building it surrounds. In this obscurity there are no fresh colors to offend, and the light and shade of evening adorn the new equally with the old.

Sept. 4. Saturday. I think I could write a poem to be called "Concord." For argument I should have the River, the Woods, the Ponds, the Hills, the Fields, the Swamps and Meadows, the Streets and Buildings, and the Villagers. Then Morning, Noon, and Evening, Spring, Summer, Autumn, and Winter, Night, Indian Summer, and the Mountains in the Horizon.

A book should be so true as to be intimate and familiar to all men, as the sun to their faces, — such a word as is occasionally uttered to a companion in the woods in summer, and both are silent.

As I pass along the streets of the village on the day of our annual fair, when the leaves strew the ground, I see how the trees keep just such a holiday all the year. The lively spirits of their sap mount higher than any plowboy's let loose that day. A walk in the autumn woods, when, with serene courage, they are preparing for their winter campaign, if you have an ear for the rustling of their camp or an eye for the glancing of their armor, is more inspiring than the Greek or Peninsular war. Any grandeur may find society as great as itself in the forest.

Pond Hill. — I see yonder some men in a boat, which floats buoyantly amid the reflections of the trees, like a feather poised in mid-air, or a leaf wafted gently from its twig to the water without turning over. They seem very delicately to have availed themselves of the natural laws, and their floating there looks like a beautiful and successful experiment in philosophy. It reminds me how much more refined and noble the life of man might be made, how its whole economy might be as beautiful as a Tuscan villa, — a new and more catholic art, the art of life, which should have its impassioned devotees end make the schools of Greece and Rome to be deserted.

Sept. 5. Saturday. Bam.

Greater is the depth of sadness  
Than is any height of gladness.

I cannot read much of the best poetry in prose or verse without feeling that it is a partial and exaggerated plaint, rarely a carol as free as Nature's. That content which the sun shines for between morning and evening is unsung. The Muse solaces herself; she is not delighted but consoled. But there are times when we feel a vigor in our limbs, and our thoughts are like a flowing morning light, and the stream of our life without reflection shows long reaches of serene ripples. And if we were to sing at such an hour, there would be no catastrophe contemplated in our verse, no tragic element in it, nor yet a comic. For the life of the gods is not in any sense dramatic, nor can be the subject of the drama; it is epic without beginning or end, an eternal interlude

without plot, — not subordinate one part to another, but supreme as a whole, at once leaf and flower and fruit. At present the highest strain is Hebraic. The church bell is the tone of all religious thought, the most musical that men consent to sing. In the youth of poetry, men love to praise the lark and the morning, but they soon forsake the dews and skies for the nightingale and evening shades. Without instituting a wider comparison I might say that in Homer there is more of the innocence and serenity of youth than in the more modern and moral poets. The Iliad is not Sabbath but morning reading, and men cling to this old song, because they have still moments of unbaptized and uncommitted life which give them an appetite for more. There is no cant in him, as there is no religion. We read him with a rare sense of freedom and irresponsibility, as though we trod on native ground, and were autochthones of the soil.

Through the fogs of this distant vale we look back and upward to the source of song, whose crystal stream still ripples and gleams in the clear atmosphere of the mountain's side.

Some hours seem not to be occasion for anything, unless for great resolves to draw breath and repose in, so religiously do we postpone all action therein. We do not straight go about to execute our thrilling purpose, but shut our doors behind us, and saunter with prepared mind, as if the half were already done.

Sometimes a day serves only to hold time together.

Sept. 12. Sunday.

Where I have been There was none seen.

Sept. 14. No bravery is to be named with that which can face its own deeds.

In religion there is no society.

Do not dissect a man till he is dead.

Love does not analyze its object.

We do not know the number of muscles in a caterpillar dead; much less the faculties of a man living.

You must believe that I know before you can tell me.

To the highest communication I can make no reply; I lend only a silent ear.

Sept. 18. Saturday. Barn. — It is a great event, the hearing of a bell ring in one of the neighboring towns, particularly in the night. It excites in me an unusual hilarity, and I feel that I am in season wholly and enjoy a prime and leisure hour.

Sept. 20. Monday. Visited Sampson Wilder of Boston. His method of setting out peach trees is as follows: —

Dig a hole six feet square and two deep, and remove the earth; cover the bottom to the depth of six inches with lime and ashes in equal proportions, and upon this spread another layer of equal thickness, of horn parings, tips of horns, bones, and the like, then fill up with a compost of sod and strong animal manure, say four bushels of hog manure to a cartload of sod. Cover the tree — which should be budded at two years old — but slightly, and at the end of two years dig a trench round it three feet from the tree and six inches deep, and fill it with lime and ashes.

For grapes: —

Let your trench be twelve feet wide and four deep, cover the bottom with paving-stones six inches, then old bricks with mortar attached or loose six inches more, then beef-bones, horns, etc., six more (Captain Bobadil), then a compost similar to the preceding. Set your roots one foot from the north side, the trench running east and west, and bury eight feet of the vine crosswise the trench, not more than eight inches below the surface. Cut it down for three or four years, that root may accumulate, and then train it from the sun up an inclined plane.

Sept. 28. Tuesday. I anticipate the coming in of spring as a child does the approach of some pomp through a gate of the city.

Sept. 30.

Better wait

Than be too late.

Nov. 29. Cambridge. — One must fight his way, after a fashion, even in the most civil and polite society. The most truly kind and gracious have to be won by a sort of valor, for the seeds of suspicion seem to lurk in every spadeful of earth, as well as those of confidence. The president and librarian turn the cold shoulder to your application, though they are known for benevolent persons. They wonder if you can be anything but a thief, contemplating frauds on the library. It is the instinctive and salutary principle of self-defense; that which makes the cat show her talons when you take her by the paw.

Certainly that valor which can open the hearts of men is superior to that which can only open the gates of cities.

You must always let people see that they serve themselves more than you, — not by your ingratitude, but by sympathy and congratulation.

The twenty-first volume of Chalmers's English Poets contains Hoole's and Mickle's Translations. In the shape of a note to the Seventh Book of the *Lusiad*, Mickle has written a long "Inquiry into the Religious Tenets and Philosophy of the Bramins."

Nov. 30. Tuesday. Cambridge. — When looking over the dry and dusty volumes of the English poets, I cannot believe that those fresh and fair creations I had imagined are contained in them. English poetry from Gower down, collected into one alcove, and so from the library window compared with the commonest nature, seems very mean. Poetry cannot breathe in the scholar's atmosphere. The Aubreys and Hickeeses, with all their learning, prophane it yet indirectly by their zeal. You need not envy his feelings who for the first time has cornered up poetry in an alcove. I can hardly be serious with myself when I remember that I have come to Cambridge after poetry; and while I am running over the catalogue and collating and selecting, I think if it would not be a shorter way to a complete volume to step at once into the field or wood, with a very low reverence to students and librarians. Milton did not foresee what company he was to fall into. On running over the titles of these books, looking from time to time at their first pages or farther, I am oppressed by an inevitable sadness. One must have come into a library by an oriel window, as softly and undisturbed as the light which falls on the books through a stained window, and not by the librarian's door, else all

his dreams will vanish. Can the Valhalla be warmed by steam and go by clock and bell?

Good poetry seems so simple and natural a thing that when we meet it we wonder that all men are not always poets. Poetry is nothing but healthy speech. Though the speech of the poet goes to the heart of things, yet he is that one especially who speaks civilly to Nature as a second person and in some sense is the patron of the world. Though more than any he stands in the midst of Nature, yet more than any he can stand aloof from her. The best lines, perhaps, only suggest to me that that man simply saw or heard or felt what seems the commonest fact in my experience.

One will know how to appreciate Chaucer best who has come down to him the natural way through the very meagre pastures of Saxon and ante-Chaucerian poetry. So human and wise he seems after such diet that we are as liable to misjudge him so as usually.

The Saxon poetry extant seems of a more serious and philosophical cast than the very earliest that can be called English. It has more thought, but less music. It translates Boethius, it paraphrases the Hebrew Bible, it solemnly sings of war, of life and death, and chronicles events. The earliest English poetry is tinctured with romance through the influence of the Normans, as the Saxon was not. The ballad and metrical romance belong to this period. Those old singers were for the most part imitators or translators. Or will it not appear, when viewed at a sufficient distance, that our brave new poets are also secondary as they, and refer the eye that reads them and their poetry, too, back and backward without end?

Nothing is so attractive and unceasingly curious as character. There is no plant that needs such tender treatment, there is none that will endure so rough. It is the violet and the oak. It is the thing we mean, let us say what we will. We mean our own character, or we mean yours. It is divine and related to the heavens, as the earth is by the flashes of the Aurora. It has no acquaintance nor companion. It goes silent and unobserved longer than any planet in space, but when at length it does show itself, it seems like the flowering of all the world, and its before unseen orbit is lit up like the trail of a meteor. I hear no good news ever but some trait of a noble character. It reproaches me plaintively. I am mean in contrast, but again am thrilled and elevated that I can see my own meanness, and again still, that my own aspiration is realized in that other. You reach me, my friend, not by your kind or wise words to me here or there; but as you retreat, perhaps after years of vain familiarity, some gesture or unconscious action in the distance speaks to me with more emphasis than all those years. I am not concerned to know what eighth planet is wandering in space up there, or when Venus or Orion rises, but if, in any cot to east or west and set behind the woods, there is any planetary character illuminating the earth.

Packed in my mind lie all the clothes  
Which outward nature wears,  
For, as its hourly fashions change,  
It all things else repairs.

My eyes look inward, not without,  
And I but hear myself,  
And this new wealth which I have got  
Is part of my own self.  
For while I look for change abroad,  
I can no difference find,  
Till some new ray of peace uncalled  
Lumines my inmost mind,  
As, when the sun streams through the wood,  
Upon a winter's mom,  
Where'er his silent beams may stray  
The murky night is gone.  
How could the patient pine have known  
The morning breeze would come,  
Or simple flowers anticipate  
The insect's noonday hum,  
Till that new light with morning cheer  
From far streamed through the aisles,  
And nimbly told the forest trees  
For many stretching miles?

[Dec.] 12. Sunday. All music is only a sweet striving to express character. Now that lately I have heard of some traits in the character of a fair and earnest maiden whom I had only known superficially, but who has gone hence to make herself more known by distance, they sound like strains of a wild harp music. They make all persons and places who had thus forgotten her to seem late and behindhand. Every maiden conceals a fairer flower and more luscious fruit than any calyx in the field, and if she go with averted face, confiding in her own purity and high resolves, she will make the heavens retrospective, and all nature will humbly confess its queen.

There is apology enough for all the deficiency and shortcoming in the world in the patient waiting of any bud of character to unfold itself.

Only character can command our reverent love. It is all mysteries in itself.  
What is it gilds the trees and clouds  
And paints the heavens so gay,  
But yonder fast-abiding light  
With its unchanging ray?  
I've felt within my inmost soul  
Such cheerful morning news,  
In the horizon of my mind  
I've seen such morning hues,  
As in the twilight of the dawn,  
When the first birds awake,  
Is heard within some silent wood

Where they the small twigs break;  
Or in the eastern skies is seen  
Before the sun appears,  
Foretelling of the summer heats  
Which far away he bears.

P. M. Walden. — I seem to discern the very form of the wind when, blowing over the hills, it falls in broad flakes upon the surface of the pond, this subtle element obeying the same law with the least subtle. As it falls it spreads itself like a mass of lead dropped upon an anvil. I cannot help being encouraged by this blithe activity in the elements in these degenerate days of men. Who hears the rippling of the rivers will not utterly despair of anything. The wind in the wood yonder sounds like an incessant waterfall, the water dashing and roaring among rocks.

[Dec.] 13. Monday. We constantly anticipate repose. Yet it surely can only be the repose that is in entire and healthy activity. It must be a repose without rust. What is leisure but opportunity for more complete and entire action? Our energies pine for exercise. That time we spend in our duties is so much leisure, so that there is no man but has sufficient of it.

I make my own time, I make my own terms. I cannot see how God or Nature can ever get the start of me.

This ancient Scotch poetry, at which its contemporaries so marvelled, sounds like the uncertain lisp of a child. When man's speech flows freest it but stutters and stammers. There is never a free and clear deliverance; but, read now when the illusion of smooth verse is destroyed by the antique spelling, the sense is seen to stammer and stumble all the plainer. To how few thoughts do all these sincere efforts give utterance! An hour's conversation with these men would have done more. I am astonished to find how meagre that diet is which has fed so many men. The music of sound, which is all-sufficient at first, is speedily lost, and then the fame of the poet must rest on the music of the sense. A great philosophical and moral poet would give permanence to the language by making the best sound convey the best sense.

[Dec.] 14. Tuesday. To hear the sunset described by the old Scotch poet Douglas, as I have seen it, repays me for many weary pages of antiquated Scotch. Nothing so restores and humanizes antiquity and makes it blithe as the discovery of some natural sympathy between it and the present. Why is it that there is something melancholy in antiquity? We forget that it had any other future than our present. As if it were not as near to the future as ourselves! No, thank heavens, these ranks of men to right and left, posterity and ancestry, are not to be thridded by any earnest mortal. The heavens stood over the heads of our ancestors as near as to us. Any living word in their books abolishes the difference of time. It need only be considered from the present standpoint.

[Dec.] 15. Wednesday. A mild summer sun shines over forest and lake. The earth looks as fair this morning as the Valhalla of the gods. Indeed our spirits never go beyond nature. In the woods there is an inexpressible happiness. Their mirth is but just repressed. In winter, when there is but one green leaf for many rods, what warm

content is in them! They are not rude, but tender, even in the severest cold. Their nakedness is their defense. All their sounds and sights are elixir to my spirit. They possess a divine health. God is not more well. Every sound is inspiriting and fraught with the same mysterious assurance, from the creaking of the boughs in January to the soft sough of the wind in July.

How much of my well-being, think you, depends on the condition of my lungs and stomach, — such cheap pieces of Nature as they, which, indeed, she is every day reproducing with prodigality. Is the arrow indeed fatal which rankles in the breast of the bird on the bough, in whose eye all this fair landscape is reflected, and whose voice still echoes through the wood?

The trees have come down to the bank to see the river go by. This old, familiar river is renewed each instant; only the channel is the same. The water which so calmly reflects the fleeting clouds and the primeval trees I have never seen before. It may have washed some distant shore, or framed a glacier or iceberg at the north, when I last stood here. Seen through a mild atmosphere, the works of the husbandman, his plowing and reaping, have a beauty to the beholder which the laborer never sees.

I seem to see somewhat more of my own kith and kin in the lichens on the rocks than in any books. It does seem as if mine were a peculiarly wild nature, which so yearns toward all wildness. I know of no redeeming qualities in me but a sincere love for some things, and when I am reprov'd I have to fall back on to this ground. This is my argument in reserve for all cases. My love is invulnerable. Meet me on that ground, and you will find me strong. When I am condemned, and condemn myself utterly, I think straightway, "But I rely on my love for some things." Therein I am whole and entire. Therein I am God-propped.

When I see the smoke curling up through the woods from some farmhouse invisible, it is more suggestive of the poetry of rural and domestic life than a nearer inspection can be. Up goes the smoke as quietly as the dew exhales in vapor from these pine leaves and oaks; as busy, disposing itself in circles and in wreaths, as the housewife on the hearth below. It is cotemporary with a piece of human biography, and waves as a feather in some man's cap. Under that rod of sky there is some plot a-brewing, some ingenuity has planted itself, and we shall see what it will do. It tattles of more things than the boiling of the pot. It is but one of man's breaths. All that is interesting in history or fiction is transpiring beneath that cloud. The subject of all life and death, of happiness and grief, goes thereunder.

When the traveller in the forest, attaining to some eminence, descries a column of smoke in the distance, it is a very gentle hint to him of the presence of man. It seems as if it would establish friendly relations between them without more ado.

[Dec.] 18. Saturday. Some men make their due impression upon their generation, because a petty occasion is enough to call forth all their energies; but are there not others who would rise to much higher levels, whom the world has never provoked to make the effort? I believe there are men now living who have never opened their mouths in a public assembly, in whom nevertheless there is such a well of eloquence that the

appetite of any age could never exhaust it; who pine for an occasion worthy of them, and will pine till they are dead; who can admire, as well as the rest, at the flowing speech of the orator, but do yet miss the thunder and lightning and visible sympathy of the elements which would garnish their own utterance.

If in any strait I see a man fluttered and his ballast gone, then I lose all hope of him, he is undone; but if he reposes still, though he do nothing else worthy of him, if he is still a man in reserve, then is there everything to hope of him. The age may well go pine itself that it cannot put to use this gift of the gods. He lives on, still unconcerned, not needing to be used. The greatest occasion will be the slowest to come.

Sometimes a particular body of men do unconsciously assert that their will is fate, that the right is decided by their fiat without appeal, and when this is the case they can never be mistaken; as when one man is quite silenced by the thrilling eloquence of another, and submits to be neglected as to his fate, because such is not the willful vote of the assembly, but their instinctive decision.

Dec. 23. Thursday. Concord. — The best man's spirit makes a fearful sprite to haunt his tomb. The ghost of a priest is no better than that of a highwayman. It is pleasant to hear of one who has blest whole regions after his death by having frequented them while alive, who has prophaned or tabooed no place by being buried in it. It adds not a little to the fame of Little John that his grave was long "celebrious for the yielding of excellent whetstones."

A forest is in all mythologies a sacred place, as the oaks among the Druids and the grove of Egeria; and even in more familiar and common life a celebrated wood is spoken of with respect, as "Barnsdale Wood" and "Sherwood." Had Robin Hood no Sherwood to resort [to], it would be difficult to invest his story with the charms it has got. It is always the tale that is untold, the deeds done and the life lived in the unexplored secrecy of the wood, that charm us and make us children again, — to read his ballads, and hear of the greenwood tree.

Dec. 24. Friday. I want to go soon and live away by the pond, where I shall hear only the wind whispering among the reeds. It will be success if I shall have left myself behind. But my friends ask what I will do when I get there. Will it not be employment enough to watch the progress of the seasons?

Dec. 25. Saturday. It does seem as if Nature did for a long time gently overlook the prophanity of man. The wood still kindly echoes the strokes of the axe, and when the strokes are few and seldom, they add a new charm to a walk. All the elements strive to naturalize the sound.

Such is our sympathy with the seasons that we experience the same degree of heat in the winter as in the summer.

It is not a true apology for any coarseness to say that it is natural. The grim woods can afford to be very delicate and perfect in the details.

I don't want to feel as if my life were a sojourn any longer. That philosophy cannot be true which so paints it. It is time now that I begin to live.

Dec. 26. Sunday. He is the rich man and enjoys the fruits of riches, who, summer and winter forever, can find delight in the contemplation of his soul. I could look as unweariedly up to that cope as into the heavens of a summer day or a winter night. When I hear this bell ring, I am carried back to years and Sabbaths when I was newer and more innocent, I fear, than now, and it seems to me as if there were a world within a world. Sin, I am sure, is not in overt acts or, indeed, in acts of any kind, but is in proportion to the time which has come behind us and displaced eternity, — that degree to which our elements are mixed with the elements of the world. The whole duty of life is contained in the question how to respire and aspire both at once.

Dec. 29. Wednesday. One does not soon learn the trade of life. That one may work out a true life requires more art and delicate skill than any other work. There is need of the nice fingers of the girl as well as the tough hand of the farmer. The daily work is too often toughening the pericarp of the heart as well as the hand. Great familiarity with the world must be nicely managed, lest it win away and bereave us of some susceptibility. Experience bereaves us of our innocence; wisdom bereaves us of our ignorance. Let us walk in the world without learning its ways. Whole weeks or months of my summer life slide away in thin volumes like mist or smoke, till at length some warm morning, perchance, I see a sheet of mist blown down the brook to the swamp, its shadow flitting across the fields, which have caught a new significance from that accident; and as that vapor is raised above the earth, so shall the next weeks be elevated above the plane of the actual; or when the setting sun slants across the pastures, and the cows low to my inward ear and only enhance the stillness, and the eve is as the dawn, a beginning hour and not a final one, as if it would never have done, with its clear western amber inciting men to lives of as limpid purity. Then do other parts of my day's work shine than I had thought at noon, for I discover the real purport of my toil, as, when the husbandman has reached the end of the furrow and looks back, he can best tell where the pressed earth shines most.

All true greatness runs as level a course, and is as un aspiring, as the plow in the furrow. It wears the homeliest dress and speaks the homeliest language. Its theme is gossamer and dew lines, johnswort and loosestrife, for it has never stirred from its repose and is most ignorant of foreign parts. Heaven is the inmost place. The good have not to travel far. What cheer may we not derive from the thought that our courses do not diverge, and we wend not asunder, but as the web of destiny is woven it [is] fulled, and we are cast more and more into the centre! And our fates even are social. There is no wisdom which can take [the] place of humanity, and I find that in old Chaucer that love rings longest which rhymes best with some saw of Milton's or Edmunds's. I wish I could be as still as God is. I can recall to my mind the stillest summer hour, in which the grasshopper sings over the mulleins, and there is a valor in that time the memory of which is armor that can laugh at any blow of fortune. A man should go out [of] nature with the chirp of the cricket or the trill of the veery ringing in his ear. These earthly sounds should only die away for a season, as the strains of the harp rise and swell. Death is that expressive pause in the music of the blast. I would be as clean

as ye, O woods. I shall not rest till I be as innocent as you. I know that I shall sooner or later attain to an unspotted innocence, for when I consider that state even now I am thrilled.

If we were wise enough, we should see to what virtue we were indebted for any happier moment we might have, nor doubt we had earned this at some time.

These motions everywhere in nature must surely [be] the circulations of God. The flowing sail, the running stream, the waving tree, the roving wind, — whence else their infinite health and freedom? I can see nothing so proper and holy as unrelaxed play and frolic in this bower God has built for us. The suspicion of sin never comes to this thought. Oh, if men felt this they would never build temples even of marble or diamond, but it would be sacrilege and profane, but disport them forever in this paradise.

In the coldest day it melts somewhere.

It seems as if only one trait, one little incident in human biography, need to be said or written in some era, that all readers may go mad after it, and the man who did the miracle is made a demigod henceforth.

What we all do, not one can tell; and when some lucky speaker utters a truth of our experience and not of our speculation, we think he must have had the nine Muses and the three Graces to help him. I can at length stretch me when I come to Chaucer's breadth; and I think, "Well, I could be that man's acquaintance," for he walked in that low and retired way that I do, and was not too good to live. I am grieved when they hint of any unmanly submissions he may have made, for that subtracts from his breadth and humanity.

Dec. 30. Thursday. I admire Chaucer for a sturdy English wit. The easy height he speaks from in his Prologue to the *Canterbury Tales* is as good as anything in it, — as if he were indeed better than any of the company there assembled.

The poet does not have to go out of himself and cease to tattle of his domestic affairs, to win our confidence, but is so broad that we see no limits to his sympathy.

Great delicacy and gentleness of character is constantly displayed in Chaucer's verse. The simplest and humblest words come readily to his lips. The natural innocence of the man appears in the simple and pure spirit in which "The Prioresses Tale" is conceived, in which the child sings *O alma redemptoris mater*, and in the account of the departure of Custance with her child upon the sea, in "The Man of Lawes Tale." The whole story of Chanticleer and Dame Partlet in "The Nonnes Preestes Tale" is genuine humanity. I know nothing better in its kind. The poets seem to be only more frank and plain-spoken than other men. Their verse is but confessions. They always confide in the reader, and speak privily with him, keeping nothing back.

I know of no safe rule by which to judge of the purity of a former age but that I see that the impure of the present age are not apt to rise to noble sentiments when they speak or write, and suspect, therefore, that there may be more truth than is allowed in the apology that such was the manner of the age.

Within the circuit of this plodding life,

There are moments of an azure hue  
 And as unspotted fair as is the violet  
 Or anemone, when the spring strews them  
 By some south woodside; which make untrue  
 The best philosophy which has so poor an aim  
 But to console man for his grievance here.  
 I have remembered when the winter came,  
 High in my chamber in the frosty nights,  
 How in the summer past some  
 Unrecorded beam slanted across  
 Some upland pasture where the Johnswort grew,  
 Or heard, amidst the verdure of my mind, the bee's long-smothered hum,  
 So by the cheap economy of God made rich to go upon my wintry work again.  
 In the still, cheerful cold of winter nights,  
 When, in the cold light of the moon,  
 On every twig and rail and jutting spout  
 The icy spears are doubling their length  
 Against the glancing arrows of the sun,  
 And the shrunk wheels creak along the way,  
 Some summer accident long past  
 Of lakelet gleaming in the July beams,  
 Or hum of bee under the blue flag,

Loitering in the meads, or busy rill which now stands dumb and still, its own memorial, purling at its play along the slopes, and through the meadows next, till that its sound was quenched in the staid current of its parent stream.

In memory is the more reality. I have seen how the furrows shone but late upturned, and where the fieldfare followed in the rear, when all the fields stood bound and hoar beneath a thick integument of snow.

When the snow is falling thick and fast, the flakes nearest you seem to be driving straight to the ground, while the more distant seem to float in the air in a quivering bank, like feathers, or like birds at play, and not as if sent on any errand. So, at a little distance, all the works of Nature proceed with sport and frolic. They are more in the eye and less in the deed.

Dec. 31. Friday. Books of natural history make the most cheerful winter reading. I read in Audubon with a thrill of delight, when the snow covers the ground, of the magnolia, and the Florida keys, and their warm sea breezes; of the fence-rail, and the cotton-tree, and the migrations of the rice-bird; or of the breaking up of winter in Labrador. I seem to hear the melting of the snow on the forks of the Missouri as I read. I imbibe some portion of health from these reminiscences of luxuriant nature.

There is a singular health for me in those words Labrador and East Main which no desponding creed recognizes. How much more than federal are these States! If there were no other vicissitudes but the seasons, with their attendant and consequent

changes, our interest would never flag. Much more is a-doing than Congress wots of in the winter season. What journal do the persimmon and buckeye keep, or the sharp-shinned hawk? What is transpiring from summer to winter in the Carolinas, and the Great Pine Forest, and the Valley of the Mohawk? The merely political aspect of the land is never very cheering. Men are degraded when considered as the members of a political organization. As a nation the people never utter one great and healthy word. From this side all nations present only the symptoms of disease. I see but Bunker's Hill and Sing Sing, the District of Columbia and Sullivan's Island, with a few avenues connecting them. But paltry are all these beside one blast of the east or south wind which blows over them all.

In society you will not find health, but in nature. You must converse much with the field and woods, if you would imbibe such health into your mind and spirit as you covet for your body. Society is always diseased, and the best is the sickest. There is no scent in it so wholesome as that of the pines, nor any fragrance so penetrating and restorative as that of everlasting in high pastures. Without that our feet at least stood in the midst of nature, all our faces would be pale and livid.

I should like to keep some book of natural history always by me as a sort of elixir, the reading of which would restore the tone of my system and secure me true and cheerful views of life. For to the sick, nature is sick, but to the well, a fountain of health. To the soul that contemplates some trait of natural beauty no harm nor disappointment can come. The doctrines of despair, of spiritual or political servitude, no priestcraft nor tyranny, was ever [sic] taught by such as drank in the harmony of nature.

## 1842

Jan. 1. Virtue is the deed of the bravest. It is that art which demands the greatest confidence and fearlessness. Only some hardy soul ventures upon it. Virtue is a bravery so hardy that it deals in what it has no experience in. The virtuous soul possesses a fortitude and hardihood which not the grenadier nor pioneer can match. It never shrunk. It goes singing to its work. Effort is its relaxation. The rude pioneer work of this world has been done by the most devoted worshippers of beauty. Their resolution has possessed a keener edge than the soldier's. In winter is their campaign; they never go into quarters. They are elastic under the heaviest burden, under the extremest physical suffering.

Methinks good courage will not flag here on the Atlantic border as long as we are outflanked by the Fur Countries. There is enough in that sound to cheer one under any circumstances. The spruce, the hemlock, and the pine will not countenance despair. Methinks some creeds in vestries and churches do forget the hunter wrapped in furs by the Great Slave Lake, or how the Esquimaux sledges are drawn by dogs, and in the twilight of the northern night the hunter does not give over to follow the seal and walrus over the ice. These men are sick and of diseased imaginations who would toll

the world's knell so soon. Cannot these sedentary sects do better than prepare the shrouds and write the epitaphs of those other busy living men? The practical faith of men belies the preacher's consolation. This is the creed of the hypochondriac.

There is no infidelity so great as that which prays, and keeps the Sabbath, and founds churches. The sealer of the South Pacific preaches a truer doctrine. The church is the hospital for men's souls, but the reflection that he may one day occupy a ward in it should not discourage the cheerful labors of the able-bodied man. Let him remember the sick in their extremities, but not look thither as to his goal.

Jan. 2. Sunday. The ringing of the church bell is a much more melodious sound than any that is heard within the church. All great values are thus public, and undulate like sound through the atmosphere. Wealth cannot purchase any great private solace or convenience. Riches are only the means of sociality. I will depend on the extravagance of my neighbors for my luxuries, for they will take care to pamper me if I will be overfed. The poor man who sacrificed nothing for the gratification seems to derive a safer and more natural enjoyment from his neighbor's extravagance than he does himself. It is a new natural product, from the contemplation of which he derives new vigor and solace as from a natural phenomenon.

In moments of quiet and leisure my thoughts are more apt to revert to some natural than any human relation.

Chaucer's sincere sorrow in his latter days for the grossness of his earlier works, and that he "cannot recall and annul" what he had "written of the base and filthy love of men towards women; but alas they are now continued from man to man," says he, "and I cannot do what I desire," is all very creditable to his character.

Chaucer is the make-weight of his century, — a worthy representative of England while Petrarch and Boccaccio lived in Italy, and Tell and Tamerlane in Switzerland and Asia, and Bruce and Rienzi in Europe, and Wickliffe and Gower in his own land. Edward III and John of Gaunt and the Black Prince complete the company. The fame of Roger Bacon came down from the preceding century, and Dante, though just departed, still exerted the influence of a living presence.

With all his grossness he is not undistinguished for the tenderness and delicacy of his muse. A simple pathos and feminine gentleness is peculiar to him which not even Wordsworth can match. And then his best passages of length are marked by a happy and healthy wit which is rather rare in the poetry of any nation. On the whole, he impresses me as greater than his reputation, and not a little like Homer and Shakespeare, for he would have held up his head in their company. Among the earliest English poets he is their landlord and host, and has the authority of such. We read him with affection and without criticism, for he pleads no cause, but speaks for us, his readers, always. He has that greatness of trust and reliance which compels popularity. He is for a whole country and country [sic] to know and to be proud of. The affectionate mention which succeeding early poets make of him, coupling him with Homer and Virgil, is also to be taken into the account in estimating his character. King James and Dunbar of Scotland speak with more love and reverence of him than

any cotemporary poet of his predecessors of the last century. That childlike relation, indeed, does not seem to exist now which was then.

Jan. 3. Monday. It is pleasant when one can relieve the grossness of the kitchen and the table by the simple beauty of his repast, so that there may be anything in it to attract the eye of the artist even. I have been popping com to-night, which is only a more rapid blossoming of the seed under a greater than July heat. The popped com is a perfect winter flower, hinting of anemones and houstonias. For this little grace man has, mixed in with the vulgarness of his repast, he may well thank his stars. The law by which flowers unfold their petals seems only to have operated more suddenly under the intense heat. It looks like a sympathy in this seed of the com with its sisters of the vegetable kingdom, as if by preference it assumed the flower form rather than the crystalline. Here has bloomed for my repast such a delicate blossom as will soon spring by the wall-sides. And this is as it should be. Why should not Nature revel sometimes, and genially relax and make herself familiar at my board? I would have my house a bower fit to entertain her. It is a feast of such innocence as might have snowed down. By my warm hearth sprang these cerealious blossoms; here was the bank where they grew.

Methinks some such visible token of approval would always accompany the simple and healthy repast. There would be such a smiling and blessing upon it. Our appetite should always be so related to our taste, and the board we spread for its gratification be an epitome of the universal table which Nature sets by hill and wood and stream for her dumb pensioners.

Jan. 5. Wednesday. I find that whatever hindrances may occur I write just about the same amount of truth in my Journal; for the record is more concentrated, and usually it is some very real and earnest life, after all, that interrupts. All flourishes are omitted. If I saw wood from morning to night, though I grieve that I could not observe the train of my thoughts during that time, yet, in the evening, the few scannel lines which describe my day's occupations will make the creaking of the saw more musical than my freest fancies could have been. I find incessant labor with the hands, which engrosses the attention also, the best method to remove palaver out of one's style. One will not dance at his work who has wood to cut and cord before the night falls in the short days of winter; but every stroke will be husbanded, and ring soberly through the wood; and so will his lines ring and tell on the ear, when at evening he settles the accounts of the day. I have often been astonished at the force and precision of style to which busy laboring men, unpracticed in writing, easily attain when they are required to make the effort. It seems as if their sincerity and plainness were the main thing to be taught in schools, — and yet not in the schools, but in the fields, in actual service, I should say. The scholar not unfrequently envies the propriety and emphasis with which the farmer calls to his team, and confesses that if that lingo were written it would surpass his labored sentences.

Who is not tired of the weak and flowing periods of the politician and scholar, and resorts not even to the Farmer's Almanac, to read the simple account of the month's

labor, to restore his tone again? I want to see a sentence run clear through to the end, as deep and fertile as a well-drawn furrow which shows that the plow was pressed down to the beam. If our scholars would lead more earnest lives, we should not witness those lame conclusions to their ill-sown discourses, but their sentences would pass over the ground like loaded rollers, and not mere hollow and wooden ones, to press in the seed and make it germinate.

A well-built sentence, in the rapidity and force with which it works, may be compared to a modern corn-planter, which furrows out, drops the seed, and covers it up at one movement.

The scholar requires hard labor as an impetus to his pen. He will learn to grasp it as firmly and wield it as gracefully and effectually as an axe or a sword. When I consider the labored periods of some gentleman scholar, who perchance in feet and inches comes up to the standard of his race, and is nowise deficient in girth, I am amazed at the immense sacrifice of thews and sinews. What! these proportions and these bones, and this their work! How these hands hewed this fragile matter, mere filagree or embroidery fit for ladies' fingers! Can this be a stalwart man's work, who has marrow in his backbone and a tendon Achilles in his heel? They who set up Stonehenge did somewhat, — much in comparison, — if it were only their strength was once fairly laid out, and they stretched themselves.

I discover in Raleigh's verses the vices of the courtier. They are not equally sustained, as if his noble genius were warped by the frivolous society of the court. He was capable of rising to a remarkable elevation. His poetry has for the most part a heroic tone and vigor as of a knight errant. But again there seems to have been somewhat unkindly in his education, and as if he had by no means grown up to be the man he promised. He was apparently too genial and loyal a soul, or rather he was incapable of resisting temptations from that quarter. If to his genius and culture he could have added the temperament of Fox or Cromwell, the world would have had cause longer to remember him. He was the pattern of nobility. One would have said it was by some lucky fate that he and Shakespeare flourished at the same time in England, and yet what do we know of their acquaintanceship?

Jan. 7. Friday. I am singularly refreshed in winter when I hear tell of service-berries, pokeweed, juniper. Is not heaven made up of these cheap summer glories?

The great God is very calm withal. How superfluous is any excitement in his creatures! He listens equally to the prayers of the believer and the unbeliever. The moods of man should unfold and alternate as gradually and placidly as those of nature. The sun shines for aye! The sudden revolutions of these times and this generation have acquired a very exaggerated importance. They do not interest me much, for they are not in harmony with the longer periods of nature. The present, in any aspect in which it can be presented to the smallest audience, is always mean. God does not sympathize with the popular movements.

Jan. 8. Saturday. When, as now, in January a south wind melts the snow, and the bare ground appears, covered with sere grass and occasionally wilted green leaves

which seem in doubt whether to let go their greenness quite or absorb new juices against the coming year, — in such a season a perfume seems to exhale from the earth itself and the south wind melts my integuments also. Then is she my mother earth. I derive a real vigor from the scent of the gale wafted over the naked ground, as from strong meats, and realize again how man is the pensioner of Nature. We are always conciliated and cheered when we are fed by [such] an influence, and our needs are felt to be part of the domestic economy of Nature.

What offends me most in my compositions is the moral element in them. The repentant say never a brave word. Their resolves should be mumbled in silence. Strictly speaking, morality is not healthy. Those undeserved joys which come uncalled and make us more pleased than grateful are they that sing.

One music seems to differ from another chiefly in its more perfect time, to use this word in a true sense. In the steadiness and equanimity of music lies its divinity. It is the only assured tone. When men attain to speak with as settled a faith and as firm assurance, their voices will sing and their feet march as do the feet of the soldier. The very dogs howl if time is disregarded. Because of the perfect time of this music-box — its harmony with itself — is its greater dignity and stateliness. This music is more nobly related for its more exact measure. So simple a difference as this more even pace raises it to the higher dignity.

Man's progress through nature should have an accompaniment of music. It relieves the scenery, which is seen through it as a subtler element, like a very clear morning air in autumn. Music wafts me through the clear, sultry valleys, with only a slight gray vapor against the hills.

Of what manner of stuff is the web of time wove, when these consecutive sounds called a strain of music can be wafted down through the centuries from Homer to me, and Homer have been conversant with that same unfathomable mystery and charm which so newly tingles my ears? These single strains, these melodious cadences which plainly proceed out of a very deep meaning and a sustained soul, are the interjections of God. They are perhaps the expression of the perfect knowledge which the righteous at length attain to. Am I so like thee, my brother, that the cadence of two notes affects us alike? Shall I not some time have an opportunity to thank him who made music? I feel a sad cheer when I hear these lofty strains, because there must be something in me as lofty that hears. But ah, I hear them but rarely! Does it not rather hear me? If my blood were clogged in my veins, I am sure it would run more freely. God must be very rich, who, for the turning of a pivot, can pour out such melody on me. It is a little prophet; it tells me the secrets of futurity. Where are its secrets wound up but in this box? So much hope had slumbered. There are in music such strains as far surpass any faith in the loftiness of man's destiny. He must be very sad before he can comprehend them. The clear, liquid notes from the morning fields beyond seem to come through a vale of sadness to man, which gives all music a plaintive air. It hath caught a higher pace than any virtue I know. It is the arch-reformer. It hastens the sun to his setting. It invites him to his rising. It is the sweetest reproach, a measured satire.

I know there is a people somewhere [where] this heroism has place. Or else things are to be learned which it will be sweet to learn. This cannot be all rumor. When I hear this, I think of that everlasting and stable something which is not sound, but to be a thrilling reality, and can consent to go about the meanest work for as many years of time as it pleases even the Hindoo penance, for a year of the gods were as nothing to that which shall come after. What, then, can I do to hasten that other time, or that space where there shall be no time, and these things be a more living part of my life, — where there will be no discords in my life?

Jan. 9. Sunday. One cannot too soon forget his errors and misdemeanors; for [to] dwell long upon them is to add to the offense, and repentance and sorrow can only be displaced by somewhat better, and which is as free and original as if they had not been. Not to grieve long for any action, but to go immediately and do freshly and otherwise, subtracts so much from the wrong. Else we may make the delay of repentance the punishment of the sin. But a great nature will not consider its sins as its own, but be more absorbed in the prospect of that valor and virtue for the future which is more properly it, than in those improper actions which, by being sins, discover themselves to be not it.

Sir W. Raleigh's faults are those of a courtier and a soldier. In his counsels and aphorisms we see not unfrequently the haste and rashness of a boy. His philosophy was not wide nor deep, but continually giving way to the generosity of his nature. What he touches he adorns by his greater humanity and native nobleness, but he touches not the true nor original. He thus embellishes the old, but does not unfold the new. He seems to have been fitted by his genius for short flights of impulsive poetry, but not for the sustained loftiness of Shakespeare or Milton. He was not wise nor a seer in any sense, but rather one of nature's nobility; the most generous nature which can be spared to linger in the purlieu of the court.

His was a singularly perverted genius, with such an inclination to originality and freedom, and yet who never steered his own course. Of so fair and susceptible a nature, rather than broad or deep, that he delayed to slake his thirst at the nearest and even more turbid wells of truth and beauty. Whose homage to the least fair or noble left no space for homage to the all fair. The misfortune of his circumstances, or rather of the man, appears in the fact that he was the author of "Maxims of State" and "The Cabinet Council" and "The Soul's Errand."

Feb. 19. Saturday. I never yet saw two men sufficiently great to meet as two. In proportion as they are great the differences are fatal, because they are felt not to be partial but total. Frankness to him who is unlike me will lead to the utter denial of him. I begin to see how that the preparation for all issues is to do virtuously. When two approach to meet, they incur no petty dangers, but they run terrible risks. Between the sincere there will be no civilities. No greatness seems prepared for the little decorum, even savage unmannerliness, it meets from equal greatness.

Feb. 20. Sunday. "Examine animal forms geometrically, from man, who represents the perpendicular, to the reptile which forms the horizontal line, and then applying to

those forms the rules of the exact sciences, which God himself cannot change, we shall see that visible nature contains them all; that the combinations of the seven primitive forms are entirely exhausted, and that, therefore, they can represent all possible varieties of morality." — From "The True Messiah; or the Old and New Testaments, examined according to the Principles of the Language of Nature. By G. Segger," translated from French by Grater.

I am amused to see from my window here how busily man has divided and staked off his domain. God must smile at his puny fences running hither and thither everywhere over the land.

My path hitherto has been like a road through a diversified country, now climbing high mountains, then descending into the lowest vales. From the summits I saw the heavens; from the vales I looked up to the heights again. In prosperity I remember God, or memory is one with consciousness; in adversity I remember my own elevations, and only hope to see God again.

It is vain to talk. What do you want? To bandy words, or deliver some grains of truth which stir within you? Will you make a pleasant rumbling sound after feasting, for digestion's sake, or such music as the birds in springtime?

The death of friends should inspire us as much as their lives. If they are great and rich enough, they will leave consolation to the mourners before the expenses of their funerals. It will not be hard to part with any worth, because it is worthy. How can any good depart? It does not go and come, but we. Shall we wait for it? Is it slower than we?

Feb. 21. I must confess there is nothing so strange to me as my own body. I love any other piece of nature, almost, better.

I was always conscious of sounds in nature which my ears could never hear, — that I caught but the prelude to a strain. She always retreats as I advance. Away behind and behind is she and her meaning. Will not this faith and expectation make to itself ears at length? I never saw to the end, nor heard to the end; but the best part was unseen and unheard.

I am like a feather floating in the atmosphere; on every side is depth unfathomable.

I feel as if years had been crowded into the last month, and yet the regularity of what we call time has been so far preserved as that I... will be welcome in the present. I have lived ill for the most part because too near myself. I have tripped myself up, so that there was no progress for my own narrowness. I cannot walk conveniently and pleasantly but when I hold myself far off in the horizon. And the soul dilutes the body and makes it passable. My soul and body have tottered along together of late, tripping and hindering one another like unpracticed Siamese twins. They two should walk as one, that no obstacle may be nearer than the firmament.

There must be some narrowness in the soul that compels one to have secrets.

Feb. 23. Wednesday. Every poet's muse is circumscribed in her wanderings, and may be well said to haunt some favorite spring or mountain. Chaucer seems to have been the poet of gardens. He has hardly left a poem in which some retired and luxurious

retreat of the kind is not described, to which he gains access by some secret port, and there, by some fount or grove, is found his hero and the scene of his tale. It seems as if, by letting his imagination riot in the matchless beauty of an ideal garden, he thus fed [sic] his fancy on to the invention of a tale which would fit the scene. The muse of the most universal poet retires into some familiar nook, whence it spies out the land as the eagle from his eyrie, for he who sees so far over plain and forest is perched in a narrow cleft of the crag. Such pure childlike love of Nature is nowhere to be matched. And it is not strange that the poetry of so rude an age should contain such polished praise of Nature; for the charms of Nature are not enhanced by civilization, as society is, but she possesses a permanent refinement, which at last subdues and educates men.

The reader has great confidence in Chaucer. He tells no lies. You read his story with a smile, as if it were the circumlocution of a child, and yet you find that he has spoke with more directness and economy of words than a sage. He is never heartless. So new was all his theme in those days, that [he] had not to invent, but only to tell.

The language of poetry is infantile. It cannot talk.

It is the charm and greatness of all society, from friendship to the drawing-room, that it takes place on a level slightly higher than the actual characters of the parties would warrant; it is an expression of faith. True politeness is only hope and trust in men. It never addresses a fallen or falling man, but salutes a rising generation. It does not flatter, but only congratulates. The rays of light come to us in such a curve that every fellow in the street appears higher than he really is. It is the innate civility of nature.

I am glad that it was so because it could be.

March 1. Whatever I learn from any circumstances, that especially I needed to know. Events come out of God, and our characters determine them and constrain fate, as much as they determine the words and tone of a friend to us. Hence are they always acceptable as experience, and we do not see how we could have done without them.

March 2. The greatest impression of character is made by that person who consents to have no character. He who sympathizes with and runs through the whole circle of attributes cannot afford to be an individual. Most men stand pledged to themselves, so that their narrow and confined virtue has no suppleness. They are like children who cannot walk in bad company and learn the lesson which even it teaches, without their guardians, for fear of contamination. He is a fortunate man who gets through the world without being burthened by a name and reputation, for they are at any rate but his past history and no prophecy, and as such concern him no more than another. Character is Genius settled. It can maintain itself against the world, and if it relapses it repents. It is as a dog set to watch the property of Genius. Genius, strictly speaking, is not responsible, for it is not moral.

March 8. I live in the perpetual verdure of the globe. I die in the annual decay of nature.

We can understand the phenomenon of death in the animal better if we first consider it in the order next below us, the vegetable.

The death of the flea and the elephant are but phenomena of the life of nature.

Most lecturers preface their discourses on music with a history of music, but as well introduce an essay on virtue with a history of virtue. As if the possible combinations of sound, the last wind that sighed, or melody that waked the wood, had any history other than a perceptive ear might hear in the least and latest sound of nature! A history of music would be like the history of the future; for so little past is it, and capable of record, that it is but the hint of a prophecy. It is the history of gravitation. It has no history more than God. It circulates and resounds forever, and only flows like the sea or air. There might be a history of men or of hearing, but not of the unheard. Why, if I should sit down to write its story, the west wind would rise to refute me. Properly speaking, there can be no history but natural history, for there is no past in the soul but in nature. So that the history of anything is only the true account of it, which will be always the same. I might as well write the history of my aspirations. Does not the last and highest contain them all? Do the lives of the great composers contain the facts which interested them? What is this music? Why, thinner and more evanescent than ether; subtler than sound, for it is only a disposition of sound. It is to sound what color is to matter. It is the color of a flame, or of the rainbow, or of water. Only one sense has known it. The least profitable, the least tangible fact, which cannot be bought or cultivated but by virtuous methods, and yet our ears ring with it like shells left on the shore.

March 11. Friday. Chaucer's familiar, but innocent, way of speaking of God is of a piece with his character. He comes readily to his thoughts without any false reverence. If Nature is our mother, is not God much more? God should come into our thoughts with no more parade than the zephyr into our ears. Only strangers approach him with ceremony. How rarely in our English tongue do we find expressed any affection for God! No sentiment is so rare as love of God, — universal love. Herbert is almost the only exception. "Ah, my dear God," etc. Chaucer's was a remarkably affectionate genius. There is less love and simple trust in Shakespeare. When he sees a beautiful person or object, he almost takes a pride in the "maistry" of his God. The Protestant Church seems to have nothing to supply the place of the Saints of the Catholic calendar, who were at least channels for the affections. Its God has perhaps too many of the attributes of a Scandinavian deity.

We can only live healthily the life the gods assign us. I must receive my life as passively as the willow leaf that flutters over the brook. I must not be for myself, but God's work, and that is always good. I will wait the breezes patiently, and grow as Nature shall determine. My fate cannot but be grand so. We may live the life of a plant or an animal, without living an animal life. This constant and universal content of the animal comes of resting quietly in God's palm. I feel as if [I] could at any time resign my life and the responsibility of living into God's hands, and become as innocent, free from care, as a plant or stone.

My life, my life! why will you linger? Are the years short and the months of no account? How often has long delay quenched my aspirations! Can God afford that I

should forget him? Is he so indifferent to my career? Can heaven be postponed with no more ado? Why were my ears given to hear those everlasting strains which haunt my life, and yet to be prophaned much more by these perpetual dull sounds?

Our doubts are so musical that they persuade themselves.

Why, God, did you include me in your great scheme? Will you not make me a partner at last? Did it need there should be a conscious material?

My friend, my friend, I'd speak so frank to thee that thou wouldst pray me to keep back some part, for fear I robbed myself. To address thee delights me, there is such cleanness in the delivery. I am delivered of my tale, which, told to strangers, still would linger on my lips as if untold, or doubtful how it ran.

March 12. Consider what a difference there is between living and dying. To die is not to begin to die, and continue; it is not a state of continuance, but of transientness; but to live is a condition of continuance, and does not mean to be born merely. There is no continuance of death. It is a transient phenomenon. Nature presents nothing in a state of death.

March 13. Sunday. The sad memory of departed friends is soon incrustated over with sublime and pleasing thoughts, as their monuments are overgrown with moss. Nature doth thus kindly heal every wound. By the mediation of a thousand little mosses and fungi, the most unsightly objects become radiant of beauty. There seem to be two sides to this world, presented us at different times, as we see things in growth or dissolution, in life or death. For seen with the eye of a poet, as God sees them, all are alive and beautiful; but seen with the historical eye, or the eye of the memory, they are dead and offensive. If we see Nature as pausing, immediately all mortifies and decays; but seen as progressing, she is beautiful.

I am startled that God can make me so rich even with my own cheap stores. It needs but a few wisps of straw in the sun, or some small word dropped, or that has long lain silent in some book. When heaven begins and the dead arise, no trumpet is blown; perhaps the south wind will blow. What if you or I be dead! God is alive still.

March 14. Chaucer's genius does not soar like Milton's, but is genial and familiar. It is only a greater portion of humanity, with all its weakness. It is not heroic, as Raleigh, or pious, as Herbert, or philosophical, as Shakespeare, but the child of the English nation, but that child that is "father of the man." His genius is only for the most part an exceeding naturalness. It is perfect sincerity, though with the behavior of a child rather than of a man. He can complain, as in the "Testament of Love," but yet so truly and unfeignedly that his complaint does not fail to interest. All England has his case at heart.

He shows great tenderness and delicacy, but not the heroic sentiment. His genius was feminine, not masculine, — not but such is rarest to find in woman (though the appreciation of it is not), — but less manly than the manliest.

It is not easy to find one brave enough to play the game of love quite alone with you, but they must get some third person, or world, to countenance them. They thrust others between. Love is so delicate and fastidious that I see not how [it] can ever begin.

Do you expect me to love with you, unless you make my love secondary to nothing else? Your words come tainted, if the thought of the world darted between thee and the thought of me. You are not venturous enough for love. It goes alone unscared through wildernesses.

As soon as I see people loving what they see merely, and not their own high hopes that they form of others, I pity, and do not want their love. Such love delays me. Did I ask thee to love me who hate myself? No! Love that I love, and I will love thee that lovest it.

The love is faint-hearted and short-lived that is contented with the past history of its object. It does not prepare the soil to bear new crops lustier than the old.

“I would I had leisure for these things,” sighs the world. “When I have done my quilting and baking, then I will not be backward.”

Love never stands still, nor does its object. It is the revolving sun and the swelling bud. If I know what I love, it is because I remember it.

Life is grand, and so are its environments of Past and Future. Would the face of nature be so serene and beautiful if man’s destiny were not equally so? What am I good for now, who am still marching after high things, but to hear and tell the news, to bring wood and water, and count how many eggs the hens lay? In the meanwhile, I expect my life will begin. I will not aspire longer. I will see what it is I would be after. I will be unanimous.

March 15. Tuesday. It is a new day; the sun shines. The poor have come out to employ themselves in the sunshine, the old and feeble to scent the air once more. I hear the bluebird and the song sparrow and the robin, and the note of the lark leaks up through the meadows, as if its bill had been thawed by the warm sun.

As I am going to the woods I think to take some small book in my pocket whose author has been there already, whose pages will be as good as my thoughts, and will eke them out or show me human life still gleaming in the horizon when the woods have shut out the town. But I can find none. None will sail as far forward into the bay of nature as my thought. They stay at home. I would go home. When I get to the wood their thin leaves rustle in my fingers. They are bare and obvious, and there is no halo or haze about them. Nature lies far and fair behind them all. I should like to meet the great and serene sentence, which does not reveal itself, — only that it is great, — which I may never with my utmost intelligence pierce through and beyond (more than the earth itself), which no intelligence can understand. There should be a kind of life and palpitation to it; under its rind a kind of blood should circulate forever, communicating freshness to its countenance.

Cold Spring. — I hear nothing but a phoebe, and the wind, and the rattling of a chaise in the wood. For a few years I stay here, not knowing, taking my own life by degrees, and then I go. I hear a spring bubbling near, where I drank out of a can in my earliest youth. The birds, the squirrels, the alders, the pines, they seem serene and in their places. I wonder if my life looks as serene to them too. Does no creature, then, see with the eyes of its own narrow destiny, but with God’s? When God made man,

he reserved some parts and some rights to himself. The eye has many qualities which belong to God more than man. It is his lightning which flashes in it. When I look into my companion's eye, I think it is God's private mine. It is a noble feature; it cannot be degraded; for God can look on all things undefiled.

Pond. — Nature is constantly original and inventing new patterns, like a mechanic in his shop. When the overhanging pine drops into the water, by the action of the sun, and the wind rubbing it on the shore, its boughs are worn white and smooth and assume fantastic forms, as if turned by a lathe. All things, indeed, are subjected to a rotary motion, either gradual and partial or rapid and complete, from the planet and system to the simplest shellfish and pebbles on the beach; as if all beauty resulted from an object turning on its own axis, or others turning about it. It establishes a new centre in the universe. As all curves have reference to their centres or foci, so all beauty of character has reference to the soul, and is a graceful gesture of recognition or waving of the body toward it.

The great and solitary heart will love alone, without the knowledge of its object. It cannot have society in its love. It will expend its love as the cloud drops rain upon the fields over which [it] floats.

The only way to speak the truth is to speak lovingly; only the lover's words are heard. The intellect should never speak; it is not a natural sound. How trivial the best actions are! I am led about from sunrise to sunset by an ignoble routine, and yet can find no better road. I must make a part of the planet. I must obey the law of nature.

March 16. Wednesday. Raleigh's Maxims are not true and impartial, but yet are expressed with a certain magnanimity, which was natural to the man, as if this selfish policy could easily afford to give place in him to a more human and generous. He gives such advice that we have more faith in his conduct than his principles.

He seems to have carried the courtier's life to the highest pitch of magnanimity and grace it was capable of. He is liberal and generous as a prince, — that is, within bounds; brave, chivalrous, heroic, as the knight in armor and not as a defenseless man. His was not the heroism of Luther, but of Bayard. There was more of grace than of truth in it. He had more taste than character. There may be something petty in a refined taste; it easily degenerates into effeminacy; it does not consider the broadest use. It is not content with simple good and bad, and so is fastidious and curious, or nice only.

The most attractive sentences are not perhaps the wisest, but the surest and soundest. He who uttered them had a right to speak. He did not stand on a rolling stone, but was well assured of his footing, and naturally breathed them without effort. They were spoken in the nick of time. With rare fullness were they spoken, as a flower expands in the field; and if you dispute their doctrine, you will say, "But there is truth in their assurance." Raleigh's are of this nature, spoken with entire satisfaction and heartiness. They are not philosophy, but poetry.

With him it was always well done and nobly said.

That is very true which Raleigh says about the equal necessity of war and law, — that “the necessity of war, which among human actions is most lawless, hath some kind of affinity and near resemblance with the necessity of law;” for both equally rest on force as their basis, and war is only the resource of law, either on a smaller or larger scale, — its authority asserted. In war, in some sense, lies the very genius of law. It is law creative and active; it is the first principle of the law. What is human warfare but just this, — an effort to make the laws of God and nature take sides with one party. Men make an arbitrary code, and, because it is not right, they try to make it prevail by might. The moral law does not want any champion. Its asserters do not go to war. It was never infringed with impunity. It is inconsistent to decry war and maintain law, for if there were no need of war there would be no need of law. I must confess I see no resource but to conclude that conscience was not given us to no purpose, or for a hindrance, but that, however flattering order and expediency may look, it is but the repose of a lethargy; and we will choose rather to be awake, though it be stormy, and maintain ourselves on this earth and in this life as we may, without signing our death-warrant in the outset. What does the law protect? My rights? or any rights? My right, or the right? If I avail myself of it, it may help my sin; it cannot help my virtue. Let us see if we cannot stay here, where God has put us, on his own conditions. Does not his law reach to the earth? While the law holds fast the thief and murderer for my protection (I should say its own), it lets itself go loose. Expediencies differ. They may clash. English law may go to war with American law, that is English interest with American interest, but what is expedient for the whole world will be absolute right, and synonymous with the law of God. So the law is only partial right. It is selfish, and consults for the interest of the few.

Somehow, strangely, the vice of men gets well represented and protected, but their virtue has none to plead its cause, nor any charter of immunities and rights. The Magna Charta is not chartered rights, but chartered wrongs.

March 17. Thursday. I have been making pencils all day, and then at evening walked to see an old schoolmate who is going to help make the Welland Canal navigable for ships round Niagara. He cannot see any such motives and modes of living as I; professes not to look beyond the securing of certain “creature comforts.” And so we go silently different ways, with all serenity, I in the still moonlight through the village this fair evening to write these thoughts in my journal, and he, forsooth, to mature his schemes to ends as good, maybe, but different. So are we two made, while the same stars shine quietly over us. If I or he be wrong, Nature yet consents placidly. She bites her lip and smiles to see how her children will agree. So does the Welland Canal get built, and other conveniences, while I live. Well and good, I must confess. Fast sailing ships are hence not detained.

What means this changing sky, that now I freeze and contract and go within myself to warm me, and now I say it is a south wind, and go all soft and warm along the way? I sometimes wonder if I do not breathe the south wind.

March 18. Friday. Whatever book or sentence will bear to be read twice, we may be sure was thought twice. I say this thinking of Carlyle, who writes pictures or first impressions merely, which consequently will only bear a first reading. As if any transient, any new, mood of the best man deserved to detain the world long. I should call Carlyle's writing essentially dramatic, excellent acting, entertaining especially to those who see rather than those who hear, not to be repeated more than a joke. If he did not think who made the joke, how shall we think who hear it? He never consults the oracle, but thinks to utter oracles himself. There is nothing in his books for which he is not, and does not feel, responsible. He does not retire behind the truth he utters, but stands in the foreground. I wish he would just think, and tell me what he thinks, appear to me in the attitude of a man with his ear inclined, who comes as silently and meekly as the morning star, which is unconscious of the dawn it heralds, leading the way up the steep as though alone and unobserved in its observing, without looking behind. He is essentially a humorist. But humors will not feed a man; they are the least satisfactory morsel to the healthy appetite. They circulate; I want rather to meet that about which they circulate. The heart is not a humor, nor do they go to the heart, as the blood does.

March 19. Saturday. When I walk in the fields of Concord and meditate on the destiny of this prosperous slip of the Saxon family, the unexhausted energies of this new country, I forget that this which is now Concord was once Musketaquid, and that the American race has had its destiny also. Everywhere in the fields, in the corn and grain land, the earth is strewn with the relics of a race which has vanished as completely as if trodden in with the earth. I find it good to remember the eternity behind me as well as the eternity before. Wherever I go, I tread in the tracks of the Indian. I pick up the bolt which he has but just dropped at my feet. And if I consider destiny I am on his trail. I scatter his hearthstones with my feet, and pick out of the embers of his fire the simple but enduring implements of the wigwam and the chase. In planting my corn in the same furrow which yielded its increase to his support so long, I displace some memorial of him.

I have been walking this afternoon over a pleasant field planted with winter rye, near the house, where this strange people once had their dwelling-place. Another species of mortal men, but little less wild to me than the musquash they hunted. Strange spirits, dæmons, whose eyes could never meet mine; with another nature and another fate than mine. The crows flew over the edge of the woods, and, wheeling over my head, seemed to rebuke, as dark-winged spirits more akin to the Indian than I. Perhaps only the present disguise of the Indian. If the new has a meaning, so has the old.

Nature has her russet hues as well as green. Indeed, our eye splits on every object, and we can as well take one path as the other. If I consider its history, it is old; if its destiny, it is new. I may see a part of an object, or the whole. I will not be imposed on and think Nature is old because the season is advanced. I will study the botany of the mosses and fungi on the decayed [wood], and remember that decayed wood is not old, but has just begun to be what it is. I need not think of the pine almond or the acorn

and sapling when I meet the fallen pine or oak, more than of the generations of pines and oaks which have fed the young tree. The new blade of the corn, the third leaf of the melon, these are not green but gray with time, but serene in respect of time.

The pines and the crows are not changed, but instead that Philip and Paugus stand on the plain, here are Webster and Crockett. Instead of the council-house is the legislature. What a new aspect have new eyes given to the land! Where is this country but in the hearts of its inhabitants? Why, there is only so much of Indian America left as there is of the American Indian in the character of this generation.

A blithe west wind is blowing over all. In the fine flowing haze, men at a distance seem shadowy and gigantic, as ill-defined and great as men should always be. I do not know if yonder be a man or a ghost.

What a consolation are the stars to man! — so high and out of his reach, as is his own destiny. I do not know but my life is fated to be thus low and grovelling always. I cannot discover its use even to myself. But it is permitted to see those stars in the sky equally useless, yet highest of all and deserving of a fair destiny. My fate is in some sense linked with that of the stars, and if they are to persevere to a great end, shall I die who could conjecture it? It surely is some encouragement to know that the stars are my fellow-creatures, for I do not suspect but they are reserved for a high destiny. Has not he who discovers and names a planet in the heavens as long a year as it? I do not fear that any misadventure will befall them. Shall I not be content to disappear with the missing stars? Do I mourn their fate?

Man's moral nature is a riddle which only eternity can solve.

I see laws which never fail, of whose failure I never conceived. Indeed I cannot detect failure anywhere but in my fear. I do not fear that right is not right, that good is not good, but only the annihilation of the present existence. But only that can make me incapable of fear. My fears are as good prophets as my hopes.

March 20. Sunday. My friend is cold and reserved because his love for me is waxing and not waning. These are the early processes; the particles are just beginning to shoot in crystals. If the mountains came to me, I should no longer go to the mountains. So soon as that consummation takes place which I wish, it will be past. Shall I not have a friend in reserve? Heaven is to come. I hope this is not it.

Words should pass between friends as the lightning passes from cloud to cloud. I don't know how much I assist in the economy of nature when I declare a fact. Is it not an important part in the history of the flower that I tell my friend where I found it? We do [not] wish friends to feed and clothe our bodies, — neighbors are kind enough for that, — but to do the like offices to ourselves. We wish to spread and publish ourselves, as the sun spreads its rays; and we toss the new thought to the friend, and thus it is dispersed. Friends are those twain who feel their interests to be one. Each knows that the other might as well have said what he said. All beauty, all music, all delight springs from apparent dualism but real unity. My friend is my real brother. I see his nature groping yonder like my own. Does there go one whom I know? then I go there.

The field where friends have met is consecrated forever. Man seeks friendship out of the desire to realize a home here. As the Indian thinks he receives into himself the courage and strength of his conquered enemy, so we add to ourselves all the character and heart of our friends. He is my creation. I can do what I will with him. There is no possibility of being thwarted; the friend is like wax in the rays that fall from our own hearts.

The friend does not take my word for anything, but he takes me. He trusts me as I trust myself. We only need be as true to others as we are to ourselves, that there may be ground enough for friendship. In the beginnings of friendship, — for it does not grow, — we realize such love and justice as are attributed to God.

Very few are they from whom we derive any information. The most only announce and tell tales, but the friend in-forms.

What is all nature and human life at this moment, what the scenery and vicinity of a human soul, but the song of an early sparrow from yonder fences, and the cackling hens in the bam? So for one while my destiny loiters within ear-shot of these sounds. The great busy Dame Nature is concerned to know how many eggs her hens lay. The Soul, the proprietor of the world, has an interest in the stacking of hay, the foddering of cattle, and the draining of peat meadows. Away in Scythia, away in India, they make butter and cheese for its larder. I wish that in some page of the Testament there were something like Charlemagne's egg account. Was not Christ interested in the setting hens of Palestine?

Nature is very ample and roomy. She has left us plenty of space to move in. As far as I can see from this window, how little life in the landscape! The few birds that flit past do not crowd; they do not fill the valley. The traveller on the highway has no fellow-traveller for miles before or behind him. Nature was generous and not niggardly, certainly.

How simple is the natural connection of events. We complain greatly of the want of flow and sequence in books, but if the journalist only move himself from Boston to New York, and speak as before, there is link enough. And so there would be, if he were as careless of connection and order when he stayed at home, and let the incessant progress which his life makes be the apology for abruptness. Do I not travel as far away from my old resorts, though I stay here at home, as though I were on board the steamboat? Is not my life riveted together? Has not it sequence? Do not my breathings follow each other naturally?

March 21. Who is old enough to have learned from experience?

March 22. Tuesday. Nothing can be more useful to a man than a determination not to be hurried.

I have not succeeded if I have an antagonist who fails. It must be humanity's success.

I cannot think nor utter my thought unless I have infinite room. The cope of heaven is not too high, the sea is not too deep, for him who would unfold a great thought. It must feed me and warm and clothe me. It must be an entertainment to which my whole nature is invited. I must know that the gods are to be my fellow-guests.

We cannot well do without our sins; they are the highway of our virtue.

March 23. Wednesday. Plain speech is always a desideratum. Men write in a florid style only because they would match the simple beauties of the plainest speech. They prefer to be misunderstood, rather than come short of its exuberance. Hussein Effendi praises the epistolary style of Ibrahim Pasha to the French traveller Botta, because of "the difficulty of understanding it: there was, he said, but one person at Jidda who was capable of understanding and explaining the Pasha's correspondence." A plain sentence, where every word is rooted in the soil, is indeed flowery and verdurous. It has the beauty and variety of mosaic with the strength and compactness of masonry. All fullness looks like exuberance. We are not rich without superfluous wealth; but the imitator only copies the superfluity. If the words were sufficiently simple and answering to the thing to be expressed, our sentences would be as blooming as wreaths of evergreen and flowers. You cannot fill a wine-glass quite to the brim without heaping it. Simplicity is exuberant.

When I look back eastward over the world, it seems to be all in repose. Arabia, Persia, Hindostan are the land of contemplation. Those Eastern nations have perfected the luxury of idleness. Mount Sabér, according to the French traveller and naturalist Botta, is celebrated for producing the Kât tree. "The soft tops of the twigs and tender leaves are eaten," says his reviewer, "and produce an agreeable soothing excitement, restoring from fatigue, banishing sleep, and disposing to the enjoyment of conversation." What could be more dignified than to browse the tree-tops with the camelopard? Who would not be a rabbit or partridge sometimes, to chew mallows and pick the apple tree buds? It is not hard to discover an instinct for the opium and betel and tobacco chewers.

After all, I believe it is the style of thought entirely, and not the style of expression, which makes the difference in books. For if I find any thought worth extracting, I do not wish to alter the language. Then the author seems to have had all the graces of eloquence and poetry given him.

I am pleased to discover myself as much a pensioner in Nature as moles and titmice. In some very direct and simple uses to which man puts Nature he stands in this relation to her. Oriental life does not want this grandeur. It is in Sadi and the Arabian Nights and the Fables of Pilpay. In the New England noontide I have discovered more materials of Oriental history than the Sanskrit contains or Sir W. Jones has unlocked. I see why it is necessary there should be such history at all. Was not Asia mapped in my brain before it was in any geography? In my brain is the Sanskrit which contains the history of the primitive times. The Vedas and their Angas are not so ancient as my serenest contemplations. My mind contemplates them, as Brahma his scribe.

I occasionally find myself to be nothing at all, because the gods give me nothing to do. I cannot brag; I can only congratulate my masters.

In idleness I am of no thickness, I am thinnest wafer. I never compass my own ends. God schemes for me.

We have our times of action and our times of reflection. The one mood caters for the other. Now I am Alexander, and then I am Homer. One while my hand is impatient to handle an axe or hoe, and at another to [sic] pen. I am sure I write the tougher truth for these calluses on my palms. They give firmness to the sentence. The sentences of a laboring man are like hardened thongs, or the sinews of the deer, or the roots of the pine.

March 24. Thursday. Those authors are successful who do not write down to others, but make their own taste and judgment their audience. By some strange infatuation we forget that we do not approve what yet we recommend to others. It is enough if I please myself with writing; I am then sure of an audience.

If hoarded treasures can make me rich, have I not the wealth of the planet in my mines and at the bottom of the sea?

It is always singular to meet common sense in very old books, as the Veeshnoo Sarma, — as if they could have dispensed with the experience of later times. We had not given space enough to their antiquity for the accumulation of wisdom. We meet even a trivial wisdom in them, as if truth were already hackneyed. The present is always younger than antiquity. A playful wisdom, which has eyes behind as well as before and oversees itself. This pledge of sanity cannot be spared in a book, that it sometimes reflect upon itself, that it pleasantly behold itself, that it hold the scales over itself. The wise can afford to doubt in his wisest moment. The easiness of doubt is the ground of his assurance. Faith keeps many doubts in her pay. If I could not doubt, I should not believe.

It is seen in this old scripture how wisdom is older than the talent of composition. It is a simple and not a compound rock. The story is as slender as the thread on which pearls are strung; it is a spiral line, growing more and more perplexed till it winds itself up and dies like the silkworm in its cocoon. It is an interminable labyrinth. It seems as if the old philosopher could not talk without moving, and each motion were made the apology or occasion for a sentence, but, this being found inconvenient, the fictitious progress of the tale was invented. The story which winds between and around these sentences, these barrows in the desert, these oases, is as indistinct as a camel track between Mourzuk and Darfur, between the Pyramids and the Nile, from Gaza to Jaffa.

The great thoughts of a wise man seem to the vulgar who do not generalize to stand far apart like isolated mounts; but science knows that the mountains which rise so solitary in our midst are parts of a great mountain-chain, dividing the earth, and the eye that looks into the horizon toward the blue Sierra melting away in the distance may detect their flow of thought. These sentences which take up your common life so easily are not seen to run into ridges, because they are the table-land on which the spectator stands. I do not require that the mountain-peaks be chained together, but by the common basis on which they stand, nor that the path of the muleteer be kept open at so much pains, when they may be bridged by the Milky Way. That they stand

frowning upon one another, or mutually reflecting the sun's rays, is proof enough of their common basis.

The book should be found where the sentence is, and its connection be as inartificial. It is the inspiration of a day and not of a moment. The links should be gold also. Better that the good be not united than that a bad man be admitted into their society. When men can select they will. If there be any stone in the quarry better than the rest, they will forsake the rest because of it. Only the good will be quarried.

In these fables the story goes unregarded, while the reader leaps from sentence to sentence, as the traveller leaps from stone to stone while the water rushes unheeded between them.

March 25. Friday. Great persons are not soon learned, not even their outlines, but they change like the mountains in the horizon as we ride along.

A man's life should be as fresh as a river. It should be the same channel, but a new water every instant. Some men have no inclination; they have no rapids nor cascades, but marshes, and alligators, and miasma instead.

How insufficient is all wisdom without love! There may be courtesy, there may be good will, there may be even temper, there may be wit, and talent, and sparkling conversation, — and yet the soul pine for life. Just so sacred and rich as my life is to myself will it be to another. Ignorance and bungling with love are better than wisdom and skill without. Our life without love is like coke and ashes, — like the cocoanut in which the milk is dried up. I want to see the sweet sap of living wood in it. Men may be pure as alabaster and Parian marble, elegant as a Tuscan villa, sublime as Terni, but if they are not in society as retiring and inexperienced as children, we shall go join Alaric and the Goths and Vandals. There is no milk mixed with the wine at the entertainment.

Enthusiasm which is the formless material of thought. Comparatively speaking, I care not for the man or his designs who would make the highest use of me short of an all-adventuring friendship. I wish by the behavior of my friend toward me to be led to have such regard for myself as for a box of precious ointment. I shall not be so cheap to myself if I see that another values me.

We talk much about education, and yet none will assume the office of an educator. I never gave any one the whole advantage of myself. I never afforded him the culture of my love. How can I talk of charity, who at last withhold the kindness which alone makes charity desirable? The poor want nothing less than me myself, and I shirk charity by giving rags and meat.

Very dangerous is the talent of composition, the striking out the heart of life at a blow, as the Indian takes off a scalp. I feel as if my life had grown more outward since I could express it.

What can I give or what deny to another but myself?

The stars are God's dreams, thoughts remembered in the silence of his night.

In company, that person who alone can understand you you cannot get out of your mind.

The artist must work with indifference. Too great interest vitiates his work.

March 26. Saturday. The wise will not be imposed on by wisdom. You can tell, but what do you know?

I thank God that the cheapness which appears in time and the world, the trivialness of the whole scheme of things, is in my own cheap and trivial moment. I am time and the world. I assert no independence. In me are summer and winter, village life and commercial routine, pestilence and famine and refreshing breezes, joy and sadness, life and death. How near is yesterday! How far to-morrow! I have seen nails which were driven before I was born. Why do they look old and rusty? Why does not God make some mistake to show to us that time is a delusion? Why did I invent time but to destroy it?

Did you ever remember the moment when you were not mean?

Is it not a satire to say that life is organic?

Where is my heart gone? They say men cannot part with it and live.

Are setting hens troubled with ennui? Nature is very kind; does she let them reflect? These long March days, setting on and on in the crevice of a hayloft, with no active employment! Do setting hens sleep?

A book should be a vein of gold ore, as the sentence is a diamond found in the sand, or a pearl fished out of the sea.

He who does not borrow trouble does not lend it.

I must confess I have felt mean enough when asked how I was to act on society, what errand I had to mankind. Undoubtedly I did not feel mean without a reason, and yet my loitering is not without defense. I would fain communicate the wealth of my life to men, would really give them what is most precious in my gift. I would secrete pearls with the shellfish and lay up honey with the bees for them. I will sift the sunbeams for the public good. I know no riches I would keep back. I have no private good, unless it be my peculiar ability to serve the public. This is the only individual property. Each one may thus be innocently rich. I inclose and foster the pearl till it is grown. I wish to communicate those parts of my life which I would gladly live again myself.

It is hard to be a good citizen of the world in any great sense; but if we do render no interest or increase to mankind out of that talent God gave us, we can at least preserve the principle unimpaired. One would like to be making large dividends to society out [of] that deposited capital in us, but he does well for the most part if he proves a secure investment only, without adding to the stock.

In such a letter as I like there will be the most naked and direct speech, the least circumlocution.

March 27. Sunday. The eye must be firmly anchored to this earth which beholds birches and pines waving in the breeze in a certain light, a serene rippling light.

Cliffs. — Two little hawks have just come out to play, like butterflies rising one above the other in endless alternation far below me. They swoop from side to side in the broad basin of the tree-tops, with wider and wider surges, as if swung by an invisible pendulum. They stoop down on this side and scale up on that.

Suddenly I look up and see a new bird, probably an eagle, quite above me, laboring with the wind not more than forty rods off. It was the largest bird of the falcon kind I ever saw. I was never so impressed by any flight. She sailed the air, and fell back from time to time like a ship on her beam ends, holding her talons up as if ready for the arrows. I never allowed before for the grotesque attitudes of our national bird.

The eagle must have an educated eye.

See what a life the gods have given us, set round with pain and pleasure. It is too strange for sorrow; it is too strange for joy. One while it looks as shallow, though as intricate, as a Cretan labyrinth, and again it is a pathless depth. I ask for bread incessantly, — that my life sustain me, as much as meat my body. No man knoweth in what hour his life may come. Say not that Nature is trivial, for to-morrow she will be radiant with beauty. I am as old — as old as the Alleghanies. I was going to say Wachusett, but it excites a youthful feeling, as I were but too happy to be so young.

March 28. Monday. How often must one feel, as he looks back on his past life, that he has gained a talent but lost a character! My life has got down into my fingers. My inspiration at length is only so much breath as I can breathe.

Society affects to estimate men by their talents, but really feels and knows them by their characters. What a man does, compared with what he is, is but a small part. To require that our friend possess a certain skill is not to be satisfied till he is something less than our friend.

Friendship should be a great promise, a perennial springtime.

I can conceive how the life of the gods may be dull and tame, if it is not disappointed and insatiate.

One may well feel chagrined when he finds he can do nearly all he can conceive.

Some books ripple on like a stream, and we feel that the author is in the full tide of discourse. Plato and Jamblichus and Pythagoras and Bacon halt beside them. Long, stringy, slimy thoughts which flow or run together. They read as if written for military men or men of business, there is such a dispatch in them, and a double-quick time, a Saratoga march with beat of drum. But the grave thinkers and philosophers seem not to have got their swaddling-clothes off; they are slower than a Roman army on its march, the rear encampment to-night where the van camped last night. The wise Jamblichus eddies and gleams like a watery slough.

But the reviewer seizes the pen and shouts, "Forward! Alamo and Fanning!" and after rolls the tide of war. Immediately the author discovers himself launched, and if the slope was easy and the grease good, does not go to the bottom.

They flow as glibly as mill-streams sucking under a race-way. The flow is oftentimes in the poor reader who makes such haste over their pages, as to the traveller the walls and fences seem to travel. But the most rapid trot is no flow after all.

If I cannot chop wood in the yard, can I not chop wood in my journal? Can I not give vent to that appetite so? I wish to relieve myself of superfluous energy. How poor is the life of the best and wisest! The petty side will appear at last. Understand once how the best in society live, — with what routine, with what tedium and insipidity, with

what grimness and defiance, with what chuckling over an exaggeration of the sunshine. Altogether, are not the actions of your great man poor, even pitiful and ludicrous?

I am astonished, I must confess, that man looks so respectable in nature, considering the littlenesses Socrates must descend to in the twenty-four hours, that he yet wears a serene countenance and even adorns nature.

March 29. Tuesday.

March 30. Wednesday. Though Nature's laws are more immutable than any despot's, yet to our daily life they rarely seem rigid, but we relax with license in summer weather. We are not often nor harshly reminded of the things we may not do. I am often astonished to see how long, and with what manifold infringements of the natural laws, some men I meet in the highway maintain life. She does not deny them quarter; they do not die without priest. All the while she rejoices, for if they are not one part of her they are another. I am convinced that consistency is the secret of health. How many a poor man, striving to live a pure life, pines and dies after a life of sickness, and his successors doubt if Nature is not pitiless; while the confirmed and consistent sot, who is content with his rank life like mushrooms, a mass of corruption, still dozes comfortably under a hedge. He has made his peace with himself; there is no strife. Nature is really very kind and liberal to all persons of vicious habits. They take great licenses with her. She does not exhaust them with many excesses.

How hard it is to be greatly related to mankind! They are only my uncles and aunts and cousins. I hear of some persons greatly related, but only he is so who has all mankind for his friend. Our intercourse with the best grows soon shallow and trivial. They no longer inspire us. After enthusiasm comes insipidity and blankness. The sap of all noble schemes drieth up, and the schemers return again and again in despair to "common sense and labor." If I could help infuse some life and heart into society, should I not do a service? Why will not the gods mix a little of the wine of nobleness with the air we drink? Let virtue have some firm foothold in the earth. Where does she dwell? Who are the salt of the earth? May not Love have some resting-place on the earth as sure [as] the sunshine on the rock? The crystals imbedded in the cliff sparkle and gleam from afar, as if they did certainly enrich our planet; but where does any virtue permanently sparkle and gleam? She was sent forth over the waste too soon, before the earth was prepared for her.

Rightfully we are to each other the gate of heaven and redeemers from sin, but now we overlook these lowly and narrow ways. We will go over the bald mountain-tops without going through the valleys.

Men do not after all meet on the ground of their real acquaintance and actual understanding of one another, but degrade themselves immediately into the puppets of convention. They do as if, in given circumstances, they had agreed to know each other only so well. They rarely get to that [point] that they inform one another gratuitously, and use each other like the sea and woods for what is new and inspiring there.

The best intercourse and communion they have is in silence above and behind their speech. We should be very simple to rely on words. As it is, what we knew before always

interprets a man's words. I cannot easily remember what any man has said, but how can I forget what he is to me? We know each other better than we are aware; we are admitted to startling privacies with every person we meet, and in some emergency we shall find how well we knew him. To my solitary and distant thought my neighbor is shorn of his halo, and is seen as privately and barely as a star through a glass.

March 31. Thursday. I cannot forget the majesty of that bird at the Cliff. It was no sloop or smaller craft hove in sight, but a ship of the line, worthy to struggle with the elements. It was a great presence, as of the master of river and forest. His eye would not have quailed before the owner of the soil; none could challenge his rights. And then his retreat, sailing so steadily away, was a kind of advance. How is it that man always feels like an interloper in nature, as if he had intruded on the domains of bird and beast?

The really efficient laborer will be found not to crowd his day with work, but will saunter to his task surrounded by a wide halo of ease and leisure. There will be a wide margin for relaxation to his day. He is only earnest to secure the kernels of time, and does not exaggerate the value of the husk. Why should the hen set all day? She can lay but one egg, and besides she will not have picked up materials for a new one. Those who work much do not work hard.

Nothing is so rare as sense. Very uncommon sense is poetry, and has a heroic or sweet music. But in verse, for the most part, the music now runs before and then behind the sense, but is never coincident with it. Given the metre, and one will make music while another makes sense. But good verse, like a good soldier, will make its own music, and it will march to the same with one consent. In most verse there is no inherent music. The man should not march, but walk like a citizen. It is not time of war but peace. Boys study the metres to write Latin verses, but it does not help them to write English.

Lydgate's "Story of Thebes," intended for a Canterbury Tale, is a specimen of most unprogressive, unmusical verse. Each line rings the knell of its brother, as if it were introduced but to dispose of him. No mortal man could have breathed to that cadence without long intervals of relaxation; the repetition would have been fatal to the lungs. No doubt there was much healthy exercise taken in the meanwhile. He should forget his rhyme and tell his story, or forget his story and breathe himself.

In Shakespeare and elsewhere the climax may be somewhere along the line, which runs as varied and meandering as a country road, but in Lydgate it is nowhere but in the rhyme. The couplets slope headlong to their confluence.

April 2. Saturday. The Prologue to the Canterbury Tales is full of good sense and humanity, but is riot transcendent poetry. It is so good that it seems like faultfinding to esteem it second to any other. For picturesque description of persons it is without a parallel. It did not need inspiration, but a cheerful and easy wit. It is essentially humorous, as no inspired poetry is. Genius is so serious as to be grave and sublime rather. Humor takes a narrower vision — however broad and genial it may be — than enthusiasm. Humor delays and looks back.

April 3. Sunday. I can remember when I was more enriched by a few cheap rays of light falling on the pond-side than by this broad sunny day. Riches have wings, indeed. The weight of present woe will express the sweetness of past experience. When sorrow comes, how easy it is to remember pleasure! When, in winter, the bees cannot make new honey, they consume the old.

Experience is in the fingers and head. The heart is inexperienced.

Sorrow singeth the sweetest strain: "The Daughters of Zion,"

"The Last Sigh of the Moor."

Joy is the nectar of flowers, sorrow the honey of bees.

I thank God for sorrow. It is hard to be abused. Is not He kind still, who lets this south wind blow, this warm sun shine on me?

I have just heard the flicker among the oaks on the hillside ushering in a new dynasty. It is the age and youth of time. Why did Nature set this lure for sickly mortals? Eternity could not begin with more security and momentousness than the spring. The summer's eternity is reestablished by this note. All sights and sounds are seen and heard both in time and eternity. And when the eternity of any sight or sound strikes the eye or ear, they are intoxicated with delight.

Sometimes, as through a dim haze, we see objects in their eternal relations; and they stand like Stonehenge and the Pyramids, and we wonder who set them up and what for.

The destiny of the soul can never be studied by the reason, for its modes are not ecstatic. In the wisest calculation or demonstration I but play a game with myself. I am not to be taken captive by myself.

I cannot convince myself. God must convince. I can calculate a problem in arithmetic, but not any morality.

Virtue is incalculable, as it is inestimable. Well, man's destiny is but virtue, or manhood. It is wholly moral, to be learned only by the life of the soul. God cannot calculate it. He has no moral philosophy, no ethics. The reason, before it can be applied to such a subject, will have to fetter and restrict it. How can he, step by step, perform that long journey who has not conceived whither he is bound? How can he expect to perform an arduous journey without interruption who has no passport to the end?

On one side of man is the actual, and on the other the ideal. The former is the province of the reason; it is even a divine light when directed upon it, but it cannot reach forward into the ideal without blindness. The moon was made to rule by night, but the sun to rule by day. Reason will be but a pale cloud, like the moon, when one ray of divine light comes to illumine the soul.

How rich and lavish must be the system which can afford to let so many moons burn all the day as well as the night, though no man stands in need of their light! There is none of that kind of economy in Nature that husband's its stock, but she supplies inexhaustible means to the most frugal methods. The poor may learn of her frugality, and the rich generosity. Having carefully determined the extent of her charity, she establishes it forever; her almsgiving is an annuity. She supplies to the bee only

so much wax as is necessary for its cell, so that no poverty could stint it more; but the little economist which fed the Evangelist in the desert still keeps in advance of the immigrant, and fills the cavities of the forest for his repast.

## 1845-1846

July 5. Saturday. Walden. — Yesterday I came here to live. My house makes me think of some mountain houses I have seen, which seemed to have a fresher auroral atmosphere about them, as I fancy of the halls of Olympus. I lodged at the house of a saw-miller last summer, on the Caatskill Mountains, high up as Pine Orchard, in the blueberry and raspberry region, where the quiet and cleanliness and coolness seemed to be all one, — which had their ambrosial character. He was the miller of the Kaaterskill Falls. They were a clean and wholesome family, inside and out, like their house. The latter was not plastered, only lathed, and the inner doors were not hung. The house seemed high-placed, airy, and perfumed, fit to entertain a travelling god. It was so high, indeed, that all the music, the broken strains, the waifs and accompaniments of tunes, that swept over the ridge of the Caatskills, passed through its aisles. Could not man be man in such an abode? And would he ever find out this grovelling life? It was the very light and atmosphere in which the works of Grecian art were composed, and in which they rest. They have appropriated to themselves a loftier hall than mortals ever occupy, at least on a level with the mountain-brows of the world. There was wanting a little of the glare of the lower vales, and in its place a pure twilight as became the precincts of heaven. Yet so equable and calm was the season there that you could not tell whether it was morning or noon or evening. Always there was the sound of the morning cricket.

July 6. I wish to meet the facts of life — the vital facts, which are the phenomena or actuality the gods meant to show us — face to face, and so I came down here. Life! who knows what it is, what it does? If I am not quite right here, I am less wrong than before; and now let us see what they will have. The preacher, instead of vexing the ears of drowsy farmers on their day of rest, at the end of the week, — for Sunday always seemed to me like a fit conclusion of an ill-spent week and not the fresh and brave beginning of a new one, — with this one other draggletail and postponed affair of a sermon, from thirdly to fifteenthly, should teach them with a thundering voice pause and simplicity. “Stop! Avast! Why so fast?” In all studies we go not forward but rather backward with redoubled pauses. We always study antiques with silence and reflection. Even time has a depth, and below its surface the waves do not lapse and roar. I wonder men can be so frivolous almost as to attend to the gross form of negro slavery, there are so many keen and subtle masters who subject us both. Self-emancipation in the West Indies of a man’s thinking and imagining provinces, which should be more than his island territory, — one emancipated heart and intellect! It would knock off the fetters from a million slaves.

July 7. I am glad to remember to-night, as I sit by my door, that I too am at least a remote descendant of that heroic race of men of whom there is tradition: I too sit here on the shore of my Ithaca, a fellow-wanderer and survivor of Ulysses. How symbolical, significant of I know not what, the pitch pine stands here before my door! Unlike any glyph I have seen sculptured or painted yet, one of Nature's later designs, yet perfect as her Grecian art. There it is, a done tree. Who can mend it? And now where is the generation of heroes whose lives are to pass amid these our northern pines, whose exploits shall appear to posterity pictured amid these strong and shaggy forms? Shall there be only arrows and bows to go with these pines on some pipe-stone quarry at length? There is something more respectable than railroads in these simple relics of the Indian race. What hieroglyphs shall we add to the pipe-stone quarry?

If we can forget, we have done somewhat; if we can remember, we have done somewhat. Let us remember this.

The Great Spirit makes indifferent all times and places. The place where he is seen is always the same, and indescribably pleasant to all our senses. We had allowed only neighboring and transient circumstances to make our occasions. They were, in fact, the causes of our distractions. But nearest to all things is that power which fashions their being. Next to us the grandest laws are being enacted and administered. Next to us is not the workman whom we have hired, but ever the workman whose work we are. He is at work, not in my backyard, but inconceivably nearer than that. We are the subjects of an experiment how singular! Can we not dispense with the society of our gossips a little while under these circumstances?

My auxiliaries are the dews and rains, — to water this dry soil, — and genial fatness in the soil itself, which for the most part is lean and effete. My enemies are worms, cool days, and most of all woodchucks. They have nibbled for me an eighth of an acre clean. I plant in faith, and they reap. This is the tax I pay for ousting johnswort and the rest. But soon the surviving beans will be too tough for woodchucks, and then they will go forward to meet new foes.

July 14. What sweet and tender, the most innocent and divinely encouraging society there is in every natural object, and so in universal nature, even for the poor misanthrope and most melancholy man! There can be no really black melancholy to him who lives in the midst of nature and has still his senses. There never was yet such a storm but it was Æolian music to the innocent ear. Nothing can compel to a vulgar sadness a simple and brave man. While I enjoy the sweet friendship of the seasons I trust that nothing can make life a burden to me. This rain which is now watering my beans and keeping me in the house waters me too. I needed it as much. And what if most are not hoed! Those who send the rain, whom I chiefly respect, will pardon me.

Sometimes, when I compare myself with other men, methinks I am favored by the gods. They seem to whisper joy to me beyond my deserts, and that I do have a solid warrant and surety at their hands, which my fellows do not. I do not flatter myself, but if it were possible they flatter me. I am especially guided and guarded.

What was seen true once, and sanctioned by the flash of Jove, will always be true, and nothing can hinder it. I have the warrant that no fair dream I have had need fail of its fulfillment.

Here I know I am in good company; here is the world, its centre and metropolis, and all the palms of Asia and the laurels of Greece and the firs of the Arctic Zone incline thither. Here I can read Homer, if I would have books, as well as in Ionia, and not wish myself in Boston, or New York, or London, or Rome, or Greece. In such place as this he wrote or sang. Who should come to my lodge just now but a true Homeric boor, one of those Paphlagonian men? Alek Therien, he called himself; a Canadian now, a woodchopper, a post-maker; makes fifty posts — holes them, i.e. — in a day; and who made his last supper on a woodchuck which his dog caught. And he too has heard of Homer, and if it were not for books, would not know what to do rainy days. Some priest once, who could read glibly from the Greek itself, taught him reading in a measure — his verse, at least, in his turn — away by the Trois Rivières, at Nicolet. And now I must read to him, while he holds the book, Achilles' reproof of Patroclus on his sad countenance.

“Why are you in tears, Patroclus, like a young child (girl)?” etc., etc.

“Or have you only heard some news from Phthia?”

They say that Menœtius lives yet, son of Actor, And Peleus lives, son of Æacus, among the Myrmidons, Both of whom having died, we should greatly grieve.”

He has a neat bundle of white oak bark under his arm for a sick man, gathered this Sunday morning. “I suppose there's no harm in going after such a thing to-day.” The simple man. May the gods send him many woodchucks.

And earlier to-day came five Lestrigones, railroad men who take care of the road, some of them at least. They still represent the bodies of men, transmitting arms and legs and bowels downward from those remote days to more remote. They have some got a rude wisdom withal, thanks to their dear experience. And one with them, a handsome younger man, a sailor-like, Greek-like man, says: “Sir, I like your notions. I think I shall live so myself. Only I should like a wilder country, where there is more game. I have been among the Indians near Appalachicola. I have lived with them. I like your kind of life. Good day. I wish you success and happiness.”

Therien said this morning (July 16th, Wednesday), “If those beans were mine, I shouldn't like to hoe them till the dew was off.” He was going to his woodchopping. “Ah!” said I, “that is one of the notions the farmers have got, but I don't believe it.”

“How thick the pigeons are!” said he. “If working every day were not my trade, I could get all the meat I should want by hunting, — pigeons, woodchucks, rabbits, partridges, — by George! I could get all I should want for a week in one day.”

I imagine it to be some advantage to live a primitive and frontier life, though in the midst of an outward civilization. Of course all the improvements of the ages do not carry a man backward nor forward in relation to the great facts of his existence.

Our furniture should be as simple as the Arab's or the Indian's. At first the thoughtful, wondering man plucked in haste the fruits which the boughs extended to him, and

found in the sticks and stones around him his implements ready to crack the nut, to wound the beast, and build his house with. And he still remembered that he was a sojourner in nature. When he was refreshed with food and sleep he contemplated his journey again. He dwelt in a tent in this world. He was either threading the valleys, or crossing the plains, or climbing the mountain-tops.

Now the best works of art serve comparatively but to dissipate the mind, for they themselves represent transitionary and paroxysmal, not free and absolute, thoughts.

Men have become the tools of their tools. The man who independently plucked the fruits when he was hungry is become a farmer.

There are scores of pitch pines in my field, from one to three inches in diameter, girdled by the mice last winter. A Norwegian winter it was for them, for the snow lay long and deep, and they had to mix much pine meal with their usual diet. Yet these trees have not many of them died, even in midsummer, and laid bare for a foot, but have grown a foot. They seem to do all their gnawing beneath the snow. There is not much danger of the mouse tribe becoming extinct in hard winters, for their granary is a cheap and extensive one.

Here is one has had her nest under my house, and came when I took my luncheon to pick the crumbs at my feet. It had never seen the race of man before, and so the sooner became familiar. It ran over my shoes and up my pantaloons inside, clinging to my flesh with its sharp claws. It would run up the side of the room by short impulses like a squirrel, which [it] resembles, coming between the house mouse and the former. Its belly is a little reddish, and its ears a little longer. At length, as I leaned my elbow on the bench, it ran over my arm and round the paper which contained my dinner. And when I held it a piece of cheese, it came and nibbled between my fingers, and then cleaned its face and paws like a fly.

There is a memorable interval between the written and the spoken language, the language read and the language heard. The one is transient, a sound, a tongue, a dialect, and all men learn it of their mothers. It is loquacious, fragmentary, — raw material. The other is a reserved, select, matured expression, a deliberate word addressed to the ear of nations and generations. The one is natural and convenient, the other divine and instructive. The clouds flit here below, genial, refreshing with their showers and gratifying with their tints, — alternate sun and shade, a grosser heaven adapted to our trivial wants; but above them repose the blue firmament and the stars. The stars are written words and stereotyped on the blue parchment of the skies; the fickle clouds that hide them from our view, which we on this side need, though heaven does not, these are our daily colloquies, our vaporous, garrulous breath.

Books must be read as deliberately and reservedly as they were written. The herd of men, the generations who speak the Greek and Latin, are not entitled by the accident of birth to read the works of genius, whose mother tongue speaks everywhere, and is learned by every child who hears. The army of the Greeks and Latins are not coætemary, though contemporary, with Homer and Plato, Virgil and Cicero. In the transition ages, nations who loudest spoke the Greek and Latin tongues, whose mother's milk they were,

learned not their nobler dialects, but a base and vulgar speech. The men of the Middle Ages who spoke so glibly the language of the Roman and, in the Eastern Empire, of the Athenian mob, prized only a cheap contemporary learning. The classics of both languages were virtually lost and forgotten. When, after the several nations of Europe had acquired in some degree rude and original languages of their own, sufficient for the arts of life and conversation, then the few scholars beheld with advantage from this more distant standpoint the treasures of antiquity, and a new Latin age commenced, the era of reading. Those works of genius were then first classical. All those millions who had spoken Latin and Greek had not read Latin and Greek. The time had at length arrived for the written word, the scripture, to be heard. What the multitude could not hear, after the lapse of centuries a few scholars read. This is the matured thought which was not spoken in the market-place, unless it be in a market-place where the free genius of mankind resorts to-day. There is something very choice and select in a written word. No wonder Alexander carried his Homer in a precious casket on his expeditions. A word which may be translated into every dialect, and suggests a truth to every mind, is the most perfect work of human art; and as it may be breathed and taken on our lips, and, as it were, become the product of our physical organs, as its sense is of our intellectual, it is the nearest to life itself. It is the simplest and purest channel by which a revelation may be transmitted from age to age. How it subsists itself whole and undiminished till the intelligent reader is born to decipher it! There are the tracks of Zoroaster, of Confucius and Moses, indelible in the sands of the remotest times.

There are no monuments of antiquity comparable to the classics for interest and importance. It does not need that the scholar should be an antiquarian, for these works of art have such an immortality as the works of nature, and are modern at the same time that they are ancient, like the sun and stars, and occupy by right no small share of the present. This palpable beauty is the treasured wealth of the world and the proper inheritance of each generation. Books, the oldest and the best, stand rightfully on the shelves of every cottage. They have not to plead their cause, but they enlighten their readers and it is gained. When the illiterate and scornful rustic earns his imagined leisure and wealth, he turns inevitably at last — he or his children — to these still higher and yet inaccessible circles; and even when his descendant has attained to move in the highest rank of the wise men of his own age and country, he will still be sensible only of the imperfection of his culture and the vanity and inefficiency of his intellectual wealth, if his genius will not permit him to listen with somewhat of the equanimity of an equal to the fames of godlike men, which yet, as it were, form an invisible upper class in every society. I have carried an apple in my pocket to-night — a sopsivine, they call it — till, now that I take my handkerchief out, it has got so fine a fragrance that it really seems like a friendly trick of some pleasant *dæmon* to entertain me with. It is redolent of sweet-scented orchards, of innocent, teeming harvests. I realize the existence of a goddess Pomona, and that the gods have really intended that men should feed divinely, like themselves, on their own nectar and ambrosia. They have so

painted this fruit, and freighted it with such a fragrance, that it satisfies much more than an animal appetite. Grapes, peaches, berries, nuts, etc., are likewise provided for those who will sit at their sideboard. I have felt, when partaking of this inspiring diet, that my appetite was an indifferent consideration; that eating became a sacrament, a method of communion, an ecstatic exercise, a mingling of bloods, and [a] sitting at the communion table of the world; and so have not only quenched my thirst at the spring but the health of the universe.

The indecent haste and grossness with which our food is swallowed have cast a disgrace on the very act of eating itself. But I do believe that, if this process were rightly conducted, its aspect and effects would be wholly changed, and we should receive our daily life and health, Antæus-like, with an ecstatic delight, and, with upright front, an innocent and graceful behavior, take our strength from day to day. This fragrance of the apple in my pocket has, I confess, deterred me from eating of it. I am more effectually fed by it another way.

It is, indeed, the common notion that this fragrance is the only food of the gods, and inasmuch as we are partially divine we are compelled to respect it.

Tell me, ye wise ones, if ye can,  
Whither and whence the race of man.  
For I have seen his slender clan  
Clinging to hoar hills with their feet,  
Threading the forest for their meat.  
Moss and lichens, bark and grain  
They rake together with might and main,  
And they digest them with anxiety and pain.  
I meet them in their rags and unwashed hair,  
Instructed to eke out their scanty fare —  
Brave race — with a yet humbler prayer.  
Beggars they are, aye, on the largest scale.  
They beg their daily bread at heaven's door,  
And if their this year's crop alone should fail,  
They neither bread nor begging would know more.  
They are the titmen of their race,  
And hug the vales with mincing pace  
Like Troglodytes, and fight with cranes.  
We walk 'mid great relations' feet.  
What they let fall alone we eat.  
We are only able  
To catch the fragments from their table.  
These elder brothers of our race,  
By us unseen, with larger pace  
Walk o'er our heads, and live our lives,  
Embody our desires and dreams,

Anticipate our hoped-for gleams.  
We grub the earth for our food.  
We know not what is good.  
Where does the fragrance of our orchards go,  
Our vineyards, while we toil below?  
A finer race and finer fed  
Feast and revel above our head.  
The tints and fragrance of the flowers and fruits  
Are but the crumbs from off their table,  
While we consume the pulp and roots.  
Sometimes we do assert our kin,  
And stand a moment where once they have been.  
We hear their sounds and see their sights,  
And we experience their delights.  
But for the moment that we stand  
Astonished on the Olympian land,  
We do discern no traveller's face,  
No elder brother of our race,  
To lead us to the monarch's court  
And represent our case;  
But straightway we must journey back,  
Retracing slow the arduous track,  
Without the privilege to tell,  
Even, the sight we know so well.  
In my father's house are many mansions.

Who ever explored the mansions of the air? Who knows who his neighbors are? We seem to lead our human lives amid a concentric system of worlds, of realm on realm, close bordering on each other, where dwell the unknown and the imagined races, as various in degree as our own thoughts are, — a system of invisible partitions more infinite in number and more inconceivable in intricacy than the starry one which science has penetrated.

When I play my flute to-night, earnest as if to leap the bounds [of] the narrow fold where human life is penned, and range the surrounding plain, I hear echo from a neighboring wood, a stolen pleasure, occasionally not rightfully heard, much more for other ears than ours, for't is the reverse of sound. It is not our own melody that comes back to us, but an amended strain. And I would only hear myself as I would hear my echo, corrected and repronounced for me. It is as when my friend reads my verse.

The borders of our plot are set with flowers, whose seeds were blown from more Elysian fields adjacent. They are the pot-herbs of the gods, which our laborious feet have never reached, and fairer fruits and unaccustomed fragrance betray another realm's vicinity. There, too, is Echo found, with which we play at evening. There is the abutment of the rainbow's arch.

Aug. 6. Walden. — I have just been reading a book called “The Crescent and the Cross,” till now I am somewhat ashamed of myself. Am I sick, or idle, that I can sacrifice my energy, America, and to-day to this man’s ill-remembered and indolent story? Carnac and Luxor are but names, and still more desert sand and at length a wave of the great ocean itself are needed to wash away the filth that attaches to their grandeur.

Carnac! Carnac! this is Camac for me, and I behold the columns of a larger and a purer temple. May our childish and fickle aspirations be divine, while we descend to this mean intercourse. Our reading should be heroic, in an unknown tongue, a dialect always but imperfectly learned, through which we stammer line by line, catching but a glimmering of the sense, and still afterward admiring its unexhausted hieroglyphics, its untranslated columns. Here grow around me nameless trees and shrubs, each morning freshly sculptured, rising new stories day by day, instead of hideous ruins, — their myriad-handed worker uncompelled as un compelling. This is my Carnac; that its unmeasured dome. The measuring art man has invented flourishes and dies upon this temple’s floor, nor ever dreams to reach that ceiling’s height. Carnac and Luxor crumble underneath. Their shadowy roofs let in the light once more reflected from the ceiling of the sky.

Behold these flowers! Let us be up with Time, not dreaming of three thousand years ago. Erect ourselves and let those columns lie, not stoop to raise a foil against the sky. Where is the spirit of that time but in this present day, this present line? Three thousand years ago are not agone; they are still lingering here this summer morn.

And Memnon’s mother sprightly greets us now;  
Wears still her youthful blushes on her brow.  
And Camac’s columns, why stand they on the plain?  
T’ enjoy our opportunities they would fain remain.  
This is my Camac, whose unmeasured dome  
Shelters the measuring art and measurer’s home,  
Whose propylæum is the system high [?]  
And sculptured façade the visible sky.

Where there is memory which compelleth Time, the Muses’ mother, and the Muses nine, there are all ages, past and future time, — unwearied memory that does not forget the actions of the past, that does not forego to stamp them freshly, that Old Mortality, industrious to retouch the monuments of time, in the world’s cemetery throughout every clime.

The student may read Homer or Æschylus in the original Greek; for to do so implies to emulate their heroes, — the consecration of morning hours to their pages.

The heroic books, though printed in the character of our mother tongue, are always written in a foreign language, dead to idle and degenerate times, and we must laboriously seek the meaning of each word and line, conjecturing a larger sense than the text renders us, at last, out of our own valor and generosity.

A man must find his own occasion in himself. The natural day is very calm, and will hardly reprove our indolence. If there is no elevation in our spirits, the pond will not seem elevated like a mountain tarn, but a low pool, a silent muddy water, a place for fishermen.

I sit here at my window like a priest of Isis, and observe the phenomena of three thousand years ago, yet unimpaired. The tantivy of wild pigeons, an ancient race of birds, gives a voice to the air, flying by twos and threes athwart my view or perching restless on the white pine boughs occasionally; a fish hawk dimples the glassy surface of the pond and brings up a fish; and for the last half-hour I have heard the rattle of railroad cars conveying travellers from Boston to the country.

After the evening train has gone by and left the world to silence and to me, the whip-poor-will chants her vespers for half an hour. And when all is still at night, the owls take up the strain, like mourning women their ancient ululu. Their most dismal scream is truly Ben-Jonsonian. Wise midnight hags! It is no honest and blunt tu-whit tu-who of the poets, but, without jesting, a most solemn graveyard ditty, — but the mutual consolations of suicide lovers remembering the pangs and the delights of supernal love in the infernal groves. And yet I love to hear their wailing, their doleful responses, trilled along the woodside, reminding me sometimes of music and singing birds, as if it were the dark and tearful side of music, the regrets and sighs, that would fain be sung. The spirits, the low spirits and melancholy forebodings, of fallen spirits who once in human shape night-walked the earth and did the deeds of darkness, now expiating with their wailing hymns, threnodiai, their sins in the very scenery of their transgressions. They give me a new sense of the vastness and mystery of that nature which is the common dwelling of us both.

“Oh-o-o-o-o that I never had been bor-or-or-or-om!” sighs one on this side of the pond, and circles in the restlessness of despair to some new perch in the gray oaks. Then, “That I never had been bor-or-or-or-om!” echoes one on the further side, with a tremulous sincerity, and “Bor-or-or-or-orn” comes faintly from far in the Lincoln woods.

— .

And then the frogs, bullfrogs; they are the more sturdy spirits of ancient wine-bibbers and wassailers, still unrepentant, trying to sing a catch in their Stygian lakes. They would fain keep up the hilarious good fellowship and all the rules of their old round tables, but they have waxed hoarse and solemnly grave and serious their voices, mocking at mirth, and their wine has lost its flavor and is only liquor to distend their paunches, and never comes sweet intoxication to drown the memory of the past, but mere saturation and water-logged dullness and distension. Still the most aldermanic, with his chin upon a pad, which answers for a napkin to his drooling chaps, under the eastern shore quaffs a deep draught of the once scorned water, and passes round the cup with the ejaculation tr-r-r-r-oonk, tr-r-r-r-oonk, tr-r-r-r-oonk I and straightway comes over the water from some distant cove the selfsame password, where the next in seniority and girth has gulped down to his mark; and when the strain has made the circuit of the shores, then ejaculates the master of ceremonies with satisfaction

tr-r-r-roonk! and each in turn repeats the sound, down to the least distended, leakiest, flabbiest paunched, that there be no mistake; and the bowl goes round again, until the sun dispels the morning mist, and only the patriarch is not under the pond, but vainly bellowing troonk from time to time, pausing for a reply.

All nature is classic and akin to art. The sumach and pine and hickory which surround my house remind me of the most graceful sculpture. Sometimes their tops, or a single limb or leaf, seems to have grown to a distinct expression as if it were a symbol for me to interpret. Poetry, painting, and sculpture claim at once and associate with themselves those perfect specimens of the art of nature, — leaves, vines, acorns, pine cones, etc. The critic must at last stand as mute though contented before a true poem as before an acorn or a vine leaf. The perfect work of art is received again into the bosom of nature whence its material proceeded, and that criticism which can only detect its unnaturalness has no longer any office to fulfill. The choicest maxims that have come down to us are more beautiful or integrally wise than they are wise to our understandings. This wisdom which we are inclined to pluck from their stalk is the point only of a single association. Every natural form — palm leaves and acorns, oak leaves and sumach - and dodder — are [sic] untranslatable aphorisms.

Twenty-three years since, when I was five years old, I was brought from Boston to this pond, away in the country, — which was then but another name for the extended world for me, — one of the most ancient scenes stamped on the tablets of my memory, the oriental Asiatic valley of my world, whence so many races and inventions have gone forth in recent times. That woodland vision for a long time made the drapery of my dreams. That sweet solitude my spirit seemed so early to require that I might have room to entertain my thronging guests, and that speaking silence that my ears might distinguish the significant sounds. Somehow or other it at once gave the preference to this recess among the pines, where almost sunshine and shadow were the only inhabitants that varied the scene, over that tumultuous and varied city, as if it had found its proper nursery.

Well, now, to-night my flute awakes the echoes over this very water, but one generation of pines has fallen, and with their stumps I have cooked my supper, and a lusty growth of oaks and pines is rising all around its brim and preparing its wilder aspect for new infant eyes. Almost the same johnswort springs from the same perennial root in this pasture. Even I have at length helped to clothe that fabulous landscape of my imagination, and one result of my presence and influence is seen in these bean leaves and com blades and potato vines.

As difficult to preserve is the tenderness of your nature as the bloom upon a peach.

Most men are so taken up with the cares and rude practice of life that its finer fruits cannot be plucked by them. Literally, the laboring man has not leisure for a strict and lofty integrity day by day; he cannot afford to sustain the fairest and noblest relations. His labor will depreciate in the market.

How can he remember well his ignorance who has so often to use his knowledge.

Aug. 15. The sounds heard at this hour, 8.30, are the distant rumbling of wagons over bridges, — a sound farthest heard of any human at night, — the baying of dogs, the lowing of cattle in distant yards.

What if we were to obey these fine dictates, these divine suggestions, which are addressed to the mind and not to the body, which are certainly true, — not to eat meat, not to buy, or sell, or barter, etc., etc., etc.?

I will not plant beans another summer, but sincerity, truth, simplicity, faith, trust, innocence, and see if they will not grow in this soil with such manure as I have, I would not forget that I deal with infinite and divine qualities in my fellow. All men, indeed, are divine in their core of light, but that is indistinct and distant to me, like the stars of the least magnitude, or the galaxy itself, but my kindred planets show their round disks and even their attendant moons to my eye.

Even the tired laborers I meet on the road, I really meet as travelling gods, but it is as yet, and must be for a long season, without speech.

Aug. 23. Saturday. I set out this afternoon to go a-fishing for pickerel to eke out my scanty fare of vegetables. From Walden I went through the woods to Fair Haven, but by the way the rain came on again, and my fates compelled me to stand a half-hour under a pine, piling boughs over my head, and wearing my pocket handkerchief for an umbrella; and when at length I had made one cast over the pickerel-weed, the thunder gan romblen in the heven with that grisly steven that Chaucer tells of. (The gods must be proud, with such forked flashes and such artillery to rout a poor unarmed fisherman.) I made haste to the nearest hut for a shelter. This stood a half a mile off the road, and so much the nearer to the pond. There dwelt a shiftless Irishman, John Field, and his wife, and many children, from the broad-faced boy that ran by his father's side to escape the rain to the wrinkled and sibyl-like, crone-like infant, not knowing whether to take the part of age or infancy, that sat upon its father's knee as in the palaces of nobles, and looked out from its home in the midst of wet and hunger inquisitively upon the stranger, with the privilege of infancy; the young creature not knowing but it might be the last of a line of kings instead of John Field's poor starveling brat, or, I should rather say, still knowing that it was the last of a noble line and the hope and cynosure of the world. An honest, hard-working, but shiftless man plainly was John Field; and his wife, she too was brave to cook so many succeeding dinners in the recesses of that lofty stove; with round, greasy face and bare breast, still thinking to improve her condition one day; with the never absent mop in hand, and yet no effects of it visible anywhere. The chickens, like members of the family, stalked about the room, too much humanized to roast well. They stood and looked in my eye or pecked at my shoe. He told me his story, how hard he worked bogging for a neighbor, at ten dollars an acre and the use of the land with manure for one year, and the little broad-faced son worked cheerfully at his father's side the while, not knowing, alas! how poor a bargain he had made. Living, John Field, alas! without arithmetic; failing to live.

“Do you ever fish?” said I. “Oh yes, I catch a mess when I am lying by; good perch I catch.”

“What’s your bait?”

“I catch shiners with fishworms, and bait the perch with them.”

“You’d better go now, John,” said his wife, with glistening, hopeful face. But poor John Field disturbed but a couple of fins, while I was catching a fair string, and he said it was his luck; and when he changed seats luck changed seats too. Thinking to live by some derivative old-country mode in this primitive new country, e g. to catch perch with shiners.

I find an instinct in me conducting to a mystic spiritual life, and also another to a primitive savage life.

Toward evening, as the world waxes darker, I am permitted to see the woodchuck stealing across my path, and tempted to seize and devour it. The wildest, most desolate scenes are strangely familiar to me.

Why not live a hard and emphatic life, not to be avoided, full of adventures and work, learn much in it, travel much, though it be only in these woods? I sometimes walk across a field with unexpected expansion and long-missed content, as if there were a field worthy of me. The usual daily boundaries of life are dispersed, and I see in what field I stand.

When on my way this afternoon, Shall I go down this long hill in the rain to fish in the pond? I ask myself. And I say to myself: Yes, roam far, grasp life and conquer it, learn much and live. Your fetters are knocked off; you are really free. Stay till late in the night; be unwise and daring. See many men far and near, in their fields and cottages before the sun sets, though as if many more were to be seen. And yet each rencontre shall be so satisfactory and simple that no other shall seem possible. Do not repose every night as villagers do. The noble life is continuous and unintermitting. At least, live with a longer radius. Men come home at night only from the next field or street, where their household echoes haunt, and their life pines and is sickly because it breathes its own breath. Their shadows morning and evening reach farther than their daily steps. But come home from far, from ventures and perils, from enterprise and discovery and crusading, with faith and experience and character. Do not rest much. Dismiss prudence, fear, conformity. Remember only what is promised. Make the day light you, and the night hold a candle, though you be falling from heaven to earth “from mom to dewy eve a summer’s day.”

For Vulcan’s fall occupied a day, but our highest aspirations and performances fill but the interstices of time.

Are we not reminded in our better moments that we have been needlessly husbanding somewhat, perchance our little God-derived capital, or title to capital, guarding it by methods we know? But the most diffuse prodigality a better wisdom teaches, — that we hold nothing. We are not what we were. By usurers’ craft, by Jewish methods, we strive to retain and increase the divinity in us, when infinitely the greater part of divinity is out of us.

Most men have forgotten that it was ever morning; but a few serene memories, healthy and wakeful natures, there are who assure us that the sun rose clear, heralded by the singing of birds, — this very day's sun, which rose before Memnon was ready to greet it.

In all the dissertations on language, men forget the language that is, that is really universal, the inexpressible meaning that is in all things and everywhere, with which the morning and evening teem. As if language were especially of the tongue of course. With a more copious learning or understanding of what is published, the present languages, and all that they express, will be forgotten.

The rays which streamed through the crevices will be no more remembered when the shadow is wholly removed.

Left house on account of plastering, Wednesday, November 12th, at night; returned Saturday, December 6th.

Though the race is not so degenerated but a man might possibly live in a cave to-day and keep himself warm by furs, yet, as caves and wild beasts are not plenty enough to accommodate all at the present day, it were certainly better to accept the advantages which the invention and industry of mankind offer. In thickly settled civilized communities, boards and shingles, lime and brick, are cheaper and more easily come by than suitable caves, or the whole logs, or bark in sufficient quantity, or even well-tempered clay or flat stones. A tolerable house for a rude and hardy race that lived much out of doors was once made here without any of these last materials. According to the testimony of the first settlers of Boston, an Indian wigwam was as comfortable in winter as an English house with all its wainscotting, and they had advanced so far as to regulate the effect of the wind by a mat suspended over the hole in the roof, which was moved by a string. Such a lodge was, in the first instance, constructed in a day or two and taken down and put up again in a few hours, and every family had one.

Thus, to try our civilization by a fair test, in the ruder states of society every family owns a shelter as good as the best, and sufficient for its ruder and simpler wants; but in modern civilized society, though the birds of the air have their nests, and woodchucks and foxes their holes, though each one is commonly the owner of his coat and hat though never so poor, yet not more than one man in a thousand owns a shelter, but the nine hundred and ninety-nine pay an annual tax for this outside garment of all, indispensable summer and winter, which would buy a village of Indian wigwams and contributes to keep them poor as long as they live. But, answers one, by simply paying this annual tax the poorest man secures an abode which is a palace compared to the Indian's. An annual rent of from twenty to sixty or seventy dollars entitles him to the benefit of all the improvements of centuries, — Rumford fireplace, back plastering, Venetian blinds, copper pump, spring lock, etc., etc. But while civilization has been improving our houses, she has not equally improved the men who should occupy them. She has created palaces, but it was not so easy to create noblemen and kings. The mason who finishes the cornice of the palace returns at night, perchance, to a hut no

better than a wigwam. If she claims to have made a real advance in the welfare of man, she must show how she has produced better dwellings without making them more costly. And the cost of a thing, it will be remembered, is the amount of life it requires to be exchanged for it, immediately or in the long run. An average house costs perhaps from one thousand to fifteen hundred dollars, and to earn this sum will require from fifteen to twenty years of the day laborer's life, even if he is not incumbered with a family; so that he must spend more than half his life before a wigwam can be earned; and if we suppose he pays a rent instead, this is but a doubtful choice of evils. Would the savage have been wise to exchange his wigwam for a palace on these terms?

When I consider my neighbors, the farmers of Concord, for instance, who are at least as well off as the other classes, what are they about? For the most part I find that they have been toiling ten, twenty, or thirty years to pay for their farms, and we may set down one half of that toil to the cost of their houses; and commonly they have not yet paid for them. This is the reason they are poor; and for similar reasons we are all poor in respect to a thousand savage comforts, though surrounded by luxuries.

But most men do not know what a house is, and the mass are actually poor all their days because they think they must have such an one as their neighbor's. As if one were to wear any sort of coat the tailor might cut out for him, or, gradually leaving off palm-leaf hat and cap of woodchuck-skin, should complain of hard times because he could not buy him a crown!

It reflects no little dignity on Nature, the fact that the Romans once inhabited her, — that from this same unaltered hill, forsooth, the Roman once looked out upon the sea, as from a signal station. The vestiges of military roads, of houses and tessellated courts and baths, — Nature need not be ashamed of these relics of her children. The hero's cairn, — one doubts at length whether his relations or Nature herself raised the hill. The whole earth is but a hero's cairn. How often are the Romans flattered by the historian and antiquary! Their vessels penetrated into this frith and up that river of some remote isle. Their military monuments still remain on the hills and under the sod of the valleys. The oft-repeated Roman stoy is written in still legible characters in every quarter of the old world, and but today a new coin is dug up whose inscription repeats and confirms their fame. Some "Judæa Capta," with a woman mourning under a palm tree, with silent argument and demonstration puts at rest whole pages of history.

The Earth

Which seems so barren once gave birth  
To heroes, who o'er ran her plains,  
Who plowed her seas and reaped her grains.

Some make the mythology of the Greeks to have been borrowed from that of the Hebrews, which however is not to be proved by analogies, — the story of Jupiter dethroning his father Saturn, for instance, from the conduct of Cham towards his father Noah, and the division of the world among the three brothers. But the Hebrew fable will not bear to be compared with the Grecian. The latter is infinitely more sublime and divine. The one is a history of mortals, the other a history of gods and

heroes, therefore not so ancient. The one god of the Hebrews is not so much of a gentleman, not so gracious and divine, not so flexible and catholic, does not exert so intimate an influence on nature as many a one of the Greeks. He is not less human, though more absolute and unapproachable. The Grecian were youthful and living gods, but still of godlike or divine race, and had the virtues of gods. The Hebrew had not all of the divinity that is in man, no real love for man, but an inflexible justice. The attribute of the one god has been infinite power, not grace, not humanity, nor love even, — wholly masculine, with no sister Juno, no Apollo, no Venus in him. I might say that the one god was not yet apotheosized, not yet become the current material of poetry.

The wisdom of some of those Greek fables is remarkable. The god Apollo (Wisdom, Wit, Poetry) condemned to serve, keep the sheep of King Admetus. So is poetry allied to the state.

To Æacus, Minos, Rhadamanthus, judges in hell, only naked men came to be judged. As Alexander Ross comments, "In this world we must not look for Justice; when we are stript of all, then shall we have it. For here something will be found about us that shall corrupt the Judge." When the island of Ægina was depopulated by sickness at the instance of Æacus, Jupiter turned the ants into men, i.e. made men of the inhabitants who lived meanly like ants.

The hidden significance of these fables which has been detected, the ethics running parallel to the poetry and history, is not so remarkable as the readiness with which they may be made to express any truth. They are the skeletons of still older and more universal truths than any whose flesh and blood they are for the time made to wear. It is like striving to make the sun and the wind and the sea signify. What signifies it?

Piety, that carries its father on its shoulders.

Music was of three kinds, — mournful, martial, and effeminate, — Lydian, Doric, and Phrygian. Its inventors Amphion, Thamyris, and Marsyas. Amphion was bred by shepherds. He caused the stones to follow him and built the walls of Thebes by his music. All orderly and harmonious or beautiful structures may be said to be raised to a slow music.

Harmony was begotten of Mars and Venus.

Antæus was the son of Neptune and the Earth. All physical bulk and strength is of the earth and mortal. When it loses this point d'appui it is weakness; it cannot soar. And so, vice versa, you can interpret this fable to the credit of the earth.

They all provoked or challenged the gods, — Amphion, Apollo and Diana, and was killed by them; Thamyris, the Muses, who conquered him in music, took away his eyesight and melodious voice, and broke his lyre. Marsyas took up the flute which Minerva threw away, challenged Apollo, was flayed alive by him, and his death mourned by Fauns, Satyrs, and Dryads, whose tears produced the river which bears his name.

The fable which is truly and naturally composed, so as to please the imagination of a child, harmonious though strange like a wild-flower, is to the wise man an apothegm and admits his wisest interpretation.

When we read that Bacchus made the Tyrrhenian mariners mad, so that they leaped into the sea, mistaking it for “a meadow full of flowers,” and so became dolphins, we are not concerned about the historical truth of this, but rather a higher, poetical truth. We seem to hear the music of a thought, and care not if our intellect be not gratified. —

The mythologies, those vestiges of ancient poems, the world’s inheritance, still reflecting some of their original hues, like the fragments of clouds tinted by the departed sun, the wreck of poems, a retrospect as [of] the loftiest fames, — what survives of oldest fame, — some fragment will still float into the latest summer day and ally this hour to the morning of creation. These are the materials and hints for a history of the rise and progress of the race. How from the condition of ants it arrived at the condition of men, how arts were invented gradually, — let a thousand surmises shed some light on this story. We will not be confined by historical, even geological, periods, which would allow us to doubt of a progress in human events. If we rise above this wisdom for the day, we shall expect that this morning of the race, in which they have been supplied with the simplest necessaries, — with corn and wine and honey and oil and fire and articulate speech and agricultural and other arts, — reared up by degrees from the condition of ants to men, will be succeeded by a day of equally progressive splendor; that, in the lapse of the divine periods, other divine agents and godlike men will assist to elevate the race as much above its present condition.

Aristæus “found out honey and oil.”

“He obtained of Jupiter and Neptune, that the pestilential heat of the dog-days, wherein was great mortality, should be mitigated with wind.”

Dec. 12. Friday. The pond skimmed over on the night of this day, excepting a strip from the bar to the northwest shore. Flint’s Pond has been frozen for some time.

Dec. 16, 17, 18, 19, 20. Pond quite free from ice, not yet having been frozen quite over.

Dec. 23. Tuesday. The pond froze over last night entirely for the first time, yet so as not to be safe to walk upon.

I wish to say something to-night not of and concerning the Chinese and Sandwich-Islanders, but to and concerning you who hear me, who are said to live in New England; something about your condition, especially your outward condition or circumstances in this world, in this town; what it is, whether it is necessarily as bad as it is, whether it can’t be improved as well as not.

It is generally admitted that some of you are poor, find it hard to get a living, haven’t always something in your pockets, haven’t paid for all the dinners you’ve actually eaten, or all your coats and shoes, some of which are already worn out. All this is very well known to all by hearsay and by experience. It is very evident what a mean and sneaking life you live, always in the hampers, always on the limits, trying to get into business and trying to get out of debt, a very ancient slough, called by the Latins *aes alienum*, another’s brass, — some of their coins being made of brass, — and still so many living and dying and buried to-day by another’s brass; always promising

to pay, promising to pay, with interest, to-morrow perhaps, and die to-day, insolvent; seeking to curry favor, to get custom, lying, flattering, voting, contracting yourselves into a nutshell of civility or dilating into a world of thin and vaporous generosity, that you may persuade your neighbor to let you make his [shoes, or his hat, or his coat, or his carriage, etc.].

There is a civilization going on among brutes as well as men. Foxes are forest dogs. I hear one barking raggedly, wildly, demoniacally in the darkness to-night, seeking expression, laboring with some anxiety, striving to be a dog outright that he may carelessly run in the street, struggling for light. He is but a faint man, before pygmies; an imperfect, burrowing man. He has come up near to my window, attracted by the light, and barked a vulpine curse at me, then retreated.

Reading suggested by Hallam's History of Literature.

1.— "Abelard and Heloise."

2. — Look at Luigi Pulci. His "Morgante Maggiore," published in 1481, "was to the poetical romances of chivalry what Don Quixote was to their brethren in prose."

3. — Leonardo da Vinci. The most remarkable of his writings still in manuscript. For his universality of genius, "the first name of the fifteenth century."

4. — Read Boiardo's "Orlando Innamorato," published between 1491 and 1500, for its influence on Ariosto and its intrinsic merits. Its sounding names repeated by Milton in "Paradise Regained."

Landor's works are: —

A small volume of poems, 1793, out of print.

Poems of "Gebir,"

"Chrysaor," the "Phoceans," etc. The "Gebir" eulogized by Southey and Coleridge.

Wrote verses in Italian and Latin.

The dramas "Andrea of Hungary,"

"Giovanna of Naples," and "Fra Rupert."

"Pericles and Aspasia."

"Poems from the Arabic and Persian," 1800, pretending to be translations.

"A Satire upon Satirists, and Admonition to Detractors," printed 1836, not published.

Letters called "High and Low Life in Italy."

"Imaginary Conversations."

"Pentameron and Pentalogia."

"Examination of William Shakspeare before Sir Thomas Lucy, Knt., touching Deer-stealing."

Vide again Richard's sail in "Richard First and the Abbot."

Phocion's remarks in conclusion of "Eschines and Phocion."

"Demosthenes and Eubulides."

In Milton and Marvel, speaking of the Greek poets, he says, "There is a sort of refreshing odor flying off it perpetually; not enough to oppress or to satiate; nothing

is beaten or bruised; nothing smells of the stalk; the flower itself is half-concealed by the Genius of it hovering round.”

Pericles and Sophocles.

Marcus Tullius Cicero and his brother Quintus. In this a sentence on Sleep and Death.

Johnson and Tooke, for a criticism on words.

It is worth the while to have lived a primitive wilderness life at some time, to know what are, after all, the necessaries of life and what methods society has taken to supply them. I have looked over the old day-books of the merchants with the same view, — to see what it was shopmen bought. They are the grossest groceries. Salt is perhaps the most important article in such a list, and most commonly bought at the stores, of articles commonly thought to be necessaries, — salt, sugar, molasses, cloth, etc., — by the farmer. You will see why stores or shops exist, not to furnish tea and coffee, but salt, etc. Here’s the rub, then.

I see how I could supply myself with every other article which I need, without using the shops, and to obtain this might be the fit occasion for a visit to the seashore. Yet even salt cannot strictly speaking be called a necessary of human life, since many tribes do not use it.

“Have you seen my hound, sir? I want to know! — what! a lawyer’s office? law books? — if you’ve seen anything of a hound about here. Why, what do you do here?”

“I live here. No, I have n’t.”

“Haven’t you heard one in the woods anywhere?”

“Oh, yes, I heard one this evening.”

“What do you do here?”

“But he was some way off.”

“Which side did he seem to be?”

“Well, I should think he [was] the other side of the pond.”

“This is a large dog; makes a large track. He’s been out hunting from Lexington for a week. How long have you lived here?”

“Oh, about a year.”

“Somebody said there was a man up here had a camp in the woods somewhere, and he’d got him.”

“Well, I don’t know of anybody. There’s Britton’s camp over on the other road. It may be there.”

“Isn’t there anybody in these woods?”

“Yes, they are chopping right up here behind me.”

“How far is it?”

“Only a few steps. Hark a moment. There, don’t you hear the sound of their axes?”

Therien, the woodchopper, was here yesterday, and while I was cutting wood, some chickadees hopped near pecking the bark and chips and the potato-skins I had thrown out. “What do you call them,” he asked. I told him.

“What do you call them,” asked I. “Mezeence [?],” I think he said. “When I eat my dinner in the woods,” said he, “sitting very still, having kindled a fire to warm my coffee, they come and light on my arm and peck at the potato in my fingers. I like to have the little fellers about me.” Just then one flew up from the snow and perched on the wood I was holding in my arms, and pecked it, and looked me familiarly in the face. Chicadee-dee-dee-dee-dee, while others were whistling phebe, — phe-bee, — in the woods behind the house.

March 26, 1846. The change from foul weather to fair, from dark, sluggish hours to serene, elastic ones, is a memorable crisis which all things proclaim. The change from foulness to serenity is instantaneous. Suddenly an influx of light, though it was late, filled my room. I looked out and saw that the pond was already calm and full of hope as on a summer evening, though the ice was dissolved but yesterday. There seemed to be some intelligence in the pond which responded to the unseen serenity in a distant horizon. I heard a robin in the distance, — the first I had heard this spring, — repeating the assurance. The green pitch [pine] suddenly looked brighter and more erect, as if now entirely washed and cleansed by the rain. I knew it would not rain any more. A serene summer-evening sky seemed darkly reflected in the pond, though the clear sky was nowhere visible overhead. It was no longer the end of a season, but the beginning. The pines and shrub oaks, which had before drooped and covered the winter through with myself, now recovered their several characters and in the landscape revived the expression of an immortal beauty. Trees seemed all at once to be fitly grouped, to sustain new relations to men and to one another. There was somewhat cosmical in the arrangement of nature. O the evening robin, at the close of a New England day! If I could ever find the twig he sits upon! Where does the minstrel really roost? We perceive it is not the bird of the ornithologist that is heard, — the *Turdus migratorius*.

The signs of fair weather are seen in the bosom of ponds before they are recognized in the heavens. It is easy to tell by looking at any twig of the forest whether its winter is past or not.

We forget how the sun looks on our fields, as on the forests and the prairies, as they reflect or absorb his rays. It matters not whether we stand in Italy or on the prairies of the West, in the eye of the sun the earth is all equally cultivated like a garden, and yields to the wave of an irresistible civilization.

This broad field, which I have looked on so long, looks not to me as the farmer, looks away from me to the sun, and attends to the harmony of nature. These beans have results which are not harvested in the autumn of the year. They do not mind, if I harvest them, who waters and makes them grow? Our grain-fields make part of a beautiful picture which the sun beholds in his daily course, and it matters little comparatively whether they fill the barns of the husbandman. The true husbandman will cease from anxiety and labor with every day, and relinquish all claim to the produce of his fields.

The avaricious man would fain plant by himself.

A flock of geese has just got in late, now in the dark flying low over the pond. They came on, indulging at last like weary travellers in complaint and consolation, or like some creaking evening mail late lumbering in with regular anserine clangor. I stood at my door and could hear their wings when they suddenly spied my light and, ceasing their noise, wheeled to the east and apparently settled in the pond.

March 27. This morning I saw the geese from the door through the mist sailing about in the middle of the pond, but when I went to the shore they rose and circled round like ducks over my head, so that I counted them, — twenty-nine. I after saw thirteen ducks.

## 1845-1847

THE small and much mutilated journal which begins here appears to belong to the Walden period (1845-47), but the entries are undated.

### THE HERO

What doth he ask?  
Some worthy task,  
Never to run  
Till that be done,  
That never done  
Under the sun.  
Here to begin  
All things to win  
By his endeavor  
Forever and ever.  
Happy and well  
On this ground to dwell,  
This soil subdued,  
Plant, and renew.,  
By might and main  
Health and strength gain,  
So to give nerve  
To his slenderness;  
Yet some mighty pain  
He would sustain,  
So to preserve  
His tenderness.  
Not be deceived,  
Of suff'ring bereaved,  
Not lose his life  
By living too well,

Nor escape strife  
In his lonely cell,  
And so find out heaven  
By not knowing hell.  
Strength like the rock  
To withstand any shock,  
Yet some Aaron's rod,  
Some smiting by God,  
Occasion to gain  
To shed human tears  
And to entertain  
Still demonic fears.  
Not once for all, forever, blest,  
Still to be cheered out of the west;  
Not from his heart to banish all sighs;  
Still be encouraged by the sunrise;  
Forever to love and to love and to love,  
Within him, around him, beneath him, above.  
To love is to know, is to feel, is to be;  
At once't is his birth and his destiny.  
Having sold all,  
Something would get,  
Furnish his stall  
With better yet, —  
For earthly pleasures  
Celestial pains,  
Heavenly losses  
For earthly gains.  
Still to begin — unheard-of sin  
A fallen angel — a risen man  
Never returns to where he began.  
Some childlike labor  
Here to perform,  
Some baby-house  
To keep out the storm,  
And make the sun laugh  
While he doth warm,  
And the moon cry  
To think of her youth,  
The months gone by,  
And wintering truth.  
How long to morning?

Can any tell?  
How long since the warning  
On our ears fell?  
The bridegroom cometh  
Know we not well?  
Are we not ready,  
Our packet made,  
Our hearts steady,  
Last words said?  
Must we still eat  
The bread we have spumed?  
Must we rekindle  
The faggots we've burned?  
Must we go out  
By the poor man's gate?  
Die by degrees,  
Not by new fate?  
Is there no road  
This way, my friend?  
Is there no road  
Without any end?  
Have you not seen  
In ancient times  
Pilgrims go by here  
Toward other climes,  
With shining faces  
Youthful and strong  
Mounting this hill  
With speech and with song?  
Oh, my good sir,  
I know not the ways;  
Little my knowledge,  
Though many my days.  
When I have slumbered,  
I have heard sounds  
As travellers passing  
Over my grounds.  
\*T was a sweet music  
Wafted them by;  
I could not tell  
If far off or nigh.  
Unless I dreamed it,

This was of yore,  
 But I never told it  
 To mortal before;  
 Never remembered  
 But in my dreams  
 What to me waking  
 A miracle seems.  
 If you will give of your pulse or your grain,  
 We will rekindle those flames again.  
 Here will we tarry, still without doubt,  
 Till a miracle putteth that fire out.  
 At midnight's hour I raised my head.  
 The owls were seeking for their bread;  
 The foxes barked, impatient still  
 At their wan [?] fate they bear so ill.  
 I thought me of eternities delayed  
 And of commands but half obeyed.  
 The night wind rustled through the glade,  
 As if a force of men there staid;  
 The word was whispered through the ranks,  
 And every hero seized his lance.  
 The word was whispered through the ranks,  
 Advance!

To live to a good old age such as the ancients reached, serene and contented, dignifying the life of man, leading a simple, epic country life in these days of confusion and turmoil, — that is what Wordsworth has done.

Retaining the tastes and the innocence of his youth. There is more wonderful talent, but nothing so cheering and world-famous as this.

The life of man would seem to be going all to wrack and pieces, and no instance of permanence and the ancient natural health, notwithstanding Burns, and Coleridge, and Carlyle. It will not do for men to die young; the greatest genius does not die young. Whom the gods love most do indeed die young, but not till their life is matured, and their years are like those of the oak, for they are the products half of nature and half of God. What should nature do without old men, not children but men?

The life of men, not to become a mockery and a jest, should last a respectable term of years. We cannot spare the age of those old Greek Philosophers. They live long who do not live for a near end, who still forever look to the immeasurable future for their manhood.

All dramas have but one scene. There is but one stage for the peasant and for the actor, and both on the farm and in the theatre the curtain rises to reveal the same majestic scenery. The globe of earth is poised in space for his stage under the foundations of the theatre, and the cope of heaven, out of reach of the scene-shifter,

overarches it. It is always to be remembered by the critic that all actions are to be regarded at last as performed from a distance upon some rood of earth and amid the operations of nature.

Rabelais, too, inhabited the soil of France in sunshine and shade in those years; and his life was no "farce" after all.

I seek the present time,  
No other clime,  
Life in to-day, —  
Not to sail another way, —  
To Paris or to Rome,  
Or farther still from home.  
That man, whoe'er he is,  
Lives but a moral death  
Whose life is not coeval  
With his breath.  
My feet forever stand  
On Concord fields,  
And I must live the life  
Which their soil yields.  
What are deeds done  
Away from home?  
What the best essay  
On the Ruins of Rome?  
The love of the new,  
The unfathomed blue,  
The wind in the wood,  
All future good,  
The sunlit tree,  
The small chickadee,  
The dusty highways,  
What Scripture says,  
This pleasant weather,  
And all else together,  
The river's meander,  
All things, in short,  
Forbid me to wander  
In deed or in thought.  
In cold or in drouth,  
Not seek the sunny South,  
But make my whole tour  
In the sunny present hour.  
For here if thou fail,

Where can'st thou prevail?  
If you love not  
Your own land most,  
You'll find nothing lovely  
On a distant coast.  
If you love not  
The latest sunset,  
What is there in pictures  
Or old gems set?  
If no man should travel  
Till he had the means,  
There'd be little travelling  
For kings or for queens.  
The means, what are they?  
They are the wherewithal  
Great expenses to pay,  
Life got, and some to spare,  
Great works on hand,  
And freedom from care,  
Plenty of time well spent  
To use,  
Clothes paid for and no rent  
In your shoes,  
Something to eat  
And something to burn,  
And above all no need to return.  
Then they who come back,  
Say, have they not failed,  
Wherever they've ridden,  
Or steamed it, or sailed?  
All your grass hay'd,  
All your debts paid,  
All your wills made;  
Then you might as well have stay'd,  
For are you not dead,  
Only not buried?  
The way unto "to-day,"  
The railroad to "here,"  
They never'll grade that way  
Nor shorten it, I fear.  
There are plenty of depots  
All the world o'er,

But not a single station  
At a man's door.  
If he would get near  
To the secret of things,  
He'll not have to hear  
When the engine bell rings.

Exaggeration! was ever any virtue attributed to a man without exaggeration? was ever any vice, without infinite exaggeration? Do we not exaggerate ourselves to ourselves, or do we often recognize ourselves for the actual men we are? The lightning is an exaggeration of light. We live by exaggeration. Exaggerated history is poetry, and is truth referred to a new standard. To a small man every greater one is an exaggeration. No truth was ever expressed but with this sort of emphasis, so that for the time there was no other truth. The value of what is really valuable can never be exaggerated. You must speak loud to those who are hard of hearing; so you acquire a habit of speaking loud to those who are not. In order to appreciate any, even the humblest, man, you must not only understand, but you must first love him; and there never was such an exaggerator as love. Who are we? Are we not all of us great men? And yet what [are] we actually? Nothing, certainly, to speak of. By an immense exaggeration we appreciate our Greek poetry and philosophy, Egyptian ruins, our Shakespeares and Miltons, our liberty and Christianity. We give importance to this hour over all other hours. We do not live by justice, but [by grace.]

Love never perjures itself, nor is it mistaken.

He is not the great writer, who is afraid to let the world know that he ever committed an impropriety. Does it not know that all men are mortal?

Carlyle told R. W. E. that he first discovered that he was not a jackass on reading "Tristram Shandy" and Rousseau's "Confessions," especially the last. His first essay is an article in Fraser's Magazine on two boys quarrelling.

Youth wants something to look up to, to look forward to; as the little boy who inquired of me the other day, "How long do those old-agers live?" and expressed the intention of compassing two hundred summers at least. The old man who cobbles shoes without glasses at a hundred, and cuts a handsome swath at a hundred and five, is indispensable to give dignity and respectability to our life.

From all points of the compass, from the earth beneath and the heavens above, have come these inspirations and been entered duly in the order of their arrival in the journal. Thereafter, when the time arrived, they were winnowed into lectures, and again, in due time, from lectures into essays. And at last they stand, like the cubes of Pythagoras, firmly on either basis; like statues on their pedestals, but the statues rarely take hold of hands. There is only such connection and series as is attainable in the galleries. And this affects their immediate practical and popular influence.

Carlyle, we should say, more conspicuously than any other, though with little enough expressed or even conscious sympathy, represents the Reformer class. In him the universal plaint is most settled and serious. Until the thousand named and nameless

grievances are righted, there will be no repose for him in the lap of Nature or the seclusion of science and literature. And all the more for not being the visible acknowledged leader of any class.

All places, all positions — all things in short — are a medium happy or unhappy. Every realm has its centre, and the nearer to that the better while you are in it. Even health is only the happiest of all mediums. There may be excess, or there may be deficiency; in either case there is disease. A man must only be virtuous enough.

I had one neighbor within half a mile for a short time when I first went to the woods, Hugh Quoil, an Irishman who had been a soldier at Waterloo, Colonel Quoil, as he was called, — I believe that he had killed a colonel and ridden off his horse, — who lived from hand — sometimes to mouth, — though it was commonly a glass of rum that the hand carried. He and his wife awaited their fate together in an old ruin in Walden woods. What life he got — or what means of death — he got by ditching.

I never was much acquainted with Hugh Quoil, though sometimes I met him in the path, and now do believe that a solid shank-bone, and skull which no longer aches, lie somewhere, and can still be produced, which once with garment of flesh and broadcloth were called and hired to do work as Hugh Quoil. He was a man of manners and gentlemanlike, as one who had seen the world, and was capable of more civil speech than you could well attend to. At a distance he had seemingly a ruddy face as of biting January, but nearer at hand it was bright carmine. It would have burnt your finger to touch his cheek. He wore a straightbodied snuff-colored coat which had long been familiar with him, and carried a turf-knife in his hand — instead of a sword. He had fought on the English side before, but he fought on the Napoleon side now. Napoleon went to St. Helena; Hugh Quoil came to Walden Pond. I heard that he used to tell travellers who inquired about myself that — and Thoreau owned the farm together, but Thoreau lived on the place and carried it on.

He was thirstier than I, and drank more, probably, but not out of the pond. That was never the lower for him. Perhaps I ate more than he. The last time I met him, the only time I spoke with him, was at the foot of the hill on the highway as I was crossing to the spring one summer afternoon, the pond water being too warm for me. I was crossing the road with a pail in my hand, when Quoil came down the hill, wearing his snuff-colored coat, as if it were winter, and shaking with delirium tremens. I hailed him and told him that my errand was to get water at a spring close by, only at the foot of the hill over the fence. He answered, with stuttering and parched lips, bloodshot eye, and staggering gesture, he'd like to see it. "Follow me there, then." But I had got my pail full and back before he scaled the fence. And he, drawing his coat about him, to warm him, or to cool him, answered in delirium-tremens, hydrophobia dialect, which is not easy to be written here, he'd heard of it, but had never seen it; and so shivered his way along to town, — to liquor and to oblivion.

On Sundays, brother Irishmen and others, who had gone far astray from steady habits and the village, crossed my bean-field with empty jugs toward Quoil's.

But what for? Did they sell rum there? I asked. "Respectable people they,"

“Know no harm of them,”

“Never heard that they drank too much,” was the answer of all wayfarers. They went by sober, stealthy, silent, skulking (no harm to get elm bark Sundays); returned loquacious, sociable, having long intended to call on you.

At length one afternoon Hugh Quoil, feeling better, perchance, with snuff-colored coat, as usual, paced solitary and soldier-like, thinking [of] Waterloo, along the woodland road to the foot of the hill by the spring; and there the Fates met him, and threw him down in his snuff-colored coat on the gravel, and got ready to cut his thread; but not till travellers passed, who would raise him up, get him perpendicular, then settle, settle quick; but legs, what are they? “Lay me down,” says Hugh hoarsely. “House locked up — key — in pocket — wife in town.” And the Fates cut, and there he lay by the wayside, five feet ten, and looking taller than in life.

He has gone away; his house here “all tore to pieces.” What kind of fighting or ditching work he finds to do now, how it fares with him, whether his thirst is quenched, whether there is still some semblance of that carmine cheek, struggles still with some liquid demon — perchance on more equal terms — till he swallow him completely, I cannot by any means learn. What his salutation is now, what his January-morning face, what he thinks of Waterloo, what start he has gained or lost, what work still for the ditcher and forester and soldier now, there is no evidence. He was here, the likes of him, for a season, standing light in his shoes like a faded gentleman, with gesture almost learned in drawing-rooms; wore clothes, hat, shoes, cut ditches, felled wood, did farm work for various people, kindled fires, worked enough, ate enough, drank too much. He was one of those unnamed, countless sects of philosophers who founded no school.

Now that he was gone, and his wife was gone too, — for she could not support the solitude, — before it was too late and the house was torn down, I went over to make a call. Now that Irishmen with jugs avoided the old house, I visited it, — an “unlucky castle now,” said they. There lay his old clothes curled up by habit, as if it were himself, upon his raised plank bed. His pipe lay broken on the hearth; and scattered about were soiled cards — king of diamonds, hearts, spades — on the floor. One black chicken, which they could not catch, still went to roost in the next apartment, stepping silent over the floor, frightened by the sound of its own wings, black as night and as silent, too, not even croaking; awaiting Reynard, its god actually dead. There was the dim outline of a garden which had been planted, but had never received its first hoeing, now overrun with weeds, with burs and cockles, which stick to your clothes; as if in the spring he had contemplated a harvest of com and beans before that strange trembling of the limbs overtook him. Skin of woodchuck fresh-stretched, never to be cured, met once in bean-field by the Waterloo man with uplifted hoe; no cap, no mittens wanted. Pipe on hearth no more to be lighted, best buried with him.

No thirst for glory, only for strong drink.

Only the convalescent are conscious of the health of nature.

In case of an embargo there will be found to be old clothes enough in everybody's garret to last till the millennium. We are fond of news, novelties, new things. The bank-bill that is tom in two will pass if you save the pieces, if you have only got the essential piece with the signatures. Lowell and Manchester and Fall River think you will let go their broadcloth currency when it is tom; but hold on, have an eye to the signature about the back of it, and endorse the man's name from whom you received it, and they will be the first to fail and find nothing at all in their garrets. Every day our garments become more assimilated to the man that wears them, more near and dear to us, and not finally to be laid aside but with such delay and medical appliance and solemnity as our other mortal coil. We know, after all, but few men, a great many coats and breeches. Dress a scarecrow with your last shift, you standing shiftless by, who would not soonest address the scarecrow and salute it?

King James loved his old shoes best. Who does not? Indeed these new clothes are often won and worn only after a most painful birth. At first movable prisons, oyster-shells which the tide only raises, opens, and shuts, washing in what scanty nutriment may be afloat. How many men walk over the limits, carrying their limits with them? In the stocks they stand, not without gaze of multitudes, only without rotten eggs, in torturing boots, the last wedge but one driven. Why should we be startled at death? Life is constant putting off of the mortal coil, — coat, cuticle, flesh and bones, all old clothes.

Not till the prisoner has got some rents in his prison walls, possibility of egress without lock and key some day, — result of steel watch-spring rubbing on iron grate, or whatever friction and wear and tear, — will he rest contented in his prison.

Clothes brought in sewing, a kind of work you may call endless.

A man who has at length found out something important to do will not have to get a new suit to do it in. For him the old will do, lying dusty in the garret for an indefinite period. Old shoes will serve a hero longer than they have served his valet. Bare feet are the oldest of shoes, and he can make them do. Only they who go to legislature and soirées, — they must have new coats, coats to turn as often as the man turns in them. Who ever saw his old shoes, his old coat, actually worn out, returned to their original elements, so that it was not [a] deed [of] charity to bestow them on some poorer boy, and by him to be bestowed on some poorer still, or shall we say on some richer who can do with less?

Over eastward of my bean-field lived Cato Ingraham, slave, born slave, perhaps, of Duncan Ingraham, Esquire, gentleman, of Concord village, who built him a house and gave him permission to live in Walden Woods, for which no doubt he was thanked; and then, on the northeast comer, Zilpha, colored woman of fame; and down the road, on the right hand, Brister, colored man, on Brister's Hill, where grow still those little wild apples he tended, now large trees, but still wild and ciderish to my taste; and farther still you come to Breed's location, and again on the left, by well and roadside, Nutting lived. Farther up the road, at the pond's end, Wyman, the potter, who furnished his townsmen with earthenware, — the squatter.

Now only a dent in the earth marks the site of most of these human dwellings; sometimes the well-dent where a spring oozed, now dry and tearless grass, or covered deep, — not to be discovered till late days by accident, — with a flat stone under the sod. These dents, like deserted fox-burrows, old holes, where once was the stir and bustle of human life overhead, and man's destiny, "fate, free-will, foreknowledge absolute," were all by turns discussed.

Still grows the vivacious lilac for a generation after the last vestige else is gone, unfolding still its early sweet-scented blossoms in the spring, to be plucked only by the musing traveller; planted, tended, weeded [?], watered by children's hands in front-yard plot, — now by wall-side in retired pasture, or giving place to a new rising forest. The last of that stirp, sole survivor of that family. Little did the dark children think that that weak slip with its two eyes which they watered would root itself so, and outlive them, and house in the rear that shaded it, and grown man's garden and field, and tell their story to the retired wanderer a half-century after they were no more, — blossoming as fair, smelling as sweet, as in that first spring. Its still cheerful, tender, civil lilac colors.

The woodland road, though once more dark and shut in by the forest, resounded with the laugh and gossip of inhabitants, and was notched and dotted here and there with their little dwellings. Though now but a humble rapid passage to neighboring villages or for the woodman's team, it once delayed the traveller longer, and was a lesser village in itself.

You still hear from time to time the whinnering of the raccoon, still living as of old in hollow trees, washing its food before it eats it. The red fox barks at night. The loon comes in the fall to sail and bathe in the pond, making the woods ring with its wild laughter in the early morning, at rumor of whose arrival all Concord sportsmen are on the alert, in gigs, on foot, two by two, three [by three], with patent rifles, patches, conical balls, spyglass or open hole over the barrel. They seem already to hear the loon laugh; come rustling through the woods like October leaves, these on this side, those on that, for the poor loon cannot be omnipresent; if he dive here, must come up somewhere. The October wind rises, rustling the leaves, ruffling the pond water, so that no loon can be seen rippling the surface. Our sportsmen scour, sweep the pond with spy-glass in vain, making the woods ring with rude [?] charges of powder, for the loon went off in that morning rain with one loud, long, hearty laugh, and our sportsmen must beat a retreat to town and stable and daily routine, shop work, unfinished jobs again.

Or in the gray dawn the sleeper hears the long ducking gun explode over toward Goose Pond, and, hastening to the door, sees the remnant of a flock, black duck or teal, go whistling by with outstretched neck, with broken ranks, but in ranger order. And the silent hunter emerges into the carriage road with ruffled feathers at his belt, from the dark pond-side where he has lain in his bower since the stars went out.

And for a week you hear the circling clamor, clangor, of some solitary goose through the fog, seeking its mate, peopling the woods with a larger life than they can hold.

For hours in fall days you shall watch the ducks cunningly tack and veer and hold the middle of the pond, far from the sportsman on the shore, — tricks they have learned and practiced in far Canada lakes or in Louisiana bayous.

The waves rise and dash, taking sides with all waterfowl.

Then in dark winter mornings, in short winter afternoons, the pack of hounds, threading all woods with hounding cry and yelp, unable to resist the instinct of the chase, and note of hunting-horn at intervals, showing that man too is in the rear. And the woods ring again, and yet no fox bursts forth on to the open level of the pond, and no following pack after their Actæon.

But this small village, germ of something more, why did it fail while Concord grows apace? No natural advantages, no water privilege, only the deep Walden Pond and cool Brister's Spring, — privileges to drink long, healthy, pure draughts, alas, all unimproved by those men but to dilute their glass. Might not the basket-making, stable-broom, mat-making, corn-parching, potters' business have thrived here, making the wilderness to blossom as the rose? Now, all too late for commerce, this waste, depopulated district has its railroad too. And transmitted the names of unborn Bristers, Catos, Hildas, Zilphas to a remote and grateful posterity.

Again Nature will try, with me for a first settler, and my house raised last spring to be the oldest in the settlement.

The sterile soil would have been proof against any lowland degeneracy.

Farmers far and near call it the paradise of beans.

And here, too, on winter days, while yet is cold January, and snow and ice lie thick, comes the prudent, foreseeing landlord or housekeeper (anticipating thirst) from the village, to get ice to cool his summer drink, — a grateful beverage if he should live, if time should endure so long. How few so wise, so industrious, to lay up treasures which neither rust nor melt, "to cool their summer drink" one day!

And cut off the solid pond, the element and air of fishes, held fast with chain and stake like corded wood, all through favoring, willing, kind, permitting winter air to wintery cellar, to underlie the summer there. And cut and saw the cream of the pond, unroof the house of fishes.

And in early mornings come men with fishing-reels and slender lunch, men of real faith, and let down their fine lines and live minnows through the snowy field to hook the pickerel and perch.

With buried well-stones, and strawberries, raspberries, thimble-berries growing on the sunny sward there; some pitchy pine or gnarled oak in the chimney-nook, or the sweet-scented black birch where the doorstone was.

Breed's, — history must not yet tell the tragedies enacted there. Let time intervene to assuage and lend an azure atmospheric tint to them.

There is something pathetic in the sedentary life of men who have travelled. They must naturally die when they leave the road.

What seems so fair and poetic in antiquity — almost fabulous — is realized, too, in Concord life. As poets and historians brought their work to the Grecian games, and

genius wrestled there as well as strength of body, so have we seen works of kindred genius read at our Concord games, by their author, in their own Concord amphitheatre. It is virtually repeated by all ages and nations.

Moles nesting in your cellar and nibbling every third potato. A whole rabbit-warren only separated from you by the flooring. To be saluted when you stir in the dawn by the hasty departure of Monsieur, — thump, thump, thump, striking his head against the floor-timbers. Squirrels and field mice that hold to a community of property in your stock of chestnuts.

The blue jays suffered few chestnuts to reach the ground, resorting to your single tree in flocks in the early morning, and picking them out of the burs at a great advantage.

The crop of blackberries small; berries not yet grown. Ground-nuts not dug.

One wonders how so much, after all, was expressed in the old way, so much here depends upon the emphasis, tone, pronunciation, style, and spirit of the reading. No writer uses so profusely all the aids to intelligibility which the printer's art affords. You wonder how others had contrived to write so many pages without emphatic, italicized words, they are so expressive, so natural and indispensable, here. As if none had ever used the demonstrative pronoun demonstratively. In another's sentences the thought, though immortal, is, as it were, embalmed and does not strike you, but here it is so freshly living, not purified by the ordeal of death, that it stirs in the very extremities, the smallest particles and pronouns are all alive with it. — You must not say it, but it. It is not simple it, your it or mine, but it. His books are solid, workmanlike, like all that England does. They tell of endless labor done, well done, and all the rubbish swept away, like this bright cutlery which glitters in the windows, while the coke and ashes, turnings, filings, borings, dust lie far away at Birmingham, unheard of. The words did not come at the command of grammar but of a tyrannous, inexorable meaning; not like the standing soldiers, by vote of Parliament, but any able-bodied countryman pressed into the service. It is no China war, but a revolution. This style is worth attending to as one of the most important features of the man that we at this distance know.

What are the men of New England about? I have travelled some in New England, especially in Concord, and I found that no enterprise was on foot which it would not disgrace a man to take part in. They seemed to be employed everywhere in shops and offices and fields. They seemed, like the Brahmins of the East, to be doing penance in a thousand curious, unheard-of ways, their endurance surpassing anything I had ever seen or heard of, — Simeon Stylites, Brahmins looking in the face of the sun, standing on one leg, dwelling at the roots of trees, nothing to it; any of the twelve labors of Hercules to be matched, — the Nemean lion, Lernæan hydra, Cæcean stag, Erymanthian boar, Augean stables, Stymphalian birds, Cretan bull, Diomedes' mares, Amazonian girdle, monster Geryon, Hesperian apples, three-headed Cerberus, nothing at all in comparison, being only twelve and having an end. For I could never see that these men ever slew or captured any of their monsters, or finished any of their labors. They have no "friend Iolaus to burn, with a hot iron, the root" of the hydra's head; for as soon as one head is crushed, two spring up.

Men labor under a mistake; they are laying up treasures which moth and rust will corrupt and thieves break through and steal. Northern Slavery, or the slavery which includes the Southern, Eastern, Western, and all others.

It is hard to have a Southern overseer; it is worse to have a Northern one; but worst of all when you are yourself the slave-driver. Look at the lonely teamster on the highway, wending to market by day or night; is he a son of the morning, with somewhat of divinity in him, fearless because immortal, going to receive his birthright, greeting the sun as his fellow, bounding with youthful, gigantic strength over his mother earth? See how he cowers and sneaks, how vaguely, indefinitely all the day he fears, not being immortal, not divine, the slave and prisoner of his own opinion of himself, fame which he has earned by his own deeds. Public opinion is a weak tyrant compared with private opinion. What I think of myself, that determines my fate.

I see young men, my equals, who have inherited from their spiritual father a soul, — broad, fertile, uncultivated, — from their earthly father a farm, — with cattle and barns and farming tools, the implements of the picklock and the counterfeiter. Better if they had been born in the open pasture and suckled by a wolf, or perhaps cradled in a manger, that they might have seen with clear eye what was the field they were called to labor in. The young man has got to live a man's life, then, in this world, pushing all these things before him, and get on as well as he can. How many a poor immortal soul I have met, well-nigh crushed and smothered, creeping slowly down the road of life, pushing before it a bam seventy-five by forty feet and one hundred acres of land, — tillage, pasture, wood-lot! This dull, opaque garment of the flesh is load enough for the strongest spirit, but with such an earthly garment superadded the spiritual life is soon plowed into the soil for compost. It's a fool's life, as they will all find when they get to the end of it. The man that goes on accumulating property when the bare necessities of life are cared for is a fool and knows better.

There is a stronger desire to be respectable to one's neighbors than to one's self.

However, such distinctions as poet, philosopher, literary man, etc., do not much assist our final estimate. We do not lay much stress on them; "a man's a man for a' that." Any writer who interests us much is all and more than these.

It is not simple dictionary it.

Talent at making books solid, workmanlike, graceful, which may be read.

Some idyllic chapter or chapters are needed.

In the French Revolution are Mirabeau, king of men; Danton, Titan of the Revolution; Camille Desmoulins, poetic editor; Roland, heroic woman; Dumouriez, first efficient general: on the other side, Marat, friend of the people; Robespierre; Tinville, infernal judge; St. Just; etc., etc.

Nutting and Le Gros by the wall-side. The Stratten house and barn where the orchard covered all the slope of Brister's Hill, — now killed out by the pines.

Brister Freeman, a handy negro, slave once of Squire Cummings (?), and Fenda, his hospitable, pleasant wife, large, round, black, who told fortunes, blacker than all the children of night, such a dusky orb as had never risen on Concord before.

Zilpha's little house where "she was spinning linen," making the Walden woods ring with her shrill singing, — a loud, shrill, remarkable voice, — when once she was away to town, set on fire by English soldiers on parole, in the last war, and cat and dog and hens all burned up. Boiling her witch's dinner, and heard muttering to herself over the gurgling pot by silent traveller, "Ye are all bones, bones."

And Cato, the Guinea negro, — his house and little patch among the walnuts, — who let the trees grow up till he should be old, and Richardson got them.

Where Breed's house stood tradition says a tavern once stood, the well the same, and all a swamp between the woods and town, and road made on logs.

Bread I made pretty well for awhile, while I remembered the rules; for I studied this out methodically, going clear back to the primitive days and first invention of the unleavened kind, and coming gradually down through that lucky accidental souring of the dough which taught men the leavening process, and all the various fermentations thereafter, till you get to "good, sweet, wholesome bread," the staff of life. I went on very well, mixing rye and flour and Indian and potato with success, till one morning I had forgotten the rules, and thereafter scalded the yeast, — killed it out, — and so, after the lapse of a month, was glad after all to learn that such palatable staff of life could be made out of the dead and scalt creature and risings that lay flat.

I have hardly met with the housewife who has gone so far with this mystery. For all the farmers' wives pause at yeast. Given this and they can make bread.

It is the axiom of the argument. What it is, where it came from, in what era bestowed on man, is wrapped in mystery. It is preserved religiously, like the vestal fire, and its virtue is not yet run out. Some precious bottleful, first brought over in the Mayflower, did the business for America, and its influence is still rising, swelling, spreading like Atlantic billows over the land, — the soul of bread, the spiritus, occupying its cellular tissue.

The way to compare men is to compare their respective ideals. The actual man is too complex to deal with.

Carlyle is an earnest, honest, heroic worker as literary man and sympathizing brother of his race.

Idealize a man, and your notion takes distinctness at once.

Carlyle's talent is perhaps quite equal to his genius.

Striving [?] to live in reality, — not a general critic, philosopher, or poet.

Wordsworth, with very feeble talent, has not so great and admirable as unquestionable and persevering genius.

Heroism, heroism is his word, — his thing.

He would realize a brave and adequate human life, and die hopefully at last.

Emerson again is a critic, poet, philosopher, with talent not so conspicuous, not so adequate to his task; but his field is still higher, his task more arduous. Lives a far more intense life; seeks to realize a divine life; his affections and intellect equally developed. Has advanced farther, and a new heaven opens to him. Love and Friendship, Religion, Poetry, the Holy are familiar to him. The life of an Artist; more variegated,

more observing, finer perception; not so robust, elastic; practical enough in his own field; faithful, a judge of men. There is no such general critic of men and things, no such trustworthy and faithful man. More of the divine realized in him than in any. A poetic critic, reserving the unqualified nouns for the gods.

Alcott is a geometer, a visionary, the Laplace of ethics, more intellect, less of the affections, sight beyond talents, a substratum of practical skill and knowledge unquestionable, but overlaid and concealed by a faith in the unseen and impracticable. Seeks to realize an entire life; a catholic observer; habitually takes in the farthest star and nebula into his scheme. Will be the last man to be disappointed as the ages revolve. His attitude is one of greater faith and expectation than that of any man I know; with little to show; with undue share, for a philosopher, of the weaknesses of humanity. The most hospitable intellect, embracing high and low. For children how much that means, for the insane and vagabond, for the poet and scholar!

Emerson has special talents unequalled. The divine in man has had no more easy, methodically distinct expression. His personal influence upon young persons greater than any man's. In his world every man would be a poet, Love would reign, Beauty would take place, Man and Nature would harmonize.

When Alcott's day comes, laws unsuspected by most will take effect, the system will crystallize according to them, all seals and falsehood will slough off, everything will be in its place.

Feb. 22 [no year]. Jean Lapin sat at my door to-day, three paces from me, at first trembling with fear, yet unwilling to move; a poor, wee thing, lean and bony, with ragged ears and sharp nose, scant tail and slender paws. It looked as if nature no longer contained the breed of nobler bloods, the earth stood on its last legs. Is nature, too, unsound at last? I took two steps, and lo, away he scud with elastic spring over the snowy crust into the bushes, a free creature of the forest, still wild and fleet; and such then was his nature, and his motion asserted its vigor and dignity. Its large eye looked at first young and diseased, almost dropsical, unhealthy. But it bounded free, the venison, straightening its body and its limbs into graceful length, and soon put the forest between me and itself.

Emerson does not consider things in respect to their essential utility, but an important partial and relative one, as works of art perhaps. His probes pass one side of their centre of gravity. His exaggeration is of a part, not of the whole.

How many an afternoon has been stolen from more profitable, if not more attractive, industry, — afternoons when a good run of custom might have been expected on the main street, such as tempt the ladies out a-shopping, — spent, I say, by me away in the meadows, in the well-nigh hopeless attempt to set the river on fire or be set on fire by it, with such tinder as I had, with such flint as I was. Trying at least to make it flow with milk and honey, as I had heard of, or liquid gold, and drown myself without getting wet, — a laudable enterprise, though I have not much to show for it.

So many autumn days spent outside the town, trying to hear what was in the wind, to hear it and carry it express. I well-nigh sunk all my capital in it, and lost my own

breath into the bargain, by running in the face of it. Depend upon it, if it had concerned either of the parties, it would have appeared in the yeoman's gazette, the Freeman, with other earliest intelligence.

For many years I was self-appointed inspector of snow-storms and rain-storms, and did my duty faithfully, though I never received one cent for it.

Surveyor, if not of higher ways, then of forest paths and all across-lot routes, keeping many open ravines bridged and passable at all seasons, where the public heel had testified to the importance of the same, all not only without charge, but even at considerable risk and inconvenience. Many a mower would have forborne to complain had he been aware of the invisible public good that was in jeopardy.

So I went on, I may say without boasting, I trust, faithfully minding my business without a partner, till it became more and more evident that my townsmen would not, after all, admit me into the list of town officers, nor make the place a sinecure with moderate allowance.

I have looked after the wild stock of the town, which pastures in common, and every one knows that these cattle give you a good deal of trouble in the way of leaping fences. I have counted and registered all the eggs I could find at least, and have had an eye to all nooks and corners of the farm, though I didn't always know whether Jonas or Solomon worked in a particular field to-day; that was none of my business. I only knew him for one of the men, and trusted that he was as well employed as I was. I had to make my daily entries in the general farm book, and my duties may sometimes have made me a little stubborn and unyielding.

Many a day spent on the hilltops waiting for the sky to fall, that I might catch something, though I never caught much, only a little, manna-wise, that would dissolve again in the sun.

My accounts, indeed, which I can swear to have been faithfully kept, I have never got audited, still less accepted, still less paid and settled. However, I haven't set my heart upon that.

I have watered the red huckleberry and the sand cherry and the hoopwood [?] tree, and the cornel and spoonhunt and yellow violet, which might have withered else in dry seasons. The white grape.

To find the bottom of Walden Pond, and what inlet and outlet it might have.

I found at length that, as they were not likely to offer me any office in the court-house, any curacy or living anywhere else, I must shift for myself, I must furnish myself with the necessaries of life.

Now watching from the observatory of the Cliffs or Annursnack to telegraph any new arrival, to see if Wachusett, Watatic, or Monadnock had got any nearer. Climbing trees for the same purpose. I have been reporter for many years to one of the journals of no very wide circulation, and, as is too common, got only my pains for my labor. Literary contracts are little binding.

The unlimited anxiety, strain, and care of some persons is one very incurable form of disease. Simple arithmetic might have corrected it; for the life of every man has, after

all, an epic integrity, and Nature adapts herself to our weaknesses and deficiencies as well as talents.

No doubt it is indispensable that we should do our work between sun and sun, but only a wise man will know what that is. And yet how much work will be left undone, put off to the next day, and yet the system goes on!

We presume commonly to take care of ourselves, and trust as little as possible. Vigilant more or less all our days, we say our prayers at night and commit ourselves to uncertainties, as if in our very days and most vigilant moments the great part were not a necessary trust still. How serenity, anxiety, confidence, fear paint the heavens for us.

All the laws of nature will bend and adapt themselves to the least motion of man.

All change is a miracle to contemplate, but it is a miracle which is taking place unobserved every instant; when all is ready it takes place, and only a miracle could stay it.

We [are] compelled to live so thoroughly and sincerely, reflecting on our steps, reverencing our life, that we never make allowance for the possible changes.

We may waive just so much care of ourselves as we devote of care elsewhere.

## 1837-1847

THIS section consists of paragraphs (chiefly undated) taken from a large commonplace-book containing transcripts from earlier journals. Thoreau drew largely from this book in writing the "Week," and to a less extent in writing "Walden." Passages used in these volumes (as far as noted), and those duplicating earlier journal entries already printed in the preceding pages, have been omitted. All the matter in the book appears to have been written before 1847.

I was born upon thy bank, river, My blood flows in thy stream, And thou meanderest forever At the bottom of my dream.

This great but silent traveller which had been so long moving past my door at three miles an hour, — might I not trust myself under its escort?

In friendship we worship moral beauty without the formality of religion.

Consider how much the sun and the summer, the buds of spring and the sered leaves of autumn, are related to the cabins of the settlers which we discover on the shore, — how all the rays which paint the landscape radiate from them. The flight of the crow and the gyrations of the hawk have reference to their roofs.

Friends do not interchange their common wealth, but each puts his finger into the private coffer of the other. They will be most familiar, they will be most unfamiliar, for they will be so one and single that common themes will not have to be bandied between them, but in silence they will digest them as one mind; but they will at the same time be so two and double that each will be to the other as admirable and as inaccessible as a star. He will view him as it were through "optic glass,"— "at evening

from the top of Fesolé.” And after the longest earthly period, he will still be in apogee to him.

It [the boat] had been loaded at the door the evening before, half a mile from the river, and provided with wheels against emergencies, but, with the bulky cargo which we stevedores had stowed in it, it proved but an indifferent land carriage. For water and water-casks there was a plentiful supply of muskmelons from our patch, which had just begun to be ripe, and chests and spare spars and sails and tent and guns and munitions for the galleon. And as we pushed it through the meadows to the river’s bank, we stepped as lightly about it as if a portion of our own bulk and burden was stored in its hold. We were amazed to find ourselves outside still, with scarcely independent force enough to push or pull effectually.

The robin is seen flying directly and high in the air at this season, especially over rivers, where in the morning they are constantly passing and repassing in company with the blackbird.

I have never insisted enough on the nakedness and simplicity of friendship, the result of all emotions, their subsidence, a fruit of the temperate zone. The friend is an unrelated man, solitary and of distinct outline.

Must not our whole lives go unexplained, without regard to us, notwithstanding a few flourishes of ours, which themselves need explanation?

Yet a friend does not afford us cheap contrasts or encounters. He forbears to ask explanations, but doubts and surmises with full faith, as we silently ponder our fates. He is vested with full powers, plenipotentiary, all in all.

“Plato gives science sublime counsels, directs her toward the regions of the ideal; Aristotle gives her positive and severe laws, and directs her toward a practical end.” — DEGERANDO.

All day the dark blue outline of Crotched mountain in Goffstown skirted the horizon. We took pleasure in beholding its outline, because at this distance our vision could so easily grasp the design of the founder. It was a pretty victory to conquer the distance and dimensions so easily with our eyes, which it would take our feet so long to traverse.

Notwithstanding the unexplained mystery of nature, man still pursues his studies with confidence, ever ready to grasp the secret, as if the truth were only contained, not withheld; as one of the three circles on the cocoanut is always so soft that it may be pierced with a thorn, and the traveller is grateful for the thick shell which held the liquor so faithfully.

Gracefulness is undulatory like these waves, and perhaps the sailor acquires a superior suppleness and grace through the planks of his ship from the element on which he lives.

The song sparrow, whose voice is one of the first heard in the spring, sings occasionally throughout the season, from a greater depth in the summer, as it were behind the notes of other birds.

As the temperature and density of the atmosphere, so the aspects of our life vary.

In this bright and chaste light the world seemed like a pavilion made for holidays and washed in light. The ocean was a summer's lake, and the land a smooth lawn for disport, while in the horizon the sunshine seemed to fall on walled towns and villas, and the course of our lives was seen winding on like a country road over the plain.

When we looked out from under our tent, the trees were seen dimly through the mist, and a cool dew hung upon the grass, and in the damp air we seemed to inhale a solid fragrance.

Communicating with the villas and hills and forests on either hand, by the glances we sent them, or the echoes we awakened. We glanced up many a pleasant ravine with its farmhouse in the distance, where some contributory stream came in; again the site of a sawmill and a few forsaken eel-pots were all that greeted us.

While we sail here we can remember unreservedly those friends who dwell far away on the banks and by the sources of this very river, and people this world for us, without any harsh and unfriendly interruptions.

At noon his horn is heard echoing from shore to shore to give notice of his approach to the farmer's wife with whom he is to take his dinner, frequently in such retired scenes that only muskrats and kingfishers seem to hear.

If ever our idea of a friend is realized it will be in some broad and generous natural person, as frank as the daylight, in whose presence our behavior will be as simple and unconstrained as the wanderer amid the recesses of these hills.

I who sail now in a boat, have I not sailed in a thought? Vide Chaucer.

The hardest material obeys the same law with the most fluid. Trees are but rivers of sap and woody fibre flowing from the atmosphere and emptying into the earth by their trunks, as their roots flow upward to the surface. And in the heavens there are rivers of stars and milky ways. There are rivers of rock on the surface and rivers of ore in the bowels of the earth. And thoughts flow and circulate, and seasons lapse as tributaries of the current year.

Consider the phenomena of morn, or eve, and you will say that Nature has perfected herself by an eternity of practice, — evening stealing over the fields, the stars coming to bathe in retired waters, the shadows of the trees creeping farther and farther into the meadows, and a myriad phenomena beside.

Occasionally we had to muster all our energy to get round a point where the river broke rippling over rocks and the maples trailed their branches in the stream.

The future reader of history will associate this generation with the red man in his thoughts, and give it credit for some sympathy with that race. Our history will have some copper tints and reflections, at least, and be read as through an Indian-summer haze; but such were not our associations. But the Indian is absolutely forgotten but by some persevering poets.

The white man has commenced a new era. What do our anniversaries commemorate but white men's exploits? For Indian deeds there must be an Indian memory; the white man will remember his own only. We have forgotten their hostility as well as friendship. Who can realize that, within the memory of this generation, the remnant of an ancient

and dusky race of mortals called the Stockbridge Indians, within the limits of this very State, furnished a company for the war, on condition only that they should not be expected to fight white man's fashion, or to train, but Indian fashion. And occasionally their wigwams are seen on the banks of this very stream still, solitary and inobvious, like the cabins of the muskrats in the meadows.

They seem like a race who have exhausted the secrets of nature, tanned with age, while this young and still fair Saxon slip, on whom the sun has not long shone, is but commencing its career.

Their memory is in harmony with the russet hue of the fall of the year.

For the Indian there is no safety but in the plow. If he would not be pushed into the Pacific, he must seize hold of a plow-tail and let go his bow and arrow, his fish-spear and rifle. This the only Christianity that will save him.

His fate says sternly to him, "Forsake the hunter's life and enter into the agricultural, the second, state of man. Root yourselves a little deeper in the soil, if you would continue to be the occupants of the country."

But I confess I have no little sympathy with the Indians and hunter men. They seem to me a distinct and equally respectable people, born to wander and to hunt, and not to be inoculated with the twilight civilization of the white man.

Father Le Jeune, a French missionary, affirmed "that the Indians were superior in intellect to the French peasantry of that time," and advised "that laborers should be sent from France in order to work for the Indians."

The Indian population within the present boundaries of New Hampshire, Massachusetts, Rhode Island, and Connecticut has been estimated not to have exceeded 40,000 "before the epidemic disease which preceded the landing of the Pilgrims," and it was far more dense here than elsewhere; yet they had no more land than they wanted. The present white population is more than 1,500,000 and two thirds of the land is unimproved.

The Indian, perchance, has not made up his mind to some things which the white man has consented to; he has not, in all respects, stooped so low; and hence, though he too loves food and warmth, he draws his tattered blanket about him and follows his fathers, rather than barter his birthright. He dies, and no doubt his Genius judges well for him. But he is not worsted in the fight; he is not destroyed. He only migrates beyond the Pacific to more spacious and happier hunting-grounds.

A race of hunters can never withstand the inroads of a race of husbandmen. The latter burrow in the night into their country and undermine them; and [even] if the hunter is brave enough to resist, his game is timid and has already fled. The rifle alone would never exterminate it, but the plow is a more fatal weapon; it wins the country inch by inch and holds all it gets.

What detained the Cherokees so long was the 2923 plows which that people possessed; and if they had grasped their handles more firmly, they would never have been driven beyond the Mississippi. No sense of justice will ever restrain the farmer from plowing up the land which is only hunted over by his neighbors. No hunting-field was

ever well fenced and surveyed and its bounds accurately marked, unless it were an English park. It is a property not held by the hunter so much as by the game which roams it, and was never well secured by warranty deeds. The farmer in his treaties says only, or means only, "So far will I plow this summer," for he has not seed corn enough to plant more; but every summer the seed is grown which plants a new strip of the forest.

The African will survive, for he is docile, and is patiently learning his trade and dancing at his labor; but the Indian does not often dance, unless it be the war dance.

In whatever moment we awake to life, as now I this evening, after walking along the bank and hearing the same evening sounds that were heard of yore, it seems to have slumbered just below the surface, as in the spring the new verdure which covers the fields has never retreated far from the winter.

All actions and objects and events lose their distinct importance in this hour, in the brightness of the vision, as, when sometimes the pure light that attends the setting sun falls on the trees and houses, the light itself is the phenomenon, and no single object is so distinct to our admiration as the light itself.

If criticism is liable to abuse, it has yet a great and humane apology. When my sentiments aspire to be universal, then my neighbor has an equal interest to see that the expression be just, with myself.

My friends, why should we live?

Life is an idle war, a toilsome peace;

To-day I would not give

One small consent for its securest ease.

Shall we outwear the year

In our pavilions on its dusty plain,

And yet no signal hear

To strike our tents and take the road again?

Or else drag up the slope

The heavy ordnance of religion's train?

Useless, but in the hope

Some far remote and heavenward hill to gain.

The tortoises rapidly dropped into the water, as our boat ruffled the surface amid the willows. We glided along through the transparent water, breaking the reflections of the trees.

Not only are we late to find our friends, but mankind are late, and there is no record of a great success in history.

My friend is not chiefly wise or beautiful or noble. At least it is not for me to know it. He has no visible form nor appreciable character. I can never praise him nor esteem him praiseworthy, for I should sunder him from myself and put a bar between us. Let him not think he can please me by any behavior or even treat me well enough. When he treats, I retreat.

I know of no rule which holds so true as that we are always paid for our suspicion by finding what we suspect. There can be no fairer recompense than this. Our suspicions exercise a demoniacal power over the subject of them. By some obscure law of influence, when we are perhaps unconsciously the subject of another's suspicion, we feel a strong impulse, even when it is contrary to our nature, to do that which he expects but reprobates.

No man seems to be aware that his influence is the result of his entire character, both that which is subject and that which is superior to his understanding, and what he really means or intends it is not in his power to explain or offer an apology for.

No man was ever party to a secure and settled friendship. It is no more a constant phenomenon than meteors and lightning. It is a war of positions, of silent tactics.

I mark the summer's swift decline;  
The springing sward its grave-clothes weaves.  
Oh, could I catch the sounds remote!  
Could I but tell to human ear  
The strains which on the breezes float  
And sing the requiem of the dying year!

Sept. 29, 1842. To-day the lark sings again down in the meadow, and the robin peeps, and the bluebirds, old and young, have revisited their box, as if they would fain repeat the summer without the intervention of winter, if Nature would let them.

Beauty is a finer utility whose end we do not see.

Oct. 7, 1842. A little girl has just brought me a purple finch or American linnnet. These birds are now moving south. It reminds me of the pine and spruce, and the juniper and cedar on whose berries it feeds. It has the crimson hues of the October evenings, and its plumage still shines as if it had caught and preserved some of their tints (beams?). We know it chiefly as a traveller. It reminds me of many things I had forgotten. Many a serene evening lies snugly packed under its wing.

Gower writes like a man of common sense and good parts who has undertaken with steady, rather than high, purpose to do narrative with rhyme. With little or no invention, following in the track of the old fablers, he employs his leisure and his pen-craft to entertain his readers and speak a good word for the right. He has no fire, or rather blaze, though occasionally some brand's end peeps out from the ashes, especially if you approach the heap in a dark day, and if you extend your hands over it you experience a slight warmth there more than elsewhere. In fair weather you may see a slight smoke go up here and there. He narrates what Chaucer sometimes sings. He tells his story with a fair understanding of the original, and sometimes it gains a little in blunt plainness and in point in his hands. Unlike the early Saxon and later English, his poetry is but a plainer and directer speech than other men's prose. He might have been a teamster and written his rhymes on his wagon-seat as he went to mill with a load of plaster.

The banks by retired roadsides are covered with asters, hazels, brakes, and huckleberry bushes, emitting a dry, ripe scent.

Facts must be learned directly and personally, but principles may be deduced from information. The collector of facts possesses a perfect physical organization, the philosopher a perfect intellectual one. One can walk, the other sit; one acts, the other thinks. But the poet in some degree does both, and uses and generalizes the results of both; he generalizes the widest deductions of philosophy.

Oct. 21, 1842. The atmosphere is so dry and transparent and, as it were, inflammable at this season that a candle in the grass shines white and dazzling, and purer and brighter the farther off it is. Its heat seems to have been extracted and only its harmless refulgent light left. It is a star dropped down. The ancients were more than poetically true when they called fire Vulcan's flower. Light is somewhat almost moral. The most intense — as the fixed stars and our own sun — has an unquestionable preeminence among the elements. At a certain stage in the generation of all life, no doubt, light as well as heat is developed. It guides to the first rudiments of life. There is a vitality in heat and light.

Men who are felt rather than understood are being most rapidly developed. They stand many deep.

In many parts the Merrimack is as wild and natural as ever, and the shore and surrounding scenery exhibit only the revolutions of nature. The pine stands up erect on its brink, and the alders and willows fringe its edge; only the beaver and the red man have departed.

My friend knows me face to face, but many only venture to meet me under the shield of another's authority, backed by an invisible corps du réserve of wise friends and relations. To such I say, "Farewell, we cannot dwell alone in the world." —

Sometimes, by a pleasing, sad wisdom, we find ourselves carried beyond all counsel and sympathy. Our friends' words do not reach us.

The truly noble and settled character of a man is not put forward, as the king or conqueror does not march foremost in a procession.

Among others I have picked up a curious spherical stone, probably an implement of war, like a small paving-stone about the size of a goose egg, with a groove worn quite round it, by which it was probably fastened to a thong or a withe and answered to strike a severe blow like a shotted colt. I have since seen larger ones of the same description.

These arrowheads are of every color and of various forms and materials, though commonly made of a stone which has a conchoidal fracture. Many small ones are found, of white quartz, which are mere equilateral triangles, with one side slightly convex. These were probably small shot for birds and squirrels. The chips which were made in their manufacture are also found in large numbers wherever a lodge stood for any length of time. And these slivers are the surest indication of Indian ground, since the geologists tell us that this stone is not to be found in this vicinity.

The spear-heads are of the same form and material only larger.

Some are found as perfect and sharp as ever, for time has not the effect of blunting them, but when they break they have a ragged and cutting edge. Yet they are so brittle that they can hardly be carried in the pocket without being broken.

It is a matter of wonder how the Indians made even those rude implements without iron or steel tools to work with. It is doubtful whether one of our mechanics, with all the aids of Yankee ingenuity, could soon learn to copy one of the thousands under our feet. It is well known the art of making flints with a cold chisel, as practiced in Austria, requires long practice and knack in the operator, but the arrowhead is of much more irregular form, and, like the flint, such is the nature of the stone, must be struck out by a succession of skillful blows.

An Indian to whom I once exhibited some, but to whom they were objects of as much curiosity as [to] myself, suggested that, as white men have but one blacksmith, so Indians had one arrowhead-maker for many families. But there are the marks of too many forges — unless they were like travelling cobblers — to allow of this.

I have seen some arrowheads from the South Seas which were precisely similar to those from here, so necessary, so little whimsical is this little tool.

So has the steel hatchet its prototype in the stone one of the Indian, as the stone hatchet in the necessities of man.

Venerable are these ancient arts, whose early history is lost in that of the race itself.

Here, too, is the pestle and mortar, — ancient forms and symbols older than the plow or the spade.

The invention of that plow which now turns them up to the surface marks the era of their burial. An era which can never have its history, which is older than history itself. These are relics of an era older than modern civilization, compared with which Greece and Rome and Egypt are modern. And still the savage retreats and the white man advances.

I have the following account of some relics in my possession which were brought from Taunton [?] in Bristol County. A field which had been planted with corn for many years. The sod being broken, the wind began to blow away the soil and then the sand, for several years, until at length it was blown away to the depth of several feet, where it ceased, and the ground appeared strewn with the remains of an Indian village, with regular circles of stones which formed the foundation of their wigwams, and numerous implements beside.

Commonly we use life sparingly, we husband it as if it were scarce, and admit the right of prudence; but occasionally we see how ample and inexhaustible is the stock from which we so scantily draw, and learn that we need not be prudent, that we may be prodigal, and all expenses will be met.

Am I not as far from those scenes, though I have wandered a different route, as my companion who has finished the voyage of life? Am I not most dead who have not life to die, and cast off my sere leaves?

It seemed the only right way to enter this country, borne on the bosom of the flood which receives the tribute of its innumerable vales. The river was the only key adequate

to unlock its maze. We beheld the hills and valleys, the lakes and streams, in their natural order and position.

A state should be a complete epitome of the earth, a natural principality, and by the gradations of its surface and soil conduct the traveller to its principal marts. Nature is stronger than law, and the sure but slow influence of wind and water will balk the efforts of restricting legislatures. Man cannot set up bounds with safety but where the revolutions of nature will confirm and strengthen, not obliterate, them.

Every man's success is in proportion to his average ability. The meadow flowers spring and bloom where the waters annually deposit their slime, not where they reach in some freshet only. We seem to do ourselves little credit in our own eyes for our performance, which all know must ever fall short of our aspiration and promise, which only we can know entirely; as a stick will avail to reach further than it will strike effectually, since its greatest momentum is a little short of its extreme end. But we do not disappoint our neighbors. A man is not his hope nor his despair, nor his past deed.

But it is in the order of destiny that whatever is remote shall be near. Whatever the eyes see, the hands shall touch. The sentinels upon the turret and at the window and on the wall behold successively the approaching traveller whom the host will soon welcome in the hall.

It is not to be forgotten that the poet is innocent; but he is young, he is not yet a parent or a brother to his race. There are a thousand degrees of grace and beauty before absolute humanity and disinterestedness.

The meanest man can easily test the noblest. Is he embraced? Does he find him a brother?

I am sometimes made aware of a kindness which may have long since been shown, which surely memory cannot retain, which reflects its light long after its heat. I realize, my friend, that there have been times, when thy thoughts of me have been of such lofty kindness that they passed over me like the winds of heaven unnoticed, so pure that they presented no object to my eyes, so generous and universal that I did not detect them. Thou hast loved me for what I was not, but for what I aspired to be. We shudder to think of the kindness of our friend which has fallen on us cold, though in some true but tardy hour we have awakened. There has just reached me the kindness of some acts, not to be forgotten, not to be remembered. I wipe off these scores at midnight, at rare intervals, in moments of insight and gratitude.

Far o'er the bow,  
Amid the drowsy noon,  
Souhegan, creeping slow,  
Appeareth soon.  
Methinks that by a strict behavior  
I could elicit back the brightest star  
That hides behind a cloud.  
I have rolled near some other spirit's path,  
And with a pleased anxiety have felt

Its purer influence on my opaque mass,  
But always was I doomed to learn, alas!  
I had scarce changed its sidereal time.

Gray sedulously cultivated poetry, but the plant would not thrive. His life seems to have needed some more sincere and ruder experience.

Occasionally we rowed near enough to a cottage to see the sunflowers before the door, and the seed-vessels of the poppy, like small goblets filled with the waters of Lethe, but without disturbing the sluggish household.

Driving the small sandpiper before us.

FOG

Thou drifting meadow of the air,  
Where bloom the daisied banks and violets,  
And in whose fenny labyrinths  
The bittern booms and curlew peeps,  
The heron wades and boding rain-crow clucks;  
Low-anchored cloud,  
Newfoundland air,  
Fountain-head and source of rivers,  
Ocean branch that flowest to the sun,  
Diluvian spirit, or Deucalion shroud,  
Dew-cloth, dream drapery,  
And napkin spread by fays,  
Spirit of lakes and seas and rivers,  
Sea-fowl that with the east wind  
Seek'st the shore, groping thy way inland,  
By whichever name I please to call thee,  
Bear only perfumes and the scent  
Of healing herbs to just men's fields.

I am amused with the manner in which Quarles and his contemporary poets speak of Nature, — with a sort of gallantry, as a knight of his lady, — not as lovers, but as having a thorough respect for her and some title to her acquaintance. They speak manfully, and their lips are not closed by affection.

“The pale-faced lady of the black-eyed night.”

Nature seems to have held her court then, and all authors were her gentlemen and esquires and had ready an abundance of courtly expressions.

Quarles is never weak or shallow, though coarse and untasteful. He presses able-bodied and strong-backed words into his service, which have a certain rustic fragrance and force, as if now first devoted to literature after having served sincere and stern uses. He has the pronunciation of a poet though he stutters. He certainly speaks the English tongue with a right manly accent. To be sure his poems have the musty odor of a confessional.

How little curious is man,

Who hath not searched his mystery a span,  
 But dreams of mines of treasure  
 Which he neglects to measure,  
 For threescore years and ten  
 Walks to and fro amid his fellow men  
 O'er this small tract of continental land,  
 His fancy bearing no divining wand.  
 Our uninquiring corpses lie more low  
 Than our life's curiosity doth go;  
 Our most ambitious steps climb not so high  
 As in their hourly sport the sparrows fly.  
 Yonder cloud's blown farther in a day  
 Than our most vagrant feet may ever stray.  
 Surely, O Lord, he hath not greatly erred  
 Who hath so little from his birthplace stirred.  
 He wanders through this low and shallow world,  
 Scarcely his bolder thoughts and hopes unfurled,  
 Through this low walled world, which his huge sin  
 Hath hardly room to rest and harbor in.  
 Bearing his head just o'er some fallow ground,  
 Some cowslip'd meadows where the bitterns sound,  
 He wanders round until his end draws nigh,  
 And then lays down his aged head to die.  
 And this is life! this is that famous strife!  
 His head doth court a fathom from the land,  
 Six feet from where his grovelling feet do stand.

What is called talking is a remarkable though I believe universal phenomenon of human society. The most constant phenomenon when men or women come together is talking. A chemist might try this experiment in his laboratory with certainty, and set down the fact in his journal. This characteristic of the race may be considered as established. No doubt every one can call to mind numerous conclusive instances. Some nations, it is true, are said to articulate more distinctly than others; yet the rule holds with those who have the fewest letters in their alphabet. Men cannot stay long together without talking, according to the rules of polite society. (As all men have two ears and but one tongue, they must spend the extra and unavoidable hours of silence in listening to the whisperings of genius, and this fact it is that makes silence always respectable in my eyes.) Not that they have anything to communicate, or do anything quite natural or important to be done so, but by common consent they fall to using the invention of speech, and make a conversation, good or bad. They say things, first this one and then that. They express their "opinions," as they are called.

By a well-directed silence I have sometimes seen threatening and troublesome people routed. You sit musing as if you were in broad nature again. They cannot stand it. Their

position becomes more and more uncomfortable every moment. So much humanity over against one without any disguise, — not even the disguise of speech! They cannot stand it nor sit against it.

Not only must men talk, but for the most part must talk about talk, — even about books, or dead and buried talk. Sometimes my friend expects a few periods from me. Is he exorbitant? He thinks it is my turn now. Sometimes my companion thinks he has said a good thing, but I don't see the difference. He looks just as he did before. Well, it is no loss. I suppose he has plenty more.

Then I have seen very near and intimate, very old friends introduced by very old strangers, with liberty given to talk. The stranger, who knows only the countersign, says, "Jonas — Eldred," giving those names which will make a title good in a court of law. (It may be presumed that God does not know the Christian names of men.) Then Jonas, like a ready soldier, makes a remark, — a benediction on the weather it may be, — and Eldred swiftly responds, and unburdens his breast, and so the action begins. They bless God and nature many times gratuitously, and part mutually well pleased, leaving their cards. They did not happen to be present at each other's christening.

Sometimes I have listened so attentively and with so much interest to the whole expression of a man that I did not hear one word he was saying, and saying too with the more vivacity observing my attention.

But a man may be an object of interest to me though his tongue is pulled out by the roots.

Men sometimes do as if they could eject themselves like bits of pack-thread from the end of the tongue.

Scholars have for the most part a diseased way of looking at the world. They mean by it a few cities and unfortunate assemblies of men and women, who might all be concealed in the grass of the prairies. They describe this world as old or new, healthy or diseased, according to the state of their libraries, — a little dust more or less on their shelves. When I go abroad from under this shingle or slate roof, I find several things which they have not considered. Their conclusions seem imperfect.

As with two eyes we see and with two ears we hear, with the like advantage is man added to man. Making no complaint, offering no encouragement, one human being is made aware of the neighboring and contemporaneous existence of another. Such is the tenderness of friendship. We never recognize each other as finite and imperfect beings, but with a smile and as strangers. My intercourse with men is governed by the same laws with my intercourse with nature.

Buonaparte said that the three-o'clock-in-the-morning courage was the rarest, but I cannot agree with him. Fear does not awake so early. Few men are so degenerate as to balk nature by not beginning the day well. I hold in my hands a recent volume of essays and poems, in its outward aspect like the thousands which the press sends forth, and, if the gods permitted their own inspiration to be breathed in vain, this might be forgotten in the mass, but the accents of truth are as sure to be heard on earth as in heaven. The more I read it the more I am impressed by its sincerity, its depth and

grandeur. It already seems ancient and has lost the traces of its modern birth. It is an evidence of many virtues in the writer. More serenely and humbly confident, this man has listened to the inspiration which all may hear, and with greater fidelity reported it. It is therefore a true prophecy, and shall at length come to pass. It has the grandeur of the Greek tragedy, or rather its Hebrew original, yet it is not necessarily referred to any form of faith. The slumbering, heavy depth of its sentences is perhaps without recent parallel. It lies like the sward in its native pasture, where its roots are never disturbed, and not spread over a sandy embankment.

On fields o'er which the reaper's hand has passed,  
Lit by the harvest moon and autumn sun,  
My thoughts like stubble floating in the wind  
And of such fineness as October airs,  
There, after harvest, could I glean my life,  
A richer harvest reaping without toil,  
And weaving gorgeous fancies at my will,  
In subtler webs than finest summer haze.

In October the air is really the fine element the poets describe. The fields emit a dry and temperate odor. There is something in the refined and elastic air which reminds us of a work of art. It is like a verse of Anacreon or a tragedy of Æschylus.

All parts of nature belong to one head, as the curls of a maiden's hair. How beautifully flow the seasons as one year, and all streams as one ocean!

I hate museums; there is nothing so weighs upon my spirits. They are the catacombs of nature. One green bud of spring, one willow catkin, one faint trill from a migrating sparrow would set the world on its legs again. The life that is in a single green weed is of more worth than all this death. They are dead nature collected by dead men. I know not whether I muse most at the bodies stuffed with cotton and sawdust or those stuffed with bowels and fleshy fibre outside the cases.

Where is the proper herbarium, the true cabinet of shells, and museum of skeletons, but in the meadow where the flower bloomed, by the seaside where the tide cast up the fish, and on the hills and in the valleys where the beast laid down its life and the skeleton of the traveller reposes on the grass? What right have mortals to parade these things on their legs again, with their wires, and, when heaven has decreed that they shall return to dust again, to return them to sawdust? Would you have a dried specimen of a world, or a pickled one?

Embalming is a sin against heaven and earth, — against heaven, who has recalled the soul and set free the servile elements, and against the earth, which is thus robbed of her dust. I have had my right-perceiving senses so disturbed in these haunts as to mistake a veritable living man for a stuffed specimen, and surveyed him with dumb wonder as the strangest of the whole collection. For the strangest is that which, being in many particulars most like, is in some essential particular most unlike.

It is one great and rare merit in the old English tragedy that it says something. The words slide away very fast, but toward some conclusion. It has to do with things, and

the reader feels as if he were advancing. It does not make much odds what message the author has to deliver at this distance of time, since no message can startle us, but how he delivers it, — that it be done in a downright and manly way. They come to the point and do not waste the time.

They say that Carew was a laborious writer, but his poems do not show it. They are finished, but do not show the marks of the chisel. Drummond was indeed a quiddler, with little fire or fibre, and rather a taste for poetry than a taste of it.

After all, we draw on very gradually in English literature to Shakespeare, through Peele and Marlowe, to say nothing of Raleigh and Spenser and Sidney. We hear the same great tone already sounding to which Shakespeare added a serener wisdom and clearer expression. Its chief characteristics of reality and unaffected manliness are there. The more we read of the literature of those times, the more does acquaintance divest the genius of Shakespeare of the in some measure false mystery which has thickened around it, and leave it shrouded in the grander mystery of daylight. His critics have for the most part made their [sic] contemporaries less that they might make Shakespeare more.

The distinguished men of those times had a great flow of spirits, a cheerful and elastic wit far removed from the solemn wisdom of later days. What another thing was fame and a name then than now! This is seen in the familiar manner in which they were spoken of by each other and the nation at large, — Kit Marlowe, and George (Peele), and Will Shakespeare, and Ben Jonson, — great fellows, — chaps.

We pass through all degrees of life from the least organic to the most complex. Sometimes we are mere pudding-stone and scorix.

The present is the instant work and near process of living, and will be found in the last analysis to be nothing more nor less than digestion. Sometimes, it is true, it is indigestion.

Daniel deserves praise for his moderation, and sometimes has risen into poetry before you know it. Strong sense appears in his epistles, but you have to remember too often in what age he wrote, and yet that Shakespeare was his contemporary. His style is without the tricks of the trade and really in advance of his age. We can well believe that he was a retired scholar, who would keep himself shut up in his house two whole months together.

Donne was not a poet, but a man of strong sense, a sturdy English thinker, full of conceits and whimsicalities, hammering away at his subject, be it eulogy or epitaph, sonnet or satire, with the patience of a day laborer, without taste but with an occasional fine distinction or poetic phrase. He was rather Doctor Donne, than the poet Donne. His letters are perhaps best.

Lovelace is what his name expresses, — of slight material to make a poet's fame. His goings and comings are of no great account. His taste is not so much love of excellence as fear of failure, though in one instance he has written fearlessly and memorably.

How wholesome are the natural laws to contemplate, as gravity, heat, light, moisture, dryness. Only let us not interfere. Let the soul withdraw into the chambers of the heart,

let the mind reside steadily in the labyrinth of the brain, and not interfere with hands or feet more than with other parts of nature.

Thomson was a true lover of nature and seems to have needed only a deeper human experience to have taken a more vigorous and lofty flight. He is deservedly popular, and has found a place on many shelves and in many cottages. There are great merits in "The Seasons" — and the almanac. In "Autumn:" —

"Attemper'd suns arise,  
... while broad and brown, below,  
Extensive harvests hang the heavy head.  
Rich, silent, deep, they stand."  
The moon in "Autumn —  
"Her spotted disk,  
Where mountains rise, umbrageous dales descend,  
... gives all his blaze again,  
Void of its flame, and sheds a softer day.  
Now through the passing cloud she seems to stoop,  
Now up the pure cerulean rides sublime.  
The whole air whitens with a boundless tide  
Of silver radiance, trembling round the world."

My friend, thou art not of some other race and family of men; — thou art flesh of my flesh, bone of my bone. Has not nature associated us in many ways? Water from the same fountain, lime from the same quarry, grain from the same field compose our bodies. And perchance our elements but reassert their ancient kindredship. Is it of no significance that I have so long partaken of the same loaf with thee, have breathed the same air summer and winter, have felt the same heat and cold, the same fruits of summer have been pleased to refresh us both, and thou hast never had a thought of different fibre from my own?

Our kindred, of one blood with us. With the favor and not the displeasure of the gods, we have partaken the same bread.

It is hard to know rocks. They are crude and inaccessible to our nature. We have not enough of the stony element in us.

It is hard to know men by rumor only. But to stand near somewhat living and conscious. Who would not sail through mutiny and storm farther than Columbus, to reach the fabulous retreating shores of some continent man?

My friend can only be in any measure my foe, because he is fundamentally my friend; for everything is after all more nearly what it should rightfully be, than that which it is simply by failing to be the other.

It [friendship] cannot be the subject of reconciliation or the theme of conversation ever between friends. The true friend must in some sense disregard all professions of friendship and forget them.

It is as far from pity as from contempt. I should hesitate even to call it the highest sympathy, since the word is of suspicious origin and suggests suffering rather than joy.

It was established before religion, for men are not friends in religion, but over and through it; and it records no apostasy or repentance, but there is a certain divine and innocent and perennial health about it.

Its charity is generosity, its virtue nobleness, its religion trust. We come nearer to friendship with flowers and inanimate objects than with merely affectionate and loving men. It is not for the friend to be just even, — at least he is not to be lost in this attribute, — but to be only a large and free existence, representative of humanity, its general court. Admirable to us as the heavenly bodies, but like them affording rather a summer heat and daylight, — the light and fire of sunshine and stars, — rather than the intense heats and splendors which our weakness and appetite require.

Yesterday I skated after a fox over the ice. Occasionally he sat on his haunches and barked at me like a young wolf. It made me think of the bear and her cubs mentioned by Captain Parry, I think. All brutes seem to have a genius for mystery, an Oriental aptitude for symbols and the language of signs; and this is the origin of Pilpay and Æsop. The fox manifested an almost human suspicion of mystery in my actions. While I skated directly after him, he cantered at the top of his speed; but when I stood still, though his fear was not abated, some strange but inflexible law of his nature caused him to stop also, and sit again on his haunches. While I still stood motionless, he would go slowly a rod to one side, then sit and bark, then a rod to the other side, and sit and bark again, but did not retreat, as if spellbound. When, however, I commenced the pursuit again, he found himself released from his durance.

Plainly the fox belongs to a different order of things from that which reigns in the village. Our courts, though they offer a bounty for his hide, and our pulpits, though they draw many a moral from his cunning, are in few senses contemporary with his free forest life.

To the poet considered as an artist, his words must be as the relation of his oldest and finest memory, and wisdom derived from the remotest experience.

I have thought, when walking in the woods through a certain retired dell, bordered with shrub oaks and pines, far from the village and affording a glimpse only through an opening of the mountains in the horizon, how my life might pass there, simple and true and natural, and how many things would be impossible to be done there. How many books I might not read!

Why avoid my friends and live among strangers? Why not reside in my native country?

Many a book is written which does not necessarily suggest or imply the phenomenon or object to explain which it professes to have been written.

Every child should be encouraged to study not man's system of nature but nature's.

Giles Fletcher knew how to write, and has left English verses behind. He is the most valuable imitator of the Spenserian stanza, and adds a moral tone of his own.

#### TO A MARSH HAWK IN SPRING

There is health in thy gray wing,  
Health of nature's furnishing.

Say, thou modern-winged antique,  
 Was thy mistress ever sick?  
 In each heaving of thy wing  
 Thou dost health and leisure bring,  
 Thou dost waive disease and pain  
 And resume new life again.  
 Man walks in nature still alone,  
 And knows no one,  
 Discovers no lineament nor feature  
 Of any creature.  
 Though all the firmament  
 Is o'er me bent,  
 Yet still I miss the grace  
 Of an intelligent and kindred face.  
 I still must seek the friend  
 Who does with nature blend.  
 Who is the person in her mask,  
 He is the friend I ask;  
 Who is the expression of her meaning,  
 Who is the uprightness of her leaning,  
 Who is the grown child of her weaning.  
 We twain would walk together  
 Through every weather,  
 And see this aged Nature  
 Go with a bending stature.  
 The centre of this world,  
 The face of Nature,  
 The site of human life,  
 Some sure foundation  
 And nucleus of a nation,  
 At least, a private station.

It is the saddest thought of all, that what we are to others, that we are much more to ourselves, — avaricious, mean, irascible, affected, — we are the victims of these faults. If our pride offends our humble neighbor, much more does it offend ourselves, though our lives are never so private and solitary.

If the Indian is somewhat of a stranger in nature, the gardener is too much a familiar. There is something vulgar and foul in the latter's closeness to his mistress, something noble and cleanly in the former's distance. Yet the hunter seems to have a property in the moon which even the farmer has not. Ah! the poet knows uses of plants which are not easily reported, though he cultivates no parterre. See how the sun smiles on him while he walks in the gardener's aisles, rather than on the gardener.

Not only has the foreground of a picture its glass of transparent crystal spread over it, but the picture itself is a glass or transparent medium to a remoter background. We demand only of all pictures that they be perspicuous, that the laws of perspective have been truly observed. It is not the fringed foreground of the desert nor the intermediate oases that detain the eye and the imagination, but the infinite, level, and roomy horizon, where the sky meets the sand, and heavens and earth, the ideal and actual, are coincident, the background into which leads the path of the pilgrim.

All things are in revolution; it is the one law of nature by which order is preserved, and time itself lapses and is measured. Yet some things men will do from age to age, and some things they will not do.

How many young finny contemporaries of various character and destiny, form and habits, we have even in this water! And it will not be forgotten by some memory that we were contemporaries. It is of some import. We shall be some time friends, I trust, and know each other better. Distrust is too prevalent now. We are so much alike! have so many faculties in common! I have not yet met with the philosopher who could, in a quite conclusive, undoubtful way, show me the, and, if not the, then how any, difference between man and a fish. We are so much alike! How much could a really tolerant, patient, humane, and truly great and natural man make of them, if he should try? For they are to be understood, surely, as all things else, by no other method than that of sympathy. It is easy to say what they are not to us, i.e., what we are not to them; but what we might and ought to be is another affair.

In the tributaries the brook minnow and the trout. Even in the rills emptying into the river, over which you stride at a step, you may see small trout not so large as your finger glide past or hide under the bank.

The character of this [the homed pout], as indeed of all fishes, depends directly upon that of the water it inhabits, those taken in clear and sandy water being of brighter hue and cleaner and of firmer and sweeter flesh. It makes a peculiar squeaking noise when drawn out, which has given it the name of the minister or preacher.

The bream is the familiar and homely sparrow, which makes her nest everywhere, and is early and late.

The pickerel is the hawk, a fish of prey, hovering over the finny broods.

The pout is the owl, which steals so noiselessly about at evening with its clumsy body.

The shiner is the summer yellowbird, or goldfinch, of the river.

The sucker is the sluggish bittern, or stake-driver.

The minnow is the hummingbird.

The trout is the partridge woodpecker.

The perch is the robin.

We read Marlowe as so much poetical pabulum. It is food for poets, water from the Castalian Spring, some of the atmosphere of Parnassus, raw and crude indeed, and at times breezy, but pure and bracing. Few have so rich a phrase! He had drunk deep of

the Pierian Spring, though not deep enough, and had that fine madness, as Drayton says, "Which justly should possess a poet's brain."

We read his "Dr. Faustus,"

"Dido, Queen of Carthage," and "Hero and Leander," especially the last, without being wearied. He had many of the qualities of a great poet, and was in some degree worthy to precede Shakespeare. But he seems to have run to waste for want of seclusion and solitude, as if mere pause and deliberation would have added a new element of greatness to his poetry. In his unquestionably fine, heroic tone it would seem as if he had the rarest part of genius, and education could have added the rest. The "Hero and Leander" tells better for his character than the anecdotes which survive.

I fain would stretch me by the highway-side,

To thaw and trickle with the melting snow,

That mingled soul and body with the tide

I too might through the pores of Nature flow,

Might help to forward the new spring along,

If it were mine to choose my toil or day,

Scouring the roads with yonder sluice-way throng,

And so work out my tax on Her highway.

Yet let us thank the purblind race

Who still have thought it good

With lasting stone to mark the place

Where braver men have stood.

In Concord, town of quiet name

And quiet fame as well,...

I've seen ye, sisters, on the mountain-side,

When your green mantles fluttered in the wind;

I Ve seen your footprints on the lake's smooth shore,

Lesser than man's, a more ethereal trace;

I have heard of ye as some far-famed race,

Daughters of gods, whom I should one day meet,

Or mothers, I might say, of all our race.

I reverence your natures, so like mine

Yet strangely different, like but still unlike.

Thou only stranger that hast crossed my path,

Accept my hospitality; let me hear

The message which thou bring'st.

Made different from me,

Perchance thou 'rt made to be

The creature of a different destiny.

I know not who ye are that meekly stand

Thus side by side with man in every land.

When did ye form alliance with our race,

Ye children of the moon, who in mild nights  
Vaulted upon the hills and sought this earth?  
Reveal that which I fear ye cannot tell,  
Wherein ye are not I, wherein ye dwell  
Where I can never come.  
What boots it that I do regard ye so?  
Does it make suns to shine or crops to grow?  
What boots [it] that I never should forget  
That I have sisters sitting for me yet?  
And what are sisters?  
The robust man, who can so stoutly strive,  
In this bleak world is hardly kept alive.  
And who is it protects ye, smooths your way?

We can afford to lend a willing ear occasionally to those earnest reformers of the age. Let us treat them hospitably. Shall we be charitable only to the poor? What though they are fanatics? Their errors are likely to be generous errors, and these may be they who will put to rest the American Church and the American government, and awaken better ones in their stead.

Let us not meanly seek to maintain our delicate lives in chambers or in legislative halls by a timid watchfulness of the rude mobs that threaten to pull down our baby-houses. Let us not think to raise a revenue which shall maintain our domestic quiet by an impost on the liberty of speech. Let us not think to live by the principle of self-defense. Have we survived our accidents hitherto, think you, by virtue of our good swords, — that three-foot lath that dangles by your side, or those brazenmouthed pieces under the burying hill which the trainers keep to hurrah with in the April and July mornings? Do our protectors burrow under the burying-ground hill, on the edge of the bean-field which you all know, gorging themselves once a year with powder and smoke, and kept bright and in condition by a chafing of oiled rags and rotten stone? Have we resigned the protection of our hearts and civil liberties to that feathered race of wading birds and marching men who drill but once a month? — and I mean no reproach to our Concord train-bands, who certainly make a handsome appearance — — and dance well. Do we enjoy the sweets of domestic life undisturbed, because the naughty boys are all shut up in that whitewashed “stone-yard,” as it is called, and see the Concord meadows only through a grating.

No, let us live amid the free play of the elements. Let the dogs bark, let the cocks crow, and the sun shine, and the winds blow!

Ye do commend me to all virtue ever,  
And simple truth, the law by which we live.  
Methinks that I can trust your clearer sense  
And your immediate knowledge of the truth.  
I would obey your influence, one with fate.

There is a true march to the sentence, as if a man or a body of men were actually making progress there step by step, and these are not the mere disjecta membra, the dispersed and mutilated members though it were of heroes, which can no longer walk and join themselves to their comrades. They are not perfect nor liberated pieces of art for the galleries, yet they stand on the natural and broad pedestal of the living rock, but have a principle of life and growth in them still, as has that human nature from which they spring.

It is a marvel how the birds contrive to survive in this world. These tender sparrows that flit from bush to bush this evening, though it is so late, do not seem improvident, [but appear] to have found a roost for the night. They must succeed by weakness and reliance, for they are not bold and enterprising, as their mode of life would seem to require, but very weak and tender creatures. I have seen a little chipping sparrow, come too early in the spring, shivering on an apple twig, drawing in its head and striving to warm it in its muffled feathers; and it had no voice to intercede with nature, but peeped as helpless as an infant, and was ready to yield up its spirit and die without any effort. And yet this was no new spring in the revolution of the seasons.

Our offense is rank, it smells to heaven. In the midst of our village, as in most villages, there is a slaughterhouse, and throughout the summer months, day and night, to the distance of half a mile, which embraces the greater part of the village, the air [is] filled with such scents as we instinctively avoid in a woodland walk; and doubtless, if our senses were once purified and educated by a simpler and truer life, we should not consent to live in such a neighborhood.

George Melvin, our Concord trapper, told me that in going to the spring near his house, where he kept his minnows for bait, he found that they were all gone, and immediately suspected that a mink had got them; so he removed the snow all around and laid open the trail of a mink underneath, which he traced to his hole, where were the fragments of his booty. There he set his trap, and baited it with fresh minnows. Going again soon to the spot, he found one of the mink's fore legs in the trap gnawed off near the body, and, having set it again, he caught the mink with his three legs, the fourth having only a short bare bone sticking out.

When I expressed some surprise at this, and said that I heard of such things but did not know whether to believe them, and was now glad to have the story confirmed, said he: "Oh, the muskrats are the greatest fellows to gnaw their legs off. Why I caught one once that had just gnawed his third leg off, this being the third time he had been trapped; and he lay dead by the trap, for he couldn't run on one leg." Such tragedies are enacted even in this sphere and along our peaceful streams, and dignify at least the hunter's trade. Only courage does anywhere prolong life, whether of man or beast.

When they are caught by the leg and cannot get into the water to drown themselves, they very frequently gnaw the limb off. They are commonly caught under water or close to the edge, and dive immediately with the trap and go to gnawing and are quackled and drowned in a moment, though under other circumstances they will live several minutes under water. They prefer to gnaw off a fore leg to a hind leg, and do not gnaw

off their tails. He says the wharf rats are very common on the river and will swim and cross it like a muskrat, and will gnaw their legs and even their tails off in the trap.

These would be times that tried men's souls, if men had souls to be tried; aye, and the souls of brutes, for they must have souls as well as teeth. Even the waterrats lead sleepless nights and live Achillean lives. There are the strong will and the endeavor. Man, even the hunter, naturally has sympathy with every brave effort, even in his game, to maintain that life it enjoys. The hunter regards with awe his game, and it becomes at last his medicine.

Of Cadew or Case worms there are the Ruff-coats or Cockspurs, whose cases are rough and made of various materials, and the Piper Cadis or Straw-worm, made of reed or rush, and straight and smooth.

Carlyle's works are not to be studied, — hardly reread. Their first impression is the truest and the deepest. There is no reprint. If you look again, you will be disappointed and find nothing answering to the mood they have excited. They are true natural products in this respect. All things are but once, and never repeated. The first faint blushes of the morning gilding the mountain-tops, with the pale phosphorus and saffron-colored clouds, — they verily transport us to the morning of creation; but what avails it to travel eastward, or look again there an hour hence. We should be as far in the day ourselves, mounting toward our meridian. There is no double entendre for the alert reader; in fact the work was designed for such complete success that it serves but for a single occasion. It is the luxury of wealth and art when for every deed its own instrument is manufactured. The knife which sliced the bread of Jove ceased to be a knife when that service was rendered.

For every inferior, earthly pleasure we forego, a superior, celestial one is substituted.

To purify our lives requires simply to weed out what is foul and noxious and the sound and innocent is supplied, as nature purifies the blood if we will but reject impurities.

Nature and human life are as various to our several experiences as our constitutions are various. Who shall say what prospect life offers to another? Could a greater miracle take place than if we should look through each other's eyes for an instant? We should live in all the ages of the world in an hour, — aye, in all the worlds of the ages. What I have read of rhapsodists, of the primitive poets, Argonautic expeditions, the life of demigods and heroes, Eleusinian mysteries, etc., suggests nothing so ineffably grand and informing as this would be.

The phoebe came into my house to find a place for its nest, flying through the windows.

It was a bright thought, that of man's to have bells; no doubt the birds hear them with pleasure.

To compete with the squirrels in the chestnut harvest, picking oftentimes the nuts that bear the mark of their teeth.

I require of any lecturer that he will read me a more or less simple and sincere account of his own life, of what he has done and thought, — not so much what he

has read or heard of other men's lives and actions, but some such account as he would send to his kindred from a distant land, — and if he has lived sincerely, it must have been in a distant land to me, — describing even his outward circumstances and what adventures he has had, as well as his thoughts and feelings about them. He who gives us only the results of other men's lives, though with brilliant temporary success, we may in some measure justly accuse of having defrauded us of our time. We want him to give us that which was most precious to him, — not his life's blood but even that for which his life's blood circulated, what he has got by living. If anything ever yielded him pure pleasure or instruction, let him communicate it. Let the money-getter tell us how much he loves wealth, and what means he takes to accumulate it. He must describe those facts which he knows and loves better than anybody else. He must not write on foreign missions. The mechanic will naturally lecture about his trade, the farmer about his farm, and every man about that which he, compared with other men, knows best. Yet incredible mistakes are made. I have heard an owl lecture with perverse show of learning upon the solar microscope, and chanticleer upon nebulous stars, when both ought to have been sound asleep, the one in a hollow tree, the other on his roost.

After I lectured here before, this winter, I heard that some of my townsmen had expected of me some account of my life at the pond. This I will endeavor to give to-night.

I know a robust and hearty mother who thinks that her son, who died abroad, came to his end by living too low, as she had since learned that he drank only water. Men are not inclined to leave off hanging men to-day, though they will be to-morrow. I heard of a family in Concord this winter which would have starved, if it had not been for potatoes — and tea and coffee.

It has not been my design to live cheaply, but only to live as I could, not devoting much time to getting a living. I made the most of what means were already got.

To determine the character of our life and how adequate it is to its occasion, just try it by any test, as for instance that this same sun is seen in Europe and in America at the same time, that these same stars are visible in twenty-four hours to two thirds the inhabitants of the globe, and who knows how many and various inhabitants of the universe. What farmer in his field lives according even to this somewhat trivial material fact.

I just looked up at a fine twinkling star and thought that a voyager whom I know, now many days' sail from this coast, might possibly be looking up at that same star with me. The stars are the apexes of what triangles! There is always the possibility — the possibility, I say — of being all, or remaining a particle, in the universe.

In these days and in this country, a few implements, as the axe, shovel, etc., and, to the studious, light and stationery and access to a few books, will rank next to necessaries, but can all be obtained at a very trifling cost. Under the head of clothing is to be ranked bedding, or night-clothes.

We are very anxious to keep the animal heat in us. What pains we take with our beds! robbing the nests of birds and their breasts, this shelter within a shelter, as the mole has a bed of leaves and grass at the end of its burrow.

In the summer I caught fish occasionally in the pond, but since September have not missed them.

In a man or his work, over all special excellence or failure, prevails the general authority or value.

Almost any man knows how to earn money, but not one in a million knows how to spend it. If he had known so much as this, he would never have earned it.

All matter, indeed, is capable of entertaining thought.

The complete subjugation of the body to the mind prophesies the sovereignty of the latter over the whole of nature. The instincts are to a certain extent a sort of independent nobility, of equal date with the mind, or crown, — ancient dukes and princes of the regal blood. They are perhaps the mind of our ancestors subsided in us, the experience of the race.

A small sum would really do much good, if the donor spent himself with it and did not merely relinquish it to some distant society whose managers do the good or the evil with it. How much might be done for this town with a hundred dollars! I could provide a select course of lectures for the summer or winter with that sum, which would be an incalculable benefit to every inhabitant. With a thousand dollars I could purchase for this town a more complete and select library than exists in the State out of Cambridge and Boston, perhaps a more available one than any. Men sit palsied and helpless by the side of their buried treasures.

After all those who do most good with money, do it with the least, because they can do better than to acquire it.

March 13, 1846. The song sparrow and blackbird heard to-day. The snow going off. The ice in the pond one foot thick.

Men talk much of cooperation nowadays, of working together to some worthy end; but what little cooperation there is, is as if it were not, being a simple result of which the means are hidden, a harmony inaudible to men. If a man has faith, he will cooperate with equal faith everywhere. If he has not faith he will continue to live like the rest of the world, whatever company he is joined to. To cooperate thoroughly implies to get your living together. I heard it proposed lately that two young men should travel together over the world, the one earning his means as he went, the other carrying a bill of exchange in his pocket. It was easy to see that they could not long be companions, or cooperate, since one would not operate at all. They would part company at the first and most interesting crisis in their adventures.

## 1850

May 12, 1850, visited an ancient garrison-house now occupied by Fred. Ayer, who said it was built one hundred and fifty or one hundred and sixty years ago by one Emerson, and that several oxen were killed by lightning while it was building. There was also a pear tree nearly as old as the house. It was built of larger and thicker and harder brick than are used nowadays, and on the whole looked more durable and still likely to stand a hundred years. The hard burnt blue-black ends of some of the bricks were so arranged as to checker the outside. He said it was considered the handsomest house in Haverhill when it was built, and people used to come up from town some two miles to see it. He thought that they were the original doors which we saw. There were but few windows, and most of them were about two feet and a half long and a foot or more wide, only to fire out of. The oven originally projected outside. There were two large fireplaces. I walked into one, by stooping slightly, and looked up at the sky. Ayer said jokingly that some said they were so made to shoot wild geese as they flew over. The chains and hooks were suspended from a wooden bar high in the chimney. The timbers were of immense size.

In all my rambles I have seen no landscape which can make me forget Fair Haven. I still sit on its Cliff in a new spring day, and look over the awakening woods and the river, and hear the new birds sing, with the same delight as ever. It is as sweet a mystery to me as ever, what this world is. Fair Haven Lake in the south, with its pine-covered island and its meadows, the hickories putting out fresh young yellowish leaves, and the oaks light-grayish ones, while the oven-bird thrums his sawyer-like strain, and the chewink rustles through the dry leaves or repeats his jingle on a tree-top, and the wood thrush, the genius of the wood, whistles for the first time his clear and thrilling strain, — it sounds as it did the first time I heard it. The sight of these budding woods intoxicates me, — this diet drink.

The strong-colored pine, the grass of trees, in the midst of which other trees are but as weeds or flowers, — a little exotic.

Humboldt says, "It is still undetermined where life is most abundant: whether on the earth or in the fathomless depths of the ocean."

As I walked, I was intoxicated with the slight spicy odor of the hickory buds and the bruised bark of the black birch, and, in the fall, the pennyroyal.

The river is higher than it has been at this season for many years.

When the far mountains are invisible, the near ones look the higher.

To-day, May 31st, a red and white cow, being uneasy, broke out of the steam-mill pasture and crossed the bridge and broke into Elijah Wood's grounds. When he endeavored to drive her out by the bars, she boldly took to the water, wading first through the meadows full of ditches, and swam across the river, about forty rods wide at this time, and landed in her own pasture again. She was a buffalo crossing her Mississippi. This exploit conferred some dignity on the herd in my eyes, already dignified, and reflectedly on the river, which I looked on as a kind of Bosphorus.

I love to see the domestic animals reassert their native rights, — any evidence that they have not lost their original wild habits and vigor.

The year has many seasons more than are recognized in the almanac. There is that time about the first of June, the beginning of summer, when the buttercups blossom in the now luxuriant grass and I am first reminded of mowing and of the dairy. Every one will have observed different epochs. There is the time when they begin to drive cows to pasture, — about the 20th of May, — observed by the farmer, but a little arbitrary year by year. Cows spend their winters in barns and cow-yards, their summers in pastures. In summer, therefore, they may low with emphasis, “To-morrow to fresh woods and pastures new.” I sometimes see a neighbor or two united with their boys and hired men to drive their cattle to some far-off country pasture, fifty or sixty miles distant in New Hampshire, early in the morning, with their sticks and dogs. It is a memorable time with the farmers’ boys, and frequently their first journey from home. The herdsman in some mountain pasture is expecting them. And then in the fall, when they go up to drive them back, they speculate as to whether Janet or Brindle will know them. I heard such a boy exclaim on such an occasion, when the calf of the spring returned a heifer, as he stroked her side, “She knows me, father; she knows me.” Driven up to be the cattle on a thousand hills.

I once set fire to the woods. Having set out, one April day, to go to the sources of Concord River in a boat with a single companion, meaning to camp on the bank at night or seek a lodging in some neighboring country inn or farmhouse, we took fishing tackle with us that we might fitly procure our food from the stream, Indian-like. At the shoemaker’s near the river, we obtained a match, which we had forgotten. Though it was thus early in the spring, the river was low, for there had not been much rain, and we succeeded in catching a mess of fish sufficient for our dinner before we had left the town, and by the shores of Fair Haven Pond we proceeded to cook them. The earth was uncommonly dry, and our fire, kindled far from the woods in a sunny recess in the hillside on the east of the pond, suddenly caught the dry grass of the previous year which grew about the stump on which it was kindled. We sprang to extinguish it at first with our hands and feet, and then we fought it with a board obtained from the boat, but in a few minutes it was beyond our reach; being on the side of a hill, it spread rapidly upward, through the long, dry, wiry grass interspersed with bushes.

“Well, where will this end?” asked my companion. I saw that it might be bounded by Well Meadow Brook on one side, but would, perchance, go to the village side of the brook. “It will go to town,” I answered. While my companion took the boat back down the river, I set out through the woods to inform the owners and to raise the town. The fire had already spread a dozen rods on every side and went leaping and crackling wildly and irreclaimably toward the wood. That way went the flames with wild delight, and we felt that we had no control over the demonic creature to which we had given birth. We had kindled many fires in the woods before, burning a clear space in the grass, without ever kindling such a fire as this.

As I ran toward the town through the woods, I could see the smoke over the woods behind me marking the spot and the progress of the flames. The first farmer whom I met driving a team, after leaving the woods, inquired the cause of the smoke. I told him. "Well," said he, "it is none of my stuff," and drove along. The next I met was the owner in his field, with whom I returned at once to the woods, running all the way. I had already run two miles. When at length we got into the neighborhood of the flames, we met a carpenter who had been hewing timber, an infirm man who had been driven off by the fire, fleeing with his axe. The farmer returned to hasten more assistance. I, who was spent with running, remained. What could I do alone against a front of flame half a mile wide?

I walked slowly through the wood to Fair Haven Cliff, climbed to the highest rock, and sat down upon it to observe the progress of the flames, which were rapidly approaching me, now about a mile distant from the spot where the fire was kindled. Presently I heard the sound of the distant bell giving the alarm, and I knew that the town was on its way to the scene. Hitherto I had felt like a guilty person, — nothing but shame and regret. But now I settled the matter with myself shortly. I said to myself: "Who are these men who are said to be the owners of these woods, and how am I related to them? I have set fire to the forest, but I have done no wrong therein, and now it is as if the lightning had done it. These flames are but consuming their natural food." (It has never troubled me from that day to this more than if the lightning had done it. The trivial fishing was all that disturbed me and disturbs me still.) So shortly I settled it with myself and stood to watch the approaching flames. It was a glorious spectacle and I was the only one there to enjoy it. The fire now reached the base of the cliff and then rushed up its sides. The squirrels ran before it in blind haste, and three pigeons dashed into the midst of the smoke. The flames flashed up the pines to their tops, as if they were powder.

When I found I was about to be surrounded by the fire, I retreated and joined the forces now arriving from the town. It took us several hours to surround the flames with our hoes and shovels and by back fires subdue them. In the midst of all I saw the farmer whom I first met, who had turned indifferently away saying it was none of his stuff, striving earnestly to save his corded wood, his stuff, which the fire had already seized and which it after all consumed.

It burned over a hundred acres or more and destroyed much young wood. When I returned home late in the day, with others of my townsmen, I could not help noticing that the crowd who were so ready to condemn the individual who had kindled the fire did not sympathize with the owners of the wood, but were in fact highly elate and as it were thankful for the opportunity which had afforded them so much sport; and it was only half a dozen owners, so called, though not all of them, who looked sour or grieved, and I felt that I had a deeper interest in the woods, knew them better and should feel their loss more, than any or all of them. The farmer whom I had first conducted to the woods was obliged to ask me the shortest way back, through his own lot. Why, then, should the half-dozen owners and the individuals who set the fire alone feel sorrow for

the loss of the wood, while the rest of the town have their spirits raised? Some of the owners, however, bore their loss like men, but other some declared behind my back that I was a “damned rascal;” and a flibbertigibbet or two, who crowed like the old cock, shouted some reminiscences of “burnt woods” from safe recesses for some years after. I have had nothing to say to any of them. The locomotive engine has since burned over nearly all the same ground and more, and in some measure blotted out the memory of the previous fire. For a long time after I had learned this lesson I marvelled that while matches and tinder were contemporaries the world was not consumed; why the houses that have hearths were not burned before another day; if the flames were not as hungry now as when I waked them. I at once ceased to regard the owners and my own fault, — if fault there was any in the matter, — and attended to the phenomenon before me, determined to make the most of it. To be sure, I felt a little ashamed when I reflected on what a trivial occasion this had happened, that at the time I was no better employed than my townsmen.

That night I watched the fire, where some stumps still flamed at midnight in the midst of the blackened waste, wandering through the woods by myself; and far in the night I threaded my way to the spot where the fire had taken, and discovered the now broiled fish, — which had been dressed, — scattered over the burnt grass.

This has been a cool day, though the first of summer. The prospect of the meadows from Lee’s Hill was very fine. I observe that the shadows of the trees are very distinct and heavy in such a day, falling on the fresh grass. They are as obvious as the trees themselves by mid-afternoon. Commonly we do not make much account of the distinct shadows of objects in the landscape.

To-day, June 4th, I have been tending a burning in the woods.

You must burn against the wind always, and burn slowly. When the fire breaks over the hoed line, a little system and perseverance will accomplish more toward quelling it than any man would believe. When a fire breaks out in the woods, and a man fights it too near and on the side, in the heat of the moment, without the systematic coöperation of others, he is disposed to think it a desperate case, and that this relentless fiend will run through the forest till it is glutted with food; but let the company rest from their labors a moment, and then proceed more deliberately and systematically, giving the fire a wider berth, and the company will be astonished to find how soon and easily they will subdue it. The woods themselves furnish one of the best weapons with which to contend with the fires that destroy them, — a pitch pine bough. It is the best instrument to thrash it with. There are few men who do not love better to give advice than to give assistance.

However large the fire, let a few men go to work deliberately but perseveringly to rake away the leaves and hoe off the surface of the ground at a convenient distance from the fire, while others follow with pine boughs to thrash it with when it reaches the line, and they will finally get round it and subdue it, and will be astonished at their own success.

As I was fighting the fire to-day, in the midst of the roaring and crackling, — for the fire seems to snort like a wild horse, — I heard from time to time the dying strain, the last sigh, the fine, clear, shrill scream of agony, as it were, of the trees breathing their last, probably the heated air or the steam escaping from some chink. At first I thought it was some bird, or a dying squirrel's note of anguish, or steam escaping from the tree. You sometimes hear it on a small scale in the log on the hearth.

Here it is the 8th of June, and the grass is growing apace.

Not till June can the grass be said to be waving in the fields. When the frogs dream, and the grass waves, and the buttercups toss their heads, and the heat disposes to bathe in the ponds and streams, then is summer begun.

June 21. A fire is without doubt an advantage on the whole. It sweeps and ventilates the forest floor, and makes it clear and clean. It is nature's besom. By destroying the punier underwood it gives prominence to the larger and sturdier trees, and makes a wood in which you can go and come. I have often remarked with how much more comfort and pleasure I could walk in woods through which a fire had run the previous year. It will clean the forest floor like a broom perfectly smooth and clear, — no twigs left to crackle underfoot, the dead and rotten wood removed, — and thus in the course of two or three years new huckleberry fields are created for the town, — for birds and men.

When the lightning burns the forest its Director makes no apology to man, and I was but His agent. Perhaps we owe to this accident partly some of the noblest natural parks. It is inspiriting to walk amid the fresh green sprouts of grass and shrubbery pushing upward through the charred surface with more vigorous growth.

Getting into Patchogue late one night in an oyster-boat, there was a drunken Dutchman aboard whose wit reminded me of Shakespeare. We were detained three hours waiting for the tide, and two of the fishermen took an extra dram at the beach house. Then they stretched themselves on the seaweed by the shore in the sun to sleep off the effects. One was an inconceivably broad-faced young Dutchman, — but oh! of such a peculiar breadth and heavy look, I should not know whether to call it more ridiculous or sublime. You would say that he had humbled himself so much that he was beginning to be exalted. An indescribable mynheerish stupidity. I was less disgusted by their filthiness and vulgarity, because I was compelled to look on them as animals, as swine in their sty. For the whole voyage they lay flat on their backs on the bottom of the boat, in the bilge-water and wet with each bailing, half insensible and wallowing in their vomit. But ever and anon, when aroused by the rude kicks or curses of the skipper, the Dutchman, who never lost his wit nor equanimity, though snoring and rolling in the vomit produced by his debauch, blurted forth some happy repartee like an illuminated swine. It was the earthiest, slimiest wit I ever heard. The countenance was one of a million. It was unmistakable Dutch. In the midst of a million faces of other races it could not be mistaken. It told of Amsterdam. I kept racking my brains to conceive how he could have been born in America, how lonely he must feel, what he did for fellowship.

There was a cross-eyed fellow used to help me survey, — he was my stake-driver, — and all he said was, at every stake he drove, “There, I should n’t like to undertake to pull that up with my teeth.”

It sticks in my crop. That’s a good phrase. Many things stick there.

Sept. 19. The trees on the bank of the river have white furrows worn about them, marking the height of the freshets, at what levels the water has stood.

Water is so much more fine and sensitive an element than earth. A single boatman passing up or down unavoidably shakes the whole of a wide river, and disturbs its every reflection.

The air is an element which our voices shake still further than our oars the water.

My companion said he would drink when the boat got under the bridge, because the water would be cooler in the shade, though the stream quickly passes through the piers from shade to sun again. It is something beautiful, the act of drinking, the stooping to imbibe some of this widespread element, in obedience to instinct, without whim. We do not so simply drink in other influences.

It is pleasant to have been to a place by the way a river went.

The forms of trees and groves change with every stroke of the oar.

There is a good echo from that wood to one standing on the side of Fair Haven. It was particularly good to-day. The woodland lungs seemed particularly sound to-day; they echoed your shout with a fuller and rounder voice than it was given in, seeming to mouth it. You had to choose the right key or pitch, else the woods would not echo it with any spirit, and so with eloquence. Of what significance is any sound if Nature does not echo it?

I used to strike with a paddle on the side of my boat on Walden Pond, filling the surrounding woods with circling and dilating sound, awaking the woods, “stirring them up,” as a keeper of a menagerie his lions and tigers, a growl from all. All melody is a sweet echo. We wake the echo of the place we are in, its slumbering music.

I should think that savages would have made a god of echo.

I will call that Echo Wood.

There was a sawmill once on Nut Meadow Brook, near Jennie’s Road. These little brooks have their history. They once turned sawmills. They even used their influence to destroy the primitive forests which grew on their banks, and now, for their reward, the sun is let in to dry them up and narrow their channels. Their crime rebounds against themselves.

What does education often do? It makes a straight-cut ditch of a free, meandering brook.

Nov. 11. Now is the time for wild apples. I pluck them as a wild fruit native to this quarter of the earth, fruit of old trees that have been dying ever since I was a boy and are not yet dead. From the appearance of the tree you would expect nothing but lichens to drop from it, but underneath your faith is rewarded by finding the ground strewn with spirited fruit. Frequented only by the woodpecker, deserted now by the farmer, who has not faith enough to look under the boughs. Food for walkers.

Sometimes apples red inside, perfused with a beautiful blush, faery food, too beautiful to eat, — apple of the evening sky, of the Hesperides.

This afternoon I heard a single cricket singing, chirruping, in a bank, the only one I have heard for a long time, like a squirrel or a little bird, clear and shrill, — as I fancied, like an evening robin, singing in this evening of the year. A very fine and poetical strain for such a little singer. I had never before heard the cricket so like a bird. It is a remarkable note. The earth-song.

That delicate, waving, feathery dry grass which I saw yesterday is to be remembered with the autumn. The dry grasses are not dead for me. A beautiful form has as much life at one season as another.

The autumnal (?) dandelion is still bright.

I saw an old bone in the woods covered with lichens, which looked like the bone of an old settler, which yet some little animal had recently gnawed, and I plainly saw the marks of its teeth, so indefatigable is Nature to strip the flesh from bones and return it to dust again. No little rambling beast can go by some dry and ancient bone but he must turn aside and try his teeth upon it. An old bone is knocked about till it becomes dust; Nature has no mercy on it. It was quite too ancient to suggest disagreeable associations. It was like a piece of dry pine root. It survives like the memory of a man. With time all that was personal and offensive wears off.

Nov. 16. I found three good arrowheads to-day behind Dennis's. The season for them began some time ago, as soon as the farmers had sown their winter rye, but the spring, after the melting of the snow, is still better.

In literature it is only the wild that attracts us. Dullness is only another name for tameness. It is the untamed, uncivilized, free, and wild thinking in Hamlet, in the Iliad, and in all the scriptures and mythologies that delights us, — not learned in the schools, not refined and polished by art. A truly good book is something as wildly natural and primitive, mysterious and marvellous, ambrosial and fertile, as a fungus or a lichen. Suppose the muskrat or beaver were to turn his views to literature, what fresh views of nature would he present! The fault of our books and other deeds is that they are too humane, I want something speaking in some measure to the condition of muskrats and skunk-cabbage as well as of men, — not merely to a pining and complaining coterie of philanthropists.

I discover again about these times that cranberries are good to eat in small quantities as you are crossing the meadows.

What shall we do with a man who is afraid of the woods, their solitude and darkness? What salvation is there for him? God is silent and mysterious.

Some of our richest days are those in which no sun shines outwardly, but so much the more a sun shines inwardly. I love nature, I love the landscape, because it is so sincere. It never cheats me. It never jests. It is cheerfully, musically earnest. I lie and relie on the earth.

Land where the wood has been cut off and is just beginning to come up again is called sprout land.

The partridge-berry leaves checker the ground on the side of moist hillsides in the woods. Are they not properly called checker-berries?

My Journal should be the record of my love. I would write in it only of the things I love, my affection for any aspect of the world, what I love to think of. I have no more distinctness or pointedness in my yearnings than an expanding bud, which does indeed point to flower and fruit, to summer and autumn, but is aware of the warm sun and spring influence only. I feel ripe for something, yet do nothing, can't discover what that thing is. I feel fertile merely. It is seedtime with me. I have lain fallow long enough.

Notwithstanding a sense of unworthiness which possesses me, not without reason, notwithstanding that I regard myself as a good deal of a scamp, yet for the most part the spirit of the universe is unaccountably kind to me, and I enjoy perhaps an unusual share of happiness. Yet I question sometimes if there is not some settlement to come.

Nov. 26. Went to-night to see the Indians, who are still living in tents.

Their spear very serviceable. The inner, pointed part, of a hemlock knot; the side spring pieces, of hickory. Spear salmon, pickerel, trout, chub, etc.; also by birch-bark light at night, using the other end of spear as pole.

Their sled, jeborgon or jebongon (?), one foot wide, four or five long, of thin wood turned up in front; draw by a strong rope of basswood bark.

Canoe of moose-hide. One hide will hold three or four. Can be taken apart and put together very quickly. Can take out cross-bars and bring the sides together. A very convenient boat to carry and cross streams with. They say they did not make birch canoes till they had edge tools. The birches the lightest. They think our birches the same, only second growth.

Their kee-nong-gun, or cradle, has a hoop to prevent the child being hurt when it falls. Can't eat dirt; can be hung up out of way of snakes.

Aboak-henjo, a birch-bark vessel for water. Can boil meat in it with hot stones; takes a long time. Also a vessel of birch bark, shaped like a pan. Both ornamented by scratching the bark, which is wrong side out. Very neatly made. Valued our kettles much.

Did not know use of eye in axe. Put a string through it and wore it round neck. Cut toes.

Did not like gun. Killed one moose; scared all the rest.

A drizzling and misty day this has been, melting the snow. The mist, divided into a thousand ghostly forms, was blowing across Walden. Mr. Emerson's Cliff Hill, seen from the railroad through the mist, looked like a dark, heavy, frowning New Hampshire mountain. I do not understand fully why hills look so much larger at such a time, unless, being the most distant we see and in the horizon, we suppose them farther off and so magnify them. I think there can be no looming about it.

Nov. 28. Thursday. Cold drizzling and misty rains, which have melted the little snow. The farmers are beginning to pick up their dead wood. Within a day or two the

walker finds gloves to be comfortable, and begins to think of an outside coat and of boots.

It is remarkable, but nevertheless true, as far as my observation goes, that women, to whom we commonly concede a somewhat finer and more sibylline nature, yield a more implicit obedience even to their animal instincts than men. The nature in them is stronger, the reason weaker. There are, for instance, many young and middle-aged men among my acquaintance — shoemakers, carpenters, farmers, and others — who have scruples about using animal food, but comparatively few girls or women. The latter, even the most refined, are the most intolerant of such reforms. It is, perchance, a part of woman's conformity and easy nature. Her savior must not be too strong, stern, and intellectual.

Dec. 23. Here is an old-fashioned snow-storm. There is not much passing on railroads. The engineer says it is three feet deep above. Walden is frozen, one third of it, though I thought it was all frozen as I stood on the shore on one side only.

I can discern a faint foot or sled path sooner when the ground is covered with snow than when it is bare. The depression caused by the feet or the wheels is more obvious; perhaps the light and shade betray it, but I think it is mainly because the grass and weeds rise above it on each side and leave it blank, and a blank space of snow contrasts more strongly with the woods or grass than bare or beaten ground.

Even the surface of the snow is wont to be in waves like billows of the ocean.

Dec. 24. In walking across the Great Meadows to-day on the snow-crust, I noticed that the fine, dry snow which was blown over the surface of the frozen field, when I looked westward over it or toward the sun, looked precisely like steam curling up from its surface, as sometimes from a wet roof when the sun comes out after a rain.

Saw a shrike pecking to pieces a small bird, apparently a snowbird. At length he took him up in his bill, almost half as big as himself, and flew slowly off with his prey dangling from his beak. I find that I had not associated such actions with my idea of birds. It was not birdlike.

## 1851

Feb. 12. Wednesday. A beautiful day, with but little snow or ice on the ground. Though the air is sharp, as the earth is half bare the hens have strayed to some distance from the barns. The hens, standing around their lord and pluming themselves and still fretting a little, strive to fetch the year about.

I find that it is an excellent walk for variety and novelty and wildness, to keep round the edge of the meadow, — the ice not being strong enough to bear and transparent as water, — on the bare ground or snow, just between the highest water mark and the present water line, — a narrow, meandering walk, rich in unexpected views and objects. The line of rubbish which marks the higher tides — withered flags and reeds and twigs and cranberries — is to my eyes a very agreeable and significant line, which

Nature traces along the edge of the meadows. It is a strongly marked, enduring natural line, which in summer reminds me that the water has once stood over where I walk. Sometimes the grooved trees tell the same tale. The wrecks of the meadow, which fill a thousand coves, and tell a thousand tales to those who can read them. Our prairial, mediterranean shore.

It is only necessary that man should start a fence that Nature should carry it on and complete it. The farmer cannot plow quite up to the rails or wall which he himself has placed, and hence it often becomes a hedgerow and sometimes a coppice.

There is something more than association at the bottom of the excitement which the roar of a cataract produces. It is allied to the circulation in our veins. We have a waterfall which corresponds even to Niagara somewhere within us.

How, when a man purchases a thing, he is determined to get and get hold of it, using how many expletives and how long a string of synonymous or similar terms signifying possession, in the legal process! What's mine's my own. An old deed of a small piece of swamp land, which I have lately surveyed at the risk of being mired past recovery, says that "the said Spaulding his Heirs and Assigns, shall and may from this (?) time, and at all times forever hereafter, by force and virtue of these presents, lawfully, peaceably and quietly have, hold, use, occupy, possess and enjoy the said swamp," etc.

May 21. Wednesday. Yesterday I made out the black and the white ashes. A double male white ash in Miles's Swamp, and two black ashes with sessile leaflets. A female white ash near railroad, in Stow's land. The white ashes by Mr. Prichard's have no blossoms, at least as yet.

If I am right, the black ash is improperly so called, from the color of its bark being lighter than the white.

The leaves of my new pine on Merriam's or Pine Hill are of intermediate length between those of the yellow pine and the Norway pine. I can find no cone to distinguish the tree by; but, as the leaves are semicylindrical and not hollowed I think it must be the red or Norway Pine, though it does not look very red, and is spruce! answering perhaps to the description of the yellow pine, which is sometimes called spruce pine.

I have heard now within a few days that peculiar dreaming sound of the frogs which belongs to the summer, — their midsummer night's dream.

I think that we are not commonly aware that man is our contemporary, — that in this strange, outlandish world, so barren, so prosaic, fit not to live in but merely to pass through, that even here so divine a creature as man does actually live. Man, the crowning fact, the god we know. While the earth supports so rare an inhabitant, there is somewhat to cheer us. I think that the standing miracle to man is man. Behind the paling yonder, come rain or shine, hope or doubt, there dwells a man, an actual being who can sympathize with our sublimest thoughts.

The frog had eyed the heavens from his marsh, until his mind was filled with visions, and he saw more than belongs to this fenny earth. He mistrusted that he was become a dreamer and visionary. Leaping across the swamp to his fellow, what was his joy and

consolation to find that he too had seen the same sights in the heavens, he too had dreamed the same dreams!

From nature we turn astonished to this near but supernatural fact.

May 25. A fine, freshening air, a little hazy, that bathes and washes everything, saving the day from extreme heat. Walked to the hills south of Wayland by the road by Deacon Farrar's. First vista just beyond Merron's (?), looking west down a valley, with a verdant-columned elm at the extremity of the vale and the blue hills and horizon beyond. These are the resting-places in a walk. We love to see any part of the earth tinged with blue, cerulean, the color of the sky, the celestial color.

There we found the celandine in blossom. The *Pyrus arbutifolia*, variety *melanocarpa*. Gray makes also the variety *erythrocarpa*. Is this the late red choke-berry of the swamps? and is the former the earlier black one of the swamps?

The marsh-marigold, *Caltha palustris*, improperly called cowslip.

The *Cratægus coccinea* (?), or scarlet-fruited thorn (?).

Thyme-leaved veronica, little bluish-white, streak-petalled flower by road sides. *Silene Pennsylvanica*.

What is the orange-yellow aster-like flower of the meadows now in blossom with a sweet-smelling stem when bruised?

What the delicate pinkish and yellowish flower with hoary-green stem and leaves, of rocky hills.

Now, at 8.30 o'clock P.M., I hear the dreaming of the frogs. So it seems to me, and so significantly passes my life away. It is like the dreaming of frogs in a summer evening.

June 3. I observed the grass waving to-day for the first time, — the swift *Camilla* on it. It might have been noticed before.

Clover has blossomed.

June 7. My practicalness is not to be trusted to the last. To be sure, I go upon my legs for the most part, but, being hard-pushed and dogged by a superficial common sense which is bound to near objects by beaten paths, I am off the handle, as the phrase is, — I begin to be transcendental and show where my heart is. I am like those guinea-fowl which Charles Darwin saw at the Cape de Verd Islands. He says, "They avoided us like partridges on a rainy day in September, running with their heads cocked up; and if pursued, they readily took to the wing."

It is a certain faeryland where we live. I wonder that I ever get five miles on my way, the walk is so crowded with events and phenomena. How many questions there are which I have not put to the inhabitants!

But how far can you carry your practicalness? How far does your knowledge really extend? When I have read in deeds only a hundred years old the words "to enjoy and possess, he and his assigns, forever," I have seen how short-sighted is the sense which conducts from day to day. When I read the epitaphs of those who died a century ago, they seem deader even than they expected. A day seems proportionally a long part of your "forever and a day."

One of those gentle, straight-down rainy days, when the rain begins by spotting the cultivated fields as if shaken from a pepper-box; a fishing day, when I see one neighbor after another, having donned his oil-cloth suit, walking or riding past with a fish-pole, having struck work, — a day and an employment to make philosophers of them all.

June 8. Sunday. In F.A. Michaux's, i.e. the younger Michaux's, "Voyage à l'ouest des Monts Alléghanys, 1802," printed at Paris, 1808: —

The current of the Ohio is so swift in the spring that it is not necessary to row. Indeed rowing would do more harm than good, since it would tend to turn the ark out of the current on to some isle or sand-bar, where it would be entangled amid floating trees. This has determined the form of the bateaux, which are not the best calculated for swiftness but to obey the current. They are from fifteen to fifty feet long by ten to twelve and fifteen, with square ends, and roof of boards like a house at one end. The sides are about four and a half feet above the water. "I was alone on the shore of the Monongahela, when I perceived, for the first time, in the distance, five or six of these bateaux which were descending this river. I could not conceive what those great square boxes were, which, abandoned to the current, presented alternately their ends, their sides, and even (or also (?), et même) their angles. As they came nearer, I heard a confused noise but without distinguishing anything, on account of the elevation of the sides. It was only on ascending the bank of the river that I perceived, in these bateaux, many families carrying with them their horses, cows, poultry, dismounted carts (charrettes), plows, harnesses, beds, agricultural implements, in short all that constitute the movables of a household (ménage) and the carrying on (exploitation) of a farm." But he was obliged to paddle his log canoe "sans cesse" because of the sluggishness of the current of the Ohio in April, 1802.

After travelling more than three thousand miles in North America, he says that no part is to be compared for the "force végétative des forêts" to the region of the Ohio between Wheeling and Marietta. Thirty-six miles above the last place he measured a plane tree on the bank of the Ohio which, at four feet from the ground, was forty-seven in circumference. Tulip and plane trees, his father had said, attained the greatest diameter of North American trees.

Gathered the first strawberries to-day.

June 11. Wednesday. Last night a beautiful summer night, not too warm, moon not quite full, after two or three rainy days. Walked to Fair Haven by railroad, returning by Potter's pasture and Sudbury road. I feared at first that there would be too much white light, like the pale remains of daylight, and not a yellow, gloomy, dreamier light; that it would be like a candlelight by day; but when I got away from the town and deeper into the night, it was better. I hear whip-poor-wills, and see a few fireflies in the meadow.

New beings have usurped the air we breathe, rounding Nature, filling her crevices with sound. To sleep where you may hear the whip-poor-will in your dreams!

The woodland paths are never seen to such advantage as in a moonlight night, so embowered, still opening before you almost against expectation as you walk; you are

so completely in the woods, and yet your feet meet no obstacles. It is as if it were not a path, but an open, winding passage through the bushes, which your feet find.

Ah, that life that I have known! How hard it is to remember what is most memorable! We remember how we itched, not how our hearts beat. I can sometimes recall to mind the quality, the immortality, of my youthful life, but in memory is the only relation to it.

I hear the night-warbler breaking out as in his dreams, made so from the first for some mysterious reason.

Our spiritual side takes a more distinct form, like our shadow which we see accompanying us.

I do not know but I feel less vigor at night; my legs will not carry me so far; as if the night were less favorable to muscular exertion, — weakened us, somewhat as darkness turns plants pale. But perhaps my experience is to be referred to being already exhausted by the day, and I have never tried the experiment fairly. Yet sometimes after a hard day's work I have found myself unexpectedly vigorous.

Only the Hunter's and Harvest moons are famous, but I think that each full moon deserves to be and has its own character well marked. One might be called the Midsummer-Night Moon.

By night no flowers, at least no variety of colors. The pinks are no longer pink; they only shine faintly, reflecting more light. Instead of flowers underfoot, stars overhead.

My shadow has the distinctness of a second person, a certain black companion bordering on the imp, and I ask, "Who is this?" which I see dodging behind me as I am about to sit down on a rock.

No one, to my knowledge, has observed the minute differences in the seasons. Hardly two nights are alike. The rocks do not feel warm to-night, for the air is warmest; nor does the sand particularly. A book of the seasons, each page of which should be written in its own season and out-of-doors, or in its own locality wherever it may be.

When you get into the road, though far from the town, and feel the sand under your feet, it is as if you had reached your own gravel walk. You no longer hear the whip-poor-will, nor regard your shadow, for here you expect a fellow-traveller. You catch yourself walking merely. The road leads your steps and thoughts alike to the town. You see only the path, and your thoughts wander from the objects which are presented to your senses. You are no longer in place. It is like conformity, — walking in the ways of men.

In Charles Darwin's "Voyage of a Naturalist round the World," commenced in 1831:

---

Hail in Buenos Ayres as large as small apples; killed thirteen deer, beside ostriches, which last also it blinded, etc., etc. Dr. Malcomson told him of hail in India, in 1831, which "much injured the cattle." Stones flat, one ten inches in circumference; passed through windows, making round holes.

I would like to read Azara's Voyage.

Horses first landed at the La Plata in 1535. Now these, with cattle and sheep, have altered the whole aspect of the country, — vegetation, etc. “The wild pig in some parts probably replaces the peccari; packs of wild dogs may be heard howling on the wooded banks of the less frequented streams; and the common cat, altered into a large and fierce animal, inhabits rocky hills.”

The great table-land of southern Mexico makes the division between North and South America with reference to the migration of animals.

Tree ferns in Van Diemen’s Land (lat. 45°) six feet in circumference.

JUNE 13. Walked to Walden last night (moon not quite full) by railroad and upland wood-path, returning by Wayland road. Last full moon the elms had not leaved out, — cast no heavy shadows, — and their outlines were less striking and rich in the streets at night.

I noticed night before night before last from Fair Haven how valuable was some water by moonlight, like the river and Fair Haven Pond, though far away, reflecting the light with a faint glimmering sheen, as in the spring of the year. The water shines with an inward light like a heaven on earth. The silent depth and serenity and majesty of water! Strange that men should distinguish gold and diamonds, when these precious elements are so common. I saw a distant river by moonlight, making no noise, yet flowing, as by day, still to the sea, like melted silver reflecting the moonlight. Far away it lay encircling the earth. How far away it may look in the night, and even from a low hill how miles away down in the valley! As far off as paradise and the delectable country! There is a certain glory attends on water by night. By it the heavens are related to the earth, undistinguishable from a sky beneath you. And I forgot to say that after I reached the road by Potter’s bars, — or further, by Potter’s Brook, — I saw the moon suddenly reflected full from a pool. A puddle from which you may see the moon reflected, and the earth dissolved under your feet. The magical moon with attendant stars suddenly looking up with mild lustre from a window in the dark earth.

I observed also the same night a halo about my shadow in the moonlight, which I referred to the accidentally lighter color of the surrounding surface; I transferred my shadow to the darkest patches of grass, and saw the halo there equally. It serves to make the outlines of the shadow more distinct.

But now for last night. A few fireflies in the meadow. Do they shine, though invisibly, by day? Is their candle lighted by day? It is not nightfall till the whip-poor-wills begin to sing.

As I entered the Deep Cut, I was affected by beholding the first faint reflection of genuine and unmixed moonlight on the eastern sand-bank while the horizon, yet red with day, was tingeing the western side. What an interval between those two lights! The light of the moon, — in what age of the world does that fall upon the earth? The moonlight was as the earliest and dewy morning light, and the daylight tinge reminded me much more of the night. There were the old and new dynasties opposed, contrasted, and an interval between, which time could not span. Then is night, when the daylight

yields to the nightlight. It suggested an interval, a distance not recognized in history. Nations have flourished in that light.

When I had climbed the sand-bank on the left, I felt the warmer current or stratum of air on my cheek, like a blast from a furnace.

The white stems of the pines, which reflected the weak light, standing thick and close together while their lower branches were gone, reminded me that the pines are only larger grasses which rise to a chaffy head, and we the insects that crawl between them. They are particularly grass-like.

How long do the gales retain the heat of the sun? I find them retreated high up the sides of hills, especially on open fields or cleared places. Does, perchance, any of this pregnant air survive the dews of night? Can any of it be found remembering the sun of yesterday even in the morning hours. Does, perchance, some puff, some blast, survive the night on elevated clearings surrounded by the forest?

The bullfrog belongs to summer. The different frogs mark the seasons pretty well, — the peeping hyla, the dreaming frog, and the bullfrog. I believe that all may be heard at last occasionally together.

I heard partridges drumming to-night as late as 9 o'clock. What singularly space penetrating and filling sound! Why am I never nearer to its source?

We do not commonly live our life out and full; we do not fill all our pores with our blood; we do not inspire and expire fully and entirely enough, so that the wave, the comber, of each inspiration shall break upon our extremest shores, rolling till it meets the sand which bounds us, and the sound of the surf come back to us. Might not a bellows assist us to breathe? That our breathing should create a wind in a calm day! We live but a fraction of our life. Why do we not let on the flood, raise the gates, and set all our wheels in motion? He that hath ears to hear, let him hear. Employ your senses.

The newspapers tell us of news not to be named even with that in its own kind which an observing man can pick up in a solitary walk, as if it gained some importance and dignity by its publicness. Do we need to be advertised each day that such is still the routine of life?

The tree-toad's, too, is a summer sound.

I hear, just as the night sets in, faint notes from time to time from some sparrow (?) falling asleep, — a vesper hymn, — and later, in the woods, the chuckling, rattling sound of some unseen bird on the near trees. The nighthawk booms wide awake.

By moonlight we see not distinctly even the surface of the earth, but our daylight experience supplies us with confidence.

As I approached the pond down Hubbard's Path, after coming out of the woods into a warmer air, I saw the shimmering of the moon on its surface, and, in the near, now flooded cove, the water-bugs, darting, circling about, made streaks or curves of light. The moon's inverted pyramid of shimmering light commenced about twenty rods off, like so much micaceous sand. But I was startled to see midway in the dark water a bright flamelike, more than phosphorescent light crowning the crests of the wavelets,

which at first I mistook for fireflies, and thought even of cucullos. It had the appearance of a pure, smokeless flame a half-dozen inches long, issuing from the water and bending flickeringly along its surface. I thought of St. Elmo's lights and the like. But, coming near to the shore of the pond itself, these flames increased, and I saw that even this was so many broken reflections of the moon's disk, though one would have said they were of an intenser light than the moon herself; from contrast with the surrounding water they were. Standing up close to the shore and nearer the rippled surface, I saw the reflections of the moon sliding down the watery concave like so many lustrous burnished coins poured from a bag with inexhaustible lavishness, and the lambent flames on the surface were much multiplied, seeming to slide along a few inches with each wave before they were extinguished; and I saw how farther and farther off they gradually merged in the general sheen, which, in fact, was made up of a myriad little mirrors reflecting the disk of the moon with equal brightness to an eye rightly placed. The pyramid or sheaf of light which we see springing from near where we stand only, in fact, is the outline of that portion of the shimmering surface which an eye takes in. To myriad eyes suitably placed, the whole surface of the pond would be seen to shimmer, or rather it would be seen, as the waves turned up their mirrors, to be covered with those bright flame-like reflections of the moon's disk, like a myriad candles everywhere issuing from the waves; i.e. if there were as many eyes as angles presented by the waves, the whole surface would appear as bright as the moon; and these reflections are dispersed in all directions into the atmosphere, flooding it with light. No wonder that water reveals itself so far by night; even further in many states of the atmosphere than by day. I thought at first it some unusual phosphorescence. In some positions these flames were star-like points, brighter than the brightest stars. Suddenly a flame would show itself in a near and dark space, precisely like some inflammable gas on the surface, — as if an inflammable gas made its way up from the bottom.

I heard my old musical, simple-noted owl. The sound of the dreaming frogs prevails over the others. Occasionally a bullfrog near me made an obscene noise, a sound like an eructation, near me. I think they must be imbodyed eructations. They suggest flatulency.

The pond is higher than ever, so as to hinder fishermen, and I could hardly get to the true shore here on account of the bushes. I pushed out in a boat a little and heard the chopping of the waves under its bow. And on the bottom I saw the moving reflections of the shining waves, faint streaks of light revealing the shadows of the waves or the opaqueness of the water.

As I climbed the hill again toward my old bean-field, I listened to the ancient, familiar, immortal, dear cricket sound under all others, hearing at first some distinct chirps; but when these ceased I was aware of the general earth-song, which my hearing had not heard, amid which these were only taller flowers in a bed, and I wondered if behind or beneath this there was not some other chant yet more universal. Why do we not hear when this begins in the spring? and when it ceases in the fall? Or is it too gradual?

After I have got into the road I have no thought to record all the way home, — the walk is comparatively barren. The leafy elm sprays seem to droop more by night (??).

June 15. Sunday. Darwin still: — [3 pages of notes]

Saw the first wild rose to-day on the west side of the railroad causeway. The white-weed has suddenly appeared, and the clover gives whole fields a rich and florid appearance, — the rich red and the sweet-scented white. The fields are blushing with the red species as the western sky at evening. The blue-eyed grass, well named, looks up to heaven. And the yarrow, with its persistent dry stalks and heads, is now ready to blossom again. The dry stems and heads of last year's tansy stand high above the new green leaves.

After walking by night several times I now walk by day, but I am not aware of any crowning advantage in it. I see small objects better, but it does not enlighten me any. The day is more trivial.

June 29. There is a great deal of white clover this year. In many fields where there has been no clover seed sown for many years at least, it is more abundant than the red, and the heads are nearly as large. Also pastures which are close cropped, and where I think there was little or no clover last year, are spotted white with a humbler growth. As this is the season for the swarming of bees, and this clover is very attractive to them, it is probably the more difficult to secure them; at any rate it is the more important to secure their services now that they can make honey so fast. It is an interesting inquiry why this year is so favorable to the growth of clover!

The panicled cornel, a low shrub, in blossom by wallsides now.

I thought that one peculiarity of my "Week" was its hypæthral character, to use an epithet applied to those Egyptian temples which are open to the heavens above, under the ether. I thought that it had little of the atmosphere of the house about it, but might wholly have been written, as in fact it was to a considerable extent, out-of-doors. It was only at a late period in writing it, as it happened, that I used any phrases implying that I lived in a house or led a domestic life. I trust it does not smell of the study and library, even of the poet's attic, as of the fields and woods; that it is a hy-pæthral or unroofed book, lying open under the ether and permeated by it, open to all weathers, not easy to be kept on a shelf.

The potatoes are beginning to blossom.

July 2. A traveller! I love his title. A traveller is to be revered as such. His profession is the best symbol of our life. Going from — toward — ; it is the history of every one of us.

It takes but little distance to make the hills and even the meadows look blue to-day. That principle which gives the air an azure color is more abundant.

To-day the milkweed is blossoming. Some of the raspberries are ripe, the most innocent and simple of fruits, the purest and most ethereal. Cherries are ripe. Strawberries in the gardens have passed their prime.

July 6. There is some advantage in being the humblest, cheapest, least dignified man in the village, so that the very stable boys shall damn you. Methinks I enjoy that

advantage to an unusual extent. There is many a coarsely well-meaning fellow, who knows only the skin of me, who addresses me familiarly by my Christian name. I get the whole good of him and lose nothing myself.

The red clover heads are now turned black. It is but a short time that their rich bloom lasts. The white is black or withering also. Whiteweed still looks white in the fields. Blue-eyed grass is now rarely seen. The grass in the fields and meadows is not so fresh and fair as it was a fortnight ago. It is dryer and riper and ready for the mowers. Now June is past. June is the month for grass and flowers. Now grass is turning to hay, and flowers to fruits. Already I gather ripe blueberries on the hills. The red-topped grass is in its prime, tingeing the fields with red.

Golden senecio.

Corydalis.

Toad

["Cocuyo," a West Indian firefly.]

July 14. Passing over the Great Fields (where I have been surveying a road) this forenoon, where were some early turnips, the county commissioners plucked and pared them with their knives and ate them. I, too, tried hard to chew a mouthful of raw turnip and realize the life of cows and oxen, for it might be a useful habit in extremities. These things occur as the seasons revolve. These are things which travellers will do.

July 16. Wednesday. Methinks my present experience is nothing; my past experience is all in all. I think that no experience which I have to-day comes up to, or is comparable with, the experiences of my boyhood. And not only this is true, but as far back as I can remember I have unconsciously referred to the experiences of a previous state of existence. My life was ecstasy. In youth, before I lost any of my senses, I can remember that I was all alive, and inhabited my body with inexpressible satisfaction; both its weariness and its refreshment were sweet to me. I can remember how I was astonished. I looked in books for some recognition of a kindred experience, but, strange to say, I found none. With all your science can you tell how it is, and whence it is, that light comes into the soul?

Berries are just beginning to ripen, and children are planning expeditions after them. They are important as introducing children to the fields and woods, and as wild fruits of which much account is made. During the berry season the schools have a vacation, and many little fingers are busy picking these small fruits. It is ever a pastime, not a drudgery. I remember how glad I was when I was kept from school a half a day to pick huckleberries on a neighboring hill all by myself to make a pudding for the family dinner. Ah, they got nothing but the pudding, but I got invaluable experience beside! A half a day of liberty like that was like the promise of life eternal. It was emancipation in New England. O, what a day was there, my countrymen!

Now, at 4 P.M., I hear the pewee in the woods, and the cuckoo reminds me of some silence among the birds I had not noticed. The vireo (red-eyed?) sings like a robin at even, incessantly, — for I have now turned into Conant's woods. The oven-bird helps fill some pauses. The poison sumach shows its green berries, now unconscious of guilt.

The heart-leaved loosestrife (*Lysimachia ciliata*) is seen in low open woods. The breeze displays the white under sides of the oak leaves and gives a fresh and flowing look to the woods. The river is a dark-blue winding stripe amid the green of the meadow. What is the color of the world? Green mixed with yellowish and reddish for hills and ripe grass, and darker green for trees and forests; blue spotted with dark and white for sky and clouds, and dark blue for water. Beyond the old house I hear the squirrel chirp in the wall like a sparrow; so Nature merges her creations into one. I am refreshed by the view of Nobscot and the southwestern vales, from Conantum, seething with the blue element. Here comes a small bird with a ricochet flight and a faint twittering note like a messenger from Elysium. The rush sparrow jingles her small change, pure silver, on the counter of the pasture. From far I see the rye stacked up. A few dead trees impart the effect of wildness to the landscape, though it is a feature rare in an old settled country.

Green apples are now so large as to remind me of coddling and the autumn again. The season of fruits is arrived. The dog's-bane has a pretty, delicate bell-like flower. The Jersey tea abounds. I see the marks of the scythes in the fields, showing the breadth of each swath the mowers cut. Filberts are formed, and you may get the berry stains out of your hands with their husks, if you have any. Nightshade is in blossom. Came through the pine plains behind James Baker's, where late was open pasture. These are among our pleasantest woods, — open, level, with blackberry vines interspersed and flowers, as lady's-slippers, earlier, and pinks on the outskirts. Each tree has room enough. And now I hear the wood thrush from the shade, who loves these pine woods as well as I.

July 18. I might have added to the list of July 16th the *Aralia hispida*, bristling aralia; the heart-leaved loosestrife (*Lysimachia ciliata*); also the upright loosestrife (*L. racemosa*), with a rounded terminal raceme; the tufted vetch (*Vicia cracca*). Sweet-gale fruit now green.

July 19. Here I am thirty-four years old, and yet my life is almost wholly unexpanded. How much is in the germ! There is such an interval between my ideal and the actual in many instances that I may say I am unborn. There is the instinct for society, but no society. Life is not long enough for one success. Within another thirty-four years that miracle can hardly take place. Methinks my seasons revolve more slowly than those of nature; I am differently timed. I am contented. This rapid revolution of nature, even of nature in me, why should it hurry me? Let a man step to the music which he hears, however measured. Is it important that I should mature as soon as an apple tree? aye, as soon as an oak? May not my life in nature, in proportion as it is supernatural, be only the spring and infantile portion of my spirit's life? Shall I turn my spring to summer? May I not sacrifice a hasty and petty completeness here to entireness there? If my curve is large, why bend it to a smaller circle? My spirit's unfolding observes not the pace of nature. The society which I was made for is not here.

July 22. The season of morning fogs has arrived. I think it is connected with dog-days. Perhaps it is owing to the greater contrast between the night and the day, the nights being nearly as cold, while the days are warmer?

I bathe me in the river. I lie down where it is shallow, amid the weeds over its sandy bottom; but it seems shrunken and parched; I find it difficult to get wet through. I would fain be the channel of a mountain brook. I bathe, and in a few hours I bathe again, not remembering that I was wetted before. When I come to the river, I take off my clothes and carry them over, then bathe and wash off the mud and continue my walk. I would fain take rivers in my walks endwise.

July 23. 8 A.M. — A comfortable breeze blowing. Methinks I can write better in the afternoon, for the novelty of it, if I should go abroad this morning. My genius makes distinctions which my understanding cannot, and which my senses do not report. If I should reverse the usual, — go forth and saunter in the fields all the forenoon, then sit down in my chamber in the afternoon, which it is so unusual for me to do, — it would be like a new season to me, and the novelty of it inspire me. The wind has fairly blown me outdoors; the elements were so lively and active, and I so sympathized with them, that I could not sit while the wind went by. Is the literary man to live always or chiefly sitting in a chamber through which nature enters by a window only? What is the use of the summer?

The mind is subject to moods, as the shadows of clouds pass over the earth. Pay not too much heed to them. Let not the traveller stop for them. They consist with the fairest weather. By the mood of my mind, I suddenly felt dissuaded from continuing my walk, but I observed at the same instant that the shadow of a cloud was passing over the spot on which I stood, though it was of small extent, which, if it had no connection with my mood, at any rate suggested how transient and little to be regarded that mood was. I kept on, and in a moment the sun shone on my walk within and without.

The button-bush in blossom. The tobacco-pipe in damp woods. Certain localities only a few rods square in the fields and on the hills, sometimes the other side of a wall, attract me as if they had been the scene of pleasure in another state of existence.

But this habit of close observation, — in Humboldt, Darwin, and others. Is it to be kept up long, this science? Do not tread on the heels of your experience. Be impressed without making a minute of it. Poetry puts an interval between the impression and the expression, — waits till the seed germinates naturally.

July 25. Friday. Started for Clark's Island at 7 A.M.

At 9 A.M. took the Hingham boat and was landed at Hull. There was a pleasure party on board, apparently boys and girls belonging to the South End, going to Hingham. There was a large proportion of ill-dressed and ill-mannered boys of Irish extraction. A sad sight to behold! Little boys of twelve years, prematurely old, sucking cigars! I felt that if I were their mothers I should whip them and send them to bed. Such children should be dealt with as for stealing or impurity. What right have parents to beget, to bring up, and attempt to educate children in a city? I thought of

infanticide among the Orientals with complacency. I seemed to hear infant voices lisp, "Give us a fair chance, parents." There is no such squalidness in the country.

July 29. Tuesday. A northeast wind with rain, but the sea is the wilder for it. In the afternoon I sailed to Plymouth, three miles, notwithstanding the drizzling rain, or "drisk," as Uncle Ned called it. We passed round the head of Plymouth beach, which is three miles long. I did not know till afterward that I had landed where the Pilgrims did and passed over the Rock on Hedge's Wharf. Returning, we had more wind and tacking to do.

This sailing on salt water was something new to me. The boat is such a living creature, even this clumsy one sailing within five points of the wind. The sailboat is an admirable invention, by which you compel the wind to transport you even against itself. It is easier to guide than a horse; the slightest pressure on the tiller suffices. I think the inventor must have been greatly surprised, as well as delighted, at the success of his experiment. It is so contrary to expectation, as if the elements were disposed to favor you. This deep, unfordable sea! but this wind ever blowing over it to transport you! At 10 P.M. it was perfectly fair and bright starlight.

July 31. At 11 A.M. set sail to Plymouth.

Mr. Thomas Russell, who cannot be seventy, at whose house on Leyden Street I took tea and spent the evening, told me that he remembered to have seen Ebenezer Cobb, a native of Plymouth, who died in Kingston in 1801, aged one hundred and seven, who remembered to have had personal knowledge of Peregrine White, saw him an old man riding on horseback (he lived to be eighty-three). White was born at Cape Cod Harbor before the Pilgrims got to Plymouth. Pilgrim Hall. They used to crack off pieces of the Forefathers' Rock for visitors with a cold chisel, till the town forbade it. The stone remaining at wharf is about seven feet square.

LEFT Plymouth at 9 A.M., August 1st.

I could make a list of things ill-managed. We Yankees do not deserve our fame. Viz.: Why have we not a decent pocket-map of the State of Massachusetts? There is the large map. Why is it not cut into half a dozen sheets and folded into a small cover for the pocket? Are there no travellers to use it? Well, to tell the truth, there are but few, and that's the reason why. Men go by railroad, and State maps hanging in bar-rooms are small enough. The State has been admirably surveyed at a great cost, and yet Dearborn's Pocket-Map is the best one we have!

Aug. 4. As my eye rested on the blossom of the meadow-sweet in a hedge, I heard the note of an autumnal cricket, and was penetrated with the sense of autumn. Was it sound? or was it form? or was it scent? or was it flavor? It is now the royal month of August.

Aug. 5. Ah, what a poor, dry compilation is the "Annual of Scientific Discovery!" I trust that observations are made during the year which are not chronicled there, — that some mortal may have caught a glimpse of Nature in some corner of the earth during the year 1851. One sentence of perennial poetry would make me forget, would atone for, volumes of mere science. The astronomer is as blind to the significant phenomena,

or the significance of phenomena, as the wood-sawyer who wears glasses to defend his eyes from sawdust. The question is not what you look at, but what you see.

Aug. 8. 7.30 P.M. — To Conantum.

The moon has not yet quite filled her horns.

Might not this be called the Invalid's Moon, on account of the warmth of the nights? The principal employment of the farmers now seems to be getting their meadow-hay and cradling some oats, etc.

Aug. 17. For a day or two it has been quite cool, a coolness that was felt even when sitting by an open window in a thin coat on the west side of the house in the morning, and you naturally sought the sun at that hour. The coolness concentrated your thought, however. As I could not command a sunny window, I went abroad on the morning of the 15th and lay in the sun in the fields in my thin coat, though it was rather cool even there. I feel as if this coolness would do me good. If it only makes my life more pensive! Why should pensiveness be akin to sadness? There is a certain fertile sadness which I would not avoid, but rather earnestly seek. It is positively joyful to me. It saves my life from being trivial. My life flows with a deeper current, no longer as a shallow and brawling stream, parched and shrunken by the summer heats. My heart leaps into my mouth at the sound of the wind in the woods. I, whose life was but yesterday so desultory and shallow, suddenly recover my spirits, my spirituality, through my hearing. For joy I could embrace the earth; I shall delight to be buried in it. And then to think of those I love among men, who will know that I love them though I tell them not! I sometimes feel as if I were rewarded merely for expecting better hours. I did not despair of worthier moods, and now I have occasion to be grateful for the flood of life that is flowing over me. I am not so poor: I can smell the ripening apples; the very rills are deep; the autumnal flowers, the *Trichostema dichotomum*, — not only its bright blue flower above the sand, but its strong wormwood scent which belongs to the season, — feed my spirit, endear the earth to me, make me value myself and rejoice; the quivering of pigeons' wings reminds me of the tough fibre of the air which they rend. I thank you, God. I do not deserve anything, I am unworthy of the least regard; and yet I am made to rejoice. I am impure and worthless, and yet the world is gilded for my delight and holidays are prepared for me, and my path is strewn with flowers. It seems to me that I am more rewarded for my expectations than for anything I do or can do. And why should I speak to my friends? for how rarely is it that I am I; and are they, then, they? We will meet, then, far away. Ah, the very brooks seem fuller of reflections than they were! Ah, such provoking sibylline sentences they are! The shallowest is all at once unfathomable. How can that depth be fathomed where a man may see himself reflected? The rill I stopped to drink at I drink in more than I expected. Nut Meadow Brook where it crosses the road beyond Jenny Dugan's that was. I do not drink in vain. I mark that brook as if I had swallowed a water snake that would live in my stomach. I have swallowed something worth the while. The day is not what it was before I stooped to drink. Ah, I shall hear from that draught! It is not in

vain that I have drunk. I have drunk an arrowhead. It flows from where all fountains rise.

How many ova have I swallowed? Who knows what will be hatched within me? There were some seeds of thought, methinks, floating in that water, which are expanding in me. The man must not drink of the running streams, the living waters, who is not prepared to have all nature reborn in him, — to suckle monsters. The snake in my stomach lifts his head to my mouth at the sound of running water. When was it that I swallowed a snake? I have got rid of the snake in my stomach. I drank of stagnant waters once. That accounts for it. I caught him by the throat and drew him out, and had a well day after all. Is there not such a thing as getting rid of the snake which you have swallowed when young, when thoughtless you stooped and drank at stagnant waters, which has worried you in your waking hours and in your sleep ever since, and appropriated the life that was yours? Will he not ascend into your mouth at the sound of running water? Then catch him boldly by the head and draw him out, though you may think his tail be curled about your vitals.

Aug. 19. Clematis Virginiana; calamint; Lycopus Europeus, water horehound.

This is a world where there are flowers.

P.M.— To Marlborough Road via Clamshell Hill, Jenny Dugan's, Round Pond, Canoe Birch Road (Deacon Dakin's), and White Pond.

The poet must be continually watching the moods of his mind, as the astronomer watches the aspects of the heavens. What might we not expect from a long life faithfully spent in this wise? The humblest observer would see some stars shoot. A faithful description as by a disinterested person of the thoughts which visited a certain mind in threescore years and ten, as when one reports the number and character of the vehicles which pass a particular point. As travellers go round the world and report natural objects and phenomena, so faithfully let another stay at home and report the phenomena of his own life, — catalogue stars, those thoughts whose orbits are as rarely calculated as comets. It matters not whether they visit my mind or yours, — only that it come from heaven. A meteorological journal of the mind. You shall observe what occurs in your latitude, I in mine.

The grass in the high pastures is almost as dry as hay. The seasons do not cease a moment to revolve, and therefore Nature rests no longer at her culminating point than at any other. If you are not out at the right instant, the summer may go by and you not see it. How much of the year is spring and fall! how little can be called summer! The grass is no sooner grown than it begins to wither.

I do not like to hear the name of particular States given to birds and flowers which are found in all equally, — an Maryland yellow-throat, etc., etc. The Canadenses and Virginicas may be suffered to pass for the most part, for there is historical as well as natural reason at least for them. Canada is the peculiar country of some and the northern limit of many more plants. And Virginia, which was originally the name for all the Atlantic shore, has some right to stand for the South.

I fear that the character of my knowledge is from year to year becoming more distinct and scientific; that, in exchange for views as wide as heaven's cope, I am being narrowed down to the field of the microscope. I see details, not wholes nor the shadow of the whole. I count some parts, and say, "I know." The cricket's chirp now fills the air in dry fields near pine woods.

Aug. 20. The *Rhexia Virginica* is a showy flower at present.

How copious and precise the botanical language to describe the leaves, as well as the other parts of a plant! Botany is worth studying if only for the precision of its terms, — to learn the value of words and of system. It is wonderful how much pains has been taken to describe a flower's leaf, compared for instance with the care that is taken in describing a psychological fact. Suppose as much ingenuity (perhaps it would be needless) in making a language to express the sentiments! We are armed with language adequate to describe each leaf in the field, or at least to distinguish it from each other, but not to describe a human character.

Aug. 22. It is the fault of some excellent writers — De Quincey's first impressions on seeing London suggest it to me — that they express themselves with too great fullness and detail. They give the most faithful, natural, and lifelike account of their sensations, mental and physical, but they lack moderation and sententiousness. They do not affect us by an ineffectual earnestness and a reserve of meaning, like a stutterer; they say all they mean. Their sentences are not concentrated and nutty. Sentences which suggest far more than they say, which have an atmosphere about them, which do not merely report an old, but make a new, impression; sentences which suggest as many things and are as durable as a Roman aqueduct; to frame these, that is the art of writing. Sentences which are expensive, towards which so many volumes, so much life, went; which lie like boulders on the page, up and down or across; which contain the seed of other sentences, not mere repetition, but creation. If De Quincey had suggested each of his pages in a sentence and passed on, it would have been far more excellent writing.

Aug. 28. The pretty little blue flower in the Heywood Brook, Class V, Order 1. Corolla about one sixth of an inch in diameter, with five rounded segments; stamens and pistil shorter than corolla; calyx with five acute segments and acute sinuses; leaves not opposite, lanceolate, spatulate, blunt, somewhat hairy on upper side with a midrib only, sessile; flowers in a loose raceme on rather long pedicels. Whole plant decumbent, curving upward. Wet ground. Said to be like the forget-me-not.

*Raphanus Raphanistrum*, or wild radish, in meadows.

Evening. — A new moon visible in the east.

I omit the unusual — the hurricanes and earthquakes — and describe the common. This has the greatest charm and is the true theme of poetry. You may have the extraordinary for your province, if you will let me have the ordinary. Give me the obscure life, the cottage of the poor and humble, the workdays of the world, the barren fields, the smallest share of all things but poetic perception. Give me but the eyes to see the things which you possess.

Aug. 29. The air is filled with mist, yet a transparent mist, a principle in it you might call flavor, which ripens fruits. This haziness seems to confine and concentrate the sunlight, as if you lived in a halo. It is August.

Aug. 31. One of these drooping clusters of potato balls would be as good a symbol, emblem, of the year's fertility as anything, — better surely than a bunch of grapes. Fruit of the strong soil, containing potash (?). The vintage is come; the olive is ripe.

Why not for my coat-of-arms, for device, a drooping cluster of potato balls, — in a potato field?

What right has a New England poet to sing of wine, who never saw a vineyard, who obtains his liquor from the grocer. A Yankee singing in praise of wine! It is not sour grapes in this case, it is sweet grapes; the more inaccessible they are the sweeter they are. It seemed to me that the year had nothing so much to brag of as these potato balls. Do they not concern New-Englanders a thousand times more than all her grapes?

Sept. 1. Is not disease the rule of existence? There is not a lily pad floating on the river but has been riddled by insects. Almost every shrub and tree has its gall, often-times esteemed its chief ornament and hardly to be distinguished from the fruit. If misery loves company, misery has company enough. Now, at midsummer, find me a perfect leaf or fruit.

Sept. 2. What affinity is it brings the goldfinch to the sunflower — both yellow — to pick its seeds? Whatever things I perceive with my entire man, those let me record, and it will be poetry.

In a day or two the first message will be conveyed or transmitted over the magnetic telegraph through this town, as a thought traverses space, and no citizen of the town shall be aware of it. The atmosphere is full of telegraphs equally unobserved. We are not confined to Morse's or House's or Bain's line.

Raise some sunflowers to attract the goldfinches, to feed them as well as your hens. I now begin to pluck wild apples.

Old Cato says well, "*Patremfamilias vendacem, non emacem, esse oportet.*" These Latin terminations express better than any English that I know the greediness, as it were, and tenacity of purpose with which the husbandman and householder is required to be a seller and not a buyer, — with mastiff-like tenacity, — these lipped words, which, like the lips of moose and browsing creatures, gather in the herbage and twigs with a certain greed. This termination *cious* adds force to a word, like the lips of browsing creatures, which greedily collect what the jaw holds; as in the word "tenacious" the first half represents the kind of jaw which holds, the last the lips which collect. It can only be pronounced by a certain opening and protruding of the lips; so "avaricious." These words express the sense of their simple roots with the addition, as it were, of a certain lip greediness. Hence "capacious" and "capacity," "emacity." When these expressive words are used, the hearer gets something to chew upon. What is luscious is especially enjoyed by the lips. To be edacious and voracious is to be not nibbling and swallowing merely, but eating and swallowing while the lips are greedily collecting more food.

There is a reptile in the throat of the greedy man always thirsting and famishing. It is not his own natural hunger and thirst which he satisfies.

A fire in the sitting-room to-day. Walk in the afternoon by Walden road and railroad to Minn's place, and round it to railroad and home. Carried umbrellas, it mizzling. As in the night, now in the rain, I smell the fragrance of the woods. The prunella leaves have turned a delicate claret or lake color by the roadside. I am interested in these revolutions as much as in those of kingdoms. Is there not tragedy enough in the autumn? Walden seems to be going down at last.

Sept. 3. Why was there never a poem on the cricket? Its creak seems to me to be one of the most prominent and obvious facts in the world, and the least heeded.

2 P.M. — To Hubbard's Swimming-Place and Grove in rain.

As I went under the new telegraph-wire, I heard it vibrating like a harp high overhead. It was as the sound of a far-off glorious life, a supernal life, which came down to us, and vibrated the lattice-work of this life of ours.

The ivy leaves are turning red. Fall dandelions stand thick in the meadows.

How much the Roman must have been indebted to his agriculture, dealing with the earth, its clods and stubble, its dust and mire. Their farmer consuls were their glory, and they well knew the farm to be the nursery of soldiers. Read Cato to see what kind of legs the Romans stood on.

Walk often in drizzly weather, for then the small weeds (especially if they stand on bare ground), covered with rain-drops like beads, appear more beautiful than ever, — the hypericums, for instance. They are equally beautiful when covered with dew, fresh and adorned, almost spirited away, in a robe of dewdrops.

Identified spotted spurge (*Euphorbia maculata*), apparently out of blossom. Shepherd's-purse and chickweed.

As for walking, the inhabitants of large English towns are confined almost exclusively to their parks and to the highways. The few footpaths in their vicinities "are gradually vanishing," says Wilkinson, "under the encroachments of the proprietors." He proposes that the people's right to them be asserted and defended and that they be kept in a passable state at the public expense. "This," says he, "would be easily done by means of asphalt laid upon a good foundation"!!! So much for walking, and the prospects of walking, in the neighborhood of English large towns.

I should die from mere nervousness at the thought of such confinement. I should hesitate before I were born, if those terms could be made known to me beforehand. Fenced in forever by those green barriers of fields, where gentlemen are seated! Can they be said to be inhabitants of this globe? Will they be content to inhabit heaven thus partially?

Sept. 4. We drink in the meadow at Second Division Brook, then sit awhile to watch its yellowish pebbles and the cress (?) in it and other weeds. The ripples cover its surface like a network and are faithfully reflected on the bottom. In some places, the sun reflected from ripples on a flat stone looks like a golden comb. The whole brook seems as busy as a loom: it is a woof and warp of ripples; fairy fingers are throwing

the shuttle at every step, and the long, waving brook is the fine product. The water is wonderfully clear.

In the summer we lay up a stock of experiences for the winter, as the squirrel of nuts, — something for conversation in winter evenings. I love to think then of the more distant walks I took in summer.

At the powder-mills the carbonic acid gas in the road from the building where they were making charcoal made us cough for twenty or thirty rods.

Saw some gray squirrels whirling their cylinder by the roadside. How fitted that cylinder to this animal! "A squirrel is easily taught to turn his cylinder" might be a saying frequently applicable. And as they turned, one leaped over or dodged under another most gracefully and unexpectedly, with interweaving motions. It was the circus and menagerie combined. So human they were, exhibiting themselves.

It is wise to write on many subjects, to try many themes, that so you may find the right and inspiring one. Be greedy of occasions to express your thought. Improve the opportunity to draw analogies. There are innumerable avenues to a perception of the truth. Improve the suggestion of each object however humble, however slight and transient the provocation. What else is there to be improved? Who knows what opportunities he may neglect? It is not in vain that the mind turns aside this way or that: follow its leading; apply it whither it inclines to go. Probe the universe in a myriad points. Be avaricious of these impulses. You must try a thousand themes before you find the right one, as nature makes a thousand acorns to get one oak. He is a wise man and experienced who has taken many views; to whom stones and plants and animals and a myriad objects have each suggested something, contributed something.

And now, methinks, this wider wood-path is not bad, for it admits of society more conveniently. Two can walk side by side in it in the ruts, aye, and one more in the horse-track.

As I looked back up the stream from near the bridge (I suppose on the road from Potter's house to Stow), I on the railroad, I saw the ripples sparkling in the sun, reminding me of the sparkling icy fleets which I saw last winter; and I saw how one corresponded to the other, ice waves to water ones; the erect ice-flakes were the waves stereotyped. It was the same sight, the reflection of the sun sparkling from a myriad slanting surfaces at a distance, a rippled water surface or a crystallized frozen one.

Here crossed the river and climbed the high hills on the west side. The walnut trees conformed in their branches to the slope of the hill, being just as high from the ground on the upper side as on the lower.

Saw quite a flock, for the first time, of goldfinches.

On hillside north of river above powder-mills the *Pycnanthemum incanum* (mountain mint, calamint) and the *Lespedeza violacea*.

Sept. 5. Wilkinson's book to some extent realizes what I have dreamed of, — a return to the primitive analogical and derivative senses of words. His ability to trace analogies often leads him to a truer word than more remarkable writers have found; as when, in his chapter on the human skin, he describes the papillary cutis as "an

encampment of small conical tents coextensive with the surface of the body.” The faith he puts in old and current expressions as having sprung from an instinct wiser than science, and safely to be trusted if they can be interpreted. The man of science discovers no world for the mind of man with all its faculties to inhabit. Wilkinson finds a home for the imagination, and it is no longer outcast and homeless. All perception of truth is the detection of an analogy; we reason from our hands to our head.

Sept. 7. We sometimes experience a mere fullness of life, which does not find any channels to flow into. We are stimulated, but to no obvious purpose. I feel myself uncommonly prepared for some literary work, but I can select no work. I am prepared not so much for contemplation, as for forceful expression. I am braced both physically and intellectually. It is not so much the music as the marching to the music that I feel. I feel that the juices of the fruits which I have eaten, the melons and apples, have ascended to my brain and are stimulating it. They give me a heady force. Now I can write nervously. Carlyle’s writing is for the most part of this character.

Our ecstatic states, which appear to yield so little fruit, have this value at least: though in the seasons when our genius reigns we may be powerless for expression, yet, in calmer seasons, when our talent is active, the memory of those rarer moods comes to color our picture and is the permanent paint-pot, as it were, into which we dip our brush. Thus no life or experience goes unreported at last; but if it be not solid gold it is gold-leaf, which gilds the furniture of the mind. It is an experience of infinite beauty on which we unfailingly draw, which enables us to exaggerate ever truly. Our moments of inspiration are not lost though we have no particular poem to show for them; for those experiences have left an indelible impression, and we are ever and anon reminded of them. When I despair to sing them, I will remember that they will furnish me with paint with which to adorn and preserve the works of talent one day. They are like a pot of pure ether. It is the difference between our river, now parched and dried up, exposing its unsightly and weedy bottom, and the same when, in the spring, it covers all the meads with a chain of placid lakes, reflecting the forests and the skies.

We are receiving our portion of the infinite. The art of life! I do not remember any page which will tell me how to spend this afternoon. I do not so much wish to know how to economize time as how to spend it.

The scenery, when it is truly seen, reacts on the life of the seer. How to live. How to get the most life. How to extract its honey from the flower of the world. That is my every-day business. I am as busy as a bee about it. I ramble over all fields on that errand, and am never so happy as when I feel myself heavy with honey and wax. I am like a bee searching the livelong day for the sweets of nature. Do I not impregnate and intermix the flowers, produce rare and finer varieties by transferring my eyes from one to another? I do as naturally and as joyfully, with my own humming music, seek honey all the day. With what honeyed thought any experience yields me I take a bee line to my cell. It is with flowers I would deal.

I am convinced that men are not well employed, that this is not the way to spend a day. If by patience, if by watching, I can secure one new ray of light, can feel myself

elevated for an instant upon Pisgah, the world which was dead prose to me become living and divine, shall I not watch ever? shall I not be a watchman henceforth? If by watching a whole year on the city's walls I may obtain a communication from heaven, shall I not do well to shut up my shop and turn a watchman? We are surrounded by a rich and fertile mystery. May we not probe it, pry into it, employ ourselves about it, a little? To devote your life to the discovery of the divinity in nature or to the eating of oysters, would they not be attended with very different results?

I cannot easily buy a blank-book to write thoughts in; they are all ruled for dollars and cents.

If the wine, the water, which will nourish me grows on the surface of the moon, I will do the best I can to go to the moon for it.

We all have our states of fullness and of emptiness, but we overflow at different points. One overflows through the sensual outlets, another through his heart, another through his head, and another perchance only through the higher part of his head, or his poetic faculty. It depends on where each is tight and open. We can, perchance, then direct our nutriment to those organs we specially use.

To Conantum via fields, Hubbard's Grove, and grain-field, to Tupelo Cliff and Conantum and returning over peak same way. 6 P.M.

Sept. 12. I can hardly believe that there is so great a difference between one year and another as my journal shows. The 11th of this month last year, the river was as high as it commonly is in the spring, over the causeway on the Corner road. It is now quite low. Last year, October 9th, the huckleberries were fresh and abundant on Conantum. They are now already dried up.

On Monday, the 15th, I am going to perambulate the bounds of the town. As I am partial to across-lot routes, this appears to be a very proper duty for me to perform, for certainly no route can well be chosen which shall be more across-lot, since the roads in no case run round the town but ray out from its centre, and my course will lie across each one. It is almost as if I had undertaken to walk round the town at the greatest distance from its centre and at the same time from the surrounding villages. There is no public house near the line. It is a sort of reconnoissance of its frontiers authorized by the central government of the town, which will bring the surveyor in contact with whatever wild inhabitant or wilderness its territory embraces.

This appears to be a very ancient custom, and I find that this word "perambulation" has exactly the same meaning that it has at present in Johnson and Walker's dictionary. A hundred years ago they went round the towns of this State every three years. And the old selectmen tell me that, before the present split stones were set up in 1829, the bounds were marked by a heap of stones, and it was customary for each selectman to add a stone to the heap.

Sept. 14. A great change in the weather from sultry to cold, from one thin coat to a thick coat or two thin ones.

2 P.M. — To Cliffs.

SEPT. 15. MONDAY. Ice in the pail under the pump, and quite a frost.

Commenced perambulating the town bounds. At 7.30 A.M. rode in company with A. A. Kelsey and Mr. Tolman to the bound between Acton and Concord near Paul Dudley's. Mr. Tolman told a story of his wife walking in the fields somewhere, and, to keep the rain off, throwing her gown over her head and holding it in her mouth, and so being poisoned about her mouth from the skirts of her dress having come in contact with poisonous plants. At Dudley's, which house is handsomely situated, with five large elms in front, we met the selectmen of Acton, Ivory Keyes and Luther Conant. Here were five of us. It appeared that we weighed, — Tolman I think about 160, Conant 155, Keyes about 140, Kelsey 130, myself 127. — described the wall about or at Forest Hills Cemetery in Roxbury as being made of stones upon which they were careful to preserve the moss, so that it cannot be distinguished from a very old wall.

Found one intermediate bound-stone near the powder-mill drying-house on the bank of the river. The workmen there wore shoes without iron tacks. He said that the kernel-house was the most dangerous, the drying-house next, the press-house next. One of the powder-mill buildings in Concord? The potato vines and the beans which were still green are now blackened and flattened by the frost.

SEPT. 16. Met the selectmen of Sudbury, Moore and Haines. I trust that towns will remember that they are supposed to be fairly represented by their select men. From the specimen which Acton sent, I should judge that the inhabitants of that town were made up of a mixture of quiet, respectable, and even gentlemanly farmer people, well to do in the world, with a rather boisterous, coarse, and a little self-willed class; that the inhabitants of Sudbury are farmers almost exclusively, exceedingly rough and countrified and more illiterate than usual, very tenacious of their rights and dignities and difficult to deal with; that the inhabitants of Lincoln yield sooner than usual to the influence of the rising generation, and are a mixture of rather simple but clever with a well-informed and trustworthy people; that the inhabitants of Bedford are mechanics, who aspire to keep up with the age, with some of the polish of society, mingled with substantial and rather intelligent farmers.

Moore of Sudbury thinks the river would be still lower now if it were not for the water in the reservoir pond in Hopkinton running into it.

SEPT. 17. Perambulated the Lincoln line.

Was it the small rough sunflower which I saw this morning at the brook near Lee's Bridge?

Saw at James Baker's a buttonwood tree with a swarm of bees now three years in it, but honey and all inaccessible. John W. Farrar tells of sugar maples behind Miles's in the Corner.

Did I see privet in the swamp at the Bedford stone near Giles's house? Swamp all dry now; could not wash my hands.

SEPT. 18. Perambulated Bedford line.

Sept. 20. 3 P.M. — To Cliffs via Bear Hill.

As I go through the fields, endeavoring to recover my tone and sanity and to perceive things truly and simply again, after having been perambulating the bounds of the

town all the week, and dealing with the most commonplace and worldly-minded men, and emphatically trivial things, I feel as if I had committed suicide in a sense. I am again forcibly struck with the truth of the fable of Apollo serving King Admetus, its universal applicability. A fatal coarseness is the result of mixing in the trivial affairs of men. Though I have been associating even with the select men of this and the surrounding towns, I feel inexpressibly begrimed. My Pegasus has lost his wings; he has turned a reptile and gone on his belly. Such things are compatible only with a cheap and superficial life.

The poet must keep himself unstained and aloof. Let him perambulate the bounds of Imagination's provinces, the realms of faery, and not the insignificant boundaries of towns. The excursions of the imagination are so boundless, the limits of towns are so petty.

Sept. 22. To the Three Friends' Hill over Bear Hill.

Yesterday and to-day the stronger winds of autumn have begun to blow, and the telegraph harp has sounded loudly. I heard it especially in the Deep Cut this afternoon, the tone varying with the tension of different parts of the wire. The sound proceeds from near the posts, where the vibration is apparently more rapid. I put my ear to one of the posts, and it seemed to me as if every pore of the wood was filled with music, labored with the strain, — as if every fibre was affected and being seasoned or timed, rearranged according to a new and more harmonious law. Every swell and change or inflection of tone pervaded and seemed to proceed from the wood, the divine tree or wood, as if its very substance was transmuted. What a recipe for preserving wood, perchance, — to keep it from rotting, — to fill its pores with music!

Shall we not add a tenth Muse to the immortal Nine? And that the invention thus divinely honored and distinguished — on which the Muse has condescended to smile — is this magic medium of communication for mankind!

To read that the ancients stretched a wire round the earth, attaching it to the trees of the forest, by which they sent messages by one named Electricity, father of Lightning and Magnetism, swifter far than Mercury, the stern commands of war and news of peace, and that the winds caused this wire to vibrate so that it emitted a harp-like and æolian music in all the lands through which it passed, as if to express the satisfaction of the gods in this invention. Yet this is fact, and we have yet attributed the invention to no god.

Sept. 23. Notwithstanding the fog, the fences this morning are covered with so thick a frost that you can write your name anywhere with your nail.

Sept. 24. 8 A.M. — To Lee's Bridge via Conantum.

It is a cool and windy morning, and I have donned a thick coat for a walk. The wind is from the north, so that the telegraph harp does not sound where I cross. This windy autumnal weather is very exciting and bracing, clear and cold, after the rain of yesterday, it having cleared off in the night.

What can be handsomer for a picture than our river scenery now? Take this view from the first Conantum Cliff. First this smoothly shorn meadow on the west side

of the stream, with all the swaths distinct, sprinkled with apple trees casting heavy shadows black as ink, such as can be seen only in this clear air, this strong light, one cow wandering restlessly about in it and lowing; then the blue river, scarcely darker than and not to be distinguished from the sky, its waves driven southward, or upstream, by the wind, making it appear to flow that way, bordered by willows and button-bushes; then the narrow meadow beyond, with varied lights and shades from its waving grass, which for some reason has not been cut this year, though so dry, now at length each grass-blade bending south before the wintry blast, as if bending for aid in that direction; then the hill rising sixty feet to a terrace-like plain covered with shrub oaks, maples, etc., now variously tinted, clad all in a livery of gay colors, every bush a feather in its cap; and further in the rear the woodcrowned Cliff some two hundred feet high, where gray rocks here and there project from amidst the bushes, with its orchard on the slope; and to the right of the Cliff the distant Lincoln hills in the horizon. The landscape so handsomely colored, the air so clear and wholesome; and the surface of the earth is so pleasingly varied, that it seems rarely fitted for the abode of man.

In Cohush Swamp the sumach leaves have turned a very deep red, but have not lost their fragrance. I notice wild apples growing luxuriantly in the midst of the swamp, rising red over the colored, painted leaves of the sumach, and reminding me that they were ripened and colored by the same influences, — some green, some yellow, some red, like the leaves.

Fell in with a man whose breath smelled of spirit which he had drunk. How could I but feel that it was his own spirit that I smelt? Behind Miles's, Darius Miles's, that was, I asked an Irishman how many potatoes he could dig in a day, wishing to know how well they yielded. "Well, I don't keep any account," he answered; "I scratch away, and let the day's work praise itself." Aye, there's the difference between the Irishman and the Yankee; the Yankee keeps an account. The simple honesty of the Irish pleases me. A sparrow hawk, hardly so big as a nighthawk, flew over high above my head, — a pretty little graceful fellow, too small and delicate to be rapacious.

Such near hills as Nobscot and Nashoba have lost all their azure in this clear air and plainly belong to earth. Give me clearness nevertheless, though my heavens be moved further off to pay for it.

Get home at noon.

At sundown the wind has all gone down.

Sept. 25. The season of flowers may be considered as past now that the frosts have come. Fires have become comfortable. The evenings are pretty long.

2 P.M. — To bathe in Hubbard's meadow, thence to Cliffs. I find the water suddenly cold, and that the bathing days are over.

I see numerous butterflies still, yellow and small red, though not in fleets. Examined the hornets' nest near Hubbard's Grove, suspended from contiguous huckleberry bushes. The tops of the bushes appearing to grow out of it, little leafy sprigs, had a pleasing effect.

SEPT. 26. Since I perambulated the bounds of the town, I find that I have in some degree confined myself, — my vision and my walks. On whatever side I look off I am reminded of the mean and narrow-minded men whom I have lately met there. What can be uglier than a country occupied by grovelling, coarse, and low-lived men? No scenery will redeem it. What can be more beautiful than any scenery inhabited by heroes? Any landscape would be glorious to me, if I were assured that its sky was arched over a single hero. Hornets, hyenas, and baboons are not so great a curse to a country as men of a similar character. It is a charmed circle which I have drawn around my abode, having walked not with God but with the devil. I am too well aware when I have crossed this line.

Most New England biographies and journals — John Adams's not excepted — affect me like opening of the tombs.

The prudent and seasonable farmers are already plowing against another year.

Sept. 28. 2 P.M. — To Conantum.

A warm, damp, mistling day, without much wind. The white pines in Hubbard's Grove have now a pretty distinct parti-colored look, — green and yellow mottled, — reminding me of some plants like the milkweed, expanding with maturity and pushing off their downy seeds. They have a singularly soft look. For a week or ten days I have ceased to look for new flowers or carry my botany in my pocket.

I see where the squirrels have carried off the ears of corn more than twenty rods from the corn-field into the woods. A little further on, beyond Hubbard's Brook, I saw a gray squirrel with an ear of yellow corn a foot long sitting on the fence, fifteen rods from the field. He dropped the corn, but continued to sit on the rail, where I could hardly see him, it being of the same color with himself, which I have no doubt he was well aware of. He next took to a red maple, where his policy was to conceal himself behind the stem, hanging perfectly still there till I passed, his fur being exactly the color of the bark. When I struck the tree and tried to frighten him, he knew better than to run to the next tree, there being no continuous row by which he might escape; but he merely fled higher up and put so many leaves between us that it was difficult to discover him. When I threw up a stick to frighten him, he disappeared entirely, though I kept the best watch I could, and stood close to the foot of the tree. They are wonderfully cunning.

Sept. 30. The white ash has got its autumnal mulberry hue. What is the autumnal tint of the black ash? The former contrasts strongly with the other shade-trees on the village street — the elms and buttonwoods — at this season, looking almost black at the first glance. The different characters of the trees appear more clearly at this season, when their leaves, so to speak, are ripe, than at any other. It is with leaves as with fruits and woods, and animals and men; when they are mature their different characters appear.

Oct. 1. 5 P.M. — Just put a fugitive slave, who has taken the name of Henry Williams, into the cars for Canada. He escaped from Stafford County, Virginia, to Boston last October; has been in Shad-rach's place at the Cornhill Coffee-House; had

been corresponding through an agent with his master, who is his father, about buying himself, his master asking \$600, but he having been able to raise only \$500. Heard that there were writs out for two Williamsses, fugitives, and was informed by his follow-servants and employer that Augerhole Burns and others of the police had called for him when he was out. Accordingly fled to Concord last night on foot, bringing a letter to our family from Mr. Lovejoy of Cambridge and another which Garrison had formerly given him on another occasion. He lodged with us, and waited in the house till funds were collected with which to forward him. Intended to dispatch him at noon through to Burlington, but when I went to buy his ticket, saw one at the depot who looked and behaved so much like a Boston policeman that I did not venture that time. An intelligent and very well-behaved man, a mulatto.

The slave said he could guide himself by many other stars than the north star, whose rising and setting he knew. They steered for the north star even when it had got round and appeared to them to be in the south. They frequently followed the telegraph when there was no railroad. The slaves bring many superstitions from Africa. The fugitives sometimes superstitiously carry a turf in their hats, thinking that their success depends on it.

These days when the trees have put on their autumnal tints are the gala days of the year, when the very foliage of trees is colored like a blossom. It is a proper time for a yearly festival, an agricultural show.

Oct. 4. Minott used the word "gavel" to describe a parcel of stalks cast on the ground to dry. His are good old English words, and I am always sure to find them in the dictionary, though I never heard them before in my life.

I was admiring his corn-stalks disposed about the barn to dry, over or astride the braces and the timbers, of such a fresh, clean, and handsome green, retaining their strength and nutritive properties so, unlike the gross and careless husbandry of speculating, money-making farmers, who suffer their stalks to remain out till they are dry and dingy and black as chips.

Minott is, perhaps, the most poetical farmer — who most realizes to me the poetry of the farmer's life — that I know. He does nothing with haste and drudgery, but as if he loved it. He makes the most of his labor, and takes infinite satisfaction in every part of it. He is not looking forward to the sale of his crops or any pecuniary profit, but he is paid by the constant satisfaction which his labor yields him. He has not too much land to trouble him, — too much work to do, — no hired man nor boy, — but simply to amuse himself and live. He cares not so much to raise a large crop as to do his work well. He knows every pin and nail in his barn. If another linter is to be floored, he lets no hired man rob him of that amusement, but he goes slowly to the woods and, at his leisure, selects a pitch pine tree, cuts it, and hauls it or gets it hauled to the mill; and so he knows the history of his barn floor.

He always prophesies a failure of the crops, and yet is satisfied with what he gets. His barn floor is fastened down with oak pins, and he prefers them to iron spikes, which he says will rust and give way. He handles and amuses himself with every ear of his

corn crop as much as a child with its playthings, and so his small crop goes a great way. He might well cry if it were carried to market. The seed of weeds is no longer in his soil.

He loves to walk in a swamp in windy weather and hear the wind groan through the pines. He keeps a cat in his barn to catch the mice. He indulges in no luxury of food or dress or furniture, yet he is not penurious but merely simple. If his sister dies before him, he may have to go to the almshouse in his old age; yet he is not poor, for he does not want riches. He gets out of each manipulation in the farmers' operations a fund of entertainment which the speculating drudge hardly knows. With never-failing rheumatism and trembling hands, he seems yet to enjoy perennial health. Though he never reads a book, — since he has finished the "Naval Monument," — he speaks the best of English.

Oct. 5. Sunday. I noticed on Friday, October 3d, that the willows generally were green and unchanged. The red maples varied from green through yellow to bright red. The black cherry was green inclining to yellow. (I speak of such trees as I chanced to see.) The apple trees, green but shedding their leaves like most of the trees. Elm, a dingy yellow. White ash, from green to dark purple or mulberry. White oak, green inclining to yellow. Tupelo, reddish yellow and red; tree bushed about the head, limbs small and slanting downward. Some maples when ripe are yellow or whitish yellow, others reddish yellow, others bright red, by the accident of the season or position, — the more or less light and sun, being on the edge or in the midst of the wood; just as the fruits are more or less deeply colored. Birches, green and yellow. Swamp white oak, a yellowish green. Black ash, greenish yellow and now sered by frost. Bass, sered yellowish.

Color in the maturity of foliage is as variable and little characteristic as naturalists have found it to be for distinguishing fishes and quadrupeds, etc.

Oct. 6. Monday. 12 M. — To Bedford line to set a stone by river on Bedford line.

7.30 P.M. — To Fair Haven Pond by boat, the moon four-fifths full, not a cloud in the sky; paddling all the way.

In the middle of the pond we tried the echo. As we paddled down the stream with our backs to the moon, we saw the reflection of every wood and hill on both sides distinctly. These answering reflections — shadow to substance — impress the voyager with a sense of harmony and symmetry, as when you fold a blotted paper and produce a regular figure, — a dualism which nature loves. What you commonly see is but half. Home at ten.

[James John Garth Wilkinson, *The Human Body and Its Connection with Man*, Illustrated by the Principal Organs, 1851.]

Probably great bidens.

Oct. 8. By the side of J.P. Brown's grain-field I picked up some white oak acorns in the path by the wood-side, which I found to be unexpectedly sweet and palatable, the bitterness being scarcely perceptible. To my taste they are quite as good as chestnuts. No wonder the first men lived on acorns. Such as these are no mean food, such as

they are represented to be. Their sweetness is like the sweetness of bread, and to have discovered this palatableness in this neglected nut, the whole world is to me the sweeter for it. To find that acorns are edible, — it is a greater addition to one's stock of life than would be imagined. I should be at least equally pleased if I were to find that the grass tasted sweet and nutritious. It increases the number of my friends; it diminishes the number of my foes. How easily at this season I could feed myself in the woods!

The farmers are ditching, — redeeming more meadow, — getting corn, collecting their apples, threshing, etc.

This warm day is a godsend to the wasps. The puffballs are split open and rayed out on the sand like five or ten (!) fingers. The milkweed seeds must be carried far, for it is only when a strong wind is blowing that they are loosened from their pods. An arrowhead. Filled my pockets with acorns. Found another gouge on Dennis's Hill. To have found the Indian gouges and tasted sweet acorns, — is it not enough for one afternoon?

Oct. 9. Heard two screech owls in the night. Boiled a quart of acorns for breakfast, but found them not so palatable as raw, having acquired a bitterish taste, perchance from being boiled with the shells and skins; yet one would soon get accustomed to this.

2 P.M. — To Conantum.

The witch-hazel here is in full blossom on this magical hillside, while its broad yellow leaves are falling. It is an extremely interesting plant, — October and November's child, and yet reminds me of the very earliest spring. Its blossoms smell like the spring, like the willow catkins; by their color as well as fragrance they belong to the saffron dawn of the year, suggesting amid all these signs of autumn, falling leaves and frost, that the life of Nature, by which she eternally flourishes, is untouched. While its leaves fall, its blossoms spring. The autumn, then, is indeed a spring. All the year is a spring.

Oct. 10. The air this morning is full of bluebirds, and again it is spring. There are many things to indicate the renewing of spring at this season. The blossoming of spring flowers, — not to mention the witch-hazel, — the notes of spring birds, the springing of grain and grass and other plants.

Plants have two states, certainly, — the green and the dry. The lespedeza and primrose heads, etc., etc., — I look on these with interest, as if they were newly blossoming plants.

Going through Britton's clearing, I find a black snake out enjoying the sun. I perceive his lustrous greenish blackness. He holds up his head and threatens; then dashes off into the woods, making a great rustling among the leaves. This might be called snake summer or snakes' week.

Another warm night.

Oct. 17. Surveying for Loring. A severe frost this morning, which puts us one remove further from summer.

Oct. 23. It is never too late to learn. I observed to-day the Irishman who helped me survey twisting the branch of a birch for a withe, and before he cut it off; and also,

wishing to stick a tall, smooth pole in the ground, cut a notch in the side of it by which to drive it with a hatchet.

Oct. 26. I awoke this morning to infinite regret. In my dream I had been riding, but the horses bit each other and occasioned endless trouble and anxiety, and it was my employment to hold their heads apart. Next I sailed over the sea in a small vessel such as the Northmen used, as it were to the Bay of Fundy, and thence overland I sailed, still over the shallows about the sources of rivers toward the deeper channel of a stream which emptied into the Gulf beyond, — the Miramichi, was it? Again I was in my own small pleasure-boat, learning to sail on the sea, and I raised my sail before my anchor, which I dragged far into the sea. I saw the buttons which had come off the coats of drowned men, and suddenly I saw my dog — when I knew not that I had one — standing in the sea up to his chin, to warm his legs, which had been wet, which the cool wind numbed. And then I was walking in a meadow, where the dry season permitted me to walk further than usual, and there I met Mr. Alcott, and we fell to quoting and referring to grand and pleasing couplets and single lines which we had read in times past; and I quoted one which in my waking hours I have no knowledge of, but in my dream it was familiar enough. I only know that those which I quoted expressed regret, and were like the following, though they were not these, viz.: —

“The short parenthesis of life was sweet,”

“The remembrance of youth is a sigh,” etc.

It had the word “memory” in it!! And then again the instant that I awoke, methought I was a musical instrument from which I heard a strain die out, — a bugle, or a clarionet, or a flute. My body was the organ and channel of melody, as a flute is of the music that is breathed through it. My flesh sounded and vibrated still to the strain, and my nerves were the chords of the lyre. I awoke, therefore, to an infinite regret, — to find myself, not the thoroughfare of glorious and world-stirring inspirations, but a scuttle full of dirt, such a thoroughfare only as the street and the kennel, where, perchance, the wind may sometimes draw forth a strain of music from a straw.

I can partly account for this. Last evening I was reading Laing’s account of the Northmen, and though I did not write in my Journal, I remember feeling a fertile regret, and deriving even an inexpressible satisfaction, as it were, from my ability to feel regret, which made that evening richer than those which had preceded it. I heard the last strain or flourish, as I woke, played on my body as the instrument. Such I knew I had been and might be again, and my regret arose from the consciousness how little like a musical instrument my body was now.

Oct. 27. This morning I wake and find it snowing and the ground covered with snow; quite unexpectedly, for last night it was rainy but not cold.

The obstacles which the heart meets with are like granite blocks which one alone cannot move. She who was as the morning light to me is now neither the morning star nor the evening star. We meet but to find each other further asunder, and the oftener we meet the more rapid our divergence.

The night is oracular. What have been the intimations of the night? I ask. How have you passed the night? Good-night!

The cold numbs my fingers this morning. The strong northwest wind blows the damp snow along almost horizontally. The birds fly about as if seeking shelter.

Winter, with its inwardness, is upon us. A man is constrained to sit down, and to think.

Nov. 1. Saturday. Man recognizes laws little enforced, and he condescends to obey them. In the moment that he feels his superiority to them as compulsory, he, as it were, courteously reënacts them but to obey them.

This on my way to Conantum, 2.30 P.M. It is a bright, clear, warm November day. I feel blessed. I love my life. I warm toward all nature. The woods are now much more open than when I last observed them; the leaves have fallen, and they let in light, and I see the sky through them as through a crow's wing in every direction. For the most part only the pines and oaks (white?) retain their leaves. At a distance, accordingly, the forest is green and reddish. The crickets now sound faintly and from very deep in the sod.

Nov. 9. In our walks C. takes out his note-book sometimes and tries to write as I do, but all in vain. He soon puts it up again, or contents himself with scrawling some sketch of the landscape. Observing me still scribbling, he will say that he confines himself to the ideal, purely ideal remarks; he leaves the facts to me. Sometimes, too, he will say a little petulantly, "I am universal; I have nothing to do with the particular and definite." He is the moodiest person, perhaps, that I ever saw. As naturally whimsical as a cow is brindled, both in his tenderness and his roughness he belies himself. He can be incredibly selfish and unexpectedly generous. He is conceited, and yet there is in him far more than usual to ground conceit upon.

I, too, would fain set down something beside facts. Facts should only be as the frame to my pictures; they should be material to the mythology which I am writing; not facts to assist men to make money, farmers to farm profitably, in any common sense; facts to tell who I am, and where I have been or what I have thought: as now the bell rings for evening meeting, and its volumes of sound, like smoke which rises from where a cannon is fired, make the tent in which I dwell. My facts shall be falsehoods to the common sense. I would so state facts that they shall be significant, shall be myths or mythologic. Facts which the mind perceived, thoughts which the body thought.

Nov. 11. 2 P.M. — A bright, but cold day, finger-cold. One must next wear gloves, put his hands in winter quarters.

White Pond is prepared for winter. The view of the southern horizon from the lane this side still attracts me, but not so much as before I had explored those Wayland hills, which look so much fairer, perhaps, than they are. To-day you may write a chapter on the advantages of travelling, and to-morrow you may write another chapter on the advantages of not travelling. The horizon has one kind of beauty and attraction to him who has never explored the hills and mountains in it, and another, I fear a less ethereal and glorious one, to him who has. That blue mountain in the horizon is certainly the

most heavenly, the most elysian, which we have not climbed, on which we have not camped for a night. But only our horizon is moved thus further off, and if our whole life should prove thus a failure, the future which is to atone for all, where still there must be some success, will be more glorious still.

“Says I to myself” should be the motto of my journal.

It is fatal to the writer to be too much possessed by his thought. Things must lie a little remote to be described.

Nov. 12. Write often, write upon a thousand themes, rather than long at a time, not trying to turn too many feeble somersets in the air, — and so come down upon your head at last. Antæus-like, be not long absent from the ground. Those sentences are good and well discharged which are like so many little resiliencies from the spring floor of our life, — a distinct fruit and kernel itself, springing from terra firma. Let there be as many distinct plants as the soil and the light can sustain. Take as many bounds in a day as possible. Sentences uttered with your back to the wall. Those are the admirable bounds when the performer has lately touched the spring-board.

C. is one who will not stoop to rise (to change the subject). He wants something for which he will not pay the going price. He will only learn slowly by failure, — not a noble, but disgraceful, failure. This is not a noble method of learning, to be educated by inevitable suffering, like De Quincey, for instance. Better dive like a muskrat into the mud, and pile up a few weeds to sit on during the floods, a foundation of your own laying, a house of your own building, however cold and cheerless.

Methinks the hawk that soars so loftily and circles so steadily and apparently without effort has earned this power by faithfully creeping on the ground as a reptile in a former state of existence. You must creep before you can run; you must run before you can fly.

Nov. 13. To Fair Haven Hill.

A cold and dark afternoon, the sun being behind clouds in the west. The landscape is barren of objects, the trees being leafless, and so little light in the sky for variety. Such a day as will almost oblige a man to eat his own heart. A day in which you must hold on to life by your teeth. You can hardly ruck up any skin on Nature’s bones. The sap is down; she won’t peel. Now is the time to cut timber for yokes and ox-bows, leaving the tough bark on, — yokes for your own neck. Finding yourself yoked to Matter and to Time. Truly a hard day, hard times these! Not a mosquito left. Not an insect to hum. Crickets gone into winter quarters. Friends long since gone there, and you left to walk on frozen ground, with your hands in your pockets. Ah, but is not this a glorious time for your deep inward fires? And will not your green hickory and white oak burn clear in this frosty air? No Indian summer have we had this November. I see but few traces of the perennial spring. Now is there nothing, not even the cold beauty of ice crystals and snowy architecture, nothing but the echo of your steps over the frozen ground, no voice of birds nor frogs. You are dry as a farrow cow. The earth will not admit a spade. All fields lie fallow.

I see snow on the Peterboro hills, reflecting the sun. It is pleasant thus to look from afar into winter. We look at a condition which we have not reached. Notwithstanding the poverty of the immediate landscape, in the horizon it is simplicity and grandeur. I look into valleys white with snow and now lit up by the sun, while all this country is in shade. This accounts for the cold northwest wind.

Just spent a couple of hours (eight to ten) with Miss Mary Emerson at Holbrook's. The wittiest and most vivacious woman that I know, certainly that woman among my acquaintance whom it is most profitable to meet, the least frivolous, who will most surely provoke to good conversation and the expression of what is in you. She is singular, among women at least, in being really and perseveringly interested to know what thinkers think. She relates herself surely to the intellectual where she goes. It is perhaps her greatest praise and peculiarity that she, more surely than any other woman, gives her companion occasion to utter his best thought. In spite of her own biases, she can entertain a large thought with hospitality, and is not prevented by any intellectuality in it, as women commonly are. In short, she is a genius, as woman seldom is, reminding you less often of her sex than any woman whom I know.

The cattle-train came down last night from Vermont with snow nearly a foot thick upon it. It is as if, in the fall of the year, a swift traveller should come out of the north with snow upon his coat. So it snows. Such, some years, may be our first snow.

Nov. 14. Friday. Surveying the Ministerial Lot in the southwestern part of the town. Unexpectedly find Hayward's Pond frozen over thinly, it being shallow and coldly placed.

In the evening went to a party. It is a bad place to go to, — thirty or forty persons, mostly young women, in a small room, warm and noisy. Was introduced to two young women. The first one was as lively and loquacious as a chickadee; had been accustomed to the society of watering-places, and therefore could get no refreshment out of such a dry fellow as I. The other was said to be pretty-looking, but I rarely look people in their faces, and, moreover, I could not hear what she said, there was such a clacking, — could only see the motion of her lips when I looked that way. I could imagine better places for conversation, where there should be a certain degree of silence surrounding you, and less than forty talking at once. Why, this afternoon, even, I did better. There was old Mr. Joseph Hosmer and I ate our luncheon of cracker and cheese together in the woods. I heard all he said, though it was not much, to be sure, and he could hear me. And then he talked out of such a glorious repose, taking a leisurely bite at the cracker and cheese between his words; and so some of him was communicated to me, and some of me to him, I trust.

These parties, I think, are a part of the machinery of modern society, that young people may be brought together to form marriage connections.

What is the use of going to see people whom yet you never see, and who never see you? I begin to suspect that it is not necessary that we should see one another.

Some of my friends make singular blunders. They go out of their way to talk with certain young women of whom they think, or have heard, that they are pretty, and

take pains to introduce me to them. That may be a reason why they should look at them, but it is not a reason why they should talk with them. I confess that I am lacking a sense, perchance, in this respect, and I derive no pleasure from talking with a young woman half an hour simply because she has regular features. The society of young women is the most unprofitable I have ever tried. They are so light and flighty that you can never be sure whether they are there or not there. I prefer to talk with the more staid and settled, settled for life, in every sense.

I met a man yesterday afternoon in the road who behaved as if he was deaf, and I talked with him in the cold in a loud tone for fifteen minutes, but that uncertainty about his ears, and the necessity I felt to talk loudly, took off the fine edge of what I had to say and prevented my saying anything satisfactory. It is bad enough when your neighbor does not understand you, but if there is any uncertainty as to whether he hears you, so that you are obliged to become your own auditor, you are so much the poorer speaker, and so there is a double failure.

Nov. 15. Here is a rainy day, which keeps me in the house.

I am pleased to read in Stoever's *Life of Linnæus* (Trapp's translation) that his father, being the first learned man of his family, changed his family name and borrowed that of Linnæus (Linden-tree-man) from a lofty linden tree which stood near his native place,—“a custom,” he says, “not unfrequent in Sweden, to take fresh appellations from natural objects.” What more fit than that the advent of a new man into a family should acquire for it, and transmit to his posterity, a new patronymic? It is refreshing to get to a man whom you will not be satisfied to call John's son or Johnson's son, but a new name applicable to himself alone, he being the first of his kind. Get yourself therefore a name, and better a nickname than none at all. There was one enterprising boy came to school to me whose name was “Buster,” and an honorable name it was. He was the only boy in the school, to my knowledge, who was named.

I think it would be a good discipline for Channing, who writes poetry in a sublimo-slipshod style, to write Latin, for then he would be compelled to say something always, and frequently have recourse to his grammar and dictionary. Methinks that what a man might write in a dead language could be more surely translated into good sense in his own language, than his own language could be translated into good Latin, or the dead language.

Nov. 16. Sunday. If it were not for death and funerals, I think the institution of the Church would not stand longer. The necessity that men be decently buried — our fathers and mothers, brothers and sisters and children (notwithstanding the danger that they be buried alive) — will long, if not forever, prevent our laying violent hands on it. If salaries were stopped off, and men walked out of this world bodily at last, the minister and his vocation would be gone. What is the churchyard but a graveyard?

Plenty of ripe checkerberries now. Do they blossom again in the spring?

Nov. 25. That kind of sunset which I witnessed on Saturday and Sunday is perhaps peculiar to the late autumn. The sun is unseen behind a hill. Only this bright white light like a fire falls on the trembling needles of the pine.

Dec. 12. Ah, dear nature, the mere remembrance, after a short forgetfulness, of the pine woods! I come to it as a hungry man to a crust of bread.

I have been surveying for twenty or thirty days, living coarsely, even as respects my diet, — for I find that that will always alter to suit my employment, — indeed, leading a quite trivial life; and to-night, for the first time, had made a fire in my chamber and endeavored to return to myself. I wished for leisure and quiet to let my life flow in its proper channels, with its proper currents; when I might not waste the days, might establish daily prayer and thanksgiving in my family; might do my own work and not the work of Concord and Carlisle, which would yield me better than money. (How much forbearance, aye, sacrifice and loss, goes to every accomplishment! I am thinking by what long discipline and at what cost a man learns to speak simply at last.)

Dec. 13. Saturday. While surveying to-day, we had one hour of almost Indian summer weather in the middle of the day. I felt the influence of the sun. It melted my stoniness a little. The pines looked like old friends again. Cutting a path through a swamp where was much brittle dogwood, etc., etc., I wanted to know the name of every shrub. This varied employment, to which my necessities compel me, serves instead of foreign travel and the lapse of time. If it makes me forget some things which I ought to remember, it no doubt enables me to forget many things which it is well to forget. By stepping aside from my chosen path so often, I see myself better and am enabled to criticise myself. Of this nature is the only true lapse of time. It seems an age since I took walks and wrote in my journal, and when shall I revisit the glimpses of the moon? To be able to see ourselves, not merely as others see us, but as we are, that service a variety of absorbing employments does us.

Dec. 14. The boys have been skating for a week, but I have had no time to skate for surveying. I have hardly realized that there was ice, though I have walked over it about this business. As for the weather, all seasons are pretty much alike to one who is actively at work in the woods.

There is a beautifully pure greenish-blue sky under the clouds now in the southwest just before sunset. I hear the ice along the edge of the river cracking as the water settles. It has settled about two feet, leaving ice for the most part without water on the meadows, all uneven and cracked over the hummocks, so that you cannot run straight for sliding. The ice takes the least hint of a core to eke out a perfect plant; the wrecks of bulrushes and meadow grass are expanded into palm leaves and other luxuriant foliage. I see delicate-looking green pads frozen into the ice, and, here and there, where some tender and still green weeds from the warm bottom of the river have lately been cast up on to the ice.

There are certain places where the river will always be open, where perchance warmer springs come in. There are such places in every character, genial and open in the coldest seasons.

Dec. 21. Sunday. My difficulties with my friends are such as no frankness will settle. There is no precept in the New Testament that will assist me. My nature, it may be,

is secret. Others can confess and explain; I cannot. It is not that I am too proud, but that is not what is wanted.

I feel sometimes as if I could say to my friends, "My friends, I am aware how I have outraged you, how I have seemingly preferred hate to love, seemingly treated others kindly and you unkindly." I can imagine how I might utter something like this in some moment never to be realized. But let me say frankly that at the same time I feel, it may be with too little regret, that I am under an awful necessity to be what I am. If the truth were known, which I do not know, I have no concern with those friends whom I misunderstand or who misunderstand me.

I am of the nature of stone. It takes the summer's sun to warm it.

My acquaintances sometimes imply that I am too cold; but each thing is warm enough of its kind. Is the stone too cold which absorbs the heat of the summer sun and does not part with it during the night? Crystals, though they be of ice, are not too cold to melt, but it was in melting that they were formed. Cold! I am most sensible of warmth in winter days. It is not the warmth of fire that you would have, but everything is warm and cold according to its nature. It is not that I am too cold, but that our warmth and coldness are not of the same nature; hence when I am absolutely warmest, I may be coldest to you. Crystal does not complain of crystal any more than the dove of its mate. You who complain that I am cold find Nature cold. To me she is warm. My heat is latent to you. Fire itself is cold to whatever is not of a nature to be warmed by it. A cool wind is warmer to a feverish man than the air of a furnace. That I am cold means that I am of another nature.

The dogwood and its berries in the swamp by the railroad, just above the red house, pendent on long stems which hang short down as if broken, betwixt yellowish (?) and greenish (?), white, ovoid, pearly (?) or waxen (?) berries. What is the color of them? Ah, give me to walk in the dogwood swamp, with its few coarse branches! Beautiful as Satan.

Dec. 25. Thursday. Via spruce swamp on Conantum to hilltop, returning across river over shrub oak plain to Cliffs.

A wind is now blowing the light snow which fell a day or two ago into drifts, especially on the lee, now the south, side of the walls, the outlines of the drifts corresponding to the chinks in the walls and the eddies of the wind. The snow glides, unperceived for the most part, over the open fields without rising into the air (unless the ground is elevated), until it reaches an opposite wall, which it sifts through and is blown over, blowing off from it like steam when seen in the sun. As it passes through the chinks, it does not drive straight onward, but curves gracefully upwards into fantastic shapes, somewhat like the waves which curve as they break upon the shore; that is, as if the snow that passes through a chink were one connected body, detained by the friction of its lower side. It takes the form of saddles and shells and porringers. It builds up a fantastic alabaster wall behind the first, — a snowy sierra. It is wonderful what sharp turrets it builds up, — builds up, i.e. by accumulation though seemingly by attrition, though the curves upward to a point like the prows of ancient vessels look like sharp

carving, or as if the material had been held before the blowpipe. So what was blown up into the air gradually sifts down into the road or field, and forms the slope of the sierra. Astonishingly sharp and thin overhanging eaves it builds, even this dry snow, where it has the least suggestion from a wall or bank, — less than a mason ever springs his brick from. This is the architecture of the snow. On high hills exposed to wind and sun, it curls off like the steam from a damp roof in the morning. Such sharply defined forms it takes as if the core had been the flames of gaslights.

I go forth to see the sun set. Who knows how it will set, even half an hour beforehand? whether it will go down in clouds or a clear sky? I feel that it is late when the mountains in the north and northwest have ceased to reflect the sun. The shadow is not partial but universal.

In a winter day the sun is almost all in all.

I witness a beauty in the form or coloring of the clouds which addresses itself to my imagination, for which you account scientifically to my understanding, but do not so account to my imagination. It is what it suggests and is the symbol of that I care for, and if, by any trick of science, you rob it of its symbolicalness, you do me no service and explain nothing. I, standing twenty miles off, see a crimson cloud in the horizon. You tell me it is a mass of vapor which absorbs all other rays and reflects the red, but that is nothing to the purpose, for this red vision excites me, stirs my blood, makes my thoughts flow, and I have new and indescribable fancies, and you have not touched the secret of that influence. If there is not something mystical in your explanation, something unexplainable to the understanding, some elements of mystery, it is quite insufficient. If there is nothing in it which speaks to my imagination, what boots it? What sort of science is that which enriches the understanding, but robs the imagination? not merely robs Peter to pay Paul, but takes from Peter more than it ever gives to Paul? That is simply the way in which it speaks to the understanding, and that is the account which the understanding gives of it; but that is not the way it speaks to the imagination, and that is not the account which the imagination gives of it. Just as inadequate to a pure mechanic would be a poet's account of a steam-engine.

If we knew all things thus mechanically merely, should we know anything really?

It would be a truer discipline for the writer to take the least film of thought that floats in the twilight sky of his mind for his theme, about which he has scarcely one idea (that would be teaching his ideas how to shoot), faintest intimations, shadowiest subjects, make a lecture on this, by assiduity and attention get perchance two views of the same, increase a little the stock of knowledge, clear a new field instead of manuring the old; instead of making a lecture out of such obvious truths, hackneyed to the minds of all thinkers. We seek too soon to ally the perceptions of the mind to the experience of the hand, to prove our gossamer truths practical, to show their connection with our every-day life (better show their distance from our every-day life), to relate them to the cider-mill and the banking institution. Ah, give me pure mind, pure thought! Let me not be in haste to detect the universal law; let me see more clearly a particular instance of it! Much finer themes I aspire to, which will yield no satisfaction to the

vulgar mind, not one sentence for them. Perchance it may convince such that there are more things in heaven and earth than are dreamed of in their philosophy. Dissolve one nebula, and so destroy the nebular system and hypothesis. Do not seek expressions, seek thoughts to be expressed. By perseverance you get two views of the same rare truth.

That way of viewing things you know of, least insisted on by you, however, least remembered, — take that view, adhere to that, insist on that, see all things from that point of view. Will you let these intimations go unattended to and watch the door-bell or knocker? That is your text. Do not speak for other men; speak for yourself. They show you as in a vision the kingdoms of the world, and of all the worlds, but you prefer to look in upon a puppet-show. Though you should only speak to one kindred mind in all time, though you should not speak to one, but only utter aloud, that you may the more completely realize and live in the idea which contains the reason of your life, that you may build yourself up to the height of your conceptions, that you may remember your Creator in the days of your youth and justify His ways to man, that the end of life may not be its amusement, speak — though your thought presupposes the non-existence of your hearers — thoughts that transcend life and death. What though mortal ears are not fitted to hear absolute truth! Thoughts that blot out the earth are best conceived in the night, when darkness has already blotted it out from sight.

We look upward for inspiration.

Dec. 29. Snow all gone from Minott's hillside. The willow at the red house shines in the sun. The boys have come out under the hill to pitch coppers. Watts sits on his door-step. It is like the first of April. The wind is west. It feels as warm as in summer; you sit on any fence-rail and vegetate in the sun, and realize that the earth may produce peas again. Yet they say that this open and mild weather is unhealthy; that is always the way with them. How admirable it is that we can never foresee the weather, — that that is always novel! Yesterday nobody dreamed of to-day; nobody dreams of tomorrow. Hence the weather is ever the news. What a fine and measureless joy the gods grant us thus, letting us know nothing about the day that is to dawn! This day, yesterday, was as incredible as any other miracle.

Dec. 31. There is a low mist in the woods. It is a good day to study lichens. The view so confined it compels your attention to near objects, and the white background reveals the disks of the lichens distinctly. They appear more loose, flowing, expanded, flattened out, the colors brighter for the damp. The round greenish-yellow lichens on the white pines loom through the mist (or are seen dimly) like shields whose devices you would fain read. The trees appear all at once covered with their crop of lichens and mosses of all kinds, — flat and tearful are some, distended by moisture. This is their solstice, and your eyes run swiftly through the mist to these things only. Nature has a day for each of her creatures, her creations. To-day it is an exhibition of lichens at Forest Hall, the livid green of some, the fruit of others. They eclipse the trees they

cover. Ah, beautiful is decay! True, as Thales said, the world was made out of water. That is the principle of all things.

Jan. 1. I have observed that one mood is the natural critic of another. When possessed with a strong feeling on any subject foreign to the one I may be writing on, I know very well what of good and what of bad I have written on the latter. It looks to me now as it will ten years hence. My life is then earnest and will tolerate no makeshifts nor nonsense. What is tinsel or euphuism or irrelevant is revealed to such a touchstone. I wish to survey my composition for a moment from the least favorable point of view. I wish to be translated to the future, and look at my work as it were at a structure on the plain, to observe what portions have crumbled under the influence of the elements.

McKean has sawed another of the pines under Fair Haven. He says it made eighty-two feet in length of mill-logs, and was so straight that it would have made a first-rate mast eighty feet long.

Jan. 4. To Fair Haven on the ice partially covered with snow.

The cracks in the ice showing a white cleavage. What is their law? Somewhat like foliage, but too rectangular, like the characters of some Oriental language. I feel as if I could get grammar and dictionary and go into it. They are of the form which a thin flake of ice takes in melting, somewhat rectangular with an irregular edge.

The pond is covered, — dappled or sprinkled, — more than half covered, with flat drifts or patches of snow which has lodged, of graceful curving outlines. One would like to skim over it like a hawk, and detect their law.

Jan. 9. The sky shut out by snow-clouds. It spits a little snow and then holds up. Where a path has been shovelled through drifts in the road, and the cakes of snow piled up, I see little azures, little heavens, in the crannies and crevices. The deeper they are, and the larger masses they are surrounded by, the darker-blue they are. Some are a very light blue with a tinge of green. Methinks I oftenest see this when it is snowing. At any rate the atmosphere must be in a peculiar state. Apparently the snow absorbs the other rays and reflects the blue. It has strained the air, and only the blue rays have passed through the sieve. Is, then, the blue water of Walden snow-water? I see the heaven hiding in nooks and crevices in the snow. Into every track which the teamster makes, this elysian, empyrean atmosphere rushes. The blue of my eye sympathizes with this blue in the snow.

I never saw the pitch pines better snowed up. They look like Chinese pagodas.

Only once.

## 1852

Jan. 12. Monday. C. says that he studied lichens a little while, but he found that if you pursued that study you must give up man. It was so thin, and there was so little of man in it! Why, the whole of it was n't more than an inch thick.

Jan. 13. Would not snow-drifts be a good study, — their philosophy and poetry? Are they not worthy of a chapter? Are they always built up, or not rather carved out of the heaps of snow by the wind passing through the chinks in the walls? I do not see yet but they are builded. They are a sort of ripple-marks which the atmospheric sea makes on the snow-covered bottom.

Jan. 14. The shrub oaks here have lost their leaves, i.e. the small scrubby kind on this hill. I can see at a distance above the level of the snow a few bushes and grasses which mark the edge of the river. They seem to write the word rivus there. That is all or most to indicate that there is a river there. It is betrayed by that thin sedgy and willowy line or border marking the snow yonder.

As usual, there was no blueness in the ruts and crevices in the snow to-day. What kind of atmosphere does this require? When I observed it the other day, it was a rather moist air, some snow falling, the sky completely overcast, and the weather not very cold. It is one of the most interesting phenomena of the winter.

Jan. 15. It is a good school the farmers' sons go to these afternoons, loading and hauling great mill-logs bigger than any cannon, — a sort of battle in the forest. I think there must be an excitement derived from their labor such as they cannot tell. After reading of the life and battles of the Northmen in Snorro Sturleson's Chronicle, these labors most remind me of that. How they renew and wear out the paths through the woods! They think I'm loafing. I think they are drudging for gain. But no doubt our employment is more alike than we suspect, and we are each serving the great Master's ends more than our own. I have my work in the woods where I meet them, though my logs do not go to the same mill.

Jan. 18. To-day, again, I saw some of the blue in the crevices of the snow. It is snowing, but not a moist snow. Perhaps the snow in the air, as well as on the ground, takes up the white rays and reflects the blue. There is no blue to be seen overhead, and it has as it were taken refuge in the chinks and crevices in the snow.

Jan. 20. I do not know but it is too much to read one newspaper in a week, for I now take the weekly Tribune, and for a few days past, it seems to me, I have not dwelt in Concord; the sun, the clouds, the snow, the trees say not so much to me. You cannot serve two masters. To read of things distant and sounding betrays us into slighting these which are then apparently near and small.

Greeley says of London, "The morning to sleep, the afternoon to business, and the evening to enjoyment, seems the usual routine with the favored classes." They have no morning life then. They are afternoon men. To begin the day at noon!

The days are now sensibly longer, and half past five is as light as five was.

Jan. 21. This winter they are cutting down our woods more seriously than ever, — Fair Haven Hill, Walden, Linnæa Borealis Wood, etc., etc. Thank God, they cannot cut down the clouds!

Jan. 22. To set down such choice experiences that my own writings may inspire me and at last I may make wholes of parts. Certainly it is a distinct profession to rescue from oblivion and to fix the sentiments and thoughts which visit all men more or less

generally, that the contemplation of the unfinished picture may suggest its harmonious completion. Associate reverently and as much as you can with your loftiest thoughts. Each thought that is welcomed and recorded is a nest egg, by the side of which more will be laid. Thoughts accidentally thrown together become a frame in which more may be developed and exhibited. Perhaps this is the main value of a habit of writing, of keeping a journal, — that so we remember our best hours and stimulate ourselves. My thoughts are my company. They have a certain individuality and separate existence, aye, personality. Having by chance recorded a few disconnected thoughts and then brought them into juxtaposition, they suggest a whole new field in which it was possible to labor and to think. Thought beget thought.

I love to look at Ebby Hubbard's oaks and pines on the hillside from Brister's Hill. Am thankful that there is one old miser who will not sell nor cut his woods, though it is said that they are wasting. It is an ill wind that blows nobody any good.

It is a sharp, cutting cold day, stiffening the face. Thermometers have lately sunk to 20°.

The surface of the snow in the fields is that of pretty large waves on a sea over which a summer breeze is sweeping.

Jan. 24. P.M. — Down the Flint's Pond road and return across.

Even the dry leaves are gregarious, and they collect in little heaps in the hollows in the snow, or even on the plane surfaces, driven in flocks by the wind. How like shrinking maidens wrapping their scarfs about them they flutter along! The oaks are made thus to retain their leaves, that they may play over the snow-crust and add variety to the winter landscape. If you wished to collect leaves, you would only have to make holes in the snow for traps. I see that my tracks are often filled two feet deep with them. They are blown quite across Walden on the wavy snow. Two flitting along together by fits and starts, now one running ahead, then another, remind me of squirrels. Mostly white oak leaves, but the other oaks, i.e. especially red oaks, also. There is a certain refinement or cultivation, even feminineness, suggested by the rounded lobes, the scalloped edge, of the white oak leaf, compared with the wild, brusque points of the red and black and scarlet and shrub oaks.

These woods! Why do I not feel their being cut more sorely? Does it not affect me nearly? The axe can deprive me of much. Concord is sheared of its pride. I am certainly the less attached to my native town in consequence. One, and a main, link is broken. I shall go to Walden less frequently.

Jan. 26. Men have ever associated the verdure of evergreen trees — hemlocks, firs, spruces, etc. — with the moisture and coolness of mountains. Our word pine is from the Celtic "pin or pen, a rock or mountain," from which is derived the name of this genus in many languages. Hence the name "Apennines" (Alpes pennines). "Pinaster is Pliny's name for the wild pine." (All this from Lindley in Loudon.) But *Pinus* does not include hemlock or larch or fir.

When the thermometer is down to 20°, the streams of thought tinkle underneath like the rivers under the ice. Thought like the ocean is nearly of one temperature. Ideas, — are they the fishes of thought?

Poetry implies the whole truth. Philosophy expresses a particle of it.

Would you see your mind, look at the sky. Would you know your own moods, be weather-wise. He whom the weather disappoints, disappoints himself.

The word is well naturalized or rooted that can be traced back to a Celtic original. It is like getting out stumps and fat pine roots.

In few countries do they enjoy so fine a contrast of summer and winter. We really have four seasons, each incredible to the other. Winter cannot be mistaken for summer here. Though I see the boat turned up on the shore and half buried under snow, as I walk over the invisible river, summer is far away, with its rustling reeds. It only suggests the want of thrift, the carelessness, of its owner.

Nature never indulges in exclamations, never says Ah! or Alas! She is not of French descent. She is a plain writer, uses few gestures, does not add to her verbs, uses few adverbs, uses no expletives. I find that I use many words for the sake of emphasis which really add nothing to the force of my sentences, and they look relieved the moment I have cancelled these. Words by which I express my mood, my conviction, rather than the simple truth.

Yesterday, though warm, it was clear enough for water and windows to sparkle.

Thaw with his gentle persuasion is more powerful than Thor with his hammer. The one melts, the other but breaks in pieces.

Jan. 27. The snow has been slowly melting, without rain or mist, the last two or three days. It has settled very much, though the eaves have not been heard to run by me. In going across lots, I walk in the woods, where the snow is not so deep, part having been caught in the trees and dissipated in the air, and a part melted by the warmth of the wood and the reflection.

The poison sumach, with its stems hanging down on every side, is a very agreeable object now, seen against the snow.

I do not know but thoughts written down thus in a journal might be printed in the same form with greater advantage than if the related ones were brought together into separate essays. They are now allied to life, and are seen by the reader not to be far-fetched. It is more simple, less artful. I feel that in the other case I should have no proper frame for my sketches. Mere facts and names and dates communicate more than we suspect. Whether the flower looks better in the nosegay than in the meadow where it grew and we had to wet our feet to get it! Is the scholastic air any advantage?

Jan. 28. Perhaps I can never find so good a setting for my thoughts as I shall thus have taken them out of. The crystal never sparkles more brightly than in the cavern. The world have always loved best the fable with the moral. The children could read the fable alone, the grown-up read both. The truth so told has the best advantages of the most abstract statement, for it is not the less universally applicable. Where else will you ever find the true cement for your thoughts? How will you ever rivet them

together without leaving the marks of the file? Yet Plutarch did not so; Montaigne did not so. Men have written travels in this form, but perhaps no man's daily life has been rich enough to be journalized.

It is remarkable that no pains is taken to teach children to distinguish colors. I am myself uncertain about the names of many.

Jan. 30. Friday. One must not complain that his friend is cold, for heat is generated between them.

I doubt if Emerson could trundle a wheelbarrow through the streets, because it would be out of character. One needs to have a comprehensive character.

Do nothing merely out of good resolutions. Discipline yourself only to yield to love; suffer yourself to be attracted. It is in vain to write on chosen themes. We must wait till they have kindled a flame in our minds. There must be the copulating and generating force of love behind every effort destined to be successful. The cold resolve gives birth to, begets, nothing. The theme that seeks me, not I it. The poet's relation to his theme is the relation of lovers. It is no more to be courted. Obey, report.

Jan. 31. Emerson is too grand for me. He belongs to the nobility and wears their cloak and manners; is attracted to Plato, not to Socrates, I fear partly because the latter's life and associates were too humble. I am a commoner. To me there is something devilish in manners. The best manners is nakedness of manners. I should value E.'s praise more, which is always so discriminating, if there were not some alloy of patronage and hence of flattery about it. In that respect he is like [erased]; they flatter you, but themselves more.

Feb. 3. I have been to the libraries (yesterday) at Cambridge and Boston. How happens it that I find not in the country, in the fields and woods, the works even of like-minded naturalists and poets. Those who have expressed the purest and deepest love of nature have not recorded it on the bark of the trees with the lichens; they have left no memento of it there; but if I would read their books I must go to the city, — so strange and repulsive both to them and to me, — and deal with men and institutions with whom I have no sympathy. When I have just been there on this errand, it seems too great a price to pay for access even to the works of Homer, or Chaucer, or Linnæus. I have sometimes imagined a library, i.e. a collection of the works of true poets, philosophers, naturalists, etc., deposited not in a brick or marble edifice in a crowded and dusty city, guarded by cold-blooded and methodical officials and preyed on by bookworms, in which you own no share, and are not likely to, but rather far away in the depths of a primitive forest, like the ruins of Central America, where you can trace a series of crumbling alcoves, the older books protecting the most modern from the elements, partially buried by the luxuriance of nature, which the heroic student could reach only after adventures in the wilderness amid wild beasts and wild men. That, to my imagination, seems a fitter place for these interesting relics, which owe no small part of their interest to their antiquity, and whose occasion is nature, than the well-preserved edifice, with its well-preserved officials on the side of a city's square. More terrible than lions and tigers these Cerberuses.

About 6 P.M. walked to Cliffs via railroad.

Snow quite deep. The sun had set without a cloud in the sky, — a rare occurrence, but I missed the clouds, which make the glory of evening. The sky must have a few clouds, as the mind a few moods; nor is the evening the less serene for them. There is only a tinge of red along the horizon. The moon is nearly full tonight, and the moment is passed when the light in the east (i.e. of the moon) balances the light in the west.

Selenite “is a stone (as is said) in Arabia, wherein is a white, which decreases and increases with the moon” (Dictionary). My summer journal was selenitic in this sense. It had this white spot in it.

Is not the sky unusually blue to-night? dark blue? Is it not always bluer when the ground is covered with snow in the winter than in summer?

The forcible writer stands bodily behind his words with his experience. He does not make books out of books, but he has been there in person.

Feb. 4. Heard Professor Blasius lecture on the tornado this evening. He said that nine vessels were wrecked daily in the world on an average; that Professor Dove of Berlin was the best meteorologist in his opinion, but had not studied the effects of wind in the fields so much as some here.

The audience are never tired of hearing how far the wind carried some man, woman, or child, or family Bible, but they are immediately tired if you undertake to give them a scientific account of it.

Feb. 6. Dioscorides, “the second father of Botany,” — what a flowery name!

The artificial system has been very properly called the dictionary, and the natural method, the grammar, of the science of botany, by botanists themselves. But are we to have nothing but grammars and dictionaries in this literature? Are there no works written in the language of the flowers?

I asked a learned and accurate naturalist, who is at the same time the courteous guardian of a public library, to direct me to those works which contained the more particular popular account, or biography, of particular flowers, from which the botanies I had met with appeared to draw sparingly, — for I trusted that each flower had had many lovers and faithful describers in past times, — but he informed me that I had read all; that no one was acquainted with the flowers, they were only catalogued like his books.

It is still thawy. A mistiness makes the woods look denser, darker, and more imposing. Seen through this veil, they are more grand and primitive.

Feb. 8. Night before last, our first rain for a long time; this afternoon, the first crust to walk on. It is pleasant to walk over the fields raised a foot or more above their summer level, and the prospect is altogether new.

Thoughts of different dates will not cohere.

Feb. 11. Wednesday. When the thermometer is down to 20° in the morning, as last month, I think of the poor dogs who have no masters. If a poor dog has no master, everybody will throw a billet of wood at him. It never rains but it pours.

It now rains, — a drizzling rain mixed with mist, which ever and anon fills the air to the height of fifteen or twenty feet.

Perhaps the best evidence of an amelioration of the climate — at least that the snows are less deep than formerly — is the snow-shoes which still lie about in so many garrets, now useless, though the population of this town has not essentially increased for seventy-five years past, and the travelling within the limits of the town accordingly not much facilitated. No man ever uses them now, yet the old men used them in their youth.

Feb. 15. Perhaps I am descended from that Northman named “Thorer the Dog-footed.” Thorer Hund— “he was the most powerful man in the North” — to judge from his name belonged to the same family. Thorer is one of the most, if not the most, common name in the chronicles of the Northmen.

Feb. 16. Laing says that “the Heimskringla has been hardly used by the learned men of the period in which it was first published. It appeared first in the literary world in 1697, frozen into the Latin of the Swedish antiquary, Peringskiöld.”

Snorro Sturleson says, “From Thor’s name comes Thorer, also Thorarinn.” Again: “Earl Rognvald was King Harald’s dearest friend, and the king had the greatest regard for him. He was married to Hilda, a daughter of Rolf Naefia, and their sons were Rolf and Thorer... Rolf became a great viking, and was of so stout a growth that no horse could carry him, and wheresoever he went he must go on foot; and therefore he was called Gange-Rolf.” (Laing says in a note, what Sturleson also tells in the text, Gange-Rolf, Rolf Ganger, Rolf the Walker, was the conqueror of Normandy.) “Gange-Rolf’s son was William, father to Richard, and grandfather to another Richard, who was the father of Richard Longspear, and grandfather of William the Bastard, from whom all the following English kings are descended.”

King Harald “set Earl Rognvald’s son Thorer over Möre, and gave him his daughter Alof in marriage. Thorer, called the Silent, got the same territory his father Rognvald had possessed.” His brother Einar, going into battle to take vengeance on his father’s murderers, sang a kind of reproach against his brothers Rollang and Rolf for their slowness and concludes, —

“And silent Thorer sits and dreams  
At home, beside the mead-bowl’s streams.”

So it seems that from one branch of the family were descended the kings of England, and from the other myself.

Feb. 18. Hakon had a daughter Thora.

Thorer Klakke was one “who had been long on Viking expeditions.”

Thorer Hiort “was quicker on foot than any man.”

I have a commonplace-book for facts and another for poetry, but I find it difficult always to preserve the vague distinction which I had in my mind, for the most interesting and beautiful facts are so much the more poetry and that is their success. They are translated from earth to heaven. I see that if my facts were sufficiently vital and

significant, — perhaps transmuted more into the substance of the human mind, — I should need but one book of poetry to contain them all.

Feb. 21. “As fat as a hen in the forehead,” — a saying which I heard my father use this morning.

Feb. 29. For the past month there has been more sea-room in the day, without so great danger of running aground on one of those two promontories that make it arduous to navigate the winter day, the morning or the evening. It is a narrow pass, and you must go through with the tide. Might not some of my pages be called “The Short Days of Winter”?

MARCH 1. Linnæus, speaking of the necessity of precise and adequate terms in any science, after naming some which he invented for botany, says, “Termini praeservarunt Anatomiam, Mathesin, Chemiam, ab idiotis; Medicinam autem eorum defectus conculcavit.” (Terms (well defined) have preserved anatomy, mathematics, and chemistry from idiots; but the want of them has ruined medicine.) But I should say that men generally were not enough interested in the first-mentioned sciences to meddle with and degrade them. There is no interested motive to induce them to listen to the quack in mathematics, as they have to attend to the quack in medicine; yet chemistry has been converted into alchemy, and astronomy into astrology.

However, I can see that there is a certain advantage in these hard and precise terms, such as the lichenist uses, for instance. No one masters them so as to use them in writing on the subject without being far better informed than the rabble about it. New books are not written on chemistry or cryptogamia of as little worth comparatively as are written on the spiritual phenomena of the day. No man writes on lichens, using the terms of the science intelligibly, without having something to say, but every one thinks himself competent to write on the relation of the soul to the body, as if that were a phænogamous subject.

After having read various books on various subjects for some months, I take up a report on Farms by a committee of Middlesex Husbandmen, and read of the number of acres of bog that some farmer has redeemed, and the number of rods of stone wall that he has built, and the number of tons of hay he now cuts, or of bushels of corn or potatoes he raises there, and I feel as if I had got my foot down on to the solid and sunny earth, the basis of all philosophy, and poetry, and religion even. I have faith that the man who redeemed some acres of land the past summer redeemed also some parts of his character. I shall not expect to find him ever in the almshouse or the prison. He is, in fact, so far on his way to heaven. When he took the farm there was not a grafted tree on it, and now he realizes something handsome from the sale of fruit. These, in the absence of other facts, are evidence of a certain moral worth.

March 4. It is discouraging to talk with men who will recognize no principles. How little use is made of reason in this world! You argue with a man for an hour, he agrees with you step by step, you are approaching a triumphant conclusion, you think that you have converted him; but ah, no, he has a habit, he takes a pinch of snuff, he remembers that he entertained a different opinion at the commencement of the controversy, and

his reverence for the past compels him to reiterate it now. You began at the butt of the pole to curve it, you gradually bent it round according to rule, and planted the other end in the ground, and already in imagination saw the vine curling round this segment of an arbor, under which a new generation was to re-create itself; but when you had done, just when the twig was bent, it sprang back to its former stubborn and unhandsome position like a bit of whalebone.

If I were to paint the short days of winter, I should represent two towering icebergs, approaching each other like promontories, for morning and evening, with cavernous recesses, and a solitary traveller, wrapping his cloak about him and bent forward against a driving storm, just entering the narrow pass. I would paint the light of a taper at midday, seen through a cottage window half buried in snow and frost, and some pale stars in the sky, and the sound of the woodcutter's axe. The icebergs with cavernous recesses. In the foreground should appear the harvest, and far in the background, through the pass, should be seen the sowers in the fields and other evidences of spring. The icebergs should gradually approach, and on the right and left the heavens should be shaded off from the light of midday to midnight with its stars. The sun low in the sky.

March 9. A warm spring rain in the night.

3 P.M. — Down the railroad.

Cloudy but springlike. When the frost comes out of the ground, there is a corresponding thawing of the man.

Again it rains, and I turn about.

The sound of water falling on rocks and of air falling on trees are very much alike.

Though cloudy, the air excites me. Yesterday all was tight as a stricture on my breast; to-day all is loosened. It is a different element from what it was.

March 10. I see flocks of a dozen bluebirds together. The warble of this bird is innocent and celestial, like its color. A woodchopper tells me he heard a robin this morning. What is the little chick-weed-like plant already springing up on the top of the Cliffs? There are some other plants with bright-green leaves which have either started somewhat or have never suffered from the cold under the snow.

March 14. Sunday. Rain, rain, rain; but even this is fair weather after so much snow.

March 15. This afternoon I throw off my outside coat. A mild spring day. I must hie to the Great Meadows. The air is full of bluebirds. The ground almost entirely bare. The villagers are out in the sun, and every man is happy whose work takes him outdoors. My life partakes of infinity. The air is as deep as our natures. I go forth to make new demands on life. I wish to begin this summer well; to do something in it worthy of it and of me; to transcend my daily routine and that of my townsmen; to have my immortality now, that it be in the quality of my daily life; to pay the greatest price, the greatest tax, of any man in Concord, and enjoy the most!! I will give all I am for my nobility. I will pay all my days for my success. I pray that the life of this spring and summer may ever lie fair in my memory. May I dare as I have never done! May I persevere as I have never done! I am eager to report the glory of the universe;

may I be worthy to do it; to have got through with regarding human values, so as not to be distracted from regarding divine values. It is reasonable that a man should be something worthier at the end of the year than he was at the beginning.

March 16. Before sunrise.

Spent the day in Cambridge Library.

The Library a wilderness of books. The volumes of the Fifteenth, Sixteenth, and Seventeenth Centuries, which lie so near on the shelf, are rarely opened, are effectually forgotten and not implied by our literature and newspapers. When I looked into Purchas's Pilgrims, it affected me like looking into an impassable swamp, ten feet deep with sphagnum, where the monarchs of the forest, covered with mosses and stretched along the ground, were making haste to become peat. Those old books suggested a certain fertility, an Ohio soil, as if they were making a humus for new literatures to spring in. I heard the bellowing of bullfrogs and the hum of mosquitoes reverberating through the thick embossed covers when I had closed the book. Decayed literature makes the richest of all soils.

March 18. This afternoon the woods and walls and the whole face of the country wear once more a wintry aspect, though there is more moisture in the snow and the trunks of the trees are whitened now on a more southerly or southeast side. These slight falls of snow which come and go again so soon when the ground is partly open in the spring, perhaps helping to open and crumble and prepare it for the seed, are called "the poor man's manure." They are, no doubt, more serviceable still to those who are rich enough to have some manure spread on their grass ground, which the melting snow helps dissolve and soak in and carry to the roots of the grass. At any rate, it is all the poor man has got, whether it is good or bad. There is more rain than snow now falling.

March 30. Having occasion to-day to put up a long ladder against the house, I found, from the trembling of my nerves with the exertion, that I had not exercised that part of my system this winter. How much I may have lost! It would do me good to go forth and work hard and sweat. Though the frost is nearly out of the ground, the winter has not broken up in me. It is a backward season with me. Perhaps we grow older and older till we no longer sympathize with the revolution of the seasons, and our winters never break up.

March 31. Intended to get up early this morning and commence a series of spring walks, but clouds and drowsiness prevented.

Perhaps after the thawing of the trees their buds universally swell before they can be said to spring.

Perchance as we grow old we cease to spring with the spring, and we are indifferent to the succession of years, and they go by without epoch as months. Woe be to us when we cease to form new resolutions on the opening of a new year!

A cold, raw day with alternating hail-like snow and rain.

It would be worth the while to tell why a swamp pleases us, what kinds please us, also what weather, etc., etc., — analyze our impressions. Why the moaning of the

storm gives me pleasure. I sometimes feel that I need to sit in a far-away cave through a three weeks' storm, cold and wet, to give a tone to my system. The spring has its windy March to usher it in, with many soaking rains reaching into April. Methinks I would share every creature's suffering for the sake of its experience and joy. The song sparrow and the transient fox-colored sparrow, — have they brought me no message this year? Have I heard what this tiny passenger has to say, while it flits thus from tree to tree? I love the birds and beasts because they are mythologically in earnest. I reproach myself because I have regarded with indifference the passage of the birds; I have thought them no better than I.

April 1. Saw the first bee of the season on the railroad causeway, also a small red butterfly and, later, a large dark one with buff-edged wings.

Walden is all white ice, but little melted about the shores. The very sight of it carries my thoughts back at once some weeks toward winter, and a chill comes over them.

We have had a good solid winter, which has put the previous summer far behind us; intense cold, deep and lasting snows, and clear, tense winter sky. It is a good experience to have gone through with.

April 2. 6 A.M. — The sun is up. The air is full of the notes of birds, — song sparrows, red-wings, robins (singing a strain), bluebirds, — and I hear also a lark, — as if all the earth had burst forth into song. A few weeks ago, before the birds had come, there came to my mind in the night the twittering sound of birds in the early dawn of a spring morning, a semiprophecy of it, and last night I attended mentally as if I heard the spray-like dreaming sound of the midsummer frog and realized how glorious and full of revelations it was. Expectation may amount to prophecy. The clouds are white watery, not such as we had in the winter.

It appears to me that man is altogether too much insisted on. The poet says the proper study of mankind is man. I say, study to forget all that; take wider views of the universe. That is the egotism of the race. What is this our childish, gossiping, social literature, mainly in the hands of the publishers? Look at our literature. What a poor, puny, social thing, seeking sympathy! The author troubles himself about his readers, — would fain have one before he dies. He stands too near his printer; he corrects the proofs. Not satisfied with defiling one another in this world, we would all go to heaven together.

I do not value any view of the universe into which man and the institutions of man enter very largely and absorb much of the attention. Man is but the place where I stand, and the prospect hence is infinite. It is not a chamber of mirrors which reflect me. When I reflect, I find that there is other than me. The universe is larger than enough for man's abode.

Landed on Tall's Island. On the rocky point, where the wind is felt, the waves are breaking merrily, and now for half an hour our dog has been standing in the water under the small swamp white oaks, and ceaselessly snapping at each wave as it broke, as if it were a living creature. He, regardless of cold and wet, thrusts his head into each

wave to gripe it. A dog snapping at the waves as they break on a rocky shore. He then rolls himself in the leaves for a napkin. We hardly set out to return, when the water looked sober and rainy. There was more appearance of rain in the water than in the sky, — April weather look. And soon we saw the dimples of drops on the surface. I forgot to mention before the cranberries seen on the bottom, as we pushed over the meadows, and the red beds of pitcher-plants.

April 3. It is a clear day with a cold westerly wind, the snow of yesterday being melted. When the sun shines unobstructedly the landscape is full of light, for it is reflected from the withered fawn-colored grass, as it cannot be from the green grass of summer. (On the back of the hill behind Gourgas's.)

The bluebird carries the sky on his back.

April 4. Sunday. I have got to that pass with my friend that our words do not pass with each other for what they are worth. We speak in vain; there is none to hear. He finds fault with me that I walk alone, when I pine for want of a companion; that I commit my thoughts to a diary even on my walks, instead of seeking to share them generously with a friend; curses my practice even. Awful as it is to contemplate, I pray that, if I am the cold intellectual skeptic whom he rebukes, his curse may take effect, and wither and dry up those sources of my life, and my journal no longer yield me pleasure nor life.

April 11. The sight of Nut Meadow Brook in Brown's land reminds me that the attractiveness of a brook depends much on the character of its bottom. I love just now to see one flowing through soft sand like this, where it wears a deep but irregular channel, now wider and shallower with distinct ripple-marks, now shelving off suddenly to indistinct depths, meandering as much up and down as from side to side, deepest where narrowest, and ever gullying under this bank or that, its bottom lifted up to one side or the other, the current inclining to one side. I stop to look at the circular shadows of the dimples over the yellow sand, and the dark-brown clams on their edges in the sand at the bottom. (I hear the sound of the piano below as I write this, and feel as if the winter in me were at length beginning to thaw, for my spring has been even more backward than nature's. For a month past life has been a thing incredible to me. None but the kind gods can make me sane. If only they will let their south winds blow on me! I ask to be melted. You can only ask of the metals that they be tender to the fire that melts them. To naught else can they be tender.) The sweet flags are now starting up under water two inches high, and minnows dart. A pure brook is a very beautiful object to study minutely. It will bear the closest inspection, even to the fine air-bubbles, like minute globules of quicksilver, that lie on its bottom. The minute particles or spangles of golden mica in these sands, when the sun shines on them, remind one of the golden sands we read of. Everything is washed clean and bright, and the water is the best glass through which to see it.

April 12. Saw the first blossoms (bright-yellow stamens or pistils) on the willow catkins to-day. The speckled alders and the maples are earlier then. The yellow blossom appears first on one side of the ament and is the most of bright and sunny color the

spring has shown, the most decidedly flower-like that I have seen. It is fit that this almost earliest spring flower should be yellow, the color of the sun.

I am made somewhat sad this afternoon by the coarseness and vulgarity of my companion, because he is one with whom I have made myself intimate. He inclines latterly to speak with coarse jesting of facts which should always be treated with delicacy and reverence. I lose my respect for the man who can make the mystery of sex the subject of a coarse jest, yet, when you speak earnestly and seriously on the subject, is silent. I feel that this is to be truly irreligious. Whatever may befall me, I trust that I may never lose my respect for purity in others. Can I walk with one who by his jests and by his habitual tone reduces the life of men and women to a level with that of cats and dogs? I can have no really serious conversation with my companion. He seems not capable of it.

In the New Forest in Hampshire they had a chief officer called the Lord Warden and under him two distinct officers, one to preserve the venison of the forest, another to preserve its vert, i.e. woods, lawns, etc. Does not our Walden need such? The Lord Warden was a person of distinction, as the Duke of Gloucester.

Walden Wood was my forest walk.

The English forests are divided into "walks," with a keeper presiding over each. My "walk" is ten miles from my house every way.

There is, this afternoon and evening, a rather cool April rain. Pleasant to hear its steady dripping.

April 13. A driving snow-storm in the night and still raging; five or six inches deep on a level at 7 A.M. All birds are turned into snowbirds. Trees and houses have put on the aspect of winter. The traveller's carriage wheels, the farmer's wagon, are converted into white disks of snow through which the spokes hardly appear. But it is good now to stay in the house and read and write. We do not now go wandering all abroad and dissipated, but the imprisoning storm condenses our thoughts. I can hear the clock tick as not in pleasant weather. My life is enriched. I love to hear the wind howl. I have a fancy for sitting with my book or paper in some mean and apparently unfavorable place, in the kitchen, for instance, where the work is going on, rather a little cold than comfortable.

April 15. Would it not be a fine office to preserve the vert of this forest in which I ramble?

Channing calls our walks along the banks of the river, taking a boat for convenience at some distant point, riparial excursions. It is a pleasing epithet, but I mistrust such, even as good as this, in which the mere name is so agreeable, as if it would ring hollow ere long; and rather the thing should make the true name poetic at last. Alcott wished me to name my book Sylvania!

April 16. As I turned round the corner of Hubbard's Grove, saw a woodchuck, the first of the season, in the middle of the field, six or seven rods from the fence which bounds the wood, and twenty rods distant. I ran along the fence and cut him off, or rather overtook him, though he started at the same time. When I was only a rod and

a half off, he stopped, and I did the same; then he ran again, and I ran up within three feet of him, when he stopped again, the fence being between us. I squatted down and surveyed him at my leisure. His eyes were dull black and rather inobvious, with a faint chestnut (?) iris, with but little expression and that more of resignation than of anger. The general aspect was a coarse grayish brown, a sort of grisel (?). A lighter brown next the skin, then black or very dark brown and tipped with whitish rather loosely. The head between a squirrel and a bear, flat on the top and dark brown, and darker still or black on the tip of the nose. The whiskers black, two inches long. The ears very small and roundish, set far back and nearly buried in the fur. Black feet, with long and slender claws for digging. It appeared to tremble, or perchance shivered with cold. When I moved, it gritted its teeth quite loud, sometimes striking the under jaw against the other chatteringly, sometimes grinding one jaw on the other, yet as if more from instinct than anger. Whichever way I turned, that way it headed. I took a twig a foot long and touched its snout, at which it started forward and bit the stick, lessening the distance between us to two feet, and still it held all the ground it gained. I played with it tenderly awhile with the stick, trying to open its gritting jaws. Ever its long incisors, two above and two below, were presented. But I thought it would go to sleep if I stayed long enough. It did not sit upright as sometimes, but standing on its fore feet with its head down, i.e. half sitting, half standing. We sat looking at one another about half an hour, till we began to feel mesmeric influences. When I was tired, I moved away, wishing to see him run, but I could not start him. He would not stir as long as I was looking at him or could see him. I walked round him; he turned as fast and fronted me still. I sat down by his side within a foot. I talked to him quasi forest lingo, baby-talk, at any rate in a conciliatory tone, and thought that I had some influence on him. He gritted his teeth less. I chewed checkerberry leaves and presented them to his nose at last without a grit; though I saw that by so much gritting of the teeth he had worn them rapidly and they were covered with a fine white powder, which, if you measured it thus, would have made his anger terrible. He did not mind any noise I might make. With a little stick I lifted one of his paws to examine it, and held it up at pleasure. I turned him over to see what color he was beneath (darker or more purely brown), though he turned himself back again sooner than I could have wished. His tail was also all brown, though not very dark, rat-tail like, with loose hairs standing out on all sides like a caterpillar brush. He had a rather mild look. I spoke kindly to him. I reached checkerberry leaves to his mouth. I stretched my hands over him, though he turned up his head and still gritted a little. I laid my hand on him, but immediately took it off again, instinct not being wholly overcome. If I had had a few fresh bean leaves, thus in advance of the season, I am sure I should have tamed him completely. Could easily have wrapped him in my handkerchief. He was not fat nor particularly lean. I finally had to leave him without seeing him move from the place. A large, clumsy, burrowing squirrel. *Arctomys*, bearmouse. I respect him as one of the natives. He lies there, by his color and habits so naturalized amid the dry leaves, the withered grass, and the

bushes. A sound nap, too, he has enjoyed in his native fields, the past winter. I think I might learn some wisdom of him.

The two states of the meadow are to be remembered: first in a March or April wind, as I have described it; second in a perfectly calm and beautiful mild morning or evening or midday, as lately, at the same season, such as I have also partially described, when there are no gulls circling over it. What different thoughts it suggests! Would it not be worth the while to describe the different states of our meadows which cover so large a portion of the town? It is not as if we had a few acres only of water surface. They answer to moods of the Concord mind. There might be a chapter: The Sudbury Meadows, the Humors of the Town.

April 17. Observed in the second of the chain of ponds between Fair Haven and Walden a large (for the pond) island patch of the dwarf andromeda, I sitting on the east bank; its fine brownish-red color very agreeable and memorable to behold. In the last long pond, looking at it from the south, I saw it filled with a slightly grayish shrub which I took for the sweet-gale, but when I had got round to the east side, chancing to turn round, I was surprised to see that all this pond-hole also was filled with the same warm brownish-red-colored andromeda. The fact was I was opposite to the sun, but from every other position I saw only the sun reflected from the surface of the andromeda leaves, which gave the whole a grayish-brown hue tinged with red; but from this position alone I saw, as it were, through the leaves which the opposite sun lit up, giving to the whole this charming warm, what I call Indian, red color, — the mellowest, the ripest, red imbrowned color; but when I looked to the right or left, i.e. north or south, the more the swamp had the mottled light or grayish aspect where the light was reflected from the surfaces of the leaves. And afterward, when I had risen higher up the hill, though still opposite the sun, the light came reflected upward from the surfaces, and I lost that warm, rich red tinge, surpassing cathedral windows. Let me look again at a different hour of the day, and see if it is really so. It is a very interesting piece of magic. It is the autumnal tints in spring, only more subdued and mellow. These leaves are so slow to decay. Vide when they fall. Already these ponds are greened with frog-spittle. I see the tracks of muskrats through it. Hear the faint croak of frogs and the still rather faint peeping of hylas. It is about 4.30 P.M.

April 18. The most interesting fact, perhaps, at present is these few tender yellow blossoms, these half-expanded sterile aments of the willow, seen through the rain and cold, — signs of the advancing year, pledges of the sun's return. Anything so delicate, both in structure, in color and in fragrance, contrasts strangely with surrounding nature and feeds the faith of man. The fields are acquiring a greenish tinge.

The birds which I see and hear in the midst of the storm are robins, song sparrows, blackbirds, and crows occasionally.

This is the spring of the year. Birds are migrating northward to their breeding-places; the melted snows are escaping to the sea. We have now the unspeakable rain of the Greek winter. The element of water prevails. The river has far overflowed its channel.

For the first time I perceive this spring that the year is a circle. I see distinctly the spring arc thus far. It is drawn with a firm line. Every incident is a parable of the Great Teacher. The cranberries washed up in the meadows and into the road on the causeways now yield a pleasant acid.

Why should just these sights and sounds accompany our life? Why should I hear the chattering of blackbirds, why smell the skunk each year? I would fain explore the mysterious relation between myself and these things. I would at least know what these things unavoidably are, make a chart of our life, know how its shores trend, that butterflies reappear and when, know why just this circle of creatures completes the world. Can I not by expectation affect the revolutions of nature, make a day to bring forth something new?

Observe all kinds of coincidences, as what kinds of birds come with what flowers.

An east wind. I hear the clock strike plainly ten or eleven P.M.

April 19. 6 A.M. — Rain still, a fine rain. The birds must live on expectation now. There is nothing in nature to cheer them yet.

That oak by Derby's is a grand object, seen from any side. It stands like an athlete and defies the tempests in every direction. It has not a weak point. It is an agony of strength. Its branches look like stereotyped gray lightning on the sky. But I fear a price is set upon its sturdy trunk and roots for ship-timber, for knees to make stiff the sides of ships against the Atlantic billows. Like an athlete, it shows its well-developed muscles.

How sweet is the perception of a new natural fact! suggesting what worlds remain to be unveiled. That phenomenon of the andromeda seen against the sun cheers me exceedingly. When the phenomenon was not observed, it was not at all. I think that no man ever takes an original or detects a principle, without experiencing an inexpressible, as quite infinite and sane, pleasure, which advertises him of the dignity of that truth he has perceived. The thing that pleases me most within these three days is the discovery of the andromeda phenomenon. It makes all those parts of the country where it grows more attractive and elysian to me. It is a natural magic. These little leaves are the stained windows in the cathedral of my world. At sight of any redness I am excited like a cow.

Scared up three blue herons in the little pond close by, quite near us. It was a grand sight to see them rise, so slow and stately, so long and limber, with an undulating motion from head to foot, undulating also their large wings, undulating in two directions, and looking warily about them. With this graceful, limber, undulating motion they arose, as if so they got under way, their two legs trailing parallel far behind like an earthy residuum to be left behind. They are large, like birds of Syrian lands, and seemed to oppress the earth, and hush the hillside to silence, as they winged their way over it, looking back toward us. It would affect our thoughts, deepen and perchance darken our reflections, if such huge birds flew in numbers in our sky. The legs hang down like a weight which they raise, to pump up as it were with its wings and convey out of danger.

April 23. The water has risen one and a half inches at six this morning since last night. There is absolutely no passing, in carriages or otherwise, over Hubbard's and the Red Bridge roads, and over none of the bridges for foot-travellers. Throughout this part of the country most people do not remember so great a flood, but, judging from some accounts, it was probably as high here thirty-five years ago. I hear this morning, in the pine woods above the railroad bridge, for the first time, that delicious cool-sounding wetter-wetter-wetter-wetter-wet from that small bird (pine warbler?) in the tops of the pines. I associate it with the cool, moist, evergreen spring woods.

April 26. P.M. — Rambled amid the shrub oak hills beyond Hayden's.

Lay on the dead grass in a cup-like hollow sprinkled with half-dead low shrub oaks. As I lie flat, looking close in among the roots of the grass, I perceive that its endless ribbon has pushed up about one inch and is green to that extent, — such is the length to which the spring has gone here, — though when you stand up the green is not perceptible. It is a dull, rain dropping and threatening afternoon, inclining to drowsiness. I feel as if I could go to sleep under a hedge. The landscape wears a subdued tone, quite soothing to the feelings; no glaring colors.

Storm begins this morning and continues five days incessantly.

April 28. I scarcely know why I am excited when, in M. Huc's book, I read of the country of the Mongol Tartars as the "Land of Grass," but I am, as much as if I were a cow.

2.30 P.M. — To Cliffs and Heywood's Brook.

Are not the flowers which appear earliest in the spring the most primitive and simplest? They have been in this town thus far, as I have observed them this spring, putting them down in the order in which I think they should be named, using Gray's names: —

*Symplocarpus foetidus* (well advanced Feb. 13th, '51) *Alnus incana* April 11 *Alnus serrulata* 8 *Acer rubrum dasycarpum* April 9 one by Red Bridge *Salix*, willow, earliest 12 *Ulmus Americana* (?) 15 one, Cheney's (others ten days or fourteen later) *Populus tremuloides* 15 *Corylus tremuloides* 16 perhaps before the last *Carex Pennsylvanica* (?) 22 *Caltha palustris* 25 many *Stellaria media* (?) 26 Cheney's garden *Capsella Bursa-pastoris* 26 Cheney's garden *Taraxacum Dens-leonis* 25 one in water (seen by another the 20th) *Equisetum arvense* 25 in water *Gnaphalium purpureum* 27 (about April 16th, '51) *Saxifraga Virginiensis* 27 (April 22d, '51) *Antennaria plantaginifolia* 27 *Ranunculus fascicularis* 28 only two (abundant April 22d, '51) All but the 3d, 8th, 11th, 12th observed in the very best season, and these within a day (?) of their flowering.

I observe that the first six are decidedly water or water-loving plants, and the 10th, 13th, and 14th were found in the water and are equally if not more confined to that element. The 7th and 8th belong to the cooler zones of the earth, the 7th, according to [George B.] Emerson, as far north as 64° and comes up (is it this?) on burnt lands first and will grow in dry, cool, dreary places. The 9th on a dry, warm rocky hillside, — the earliest (?) grass to blossom, — also the 18th; the 11th and 12th in cold, damp gardens, like the earth first made dry land; the 15th and 17th on dry (scantly clad

with grass) fields and hills, hardy; the 16th, sunny bare rocks, in seams on moss, where also in a day or two the columbine will bloom. The 18th is also indebted to the warmth of the rocks.

This may, perhaps, be nearly the order of the world's creation. Thus we have in the spring of the year the spring of the world represented. — Such were the first localities afforded for plants, — water-bottoms, bare rocks, and scantily clad lands, and land recently bared of water.

May 1. The little peeping frogs which I got last night resemble the description of the *Hylodes Pickeringii* and in some respects the peeping hyla, but they are probably the former, though every way considerably smaller (vide pencil mark in report). Mine are about three quarters of an inch long as they sit, seven eighths if stretched; thigh five sixteenths, leg same; tarsus and toes one half; four-fingered and five-toed with small tubercles on the ends of them. Some difference in their color; one is like a pale oak leaf at this season, streaked with brown; two others more ashy. Two have crosses like this on back, of dark brown. On the head thus, with transverse bands on the legs. I keep them in a tumbler. Peep at twilight and evening, occasionally at other times. One that got out in the evening on to the carpet was found soon after by his peeping on the piano. They easily ascend the glass of the window; jump eighteen inches and more. When they peep, the loose wrinkled skin of the throat is swelled up into a globular bubble, very large and transparent and quite round, except on the throat side, behind which their little heads are lost, mere protuberances on the side of this sphere; and the peeping wholly absorbs them; their mouths shut, or apparently so. Will sit half a day on the side of a smooth tumbler. Made that trilling note in the house. Remain many hours at the bottom of the water in the tumbler, or sit as long on the leaves above. A pulse in the throat always, except in one for an hour or two apparently asleep. They change their color to a darker or lighter shade, chameleon-like.

May 2. 6 A.M. — Is not the chipping sparrow the commonest heard in the village streets in the mornings now, sitting on an elm or apple tree? Was it the black and white warbler that I saw this morning? It did not stop to creep round the trunks; was very shy. Or was it the myrtle-bird? Might it have been the log-cock woodpecker that I saw yesterday morning? Reptiles must not be omitted, especially frogs; their croaking is the most earthy sound now, a rustling of the scurf of the earth, not to be overlooked in the awakening of the year. It is such an earth-sound.

May 3. 5 A.M. — To Cliffs.

Hear the first brown thrasher, — two of them. Minott says he heard one yesterday, but does he know it from a catbird? They drown all the rest. He says cherruwit, cherruwit; go ahead, go ahead; give it to him, give it to him; etc., etc., etc. Plenty of birds in the woods this morning.

P.M. — Cinquefoil or five-finger (*Potentilla Canadensis*). Also the golden saxifrage (what a name!) (*Chrysosplenium Americanum*), in the meadow at Brister's Hill, in the water, in moss-like beds. It may have been in bloom some time; an obscure flower.

Going through the Depot Field, I hear the dream frog at a distance. The little peeping frogs make a background of sound in the horizon, which you do not hear unless you attend. The former is a trembling note, some higher, some lower, along the edge of the earth, an all-pervading sound. Nearer, it is a blubbering or rather bubbling sound, such as children, who stand nearer to nature, can and do often make, — this and many others, remembering the frog state. There is no dew (I have observed none yet). The dream of the frog sounds best at a distance, — most dreamy. The little peeper prefers a pool on the edge of a wood, which mostly dries up at midsummer, whose shore is covered with leaves and where twigs lie in the water, as where choppers have worked.

Summer is coming apace. Within three or four days the birds have come so fast I can hardly keep the run of them, — much faster than the flowers. I did not watch for the very earliest, however.

May 4. R. W. E. tells me he does not like Haynes as well as I do. I tell him that he makes better manure than most men.

May 5. Heard the first cricket singing, on a lower level than any bird, observing a lower tone — the sane, wise one — than all the singers. He came not from the south, but from the depths. He has felt the heats at last, — that migrates downward. The smallest of birds. The myrtle-bird again, rather tame. In the small ponds I hear a slight bullfroggy note. The andromeda is now a brownish-green; very little of the redness left. Seen from the sun side, now the sun is getting low, it looks like a large bed of greenish-gray moss, reflecting the light. What has become of its red leaves? Does it shed them, and the present fresher ones not till next spring?

A fine scarlet sunset. As I sit by my window and see the clouds reflected in the meadow, I think it is important to have water, because it multiplies the heavens.

MAY 6. 3 P.M. — To Conantum.

Heard the first warbling vireo this morning on the elms. This almost makes a summer. Heard also, as I sat at my desk, the unusual low of cows being driven to their country pastures. Sat all day with the window open, for the outer air is the warmest. The balm-of-Gilead was well blossomed out yesterday, and has been for three or four days probably. The woods seen a mile off in the horizon are more indistinct yesterday and today, these two summer-like days (it is a summer heat), the green of the pines being blended with the gray or ash of the deciduous trees; partly, perhaps, because the fine haze in the air is the color of the twigs, and partly because the buds are expanded into leaves on many; but this last cause is hardly admissible. Now the wasps have come.

My dream frog turns out to be a toad. I watched half a dozen a long time at 3.30 this afternoon in Hubbard's Pool, where they were frogging (?) lustily. They sat in the shade, either partly in the water, or on a stick; looked darker and narrower in proportion to their length than toads usually do, and moreover are aquatic. I see them jump into the ditches as I walk. After an interval of silence, one appeared to be gulping the wind into his belly, inflating himself so that he was considerably expanded; then he

discharged it all into his throat while his body or belly collapsed suddenly, expanding his throat to a remarkable size. Was nearly a minute inflating itself; then swelled out its sac, which is rounded and reminded me of the bag to a work-table, holding its head up the while. It is whitish specked (the bag) on a dull bluish or slate ground, much bigger than all the rest of the head, and nearly an inch in diameter. It was a ludicrous sight, with their so serious prominent eyes peering over it; and a deafening sound, when several were frogging at once, as I was leaning over them. The mouth [seemed] to be shut always, and perhaps the air was expelled through the nostrils. The strain appeared prolonged as long as the air lasted, and was sometimes quavered or made intermittent, apparently by closing the orifice, whatever it was, or the blast. One, which I brought home, answers well enough to the description of the common toad (*Bufo Americanus*), though it is hardly so gray. Their piping (?) was evidently connected with their loves. Close by, it is an unmusical monotonous deafening sound, a steady blast, — not a peep nor a croak, but a kind of piping, — but, far away, it is a dreamy, lulling sound, and fills well the crevices of nature. Out of its place, as very near, it would be as intolerable as the thrumming of children. The plover yesterday disturbed a toad in the garden, the first I have heard of. I must catch him and compare them. Their heads are well above the water when they pipe.

Saw a striped snake lying by the roadside as if watching for toads, though they must be scarce now, his head just on the edge of the road. The most flexible of creatures, it is so motionless it appears the most rigid, in its waving line.

The yellow willows on the causeways are now fairly leaving out. They are more forward in this respect than that early willow, or any other that I see. The trees are already a mass of green, partly concealing the yellow stems, — a tender, fresh light green. No trees look so forward in this respect, and, being in rows, they make the more show, their branches are so thick and numerous, close together. If some have leaves as large, they are much more scattered and make no such show. I did not observe what time the willow bark would strip and make whistles. The female maple is more crimson, the male more scarlet. The horse-chestnut buds are so advanced that they are larger than the leaves of any tree. The elder, the wild cherry, thimble-berries, sweet-briars, cultivated cherry, and early apples, etc., white birches, hazels, aspens, hornbeams, maples, etc., etc., — not quite the hickory and alder, — are opening their buds; the alders are beginning to.

It is pleasant when the road winds along the side of a hill with a thin fringe of wood through which to look into the low land. It furnishes both shade and frame for your pictures, — as this Corner road. The first *Anemone nemorosa*, wind-flower or wood anemone, its petals more slightly tinged with purple than the rue-leaved. See the ferns here at the spring curling up like the proboscis of the sphinx moth. The first *Viola blanda* (sweet-scented white), in the moist ground, also, by this spring. It is pretty numerous and may have been out a day or two. I think I could not find so many blue ones. It has a rather strong scent like heliotrope (?). The *Convallaria bifolia* budded. Sometimes the toad reminds me of the cricket, its note also proceeding from the ground.

See now the woodchuck rollicking across a field toward his hole and tumbling into it. See where he has just dug a new hole. Their claws long and rather weak-looking for digging. The wood-peckers tapping. The first columbine (*Aquilegia Canadensis*) to-day, on Conantum. Shade is grateful, and the walker feels a desire to bathe in some pond or stream for coolness and invigoration.

Cowslips show at a distance in the meadows (Miles's). The new butter is white still, but with these cows' lips in the grass it will soon be yellow, I trust. This yellowness in the spring, derived from the sun, affects even the cream in the cow's bag, and flowers in yellow butter at last. Who has not turned pale at the sight of hay butter? These are the cows' lips.

The music of all creatures has to do with their loves, even of toads and frogs. Is it not the same with man?

There are odors enough in nature to remind you of everything, if you had lost every sense but smell. The fever-bush is an apothecary's shop.

The farmers are very busily harrowing and rolling in their grain. The dust flies from their harrows across the field. The tearing, toothed harrow and the ponderous cylinder, which goes creaking and rumbling over the surface, heard afar, and vying with the sphere. The cylinder is a simple machine, and must go into the new symbols. It is an interesting object, seen drawn across a grain-field. The willows are now suddenly of a light, fresh, tender yellowish-green. A green bittern, a gawky bird. As I return over the bridge, shadflies very numerous. Many insects now in the evening sunshine, especially over the water.

*Houstonia* (*Hedyotis coerulea*), bluets, now just begun. Dewey calls it Venus' Pride. Gray says truly, "a very delicate little herb,... producing in spring a profusion of handsome bright blue blossoms fading to white, with a yellow eye." I should say bluish-white. The dwarf andromeda (*A. calyculata*) just begun; leaves called evergreen; flowers on "one-sided leafy racemes." Methinks its leaves remain two years, and fall in the spring, the small ones continuing to grow.(?)The ground is now strewn with the old red-brown lower leaves, and only the smaller and fresher green ones remain.

The common toad, with which I compared the dream toad I brought home, has two horn-like dark marks reaching over the eyes. It is not depressed, but rather has a tubercle, on the top of the head between the eyes. It is also much wider in proportion to length, and is triangular, as I have drawn in report. Yet they are probably the same. The garden toad made the same faint chicken-like, musical croak, when I held him in my hand, with the other, and in the same manner swelling his bag. The garden toad was yellowish beneath, the other white with some small spots. The latter turned much lighter-colored, — from brown to a yellowish and light-brown green, or rather greenish-brown, — while I had him. They have a bright eye, with coppery or golden-coppery iris. It is their redeeming feature. But why do I not hear them in the garden? They appear to frequent the water first, and breed there, then hop to the gardens, and turn lighter and grow thicker.

May 7. I would fain see the sun as a moon, more weird. Methinks the birds sing more some mornings than others, when I cannot see the reason.

I think that birds vary their notes considerably with the seasons. When I hear a bird singing, I cannot think of any words that will imitate it. What word can stand in place of a bird's note? You would have to surround it with a chevaux de frise of accents, and exhaust the art of the musical composer besides with your different bars, to represent it, and finally get a bird to sing it, to perform it. It has so little relation to words. The wood thrush says ah-tully-tully for one strain.

I fear that the dream of the toads will not sound so musical now that I know whence it proceeds. But I will not fear to know. They will awaken new and more glorious music for me as I advance, still farther in the horizon, not to be traced to toads and frogs in slimy pools.

P.M. — To Nawshawtuct.

May 9. It is impossible to remember a week ago. A river of Lethe flows with many windings the year through, separating one season from another. The heavens for a few days have been lost. It has been a sort of paradise instead.

Saw a green snake, twenty or more inches long, on a bush, hanging over a twig with its head held forward six inches into the air, without support and motionless. What there for? Leaves generally are most beautiful when young and tender, before insects or weather has defaced them.

These are the warm-west-wind, dream-frog, leafing-out, willowy, haze days. Is not this summer, whenever it occurs, the vireo and yellowbird and golden robin being here? The young birch leaves reflect the light in the sun.

Mankind seen in a dream. The gardener asks what kind of beans he shall plant. Nobody is looking up into the sky.

May 10. This Monday the streets are full of cattle being driven up-country, — cows and calves and colts. The rain is making the grass grow apace. It appears to stand upright, — its blades, — and you can almost see it grow. For some reason I now remember the autumn, — the succory and the goldenrod. We remember autumn to best advantage in the spring; the finest aroma of it reaches us then. How closely the flower follows upon, if it does not precede, the leaf! The leaves are but calyx and escort to the flower. Some beds of clover wave.

Some look out only for the main chance, and do not regard appearances nor manners; others — others regard these mainly. It is an immense difference. I feel it frequently. It is a theme I must dwell upon.

May 13. P.M. — To Walden in rain.

A May storm, yesterday and to-day; rather cold. The fields are green now, and the cows find good feed. All these expanding leaves and flower-buds are much more beautiful in the rain, — covered with clear drops. They have lost some of their beauty when I have shaken the drops off. They who do not walk in the woods in the rain never behold them in their freshest, most radiant and blooming beauty.

May 14. Hastily reviewing this Journal, I find the flowers to have appeared in this order since the 28th of April (perhaps some note in my Journal has escaped me): —

*Acer rubrum* April 28 male; a female 30th; first date is perhaps early enough for both. *Populus grandidentata* 29 *Epigæa repens* 30 (April 25, '51). Sweet-gale 30 probably a day or two before. *Viola ovata* May 1 (April 25, '51). [Etc. — 32 more.] BIRDS SINCE 28TH APRIL Saw the last *Fringilla hyemalis* May 4. First Savannah (?) sparrow May 1 or a day or two before. Ground robin May 1 Catbird 1 Black and white creeper 1 Purple finch 1 Myrtle-bird 2 [Etc. — 22 more.] Snow in hollows? April 28 Saw frog spawn 28 Rushes at Second Division one foot high, highest of grasslike herbs 29 A large water-bug 29 Heard toad (dreaming) 30 Bull(?)frog (saw him) 30 Flies buzz outdoors Gooseberry leaves (earliest of leaves?) April 30 Sit without fire to-night. Spearing. Chickadee's tull-a-lull May 4 First cricket on Cliff 5 Shad-fly 5 Toad in garden 5 Wasps 6 Willows suddenly green 6 Cows going up-country Many trees just beginning to expand leaves 6 First fog, very slight Ant-hills 7 Humblebee 7 Partridge drums 7 Stinkpot tortoise 8 How much earlier? Birch leaves, sweet-scented 8 Ground still frozen in some places 8 Barn swallows twitter 8 Apple and cherry trees begin to show green 9 Elms darkened with samaræ A green snake 9 Reduce neck-cloth Clover waves 10 Frogs snore in the river 10 One oak in the gray 13 Pines start 13 A May storm 13 These pages do not contain the earliest phenomena of the spring, for which see the previous journal, as far as observed.

May 26. Wednesday. Surveying the Brooks farm.

The early thalictrum has been in bloom some time. Perceive the rank smell of brakes. Observe the yellow bark of the barberry.

The air is full of the odor of apple blossoms, yet the air is fresh as from the salt water. The meadow smells sweet as you go along low places in the road at sundown. To-night I hear many crickets. They have commenced their song. They bring in the summer.

May 27. My early willow is either the swamp willow or the bog willow of Bigelow. The *Salix nigra*, or black willow, of Gray, in bloom. *Myosotis laxa*, water mouse-ear, by Depot Field Brook. The fruit of the sweet flag is now just fit to eat, and reminds me of childhood, — the critchicrotches. They would help sustain a famished traveller. The inmost tender leaf, also, near the base, is quite palatable, as children know. I love it as well as muskrats(?) The smooth speedwell, the minute pale-blue striated flower by the roadsides and in the short sod of fields common now. I hear but few toads and peepers now. The tall crowfoot out. The fringed polygala near the Corner Spring is a delicate flower, with very fresh tender green leaves and red-purple blossoms; beautiful from the contrast of its clear red-purple flowers with its clear green leaves. The cuckoo. Caught a wood frog (*Rana sylvatica*), the color of a dead leaf. He croaked as I held him, perfectly frog-like. A humblebee is on my bunch of flowers laid down.

May 30. Sunday. Now is the summer come. A breezy, washing day. A day for shadows, even of moving clouds, over fields in which the grass is beginning to wave. *Senecio* in bloom. A bird's nest in grass, with coffee-colored eggs. Cinquefoil and *houstonia* cover

the ground, mixed with the grass and contrasting with each other. Strong lights and shades now.

June 5. The lupine is now in its glory. It is the more important because it occurs in such extensive patches, even an acre or more together, and of such a pleasing variety of colors, — purple, pink, or lilac, and white, — especially with the sun on it, when the transparency of the flower makes its color changeable. It paints a whole hillside with its blue, making such a field (if not meadow) as Proserpine might have wandered in. Its leaf was made to be covered with dewdrops. I am quite excited by this prospect of blue flowers in clumps with narrow intervals. Such a profusion of the heavenly, the elysian, color, as if these were the Elysian Fields. They say the seeds look like babies' faces, and hence the flower is so named. No other flowers exhibit so much blue. That is the value of the lupine. The earth is blued with them. Yet a third of a mile distant I do not detect their color on the hillside. Perchance because it is the color of the air.

JUNE 6. Sunday. First devil's-needles in the air, and some smaller, bright-green ones on flowers. The earliest blueberries are now forming as greenberries. The wind already injures the just-expanded leaves, tearing them and making them turn black. I see the effects of recent frosts on the young oaks in hollows in the woods. The leaves are turned dry, black, and crisp. The side-flowering sandwort, an inconspicuous white flower like a chickweed.

JUNE 7. Surveying for Sam. Pierce. Found piece of an Indian soapstone pot.

June 9. The season of waving boughs; and the lighter under sides of the new leaves are exposed. This is the first half of June. Already the grass is not so fresh and liquid-velvety a green, having much of it blossomed and some even gone to seed, and it is mixed with reddish ferns and other plants, but the general leafiness, shadiness, and waving of grass and boughs in the breeze characterize the season. The weather is very clear, and the sky bright. The river shines like silver. Methinks this is a traveller's month. The locust in bloom. The waving, undulating rye. The deciduous trees have filled up the intervals between the evergreens, and the woods are bosky now.

Evelyn has collected the fine exaggerations of antiquity respecting the virtues and habits of trees and added some himself. If the oft-repeated glorification of the forest from age to age smacks of religion, is even druidical, Evelyn is as good as several old druids, and his "Silva" is a new kind of prayerbook, a glorifying of the trees and enjoying them forever, which was the chief end of his life.

Evelyn speaks of "mel-dews" attracting bees. Can mildews be corrupted from this? Says that the alder, laid under water, "will harden like a very stone," and speaks of their being used "for the draining of grounds by placing them...in the trenches," which I have just seen done here under Clamshell Hill.

Evelyn's love of his subject teaches him to use many expressive words, some imported from the Latin, which I wonder how we can do without. He says of the "oziers or aquatic salix," "It likewise yields more limber and flexible twigs for baskets, flaskets, hampers, cages, lattices, cradles,...the bodies of coaches and waggons,...for chairs, hur-

dles, stays, bands," etc.; "likewise for fish-weirs, and to support the banks of impetuous rivers: In fine, for all wicker and twiggy works;

'Viminibus Salices' — VIRG."

Many of his words show a poetic genius.

Evelyn well says "a sobbing rain."

He speaks of pines "pearling out into gums." Things raised in a garden he calls "hortular furniture." He talks of modifying the air as well as the soil, about plants, "and make the remedy as well regional as topical." This suggests the propriety of Shakespeare's expression the "region cloud," region meaning then oftener upper regions relatively to the earth.

He speaks of a "dewie sperge or brush," to be used instead of a watering-pot, which "gluts" the earth. He calls the kitchen-garden the "olitory garden." In a dedication of his "Kalendarium Hortense" to Cowley, he inserts two or three good sentences or quotations, viz.: "As the philosopher in Seneca desired only bread and herbs to dispute felicity with Jupiter," so of Cowley's simple retired life. "Who would not, like you, cacher sa vie?" "Delivered from the gilded impertinences of life."

June 12. How difficult, if not impossible, to do the things we have done! as fishing and camping out. They seem to me a little fabulous now.

Boys are bathing at Hubbard's Bend, playing with a boat (I at the willows). The color of their bodies in the sun at a distance is pleasing, the not often seen flesh-color. I hear the sound of their sport borne over the water. As yet we have not man in nature. What a singular fact for an angel visitant to this earth to carry back in his notebook, that men were forbidden to expose their bodies under the severest penalties! A pale pink, which the sun would soon tan. White men! There are no white men to contrast with the red and the black; they are of such colors as the weaver gives them.

Hedge-mustard. Some fields are almost wholly covered with sheep's-sorrel, now turned red, — its valves (?). It helps thus agreeably to paint the earth, contrasting even at a distance with the greener fields, blue sky, and dark or downy clouds. It is red, marbled, watered, mottled, or waved with greenish, like waving grain, — three or four acres of it. To the farmer or grazier it is a troublesome weed, but to the landscape-viewer an agreeable red tinge laid on by the painter. I feel well into summer when I see this redness. It appears to be avoided by the cows.

The color of the earth at a distance where a wood has been cut off is a reddish brown. Nature has put no large object on the face of New England so glaringly white as a white house.

June 15. Very warm. Now for a thin coat. This melting weather makes a stage in the year. The drouth begins. The dry z-ing of the locust is heard. Bathing cannot be omitted. The conversation of all boys in the streets is whether they will or not or who will go in a-swimming, and how they will not tell their parents. You lie with open windows and hear the sounds in the streets.

I will note such birds as I observe in this walk, beginning on the railroad causeway in middle of this hot day. The chuckling warble of martins heard over the meadow,

from a village box. The lark. The fields are blued with blue-eyed grass, — a slaty blue. The epilobium shows some color in its spikes.

How rapidly new flowers unfold! as if Nature would get through her work too soon. One has as much as he can do to observe how flowers successively unfold. It is a flowery revolution, to which but few attend. Hardly too much attention can be bestowed on flowers. We follow, we march after, the highest color; that is our flag, our standard, our "color." Flowers were made to be seen, not overlooked. Their bright colors imply eyes, spectators.

The oven-bird, chewink, pine warbler (?), thrasher, swallows on the wire, cuckoo, phœbe, red-eye, robin, veery. The maple-leaved viburnum is opening with a purplish tinge. Wood thrush.

Young robins, dark-speckled, and the pigeon wood-pecker flies up from the ground and darts away. I forget that there are lichens at this season.

On Mt. Misery, panting with heat, looking down the river. Methinks there is a male and female shore to the river, one abrupt, the other flat and meadowy. Have not all streams this contrast more or less, on the one hand eating into the bank, on the other depositing their sediment? The year is in its manhood now. The very river looks warm, and there is none of that light celestial blue seen in far reaches in the spring.

8 P.M. — On river.

No moon. A deafening sound from the toads, and intermittingly from bullfrogs. What I have thought to be frogs prove to be toads, sitting by thousands along the shore and trilling short and loud, — not so long a quaver as in the spring. (I do not know what to think of my midsummer frog now.)

June 19. Saturday. These are the clover days. The light of June is not golden but silvery, not a torrid but somewhat temperate heat. See it reflected from the bent grass and the under sides of leaves.

Grape in bloom; agreeable perfume to many, to me not so.

What subtle differences between one season and another! The warmest weather has, perchance, arrived and the longest days, but not the driest. When I remember gathering ripe blackberries on sandy fields or stones by the roadside, the very berries warmed by the sun, I am convinced of this. The seasons admit of infinite degrees in their revolutions.

June 23. These are very agreeable pastures to me; no house in sight, no cultivation. I sit under a large white oak, upon its swelling instep, which makes an admirable seat, and look forth over these pleasant rocky and bushy pastures, where for the most part there are not even cattle to graze them, but patches of huckleberry bushes, and birches, and pitch pines, and barberry bushes, and creeping juniper in great circles, its edges curving upward, and wild roses spotting the green with red, and numerous tufts of indigo-weed, and, above all, great gray boulders lying about far and near, with some barberry bush, perchance, growing half-way up them; and, between all, the short sod of the pasture here and there appears.

The beauty and fragrance of the wild rose are wholly agreeable and wholesome and wear well, and I do not wonder much that men have given the preference to this family of flowers, notwithstanding their thorns. It is hardy and more complete in its parts than most flowers, — its color, buds, fragrance, leaves, the whole bush, frequently its stem in particular, and finally its red or scarlet hips. I take the wild rose buds to my chamber and put them in a pitcher of water, and they will open there the next day, and a single flower will perfume a room; and then, after a day, the petals drop off, and new buds open.

I am inclined to think that my hat, whose lining is gathered in midway so as to make a shelf, is about as good a botany-box as I could have and far more convenient, and there is something in the darkness and the vapors that arise from the head — at least if you take a bath — which preserves flowers through a long walk. Flowers will frequently come fresh out of this botany-box at the end of the day, though they have had no sprinkling.

This grassy road now dives into the wood, as if it were entering a cellar or bulkhead, the shadow is so deep. June is the first month for shadows. How is it in July?

The sweet-briar bud which I brought home opened in the night. Is that the habit of roses?

June 25. 8.30 P.M. — To Conantum.

The great story of the night is the moon's adventures with the clouds. What innumerable encounters she has had with them!

June 26. I have not put darkness, duskiness, enough into my night and moonlight walks. Every sentence should contain some twilight or night. At least the light in it should be the yellow or creamy light of the moon or the fine beams of stars, and not the white light of day. The peculiar dusky serenity of the sentences must not allow the reader to forget that it is evening or night, without my saying that it is dark. Otherwise he will, of course, presume a daylight atmosphere.

P.M. — Boated up the Assabet.

The *Nymphæa odorata*, water nymph, sweet water-lily, pond-lily, in bloom. A superb flower, our lotus, queen of the waters. Now is the solstice in still waters. How sweet, innocent, wholesome its fragrance! How pure its white petals, though its root is in the mud! It must answer in my mind for what the Orientals say of the lotus flower. Probably the first a day or two since. To-morrow, then, will be the first Sabbath when the young men, having bathed, will walk slowly and soberly to church in their best clothes, each with a lily in his hand or bosom, — with as long a stem as he could get. At least I used to see them go by and come into church smelling a pond-lily, when I used to go myself. So that the flower is to some extent associated with bathing in Sabbath mornings and going to church, its odor contrasting and atoning for that of the sermon. We now have roses on the land and lilies on the water, — both land and water have done their best, — now just after the longest day. Nature says, "You behold the utmost I can do." And the young women carry their finest roses on the other hand.

Roses and lilies. The floral days. The highest, intensest color belongs to the land, the purest, perchance, to the water.

June 27. Saw a very large white ash tree, three and a half feet in diameter, in front of the house which White formerly owned, under this hill, which was struck by lightning the 22d, about 4 P.M. The lightning apparently struck the top of the tree and scorched the bark and leaves for ten or fifteen feet downward, then began to strip off the bark and enter the wood, making a ragged narrow furrow or crack, till, reaching one of the upper limbs, it apparently divided, descending on both sides and entering deeper and deeper into the wood. At the first general branching, it had got full possession of the tree in its centre and tossed off the main limbs butt foremost, making holes in the ground where they struck; and so it went down in the midst of the trunk to the earth, where it apparently exploded, rending the trunk into six segments, whose tops, ten or twenty feet long, were rayed out on every side at an angle of about 30° from a perpendicular, leaving the ground bare directly under where the tree had stood, though they were still fastened to the earth by their roots. The lightning appeared to have gone off through the roots, furrowing them as the branches, and through the earth, making a furrow like a plow, four or five rods in one direction, and in another passing through the cellar of the neighboring house, about thirty feet distant, scorching the tin milk-pans and throwing dirt into the milk, and coming out the back side of the house in a furrow, splitting some planks there. The main body of the tree was completely stripped of bark, which was cast in every direction two hundred feet; and large pieces of the inside of the tree, fifteen feet long, were hurled with tremendous force in various directions, one into the side of a shed, smashing it, another burying itself in a wood-pile. The heart of the tree lay by itself. Probably a piece as large as a man's leg could not have been sawn out of the trunk which would not have had a crack in it, and much of it was very finely splintered. The windows in the house were broken and the inhabitants knocked down by the concussion. All this was accomplished in an instant by a kind of fire out of the heavens called lightning, or a thunderbolt, accompanied by a crashing sound. For what purpose? The ancients called it Jove's bolt, with which he punished the guilty, and we moderns understand it no better.

This is one of those instances in which a man hesitates to refer his safety to his prudence, as the putting up of a lightning-rod. There is no lightning-rod by which the sinner can finally avert the avenging Nemesis. Though I should put up a rod if its utility were satisfactorily demonstrated to me, yet, so mixed are we, I should feel myself safe or in danger quite independently of the senseless rod. Yet there is a degree of faith and righteousness in putting up a rod, as well as trusting without one, though the latter, which is the rarest, I feel to be the most effectual rod of the two. The savage's and the civilized man's instincts are right. Science affirms too much. Science assumes to show why the lightning strikes a tree, but it does not show us the moral why any better than our instincts did. Why should trees be struck? It is not enough to say because they are in the way. All the phenomena of nature need to be seen from the point of view of wonder and awe, like lightning; and, on the other hand, the lightning itself needs to

be regarded with serenity, as the most familiar and innocent phenomena are. Men are probably nearer to the essential truth in their superstitions than in their science.

June 29. In my experience nothing is so opposed to poetry — not crime — as business. It is a negation of life.

Children bring you the early blueberry to sell now. It is considerably earlier on the tops of hills which have been recently cut off than on the plains or in vales. The girl that has Indian blood in her veins and picks berries for a living will find them out as soon as they turn.

July 1. Thursday. 9.30 A.M. — To Sherman's Bridge by land and water.

A cloudy and slightly showery morning, following a thunder-shower the previous afternoon. One object to see the white lilies in blossom.

Borrowed Brigham the wheelwright's boat at the Corner Bridge. He was quite ready to lend it, and took pains to shave down the handle of a paddle for me, conversing the while on the subject of spiritual knocking, which he asked if I had looked into, — which made him the slower. An obliging man, who understands that I am abroad viewing the works of Nature and not loafing, though he makes the pursuit a semi-religious one, as are all more serious ones to most men. All that is not sporting in the field, as hunting and fishing, is of a religious or else love-cracked character. Another hard-featured but talkative character at the bridge inquired, as I was unlocking the boat, if I knew anything that was good for the rheumatism; but I answered that I had heard of so many and had so little faith in any that I had forgotten them all. (On Conantum I had found *Krigia Virginica*, one of the smallest compound flowers.) The white lilies were in all their splendor, fully open, sometimes their lower petals lying flat on the surface. The largest appeared to grow in the shallower water, where some stood five or six inches out of water, and were five inches in diameter. Two which I examined had twenty-nine petals each.

The freshly opened lilies were a pearly white, and though the water amid the pads was quite unrippled, the passing air gave a slight oscillating, boat-like motion to and fro to the flowers, like boats held fast by their cables. Some of the lilies had a beautiful rosaceous tinge, most conspicuous in the half-opened flower, extending through the calyx to the second row of petals, on those parts of the petals between the calyx-leaves which were most exposed to the influence of the light. They were tinged with red, as they are very commonly tinged with green, as if there were a gradual transition from the stamens to the petals. Yet these rosaceous ones are chiefly interesting to me for variety, and I am contented that lilies should be white and leave those higher colors to the land. I wished to breathe the atmosphere of lilies, and get the full impression which lilies are fitted to make.

After eating our luncheon at Rice's landing, we observed that every white lily in the river was shut. It would be interesting to observe how instantaneously these lilies close at noon.

July 2. Bigelow tells me that saddlers sometimes use the excrescence, the whitish fungus, on the birch to stick their awls in. Men find a use for everything at last. I saw one nailed up in his shop with an awl in it.

Last night, as I lay awake, I dreamed of the muddy and weedy river on which I had been paddling, and I seemed to derive some vigor from my day's experience, like the lilies which have their roots at the bottom.

I have plucked a white lily bud just ready to expand, and, after keeping it in water for two days, have cut its stem short and placed it in a broad dish of water, where it sailed about under the breath of the beholder with a slight undulatory motion. The breeze of his half-suppressed admiration it was that filled its sail. It was a rare-tinted one.

Nature is reported not by him who goes forth consciously as an observer, but in the fullness of life. To such a one she rushes to make her report. To the full heart she is all but a figure of speech. This is my year of observation, and I fancy that my friends are also more devoted to outward observation than ever before, as if it were an epidemic. At this season, methinks, we do not regard the larger features of the landscape, as in the spring, but are absorbed in details. Then, when the meadows were flooded, I looked far over them to the distant woods and the outlines of hills, which were more distinct. I should not have so much to say of extensive water or landscapes at this season. You are a little bewildered by the variety of objects. There must be a certain meagreness of details and nakedness for wide views.

July 4. Sunday. 3 A.M. — To Conantum, to see the lilies open.

I hear an occasional crowing of cocks in distant barns, as has been their habit for how many thousand years. It was so when I was young; and it will be so when I am old. I hear the croak of a tree-toad as I am crossing the yard. I am surprised to find the dawn so far advanced. Now, on the Corner road, the hedges are alive with twittering sparrows, a bluebird or two, etc. The daylight now balances the moonlight. How short the nights! The last traces of day have not disappeared much before 10 o'clock, or perchance 9.30, and before 3 A.M. you see them again in the east, — probably 2.30, — leaving about five hours of solid night, the sun so soon coming round again.

July 5. There is a meadow on the Assabet just above Derby's Bridge, — it may contain an acre, — bounded on one side by the river, on the other by alders and a hill, completely covered with small hummocks which have lodged on it in the winter, covering it like the mounds in a graveyard at pretty regular intervals. Their edges are rounded like the latter, and they and the paths between are covered with a firm, short greensward, with here and there hardhacks springing out of them, so that they make excellent seats, especially in the shade of an elm that grows there. They are completely united with the meadow, forming little oblong hillocks from one to ten feet long, flat as a mole to the sward. I am inclined to call it the elfin burial-ground, or perchance it might be called the Indian burial-ground. It is a remarkably firm-swarded meadow, and convenient to walk on. I love to ponder the natural history thus written on the banks of the stream, for every higher freshet and intenser frost is recorded by it. The stream

keeps a faithful and a true journal of every event in its experience, whatever race may settle on its banks; and it purls past this natural graveyard with a storied murmur, and no doubt it could find endless employment for an old mortality in renewing its epitaphs.

The progress of the season is indescribable. It is growing warm again, but the warmth is different from that we have had. We lie in the shade of locust trees. Haymakers go by in a hay-rigging. I am reminded of berrying. I scent the sweet-fern and the dead or dry pine leaves. Cherry-birds alight on a neighboring tree. The warmth is something more normal and steady, ripening fruits. Nature offers fruits now as well as flowers. We have become accustomed to the summer. It has acquired a certain eternity. The earth is dry. Perhaps the sound of the locust expresses the season as well as anything. The farmers say the abundance of the grass depends on wet in June. I might make a separate season of those days when the locust is heard.

I see many devil's-needles zigzagging along the Second Division Brook, some green, some blue, both with black and perhaps velvety wings. They are confined to the brook. How lavishly they are painted! How cheap was the paint! How free the fancy of their creator! I caught a handful of small water-bugs, fifteen or twenty, about as large as apple seeds. Some country people call them apple seeds, it is said, from their scent. I perceived a strong scent, but I am not sure it was like apples. I should rather think they were so called from their shape.

The robin, the red-eye, the veery, the wood thrush, etc., etc.

How fitting to have every day in a vase of water on your table the wild-flowers of the season which are just blossoming! Can any house be said to be furnished without them? Shall we be so forward to pluck the fruits of Nature and neglect her flowers? These are surely her finest influences. So may the season suggest the fine thoughts it is fitted to suggest. Shall we say, "A penny for your thoughts," before we have looked into the face of Nature? Let me know what picture she is painting, what poetry she is writing, what ode composing, now.

The sun has set. We are in Dennis's field. The dew is falling fast. Some fine clouds, which have just escaped being condensed in dew, hang on the skirts of day and make the attraction in our western sky, — that part of day's gross atmosphere which has escaped the clutches of the night and is not enough condensed to fall to earth. They are remarkably finely divided clouds, a very fine mackerel sky, or, rather, as if one had sprinkled that part of the sky with a brush, the outline of the whole being that of several large sprigs of fan coral. C., as usual, calls it a Mediterranean sky.

July 6. Hosmer is haying, but inclined to talk as usual. I blowed on his horn at supper-time. I asked if I should do any harm if I sounded it. He said no, but I called Mrs. Hosmer back, who was on her way to the village, though I blowed it but poorly. I was surprised to find how much skill and breath it took, depending on the size of the throat. Let blow a horn, says Robin, that good fellowship may us know. Where could a man go to practice on the horn, unless he went round to the farmer's at meal-time?

I am disappointed that Hosmer, the most intelligent farmer in Concord, and perchance in Middlesex, who admits that he has property enough for his use without accumulating more, and talks of leaving off hard work, letting his farm, and spending the rest of his days easier and better, cannot yet think of any method of employing himself but in work with his hands; only he would have a little less of it. Much as he is inclined to speculation in conversation — giving up any work to it for the time — and long-headed as he is, he talks of working for a neighbor for a day now and then and taking his dollar. He “would not like to spend his time sitting on the mill-dam.” He has not even planned an essentially better life.

July 8. P.M. — Down river in boat to the Holt.

It is perhaps the warmest day yet.

We held on to the abutments under the red bridge to cool ourselves in the shade. No better place in hot weather, the river rippling away beneath you and the air rippling through beneath the abutments, if only in sympathy with the river, while the planks afford a shade, and you hear all the travel and the travellers' talk without being seen or suspected. The bullfrog it is, methinks, that makes the dumping sound. There is generally a current of air circulating over water, always, methinks, if the water runs swiftly, as if it put the air in motion. There is quite a breeze here this sultry day. Commend me to the sub-pontean, the under-bridge, life.

I found a remarkable moth lying flat on the still water as if asleep (they appear to sleep during the day), as large as the smaller birds. Five and a half inches in alar extent and about three inches long, something like the smaller figure in one position of the wings (with a remarkably narrow lunar-cut tail), of a sea-green color, with four conspicuous spots whitish within, then a red line, then yellowish border below or toward the tail, but brown, brown orange, and black above, toward head; a very robust body, covered with a kind of downy plumage, an inch and a quarter long by five eighths thick. The sight affected me as tropical, and I suppose it is the northern verge of some species. It suggests into what productions Nature would run if all the year were a July. By night it is active, for, though I thought it dying at first, it made a great noise in its prison, a cigar-box, at night. When the day returns, it apparently drops wherever it may be, even into the water, and dozes till evening again. Is it called the emperor moth?

Drive about the 10th of May to Ashburnham.

N.B. Spring of '51 ten days or more earlier.

*Corylus rostrata* when?

N.B. Is the *Hepatica triloba* found here?

The Latin Gray's. By last of June, '51 is apparently three or four days earlier than '52.

[“Seringo” in pencil written over “Savannah” and “Baywinged” under.]

[John Evelyn, *Silva*: or a Discourse of Forest Trees.]

Till July 3d.

July 9. Friday. 4 A.M. — To Cliffs.

No dew; no dewy cobwebs. The sky looks mist-like, not clear blue. An aurora fading into a general saffron color. At length the redness travels over, partly from east to west, before sunrise, and there is little color in the east. There is no name for the evening red corresponding to aurora. It is the blushing foam about the prow of the sun's boat, and at eve the same in its wake.

Morton, in his "Crania Americana," says, referring to Wilkinson as his authority, that "vessels of porcelain of Chinese manufacture have of late been repeatedly found in the catacombs of Thebes, in Egypt," some as old as the Pharaonic period, and the inscriptions on them "have been read with ease by Chinese scholars, and in three instances record the following legend: The flower opens, and lo! another year." There is something sublime in the fact that some of the oldest written sentences should thus celebrate the coming in of spring. How many times have the flowers opened and a new year begun! Hardly a more cheering sentence could have come down to us. How old is spring, a phenomenon still so fresh! Do we perceive any decay in Nature? How much evidence is contained in this short and simple sentence respecting the former inhabitants of this globe! It is a sentence to be inscribed on vessels of porcelain. Suggesting that so many years had gone before. An observation as fit then as now.

Bathing is an undescribed luxury. To feel the wind blow on your body, the water flow on you and lave you, is a rare physical enjoyment this hot day. The water is remarkably warm here, especially in the shallows, — warm to the hand, like that which has stood long in a kettle over a fire. The pond water being so warm made the water of the brook feel very cold; and this kept close on the bottom of the pond for a good many rods about the mouth of the brook, as I could feel with my feet; and when I thrust my arm down where it was only two feet deep, my arm was in the warm water of the pond, but my hand in the cold water of the brook.

July 13. A journal, a book that shall contain a record of all your joy, your ecstasy.

July 14. A writer who does not speak out of a full experience uses torpid words, wooden or lifeless words, such words as "humanitary," which have a paralysis in their tails.

Saw to-day for the first time this season fleets of yellow butterflies dispersing before us, we rode along berrying on the Walden road. Their yellow fleets are in the offing. Do I ever see them in numbers off the road? They are a yellow flower that blossoms generally about this time. Like a mackerel fleet, with their small hulls and great sails. Collected now in compact but gorgeous assembly in the road, like schooners in a harbor, a haven; now suddenly dispersing on our approach and filling the air with yellow snowflakes in their zigzag flight, or as when a fair wind calls those schooners out and disperses them over the broad ocean.

How deep or perhaps slaty sky-blue are those blueberries that grow in the shade! It is an unexpected and thrilling discovery to find such ethereal fruits in dense drooping clusters under the fresh green of oak and hickory sprouts. Those that grow in the sun appear to be the same species, only to have lost their bloom and freshness, and hence are darker.

The youth gets together his materials to build a bridge to the moon, or perchance a palace or temple on the earth, and at length the middle-aged man concludes to build a wood-shed with them.

July 16. The bass on Conantum is a very rich sight now. Its twigs are drooping, weighed down with pendulous flowers, so that, when you stand directly under it and look up, you see one mass of flowers, a flowery canopy. Its conspicuous leaf-like bracts, too, have the effect of flowers. The tree resounds with the hum of bees, — bumblebees and honey-bees; rose-bugs and butterflies, also, are here, — a perfect susurrus, a sound, as C. says, unlike any other in nature,

— not like the wind, as that is like the sea. The bees abound on the flowers of the smooth sumach now. The branches of this tree touch the ground, and it has somewhat the appearance of being weighed down with flowers. The air is full of sweetness. The tree is full of poetry.

I observe the yellow butterflies everywhere in the fields and on the pontederias, which now give a faint blue tinge to the sides of the rivers. I hear the link link, fall-like note of the bobolink (?) in the meadows; he has lost the bobo off. This is a still, thoughtful day, the air full of vapors which shade the earth, preparing rain for the morrow.

July 17. P.M. — A summer rain. A gentle steady rain, long a-gathering, without thunder or lightning, — such as we have not, and, methinks, could not have had, earlier than this.

I pick raspberries dripping with rain beyond Sleepy Hollow. This weather is rather favorable to thought. On all sides is heard a gentle dripping of the rain on the leaves, yet it is perfectly warm. It is a day of comparative leisure to many farmers. Some go to the mill-dam and the shops; some go a-fishing.

July 18. Sunday. 8.30 A.M. — To the Sudbury meadows in boat.

I observe that even in these meadows, where no willows nor button-bushes line the shore, there is still a pretty constant difference between the shores. The border of pontederia is rarely of equal depth on both sides at once, but it keeps that side in the meander where the sediment is deposited, the shortest course which will follow the shore, as I have dotted it, crossing from this side to that as the river meanders; for on the longest side the river is active, not passive, wearing into the bank, and runs there more swiftly. This is the longest line of blue that nature paints with flowers in our fields, though the lupines may have been more densely blue within a small compass. Thus by a natural law a river, instead of flowing straight through its meadows, meanders from side to side and fertilizes this side or that, and adorns its banks with flowers. The river has its active and its passive side, its right and left breast.

Every poet has trembled on the verge of science.

Got green grapes to stew.

July 22. We have more of the furnace-like heat to-day, after all. The *Rhus glabra* flowers are covered with bees, large yellowish wasps, and butterflies; they are all alive with them. How much account insects make of some flowers! There are other botanists

than I. The *Asclepias syriaca* is going to seed. Here is a kingfisher frequenting the Corner Brook Pond. They find out such places. Huckleberrying and blackberrying have commenced.

July 24. The cardinal-flower probably open to-day. The quails are heard whistling this morning near the village.

I sympathize with weeds perhaps more than with the crop they choke, they express so much vigor. They are the truer crop which the earth more willingly bears.

Just after sunrise this morning I noticed Hayden walking beside his team, which was slowly drawing a heavy hewn stone swung under the axle, surrounded by an atmosphere of industry, his day's work begun. Honest, peaceful industry, conserving the world, which all men respect, which society has consecrated. A reproach to all sluggards and idlers. Honest, manly toil. His brow has commenced to sweat. Honest as the day is long. One of the sacred band doing the needful but irksome drudgery. The day went by, and at evening I passed a rich man's yard, who keeps many servants and foolishly spends much money while he adds nothing to the common stock, and there I saw Hayden's stone lying beside a whimsical structure intended to adorn this Lord Timothy Dexter's mansion, and the dignity forthwith departed from Hayden's labor, in my eyes. How much of the industry of the boor, traced to the end, is found thus to be subserving some rich man's foolish enterprise! There is a coarse, boisterous, money-making fellow in the north part of the town who is going to build a bank wall under the hill along the edge of his meadow. The powers have put this into his head to keep him out of mischief, and he wishes me to spend three weeks digging there with him. The result will be that he will perchance get a little more money to hoard, or leave for his heirs to spend foolishly when he is dead. Now, if I do this, the community will commend me as an industrious and hardworking man; but, as I choose to devote myself to labors which yield more real profit, though but little money, they regard me as a loafer. But, as I do not need this police of meaningless labor to regulate me, and do not see anything absolutely praiseworthy in his undertaking, however amusing it may be to him, I prefer to finish my education at a different school.

July 25. 4 A.M. — To Cliffs.

This early twitter or breathing of chip-birds in the dawn sounds like something organic in the earth. This is a morning celebrated by birds. This morning is all the more glorious for a white fog, which, though not universal, is still very extensive over all lowlands, some fifty feet high or more, though there was none at ten last night. There are white cobwebs on the grass. The battalions of the fog are continually on the move.

When I return this way I find two farmers loading their cart with dirt, and they are so unmanly as to excuse themselves to me for working this Sunday morning by saying with a serious face that they are burying a cow which died last night after some months of sickness, — which, however, they unthinkingly admit that they killed last night, being the most convenient time for them, and I see that they are now putting more loads of soil over her body to save the manure. How often men will betray their

sense of guilt, and hence their actual guilt, by their excuses, where no guilt necessarily was.

July 26. By my intimacy with nature I find myself withdrawn from man. My interest in the sun and the moon, in the morning and the evening, compels me to solitude.

My desire for society is infinitely increased; my fitness for any actual society is diminished.

Went to Cambridge and Boston to-day. Dr. Harris says that my great moth is the *Attacus luna*; may be regarded as one of several emperor moths. They are rarely seen, being very liable to be snapped up by birds. Once, as he was crossing the College Yard, he saw the wings of one coming down, which reached the ground just at his feet. What a tragedy! The wings came down as the only evidence that such a creature had soared, — wings large and splendid, which were designed to bear a precious burthen through the upper air. So most poems, even epics, are like the wings come down to earth, while the poet whose adventurous flight they evidence has been snapped up by the ravenous vulture of this world. If this moth ventures abroad by day, some bird will pick out the precious cargo and let the sails and rigging drift, as when the sailor meets with a floating spar and sail and reports a wreck seen in a certain latitude and longitude. For what were such tender and defenseless organizations made? The wreck of an argosy in the air.

July 30. The fore part of this month was the warmest weather we have had; the last part, sloping toward autumn, has reflected some of its coolness, for we are very forward to anticipate the fall. Perhaps I may say the spring culminated with the commencement of haying, and the summer side of the year in mid-July.

Do not all flowers that blossom after mid-July remind us of the fall? After midsummer we have a belated feeling as if we had all been idlers, and are forward to see in each sight and hear in each sound some presage of the fall, just as in middle age man anticipates the end of life.

Caught in a thunder-shower, when south of Flint's Pond. Stood under thick trees. I care not how hard it rains, if it does not rain more than fifteen minutes. I can shelter myself effectually in the woods. It is a grand sound, that of the rain on the leaves of the forest a quarter of a mile distant, approaching. But I got wet through, after all, being caught where there were no trees.

Aug. 2. Wachusett from Fair Haven Hill looks like this: — the dotted line being the top of the surrounding forest. Even on the low principle that misery loves company and is relieved by the consciousness that it is shared by many, and therefore is not so insignificant and trivial, after all, this blue mountain outline is valuable. In many moods it is cheering to look across hence to that blue rim of the earth, and be reminded of the invisible towns and communities, for the most part also unremembered, which lie in the further and deeper hollows between me and those hills. Towns of sturdy uplandish fame, where some of the morning and primal vigor still lingers, I trust. Ashburnham, Rindge, Jaffrey, etc., — it is cheering to think that it is with such communities that we survive or perish. Yes, the mountains do thus impart, in the mere prospect of

them, some of the New Hampshire vigor. The melancholy man who had come forth to commit suicide on this hill might be saved by being thus reminded how many brave and contented lives are lived between him and the horizon. Those hills extend our plot of earth; they make our native valley or indentation in the earth so much the larger.

Aug. 5. Hearing that one with whom I was acquainted had committed suicide, I said I did not know when I had planted the seed of that fact that I should hear of it.

P.M. — To C. Miles's blueberry swamp.

That is a glorious swamp of Miles's, — an extensive rich moss-like bed, in which you sink three feet to a dry bottom of moss or dead twigs; surrounded all by wild-looking woods, with the wild white spruce advancing into it and the pitch pine here and there, and high blueberry and tall pyrus and holly and other bushes under their countenance and protection. These are the wildest and richest gardens that we have. Such a depth of verdure into which you sink.

Aug. 6. Gathered some of those large, sometimes pear-shaped, sweet blue huckleberries which grow amid the rubbish where woods have just been cut.

Milkweeds and trumpet-flowers are important now, to contrast with the cool, dark, shaded sides and recesses of moist copses. I see their red under the willows and alders everywhere against a dark ground. Methinks that blue, next to red, attracts us in a flower. Blue vervain is now very attractive to me, and then there is that interesting progressive history in its rising ring of blossoms. It has a story. Next to our blood is our prospect of heaven. Does not the blood in fact show blue in the covered veins and arteries, when distance lends enchantment to the view? The sight of it is more affecting than I can describe or account for.

Methinks there are few new flowers of late. An abundance of small fruits takes their place. Summer gets to be an old story. Birds leave off singing, as flowers blossom, i.e. perhaps in the same proportion.

Aug. 8. I only know myself as a human entity, the scene, so to speak, of thoughts and affections, and am sensible of a certain doubleness by which I can stand as remote from myself as from another. However intense my experience, I am conscious of the presence and criticism of a part of me which, as it were, is not a part of me, but spectator, sharing no experience, but taking note of it, and that is no more I than it is you. When the play — it may be the tragedy of life — is over, the spectator goes his way. It was a kind of fiction, a work of the imagination only, so far as he was concerned.

*Ambrosia artemisiæfolia*. July was a month of dry, torrid heat and drouth, especially the fore part. August, thus far, of gentle rain-storms and fogs, dog-days. Things mildew now. I notice now, along the North River, horse-mint, arrowhead, cardinal-flower, trumpet-weed (just coming out), water parsnip, skull-cap (*lateriflora*), monkey-flower, etc., etc. Rivers meander most not amid rugged mountains, but through soft level meadows. In some places the ground is covered now with the black umbelled berries of the sarsaparilla. No man ever makes a discovery, ever an observation of the least importance, but he is advertised of the fact by a joy that surprises him. The

powers thus celebrate all discovery. The squirrels are now devouring the hazelnuts fast.

Aug. 21. Weeds in potato-fields are now very rank. What should we come to if the season were longer, and the reins were given to vegetation? Young turkeys are straying in the grass, which is alive with grasshoppers.

The bees, wasps, etc., are on the goldenrods, impatient to be interrupted, improving their time before the sun of the year sets. A man killed by lightning would have a good answer ready in the next world to the question "How came you here?" which he need not hesitate to give.

The sound of the crickets gradually prevails more and more. I hear the year falling asleep.

Aug. 23. About 8 P.M. — Now I sit on the Cliffs and look abroad over the river and Conantum hills. I live so much in my habitual thoughts, a routine of thought, that I forget there is any outside to the globe, and am surprised when I behold it as now, — yonder hills and river in the moonlight, the monsters. Yet it is salutary to deal with the surface of things. What are these rivers and hills, these hieroglyphics which my eyes behold? There is something invigorating in this air, which I am peculiarly sensible is a real wind, blowing from over the surface of a planet. I look out at my eyes, I come to my window, and I feel and breathe the fresh air. It is a fact equally glorious with the most inward experience. Why have we ever slandered the outward? The perception of surfaces will always have the effect of miracle to a sane sense.

Aug. 24. The year is but a succession of days, and I see that I could assign some office to each day which, summed up, would be the history of the year. Everything is done in season, and there is no time to spare. The bird gets its brood hatched in season and is off. I looked into the nest where I saw a vireo feeding its young a few days ago, but it is empty; it is fledged and flown.

Sept. 18. The poor student begins now to seek the sun. In the forenoons I move into a chamber on the east side of the house, and so follow the sun round. It is agreeable to stand in a new relation to the sun. They begin to have a fire occasionally below-stairs.

3.30 P.M. — A-barberrying to Flint's Pond.

How much handsomer in fruit for being bent down in wreaths by the weight! The increasing weight of the fruits adds gracefulness to the form of the bush. I get my hands full of thorns, but my basket full of berries.

Sept. 26. Dreamed of purity last night. The thoughts seemed not to originate with me, but I was invested, my thought was tinged, by another's thought. It was not I that originated, but I that entertained the thought.

The river is getting to be too cold for bathing.

Sept. 27. Monday. P.M. — The flashing clearness of the atmosphere. More light appears to be reflected from the earth, less absorbed.

The touch-me-not seed-vessels go off like pistols, — shoot their seeds off like bullets. They explode in my hat.

Sept. 30. Thursday. 10 A.M. — To Fair Haven Pond, bee-hunting, — Pratt, Rice, Hastings, and myself, in a wagon.

A fine, clear day after the coolest night and severest frost we have had. The apparatus was, first a simple round tin box about four and a half inches in diameter and one and a half inches deep, containing a piece of empty honeycomb of its own size and form, filling it within a third of an inch of the top; also another, wooden box about two and a half inches square every way, with a glass window occupying two thirds the upper side under a slide, with a couple of narrow slits in the wood, each side of the glass, to admit air, but too narrow for the bees to pass; the whole resting on a circular bottom a little larger than the lid of the tin box, with a sliding door in it. We were earnest to go this week, before the flowers were gone, and we feared the frosty night might make the bees slow to come forth.

After we got to the Baker Farm, to one of the open fields nearest to the tree I had marked, the first thing was to find some flowers and catch some honey-bees. We followed up the bank of the brook for some distance, but the goldenrods were all dried up there, and the asters on which we expected to find them were very scarce. We had no better luck at Clematis Brook. Not a honey-bee could we find, and we concluded that we were too late, — that the weather was too cold.

After eating our lunch, we set out on our return. By the roadside at Walden, on the sunny hillside sloping to the pond, we saw a large mass of goldenrod and aster several rods square and comparatively fresh. Getting out of our wagon, we found it to be resounding with the hum of bees. (It was about 1 o'clock.) There were far more flowers than we had seen elsewhere. Here were bees in great numbers, both bumblebees and honey-bees, as well as butterflies and wasps and flies. So, pouring a mixture of honey and water into the empty comb in the tin box, and holding the lid of the tin box in one hand and the wooden box with the slides shut in the other, we proceeded to catch the honey-bees by shutting them in suddenly between the lid of the tin box and the large circular bottom of the wooden one, cutting off the flower-stem with the edge of the lid at the same time. Then, holding the lid still against the wooden box, we drew the slide in the bottom and also the slide covering the window at the top, that the light might attract the bee to pass up into the wooden box. As soon as he had done so and was buzzing against the glass, the lower slide was closed and the lid with the flower removed, and more bees were caught in the same way. Then, placing the other, tin, box containing the comb filled with honeyed water close under the wooden one, the slide was drawn again, and the upper slide closed, making it dark; and in about a minute they went to feeding, as was ascertained by raising slightly the wooden box. Then the latter was wholly removed, and they were left feeding or sucking up the honey in broad daylight. In from two to three minutes one had loaded himself and commenced leaving the box. He would buzz round it back and forth a foot or more, and then, sometimes, finding that he was too heavily loaded, alight to empty himself or clean his feet. Then, starting once more, he would begin to circle round irregularly, at first in a small circle only a foot or two in diameter, as if to examine the premises

that he might know them again, till, at length, rising higher and higher and circling wider and wider and swifter and swifter, till his orbit was ten or twelve feet in diameter and as much from the ground, — though its centre might be moved to one side, — so that it was very difficult to follow him, especially if you looked against a wood or the hill, and you had to lie low to fetch him against the sky (you must operate in an open space, not in a wood); all this as if to ascertain the course to his nest; then, in a minute or less from his first starting, he darts off in a bee-line, that is, as far as I could see him, which might be eight or ten rods, looking against the sky (and you had to follow his whole career very attentively indeed to see when and where he went off at a tangent), in a waving or sinuous (right and left) line, toward his nest.

We sent forth as many as a dozen bees, which flew in about three directions, but all toward the village, or where we knew there were hives. They did not fly so almost absolutely straight as I had heard, but within three or four feet of the same course for half a dozen rods, or as far as we could see. Those belonging to one hive all had to digress to get round an apple tree. As none flew in the right direction for us, we did not attempt to line them. In less than half an hour the first returned to the box still lying on the wood-pile, — for not one of the bees on the surrounding flowers discovered it, — and so they came back, one after another, loaded themselves and departed; but now they went off with very little preliminary circling, as if assured of their course. We were furnished with little boxes of red, blue, green, yellow, and white paint, in dry powder, and with a stick we sprinkled a little of the red powder on the back of one while he was feeding, — gave him a little dab, — and it settled down amid the fuzz of his back and gave him a distinct red jacket. He went off like most of them toward some hives about three quarters of a mile distant, and we observed by the watch the time of his departure. In just twenty-two minutes red jacket came back, with enough of the powder still on his back to mark him plainly. He may have gone more than three quarters of a mile. At any rate, he had a head wind to contend with while laden. They fly swiftly and surely to their nests, never resting by the way, and I was surprised — though I had been informed of it — at the distance to which the village bees go for flowers.

The rambler in the most remote woods and pastures little thinks that the bees which are humming so industriously on the rare wild flowers he is plucking for his herbarium, in some out-of-the-way nook, are, like himself, ramblers from the village, perhaps from his own yard, come to get their honey for his hives. All the honey-bees we saw were on the blue-stemmed goldenrod (*Solidago cæsia*), which is late, lasts long, which emitted a sweet agreeable fragrance, not on the asters. I feel the richer for this experience. It taught me that even the insects in my path are not loafers, but have their special errands. Not merely and vaguely in this world, but in this hour, each is about its business. If, then, there are any sweet flowers still lingering on the hillside, it is known to the bees both of the forest and the village. The botanist should make interest with the bees if he would know when the flowers open and when they close.

Those I have named were the only common and prevailing flowers at this time to look for them on.

Our red jacket had performed the voyage in safety; no bird had picked him up. Are the kingbirds gone? Now is the time to hunt bees and take them up, when the combs are full of honey and before the flowers are so scarce that they begin to consume the honey they have stored.

Rees's Cyclopædia says that "Philliscus retired into a desert wood, that he might have the opportunity of observing them [bees] to better advantage." Paul Dudley wrote the Royal Society about 1723 that the Indians had no word for bee; called it "English-man's fly."

OCT. 9. Touch-me-not, self-heal, *Bidens cernua*, ladies'-tresses, *cerastium*, dwarf tree-primrose, butter-and-eggs (abundant), *prenanthes*, *sium*, silvery cinquefoil, mayweed. My rainbow rush must be the *Juncus militaris*, not yet colored.

OCT. 10. Burdock, *Ranunculus acris*, rough hawkweed. A drizzling rain to-day. The air is full of falling leaves. The streets are strewn with elm leaves. The trees begin to look thin. The butternut is perhaps the first on the street to lose its leaves. Rain, more than wind, makes the leaves fall. Glow-worms in the evening.

Oct. 15. 9 A.M. — The first snow is falling (after not very cool weather), in large flakes, filling the air and obscuring the distant woods and houses, as if the inhabitants above were emptying their pillow-cases. Like a mist it divides the uneven landscape at a little distance into ridges and vales. The ground begins to whiten, and our thoughts begin to prepare for winter. Whiteweed. The snow lasted but half an hour. Ice a week or two ago.

P.M. — Walden.

The rain of the night and morning, together with the wind, had strewn the ground with chestnuts. The burs, generally empty, come down with a loud sound, while I am picking the nuts in the woods. It is a pleasure to detect them in the woods amid the firm, crispy, crackling chestnut leaves. There is somewhat singularly refreshing in the color of this nut, the chestnut color. No wonder it gives a name to a color. One man tells me he has bought a wood-lot in Hollis to cut, and has let out the picking of the chestnuts to women at the halves. As the trees will probably be cut for them, they will make rapid work of it.

Oct. 20. Canada snapdragon, tansy, white goldenrod, blue-stemmed ditto. *Aster undulatus*, autumnal dandelion, tall buttercup, yarrow, mayweed. Picking chestnuts on Pine Hill.

Oct. 25. Monday. P.M. — Down river to Ball's Hill in boat.

Mint is still green and wonderfully recreating to smell. I had put such things behind me. It is hard to remember lilies now.

Oct. 28. Four months of the green leaf make all our summer, if I reckon from June 1st to October 1st, the growing season, and methinks there are about four months when the ground is white with snow. That would leave two months for spring and

two for autumn. October the month of ripe or painted leaves; November the month of withered leaves and bare twigs and limbs.

I heard one boy say to another in the street to-day "You don't know much more than a piece of putty."

Nov. 1. Day before yesterday to the Cliffs in the rain, misty rain. In November, a man will eat his heart, if in any month. The birches have almost all lost their leaves. On the river this afternoon, the leaves, now crisp and curled, when the wind blows them on to the water become rude boats which float and sail about awhile conspicuously before they go to the bottom, — oaks, walnuts, etc.

Nov. 4. Autumnal dandelion and yarrow.

Must be out-of-doors enough to get experience of wholesome reality, as a ballast to thought and sentiment. Health requires this relaxation, this aimless life. This life in the present. Let a man have thought what he will of Nature in the house, she will still be novel outdoors. I keep out of doors for the sake of the mineral, vegetable, and animal in me.

My thought is a part of the meaning of the world, and hence I use a part of the world as a symbol to express my thought.

Nov. 18. Measured a stick of round timber, probably white pine, on the cars this afternoon, — ninety-five feet long, nine and ten twelfths in circumference at butt, and six and two twelfths in circumference at small end, quite straight. From Vermont. Yarrow and tansy still. These are cold, gray days.

Nov. 23. There is something genial even in the first snow, and Nature seems to relent a little of her November harshness.

This, then, may be considered the end of the flower season for this year, though this snow will probably soon melt again.

I had a thought in a dream last night which surprised me by its strangeness, as if it were based on an experience in a previous state of existence, and could not be entertained by my waking self. Both the thought and the language were equally novel to me, but I at once perceived it to be true and to coincide with my experience in this state.

Nov. 27. Like many of my contemporaries I had rarely for many years used animal food, or tea or coffee, etc., etc., not so much because of any ill effects which I had traced to them in my own case, though I could theorize extensively in that direction, as because it was not agreeable to my imagination. It appeared more beautiful to live low and fare hard in many respects; and though I never did so, I went just far enough to please my imagination. But now I find myself somewhat less particular in these respects. I carry less religion to the table, ask no blessing, not because I am wiser than I was, but, I am obliged to confess, because, however much it is to be regretted with years I have grown more coarse and indifferent.

Nov. 29, 30, and Dec. 1. The snow which fell the 23d whitened the ground but a day or two. These have been the mildest and pleasantest days since November came in.

Dec. 2. The pleasantest day of all.

Started in boat before 9 A.M. down river to Billerica with W.E.C. Not wind enough for a sail. I do not remember when I have taken a sail or a row on the river in December before. Still no snow.

Dec. 5. P.M. — Rowed over Walden!

A dark, but warm, misty day, completely overcast.

Dec. 7. P.M. — Perhaps the warmest day yet. True Indian summer. The walker perspires. The shepherd's-purse is in full bloom; the andromeda not turned red.

## 1853

Jan. 3. The evergreens appear to relieve themselves soonest of the ice, perhaps because of the reflection from their leaves. Those trees, like the maples and hickories, which have most spray and branches make the finest show of ice. This afternoon it snows, the snow lodging on the ice, which still adheres to the trees. The more completely the trees are changed to ice trees, to spirits of trees, the finer. Instead of the minute frostwork on a window, you have whole forests of silver boughs. The "brattling" of the ice. Is not that the word?

I love Nature partly because she is not man, but a retreat from him. None of his institutions control or pervade her. There a different kind of right prevails. In her midst I can be glad with an entire gladness. If this world were all man, I could not stretch myself, I should lose all hope. He is constraint, she is freedom to me. He makes me wish for another world. She makes me content with this.

Methinks that these prozers, with their saws and their laws, do not know how glad a man can be. What wisdom, what warning, can prevail against gladness? There is no law so strong which a little gladness may not transgress. I have a room all to myself; it is nature. It is a place beyond the jurisdiction of human governments. There is a prairie beyond your laws. Nature is a prairie for outlaws. There are two worlds, the post-office and nature. I know them both. I continually forget mankind and their institutions, as I do a bank.

Well, now this afternoon the snow is lodging on all this ice. Walden not yet frozen.

The air is thick and darkened with falling snow, and the woods are being draped with it in white wreaths. This is winter. They are putting on their white greatcoats.

Jan. 4. I must call that swamp of E. Hubbard's west of the Hunt Pasture, Yellow Birch Swamp. How pleasing to stand beside a new or rare tree! And few are so handsome as this. The sight of these trees affects me more than California gold. We have the silver and the golden birch. This is like a fair, flaxen-haired sister of the dark-complexioned black birch, with golden ringlets. How lustily it takes hold of the swampy soil, and braces itself! In an undress, this tree. Ah, time will come when these will be all gone. Among the primitive trees. What sort of dryads haunt these? Blond nymphs.

Jan. 9. As I walked the railroad this springlike day, I heard from time to time the sound of stones and earth falling and rolling down the bank in the cuts. The earth is almost entirely bare. We have not yet had snow more than one inch deep!!!

As I climbed the Cliff, I paused in the sun and sat on a dry rock, dreaming. I thought of those summery hours when time is tinged with eternity, — runs into it and becomes of one stuff with it. How much — how, perhaps, all — that is best in our experience in middle life may be resolved into the memory of our youth! I remember how I expanded. If the genius visits me now I am not quite taken off my feet, but I remember how this experience is like, but less than, that I had long since.

Jan. 14. Snows all day. P.M. — To Walden and Andromeda Ponds.

It is a very light snow, lying like down or feathery scales. Examined closely, the flakes are beautifully regular six-rayed stars or wheels with a centre disk, perfect geometrical figures in thin scales like this: far more perfect than I can draw. These thin crystals are piled about a foot deep all over the country, but as light as bran. The surface of fields, as I look toward the western light, appears waved or watered on a large scale, as if different kinds of flakes drifted together, some glistening scales, others darker; or perhaps the same reflected the light differently from different sides of slight drifts or undulations on the surface. Thus beautiful the snow.

I suppose that the meadow mouse can still pick up chestnuts under the snow. The nuts commonly lie as they fell from the bur, two or three together.

The bones of children soon turn to dust again.

Jan. 16. Sunday. Cold, with blustering winds drifting the snow. Yesterday the hounds were heard. It was a hunter's day. All tracks were fresh, the snow deep and light. I met Melvin with his bag full.

Trench says that “‘rivals,’ in the primary sense of the word, are those who dwell on the banks of the same stream” or “on opposite banks,” but as he says, in many words, since the use of water-rights is a fruitful source of contention between such neighbors, the word has acquired this secondary sense. My friends are my rivals on the Concord, in the primitive sense of the word. There is no strife between us respecting the use of the stream. The Concord offers many privileges, but none to quarrel about. It is a peaceful, not a brawling, stream. It has not made rivals out of neighbors that lived on its banks, but friends. My friends are my rivals; we dwell on opposite banks of the stream, but that stream is the Concord, which flows without a ripple or a murmur, without a rapid or a brawl, and offers no petty privileges to quarrel about.

Jan. 21. A fine, still, warm moonlight evening.

I easily read the moral of my dreams. Yesterday I was influenced with the rottenness of human relations. They appeared full of death and decay, and offended the nostrils. In the night I dreamed of delving amid the graves of the dead, and soiled my fingers with their rank mould. It was sanitarily, morally, and physically true.

Jan. 27. Trench says a wild man is a willed man. Well, then, a man of will who does what he wills or wishes, a man of hope and of the future tense, for not only the obstinate is willed, but far more the constant and persevering. The obstinate man,

properly speaking, is one who will not. The perseverance of the saints is positive willedness, not a mere passive willingness. The fates are wild, for they will; and the Almighty is wild above all, as fate is.

What are our fields but felds or felled woods. They bear a more recent name than the woods, suggesting that previously the earth was covered with woods. Always in the new country a field is a clearing.

Feb. 11. While surveying on the Hunt farm the other day, behind Simon Brown's house I heard a remarkable echo. In the course of surveying, being obliged to call aloud to my assistant from every side and almost every part of a farm in succession, and at various hours of a day, I am pretty sure to discover an echo if any exists, and the other day it was encouraging and soothing to hear it. After so many days of comparatively insignificant drudgery with stupid companions, this leisure, this sportiveness, this generosity in nature, sympathizing with the better part of me; somebody I could talk with, — one degree, at least, better than talking with one's self. Some voice of somebody I pined to hear, with whom I could form a community. I did wish, rather, to linger there and call all day to the air and hear my words repeated, but a vulgar necessity dragged me along round the bounds of the farm, to hear only the stale answers of my chain-man shouted back to me.

I am surprised that we make no more ado about echoes. They are almost the only kindred voices that I hear.

It was the memorable event of the day, not anything my companions said, or the travellers whom I met, or my thoughts, for they were all mere repetitions or echoes in the worst sense of what I had heard and thought before many times; but this echo was accompanied with novelty, and by its repetition of my voice it did more than double that. It was a profounder Socratic method of suggesting thoughts unutterable to me the speaker. There was one I heartily loved to talk with. Under such favorable auspices I could converse with myself, could reflect.

Feb. 23. I think myself in a wilder country, and a little nearer to primitive times, when I read in old books which spell the word savages with an *l* (salvages), like John Smith's "General Historie of Virginia, etc.," reminding me of the derivation of the word from *sylva*. There is some of the wild wood and its bristling branches still left in their language. The savages they described are really salvages, men of the woods.

Feb. 27. A week or two ago I brought home a handsome pitch pine cone which had freshly fallen and was closed perfectly tight. It was put into a table drawer. To-day I am agreeably surprised to find that it has there dried and opened with perfect regularity, filling the drawer, and from a solid, narrow, and sharp cone, has become a broad, rounded, open one, — has, in fact, expanded with the regularity of a flower's petals into a conical flower of rigid scales, and has shed a remarkable quantity of delicate-winged seeds. Each scale, which is very elaborately and perfectly constructed, is armed with a short spine, pointing downward, as if to protect its seed from squirrels and birds. That hard closed cone, which defied all violent attempts to open it, has thus yielded to

the gentle persuasion of warmth and dryness. The expanding of the pine cones, that, too, is a season.

March 5. The secretary of the Association for the Advancement of Science requests me, as he probably has thousands of others, by a printed circular letter from Washington the other day, to fill the blank against certain questions, among which the most important one was what branch of science I was specially interested in, using the term science in the most comprehensive sense possible. Now, though I could state to a select few that department of human inquiry which engages me, and should be rejoiced at an opportunity to do so, I felt that it would be to make myself the laughing-stock of the scientific community to describe or attempt to describe to them that branch of science which specially interests me, inasmuch as they do not believe in a science which deals with the higher law. So I was obliged to speak to their condition and describe to them that poor part of me which alone they can understand. The fact is I am a mystic, a transcendentalist, and a natural philosopher to boot. Now I think of it, I should have told them at once that I was a transcendentalist. That would have been the shortest way of telling them that they would not understand my explanations.

How absurd that, though I probably stand as near to nature as any of them, and am by constitution as good an observer as most, yet a true account of my relation to nature should excite their ridicule only! If it had been the secretary of an association of which Plato or Aristotle was the president, I should not have hesitated to describe my studies at once and particularly.

March 6. Sunday. Last Sunday I plucked some alder (apparently speckled) twigs, some (apparently tremuloides) aspen, and some swamp (?) willow, and put them in water in a warm room. Immediately the alder catkins were relaxed and began to lengthen and open, and by the second day to drop their pollen; like handsome pendants they hung round the pitcher, and at the same time the smaller female flower expanded and brightened. In about four days the aspens began to show their red anthers and feathery scales, being an inch in length and still extending. March 2d, I added the andromeda; March 3d, the rhodora.

March 7. What is the earliest sign of spring? The motion of worms and insects? The flow of sap in trees and the swelling of buds? Do not the insects awake with the flow of the sap? Bluebirds, etc., probably do not come till insects come out. Or are there earlier signs in the water? — the tortoises, frogs, etc.

March 8. Saw two or three hawks sailing. Saw the remains of four cows and a horse that were burned in a barn a month ago. Where the paunch was, a large bag of coarse hay and stalks was seen in the midst of an indistinct circumference of ribs. Saw some very large willow buds expanded (their silk) to thrice the length of their scales, indistinctly carved or waved with darker lines around them. They look more like, are more of, spring than anything I have seen. Heard the phebe, or spring note of the chickadee, now, before any spring bird has arrived.

Heard the first flies buzz in the sun on the south side of the house.

[Richard Trench's Emersonian On the Study of Words, 1851.]

Bailey, I find, has it: "Rival (*Rivalis* L.q.d. qui juxta eundem rivum pascit)." My friends my rivals are.

March 10. This is the first really spring day. The sun is brightly reflected from all surfaces, and the north side of the street begins to be a little more passable to foot-travellers. You do not think it necessary to button up your coat.

I see many middling-sized black spiders on the edge of the snow, very active. The radical leaves of innumerable plants (as here a dock in and near the water) are evidently affected by the spring influences. Many plants are to some extent evergreen, like the buttercup now beginning to start. Methinks the first obvious evidence of spring is the pushing out of the swamp willow catkins, then the relaxing of the earlier alder catkins, then the pushing up of skunk-cabbage spathes (and pads at the bottom of water). This is the order I am inclined to, though perhaps any of these may take precedence of all the rest in any particular case.

At Nut Meadow Brook crossing we rest awhile on the rail, gazing into the eddying stream. The ripple-marks on the sandy bottom, where silver spangles shine in the river with black wrecks of caddis-cases lodged under each shelving sand, the shadows of the invisible dimples reflecting prismatic colors on the bottom, the minnows already stemming the current with restless, wiggling tails, ever and anon darting aside, probably to secure some invisible mote in the water, whose shadows we do not at first detect on the sandy bottom, — when detected so much more obvious as well as larger and more interesting than the substance, — in which each fin is distinctly seen, though scarcely to be detected in the substance; these are all very beautiful and exhilarating sights, a sort of diet drink to heal our winter discontent. Have the minnows played thus all winter? The equisetum at the bottom has freshly grown several inches. Then should I not have given the precedence on the last page to this and some other water-plants? I suspect that I should, and the flags appear to be starting.

What was that sound that came on the softened air? It was the warble of the first bluebird from that scraggy apple orchard yonder. When this is heard, then has spring arrived.

It must be that the willow twigs, both the yellow and green, are brighter-colored than before. I cannot be deceived.

March 12. Last night it snowed, a sleety snow again, and now the ground is whitened with it, and where are gone the bluebirds whose warble was wafted to me so lately like a blue wavelet through the air?

The greater part of the alder catkins (as well as the willow) are still in their winter condition, but some have their scales conspicuously loosened and elevated, showing their lighter-colored edges and interstices. They are actually beginning to blossom, certainly in advance of the willows. The sweet-gale is the prettiest flower which I have found expanded yet.

It is essential that a man confine himself to pursuits — a scholar, for instance, to studies — which lie next to and conduce to his life, which do not go against the grain, either of his will or his imagination. The scholar finds in his experience some studies

to be most fertile and radiant with light, others dry, barren, and dark. If he is wise, he will not persevere in the last, as a plant in a cellar will strive toward the light. He will confine the observations of his mind as closely as possible to the experience or life of his senses. His thought must live with and be inspired with the life of the body. Some men endeavor to live a constrained life, to subject their whole lives to their wills, as he who said he would give a sign if he were conscious after his head was cut off, — but he gave no sign. Dwell as near as possible to the channel in which your life flows. A man may associate with such companions, he may pursue such employments, as will darken the day for him. Men choose darkness rather than light.

March 14. P.M. — Repairing my boat.

High winds, growing colder and colder, ground stiffening again. My ears have not been colder the past winter. March is rightly famous for its winds.

March 15. There were few colder nights last winter than the last. The water in the flower-stand containing my pet tortoise froze solid, — completely enveloping him, though I had a fire in my chamber all the evening, — also that in my pail pretty thick. But the tortoise, having been thawed out on the stove, leaving the impression of his back shell in the ice, was even more lively than ever. His efforts at first had been to get under his chip, as if to go into the mud. To-day the weather is severely and remarkably cold. It is not easy to keep warm in my chamber. I have not taken a more blustering walk the past winter than this afternoon.

March 18. P.M. — To Conantum.

I find it unexpectedly mild. It appears to be clearing up but will be wet underfoot.

Now, then, spring is beginning again in earnest after this short check. Is it not always thus? Is there not always an early promise of spring, something answering to the Indian summer, which succeeds the summer, so an Indian or false spring preceding the true spring, — first false promise which merely excites our expectations to disappoint them, followed by a short return of winter? Yet all things appear to have made progress, even during these wintry days, for I cannot believe that they have thus instantaneously taken a start. I no sooner step out of the house than I hear the bluebirds in the air, and far and near, everywhere except in the woods, throughout the town you may hear them, — the blue curls of their warblings, — harbingers of serene and warm weather, little azure rills of melody trickling here and there from out the air, their short warble trilled in the air reminding of so many corkscrews assaulting and thawing the torpid mass of winter, assisting the ice and snow to melt and the streams to flow. Everywhere also, all over the town, within an hour or two have come out little black two-winged gnats with plumed or fuzzy shoulders. When I catch one in my hands, it looks like a bit of black silk ravelling. They have suddenly come forth everywhere.

I came forth expecting to hear new birds, and I am not disappointed. We know well what to count upon. Their coming is more sure than the arrival of the sailing and steaming packets.

It grows more and more fair. Yesterday at this hour it was more raw and blustering than the past winter; to-day it seems more mild and balmy than summer. I have rarely known a greater contrast.

To-day first I smelled the earth.

March 20. (Yesterday I forgot to say I painted my boat. Spanish brown and raw oil were the ingredients. I found the painter had sold me the brown in hard lumps as big as peas, which I could not reduce with a stick; so I passed the whole when mixed through an old coffee-mill, which made a very good paint-mill, catching it in an old coffeepot, whose holes I puttied up, there being a lack of vessels; and then I broke up the coffee-mill and nailed a part over the bows to protect them, the boat is made so flat. I had first filled the seams with some grafting-wax I had, melted.)

It is evident that the English do not enjoy that contrast between winter and summer that we do, — that there is too much greenness and spring in the winter. There is no such wonderful resurrection of the year. Birds kindred with our first spring ones remain with them all winter, and flowers answering to our earliest spring ones put forth there in January. In one sense they have no winter but such as our spring. Our April is their March; our March, their February; our February, January, and December are not theirs at all under any name or sign.

The peculiarity of to-day is that now first you perceive that dry, warm, summer-presaging scent from dry oak and other leaves, on the sides of hills and ledges. You smell the summer from afar. The warm makes a man young again. There is also some dryness, almost dustiness, in the roads. The mountains are white with snow, and sure as the wind is northwest it is wintry; but now it is more westerly.

March 21. Morning along the river.

Might not my Journal be called "Field Notes?"

I see a honey-bee about my boat, apparently attracted by the beeswax (if there is any) in the grafting-wax with which I have luted it. There are many; one is caught and killed in it.

P.M. — To Kibbe Place.

It is a genial and reassuring day; the mere warmth of the west wind amounts almost to balminess. The softness of the air mollifies our own dry and congealed substance. I sit down by a wall to see if I can muse again. We are affected like the earth, and yield to the elemental tenderness; winter breaks up within us; the frost is coming out of me, and I am heaved like the road; accumulated masses of ice and snow dissolve, and thoughts like a freshet pour down unwonted channels. Roads lead elsewhere than to Carlisle and Sudbury. Our experience does not wear upon us. It is seen to be fabulous or symbolical, and the future is worth expecting. In all my walking I have not reached the top of the earth yet.

March 22. No sap flows from the maples I cut into, except that one in Lincoln. What means it? *Hylodes Pickeringii*, a name that is longer than the frog itself! A description of animals, too, from a dead specimen only, as if, in a work on man, you were to describe a dead man only, omitting his manners and customs, his institutions

and divine faculties, from want of opportunity to observe them, because you do not live in the country. Only dindons and dandies. Nothing is known of his habits. Food: seeds of wheat, beef, pork, and potatoes.

P.M. — To Martial Miles Meadow, by boat to Nut Meadow Brook.

Launched my new boat. It is very steady, too steady for me; does not toss enough and communicate the motion of the waves. Beside, the seats are not well arranged; when there are two in it, it requires a heavy stone in the stern to trim. But it holds its course very well with a side wind from being so flat from stem to stern.

The cranberries now make a show under water, and I always make it a point to taste a few.

March 23. 5 A.M. — I hear the robin sing before I rise.

6 A.M. — Up the North River.

A fresh, cool spring morning.

The cat-tail down puffs and swells in your hand like a mist, or the conjurer's trick of filling a hat with feathers, for when you have rubbed off but a thimbleful, and can close and conceal the wound completely, the expanded down fills your hand to overflowing. Apparently there is a spring to the fine elastic threads which compose the down, which, after having been so long closely packed, on being the least relieved at the base, spring open apace into the form of parachutes to convey the seed afar. Where birds or the winds or ice have assaulted them, this has spread like an eruption. Again, when I rub off the down of its spike with my thumb, I am surprised at the sensation of warmth it imparts to my hand, as it flushes over it magically, at the same time revealing a faint purplish-crimson tinge at the base of the down, as it rolls off and expands. It is a very pleasing experiment to try.

Man cannot afford to be a naturalist, to look at Nature directly, but only with the side of his eye. He must look through and beyond her. To look at her is fatal as to look at the head of Medusa. It turns the man of science to stone. I feel that I am dissipated by so many observations. I should be the magnet in the midst of all this dust and filings. I knock the back of my hand against a rock, and as I smooth back the skin, I find myself prepared to study lichens there. I look upon man but as a fungus. I have almost a slight, dry headache as the result of all this observing. How to observe is how to behave. O for a little Lethe! To crown all, lichens, which are so thin, are described in the dry state, as they are most commonly, not most truly, seen. Truly, they are dryly described.

I am surprised as well as delighted when any one wishes to know what I think. It is such a rare use they would make of me, as if they were acquainted with the tool. Commonly, if men want anything of me, it is only to know how many acres I make of their land, or, at most, what trivial news I have burdened myself with. They never will go to law for my meat. They prefer the shell.

March 24. Since the cold snap of the 14th, 15th, etc., have walked for the most part with unbuttoned coat, and for the most part without mittens.

There are very slight but white mists on the river these mornings.

It spits a little snow this afternoon.

The white pine wood, freshly cut, piled by the side of the Charles Miles road, is agreeable to walk beside. I like the smell of it, all ready for the borers, and the rich light-yellow color of the freshly split wood and the purple color of the sap at the ends of the quarters, from which distill perfectly clear and crystalline tears, colorless and brilliant as diamonds, tears shed for the loss of a forest in which is a world of light and purity, its life oozing out. These beautiful accidents that attend on man's works! I am surprised to find that these terebinthine (?) tears have a hard (seemingly soft as water) not film but transparent skin over them. How many curiosities are brought to us with our wood! The trees and the lichens that clothe them, the forest warrior and his shield adhering to him.

March 25. When I saw the fungi in my lamp, I was startled and awed, as if I were stooping too low, and should next be found classifying carbuncles and ulcers. Is there not sense in the mass of men who ignore and confound these things, and never see the cryptogamia on the one side any more than the stars on the other? Underfoot they catch a transient glimpse of what they call toad-stools, mosses, and frog-spittle, and overhead of the heavens, but they can all read the pillars on a Mexican quarter. They ignore the worlds above and below, keep straight along, and do not run their boots down at the heel as I do. How to keep the heels up I have been obliged to study carefully, turning the nigh foot painfully on side-hills. I find that the shoemakers, to save a few iron heel-pegs, do not complete the rows on the inside by three or four, — the very place in the whole boot where they are most needed, — which has fatal consequences to the buyer. I often see the tracks of them in the paths. It is as if you were to put no under-pinning under one corner of your house. I have managed to cross very wet and miry places dry-shod by moving rapidly on my heels. I always use leather strings tied in a hard knot; they untie but too easily even then.

The various lights in which you may regard the earth, e.g. the dry land as sea bottom, or the sea bottom as a dry down.

March 26. Saw about 10 A.M. a gaggle of geese, forty-three in number, in a very perfect harrow flying northeasterly. One side the harrow was a little longer than the other. They appeared to be four or five feet apart. It is remarkable that we commonly see geese go over in the spring about 10 o'clock in the morning, as if they were accustomed to stop for the night at some place southward whence they reached us at that time. Goodwin saw six geese in Walden about the same time.

March 27. The hazel is fully out. The 23d was perhaps full early to date them. It is in some respects the most interesting flower yet, though so minute that only an observer of nature, or one who looked for them, would notice it. It is the highest and richest colored yet, — ten or a dozen little rays at the end of the buds which are the ends and along the sides of the bare stems. Some of the flowers are a light, some a dark crimson. The high color of this minute, unobserved flower, at this cold, leafless, and almost flowerless season! Moreover, they are so tender that I never get one home in good condition. They wilt and turn black.

Tried to see the faint-croaking frogs at J.P. Brown's Pond in the woods. They are remarkably timid and shy; had their noses and eyes out, croaking, but all ceased, dove, and concealed themselves, before I got within a rod of the shore. Stood perfectly still amid the bushes on the shore, before one showed himself; finally five or six, and all eyed me, gradually approached me within three feet to reconnoitre, and, though I waited about half an hour, would not utter a sound nor take their eyes off me, — were plainly affected by curiosity. Dark brown and some, perhaps, dark green, about two inches long; had their noses and eyes out when they croaked.

March 28. My Aunt Maria asked me to read the life of Dr. Chalmers, which however I did not promise to do. Yesterday, Sunday, she was heard through the partition shouting to my Aunt Jane, who is deaf, "Think of it! He stood half an hour to-day to hear the frogs croak, and he would n't read the life of Chalmers."

6 A.M. — To Cliffs.

I do not now think of a bird that hops so distinctly, rapidly, and commonly as the robin, with its head up.

Why is the pollen of flowers commonly yellow?

March 29. 6 A.M. — To Leaning Hemlocks, by boat.

The sun has just risen, but there is only a now clear saffron belt next the east horizon; all the rest of the sky is covered with clouds, broken into lighter and darker shades. An agreeable yellow sunlight falls on the western fields and the banks of the river. Whence this yellow tinge? Probably a different light would be reflected if there were no dark clouds above.

This is one of those days divided against itself, when there is a cool wind but a warm sun, when there is little or no coolness proper to this locality, but it is wafted to us probably from the snow-clad northwest, and hence in sheltered places it is very warm. However, the sun is rapidly prevailing over the wind, and it is already warmer than when I came out.

Four ducks, two by two, are sailing conspicuously on the river. There appear to be two pairs. In each case one two-thirds white and another grayish-brown and, I think, smaller. They are very shy and fly at fifty rods' distance. Are they whistlers? The white are much more white than those I saw the other day and at first thought summer ducks. Would it not be well to carry a spy-glass in order to watch these shy birds such as ducks and hawks? In some respects, methinks, it would be better than a gun. The latter brings them nearer dead, but the former alive. You can identify the species better by killing the bird, because it was a dead specimen that was so minutely described, but you can study the habits and appearance best in the living specimen.

Walking along near the edge of the meadow under Lupine Hill, I slumped through the sod into a muskrat's nest, for the sod was only two inches thick over it, which was enough when it was frozen. I laid it open with my hands. There were three or four channels or hollowed paths, a rod or more in length, not merely worn but made in the meadow, and centring at the mouth of this burrow. They were three or four inches deep, and finally became indistinct and were lost amid the cranberry vines and grass

toward the river. The entrance to the burrow was just at the edge of the upland, here a gently sloping bank, and was probably just beneath the surface of the water six weeks ago. It was about twenty-five rods distant from the true bank of the river. From this a straight gallery, about six inches in diameter every way, sloped upward about eight feet into the bank just beneath the turf, so that the end was about a foot higher than the entrance. There was a somewhat circular enlargement about one foot in horizontal diameter and the same depth with the gallery; and it was nearly a peck of coarse meadow stubble, showing the marks of the scythe, with which was mixed accidentally a very little of the moss which grew with it. Three short galleries, only two feet long, were continued from this centre somewhat like rays toward the high land, as if they had been prepared in order to be ready for a sudden rise of the water, or had been actually made so far under such an emergency. The nest was of course thoroughly wet and, humanly speaking, uncomfortable, though the creature could breathe in it. But it is plain that the muskrat cannot be subject to the toothache. I have no doubt this was made and used last winter, for the grass was as fresh as that in the meadow (except that it was pulled up), and the sand which had been taken out lay partly in a flattened heap in the meadow, and no grass had sprung up through it.

In the course of the above examination I made a very interesting discovery. When I turned up the thin sod from over the damp cavity of the nest, I was surprised to see at this hour of a pleasant day what I took to be beautiful frost crystals of a rare form, — frost bodkins I was in haste to name them, for around the fine white roots of the grass, apparently the herd's-grass, which were from one to two or more inches long, reaching downward into the dark, damp cavern (though the green blades had scarcely made so much growth above; indeed, the growth was scarcely visible there), appeared to be lingering still into the middle of this warm afternoon rare and beautiful frost crystals exactly in the form of a bodkin, about one sixth of an inch wide at base and tapering evenly to the lower end, sometimes the upper part of the core being naked for half an inch, which last gave them a slight resemblance to feathers, though they were not flat but round, and at the abrupt end of the rootlet (as if cut off) a larger, clear drop. On examining them more closely, feeling and tasting them, I found that it was not frost but a clear, crystalline dew in almost invisible drops, concentrated from the dampness of the cavern, and perhaps melted frost still reserving by its fineness its original color, thus regularly arranged around the delicate white fibre; and, looking again, incredulous, I discerned extremely minute white threads or gossamer standing out on all sides from the main rootlet in this form and affording the core for these drops. Yet on those fibres which had lost their dew, none of these minute threads appeared. There they pointed downward somewhat like stalactites, or very narrow caterpillar brushes. It impressed me as a wonderful piece of chemistry, that the very grass we trample on and esteem so cheap should be thus wonderfully nourished, that this spring greenness was not produced by coarse and cheap means, but in sod, out of sight, the most delicate and magical processes are going on. The half is not shown. The very sod is replete with mechanism far finer than that of a watch, and yet it is cast

under our feet to be trampled on. The process that goes on in the sod and the dark, about the minute fibres of the grass, — the chemistry and the mechanics, — before a single green blade can appear above the withered herbage, if it could be adequately described, would supplant all other revelations. We are acquainted with but one side of the sod. I brought home some tufts of the grass in my pocket, but when I took it out I could not at first find those pearly white fibres and thought that they were lost, for they were shrunk to dry brown threads; and, as for the still finer gossamer which supported the roscid droplets, with few exceptions they were absolutely undiscoverable, — they no longer stood out around the core, — so fine and delicate was their organization. It made me doubt almost if there were not actual, substantial, though invisible cores to the leaflets and veins of the hoar frost. And can these almost invisible and tender fibres penetrate the earth where there is no cavern? Or is what we call the solid earth porous and cavernous enough for them?

The trout glances like a film from side to side and under the bank.

Tried several times to catch a skater. Got my hand close to him; grasped at him as quick as possible; was sure I had got him this time; let the water run out between my fingers; hoped I had not crushed him; opened my hand; and lo! he was not there. I never succeeded in catching one. What are those common snails in the mud in ditches, with their feet out, for some time past?

The early willow will bloom to-morrow. Its catkins have lost many of their scales. The crowded yellow anthers are already bursting out through the silvery down, like the sun of spring through the clouds of winter.

March 30. Now commences the season for fires in the woods. The winter, and now the sun and winds, have dried the old leaves more thoroughly than ever, and there are no green leaves to shade the ground or to check the flames, and these high March winds are the very ones to spread them. The woods look peculiarly dry and russet. There is as yet no new greenness in the landscape. With these thoughts and impressions I had not gone far before I saw the smoke of a fire on Fair Haven Hill. Some boys were going sassafras, for boys will have some pursuit peculiar to every season. A match came in contact with a marble, nobody knew how, and suddenly the fire flashed up the broad open hillside, consuming the low grass and sweet-fern and leaving a smoking, blackened waste. A few glowing stumps, with spadefuls of fresh earth thrown on them, the white ashes here and there on the black ground, and the not disagreeable scent of smoke and cinders was all that was left when I arrived.

Dry leaves, which I at first mistake for birds, go sailing through the air in front of the Cliff.

The motions of a hawk correcting the flaws in the wind by raising his shoulder from time to time, are much like those of a leaf yielding to them.

Ah, those youthful days! are they never to return? when the walker does not too curiously observe particulars, but sees, hears, scents, tastes, and feels only himself, — the phenomena that show themselves in him, — his expanding body, his intellect and

heart. No worm or insect, quadruped or bird, confined his view, but the unbounded universe was his. A bird is now become a mote in his eye.

March 31. Brown has these birds set up which I may wish to examine: —

Turtle-dove, green heron, *Ardea Herodias*, pileated woodpecker, fox-colored sparrow, young of purple finch, white-eyed vireo, goldfinch, brown creeper, scarlet tanager (male and female), white-breasted nuthatch, solitary vireo, red-eyed vireo, yellow redpoll warbler, hermit thrush (killed here), cardinal grosbeak, pine grosbeak, black-billed cuckoo, mockingbird, woodcock, *Totanus flavipes* (or small yellow-leg), (great ditto ?), Bartram's tatler (or upland plover), golden ditto, *Falco sparverius*, sharp-shinned or slate-colored hawk, or *F. Pennsylvanicus* of Wilson, green-winged teal, blue-winged teal, wood duck (young drakes).

April 3. The last two Tribunes I have not looked at. I have no time to read newspapers.

April 6. 6 A.M. — To Cliffs.

How many walks along the brooks I take in the spring! What shall I call them? Lesser riparial excursions? Prairial? rivular?

When I came out there was not a speck of mist in the sky, but the morning without a cloud is not the fairest. Now, 8.30 A.M., it rains. Such is April.

April 7. 10 A.M. — Down river in boat to Bedford, with C.

If you make the least correct observation of nature this year, you will have occasion to repeat it with illustrations the next, and the season and life itself is prolonged.

May 1. Sunday. The oak leaves on the plain are fallen. The colors are now: light blue above (where is my cyanometer? Saussure invented one, and Humboldt used it in his travels); landscape russet and greenish, spotted with fawn-colored plowed lands, with green pine and gray or reddish oak woods intermixed, and dark-blue or slate-colored water here and there. It is greenest in the meadows and where water has lately stood, and a strong, invigorating scent comes up from the fresh meadows. It is like the greenness of an apple faintly or dimly appearing through the russet.

The columbines have been out some days. How ornamental to these dark-colored perpendicular cliffs, nodding from the clefts and shelves!

May 6. The whole landscape is many shades greener for the rain, almost a blue green.

May 10. 5 A.M. I proceed down the Turnpike. The masses of the golden willow are seen in the distance on either side the way, twice as high as the road is wide, conspicuous against the distant, still half-russet hills and forests, for the green grass hardly yet prevails over the dead stubble, and the woods are but just beginning to gray. The female willow is a shade greener. At this season the traveller passes through a golden gate on causeways where these willows are planted, as if he were approaching the entrance to Fairyland; and there will surely be found the yellowbird, and already from a distance is heard his note, a tche tche tche tcha tchar tcha, — ah, willow, willow. And as he passes between the portals, a sweet fragrance is wafted to him; he not only breathes but scents and tastes the air, and he hears the low humming or susurrus of

a myriad insects which are feeding on its sweets. It is, apparently, these that attract the yellowbird. The golden gates of the year, the May-gate. The traveller cannot pass out of Concord by the highways in any direction without passing between such portals, — graceful, curving, drooping, wand-like twigs, on which leaves and blossoms appear together.

He is the richest who has most use for nature as raw material of tropes and symbols with which to describe his life. If these gates of golden willows affect me, they correspond to the beauty and promise of some experience on which I am entering. If I am overflowing with life, am rich in experience for which I lack expression, then nature will be my language full of poetry, — all nature will fable, and every natural phenomenon be a myth.

The hornbeam (*Carpinus*) is just ready to bloom. I was in search of this, and, not observing it at first, and having forgotten it, I sat down on a rock, with the thought that if I sat there quietly a little while I might see some flower or other object about me; unexpectedly, as I cast my eyes upward, over my head stretched a spreading branch of the *carpinus* full of small catkins with anthers now reddish, spread like a canopy just over my head. As it is best to sit in a grove and let the birds come to you, so, as it were, even the flowers will come to you.

I sit here surrounded by hellebores eighteen inches high or more, with handsome, regular, plaited leaves, regularly arranged around the erect stems, and a multitude of ferns are unrolling themselves, altogether making the impression of a tropical vegetation.

I leave the woods and begin to ascend Smith's Hill along the course of the rill. From the hill, I look westward over the landscape. As you ascend, the near and low hills sink and flatten into the earth; no sky is seen behind them; the distant mountains rise. The truly great are distinguished. You see, not the domes only, but the body, the façade, of these terrene temples. You see that the foundation answers to the superstructure. Moral structures. (The sweet-fern leaves among odors now.) The value of the mountains in the horizon, — would not that be a good theme for a lecture? The text for a discourse on real values, and permanent; a sermon on the mount. They are stepping-stones to heaven, — as the rider has a horse-block at his gate, — by which to mount when we would commence our pilgrimage to heaven — from this bare actual earth, which has so little of the hue of heaven. They make it easier to die and easier to live. They let us off.

They are valuable to mankind as is the iris of the eye to a man. They are the path of the translated. They are the pastures to which we drive our thoughts on these 20ths of May. (George Baker told me the other day that he had driven cows to Winchendon, forty miles, in one day.)

May 11. The late pipes (*limosum?*), now nearly a foot high, are very handsome, like Oriental work, their encircled columns of some precious wood or gem, or like small bamboos, from Oriental jungles. Very much like art. The gold-thread, apparently for

a day or two, though few flowers compared with buds. A high blueberry by Potter's heater piece. A yellow lily.

As I stand by the river in the truly warm sun, I hear the low trump of a bullfrog, but half sounded, — doubting if it be really July, — some bassoon sounds, as it were the tuning that precedes the summer's orchestra; and all is silent again. How the air is saturated with sweetness on causeways these willowy days!

Some grass is seen to wave in the distance on the side of N. Barrett's warm hill, showing the lighter under sides. That is a soft, soothing, June-like impression when the most forward grass is seen to wave and the sorrel looks reddish. The year has the down of youth on its cheek. Now it is too late to retreat from the summer adventure. You have passed the Rubicon, and will spend your summer here.

May 14. Saturday. 9 A.M. — To Wayland by boat. Close under the lee of the button-bushes which skirt the pond, as I look south, there is a narrow smooth strip of water, silvery and contrasting with the darker rippled body of the pond. Its edge, or the separation between this, which I will call the polished silvery border of the pond, and the dark and ruffled body, is not a straight line or film, but an ever-varying, irregularly and finely serrated or fringed border, ever changing as the breeze falls over the bushes at an angle more or less steep, so that this moment it is a road wide, the next not half so much. Every feature is thus fluent in the landscape.

May 15. The golden willow catkins begin to fall; their prime is past. And buttercups and silvery cinquefoil, and the first apple blossoms, and waving grass beginning to be tinged with sorrel, introduce us to a different season. The huckleberry, resinosa, its red flowers are open, in more favorable places several days earlier, probably; and the earliest shrub and red and black oaks in warm exposures may be set down to to-day. A red butterfly goes by. Methinks I have seen them before. The painted-cup is now abundantly and fully out. Six or eight inches high above its spidery leaves, almost like a red flame, it stands on edge of the hill just rising from the meadow, — on the instep of the hill. It tells of July with its fiery color. It promises a heat we have not experienced yet. This is a field which lies nearer to summer. Yellow is the color of spring; red, of midsummer. Through pale golden and green we arrive at the yellow of the buttercup; through scarlet, to the fiery July red, the red lily.

May 16. It has been oppressively warm to-day, the first really warm, sultry-like weather, so that we were prepared for a thunder-storm at evening. At 5 P.M., dark, heavy, wet-looking clouds are seen in the northern horizon, perhaps over the Merrimack Valley. People stand at their doors in the warm evening, listening to the muttering of distant thunder and watching the forked lightning, now descending to the earth, now ascending to the clouds. This the first really warm day and thunder-shower. Nature appears to have passed a crisis. All slimy reptile life is wide awake. We smell the fresher and cooler air from where the storm has passed. And now that it has grown dark, the skirts of the cloud seem to promise us a shower. We look out into the dark, and ever and anon comes a sudden illumination blinding our eyes, like a vast glow-worm, succeeded

ere long by the roll of thunder. The first pattering of drops is heard; all west windows are hastily shut. The weak-eyed sit with their backs to windows and close the blinds.

May 21. P.M. — Up Assabet to cress, with Sophia.

May 22. Sunday. It is clear June, the first day of summer. The rye, which, when I last looked, was one foot high, is now three feet high and waving and tossing its heads in the wind. We ride by these bluish-green waving rye-fields in the woods, as if an Indian juggler had made them spring up in a night. Though I walk every day I am never prepared for this magical growth of the rye. I am advanced by whole months, as it were, into summer. Sorrel reddens the fields. Cows are preparing the milk for June butter.

When yesterday Sophia and I were rowing past Mr. Prichard's land, where the river is bordered by a row of elms and low willows, at 6 P.M., we heard a singular note of distress as it were from a catbird — a loud, vibrating, catbird sort of note, as if the catbird's mew were imitated by a smart vibrating spring. Blackbirds and others were flitting about, apparently attracted by it. At first, thinking it was merely some peevish catbird or red-wing, I was disregarding it, but on second thought turned the bows to the shore, looking into the trees as well as over the shore, thinking some bird might be in distress, caught by a snake or in a forked twig. The hovering birds dispersed at my approach; the note of distress sounded louder and nearer as I approached the shore covered with low osiers. The sound came from the ground, not from the trees. I saw a little black animal making haste to meet the boat under the osiers. A young muskrat? a mink? No, it was a little dot of a kitten. It was scarcely six inches long from the face to the base — or I might as well say the tip — of the tail, for the latter was a short, sharp pyramid, perfectly perpendicular but not swelled in the least. It was a very handsome and very precocious kitten, in perfectly good condition, its breadth being considerably more than one third of its length. Leaving its mew, it came scrambling over the stones as fast as its weak legs would permit, straight to me. I took it up and dropped it into the boat, but while I was pushing off it ran the length of the boat to Sophia, who held it while we rowed homeward. Evidently it had not been weaned — was smaller than we remembered that kittens ever were — almost infinitely small; yet it had hailed a boat, its life being in danger, and saved itself. Its performance, considering its age and amount of experience, was more wonderful than that of any young mathematician or musician that I have read of. Various were the conjectures as to how the kitten came there, a quarter of a mile from a house. The possible solutions were finally reduced to three: first, it must either have been born there, or, secondly, carried there by its mother, or, thirdly, by human hands. In the first case, it had possibly brothers and sisters, one or both, and its mother had left them to go a-hunting on her own account and might be expected back. In the second, she might equally be expected to return. At any rate, not having thought of all this till we got home, we found that we had got ourselves into a scrape; for this kitten, though exceedingly interesting, required one nurse to attend it constantly for the present, and, of course, another to spell the first; and, beside, we had already a cat well-nigh grown, who manifested such a disposition

toward the young stranger that we had no doubt it would have torn it in pieces in a moment if left alone with it. As nobody made up his or her mind to have it drowned, and still less to drown it, — having once looked into its innocent extremely pale blue eyes (as of milk thrice skimmed) and had his finger or his chin sucked by it, while, its eyes being shut, its little paws played a soothing tune, — it was resolved to keep it till it could be suitably disposed of. It rested nowhere, in no lap, under no covert, but still faintly cried for its mother and its accustomed supper. It ran toward every sound or movement of a human being, and whoever crossed the room it was sure to follow at a rapid pace. It had all the ways of a cat of the maturest years; could purr divinely and raised its back to rub all boots and shoes. When it raised its foot to scratch its ear, which by the way it never hit, it was sure to fall over and roll on the floor. It climbed straight up the sitter, faintly mewling all the way, and sucked his chin. In vain, at first, its head was bent down into saucers of milk which its eyes did not see, and its chin was wetted. But soon it learned to suck a finger that had been dipped in it, and better still a rag; and then at last it slept and rested. The street was explored in vain to find its owner, and at length an Irish family took it into their cradle. Soon after we learned that a neighbor who had heard the mewling of kittens in the partition had sent for a carpenter, taken off a board, and found two the very day at noon that we sailed. That same hour it was first brought to the light a coarse Irish cook had volunteered to drown it, had carried it to the river, and without bag or sinker had cast it in! It saved itself and hailed a boat! What an eventful life! What a precocious kitten! We feared it owed its first plump condition to the water. How strong and effective the instinct of self-preservation!

Our quince blossomed yesterday. Saw many low blackberries in bloom to-day.

May 23. To-day I am surprised by the dark orange-yellow of the senecio. At first we had the lighter, paler spring yellows of willows (cowslips even, for do they not grow a little darker afterward?), dandelion, cinquefoil, then the darker (methinks it is a little darker than the cowslip) and deeper yellow of the buttercup; and then this broad distinction between the buttercup and the krigia and senecio, as the seasons revolve toward July. Every new flower that opens, no doubt, expresses a new mood of the human mind. Have I any dark or ripe orange-yellow thoughts to correspond? The flavor of my thoughts begins to correspond. Lupines now for some days, probably about the 19th.

White clover. I see the light purple of the rhodora enlivening the edges of swamps — another color the sun wears. Is it not the most showy high-colored flower or shrub? Flowers are the different colors of the sunlight.

An abundance of pure white fringed polygalas, very delicate, by the path at Harrington's mud-hole. Thus many flowers have their nun sisters, dressed in white. At Loring's Wood heard and saw a tanager. That contrast of a red bird with the green pines and the blue sky! Even when I have heard his note and look for him and find the bloody fellow, sitting on a dead twig of a pine, I am always startled. (They seem to love the darkest and thickest pines.) That incredible red, with the green and blue, as if these

were the trinity we wanted. Yet with his hoarse note he pays for his color. I am transported; these are not the woods I ordinarily walk in. How he enhances the wildness and wealth of the woods! This and the emperor moth make the tropical phenomena of our zone.

May 25. I quarrel with most botanists' description of different species, say of willows. It is a difference without a distinction. No stress is laid upon the peculiarity of the species in question, and it requires a very careful examination and comparison to detect any difference in the description. Having described you one species, he begins again at the beginning when he comes to the next and describes it absolutely, wasting time; in fact does not describe the species, but rather the genus or family; as if, in describing the particular races of men, you should say of each in its turn that it is but dust and to dust it shall return. The object should be to describe not those particulars in which a species resembles its genus, for they are many and that would be but a negative description, but those in which it is peculiar, for they are few and positive.

Steady fisherman's rain, without wind, straight down, flooding the ground and spattering on it, beating off the blossoms of apples and thorns, etc. Within the last week or so the grass and leaves have grown many shades darker, and if we had leaped from last Wednesday to this, we should have been startled by the change — the dark bluish green of rank grass especially. How rapidly the young twigs shoot — the herbs, trees, shrubs no sooner leaf out than they shoot forward surprisingly, as if they had acquired a head by being repressed so long. They do not grow nearly so rapidly at any other season. Many do most of their growing for the year in a week or two at this season. They shoot — they spring — and the rest of the year they harden and mature, and perhaps have a second spring in the latter part of summer or in the fall.

May 27. 5.30 A.M. — To Island.

A turtle walking is as if a man were to try to walk by sticking his legs and arms merely out the windows.

May 29. Cattle stand in the river by the bridge for coolness. Place my hat lightly on my head that the air may circulate beneath. Fields are whitened with mouse-ear gone to seed — a mass of white fuzz blowing off one side — and also with dandelion globes of seeds. Some plants have already reached their fall. How still the hot noon; people have retired behind blinds. I see men and women through open windows in white undress taking their Sunday-afternoon nap, overcome with heat.

May 31. Some incidents in my life have seemed far more allegorical than actual; they were so significant that they plainly served no other use. That is, I have been more impressed by their allegorical significance and fitness; they have been like myths or passages in a myth, rather than mere incidents or history which have to wait to become significant. Quite in harmony with my subjective philosophy. This, for instance: that, when I thought I knew the flowers so well, the beautiful purple azalea or pinxter-flower should be shown me by the hunter who found it. Such facts are lifted quite above the level of the actual. They are all just such events as my imagination prepares me for, no matter how incredible. Ever and anon something will occur which my philosophy has

not dreamed of. The limits of the actual are set some thoughts further off. That which had seemed a rigid wall of vast thickness unexpectedly proves a thin and undulating drapery. The boundaries of the actual are no more fixed and rigid than the elasticity of our imaginations. The fact that a rare and beautiful flower which we never saw, perhaps never heard, for which therefore there was no place in our thoughts, may at length be found in our immediate neighborhood, is very suggestive.

P.M. — A change in the weather. It is comparatively cool since last night, and the air is very clear accordingly; none of that haze in it occasioned by the late heat. The leaves are now fairly expanded — that has been the work of May — and are of a dark summer greenness. It is surprising to see how many leaves are already attacked by insects, — leafrollers, pincushion galls, one kind of oak-balls, etc., etc.; and many a shrub and tree, black cherry and shrub oak, is no sooner leaved out than it is completely stripped by its caterpillar foes.

I am going in search of the *Azalea nudiflora*. Sophia brought home a single flower without twig or leaf from Mrs. Brooks's last evening. Mrs. Brooks, I find, has a large twig in a vase of water, still pretty fresh, which she says George Melvin gave to her son George. I called at his office. He says that Melvin came in to Mr. Gourgas's office, where he and others were sitting Saturday evening, with his arms full and gave each a sprig, but he does n't know where he got it. Somebody, I heard, had seen it at Captain Jarvis's; so I went there. I found that they had some still pretty fresh in the house. Melvin gave it to them Saturday night, but they did not know where he got it. A young man working at Stedman Buttrick's said it was a secret; there was only one bush in the town; Melvin knew of it and Stedman knew; when asked, Melvin said he got it in the swamp, or from a bush, etc. The young man thought it grew on the Island across the river on the Wheeler farm. I went on to Melvin's house, though I did not expect to find him at home at this hour, so early in the afternoon. (Saw the wood-sorrel out, a day or two perhaps, by the way.) At length I saw his dog by the door, and knew he was at home.

He was sitting in the shade, bareheaded, at his back door. He had a large pailful of the azalea recently plucked and in the shade behind his house, which he said he was going to carry to town at evening. He had also a sprig set out. He had been out all the forenoon and said he had got seven pickerel — perhaps — apparently he had been drinking and was just getting over it. At first he was a little shy about telling me where the azalea grew, but I saw that I should get it out of him. He dilly-dallied a little; called to his neighbor Farmer, whom he called "Razor," to know if he could tell me where that flower grew. He called it, by the way, the "red honeysuckle." This was to prolong the time and make the most of his secret. I felt pretty sure the plant was to be found on Wheeler's land beyond the river, as the young man had said, for I had remembered how, some weeks before this, when I went up the Assabet after the yellow rocket, I saw Melvin, who had just crossed with his dog, and when I landed to pluck the rocket he appeared out of the woods, said he was after a fish-pole, and asked me the name of my flower. Did n't think it was very handsome,— "not so handsome as the honeysuckle,

is it?" And now I knew it was his "red honeysuckle," and not the columbine, he meant. Well, I told him he had better tell me where it was; I was a botanist and ought to know. But he thought I could n't possibly find it by his directions. I told him he'd better tell me and have the glory of it, for I should surely find it if he did n't; I'd got a clue to it, and should n't give it up. I should go over the river for it. I could smell it a good way, you know. He thought I could smell it half a mile, and he wondered that I had n't stumbled on it, or Channing. Channing, he said, came close by it once, when it was in flower. He thought he'd surely find it then; but he did n't, and he said nothing to him.

He told me he found it about ten years ago, and he went to it every year. It blossomed at the old election time, and he thought it "the handsomest flower that grows." Yarrow just out.

In the meanwhile, Farmer, who was hoeing, came up to the wall, and we fell into a talk about Dodge's Brook, which runs through his farm. A man in Cambridge, he said, had recently written to Mr. Monroe about it, but he did n't know why. All he knew about the brook was that he had seen it dry and then again, after a week of dry weather in which no rain fell, it would be full again, and either the writer or Monroe said there were only two such brooks in all North America. One of its sources — he thought the principal one — was in his land. We all went to it. It was in a meadow, — rather a dry one, once a swamp. He said it never ceased to flow at the head now, since he dug it out, and never froze there. He ran a pole down eight or nine feet into the mud to show me the depth. He had minnows there in a large deep pool, and cast an insect into the water, which they presently rose to and swallowed. Fifteen years ago he dug it out nine feet deep and found spruce logs as big as his leg, which the beavers had gnawed, with the marks of their teeth very distinct upon them; but they soon crumbled away on coming to the air. Melvin, meanwhile, was telling me of a pair of geese he had seen which were breeding in the Bedford Swamp. He had seen them within a day. Last year he got a large brood (11?) of black ducks there.

We went on down the brook, — Melvin and I and his dog, — and crossed the river in his boat, and he conducted me to where the *Azalea nudiflora* grew, — it was a little past its prime, perhaps, — and showed me how near Channing came. ("You won't tell him what I said; will you?" said he.) I offered to pay him for his trouble, but he would n't take anything. He had just as lief I'd know as not. He thought it first came out last Wednesday, on the 25th.

*Azalea nudiflora*, — purple azalea, pinxter-flower, — but Gray and Bigelow say nothing about its clamminess. It is a conspicuously beautiful flowering shrub, with the sweet fragrance of the common swamp-pink, but the flowers are larger and, in this case, a fine lively rosy pink, not so clammy as the other. With a broader, somewhat downy pale-green leaf. Growing in the shade of large wood, like the laurel. Eaton says the *nudiflora* is "not viscous;" names half a dozen varieties and among them *A. partita* (flesh-colored flowers, 5-parted to the base), but then this is viscous. And it cannot

be his species *A. nitida*, with glabrous and shining and small leaves. It must be an undescribed variety — a viscous one — of *A. nudiflora*.

There is a little danger of a frost to-night.

June 1. The pincushion galls on young white oaks are now among the most beautiful objects in the woods, coarse woolly white to appearance, spotted with bright red or crimson on the exposed side. It is remarkable that a mere gall, which at first we are inclined to regard as something abnormal, should be made so beautiful, as if it were the flower of the tree; that a disease, an excrescence, should prove, perchance, the greatest beauty, — as the tear of the pearl. Beautiful scarlet sins they may be. Through our temptations, — aye, and our falls, — our virtues appear. As in many a character, — many a poet, — we see that beauty exhibited in a gall, which was meant to have bloomed in a flower, unchecked. Such, however, is the accomplishment of the world. The poet cherishes his chagrins and sets his sighs to music. This gall is the tree's "Ode to Dejection."

June 2. 3.30 A.M. — When I awake I hear the low universal chirping or twittering of the chip-birds, like the bursting bead on the surface of the uncorked day. First come, first served! You must taste the first glass of the day's nectar, if you would get all the spirit of it.

4 A.M. — I go to the river in a fog through which I cannot see more than a dozen rods, — three or four times as deep as the houses.

Now I have reached the hilltop above the fog at a quarter to five, about sunrise, and all around me is a sea of fog, level and white, reaching nearly to the top of this hill, only the tops of a few high hills appearing as distant islands in the main. It resembles nothing so much as the ocean. You can get here the impression which the ocean makes, without ever going to the shore. Men — poor simpletons as they are — will go to a panorama by families, to see a Pilgrim's Progress, perchance, who never yet made progress so far as to the top of such a hill as this at the dawn of a foggy morning. All the fog they know is in their brains. The seashore exhibits nothing more grand or on a larger scale. It is as boundless as the view from the highlands of Cape Cod.

Meanwhile my hands are numb with cold and my wet feet ache with it. Now, at 5.15, before this southwest wind, it is already grown thin as gossamer in that direction, and woods and houses are seen through it, while it is heaped up toward the sun, and finally becomes so thick there that for a short time it appears in one place a dark, low cloud, such as else can only be seen from mountains; and now long, dark ridges of wood appear through it, and now the sun reflected from the river makes a bright glow in the fog, and now, at 5.30, I see the green surface of the meadows and the water through the trees, sparkling with bright reflections.

June 4. Saturday. Looked over the oldest town records at the clerk's office this evening, the old book containing grants of land. Am surprised to find such names as "Walden Pond" and "Fair Haven" as early as 1653, and apparently 1652; also, under the first date at least, "Second Division," the rivers as North and South Rivers (no Assabet at that date), "Swamp bridge," apparently on back road, "Goose Pond," "Mr.

Flints Pond," "Nutt Meadow," "Willow Swamp," "Spruce Swamp," etc., etc. "Dongy," "Dung Hole," or what-not, appears to be between Walden and Fair Haven. Is Rocky Hill Mr. Emerson's or the Cliffs? Where are South Brook, Frog Ponds, etc., etc., etc.? It is pleasing to read these evergreen wilderness names, i.e. of particular swamps and woods, then applied to now perchance cleared fields and meadows said to be redeemed. The Second Division appears to have been a very large tract between the two rivers.

June 7. P.M. — To Walden.

Visited my nighthawk on her nest. Could hardly believe my eyes when I stood within seven feet and beheld her sitting on her eggs, her head to me. She looked so Saturnian, so one with the earth, so sphinx-like, a relic of the reign of Saturn which Jupiter did not destroy, a riddle that might well cause a man to go dash his head against a stone. It was not an actual living creature, far less a winged creature of the air, but a figure in stone or bronze, a fanciful production of art, like the gryphon or phoenix. It was enough to fill one with awe. All the while, this seemingly sleeping bronze sphinx, as motionless as the earth, was watching me with intense anxiety through those narrow slits in its eyelids. Another step, and it fluttered down the hill close to the ground, with a wabbling motion, as if touching the ground now with the tip of one wing, now with the other, so ten rods to the water, which it skimmed close over a few rods, then rose and soared in the air above me. Wonderful creature, which sits motionless on its eggs on the barest, most exposed hills, through pelting storms of rain or hail, as if it were a rock or a part of the earth itself, the outside of the globe, with its eyes shut and its wings folded, and, after the two days' storm, when you think it has become a fit symbol of the rheumatism, it suddenly rises into the air a bird, one of the most aerial, supple, and graceful of creatures, without stiffness in its wings or joints! It was a fit prelude to meeting Prometheus bound to his rock on Caucasus.

June 9. I was amused by the account which Mary, the Irish girl who left us the other day, gave of her experience at Joseph Brown, the milkman's, in the north part of the town. She said that twenty-two lodged in the house the first night, including two pig men, that Mr. Brown kept ten men, had six children and a deaf wife, and one of the men had his wife with him, who helped sew, beside taking care of her own child. Also all the cooking and washing for his father and mother, who live in another house and whom he is bound to carry through, is done in his house, and she, Mary, was the only girl they hired; and the workmen were called up at four by an alarm clock which was set a quarter of an hour ahead of the clock downstairs, — and that more than as much ahead of the town clock, — and she was on her feet from that hour till nine at night. Each man had two pairs of overalls in the wash, and the cans to be scalded were countless. Having got through washing the breakfast dishes by a quarter before twelve, Sunday noon, by Brown's time, she left, no more to return. He had told her that the work was easy, that girls had lived with him to recover their health, and then went away to be married. He is regarded as one of the most enterprising and thrifty farmers in the county, and takes the premiums of the Agricultural Society. He probably exacts too much of his hands.

The steam of the engine streaming far behind is regularly divided, as if it were the vertebræ of a serpent, probably by the strokes of the piston. The reddish seeds or glumes of grasses cover my boots now in the dewy or foggy morning. The first white lily bud.

8 A.M. — To Orchis Swamp; Well Meadow.

I have come with a spy-glass to look at the hawks. They have detected me and are already screaming over my head more than half a mile from the nest. I find no difficulty in looking at the young hawk (there appears to be one only, standing on the edge of the nest), resting the glass in the crotch of a young oak. I can see every wink and the color of its iris. It watches me more steadily than I it, now looking straight down at me with both eyes and outstretched neck, now turning its head and looking with one eye. How its eye and its whole head express anger! Its anger is more in its eye than in its beak. It is quite hoary over the eye and on the chin. The mother meanwhile is incessantly circling about and above its charge and me, farther or nearer, sometimes withdrawing a quarter of a mile, but occasionally coming to alight for a moment almost within gunshot, on the top of a tall white pine; but I hardly bring my glass fairly to bear on her, and get sight of her angry eye through the pine-needles, before she circles away again. Thus for an hour that I lay there, screaming every minute or oftener with open bill. Now and then pursued by a kingbird or a blackbird, who appear merely to annoy it by dashing down at its back. Meanwhile the male is soaring, apparently quite undisturbed, at a great height above, evidently not hunting, but amusing or recreating himself in the thinner and cooler air, as if pleased with his own circles, like a geometer, and enjoying the sublime scene. I doubt if he has his eye fixed on any prey, or the earth. He probably descends to hunt.

Prunella out. The meadows are now yellow with the golden senecio, a more orange yellow, mingled with the light glossy yellow of the buttercup. The green fruit of the sweet-fern now. The *Juniperus repens* appears, though now dry and effete, to have blossomed recently.

The tall white *Erigeron annuus* (?), for this is the only one described as white tinged with purple, just out.

June 13. 9 A.M. — To Orchis Swamp.

Find that there are two young hawks; one has left the nest and is perched on a small maple seven or eight rods distant. This one appears much smaller than the former one. I am struck by its large, naked head, so vulture-like, and large eyes, as if the vulture's were an inferior stage through which the hawk passed. Its feet, too, are large, remarkably developed, by which it holds to its perch securely like an old bird, before its wings can perform their office. It has a buff breast, striped with dark brown. Pratt, when I told him of this nest, said he would like to carry one of his rifles down there. But I told him that I should be sorry to have them killed. I would rather save one of these hawks than have a hundred hens and chickens. It was worth more to see them soar especially now that they are so rare in the landscape. It is easy to buy eggs, but not to buy hen-hawks. My neighbors would not hesitate to shoot the last pair of

hen-hawks in the town to save a few of their chickens! But such economy is narrow and grovelling. It is unnecessarily to sacrifice the greater value to the less. I would rather never taste chickens' meat nor hens' eggs than never to see a hawk sailing through the upper air again. This sight is worth incomparably more than a chicken soup or a boiled egg. So we exterminate the deer and substitute the hog. It was amusing to observe the swaying to and fro of the young hawk's head to counterbalance the gentle motion of the bough in the wind.

June 14. C. says he saw a "lurker" yesterday in the woods on the Marlborough road. He heard a distressing noise like a man sneezing but long continued, but at length found it was a man wheezing. He was oldish and grizzled, the stumps of his grizzled beard about an inch long, and his clothes in the worst possible condition, — a wretched-looking creature, an escaped convict hiding in the woods, perhaps. He appeared holding on to his paunch, and wheezing as if it would kill him. He appeared to have come straight through the swamp, and — what was most interesting about him, and proved him to be a lurker of the first class, — one of our party, as C. said, — he kept straight through a field of rye which was fully grown, not regarding it in the least; and, though C. tried to conceal himself on the edge of the rye, fearing to hurt his feelings if the man should mistake him for the proprietor, yet they met, and the lurker, giving him a short bow, disappeared in the woods on the opposite side of the road. He went through everything.

June 15. A great fog this morning.

Clover now in its prime. What more luxuriant than a clover-field? The poorest soil that is covered with it looks incomparably fertile. This is perhaps the most characteristic feature of June, resounding with the hum of insects. It is so massive, such a blush on the fields. The rude health of the sorrel cheek has given place to the blush of clover. Painters are wont, in their pictures of Paradise, to strew the ground too thickly with flowers. There should be moderation in all things. Though we love flowers, we do not want them so thick under our feet that we cannot walk without treading on them. But a clover-field in bloom is some excuse for them.

June 17. Here have been three ultra-reformers, lecturers on Slavery, Temperance, the Church, etc., in and about our house and Mrs. Brooks's the last three or four days, — A.D. Foss, once a Baptist minister in Hopkinton, N.H.; Loring Moody, a sort of travelling pattern-working chaplain; and H.C. Wright, who shocks all the old women with his infidel writings. Though Foss was a stranger to the others, you would have thought them old and familiar cronies. (They happened here together by accident.) They addressed each other constantly by their Christian names, and rubbed you continually with the greasy cheeks of their kindness. They would not keep their distance, but cuddle up and lie spoon-fashion with you, no matter how hot the weather nor how narrow the bed, — chiefly Wright. I was awfully pestered with his benignity; feared I should get greased all over with it past restoration; tried to keep some starch in my clothes. He wrote a book called "A Kiss for a Blow," and he behaved as if there were no alternative between these, or as if I had given him a blow. I would have preferred

the blow, but he was bent on giving me the kiss, when there was neither quarrel nor agreement between us. I wanted that he should straighten his back, smooth out those ogling wrinkles of benignity about his eyes, and, with a healthy reserve, pronounce something in a downright manner. It was difficult to keep clear of his slimy benignity, with which he sought to cover you before he swallowed you and took you fairly into his bowels. It would have been far worse than the fate of Jonah. I do not wish to get any nearer to a man's bowels than usual. They lick you as a cow her calf. They would fain wrap you about with their bowels. W. addressed me as "Henry" within one minute from the time I first laid eyes on him, and when I spoke, he said with drawling, sultry sympathy, "Henry, I know all you would say; I understand you perfectly; you need not explain anything to me;" and to another, "I am going to dive into Henry's inmost depths." I said, "I trust you will not strike your head against the bottom." He could tell in a dark room, with his eyes blinded and in perfect stillness, if there was one there whom he loved. One of the most attractive things about the flowers is their beautiful reserve. The truly beautiful and noble puts its lover, as it were, at an infinite distance, while it attracts him more strongly than ever. I do not like the men who come so near me with their bowels. It is the most disagreeable kind of snare to be caught in. Men's bowels are far more slimy than their brains. They must be ascetics indeed who approach you by this side.

June 18. Saturday. 4 A.M. — By boat to Nawshawtuct; to Azalea Spring, or Pinxter Spring.

As I was going up the hill, I was surprised to see rising above the June-grass, near a walnut, a whitish object, like a stone with a white top, or a skunk erect, for it was black below. It was an enormous toadstool, or fungus, a sharply conical parasol in the form of a sugar loaf, slightly turned up at the edges, which were rent half an inch in every inch or two. The whole height was sixteen inches. The pileus or cap was six inches long by seven in width at the rim, though it appeared longer than wide. There was no veil, and the stem was about one inch in diameter and naked.

It looked much like an old felt hat that is pushed up into a cone and its rim all ragged and with some meal shaken on to it; in fact, it was almost big enough for a child's head. It was so delicate and fragile that its whole cap trembled on the least touch, and, as I could not lay it down without injuring it, I was obliged to carry it home all the way in my hand and erect, while I paddled my boat with one hand. It was a wonder how its soft cone ever broke through the earth. Such growths ally our age to former periods, such as geology reveals. I wondered if it had not some relation to the skunk, though not in odor, yet in its colors and the general impression it made. It suggests a vegetative force which may almost make man tremble for his dominion. It carries me back to the era of the formation of the coal-measures — the age of the saurus and pleiosaurus and when bullfrogs were as big as bulls. Its stem had something massy about it like an oak, large in proportion to the weight it had to support (though not perhaps to the size of the cap), like the vast hollow columns under some piazzas, whose caps have hardly weight enough to hold their tops together. It made you think of

parasols of Chinese mandarins; or it might have been used by the great fossil bullfrog in his walks. What part does it play in the economy of the world?

I have just been out (7.30 A.M.) to show my fungus. The milkman and the butcher followed me to inquire what it was, and children and young ladies addressed me in the street who never spoke to me before. It is so fragile I was obliged to walk at a funereal pace for fear of jarring it. It is so delicately balanced on its stem that it falls to one side across it on the least inclination; falls about like an umbrella that has lost its stays. It is rapidly curling up on the edge, and the rents increasing, until it is completely fringed, and is an inch wider there. It is melting in the sun and light, and black drops and streams falling on my hand and fragments of the black fringed rim falling on the sidewalk. Evidently such a plant can only be seen in perfection in the early morning. It is a creature of the night, like the great moths. They wish me to send it to the first of a series of exhibitions of flowers and fruits to be held at the court-house this afternoon, which I promise to do if it is presentable then. Perhaps it might be placed in the court-house cellar and the company be invited at last to walk down and examine it. Think of placing this giant parasol fungus in the midst of all their roses; yet they admit that it would overshadow and eclipse them all. It is to be remarked that this grew, not in low and damp soil, but high up on the open side of a dry hill, about two rods from a walnut and one from a wall, in the midst of and rising above the thin June-grass. The last night was warm; the earth was very dry, and there was a slight sprinkling of rain.

I believe the 14th was the first day I began to wear my single thin sack in my walk and at night sleep with both windows open; say, when the swamp-pink opens.

I think the blossom of the sweet-briar, now in prime, — eglantine, — is more delicate and interesting than that of the common roses, though smaller and paler and without their spicy fragrance; but its fragrance is in its leaves all summer, and the form of the bush is handsomer, curving over from a considerable height in wreaths sprinkled with numerous flowers. They open out flat soon after sunrise. Flowers whitish in middle, then pinkish-rose inclining to purple toward the edges.

I put the parasol fungus in the cellar to preserve it, but it went on rapidly melting and wasting away from the edges upward, spreading as it dissolved, till it was shaped like a dish cover. By night, though kept in the cellar all the day, there was not more than two of the six inches of the height of the cap left, and the barrel-head beneath it and its own stem looked as if a large bottle of ink had been broken there. It defiled all it touched. Probably one night produced it, and in one day, with all our pains, it wasted away. Is it not a giant mildew or mould? The Pyramids and other monuments of Egypt are a vast mildew or toadstools which have met with no light of day sufficient to waste them away. Slavery is such a mould, and superstition, — which are most rank in the warm and humid portions of the globe. Luxor sprang up one night out of the slime of the Nile. The humblest, puniest weed that can endure the sun is thus superior to the largest fungus, as is the peasant's cabin to those foul temples. It is a temple

consecrated to Apis. All things flower, both vices and virtues, but the one is essentially foul, the other fair. In hell, toadstools should be represented as overshadowing men.

At the Flower Exhibition, saw the rhododendron plucked yesterday in Fitzwilliam, N.H. It was the earliest to be found there, and only one bud yet fully open. They say it is in perfection there the 4th of July, nearer Monadnock than the town.

This unexpected display of flowers culled from the gardens of the village suggests how many virtues also are cultivated by the villagers, more than meet the eye.

It would be an interesting subject, — the materials with which different birds line their nests, or, more generally, construct them. The hickory catkins, etc., of the cuckoo, the hypnum and large nest of the phœbe.

8.30 P.M. — To Cliffs.

Moon not quite full. There is no motion nor sound in the woods (Hubbard's Grove) along which I am walking. The trees stand like great screens against the sky. The distant village sounds are the barking of dogs, that animal with which man has allied himself, and the rattling of wagons, for the farmers have gone into town a-shopping this Saturday night. The dog is the tamed wolf, as the villager is the tamed savage. But near, the crickets are heard in the grass, chirping from everlasting to everlasting, a mosquito sings near my ear, and the humming of a dor-bug drowns all the noise of the village, so roomy is the universe. The moon comes out of the mackerel cloud, and the traveller rejoices. How can a man write the same thoughts by the light of the moon, resting his book on a rail by the side of a remote potato-field, that he does by the light of the sun, on his study table? The light is but a luminousness. My pencil seems to move through a creamy, mystic medium. The moonlight is rich and somewhat opaque, like cream, but the daylight is thin and blue, like skimmed milk. I am less conscious than in the presence of the sun; my instincts have more influence.

June 21.

The warmest day yet. For the last two days I have worn nothing about my neck. This change or putting off of clothing is, methinks, as good an evidence of the increasing warmth of the weather as meteorological instruments. I thought it was hot weather perchance, when, a month ago, I slept with a window wide open and laid aside a comfortable, but by and by I found that I had got two windows open, and to-night two windows and the door are far from enough.

At sunset to Island.

Between the heavy masses of clouds, mouse-colored, with dark-blue bases, the patches of clear sky are a glorious cobalt blue, as Sophia calls it. How happens it that the sky never appears so intensely, brightly, memorably blue as when seen between clouds and, it may be, as now in the south at sunset? This, too, is like the blue in snow. For the last two or three days it has taken me all the forenoon to wake up.

June 24. There were piles of dried heart-leaf on shore at the bathing-place, a foot high and more. Were they torn up and driven ashore by the wind? I suspect it is the wind in both cases. As storms at sea tear up and cast ashore the seaweeds from the rocks. These are our seaweeds cast ashore in storms, but I see only the eel-grass and

the heart-leaf thus served. Our most common in the river appears to be between the *Potamogeton natans* and *pulcher*; it answers to neither, but can be no other described. All these have a strong fresh-water marsh smell, rather agreeable sometimes as a bottle of salts, like the salt marsh and seaweeds, invigorating to my imagination. In our great stream of distilled water going slowly down to ocean to be salted. There are the heart-leaf ponds, but I cannot say the potamogeton rivers on account of the tautology, and, beside, I do not like this last name, which signifies that it grows in the neighborhood of rivers, when it is not a neighbor but an indweller. You might as well describe the seaweeds as growing in the neighborhood of the sea.

June 25. Great orange lily beyond stone bridge. Found in the Glade (?) Meadows an unusual quantity of *amelanchier* berries now in their prime. These are the first berries after strawberries, or the first, and I think the sweetest, bush berries. Somewhat like high blueberries, but not so hard. Much eaten by insects, worms, etc. As big as the largest blueberries or peas. These are the "service-berries" which the Indians of the north and the Canadians use. *La poire* of the latter (vide Indian books, No. 6, p. 13). I felt all the while I was picking them, in the low, light, wavy shrubby wood they make, as if I were in a foreign country. Several old farmers say, "Well, though I have lived seventy years, I never saw nor heard of them." I think them a delicious berry, and no doubt they require only to be more abundant every year to be appreciated.

JUNE 28. Nettle out a few days. Pepper-grass, a week or more. Catnep, also, a few days. We have warmer weather now again.

July 1. I am surveying the Bedford road these days, and have no time for my Journal. Saw one of those great pea-green emperor moths, like a bird, fluttering over the top of the woods this forenoon, 10 A.M., near Beck Stow's. Gathered the early red blackberry in the swamp or meadow this side of Pedrick's, where I ran a pole down nine feet.

July 12. White vervain. Checkerberry, maybe some days. Spikenard, not quite yet. The green-flowered lanceolate-leafed orchis at Azalea Brook will soon flower. Wood horse-tail very large and handsome there.

July 21. 2 P.M. — Went, in pursuit of boys who had stolen my boat-seat, to Fair Haven.

July 24. With or without reason, I find myself associating with the idea of summer a certain cellar-like coolness, resulting from the depth of shadows and the luxuriance of foliage. I think that after this date the crops never suffer so severely from drought as in June, because of their foliage shading the ground and producing dews. We had fog this morning, and no doubt often the last three weeks, which my surveying has prevented my getting up to see.

How far behind the spring seems now, — farther off, perhaps, than ever, for this heat and dryness is most opposed to spring. Where most I sought for flowers in April and May I do not think to go now; it is either drought and barrenness or fall there now. The reign of moisture is long since over. For a long time the year feels the influence of the snows of winter and the long rains of spring, but now how changed! It is like another and a fabulous age to look back on, when earth's veins were full of moisture,

and violets burst out on every hillside. Spring is the reign of water; summer, of heat and dryness; winter, of cold. Summer is one long drought. Rain is the exception. All the signs of it fail, for it is dry weather. Though it may seem so, the current year is not peculiar in this respect.

The shaggy hazelnuts now greet the eye, always an agreeable sight to me, with which when a boy I used to take the stains of berries out of my hands and mouth. These and green grapes are found at berry time.

July 25. I have for years had a great deal of trouble with my shoe-strings, because they get untied continually. They are leather, rolled and tied in a hard knot. But some days I could hardly go twenty rods before I was obliged to stop and stoop to tie my shoes. My companion and I speculated on the distance to which one tying would carry you, — the length of a shoe-tie, — and we thought it nearly as appreciable and certainly a more simple and natural measure of distance than a stadium, or league, or mile. Ever and anon we raised our feet on whatever fence or wall or rock or stump we chanced to be passing, and drew the strings once more, pulling as hard as we could. It was very vexatious, when passing through low scrubby bushes, to become conscious that the strings were already getting loose again before we had fairly started. What should we have done if pursued by a tribe of Indians? My companion sometimes went without strings altogether, but that loose way of proceeding was not to be thought of by me. One shoemaker sold us shoe-strings made of the hide of a South American jackass, which he recommended; or rather he gave them to us and added their price to that of the shoes we bought of him. But I could not see that these were any better than the old. I wondered if anybody had exhibited a better article at the World's Fair, and whether England did not bear the palm from America in this respect. I thought of strings with recurved prickles and various other remedies myself. At last the other day it occurred to me that I would try an experiment, and, instead of tying two simple knots one over the other the same way, putting the end which fell to the right over each time, that I would reverse the process, and put it under the other. Greatly to my satisfaction, the experiment was perfectly successful, and from that time my shoe-strings have given me no trouble, except sometimes in untying them at night.

On telling this to others I learned that I had been all the while tying what is called a granny's knot, for I had never been taught to tie any other, as sailors' children are; but now I had blundered into a square knot, I think they called it, or two running slip-nooses. Should not all children be taught this accomplishment, and an hour, perchance, of their childhood be devoted to instruction in tying knots?

Aug. 6. More dog-days.

I see the sunflower's broad disk now in gardens, probably a few days, — a true sun among flowers, monarch of August. Do not the flowers of August and September generally resemble suns and stars? — sunflowers and asters and the single flowers of the goldenrod. I once saw one as big as a milk-pan, in which a mouse had its nest.

I have seen some red leaves on the low choke-berry. Now begins the vintage of their juices. Nature is now a Bacchanal, drunk with the wines of a thousand plants and berries.

Aug. 7. I think that within a week I have heard the alder cricket, — a clearer and shriller sound from the leaves in low grounds, a clear shrilling out of a cool moist shade, an autumnal sound. The year is in the grasp of the crickets, and they are hurling it round swiftly on its axle. Some wasps (I am not sure there's more than one) are building a nest in my room, of mud, these days, buzzing loudly while at work, but at no other time.

Now for the herbs, — the various mints. The pennyroyal is out abundantly on the hills. I do not scent these things enough. Would it not be worth the while to devote a day to collecting the mountain mint, and another to the peppermint?

How trivial and uninteresting and wearisome and unsatisfactory are all employments for which men will pay you money! The ways by which you may get money all lead downward. To have done anything by which you earned money merely is to have been truly idle. If the laborer gets no more than the wages his employer pays him, he is cheated, he cheats himself. Those services which the world will most readily pay for, it is most disagreeable to render. You are paid for being something less than a man. The state will pay a genius only for some service which it is offensive to him to render. Even the poet-laureate would rather not have to celebrate the accidents of royalty.

Dangle-berries have begun.

It is worth the while to walk in wet weather; the earth and leaves are strewn with pearls.

As I was walking along a hillside the other day, I smelled penny-royal, but it was only after a considerable search that I discovered a single minute plant, which I had trodden on, the only one near. When, yesterday, a boy spilled his huckleberries in the pasture, I saw that Nature was making use of him to disperse her berries, and I might have advised him to pick another dishful. The three kinds of epilobium grow rankly where Hubbard burned his swamp this year, also erechthites. I think that I have observed that this last is a true fireweed.

Is it not as language that all natural objects affect the poet? He sees a flower or other object, and it is beautiful or affecting to him because it is a symbol of his thought, and what he indistinctly feels or perceives is matured in some other organization. The objects I behold correspond to my mood.

The past has been a remarkably wet week, and now the earth is strewn with fungi. The earth itself is mouldy. I see a white mould in the path.

I was struck by the perfect neatness, as well as elaborateness and delicacy, of a lady's dress the other day. She wore some worked lace or gauze over her bosom, and I thought it was beautiful, if it indicated an equal inward purity and delicacy, — if it was the soul she dressed and treated thus delicately.

Aug. 10. Alcott spent the day with me yesterday. He spent the day before with Emerson. He observed that he had got his wine and now he had come after his venison.

Such was the compliment he paid me. The question of a livelihood was troubling him. He knew of nothing which he could do for which men would pay him. He could not compete with the Irish in cradling grain. His early education had not fitted him for a clerkship. He had offered his services to the Abolition Society, to go about the country and speak for freedom as their agent, but they declined him. This is very much to their discredit; they should have been forward to secure him. Such a connection with him would confer unexpected dignity on their enterprise. But they cannot tolerate a man who stands by a head above them. They are as bad — Garrison and Phillips, etc. — as the overseers and faculty of Harvard College. They require a man who will train well under them.

Aug. 11. Evening draws on while I am gathering bundles of penny-royal on the further Conantum height. I find it amid the stubble mixed with blue-curls and, as fast as I get my hand full, tie it into a fragrant bundle. Evening draws on, smoothing the waters and lengthening the shadows, now half an hour or more before sundown. What constitutes the charm of this hour of the day? Is it the condensing of dews in the air just beginning, or the grateful increase of shadows in the landscape?

What shall we name this season? — this very late afternoon, or very early evening, this severe and placid season of the day.

Aug. 12. 9 A.M. — To Conantum by boat, berrying, with three ladies.

Carried watermelons for drink. What more refreshing and convenient! This richest wine in a convenient cask, and so easily kept cool! No foreign wines could be so grateful. The first muskmelon to-day. If you would cool a watermelon, do not put it in water, which keeps the heat in, but cut it open and set it in a cellar or in the shade. If you have carriage, carry these green bottles of wine.

Aug. 14. In the low woodland paths full of rank weeds, there are countless great fungi of various forms and colors, the produce of the warm rains and muggy weather of a week ago, now rapidly dissolving. One great one, more than a foot in diameter, with a stem  $2\frac{1}{2}$ + inches through and 5 inches high, and which has sprung up since I passed here on the 10th, is already sinking like lead into that portion already melted. The ground is covered with foul spots where they have dissolved, and for most of my walk the air is tainted with a musty, carrion-like odor, in some places very offensive, so that I at first suspected a dead horse or cow. They impress me like humors or pimples on the face of the earth, toddy-blossoms, by which it gets rid of its corrupt blood. A sort of excrement they are. It never occurred to me before to-day that those different forms belong to one species.

Aug. 17. Rain, rain, rain again! Good for grass and apples; said to be bad for potatoes, making them rot; makes the fruit now ripening decay, — apples, etc.

Aug. 18. Rain again.

Now again I am caught in a heavy shower in Moore's pitch pines on edge of Great Fields, and am obliged to stand crouching under my umbrella till the drops turn to streams, which find their way through my umbrella, and the path up the hillside is

all afloat, a succession of puddles at different levels, each bounded by a ridge of dead pine-needles.

What means this sense of lateness that so comes over one now, — as if the rest of the year were down-hill, and if we had not performed anything before, we should not now? The season of flowers or of promise may be said to be over, and now is the season of fruits; but where is our fruit? The night of the year is approaching. What have we done with our talent? All nature prompts and reproves us. How early in the year it begins to be late! It matters not by how little we have fallen behind; it seems irretrievably late. The year is full of warnings of its shortness, as is life.

Vide next page.

Vide amount of seed in Tribune, Mar. 16, 1860.

These were either mergansers or the golden-eye; I think the former, i.e. *Mergus serrator*, or red-breasted merganser (?), or sheldrake.

Does next morning in pitcher.

I think it is *strigosus*, but tinged with purple sometimes.

[From Greek: *potamo* = river; *geiton* = neighbor.]

[“Then there were huckleberrying parties. These were under the guidance of Thoreau, because he alone knew the precise locality of every variety of the berry. I recall an occasion when little Edward Emerson, carrying a basket of fine huckleberries, had a fall and spilt them all. Great was his distress, and our offers of berries could not console him for the loss of those gathered by himself. But Thoreau came, put his arm around the troubled child, and explained to him that if the crop of huckleberries was to continue it was necessary that some should be scattered. Nature had provided that little boys should now and then stumble and sow the berries. We shall have a grand lot of bushes and berries in this spot, and we shall owe them to you. Edward began to smile.” — Moncure Daniel Conway, *Autobiography*, Boston, 1904, vol. I, p. 148.]

Or in a draught.

Aug. 19. Friday. 9 A.M. — To Sudbury by boat with W.E.C.

Cooler weather. Last Sunday we were sweltering here and one hundred died of the heat in New York; to-day they have fires in this village. After more rain, with wind in the night, it is now clearing up cool. A considerable wind wafts us along with our one sail and two umbrellas, sitting in thick coats. I was going to sit and write or mope all day in the house, but it seems wise to cultivate animal spirits, to embark in enterprises which employ and recreate the whole body.

We landed at the first cedar hills above the causeway and ate our dinner and watermelon on them. A great reddish-brown marsh hawk circling over the meadow there. How freshly, beautifully green the landscape after all these rains! The poke-berry ripe.

Aug. 23. Observing the blackness of the foliage, especially between me and the light, I am reminded that it begins in the spring, the dewy dawn of the year, with a silvery hoary downiness, changing to a yellowish or light green, — the saffron-robed morn, — then to a pure, spotless, glossy green with light under sides reflecting the light, — the forenoon, — and now the dark green, or early afternoon, when shadows begin to

increase, and next it will turn yellow or red, — the sunset sky, — and finally sere brown and black, when the night of the year sets in.

I am again struck by the perfect correspondence of a day — say an August day — and the year. I think that a perfect parallel may be drawn between the seasons of the day and of the year. Perhaps after middle age man ceases to be interested in the morning and in the spring.

Live in each season as it passes; breathe the air, drink the drink, taste the fruit, and resign yourself to the influences of each. In August live on berries, not dried meats and pemmican, as if you were on shipboard making your way through a waste ocean, or in a northern desert. Be blown on by all the winds. Open all your pores and bathe in all the tides of Nature, in all her streams and oceans, at all seasons. Why, “nature” is but another name for health, and the seasons are but different states of health.

Aug. 26. Saw the comet in the west to-night. It made me think of those imperfect white seeds in a watermelon, — an immature, ineffectual meteor.

Aug. 27. September is at hand; the first month (after the summer heat) with a burr to it, month of early frosts; but December will be tenfold rougher. January relents for a season at the time of its thaw, and hence that liquid r in its name.

Aug. 29. The 25th and 26th I was surveying Tuttle’s farm. The northeast side bounds on the Mill Brook and its tributary and is very irregular. I find, after surveying accurately the windings of several brooks and of the river, that their meanders are not such regular serpentine curves as is commonly supposed, or at least represented. They flow as much in a zigzag as serpentine manner. The eye is very much deceived when standing on the brink, and one who had only surveyed a brook so would be inclined to draw a succession of pretty regular serpentine curves. But, accurately plotted, the regularity disappears, and there are found to be many straight lines and sharp turns. I want no better proof of the inaccuracy of some maps than the regular curving meanders of the streams, made evidently by a sweep of the pen. No, the Meander no doubt flowed in a very crooked channel, but depend upon it, it was as much zigzag as serpentine. This last brook I observed was doubly zigzag, or compoundly zigzag; i.e., there was a zigzag on a large scale including the lesser. To the eye this meadow is perfectly level. Probably all streams are (generally speaking) far more meandering in low and level and soft ground near their mouths, where they flow slowly, than in high and rugged ground which offers more obstacles. The meadow being so level for long distances, no doubt as high in one direction as another, how, I asked myself, did the feeble brook, with all its meandering, ever find its way to the distant lower end? What kind of instinct conducted it forward in the right direction? How unless it is the relict of a lake which once stood high over all these banks, and knew the different levels of its distant shores? How unless a flow which commenced above its level first wore its channel for it? Thus, in regard to most rivers, did not lakes first find their mouths for them, just as the tide now keeps open the mouths of sluggish rivers? And who knows to what extent the sea originally channelled the submerged globe?

Sept. 1. The character of the past month, as I remember, has been, at first, very thick and sultry, dogdayish, the height of summer, and throughout very rainy, followed by crops of toadstools, and latterly, after the dogdays and most copious of the rains, autumnal, some-what cooler, with signs of decaying or ripening foliage. The month of green corn and melons and plums and the earliest apples, — and now peaches, — of rank weeds. As July, perchance, has its spring side, so August has its autumnal side.

Sept. 2. P.M. — Collected and brought home in a pail of water this afternoon the following asters and diplopappi, going by Turnpike and Hubbard's Close to Saw Mill Brook, and returning by Goose Pond: (1) *A. Tradescanti*, now well under way, most densely flowered, by low roadsides; (2) *dumosus*, perhaps the most prevalent of the small whitish ones, especially in wood-paths; [etc. — ten more].

These twelve placed side by side, Sophia and I decided that, regarding only individual flowers, the handsomest was —

1st, *A. patens*, deep bluish-purple ("deep blue-purple" are Gray's very words), large!

2d, *lœvis* bright lilac-purple, large.

3d, perhaps *Radula*, pale bluish-purple, turning white, large! [Etc. for all 12.]

The first (*patens*) has broader rays than the second, paler within toward the large handsome yellow disk. Its rough leaves are not so handsome.

The *lœvis* is more open and slender-rayed than the last, with a rather smaller disk, but, including its stem and leaves, it is altogether the most delicate and graceful, and I should incline to put it before the last. [Etc. for all 12.]

Sept. 7. Yesterday and to-day and day before yesterday, some hours of very warm weather, as oppressive as any in the year, one's thermometer at 93°.

Sept. 11. Sunday. Cool weather. Sit with windows shut, and many by fires. A great change since the 6th, when the heat was so oppressive. The air has got an autumnal coolness which it will not get rid of again.

Signs of frost last night in M. Miles's cleared swamp. Potato vines black. How much farther it is back to frost from the greatest heat of summer, i.e. from the 6th back to the 1st of June, three months, than forward to it, four days!

OCT. 12. To-day I have had the experience of borrowing money for a poor Irishman who wishes to get his family to this country. One will never know his neighbors till he has carried a subscription paper among them. Ah! it reveals many and sad facts to stand in this relation to them. To hear the selfish and cowardly excuses some make, — that if they help any they must help the Irishman who lives with them, — and him they are sure never to help! Others, with whom public opinion weighs, will think of it, trusting you never will raise the sum and so they will not be called on again; who give stingily after all. What a satire in the fact that you are much more inclined to call on a certain slighted and so-called crazy woman in moderate circumstances rather than on the president of the bank! But some are generous and save the town from the distinction which threatened it, and some even who do not lend, plainly would if they could.

Oct. 20. How pleasant to walk over beds of these fresh, crisp, and rustling fallen leaves, — young hyson, green tea, clean, crisp, and wholesome! How beautiful they go to their graves! how gently lay themselves down and turn to mould! — painted of a thousand hues and fit to make the beds of us living. So they troop to their graves, light and frisky. They put on no weeds.

Oct. 22. A week or more of fairest Indian summer ended last night, for to-day it rains. It was so warm day before yesterday, I worked in my shirt-sleeves in the woods.

I cannot easily dismiss the subject of the fallen leaves. How densely they cover and conceal the water for several feet in width, under and amid the alders and button-bushes and maples along the shore of the river, — still light, tight, and dry boats, dense cities of boats, their fibres not relaxed by the waters, undulating and rustling with every wave, of such various pure and delicate, though fading, tints, — of hues that might make the fame of teas, — dried on great Nature's coppers. And then see this great fleet of scattered leaf boats, still tight and dry, each one curled up on every side by the sun's skill, like boats of hide, scarcely moving in the sluggish current, — like the great fleets with which you mingle on entering some great mart, some New York which we are all approaching together.

Consider what a vast crop is thus annually shed upon the earth. This, more than any mere grain or seed, is the great harvest of the year. This annual decay and death, this dying by inches, before the whole tree at last lies down and turns to soil. As trees shed their leaves, so deer their horns, and men their hair or nails. The year's great crop. They teach us how to die. How many flutterings before they rest quietly in their graves! By what subtle chemistry they will mount up again, climbing by the sap in the trees.

For beautiful variety can any crop be compared with them?

Yesterday, toward night, gave Sophia and mother a sail as far as the Battle-Ground. One-eyed John Goodwin, the fisherman, was loading into a hand-cart and conveying home the piles of driftwood which of late he had collected with his boat. It was a beautiful evening, and a clear amber sunset lit up all the eastern shores; and that man's employment, so simple and direct, — though he is regarded by most as a vicious character, — whose whole motive was so easy to fathom, — thus to obtain his winter's wood, — charmed me unspeakably. So much do we love actions that are simple. They are all poetic. We, too, would fain be so employed. So unlike the pursuits of most men, so artificial or complicated. Consider how the broker collects his winter's wood, what sport he makes of it, what is his boat and hand-cart! Postponing instant life, he makes haste to Boston in the cars, and there deals in stocks, not quite relishing his employment, — and so earns the money with which he buys his fuel. And when, by chance, I meet him about this indirect and complicated business, I am not struck with the beauty of his employment. It does not harmonize with the sunset. How much more the former consults his genius, some genius at any rate!

No trade is simple, but artificial and complex. It postpones life and substitutes death. It goes against the grain. The oldest, wisest politician grows not more human

so, but is merely a gray wharf rat at last. He makes a habit of disregarding the moral right and wrong for the legal or political, commits a slow suicide, and thinks to recover by retiring on to a farm at last. This simplicity it is, and the vigor it imparts, that enables the simple vagabond, though he does get drunk and is sent to the house of correction so often, to hold up his head among men.

Oct. 23. Sunday. I find my clothes all bristling as with a *chevaux-de-frise* of beggarticks, which hold on for many days. A storm of arrows these weeds have showered on me, as I went through their moats. How irksome the task to rid one's self of them! We are fain to let some adhere. Through thick and thin I wear some; hold on many days. In an instant a thousand seeds of the *bidens* fastened themselves firmly to my clothes, and I carried them for miles, planting one here and another there. They are as thick on my clothes as the teeth of a comb.

It is the season of fuzzy seeds, — goldenrods, everlasting, *senecio*, asters, *epilobium*, etc., etc. *Viburnum Lentago*, with ripe berries and dull-glossy red leaves; young black cherry, fresh green or yellow; mayweed. The chestnuts have mostly fallen. One *Diplopappus linariifolius* in bloom, its leaves all yellow or red. This and *A. undulatus* the asters seen to-day.

The red oak now red, perhaps inclining to scarlet; the white, with that peculiar ingrained redness; the shrub oak, a clear thick leather-color; some dry black oak, darker brown; chestnut, light brown; hickory, yellow, turning brown. These the colors of some leaves I brought home.

Oct. 24. It has rained all day, filling the streams. Just after dark, high southerly winds arise, but very warm, blowing the rain against the windows and roof and shaking the house. It is very dark withal, so that I can hardly find my way to a neighbor's. We think of vessels on the coast, and shipwrecks, and how this will bring down the remaining leaves and to-morrow morning the street will be strewn with rotten limbs of the elms amid the leaves and puddles, and some loose chimney or crazy building will have fallen. Some fear to go to bed, lest the roof be blown off.

Oct. 26. I well remember the time this year when I first heard the dream of the toads. I was laying out house-lots on Little River in Haverhill. We had had some raw, cold and wet weather. But this day was remarkably warm and pleasant, and I had thrown off my outside coat. I was going home to dinner, past a shallow pool, which was green with springing grass, and where a new house was about being erected, when it occurred to me that I heard the dream of the toad. It rang through and filled all the air, though I had not heard it once. And I turned my companion's attention to it, but he did not appear to perceive it as a new sound in the air. Loud and prevailing as it is, most men do not notice it at all. It is to them, perchance, a sort of simmering or seething of all nature. That afternoon the dream of the toads rang through the elms by Little River and affected the thoughts of men, though they were not conscious that they heard it.

How watchful we must be to keep the crystal well that we were made, clear! — that it be not made turbid by our contact with the world, so that it will not reflect objects.

What other liberty is there worth having, if we have not freedom and peace in our minds, — if our inmost and most private man is but a sour and turbid pool? Often we are so jarred by chagrins in dealing with the world, that we cannot reflect.

Ah! the world is too much with us, and our whole soul is stained by what it works in, like the dyer's hand. A man had better starve at once than lose his innocence in the process of getting his bread.

It is surprising how any reminiscence of a different season of the year affects us. When I meet with any such in my Journal, it affects me as poetry, and I appreciate that other season and that particular phenomenon more than at the time. The world so seen is all one spring, and full of beauty. You only need to make a faithful record of an average summer day's experience and summer mood, and read it in the winter, and it will carry you back to more than that summer day alone could show. Only the rarest flower, the purest melody, of the season thus comes down to us.

When, after feeling dissatisfied with my life, I aspire to something better, am more scrupulous, more reserved and continent, as if expecting somewhat, suddenly I find myself full of life as a nut of meat, — am overflowing with a quiet, genial mirthfulness. I think to myself, I must attend to my diet; I must get up earlier and take a morning walk; I must have done with luxuries and devote myself to my muse. So I dam up my stream, and my waters gather to a head. I am freighted with thought.

Oct. 27. Some less obvious and commonly unobserved signs of the progress of the seasons interest me most, like the loose, dangling catkins of the hop-hornbeam or of the black or yellow birch. I can recall distinctly to my mind the image of these things, and that time in which they flourished is glorious as if it were before the fall of man. I see all nature for the time under this aspect. These features are particularly prominent; as if the first object I saw on approaching this planet in the spring was the catkins of the hop-hornbeam on the hillsides. As I sailed by, I saw the yellowish waving sprays.

Oct. 28. Rain in the night and this morning, preparing for winter.

For a year or two past, my publisher, falsely so called, has been writing from time to time to ask what disposition should be made of the copies of "A Week on the Concord and Merrimack Rivers" still on hand, and at last suggesting that he had use for the room they occupied in his cellar. So I had them all sent to me here, and they have arrived to-day by express, filling the man's wagon, — 706 copies out of an edition of 1000 which I bought of Munroe four years ago and have been ever since paying for, and have not quite paid for yet. The wares are sent to me at last, and I have an opportunity to examine my purchase. They are something more substantial than fame, as my back knows, which has borne them up two flights of stairs to a place similar to that to which they trace their origin. Of the remaining two hundred and ninety and odd, seventy-five were given away, the rest sold. I have now a library of nearly nine hundred volumes, over seven hundred of which I wrote myself. Is it not well that the author should behold the fruits of his labor? My works are piled up on one side of my chamber half as high as my head, my opera omnia. This is authorship; these are the

work of my brain. There was just one piece of good luck in the venture. The unbound were tied up by the printer four years ago in stout paper wrappers, and inscribed, —  
H.D. Thoreau's  
Concord River  
50 cops.

So Munroe had only to cross out "River" and write "Mass." and deliver them to the expressman at once. I can see now what I write for, the result of my labors.

Nevertheless, in spite of this result, sitting beside the inert mass of my works, I take up my pen to-night to record what thought or experience I may have had, with as much satisfaction as ever. Indeed, I believe that this result is more inspiring and better for me than if a thousand had bought my wares. It affects my privacy less and leaves me freer.

Oct. 31. 7 A.M. — By river to Nawshawtuct.

The flood and wind have washed up great quantities of cranberries loosened by the rake, which now line the shore, mixed with the wrecked grass and weeds. We gathered five quarts, partly frost-bitten.

I slowly discover that this is a gossamer day. I first see the fine lines stretching from one weed or grass stem or rush to another, sometimes seven or eight feet distant, horizontally and only four or five inches above the water. When I look further, I find that they are everywhere and on everything, sometimes forming conspicuous fine white gossamer webs on the heads of grasses, or suggesting an Indian bat. They are so abundant that they seem to have been suddenly produced in the atmosphere by some chemistry, — spun out of air, — I know not for what purpose. These gossamer lines are not visible unless between you and the sun. We pass some black willows, now of course quite leafless, and when they are between us and the sun they are so completely covered with these fine cobwebs or lines, mainly parallel to one another, that they make one solid woof, a misty woof, against the sun. They are not drawn taut, but curved downward in the middle, like the rigging of vessels, — the ropes which stretch from mast to mast, — as if the fleets of a thousand Lilliputian nations were collected one behind another under bare poles. But when we have floated a few feet further, and thrown the willow out of the sun's range, not a thread can be seen on it.

I am at a loss to say what purpose they serve, and am inclined to think that they are to some extent attached to objects as they float through the atmosphere; for I noticed, before I had gone far, that my grape-vines in a basket in the boat had got similar lines stretching from one twig to another, a foot or two, having undoubtedly caught them as we paddled along. It might well be an electric phenomenon. The air appeared crowded with them. It was a wonder they did not get into the mouth and nostrils, or that we did not feel them on our faces, or continually going and coming amid them did not whiten our clothes more. And yet one with his back to the sun, walking the other way, would observe nothing of all this. Only stand so as to bring the south side of any tree, bush, fence, or other object between you and the sun. Methinks

it is only on these very finest days late in autumn that this phenomenon is seen, as if that fine vapor of the morning were spun into these webs.

According to Kirby and Spence, "in Germany these flights of gossamer appear so constantly in autumn that they are there metaphorically called 'Der fliegender Sommer' (the flying or departing summer)." What can possess these spiders thus to run all at once to every the least elevation, and let off this wonderful stream? Sophia thought that thus at last they emptied themselves and wound up, or, I suggested, unwound, themselves, — cast off their mortal coil. It looks like a mere frolic spending and wasting of themselves, of their vigor, now that there is no further use for it, their prey, perchance, being killed or banished by the frost.

Nov. 1. 6.30 A.M. — To Hubbard's Bridge to see the gossamer.

About three weeks ago my indignation was roused by hearing that one of my townsmen, notorious for meanness, was endeavoring to get and keep a premium of four dollars which a poor Irish laborer whom he hired had gained by fifteen minutes' spading at our Agricultural Fair. To-night a free colored woman is lodging at our house, whose errand to the North is to get money to buy her husband, who is a slave to one Moore in Norfolk, Virginia. She persuaded Moore, though not a kind master, to buy him that he might not be sold further South. Moore paid six hundred dollars for him, but asks her eight hundred. My most natural reflection was that he was even meaner than my townsman. As mean as a slaveholder!

Nov. 3. Heard a bluebird about a week ago.

There are very few phenomena which can be described indifferently as occurring at different seasons of the year, for they will occur with some essential difference.

A warm westerly wind, the sky concealed and a storm gathering. A sober, cloudy afternoon. To-day I see yarrow, very bright; red clover; autumnal dandelion; the silvery potentilla, and one *Canadensis*; and the *Norvegica*; and a dandelion; *Veronica arvensis*; and gnawel; one *Aster lœvis* (!) by the Hosmer Ditch; and, to my surprise, that *solidago* of September 11th, still showing some fresh yellow petals and a very fresh stem and leaves.

I make it my business to extract from Nature whatever nutriment she can furnish me, though at the risk of endless iteration. I milk the sky and the earth.

Nov. 6. Still the Canada snapdragon, yarrow, autumnal dandelion, tansy, shepherd's-purse, silvery cinquefoil, witch-hazel.

The witch-hazel spray is peculiar and interesting, with little knubs at short intervals, zigzag, crinkle-crinkle. How happens it? Did the leaves grow so close? The bud is long against the stem, with a neck to it.

Nov. 8. 10 A.M. — Our first snow, the wind southerly, the air chilly and moist; a very fine snow, looking like a mist toward the woods or horizon, which at 2 o'clock has not whitened the ground. The children greet it with a shout when they come out at recess.

Nov. 12. I cannot but regard it as a kindness in those who have the steering of me that, by the want of pecuniary wealth, I have been nailed down to this my native

region so long and steadily, and made to study and love this spot of earth more and more. What would signify in comparison a thin and diffused love and knowledge of the whole earth instead, got by wandering? The traveller's is but a barren and comfortless condition. It is insignificant, and a merely negative good fortune, to be provided with thick garments against cold and wet, an unprofitable, weak, and defensive condition, compared with being able to extract some exhilaration, some warmth even, out of cold and wet themselves, and to clothe them with our sympathy. The rich man buys woollens and furs, and sits naked and shivering still in spirit, besieged by cold and wet. But the poor Lord of Creation, cold and wet he makes to warm him, and be his garments.

Tasted to-day a black walnut, a spherical and corrugated nut with a large meat, but of a strong oily taste.

Nov. 13. Rain all day.

Nov. 15. After having some business dealings with men, I am occasionally chagrined, and feel as if I had done some wrong, and it is hard to forget the ugly circumstance. I see that such intercourse long continued would make one thoroughly prosaic, hard, and coarse. But the longest intercourse with Nature, though in her rudest moods, does not thus harden and make coarse. A hard, insensible man whom we liken to a rock is indeed much harder than a rock. From hard, coarse, insensible men with whom I have no sympathy, I go to commune with the rocks, whose hearts are comparatively soft.

Together with the barberry, I dug up a brake root by chance. This, too, should have gone into the witches' caldron. It is large and black, almost like a cinder without, and within curiously black and white in parallel fibres, with a sort of mildewiness as if it were rotting; yet fresh shoots are ready for the spring with a cottony point.

This afternoon has wanted no condition to make it a gossamer day, it seems to me, but a calm atmosphere. Plainly the spiders cannot be abroad on the water unless it is smooth. The one I witnessed this fall was at time of flood. May it be that they are driven out of their retreats like muskrats and snow-fleas, and spin these lines for their support?

I see many cranberries on the vines at the bottom, making a great show. It might be worth the while, where possible, to flood a cranberry meadow as soon as they are ripe and before the frosts, and so preserve them plump and sound till spring.

Nov. 18. Conchologists call those shells "which are fished up from the depths of the ocean" and are never seen on the shore, which are the rarest and most beautiful, Pelagii, but those which are cast on shore and are never so delicate and beautiful as the former, on account of exposure and abrasion, Littorales. So it is with the thoughts of poets: some are fresh from the deep sea, radiant with unimagined beauty, — Pelagii; but others are comparatively worn, having been tossed by many a tide, — Littorales, — scaled off, abraded, and eaten by worms.

Nov. 19. What is the peculiarity of the Indian summer? From the 14th to the 21st October inclusive, this year, was perfect Indian summer; and this day the next? Me-thinks that any particularly pleasant and warmer weather after the middle of October

is thus called. Has it not fine, calm spring days answering to it? Autumnal dandelion quite fresh. Tansy very fresh yesterday.

Nov. 20. What enhances my interest in dew — I am thinking of the summer — is the fact that it is so distinct from rain, formed most abundantly after bright, starlit nights, a product especially of the clear, serene air. That nightly rain called dew, which gathers and falls in so low a stratum that our heads tower above it like mountains in an ordinary shower. A writer in Harper's Magazine (vol. vii, page 505) says that the mist at evening does not rise, "but gradually forms higher up in the air." He calls it the moisture of the air become visible. Says there is most dew in clear nights, because clouds prevent the cooling down of the air; they radiate the heat of the earth back to it; and that a strong wind, by keeping the air in motion, prevents its heat from passing off. Therefore, I proceed, for a plentiful dew it must not only be clear but calm. The above writer says bad conductors of heat have always most dew on them, and that wool or swan's-down is "good for experimenting on the quantity of dew falling," — weight before and after. Thinks it not safe to walk in clear nights, especially after midnight, when the dew is most abundantly forming; better in cloudy nights, which are drier. Also thinks it not prudent to venture out until the sun begins to rise and warms the air. But methinks this prudence begets a tenderness that will catch more cold at noonday than the opposite hardness at midnight.

Nov. 22. I see still, here and there, a few deep-sunk yellow and decayed pads, the bleared, dulled, drowned eyes of summer.

I was just thinking it would be fine to get a specimen leaf from each changing tree and shrub and plant in autumn, in September and October, when it had got its brightest characteristic color, the intermediate ripeness in its transition from the green to the russet or brown state, outline and copy its color exactly with paint in a book, — a book which should be a memorial of October, be entitled October Hues or Autumnal Tints. I remember especially the beautiful yellow of the *Populus grandidentata* and the tint of the scarlet maple. What a memento such a book would be, beginning with the earliest reddening of the leaves, woodbine and ivy, etc., etc., and the lake of radical leaves, down to the latest oaks! I might get the impression of their veins and outlines in the summer with lampblack, and after color them.

Nov. 24. At noon, after a drizzling forenoon, the weather suddenly changed to clear and wintry, freezing cold with strong wind from a northerly quarter. It seems like the beginning of winter. Ice forms in my boat at 5 P.M., and what was mud in the street is fast becoming a rigid roughness.

Nov. 27. Now a man will eat his heart, if ever, now while the earth is bare, barren and cheerless, and we have the coldness of winter without the variety of ice and snow; but methinks the variety and compensation are in the stars now. How bright they are now by contrast with the dark earth! The days are short enough now. The sun is already setting before I have reached the ordinary limit of my walk, but the 21st of next month the day will be shorter still by about twenty-five minutes.

It is too cold to-day to use a paddle; the water freezes on the handle and numbs my fingers.

Dec. 5. P.M. — Got my boat in. The river frozen over thinly in most places and whitened with snow, which was sprinkled on it this noon.

It is a startling thought that the Assyrian king who with so much pains recorded his exploits in stone at Nineveh, that the story might come down to a distant generation, has indeed succeeded by those means which he used. All was not vanity, quite.

DEC. 10. Another still more glorious day, if possible; Indian-summery even. These are among the finest days in the year, on account of the wholesome bracing coolness and clearness.

Paddled Cheney's boat up Assabet.

Passed in some places between shooting ice-crystals, extending from both sides of the stream. Upon the thinnest black ice-crystals, just cemented, was the appearance of broad fern leaves, or ostrich-plumes, or flat fir trees with branches bent down. The surface was far from even, rather in sharp-edged plaits or folds. The form of the crystals was oftenest that of low, flattish, three-sided pyramids; when the base was very broad the apex was imperfect, with many irregular rosettes of small and perfect pyramids, the largest with bases equal to two or three inches. All this appeared to advantage only while the ice (one twelfth of an inch thick, perhaps) rested on the black water.

What I write about at home I understand so well, comparatively! and I write with such repose and freedom from exaggeration.

Dec. 22. Surveying the last three days. They have not yielded much that I am aware of. All I find is old bound-marks, and the slowness and dullness of farmers reconfirmed. They even complain that I walk too fast for them. This coarse and hurried outdoor work compels me to live grossly or be inattentive to my diet; that is the worst of it. Like work, like diet; that, I find, is the rule. Left to my chosen pursuits, I should never drink tea nor coffee, nor eat meat. The diet of any class or generation is the natural result of its employment and locality. It is remarkable how unprofitable it is for the most part to talk with farmers. They commonly stand on their good behavior and attempt to moralize or philosophize in a serious conversation. Sportsmen and loafers are better company. For society a man must not be too good or well-disposed, to spoil his natural disposition. The bad are frequently good enough to let you see how bad they are, but the good as frequently endeavor to get between you and themselves.

I have dined out five times and tea'd once within a week. Four times there was tea on the dinner-table, always meat, but once baked beans, always pie, but no puddings. I suspect tea has taken the place of cider with farmers. I am reminded of Haydon the painter's experience when he went about painting the nobility. I go about to the houses of the farmers and squires in like manner. This is my portrait-painting, — when I would fain be employed on higher subjects. I have offered myself much more earnestly as a lecturer than a surveyor. Yet I do not get any employment as a lecturer; was not invited to lecture once last winter, and only once (without pay) this winter. But I can get surveying enough, which a hundred others in this county can do as well as I,

though it is not boasting much to say that a hundred others in New England cannot lecture as well as I on my themes. But they who do not make the highest demand on you shall rue it. It is because they make a low demand on themselves. All the while that they use only your humbler faculties, your higher unemployed faculties, like an invisible cimetar, are cutting them in twain. Woe be to the generation that lets any higher faculty in its midst go unemployed! That is to deny God and know him not, and he, accordingly, will know not of them.

DEC. 27. High wind with more snow in the night. The snow is damp and covers the panes, darkening the room. At first I did not know that more snow had fallen, it was so drifted. Snowy ridges cross the village street and make it look as wild and bleak as a pass of the Rocky Mountains or the Sierra Nevada.

P.M. — To Fair Haven Pond up meadows and river.

The snow blows like spray, fifteen feet high, across the fields, while the wind roars in the trees as in the rigging of a vessel. It is altogether like the ocean in a storm. The wind, eddying through and over the wall, is scooping it out in fantastic forms, — shells and troughs and glyphs of all kinds. Sometimes the drift is pierced with many holes as big as one's fist, where the fine snow-drift is passing through like steam. As it flows over, it builds out eaves to the bank of razor sharpness.

It is surprising what things the snow betrays. I had not seen a meadow mouse all summer, but no sooner does the snow come and spread its mantle over the earth than it is printed with the tracks of countless mice and larger animals. I see where the mouse has dived into a little hole in the snow, not larger than my thumb, by the side of a weed, and a yard further reappeared again, and so on alternately above and beneath. A snug life it lives. The crows come nearer to the houses, alight on trees by the roadside, apparently being put to it for food. I saw them yesterday also.

The wind has now shaken the snow from the trees, and it lies in irregular little heaps on the snow beneath, except that there is a white ridge up and down their trunks on the northwest side, showing which side the storm came from, which, better than the moss, would enable one to find his way in the night. It is a true winter sunset, almost cloudless, clear, cold indigo-y along the horizon. The evening (?) star is seen shining brightly, before the twilight has begun. A rosy tint suffuses the eastern horizon. The outline of the mountains is wonderfully distinct and hard, and they are a dark blue and very near. Wachusett looks like a right whale over our bow, plowing the continent, with his flukes well down. He has a vicious look, as if he had a harpoon in him.

I wish that I could buy at the shops some kind of india-rubber that would rub out at once all that in my writing which it now costs me so many perusals, so many months if not years, and so much reluctance, to erase.

Dec. 29. All day a driving snow-storm, imprisoning most, stopping the cars, blocking up the roads. No school to-day. I cannot see a house fifty rods off from my window through; yet in midst of all I see a bird, probably a tree sparrow, partly blown, partly flying, over the house to alight in a field. The snow penetrates through the smallest crevices under doors and side of windows.

P.M. — Tried my snow-shoes. They sink deeper than I expected, and I throw the snow upon my back. When I returned, twenty minutes after, my great tracks were not to be seen. It is the worst snow-storm to bear that I remember. The strong wind from the north blows the snow almost horizontally, and, beside freezing you, almost takes your breath away. The driving snow blinds you, and where you are protected, you can see but little way, it is so thick. Yet in spite, or on account, of all, I see the first flock of arctic snowbirds (*Emberiza nivalis*) near the depot, white and black, with a sharp, whistle-like note. An hour after I discovered half a pint of snow in each pocket of my greatcoat.

What a contrast between the village street now and last summer! The leafy elms then resounding with the warbling vireo, robins, bluebirds, and the fiery hangbird, etc., to which the villagers, kept indoors by the heat, listen through open lattices. Now it is like a street in Nova Zembla, — if they were to have any there. I waded to the post-office as solitary a traveller as ordinarily in a wood-path in winter. The snow is mid-leg deep, while drifts as high as one's head are heaped against the houses and fences, and here and there range across the street like snowy mountains. There is not a track leading from any door to indicate that the inhabitants have been forth to-day, any more than there is track of any quadruped by the wood-paths. It is all pure untrodden snow, banked up against the houses now at 4 P.M., and no evidence that a villager has been abroad to-day. In one place the drift covers the front-yard fence and stretches thence upward to the top of the front door, shutting all in, and frequently the snow lies banked up three or four feet high against the front doors, and the windows are all snowed up, and there is a drift over each window, and the clapboards are all hoary with it. It is as if the inhabitants were all frozen to death, and now you threaded the desolate streets weeks after that calamity. Yet they are warmer, merrier than ever there within. At the post-office they ask each traveller news of the cars,— “Is there any train up or down?” — or how deep the snow is on a level.

The thoughts and associations of summer and autumn are now as completely departed from our minds as the leaves are blown from the trees. Some withered deciduous ones are left to rustle, and our cold immortal evergreens. Some lichenous thoughts still adhere to us.

Dec. 31. Walden froze completely over last night. It is, however, all snow ice, as it froze while it was snowing hard, and it looks like frozen yeast somewhat. I waded about in the woods through the snow, which certainly averaged considerably more than two feet deep where I went. It stuck to my clothes and melted, and so was more inconvenient than yesterday. Saw probably an otter's track, very broad and deep, as if a log had been drawn along. It was nearly as obvious as a man's track. It was made before last night's snow fell. The creature from time to time went beneath the snow for a few feet, to the leaves. This animal probably I should never see the least trace of, were it not for the snow, the great revealer.

Jan. 1. The drifts mark the standstill or equilibrium between the currents of air or particular winds. In our greatest snow-storms, the wind being northerly, the greatest drifts are on the south sides of the houses and fences and accordingly on the left-hand side of the street going down it. I notice that in the angle made by our house and shed, a southwest exposure, the snow-drift does not lie close about the pump, but is a foot off, forming a circular bowl, showing that there was an eddy about it. It shows where the wind has been, the form of the wind. The snow is like a mould, showing the form of the eddying currents of air which have been impressed on it, while the drift and all the rest is that which fell between the currents or where they counterbalanced each other. These boundary lines are mountain barriers.

The snow is the great betrayer. It not only shows the tracks of mice, otters, etc., etc., which else we should rarely if ever see, but the tree sparrows are more plainly seen against its white ground, and they in turn are attracted by the dark weeds which it reveals. It also drives the crows and other birds out of the woods to the villages for food. If one could detect the meaning of the snow, would he not be on the trail of some higher life that has been abroad in the night? Are there not hunters who seek for something higher than foxes? Is the great snow of use to the hunter only, and not to the saint, or him who is earnestly building up a life? Do the Indian and hunter only need snow-shoes, while the saint sits indoors in embroidered slippers?

The Indians might have imagined a large snow bunting to be the genius of the storm.

This morning it is snowing again fast, and about six inches has already fallen by 10 A.M., of a moist and heavy snow.

I would fain be a fisherman, hunter, farmer, preacher, etc., but fish, hunt, farm, preach other things than usual.

Jan. 2. I noticed yesterday that the damp snow, falling gently without wind on the top of front-yard posts, had quite changed the style of their architecture, — to the dome style of the East, a four-sided base becoming a dome at top. I observe other revelations made by the snow. The team and driver have long since gone by, but I see the marks of his whip-lash on the snow, — its recoil, — but alas! these are not a complete tally of the strokes which fell upon the oxen's back. The unmerciful driver thought perchance that no one saw him, but unwittingly he recorded each blow on the unspotted snow behind his back as in the book of life. To more searching eyes the marks of his lash are in the air.

Jan. 9. P.M. — To Heywood's Pond with Tappan.

T. has a singularly elastic step. He will run through the snow, lifting his knees like a child who enjoys the motion. When he slumped once through to water and called my attention to it, with an indescribable flash of his eye, he reminded me forcibly of Hawthorne's little son Julian. He used the greatest economy in speech of any man

I know. Speaks low, beside, and without emphasis; in monosyllables. I cannot guess what the word was for a long time.

Jan. 10. When we were walking last evening, Tappan admired the soft rippling of the Assabet under Tarbell's bank. One could have lain all night under the oaks there listening to it. Westward forty rods, the surface of the stream reflected a silvery whiteness, but gradually darkened thence eastward, till beneath us it was almost quite black.

What you can recall of a walk on the second day will differ from what you remember on the first day, as the mountain chain differs in appearance, looking back the next day, from the aspect it wore when you were at its base, or generally, as any view changes to one who is journeying amid mountains when he has increased the distance.

With Tappan, his speech is frequently so frugal and reserved, in monosyllables not fairly uttered clear of his thought, that I doubt if he did not cough merely, or let it pass for such, instead of asking what he said or meant, for fear it might turn out that he coughed merely.

I mistook the creaking of a tree in the woods the other day for the scream of a hawk. How numerous the resemblances of the animate to the inanimate!

Jan. 11. The north side of all stubble, weeds, and trees, and the whole forest is covered with a hoar frost a quarter to a half inch deep. It is easily shaken off. The air is still full of mist. No snow has fallen, but, as it were, the vapor has been caught by the trees like a cobweb. The trees are bright hoary forms, the ghosts of trees. In fact, the warm breath of the earth is frozen on its beard. Closely examined or at a distance, it is just like the sheaf-like forms of vegetation and the diverging crystals on the window-panes. Even birds' nests have a white beard.

Birches, especially, are the trees for these hoar frosts and also for glazes. They are so thickly twigged and of such graceful forms and attitudes. I can distinguish a birch now further off than ever. As I stand by its north side (Hubbard's Grove), almost the whole forest is concealed by the hoar frost. It is as if the mist had been caught on an invisible net spread in the air. Yet the white is tinged with the ground color of reddish oak leaves and even green pine-needles. Nature is now gone into her winter palace.

The humblest weed is indescribably beautiful, of purest white and richest form. The hogweed becomes a fairy's wand. The blue-curls, rising from bare gray sand, is perhaps particularly beautiful. Every part of the plant is concealed. Its expression is changed or greatly enriched by this exaggeration or thickening of the mere linear original. It is an exquisitely delicate frost plant, trembling like swan's-down. As if Nature had sprinkled her breast with down this cold season. The character of each tree and weed is rendered with spirit, — the pine plumes and the cedar spires. All this you see going from north to south; but, going the other way (perchance?), you might not be struck with the aspect of the woods.

Jan. 13. I saw yesterday my snow-shoe tracks quite distinct, though made January 2d. Though they pressed the snow down four or five inches, they consolidated it, and it now endures and is two or three inches above the general level there, and more white.

Jan. 14. Cato makes the vineyard of first importance to a farm; second, a well-watered garden; third, a willow plantation (*salictum*); fourth, an olive-yard (*oletum*); fifth, a meadow or grass ground (?) (*pratium*); sixth, a grain-field or tillage (?) (*campus frumentarius*); seventh, a copsewood (?) for fuel (?) (*silva caedua*) (Varro speaks of planting and cultivating this); eighth, an arbustum (Columella says it is a plantation of elms, etc., for vines to rest on) (*arbustum*); ninth, a wood that yields mast (*glandaria silva*). He says elsewhere the arbustum yields *ligna et virgae*.

He says: "In earliest manhood the master of a family must study to plant his ground; as for building he must think a long time about it (*diu cogitare*); he must not think about planting, but do it. When he gets to be thirty-six years old, then let him build, if he has his ground planted. So build, that the villa may not have to seek the farm, nor the farm the villa." This contains sound advice, as pertinent now as ever.

"If you have done one thing late, you will do all your work late," says Cato to the farmer.

Jan. 22. Once or twice of late I have seen the mother-o'-pearl tints and rainbow flocks in the western sky. The usual time is when the air is clear and pretty cool, about an hour before sundown. Yesterday I saw a very permanent specimen, like a long knife-handle of mother-of-pearl, very pale with an interior blue and rosaceous tinges. Methinks the summer sky never exhibits this so finely.

When I was at C.'s the other evening, he punched his cat with the poker because she purred too loud for him.

No second snow-storm in the winter can be so fair and interesting as the first. Last night was very windy, and to-day I see the dry oak leaves collected in thick beds in the little hollows of the snow-crust. These later falls of the leaf.

Jan. 27. I have an old account-book, found in Deacon R. Brown's garret since his death. The first leaf or two is gone. Its cover is brown paper, on which, amid many marks and scribblings, I find written: —

"Mr. Ephraim Jones  
His Wast Book  
Anno Domini  
1742"

It extends from November 8th, 1742, to June 20th, 1743 (inclusive). It appears without doubt from the contents of this book that he is the one of whom Shattuck writes in his history that he "married Mary Hayward, 1728, and died November 29th, 1756, aged 51; having been captain, town-clerk, and otherwise distinguished." His father's name was Ephraim, and he had a son Ephraim. The entries are made apparently by himself, or a boy, or his wife, or some other when he was out. The book is filled with familiar Concord names, the grandfathers and great-grandfathers of the present generation. Dr. Hartshorn — he lived to be ninety-two — and Dr. Temple send to the store once or twice. It is more important now what was bought than who bought it.

The articles most commonly bought were mohair (commonly with buttons) (a kind of twist to sew on buttons with), rum (often only a gill to drink at the store), — more

of these than anything; salt, molasses, shalloon, fish, calico, some sugar, a castor hat, almanac, psalter (and sometimes primer and testament), paper, knee-buckles and shoe-buckles, garters and spurs by the pair, deer skins, a fan, a cart whip, various kinds of cloth and trimmings, — as half-thick, osnaburg, a very little silk, ferret, quality, serge for breeches, etc., etc., — gloves, a spring knife, an ink-horn, a gun, cap, spice, a pocket case, timber, iron, etc., earthenware; no tea (?) (I am in doubt about one or perhaps two entries), nor coffee, nor meal, nor flour. Of the last two they probably raised all they wanted. Credit is frequently given for timber and once for cloth brought to the store.

On the whole, it is remarkable how little provision was sold at the store. The inhabitants raised almost everything for themselves. Chocolate is sold once. Rum, salt, molasses, fish, a biscuit with their drink, a little spice, and the like are all that commonly come under this head that I remember.

On a loose piece of paper is a bill for “todey,” “a bowl of punch,” etc., and on another piece is Jonathan Dwight’s (innholder’s?) bill against the Estate of Capt. Ephraim Jones for entertainment, etc., etc. (apparently he treated his company) at divers times for half a dozen years, amounting to over £146. One entry is “Dea Brown to flip & rum.”

The people apparently made their own cloth and even thread, and hence for the most part bought only buttons and mohair and a few trimmings.

Feb. 1, 1742. “Town of Concord Dr to sundry for the funerel of Widow Williams daughter to 5 pr gloves @ 1/9 1 DP. @ 2/1 ½ 0–10–10½ “ Jan. 10, 1742 (3). “Jona Edes to 3 Raccoon skins @ 2/9 2 minks @ 1/6 4 musquash @ / 3½ 0–12– 5 “ Jan. 18, 1742 (3). “John Melven Cr by 1 Grey fox 0– 2– 3 “ Feb. 14, 1742 (3). “Aaron Parker Cr by 100 squirell skins 0– 6– 3 “ Deer skins were sold at from ten to seventeen shillings. Sometimes it is written “old” or “new tenor.”

Many of the customers came from as far as Harvard, or much farther.

A fan, a jack-knife, or a pair of garters are much more important relatively to the other goods sold than now.

No butter, nor rice, nor oil, nor candles are sold. They must have made their own butter and done without rice. There is no more authentic history of those days than this “Wast Book” contains, and, being money matters, it is more explicit than almost any other statement; something must be said. Each line contains and states explicitly a fact. It is the best of evidence of several facts. It tells distinctly and authoritatively who sold, who bought, the article, amount, and value, and the date. You could not easily crowd more facts into one line. You are warned when the doctor or deacon had a new suit of clothes, by the charge for mohair, buttons, and trimmings, or a castor hat; and here also is entered the rum which ran down their very throats.

Jan. 29. A very cold morning. Thermometer, or mercury, 18° below zero.

The village is the place to which the roads tend, a sort of expansion of the highway, as a lake of a river, the thoroughfare and ordinary of travellers, a trivial or quadrivial place. It is the body of which roads are the arms and legs. It is from the Latin villa,

which, together with *via* (a way), or more anciently *vea* and *vella*, Varro derives from *veho* (to carry), because the villa is the place to and from which things are carried. And whence the Latin *vilis* and our word villain (?). The inhabitants are way-worn by the travel that goes by and over them without travelling themselves.

Jan. 30. This morning, though not so cold by a degree or two as yesterday morning, the cold has got more into the house, and the frost visits nooks never known to be visited before. The sheets are frozen about the sleeper's face; the teamster's beard is white with ice. Last night I felt it stinging cold as I came up the street at 9 o'clock; it bit my ears and face, but the stars shone all the brighter. The windows are all closed up with frost, as if they were ground glass.

The winter, cold and bound out as it is, is thrown to us like a bone to a famishing dog, and we are expected to get the marrow out of it. While the milkmen in the outskirts are milking so many scores of cows before sunrise these winter mornings, it is our task to milk the winter itself. It is true it is like a cow that is dry, and our fingers are numb, and there is none to wake us up. But the winter was not given to us for no purpose. We must thaw its cold with our genialness. If it is a cold and hard season, its fruit, no doubt, is the more concentrated and nutty.

Shall we take refuge in cities in November? Shall the nut fall green from the tree? Let not the year be disappointed of its crop. I knew a crazy man who walked into an empty pulpit one Sunday and, taking up a hymn-book, remarked: "We have had a good fall for getting in corn and potatoes. Let us sing Winter." So I say, "Let us sing winter." What else can we sing, and our voices be in harmony with the season?

Jan. 31. The wind is more southerly, and now the warmth of the sun prevails, and is felt on the back. The snow softens and melts. It is a beautiful clear and mild winter day. Our washwoman says she is proud of it. But I do not melt; there is no thaw in me; I am bound out still.

Feb. 2. Up river on ice to Clematis Brook.

Another warm, melting day, like yesterday. You can see some softening and relenting in the sky.

Already we begin to anticipate spring, and this is an important difference between this time and a month ago. We begin to say that the day is springlike.

Is not January the hardest month to get through? When you have weathered that, you get into the gulf-stream of winter, nearer the shores of spring.

Feb. 9. My ink was frozen last month, and is now pale.

Is not January alone pure winter? December belongs to the fall; is a wintry November: February, to the spring; it is a snowy March.

Feb. 12. Another cold morning. The snow-fleas look like little patches of rust on the ice.

At first, in clear cold weather, we may be walking on dry snow, which we crunch with squeaking sound under our feet. Then comes a thaw, and we slump about in slosh half a foot deep. Then, in a single night, the surface of the earth is all dried and stiffened, and we stagger over the rough, frozen ground and ice on which it is torture to

walk. It becomes quite a study how a man will shoe himself for a winter. For outdoor life in winter, I use three kinds of shoes or boots: first and chiefly, for the ordinary dry snows or bare ground, cowhide boots; secondly, for shallow thaws, half-shoe depth, and spring weather, light boots and india-rubbers; third, for the worst sloshy weather, about a week in the year, india-rubber boots.

P.M. — Skate to Pantry Brook.

I was not aware till I came out how pleasant a day it was. It was very cold this morning, and I have been putting on wood in vain to warm my chamber, and lo! I come forth, and am surprised to find it warm and pleasant. There is very little wind, here under Fair Haven especially. I begin to dream of summer even. I take off my mittens.

To make a perfect winter day like this, you must have a clear, sparkling air, with a sheen from the snow, sufficient cold, little or no wind; and the warmth must come directly from the sun. It must not be a thawing warmth. The tension of nature must not be relaxed.

The sun being low, I see as I skate, reflected from the surface of the ice, flakes of rainbow somewhat like cobwebs, where the great slopes of the crystallization fall at the right angle, six inches or a foot across, but at so small an angle with the horizon that they had seemed absolutely flat and level before. Think of this kind of mosaic and tessellation for your floor! A floor made up of surfaces not absolutely level, — though level to the touch of the feet and to the noonday eye, — composed of crystals variously set, but just enough inclined to reflect the colors of the rainbow when the sun gets low.

In an ordinary snow-storm, when snowing fast, Jan. 1st, '54, I can see E. Wood's house, or about a mile.

Feb. 16. Saw two large hawks circling over the woods by Walden, hunting, — the first I have seen since December 15th. That Indian trail on the hillside about Walden was revealed with remarkable distinctness to me standing on the middle of the pond, by the slight snow which had lodged on it forming a clear white line unobscured by weeds and twigs. (For snow is a great revealer not only of tracks made in itself, but even in the earth before it fell.) It was quite distinct in many places where you would not have noticed it before. A light snow will often reveal a faint foot or cart track in a field which was hardly discernible before, for it reprints it, as it were, in clear white type, alto-relievo.

Feb. 18. The last part of January and all February thus far have been alternate thaw and freeze and snow. It has more thaws, even as the running "r" (root of =°v) occurs twice in it and but once in January. It does not take so much fuel to keep us warm of late. I begin to think that my wood will last. We begin to have days precursors of spring.

I read some of the speeches in Congress about the Nebraska Bill, — a thing the like of which I have not done for a year. What trifling upon a serious subject!

De Quincey says that "the ancients had no experimental knowledge of severe climates." Neither have the English at home as compared with us of New England, nor we, compared with the Esquimaux.

This is a common form of the birch scale, — black, I think, — not white, at any rate.

Feb. 19. For several weeks the fall has seemed far behind, spring comparatively near. Yet I cannot say that there is any positive sign of spring yet; only we feel that we are sloping toward it. The sky has sometimes a warmth in its colors more like summer. A few birds have possibly strayed northward further than they have wintered.

The large moths apparently love the neighborhood of water, and are wont to suspend their cocoons over the edge of the meadow and river, places more or less inaccessible, to men at least. I saw the light ash-colored cocoons of the *A. Promethea*, four or five, with the completely withered and faded leaves wrapped around them, and so artfully and admirably secured to the twigs by fine silk wound round the leaf-stalk and the twig, — which last add nothing to its strength, being deciduous, but aid its deception, — they are taken at a little distance for a few curled and withered leaves left on. Each and all such disguises and other resources remind us that not some poor worm's instinct merely, as we call it, but the mind of the universe rather, which we share, has been intended upon each particular object. All the wit in the world was brought to bear on each case to secure its end. It was long ago, in a full senate of all intellects, determined how cocoons had best be suspended, — kindred mind with mine that admires and approves decided it so.

Feb. 20. We have had but one (and that I think was the first) of those gentle moist snows which lodge perfectly on the trees and make perhaps the most beautiful sight of any. Much more common is what we have now, i.e. —

Feb. 21. A.M. — A fine, driving snow-storm. Have seen no good samples of the blue in snow this winter. At noon clears up.

Feb. 27. Morning. — Rain over; water in great part run off; wind rising; river risen and meadows flooded.

It looks as if Nature had a good deal of work on her hands between now and April, to break up and melt twenty-one inches of ice on the ponds, — beside melting all the snow, — and before planting-time to thaw from one to two and a half or three feet of frozen ground.

March 5. Sunday. Channing, talking with Minott the other day about his health, said, "I suppose you'd like to die now." "No," said Minott, "I've toughed it through the winter, and I want to stay and hear the bluebirds once more."

March 8. I wrote a letter for an Irishman night before last, sending for his wife in Ireland to come to this country. One sentence which he dictated was, "Don't mind the rocking of the vessel, but take care of the children that they be not lost overboard."

Lightning this evening, after a day of successive rains.

March 10. Misty rain, rain, — the third day of more or less rain.

It occurs to me that heavy rains and sudden meltings of the snow, such as we had a fortnight ago (February 26th), before the ground is thawed, so that all the water, instead of being soaked up by the ground, flows rapidly into the streams and ponds, is necessary to swell and break them up. If we waited for the direct influence of the

sun on the ice and the influence of such water as would reach the river under other circumstances, the spring would be very much delayed. In the violent freshet there is a mechanic force added to the chemic. Saw a skunk in the Corner road, which I followed sixty rods or more. Out now about 4 P.M., — partly because it is a dark, foul day. It is a slender black (and white) animal, with its back remarkably arched, standing high behind and carrying its head low; runs, even when undisturbed, with a singular teeter or undulation, like the walking of a Chinese lady. Very slow; I hardly have to run to keep up with it. It has a long tail, which it regularly erects when I come too near and prepares to discharge its liquid. It has a remarkably long, narrow, pointed head and snout, which enable it to make those deep narrow holes in the earth by which it probes for insects. Its eyes have an innocent, childlike, bluish-black expression. It made a singular loud patting sound repeatedly, on the frozen ground under the wall, undoubtedly with its fore feet (I saw only the upper part of the animal), which reminded me of what I have heard about your stopping and stamping in order to stop the skunk. Probably it has to do with its getting its food, — patting the earth to get the insects or worms. Though why it did so then I know not.

March 13. To Boston.

Bought a telescope to-day for eight dollars.

P.M. — To Great Meadows.

Counted over forty robins with my glass in the meadow north of Sleepy Hollow, in the grass and on the snow. A large company of fox-colored sparrows in Heywood's maple swamp close by.

March 30. 6 A.M. — To Island.

First still hour since the afternoon of the 17th. March truly came in like a lamb and went out like a lion this year. Remarkably and continuously pleasant weather from the very first day till the 18th. Apparently an early spring, — buds and birds well advanced, — then suddenly very severe cold and high winds cold enough to skim the river over in broad places at night, and commencing with the greatest and most destructive gale for many a year, felt far and wide; and it has never ceased to blow since till this morning. Vegetation is accordingly put back.

April 1. April has begun like itself. It is warm and showery, while I sail away with a light southwest wind toward the Rock. Sometimes the sun seems just ready to burst out, yet I know it will not. The meadow resounds with the sprayey notes of blackbirds. The birds sing this warm, showery day after a fortnight's cold (yesterday was wet too), with a universal burst and flood of melody. The lines of sawdust from Barrett's mill at different heights on the steep, wet bank under the hemlocks rather enhance the impression of freshness and wildness, as if it were a new country.

April 5. These days, when a soft west or southwest wind blows and it is truly warm, and an outside coat is oppressive, — these bring out the butterflies and the frogs, and the marsh hawks which prey on the last. Just so simple is every year. Whatever year it may be, I am surveying, perhaps, in the woods; I have taken off my outside coat, perhaps for the first time, and hung it on a tree; the zephyr is positively agreeable

on my cheek; I am thinking what an elysian day it is, and how I seem always to be keeping the flocks of Admetus such days — that is my luck; when I hear a single, short, well-known stertorous croak from some pool half filled with dry leaves.

April 8. At Nut Meadow Brook saw, or rather heard, a muskrat plunge into the brook before me, and saw him endeavoring in vain to bury himself in the sandy bottom, looking like an amphibious animal. I stooped and, taking him by his tail, which projected, tossed him ashore. He did not lose the points of compass, but turned directly to the brook again, though it was toward me, and, plunging in, buried himself in the mud, and that was the last I saw of him.

Hazel, the very first male, open.

I find that I can criticise my composition best when I stand at a little distance from it, — when I do not see it, for instance. I make a little chapter of contents which enables me to recall it page by page to my mind, and judge it more impartially when my manuscript is out of the way. The distraction of surveying enables me rapidly to take new points of view. A day or two surveying is equal to a journey.

April 10. April rain. How sure a rain is to bring the tree sparrows into the yard, to sing sweetly, canary-like!

I bought me a spy-glass some weeks since. I buy but few things, and those not till long after I begin to want them, so that when I do get them I am prepared to make a perfect use of them and extract their whole sweet.

April 13. The golden-brown tassels of the alder are very rich now. The poplar (*tremuloides*) by Miles's Swamp has been out — the earliest catkins — maybe two or three days. On the evening of the 5th the body of a man was found in the river between Fair Haven Pond and Lee's, much wasted. How these events disturb our associations and tarnish the landscape! It is a serious injury done to a stream. One or two crowfoots on Lee's Cliff, fully out, surprise me like a flame bursting from the russet ground. The saxifrage is pretty common, ahead of the crowfoot now.

April 15. Morning. — Snow and snowing; four inches deep. Yesterday was very cold. Now, I trust, it will come down and out of the air. Many birds must be hard put to it.

April 17. Snows again.

It is remarkable how the American mind runs to statistics. Consider the number of meteorological observers and other annual phenomena. The Smithsonian Institution is a truly national institution. Every shopkeeper makes a record of the arrival of the first martin or bluebird to his box. Dodd, the broker, told me last spring that he knew when the first bluebird came to his boxes, he made a memorandum of it: John Brown, merchant, tells me this morning that the martins first came to his box on the 13th, he "made a minute of it." Beside so many entries in their day-books and ledgers, they record these things.

April 19. Do I ever see the marsh hawk? Is it not the sharp-shinned which I have mistaken for it? A man came to me yesterday to offer me as a naturalist a two-headed calf which his cow had brought forth, but I felt nothing but disgust at the idea and began to ask myself what enormity I had committed to have such an offer made to me.

I am not interested in mere phenomena, though it were the explosion of a planet, only as it may have lain in the experience of a human being.

April 20. I find some advantage in describing the experience of a day on the day following. At this distance it is more ideal, like the landscape seen with the head inverted, or reflections in water.

April 23. Saw my white-headed eagle again, first at the same place, the outlet of Fair Haven Pond. It was a fine sight, he is mainly — i.e. his wings and body — so black against the sky, and they contrast so strongly with his white head and tail. Lying on the ground with my glass, I could watch him very easily, and by turns he gave me all possible views of himself. When I observed him edgewise I noticed that the tips of his wings curved upward slightly the more, like a stereotyped undulation. He rose very high at last, till I almost lost him in the clouds, circling or rather looping along westward, high over river and wood and farm, effectually concealed in the sky. We who live this plodding life here below never know how many eagles fly over us. They are concealed in the empyrean. I think I have got the worth of my glass now that it has revealed to me the white-headed eagle. Now I see him edgewise like a black ripple in the air, his white head still as ever turned to earth, and now he turns his under side to me, and I behold the full breadth of his broad black wings, somewhat ragged at the edges.

May 6. P.M. — To epigæa via Clamshell Hill.

There is no such thing as pure objective observation. Your observation, to be interesting, i.e. to be significant, must be subjective. The sum of what the writer of whatever class has to report is simply some human experience, whether he be poet or philosopher or man of science. The man of most science is the man most alive, whose life is the greatest event. Senses that take cognizance of outward things merely are of no avail. It matters not where or how far you travel, — the farther commonly the worse, — but how much alive you are. If it is possible to conceive of an event outside to humanity, it is not of the slightest significance, though it were the explosion of a planet. No mere willful activity whatever, whether in writing verses or collecting statistics, will produce true poetry or science. If you are really a sick man, it is indeed to be regretted, for you cannot accomplish so much as if you were well. All that a man has to say or do that can possibly concern mankind, is in some shape or other to tell the story of his love, — to sing; and, if he is fortunate and keeps alive, he will be forever in love. This alone is to be alive to the extremities. It is a pity that this divine creature should ever suffer from cold feet; a still greater pity that the coldness so often reaches to his heart. I look over the report of the doings of a scientific association and am surprised that there is so little life to be reported; I am put off with a parcel of dry technical terms. Anything living is easily and naturally expressed in popular language. I cannot help suspecting that the life of these learned professors has been almost as inhuman and wooden as a rain-gauge or self-registering magnetic machine. They communicate no fact which rises to the temperature of blood-heat. It does n't all amount to one rhyme.

Dandelions, perhaps the first, yesterday. This flower makes a great show, — a sun itself in the grass. How emphatic it is! You cannot but observe it set in the liquid green grass even at a distance. I am surprised that the sight of it does not affect me more, but I look at it as unmoved as if but a day had elapsed since I saw it in the fall.

May 7. Flowers, e.g. willow and hazel catkins, are self-registering indicators of fair weather. I remember how I waited for the hazel catkins to become relaxed and shed their pollen, but they delayed, till at last there came a pleasanter and warmer day and I took off my greatcoat while surveying in the woods, and then, when I went to dinner at noon, hazel catkins in full flower were dangling from the banks by the roadside and yellowed my clothes with their pollen. If man is thankful for the serene and warm day, much more are the flowers.

May 8. P.M. — By boat to Fair Haven.

It is long since I have sailed on so broad a tide. How dead would the globe seem, especially at this season, if it were not for these water surfaces! We are slow to realize water, — the beauty and magic of it. It is interestingly strange to us forever. Immortal water, alive even in the superficies, restlessly heaving now and tossing me and my boat, and sparkling with life! I look round with a thrill on this bright fluctuating surface on which no man can walk, whereon is no trace of footstep, unstained as glass. When I got off this end of the Hollowell place I found myself in quite a sea with a smacking wind directly aft. I felt no little exhilaration, mingled with a slight awe, as I drove before this strong wind over the great black-backed waves I judged to be at least twenty inches or two feet high, cutting through them, and heard their surging and felt them toss me. I was even obliged to head across them and not get into their troughs, for then I could hardly keep my legs. They were crested with a dirty-white foam and were ten or twelve feet from crest to crest. They were so black, — as no sea I have seen, — large and powerful, and made such a roaring around me, that I could not but regard them as gambolling monsters of the deep. They were *melainai* — what is the Greek for waves? This is our black sea. You see a perfectly black mass about two feet high and perhaps four or five feet thick and of indefinite length, round-backed, or perhaps forming a sharp ridge with a dirty-white crest, tumbling like a whale unceasingly before you. Only one of the epithets which the poets have applied to the color of the sea will apply to this water, — *melaina*, *m<sup>o</sup>laina y<sup>a</sup>lassa*. I was delighted to find that our usually peaceful river could toss me so. How much more exciting than to be planting potatoes with those men in the field! What a different world!

May 13. The portion of the peach trees in bloom in our garden shows the height of the snow-drifts in the winter.

May 15. Have just been looking at Nuttall's "North American Sylva." Much research, fine plates and print and paper, and unobjectionable periods, but no turpentine, or balsam, or quercitron, or salicin, or birch wine, or the aroma of the balm-of-Gilead, no gallic, or ulmic, or even malic acid. The plates are greener and higher-colored than the words, etc., etc. It is sapless, if not leafless.

May 16. On Hubbard's meadow, saw a motion in the water as if a pickerel had darted away; approached and saw a middle-sized snapping turtle on the bottom; managed at last, after stripping off my coat and rolling up my shirt-sleeve, by thrusting in my arm to the shoulder, to get him by the tail and lift him aboard. He tried to get under the boat. He snapped at my shoe and got the toe in his mouth. His back was covered with green moss (?), or the like, mostly concealing the scales. In this were small leeches. Great, rough, but not hard, scales on his legs. He made a pretty loud hissing like a cross dog, by his breathing. It was wonderful how suddenly this sluggish creature would snap at anything. As he lay under the seat, I scratched his back, and, filling himself with air and rage, his head would suddenly fly upward, his shell striking the seat, just as a steel trap goes off, and though I was prepared for it, it never failed to startle me, it was so swift and sudden. He slowly inflated himself, and then suddenly went off like a percussion lock snapping the air. Thus undoubtedly he catches fishes, as a toad catches flies. His laminated tail and great triangular points in the rear edge of his shell. Nature does not forget beauty of outline even in a mud turtle's shell.

May 17. 5.30 A.M. — To Island.

I found a large snapping turtle on the bottom. He appeared of a dirty brown there, very nearly the color of the bottom at present. With his great head, as big as an infant's, and his vigilant eyes as he paddled about on the bottom in his attempts to escape, he looked not merely repulsive, but to some extent terrible even as a crocodile. At length, after thrusting my arm in up to the shoulder two or three times, I succeeded in getting him into the boat, where I secured him with a lever under a seat. I could get him from the landing to the house only by turning him over and drawing him by the tail, the hard crests of which afforded a good hold; for he was so heavy that I could not hold him off so far as to prevent his snapping at my legs. He weighed thirty and a half pounds.

Extreme length of shell  $15\frac{1}{2}$  inches Length of shell in middle 15 inches Greatest width of shell (This was toward the rear.)  $12\frac{1}{2}$  inches Tail (beyond shell)  $11\frac{1}{2}$  inches His head and neck it was not easy to measure, but, judging from the proportions of one described by Storer, they must have been 10 inches long at least, which makes the whole length 37 inches. Width of head  $4\frac{1}{2}$  inches; with the skin of the neck, more than 5. He had a very ugly and spiteful face (with a vigilant gray eye, which was never shut in any position of the head), surrounded by the thick and ample folds of the skin about his neck. His shell was comparatively smooth and free from moss, — a dirty black. He was a dirty or speckled white beneath. He made the most remarkable and awkward appearance when walking. The edge of his shell was lifted about eight inches from the ground, tilting now to this side, then to that, his great scaly legs or flippers hanging with flesh and loose skin, — slowly and gravely (?) hissing the while. His walking was perfectly elephantine. Thus he stalked along, — a low conical mountain, — dragging his tail, with his head turned upward with the ugliest and most venomous look, on his flippers, half leg half fin. But he did not proceed far before he sank down to rest. If he could support a world on his back when lying down, he certainly could not stand up

under it. All said that he walked like an elephant. When lying on his back, showing his dirty white and warty under side, with his tail curved round, he reminded you forcibly of pictures of the dragon. He could not easily turn himself back; tried many times in vain, resting betweenwhiles. Would inflate himself and convulsively spring with head and all upward, so as to lift his shell from the ground, and he would strike his head on the ground lift up his shell, and catch at the earth with his claws.

The turtle was very sluggish, though capable of putting forth great strength. He would just squeeze into a flour barrel and would not quite lie flat in it when his head and tail were drawn in. I hear of a man who injured his back seriously for many years by carrying one some distance at arm's length to prevent his biting him. They are frequently seen fighting and their shells heard striking together.

The turtle's snapping impressed me as something mechanical, like a spring, as if there were no volition about it. Its very suddenness seemed too great for a conscious movement. Perhaps in these cold-blooded and sluggish animals there is a near approach to the purely material and mechanical. Their very tenacity of life seems to be owing to their insensibility or small amount of life, — indeed, to be an irritation of the muscles. One man tells me of a turtle's head which, the day after it was cut off, snapped at a dog's tail and made him run off yelping, and I have witnessed something similar myself. I can think of nothing but a merely animated jaw, as it were a piece of mechanism.

Observed a rill emptying in above the stone-heaps, and afterward saw where it ran out of June-berry Meadow, and I considered how surely it would have conducted me to the meadow, if I had traced it up. I was impressed as it were by the intelligence of the brook, which for ages in the wildest regions, before science is born, knows so well the level of the ground and through whatever woods or other obstacles finds its way. Who shall distinguish between the law by which a brook finds its river, the instinct by which a bird performs its migrations, and the knowledge by which a man steers his ship round the globe? The globe is the richer for the variety of its inhabitants.

Saw a large gray squirrel near the split rock in the Assabet. He went skipping up the limb of one tree and down the limb of another, his great gray rudder undulating through the air, and occasionally hid himself behind the main stem. The *Salix nigra* will open to-morrow.

May 23. We soon get through with Nature. She excites an expectation which she cannot satisfy. The merest child which has rambled into a copsewood dreams of a wilderness so wild and strange and inexhaustible as Nature can never show him. I expected a fauna more infinite and various, birds of more dazzling colors and more celestial song. How many springs shall I continue to see the common sucker (*Catostomus Bostoniensis*) floating dead on our river! Will not Nature select her types from a new fount? This earth which is spread out like a map around me is but the lining of my inmost soul exposed. In me is the sucker that I see. No wholly extraneous object can compel me to recognize it. I am guilty of suckers. I go about to look at flowers and listen to the birds. There was a time when the beauty and the music were all within, and I sat and listened to my thoughts, and there was a song in them. I sat for hours

on rocks and wrestled with the melody which possessed me. When you walked with a joy which knew not its own origin. Man should be the harp articulate. When your cords were tense.

May 29. These days it is left to one Mr. Loring to say whether a citizen of Massachusetts is a slave or not. Does any one think that Justice or God awaits Mr. Loring's decision? Such a man's existence in this capacity under these circumstances is as impertinent as the gnat that settles on my paper. We do not ask him to make up his mind, but to make up his pack. Why, the United States Government never performed an act of justice in its life!

It is really the trial of Massachusetts. Every moment that she hesitates to set this man free, she is convicted. The Commissioner on her case is God. Perhaps the most saddening aspect of the matter is the tone of almost all the Boston papers, connected with the fact that they are and have been of course sustained by a majority of their readers. They are feeble indeed, but only as sin compared with righteousness and truth. They are eminently time-serving. I never look at them except at such a time as this. Their life is abject even as that of the marines. Will mankind never learn that policy is not morality, that it never secures any moral right, but always considers merely what is "expedient," — chooses the available candidate, who, when moral right is concerned, is always the devil? Witness the President of the United States. I do not vote at the polls. I wish to record my vote here. The majority of the men of the North, and of the South and East and West, are not men of principle. If they vote, they do not send men to Congress on errands of humanity; but, while their brothers and sisters are being scourged and hung for loving liberty, while (insert here all the inhumanities that pandemonium can conceive of), it is the mismanagement of wood and iron and stone and gold which concerns them. Do what you will, O Government, with my mother and brother, my father and sister, I will obey your command to the letter. It will, indeed, grieve me if you hurt them, if you deliver them to overseers to be hunted by hounds, and to be whipped to death; but, nevertheless, I will peaceably pursue my chosen calling on this fair earth, until, perhaps, one day I shall have persuaded you to relent. Such is the attitude, such are the words of Massachusetts. Rather than thus consent to establish hell upon earth, — to be a party to this establishment, — I would touch a match to blow up earth and hell together. As I love my life, I would side with the Light and let the Dark Earth roll from under me, calling my mother and my brother to follow me.

June 5. 6 P.M. — To Cliffs.

Large yellow butterflies with black spots since the 3d. Carrion-flower, maybe a day. Dangle-berry, probably June 3d at Trillium Woods. Now, just before sundown, a nighthawk is circling, imp-like, with undulating, irregular flight over the sprout-land on the Cliff Hill, with an occasional squeak and showing the spots on his wings. He does not circle away from this place, and I associate him with two gray eggs somewhere on the ground beneath and a mate there sitting. I have come to this hill to see the sun go down, to recover sanity and put myself again in relation with Nature. I would

fain drink a draft of Nature's serenity. I love to sit here and look off into the broad deep vale in which the shades of night are beginning to prevail. When the sun has set, the river becomes more white and distinct in the landscape. The caterpillars are and have been very numerous this year. I see large trees (wild cherry and apple) completely stripped of leaves. Some of the latter, twenty or thirty feet high, are full of blossoms without a single leaf. I return by moonlight.

June 9. The mosquitoes encircle my head and torment me, and I see a great moth go fluttering over the tree-tops and the water, black against the sky, like a bat. A full moon.

While the whole military force of the State, if need be, is at the service of a slaveholder, to enable him to carry back a slave, not a soldier is offered to save a citizen of Massachusetts from being kidnapped. Is this what all these arms, all this "training," has been for these seventy-eight years past? What is wanted is men of principle, who recognize a higher law than the decision of the majority. The marines and the militia whose bodies were used lately were not men of sense nor of principle; in a high moral sense they were not men at all.

June 15. 5.30 A.M. — To Island and Hill.

A young painted tortoise on the surface of the water, as big as a quarter of a dollar, with a reddish or orange sternum. Found a nest of tortoise eggs, apparently buried last night, which I brought home, ten in all, — one lying wholly on the surface, — and buried in the garden.

7 P.M. — To Cliff by railroad.

Cranberry. Methinks the birds sing a little feebler nowadays. The sun has set, or is at least concealed in a low mist.

June 16. Heart-leaf. *Nymphæa odorata*. Again I scent the white water-lily, and a season I had waited for is arrived. How indispensable all these experiences to make up the summer! It is the emblem of purity, and its scent suggests it. Growing in stagnant and muddy water, it bursts up so pure and fair to the eye and so sweet to the scent, as if to show us what purity and sweetness reside in, and can be extracted from, the slime and muck of earth. I think I have plucked the first one that has opened for a mile at least. What confirmation of our hopes is in the fragrance of the water-lily! I shall not so soon despair of the world for it, notwithstanding slavery, and the cowardice and want of principle of the North. It suggests that the time may come when man's deeds will smell as sweet. Such, then, is the odor our planet emits. It reminds me that Nature has been partner to no Missouri compromise. So behave that the odor of your actions may enhance the general sweetness of the atmosphere, that, when I behold or scent a flower, I may not be reminded how inconsistent are your actions with it; for all odor is but one form of advertisement of a moral quality.

The effect of a good government is to make life more valuable, — of a bad government, to make it less valuable. Every man in New England capable of the sentiment of patriotism must have lived the last three weeks with the sense of having suffered a vast, indefinite loss. I had never respected this government, but I had foolishly thought

that I might manage to live here, attending to my private affairs, and forget it. For my part, my old and worthiest pursuits have lost I cannot say how much of their attraction, and I feel that my investment in life here is worth many per cent. less since Massachusetts last deliberately and forcibly restored an innocent man, Anthony Burns, to slavery. I dwelt before in the illusion that my life passed somewhere only between heaven and hell, but now I cannot persuade myself that I do not dwell wholly within hell. The sight of that political organization called Massachusetts is to me morally covered with scorixæ and volcanic cinders, such as Milton imagined. If there is any hell more unprincipled than our rulers and our people, I feel curious to visit it. Life itself being worthless, all things with it, that feed it, are worthless. Suppose you have a small library, with pictures to adorn the walls, — a garden laid out around, — and contemplate scientific and literary pursuits, etc., etc., and discover suddenly that your villa, with all its contents, is located in hell, and that the justice of the peace is one of the devil's angels, has a cloven foot and a forked tail, — do not these things suddenly lose their value in your eyes? Are you not disposed to sell at a great sacrifice?

Autumnal dandelion, some time, in Emerson's meadow pasture. *Potentilla Norvegica*, a day or two, in low ground; very abundant at Baker Ditch with other weeds, on a cleared and ditched swamp. Veiny-leaved hawkweed at Heywood Peak appears shut up at midday, — also the autumnal dandelion.

There is a cool east wind, — and has been afternoons for several days, — which has produced a very thick haze or a fog. I find a tortoise egg on this peak at least sixty feet above the pond. There is a fine ripple and sparkle on the pond, seen through the mist. But what signifies the beauty of nature when men are base? We walk to lakes to see our serenity reflected in them. When we are not serene, we go not to them. Who can be serene in a country where both rulers and ruled are without principle? The remembrance of the baseness of politicians spoils my walks. My thoughts are murder to the State; I endeavor in vain to observe nature; my thoughts involuntarily go plotting against the State. I trust that all just men will conspire.

It is eight days since I plucked the great orchis; one is perfectly fresh still in my pitcher. It may be plucked when the spike is only half opened, and will open completely and keep perfectly fresh in a pitcher more than a week. Do I not live in a garden, — in paradise? I can go out each morning before breakfast — I do — and gather these flowers with which to perfume my chamber where I read and write, all day. The note of the cherry-bird is fine and ringing, but peculiar and very noticeable. With its crest it is a resolute and combative-looking bird.

June 19. Men may talk about measures till all is blue and smells of brimstone, and then go home and sit down and expect their measures to do their duty for them. The only measure is integrity and manhood.

JULY 4. A sultry night the last; bear no covering; all windows open.

8 A.M. — To Framingham.

Great orange-yellow lily, some days, wild yellow lily, drooping, well out. *Asclepias obtusifolia*, also day or two. Some chestnut trees show at distance as if blossoming.

Buckwheat, how long? I probably saw *Asclepias purpurascens* (??) over the walls. A very hot day.

July 10. Monday. Took up one of the small tortoise eggs which I had buried June 15th. The eye was remarkable, developed in the colorless and almost formless head, one or two large dark circles of the full diameter; a very distinct pulsation where the heart should be and along the neck was perceptible; but there seemed to be no body but a mass of yellow yolk.

The following are the birds I chanced to hear in this walk (did not attend much): The seringos on fences, link of bobolink, crow, oven-bird, tanager, chewink, huckleberry-bird (pretty often and loud), flicker cackle, wood thrush, robin (?), before 3 P.M.; then red-eye, veery trill, catbird rigmarole, etc., etc.

The singing birds at present are: —

Villageous: Robin, chip-bird, warbling vireo, swallows.

Rural: Song sparrow, seringos, flicker, kingbird, goldfinch, link of bobolink, cherry-bird.

Sylvan: Red-eye, tanager, wood thrush, chewink, veery, oven-bird, — all even at midday. Catbird full strain, whip-poor-will, crows.

July 14. Friday. Awake to day of gentle rain, — very much needed; none to speak of for nearly a month, methinks. The cooler and stiller day has a valuable effect on my spirits.

It holds up from time to time, and then a fine, misty rain falls. It lies on the fine reddish tops of some grasses, thick and whitish like morning cobwebs. The stillness is very soothing. This is a summer rain. The earth is being bedewed. There is no storm or violence to it. Health is a sound relation to nature.

July 17. 11 A.M. — By river to Fair Haven.

I go to observe the lilies. I see a rail lodged in the weeds with seven tortoises on it, another with ten, another with eleven, all in a row sunning now at midday, hot as it is. They are mostly the painted tortoise. Apparently no weather is too hot for them thus to bask in the sun. The *pontederia* is in its prime, alive with butterflies, yellow and others. I see its tall blue spikes reflected beneath the edge of the pads on each side, pointing down to a heaven beneath as well as above. Earth appears but a thin crust or pellicle.

I am surprised to see crossing my course in middle of Fair Haven Pond great yellowish devil's-needles, flying from shore to shore, from Island to Baker's Farm and back, about a foot above the water, some against a head wind; also yellow butterflies; suggesting that these insects see the distant shore and resolve to visit it. In fact, they move much faster than I can toward it, yet as if they were conscious that they were on a journey, flying for the most part straight forward. It shows more enterprise and a wider range than I had suspected. It looks very bold. If devil's-needles cross Fair Haven, then man may cross the Atlantic.

July 18. We have very few bass trees in Concord, but walk near them at this season and they will be betrayed, though several rods off, by the wonderful susurrus of the

bees, etc., which their flowers attract. It is worth going a long way to hear. I was warned that I was passing one in two instances on the river, — the only two I passed, — by this remarkable sound. At a little distance it is like the sound of a waterfall or of the cars; close at hand like a factory full of looms. They were chiefly humblebees, and the great globose tree was all alive with them. I heard the murmur distinctly fifteen rods off. You will know if you pass within a few rods of a bass tree at this season in any part of the town, by this loud murmur, like a waterfall, which proceeds from it.

July 22. The hottest night, — the last.

It was almost impossible to pursue any work out-of-doors yesterday. There were but few men to be seen out. You were prompted often, if working in the sun, to step into the shade to avoid a sunstroke. At length a shower passing in the west slightly cooled the air. The domestic animals suffer much. Saw a dog which had crawled into a corner and was apparently dying of heat.

July 26. To-day I see in various parts of the town the yellow butterflies in fleets in the road, on bare damp sand (not dung), twenty or more collected within a diameter of five or six inches in many places. They are a greenish golden, sitting still near together, and apparently headed one way if the wind blows. At first, perhaps, you do not notice them, but, as you pass along, you disturb them, and the air is suddenly all alive with them fluttering over the road, and, when you are past, they soon settle down in a new place. How pretty these little greenish-golden spangles! Some are a very pale greenish yellow. I do not know what attracts them thus to sit near together, like a fleet in a haven; why they collect in groups. I see many small red ones elsewhere on the sericocarpus, etc., etc.

JULY 28. Friday. Clethra. Methinks the season culminated about the middle of this month, — that the year was of indefinite promise before, but that, after the first intense heats, we postponed the fulfillment of many of our hopes for this year, and, having as it were attained the ridge of the summer, commenced to descend the long slope toward winter, the afternoon and down-hill of the year. Last evening it was much cooler, and I heard a decided fall sound of crickets.

Partridges begin to go off in packs.

Lark still sings, and robin.

Small sparrows still heard.

Kingbird lively.

Veery and wood thrush (?) not very lately, nor oven-bird.

Red-eye and chewink common.

Night-warbler and evergreen-forest note not lately.

Cherry-bird common.

Turtle dove seen.

July 30. Opened one of the snapping turtle's eggs at Dugan Desert, laid June 7th. There is a little mud turtle squirming in it, apparently perfect in outline, shell and all, but all soft and of one consistency, — a bluish white, with a mass of yellowish yolk (?) attached. Perhaps it will be a month more before it is hatched.

Aug. 2. Wednesday.

Surveyed east part of Lincoln.

5 P.M. — To Conantum on foot.

My attic chamber has compelled me to sit below with the family at evening for a month. I feel the necessity of deepening the stream of my life; I must cultivate privacy. It is very dissipating to be with people too much. As C. says, it takes the edge off a man's thoughts to have been much in society. I cannot spare my moonlight and my mountains for the best of man I am likely to get in exchange.

I am inclined now for a pensive evening walk. Methinks we think of spring mornings and autumn evenings. July has been to me a trivial month. It began hot and continued drying, then rained some toward the middle, bringing anticipations of the fall, and then was hot again about the 20th. It has been a month of haying, heat, low water, and weeds.

As I go up the hill, surrounded by its shadow, while the sun is setting, I am soothed by the delicious stillness of the evening, save that on the hills the wind blows. I was surprised by the sound of my own voice. For the first time for a month, at least, I am reminded that thought is possible. The din of trivialness is silenced. I float over or through the deeps of silence. It is the first silence I have heard for a month. My life had been a River Platte, tinkling over its sands but useless for all great navigation, but now it suddenly became a fathomless ocean. It shelved off to unimagined depths.

The surface of the forest on the east of the river presents a singularly cool and wild appearance, — cool as a pot of green paint, — stretches of green light and shade, reminding me of some lonely mountainside. A few fireflies in the meadows. I am uncertain whether that so large and bright and high was a firefly or a shooting star. Shooting stars are but fireflies of the firmament. The crickets on the causeway make a steady creak, on the dry pasture-tops an interrupted one. I was compelled to stand to write where a soft, faint light from the western sky came in between two willows.

Fields to-day sends me a specimen copy of my "Walden." It is to be published on the 12th.

Aug. 5. I find that we are now in the midst of the meadow-haying season, and almost every meadow or section of a meadow has its band of half a dozen mowers and rakers, either bending to their manly work with regular and graceful motion or resting in the shade, while the boys are turning the grass to the sun. I passed as many as sixty or a hundred men thus at work to-day. They stick up a twig with the leaves on, on the river's brink, as a guide for the mowers, that they may not exceed the owner's bounds. I hear their scythes cronching the coarse weeds by the river's brink as I row near. In one place I see one sturdy mower stretched on the ground amid his oxen in the shade of an oak, trying to sleep; or I see one wending far inland with a jug to some well-known spring.

There is very little air stirring to-day.

Aug. 7. It is inspiring at last to hear the wind whistle and moan about my attic, after so much trivial summer weather, and to feel cool in my thin pants.

Do you not feel the fruit of your spring and summer beginning to ripen, to harden its seed within you? Do not your thoughts begin to acquire consistency as well as flavor and ripeness? How can we expect a harvest of thought who have not had a seed-time of character?

P.M. — To Peter's, Beck Stow's, and Walden.

Still autumnal, breezy with a cool vein in the wind; so that, passing from the cool and breezy into the sunny and warm places, you begin to love the heat of summer. It is the contrast of the cool wind with the warm sun. I walk over the pinweed-field. It is just cool enough in my thin clothes. There is a light on the earth and leaves, as if they were burnished. It is the glistening autumnal side of summer. I feel a cool vein in the breeze, which braces my thought, and I pass with pleasure over sheltered and sunny portions of the sand where the summer's heat is undiminished, and I realize what a friend I am losing. This off side of summer glistens like a burnished shield. Tansy is apparently now in its prime, and the early goldenrods have acquired a brighter yellow. From this off side of the year, this imbricated slope, with alternating burnished surfaces and shady ledges, much more light and heat are reflected (less absorbed), methinks, than from the springward side. In mid-summer we are of the earth, — confounded with it, — and covered with its dust. Now we begin to erect ourselves somewhat and walk upon its surface. I am not so much reminded of former years, as of existence prior to years.

A wasp stung me at one high blueberry bush on the forefinger of my left hand, just above the second joint. It was very venomous; a white spot with the red mark of the sting in the centre, while all the rest of the finger was red, soon showed where I was stung, and the finger soon swelled much below the joint, so that I could not completely close the finger, and the next finger sympathized so much with it that at first there was a little doubt which was stung. These insects are effectively weaponed. But there was not enough venom to prevail further than the finger.

AUG. 9. Wednesday. — To Boston.

“Walden” published. Elder-berries. Waxwork yellowing.

Aug. 12. The wind is autumnal and at length compels me to put on my coat. I bathe at Hubbard's. The water is rather cool, comparatively. As I look down-stream from southwest to northeast, I see the red under sides of the white lily pads about half exposed, turned up by the wind to an angle of 45° or more. These hemispherical red shields are so numerous as to produce a striking effect on the eye, as of an endless array of forces with shields advanced; sometimes four or five rods in width.

On Conantum saw a cow looking steadily up into the sky for a minute. It gave to her face an unusual almost human or wood-god, faun-like expression, and reminded me of some frontispieces to Virgil's *Bucolics*. She was gazing upward steadily at an angle of about 45°. There were only some downy clouds in that direction. It was so unusual a sight that any one would notice it. It suggested adoration.

Aug. 18. A great drought now for several weeks. The haymakers have been remarkably uninterrupted this year by rain. Corn and potatoes are nearly spoiled. Our melons

suffer the more because there was no drought in June and they ran to vine, which now they cannot support. Hence there is little fruit formed, and that small and dying ripe. Almost everywhere, if you dig into the earth, you find it all dusty. Even wild black cherries and choke-cherries are drying before fairly ripe, all shrivelled. Many are digging potatoes half grown. Trees and shrubs recently set out, and many old ones, are dying. A good time to visit swamps and meadows.

Aug. 19. The near meadow is very beautiful now, seen from the railroad through this dog-day haze, which softens to velvet its fresh green of so many various shades, blending them harmoniously, — darker and lighter patches of grass and the very light yellowish-green of the sensitive fern which the mowers have left. It has an indescribable beauty to my eye now, which it could not have in a clear day. The haze has the effect both of a wash or varnish and of a harmonizing tint. It destroys the idea of definite distance which distinctness suggests. It is as if you had painted a meadow of fresh grass springing up after the mower, — here a dark green, there lighter, and there again the yellowish onoclea, — then washed it over with some gum like a map and tinted the paper of a fine misty blue. This is an effect of the dog-days.

Aug. 22. P.M. — To Great Meadows on foot along bank into Bedford meadows; thence to Beck Stow's and Gowing's Swamp.

Walking may be a science, so far as the direction of a walk is concerned. I go again to the Great Meadows, to improve this remarkably dry season and walk where in ordinary times I cannot go. There is, no doubt, a particular season of the year when each place may be visited with most profit and pleasure, and it may be worth the while to consider what that season is in each case.

This was a prairial walk. I went along the river and meadows from the first.

At the lower end of these meadows, between the river and the firm land, are a number of shallow muddy pools or pond-holes, where the yellow lily and pontederia, etc., grow, where apparently the surface of the meadow was floated off some spring and so a permanent pond-hole was formed in which, even in this dry season, there is considerable water left.

In these shallow muddy pools, but a few inches deep and few feet in diameter, I was surprised to observe the undulations produced by pretty large fishes endeavoring to conceal themselves. In one little muddy basin where there was hardly a quart of water, caught half a dozen little breams and pickerel, only an inch long, as perfectly distinct as full grown, and in another place, where there was little else than mud left, breams two or three inches long still alive. In many dry hollows were dozens of small breams, pickerel, and pouts, quite dead and dry. Hundreds, if not thousands, of fishes had here perished on account of the drought.

Saw a blue heron — apparently a young bird, of a brownish blue — fly up from one of these pools, and a stake-driver from another, and also saw their great tracks on the mud, and the feathers they had shed, — some of the long, narrow white neck-feathers of the heron. The tracks of the heron were about six inches long. Here was a rare chance for the herons to transfix the imprisoned fish. It is a wonder that any have

escaped. I was surprised that any dead were left on the mud, but I judge from what the book says that they do not touch dead fish. To these remote shallow and muddy pools, usually surrounded by reeds and sedge, far amid the wet meadows, — to these, then, the blue heron resorts for its food. Here, too, is an abundance of the yellow lily, on whose seeds they are said to feed. There, too, are the paths of muskrats.

I find at length a pitcher-plant with a spoonful of water in it. It must be last night's dew. It is wonderful that in all this drought it has not evaporated.

Aug. 25. I think I never saw the haze so thick as now, at 11 A.M., looking from my attic window. I cannot quite distinguish J. Hosmer's house, only the dark outline of the woods behind it.

Aug. 26. Opened one of my snapping turtle's eggs. The egg was not warm to the touch. The young is now larger and darker-colored, shell and all, more than a hemisphere, and the yolk which maintains it is much reduced. Its shell, very deep, hemispherical, fitting close to the shell of the egg, and, if you had not just opened the egg, you would say it could not contain so much. Its shell is considerably hardened, its feet and claws developed, and also its great head, though held in for want of room. Its eyes are open. It puts out its head, stretches forth its claws, and liberates its tail, though all were enveloped in a gelatinous fluid. With its great head it has already the ugliness of the full-grown, and is already a hieroglyphic of snappishness. It may take a fortnight longer to hatch it.

How much lies quietly buried in the ground that we wot not of! We unconsciously step over the eggs of snapping turtles slowly hatching the summer through. Not only was the surface perfectly dry and trackless there, but blackberry vines had run over the spot where these eggs were buried and weeds had sprung up above. If Iliads are not composed in our day, snapping turtles are hatched and arrive at maturity. It already thrusts forth its tremendous head, — for the first time in this sphere, — and slowly moves from side to side, — opening its small glistening eyes for the first time to the light, — expressive of dull rage, as if it had endured the trials of this world for a century. When I behold this monster thus steadily advancing toward maturity, all nature abetting, I am convinced that there must be an irresistible necessity for mud turtles. With what tenacity Nature sticks to her idea!

Grapes ripe, owing to the hot dry weather.

Passing by M. Miles's, he told me he had a mud turtle in a box in his brook, where it had lain since the last of April, and he had given it nothing to eat. He wished he had known that I caught some in the spring and let them go. He would have bought them of me. He is very fond of them. He bought one of the two which Ed. Garfield caught on Fair Haven in the spring; paid him seventy-five cents for it. Garfield was out in his boat and saw two fighting on the pond. Approached carefully and succeeded in catching both and getting them into the boat. He got them both home by first carrying one along a piece, then putting him down and, while he was crawling off, going back for the other. One weighed forty-three or forty-four pounds and the other forty-seven. Miles gave me the shell of the one he bought, which weighed forty-three or forty-four.

It is fifteen and six eighths inches long by fourteen and a half broad, of a roundish form, broadest backward. The upper shell is more than four and a half inches deep and would make a good dish to bail out a boat with. He said he had no trouble in killing them. It was of no great use to cut off their heads. He thrust his knife through the soft thin place in their sternum and killed them at once. Told of one Artemas (?) Wheeler of Sudbury who used to keep fifteen or twenty in a box in a pond-hole, and fat them and eat them from time to time, having a great appetite for them. Some years ago, in a January thaw, many came out on the Sudbury meadows, and, a cold snap suddenly succeeding, a great many were killed. One man counted eighty or more dead, some of which would weigh eighty to a hundred pounds. Miles himself found two shells on his river meadow of very large ones. Since then they have been scarce. It increases my respect for our river to see these great products of it. No wonder the Indians made much of them. Such great shells must have made convenient household utensils for them.

Even the hinder part of a mud turtle's shell is scalloped, one would say rather for beauty than use.

Hear by telegraph that it rains in Portland and New York.

In the evening, some lightning in the horizon, and soon after a little gentle rain, which —

(Aug. 27) I find next day has moistened the ground about an inch down only. But now it is about as dry as ever.

Many red oak acorns have fallen. The great green acorns in broad, shallow cups. How attractive these forms! No wonder they are imitated on pumps, fence and bed posts. Is not this a reason that the pigeons are about? The yellow birch is yellowed a good deal, the leaves spotted with green. The dogbane a clear yellow. On the Walden road some maples are yellow and some chestnuts brownish-yellow and also sere. From Heywood's Peak I am surprised to see the top of Pine Hill wearing its October aspect, — yellow with changed maples and here and there faintly blushing with changed red maples. This is the effect of the drought. Among other effects of the drought I forgot to mention the fine dust, which enters the house and settles everywhere and also adds to the thickness of the atmosphere. Fences and roadside plants are thickly coated with it.

When I awake in the morning, I remember what I have seen and heard of snapping turtles, and am in doubt whether it was dream or reality. I slowly raise my head and peeping over the bedside see my great mud turtle shell lying bottom up under the table, showing its prominent ribs, and realize into what world I have awaked. Before I was in doubt how much prominence my good Genius would give to that fact. That the first object you see on awakening should be an empty mud turtle's shell!! Will it not make me of the earth earthy? Or does it not indicate that I am of the earth earthy? What life, what character, this has shielded, which is now at liberty to be turned bottom upward! I can put specimens of all our other turtles into this cavity. This too was once an infant in its egg. When I see this, then I am sure that I am not dreaming, but am

awake to this world. I do not know any more terrene fact. It still carries the earth on its back. Its life is between the animal and vegetable; like a seed it is planted deep in the ground and is all summer germinating. Does it not possess as much the life of the vegetable as the animal?

Would it not be well to describe some of those rough all-day walks across lots? — as that of the 15th, picking our way over quaking meadows and swamps and occasionally slipping into the muddy batter midleg deep; jumping or fording ditches and brooks; forcing our way through dense blueberry swamps, where there is water beneath and bushes above; then brushing through extensive birch forests all covered with green lice, which cover our clothes and face; then, relieved, under larger wood, more open beneath, steering for some more conspicuous trunk; now along a rocky hillside where the sweet-fern grows for a mile, then over a recent cutting, finding our uncertain footing on the cracking tops and trimmings of trees left by the choppers; now taking a step or two of smooth walking across a highway; now through a dense pine wood, descending into a rank, dry swamp, where the cinnamon fern rises above your head, with isles of poison-dogwood; now up a scraggy hill covered with shrub oak, stooping and winding one's way for half a mile, tearing one's clothes in many places and putting out one's eyes, and find at last that it has no bare brow, but another slope of the same character; now through a corn-field diagonally with the rows; now coming upon the hidden melon-patch; seeing the back side of familiar hills and not knowing them, — the nearest house to home, which you do not know, seeming further off than the farthest which you do know; — in the spring defiled with the froth on various bushes, etc., etc., etc.; now reaching on higher land some open pigeon-place, a breathing-place for us.

Aug. 28. The meadow is drier than ever, and new pools are dried up. The breams, from one to two and a half inches long, lying on the sides and quirking from time to time, a dozen together where there is but a pint of water on the mud, are a handsome but sad sight, — pretty green jewels, dying in the sun. I saved a dozen or more by putting them in deeper pools. Saw a whole school of little pouts, hundreds of them one and a half inches long, many dead, all apparently fated to die, and some full-grown fishes. The muddy bottom of these pools dried up is cracked into a sort of regular crystals. In the soft mud, the tracks of the great bittern and the blue heron. Scared up one of the former and saw a small dipper on the river.

In my experience, at least of late years, all that depresses a man's spirits is the sense of remissness, — duties neglected, unfaithfulness, — or shamming, impurity, falsehood, selfishness, inhumanity, and the like.

Aug. 29. Early for several mornings I have heard the sound of a flail. It leads me to ask if I have spent as industrious a spring and summer as the farmer, and gathered as rich a crop of experience. If so, the sound of my flail will be heard by those who have ears to hear, separating the kernel from the chaff all the fall and winter, and a sound no less cheering it will be. If the drought has destroyed the corn, let not all harvests fail. Have you commenced to thresh your grain? The lecturer must commence his threshing as early as August, that his fine flour may be ready for his winter customers.

Aug. 30. The clearness of the air which began with the cool morning of the 28th makes it delicious to gaze in any direction. Though there has been no rain, the valleys are emptied of haze, and I see with new pleasure to distant hillsides and farmhouses and a river-reach shining in the sun, and to the mountains in the horizon. Coolness and clarity go together. Was not that a meadow-hen which I scared up in two places by the riverside, — of a dark brown like a small woodcock, though it flew straight and low? I go along the flat Hosmer shore to Clamshell Hill. The sparganium seed balls begin to brown and come off in the hand. Are they not young hen-hawks which I have seen sailing for a week past, without red tails?

Sept. 2. The second still, misty, mizzling and rainy day. We all lie abed late. Now many more sparrows in the yard, larger than chip-birds and showing ashy under sides as they fly.

P.M. — By boat to Purple Utricularia Shore.

To my great surprise I find this morning (September 3d) that the little unhatched turtle, which I thought was sickly and dying, and left out on the grass in the rain yesterday morn, thinking it would be quite dead in a few minutes — I find the shell alone and the turtle a foot or two off vigorously crawling, with neck outstretched (holding up its head and looking round like an old one) and feet surmounting every obstacle. It climbs up the nearly perpendicular side of a basket with the yolk attached. They thus not only continue to live after they are dead, but begin to live before they are alive!

[Noted on the inside back cover:] My faults are: —

Paradoxes, — saying just the opposite, — a style which may be imitated.

Ingenious.

Playing with words, — getting the laugh, — not always simple, strong, and broad.

Using current phrases and maxims, when I should speak for myself.

Not always earnest.

“In short,” “in fact,” “alas!” etc.

Want of conciseness.

Walden published, Wednesday, Aug. 9th, ‘54.

Sent Fields 12 copies of the Week, Oct. 18th, ‘54.

No more this winter.

I think the early large hawk was it.

[On May 24, the fugitive slave Anthony Burns was arrested in Boston; under the Fugitive Slave Law of 1850 he had to be returned to his master in Virginia. This law made the north more obviously complicit in the slave system, and the Burns case radicalized many northerners into abolitionists. Edward G. Loring was the judge in the case. Cf. July 4, below.]

[There, at an antislavery rally where William Lloyd Garrison burned a copy of the Constitution, Thoreau gave his passionate lecture “Slavery in Massachusetts.”]

Were they not cast down?

Sept. 3. Woodbine berries purple. Even at this season I see some fleets of yellow butterflies in the damp road after the rain, as earlier. Close to the left-hand side of bridle-road, about a hundred rods south of the oak, a bayberry bush without fruit, probably a male one. It made me realize that this was only a more distant and elevated sea-beach and that we were within reach of marine influences. My thoughts suffered a sea-turn.

Sept. 4. Monday. I have provided my little snapping turtle with a tub of water and mud, and it is surprising how fast he learns to use his limbs and this world. He actually runs, with the yolk still trailing from him, as if he had got new vigor from contact with the mud. The insensibility and toughness of his infancy make our life, with its disease and low spirits, ridiculous. He impresses me as the rudiment of a man worthy to inhabit the earth. He is born with a shell. That is symbolical of his toughness. His shell being so rounded and sharp on the back at this age, he can turn over without trouble.

Sept. 6. My little turtle, taken out of the shell September 2d, has a shell one and seven fortieths inches long, or four fortieths longer than the diameter of the egg-shell, to say nothing of head and tail. Warm weather again, and sultry nights the last two. The last a splendid moonlight and quite warm.

Sept. 8. I have brought home a half-bushel of grapes to scent my chamber with. It is impossible to get them home in a basket with all their rich bloom on them, which, no less than the form of the clusters, makes their beauty. As I paddled home with my basket of grapes in the bow, every now and then their perfume was wafted to me in the stern, and I thought that I was passing a richly laden vine on shore. Some goldfinches twitter over, while I am pulling down the vines from the birchtops.

Sept. 9. This morning I find a little hole, three quarters of an inch or an inch over, above my small tortoise eggs, and find a young tortoise coming out (apparently in the rainy night) just beneath. It is the *Sternotherus odoratus* — already has the strong scent — and now has drawn in its head and legs. I see no traces of the yolk, or what-not, attached. It may have been out of the egg some days. Only one as yet. I buried them in the garden June 15th.

I am affected by the thought that the earth nurses these eggs. They are planted in the earth, and the earth takes care of them; she is genial to them and does not kill them. It suggests a certain vitality and intelligence in the earth, which I had not realized. This mother is not merely inanimate and inorganic. Though the immediate mother turtle abandons her offspring, the earth and sun are kind to them. The old turtle on which the earth rests takes care of them while the other waddles off. Earth was not made poisonous and deadly to them. The earth has some virtue in it; when seeds are put into it, they germinate; when turtles' eggs, they hatch in due time. Though the mother turtle remained and brooded them, it would still nevertheless be the universal world turtle which, through her, cared for them as now. Thus the earth is the mother of all creatures.

Sept. 10. Yesterday and to-day the first regular rain-storm, bringing down more leaves, — elms, button woods, and apple tree, — and decidedly raising the river and

brooks. Already the grass both in meadows and on hills looks greener, and the whole landscape, this overcast rainy day, darker and more verdurous. Hills which have been russet and tawny begin to show some greenness.

On account of the drought one crop has almost entirely failed this year thus far, which the papers have not spoken of. Last year, for the last three weeks of August, the woods were filled with the strong musty scent of decaying fungi, but this year I have seen very few fungi and have not noticed that odor at all, — a failure more perceptible to frogs and toads, but no doubt serious to those whom it concerns.

As for birds: —

About ten days ago especially I saw many large hawks, probably hen-hawks and young, about.

Within a week several of the small slate-colored and black-tipped hawks.

August 20th, saw a sucker which I suppose must have been caught by a fish hawk.

Hear screech owls and hooting owls these evenings.

Have not noticed blue jays of late.

Bats common.

[Etc. — 40 more.]

Sept. 11. Measured to-day the little *Sternotherus odoratus* which came out the ground in the garden September 9th. Its shell is thirty-two fortieths of an inch long, by twenty-five fortieths wide. It has a distinct dorsal ridge, and its head and flippers are remarkably developed. Its raised back and dorsal ridge, as in the case of the mud turtle, enable it to turn over very easily. It may have been hatched some time before it came out, for not only there was no trace of the yolk (?), but its shell was much wider than the egg, when it first came out of the ground. I put it into the tub on the edge of the mud. It seems that it does not have to learn to walk, but walks at once. It seems to have no infancy such as birds have. It is surprising how much cunning it already exhibits. It is defended both by its form and color and its instincts. As it lay on the mud, its color made it very inobvious, but, besides, it kept its head and legs drawn in and perfectly still, as if feigning death; but this was not sluggishness. At a little distance I watched it for ten minutes or more. At length it put its head out far enough to see if the coast was clear, then, with its flippers, it turned itself toward the water (which element it had never seen before), and suddenly and with rapidity launched itself into it and dove to the bottom. Its whole behavior was calculated to enable it to reach its proper element safely and without attracting attention. Not only was it made of a color and form (like a bit of coal) which alone almost effectually concealed it, but it was made, infant as it was, to be perfectly still as if inanimate and then to move with rapidity when unobserved. The oldest turtle does not show more, if so much, cunning. I think I may truly say that it uses cunning and meditates how it may reach the water in safety. When I first took it out of its hole on the morning of the 9th, it shrunk into its shell and was motionless, feigning death. That this was

not sluggishness, I have proved. When to-day it lay within half an inch of the water's edge, it knew it for a friendly element and, without deliberation or experiment, but at last, when it thought me and all foes unobservant of its motions, with remarkable precipitation it committed itself to it as if realizing a long-cherished idea. Plainly all its motions were as much the result of what is called instinct as is the act of sucking in infants. Our own subtlest is likewise but another kind of instinct. The wise man is a wise infant obeying his finest and never-failing instincts. It does not so much impress me as an infantile beginning of life as an epitome of all the past of turtledom and of the earth. I think of it as the result of all the turtles that have been.

The little snapping turtle lies almost constantly on the mud with its snout out of water. It does not keep under water long. Yesterday in the cold rain, however, it lay buried in the mud all day!

This is a cold evening with a white twilight, and threatens frost, the first in these respects decidedly autumnal evening. It makes us think of wood for the winter. For a week or so the evenings have been sensibly longer, and I am beginning to throw off my summer idleness. This twilight is succeeded by a brighter starlight than heretofore.

Sept. 14. 8 A.M. — To opposite Pelham's Pond by boat.

Quite cool, with some wind from east and southeast. Took a watermelon for drink. Now, instead of haying, they are raking cranberries all along the river. The raker moves slowly along with a basket before him, into which he rakes (hauling) the berries, and his wagon stands one side. It is now the middle of the cranberry season.

We see half a dozen herons in this voyage. Their wings are so long in proportion to their bodies that there seems to be more than one undulation to a wing as they are disappearing in the distance, and so you can distinguish them. You see another begin before the first has ended. It is remarkable how common these birds are about our sluggish and marshy river. We must attract them from a wide section of country. It abounds in those fenny districts and meadow pond-holes in which they delight. A flock of thirteen telltales, great yellow-legs, start up with their shrill whistle from the midst of the great Sudbury meadow, and away they sail in a flock, — a sailing (or skimming) flock, that is something rare methinks, — showing their white tails, to alight in a more distant place. The great bittern, too, rises from time to time, slowly flapping his way along at no great height above the meadow.

Sept. 16. Sophia and mother returned from Wachusett. S. saw much bayberry in Princeton.

Another little sternothærus has come out of the ground since eight this morning (it is now 11 A.M.). The first sternothærus has remained buried in the mud in the tub from the first, and the snapping turtle also for the last few days.

Sept. 19. Thinking this afternoon of the prospect of my writing lectures and going abroad to read them the next winter, I realized how incomparably great the advantages of obscurity and poverty which I have enjoyed so long (and may still perhaps enjoy). I thought with what more than princely, with what poetical, leisure I had spent my years hitherto, without care or engagement, fancy-free. I have given myself up to nature; I

have lived so many springs and summers and autumns and winters as if I had nothing else to do but live them, and imbibe whatever nutriment they had for me; I have spent a couple of years, for instance, with the flowers chiefly, having none other so binding engagement as to observe when they opened; I could have afforded to spend a whole fall observing the changing tints of the foliage. Ah, how I have thriven on solitude and poverty! I cannot overstate this advantage. I do not see how I could have enjoyed it, if the public had been expecting as much of me as there is danger now that they will. If I go abroad lecturing, how shall I ever recover the lost winter?

It has been my vacation, my season of growth and expansion, a prolonged youth.

An upland plover goes off from Conantum top (though with a white belly), uttering a sharp white, tu white.

That drought was so severe that a few trees here and there — birch, maple, chestnut, apple, oak — have lost nearly all their leaves.

Sept. 21. Thursday. P.M. — To Flint's Pond.

The first frost in our yard last night, the grass white and stiff in the morning. The muskmelon vines are now blackened in the sun. There have been some frosts in low grounds about a week. The forenoon is cold, and I have a fire, but it is a fine clear day, as I find when I come forth to walk in the afternoon, a fine grained air with a seething or shimmering in it, as I look over the fields, — days which remind me of the Indian summer that is to come. Do not these days always succeed the first frosty mornings?

I sometimes seem to myself to owe all my little success, all for which men commend me, to my vices. I am perhaps more willful than others and make enormous sacrifices, even of others' happiness, it may be, to gain my ends. It would seem even as if nothing good could be accomplished without some vice to aid in it.

Sept. 24. Sunday. 6 A.M. — To Hill.

Low fog-like veil on meadows.

Man identifies himself with earth or the material, just as he who has the least tinge of African blood in his veins regards himself as a negro and is identified with that race. Spirit is strange to him; he is afraid of ghosts.

What name of a natural object is most poetic? That which he has given for convenience whose life is most nearly related to it, who has known it longest and best.

Sept. 26. Took my last bath the 24th. Probably shall not bathe again this year. It was chilling cold. It is a warm and very pleasant afternoon, and I walk along the riverside in Merrick's pasture.

Sept. 30. The clear bright-scarlet leaves of the smooth sumach in many places are curled and drooping, hanging straight down, so as to make a funereal impression, reminding me of a red sash and a soldier's funeral. They impress me quite as black crape similarly arranged, the bloody plants.

The conventional acorn of art is of course of no particular species, but the artist might find it worth his while to study Nature's varieties again.

Oct. 7. Went to Plymouth to lecture and survey Watson's grounds. Returned the 15th.

Nov. 11. Minott heard geese go over night before last, about 8 P.M. Therien, too, heard them "yelling like anything" over Walden, where he is cutting, the same evening. He cut down a tree with a flying squirrel on it; often sees them. Receive this evening a letter in French and three "ouvrages" from the Abbé Rougette in Louisiana.

Nov. 20. To Philadelphia. 7 A.M., to Boston; 9 A.M., Boston to New York, by express train, land route.

See the reddish soil (red sandstone?) all through Connecticut. Pleasantest part of the whole route between Springfield and Hartford, along the river; perhaps include the hilly region this side of Springfield. Reached Canal Street at 5 P.M., or candle-light.

Started for Philadelphia from foot of Liberty Street at 6 P.M. Saw only the glossy panelling of the cars reflected out into the dark, like the magnificent lit façade of a row of edifices reaching all the way to Philadelphia, except when we stopped and a lantern or two showed us a ragged boy and the dark buildings of some New Jersey town. Arrive at 10 P.M.; time, four hours from New York, thirteen from Boston, fifteen from Concord. Put up at Jones's Exchange Hotel, 77 Dock Street; lodgings thirty-seven and a half cents per night, meals separate.

Nov. 21. Looked from the cupola of the State-House, where the Declaration of Independence was declared. The best view of the city I got. Was interested in the squirrels, gray and black, in Independence and Washington Squares. Heard that they have, or have had, deer in Logan Square. The squirrels are fed, and live in boxes in the trees in the winter.

In the narrow market-houses in the middle of the streets, was struck by the neat-looking women marketers with full cheeks. There was a mosquito about my head at night.

Nov. 22. Left at 7.30 A.M. for New York. Went to Crystal Palace; admired the houses on Fifth Avenue, the specimens of coal at the Palace, one fifty feet thick as it was cut from the mine, in the form of a square column, iron and copper ore, etc. Saw sculptures and paintings innumerable, and armor from the Tower of London, some of the Eighth Century. Saw Greeley; Snow, the commercial editor of the Tribune; Solon Robinson; Fry, the musical critic, etc.; and others. Greeley carried me to the new opera-house, where I heard Grisi and her troupe. First, at Barnum's Museum, I saw the camelopards, said to be one eighteen the other sixteen feet high. I should say the highest stood about fifteen feet high at most (twelve or thirteen ordinarily). The body was only about five feet long. Why has it horns, but for ornament? Looked through his diorama, and found the houses all over the world much alike. Greeley appeared to know and be known by everybody; was admitted free to the opera, and we were led by a page to various parts of the house at different times.

Dec. 6. To Providence to lecture.

I see thick ice and boys skating all the way to Providence, but know not when it froze, I have been so busy writing my lecture; probably the night of the 4th.

Was struck with the Providence depot, its towers and great length of brick. Lectured in it.

After lecturing twice this winter I feel that I am in danger of cheapening myself by trying to become a successful lecturer, i.e., to interest my audiences. I am disappointed to find that most that I am and value myself for is lost, or worse than lost, on my audience. I fail to get even the attention of the mass. I should suit them better if I suited myself less. I feel that the public demand an average man, — average thoughts and manners, — not originality, nor even absolute excellence. You cannot interest them except as you are like them and sympathize with them. I would rather that my audience come to me than that I should go to them, and so they be sifted; i.e., I would rather write books than lectures. That is fine, this coarse. To read to a promiscuous audience who are at your mercy the fine thoughts you solaced yourself with far away is as violent as to fatten geese by cramming, and in this case they do not get fatter.

Dec. 8. Winter has come unnoticed by me, I have been so busy writing. This is the life most lead in respect to Nature. How different from my habitual one! It is hasty, coarse, and trivial, as if you were a spindle in a factory. The other is leisurely, fine, and glorious, like a flower. In the first case you are merely getting your living; in the second you live as you go along. You travel only on roads of the proper grade without jar or running off the track, and sweep round the hills by beautiful curves.

Dec. 20. 7 A.M. — To Hill.

Said to be the coldest morning as yet. The river appears to be frozen everywhere. Where was water last night is a firm bridge of ice this morning. The snow which has blown on to the ice has taken the form of regular star-shaped crystals, an inch in diameter. Sometimes these are arranged in a spear three feet long quite straight. The woodchoppers are making haste to their work far off, walking fast to keep warm, before the sun has risen, their ears and hands well covered, the dry, cold snow squeaking under their feet. They will be warmer after they have been at work an hour.

P.M. — Skated to Fair Haven with C.

C.'s skates are not the best, and beside he is far from an easy skater, so that, as he said, it was killing work for him. Time and again the perspiration actually dropped from his forehead on to the ice, and it froze in long icicles on his beard. Yet he kept up his spirits and his fun, said he had seen much more suffering than I, etc., etc.

It has been a glorious winter day, its elements so simple, — the sharp clear air, the white snow everywhere covering the earth, and the polished ice. Cold as it is, the sun seems warmer on my back even than in summer, as if its rays met with less obstruction. And then the air is so beautifully still; there is not an insect in the air, and hardly a leaf to rustle. I am surprised to find how fast the dog can run in a straight line on the ice. I am not sure that I can beat him on skates, but I can turn much shorter. It is very fine skating for the most part.

Dec. 21. What a grovelling appetite for profitless jest and amusement our countrymen have! Next to a good dinner, at least, they love a good joke, — to have their sides tickled, to laugh sociably, as in the East they bathe and are shampooed. Curators of lyceums write to me: —

DEAR SIR, — I hear that you have a lecture of some humor. Will you do us the favor to read it before the Bungtown Institute?

Dec. 26. At Ricketson's [in New Bedford on the coast].

I do not remember to have ever seen such a day as this in Concord. There is no snow here (though there has been excellent sleighing at Concord since the 5th), but it is very muddy, the frost coming out of the ground as in spring with us. I went to walk in the woods with R. It was wonderfully warm and pleasant, and the cockerels crowed just as in a spring day at home. I felt the winter breaking up in me, and if I had been at home I should have tried to write poetry. They told me that this was not a rare day there, that they had little or no winter such as we have, and it was owing to the influence of the Gulf Stream, which was only sixty miles from Nantucket at the nearest, or one hundred and twenty miles from them. In midwinter, when the wind was southeast or even southwest, they frequently had days as warm and debilitating as in summer. There is a difference of about a degree in latitude between Concord and New Bedford, but far more in climate.

The American holly is quite common there, with its red berries still holding on, and is now their Christmas evergreen. I heard the larks sing strong and sweet, and saw robins. There is a Quaker meeting-house there. Such an ugly shed, without a tree or bush about it, which they call their meeting-house (without steeple, of course) is altogether repulsive to me, like a powder-house or grave. And even the quietness and perhaps unworldliness of an aged Quaker has something ghostly and saddening about it, as it were a mere preparation for the grave.

Dec. 28. Visited the museum at the Athenæum. Various South Sea implements, etc., etc., brought home by whalers.

The last Indian, not of pure blood, died this very month, and I saw his picture with a basket of huckleberries in his hand.

## 1855

Jan. 4. To Worcester to lecture.

Visited the Antiquarian Library of twenty-two or twenty-three thousand volumes. It is richer in pamphlets and newspapers than Harvard. One alcove contains Cotton Mather's library, chiefly theological works, reading which exclusively you might live in his days and believe in witchcraft. Old leather-bound tomes, many of them as black externally as if they had been charred with fire. Time and fire have the same effect. Haven said that the Rev. Mr. Somebody had spent almost every day the past year in that alcove.

Saw after my lecture a young negro who introduced himself as a native of Africa, Leo L. Lloyd, who lectures on "Young Africa"! I never heard of anything but old Africa before.

Jan. 5. At Quinsigamond Village, a Mr. Washburn showed me the wire rolling and drawing mill in which he is concerned. All sorts of scrap iron is first heated to a welding heat in masses of about two hundredweight, then rolled between vast iron rollers in successive grooves till it is reduced to long rods little more than an inch in diameter. These are cut up by powerful shears into lengths of about three feet, heated again, and rolled between other rollers in grooves successively of various forms, — square, oval, round, diamond, etc., which part of the work only one man in the concern fully understood and kept secret. It was here rolled and reduced to a large-sized wire maybe three eighths of an inch in diameter, of which screws are made. At this stage, first, it begins to be drawn, though it must be heated again in the course of the drawing to restore its ductility. Make a great deal of telegraph-wire, and for pail-bails, etc. About twenty miles of telegraph-wire in a day, of the best Swedish iron for strength. Cannot make so good iron in this country, because we cannot afford to work it over so much, labor being higher. I saw a part of the glowing mass which had been heated to a welding heat, ready to be rolled, but had dropped on its way. I could still trace the outlines of the various scraps which composed it, — screws, bolts, bar iron, an old axe curiously twisted, etc., etc., — all which by mere pressure would have been rolled into a homogeneous mass. It was now in the condition of many a piece of composition, which, however, mere compression would weld together into a homogeneous mass or a continuous rod. Washburn said the workmen were like sailors; their work was exciting and they drank more spirit than other laborers. In hot weather would sometimes drink two quarts of water an hour and sweat as much. If they could not sweat, left off work. Showed me a peculiar coarse yellow sand which they imported from the shore of Long Island, whose quartz, examined by a microscope, was seen to be perfect crystals. This they used on the floor of their furnace to repair and level it when their iron bars had furrowed it. In the cavernous furnace I saw the roof dripping with dark stalactites from the mortar and bricks.

Higginson showed me a new translation of the Vishnu Sarma. Spoke of the autobiography of a felon older than Stephen Burroughs, one Fitch of Revolutionary days.

R.W.E. told of Mr. Hill, his classmate, of Bangor, who was much interested in my "Walden," but relished it merely as a capital satire and joke, and even thought that the survey and map of the pond were not real, but a caricature of the Coast Surveys. Also of Mr. Frost, the botanist, of Brattleboro, who has found five or six new species of lichens thereabouts.

Jan. 7. Sunday. Cloudy and misty. On opening the door I feel a very warm south-westerly wind, contrasting with the cooler air of the house, and find it unexpectedly wet in the street, and the manure is being washed off the ice into the gutter. It is, in fact, a January thaw. The channel of the river is quite open in many places, and in others I remark that the ice and water alternate like waves and the hollow between them. I hear the pleasant sound of running water.

The delicious soft, spring-suggesting air, — how it fills my veins with life! Life becomes again credible to me. A certain dormant life awakes in me, and I begin to

love nature again. Here is my Italy, my heaven, my New England. I understand why the Indians hereabouts placed heaven in the southwest, — the soft south.

The bank is tinged with a most delicate pink or bright flesh-color — where the *Bæomyces roseus* grows. It is a lichen day. How full of life and of eyes is the damp bark! It would not be worth the while to die and leave all this life behind one.

Jan. 9. P.M. — To Conantum.

A cloudy day, threatening snow; wet under foot. How pretty the evergreen radical shoots of the St. John's-wort now exposed, partly red or lake, various species of it. Have they not grown since fall? I put a stone at the end of one to try it. A little wreath of green and red lying along on the muddy ground amid the melting snows. I am attracted at this season by the fine bright-red buds of the privet andromeda, sleeping couchant along the slender light-brown twigs. They look brightest against a dark ground.

This winter I hear the axe in almost every wood of any consequence left standing in the township.

What a strong and hearty but reckless, hit-or-miss style had some of the early writers of New England, like Josselyn and William Wood and others elsewhere in those days; as if they spoke with a relish, smacking their lips like a coach-whip, caring more to speak heartily than scientifically true. They are not to be caught napping by the wonders of Nature in a new country, and perhaps are often more ready to appreciate them than she is to exhibit them. They give you one piece of nature, at any rate, and that is themselves. (Cotton Mather, too, has a rich phrase.) They use a strong, coarse, homely speech which cannot always be found in the dictionary, nor sometimes be heard in polite society, but which brings you very near to the thing itself described. The strong new soil speaks through them. I have just been reading some in Wood's "New England's Prospect." He speaks a good word for New England, indeed will come very near lying for her, and when he doubts the justness of his praise, he brings it out not the less roundly; as who cares if it is not so? we love her not the less for all that. Certainly that generation stood nearer to nature, nearer to the facts, than this, and hence their books have more life in them.

They speak like men who have backs and stomachs and bowels, with all the advantages and disadvantages that attach to them. Ready to find lions here, some having "heard such terrible roarings," "which must be either Devils or Lions; there being no other creatures which use to roar." What a gormandizing faith (or belief) he has, ready to swallow all kinds of portents and prodigies!

Jan. 11. P.M. — Skated to Lee's Bridge and Farrar's Swamp — call it Otter Swamp.

A fine snow had just begun to fall, so we made haste to improve the skating before it was too late. Our skates made tracks often nearly an inch broad in the slight snow which soon covered the ice. All along the shores and about the islets the water had broadly overflowed the ice of the meadows, and frequently we had to skate through it, making it fly. The snow soon showed where the water was. It was a pleasant time to skate, so still, and the air so thick with snowflakes that the outline of near hills was

seen against it and not against the more distant and higher hills. Single pines stood out distinctly against it in the near horizon.

Jan. 12. Where are the shiners now, and the trout? I see none in the brook. Have the former descended to the deep water of the river? Ah, may I be there to see when they go down! Why can they not tell me? Or gone into the mud? There are few or no insects for them now.

The strong scent of this red oak, just split and corded, is a slight compensation for the loss of the tree.

How cheering the sight of the evergreens now, on the forest floor, fresh as in summer!

What is that mint whose seed-vessels rubbed are so spicy to smell — minty — at the further end of the pond by the Gourgas wood-lot?

Well may the tender buds attract us at this season, no less than partridges, for they are the hope of the year, the spring rolled up. The summer is all packed in them.

Observed this afternoon the following oak leaves: —

1st, the white oak, the most withered and faded and curled; many spotted with black dot lichens.

2d, the bear scrub, the most firm and fresh-colored and flat. [Etc. — 5 more.]

For color, perhaps all may be called brown, and vary into each other more or less.

The 1st, as both sides are seen, pale-brown with a salmon tinge beneath.

2d, clear reddish-brown, leather-like, above, often paler, whitish or very light beneath, silveryish. [Etc.]

The oak leaves now resemble the different kinds of calf, sheep, Russia leather, and Morocco (a few scarlet oaks), of different ages.

Jan. 14. Skated to Baker Farm with a rapidity which astonished myself, before the wind, feeling the rise and fall, — the water having settled in the suddenly cold night, — which I had not time to see. A man feels like a new creature, a deer, perhaps, moving at this rate. He takes new possession of nature in the name of his own majesty. There was I, and there, and there, as Mercury went down the Idæan Mountains.

Jan. 15. P.M. — Skated to Bedford.

It had just been snowing, and this lay in shallow drifts or waves on the Great Meadows, alternate snow and ice. Skated into a crack, and slid on my side twenty-five feet.

The river-channel dark and rough with fragments of old ice, — polygons of various forms, — cemented together, not strong.

Jan. 19. 7 A.M. — Yesterday it rained hard all day, washing off the little snow that was left down to the ice, the gutters being good-sized mill-brooks and the water over shoes in the middle of the road.

In the night it turned to snow, which still falls, and now covers the wet ground three or four inches deep. It is a very damp snow or sleet, perhaps mixed with rain, which the strong northwest wind plasters to that side of the trees and houses. I never saw the blue in snow so bright as this damp, dark, stormy morning at 7 A.M., as I was coming down the railroad. I did not have to make a hole in it, but I saw it some rods off in the

deep, narrow ravines of the drifts and under their edges or eaves, like the serenest blue of heaven, though the sky was, of course, wholly concealed by the driving snow-storm; suggesting that in darkest storms we may still have the hue of heaven in us.

P.M. — The damp snow still drives from the northwest nearly horizontally over the fields, while I go with C. toward the Cliffs and Walden. Though considerable snow has fallen, it lies chiefly in drifts under the walls. It was worth the while to see what a burden of damp snow lay on the trees notwithstanding the wind. Pitch pines were bowed to the ground with it, and birches also, and white oaks. I saw one of the last, at least twenty-five feet high, splintered near the ground past recovery. The snow, a little damp, had lodged not only on the oak leaves and the evergreens, but on every twig and branch, and stood in upright walls or ruffs five or six inches high, like miniature Chinese walls, zigzag over hill and dale, making more conspicuous than ever the arrangement and the multitude of the twigs and branches; and the trunks also being plastered with snow, a peculiar soft light was diffused around, very unlike the ordinary darkness of the forest, as if you were inside a drift or snow house. This even when you stood on the windward side. In most directions you could not see more than four or five rods into this labyrinth or maze of white arms. This is to be insisted on. They were so thick that they left no crevice through which the eye could penetrate further. The path was for the most part blocked up with the trees bent to the ground, which we were obliged to go round by zigzag paths in the woods, or carefully creep under at the risk of getting our necks filled with an avalanche of snow. Often we touched a tree with our foot or shook it with our hand, and so relieved it of a part of its burden, and, rising a little, it made room for us to pass beneath. Often singular portals and winding passages were left between the pitch pines, through which, stooping and grazing the touchy walls, we made our way. Where the path was open in the midst of the woods, the snow was about seven or eight inches deep. The trunks of the trees so uniformly covered on the northerly side, as happens frequently every winter, and sometimes continuing so for weeks, suggested that this might be a principal reason why the lichens watered by the melting snow flourished there most. The snow lay in great continuous masses on the pitch pines and the white, not only like napkins, but great white table-spreads and counter panes, when you looked off at the wood from a little distance. Some white pine boughs hung down like fans or the webbed feet of birds. On some pitch pines it lay in fruit-like balls as big as one's head, like cocoanuts. Where the various oaks were bent down, the contrast of colors of the snow and oak leaves and the softened tints through the transparent snow — often a delicate fawn-color — were very agreeable.

As we returned over the Walden road the damp, driving snowflakes, when we turned partly round and faced them, hurt our eyeballs as if they had been dry scales.

It may be that the linarias come into the gardens now not only because all nature is a wilderness to-day, but because the woods where the wind has not free play are so snowed up, the twigs are so deeply covered, that they cannot readily come at their food. We saw only one indistinct, snow-covered trail of an animal. Where are the crows now? I never see them at such a time. The channel ice is lifted up by the freshet, and

there is dry white snow, but on each side are broad dirty or yellowish green strips of slosh. Whence comes this green color?

The houses have that peculiarly wintry aspect now on the west side, being all plastered over with snow adhering to the clapboards and half concealing the doors and windows.

You would not have believed there were so many twigs and branches in a wood as were revealed by the snow resting on them; perfect walls of snow; no place for a bird to perch.

Jan. 20. You can tell by the ridges of the drifts on the south side of the walls which way the wind was. They all run from north to south; i.e., the common drift is divided into ridges or plaits in this direction, frequently down to the ground between; which separate drifts are of graceful outlines somewhat like fishes, with a sharp ridge or fin gracefully curved, both as you look from one side and down on them, their sides curving like waves about to break. The thin edge of some of these drifts at the wall end, where the air has come through the wall and made an eddy, are remarkably curved, like some shells, even thus, more than once round: I would not have believed it.

T. admired much the addition to the red house, with its steep bevelled roof. Thought he should send Mr. Upjohn to see it. The whole house, methought, was well planted, rested solidly on the earth, with its great bank (green in summer) and few stately elms before, it so much simpler and more attractive than a front yard with its knickknacks. To contrast with this pleasing structure, which is painted a wholesome red, was a modern addition in the rear, perhaps no uglier than usual, only by contrast, — such an outline alone as our carpenters have learned to produce. I see that I cannot draw anything so bad as the reality. So you will often see an ugly new barn beside a pleasing old house.

I doubt if I can convey an idea of the appearance of the woods yesterday, as you stood in their midst and looked round on their boughs and twigs laden with snow. It seemed as if there could have been none left to reach the ground. These countless zigzag white arms crossing each other at every possible angle completely closed up the view, like a light drift within three or four rods on every side. The wintriest prospect imaginable. That snow which sifted down into the wood-path was much drier and lighter than elsewhere.

Jan. 24. I am reading William Wood's "New England's Prospect." He left New England August 15th, 1633, and the last English edition referred to in this American one of 1764 is that of London, 1639.

The wild meadow-grasses appear to have grown more rankly in those days. He describes them as "thick and long, as high as a man's middle; some as high as the shoulders." (Vide Indian book.) Strawberries too were more abundant and large before they were so cornered up by cultivation, "some being two inches about; one may gather half a bushel in a forenoon;" and no doubt many other berries were far more abundant, as gooseberries, raspberries, and especially currants, which last so many old writers speak of, but so few moderns find wild. We can perhaps imagine how the primitive

wood looked from the sample still left in Maine. "Here no doubt might be good done with saw mills; for I have seene of these stately high grown trees [he is speaking of pines particularly] ten miles together close by the river [probably Charles River] side." He says at first "fir and pine," as if the fir once grew in this part of the State abundantly, as now in Maine and further west. Of the oaks he says, "These trees afford much mast for hogs, especially every third year." Does not this imply many more of them than now? "The hornbound tree is a tough kind of wood, that requires so much pains in riving as is almost incredible, being the best to make bowls and dishes, not being subject to crack or leak," and he speaks, both in prose and verse, of the vines being particularly inclined to run over this tree. If this is the true hornbeam it was probably larger then, but I am inclined to think it the tupelo, and that it was both larger and more abundant than commonly now, for he says it was good for bowls, and it has been so used since. Of the plums of the country he says, "They be black and yellow, about the bigness of damsons, of a reasonable good taste." Yet Emerson has not found the yellow plum, i.e. Canada, growing wild in Massachusetts.

Of quadrupeds no longer found in Concord, he names the lion, — that Cape Ann Lion "which some affirm that they have seen," which may have been a cougar, for he adds, "Plimouth men have traded for Lions skins in former times," — bear, moose, deer, porcupines, "the grim-fac'd Ounce, and rav'nous howling Wolf," and beaver. Martens.

For moose and deer see Indian book.

Complains of the wolf as the great devourer of bear, moose, and deer, which kept them from multiplying more.

For porcupine and raccoon vide Indian book.

Gray squirrels were evidently more numerous than now.

I do not know whether his ounce or wild cat is the Canada lynx or wolverine. He calls it wild cat and does not describe the little wildcat. (Vide Indian book.) Says they are accounted "very good meat. Their skins be a very deep kind of fur, spotted white and black on the belly." Audubon and Bachman make the *Lynx rufus* black and white beneath.

Says the beaver are so cunning the English "seldom or never kill any of them, being not patient to lay a long siege" and not having experience.

Eagles are probably less common; pigeons of course (vide Indian book); heath cocks all gone (price "four pence"); and turkeys (good cock, "four shillings"). Probably more owls then, and cormorants, etc., etc., sea-fowl generally (of humilities he "killed twelve score at two shots"), and swans. Of the crane, "almost as tall as a man," probably blue heron, — possibly the whooping crane or else the sandhill, — he says, "I have seen many of these fowls, yet did I never see one that was fat, though very sleeky;" neither did I. "There be likewise many Swans, which frequent the fresh ponds and rivers, seldom consorting themselves with ducks and geese; these be very good meat, the price of one is six shillings." Think of that!

Sturgeon were taken at Cape Cod and in the Merrimack especially, "pickled and brought to England, some of these be 12, 14, and 18 feet long." An abundance of salmon, shad, and bass, —

"The stately Bass old Neptune's fleeting post,  
That tides it out and in from sea to coast;"

"one of the best fish in the country," taken "sometimes two or three thousand at a set," "some four foot long," left on the sand behind the seine; sometimes used for manure. "Alewives...in the latter end of April come up to the fresh rivers to spawn, in such multitudes as is almost incredible, pressing up in such shallow waters as will scarce permit them to swim, having likewise such longing desire after the fresh water ponds, that no beatings with poles, or forcive agitations by other devices, will cause them to return to the sea, till they have cast their spawn."

"The Oysters be great ones in form of a shoe-horn, some be a foot long; these breed on certain banks that are bare every spring tide. This fish without the shell is so big, that it must admit of a division before you can well get it into your mouth." For lobsters, "their plenty makes them little esteemed and seldom eaten." Speaks of "a great oyster bank" in the middle of Back Bay, just off the true mouth of the Charles, and of another in the Mistick. These obstructed the navigation of both rivers. Vide book of facts.

P.M. — To Walden and Andromeda Ponds.

I was surprised to find the ice in the middle of the last pond a beautiful delicate rose-color for two or three rods, deeper in spots. It reminded me of red snow, and may be the same. I tried to think it the blood of wounded muskrats, but it could not be. It extended several inches into the ice, at least, and had been spread by the flowing water recently. As for vegetable pigments, there were button-bushes in and about it. It was quite conspicuous fifteen rods off, and the color of spring-cranberry juice. This beautiful blushing ice! What are we coming to?

Was surprised to see oak-balls on a bear scrub oak. Have them, then, on black, scarlet, red, and bear scrub.

Saw a young (apparently) red oak (it did not taste bitter) ten feet high, the ends of whose twigs looked at first sight as if they had been twisted off by some hungry browsing bird, leaving the fibres streaming. These I found were the strong woody fibres of last year's leaf-stalk, standing out white, in some cases two inches in all directions, from the ends of the twigs, in others rolled together like strong twine; sometimes four or five leaf-stalks' fibres, with wonderful regularity, as if braided, — like braided horse-tails. It was wonderful how they could have become so wonderfully knotted or braided together, but Nature had made up in assiduity for want of skill. I think it must be that these leaves died (perhaps in the great drought of last year) while their fibres were still strongly united with their twigs and so preserving their flexibility without losing their connection, and so the wind flapping the leaves, which hang short down, has twisted them together and commonly worn out the leaves entirely, without loosening or breaking the tough leaf-stalk. Here is self-registered the flutterings of a

leaf in this twisted, knotted, and braided twine. So fickle and unpredictable, not to say insignificant, a motion does yet get permanently recorded in some sort. Not a leaf flutters, summer or winter, but its variation and dip and intensity are registered in THE BOOK.

Jan. 25. I have come with basket and hatchet to get a specimen of the rose-colored ice. It is covered with snow. I push it away with my hands and feet. At first I detect no rose tint, and suspect it may have disappeared, — faded or bleached out, — or it was a dream. But the surrounding snow and the little body of the ice I had laid bare was what hindered. At length I detect a faint tinge; I cut down a young white oak and sweep bare a larger space; I then cut out a cake. The redness is all about an inch below the surface, the little bubbles in the ice there for half an inch vertically being coated interruptedly within or without with what looks like a minute red dust when seen through a microscope, as if it had dried on. Little balloons, with some old paint almost scaled off their spheres. It has no beauty nor brightness thus seen, more than brick-dust. And this it is which gave the ice so delicate a tinge, seen through that inch of clear white ice. What is it? Can it be blood?

Jan. 26. I am afraid I have not described vividly enough the aspect of that Lodging Snow of the 19th and to-day partly. Imagine the innumerable twigs and boughs of the forest (as you stand in its still midst), crossing each other at every conceivable angle on every side from the ground to thirty feet in height, with each its zigzag wall of snow four or five inches high, so innumerable at different distances one behind another that they completely close up the view like a loose-woven downy screen, into which, however, stooping and winding, you ceaselessly advance. The wintriest scene, — which perhaps can only be seen in perfection while the snow is yet falling, before wind and thaw begin. Else you miss, you lose, the delicate touch of the master. A coarse woof and warp of snowy batting, leaving no space for a bird to perch.

In many places where you knew there was a thrifty young wood, there appears to be none, for all is bent down and almost completely buried in the snow, and you are stepping over them. The pitch pines are most round-headed, and the young white oaks are most leaved at top, and hence suffer most.

What changes in the aspect of the earth! one day russet hills, and muddy ice, and yellow and greenish pools in the fields; the next all painted white, the fields and woods and roofs laid on thick. The great sloshy pools in the fields, freezing as they dried away, look like bread that has spewed in the baking, the fungi of a night, an acre in extent; but trust not your feet on it, for the under side is not done; there the principle of water still prevails.

Jan. 27. P.M. — Up meadow to Cliffs and Walden road.

I came upon a fox's track under the north end of the Cliffs and followed it. It was made last night, after the sleet and probably the rain was over, before it froze; it must have been at midnight or after. The tracks were commonly ten or twelve inches apart and each one and three quarters or two inches wide. Sometimes there was a longer interval and two feet fell nearer together, as if in a canter. It did not wind round the

prominent rocks, but leaped upon them as if to reconnoitre. At length, after going perhaps half a mile, it turned as if to descend a dozen rods beyond the juniper, and suddenly came to end. Looking closely I found the entrance (apparently) to its hole, under a prominent rock which seemed to lie loose on the top of the ledge and about two feet from the nearest track. By stooping it had probably squeezed under this and passed into its den beneath. I could find no track leading from it.

Their tracks are larger than you would expect, as large as those of a much heavier dog, I should think. What a life is theirs, venturing forth only at night for their prey, ranging a great distance, trusting to pick up a sleeping partridge or a hare, and at home again before morning! With what relish they must relate their midnight adventures to one another there in their dens by day, if they have society! I had never associated that rock with a fox's den, though perhaps I had sat on it many a time. There are more things in heaven and earth, Horatio, etc., etc. They are the only outlaws, the only Robin Hoods, here nowadays. Do they not stand for gypsies and all outlaws? Wild dogs, as Indians are wild men.

Jan. 31. Wednesday. A clear, cold, beautiful day. Fine skating. An unprecedented expanse of ice.

As I skated near the shore under Lee's cliff, I saw what I took to be some scraggs or knotty stubs of a dead limb lying on the bank beneath a white oak, close by me. Yet while I looked directly at them I could not but admire their close resemblance to partridges. I had come along with a rapid whirl and suddenly halted right against them, only two rods distant, and, as my eyes watered a little from skating against the wind, I was not convinced that they were birds till I had pulled out my glass and deliberately examined them. They sat and stood, three of them, perfectly still with their heads erect, some darker feathers like ears, methinks, increasing their resemblance to scraggs, as where a small limb is broken off. I was much surprised at the remarkable stillness they preserved, instinctively relying on the resemblance to the ground for their protection, i.e. withered grass, dry oak leaves, dead scraggs, and broken twigs. I thought at first that it was a dead oak limb with a few stub ends or scraggs sticking up, and it was not till I brought my glass to bear on them and saw their eyes distinctly, steadily glaring on me, their necks and every muscle tense with anxiety, that I was convinced. At length, on some signal which I did not perceive, they went with a whirl, as if shot, off over the bushes.

It was quite an adventure getting over the bridgeways or causeways, for on every shore there was either water or thin ice which would not bear. Returning, I saw a large hawk flapping and sailing low over the meadow. There was some dark color to its wings.

You were often liable to be thrown when skating fast, by the shallow puddles on the ice formed in the middle of the day and not easy to be distinguished. These detained your feet while your unimpeded body fell forward.

Feb. 2. Snowed again half an inch more in the evening, after which, at ten o'clock, the moon still obscured, I skated on the river and meadows. Our skates make but little

sound in this coating of snow about an inch thick, as if we had on woollen skates, and we can easily see our tracks in the night. We seem thus to go faster than before by day, not only because we do not see (but feel and imagine) our rapidity, but because of the impression which the mysterious muffled sound of our feet makes. Now and then we skated into some chippy, crackling white ice, where a superficial puddle had run dry before freezing hard, and got a tumble.

Feb. 3. This morning it is snowing again. This will deserve to be called the winter of skating.

Skated up the river with Tappan in spite of the snow and wind. It was a novel experience, this skating through snow, sometimes a mile without a bare spot, this blustering day. In many places a crack ran across our course where the water had oozed out, and the driving snow catching in it had formed a thick batter with a stiffish crust in which we were tripped up and measured our lengths on the ice. The few thin places were concealed, and we avoided them by our knowledge of the localities. Sometimes a thicker drift, too, threw us, or a sudden unevenness in the concealed ice; but on the whole the snow was but a slight obstruction. We skated with much more facility than I had anticipated, and I would not have missed the experience for a good deal.

We went up the Pantry Meadow above the old William Wheeler house, and came down this meadow again with the wind and snow dust, spreading our coat-tails, like birds, though somewhat at the risk of our necks if we had struck a foul place. I found that I could sail on a tack pretty well, trimming with my skirts. Sometimes we had to jump suddenly over some obstacle which the snow had concealed before, to save our necks. It was worth the while for one to look back against the sun and wind and see the other sixty rods off coming, floating down like a graceful demon in the midst of the broad meadow all covered and lit with the curling snow-steam, between which you saw the ice in dark, waving streaks, like a mighty river Orellana braided of a myriad steaming currents, — like the demon of the storm driving his flocks and herds before him. In the midst of this tide of curling snow-steam, he sweeps and surges this way and that and comes on like the spirit of the whirlwind.

At Lee's Cliff we made a fire, kindling with white pine cones, after oak leaves and twigs, — else we had lost it; these saved us, for there is a resinous drop at the point of each scale, — and then we forgot that we were outdoors in a blustering winter day.

Some little boys ten years old are as handsome skaters as I know. They sweep along with a graceful floating motion, leaning now to this side, then to that, like a marsh hawk beating the bush.

I still recur in my mind to that skate of the 31st. I was thus enabled to get a bird's-eye view of the river, — to survey its length and breadth within a few hours, connect one part (one shore) with another in my mind, and realize what was going on upon it from end to end, — to know the whole as I ordinarily knew a few miles of it only. I connected the chestnut-tree house, near the shore in Wayland, with the chimney house in Billerica, Pelham's Pond with Nutting's Pond in Billerica. There is good skating

from the mouth to Saxonville, measuring in a straight line some twenty-two miles, by the river say thirty now, Concord midway. It is all the way of one character, — a meadow river, or dead stream, — Musketicook, — the abode of muskrats, pickerel, etc., crossed by some twenty low wooden bridges, *sublicii pontes*, connected with the mainland by willowy causeways. Thus the long, shallow lakes divided into reaches. These long causeways all under water and ice now, only the bridges peeping out from time to time like a dry eyelid.

Feb. 5. It was quite cold last evening, and I saw the scuttle window reflecting the lamp from a myriad brilliant points when I went up to bed. It sparkled as if we lived inside of a cave, but this morning it has moderated considerably and is snowing. Already one inch of snow has fallen.

According to Webster, in Welsh a hare is “furze or gorse-cat.” Also, “Chuk, a word used in calling swine. It is the original name of that animal, which our ancestors brought with them from Persia, where it is still in use. Pers. *chuk*,” etc. “Sans. *sugara*. Our ancestors while in England adopted the Welsh *hwc*, hog; but *chuck* is retained in our popular name of woodchuck, that is, wood hog.”

In a journal it is important in a few words to describe the weather, or character of the day, as it affects our feelings. That which was so important at the time cannot be unimportant to remember.

Feb. 6. The coldest morning this winter. Our thermometer stands at  $-14^{\circ}$  at 9 A.M.; others, we hear, at 6 A.M. stood at  $-18^{\circ}$ , at Gorham, N.H.,  $-30^{\circ}$ . There are no loiterers in the street, and the wheels of wood wagons squeak as they have not for a long time, — actually shriek. Frostwork keeps its place on the window within three feet of the stove all day in my chamber. At 4 P.M. the thermometer is at  $-10^{\circ}$ ; at six it is at  $-14^{\circ}$ .

I was walking at five, and found it stinging cold. It stung the face. The setting sun no sooner leaves our west windows than a solid but beautiful crystallization coats them, except perhaps a triangularish bare spot at one corner, which perhaps the sun has warmed and dried. (I believe the saying is that by the 1st of February the meal and grain for a horse are half out.)

Feb. 7. The coldest night for a long, long time was last. Sheets froze stiff about the faces. Cat mewed to have the door opened, but was at first disinclined to go out. When she came in at nine she smelt of meadow hay. We all took her up and smelled of her, it was so fragrant. Had cuddled in some barn. People dreaded to go to bed. The ground cracked in the night as if a powder-mill had blown up, and the timbers of the house also. My pail of water was frozen in the morning so that I could not break it. Must leave many buttons unbuttoned, owing to numb fingers. Iron was like fire in the hands. Thermometer at about 7.30 A.M. gone into the bulb,  $-19^{\circ}$  at least. The cold has stopped the clock. Every bearded man in the street is a graybeard. Bread, meat, milk, cheese, etc., etc., all frozen. Pity the poor who have not a large wood-pile. The latches are white with frost, and every nail-head in entries, etc., has a white cap. The chopper hesitates to go to the woods. Yet I see S. Wetherbee stumping past, three

quarters of a mile, for his morning's dram. Neighbor Smith's thermometer stood at  $-26^{\circ}$  early this morning. But this day is at length more moderate than yesterday.

This, i.e. yesterday, the 6th, will be remembered as the cold Tuesday. The old folks still refer to the Cold Friday, when they sat before great fires of wood four feet long, with a fence of blankets behind them, and water froze on the mantelpiece. But they say this is as cold as that was.

Feb. 15. All day a steady, warm, imprisoning rain carrying off the snow, not unmusical on my roof. It is a rare time for the student and reader who cannot go abroad in the afternoon, provided he can keep awake, for we are wont to be drowsy as cats in such weather. Without, it is not walking but wading. The fire needs no replenishing, and we save our fuel. It seems like a distant forerunner of spring.

Feb. 18. After a thaw old tracks in the snow, from basso, become alto relieve. The snow which was originally compressed and hardened beneath the feet, — also, perhaps, by the influence of the sun and maybe rain, — being the last to melt, becomes protuberant, the highest part and most lasting. The track becomes a raised almost icy type. How enduring these trails! How nature clings to these types. The track even of small animals like a skunk will outlast a considerable thaw.

Feb. 21. A clear air, with a northwesterly, March-like wind, as yesterday. What is the peculiarity in the air that both the invalid in the chamber and the traveller on the highway say these are perfect March days?

A warmth begins to be reflected from the partially dried ground here and there in the sun in sheltered places, very cheering to invalids who have weak lungs, who think they may weather it till summer now.

Mar. 1. The last day for skating. It is a very pleasant and warm day, the finest yet, with considerable coolness in the air, however, — winter still. The dusty banks of snow by the railroad reflect a wonderfully dazzling white from their pure crannies, being melted into an uneven, sharp, wavy surface. This more dazzling white must be due to the higher sun.

Examined again the ice and meadow-crust deposited just south of Derby's Bridge.

I think the meadow is lifted in this wise: First, you have a considerable freshet in midwinter, succeeded by severe cold before the water has run off much. Then, as the water goes down, the ice for a certain width on each side the river meadows rests on the ground, which freezes to it. Then comes another freshet, which rises a little higher than the former. This gently lifts up the river ice, and that meadow ice on each side of it which still has water under it, without breaking them, but overflows the ice which is frozen to the bottom. Then, after some days of thaw and wind, the latter ice is broken up and rises in cakes, larger or smaller with or without the meadow-crust beneath it, and is floated off before the wind and current till it grounds somewhere, or melts and so sinks, frequently three cakes one upon another, on some swell in the meadow or the edge of the upland. The ice is thus with us a wonderful agent in changing the aspect of the surface of the river-valley. I think that there has been more meadow than usual

moved this year, because we had so great a freshet in midwinter succeeded by severe cold, and that by another still greater freshet before the cold weather was past.

I did well to walk in the forenoon, the fresh and inspiring half of this bright day, for now, at midafternoon, its brightness is dulled, and a fine stratus is spread over the sky.

March 4. Sunday. We go over the Cliffs. At the Bee Hill-side, a striped squirrel, which quickly dives into his hole at our approach. May not this season of springlike weather between the first decidedly springlike day and the first blue-bird, already fourteen days long, be called the striped squirrel spring? In which we go listening for the blue-bird, but hear him not.

March 6. Our woods are now so reduced that the chopping of this winter has been a cutting to the quick. At least we walkers feel it as such. There is hardly a wood lot of any consequence left but the chopper's axe has been heard in it this season. They have even infringed fatally on White Pond, on the south of Fair Haven Pond, shaved off the topknot of the Cliffs, the Colburn farm, Beck Stow's, etc., etc.

March 7. We were walking along the sunny hillside on the south of Fair Haven Pond (on the 4th), which the choppers had just laid bare, when, in a sheltered and warmer place, we heard a rustling amid the dry leaves on the hillside and saw a striped squirrel eying us from its resting-place on the bare ground. It sat still till we were within a rod, then suddenly dived into its hole, which was at its feet, and disappeared. The first pleasant days of spring come out like a squirrel and go in again.

March 10. I am not aware of growth in any plant yet, unless it be the further peeping out of willow catkins. They have crept out further from under their scales, and, looking closely into them, I detect a little redness along the twigs even now. You are always surprised by the sight of the first spring bird or insect; they seem premature, and there is no such evidence of spring as themselves, so that they literally fetch the year about. It is thus when I hear the first robin or bluebird or, looking along the brooks, see the first water-bugs out circling. But you think, They have come, and Nature cannot recede.

March 11. On Abel Hosmer's pasture, just southeast of the stone bridge, I see where the sod was lifted up over a great space in the flood of the 17th of February. The sod carried off is from four to six inches thick commonly. Pieces of this crust are resting within ten or twenty rods. One has sunk against the causeway bridge, being too wide to go through. I see one piece of crust, twelve feet by six, turned completely topsyturvy with its ice beneath it. This has prevented the ice from melting, and on examining it I find that the ice did not settle down on to the grass after the water went down and then freeze to it, for the blades of grass penetrate one inch into the ice, showing that, the water being shallow, the whole froze, and the grass was frozen in, and thus, when the water rose again, was lifted up.

Saw a cake of recent ice very handsomely marked as it decayed, with darker marks for the original crystals centred with the original white. It would be a rare pattern for a carpet, because it contains a variety of figures agreeable to the eye without regularity.

March 13. Northern lights last night. Rainbow in east this morning.

March 20. A flurry of snow at 7 A.M. I go to turn my boat up. Four or five song sparrows are flitting along amid the willows by the waterside. Probably they came yesterday with the bluebirds.

It is remarkable by what a gradation of days which we call pleasant and warm, beginning in the last of February, we come at last to real summer warmth. At first a sunny, calm, serene winter day is pronounced spring, or reminds us of it; and even the first pleasant spring day perhaps we walk with our greatcoat buttoned up and gloves on.

Trying the other day to imitate the honking of geese, I found myself flapping my sides with my elbows, as with wings, and uttering something like the syllables mow-ack with a nasal twang and twist in my head; and I produced their note so perfectly in the opinion of the hearers that I thought I might possibly draw a flock down.

March 22. I hear a song sparrow on an alder-top sing ozit ozit oze-e-e | (quick) tchip tchip tchip tchip tchay | te tchip ter che ter tchay; also the same shortened and very much varied. Heard one sing uninterruptedly, i.e. without a pause, almost a minute. I crossed Fair Haven Pond, including the river, on the ice, and probably can for three or four days yet.

Going along the steep side-hill on the south of the pond about 4 P.M., on the edge of the little patch of wood which the choppers have not yet levelled, — though they have felled many an acre around it this winter, — I observed a rotten and hollow hemlock stump about two feet high and six inches in diameter, and instinctively approached with my right hand ready to cover it. I found a flying squirrel in it, which, as my left hand had covered a small hole at the bottom, ran directly into my right hand. It struggled and bit not a little, but my cotton glove protected me, and I felt its teeth only once or twice. It also uttered three or four dry shrieks at first, something like cr-r-rack cr-r-r-ack cr-r-r-ack. I rolled it up in my handkerchief and, holding the ends tight, carried it home in my hand, some three miles. It struggled more or less all the way, especially when my feet made any unusual or louder noise going through leaves or bushes. I could count its claws as they appeared through the handkerchief, and once it got its head out a hole. It even bit through the handkerchief.

Color, as I remember, above a chestnut ash, inclining to fawn or cream color (?), slightly browned; beneath white, the under edge of its wings (?) tinged yellow, the upper dark, perhaps black, making a dark stripe. Audubon and Bachman do not speak of any such stripe! It was a very cunning little animal, reminding me of a mouse in the room. Its very large and prominent black eyes gave it an interesting innocent look. Its very neat flat, fawn-colored, distichous tail was a great ornament. Its “sails” were not very obvious when it was at rest, merely giving it a flat appearance beneath. It would leap off and upward into the air two or three feet from a table, spreading its “sails,” and fall to the floor in vain; perhaps strike the side of the room in its upward spring and endeavor to cling to it. It would run up the window by the sash, but evidently

found the furniture and walls and floor too hard and smooth for it and after some falls became quiet. In a few moments it allowed me to stroke it, though far from confident.

I put it in a barrel and covered it for the night. It was quite busy all the evening gnawing out, clinging for this purpose and gnawing at the upper edge of a sound oak barrel, and then dropping to rest from time to time. It had defaced the barrel considerably by morning, and would probably have escaped if I had not placed a piece of iron against the gnawed part. I had left in the barrel some bread, apple, shagbarks, and cheese. It ate some of the apple and one shagbark, cutting it quite in two transversely.

In the morning it was quiet, and squatted somewhat curled up amid the straw, with its tail passing under it and the end curled over its head very prettily, as if to shield it from the light and keep it warm. I always found it in this position by day when I raised the lid.

MARCH 23. P.M. — To Fair Haven Pond.

Carried my flying squirrel back to the woods in my handkerchief. I placed it, about 3.30 P.M., on the very stump I had taken it from. It immediately ran about a rod over the leaves and up a slender maple sapling about ten feet, then after a moment's pause sprang off and skimmed downward toward a large maple nine feet distant, whose trunk it struck three or four feet from the ground. This it rapidly ascended, on the opposite side from me, nearly thirty feet, and there clung to the main stem with its head downward, eyeing me. After two or three minutes' pause I saw that it was preparing for another spring by raising its head and looking off, and away it went in admirable style, more like a bird than any quadruped I had dreamed of and far surpassing the impression I had received from naturalists' accounts. I marked the spot it started from and the place where it struck, and measured the height and distance carefully. It sprang off from the maple at the height of twenty-eight and a half feet, and struck the ground at the foot of a tree fifty and a half feet distant, measured horizontally. Its flight was not a regular descent; it varied from a direct line both horizontally and vertically. Indeed it skimmed much like a hawk and part of its flight was nearly horizontal, and it diverged from a right line eight or ten feet to the right, making a curve in that direction. There were six trees from six inches to a foot in diameter, one a hemlock, in a direct line between the two termini, and these it skimmed partly round, and passed through their thinner limbs; did not as I could perceive touch a twig. It skimmed its way like a hawk between and around the trees. Though it was a windy day, this was on a steep hillside away from the wind and covered with wood, so it was not aided by that. As the ground rose about two feet, the distance was to the absolute height as fifty and a half to twenty-six and a half, or it advanced about two feet for every one foot of descent. After its vain attempts in the house, I was not prepared for this exhibition. It did not fall heavily as in the house, but struck the ground gently enough, and I cannot believe that the mere extension of the skin enabled it to skim so far. It must be still further aided by its organization. Perhaps it fills itself with air first. Perhaps I had a fairer view than common of its flight, now at 3.30 P.M. Audubon and Bachman say

he saw it skim "about fifty yards," curving upwards at the end and alighting on the trunk of a tree. This in a meadow in which were scattered oaks and beeches. This near Philadelphia. Wesson says he has seen them fly five or six rods.

Kicking over the hemlock stump, which was a mere shell with holes below, and a poor refuge, I was surprised to find a little nest at the bottom, open above just like a bird's nest, a mere bed. It was composed of leaves, shreds of bark, and dead pine-needles. As I remember, it was not more than an inch and a half broad when at rest, but when skimming through the air I should say it was four inches broad. This is the impression I now have. Captain John Smith says it is said to fly thirty or forty yards. Audubon and Bachman quote one Gideon B. Smith, M.D., of Baltimore, who has had much to do with these squirrels and speaks of their curving upward at the end of their flight to alight on a tree-trunk and of their "flying" into his windows. In order to perform all these flights, — to strike a tree at such a distance, etc., etc., — it is evident it must be able to steer. I should say that mine steered as a hawk that moves without flapping its wings, never being able, however, to get a new impetus after the first spring.

C. saw geese to-night.

March 24. Passing up the Assabet, by the Hemlocks, where there has been a slide and some rocks have slid down into the river, I think I see how rocks come to be found in the midst of rivers. Rivers are continually changing their channels, — eating into one bank and adding their sediment to the other, — so that frequently where there is a great bend you see a high and steep bank or hill on one side, which the river washes, and a broad meadow on the other. As the river eats into the hill, especially in freshets, it undermines the rocks, large and small, and they slide down, alone or with the sand and soil, to the water's edge. The river continues to eat into the hill, carrying away all the lighter parts of the sand and soil, to add to its meadows or islands somewhere, but leaves the rocks where they rested, and thus in course of time they occupy the middle of the stream and, later still, the middle of the meadow, perchance, though it may be buried under the mud. But this does not explain how so many rocks lying in streams have been split in the direction of the current. Again, rivers appear to have travelled back and worn into the meadows of their creating, and then they become more meandering than ever. Thus in the course of ages the rivers wriggle in their beds, till it feels comfortable under them. Time is cheap and rather insignificant. It matters not whether it is a river which changes from side to side in a geological period or an eel that wriggles past in an instant.

The last four days, including this, have been very cold and blustering. We have had several flurries of snow, when we hoped it would snow in earnest and the weather be warmer for it. It is too cold to think of those signs of spring which I find recorded under this date last year.

March 26. P.M. — Sail down to the Great Meadows. A strong wind with snow driving from the west and thickening the air. The farmers pause to see me scud before it.

March 28. I run about these cold and blustering days, on the whole perhaps the worst to bear in the year, — partly because they disappoint expectation, — looking almost in vain for some animal or vegetable life stirring. The warmest springs hardly allow me the glimpse of a frog's heel as he settles himself in the mud, and I think I am lucky if I see one winter-defying hawk or a hardy duck or two at a distance on the water. As for the singing of birds, — the few that have come to us, — it is too cold for them to sing and for me to hear. The bluebird's warble comes feeble and frozen to my ear. We still walk on frozen ground, though in the garden I can thrust a spade in about six inches.

March 30. He must have a great deal of life in him to draw upon, who can pick up a subsistence in November and March. Man comes out of his winter quarters this month as lean as a woodchuck. Except for science, do not travel in such a climate as this in November and March. I tried if a fish would take the bait to-day; but in vain; I did not get a nibble. Where are they?

March 31. I see through the window that it is a very fine day, the first really warm one. I did not know the whole till I came out at 3 P.M. and walked to the Cliffs.

The fuzzy gnats are in the air, and bluebirds, whose warble is thawed out. I am uncomfortably warm, gradually unbutton both my coats, and wish that I had left the outside one at home.

It is suddenly warm, and this amelioration of the weather is incomparably the most important fact in this vicinity. It is incredible what a revolution in our feelings and in the aspect of nature this warmer air alone has produced. Yesterday the earth was simple to barrenness, and dead, — bound out. Out-of-doors there was nothing but the wind and the withered grass and the cold though sparkling blue water, and you were driven in upon yourself. Now you would think that there was a sudden awakening in the very crust of the earth, as if flowers were expanding and leaves putting forth; but not so; I listen in vain to hear a frog or a new bird as yet; only the frozen ground is melting a little deeper, and the water is trickling down the hills in some places. No, the change is mainly in us. We feel as if we had obtained a new lease of life. Some juniper (*repens*) berries are blue now. Looking from the Cliffs I see that Walden is open to-day first, and Fair Haven Pond will open by day after to-morrow.

April 1. The month comes in true to its reputation. We wake, though late, to hear the sound of a strong, steady, and rather warm rain on the roof, and see the puddles shining in the road.

When I look out the window I see that the grass on the bank on the south side of the house is already much greener than it was yesterday. As it cannot have grown so suddenly, how shall I account for it? I suspect that the reason is that the few green blades are not merely washed bright by the rain, but erect themselves to imbibe its influence, and so are more prominent, while the withered blades are beaten down and flattened by it.

April 2. Not only the grass but the pines also were greener yesterday for being wet. To-day, the grass being dry, the green blades are less conspicuous than yesterday. It

would seem, then, that this color is more vivid when wet, and perhaps all green plants, like lichens, are to some extent greener in moist weather. Green is essentially vivid, or the color of life, and it is therefore most brilliant when a plant is moist or most alive. A plant is said to be green in opposition to being withered and dead. The word, according to Webster, is from the Saxon *grene*, to grow, and hence is the color of herbage when growing.

High winds all night, rocking the house, opening doors, etc. To-day also. It is wintry cold also, and ice has formed nearly an inch thick in my boat.

P.M. — Down the river-bank.

April 15. 9 A.M. — To Atkins's boat-house.

Returning, we had a fine view of a blue heron, standing erect and open to view on a meadow island, by the great swamp south of the bridge, looking as broad as a boy on the side. When the heron takes to flight, what a change in size and appearance! It is presto change! There go two great undulating wings pinned together, but the body and neck must have been left behind somewhere.

April 19. 5 A.M. — Up Assabet.

Warm and still and somewhat cloudy. Am without greatcoat. Many tortoises have their heads out. The river has fallen a little. Going up the Assabet, two or three tortoises roll down the steep bank with a rustle. One tumbles on its edge and rolls swiftly like a disk cast by a boy, with its back to me, from eight or ten feet into the water.

P.M. — To Walden.

APRIL 20. Rains all day, taking out the frost and imprisoning me. You cannot set a post yet on account of frost.

April 22. Fair, but windy. The yellow willow catkins pushing out begin to give the trees a misty, downy appearance, dimming them. The bluish band on the breast of the kingfisher leaves the pure white beneath in the form of a heart. The blossoms of the sweet-gale are now on fire over the brooks, contorted like caterpillars.

April 29. That lake grass — or perhaps I should call it purple grass — is now apparently in perfection on the water. Long and slender blades (about an eighth of an inch wide and six to twelve inches long, the part exposed) lie close side by side straight and parallel on the surface, with a dimple at the point where they emerge. Some are a very rich purple, with apparently a bloom, and very suggestive of placidity. It is a true bloom, at any rate, — the first blush of the spring caught on these little standards elevated to the light. By the water they are left perfectly smooth and flat and straight, as well as parallel, and thus, by their mass, make the greater impression on the eye. It has a strong marshy, somewhat fishy, almost seaweed-like scent when plucked. Seen through a glass the surface is finely grooved.

April 30. I hear from far the scream of a hawk circling over the Holden woods and swamp. This accounts for those two men with guns just entering it. What a dry, shrill, angry scream! I see the bird with my glass resting upon the topmost plume of a tall white pine. Its back, reflecting the light, looks white in patches; and now it circles

again. It is a red-tailed hawk. The tips of its wings are curved upward as it sails. How it scolds at the men beneath! I see its open bill. It must have a nest there. Hark! there goes a gun, and down it tumbles from a rod or two above the wood. So I thought, but was mistaken. In the meanwhile, I learn that there is a nest there, and the gunners killed one this morning, which I examined. They are now getting the young. Above it was brown, but not at all reddish brown except about head.

Powerful neck and legs. The claws pricked me as I handled it. It measured one yard and three eighths plus from tip to tip, i.e. four feet and two inches. Some ferruginous on the neck; ends of wings nearly black.

May 1. Rained some in the night; cloudy in the forenoon; clears up in the afternoon. P.M. — By boat with Sophia to Conantum, a maying.

There is an unaccountable sweetness as of flowers in the air, — a true May day. Raw and drizzling in the morning. The grackle still. What various brilliant and evanescent colors on the surface of this agitated water! It reminds me of the sea.

Went to Garfield's for the hawk of yesterday. It was nailed to the barn in terrorem and as a trophy. He gave it to me with an egg. He called it the female, and probably was right, it was so large. He tried in vain to shoot the male, which I saw circling about just out of gunshot and screaming, while he robbed the nest.

The hawk measures exactly  $22\frac{1}{2}$  inches in length and 4 feet  $4\frac{1}{2}$  inches in alar extent, and weighs  $3\frac{1}{4}$  pounds. The ends of closed wings almost two inches short of end of tail. The wing-coverts and scapulars glossed with purple reflections. The twelve tail-feathers (which MacGillivray says is the number in all birds of prey, i.e. the Falconinæ and Striginæ) showing five and three quarters inches a clear brown red, or rather fox-color, above, with a narrow dark band within half an inch of the end, which is tipped with dirty white.

Bill very blue black, with a short, stout curved tip, — curving from the cere more than a quarter of a circle, extends not quite a quarter of an inch beyond the lower mandible. [Etc.: 5 more pages of data — observation, dissection, reading].

May 5. Looking over my book, I found I had done my errands, and said to myself I would find a crow's nest. (I had heard a crow scold at a passing hawk a quarter of an hour before.) I had hardly taken this resolution when, looking up, I saw a crow wending his way across an interval in the woods towards the highest pines in the swamp, on which he alighted. I directed my steps to them and was soon greeted with an angry caw, and, within five minutes from my resolve, I detected a new nest close to the top of the tallest white pine in the swamp. A crow circled cawing about it within gunshot, then over me surveying, and, perching on an oak directly over my head within thirty-five feet, cawed angrily. But suddenly, as if having taken a new resolution, it flitted away, and was joined by its mate and two more, and they went off silently a quarter of a mile or more and lit in a pasture, as if they had nothing to concern them in the wood.

May 7. 5 A.M. — To Island. Finger-cold and windy.

A crow's nest near the top of a pitch pine about twenty feet high, just completed, betrayed by the birds' cawing and alarm. As on the 5th, one came and sat on a bare

oak within forty feet, cawed, reconnoitred; and then both flew off to a distance, while I discovered and climbed to the nest within a dozen rods. One comes near to spy you first.

P.M. — Climbed to two crows' nests, — or maybe one of them a squirrel's, — in Hubbard's Grove. Do they not sometimes use a squirrel's nest for a foundation? A ruby-crested wren is apparently attracted and eyes me. It is wrenching and fatiguing, as well as dirty, work to climb a tall pine with nothing, or maybe only dead twigs and stubs, to hold by. You must proceed with great deliberation and see well where you put your hands and your feet. Scared up two gray squirrels in the Holden wood, which ran glibly up the tallest trees on the opposite side to me, and leaped across from the extremity of the branches to the next trees, and so on very fast ahead of me. Remembering — aye, aching with — my experience in climbing trees this afternoon and morning, I could not but admire their exploits. To see them travelling with so much swiftness and ease that road over which I climbed a few feet with such painful exertion!

A short distance beyond the hawk's-nest pine, I observed a middling-sized red oak standing a little aslant on the side-hill over the swamp, with a pretty large hole in one side about fifteen feet from the ground, where apparently a limb on which a felled tree lodged had been cut some years before and so broke out a cavity. I thought that such a hole was too good a one not to be improved by some inhabitant of the wood. Perhaps the gray squirrels I had just seen had their nest there. Or was not the entrance big enough to admit a screech owl? So I thought I would tap on it and put my ear to the trunk and see if I could hear anything stirring within it, but I heard nothing. Then I concluded to look into it. So I shinned up, and when I reached up one hand to the hole to pull myself up by it, the thought passed through my mind perhaps something may take hold my fingers, but nothing did. The first limb was nearly opposite to the hole, and, resting on this, I looked in, and, to my great surprise, there squatted, filling the hole, which was about six inches deep and five to six wide, a salmon-brown bird not so big as a partridge, seemingly asleep within three inches of the top and close to my face. It was a minute or two before I made it out to be an owl. It was a salmon-brown or fawn (?) above, the feathers shafted with small blackish-brown somewhat hastate (?) marks, grayish toward the ends of the wings and tail, as far as I could see. A large white circular space about or behind eye, banded in rear by a pretty broad (one third of an inch) and quite conspicuous perpendicular dark-brown stripe. It lay crowded in that small space, with its tail somewhat bent up and one side of its head turned up with one egret, and its large dark eye open only by a long slit about a sixteenth of an inch wide; visible breathing. After a little while I put in one hand and stroked it repeatedly, whereupon it reclined its head a little lower and closed its eye entirely. Though curious to know what was under it, I disturbed it no farther at that time.

In the meanwhile, the crows were making a great cawing amid and over the pine-tops beyond the swamp, and at intervals I heard the scream of a hawk, probably the surviving male hen-hawk, whom they were pestering (unless they had discovered the

18th. Another found out on the morning of the 19th. Another was dug out the 25th. (All hatched, then, but one egg which I have.)

A snapping turtle had come out on the morning of the 20th, one at least. Another on the morning of the 23d Sept. Another on the morning of the 26th.

[Abbé Adrien Rougette of New Orleans — Louisiana Creole, authority on monastic solitude, friend of the Choctaw Indians, and nature writer — praised Walden and sent Thoreau three of his own books: *La Thébaïde en Amérique*, *Wild Flowers*, and *Les Savanes*.]

Lycopus.

Vide 20th and 26th.

[Thoreau's notebook on Indians.]

Probably this.

Or rather all the water freezes where it is shallow and the grass is frozen into it. Vide Mar. 11th.

Vide Mar. 7th.

Vide next page.

No.

Vide forward. More.

A mistake.

MacGillivray describes no eggs of this color, — only white, — and the same with Nuttall, except the great gray owl.

MAY 17. Waked up at 2.30 by the peep of robins, which were aroused by a fire at the pail-factory about two miles west. I hear that the air was full of birds singing thereabouts. It rained gently at the same time, though not steadily.

MAY 19. Put my little turtles into the river. They had not noticeably increased in size, — or hardly. Three had died within a week for want of attention, — two mud turtles and one musk turtle. Two were missing, — one mud and one musk. Five musk were put into the river.

May 25. Critchicrotches in prime.

Heard the first regular bullfrog's trump on the 18th; none since.

Juniper, plucked yesterday, sheds pollen in house to-day, and probably in field.

The golden robin keeps whistling something like *Eat it, Potter, eat it!*

May 28. I see a tanager, the most brilliant and tropical-looking bird we have, bright-scarlet with black wings, the scarlet appearing on the rump again between wing-tips. He brings heat, or heat him. A remarkable contrast with the green pines.

June 11. What if we feel a yearning to which no breast answers? I walk alone. My heart is full. Feelings impede the current of my thoughts. I knock on the earth for my friend. I expect to meet him at every turn; but no friend appears, and perhaps none is dreaming of me. I am tired of frivolous society, in which silence is forever the most natural and the best manners. I would fain walk on the deep waters, but my companions will only walk on shallows and puddles. I am naturally silent in the midst of twenty from day to day, from year to year. I am rarely reminded of their presence.

Two yards of politeness do not make society for me. One complains that I do not take his jokes. I took them before he had done uttering them, and went my way. One talks to me of his apples and pears, and I depart with my secret untold. His are not the apples that tempt me.

Now (September 16, '55), after four or five months of invalidity and worthlessness, I begin to feel some stirrings of life in me.

What a difference between one red-wing blackbird's egg and another's! C. finds one long as a robin's, but narrow, with large black spots on larger end and on side, on or between the bushes by riverside; another much shorter, with a large black spot on the side. Both pale-blue ground.

I have noticed the green oak-balls some days. Now observe the dark evergreen of June.

AUG. 7. To Tarbell Hill again with the Emersons, a-berrying.

Very few berries this year.

Sept. 14. It costs so much to publish, would it not be better for the author to put his manuscripts in a safe?

Sept. 24. P.M. — Up river to Conantum with C.

A very bright and pleasant fall day. The button-bushes pretty well browned with frost (though the maples are but just beginning to blush), their pale-yellowish season past. Nowadays remark the more the upright and fresh green phalanxes of bulrushes when the pontederias are mostly prostrate.

Brought home quite a boat-load of fuel, — one oak rail, on which fishers had stood in wet ground at Bittern Cliff, a white pine rider (?) with a square hole in it made by a woodpecker anciently, so wasted the sap as to leave the knots projecting, several chestnut rails; and I obtained behind Cardinal Shore a large oak stump which I know to have been bleaching there for more than thirty years, with three great gray prongs sprinkled with lichens. It bore above the marks of the original burning. Also, at Clamshell Hill Shore, a chestnut boat-post with a staple in it, which the ice took up last winter, though it had an arm put through it two feet underground. Some much decayed perhaps old red maple stumps at Hubbard's Bath Place. It would be a triumph to get all my winter's wood thus. How much better than to buy a cord coarsely from a farmer, seeing that I get my money's worth! Then it only affords me a momentary satisfaction to see the pile tipped up in the yard. Now I derive a separate and peculiar pleasure from every stick that I find. Each has its history, of which I am reminded when I come to burn it, and under what circumstances I found it. Got home late. C. and I supped together after our work at wooding, and talked it over with great appetites.

Dr. Aikin, in his "Arts of Life," says that "the acorns of warm climates are fit for human food."

Sept. 25. A very fine and warm afternoon after a cloudy morning. Carry Aunt and Sophia a-barberrying to Conantum. Saw two marsh hawks skimming low over the meadows and another, or a hen-hawk, sailing on high.

We got about three pecks of barberries from four or five bushes, but I filled my fingers with prickles to pay for them. With the hands well defended, it would be pleasant picking, they are so handsome, and beside are so abundant and fill up so fast. I take hold the end of the drooping twigs with my left hand, raise them, and then strip downward at once as many clusters as my hand will embrace, commonly bringing away with the raceme two small green leaves or bracts, which I do not stop to pick out. When I come to a particularly thick and handsome wreath of fruit, I pluck the twig entire and bend it around the inside of the basket. Meanwhile the catbird mews in the alders by my side, and the scream of the jay is heard from the wood-side.

In the evening went to Welch's (?) circus with C. Approaching, I perceived the peculiar scent which belongs to such places, a certain sourness in the air, suggesting trodden grass and cigar smoke. The curves of the great tent, at least eight or ten rods in diameter, — the main central curve and wherever it rested on a post, — suggested that the tent was the origin of much of the Oriental architecture, the Arabic perhaps. There was the pagoda in perfection. It is remarkable what graceful attitudes feats of strength and agility seem to require.

Sept. 26. Went up Assabet for fuel. One old piece of oak timber looks as if it had been a brace in a bridge. I get up oak rails here and there, almost as heavy as lead, and leave them to dry somewhat on the bank. Stumps, partially burned, which were brought by the freshet from some newly cleared field last spring; bleached oak trees which were once lopped for a fence; alders and birches which the river ice bent and broke by its weight last spring. It is pretty hard and dirty work.

Oct. 2. Rode [from New Bedford] to Middleborough, thirteen miles. Many quails in road. Passed over a narrow neck between the two Quitticus ponds, after first visiting Great Quitticus on right of road and gathering clamshells there, as I had done at Long Pond and intend to do at Assawampsett. These shells labelled will be good mementos of the ponds.

Returning along the shore, we saw a man and woman putting off in a small boat, the first we had seen. The man was black. He rowed, and the woman steered. R. called to them. They approached within a couple of rods in the shallow water. "Come nearer," said R. "Don't be afraid; I ain't a-going to hurt you." The woman answered, "I never saw the man yet that I was afraid of." The man's name was Thomas Smith, and, in answer to R.'s very direct questions as to how much he was of the native stock, said that he was one-fourth Indian. He then asked the woman, who sat unmoved in the stern with a brown dirt-colored dress on, a regular countrywoman with half an acre of face (squaw-like), having first inquired of Tom if she was his woman, how much Indian blood she had in her. She did not answer directly so home a question, yet at length as good as acknowledged to one-half Indian, and said that she came from Carver, where she had a sister; the only half-breeds about here. Said her name was Sepit, but could not spell it. R. said, "Your nose looks rather Indiany." Where will you find a Yankee and his wife going a-fishing thus? They lived on the shore. Tom said he had seen turtles in the pond that weighed between fifty and sixty; had caught a pickerel that morning

that weighed four or five pounds; had also seen them washed up with another in their mouths.

Their boat was of peculiar construction, and T. said it was called a sharper; with very high sides and a remarkable run on the bottom aft, and the bottom boards were laid across, coming out flush, and the sides set on them. An ugly model.

This boat had a singular "wooden grapple," as Tom called it, made in form of a cross, thus: with a stone within.

The arrowheads hereabouts are commonly white quartz.

R. says "gamble-roof." This should be "gambrel," apparently from the hind leg of a horse, — crooked like it.

Oct. 12. Carried home a couple of rails which I fished out of the bottom of the river and left on the bank to dry about three weeks ago. One was a chestnut which I have noticed for some years on the bottom of the Assabet, just above the spring on the east side, in a deep hole. It looked as if it had been there a hundred years. It was so heavy that C. and I had as much as we could do to lift it, covered with mud, on to the high bank. It was scarcely lighter to-day, and I amused myself with asking several to lift one half of it after I had sawed it in two. They failed at first, not being prepared to find it so heavy, though they could easily lift it afterward.

Oct. 16. P.M. — To the white pine grove beyond Beck Stow's.

How evenly the freshly fallen pine-needles are spread on the ground! quite like a carpet. Throughout this grove no square foot is left bare. I dug down with a stick and found that the layers of three or four years could be distinguished with considerable ease, and much deeper the old needles were raised in flakes or layers still. The topmost, or this year's, were fawn-colored; last year's, dark dull reddish; and so they went on, growing darker and more decayed, till, at the depth of three inches, where, perhaps, the needles were fifteen or twenty years old, they began to have the aspect of a dark loose-lying virgin mould, mixed with roots (pine cones and sticks a little higher). The freshly fallen needles lay as evenly strewn as if sifted over the whole surface, giving it a uniform neat fawn-color, tempting one to stretch himself on it. They rested alike on the few green leaves of weeds and the fallen cones and the cobwebs between them, in every direction across one another like joggle-sticks. In course of years they are beaten by rain and snow into a coarse, thick matting or felt to cover the roots of the trees with.

Oct. 18. Last night I was reading Howitt's account of the Australian gold-diggings, and had in my mind's eye the numerous valleys with their streams all cut up with foul pits, ten to a hundred feet deep and half a dozen feet across, as close as they can be dug, and half full of water, where men furiously rushed to probe for their fortunes, uncertain where they shall break ground, not knowing but the gold is under their camp itself; sometimes digging a hundred and sixty feet before they strike the vein, or then missing it by a foot; turned into demons and regardless of each other's rights in their thirst after riches; whole valleys for thirty miles suddenly honeycombed by the pits of the miners, so that hundreds are drowned in them. Standing in water and covered

with mud and clay, they work night and day, dying of exposure and disease. Having read this and partly forgotten it, I was thinking of my own unsatisfactory life, doing as others do without any fixed star habitually in my eye, my foot not planted on any blessed isle. Then, with that vision of the diggings before me, I asked myself why I might not be washing some gold daily, though it were only the finest particles, or might not sink a shaft down to the gold within me and work that mine. There is a Ballarat or Bendigo for you. What though it were a "Sulky Gully"? Pursue some path, however narrow and crooked, in which you can walk with love and reverence. Wherever a man separates from the multitude and goes his own way, there is a fork in the road, though the travellers along the highway see only a gap in the paling.

P.M. — To Great Meadows to observe the hummocks left by the ice. I find the white fragments of a tortoise-shell in the meadow, — thirty or forty pieces, straight-sided polygons, — which apparently a hay-cart passed over. They look like broken crockery. I brought it home and amused myself with putting it together. It is a painted tortoise. The variously formed sections or component parts of the shell are not broken, but only separated. To restore them to their places is like the game which children play with pieces of wood completing a picture. It is surprising to observe how these different parts are knitted together by countless minute teeth on their edges. Then the scales, which are not nearly so numerous, and therefore larger commonly, are so placed over the former as to break joints always, as appears by the indented lines at their edges and the serrations of the shell. These scales, too, slightly overlap each other, i.e. the foremost over the next behind, so that they may not be rubbed off. Thus the whole case is bound together like a very stout band-box. The bared shell is really a very interesting study. The sternum in its natural position looks like a well-contrived drag, turned up at the sides in one solid piece.

When I was surveying for Legross, as we went to our work in the morning, we passed by the Dudley family tomb, and Legross remarked to me, all in good faith, "Would n't you like to see old Daddy Dudley? He lies in there. I'll get the keys if you'd like. I sometimes go in and look at him."

Those bright-red marks on the marginal scales of the painted tortoise remind me of some Chinese or other Oriental lacquer-work on waiters (?). This color fades to a pale yellow. The color is wholly in the scale above the bone. Of the bright colors, the yellow marks on tortoise-shells are the fastest.

How much beauty in decay! I pick up a white oak leaf, dry and stiff, but yet mingled red and green, October-like, whose pulpy part some insect has eaten beneath, exposing the delicate network of its veins. It is very beautiful held up to the light, — such work as only an insect eye could perform. Yet, perchance, to the vegetable kingdom such a revelation of ribs is as repulsive as the skeleton in the animal kingdom. In each case it is some little gourmand, working for another end, that reveals the wonders of nature. There are countless oak leaves in this condition now, and also with a submarginal line of network exposed.

Men rush to California and Australia as if the true gold were to be found in that direction; but that is to go to the very opposite extreme to where it lies. They go prospecting further and further away from the true lead, and are most unfortunate when most successful. Is not our native soil auriferous? Does not a stream from the golden mountains flow through our native valley? and has it not for more than geologic ages been bringing down the shining particles and the nuggets? Yet, strange to tell, if a digger steal away prospecting for this true gold into the unexplored solitudes, there is no danger, alas, that any will dog his steps and endeavor to supplant him. He may claim and undermine the whole valley, even the cultivated and uninhabited portions, his whole life long in peace, and no one will ever dispute his claim.

To rebuild the tortoise-shell is a far finer game than any geographical or other puzzle, for the pieces do not merely make part of a plane surface, but you have got to build a roof and a floor and the connecting walls. These are not only thus dovetailed and braced and knitted and bound together, but also held together by the skin and muscles within. It is a band-box.

Oct. 19. P.M. — To Pine Hill for chestnuts.

I see Mrs. Riordan and her little boy coming out of the woods with their bundles of fagots on their backs. It is surprising what great bundles of wood an Irish-woman will contrive to carry. I confess that though I could carry one I should hardly think of making such a bundle of them. They are first regularly tied up, and then carried on the back by a rope, — somewhat like the Indian women and their straps. There is a strange similarity; and the little boy carries his bundle proportionally large. The sticks about four feet long. They make haste to deposit their loads before I see them, for they do not know how pleasant a sight it is to me. The Irishwoman does the squaw's part in many respects.

When, returning at 5 o'clock, I pass the pond in the road, I see the sun, which is about entering the grosser hazy atmosphere above the western horizon, brilliantly reflected in the pond, — a dazzling sheen, a bright golden shimmer. His broad sphere extended stretches the whole length of the pond toward me. First, in the extreme distance, I see a few sparkles of the gold on the dark surface; then begins a regular and solid column of shimmering gold, straight as a rule, but at one place, where a breeze strikes the surface from one side, it is remarkably spread or widened, then recovers its straightness again, thus: Again it is remarkably curved, say thus: then broken into several pieces, then straight and entire again, then spread or blown aside at the point like smoke from a chimney, thus: Of course, if there were eyes enough to occupy all the east shore, the whole pond would be seen as one dazzling shimmering lake of melted gold. Such beauty and splendor adorns our walks!

Talking with Bellew this evening about Fourierism and communities, I said that I suspected any enterprise in which two were engaged together. "But," said he, "it is difficult to make a stick stand unless you slant two or more against it." "Oh, no," answered I, "you may split its lower end into three, or drive it single into the ground, which is the best way; but most men, when they start on a new enterprise, not only

figuratively, but really, pull up stakes. When the sticks prop one another, none, or only one, stands erect."

He showed me a sketch of Wachusett. Spoke of his life in Paris, etc. I asked him if he had ever visited the Alps and sketched there. He said he had not. Had he been to the White Mountains? "No," he answered, "the highest mountains I have ever seen were the Himalayas, though I was only two years old then." It seems that he was born in that neighborhood.

He complains that the Americans have attained to bad luxuries, but have no comforts.

Oct. 20. I have collected and split up now quite a pile of driftwood, — rails and riders and stems and stumps of trees, — perhaps half or three quarters of a tree. It is more amusing, not only to collect this with my boat and bring it up from the river on my back, but to split it also, than it would be to speak to a farmer for a load of wood and to saw and split that. Each stick I deal with has a history, and I read it as I am handling it, and, last of all, I remember my adventures in getting it, while it is burning in the winter evening. That is the most interesting part of its history. It has made part of a fence or a bridge, perchance, or has been rooted out of a clearing and bears the marks of fire on it. When I am splitting it, I study the effects of water on it, and, if it is a stump, the curiously winding grain by which it separates into so many prongs, — how to take advantage of its grain and split it most easily. I find that a dry oak stump will split pretty easily in the direction of its diameter, but not at right angles with it or along its circles of growth. I got out some good knees for a boat. Thus one half the value of my wood is enjoyed before it is housed, and the other half is equal to the whole value of an equal quantity of the wood which I buy.

Some of my acquaintances have been wondering why I took all this pains, bringing some nearly three miles by water, and have suggested various reasons for it. I tell them in my despair of making them understand me that it is a profound secret, — which it has proved, — yet I did hint to them that one reason was that I wanted to get it. I take some satisfaction in eating my food, as well as in being nourished by it. I feel well at dinner-time as well as after it. The world will never find out why you don't love to have your bed tucked up for you, — why you will be so perverse. I enjoy more drinking water at a clear spring than out of a goblet at a gentleman's table. I like best the bread which I have baked, the garment which I have made, the shelter which I have constructed, the fuel which I have gathered.

Oct. 21. It began to rain about 10 o'clock last evening after a cloudy day, and it still rains, gently but steadily, this morning. The wind must be east, for I hear the church bell very plainly; yet I sit with an open window, it is so warm.

I enjoyed getting that large oak stump from Fair Haven some time ago, and bringing it home in my boat. I tipped it in with the prongs up, and they spread far over the sides of the boat. There was no passing amidships. I much enjoyed this easy carriage of it, floating down the Musketaquid from far. It was a great stump and sunk my boat considerably, and its prongs were so in the way that I could take but a short stroke

with my paddle. I enjoyed every stroke of my paddle, every rod of my progress, which advanced me so easily nearer to my port. It was as good as to sit by the best oak wood fire. I still enjoy such a conveyance, such a victory, as much as boys do riding on a rail. All the upper part of this, when I came to split it, I found to be very finely honeycombed, reduced to a coarse cellular mass, apparently by shrinkage and wasting; but it made excellent fuel, nevertheless, as if all the combustible part remained. Only the earthy had returned to earth.

I have been thinking over with Father the old houses in this street. There was the Hubbard (?) house at the fork of the roads; the Thayer house (now Garrison's); Sam Jones's (now Channing's); Willoughby Prescott's (a bevel-roof, which I do not remember), where Loring's is (Hoar's was built by a Prescott); Ma'm Bond's; the Jones Tavern (Bigelow's); the old Hurd (or Cumming's?) house; the Dr. Hurd house; the old mill; and the Richardson Tavern (which I do not remember). On this side, the Monroe house, in which we lived; the Parkman house, which William Heywood told me twenty years ago that he helped raise the rear of sixty years before (it then sloping to one story behind), and that then it was called an old house (Dr. Ripley said that a Bond built it); the Merrick house; a rough-cast house where Bates's is (Betty?); and all the south side of the Mill-Dam. Still further from the centre the old houses and sites are about as numerous as above. Most of these houses slanted to one story behind.

Oct. 22. The Plymouth fishermen have just come home from the Banks, except one.

Oct. 23. The streets are strewn with buttonwood leaves, which rustle under your feet, and the children are busy raking them into heaps, some for bonfires. The sugar maples on the Common stand dense masses of rich yellow leaves with a deep scarlet blush, — far more than blush. They are remarkably brilliant this year on the exposed surfaces. The last are as handsome as any trees in the street. I am struck with the handsome form and clear, though very pale, say lemon, yellow of the black birch leaves on sprouts in the woods, finely serrate and distinctly plaited from the midrib. I plucked three leaves from the end of a red maple shoot, an underwood, each successively smaller than the last, the brightest and clearest scarlet that I ever saw. These and the birch attracted universal admiration when laid on a sheet of white paper and passed round the supper table, and several inquired particularly where I found them. I never saw such colors painted. They were without spot; ripe leaves.

Now is the time for chestnuts. A stone cast against the trees shakes them down in showers upon one's head and shoulders. But I cannot excuse myself for using the stone. It is not innocent, it is not just, so to maltreat the tree that feeds us. I sympathize with the tree, yet I heaved a big stone against the trunks like a robber, — not too good to commit murder. I trust that I shall never do it again. It is worse than boorish, it is criminal, to inflict an unnecessary injury on the tree that feeds or shadows us. Old trees are our parents, and our parents' parents, perchance. If you would learn the secrets of Nature, you must practice more humanity than others. I was affected as if I had cast a rock at a sentient being, — with a duller sense than my own, it is true, but yet a distant relation.

Faded white ferns now at Saw Mill Brook. They press yellow or straw-color.

Oct. 26. I see a red squirrel dash out from the wall, snatch an apple from amid many on the ground, and, running swiftly up the tree with it, proceed to eat it, sitting on a smooth dead limb, with its back to the wind and its tail curled close over its back. It allows me to approach within eight feet. It holds the apple between its two fore paws and scoops out the pulp, mainly with its lower incisors, making a saucer-like cavity, high and thin at the edge, where it bites off the skin and lets it drop. It keeps its jaws a-going very fast, from time to time turning the apple round and round with its paws (as it eats), like a wheel in a plane at right angles to its body. It holds it up and twirls it with ease. Suddenly it pauses, having taken alarm at something, then drops the remainder of the apple in the hollow of the bough and glides off by short snatches, uttering a faint, sharp bird-like note.

I sometimes think that I must go off to some wilderness where I can have a better opportunity to play life, — can find more suitable materials to build my house with, and enjoy the pleasure of collecting my fuel in the forest. I have more taste for the wild sports of hunting, fishing, wigwam-building, making garments of skins, and collecting wood wherever you find it, than for butchering, farming, carpentry, working in a factory, or going to a wood market.

Oct. 28. As I paddle under the Hemlock bank this cloudy afternoon, about 3 o'clock, I see a screech owl sitting on the edge of a hollow hemlock stump about three feet high, at the base of a large hemlock. It sits with its head drawn in, eyeing me, with its eyes partly open, about twenty feet off. When it hears me move, it turns its head toward me, perhaps one eye only open, with its great glaring golden iris. You see two whitish triangular lines above the eyes meeting at the bill, with a sharp reddish-brown triangle between and a narrow curved line of black under each eye. At this distance and in this light, you see only a black spot where the eye is, and the question is whether the eyes are open or not. It sits on the lee side of the tree this raw and windy day. You would say that this was a bird without a neck. Its short bill, which rests upon its breast, scarcely projects at all, but in a state of rest the whole upper part of the bird from the wings is rounded off smoothly, excepting the horns, which stand up conspicuously or are slanted back. After watching it ten minutes from the boat, I landed two rods above, and, stealing quietly up behind the hemlock, though from the windward, I looked carefully around it, and, to my surprise, saw the owl still sitting there. So I sprang round quickly, with my arm outstretched, and caught it in my hand. It was so surprised that it offered no resistance at first, only glared at me in mute astonishment with eyes as big as saucers. But ere long it began to snap its bill, making quite a noise, and, as I rolled it up in my handkerchief and put it in my pocket, it bit my finger slightly. I soon took it out of my pocket and, tying the handkerchief, left it on the bottom of the boat. So I carried it home and made a small cage in which to keep it, for a night. When I took it up, it clung so tightly to my hand as to sink its claws into my fingers and bring blood.

When alarmed or provoked most, it snaps its bill and hisses. It puffs up its feathers to nearly twice its usual size, stretches out its neck, and, with wide-open eyes, stares this way and that, moving its head slowly and undulatingly from side to side with a curious motion. While I write this evening, I see that there is ground for much superstition in it. It looks out on me from a dusky corner of its box with its great solemn eyes, so perfectly still itself. I was surprised to find that I could imitate its note as I remember it, by a guttural whinnering.

A remarkably squat figure, being very broad in proportion to its length, with a short tail, and very catlike in the face with its horns and great eyes. Remarkably large feet and talons, legs thickly clothed with whitish down, down to the talons. It brought blood from my fingers by clinging to them. It would lower its head, stretch out its neck, and, bending it from side to side, peer at you with laughable circumspection; from side to side, as if to catch or absorb into its eyes every ray of light, strain at you with complacent yet earnest scrutiny. Raising and lowering its head and moving it from side to side in a slow and regular manner, at the same time snapping its bill smartly perhaps, and faintly hissing, and puffing itself up more and more, — cat-like, turtle-like, both in hissing and swelling. The slowness and gravity, not to say solemnity, of this motion are striking. There plainly is no jesting in this case.

General color of the owl a rather pale and perhaps slightly reddish brown, the feathers centred with black. Perches with two claws above and two below the perch. It is a slight body, covered with a mass of soft and light-lying feathers. Its head muffled in a great hood. It must be quite comfortable in winter. Dropped a pellet of fur and bones (?) in his cage. He sat, not really moping but trying to sleep, in a corner of his box all day, yet with one or both eyes slightly open all the while. I never once caught him with his eyes shut. Ordinarily stood rather than sat on his perch.

Oct. 29. P.M. — Up Assabet.

Carried my owl to the hill again. Had to shake him out of the box, for he did not go of his own accord. (He had learned to alight on his perch, and it was surprising how lightly and noiselessly he would hop upon it.) There he stood on the grass, at first bewildered, with his horns pricked up and looking toward me. In this strong light the pupils of his eyes suddenly contracted and the iris expanded till they were two great brazen orbs with a centre spot merely. His attitude expressed astonishment more than anything. I was obliged to toss him up a little that he might feel his wings, and then he flapped away low and heavily to a hickory on the hillside twenty rods off. (I had let him out in the plain just east of the hill.) Thither I followed and tried to start him again. As I moved around him, he turned his head always toward me, till he looked directly behind himself as he sat crosswise on a bough. He behaved as if bewildered and dazzled, gathering all the light he could and ever straining his great eyes toward you to make out who you are, but not inclining to fly. He never appeared so much alarmed as surprised and astonished.

When I moved him in his cage he would cling to the perch, though it was in a perpendicular position, one foot above another, suggesting his habit of clinging to and climbing the inside of hollow trees.

I have got a load of great hardwood stumps. For sympathy with my neighbors I might about as well live in China. They are to me barbarians, with their committee-works and gregariousness.

## NOVEMBER, 1855

Nov. 1. Thursday. P. M. — Up Assabet, a-wooding.

After a rain-threatening morning it is a beautiful Indian-summer day, the most remarkable hitherto and equal to any of the kind. Yet we kept fires in the forenoon, the warmth not having got into the house. It is akin to sin to spend such a day in the house. The air is still and warm. This, too, is the recovery of the year, — as if the year, having nearly or quite accomplished its work, and abandoned all design, were in a more favorable and poetic mood, and thought rushed in to fill the vacuum. The river is perfectly smooth. Whole schools of little minnows leap from the surface at once with a silvery gleam. The wool-grass, with its drooping head and the slender withered leaves dangling about its stem, stands in little sheaves upon its tussocks, clean dry straw, and is thus reflected in the water. This is the November shore. The maples and swamp oaks and willows are for the most part bare, but some of the oaks are partly clothed yet with withered ones [sic]. I see one white maple quite thick and green, and some black willows are thinly clad with green leaves, and many yellowish leaves are seen on the sallows rising above the bare button-bushes. Yet I see no painted tortoises out, and I think it is about a fortnight since I saw any.

As I pushed up the river past Hildreth's, I saw the blue heron (probably of last Monday) arise from the shore and disappear with heavily-flapping wings around a bend in front; the greatest of the bitterns (*Ardeoe*), with heavily-undulating wings, low over the water, seen against the woods, just disappearing round a bend in front; with a great slate-colored expanse of wing, suited to the shadows of the stream, a tempered blue as of the sky and dark water commingled. This is the aspect under which the Musketaquid might be represented at this season: a long, smooth lake, reflecting the bare willows and button-bushes, the stubble, and the wool-grass on its tussock, a muskrat-cabin or two conspicuous on its margin amid the unsightly tops of *pontederia*, and a bittern disappearing on undulating wing around a bend.

The wood I get is pretty rotten. The under side of an oak which has lain for years on the miry bank is turned almost to mould, — in this I find ants, — while the upper is hard and dry. Or else it is stumps whose fangs have so rotted off that I can kick them over at last, but then I must shake out a half a peck or more of mould. I made out to get one great and heavy stump to the water twenty rods distant by ant-like turning it over and over laboriously. It sunk my craft low in the water. Others are boughs which

in the winter fell or were dragged down by the ice, their tops in the water and their butts on shore. These I saw off where they dip into the water, though the saw pinches.

Returning in the twilight, I see a bat over the river.

Nov. 4. P. M. — To Hill by Assabet.

This forenoon the boys found a little black kitten about a third grown on the Island or Rock, but could not catch it. We supposed that some one had cast it in to drown it. This afternoon, as I was paddling by the Island, I saw what I thought a duck swimming down the river diagonally, to the south shore just below the grassy island, opposite the rock; then I thought it two ducks, then a muskrat. It passed out of sight round a bend. I landed and walked alongshore, and found that it was a kitten, which had just got ashore. It was quite wet excepting its back. It swam quite rapidly, the whole length of its back out, but was carried down about as fast by the stream. It had probably first crossed from the rock to the grassy island, and then from the lower end of this to the town side of the stream, on which side it may have been attracted by the noise of the town. It was rather weak and staggered as it ran, from starvation or cold, being wet, or both. A very pretty little black kitten.

It is a dark, almost rainy day. Though the river appears to have risen considerably, it is not more than nine or ten inches above the lowest summer level, as I see by the bridge. Yet it brings along a little driftwood. Whatever rails or boards have been left by the water's edge the river silently takes up and carries away. Much small stuff from the pail-factory.

The winter is approaching. The birds are almost all gone. The note of the dee de de sounds now more distinct, prophetic of winter, as I go amid the wild apples on Nawshawtuct. The autumnal dandelion sheltered by this apple-tree trunk is drooping and half closed and shows but half its yellow, this dark, late, wet day in the fall.

Gathered a bag of wild apples. A great part are decayed now on the ground. The snail slug is still eating them. Some have very fiery crimson spots or eyes on a very white ground.

Returned, and went up the main stream. Larches are now quite yellow, — in the midst of their fall.

The river-brink — at a little distance at least — is now all sere and rustling, except a few yellowed sallow leaves, though beyond in the meadows there is some fresh greenness, but cattle seem to stray wider for food than they did. They are turned into the meadows now, where is all the greenness. New fences are erected to take advantage of all the fall feed. But the rank herbage of the rivers brink is more tender and has fallen before the frosts. Many new muskrat-houses have been erected this wet weather, and much gnawed root is floating. When I look away to the woods, the oaks have a dull, dark red now, without brightness. The willow-tops on causeways have a pale, bleached, silvery, or wool-grass-like look.

See some large flocks of *F. hyemalis*, which fly with a clear but faint chinking chirp, and from time to time you hear quite a strain, half warbled, from them. They rise in

a body from the ground and fly to the trees as you approach. There are a few tree sparrows with them. These and one small soaring hawk are all the birds I see.

I have failed to find White pine seed this year, though I began to look for it a month ago. The cones were fallen and open. Look the first of September.

From my experience with wild apples I can understand that there may be a reason for a savage preferring many kinds of food which the civilized man rejects. The former has the palate of an outdoor man. It takes a savage or wild taste to appreciate a wild apple. I remember two old maids to whose house I enjoyed carrying a purchaser to talk about buying their farm in the winter, because they offered us wild apples, though with an unnecessary apology for their wildness.

Nov. 5. I hate the present modes of living and getting a living. Farming and shop-keeping and working at a trade or profession are all odious to me. I should relish getting my living in a simple, primitive fashion. The life which society proposes to me to live is so artificial and complex — bolstered up on many weak supports, and sure to topple down at last — that no man surely can ever be inspired to live it, and only “old fogies” ever praise it. At best some think it their duty to live it. I believe in the infinite joy and satisfaction of helping myself and others to the extent of my ability. But what is the use in trying to live simply, raising what you eat, making what you wear, building what you inhabit, burning what you cut or dig, when those to whom you are allied insanely want and will have a thousand other things which neither you nor they can raise and nobody else, perchance, will pay for? The fellow-man to whom you are yoked is a steer that is ever bolting right the other way.

I was suggesting once to a man who was wincing under some of the consequences of our loose and expensive way of living, “But you might raise all your own potatoes, etc., etc.” We had often done it at our house and had some to sell. At which he demurring, I said, setting it high, “You could raise twenty bushels even.”

“But,” said he, “I use thirty-five.”

“How large is your family?”

“A wife and three infant children.” This was the real family; I need not enumerate those who were hired to help eat the potatoes and waste them. So he had to hire a man to raise his potatoes.

Thus men invite the devil in at every angle and then prate about the garden of Eden and the fall of man.

I know many children to whom I would fain make a present on some one of their birthdays, but they are so far gone in the luxury of presents — have such perfect museums of costly ones — that it would absorb my entire earnings for a year to buy them something which would not be beneath their notice.

P. M. — To foot of Fair Haven Hill via Hubbard’s Grove.

I see the shepherd’s-purse, hedge-mustard, and red clover, — November flowers. Crossing the Depot Field Brook, I observe the downy, fuzzy globular tops of the *Aster puniceus*. They are slightly tinged with yellow, compared with the hoary gray of the goldenrod. The distant willow-tops are yellowish like them in the right light.

At Hubbard's Crossing I see a large male hen-harrier skimming over the meadow, its deep slate somewhat sprinkled or mixed with black; perhaps young. It flaps a little and then sails straight forward, so low it must rise at every fence. But I perceive that it follows the windings of the meadow over many fences. I pass a great white pine stump, — half a cord in it and more, — turned up out of a meadow. I look upon it with interest, and wish I had it at my door, for there are many warm fires in that. You could have many thoughts and tell many stories while that was burning.

Walked through Potter's Swamp. That white birch fungus always presents its face to the ground, parallel with it. For here are some on an upright dead birch whose faces or planes are at right angles with the axis of the tree as usual, looking down; but others, attached to the top of the tree, which lies prostrate on the ground, have their planes parallel with the axis of the tree, as if looking round the birch. When the epidermis is cracked, apparently as they grew, they are watered handsomely with white streams an eighth of an inch wide above. They have remarkably thick necks. They protrude through a rent in the bark, carrying it along with their necks, a little way.

The brightness of the foliage generally ceased pretty exactly with October. The still bright leaves which I see as I walk along the river edge of this swamp are birches, clear yellow at top; high blueberry, some very bright scarlet red still; some sallows; *Viburnum nudum*, fresh dark red; alder sprouts, large green leaves. Swamp-pink buds now begin to show. The late growth of the pyrus is now checked by the frost. The bark of many frostweeds is now cracked or burst off, and curled backward in five or six strips for about an inch, leaving the woody part bare at, or an inch above, the ground, sometimes five or six inches above the ground. I suspect the frost is the dying breath of the weed congealed.

I am pleased to see that the lower and larger four or five leaves of the water andromeda on the edge of the meadow next the swamp are pretty commonly turned a dark scarlet now, just as they fall, Confirming my old impression. I have not observed for some years.

A nest made very thick, of grass and stubble, and lined with finer grass and horsehair, as big as a kingbird's, on an alder, within eighteen inches of ground, close to the water, at Cardinal Shore. The alder had been broken down at that height by the ice, and the nest rested on the stub ends. I took a few dead leaves out and to my surprise found an egg, — very pale greenish-blue. Probably the wood thrush, if not the olivaceous one, whose eggs I have not seen described. Not quite so big as a bluebird's. This egg popped and burst suddenly, with a noise about as loud as popping corn, or like a pop-gun, while I held it in my hand in my chamber. It had been addled when new. I had another pop in the chamber some months ago. So you must blow them before you bring them into a warm room.

I am puzzled with the lecheas. Are there not four kinds? First, there is the *L.* major, with broad leaves; and second, the least, with fine spreading branches and with branched shoots at base. Third, there is the very common one, intermediate in size, with large fruit and linear-lanceolate leaves, now commonly fallen. But I see, fourth

(?), this afternoon, one fifteen inches high, half a dozen rods from Cardinal Shore, and stout, with leaves like the third, but fruit very small and abundant (there is apparently a little recent-growth opening of leaves at the extremities of it, some radical shoots on stem six inches from ground!); and fifth, close by, a slender one a foot high, with leaves elliptic pointed, one half inch by one sixth, and larger fruit than last, at top and generally. (May be a variety of *L. major*? It has some leaves like it.) It is perhaps the third kind which, when only three or four inches high now, has such dense linear leaves one half inch plus long, pine-tree-like and spreading branches just above radical shoots.

I find that one of my old oak logs, which was lying on the damp bank of the river, half rotted through below, contained many great black ants gone into winter quarters in those great eaten cells of the rotten wood. Yet this would have been covered with water in the winter. Those with wings were three quarters of an inch or more long. They move but slowly when exposed. In one I set up for splitting in the yard, I find a clamshell, carried in by a muskrat.

Nov. 6. A mizzling rain from the east drives me home from my walk. The knawel in the sand on the railroad causeway grows in dense green tufts like the hudsonia, six or eight inches in diameter and one or two high. It is still in bloom. The gooseberry leaves at the end of the currant row, being wet, are a still more brilliant scarlet.

A great many rainy or mizzling days the last fortnight, yet not much rain.

Pennyroyal has a long time stood withered and dark, blackish brown, in the fields, yet scented.

I can hardly resist the inclination to collect driftwood, to collect a great load of various kinds, which 'will sink my boat low in the water, and paddle or sail slowly home with it. I love this labor so much that I would gladly collect it for some person of simple habits who might want it. Men ordinarily do not have the pleasure of sawing and splitting their wood even, for while they are buying it an Irishman stands by with his sawhorse on his back, and the next thing I see him in their yards — him and his understrapper — sawing for dear life and two shillings a cut. When I think, too, of the many decaying stumps and logs which the coming freshets will carry off perchance to sea. Rails and posts and bits of boards and boughs are carried far into the swamps.

Nov. 7. Another drizzling day, — as fine a mist as can fall.

P. M. — Up Assabet.

I see a painted tortoise swimming under water, and to my surprise another afterward out on a willow trunk this dark day. It is long since I have seen one of any species except the insculpta. They must have begun to keep below and go into winter quarters (?) about three weeks ago.

Looking west over Wheeler's meadow, I see that there has been much gossamer on the grass, and it is now revealed by the dewy mist which has collected on it. Some green-briar leaves still left, a dull red or scarlet, others yellowish; also the silky cornel is conspicuously dull-red, and others yellowish-red. And the sallow on river's brink (not cordata), with a narrow leaf pointed at both ends, shows some clear chrome-

yellow leaves atop. The white birches lose their lower leaves first, and now their tops show crescents or cones of bright-yellow (spiring flames) leaves, some of the topmost even green still. The black willows almost everywhere entirely bare, yet the color of their twigs gives them the aspect of the crisp brown weeds of the river's brink. How completely crisp and shrivelled the leaves and stems of the *Polygonum amphibium* var *terrestre*, still standing above the water and grass!

The river has risen a little more, the North Branch especially, and the pail-stuff which has drifted down it has been carried a few rods up the main stream above the junction. It rises and falls very suddenly, and I was surprised to see the other day a line of sawdust more than a foot above the water's edge, showing that it had risen to that height and suddenly fallen without my knowledge.

Opened a muskrat-house nearly two feet high, but there was no hollow to it. Apparently they do not form that part yet.

I find it good to be out this still, dark, mizzling afternoon; my walk or voyage is more suggestive and profitable than in bright weather. The view is contracted by the misty rain, the water is perfectly smooth, and the stillness is favorable to reflection. I am more open to impressions, more sensitive (not calloused or indurated by sun and wind), as if in a chamber still. My thoughts are concentrated; I am all compact. The solitude is real, too, for the weather keeps other men at home. This mist is like a roof and walls over and around, and I walk with a domestic feeling. The sound of a wagon going over an unseen bridge is louder than ever, and so of other sounds. I am compelled to look at near objects. All things have a soothing effect; the very clouds and mists brood over me. My power of observation and contemplation is much increased. My attention does not wander. The world and my life are simplified. What now of Europe and Asia?

Birds are pretty rare now. I hear a few tree sparrows in one place on the trees and bushes near the river, — a clear, chinking chirp and a half-strain, — a jay at a distance; and see a nuthatch flit with a ricochet flight across the river, and hear his gnah half uttered when he alights.

A gray squirrel — as day before yesterday — runs down a limb of an oak and hides behind the trunk and I lose him. A red one runs along the trees to scold at me, boldly or carelessly, with a chuckling, birdlike note and that other peculiar sound at intervals, between a purr and a grunt. He is more familiar than the gray and more noisy. What sound does the gray make?

Some of my driftwood is the burnt timbers of a mill, which the swollen river has gleaned for me.

Found in Wheeler's potato-field, which has been burned over to get rid of the weeds before digging, near the Hemlocks by river, a little mouse dead. Whole length three inches (minus); tail hardly seven eighths of an inch, so short (less than half the body) I thought at first it had been bitten off by some animal. General color above, a rust of brown or tawny brown, with mouse-color seen through it; beneath, rather hoary mouse-color, but nowhere white; the fur dark-slate. Snout and head blunt, the latter large.

Hind legs longest. Ears quite concealed in the fur. It answers to Emmons's *Arvicola hirsutus*, or meadow mouse, except that it is smaller. Is it a young one? Tips of incisors light-yellow.

Nov. 8. A quite warm and foggy morning. I can sit with my window open and no fire. Much warmer than this time last year. Though there is quite a fog over the river and doubtful weather behind, the reflection of the wool-grass, etc., is quite distinct, the reflection from the fog or mist making the water light for a background.

Nov. 9. 7 A. M. — Grass white and stiff with frost.

9 A. M. — With Blake up Assabet.

A clear and beautiful day after frost.

Looking over the meadow westward from Merrick's Pasture Shore, I see the alders beyond Dodd's, now quite bare and gray (maple-like) in the morning sun (the frost melted off, though I found a little ice on my boat-seat), — that true November sight, — ready to wear frost leaves and to transmit (so open) the tinkle of tree sparrows. How wild and refreshing to see these old black willows of the river-brink, unchanged from the first, which man has never cut for fuel or for timber! Only the muskrat, tortoises, blackbirds, bitterns, and swallows use them.

Two blackbirds fly over pretty near, with a chuck, — either red-wings or grackles, but I see no red. See a painted tortoise and a wood tortoise in different places out on the bank still!

Saw in the pool at the Hemlocks what I at first thought was a brighter leaf moved by the zephyr on the surface of the smooth dark water, but it was a splendid male summer duck, which allowed us to approach within seven or eight rods, sailing up close to the shore, and then rose and flew up the curving stream. We soon overhauled it again, and got a fair and long view of it. It was a splendid bird, a perfect floating gem, and Blake, who had never seen the like, was greatly surprised, not knowing that so splendid a bird was found in this part of the world. There it was, constantly moving back and forth by invisible means and wheeling on the smooth surface, showing now its breast, now its side, now its rear. It had a large, rich, flowing, green burnished crest, — a most ample head-dress, — two crescents of dazzling white on the side of the head and the black neck, a pinkish (?) -red bill (with black tip) and similar irides, and a long white mark under and at wing point on sides; the side, as if the form of wing at this distance, light bronze or greenish brown; but, above all, its breast, when it turns into the right light, all aglow with splendid purple (?) or ruby (?) reflections, like the throat of the hummingbird. It might not appear so close at hand. This was the most surprising to me. What an ornament to a river to see that glowing gem floating in contact with its waters! As if the hummingbird should recline its ruby throat and its breast on the water. Like dipping a glowing coal in water! It so affected me.

It became excited, fluttered or flapped its wings with a slight whistling noise, and arose and flew two or three rods and alighted. It sailed close up to the edge of a rock, by which it lay pretty still, and finally sailed fast up one side of the river by the willows, etc., off the duck swamp beyond the spring, now and then turning and sailing back

a foot or two, while we paddled up the opposite side a rod in the rear, for twenty or thirty rods. At length we went by it, and it flew back low a few rods to where we roused it. It never offered to dive. We came equally near it again on our return. Unless you are thus near, and have a glass, the splendor and beauty of its colors will not be discovered.

Found a good stone jug, small size, floating stopple up. I drew the stopple and smelled, as I expected, molasses and water, or something stronger (black-strap?), which it had contained. Probably some meadow-haymakers' jug left in the grass, which the recent rise of the river has floated off. It will do to put with the white pitcher I found and keep flowers in. Thus I get my furniture.

Yesterday I got a perfectly sound oak timber, eight inches square and twenty feet long, which had lodged on some rocks. It had probably been the sill of a building. As it was too heavy to lift aboard, I towed it. As I shall want some shelves to put my Oriental books on, I shall begin to save boards now.

I deal so much with my fuel, — what with finding it, loading it, conveying it home, sawing and splitting it, — get so many values out of it, am warmed in so many ways by it, that the heat it will yield when in the stove is of a lower temperature and a lesser value in my eyes, — though when I feel it I am reminded of all my adventures. I just turned to put on a stick. I had my choice in the box of gray chestnut rail, black and brown snag of an oak stump, dead white pine top, gray and round, with stubs of limbs, or else old bridge plank, and chose the last. Yes, I lose sight of the ultimate uses of this wood and work, the immediate ones are so great, and yet most of mankind, those called most successful in obtaining the necessaries of life, — getting their living, — obtain none of this, except a mere vulgar and perhaps stupefying warmth. I feel disposed, to this extent, to do the getting a living and the living for any three or four of my neighbors who really want the fuel and will appreciate the act, now that I have supplied myself. There was a fat pine plank, heavy as lead, I gave to Aunt L. for kindling.

That duck was all jewels combined, showing different lustres as it turned on the unrippled element in various lights, now brilliant glossy green, now dusky violet, now a rich bronze, now the reflections that sleep in the ruby's grain.

I see floating, just above the Hemlocks, the large sliding door of a railroad car, burnt to a cinder on one side and lettered in large bright-yellow letters on the other, "Cheshire 1510." It may have been cast over at the railroad bridge.

I affect what would commonly be called a mean and miserable way of living. I thoroughly sympathize with all savages and gypsies in so far as they merely assert the original right of man to the productions of Nature and a place in her. The Irishman moves into the town, sets up a shanty on the railroad land, and then gleans the dead wood from the neighboring forest, which would never get to market. But the so-called owner forbids it and complains of him as a trespasser. The highest law gives a thing to him who can use it.

Nov. 11. P. M. — Up Assabet.

As long as the sun is out, it is warm and pleasant.

The water is smooth. I see the reflections, not only of the wool-grass, but the bare button-bush, with its brown balls beginning to crumble and show the lighter inside, and the brittle light-brown twigs of the black willow, and the coarse rustling sedge, now completely withered (and hear it pleasantly whispering), and the brown and yellowish sparganium blades curving over like well-tempered steel, and the gray cottony mikania.

The bricks of which the muskrat builds his house are little masses or wads of the dead weedy rubbish on the muddy bottom, which it probably takes up with its mouth. It consists of various kinds of weeds, now agglutinated together by the slime and dried confervæ threads, utricularia, horn wort, etc., — a streaming, tuft-like wad. The building of these cabins appears to be coincident with the commencement of their clam diet, for now their vegetable food, excepting roots, is cut off. I see many small collections of shells already left along the river's brink. Thither they resort with their clam to open and eat it. But if it is the edge of a meadow which is being overflowed, they must raise it and make a permanent dry stool there, for they cannot afford to swim far with each clam. I see where one has left half a peck of shells on perhaps the foundation of an old stool or a harder clod, which the water is just about to cover, and he has begun his stool by laying two or three fresh wads upon the shells, the foundation of his house. Thus their cabin is first apparently intended merely for a stool, and afterward, when it is large, is perforated as if it were the bank! There is no cabin for a long way above the Hemlocks, where there is no low meadow bordering the stream.

The clamshells freshly opened are handsomest this month (or rather are most observable, before the ice and snow conceal them) and in the spring.

I am surprised to see quite a number of painted tortoises out on logs and stones and to hear the wood tortoise rustling down the bank. Frogs are rare and sluggish, as if going into winter quarters. A cricket also sounds rather rare and distinct.

At the Hemlocks I see a narrow reddish line of hemlock leaves and, half an inch below, a white line of sawdust, eight inches above the present surface, on the upright side of a rock, both mathematically level. This chronicles the hemlock fall, which I had not noticed, we have so few trees, and also the river's rise. The North Branch must have risen suddenly before the South, for I see much pail-stuff from the Fort Pond Brook, which has been carried eighteen rods up the latter stream above the Rock, or as far as it extends immediately due west there. By "pail-stuff" I mean the curved and grooved pieces which form the sides and the flat ones for the bottom and their trimmings.

High blueberry leaves still conspicuous bright scarlet; also duller and darker green-briar leaves hold on on the Island.

I hear gray squirrels coursing about on the dry leaves, pursuing one another, and now they come in sight, coursing from pine to pine on their winding way, on their unwearable legs, on their undulating and winding course. It is a motion intermediate between running and flying. I hear but a tree sparrow and a chickadee this voyage.

Nov. 13. In mid-forenoon (10.45), seventy or eighty geese, in three harrows successively smaller, flying southwest — pretty well west — over the house. A completely overcast, occasionally drizzling forenoon. I at once heard their clangor and rushed to and opened the window. The three harrows were gradually formed into one great one before they were out of sight, the geese shifting their places without slacking their progress.

P. M. — To Cardinal Shore.

Going over Swamp Bridge Brook at 3 p. M., I saw in the pond by the roadside, a few rods before me, the sun shining bright, a mink swimming, the whole length of his back out. It was a rich brown fur, glowing internally as the sun fell on it, like some ladies' boas, not black, as it sometimes appears, especially on ice. It landed within three rods, showing its long, somewhat cat-like neck, and I observed was carrying something by its mouth, dragging it overland. At first I thought it a fish, maybe an eel, and when it had got half a dozen feet, I ran forward, and it dropped its prey and went into the wall. It was a muskrat, the head and part of the fore legs tom off and gone, but the rest still fresh and quite heavy, including hind legs and tail. It had probably killed this muskrat in the brook, eaten so much, and was dragging the remainder to its retreat in the wall.

A fine clear afternoon after the misty morning and heavy rain of the night. Even after all this rain I see the streaming lines of gossamer from trees and fences. From Fair Haven Hill the air is clear and fine-grained, and now it is a perfect russet November landscape, — including the reddish brown of the oaks, excepting where the winter-rye fields and some low meadows show their green, the former quite bright, and also the evergreen patches of pines, edged in the northwest by the blue mountain ridges.

Got the wood thrush's (?) nest of November 5th. It is about five inches [in] diameter from outside to outside, and two and a half within. Outside of some weedy tufts (beneath), weed stems and stubble (some dry galium stems, small), and lined with a little fine grass and horsehair. I found the egg partly concealed by some dry alder leaves which had fallen into the nest.

Nov. 14. Minott hears geese to-day.

Heard to-day in my chamber, about 11 A. M., a singular sharp crackling sound by the window, which made me think of the snapping of an insect (with its wings, or striking something). It was produced by one of three small pitch pine cones which I gathered on the 7th, and which lay in the sun on the window-sill. I noticed a slight motion in the scales at the apex, when suddenly, with a louder crackling, it burst, or the scales separated, with a snapping sound on all sides of it. It was a general and sudden bursting or expanding of all the scales with a sharp crackling sound and motion of the whole cone, as by a force pent up within it.

I suppose the strain only needed to be relieved in one point for the whole to go off.

I was remarking to-day to Mr. Rice on the pleasantness of this November thus far, when he remarked that he remembered a similar season fifty-four years ago, and he remembered it because on the 13th of November that year he was engaged in pulling

turnips and saw wild geese go over, when one came to tell him that his father was killed by a bridge giving way when his team was crossing it, and the team falling on him walking at its side.

P. M. — Up Assabet with Sophia.

A clear, bright, warm afternoon. A painted tortoise swimming under water and a wood tortoise out on the bank. The rain has raised the river an additional foot or more, and it is creeping over the meadows. My boat is two thirds full and hard to come at. The old weedy margin is covered and a new grassy one acquired. The current is stronger, though the surface is pretty smooth. Much small rubbish is drifting down and slowly turning in the eddies. The motion of my boat sends an undulation to the shore, which rustles the dry sedge half immersed there, as if a tortoise were tumbling through it. Leaves and sticks and billets of wood come floating down in middle of the full, still stream, turning round in the eddies, and I mistake them for ducks at first. See two red-wing blackbirds alight on a black willow.

Nov. 15. The river rising. I see a spearer's light to-night.

Nov. 16. Minott speaks of the last fortnight as good weather to complete the harvesting, — com, potatoes, turnips, carrots, etc. It seemed late for harvest, but some of the above crops were not gathered.

A part of to-day and yesterday I have been making shelves for my Oriental books, which I hear to-day are now on the Atlantic in the Canada.

Mr. Rice asked me to-night if I knew how hard a head a goat had. When he lived in Roxbury a man asked him to kill a goat for him. He accordingly struck the goat with a hatchet, hard enough, as he supposed, to dash his brains out, but the goat instantly, with a bleat, leaped on to a wall and ran twenty rods on the wall faster than they could on the ground after him, and he saw him as much as a month afterward none the worse for the blow.

He thinks that muskrats have always, even in the winter, a dry bed in the bank, as well as the wet place to eat in their cabins. Told me again the story of the muskrat which he saw resting under the ice, he himself lying flat and still upon the ice and the muskrat having a long way to go from the bank to his cabin. As soon as he stopped with his nose against the ice, a bubble issued from his mouth and flatted out to three inches in diameter against the ice, and he remained for half a minute with his mouth in it. Then drew it in, all but a little, and proceeded.

He spoke of the mud turtle resting on the "river-bush" (meaning the button-bush) in the spring, so near the top of the water that he could put his snout out when he pleased. Has taken them in April formerly, on Fast-Day.

I think that by the "swamp robin" he means the veery.

I see many more nests in the alders now than I suspected in the summer.

Nov. 17. Just after dark the first snow is falling, after a chilly afternoon with cold gray clouds, when my hands were uncomfortably cold.

It is interesting to me to talk with Rice, he lives so thoroughly and satisfactorily to himself. He has learned that rare art of living, the very elements of which most

professors do not know. His life has been not a failure but a success. Seeing me going to sharpen some plane-irons, and hearing me complain of the want of tools, he said that I ought to have a chest of tools. But I said it was not worth the while. I should not use them enough to pay for them. "You would use them more, if you had them," said he. "When I came to do a piece of work I used to find commonly that I wanted a certain tool, and I made it a rule first always to make that tool. I have spent as much as \$3000 thus on my tools." Comparatively speaking, his life is a success; not such a failure as most men's. He gets more out of any enterprise than his neighbors, for he helps himself more and hires less. Whatever pleasure there is in it he enjoys. By good sense and calculation he has become rich and has invested his property well, yet practices a fair and neat economy, dwells not in untidy luxury. It costs him less to live, and he gets more out of life, than others. To get his living, or keep it, is not a hasty or disagreeable toil. He works slowly but surely, enjoying the sweet of it. He buys a piece of meadow at a profitable rate, works at it in pleasant weather, he and his son, when they are inclined, goes a-fishing or a-bee-hunting or a-rifle-shooting quite as often, and thus the meadow gets redeemed, and potatoes get planted, perchance, and he is very sure to have a good crop stored in his cellar in the fall, and some to sell. He always has the best of potatoes there. In the same spirit in which he and his son tackle up their Dobbin (he never keeps a fast horse) and go a-spearing or a-fishing through the ice, they also tackle up and go to their Sudbury farm to hoe or harvest a little, and when they return they bring home a load of stumps in their hay-rigging, which impeded their labors, but, perchance, supply them with their winter wood. All the woodchucks they shoot or trap in the bean-field are brought home also. And thus their life is a long sport and they know not what hard times are.

Rice says there are no bees worth hunting about here now. He has sometimes been to a large wood in the west part of Sudbury, and also to Nagog, yet there was little honey there.

Saw Goodwin this afternoon returning from the river with two minks, one trapped, the other shot, and half a dozen muskrats. Mink seem to be more commonly seen now, and the rising of the river begins to drive out the muskrats.

Labaupe says that he wrote his journal of the Campaign in Russia each night, in the midst of incredible danger and suffering, with "a raven's quill, and a little gunpowder, mixed with some melted snow, in the hollow of my hand," the quill cut and mended with "the knife with which I had carved my scanty morsel of horse-flesh." Such a statement promises well for the writer's qualifications to treat such a theme.

Nov. 18. About an inch of snow fell last night, but the ground was not at all frozen or prepared for it. A little greener grass and stubble here and there seems to burn its way through it this forenoon.

It clears up at noon, and at 1 — p. M. I go to Fair Haven Hill via Hubbard's Grove.

As I sat in the house, I was struck with the brightness and heat of the sun reflected from this our first snow. There was an intenser light in the house, and I felt an uncommon heat from the sun's rays on my back. The air is very clear, and the sky

heavenly, with a few floating downy clouds. I am prepared to hear sharp, screaming notes rending the air, from the winter birds. I do, in fact, hear many jays, and the tinkling, like rattling glass, from chickadees and tree sparrows. I do not detect any peculiar brightness whatever in the osiers on the Hubbard causeway; they are scarcely, if at all, brighter than the tops of the trees. Now first mark the stubble and numerous withered weeds rising above the snow. They have suddenly acquired a new character. Tansy still shows its yellow disks, but yarrow is particularly fresh and perfect, cold and chaste, with its pretty little dry-looking rounded white petals and green leaves. Its very color gives it a right to bloom above the snow, — as level as a snow-crust on the top of the stubble. It looks like a virgin wearing a white ruff.

The snow is the great track-revealer. I come across the tracks of persons who, at a different hour from myself, have crossed, and perhaps often cross, some remote field on their errands, when I had not suspected a predecessor; and the track of the dog or staff are seen too. The cattle have tracked their whole pasture over, as if there had been a thousand. I have this silent but unerring evidence of any who have crossed the fields since last night. It is pleasant to see tracks leading towards the woods, — to be reminded that any have engagements there. Yet for the most part the snow is quite untrodden. Most fields have no track of man in them. I only see where a squirrel has leaped from the wall.

I now remark how the perfectly leafless alder thickets are much darker than the maples, now that the ground is whitened. The pasture directly under my face is white, but, seen aslant a few rods off, mostly russet. Gathered a bagful of fair apples on Fair Haven, showing their red cheeks above the snow.

I was so warmed in spirit in getting my wood that the heat it finally yielded when burnt was coldness in comparison. That first is a warmth which you cannot buy.

These apples which I get nowadays — russets and Baldwins — are the ripest of all, being acted on by the frost and partly left because they were slightly overripe for keeping. I come home with a heavy bagful and rob no one.

Instead of walking in the wood-market amid sharp-visaged teamsters, I float over dark reflecting waters in which I see mirrored the stumps on the bank, and am dazzled by the beauty of a summer duck. Though I should get no wood, I should get a beauty perhaps more valuable. The price of this my wood, however high, is the very thing which I delight to pay. What I obtain with the most labor — the most water-logged and heaviest wood which I fish up from the bottom and split and dry — warms the most. The greater, too, the distance from which I have conveyed it, the more I am warmed by it in my thought. All the intervening shores glow and are warmed by it as it passes, or as I repress them in my mind. And yet men will cut their wood with sorrow, and burn it with lucifer matches. This was where I drove my team afield, and, instead of the grey-fly, I heard the wood tortoises even yet rustling through the sedge to the water, or the gray squirrel coursing from maple to maple.

One man thinks that he has a right to burn his thirty cords in a year because he can give a certain sum of money in exchange for them, but that another has no right

to pick up the fagots which else nobody would burn. They who will remember only this kind of right do as if they stood under a shed and affirmed that they were under the unobscured heavens. The shed has its use, but what is it to the heavens above?

So of the warmth which food, shelter, and clothing afford, or might afford, if we used economical stoves. We might burn the smoke which now puts our eyes out. The pleasure, the warmth, is not so much in having as in a true and simple manner getting these necessaries.

Men prefer foolishly the gold to that of which it is the symbol, — simple, honest, independent labor. Can gold be said to buy food, if it does not buy an appetite for food? It is fouler and uglier to have too much than not to have enough.

Nov. 19. A cold, gray day, once spitting snow. Water froze in tubs enough to bear last night.

Minott had two cats on his knee. One given away without his knowledge a fortnight before had just found its way back. He says he would not kill a cat for twenty dollars, — no, not for fifty. Finally he told his women folks that he would not do it for five hundred, or any sum. He thought they loved life as well as we. Johnny Vose would n't do it. He used to carry down milk to a shop every day for a litter of kittens.

Speaking of geese, he says that Dr. Hurd told a tough story once. He said that when he went out to the well there came a flock of geese flying so low that they had to rise to clear the well-sweep. M. says that there used to be a great many more geese formerly; he used to hear a great many flocks in a day go “yelling” over. Brant, too, he used to see.

Told me of his fishing for pickerel once in the brook, when a mink leaped into the water toward his bait (a frog), but, seeing the end of his pole, he dived and made off. Some years ago he saw a mink steal out of the brook, which, being disturbed, dropped a pout half grown which it had caught. This was in his rye, then five or six inches high. Presently it returned and carried the pout to the wall by the elm at R. W. E. 's bound. He followed, looked under a rock, and saw two young minks. He has taken the jackets off many a one, but they smell so rank it is unpleasant work.

Rice says that that brook which crosses the road just beyond his brother Israel's is called Cold Brook. It comes partly from Dunge Hole. When the river is rising it will flow up the brook a great way.

Rice told his turtle story the other night: “One day I was going through Boston market and I saw a huddle of men around something or other. I edged my way between them and saw that they had got a great mud turtle on a plank, and a butcher stood over him with a cleaver in his hand. ‘Eh,’ said I, ‘what are you trying to do?’

‘We are waiting for him to put out his head so that we may cut it off. Look out,’ they said; ‘don't come so near, or he'll bite you.’

‘Look here,’ said I, ‘let me try. I guess I can make him put his head out.’

‘Let him try. Let him try,’ they said, with a laugh. So I stepped into the ring and stood astride of the turtle, while they looked on to see the sport. After looking at him a moment, I put down my hands and turned him over on to his back, whereupon he

immediately ran out his head and pushed against the plank to turn himself back, but, as they were not ready to cut at once, or his neck was not in a good position, I seized his head in both hands and, putting my feet against his breast-bone, drew his head out the full length of his neck and said, 'Now cut away. Only take care you don't cut my fingers.' They cut, and I threw the head down on the floor. As I walked away, some one said, 'I guess that fellow has seen mud turtles before to-day.'"

Nov. 20. Again I hear that sharp, crackling, snapping sound and, hastening to the window, find that another of the pitch pine cones gathered November 7th, lying in the sun, or which the sun has reached, has separated its scales very slightly at the apex. It is only discoverable on a close inspection, but while I look the whole cone opens its scales with a smart crackling and rocks and seems to bristle up, scattering the dry pitch on the surface. They all thus fairly loosen and open, though they do not at once spread wide open. It is almost like the disintegration of glass. As soon as the tension is relaxed in one part, it is relaxed in every part.

A cold day. The snow that fell November 17th in the evening is still seen on the ground.

Nov. 24. Geese went over on the 13th and 14th, on the 17th the first snow fell, and the 19th it began to be cold and blustering. That first slight snow has not yet gone off! and very little has been added. The last three or four days have been quite cold, the sidewalks a glare of ice and very little melting. To-day has been exceedingly blustering and disagreeable, as I found while surveying for Moore. The farmers now bring the apples they have engaged (and the cider); it is time to put them in the cellar, and the turnips. Ice has frozen pretty thick in the bottom of my boat.

Nov. 26. Bottom of boat covered with ice. The ice next the shore bore me and my boat.

Nov. 21. P. M. — By river to J. Farmer's.

He gave me the head of a gray rabbit which his boy had snared. This rabbit is white beneath, the whole length, reddish-brown on the sides, and the same spotted with black, above; the hairs coarse and homely, yet the fur beneath thick and slate-colored as usual. Well defended from the cold. Sides I might say pale brick-color, the brown part. The fur under the feet dirty-yellowish, as if stained by what it trod upon. He makes no use of their skins or fur. The skin is very tender. The tail, short and curled up, is white on the inside like that of the deer described by Loskiel, q v., Indian book.

He showed me the preserved skin of the heads of a double-headed calf, still-born, also the adjoining portion of the spine, where two short spinal columns, two or three inches long, merged in one. Only one body and other organs.

I told him I saw a mink. He said he would have given me \$1.50 and perhaps something more for him. I hear that he gives \$1.75, and sells them again at a profit. They are used to trim ladies' coats with, among other things. A mink skin which he showed me was a darker brown than the one I saw last (he says they changed suddenly to darker about a fortnight since); and the tail was nearly all black.

He said that his grandfather, who could remember one hundred and twenty-five years before this, told him that they used to catch wolves in what is now Carter's pasture by the North River (east of Dodge's Brook) in this manner: They piled up logs, cob-house fashion, beginning with a large base, eight or ten feet square, and narrowing successively each tier, so as to make steps for the wolves to the top, say ten feet high. Then they put a dead sheep within. A wolf soon found it in the night, sat down outside and howled till he called his comrades to him, and then they ascended step by step and jumped down within; but when they had done they could not get out again. They always found one of the wolves dead, and supposed that he was punished for betraying the others into this trap.

A man in Brighton, whom he fully believes, told him that he built a bower near a dead horse and placed himself within to shoot crows. One crow took his station as sentinel on the top of the tree, and thirty or forty alighted upon the horse. He fired and killed seven or eight, but the rest, instead of minding him, immediately flew to their sentinel and pecked him to pieces before his eyes. Also Mr. Joseph Clark told him that, as he was going along the road, he cast a stick over the wall and hit some crows in a field, whereupon they flew directly at their sentinel on an apple tree and beat and buffeted him away to the woods as far as he could see.

There is little now to be heard along the river but the sedge rustling on the brink. There is a little ice along most of the shore throughout the day.

Farmer told me that some one told him he found a pickerel washed up in the river, choked by a bream which it had endeavored to swallow.

Nov. 30. River skimmed over behind Dodd's and elsewhere. Got in my boat. River remained iced over all day.

This evening I received Cholmondeley's gift of Indian books, forty-four volumes in all, which came by the Canada, reaching Boston on the morning of the 24th. Left Liverpool the 10th.

Goodwin and Farmer think that a dog will not touch the dead body of a mink, it smells so strongly. The former, after skinning them, throws the carcass into a tree for the crows. He has got eleven this fall; shot two and trapped the rest.— ‘

On the 27th, when I made my last voyage for the season, I found a large sound pine log about four feet long floating, and brought it home. Off the larger end I sawed two wheels, about a foot in diameter and seven or eight inches thick, and I fitted to them an axle-tree made of a joist, which also I found in the river, and thus I had a convenient pair of wheels on which to get my boat up and roll it about. The assessors called me into their office this year and said they wished to get an inventory of my property; asked if I had any real estate. No. Any notes at interest or railroad shares? No. Any taxable property? None that I knew of. "I own a boat," I said; and one of them thought that that might come under the head of a pleasure carriage, which is taxable. Now that I have wheels to it, it comes nearer to it. I was pleased to get my boat in by this means rather than on a borrowed wheelbarrow. It was fit that the river

should furnish the material, and that in my last voyage on it, when the ice reminded me that it was time to put it in winter quarters.

I am waiting for colder weather to survey a swamp, now inaccessible on account of the water.

I asked Aunt L. to-night why Scheeter Potter was so called. She said, because his neighbors regarded him as so small a man that they said in jest that it was his business to make mosquitoes' bills. He was accused of catching his neighbor's hens in a trap and eating them. But he was crazy.

William Wheeler says that he went a-spearing on the 28th (night before Thanksgiving) and, besides pouts and pickerel, caught two great suckers. He had one of the last stuffed and baked for Thanksgiving, and made himself sick by eating too heartily of it.

## DECEMBER, 1855

Dec. 3. Monday. A pleasant day. No snow yet (since that first whitening which lasted so long), nor do I see any ice to speak of.

Hear and see, of birds, only a tree sparrow in the willows on the Turnpike. Met Goodwin going out with his gun. He shot (evidently) some crossbills once in Roxbury. He sometimes gets a skunk drowned in his muskrat or mink traps, and so can get at their secretion without being disturbed by the scent. He, too, has heard that it is a sure cure for the phthisic.

The fields and woods seem now particularly empty and bare. No cattle in pasture; only here and there a man carting or spreading manure.

Every larger tree which I knew and admired is being gradually culled out and carried to mill. I see one or two more large oaks in E. Hubbard's wood lying high on stumps, waiting for snow to be removed. I miss them as surely and with the same feeling that I do the old inhabitants out of the village street. To me they were something more than timber; to their owner not so.

Dec. 4. Melvin says that he shot a sheldrake once in the act of swallowing a perch seven or eight inches long. He had got nothing to-day, for he forgot his' caps.

A pleasant day and yet no snow nor ice. The younger osiers on Shattuck's row do shine.

Dec. 6. 10 p. M. — Hear geese going over.

Dec. 8. Saturday. Still no snow, — nor ice noticeable. I might have left my boat out till now. I have not worn gloves yet.

This afternoon I go to the woods down the railroad, seeking the society of some flock of little birds, or some squirrel, but in vain. I only hear the faint lisp of (probably) a tree sparrow. I go through empty halls, apparently unoccupied by bird or beast. Yet it is cheering to walk there while the sun is reflected from far through the aisles with a silvery light from the needles of the pine. The contrast of light or sunshine and shade,

though the latter is now so thin, is food enough for me. Some scarlet oak leaves on the forest floor, when I stoop low, appear to have a little blood in them still. The shrivelled Solomon's-seal berries are conspicuously red amid the dry leaves. I visited the door of many a squirrel's burrow, and saw his nutshells and cone-scales and tracks in the sand, but a snow would reveal much more. Let a snow come and clothe the ground and trees, and I shall see the tracks of many inhabitants now unsuspected, and the very snow covering up the withered leaves will supply the place of the green ones which are gone. ' In a little busy flock of lispings birds, — chickadees or lesser redpolls, — even in a nuthatch or downy woodpecker, there would have been a sweet society for me, but I did not find [it]. Yet I had the sun penetrating into the deep hollows through the aisles of the wood, and the silvery sheen of its reflection from masses of white pine needles.

Met Therien coming from Lincoln on the railroad. He says that he carried a cat from Jacob Baker's to Riordan's shanty in a bag in the night, but she ran home again. "Had they not a cat in the shanty?" I asked. "Yes," said he, "but she was run over by the cars and killed; they found her head on the track separated from her body, just below the pond." That cat of Baker's used to eat eggs and so he wished to get rid of her. He carried her in a bag to Waltham, but she came back.

Therien had several times seen where tortoises had been run over. They lie just under the rail, and put their heads out upon the rail to see what is coming, and so their heads are crushed. Also he has seen snakes cut in two. The men on the road told him that small birds were frequently run over.

Jacob Farmer brought me the head of a mink tonight and took tea here. He says that partridges sometimes fly against a house in the night, he thinks when started by a fox. His man found one in his bam this fall, which had come in in the night, and caught it before it could get out.

The mink has a delicate pard-like nose, cat-like. The long hairs are black or blackish, yet the general aspect is brown.

Farmer says he can call a male quail close to him by imitating the note of the female, which is only a single faint whistle. He says if you take eggs out of a partridge's nest and put them back, you will find just as many cast out afterwards as you took out.

Dec. 9. A still, completely gray, overcast, chilly morning. At 8.30 a fine snow begins to fall, increasing very gradually, perfectly straight down, till in fifteen minutes the ground is white, the smooth places first, and thus the winter landscape is ushered in. And now it is falling thus all the land over, sifting down through the tree-tops in woods, and on the meadow and pastures, where the dry grass and weeds conceal it at first, and on the river and ponds, in which it is dissolved. But in a few minutes it turns to rain, and so the wintry landscape is postponed for the present.

Dec. 10. To Cambridge.

Dec. 11. P. M. — To Holden Swamp, Conantum.

For the first time I wear gloves, but I have not walked early this season.

I see no birds, but hear, methinks, one or two tree sparrows. No snow; scarcely any ice to be detected. It is only an aggravated November. I thread the tangle of the

spruce swamp, admiring the leaflets of the swamp pyrus which had put forth again, now frostbitten, the great yellow buds of the swamp-pink, the round red buds of the high blueberry, and the fine sharp red ones of the paniced andromeda. Slowly I worm my way amid the snarl, the thicket of black alders and blueberry, etc.; see the forms, apparently, of rabbits at the foot of maples, and catbirds' nests now exposed in the leafless thicket.

Standing there, though in this bare November landscape, I am reminded of the incredible phenomenon of small birds in winter. That ere long, amid the cold powdery snow, as it were a fruit of the season, will come twittering a flock of delicate crimson-tinted birds, lesser redpolls, to sport and feed on the seeds and buds now just ripe for them on the sunny side of a wood, shaking down the powdery snow there in their cheerful social feeding, as if it were high midsummer to them. These crimson aerial creatures have wings which would bear them quickly to the regions of summer, but here is all the summer they want. What a rich contrast! tropical colors, crimson breasts, on cold white snow! Such etherealness, such delicacy in their forms, such ripeness in their colors, in this stern and barren season! It is as surprising as if you were to find a brilliant crimson flower which flourished amid snows. They greet the chopper and the hunter in their furs. Their Maker gave them the last touch and launched them forth the day of the Great Snow. He made this bitter imprisoning cold before which man quails, but He made at the same time these warm and glowing creatures to twitter and be at home in it. He said not only, Let there be linnets in winter, but linnets of rich plumage and pleasing twitter, bearing summer in their natures. The snow will be three feet deep, the ice will be two feet thick, and last night, perchance, the mercury sank to thirty degrees below zero. All the fountains of nature seem to be sealed up. The traveller is frozen on his way. But under the edge of yonder birch wood will be a little flock of crimson-breasted lesser redpolls, busily feeding on the seeds of the birch and shaking down the powdery snow! As if a flower were created to be now in bloom, a peach to be now first fully ripe on its stem. I am struck by the perfect confidence and success of nature. There is no question about the existence of these delicate creatures, their adaptedness to their circumstances. There is superadded superfluous paintings and adornments, a crystalline, jewel-like health and soundness, like the colors reflected from ice-crystals.

When some rare northern bird like the pine grosbeak is seen thus far south in the winter, he does not suggest poverty, but dazzles us with his beauty. There is in them a warmth akin to the warmth that melts the icicle. Think of these brilliant, warm-colored, and richly warbling birds, birds of paradise, dainty-footed, downy-clad, in the midst of a New England, a Canadian winter. The woods and fields, now somewhat solitary, being deserted by their more tender summer residents, are now frequented by these rich but delicately tinted and hardy northern immigrants of the air. Here is no imperfection to be suggested. The winter, with its snow and ice, is not an evil to be corrected. It is as it was designed and made to be, for the artist has had leisure to add beauty to use. My acquaintances, angels from the north. I had a vision thus

prospectively of these birds as I stood in the swamps. I saw this familiar — too familiar — fact at a different angle, and I was charmed and haunted by it. But I could only attain to be thrilled and enchanted, as by the sound of a strain of music dying away. I had seen into paradisaic regions, with their air and sky, and I was no longer wholly or merely a denizen of this vulgar earth. Yet had I hardly a foothold there. I was only sure that I was charmed, and no mistake. It is only necessary to behold thus the least fact or phenomenon, however familiar, from a point a hair's breadth aside from our habitual path or routine, to be overcome, enchanted by its beauty and significance. Only what we have touched and worn is trivial, — our scurf, repetition, tradition, conformity. To perceive freshly, with fresh senses, is to be inspired. Great winter itself looked like a precious gem, reflecting rainbow colors from one angle.

My body is all sentient. As I go here or there, I am tickled by this or that I come in contact with, as if I touched the wires of a battery. I can generally' recall — have fresh in my mind — several scratches last received. These I continually recall to mind, reimpress, and harp upon. The age of miracles is each moment thus returned. Now it is wild apples, now river reflections, now a flock of lesser redpolls. In winter, too, resides immortal youth and perennial summer. Its head is not silvered; its cheek is not blanched but has a ruby tinge to it.

If any part of nature excites our pity, it is for ourselves we grieve, for there is eternal health and beauty. We get only transient and partial glimpses of the beauty of the world. Standing at the right angle, we are dazzled by the colors of the rainbow in colorless ice. From the right point of view, every storm and every drop in it is a rainbow. Beauty and music are not mere traits and exceptions. They are the rule and character. It is the exception that we see and hear. Then I try to discover what it was in the vision that charmed and translated me. What if we could daguerreotype our thoughts and feelings! for I am surprised and enchanted often by some quality which I cannot detect. I have seen an attribute of another world and condition of things. It is a wonderful fact that I should be affected, and thus deeply and powerfully, more than by aught else in all my experience, — that this fruit should be borne in me, sprung from a seed finer than the spores of fungi, floated from other atmospheres! finer than the dust caught in the sails of vessels a thousand miles from land! Here the invisible seeds settle, and spring, and bear flowers and fruits of immortal beauty.

Dec. 13. This morning it is snowing, and the ground. is whitened. The countless flakes, seen against the dark evergreens like a web that is woven in the air, impart a cheerful and busy aspect to nature. It is like a grain that is sown, or like leaves that have come to clothe the bare trees. Now, by 9 o'clock, it comes down in larger flakes, and I apprehend that it will soon stop. It does.

How pleasant a sense of preparedness for the winter, — plenty of wood in the shed and potatoes and apples, etc., in the cellar, and the house banked up! Now it will be a cheerful sight to see the snows descend and hear the blast howl.

Sanborn tells me that he was waked up a few nights ago in Boston, about midnight, by the sound of a flock of geese passing over the city, probably about the same night

I heard them here. They go honking over cities where the arts flourish, waking the inhabitants; over State-houses and capitols, where legislatures sit; over harbors where fleets lie at anchor; mistaking the city, perhaps, for a swamp or the edge of a lake, about settling in it, not suspecting that greater geese than they have settled there.

Dec. 14. It began to snow again last evening, but soon ceased, and now it has turned out a fine winter morning, with half an inch of snow on the ground, the air full of mist, through which the smokes rise up perfectly straight; and the mist is frozen in minute leafets on the fences and trees and the needles of the pines, silvering them. —

I stood by Bigelow the blacksmith's forge yesterday, and saw him repair an axe. He burned the handle out, then, with a chisel, cut off the red-hot edge even, there being some great gaps in it, and by hammering drew it out and shaped it anew, — all in a few minutes. It was interesting to see performed so simply and easily, by the aid of fire and a few rude tools, a work which would have surpassed the skill of a tribe of savages.

P. M. — To Pink Azalea Woods.

The warm sun has quite melted the thin snow on the south sides of the hills, but I go to see the tracks of animals that have been out on the north sides. First, getting over the wall under the walnut trees on the south brow of the hill, I see the broad tracks of squirrels, probably red, where they have ascended and descended the trees, and the empty shells of walnuts which they have gnawed left on the snow. The snow is so very shallow that the impression of their toes is the more distinctly seen. It imparts life to the landscape to see merely the squirrels' track in the snow at the base of the walnut tree. You almost realize a squirrel at every tree. The attractions of nature are thus condensed or multiplied. You see not merely bare trees and ground which you might suspect that a squirrel had left, but you have this unquestionable and significant evidence that a squirrel has been there since the snow fell, — as conclusive as if you had seen him.

A little further I heard the sound [of] a downy woodpecker tapping a pitch pine in a little grove, and saw him inclining to dodge behind the stem. He flitted from pine to pine before me. Frequently, when I pause to listen, I hear this sound in the orchards or streets. This was in one of these dense groves of young pitch pines.

Suddenly I heard the screwing mew and then the whir of a partridge on or beneath an old decaying apple tree which the pines had surrounded. There were several such, and another partridge burst away from one. They shoot off swift and steady, showing their dark-edged tails, almost like a cannon-ball. I saw one's track under an apple tree and where it had pecked a frozen-thawed apple.

Then I came upon a fox-track made last night, leading toward a farmhouse, — Wheeler's, where there are many hens, — running over the side of the hill parallel with Wheeler's new wall. He was dainty in the choice of his ground, for I observed that for a mile he had adhered to a narrow cow-path, in which the snow lay level, for smoothness. Sometimes he had cantered, and struck the snow with his foot between his tracks. Little does the farmer think of the danger which threatens his hens.

In a little hollow I see the sere gray pennyroyal rising above the snow, which, snuffed, reminds me of garrets full of herbs.

Now I hear, half a mile off, the hollow sound of woodchopping, the work of short winter days begun, which is gradually laying bare and impoverishing our landscape. In two or three thicker woods which I have visited this season, I was driven away by this ominous sound.

Further over toward the river, I see the tracks of a deer mouse on a rock, which suddenly come to an end where apparently it had ascended a small pine by a twig which hung over it. Sometimes the mark of its tail was very distinct. Afterwards I saw in the pasture westward where many had run about in the night. In one place many had crossed the cow-path in which I was walking, in one trail, or the same one had come and gone many times. In the large hollows where rocks have been blasted, and on the sides of the river, I see irregular spaces of dark ice bare of snow, which was frozen after the snow ceased to fall. But this ice is rotten and mixed with snow. I am surprised to see the river frozen over for the most part with this thin and rotten snow ice, and the drooping or bent alders are already frozen into this slush, giving to the stream a very wintry aspect. I see some squirrel-tracks about a hole in a stump.

At the azalea meadow or swamp, the red tops of the osiers, which are very dense and of a uniform height, are quite attractive, in the absence of color at this season. Any brighter and warmer color catches our eye at this season. I see an elm there whose bark is worn quite smooth and white and bare of lichens, showing exactly the height at which the ice stood last winter.

Looking more closely at the light snow there near the swamp, I found that it was sprinkled all over (as with pellets of cotton) with regular star-shaped cottony flakes with six points, about an eighth of an inch in diameter and on an average a half an inch apart. It snowed geometry.

How snug and warm a hemlock looks in the winter! That by the azalea looks thus:

There is a tendency in the limbs to arrange themselves ray-wise about a point one third from the base to the top. What singular regularity in the outline of a tree!

I noticed this morning successive banks of frost on the windows, marked by their irregular waving edges, like the successive five, ten, and fifteen fathom lines which mark the depth of the shores on charts.

Thus by the snow I was made aware in this short walk of the recent presence there of squirrels, a fox, and countless mice, whose trail I had crossed, but none of which I saw, or probably should have seen before the snow fell. Also I saw this afternoon the track of one sparrow, probably a tree sparrow, which had run among the weeds in the road.

Dec. 15. This morning it has begun to snow apparently in earnest. The air is quite thick and the view confined. It is quite still, yet some flakes come down from one side and some from another, crossing each other like woof and warp apparently, as they are falling in different eddies and currents of air. In the midst of it, I hear and see a few little chickadees prying about the twigs of the locusts in the graveyard. They

have come into town with the snow. They now and then break forth into a short sweet strain, and then seem suddenly to check themselves, as if they had done it before they thought.

The boys have skated a little within two or three days, but it has not been thick enough to bear a man yet.

How like a bird of ill omen the crow behaves! Still holding its ground in our midst like a powwow that is not to be exterminated! Sometimes when I am going through the Deep Cut, I look up and see half a dozen black crows flitting silently across in front and ominously eying down; passing from one wood to another, yet as if their passage had reference to me.

The snow turned to rain, and this afternoon I walk in it down the railroad and through the woods. The low grass and weeds, bent down with a myriad little crystalline drops, ready to be frozen perhaps, are very interesting, but wet my feet through very soon. A steady but gentle, warm rain.

Dec. 16. Steady, gentle, warm rain all the forenoon, and mist and mizzling in the afternoon, when I go round by Abel Hosmer's and back by the railroad.

The mist makes the near trees dark and noticeable, like pictures, and makes the houses more interesting, revealing but one at a time. The old apple trees are very important to this landscape, they have so much body and are so dark. It is very pleasing to distinguish the dim outline of the woods, more or less distant, through the mist, sometimes the merest film and suspicion of a wood. On one side it is the plump and rounded but soft masses of pitch pines, on another the brushy tops of maples, birches, etc. Going by Hosmer's, the very heaps of stones in the pasture are obvious as cairns in one of Ossian's landscapes.

Saw two red squirrels on the fence, one on each side of his house, particularly red along their backs and top of head and tail. They are remarkably tame. One sits twirling apparently a dried apple in his paws, with his tail curled close over his back as if to keep it warm, fitting its curve. How much smothered sunlight in their wholesome brown red this misty day! It is clear New England, Nov-anglia, like the red subsoil. It is springlike.

As we go over the bridge, admire the reflection of the trees and houses from the smooth open water over the channel, where the ice has been dissolved by the rain.

Dec. 17. 9.30 A. M. — To Hill.

A remarkably fine, springlike morning. The earth all bare; the sun so bright and warm; the steam curling up from every fence and roof, and carried off at [an] angle by the slight northwesterly air. After those rainy days the air is apparently uncommonly clear, and hence (?) the sound of cock-crowing is so sweet, and I hear the sound of the sawmill even at the door, also the cawing of crows. There is a little ice, which makes it as yet good walking, in the roads. The peculiar brightness and sunniness may be partly owing to the sun being reflected through the cleansed air from the more than russet, the bleached, surface of the earth. Methinks every squirrel will be out now. This is the morning. Ere long the wind will rise and this season will be over. There will probably be some wrack in the afternoon sky.

Columella says you must be careful not to carry out seeds in your manure and so have segetes herbidas (weedy crops).

Dec. 18. Saw to-day a dark-colored spider of the very largest kind on ice, — the mill-pond at E. Wood's in Acton.

J. Farmer says that he once tried to kill a cat by taking her by the legs and striking her head against a stone, but she made off, and in a week was about again, apparently as well as ever, and he did not meddle with her again.

Dec. 20. Still no snow, and, as usual, I wear no gloves.

P. M. — To Hubbard's skating meadow.

A few chickadees busily inspecting the buds at the willow-row ivy tree, for insects, with a short, clear chink from time to time, as if to warn me of their neighborhood.

Boys are now devoted to skating after school at night, far into evening, going without their suppers. It is pretty good on the meadows, which are somewhat overflown, and the sides of the river, but the greater part of it is open. I walk along the side of the river, on the ice beyond the Bath Place. Already there is dust on this smooth ice, on its countless facets, revealed by the sun. How warm the dull-red cranberry vine rises above the ice here and there! I stamped and shook the ice to detect the holes and weak places where that little brook comes in there. They were plainly revealed, for the water beneath, being agitated, proclaimed itself at every hole far and wide or for three or four rods. The edge of the ice toward the channel is either rubbed up or edged with a ridge of frozen foam.

I see some gossamer on the weeds above the ice. Also, in now hard, dark ice, the tracks apparently of a fox, made when it was saturated snow. So long his trail is revealed, but over the pastures no hound can now trace him. There has been much overflow about every tussock in the meadow, making that rough, opaque ice, like yeast. I mark the many preparations for another year which the farmer has made, — his late plowings, his muck-heaps in fields, perhaps of grass, which he intends to plow and cultivate, his ditches to carry off the winter's floods, etc. How placid, like silver or like steel in different lights, the surface of the still, living water between these borders of ice, reflecting the weeds and trees, and now the warm colors of the sunset sky! The ice is that portion of the flood which is congealed and laid up in our fields for a season.

Dec. 21. Going to the post-office at 9 A. M. this very pleasant morning, I hear and see tree sparrows on Wheildon's pines, and just beyond scare a downy woodpecker and a brown creeper in company, from near the base of a small elm within three feet of me. The former dashes off with a loud rippling of the wing, and the creeper flits across the street to the base of another small elm, whither I follow. At first he hides behind the base, but ere long works his way upward and comes in sight. He is a gray-brown, a low curve from point of beak to end of tail, resting flat against the tree.

P. M. — Via Hubbard's Grove and river to Fair Haven Pond. Return by Andromeda Ponds.

See only a jay (?) flying high over the fields, and chickadees. The last rarely seem to mind you, keeping busy at work, yet hop nearer and nearer. Hubbard's barren pasture

under Fair Haven Hill, whose surface is much broken, alternate sod and bare sand, is now tinged with the pale leather or cinnamon color of the second-sized pinweed, which thickly covers it.

I here take to the riverside. The broader places are frozen over, but I do not trust them yet. Fair Haven is entirely frozen over, probably some days. Already some eager fisherman has been here, this morning or yesterday, and I hear that a great pickerel was carried through the street. I see, close under the high bank on the east side, a distinct tinge of that red in the ice for a rod.

I remark the different pale colors to which the grasses have faded and bleached. Those coarse sedges amid the button - bushes are bleached particularly light. Some, more slender, in the Pleasant Meadow, is quite light with singular reddish or pinkish radical blades making a mat at the base. Some dense sedge or rushes in tufts in the Andromeda Ponds have a decided greenish tinge, somewhat like well-cured hay.

A few simple colors now prevail. Even the apples on the trees have assumed the brown color of the leaves.

I do not remember to have seen the Andromeda Ponds so low. The weedy and slimy bottom is for the most part exposed. The slime, somewhat clay-colored, is collected here and there into almost organic forms, — manna[?] -like, with a skin to it. I make a nosegay of the sphagnum, which must suffer from this unusual exposure. It is frozen stiff at the base. What rugged castellated forms it takes at the base of the andromeda which springs from it! Some is green or yellowish-green, some bright-crimson, some brown, some quite white, with different shades of all these colors. Such are the temples and cheeks of these soft crags. What a primitive and swampy wilderness for the wild mice to run amidst! — the andromeda woods!

Walden is skimmed over, all but an acre, in my cove. It will probably be finished to-night.

No doubt the healthiest man in the world is prevented from doing what he would like by sickness.

Dec. 22. Dull overcast morning, so warm that it has actually thawed in the night, and there is a wet space larger than the ice on the sidewalk. It draws forth crowing from cockerels, as spring does rills from glaciers.

P. M. — Warm rain and frost coming out and muddy walking.

In reading Columella I am frequently reminded, not only by the general tone, but even by the particular warnings and directions, of our agricultural journals and reports of farmers' clubs. Often what is last and most insisted on among us, was most insisted on by the Romans. As when he says it is better to cultivate a little land well than a great deal ill, and quotes the poet: —

“... Laudato ingentia rura, Exiguum colito.”

“Modus ergo, qui in omnibus rebus, etiam parandis agris adhibebitur: tantum enim obtinendum est, quanto est opus, ut emisse videamur quo potiremur, non quo oneremur ipsi, atque aliis fruendum eriperemus, more praepotentium, qui possident fines gentium, quos ne circumire equis quidem valent, sed proculcandos pecudibus, et va-

standos ac populandos feris derelinquunt, aut occupatos nexu civium, et ergastulis tenent.” (Therefore, as in all things, so in buying land moderation will be used; for only so much is to be obtained as is necessary, to make it appear that we have bought what we can use, not what we may be burdened with, and hinder others from enjoying, like those overpowerful ones who possess the territory of nations, which they cannot go round even with horses, but leave to be trampled by herds, and to be laid waste and depopulated by wild beasts, or keep occupied by nexu civium and prisons.)

This reminds me of those extensive tracts said to belong to the Peter Piper estate, running back a mile or more and absorbing several old farms, but almost wholly neglected and run out, which I often traverse and am better acquainted with than their so-called owners. Several times I have had to show such the nearest way out of their wood-lots. Extensive wood-lots and cranberry meadows, perhaps, and a rambling old country house on one side, but you can't buy an acre of land for a house-lot. “Where wealth accumulates and men decay.”

Dec. 23. P. M. — To Conantum-End.

A very bright and pleasant day with remarkably soft wind from a little north of west. The frost has come out so in the rain of yesterday that I avoid the muddy plowed fields and keep on the grass ground, which shines with moisture. I think I do not remember such and so much pleasant, springlike weather as this and some other days of this month.

I admire those old root fences which have almost entirely disappeared from tidy fields, — white pine roots got out when the neighboring meadow was a swamp, — the monuments of many a revolution. These roots have not penetrated into the ground, but spread over the surface, and, having been cut off four or five feet from the stump, were hauled off and set up on their edges for a fence. The roots are not merely interwoven, but grown together into solid frames, full of loopholes like Gothic windows of various sizes and all shapes, triangular and oval and harp-like, and the slenderer parts are dry and resonant like harp-strings. They are rough and unapproachable, with a hundred snags and horns which bewilder and balk the calculation of the walker who would surmount them. The part of the trees above ground presents no such fantastic forms. Here is one seven paces, or more than a rod, long, six feet high in the middle, and yet only one foot thick, and two men could turn it up, and in this case the roots were six or nine inches thick at the extremities. The roots of pines growing in swamps grow thus in the form of solid frames or rackets, and those of different trees are interwoven with all so that they stand on a very broad foot and stand or fall together to some extent before the blasts, as herds meet the assault of beasts of prey with serried front. You have thus only to dig into the swamp a little way to find your fence, — post, rails, and slats already solidly grown together and of material more durable than any timber. How pleasing a thought that a field should be fenced with the roots of the trees got out in clearing the land a century before! I regret them as mementoes of the primitive forest. The tops of the same trees made into fencing-stuff would have decayed generations ago. These roots are singularly unobnoxious to the effects of moisture.

The swamp is thus covered with a complete web of roots. Wild trees, such as are fitted to grow in the uncultivated swamps.

I detect the Irishman where the elms and maples on the causeway are cut off at the same height with the willows to make 'pollards of!

I sit on the hillside near the wall corner, in the further Conantum field, as I might in an Indian-summer day in November or October. These are the colors of the earth now: all land that has been some time cleared, except it is subject to the plow, is russet, the color of withered herbage and the ground finely commixed, a lighter straw-color where are rank grasses next water; sprout-lands, the pale leather-color of dry oak leaves; pine woods, green; deciduous woods (bare twigs and stems and withered leaves commingled), a brownish or reddish gray; maple swamps, smoke-color; land just cleared, dark brown and earthy; plowed land, dark brown or blackish; ice and water, slate-color or blue; andromeda swamps, dull red and dark gray; rocks, gray.

At Lee's Cliff I notice these radical (?) leaves quite fresh: saxifrage, sorrel, polypody, mullein, columbine, veronica, thyme-leaved sandwort, spleenwort, strawberry, buttercup, radical johnswort, mouse-ear, radical pinweeds, cinquefoils, checkerberry, wintergreen, thistles, catnip, *Turritis stricta* especially fresh and bright. What is that fine very minute plant thickly covering the ground, like a young arenaria?

Think of the life of a kitten, ours for instance: last night her eyes set in a fit, doubtful if she will ever come out of it, and she is set away in a basket and submitted to the recuperative powers of nature; this morning running up the clothes-pole and erecting her back in frisky sport to every passer.

Dec. 25. 9 A. M. — Snow driving almost horizontally from the northeast and fast whitening the ground, and with it the first tree sparrows I have noticed in the yard. It turns partly to rain and hail at midday.

Dec. 26. After snow, rain, and hail yesterday and last night, we have this morning quite a glaze, there being at last an inch or two of crusted snow on the ground, the most we have had. The sun comes out at 9 A. M. and lights up the ice-incrusted trees, but it is pretty warm and the ice rapidly melts.

I go to Walden via the almshouse and up the railroad. Trees seen in the west against the dark cloud, the sun shining on them, are perfectly white as frostwork, and their outlines very perfectly and distinctly revealed, great wisps that they are and ghosts of trees, with recurved twigs. The walls and fences are encased, and the fields bristle with a myriad of crystal spears. Already the wind is rising and a brattling is heard overhead in the street. The sun, shining down a gorge over the woods at Brister's Hill, reveals a wonderfully brilliant as well as seemingly solid and diversified region in the air. The ice is from an eighth to a quarter of an inch thick about the twigs and pine-needles, only half as thick commonly on one side. Their heads are bowed; their plumes and needles are stiff, as if preserved under glass for the inspection of posterity.

Thus is our now especially slow-footed river laid up not merely on the meadows, but on the twigs and leaves of the trees, on the needles of the pines. The pines thus weighed down are sharp-pointed at top and remind me of firs and even hemlocks, their drooping

boughs being wrapped about them like the folds of a cloak or a shawl. The crust is already strewn with bits of the green needles which have been broken off. Frequently the whole top stands up bare, while the middle and lower branches are drooping and massed together, resting on one another. But the low and spreading weeds in the fields and the wood-paths are the most interesting. Here are asters, savoryleaved, whose flat imbricated calyxes, three quarters of an inch over, are surmounted and inclosed in a perfectly transparent ice button, like a glass knob, through which you see the reflections of the brown calyx. These are very common. Each little blue-curls calyx has a spherical button like those brass ones on little boys' jackets, — little sprigs on them, — and the pennyroyal has still smaller spheres, more regularly arranged about its stem, chandelier-wise, and still smells through the ice. The finest grasses support the most wonderful burdens of ice and most branched on their minute threads. These weeds are spread and arched over into the snow again, — countless little arches a few inches high, each cased in ice, which you break with a tinkling crash at each step.

The scarlet fruit of the cockspur lichen, seen glowing through the more opaque whitish or snowy crust of a stump, is, on close inspection, the richest sight of all, for the scarlet is increased and multiplied by reflection through the bubbles and hemispherical surfaces of the crust, as if it covered some vermilion grain thickly strewn. And the brown cup lichens stand in their midst. The whole rough bark, too, is encased.

Already a squirrel has perforated the crust above the mouth of his burrow, here and there by the side of the path, and left some empty acorn shells on the snow. He has shovelled out this morning before the snow was frozen on his door-step.

Now, at 10 A. M., there blows a very strong wind from the northwest, and it grows cold apace.

Particularly are we attracted in the winter by greenness and signs of growth, as the green and white shoots of grass and weeds, pulled or floating on the water, and also by color, as cockspur lichens and crimson birds, etc.

Thorny bushes look more thorny than ever; each thorn is prolonged and exaggerated.

Some boys have come out to a wood-side hill to coast. It must be sport to them, lying on their stomachs, to hear their sled cronching the crystallized weeds when they have reached the more weedy pasture below.

4 p. M. — Up railroad.

SiNcE the sun has risen higher and fairly triumphed over the clouds, the ice has glistened with all the prismatic hues. On the trees it is now considerably dissipated, but rather owing to the wind than the sun. The ice is chiefly on the upper and on the storm side of twigs, etc. The whole top of the pine forest, as seen miles off in the horizon, is of sharp points, the leading shoots with a few plumes, even more so than I have drawn on the last page but one.

It has grown cold, and the crust bears. The weeds and grasses, being so thickened by this coat of ice, appear much more numerous in the fields. It is surprising what a bristling crop they are. The sun is gone before five. Just before I looked for rainbow

flocks in the west, but saw none, — only some small pink-dun (?) clouds. In the east still larger ones, which after sunset turned to pale slate.

In a true history or biography, of how little consequence those events of which so much is commonly made! For example, how difficult for a man to remember in what towns or houses he has lived, or when! Yet one of the first steps of his biographer will be to establish these facts, and he will thus give an undue importance to many of them. I find in my Journal that the most important events in my life, if recorded at all, are not dated.

Dec. 27. Recalled this evening, with the aid of Mother, the various houses (and towns) in which I have lived and some events of my life.

Born, July 12, 1817, in the Minott House, on the Virginia Road, where Father occupied Grandmother's thirds, carrying on the farm. The Catherines the other half of the house. Bob Catherines and John threw up the turkeys. Lived there about eight months. Si Merriam next neighbor. Uncle David died when I was six weeks old. I was baptized in old M. H. by Dr. Ripley, when I was three months, and did not cry.

The Red House, where Grandmother lived, we the west side till October, 1818, hiring of Josiah Davis, agent for Woodward's. (There were Cousin Charles and Uncle C. more or less.) According to day-book, Father hired of Proctor, October 16, 1818, and shop of Spaulding, November 10, 1818. Day-book first used by Grandfather, dated 1797. His part cut out and used by Father in Concord in 1808-9, and in Chelmsford, 1818-19-20-21.

(Chelmsford,) till March, 1821. (Last charge in Chelmsford about middle of March, 1821.) Aunt Sarah taught me to walk there when fourteen months old. Lived next the meeting-house, where they kept the powder in the garret. Father kept shop and painted signs, etc.

(Pope's House,) at South End in Boston, five or six (?) months, a ten-footer. Moved from Chelmsford through Concord, and may have tarried in Concord a little while. Day-book says, "Moved to Pinkney Street Sep 10th 1821 on Monday."

(Whitwell's House,) Pinckney Street, Boston, to March, 1823 (?).

(Brick House,) Concord, to spring of 1826.

(Davis's House)(next to S. Hoar's) to May 7th, 1827.

(Shattuck House) (now William Monroe's) to spring (Hollis Hall,) of 1835. (Hollis, Cambridge, Cambridge) 1833.)

Aunts House, to spring of 1837. At Brownson's (Hollis Hall and Canton)

Parkman House, (Hollis, Cambridge)

(R. W. E.'s)

(William Emerson's, Staten Island) while teaching in winter of 1835. Went to New York with Father, peddling, in 1836. to fall of 1844. Was graduated in 1837. — Kept town school a fortnight in 1837 (?). Began the big Red Journal, October, 1837. Found first arrowheads, fall of 1837. Wrote a lecture (my first) on Society, March 14th, 1838, and read it before the Lyceum in the Masons' Hall, April 11th, 1838. Went to Maine for a school in May, 1838. Commenced school in the house in summer of 1838. Wrote an

essay on Sound and Silence, December, 1838. — Fall of 1839 up Merrimack to White Mountains. "Aulus Persius Flaccus," first printed paper of consequence, February 10th, 1840. The Red Journal of 546 pages ended, June, 1840. Journal of 396 pages ended January 31st, 1841. Went to R. W. E.'s in spring of 1841 and stayed there to summer of 1843. Went to Staten Island, June, 1843, and returned in December, 1843, or to Thanksgiving. Made pencils in 1844.

Texas House, to August 29th, 1850. At Walden, (Walden) — July, 1845, to fall of 1847, then at (R. W. E.'s) R. W. E.'s to fall of 1848, or while he was in Europe.

Yellow House, reformed, till present.

Dec. 28. P. M. — Hollowell place and back near Hubbard's Bridge.

To-day and yesterday the boys have been skating on the crust in the streets, — it is so hard, the snow being very shallow. Considerable ice still clings to the rails and trees and especially weeds, though much attenuated. The birches were most bent — and are still — in hollows on the north fit' sides of hills. Saw some rabbit's fur on the crust and some (apparently — bird?) droppings, since the sleet fell, — a few pinches of fur the only trace of the murder. Was it a hawk's work? Crossed the river on the ice in front of Puffer's. What do the birds do when the seeds and bark are thus encased in ice?

Dec. 29. Down railroad to Andromeda Ponds.

I occasionally see a small snowflake in the air against the woods. It is quite cold, and a serious storm seems to be beginning. Just before reaching the Cut I see a shrike flying low beneath the level of the railroad, which rises and alights on the topmost twig of an elm within four or five rods. All ash or bluish-slate above down to middle of wings; dirty-white breast, and a broad black mark through eyes on side of head; primaries (?) black, and some white appears when it flies. Most distinctive its small hooked bill (upper mandible). It makes no sound, but flits to the top of an oak further off. Probably a male.

Am surprised to find eight or ten acres of Walden still open, notwithstanding the cold of the 26th, 27th, and 28th and of to-day. It must be owing to the wind partly. If quite cold, it will probably freeze to-night.

I find in the andromeda bushes in the Andromeda Ponds a great many nests apparently of the red-wing (?) suspended after their fashion amid the twigs of the andromeda, each now filled with ice. I count twenty-one within fifteen rods of a centre, and have no doubt there are a hundred in that large swamp, for I only looked about the edge part way. It is remarkable that I do not remember to have seen flocks of these birds there. It is an admirable place for them, these swamps are so impassable and the andromeda so dense. It would seem that they steal away to breed here, are not noisy here as along the river.

I never knew, or rather do not remember, the crust so strong [and] hard as it is now and has been for three days. You can skate over it as on ice in any direction. I see the tracks of skaters on all the roads, and they seem hardly to prefer the ice. Above Abiel Wheeler's, on the back road, the crust is not broken yet, though many sleds and

sleighs have passed. The tracks of the skaters are as conspicuous [as] any there. But the snow is but two or three inches deep. Jonas Potter tells me that [he] has known the crust on snow two feet deep to be as strong as this, so that he could drive his sled anywhere over the walls; so that he cut off the trees in Jenny's lot three feet from the ground, and cut again after the snow was melted.

When two men, Billings and Prichard, were dividing the stock of my father and Hurd, the former acting for Father, P. was rather tight for Hurd. They came to a cracked bowl, at which P. hesitated and asked, "Well, what shall we do with this?" B. took it in haste and broke it, and, presenting him one piece, said, "There, that is your half and this is ours."

A good time to walk in swamps, there being ice but no snow to speak of, — all crust. It is a good walk along the edge of the river, the wild side, amid the button-bushes and willows. The eupatorium stalks still stand there, with their brown hemispheres of little twigs, orreries.

The nests of last page are suspended very securely between eight or ten andromeda stems, about halfway up them; made of more or less coarse grass or sedge without, then about half an inch of dense and fine, now frozen sphagnum, then fine wild grass or sedge very regularly, and sometimes another layer of sphagnum and of fine grass above these, the whole an inch thick, the bottom commonly rounded. The outside grasses are well twisted about whatever andromeda stems stand at or near the river. I saw the traces of mice in some of them.

Dec. 30. The snow which began last night has continued to fall very silently but steadily, and now it is not far from a foot deep, much the most we have had yet; a dry, light, powdery snow. When I come down I see it in miniature drifts against the panes, alternately streaked dark and light as it is more or less dense. A remarkable, perfectly regular conical peak, a foot high, with concave sides, stands in the fireplace under the sink-room chimney. The pump has a regular conical Persian (?) cap, and every post about the house a similar one. It is quite light, but has not drifted. About 9 A. M. it ceases, and the sun comes out, and shines dazzlingly over the white surface. Every neighbor is shovelling out, and hear the sound of shovels scraping on door-steps. Winter now first fairly commenced, I feel.

The places which are slowest to freeze in our river are, first, on account of warmth as well as motion, where a brook comes in, and also probably where are springs in banks and under bridges; then, on account of shallowness and rapidity, at bends. I perceive that the cold respects the same places every winter. In the dark, or after a heavy snow, I know well where to cross the river most safely. Where the river is most like a lake, broad with a deep and muddy bottom, there it freezes first and thickest. The open water at a bend seems to be owing to the swiftness of the current, and this to the shallowness, and this to the sands taken out of the opposing bank and deposited there.

There was yesterday eight or ten acres of open water at the west end of Walden, where is depth and breadth combined.

What a horrid shaggy and stiff low wilderness were the Andromeda Ponds yesterday! What then must they have been on the 21st! As it was, it was as if I walked through a forest of glass (with a tough woody core) up to my middle. That dense tufted grass with a greenish tinge was still stiffly coated with ice, as well as everything else, and my shoes were filled with the fragments, but here and there the crimson sphagnum blushed through the crust beneath. Think of that dense grass, a horrid stiff crop, [Water Milkweed Pods. See page 72] each stem as big as your finger, firm but brittle and about two feet high, and the countless birds' nests filled even with ice!

P. M. —

Across river and over Hill.

The wind has been blowing and the snow drifting. — [Rose Hips. See page 72]

The paths are filled up again. The surface of the snow is coarsely waved and rough now, as if it caught at every straw and faced its windy foe again. It appears a coarser grain now. By the river are conspicuous the now empty and spread pods of the water milkweed, gray-brown without, silky-white within, — in some a seed or two left still; also the late rose corymbs of red hips; also the eupatorium drawn at venture four pages back, or more erect, thus, — some with brown fuzz and seeds still; the sium sometimes, with its very flat cymes; and that light-brown sedge or rush.

Some black ash keys still hang on amid the black abortions (?).

For a few days I have noticed the snow sprinkled with alder and birch scales. I go now through the birch meadow southwest of the Rock. The high wind is scattering them over the snow there. See one downy (?) woodpecker and one or two chickadees. The track of a squirrel on the Island Neck. Tracks are altered by the depth of the The Mead-snow. Looking up over the top of the hill now, ow-sweet southwest, at 3.30 p m., I see a few mother-o'-pearl tints, and methinks the same or rainbow tints in the drifting snow there, against the bright light of the unseen sun. Only in such clear cold air as this have the small clouds in the west that fine evanishing edge. It requires a state of the air that quickly dissipates all moisture. It must be rare in summer. In this rare atmosphere all cloud is quickly dissipated and mother-o'-pearl tinted as it passes away. The snow is too deep and soft yet for many tracks. No doubt the mice have been out beneath it.

Recrossing the river behind Dodd's, now at 4 p. M., the sun quite low, the open reach just below is quite green, a vitreous green, as if seen through a junk-bottle. Perhaps I never observed this phenomenon but when the sun was low.

He who would study birds' nests must look for them in November and in winter as well as in midsummer, for then the trees are bare and he can see them, and the swamps and streams are frozen and he can approach new kinds. He will often be surprised to find how many have haunted where he little suspected, and will receive many hints accordingly, which he can act upon in the summer. I am surprised to find many new ones (i.e. not new species) in groves which I had examined several times with particular care in the summer.

This was not a lodging snow, and the wind has already blown most of it off the trees, yet the long-limbed oak on the north of the hill still supports a ridge of its pure white as thick as its limbs. They lie parallel like the ulna and radius, and one is a bare white bone.

Beside the other weeds on the last page, I might have shown the — tall rough golden-rod, still conspicuous:

Found, in the Wheeler — meadow, southwest of the Island, a nest — in the fork of an alder about eight feet from — ground, partly saddled on, made apparently chiefly of fine grass and bark fibres, quite firm and very thick bottomed, and well bound without with various kind of lint. This is a little oval, three by three and a half inches within and seven eighths deep, with a very firm, smooth rim of fine grass and dark shreds, lined with the same and some lint. A few alder leaves dangle from the edge, and, what is remarkable, the outer edge all around is defiled, quite covered, with black and white caterpillarlike droppings of the young birds. It is broader and shallower than a yellowbird's and larger than a wood pewee's. Can it be a redstart's? I should think it too large.

Dec. 31. It is one of the mornings of creation, and the trees, shrubs, etc., etc., are covered with a fine leaf frost, as if they had their morning robes on, seen against the sun. There has been a mist in the night. Now, at 8.30 A. m., I see, collected over the low grounds behind Mr. Cheney's, a dense fog (over a foot of snow), which looks dusty like smoke by contrast with the snow. Though limited to perhaps twenty or thirty acres, it [is] as dense as any in August. This accounts for the frost on the twigs. It consists of minute leaves, the longest an eighth of an inch, all around the twigs, but longest commonly on one side, in one instance the southwest side.

Clearing out the paths, which the drifting snow had filled, I find already quite [a] crust, from the sun and the blowing making it compact; but it is soft in the woods.

9 a m. — To Partridge Glade.

I see many partridge-tracks in the light snow, where they have sunk deep amid the shrub oaks; also gray rabbit and deer mice tracks, for the last ran over this soft surface last night. In a hollow in the glade, a gray rabbit's track, apparently, leading to and from a hole in the snow, which, following, and laying open, I found to extend curving about this pit, four feet through and under the snow, to a small hole in the earth, which apparently led down deep.

At ten the frost leaves are nearly all melted.

It is invariably the east track on the railroad causeway which has the least snow on it. Though it is nearly all blown off elsewhere on the causeway, Trillium Woods have prevented its being blown off opposite to them. The snow-plow yesterday cast the snow six feet one side the edge of the cars, and it fell thick and rich, evenly broken like well-plowed land. It lies like a rich tilth in the sun, with its glowing cottony-white ridges and its shadowy hollows.

## JANUARY, 1856

Jan. 1. Speaking of foxes, J. Farmer told me last evening that some time ago Sherman Barrett's folks heard a squealing, and, running up, saw a fox leap out of the pen with a sucking-pig in his mouth and escape with it. Farmer says they commonly take the dead lambs from the fields, though most dogs will not.

P. M. — To Walden.

Walden is covered with white snow ice six inches thick, for it froze while it was snowing, though commonly there is a thin dark beneath. This is now, therefore, bare, while the river, which was frozen before, is covered with snow. A very small patch of Walden, frozen since the snow, looks at a little distance exactly like open water by contrast with the snow ice, the trees being reflected in it, and indeed I am not certain but a very small part of this patch was water.

The track-repairers have shovelled four little paths by the sides of the rails, all the way from the depot to Walden. As I went by the engine house, I saw great icicles four feet long hanging from the eastern eaves, like slender pointed spears, the last half blown aside by the wind:and still more. By the side of the Deep Cut If are the tracks of probably tree sparrows If about the weeds, and of partridges. —

On the ice at Walden are very beautiful great leaf crystals in great profusion. The ice is frequently thickly covered with them for many rods. They seem to be connected with the rosettes, — a running together of them. They look like a loose web of small white feathers springing from a tuft of down, for their shafts are lost in a tuft of fine snow like the down about the shaft of a feather, as if a feather bed had been shaken over the ice. They are, on a close examination, surprisingly perfect leaves, like ferns, only very broad for their length and commonly more on one side the midrib than the other. They are from an inch to an inch and a half long and three quarters wide, and slanted, where I look, from the southwest. They have, first, a very distinct midrib, though so thin that they cannot be taken up; then, distinct ribs branching from this, commonly opposite, and minute ribs springing again from these last, as in many ferns, the last running to each crenation in the border. How much further they are subdivided, the naked eye cannot discern. They are so thin and fragile that they melt under your breath while looking closely at them. A fisherman says they were much finer in the morning. In other places the ice is strewn with a different kind of frostwork in little patches, as if oats had been spilled, like fibres of asbestos rolled, a half or three quarters of an inch long and an eighth or more wide. Here and there patches of them a foot or two over. Like some boreal grain spilled.

Here are two fishermen, and one has preceded them. They have not had a bite, and know not why. It has been a clear winter day.

On the north shore, near the railroad, I see the tracks apparently of a white rabbit, afterward many tracks of gray rabbits, and where they had squatted under or rather by the side of an alder stem or the like, and left many balls in the pure snow. Many have run in one course. In the midst of them I see the track of a large rabbit, probably

a white one, which was evidently on the full spring. Its tracks are four feet apart, and, unlike the others, which are on the surface even of this light snow, these break through deep, making a hole six inches over. Why was this one in such haste? I conclude to trace him back and find out. His bounds grow greater and greater as I go back, now six feet quite, and a few rods further are the tracks of a fox (possibly a dog, but I think not) exactly on the trail! A little further, where the rabbit was ascending a considerable slope, through this snow nearly a foot deep, the bounds measure full seven feet, leaving the snow untouched for that space between. It appeared that the fox had started the rabbit from a bank on which it was resting, near a young hemlock, and pursued it only a dozen rods up the hill, and then gave up the chase, — and well he might, methought.

Goodwin says that the white rabbit never burrows, but the gray regularly. Yet he once knew a white one to earth itself.

In a rabbit's track the two fore feet are the furthest apart, thus: This chase occurred probably in the night, either the last or night before, when there was not a man within a mile; but, treading on these very deep and distinct tracks, it was as if I had witnessed it, and in imagination I could see the sharp eyes of the crafty fox and the palpitating breast of the timorous rabbit, listening behind. We unwittingly traverse the scenery of what tragedies! Every square rod, perchance, was the scene of a life or death struggle last night. As you track the rabbit further off, its bounds becoming shorter and shorter, you follow also surely its changing moods from desperate terror till it walks calmly and reassured over the snow without breaking its very slight crust, — perchance till it gnaws some twig composedly, — and in the other direction you trace the retreating steps of the disappointed fox until he has forgotten this and scented some new game, maybe dreams of partridges or wild mice. Your own feelings are fluttered proportionably.

Jan. 2. Probably the coldest morning yet, our thermometer  $6^{\circ}$  below zero at 8 A. M.; yet there was quite a mist in the air. The neighbors say it was  $10^{\circ}$  below zero at 7 A. M.

P. M. — To Walden.

As for the fox and rabbit race described yesterday, I find that the rabbit was going the other way, and possibly the fox was a rabbit, for, tracing back the rabbit, I found that it had first been walking with alternate steps, fox-like.

There were many white rabbits' tracks in those woods, and many more of the gray rabbit, but the former broke through and made a deep track, except where there was a little crust on the south slope, while the latter made but a faint impression on the surface. The latter run very much in the same path, which is well trodden, and you would think you were in the midst of quite a settlement of them.

Crossing the railroad at the Heywood meadow, I saw some snow buntings rise from the side of the embankment, and with surging, rolling flight wing their way up through the cut. I walked through the westernmost Heywood swamp. There are the tracks of many rabbits, both gray and white, which have run about the edges of these swamps since this snow came, amid the alders and shrub oaks, and one white one has crossed it. The cat-tails rise high above the snow in the swamp, their brown heads bursting

on one side into creamy (?) billows and wreaths, or partly bare. Also the rattlesnake grass is still gracefully drooping on every side, with the weight of its seeds, — a rich, wild grain. And other wild grasses and rushes rise above the snow. There is the wild-looking remnant of a white pine, quite dead, rising fifteen or twenty feet, which the woodpeckers have bored; and it is still clad with sulphur lichens and many dark-colored tufts of cetraria in the forks of its branches.

Returning, I saw, near the back road and railroad, a small flock of eight snow buntings feeding on the seeds of the pigweed, picking them from the snow, — apparently flat on the snow, their legs so short, — and, when I approached, alighting on the rail fence. They were pretty black, with white wings and a brown crescent on their breasts. They have come with this deeper snow and colder weather.

Jan. 3. Snows again. About two inches have fallen in the night, but it turns to a fine mist. It was a damp snow.

P. M. — To Hill.

The snow turned to a fine mist or mizzling, through which I see a little blue in the snow, lurking in the ruts.

In the river meadows and on the (perhaps moist) sides of the hill, how common and conspicuous the brown spear-heads of the hardhack, above the snow, and looking black by contrast with it!

Just beyond the Assabet Spring I see where a squirrel, gray or red, dug through the snow last night in search of acorns. I know it was last night, for it was while the last snow was falling, and the tracks are partly filled by it; they are like this: T h i s squirrel has burrowed to the ground in many places within a few yards, probing the leaves for acorns in various directions, making a short burrow under the snow, sometimes passing under the snow a yard and coming out at another place; for, though it is somewhat hardened on the surface by the nightly freezing and the hail, it is still quite soft and light beneath next the earth, and a squirrel or mouse can burrow very fast indeed there. I am surprised to find how easily I can pass my hand through it there. In many places it has dropped the leaves, etc., about the mouth of the hole. (The whole snow about ten inches deep.) I see where it sat in a young oak and ate an acorn, dropping the shells on the snow beneath, for there is no track to the shells, but only to the base of the oak. How independently they live, not alarmed, though the snow be two feet deep!

Now, when all the fields and meadows are covered deep with snow, the warm-colored shoots of osiers, red and yellow, rising above it, remind me of flames.

It is astonishing how far a merely well-dressed and good-looking man may go without being challenged by any sentinel. What is called good society will bid high for such.

The man whom the State has raised to high office, like that of governor, for instance, from some, it may be, honest but less respected calling, cannot return to his former humble but profitable pursuits, his old customers will be so shy of him. His ex-honorableness-ship stands seriously in his way, whether he is a lawyer or a shopkeeper. He can't get ex-honored. So he becomes a sort of State pauper, an object of charity

on its hands, which the State is bound in honor to see through and provide still with offices of similar respectability, that he may not come to want. A man who has been President becomes the Ex-President, and can't travel or stay at home anywhere but men will persist in paying respect to his ex-ship. It is cruel to remember his deeds so long. When his time is out, why can't they let the poor fellow go?

Jan. 4. A clear, cold day.

P. M. — To Walden to examine the ice.

I think it is only such a day as this, when the fields on all sides are well clad with snow, over which the sun shines brightly, that you observe the blue shadows on the snow. I see a little of it to-day.

December 29th there were eight or ten acres of Walden still open. That evening it began to snow and snowed all night, and the remainder of the pond was frozen on that [and] the succeeding night. But on January 1st I was surprised to find all the visible ice snow ice, when I expected that only the eight or ten acres would be; but it appeared that the weight of the snow had sunk the ice already formed and then partly dissolved in the water, which rose above it and partly was frozen with it. The whole ice January 1st was about six inches thick, and I should have supposed that over the greater part of the pond there would be a clear ice about two inches thick on the lower side, yet, where I cut through near the shore, I distinguished two kinds of ice, the upper two and a half inches thick and evidently snow ice, the lower about four inches thick and clearer, yet not remarkably clear.

Some fishermen had, apparently by accident, left two of their lines there, which were frozen in. I could see their tracks leading from hole to hole, where they had run about day before yesterday, or before the snow, and their dog with them. And the snow was stained with tobacco-juice. They had had lines set in two or three distant coves. They had, apparently, taken no fish, for they had cut no well to put them in. I cut out the lines, the ice being about an inch thick around them, and pulled up a fine yellow pickerel which would weigh two pounds or more. At first I thought there was none, for he was tired of struggling, but soon I felt him. The hook had caught in the outside of his jaws, and the minnow hung entire by his side. It was very cold, and he struggled but a short time, not being able to bend and quirk his tail; in a few minutes became quite stiff as he lay on the snowy ice. The water in his eyes was frozen, so that he looked as if he had been dead a week. About fifteen minutes after, thinking of what I had heard about fishes coming to life again after being frozen, on being put into water, I thought I would try it. This one was to appearance as completely dead as if he had been frozen a week. I stood him up on his tail without bending it. I put him into the water again without removing the hook. The ice melted off, and its eyes looked bright again; and after a minute or two [I] was surprised by a sudden, convulsive quirk of the fish, and a minute or two later by another, and I saw that it would indeed revive, and drew it out again. Yet I do not believe that if it had been frozen solid through and through it would have revived, but only when it is superficially frozen.

This reminded me of the pickerel which I caught here under similar circumstances for Peter Hutchinson, and thrust my mittened hands in after. When I put this pickerel in again after half an hour, it did not revive, but I held it there only three or four minutes, not long enough to melt the ice which encased it.

Another man had passed since the last snow fell, and pulled up at least one of the lines. I knew it was to-day and not yesterday by the character of his track, for it was made since the stiff crust formed on this snow last night, a broad depression cracking the crust around; but yesterday it was comparatively soft and moist.

Aunt says that Mr. Hoar tells a story of Abel Davis to this purport: He had once caught a pickerel in the brook near his house and was overheard to say, "Why, who'd V thought to find you here in Temple Brook. With a slice of pork you 'll make Rhody" (or whatever the name of his wife was) "and I a good meal." He probably was not much of a fisherman, and could hardly contain himself for joy.

It is snapping cold this night (10 p m.). I see the frost on the windows sparkle as I go through the passageway with a light.

Jan. 5. One of the coldest mornings. Thermometer — 9°, say some.

P. M. — Up river to Hubbard's Bridge.

It has been trying to snow all day, but has not succeeded; as if it were too cold. Though it has been falling all day, there has not been enough to whiten the coat of the traveller. I come to the river, for here it is the best walking. The snow is not so deep over the ice. Near the middle, the superincumbent snow has so far been converted into a coarse snow ice that it will bear me, though occasionally I slump through intervening water to another ice below. Also, perhaps, the snow has been somewhat blown out of the river valley. At any rate, by walking where the ice was frozen last, or over the channel, I can get along quite comfortably, while it is hard travelling through this crusted snow in the fields. Generally, to be sure, the river is but a white snow-field, indistinguishable from the fields, but over the channel there is a thread, commonly, of yellowish porous-looking snow ice.

The hardhack above the snow has this form: Should not that meadow where tip the first bridge was built be called Hardhack Meadow? Also there are countless small ferns, with terminal leafet only left on, still rising above the snow, for I notice the herbage of the riverside now, — thus, like the large ones in swamps: What with the grasses — that coarse, now straw-colored grass — and the stems of the button-bushes, the snow about the button-bushes forms often broad, — several rods broad, — low mounds, nearly burying the bushes, along which the tops of the button-bushes and that broad-bladed now straw colored grass still rise, with masses of thin, now black-looking balls, erect or dangling. The black willows have here and there still a very few little curled and crispy leaves.

The river is last open, methinks, just below a bend, as now at the Bath Place and at Clamshell Hill; and quite a novel sight is the dark water there. How little locomotive now look the boats whose painted stems I just detect where they are half filled with ice and almost completely buried in snow, so neglected by their improvident owners,

— some frozen in the ice, opening their seams, some drawn up on the bank. This is not merely improvidence; it is ingratitude.

Now and then I hear a sort of creaking twitter, maybe from a passing snow bunting. This is the weather for them. I am surprised that Nut Meadow Brook has overflowed its meadow and converted it into that coarse yellowish snow ice. Otherwise it had been a broad snow-field, concealing a little ice under it. There is a narrow thread of open water over its channel.

The thin snow now driving from the north and lodging on my coat consists of those beautiful star crystals, not cottony and chubby spokes, as on the 13th December, but thin and partly transparent crystals. They are about a tenth of an inch in diameter, perfect little wheels with six spokes without a tire, or rather with six perfect little leafets, fern-like, with a distinct straight and slender midrib, raying from the centre. On each side of each midrib there is a transparent thin blade with a crenate edge, thus: How full of the creative genius is the air in which these are generated! I should hardly admire more if real stars fell and lodged on my coat. Nature is full of genius, full of the divinity; so that not a snowflake escapes its fashioning hand. Nothing is cheap and coarse, neither dewdrops nor snowflakes. Soon the storm increases, — it was already very severe to face, — and the snow comes finer, more white and powdery. Who knows but this is the original form of all snowflakes, but that when I observe these crystal stars falling around me they are but just generated in the low mist next the earth? I am nearer to the source of the snow, its primal, auroral, and golden hour or infancy, but commonly the flakes reach us travel-worn and agglomerated, comparatively without order or beauty, far down in their fall, like men in their advanced age.

As for the circumstances under which this phenomenon occurs, it is quite cold, and the driving storm is bitter to face, though very little snow is falling. It comes almost horizontally from the north. Methinks this kind of snow never falls in any quantity.

A divinity must have stirred within them before the crystals did thus shoot and set. Wheels of the storm-chariots. The same law that shapes the earth-star shapes the snow-star. As surely as the petals of a flower are fixed, each of these countless snow-stars comes whirling to earth, pronouncing thus, with emphasis, the number six. Order, *κόσμος*.

On the Saskatchewan, when no man of science is there to behold, still down they come, and not the less fulfill their destiny, perchance melt at once on the Indian's face. What a world we live in! where myriads of these little disks, so beautiful to the most prying eye, are whirled down on every traveller's coat, the observant and the unobservant, and on the restless squirrel's fur, and on the far-stretching fields and forests, the wooded dells, and the mountain-tops. Far, far away from the haunts of man, they roll down some little slope, fall over and come to their bearings, and melt or lose their beauty in the mass, ready anon to swell some little rill with their contribution, and so, at last, the universal ocean from which they came. There they lie, like the wreck of chariot-wheels after a battle in the skies. Meanwhile the meadow mouse shoves them aside in his gallery, the schoolboy casts them in his snowball, or the woodman's sled

glides smoothly over them, these glorious spangles, the sweeping of heaven's floor. And they all sing, melting as they sing of the mysteries of the number six, — six, six, six. He takes up the water of the sea in his hand, leaving the salt; He disperses it in mist through the skies; He recollects and sprinkles it like grain in six-rayed snowy stars over the earth, there to lie till He dissolves its bonds again.

Found on a young red maple near the water, in Hubbard's riverside grove, a nest, perhaps a size bigger than a summer yellowbird's, chiefly of bark shreds, bound and lined with lint and a little of something like dried hickory blossoms. A little feather, yellow at the extremity, attached to the outside. It was on a slanting twig or small branch about eighteen feet high, and I shook it down. The rim of fine shreds of grapevine bark chiefly, the outer edge being covered with considerable of the droppings of the young birds. I thought it the same kind with that found December 30th ult. Can it be a redstart, or is [it] one of the vireos possibly? or a goldfinch? which would account for the yellow-tipped feather.

In the blueberry swamp near by, which was cut down by the ice, another, perhaps a little smaller, of very similar materials but more of the hickory (??) blossoms on the outside beneath, but this was in a nearly upright fork of a red maple about seven feet high. The little nest of June 26th, 1855, looks like the inside of one of these. Upon these two nests found to-day and on that of the 30th December, I find the same sort of dried catkin (apparently not hickory) connected with a little sort of brown bud, maybe birch or alder. This makes me suspect they may be all one kind, though the last was in an upright fork and had no droppings on it.

Jan. 6. High wind and howling and driving snowstorm all night, now much drifted. There is a great drift in the front entry and at the crack of every door and on the window-sills. Great drifts on the south of walls.

Clears up at noon, when no vehicle had passed the house.

Frank Morton has brought home, and I opened, that pickerel of the 4th. It is frozen solid. Yellow spawn as big as a pin-head, with smaller between, enwraps its insides the whole length, half an inch thick. It must spawn very early then. I find in its gullet, or paunch, or maw (the long white bag), three young perch, one of them six inches long, and the tail of a fourth. Its belly was considerably puffed out. Two of the perch lay parallel, side by side, of course head downward, in its gullet (?). The upper and largest perch was so high that he was cut in two in the middle in cutting off the head. And yet it was caught in endeavoring to swallow another large minnow! This is what you may call voracity.

P. M. — To Drifting Cut.

The snow is now probably more than a foot deep on a level.

While I am making a path to the pump, I hear hurried rippling notes of birds, look up, and see quite a flock of snow buntings coming to alight amid the currant-tops in the yard. It is a sound almost as if made with their wings. What a pity our yard was made so tidy in the fall with rake and fire, and we have now no tall crop of weeds rising above this snow to invite these birds!

I am come forth to observe the drifts. They are, as usual, on the south side of the walls and fences and, judging from the direction of their ridges, the wind was due north. Behind Monroe's tight board fence it is a regularly swelled, unbroken bank, but behind the wall this side carved into countless scallops, perforations, scrolls, and copings. An open wall is, then, the best place for a drift. Yet these are not remarkably rich. The snow was perhaps too dry. Perhaps six more inches on a level has fallen, or more. It has not lodged on the trees.

Now, at 4.15, the blue shadows are very distinct on the snow-banks.

On the north side of the Cut, above the crossing, the jutting edges of the drift are quite handsome upon the bank. The snow is raised twelve feet above the track, and it is all scalloped with projecting eaves or copings, like turtle-shells.

They project from three to five feet, and I can stand under them. They are in three or four great layers, one lapping over another like the coarse edge of a shell. Looking along it, they appear somewhat thus: —

Often this coping has broken by its own weight, and great blocks have fallen down the bank, like smoothed blocks of white marble. The exquisite purity of the snow and the gracefulness of its curves are remarkable.

Around some houses there is not a single track. Neither man, woman, nor child, dog nor cat nor fowl, has stirred out to-day. There has been no meeting. Yet this afternoon, since the storm, it has not been very bad travelling.

Jan. 7. At breakfast time the thermometer stood at  $-12^{\circ}$ . Earlier it was probably much lower. Smith's was at  $-24^{\circ}$  early this morning. The latches are white with frost at noon. They say there was yet more snow at Boston, two feet even.

They tell how I swung on a gown [?] on the stairway when I was at Chelmsford. The gown [?] gave way; I fell and fainted, and it took two pails of water to bring me to, for I was remarkable for holding my breath in those cases.

Mother tried to milk the cow which Father took on trial, but she kicked at her and spilt the milk. (They say a dog had bitten her teats.) Proctor laughed at her as a city girl, and then he tried, but the cow kicked him over, and he finished by beating her with his cowhide shoe. Captain Richardson ipilked her warily, standing up. Father came home, and thought he would "brustle right up to her," for she needed much to be milked, but suddenly she lifted her leg and "struck him fair and square right in the muns," knocked him flat, and broke the bridge of his nose, which shows it yet. He distinctly heard her hoof rattle on his nose. This "started the claret," and, without stanching the blood, he at once drove her home to the man he had her of. She ran at some young women by the way, who saved themselves by getting over the wall in haste.

Father complained of the powder in the meetinghouse garret at town meeting, but it did not get moved while we lived there. Here he painted over his old signs for guide-boards, and got a fall when painting Hale's (?) factory. Here the bladder John was playing with burst on the hearth. The cow came into the entry after pumpkins. I cut my toe, and was knocked over by a hen with chickens, etc., etc.

Mother tells how, at the brick house, we each had a little garden a few feet square, and I came in one day, having found a potato just sprouted, which by her advice I planted in my garden. Ere long John came in with a potato which he had found and had it planted in his garden,— “Oh, mother, I have found a potato all sprouted. I mean to put it in my garden,” etc. Even Helen is said to have found one. But next I came crying that somebody had got my potato, etc., etc., but it was restored to me as the youngest and original discoverer, if not inventor, of the potato, and it grew in my garden, and finally its crop was dug by myself and yielded a dinner for the family.

I was kicked down by a passing ox. Had a chicken given me by Lidy — Hannah — and peeped through the keyhole at it. Caught an eel with John. Went to bed with new boots on, and after with cap. “Rasselas” given me, etc., etc. Asked P. Wheeler, “Who owns all the land?” Asked Mother, having got the medal for geography, “Is Boston in Concord?” If I had gone to Miss Wheeler a little longer, should have received the chief prize book, “Henry Lord Mayor,” etc., etc.

P. M. — Up river.

The snow is much deeper on the river than it was, — on an average, eight or nine inches. The cold weather has brought the crows, and for the first time this winter I hear them cawing amid the houses. I noticed yesterday, from three to six feet behind or northwest of a small elm, a curve in a drift answering to the tree, showing how large an eddy it had produced. The whole surface of the snow on fields and river is composed now of flat, rough little drifts, like the surface of some rough slaty rocks. Hardly anywhere is the ice visible now.

It is completely frozen at the Hubbard’s Bath bend now, — a small strip of dark ice, thickly sprinkled with those rosettes of crystals, two or three inches in diameter, this surrounded by a broad border of yellowish spew. The water has oozed out from the thinnest part of the black ice, and I see a vapor curling up from it. There is also much vapor in the air, looking toward the woods. I go along the edge of the Hubbard Meadow woods, the north side, where the snow is gathered, light and up to my middle, shaking down birds’ nests. Returning, just before sunset, the few little patches of ice look green as I go from the sun (which is in clouds). It is probably a constant phenomenon in cold weather when the ground is covered with snow and the sun is low, morning or evening, and you are looking from it.

I see birch scales (bird-like) on the snow on the river more than twenty rods south of the nearest and only birch, and trace them north to it.

Jan. 8. P. M. — To Walden.

The snow is about a foot, or probably a little more, deep on a level, and considerably drifted, but on the pond it is not more than five inches deep on an average, being partly turned into snow ice by the sinking of the ice, and perhaps partly blown off.

Many catbird-nests about the pond. In apparently one I see a snake’s slough interwoven. The leaves of red oak shrubs are still quite bloody-colored. All of the pitch pine cones that I see, but one, are open. I see prying into the black fruit of the alder, along

the pond-side, a single probably lesser redpoll (?). Yellowish breast and distinct white bar on wing.

Monroe is fishing there. As usual, a great pickerel had bitten and ran off, and was lost, he supposed, among the brush by the shore. He tells of an eel up the North Branch that weighed seven pounds; also that George Melvin, spearing one night, speared a large owl (probably cat owl) that sat near by.

For a couple of days the cars have been very much delayed by the snow, and it is now drifting somewhat. The fine dry snow is driving over the fields like steam, if you look toward the sun, giving a new form to the surface, spoiling the labor of the track-repairers, gradually burying the rails. The surface of the snow on the pond is finely scored in many places by the oak leaves which have been blown across it. They have furrowed deeper than a mouse's track and might puzzle a citizen. They are more frisky than a squirrel. Many of the young oaks appear not to have lost any leaves yet. They are so full of them that they still sustain some masses of snow, as if there were birds' nests for a core. I see the great tracks of white rabbits that have run and frisked in the night along the pond-side.

Jan. 9. Clear, cold morning. Smith's thermometer — 16°; ours — 14° at breakfast time, — 6° at 9 A. M.

3 P. M. — To Beck Stow's.

The thermometer at + 2°. When I return at 4.30, it is at — 2°. Probably it has been below zero far the greater part of the day. I meet choppers, apparently coming home early on account of the cold. I wade through the swamp, where the snow lies light eighteen inches deep on a level, a few leaves of andromedas, etc., peeping out. (I am a-birds'-nesting.) The mice have been out and run over it. I see one large bush of winter-berries still quite showy, though somewhat discolored by the cold. The rabbits have run in paths about the swamp. Go now anywhere in the swamp and fear no water. The fisherman whom I saw on Walden last night will find his lines well frozen in this morning.

In passing through the deep cut on the new Bedford road, [I saw] that a little sand, which was pretty coarse, almost gravel, had fallen from the bank, and was blown over the snow, here and there. The surface of the snow was diversified by those slight drifts, or perhaps cliffs, which are left a few inches high (like the fracture of slate rocks), with a waved outline, and all the sand was collected in waving lines just on the edge of these little drifts, in ridges, maybe an eighth of an inch high. This may help decide how those drifts (?) or cliffs (?) are formed.

It has not been so cold throughout the day, before, this winter. I hear the boots of passing travellers squeak.

Jan. 10. The weather has considerably moderated; — 2° at breakfast time (it was — 8° at seven last evening); but this has been the coldest night probably. You lie with your feet or legs curled up, waiting for morning, the sheets shining with frost about your mouth. Water left by the stove is frozen thickly, and what you sprinkle in bathing falls on the floor ice. The house plants are all frozen and soon droop and turn black.

I look out on the roof of a cottage covered a foot deep with snow, wondering how the poor children in its garret, with their few rags, contrive to keep their toes warm. I mark the white smoke from its chimney, whose contracted wreaths are soon dissipated in this stinging air, and think of the size of their wood-pile, and again I try to realize how they panted for a breath of cool air those sultry nights last summer. Realize it now if you can. Recall the hum of the mosquito.

It seems that the snow-storm of Saturday night was a remarkable one, reaching many hundred miles along the coast. It is said that some thousands passed the night in cars.

The kitchen windows were magnificent last night, with their frost sheaves, surpassing any cut or ground glass.

I love to wade and flounder through the swamp now, these bitter cold days when the snow lies deep on the ground, and I need travel but little way from the town to get to a Nova Zembla solitude, — to wade through the swamps, all snowed up, untracked by man, into which the fine dry snow is still drifting till it is even with the tops of the water andromeda and halfway up the high blueberry bushes. I penetrate to islets inaccessible in summer, my feet slumping to the sphagnum far out of sight beneath, where the alder berry glows yet and the azalea buds, and perchance a single tree sparrow or a chickadee lisp by my side, where there are few tracks even of wild animals; perhaps only a mouse or two have burrowed up by the side of some twig, and hopped away in straight lines on the surface of the light, deep snow, as if too timid to delay, to another hole by the side of another bush; and a few rabbits have run in a path amid the blueberries and alders about the edge of the swamp. This is instead of a Polar Sea expedition and going after Franklin. There is but little life and but few objects, it is true. We are reduced to admire buds, even like the partridges, and bark, like the rabbits and mice, — the great yellow and red forward-looking buds of the azalea, the plump red ones of the blueberry, and the fine sharp red ones of the paniced andromeda, sleeping along its stem, the speckled black alder, the rapid-growing dogwood, the pale-brown and cracked blueberry, etc. Even a little shining bud which lies sleeping behind its twig and dreaming of spring, perhaps half concealed by ice, is object enough. I feel myself upborne on the andromeda bushes beneath the snow, as on a springy basketwork, then down I go up to my middle in the deep but silent snow, which has no sympathy with my mishap. Beneath the level of this snow how many sweet berries will be hanging next August!

This freezing weather I see the pumps dressed in mats and old clothes or bundled up in straw. Fortunate he who has placed his cottage on the south side of some high hill or some dense wood, and not on the middle of the Great Fields, where there is no hill nor tree to shelter it. There the winds have full sweep, and such a day as yesterday the house is but a fence to stay the drifting snow. Such is the piercing wind, no man loiters between his house and bam. The road-track is soon obliterated, and the path which leads round to the back of the house, dug this morning, is filled up again, and you can no longer see the tracks of the master of the house, who only an hour ago took

refuge in some halfsubterranean apartment there. You know only by an occasional white wreath of smoke from his chimney, which is at once snapped up by the hungry air, that he sits warming his wits there within, studying the almanac to learn how long it is before spring. But his neighbor, who, only half a mile off, has placed his house in the shelter of a wood, is digging out of a drift his pile of roots and stumps, hauled from the swamp, at which he regularly dulls his axe and saw, reducing them to billets that will fit his stove. With comparative safety and even comfort he labors at this mine.

As for the other, the windows give no sign of inhabitants, for they are frosted over as if they were ground glass, and the curtains are down beside. The path is snowed up, and all tracks to and fro. No sound issues from within. It remains only to examine the chimney's nostrils. I look long and sharp at it, and fancy that I see some smoke against [the] sky there, but this [is] deceptive, for, as we are accustomed to walk up to an empty fireplace and imagine that we feel some heat from it, so I have convinced myself that I saw smoke issuing from the chimney of a house which had not been inhabited for twenty years. I had so vivid an idea of smoke curling up from a chimney's top that no painter could have matched my imagination. It was as if the spirits of the former inhabitants, revisiting their old haunts, were once more boiling a spiritual kettle below, — a small whitish-bluish cloud, almost instantly dissipated, as if the fire burned with a very clear flame, or else, the postmeridian hours having arrived, it were partially raked up, and the inhabitants were taking their siesta.

P. M. — Worked on flower-press.

Jan. 11. P. M. — To Walden.

Cold as the weather has been for some days, it [is] melting a little on the south side of houses to-day for the first time for quite a number of days, though the 9th was the coldest day thus far, the thermometer hardly going above zero during the day. Yet whenever I have been to Walden, as January 4th, 8th, and to-day, I have found much water under the snow above the ice, though there is but about five inches, both snow and water, above the ice. January 4th was the coldest day that I have been there, and yet I slumped through the snow into water, which evidently was prevented from freezing at once by the snow. I think that you may find water on the ice thus at any time, however cold, and however soon it may freeze. Probably some of the overflow I noticed on the river a few days ago was owing to the weight of the snow, as there has been no thaw.

Observed that the smooth sumachs about the north side of the Wyman meadow had been visited by partridges and a great many of the still crimson berries were strewn on the snow. There they had eaten them, perched on the twigs. Elsewhere they had tracked the snow from bush to bush, visiting almost every bush Sumachs and leaving their traces. The mice, also, had run from the base of one sumach to that of another on all sides, though there was no entrance to the ground there. Probably they had climbed the stems for berries. Most of the bunches now hang half broken off, by time, etc.

The lespedeza, now a very pale brown, looks thus: —

The sunsets, I think, are now particularly interesting. The colors of the west seem more than usually warm, perhaps by contrast with this simple snow-clad earth over which we look and the clear cold sky, — a sober but extensive redness, almost every night passing into a dun. There is nothing to distract our attention from it.

Monroe, who left his lines in Walden on the 8th, cut them out to-day, but he got no fish, though all his bait were gone.

The January Sunsets.

To-day I burn the first stick of the wood which I bought and did not get from the river. What I have still left of the river wood, added to what of it I reserve for other uses, would last me a week longer.

Animals that live on such cheap food as buds and leaves and bark and wood, like partridges and rabbits and wild mice, never need apprehend a famine.

I have not done wondering at that voracity of the pickerel, — three fresh perch and part of another in its maw! If there are a thousand pickerel in the pond, and they eat but one meal a day, there go a thousand perch or shiners for you out of this small pond. One year would require 365,000! not distinguishing frogs. Can it be so? The fishermen tell me that when they catch the most, the fish are fullest.

Mother reminds me that when we lived at the Parkin an house she lost a ruff a yard and a half long and with an edging three yards long to it, which she had laid on the grass to whiten, and, looking for it, she saw a robin tugging at the tape string of a stay on the line. He would repeatedly get it in his mouth, fly off and be brought up when he got to the end of his tether. Miss Ward thereupon tore a fine linen handkerchief into strips and threw them out, and the robin carried them all off. She had no doubt that he took the ruff.

It is commonly said that fishes are long-lived on account of the equable temperature of their element. The temperature of the body of Walden may perhaps range from 85° — perhaps at bottom much less — down to 32°, or 53°, while that of the air ranges from 100° down to — 28°, or 128°, more than twice as much. Yet how large a portion of animal life becomes dormant or migrates in the winter! And on those that remain with us there is an increase of fur, and probably of down, corresponding to the increased cold. If there is no corresponding thickening of the integument or scales of fishes on the approach of winter, they would seem to enjoy no advantage over land animals. Beside their thick coats, most land animals seek some comparatively warm and sheltered place in which to sleep, but where do the fishes resort? They may sink to the bottom, but it is scarcely so warm there as at the bottom of a gray rabbit's or a fox's burrow. Yet the fish is a tender animal in respect to cold. Pull him out in the coldest weather, and he at once becomes encased in ice and as stiff as a stake, and a fox (?) stands at his ease on the ice devouring him. Frogs, which, perchance, are equally tender, and must (?) come to the air occasionally, are therefore compelled [to] go into the mud and become dormant. They may be said to live there in a southern climate. Even the tough mud turtle possesses a southern constitution. He would snap in vain, and soon cease

snapping, at the northwest wind when the thermometer is at 25° below zero. Wild mice and spiders and snow-fleas would be his superiors.

Jan. 12. Moderating, though at zero at 9 A. M.

P. M. — To Andromeda Swamps, measuring snow. It is a fortnight since we had about a foot of snowfall on two or three inches which was firmly crusted, and a week since about six inches fell upon the last, — I guess at these depths, — and we have had clear cold weather ever since. I carry a four-foot stick marked in inches, striking it down as far as it will go at every tenth step. First, beginning in the first field west of the railroad causeway, four to six rods from the railroad, and walking parallel with the railroad, — open fields north to south: —

Other things being equal, the snow should be deeper in woods than in open fields because the trunks of trees take up room there, but this may be more than balanced by what is dissipated on the branches.

The result of 34 measures on Walden, eight or ten acres of which did not freeze till during the snow of a fortnight ago, gave 51/6.

Probably there is less snow in the woods than in open land, though it may lie high and light.

In the swamp the dull-red leaves of the andromeda were just peeping out, the snow lying not quite level, but with gentle swells about the highest clumps of bushes.

Deep as the snow was, it was no harder but perhaps easier walking there than in summer. It would not much impede a mouse running about below.

Though the snow is only ten inches deep on a level, farmers affirm that it is two feet deep, confidently.

Jan. 13. Sunrise. — A heavy lodging snow, almost rain, has been falling — how long? — coming from the eastward. The weather comparatively warm, but windy. It will probably turn to rain. Say four or five inches deep. It sticks to the sides of the houses.

Took to pieces a pensile nest which I found the 11th on the south shore of Walden on an oak sapling (red or black), about fifteen feet from the ground. Though small, it measures three inches by three in the extreme, and was hung between two horizontal twigs or in a fork forming about a right angle, the third side being regularly rounded without any very stiff material. The twigs extended two or three inches beyond the nest. The bulk of it is composed of fine shreds or fibres, pretty long (say three to six inches), of apparently inner oak (?) bark, judging from some scraps of the epidermis adhering. It looks at first sight like sedge or grass. The bottom, which I accidentally broke off and disturbed the arrangement of, was composed of this and white and pitch pine needles and little twigs about the same size and form, rough, with little leaf-stalks or feet (probably hemlock (?)), and also strips and curls of paper birch epidermis, and some hornet or other wasp nest used like the last. I mention the most abundant

material first. Probably the needles and twigs were used on account of their curved form and elasticity, to give shape to the bottom. The sides, which were not so thick, were composed of bark shreds, paper birch, and hornet-nest (the two latter chiefly outside, probably to bind and conceal and keep out the wind), agglutinated together. But most pains was taken with the thin edge and for three quarters of an inch down, where, beside the bark-fibres, birch paper, and hornets' nest, some silky reddish-brown and also white fibre was used to bind all with, almost spun into threads and passed over the twigs and agglutinated to them, or over the bark edge. The shreds of birch paper were smaller there, and the hornets' nest looked as if it had been reduced to a pulp by the bird and spread very thinly here and there over all, mixed with the brown silk. This last looked like cow's hair, but as I found a piece of a small brown cocoon, though a little paler, I suspect it was from that. The white may have been from a cocoon, or else vegetable silk. Probably a vireo's nest, maybe red-eye's.

In our workshops we pride ourselves on discovering a use for what had previously been regarded as waste, but how partial and accidental our economy compared with Nature's. In Nature nothing is wasted. Every decayed leaf and twig and fibre is only the better fitted to serve in some other department, and all at last are gathered in her compost-heap. What a wonderful genius it is that leads the vireo to select the tough fibres of the inner bark, instead of the more brittle grasses, for its basket, the elastic pine-needles and the twigs, curved as they dried to give it form, and, as I suppose, the silk of cocoons, etc., etc., to bind it together with! I suspect that extensive use is made of these abandoned cocoons by the birds, and they, if anybody, know where to find them. There were at least seven materials used in constructing this nest, and the bird visited as many distinct localities many times, always with the purpose or design to find some particular one of these materials, as much as if it had said to itself, "Now I will go and get some old hornets' nest from one of those that I saw last fall down in the maple swamp — perhaps thrust my bill into them — or some silk from those cocoons I saw this morning."

It turned to rain before noon, four or five inches of very moist snow or sleet having fallen.

Jan. 14. Sunrise. — Snows again. I think that you can best tell from what side the storm came by observing on which side of the trees the snow is plastered.

The crows are flitting about the houses and alight upon the elms.

After snowing an inch or two it cleared up at night. Boys, etc., go about straddling the fences, on the crust.

Jan. 15. A fine, clear winter day.

P. M. — To Hemlocks on the crust, slumping in every now and then.

A bright day, not cold. I can comfortably walk without gloves, yet my shadow is a most celestial blue. This only requires a clear bright day and snow-clad earth, not great cold. I cross the river on the crust with some hesitation. The snow appears considerably deeper than the 12th, maybe four or five inches deeper, and the river is indicated by a mere depression in it.

In the street not only fences but trees are obviously shortened, as by a flood. You are sensible that you are walking at a level a foot or more above the usual one. Seeing the tracks where a leaf had blown along and then tacked and finally doubled and returned on its trail, I thought it must be the tracks of some creature new to me.

I find under the hemlocks, in and upon the snow, apparently brought down by the storm, an abundance of those little dead hemlock twigs described on the 13th. They are remarkably slender, and without stiffness like the fir (and I think spruce) twigs, and this gives the hemlock its peculiar grace. These are not yet curved much, and perhaps they got that form from being placed in the nest.

Jan. 16. 8 A. M. — Down railroad, measuring snow, having had one bright day since the last flake fell; but, as there was a crust which would bear yesterday (as to-day), it cannot have settled much. The last storms have been easterly and northeasterly.

Why so much (five and one half inches) more now in the woods than on the 12th, as compared with open fields? Was the driving snow caught in a small wood, or did it settle less in the rain there, or since the snow on account of bushes?

I hear flying over (and see) a snow bunting, — a clear loud tcheep or tcheop, sometimes rapidly trilled or quavered, — calling its mates.

With this snow the fences are scarcely an obstruction to the traveller; he easily steps over them. Often they are buried. I suspect it is two and a half feet deep in Andromeda Swamps now. The snow is much deeper in yards, roads, and all small inclosures than in broad fields.

Jan. 17. Henry Shattuck tells me that the quails come almost every day and get some saba beans within two or three rods of his house, — some which he neglected to gather. Probably the deep snow drives them to it.

Jan. 18. J. B. Moore says that he has caught twenty pounds of pickerel in Walden in one winter, etc., and had had nearly as good luck five or six times the same winter there, not less than ten pounds at one time. Suppose, then, that he has caught fifty pickerel there in one winter, and all others the same winter a hundred and fifty, you have two hundred caught in one winter. I suspect there are as many as two thousand that will weigh a pound. Five men caught three hundred and thirty-three pounds in a pond in Eastham in one day this winter, say the papers, — largest five and a half pounds.

Analyzed a nest which I found January 7th in an upright fork of a red maple sapling on the edge of Hubbard's Swamp Wood, north side, near river, about eight feet from the ground, the deep grooves made by the twigs on each side. It may be a yellowbird's.

Extreme breadth outside, three inches; inside, one and a half. Extreme height outside, three inches; inside, one and five eighths; sides, three quarters of an inch thick.

It is composed of seven principal materials. (I name the most abundant first; I mean most abundant when compressed.)

1. — Small compact lengths of silvery pappus about seven eighths of an inch long, perhaps of erechthites, one half inch deep and nearly pure, a very warm bed, chiefly concealed, just beneath the lining inside.

2. — Slender catkins, often with the buds and twig ends (of perhaps hazel), throughout the whole bottom and sides, making it thick but open and light, mixed with (3) milkweed silk, i.e. fibres like flax, but white, being bleached, also in sides and rim, some of it almost threadlike, white with some of the dark epidermis. From the pods?

4. — Thin and narrow strips of grape-vine bark, chiefly in the rim and sides for three quarters of an inch down, and here and there throughout.

5. — Wads of apparently brown fern wool, mixed with the last three.

6. — Some finer pale-brown and thinner shreds of bark within the walls and bottom, apparently not grape. If this were added to the grape, these five materials would be not far from equally abundant.

7. — Some very fine pale-brown wiry fibres for a lining, just above the pappus and somewhat mixed with it, perhaps for coolness, being springy.

Directly beneath the pappus were considerable other shreds of grape and the other bark, short and broken. In the rim and sides some cotton ravellings and some short shreds of fish-line or crow-fence. A red maple leaf within the bottom; a kernel of corn just under the lining of fibres (perhaps dropped by a crow or blackbird or jay or squirrel while the nest was building). A few short lengths of stubble or weed stems in the bottom and sides. A very little brown wool, like, apparently, that in the nest last described, which may be brown fern wool. The milkweed and fern wool conspicuous without the rim and about the twigs. I was most struck by that mass of pure pappus under the inside lining.

P. M. — To Walden to learn the temperature of the water.

The snow is so deep at present in the streets that it is very difficult turning out, and there are cradle-holes between this and the post-office. The sidewalks being blotted out, the street, like a woodman's path, looks like a hundred miles up country. I see where children have for some days come to school across the fields on the crust from Abiel Wheeler's to the railroad crossing. I see their tracks in the slight snow upon the crust which fell the 14th. They save a great distance and enjoy the novelty.

This is a very mild, melting winter day, but clear and bright, yet I see the blue shadows on the snow at Walden. The snow lies very level there, about ten inches deep, and for the most part bears me as I go across with my hatchet. I think I never saw a more elysian blue than my shadow. I am turned into a tall blue Persian from my cap to my boots, such as no mortal dye can produce, with an amethystine hatchet in my hand. I am in raptures at my own shadow. What if the substance were of as ethereal a nature? Our very shadows are no longer black, but a celestial blue. This has nothing to do with cold, methinks, but the sun must not be too low.

I cleared a little space in the snow, which was nine to ten inches deep over the deepest part of the pond, and cut through the ice, which was about seven inches thick, only the first four inches, perhaps, snow ice, the other three clear. The moment I reached the water, it gushed up and overflowed the ice, driving me out this yard in the snow, where it stood at last two and a half inches deep above the ice.

The thermometer indicated  $33\frac{1}{2}^{\circ}$  at top and  $34^{\circ}$  when drawn up rapidly from thirty feet beneath. So, apparently, it is not much warmer beneath.

Goodwin was fishing there. He says he once caught fifty pounds of pickerel here in two days; he thought twenty-five or thirty fishes. Thought that there were many hundred caught here in a winter; that nearly all were females.

Observed some of those little hard galls on the high blueberry, pecked or eaten into by some bird (or possibly mouse), for the little white grubs which lie curled up in them. What entomologists the birds are! Most men do not suspect that there are grubs in them, and how secure the latter seem under these thick dry shells! Yet there is no secret but it is confided to some one.

Jan. 19. Another bright winter day.

P. M. — To river to get some water asclepias to see what birds' nests are made of.

The only open place in the river between Hunt's Bridge and the railroad bridge is a small space against Merrick's pasture just below the Rock. As usual, just below a curve, in shallow water, with the added force of the Assabet.

The willow osiers of last year's growth on the pollards in Shattuck's row, Merrick's pasture, from four to seven feet long, are perhaps as bright as in the spring, the lower half yellow, the upper red, but they are a little shrivelled in the bark.

Measured again the great elm in front of Charles Davis's on the Boston road, which he is having cut down. The chopper, White, has taken off most of the limbs and just begun, tried his axe, on the foot of the tree. He will probably fall it on Monday, or the 21st. At the smallest place between the ground and the limbs, seven feet from the ground, it is fifteen feet and two inches in circumference; at one foot from the ground on the lowest side, twenty-three feet and nine inches. White is to have ten dollars for taking off the necessary limbs and cutting it down merely, help being found him. He began on Wednesday. Davis and the neighbors were much alarmed by the creaking in the late storms, for fear it would fall on their roofs. It stands two or three feet into Davis's yard.

As I came home through the village at 8.15 p. M., by a bright moonlight, the moon nearly full and not more than  $18^{\circ}$  from the zenith, the wind northwest, but not strong, and the air pretty cold, I saw the melon-rind arrangement of the clouds on a larger scale and more distinct than ever before. There were eight or ten courses of clouds, so broad that with equal intervals of blue sky they occupied the whole width of the heavens, broad white cirro-stratus in perfectly regular curves from west to east across the whole sky. The four middle ones, occupying the greater part of the visible cope, were particularly distinct. They were all as regularly arranged as the lines on a melon, and with much straighter sides, as if cut with a knife. I hear that it attracted the attention of those who were abroad at 7 p. M., and now, at 9 P. M., it is scarcely less remarkable. On one side of the heavens, north or south, the intervals of blue look almost black by contrast. There is now, at nine, a strong wind from the northwest. Why do these bars extend east and west? Is it the influence of the sun, which set so

long ago? or of the rotation of the earth? The bars which I notice so often, morning and evening, are apparently connected with the sun at those periods.

In Oliver N. Bacon's History of Natick, page 235. it is said that, of phænogamous plants, "upwards of 800 species were collected from Natick soil in three years' time, by a single individual." I suspect it was Bacon the surveyor. There is given a list of those which are rare in that vicinity. Among them are the following which I do not know to grow here: *Actœa rubra* (W.), *Asclepias tuberosa*, *Alopecurus pratensis*, *Corallorhiza odontorhiza* (?) (Nutt.), *Drosera filiformis* (Nutt.), *Ledum latifolium*, *Malaxis lilifolia* (W.) (what in Gray?), *Sagina procumbens*. Among those rare there but common here are *Calla Virginica*, *Glecoma hederacea*, *Iris prismatica*, *Lycopus Virginicus*, *Mikania scandens*, *Prunus borealis*, *Rhodod Canadensis*, *Xyris aquatica*, *Zizania aquatica*. They, as well as we, have *Equisetum hyemale*, *Kalmia glauca*, *Liatris scariosa*, *Ulmus fulva*, *Linnœa borealis*, *Pyrola maculata*, etc., etc.

Bacon quotes White, who quotes Old Colony Memorial account of manners and customs, etc., of our ancestors.

Bacon says that the finest elm in Natick stands in front of Thomas F. Hammond's house, and was set out "about the year 1760."

"The trunk, five feet from the ground, measures fifteen and a half feet." G. Emerson gives a different account, q v.

Observed within the material of a robin's nest, this afternoon, a cherry-stone.

Gathered some dry water milkweed stems to compare with the materials of the bird's nest of the 18th. The bird used, I am almost certain, the fibres of the bark of the stem, — not the pods, — just beneath the epidermis; only the bird's is older and more fuzzy and finer, like worn twine or string. The fibres and bark have otherwise the same appearance under the microscope. I stripped off some bark about one sixteenth of an inch wide and six inches long and, separating ten or twelve fibres from the epidermis, rolled it in my fingers, making a thread about the ordinary size. This I could not break by direct pulling, and no man could. I doubt if a thread of flax or hemp of the same size could be made so strong. What an admirable material for the Indian's fish-line! I can easily get much longer fibres. I hold a piece of the dead weed in my hands, strip off a narrow shred of the bark before my neighbor's eyes and separate ten or twelve fibres as fine as a hair, roll them in my fingers, and offer him the thread to try its strength. He is surprised and mortified to find that he cannot break it. Probably both the Indian and the bird discovered for themselves this same (so to call it) wild hemp. The corresponding fibres of the mikania seem not so divisible, become not so fine and fuzzy; though somewhat similar, are not nearly so strong. I have a hang-bird's nest from the riverside, made almost entirely of this, in narrow shreds or strips with the epidermis on, wound round and round the twigs and woven into a basket. That is, this bird has used perhaps the strongest fibre which the fields afforded and which most civilized men have not detected.

Knocked down the bottom of that summer yellow-bird's nest made on the oak at the Island last summer. It is chiefly of fern wool and also, apparently, some sheep's wool

(?), with a fine green moss (apparently that which grows on button-bushes) inmixed, and some milkweed fibre, and all very firmly agglutinated together. Some shreds of grape-vine bark about it. Do not know what portion of the whole nest it is.

Jan. 20. In my experience I have found nothing so truly impoverishing as what is called wealth, i.e. the command of greater means than you had before possessed, though comparatively few and slight still, for you thus inevitably acquire a more expensive habit of living, and even the very same necessaries and comforts cost you more than they once did. Instead of gaining, you have lost some independence, and if your income should be suddenly lessened, you would find yourself poor, though possessed of the same means which once made you rich. Within the last five years I have had the command of a little more money than in the previous five years, for I have sold some books and some lectures; yet I have not been a whit better fed or clothed or warmed or sheltered, not a whit richer, except that I have been less concerned about my living, but perhaps my life has been the less serious for it, and, to balance it, I feel now that there is a possibility of failure. Who knows but I may come upon the town, if, as is likely, the public want no more of my books, or lectures (which last is already the case)? Before, I was much likelier to take the town upon my shoulders. That is, I have lost some of my independence on them, when they would say that I had gained an independence. If you wish to give a man a sense of poverty, give him a thousand dollars. The next hundred dollars he gets will not be worth more than ten that he used to get. Have pity on him; withhold your gifts.

P. M. — Up river to Hollowell place.

I see the blue between the cakes of snow cast out in making a path, in the triangular recesses, though it is pretty cold, but the sky is completely overcast.

It is now good walking on the river, for, though there has been no thaw since the snow came, a great part of it has been converted into snow ice by sinking the old ice beneath the water, and the crust of the rest is stronger than in the fields, because the snow is so shallow and has been so moist. The river is thus an advantage as a highway, not only in summer and when the ice is bare in the winter, but even when the snow lies very deep in the fields. It is invaluable to the walker, being now not only the most interesting, but, excepting the narrow and unpleasant track in the highways, the only practicable route. The snow never lies so deep over it as elsewhere, and, if deep, it sinks the ice and is soon converted into snow ice to a great extent, beside being blown out of the river valley. Neither is it drifted here. Here, where you cannot walk at all in the summer, is better walking than elsewhere in the winter. But what a different aspect the river's brim now from what it wears in summer! I do not this moment hear an insect hum, nor see a bird, nor a flower. That museum of animal and vegetable life, a meadow, is now reduced to a uniform level of white snow, with only half a dozen kinds of shrubs and weeds rising here and there above it.

Nut Meadow Brook is open in the river meadow, but not into the river. It is remarkable that the short strip in the middle below the Island (vide yesterday) should be the only open place between Hunt's Bridge and Hubbard's, at least, — probably as far as

Lee's. The river has been frozen solidly ever since the 7th, and that small open strip of yesterday (about one rod wide and in middle) was probably not more than a day or two old. It is very rarely closed, I suspect, in all places more than two weeks at a time. Ere long it wears its way up to the light, and its blue artery again appears here and there. In one place close to the river, where the forget-me-not grows, that springy place under the bank just above the railroad bridge, the snow is quite melted and the bare ground and flattened weeds exposed for four or five feet.

Broke open a frozen nest of mud and stubble in a black willow, probably a robin's, in which were a snail (?) shell and a skunk-cabbage seed (? ). Were they not left there by a mouse? Or could they have been taken up with the mud? (They were somewhat in the mud. A downy woodpecker without red on head the only bird seen in this walk [? ]. I stand within twelve feet.

The arrangement of the clouds last night attracted attention in various parts of the town.

A probable kingbird's nest, on a small horizontal branch of a young swamp white oak, amid the twigs, about ten feet from ground. This tree is very scraggy; has numerous short twigs at various angles with the branches, making it unpleasant to climb and affording support to birds' nests. The nest is round, running to rather a sharp point on one side beneath. Extreme diameter outside, four and a half to five inches; within, three inches; depth within, two inches; without, four or more. The principal materials are ten, in the order of their abundance thus: —

1. — Reddish and gray twigs, some a foot and more in length, which are cranberry vines, with now and then a leaf on, probably such as were tom up by the rakers. Some are as big round as a knitting-needle, and would be taken for a larger bush. These make the stiff mass of the outside above and rim.

2. — Woody roots, rather coarser, intermixed from waterside shrubs. Probably some are from cranberry vines. These are mixed with the last and with the bottom.

3. — Softer and rather smaller roots and root-fibres of herbaceous plants, mixed with the last and a little further inward, for the harshest are always most external.

4. — (Still to confine myself to the order of abundance) withered flowers and short bits of the gray downy stems of the fragrant everlasting; these more or less compacted and apparently agglutinated from the mass of the solid bottom, and more loose, with the stems run down to a point on one side the bottom.

5. — What I think is the fibrous growth of a willow, moss-like with a wiry dark-colored hair-like stem (possibly it is a moss). This, with or without the tuft, is the lining, and lies contiguous in the sides and bottom.

6. — What looks like brown decayed leaves and confervae from the dried bottom of the riverside, mixed with the everlasting-tops internally in the solid bottom.

7. — Some finer brown root-fibres, chiefly between the lining of No. 6 and hair and the coarser fibres of No. 3.

8. — A dozen whitish cocoons, mixed with the everlasting-tops and dangling about the bottom peak externally; a few within the solid bottom. Also eight or ten very minute cocoons mixed with these, attached in a cluster to the top of an everlasting.

9. — A few black much branched roots (?) (perhaps some utricularia from the dried bottom of river), mixed with Nos. 2 and 3.

10. — Some horsehair, white and black, together with No. 5 forming the lining.

There are also, with the cocoons and everlasting-tops externally, one or two cotton-grass heads, one small white feather, and a little greenish-fuscous moss from the button-bush, and, in the bottom, a small shred of grape-vine bark.

Jan. 21. Four men, cutting at once, began to fell the big elm (vide 19th) at 10 a. m., went to dinner at 12, and got through at 2.30 p. m. They used a block and tackle with five falls, fastened to the base of a buttonwood, and drawn by a horse, to pull it over the right way; so it fell without harm down the road. One said he pulled twenty turns. I measured it at 3 p. m., just after the top had been cut off.

It was 15 feet to the first crotch. At 75 feet, the most upright and probably highest limb was cut off, and measured 27 inches in circumference. As near as I could tell from the twigs on the snow, and what the choppers said who had just removed the top, it was about 108 feet high. At 15 feet from the stump, it divided into two parts, about an equal size. One was decayed and broken in the fall, being undermost, the other (which also proved hollow) at its origin was  $11 \frac{4}{12} \frac{4}{12}$  feet in circumference. (The whole tree directly beneath this crotch was  $19 \frac{3}{12}$  round.) This same limb branched again at  $36 \frac{8}{12}$  from the stump, and there measured, just beneath the crotch,  $14 \frac{10}{12}$  in circumference. At the ground the stump measured  $8 \frac{4}{12}$  one way,  $8 \frac{3}{12}$  another,  $7 \frac{1}{2}$  another. It was solid quite through at butt (excepting 3 inches in middle), though somewhat decayed within, and I could count pretty well 105 rings, to which add 10 more for the hollow and you have 115.

There was a currant bush opposite the first crotch, in a large hole at that height, where probably a limb once broke off (making three there), and also a great many stones bigger than a hen's egg, probably cast in by the boys. There was also part of an old brick with some clay, thirty or forty years within the tree at the stump, completely overgrown and cut through by the axe. I judged that there were at least seven cords then in the road, supposing one main limb sound, and Davis thought that the pile in the yard, from the limbs taken off last week, contained four more. He said that there were some flying squirrels within and upon it when they were taking off the limbs. There was scarcely any hollowness to be discovered. It had grown very rapidly the first fifty years or so. You could see where there had once been deep clefts between different portions of the trunk at the stump, but the tree had afterward united and overgrown them, leaving some bark within the wood. In some places the trunk as it lay on the ground (though flatwise) was as high as a man's head.

This tree stood directly under the hill, which is some sixty feet high, the old burying hill continued, south of where the flagstaff was planted when the British marched into town. This tree must have been some fifty years old and quite sizable then. White,

when taking off the limbs, said that he could see all over Sleepy Hollow, beyond the hill. There were several great wens on the trunk, a foot in diameter and nearly as much in height. The tree was so sound I think it might have lived fifty years longer; but Mrs. Davis said that she would not like to spend another such a week as the last before it was cut down. They heard it creak in the storm. One of the great limbs which reached over the house was cracked. The two main limbs proved hollow.

Jan. 22. P. M. — To Walden.

The Walden road is nearly full of snow still, to the top of the wall on the north side, though there has been no snow falling since the 14th. The snow lies particularly solid. Looking toward the sun, the surface consists of great patches of shining crust and dry driving snow, giving it a watered appearance.

Miss Minott talks of cutting down the oaks about her house for fuel, because she cannot get her wood sledged home on account of the depth of the snow, though it lies all cut there. James, at R. W. E.'s, waters his cows at the door, because the brook is frozen.

If you wish to know whether a tree is hollow, or has a hole in it, ask the squirrels. They know as well as whether they have a home or not. Yet a man lives under it all his life without knowing, and the chopper must fairly cut it up before he can tell. If there is a cleft in it, he is pretty sure to find some nutshell or materials of a bird's nest left in it.

At Brister's Spring I see where a squirrel has been to the spring and also sat on a low alder limb and eaten a hazelnut. Where does he find a sound hazelnut now? Has them in a hollow tree.

See tracks of fishermen and pickerel. Vide forward.

At Walden, near my old residence, I find that since I was here on the 11th, apparently within a day or two, some gray or red squirrel or squirrels have been feeding on the pitch pine cones extensively. The snow under one young pine is covered quite thick with the scales they have dropped while feeding overhead. I count the cores of thirty-four cones on the snow there, and that is not all. Under another pine there are more than twenty, and a well-worn track from this to a fence-post three rods distant, under which are the cores of eight cones and a corresponding amount of scales. The track is like a very small rabbit. They have gnawed off the cones which were perfectly closed.

I see where one has taken one of a pair and left going up the page the other partly off. He had first sheared off the needles that were in the way, and then gnawed off the sides or cheeks of the twig to come at the stem of the cone, which as usual was cut by successive cuts as with a knife, while bending it. One or two small, perhaps dead, certainly unripe ones were taken off and left unopened. I find that many of those young pines are now full of unopened cones, which apparently will be two years old next summer, and these, the squirrel now eats. There are also some of them open, perhaps on the most thrifty twigs.

F. Morton hears to-day from Plymouth that three men have just caught in Sandy Pond, in Plymouth, about two hundred pounds of pickerel in two days.

Somebody has been fishing in the pond this morning, and the water in the holes is beginning to freeze. I see the track of a crow, the toes as usual less spread and the middle one making a more curved furrow in the snow than the partridge, as if they moved more unstably, recovering their balance, — feeble on their feet. The inner toe a little the nearest to the middle one. This track goes to every hole but one or two out of a dozen, — directly from hole to hole, sometimes flying a little, — and also to an apple-core on the snow. I am pretty sure that this bird was after the bait which is usually dropped on the ice or in the hole. E. Garfield says they come regularly to his holes for bait as soon as he has left. So, if the pickerel are not fed, it is. It had even visited, on the wing, a hole, now frozen and snowed up, which I made far from this in the middle of the pond several days since, as I discovered by its droppings, the same kind that it had left about the first holes.

I was surprised, on breaking with my foot the ice in a pickerel-hole near the shore, evidently frozen only last night, to see the water rise at once half an inch above it. Why should the ice be still sinking? Is it growing more solid and heavier?

Most were not aware of the size of the great elm till it was cut down. I surprised some a few days ago by saying that when its trunk should lie prostrate it would be higher than the head of the tallest man in the town, and that two such trunks could not stand in the chamber we were then in, which was fifteen feet across; that there would be ample room for a double bedstead on the trunk, nay, that the very dinner-table we were sitting at, with our whole party of seven, chairs and all, around it, might be set there. On the decayed part of the butt end there were curious fine black lines, giving it a geographical look, here and there, half a dozen inches long, sometimes following the line of the rings; the boundary of a part which had reached a certain stage of decay. The force on the pulleys broke off more than a foot in width in the middle of the tree, much decayed.

I have attended the felling and, so to speak, the funeral of this old citizen of the town, — I who commonly do not attend funerals, — as it became me to do. I was the chief if not the only mourner there. I have taken the measure of his grandeur; have spoken a few words of eulogy at his grave, remembering the maxim *de mortuis nil nisi bonum* (in this case *magnum*). But there were only the choppers and the passers-by to hear me. Further the town was not represented; the fathers of the town, the selectmen, the clergy were not there. But I have not known a fitter occasion for a sermon of late. Travellers whose journey was for a short time delayed by its prostrate body were forced to pay it some attention and respect, but the axe-boys had climbed upon it like ants, and commenced chipping at it before it had fairly ceased groaning. There was a man already bargaining for some part. How have the mighty fallen! Its history extends back over more than half the whole history of the town. Since its kindred could not conveniently attend, I attended. Methinks its fall marks an epoch in the history of the town. It has passed away together with the clergy of the old school and the stage-coach which used to rattle beneath it. Its virtue was that it steadily grew and expanded from year to year to the very last. How much of old Concord falls with it!

The town clerk will not chronicle its fall. I will, for it is of greater moment to the town than that of many a human inhabitant would be. Instead of erecting a monument to it, we take all possible pains to obliterate its stump, the only monument of a tree which is commonly allowed to stand. Another link that bound us to the past is broken. How much of old Concord was cut away with it! A few such elms would alone constitute a township. They might claim to send a representative to the General Court to look after their interests, if a fit one could be found, a native American one in a true and worthy sense, with catholic principles. Our town has lost some of its venerableness. No longer will our eyes rest on its massive gray trunk, like a vast Corinthian column by the wayside; no longer shall we walk in the shade of its lofty, spreading dome. It is as if you had laid the axe at the feet of some venerable Buckley or Ripley. You have laid the axe, you have made fast your tackle, to one of the king-posts of the town. I feel the whole building wracked by it. Is it not sacrilege to cut down the tree which has so long looked over Concord beneficently?

Supposing the first fifteen feet to average six feet in diameter, they would contain more than three cords and a foot of wood; but probably not more than three cords.

With what feelings should not the citizens hear that the biggest tree in the town has fallen! A traveller passed through the town and saw the inhabitants cutting it up without regret.

The tracks of the partridges by the sumachs, made before the 11th, are perhaps more prominent now than ever, for they have consolidated the snow under them so that as it settled it has left them alto-relievo. They look like broad chains extending straight far over the snow.

I brought home and examined some of the droppings of the crow mentioned four pages back. They were brown and dry, though partly frozen. — After long study with a microscope, I discovered that they consisted of the seeds and skins and other indigestible parts of red cedar berries and some barberries (I detected the imbricated scale-like leaves of a berry stem and then the seeds and the now black skins of the cedar berries, but easily the large seeds of the barberries) and perhaps something more, and I knew whence it had probably come, i.e. from the cedar woods and barberry bushes by Flint's Pond. These, then, make part of the food of crows in severe weather when the snow is deep, as at present.

Jan. 23. Brown is filling his ice-house. The clear ice is only from one and a half to four inches thick; all the rest, or nearly a foot, is snow ice, formed by the snow sinking the first under the water and freezing with the water. The same is the case at Walden. To get ice at all clear or transparent, you must scrape the snow off after each fall. Very little ice is formed by addition below, such a snowy winter as this.

There was a white birch scale yesterday on the snowed-up hole which I made in the very middle of Walden. I have no doubt they blow across the widest part of the pond.

When approaching the pond yesterday, through my bean-field, I saw where some fishermen had come away, and the tails of their string of pickerel had trailed on the deep snow where they sank in it. I afterward saw where they had been fishing that

forenoon, the water just beginning to freeze, and also where some had fished the day before with red-finned minnows, which were frozen into an inch of ice; that these men had chewed tobacco and ate apples. All this I knew, though I saw neither man nor squirrel nor pickerel nor crow.

Measured, this afternoon, the snow in the same fields which I measured just a week ago, to see how it had settled. It has been uniformly fair weather of average winter coldness, without any thaw. West of railroad it averages  $11 \frac{1}{3} +$  (On the 16th it was  $12 \frac{1}{4}$ .) East of railroad, 14 inches (16th,  $15 \frac{5}{8}$ ). Or average of both  $12 \frac{1}{3} +$  — say  $12 \frac{1}{2}$ . It has settled, therefore, in open fields  $1 \frac{1}{10}$  inches, showing how very solid it is, as many have remarked. Not allowing for what of the light snow above the crust may have drifted against the railroad embankment (though I measured on both sides of it). Trillium Woods,  $13 \frac{1}{4} +$ ; 16th it was 17. Has settled  $3 \frac{3}{4}$ . It seems, then, that, as it lies light in the wood at first, it settles much faster there, so that, though it was nearly  $3 \frac{1}{2}$  inches the deepest there a week ago, it is less than 1 inch the deepest there now.

Jan. 24. A journal is a record of experiences and growth, not a preserve of things well done or said. I am occasionally reminded of a statement which I have made in conversation and immediately forgotten, which would read much better than what I put in my journal. It is a ripe, dry fruit of long-past experience which falls from me easily, without giving pain or pleasure. The charm of the journal must consist in a certain greenness, though freshness, and not in maturity. Here I cannot afford to be remembering what I said or did, my scurf cast off, but what I am and aspire to become.

Reading the hymns of the Rig Veda, translated by Wilson, which consist in a great measure of simple epithets addressed to the firmament, or the dawn, or the winds, which mean more or less as the reader is more or less alert and imaginative, and seeing how widely the various translators have differed, they regarding not the poetry, but the history and philology, dealing with very concise Sanscrit, which must almost always be amplified to be understood, I am sometimes inclined to doubt if the translator has not made something out of nothing, — whether a real idea or sentiment has been thus transmitted to us from so primitive a period. I doubt if learned Germans might not thus edit pebbles from the seashore into hymns of the Rig Veda, and translators translate them accordingly, extracting the meaning which the sea has imparted to them in very primitive times. While the commentators and translators are disputing about the meaning of this word or that, I hear only the resounding of the ancient sea and put into it all the meaning I am possessed of, the deepest murmurs I can recall, for I do not the least care where I get my ideas, or what suggests them.

I knew that a crow had that day plucked the cedar berries and barberries by Flint's Pond and then flapped silently through the trackless air to Walden, where it dined on fisherman's bait, though there was no living creature to tell me.

Holbrook's elm measured to-day 11 feet 4 inches in circumference at six feet from ground, the size of one of the branches of the Davis elm (call it the Lee elm, for a Lee formerly lived there). Cheney's largest in front of Mr. Frost's, 12 feet 4 inches, at

six feet; 16 feet 6 inches, at one foot. The great elm opposite Keyes's land, near by (call it the Jones elm): 17 feet 6 inches, at two behind and one plus before; 15 feet 10 inches, at four; 15 feet 5 inches, at six; 16 feet at seven and a half, or spike on west side. At the smallest place between the ground and branches, this is a little bigger than the Davis elm, but it is not so big at or near the ground, nor is it so high to the branching, — about twelve feet, — nor are the branches so big, but it is much sounder, and its top broader, fuller, and handsomer. This has an uncommonly straight-sided and solid-looking trunk, measuring only two feet less at six feet from the ground than at two.

P. M. — Up Assabet.

Even the patches of shining snow-crust between those of dry white surface snow are slightly blue, like ice and water.

You may walk anywhere on the river now. Even the open space against Merrick's, below the Rock, has been closed again, and there is only six feet of water there now. I walk with a peculiar sense of freedom over the snow-covered ice, not fearing that I shall break through. I have not been able to find any tracks of muskrats this winter. I suspect that they very rarely venture out in winter with their wet coats.

I see squirrel-tracks about the hemlocks.

They are much like rabbits, only the toes, are very distinct. From this they pass into a semicircular figure sometimes. Some of the first are six inches from outside to outside lengthwise, with one to two feet of interval.

Are these the gray or red?

A great many hemlock cones have fallen on the snow and rolled down the hill.

Higher up, against the Wheeler Swamp, I see where many squirrels — perhaps red, for the tracks appear smaller — have fed on the alder cones on the twigs which are low or frozen into the ice, stripping them to the core just as they do the pine cones.

Here are the tracks of a crow, like those of the 22d, with a long hind toe, nearly two inches. The two feet are also nearly two inches apart. I see where the bird alighted, descending with an impetus and breaking through the slight crust, planting its feet side by side.

How different this partridge-track, with its slight hind toe, open and wide-spread toes on each side, both feet forming one straight line, exactly thus: —

(Five inches from centre to centre.) The middle toe alternately curved to the right and to the left, and what is apparently the outer toe in each case shorter than the inner one.

I see under a great many trees, black willow and swamp white oak, the bark scattered over the snow, some pieces six inches long, and above see the hole which a woodpecker has bored.

The snow is so deep along the sides of the river that I can now look into nests which I could hardly reach in the summer. I can hardly believe them the same. They have only an ice egg in them now. Thus we go about, raised, generally speaking, more than a foot above the summer level. So much higher do we carry our heads in the winter.

What a great odds such a little difference makes! When the snow raises us one foot higher than we have been accustomed to walk, we are surprised at our elevation! So we soar.

I do not find a foot of open water, even, on this North Branch, as far as I go, i, e to J. Hosmer's lot. The river has been frozen unusually long and solidly. They have been sledding wood along the river for a quarter of a mile in front of Merriam's and past the mouth of Sam Barrett's Brook, where it is bare of snow, — hard, glare ice on which there is scarcely a trace of the sled or oxen. They have sledded home a large oak which was cut down on the bank. Yet this is one of the rockiest and swiftest parts of the stream. Where I have so often stemmed the swift current, dodging the rocks, with my paddle, there the heavy, slowpaced oxen, with their ponderous squeaking load, have plodded, while the teamster walked musing beside it.

That Wheeler swamp is a great place for squirrels. I observe many of their tracks along the riverside there. The nests are of leaves, and apparently of the gray species.

There is much of the water milkweed on the little island just above Dove Rock. It rises above the deep snow there.

It is remarkable how much the river has been tracked by dogs the week past, not accompanied by their masters. They hunt, perchance, in the night more than is supposed, for I very rarely see one alone by day.

The river is pretty low and has fallen within a month, for there has been no thaw. The ice has broken and settled around the rocks, which look as if they had burst up through it. Some maple limbs which were early frozen in have been broken and stripped down by this irresistible weight.

You see where the big dogs have slipped on one or two feet in their haste, sinking to the ice, but, having two more feet, it did not delay them.

I walk along the sides of the stream, admiring the rich mulberry catkins of the alders, which look almost edible. They attract us because they have so much of spring in them. The clear red osiers, too, along the riverside in front of Merriam's on Wheeler's side.

I have seen many a collection of stately elms which better deserved to be represented at the General Court than the manikins beneath, — than the barroom and victualling cellar and groceries they overshadowed. When I see their magnificent domes, miles away in the horizon, over intervening valleys and forests, they suggest a village, a community, there. But, after all, it is a secondary consideration whether there are human dwellings beneath them; these may have long since passed away. I find that into my idea of the village has entered more of the elm than of the human being. They are worth many a political borough. They constitute a borough. The poor human representative of his party sent out from beneath their shade will not suggest a tithe of the dignity, the true nobleness and comprehensiveness of view, the sturdiness and independence, and the serene beneficence that they do. They look from township to township. A fragment of their bark is worth the backs of all the politicians in the union. They are free-soilers in their own broad sense. They send their roots north and south and east and west into many a conservative's Kansas and Carolina, who does not suspect such underground

railroads, — they improve the subsoil he has never disturbed, — and many times their length, if the support of their principles requires it. They battle with the tempests of a century. See what scars they bear, what limbs they lost before we were born! Yet they never adjourn; they steadily vote for their principles, and send their roots further and wider from the same centre. They die at their posts, and they leave a tough butt for the choppers to exercise themselves about, and a stump which serves for their monument. They attend no caucus, they make no compromise, they use no policy. Their one principle is growth. They combine a true radicalism with a true conservatism. Their radicalism is not cutting away of roots, but an infinite multiplication and extension of them under all surrounding institutions. They take a firmer hold on the earth that they may rise higher into the heavens. Their conservative heart-wood, in which no sap longer flows, does not impoverish their growth, but is a firm column to support it; and when their expanding trunks no longer require it, it utterly decays. Their conservatism is a dead but solid heart-wood, which is the pivot and firm column of support to all this growth, appropriating nothing to itself, but forever by its support assisting to extend the area of their radicalism. Half a century after they are dead at the core, they are preserved by radical reforms. They do not, like men, from radicals turn conservative. Their conservative part dies out first; their radical and growing part survives. They acquire new States and Territories, while the old dominions decay, and become the habitation of bears and owls and coons.

Jan. 25. P. M. — Up river.

The hardest day to bear that we have had, for, beside being 5° at noon and at 4 p m., there is a strong northwest wind. It is worse than when the thermometer was at zero all day. Pierce says it is the first day that he has not been able to work outdoors in the sun. The snow is now very dry and powdery, and, though so hard packed, drifts somewhat. The travellers I meet have red faces. Their ears covered. Pity those who have not thick mittens. No man could stand it to travel far toward this wind. It stiffens the whole face, and you feel a tingling sensation in your forehead. Much worse to bear than a still cold. I see no life abroad, no bird nor beast. What a stem, bleak, inhospitable aspect nature now wears! (I am off Clamshell Hill.) Where a few months since was a fertilizing river reflecting the sunset, and luxuriant meadows resounding with the hum of insects, is now a uniform crusted snow, with dry powdery snow drifting over it and confounding river and meadow. I make haste away, covering my ears, before I freeze there. The snow in the road has frozen dry, as dry as bran.

A closed pitch pine cone gathered January 22d opened last night in my chamber. If you would be convinced how differently armed the squirrel is naturally for dealing with pitch pine cones, just try to get one off with your teeth. He who extracts the seeds from a single closed cone with the aid of a knife will be constrained to confess that the squirrel earns his dinner. It is a rugged customer, and will make your fingers bleed. But the squirrel has the key to this conical and spiny chest of many apartments. He sits on a post, vibrating his tail, and twirls it as a plaything.

But so is a man commonly a locked-up chest to us, to open whom, unless we have the key of sympathy, will make our hearts bleed.

The elms, they adjourn not night nor day; they pair not off. They stand for magnificence; they take the brunt of the tempest; they attract the lightning that would smite our roofs, leaving only a few rotten members scattered over the highway. The one by Holbrook's is particularly regular and lofty for its girth, a perfect sheaf, but thin-leaved, apparently a slow grower. It bore a tavern sign for many a year. Call it the Bond (?) elm.

Jan. 26. When I took the ether my consciousness amounted to this: I put my finger on myself in order to keep the place, otherwise I should never have returned to this world.

They have cut and sawed off the butt of the great elm at nine and a half feet from the ground, and I counted the annual rings there with the greatest ease and accuracy. Indeed I never saw them so distinct on a large butt. The tree was quite sound there, not the least hollow even at the pith. There were one hundred and twenty-seven rings. Supposing the tree to have been five years old when nine and a half feet high, then it was one hundred and thirty-two years old, or came up in the year 1724, just before Lovewell's Fight.

There were two centres, fourteen inches apart. The accompanying coarse sketch will give a general idea of it. There were thirteen distinct rings about each centre, before they united and one ring inclosed both.

Then there was a piece of bark, — which may be rudely represented by the upper black mark, — say six or eight inches long. This was not overgrown but by the twenty-fourth ring. These two centres of growth corresponded in position to the two main branches six feet above, and I inferred that when the tree was about eighteen years old, the fork commenced at nine and a half feet from the ground, but as it increased in diameter, it united higher and higher up. I remember that the bark was considerably nearer one centre than the other. There was bark in several places completely overgrown and included on the extreme butt end where cut off, having apparently overgrown its own furrows.

Its diameter, where I counted the rings, was, one way, as near as I could measure in spite of the carf, four feet and three inches; another, four feet and eight inches; and five feet. On the line by which I counted, which was the long way of the tree, it had grown in the first fifty years twenty inches, or two fifths of an inch a year; the last fifty, five and three quarters inches or about one ninth of an inch a year; and there was a space of about five inches between the two, or for the intermediate twenty-seven years. At this height, it had grown on an average annually nearly twenty-four one-hundredths of an inch from the centre on one side.

The white or sap wood averaged about two inches thick. The bark was from one to two inches thick, and in the last case I could count from twelve to fifteen distinct rings in it, as if it were regularly shed after that period.

The court-house elm measured, at six feet from the ground on the west side, twelve feet one and one half inches in circumference. The willow by the Jim Jones house, fourteen feet at about eighteen inches from ground; thirteen feet eight inches, at about six inches from ground; and it bulged out much larger above this.

P. M. — Walked down the river as far as the south bend behind Abner Buttrick's. I also know its condition as far as the Hubbard Bridge in the other direction. There is not a square foot open between these extremes, and, judging from what I know of the river beyond these limits, I may safely say that it is not open (the main stream, I mean) anywhere in the town. (Of the North Branch above the Bath Place, the goose ground, say to the stone bridge, I cannot speak confidently.) The same must have been the case yesterday, since it was colder. Probably the same has been true of the river, excepting the small space against Merrick's below the Rock (now closed), since January 7th, when it closed at the Hubbard Bath, or nearly three weeks, — a long time, methinks, for it to be frozen so solidly. A sleigh might safely be driven now from Carlisle Bridge to the Sudbury meadows on the river. Methinks it is a remarkably cold, as well as snowy, January, for we have had good sleighing ever since the 26th of December and no thaw.

Walked as far as Flint's Bridge with Abel Hunt, where I took to the river. I told him I had come to walk on the river as the best place, for the snow had drifted somewhat in the road, while it was converted into ice almost entirely on the river. "But," asked he, "are you not afraid that you will get in?"

"Oh, no, it will bear a load of wood from one end to the other."

"But then there may be some weak places." Yet he is some seventy years old and was born and bred immediately on its banks. Truly one half the world does not know how the other half lives.

Men have been talking now for a week at the postoffice about the age of the great elm, as a matter interesting but impossible to be determined. The very choppers and travellers have stood upon its prostrate trunk and speculated upon its age, as if it were a profound mystery. I stooped and read its years to them (127 at nine and a half feet), but they heard me as the wind that once sighed through its branches. They still surmised that it might be two hundred years old, but they never stooped to read the inscription. Truly they love darkness rather than light. One said it was probably one hundred and fifty, for he had heard somebody say that for fifty years the elm grew, for fifty it stood still, and for fifty it was dying. (Wonder what portion of his career he stood still!) Truly all men are not men of science. They dwell within an integument of prejudice thicker than the bark of the cork-tree, but it is valuable chiefly to stop bottles with. Tied to their buoyant prejudices, they keep themselves afloat when honest swimmers sink. —

Talking with Miss Mary Emerson this evening, she said, "It was not the fashion to be so original when I was young." She is readier to take my view — look through my eyes for the time — than any young person that I know in the town.

The white maple buds look large, with bursting downy scales as in spring.

I observe that the crust is strongest over meadows, though the snow is deep there and there is no ice nor water beneath, but in pastures and upland generally I break through. Probably there is more moisture to be frozen in the former places, and the snow is more compact.

Jan. 27. I have just sawed a wheel an inch and three quarters thick off the end of (apparently) a stick of red oak in my pile. I count twenty-nine rings, and about the same number of rings, or divisions of some kind, with more or less distinctness, in the bark, which is about a quarter of an inch thick. Is not the whole number of rings contained in the bark of all trees which have a bark externally smooth? This stick has two centres of growth, each a little one side of the middle. I trace one easily to a limb which was cut off close to the tree about three and a half inches above the lower side of the section. The two centres are one inch apart on the lower side, two inches and five eighths on the upper side. There are three complete circles to the main one on the lower side, and ten on the upper side, before they coalesce; hence it was seven years closing up through an inch and three quarters of height. There is a rough ridge, confined to the bark only and about a quarter of an inch high, extending from the crotch diagonally down the tree, apparently to a point over the true centre of growth.

P. M. — Walked on the river from the old stone to Derby's Bridge. It is open a couple of rods under the stone bridge, but not a rod below it, and also for forty rods below the mouth of Loring's Brook, along the west side, probably because this is a mill-stream. The only other open places within the limits mentioned yesterday are in one or two places close under the bank, and concealed by it, where warm springs issue, the river, after freezing, having shrunk and the ice settled a foot or eighteen inches there, so that you can see water over its edge.

The white maple at Derby's Bridge measures fifteen feet in circumference at ground, including apparently a very large sucker, and ten feet five inches, at four feet above the ground, not including sucker, there free.

The lodging snow of January 13th, just a fortnight ago, still adheres in deep and conspicuous ridges to large exposed trees, too stubborn to be shaken by the wind, showing from which side the storm came.

The fruit stems of the dogwood still hold on, and a little fruit. (Of course, the limbs should be smoother.) The outline much like a peach tree, but it is without the numerous small limbs or twigs.

Saw what I think were bass nuts on the snow on the river, at Derby's railroad bridge, probably from up-stream.

Jan. 28. Snowed all day, about two inches falling. They say it snowed about the same all yesterday in New York. Cleared up at night.

Jan. 29. P. M. — Measured the snow in the same places measured the 16th and 23d, having had, except yesterday, fair weather and no thaw.

As I measured oftener west than east of railroad, the snow is probably about fourteen on a level in open fields now, or quite as deep as at any time this winter. Yet it has

apparently been settling a little the last six days. In the woods, apparently, it has also been settling, but it is not so deep there as on the 16th, because it settled rapidly soon after that date. It is deeper east of railroad, evidently because it lies behind it like a wall, though I measure from six to ten or twelve rods off on that side. Since the 13th there has been at no time less than one foot on a level in open fields.

It is interesting to see near the sources, even of small streams or brooks, which now flow through an open country, perhaps shrunken in their volume, the traces of ancient mills, which have devoured the primitive forest, the earthen dams and old sluiceways, and ditches and banks for obtaining a supply of water. These relics of a more primitive period are still frequent in our midst. Such, too, probably, has been the history of the most thickly settled and cleared countries of Europe. The saw-miller is neighbor and successor to the Indian.

It is observable that not only the moose and the wolf disappear before the civilized man, but even many species of insects, such as the black fly and the almost microscopic "no-see-em." How imperfect a notion have we commonly of what was the actual condition of the place where we dwell, three centuries ago!

For the most part the farmers have not been able to get into the woods for the last fortnight or more, on account of the snow, and some who had not got up their wood before are now put to their trumps, for though it may not be more than eighteen inches deep on a level in sprout-lands, the crust cuts the legs of the cattle, and the occasional drifts are impassable. Sometimes, with two yoke of oxen and a horse attached to the sled, the farmer attempts to break his way into his lot, one driving while another walks before with a shovel, treading and making a path for the horse, but they must take off the cattle at last and turn the sled with their hands.

Miss Minott has been obliged to have some of her locusts about the house cut down. She remembers when the whole top of the elm north of the road close to Dr. Heywood's broke off, — when she was a little girl. It must have been there before 1800.

Jan. 30. 8 A. M. — It has just begun to snow, — those little round dry pellets like shot.

George Minott says that he was standing with Bowers (?) and Joe Barrett near Dr. Heywood's bam in the September gale, and saw an elm, twice as big as that which broke off before his house, break off ten feet from the ground, — splinter all up, — and the bam bent and gave so that he thought it was time to be moving. He saw stones "as big as that [air-tight] stove, blown right out of the wall." So, by bending to the blast, he made his way home. All the small buildings on the Walden road across the brook were blown back toward the brook. Minott lost the roof of his shed. The wind was southerly.

As I walked above the old stone bridge on the 27th, I saw where the river had recently been open under the wooded bank on the west side; and recent sawdust and shavings from the pail-factory, and also the ends of saplings and limbs of trees which had been bent down by the ice, were frozen in. In some places some water stood above

the ice, and as I stood there, I saw and heard it gurgle up through a crevice and spread over the ice. This was the influence of Loring's Brook, far above.

Stopped snowing before noon, not having amounted to anything.

P. M. — Measured to see what difference there was in the depth of the snow in different adjacent fields as nearly as possible alike and similarly situated. Commenced fifteen or twenty rods east of the railroad and measured across Hubbard's (?), Stow's, and Collier's fields toward a point on the south side of the last, twenty-five rods east of Trillium Woods. These three fields were nearly level, somewhat meadowy, especially the second, and at least twenty-five rods from the nearest disturbing influence, such as the railroad embankment or a wood.

The walls, no doubt, gave the first and third fields somewhat more snow. Yet I am inclined to think that in this trial the snow is shallower very nearly as the fields are more moist. It is three inches shallower here than nearer the railroad, where I measured yesterday, showing the effect of that bank very clearly, six to fifteen rods off, but the average is the same obtained yesterday for open fields east and west of railroad, and proves the truth of that measuring. The snow in the first field measured two inches more than that in the second!

The andromeda swamp gave 26  $\frac{1}{2}$  4- (on the 12th it was 23  $\frac{4}{5}$ ). It has probably been more than feet, say on the 16th. The *Andromeda calyculata* is now quite covered, and I walk on the crust over an almost uninterrupted plain there; only a few blueberries and

*Andromeda paniculata* rise above it. Near the last, I break through. It is so light beneath that the crust breaks there in great cakes under my feet, and immediately falls about a foot, making a great hole, so that once pushing my way through — for regularly stepping is out of the question in the weak places — makes a pretty good path.

In Wheeler's squirrel wood, which on the 12th gave 10 inches of snow now gives 15, which is what I should have judged from the changes in Trillium Wood. They are affected alike.

The sprout-land just south of this wood gives as average of fourteen measurements 214/10, which I suspect is too much, it is so sheltered a place.

By the railroad against Walden I heard the lisp of a chickadee, and saw it on a sumach. It repeatedly hopped to a bunch of berries, took one, and, hopping to a more horizontal twig, placed it under one foot and hammered at it with its bill. The snow was strewn with the berries under its foot, but I could see no shells of the fruit. Perhaps it clears off the crimson only. Some of the bunches are very large and quite upright there still.

Again, I suspect that on meadows the snow is not so deep and has a firmer crust. In an ordinary storm the depth of the snow will be affected by a wood twenty or more rods distant, or as far as the wood is a fence.

The snow is so light in the swamps under the crust, amid the andromeda, that a cat could almost run there. There are but few tracks of mice, now the snow is so deep. They run underneath.

The drift about Lynch's house is like this: —

There is a strong wind this afternoon from northwest, and the snow of the 28th is driving like steam over the fields, drifting into the roads. On the railroad causeway it lies in perfectly straight and regular ridges a few feet apart, northwest and southeast. It is dry and scaly, like coarse bran. Now that there is so much snow, it slopes up to the tops of the walls on both sides.

What a difference between life in the city and in the country at present, — between walking in Washington Street, threading your way between countless sledges and travellers, over the discolored snow, and crossing Walden Pond, a spotless field of snow surrounded by woods, whose intensely blue shadows and your own are the only objects. What a solemn silence reigns here!

Jan. 31. P. M. — Up North Branch.

There are a few inches of light snow on top of the little, hard and crusted, that I walked on here last, above the snow ice. The old tracks are blotted out, and new and fresher ones are to be discerned. It is a tabula rasa. These fresh falls of snow are like turning over a new leaf of Nature's Album. At first you detect no track of beast or bird, and Nature looks more than commonly silent and blank. You doubt if anything has been abroad, though the snow fell three days ago, but ere long the track of a squirrel is seen making to or from the base of a tree, or the hole where he dug for acorns, and the shells he dropped on the snow around that stump.

The wind of yesterday has shaken down countless oak leaves, which have been driven hurry-scurry over this smooth and delicate and unspotted surface, and now there is hardly a square foot which does not show some faint trace of them. They still spot the snow thickly in many places, though few can be traced to their lairs. More hemlock cones also have fallen and rolled down the bank. The fall of these withered leaves after each rude blast, so clean and dry that they do not soil the snow, is a phenomenon quite in harmony with the winter.

Perhaps the tracks of the mice are the most amusing of any, they take such various forms and, though small, are so distinct. Here is where one has come down the bank and hopped meanderingly across the river.

Or An inch and a quarter wide by five, six, or seven apart from centre to centre.

But what track is this, just under the bank?

It must be a bird, which at last struck the snow with its wings and took to flight. There were but four hops in all, and then it ended as above, though there was nothing near enough for it to hop upon from the snow. The form of the foot was somewhat like that of a squirrel, though only the outline was distinguished. The foot was about two inches long, and it was about two inches from outside of one foot to outside of the other. Sixteen inches from hop to hop, the rest in proportion. Looking narrowly, I saw

where one wing struck the bank ten feet ahead, thus: —— as it passed. A quarter of a mile down-stream it occurred again, thus: and near by still less of a track, but marks as if it had pecked in the snow. Could it be the track a crow its toes unusually close together? Or was it an owl?

Some creature has been eating elm blossom-buds and dropping them over the snow.

The tracks of the mice suggest extensive hopping in the night and going a-gadding. They commence and terminate in the most insignificant little holes by the side of a twig or tuft, and occasionally they give us the type of their tails very distinctly, even sidewise to the course on a bank-side, thus: —

Saw also the tracks, probably of a muskrat, for a few feet leading from hole to hole just under the bank.

## FEBRUARY, 1856

Feb. 1. Our kitten Min, two-thirds grown, was playing with Sophia's broom this morning, as she was sweeping the parlor, when she suddenly went into a fit, dashed round the room, and, the door being opened, rushed up two flights of stairs and leaped from the attic window to the ice and snow by the side of the doorstep, — a descent of a little more than twenty feet, —— passed round the house and was lost. But she made her appearance again about noon, at the window, quite well and sound in every joint, even playful and frisky.

P. M. — Up river. —

What gives to the excrements of the fox that clay-color often, even at this season? Left on an eminence.

I scented a fox's trail this afternoon (and have done so several times before), where he crossed the river, just three rods distant. Looked sharp, and discovered where it had stopped by a prominence. Yet he could not have passed since last night, or twelve hours before, it being near the village. How widely they range these nights! I hear that Daniel Foster of Princeton had eleven turkeys taken from under his bam in one night last fall, probably by a fox. Two were found a week after, buried under some brush in a neighboring wood.

The snow is somewhat banked toward the sides of the river, but shows darker-yellowish or icy in the middle. Lichens, blown from the black willows, lie here and there on the snow. Nut Meadow Brook open for some distance in the meadow. I was affected by the sight of some green polygonum leaves there. Some kind of minnow darted off. I see where a crow has walked along its side. In one place it hopped, and its feet were side by side, as in the track of yesterday, though a little more spread, the toes. I have but little doubt that yesterday's track was a crow's. The two inner toes are near together; the middle, more or less curved often.

I see a gray rabbit amid the young oaks in Hubbard's riverside grove, curled and shrunk up, squatting on the snow. I advance and begin to sketch it, when it plunges

into a little hole in the snow by its side, the entrance to its burrow, three inches wide by a little more in length. The track of its foot is about one inch wide.

I see a pitch pine seed, blown thirty rods from J. Hosmer's little grove.

The Sheldon house in Deerfield, pulled down about eight years since, represented in Gleason's Pictorial for 1851 and in Barber, is in the style of the Hunt house, except that there is but one window on each side of the door. It and the meeting-house alone of those within the fort survived the assault of 1704, and the door through which a hole was cut and a woman shot is still preserved.

This has been a memorable January for snow and cold. It has been excellent sleighing ever since the 26th of December, — not less than a foot at any time since January 6th on a level in open fields, in swamps much more. Cars have been detained; the wood-lots for the most part inaccessible. The river has been closed up from end to end, with the exception of one or two insignificant openings on a few days. No bare ice. The crows have been remarkably bold, coming to eat the scraps cast out behind the houses. They alight in our yard. I think I have not noticed a tree sparrow during the month. Blue jays and chickadees also common in the village, more than usual. We have completely forgotten the summer. There has been no January thaw, though one prophesied it a fortnight ago because he saw snow-fleas. The ponds are yielding a good crop of ice. The eaves have scarcely run at all. It has been what is called "an old-fashioned winter."

Feb. 2. Snowed again last night, perhaps an inch, erasing the old tracks and giving us a blank page again, restoring the purity of nature. It may be even a trifle deeper now than hitherto.

Feb. 3. Analyzed the crow blackbird's nest from which I took an egg last summer, eight or ten feet up a white maple by river, opposite Island. Large, of an irregular form, appearing as if wedged in between a twig and two large contiguous trunks. From outside to outside it measures from six to eight inches; inside, four; depth, two; height, six. The foundation is a loose mass of coarse strips of grape-vine bark chiefly, some eighteen inches long by five eighths of an inch wide; also slender grass and weed stems, mikania stems, a few cellular river weeds, as rushes, sparganium, pipe-grass, and some soft, coarse, fibrous roots. The same coarse grape-vine bark and grass and weed stems, together with some harder, wiry stems, form the sides and rim, the bark being passed around the twig. The nest is lined with the finer grass and weed stems, etc. The solid part of the nest is of half-decayed vegetable matter and mud, full of fine fibrous roots and wound internally with grass stems, etc., and some grape bark, being an inch and a half thick at bottom. Pulled apart and lying loose, it makes a great mass of material. This, like similar nests, is now a great haunt for spiders.

P. M. — Up North Branch.

A strong northwest wind (and thermometer 11°), driving the surface snow like steam. About five inches of soft snow now on ice. See many seeds of the hemlock on the snow still, and cones which have freshly rolled down the bank.

Tracked some mice to a black willow by riverside, just above spring, against the open swamp; and about three feet high, in apparently an old woodpecker's hole, was probably the mouse-nest, a double handful, consisting, four ninths, of fine shreds of inner bark, perhaps willow or maple; three ninths, the greenish moss, apparently, of button-bush; two ninths, the gray-slate fur, apparently, of rabbits or mice. Half a dozen hog's bristles might have been brought by some bird to its nest there. These made a very warm and soft nest.

Got some kind of vireo's nest from a maple far up the stream, a dozen feet high, pensile; within, almost wholly rather coarse grape-vine shreds; without, the same and bark, covered with the delicate white spider-nests (?), birch-bark shreds, and brown cocoon silk.

Returning, saw near the Island a shrike glide by, cold and blustering as it was, with a remarkably even and steady sail or gliding motion like a hawk, eight or ten feet above the ground, and alight in a tree, from which at the same instant a small bird, perhaps a creeper or nuthatch, flitted timidly away. The shrike was apparently in pursuit.

We go wading through snows now up the bleak river, in the face of the cutting northwest wind and driving snow-steam, turning now this ear, then that, to the wind, and our gloved hands in our bosoms or pockets. Our tracks are obliterated before we come back. How different this from sailing or paddling up the stream here in July, or poling amid the rocks! Yet still, in one square rod, where they have got out ice and a thin transparent ice has formed, I can see the pebbly bottom the same as in summer.

It is a cold and windy Sunday. The wind whistles round the northwest corner of the house and penetrates every crevice and consumes the wood in the stoves, — soon blows it all away. An armful goes but little way. Such a day makes a great hole in the wood-pile. [It] whisks round the corner of the house, in at a crevice, and flirts off with all the heat before we have begun to feel it.

Some of the low drifts but a few inches deep, made by the surface snow blowing, over the river especially, are of a fine, pure snow, so densely packed that our feet make hardly any impression on them.

River still tight at Merrick's.

There comes a deep snow in midwinter, covering up the ordinary food of many birds and quadrupeds, but anon a high wind scatters the seeds of pines and hemlocks and birch and alder, etc., far and wide over the surface of the snow for them.

You may now observe plainly the habit of the rabbits to run in paths about the swamps.

Mr. Emerson, who returned last week from lecturing on the Mississippi, having been gone but a month, tells me that he saw boys skating on the Mississippi and on Lake Erie and on the Hudson, and has no doubt they are skating on Lake Superior; and probably at Boston he saw them skating on the Atlantic.

The inside of the gray squirrel, or leaf, nests is of leaves chewed or broken up finely. I see where one, by the snow lodging on it, has helped weigh down a birch.

In Barber's "Historical Collections," page 476, there is a letter by Cotton Mather, dated "Boston, 10th Dec. 1717," describing the great snow of the previous February, from which I quote: —

"On the twentieth of the last February there came on a snow, which being added unto what had covered the ground a few days before, made a thicker mantle for our mother than what was usual: And the storm with it was, for the following day, so violent as to make all communication between the neighbors everywhere to cease. People, for some hours, could not pass from one side of a street unto another... On the 24th day of the month, comes Pelion upon Ossa: Another snow came on which almost buried the memory of the former, with a storm so famous that Heaven laid an interdict on the religious assemblies throughout the country, on this Lord's day, the like whereunto had never been seen before. The Indians near an hundred years old affirm that their fathers never told them of anything that equalled it. Vast numbers of cattle were destroyed in this calamity. Whereof some there were, of the stranger [stronger? mine] sort, were found standing dead on their legs, as if they had been alive many weeks after, when the snow melted away. And others had their eyes glazed over with ice at such a rate, that being not far from the sea, their mistake of their way drowned them there. One gentleman, on whose farms were now lost above 1100 sheep, which with other cattle, were interred (shall I say) or innived, in the snow, writes me word that there were two sheep very singularly circumstanced. For no less than eight and twenty days after the storm, the people pulling out the ruins of above an hundred sheep out of a snow bank which lay sixteen foot high, drifted over them, there was two found alive, which had been there all this time, and kept themselves alive by eating the wool of their dead companions. When they were taken out they shed their own fleeces, but soon got into good case again."

"A man had a couple of young hogs, which he gave over for dead, but on the 27th day after their burial, they made their way out of a snow-bank, at the bottom of which they had found a little tansy to feed upon."

"Hens were found alive after seven days; Turkeys were found alive after five and twenty days, buried in the snow, and at a distance from the ground, and altogether destitute of anything to feed them."

"The wild creatures of the woods, the out-goings of the evening, made their descent as well as they could in this time of scarcity for them towards the sea-side. A vast multitude of deer, for the same cause, taking the same course, and the deep snow spoiling them of their only defence, which is to run, they became such a prey to these devourers that it is thought not one in twenty escaped."

"It is incredible how much damage is done to the orchards, for the snow freezing to a crust, as high as the bows of the trees, anon split them to pieces. The cattle, also, walking on the crusted snow a dozen foot from the ground, so fed upon the trees as very much to damnify them."

"Cottages were totally covered with the snow, and not the very tops of their chimneys to be seen." These "odd accidents," he says, "would afford a story. But there not

being any relation to Philosophy in them, I forbear them." He little thought that his simple testimony to such facts as the above would be worth all the philosophy he might dream of.

Feb. 4. P. M. — To Walden.

I go to walk at 3 p. M., thermometer 18°. It has been about this (and 22°) at this hour for a week or two. All the light snow, some five inches above the crust, is adrift these days and driving over the fields like steam, or like the foam-streaks on a flooded meadow, from northwest to southeast. The surface of the fields is rough, like a lake agitated by the wind.

I see that the partridges feed quite extensively on the sumach berries, e g. at my old house. They come to them after every snow, making fresh tracks, and have now stripped many bushes quite bare.

At Tanager Glade I see where the rabbits have gnawed the bark of the shrub oaks extensively, and the twigs, down to the size of a goose-quill, cutting them off as smoothly as a knife. They have also gnawed some young white oaks, black cherry, and apple. The shrub oaks look like hedges which have been trimmed or clipped.

I have often wondered how red cedars could have sprung up in some pastures which I knew to be miles distant from the nearest fruit-bearing cedar, but it now occurs to me that these and barberries, etc., may be planted by the crows, and probably other birds.

The oak leaves which have blown over the snow are collected in dense heaps on the still side of the bays at Walden, where I suspect they make warm beds for the rabbits to squat on.

Feb. 5. The weather is still clear, cold, and unrelenting. I have walked much on the river this winter, but, ever since it froze over, it has been on a snow-clad river, or pond. They have been river walks because the snow was shallowest there. Even the meadows, on account of the firmer crust, have been more passable than the uplands. In the afternoons I have walked off freely up or down the river, without impediment or fear, looking for birds and birds' nests and the tracks of animals; and, as often as it was written over, a new snow came and presented a new blank page. If it were still after it, the tracks were beautifully distinct. If strong winds blew, the dry leaves, losing their holds, traversed and scored it in all directions. The sleighing would have been excellent all the month past if it had not been for the drifting of the surface snow into the track whenever the wind blew, but that crust on the old snow has prevented very deep drifts. I should [say] the average cold was about 8° at 8 A. M. and 18° or 20° at 3 P. M.

Feb. 6. P. M. — To Walden.

The down is just peeping out from some of the aspen buds. Cut a cake of ice out of the middle of Walden, within three rods of where I cut on the 18th of January. The snow was about an inch deep only, so fast has it been converted into snow ice. I was obliged to make a hole about four feet square in order to get out a cake, and with great care to approach the water evenly on all sides, so that I might have the less chopping

to do after the water began to rush in, which would wet me through. It was surprising with what violence the water rushed in as soon as a hole was made, under the pressure of that body of ice. On the 18th of January the ice had been about seven inches thick here, about four being snow ice, and about three water ice. It was now 19 inches thick, 11 1/2 — being snow ice and 7 1/2 water ice. Supposing it an inch thick only here when the snow began to fall on it (for it began to fall almost immediately), it had increased since that time 6j+ inches downward and 11 1/2 — upward. Since the 18th of January, when there was ten inches of snow on it, it had increased about downward and about 7 1/2 upward. I was not prepared to find that any ice had formed on the under side since the 18th. The water ice was very crystalline. This ice was thicker than the snow has been in open fields any time this winter, yet this winter has been remarkable for the abundance of snow. I also cut through and measured in the Ice Heap Cove. The snow ice was 12 1/4, and the water ice about 6, but perhaps a little was broken off in cutting through the last. In all about 18 1/4 inches. I was not prepared to find it thickest in the middle. Earlier in the winter, or on the 18th January, it was thickest near the shore.

Goodwin says that he has caught two crows this winter in his traps set in water for mink, and baited with fish. The crows, probably put to it for food and looking along the very few open brooks, attracted by this bait, got their feet into the traps. He thinks that [what] I call muskrat-tracks are mink-tracks by the Rock, and that muskrat do not come out at all this weather. I saw a clamshell opened, and they say minks do not open them (? ).

Feb. 7. Began to snow at 8 A. M.; turned to rain at noon, and cleared off, or rather ceased raining, at night, with some glaze on the trees. This the first thawing, though slight, since the 25th of December. During the rain the air was thick, the distant woods bluish, and the single trees, etc., on the hill, under the dull, mist-covered sky, remarkably distinct and black.

Feb. 8. 9 A. M. — To Fair Haven Pond.

A clear and a pleasanter and warmer day than we have had for a long time. The snow begins (at noon) to soften somewhat in the road.

For two or three weeks, successive light and dry snows have fallen on the old crust and been drifting about on it, leaving it at last three quarters bare and forming drifts against the fences, etc., or here and there low, slaty, fractured ones in mid-field, or pure white hard-packed ones. These drifts on the crust are commonly quite low and flat. But yesterday's snow turning to rain, which froze as it fell, there is now a glaze on the trees, giving them a hoary look, icicles like rakes' teeth on the rails, and a thin crust over all the snow. At this hour the crust sparkles with a myriad brilliant points or mirrors, one to every six inches, at least. This crust is cracked like ice into irregular figures a foot or two square. Perhaps the snow has settled considerably, for the track in the roads is the highest part. Some heard a loud cracking in the ground or ice last night.

I cut through, five or six rods from the east shore of Fair Haven, and find seven inches of snow, nine inches of snow ice and eight of water ice, — seventeen of both. The water rises to within half an inch of the top of the ice. Isaac Garfield has cut a dozen holes on the west side. The ice there averages nineteen inches in thickness. Half the holes are five or six rods from the shore, and the rest nine or ten, the water from three to seven feet deep. In some places more than half the whole depth is ice. The thinnest ice is 17 inches; the thickest, 20 +. The inner row invariably the thickest. The water rises above the ice in some cases.

Edward and Isaac Garfield were fishing there, and Puffer came along, and afterward Lewis Miner with his gun. He cannot get near the partridges on account of the cracklings of the crust. I saw the last two approaching with my glass.

The fishermen agree in saying that the pickerel have generally been eating, and are full, when they bite. Puffer thinks they eat a good deal, but seldom. Some think it best to cut the holes the day before, because the noise frightens them; and the crackling of the crust to-day was thought to frighten them. E. Garfield says that his Uncle Daniel was once scaling a pickerel, when he pricked his finger against the horn of a pout which the pickerel had swallowed. He himself killed a pickerel with a paddle, in the act of swallowing a large perch. Puffer had taken a striped snake out of one.

They send to Lowell for their bait, and fishermen send thither from far and wide, so that there is not a sufficient supply for them. I. Garfield once caught an eel there with his pickerel bait, through the ice; also speared a trout that weighed three and a half pounds, he says, off Well Meadow.

E. Garfield says that he was just turning into the pond from up-stream when he heard a loud sound and saw and caught those two great mud turtles. He let the boat drift down upon them. One had got the other by the neck, and their shells were thumping together and their tails sticking up. He caught one in each hand suddenly, and succeeded in getting them into the boat only by turning them over, since they resisted with their claws against the side; then stood on them turned over, paddled to nearest shore, pulled his boat up with his heel, and, taking a tail in each hand, walked backward through the meadow in water a foot deep, dragging them; then carried one a few rods, left him and returned for the other, and so on. One weighed forty-three and the other forty-seven pounds, together ninety. Puffer said that he never saw two together so heavy. I. Garfield said that he had seen one that weighed sixty-three pounds. All referred to the time when (about fifteen years ago; one said the year of the Bunker Hill Monument celebration) some forty were found dead on the meadows between there and Sudbury. It was about the end of March, and Puffer inferred that they had come out thus early from the river, and, the water going down, the ice had settled on them and killed them; but the Garfields thought that the ice, which tore up the meadows very much that year, exposed them and so they froze. I think the last most likely. Puffer searches for them in May under the cranberry vines with a spear, and calls one of the small kinds the "grass tortoise."

E. Garfield says that he saw the other day where a fox had caught in the snow three partridges and eaten two. He himself last winter caught two, on the hillside south of Fair Haven, with his hands. They flew before him and dived into the snow, which was about a foot deep, going twice their length into it. He thrust his hand in and caught them. Puffer said that his companion one night speared a partridge on the alders on the south side the pond.

E. Garfield says there were many quails here last fall, but that they are suffering now. One night as he was spearing on Conant's cranberry meadow, just north, the pond, his dog caught a sheldrake in the water by the shore. Some days ago he saw what he thought a hawk, as white as snow, fly over the pond, but it may have been a white owl (which last he never saw). He sometimes sees a hen-hawk in the winter, but never a partridge or other small hawk at this season. Speaks again of that large speckled hawk he killed once, which some called a "Cape eagle." Had a hum-bird's nest behind their house last summer, and was amused to see the bird drive off other birds; would pursue a robin and alight on his back; let none come near. I. Garfield saw one's nest on a horizontal branch of a white pine near the Charles Miles house, about seven feet from ground. E. Garfield spoke of the wren's nest as not uncommon, hung in the grass of the meadows, and how swiftly and easily the bird would run through a winrow of hay.

Puffer saw a couple of foxes cross the pond a few days ago. The wheelwright in the Comer saw four at once, about the same time.

They think that most squirrel-tracks now are of the gray ones; that they do not lay up anything. Their tracks are much larger than those of the red. Puffer says that five gray squirrels came out of one of their leafy nests in a middle-sized white pine, after it was cut down, behind the Harrington house the other day, and, a day or two after, three out of another. He says that they, too, use bark in making their nests, as well [as] leaves, — the inner bark of old chestnut rails, which looks like seaweed.

E. Garfield says the chip squirrels come out this month.

Puffer saw a star-nosed mole yesterday in the road. Its track was dog-like.

Coming home at twelve, the ice is fast melting on the trees, and I see in the drops the colors of all the gems. The snow is soft, and the eaves begin to run as not for many weeks.

Thermometer at 3.30 p. M., 31°.

Puffer once found the nest of what he calls the deer mouse (probably jumping) in pile of wood at what is now R. Rice's place in Sudbury, and the old one carried off nine young clinging to her teats. These men do not chop now; they saw, because the snow is so deep and the crust cuts their legs.

Mr. Prichard tells me that he remembers a six weeks of more uninterruptedly severe cold than we have just [had], and that was in '31, ending the middle of January. The eaves on the south side of his house did not once run during that period, but they have run or dripped a trifle on several days during the past six weeks.

Puffer says that he and Daniel (?) Haynes set lines once when there was good skating in all the bays, from the long causeway in Sudbury down to the railroad bridge, but caught only two or three perch.

Feb. 9. How much the northwest wind prevails in the winter! Almost all our storms come from that quarter, and the ridges of snow-drifts run that way. If the Indians placed their heaven in the southwest on account of the warmth of the southwest wind, they might have made a stem winter god of the northwest wind.

P. M. — Up Assabet.

3.30 p. M., thermometer 30°. This and yesterday comparatively warm weather. Half an inch of snow fell this forenoon, but now it has cleared up. I see a few squirrel-tracks, but no mice-tracks, for no night has intervened since the snow. It is only where the river washes a wooded bank that I see mice or even squirrel tracks; elsewhere only where dogs and foxes have traversed it. For example, there are no tracks on the side of the river against Hosmer's and Emerson's land, though many alders, etc., there, but many tracks commonly on the opposite wooded side. In the swamp west of Pigeon Rock, I see where the rabbits have bitten off the swamp white oak sprouts, where they have sprung up tender, looking like poplar, from stocks broken by the ice last winter.

I hear a phœbe note from a chickadee.

Saw a pensile nest eighteen feet high, within a lichen-clad red maple on the edge of the Assabet Spring or Pink Azalea Swamp. It looked very much like a bunch of the lichens dangling, and I was not sure it was not till I climbed up to it. Without, it was chiefly the coarse greenish lichens of the maple, bound with coarse bits of bark and perhaps bleached milkweed bark (??) and brown cocoon silk, and within, a thin lining of pine-needles, hemlock twigs, and the like. Was it a yellow-throat vireo's? It was not shaped like the red-eye's, but, sidewise, thus: looking down upon it, thus! On a side twig to one of the limbs — and about a foot from the end of the twig.

Feb. 10. Speaking about the weather and the fishing with E. and I. Garfield on the 8th, I was amused to hear these two young farmers suddenly disputing as to whether the moon (?), if that be it, was in the Feet or the Head or elsewhere. Though I know far more of astronomy than they, I should not know how at once to find out this nonsense in an almanac. Yet they talk very glibly about it, and go a-fishing accordingly. Again, in the evening of the same day, I overtook Mr. Prichard and observed that it was time for a thaw, but said he, "That does not look like it," pointing to the moon in the west. "You could hang a powder-horn upon that pretty well."

P. M. — To Walden.

Returning, I saw a fox on the railroad, at the crossing below the shanty site, eight or nine rods from me. He looked of a dirty yellow and lean. I did not notice the white tip to his tail. Seeing me, he pricked up his ears and at first ran up and along the east bank on the crust, then changed his mind and came down the steep bank, crossed the railroad before me, and, gliding up the west bank, disappeared in the woods. He coursed, or glided, along easily, appearing not to lift his feet high, leaping over obstacles, with his

tail extended straight behind. He leaped over the ridge of snow about two feet high and three wide between the tracks, very easily and gracefully.

I followed, examining his tracks. There was about a quarter of an inch of recent snow above the crust, but for the most part he broke in two or three inches. I slumped from one to three feet. His tracks when running, as I have described, were like this: — being about two by five inches, as if he slid a little, no marks of toes being seen in that shallow snow; the greatest interval above, one foot. Soon after, thus:

The greatest interval sometimes four feet even. Sometimes the three tracks merged together where the crust broke:

When walking at ease, before he saw me his tracks were more round and nearer together, — about two inches by two and a half, thus: —

Sometimes I thought his tail had scraped the snow. He went off at an easy gliding pace such as he might keep up for a long time, pretty direct after his first turning.

Feb. 11. P. M. — To Fair Haven Pond by river.

Israel Rice says that he does not know that he can remember a winter when we had as much snow as we have had this winter. Eb. Conant says as much, excepting the year when he was twenty-five, about 1803. It is now fairly thawing, the eaves running; and puddles stand in some places. The boys can make snowballs, and the horses begin to slump occasionally.

Saw a partridge by the riverside, opposite Fair Haven Hill, which at first I mistook for the top of a fence-post above the snow, amid some alders. I shouted and waved my hand four rods off, to see if it was one, but there was no motion, and I thought surely it must be a post. Nevertheless I resolved to investigate. Within three rods, I saw it to be indeed a partridge, to my surprise, standing perfectly still, with its head erect and neck stretched upward. It was as complete a deception as if it had designedly placed itself on the Une of the fence and in the proper place for a post. It finally stepped off daintily with a teetering gait and head up, and took to wing.

I thought it would be a thawing day by the sound, the peculiar sound, of cock-crowing in the morning.

It will indicate what steady cold weather we have had to say that the lodging snow of January 13th, though it did not lodge remarkably, has not yet completely melted off the sturdy trunks of large trees.

Feb. 12. Thawed all day yesterday and rained somewhat last night; clearing off this morning. Heard the eaves drop all night. The thermometer at 8.30 a. m., 42°. The snow or crust and cold weather began December 26th, and not till February 7th was there any considerable relenting, when it rained a little; i.e. forty-three days of uninterrupted cold weather, and no serious thaw till the 11th, or yesterday. How different the sunlight over thawing snow from the same over dry, frozen snow! The former excites me strangely, and I experience a springlike melting in my thoughts. Water now stands above the ice and snow on the river.

I find, on shovelling away the snow, that there is about two inches of solid ice at the bottom, — that thin crusted snow of December 26th. These two inches must be

added, then, to my measures of January 12th, 16th, 23d, 29th, and 30th. To-day I find it has settled since the 29th — owing, of course, mainly to the rain of the 7th and especially of last night — about two inches in open land and an inch and a half in Trillium Woods. Thus, west of railroad,  $11 \frac{1}{4} + 2 = 12 \frac{1}{4}$  [sic]; east of railroad,  $13 + 2 = 15 \frac{1}{5}$ ; Trillium Woods,  $13 + 2 = 15$ ; average,  $12 + 2 = 14$ . There has been scarcely any loss on the west side of the railroad, but 3f on the east side. It may be owing to the drifting since the 29th.

From January 6th to January 13th, not less than a foot of snow on a level in open land, and from January 13th to February 7th, not less than sixteen inches on a level at any one time in open land, and still there is fourteen on a level. That is, for twenty-five days the snow was sixteen inches deep in open land!!

Feb. 13. Grew cold again last night, with high wind. The wind began about midday. I think a high wind commonly follows rain or a thaw in winter. The thermometer at 8.30 A. M. is at zero. (At 1 p. M.,  $8^{\circ} +$ .) This fall of  $42^{\circ}$  from 8.30 A. M. yesterday to the same time to-day has produced not a thin and smooth, but a very firm and thick, uneven crust, on which I go in any direction across the fields, stepping over the fences; yet there is some slosh at the bottom of the snow, above the icy foundation.

Now, no doubt, many sportsmen are out with their dogs, who have been imprisoned by the depth of the snow. In the woods where there are bushes beneath, you still slump more or less.

The crust is quite green with the needles of pitch pines, sometimes whole plumes which have recently fallen. Are these chiefly last year's needles brought down by the glaze, or those of the previous year which had not fallen before? I suspect they are chiefly the former, but maybe some of the latter.

Feb. 14. Still colder this morning, —  $7^{\circ}$  at 8.30 A. M.

P. M. — To Walden.

I find that a great many pine-needles, both white and pitch, of '54 still hold on, bristling around the twigs, especially if the tree has not grown much the last year. So those that strew the snow now are of both kinds.

I can now walk on the crust in every direction at the Andromeda Swamp; can run and stamp without danger of breaking through, raised quite above the andromeda (which is entirely concealed), more than two feet above the ground. But in the woods, and even in wood-paths, I slump at every other step.

In all the little valleys in the woods and sprout-lands, and on the southeast sides of hills, the oak leaves which have blown over the crust are gathered in dry and warm-looking beds, often five or six feet in diameter, about the base of the shrub oaks. So clean and crisply dry and warm above the cold, white crust, they are singularly inviting to my eye. No doubt they are of service to conceal and warm the rabbit and partridge and other beasts and birds. They fill every little hollow, and betray thus at a distance a man's tracks made a week ago, or a dog's many rods off on a hillside. If the snow were not crusted, they would not be gathered thus in troops.

I walk in the bare maple swamps and detect the minute pensile nests of some vireo high over my head, in the fork of some unattainable twig, where I never suspected them in summer, — a little basket cradle that rocked so high in the wind. And where is that young family now, while their cradle is filled with ice?

I was struck to-day by the size and continuousness of the natural willow hedge on the east side of the railroad causeway, at the foot of the embankment, next to the fence. Some twelve years ago, when that causeway was built through the meadows, there were no willows there or near there, but now, just at the foot of the sand-bank, where it, meets the meadow, and on the line of the fence, quite a dense willow hedge has planted itself. I used to think that the seeds were brought with the sand from the Deep Cut in the woods, but there is no golden willow there; but now I think that the seeds have been blown hither from a distance, and lodged against the foot of the bank, just as the snow-drift accumulates there, for I see several ash trees among them, which have come from an ash ten rods east in the meadow, though none has sprung up elsewhere. There are also a few alders, elms, birch, poplars, and some elder. For years a willow might not have been persuaded to take root in that meadow; but run a barrier like this through it, and in a few years it is lined with them. They plant themselves here solely, and not in the open meadow, as exclusively as along the shores of a river. The sand-bank is a shore to them, and the meadow a lake. How impatient, how rampant, how precocious these osiers! They have hardly made two shoots from the sand in as many springs, when silvery catkins burst out along them, and anon golden blossoms and downy seeds, spreading their race with incredible rapidity. Thus they multiply and clan together. Thus they take advantage even of the railroad, which elsewhere disturbs and invades their domains. May I ever be in as good spirits as a willow! How tenacious of life! How withy! How soon it gets over its hurts! They never despair. Is there no moisture longer in nature which they can transmute into sap?

They are emblems of youth, joy, and everlasting life. Scarcely is their growth restrained by winter, but their silvery down peeps forth in the warmest days in January (?). The very trees and shrubs and weeds, if we consider their origin, have drifted thus like snow against the fences and hillsides. Their growth is protected and favored there. Soon the alders will take their places with them. This hedge is, of course, as straight as the railroad or its bounding fence.

Over this crust, alder and birch and pine seeds, etc., which in summer would have soon found a resting-place, are blown far and wide.

Feb. 16. P. M. — To Walden.

It has been trying to snow for two days. About one inch fell last night, but it clears up at noon, and sun comes out very warm and bright. Wild says it is the warmest day at 12 M. since the 22d of December, when the thermometer stood at 50°. To-day it is at 44. I hear the eaves running before I come out, and our thermometer at 2 p. M. is 38°. The sun is most pleasantly warm on my cheek; the melting snow shines in the ruts; the cocks crow more than usual in bams; my greatcoat is an incumbrance.

There is no down visible on the shallows when I descend the east side of the railroad, unless a scale has come off.

Where I measured the ice in the middle of Walden on the 6th I now measure again, or close by it, though without cutting out the cake. I find about  $11 \frac{1}{4}$  (probably about same as the 6th, when called  $11 \frac{1}{2}$ ) of snow ice and  $21 \frac{1}{2}$  in all, leaving  $10 \frac{1}{4}$  clear ice, which would make the ice to have increased beneath through all this thickness and in spite of the thaws  $2 \frac{3}{4}$  — inches. Near the shore in one place it was twenty-two inches.

Feb. 17. Some three or four inches of snow fallen in the night and now blowing. At noon begins to snow again, as well as blow. Several more inches fall.

Feb. 18. Yesterday's snow drifting. No cars from above or below till 1 p. M.

Feb. 19. Measure snow again, on account of what fell on 17th. West of railroad,  $15 + 2$ ; east of railroad,  $12 \frac{1}{2} - + 2$ ; average of both,  $14 + 2 = 16$ ; Trillium Wood,  $18 \frac{1}{2} + 2 = 20 \frac{1}{2}$ . The great body of the last snow appears to have settled under the east side of the railroad. There are five and one half inches more in the wood than on the 12th, and I think this is about the average of what fell on the 17th (night and day). Accordingly, the snow has been deeper since the 17th than before this winter. I think if the drifts could be fairly measured it might be found to be seventeen or eighteen inches deep on a level. This snow, you may say, is all drifted, for in the fields east of the railroad there is not so much as there was a week ago, while west there is about four inches more.

Feb. 20. P. M. — Up Assabet.

See a broad and distinct otter-trail, made last night or yesterday. It came out to the river through the low woods north of Pinxter Swamp, making a very conspicuous trail, from seven to nine or ten inches wide and three or four deep, with sometimes singularly upright sides, as if a square timber had been drawn along, but commonly rounded. It made some short turns and zigzags; passed under limbs which were only five inches above the snow, not over them; had apparently slid down all banks and declivities, making a uniform broad hollow trail there without any mark of its feet. On reaching the river, it had come along under the bank, from time to time looking into the crevices where it might get under the ice there, sometimes ascending the bank and sliding back.

Commonly seven to nine or ten inches wide, and tracks of feet twenty to twenty-four apart; but sometimes there was no track of the feet for twenty-five feet, frequently for six; in the last case swelled in the outline, as above. Having come down as far as opposite the great white [sic] on the hill, it returned on its track and entered a hole under the ice at Assabet Spring, from which it has not issued.

Feb. 22. P. M. — To Assabet stone bridge and home on river.

It is a pleasant and warm afternoon, and the snow is melting. Yet the river is still perfectly closed (as it has been for many weeks), both against Merrick's and in the Assabet, excepting directly under this upper stone bridge and probably at mouth of

Loring's Brook. I am surprised that the warm weather within ten days has not caused the river to open at Merrick's, but it was too thick to be melted.

Now first, the snow melting and the ice beginning to soften, I see those slender grayish-winged insects creeping with closed wings over the snow-clad ice, — Perla (?). On all parts of the river. Have seen none before, this winter ml Just below this bridge begins an otter-track, several days old yet very distinct, which I trace half a mile down the river. In the snow less than an inch deep, on the ice, each foot makes a track three inches wide, apparently enlarged in melting, and the whole four appear thus: —

The clear interval, sixteen inches; the length occupied by the four feet, fourteen inches. It looks as if some one had dragged a round timber down the middle of the river a day or two since, which bounced as it went.

There is now a crack running down the middle of the river, and it is slightly elevated there, owing, probably, to the increasing temperature.

Feb. 23. 9 A. M. — To Fair Haven Pond, up river.

A still warmer day. The snow is so solid that it still bears me, though we have had several warm suns on it. It is melting gradually under the sun. In the morning I make but little impression in it. As it melts, it acquires a rough but regularly waved surface. It is inspiring to feel the increased heat of the sun reflected from the snow. There is a slight mist above the fields, through which the crowing of cocks sounds springlike.

I sit by a maple on a maple [sic]. It wears the same shaggy coat of lichens summer and winter.

At 2 p. M. the thermometer is 47°. Whenever it is near 40 there is a speedy softening of the snow.

I read in the papers that the ocean is frozen, — not to bear or walk on safely, — or has been lately, on the back side of Cape Cod; at the Highland Light, one mile out from the shore. A phenomenon which, it is said, the oldest have not witnessed before.

Feb. 24. Dr. Jarvis tells me that he thinks there was as much snow as this in '35, when he lived in the Parkman house and drove in his sleigh from November 23d to March 30th excepting one day.

Feb. 25. P. M. — To Walden and Fair Haven.

The only bare ground is the railroad track, where the snow was thin. The crust still bears, and [I] left the railroad at Andromeda Ponds and went through on crust to Fair Haven. Was surprised to see some little minnows only an inch long in an open place in Well Meadow Brook. As I stood there, saw that they had just felled my bee tree, the hemlock. The chopper even then stood at its foot. I went over and saw him cut into the cavity by my direction. He broke a piece out of his axe as big as my nail against a hemlock knot in the meanwhile. There was no comb within. They have just been cutting wood at Bittern Cliff. The sweet syrup is out on the ends of the hickory logs there.

Gathered some facts from Henry Bond's "Genealogies of the Families of Watertown, etc."

My mother's mother was Mary Jones, only daughter of "Col. Elisha Jones, Esq., of Weston. A Boston newspaper, of Feb. 15, 1775, says 'On Monday last, died, in this town, in the sixty-sixth year of his age, Elisha Jones Esq., late of Weston, for many years a magistrate, Col of a Regiment of Militia, and member of the General Assembly. In the many departments in which he acted, he eminently showed the man of principle, virtue,' &c. He married, Jan. 24, 1733-4, Mary Allen, and occupied his father's homestead." (Mary Allen was the daughter of Abel Allen, who was the son of Lewis Allen of Watertown Farms, who died 1707-8.)

The children of E. Jones and Mary Allen were (1) Nathan (2d son died in infancy), (3) Elisha, (4) Israel, (5) Daniel, (6) Elias, (7) Josiah, (8) Silas, (9) Mary (b. 1748), (10) Ephraim, (11) Simon (or Simeon), (12) Stephen, (13) Jonas, (14) Phillemore, (15) Charles.

Colonel Elisha Jones was born 1710, the son of Captain Josiah Jones (bom, 1670, in Weston) and Abigail Barnes. Captain Josiah Jones was the son of Josiah Jones of Watertown Farms (bom 1643) and Lydia Treadway (daughter of Nathaniel Treadway, who died in Watertown, 1689). Josiah Jones was son of Lewis Jones (who appears to have moved from Roxbury to Watertown about 1650, and died 1684) and Anna (perhaps Stone? born in England). This Josiah Jones in 1666 bought "of John Stone and wife Sarah, of Wat[ertown], a farm of 124 acres on the N. side of Sudbury highway, about two miles from Sudbury."

Feb. 26. P. M. — To Hubbard's Close.

I see at bottom of the mill brook, below Emerson's, two dead frogs. The brook has part way yet a snowy bridge over it. Were they left by a mink, or killed by cold and ice? In Hubbard's maple swamp beyond, I see the snow under a dead maple, where a woodpecker has drilled a handsome round hole. Excepting the carrying it downward within, it is ready for a nest. May they not have a view to this use even now?

Feb. 27. Wednesday. P. M. — Up Assabet.

Am surprised to see how the ice lasts on the river. It but just begins to be open for a foot or two at Merrick's, and you see the motion of the stream. It has overflowed the ice for many rods a few feet in width. It has been tight even there (and of course everywhere else on the main stream, and on North Branch except at Loring's Brook and under stone bridge) since January 25th, and elsewhere on the main stream since January 7th, as it still is. That is, we may say that the river has been frozen solidly for seven weeks. On the 25th I saw a load of wood drawn by four horses up the middle of the river above Fair Haven Pond. On that day, the 25th, they were cutting the last of Baker's wood-lot on the south side of Fair Haven. They cut the greater part of it last winter, and this was the wood they were hauling off.

I see many birch scales, freshly blown over the snow. They are falling all winter. What is that narrow, twisted, yellowish-brown scale which is seen on the snow all winter near woods?

Shaped like this: —

Found, in the snow in E. Hosmer's meadow, a gray rabbit's hind leg, freshly left there, perhaps by a fox.

The papers are talking about the prospect of a war between England and America. Neither side sees how its country can avoid a long and fratricidal war without sacrificing its honor. Both nations are ready to take a desperate step, to forget the interests of civilization and Christianity and their commercial prosperity and fly at each other's throats. When I see an individual thus beside himself, thus desperate, ready to shoot or be shot, like a blackleg who has little to lose, no serene aims to accomplish, I think he is a candidate for bedlam. What asylum is there for nations to go to? Nations are thus ready to talk of wars and challenge one another, because they are made up to such an extent of poor, low-spirited, despairing men, in whose eyes the chance of shooting somebody else without being shot themselves exceeds their actual good fortune. Who, in fact, will be the first to enlist but the most desperate class, they who have lost all hope? And they may at last infect the rest.

Minott says that partridges will bud on black birches as on apple trees.

Feb. 28. P. M. — To Nut Meadow.

Mother says that the cat lay on her bread one night and caused it to rise finely all around her.

I go on the crust which we have had since the 13th, i.e. on the solid frozen snow, which settles very gradually in the sun, across the fields and brooks.

The very beginning of the river's breaking up appears to be the oozing of water through cracks in the thinnest places, and standing in shallow puddles there on the ice, which freeze solid at night. The river and brooks are quite shrunken. The brooks flow far under the hollow ice and snow-crust a foot thick, which here and there has fallen in, showing the shrunken stream far below. The surface of the snow melts into a regular waved form, like raised scales.

Miles is repairing the damage done at his new mill by the dam giving way. He is shovelling out the flume, which was half filled with sand, standing in the water. His sawmill, built of slabs, reminds me of a new country. He has lost a head of water equal to two feet by this accident. Yet he sets his mill agoing to show me how it works. What a smell as of gun-wash when he raised the gate! He calls it the sulphur from the pond. It must be the carburetted hydrogen gas from the bottom of the pond under the ice. It powerfully scents the whole mill. A powerful smelling-bottle. How pleasant are the surroundings of a mill! Here are the logs (pail-stuff), already drawn to the door from a neighboring hill before the mill is in operation. The dammed-up meadow, the meadow [sic], the melted snow, and welling springs are the serf he compels to do his work. He is unruly as yet, has lately broken loose, filled up the flume, and flooded the fields below. He uses the dam of an old mill which stood here a hundred years ago, which now nobody knows anything about. The mill is built of slabs, of the worm-eaten sap-wood. The old dam had probably been undermined by muskrats. It would have been most prudent to have built a new one. Rude forces, rude men, and rude appliances.

Martial Miles, who is there, says that there are many trout in this brook. He sees them running down just before winter, and at that time Charles Snow once speared a great many, one weighing four pounds. He once came within four feet of an otter at 10 p. M., in the middle of the road, by the guide-board just north of this brook. Spoke of the one shot in a ditch at Donge Hole, as I had heard before; also of the three killed (shot) at Farrar's Swamp. The one who shot them told him that he attempted to kill them with a shovel, but that they would take it out of his hands as often as he attempted it.

Coombs came along with his dog and gun, on his way to shoot partridges, which will come out to bud this evening on certain young apple trees. He has got four or five for several nights in succession, and sees foxes there, running about on the crust. Francis Wheeler says he sold two young fox-skins to a tin peddler to-day for a dollar. Coombs says they got a silver-gray fox in Lincoln this winter, and sold its skin for sixteen dollars! He says that he killed a shelldrake a month or six weeks ago in a small open place beneath the falls at the factory. This shows what hardy birds they are. Last summer he found a black duck's nest on one of the islands in Loring's Pond. He saw the duck hide in the grass, came up, and put his hand on a parcel of feathers and, raising a handful, was surprised to find the eggs under them.

How various are the talents of men! From the brook in which one lover of nature has never during all his lifetime detected anything larger than a minnow, another extracts a trout that weighs three pounds, or an otter four feet long. How much more game he will see who carries a gun, i.e. who goes to see it! Though you roam the woods all your days, you never will see by chance what he sees who goes on purpose to see it. One gets his living by shooting woodcocks; most never see one in their lives.

Coombs goes to shoot partridges this evening by a far-off wood-side, and M. Miles goes home to load up, for he is going to Boston with a load of wood to-night.

Our young maltese cat Min, which has been absent five cold nights, the ground covered deep with crusted snow, — her first absence, — and given up for dead, has at length returned at daylight, awakening the whole house with her mewing and afraid of the strange girl we have got in the meanwhile. She is a mere wrack of skin and bones, with a sharp nose and wiry tail. She is as one returned from the dead. There is as much rejoicing as at the return of the prodigal son, and if we had a fatted calf we should kill it. Various are the conjectures as to her adventures, — whether she has had a fit, been shut up somewhere, or lost, tom in pieces by a certain terrier or frozen to death. In the meanwhile she is fed with the best that the house affords, minced meats and saucers of warmed milk, and, with the aid of unstinted sleep in all laps in succession, is fast picking up her crumbs. She has already found her old place under the stove, and is preparing to make a stew of her brains there.

That strong gun-wash scent from the mill-pond water was very encouraging. I who never partake of the sacrament make the more of it.

How simple the machinery of the mill! Miles has dammed a stream, raised a pond or head of water, and placed an old horizontal mill-wheel in position to receive a jet

of water on its buckets, transferred the motion to a horizontal shaft and saw by a few cogwheels and simple gearing, and, throwing a roof of slabs over all, at the outlet of the pond, you have a mill.

Returning on the crust, over Puffer's place, I saw a fine, plump hen hanging from an apple tree and a crow from another, probably poisoned to kill foxes with, — a hen which probably a fox had killed.

Stopped at Martial Miles's to taste his cider. Marvellously sweet and spirited without being bottled; alum and mustard put into the barrels.

A weight of water stored up in a meadow, applied to move a saw, which scratches its way through the trees placed before it. So simple is a sawmill.

A millwright comes and builds a dam across the foot of the meadow, and a mill-pond is created, in which, at length, fishes of various kinds are found; and muskrats and minks and otter frequent it. The pond is like a weight wound up.

Feb. 29. Minott told me this afternoon of his catching a pickerel in the Mill Brook once, — before the pond was drawn off, when the brook had four or five times as much water as now, — which weighed four pounds. Says they stayed in it all winter in those days. This was near his land up the brook. He once also caught there, when fishing for pickerel, a trout which weighed three and a half pounds. He fell within two feet of the water, but [he] succeeded in tossing him higher up. When cutting peat thereabouts, he saw a stinkpot turtle in the water eating a frog which it had just caught. Speaks of seeing a mink swimming along a little [sic] in his beech wood-lot, and from time to time running along the shore; part way up an alder and down again.

He loves to recall his hunting days and adventures, and I willingly listen to the stories he has told me half a dozen times already. One day he saw about twenty black ducks on Goose Pond, and stole down on them, thinking to get a shot, but it chanced that a stray dog scared them up before he was ready. He stood on the point of the neck of land between the ponds, and watched them as they flew high toward Flint's Pond. As he looked, he saw one separate from the flock when they had got half-way to Flint's Pond, or half a mile, and return straight toward Goose Pond again. He thought he would await him, and give him a shot if he came near enough. As he flew pretty near and rather low, he fired, whereupon the duck rose right up high into the air, and he saw by his motions that he was wounded. Suddenly he dropped, by a slanting fall, into the point of a thick pine wood, and he heard him plainly strike the ground like a stone. He went there and searched for a long time, and was about giving it up, when at length he saw the duck standing, still alive and bleeding, by the side of a stump, and made out to kill him with a stick before he could reach the water.

He said he saw Emerson come home from lecturing the other day with his knitting-bag (lecture-bag) in his hand. He asked him if the lecturing business was as good as it used to be. Emerson said he did n't see but it was as good as ever; guessed the people would want lectures "as long as he or I lived."

Told again of the partridge hawk striking down a partridge which rose before him and flew across the run in the beech woods, — how suddenly he did it, — and he,

hearing the fluttering of the partridge, came up and secured it, while the hawk kept out of gunshot.

## MARCH, 1856

March 1. 9 A. M. — To Flint's Pond via Walden, by railroad and the crust.

I hear the hens cackle as not before for many months. Are they not now beginning to lay?

The catkins of the willow by the causeway and of the aspens appear to have pushed out a little further than a month ago. I see the down of half a dozen on that willow by the causeway; on the aspens pretty generally. As I go through the cut it is still, warm, and more or less sunny, springlike (about  $40^{\circ} +$ ), and the sand and reddish subsoil is bare for about a rod in width on the railroad. I hear several times the fine-drawn phe-be note of the chickadee, which I heard only once during the winter. Singular that I should hear this on the first spring day.

I see a pitch pine seed with its wing, far out on Walden.

Going down the hill to Goose Pond, I slump now and then. Those dense, dry beds of leaves are gathered especially about the leafy tops of young oaks, which are bent over and held down by the snow. They lie up particularly light and crisp. The birch stubs stand around Goose Pond, killed by the water a year or two ago, five or six feet high and thickly, as if they were an irregular stake fence a rod out.

Going up the hill again, I slump in up to my middle.

At Flint's I find half a dozen fishing. The pond cracks a very little while I am there, say at half past ten. I think I never saw the ice so thick. It measures just two feet thick in shallow water, twenty rods from shore.

Goodwin says that somewhere where he lived they called cherry-birds "port-royals."

Haynes of Sudbury brought some axe-helves which he had been making to Smith's shop to sell to-day. Those made by hand are considered stronger than those which are turned, because their outline conforms to the grain. They told him they had not sold any of the last yet. "Well," said he, "you may depend on it you will. They've got to come after them yet, for they have n't been able to get into the woods this winter on account of the snow, and they'll have to do all their chopping this month."

I like to see the farmer whittling his own axe-helve, as I did E. Hosmer a white oak one on the 27th ult.

It is remarkable, that though I have not been able to find any open place in the river almost all winter, except under the further stone bridge and at Loring's Brook, — this winter so remarkable for ice and snow, — Coombs should (as he says) have killed two sheldrakes at the falls by the factory, a place which I had forgotten, some four or six weeks ago. Singular that this hardy bird should have found this small opening, which I had forgotten, while the ice everywhere else was from one to two feet thick, and the snow sixteen inches on a level. If there is a crack amid the rocks of some waterfall, this

bright diver is sure to know it. Ask the sheldrake whether the rivers are completely sealed up.

March 2. Has snowed three or four inches — very damp snow — in the night; stops about 9 A. M. This will probably help carry off the old snow, so solid and deep.

P. M. — Walking up the river by Prichard's, was surprised to see, on the snow over the river, a great many seeds and scales of birches, though the snow had so recently fallen, there had been but little wind, and it was already spring. There was one seed or scale to a square foot, yet the nearest birches were, about fifteen of them, along the wall thirty rods east. As I advanced toward them, the seeds became thicker and thicker, till they quite discolored the snow half a dozen rods distant, while east of the birches there was not one. The birches appear not to have lost a quarter of their seeds yet. As I went home up the river, I saw some of the seeds forty rods off, and perhaps, in a more favorable direction, I might have found them much further. It suggested how unwearied Nature is, spreading her seeds. Even the spring does not find her unprovided with birch, aye, and alder and pine seed. A great proportion of the seed that was carried to a distance lodged in the hollow over the river, and when the river breaks up will be carried far away, to distant shores and meadows.

The opening in the river at Merrick's is now increased to ten feet in width in some places.

I can hardly believe that hen-hawks may be beginning to build their nests now, yet their young were a fortnight old the last of April last year.

March 3. To Cambridge.

March 4. To Carlisle, surveying.

I had two friends. The one offered me friendship on such terms that I could not accept it, without a sense of degradation. He would not meet me on equal terms, but only be to some extent my patron. He would not come to see me, but was hurt if I did not visit him. He would not readily accept a favor, but would gladly confer one. He treated me with ceremony occasionally, though he could be simple and downright sometimes; and from time to time acted a part, treating me as if I were a distinguished stranger; was on stilts, using made words. Our relation was one long tragedy, yet I did not directly speak of it. I do not believe in complaint, nor in explanation. The whole is but too plain, alas, already. We grieve that we do not love each other, that we cannot confide in each other. I could not bring myself to speak, and so recognize an obstacle to our affection.

I had another friend, who, through a slight obtuseness, perchance, did not recognize a fact which the dignity of friendship would by no means allow me to descend so far as to speak of, and yet the inevitable effect of that ignorance was to hold us apart forever.

March 5. Snowed an inch or two in the night.

Went to Carlisle, surveying.

It is very hard turning out, there is so much snow in the road. Your horse springs and flounders in it. The snow in the wood-lot which I measured was about two feet on a level.

March 6. P. M. — Up Assabet.

The snow is softening. Methinks the lichens are a little greener for it. A thaw comes, and then the birches, which were gray on their white ground before, appear prettily clothed in green. I see various kinds of insects out on the snow now. On the rock this side the Leaning Hemlocks, is the track of an otter. He has left some scentless jelly-like substance an inch and a half in diameter there, yellowish beneath, maybe part of a fish, or clam (?), or himself. The leaves still hanging on some perhaps young swamp white oaks are remarkably fresh, almost ochre-colored brown.

See the snow discolored yellowish under a (probably) gray squirrel's nest high in a pitch pine, and acorn-shells about on it. Also a squirrel's track on the snow over Lee's Hill. The outside toe on the fore feet is nearly at right angles with the others. This also distinguishes it from a rabbit's track. It visits each apple tree, digs up frozen apples and sometimes filberts, and when it starts again, aims for an apple tree, though fifteen rods distant.

March 7. P. M. — Measured snow on account of snow which fell 2d and 4th. West of railroad, 16 +; east of railroad, 16; average, say 16 +; Trillium Wood, 21. Probably quite as deep as any time before, this year. There are still two or more inches of ice next the ground in open land.

I may say that there has not been less than sixteen inches of snow on a level in open land since January 13th. My stick entered the earth in some cases in the wood, as it has not done before. There has been some thawing under the snow.

March 9. Thermometer at 2 P. M. 15°, sixteen inches of snow on a level in open fields, hard and dry, ice in Flint's Pond two feet thick, and the aspect of the earth is that of the middle of January in a severe winter. Yet this is about the date that bluebirds arrive commonly. A pail of water froze nearly half an inch thick in my chamber, with fire raked up. The train which should have got down last night did not arrive till this afternoon (Sunday), having stuck in a drift.

March 10. Thermometer at 7 A. M. 6° below zero. Dr. Bartlett's, between 6.30 and 7 A. M., was at — 13°; Smith's at — 13° or — 14°, at 6 A. M.

P. M. — Up river to Hubbard Bridge.

Thermometer +9° at 3.30 p. M. (the same when I return at five). The snow hard and dry, squeaking under the feet; excellent sleighing. A biting northwest wind compels to cover the ears. It is one of the hardest days of the year to bear. Truly a memorable 10th of March. There is no opening yet in the main stream at Prichard's, Hubbard Bath, or the Clamshell, or probably anywhere but at Merrick's, and that a dozen rods long by ten feet; and it is tight and strong under the bridges. A bluebird would look as much out of place now as the 10th of January.

I suspect that in speaking of the springing of plants in previous years I have been inclined to make them start too early generally.

The ice on ponds is as solid as ever. There has been no softening of it. Now is a good time to begin to cut; only its great thickness would hinder you. The blue shadows on snow are as fine as ever. It is hard to believe the records of previous years.

I have not seen a tree sparrow, methinks, since January. Probably the woods have been so generally buried by the snow this winter that they have migrated further south. There has not been one in the yard the past winter, nor a redpoll. I saw perhaps one redpoll in the town; that is all. The pinched crows are feeding in the road to-day in front of the house and alighting on the elms, and blue jays also, as in the middle of the hardest winter, for such is this weather. The blue jays hop about in yards.

The past has been a winter of such unmitigated severity that I have not chanced to notice a snow-flea, which are so common in thawing days.

I go over the fields now in any direction, sinking but an inch or two to the old solid snow of the winter. In the road you are on a level with the fences, and often considerably higher, and sometimes, where it is a level causeway in summer, you climb up and coast down great swells of hard-frozen snow, much higher than the fences. I may say that I have not had to climb a fence this winter, but have stepped over them on the snow.

Think of the art of printing, what miracles it has accomplished! Covered the very waste paper which flutters under our feet like leaves and is almost as cheap, a stuff now commonly put to the most trivial uses, with thought and poetry! The woodchopper reads the wisdom of ages recorded on the paper that holds his dinner, then lights his pipe with it. When we ask for a scrap of paper for the most trivial use, it may have the confessions of Augustine or the sonnets of Shakespeare, and we not observe it. The student kindles his fire, the editor packs his trunk, the sportsman loads his gun, the traveller wraps his dinner, the Irishman papers his shanty, the schoolboy peppers the plastering, the belle pins up her hair, with the printed thoughts of men. Surely he who can see so large a portion of earth's surface thus darkened with the record of human thought and experience, and feel no desire to learn to read it, is without curiosity. He who cannot read is worse than deaf and blind, is yet but half alive, is still-born.

Still there is little or no chopping, for it will not pay to shovel the snow away from the trees; unless they are quite large, and then you must work standing in it two feet deep. There is an eddy about the large trees beside, which produces a hollow in the snow about them, but it lies close up to the small ones on every side.

10 p. M. — Thermometer at zero.

I read, when last at Cambridge, in the Philadelphia Philosophical Transactions, that, in the cold winter of 1780, many shellfish, frogs, insects, etc., as well as birds and plants, perished.

March 11. Thermometer at 7 A. M. 6°, yet, the fire going out, Sophia's plants are frozen again. Dr. Bartlett's was — 4°.

When it was proposed to me to go abroad, rub off some rust, and better my condition in a worldly sense, I fear lest my life will lose some of its homeliness. If these fields and streams and woods, the phenomena of nature here, and the simple occupations of the

inhabitants should cease to interest and inspire me, no culture or wealth would atone for the loss. I fear the dissipation that travelling, going into society, even the best, the enjoyment of intellectual luxuries, imply. If Paris is much in your mind, if it is more and more to you, Concord is less and less, and yet it would be a wretched bargain to accept the proudest Paris in exchange for my native village. At best, Paris could only be a school in which to learn to live here, a stepping-stone to Concord, a school in which to fit for this university. I wish so to live ever as to derive my satisfactions and inspirations from the commonest events, every-day phenomena, so that what my senses hourly perceive, my daily walk, the conversation of my neighbors, may inspire me, and I may dream of no heaven but that which lies about me. A man may acquire a taste for wine or brandy, and so lose his love for water, but should we not pity him?

The sight of a marsh hawk in Concord meadows is worth more to me than the entry of the allies into Paris. In this sense I am not ambitious. I do not wish my native soil to become exhausted and run out through neglect. Only that travelling is good which reveals to me the value of home and enables me to enjoy it better. That man is the richest whose pleasures are the cheapest.

It is strange that men are in such haste to get fame as teachers rather than knowledge as learners.

I hear that Goodwin found one of his traps frozen in this morning, where it has not frozen before this year.

P. M. — 3.30, thermometer 24°.

Cut a hole in the ice in the middle of Walden. It is just 24  $\frac{3}{4}$  inches thick, 11  $\frac{1}{2}$ + being snow ice, 12  $\frac{3}{4}$  water ice; and there is between 3 and 4 inches of crusted snow above this. The water rises to within 2  $\frac{1}{2}$  inches of the top of the ice, i.e. between a ninth and tenth of the whole thickness. The clear ice has therefore gained 2  $\frac{3}{4}$  inches beneath since the 16th of February. It has gone on freezing under 21  $\frac{1}{2}$  inches of ice. Yet people very commonly say that it will not continue to freeze under half that thickness of snow and ice. It is a job to cut a hole now. Snow and ice together make a curtain twenty-eight inches thick now drawn over the pond. Such is the prospect of the fishes!

March 12. The last four cold days have closed the river again against Merrick's, and probably the few other small places which may have opened in the town, at the mouth of one or two brooks. I hear, from two sources, of portions of brooks, etc., being frozen over within two days, which had not frozen before this winter.

We had a colder day in the winter of '54 and '55 than in the last, yet the ice did not get to be so thick. It is long-continued, steady cold which produces thick ice. If the present cold should continue uninterrupted a thousand years would not the pond become solid?

Rufus Hosmer says he has known the ground here to be frozen four feet deep.

I never saw such solid mountains of snow in the roads. You travel along for many rods over excellent dry solid sleighing, where the road is perfectly level, not thinking

but you are within a foot of the ground, then suddenly descend four or five feet and find, to your surprise, that you had been traversing the broad back of a drift.

The crow has been a common bird in our street and about our house the past winter.

One large limb of the great elm — at Davis's, sawed off, presented this outline: a perfect harp.

March 13. P. M. — To Flint's Pond.

Much warmer at last. On Flint's Pond I cut a hole and measured the ice twenty-two rods from the shore nearest to Walden, where the water was nine feet deep (measuring from its surface in the hole). The ice was twenty-six inches thick, thirteen and one half of it being snow ice, and the ice rose above the water two inches. This ice is as solid as at any time in the winter. Three inches of snow above. It was so much work to cut this hole with a dull axe that I did not try any other place where it may have been thicker. Perhaps it was thicker in the middle, as in '47.

March 14. Friday. Quite warm. Thermometer 46°.

3 P. M. — Up Assabet.

The ice formed the fore part of this week, as that at Merrick's noticed on the 12th, and heard of elsewhere in the Mill Brook, appears to have been chiefly snow ice, though no snow fell. It was apparently blown into the water during those extremely cold nights and assisted its freezing. So that it is a question whether the river would have closed again at Merrick's on the night of the 10th and 11th, notwithstanding the intense cold, if the snow had not been blown into it, — a question, I say, because the snow was blown into it.

I think it remarkable that, cold as it was, I should not have supposed from my sensations that it was nearly so cold as the thermometer indicated.

Tapped several white maples with my knife, but find no sap flowing; but, just above Pinxter Swamp, one red maple limb was moistened by sap trickling along the bark. Tapping this, I was surprised to find it flow freely. Where the sap had dried on the bark, shining and sticky, it tasted quite sweet. Yet Anthony Wright tells me that he attempted to trim some apple trees on the 11th, but was obliged to give up, it was so cold. They were frozen solid. This is the only one of eight or ten white and red maples that flows. I do not see why it should be.

As I return by the old Merrick Bath Place, on the river, — for I still travel everywhere on the middle of the river, — the setting sun falls on the osier row toward the road and attracts my attention. They certainly look brighter now and from this point than I have noticed them before this year, — greenish and yellowish below and reddish above, — and I fancy the sap fast flowing in their pores. Yet I think that on a close inspection I should find no change. Nevertheless, it is, on the whole, perhaps the most springlike sight I have seen.

March 15. Put a spout in the red maple of yesterday, and hung a pail beneath to catch the sap. Mr. Chase (of the Town School), who has lived a hundred miles distant in New Hampshire, speaks of the snow-fleas as a spring phenomenon, — probably

because the winter is more uniformly cold there, — and says that they think it time to stop making maple-sugar when they observe them. They get into the sap by myriads and trouble them much.

March 16. 7 A. M. — The sap of that red maple has not begun to flow yet. The few spoonfuls in the pail and in the hole are frozen.

These few rather warmer days have made a little impression on the river. It shows a rough, snowy ice in many places, suggesting that there is a river beneath, the water having probably oozed up or the snow blown and melted off there. A rough, softening snowy ice, with some darker spots where you suspect weakness, though it is still thick enough.

1 — p. M. — The red maple [sap] is now about an inch deep in a quart pail, — nearly all caught since morning. It now flows at the rate of about six drops in a minute. Has probably flowed faster this forenoon. It is perfectly clear, like water. Going home, slipped on the ice, throwing the pail over my head to save myself, and spilt all but a pint. So it was lost on the ice of the river. When the river breaks up, it will go down the Concord into the Merrimack, and down the Merrimack into the sea, and there get salted as well as diluted, part being boiled into sugar. It suggests, at any rate, what various liquors, beside those containing salt, find their way to the sea, — the sap of how many kinds of trees!

There is, at any rate, such a phenomenon as the willows shining in the spring sun, however it is to be accounted for.

March 17. Monday. Snow going off very gradually under the sun alone. Going begins to be bad; horses slump; hard turning out. See where the cattle, which have stepped a few inches one side the sled-track, have slumped two feet or more, leaving great holes.

March 18. P. M. — Up river.

It is still quite tight at Hubbard's Bath Bend and at Clamshell, though I hesitate a little to cross at these places. There are dark spots in the soft, white ice, which will be soon worn through.

What a solid winter we have had! No thaw of any consequence; no bare ground since December 25th; but an unmelting mass of snow and ice, hostile to all greenness. Have not seen a green radical leaf even, as usual, all being covered up.

Nut Meadow Brook is open for a dozen rods from its mouth, and for a rod into the river. Higher up, it is still concealed by a snowy bridge two feet thick. I see the ripples made by some fishes, which were in the small opening at its mouth, making haste to hide themselves in the ice-covered river. This square rod and one or two others like it in the town are the only places where I could see this phenomenon now. Thus early they appear, ready to be the prey of the fish hawk. Within the brook I see quite a school of little minnows, an inch long, amid or over the bare dead stems of polygonums, and one or [two] little water-bugs (apple-seeds). The last also in the broad ditch on the Corner road, in Wheeler's meadow. Notwithstanding the backwardness of the season, all the town still under deep snow and ice, here they are, in the first open and smooth water, governed by the altitude of the sun.

I see many small furrows, freshly made, in the sand at the bottom of the brook, from half an inch to three quarters wide, which I suspect are made by some small shellfish already moving, perhaps *Paludina*!

March 19. P. M. — To Walden.

Measured the snow again. West of railroad, 15; east of railroad,  $11 \frac{4}{5}$ ; average,  $13 \frac{2}{5}$ ; Trillium Woods,  $16 \frac{3}{4}$ . The last measurement was on the 7th, when it averaged about sixteen inches in the open land. This depth it must have preserved, owing to the remarkably cold weather, till the 13th at least. So it chanced that the snow was constantly sixteen inches deep, at least, on a level in open land, from January 13th to March 13th. It is remarkable how rapidly it has settled on the east of the railroad as compared with the west since the 7th (or I may say rather the 13th). The whole average settling, in open land, since say the 13th, is a little less than three inches.

The thickness of the ice on Walden in the long cove on the south side, about five rods from shore, where the water is nineteen and a half feet deep, is just twenty-six inches, about one foot being snow ice. In the middle it was twenty-four and a quarter on the 11th. It is the same there now, and undoubtedly it was then twenty-six in the long cove. Probably got to be the thickest on this side. Since the warmer weather which began on the 13th, the snow, which was three or four inches deep, is about half melted on the ice, under the influence of the sun alone, and the ice is considerably softened within the last five days, thus suddenly, quite through, it being easier to cut and more moist, quite fine and white like snow in the hole, sticking together as damp snow when I shovel it out on my axe, the dust not at all hard, dry, and crystalline. Apparently, then, Walden is as thickly frozen about shore as Flint's.

While I am measuring, though it is quite warm, the air is filled with large, moist snowflakes, of the star form, which are rapidly concealing the very few bare spots on the railroad embankment. It is, indeed, a new snow-storm.

Another old red maple bleeds now, on the warm south edge of Trillium Wood. The first maple was old and in a warm position.

#### WHAT BEFELL AT MRS. BROOKS'S.

On the morning of the 17th, Mrs. Brooks's Irish girl Joan fell down the cellar stairs, and was found by her mistress lying at the bottom, apparently lifeless. Mrs. Brooks ran to the street-door for aid to get her up, and asked a Miss Farmer, who was passing, to call the blacksmith near by. The latter lady turned instantly, and, making haste across the road on this errand, fell flat in a puddle of melted snow, and came back to Mrs. Brooks's, bruised and dripping and asking for opodeldoc. Mrs. Brooks again ran to the door and called to George Bigelow to complete the unfinished errand. He ran nimbly about it and fell flat in another puddle near the former, but, his joints being limber, got along without opodeldoc and raised the blacksmith. He also notified James Burke, who was passing, and he, rushing in to render aid, fell off one side of the cellar stairs in the dark. They no sooner got the girl up-stairs than she came to and went raving, then had a fit.

Haste makes waste. It never rains but it pours. I have this from those who have heard Mrs. Brooks's story, seen the girl, the stairs, and the puddles.

No sooner is some opening made in the river, a square rod in area, where some brook or rill empties in, than the fishes apparently begin to seek it for light and warmth, and thus early, perchance, may become the prey of the fish hawk. They are seen to ripple the water, darting out as you approach.

I noticed on the 18th that springy spot on the shore just above the railroad bridge, by the ash, which for a month has been bare for two or three feet, now enlarged to eight or ten feet in diameter. And in a few other places on the meadowy shore, e g. just above mouth of Nut Meadow, I see great dimples in the deep snow, eight or ten feet over, betraying springs. There the pads (Nuphar) and cress already spring, and shells are left by the rat. At the broad ditch on the Corner road, opposite Bear Garden, the snowy crust had slumped or fallen in here and there, and, where the bridge was perfect, I saw it quite two feet thick. In the smooth open water there, small water-bugs were gyrating singly, not enough to play the game.

I am surprised at the sudden change in the Walden ice within five days. In cutting a hole now, instead of hard, dry, transparent chips of ice, you make a fine white snow, very damp and adhering together, with but few chips in it. The ice has been affected throughout its twenty-six inches, though most, I should say, above. Hard to say exactly where the ice begins, under the two inches of snow.

March 20. It snowed three or four inches of damp snow last afternoon and night, now thickly adhering to the twigs and branches. Probably it will soon melt and help carry off the snow.

P. M. — To Trillium Wood and to Nut Meadow Brook to tap a maple, see paludina, and get elder and sumach spouts, slumping in the deep snow. It is now so softened that I slump at every third step. The sap of red maples in low and warm positions now generally flows, but not in high and exposed ones.

Where I saw those furrows in the sand in Nut Meadow Brook the other day, I now explore, and find within a square foot or two half a dozen of *Paludina decisa* with their feet out, within an inch of the surface, so I have scarcely a doubt that they made them. I suppose that they do not furrow the bottom thus under the ice, but as soon as the spring sun has thawed it, they come to the surface, — perhaps at night only, — where there is some little sand, and furrow it thus by their motions. Maybe it is the love season. Perhaps these make part of the food of the crows which visit this brook and whose tracks I now see on the edge, and have all winter. Probably they also pick up some dead frogs.

Father read in a paper to-day of seven hundred and forty-odd apple tree buds recently taken out of the crop of a partridge.

Last night's snow, which is melting very fast, is evidently helping to rot the ice very fast, in the absence of rain, by settling into it, as did the older snow, indeed. Maybe it will thaw the ground in the same way. Considering how solid and thick the river was a

week ago, I am surprised to find how cautious I have grown about crossing it in many places now.

For two or three days I have heard the gobbling of turkeys, the first spring sound, after the chickadees and hens, that I think of. The river has just begun to open at Hubbard's Bend. It has been closed there since January 7th, i.e. ten weeks and a half.

Set a pail before coining here to catch red maple sap, at Trillium Wood. I am now looking after elder and sumach for spouts. I find the latter best, for though the former has as large a pith (larger in proportion to its size), its wood commonly being less, it does not fill so large a hole, nor is it so strong. Yet there is some by A. Barrett's ditch more than two inches in diameter, very strong, but its pith small. The pith, etc., of the smooth smells to me like weak tobacco. What other shrubs have a large pith? Got my smooth sumach on the south side of Nawshawtuct. I know of no shrubs hereabout except elders and the sumachs which have a suitable pith and wood for such a purpose. The pith of the smooth sumach is a light brown, like yellow snuff. The ring of old wood next to it is a decayed-looking greenish yellow; the sap-wood is white. When cut or broken, it has a singularly particolored and decayed look, there being often but a small proportion of sap-wood. A white sticky juice oozes out of the edge of the bark where cut, and soon turns yellow and hard in drops like pitch or hickory sap. This pith does not come out quite so entire and smooth as elder, being drier now at least. You can shove it past the axils of twigs. The old wood of the ivy is also yellow like this, but there is more and harder sap-wood and the pith is quite small. The pith of the poison sumach or dogwood is considerably smaller, but I think it has the same scent with the smooth. Another poison-dogwood has a very large pith, and I am not sure about the scent. The juice of the bark is not white.

March 21. George Brooks, of the North Quarter, tells me that he went a-fishing at Nagog Pond on the 18th and found the ice from thirty to thirty-seven inches thick (the greater part, or all but about a foot, snow ice), the snow having blown on to the ice there. He measured it with a rule and a hooked stick. (But at Walden, where I measured, there was no drifting of the snow.) It may have been no thicker at Nagog on an average. He says that both the gray squirrel and the red eat pine seed, but not in company. The former have been quite common about his house the past winter, and his neighbor caught two in his yard.

10 A. M. — To my red maple sugar camp. Found that, after a pint and a half had run from a single tube after 3 p. M. yesterday, it had frozen about half an inch thick, and this morning a quarter of a pint more had run. Between 10.30 and 11.30 A. M. this forenoon, I caught two and three quarters pints more, from six tubes, at the same tree, though it is completely overcast and threatening rain. Four and one half pints in all. This sap is an agreeable drink, like iced water (by chance), with a pleasant but slight sweetish taste. I boiled it down in the afternoon, and it made an ounce and a half of sugar, without any molasses, which appears to be the average amount yielded by the sugar maple in similar situations, viz south edge of a wood, a tree partly decayed, two feet [in] diameter.

It is worth the while to know that there is all this sugar in our woods, much of which might be obtained by using the refuse wood lying about, without damage to the proprietors, who use neither the sugar nor the wood.

I left home at ten and got back before twelve with two and three quarters pints of sap, in addition to the one and three quarters I found collected.

I put in saleratus and a little milk while boiling, the former to neutralize the acid, and the latter to collect the impurities in a skum. After boiling it till I burned it a little, and my small quantity would not flow when cool, but was as hard as half-done candy, I put it on again, and in a minute it was softened and turned to sugar.

While collecting sap, the little of yesterday's lodging snow that was left, dropping from the high pines in Trillium Wood and striking the brittle twigs in its descent, makes me think that the squirrels are running there.

I noticed that my fingers were purpled, evidently from the sap on my auger.

Had a dispute with Father about the use of my making this sugar when I knew it could be done and might have bought sugar cheaper at Holden's. He said it took me from my studies. I said I made it my study; I felt as if I had been to a university.

It dropped from each tube about as fast as my pulse beat, and, as there were three tubes directed to each vessel, it flowed at the rate of about one hundred and eighty drops in a minute into it. One maple, standing immediately north of a thick white pine, scarcely flowed at all, while a smaller, farther in the wood, ran pretty well. The south side of a tree bleeds first in spring. I hung my pails on the tubes or a nail. Had two tin pails and a pitcher. Had a three-quarters-inch auger. Made a dozen spouts, five or six inches long, hole as large as a pencil, smoothed with a pencil.

March 22. Saturday. P.M. — To white maples and up Assabet.

The ice of the river is very rapidly softening, still concealed by snow, the upper part becoming homogeneous with the melting snow above it. I sometimes slump into snow and ice six or eight inches, to the harder ice beneath.

I walk up the middle of the Assabet, and most of the way on middle of South Branch.

Many tracks of crows in snow along the edge of the open water against Merrick's at Island. They thus visit the edge of water — this and brooks — before any ground is exposed. Is it for small shellfish? The snow now no longer bears you. It has become very coarse-grained under the sun, and I hear it sink around me as I walk.

Part of the white maples now begin to flow, some perhaps two or three days. Probably in equally warm positions they would have begun to flow as early as those red ones which I have tapped. Their buds, and apparently some of the red ones, are visibly swollen. This probably follows directly on the flowing of the sap. In three instances I cut off a twig, and sap flowed and dropped from the part attached to the tree, but in no case would any sap flow from the part cut off (I mean where I first had cut it), which appears to show that the sap is now running up. I also cut a notch in a branch two inches in diameter, and the upper side of the cut remained dry, while sap flowed from the lower side, but in another instance both sides were wet at once and equally. The

sap, then, is now generally flowing upward in red and white maples in warm positions. See it flowing from maple twigs which were gnawed off by rabbits in the winter.

The down of willow catkins in very warm places has in almost every case peeped out an eighth of an inch, generally over the whole willow.

On water standing above the ice under a white maple, are many of those Perla (?) insects, with four wings, drowned, though it is all ice and snow around the country over. Do not see any flying, nor before this.

The woodchoppers, who re cutting the wood at Assabet Spring, now at last go to their work up the middle of the river, but one got in yesterday, one leg the whole length. It is rotted through in many places behind Prichard's.

At the red maple which I first tapped, I see the sap still running and wetting the whole side of the tree. It has also oozed out from the twigs, especially those that are a little drooping, and run down a foot or two bathing them sometimes all around, both twigs and buds sometimes, or collected in drops on the under sides of the twigs and all evaporated to molasses, which is, for the most part, as black as blacking or ink, having probably caught the dust, etc., even over all this snow. Yet it is as sweet and thick as molasses, and the twigs and buds look as if blacked and polished. Black drops of this thick, sweet syrup spot the under sides of the twigs. No doubt the bees and other insects frequent the maples now. I thought I heard the hum of a bee, but perhaps it was a railroad whistle on the Lowell Railroad. It is as thick as molasses. See a fuzzy gnat on it. It is especially apt to collect about the bases of the twigs, where the stream is delayed. Where the sap is flowing, the red maple being cut, the inner bark turns crimson. I see many snow-fleas on the moist maple chips.

Saw a pigeon woodpecker under the swamp white oak in Merrick's pasture, where there is a small patch of bare ground. Probably Minott saw one in his door-yard in midwinter.

March 23. I spend a considerable portion of my time observing the habits of the wild animals, my brute neighbors. By their various movements and migrations they fetch the year about to me. Very significant are the flight of geese and the migration of suckers, etc., etc. But when I consider that the nobler animals have been exterminated here, — the cougar, panther, lynx, wolverene, wolf, bear, moose, deer, the beaver, the turkey, etc., etc., — I cannot but feel as if I lived in a tamed, and, as it were, emasculated country. Would not the motions of those larger and wilder animals have been more significant still? Is it not a maimed and imperfect nature that I am conversant with? As if I were to study a tribe of Indians that had lost all its warriors. Do not the forest and the meadow now lack expression, now that I never see nor think of the moose with a lesser forest on his head in the one, nor of the beaver in the other? When I think what were the various sounds and notes, the migrations and works, and changes of fur and plumage which ushered in the spring and marked the other seasons of the year, I am reminded that this my life in nature, this particular round of natural phenomena which I call a year, is lamentably incomplete. I listen to [a] concert in which so many parts are wanting. The whole civilized country is to some extent turned into a city, and I am that

citizen whom I pity. Many of those animal migrations and other phenomena by which the Indians marked the season are no longer to be observed. I seek acquaintance with Nature, — to know her moods and manners. Primitive Nature is the most interesting to me. I take infinite pains to know all the phenomena of the spring, for instance, thinking that I have here the entire poem, and then, to my chagrin, I hear that it is but an imperfect copy that I possess and have read, that my ancestors have torn out many of the first leaves and grandest passages, and mutilated it in many places. I should not like to think that some demigod had come before me and picked out some of the best of the stars. I wish to know an entire heaven and an entire earth. All the great trees and beasts, fishes and fowl are gone. The streams, perchance, are somewhat shrunk. — .

I see that a shopkeeper advertises among his perfumes for handkerchiefs “meadow flowers” and “new-mown hay.”

P. M. — To Walden.

The sugar maple sap flows, and for aught I know is as early as the red.

I think I may say that the snow has been not less than a foot deep on a level in open land until to-day, since January 6th, about eleven weeks. It probably begins to be less about this date. The bare ground begins to appear where the snow is worn in the street. It has been steadily melting since March 13th, the thermometer rising daily to 40 and 45 at noon, but no rain.

The east side of the Deep Cut is nearly bare, as is the railroad itself, and, on the driest parts of the sandy slope, I go looking for *Cicindela*, — to see it run or fly amid the sere blackberry vines, — some life which the warmth of the dry sand under the spring sun has called forth; but I see none. I am reassured and reminded that I am the heir of eternal inheritances which are inalienable, when I feel the warmth reflected from this sunny bank, and see the yellow sand and the reddish subsoil, and hear some dried leaves rustle and the trickling of melting snow in some sluiceway. The eternity which I detect in Nature I predicate of myself also. How many springs I have had this same experience! I am encouraged, for I recognize this steady persistency and recovery of Nature as a quality of myself.

The first places which I observe to be bare now, though the snow is generally so deep still, are the steep hillsides facing the south, as the side of the Cut (though it looks not south exactly) and the slope of Heywood's Peak toward the pond, also under some trees in a meadow (there is less snow there on account of eddy, and apparently the tree absorbs heat), or a ridge in the same place. Almost the whole of the steep hillside on the north of Walden is now bare and dry and warm, though fenced in with ice and snow. It has attracted partridges, four of which whirl away on my approach. There the early sedge is exposed, and, looking closer, I observe that it has been sheared off close down, when green, far and wide, and the fallen withered tops are little handfuls of hay by their sides, which have been covered by the snow and sometimes look as if they had served as nests for the mice, — for their green droppings are left in them abundantly, — yet not such plain nests as in the grain-field last spring, — probably

the *Mus leucopus*, — and the wintergreen and the sere pennyroyal still retain some fragrance.

As I was returning on the railroad, at the crossing beyond the shanty, hearing a rustling, I saw a striped squirrel amid the sedge on the bare east bank, twenty feet distant. After observing me a few moments, as I stood perfectly still between the rails, he ran straight up to within three feet of me, out of curiosity; then, after a moment's pause, and looking up to my face, turned back and finally crossed the railroad. All the red was on his rump and hind quarters. When running he carried his tail erect, as he scratched up the snowy bank.

Now then the steep south hillsides begin to be bare, and the early sedge and sere, but still fragrant, pennyroyal and rustling leaves are exposed, and you see where the mice have sheared off the sedge and also made nests of its top during the winter. There, too, the partridges resort, and perhaps you hear the bark of a striped squirrel, and see him scratch toward his hole, rustling the leaves. For all the inhabitants of nature are attracted by this bare and dry spot, as well as you.

The muskrat-houses were certainly very few and small last summer, and the river has been remarkably low up to this time, while, the previous fall, they [were] very numerous and large, and in the succeeding winter the river rose remarkably high. So much for the muskrat sign. The bare ground just begins to appear in a few spots in the road in middle of the town.

March 24. Monday. Very pleasant day. Thermometer 48° at noon.

9 A. M. — Start to get two quarts of white maple sap and home at 11.30. One *F. hyemalis* in yard. Spend the forenoon on the river at the white maples. I hear a bluebird's warble and a song sparrow's chirp. So much partly for being out the whole forenoon. Bluebirds seen in all parts of the town to-day for first time, as I hear. The *F. hyemalis* has been seen two or three days. Cross the river behind Monroe's. Go everywhere on the North Branch — it is all solid — and almost everywhere on the South Branch. The crust bears in the morning. The snow is so coarse-grained and hard that you can hardly get up a handful to wash your hands with, except the dirty surface. The early aspen buds down very conspicuous, half an inch long; yet I detect no flow of sap.

The white maple sap does not flow fast generally at first, — or 9 A. M., — not till about ten. Yet last year I paddled my boat to Fair Haven Pond on the 19th of March! Before noon I slump two feet in the snow.

You bore a little hole with your knife, and presently the wounded sap-wood begins to glisten with moisture, and anon a clear crystalline tear-like drop flows out and runs down the bark, or drops at once to the snow. This is the sap of which the far-famed maple-sugar is made. That's the sweet liquor which the Indians boiled a thousand years ago.

Cut a piece of *Rhus Toxicodendron* resting on rock at Egg Rock, five eighths of an inch in diameter, which had nineteen rings of annual growth. It is quite hard and stiff.

My sugar-making was spoiled by putting in much soda instead of saleratus by accident. I suspect it would have made more sugar than the red did. It proved only brittle black candy. This sap flowed just about as fast as that of the red maple.

It is said that a great deal of sap will run from the yellow birch.

The river begins to open generally at the bends for ten or twenty rods, and I see the dark ice alternating with dark water there, while the rest of the river is still covered with snow.

March 25. P. M. — To Walden.

The willow and aspen catkins have pushed out considerably since the 1st of February in warm places.

I have frequently seen the sap of maples flow in warm days in the winter, in warm localities. This was in twigs. Would it in the trunks of large trees? And if not, is not this an evidence that this sap did not come up from the roots?

The meadow east of the railroad causeway is bare in many spots, while that on the west is completely and deeply covered; yet a few weeks ago it was deepest on the east. I think of no reason for this, except that the causeway may keep off the cold northwest winds from the former meadow. For thirty rods distant there are no bare spots. Why is the eastern slope, now, as every spring, (almost completely) bare, long before the western? The road runs north and south, and the sun lies on the one side as long as on the other. Is it more favorable that the frozen snow be acted on by the warmed air before the sun reaches it than after it has left it? Another and second reason is probably that there is less snow on that side or on the west slope of a hill than on the eastern. Snow drifting from the northwest lodges under the west bank. So I observe to-day that the hills rising from the north and west (and this seems to give weight to the second reason urged above) sides of Walden are partially bare, while those on the south and east are deeply and completely covered with snow. Mr. Bull tells me that his grapes grow faster and ripen sooner on the west than the east side of his house.

There have been few if any small migratory birds the past winter. I have not seen a tree sparrow, nuthatch, creeper, nor more than one redpoll since Christmas. They probably went further south.

I now slump from two to four inches into Walden, though there has been no rain since I can remember. I cannot cut through, on account of the water in the softened ice flowing into the hole. At last, in a drier place, I was not troubled with water, till I had cut about a foot, or through the snow ice, when two or three streams of water half an inch or more in diameter spurted up through holes in the disorganized, partly honeycombed clear ice; so I failed to get through. Probably the clear ice is thus riddled all over the pond, for this was a drier place than usual. Is it the effect of the melted snow and surface working down? or partly of water pressing up? The whole mass in the middle is about twenty-four inches thick, but I scrape away about two inches of the surface with my foot, leaving twenty-two inches. For about a rod from the shore, on the north and west sides (I did not examine the others), it is comparatively firm

and dry, then for two rods you slump four inches or more, then, and generally, only about two. Is that belt the effect of reflection from the hills?

Hear the hurried and seemingly frightened notes of a robin and see it flying over the railroad lengthwise, and afterwards its tut tut at a distance. This and the birds of yesterday have come, though the ground generally is covered deep with snow. They will not only stay with us through a storm, but come when there are but resting-places for them. It must be hard for them to get their living now.

The tallest water andromedas now rise six or eight inches above the snow in the swamp.

March 26. To Cambridge.

I hear that Humphrey Buttrick found a whole covey of quails dead. At Philadelphia, a month or two since, they offered a reward for live ones, more than market price, to preserve them. We have heard of an unusual quantity of ice in the course of the Liverpool packets this winter. Perhaps the Pacific has been sunk by one, as we hear that some other vessels have been. Yet the papers say it has been warmer about Lake Superior than in Kansas and that the lake will break up earlier than usual.

They are just beginning to use wheels in Concord, but only in the middle of the town, where the snow is at length worn and melted down to bare ground in the middle of the road, from two to ten feet wide. Sleighs are far the most common, even here. In Cambridge there is no sleighing. For the most part, the middle of the road from Porter's to the College is bare and even dusty for twenty to thirty feet in width. The College Yard is one half bare. So, if they have had more snow than we, as some say, it has melted much faster.

There is also less in the towns between us and Cambridge than in Concord. The snow lies longer on the low, level plain surrounded by hills in which Concord is situated. I am struck by the more wintry aspect — almost entirely uninterrupted snow-fields — on coming into Concord in the cars.

The Romans introduced husbandry into England, where but little was practiced before, and the English have introduced it into America. So we may well read the Roman authors for a history of this art as practiced by us.

I am sometimes affected by the consideration that a man may spend the whole of his life after boyhood in accomplishing a particular design; as if he were put to a special and petty use, without taking time to look around him and appreciate the phenomenon of his existence. If so many purposes are thus necessarily left unaccomplished, perhaps unthought of, we are reminded of the transient interest we have in this life. Our interest in our country, in the spread of liberty, etc., strong and, as it were, innate as it is, cannot be as transient as our present existence here. It cannot be that all those patriots who die in the midst of their career have no further connection with the career of their country.

March 27. Uncle Charles died this morning, about midnight, aged seventy-six.

The frost is now entirely out in some parts of the New Burying-Ground, the sexton tells me, — half-way up the hill which slopes to the south, unless it is bare of snow,

he says. In our garden, where it chances to be bare, two or more rods from the house, I was able to dig through the slight frost. In another place near by I could not.

The river is now open in reaches of twenty or thirty rods, where the ice has disappeared by melting.

Elijah Wood, Senior, about seventy, tells me he does not remember that the river was ever frozen so long, nor that so much snow lay on the ground so long. People do not remember when there was so much old snow on the ground at this date.

March 28. Uncle Charles buried. He was born in February, 1780, the winter of the Great Snow, and he dies in the winter of another great snow, — a life bounded by great snows.

Cold, and the earth stiff again, after fifteen days of steady warm and, for the most part, sunny days (without rain), in which the snow and ice have rapidly melted.

Sam Barrett tells me that a boy caught a crow in his neighborhood the other day in a trap set for mink. Its leg was broken. He brought it home under his arm, and laid it down in a shop, thinking to keep it there alive. It looked up sidewise, as it lay seemingly helpless on the floor, but, the door being open, all at once, to their surprise, it lifted itself on its wings and flitted out and away without the least trouble. Many crows have been caught in mink-traps the past winter, they have been compelled to visit the few openings in brooks, etc., so much for food.

Barrett has suffered all winter for want of water.

I think to say to my friend, There is but one interval between us. You are on one side of it, I on the other. You know as much about it as I, — how wide, how impassable it is. I will endeavor not to blame you. Do not blame me. There is nothing to be said about it. Recognize the truth, and pass over the intervals that are bridged.

Farewell, my friends, my path inclines to this side the mountain, yours to that. For a long time you have appeared further and further off to me. I see that you will at length disappear altogether. For a season my path seems lonely without you. The meadows are like barren ground. The memory of me is steadily passing away from you. My path grows narrower and steeper, and the night is approaching. Yet I have faith that, in the definite future, new suns will rise, and new plains expand before me, and I trust that I shall therein encounter pilgrims who bear that same virtue that I recognized in you, who will be that very virtue that was you. I accept the everlasting and salutary law, which was promulgated as much that spring that I first knew you, as this that I seem to lose you.

My former friends, I visit you as one walks amid the columns of a ruined temple. You belong to an era, a civilization and glory, long past. I recognize still your fair proportions, notwithstanding the convulsions which we have felt, and the weeds and jackals that have sprung up around. I come here to be reminded of the past, to read your inscriptions, the hieroglyphics, the sacred writings. We are no longer the representatives of our former selves.

Love is a thirst that is never slaked. Under the coarsest rind, the sweetest meat. If you would read a friend aright, you must be able to read through something thicker

and opaquer than horn. If you can read a friend, all languages will be easy to you. Enemies publish themselves. They declare war. The friend never declares his love.

March 29. Another cold day. Scarcely melts at all. Water skimmed over in chamber, with fire.

March 30. P. M. — To Walden and Fair Haven.

Still cold and blustering. I come out to see the sand and subsoil in the Deep Cut, as I would to see a spring flower, some redness in the cheek of Earth. These cold days have made the ice of Walden dry and pretty hard again at top. It is just twenty-four inches thick in the middle, about eleven inches of snow ice. It has lost but a trifle on the surface. The inside is quite moist, the clear ice very crystalline and leaky, letting the water up from below, so as to hinder my cutting. It seems to be more porous and brittle than the snow ice.

I go to Fair Haven via the Andromeda Swamps. The snow is a foot and more in depth there still. There is a little bare ground in and next to the swampy woods at the head of Well Meadow, where the springs and little black rills are flowing. I see already one blade, three or four inches long, of that purple or lake grass, lying flat on some water, between snow-clad banks, — the first leaf with a rich bloom on it. How silent are the footsteps of Spring! There, too, where there is a fraction of the meadow, two rods over, quite bare, under the bank, in this warm recess at the head of the meadow, though the rest of the meadow is covered with snow a foot or more in depth, I am surprised to see the skunk-cabbage, with its great spear-heads open and ready to blossom (i.e. shed pollen in a day or two); and the *Caltha palustris* bud, which shows yellowish; and the golden saxifrage, green and abundant; also there are many fresh tender leaves of (apparently) the goldthread in open meadow there, all surrounded and hemmed in by snow, which [has] covered the ground since Christmas and stretches as far as you can see on every side; and there are as intense blue shadows on the snow as I ever saw. The spring advances in spite of snow and ice, and cold even. The ground under the snow has long since felt the influence of the spring sun, whose rays fall at a more favorable angle. The tufts or tussocks next the edge of the snow were crowned with dense phalanxes of stiff spears of the stiff triangularish sedge-grass, five inches high but quite yellow with a very slight greenness at the tip, showing that they pushed up through the snow, which melting, they had not yet acquired color. This is the greatest growth of any plant I have seen. I had not suspected any. I can just see a little greening on our bare and dry south bank. In warm recesses and clefts in meadows and rocks in the midst of ice and snow, nay, even under the snow, vegetation commences and steadily advances.

I find Fair Haven Pond and the river lifted up a foot or more, the result [of] the long, steady thaw in the sun. The water of the pond and river has run over the meadows, mixing with and partly covering the snow, making it somewhat difficult to get into the river on the east side. On the east side of the pond, the ice next the shore is still frozen to the bottom under water by one edge, while the other slants upward to meet the main body of the ice of the pond. This sort of canal on one or both sides of the

river is from a rod to three or four rods wide. This is the most decided step toward breaking up as yet. But the pond and river are very solid yet. I walk over the pond and down on the middle of the river to the bridge, without seeing an opening.

Saw probably a hen-hawk (?) (saw the black tips to wings), sailing low over the low cliff next the river, looking probably for birds. The south hillsides no sooner begin to be bare, and the striped squirrels and birds resort there, than the hawks come from southward to prey on them. I think that even the hen-hawk is here in winter, only as the robin is.

For twenty-five rods the Comer road is impassable to horses, because of their slumping in the old snow; and a new path has been dug, which a fence shuts off the old. Thus they have served the roads on all sides the town.

March 31. P. M. — To Peter's via Winter Street [? ].

I see the scarlet tops of white maples nearly a mile off, down the river, the lusty shoots of last year. Those of the red maple do not show thus.

I see many little holes in this old and solid snow where leaves have sunk down gradually and perpendicularly, eleven or twelve inches, — the hole no larger at the top than at the bottom, nay, often partly closed at top by the drifting, and exactly the form and size of the leaf. It is as if the sun had driven this thin shield like a bullet thus deep into the solid snow. It is remarkable how deep the leaves settle into an old snow like this.

See a small ant running about over a piece of meadow turf. The celandine begins to be conspicuous, springing under Brown's fence.

## APRIL, 1856

April 1. P. M. — Down railroad, measuring snow, and to Fair Haven Hill.

It appears from the above how rapidly the snow has melted on the east side of the railroad causeway, though eight to twelve rods from it, being sheltered by it from the northwest wind. It is for the most part bare ground there. Adhering to these localities, the average depth in open land is five and one half inches, but the east side of railroad is a peculiarly sheltered place and hence bare, while the earth generally is covered. It is probably about seven inches deep on a level generally in open land. It has melted at about the same rate west of railroad and in Trillium Woods since the 19th. It is a question whether it is better sleighing or wheeling now, taking all our roads together. At any rate we may say the sleighing lasted till April. In some places it still fills the roads level with the walls, and bears me up still in the middle of the day. It grows more and more solid, apparently freezing at night quite through. William Wheeler (of the Comer road) tells me that it was more solid this morning than any time in the winter, and he was surprised to find that it would bear his oxen where three or four feet deep behind his house. On some roads you walk in a path recently shovelled out,

with upright walls of snow three or four feet high on each side and a foot of snow beneath you, for twenty or thirty rods; and this is old snow. We have had none since March 20th, and that was very moist and soon melted. The drifts on the east side of the depot, which have lain there a great part of the winter, still reach up to the top of the first pane of glass. But, generally speaking, we slump so much, especially in the woods, except in the morning, and the snow is so deep, that we are confined to the roads or the river still. Choppers cannot work in the woods yet, and teams cannot get in for wood yet.

A new snow of this depth would soon go off, but this old snow is solid and icy and wastes very slowly. It seems to be gradually turning to ice. I observe that, while the snow has melted unevenly in waves and ridges, there is a transparent icy glaze about one sixteenth of an inch thick but as full of holes as a riddle, spread like gauze level over all, resting on the prominent parts of the snow, leaving hollows beneath from one inch to six or more inches in depth. I often see the spiders running underneath this. This is the surface, which has melted and formed an icy crust, and, being transparent, it has transmitted the heat to the snow beneath and has outlasted that. This crashes and rattles under your feet.

The bare places now are the steep south and west, or southwest, sides of hills and cliffs, and also next to woods and houses on the same sides, the bridges and brows of hills and slighter ridges and prominences in the fields, low open ground protected from the northwest wind, under trees, etc. I might have put the roads second.

Going by the path to the springs! Find great beds of oak leaves, sometimes a foot thick, very dry and crisp and filling the path, or one side of it, in the woods for a quarter of a mile, inviting one to lie down. They have absorbed the heat and settled, like the single one seen yesterday, in mass a foot or more, making a path to that depth. Yet when they are unusually thick they preserve the snow beneath and are found to cover an almost icy mound.

April 2. 8 A. M. — To Lee's Cliff via railroad, Andromeda Ponds, and Well Meadow.

I go early, while the crust is hard. I hear a few song sparrows tinkle on the alders by the railroad. They skulk and flit along below the level of the ground in the ice-filled ditches; and bluebirds warble over the Deep Cut. A foot or more of snow in Andromeda Ponds.

In the warm recess at the head of Well Meadow, which makes up on the northeast side of Fair Haven, I find many evidences of spring. Pushed up through the dead leaves, yet flattened by the snow and ice which has just melted here, behold! the skunk-cabbage has been in bloom, i.e. has shed pollen some time and been frost-bitten and decayed. All that now sheds pollen here has been frost-bitten. Others are ready to shed it in a day or two. I find no other flower nearly so forward as this. The cowslip appears to be coming next to it. Its buds are quite yellowish and half an inch, almost, in diameter. The alder scales do not even appear relaxed yet. This year, at least, the cabbage is the first flower; and perhaps it is always earlier than I have thought, if you seek it in a favorable place. The springy soil in which it grows melts the snows early, and if, beside,

it is under the south side of a hill in an open oozy alder swamp in a recess sheltered from cold winds like this, it may commonly be the first flower.

It will take you half a lifetime to find out where to look for the earliest flower. I have hitherto found my earliest at Clamshell, a much more exposed place. Look for some narrow meadowy bay, running north into a hill and protected by the hill on the north and partly on the east and west. At the head of this meadow, where many springs ooze out from under the hill and saturate all the ground, dissolving the snow early in the spring, in the midst, or on the edge, of a narrow open alder swamp, there look for the earliest skunk-cabbage and cowslip, where some little black rills are seen to meander or heard to tinkle in the middle of the coldest winter. There appear the great spear-heads of the skunk-cabbage, yellow and red or uniform mahogany-color, ample hoods sheltering their purple spadixes. The plaited buds of the hellebore are four or five inches high. There are beds of fresh green moss in the midst of the shallow water. What is that coarse sedge-like grass, rather broadly triangularish, two inches high in the water? This and the cress have been eaten, probably by the rabbits, whose droppings are abundant. I see where they have gnawed and chipped off the willow osiers. Common grass is quite green.

Here, where I come for the earliest flowers, I might also come for the earliest birds. They seek the same warmth and vegetation. And so probably with quadrupeds, — rabbits, skunks, mice, etc. I hear now, as I stand over the first skunk-cabbage, the notes of the first red-wings, like the squeaking of a sign, over amid the maples yonder. Robins are peeping and flitting about. Am surprised to hear one sing regularly their morning strain, seven or eight rods off, yet so low and smothered with its ventriloquism that you would say it was half a mile off. It seems to be wooing its mate, that sits within a foot of it.

There are many holes in the surface of the bare, springy ground amid the rills, made by the skunks or mice, and now their edges are bristling with featherlike frostwork, as if they were the breathing-holes or nostrils of the earth.

That grass which had grown five inches on the 30th is apparently the cut-grass of the meadows. The withered blades which are drooping about the tufts are two feet long. I break the solid snow-bank with my feet and raise its edge, and find the stiff but tender yellow shoots beneath it. They seem not to have pierced it, but are prostrate beneath it. They have actually grown beneath it, but not directly up into it to any extent; rather flattened out beneath it.

Cross Fair Haven Pond to Lee's Cliff. The crowfoot and saxifrage seem remarkably backward; no growth as yet. But the catnep has grown even six inches, and perfumes the hillside when bruised. The columbine, with its purple leaves, has grown five inches, and one is flower-budded, apparently nearer to flower than anything there. *Turritis stricta* very forward, four inches high.

It is evident that it depends on the character of the season whether this flower or that is the most forward; whether there is more or less snow or cold or rain, etc. I am tempted to stretch myself on the bare ground above the Cliff, to feel its warmth in my

back, and smell the earth and the dry leaves. I see and hear flies and bees about. A large buff-edged butterfly flutters by along the edge of the Cliff, — *Vanessa antiopa*. Though so little of the earth is bared, this frail creature has been warmed to life again. Here is the broken shell of one of those large white snails (*Helix albolabris*) on the top of the Cliff. It is like a horn with ample mouth wound on itself. I am rejoiced to find anything so pretty. I cannot but think it nobler, as it is rarer, to appreciate some beauty than to feel much sympathy with misfortune. The Powers are kinder to me when they permit me to enjoy this beauty than if they were to express any amount of compassion for me. I could never excuse them that.

A woodchuck has been out under the Cliff, and patted the sand, cleared out the entrance to his burrow.

Muskrat-houses have been very scarce indeed the past winter. If they were not killed off, I cannot but think that their instinct foresaw that the river would not rise. The river has been at summer level through the winter up to April!

I returned down the middle of the river to near the Hubbard Bridge without seeing any opening.

Some of the earliest plants are now not started because covered with snow, as the *stellaria* and *shepherd's-purse*. Others, like the *Car ex Pennsylvania*, the *crowfoot*, *saxifrage*, *callitriche*, are either covered or recently uncovered. I think it must be partly owing to the want of rain, and not wholly to the snow, that the first three are so backward.

The white maples and hazels and, for the most part, the alders still stand in snow; yet those alders on the bare place by the *skunk-cabbage*, above named, appear to be no more forward! Maybe trees, rising so high, are more affected by cold winds than herbaceous plants.

April 3. When I awoke this morning I heard the almost forgotten sound of rain on the roof. I think there has not been any of any consequence since Christmas Day. Looking out, I see the air full of fog, and that the snow has gone off wonderfully during the night. The drifts have settled and the patches of bare ground extended themselves, and the river is fast spreading over the meadows. The pattering of the rain is a soothing, slumberous sound, which tempts me to lie late, yet there is more fog than rain. Here, then, at last, is the end of the sleighing, which began the 25th of December. Not including that date and to-day it has lasted ninety-nine days. I hear that young Demond of the Factory will have come into town one hundred times in his sleigh the past winter, if he comes to-day, having come probably only once in a day.

P. M. — To Hunt's Bridge.

It is surprising how the earth on bare south banks begins to show some greenness in its russet cheeks in this rain and fog, — a precious emerald-green tinge, almost like a green mildew, the growth of the night, — a green blush suffusing her cheek, heralded by twittering birds. This sight is no less interesting than the corresponding bloom and ripe blush of the fall. How encouraging to perceive again that faint tinge of green, spreading amid the russet on earth's cheeks! I revive with Nature; her victory is mine.

This is my jewelry. It rains very little, but a dense fog, fifteen or twenty feet high, rests on the earth all day, spiriting away the snow, — behind which the cockerels crow and a few birds sing or twitter. The osiers look bright and fresh in the rain and fog, like the grass. Close at hand they are seen to be beaded with drops from the fog. There seems to be a little life in the bark now, and it strips somewhat more freely than in winter. What a lusty growth have these yellow osiers! Six feet is common the last year, chiefly from the summit of the pollards, — but also from the sides of the trunk, — filling a quadrant densely with their yellow rays. The white maple buds on the south side of some trees have slightly opened, so that I can peep into their cavities and detect the stamens. They will probably come next to the skunk-cabbage this year, if the cowslip does not.. Yet the trees stand in the midst of the old snow.

I see small flocks of robins running on the bared portions of the meadow. Hear the sprayey tinkle of the song sparrow along the hedges. Hear also, squeaking notes of an advancing flock of red-wings, somewhere high in the sky. At length detect them high overhead, advancing northeast in loose array, with a broad extended front, competing with each other, winging — their way to some northern meadow which they remember. The note of some is like the squeaking of many signs, while others accompany them with a steady dry tchuck, tchuck.

Hosmer is overhauling a vast heap of manure in the rear of his bam, turning the ice within it up to the light; yet he asks despairingly what life is for, and says he does not expect to stay here long. But I have just come from reading Columella, who describes the same kind of spring work, in that to him new spring of the world, with hope, and I suggest to be brave and hopeful with nature. Human life may be transitory and full of trouble, but the perennial mind, whose survey extends from that spring to this, from Columella to Hosmer, is superior to change. I will identify myself with that which did not die with Columella and will not die with Hosmer.

Coming home along the causeway, a robin sings (though faintly) as in May. The road is a path, here and there shovelled through drifts which are considerably higher than a man's head on each side.

People are talking about my Uncle Charles. Minott tells how he heard Tilly Brown once asking him to show him a peculiar (inside?) lock in wrestling. "Now, don't hurt me, don't throw me hard." He struck his antagonist inside his knees with his feet, and so deprived him of his legs. Hosmer remembers his tricks in the barroom, shuffling cards, etc. He could do anything with cards, yet he did not gamble. He would toss up his hat, twirling it over and over, and catch it on his head invariably. Once wanted to live at Hosmer's, but the latter was afraid of him. "Can't we study up something?" he asked. H. asked him into the house and brought out apples and cider, and Charles talked. "You!" said he, "I burst the bully of Lowell" (or Haverhill?). He wanted to wrestle; would not be put off. "Well, we won't wrestle in the house." So they went out to the yard, and a crowd got round. "Come spread some straw here," said C. "I don't want to hurt him." He threw him at once. They tried again. He told them to spread more straw and he "burst" him.

He had a strong head and never got drunk; would drink gin sometimes, but not to excess. Did not use tobacco, except snuff out of another's box sometimes. Was very neat in his person. Was not profane, though vulgar.

Very few men take a wide survey; their knowledge is very limited and particular. I talked with an old man the other day about the snow, hoping he would give me some information about past winters. I said, "I guess you don't remember so much old snow on the ground at this season." He answered, "I never saw the snow so deep between my house and John's." It was n't a stone's throw.

Uncle Charles used to say that he had n't a single tooth in his head. The fact was they were all double, and I have heard that he lost about all of them by the time he was twenty-one. Ever since I knew him he could swallow his nose.

The river is now generally and rapidly breaking up. It is surprising what progress has been made since yesterday. It is now generally open about the town. It has gradually worn and melted away at the bends, where it is shallow and swift, and now small pieces are breaking off around the edges and floating down these reaches. It is not generally floated off, but dissolved and melted where it is, for the open reaches gradually extend themselves till they meet, and there is no space or escape for floating ice in any quantity, until the ice is all gone from the channel. I think that what I have seen floating in former years is commonly such as had risen up afterward from the bottom of flooded meadows. Sometimes, however, you observe great masses of floating ice, consisting of that which is later to break up, the thicker and more lasting ice from broad bays or between bridges. There is now an open water passage on each side of the broad field of ice in the bay above the railroad. The water, which is rapidly rising, has overflowed the icy snow on the meadows, which is seen a couple of feet beneath it, for there is no true ice there. It is this rising of the water that breaks up the ice more than anything. The Mill Brook has risen much higher comparatively than the river.

April 4. P. M. — To Clamshell, etc.

The alder scales south of the railroad, beyond the bridge, are loosened. This corresponds to the opening (not merely expansion showing the fuzziness) of the white maple buds.

There is still but little rain, but the fog of yesterday still rests on the earth. My neighbor says it is the frost coming out of the ground. This, perhaps, is not the best description of it. It is rather the moisture in this warm air, condensed by contact with the snow and ice and frozen ground. Where the fields are bare I slump now three or four inches into the oozy surface, also on the bare brows of hills clad with cladonias. These are as full of water as a sponge. The muskrats, no doubt, are now being driven out of the banks. I hear, as I walk along the shore, the dull sound of guns — probably most of them fired at muskrats — borne along the river from different parts of the town; one every two or three minutes.

Already I hear of a small fire in the woods in Emerson's lot, set by the engine, the leaves [sic] that are bare are so dry.

I find many sound cabbages shedding their pollen under Clamshell Hill. They are even more forward generally here than at Well Meadow. Probably two or three only, now dead among the alders at the last place, were earlier. This is simply the earliest flower such a season as this, i.e. when the ground continues covered with snow till very late in the spring. For this plant occupies ground which is the earliest to be laid bare, those great dimples in the snow about a springy place in the meadow, five or ten feet over, where the sun and light have access to the earth a month before it is generally bare. In such localities, then, they will enjoy the advantage over most other plants, for they will not have to contend with abundance of snow, but only with the cold air, which may be no severer than usual. Cowslips and a few other plants sometimes enjoy the same advantage. Sometimes, apparently, the original, now outer, spathe has been frost-bitten and is decayed, and a fresh one is pushing up. I see some of these in full bloom, though the opening to their tents is not more than half an inch wide. They are lapped like tent doors, effectually protected. Methinks most of these hoods open to the south. It is remarkable how completely the spadix is protected from the weather, first by the ample hood, whose walls are distant from it, next by the narrow tent-like doorway, admitting air and light and sun, generally I think on the south side, and also by its pointed top, curved downward protectingly over it. It looks like a monk in his crypt with powdered head. The sides of the doorway are lapped or folded, and one is considerably in advance of the other. It is contrived best to catch the vernal warmth and exclude the winter's cold. Notwithstanding all the snow the skunk-cabbage is earlier than last year, when it was also the earliest flower and blossomed on the 5th of April. It is, perhaps, owing to the long-continued warm weather from March 13th to 28th.

Yet it has been a hard winter for many plants, on dry, exposed hills. I am surprised to see the clover, cinquefoil, etc., etc., on the top of the bank at Clamshell completely withered and straw-colored, probably from the snow resting on it so long and incessantly. And plants that grow on high land are more backward than last year.

The ground no sooner begins to be bare to a considerable extent than I see a marsh hawk, or harrier.

The sap of the white birch at Clamshell begins to flow.

April 5. The April weather still continues. It looks repeatedly as if the sun would shine, and it rains five minutes after. I look out to see how much the river has risen. Last night there were a great many portions or islets visible, now they are engulfed, and it is a smooth expanse of water and icy snow. The water has been steadily deepening on Concord meadows all night, rising with a dimple about every stem and bush.

P. M. — To North River at Tarbell's.

Fair weather again. Saw half a dozen blackbirds, uttering that sign-like note, on the top of Cheney's elm, but noticed no red at this distance. Were they grackles? Hear after some red-wings sing boby-lee. Do these ever make the sign-like note? Is not theirs a fine shrill whistle?

The ice from the sides of the rivers has wheeled round in great cakes and lodged against each of the railroad bridges, i.e. over each stream. Near the town there is the firmest body of ice (in the river proper) above Hubbard's Bridge.

A warm and pleasant afternoon. The river not yet so high by four or five feet as last winter. Hear, on all sunny hillsides where the snow is melted, the chink-clicking notes of the *F. hyemalis* flitting before me. I am sitting on the dried grass on the south hillside behind Tarbell's house, on the way to Brown's. These birds know where there is a warm hillside as well as we. The warble of the bluebird is in the air. From Tarbell's bank we had looked over the bright moving flood of the Assabet with many maples standing in it, the purling and eddying stream, with a hundred rills of snow water trickling into it.

Further toward J. P. Brown's, saw two large ant-hills (red before, black abdomens), quite covered on all the sunny portion with ants, which appeared to have come forth quite recently and were removing obstructions from their portals. Probably the frost is quite out there. Their black abdomens glistened in the sun. Each was bringing up some rubbish from beneath.

The outlines of one of these hills were a very regular cone; both were graceful curves. Came out upon the high terrace behind Hosmer's, whence we overlooked the bright-blue flood alternating with fields of ice (we being on the same side with the sun). The first sight of the blue water in the spring is exhilarating.

Saw half a dozen white sheldrakes in the meadow, where Nut Meadow Brook was covered with the flood. There were two or three females with them. These ducks would all swim together first a little way to the right, then suddenly turn together and swim to the left, from time to time making the water fly in a white spray, apparently with a wing. Nearly half a mile off I could see their green crests in the sun. They were partly concealed by some floating pieces of ice and snow, which they resembled.

On the hill beyond Clamshell scared up two turtle doves.

It is that walking when we must pick the hardest and highest ground or ice, for we commonly sink several inches in the oozy surface.

April 6. 7 A. M. — To Willow Bay.

The meadow has frozen over, skimmed over in the night. The ducks must have had a cold night of it. I thought [I] heard white-bellied swallows over the house before I arose. The hedges resound with the song of the song sparrow. He sits high on a spray singing, while I stand near, but suddenly, becoming alarmed, drops down and skulks behind the bushes close to the ground, gradually removing far to one side. I am not certain but I have seen the grass-bird as well as song sparrow this year, — on the 2d, — a sparrow with a light breast and less brown about the cheeks and head. The song sparrow I see now has a very brown breast. What a sly, skulking fellow! I have a glimpse of him skulking behind a stone or a bush next to the ground, or perhaps he drops into a ditch just before me, and when I run forward he is not to be seen in it, having flitted down it four or five rods to where it intersected with another, and then up that, all beneath the level of the surface, till he is in the rear of me. -

Just beyond Wood's Bridge, I hear the pewee. With what confidence after the lapse of many months, I come out to this waterside, some warm and pleasant spring morning, and, listening, hear, from farther or nearer, through the still concave of the air, the note of the first pewee! If there is one within half a mile, it will be here, and I shall be sure to hear its simple notes from those trees, borne over the water. It is remarkable how large a mansion of the air you can explore with your ears in the still morning by the waterside.

I can dig in the garden now, where the snow is gone, and even under six inches of snow and ice I make out to get through the frost with a spade. The frost will all be out about as soon as last year, for the melting of the snow has been taking it out. It is remarkable how rapidly the ground dries, for where the frost is out the water does not stand, but is soaked up.

There has been no skating the last winter, the snow having covered the ice immediately after it formed and not melting, and the river not rising till April, when it was too warm to freeze thick enough.

As we sat yesterday under the warm, dry hillside, amid the *F. hyemalis* by Tarbell's, I noticed the first bluish haze — a small patch of it — over the true Nut Meadow, seen against the further blue pine forest over the near low yellow one. This was of course the subtle vapor which the warmth of the day raised from Nut Meadow. This, while a large part of the landscape was covered with snow, an affecting announcement of the approach of summer. The one wood seemed but an underwood on the edge of the other, yet all Nut Meadow's varied surface intervened, with its brook and its cranberries, its sweet-gale, alder, and willow, and this was its blue feather!

P. M. — To Hubbard's second grove, by river.

At Ivy Tree, hear the fine tseep of a sparrow, and detect the fox-colored sparrow on the lower twigs of the willows and from time to time scratching the ground beneath. It is quite tame, — a single one with its ashy head and mottled breast.

It is a still and warm, overcast afternoon, and I am come to look for ducks on the smooth reflecting water which has suddenly surrounded the village, — water half covered with ice or icy snow. On the 2d it was a winter landscape, — a narrow river covered thick with ice for the most part, and only snow on the meadows. In three or four days the scene is changed to these vernal lakes, and the ground more than half bare. The reflecting water alternating with unreflecting ice.

Apparently song sparrows may have the dark splash on each side of the throat but be more or less brown on the breast and head. Some are quite light, some quite dark. Here is one of the light-breasted on the top of an apple tree, sings unweariedly at regular intervals something like tchulp | chilt chilt, chilt chilt, (faster and faster) chilt chilt, chilt chilt | fuller tchay ter splay-ee. The last, or third, bar I am not sure about. It flew too soon for me. I only remember that the last part was sprinkled on the air like drops from a rill, as if its strain were moulded by the spray it sat upon. Now see considerable flocks of robins hopping and running in the meadows; crows next the water-edge, on small isles in the meadow.

As I am going along the Comer road by the meadow mouse brook, hear and see, a quarter of a mile northwest, on those conspicuous white oaks near the river in Hubbard's second grove, the crows buffeting some intruder. The crows had betrayed to me some large bird of the hawk kind which they were buffeting. I suspected it before I looked carefully. I saw several crows on the oaks, and also what looked to my naked eye like a cluster of the palest and most withered oak leaves with a black base about as big as a crow. Looking with my glass, I saw that it was a great bird. The crows sat about a rod off, higher up, while another crow was occasionally diving at him, and all were cawing. The great bird was just starting. It was chiefly a dirty white with great broad wings with black tips and black on other parts, giving it the appearance of dirty white, barred with black. I am not sure whether it was a white-headed eagle or a fish hawk. There appeared much more white than belongs to either, and more black than the fish hawk has. It rose and wheeled, flapping several times, till it got under way; then, with its rear to me, presenting the least surface, it moved off steadily in its orbit over the woods northwest, with the slightest possible undulation of its wings, — a noble planetary motion, like Saturn with its ring seen edgewise. It is so rare that we see a large body self-sustained in the air. While crows sat still and silent and confessed their lord. Through my glass I saw the outlines of this sphere against the sky, trembling with life and power as it skimmed the topmost twigs of the wood toward some more solitary oak amid the meadows. To my naked eye it showed only so much black as a crow in its talons might. Was it not the white-headed eagle in the state when it is called the sea eagle? Perhaps its neck-feathers were erected.

I went to the oaks. Heard there a nuthatch's faint vibrating tut-tut, somewhat even like croaking of frogs, as it made its way up the oak bark and turned head down to peck. Anon it answered its mate with a gnah gnah. Smelt a skunk on my return, at Hubbard's blueberry swamp, which some dogs that had been barking there for half an hour had probably worried, for I did not smell it when I went along first. I smelt this all the way thence home, the wind being southwest, and it was quite as perceptible in our yard as at the swamp. The family had already noticed it, and you might have supposed that there was a skunk in the yard, yet it was three quarters of a mile off, at least.

April 7. Monday. Launched my boat, through three rods of ice on the riverside, half of which froze last night. The meadow is skimmed over, but by midforenoon it is melted.

P. M. — Up river in boat.

The first boats I have seen are out to-day, after muskrats, etc. Saw one this morning breaking its way far through the meadow, in the ice that had formed in the night. How independent they look who-have come forth for a day's excursion! Melvin is out, and Goodwin, and another boat still. They can just row through the thinnest of the ice. The first boat on the meadows is exciting as the first flower or swallow. It is seen stealing along in the sun under the meadow's edge. One breaks the ice before it with a paddle, while the other pushes or paddles, and it grates and wears against the bows.

We see Goodwin skinning the muskrats he killed this forenoon on bank at Lee's Hill, leaving their red and mutilated carcasses behind. He says he saw a few geese go over the Great Meadows on the 6th. The half of the meadows next the river, or more, is covered with snow ice at the bottom, which from time to time rises up and floats off. These and more solid cakes from over the river clog the stream where it is least broken up, bridging it quite over. Great cakes rest against every bridge. We were but just able to get under the stone arches by lying flat and pressing our boat down, after breaking up a large cake of ice which had lodged against the upper side. Before we get to Clamshell, see Melvin ahead scare up two black ducks, which make a wide circuit to avoid both him and us. Sheldrakes pass also, with their heavy bodies. See the red and black bodies of more muskrats left on the bank at Clamshell, which the crows have already attacked. Their hind legs are half-webbed, the fore legs not at all. Their paunches are full apparently of chewed roots, yellowish and bluish. Goodwin says they are fatter than usual, perhaps because they have not been driven out of their holes heretofore. The open channel is now either over the river or on the upper side of the meadows next the woods and hills. Melvin floats slowly and quietly along the willows, watching for rats resting there, his white hound sitting still and grave in the prow, and every little while we hear his gun announcing the death of a rat or two. The dog looks on understanding and makes no motion.

At the Hubbard Bridge, we hear the incessant note of the phoebe, — pevet, pe-e-vet, pevee', — its innocent, somewhat impatient call. Surprised to find the river not broken up just above this bridge and as far as we can see, probably through Fair Haven Pond. Probably in some places you can cross the river still on the ice.

Yet we make our way with some difficulty, through a very narrow channel over the meadow and drawing our boat over the ice on the river, as far as foot of Fair Haven. See clams, fresh-opened, and roots and leaf-buds left by rats on the edge of the ice, and see the rats there. By rocking our boat and using our paddles, we can make our way through the softened ice, six inches or more in thickness.

The tops of young white birches now have a red-pink color. Leave boat there.

See a yellow-spotted tortoise in a ditch; and a bay-wing sparrow. It has no dark splash on throat and has a light or gray head.

April 8. 1 p. M. — To boat at Cardinal Shore, and thence to Well Meadow and back to port.

Another very pleasant and warm day. The white-bellied swallows have paid us twittering visits the last three mornings. You must rush out quickly to see them, for they are at once gone again. Warm enough to do without greatcoat to-day and yesterday, though I carry it and put it on when I leave the boat.

Hear the crack of Goodwin's piece close by, just as I reach my boat. He has killed another rat. Asks if I am bound up-stream. "Yes, to Well Meadow." Says I can't get above the hay-path a quarter of a mile above on account of ice; if he could, he'd 'a' been at Well Meadow before now. But I think I will try, and he thinks if I succeed he will try it. By standing on oars, which sink several inches, and hauling over one cake

of ice, I manage to break my way into an open canal above, where I soon see three rats swimming. Goodwin says that he got twenty-four minks last winter, more than ever before in one season; trapped most, shot only two or three. From opposite Bittern Cliff, I pushed along, with more or less difficulty, to Well Meadow Brook. There was a water passage ten feet wide, where the river had risen beyond the edge of the ice, but not more than four or five feet was clear of the bushes and trees. By the side of Fair Haven Pond it was particularly narrow. I shoved the ice on the one hand and the bushes and trees on the other all the way. Nor was the passage much wider below, as far back as where I had taken my boat. For all this distance, the river for the most part, as well as all the pond, was an unbroken field of ice. I went winding my way and scraping between the maples. Half a dozen rods off on the ice, you would not have supposed that there was room for a boat there. In some places you could have got on to the ice from the shore without much difficulty. But all of Well Meadow was free of ice, and I paddled up to within a rod or two of where I found the cowslips so forward on the 2d. It is difficult pushing a boat over the meadows now, for even where the bottom is not covered with slippery snow ice which affords no hold to the paddle, the meadow is frozen and icy hard, for it thaws slowly under water. This meadow is completely open, because none of the snow ice has risen up. Sometimes you see a small piece that has been released come up suddenly, with such force as to lift it partly out of water, but, sinking again at once, it looks like a sheldrake which has dived at a distance.

There, in that slow, muddy brook near the head of Well Meadow, within a few rods of its source, where it winds amid the alders, which shelter the plants somewhat, while they are open enough now to admit the sun, I find two cowslips in full bloom, shedding pollen; and they may have opened two or three days ago; for I saw many conspicuous buds here on the 2d which now I do not see. Have they not been eaten off? Do we not often lose the earliest flowers thus? A little more, or if the river had risen as high as frequently, they would have been submerged. What an arctic voyage was this in which I find cowslips, the pond and river still frozen over for the most part as far down as Cardinal Shore!

Saw two marsh hawks this afternoon, circling low over the meadows along the water's edge. This shows that frogs must be out. Goodwin and Puffer both fired at one from William Wheeler's shore. They say they made him duck and disturbed his feathers some. The muskrats are now very fat. They are reddish-brown beneath and dark-brown above. I see not a duck in all this voyage. Perhaps they are moving forward this bright and warm day.

Was obliged to come down as far as Nut Meadow (being on the west side), before I could clear the ice, and, setting my sail, tack across the meadow for home, the wind northwesterly. The river is still higher than yesterday.

About 8.0 p. M., hear geese passing quite low over the river.

Found beneath the surface, on the sphagnum, near the cowslips, a collection of little hard nuts with wrinkled shells, a little like nutmegs, perhaps bass nuts, collected after a freshet by mice! I noticed that the fibres of the alder roots in the same place were

thickly [sic] with little yellow knubby fruit. Was not that clear light-brown snail in that sphagnum a different species from the common one in brooks? See a few cranberries and smell muskrats.

On the Fair Haven Cliff, crowfoot and saxifrage are very backward. That dense-growing moss on the rocks shows now a level surface of pretty crimson cups.

Noticed, returning, this afternoon, a muskrat sitting on the ice near a small hole in Willow Bay, so motionless and withal round and featureless, of so uniform a color, that half a dozen rods off I should not have detected him if not accustomed to observing them. Saw the same thing yesterday. It reminds me of the truth of the Indian's name for it,—“that sits in a round form on the ice.” You would think it was a particularly round clod of meadow rising above the ice. But while you look, it concludes its meditations or perchance its meal, and deliberately takes itself off through a hole at its feet, and you see no more of it. I noticed five muskrats this afternoon without looking for them very carefully. Four were swimming in the usual manner, showing the vertical tail, and plunging with a half-somerset suddenly before my boat. While you are looking, these brown clods slide off the edge of the ice, and it is left bare. You would think that so large an animal, sitting right out upon the ice, would be sure to be seen or detected, but not so. A citizen might paddle within two rods and not suspect them. Most countrymen might paddle five miles along the river now and not see one muskrat, while a sportsman a quarter of a mile before or behind would be shooting one or more every five minutes. The other, left to himself, might not be able to guess what he was firing at.

The marsh hawks flew in their usual irregular low tacking, wheeling, and circling flight, leisurely flapping and beating, now rising, now falling, in conformity with the contour of the ground. The last I think I have seen on the same beat in former years. He and his race must be well acquainted with the Musketcook and its meadows. No sooner is the snow off than he is back to his old haunts, scouring that part of the meadows that is bare, while the rest is melting. If he returns from so far to these meadows, shall the sons of Concord be leaving them at this season for slight cause?

River had risen so since yesterday I could not get under the bridge, but was obliged to find a round stick and roll my boat over the road.

April 9. Wednesday. Another fine day.

— A. M. — To Trillium Woods.

Air full of birds. The line I have measured west of railroad is now just bare of snow, though a broad and deep bank of it lies between that line and the railroad. East of railroad has been bare some time. The line in Trillium Woods is apparently just bare also. There is just about as much snow in these woods now as in the meadows and fields around generally; i.e., it is confined to the coldest sides, as in them. There is not so much as on the east side of Lee's Hill. It is toward the north and east sides of the wood. Hence, apparently, in a level wood of this character the snow lies no longer than in adjacent fields divided by fences, etc., or even without them.

The air is full of birds, and as I go down the causeway, I distinguish the seringo note. You have only to come forth each morning to be surely advertised of each newcomer into these broad meadows. Many a larger animal might be concealed, but a cunning ear detects the arrival of each new species of bird. These birds give evidence that they prefer the fields of New England to all other climes, deserting for them the warm and fertile south. Here is their paradise. It is here they express the most happiness by song and action. Though these spring mornings may often be frosty and rude, they are exactly tempered to their constitutions, and call forth the sweetest strains.

The yellow birch sap has flowed abundantly, probably before the white birch.

8 A. M. — By boat to V. palmata Swamp for white birch sap.

Leave behind greatcoat. The waters have stolen higher still in the night around the village, bathing higher its fences and its dry withered grass stems with a dimple. See that broad, smooth vernal lake, like a painted lake. Not a breath disturbs it. The sun and warmth and smooth water and birds make it a carnival of Nature's. I am surprised when I perceive men going about their ordinary occupations. I presume that before ten o'clock at least all the villagers will have come down to the bank and looked over this bright and placid flood, — the child and the man, the housekeeper and the invalid, — even as the village beholds itself reflected in it. How much would be subtracted from the day if the water was taken away! This liquid transparency, of melted snows partially warmed, spread over the russet surface of the earth! It is certainly important that there be some priests, some worshippers of Nature. I do not imagine anything going on to-day away from and out of sight of the waterside.

Early aspen catkins have curved downward an inch, and began to shed pollen apparently yesterday. White maples also, the sunny sides of clusters and sunny sides of trees in favorable localities, shed pollen to-day.

I hear the note of a lark amid the other birds on the meadow. For two or three days, have heard delivered often and with greater emphasis the loud, clear, sweet phebe note of the chickadee, elicited by the warmth. Cut across Hosmer's meadow from Island to Black Oak Creek, where the river, still rising, is breaking over with a rush and a rippling. Paddled quite to the head of Pinxter Swamp, where were two black ducks amid the maples, which went off with a hoarse quacking, leaving a feather on the smooth dark water amid the fallen tree-tops and over the bottom of red leaves.

Set two sumach spouts in a large white birch in the southward swamp, and hung a tin pail to them, and set off to find a yellow birch. Wandering over that high huckleberry pasture, I hear the sweet jingle of the *Fringilla juncorum*.

In a leafy pool in the low wood toward the river, hear a rustling, and see yellow-spot tortoises dropping off an islet, into the dark, stagnant water, and four or five more lying motionless on the dry leaves of the shore and of islets about. Their spots are not very conspicuous out of water, and in most danger. The warmth of the day has penetrated into these low, swampy woods on the northwest of the hill and awakened the tortoises from their winter sleep. These are the only kind of tortoise I have seen this year. Probably because the river did not rise earlier, and the brooks, and thaw

them out. When I looked about, I saw the shining black backs of four or five still left, and when I threw snowballs at them, they would not move. Yet from time to time I walk four or five rods over deep snow-banks, slumping in on the north and east sides of hills and woods. Apparently they love to feel the sun on their shells.

As I walk in the woods where the dry leaves are just laid bare, I see the bright-red berries of the Solomon's-seal still here and there above the leaves, affording food, no doubt, for some creatures.

Not finding the birches, I returned to the first swamp and tapped two more white birches. They flow generally faster than the red or white maples when I tried them. I sit on a rock in the warm, sunny swamp, where the ground is bare, and wait for my vessels to be filled. It is perfectly warm and perhaps drier than ever here. The great butterflies, black with buff-edged wings, are fluttering about, and flies are buzzing over this rock. The spathes of the skunk-cabbage stand thickly amid the dead leaves, the only obvious sign of vegetable life. A few rods off I hear some sparrows busily scratching the floor of the swamp, uttering a faint tseep tseep and from time to time a sweet strain. It is probably the fox-colored sparrow. These always feed thus, I think, in woody swamps, a flock of them rapidly advancing, flying before one another, through the swamp. A robin peeping at a distance is mistaken for a hyla. A gun fired at a muskrat on the other side of the island towards the village sounds like planks thrown down from a scaffold, borne over the water. Meanwhile I hear the sap dropping into my pail. The birch sap flows thus copiously before there is any other sign of life in the tree, the buds not visibly swollen. Yet the aspen, though in bloom, shows no sap when I cut it, nor does the alder. Will their sap flow later? Probably this birch sap, like the maple, flows little if any at night. It is remarkable that this dead-looking trunk should observe such seasons, — that a stock should distinguish between day and night.

When I return to my boat, I see the snow-fleas like powder, in patches on the surface of the smooth water, amid the twigs and leaves. I had paddled far into the swamp amid the willows and maples. The flood has reached and upset, and is floating off the chopper's corded wood. Little did he think of this thief. It is quite hazy to-day. The red-wing's o'gurgle-ee-e is in singular harmony with the sound and impression of the lapsing stream or the smooth, swelling flood beneath his perch. He gives expression to the flood. The water reaches far in amid the trees on which he sits, and they seem like a water-organ played on by the flood. The sound rises up through their pipes. There was no wind, and the water was perfectly smooth, — a Sabbath stillness till 11 A. M. We have had scarcely any wind for a month.

Now look out for fires in the woods, for the leaves are never so dry and ready to burn as now. The snow is no sooner gone, — nay, it may still cover the north and west sides of hills, — when a day or two's sun and wind will prepare the leaves to catch at the least spark. Indeed these are such leaves as have never yet been wet, as have blown about and collected in heaps on the snow, and they would burn there in midwinter, though the fire could not spread much.

If the ground were covered with snow, would any degree of warmth produce a blue haze like this?

But such a fire can only run up the south and southwest sides of hills at this season. It will stop at the summit and not advance forward far, nor descend at all toward the north and east.

P. M. — Up railroad. A very warm day.

The *Alnus incana*, especially by the railroad opposite the oaks, sheds pollen. At the first-named alder saw a striped snake, which probably I had scared into the water from the warm railroad bank, its head erect as it lay on the bottom and swaying back and forth with the waves, which were quite high, though considerably above it. I stood there five minutes at least, and probably it could remain there an indefinite period.

The wind has now risen, a warm, but pretty stormy southerly wind, and is breaking up those parts of the river which were yet closed. The great mass of ice at Willow Bay has drifted down against the railroad bridge. I see no ducks, and it is too windy for muskrat-shooters. In a leafy pond by railroad, which will soon dry up, I see large skater insects, where the snow is not all melted. The willow catkins there near the oaks show the red of their scales at the base of the catkins dimly through their down, — a warm crimson glow or blush. They are an inch long, others about as much advanced but rounded. They will perhaps blossom by day after tomorrow, and the hazels on the hillside beyond as soon at least, if not sooner. They are loose and begin to dangle. The stigmas already peep out, minute crimson stars, — Mars. The skaters are as forward to play on the first smooth and melted pool, as boys on the first piece of ice in the winter. It must be cold to their feet.

I go off a little to the right of the railroad, and sit on the edge of that sand-crater near the spring by the railroad. Sitting there on the warm bank, above the broad, shallow, crystalline pool, on the sand, amid russet banks of curled early sedge-grass, showing a little green at base, and dry leaves, I hear one hyla peep faintly several times. This is, then, a degree of warmth sufficient for the hyla. He is the first of his race to awaken to the new year and pierce the solitudes with his voice. He shall wear the medal for this year. You hear him, but you will never find him. He is somewhere down amid the withered sedge and alder bushes there by the water's edge, but where? From that quarter his shrill blast sounded, but he is silent, and a kingdom will not buy it again.

The communications from the gods to us are still deep and sweet, indeed, but scanty and transient, — enough only to keep alive the memory of the past. I remarked how many old people died off on the approach of the present spring. It is said that when the sap begins to flow in the trees our diseases become more violent. It is now advancing toward summer apace, and we seem to be reserved to taste its sweetness, but to perform what great deeds? Do we detect the reason why we also did not die on the approach of spring?

I measured a white oak stump, just sawed off, by the railroad there, averaging just two feet in diameter with one hundred and forty-two rings; another, near by, an inch and a half broader, had but one hundred and five rings.

While I am looking at the hazel, I hear from the old locality, the edge of the great pines and oaks in the swamp by the railroad, the note of the pine warbler. It sounds far off and faint, but, coming out and sitting on the iron rail, I am surprised to see it within three or four rods, on the upper part of a white oak, where it is busily catching insects, hopping along toward the extremities of the limbs and looking off on all sides, twice darting off like a wood pewee, two rods, over the railroad, after an insect and returning to the oak, and from time to time uttering its simple, rapidly iterated, cool-sounding notes. When heard a little within the wood, as he hops to that side of the oak, they sound particularly cool and inspiring, like a part of the evergreen forest itself, the trickling of the sap. Its bright-yellow or golden throat and breast, etc., are conspicuous at this season, — a greenish yellow above, with two white bars on its bluish-brown wings. It sits often with loose-hung wings and forked tail.

Meanwhile a bluebird sits on the same oak, three rods off, pluming its wings. I hear faintly the warbling of one, apparently a quarter of a mile off, and [am] very slow to detect that it is even this one before me, which, in the intervals of pluming itself, is apparently practicing in an incredibly low voice.

The water on the meadows now, looking with the sun, is a far deeper and more exciting blue than the heavens.

The thermometer at 5 p. M. is  $66^{\circ} +$ , and it has probably been  $70^{\circ}$  or more; and the last two days have been nearly as warm.

This degree of heat, then, brings the *Fringilla juncorum* and pine warbler and awakes the hyla.

April 10. Thursday. East-Day. — Some fields are dried sufficiently for the games of ball with which this season is commonly ushered in. I associate this day, when I can remember it, with gantes of baseball played over behind the hills in the russet fields toward Sleepy Hollow, where the snow was just melted and dried up, and also with the uncertainty I always experienced whether the shops would be shut, whether we should have an ordinary dinner, an extraordinary one, or none at all, and whether there would be more than one service at the meeting-house. This last uncertainty old folks share with me. This is a windy day, drying up the fields; the first we have had for a long time.

Therien describes to me the diagonal notch he used to cut in maples and birches (not having heard of boring) and the half-round spout, cut out of chestnut or other straight-grained wood with a half-round chisel, sharpened and driven into a new-moon cut made by the same tool partly sidewise to the tree. This evidently injured the trees more than the auger. He says they used to boil the birch down to a syrup, and he thought that the black birch would run more than any tree.

P. M. — I set out to sail, the wind northwest, but it is so strong, and I so feeble, that I gave it up. The waves dashed over into the boat and with their sprinkling wet

me half through in a few moments. Our meadow looks as angry now as it ever can. I reach my port, and go to Trillium Wood to get yellow birch sap.

The Deep Cut is full of dust. This wind, unlike yesterday's, has a decidedly cold vein in it. The ditch by Trillium Wood is strewn with yellowish hemlock leaves, which are still falling. In the still warmer and broader continuation of this ditch, south of the wood, in the southwest recess, I see three or four frogs jump in, some probably large *Rana palustris*, others quite small. They are in before I see them plainly, and bury themselves in the mud before I can distinguish them clearly. They were evidently sitting in the sun by that leafy ditch in that still and warm nook. Let them beware of marsh hawks. I saw also four yellow-spot tortoises paddling about under the leaves on the bottom there. Once they were all together. This ditch is commonly dry in the summer.

The yellow birch sap runs very fast. I set three spouts in a tree one foot in diameter, and hung on a quart pail; then went to look at the golden saxifrage in Hubbard's Close. When I came back, the pail was running over. This was about 3 p. M. Each spout dropped about as fast as my pulse, but when I left, at 4 p. M., it was not dropping so fast. The red maples here do not run at all now, nor did they yesterday. Yet one up the Assabet did yesterday. Apparently the early maples have ceased to run.

We may now say that the ground is bare, though we still see a few patches or banks of snow on the hillsides at a distance, especially on the northeast sides of hills. You see much more snow looking west than looking east. Thus does this remarkable winter disappear at last. Here and there its veteran snow-banks spot the russet landscapes. In the shade of walls and north hillsides and cool hollows in the woods, it is panting its life away. I look with more than usual respect, if not with regret, on its last dissolving traces.

Is not that a *jungermannia* which so adorns the golden epidermis of the yellow birch with its fine fingers?

I boil down about two quarts of this yellow birch sap to two teaspoonfuls of a smart-tasting syrup. I stopped there; else should have boiled it all away. A slightly medicinal taste, yet not disagreeable to me. It yields but little sugar, then.

April 11. 8.0 A. M. — To Tarbell's to get black and canoe birch sap.

Going up the railroad, I see a male and female rusty grackle alight on an oak near me, the latter apparently a flaxen brown, with a black tail. She looks like a different species of bird. Wilson had heard only a tchuck from the grackle, but this male, who was courting his mate, broke into incipient warbles, like a bubble burst as soon as it came to the surface, it was so aerated. Its air would not be fixed long enough.

Set two spouts in a canoe birch fifteen inches [in] diameter, and two in a black birch two feet plus in diameter. Saw a kingfisher on a tree over the water. Does not its arrival mark some new movement in its finny prey? He is the bright buoy that betrays it! And hear in the old place, the pitch pine grove on the bank by the river, the pleasant ringing note of the pine warbler. Its a-che, vitter vitter, vitter vitter, vitter vitter, vitter vitter, vet rings through the open pine grove very rapidly. I also heard it

at the old place by the railroad, as I came along. It is remarkable that I have so often heard it first in these two localities, i.e. where the railroad skirts the north edge of a small swamp densely filled with tall old white pines and a few white oaks, and in a young grove composed wholly of pitch pines on the otherwise bare, very high and level bank of the Assabet. When the season is advanced enough, I am pretty sure to hear its ringing note in both those places.

The hazel sheds pollen to-day; some elsewhere possibly yesterday. The swallow up railroad will, if it is pleasant, to-morrow.

When I cut or break white pine twigs now, the turpentine exudes copiously from the bark, even from twigs broken off in the fall and now freshly broken, clear as water, or crystal. How early did it?

The canoe birch sap flowed rather the fastest. I have now got four kinds of birch sap. That of the white birch is a little tinged brown, apparently by the bark; the others are colorless as water. I am struck by the coolness of the sap, though the weather may be warm. Like wild apples, it must be tasted in the fields, and then it has a very slightly sweetish and acid taste, and cool as iced water. I do not think I could distinguish the different kinds of birch with my eyes shut. I drank some of the black birch wine with my dinner for the name of it; but, as a steady drink, it is only to be recommended to outdoor men and foresters. Now is apparently the very time to tap birches of all kinds. I saved a bottleful each of the white, canoe; and black birch sap (the yellow I boiled), and, in twenty-four hours, they had all three acquired a slight brown tinge but the white birch the most brown. They were at first colorless. On the whole, I have not observed so much difference in the amount of sap flowing from the six kinds of trees which I have tapped as I have observed between different trees of the same kind, depending on position and size, etc. This flowing of the sap under the dull rinds of the trees is a tide which few suspect.

Though the snow melted so much sooner on the east side of the railroad causeway than on the west, I notice that it still lies in a broad, deep bank on the east side of Cheney's row of arbor-vitæ, while the ground is quite bare on the west. Whence this difference?

A few more hylas peep to-day, though it is not so warm as the 9th.

These warm pleasant days I see very few ducks about, though the river is high.

The current of the Assabet is so much swifter, and its channel so much steeper than that of the main stream, that, while a stranger frequently cannot tell which way the latter flows by his eye, you can perceive the declination of the channel of the former within a very short distance, even between one side of a tree and another. You perceive the waters heaped on the upper side of rocks and trees, and even twigs that trail in the stream.

Saw a pickerel washed up, with a wound near its tail, dead a week at least. Was it killed by a fish hawk? Its oil, when disturbed, smoothed the surface of the water with splendid colors. Thus close ever is the fair to the foul. The iridescent, oily surface. The same object is ugly or beautiful, according to the angle from which you view it. Here,

also, in the river wreck is the never-failing teazle, telling of the factory above, and sawdust from the mill. The teased river! These I do not notice on the South Branch.

I hear of one field plowed and harrowed, — George Heywood's. Frost out there earlier than last year.

You thread your way amid the rustling oak leaves on some warm hillside sloping to the south, detecting no growth as yet, unless the flower-buds of the amelanchier are somewhat expanded, when, glancing along the dry stems, in the midst of all this dryness, you detect the crimson stigmas of the hazel, like little stars peeping forth, and perchance a few catkins are dangling loosely in the zephyr and sprinkling their pollen on the dry leaves beneath.

You take your way along the edge of some swamp that has been cleared at the base of some south hillside, where there is sufficient light and air and warmth, but the cold northerly winds are fended off, and there behold the silvery catkins of the shallows, which have already crept along their lusty osiers, more than an inch in length, till they look like silvery wands, though some are more rounded, like bullets. The lower part of some catkins which have lost their bud-scales emit a tempered crimson blush through their down, from the small scales within. The catkins grow longer and larger as you advance into the warmest localities, till at last you discover one catkin in which the reddish anthers are beginning to push from one side near the end, and you know that a little yellow flame will have burst out there by to-morrow, if the day is fair.

I might [have] said on the 8th: Behold that little hemisphere of green in the black and sluggish brook, amid the open alders, sheltered under a russet tussock. It is the cowslips' forward green. Look narrowly, explore the warmest nooks; here are buds larger yet, showing more yellow, and yonder see two full-blown yellow disks, close to the water's edge. Methinks they dip into it when the frosty nights come. Have not these been mistaken for dandelions?

Or, on the 9th: This still warm morning paddle your boat into yonder smooth cove, close up under the south edge of that wood which the April flood is bathing, and observe the great mulberry-like catkins of yonder aspen curving over and downward, some already an inch or more in length, like great reddish caterpillars covered thickly with down, forced out by heat, and already the sides and ends of some are loose and of a pale straw-color, shedding their pollen. These, for their forwardness, are indebted to the warmth of their position.

Now for the white maple the same day: Paddle under yonder graceful tree which marks where is the bank of the river, though now it stands in the midst of a flood a quarter of a mile from land; hold fast by one of its trailing twigs, for the stream runs swiftly here. See how the tree is covered with great globular clusters of buds. Are there no anthers nor stigmas to be seen? Look upward to the sunniest side. Steady! When the boat has ceased its swaying, do you not see two or three stamens glisten like spears advanced on the sunny side of a cluster? Depend on it, the bees will find it out before noon, far over the flood as it is.

Seek out some young and lusty-growing alder (as on the 9th), with clear, shining, and speckled bark, in the warmest possible position, perchance where the heat is reflected from some bank or hillside and the water bathes its foot. The scales of the catkins generally are loosened, but on the sunniest cheek of the clump, behold one or two far more considerably loosened, wholly or partially dangling and showing their golden insides. Give the most forward of these a chuck, and you will get a few grains of its yellow dust in your hand. Some will be in full bloom above, while their extremities are comparatively dead, as if struck with a palsy in the winter. Soon will come a rude wind and shake their pollen copiously over the water.

April 12. There is still a little snow ice on the north side of our house, two feet broad, a relic of the 25th of December. This is all there is on our premises.

According to Rees's Cyclopaedia, the sap of the birches is fermentable in its natural state. Also, "Ratray, the learned Scot, affirms, that he has found by experiment, that the liquor which may be drawn from the birch tree in the springtime is equal to the whole weight of the tree, branches, roots, and all together."

I think on the whole that, of the particular trees which I tapped, the yellow and canoe birches flowed the fastest.

Hazy all day, with wind from the west, threatening rain. Haze gets to be very thick and perhaps smoky in the afternoon, concealing distinct forms of clouds, if there are any. Can it have anything to do with fires in woods west and southwest? Yet it is warm.

5 p. M. — Sail on the meadow.

There suddenly flits before me and alights on a small apple tree in Mackay's field, as I go to my boat, a splendid purple finch. Its glowing redness is revealed when it lifts its wings, as when the ashes is blown from a coal of fire. Just as the oriole displays its gold.

The river is going down and leaving the line of its wrack on the meadow. It was at its height when the snow generally was quite melted here, i.e. yesterday.

Rains considerably in the evening. Perhaps this will raise the river again.

April 13. Sunday. 8 A. M. — Up railroad.

Cold, and froze in the night. The willow will not open till some time to-day.

I hear a bay-wing on the railroad fence sing — the rhythm — somewhat like, char char (or here here), che che, chip chip chip (fast), chitter chitter chitter chit (very fast and jingling), tchea tchea (jinglingly). It has another strain, considerably different, but a second also sings the above. Two on different posts are steadily singing the same, as if contending with each other, notwithstanding the cold wind.

P. M. — To Walden and Fair Haven Ponds.

Still cold and windy.

The early gooseberry leaf-buds in garden have burst, II — now like small green frilled horns. Also the amelanchier flower-buds are bursting.

As I go down the railroad causeway, I see a flock of eight or ten bay-wing sparrows flitting along the fence and alighting on an apple tree. There are many robins about also. Do they not incline more to fly in flocks a cold and windy day like this?

The snow ice is now all washed and melted off of Walden, down to the dark-green clear ice, which appears to be seven or eight inches thick and is quite hard still. At a little distance you would mistake it for water; further off still, as from Fair Haven Hill, it is blue as in summer. You can still get on to it from the southerly side, but elsewhere there is a narrow canal, two or three to twelve feet wide, next the shore. It may last four or five days longer, even if the weather is warm.

As I go by the Andromeda Ponds, I hear the tut tut of a few croaking frogs, and at Well Meadow I hear once or twice a prolonged stertorous sound, as from river meadows a little later usually, which is undoubtedly made by a different frog from the first.

Fair Haven Pond, to my surprise, is completely open. It was so entirely frozen over on the 8th that I think the finishing stroke must have been given to it but by last night's rain. Say then apparently April 13th (?).

Return over the Shrub Oak Plain and the Cliff. Still no cowslips nor saxifrage. There were alders out at Well Meadow Head, as large bushes as any. Can they be *A. serrulata*? Vide leaves by and by.

Standing on the Cliffs, I see most snow when I look southwest; indeed scarcely a particle in any other direction, far or near, from which and from other observations, I infer that there is most snow now under the northeast sides of the hills, especially in ravines there.

At the entrance to the Boiling Spring wood, just beyond the orchard (of Hayden), the northeast angle of the wood, there is still a snow-drift as high as the wall, or three and a half feet deep, stretching quite across the road at that height, and the snow reaches six rods down the road. I doubt if there is as much in the road anywhere else in the town. It is quite impassable there still to a horse, as it has been all winter. This is the heel of the winter.

Scare up two turtle doves in the dry stubble in Wheeler's hill field by the railroad. I saw two together once before this year; probably they have paired.

April 14. Monday. A raw, overcast morning.

8 A. M. — Up Assabet.

See one striped squirrel chasing another round and round the Island, with a faint squeak from time to time and a rustling of the dry leaves. They run quite near to the water.

Hear the flicker's cackle on the old aspen, and his tapping sounds afar over the water. Their tapping resounds thus far, with this peculiar ring and distinctness, because it is a hollow tree they select to play on, as a drum or tambour. It is a hollow sound which rings distinct to a great distance, especially over water.

I still find small turtle's eggs on the surface entire, while looking for arrowheads by the Island.

See from my window a fish hawk flying high west of the house, cutting off the bend between Willow Bay and the meadow, in front of the house, between one vernal lake and another. He suddenly wheels and, straightening out his long narrow wings, makes one circle high above the last meadow, as if he had caught a glimpse of a fish beneath, and then continues his course down the river.

P. M. — Sail to Hill by Bedford line.

Wind southwest and pretty strong; sky overcast; weather cool. Start up a fish hawk from near the swamp white oaks southwest of the Island, undoubtedly the one of the morning. I now see that this is a much darker bird, both above and beneath, than that bird of the 6th. It flies quite low, surveying the water, in an undulating, buoyant manner, like a marsh hawk, or still more a nighthawk, with its long curved wings. He flies so low westward that I lose sight of him against the dark hillside and trees.

The river is going down rapidly, yet the Hunt's Bridge causeway is but just bare. The south side of Ponkawtasset looks much greener and more forward than any part of the town I have noticed. It is almost like another season there. They are already plowing there.

I steer down straight through the Great Meadows, with the wind almost directly aft, feeling it more and more the farther I advance into them. They make a noble lake now. The boat, tossed up by the rolling billows, keeps falling again on the waves with a chucking sound which is inspiring. There go a couple of ducks, which probably I have started, now scaling far away on motionless pinions, with a slight descent in their low flight, toward some new cove. Anon I scare up two black ducks which make one circle around me, reconnoitring and rising higher and higher, then go down the river. Is it they that so commonly practice this manoeuvre? Peter's is now far behind on a forgotten shore. The boat moored beneath his hill is no longer visible, and the red russet hill which is my goal rises before me. I moor my boat to a tree at the base of this hill.

The waves are breaking with violence on this shore, as on a sea-beach, and here is the first painted tortoise just cast up by them and lying on his back amid the stones, in the most favorable position to display his bright-vermilion marks, as the waves still break over him. He makes no effort to turn himself back, probably being weary contending with the waves. A little further is another, also at the mercy of the waves, which greatly interfere with its staid and measured ways, its head helplessly wagging with every billow. Their scales are very clean and bright now. The only yellow I notice is about the head and upper part of the tail. The scales of the back are separated or bordered with a narrow greenish-yellow edging.

Looking back over the meadow from the top of this hill, I see it regularly watered with foam-streaks from five to ten feet apart, extending quite across it in the direction of the wind. Washed up against this shore, I see the first dead sucker. You see nowadays on every side, on the meadow bottom, the miserable carcasses of the musquash stripped of their pelts. I saw one plunge from beneath the monument. There is much lumber — fencing-stuff, etc. — to be gathered now by those inclined.

I see an elm-top at the Battle-Ground covered [with blackbirds] uttering their squeaks and split whistles, as if they had not got their voices yet, and a coarse, rasping tchuck or char, not in this case from a crow blackbird.

Again I see the fish hawk, near the old place. He alights on the ground where there is a ridge covered with bushes, surrounded by water, but I scare him again, and he finally goes off northeast, flying high. He had apparently stayed about that place all day fishing.

April 15. 6.0 A. M. — To Hill.

It is warmer and quite still; somewhat cloudy in the east. The water quite smooth, — April smooth waters. I hear very distinctly Barrett's sawmill at my landing. The purple finch is singing on the elms about the house, together with the robins, whose strain it resembles, ending with a loud, shrill, ringing chilt chilt chilt chilt. I push across the meadow and ascend the hill. The white-bellied swallows are circling about and twittering above the apple trees and walnuts on the hillside. Not till I gain the hilltop do I hear the note of the *Fringilia junco* (huckleberry-bird) from the plains beyond. Returned again toward my boat, I hear the rich watery note of the martin, making haste over the edge of the flood. A warm morning, over smooth water, before the wind rises, is the time to hear it. Near the water are many recent skunk probings, as if a drove of pigs had passed along last night, death to many beetles and grubs. From amid the willows and alders along the wall there, I hear a bird sing, a-chitter chitter chitter chitter chitter, che che che che, with increasing intensity and rapidity, and the yellow redpoll hops in sight. A grackle goes over (with two females), and I hear from him a sound like a watchman's rattle, — but little more musical.

What I think the *Alnus serrulaia* (?) will shed pollen to-day on the edge of Catbird Meadow. Is that one at Brister's Spring and at Depot Brook crossing? Also grows on the west edge of Trillium Wood.

Coming up from the riverside, I hear the harsh rasping char-r char-r of the crow blackbird, like a very coarsely vibrating metal, and, looking up, see three flying over.

Some of the early willow catkins have opened in my window. As they open, they curve backwards, exposing their breasts to the light.

By 9 A. M. the wind has risen, the water is ruffled, the sun seems more permanently obscured, and the character of the day is changed. It continues more or less cloudy and rain-threatening all day.

First salmon and shad at Haverhill to-day.

Ed. Emerson saw a toad in his garden to-day, and, coming home from his house at 11 p. M., a still and rather warm night, I am surprised to hear the first loud, clear, prolonged ring of a toad, when I am near Charles Davis's house. The same, or another, rings again on a different key. I hear not more than two, perhaps only one. I had only thought of them as commencing in the warmest part of some day, but it would seem that [they] may first be heard in the night. Or perhaps this one may have piped in the day and his voice been drowned by day's sounds. Yet I think that this night is warmer than the day has been. While all the hillside else, perhaps, is asleep, this

toad has just awaked to a new year. It was a rather warm, moist night, the moon partially obscured by misty clouds, all the village asleep, only a few lights to be seen in some windows, when, as I passed along under the warm hillside, I heard a clear, shrill, prolonged ringing note from a toad, the first toad of the year, sufficiently countenanced by its Maker in the night and the solitude, and then again I hear it (before I am out of hearing, i.e. it is deadened by intervening buildings), on a little higher key. At the same time, I hear a part of the hovering note of my first snipe, circling over some distant meadow, a mere waif, and all is still again. A-lulling the watery meadows, fanning the air like a spirit over some far meadow's bay. And now for vernal sounds there is only the low sound of my feet on the Mill-Dam sidewalks.

April 16. I have not seen a tree sparrow, I think, since December.

5.0 A. M. — To Pinxter Swamp over Hill.

A little sunshine at the rising. I, standing by the river, see it first reflected from E. Wood's windows before I can see the sun. Standing there, I hear that same stertorous note of a frog or two as was heard the 13th, apparently from quite across all this flood, and which I have so often observed before. What kind is it? It seems to come from the edge of the meadow, which has been recently left bare. Apparently this low sound can be heard very far over the water. The robins sing with a will now. What a burst of melody! It gurgles out of all conduits now; they are choked with it. There is such a tide and rush of song as when a river is straightened between two rocky walls. It seems as if the morning's throat were not large enough to emit all this sound. The robin sings most before 6 o'clock now. I note where some suddenly cease their song, making a quite remarkable vacuum.

As I walk along the bank of the Assabet, I hear the yeeep yeeep yeeep yeeep yeeep yeeep, or perhaps peop, of a fish hawk, repeated quite fast, but not so shrill and whistling as I think I have heard it, and directly I see his long curved wings undulating over Pinxter Swamp, now flooded.

From the hilltop I see bare ground appearing in ridges here and there in the Assabet meadow.

A grass-bird, with a sort of spot on its breast, sings, here here hé, che che che, chit chit chit, f chip chip chip chip chip. The latter part especially fast. The F. juncorum says, phe phe phe phe ph-ph-p-p-p-p-p-p-p-p, faster and faster; flies as I advance, but is heard distinctly still further off.

A moist, misty, rain-threatening April day. About noon it does mizzle a little. The robin sings throughout it. It is rather raw, tooth-achy weather.

P. M. — Round Walden.

The *Stellaria media* is abundantly out. I did not look for it early, it was so snowy. It evidently blossomed as soon after the 2d of April — when I may say the [snow] began to go off in earnest — as possible. The shepherd's-purse, too, is well out, three or four inches high, and may have been some days at least.

Cheney's elm shows stamens on the warm side pretty numerously. Probably that at Lee's Cliff a little earlier.

Plowing and planting are now going on commonly. As I go down the railroad, I see two or three teams in the fields. Frost appears to be out of most soil. I see a pine warbler, much less yellow than the last, searching about the needles of the pitch and white pine. Its note is somewhat shorter, — a very rapid and continuous trill or jingle which I remind myself of by *vetter vetter vetter vetter vet*’, emphasizing the last syllable.

Walden is still covered with ice, which [is] still darker green and more like water than before. A large tract in the middle is of a darker shade and particularly like water. Mr. Emerson told me yesterday that there was a large tract of water in the middle! This ice trembles like a batter for a rod around when I throw a stone on to it. One as big as my fist, thrown high, goes through. It appears to be three or four inches thick. It extends quite to the shore on the north side and is there met by snow.

The needles of the pines still show where they were pressed down by the great burden of snow last winter. I see a maple twig eaten off by a rabbit four and a quarter feet from the ground, showing how high the snow was there. Golden saxifrage at Hubbard’s Close. Frogs sit round Callitriche Pool, where the tin is cast. We have waste places — pools and brooks, etc., — where to cast tin, iron, slag, crockery, etc. No doubt the Romans and Ninevites had such places. To what a perfect system this world is reduced! A place for everything and everything in its place!

April 17. Was awakened in the night by a thunder and lightning shower and hail-storm — the old familiar burst and rumble, as if it had been rumbling somewhere else ever since I heard it last, and had not lost the knack. I heard a thousand hailstones strike and bounce on the roof at once. What a clattering! Yet it did not last long, and the hail took a breathing-space once or twice. I did not know at first but we should lose our windows, the blinds being away at the painters’. These sounds lull me into a deeper slumber than before. Hail-storms are milked out of the first summer-like warmth; they belong to lingering cool veins in the air, which thus burst and come down. The thunder, too, sounds like the final rending and breaking up of winter; thus precipitous is its edge. The first one is a skirmish between the cool rear-guard of winter and the warm and earnest vanguard of summer. Advancing summer strikes on the edge of winter, which does not drift fast enough away, and fire is elicited. Electricity is engendered by the early heats. I love to hear the voice of the first thunder as of the toad (though it returns irregularly like pigeons), far away in his moist meadow where he is warmed to life, and see the flash of his eye.

Hear a chip-bird high on an elm this morning, and probably that was one I heard on the 15th. You would not be apt to distinguish the note of the earliest. I still see quite a snow-bank from my window on the hillside at the northeast end of Clamshell, say a northeast exposure. This is on the surface, but the snow lies there in still greater quantity, in two hollows where sand has been dug for the meadow, on the hillside, though sloping to the southeast, where it is quite below the general surface. We have had scarcely any rain this spring, and the snow has been melting very gradually in the sun.

P. M. — Start for Conantum in boat, wind southwest. I can hide my oars and sail up there and come back another day. A moist muggy afternoon, rain-threatening, true April weather, after a particularly warm and pleasant forenoon. The meadows are still well covered, and I cut off the bends. The red-wing goes over with his cha-e-e che-e-e, chatter, chatter, chatter. On Hubbard's great meadow I hear the sound of some fowl, perhaps a loon, rushing through the water, over by Dennis's Hill, and push for it. Meanwhile it grows more and more rain-threatening, — all the air moist and muggy, a great ill-defined cloud darkening all the west, III — but I push on till I feel the first drops, knowing that the wind will take me back again. Now I hear ducks rise, and know by their hoarse quacking that they are black ones, and see two going off as if with one mind, along the edge of the wood.

Now comes the rain with a rush. In haste I put my boat about, raise my sail, and, cowering under my umbrella in the stem, with the steering oar in my hand, begin to move homeward. The rain soon fulls up my sail, and it catches all the little wind. From under the umbrella I look out on the scene. The big drops pepper the watery plain, the aequor, on every side. It is not a hard, dry pattering, as on a roof, but a softer, liquid pattering, which makes the impression of a double wateriness. You do not observe the drops descending but where they strike, for there they batter and indent the surface deeply like buckshot, and they, or else other drops which they create, rebound or hop up an inch or two, and these last you see, and also when they fall back broken into small shot and roll on the surface. Around each shot-mark are countless circling dimples, running into and breaking one another, and very often a bubble is formed by the force of the shot, which floats entire for half a minute. These big shot are battering the surface every three inches or thicker. I make haste to take down my sail at the bridges, but at the stone arches forgot my umbrella, which was unavoidably crushed in part. Even in the midst of this rain I am struck by the variegated surface of the water, different portions reflecting the light differently, giving what is called a watered appearance. Broad streams of light water stretch away between streams of dark, as if they were different kinds of water unwilling to mingle, though all are equally dimpled by the rain, and you detect no difference in their condition. As if Nature loved variety for its own sake. It is a true April shower, or rain, — I think the first. It rains so easy, IV — has a genius for it and infinite capacity for [it]. Many showers will not exhaust the moisture of April.

When I get home and look out the window, I am surprised to see how it has greened the grass. It springs up erect like a green flame in the ditches on each side the road, where we had not noticed it before. Grass is bom. There is a quite distinct tinge of green on the hillside seen from my window now. I did not look for the very first.

I learn from the papers that an unusual number of fruit trees have been girdled by the mice under the deep snow of the past winter. Immense damage has been done to nurseries and orchards. I saw where a prostrate maple in the Great Meadows had been gnawed nearly bare.

Our river was generally breaking up on the 3d of April, though some parts were frozen till the 12th.

I see by the papers that the ice had left Lake St. Peter (St. Lawrence) the 12th. Another paper (of the 11th) has heard that the St. Lawrence was open from Quebec to Three Rivers, or before the Hudson. The ice on Lake Champlain was broken up on the 12th. Fair Haven Pond was quite open the 13th. The ice moved down the Penobscot, and the river opened the 15th. Lake Ontario was free of ice the 16th. The Kennebec is expected to open this week. (To-day is Thursday.) There is still ice in Walden.

April 18. P. M. — To Lee's Cliff by boat.

A strong northwest wind. The waves were highest off Hubbard's second grove, where they had acquired their greatest impetus and felt the full force of the wind. Their accumulated volume was less beyond on account of the turn in the river. The greatest undulation is at the leeward end of the longest broad reach in the direction of the wind. I was steering there diagonally across the black billows, my boat inclined so as almost to drink water. Scare up the same two black ducks (and twice again). The under sides of their wings show quite light and silvery as they rise in the light.

Red maple stamens in some places project considerably, and it will probably blossom to-morrow if it is pleasant.

The farmer neglects his team to watch my sail. The slippery elm, with its round rusty woolly buds and pale-brown ashy twigs. That pretty, now brown-stemmed moss with green oval fruit. Common saxifrage and also early sedge I am surprised to find abundantly out — both — considering their backwardness April 2d. Both must have been out some, i.e. four or five, days half-way down the face of the ledge. Crowfoot, apparently two or three days. *Antennaria* at end of Cliff as you descend, say yesterday. *Turritis stricta*. Columbine, and already eaten by bees. Some with a hole in the side. It is worth the while to go there to smell the catnep. I always bring some home for the cat at this season.

See those great chocolate puffballs burst and diffusing their dust on the side of the hill. At the sandy place where I moored my boat, just this side this Cliff, the *Selaginella apus* is abundant, and on Conantum shore near elms thirty or forty rods below.

Left boat opposite Bittern Cliff.

Bearberry grows by path from river, seven rods beyond last pine, south side, now strongly flower-budded. Observed a large mass of white lily root with the mud washed up, the woolly steel-blue root, with singular knobs for offshoots and long, large, succulent white roots from all sides, the leaf-buds yellow and lightly rolled up on each side. Small sallow next above tristis, three feet high, in path to Walden.

Walden is open entirely to-day for the first time, owing to the rain of yesterday and evening. I have observed its breaking up of different years commencing in '45, and the average date has been April 4th.

This evening I hear the snipes generally and peeping of hylas from the door.

A small brown wasps' (?) nest (last year's, of course) hung to a barberry bush on edge of Lee's Cliff.

April 19. Was awakened in the night to a strain of music dying away, — passing travellers singing. My being was so expanded and infinitely and divinely related for a brief season that I saw how unexhausted, how almost wholly unimproved, was man's capacity for a divine life. When I remembered what a narrow and finite life I should anon awake to!

Though, with respect to our channels, our valleys, and the country we are fitted to drain, we are Amazons, we ordinarily live with dry channels.

The arbor-vitæ by riverside behind Monroe's appears to be just now fairly in blossom. I notice acorns sprouted. My birch wine now, after a week or more, has become pretty clear and colorless again, the brown part having settled and now coating the glass.

Helped Mr. Emerson set out in Sleepy Hollow two over-cup oaks, one beech, and two arbor-vitæ.

As dryness will open the pitch pine cone, so moisture closes it up again. I put one which had been open all winter into water, and in an hour or two it shut up nearly as tight as at first.

April 20. Rain, rain, rain, — ; a northeast storm. I see that it is raising the river somewhat again. Some little islets which had appeared on the meadow northwest of Dodd's are now fast being submerged again.

April 22. It has rained two days and nights, and now the sun breaks out, but the wind is still easterly, and the storm probably is not over. In a few minutes the air is full of mizzling rain again.

2 — A. M. — Go to my boat opposite Bittern Cliff.

Monroe's larches by river will apparently shed pollen soon. The staminate flowers look forward, but the pistillate scarcely show any red. There is snow still (of the winter) in the hollows where sand has been dug on the hillside east of Clamshell. Going through Hubbard's root-fence field, see a pigeon woodpecker on a fence-post. He shows his lighter back between his wings cassock-like and like the smaller woodpeckers. Joins his mate on a tree and utters the wooing note o-week o-week, etc.

The seringo also sits on a post, with a very distinct yellow line over the eye, and the rhythm of its strain is ker chick | ker che | ker-char-r-r-r-r | chick, the last two bars being the part chiefly heard. The huckleberry buds are much swollen. I see the tracks of some animal which has passed over Potter's sand, perhaps a skunk. They are quite distinct, the ground being smoothed and softened by rain. The tracks of all animals are much more distinct at such a time. By the path, and in the sandy field beyond, are many of those star-fingered puffballs. I think they must be those which are so white, like pigeons' eggs, in the fall, the thick, leathery rind bursting into eight to eleven segments, like those of a boy's batting ball, and curving back. They are very pretty and remarkable now, sprinkled over the sand, smooth and plump on account of the rain. (I find some beyond at Mountain Sumach Knoll, smaller with a very thin rind and more turned back, a different species plainly.) The inside of the rind, which is uppermost, approaches a chocolate-color; the puffball is a rough dirty or brownish

white; the dust which does not fly now at any rate is chocolate-colored. Seeing these thus open, I should know there had been wet weather.

The mountain sumach berries have no redness now, though the smooth sumach berries have. Its twigs are slender and so have a small pith. Its heart-wood is not yellow, like the smooth and the dogwood, but green. Its bark is more gray than that of the smooth, which last, when wet, is slightly reddish. Its bark sap or juice is not yellow like that of the smooth, and is slower to harden.

Some hellebore leaves are opened in the Cliff Brook Swamp. My boat is half full of water. There are myriads of snow-fleas in the water amid the bushes, apparently washed out of the bark by the rain and rise of river. —

I push up-stream to Lee's Cliff, behind Goodwin, who is after musquash. Many suckers and one perch have washed up on the Conantum shore, the wind being southeasterly. I do not detect any wound. Their eyes are white, — it would be worth while to see how long before this happens, — and they appear to have been dead some time; their fins are worn, and they are slimy. I cut open a sucker, and it looked rather yellow within. I also see sometimes their bladders washed up. They float on their backs. When cut open they sink, but the double bladder is uppermost and protruded as far as possible. Saw some pieces of a sucker recently dropped by some bird or beast, eight or ten rods from the shore. Much root and leaf-bud washed up. A gull. Very perfect and handsome clamshells, recently opened by the musquash, i.e. during the storm, lie on the meadow and the hillside just above water-mark. They are especially handsome because wet by the rain. I buy a male muskrat of Goodwin, just killed. He sometimes baits his mink-traps with muskrat; always with some animal food. The musquash does not eat this, though he sometimes treads on the trap and is caught. It rains hard and steadily again, and I sail before it. Now I see many more ducks than in all that fair weather, — sheldrakes, etc. A marsh hawk, in the midst of the rain, is skimming along the shore of the meadow, close to the ground, and, though not more than thirty rods off, I repeatedly lose sight of it, it is so nearly the color of the hillside beyond. It is looking for frogs. The small slate-colored hawk which I have called pigeon hawk darts away from a bushy island in the meadow.

The muskrat, which I bought for twelve cents, weighs three pounds, six ounces. Goodwin thought that some would weigh a half to three quarters of a pound more than this; I think a pound more. Thought this was a young one of last year, — judged by the tail, 1839. — and that they hardly came to their growth in one year. Extreme length, twenty-three inches; length of bare tail, nine inches; breadth of tail, seven eighths of an inch; breadth of body, etc., as it lies, six and a half. An oval body, dark-brown above (black in some lights, the coarse wind hairs aft), reddish-brown beneath. Thus far the color of the hair. The fur within slate-color. Tail black; feet a delicate glossy dark slate (?), with white nails. The hind feet half webbed, and their sides and toes fringed thickly with stiff hair, apparently to catch water; ears (the head is wet and bruised), partly concealed in the fur, short and round; long black mustachial bristles;

fore legs, quite short, more like hands; hind ones, about three inches without the line of the body's fur and hair. Tail, on the skin, is a little curved downwards.

The star fungi, as they dried in my chamber in the course of two or three hours, drew in the fingers. The different segments curled back tightly upon the central puff, the points being strongly curled downward into the middle dimple-wise. It requires wet weather, then, to expand and display them to advantage. They are hygrometers. Their coat seems to be composed of two thicknesses of different material and quality, and I should guess that the inside chocolate-colored had a great affinity for moisture and, being saturated with it, swelled, and so necessarily burst off and turned back, and perchance the outside dirty-white or pale-brown one expands with dryness.

A single male sheldrake rose from amid the alders against Holden Swamp Woods, as I was sailing down in the rain, and flew with outstretched neck at right angles across my course, only four or five rods from me and a foot or two above the water, finally circling round into my rear.

Soon after I turned about in Fair Haven Pond, it began to rain hard. The wind was but little south of east and therefore not very favorable for my voyage. I raised my sail and, cowering under my umbrella in the stem, wearing the umbrella like a cap and holding the handle between my knees, I steered and paddled, almost perfectly sheltered from the heavy rain. Yet my legs and arms were a little exposed sometimes, in my endeavors to keep well to windward so as to double certain capes ahead. For the wind occasionally drove me on to the western shore. From time to time, from under my umbrella, I could see the ducks spinning away before me, like great bees. For when they are flying low directly from you, you see hardly anything but their vanishing dark bodies, while the rapidly moving wings or paddles, seen edgewise, are almost invisible. At length, when the river turned more easterly, I was obliged to take down my sail and paddle slowly in the face of the rain, for the most part not seeing my course, with the umbrella slanted before me. But though my progress was slow and laborious, and at length I began to get a little wet, I enjoyed the adventure because it combined to some extent the advantages of being at home in my chamber and abroad in the storm at the same time.

It is highly important to invent a dress which will enable us to be abroad with impunity in the severest storms. We cannot be said to have fully invented clothing yet. In the meanwhile the rain-water collects in the boat, and you must sit with your feet curled up on a paddle, and you expose yourself in taking down your mast and raising it again at the bridges. These rain-storms — this is the third day of one — characterize the season, and belong rather to winter than to summer. Flowers delay their blossoming, birds tarry in their migrations, etc., etc. It is surprising how so many tender organizations of flowers and insects survive them uninjured.

The muskrat must do its swimming chiefly with its hind feet. They are similar in form and position to those of the sheldrake. Its broad oval and flattish body, too, must help keep it up.

Those star puffballs which had closed up in my chamber, put into water, opened again in a few hours.

What is that little bodkin-shaped bulb which I found washed up on the edge of the meadow, white with a few small greenish rounded leaflets?

On the 19th, when setting out one of those overcup oaks in Sleepy Hollow, digging at the decayed stump of an apple tree, we disturbed, dug up, a toad, which probably had buried itself there last fall and had not yet come out.

April 23. P. M. — Up Assabet to white cedars.

The river risen again, on account of the rain of the last three days, to nearly as high as on the 11th. I can just get over Hosmer's meadow. The red maple did not shed pollen on the 19th and could not on the 20th, 21st, or 22d, on account of rain; so this must be the first day, — the 23d, — though I see none quite so forward by the river. The wind is now westerly and pretty strong. No sap to be seen in the bass. The white birch sap flows yet from a stump cut last fall, and a few small bees, flies, etc., are attracted by it. Along the shore by Dove Rock I hear a faint tseep like a fox-colored sparrow, and, looking sharp, detect upon a maple a white-throated sparrow. It soon flies to the ground amid the birches two or three rods distant, a plump-looking bird and, with its bright white and yellow marks on the head distinctly separated from the slate-color, methinks the most brilliant of the sparrows. Those bright colors, however, are not commonly observed.

The white cedar swamp consists of hummocks, now surrounded by water, where you go jumping from one to another. The fans are now dotted with the minute reddish staminate flowers, ready to open. The skunk-cabbage leaf has expanded in one open place there; so it is at least as early as the hellebore of yesterday. Returning, when near the Dove Rock saw a musquash crossing in front. He dived without noise in the middle of the river, and I saw by a bubble or two where he was crossing my course, a few feet before my boat. He came up quietly amid the alders on my right, and lay still there with his head and back partly out. His back looked reddish-brown with a black grain inmixed.

I think that that white root washed up since the ice broke — up, with a stout stem flat on one side and narrow green or yellowish leaf-bud rolled up from each side, with a figure — in the middle, is the yellow lily, and probably I have seen no pontederia. The white lily root is thickly clothed with a slate-blue fur or felt, close-fitting, reflecting prismatic colors under the microscope, but generally the slate-color of the fur of most animals, and perhaps it is designed to serve a similar use, viz for warmth and dryness. The end of the root is abruptly rounded and sends forth leaves, and along the sides of the root are attached oval bulb-like offshoots, one or two inches long, with very narrow necks, ready, apparently, to be separated soon from the parent stock.

Hear the yellow redpoll sing on the maples below Dove Rock, — a peculiar though not very interesting strain, or jingle.

A very handsome little beetle, deep, about a quarter of an inch long, with pale-golden wing-cases, artificially and handsomely marked with burnished dark-green

marks and spots, one side answering to the other; front and beneath burnished dark-green; legs brown or cinnamon-color. It was on the side of my boat. Brought it home in a clam's shells tied up, — a good insect-box.

April 24. A rain-threatening April day. Sprinkles a little in the forenoon.

P. M. — To mayflower.

The yellow willow peels fairly, probably for several days. Its buds are bursting and showing a little green, at end of railroad bridge. On Money-Diggers' Shore, much large yellow lily root washed up; that white root with white fibres and yellowish leaf-buds. I doubt if I have seen any *pontederia* this year. I find, on the southeast side of Lupine Hill, nearly four rods from the water and a dozen feet above its level, a young *Emys picta*, one and five eighths inches long and one and a half wide. I think it must have been hatched year before last. It was headed up-hill. Its rear above was already covered with some kind of green moss (?) or the like, which probably had adhered or grown to it in its winter quarters.

Warren Miles at his new mill tells me that he found a mud turtle of middling size in his brook there last Monday, or the 21st. I saw a wood tortoise there. He has noticed several dead trout, the young man says, and eels, about the shore of the pond, which had apparently died in the winter, washed up about his mill, some that would weigh a pound, and thought that they had been killed by that strong-scented stagnant water of his pond. They could not get down. Also they can't get above his mill now, in the spring. He says that at his mill near the factory, where he used a small undershot wheel, eighteen inches in diameter, for grinding lead, he was prevented from grinding at night by the eels stopping the wheel. It was in August, and they were going down-stream. They never ran till about dark, nor after daylight, but at that season one would get under the wheel every five minutes and stop it, and it had to be taken out. There was not width enough beneath the wheel, a small undershot one, i.e. between the wheel and the apron, to allow an eel of ordinary size to pass, and they were washed in sidewise so as to shut this space up completely. They were never troubled by them when going up, which he thought was in April. At the factory they can sometimes catch a bushel in a night at the same time in the box of wire in which they wash wool. Said that they had a wheel at the paper-mills above which killed every eel that tried to go through.

A Garfield (I judge from his face) confirmed the story of sheldrakes killed in an open place in the river between the factory and Harrington's, just after the first great snow-storm (which must have been early in January), when the river was all frozen elsewhere. There were three, and they persisted in staying and fishing there. He killed one.

The epigæa on the upper edge of the bank shows a good deal of the pink, and may open in two or three days if it is pleasant. *Equisetum arvense*, by path beyond second brook, probably yesterday. As usual, am struck with the forwardness of the dark patch of slender rush at the cowslip place.

Returning, in the low wood just this side the first Second Division Brook, near the meadow, see a brown bird flit, and behold my hermit thrush, with one companion,

fitting silently through the birches. I saw the fox-color on his tail-coverts, as well as the brown streaks on the breast. Both kept up a constant jerking of the tail as they sat on their perches.

This season of rain and superabundant moisture makes attractive many an unsightly hollow and recess.

I see some roadside lakes, where the grass and clover had already sprung, owing to previous rain or melted snow, now filled with perfectly transparent April rainwater, through which I see to their emerald bottoms, 1840. — paved with emerald. In the pasture beyond Nut Meadow Brook Crossing, the unsightly holes where rocks have been dug and blasted out are now converted into perfect jewels. They are filled with water of crystalline transparency, paved with the same emerald, with a few hardhacks and meadow-sweets standing in them, and jagged points of rock, and a few skaters gliding over them. Even these furnish goblets and vases of perfect purity to hold the dews and rains, and what more agreeable bottom can we look to than this which the earliest moisture and sun had tinged green? We do not object to see dry leaves and withered grass at the bottom of the goblet when we drink, if these manifestly do not affect the purity of the water. What wells can be more charming? If I see an early grasshopper drowning in one, it looks like a fate to be envied. Here is no dark unexplored bottom, with its imagined monsters and mud, but perfect sincerity, setting off all that it reveals. Through this medium we admire even the decaying leaves and sticks at the bottom.

The brook had risen so, owing to Miles's running his mill, that I could not get over where I did going.

April wells, call them, vases clean as if enamelled.

There is a slight sea-tum. I saw it like a smoke beyond Concord from Brown's high land, and felt the cool fresh east wind. Is it not common thus early?

The old caterpillar-nests which now lie on the ground under wild cherry trees, and which the birds may use, are a quite light-colored cottony web, close and thick-matted, together with the dried excrement of caterpillars, etc., on the inside.

See a dog's-bane with two pods open and partially curved backward on each side, but a third not yet open. This soon opens and scatters its down and seeds in my chamber. The outside is a dull reddish or mahogany-color, but the inside is a singularly polished very pale brown. The inner bark of this makes a strong twine like that of the milkweed, but there is not so much of it.

What is that now ancient and decayed fungus by the first mayflowers, — trumpet-shaped with a very broad mouth, the chief inner part green, the outer dark brown?

The earliest gooseberry leaf has spread a third of an inch or more.

Goodwin shot, about 6 p. M., and brought to me a cinereous coot (*Fulica Americana*) which was flying over the willows at Willow Bay, where the water now runs up.

It measures fourteen inches to end of tail; eighteen and one half to end of legs. Tail projects a halfinch beyond closed wings. Alar extent twenty-six inches. (These dimensions are somewhat stretched.) Above it is a bluish slate, passing into olive

behind the wings, the primaries more brownish. Beneath, ash-color or pale slate. Head and neck, uniform deep black. Legs, clear green in front, passing into lead-color behind and on the lobes. Edging of wings, white; also the tips of the secondaries for one fourth of an inch, and a small space under the tail. Wings beneath, very light, almost silvery, slate. Vent, for a small space, black. Bill, bluish-white, with a chestnut bar near tip, and corresponding chestnut spot on each side of lower mandible and a somewhat diamond-shaped chestnut spot at base in front. No noticeable yellow on bill. Irides, reddish. No noticeable whitish spot beneath eyes; only bare lid. Legs and feet are very neat; talons very slender, curving, and sharp, the middle ones  $\frac{1}{2}$  inch + long. Lobes chiefly on the inner side of the toes. Legs bare half an inch above the joint. From its fresh and tender look I judge it to be a last year's bird. It is quite lousy.

According to Nuttall, they range from 55° north latitude to Florida and Jamaica and west to Oregon (?) and Mexico. Probably breed in every part of North America, — even in Fresh Pond, he would imply, — but their nests, eggs, and breeding-habits are yet unknown. Nocturnal, hiding by day. In Florida in the winter. Come to Fresh Pond in September. A pair there in April, and seen with young birds in June. When alarmed utter a “hoarse kruk.” Called “flusterers” in Carolina, according to Lawson, because they fly trailing their legs or pattering with them over the water. Food: vegetables, also small shellfish, insects, gravel, etc. Leave the Northern States in November.

April 25. Minott tells me of David Wheeler of the Virginia Road, who used to keep an account of the comings and goings, etc., of animals. He was one of the few who knew [how] to set a trap for a fox so that he would get into it; scented it in a peculiar way, perhaps. Brought one home once on his shoulder, feigning death, which came to life suddenly in his entry and ran off with the trap.

Minott says that he could hardly raise cucumbers in his garden by the brook, the tortoises (painted, I judge, from his description) used to eat them so, both small and large, eating out the insides of the last. He sometimes found three or four there at once, and they lay all day hid among the vines.

Saw wasps about his dooryard.

P. M. — To Hill by boat.

Sweet-gale is out in some parts of the Island birch meadow, next the Indian field, probably several days, at least in some places. Larch not yet sheds pollen.

The toads have begun fairly to ring at noonday in earnest. I rest awhile on my oars in this meadow amid the birches [?] to hear them. The wind is pretty strong and easterly. There are many, probably squatted about the edge of the falling water, in Merrick's pasture. (The river began to fall again, I think, day before yesterday.) It is a low, terrene sound, the undertone of the breeze. Now it sounds low and indefinitely far, now rises, as if by general consent, to a higher key, as if in another and nearer quarter, — a singular alternation. The now universal hard metallic ring of toads blended and partially drowned by the rippling wind. The voice of the toad, the herald of warmer weather.

The cinquefoil well out. I see two or three on the hemlock dry plain, — probably a day or two. I observe a male grackle with a brownish head and the small female on one tree, red-wings on another. Return over the top of the hill against the [wind]. The Great Meadows now, at 3.0 p m., agitated by the strong easterly wind this clear day, when I look against the wind with the sun behind me, look particularly dark blue.

Aspen bark peels; how long?

I landed on Merrick's pasture near the rock, and when I stepped out of the boat and drew it up, a snipe flew up, and lit again seven or eight rods off. After trying in vain for several minutes to see it on the ground there, I advanced a step and, to my surprise, scared up two more, which had squatted on the bare meadow all the while within a rod, while I drew up my boat and made a good deal of noise. In short, I scared up twelve, one or two at a time, within a few rods, which were feeding on the edge of the meadow just laid bare, each rising with a sound like squeak squeak, hoarsely. That part of the meadow seemed all alive with them. It is almost impossible to see one on the meadow, they squat and run so low, and are so completely the color of the ground. They rise from within a rod, fly half a dozen rods, and then drop down on the bare open meadow before your eyes, where there seems not stubble enough to conceal [them], and are at once lost as completely as if they had sunk into the earth. I observed that some, when finally scared from this island, flew off rising quite high, one a few rods behind the other, in their peculiar zigzag manner, rambling about high over the meadow, making it uncertain where they would settle, till at length I lost sight of one and saw the other drop down almost perpendicularly into the meadow, as it appeared.

5 p.m. — Went to see Tommy Wheeler's bounds.

Warren Miles had caught three more snapping turtles since yesterday, at his mill, one middling-sized one and two smaller. He said they could come down through his mill without hurt. Were they all bound down the brook to the river? I brought home one of the small ones. It was seven and one eighth inches long. Put it in a firkin for the night, but it got out without upsetting it. It had four points on each side behind, and when I put it in the river I noticed half a dozen points or projections on as many of its rear plates, in keeping with the crest of its tail. It buried itself in the grassy bottom within a few feet of the shore. Moves off very flat on the bottom. These turtles have been disturbed or revealed by his operations.

Anne Kamey, our neighbor, looking over her garden yesterday with my father, saw what she said was shamrock, which the Irish wear on their caps on St. Patrick's Day, the first she had ever seen in this country. My father pointed it out in his own garden to the Irishman who was working for him, and he was glad to see it, for he had had a dispute with another Irishman as to whether it grew in this country and now he could convince him, and he put it in his pocket. I saw it afterward and pronounced it common white clover, and, looking into Webster's Dictionary, I read, under Shamrock: "The Irish name for a three-leaved plant, the *Oxalis Acetosella*, or common wood-sorrel. It has been often supposed to be the *Trifolium repens*, white trefoil or white clover."

This was very satisfactory, though perhaps Webster's last sentence should have been, The *Trifolium repens* has often been mistaken for it.

At evening see a spearer's light.

April 26. Worm-piles about the door-step this morning; how long?

The white cedar gathered the 23d does not shed pollen in house till to-day, and I doubt if it will in swamp before to-morrow. Monroe's larch will, apparently, by day after to-morrow. The white birch at Clamshell, which I tapped long ago, still runs and is partly covered with a pink froth. Is not this the only birch which shows this colored froth, as its sap is the most tinged and most inclined to ferment? — a sort of mother which is left on the bark and in the hole.

Looked over hastily the first two hundred lines of Lucretius, but was struck only with the lines referring to Prometheus, whose *vivida vis animi*

“extra

*Processit longe flammantia moenia mundi.*

“But the custom of our ancestors also permitted these things on holidays: to pound wheat, cut torches, make candles, cultivate a hired vineyard, clear out and purge fish-ponds, ponds, and old ditches, mow grass ground a second time, spread dung, store up hay on scaffolds, gather the fruit of a hired olive yard, spread apples, pears, and figs, make cheese, bring home trees for the sake of planting on our shoulders or on a pack-mule, but not with one harnessed to a cart, nor to plant them when brought home, nor to open the ground, nor prune a tree, not even to attend to sowing seed, unless you have first sacrificed a puppy.”

This reminds me of my bringing home an apple tree on my shoulder one Sunday and meeting the stream of meeting-goers, who seemed greatly outraged; but they did not know whether I set it out or not that day, or but that I sacrificed a puppy if I did.

April 27. P. M. — Up Assabet.

I find none of Monroe's larch buds shedding pollen, but the anthers look crimson and yellow, and the female flowers are now fully expanded and very pretty, but small. I think it will first scatter pollen to-morrow.

Apparently a small bullfrog by riverside, though it looks somewhat like a *Rana fontinalis*; also two or three (apparently) *R. palustris* in that well of Monroe's, which have jumped in over the curb, perhaps. I see quite a number of tortoises out sunning, just on the edge of the Hosmer meadow, which is rapidly becoming bare. Their backs shine from afar in the sun. Also one *Emys insculpta* out higher up. From close by I hear a red-wing's clear, loud whistle, — not squeak (which I think may be confined to the grackle). It is like *pte'-a pte'a*, or perhaps without the *p*.

The tapping of a woodpecker is made a more remarkable and emphatic sound by the hollowness of the trunk, the expanse of water which conducts the sound, and the morning hour at which I commonly hear it. I think that the pigeon woodpeckers must be building, they frequent the old aspen now so much.

At the Hemlocks I see a rock which has been moved since last fall seven or eight feet into the river, though the ground is but little descending. The rock is about five and

a half feet by three by one. I see [a] rather large devil's-needle coursing over the low osiers in Pinxter Swamp. Is it not early for one? The white birch which I tapped in V. palmata Swamp still runs; and the holes are full of, and the base of the tree covered with, a singular sour-tasted, rather hard-crusted white (not pink) froth, and a great many of those flat beetles (?), lightning-bug-like, and flies, etc., are sucking it.

April 28. Surveying the Tommy Wheeler farm.

Again, as so many times, I [am] reminded of the advantage to the poet, and philosopher, and naturalist, and whomsoever, of pursuing from time to time some other business than his chosen one, — seeing with the side of the eye. The poet will so get visions which no deliberate abandonment can secure. The philosopher is so forced to recognize principles which long study might not detect. And the naturalist even will stumble upon some new and unexpected flower or animal.

Mr. Newton, with whom I rode, thought that there was a peculiar kind of sugar maple which he called the white; knew of a few in the middle of Framingham and said that there was one on our Common.

How promising a simple, unpretending, quiet, somewhat reserved man, whether among generals or scholars or farmers! How rare an equanimity and serenity which are an encouragement to all observers! Some youthfulness, some manliness, some goodness. Like Tarbell, a man apparently made a deacon on account of some goodness, and not on account of some hypocrisy and badness as usual.

Is not the Hubbard Ditch plant the same I see in a Nut Meadow pool, and a remarkable evergreen? with much slime and many young snails on it?

I hear to-day frequently the seezer seezer seezer of the black and white creeper, or what I have referred to that, from J. P. Brown's wood bounding on Dugan. It is not a note, nor a bird, to attract attention; only suggesting still warmer weather, — that the season has revolved so much further. See, but not yet hear, the familiar chewink amid the dry leaves amid the underwood on the meadow's edge.

Many *Anemone nemorosa* in full bloom at the further end of Yellow Thistle Meadow, in that warm nook by the brook, some probably a day or two there. I think that they are thus early on account of Miles's dam having broken away and washed off all the snow for some distance there, in the latter part of the winter, long before it melted elsewhere. It is a warm corner under the south side of a wooded hill, where they are not often, if ever before, flooded.

As I was measuring along the Marlborough road, a fine little blue-slate butterfly fluttered over the chain. Even its feeble strength was required to fetch the year about. How daring, even rash, Nature appears, who sends out butterflies so early! Sardanapalus-like, she loves extremes and contrasts.

I began to survey the meadow there early, before Miles's new mill had been running long this Monday morning and flooded it, but a great stream of water was already rushing down the brook, and it almost rose over our boots in the meadow before we had done.

Observing the young pitch pines by the road south of Loring's lot that was so heavily wooded, George Hubbard remarked that if they were cut down oaks would spring up, and sure enough, looking across the road to where Loring's white pines recently stood so densely, the ground was all covered with young oaks. Mem. — Let me look at the site of some thick pine woods which I remember, and see what has sprung up; e g. the pitch pines on Thrush Alley and the white pines on Cliffs, also at Baker's chestnuts, and the chestnut lot on the Tim. Brooks farm.

This was a very pleasant or rather warm day, looking a little rainy, but on our return the wind changed to easterly, and I felt the cool, fresh sea-breeze.

This has been a remarkably pleasant, and I think warm, spring. We have not had the usual sprinklings of snow, having had so much in the winter, — none since [that] I can remember. There is none to come down out of the air.

April 29. Was awakened early this morning by thunder and some rain, — the second thunder-shower of the season, — but it proved a fair day. At midforenoon saw a fish hawk flying leisurely over the house northeasterly.

P. M. — To Cedar Swamp.

Monroe's larch staminate buds have now erected and separated their anthers, and they look somewhat withered, as if they had shed a part of their pollen. If so, they began yesterday.

It was quite warm when I first came out, but about 3 p. M. I felt a fresh easterly wind, and saw quite a mist in the distance produced by it, a sea-tum. There was the same phenomenon yesterday at the same hour, and on the 24th, later in the day. Yet to-day the air was not much cooled. Your first warning of it may be the seeing a thick mist on all the hills and in the horizon. The wind is southeast.

I see great devil's-needles whiz by, coupled.

Do not sail well till I reach Dove Rock, then glide swiftly up the stream. I move upward against the current with a moderate but fair wind, the waves somewhat larger, probably because the wind contends with the current. The sun is in my face, and the waves look particularly lively and sparkling. I can steer and write at the same time. They gurgle under my stem, in haste to fill the hollow which I have created. The wave's seem to leap and roll like porpoises, with a slight surging sound when their crests break, and I feel an agreeable sense that I am swiftly gliding over and through them, bound on my own errands, while their motion is chiefly but an undulation, and an apparent one. It is pleasant, exhilarating, to feel the boat tossed up a little by them from time to time. Perhaps a wine-drinker would say it was like the effect of wine. It is flattering to a sense of power to make the wayward wind our horse and sit with our hand on the tiller. Sailing is much like flying, and from the birth of our race men have been charmed by it.

Near the little larch, scared a small dark-brown hawk from an apple tree, which flew off low to another apple tree beside Barrett's Pond. Just before he flew again I saw with my glass that his tail was barred with white. Must it not be a pigeon hawk then? He looked a dark slate as he sat, with tawny-white thighs and under head, —

far off. He soon started a third time, and a crow seemed to be in chase of him. I think I have not described this white-barred hawk before, but for the black-barred vide May 8, 1854, and April 16, 1855.

The white cedar now sheds pollen abundantly.

Many flowers are effete, though many are not open. Probably it began as much as three days ago. I strike a twig, and its peculiar pinkish pollen fills the air. Sat on the knoll in the swamp, now laid bare. How pretty a red maple in bloom (they are now in prime), seen in the sun against a pine wood, like these little ones in the swamp against the neighboring wood, they are so light and ethereal, not a heavy mass of color impeding the passage of the light, and they are of so cheerful and lively a color.

The pine warbler is heard very much now at midday, when already most birds are quiet. It must be the female which has so much less yellow beneath. Do not the toads ring most on a windy day like this? I heard but few on the still 27th. A pigeon woodpecker alights on a dead cedar top near me. Its cackle, thus near, sounds like eh eh eh eh eh, etc., rapidly and emphatically repeated. Some birch sprouts in the swamp are leafed as much as any shrub or tree. Barn swallows and chimney, with white-bellied swallows, are flying together over the river. I thought before that I distinguished the twitter of the chimney swallow.

April 30. Surveying the Tommy Wheeler farm.

A fine morning. I hear the first brown thrasher singing within three or four rods of me on the shrubby hillside in front of the Hadley place. I think I had a glimpse of one darting down from a sapling-top into the bushes as I rode by the same place on the morning of the 28th. This, I think, is the very place to hear them early, a dry hillside sloping to the south, covered with young wood and shrub oaks. I am the more attracted to that house as a dwelling-place. To live where you would hear the first brown thrasher! First, perchance, you have a glimpse of one's ferruginous long brown back, instantly lost amid the shrub oaks, and are uncertain if it was a thrasher, or one of the other thrushes; and your uncertainty lasts commonly a day or two, until its rich and varied strain is heard. Surveying seemed a noble employment which brought me within hearing of this bird. I was trying to get the exact course of a wall thickly beset with shrub oaks and birches, making an opening through them with axe and knife, while the hillside seemed to quiver or pulsate with the sudden melody. Again, it is with the side of the ear that you hear. The music or the beauty belong not to your work itself but some of its accompaniments. You would fain devote yourself to the melody, but you will hear more of it if you devote yourself to your work.

Cutting off the limbs of a young white pine in the way of my compass, I find that it strips freely. How long this?

By the time I have run through to the Harvard road, I hear the small pewee's tche-vetf repeatedly.

The Italian with his hand-organ stops to stare at my compass, just as the boys are curious about his machine. We have exchanged places.

As I go along the Assabet, a peewee skims away from the shore. The canoe birch sap still flows. It is much like that of the white, and is now pink, white, and yellow on the bark.

Bluets out on the bank by Tarbell's spring brook, maybe a day or two.

This was a very warm as well as pleasant day, but at one o'clock there was the usual fresh easterly wind and sea-turn, and before night it grew quite cold for the season. The regularity of the recurrence of this phenomenon is remarkable. I have noticed [it], at least, on the 24th late in the day, the 28th and the 29th about 3 p m., and to-day at 1 p m. It has been the order. Early in the afternoon, or between one and four, the wind changes (I suppose, though I did not notice its direction in the forenoon), and a fresh cool wind from the sea produces a mist in the air.

About 3.0 p m., when it was quite cloudy as well as raw, and I was measuring along the river just south of the bridge, I was surprised by the great number of swallows — white-bellied and barn swallows and perhaps republican — flying round and round, or skimming very low over the meadow, just laid bare, only a foot above the ground. Either from the shape of the hollow or their circling, they seemed to form a circular flock three or four rods in diameter and one swallow deep. There were two or three of these centres and some birds equally low over the river. It looked like rain, but did not rain that day or the next. Probably their insect food was flying at that height over the meadow at that time. There were a thousand or more of swallows, and I think that they had recently arrived together on their migration. Only this could account for there being so many together. We were measuring through one little circular meadow, and many of them were not driven off by our nearness. The noise of their wings and their twittering was quite loud.

## MAY, 1856

May 1. 6 p m. — To Hill.

I judge that the larch blossomed when the anthers began to be loose and dry and yellow on their edges. Say then the 28th. The water on the meadows is rapidly going down. I am now confined to the river for the most part. The water begins to feel as warm or warmer than the air when cool.

The scrolls of the ferns clothed in wool at Sassafras Shore, five or six inches high. *Thalictrum anemonoides* well out, probably a day or two, same shore, by the apple trees. *Viola ovata* on southwest side of hill, high up near pines. How pleasing that early purple grass in smooth water! Half a dozen long, straight purple blades of different lengths but about equal width, close together and exactly parallel, resting flat on the surface of the water. There is something agreeable in their parallelism and flatness.

From the hilltop I look over Wheeler's maple swamp. The maple-tops are now, I should say, a bright brick red. It is the red maple's reign now, as the peach and the apple will have theirs. Looking over the swamps a quarter of a mile distant, you see

dimly defined crescents of bright brick red above and amid a maze of ash-colored branches.

May 2. The tea lee of the yellow-rump warbler in the street, at the end of a cool, rainy day.

May 3. Another cool, rainy day. A staminate balm-of-Gilead poplar by Peter's path. Many of the catkins fallen and effete in the rain, but many anthers still red and unopen. Probably began five or six days ago.

May 4. P. M. — To Cedar Swamp via Assabet.

Among others, I see republican swallows flying over river at Island. Again I see, as on the 30th of April, swallows flying low over Hosmer's meadow, over water, though comparatively few. About a foot above the water, about my boat, are many of those little fuzzy gnats, and I suspect that it is these they are attracted by. (On the 6th, our house being just painted, the paint is peppered with the myriads of the same insects which have stuck to it. They are of various sizes, though all small, and there are a few shad-flies also caught. They are particularly thick on the coping under the eaves, where they look as if they had been dusted on, and dense swarms of them are hovering within a foot. Paint a house now, and these are the insects you catch.

— suspect it is these fuzzy gnats that the swallows of the 30th were catching.)

The river is gone down so much — though checked by the rain of the 2d and 3d — that I now observe the tortoises on the bottom, a stemothærus among them.

Hear the something like tve tve tve tve twé, ter té te tve tve of the myrtle-bird, and see the bird on the swamp white oaks by Island.

The aspen there just begun to leaf; not quite the white maple. I observe that the river meadows, especially Hosmer's, are divided by two or more ridges and valleys (the latter alone now covered with water and so revealed), parallel with the river. The same phenomenon, but less remarkable, on the Wheeler meadow. Are they the traces of old river-banks, or where, in freshets, the current of the river meets the meadow current, and the sediment is deposited?

See a peetweet on Dove Rock, which just peeps out. As soon as the rocks begin to be bare the peetweet comes and is seen teetering on them and skimming away from me.

Having fastened my boat at the maple, met, on the bank just above, Luke Dodge, whom I met in a boat fishing up that way once or twice last summer and previous years. Was surprised to hear him say, "I am in my eighty-third year." He still looks pretty strong and has a voice like a nutmeg-grater. Within two or three years at most, I have seen him walking, with that remarkable gait. It is encouraging to know that a man may fish and paddle in this river in his eighty-third year. He says he is older than Winn, though not the oldest man in the town. Mr. Tolman is in his eighty-sixth year.

Went up Dodge's (an Englishman who once lived up it and no relation of the last-named) Brook and across Barrett's dam. In the Cedar Swamp *Andromeda calyculata* abundantly out; how long? *Viburnum nudum* leafing. *Smilacina trifolia* recently up; will apparently open in ten or twelve days.

At the dam, am amused with the various curves of jets of water which leak through at different heights. According to the pressure. For the most part a thin sheet was falling smoothly over the top and cutting short off some smaller jets from the first crack (or edge of the first plank), leaving them like white spikes seen through the water. The dam leaked in a hundred places between and under the planks, and there were as many jets of various size and curve. Reminds me of the tail-piece in Bewick, of landlord drawing beer(?) from two holes, and knowledge of artist shown.

Shad-flies on the water, schooner-like. Hear and see a goldfinch, on the ground.

May 6. To Clamshell by river.

Our earliest currant out. Oat spawn showing little pollywogs (?) in meadow water. The horse-chestnut and mountain-ash leafing. Knawel out at Clamshell; how long? Cerastium out there under the bank. That early white birch there has about done running sap. Equisetum sylvaticum a day or two on the ditch bank there.

May 7. Wednesday. Fresh easterly wind.

— p. M. — To bear-berry on Major Heywood road.

In Deacon Hosmer's bam meadows, hear the don't don't of a bullfrog.

In the first hollow in the bank this side of Clamshell, where sand has been dug for the meadow, are a hundred or more bank swallows at 2 p. M. (I suspect I have seen them for some time) engaged in prospecting and digging their holes and circling about. It is a snug place for them, — though the upright portion of the bank is only four or five feet high, — a semicircular recess facing the southeast. Some are within scratching out the sand, — I see it cast out of the holes behind them, — others hanging on to the entrance of the holes, others on the flat sandy space beneath in front, and others circling about, a dozen rods off over the meadow. Theirs is a low, dry, grating twitter, or rather rattle, less metallic or musical than the vite vite and twittering notes of bam and white-bellied swallows. They are white-bellied, dark winged and tailed, with a crescent of white [sic] nearly around the lower part of the neck, and mouse-colored heads and backs. The upper and greater part of this bank is a coarse sliding gravel, and they build only in the perpendicular and sandy part (I sit and watch them within three or four rods) and close to the upper part of it. While I am looking, they all suddenly with one consent take to wing, and circle over the hillside and meadow, as if they chose to work at making their holes a little while at a time only. I find the holes on an average about a foot deep only as yet, some but a few inches.

In the meanwhile I hear, through this fresh, raw east wind, the te-a-lea of myrtle-birds from the woods across the river.

The bear-berry will perhaps open to-morrow.

I hear the evergreen-forest note close by; and hear and see many myrtle-birds, at the same time that I hear what I have called the black and white creeper's note. Have I ever confounded them?

Over the edge of Miles's mill-pond, now running off, a bumblebee goes humming over the dry brush. I think I saw one on the 5th also.

Miles began last night to let the water run off. The pond falls about three inches in twenty-four hours. The brook below is full of fishes, — suckers, pouts, eels, trouts, — endeavoring to get up, but his dam prevents. This morning his young man killed a number of pouts and eels and suckers with a shovel. Here he comes now, at 4 p m., with a spear, and raises the gate and waits a few moments for the water, which was two or three feet deep just below the mill, to run off; and then I see a good-sized trout, four or five pouts, and several suckers, and one eel still making their way upward, though the water hardly covers their backs. They do not turn and go down the stream with the water which is thus suddenly and rapidly let off. Meanwhile this young man picks out half a dozen pouts, eels, and suckers with his spear. Twenty rods down the brook I saw many more suckers trying to make their way up. They found it difficult now to get over the bars where the water was very shallow, and were sometimes confined to the hollows between. I saw two or three in company trying to squeeze through a narrow passage under some alder boughs, which was blocked up by two spotted tortoises; and one large eel squirming directly over an indifferent wood turtle, concluding to go down the stream, but it soon hid under a projecting bank. The pouts, etc., would suddenly bury themselves in the sand or mud and be lost. The fishes seemed unwilling to turn and go down the brook, and for the most part would come so near in the shallow water that they could easily be struck with the spear.

The water thus suddenly let off, there were many spotted and wood tortoises seen crawling about on the bottom. One little snapping (making the fifth of its species here), three and a half inches long, going down a few rods below the dam. This, like the larger ones, going down the brook. Where to? and why? He cannot be old enough to breed yet, and it is too early to be laying at the desert. This young snapping turtle was very strong-scented. Its tail appeared particularly long, as long as its shell, and very tapering, and very distinctly and sharply keeled. The first half-dozen of its dorsal serrations were very prominent and sharp, and its bill was very sharp also. It had four sharp points on each side of its shell behind, and I noticed that it swam better than other kinds of tortoises. Its head was as large as that of an ordinary wood tortoise. There were tracks of other turtles on the sandy bank.

The young man said that the eels came along as many as three in an hour in the night, and this morning there were a great many of them about the wheel. Last fall (this dam being made late in the fall), they found in the hollow under the wheel which they bailed out sixteen trout which weighed eight pounds. It is surprising how many fishes will run up and breed in such a little brook as this. The fishes generally would conceal themselves in the mud under a projecting bank, or in some deep hole in the sand in mid-channel which communicated with the mud beneath.

One of those larger snapping turtles seized the one I had by the head and they braced and struggled awhile.

The miller now raises his gate and lets his pond run off. Do they not generally earlier?

For a week the road has been full of cattle going up country.

May 10. The third day of rain. The river has again gone over the meadows, which were almost bare.

P. M. — To Walden in rain.

R. Rice speaks of having seen myriads of eels formerly, going down the Charles River, young ones not longer than his hand, stopped behind a board at the dam. That once there, when repairing the dam, he saw, while standing on the bared bottom below it, a large eel come up close by it through hard gravel and he believed it had just come down the river and had penetrated through six feet in thickness of the same character, for the dam was carried down to that depth below the bottom of the river.

That the snapping turtle caught fish by lying buried in the mud with only his eyes out, was Rice's supposition.

Some *Vaccinium Pennsylvanicum* out in Cut woods; maybe a day, as it has rained steadily the last two days. It seems to bloom with or immediately after the bear-berry.

I would gladly walk far in this stormy weather, for now I see and get near to large birds. Two quails whir away from the old shanty stubble-field, and two turtle doves go off from an apple tree with their clikit. Also at Walden shore a pigeon hawk (or else sharpshinned), with deep-brown back, went off from close at hand.

I see there, just above the edge of the Pool in Hubbard's Wood Path, the *Viola blanda* passing into the *V. lanceolata*, which last also is now in bloom, probably earlier there than in wetter places. May have been as early as the *blanda*.

Where the pitch pines were cut some years ago on Thrush Alley, I now see birches, oaks, and pitch and white pines.

On the railroad causeway against Trillium Wood, I see an apparently native willow, a shrub, with greenish bark and conspicuous yellow catkins, now in full bloom, apparently a little earlier than the *Salix alba*, but its leaflets or bracts much less advanced and conspicuous. Another on the Walden road. What is it? Mr. Prichard's Canada plum will open as soon as it is fair weather.

May 11. Rains still.

I noticed the other day that the stump of the large oak at Clamshell Hill, cut down fifteen years ago or more, was quite rotten, while the trunk which lay by its side, having never been removed, was comparatively sound.

The Roman writers Columella and Palladius warn not to build in a low valley or by a marsh, and the same rule is observed here to-day. In the West the prudent settler avoids the banks of rivers, choosing high and open land. It suggests that man is not completely at one with Nature, or that she is not yet fitted to be his abode. Adam soon found that he must give a marsh a wide berth, — that he must not put his bower in or near a swamp in the new country, — else he would get the fever and ague or an intermittent fever. Either nature may be changed or man. Some animals, as frogs and musquash, are fitted to live in the marsh. Only a portion of the earth is habitable by man. Is the earth improving or deteriorating in this respect? Does it require to be improved by the hands of man, or is man to live more naturally and so more safely?

P. M. — To Cedar Swamp up Assabet.

There is at length a prospect of fair weather. It will clear up at evening this fourth day of the rain. The river is nearly as high as it has been this spring.

The *Salix alba* by my boat is out and beaten by the rain; perhaps three or four days in some places, but not on the 6th. It does not rain now, though completely overcast, but looks as if it would clear up before night.

There are many swallows circling low over the river behind Monroe's, — bank swallows, barn, republican, chimney, and white-bellied. These are all circling together a foot or two over the water, passing within ten or twelve feet of me in my boat. It is remarkable how social the different species of swallow are one with another. They recognize their affinity more than usual. On the prospect of fair weather after so long a storm, the birds are more lively than ever. As I float through the Wheeler Indian field meadow, I see a veery hopping silent under the alders. The black and white creeper also is descending the oaks, etc., and uttering from time to time his seeser seeser seeser. What a rich, strong striped blue-black (?) and white bird, much like the myrtle-bird at a little distance, when the yellow of the latter is not seen. At a distance I hear the first yellow-bird.

The *Salix sericea* at Island rock is out, also the *S. cordata* off Prichard's, both apparently with *S. alba*. But I have not yet compared them (for date) quite accurately enough. I think I can pretty well distinguish the *sericea* by the grayness of the female catkins, twig and all, but am not sure I have seen the staminate. Neither am I sure that I see the staminate *S. cordata*. Those at Prichard's are apparently all female. There are many staminate ones now in full bloom in the Wheeler meadow, I suspect like that of the railroad causeway, male and female side by side, five rods north of *S. alba*; also male, west side below ring-post (vide May 10th), or they may be staminate plants of *S. cordata*, or some perhaps of *S. sericea*. Vide how many different kinds of leaves and mark them six weeks hence. Vide if those just off the north end of Holden Wood (Conantum) are all *S. cordata*, for there are many staminate ones like the last-named; also vide that one on the north side of the road and root fence beyond brook on Comer road (perhaps like the railroad one), male and female now a little past prime. All these willows blossom when the early willows, which bloom before leafing, are going to seed.

Large white maples are leafing.

I see, near the top of the bank at the further end of the first hemlocks, dirty-white fungi in nests, each about three quarters of an inch [in] diameter, without any thick rind which peels off. Each one is burst a little at top, and is full of dust of a yellowish rotten-stone color, which is perfectly dry and comes forth like a puff of smoke on being pinched, now after four days of rain, before the fair weather has come, and though each one is nearly half full of water. This dust certainly has but little affinity for moisture and might be of use in some cases.

I leave my boat in Hosmer's poke-logan and walk up the bank. A bluebird's nest and five eggs in a hollow apple tree three feet from ground near the old bank swallow pit, made with much stubble and dried grass. Can see the bird sitting from without.

There are a great many large flat black cockroach(?) - like beetles floating and paddling on the flood on the meadows, which have perhaps fallen in in the night (if not washed out of the grass); also a few of the thick dull reddish-brown ones.

May 12. A glorious day.

P. M. — Walked round by Dennis's and Hollowell place with Alcott.

It is suddenly very warm. A washing day, with a slight haze accompanying the strong, warm wind. I see, in the road beyond Luther Hosmer's, in different places, two bank swallows which were undoubtedly killed by the four days' northeast rain we have just had.

Puffer says he has seen two or three dead sparrows also. The sudden heat compels us to sit in the shade at the bars above Puffer's, whence we hear the first bobolink. How suddenly the birds arrive after the storm, — even yesterday before it was fairly over, — as if they had foreseen its end! How much life the note of the bobolink imparts to the meadow! I see a cultivated cherry in bloom, and Prichard's Canada plum will probably bloom to-morrow. The river is higher than yesterday, about the same as when highest before this spring, and goes no higher. Thus attains its height the day after the rain.

May 13. Hear a warbling vireo. Dandelions by roadside; probably several days in some places.

P. M. — Up river to *Kalmia glauca* Swamp.

In the swallows' holes behind Dennis's, I find two more dead bank swallows, and one on the sand beneath, and the feathers of two more which some creature has eaten. This makes at least seven dead bank swallows in consequence of the long, cold northeast rain. A male harrier, skimming low, had nearly reached this sandpit before he saw me and wheeled. Could it have been he that devoured the swallows?

These swallows were  $10 \frac{3}{4}$  + alar extent,  $4 \frac{3}{4}$  inches long; a wing  $4 \frac{3}{4}$  + by  $1 \frac{3}{4}$ +. Above they were a light brown on their backs, wings blackish, beneath white, with a dark-brown band over the breast and again white throat and side of neck; bill small and black; reddish-brown legs, with long, sharp, slender claws. It chanced that each one of two I tried weighed between five and six sixteenths of an ounce, or between five and six drams avoirdupois. This seems to be the average weight, or say six drams because they have pined a little. A man who weighs one hundred and fifty pounds weighs sixty-four hundred times as much as one. The wing of one contains about seven square inches, the body about five, or whole bird nineteen. If a man were to be provided with wings, etc., in proportion to his weight, they would measure about 844 square feet, and one wing would cover 311 feet, or be about 33 feet long by 14 wide. This is to say nothing of his muscles.

The *Kalmia glauca* will not open for some days at least.

Mrs. Ripley told me last night that Hill said the toads rang till they died if their call was not answered or attended to.

At the swamp, hear the yorrick of Wilson's thrush; the tweezer-bird or *Sylvia Americana*. Also the oven-bird sings. Caterpillars' nests on an apple two inches [in] diameter. Downy amelanchier just out at Lupine Bank; elsewhere, maybe, a day or two.

Where my sap has dried on the white birch bark it has now turned a bright light red. What a variety of colors it assumes!

Potter has a remarkable field of mulleins, sown as thickly as if done with a machine (under Bear Garden Hill). I remarked them last year. William Wheeler thinks the seed lies in the ground an indefinite period ready to come up. I thought that it might have been introduced with his grain when it was sown lately. Wheeler says that many a pasture, if you plow it up after it has been lying still ten years, will produce an abundant crop of wormwood, and its seeds must have lain in the ground. Why do not the chemists in their analyses of soils oftener mention the seeds of plants? Would not a careful analysis of old pasture sod settle the question?

I suspect that I can throw a little light on the fact that when a dense pine wood is cut down oaks, etc., may take its place. There were only pines, no other tree. They are cut off, and, after two years have elapsed, you see oaks, or perhaps a few other hard woods, springing up with scarcely a pine amid them, and you wonder how the acorns could have lain in the ground so long without decaying. There is a good example at Loring's lot. But if you look through a thick pine wood, even the exclusively pitch pine ones, you will detect many little oaks, birches, etc., sprung probably from seeds carried into the thicket by squirrels, etc., and blown thither, but which are overshadowed and choked by the pines. This planting under the shelter of the pines may be carried on annually, and the plants annually die, but when the pines are cleared off, the oaks, etc., having got just the start they want, and now secured favorable conditions, immediately spring up to trees. Scarcely enough allowance has been made for the agency of squirrels and birds in dispersing seeds.

At the Kalmia Swamp, the parti-colored warbler, and was that switter switter switter switter swit' also by it?

May 14. Air full of golden robins. Their loud clear note betrays them as soon as they arrive. Yesterday and to-day I see half a dozen tortoises on a rail, — their first appearance in numbers. Catbird amid shrub oaks. Female red-wing. Flood tells me he saw cherry-birds on the 12th of April in Monroe's garden.

May 15. A fog this morning. Our peach out.

P. M. — To beeches.

As I sat by the Riordan crossing, thought it was the tanager I heard? I think now, only because it is so early, that it may have been the yellow-throat vireo.

See also, for a moment, in dry woods, a warbler with blue-slate head and apparently all yellow beneath for a minute, nothing else conspicuous; note slightly like tseep, tseep, tseep, tseep, tsit sitter ra-re-ra, the last fast, on maples, etc. Maybe I heard the same yesterday.

Northern wild red cherry out, cut by railroad; maybe day or two elsewhere. At Heywood Spring I see a clumsy woodchuck, now, at 4 p. M., out feeding, gray or

grizzly above, brown beneath. It runs, or waddles, to its hole two or three rods off, and as usual pauses, listening, at its entrance till I start again, then dives in.

*Viola cucullata* abundant now. Just on the brink of this Heywood Spring, I find what may be the *Stellaria borealis* (if it is not the *longifolia*, but it is not in cymes like that; only a single flower to each axil, now at least), though Bigelow makes its calyx-divisions nerveless. These are three-nerved, and one flower, at least, has five (!) styles. It has been out perhaps several days. Some of the flowers are without petals, others with those very deeply cleft or divided white petals. The others may have pollen.

Strawberry well out; how long? On *Amelanchier Botryapium*, many narrow dark bronze-colored beetles (say three fourths inch long) coupled and at same time eating the flowers, calyx and all. Night-warbler. Hickory leaflets not so large as beech. Beech leaves two inches long. Say it has leafed a day or two. White birch pollen. Beech not out yet.

Checker-berries very abundant on south side of Pine Hill, by pitch pine wood. Now is probably best time to gather them.

Cleared out the Beech Spring, which is a copious one. So I have done some service, though it was a wet and muddy job. Cleared out a spring while you have been to the wars. Now that warmer days make the traveller thirsty, this becomes an important work. This spring was filled and covered with a great mass of beech leaves, amid and beneath which, damp and wet as they were, were myriads of snow-fleas and also their white exuviae; the latter often whitening a whole leaf, mixed with live ones. It looks as if for coolness and moisture 14 — which the snow had afforded — they were compelled to take refuge here.

*Cerasus pumila*, south side Pine Hill, not yet by Cut woods. Perceive some of that delicious meadow fra grance coming over the railroad causeway. Measured a chestnut stump cut last winter on Pine Hill; twenty-five inches in diameter and fifty-six rings.

May 16. Rainy day.

May 17. Rain still or lowering.

P. M. — To my boat at Cardinal Shore, thence to Lee's Cliff.

Kingbird. The beech twigs I gathered the 15th show anthers to-day in chamber; so it probably blossoms to-day or to-morrow in woods. *Vaccinium vacillans* apparently a day or two at least. *Veronica serpyllifolia* abundant now on banks, erected. Maryland yellow-throat heard afar in meadows, as I go along the road towards Hubbard's Bridge. It is warm, but still overcast and sprinkling occasionally, near the end of the rain, and the birds are very lively. A goldfinch twitters over.

In the dry lupine bank pasture, about fifteen rods from the river, apparently travelling up the hill, I see a box tortoise, the first I have found in Concord. Beside being longer (its upper shell five and one half by four and one fourth inches), it is much flatter and more oblong, less oval, than the one I found on Cape Cod last July. Especially it is conspicuously broader and flatter forward. The two rear marginal plates have a triangular sinus between them while the Cape Cod ones come to a point.

The fifth and sixth marginal plates do not project by their edges beyond the shell. The yellow marks are much narrower, and more interrupted and like Oriental characters, than in the Cape Cod one. The sternum also is less oval, uniformly blackish-brown except a few slight bone-[] or horn-colored blotches, while the Cape Cod one is light-yellow with a few brown blotches. The scales of the sternum in this are much less sharp-angled than in the Cape Cod one. The sternum more hollow or depressed.

The tail about three eighths of an inch long only, beyond the anus (?). The bill is very upright, somewhat like this: — A beak like any Cæsar's. Fore legs covered orange-colored scales.

Hind ones mostly brown or bronze with a few orange spots. Beside the usual hiss, uttered in the evening as I was carrying it, a single, as it were involuntary, squeak much like a croaking frog. Iris, bright light red, or rather vermilion, remarkable. Head, brown above with yellow spots; orange beneath and neck.

The river is about a foot lower than on the 13th, notwithstanding yesterday's and to-day's rain.

At the Kalmia Swamp, see and hear the redstart, very lively and restless, flirting and spreading its reddish tail. The sylvias — *S. Americana* and redstart and summer yellowbird, etc. — are very lively there now after the rain, in the warm, moist air, amid the hoary bursting buds of maples, oaks, etc.

I stand close on the edge of the swamp, looking for the kalmia. Nothing of its flower to be seen yet. The rhodora there will open in a day or two.

Meanwhile I hear a loud hum and see a splendid male hummingbird coming zigzag in long tacks, like a bee, but far swifter, along the edge of the swamp, in hot haste. He turns aside to taste the honey of the *Andromeda calyculata* (already visited by bees) within a rod of me. This golden-green gem. Its burnished back looks as if covered with green scales dusted with gold. It hovers, as it were stationary in the air, with an intense humming before each little flower-bell of the humble *Andromeda calyculata*, and inserts its long tongue in each, turning toward me that splendid ruby on its breast, that glowing ruby. Even this is coal-black in some lights! There, along with me in the deep, wild swamp, above the andromeda, amid the spruce. Its hum was heard afar at first, like that of a large bee, bringing a larger summer. This sight and sound would make me think I was in the tropics, — in Demerara or Maracaibo.

Nemopanthes on that very swamp-edge. *Vaccinium corymbosum* (?) or the high blueberry.

Hear the first veery note and doubtless the *Muscicapa olivacea*. The *Sylvia Americana* (parti-colored warbler, etc.) is very numerous there, darting about amid the hoary buds of the maples and oaks, etc. It seems the most restless of all birds, blue more [or] less deep above, with yellow dust on the back, yellow breast, and white beneath (the male with bright-orange throat, and some with a rufous crescent on breast); wings and tail, dark, black, with two white bars or marks, dark bill and legs.

At Lee's the *Turritis stricta* pods three inches long, and plant two and a half feet high by measure. Get some to press. *Myosotis stricta* above there, maybe several days. *Ranunculus bulbosus* a day or two at least. *Arenaria serpyllifolia*.

Mrs. Ripley showed me, from her son Gore in Minnesota, a few days ago, the first spring flower of the prairie there, a hairy-stemmed, slender-divisioned, and hairy-involucered, six-petalled blue flower, probably a species of *hepatica*. No leaves with it. Not described in Gray.

Yellow columbine well out at Lee's, one rod from rock, one rod east of ash.

How plainly we are a part of nature! For we live like the animals around us. All day the cow is cropping the grass of yonder meadow, appropriating, as it were, a part of the solid earth into herself, except when she rests and chews the cud; and from time to time she wends her way to the river and fills her belly with that. Her food and drink are not scarce and precious, but the commonest elements of which nature is composed. The dry land in these latitudes, except in woods and deserts, is almost universally clothed with her food, and there are inland seas, ready mixed, of the wine that she loves. The Mississippi is her drink, the prairie grass her food.

The shrub oak and some other oak leaflets, just expanding, now begin to be pretty.

Within the shell of my box turtle, in the cavity between its thighs and its body, were small dry leaves and seeds, showing where it laid. From these I should say it had come from amidst the alders.

May 18. Ed. Emerson says he saw at Medford yesterday many ground-birds' nests and eggs under apple trees.

R. W. E.'s black currant (which the wild *Ribes floridum* is said to be much like), maybe a day.

R. W. E. says that Agassiz tells him he has had turtles six or seven years, which grew so little, compared with others of the same size killed at first, that he thinks they may live four or five hundred years.

P. M. — To Kalmia Swamp.

Go across fields from R. W. E.'s to my boat at Cardinal Shore. In A. Wheeler's stubble-field west of Deep Cut, a female (?) goldfinch on an oak, without any obvious black, is mewling incessantly, the note ending rather musically. When I get over the fence, a flock of twenty or more, male and female, rise from amid the stubble, and, alighting on the oaks, sing pleasantly all together, in a lively manner.

Going along the Spring Path, hear an oft-repeated tchip tchar, tchip tchar, etc., or tchip tcharry (this is a common note with birds) from a large bird on a tree-top, a sort of flaxen olive. Made me think of a female rose-breasted grosbeak, though we thought the beak more slender.

On the surface of the water amid the maples, on the Holden Wood shore where I landed, I noticed some of the most splendid iridescence or opalescence from some oily matter, where the water was smooth amid the maples, that I ever saw. It was where some sucker or other fish, perchance, had decayed. The colors are intense blue and crimson, with dull golden. The whole at first covering seven or eight inches, but
