Aztec Religion – Pre-Columbian	395
1) Sacred Topography: From Mythic Origins to a New Center of the World	395
2) Cosmology, Divination, and Calendar	396
3) A Pantheon of Life-sustaining Forces and Divine Beings	397
4) The Preservation of Nature Through Ritual and Sacrifice	398
A Song of Sorrow – icnocuicatl	399
5) Earth’s Vegetation, Plants and Flowers	400
6) Underworld, Death and Tenochtitlan’s Final Destruction According to Aztec cosmology, all the “normal” dead – even the great kings – had to go to Mictlan, a subterranean place of unattractive afterlife with dark and rather frightening features. The inevitable destiny of this “mysterious land,” or “land of no return,” inspired many songs:	401

Printed and bound in the UK by Antony Rowe Ltd. This book is printed on acid-free paper, sewn, and cased in a durable buckram cloth.

Introduction

Introducing Religion and Nature

What are the relationships between human beings, their diverse religions, and the Earth's living systems?

The question animating this encyclopedia can be simply put. The answers to it, however, are difficult and complex, intertwined with and complicated by a host of cultural, environmental, and religious variables. This encyclopedia represents an effort to explore this question in a way that illuminates these relationships without oversimplifying the dynamic relations between human beings, their religions, and the natural environment.

This introduction and the "readers guide" that follows it provide a map to this terrain. The introduction explains the questions that gave rise to this project, describes the approach taken and rationale for editorial judgments made along the way, spotlights some of the volume's most important entries, and speculates about the future of nature-related religion as well as the increasingly interdisciplinary scholarly field that has emerged to track it. The "Readers Guide," located after this introduction, should not be missed, for it describes the different types of entries included in the encyclopedia and explains how to use it.

Religion and Nature Conundrums

In the second half of the twentieth century, as environmental alarm grew and intensified, so did concern about the possible role of religion in nature. Much of this concern has involved a hope for a “greening” of religion; in other words, it envisioned religion promoting environmentally responsible behavior. So fervent has this preoccupation become that, since the early 1970s, “green” has become a synonym for “environmental” in its original adjectival form, and it has now also mutated into verb and adverb, regularly deployed to signal environmentally protective action. Indeed, the term “green” will be used throughout these volumes to convey environmental concern, awareness, or action.

Curiosity regarding the relationships between human culture, religion, and the wider natural world, however, goes far beyond the question as to whether religions are naturally green, turning green, or herbicidal. The kinds of questions that arise from the nexus of religion and nature are many and diverse – but they have not always been in scholarly focus, a fact that this encyclopedia seeks to remedy.

In the *Encyclopedia of Religion and Nature* (ERN) we set forth a dozen analytical categories, both while pursuing entries and while guiding contributors, hoping this would arouse discussion and debate in a number of areas that had received too little critical scrutiny. Additionally, the aim was to foster a more nuanced analysis in areas that had already drawn significant attention. We asked prospective writers to illuminate the following questions, grouped into a dozen analytical categories, to the fullest extent possible, given their relevance to the specific subject matter in focus:

1. How have ecosystems shaped human consciousness, behavior, and history, in general, and *religions* and their environment-related behaviors in particular, if they have?
2. What are the perceptions and beliefs of the world’s religions toward the Earth’s living systems in general and toward individual organisms in particular? In what ways have these traditions promoted ecologically beneficent or destructive lifeways? Are some religions intrinsically greener than others?
3. Are religions being transformed in the face of growing environmental concern, and if so, how? To what extent do expressed beliefs about duties toward nature cohere with behaviors toward it?
4. Do various religions have internal and external resources for, or barriers to, the kind of transformations that are widely considered necessary if humans are to achieve ecologically sustainable societies? If they can be, what are the effective ways in which greener religions have been and can be encouraged?

5. How are various and different religions, from old and established to new and emergent, influencing one another as people struggle to address – and to make sense of – their environmental predicaments? How are contemporary environmental understandings influencing religion? Are ecological understandings more influential on religions than the other way around?

6. To what extent (if at all) can contemporary environmental movements be considered religious? If they are religious, should we consider all of the resource-related conflicts in which they are engaged to be religious struggles?

7. What are the reciprocal influences between nature and religion in interhuman conflict and violence? Does natural resource scarcity play a significant role in this regard, intensifying conflicts and the likelihood of religion-and-nature-related violence? Yet more specifically, what are the reciprocal influences between apocalyptic or millenarian religions, and environmental sciences, which are producing increasingly alarming prognostications?

8. What are the relationships among religious ideas, breeding, and population growth and decline? How is this related to other questions listed here?

9. How are the sciences integrated into contemporary nature-related religion and ethics? Is it possible for religions to consecrate scientific narratives, such as evolution, in such a way as to invent religions with *no* supernatural dimension? If so, can we still call such worldviews and perceptions religious?

10. With regard to nature religions, here defined as religions that consider nature to be sacred: What are the “spiritual epistemologies,” the perceptions in nature, the sources and cultural constructions, which have shaped them? And how and to what extent are political ideologies integrated into the nature-religion stew?

11. What are the impacts of “globalization” on nature-related religion and behavior; specifically, what are the processes, pathways, and limits to crossfertilization within and among different religions and regions in our increasingly interconnected world? Are there any patterns or tendencies emerging globally in contemporary Earth-related spirituality and religion?

12. If, indeed, there are patterns and tendencies, how are the people involved in nature-related religion and spiritualities reshaping not only the religious terrain, but also the political and ecological landscape around the world?

Readers interested in such questions should find much of interest in these volumes.

The remainder of this introduction explores the emerging fields related to religion and nature that have variously been dubbed “religion and ecology,” “ecological anthropology,” “cultural ecology,” and “environmental history.” The discussion of these fields and subfields includes several dimensions:

1. It provides and examines working definitions for terms that were critical to the framing of the project, including “religion,” “nature,” and “nature religion.”

2. It explores the genesis and evolution of interest in “religion and nature,” both among religionists and scholars. This section focuses first on the American Conservation Movement, and secondly on seventeenth-century Europe and on developments up

to the Environmental Age (shorthand in this introduction for the age of environmental awareness that emerged forcefully in the 1960s). It then spotlights the religion and nature debates during this period, including developments among “world religions,” “nature religions,” and in theories purporting to explain the natural origins and persistence of religion.

3. A concluding section overviews some of the ways in which this encyclopedia begins to address the future of religion, nature, and the understandings of these relationships.

Defining Religion, Nature, and Nature Religion

From the beginning of this project, the objective has been to encourage robust debate and to explore the widest possible range of phenomena related to the relationships between religion, nature, and culture. This leads inevitably to the very beginnings of the scholarly study of religion, for long and lively debates regarding what constitutes religion have often been deeply connected to discussions about the role nature plays in it. Because even this definitional terrain has been contested, in constructing this encyclopedia the aim has been to avoid excluding by definitional fiat some of the very phenomena and perspectives that are under discussion. Despite this reluctance to impose a definition of religion on the overall endeavor, however, any study has to be guided by a consistent set of standards and has to be clear about its subject matter. This terminological section, therefore, explains the operational definition of religion that has informed the construction of these volumes. It also clarifies other terms critical for this study, such as “spirituality,” “nature,” and “nature religion.”

One reason for this terminological interlude is that in contemporary parlance, people increasingly replace the term “religion” with “spirituality” when trying to express what moves them most deeply. Nowhere is the preference for the term “spirituality” over “religion” more prevalent than among those engaged in nature-based or nature-focused religion.

A number of scholars have noted and sought to understand the distinction between the terms spirituality and religion, and the preference many contemporary people express for the former over the latter. In one seminal study, the sociologist of religion Wade Clark Roof found that for many, “to be religious conveys an institutional connotation [while] to be spiritual . . . is more personal and empowering and has to do with the deepest motivations in life” (Roof 1993: 76–7). A number of subsequent empirical studies supported Roof’s analysis and found ample evidence that many people understood the distinction as Roof had described it and considered themselves spiritual but not religious. In survey research conducted by Daniel Helminiak, for example, 19 percent of respondents called themselves spiritual. For these people, religion “implies a social and political organization with structures, rules, officials, [and] dues [while] *spirituality* refers only to the sense of the transcendent, which organized religions carry and are supposed to foster” (Helminiak 1996: 33). Another study similarly found that “religiousness is increasingly characterized as ‘narrow and institutional,’ and spirituality . . . as ‘personal and subjective’ ” (Zinnbauer et al. 1997: 563).

The distinction between *religion* as “organized” and “institutional” and *spirituality* as involving one’s deepest moral values and most profound life experiences is probably the most commonly understood difference between the two terms. But there are additional idea clusters that often are more closely associated with spirituality than religion; and these ideas tend to be closely connected with nature and a sense of its value and sacredness.

Given its commonplace connection with environmental concerns, when considering nature-related religion, it is important to include what some people call *spirituality*. This is not to say that scholars and other observers must maintain the same understanding of the distinction between spirituality and religion that has emerged in popular consciousness. Most of those who consider themselves to be spiritual can be considered religious by an external observer, for they generally believe that life has meaning and that there is a sacred dimension to the universe.

Some argue that religion requires belief in divine beings and supernatural realities, however, and insist that even profoundly meaningful experiences and strong moral commitments cannot count as religion in the absence of such beliefs. An entry on the “Anthropology of Religion” by Jonathan Z. Smith and William Scott Green in *The HarperCollins Dictionary of Religion* asserts, for example, that religion is best defined as “a system of beliefs and practices that are relative to *superhuman* beings” (1995: 893). They argue that such a restrictive definition is best because it “moves away from defining religion as some special kind of experience or worldview” and excludes “quasi-religious religious movements” such as Nazism, Marxism, or Nationalism (1995: 893–4).

While the desire to exclude such movements as religions is understandable, to strictly enforce this definition would be unduly restrictive. It would eliminate some forms of Buddhism, for example, as well as a wide variety of people who consider themselves to be deeply spiritual and who regularly rely on terms like “the sacred” to describe their understanding of the universe or their places in it, but who do not believe in divine beings or supernatural realities. In short, such a restrictive definition of religion would preclude consideration of much nature-related religiosity.

By way of contrast, the framing of this encyclopedia was influenced more by religion scholar David Chidester’s reflections on the sometimes violent debates and struggles over understandings and definitions of religion. Chidester acknowledges that some working definition of religion is required for its study. But he also argues that because the term “*religion*” has been a contested category, a single, incontestable definition of religion cannot simply be established by academic fiat” (Chidester 1996b: 254). He proposes, instead, a self-consciously vague definition: religion is “that dimension of human experience engaged with sacred norms” (1987: 4).

Chidester acknowledges that some will consider such a definition not only vague but circular, but contends that vagueness can be an asset when trying to understand the diversity of religion. Vagueness is certainly a virtue when studying nature-related religion, partly because there are so many forms of it. Circularity may be inevitable.

Chidester asserts, “A descriptive approach to the study of religion *requires* a circular definition of the sacred: Whatever someone holds to be sacred is sacred.” He concludes that the task of religious studies, therefore, “is to describe and interpret sacred norms that are actually held by individuals, communities, and historical traditions” (1987: 4). This encyclopedia is premised similarly, for to adopt a more restrictive definition would exclude a variety of actors who regularly deploy metaphors of the sacred to describe their deepest spiritual and moral convictions. Moreover, some substantive definitions of religion (which specify things that constitute religion, such as myths, beliefs in divine beings, symbols, rites and ethics) as well as functional ones (which describe how religions operate and influence and/or are influenced by nature and culture), create restrictive lenses that make it impossible for them to apprehend some forms of nature spirituality. So to adopt such definitions would preclude from discussion much of what *The Encyclopedia of Religion and Nature* set out to illuminate.

Filling out further his understanding of religion as an engagement with the sacred, however this is understood, Chidester adds, what people hold to be sacred tends to have two important characteristics: ultimate meaning and transcendent power . . . Religion is not simply a concern with the meaning of human life, but it is also an engagement with the transcendent powers, forces, and processes that human beings have perceived to impinge on their lives (1987: 4).

Such a flexible understanding of religion provides a good starting point for this encyclopedia’s inquiry into the connections between nature, religion, and culture. The only part of Chidester’s definition that we might need occasionally to set aside is the nebulous term “transcendent” – at least if this evokes a sense of something supernatural or somehow beyond the observable and sensible world – for much nature-based spirituality involves a perception of the sacred as immanent.

From the outset, then, an open operational definition, adapted from Chidester’s, has informed the construction of this encyclopedia. It understands religion as “*that dimension of human experience engaged with sacred norms, which are related to transformative forces and powers and which people consider to be dangerous and/or beneficent and/or meaningful in some ultimate way.*” For many, this meaningfulness and the sacred norms associated with it have much to do with nature. And nature itself, another problematic term that also has inspired robust discussion, can be for our purposes understood simply: Nature is that world which includes – but at the same time is perceived to be largely beyond – our human bodies, and which confronts us daily with its apparent otherness.

With such minimalist definitions of religion and nature in mind, how then are we to understand them when they are combined into the term “nature religion”? Here also there is no scholarly consensus, as illustrated in the entry on NATURE RELIGION itself, as well as in my own entry on “Nature Religion” in *The Encyclopedia of Religion* (Taylor 2005). (Encyclopedia entries mentioned in this introduction are indicated by SMALL CAPITAL LETTERS, as in the previous sentence.) But in contemporary parlance there does seem to be a strong tendency to define as nature religion any

religiosity that considers nature to be sacred (extraordinarily powerful in both dangerous and beneficial ways) and worthy of reverent care. This is the simple definition that I will employ in this introduction as shorthand for what I have sometimes called “nature-as-sacred” religion.

This encyclopedia’s contributors have not, however, been bound to my own usage of the term in this introduction. Catherine Albanese, for example, in *NATURE RELIGION IN THE UNITED STATES*, which builds upon her influential book *Nature Religion in America* (1990), understands the term more broadly. For Albanese, nature religion is a trope for all religious phenomena in which nature is an important religious symbol or conceptual resource, whether or not nature is considered sacred. Careful readers will be alert to the different ways contributors in this encyclopedia may use the same terminology.

In sum, the definitions that shaped the construction of this encyclopedia, and this introduction and reader’s guide, were adopted for strategic reasons. The aim in finding simple and inclusive definitions of “religion” and “nature” has been to invite the widest variety of perspectives to engage the meaning and relationships that inhere to the human religious encounter with nature. The aim in defining nature religion as “nature-as-sacred” religion (in this introduction only) has been to distinguish it from “the natural dimension of religion,” an apt phrase borrowed from Albanese that I use to represent the entire “religion and nature” or “religion and ecology” field (Albanese

1990: 6). Understanding this wider, natural dimension of religion is certainly as important as understanding religions that consider nature to be sacred. The rest of this introduction and the diversity of entries that follow make this clear.

The Evolution of Interest in Religion and Nature

This overview of the genesis and evolution of interest in religion and nature covers a lot of territory and is necessarily selective. While impressionistic, it does describe the major trends and tendencies characteristic of the religion and nature discussion. It is divided into three sections.

The first section is focused on the United States between the mid-nineteenth century and the age of environmentalism which, despite the presence of conservationists and conservation thinkers before this period, cannot be said to have arrived until the 1960s. This section introduces the important role that differing perspectives on religion and nature played in the rise of environmentalism globally. The second section focuses on the evolution of nature and religion-related thinking among intellectuals, especially since the seventeenth century in Europe, and it follows these streams into the 1960s. This section explores the ways “nature religions” were understood before and after the Darwinian revolution, and suggests some ways in which evolutionary theory transformed the religion and nature debate, both for intellectuals and wider publics. Introducing these two streams sets the stage for an introduction to the perspectives and debates surrounding religion and nature during the age of environmentalism. Taken together, this overview illuminates trends that are likely to continue and thus it poses questions about the future of religion and nature.

Religion and Nature in the American Conservation Movement

When analyzing the ways and reasons people have thought about the relationships between religion and nature, it is wise to consider not only the cultural, but also the environmental context. This is certainly true when we examine the emergence of the conservation movement, and its intersections with perspectives on religion and nature.

By the mid-nineteenth century, largely for building construction and the production of “pig iron,” deforestation in the United States had begun to evoke environmental alarm. This led to a survey in the Federal Census of 1880 that documented the dramatic decline of American forests. Meanwhile, the fossil-fuel age had begun with the first pumping of petroleum from the ground in 1859

(by Edwin L. Drake in Pennsylvania) and the invention of practical and useful two and four-stroke internal combustion engines in Europe (in 1875 and 1876). These developments led to the automobile age, which for all practical purposes began in 1885.

The invention of the internal combustion motor was accompanied by a dramatic increase in self-conscious reflection on the role that religion plays in shaping environments. This occurred in no small part because the alteration (and degradation) of the world's environments intensified and accelerated rapidly as humans developed and wielded ever-more powerful petroleum-fueled power tools as they reshaped ecosystems and their own, built environments.

Not coincidentally, this was also a period when ROMANTICISM and other nature-related spiritualities, birthed first in Europe, as well as the modern conservation movement, were germinating on American ground. The artist Frederick Edwin Church, for example, painted "Twilight in the Wilderness" (1860) inspiring the so-called Hudson School and generations of painters and later photographers (*see* ART), including the twentieth-century photographer ANSEL ADAMS, who depicted the sublime that he found in the American landscape. The American naturalist and political writer HENRY DAVID THOREAU, who was also a leading figure in the religious movement known as TRANSCENDENTALISM, wrote *Walden* in 1854. He included in it a now-famous aphorism, "in wildness is the preservation of the world" and believed that nature not only has intrinsic value but provides the source of spiritual truth. Thoreau kindled the WILDERNESS RELIGION that found fertile ground in America and provided a spiritual basis for conservation. In *The Maine Woods* (1864) Thoreau called for the establishment of national forest preserves, helping to set the stage for the National Park movement and the BIOSPHERE RESERVES AND WORLD HERITAGE SITES that would follow. In that very year, the American President Abraham Lincoln protected California's spectacular Yosemite Valley, which eventually expanded in size and became one of the world's first national parks.

Thoreau influenced JOHN MUIR, the Scottish-born nature mystic who, after growing up on a Wisconsin farm and hiking to the Gulf of Mexico as a young man, eventually wandered his way to California in 1868. Muir became one of the first Europeans to explore Yosemite and the rest of the Sierra Nevada Mountains. He found in them a sacred place where he could hear the "divine music" of nature, even giving RALPH WALDO EMERSON, Thoreau's Transcendentalist mentor, a tour of Yosemite Valley in 1871. Muir was, however, bitterly disappointed by Emerson's unwillingness to linger and listen to the valley's sacred voices. In 1892 Muir founded the SIERRA CLUB to prevent the desecration of these mountains by insensitive humans.

In the early twentieth century an archetypal battle was joined between John Muir and GIFFORD PINCHOT. At this time Muir was America's foremost representative of an ethic of "nature preservation." He would also become the spiritual godfather of the international National Park movement, which was founded significantly on perceptions of the sacredness of natural systems. Pinchot served as the first Chief Forester of the United States between 1899 and 1910. He influentially espoused a utilitarian

environmental ethic of fair and responsible use of nature for the benefit of all citizens, present and future.

Pinchot, like many politically progressive Christians of his day in North America, had been decisively influenced by its “Social Gospel” movement, a largely liberal expression of Christianity that sought to apply Christian principles to the social problems of the day. Consequently Pinchot sought to promote “the conservation of natural resources” (bringing the phrase into common parlance) partly to aid the poor and partly to promote democratic ideals against powerful corporate interests, which he believed unwisely despoiled the country’s natural heritage. Although Muir and Pinchot initially became friends, based in part on their mutual passion for the outdoors, Pinchot’s utilitarian ethic and Muir’s preservationist one were incompatible. Their competing values led them, inexorably, into an epic struggle over which management philosophy, with its attendant religious underpinnings, would guide policies related to public wildlands.

Muir considered the grazing of sheep in Yosemite, and later, plans to dam Yosemite’s Hetch Hetchy Valley, for example, to be desecrating acts. Pinchot became a powerful federal official who successfully promoted grazing and dam building. Muir denounced Pinchot as an agent of desecration asserting that there was “no holier temple” than Hetch Hetchy Valley. Pinchot thought Muir had failed to apprehend the religious duty to develop natural resources for the good of humankind. The historian Roderick Nash called the Hetch Hetchy controversy a “spiritual watershed” in American environmental history. This watershed demonstrated that a “wilderness cult” had become an important political force in American environmental politics (Nash 1967: 181). (*See also* WILDERNESS SOCIETY, MARSHALL, ROBERT and LEOPOLD, ALDO.) In subsequent decades such WILDERNESS RELIGION would remain potent and lead to bitter land-based conflicts all around the world. Indeed, as the preservationist national parks model spread, often alongside and competing with management models that promoted a utilitarian, “multiple use” doctrine for public lands, the cultural divide between the competing ethical and religious orientations represented by Muir and Pinchot appeared to go global.

There were many other dimensions to such religion-related land-use disputes, however, including the typical deracination (displacement from their original habitats), sometimes by genocide, of the peoples already living on lands designated “public” by nation-states. These people often had their own religious claims and connections to these lands. So as the demand to protect natural places intensified around the world, it involved more than a dispute between the spiritual biocentrism (life-centered ethics) of John Muir and the utilitarian anthropocentrism (human-centered ethics) of Gifford Pinchot. Whether in view or hidden from sight, the resulting disputes often, if not always, intertwined with disputes related to power, ethnicity, class, and nationality (*see* MANIFEST DESTINY). These controversies were inevitably mixed in with diverse and competing understandings regarding how properly to understand the sacred dimensions of life, and where the sacred might be most powerfully located.

Some of the peoples who survived deracination as the result of the global expansion of nation-states would eventually claim a right to their original lands and landbased spiritual traditions. This trend further complicated the complex relationships between political, natural, and cultural systems. The disputes between Muir and Pinchot were repeated in the years that followed; and to these were added disputes between their spiritual progeny and those who later condemned both conservationist and preservationist movements for promoting an imperial project that harmed the inhabitants of lands immorally, if not illegally, declared public. In the United States and many other countries that established national parks, as environmental degradation continued, movements arose in resistance to them. Such conflicts provided one more tributary to the growing of scholarly interest in religion, nature, and culture.

Religion and Nature from Seventeenth-Century Europe to the Environmental Age

Curiosity about the relationships between nature, religion, and culture, of course, predated the modern conservation era. Much of this resulted from the encounter between anthropological observers and indigenous people, and much of this occurred (from the mid-nineteenth century onward) in a Darwinian context involving an effort to understand the ways in which religions emerged, and changed, through the processes of biological evolution. Put differently, a central question was: *How and why did religion evolve from the natural habitats from which humans themselves evolved?*

Many answers have been proposed, and these have often been grounded largely upon analyses of the religions of indigenous peoples. In many indigenous societies, the elements or forces of nature are believed to be inspirited and in reciprocal moral relationships in which there are two-way ethical obligations between non-human and human beings. In the eighteenth century such perceptions were labeled, for the first time, NATURE RELIGION and TOTEMISM (which postulated early religion as involving a felt sense of spiritual connection or kinship relationship between human and nonhuman beings). In the late nineteenth century the anthropologist E.B. Tylor coined the term ANIMISM as a trope for beliefs that the natural world is inspirited. Many early anthropologists considered Totemism and/or Animism to be *an* early if not *the* original religious form. Tylor and many other anthropologists and intellectuals observing (or imagining) indigenous societies also considered their religions to be “primitive,” and expected such perceptions and practices to wither away as Western civilization expanded.

Over the past few centuries a variety of terms have been used which capture the family resemblances found in the spiritualities of many indigenous societies, as well as contemporary forms of religious valuation of nature, including “natural religion,” “nature worship,” “nature mysticism,” “Earth religion,” PAGANISM and PANTHEISM

(belief that the Earth, or even the universe, is divine). Whatever the terms of reference (and readers will do well to consult the specific entries on these terms for their various and often contested, specific definitions), nature religion has been controversial, whether it is that of wilderness aficionados, indigenous people, or pagans. Here we can introduce this rich and contested terrain only by underscoring a few central tendencies, pivotal figures, and watershed moments in the unfolding cultural ferment over religion and nature. In-depth treatments are scattered, of course, throughout the encyclopedia.

In mainstream occidental (Western) culture, which was shaped decisively by the monotheistic, Abrahamic religions (Judaism, Christianity, and Islam), the tendency has been to view what we are calling nature religions (in general) and paganism (in particular) as primitive, regressive, or even evil. (*See* PAGANISM: A JEWISH PERSPECTIVE, for one example). One way or another, these critics have viewed nature religions negatively as having failed to apprehend or as having willfully rejected a true theocentric understanding of the universe as God-created. According to this point of view, nature religions perilously worship the created order or elements of it rather than the creator God.

Such criticisms came not only from monotheistic conservatives but also from some of the Western world's greatest thinkers. The German philosopher FRIEDRICH HEGEL, for example, advanced an idealistic philosophy that considered nature religions primitive because of their failure to apprehend the divine spirit moving through the dialectical process of history.

There were strong countercurrents, however, to the general tendency to view nature religions negatively. The cultural movement known as ROMANTICISM, already mentioned as an influence on the American conservation movement, emerged as a strong social force in the eighteenth century. Inspired in large measure by the French philosopher JEAN-JACQUES ROUSSEAU (1712–1778), Romanticism was further developed and popularized by a number of literary figures including Samuel Taylor Coleridge (1772–1834) in England and Johann Wolfgang von Goethe (1749–1832) in Germany. Those philosophers who labored to develop a compelling PHILOSOPHY OF NATURE also played a major role in the influence of Romanticism, both in Europe and America.

The Romantics rejected destructive, dualistic and reductionistic worldviews, which they considered to be a central feature of Western civilization. For Rousseau, and many dissenters to the occidental mainstream before and since, indigenous peoples and their nature religions were not primitive but noble, providing models for an egalitarian and humane way of life, one that was immune from the avarice and strife characteristic of the dominant European cultures. (*See* ROMANTICISM AND INDIGENOUS PEOPLES and NOBLE SAVAGE.)

It was into this social milieu, in which views about nature religion were already polarized, that CHARLES DARWIN introduced *On the Origin of Species* in 1859. The work elaborated the nascent theory of evolution that had already begun to emerge, perhaps most significantly, by specifying natural selection as its central process. The theory soon made its own, decisive impact.

For many, evolutionary theory disenchanting (took the spirits out of) the world. Generations of scholars after Darwin came to view religions as originating in misperceptions that natural forces were animated or alive. A close friend of Darwin, John Lubbock, initiated such reflection in *The Origin of Civilization and the Primitive Condition of Man* (1870), citing as evidence Darwin's observation that dogs mistake inanimate objects for living beings. Lubbock asserted that religion had its origin in a similar misapprehension by early humans.

In the next century an explosion of critically important scholarly works appeared. Most wrestled with what they took to be the natural origins of religion, or with "natural religion," or with what they considered to be the "worship of nature," or with the symbolic importance and function of natural symbols in human cultural and religious life. Among the most important were J.F. McLennan's articles on "The Worship of Animals and Plants" (1869–1870),

E.B. Tylor's *Primitive Culture* (1871), F. Max Müller's *Natural Religion* (1888), Robertson Smith's *Lectures on the Religion of the Semites* (1889), Baldwin Spencer and F.J. Gillen's *Native Tribes of Central Australia* (1899), Emile Durkheim's *Elementary Forms of the Religious Life* (1912), James G. Frazer's *Totemism and Exogamy* (1910) and *The Worship of Nature* (1926), Mircea Eliade's *Patterns in Comparative Religion* (1958) and *The Sacred and the Profane* (1959), Claude Lévi-Strauss's *Totemism* (1962, translation 1969), Victor Turner's *Forest of Symbols* (1967), and Mary Douglas's *Purity and Danger* (1966) and *Natural Symbols* (1970).

Among the high points in these works were E.B. Tylor's invention of the term animism as a name for indigenous nature religion and a corresponding theory to explain how it came into existence; and FRIEDRICH MAX MÜLLER's historiography which traced the origin of Indo-European religion to religious metaphors and symbolism grounded in the natural environment, especially the sky and sun. Sir James Frazer, who had been decisively influenced by both of these figures, added his own theories that the personification and "worship of nature" was the common root of all religion and that the remnants of pagan religion can be discerned in European folk culture. Quoting Frazer provides a feeling for the ethos prevalent among these early anthropologists.

[By] the worship of nature, I mean . . . the worship of natural phenomena conceived as animated, conscious, and endowed with both the power and the will to benefit or injure mankind. Conceived as such they are naturally objects of human awe and fear . . . to the mind of primitive man these natural phenomena assume the character of formidable and dangerous spirits whose anger it is his wish to avoid, and whose favour it is his interest to conciliate. To attain these desirable ends he resorts to the same means of conciliation which he employs towards human beings on whose goodwill he happens to be dependent; he proffers requests to them, and he makes them presents; in other words, he prays and sacrifices to them; in short, he worships them. Thus what we may call the worship of nature is based on the personification of natural phenomena (Frazer 1926: 17).

Reflecting the influence of the evolutionary perspective, Frazer thought that nature religions were anthropomorphic superstitions and would naturally be supplanted, first by polytheism, then by monotheism. He also believed that this was part of a “slow and gradual” process that was leading inexorably among civilized peoples to the “despiritualization of the universe” (Frazer 1926: 9). Many anthropological theorists during the nineteenth and early twentieth century seemed to agree that the nature religion characteristic of early humans and the world’s remaining “primitives” would eventually be supplanted either with monotheistic forms or no religion at all. Many of these early anthropologists were, therefore, also early proponents of the secularization thesis, which generally expects the decline of religion.

MIRCEA ELIADE drew on much of this earlier scholarship when publishing his seminal works in the 1950s and early 1960s, but in contrast to much of it, he maintained a subtle, positive evaluation of religion, including nature religion. At the heart of his theory lay his belief that early religion was grounded in a perception that a “sacred” reality exists that is different from everyday, “profane” realities, and that it manifests itself at special times and places, usually through natural entities and places. Indeed, for Eliade, the sacred/profane dichotomy was at the center of all religious perception. Moreover, for Eliade, the recognition of the sacred has something fundamental to do with what it means to be human.

Although Eliade’s theory was sharply criticized in the latter half of the twentieth century, his exhaustive comparative scholarship helped to establish that, in the history of religions, natural systems and objects are intimately involved in the perception of the sacred, and that this is an important aspect of religious life. Symbolic anthropologists, including Claude Lévi-Strauss (in some minds), Victor Turner, and Mary Douglas, for their part, scrutinized the functions of natural symbols in religion and culture, making provocative suggestions as to why nature draws human attention in a religious way.

Clearly, while there have been many competing perspectives about the relationships between religion and nature, some generalizations can be made. Many people have considered forces and entities in nature to have their own powers, spiritual integrity, or divinity, and have considered plants and animals, as well as certain earthly and celestial places, to be sacred. Certainly, these kinds of beliefs have often enjoined specific ritual and ethical obligations. Undoubtedly, the forces and entities of nature have been important and sometimes central religious symbols that work for people and their cultures in one way or another. Even when these entities and forces are not themselves considered divine, sacred, or even personal, they can point or provide access to divine beings or powers that are beyond ordinary perception. In sum, to borrow an expression from Claude Lévi-Strauss who first used it when reflecting, more narrowly, about animals in the history of religion, nature, from the most distant reaches of the imagined universe, to the middle of the Earth, is religiously “good to think.”

Religion and Nature in the Environmental Age

This brief review brings us up to the 1960s, the cusp of the age of environmental awareness and concern, which was symbolically inaugurated with the celebration of the first Earth Day in 1970. This was a period characterized by an explosion of interest in religion and nature, although such interest was not new. What was novel was a widespread and rapidly growing alarm about environmental deterioration, which for some added an apocalyptic urgency to the quest to determine whether religion was to blame or might provide an antidote. If so, the question naturally followed, of what sort would such an antidote be?

A multitude of entries in this encyclopedia explore this period and its competing perspectives. Here we will outline the main streams of discussion from this period to the present, noting especially how the environmental consequences of religious belief and practice came to the fore- front of the discussion for the first time. Discussion of the main issues and questions that were engaged are listed in the following three subsections.

World Religions and Environmentalism

In 1967 CLARENCE GLACKEN published *Traces on the Rhodian Shore: Nature and Culture in Western Thought from Ancient Times to the End of the Eighteenth Century*. It was the most important historical overview of the complicated and ambiguous relationships between religion and nature in the Western world. Especially detailed in its analysis of Classical culture (including its pagan dimensions and long-term cultural echoes) and Christianity, it brought the reader right up to the advent of the Darwinian age. Donald Worster in *Nature's Economy: A History of Ecological Ideas* (1977, second edition 1994) continued the story up and into the age of ecology. This work helped inspire further scholarly investigation during the 1960s and 1970s of the environmental impacts brought on by Western culture and its philosophical, religious, and scientific underpinnings. Taken together, these works portray (sometimes in an oversimplified manner) an epic struggle in Western culture between organicist and mechanist world-views – and concomitantly – between those who view the natural world as somehow sacred and having intrinsic value, and those who view the Earth as a way station to a heavenly realm beyond the Earth, or, who viewed life on Earth in a utilitarian way, as having value only in its usefulness to human ends. A common dialectic in these works, as seen in the growing body of literature that followed, was the notion that religious ideas were decisive variables in human culture, and thus, they were either culprit or savior with regard to environmental and social well-being.

It was during the decade between the publication of Glacken's and Worster's works (1967 and 1977) that ENVIRONMENTAL ETHICS sprang forth as a distinct subdiscipline in philosophy. While there were many factors that led to this outpouring of

ethical interest in nature, a short article by the historian Lynn White became a lightning rod for much of the subsequent discussion. Indeed, the LYNN WHITE THESIS became well known and played a significant role in the intense scrutiny that would soon be focused on the environmental values and practices that inhere to the so-called “world religions.” (“World religions” is shorthand for Judaism, Christianity, Islam, Daoism, Confucianism, Buddhism, Hinduism, and sometimes Jainism, which are commonly considered of major importance either because of their antiquity, influence, transnational character, or large number of adherents.)

Published in 1967 in the widely read journal *Science*, White’s article contended that monotheistic, occidental religions, especially Christianity, fostered anti-nature ideas and behaviors. His most striking and influential claim, however, may have been: “Since the roots of our

[environmental] trouble[s] are so largely religious, the remedy must also be essentially religious” (White 1967: 1207). Although others had expressed such views long before he did, the increasing receptivity in America to non-Western religious beliefs that accompanied the 1960s cultural upheavals, combined with the simultaneous growth of environmental alarm, made the ground fertile for the reception and debate of such views. Much of the environmental alarm was precipitated by RACHEL CARSON – an American scientist who was motivated by her own deep, spiritual connections to nature – whose *Silent Spring* (1962) warned about the environmentally devastating consequences of industrial pollution and pesticide use. With such works fueling environmental anxieties, White’s assertions quickly engendered several types of response, both among scholars and the wider public.

From those already acquainted with such arguments, there was often hearty agreement. Some had already been influenced by Romantic thought, or by historical analyses such as Perry Miller’s classic work, *Errand into the Wilderness* (1956), which analyzed the Puritans’ encounter with wild nature in America, or Max Weber’s *The Protestant Ethic and the Spirit of Capitalism* (1958), which found in religious ideas the roots of capitalism’s voracious appetite for nature’s resources. White’s thesis also inculcated or reinforced beliefs that were becoming more prevalent in America, that religions originating in Asia, or nature religions including those of indigenous societies, were spiritually and ethically superior to those which had come to predominate in the Western world. This was ironic, for White thought there were currents in the Christian tradition that could provide solid ground for environmental ethics.

Those in the monotheistic, Abrahamic traditions, who encountered such perspectives, tended to respond in one of three ways: either apologetically, arguing that properly understood, their traditions were environmentally sensitive; in a confessional way, acknowledging that there were truths to such criticisms and that internal religious reform should be undertaken to make their religions environmentally responsible; or with indifference, viewing the criticisms, and environmental concern, as of minor if any importance to their religious faith. This latter response ironically provided evidence for the critical aspects of White’s thesis.

These types of responses came from both laypeople and scholars. Scholarly experts in sacred texts, both those religiously committed and uncommitted to the traditions associated with them, began investigating these texts and other evidence about their traditions for their explicit or implicit environmental values.

Before long, the soul searching White's thesis helped to precipitate within occidental religions began to be taken up by devotees and scholars of religions originating in Asia. This occurred, in part, because of certain scholarly reactions to White's thesis. The geographer Yi Fu Tuan, for example, pointed out in an influential article published in 1968, that deforestation was prevalent before the advent of Christianity. Moreover, he asserted, in China there was great abuse of the land before Western civilization could influence it.

Following Tuan, gradually, more scholars began to ask, "Why has environmental decline been so pronounced in Asia if, as had become widely believed, Asian religions promote environmental responsibility?" Just as White's thesis had precipitated apologetic, confessional, and indifferent reactions within the world's Abrahamic traditions, the diverse reactions to White's thesis triggered similar reactions among religionists and scholars engaged with Asian religions.

In the case of both Western and Asian religions, religious studies scholars played a significant role in the efforts to understand the environmental strengths and weaknesses of their traditions. Scholars of religion have often played twin roles as observers and participants in the religions they study, of course, so it is unsurprising that, in the face of newly perceived environmental challenges, they would play a role in rethinking the traditions' responsibilities in the light of them. Quite a number of them, indeed, became directly involved in efforts to push the traditions they were analyzing toward ethics that take environmental sustainability as a central objective. The many, diverse entries exploring the world's religious traditions describe in substantial detail the emergence of efforts to turn the world's major religious traditions green. The role of religion scholars in these efforts is reviewed in

RELIGIOUS STUDIES AND ENVIRONMENTAL CONCERN.

What is perhaps most remarkable about these efforts is how rapidly the environment became a centerpiece of moral concern for substantial numbers of religious practitioners, and scholars engaged with the world's major religious traditions. More empirical work is needed to understand the extent to which and in what ways environmental values have been influencing practitioners of the world's dominant religions. Early efforts by social scientists to understand these trends, and the challenges they face as they seek to do so, are assessed in SOCIAL SCIENCE ON RELIGION AND NATURE.

Nature Religions and Environmentalism

In addition to the view that Asian religions provide an antidote to the West's environmental destructiveness, nature religions have been offered as alternatives which

foster environmentally sensitive values and behaviors. While indigenous societies have been foremost in mind in this regard, paganism, whether newly invented or revitalized from what can be reconstructed of a pre-Christian past (or both), has also been considered by some to offer an environmentally sensitive alternative. In this light or sense, a variety of new religious movements, recreational practices, scientific endeavor, and other professional work, can also be understood as nature religions.

As was the case in the late nineteenth and early twentieth century, during the age of ecology, anthropology was a major contributor to the debates. But the tendency to view negatively such cultures was decisively reversed as some anthropologists began to ask questions *from* an evolutionary perspective. The most important of these was whether religion in general (and the religions of indigenous societies in particular) served to enhance the survival of the human organism. Put differently, they asked: Does religion help the human species to adapt successfully to its natural habitats, and if so, under what circumstances?

The answer that many came to was that the taboos, ethical mores, and rituals that accompany religious worldviews often evolve in such a way that the religion promotes environmental health and thus individual reproduction and group survival.

This kind of perspective can be briefly illustrated. In the mid-twentieth century, the anthropologist Julian Steward, whose own work in “cultural ecology” was based foremost on his analyses of the relationships between indigenous peoples of western North America’s Great Basin, argued that human culture represents an ecological adaptation of a group to its specific environment. He asserted that such adaptation always involved the effort to harness and control energy. The anthropologist Leslie White, who like Steward based his perspective on studies of North American Indians, also considered social evolution to involve the effort to harness and control energy. In the 1960s, MARVIN HARRIS followed their lead, especially spotlighting the role of religion. He found, for example, that the myth of the sacred cow in India confers on the human cultures of South Asia material and ecological advantages. The myth functioned in an ecologically adaptive manner, he argued, by helping to maintain the nutrient cycles necessary for India’s agro-ecosystems, thus maintaining the carrying capacity of the land. An often cited quote from Harris conveys his perspective:

Beliefs and rituals that appear to the nonanthropological observer as wholly irrational, whimsical, and even maladaptive have been shown to possess important positive functions and to be the dependent variable of recurrent adaptive processes (1971: 556).

ROY RAPPAPORT was another anthropologist who began publishing in the mid-1960s, including his path-breaking book, *Pigs for the Ancestors: Ritual in the Ecology of a New Guinea People* (1968). His arguments had affinities with Steward and Harris, but his focus was on how religious rituals and symbol systems can function in ecologically adaptive ways. Indeed, for Rappaport, “Religious rituals

. . . are . . . neither more nor less than part of the behavioral repertoire employed by an aggregate of organisms in adjusting to its environment” (Rappaport 1979: 28).

For such theorists, religions evolve and function to help people create successful adaptations to their diverse environmental niches. Moreover, naturalistic evolutionary assumptions (rather than the supernaturalistic beliefs of their adherents) are sufficient for understanding the complex relationships between religions and ecosystems. Such a theoretical perspective, it is important to note, is the opposite of the idealistic premises informing much of the rest of the religion-and-nature discussion, which has tended to assume that religious ideas are the driving force behind environmental changes.

Steward, White, Harris, and Rappaport are considered pioneers of the fields variously called “cultural ecology,” “ecological anthropology,” and “historical ecology.” Sometimes dismissed as “environmental determinists” by their critics, in their own distinct ways, they brought evolution forcefully back into the analysis of human/ecosystem relationships by insisting that, while there certainly are reciprocal influences between human beings and the natural world, the ways human beings and their religious cultures are shaped *by* nature and its evolutionary processes should not be forgotten.

ETHNOBOTANY is another sub-field of anthropology that was influenced by and contributed to analyses of ecological adaptation. Its roots can be traced to early twentieth-century efforts to document the uses of plants by indigenous peoples. By mid-century, however, its focus had expanded to an analysis of the ways in which plants are used in traditional societies to promote the health of people, their cultures, and environments. Ethnobotany has been interested in the way plants are used to effect healing and facilitate connection and harmony with divine realities, as well as (sometimes) in the ecosystem changes brought on by such uses.

Ethnobotany became a major tributary to a related but broader line of anthropological inquiry into “indigenous knowledge systems” and TRADITIONAL ECOLOGICAL KNOWLEDGE, which is a subset of such knowledge systems. Here the focus was on the entire corpus of ecological knowledge gained by a people in adapting to their environments over time. Quite often, this analysis attended to the ways in which religious beliefs and practices become intertwined with such knowledge and inseparable from it. Leading figures in ethnobotany and in the analysis of traditional ecological knowledge included Harold Conklin, Richard Schultes, Darrell Posey, William Balée, Gerardo ReichelDolmatoff, and Stephen Lansing. In various ways and drawing on research among different peoples, they asserted that religious beliefs in general, including those having to do with the spiritual importance or power of plants, animals, and sacred places, can lead to practices that maintained the integrity of the ecosystems to which they belonged. A large volume edited by Darrel Posey entitled *Cultural and Spiritual Values of Biodiversity* (1999), which was published by the United Nations Environmental Programme, shows the growing influence of such analysis.

For many of the anthropologists investigating religion/ environment relationships in indigenous cultures, it was irrelevant whether indigenous people accurately perceived dimensions of experience outside of the powers of ordinary observation (such as divine spirits in natural entities). Some analysts of such systems, however, based

on experiences they had while living among indigenous peoples and participating in their lifeways and ceremonies, became convinced that there were important spiritual truths expressed by their worldviews and practices. For those moved spiritually by these cultures there was value in them beyond their ability to foster environmentally sustainable lifeways.

The preceding developments, leading to the conclusion that the worldviews of indigenous cultures promote environmentally sustainable lifeways, represented a remarkable shift in the understanding of such peoples. But this change did not go unchallenged. Critics including Shepard Kretch argued that these sorts of perspectives – which purported to find ecological sensitivity embedded in cultures living in relatively close proximity to natural ecosystems – actually expressed an unfounded and romantic (and often denigrating) view of indigenous people. Some such critics complained that tropes of the “ecological Indian” perpetuate views of indigenous people as primitive and unable to think scientifically. The use of plants and animals in traditional medicines, which has contributed significantly to the dramatic decline of some species, was used as evidence to question assertions that indigenous, nature-oriented religions are adaptive, rather than maladaptive, with regard to ecosystem viability.

This introduction to the lively debates about indigenous societies and their nature religions can be followed up in a number of entries (and the cross-references in them), including AMERICAN INDIANS AS “FIRST ECOLOGISTS,” ANTHROPOLOGY, ANTHROPOLOGY AS A SOURCE OF NATURE RELIGION, ECOLOGY AND RELIGION, ECOLOGICAL ANTHROPOLOGY, ETHNOBOTANY, RELIGIOUS ENVIRONMENTALIST PARADIGM, and TRADITIONAL ECOLOGICAL KNOWLEDGE.

PAGANISM, including WICCA, HEATHENRY, and DRUIDRY, to name a few types, is another form of nature religion that has also enjoyed a positive reappraisal during the age of ecology. Contemporary Paganism is now often labeled “neo-paganism” to contrast current forms with Classical ones, or to indicate that such spirituality has been undergoing a process that involves (depending on the analysis) either revitalization (based on formerly underground and suppressed knowledge), or imaginative reconstruction (based on what can be surmised about pre-monotheistic religions through archeological and historical research). Much of this new religious production draws directly on (sometimes discredited) scholarly work. James Frazer’s belief that remnants of pagan worldviews and lifeways can be discerned in the folk customs of Europe provided pagans a sourcebook in folk culture for the construction of their religions. The poet and literary figure ROBERT VON RANKE GRAVES in *The White Goddess* (1948) offered an influential work subsequently used by many pagans to construct their own goddess-centered, Earth-revering spirituality. And the archeologist Marija Gimbutas – who controversially claimed in the 1980s and 1990s that a goddess-centered culture, which honored women and the Earth, existed in much of Eastern Europe prior to the invasion of a bellicose and patriarchal Indo-European society – provided what

for many pagans was an inspiring vision of the potential to reestablish egalitarian, Earth-revering, pagan culture.

Indeed, toward the end of the twentieth century, a growing number of scholars who identified themselves as pagan were involved in the diverse efforts to make viable religious options out of these traditions. A part of this endeavor has involved assertions that paganism holds nature sacred and therefore has inherent reason to promote its protection and reverent care. This kind of perspective proliferated as did the number of tabloids, magazines, journals, and books devoted to analyzing, and promoting, contemporary paganism.

Paganism thus became an attractive religious alternative for some non-indigenous moderns, perhaps especially environmentally concerned ones, who value indigenous religious cultures for their environmental values, but either found them largely inaccessible, or chose not to borrow from them because of the often strongly asserted view that efforts to “borrow” from indigenous peoples actually constitute cultural theft. (Various perspectives in this regard are discussed in *INDIGENOUS RELIGIONS AND CULTURAL BORROWING*.) Paganism also sometimes shares ideas and members, and certainly has some affinities, with those environmental movements that expressly consider nature to be sacred, such as *BIOREGIONALISM*, *DEEP ECOLOGY*, *ECOFEMINISM*, *ECOPSYCHOLOGY*, and *RADICAL ENVIRONMENTALISM*. Participants in these movements usually view both indigenous and pagan religions as environmentally salutary and often link their own identity to such spirituality.

A growing number of scientists, including those pioneering the fields of *CONSERVATION BIOLOGY* and *RESTORATION ECOLOGY*, and those promoting *RELIGIOUS NATURALISM*, share a central, common denominator belief in nature religions regarding the sacredness of life. Unlike many of the other forms of nature religion, they tend to stress the sacrality of the evolutionary processes that produce biological diversity. Participants in such scientific professions often view their work as a spiritual practice. Some of these have been influenced by those who, like the religion scholar

THOMAS BERRY, believe that science-grounded cosmological and evolutionary narratives should be understood as sacred narratives, and that so understood, they will promote reverence-for-life ethics. The entomologist *EDWARD O. WILSON*’s apt phrase for the grandeur of the evolutionary process, which he called the “*EPIC OF EVOLUTION*”; the “*GAIA*” theory, which was developed by atmospheric scientist *JAMES LOVELOCK* and conceives of the biosphere as a selfregulating organism; as well as *CHAOS* and *COMPLEXITY THEORY*, which draw on advanced cosmological science and reinforce metaphysics of interdependence, have all been used to express this kind of spirituality.

Such science has contributed, through *EVOLUTIONARY EVANGELISM* and ritual processes such as the *COUNCIL OF ALL BEINGS*, to efforts to resacralize the human perception of the Earth. Indeed, scientific narratives reverencing cosmological and biological evolution are increasingly being grafted onto existing world religions. They are also emerging as new religious forms, independent of the longstanding reli-

gious traditions. Some such scientific nature religion, while relying on metaphors of the sacred to describe feelings of belonging and attachment to the biosphere, sometimes also self-consciously express a nonsupernaturalistic worldview.

Whether they retain or eschew supernaturalism, sacralized evolutionary narratives are proving influential in international venues – perhaps most significantly through the EARTH CHARTER initiative and during the UNITED NATION’S “EARTH SUMMITS” – in which belief in evolution and a reverence for life are increasingly affirmed. These sorts of religious developments suggest some of the directions that nature religion may continue to move in the future.

Many NEW RELIGIOUS MOVEMENTS and forms of NEW AGE spirituality also qualify as nature religions, including religiosity related to ASTROLOGY, CROP CIRCLES, DOLPHINS, SATANISM, THE COUNCIL OF ALL BEINGS, THE HARMONIC CONVERGENCE, THE MEN’S MOVEMENT, and UFOs and EXTRA TERRESTRIALS. A wide variety of recreational and other practices that might not seem at first glance to have anything to do with nature spirituality can on close observation also qualify, such as

MOUNTAINEERING, ROCK CLIMBING, SURFING, FLY FISHING, HUNTING,

GARDENING, and even attendance at MOTION PICTURES and THEME PARKS. As was the case with PAGANISM, during the environmental age, these diverse practices and forms of spirituality have increasingly taken on green characteristics, which are then, to an uncertain degree, integrated into worldviews and ethics.

The New Age movement has contributed significantly to the spiritualities and ritualizing of other nature religions, including paganism and radical environmentalism, to name just two. The reciprocal influences among nonmainstream religious subcultures have begun to draw more scholarly attention, as for example in *The Cultic Milieu: Oppositional Subcultures in an Age of Globalization* (Kaplan and Lööv 2002). Such an analysis is pertinent to the examination of much nature-related religious production, as can be seen in PAGAN FESTIVALS, NEW AGE, and the CELESTINE PROPHECY, among other entries.

Like most religions, nature religions carve out their religious identity in contrast (indeed often in selfconscious opposition) to other religious perspectives and interests. Participants in nature religions tend especially to criticize other religions for their environmental failings. Nature religions themselves, as we have seen, have long been criticized as misguided, primitive, and dangerous. Beginning in the 1980s they have also sometimes been charged with being violence-prone and criticized for promoting ethnic nationalism, and even racism and Fascism. (*See also* NEO-PAGANISM AND ETHNIC NATIONALISM IN EASTERN EUROPE.)

In the age of ecology, then, it is clear that nature religions received a mixed reception, both denigrated as regressive and lauded for promoting environmental sensitivity. While scholars and laypeople continued to express both points of view and the issue

may have become more polarized, it is also true that significant growth toward more positive views occurred. Indeed, as illustrated in RELIGIOUS ENVIRONMENTALIST PARADIGM, an increasing number of scholars express a Rousseau-like belief in the superiority of those societies that can be characterized as having intimate spiritual relationships with nature; especially when such societies are compared to those with otherworldly cosmologies and/or which privilege science-based epistemologies.

Theories on the Natural Origins and Persistence of Religion

A third important area of discussion regarding the relationships between religion and nature intensified during the age of ecology. It reprised the effort to uncover the origins and persistence of religious and ethical systems, by examining both biological and cultural evolution.

Like James Frazer, who viewed religion as a product of evolution grounded in an anthropomorphism that personifies natural phenomena, these newer theories continued to be reductionistic; they implicitly or explicitly discounted what believers consider to be the “truths” involved. While such evolutionary theories were inevitably speculative in nature, the newer ones had the advantage of being able to draw on new fields such as evolutionary psychology and cognitive science, as well as on a much more sophisticated and critical body of ethnographic data.

Edward Wilson began his career as an entomologist and became, by the end of the twentieth century, one of America’s best-known scientists, in part due to his work on biological diversity and because of the growing concern about losses to it. But in 1984 he published *Biophilia: The Human Bond with Other Species*, in which he articulated an important theory that purported to explain the origins of the human love for nature. His thinking along these lines was an outgrowth of his broader theory on the origins of ethical systems, published as *Sociobiology* (in 1975). This theory asserted that affective, spiritual, and moral sentiments all evolve from evolutionary processes because they favor individual and collective survival. Ethics in general and environmental values in particular, therefore, are the natural result of human organisms finding their ecological niche and adapting to their environment. Wilson’s ideas stimulated much of the subsequent discussion over the possibility of an evolutionary root of religion, ethics, and environmental concern.

Among the most important works to follow were Stewart Guthrie’s *Faces in The Clouds: A New Theory of Religion* (1993), Pascal Boyer’s *The Naturalness of Religious Ideas: A Cognitive Theory of Religion* (1994) and *Religion Explained: The Evolutionary Origins of Religious Thought* (2002), Walter Burkert’s *Creation of the Sacred: Tracks of Biology in Early Religions* (1996), V.S. Ramachandran and Sandra Blakeslee’s *Phantoms in the Brain* (1998), David Sloan Wilson’s *Darwin’s Cathedral:*

Evolution, Religion, and the Nature of Society (2002), and Scott Atran's *In Gods We Trust: The Evolutionary Landscape of Religion* (2002).

Guthrie sounded much like Frazer, drawing on cognitive science and psychology to argue that religion is, essentially, anthropomorphism, resulting from the human penchant to explain realities by attributing them to something other than human agency. According to Guthrie, humans opt for such beliefs unconsciously, for the most part, but they do so for what are ultimately rational reasons, for if the belief is correct, then there is much to gain from it and little to lose if the belief is unfounded.

Boyer, Burkert, and Atran agreed with much of Guthrie's analysis, tracing religiosity, at least in part, to the existential challenges that come with the uncertainties of life, and a corresponding tendency to anthropomorphize natural entities and forces. Boyer lucidly explained the logic behind such human cognitive tendencies. Boyer argued, in summarizing a number of studies including a doctoral dissertation by Justin Barrett, that it is *natural* to invent agent-like . . . gods and spirits [because] our agency detection systems are biased toward over-detection. Our evolutionary heritage is that of organisms that must deal with both predators and prey. In either situation, it is far more advantageous to overdetect agency than to underdetect it. The expense of false positives (seeing agents where there are none) is minimal, if we can abandon these misguided intuitions. In contrast, the cost of not detecting agents when they are actually around (either predator or prey) could be very high (Boyer 2001: 145; [See also

HUNTING AND THE ORIGINS OF RELIGION.]

David Sloan Wilson takes a similar approach to these theorists, drawing on evolutionary and cognitive science, agreeing that religion is a product of evolution and that the religious beliefs of its practitioners are fallacious. Like them, he sees survival value in the tendencies that spur religion. He concluded, however, in a way that seemed to echo Edward O. Wilson's arguably more positive view of religion: religion promotes individual and collective fitness by providing values that promote cooperative behaviors that in turn enhance the prospects for survival. This point of view resembles that of Edward Wilson's later work, in which he expressed hope that new religious forms and values would evolve that would be grounded in science and promote environmental conservation.

The theorists introduced here agree that nature plays a major, if not the decisive role in shaping human culture, religion, and survival strategies. But they disagree about many of the particulars – for example, about whether religion is ecologically adaptive, maladaptive, both, or neither. Moreover, they face strong criticisms from scholars who believe they overemphasize the influence of nature on people and their societies, and neglect the importance of human agency and the power of culture. The archeologist Jacques Cauvin, for one important example, disputes those who claim to have revealed environmental or materialist causes for the shift from foraging lifeways and animistic spiritualities to agriculture and theistic religions. In *The Birth of the Gods and the Origins of Agriculture* (2000), he claimed that archeological evidence proves that belief in gods predated the agricultural revolution. He deduced from this his conclusion

that those who believe theistic religion is a product (or an adaptation related to) the domestication of plants and animals, cannot muster compelling supporting evidence.

The body of research available as data for those exploring such issues has grown rapidly. Discussion and debate will continue over the origins, persistence, or “natural decline” of religion, as well as over its possible ecological functions. New lines of inquiry may play increasingly important roles. Just as cognitive science exploring human consciousness has spurred further debate, ethology (the study of animal cognition and behavior) is also beginning to make some interesting if speculative suggestions. In this encyclopedia, for example, JANE GOODALL reflects on the possibility of a kind of nature-related PRIMATE SPIRITUALITY, based on her observations of chimpanzee behavior near jungle waterfalls, and Mark Beckoff, in COGNITIVE ETHOLOGY, SOCIAL MORALITY, AND ETHICS, argues that such science may well revolutionize human understandings of both religion and ethics, extending both beyond humankind.

While there is a robust debate under way among the various theorists and perspectives which is here only briefly introduced, it is critical to remember that these perspectives are not mutually exclusive. There may be strong “natural” inclinations to religious perception, as well as maladaptive and/or adaptive functions of such religions, for example. With regard to the possible ecological functions of religion, it would be wise to remember, as Gustavo Benavides suggests in ECOLOGY AND RELIGION, that “adaptation is a process rather than a state.” Therefore, it is important to analyze both maladaptive and adaptive religious phenomena, and even more importantly for environmental conservation, to determine the circumstances under which religion might shift from maladaptive to adaptive forms.

Religion and Nature and the Future of Religion and Nature

Shortly before his death in 1975, the British historian Arnold Toynbee argued

The present threat to mankind's survival can be removed only by a revolutionary change of heart in individual human beings. This change of heart must be inspired by religion in order to generate the will power needed for putting arduous new ideals into practice (Porritt 1984: 211; for the original quote see Toynbee and Ikeda 1976: 37).

Jonathan Porritt, who paraphrased Toynbee in this quote, was a prominent member of the International Green Party movement in the 1970s and went on to lead Friends of the Earth (UK) in 1984. Porritt's subsequent comment on Toynbee's view illustrates a common understanding about religion found within green subcultures all around the world:

I would accept this analysis, and would argue therefore that some kind of spiritual commitment, or religion in its true meaning (namely, the reconnection between each of us and the source of all life), is a fundamental part of the transformation that ecologists are talking about (Porritt 1984: 211).

Obviously, Lynn White was not the only one who was convinced that religion was a decisive factor in the environmental past and that it could play an equally important role in the future. For his part, Toynbee thought that humankind needed a new religion that respected natural systems and that such a religion would resemble pantheism. Moreover, such a religion would have more in common with Buddhism than with historical monotheism, which he thought (again like White) was especially responsible for environmental decline.

Such views, that religion could be both a cause and a solution to environmental decline, precipitated much of the ferment over religion and nature throughout the environmental age. It certainly led to efforts to awaken the world's predominant religious traditions to an understanding that the protection of the Earth and its living systems should be considered a "sacred trust" (as the EARTH CHARTER ecumenically put it). This idealistic assumption, that religious ideas can shape environmental behavior, has also inspired many efforts to revitalize or invent nature religions, all of which in one way or another consider nature to be sacred, and deduce from this perception a reverence-for-life ethic. It is not easy to answer whether this idealistic perspective is correct; this introduction and many of the entries to which it points demonstrate how complicated such an assessment can be. It may well be that those who argue that religion is an important or decisive variable in the ways in which human beings relate

to the Earth's living systems are simply exaggerating the importance of religious ideas when it comes to their influence on environment-related behavior.

If those who think that religion is a decisive or important variable in the human impact on nature are correct, however, or even on the right track and in need only of minor correction, then the inquiry into the relationships between people and Earth's living systems is not merely an intellectual exercise. The answers, however murky, might illuminate the paths to an environmentally sustainable, and perhaps even a socially just future. The answers might just suggest promising ways to think about the proper relationships between people and other forms of life, and inspire actions in concert with them. Although many engaged in the religion-and-nature field hope for such a payoff, the diverse and contested approaches to religion and nature revealed in this encyclopedia suggest that any consensus will be difficult to achieve.

In addition to questions about whether and to what extent religion has shaped or might shape environments (negatively or positively), this encyclopedia introduces and addresses a battery of additional conundrums. These include questions along a path less often traveled during the debates over religion and ecology: especially questions regarding the impact of nature, and different natures for that matter, on human consciousness in general and on religion (and religion-inspired environmental practices) in particular.

Perhaps these sorts of questions, while fundamentally scientific in nature, are themselves a reflection of new ethical forms that began to flower in the wake of Darwinian thought. These values are quite easily deduced from an evolutionary worldview, which promotes a sense of kinship grounded in an understanding that all life shares a common ancestor and came into existence through the same survival struggle. These values displace human beings from an isolated place, alone at the center of moral concern. Perhaps these scientific questions, in reciprocal production with new forms of religious thought, will shape the religious hybrids that will come to characterize most the religious future. Perhaps these hybrids will prove adaptive, facilitating the survival not only of the human community, but also of the wider community of life, upon which humans depend. If so, this exceptionally interesting species, *Homo sapiens sapiens*, might yet live up to its lofty (if self-designated and highly ironic) name.

Acknowledgments and Description of the Genesis and Evolution of the Encyclopedia

The idea for this encyclopedia was hatched by Jeffrey Kaplan who suggested it to me over lunch during the American Academy of Religion meeting in San Francisco in November, 1997. He became interested in the relationships between religion and nature when noting some interesting similarities in the nature spiritualities that could be found within two distinct, radical subcultures in Europe and America, that of the racist right, which he had been studying for years, and radical environmentalism, a movement with which I had conducted extensive field work. He knew I had been focusing broadly on “religion and nature” and thought that given his extensive work with major reference works – including his own *Encyclopedia of White Power* (2000) and as a graduate student assisting in the production of *The Fundamentalism Project* (Marty and Appleby 1991–1995) – that we could produce a valuable reference work. I agreed and began to work up a prospective list of entries.

It was obvious from the outset that the field was very broad and that to do it justice we would need to reach widely across disciplinary lines. During the next two years we brainstormed over 400 entries and contributors, began issuing invitations to those we hoped would agree to be associate or assistant editors, secured a publisher, and brought Sean Connors on board to develop a beautiful website for introducing and administering the project, which was set up at www.religionandnature.com. Connors became a web guru in the subsequent years, and I am grateful he stuck through this project. He did so graciously despite many pressures, and moreover, has put in a significant amount of *pro bono* time.

A number of scholars were invited to a November 1998 meeting in Boston, immediately before the American Academy of Religion meeting, to think about the project. The night before, during a conversation over what name would be best for the encyclopedia, of many options, “religion and nature” was offered up, and it quickly appeared to provide the broadest trope for the project, superior therefore to the more common “religion and ecology” appellation. The next day some twenty scholars joined in a day-long discussion of the breadth and framing of the project, as well as its specific entries and contributors. From there we developed lists of cooperating editors and an additional list of entries to pursue. After the meeting the amalgamated list was dis-

tributed to all of those then involved in the project. These scholars were then asked what entries, contributors, and perspectives were missing. Throughout the project, I invited newly identified contributors to consult the online lists of entries (which could be sorted and reviewed in a number of ways) and suggest how we could strengthen it. This encyclopedia has, therefore, been shaped by a snowball methodology. Snowball it did, to nearly 1000 entries and over 500 contributors.

Throughout the project we sought to provide broad coverage of the subject matter, both chronologically and with regard to religious type, geographical region, and a number of other themes (such as science, religion, and nature). With the enthusiastic help of the University of Tennessee's Rosalind Hackett, who served as conference chair for the 2000 International Association for the History of Religions in Durban, South Africa, I convened a series of sessions on religion and nature. These sessions helped to ensure that the African continent would not be neglected, and led to many valuable connections. I also had many meetings and a great deal of correspondence with all of the collaborating editors and many of the encyclopedia's contributors. I followed up every suggestion that seemed promising.

This is not to say that the encyclopedia succeeded at being comprehensive – there are some regions where I failed to find able and willing contributors; North Africa west of Egypt and Antarctica come immediately to mind as examples. We did cover more ground than I thought would be possible at the outset, however. It turned out that there are many scholars who, when asked, can analyze religion and nature in the regions or traditions or periods they are most familiar with, even if they had not previously focused their view in this direction. Nevertheless, some readers will no doubt wonder why one subject and not another was covered. There may be justifiable criticisms along these lines, although most of the subjects likely to be identified as missing were probably pursued without success. More importantly, however, is the recognition that today no reference work can be entirely comprehensive, so perhaps a better test of an encyclopedia's efficacy is its success at demarcating the territory to be covered and analyzing carefully a representative sample of the phenomena in question.

One incurs many debts in orchestrating a scholarly project like this and I wish to acknowledge the many and sometimes extraordinary contributions that have been made. First, I would like to thank those I have, in agreement with Consulting Editor Jeffrey Kaplan, designated Executive, Associate and Assistant Editors. These decisions were based on their overall contributions to the project. Associate Editors played significant roles in shaping a sub-area in the encyclopedia, often helping to identify entries and recruit contributors and providing peer reviews of entries in their own areas of expertise, as well as making substantial contributions of their own to it. Assistant Editors provided significant assistance in recommending entries and/or recruiting contributors, sometimes played a role in reviewing submissions, and usually contributed their own entries. They are listed immediately after the title page of this encyclopedia. Three scholars who deserve special recognition have been designated Executive Editors: Michael York, Adrian Ivakhiv, and Laura Hobgood-Oster. They have done

everything the other editors have done but more of it, and always in an exceptionally good-natured and timely manner.

Many of the 518 contributors, in addition to their own writing, provided suggestions and leads which enriched the project significantly. I cannot remember where all such good ideas came from, but wish to thank those who provided them. I would also like to thank those contributors who, at one point or another, went out of their way to find a prospective contributor, a bibliographical reference, or provided a peer review of one or more entries. These extra efforts represented extraordinary kindness, which I will not forget. Every standard entry in this encyclopedia was fully peer reviewed, not only by Jeffrey Kaplan and myself, but by one or more scholars familiar with the subject under scrutiny. I also wish to thank the fine scholars who reviewed and helped me improve my own contributions to this encyclopedia, including Sarah McFarland Taylor, Becky Gould, Sarah Pike, Graham Harvey, Arne Kalland, Michael York, Adrian Ivakhiv, Michael Zimmerman, Curt Meine, Ron Engel, Les Sponsel, Stephen Humphrey, and Anna Peterson. Having such friends and colleagues is one of the great rewards of this kind of collaborative scholarship.

I would like to thank the pioneers of the emerging scholarly fields which have most often been labeled “environmental ethics” and “religion and ecology.” Some of these figures have entries about them, for their contributions have been seminal. Many others (but not all who could have been mentioned) appear in RELIGIOUS STUDIES AND ENVIRONMENTAL CONCERN, ENVIRONMENTAL ETHICS, or other entries. These scholars provided the foundational work that made this project possible, and in some ways timely and necessary. They were the ones who raised many of the questions that are probed in these pages.

I also need to thank a number of student assistants who have assisted in this project, often for short periods of time, but without whom this encyclopedia would not have been completed as promptly as it was. A number of these were involved with the Environmental Studies program at the University of Wisconsin Oshkosh, where I was before I moved to the University of Florida (in 2002) to help develop a graduate program that has an emphasis in Religion and Nature. Now settled in, I have had the able assistance of several exceptional graduate students, Todd Best, Gavin Van Horn, Luke Johnson, and Bridgette O’Brien, who handled, with scrupulous attention to detail, many of the production tasks. I have also, already, learned a great deal from my new colleagues in Florida, including through their contributions to this encyclopedia; eight faculty members and three graduate students have contributed articles to it.

As is usually the case, the greatest debts of gratitude that accumulate during a scholarly project are to those who have suffered the most from it. I wish to underscore, therefore, my gratitude to Jeffrey Kaplan for seeing through this project. Over its course it more than doubled in size. Despite this unwelcome increase in workload, he read nearly every entry (sometimes several times). With his broad, history of religion training, he made regular and substantial contributions to its quality. I am grateful, as well, to Jeff’s wife, Eva. She has been remarkably gracious considering the hours this

project has consumed that might otherwise have been more family focused. Finally to my children, Anders, Kaarin, and Kelsey, and to my wife Beth, I owe the greatest measure of thanks, for their long forbearance and support, which affords me the luxury of pursuing the issues engaged in these pages.

Bron Taylor, The University of Florida

Reader's Guide

This encyclopedia explores the conundrums addressed in the volume's introduction and it does so by examining a wide variety of religion-and-nature-related phenomena. It also does so in a variety of ways, including through its three distinct entry genres.

Scholarly entries have been written in a standard encyclopedia genre in which the premium has been to introduce a theme, historical period or event, region, tradition, group, or individual, while analyzing its relevance to the overall discussion in a scholarly and balanced way. With these fully peer-reviewed entries, care has been taken to provide readers with sufficient information and recommended readings to enable independent follow-up and further research.

Scholarly Perspectives entries, which are demarcated and are denoted by the symbol **SP**, afford prominent figures an opportunity to reflect on the religion and nature field in a more personal and reflective way, or their authors may advance an argument in a way that would be atypical in a standard, scholarly encyclopedia entry.

Practitioner entries, which are also demarcated by the symbol **P** are written by individuals actively engaged in one or another form of nature-related spirituality. They further illuminate the ferment over religion and nature by providing wide latitude for religious practitioners who are interested in religion and nature to express themselves in their own words.

Most entries are easy to find alphabetically. Some that are closely related to longer ones are nestled adjacent to them in "sidebar" entries, which are enclosed in a lined box. Sidebars are designed to illuminate or otherwise extend the discussion in the associated entry.

Because website locations are notoriously ephemeral, unless direct quotes are taken from them they have not been included in the further reading sections. The many groups and individuals discussed in these volumes can, of course, be easily found through internet search engines. The website associated with this project, which is located at www.religionandnature.com, has links to many of the groups noted in the text, as well as to supplementary information related to many of the entries. This information includes graphics, photographs, music, non-English bibliographic resources, and bibliographic information available after the encyclopedia was published. Readers will be able to learn more by visiting this website in the future, which is intended to be periodically updated.

Cross-references follow most entries. These do more than point to directly related entries; they provide contrasts and sometimes unexpected comparative reference points. In this introduction, cross-references are indicated by SMALL CAPS in the text, as are

the cross-references in two entries that were written to complement the introduction: ENVIRONMENTAL ETHICS and RELIGIOUS STUDIES AND ENVIRONMENTAL CONCERN.

Indeed, after reading the introduction most readers would do well to begin with these two entries, adding

ECOLOGY AND RELIGION, ECOLOGICAL ANTHROPOLOGY, and SOCIAL SCIENCE ON RELIGION AND NATURE for an overview of anthropological and other social scientific approaches to understanding the religion/nature/culture nexus. Combined with the adjoining encyclopedia introduction, these entries provide a broad introduction to the religion and nature field.

Of course, some will prefer to begin immediately by paging through the volumes and reading entries that strike their interest, then following the cross-references at the end of each entry. Another approach would be to page through the general index and read entries clustered there, for example, by religion or region. Alternatively, one could follow a particular figure of interest through many entries where she or he might be mentioned, an approach that would illuminate that individual's contributions and influence. The work can be read in other ways as well – regional overviews first, or all the entries on specific traditions or themes. It could also be read chronologically, starting with our entries on PALEOLITHIC RELIGIONS and then those exploring ancient civilizations, for example, before moving to later periods. Another way to start would be to turn to the volume's list of contributors and read the entries written by writers with whom one is already familiar. The voices in the *Encyclopedia of Religion and Nature* include some of the world's environmental, religious, and scholarly luminaries, as well as a wide variety of scholars and religious practitioners from around the world. For many of the contributors, English is not their first language, and their writing reflects some of the grammatical conventions of their mother tongues. We have edited such entries lightly, and hopefully, have retained the sense as well as the feel for the original submission.

The approaches to this work will, little doubt, be as numerous and diverse as the contributors to it and the readers of it.

Epigraph

The earth holds manifold treasures in secret places; wealth, jewels, and gold shall she give to me.

She bestows wealth liberally; let that kindly goddess bestow wealth upon us! (44)

Your snowy mountain heights, and your forests, O earth, shall be kind to us!

The brown, the black, the red, the multi-colored, the firm earth that is protected by Indra,

I have settled upon, not suppressed, not slain, not wounded. (11)

(Hymns of the Atharva Veda, tr. Maurice Bloomfield, University of Oxford Press, 1897).

The gentle Way of the universe appears to be empty, yet its usefulness is inexhaustible . . .

It harmonizes all things

And unites them as one integral whole.

Dao Te Ching, 4

The virtue of the universe is wholeness It regards all things as equal

The virtue of the sage is wholeness He too regards all things as equal

Dao Te Ching, 5

When people lack a sense of pure spiritual piety Toward natural life, then awful things happen in their life. Therefore, respect where you dwell.

Dao Te Ching, 72

God made wild beasts of every kind and cattle of every kind, and all kinds of creeping things of the earth.

And God saw that this was good.

Genesis 1:25 (New Jewish Publication Society Translation, 1985)

A

Abbey, Edward (1927–1989)

Edward Abbey spent many seasons in the wilderness as fire lookout, back-country ranger, explorer, river rat, self-styled “follower of the truth no matter where it leads.” He was the author of twenty-one books and scores of articles that collectively express his lifelong commitment to the principles of anarchism, and his deep, abiding love for the flow of Nature. With the publication of his classic book of essays, *Desert Solitaire* in 1967, he became recognized as both a gifted writer and an outspoken advocate for the natural environment. And with the publication of his best-known novel *The Monkey Wrench Gang* in 1975, Abbey became the earliest and perhaps most influential voice of the newly awakened radical environmental movement.

Abbey was born on 29 January 1927 and grew up in rural northwestern Pennsylvania which he felt imposed upon him a sense of intellectual and spiritual myopia. He required the vast, arid landscape of the American Southwest wherein his mind and soul were free to soar as he explored the hidden slot canyons, climbed countless mountains, ran exquisite rivers, and hiked the boundless Colorado Plateau and Basin and Range provinces. He arrived in New Mexico shortly after World War II equipped with a brilliant mind, a powerful sense of intuition, and a finely honed body well suited for any adventure. He loved to read, write, listen to great music, make love to beautiful women (“I never made love to a woman I didn’t love, at least a little bit”), and wander the back country alone, or with a good friend or two. He placed supreme value on friendship, honor, and a lifetime free to explore the mysteries of nature.

While both an undergraduate and post-graduate student at the University of New Mexico, Abbey was mentored by Professor Archie Bahm who specialized in Chinese philosophy. Professor Bahm introduced Abbey to the works of Lao Tzu and Chuang Tzu, Daoist philosophers in whose works Abbey was able to perceive the wellsprings of anarchism.

In May, 1951, Abbey was invited to speak on anarchist philosophy at the University of New Mexico by Professor Bahm. In this lecture, the notes from which I have in my collection of Abbey papers, Abbey provided early evidence of what would become his great philosophical contribution to Western culture, a meld of anarchism and radical environmentalism. He went on in the lecture to define many types of anarchism and styled himself a barefooted anarchist.

I hate cement. I have never seen a sunflower grow in cement. Nor a child.

Now even Aristotle recognized the vegetative element in man. It is that which enables us to grow. A man *is* a plant, fundamentally, and if he is to grow he must grow like a cottonwood, upward and outward, exfoliating in air and light, his head in

the clouds, perhaps, but his feet rooted in Mother Earth. Now if we insist on sealing ourselves off from the Earth below by cement and asphalt and iron and other dead and sterile substances, and from the sun above by a dense layer of smoke, soot, poisonous gases, skyscrapers, helicopters, I do not think we will survive as human beings...

For these reasons, I must advocate bare-footed anarchism, anti-urban, anti-industrial, anti-housing development, anti-land improvement anarchism. I look forward to that happy day when shoes will become obsolete and all of us can run around squelching our toes in the mud of April (Author's lecture notes).

Ultimately, Abbey was awarded a master's degree in philosophy. His thesis was entitled "The Morality of Violence" and focused on the points of view of five libertarian or anarchist thinkers including Proudhon, Bakunin, Godwin, Sorel and Kropotkin. He remained a self-proclaimed anarchist throughout his life, an anarchist at large within the flow of Nature.

Edward Abbey was a great outdoorsman. Much of his writing was inspired by recollections of wandering through desert wildernesses where encounters with fellow humans were infrequent. He told me that once, while living in Death Valley, he had what he regarded to be a natural mystical experience wherein he perceived himself to be integrated within the natural world around him, able to perceive an interconnective energy between all animate and inanimate objects, all the while immersed in a level of joy never to be repeated during his lifetime. His quest to return to this state of consciousness is revealed on page six of the original edition of *Desert Solitaire* published in 1967.

The personification of the natural is exactly the tendency I wish to suppress in myself . . . I want to be able to look at and into a juniper tree, a piece of quartz, a vulture, a spider, and see it as it is in itself, devoid of all humanly ascribed qualities . . . I dream of a hard and brutal mysticism in which the naked self merges with a non-human world and yet somehow survives still intact, individual, separate.

In 1975, Abbey delivered a lecture entitled "In Defense of Wilderness" at St. John's College in Santa Fe, New Mexico, which I recorded and subsequently excerpted for my biographical memoir of Abbey entitled *Adventures with Ed: A Portrait of Abbey*. This lecture includes one of Abbey's more imaginative speculations on the nature of reality.

Is it not possible that rocks, hills and mountains, and the great physical body of the Earth itself may enjoy a sentience, a form of consciousness which we humans cannot perceive only because of the vastly different time scales involved? . . . Say that a mountain takes 5,000,000 of our human or solar years to complete a single thought. But what a grand thought that single thought must be. If only we could tune in on it. The classic philosophers of both east and west have tried for 5,000 years more or less to convince us that *Mind* is the basic reality, maybe the only reality and that our bodies, the Earth and the entire universe is no more than a thought in the mind of God. But consider an alternative hypothesis. That Buddha, Plato, Einstein and we are all thoughts in the minds of mountains, or that humanity is a long, long thought in the mind of the Earth. That we are the means by which the Earth, and perhaps the

universe becomes conscious of itself. I tell you that God, if there is a god, may be the end, not the origin of this process. If so, then our relationship to Earth is something like that of our minds to our bodies. They are interdependent. We cannot exploit or abuse our bodies without peril to our mental health and our survival . . . As mind is to body, so is humanity to Earth. We cannot dishonor one without dishonoring and destroying ourselves (Loeffler 2000: 127–8).

On 1 January 1983, Ed Abbey and I returned to his home in the Sonoran Desert after a camping trip in the Superstition Mountains of southern Arizona. Abbey had recently learned that he was afflicted with the malaise that would ultimately claim his life. I recorded Abbey reflecting on the nature of religion in today's technocratic world, which is included in my book, *Headed Upstream: Conversations with Iconoclasts*.

I regard the invention of monotheism and the otherworldly God as a great setback for human life . . . Once we took the gods out of nature, out of the hills and forests around us and made all those little gods into one great god up in the sky, somewhere in outer space, why about then human beings, particularly

Europeans, began to focus our attention on transcendental values, a transcendental deity, which led to a corresponding contempt for nature and the world which feeds and supports us. From that point of view, I think the (American) Indians and most traditional cultures had a much wiser world view, in that they invested every aspect of the world around them – all of nature – animal life, plant life, the landscape itself, with gods, with deity. In other words, everything was divine in some way or another. Pantheism probably led to a much wiser way of life, more capable of surviving over long periods of time.

. . . Call me a pantheist. If there is such a thing as divinity . . . then it must exist in everything, and not simply be localized in one supernatural figure beyond time and space. Either everything is divine, or nothing is. All partake of the universal divinity – the scorpion and the packrat, the Junebug and the pismire. Even human beings. All or nothing, now or never, here and now (Loeffler 1989: 14–15).

Abbey thoroughly believed in living life to its fullest and confronting the truth fearlessly. The following also appears in *Headed Upstream*.

An adventurous human life should be enough for anybody, and should free us from the childish hankering for immortality . . . If this life here and now on this splendid planet we call Earth is not good enough for us, then what possible pleasure or satisfaction or happiness could we find in some sort of transcendental, eternal existence beyond time and space? Eternity, in that sense, beyond time, could be nothing but a moment, a flash, and we probably experience that brilliant flash of eternity at the moment of death. Then we should get the hell out of the way, with our bodies decently planted in the Earth to nourish other forms of life – weeds, flowers, shrubs, trees . . . which support the ongoing human pageant – the lives of our children. That seems good enough for me . . . I think the desire for immortality is based on . . . a terrible fear of dying, fear of death, which comes from not having fully lived. If your life has been wasted, then naturally you're going to hate giving it up. If you've led a cowardly,

or paltry, or tedious, or uneventful life, then as you near the end of it, you're going to cling like a drowning man to whatever kind of semi-life medical technology can offer you . . . Better by far to fall off a rock while climbing a cliff, or to die in battle (Loeffler 1989: 17–18).

For Edward Abbey, sauntering through landscapes both known and especially unknown was among life's greatest pleasures. We sauntered together for many miles over the course of many years, and the act of walking and musing resulted in countless hours of boundless conversation. Often Abbey reflected on the meaning of existence. We discussed the role of the anarchist as environmentalist, and Abbey clearly revealed his belief that every species including the human species has a right to existence, but that the human species has no greater right than any other. He determined that the voices of other species, indeed that of the entire biotic community, were not being heard by humanity. Thus he concluded that humans sensitive to the miracle of life must assume responsibility for defending habitat against encroachers from within what he called "the military-industrial complex and their lackeys in government."

He regarded sabotage against the tools of governmental and industrial terrorism as a supremely ethical act. He clearly differentiated between terrorism and sabotage, proclaiming that everything from the military strafing of villages in Vietnam to the chaining of trees to clear land for cattle grazing were acts of terrorism against life. Committing acts of sabotage against tools of terrorism was required if habitats were to be defended against indiscriminate pillagers who pursued growth for the sake of growth, a condition he regarded as the ideology of the cancer cell.

Abbey believed that causing harm to fellow humans was to be avoided unless one's self, family or friends were being threatened. He advocated sabotage but warned that under no circumstances must people be harmed as a result of sabotage. In a word, eco-terrorists are those engaged in acts of terrorism against the natural environment, and definitely not those who are defending the environment against the onslaught of eco-terrorism.

Abbey believed in the evidence of the five bodily senses. He believed in protecting every freedom that allowed his intellect to soar. He regarded himself as an absolute egalitarian. He also intuited a sense of the numinous in nature, and although he rarely wrote about that, it was not an uncommon topic for conversation. He was not frivolous in his speculations, but as with any intelligent philosopher, he constantly sought the underlying meaning of existence. He experienced one episode with a hallucinogen, LSD. It was an uncomfortable experience, not at all illuminating. He frequently reiterated that the only time he felt close to that numinous quality was after he had been camping for a minimum of ten days, or enough time for the flow of Nature to purge the "white noise" generated by day-to-day existence within the materialistic technocracy of American culture.

Abbey loved the natural world, and felt himself "out of synch" with the time into which he had been born. He told me he would have been at home in the Pleistocene as a hunter-gatherer; or as a Plains Indian riding bareback through the early nineteenth

century. He regarded the advent of agriculture as the beginning of serfdom and slavery. He contended that more harm had been wrought by the plowshare than the sword.

Abbey's great contribution to philosophy was the meld of anarchism and environmentalism. These two distinct philosophic persuasions conjoined in his mind. On the one hand, the anarchists Proudhon, Bakunin and Kropotkin defined that spirit of resistance to government, human hierarchy and deadly immersion in the status quo that Abbey practiced his life long. On the other hand, Henry David Thoreau, John Muir, Robinson Jeffers and David Brower forwarded an environmentalist point of view that also prevailed in Abbey's mind from an early age. With the publication of his novel, *The Monkey Wrench Gang*, he brought these two philosophic themes together. He told me that it was in this novel that he actually found his voice, a voice that must never be stilled.

Abbey believed that unless the current juggernaut of "growth for the sake of growth" can be forestalled, the higher vertebrates including the human species are in grave jeopardy of extinction. He calls for a much higher ideal wherein recognition of the sacred quality of life within habitat sets the standard for the human endeavor. A few days before his death, he gave a final speech before a gathering of Earth First! members, exhorting them to keep the faith with courage and dignity.

Edward Abbey died on 14 March 1989 at the age of 62 years and 45 days in his writing cabin in the Sonoran Desert west of Tucson. He lies buried in a desert wildness far from any human community. His grave is marked with a single stone that bears his name, the dates of his birth and death, and his epitaph, which reads, "No Comment."

Aboriginal Art – Warlpiri

Indigenous Australians produce rich and diverse art expressive of their relationships with the land and the cosmos. By way of example, this entry focuses on Warlpiri graphic art of the Western Desert region of Australia.

The Dreaming is the most powerful mechanism through which Warlpiri organize and understand the significance of places. The Dreaming has various levels of meaning: it is the mythological realm of totemic Ancestors; it is the embodiment of metaphysical potency in the land; it is the “Law” to which humans must conform; and it is the spiritual identity of the individual.

The Warlpiri conceive of landscape as a manifestation of the Dreaming. Like other Australian Aboriginal peoples, Warlpiri tell of a realm in which the Earth and animals do not exist in their present forms. In this realm, mythological ancestors emerge from a featureless Earth, transform it, and create the landscape. The clouds and hills, billabongs, grasses, and trees are created during this period, as are animals, and kinship patterns, taboos, and other tribal laws. When the ancestors complete their creative wanderings they change into Spirit Beings, and they continue to dwell in special places within the land.

The landscape is understood by Warlpiri as being criss-crossed with mythological tracks, each with an accompanying mythic narrative, song-cycle, dance enactment, and ritual caretakers. Each of these Dreaming tracks consists of a series of sacred sites and the paths between these sites. The myths associated with these tracks recount the actions of the ancestors; their subsistence activities, their fights, their love making, their ceremonies, etc.

Warlpiri art and myth can best be understood in terms of places, for it is the landscape which provides the most obvious and enduring evidence of Dreaming occurrences. But for Warlpiri, land is more than simple evidence, it is the actual transfiguration of Ancestral Being. The Land *is* the Dreaming. Each myth has an accompanying graphic map and a song, which refer to incidents and places associated with the Ancestors. To Warlpiri, myth, graphic design, and song reinforce each other and share in the virtue of the Dreaming.

Warlpiri art is concerned with mapping the mythological landscape. Paintings function as Dreaming maps of important places and events; charting the travels of totemic ancestors, and depicting sacred places they create. The paintings being done by Warlpiri today belong to a class of Aboriginal art that has come to be known as the Western Desert Style. The canvas paintings, executed in acrylics, are enmeshed in the larger system of Warlpiri social, political, religious, and ecological values. Derived

from traditional designs, they are expressive of Warlpiri emotion, purpose, and place within the landscape.

The visual style of Warlpiri art replicates the narrative style of Warlpiri myth. Myths recount ancestral travels through the country; paintings depict these travels and the sites associated with them. This narrative style is evident in the interconnected circles and lines that are so prevalent in Warlpiri paintings. The circle/line composition is widely used to illustrate the journeys of Ancestral Beings and the places that they create; the sites represented by circles, the paths connecting the sites represented by lines. This site/path structure graphically maps the Dreaming and iconically illustrates the movements of Ancestral Beings across the land. It provides a structure that links Dreaming events to geographical places and life experiences.

The line motif reflects Warlpiri mobility and the emphasis on movement across the country. It illustrates travels through the landscape and depicts the tracks of Ancestral Beings. Conversely, circles are used to depict places. The symmetry of Warlpiri art assists in the ordering of experience and space. Through symmetrical compositions, Warlpiri impose a structure on phenomena that may otherwise lack this quality.

Every Warlpiri graphic design represents both an identifiable locality and its mythological association, but the knowledge to interpret the design is gained only through synthetic understanding of the Dreaming and the land. Dreaming maps, however, are not just about farremoved myths. They signify, among other things, aspects of cultural ecology around which society is organized. They are expressive of kinship rules, rights to resources, ecological and sacred knowledge, and other elements of social and environmental organization.

Paintings recall the ancestral landscape and map the interdependent relationship between humans and natural systems. In “reading” paintings, Warlpiri interpret that land and their place within it. Warlpiri paintings are rooted in specific locales, and metaphorically relate to the ancestors who created those places. Graphic designs illustrate the way in which Warlpiri view themselves within the context of the world and its origins.

Aboriginal Dreaming (Australia)

The concept of the “Dreaming,” or “Dreamtime,” is the great gift that Aboriginal Australians bring to world spirituality. Dreaming celebrates the joy and plenitude of the living world. At the heart of Dreaming is life – its emergence, its growth and nurturance, its interactions and organization, its connections and continuities.

The power that created the world is neither dead nor confined to the past. Creation stories vary across the continent, but hold as shared concepts of origin the travels and actions of the great creative ancestral beings, or Dreamings, who walked the land and sea. All through their travels, the Dreamings brought into being the differences that matter. Foundational creation concerns that which endures.

The Australian continent is well covered with the tracks of the Dreamings: walking, slithering, crawling, flying, swimming, chasing, hunting, weeping, dying, giving birth. They were performing rituals, distributing the plants and marking the zones of animal distributions, making the landforms and water, and making the relationships between one place and another, one species and another. They were leaving parts or essences of themselves; they would look back in sorrow; and then continue traveling, changing languages, changing songs, changing identity. They were changing shape from animal to human and back to animal again, and they were becoming ancestral to particular animals and particular humans. Through their creative actions they demarcated a world of difference. And they made the patterns and connections that crosscut difference.

Dreaming men and women, whatever their species, created a gendered landscape. Land and sea do not privilege women to the exclusion of men, and while gendered places may speak to opposition, they speak also to dialogue. Gendered place locates women and men separately as well as together.

One side of Dreaming is that which creates and endures, and the other side is this ephemeral world: the living things, the relationships between and among them, the waters that support their lives, the cultural forms of action and knowledge that sustain the created world. Aboriginal people’s daily lives, as well as their ritual and other forms of care, unfold in an ecological poetics of connection. The work of creation continues to happen in the world precisely through the ephemeral. Both daily and ritual work seeks to ensure the continuous flourishing of ephemeral life. Dreaming is thus actualized in present time; the perduring life of creation is carried in contemporary time and place by ephemeral life forms. Aboriginal religious practice intensifies the experience of life, placing ultimate value in the living systems and life processes that sustain this, the created world.

Country

Dreamings established countries. A country is small enough to accommodate face-to-face groups of people and large enough to sustain their lives; it is politically autonomous in respect of other, structurally equivalent countries, and at the same time is interdependent with other countries. Each country is itself the focus and source of law and life practice. To use the philosopher's term, one's country is a nourishing terrain, a place that gives and receives life.

Country is multi-dimensional – it consists of people, animals, plants, Dreamings, underground, Earth, soils, minerals and waters, surface water, and air. There is sea country and land country; in some areas people talk about sky country. Country has origins and a future; it exists both in and through time. I use the term “eco-place” to speak to a locatedness that is not human-centered and that is attentive to the complexities of life in a given place. Each country (land or sea) contains a plurality of sites, and the sites are connected by tracks; the tracks are also ceremonies that work across bounded countries. The system of eco-places thus situates sites within countries; equally importantly the tracks are connectivities. Dreaming geography elaborates the intersecting and crosscutting patterns of connection between eco-places.

Country in Aboriginal English is not only a common noun but also a proper noun. People talk about country in the same way that they would talk about a person: they speak to country, sing to country, visit country, worry about country, feel sorry for country, and long for country. People say that country knows, hears, smells, takes notice, takes care, is sorry or happy. Country is a living entity with a yesterday, today and tomorrow, with a consciousness, and a will toward life. Because of this richness, country is home, and peace; nourishment for body, mind, and spirit; heart's ease.

Caring for country

My teacher Hobbles Danaiyarri, who belonged to the savanna region on the desert fringe in the Northern Territory, offered a succinct explanation of his people's responsibilities toward land: “Before white people, Aboriginal people were just walking around organizing the country.”

Research into how Aboriginal people organize the country is still quite new. Looking at the continent as a whole, it is now evident that Aboriginal people's fire ecology is responsible for the open grasslands that covered much of the continent, for the preservation of specific stands of fire sensitive vegetation and remnant rainforests, and for the maintenance of a mosaic of micro-ecological niches which enable a rich diversity of life forms to flourish. Animal and plant life was sustained through habitat diversity and through a range of protections that include preservation of breeding sites and refugia, and the imposition of food taboos.

Aboriginal ecological poetics are sensual. People say that their country calls them into action: they know the messages, they listen, smell, see, understand, and respond. When people are away from country they know well they experience sensory deprivation that feels like loss, banality, and inertness of spirit. One of my teachers, Kathy Deveraux, whose home is in the paperbark swamps of the north, described the experience of coming home: “You see the birds, you see the country, and your senses come back to you. You know what to do and where to go.”

Ecological poetics cluster around practices of knowledgeable care. Many people have an encyclopedic knowledge of the plants and animals of their country, of the habitat requirements of plants and animals, of how to interpret the tracks and other traces of life in the land, of signs and seasons, and of the communities of symbiosis that enable life to flourish through the generations. April Bright, another paperbark person, explained the responsibility to burn: “The country tells you when and where to burn . . . If we don’t burn our country every year, we are not looking after our country” (Bright 1995: 59).

Care of country expresses two major propositions concerning the flourishing of life in this created world. The first is that a country and its people take care of each other. This proposition emphasizes place and proximity in the organization of care, and asserts that relationships of care are reciprocal. To take care of one’s country is to take care of the conditions whereby country can continue to provide sustenance for living things, including the people who belong to (and take care of) the place. The second proposition is that those who destroy their country ultimately destroy themselves.

Local, fine-grained detailed knowledge is transmitted in the pedagogy of daily life, in myth and story, in song, ceremony and the visual arts. The conventional Western division between pragmatic action and religious action falls down completely in practices of care. One of the best-documented examples of the convergence of pragmatic action and mythico-religious action is the Dreaming track of the red kangaroo (*Macropus rufus*) in Central Australia. This track traverses some of the toughest desert country in the world, and the sacred sites coincide with the most favored areas for kangaroos. In particular, there is a strong correlation between Red Kangaroo Dreaming sites and the permanent waters that are the sources of fresh herbage during drought. The red kangaroo requires fresh green herbage; after rains the animals forage widely, but in drought they must rely on localized areas. As the sites are protected, so too are the kangaroos at these sites. These are places to which living things retreat during periods of stress, and in which hunting is forbidden.

Totemism

There are numerous types of totemism within Australia, and all express a non-random relationship between a particular person and particular other species or other

aspects of the natural world. Clan totemism is widespread; it links group, ancestral/Dreaming species, and country (sites and, often, tracks). According to Strehlow's key analysis of Aranda societies in the Central Australian desert, each clan is associated with a number of totemic beings, with one of which the clan is most intimately associated and for which it bears a central responsibility. Each clan is a set of descendants of a Dreaming ancestor.

A set of clans comprises a regional ritual community, and that regional group is also a community of social and ecological reproduction. It is a community made up of politically autonomous groups, each of which is responsible for the well-being of several species and of the other groups. The system is one of interdependence – the rain people, for example, make rain for everybody, humans and non-humans, and they depend on others to fulfill their responsibilities. The kangaroo people depend on the rain people for water, and take responsibilities for kangaroos. Their actions benefit everybody, including kangaroos.

Not only in Central Australia, but across the whole continent, there are similar structures of interdependence, restraint, control of sanctuaries, protection of permanent waters, refugia, breeding sites, and selective burning for the preservation of certain plant communities and other fire-sensitive areas.

Ceremony

Ceremony invigorates creation. Dreamings traveled, and they stopped, and now they remain fixed in place, except in ceremony. The work of ceremony draws the Dreamings into direct contact. In many parts of Australia, ceremony brings the Dreamings up from their underground or underwater sites and brings them into the surface world again. People sing and dance the tracks of major Dreamings, and as they do so they charge up the fertility, patterning and connectedness of the created world.

Many of the ceremonies are “increase rituals.” These rituals aim toward the regeneration of a particular species, but as the ethnobotanist Peter Latz points out, people are not attempting to initiate uncontrolled increase. The goal is to maintain the levels of resources within their country. In his studies in Central Australia Peter Latz concludes that increase ceremonies were carried out for each of the important food plants and animal species utilized by desert people. To promote the well-being of animals and plants it is necessary that the appropriate rituals be performed by the correct people (that is, the people whose totem or Dreaming that species is or whose country it is through other forms of relationship). Sites repeat across the landscape, so that the well-being of any one species does not depend solely on one site but is linked to people in many places, all of whom carry out their responsibilities. The mosaic patterning of habitat diversity and connection is also the pattern of human groups in regional associations.

Land is Law

Indigenous knowledge systems and systems based on Western scientific tradition have often been seen as the most distant poles on a continuum that ranges from “myth” to “fact.” Recent analysis undermines this dichotomy, and research in Australia shows that indigenous ecological knowledge on this continent is detailed, localized, and well grounded in empirical observations. Moreover, indigenous knowledge is embedded within a system of ethics that is oriented toward long-term productivity.

The ecological poetics of Dreaming concern life’s continuity and ability to flourish. Dreaming thus constitutes laws of existence and guides for behavior. Both metaphysical and ecological, Dreaming configures human life within the context of creation and continuity.

The Aboriginal philosopher Mary Graham writes that indigenous cultures of land and place are based on two axioms: the land is the law; and you are not alone in the world. These two axioms can be heard as an indigenous ethic and practice of connectivity. The second axiom – you are not alone – situates humanity as participant in a larger living system. The first – land is law – requires humanity to work with rather than against nature. The purpose of law is the purpose of Dreaming: to sustain a world in which life flourishes.

“White people ask us . . .”

One of the best Aboriginal explanations of Dreaming is by Mussolini Harvey:

White people ask us all the time, what is Dreaming? This is a hard question because Dreaming is a really big thing for Aboriginal people. The Dreamings made our Law. This Law is the way we live, our rules. This Law is our ceremonies, our songs, our stories; all of these things came from the Dreaming.

The Dreamings are our ancestors, no matter if they are fish, birds, men, women, animals, wind or rain . . . All things in our country have Law, they have ceremony and song, and they have people who are related to them...

In our ceremonies we wear marks on our bodies, they come from the Dreaming too . . . When we wear that Dreaming mark we . . . are keeping the country and the Dreaming alive. That is the most important thing . . . (in Bradley 1988: xi–xi).

Past and future

Mussolini Harvey’s statement that Dreaming law cannot change fits well with archeological evidence. The best contemporary dating techniques indicate that Aboriginal people have been in Australia for at least 60,000 years, and the archeological record shows long periods of apparent stability. This was the continent of huntergatherers; it

was the only continent inhabited solely by people whose way of life depended on “organizing the country” without domesticating plants and animals. It was thus unique, and Aboriginal Dreaming may fairly be said to constitute one of the most deeply developed religions emergent from this particular way of being human.

Many Aboriginal people claim that they have the oldest continuous religious tradition extant on Earth. This claim rests primarily on evidence from the rock art of Arnhem Land. In this vast body of religious art, the sequence reveals a moment at which the Rainbow Snake is unambiguously identifiable. As the Rainbow Snake is of continuing and extreme significance, continuity is asserted. Experts’ views on dates vary considerably, and at this time the dating is based on inference rather than technology, so it has not yet been possible to offer objective evidence. A widely shared view is that the Rainbow Snake images date from the period of sea-level rise following the last glaciation, and thus could be about 8000–9000 years old. Rainbow Snakes in this ancient art are nearly identical to those that are painted on bark and canvas in Arnhem Land today, as prehistorian Darrell Lewis (1988) shows in his monograph on Arnhem Land rock art.

Claims for the antiquity and continuity of Aboriginal religious traditions are balanced by current evidence of the flexibility and contemporary viability of these same traditions. In spite of nearly two centuries of predictions that Aboriginal people were dying out, losing their culture, losing their traditions, and assimilating into “white” society, Aboriginal Dreaming is alive and well all over Australia.

Flexibility has been demonstrated most profoundly in encounters between Dreaming and Christianity. While many of these encounters have been extremely painful, particularly when missionaries were involved in breaking up families, suppressing indigenous culture, and forcibly requiring people to abandon their traditional religious practices, the resilience of indigenous religion has facilitated an astonishing measure of cultural survival. Rather than abandoning their traditions, in many parts of Australia Aboriginal people found ways to accommodate Christian teachings within Dreaming. In the process of accommodation they indigenized Christianity, bringing it into country, locating it in sacred sites, connecting it directly with the Dreamings and people of each country. Australia is now marked not only with indigenous Dreaming action, but also with exogenous activity: the footprints of Jesus, remnants of Arks, the hill where Ned Kelly landed his boat, and similar sites offer the prospect that colonizing action is being transformed into Dreaming geography.

In addition to indigenizing Christianity and colonial culture, Aboriginal religious practice is, in some areas, now indigenizing “settler” Australians. Aboriginal spiritual leaders working in contexts of decolonization open their sacred sites to non-indigenous people, share the teachings, accede to a variety of religious practices within their sacred sites, and seek to impart their modes of belonging to people whose roots are elsewhere. Non-indigenous people who are welcomed into indigenous sites are themselves spiritual seekers who are looking for less oppressive ways of settling into Australia.

Working with the view that the violence and racism of conquest scar the oppressor as well as the oppressed, some indigenous spiritual leaders organize intercultural events within which they assist in healing the pain of colonization for all the participants.

The idea of caring for country has been adopted from indigenous people and has become a national slogan directed toward developing an Australian environmental conscience. Indigenous practices of care in upholding biological diversity are taken as models for sustainable human life in Australia. An emergent movement of spiritual revitalization emphasizes the land as the source of social and spiritual recovery. Aboriginal leaders in this movement see non-Aboriginal Australians' alienation from the land as a spiritual void that can be healed.

The future of Dreaming is thus predicated on the poetics of its long history: the mutually life-affirming relationships between people and country, among people and other living things, and between past and present. Increasingly, Dreaming Law is generating life-affirming relationships between settler and indigenous peoples and is offering a spiritual and ecological template for the future.

Aboriginal Environmental Groups in Canada

Indigenous peoples in Canada have been active in protecting their territories from exploitation for centuries. Fighting to protect indigenous land rights and self-determination is synonymous with environmental protection for many Aboriginal people, since the land and creation provide the foundation for their languages, spirituality, knowledge systems, and traditional forms of governance. Aboriginal cultures in Canada view the “environment” quite broadly, as a concept that encompasses relationships between the physical and spiritual worlds, inter-relationship and interdependency between humans, plants and animals and our own internal environments. This broad view relates issues around health and healing, decolonization, resistance, governance, language and self-determination to the land. These issues, often viewed outside of the concept of “environment” from a Western perspective, are included in Aboriginal environmental perspectives.

Aboriginal nations are often on the front lines when it comes to dealing with environmental devastation and their nations have employed a diversity of strategies to promote environmental protection including public education, legal action, engaging in scientific research, alliance building with non-Aboriginal environmental groups, and direct action, to name a few. The Innu nation has worked hard to protect their lands from the impacts of mining, road building, potential forestry development and low-level military flight-testing. The Grand Council of Crees has educated Canadians and Americans about the devastating impacts of hydro-electric development and unsustainable forestry practices on Cree lands. The Interior Alliance, composed of the Southern Carrier, St’at’imc, Secwepemec, Nlaka’pamux and Okanagan nations, has been a prominent voice raising the environmental impacts of large-scale tourist development in the Canadian media, in addition to outlining the potential impacts of recent trade agreements on their rights and their lands. In Nunavut, the Inuit Tapirisat has documented the impacts of contamination on Inuit communities and the Arctic environment in addition to sounding alarms about startling changes in their climate and ecosystem as a result of global warming.

Many Aboriginal people consider themselves the original caretakers of Mother Earth, and feel they have a responsibility to work to protect and heal the land from centuries of exploitation. At the local level, several communities have initiated local environmental groups concerned with issues impacting the land. The Grassy Narrows Environmental Group has worked to protect their territory in northern Ontario from industrial log-

ging and to heal their lands from the devastating impacts of mercury contamination. The Kanawake Environmental Program developed a successful community recycling program on their territory near Montreal. The Pictou Landing First Nation in Nova Scotia is operating the first Forest Stewardship Council certified woodlot in Canada. These projects have succeeded despite numerous barriers. It is often difficult for Aboriginal communities in Canada to initiate these projects because they are not afforded any core funding for environmental protection from the Department of Indian Affairs. It is still quite difficult to attract necessary financial support from other government departments and private foundations, leaving the economically poorest communities in Canada with few financial resources to deal with the enormous environmental issues they face.

One of the first Aboriginal environmental organizations in Canada formed in response to extreme industrial contamination in the Mohawk Territory of Akwesasne. The Akwesasne Task Force on the Environment (ATFE) was created in 1987 as a community-based, grass-roots organization, to address the environmental problems facing the Mohawk Nation community of Akwesasne. The “mission of the Akwesasne Task Force on the Environment is to conserve, preserve, protect and restore the environment, natural and cultural resources within the Mohawk Territory of Akwesasne.” The task force founded the Kaniatarowanen’neh Research Institute to conduct environmental research as well as launching advocacy campaigns to promote the clean-up of toxic waste sites adjacent to the community created by industry. The ATFE is also involved in environmental education initiatives as well as promoting the development of sustainable economic initiatives at the community level. Similar work is carried on at the confederacy level by the Haudenosaunee Environmental Task Force (HETF), composed of representatives from 15 Haudenosaunee communities in Canada and the United States (HETF, nd).

At the national level, the Assembly of First Nations (AFN) under the current leadership of Matthew Coon Come has continued to emphasize the importance of the environment despite massive government funding cuts. The AFN is currently involved in the development of the Nuclear Fuel Waste Act, and the proposed Species at Risk and Marine Conservation Areas Acts, in addition to participating in the development of amendments to the Canadian Environmental Assessment Act. The Congress of Aboriginal peoples, representing Métis and off-reserve Aboriginal peoples, works to address environmental issues impacting urban Aboriginal people and Métis communities.

The Centre for Indigenous Environmental Resources (CIER) is another organization active at the national level. CIER is an Aboriginal-controlled non-profit organization based in Winnipeg, Manitoba and is dedicated to the protection, preservation and renewal of Mother Earth. Founded in 1994, CIER was created to implement environmental-capacity-building initiatives in First Nations by developing necessary research, education and technical resources to enable communities to address the environmental issues facing their communities. To this end, CIER operates the First Nations Environment and Education Program for Aboriginal youth from across Canada

educating their youth in indigenous and western scientific environmental perspectives. CIER also operates Winds and Voices Environmental Services, offering Aboriginal environmental consulting to organizations from across Canada. In addition to advocating for Aboriginal peoples and the environment at national and international levels, CIER has also created an innovative green office space demonstrating that it is possible to promote indigenous environmental values in contemporary times and in urban environments.

Aboriginal environmental organizations are also committed to sharing information and building alliances with other environmental and social justice groups. The First Nations Environmental Network (FNEN), affiliated with the Canadian Environmental Network, is a national organization of indigenous nations, individuals, and nonprofit groups working on environmental issues. They are committed to protecting, defending, and restoring the balance of all life by respecting and honoring traditional indigenous values. They operate as a network, linking grassroots indigenous peoples nationally and internationally to lend support to the variety of environmental issues facing indigenous peoples.

The Boreal Forest Network (BFN), the North American Affiliate of the Taiga Rescue Network, is a network of environmental groups, indigenous peoples and individuals working together to protect, restore and promote the sustainable use of North America's remaining boreal forest, in addition to ensuring that indigenous rights are respected and there is local control of forest resources. Given that 80 percent of the people living in North America's boreal forests are indigenous peoples, the participation of indigenous nations within the network has been an important force facing policy and decision making within the network.

Aboriginal Spirituality and the New Age in Australia

Australian Aboriginal religious traditions are the focus of some interest in the international alternative health and spirituality movement, better known as the “New Age.” This interest emerges from and reflects a wider pattern in “Western” thought that imagines contemporary indigenous peoples as embodying a primal human relationship to the natural world. Within this framework, the “West” tends to be associated with a set of cultural attitudes that reduce natural landscapes to mere resources for economic exploitation, while indigenous peoples are characterized as the guardians of true ecological and, therefore, spiritual wisdom. This link between spirituality and knowledge of the natural world can be traced throughout the history of European thought. It is clearly evident, for example, in the eighteenth-century work of Jean Jacques Rousseau, who wrote about the “Noble Savage,” and in nineteenth-century Romanticism, which celebrated all that was “natural” in the face of ever-increasing industrialization.

Although many Aboriginal people live in cities and rural towns, and although the Australian continent is environmentally diverse, New Age representations of Aboriginal culture tend to focus on spiritual connections with the central desert region. One of the most well-known New Age accounts of Aboriginal spirituality is Marlo Morgan’s novel, *Mutant Message Down Under*. This popular story, originally published as non-fiction, introduces a group whom Morgan refers to as the “Real People.” The members of this central Australian “tribe” have had no contact with non-Aboriginal Australians and embody, according to Morgan, all that is wise and good in human-kind. Her narrative explains that the Real People have chosen to “leave Planet Earth” because damage to the environment is making it increasingly uninhabitable for them (1994: 148). Before they disappear, however, the Real People decide to pass their ecological and spiritual wisdom on to a white American woman (Morgan) so that she can carry their “message” to the rest of the world; the message being that non-indigenous people (mutants) must become more spiritually aware and less destructive of the natural environment. Similarly Lynn Andrews’ book, *Crystal Woman*, tells of the author’s spiritual journey to central Australia where she meets an elderly Aboriginal woman, a “shamaness,” who shares her wisdom with the white, American “apprentice.” In Andrews’ story, however, the American heroine heals the Aboriginal community she visits and paves the way for its members to join forces with indigenous peoples throughout the world. Although Andrews and Morgan both claim that their stories are true, their accounts are more

representative of the themes that inform New Age discourses than of the experiences and concerns commonly reported by Aboriginal people themselves.

Other well-known New Age texts that focus on Aboriginal spirituality are Robert Lawlor's *Voices of the First Day* and the collection of books by James Cowan, most especially *The Elements of the Aborigine Tradition*. Unlike the volumes by Morgan and Andrews, these are clearly presented as non-fiction and offer seemingly authoritative descriptions of Aboriginal culture. However, like Morgan and Andrews, their interpretations are idiosyncratic and highly contested outside of the New Age community.

It is possible to argue that there has been a greater curiosity about Aboriginal spirituality in European and American New Age communities, especially in the healing powers attributed to didjeridu music, than in the Australian context, where interest in the spiritual traditions of indigenous North Americans has often been more visible. Research on the alternative health and spirituality movement in Australia, however, does indicate that Aboriginal imagery is occasionally incorporated into New Age workshops and rituals, often in combination with images from other indigenous cultures. There have also been several Australian versions of New Age vision quests, based on Native American models. These have focused on stories, images and places associated with Aboriginal cultures and have tended to take the form of pilgrimages, for non-Aboriginal people, to places of spiritual significance to Aboriginal communities. These "quests" often start in a capital city and involve an overland journey into Central Australia.

Aboriginal sacred sites, most especially Uluru in the center of Australia, are commonly believed, by many New Age thinkers, to constitute important components of a magnetic energy grid that spans the entire planet. Many New Age believers gathered at Uluru on 16 August 1987 to participate in the Harmonic Convergence, a global event that involved thousands of people traveling to sacred sites around the world to meditate on universal peace. The traditional Aboriginal owners later discouraged New Age gatherings at Uluru, claiming that New Age visitors failed to respect their requests for privacy and sensitivity.

Aboriginal reactions to New Age interest in their religious beliefs and practices, like those of other indigenous peoples, vary widely. It is possible to identify three general overlapping categories of response. Some Aboriginal people actively accommodate the New Age. These individuals believe that there is potential for the Aboriginal community to benefit from such attention. The HarperCollins edition of Marlo Morgan's book, for example, originally included a written endorsement by Burnam Burnam, an Aboriginal man who felt that the story rightfully represented Aboriginal people as "regal and majestic." Other Aboriginal elders have also argued that sharing their spiritual traditions with non-Aboriginal people is a way of encouraging greater levels of understanding and appreciation of their cultures, thus furthering Aboriginal struggles for land rights and social justice. Another category includes Aboriginal people who themselves adopt New Age beliefs and practices and merge them with traditional Aboriginal spirituality. Some of these people, such as Tjanara Goreng-Goreng, an Aboriginal woman from Queensland, have run workshops in Australia and overseas for

non-Aboriginal people interested in Aboriginal spirituality and New Age philosophies. While Goreng-Goreng clearly asserts that there are many things she would never share with non-Aboriginal people, she also feels that it is important to build spiritual and social bridges between indigenous and non-indigenous groups in Australia and around the world.

A third category of response includes those who are strongly opposed to New Age “appropriations” of Aboriginal cultural imagery and actively protest against them. Robert Eggington, the Chairman of an Aboriginal arts advisory committee based in Western Australia, has promoted a “declaration against the continued spiritual colonization” of Aboriginal people and has led a long-term campaign against Marlo Morgan for what many believe are her blatant misrepresentations of Aboriginal cultures.

Commentators and indigenous activists worldwide argue, along similar lines to Eggington, that New Age interest in and use of indigenous spiritual and cultural imagery represents the ongoing colonization of indigenous peoples. Aboriginal lawyer, Larissa Behrendt (1998) draws attention to the ways in which romantic representations of indigenous people, such as those favored by the alternative health and spirituality movement, can have real disadvantages for Aboriginal people in their daily lives. She suggests that those Aboriginal individuals and groups who do not fit New Age stereotypes of “traditional” indigenous culture can suffer discrimination resulting from accusations that they are not “authentic” or “real.” Such challenges to individual and group identity can have serious political consequences for indigenous minorities.

One of the criticisms often directed, by Aboriginal people and their supporters, at participants in the New Age movement who profess an interest in Aboriginal spirituality, is that this interest often fails to acknowledge the links between religious beliefs and other less esoteric cultural traditions. For example, in an interview with researchers Denise Cuthbert and Michelle Grossman, Helena Gulash, an Aboriginal woman from Queensland, drew attention to Aboriginal attitudes to the restriction of religious knowledge. She explained that Aboriginal culture was not “an open book” and that there were certain things that were only appropriate for people to learn at specific times in their lives (1997: 51–2). Gulash pointed out that many New Age believers were unwilling to accept or respect such restrictions. She also indicated that while people involved in the New Age movement were often very eager for Aboriginal people to “share” their spiritual wisdom they tended to be less interested in learning about “the human level of things,” or in “developing connections” with the Aboriginal community (1997: 61). Gulash also claimed that there had been “very little practical help forthcoming or offered from the New Age movement to actually help [Aboriginal people] get [their] land back” (1997: 56), a struggle that is constantly identified as being essential to the ongoing survival of Aboriginal communities and cultures. There is, however, enormous diversity within the alternative health and spirituality movement, and degrees of individual commitment to matching spiritual “rhetoric” with lifestyle change and political and environmental activism vary considerably. While some people want to “honor” indigenous people without supporting them, others are eager to become

more involved in indigenous issues. Occasionally this desire may even result in a move away from some of the assumptions promoted in mainstream New Age discourses.

New Age interests in indigenous belief systems sometimes overlap with those of people involved in the environmentalist movement. Jane Jacobs, a lecturer in geography and environmental studies, explained that “the spiritualism and holistic visions associated with land-based indigenous cultures have an obvious appeal” (1994: 305) to ecofeminists and deep ecologists. She argued that although these “Western” groups tend to emphasize the seemingly universal values of Aboriginal cultures at the expense of the particular characteristics that make them unique and valuable to their places of origin, opportunities also exist for Aboriginal people to benefit from such interest. Jacobs told the story of a group of Aboriginal women (Arnernte) from Australia’s Northern Territory who managed to gain crucial financial and political support from feminist and environmentalist groups around the world for their campaign against the destruction of a sacred women’s site by government developers. Their cause was successful partly because the traditional Aboriginal owners promoted the site as a place of importance for all Australian women, not just for Aboriginal women – even if non-Aboriginal people were unaware of it. Jacobs believed that by universalizing the value of their site these Aboriginal women were able to gain the active support of non-Aboriginal “counter-cultural” groups.

The New Age movement is especially vulnerable to accusations of cultural appropriation because of its emphasis on “picking and mixing” elements of many different spiritual traditions to create belief systems tailored to the interests and concerns of individual participants. However, New Age use of indigenous imagery cannot be understood apart from the currency that same imagery has in the wider society. Although the borrowing of cultural imagery, ideas or behaviors always has the potential to cause harm or offense to some groups, it is also a taken-for-granted practice in both indigenous and nonindigenous societies. New Age representations of and interests in Aboriginal people must be understood within the cultural context from which they emerge. However, they must also be understood within their political contexts and due consideration must be given to their possible consequences for “real-life” communities.

Abortion

Almost all environmental problems – pollution, overconsumption of limited resources, global climate change, destruction of non-human species, habitat, and land – are results of humans exceeding the carrying capacity of the planet. While part of the solution to these problems involves changing behaviors so that we might “walk more lightly” on the Earth, a central strategy to saving the Earth involves curbing population growth. Although education, increased rights of women, and a more just distribution of economic resources are essential to long-term population control, family planning has been an important policy with regard to short-term efforts to curb population growth. And effective family planning practices have almost always included inexpensive access to abortion, particularly where access to and effectiveness of other forms of contraception are limited. Consequently, the religious and ethical issues surrounding abortion become important in the religious and ethical discussion of environmental sustainability.

Daniel Maguire observes that when it comes to overpopulation, “Religion has been part of the problem” (2001: 149). Whether it is the biblical injunction to be fruitful and multiply, the Vedic view that a woman should marry before puberty so as not to waste any opportunity to become pregnant, or the Confucian ideal that status comes from numerous offspring, virtually all the traditional religions of the world have promoted increased fertility rather than limited family size. Concomitant to the promotion of fertility, many traditional religions are associated with teachings that explicitly condemn abortion. Of the world’s religions, Christianity, in particular, especially in its Roman Catholic and conservative evangelical Protestant forms, has taken the strongest stand against abortion, not only by teaching the view in its churches, but also by promoting political activism to make abortion illegal for anyone, Christian or not. Hindu, Buddhist, and Islamic religious bodies have often spoken out against abortion, though they have been less likely to promote the view as social policy. However, conservative Islamic nations allied themselves with the Vatican to oppose United Nations initiatives supportive of family planning and abortion at conferences in Rio de Janeiro in 1992 and Cairo in 1994 (Maguire 2001: 31). A survey of the teachings of these traditional religions, (see Steffan 1996), suggests that opposition – or at least resistance – to abortion, is rooted in a common conviction, namely, that all life, even fetal life, is sacred.

Ironically, the very concern with the sacredness of all life found in the world’s traditional religions, has increasingly been recognized by various environmentalists as an important resource for supporting environmentalism, even deep ecology and

ecofeminism (see Barnhill and Gottlieb, *Deep Ecology and World Religions*). Put simply, the recognition that all life is sacred, whether that is understood in terms of the intrinsic goodness of all creatures who are valued by their creator or in terms of a divine aspect present in every thing, supports the conviction of biocentric ethics that recognizes all living creatures have value in themselves apart from human use. However, if various forms of environmentalism share the view that all life is sacred or intrinsically valuable, then does this imply that deep ecologists and ecofeminists, among others, should oppose abortion for the same reasons that many traditional religions have apparently opposed abortion? Indeed, some critics have asserted as much. Janet Biehl has argued that for ecofeminists to be consistent, they must “oppose abortion on the grounds that it is destructive to ‘life’ ”(Biehl in Clausen 1991: 346). Even though Clausen dismisses Biehl’s claim as “indiscriminate” and not a view held by ecofeminists, there does seem to be a moral ambiguity about abortion that warrants examination. After all, the biocentric affirmation of the intrinsic value (or sacred status) of non-human life, by implication, raises the intrinsic value or sacred status of incipient human life or fetal life as well. Indeed, it does not appear to matter whether the fetus is understood as human or less than human, for if all living things are sacred, then fetuses count as sacred too. While Biehl’s assertion may not represent the de facto views of ecofeminists and other biocentric environmentalists, it would seem that if we ignore or dismiss the intrinsic value or sacredness of fetal life, that we run the risk of trivializing the intrinsic value of nonhuman life. Is there, then, a way to talk about the intrinsic value or sacred worth of fetal life that still allows for the practice of abortion as one means of family planning, or does a consistent biocentrism ultimately lead to opposition to abortion? At this point, Daniel Maguire suggests that religion might “be part of the solution” (2001: 149).

Maguire points out that in spite of the stereotype that traditional religions are anti-abortion, a more careful survey indicates that the major world religions have actually had a more nuanced assessment of the practice of abortion. Even in the Roman Catholic expression of Christianity, the strong anti-abortion stance of the Church is a relatively new development, and it is not universally affirmed by theologians. The official theologian of the Catholic Church, Thomas Aquinas, did not consider the fetus to have a human soul for at least forty days after conception (if male – ninety days if female). The fifteenth-century Saint Antoninus and seventeenth-century Jesuit theologian Thomas Sanchez allowed that abortions were permissible to save the life of the mother (Maguire 2001: 37–8). As late as the first half of the nineteenth century, the Vatican distinguished between abortions that were homicides (when the fetus was fully formed) and those that were not. Of course, Maguire is not arguing that the Catholic Church has ever been supportive of abortion on demand, but he is pointing out that the Church’s teaching has reflected an ambiguity about the nature of the fetus; even when abortion was condemned in the earlier tradition, it was not usually viewed as homicide. Although, current papal teaching does condemn all abortion as homicide,

there is, nonetheless, among today's Catholic theologians, a wide range of perspectives on abortion that can claim to be rooted in the tradition.

Maguire and others provide parallel analyses of non-Christian religions that indicate that abortion, even where it was seen as undesirable, was also viewed as permissible under certain circumstances, ranging from health of the mother to the psychological and economic well-being of the family and the sustainability of the community. Perhaps the most interesting example of how a traditional religion has dealt with the moral ambiguity surrounding abortion is found in Japanese Buddhism. In spite of the "First Precept of Buddhism," namely, "Do not kill, but rather preserve and cherish all life," which for many Buddhists entails vegetarianism, abortion is a fairly important means of birth control among Japanese Buddhists. Indeed, many have credited Japan's liberal laws on abortion as the major reason for Japan's success in curbing its population growth. There is an obvious tension between Buddhist principle and practice here.

One way that Japanese Buddhists have dealt with this tension is through a ritual called *mizuko kuyo*⁻, a term which has been translated as "water child" or "liquid life" ritual. In this ritual, a person who has had an abortion (or miscarriage or still-birth) performs a ceremony similar to that of honoring one's ancestors, but along with memorializing the aborted fetus, the person in effect apologizes to the *mizuko* or "water child" for not having the opportunity to be born (see LaFleur 1996: 218–25 for a fuller description of various forms of *mizuko kuyo*⁻). The ritual provides a means to assuage guilt, or more positively, to maintain one's sense of humanity. According to LaFleur, the ritual is a pivotal way that Japanese Buddhists have dealt with the morality of aborting a life with sacred value: "through this ritual their moral options are not limited to either categorically forbidding abortion or, at the exact opposite pole, treating the fetus as so much inert matter to be dispensed with guiltlessly" (LaFleur 1996: 224). Elsewhere,

LaFleur argues that *mizuko kuyo*⁻ provides another option [to viewing the fetus as either fully human or as entirely non-human], however, one which may be both more accurate and more useful, namely that of seeing the fetus as an ambiguous entity, neither exactly human nor adequately rendered as a mere thing. What interests many of us in the Japanese case is that in Japan, at least by persons wanting to bring religious values into the equation, the fetus is described largely in terms of this ambiguity (LaFleur 1998: 388).

In short, the sacredness of human life is honored without being absolutized.

These examples from traditional religions demonstrate that while it is wrong to say that these religions unequivocally oppose family planning efforts that include abortion, it is true that they see abortion as morally problematic. Even Maguire's liberal reading of Roman Catholic tradition acknowledges that a newly developed fetus has some value, and the rite of *mizuko* reminds the practitioner that the death of the fetus is a real loss. Although recognizing that abortion is morally problematic might seem to point back to anthropocentrism, that very recognition also affirms that there is something sacred at stake. What is implied for a biocentric ethics is that while the affirmation of

the intrinsic value of all life does not preclude abortion as one means of family planning and population control, it does encourage us to seek less harmful alternatives wherever those are feasible.

Adams, Ansel (1902–1984)

A renowned American photographer and conservationist, Adams fused his passions for photography and nature into stunning black-and-white images of the American West, and in the process became one of the best-known and most honored lensmen in the world.

Unchurched, yet deeply religious, Adams viewed nature as sacred and California's Sierra Nevada Mountains as his cathedral. According to photography scholar John

Stzarkowski, "The thing that Adams most wanted to do as an artist was to photograph his mountains as a holy place" (Starkowski in Adams 1994: 26).

Adams' belief in the sanctity of nature derived from several sources. His father introduced him to Walt Whitman, Henry David Thoreau, and Ralph Waldo Emerson. Whitman's pantheism, Thoreau's faith in nature, and Emerson's transcendental view of God in nature set well with him.

On a mountain outing in 1925, Adams carried a copy of English poet Edward Carpenter's *Toward Democracy*. The book extolled nature as the ultimate source of spiritual insight.

When Ansel Adams read Carpenter among the granite peaks of the Sierra Nevada, it was the perfect combination of a time and a place, a set of ideas and a receptive mind. Reading Carpenter helped to confirm his growing sense of the spiritual power of nature and its potential for the redemption of society (Spaulding 1995: 50).

The following year, Adams met the pantheist poet Robinson Jeffers and his wife Una at their home in Carmel. They became friends. Jeffers regarded the universe as divine, a vibrant whole, with all of its parts expressions of the same creative energy. Jeffers' poetry deeply affected the photographer. Adams considered Jeffers a genius who "produced much of America's greatest poetry . . . Jeffers was a prophet of our age" (Adams 1985: 86–7).

Intellectual debts aside, Adams' greatest inspiration sprang from wild nature. He experienced natural wonders as symbols of spiritual life. Adams "stressed that people have a profoundly spiritual need for nature. It was this spiritual connection between the Earth and its inhabitants that Adams sought to express in his photographs" (Adams 1995: 8).

To make the connection, Adams consciously tried to convey the equivalent of what he saw and felt at the moment he released the shutter. He spent countless hours in his darkroom perfecting his images. Adams devised a "Zone System" to gain maximum tonal range from black-and-white film. He defined it as "a framework for understanding exposure and development, and visualizing their effect in advance" (Adams 1985: 311).

He called negatives “the score” and prints “the performance.” Adams altered the “straight reality” of his negatives by intensifying or subduing the dramatic play of light and shadow in his prints, thereby attaining his vision of nature’s grandeur.

Adams’ compositions drew criticism from some quarters because they excluded human beings and ignored environmental deterioration. He responded that his pictures always included two persons, the photographer and the viewer, and he chose to accent the positive in his work. Through his photography, Adams sought to lift people’s thoughts above material concerns:

We are now sufficiently advanced to consider resources other than materialistic, but they are tenuous, intangible, and vulnerable to misapplication. They are, in fact, the symbols of spiritual life – a vast impersonal pantheism – transcending the confused myths and prescriptions that are presumed to clarify ethical and moral conduct . . . In contemplation of the eternal incarnations of the spirit which vibrate in every mountain, leaf, and particle of Earth, in every cloud, stone, and flash of sunlight, we make new discoveries on the planes of ethical and humane discernment, approaching the new society at last, proportionate to nature . . . (Adams 1950: 50).

His ability to give viewers a sense of “the metaphysical implied by the physical” informs his best work, says art authority David Robertson. By evoking immanent divinity in his natural landscapes, Adams captures a transforming vision of a cosmic order that contains and maintains our world . . . No artist in Yosemite history has so effectively as Ansel Adams let us glimpse the majesty of this order; no other artist has so enabled us to sense its glory and partake of its power (Robertson 1984: 124).

To commemorate his legacy, Congress named a wilderness area south of Yosemite in his honor, and the U.S. Geological Survey demarked an 11,760 foot peak “Mount Ansel Adams.” His ashes were scattered on its slopes, becoming one with the mountains he loved and photographed so stunningly.

His images live on to stir deeper appreciation for wildlands and greater reverence for the natural world.

Adams, Carol (1950–)

Carol Adams has been the primary voice linking animal rights with feminism, particularly focusing on the religious dimensions of these issues. Her seemingly obvious yet incredibly controversial statement that “people with power have always eaten meat” points to the inherent sexism, racism, speciesism and violence of patriarchal culture. Adams has published close to 100 books and articles on issues of ecofeminism, domestic violence and the spirituality of vegetarianism. In addition, her work has been featured in the documentary “A Cow at My Table.”

Since the 1970s Adams has been an activist addressing issues of poverty, racism, sexism and animal rights. She received her Master of Divinity from Yale University Divinity School in 1976 and is an adjunct professor at Perkins School of Theology, Southern Methodist University, in Dallas.

Adams’ seminal work, *The Sexual Politics of Meat: A Feminist-Vegetarian Critical Theory* (1990), suggests that animals are the absent referent in the act of meat eating. They also become the absent referent in images of women butchered, fragmented, or consumable. Thus a structure of overlapping but absent referents links violence against women and animals. Through the structure of the absent referent, patriarchal values become institutionalized. Presentations of this book are often accompanied by her widely acclaimed “Sexual Politics of Meat Slide Show” in which Adams visualizes the links between women and meat.

She also edited the volume *Ecofeminism and the Sacred* (1993), the first anthology to focus on ecofeminism and spirituality. Adams deliberately included essays that embody the diverse manifestations of ecofeminist spirituality. In various essays she analyzes the construction of bodies in feminism. She posits that self/other dualisms central to patriarchal thought lead to a feminizing or animalizing of all “others.” Thus all “others” can “naturally” be dominated.

She elaborates on the themes of compassionate spiritual practice in *Meditations on the Inner Art of Vegetarianism: Spiritual Practices for the Body and Soul* (2001). Central to her ecofeminist work is the shared embodiedness of all beings. Carol Adams’ provocative, ground-breaking insights into the interconnections between violence against human and nonhuman animals provides a powerful lens through which patriarchal culture can be viewed and critiqued.

Aesthetics and Nature in China and Japan

Chinese Aesthetics

Chinese aesthetics, influenced strongly by Daoism, Confucianism, and Buddhism, manifests a distinctive and complex view of nature. The basic assumption is that the world of phenomena manifests the *Dao*, the way of nature. The *Dao* is not a separate reality but rather the patterned processes of the natural world, or perhaps the disposition of the universe to act in a patterned, harmoniously interactive way. The human ideal is to understand the *Dao* and act in harmony with it.

This view of nature can appropriately be called “organic” for various reasons. First, all of reality is included. There is no separate, transcendent realm; heaven, Earth, and humans (the “Triad”) are all fully part of nature. Second, nature is self-creative. Rather than a separate creator who made the world in the past, nature by itself displays ongoing creation. *Zaohua*, the “Creative,” acts in spontaneous and unpredictable ways but is always skillful in creating the beauty and harmony of the natural world.

Third, all things – including rocks and water – have vitality, called in Chinese *qi*, literally the “breath” of life. Fourth, each phenomenon has an individual nature, and this consists not of some essence but of a distinctive power (*de*), spirit (*shen*), and pattern of growth. And finally, all phenomena are organically interrelated. The world is one continuous field of *qi*, with each phenomenon not a separate thing but rather a temporary form within it, like a whirlpool in a stream.

Art is the evocation of the spirit of phenomena, rather than a depiction of surface reality. Painters, for instance, are supposed to capture the specific *qi* or “spirit resonance” of things. If the artist does, then the painting itself will exhibit *qi* and be an instance of *zaohua*. The artist participates in nature’s creativity.

In order to accomplish this, the artist or poet must go through meditative practices that consist fundamentally of two things: removing the delusion of a separate self and the desires it produces, and concentrating upon the subject until there is a direct communion with it. That communion is described metaphorically in various ways, for instance, as “entering into” the rock or tree, or as allowing the phenomenon to enter into the artist, resulting in the “complete bamboo in the breast.” Literary treatises such as the *The Poetic Exposition on Literature* (*Wen fu*) by Lu Ji (261–303) and the *The Literary Mind and the Carving of Dragons* (*Wenxin diaolong*, ca. 523) by Liu Xie

(465–522) spoke of a “spirit journey” in which the poet’s inner spirit roamed out into the world. Such communing with nature is possible because we are within nature’s field of *qi* and thus ontologically continuous with all other things.

Thus a major aesthetic concern was the relationship between self and nature, inner and outer. The Chinese saw nature as an ongoing dynamic of stimulus and response among all things, and humans were included in this. Emotions arise in reaction to circumstance, and from the earliest statement of poetics, the “Great Preface” to the Book of Song (*Shi jing*) [ca. first century], poetry was seen as a voicing of that response. It was assumed that there was a strong correlation between “scene” (*jing*) and “emotional response” (*qing*), and the great poet achieved a unity of the two.

Because humans are a part of nature, human culture is not seen as something separate from nature or unnatural. This was particularly stressed in the first chapter of *The Literary Mind and the Carving of Dragons*. The term for both literature and culture is *wen*. Originally the term meant the pattern a phenomenon makes (e.g., the particular sound a pine makes in the wind, the colors of a tiger, the shapes of a cloud). Human culture – literature and art in particular – is the *wen* of humans. The words written by a poet are essentially no different from the tracks a bird makes in sand. Culture is, thus, natural, but that naturalness is realized only if the person acts as nature does, with spontaneity according to one’s true inner nature rather than based on the desires of the ego-self.

This view gives humans a paradoxical status within nature. We are the only phenomena that fail to exhibit naturalness. However, humans also are given an exalted status within nature, for if an artist creates in a natural way, then the “mind of nature” is revealed and the transformations of nature are brought to “completion.” Thus we have a responsibility to act in a natural way. If we act on the basis of our personal desires or if we delude ourselves into thinking we are separate from nature, then nature’s transformations cannot reach fulfillment and disharmony results.

The notion of nature at work here is different from what we are used to in the West. Although there are numerous different meanings of our word “nature,” two meanings have been particularly influential. One we could call “dualistic”: nature is whatever humans have not created or manipulated. The opposite of this notion of nature would be “culture” or “human,” and a skyscraper or toxic waste would be considered unnatural. The second notion of nature we could call “monistic”: nature is whatever exists in our world. A skyscraper or toxic waste are in this sense natural, and the “natural” sciences can study them. Here the opposite of nature would be the “supernatural.” Chinese aesthetics is based on a third, “adverbial” notion of nature. As in the monistic notion of nature, humans are “essentially” a part of nature. However, existentially humans may act unnaturally if they don’t act spontaneously according to their nature. The opposite of this sense of the natural is the artificial, the forced, and inevitably the disharmonious. Thus human culture may or may not manifest the mind of nature. Essentially humans are natural, but existentially the natural is only a possibility. We must work to realize it.

Japanese Aesthetics

Japanese literary aesthetics are rooted in both Shinto and Buddhism. In Shinto, nature is characterized by places of spiritual power, mystery, and beauty. Moreover, the agricultural year is ritualized according to seasons, with special religious festivals celebrating the particular character of the season. Thus nature has places ritually set-off as divine and also involves a natural process of seasonal change that we are actively enmeshed in.

Buddhism offered a view of nature that emphasized impermanence and interrelationship. All things are transient and unstable, and they are radically interdependent. Reality is “empty” of the permanence and self-subsistent independence we normally associate with it. But as the Heart Sutra states, “emptiness is form and form is emptiness”: the phenomenal world is also ultimate reality, a vast dynamic field of interrelationships. The problem is that our delusion about permanence and discreteness involves a sense of separation from the world and leads to desires and attachments and thus suffering. The ideal is an experience of oneness with the world, a realization of its sacred nature, deep contentment, and a spontaneous way of acting devoid of desires.

The first major statement of Japanese poetics is the introduction to the *Collection of Poems Ancient and Modern* (*Kokinwakshū*, ca. 920). It reflects the sense of intimate connection between humans and nature found in

Shinto and Chinese aesthetics. Poetry is a natural reaction to what is emotionally moving in a particular moment, with nature and love being the two main contexts for deep feeling. To be human is to be moved by nature’s beauty and to express one’s emotions, and thus poetry is as natural as a bird’s song. Artistic expression of emotion arose as a refinement and fulfillment of our natural movements.

A focus on nature, recognition of the transience of all things of beauty, and the ideal of tranquility formed the basis of many Japanese aesthetic ideals. The most fundamental aesthetic idea may be *mono-no-aware*, the “pathos of things.” It involves an exquisite sensitivity to impermanence, whether it is the falling of leaves or one’s own process of aging. A kind of sweet sorrow arises from the simultaneous affirmation of beauty and a recognition of its passing away. Included is a sense of acceptance, resulting in a tranquil sorrow that comes from seeing and conforming to the essential quality of life. Thus *aware* refers to both an objective condition of reality and an emotional state of mind.

Yūgen (“mysterious depth”) is an ideal that was particularly prominent in the medieval period (1186–1603) when aesthetics were particularly influenced by Zen Buddhism. Although *yūgen* was interpreted in various ways over the centuries, it generally refers to the inexhaustible richness of reality that defies human conception. The world has a dimension of mystery that we can only indirectly feel or intuit. Because of this sense of wonder and depth, *yūgen* often is characterized by a feeling of sorrowful, calm yearning for a beauty that cannot be fully grasped. As the poet Fujiwara no Shunzei (1114–1204) stated, a deep intuition into *yūgen* can be attained through *shikan*,

“tranquility and insight,” a Buddhist form of meditation on the vast and ever-changing net of interrelationships that characterize the world. It is suggested in poetry by images that have reverberations of meaning that create an indefinable atmosphere. For Kamo no Cho^{mei} (1155– 1216), the profound subtlety of *yu^{gen}* can be found in an autumn evening when, looking up at a limitless sky empty of color, we are inexplicably moved to tears.

A different type of poetic idea that is relevant to the Japanese view of nature is *hon'i* (“poetic essences”). Plants and animals as well as famous scenes in nature tended to be associated with particular qualities. A tree, a bird, and a particular landscape were thought to have a kind of “true nature” that poets were expected to grasp and then suggest in their poetry. In most cases, these qualities were also linked to particular seasons. The poetic essence of the bird *chidori* (plover), for instance, is melancholy. This correlation stemmed from the sorrowful sound of its call and from being found along the coast, which was considered a place distant from the capital, thus suggesting loneliness. Because of its association with sadness and its tendency to flock during the desolation of winter, it is a “winter” image

(despite being a year-round resident of Japan). While those in the modern West might feel that this aesthetic puts artificial limitations on our responses to nature, to the traditional Japanese it is a way of recognizing the essential nature of things and cultivating a sensitivity that responds to their depth and subtlety.

Aesthetics of Nature and the Sacred

1. Natural Archetypes

Confronting nature one experiences archetypes of the world – sun and sky, wind and rain, rivers and Earth, the everlasting hills, shores, seas, forests and grasslands, the fauna and flora. These represent – more literally represent, present again – the elemental forces of nature. They bear the signature of time and eternity, with an aura of ancient past subliminally there, processes timelessly recurring. A living landscape couples dynamism with antiquity and demands an order of aesthetic interpretation that one is unlikely to find in art and its artifacts.

The phenomenon of forests, for example, is so widespread, persistent, and diverse, spontaneously appearing almost wherever moisture and climatic conditions permit, that forests cannot be accidents or anomalies but rather must be a characteristic expression of the creative process. There is also the steppe and the veldt, the tundra and the sea, and these too have their power to arouse a sense of antiquity and of ongoing life.

Aesthetic experience of nature moves beholders with how the central goods of the biosphere – hydrologic cycles, photosynthesis, soil fertility, food chains, genetic codes, speciation, reproduction, succession – were in place long before humans arrived. Aesthetics is something that goes on in experiences of the human mind, but the dynamics and structures organizing natural history do not come out of the mind. Immersed in a nonhuman frame of reference, subjective though aesthetic experience may be, one makes contact with the natural certainties. At more depth, these are the timeless natural givens that support everything else.

On these scales humans are a late-coming novelty, and yet the only species that can behold and ponder this genesis, and that awareness too is aesthetically demanding. The challenge is to complement the natural dynamics, which have been ongoing over the millennia, with this novel emergent that comes into being when persons arrive, enjoy their unique presence, and search for the significance of life. “I went to the woods,” remarked Thoreau, “because I wished to live deliberately, to front only the essential facts of life, and see if I could not learn what it had to teach, and not, when I came to die, discover that I had not lived” (Thoreau 1966: 61).

No one can live in bare woods alone; civilization too is, for humans, an essential fact of life. The town, however, is not so aboriginally archetypal. Were civilization to collapse, the Earth would revert to wildness, because this is the foundational ground. Such aesthetic power of nature stands in strong contrast to classical experience of art forms, religious though these arts often are. The creations of sculptors, painters, musicians, and craftsmen always betoken civilization. In nature, one is not dealing with art, artifact, artist; one has penetrated to the foundational ground.

In the heavens, there are stars, galaxies, celestial beauties, which are also required (as astronomers have discovered) for the construction of all but the simplest elements, and thus they are required for Earth and life. There are inanimate earthen kinds that nature generates over the epochs: mountains, canyons, rivers, estuaries, also stimulating aesthetically. But the miracle of Earth is that nature decorates this geomorphology with life. There are trees rising toward the sky, birds on the wing and beasts on the run, age after age, impelled by a genetic language two billion years old. There is struggle and adaptive fitness, energy and evolution inventing fertility and prowess. There is succession and speciation, muscle and fat, smell and appetite, law and form, structure and process. There is light and dark, life and death, the mystery of existence.

Once this was Eden with its tree of life, or the shoot growing out of the stump of Jesse, or the cedars of Lebanon clapping their hands in joy; today the experience is more science-based. Some aestheticians caution whether one should require much science here, since being moved by natural beauty is perennial and multi-cultural. Still, when the science is added, the science only intensifies this sense of life's transient beauty sustained over chaos, life persisting in the midst of its perpetual perishing. A visit to these wilds contributes to the human sense of place in space and time, of duration, antiquity, continuity, to the human mystery of being the sole aesthetician in a kaleidoscopic universe. There one encounters "the types and symbols of Eternity" (William Wordsworth in Selincourt 1965: 536).

2. Sublime Nature

Encountering these outdoor archetypes humans reach the sense of the sublime. By contrast, few persons get goose pimples indoors; maybe in church, but infrequently in art museums, in shopping centers, or at the city park. The sublime invokes a category that was, in centuries past, important in aesthetics, but today many think it to have lapsed. Still, although the category is not currently fashionable, the sublime is perennial in encounter with nature because wherever people step to the edge of the familiar, everyday world, they risk encounter with grander, more provocative forces that touch heights and depths beyond normal experience, forces that transcend daily life and which both attract and threaten. Mountains, forests, canyons, seas – these are never very modern or postmodern, or even classical or pre-modern. They explode such categories and move beholders outside culture into fundamental nature.

Almost by definition, the sublime runs off scale. There is vertigo before vastness, magnitude, antiquity, power, elemental forces austere and fierce, enormously more beyond our limits. The forest's roots, its radical origins, plunge down to depths one knows not where. The trees point upward along the mountain slope, which rises to join the sky, and the scene soars off to heights unknown. The frames and pedestals familiar to cultured aesthetic experience are gone. There is no choir, no organist seated at the console, no artist signature at the bottom of the painting, no gardener planting the oncoming season's flowers. One encounters what was aboriginally there in its present incarnation.

In some realms of nature – awe-struck before the midnight sky, or watching a sunset over arctic ice, or deep in the Vishnu schist of the Grand Canyon in the Southwestern United States – beauty and power are yet lifeless. In a forest, however, the sublime and the beautiful are bound up with the struggle for life – windswept bristlecone pines along a ridge in California's Sierra Nevada. The aesthetic challenge is conflict and resolution presented on these awesome scales. In the intensity of this conflict, there can often be religious yearning for life in another world, where the hunger, thirst, death of this one is transcended. But the earthen beauty remains nevertheless. The ancient Hebrews found green pastures in the valley of the shadow of death (Psalm 23). The desert languished, but sooner, later, always, there was rain: "The desert shall rejoice and blossom; like the crocus it shall blossom abundantly" (Isa. 35:1–2).

Clouds, seashores, mountains, forests, even deserts are never ugly; they are only more or less beautiful; the scale runs from zero upward with no negative domain. Destroyed forests can be ugly – a burned, windthrown, or diseased forest. But even the ruined forest, regenerating itself, still has positive aesthetic properties. Trees rise to fill the empty place against the sky. A forest is filled with organisms that are marred and ragged – oaks with broken limbs, a crushed violet, the carcass of an elk. But these are only penultimately ugly; ultimately these are presence and symbol of life forever renewed before the winds that blast it. Consider the "flower of the field; for the wind passes over it, and it is gone, and its place knows it no more" (Ps. 103:15–16). "Consider the lilies of the field, how they grow; . . . I tell you, even Solomon in all his glory was not arrayed like one of these" (Matt. 6:28–29).

Forests are full of shadows, and this is metaphorically as well as literally true. The darkness shadowing life is as much the source of beauty as is light or life. In some moods, nature is ugly, even evil ("fallen"), and the problem of justifying nature's harshness has much troubled religious thought. Still, there are streams in the desert. Light shines in the darkness, and the darkness has not overcome it. Yes, giants have fallen, and rotting logs fill the forest floor. See these cones: there is power in them enough to regenerate the forest for millennia. Put your hand in this humus from which the present forest rises – "the immeasurable height of woods decaying, never to be decayed" (William Wordsworth in Selincourt 1965: 536). The ugliness softens and is reset in somber beauty. When one remembers this regeneration of new life out of old on a scale of centuries and millennia, one knows the sense of the sublime.

3. Sacred Nature

When beauty transforms into the sublime, the aesthetic is elevated into the numinous. “Break forth into singing, O mountains, O forest, and every tree in it!” (Isa. 44:23). “The trees of the Lord are watered abundantly; the cedars of Lebanon which he planted” (Ps. 104:16). “The groves were God’s first temples” (William Cullen Bryant in Frazer 1994: 82–97). The forest is a kind of church. Trees pierce the sky, like cathedral spires. Light filters down, as through stained glass. The forest canopy is lofty, far above our heads. Forests, like sea and sky, invite transcending the human world and experiencing a comprehensive, embracing realm. Encounters with primordial nature often prove more provocative, perennial signs of this than many of the traditional, often outworn, symbols devised by the churches. Life regenerated is out there in nature; on such an Earth we may hope in beauty forever.

Parallel experiences are found in Asian faiths:

As I come along the mountain path, What a heart-warming surprise,
This cluster of dainty violets! (Basho[⁻])

Full moon, and under the trees Patterned shadows – how beautiful
Alongside mine! (Baishitsu)

As with Christian longing for heaven beyond Earth and its struggles, the Asian faiths can also dwell on the *dukkha*, suffering, and unsatisfactoriness of this life, at times casting this aesthetic experience into doubt.

Aestheticians may protest that their experiences need not be religious (as some protested before that these experiences need not be scientific). Nevertheless, the line between aesthetic respect and reverence for nature is often crossed unawares, somewhere in the region of the sublime. Mountaintop experiences, the wind in the pines, a howling storm, a quiet snowfall in wintry woods, solitude in a grove of towering spruce, an overflight of honking geese – these generate “a sense sublime of something far more deeply interfused . . . a motion and spirit that impels . . . and rolls through all things. Therefore I am still a lover of the meadows and the woods, and mountains” (William Wordsworth in Selincourt 1965: 105). John Muir exclaimed, “The clearest way into the Universe is through a forest wilderness” (in Wolfe 1938: 313).

Science secularizes nature, although historians will notice that Christian monotheism had already disenchanted nature. That might be thought to make secular nature less provocative of religious experience. But primordial nature has proved strangely resistant to being secularized in the etymological sense of that term, being reduced to “this present age” (Latin *saeculum*), or reduced to the merely “profane” (common, ordinary) either. Some features of nature mechanize well (planets in orbit; tectonic plates). But elsewhere there is too much that is organic, or, better, too much that is vital, or, better still, too much that is valuable.

When value is discovered there, as with the forest as spontaneously self-organizing, as generator of life, not merely as resource, but as Source of being, the forest starts to become a sacrament of something beyond, something ultimate in, with, and under

these cathedral groves. Vital nature has a way of spontaneously reenchanting itself – a vast scene of sprouting, budding, leafing out, flowering, fruiting, passing away, passing life on. Forests are not haunted, but that does not mean that there is nothing haunting about forests. Perhaps the supernatural is gone, but here the natural can be supercharged with mystery. Science removes the little mysteries (how acorns make oaks which make acorns) to replace them with bigger ones (how the acorn-oak-acorn loop got established in the first place). Thanks to the biochemists, molecular biologists, geneticists, botanists, and ecologists, modern beholders know about how this green world works. But is this an account that demystifies what is going on?

Moses thought that the burning bush, not consumed, was quite a miracle. Modern naturalists hardly believe any more in that sort of supernatural miracle; science has made such stories incredible. What has it left instead? A self-organizing photosynthesis driving a life synthesis that has burned for millennia, life as a strange fire that outlasts the sticks that feed it. This is rather spirited behavior on the part of secular matter, “spirited” in the animated, root sense of a “breath” or “wind” that energizes this mysterious, vital metabolism. The bushes in the Sinai desert, the cedars of Lebanon – all such woody flora are hardly phenomena less marvelous even if one no longer wants to say that this is miraculous.

Indeed, in the original sense of “miracle” – a wondrous event, without regard to the question whether natural or supernatural – the phenomenon of photosynthesis with the continuing floral life it supports is the secular equivalent of the burning bush. The bush that Moses watched was an individual in a species line that had perpetuated itself for millennia, coping by the coding in its DNA, fueled by the sun, using cytochrome *c* molecules several billion years old, and surviving without being consumed.

To go back to the miracle that Moses saw, a bush that burned briefly without being consumed, would be to return to something several orders of magnitude less spectacular.

The current account from science is a naturalistic account, but this nature is quite spectacular stuff. The forest wilderness, Muir insisted, is a window into the universe. Science traces out some causes, which disappear rearward in deep time, and carry on a continuing genesis, and leave the beholder stuttering for meanings. The forest remains a kind of wonderland, a land that provokes wonder. The empirical phenomena about which there is absolutely no doubt need more explanation than the secular categories seem able to give.

Loren Eiseley, surveying evolutionary history, exclaims, “Nature itself is one vast miracle transcending the reality of night and nothingness” (1960: 71). Ernst Mayr, one of the most celebrated living biologists, impressed by the creativity in natural history, says, “Virtually all biologists are religious, in the deeper sense of this word, even though it may be a religion without revelation . . . The unknown and maybe unknowable instills in us a sense of humility and awe” (Mayr 1982: 81). The sublime is never really far from the religious. If anything at all on Earth is sacred, it must

be this enthralling creativity that characterizes our home planet. Here an appropriate aesthetics becomes spiritually demanding.

African Earthkeeping Churches – Association of (Zimbabwe)

During his study of religious factors in Zimbabwe's political liberation struggle (*chimurenga*), Professor M.L. Daneel became aware of a widespread need in African grassroots society in the Masvingo Province for effective engagement in the preservation of a fast deteriorating environment. After initial discussions with rural traditionalists and Christians it was decided to engage in a new liberation struggle, this time on behalf of God's creation. Thus the "war of the trees" was declared; a war which targeted three environmental concerns: tree planting, wildlife conservation, and the protection of water resources; a war, moreover, which was to draw on similar sources of religious inspiration, as did the preIndependence *chimurenga*.

The "green army" of earthkeepers which came into being was composed of two sister organizations: AZTREC, the "Association of Zimbabwean Traditionalist Ecologists," and the AAEC, "Association of African Earthkeeping Churches." The former comprises traditionalist chiefs, clan elders, and spirit mediums who engage in environmental reform at the behest of the senior guardian ancestors of the land (*varidzi venyika*) and the oracular high-god cult at the Matopo hills. The latter is made up of some 150 to 180 African Initiated Churches (AICs), mainly of the prophetic or pentecostal type (i.e., Zionists and Apostles) that represent an estimated total of two million adherents throughout Zimbabwe.

Together the two sister organizations belong to a financially and tactically empowering agency called ZIRRCON (Zimbabwean Institute of Religious Research and Ecological Conservation) – an expanded version of Professor Daneel's original empirical research unit. This body today represents the largest NGO for environmental reform at the rural grassroots of Zimbabwe. Some eight million trees have already been planted in several thousand woodlots since the inception of the movement in the period 1986 to 1988. Twelve main nurseries in various districts of the Masvingo Province each cultivate between 50,000 and 100,000 seedlings annually. Through AZTREC and the AAEC peasant communities are mobilized on a massive scale to establish their own woodlots near stable water points. Satellite nurseries for seedlings are also developed by women's clubs, youth groups at schools, and AIC theological training centers. A great variety of trees are planted for commercial, religious, aesthetic, and ecologically-protective purposes. ZIRRCON and its sister organizations cultivate larger numbers of indigenous tree seedlings than any other institute in Zimbabwe.

The main “weapon” used by the AAEC in its quest for a liberated, rejuvenated creation is a eucharist of tree planting, popularly and aptly referred to by AIC participants as the *maporesanyika* (i.e., “Earth-healing”) ceremony. As a thoroughly contextualized sacrament in the African context, this ceremony represents a compelling challenge to African churches and the world Church, as regards Christian stewardship in creation.

The ceremony is always ecumenical in nature. Green fighters of numerous churches attend to provide momentum from a united platform. In addition, a contingent of traditionalist AZTREC members are invited to participate, in recognition of religious pluriformity in the struggle, as well as the concern for all of life, the entire Earth community. The liturgical sequence of the eucharist starts with the digging of holes and related preparations (e.g., fencing in the new woodlot, called “the Lord’s Acre”). The preparation of the Holy Communion table, with tree seedlings and sacramental elements standing side by side, is followed by song and dance in celebration of the renewal of God’s Earth. Leading AIC earthkeepers preach rousing sermons, the contents of which profile the emergence of an intuitive grassroots theology of the environment.

The sacrament itself is introduced by public confessions of ecological sins, such as random tree felling, causing soil erosion through riverbank cultivation and the use of sledges, etc., under the guidance of Spirit-filled prophets. Communicants then proceed to the communion table, seedling in hand, as if to draw creation symbolically into the inner circle of Christ, the Redeemer of all creation. As they move from the communion table to “the Lord’s Acre” the communicants further enact the ritual incorporation of Earth community in sacramental celebration by addressing the seedlings to be planted, as follows:

You, tree, my brother . . . my sister Today I plant you in this soil
I shall give water for your growth

Have good roots to keep the soil from eroding Have many branches and leaves so
that we can sit in your shade breathe fresh air and find firewood.

Personalizing humans’ relations with nature in this manner fosters new attitudes of respect for the inanimate members of Earth-community and promotes sound after-care of the trees planted. In conclusion, a healing ceremony for afflicted earthkeepers is performed with laying-on of hands, sprinkling of holy water, and prayers to the tune of rhythmic dance and song. Thus the treeplanting sacrament integrates the healing of Earth and humans as witness of Christ’s good news to the world.

The AAEC’s tree-planting eucharist represents ecclesiological reorientation and change. Through repeated implementation of this sacrament the Church’s mission obtains a more comprehensive liberationist and ecological thrust. Whereas the Zionists and Apostles have always used the annual *Paschal* celebrations with their climactic eucharistic ceremonies as “launching pads” for wideranging missionary campaigns, the earthkeeping eucharist itself, in this instance, becomes the witnessing event, the proclamation of good news to all creation. It is enacted in nature and in the presence of non-Christian fellow fighters

(of AZTREC) in “the war of the trees.” The implication here is not that the classical mission mandate of Matthew 28:19, with its call for repentance, conversion, human salvation, and church formation is overridden. But mission in this context derives from and reenacts the healing ministry of Christ. It relates to the believer’s stewardship in service of all creation, as required in the Genesis story, and is strengthened by faith in Christ “in whom all things hang together” (Col. 1:17).

During a tree-planting eucharist Bishop Wapendama, leader of the “Signs of the Apostles Church,” preached about the church’s environmental mission as follows:

We are now deliverers of the stricken land . . . Deliverance, God says, lies in the trees. The task that Jesus has left us is the one of healing. We, the followers of Jesus have to continue with his healing ministry . . . So, let us all fight, clothing, healing the Earth with trees! It is our task to strengthen this mission with our [large] numbers of people. If all of us work with enthusiasm, we shall heal and clothe the entire land (Wapendama sermon, Signs of the Apostles Church headquarters in Masvingo district, November 1991).

In his call for engagement in the earthkeeping mission, Wapendama shows awareness of the fact that God is the one who initiates deliverance and restoration of the ravaged Earth. But he emphasizes that the responsibility to deliver the stricken Earth here and now lies with the Christian body of believers (i.e., the Church). Wapendama’s insights also reflect the understanding of African earthkeeping Christians that the Church’s mission involves much more than mere soul-saving. Through their Earthcare commitments they share a vision similar to the one held by Bishop Anastasios of Androussa, that “the whole world, not only humankind but the entire universe, has been called to share in the restoration that was accomplished by the redeeming work of Christ” (Androussa in Messer 1992: 69–70).

How then does the “green mission” affect the life and shape of an earthkeeping church? First, there is a noticeable shift of the healing focus at AIC church headquarters. The black “Jeruselems” of Zion are still healing colonies where the afflicted, the marginalized, and the poor can feel at home. But the concept *hospitara* now includes the connotation of “environmental hospital” to care for the wounded Earth. The “patient” is the denuded land; the “dispensary” becomes the nursery with its assortment of medicines (i.e., exotic, indigenous, and fruit-tree seedlings); and the entire church community becomes the healing agent under the guidance of the church’s principal Earth-healer. Second, in the context of the AAEC a new generation of iconic church leaders is emerging. They replace the first-generation icons, such as Bishop Mutendi of the Zion Christian Church and Prophet Johane Maranke of the *vaPostori* who featured as “black Messiahs” to their followers. Now, instead of a single leader mirroring the presence of the biblical Messiah in Africa’s rural society, the mode of operation is shifted to an entire group of “Jeruselems” enacting and proclaiming the grace and salvation implicit in Christ’s presence in the Creator’s neglected and abused world. Thereby the entire *oikos* is declared God’s “holy city.” Third, the AAEC’s afforestation programs have stimulated a need for the formulation and implementation of new

ethical codes. Leading earthkeepers increasingly insist that the Church is an institution with legislative and disciplinary powers, the vehicle of uncompromising struggle as it discerns and opposes evil forces that feed on mindless exploitation of the limited resources of the Earth. In this mission the militant Church is at risk, prepared to be controversial, to suffer and sacrifice whatever discipleship in this realm requires.

The AAEC's message of and struggle for liberation is holistic in nature. By virtually standing in embrace with trees at the communion table the earthkeeping communicants acknowledge Christ's Lordship over all the Earth (Matt. 28:18). In this demonstration of respect to all "members" of Earth community the AICs substitute exploitive perceptions of human dominion over nature with a service of humble stewardship. At the same time this form of Earth-care underscores the empowerment of poor and marginalized people to make a contribution of such significance that it captures, for once, the imagination of the nation, the recognition of the government. It incorporates quality of being for the earthkeepers, their liberation from obscurity in remote rural areas of Zimbabwe, their overcoming of marginality and futility as news media repeatedly report on their work, and their liberation from the hopelessness of poverty as salaried nursery keepers and office workers; budding woodlots and smallscale income-generating projects at least revive some hope for a better future. Hence, the dehumanizing shackles of decades of colonial rule and the desecration of nature, caused largely by disproportionate land apportionment, are both shaken off in the quest for salvific healing for all life on Earth.

African Independent Churches (South Africa)

The multitude and variety of churches that have arisen since the advent of Christianity in South Africa are commonly referred to in literature as African Independent Churches (AIC). Political correctness insists on the substitution of “indigenous” or “initiated” for “independent,” since the carving out of independence would imply an original dependence on missionary Christianity, whose parental claims might still be exercised. Neither one of the alternatives is, however, historically accurate. Whatever the label, an AIC more neutrally describes a religious association, exclusively African in membership, that is free from white administration and tutelage. First appearing at the close of the nineteenth century, these churches have historical roots that can be traced to developments early in the century, when white expansion northward from the Cape Colony began to overwhelm with its superior technology predominantly pastoral societies, turning them into vassals deprived of their land. Foremost in African experience of this invasion were the inroads of foreign missionary societies into indigenous culture and religious beliefs. It was in the gradual conversion of these societies into a Christian proletariat that the seeds of religious independence were planted.

The AICs in South Africa took two divergent forms arising from different sets of circumstances in the experience of the colonized: missionary discrimination and the repression of workers. The discriminatory practices of the missionaries produced churches called Ethiopian, the first of their kind appearing in 1892. Although they preached a Christian creed of egalitarianism, the missionaries were reluctant to promote black pastors to positions of responsibility and refused to interact with them as equals. The educated lower clergy eventually rebelled by establishing separate African churches in Johannesburg that were free from white control, but in all other respects were replicas of the parent bodies. Ethiopia was chosen as a rallying point because it was the biblical prototype of Africa and because contemporary Ethiopia embodied the ideal of political independence. In 1904, the first charismatic Zionist Church appeared among exploited farm workers in a remote rural area. As a response to conditions of near enslavement, the workers adopted a Pentecostal strain, imported from working-class America by a white missionary, which empowered them with the Holy Spirit to provide a novel form of healing that was neither scientific nor African.

Since the beginning of the twentieth century, the AICs have grown phenomenally and have spread geographically throughout southern Africa, following the migrant

routes from the South African mines to present-day Zimbabwe, Zambia, Malawi and Congo. Within South Africa alone, according to the official enumeration in 1990, AIC members constitute 30 percent of the total African population. Since they are most numerous in northeastern South Africa and heavily concentrated in the densely populated urban areas around Johannesburg and Durban, their proportional representation in these cities is in the region of 40 percent or beyond. There is an unmistakable correlation between AIC expansion and the transformation of rural migrants into a settled urban population. Although no exact figures are available, there is every indication that this development has favored the growth of Zionist rather than Ethiopian churches.

While retaining the doctrine and organization of their missionary forebears, the “Ethiopians” strive to project an image of Christian autonomy under black leadership. Typically, the ministry is moderately educated with some scriptural training, often by correspondence and ironically from Bible colleges established by the churches from which they originally seceded. Once strongly committed to African emancipation through alignment with nationalist movements, “Ethiopians” are now politically quiescent, respectable Christians with middle-class aspirations. They have not attracted much in the way of recent scholarly attention, but the available evidence suggests that they are in decline, with nothing distinctive to offer and unable to recruit replacements for their largely aging membership. A few of their leaders have achieved some prominence by claiming to be spokesmen for AICs in general, but without the support of the Zionist majority.

There are several thousand Zionist churches in existence at any time, some expanding while others decline, and new ones arising at a rate faster than those dying out. Nobody can claim to speak for Zionists in general because, lacking a semblance of central organization or an agreed canon of orthodoxy, they are characterized by wide variation of belief and by obsessive disunity. Many retain a sense of authenticity and orthodoxy by tracing historical links to the first Zionist foundation and by preserving certain tenets of the early founders. These groups take pride in calling themselves “Christian” Zionists and distance themselves from “new” Zionists, whose pretensions they disparage. “New” Zionists, some old in years of existence, are undoubtedly in the majority, if only because anyone inspired by a spiritual vision and prophetic message can set up a church and woo followers by borrowing selected elements of Zionism, mixing them with features of African religion and reconstructing these to fit the founder’s own esoteric design. Still other charismatic churches are not Zionist in any sense. Also of prophetic origin, these churches are attempts to adapt traditional religion to modern needs and are often led by several generations of a particular family. Some – for example the Zion Christian Church near Pietersburg, under the leadership of Lekyanyane, and the Nazareth Baptist Church outside of Durban, identified with Shembe – are spectacularly large, even though both churches exaggerate the size of their followings. Most Zionist churches are of very modest size because of an inherent tendency to segment and subdivide, to which even the large “traditionals” are not entirely immune.

While the range of differences expressed in Zionism defies generalization, some salient features may be singled out for comment, predominantly in connection with “Christian” Zionists. Most Zionist churches seek to ameliorate/alleviate the condition of the poor, with varying success. The two main strategies are economic uplift and healing. The first is an economic package blending a disciplined way of life, sobriety, abstemiousness, hard work, saving and mutual support. The maintenance of discipline is entrusted to a preaching hierarchy of preacher, who preaches to a local congregation and may recruit converts; an evangelist, who in addition to preaching has the right to baptize and process entry into full membership; a minister who has charge of one or more congregations; and a bishop, who oversees several ministers. These positions can be embellished at will by the addition of contingent offices. The preaching function draws on the Bible as a source of moral precept and exemplary precedent. At the “Christian” end of the Zionist spectrum, the preaching ranks are monopolized by married men; “newer” Zionists admit women to the ministry and there are even female bishops. The ministry, however, is unspecialized. Unwaged and without formal training, incumbents must work for a living and, since leaders are seldom more than barely literate, education is not a qualification for office. Apart from founding a church of one’s own, entitlement to office rests upon experience, endurance and an ability to recruit followers.

Healing draws on a different kind of expertise, that of the prophet; and here the difference between “Christian” and “new” becomes more manifest. Later strains of Zionism restored ancestors to their healing role, commonly in some form of partnership with the Holy Spirit, and prophets in their healing work derived their insights into the nature of illness and remedy from these twin sources. With this goes a marked tendency for prophetic healing to become the dominant or sole concern of these

“newer” churches, to the virtual exclusion of Biblecentered preaching. Prophet leadership then becomes the norm, with corresponding female ascendancy. The more conservative “Christian” Zionists recognize both male and female prophets, but male prophets are given a better hearing and all prophets are subordinate to the male preaching hierarchy. Healing power and prophetic insight are derived from the Holy Spirit alone and healing power is not divorced from preaching. Preachers are charged with drawing on the Bible to stir up the enthusiasm of the congregation and arouse the Holy Spirit among them, in such a way as to build up a wave of spiritual power that can be used by the prophet to heal the sick. A major concern is to alleviate the damage done to individuals by sorcery and to equip them with symbolic protective devices suffused with the power of communal prayer.

Zionists eschew the pharmacopoeia of traditional African healing specialists, who rely on potions and powders made from plant and animal ingredients, while equally rejecting the medicines available at modern pharmacies and other commercial outlets. Christian Zionists in particular rely almost exclusively on the healing properties of water, often fortified with the impress of a communal blessing. Water is ritually employed to regenerate, to renew and to purify in the motions both of external washing and of in-

ternal purging. The first major washing that a Zionist undergoes is that of baptism by triune immersion, ideally in ocean breakers or in a strong river current, performed by a minister or evangelist in the name of the Christian trinity. On numerous subsequent occasions during their lifetime, Zionists submit to repeated dunking by a prophet, invoking the Holy Spirit, for purposes of purification and renewal. The point about these exercises is that the water should be in motion, turbulent or surging, and charged with natural energy; an indication that the Spirit is active in these events. Less orthodox Zionists may credit ancestors with secondary influence on such occasions. All Zionists have recourse to water as an emetic and as a purgative to expel evil from a body in distress, for sorcery is manifest in its corporeal effects. Saltwater, to which a blessing is imparted, is used for this purpose, often with the addition of ashes. Zionist healers who lapse into the usage of traditional medicines are quietly cut off from Christian fellowship. The other natural agent in Zionist healing is wood. The staff that each Zionist carries is cut from trees growing close to water and is a conductor of personal spiritual vitality and healing power. The staff is explicitly referred to as a “weapon,” to be used in the unremitting battle with sorcery.

The Zionist AICs are churches of the poor and uneducated, seeking to meet the needs of the hard-pressed, for whom the primary appeal is the healing service. The attraction is greater for women, who outnumber men among members by at least two to one. They gain not only from healing attention and communal support, but also from marriage to a disciplined frugal breadwinner or, failing that, the possibility of converting a spouse into a reliable Zionist provider. Zionism, therefore, values and promotes the stability of the family unit in an urban environment not conducive to it, and it rewards good family men with status and office. The insistence on monogamous marriage and on premarital sexual abstinence, however much some individuals may succeed in slipping its constraints, means that Zionists are particularly well placed to survive the worst of the rampant AIDS epidemic. In general, Zionists do not confront AIDS as such. In common with many other Africans, they are prone to consider any such insidious wasting disease to be the outcome of sorcery, a malady that is mystically transmitted by malicious others, and to be treated on those terms. Should a church member contract the disease, he or she is assured of the compassionate support of a small caring community and will not be abandoned. Where Zionists really hold the advantage over AIDS is in their preventative measures, derived from their overall morally driven restrictive pattern of living. Their closed disciplined communities, within which faithfulness to a single marriage partner is enjoined and premarital sexual activity is proscribed, are consciously maintained to exclude spiritual contamination, but have the unintended consequence of erecting a *cordon sanitaire* against sexually transmitted diseases. While some of the youth may rebel against the restrictions and take their chances outside the fold, the majority who remain within are morally armed against the epidemic.

Economically, morally and therapeutically, for men and women alike, Zionist churches provide havens of safety and order in the perceived chaos of urban society.

Set apart by their chosen lifestyle, Zionists are separated from normal patterns of association and, accordingly, behave as isolates in the workplace and other public spaces. Part of their refusal to participate fully in relations with outsiders, with whom they have little in common, is their consistent avoidance of any political activity. This apolitical stance did not endear them to the activists of the liberation struggle and it left them doubly exposed to the bitter street fighting between rival contenders for power in the preelection period. Paradoxically, it ultimately earned them a kind of political respectability, as party leaders went in search of votes among this very large constituency.

African Religions and Nature Conservation

Religions originating in Africa traditionally held an integrated cosmogony between the gods and nature. Indeed, although most African Traditional Religion(s) contain various aetiologies (the investigation in philosophical terms of causes and origins), the notion of a disjunction between the spiritual life and nature is entirely antithetical to African thought. While wariness of generalizations and parodying is important, it is nevertheless the case that it was with the advent of colonialism, and the concurrent importation of religions from outside the continent, that a breach between religion and nature first crept, then sped, and finally hurtled, into Africa. Traditionally, Africans, especially outside of the cities, were conscious of their natural environment. Nature conservation thus found its “natural” home in the beliefs and practices of African Religions.

Many African Traditional Religions (ATRs) contain myths about the creation of the world, and in most there is a belief in a creator God/god or gods. Such stories serve to explain why societies are the way they are; why the world around looks and functions the way it does; and often give an acknowledgement of the presence of good and evil. Almost without exception nature provides the centerpiece for such stories. Traditionally, the gods are all around: present in the nature of which people are a part. Therefore to respect the spiritual is to respect nature. The converse is equally true. The rape of the land is traditionally seen as a violation of the spirit world, and only to be undertaken at peril.

The inseparable link between religion and nature pervades traditional African religious life, and is therefore important in conservation. Where there are rivers we often find a god described in terms of water. Spiritual beliefs and practices thereby reflect the close link with water. Rain is vital and valued in all African societies, and occasionally the gods share the same name as, or cognate derivatives of, water itself. Thus the Didinga name for God is *Tamukujen*, and for rain *tamu*. Likewise, the Idowu use *Owo*, and the Maasai *En-kai*, for both God and rain. Sometimes rain is personified as a divinity or deity, for example, among the Elgeyo, Igbo, Suk, and Tonga peoples. Sometimes, as in the Akamba and the Tiv peoples, rain is seen as God’s saliva. All over Africa God is seen as rain giver, and everywhere there are thus rain makers. Bodies of water such as rivers, lakes, streams, and waterfalls are often associated with major deities or spirits and are thus held in great respect and revered. A good example of this is the famous Mami Water (Mother of Water) of West Africa.

For some peoples, such as the Lugbara and Langi, rocks are a manifestation of God. The Luvedu claim that God left his footprints on certain rocks that are still soft and visible. For the Akamba the first people came out of a rock that can still be seen today. Where the sky is readily visible, the gods may be described by celestial objects. The same is true of mountains, forests, plains, and rocks: examples of this may be seen among the Banyarwanda, Bari, Bavenda, Ingassana, Madi, and Sonjo. Sometimes God is described in terms of pastoralists, other times of cultivators. For example, for the Batammaliba of Togo and Benin, Kuiye is the God who lives in the mountains and savannah: a religious reflection of the immediate surrounding environment. Thus for the Ngombe peoples the dense rainforest is associated with God, and his name means “the everlasting One of the forest” or “the One who clears the forest” or “the One who began the forest.” Words associated with the gods thus reflect this link with nature. The creator God is variously described as “He of the big rainbow” (*Chiuta*); “Of the Water” (*Chisumphu*); “Of the Sky” (*Mulungu*). For the Galla of Ethiopia the sun is God’s eye; whilst for the Balese the sun is God’s right eye and the moon his left. Amongst the Ila of Zambia the sun signifies God’s eternity; and for the Fon of Ghana the moon has special significance in their rituals – and babies are brought out to be bathed in its light.

Thunder is likewise something spiritual: usually it is heard as God’s voice. For some, such as the Zulu and Gikuyu, it is the movement of God. For the Yoruba and Tiv it is an expression of God’s anger. Among the Banunu, Bateke, Batende, and Basengoli of the Congo thunder is traditionally seen as a fight between the sky giants. Amongst the Akan of Ghana, thunderbolts are God’s axes; but in many other ATRs the storms are governed by deities of the sky rather than the so-called high-God. Lightning is similarly spectacular in much of Africa. For the Gikuyu it is God’s weapon for clearing the way when moving from one sacred place to another. For many African peoples, lightning is a form of punishment.

Thus sacred sites, whether of water, rocks, trees, or mountains, exist in many African societies. This provides a natural cradle for conservation. Nature is both respected and revered. But this is not to say that Africans traditionally view the relationship between life and nature as perfect: far from it. Almost all understand the world around them to be disordered in some way. Nature is by no means perfect. Signs of slippage and decay are all around. One of the most common myths, with slight regional variations, describes the separation of Earth and sky. In the beginning, the sky and the Earth were close together, and people went back and forth to the sky by means of a rope ladder. When people died, the creator God brought them back to life again. In those times a woman needed to pound only one kernel of corn in her mortar to feed everyone. But once, a newly married woman, in a moment of impulsive greed, put more than a single kernel of corn into her mortar so that she could make more than the normal quantity of flour. Because of the extra corn in the mortar she had to lift her pestle higher to pound the extra corn. As she raised her pestle higher she hit God in the sky. God became angry and said, “Before you were always satisfied with a little food, but

from now on you will always know hunger, even if you cultivate a great deal.” Then a sparrow flew by and cut the rope, and later a man died. People grieved because they had never before known a person to die, so they threw ashes on themselves as a sign of mourning.

There are many other similar myths that describe a state of disorder in the natural world. In all cases, however, it is important to remember that humans are seen as a part of nature, and also, therefore, as part of the disorder. ATRs do not place humans on a particular pedestal. Rather, spiritual well-being depends on a harmonic relationship with the gods and with the environment. Life is a unity, a web of relationships extending outwards with all that is around: humans, flora, fauna, and gods. Indeed, even to separate those terms, as if distinct categories, is to miss the point that in African religious life everything is interconnected. As such, if one part suffers, all do. South Africa’s independence movement leader, Archbishop Desmond Tutu, had a famous aphorism that African epistemology may be summarized as “I think, therefore we are” and is not to be limited to *Homo sapiens*, but applies to the entirety of nature.

Neither, therefore, are such beliefs in the origin of life and the place of the gods to be confined to the past. Indeed, their importance lies in their presence in everyday life. The stories live on, in part because they provide explanations for the current relationship between African religions and nature. In all these cases the essential element is the requirement to remain in harmony with nature and the spirits. There is no place here for a naive liberal hermeneutic, however. Africans kill animals as much in their everyday life for food as they do in their traditional rituals. But in traditional thought such actions were always characterized by mutual respect between human being and environment, by a deep sense of one’s own fragility, and by thanksgiving. Not only do Africans traditionally live in the present, but there is also an awareness that today’s hunter may become tomorrow’s prey. In the cycle of life nothing can be taken for granted, and every day is a day more than might be expected.

Many taboos exist in order to preserve this delicate balance between humans and nature: a balance believed to be in the hands of the gods and departed spirits who, therefore, need to be placated. In the Bandundu region of the Congo the spirits require a day of rest every fourth day, known as *Mpika*. No hunting is allowed on *Mpika* for it gives the forest a rest, allows animals a chance to hide, and acknowledges the dependence of all human beings on the gods for material well-being. A similar notion can be found in many African societies. Another example can be seen among Ghanaian fishermen who must also rest every fourth day to allow the sea a chance to rest alike. To break such a taboo would be to incur the wrath of the sea-god. In this we also find an example of the deep respect for the hunter’s prey. Nothing is taken for granted in the link with nature. To catch and kill, just as to cultivate, traditionally requires skill, cunning, and the blessing of the gods.

Taboos that have been generated by folkloric myths about animals have also in the past helped to preserve them. For example, there have been long-held taboos against the killing of bonobos. The Mondangu people of Wamba in the Democratic Republic

of the Congo have a story that humans and bonobos once lived alongside each other in the forest, with both species going about their daily lives naked. Cloth was introduced into the village one day, but no bonobo was present. Consequently, the cloth was divided among those there. When the bonobo returned he asked for a piece of the cloth but there was none left. The bonobo sped off into the forest shouting that he hadn't wanted to live in the village anyway, nor wear the cloth. But such stories of the "brotherly" heritage humans and bonobos share have been discounted as antiquated by many people, and the hunting of bonobos in this area has increased drastically over the last twenty years.

This breaking-down of taboos can be seen throughout Africa. Whilst there are complex reasons for taboo alteration, at least part of the reason for it can be attributed to the increasing loss of control Africans have over their environment. With the crippling dependency of African nations on other countries, natural conservation practices were at first marginalized, and then frequently discarded. The economic and population pressures facing most African countries severely limit the choice over which animal to hunt, or not to hunt. Without natural resources to turn to, there is little room for taboos to restrict killing, let alone for nature conservation.

Nowhere is the breaking of the link between religion and nature in traditional African life seen more than in the sense of place. Prior to the arrival of colonialists Africans saw themselves more as lodgers in the land than possessors. The notion of owning land was felt to run counter to the delicate balance between humans and the environment which pervades ATRs. How, after all, can one "own" nature? In this traditionally held cosmogony, nature is seen as humanity's neighbor, and the spirit world as its custodian who must be placated. But the God of Christianity and Islam who was brought to Africa by outsiders was theologically a God who was distinct from nature. Notwithstanding the desire of some African theologians to demonstrate monotheism retrospectively, the God brought by missionaries was, in some important respects, the opposite of the deities of ATRs: and it does traditional African beliefs an ill-service to pretend otherwise. For, although it is true that the creator God of many ATRs is distant and remote, less accessible than the spirits and intermediaries, nevertheless this God is still connected with the natural world – be it the sky, the fields, the forest, or the water. The God of Christianity and Islam imported to Africa was, crucially, ontologically different from the created order. The latent dualism of the Fall-redemption model inherent in both Western Christianity and Islam was alien to Africa. In ATRs the creator God is connected with, and a part of, the natural order. It is highly significant that the doctrine of *creatio ex nihilo* is absent from ATRs. In this sense God unconnected from the natural world is inconceivable. The implications for nature conservation in Africa have been marked. In much Christian theology, humans are seen as the custodian of the animal kingdom, which is a far cry from the "within nature" perspective of ATRs. Animals are no longer to be admired or, when hunted, revered and thanked, but clinically killed, processed and sold in a never-ending conveyor belt of consumerism.

Alongside the arrival of the imported religions came the now-relentless assault of modernity. In addition, the Christianity brought to the continent by missionaries came hand in glove with Western medicine and Western progress. Rather than a holistic view of human nature came an allopathic approach. The traditional African belief of an inextricable link between religion and nature now teeters on the verge of collapse. African Traditional Religions, once the bedrock of nature conservation, hewn out from the surrounds over hundreds of years, are undergoing dynamic, and occasionally terminal, change.

There is a bitter irony in that “nature conservation” is much promoted in the West when the main culprit of the depletion of the rainforests is unequivocally Western logging and mining companies. These mainly French, British and German companies, having exhausted the more accessible forests of Africa, now turn upon the remote regions of Central Africa to pillage the timber, making great gashes through the virgin forests, opening them up to wide-scale hunting. Consequently the bushmeat trade is booming. For example, by 1986, 80 percent of the rainforests of the Ivory Coast had been decimated by logging. African traditional beliefs and practices are no match for multinational companies in terms of power and influence.

In face of the onslaught, there seems little choice but to jump on the bandwagon and embrace commercialization. The lure of the lifestyle of the West, and its portrayal on television, has also taken its toll on religious beliefs and practices, which in turn has had consequences for attitudes to nature. There is such an imbalance in material wealth between the West and Africa that many Africans have been lured into assimilating Western values for their own. Traditional religious values replaced with Western values include new belief systems and ways of dealing with nature. In countries from the Democratic Republic of the Congo to Liberia, hunting parties en masse are ransacking the forests of their animals, with no animal safe from the droves into trade or medicine. This has led to the phenomenon of so-called “silent forests,” where trees may be increasingly protected from the chainsaw but the forests are emptied of their fauna. Although Westernization can be partly attributable as a cause, the growing numbers of people are having an impact on wildlife, as is the opening of roads for logging and the huge monetary rewards people have found in the medicinal trade. The results for nature conservation on the continent are potentially catastrophic.

Afrikaner Theology

In 1652, Dutch, German, and French colonists began arriving at the Cape of Good Hope to find a new place for themselves under the African sun. In the words of Afrikaans lyricist Johannes Kerkorrel: they came to ask for food and water and stayed for so much more. These groups of colonists later blended into the Afrikaner people, with its own history, language (Afrikaans), internal tensions, cultures and subcultures. The history of the Afrikaner people is filled with ambiguities. It is inseparable from the legacy of colonialism and slavery. As elsewhere in the world, European colonists subjugated the indigenous peoples with military and economic power. They conquered the land with determination, sweat, tears, blood and a Calvinist sense of calling. And then they fell in love with the land. Traditionally, Afrikaner people have a deep sense of rootedness in the land. Many Afrikaners are able to trace their ancestors back for up to twelve generations. Afrikaans poets such as Leipoldt and Boerneef express a deep love for the land in beautiful and humorous nature poetry.

After 1806, the colonial conquests of the Afrikaner people were overshadowed by those of the British. This led to a quest for political independence and further colonial conquests. The evils of British imperialism blinded most Afrikaner people to the evils of their own colonial conquests. The “Great Trek” of 1832, the formation of two Boer republics, the discovery of diamonds and gold and the Anglo-Boer war (1899–1902) followed. Together with the rise of Afrikaner nationalism, the apartheid era (1948–1994) represents a brief but tragic episode when Afrikaners managed to exercise political power yet again. The notion of “Afrikaners” is a highly contested one.

It is not necessarily the preferred self-description of all Afrikaans-speaking people of European descent. This category would also have to include many Afrikaansspeaking “colored” people who trace their complex biological and historical roots to the indigenous Khoi and San, Malay slaves, European colonists and Nguni tribes. The term “Afrikaner” is often used in a narrower sense to refer to those who maintain Afrikaner nationalist sentiments, or even more narrowly, to those who strive for political independence. It will be used here, somewhat imprecisely, in a broader sense (i.e., to refer to all people who were classified as “white” under apartheid rule and whose home language is Afrikaans).

Most Afrikaners belong to, or used to belong to, reformed churches of Dutch origin. The notion of “Afrikaner theology” is more complex though. In an important article on “The Roots and Fruits of Afrikaner Civil Religion,” David Bosch identified three dominant influences on the religious beliefs of Afrikaners. This includes the staunch Dutch Calvinism of Abraham Kuyper (who asserted that every inch of society must come

under God's reign), the deep pietism of Scottish and Dutch evangelicalism, and neo-Fichtean romantic nationalism. These streams were blended into what Bosch labeled "Afrikaner civil religion."

Afrikaner theology should not be equated with apartheid theology that emerged in the 1930s in an attempt to legitimize the emerging socio-political dispensation at that time. The latter should be understood as one somewhat esoteric manifestation of the former. Apartheid theology was based on the notion of the divine orders of creation in the neo-Calvinist cosmology of Dooyeweerd and Stoker. It assumed that each order of creation was sovereign within its own context. The existence of different racial groups was treated as one of these orders of creation. The different races were ordained by God to be

"apart" from one another from the very beginning. They are not only distinct from one another; they should also be kept apart, hence the socio-political dispensation of apartheid/apartness.

Afrikaner theology, especially in its more recent forms, should be understood as a broad spectrum of reformed and often deeply evangelical theologies that emerged from these historical roots. In religion and in politics, Afrikaners have seldom been a homogeneous people.

What, then, is the relationship between Afrikaner theology and nature? A few comments will illustrate the moral ambiguities in this regard.

In many ways, the history of the Afrikaner people forms a trajectory in the interpretation of Genesis 1:28. The command to "subdue" and to "rule" over the Earth provided them with a strong sense of calling. Afrikaners became fruitful and multiplied and they literally subdued the land, its indigenous peoples, the slaves, and the oftenharsh agricultural conditions. They built dams to "tame" the rivers and to provide water for agriculture and new towns in a water-scarce country. They hunted the wildlife, some to the point of extinction. They felled indigenous trees (especially yellowwood and stinkwood) to provide timber for building material and furniture. They built roads and railways to gain access to remote areas. They planted crops in areas that were not suitable for agriculture. They occupied the land and marginalized the land claims of other peoples and of other living species. The way in which they ruled the land was not always compatible with their love for the land.

The disastrous environmental legacy of the apartheid period has been well documented. The creation of squalid urban townships has led to air and water pollution, a lack of sanitation and waste removal, contagious diseases and localized overpopulation. These conditions still affect the living conditions and health of millions of South Africans. Forced removals under apartheid led to a very high population density in former "homelands" or Bantustans. This created a vicious circle of poverty and malnutrition, overgrazing, deforestation, soil erosion, the disruption of river systems and further poverty. In addition, indigenous peoples were marginalized on land that was earmarked for nature conservation, game parks and eco-tourism (for the wealthy). The

ideology and theology of apartheid allowed these conditions to deteriorate unabatedly for decades.

The command to rule over the Earth in Genesis 1:28 is indeed ambiguous. For many Afrikaners it has the more positive connotations of stewardship, of being the land's caretakers, of "tending the garden," of earthkeeping (Gen. 2:15). This has fostered an environmental ethos among Afrikaners where emphasis is placed on using resources wisely and frugally. Accordingly, the environmental "track record" of Afrikaner people, on the land that they have occupied, is quite satisfactory. This applies to the prudent use of farmland, numerous exemplary nature conservation projects and to urban landscaping. Indeed, Afrikaner people are rooted in the land and many are deeply committed to the land that they inhabit.

Traditionally, the self-understanding of Afrikaner people was expressed in the stereotype of a rugged but honest farmer who lives close to nature in a harsh environment. This sense of being close to "nature out there" has been retained in an urbanized context. Many Afrikaner families and the youth (who can afford it) spend their holidays and weekends closer to nature (e.g., at pristine beaches, on mountain and hiking trails, touring the countryside, on game safaris, on hunting and fishing expeditions, or on outstretched farms). The irony is that the environmental consequences of this quest to experience nature "out there" are seldom recognized. The longing for tranquility is also undermined by the quest for ever-greater adventure and excitement. As a result, this longing for nature does not manage to counter an increasingly consumerist culture but actually reinforces it.

The quest for experience and adventure has a religious parallel. Since 1994, many Afrikaner Christians have opted for an apolitical form of Christianity. Many, including those who remain within reformed churches, are lured toward more experiential forms of religious expression that are more and more influenced by Pentecostal spiritualities. This does not offer much hope to counter the greedy and vulgar forms of consumerism than seem to possess many Afrikaners and that can only alienate people from nature.

Ahimsa

Ahimsa, a Sanskrit word meaning “non-injury” and often known in the English language as “non-violence,” is a significant concept in several of the religions originating in South Asia. Ahimsa implies both not causing injuries to other living beings and not adopting an aggressive attitude. The early protagonists of ahimsa in ancient India, who probably lived in Bihar and the eastern part of Uttar Pradesh, directed their critique toward animal sacrifice.

The principle of non-injury, therefore, became generally recognized not so much as a critique of war but as an opposition to the institutionalized killing of animals. Hence in South Asia, ahimsa has especially been understood to regulate the relationship between humans and the living beings of nature and the discussions of ahimsa in the religious texts often concern the human–nature relationship.

In South Asian religions the borders between humans and other species are not absolute. Humans are reborn as animals and plants, animals and plants are reborn as humans. Other living beings are therefore in a fundamental way similar to humans. The religious foundation of ahimsa is the idea that the same life or consciousness principle (*atman*, *purusha*, *jiva*) is present in all living beings, that this life principle does not die when the body dies but is reborn in a new body, and that the new body in principle can belong to any species. Killing living beings, or causing others to kill them, stains the individual with moral impurities and will be punished after death. What kind of rebirth an individual gets, that is, if she is reborn as a human, an animal, as a plant, in hell, etc., is determined by karma, that is, the sum total of her acts, and by the rituals performed on her behalf.

Two classical traditions of ahimsa are found in South Asia; one considers ahimsa as an absolute value, the other considers ahimsa as the foremost duty (*ahimsa paramodharma*) but accepts justified violence. The first tradition is tied up with renunciation, asceticism and monasticism and is an ideal for monks and nuns in Jainism, Buddhism and Hinduism. The second has dominated Hinduism (with the exception of its renunciant traditions).

Ahimsa is the religious motivation for vegetarianism, a custom more popular in India than in any other part of the world. Ahimsa problematized the human relationship to nature as food. Eating, a fundamental necessity in order to stay alive, is mainly based on killing other living beings (animals or plants) or having them killed for us by someone else. Most Jains, therefore, are vegetarians. Most Buddhists of the world are not vegetarians since Buddhism identifies karma strictly with intention (*cetana*). Hence eating meat not intentionally killed for oneself is not a moral fault, according to

Buddhism. Western converts to Buddhism, however, are often vegetarians. Less than half of the Hindus are vegetarians, and although some Hindus would be disgusted by even the thought of eating meat, many consider eating meat a minor offence.

Because it is impossible to live without killing other living beings, the ultimate act of ahimsa is to avoid being reborn, that is, to attain *moksha*, ultimate salvation. Ahimsa is therefore not attainable in this world but is an ideal and a distant goal toward which one can progress. A sign that a person has progressed far in perfection of ahimsa is, according to the Yoga tradition, that his presence generates an absence of enmity (*Yogasutra* 2.35).

In the classical texts, examples of a lack of enmity in animals are used to illustrate the power of ahimsa of such a person. Wild animals become peaceful in the presence of such a yogin and the enmity between animals such as cat and mouse ceases.

Mahatma Gandhi believed in the dogma of Yoga that perfection in ahimsa begets a suspension of enmity in one's surroundings. He expanded the meaning of ahimsa by having it include not only non-injury toward all living beings, but also service, love and humility. He also reformed ahimsa by transforming it into a political method of nonviolent resistance. Gandhi further interpreted ahimsa as the complete, and in fact as the only method, to realize God. Ahimsa for Gandhi meant a humble acceptance of the right of all life forms to flourish. He wrote: "So long as man does not of his own free will put himself last among his fellow creatures, there is no salvation for him. Ahimsa is the farthest limit of humility" (1957: 505).

A reinterpretation of the Gandhian tradition of ahimsa is at the foundation of the Deep Ecology tradition of contemporary environmentalism. Here ahimsa means an acceptance of the right of all living beings to flourish, and a willingness to defend with nonviolent means parts of nature such as rivers, waterfalls, forests and wilderness areas which by themselves are defenseless against human violence.

Albert the Great (ca. 1206–1280)

Best known as one of the first medieval philosophertheologians to clarify Christian teachings through the appropriation of Aristotelian philosophy, and as the teacher of Thomas Aquinas, Albert the Great (*Albertus Magnus*) was also a pioneering natural scientist. During the Middle Ages he gained a reputation on a par with Aristotle's in physics, astronomy, chemistry, mineralogy, geography, human and animal physiology, zoology, and botany.

Albert was born near the river Danube, in Swabia (now Germany). While a student in Padua, he joined the Dominicans. His order assigned him numerous tasks that required travel, especially between Cologne, Paris, and Rome. As a mendicant priest, "Father Albert" traveled by foot and relied on the hospitality of farmers and villagers. Through observation and local inquiry he thoroughly familiarized himself with the flora and fauna of Western Europe, including its mountain ranges. (Once he arranged to have himself lowered over a cliff's edge to check whether eagles indeed lay only one egg per season, as was the common belief.) His illustrated descriptions, classifications, and explanations (still largely untranslated from the Latin), form the first encyclopedic overview of European natural history.

Albert's scientific work led contemporaries to object that he spent his time on matters irrelevant to salvation – or worse, on sorcery. However, Albert insisted that reason will not contradict revelation. Familiar with the parallel view of contemporary Muslim scholars, he had come to see the rational exploration of experiential data as an important avenue to knowing and serving the Creator.

Alchemy

Alchemy in the West is chiefly understood as a European search, possibly from the first century developing initially in Hellenistic Egypt, for the *philosopher's stone* (*lapis philosophorum*) or elixir of immortality. As the endeavor to transform chemicals and particularly base metals into gold, medieval alchemy became the springboard for modern chemistry. Alchemy itself underlies much religious development in general and is especially to be found in Daoism, Hinduism, Buddhism and Hermetic Christianity. Comprising both the more mundane effort to develop precious substances and the more esoteric concern of spiritual transformation, alchemy flourished in Greece during the second and third centuries and in the Arab world of the seventh and eighth centuries. It reentered Europe with the Moors of Spain in the tenth century where it was combined with various kabbalistic understandings.

Its peak occurred during the Renaissance in the works of Theophrastus Paracelsus (1493–1541), Giordano Bruno (1548–1600), John Dee (1527–1608), Jacob Boehme (1575–1624) and Robert Fludd (1574–1637). As a spiritual pursuit, alchemy became superseded by the development of chemistry as a physical science. It suffered not only through ecclesiastical opposition – even persecution – but also with the growth of rationalism as well as the replacement of its theory of the four elements (water, Earth, fire and air) as the building blocks of all tangible reality.

European alchemy traces its origins to Hermes Trismegistus, the legendary magician and astrologer. A product of the Platonic/Neoplatonic tradition, the hermetic arts adhered to the understanding of correspondence: as above, so below. Alchemy's "Great Work," accordingly, seeks to reconcile opposites and augment the divine harmony between heaven and Earth. As part of this pursuit, the alchemist attempts not only to transform something from lesser to greater value but also to find the panacea for disease and the ability to prolong life indefinitely. Consequently, in its heyday, the art of alchemy was both a medieval chemical science and a speculative philosophy. It consisted of three parts – each paralleling the supposed fundamental principles of all existence, namely, sal, sulphur and mercury. Sal, or what Fulcanelli termed "spagyrik," Paracelsus' *spao* ("I separate") plus *ageiro* ("I combine"), concerns the preparation of remedies. Mercury refers to the alchemist's spiritual development and his or her consequent ability to manipulate the physical realm. For Jung, this is the area that corresponds to depth psychology. Sulphur is correlated to the third phase of alchemy that seeks, through the Philosopher's Stone, to rectify nature's part in the Fall as Christ was able to redeem humanity. When all metals are changed into gold, the construction of the golden Jerusalem will be possible.

Despite its decline, the medieval understanding of alchemy has been transformed by Carl Jung (1875–1961) into a spiritual understanding that has come to permeate much of today’s magical and New Age practice. Recognizing alchemy as a projective system in which psychic configurations of the unconscious become understandable once mirrored in outer reality, Jung stressed the study of alchemy and astrology as vehicles for discovering archetypal components of the human psyche. Jung referred to individuation as the result of psychological insight and spiritual development that arise through understanding the magical qualities of matter and celestial bodies as unconscious psychical projections. In traditional alchemical drawings of Alchymia, the personification of alchemy, the figure is depicted holding the “Hermetic Vessel” that allegedly contains the key or “philosopher’s stone” to all mysteries. It is within this vessel that the “Great Work” is undertaken. For Jung, distinguishing between the *prima material* (primal substance) and the *massa confusa* (unconscious), the allegorical attempt to liberate gold represents the differentiation of the primal Self into consciousness. In other words, it is symbolic of bringing the Self to full realization and completion. Following the alchemical trajectory and rationalization, Jung felt that the perfected transmutation of the soul is achieved by the total union of opposites – a coming together that engenders the soul’s own metamorphosis. The emerald vessel and tablet belonging to Hermes Trismegistus have come to be identified with the Holy Grail which, in turn, has tended to fuse Arthurian legend with the art of alchemy. Apart from the modern esoteric and psychological interpretations of alchemy by Jung and others, it is important to recognize the fundamental contrast between alchemy and science. The former is religious to the extent that it proceeds from certain assumptions about nature. Modern sciences work instead, at least theoretically, with no intrinsic assumptions about nature but rather from verified laws and hypotheses based on these laws. But for alchemy, the “law of correspondence” upon which it traditionally operates presupposes an analogy between the macrocosm and microcosm, between the cosmos and the human being. From this, it follows that coordination exists between the planets, plants, metals and various regions within the human body. According to Paracelsus, certain gifted people who are in the “light of nature” are capable of discerning the signatures or signs that signify the synchronization between the different cosmic levels. The underlying assumption of alchemy is that the whole of nature is alive – including the metals which are believed to be growing within the womb of Mother Earth. For Basilius Valentinus, metals themselves desire to become gold and their transmutation by the alchemist through the Philosopher’s Stone is simply an acceleration of natural healing processes.

Alchemy has made a further comeback beyond Jung’s work with psychological archetypes. In its contemporary form there is a return to the correlation between physical processes of transformation and psychological/spiritual states of mind, but this is currently understood more in psychonautic terms, that is, the exploration of consciousness through ingestion, even combinations, of entheogens, hallucinogens or psychedelics. The basic assumption upon which the psychotropic community proceeds is the interconnectedness of all life and the universe. James Lovelock’s Gaia Hypoth-

esis that considers the world to be a single living organism is one articulation of this assumption. Exploring the depths and the inner recesses of the mind is believed to be the corollary of cosmological reflection and philosophy – one that is supported and even encouraged by the “gifts” of nature. If contemporary alchemists no longer hold the world to be in a fallen state requiring redemption or transmutation, they nevertheless consider nature to be alive and intrinsically sacrosanct.

Allen, Paula Gunn (1939–)

Paula Gunn Allen is a writer and literary critic. With a Laguna Pueblo/Sioux/Scotch mother and a Lebanese American father, Allen focuses much of her writing and analyses on issues of identity. She is particularly engaged with the theme of recovering American Indian spiritual identity and values of harmony, peace, and cooperation.

The cosmology of the Laguna Pueblo is woman-centered and Earth-affirming. The Great Goddess, sometimes called Grandmother Spider or Thought Woman, is the creator of all things – material and immaterial. The female-centered traditions of her mother’s cultural group, as well as the goddess-centered strands of Lebanese and Celtic Scots that make up the rest of her heritage, permeate Allen’s writing. In her novel, *The Woman Who Owned the Shadows* (1983), the “half-breed” protagonist finds a spiritual identity or home in the god-women traditions. Allen’s other writings continue this theme of the recovery of spiritual identity and renewed harmony.

In *Spider Woman’s Granddaughters* (1989), Allen recovers women-centered traditions by collecting the stories of various native women. Their stories, like her own, articulate the threats of colonizing patriarchal European culture, as well as the persistent hope for healing and enduring power of tribal understandings of reciprocity and right relationship – human, ecological, and spiritual.

Storytelling for Allen serves as a ritual map, or guide, in the recovery of native spiritual traditions. The spiritual recovery entails a renewed harmony with one’s body and with the rest of nature. In her brief essay “The Woman I Love is a Planet; the Planet I Love is a Tree” reprinted in *Off the Reservation* (1998), Allen describes spiritual harmony as honoring the gifts of the Earth and cherishing of bodies. She explains that the body “is not the dwelling place of the spirit – it is the spirit . . . it is life itself” (1998: 122).

Alliance of Religion and Conservation (ARC)

One day in 1953 two men stood on the summit of Mt. Everest, Sir Edmund Hillary, a Western scientist, and Sherpa Tenzing, a Himalayan Buddhist. Separated as they were by culture and beliefs, they had together scaled the highest mountain in the world and had, for the first time in history, reached its summit. What they did speaks volumes for the real differences between them and their cultures. Edmund Hillary stuck a Union Jack, the flag of Great Britain, in the snow and claimed to have “conquered” Mt. Everest. Sherpa Tenzing sank to his knees and asked forgiveness of the gods of the mountain for having disturbed them.

This story told by Martin Palmer catches much of the spirit and rationale of The Alliance of Religion and Conservation (ARC), which in 1995 succeeded the WWF (World Wide Fund for Nature) Network on Conservation and Religion, and extended the emphasis of the Network to support and develop practical projects.

The Network, launched in 1986 in Assisi, started out with representatives from five major religious traditions (Buddhism, Christianity, Islam, Hinduism, and Judaism). By 1995, when ARC took over from the Network, groups from four more religious traditions (Baha’i, Sikh, Jainism, and Daoism) had joined. By 2001 the members of ARC numbered eleven (Shintoism and Zoroastrianism having been added) and according to its latest newsletter ARC currently works with 41 different faith traditions within the mentioned major religious traditions. ARC’s aims are to assist and encourage evolution of practical, educational projects furthering the involvement of religions in caring for the natural environment, to assist and encourage the development of religious and ethical programs within conservation bodies, to assist and encourage events which bring together religion and conservation groups, to raise funds for these aims and to publish and promote materials exploring the links between religions and conservation.

Examples of projects are: reforestation and education programs to preserve the ancient pilgrimage sites of Vrindavan and Sri Jgannath Forests in India, programs of preservation of Huichol Indian sacred landscape and pilgrimage routes in Mexico, environmental surveys and educational programs to manage the needs of increased tourism of Daoist and Buddhist sacred mountains in China, a churchyard conservation project and a sacred land project in the UK, a Muslim environmental management of Misali Islan in Tanzania, protection (with the Maronite Church) of the Harisa forest in

Lebanon, and projects for restoring the biodiversities of monasteries of Mount Athos (Greece), of Solan (France), and of Petrovka (Russia).

In addition to this, ARC supports a development dialogue between representatives of the member religious traditions and the World Bank, and like its predecessor, the Network on Religion and Conservation, ARC supports conferences and the issuing and evaluation of declarations on nature and conservation by the members.

In November 2000 another project, the Sacred Gifts, in which faith groups are invited to pledge, as Sacred Gifts, projects ranging from issues of climate change to marine conservation, was formally presented and celebrated in

Nepal. Climate change, ethical investments, toxics, forests, and sacred land have been identified as key areas for ARC-supported projects.

ARC is an independent foundation, a registered charity, sponsored by WWF-UK, WWF-International, MOA International and the Pilkington Foundation. The administration of ARC is headed by Martin Palmer, International Consultancy on Religion, Education & Culture (ICOREC).

Alpha Farm

Located in the coastal range of central Oregon, the intentional community of Alpha Farm was founded in 1972. The community grows a substantial amount of its own food using completely organic growing methods, and attained certified organic status in January 2001. Income is shared collectively, and the community owns the land and buildings. Although Alpha members are occasionally employed at “outside” jobs or freelance work, most community work centers on the farm and communally owned enterprises such as Alpha-Bit, a cafe/bookstore/gift shop in nearby Mapleton.

Alpha community members claim a non-specific, nature-based spiritual self-identity. While the early days of Alpha were infused by language reflecting interest in a variety of spiritual influences, contemporary discourse implies an increasing unwillingness to paint themselves a particular religious color. Members emphasize a quest for harmony with a generalized “spirit,” choosing not to express this harmony through “god talk” or specific religious symbols, but instead utilizing nature-religion-oriented themes.

Many residents of Alpha Farm claim the presence of “nature devas” on community land, an appropriation of a concept often credited to the Findhorn community. The land at Alpha functions both as a physical setting for the daily life of community members and as a spiritual context through acknowledgment of devic life. Nature devas are believed to be the architectural blueprints for the varieties of plant life on Earth, determinants of physical characteristics such as shape, smell, medicinal potential, etc. Nature spirits are the individualized conscious essence of particular plants, manifesting the archetypal blueprints in local environments. Both nature devas and nature spirits are open to communication with “sensitive” humans sharing the land. In exchange for the guidance and wisdom of nature devas and spirits, Alpha Farm has designated an isolated section of community land offlimits to humans, creating an undisturbed sanctuary for the nature intelligences. The prohibition on human intrusion into this area is considered an act of respect, a gift of isolation.

Nature religion as practiced at Alpha Farm is a practical strategy responding to what sociologists term the “chaos of modernity.” The creed is environmentalism, the rejection is not of worldly pleasures but the pressure of the modern world, the dogma is simplicity. This brand of nature religion is rooted in a feeling of activism, less theoretical than practical, less theological than lived.

Alpha Farm’s self-identified values include pacifism, feminism, voluntary simplicity, and the power of group process. Maintenance of the farm and community represents a strategy for the expression and manifestation of one’s individual spirituality in a communal context. The aphorism “work is love made visible,” utilized by the Bruderhof

and other intentional communities, serves to self-identify Alpha Farm as part of the lineage of intentional communities in the United States.

Intentional communities like Alpha Farm represent the manifestation of a larger dissatisfaction with modern society. Communal life at Alpha Farm is practiced in a context of shared meaning: a lived response to materialism and consumerism; a consciousness of place catalyzed by a belief in conscious, sacred nature intelligences; and the embracing of a meaningful and sustainable alternative lifestyle.

Altars and Shrines

Altars and shrines are sacred spaces where the everyday world touches on and interacts with the divine. There, individuals and groups establish, negotiate and maintain relationships to the sacred. An altar is a surface where acts of worship are performed, while a shrine is a natural or human-made place made sacred by its associations with a holy personage or quality. Altars and shrines may be located in either public or private spaces. They have been important in many religions for thousands of years.

The earliest shrines were located in natural places such as caves and springs. Archeologists have found objects and paintings at these locations that suggest Paleolithic hunters were leaving offerings there. While we know little about the beliefs and practices of our early human ancestors, the leaving of offerings and sacrifices presupposes the existence of a reciprocal relationship between the devotee and the powers being worshipped or appeased: devotees assume that spirits feel and behave much like human beings, returning gifts with special favors such as good hunting and plentiful game. This aspect of religious behavior seems to be nearly universal, and is central to the development of shrines and altars.

Because early humans were completely dependent on the natural environment for survival, they considered natural forces, such as those associated with Earth and water, sacred, and made shrines in natural locations to maintain good relations with those forces. A number of religions have maintained this practice.

The Japanese ancestral religion known as Shinto, or “the way of the gods,” preserves this traditional relationship between humans and the natural world. In Shinto, the gods, or *kami*, which range from Amaterasu, the goddess of the sun, to local and ancestral spirits, are believed to dwell in remote natural places such as mountains, streams and forests. Early Japanese agriculturalists observed that water, which was necessary for rice cultivation, came down from the mountains in form of streams. They deduced that mountains and streams were sacred forces animated by *kami*; in order to ensure a successful rice harvest, the farmers needed to maintain good relations with the *kami*. Since the *kami* lived far away from the villages, the farmers built shrines so they could visit once a year during their festivals and receive offerings from their worshippers.

Today, each village and town has its Shinto shrine. Shrines are constructed to suggest a forest so that the visiting *kami* will feel more at home. Many Japanese visit these shrines at times of important transition – before a job interview, a significant exam, or upon the birth of a child – to ensure good luck. They purify themselves with water, then leave an offering, usually a coin, for the *kami*. Sometimes offerings of incense, food or flowers are left for the *kami* at natural shrines in the mountains or forests.

Some Japanese also keep home altars for ancestral kami that protect the patriline. While Japan has become an urban, industrialized culture, the shrines symbolize the continuing connection between humans and natural world, and a recognition of human dependence on nature. Anthropologist Conrad Arensberg, working in Ireland, discovered a connection between natural shrines and folk beliefs that served to maintain a clean environment and good community relations. Local farmers believed that certain trees, hills and streams belonged to the fairies, spiritual beings associated with specific locations. They told Arensberg that very bad luck would come to those who violated fairy sites by cutting down trees, planting or building on fairy land, or fouling water sources; such actions, they said, would offend the fairies, who would then punish the offender with misfortune. Arensberg reasoned that these beliefs kept farmers from over-farming the land and polluting their environment. The prohibition against dumping waste into streams also kept community relations harmonious. Much like some rituals, certain shrines and the practices associated with them can function to regulate relations between human communities and their environments.

Some new religious movements in North America and Europe use altars to reconnect with the sacred in nature. Neo-pagans often keep altars in their homes that serve to hold tools for rituals. Tools may include natural objects that reinforce the connection between practitioners and the sacred and symbolize aspects of the divine. For example, a neo-pagan altar usually holds natural objects to represent the elements air, fire, water and Earth, which are thought to correspond to the four cardinal directions and to be the principal elements of life. Neo-pagans may conceive of the Earth itself as a goddess; their altars often hold representations of her as well. For neo-pagans, the presence of these sacred objects represents their connection to the immanent divine in nature, and their respect and reverence for the planet and all life on it. In many cases, this translates into political and environmental activism.

Not all religions with natural shrines use them to preserve an ecologically friendly relationship between humans and their environment. A case in point is Hinduism. In rural India, many natural places and objects are considered dwelling places of the gods, and are treated as shrines. Local deities called *yaksas* and *nagas* are associated with trees and pools. Stones and Earth mounds are thought to contain the essence of Shiva, the lord of death and rebirth. Villagers may sprinkle these objects with water or smear them with *kumkum*, a red powder thought to convey blessings. They leave offerings of food, flowers, incense, and statues at these sites to propitiate the deities, which are considered both beneficent and potentially dangerous. However, after the *puja*, or celebration honoring a deity, is over, worshippers dump the offerings, including clay and plaster representations of the deities, into lakes, streams and rivers. Toxins from the decomposing garbage can cause the death of fish and other organisms that live in the water. Thus existence of natural altars and shrines within a culture is not always an indicator of increased environmental consciousness.

Altner, Günter (1936–)

German biologist and theologian Günter Altner was a pioneer in Europe for his interpretation of the environmental crisis as a radical challenge to change the understanding and praxis of (natural) science and to change the cultural self-understanding of our civilization and Christianity. He also founded the Institute for Applied Ecology in Freiburg.

Since 1974 Altner has argued for the need of an alternative epistemology for the perception and understanding of nature, and he has profiled such an alternative in dialogue with an impressive manifold of concepts such as ecological evolution theory, open-system-physics, nature philosophy, zoology semiotics and creation theology. One of Altner's studies proposes the thesis that the European culture is characterized by an obvious "Verdrängung" of the fear of death. Technical progress gives humans the illusion of being able to escape from death. Love of life necessarily needs a consciousness of dying, he claims.

As environmental ethicist, Altner has drawn on Albert Schweitzer and developed a holistic ethics of respect for life. Schweitzer's sentence "I want to live among others who want to live" was given a central significance for ethics by Altner in his solution of the conflict between anthropocentrism and bio/ecocentrism. The conflict between creatures struggling for their survival is real and serious. Creatures have to enter a discourse about their singular and common conditions of survival. Every one of them has to be given the chance to participate and to be heard. Common interests have to be identified. Nonhuman creatures have to be represented in the discourse. Life can never be qualified in a quantitative hierarchy, as for example in utilitarian ethics, but: "All life is worth to live." As a Christian theologian Altner interpreted the ecological challenge in light of the Cross, where nature revealed a civilization in crisis. The contribution of Christians and churches is to motivate a new integration of ecological, scientific, ethical, and religious concepts in the openness of the encounter of humanity and nature. "Creation" is understood by Altner as "an event of emergence in time" of which human beings are a part. Altner's God is present in the midst of the suffering of creation where s/he acts as a Savior of life in its wholeness.

Altner has been influenced philosophically by Martin Heidegger, Georg Picht and Carl von Weizsäcker; ethically by A. Schweitzer; and theologically by Ernst Wolf,

J. Moltmann, and later by Teilhard de Chardin. One of his most interesting contributions to environmental ethics is the adaptation of the theory of "the semiotic circle" of life that has been developed by zoologist Jakob von Uexküll. Altner's many contributions have strongly influenced environmental debates in German-speaking countries.

To these he has contributed with humility and respect for the mystery of life and an open-minded anti-reductionist reflexivity with phenomenological, ethical, and ecotheological significance.

Amazonia

Because traditionally most indigenous societies in Amazonia think in monistic rather than dualistic terms, their biological, cultural, and spiritual ecologies coincide in many ways. Of course indigenes distinguish between ordinary and extraordinary phenomena. However, indigenes usually nurture a holistic view of their place in relation to nature and the supernatural. Most consider the human body to be the residence for several spirits. Many more spirits are thought to dwell in the mountains, forests, waters, and rocks of the local landscape which are often considered to be sacred places. Accordingly, the Amazon forest as habitat is a source of spiritual as well as physical sustenance.

The geographical region called Amazonia encompasses the Amazon river basin and adjacent areas such as the Orinoco. The largest portion of Amazonia is in Brazil, but it also extends into adjacent Bolivia, Peru, Colombia, Venezuela, Guyana, Suriname, and French Guiana. Amazonia contains about 40 percent of the world's rainforests, and within this natural cathedral many indigenes still practice their own religion.

A major consideration for understanding nature, culture, and religion in Amazonia is diversity within and between different environments and through space and time. Some 30,000 species of vascular plants occur in the various environments. Many types of forests are found, from wet, semi-deciduous, and dry; lowland, hill, and mountain; and seasonally flooded (*varzea*, *igapo*, or *pirizal*, depending on water conditions) to areas never inundated (*terra firme*). Other types of forest are characterized by distinctive concentrations of a special plant form like lianas, or a particular taxa like bamboo or babassu palms. Mangroves grow along muddy coasts where tides infuse saltwater. There are also many other types of environments, including savannahs (grasslands) and aquatic ecosystems (rivers, streams, lakes, and swamps). Distinctive ecosystems occur in northern Brazil and the Guayana Highlands on island-like land forms such as sandstone table mountains (*tepui*) and granite outcrops or domes (*inselbergs*). These are often believed to be sacred places by locals with the result that the use of resources in and around them is greatly reduced, avoided, or even prohibited, thus in effect creating wildlife sanctuaries.

In Amazonia neither environments nor societies are primeval, pristine, static, and uniform. The initial colonization and subsequent economic development of Amazonia by indigenes themselves may extend back 10,000 years or more. Estimates vary, but in 1500, when Europeans started to explore the Amazon, there may have been one to six million people living in several hundred different cultures with distinctive languages. The first Europeans observed large population concentrations with hierarchical chief-

doms on Marajo Island in the mouth of the Amazon River and extending up stream along its floodplains and those of its major tributaries.

European contact devastated native societies along the major rivers through warfare, economic exploitation, slavery, new diseases and massive epidemics, Christian missionization, and so on. Massive depopulation as the result of introduced epidemics and other contact agencies reduced many populations by up to 90 percent or more. The systemic repercussions of depopulation throughout indigenous cultures must have severely challenged their worldviews and rendered them more susceptible to colonial forces such as missionaries. Those indigenes along the major rivers who survived, usually became *caboclos*, a mixture of indigenous, African, and European elements, biologically as well as culturally and religiously. Indigenes deep in the interior, especially in watersheds of distant tributaries above a series of rapids and falls where navigation was extremely difficult, were usually more likely to survive and retain their culture and religion, but did not completely escape external influences.

Recent scholarship tends to view prehistoric and historic societies in Amazonia as qualitatively different in culture, religion, demography, ecology, and environmental impact. Massive depopulation of indigenes with initial contact processes relieved economic pressure on the environment and nature rapidly recovered. Thus, subsequent Western explorers and colonists encountered something they imagined to be “wilderness” or an underpopulated and underexploited frontier.

Current intellectual fashions in anthropology, ecology, and related fields, debate the extent to which the forests of Amazonia are natural and/or anthropogenic. This reflects the dualistic thinking of most Westerners which constructs and imposes binary oppositions on phenomena such as nature/culture, animal/human, wild/domesticated, wilderness/garden, primitive/civilized, and natural/supernatural. However, many indigenous cultures challenge such dualisms. If indigenes are an integral and inseparable part of nature, then forest is garden and garden is forest. Of course, indigenes can distinguish between garden and forest, but most do not do so in terms of unnatural versus natural. An indigenous garden is no less natural than the massive underground chambers of leaf-cutter ants where they cultivate fungi from leaves as food. It is not that much different from a gap in the forest created by a tree fall from senility, a storm, landslide, river shift, or other natural cause. Indeed, human technology (ax, bush knife, and fire) is used to create the slash-and-burn garden or swidden, and plant species which local people consider useful are concentrated in it. However, fire is a natural force when it occurs from lightning or a volcano, and is not necessarily unnatural just because a human ignites and uses it. The plants in a swidden are not plastic, but natural, no matter to what degree they are domesticated, cultivated, and managed. In traditional swidden horticulture, the space in the forest is used only temporarily as a garden, and then gradually over a few decades nature recovers until it becomes indistinguishable from the surrounding forest.

Indigenous environmental impact is usually negligible to moderate, unless population and/or market pressures exceed the regenerative capacity of the forest, thereby

creating patches of savanna in the forest or even contributing to local or regional deforestation. Swiddens are sustainable under traditional conditions – low population density, subsistence economy, and large reserves of forest for future gardens while old ones turn to fallow and eventually into forest. This is utterly unlike Western clear-cutting for conversion to pasture for cattle ranching, or flooding by dams for hydro-electric power, both to supply luxuries for distant cities at the expense of the local environment and people. However, the difference is not merely ecological and economic, it is also the difference between worldviews and associated attitudes and values. For most indigenes and many caboclos, nature is respected and revered as inhabited by spirits. For most other people entering Amazonia, nature is treated as merely object and commodity for economic exploitation.

When the indigenous hunter leaves his village or camp to go hunting in the forest, he believes that he experiences not only the ordinary plants and animals, but also the extraordinary. He thinks that the spirit guardians of the animals may allow him to kill certain prey for food, or even facilitate this by placing them in his path. As long as he enacts appropriate respect, reciprocity, and rituals, then he and his relatives will eat meat. However, if he or someone else disrupts the spiritual world of the forest, then the indigenes believe that there will be negative repercussions, the hunter or a member of his family or community will become sick or even die. Then the local shaman, a parttime religious specialist, attempts to restore balance and harmony to nature and society. He monitors the condition of the interpenetrating ecological, human, and spiritual communities, and tries to make adjustments through contacting helper spirits to mediate, usually with the assistance of tobacco or hallucinogenic plant substances like *ayahuasca*. Indigenous Amazonians try to promote the survival and well-being of their community through an elaborate system of taboos, rituals, ceremonies, symbols, and associated oral traditions.

There is a tendency, for instance, among traditional indigenous societies in Amazonia to avoid or prohibit killing animals like the harpy eagle, jaguar, anaconda snake, river otter, and freshwater dolphin. In effect, even if only inadvertently, this recognizes the ecological role of these keystone species as top carnivores crucial in the regulation of prey populations. However, various combinations of carnivore and herbivore species are avoided or taboo among indigenous cultures. This may have a conservation effect, even if unintentional, by creating a mosaic of reserves freeing a somewhat different combination of species from predation pressure in each. Also among some societies, faunal taboos may channel hunting away from the less accessible and more vulnerable herbivore species, like tapir or deer, to those which provide a better cost/benefit ratio together with a more sustained yield, such as large rodents like the paca or capybara. Special places in the forest and in water bodies may be considered sacred, or the haunts of dangerous spirits, and avoided accordingly, thus, in effect, creating game sanctuaries.

Indigenous practices comprise no less of a system of land and natural resource use, management, conservation, and development than their Western counterparts, if

racist and ethnocentric thinking is rejected. Furthermore, most traditional indigenous societies are usually sustainable and green in their beliefs, values, and practices. They have not only been tested, developed, and refined over many centuries or even millennia, but they are grounded religiously as well as pragmatically.

In 1500, Amazonia was not an endangered region, but it has progressively become so under the influences of colonialism, neocolonialism, industrialization, and globalization, especially in recent decades. By now change is simply unprecedented in its rate, scale, and repercussions. Today Amazonia is one of the world's most endangered places in every respect, including ecologically, demographically, epidemiologically, technologically, economically, socially, culturally, and spiritually. It is as if industrial society were out to destroy one of the very things that might save it. Amazonia is generally viewed by industrial nations as one of the last frontiers on the planet with an untapped wealth of natural resources such as gold, minerals, oil, timber, and medicinal plants awaiting discovery and extraction to distant markets for quick profit. The myth of El Dorado persists, although in twenty-first century form. Meanwhile, indigenous systems that have proven adaptive for centuries to millennia are being threatened, degraded, and even destroyed by maladaptive alien systems.

Amazonian Folktales

In addition to the immense lore produced by indigenous groups in the Amazon, there also exists a large body of oral and written narratives produced by mestizo descendants of natives and multi-ethnic newcomers to the region who live in the forest and small settlements throughout Amazonia. While a few of the tales contain themes and characters related to life in an urban setting, the large majority articulate plot developments involving humans, supernatural animals and entities inhabiting the deep forest, rivers and lakes. These stories combine elements of the ecological cosmologies of native Amazonians, Judeo-Christian and other Western themes, and historical transformations enacted by old and new inhabitants coming into the region since the arrival of colonialism.

While vividly manifesting and illustrating many aspects of Amazonian life, expectations, desires, and negotiations with the immediate environment, these oral narratives incorporate the presence of an array of magical plants and animals, enchanted places, spiritual beings living in the forests, and underwater and celestial realms. Voiced within notions of conservation and a socialized nature, these tales convey beliefs of regional indigenous cultures that perceive the human realm to be part of the environment, related to animals, trees and sacred places. The supernatural animals and magical entities play important roles in the tales by providing people with advice and knowledge of the forest. They have the power to reward or penalize humans according to their interaction with others and natural beings.

Many of the tales which illustrate such mythological importance of reciprocity and balance with nature are constructed with the fabric of direct experiences of fishermen, loggers, rubber tappers, hunters, intruders, and other forest dwellers. In accordance with the indigenous ecological cosmologies, central characters who make their living hunting or fishing may experience punishment from the guardian of the forest or from supernatural animals dwelling in the waters when they kill animals who are too young or when they slay too many. Plots also convey a prescribed visit to a shaman who serves as the mediator between human and supernatural domains. Many times he is a mestizo who lives in and serves the small settlements. Often the shaman advises a special penance to repair damage done by a careless individual. Charms and prayers from the shaman during a hallucinatory state, accompanied by tobacco smoke, may help to appease the spirit of the forest who is angry with the hunter or fisherman daring to disrupt the balance. It is not unusual to see the tales end with intruders dying from a spirit-sent disease that the shaman is unable to cure.

Among the lore surrounding entities who dwell in the rainforest, there are stories about those who serve as guardians. Plants and animals are believed to have mothers or spirits to defend them. The most feared by hunters, and known by many Amazonians, is a protean figure called *Curupira* in the Brazilian and Colombian Amazon and *Chullachaqui* or *Shapshico* in Peru. *Chullachaqui* means *uneven foot* and is frequently depicted in this manner. He is the protector of animals, frequently known to kidnap his victims or cause them to become lost in the forest. In order to find a lost hunter, relatives and friends must seek help from a shaman. With the help of tobacco or in many cases a hallucinogenic vine called Yagé, the shaman can locate the person. Many times he must explain that the hunter has been taken and punished for his disrespectful behavior or for disobeying the *Curupira*'s warning given directly or in the hunter's dreams asking him not to kill young animals, go hunting during certain times, or enter forbidden realms.

Involving a composite of cultural themes, these tales also feature Christian morality and observances of certain sacred days. One example is the tale of the *Mapinguari*, a one-eyed hideous giant forest monkey and a greedy hunter who disobeys the sacred principle of resting on the Sabbath day to keep it holy. Disregarding advice, the hunter pushed into the forest to hunt on Sunday anyway claiming that "one must also eat on Sundays." For this disobedience, he is punished with death. While gnawing the limbs of the hunter the *Mapinguari* affirms, "one must also eat on Sundays."

These codes of conduct and attitudes of respect for nature show the powerful presence of indigenous cosmologies that view nature as a living being rather than an expendable commodity. Spirits, supernatural animals and characters who populate the air, rivers and lakes watch over behavior, and give power and advice to healers and shamans who constitute an integral part of this lore. Freshwater dolphins are considered extraordinary beings that live in modern and sophisticated underwater cities. They are believed to be able to turn into handsome men and sneak into riverbank settlements and charm women. Killing a dolphin and eating its meat is considered taboo by most Amazonian tribes. Characters in the tales who commit such actions are severely punished. Dolphins are able to grant good luck to fishermen and reveal places for good fishing. They also reprimand avaricious behavior when people overexploit certain fish in the lakes and rivers.

Riverine inhabitants tell countless stories about other animals whose guardians and "mothers" safeguard them by punishing abusive practices. Turtles, for example, whose eggs and meat are sought during the dry season are protected by *Charapamama*. The Anaconda, who along with the dolphins could be regarded as one of the most important mythological figures in all folk narratives in the region, undergoes a variety of transformations in the Amazonian imagination and plays important roles in the notion of respect for the landscape. In many tales the Anaconda also gives advice and healing powers and grants permission for fishing in certain areas. However the Anaconda can become furious and take the form of a *Yacumama*, a fantastic snake with

eyes like the headlights of a truck, and produce an array of atmospheric phenomena tilting boats of greedy fisherman and people who trespass into her realm.

Amazonian folktales, with notions of natural beings who are sometimes rewarding and often vindictive, reflect influences of European and African traditions, as well as native Amazonian lore. Although Christian missionary work has altered Amazonian cultures, the overriding themes of a social relationship with nature continue. These ideas persist in the minds of natives, mestizos, loggers, fishermen and ordinary people in small settlements who articulate their daily lives, needs and expectations within frameworks of respect for nature. With deforestation and increasing need for commodities, new ideologies that seek to demystify nature have emerged.

As a result traditional lore is losing influence in some regions. Time is of the essence in the gathering, studying, recasting, and preservation of Amazonian folktales. Locals, anthropologists, scholars and writers are playing a key role in working with storytellers who are the keepers of the mythologized world. Amazonian populations have become more urban, with the presence of electric lamps, radio, TV, and vehicles even in the most remote areas. These new technologies and the ideas associated with them have in many ways disconnected people from trees, rivers, night and stars in the sky. Thus modern life and rational accounts are transforming imaginative explanations based on interactions with nature. Such factors draw the young from this lore which has served Amazonians not only as entertainment but also as a moral code which maintains the social balance between humankind and nature.

Juan Carlos Galeano

Breakout Box: Mapinguari

Near Tefé, on the banks of the Amazon river, there was a man who loved hunting so much that he'd go almost every day of the year. One Sunday he told his wife, "I'm going to a place where there is good hunting."

"It would be better to wait until tomorrow," his wife said. "It's not good to hunt on Sunday."

"One must also eat on Sundays," the man said as he grabbed his rifle and left.

On his way to the forest, the man stopped by a neighbor's house to invite him. The neighbor didn't want to go and also told him, "It's not good to hunt on Sundays."

The hunter persuaded his neighbor by saying, "One must also eat on Sundays."

The two men crossed a small river and walked for some time through the bush without finding anything. It was as if the animals had disappeared. Toward the end of the afternoon they were frightened by some terrifying screams followed by noise and footsteps. They thought it was a big man, but it was an animal, a black haired apelike creature with a turtle's shell and one big green eye in the middle of its forehead. The men were afraid and the hunter started to shoot, but the bullets could not penetrate the shell. He kept shooting but to no avail.

The animal walked toward the hunter, grabbed him, and threw him to the ground with one of its enormous arms. The other man climbed a tree and watched in horror as the animal tore his friend apart. As it gnawed his friend's arm it said, "One must also eat on Sundays." Then gnawing a leg it repeated,

"One must also eat on Sundays." After the creature devoured the hunter and walked away yawning, the man ran to the town and gave an account of his friend's death. Some people tried to guess what kind of an animal could have eaten the hunter. "If it has only one green eye and its feet are as big as a pestle, it has to be the Mapinguari," said the dead hunter's cousin.

"Surely it didn't eat you, don Luis, because you didn't have a rifle," added the others. One of the men, who knew a great deal, said the hunter could have saved his life if he had shot the creature in the belly button, "because that is where its heart is." The people from the town were so outraged that they organized a search party and went hunting for the creature. They didn't have to look too hard, because the Mapinguari had come back to lick and chew the bones of the hunter.

As soon as it saw the group of men, it attacked, wanting to eat them too. The men fired, not as their friend had done, but straight into its belly button to hit it in the heart. The Mapinguari, shrieking with rage, took off running and disappeared into the forest. Then the men gathered the uneaten bones of the hunter, put them in a sack, and took them back to town. His wife put the bones in a small coffin, and after she and her children mourned him for two nights, she took them to the cemetery. "If only he had heeded my warning," sobbed the poor woman. They say that later she took her children to Manaus where the rest of her family lived.

American Indians as “First Ecologists”

The image of North American Indians as first ecologists, conservationists, and environmentalists, which can be called the Ecological Indian, became dominant in the 1960s. Today, many, including American Indians, accept it as an accurate representation of Indian behavior through time. Yet the image has deep intellectual roots and has gone through various iterations, from a generalized nature-dwelling noble indigeneness, through one emphasizing pragmatic skill in the environment, to today’s full-blown Ecological Indian.

The Noble Indian in Nature

From the moment they encountered indigenous people in the Western hemisphere, Europeans classified them in order to make them sensible. They made the exotic comprehensible with familiar categories. In the process they reduced men and women to stereotypes, to caricatures, noble or ignoble, benign or malignant, rational or irrational, human or cannibal – savages all. For centuries two polar images of Indians in the New World – noble and ignoble – have clashed. Until recently, the Ignoble Indian ruled; a menacing, malignant image construing the Indian in the extreme as a bloodthirsty, inhuman cannibal akin to the Wild Man of European folklore. In contrast, the Noble Indian (or Noble Savage), never entirely absent – the peaceful, carefree, unshackled human; the wise, dignified elder; the nostalgic romantic; the spiritual guide; the polished orator – was and is a benign, often romantic, image of people living innocent, vigorous, clean lives in a golden world of nature.

Columbus was first to ennoble the inhabitants of the New World when, on his second voyage, he wrote that he had found the Islands of the Blessed and its natural inhabitants – a place and people in the European imagination. His readers were not surprised – at least not those for whom several mythic places originating in pagan or Christian tradition were linked in the imagination and collectively expressed ideas of earthly paradise, eternal spring, or innocent life removed in space or time. An imagery traceable to these understandings remained potent long after Columbus as writers invoked ancients like Tacitus or various classical analogs like the Scythians to render intelligible the native people of the New World.

Over two centuries, the French were without peer in developing an imagery of nobleness. Best known was Jean-Jacques Rousseau, who presented savage life as simple, communal, happy, free, equal, and pure, and ensured that Noble Indians would rule the second half of the eighteenth century as allegorical America or in other genres. He and others mined the classics for ennobling thoughts that they applied unhesitatingly to the native people of the New World, and quickly linked the development of favorable virtues to “la pure Nature.” Many still considered their own (French) civilization superior to any developed by the children of nature in the New World; indigenous people came up wanting in faith, laws, and kings (*ni foi, ni loi, ni roi*). *Ni foi* meant, of course, that religion was barely worthy of the name (as had also been so for Columbus, who depicted Caribs as lacking in religion). Yet while they denigrated these aspects of indigenous culture and institutions they also seized on liberty and equal access to basic resources as characteristic of savage life and important virtues to emulate. Thus, contained in their observations of the New World was a critique of their home society. For example, Michel de Montaigne and Baron de Lahontan set the stage for Rousseau by lauding natural New Worlders and in the next breath condemning French society. Lahontan even invented a Huron Indian named Adario to critique the European scene and those who had stripped him of property. As one historian remarked, many used the New World as a stick with which to beat the Old.

The Skilled Woodcrafter

The nineteenth-century inheritors of the tradition of the Noble Indian in nature include not simply Romantic nature poets but James Fenimore Cooper, the best-selling author from the 1820s through the 1840s and arguably the most important figure in the nineteenth century for further development of such imagery. All manner of Indians can be found in Cooper’s works, especially the Leather-

-family:”Bookman Old Style”;mso-font-width:95%’>stocking series, of which *Last of the Mohicans* is best known today. The most famous are dignified, firm, faultless, wise, graceful, sympathetic, intelligent, and reminiscent of classical sculpture in their bodily proportions. In his portrayal of Noble Indians, Cooper was strongly influenced by John Heckewelder, the Moravian missionary and relativist sympathetic to the Lenape and their history; indeed some criticized Cooper for unrealistically noble portraits “in the school of Heckewelder.”

Whereas for writers of an earlier day it was enough that Indians’ lives unfolded in “nature,” for Cooper what was weighty were Indian *actions* in nature; specifically, their skill in the forests and prairies. Cooper’s Indians demonstrated competence and even transcendent skill in nature. In contrast, non-Indians (except the protagonist Natty Bumppo) generally lacked such skills. Moreover, white men (except Natty) often wasted what they killed or otherwise were greedy. It is Natty, the conservationist, not some

Indian, who has something to say about the gluttony of whites and remarks, “Use, but don’t waste.” There is one notable exception: in forceful remarks in *Last of the Mohicans*, Magua, a Wyandotte Huron lumped with Mohawks and other Iroquois as “Mingoes,” states passionately that the Great Spirit gave Indians North America (“this island”), forested and full of game, but then he also granted whites “the nature of the pigeon” – that is, exploding numbers, tirelessness, and insatiable appetites suited to control over the Earth.

Magua, no Noble Indian, is one of the most infamous of Cooper’s arch-demons, which substantially muddied reception of his message about the Great Spirit or white people’s avarice. For authority one needed Natty himself, the protagonist of heroic proportions (in part from taking on the anti-conservationists of the frontier) and nature herself, heroine of unsurpassed dimensions. Cooper cast nature as sacred for Natty (not Magua), its sacramental quality deriving from God not indigenous animism. There are no such complications, however, when it comes to Cooper’s highly pragmatic image of indigenous skill and craft in nature, which in the mid-nineteenth century was shared even by writers who seldom had anything positive to say about Indians.

When he set out, at the turn of the twentieth century, to reproduce Cooper’s image of skill and craft in nature, Ernest Thompson Seton, a founder of the Boy Scout movement and first chief scout in America, ensured that the image did not die. Charismatic, a riveting speaker and fluid writer whose words reached millions, Seton placed the utmost emphasis on this aspect of Cooperian nobility – Indian skill in nature, which became known as woodcraft. In the 1890s, Seton formed the Woodcraft Indians, a boys’ group that spread and contained the seeds of the Boy Scouts. In time, Seton sought to combat degeneracy and build character and manhood in boys through proficiency in camping, hunting, fishing, mountaineering, boating, signaling, sports, and nature study. He sought to instill in each boy his version of Cooper’s Ideal Indian – a person who was kind, hospitable, cheerful, obedient, chaste, brave, honest, sober, thrifty, and provident; who held land, animals, and all property in common thereby checking greed and the accumulation of wealth (and division between rich and poor); and who condemned waste and those who took delight in slaughtering animals.

Seton’s appropriation of Cooper resulted in the domination, for almost one century, of an image of the Indian as the Skilled Woodcrafter (who increasingly practiced his craft safely in the past). This image flowered in the wake of sharp declines in numbers of buffaloes, white-tailed deer, turkeys, and beaver, and the extinction of the passenger pigeon; deforestation and the western creep of population and industrialization; and the birth of national parks and promotion of conservation through new organizations.

It flourished at the time of – and was in tune with – the progressive conservation movement.

Some traits of Seton’s Skilled Woodcrafter characteristic of Natty Bumppo rather than Cooper’s Indians – thriftiness, condemnation of waste – can probably be traced to the influence of Charles Eastman (also known as Ohiyesa), who was active in scouting circles at Seton’s time and consulted by Seton before the latter published his Ideal

Indian character traits. Eastman was a Sioux Indian who took his maternal grandfather's (the soldier-artist, Captain Seth Eastman) White Man's Road to college and medical school, and for nearly forty years (1900–1940) was the most visible Native American writer and public speaker, producing best-selling books on his own life and Indian ways. Betraying the complexity in the origin of his ideas, he paid homage not just to his Dakota grandparents but to the nature poet Coleridge, and ceased publishing books after he became estranged from his wife, a skilled non-Indian writer from Boston and New York.

Eastman's works (like Seton's) ennobled Indians both by resurrecting romantic visions of lives long past and by emphasizing woodcraft. In the autobiographical *Indian Boyhood*, Eastman spoke about Indians as wild, free, students and children of nature, and masters of woodcraft, and about animals as friends who offered their bodies for sustenance. His relatives, he remarked, taught him to be a close observer of nature and a skilled hunter. He extolled their "spiritual communion" with brother-like animals. He depicted his early life with Indian relatives as natural, altruistic and reverent, and his current life in the company of whites as artificial, selfish, and materialistic. He sought to train Scouts in what he called the "School of Savagery" emulating Indian training in the "natural way." One refrain in Eastman's books – and found in Seton as well – contrasts conservation among Indians and whites: Eastman wrote that Indians killed animals from necessity while white people killed them wantonly for amusement or greedily until none remained. Lastly, Eastman, far more than anyone who preceded him, emphasized the sacral qualities of nature. Even though Eastman considered the Sun Dance barbaric, he extolled the "spiritual communion" that Indians established with animals that possess childlike (innocent) souls. He wrote about every act being a religious act and about sublime nature. A transitional figure, his influence cannot be overstated.

The Ecological Indian from Earth Day to Today

In both Seton and Eastman can be found the germ for the image of the Ecological Indian, which, in the late 1960s early 1970s, became the latest in a 500-year history of images ennobling the relationship between North American Indians and nature. The Ecological Indian is the original ecologist, conservationist, and environmentalist, who has always possessed an intuitive, natural attitude toward the living world. Its most famous rendition appeared in 1971: the Crying Indian (Iron Eyes Cody, a self-ascribed Cherokee actor) enlisted by Keep America Beautiful in an anti-litter campaign; an American Indian weeping because pollution is "a crying shame," his direct gaze riveting viewers and shortly making, to use the language of advertising, over 15 billion people-impressions.

The Crying Indian is structurally reminiscent of Lahontan's Adario in that he stands not alone but against

– against the non-ecological whiteman. The Crying Indian wept for history, for America shattered by European settlers and their successors, for animals hunted to extinction by people of European descent, for trashed, even burning, rivers, littered and scarred and even desecrated landscapes, oil-slicked and tarred seas, and other environmental horrors. The Crying Indian, an American Indian, was free from blame but non-Indians in his gaze were not. As Iron Eyes became iconic, American Indians henceforth became widespread symbols for environmental attitudes and the conservation cause.

Like the preceding images – the Noble Indian in Nature and the Skilled Woodcrafter – the Ecological Indian was the image for the times: an era of violent anti-war and civil rights protest, and of assassination and societal upheaval, but also unprecedented for bitter battles over environmental issues. In this period the language and science of ecology broke into public consciousness (and were conflated with environmentalism), environmental prophets like Rachel Carson gained fame and notoriety, as books appeared with titles speaking to America raped, explosive population growth, or Earth as a sinking ark. The first Earth Day (April 1970) drew the largest demonstration in American history, environmental problems were *Time's* “Issue of the Year” in 1971, and the 1970s were the so-called Environmental Decade.

And as the deployment of the Crying Indian makes clear, Ecological Indians were marshaled to the support of environmental causes. Many in the countercultural movement moved back to the land in communal groups, seeking to reverse their alienation from nature. They turned their backs on Judeo-Christian anthropocentrism and biblical injunctions of dominion and rule over nature (even if one could find almost anything one looks for on humans and nature in the Old and New Testaments, or if adherents to these faiths have behaved in almost every conceivable way toward nature). Many consciously looked to American Indian lives for community, new aesthetics, and personal freedom; they wore beads, lived in tepees, and used tribal metaphors; they mined American Indian religions (and Zen Buddhism) for insight on sacramental qualities in nature. Theirs was a conscious critique of society; in them Lahontan and Rousseau were reborn.

One of the most important environmental organizations to emerge in this era, Greenpeace, was also the most visible for the convergence of environmentalism, critique of the social order, and the Ecological Indian. One Greenpeace founder considered that its aim was to fulfill an American Indian prophecy of a time when people of different ethnic backgrounds would join forces to defend the Earth. They were Warriors of the Rainbow – the name was from a book on American Indian prophecy – who would stop the desecration of the Earth and, like Ecological Indians, preach love for animals and use only what is required for food or clothing. Greenpeace activists wore Red Power buttons, adopted a Northwest Coast killerwhale crest as a symbol, and were blessed by the Kwakwaka'wakw en route to protest in the Aleutians. Greenpeace was supported by the most famous Indian actor, Chief Dan George, and cursed by the most famous Indian fighter on the screen, John Wayne.

American Indians embraced the new shift in perception and actively helped construct the new image of themselves. In 1969, Indians who occupied Alcatraz Island not only sought justice on a number of issues but aimed (among other things) to form an Indian Center of Ecology in order to halt environmental destruction. The Iroquois, through the White Roots of Peace, advocated environmental education, and the Hopi spoke of the need to clean up the Earth else it would again be destroyed.

In Indian writing, a new canon emerged in which nature and the environment figured significantly and which contained an explicit critique of people of European descent and their culture. A concern for sacredness, beauty and harmony, and place and community is manifest in this literature. Among the most widely read works were *Black Elk Speaks* (originally published in 1932), in which Black Elk's reminiscences were filtered (and sometimes created) by John Neihardt, whose goal was to live decently on Earth. Chief Seattle's lament on environmental destruction became gospel for Indians and environmentalists. These and other works in the new canon, by Scott Momaday and others, were replete with images of nature, animism, and harmony in Indian relationships to the environment in contrast to the destructiveness of non-Indians. All this provided fertile soil for the image of the Ecological Indian. This imagery has remained virtually unchanged in the last forty years – but so has concern for the mounting human impact on the environment. The 20th Earth Day in 1990 was considered by some as the largest global demonstration ever, with over 100 million people marking the day in some way. First ozone depletion and now global warming have become worldwide concerns. Today there is worldwide concern over the role the United States will play in solving global environmental problems that to a large extent are of its own making.

Indigenous people generally and American Indians in particular continue to serve as symbols of a time when the human impact on the environment is perceived to have been negligible. In 1992, indigenous people participated critically in the Rio Earth Conference and today they loom large in discussions of the rainforest. Ecological Indians can be found in best-selling books, in film, and on television and video, on global Earth Summit stages, in the writings of historians, native people, ecofeminists, deep ecologists, and others. Most key texts in the new canon remain authoritative although Chief Seattle's speech has deservedly lost its luster. The imagery that fell into place decades ago after centuries of rootedness in ennobling soil has proven to be remarkably resilient. And for many Indian people today, the Ecological Indian is an important aspect of their identity as Indian.

But is the fit, through time, between image and behavior a good one in North America? This important question, especially in a day when neither the enormous scale of transformation in the modern global environment nor the antiquity of the human role in environmental change, in North America or the world, should be in doubt, has been scrutinized elsewhere (for example, in human environmental impact). With respect to the two principal components of the image of the Ecological Indian, ecology and conservation, I have argued in *The Ecological Indian: Myth and History* that while ecological or systemic thought was surely widespread if always culturally

framed, conservation was not. In fact, for the many indigenous people in North America who believed that if respected in proper fashion (respect having nothing to do with Western conservation biology), their prey would later be reborn or reincarnated so that they might again be killed, conservation as it came to be defined in the West was foreign and even senseless. Moreover, no matter what people's beliefs or attitudes might have been, there were surely too few American Indians too thinly spread out to have made much of a lasting difference on lands and resources. The story, in other words, is far more complicated than simple stereotypes suggest.

Ammons, A.R. (1926–2001)

For the American poet A.R. Ammons, divinity was an omnipresent force that flowed through everything in existence. In retracing the spiritual journeys of his verse, one finds elements of Christian asceticism, Buddhist renunciation, and Daoist affirmation – but it might be most accurate to describe the religious dimension of Ammons’ work as *pantheistic*. This poet’s world is aflame with a divine spark that appears “everywhere partial and entire . . . on the inside of everything and on the outside” (“Hymn”) (1986: 9), from the darkest depths of space to the teeming sub-layers of soil. Though such a universe might seem godless and uncaring, this would rest on a limited understanding of divinity. For Ammons, the whole world pulsates with power, its spirit dispersed across air, water, and Earth rather than withheld on a shadowy plane.

Like Emerson and Whitman, Ammons senses a primal, primary energy permeating and connecting everything – including the poet. “My nature singing in me is your nature singing,” his glorious ode “Singing & Doubling Together” proclaims (1986: 114). Each created form partakes of an original grace: “I know / there is / perfection in the being / of my being, / that I am / holy in amness / as stars or / paperclips” (“Come Prima”) (1971: 52). All life stems from a cosmic point of beginning, what ancient civilizations called the godhead. The interpenetration of matter is beautifully expressed in Ammons’ early poem “Interval”:

The world is bright after rain for rain washes death out of the land and hides it far beneath the soil and it returns again cleansed with life and so all is a circle and nothing is separable (1971: 36).

This ceaseless cycling is embodied (and disembodied) by the maggot, which “spurs the rate of change,” transfiguring organic matter so that it will someday return to live again (“Catalyst”) (1971: 110). Though every thing must pass away, the irreducible unity of the larger field is preserved: “Earth brings to grief / much in an hour that sang, leaped, swirled, / yet keeps a round / quiet turning, / beyond loss or gain, / beyond concern for the separate reach” (“Salience”) (1986: 50).

The state of things is transience and flux – this is forever brought home to Ammons by his Virgil, the wind: vehicle of mere caprice, but also capable, through its powers of erosion and conveyance, of resisting fixity and hastening change. And so the poet’s efforts “to gather the stones of Earth / into one place” – a suitable metaphor for all our Sisyphean strivings for certitude – are constantly scattered by a wind which has “sown loose dreams / in my eyes / and telling unknown tongues / drawn me out beyond the land’s end” (“In the Wind My Rescue Is”) (1986: 5).

Yet, as one of Rilke's *Sonnets to Orpheus* puts it, "Song is reality" (1986: 231). Even in foreknowledge of its evanescence, poetry follows its way ever onward. The writerly task, for Ammons, is to accept the world through language, rather than create it anew. Wallace Stevens placed his jar upon a hill in Tennessee and emphasized the heroic aspect of poetry, its refashioning of reality from raw materials. But the "Poetics" of Ammons "look for the forms / things want to come as" instead of shaping things into forms (1986: 61). His late book-length poem *Garbage* (1993) is an encomium to found treasures, gold gleaned from the cast-offs of civilization – and dedicated to "bacteria, tumblebugs, scavengers, wordsmiths," all of whom busily rejigger the infinite forms of existence.

"New religions are surfaces," Ammons writes in *Garbage*, "beliefs the shadows / of images trying to construe what needs no / belief . . ." (1993: 27). His poetry does not offer explanations for the mystery of life, but recapitulations of it. "Poems / are fingers, methods, / nets,

/ not what is or / was" ("Motion") (1971: 146), a Zen-like approach that supplants explication with experience, however enigmatic. Accepting the world as a continuum carves out the space for affirmation, however difficult it is to affirm that "to be / you have to stop not-being and break / off from *is to flowing*" ("Guide") (1986: 23).

For Ammons is no tranquil sage sitting cross-legged beneath a tree; at times he quails at the infinite breadth of a universe not actively ordered by a benevolent deity, but imbued with an ambiguous and often violent energy. There are, as Harold Bloom points out, moments of terror in this poetry. But, as spring succeeds each difficult winter in upstate New York, where Ammons taught for many years, affirmation emerges through these reckonings with mortality. In a long poem called "Hibernaculum," Ammons cites a saying of St. Francis (If you give up everything, it's all yours) and opines that nothingness, far from being failure's puzzlement, is really the point of lovely liberation, when gloriously every object in and on Earth becomes just itself, total and marvelous in its exact scope able to exist without compromise out to the precise skin-limit of itself: it allows freedom to fall back from the thrust to the absolute into the world so manifold with things and beings . . . (1971: 379–80).

Even as it embraces life – "I want to get / around to where I can say I'm glad I was here, / even if I must go" (1993: 88) – Ammons' poetry renounces egotism and the grand gesture. Emptying leads to fulfillment, affirmation comes from renunciation; "being is born of not being," in the words of the Tao te Ching. "I have reached no conclusions, have erected no boundaries," Ammons writes in "Corsons Inlet," "no arranged terror: no forcing of image, plan, / or thought: / no propaganda, no humbling of reality to precept" (1986: 44). Coming to enjoy the autonomy of a given moment, the poet gives up any vain hope of freezing life's procession at a standstill.

Ammons is a crucial poet for a spiritually hungry and environmentally impoverished era because his work places *Homo sapiens* not alone on a pedestal, but as one vessel of life force among countless others. In "Corsons Inlet," he watches a flock of swallows preparing for fall migration and calls them "a congregation / rich with en-

tropy” (1986: 45). The religious connotation is not unintentional. For Ammons, we are all “instruments of miracle” – participants in a great cosmic rite of life, death, and eternal change.

Amte, Baba (1914–)

Baba Amte is one of India's most inspiring advocates for the rights of the oppressed, a champion of social justice and environmental awareness. His most recognizable accomplishment is Anandwan, a center for the treatment and rehabilitation of lepers and other disabled people in Chandrapur District in the state of Maharashtra. He is also widely known for his leadership in the protest against the

Narmada Valley Project, the most expensive hydroelectric and irrigation venture ever attempted in India. Amte's vision for India's future was inspired by, among others, Mohandas K. Gandhi, Rabinbranth Tagore, and Sane Guruji, and by the life and teachings of Jesus.

Born Murlidar Devidas Amte on 26 December 1914, in Hinganghat, Wardha District in Maharashtra, the eldest son of a wealthy Brahmin family, his high school studies at a Christian institution in Nagpur acquainted him with the Bible. Later in his life he was to say, "I am a Hindu Brahmin, and a follower of Christ." He states that to be a follower of Christ is not to be affiliated with particular religious institutions but to walk in the shadow of the cross, to follow the example of Jesus in crucifying one's own life for the sake of others. This ideal together with the Hindu concepts of *nishkana karma yoga*, or selfless service without the expectation of reward, and the ideal of *loka sangrahya*, or responsibility for the uplift of the world, produced in him the strong motivation to address issues of moral gravity in the present world.

His commitment to walk in the shadow of the cross was challenged in his early thirties when, after rejecting a lucrative career in law, he served as President of the Worora Municipality. When the local sweepers union went on strike, he identified with their cause by collecting night soil from the town's latrines for a period of nine months. On a rainy night while carrying a basket of night soil on his head, his frightful encounter with a forsaken man suffering through the final stages of leprosy put his life's purpose into focus. After studying at the Calcutta School of Tropical Medicine he set up clinics in villages, providing treatment for over 4000 patients. In 1949 Amte founded a society called the Maharogi Sewa Samity, centered at the place he called Anandwan (the forest of joy). With heroic effort and a government grant of 50 acres of degraded land (later expanded by the grant of another 200 acres), the society, comprised mostly of leprosy patients, constructed a residential facility for the treatment and rehabilitation of lepers and a farm to support its activities. Eventually, Anandwan became a ministry by lepers to other disabled persons, and to the community at large.

In 1964 Baba Amte contracted spondylitis, a condition that has resulted in the progressive degeneration of his spine. During long periods of convalescence he formulated

his vision of a new India, for which Anandwan was the inspiration and model. His vision is of the India advocated by Gandhi in which arrangements are set up not to address the greed of the few but the needs of all, where needs are met by working with nature rather than working to destroy it. He believed that if outcast people on outcast land could develop a self-sufficient community that could benefit others, then a healthy people should be able to do the same for India.

The most visible cause for which Baba Amte has been known in recent years is the Narmada Bachao Andolan

(Save the Narmada Movement). In 1987 he invited a gathering of the most distinguished environmentalists in India to discuss the Narmada Valley Project. At their meeting at Anandwan they concluded that this plan for the construction of 30 major, 15 medium, and 3000 minor dams on the Narmada River and its tributaries would benefit only a few people at the cost of the environment upon which 300,000 local, mostly tribal people, depended. For Amte, who from an early age had been impressed with the traditions of the tribal people of India, and especially for their reverence for nature, this was a morally intolerable undertaking. In 1989 he helped organize and, in spite of failing health, participated in a highly visible protest rally at Harsud, a town in the Narmada Valley to be submerged by the project. In *Cry, The Beloved Narmada* (1989), and other publications, Baba Amte argued that the result of the project would be ethnocide. On 6 March 1990, Baba Amte joined 10,000 protesters who blocked the national highway at Khalghat bridge over the Narmada for 28 hours. Here, with his wife, he resolved to settle among the tribal people in the Narmada Valley, where despite injuries from confrontations with police and repeated arrests he remains a tireless advocate for the poor and for environmental awareness.

For his work with lepers, with the disabled, with tribal people, and for the protection of the environment, Baba Amte has been the recipient of numerous awards both in India and abroad, including the Templeton Prize for Progress in Religion. In the speech he wrote for his son to deliver at the Templeton Award ceremony in London, he stated that his religion is his work and described his work as grounded in *sraddha* or faith and inspired by *karuna* or compassion.

Ananda Marga's Tantric Neo-Humanism

Ananda Marga is a contemporary Hindu Tantric sect with an international following of several million people. Their animal and plant-rights philosophy, called

Neo-Humanism, is based on a book of the same name written by P.R. Sarkar (1921–1990). He was the organization's founder and wrote spiritual philosophy under the name of Shrii Shrii Anandamurti. The ideology of NeoHumanism is derived from a monistic religious belief that everything is a manifestation of Supreme Consciousness and should be treated as sacred. Sarkar said that the sentiment human beings share toward one another should be extended to include all animate and inanimate entities. He claimed that adopting this point of view would be an aid toward self-realization and establish its practitioners in universalism.

Neo-Humanism emphasizes intensive intellectual analysis and rationality. It encourages people to channel their limited social sentiments into an inclusive ideal termed *Sama-samaja Tattva*, the principle of Social Equality. Simultaneously, Sarkar encouraged people to fight against the social exploitation and dogmas linked to environmental degradation. He decried the destruction of the ecological balance between the human, plant and animal worlds as a result of deforestation. One of NeoHumanism's principle tenets is that all entities have both "existential value" and "utility value." Sarkar pointed out that many people fail to understand this and only work to preserve those entities that have some immediate utility value for them. He considered this both immoral and foolish, not to mention a direct result of human ignorance. One of his controversial assertions, which he elaborated on at length in his book, was the demonization of hypocritical and manipulative exploiters who were engaged in socially and spiritually destructive activities. He literally referred to them as "demons in human form." Sarkar advised that such people be identified and reeducated, essentially along spiritual lines. But in other books of his, such as *Problems of the Day* and *PROUT in a Nutshell – Part VIII*, he stated that force might be necessary in order to control them. Because he approved the use of force in certain circumstances, some members of his organization interpreted that as a call to direct action.

Sarkar's humanistic and environmental concerns are fully integrated into his socioeconomic and political platform called the Progressive Utilization Theory, or PROUT. PROUT is concerned with a more equitable distribution of global wealth and the proper utilization of the physical, mental, and spiritual potential of every living being. Therefore, noted Liberation Theologian Leonardo Boff has supported Ananda Marga's

socio-economic ideas. But the organization has made many wary by calling for a political dictatorship of the self-realized or spiritually evolved.

Ananda Marga is not an apocalyptic sect; therefore its environmental concerns are not connected to a belief in our collective, impending doom. Its spirituality is based on a Hindu type of Tantrism. Despite this, Sarkar's protectiveness with regard to animal and plant life did not hinge on the idea that human beings might be reincarnated into animal or plant bodies. He was a supporter of reincarnation theory, but he was of the opinion that once an entity achieved a human birth, it was, from an evolutionary point of view, very unlikely that such a being would once again return to an animal or plant form. His central concerns were the issues of a spiritually monistic philosophy and the social justice such a philosophy demanded.

Based on Sarkar's writings, organizational members feel that time is of the essence in the fight to establish social justice. They believe that in many parts of the world today, exploited human beings are being crushed under the weight of capitalism and that it may very well be necessary to use force in order to check that trend. It is perhaps with a combined sense of that perceived injustice and a devotional concern for animal life that in the 1980s some of its members in northern England decided in favor of direct action. They planned and allegedly executed the release of animals involved in scientific experiments.

When the news of this direct action was written up in the newspapers, it sparked a debate within the organization about the policy of direct action compared to the slower process of reeducating the general public. Those in favor of the latter had some of Sarkar's writings on their side and they also had hard practical experience. During the 1970s a radical faction of PROUT called the Universal PROUTists Revolutionary Federation engaged in acts of international political terrorism that were contrary to the official policy of both Ananda Marga and PROUT. In the most infamous act a member was jailed for a 1978 bombing of a Hilton Hotel in Sydney, Australia that killed three people.

During this time, Sarkar was imprisoned by Indira Gandhi's government on charges that Ananda Margiis say were purely politically motivated. He was held for seven years and eventually exonerated by the Indian High Court. It seems the bombing was an agitation that aimed to secure his release from jail. The acts of terrorism had a negative impact on all branches of the organization. In the United States, Ananda Marga lost the support of federal financial funding in the form of CETA grants. "Community Education Technical Advocates" grants had been given to the workers of their permanent social service projects. Throughout the world, an organizational reputation for terrorism hampered both the propagation of their spiritual ideals as well as the establishment of their social service projects.

It is noteworthy that while the ideology of NeoHumanism originated on the Indian subcontinent those who elected to engage in direct action based on it were born in England. The vast majority of the organization's spiritual practitioners express their Neo-Humanistic environmentalism in quieter ways. On a daily basis they personally

perform *bhuta yajina*, service to the created universe. Ideally, this consists of services to plants and animals, but services to lesser-evolved, inanimate objects are also undertaken.

As part of an effort to introduce Neo-Humanism into society, Sarkar advocated that Ananda Margiis maintain a series of agrarian communities called Master Units. He placed a special emphasis on them during the last ten years of this life. By the early twenty-first century such communities had been established in India, Australia, Europe, South America, and the United States, although at that time, some entailed little more than land held in the organization's name. In many of these communities, the ideals of Neo-Humanism, such as rural self-empowerment and economic self-sufficiency, have been practically implemented. The premier example among them was established at Ananda Nagar in the Purulia District of West Bengal. It showcases integrated farming techniques, water conservation projects, soil erosion counter measures, a two-phased afforestation program, alternative energy ideas, and a variety of related projects, all spearheaded by Sarkar.

It seems to have been Sarkar's hope that the Master Units would serve as an example of alternative socioeconomic organization that would ultimately have political ramifications. In this regard he spoke about a type of bioregionalism tied to cultural and linguistic factors. He named those regions *Samaj*, which literally means "society." They would be decentralized socio-economic areas. Dividing the world into *Samaj*, along natural ecological, cultural, and linguistic lines, was a visionary system. Sarkar viewed such bioregional politics to be more beneficial than today's modern nation states.

Clearly the organization's socio-spiritual doctrines have fostered environmentally sustainable behavior. But their association with violence and occasional acts of terrorism continues in the minds of many people. The crux of the matter is their stated willingness to use force against society's "demons" in an effort to establish their concept of social justice. During his lifetime, Sarkar was not silent on the issue of terrorism. He stated that those who engaged in it had no understanding of his ideology. In the continuing debate over whether Hindu spiritual traditions promote or detract from ecological awareness and activism Ananda Marga represents affirmative evidence. The extent to which it will effectively promote its socio-economic and political objectives remains an open question.

Anarchism

The anarchist tradition has been sharply divided in its relationship to religion, spirituality and nature. On the one hand, the mainstream of Western anarchism has in general been atheist, anti-religious and anti-clerical, and has looked upon religion as a supernaturalist negation of the natural world. On the other hand, there is a long history of anarchistic thought and practice having strong spiritual or religious dimensions, and very often these have taken the form of nature spirituality. The following discussion will examine first the more familiar anti-religious perspective of modern Western anarchism, then various anarchist tendencies across history that have held a spiritual view of reality, and finally, some contemporary anarchist views that exhibit both standpoints.

Almost all the major European classical anarchist theorists opposed religion and defended a secularist, scientific and sometimes positivistic view of nature against what they saw as religious obscurantism and other-worldliness. Max Stirner (1806–1856), the major individualist anarchist theorist, dismissed religion as a belief in illusory “spooks” that undermined the individuality and selfdetermination of the individual. Pierre-Joseph Proudhon (1809–1865), the first important social anarchist theorist, stated that the concept of God was contradictory to rational thought and to human freedom, and that social progress is proportional to the degree to which the concept is eliminated. The anarchist anti-religious viewpoint is perhaps most widely associated with political theorist and revolutionary Mikhail Bakunin (1813–1876), who proclaimed, “I reverse the phrase of Voltaire, and say that, *if God really existed, it would be necessary to abolish him*” (Bakunin 1970: 79–80).

For Bakunin, religion denigrates human nature and the world, and is a means of oppressing humanity. In his view, it is a negation of nature, since it exalts a supernatural and transcendent reality and devalues the material and natural. He claims that there is an objective naturalistic basis for religion: it arises essentially out of the human being’s feeling of absolute dependence on an eternal and omnipotent nature and out of primitive fear of its awe-inspiring powers. He contends that it begins with the attribution of this power to fetishes and ends with its concentration in an all-powerful God, which he sees as the reversal and magnification of the human image itself. Religion is thus essentially a misunderstanding of nature. The system of social domination makes use of this confusion to keep people in a state of subjection and submissiveness through the alliance between the coercive power of the state and the ideological power of the Church.

The large anarchist movements of the nineteenth and early twentieth centuries in general shared the atheism and anti-clericalism of its theoretical founders. The

Bakuninists of the First International (International Working Men's Association, 1864–1876) fought to make the workers' movement officially anti-religious, and the large anarcho-syndicalist movements in southern Europe and Latin America defined themselves in part through their strong opposition to a generally reactionary and hierarchical Church and clergy. The Spanish Revolution (1936–1939), the most important event in the history of the anarchist movement, was marked by fierce opposition to the Church, to the extent of the desecration and burning of churches and harsh treatment of clergy. The Spanish anarchists largely shared Bakunin's view that religion was based on a denial of the natural world. Yet a kind of nature spirituality emerged even within their milieu. This tendency was expressed in a cult of the natural, the romanticizing of nature, and practices such as health-consciousness, nudism and vegetarianism. In this regard, the movement was influenced by the anarchist philosopher-geographer Elisée Reclus (1830–1905), who developed a non-theistic but holistic and spiritual view of nature, advocated animal rights, and wrote of the sublime and inspirational qualities of the natural world.

When one turns to the positive relationship between anarchism and spirituality, one finds a wealth of evidence in many cultures of the world. Some have found one of the earliest anarchist philosophies of nature and human nature in the ancient Chinese classic, the *Tao te Ching* of Lao Tzu (ca. fourth century B.C.E). Daoism is the philosophy of the tao, or way, a term that refers both to the source of all being, and to the path of self-realization of all beings when they are allowed to act freely and spontaneously according to their nature. Lao Tzu presents a vision of nature and human society as an organic unity-in-diversity in which the uniqueness and creative activity of each part of the whole are valued. The natural world is seen as a dynamic balance (symbolized through the complementary polarities of yin and yang) that produces order and harmony when not disrupted by human aggression and domination. Lao Tzu describes this natural harmony in poetic terms: "Heaven and Earth unite to drip sweet dew. Without the command of men, it drips evenly over all" (Lao Tzu 1963: 156). Coercive and authoritarian social institutions are shown to destroy natural balance and the generosity of nature and produce disaster not only for the surrounding natural world, but also within human society itself. The ideal society is depicted as a decentralized, egalitarian community in which all value the "Three Treasures" of compassion, simplicity, and humility. Lao Tzu was a harsh critic of the violent, hierarchical society of his own day, and laments the injustices and inequities that are created in human society by the pursuit of political and economic power. He declares that "[t]he Way of Heaven reduces whatever is excessive and supplements whatever is insufficient. The Way of Man is different. It reduces the insufficient to offer to the excessive" (Lao Tzu 1963: 174). For Lao Tzu, the pursuit of wealth, power and egoistic gratification must be rejected in favor of a way of life based on "non-action" or "actionless action" (*wu-wei*), by which is meant activity that is in accord with one's own Tao or way, but which respects the ways of all others.

Despite these apparently anarchistic or libertarian tendencies in Lao Tzu's thought, some have interpreted him as a defender of the traditional system of rule and even as an advocate of manipulation of the people for authoritarian purposes. For example, the eminent Chinese scholar D.C. Lau interprets the *Tao te Ching* as a rather eclectic collection of writings that has a primarily ethical rather than mystical or philosophical import, and which does not question the concept of political rule. In his view, passages concerning the sage or ruler apply to any follower of the Tao, but are also specific references to an enlightened and skillful "ruler," in a quite literal sense. Social ecologists Murray Bookchin and Janet Biehl have contended that ancient Daoism is merely a form of regressive mysticism. They attacked the idea that the *Tao te Ching* has any anarchistic implications and contend that all references to rulership should be interpreted in an entirely literal sense.

The second great ancient Taoist philosopher, Chuang Tzu, has sometimes been seen as even more radically anarchistic than Lao Tzu and equally ecological in outlook. Chuang Tzu warned against the impulse to eliminate chaos and impose order on the world, which in his view leads ultimately to great destruction. He took a perspectivist position on knowledge and truth, and emphasized, often through humorous or ironic anecdotes, the fact that each being has its own good and perceives reality from its own ultimately incomparable point of view. He rejected human-centered views of reality and the tendency to project human meanings and values onto the natural world. Though the specifically political implications of Chuang Tzu's thought are far from clear, his Daoism has been interpreted as one of the most consistently anarchistic critiques of the domination of humanity and nature and of the egocentric and anthropocentric mentality that underlies domination.

Some have also found a deeply anarchistic dimension in both ancient Buddhism and also in various schools in later Buddhist history. Original Buddhism as established by the founder Shakyamuni Buddha (ca. 563–463 B.C.E.) came out of a questioning of both the social order (the caste system) and the ideological basis (the authority of the Vedic scriptures) of ancient India. It also rejected the idea that any authority, whether a person or written document, could lead one to truth, and that it must instead be reached through direct personal experience. The central Buddhist idea of non-attachment can be given an anarchistic interpretation. Although historical Buddhism has been to varying degrees influenced by inegalitarian social institutions, its goal of non-attachment can be seen as an attack on the foundation of political, economic and patriarchal domination in the desire to aggrandize an illusory ego-self. According to such an interpretation, the ideal of the *sangha* or spiritual community is seen as an anarchistic concept of association based on compassion and recognition of true need, rather than on economic and political power and coercive force. Similarly, Buddhist mindfulness, an awakened awareness of present experience, is seen as implying a sensitivity to the realities of nature and human experience, as opposed to appropriating and objectifying forms of consciousness. The Buddhist tradition is vast, and has been developed in many directions, but it is not difficult to discover in the Buddhist concepts of

awakened mind, non-attachment, and compassion an implicit critique of material consumption and accumulation, coercive laws, and bureaucratic and technocratic forms of social organization.

Nagarjuna (ca. second century) is often considered the most important Buddhist philosopher since Shakyamuni Buddha. Indeed, he can plausibly be interpreted as the most theoretically anarchistic thinker in the history of philosophy. His radically destructive or deconstructive dialectic reveals the contradictions in any formulation of truth or attribution of substantiality to any being. The only “truth” for Nagarjuna consists not in ideas or propositions, all of which lead to contradiction, but rather in the practice of universal compassion and nonattachment. His rejection of the imposition of dualistic and objectifying categories on an internally related and “dependently arising” reality can be seen as an affirmation of the non-objectifiable wholeness and self-creativity of being and nature.

The anarchist tendencies in Buddhism were developed furthest and synthesized with certain aspects of Daoism in the Chinese Ch’an (meditation) School of Buddhism and in its Japanese version, Zen. Zen questions all authorities, including political, intellectual and spiritual ones, and insists on the absolute priority of direct personal experience. Lin-Chi (Rinzai) (d. 866) the founder of Ch’an, is known for his shocking admonition, “Whether you’re facing inward or facing outward, whatever you meet up with, just kill it! If you meet a Buddha, kill the Buddha. If you meet a patriarch, kill the patriarch!” This iconoclastic maxim is a classic Zen statement of the radically anarchistic view that none of our concepts of substantial realities (including even our most exalted concepts) can capture the nature of an ever-changing reality that constantly surpasses all categories and preconceptions. Inherent in this outlook is a deep respect for the integrity of nature and a desire to allow nature to express itself without human domination. Zen painting and poetry (much in the tradition of Daoist art) are noted for their focus on nature and on the numinous power of things themselves.

Anarchistic forms of spirituality have not been limited to Asian traditions, but have also emerged periodically through the history of Western religion. The Joachimite tendency in medieval Christianity is perhaps the most striking example. Joachim of Fiore spoke of the “Third Age” of world history, the Age of the Holy Spirit, which would supersede the rule of law and authority and usher in the reign of universal freedom and love. The Movement of the Free Spirit, which emerged out of the Joachimite and millenarian traditions, is often considered the most anarchistic tendency within medieval and early modern Christianity. The movement originated in the thirteenth century and spread widely across central and Western Europe during the fourteenth and fifteenth centuries. Its most radical tendencies rejected the established Church, the state, law, private property and marriage. Its social outlook was at times a rather curious combination of a radically anarchistic quest for freedom and an elitism that justified an instrumental view of non-members and of things in nature, and a ruthless destructiveness toward all who stood in its way. Nevertheless, it often strongly affirmed nature and the natural. The Adamite tendency in particular saw believers as existing

in a “natural,” prefallen condition, and others spoke of exercising “natural freedom” and following “natural desires.” They practiced nudism and free love, held property in common, and waged relentless war against their surrounding enemies. The anarchistic interpretation of the Free Spirit is best known from Norman Cohn’s classic work, *The Pursuit of the Millennium*. The Free Spirit also plays an important role in anarchist theorist Fredy Perlman’s critique of civilization, *Against History*, and Situationist Raoul Vaneigem devoted an entire book to the movement.

A more recent expression of an anarchistic spirituality within the Christian tradition is the radical religious vision of Romantic poet William Blake (1757–1827). Blake stressed the sacredness of nature, its organic qualities, and the need for humane treatment of other beings. He was one of the most important early rebels against the mechanistic, objectivist, reductionist worldview that came out of Newtonian science. His rejection of the dominant mechanistic worldview is encapsulated in his well-known plea, “may God us keep / From Single vision and Newton’s sleep!” (Blake 1988: 722). His attack on the patriarchal authoritarian God and a spiritually degraded world, and his creation of a new radically utopian mythology can be interpreted as an anarchistic critique of the state, early capitalism, and any ideology or social imaginary based on hierarchy, domination, and the repression of desire, the body, and nature.

Although nineteenth and early twentieth-century European anarchism was generally anti-religious, even there one finds a more overt religious tendency, primarily under the influence of the famous novelist and pacifist anarchist Leo Tolstoy (1828–1910). Tolstoy’s conception of God was not the naively anthropomorphic image that other anarchists attacked, but referred rather to the whole of reality and truth. Furthermore, he believed that the true essence of Christianity is found not in a transcendent Supreme Being or an afterlife with rewards and punishments, but rather in Jesus’ teaching of universal love. For Tolstoy, an acceptance of this teaching satisfies the human longing for meaning in purpose in life, and has far-reaching implications for one’s relationship to both society and nature. First, it results in a dedication to complete nonviolence in society, including an absolute anarchistic rejection of participation in the state, which Tolstoy saw as the most monstrous form of organized violence and coercion. Furthermore, it requires a nonviolent stance toward the whole of nature, a refusal to inflict suffering on sentient beings, and a practice of ethical vegetarianism.

Another important nineteenth-century literary figure in whose work anarchist themes intersect with a spirituality of nature is Henry David Thoreau (1817–1862). In his essay “Civil Disobedience,” Thoreau proclaimed the priority of individual conscience over political authority, asserting his view that “that government is best which governs least” and consequently “that government is best which governs not at all.” He refused to pay his taxes to the state on the anarchist secessionist principle that he could not recognize as his own government one that was also the slave’s government. Although Thoreau’s philosophical and religious perspective is usually associated with American “Transcendentalism,” it can also be seen as an anarchistic spirituality with affinities to aspects of Daoist, Buddhist and indigenous traditions. Thoreau is

best known for his eloquent expression in *Walden* of such themes as the love of and communion with nature, the affirmation of life, compassion for all living beings, and the ills of a materialistic society that is alienated from the natural world and enslaved by its own possessions. His spirituality is perhaps best expressed in the essay on “Walking,” which contains his famous statement that “in Wildness is the preservation of the world.” Thoreau links wildness, freedom, sacredness, and “the gospel according to this moment,” an idea much in the spirit of Buddhist mindfulness. His concern for and celebration of the particularities of place link him to later bioregional thought, and contain an implicit critique of political and economic conceptions of reality.

The renowned anarchist geographer Peter Kropotkin has often been looked to as the major source of ecological ideas among the classical anarchist theorists. His concepts of the importance of mutual aid, spontaneity and diversity in both the natural world and in human society have been important in introducing ecological concepts into social thought. However, Kropotkin was in many ways carrying on the work of his predecessor, the nineteenth-century French geographer and revolutionary Elisée Reclus, who had already developed a profoundly ecological philosophy and social theory. Reclus is one of the most important figures in the development of an anarchistic ecological philosophy and spirituality.

Reclus came out of a tradition of radical Protestant religious dissent, his father having been a minister of a so-called “free church” that broke with the Reformed Church. Though he rejected theism, his anarchism can in some ways be seen as a continuation of his religious tradition. Central to his philosophy was a belief in universal love, which in his view must be extended to all human beings, to other sentient beings, and to nature as a whole. His deep respect for the natural world sometimes reaches a level of awe that verges on a kind of nature mysticism. For Reclus, social organization must be based on this love and solidarity, expressed through a voluntary commitment to the good of the community and the Earth itself. In such a system, each individual would be guided to the greatest degree possible by a free conscience rather than by coercion or centralized authority.

Reclus’ outlook toward nature is at once scientific, moral, aesthetic, and spiritual. In his monumental 16,000-page *New Universal Geography*, and his magnum opus of social theory, *Man and the Earth*, he offers a holistic, evolutionary vision of humanity and nature. Like later ecological thinkers, Reclus finds a harmony and balance in nature, in addition to a tendency toward discord and imbalance. His investigation of the intimate relationship between humanity and the Earth’s regional and local particularities anticipates later bioregional thought. He emphasizes the moral and spiritual aspects of humanity’s relationship to nature, condemns the growing devastation produced by industry and economic exploitation, and argues that whenever humanity degrades the natural world, it degrades itself. A vehement advocate of the humane treatment of animals and of ethical vegetarianism, Reclus wrote several widely reprinted pamphlets on these topics.

An important though relatively neglected figure in early twentieth-century anarchist spirituality is the German political theorist and non-violent revolutionary Gustav Landauer (1870–1919). Landauer is best known as a martyr killed for his leadership in the Munich Council Republic of 1919 and as the mentor of the Jewish libertarian and communitarian religious philosopher Martin Buber (1878–1965). Landauer’s philosophy is rooted in German Romanticist thought and is often described as having mystical and pantheistic tendencies. His major concepts are Spirit (*Geist*), People (*Volk*), and Nation (*Nation*), and his central focus is on the place of the individual in the larger human community, in nature, and in a greater spiritual reality. Landauer associates Spirit with the search for wholeness and universality, and interprets it as an immanent, living reality, the underlying unity of all beings that encompasses both humanity and nature. For Landauer, the great conflict in history is between Spirit and the state. In his famous formulation, the state is above all a relationship between human beings and it can be replaced by creating new relationships based on cooperation rather than domination. Socialism, which is what he called the free, cooperative society, is not a utopian ideal in the future, but rather something that is already present in all cooperative, loving human relationships and which can expand to encompass the whole of society as more non-coercive, non-exploitative relationships are established. Landauer believed that the cooperative society would be achieved when people left the increasingly dominant corrupt and alienated urban society and returned to the land. The new society was to be based on village communities rooted in their natural regions, in which fair exchange would replace economic exploitation, and in which agriculture and industry would be integrated.

Undoubtedly, one of the most important influences on modern anarchist spirituality throughout the world is Mohandas Gandhi (1869–1948), who is widely known for his principles of nonviolence, cooperation, decentralization, and local self-sufficiency. Gandhi summarized his religious outlook as the belief that God is Truth, or more accurately, that Truth is God, and that the way to this Truth is through love. He also states that God is “the sum-total of all life” (Gandhi 1963: 316). At the roots of Gandhian spirituality is the concept of *ahimsa*, which is often translated as “nonviolence” (paralleling the original Sanskrit), but is actually for Gandhi a more positive conception of replacing force and coercion with love and cooperation. Similarly, he is sometimes called an advocate of “civil disobedience,” but he defined his approach, *satyagraha*, as a more positive conception of “nonviolent resistance” to evil, including the injustices of the state.

Although Gandhi did not absolutely reject all participation in the existing state, he rejected the state as a legitimate form of social organization, advocated its eventual elimination, and strongly opposed its increasing power. He warned against looking to the state to reduce exploitation, arguing that its concentrated power and vast coercive force necessarily does great harm and destroys individuality. In place of the centralized state, he proposed village autonomy or self-government, community selfreliance, and local production based on human-scale technologies, ideas that have been enormously

influential on twentieth-century eco-anarchism. Gandhi was also a critic of Western medicine, which he saw as dependent on concentrated wealth and sophisticated technologies, and advocated instead “nature cure” in which the cheapest, simplest and most accessible treatments are used.

For Gandhi, the principle of *ahimsa* was to be extended throughout the natural world. Humans should make an effort to avoid inflicting physical or mental injury to any living being to the greatest possible degree. Accordingly, Gandhi advocated ethical vegetarianism and had a deeply held belief that the Indian tradition of cow protection was of great moral and spiritual value. One of his most oftenquoted statements is that the greatness and moral progress of a nation can be judged by its treatment of animals. Although his concern was often expressed in terms of the welfare of individual beings, he sometimes expressed more strongly ecological concepts, as when he warned of the dangers of human abuse of nature using the image of nature’s ledger book in which the debits and credits must always be equal.

After Gandhi’s death, Sarvodaya, a movement based on his spiritual, ethical and political principles emerged. Vinoba Bhave (1895–1982), the leading figure in the movement for many years, taught absolute nonviolence, social organization based on universal love, decision making by consensus, the replacement of coercion by the recognition of moral authority, and the minimization and eventual abolition of state power. Vinoba’s social philosophy was fundamentally anarchist and communitarian. In pursuit of the movement’s goals he pursued a policy of asking landowners to donate land to the poor (Bhoodan, or “gift of land”) and of establishing village cooperative agriculture (Gramdan or “village gift”). Over a decade, Vinoba walked 25,000 miles across India and accepted eight million acres of Bhoodan land. The history of the Sarvodaya movement is recounted in Geoffrey Ostergaard and Melville Currell’s study, *The Gentle Anarchists*.

Among contemporary thinkers, the celebrated poet and essayist Gary Snyder has probably had the greatest influence in linking anarchism, spirituality and nature. He has also been a major influence on the contemporary ecology movement in showing the ecological implications of Buddhist, Daoist and indigenous traditions. Snyder has connected the concepts of “the wild,” “wild nature” and “wilderness” with the Tao of ancient Chinese philosophy and the dharma of Buddhism. For Snyder, the concept of “the wild” implies a freedom and spontaneity that are found not only in undomesticated nature, but also in the imagination of the poet and in the mind of the spiritually attuned person. He expresses the anarchic nature of the Zen mind in his statement: “the power of no-power; this is in the practice of Zen” (Snyder 1980: 4).

For Snyder, such concepts have farreaching political implications. By the early 1970s he had already outlined a bioregional anarchist position that would replace the state and its artificial political boundaries with a regionalism based on lived experience and a knowledge of the particularities of place. Snyder links the spirituality of place with “reinhabitation,” the development of an intimate acquaintance with one’s locality and region, and the achievement of a larger sense of community that incorporates other

life forms. Snyder finds the roots of such a social vision in the Neolithic community, with its emphasis on productive work, the sharing of goods, and the self-determination of local village communities. From the standpoint of such decentralized, egalitarian communities, the state, social hierarchy, and centralized power are not only illegitimate and oppressive, but also a source of disorder and destruction in both society and the natural world. The wisdom of traditional societies has been a widespread theme in contemporary anarchist thought. This is exemplified by a significant “neo-primitivist” current in ecological anarchism that has identified very strongly with many of the values and institutions of tribal societies. Its proponents argue that for 99 percent of human history human beings lived in stateless societies in which nature spirituality was central to their culture. The nonhierarchical, cooperative, symbiotic and ecological spiritualities of these societies have been taken as an inspiration for a future post-civilized anarchist society.

A strong influence on this current is anarchist theorist Fredy Perlman (1934–1985), who in his influential work *Against His-story, Against Leviathan* depicts (in a kind of radicalized version of the “Myth of the Machine” of social critic Lewis Mumford [1895–1990]) the millennia-long history of the assault of the technological megamachine on humanity and the Earth. Perlman describes early tribal spirituality as a celebration of human existence and nature, and depicts the rise of the ancient despotism that destroyed these societies and replaced their spirituality with a repressive, patriarchal and authoritarian monotheism. He interprets the emergence of such spiritual movements as ancient Daoism, Buddhism and Zoroastrianism as a rebellion against social hierarchy and the domination of nature, and describes the processes through which these spiritualities of freedom were transformed in religions of domination. He also outlines the history of anarchistic spiritual movements, including such striking examples as the Taoist Yellow Turbans, a revolutionary, egalitarian movement of the second century.

Similar themes are developed by David Watson, a leading contemporary critic of the technological megamachine. Watson contends in *Against the Megamachine* that in modern societies an aura of sacredness is concentrated in the ego, in the system of technology, and in economic and political power, whereas primal societies have seen the sacred as pervading the self, the community and the world of nature. Primal spirituality was, he argues, an integral part of a system of egalitarian, libertarian and ecological social values. Furthermore, the participating consciousness of primal peoples conceives of humans as inseparable from larger natural and transhuman realities. Thus, primal peoples have had an anarchistic, nonhierarchical view of both society and nature that constitutes a powerful critique of modern industrial society and offers inspiration for future non-dominating ecological communities.

Ideas similar to those of Perlman and Watson inspire a rather large, vigorous and growing anarcho-primitivist or anti-civilization movement. The best-known theoretical spokesperson for this movement is John Zerzan, who presents a withering critique of civilization, industrialism, technology, the state, and even language and community. Anarcho-primitivist ideas often appear in such publications as *Green Anarchy, Live*

Free or Die, Anarchy: A Journal of Desire Armed and *The Fifth Estate*. Anarchoprimitivism plays an important role in the Earth Liberation Front, which practices sabotage in defense of nature, and in the much larger Earth First!, which is the most important direct action environmental organization. It is also a significant undercurrent in the anti-globalization movement.

Anarcho-primitivists see an inextricable relationship between civilization and the domination of humanity and nature. One of their central themes is the inevitability of the collapse of industrial society, an event that is often looked forward to with anticipation. Primitivists value all that remains free from the domination of civilization, including remaining wilderness areas and autonomous, spontaneous human activity. They look to tribal traditions and hunter-gatherer economies for examples of an ecological sensibility, a balanced relationship to nature, and an ethos of sharing and generosity. However, they do not in general propose a simple reversion to such previous social formations, which are sometimes criticized for alienated social practices. Many primitivists find inspiration in various nature-affirming spiritual traditions as an alternative to the narrow technical rationality of civilization. These include the spirituality of tribal people, various forms of nature mysticism, a general reverence for life and nature, pantheism, and neo-paganism.

Indeed, one finds a continuous and strong anarchist current in neo-paganism in general in both Britain and the United States in recent decades. In Britain there are important anarchist and neo-pagan tendencies within the large marginal subculture that centers around the antiroads movement and defends sites that are of natural, cultural and spiritual significance. Both anti-roads activists and neo-pagans often form decentralized, non-hierarchical organizations practicing such anarchist principles as direct action and consensus decision making. Starhawk, one of the best-known neo-pagan theorists and writers, and an important figure in ecofeminism, has emphasized the connection between the nonviolent, egalitarian, cooperative, anti-patriarchal, anti-hierarchical, and nature-affirming values of anarchism and the pagan worldview and sensibility. The pioneering ecofeminist writer Susan Griffin has inspired thinking about these interconnections since her wide-ranging landmark work *Woman and Nature*, published in 1978. Even earlier, the well-known short-story writer and poet Grace Paley had incorporated feminist, anarchist and ecological themes in her works, which also expresses a deep but subtle spirituality of everyday life.

Hakim Bey, one of the most widely read contemporary anarchist writers, has developed an “ontological anarchism” that finds inspiration in esoteric spiritual traditions of many cultures, including Islamic mysticism, sorcery, shamanism, alchemy, and primordial myths of chaos. Bey’s anarchic sensibility and spirituality encompass everything related to joy, eros, creativity, play, and “the marvelous.” His concept of the Temporary Autonomous Zone (TAZ) as a sphere in which such realities can be experienced is one of the most influential ideas in contemporary anarchism and has stimulated interest in heretical, dissident and exotic anarchistic spiritualities.

There has also been considerable theoretical discussion of anarchism, nature and spirituality in the context of debates within social ecology. Such well-known exponents of social ecology as Murray Bookchin and Janet Biehl have attacked spiritual ecologies as forms of irrational mysticism that often produce social passivity and sometimes are linked to reactionary or fascist politics. On the other hand, proponents of the value of spiritual ecologies (such as David Watson, John Clark and Peter Marshall) have argued for the importance to an anarchist social ecology of spiritual values that are ecological, holistic, communitarian and socially emancipatory. It has been argued that some social ecologists have uncritically adopted a modernist, Promethean, and naively rationalistic view of the self and its relationship to the world, and that spiritual ecologies derived from Asian philosophies and indigenous worldviews, among other sources, can contribute to a more critical, dialectical, and implicitly anarchistic view of selfhood and the place of humanity in nature. This brief survey is far from comprehensive, and a fuller account would encompass such topics as Quakerism and other forms of radical Protestantism, the Catholic Worker movement and other tendencies within the Catholic Left, the spirituality of anarchist intentional communities, and the many literary and artistic figures (including such notable examples as poet Allen Ginsberg and novelist Ursula LeGuin) who have had important insights relating to anarchism, spirituality and nature. However, from the examples discussed, it should be clear that anarchist thought and practice have encompassed a wide diversity of approaches to religion, spirituality, and nature. This multiplicity and divergence continues today. Many contemporary anarchists (especially in Europe and in organizations in the anarcho-syndicalist and anarchocommunist traditions) carry on the atheist, anti-religious, anti-clerical outlook of the classical anarchist movement. Others, including many of the young people who have been drawn to contemporary anarchism through direct action movements, have neither great interest in nor particular antipathy to religion and spirituality. However, an increasing number of political and cultural anarchists are developing an interest in spirituality, and many others have been drawn to anarchist political movements and social tendencies through an initial interest in anarchistic spirituality. Consequently, spirituality, and more particularly the nature-affirming spiritualities of Daoism, Buddhism, neo-Paganism, indigenous traditions, and various radical undercurrents within Western religion, play a significant role in anarchism today and can be expected to do so in the future.

Anarcho-Primitivism and the Bible

“Anarcho-primitivism” (hereafter AP) is an important current of contemporary deep ecological thought which responds to contemporary environmental and social crises with a radical revisionism of the history of civilization. Though there have been few vigorous engagements between Christian theologians and these radical philosophical currents (exceptions include Jacques Ellul and Vernard Eller), this entry reflects upon possible points of contact between AP ideas and certain trajectories found in the Bible.

The trenchant AP critique of civilization finds surprising resonance in the Hebrew-Christian scriptures – if, that is, they are read as documents of Israelite resistance to Ancient Near Eastern empires from Egypt to Rome, rather than as a legitimating ideology for Christendom. The following eight “talking points” (appearing below in italics), representing salient aspects of the AP perspective as articulated by, for example, John Zerzan, are here correlated with minor and major biblical themes. i) *Civilization represents for AP a pathological regression, rather than an ingenuous progression, of human consciousness.* Although mainstream theology has largely bought into the dominant evolutionary narrative of “Progress,” the Bible’s perspective on historical origins is quite contrary – which is perhaps why it has been increasingly marginalized since the Enlightenment. The “primeval history” of Gen. 1–11, for example, portrays civilization as the “fruit” not of human genius, but of alienation from the symbiotic lifeways of the “Garden.” Its narrative of the “Fall” is one of hard labor, murder, violence and predatory urbanism, culminating in the symbol of Babel’s tower as the zenith of human rebellion against God and nature. It can be read not only as a polemic against the Ancient Near Eastern empires that surrounded Israel, but also as an archetypal diagnosis of civilization-as-pathology. Throughout the rest of the biblical literature this strong strand of skepticism prevails, summarized perhaps best by

Jesus’ trope that “Solomon in all his glory” (an allusion to the Davidic Temple-State, the zenith of Israel’s civilizational power) was less intrinsically valuable than a single wildflower (Lk. 12:27). ii) *AP’s perspective on “pre-history” argues that the late Neolithic domestication of plants and animals led to the domestication of human beings.* Agriculture inexorably gave rise to concentrated populations and increasingly centralized and hierarchical societies in built urban environments. These in turn developed into oppressive city-states, an aggressively colonizing civilization that exerted a powerful centripetal force upon the hinterlands. Thus agriculture is portrayed in Genesis not as a gift of the gods – as in other Ancient Near Eastern myths – but as a curse, the result of human rejection of the old symbiotic lifeways of the “Garden” (Gen. 3:17–19).

While pastoralism is more sympathetically depicted in the biblical literature, we should keep in mind that during the period herders were socially marginalized fringe-dwellers.

From the Babel story on, the walled city and its architecture of domination is denounced regularly, as Ellul argues, including the Egyptian “store cities” built by Hebrew forced labor (Ex. 1:11–14) and the Canaanite fortress of Jericho (Josh. 6:26). And while much literature of the post-Davidic era romanticizes Jerusalem as the “city of God,” the prophetic voice continued to call those who “weigh tribute and count towers” agents of terror – including Israelite rulers (Isa. 33:18; Ezek. 26:3–9; Zeph. 1:16; 3:6). This urban antipathy is best captured by the Psalmist’s lament: “Truly I would flee to the wilderness . . . for I see violence and strife in the city . . . oppression and fraud on its streets” (Ps. 55:7, 9, 11). In the New Testament, John’s vision of the New Jerusalem portends a radical “greening” of the city: gates always open and a river running down Main Street on whose banks grow Eden’s Trees of Life (Rev. 21–22). iii) *AP endorses revisionist anthropological studies that offer a more sympathetic assessment of hunter-gatherer social and economic organization, emphasizing what Marshall Sahlins called the “original affluence” of stoneage cultures.* Up until the last quarter-century, modern anthropologists tended to share Thomas Hobbes’ bias that the lives of “uncivilized” humans were “solitary, poor, nasty, brutish, and short.” Since Sahlins, the consensus (as reflected in, for example, John Gowdy’s collection) has shifted almost 180 degrees; hunter-gatherer cultures tend now to be portrayed as healthier, more leisurely, freer, more materially satisfied, less anxious and infinitely more ecologically sustainable than modern industrial ones. In particular, indigenous practices of subsistence and gift exchange are now being appreciated (particularly by Hyde) as a viable, if radically different, economic paradigm.

This encourages a reassessment of the economic cosmology of the Bible. For example, the story of the manna in the wilderness instructs Israel (newly liberated from slavery in Egypt) about material sustenance as a divine gift (Ex. 16:4). The narrative stresses principles of “just gathering”: only take what is needed, don’t accumulate, and make sure each member of the community has enough

– but not too much (16:16–25)! The Bible emphasizes providential natural abundance, community selflimitation and just sharing. Sabbath year programs of debt-release and wealth redistribution – most notably in the Levitical Jubilee (Lev. 25) – were a hedge against the intense stratification that characterized the slaveand tribute-based economies of ancient Egypt, Assyria and Babylon. The Gift cosmology is reiterated by the prophets: “Come, you who have no money, come buy and eat; come buy wine and milk without money and without cost” (Isa. 55:1). It also makes better sense of New Testament texts that have been anathema to capitalist religion, such as Jesus’ teachings about giving up possessions (Lk. 12:13– 34), the economic sharing in the Acts community (Acts 2:42ff.), and even Paul’s practice of inter-church mutual aid (2 Cor. 8). These suggest that biblical writers may have been trying to rehabilitate the economic ethos of “precivilized” indigenous cultures as a better way. iv) *For AP the ecological crisis necessitates a radical critique of advanced toolmaking and all forms*

of industrial technology, in the belief that when we use tools they use us back in a way that dehumanizes us and destroys our more natural competences. The Bible, as an ancient text, has relatively little to say about “technology” *per se*, but two texts from the earliest strata of Torah are germane. One is the prohibition of domestic fires on the Sabbath (Ex. 35:3), thus circumscribing what clearly was the most ancient human tool. The other reflects a primal suspicion of tools as instruments of domination in relation to nature: “If you make an altar of stones for Me, do not construct it from hewn stone; if you use a tool on it you will defile it” (Ex. 20:25). Scripture has plenty to say about the danger of manufactured objects, particularly in the well-known prohibitions on image-making. But this taboo is more anti-fetishistic than anti-iconic, recognizing that “made objects” inevitably become mystified and sacralized, thus taking on more value than their makers (a classic statement is found in Isa. 43:9–20). This insight was later resurrected in Marx’s theory of commodity fetishism in capitalism, as Guy Debord has shown. Moreover, James Kennedy has also argued that Israel’s rejection of idols was a socioeconomic strategy of resistance to the public symbolism of tributary imperialism in Canaan (Ex. 32; Judg. 6; Deut. 4:19f.).

v) *Work for wages and hierarchical divisions of labor, the sine qua non of toxic civilization, are inherently alienating.* We have seen that agricultural labor is portrayed as antithetical to the divine will in the Fall story (Gen. 3:19). More generally, the Sabbath codes, which grounded in God’s own Self-limiting character (Gen. 2:2f.), sought to constrain the compulsive-addictive potential of all work by circumscribing it. Keeping the Sabbath is the first (Ex. 16:23) and last (Ex. 35:1–3) commandment in the Covenant Code, regularly interrupting the rhythm of the Israel agricultural year by ritual “work stoppages” (Lev. 23). The Law and prophets relentlessly criticize how the rich exploit the labor of the poor (e.g., Lev. 19:13; Am. 5:11). Jesus spins stories that undermine the sanctity of wage-labor (Matt. 20:1–16), and that pit rebellious peasants against wealthy landowners (Mk. 12:1–10). He advocates the right of the hungry to steal food (Mk. 2:23ff.) and invokes the cosmology of divine gift: “Consider the ravens: They do not sow or reap . . . yet God feeds them” (Lk. 12:24). Despite the captivity of modern Christian theology to the Protestant work ethic, the Bible’s Sabbath ethos (including Paul’s theology of grace) privileges being over doing, celebration over work, and gift over possession – again resonating with indigenous wisdom concerning personal, social and physical ecology.

vi) *For some AP theorists, symbolic representation (including language itself) lies at the heart of the “descent” into civilization, becoming a substitute for direct sensory experience of nature and engendering social differentiation.* While a radical critique of language finds no echo in the Bible (indeed, John speculates that “in the beginning was the Word,” Jn. 1:1), the suspicion of “representation” does. Israel’s covenant is sealed not only in the words of Torah, but also by the “witness” of a large stone under an oak tree (Josh. 24:27). It is idolatry (i.e., overrepresentationalism) that is the problem for biblical writers, not nature. Indeed the prophets recognize that even Israel’s own cultic apparatus can become a vehicle of oppression (Amos 5:21–24; Jer. 7:9–14, a text that inspired Jesus’ direct action in the Temple, Mk. 11:15:ff.).

Thus the story of early Israel is full of wild and often magical landscapes that directly reveal God (Ps. 104 and Job 38–41). These include remote deserts (Ex. 17:1) and spring-flooded streams (Josh. 3); lowlands springs (Gen. 26:19–22) and highlands caves (Gen. 19:30; Judg. 6:2;

1 Kgs. 19:9); singing forests and hills (Isa. 44:23; 55:12). YHWH appears under oak trees (Gen. 12:6f.; 18:1; Judg. 6:11; 1 Kgs. 19:4) and the divine voice is encountered in a burning bush (Ex. 3) and on a clouded mountain peak (Ex. 19; see Mk. 9:7). Heroes of the community are “born” in rivers (Ex. 2:3; see Mk. 1:9–11), buried under trees (Gen. 35:8; 1 Sam. 31:13) and walk on the sea (Mk. 4:35–41). Jacob’s ecstatic vision of the *axis mundi* comes in desert wildlands, his head on a dreaming stone: “How awesome is this place! This is none other than the House of God, the gate of heaven!” (Gen. 28:16–17). YHWH is imagined – but never imaged – as a roaring lion (Hos. 11:10), a nursing eagle (Deut. 32:11) and an angry mother bear (Hos. 13:8). As in all tribal societies, there are tales of dangerous adventures with wild animals, from Jonah’s whale to Daniel’s lions. And Israel’s ritual life is in tune with the seasons (Lev. 23) and the cycles of the moon (Ps. 81:3). Jesus prefers the solitude of the wilderness (Mk. 1:35), and invites his disciples to learn from seeds (Mk. 4), trees (13:28), birds (Lk. 12:24) and rain (Mt. 5:45). There are also some eschatological hints that primal, unmediated communion between God, nature and humans will one day be restored (Jer. 24:7; 31:33; Ezek. 36:26), which are intensified in John’s metaphors of existential unity (Jn. 6:35); in Paul’s notion of being “in Christ” (Rom. 8:35–39); and in the Temple-less New Jerusalem in which God dwells directly (Rev. 21:22). vii) *AP advocates a variety of individual and group strategies of “going feral,” both skirmishing with the dominant system and “re-inhabiting” natural spaces for their protection and our “detoxification.”* Two distinctive features of biblical theology are worth noting here. One is the way in which YHWH inhabits the undomesticated spaces outside of civilization, and is encountered only by humans who journey into the wilderness. This becomes the master metaphor of liberation in the Exodus story, and continues in the life of the prophets who go “feral” such as Elijah (1 Kgs. 19:3ff.), John the Baptist (Lk. 3) and Jesus, who begins his ministry with a wilderness “vision-quest” (Matt. 4:1–11). The writer of Hebrews invites believers to solidarity with Christ “outside the gates” of civilization (Heb. 13:12f.), and calls to mind the heroes of the faith who resisted empire by going feral, “wandering in deserts and mountains and living in caves” (Heb. 11:38). The Church is portrayed fleeing the imperial Beast into the desert in John’s Apocalypse (Rev. 12:6).

The other feature is the way nature is portrayed in “opposition” to imperial civilization. Egypt buckles under a siege of natural disasters (the “plagues” of Ex. 7–10). Prophetic oracles denounce the logging practices of Assyria (1 Kgs. 19:20ff.) and the river-polluting cattle ranches of Pharaoh (Ezek. 32:13f.), and long for the day when wild animals will re-inhabit the spaces that citystates have colonized (Isa. 13:19–22; 34:8–15; Ezek. 31): “I will give you as food to the wild birds and animals” (Ezek. 39:4). There is a fascinating story of people returning (if incompetently) to older food-gathering ways during famine (2 Kgs. 4:38–44), a parable of divine abundance vs. imperial scarcity

that Jesus re-enacts in his wilderness feedings (Mk. 6:35ff.). And the apostle Paul – who did his own time in the desert (Gal. 3:17) – calls for radical non-conformity to the dominant cultural codes of Roman civilization (Rom 12:1–2). viii) *The goal of AP is not to “go back to the Neolithic,” which is recognized to be impossible, but rather to (re)discover “future primitivity.”* The Bible agrees that since the Fall the natural world has been increasingly wrenched out of balance by the violence and greed of civilization. It proposes Torah as a code of alternative communal practices having to do with self-limitation. In it we find several interesting attempts to constrain ecocidal tendencies, such as the taboo against eating both mother and young game birds (Deut. 22:6) and the remarkable prohibition on destroying nature during war: “Are trees in the field human beings that they should come under siege from you?” (Deut. 20:19–20). The gospels seem to call for the re-opening of older ways (Mk. 1:2), and Jesus is called the archetypal “Human One” (Mk. 2:28) and the “eschatological Adam” (1 Cor. 15:45). Stories of his healing power suggest an ancient capacity renewed, not just for “shamans” but for all disciples (Mk. 6:12; Acts 3:1ff.). His oppositional stance led the representatives of civilization in Roman Palestine to execute Jesus as a heretic/dissident. The NT thus speaks candidly of the “cost of discipleship” and of faith as “being sure of what we hope for and certain of what we do not see; this is what the ancients were commended for” (Heb. 11:1). The same divine power that created the world is believed able to renew it, and biblical eschatology envisions the restoration of “original peacableness” (Isa. 11:6–9), insisting that a “new heaven and Earth” will ultimately eclipse the dreary reality of empire. This alternative consciousness is not escapist fantasy; it empowers practices of both renewal and resistance (2 Cor. 10:4; Eph. 6:10ff.). As Paul puts it, nature is groaning under its state of captivity, awaiting humans who will cooperate with the divine plan for the liberation of every living thing (Rom. 8:20f.).

Admittedly, few of the interpretations sketched above have been advanced by the theologies of Christendom, nor by contemporary mainstream biblical scholarship – quite the contrary. And there are, to be sure, certain strands of biblical literature that celebrate Israel-as-civilization, which have been used to promote everything AP deplores. But while the Judeo-Christian scriptures may not agree with all AP perspectives, what is surprising is to discover the degree of resonance. As is always the case, new questions open up new hermeneutical vistas. The above suggests that a conversation between biblical theology and radical green anarchism is not only possible, but also key to our exploration of the intersection between religion and nature.

Andean Traditions

W'aka – The Pre-Colombian Andean Concept of the Sacred

In 1609 the Inca Garcilaso de la Vega, a converted Christian, provided the first Native Andean definition of the term *w'aka*, the pre-Colombian Quechua word used to describe the sacred. According to Inca Garcilaso, *w'aka* not only meant a “sacred thing” such as “idols, rocks, great stones or trees which the enemy (i.e., Satan) entered to make the people believe he was a god” but in addition, Andeans

. . . also give the name *huaca* to things they have offered to the Sun, such as figures of men, birds, and animals . . . *Huaca* is applied to any temple, large or small, to the sepulchers set up in the fields, and to the corners in their houses where the Devil spoke to their priests . . . The same name is given to all those things which for their beauty or excellence stand above other things of the same kind, such as a rose, an apple, or a pippin, or any other fruit that is better or more beautiful than the rest . . . On the other hand they give the name *huaca* to ugly and monstrous things . . . the great serpents of the Antis [Andes] . . . [any] eerie thing that is out of the usual course of nature, as a woman who gives birth to twins . . . double-yolked eggs are *huaca* . . . They use the word *huaca* of the great range of the Sierra Nevada . . . The same name is given to very high hills that stand above the rest as high towers stand above ordinary houses, and to steep mountain slopes . . . (Vega 1966: 76–7).

In other words, *w'aka* could be used to describe primordial beings, objects of worship, sacred spaces, temples, ritual gifts, sacrifices and extraordinary phenomenon of nature. The fluid character of this category reflects the

fluidity of religious forms in the Andes where the sacred emerged directly out of daily encounters with nature – in a basket of harvested fruit might lie a *w'aka* apple.

Andean Creation Myths

Myths about *w'aka* ancestors emphasized the way that nature evolved by adapting to conflict and change. Written in Quechua sometime between 1598 and 1608, the Peruvian Huarochirí manuscript is the oldest Native Andean document that relates local religious traditions and provides detailed accounts of the myths of two of the *w'aka* ancestors, Viracocha and Paria Caca. The manuscript relates how these *w'akas*

created and transformed the world as they traveled through it. As Viracocha or Paria Caca met up with other people, animals, plants or land forms, they would strategically change these creatures through blessings or curses depending on whether the creatures were helpful or hostile to the wanderers. Plant and animal characteristics and features of the Earth and sky all served as proof of the *w'akas'* travels. In the *altiplanos* of Peru these myths still resonate with contemporary *ayllus*, or lineage groups, who say, for example, that the Milky Way is the trail of Viracocha's sperm seeding the night.

In part, the structure of these Andean creation myths responded to a richly varied topography where the combined effect of the equator with extreme changes in altitude gives rise to radical shifts in landscape, flora, and fauna across relatively short distances. Intrinsically, the rugged Andean terrain highlights movement and change. Like the Huarochirí manuscript, oral narratives throughout the region incorporate these themes in creation stories, which illustrate how the world came into being through the interaction of travelers with the environment, other people, plants, animals, elements, and land forms. This understanding of the creation of the world inherently incorporates the experience of migration and immigration, the arrival of the foreign and encounters with the strange. Evolutionary in structure, these narratives address how the familiar world was transformed in these encounters.

Pacarinas – The Dawning Places of Andean People

Unlike the Judeo-Christian creation story, which posits a world that springs into being through verbal command and in a kind of immediate and orderly progression, Andean creation stories insist on many creations always in motion. Out of each valley, from each mountain ridge, arise a new people. The Huarochirí myths, for example relate how Viracocha and Paria Caca served as the progenitors and founders of separate *ayllus* around the region. After a time, often after a difficult battle, these *w'akas* were transformed into stones or prominent features of the landscape. Thus, the Andean people descended both from the *w'aka* as superhuman creature and the

w'aka as specific site of land whether hill, rock, river, spring, cave, tree or stone. This *ayllu* place of origin was known as *pacarina* or “dawning place.”

For Andeans, *pacarinas* created the possibility of multiple, contradictory and yet, non-competitive cosmological truths which could coexist within an extended social space. They served as the primary explanation for differences between people. This informing notion of identity continues in the contemporary Andean world where communities develop differences in dress, agricultural products, and professional specialization in response to the resources available on their home mountain or valley. In Bolivia, for example, the Aymara who were born from and continue to live on Mount Kaata “become the mountain and the mountain becomes them. Wearing symbols of the mountain, they dress like the mountain that gives them their clothes – and the

design for their clothes. Their oneness with the mountain is their integrity” (Bastien 1978: xxiv).

For Andeans, this profound identification with their home place served to sustain and protect Andean belief, culture and community in the face of radical change. According to Christian colonial authorities, for example, *pacarinas* served as the major intrinsic obstacle blocking Andeans from converting to Christianity. In 1621 Pablo José de Arriaga, the infamous Jesuit extirpator, wrote

It is this ignorance which is the cause of [the Andean’s] errors, which they believe deeply, and which has taken root in all of them. They do not know that we all proceed from our first Parents [Adam and Eve] and instead they are persuaded not only that the Spaniards originate from one place, the blacks from another, but that every *ayllu* and groupings of Indians have their own origin and *Pacarina*, which is their own and they name it and adore and offer sacrifices to it. They call it *Camac* which means Creator and everyone says that they have their own Creator and some say that it is such and such a Mountain, others that it is a Spring and others tell many fables and old wives tales about their *Pacarina* (Arriaga 1920: 69).

As Arriaga confirmed in the seventeenth century, at the heart of the Spanish Catholic encounter with Andeans lay a radical difference in interpretations of the sacred and nature.

Andeans and the Living World

For Andeans, the divine permeated everyday life and like nature itself, the sacred expressed its character in multiple and often contradictory ways. This understanding of the sentient, responsive nature of the world yielded up a religious experience that required interacting with and continually acknowledging the spirit character of objects and land. Andean traditions honored the living nature of *Inti* the sun, *Quilla* the moon, specific stars and distinct weather phenomenon like white fog, red fog, rainbows, tornadoes and lightning. They honored *Mamacocha*, the sea and *Mamapacha*, the Earth. Lakes, rivers, the *poquios* or springs, the *cerros*, or high mountains, large rock formations and the rocks themselves all have names and personalities. More specifically, Andeans honored their *pacarinas*, their individual place of origin – the mountains, springs, rivers and lakes out of which the First Man and the First Woman of the *ayllus* were born.

As historian Kenneth Mills argues, what to Arriaga and other “seventeenth-century Europeans seemed a vain cult of stone was in fact a present embodiment – albeit often in natural, petrified forms – and reinterpretation of a long cultural past” (Mills 1997: 43). This “embodiment” and “reinterpretation of a long cultural past” took additional form in the Andean religious practice that focused on the veneration of preserved ancestors, or *malquis*, who were said to be the sons and daughters of the *w’akas*. The

malquis were kept in ancient houses or sepulchers called *machays*. Like the *w'akas*, *malquis* had their own priests, possessions and feast days.

Within their homes, Andeans kept chances – lineage gods that were passed down through family lines and served to guard the welfare of the family – and *conopas*, personal fertility gods. The *conopas* were small natural stones or stones carved to represent llamas, coca, corn, potatoes, etc. These *conopas* served to attract health and bounty to the crop or herd that they represented. While *w'akas* were recognized as sacred sites within the larger *ayllu* or sometimes throughout an entire mountain region, *chancas* and *conopas* offered guidance and protection within the smaller family realm.

Andean Strategies for Engaging Difference

Because the greater Andean cosmological system took into account the specific variance of religious beliefs, sacred sites, and ritual practice that shifted from valley to valley and mountain to mountain, Andeans retained a strong capacity for accepting and acknowledging a range of cultural, mythological, and ritual differences. The “morphing” ability of the *w'akas* themselves, which enabled them to shape-shift from superhuman creature to human ancestor, to land form, to animal or bird, served as pedagogical lessons for engaging differences and ultimately revealed fluidity in Andean notions of identity.

Anthropologist Frank Salomon argues that the theme of transformation through conflict marks the most important cultural value shaping Andean mythology. Accordingly, Huarochirí myths delineate a dominant model “of passage from mere difference (for example, the juxtaposition of antagonistic deities strange to each other) to complementary difference (for example, a revised juxtaposition in which the deities become male and female spouses or siblings embodying opposite ecological principles).” This “formal architecture” of these myths “owes everything to Andean patterns” and “occurs at the greatest and smallest levels of the mythology, in domains from the cults of apical deities . . . to the household relationship between in-laws” (Salomon and Urioste 1991: 4).

This Andean epistemological framework engages multiple and seemingly competitive realities at the same time by incorporating an extensive system of binaries. Unlike the Platonic and Hegelian forms, Andean binaries are complementary and propel circles of exchange along a moving axis. For instance: the sun Inti, associated with the Father, rules men and soil, moves through the day and the year marking his own calendar. On the other end of the axis, the moon Quilla, which rules women and water, moves through the night and the month marking her calendar. Inti and Quilla approach, their light and darkness intermingle, but they never quite connect.

Like Inti and Quilla, men and women, too, maintain complementary differences, which they negotiate sometimes in cooperation, at other times in tension as they move

toward and away from each other in a constant dance. Andean *fiesta* dances mirror this axis of tension and attraction combining lines and circles as women and men approach each other on a line and then move back, or follow each other on a circle, tightly controlled by a repetitive melody and rhythm. In this way, Andean binaries allow the incorporation of very different others by highlighting complementary relationships of exchange.

Andean Traditions Engage Christianity

In the Andes, Native traditions and Christian traditions also exist in this kind of binary relationship of tension and attraction. Based on the patterns of nature found in the Andes, Andean cosmologies privileged transformation and accretion emphasizing complementary differences and thus making room for binary oppositions. This directly shaped how Andeans engaged Christianity. The cult of the Christian saints allowed Andeans to incorporate additional powerful icons into their network of sacred relationships – *w'akas* whose range of influence potentially led all the way to Spain. Because Andean sacred authority depended on a network of *w'aka* alliances with the living land, influential Saints necessarily were understood to have made the appropriate Andean pacts with the *cerros* and other *w'akas* in order to sustain their miraculous power.

This interpretation continues in the Andes today. In Ecuador, for instance, contemporary Quito Runa say that their patron saint, La Virgen del Presentación de Quinche, was born from a rock in the Guayllabamba river. La Virgen de Quinche is a powerful midwife and, like the *w'akas*, she can shape-shift and sometimes appears as a turtle dove beside local *pocyos*, the mountain springs that serve as the eyes or doors to the inner mountain world. Ecuadorian shamans, or *yachajs* say that on the inside of these living mountains lie parallel cities filled with plants, animals, minerals and the spirits of the dead and the unborn. *Yach-ajs* make pacts with the mountains by bathing in the *pocyos*. On the basis of these alliances *yachajs* can attract and repel the circulation of life-giving and life-taking energies and produce coming from the inner mountain world to the communities on the outside. The Virgin of Quinche's ability to transform into a turtle dove and her association with the *pocyos* suggests that she, too, has formed alliances with the living mountains in order to fortify her healing powers.

For Andeans, the morphic quality of the *w'akas*, who in turn reflected evolutionary patterns in nature, formed a structural precedent of change that provided strategies for developing complimentary differences when engaging others. For the Andean people these strategies enabled them to flexibly combine their traditional beliefs with mythic elements introduced by Christianity while, at the same time, preserving communal identities. In effect, the *w'akas* flexibly shape-shifted from ancestor, to *cerro*, to bird, to saint while each manifestation, in turn, continued to represent the "home" *ayllu*.

Andean Identity and Place

In the post-contact era, we can see this transformative fluidity in the expression of Andean identity from the first moments after Spanish conquest all the way to contemporary expressions of traditional Andean culture. In 1555 the *ayllus* surrounding Cuzco converged on the main square carrying one hundred different images of the saints in order to celebrate the first Corpus Christi after the conquest. Anthropologist Michael Sallnow describes how

. . . [e]ach nation paraded in its distinctive ceremonial costume [traditionally ordered by the mountains], carrying aloft along with its saints an image of its bird or animal totem [i.e., its *w'aka* in bird or animal form], or a picture of its *pacarina* – spring, river, lake, mountain, cave, or whatever. Each had its band of flutes, drums, and tambourines, and they sang not in Quechua but in their native tongues, “so as to differentiate one nation from another” (Sallnow 1987: 57).

Here we see how Andean nations expressed their identity through multiple media: native language, song, music, dance, ceremonial dress, *w'aka* totems, and pictures of *pacarinas*, along with the images of their new patron saints. Sallnow argues that while superficially this ceremony resembled a traditional Corpus Christi celebration in Spain there remained a crucial difference. “[T]he Indians accompanying the Christian images in Cuzco were organized not according to any Iberian model but on the basis of national affiliation – affiliation, that is, to one or other of the diverse ethnic groups of the region” (1987: 56). Ultimately, this is an affiliation to and thus an expression of each *ayllu*'s home place – the sacred center of Andean life. Contemporary Qamawara pilgrimages through the department of Cuzco continue ritually to express Andean identity through song, dance, ceremonial dress and *laminas* or framed prints that combine images of their own local saint and *pacarina*. One Qamawaran *lamina*, for instance, features an image of a local miraculous Christ – Qoyllur Rit'i who is accompanied by two *wayrich'uncho* dancers and Mt. Ausankati, the *ayllu*'s home *cerro* in the background. As in colonial times, in the contemporary Native Andean world the strength of the Andean *ayllu* arises directly from its relationship to and identification with powerful living places.

The Living Mountains – The Sacred Center of Andean Life

For Andeans the communal body reflects and expresses the body of the land. The Aymara of Bolivia, for example, see their mountains as sentient creatures with living bodies, complete with head, torso and legs, who must maintain complicated relationships just as people do. As one young Aymaran described his home, Mount Kaata,

The mountain is like us, and we're like it . . . The mountain has a head where alpaca hair and bunchgrass grow. The highland herders of Apacheta offer llama fetuses into

the lakes, which are its eyes, and into a cave, which is its mouth, to feed the head. There you can see Tit Hill on the trunk of the body

. . . Kaata is the heart and guts, where potatoes and oca grow beneath the Earth. The great ritualists live there. They offer blood and fat to this body. If we don't feed the mountain, it won't feed us. Corn grows on the lower slopes of Niñokorin, the legs of Mount Kaata (in Bastien 1978: xix).

Within this Aymaran cosmology the mountain's body produces three different kinds of produce that each express specific characteristics of the *cerro* and the *ayllus* who live there. The communities of Apacheta, Kaata, and Niñokorin each trade, first and foremost, with the corresponding body part – whether head, belly or legs – on which they live. By feeding shrines coca, *chicha* and llama fat and blood, or sacrificing a llama to the land in specific agricultural rites, these communities offer gifts to the mountain in exchange for the mountain's gifts of llama hair, potatoes or corn. Then through trade between the upper, middle and lower communities, these three different kinds of produce, from the three sections of the mountain body, are brought together so that, within each community, the body of the mountain is reunited. Here mountain wholeness incorporates communal and mythoecological differences.

The *ayllus* of Mount Kaata trade in turn with other *ayllus* from neighboring mountains thereby creating extensive flows of produce and communal alliances that ultimately stretch across the Andes like links in a long chain. Local and regional agricultural festivals honoring planting, first fruit and harvest serve as a means to properly celebrate and nourish the mountains while forging bonds between neighboring communities. The local saints that preside over these festivals in turn draw their authority from their historical association to those specific Andean places.

Throughout the Andes, it is the *yachaj's* responsibility to maintain a balance of exchange between the mountain and human communities, between ritually feeding the *cerros* and consuming the fruit of the mountain's body. Should communities fail to nourish appropriately the mountain they live on and take more than they give back, a deficit can arise where the mountain becomes hungry and may begin to kill in order to eat, consuming people in landslides, floods, falls into mountain ravines, or wasting illness. Excessive mining, road building, or thoughtless construction, in particular, can create a ravenous imbalance as machines devour huge portions of the mountain's body. Mining accidents and deadly landslides on roads frequently reveal a hungry mountain – a *cerro bravo* who has been improperly compensated for its loss.

A semantic shift in the modern-day usage of the word *w'aka* reflects the impact that greed has had not only on the relationship between Andean people and the living land, but on the Andean experience of the sacred as well. In Spanish-speaking circles *w'aka* has come to represent “treasure” and refers only to the valuable objects that people left in order to nourish the living places – the objects looted since the conquest from *w'aka* temples, *w'aka* tombs, and other *w'aka* sites. Accordingly, in the contemporary Andean world, the spiritually neglected and therefore greedy mountain no longer dresses in traditional Andean fashion; instead it appears as the Devil or as a Gringo – a white

man dressed in European clothing. Even here, the land's body continues to reflect the social body – changing in appearance as people's identity and their relation to the land also transforms.

Anima Mundi – The World Soul

Despite Western civilization's persistent bent toward separation from and control of an objectified natural environment, the image of a living, interconnected, and sacred world has persisted. Today that sense of sacrality finds expression in deep ecology, in ecopsychology, and in emergent nature religions. In Classical times, however, and again in the Renaissance, the living world was seen as embodying the "world soul," or in Latin, the *anima mundi*. Since ancient times, therefore, the West has retained the idea of the *anima mundi* in tension with materialist views of the natural world.

The early Greek philosopher Heraclitus (sixth century B.C.E.) taught that the world existed as a tension of opposites, such as war and peace, all animated by a "soul" or essence imagined as divine fire, eternal and uncreated.

About 150 years later, the philosopher Plato, in his dialog *Timaeus*, described how the creator-god (demiurge) placed soul (psyche) at the world's center. This "world soul" mediated between nature and the world of "forms," the abstract, transcendent models used by the creator-god to fashion the universe.

Plato's subsequent followers, the Middle Platonists, viewed the world soul as generating individual souls. They identified it with the goddess Hekate, who moved between worlds and guided souls after death from the earthly realm to heavenly ones.

Soteriologically minded philosophers and theurgists, who wished to assure the rising of their own souls, later advanced the idea that Hekate, by controlling the crossing of the boundary between humanity and divinity, either could aid the ascent or could force the decent of the [individual] soul (Johnston 1990: 38).

The Neoplatonic school, founded by Plotinus (205–270) continued to teach that the universe emanated from a divine incomprehensible source, stretching down to the material world, with the *anima mundi* occupying the middle position. Neoplatonism was revived during the Renaissance, thanks largely to the efforts of philosopher and translator Marsilio Ficino (1433–1499). Exemplifying the humanist tradition that aimed to elevate humans' position in the universe, Ficino taught that humans, through imagination, artistry and magic, could tap into a network of elaborate correspondences through the medium of the *anima mundi* in order to understand and manipulate natural forces.

During the Enlightenment, Europeans embraced the notion that a rational, progressive civilization could transform the world into a smoothly functioning machine. Romantics, however, revived the idea of a living universe whose mysteries can be approached through the power of imagination, which allows communication between humans and the rest of nature.

Twentieth-century thinkers also advanced new concepts of the world soul. The French paleontologist and theologian Teilhard de Chardin suggested that the planet found its soul in the “noosphere,” the total consciousness of all intelligent life. The reality of this consciousness would transcend the biosphere, the sum of all living plants and animals. In 1969, the British scientist James Lovelock suggested that planet Earth be regarded as a totality or a cybernetic (self-correcting) mechanism that seeks to keep all its physical and chemical elements in the right balance for life to exist. This system could be hypothetically regarded as a living entity, “Gaia,” he suggested. According to Lovelock, it seems extremely unlikely that this balance occurred by mere chance; thus, the intention behind it might be said to derive from the *anima mundi*, the world soul.

Animal Rights in the Jewish Tradition

Any discussion of animal rights in the Jewish tradition must start from the recognition that the concept of “rights,” based on a modern understanding of individuality, is foreign to Judaism. Rather, Jewish law defines obligations that people have to others, whether those others are people, or animals or the land, or whichever entity has moral standing. The equivalent of a right possessed by a person in Jewish law would be the determination that a Jewish or human obligation existed toward that person. One finds that such obligations exist in Jewish law and theology with respect to animals and not only with respect to human beings.

It is clear in the Torah that animals have moral status. Laws about helping an animal fallen under its load (Ex. 23:5, Deut. 22:4), about not muzzling an animal so that it can eat while it works (Deut. 25:4), as well as many of the laws concerning kosher slaughter or *shechitah*, appear to have consideration for the subjective needs of the creatures. The laws of *shechitah* have two goals: minimizing pain to the animal and draining all the blood from the animal’s body. The latter goal is directly connected to a primitive understanding of animal rights, which was expressed in animistic desire to release the animal’s soul, which according to the Torah is found in its blood (Gen. 8:3–4; Lev. 17:14; Deut. 12:23–25). Other laws, like the prohibition against taking the life of a mother and child animal on the same day (Lev. 22:8), reflect a concern for the subjectivity of animals as sympathetically understood by human beings. The prohibitions against sterilizing any animal and against crossbreeding between animals also seem to be rooted in needs of species as well as of individual animals.

The Torah maintains that even domestic animals live for their own sake and not just for ours. All the more so, Torah prohibitions that limit the slaughter of wild animals (Lev. 17:13–14), require one to free a wild mother bird if one wishes to take its eggs (Deut. 22:6–7), and assert the need for wild animals to share in the produce of the land (Lev. 25:6–7), reflect a consciousness that animals have their own purposes and needs that are not trumped by human interests.

In the *halakhah* or legal system of the rabbis, the Torah’s specific prohibitions were organized into a general valorization of the needs of animals (Schochet 1984: 151). The Talmud established that the Torah forbade causing pain and suffering to animals, *tza’ar ba’alei chayyim*, even though this idea is not articulated in any scriptural verse (BT Baba Metzi’a 32b). The laws of Shabbat could be overridden for the sake of this principle (Schochet 1984: 155–7). The rabbis also articulated a near-blanket prohibition

of hunting, despite the Torah's acceptance of slaughtering wild animals as long as their blood was buried in the Earth.

In general, rabbinic interpretation extended and strengthened laws related to animal welfare. Yet there was an understanding of the needs of animals and all creatures that was far deeper than the notion of "welfare." Emero Stiegman writes that in the rabbinic worldview, man is not considered the measure of all things. Nature is not measured against him in metaphysical categories . . . Things were not forced to coalesce; each was seen, not "objectively", but . . . in its specific, separate relationship to its Maker . . . [S]uch a view . . . compels an acceptance of creatures, not according to their supposed nature, but according to their concrete relationships, to God not least. Man also, then, is not seen as an essence, but as related (1979: 500).

If humans are ends-in-themselves, it is not because they possess some essence which sets them apart over all other species. Rather, their value comes from the significance of their relationships, with humans, other creatures and God. Many *midrashim* teach that human beings imitate God by extending mercy to other creatures. *Midrash Tanchuma* asks: "Why is Noah called righteous? Because he fed the creatures of the Holy One, and became like his Creator. Thus it says, 'For the Lord is righteous, loving righteous deeds'" (*Noach* sec. 4, 35). Fundamentally, the meaning of being human is established not only by the way we treat human beings but also by the way we treat the other animals. Stiegman speculates that this emphasis on relationship may be "why the rabbis could affirm man's centrality in creation and his dominion without reducing the world to a mere complex of useful functions."

Since other creatures stand in relation to God and to each other, they have the rabbinic equivalent of intrinsic value, so that the intrinsic needs of animals could override their use-value to humans. These intrinsic needs may be recognized as the equivalent of "animal rights."

Notwithstanding the rules and precepts affirming that animals deserve just treatment, the framework of both the

Torah and the rabbis allowed humans to use animals and to kill them to serve human needs. The application of these laws involved finding a balance between using animals for human purposes, and allowing them to fulfill their own purposes. In essence, Judaism recognized the rights of animals to live according to their needs, while recognizing that human beings had the right to use animals as long as the quality of their lives was preserved.

Rabbinic Theology

What these laws meant theologically is a more complex subject. In rabbinic Judaism, there was a general acceptance of the idea that animals had souls (*Tanchuma*, *Noach* sec. 10, 39; *Genesis Rabbah* 30:6) and that they could choose to fulfill God's purpose. A

traditional way of framing the latter concept is found in a *midrash* about the animals that were saved in Noah's ark:

If [God] remembered Noah, why also the animals? May the name of the Holy One be blessed, who never deprives any creature of its reward. If even a mouse has preserved its family [i.e. species] it deserves to receive a reward (*Tanchuma, Noah* sec. 11, 41).

This affirmation of animals participating in the moral order is expressed directly in the Noah story itself, where the first covenant that God establishes explicitly includes the animals as partners (Gen. 9:12–16). On a more folkloric level, the rabbis held that animals could be moral actors. Animals like Rabbi Pinchas' donkey, who refused to eat untithed grain, could be especially pious, and animals could show mercy to people, as does the raven in this story:

Adam and his partner came and cried over Abel, and they didn't know what to do . . . One raven whose companion died said, "I will teach Adam that this is what to do." He set down his friend and dug in the earth before their eyes and buried him. Adam said, "Like the raven, this is what we will do" (*Pirkei d'Rabi Eli'ezer*, sec. 21).

Within the rabbinic worldview, it is not only human beings who have the capacity to show mercy. In general, ethics is in its essence seen by the rabbis as part of the natural order; this is what it means to call normal ethical behavior "*derekh erez*" or "the way of the Earth" (Kadushin 1938: 117–30). At the same time, there are passages that suggest that everything, including the animals, was created to serve humanity. Rabbinic literature preserves the wisdom of many schools of thought and often expresses the complexity of its subjects by juxtaposing contradictory values.

Theologically, the rabbis also held a modest understanding of the dominion granted to Adam in Genesis 1:26–28. They understood these verses as allowing human beings to use animals for work, but *not* to kill them

(BT *Sanhedrin* 59b). The power of dominion over other animals and the power of conquest over the land, which were present in the blessings of Genesis 1, are noticeably absent in the blessings given to Noah (Gen. 9:1–7), where the permission to eat meat is first articulated. *Genesis Rabbah* (34:12) learns from this that humanity no longer exercised dominion over the animals after the flood; rather, dominion was replaced by fear. According to Rashi's commentary on this passage (11th century), the "dominion" of the garden was the opposite of fear because it meant the power to draw the animals close; that is, "Adam would call the animals and they would come."

One way in which these potentially contradictory values of dominion and compassion were integrated is that animals were understood to fulfill their own needs, on a soul level, by being used for sanctified ends. The ultimate example of this can be found in the animal sacrifices in the Temple, which harvested the intrinsic value of the animal for an end greater than human needs or desires, something we might term its "holiness-value." From a biblical perspective, using animals for sacrifices was a mechanism that affirmed the sacredness of their lives while still allowing them to be eaten. The blood, defined as the *nefesh* or soul in the animal, was put on the altar to make clear that the essence of the animal was not allowed to be used by human beings.

The rabbis affirmed this system, while also occasionally questioning it. When Rabbi Yehudah haNasi, the leading figure of the Talmud, sent a calf that sought refuge with him back to be sacrificed, saying “Go, for you were created for that purpose,” the angels afflicted him with sickness and suffering (BT Baba Metzi’a 85a). The conflicted message of this story is that even the highest use of an animal’s life could not be fully justified from the perspective of righteousness.

Medieval Thought

Rabbinic literature is quite explicit that God cares for animals (e.g., *Deuteronomy Rabbah* 6:1). Nonetheless, later medieval thinkers like Ibn Ezra and Abravanel, influenced by Aristotle’s division between rational beings and all other creatures, declared that the only purpose of the laws against *tza’ar ba’alei chayyim* was moral education (Schochet: 212–15). Importantly, Nachmanides, the earliest one to make this interpretation, emphasized not only that the laws “teach us the trait of compassion” but also that they forbid actions which would cause the extinction of a species (commentary to Deut. 22:7).

Some scholars like David Bleich have interpreted Maimonides as holding this position in *The Guide for the Perplexed* (3:17), though this is incorrect, since Maimonides affirms there that compassion must be shown to the individual animal. This is made clear by the other passages in which Maimonides describes the suffering of animals as the paramount reason for these laws (3:48). In the disagreement between Maimonides and Nachmanides are echoes of the contemporary debate between animal rights and environmental activists over the value of individual lives of animals versus the well-being of species.

In medieval Jewish mysticism and Kabbalah, sensitivity to animals became greatly magnified, in line with the general motive held by the mystics of rejecting the rationalistic thought of the philosophers. For example, *Sefer Chasidim* (Yehudah Hechasi, 12th century) says that if a person causes needless pain to animals . . . he comes to judgment . . . Thus the sages explained “in that day I will strike every horse” (Zech. 12:4) to mean that the Holy One is destined to punish [human beings] for the humiliation of horses from their riders (sec. 43, 104).

Similarly, the innocence of animals is invoked in this same work to understand the reason for the commandment to cover the blood of a slaughtered animal:

[W]hen a person slaughters an animal or bird he should think in his heart, this one that did not sin was slaughtered . . . He should consider how the Holy One commanded him to cover an animal or bird’s blood, lest the angel having authority over them should say, “How is the blood of this one that didn’t sin spilled by the hand of a sinner whose sin is like scarlet and worm” (sec. 373, 273).

Other important figures emphasizing compassion for animals include Rabbis Moshe Cordovero and Moshe Chayyim Luzzato (Sears, 2003). With the emphasis on transmi-

gration of the soul in Kabbalah, the belief that both the righteous and wicked were sometimes reincarnated in animals became widespread. Though some Kabbalists emphasized the practice of strict vegetarianism in response to this belief, most affirmed that an animal's soul could be elevated through being slaughtered and eaten with the right intention by holy people. Moreover, the animal was thought of as yearning for this to happen. Many Chasidic rebbes and teachers also emphasized the deepest compassion for animals; Dovid of Lelov (1746– 1814) was especially known for his piety and passion in this regard. Most of this mystical material was not directed at the normally observant Jew but only at the circle of mystics or *tzadikim*. While this material has relevance to ethical questions it is tangential to the formulation of animal rights in Judaism because it was never seen as binding on the entire community.

Modern Applications

Much of the law relevant to contemporary questions is still being worked out. Rabbi David Rosen, the former Chief Rabbi of Ireland, believes that *tza'ar ba'alei chayyim* requires the prohibition of commercially produced meat:

“The current treatment of animals in the livestock trade definitely renders the consumption of meat halakhically unacceptable as the product of illegitimate means” (1995: 53). Followers of Rabbi Abraham Isaac Kook like Shear-Yashuv Cohen and David Sears, as well as many early leaders of the Jewish environmental movement in North America, such as Richard Schwartz, have strongly advocated for vegetarianism as the best modern response to laws protecting animals. Prohibitions against using animals for cosmetics testing and similarly inessential research have also been made in the United States and Israel. With respect to genetic engineering, some have raised the question of whether these techniques may be applied to animals without violating halakhic mandates, but there is as yet no consensus in this regard.

Animals

Any account of religious traditions' engagement with other animals will swell into a multitude of diverse issues, a number of which are extraordinarily complex. Some of the complexities stem from the well-known fact that over the millennia of their existence, religious traditions have provided an astonishing array of views and materials on virtually any general subject that believers, scholars and other interested parties might explore. This variety is made all the more challenging because even within any one religious tradition, such views and materials can be in significant tension.

A very different set of complexities arises from how living beings outside our own species can be startlingly different from one another. Many are mentally, socially, and individually very simple, but others are so complicated and enigmatic mentally and socially that we may not have the ability to understand their lives well. Ignorance of these differences has often led, both within and without religion, to crass oversimplifications. Indeed, many of our most familiar ways of talking about the nonhuman living beings upon the Earth turn out to be, upon careful examination, coarse caricatures and profoundly inaccurate descriptions.

Whatever else may be said of religious traditions regarding nonhuman animals, these ancient and enduring cultural and ethical traditions have unquestionably had profound impacts on countless humans' actions affecting the living beings amidst which we live. Indeed, religion has often been the primary source for answers to questions such as, "Which living beings really should matter to me and my community?" The answers to such questions given by, for example, the early Jains and Buddhists and the early Christians have had, in their respective cultural milieus and beyond, great influence on how the living beings outside the human species have been understood and treated.

Basic Tools and Conceptual Problems

The Place of Inherited Conceptions

Many religious believers' perspectives on nonhuman animals have been dominated by something other than a careful engagement with the animals themselves. For example, inherited preconceptions, which often have taken the form of dismissive generalizations found in documents held to be revealed, in some cases operate as definitive assessments of *all* nonhuman animals' nature, abilities, and moral significance. Heritages of this kind can present severe problems for historians, theologians, and believers who

wish to engage readily available, empirically-based evidence that contradicts, in letter or spirit, inherited views that are inaccurate or in some other way misleading.

Symbolism

Images of nonhuman living beings abound in religious art, writing, and oral traditions. While some of these images are connected in one way or another to the animals portrayed, many are not any more related to the animals pictured or named than the saying “love of money is the root of all evil” (1 Tim. 6:10) is related to botany. Some studies of “religion and animals” are confined solely to the study of religious images of other animals, and in no way raise the issue of the actual biological beings themselves.

Ethics

Religious traditions characteristically foreground ethical concerns for “others.” These others can, of course, include both humans and nonhumans. Some religious traditions insist that the universe of morally considerable beings includes all living beings, while others have had, ethically speaking, a pronounced human-centered bias because they assert that only humans truly matter. Note, however, that even if proponents of these competing claims differ radically as to the extent to which human caring abilities should reach outside the human species, they share the conviction that humans are characterized by extraordinary ethical abilities to care for “others.” A central question in the study of religion and animals is, “Who are the others?”

Treatment of Other Animals

Although there is in many circles a tendency to equate religious views with factual propositions about the world, most religious traditions include the insight that acts speak louder about what one really believes than do spoken or written words. Accordingly, what religious traditions truly “think” about other animals is, at least in part, represented by the actual, “on the ground” treatment of other living beings. A religion which features, say, bull worship in its temples but in no way addresses brutal treatment of cattle in the daily world outside the temple will, quite naturally, seem to us to have a different view of cattle than does a religion that unequivocally prohibits harsh treatment or even killing of bulls and cows.

Interlocking Oppressions

An ancient ethical insight suggests that when a human harms another living being, the actor and even other humans are desensitized, such that they may subsequently

harm more individuals. This insight, found in one form or another in some religious traditions, was one of the classic justifications for anti-cruelty traditions applying to non-human animals. A modern version of this insight underlies contemporary sociologists' and law enforcement officials' assumption that certain instances of human-on-human oppression, such as domestic violence, are psychologically linked to or "interlocked" with violence to nonhuman animals (Ascione and Arkow 1999 provide details of the correlation of, for example, domestic violence against a spouse or children and violence against nonhuman animals). More broadly, the respected Oxford historian

K. Thomas suggests further that the domestication of nonhuman animals "generated a more authoritarian attitude" and "became the archetypal pattern for other kinds of social subordination" (Thomas 1983: 46). These ethical insights suggest that because oppression of one kind of living being seems to lead to the oppression of other kinds of living beings, the study of religion and animals will often benefit from careful study of social justice concerns.

Religions as Carriers of Views about Animals and their Habitat

As holders and educators in matters cultural, intellectual, ethical, social, and ecological, religious traditions mediate views of the world around us across time and place. It is natural then that, since nonhuman animals are truly around and with us in our ecological communities, religious traditions have had a major role in passing along basic ideas about these beings' place in, or exclusion from, our communities of concern. Understanding this feature of religion, particularly as it is a highly contextualized piece in any religious tradition's larger puzzle, is an essential task in the study of religion and animals.

History of Scholarship on Religion and Animals

Even though astonishingly rich information has been developed in certain contemporary life sciences regarding various nonhuman animals' mental, social and emotional complexities, the vast majority of scholarship in contemporary academic institutions goes forward on the assumption that humans alone are intellectually complex, capable of emotional depth and commitment, characterized by social connections and personality development, and able to develop the kinds of autonomy that moral beings intuitively respect. Academic expression today thus reflects regularly the anthropocentric bias of the Western intellectual tradition.

Numerous religious believers across time and place, however, have not adhered to the broad dismissal of nonhuman animals characteristic of the Western intellectual tradition. Many indigenous traditions, for example, reflect a serious engagement with some other living beings as morally and religiously significant beings. There have been

vibrant debates in various places, including the Indian subcontinent, the Hellenistic world, and contemporary life sciences, regarding the specific abilities of nonhuman animals. Sorabji (1993) concludes that Augustine was the pivotal figure in shutting down the debate in the Western intellectual tradition, the upshot being a broad dismissal of other animals' significance relative to humans' importance. Even if this is true, it is well known that concerns for nonhuman animals' welfare have continued to have a place, albeit a subordinate one, in the complex Jewish, Christian, and Islamic traditions as they carried their ancient religious insights into modern times. Francis of Assisi and Albert Schweitzer are oft-cited examples of profound concern for other animals, but seminal figures like Ambrose, Basil, Rumi, Maimonides,

Luther, Calvin, Wesley, Ibn Taymiyah, Isaac Bashevis Singer, Barth, Tillich, Teilhard, and Thomas Berry have reflected their traditions' respective capacities to enable believers to see and care about living beings beyond our species.

Thus, it is facile to conclude that all who have thought about religion and animal issues have, quite naturally and obviously, thought about the issues in the dismissive manner which dominates thinking in the Western intellectual world today. Although there is, as yet, no systematic treatment of the place of nonhuman animals in the doctrines, rituals, experiences, ethics, myths, social realities, and ecological perspectives of religious traditions, it is clear that the picture, when drawn, will be diverse and offer many alternatives for interacting with the Earth's nonhuman lives.

Institutional Realities

In the official pronouncements of the vast majority of organized religions, however, a pronounced humancenteredness still reigns. The eminently anthropocentric biases that dominate modern religious institutions' discourse and conceptual generalities are reflected in the prevailing assumptions as to which "others" are appropriate subjects for humans' considerable ethical abilities. Paragraph 2415 of the revised Catholic Catechism (1994) provides an example of the prevailing anthropocentrism: "Animals, like plants and inanimate things, are by nature destined for the common good of past, present and future humanity." As a result of this kind of human-centeredness, mainline religious institutions have left unchallenged the prevailing practices of modern food animal production and the use of nonhuman animals as subjects in biomedical experimentation. There have been, to be sure, some challenges, though most have come from indigenous traditions and those of the Indian subcontinent.

The World Religions

Hinduism

As a vast set of religious beliefs and subtraditions, this oldest of the so-called world religions offers an immense range of views about the living beings who share our ecological niches. The different views are dominated by two general beliefs that govern the ways in which other animals are conceived. First, human beings, though recognized to be in a continuum with other animals, are considered the model of what biological life should be. A corollary of this hierarchical belief is the claim that the status “human” is far above the status of any other animal. Second, belief in reincarnation, a hallmark of most, though not all, Hindus’ beliefs, includes the notion that any living being’s current position in the cycle of life is a deserved position because it has been determined by the strict law of karma.

These two beliefs have resulted in other animals being viewed with uncertainty. Positively, other animals have been understood to have souls just as do humans. Negatively, though, other animals have been understood to be inferior to any human, a corollary of which is the belief that the existence of other animals must be particularly unhappy, at least compared to human existence. Importantly, humans are by no means considered equal to one another in classical Hinduism, for according to the *sanatana dharma* or eternal law and moral structure of the universe, all humans, like other animals, are born into that station in life for which their past karma has fitted them. Inequalities existing within the social system, as well as the fact that nonhuman animals were considered of less stature than humans, were not viewed as unjust; rather, these different stations in the hierarchy were explained as the result of good or bad deeds performed in former lives. A common claim is that those who act morally are assured of a good rebirth in higher social classes, while wrongdoers are assured of being reborn into the wombs of outcasts or, worse yet, a nonhuman animal. Hindu social codes, embodied in the Laws of Manu, reflect in many different ways this one-dimensional view of other animals as inferior to humans.

Despite the implicit and explicit deprecation of nonhuman animals (and, of course, of “lower”-level humans), the tradition has often exhibited great sensitivity to other animals. The vast scriptures of this tradition include many injunctions that one should treat other animals exactly like one’s own children. Many central texts in the canon, such as Rig-Veda and Atharva-Veda, reveal that the Earth was not thought of as created for humans alone, but for other creatures as well. Thus, many contemporary Hindus argue that all lives, human or nonhuman, are of equal value, and all have the same right to existence. More generally, village life in India provides many examples of coexistence with other animals, though there are, to be sure, examples of mistreatment as well.

Humans, then, even if they have a privileged place in the hierarchy, also have special obligations to all living beings. This way of thinking is often buttressed by the obser-

vation that many Hindu deities, such as Rama and Krishna, who are, respectively, closely associated with monkeys and cows, have been incarnated as other animals. In addition, the deities worshipped in India include Ganesh, an elephant-headed god, and Hanuman, the monkey god.

An ancient form of the tradition was challenged by Buddhists and Jains because it was characterized by a heavy emphasis on animal sacrifice, a practice that stemmed from the ancient scriptures known as the Vedas. The Jains and Buddhists challenged these sacrifices as cruel and unethical, and had a great effect on the later Hindu views of the decency of intentionally sacrificing other animals. *Ahimsa*, the historically important emphasis on nonviolence, has now become a central feature of the tradition.

This sensitive side in Hindus' awareness of other animals is often symbolized by the image of sacred cows wandering the streets of India unmolested and free; yet, the realities for animals in Hindu societies have been and continue to be far more complicated. The traditional respect for other animals has been affected greatly by economic factors which inhibit transmission of ancient values which encourage respect for other animals. Nowadays, the pace of modern development is leaving behind the strong emphasis which almost all Hindu scriptures place on the notion that benefits can be received by not killing or harming other animals.

Buddhism

The place of other animals in the Buddhist tradition is not a simple matter even though there are believers and scholars who claim that Buddhism takes a kind, sympathetic view toward nonhuman lives. Compassion toward other animals is, without question, an important feature of much Buddhist thinking, for the tradition unequivocally expresses concern for nonhuman animals as fellow voyagers in *samsara*. But in important senses the tradition carries an overall negative view of nonhuman animals' existence, standing, and abilities relative to those of members of the human species.

From its earliest stages, the tradition has been characterized by a consistent disparagement of biological beings outside the human species. That deprecation is closely allied with the coarse grouping of all nonhuman animals into a single realm or category thought of as below the human realm. Indeed, the very fact of birth as any kind of animal other than a human is thought of negatively by Buddhists in the sense that it is an unhappy place – as the historical Buddha said in the *Majjhima Nikaya* (III: 213), “so many are the anguishes of animal birth.” Birth at this lower level in the Buddhist hierarchy is the direct result of less than ideal conduct. For example, a human who violates moral norms is constantly threatened with the punishment of re-entering existence at the “lower” level of some nonhuman animal.

Importantly, however, these negative views are moderated by central ethical commitments. One of the most common passages in Buddhist scriptures is the undertaking known as the First Precept, by which a Buddhist commits to refrain from killing any life forms. Vegetarianism, though not universal, is an important ideal as well. And the

bodhisattva's vow to refrain from entering nirvana until all beings are saved reflects the deep commitment possible in the Buddhist tradition to beings outside the human species.

Yet in general, to the Buddhist mind, all other animals are simple relative to humans, and easily understood by the qualitatively superior human capacity for moral and intellectual thinking. Buddhist scriptures also reflect that other animals are often thought of as pests in competition with elevated humans.

All of these factors lead to descriptions of other animals that are caricatures and fundamentally negative, while membership in the human species is seen as an extraordinary attainment and the first of Buddhism's fundamental paradigms. Once a "lower being" has attained membership in the human species, the second, soteriological paradigm set out by Gotama's teachings becomes the focal point.

Buddhist claims about other animals, then, are grounded in the tradition's heavy investment in hierarchical thinking, although the consequences of the hierarchical thinking are surely moderated by the profound ethical commitments to the value of all life. Because of the dominant understanding of the importance of existence as a human versus existence as any other kind of animal, the tradition has never emphasized seeing other animals in terms of their realities. As a result, the dominant claims of Buddhists about other animals tend to the ideological, in that there is a prejudgment about possibilities and an underdetermination of views by factual realities.

The Abrahamic Traditions Generally

Islam, Judaism and Christianity are, on the issue of nonhuman animals, in many essential respects dominated by an ethical anthropocentrism, that is, a pronounced tendency to focus on the members of the human species as if they alone should be the object of fundamental moral protections. This human-centeredness is moderated at critical points, however, by important qualifications. For example, each of the Abrahamic traditions has included, at different times and places, important insights into (1) the moral dimension of other animals' lives, and (2) the importance of limits on humans' instrumental use of other animals.

On the whole, however, each of the Abrahamic traditions, particularly in its mainline interpretations, has been characterized by an unrelenting insistence that it is humans alone who are the deity's chosen species. This elevation of members of the human species over all other animals has often had the effect of providing ready justifications of practices that harm other animals.

Judaism

The views of nonhuman animals that characterize the Jewish tradition are diverse and even contradictory, in part because the Hebrew Bible contains a number of options for thinking about humans in relation to other animals. The prominent paradisa-

model is undergirded by a vision of peace with and between wild animals, and it often functions as a metaphor for cosmic and social peace. A second option – the realistic, this-worldly model – focuses on peace from other animals as a practical aspect of desired *shalom*.

Of these two visions, the second dominates in the sense that human interests, far more than the interests of any nonhuman animals, are typically seen as overwhelmingly more important. The notion “peace from evil animals” is, as Bauckham notes, an “ancient tendency, at least in the Jewish tradition, to consider wild animals primarily as threats to human life” (Bauckham 1994: 8).

This tendency to a negative view of the animals not under humans’ control is represented well by Philo’s image of a continuous war with nonhuman animals. There is, however, a certain irony in the dominant view of wild animals as evil, given that it is a common biblical theme that the disorder in nature comes from archetypal acts of human ancestors and the unfaithfulness of Israel.

Yet even if the dominant view in the Hebrew Bible is that wild animals are evil, other animals nonetheless live under God’s reign. God created and feeds them, and they are a source of pride in God’s exchanges with Job. Nonhuman animals at times appear as examples of right order in great contrast to humans. This less dominant view reflects the important notion that God as the source of creation has conferred goodness on it generally.

The law codes (Ex. 22–23 and 34, Lev. 22 and 25, and Deut. between 14 and 26) also contain many provisions which recognize, at least to some extent, the welfare of other animals. Such recognition is, however, limited in an important respect, for the subject matter is primarily (1) the welfare of domestic animals, that is, those that work or produce benefits for humans, and (2) restrictions on the killing of the few animals which could be sacrificed.

Other animals are mentioned in some of the covenants found in the Hebrew Bible. Most prominent is the covenant with Noah in Genesis 9:9–16. Some theologians, such as Linzey, make a great deal of this in their works, but others have argued that the larger context, and particularly the preceding set of verses (Gen. 9:1–7), radically qualifies the meaning of 9:9–16 and reflects that other animals are “in the subordinate relationship to humankind which has already been set forth in Genesis” (Murray 1992: 33–4).

While there are other, more animal-friendly covenants that are important in the Hebrew Bible, the dominance of the animal-exclusive Abrahamic, Mosaic and Davidic covenants reflects the background beliefs about the importance of members of the human species relative to all other animals. These background beliefs are found throughout the Hebrew Bible, and are particularly evident in the Genesis accounts of (1) the order of creation, the naming of animals, the charge of dominion, and the image of God, and (2) the flood story by way of its emphasis on stewardship, the focus on terrestrials, and the permission to eat other animals.

Yet even if humans were conceived of as separate from the rest of life in critically important ways, the breadth of generalizations about living beings, the number of specific animals mentioned, and observations about the variety of life, confirm that the Hebrews noticed and appreciated, at least in some ways, the extraordinary diversity and interconnectedness of human and nonhuman beings.

The practice of sacrifice (*zebach*) in the Jewish tradition raises complex issues. The animals selected for sacrifice were those which were deemed useful to humans, and both anthropomorphism and anthropocentrism can be seen in the description of these animals, and not others, as “pleasing to God.” Sacrifices of selected animals functioned as an institutionalized means of relief from the impurity generated by humans’ violations of moral rules or purity taboos.

Maimonides in the twelfth century argued that sacrifices were a concession to barbarism. Some modern theologians, looking at the entire range of practices involved and not merely at the act of killing, continue to argue that sacrifice “in its way” represents respect for animal life. A more balanced observation is that sacrifice does not necessarily involve a low view of the sacrificed animals’ lives, though it surely produces what is, from the viewpoint of the animal sacrificed, a harm. Following the destruction of the Temple in 70 C.E., sacrifice of animals within Judaism was no longer a central religious practice, though some Jews pray to this day for a reestablishment of the Temple sacrifices even as various movements of Judaism that advocate modernizing reforms assert vigorously that animal sacrifice should remain a discarded practice.

The occurrence of these instrumental uses of other animals and ultimate rejection of the old sacrificial practices are of limited value in assessing Judaism’s views of other animals, as they deal with only a few domestic animals. There were many other complex animals with which the Jewish tradition was unfamiliar. Further, the significance of sacrifice as a central part of ancient Hebrew practices cannot be evaluated without reference to the Jewish scriptures which reflect moral concern of some kind for other animals. *Tsa’ar ba’alei chayim*, the body of traditional Jewish law that concerns itself with animal welfare, provides a basis for arguing that care for other animals is mandated by the core values and insights of the tradition.

Christianity

The Hebrew vision of humans as a group to be distinguished from all other animals is an emphasis that the early Christians inherited. One interpretation of the mainline Christian tradition is that it narrowed this heritage because the tradition asserted, as part of its basic message, not only a fundamental, radical division between human animals and all other animals, but also the *exclusion* of all other animals’ interests when they are in conflict with even minor, unnecessary human interests. Such an exclusion is more in line with Christianity’s Greek heritage than its Hebrew heritage (Greek views were not mono-lithic, of course – for example, Pythagorean and Dionysian elements

reflect different valuations than do the betterknown Apollonian, rationalist tendencies to elevate human speech and reasoning to god-like levels).

Some prominent claims of the tradition, such as the claim that all humans are made in the image of God and have been given dominion over the Earth, have resulted in persistent refusals to examine the relevance of other animals' actual realities. Some have even insisted that it is *only* human realities which are morally considerable, as occurred when Pope Pius IX said to the English antivivisectionist Anna Kingsford, "Madame, humankind has no duties to the animals" and backed this up by "vigorously" opposing the establishment of a society for the protection of animals in Rome (Gaffney 1986: 149).

An examination of the origin, expression and development of Christian views of other animals suggests that they were integrally tied to deeply ingrained or background cultural views from the Greeks and Hebrews that operated at the level of cultural datum – humans are distinct in every relevant way from all other animals, and therefore are ontologically distinct from the rest of creation. This claim that humans are more important than all other animals continues to be the dominant one in mainline Christian circles.

As noted above, however, there have been many voices within this tradition that have sounded the inherently ethical themes of compassion for and coexistence with other animals. Andrew Linzey has even argued that it is of the essence of Christian theological values that Christians carry out duties of care toward other animals.

Whether the dominant interpretation will remain immune to new factual information developed during careful inquiries into the lives and realities of other animals will be an important indicator of the quality and nature of Christian views about nonhuman animals.

Islam

Even if the Abrahamic traditions' characteristic emphasis on humans as the centerpiece of a created universe can be found throughout the Islamic tradition, it does not always translate into the claim that other animals have been placed on Earth solely for the benefit of humans. It is true that such claims are asserted in the Qur'an (see, for example, *Surahs* 5:4, 16:5–8; 22:28; 22:36; 23:21; 36:71–

3; and 40:79). Yet the tradition also reflects a countervailing recognition of the moral dimension of the very existence of other animals. Further, humans' treatment of other animals, who are deemed creatures of Allah, also plays an important role in the tradition, as indicated not only in the Qur'an but also in passages from other central writings of the tradition such as the body of legal provisions known as *Shari'ah* (the "Way"), and the *Hadith*, the traditional collection relating the actions and sayings of Mohammed and his companions. All of these sources reflect in numerous ways Islamic recognition that other animals have their own importance as Allah's creatures. *Surah* 6:38 admonishes that all other animals have their own communities, and *Surah* 17:44

notes that the component parts of nature are in continuous praise of Allah, although humans may not be able to understand this. Many passages ask that humans see the manner in which other living things testify to Allah's presence and power (see, for example, *Surahs* 16:68–9 and 79; 24:41; and 67:19).

Mohammed himself commented, "Whoever is kind to the creatures of Allah, is kind to himself." He also compared the doing of good or bad deeds to other animals to similar acts done to humans.

There are, to be sure, negative views of other animals in some Qur'anic passages. Negative views also appear in the beliefs of various Islamic sects that infidels after death become other animals or that hell is full of noxious nonhuman animals. The practice of public, ritualized slaughter of other animals for food (*dhabh*), which occurs at the end of the traditional month of fasting (*Ramadan*) and at other times when the meat is used for a celebrative feast and often distributed to the poor, reflects the basic belief that humans are the vicegerent (*Khalifah*) of Allah and that other animals, even if not solely for human use, are in special instances ordained for humans' use. Rules designed to make the killing more humane moderate the meta-message that humans are the living beings that truly matter.

There is a long tradition within Islam by which the arrogance of humans is checked. The commentator Ibn Taymiyah, who died in 1328, argued regarding the Qur'an verses which state that Allah created various parts of the environment to serve humanity: "In considering all these verses it must be remembered that Allah in His wisdom created these creatures for reasons other than serving man, for in these verses He only explains the benefits of these creatures [to man]" (in Deen 1990: 190). Thus, the tradition offers the view that other animals have an integrity or inherent value of their own, even when the standard Abrahamic interpretation of humans as the centerpiece of creation is maintained.

Beyond the World Religions

The traditions considered above by no means exhaust the possibilities or scope of "religion and animals." Native or indigenous traditions provide countless examples of humans' natural and special relationship with many kinds of nonhuman living beings. The diversity cannot be exemplified by anything other than a close engagement with the lifeways of such peoples, but a few passages suffice to hint at the richness of perspectives available in these religious worldviews.

Black Elk opens his now famous account with a reference to sharing and kinship with other animals:

It is the story of all life that is holy and is good to tell, and of us two-leggeds sharing in it with the four-leggeds and the wings of the air and all green things; for these are children of one mother and their father is one Spirit (in Neihardt 1972: 1).

Such connections to other animals lead to extraordinary suggestions, such as, “Birds make their nests in circles, for theirs is the same religion as ours” (in Neihardt 1972: 164– 5). Comparable respect for nonhuman lives can be drawn from stories told by many other indigenous peoples.

There are many additional forms of nature-oriented spirituality that reflect deep concerns for and connections with nonhuman animals. These range from those who focus on communications with specific kinds of animals (often mammals or birds known to be highly social and intelligent, such as dolphins or ravens) to radical environmentalists or “greens” who have experienced an animistic connection of some kind with a particular animal or its larger community. Tending to be decentralized, these religious traditions often give primacy to individual experience. There are also respected members of contemporary science communities, such as the primatologist Jane Goodall and the cognitive ethologist Marc Bekoff, who emphasize the relevance to humans’ spiritual quests of rigorous empirical study of animals outside the human species. Many of the diverse forms of nature-oriented spirituality emphasizing nonhuman animals minimize divisions between “human/nonhuman” and “nature/culture.”

In addition to these nature-oriented forms of spirituality that emphasize noticing and taking nonhuman animals seriously, the Chinese traditions (folk, Taoist, and Confucian), Japanese Shinto, the Jain tradition of India, Sikhism, and many other religious traditions offer profound insights into the importance and ethical dimensions of humans’ connections with other natural beings.

Conclusion

The simple enterprise of asking how the two important topics of “religion” and “animals” intersect offers profound prospects for a deeper understanding of religion, other animals, and humans’ place within ecological webs. In particular, the “religion and animals” inquiry leads to questions about the nature of religious views, language and claims about other animals. These include, of course, questions of a fundamentally ecological nature, for one cannot know about the lives of living beings, human or otherwise, without knowing about their communities, habitats, and wider ecological webs.

Animals in African Legend and Ethiopian Scriptures

Animals have played a major role in religious thought all over Africa, not only in what are known as African traditional religions, but also in scriptures preserved by African Judaism, African Christianity, and African Islam. These ancient manuscripts are to be found mainly in the Ethiopian language, Ge'ez, which, although no longer spoken, is still the liturgical language of the Ethiopian Orthodox Church.

When Islam became dominant in North Africa and Arabs controlled the trade route along the Red Sea, Ethiopian Jews and Christians became isolated from their co-religionists. As a result the Falasha Jews (known as *Beta Israel*) are unfamiliar with the Talmud, which was only codified around the year 500. The Torah they use is written not in Hebrew but in Ge'ez. Although they retain only a few Hebrew words in their prayers, they strictly observe the Sabbath, adhere to the dietary commandments in the Book of Leviticus, and celebrate the new moons and the majority of festivals as prescribed in the Pentateuch.

Both African Judaism and African Christianity were enriched by writings not included in the Hebrew Bible, such as *The Book of Jubilees*, *The Ascension of Isaiah* and *1 Enoch* (known as Ethiopian Enoch). Preserved in Ge'ez translations in Ethiopia, most are now extant in their entirety nowhere else. *The Book of Jubilees* (also known as *The Little Genesis* [The blind Alexandrian Christian scholar Didymus referred to it by this name in the fourth century, as did Jerome in the following one.]), which is thought to have been originally composed in Hebrew or Aramaic some time between 175 and 140 B.C.E., enlarges on, and differs from, the canonical Book of Genesis in various respects. It is an apocalypse, so that events such as the Flood are recounted to make them look prophetic – foreshadowings of the final cataclysm. From *Jubilees* we learn that, before the Fall, animals were able to communicate with one another in a “common tongue.” It was only on their expulsion from the Garden of Eden that the mouths of cattle and birds and “of everything that walks or moves, were shut” (*Jubilees* in Sparks 1984: 21).

The book of *Enoch* enjoyed great prestige in the early church and was quoted by Judge and Barnabas, among others. Clement of Alexandria, Irenaeus, and Tertullian all regarded it as “canonical” and, although later rejected by Jerome and Augustine, in the Eastern church *Enoch* continued to be treated with great respect. Chapters 85–90 of *1 Enoch* are known as the *Animal Apocalypse*. Here the various nations are symbolized by animals:

The first generations of mankind were appropriately represented by bulls and cows. It was only after the intervention of the fallen angels that the various peoples could be appropriately represented by such creatures as lions, tigers, wolves, dogs, hyenas, wild boars, foxes, badgers, pigs, facons, vultures, kites, eagles, ravens: many of them fierce and dangerous to man, all of them unclean by Jewish standards and all, certainly, inferior to the original bulls and cows

. . . But all this changes when God has established his kingdom on Earth (Cohn 1993: 176).

This vision of the Last Judgment sees not only human beings but all animal species being changed. As in the vision of Isaiah 65, the lion will literally lie down with the lamb.

In Africa, human beings are traditionally thought of as being part of the animal kingdom, closely related to and not uniquely different from other creatures. Because the creator God intended all creatures to live in harmony, sharing the world's resources without conflict, originally they were able to speak and understand each other's languages.

This paradisaical state of nature is exemplified in legends about the Queen of Sheba. Jews, Christians, and Muslims believe that King Solomon and the Queen of Sheba (known in the Qur'an as Bilqis) shared remarkable gifts of wisdom and learning. Both were able to converse with animals. While the Hebrew Bible briefly records the visit of this African Queen to King Solomon's temple in Jerusalem and the valuable gifts of gold and spices that she brought him (1 Kgs. 10), considerably more of their relationship is revealed in the Talmud, in the Qur'an, in Swahili legend, and in the Ethiopian national epic known as the *Kebra Nagast* (the "Book of the Glory of Kings"). Written in Ge'ez in the fourteenth century, it describes how the Ark of the Covenant was "the first of all things in creation, and how it came to Earth containing the Mosaic law."

When the Queen of Sheba visited Solomon, she not only learnt much of his proverbial wisdom, including astronomy and the languages of the animals, but returned to Ethiopia bearing Solomon's son, Menelik, who later became the first Emperor of Ethiopia. As a young man Menelik was educated in Jerusalem. When he returned home to Ethiopia, he was accompanied by representatives of the twelve tribes of Israel as a bodyguard. In order not to be separated from Zion, these young Israelites carried off the Ark of the Covenant to Ethiopia. The Ark was installed at Aksum, which thus later became the true Jerusalem for Christians as well as for African Jews.

Today, Ethiopian clergy known as *dabtara* are believed to be descended from these officers, and they are respected as the guardians of a long tradition of talismanic art, including pharmaceutical knowledge, bequeathed to Solomon by the angels and written by him in a book which was brought to Ethiopia by Menelik. Of the *dabtara*, Ninian Smart observes:

Their primary art is to sing, and they must study over a long period not merely the complexities of traditional religious music, but also the sacred language of Ge'ez.

Though their knowledge is archaic, they have traditionally formed the learned class and so have been employed often in administration (Smart 1979: 62–3).

Jacques Mercier found that the *dabtara* “moves in the world before the Flood, when spirits revealed themselves to humans and showed them the secrets of the heavens” (1997: 48). Solomon’s book contained portraits of demons that are still used in talismanic scrolls. The art of making scrolls is dependent on animal sacrifice, because until quite recently all Ethiopia’s bound books were handwritten on parchment made from animal skin. The *dabtara* draws images with a red pen on the parchment’s inner side. There is usually an image at the top, one in the middle, and one at the bottom. Then he writes the prayers, inserting the recipient’s baptismal name in red ink. Finally he makes a cylindrical case for the scroll in red leather (Mercier 1997: 48).

Talismans make use of the principal motifs of the Solomon legend – the ring, the seal, the mirror, the palace as labyrinth, the power over demons – that also developed in the Orient, appearing in many stories and esoteric rituals.

Like the *Kebra Nagast*, Swahili legends about King Solomon enlarge on what is recorded in the Qur’an:

Sulemani bin Daudi, King Solomon, ruled many peoples, human, animal and invisible. Allah gave him wisdom and knowledge, so that he understood the secrets of the stars as well as the language of the animals. He could hear what the cocks crowed, what the horses neighed, what the snakes hissed. He also knew the languages of the fishes in the sea and of the demons in the fire; yes, he could even understand the intentions of the trees rustling with their leaves, or the moods of the winds, whispering and roaring (Knappert 1992: 58–9).

It is recorded in the Qur’an that a messenger bird, the hoopoe, first brought Solomon news of the realm of Sheba:

The bird, who was not long in coming, said: “I have just seen what you know nothing of. With truthful news I come to you from Sheba, where I found a woman reigning over the people. She is possessed of every virtue and has a splendid throne” (Surah 27).

From this Surah, *Ta’sin* (The Ant), we learn that Solomon conversed not only with the birds but even with insects:

Solomon succeeded David. He said: “Know, my people, we have been taught the tongue of birds and endowed with all good things. Surely this is the signal favour.”

His forces of jinn and men and birds were called to Solomon’s presence, and ranged in battled array. When they came to the Valley of the Ants, an ant said: “Go into your dwellings, ants, lest Solomon and his warriors should unwittingly crush you.”

He smiled at her words, and said: “Inspire me, Lord, to render thanks for the favour You have bestowed on me and my parents, and to do good works that will please You. Admit me, through Your mercy, among Your righteous servants” (Surah 27).

It is recorded in the Qur’an that, when they were driven out of Mecca, some of Mohammed’s followers found refuge in Abyssinia, but long before Muslims arrived,

Jews had migrated there. They brought with them stories (*midrashim*) about animals that formed part of their oral tradition. According to one such *midrash*:

Solomon was in the habit of summoning all the beasts, birds, reptiles, and spirits to perform in front of him and his fellow kings from neighboring countries. They all came of their own accord. On one occasion the hoopoe (a small bird native to Madagascar) was missing; when finally it was found, it reported to the king that it had been in search of a country anywhere in the world that might not be subject to the authority of Solomon. Eventually the hoopoe had found the city of Qitor in the East, full of gold and silver, and trees watered from the Garden of Eden; its ruler was the Queen of Sheba. Solomon then commanded his scribes to tie a letter to the hoopoe's wing, which it delivered to the queen (Ullendorff 1997: 136, 138).

Moreover, Solomon later made himself a flying carpet to visit Africa but found the heat of the sun unbearable, so he recruited a flock of hoopoes to fly above him and keep his carpet in the shade. As a reward for this service, the hoopoes asked for their heads to be decorated with golden crowns, to which, against his better judgment, Solomon agreed. The result was first that fowlers shot hoopoes for their beauty, and then hunters set traps of cages with looking glasses inside. The foolish hoopoes, lured to see how beautiful they had become, were taken prisoners and sold for their plumage. Finally they went to Solomon:

“What have you done to us? Before we helped you, none sought our lives, now we are in danger of being utterly destroyed.” Solomon replied: “I now see that some creatures are incapable of choosing what is best for themselves, and it is necessary for wiser rulers to help them choose. I warned you that vanity would be your downfall. Now I suggest that all golden crowns be changed to feathers.” And turning his magic ring the king pronounced the necessary words and it was done. The hoopoes exclaimed: “Wise and great is Solomon the king!” (Toperoff 1995: 118–19)

Ethiopia has preserved not only scriptures that supplement and enlarge on those in the Hebrew Bible, but also scriptures that rival those in the New Testament canon. There are gospels and epistles which were judged by St. Jerome and the Roman curia to be “apocryphal” but which continued to be venerated in the Coptic and other oriental orthodox churches. One such, *The Acts of Philip*, has survived in its entirety only in Coptic and Ethiopic translations. From this we learn that the Apostle Philip, accompanied by Mariamne (his sister) and Bartholomew, set out to preach the gospel in Ophiani. Passing through “the wilderness of dragons,” they met a great leopard, who spoke with a human voice, “I worship you, servants of the divine greatness and apostles of the only-begotten Son of God; command me to speak perfectly.” When Philip said, “In the name of Jesus Christ, speak,” the leopard adopted perfect speech..”

Thereupon the leopard confessed that he had the previous night seized a kid, which had “wept like a little child” and begged him “to put off your fierce heart and the beastlike part of your nature, and put on mildness, for the apostles of the divine greatness are about to pass through this desert to accomplish perfectly the promise

of the glory of the only-begotten Son of God.” So Philip and Bartholomew prayed for these two animals, who responded:

We glorify and bless you who have visited and remembered us in this desert, and changed our beastlike and wild nature into tameness, and granted us the divine word, and put in us a tongue and sense to speak and praise your name, for great is your glory.

At the end of this story, the leopard and the kid “fell and worshipped Philip and Bartholomew and Mariamne; and all set out together, praising God” (“The Acts of Philip” in Elliot 1993: 515–16).

Another important scripture, *The Acts of Thomas*, survived in Ge’ez, in both Arabic and Coptic (which is probably the earliest version). It contains many stories of the animals encountered by the Apostle Thomas (known as “The Twin”) on his way to India. One “colt of an ass” identified itself as being “of the family which served Balaam; and to which also belonged that colt on which sat your Lord and your Master.” This encounter caused the apostle to exclaim:

O Jesus Christ, Son of the perfect mercy, O rest and calmness, and you of whom even the unreasoning animals speak; . . . good shepherd, who offered yourself for your sheep, overcame the wolf, and redeemed your sheep and led them to good pastures

– we praise and glorify you and your invisible Father and your Holy Spirit and the mother of all creation (*The Acts of Thomas* in Elliot 1993: 464–5).

Stories of the infant Jesus, who spent his early childhood in Egypt, are found in *The Infancy Gospel of Thomas*, the *Protoevangelium of James* and *The Gospel of Pseudo-Matthew*. From the latter, medieval Christianity derived the image of an ox and an ass round the manger at the Nativity. Many of these stories refer to the Christ-child’s friendly relationship with animals. For instance, soon after their arrival in Egypt, the Holy Family took shelter in a cave where they encountered “many dragons, which worshipped Jesus and then departed . . . Likewise, lions and panthers adored him and accompanied them in the desert.” When Jesus was eight years old, the Holy Family was on the road out of Jericho to the river Jordan, when they met a lioness and her cubs, who played around his feet. The astonishment of the local people at this behavior caused Jesus to exclaim: “How much better are the beasts than you, seeing that they recognize their Lord and glorify him; while you men, who have been made in the image and likeness of God, do not know him!” (*The Gospel of Pseudo-Matthew* in Elliot 1993: 94–7)

These scriptures and legends enable African Christians, Muslims, and Jews to develop a unique awareness of the significance of other species in God’s creation and their intended role in the redemption of this planet.

Animals in the Bible and Qur'an

The scriptures of the leading Monotheistic religions, Judaism, Christianity and Islam, assume the supremacy of humankind, established by an almighty God. As stated in the opening remarks of the Bible:

So God created man in his own image, in the image of God created he him; male and female created he them. And God blessed them, and God said unto them, be fruitful, and multiply, and replenish the Earth, and subdue it: and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the Earth (Gen. 1:27–28).

Genesis sanctioned the active participation of the first man at God's side, complementing creation: "Whatsoever Adam called every living creature, that was its name" (Gen. 2:19). Acknowledgment of human beings' domination "over every living thing that moves upon the Earth" did not, at first, bring about any rupture in the basic harmony that characterized all components of divine creation. In the Edenic context humans were vegetarian; only plants – not animals – were intended as food for the forefathers of the human race (Gen. 2:9, 16). Yet, the expulsion of Adam and Eve from the Garden of Eden – explained in terms of the "original sin" in Christian theology – led to the degeneration of Earth, which became hostile and intimidating to human beings. Animals, as well, became fierce; they revolted against their bondage and attacked human society.

Following the Flood, however, when God renewed his alliance with the human race, He confirmed once more human control over the animal kingdom while defining the practical consequences:

And the fear of you and the dread of you shall be upon every beast of the earth, and upon every fowl of the air, upon all that moves upon the earth, and upon all the fishes of the sea; into your hand are they delivered. Every moving thing that lives shall be meat for you . . ." (Gen. 9:2–3).

The message was clear: from then on, animals could lawfully be killed and eaten, in accordance with God's will, subject only to religious dietary restrictions, such as not eating flesh with its blood (Gen. 9:4). Biblical narrative thus fostered an instrumental approach to animals: their existence was justified by their serving the needs of human beings. Still, it encouraged proper care for the needs of domestic animals, "A righteous man regards the life of his beast," (Prov. 12:10), allowing them to rest during the Sabbath (Deut. 5:14) and forbidding taking a mother bird with her eggs for food (Deut. 22:6).

The instrumental approach of the Bible may be explained by the prevailing dependence on animals in agrarian and nomadic societies, for which animals fulfilled different working and guard functions. On the other hand, there is a clear reticence, if not outright antagonism, when it comes to emotional links between the human and animal realms; the latter is relegated to an inferior, independent sphere (in contrast to the role played by animals in Greek mythology, for example). One possible explanation may lie in the Bible's essential animosity toward any remnant of polytheism, especially Egyptian cult and rites. Many animals – dogs, cats, falcons, scarabs, cows, hawks, crocodiles, jackals, lionesses, hippopotami, *inter alia* – were incorporated into the Egyptian pantheon, thus possibly generating the reticence that animals encountered in the Hebrew Bible. From an ecological perspective, moreover, the proliferation of wild animals in the Near East, with the resulting problem of rabies and other diseases that they propagated, might provide a suitable key to the biblical attitude.

Consensus on the precedence of human society, however, did not in itself impose specific attitudes toward individual animals, and differences were indeed considerable in this regard. Biblical literature differentiates between ritually clean and unclean animals, and those that remain in the wild state as against those that have been domesticated. Clean animals were considered suitable for human consumption; they include mammals, such as cattle and sheep, which have a split hoof and chew the cud. Unclean domestic animals include beasts of burden, like the ass, camel, and horse, and pets, like dogs and cats. The prevailing attitude toward animals in the New Testament and early Christian theology, which opposed any close proximity between the human and animal species, was heavily influenced by the biblical approach. The Pauline ideal of contempt for this world of sin further strengthened the gap between the faithful, who became pilgrims on Earth, and the animal kingdom, represented as another reflection of the flesh, with all its vices and weaknesses. The basic recognition of the mastery of human beings, moreover, was further strengthened by the principle of *nomina res essentiant* (i.e., the names Adam gave the animals not only suggested their character but also influenced their role and destination on Earth). Christian doctrine, as it developed from the second century onwards, further brought these tenets to their “logical” conclusions. Theologians like Tertullian, Origen, Saint Augustine, Bede, and Petrus Comestor, preached the total mastery of human beings over animals, since the former were created in God's image and, therefore, were the beneficiaries of his wisdom. If such was the case with simple human beings, it was rather obvious that saints, with their greater commitment to God, were bestowed with a special precedence over animals, similar to that which Adam had enjoyed in paradise. It was said about the abbess of Arles, for example, that “because of her many virtues, birds and animals were obedient to her.” The unprecedented attempt by St. Francis in the early thirteenth century to spread the idea of equality among all creatures – while creating a harmonious balance between humankind and the animal world – was therefore condemned to failure. St. Francis' creed, which favored a more harmonious perception of the universe, was

indeed neglected from medieval to early modern times. It found more receptive ground only in the last century.

At a metaphorical level, Christian liturgy developed, from its very beginnings, a rich symbolic thesaurus, with animal representing the most common virtues and vices that could be found among human beings, as well as humans' relationship with their Creator: the lion courage, the bull strength, the dog fidelity, the snake caution and prudence; the chameleon hypocrisy, the hyena impurity, the wolf greed, the serpent the devil. The fish became one of the earliest, most important Christian symbols, with the five Greek letters of the word, $\iota\chi\theta\upsilon\varsigma$ forming an acrostic signifying Jesus Christ, Son of God, and Savior. Animals also came to represent the principles of the Christian faith: the lamb, the sacrifice of Christ on the cross and the weakness of the Christian; the dove, the image of the Holy Spirit; the deer, the Christians' longing for salvation.

The basic principles of the Islamic faith corroborate some of the characteristics found in the Bible, first and foremost the battle to eradicate any remnant of polytheism. The Qur'an criticizes the practice of consecrating certain animals or of applying a taboo to them (5:103, 6:138–139). Since God had created all animals – a pair of each (51:49) – Muslims are exhorted to treat them kindly. They will be held accountable for how they treat their mounts before Allah in the next world. Notwithstanding the general nature of these claims, Islam, as well, differentiates between those animals that benefited from special divine grace – such as camels, horses, cows, sheep, greyhounds, and bees – and those that possess the evil eye and are, instead, the devil's emissaries, the most prominent being dogs. At a more practical level, the consumption of pigs is forbidden, but all fish may be eaten without ritual slaughter. Although killing a cock is allowed, the Prophet forbade reviling this fowl because it served the faithful by awakening them to perform their religious duty; the same rule applies to fleas “who awakened a prophet.”

All three scriptures further condemn any manifestation of cruelty *per se* toward animals, which are recognized as creatures of God; however, Judaism, Christianity, and Islam also encourage an instrumental approach to animals, at best, while allowing their arbitrary killing, at worst. Perhaps this was the natural sequence in the process of turning the human race into the apex of divine creation, a creed that does not allow any partners of equal status at the side of human beings. Furthermore, teachers from these traditions condemn the practice of pet keeping, relegating the most favorite among the pets, especially dogs, to the status of unclean or maligned animals. Such antagonism may result from the apprehension of ecclesiastical persons that attachment to pets – which bestows on human beings a complete mastery over these creatures and, in consequence, may bring about higher self-esteem

– might have detrimental consequences for the submission of the faithful to an almighty God. No less important, the emotional linkage between a person and his/her pet may weaken human dependence on God's representatives on Earth, the clergy.

Animism

Coined by the anthropologist E.B. Tylor (1832–1917), the term “animism” refers not to a type of religion but to a theory of religion. Asserting a minimal definition of religion as “belief in spiritual beings,” Tylor argued that religious belief originated in the primordial mistake of attributing life, soul, or spirit to inanimate objects. Although it has generally been dismissed in the academic study of religion as an obsolete term for describing the belief systems of indigenous people who hold that natural phenomena have souls or spirits, animism has nevertheless persisted in popular usage and academic theory to raise problems about the meaning and value of materiality in religion.

Tylor’s theory of animism was premised on a kind of materialism, since he assumed that materiality by definition was “dead” matter, but his theory was also framed in terms of an ideology of European progress, underwritten by evolutionary science, which bore a strange contradiction. Although Europeans supposedly represented the pinnacle of evolutionary development, they could only know that by comparing themselves to a baseline represented by others who had supposedly not evolved. Like other social evolutionists, Tylor found his evolutionary baseline, the “primitive,” in reports submitted by European travelers, missionaries, and colonial agents about indigenous people, the “savage,” on the periphery of empire. While Europeans according to Tylor’s evolutionary scheme had progressed along a developmental trajectory through animism, polytheism, and monotheism to reach the highest achievements of science, evolving from primitive to civilized, indigenous people of the Americas, Africa, Asia, Australia, and the Pacific had supposedly been left behind by evolution, standing over as savage “survivals” of the primitive.

Although Tylor was only interested in contemporary indigenous religions as data for building a theory of the original, primordial, or primitive animism, his term caught on to such an extent that it became commonplace in European inventories of the religions of the world to identify contemporary adherents of indigenous religions as animists. A recent guidebook for Christian missionaries, for example, asserts that 40 percent of the world’s population is animistic (Van Rheen 1991: 30). While this characterization has often been experienced by indigenous people as denigrating, it has occasionally been adopted as a term of self-identification. In Indonesia and Nigeria, for example, representatives of indigenous religions, struggling in a political arena dominated by Muslim and Christian interests, have sought formal recognition as animists. At the same time, animism has sometimes been adopted as a term of self-identification in New Age, neo-pagan, or environmentalist movements. Without addressing those appropria-

tions of the term, this entry concentrates on the history, rationale, and consequences of animism as a theory of religion.

History of Animism

During the nineteenth century, European social scientists developed different terms – fetishism, totemism, and animism – for the original religion of humanity, but each term carried the same allegation that “primitives” or “savages” were incapable of assessing the meaning and value of material objects.

The term, “fetish,” for example, emerged out of intercultural trading relations in West Africa in which European traders argued that Africans, unlike European Christians, had no stable system of value in which they could evaluate objects. Overvaluing apparently trifling objects such as feathers, bones, and cloth used in ritual, Africans undervalued the trade goods brought by Europeans. In this context, European Christians referred to African ritual objects as “fetishes,” a term derived from the Portuguese *feitiço*, referring to nefarious instruments of magic and witchcraft (Pietz 1985). The term, “totemism,” according to John Ferguson M’Lennan, referred to communal alliances under the sign of an animal or an object that combined fetishism with exogamy, mixing the inability to evaluate materiality with regulations governing sexuality (M’Lennan 1870). Arguably, the term, “animism,” mixed fetishism not with human sexuality but with animal psychology. The psychology of dogs, in particular, provided the key to a theory of religion based on attributing animation to inanimate objects.

In his popular survey of human evolution, *The Origin of Civilization and the Primitive Condition of Man*, John Lubbock explained that religion originated as the result of the primitive tendency to attribute animation to inanimate objects. To illustrate this primitive “frame of mind,” Lubbock cited evidence from southern Africa, relying on the early nineteenth-century report from the traveler Henry Lichtenstein that the Xhosa in the Eastern Cape assumed that an anchor cast ashore from a shipwreck was actually alive. In a footnote, Lubbock observed, “Dogs appear to do the same” (Lubbock 1889: 287). As Lubbock’s friend and mentor, Charles Darwin, maintained, religion could be explained in terms of dog behavior. Like Lubbock, Darwin observed that dogs characteristically attributed life to inanimate objects. His dog’s attention to a parasol blowing in the wind, for example, suggested to Darwin that the animal assumed that objects were alive. In this animal psychology, therefore, nineteenth-century theorists had a basis for understanding animism as the “primitive” or “savage” propensity to attribute animation to inanimate objects.

Evidence of Animism

In standard accounts, E.B. Tylor's theory of animism is derived from the "primitive" inability to distinguish between dreams and waking consciousness. When the "primitive" ancestors of humanity dreamed about deceased friends or relatives, they assumed that the dead were still alive in some spiritual form. Out of dreams, therefore, evolved "the doctrine of souls and other spiritual beings in general," a doctrine that was "rational," even if it was a "childish philosophy" enveloped in "intense and inveterate ignorance" (Tylor 1871: I, 22–3).

Where did Tylor get his evidence to support this finding? Instead of observing dogs, Tylor collected accounts about indigenous people, the "savages" who appeared in reports from European travelers, missionaries, and colonial agents. Arguably, Tylor's most important source was an account of Zulu religion from South Africa, *The Religious System of the Amazulu*, which had been published under the authorship of the Anglican missionary Henry Callaway, although the Zulu Christian convert, Mpengula Mbande, actually provided most of the reports collected in the book. Tylor praised *The Religious System of the Amazulu* for providing "the best knowledge of the lower phases of religious belief" (1871: I, 380).

Certainly, Tylor found evidence of an active dream life among Callaway's Zulus. Zulus often saw the shade or shadow of deceased ancestors in dreams. However, Callaway's volume included a detailed account about one Zulu man, an apprenticed diviner, who had become so overwhelmed with visions of spirits that he had described his own body as "a house of dreams" (Callaway 1868–1870: 228, 260, 316). According to Tylor, all Zulus, as "savage" survivals of the "primitive," were subject to dream visions, but "as for the man who is passing into the morbid condition of the professional seer, phantoms are continually coming to talk to him in his sleep, till he becomes as the expressive native phrase is, 'a house of dreams' " (1871: I, 443). Although Tylor appropriated him as an archetype of the "primitive," this particular Zulu man, who served Tylor as a "savage" survival of the original "house of dreams" from which religion originated, was James Mbande, the brother of the Christian convert, Mpengula Mbande. Like his brother, James was torn between the Christian mission and indigenous tradition. While Mpengula went one way, becoming a catechist for the mission, James struggled in the other direction, striving to keep an ancestral dream alive under increasingly difficult colonial conditions. In this case, therefore, the "house of dreams" was not a "primitive," but a colonial situation, the product of contemporary conflicts in southern Africa.

The analysis of dreams, however, did not provide the only evidence for Tylor's theory of animism. In addition, the involuntary physical phenomenon of sneezing was central to Tylor's argument. Here again Callaway's Zulu evidence was definitive. As Tylor observed, sneezing was not originally an arbitrary and meaningless custom, but the working out of a principle. The plain statement by the modern Zulus fits with the hints to be gained from the superstition and folklore of other races, to connect the

notions and practices as to sneezing with the ancient and savage doctrine of pervading and invading spirits, considered as good or evil, and treated accordingly (1871: I, 104).

From Callaway's account, Tylor derived the ethnographic facts that Zulus thought their deceased ancestors caused sneezing; that sneezing reminded Zulus to name and praise their ancestors; that the ancestors entered the bodies of their descendants when they sneezed; and that ritual specialists, such as Zulu diviners, regularly sneezed as a ritual technique for invoking the spiritual power of the ancestors. These Zulu concepts and practices, Tylor concluded, were remnants of a prehistoric era in which sneezing was not merely a "physiological" phenomenon, "but was still in the 'theological stage' " (1871: I, 104).

Much has been made of Tylor's "intellectualist" theory of religion. Although primitives suffered from primordial stupidity, Tylor argued that they nevertheless exercised their limited intellectual powers to develop explanations of the world in which they lived. Unfortunately, Tylor cited a Zulu source in support of this proposition, Callaway's catechist, Mpengula Mbande, who observed that "we are told all things, and assent without seeing clearly whether they are true or not" (1871: II, 387). Although cited by Tylor as evidence of savage ignorance, Mbande's point in this statement was that most Zulus had not been exposed to Callaway's new Christian gospel. Rather than offering evidence of primordial stupidity, therefore, Mbande was announcing his recently acquired Christian commitment. In any event, Tylor's theoretical work, and his use of Zulu evidence, demonstrated that his theory of the origin of religion was based on an analysis of the body as well as the mind. More animal than human, in this respect, "primitive" religion, as revealed according to Tylor by its survival among contemporary Zulu "savages," had evolved out of a bodily process that was as simple, basic, and involuntary as sneezing. However much it might have been theologized, sneezing marked the physiological origin of religion as animism, the belief in pervading and invading spirits.

Consequences of Animism

In building his theory of animism, E.B. Tylor intentionally disguised the colonial conditions that provided his evidence. Ignoring the social, political, intercultural, and interreligious contexts in which his evidence was embedded was not an oversight. It was a method. According to Tylor, "savage religion" had to be abstracted from its living contexts in order to be used in an evolutionary history of human culture that began with primitive animism. "In defining the religious systems of the lower races, so as to place them correctly in the history of culture," Tylor observed in 1892, "careful examination is necessary to separate the genuine developments of native theology from the effects of intercourse with civilized foreigners"

(Tylor 1892: 283). Any trace of more advanced religious concepts, such as ideas of deity, morality, or retribution in an afterlife, could only have entered "savage" religion,

Tylor argued, through such foreign intercourse with “higher” races. Factoring out colonial contacts, relations, and exchanges, he argued, “leaves untouched in the religions of the lower races the lower developments of animism” (Tylor 1892: 298). According to this method, therefore, animism appeared as the original religion – the earliest, the lowest – only by erasing the actual colonial situations in which indigenous people lived. As a result, the theory of animism provided an ideological supplement to the imperial project.

Although it was posed as a scientific explanation of the origin and development of religion, the theory of animism also addressed nineteenth-century European dilemmas about the meaning of materiality. Despite the expansion of scientific materialism, with its implicit challenge to religious belief, the séances of spiritualism were gaining popularity in Europe, promising material proof of spiritual survival of death. Initially, E.B. Tylor considered using the term “spiritualism” for his theory of religion, regarding contemporary spiritualist practices in Europe as a “survival” of prehistoric religion. Like the religious beliefs and practices of indigenous people on the colonized periphery of empire, the spiritualist séance represented an unwarranted persistence in attributing life to dead matter. As a European intellectual problem, therefore, the theory of animism can be situated in the context of nineteenth-century distress about the religious implications of scientific materialism and the scientific implications of a new religious practice such as spiritualism.

At the same time, this theory of the animation of “dead” matter was developed in the midst of the consolidation of commodity capitalism in Europe and North America. The commodity, as Karl Marx provocatively proposed, was not dead matter because it was animated by a “fetishism of commodities,” similar to “primitive” religion, which attributed life to objects “abounding in metaphysical subtleties and theological niceties” (1974: I, 81). While supplementing the colonization of indigenous people, therefore, the theory of animism was also entangled in European struggles to understand the animation of matter in capitalism.

In the anthropology of religion, some theorists have recently attempted to rehabilitate the theory of animism, restating the argument that religion originated in the basic animistic propensity to project human characteristics of life, thought, and feeling onto the natural world, or redefining animism as a “relational epistemology” through which indigenous people gain knowledge by entering into humanizing relations with the natural world. The history of the theory of animism, however, suggests that this theoretical project has inevitably been entangled in local and global negotiations over the meaning of materiality. As a point of entry into the study of religion and nature, the theory of animism presents a problem, bearing traces of nineteenth-century European imperialism, colonialism, and capitalism, rather than a solution for our understanding of religious engagements with the natural world.

Animism – A Contemporary Perspective

Animism is a term coined to serve in an argument about the origins of religion, but it has survived the widespread rejection of that theory and now thrives as a label for a particular kind of religion. For E.B. Tylor (1871), the term “animism” summarizes his definition of religion as “belief in spiritual beings.” In its new application, animism now labels a type of religion comparable to other types (e.g., monotheism and polytheism). It is typically applied to religions that engage with a wide community of living beings with whom humans share this world or particular locations within it. It might be summed up by the phrase “all that exists lives” and, sometimes, the additional understanding that “all that lives is holy.” As such the term animism is sometimes applied to particular indigenous religions in comparison to Christianity or Islam, for example. It is also used as a self-definition by some indigenous people and some eco-pagans.

The application of the term animism no longer depends on notions about “spirits” or “supernatural” entities. It has been found helpful in drawing attention to ontologies and epistemologies in which life is encountered in a wide community of persons only some of whom are human. Certainly this new usage shares with Tylor’s discussion a concern with materiality and, in this, links animism to wider contestations, for example, about environmentalism and the dichotomous opposition of culture and nature.

In the language of classical European philosophy “person” refers principally to humans and deity. At various times, the question of the personhood of particular groups of humans (Africans and women in particular) has been problematic (e.g., in debates about the recognition and increasing application of human rights). Other beings (animals especially) are problematic in as much as some might be more or less like humans in particular ways (e.g., the feeling of pain, the use of language, or some indicator of intellect or agency) that seem to some theorists to justify the recognition of personhood and thus the extension or recognition of rights. Similarly, Piaget’s approach to childhood development (1933) seems to assume that reality is accurately described in English language’s use of gendered pronouns (“he” or “she”) for persons, in contrast to a wider range of inanimate objects (“it”). In this theory, children “naturally” project life onto inanimate objects until they reach a more advanced stage of development. Reference to European languages in which personal pronouns are applied to what native speakers of those languages also consider inanimate (e.g., chairs) may not necessarily falsify these notions, especially because the concomitant imputation of gender is neither considered nor meaningful. In these and similar ways, animism is problematic

in European-rooted worldviews and discourse. It simultaneously insists on the veracity of Western notions about personhood and materiality, while denigrating other understandings as childish and/or primitive. Those indigenous and environmentalist perspectives that might challenge such positions are thereby disabled and marginalized.

In Anishinaabemowin, the language of Anishinaabeg or Ojibwe people (Native Americans indigenous to the Great Lakes area), the grammatical animism of some words is indicative of something more profound. Here, words are not gendered as they are in European languages, but they are necessarily either “animate” or “inanimate.” This is certainly not a systematized or abstract complex, and speakers may not know why x is animate when y is inanimate, but it does arise from a broader culture in which one might speak *with* animate persons but only *about* inanimate objects. The possibility that gifts might be given to and received from those identified as animate persons is one indication of a “relational epistemology” (Bird-David 1999). Irving Hallowell’s (1960) discussion of Ojibwe ontology includes an important discussion with an unnamed “old man” about whether all rocks are alive and, since he avers that not all rocks are alive, how one might know which ones are. Contrary to the theories of Piaget (1933) and Guthrie (1993), this depends on more than the projection of personality or human-likeness onto allegedly inanimate objects. It is not just that some rocks “look human” (e.g., appearing to have a mouth), or that some are said to have moved of their own volition, but that some humans relate to some rocks in ways that indicate the recognition of life. These ways might include recognition of expressions of agency, will, intellect and so on, but are fundamentally about engagement in a cultural system of respect and reciprocity. Rocks are not mere “nature” in opposition to “culture” but are, or might be, persons who engage with other persons in particular ways. If humans give gifts to rocks, rocks not only receive gifts from humans but also give gifts that initiate relationships.

Nurit Bird-David (1999) has brought Hallowell’s discussion into relation with wider consideration of the relational constitution of persons and with her own research among the Nayaka of south India. Her exploration of this hunter-gatherer epistemology exemplifies the possibilities raised by the new use of the term animism as a challenge to previous approaches. Her work is parallel to that of Ken Morrison (1992) and other scholars of Native American religious traditions who point out that the privileging of spirit over matter, or supernatural over natural, has misdirected attention from the irrelevance of such dichotomies to those who engage religiously with this world. An even stronger critique is raised by Eduardo Viveiros de Castro who contrasts the Western notion that there is a singular nature and multiple cultures (hence multiculturalism) with Amazonian indigenous perspectives that there is a singular culture and multiple natures and therefore “multinaturalism.” While he sees “animism” as “the extension of [human] qualities to beings of other species” (i.e., a term compromised by its role in Tylor’s theory), his own discussion clearly dovetails with those cited above. It further contributes the important invitation to consider that “culture” is not the preserve of humans, but is evident (when seen as these indigenous peoples see things) among other-

than-human persons too. In this light, Western discourses about religions, especially shamanisms, in which “spirits” and “spirituality” are privileged, might be corrected from the animist perspective that everything that lives (and this is a wider category than is typically assumed in the West) is involved in culture.

In addition to anthropological research that discovers or theorizes animisms (in various ways) and categorizations of the world’s religions that include “animists,” it is instructive to consider animism in imaginative literatures. Three examples might suffice. In Alice Walker’s *The Color Purple* (1982) the heroine, Celie, finally stands up to her main abuser and finds that the elements are with her. Her statement, “I am here” can be read as foundational for Walker’s later autobiographical accounts of her own spiritual quest in which it is good to be “here.” In a very different style, Daniel Quinn’s didactic novels (beginning with *Ishmael*, 1995) provoke a consideration that the majority of human cultures are preferable to that of the West. These “leaver” societies assaulted by “taker” culture and its “totalitarian agriculture” demonstrate alternative ways to be human and encourage efforts to create better alternatives for the future. His animism is a principled evocation of the possibility that humanity might live as others live: leaving what is not needed now for others or ourselves to share in the future, going beyond the discourse of sustainability to the celebration of diverse modes of engaging with the world. Central to these novels, once again, is a debate about the commonalities and diversities of culture(s) and nature(s). Finally, in this brief introduction to recent literatures of animism, much Fantasy Fiction suggests that the world is inhabited by a wide range of autonomous living beings with their own interests and concerns. Whether these be speaking trees or elusive elves, it seems that life (including communication, intelligence, suffering, joy and so on) is to be found everywhere in this and any possible otherworlds. These literatures not only explore but encourage imaginative engagements with the world that can be labeled “animist.”

Indigenous, anthropological, fictional and philosophical writings all provide material for a reconsideration of animism. Confronted by the diminishment of ecological diversity, by assaults on “natural environments” and by the seemingly ever-increasing dominance of humanity over this planet, there are those who find the term “animism” helpful in recognizing alternatives. Eco-pagans are significant among the environmentalists whose activism arises from animist perspectives. They are activist not primarily because human life may become untenable if such anti-ecological lifeways continue, nor because a creator deity requires an account of how humans have executed their stewardship of the planet. Animist ecoPagans are primarily on the front lines confronting road building, quarrying, clear-cutting and other exploitative actions, because the community of life is threatened. It is not that only humans can protest or act – although the sight of a human lying in the mud in front of a bulldozer may be a more powerful preventive of destruction than that of a mere animal or plant. In the understanding of many such activists, protest venues might be a location in which humanity confronts itself with conflicting assessments of its place in the scheme of things. Over against the notion that everything is a resource for humanity’s benefit (provided either by

God or nature) is the understanding that humans are only one species among those whose lives and cultures require sustenance and support. Animists may be inspired by experiences of the participation of elusive otherworld beings, but their primary motive is the celebration of seemingly more mundane relationships.

Tylor's theory of animism has been rejected by most. But contemporary animists do not offer assertions about the origins, development and true nature of all religion, but a focused discussion about particular ways of being related to the world. Like the earlier theory it is entangled with notions of materiality, but now this arises from a challenge to discourses that divide spirit and flesh, soul and body, subject and object, life and matter, supernatural and natural, culture and nature, people and environment, community and resources, and so on. In dialogue with particular indigenous ontologies, epistemologies and cosmologies, the new animism contests modernist preconceptions and invites the widening of relational engagements generated and enhanced by gift exchanges and other forms of mutuality. In both indigenous and Western forms, animism encourages humans to see the world as a diverse community of living persons worthy of particular kinds of respect.

Animism is, however, more than the recognition of life in those otherwise considered inanimate. This would continue to prioritize what is exceptional to the West and ignore what is self-evident to those who might appropriately be named "animists." In the end, the recognition of life is far too simple to be generative. What is important is the mutual recognition of the ability to reciprocate, relate and engage. Animists are people who encounter other persons, only some of whom are human, as cultural beings. Their various engagements with what might otherwise be considered the environment or nature constitutes a complex of cultural relationships with a large and diverse community. Such worldviews and lifeways proffer exciting possibilities for underpinning relationships with the other-than-human world that contrast dramatically with what is now normal or natural in modernity. Animism promises the enrichment of human cultures by fuller engagement with what is too often taken as background or resource-available to the construction of culture. Instead, animists are those who seek cultures of relationship rooted and expressed in respectful relationships.

Animism – Humanity’s Original Religious Worldview

By the middle of the nineteenth century, the mere fact of evolution had been around for a good long while. Fossil evidence made it clear that species had undergone evolutionary change from ancient times to the present, and most thinkers of the time were perfectly content to leave it at that. The absence of a theory to explain evolutionary change was not felt by them, not experienced as a pressure, as it was by Charles Darwin. The fact alone wasn’t sufficient for him. He wanted to know *why* species had evolved over time. He knew there had to be some intelligible mechanism or dynamic that would account for it, and this is what he went looking for – with well known results. In his *Origin of Species*, he wasn’t announcing the *fact* of evolution, he was trying to make *sense* of the fact.

In my mid-twenties I began to feel a similar sort of pressure, but it was a vague and undirected one. The modern Age of Anxiety – the anxiety we’re all quite used to living with today – was just being born. In her book *Silent Spring* (1962) Rachel Carson enunciated a startlingly new idea: the pollutants we were so prodigiously pouring into the world didn’t just obligingly vanish, they produced changes, and these changes had consequences – very possibly catastrophic ones. Of course everyone takes this for granted now, but at the time this was devastating news. In his book *The Population Bomb* (1968) Paul Ehrlich pointed out that at our present rate of growth, we were going to make the Earth uninhabitable to our own species within a century. Again, a commonplace idea today, but not so then. Overshadowing these things was the fact that we all lived from day to day with the knowledge that at any moment nuclear devastation could rain down on American cities, to be answered by a rain of nuclear devastation on Soviet cities. The end of civilization – perhaps even of human life itself – was a button-push away.

I wasn’t satisfied with the conventional explanation of all this, which is that we’ve ended up badly because of the Industrial Revolution. To my mind, this is like saying that Hamlet ended up badly because he took on Laertes in a fencing match. To understand why Hamlet ended up badly, you can’t just look at the last ten minutes of his life, you have to go right back to the beginning of his story. I felt a pressure to do the same with us.

But where is the beginning of our story? This isn’t a difficult question to answer. Every schoolchild learns that our story began about 10,000 years ago with the Agricultural Revolution. This isn’t the beginning of the *human* story, but it’s certainly the

beginning of *our* story. It was from this beginning that all the wonders and horrors of our civilization grew.

Everyone is vaguely aware that there have been two ways of looking at the Agricultural Revolution within our culture, two contradictory stories about its significance. The standard version – the version taught in our schools – goes something like this. Humans had been around for a long time, three or four million years, living a miserable and shiftless sort of life for most of that time, accomplishing nothing and getting nowhere. But then about 10,000 years ago it finally dawned on folks living in the Fertile Crescent that they didn't have to live like beavers and bears, making do with whatever food happened to come along; they could cultivate their own food and thus control their own destiny and well-being. Agriculture made it possible for them to give up the nomadic life for the life of farming villagers. Village life encouraged occupational specialization and the advancement of technology on all fronts. Before long, villages became towns, towns became cities, and cities were gathered into kingdoms and empires. Trade connections, elaborate social and economic systems, and literacy soon followed, and *there we went*. All these advances were based on – and impossible without – agriculture, manifestly humanity's greatest blessing.

The other story, a much older one, is tucked away in a different corner of our cultural heritage. It too is set in the Fertile Crescent and tells a tale of the birth of agriculture, but in this telling agriculture isn't represented as a blessing but rather as a curse: a punishment for a crime whose exact nature has always profoundly puzzled us. I'm referring, of course, to the story told in the third chapter of Genesis, the Fall of Adam.

Both these stories are known to virtually everyone who grows up in our culture, from Boston to Beirut to Beijing, including every historian, philosopher, theologian, and anthropologist. But like most thinkers of the midnineteenth century, who were content with the mere fact of evolution and felt no pressure to explain it, all these historians, philosophers, theologians, and anthropologists seem perfectly content to live with these two contradictory stories. The conflict is manifest but, for them, demands no explanation.

For me, it did. As evolution demanded of Darwin a theory that would make sense of it, the story in Genesis demanded of me a theory that would make sense of it.

There have traditionally been two approaches to Adam's crime and punishment. The text tells us Adam was invited to partake of every tree in the garden of Eden except one, mysteriously called the tree of the knowledge of good and evil. As we know, Adam succumbed to the temptation to sample the fruit of this tree. In one approach, the crime is viewed as simple disobedience. From this point of view, the selection of the knowledge of good and evil for interdiction seems entirely arbitrary. God might just as well have chosen the knowledge of war and peace or the knowledge of pride and prejudice. The point was simply to forbid Adam *something* in order to test his obedience. Under this approach, Adam's punishment – banishment from Eden to live by the sweat of his brow as a farmer – was in effect just a spanking; it doesn't

“fit the crime” in any particular way. This is presumably the punishment he would have received no matter what test he failed.

The second approach attempts to make some sort of connection between Adam’s crime and his punishment. Under this approach, Eden is conventionally viewed as a metaphor for the state of innocence, which is lost when Adam gains the knowledge of good and evil. This makes sense, but only if the knowledge of good and evil is understood as a metaphor for knowledge that destroys innocence. So with roughly equivalent metaphors at either end, the story is reduced to banality: Adam lost his innocence by gaining knowledge that destroyed his innocence.

The story of the Fall is coupled with a second that is equally famous and equally baffling, the story of Cain and

Abel. As conventionally understood, these two brothers were literal individuals, the elder, Cain, a tiller of the soil, and the younger, Abel, a herder. The improbability that two members of the same family would embrace lifestyles that were completely antithetical should tip us off to the fact that these were not individuals but emblematic figures, just as Adam was (*Adam* merely being the Hebrew word for *Man*).

If we understand these as emblematic figures, then the story begins to make sense. The firstborn of agriculture was indeed the tiller of the soil, as Cain was said to be the firstborn of Adam. This is an undoubted historical fact. The domestication of plants is a process that begins the day you plant your first seed, but the domestication of animals is a process that takes generations; wild animals don’t become tame overnight, so the herder Abel was indeed the second-born – by centuries, if not millennia (another reason to be skeptical of the notion that Cain and Abel were literally second-generation brothers). A further reason for skepticism on this point is the fact that the farmers and herders of the period occupied adjacent but distinctly different regions of the Near East. Farming was the occupation of the Caucasian inhabitants of the lush Fertile Crescent. Herding was the occupation of the Semitic inhabitants of the Arabian Peninsula to the south. Another piece of background that needs to be understood is that in very ancient times the farming lifestyle was radically different from the herding lifestyle. Tillers of the soil were by the very nature of their work settled villagers; but herders (by the very nature of *their* work) were nomads, just as many present-day herding peoples are. The herding lifestyle was closer to the hunting- gathering lifestyle than it was to the farming lifestyle.

As the farming peoples of the north expanded, it was inevitable that they would confront their Semitic herding neighbors to the south, perhaps in what is now Iraq – with the predictable result. As they have done from the beginning to the present moment, the tillers of the soil needed more land to put to the plow, and as they have done from the beginning to the present moment, they took it. As the Semites saw it (and it is of course their version of the story that we have in Genesis), the tiller of the soil Cain was watering his fields with the blood of Abel the herder.

That the version we have is the Semitic version explains the central mystery of the story, which is why God rejected Cain’s gift but accepted Abel’s. Naturally, this is the

way the Semites *would* see it. In essence, the story says, “God is on our side. God loves us and the way we live but hates the tillers of the soil and the way they live.”

With these provisional understandings in place, I was ready to offer a theory about the first part of the story, the story of Adam’s Fall. What the Semitic authors knew was only the *present* fact that their brothers from the north were encroaching on them in a murderous way. They hadn’t been physically present in the Fertile Crescent to witness the actual birth of agriculture; this was an event that may have occurred hundreds of years earlier, perhaps even thousands of years earlier. All that was clear to them was that some strange development had saddled their brothers to the north with a laborious lifestyle and had turned them into murderers, and they could only suppose that this development was a catastrophe of some kind.

What they observed about their brothers to the north was this peculiarity: they seemed to have the strange idea that they knew how to run the world as well as God. This is what marks them as our cultural ancestors. As we go about our business of running the world, we have no doubt that we’re doing as good a job as God, if not better. Obviously God put a lot of creatures in the world that are superfluous and even baneful, and we’re quite at liberty to get rid of them. We know where the rivers should run, where the swamps should be drained, where the forests should be razed, where the mountains should be leveled, where the plains should be scoured, where the rain should fall. To us, it’s perfectly obvious that we have this knowledge.

In fact, to the authors of the stories in Genesis, it looked as if their brothers to the north had the bizarre idea that they had eaten at *God’s own tree of wisdom* and had gained the very knowledge that God uses to rule the world. And what knowledge is this? It is a knowledge that only God is competent to use, the knowledge that every single action that he might take – no matter what it is, no matter how large or small – is good for one but evil for another. If a fox goes out to stalk a pheasant, it’s in the hands of God whether she will catch the pheasant or the pheasant will escape. If God gives the pheasant to the fox, then this is good for the fox but evil for the pheasant. If God allows the pheasant to escape, then this is good for the pheasant but evil for the fox. There is no outcome that is good for both. The same is true in every area of the world’s governance. If God allows an early thaw and the valley is flooded, then this is good for some but evil for others. If God holds back the thaw then this too will be good for some but evil for others.

Decisions of this kind are clearly at the very root of what it means to rule the world, and the wisdom to make them cannot possibly belong to any mere creature, like Man, for any creature making such decisions would inevitably say, “Every choice I make will be good for me but evil for all others.” And of course this is precisely how the agriculturalist operates, saying,

If I scour this plain to plant food for myself, then this will be evil for all the creatures that inhabit the plain, but it’ll be good for me. If I raze this forest to plant food for myself, then this will be evil for all the creatures that inhabit the forest, but it’ll be

good for me. If I kill off all the predators who might attack my herds or my flocks, then this will be evil for them but good for me.

What the authors of the stories in Genesis perceived was that their brothers to the north had taken into their own hands the rule of the world; they had usurped the role of God. Those who let God run the world and take the food that he has planted for them have an easy life. But those who are not content with the way God runs the world and want to run it themselves must necessarily plant *their own* food, must necessarily make their living by the sweat of their brow. As this makes plain, agriculture was not the crime itself but rather the result of the crime, the punishment that must inevitably follow such a crime. It was wielding the knowledge of good and evil that had turned their brothers in the north into farmers – and into murderers (for murder comes easy to those who think they know how to run the world better than God).

But these were not the only consequences to be expected from Adam's act. The fruit of the tree of the knowledge of good and evil is harmless to God but deadly to Man. It seemed to the authors of these stories that usurping God's role in the world would be the very death of Man.

And so it seemed to me when I finally worked all this out in the late 1970s. This investigation of the stories in Genesis was not, for me, an exercise in biblical exegesis. I'd gone looking for a way to understand how in the world we'd brought ourselves face to face with death in such a relatively short period of time – ten thousand years, a mere eye-blink in the lifespan of our species – and had found it in an ancient story that we long ago adopted as our own and that remained stubbornly mysterious to us as long as we insisted on reading it as if it *were* our own. When examined from a point of view *not* our own, however, it ceased to be mysterious and delivered up a meaning that not only would have made sense to a beleaguered herding people seven or eight thousand years ago but that would also make sense to the beleaguered people of the late twentieth century.

As far as I was concerned, the authors of this story had gotten it right. In spite of the terrible mess we've made of it, we *do* think we can run the world, and if we continue to think this, it *is* going to be the death of us.

In case it isn't evident, I should add that my reading of Genesis is, of course, only a theory. This is what creationists say of evolution, that it's "only a theory, it hasn't been proved," as though this in itself is grounds for dismissal. This misrepresents the point of formulating a theory, which is to make sense of the evidence. So far, Darwin's theory remains the best way we've found to make sense of the evidence, and my own theory has to be evaluated in the same way. Does it make sense of the evidence – the stories themselves – and does it make more sense than any other theory?

But solving this particular riddle only began to alleviate the pressure I felt for answers that were not being looked for at any level of our culture. The philosophical and theological foundations of our culture were laid down by people who confidently believed that Man had been *born* an agriculturalist and civilization builder. These things were as instinctive to him as predation is to lions or hiving is to bees. This

meant that, to find and date Man's birth, one had only to look for the beginnings of agriculture and civilization, and these were obviously not very far back in time.

When in 1650 Irish theologian James Ussher announced the date of creation as 23 October 4004 B.C.E., no one laughed or scoffed, or if they did, it was because of the absurd exactitude of the date, not because the date was absurdly recent. In fact, 4004 B.C.E. is quite a serviceable date for the beginning of what we would recognize as civilization. This being the case, it's hardly surprising that, for people who took it for granted that Man began building civilization almost as soon as he was created, 4004 B.C.E. would seem like a perfectly reasonable date for his creation.

But all this was soon to change. By the middle of the nineteenth century the accumulated evidence of many new sciences had pushed nearly every date in sight back by many orders of magnitude. The universe and the Earth were not thousands of years old, they were billions of years old. The human past extended back millions of years beyond the appearance of agriculture and the birth of civilization. Only those who clung to a very literal reading of the biblical creation story rejected the evidence; they saw it as a hoax perpetrated on us either by the devil (to confound us) or by God (to test our faith). For those who accept the evidence of science, however, the notion that Man had been born an agriculturalist and civilization builder had been rendered totally untenable. He had very definitely not been born either one.

This meant that the philosophical and theological foundations of our culture had been laid by people with a profoundly erroneous understanding of our nature, our origins, and our history. It was therefore urgently important to reexamine these foundations and if necessary to rebuild them from the ground up. Except, of course, that no one at all thought this was urgently important – or even slightly important. So human history extended millions of years back beyond the birth of agriculture. Who cares? No one in the ranks of philosophers or theologians felt the sort of pressure that had moved Darwin to go *beyond* mere acceptance of the fact. Pierre Teilhard de Chardin managed to look at the facts and conclude that the phenomenon of Man was still the central event in cosmic history, so the foundations were intact. But then he had a vested interest in preserving those foundations. Even so, his superiors told him in no uncertain terms to leave the matter alone.

In the last century we gained an understanding of the human story that made nonsense of everything we'd been telling ourselves for upwards of three thousand years, but our settled understandings remained completely unshaken. So what that Man had not been born an agriculturalist and a civilization builder? He was certainly born *to become* an agriculturalist and a civilization builder. It was beyond question that this was our foreordained destiny, and the way we live is the way humans were *meant* to live from the beginning of time. And indeed we must *go on* living this way – even if it kills us.

Facts that were indisputable to all but biblical literalists had radically repositioned us not only in the physical universe but in the history of our own species. That we had been repositioned was all but universally acknowledged, but no one felt any pressure

to develop a theory that would make sense of the fact, the way Darwin had made sense of the fact of evolution. I did.

In *Ishmael* I made the point that the conflict between the emblematic figures Cain and Abel didn't end six or eight thousand years ago in the Near East. Cain the tiller of the soil has carried his knife with him to every corner of the world, watering his fields with the blood of tribal peoples wherever he found them. He arrived here in 1492 and over the next three centuries watered his fields with the blood of millions of Native Americans. Today, he's down there in Brazil, knife poised over the few remaining aboriginals in the heart of that country.

I sent a copy of the book to a friend who, by chance, is a historian. He came back to me with a challenge: *How do you know that humans were living tribally 10,000 years ago?* This is an entirely valid question, which I answered this way: *How do you know that wolves were living in packs 10,000 years ago? That whales were living in pods 10,000 years ago? That geese were living in flocks 10,000 years ago? That baboons were living in troops 10,000 years ago? That bison were living in herds 10,000 years ago? That bees were living in hives 10,000 years ago?* Well, of course you don't, and you can't. Social organizations – and that's what we're talking about here – leave no fossils. In the total absence of contrary evidence, however, it's entirely legitimate to assume that wolves, whales, geese, baboons, bison, and bees did not just recently begin living in packs, pods, flocks, troops, herds, and hives. It's legitimate for much the same reason that it's legitimate to assume that the universe did not just recently begin expanding. It's perfectly conceivable – but not at all credible – that the universe just began expanding in the year 1776.

Everything we're able to observe about the world and the universe indicates that things that work don't capriciously change the way they work. It would be absurd to suppose that wolves originally evolved in hives but then capriciously began living in packs instead, that bees originally evolved in troops but then capriciously began living in hives instead. On the contrary, the only thing that makes sense is to assume that the reason we see wolves living in packs today is that they evolved in packs, that the reason we see bees living in hives today is that they evolved in hives. It's self-evident that no species emerges by failing. Every species emerges by succeeding, and natural selection rewards success with stability and longevity. This is why we must assume that hiving for bees represents the success that allowed bees to emerge as a species in the first place.

In the fifteenth century, for the first time, we began systematically exploring the territory beyond the civilized world, and everywhere we went we found people living in tribes – in every region of every continent. We found the occasional civilization as well, of course, but again, wherever we did not find civilization, we found people living in tribes, and there was no doubt in our minds that this social organization predated our own – was more “primitive” than our own.

The tribe among aboriginal peoples is as universal as the flock among geese, and I doubt if any anthropologist questions that it was humanity's original social organiza-

tion. We didn't evolve in troops or hordes or bands. Rather, we evolved in a social organization that was peculiarly human, that was uniquely successful for *culture-bearers*. It's as reasonable to assume that we evolved as tribal beings as it is to assume that bees evolved as hiving beings. The tribe was successful for humans, which is why it was still universally in place throughout the world three million years later. That it was successful doesn't, by the way, mean it was invulnerable. If we were to explode a hydrogen bomb in the interior of Brazil, we would wipe out hundreds of thousands of species totally, but it would hardly be reasonable to conclude that these species were unsuccessful because they couldn't survive a nuclear explosion.

Our first look into the human past presents us with a resounding challenge to the notion that the way we live was the way humans were somehow *meant* to live from the beginning of time. We *can* live in this hierarchical organization called civilization, just as lions can live in captivity, but saying that this was our inescapable destiny is not much more sensible than saying that the zoo was the inescapable destiny of lions. The tribal organization was natural selection's gift to humanity in the same way that the flock was natural selection's gift to geese.

The elemental glue that holds any tribe together is tribal law. Though this is easy to say, it's less easy to understand, because the operation of tribal law is entirely different from the operation of our law. *Prohibition* is the essence of our law, but the essence of tribal law is *remedy*. Misbehavior isn't outlawed in any tribe. Rather, tribal law prescribes what must happen in order to minimize the effect of misbehavior and to produce a situation in which everyone feels that they've been made as whole as possible. Members of the tribe view their laws as inherently friendly to them, invariably geared to make things better for them, collectively and individually, never worse. For us, of course, the law is an enemy. Collectively, perhaps, it's possible for us to view the law as society's friend, but for each of us individually, the law is an enemy always poised to pounce on us. This doesn't have to be pointed out to anyone who happens to belong to a racial or ethnic group that's subject to police profiling. But it's true for all of us to a degree. A momentary loss of control or lapse in judgment, a stupid action taken in panic, even an innocent gesture taken the wrong way can put you behind bars.

In *The Story of B I* I described in detail how adultery is handled among the Alawa of Australia. If you have the misfortune to fall in love with another man's wife or another woman's husband, the law doesn't say, "This is prohibited and may not go forward." It says, "If you want your love to go forward, here's what you must do to make things right with all parties and to see to it that marriage isn't cheapened in the eyes of our children." It's quite an elaborate process, but it works remarkably well. What makes it even more remarkable is that the process was not worked out in any legislature or by any committee. It's another gift of natural selection. Over countless generations of testing, no better way of handling adultery has been found or even conceivably could be found, because – behold! – it *works*! It does just what the Alawa want it to do, and no one tries to evade it. Even adulterers don't try to evade it – that's how beautifully it works.

Some tribes live under laws that seem grotesque to us, but they don't ask us to live under them. Those laws work for *them* – or they wouldn't be in place. No tribe has ever been found where the people hate their tribal laws. Doubtless there have been tribes where people came to be dissatisfied with their laws, but if so, those tribes have disappeared. In a very real sense, dysfunctional tribes are eliminated by natural selection in the same way dysfunctional species are.

One of the virtues of tribal law is that it presupposes that people are just the way we know they are: generally wise, kind, generous, and well intentioned but perfectly capable of being foolish, unruly, moody, cantankerous, selfish, greedy, violent, stupid, bad-tempered, sneaky, lustful, treacherous, careless, vindictive, neglectful, petty, and all sorts of other unpleasant things. Tribal law doesn't punish people for their shortcomings, as our law does. Rather, it makes the management of their shortcomings an easy and ordinary part of life, which is why the tribe has worked so well for so long.

But during the developmental period of our hierarchical civilization, all this changed very dramatically. Tribal peoples began to come together in larger and larger associations, and one of the casualties of this process was tribal law. If you take the Alawa of Australia and put them together with the Gebusi of New Guinea, the Bushmen of the Kalahari, and the Yanomami of Brazil, they are very literally not going to know how to live. None of these tribes is going to embrace the laws of the others, which may not only be unknown to them but also be incomprehensible to them. How then are they going to handle mischief that occurs among them? The Gebusi way or the Yanomami way? The Alawa way or the Bushman way? Multiply this by a hundred, and you'll have a fair approximation of where people stood in the early millennia of our own cultural development in the Near East.

When you gather up a hundred tribes and expect them to work and live together, tribal law becomes inapplicable and useless. But of course the people in this amalgam are the same as they always were: capable of being foolish, moody, cantankerous, selfish, greedy, violent, stupid, bad-tempered, and all the rest. In the tribal situation, this was no problem, because tribal law was *designed* for people like this. But all the tribal ways of handling these ordinary human tendencies had been expunged in our burgeoning civilization. A new way of handling them had to be invented – and I stress the word *invented*. There was no received, tested way of handling the mischief people were capable of. Our cultural ancestors had to make something up, and what they made up were lists of *prohibited* behavior.

Very understandably, they began with the big ones. They weren't going to prohibit moodiness or selfishness. They prohibited things like murder, assault, and theft. Of course we don't know what the lists were like until the dawn of literacy, but you can be sure they were in place, because it's hardly plausible that we murdered, robbed, and thieved with impunity for five or six thousand years until Hammurabi finally noticed that these were rather disruptive activities.

When the Israelites escaped from Egypt in the thirteenth century B.C.E., they were literally a lawless horde, because of course they'd left the Egyptian list of prohibitions

behind. They needed their own list of prohibitions, which God in his thoughtful way provided – the famous ten. But of course ten didn't do it. Hundreds more followed.

No number has ever done it for us. Not ten, not a hundred, not a thousand, not ten thousand, not a hundred thousand. I have no idea how long the list is by now, but I suspect it runs into the millions, and every single year we pay our legislators to come up with more. But no matter how many prohibitions we come up with, they never do the trick, because no prohibited behavior has ever been eliminated by passing a law against it. Every time someone is sent to prison or executed, this is said to be "sending a message" to miscreants, but for some strange reason the message never arrives, year after year, generation after generation, century after century. Naturally, we consider this to be a very advanced system.

No tribal people has ever been found that claimed *not* to know how to live. On the contrary, anthropologists find them to be completely confident that they know how to live. But with the disappearance of tribal law among us, people began to be acutely aware of not knowing how to live. A new class of specialists came to be in demand, their specialty being the annunciation of how people are supposed to live. These specialists we call prophets.

Naturally it takes special qualifications to be a prophet. You must by definition know something the rest of us don't know, something the rest of us are clearly unable to know. This means you must have a source of information that is beyond normal reach – or else what good would it be? A transcendent vision will do, as in the case of Siddhartha Gautama. A vision led Joseph Smith to the hidden scriptures known as the *Book of Mormon*. A dream will do, provided it comes from God. But best of all, of course, is direct, personal, unmediated communication with God. The most persuasive and most highly valued prophets, the ones that are worth dying for and killing for, have the word directly from God.

But isn't it true (people sometimes ask) that tribal peoples have claimed to have prophets as well? Yes, absolutely, but only when their tribal culture has been destroyed by contact with us; they no longer know how to live and so need the services of a prophet. One of the most famous of these was Wovoka, to whom the means of salvation for his people were revealed in a series of dreams or visions; his Ghost Dance religion would defeat the white man and restore the land to the natives of America. Although some tribal peoples attribute their laws to culture heroes in the distant past, that's all it is, an attribution, rather like the attribution of fire to Prometheus. They don't consult these heroes about how to live (the way we consult our prophets) any more than the Greeks consulted Prometheus about how to start a fire. They don't have to consult them, because they themselves know how to live. The knowledge is in *them*, not in some remote and inaccessible being.

The appearance of religions based on prophetic revelations is unique to our culture. We alone in the history of all humanity needed such religions. We still need them (and new ones are being created every day), because we still profoundly feel that we don't

know how to live. Our religions are the peculiar creation of a bereft people. Yet we don't doubt for a moment that they are the religions of humanity itself.

This belief was not an unreasonable one when it first took root among us. Having long since forgotten that humanity was here long before we came along, we assumed that we were humanity itself and that our history was human history itself. We imagined that humanity had been in existence for just a few thousand years – and that God had been in communication with us from the beginning. So why *wouldn't* our religions be the religions of humanity itself?

When it became known that humanity was millions of years older than we are, no one thought it odd that God had remained aloof from the thousands of generations that had come before us. After all, these were mere savages, unworthy of his attention. The philosophers and theologians of the nineteenth and twentieth centuries weren't troubled by the fact that God disdained to reveal himself until we came along. The fact alone was enough for them, and they felt no pressure to develop a theory to make sense of it. For Christians, it had long been accepted that Christianity was humanity's religion (which is why all of humanity had to be converted to it, of course). It was an effortless step for thinkers like Teilhard de Chardin and Matthew Fox to promote Christ from humanity's Christ to the Cosmic Christ.

On examination of the historical record, however, it seemed to me that there once *was* a religion that could plausibly be called the religion of humanity. It was humanity's first religion and its only universal religion, found wherever humans were found, and it was plausible to suppose that it had been in place for tens of thousands of years. Christian missionaries encountered it wherever they went, and piously set about destroying it. By now it has been all but stamped out either by missionary efforts or more simply by exterminating its adherents. If I am the first to nominate it the most reasonable candidate to stand as the religion of humanity, I certainly take no pride in this, since it's been in plain sight to us for hundreds of years.

Of course it isn't accounted a "real" religion, since it isn't one of ours. It's just a sort of half-baked "prereligion." How could it be anything else, since it emerged long before God decided humans were worth talking to? It wasn't revealed by any accredited prophet, has no dogma, no evident theology or doctrine, no liturgy, and produces no interesting heresies or schisms. Worst of all, as far as I know, no one has ever killed for it or died for it – and what sort of religion is that? Considering all this, it's actually remarkable that we even have a name for it.

The religion I'm talking about is, of course, animism. The name is our invention, derived from the Latin word for soul or spirit. It came to be applied to the religious notions of primitive peoples in the 1860s and 1870s. An early definition was supplied by Sir Edward Tyler in his book *Primitive Culture*:

Animism is the doctrine which places the sources of mental and even physical life in an energy independent of, or at least distinct from, the body. From the point of view of the history of religions, the term is taken, in the wider sense, to denote the belief in the existence of spiritual beings, some attached to bodies of which they constitute the

real personality (souls), others without necessary connection with a determinate body (spirits) (Tyler in Anderson 1950: 9).

I frankly haven't any idea what that means, and I doubt if you could find anyone to explain it to you in the jungles of Brazil or New Guinea. When that definition was cobbled together, missionary reports were pretty thick on the ground, but objective anthropological field studies were as yet nonexistent. After decades of trying to understand what so-called primitive people were trying to tell us about their lives and their vision of humanity's place in the world, I concluded that a very simple worldview was at the foundation of everything they were saying: *The world is a sacred place, and humanity belongs in such a world.*

It's simple but also deceptively simple. This can best be seen if we contrast it with the worldview at the foundation of what our own religions tell us. In the worldview of our religions, the world is anything but a sacred place. For Christians, it's merely a place of testing and has no intrinsic value; it's revealingly said that Satan is the Prince of the World. For Buddhists the world is a place where suffering is inevitable. If I oversimplify, my object is not to misrepresent but only to clarify the general difference between the animist worldview and the worldviews of our culture's religions.

For Christians, the world is not where humans *belong*; it's not our true home, it's just a sort of waiting room where we pass the time before moving on to our true home, which is heaven. For Buddhists, the world is another kind of waiting room, which we visit again and again in a repeating cycle of death and rebirth until we finally attain liberation in the state of nirvana. For Christians, if the world *were* a sacred place, we wouldn't belong in it, because we're all sinners; God didn't send his onlybegotten son to make us worthy of living in a sacred world but to make us worthy of living in heaven. For Buddhists, if the world were a sacred place, then why would we hope to escape it? If the world were a sacred place, then would we not rather welcome the repeating cycle of death and rebirth?

From the animist point of view, humans belong in a sacred place because they themselves are sacred. Not sacred in a special way, not *more* sacred than anything else, but merely *as* sacred as anything else – as sacred as bison or salmon or crows or crickets or bears or sunflowers.

I sometimes encounter those who resent the idea that our ancestors may have gotten in ahead of us, may have possessed a more sublime vision of the world and humanity's place in it than any of ours. They'll ask, "Well, isn't this just paganism?" or "Isn't this just pantheism?" Meaning, didn't we come up with the same thing? I quarrel with no one's answer to this question, but my own answer is no. Paganism, derived from the Latin word for *country-dweller*, is a farmer's religion and developed from farmers' concerns for the fertility of their land and animals, spawning one god after another to look after one thing after another when appropriately compensated through one kind of a sacrifice or another. If animism were kin to paganism, I'd expect to see it producing similar results, but

I've never done so. Varying widely in its details from people to people, animism doesn't automatically posit the existence of one God or many gods or any gods at all. Pantheism declares not only that a specifically singular God exists but that *everything* is God. If anthropological studies of them are to be trusted, tribal animists have no taste for such dogmatic speculations about the nature of God, so I see no grounds for equating animism with pantheism.

The religions of our culture – the so-called Major Religions – are very much ours (and not humanity's), because they answer our particular needs, providing us with ways to rationalize the immutable condition of inequity we experience. Why do a few of us enjoy lives of wealth, power, ease, and luxury while the masses endure lives of poverty, helplessness, toil, and squalor?

Different rationales for this condition developed in the East and West. In the East, under the theory of karma, one's sins and virtues are punished or rewarded in this and subsequent lives; thus if you're born to the life of an untouchable in Bhaktapur, India, where you can never hope to rise to any occupation above cleaning latrines, you have no one to blame but yourself. You have no grounds to envy or hate the Brahmans who shun and despise you; their life of felicity and leisure is only what they deserve, just as your life of poverty and misery is only what you deserve. In this way the arrangement of people into high, middle, and low classes is shown to be justice made manifest in a divinely ordered universe. Buddhism may be seen as offering relief from this rigid posture of resignation to one's lot. Buddha assured his followers that the poor and downtrodden are (or ultimately will be) better off than the rich and powerful, who will find it almost impossible to attain salvation. The poor can live most happily, Buddha said, possessing nothing and living on joy alone, like the radiant gods.

In the West a different rationale was offered by the religions of the Abrahamic tradition – Judaism, Christianity, and Islam. The meek (that is, the suffering poor) will inherit the Earth, Jesus said, and the kingdom of God will turn the hierarchy upside down; the kingdom of God will belong to the poor, not to the rich, and rulers and ruled will change places, making the first last and the last first. Jesus and Buddha agree that, contrary to appearances, riches don't make people happy. Rather, says Buddha, riches just make them greedy. And the poor shouldn't envy the rich their treasures, which are always subject to being stolen by thieves or eaten up by moths and rust; rather, Jesus says, they should accumulate incorruptible treasures in heaven.

Humanity lived for three or four million years without needing rationales like these, since in the tribal organization – notably nonhierarchical – when times are bad all suffer alike, and when times are good all flourish alike. For two hundred thousand generations of our species, religions like ours not only didn't exist, they would also have been superfluous and incomprehensible.

Anishnabeg Culture

The Algonkian-speaking Anishnabeg (meaning “human beings”) of the Great Lakes region of North America includes speakers of the Odawa (Ottawa), Ojibwe (Chippewa) and Potawatomi dialects, now known among themselves as the Three Fires, as well as the Algonquins, to their east. Sharing major features of their religion, language and culture are the Cree who live to their north and west, and the various native peoples who live north and south of the St. Lawrence River, as well as Labrador and Newfoundland; more distantly related are the Pikuni (Blackfoot, Blood), who live east of the northern Rockies.

The Anishnabe reserves (Canada) and reservations (United States) are now located in Minnesota, Wisconsin, Michigan, Manitoba and Ontario. Their migration myth speaks of moving from the Atlantic coast along the St. Lawrence River to the Great Lakes. In pre-contact times, the Anishnabeg lived not only in the above areas but along the Atlantic seaboard and the Midwest (Ohio, Illinois, Kentucky) of the present-day United States. In the latter areas, they practiced horticulture and lived in settlements.

Before the effects of contact with Europeans, the Great Lakes Anishnabeg lived a semi-nomadic hunting-gathering lifestyle, traveling by canoe and snowshoe over an established yearly round; for example, traveling to maple forests in early spring when the sap runs and particular lakes in early fall when the “wild rice” ripens. Many traded with more settled peoples, such as the Iroquoian-speaking Wyandot (Hurons), exchanging dried meat and hides for corn and tobacco. Some carried out small-scale horticulture on their own, where the soil and climate was suitable. Some mined copper in shallow pits. Hence, they were familiar not only with towns, but with urban, mercantile centers, such as Cahokia, across the Mississippi from present-day St. Louis, long before Europeans arrived on the scene.

For these people, as hunting-gathering cultures everywhere, “religion,” “spirituality” and “nature” are meaningless terms, for each term would include every aspect of their lives; hence, these words do not denote anything distinguishable, in and of themselves. It is impossible for modern humans to fully appreciate what it meant to live in a situation where everything perceivable is undomesticated nature and every facet of nature is individually numinous. Hence, virtually everything observed or done involved a spiritual, ritual interaction with a *manido* (spirit/deity); all one’s neighbors shared the same understanding; and one’s language reflected these understandings in nuanced, complex ways. Let us, however, attempt to generalize from the contemporary hermeneutic as to how we humans understood the environment as hunter-gatherers.

The world around one – sun, moon, stars, Earth, rivers and lakes, animals, fish, trees, plants, stones (those that are animate), etc. – consists of numinous relatives; we live amidst the divine. These relatives are all more powerful than humans, for humans depend on them for life, but they do not need humans to survive. We need these relations to sacrifice themselves for the many things we require: branches and bark for shelter (wigwams), canoes, baskets and firewood; skin, flesh, bones and sinews for clothing, food, tools and thread; berries, seeds (wild grains), sap and tubers for food, medicine, glue and waterproofing. We encourage our relatives to give themselves to us for these needs by crying to them, asking them to pity us and give us their lives so we may live; in turn, we reciprocate by giving them symbolic gifts, especially tobacco, by honoring them through rituals, by always speaking to them respectfully, and by never wasting their precious gifts. For if we do not, they may not listen to us again or may not come back to life so that they can again sacrifice themselves for our needs.

Humans are so weak and pitiable that not only do we need the gifts of spirits to live, we also need a special, personal relationship with one or more *manido* in order to carry out our functions and for protection from assorted dangers. We are born into a clan, and the clan *dodem* (tutelary spirit, animal or plant) provides a generalized connection to the spirit realm but not a personal one. Hence, elders with known powerful, spiritual connections are asked to dream a name by the parents of an infant. These names provide protection to the children until they are old enough to begin creating their own connections. This is done by vision-questing through fasting, for every human must have a special relationship with a *manido* in order to live.

Children are encouraged, starting with a fast from dawn to dusk, to seek visionary experiences with the numinous, usually theriomorphic spirits (spirits in animal form). Every animal we encounter as we walk through woods and meadows, or paddle on lakes and rivers, is simultaneously an animal and a spirit. On each encounter, it is the animal who chooses in which mode she or he will relate to us; hence, we must always treat every meeting with the greatest respect. Through fasting, we encourage particular spirits to come and speak to us, to offer their powers to aid us in our supporting our family and band, to be a spiritual ally against those who might use their powers to attack us and our kin, even to be a friend. Fasting periods are increased until by adolescence, fasts are of four days or longer duration. Fasting means no food, no water, no sleep, and paying constant attention to our surroundings for those who may come. The major fast for females is at their menarche; for males, it is during puberty. But fasting continues throughout one's life, whenever there is need. For females, each cycle of the moon involves an intimate relationship with Earth and Moon, when the body is renewed and purified. This lessens the need for fasting in order to encounter the spirit realm as compared to males. Other means of communicating with the spirit realm are through lucid dreaming and the use of the Spirit Lodge (called "sweat lodge" by Euroamericans).

Some people develop relationships with the most powerful and dangerous spirits, such as Thunder or the terrible underwater being we dare not name, and can use these

relationships to help other individuals or the community as a whole. There are four different types of experts with specific spiritual talents in these regards. The most powerful perform the “shaking tent” ritual, in which the spirits come and speak with one so all can hear.

The above way of life became disrupted by the earliest contacts with Europeans. These strangers brought diseases for which the people had no immunity and the majority died in repeated waves of epidemics: measles, smallpox, even the common cold. The second factor was the fur trade.

The fur trade was developed mutually, and native peoples saw it as advantageous. For, at first, easily obtainable furs from animals hitherto only occasionally hunted, native people received iron tools, brass pots and firearms.

But under the pressure of the fur trade, the beaver disappeared over much of its traditional area. Peoples of similar cultures allied together and struggled to gain trading monopolies over the disappearing beaver. Warfare replaced raiding, whose primary purpose was to exhibit masculine values, in order to take over large trading and trapping areas. The Iroquoian-speaking Haudenosaunee amalgamated into the Five (later Six) Nations, and armed by the British, drove the Anishnabeg from their traditional areas to their north and west. The Anishnabeg, armed by the French, moved west and pushed Souian-speaking peoples onto the Plains where they found the Spanish-introduced horse. The Anishnabeg returned and pushed the Six Nations south of the Great Lakes, where they remained until, siding with the British during the American Revolution, many fled into Canada.

Thus the fur trade had a major effect on relationships, both human and spiritual. Reliance on trading furs for flour, sugar, blankets and pots – all previously supplied by women through gathering and manufacture from bark and hides – led to a lessening of the economic importance of females. The trapping of beaver, requiring exclusive use of large territories by trappers, usually males, led to the concept of exclusive trapping rights by clans. Both transitions led to the bilateral clans becoming patrilineal. The use of firearms, primarily for warfare, led to a reliance on them for hunting, even though the bow was more practical in the wooded terrain, requiring the trapping of ever more beaver for guns and powder. Animals were becoming a commodity, leading to the desacralization of certain species, as well as dependency, not on the *manido*, but on Europeans. Finally, a taste developed for traded whisky, for which there were no cultural controls, unlike the native cultures in the southern part of North America, where alcohol was used ritually.

The success of the American colonists against the British led to a massive migration of Euro-Americans westward, and the Scottish Highland clearances, followed by the Irish potato famine, led to considerable migration of Europeans into the still British-held north. In both the United States and Canada, the Anishnabeg were forced onto ever-shrinking pieces of land, which the respective governments put under the control of Christian missionaries. Anishnabe children were forcibly removed from their parents and communities and placed in residential schools where they were physically brutal-

ized for speaking their language or continuing any traditional customs, when they did not die of disease. Thus began an official policy of cultural genocide, whose purpose was to destroy native culture and religion, if not the native peoples themselves.

The traditional rituals and relationships with the spirit realm of nature were outlawed, and these laws were enforced by the military (U.S.) and police (Canada). The replacement of traditional spirituality by a simplistic

Christianity emphasizing the sinfulness of native people due to their “race,” and the destruction of the traditional economy based on nature by missionary-controlled welfare led to cultural ennui, to alcoholism, despair, suicide, and the use of relationships with *manido* for sorcery (the use of spiritual power against one’s own neighbors and community for personal gain). The relationship between religion and nature become extremely attenuated; the end of traditional rituals in the early twentieth century, especially vision-questing, meant that most individuals no longer had an intimate relationship with the numinous.

Traditional religion did continue, but in two ways. On the one hand, the original teachings and rituals went underground, to resurface in the 1970s. On the other hand, generations of simplistic Christian missionary teachings led to a focus on the first part of Genesis, misogynistically interpreted, and the *Pater Noster* (“Our Father”) prayer. A revised form of traditional religion, reinterpreted through the missionary lens, arose. Anthropologists studying these cultures passed on to the Anishnabeg Russian scholars’ misunderstandings of Siberian shamanism as the correct way to understand Anishnabe concepts.

Hence, the understanding of the numinous as a multiplicity of natural spirits was overlaid by the assumed superiority of monotheism, and prayers in English were made to a male “Creator” on the model of Genesis or “Our Father,” while in the native language, the reference was made to Grandfather alone, taken from the primal generative couple of Grandmother Sky and Grandmother Earth. But these patrifocal utterances were contradicted by the traditional offerings of tobacco to Sky, Earth and the Four Directions equally. Anthropologists convinced many that it was not all of nature that was numinous, but each species had a male “Master” that alone was divine; this in a culture that had been completely egalitarian with no notion of a chief or “master” and understood that the animals on which humans relied for survival were female, as nurturing and sustenance comes from the female domain. Anthropologists also taught that individuals did not have their own relationships with the spirit realm, but only special individuals to be called by the Tungistic word, “shaman.” Finally, in the late 1960s, the romantic “back to Earth” movement of the dominant culture provided a new term and concept for the female numinous Earth: “Mother Earth.” This was an idealized abstraction of the Earth mother that had little reality to that numinous being, Grandmother Earth, on and by which we live, with whom we can have a vital, intimate relationship.

The actual tradition which went underground began to resurface with the formation of the American Indian Movement (AIM) in the late 1960s. Begun by Anishnabeg in

the Minneapolis-St. Paul area as a force to protect urban natives from racist violence, the youths became connected with traditionalist elders, bypassing their middle-aged parents and Euro-American-recognized political “chiefs,” and began to fast, take part in Spirit Lodges, and, on the Plains, the Thirst Dance (“Sun Dance”). After a phase of militancy which brought the severe plight of native peoples to the public eye, the founding leaders involved themselves with native education and a revitalization of traditional religion.

Among the Anishnabeg, this began with the surfacing of the Midéwiwin, a quasi-institutionalized mode of traditional religion, important in its present form since the earliest days of the fur trade, that suited the modern situation. At first, young people who wished to take up the traditional spiritual life, along with Midéwiwin rituals, were forced by the Christian churches to leave their homes and create communities off the reserves. Slowly, the new traditionalist influence spread and missionaries lost control over the reserves. Non-Midéwiwin traditionalists began to publicly practice healing with natural herbs and their personal relationship with the numinous. Reserves began to gain control over their schools, health centers, police, etc., and the traditional rituals began to be openly practiced.

The Midéwiwin rituals, which hold ceremonial gatherings bringing Anishnabeg together on different reservations four times a year, create a means for urban native people to be again in nature, to fast, participate in Spirit Lodges, and attend four-day initiation and seasonal rituals. Prayers are again addressed, as in the past, to the Grandmothers and Grandfathers, honoring and respecting all aspects of the numinous. In urban areas, the availability of traditional spirituality has provided a foundation for support and health services for natives suffering from alcoholism and other ills of despair. While only a minority of Anishnabeg avail themselves of these opportunities, their numbers continually grow, and with this growth comes a renewed spiritual relationship with nature.

Along with the spiritual plight of the Anishnabeg, the leaders of the revitalized Midéwiwin focused on the contemporary human devastation of Earth, lest Earth take revenge and destroy us. Much of the Midéwiwin’s activities are oriented to education concerning the predicament of our planet, as well as concern and prayers for its recovery during their ceremonials.

Anthropic Principle

The term “Anthropic Principle” refers to two distinct responses – one logical and one metaphysical – to the finding by Western scientific cosmologists that the early universe provided the very conditions necessary for the existence of humankind (Gr: *anthropoi*). According to the logical response, also known as the Weak Anthropic Principle, these cosmological data simply confirm the obvious, for if the initial conditions had not been consistent with the emergence of human life, we would not have been around to observe them (see Barrow and Tipler). According to the metaphysical response, known as the Strong Anthropic Principle, the cosmological data rather provide an occasion for amazement and awe, since they show just how many highly improbable conditions had to pertain simultaneously to make human life possible; when we contemplate this fine-tuning, we may well conclude that the universe has been destined to give rise to us (see Dyson). Because of its teleological character, the Strong Anthropic Principle figures prominently in modern arguments for divine design (see Davies).

Both versions of the Anthropic Principle are inspired by the same scientific data. Cosmologists have shown that although many possible universes would fit Einstein’s equations, very few could support carbon-based life. For such life to emerge, a highly particular set of laws and circumstances must pertain. For example:

If the gravitational constant had been slightly smaller, then stars and planets would not have coalesced; had it been larger, then the universe would have collapsed upon itself.

If the strong nuclear force (which holds nuclei together) had been slightly smaller, then the universe would have contained only the simplest element, hydrogen; had it been larger, then all carbon would have turned into oxygen.

If the weak nuclear force (which causes some nuclei to disintegrate) had been smaller, then no hydrogen could have formed and the universe would have lacked hydrogen-burning stars like our sun, not to mention life-giving water; had it been larger, then supernovae would not have ejected carbon, iron, and oxygen, all essential to life.

If the electromagnetic constant had been smaller, then stars would have burned out too quickly for life to evolve; had it been larger, then stars would not have been hot enough to warm planets sufficiently for carbon-based life.

Some critics of the Strong Anthropic Principle argue that all these conditions, though highly specific, could be the result of chance if enough universes existed to make ours statistically likely. Other critics suggest that, as science progresses, we will likely learn that the seemingly arbitrary laws and circumstances of our universe are in fact necessary. Both chance and necessity are presented as challenges to the idea of

cosmic design, especially by an omnipotent divine agent. In response, proponents of the Anthropic Principle typically argue that these critiques do not rule out divine design as a logical possibility – hence the reasonableness of responding to the hospitality of our universe with a sense of awe.

Anthropologists

Anthropologists have studied religion since the beginning of the discipline through a succession of three major different theoretical and methodological approaches: ethnological, ethnographic, and ecological. The ethnological approach was developed mainly in England during the late nineteenth and early twentieth centuries, and principally by Edward B. Tylor (1832–1917) at Oxford University and James G. Frazer (1851–1941) at Cambridge University. Their method involved extensive and detailed cross-cultural comparisons through library research. Their theoretical framework was unilinear evolutionism in which so-called primitive societies were thought to reflect earlier stages in cultural evolution. Tylor considered animism, which he defined as a belief in spiritual beings, to be the foundation of all religion.

Frazer is famous for his monumental *Golden Bough* (1890–1915), a compendium of 12 volumes based on his extensive readings about myth, religion, and magic. His influence was widespread in the academic and public arenas. The abridged version of the *Golden Bough*, first published in 1922, has never gone out of print. In *Totemism and Exogamy* (1910) Frazer examined totemism as both a religion and a form of kinship classification that identifies individuals and groups as descendants of some common ancestor in mythic times, often a species of animal or plant. He recognized that totemic species were usually prohibited as food, foreshadowing more recent research on the potential consequences of taboos for environmental conservation.

In Paris, France, the ethnological approach was pursued by sociologist Emile Durkheim (1858–1918) at the Sorbonne and later by philosopher Claude Lévi-Strauss (1908–) at the College of France. Durkheim's classic study, *The Elementary Forms of Religious Life* (1915), drew mainly from the ethnographic record on Australian Aborigines. From an evolutionary perspective he thought that the Australian aboriginal society was the most primitive and thus provided an opportunity to explore the ultimate origin, character, and functions of religion. However, Durkheim rejected any definition of religion in terms of the supernatural (cf. Tylor), and opposed animism and naturism as adequate explanations of religion (cf. Frazer). (Naturism views aspects of nature like clouds, thunder, lightning, or rainbows as the expression of spiritual beings or forces.) Instead, Durkheim viewed religion as a reflection of society and its power over individuals. He distinguished between the sacred and profane, and considered the sacred to be a social construction as in the case of totemism. Also, he thought that religion molds social categories for understanding nature in terms of time, space, cause, substance, soul, and so on.

Lévi-Strauss, more than any other ethnologist, is associated with the development of structuralism, a perspective that emphasizes the analysis of structural relations as the key to scientific understanding. Things assume meaning through their place in a system. His crosscultural analyses seek to reveal the deeper structural unity underlying the surface diversity of cultures, and thereby to discover natural laws of mind and culture. He approaches myth, ritual, and symbol as functioning to mediate and reconcile elemental binary oppositions like nature/culture, animal/human, and natural/supernatural. However, while he often deals with natural phenomena as conceptualized by a culture, he does not do so in any ecological manner.

Accumulating criticisms of cross-cultural comparisons as a basis for armchair theorizing about cultural evolution and universals led an increasing number of anthropologists to turn away from generalizing toward particularizing instead. Thus, Franz Boas (1858–1942) in the

U.S. emphasized culture history (historical particularism), and A.R. Radcliffe-Brown (1881–1955) and Bronislaw

Malinowski (1884–1942) in England emphasized the practical functions of culture in satisfying psychobiological and social needs (functionalism). In this second approach, ethnography, anthropologists especially interested in religion concentrated on developing a detailed description of this component of culture as a system, based on extensive personal field research. For example, Elsie Clews Parsons (1875–1941) published her two-volume book *Pueblo Indian Religion* (1939) after a quarter of a century of fieldwork. The Pueblos daily interact intimately with the ecosystems in their habitats in Arizona and New Mexico, and this is reflected in much of their religion, as is the case for most indigenous cultures.

In England, Radcliffe-Brown published one of the first monographs on nature religion based on ethnographic fieldwork, *The Andaman Islanders* (1922). (These islands are located in the east Bay of Bengal as part of the territory of India.) The Andamanese believe in spirits of the dead in the sky, forest, and sea, as well as other spirits in natural phenomena. Andamanese relate these spirits to subsistence, food taboos, ceremonies, and aspects of social structure. Also Edward E. Evans-Pritchard's (1902–1973) fieldwork with the Nuer of the Sudan in northern Africa during the 1930s exemplified the ethnographic approach. In his classic book, *The Nuer* (1940), he revealed that their religion is closely connected with their herding economy and society, such as in the ritual sacrifice of cattle to appease spirits during epidemics. The in-depth interpretation of the multiple meanings of religious symbols, behavior, and objects was advanced further in subsequent ethnographic fieldwork in Africa by Victor Turner (1920–1983) in his *The Forests of Symbols* (1967), which focused on the sacred tree of the Ndembu of Zambia in southeastern Africa. Mary Douglas (1921–) also contributed to the interpretative perspective in the anthropological study of religion in her *Purity and Danger* (1966) and *Natural Symbols* (1969), which included comparative analysis of cultural beliefs about pollution as metaphorical statements about society and nature.

Any relevance of the ethnological and ethnographic approaches for understanding the relationships between religions and nature is an inadvertent result of concentrating on indigenous cultures whose religions are usually nature-oriented. However, by the 1940s, the biological science of ecology was beginning to flourish, and by the 1960s, so was environmentalism. These are among the influences in the emergence of a third approach to the anthropology of religion, one that is explicitly, directly, and systematically ecological. Initially it was developed mainly by Roy Rappaport (1926–1997) and Marvin Harris (1927–2001).

Rappaport's dissertation fieldwork with the Maring of Papua New Guinea formed the basis of his subsequent book *Pigs for the Ancestors: Ritual in the Ecology of a New Guinea People* (1967, 1984). This classic work emphasizes the collection of empirical and quantitative data as well as the application of systems theory to examine the functional role of ritual in regulating the relationship between the dynamic fluctuations in human population and natural resources. Rappaport's subsequent studies are largely theoretical, his collection of essays *Ecology, Meaning, and Religion* (1979) and his monumental treatise *Ritual and Religion in the Making of Humanity* (1999).

Harris explicitly and systematically formulated the foundations and principles of cultural materialism and critiqued competing theoretical approaches in his *The Rise of Anthropological Theory* (1968) and *Cultural Materialism: The Struggle for a Science of Culture* (1979). The main point of cultural materialism as a scientific research strategy is that much of culture can be explained as practical responses to the problems of everyday survival and maintenance. Harris assigns infrastructure research priority and causal primacy, and emphasizes “etic” and behavior over “emic” and thought. Infrastructure is the product of the interaction of environment, population, technology, and economy – the material foundation of society and culture. Etic refers to a Western scientific approach, and emic to native or folk viewpoints. In a series of ingenious essays Harris attempts to analyze and explain numerous curious cultural puzzles as stemming from the material conditions of existence, including the religious phenomena of Aztec ritual sacrifice, the sacred cow in India, and the Muslim and Jewish prohibition on eating pork. (Also see his *Cows, Pigs, Wars, and Witches: The Riddles of Culture* [1974], *Cannibals and Kings: The Origins of Culture* [1977], and *Good to Eat: Riddles of Food and Culture* [1985]).

The ecological approaches developed by Rappaport and Harris have been variously followed by several other anthropologists in studying the relationships between religion and nature, including Gerardo Reichel-Dolmatoff in *Amazonian Cosmos* (1971) about the Desana of the Colombian Amazon, Barbara G. Meyerhoff in *Peyote Hunt* (1974) on the Huichol of northern Mexico, Richard Nelson in *Make Prayers to the Raven* (1983) with the Kutchin foragers in the Alaskan forest, and Stephen Lansing in *Priests and Programmers* (1991) on Balinese temple priests and crop irrigation. Recent anthologies edited by John Grim (2001) and Darrell Posey (1999) demonstrate how important this ecological approach to religion has become. Nevertheless, only very recently has the study of spiritual ecology, the relationships between religions and nature, started

to penetrate textbooks on the anthropology of religion (e.g., Bowie 2000). This may coincide with growing awareness of the importance of religion in helping to resolve ecocrises and the unique role anthropologists may play in providing heuristic cases of sustainable green societies in which religion is pivotal.

Anthropology as a Source of Nature Religion

Except for anthropologists and until recently, most scholars of religion tended to concentrate on the so-called great, major, or world religions, namely Buddhism, Christianity, Hinduism, Islam, and Judaism. Certainly these religions are of great historical, cultural, and political importance and their adherents now comprise the majority of humanity, a result of centuries or more of crosscultural contact and especially missionization and colonial expansion that has often decimated preexisting native religions.

Another perspective, however, is provided by cultural evolution, encompassing the prehistoric as well as historic periods. The antiquity of religion appears to extend back to the time of Neanderthals some 70,000 years ago where archeologists find the earliest evidence of intentional burial with funeral offerings such as red ochre and even flowers as evidence by pollen remains. In contrast, so-called great, major, or world religions are relatively recent, developing within just the last few thousand years. In other words, the real great, major, or world religion of humanity from a cultural evolutionary and/or temporal perspective is Animism, which can be considered “nature religion.” This is the belief that nature includes spirits, sacred forces, and similar extraordinary phenomena.

Most humans throughout time and space have practiced some variety of this nature religion, or what anthropologists generally refer to as Animism (Guthrie 1993;

McFadden 1991). While from historic times until today Animism is known to be common in hunter-gatherer, horticultural, and pastoralist societies, it may be present as well to various degrees in others, including nonindigenous ones. Asians often embrace elements of Animism in their personal religion along with “mainstream” religions such as Buddhism, Hinduism, or Islam. In Japan, for instance, Shintoism and Buddhism coexist and often commingle, and Shintoism is a variety of Animism. Neopaganism in contemporary Europe, North America, and elsewhere is a form of nature religion too.

Beyond its prior antiquity and universality, Animism is also important because arguably it is far more natural or ecological than any other religion. White’s (1967) classic essay on the roots of the environmental crisis blamed Christianity, although his line of argument logically encompasses Judaism and Islam as well. These three Abrahamic religions are not very environmentally friendly in the selective interpretations of sacred texts which prevail and tend to oppose spirit against nature, with a rare exception such as St. Francis of Assisi (Lane 1998). While Buddhism, Daoism, Hinduism, and Jainism are arguably potentially far more environmentally friendly than the Abrahamic religions, the Asian countries where the populace practices one or more

of the former set of religions all have severe problems of natural resource depletion and environmental degradation as well, although this is often associated with Westernization. Such degradation points to the perennial problem of discrepancies between the religious ideals and actual behaviors. On the other hand, most indigenous societies which pursued Animism were relatively sustainable ecologically, as is obvious given their existence for centuries or even millennia in the same region without causing natural resource depletion and environmental degradation to an irreversible degree. For such societies, interacting with nature is not merely a physical experience or economic enterprise, but an emotional and spiritual path. Most indigenes do not separate the natural and supernatural as distinct domains; instead they view spirit as part of the web of life.

As the Western study of religion developed, including comparative religion, a division of labor emerged in which most scholarship concentrated on Christianity, Judaism, and eventually included Islam and then later the main Asian religions. The remaining religions, mostly varieties of Animism, were largely left to anthropology. This reflects the tendency to divide religions (and societies) into “civilized” (literate) and “primitive” (oral) traditions, anthropology concentrating on the latter albeit not exclusively (e.g., see Eliade). (However, today the qualifiers oral, pagan, primal, primitive, and tribal are avoided by most anthropologists as pejorative). Thus, from a cultural evolutionary and/or temporal perspective, the majority of the students of religion studied the minority religions (Christianity, Judaism, and so on). In contrast, the relative minority of students of religion (anthropologists) studied the majority religion (Animism). Only in recent decades have anthropologists begun also to study religions like Buddhism or Islam.

As a consequence of this academic division of labor, no other Western discipline is more important as a source for understanding about nature religion than anthropology. There are up to about 7000 distinct cultures in the world today, and many others were known and documented within the last couple of centuries before they became extinct. The majority of these cultures have animistic religions. Because of the holistic approach to describing culture as a whole, most ethnographic monographs, descriptions of a particular culture based on personal fieldwork, include at least one chapter on the local religion. Furthermore, there are numerous ethnographies focused mostly on religion, albeit in its social and cultural contexts while emphasizing behavior as well as beliefs. One need only decide which culture or region is of most interest, and then pursue the available literature through standard sources and research procedures, not that these are perfect. (See Lambek 2002: 573–613 for the most recent and extensive bibliography which is indexed by topic and region.)

If one is concerned with the vast ethnographic record of traditional indigenous societies as a source for nature religions, then it is necessary to identify and probe the relationships between religion and environment by reading between the lines. Spiritual ecology, research explicitly focused on the dynamics of these relationships, only

emerged in the 1990s. Nevertheless, that does not diminish the unique significance of ethnography as an unparalleled source for learning about nature religions.

Some people think that there are problems with recent phenomena like the New Age and prior spiritual movements which often extract and manipulate a creative eclectic mixture of elements from different religions including native ones. Probably the most serious problem is that this appropriation, and the commercialization that often accompanies it, may be considered by the indigenous adherents to the religion to be exploitative, offensive and even sacrilegious. However, some indigenous shamans or spiritual healers have no problem whatsoever with guiding non-indigenes in their own spiritual journey or vision-quest by way of long-established native cultural traditions and techniques. A related problem is that the rich and complex beliefs, values, rituals, symbols, and other phenomena associated with the indigenous religion may quickly lose their original meanings when extracted from their historical, social, cultural, spiritual, and ecological contexts. Nevertheless, often the ethnographic record can help alleviate this problem to some degree by providing detailed information on indigenous religions and their contexts. Furthermore, it could be argued that, if indigenes can adopt religions like some variety of Catholicism or Protestantism, then surely non-indigenes can adopt indigenous religions provided that they do so faithfully. After all, ideally, religious freedom applies to everyone without any kind of racial or cultural discrimination from anyone. Moreover, significantly some anthropologists themselves have become converts and practitioners of some variety of Animism or shamanism, most notable of all Carlos Castaneda and Michael Harner (see Narby and Huxley 2001).

In conclusion, a major challenge for anthropologists and other academics is to reach beyond basic research to actually apply knowledge and engage in advocacy to help protect indigenous religious freedom and its sacred places as well as the environmentally friendly nature of the spiritual, cultural, and historical ecology of the overwhelming majority of such societies. Also, others can learn from indigenous nature religions to promote their own spirituality as well as more sustainable and green societies of their own. At the same time, it must be realized that, under the pretense of scientific objectivity which sometimes assumes the fanatical extreme of scientism, most anthropologists are limited by approaching religion only intellectually and as non-believers rather than also spiritually. (The outsider and insider each have a different set of advantages and disadvantages in understanding any particular religion, thus some moderates would consider them to be complementary approaches.) Therefore, anthropology cannot be considered the only source for learning about nature religions. Ultimately the primary source must remain the nature religion itself, usually through the community of adherents, or through personal communion with nature and especially at sacred places.

Boulder, CO: Westview Press, 1995. because of the Fall, God caused enmity between humans, the serpent, and the Earth itself, so that humans would have to earn their food by harsh work from the hostile ground (Gen. 3:14–19). Humans hunt, kill and devour animals because of the Fall. Animals attack, slay and eat each other for the same reason. Until the twentieth century in Europe and America – and still throughout much of the world – farmers put in hard labor to produce small crops and nomadic pastoralists lived in tents so that their animals could find sufficient forage in steppes where there is insufficient rainfall to permit agriculture or continuous grazing of the same pastures. In summary, according to Genesis the world, as humans have experienced it, is the result of sin, which disordered the harmonious relationships that God had originally intended. Some apocalyptic thinkers have envisioned the goal of history to be a “new heaven and a new Earth” in which that original harmony is restored and even improved. In these instances nature has been allotted a significant role in apocalypticism.

Isaiah of Jerusalem, writing in the eighth century B.C.E., envisioned a messiah in whose days wolf and sheep, leopard and kid, lion and calf would live peacefully together (Isa. 11:1–9). Isaiah or a later disciple envisioned the Earth drying up and becoming

sick, with only a few inhabitants left, but then God would prepare an immense feast for all the peoples, death would cease to occur and there would never again be sorrow or tears (Isa. 24:4–6, 25:6–8). Another disciple of Isaiah, writing during the discouraging years after the exiles had been allowed to return from Babylon, but had come home to despair rather than glory, summarized the earlier texts about the new heaven and the new Earth in which the redeemed would live in harmony and abundance with all other species (Isa. 65:17–25).

Paul wrote to the Romans that the entire creation had been chained up and made subject to death until that time when God would unveil the coming splendor that would set all of creation free along with the elect (Rom. 8:18–21). John of Patmos envisioned a resurrection of the martyrs who would reign on Earth with Christ for a thousand years (Rev. 20:1–6), and then be replaced by a new heaven and new Earth in the middle of which would be a new Jerusalem, with a tree of life yielding twelve different fruits (Rev. 21:1–22:5).

Two themes emerged from biblical apocalypticism: future harmony between humans and all other species and a transformed Earth that would yield abundant food and drink effortlessly. Both of these themes are expounded in the millennium that the North African Christian Lactantius described in the seventh book of his *Divine Institutes* (ca. 303–317). Lactantius accepted the notion that history was divided into seven world-weeks, each of which would include a thousand years. The seventh or Sabbath worldweek would begin around the year 500. Nature would bring forth abundant food and drink without human effort and peace would prevail between the different species of animals.

Asceticism, however, was sweeping the Roman World from the second century onward. Neo-Platonism taught its adherents to turn away from the material and sensible world toward the One, the source of all being, that could be known only by the mind. Physicians advised abstinence from sex. Monasticism spread rapidly from Egypt and Syria among Christians. Dualists thought that anything material was actually evil, while Christians believed that the body was inferior to the soul and accepted the resurrection of the body only because it was clearly scriptural. Augustine, Bishop of Hippo, (354–430) came to Christianity by way of Neo-Platonism, which satisfied his strongly ascetic bent. Augustine attacked both the worldweek notion and the belief in an earthly millennium. He replaced the world-week with a scheme of seven ages, five of which preceded the birth of Jesus Christ, while the sixth represented the suffering of humans on Earth between Christ and the end of history. The seventh belonged to those souls who had died in Christ and rested in heaven. Augustine spiritualized and individualized the Apocalypse. God had created humans in order to replace the fallen angels with elect, human souls. The City of God was made up of these souls and history would continue until the last one of these had died and been saved. On Earth these elect souls were mingled with the much more numerous reprobate who were the City of Earth and after death the elect rested with God in heaven. Christians should focus themselves as much as possible on spiritual concerns. Material goods hindered spiri-

tual concentration and, therefore, were to be used minimally. Any notion of earthly abundance was repugnant to Augustine. On Earth the reprobate dominated and their greed led to incessant war and strife, which would continue as long as time lasted.

Not all Christians were as ascetic as Augustine. An anonymous fourth-century author composed the *Tiburtine Sibyl*, which concluded by predicting the coming of an emperor whose name would be Constans and who would reign 112 years. Fruit, wheat and wine would be abundant and cheap during his reign, which would end with the arrival of the Antichrist. The Pseudo-Methodius, actually an anonymous eighth-century author, inspired by the Arab Conquest, took up the notion of a final, all-victorious emperor but omitted any mention of earthly prosperity. Adso, writing in the late tenth century in the Ardennes, transferred the role of messianic final emperor to the Frankish kings, again without the notion of material plenty. All three of these texts were widely circulated in medieval Europe after 1000, especially the latter two.

Monastic authors found Augustine's thinking congenial. Often they believed implicitly, if not explicitly, that the elect included only monks. Augustine had postponed the end of history into the indefinite future. The *Tiburtine Sibyl* and similar texts focused primarily on the final generation before the end of time and the second coming.

Reformist apocalyptics applied the concepts and language normally associated with the end of history to the struggle to reform the clergy, a struggle initiated by Pope Leo IX and his successor, Gregory VII in the second half of the eleventh century. Reformists focused on their own contemporary era and the immediate future, not the distant end of time. One of the most prominent and innovative reformists was Hildegard of Bingen (1098–1179) who in her *Scivias*, (1141–1151) followed Augustine, but stated that the Earth had entered the seventh millennium. Reformism appeared strongly in her *Book of the Divine Works* (1163–1173), where Hildegard predicted that the lay princes would force the clergy to divest themselves of their temporal wealth and to give up simony, causing an era of unsurpassed material abundance, spiritual justice, and peace during which Christians would give up their weapons (Part 3, vision 5, chp. 20). Hildegard's ideas were spread widely by a selection of key texts chosen by her disciple Gebeno in the thirteenth century, which included the passage on reform of the clergy.

Abbot Joachim of Fiore (1135–1202), another reformist apocalyptic, used natural imagery, especially in the figures, which he drew to illustrate his notion of three historical phases, the last of which placed Augustine's seventh age within history. Just as the Son came from the Father and the Holy Spirit from both the Father and the Son, so the first phase belonged to the Father, the second predominantly to the Son and secondarily to the Spirit and the third predominantly to the Spirit. The third age had already begun with Bernard of Clairvaux (1090–1153) and would culminate soon after 1200. In one figure, the three periods are represented by two vines that grow and intertwine to form three circles, in the last of which the entire space is covered with foliage. Joachim, however, was thinking in terms of sweeping clerical and monastic reform accompanied by an unprecedented degree of holiness and spiritual understanding among Christians. The future era of the Holy Spirit would be more spiritual and ascetic than

its predecessors. Hence, Joachim nowhere spoke of earthly abundance. Some scholars, however, interpret the era of the Holy Spirit as millennial, but that probably does not imply abundance and earthly prosperity.

Joachimism spread widely between the beginning of the thirteenth century and the middle of the seventeenth century as Marjorie Reeves has shown, but most apocalyptic texts focused on church reform. Thus, the Second Charlemagne prophecy, which was extremely popular in France, predicted the coming of another Charles who would conquer all the enemies of Christ and force all of them to convert.

Exceptions were few. Jean de Roquetaillade (ca. 1310–1366) believed that the millennium would begin in 1370 and endure for exactly 1000 years. Jean quoted Isaiah 2:2–4 about all the peoples coming to the “mountain of the house of the Lord.” Jean’s primary focus was the conversion of the infidels to Christianity and a long period of peace under total Christian dominance. Roquetaillade, however, did briefly allude to Isaiah 60, which hints at material prosperity. The prophecy of a new David in William Langland’s fourteenth-century *Piers Plowman* predicted a king in England whose reign would see all weapons destroyed, warfare ended and honest, fair justice prevailing (passus 3, lines 259–324).

As late as the seventeenth century most apocalyptics focused on reform of the Church and the attainment of unprecedented levels of Christian spirituality. Despite a perceptible shift toward a more positive evaluation of the material world and of this life which began in the twelfth century, the ascetic outlook of the Late Antique world continued to prevail in Christian circles. Christians focused primarily on the salvation of individual souls. Nature, therefore, continued to play only a tangential role in Western apocalypticism.

Appiko Movement (India)

Appiko is a nonviolent grassroots movement for ecological preservation and restoration centered in the Indian State of Karnataka. The word Appiko, meaning “embrace” or “hug” in Kannada, the local language, is derived from the Hindi word Chipko, employed by the movement of that name in the Northern State of Uttar Pradesh (now Uttaranchal). The leader of the Appiko movement, Pandurang Hegde, worked with Sunderlal Bahuguna, a Chipko organizer, and in 1981 participated in part of Bahuguna’s *padyathra* (or foot march) of 4870 kilometers, through the foothills of the Himalayas. In 1987 Bahuguna accompanied Hegde and other Appiko activists in a *pady- athra* of 1450 kilometers through the Western Ghats, presenting slide shows and lectures to create environmental awareness.

Appiko shares with Chipko a recognition of the sacredness of the forests and other aspects of nature upon which the local people depend, the strategy of nonviolent protest which Gandhi practiced and that goes back to the protest against the destruction of trees which the Bishnois people of Rajasthan practiced in 1730, and the non-violent method of disseminating their message through *pady- athras*, folk songs, street plays, and dance dramas. At the same time the Appiko movement is a response to conditions peculiar to the ecological history of the hill regions of Karnataka.

In what is today the Uttara Kannada district of Karnataka, the British takeover of forest resources in the nineteenth century provoked a peasant struggle that continued into the twentieth century. After independence, commercial exploitation continued to ignore the interests of local people. In April 1983, the people of the village of Salkani were shocked at the devastation of a local sacred forest, where every year they gathered to worship the forest goddess. A youth group in the neighboring village of Gubbigadde was also considering measures to stop deforestation. In response to their letters, forest officials stated that the tree felling was being undertaken according to scientific principles and warned them not to interfere. In August 1983 the local people invited Sunderlal Bahuguna to relate the story of the Chipko struggle and the nonviolent method of hugging the trees to save them from the axe. The local people resolved to save their forest by the same nonviolent strategy.

In September of 1983 the Forest Department began felling trees some distance from either Salkani or Gubbigadde. But the news quickly reached the two villages. Before dawn on 8 September 1983, 160 people set out, despite rain and the menace of leeches, for the forest. The village people rushed to the first tree and embraced the trunk before the workers could strike a blow. The wood cutters were moved by their courage and agreed not to fell any trees until the forest department had consulted

with the local people. In October a similar movement was launched in the village of Hursi. In December the state government sent the Forest Minister who agreed, after discussions with local people and an examination of the affected areas, that tree felling was responsible for significant ecological damage. He assured the people that no further clear-felling of natural forests would take place; only dead and dry trees would be cut. Appiko activities soon began in Modagu, another hill district of Karnataka. In Kodagu District the government imposed a ban on the felling of trees. As it came to be known throughout the state, the Appiko movement engendered a new ecological awareness.

The objectives of the Appiko movement are (1) to preserve the remaining tropical forests of the Western Ghats by demanding a basic change in forest policy, from revenue-based to ecology-based management; (2) to restore the natural forests, planting trees that provide food, fodder, fuel, fertilizer, and fiber to local people; and (3) to promote rational use of forest resources by educating local people to avoid harmful practices. To support these objectives the Appiko movement has employed methods derived from the religious traditions of the people. The *padyathra* is an adaptation of the tradition of the pilgrimage that has been a central feature of the religious life of India from ancient times. During the *padyathra* the participants temporarily depart from their homes and encounter the forest as a threatened sacred space. During the *padyathra*, works of the traditional folk theater of Karnataka, called *Yakshagana*, integrate subject matter from the Mahabharata and the Ramayana with contemporary environmental concerns. At these events, special *pujas*, or services of worship, are undertaken in which the local people pledge themselves to the protection of the forest by nonviolent means.

To further these activities, Appiko has established an informal institution called the Parisara Sanmrakshana Kendra (Environmental Conservation Centre) in the town of Sirsi, in which activists from a variety of local groups work together toward their common goal.

Aquinas, Thomas (1225?–1274)

Renowned in the Roman Catholic tradition as a saint who was canonized for being a teacher and scholar (1323), a Doctor of the Universal Church (1567), the Prince and Master of all Scholastic Doctors (1879), and the Patron of all Catholic universities and colleges (1880), Thomas Aquinas continues to attract the interest of moral theologians who strive to respond to the problems of their times. The environmental crisis of the twentieth century prompted the examination of his thinking, especially his creation theology and teachings on the moral virtues, and the application of notions that encourage more responsible behavior toward other species and ecological systems. Some scholars have dubbed the ongoing appropriation of these teachings as “eco-Thomism.”

Among the particularly relevant notions in Aquinas’ creation theology are: (1) the innate goodness of all types of animate and inanimate creatures, each of which is essential to the perfection of the universe; (2) the unity of diverse creatures through their interactions with one another to sustain themselves and the internal functioning of the universe; (3) the sacramentality of the physical creation which manifests the invisible presence and character of God, particularly God’s power, goodness, and wisdom; and, (4) the unique capacity of the human creature to identify and choose to act on other creatures in ways that achieve the common good in temporal life as eternal happiness with God is sought.

Scholars are wise to approach these notions recognizing the all-encompassing theological framework within which Aquinas wrote and his medieval understanding of the world as geocentric with its various species created and ordered hierarchically to one another by God to achieve divine purposes. His pertinent teachings must also be retrieved cautiously and informed by contemporary science so that they are meaningful during the twentyfirst century.

When appropriated from an ecological perspective, Aquinas’ teachings may facilitate the faithful to value all types of biota and abiota for their intrinsic and instrumental goodness as essential parts of ecosystems and the greater biosphere, to cooperate with all species and biological systems so they are able to function in sustainable ways for their common good now and into the future, and to preserve species and natural systems because they manifest the character of God who empowers the emergence of creatures over time, who generously endows the universe with the capability to develop itself without divine coercion or interference, and who patiently waits for the universe to emerge at its own pace in expanding space and extending time. Aquinas’ ideas about the human creature need reformulation to enable a more realistic view of *Homo sapiens* as intricately connected with and radically dependent upon other species and physical

systems over cosmological and biological evolutionary time, but his understanding of the human capacity to discern responsible ways of acting in temporal life and to choose whether or not to act accordingly provides a vital perspective from which the faithful can approach ecological degradation.

Appropriating Aquinas' theological anthropology requires accepting the instrumental valuing that permeated his thinking about the human in relation to other creatures. That God intends humans to use other animate and inanimate beings is integral to the medievalist's thinking that God intends creatures to use one another for their sustenance. Within this framework of thinking, humans are restricted to using other creatures for two purposes:

(1) to acquire the necessities for functioning in temporal life, and (2) to gain some inkling of God's character as manifested through the world. The moral virtues guide humans in their use of other creatures, Aquinas explains, and his teachings on the cardinal virtues of prudence, justice, moderation, and fortitude provide a blueprint for responsible behavior that has significance for environmental ethics today.

Key among these virtues, prudence inclines the human person to discern correct ways of acting through a discretionary process of seeking informed advice about the appropriate means of meeting one's needs in life, making a judgment about the best means, and executing that judgment. Seeking counsel on the best options for acquiring the necessities for living constitutes an act of inquiry during which the private needs of the individual and the common good of others are considered. Judging the most appropriate means of acting requires foresight to determine whether or not future needs can be met, circumspection to assure that an action is most suitable in light of a combination of circumstances that may arise, and caution so that evil is avoided by having a firm understanding of the common good. Aquinas' thinking about prudence suggests a theocentric way of assessing how human beings should act toward one another, other living beings, the air, land and water that the faithful can appropriate, inform with contemporary scientific findings, and apply to ecological problems.

The virtues of temperance, justice and fortitude incline the person to follow the dictates of prudence in ecologically responsible ways. Because temperance inclines the individual to curb immoderate desires for material goods and bodily pleasures, the use of intrinsic goods of Earth would be minimized when meeting basic needs. Because the virtue of justice inclines humans individually and collectively to consider the needs of other people to sustain themselves in temporal life, excessive goods would not be coveted by some so others in the present and future would be able to acquire their necessities of life and renewable goods would be sought. Because fortitude strengthens the individual to act virtuously in relation to others despite impediments and dangers that occur, the faithful would persist in acting prudently, justly and moderately in relation to other humans, other species and ecological systems in this life as they seek eternal life with God.

Aquinas' teachings about secondary virtues and vices also have relevance for addressing ecological concerns. A pertinent secondary virtue to temperance is humility,

which removes obstacles like the quest for temporal riches to the person's spiritual quest for eternal happiness with God. All physical goods would be used humbly because they relate ultimately to God, and all the words, deeds, and gestures stemming from the use of physical goods would manifest reverence to God for having enabled their existence. Among the vices that must be avoided are gluttony for physical goods and cruelty to living creatures, both of which have been widely practiced in some sectors of society.

The human person has the innate ability to acquire the moral virtues over time, Aquinas insists. Their application is motivated by the theological virtue of love (*caritas*) which is gratuitously infused in the human person by God and aims ultimately toward eternal happiness with God. This linking of all behavior with the quest for eternity with God provides an incentive for the faithful to strive to live virtuously with other beings of our shared physical systems.

Aradia

The goddess Aradia was described in 1898 by the American folklorist Charles Godfrey Leland (1824–1903), who placed her worship as central to an underground pagan Italian religion which he claimed had existed continuously since Etruscan times. Leland, a fascinating combination of progressive journalist, linguist, and serious researcher into little-known arts, from handicrafts to magic, lived primarily in Philadelphia, and in the latter third of his life primarily in London and Florence. In Florence in 1886 he met a woman whom he referred to as “Maddalena,” although her actual name may have been Margherita Talenti. He described her as someone “who was not only skilled in fortune-telling, but who had inherited as a family gift from generations, skill in witchcraft – that is, a knowledge of mystical cures, the relieving of people who were bewitched, the making of amulets, and who had withal a memory stocked with a literally incredible number of tales and names of spirits, with the invocations to them, and strange rites and charms” (Leland 1998: 33). From then on, Leland paid Maddalena a stipend to collect information on Italian folklore and witchcraft, in which he saw elements traceable back to the ancient Etruscan and Roman populations. According to Leland, he learned in 1886 that a manuscript existed “setting forth the doctrines of Italian witchcraft” (Leland 1998: 225). He urged Maddalena to acquire a copy, and in January 1897, she gave him what he called *Aradia*, or the *Gospel of the Witches*.

Leland’s edited version of the *Vangelo*, or *Gospel*, was published two years later. It presents Aradia as the witches’ Messiah, daughter of Diana the Moon goddess. The name “Aradia,” as Leland noted, may have been derived from Herodias, wife of King Herod Antipas of Galilee, and described in the New Testament as an evil woman. In the *Vangelo*, however, Aradia is the brother of Lucifer the Sun god, queen of the witches, and patroness of the poor, the outcast, the outlaw, and the rebel. Although her worship is misrepresented by the Catholic Church as the worship of Satan, Leland viewed it as a “counter-religion” that divinized the Feminine principle of creation, honored the natural cycles of the Moon, and placed its practitioners in an intimate relationship with the powers of the Earth, especially as expressed through herbs and minerals.

Scholars who have studied the published text suggest that she may have presented him with a collection of legends, spells, and rituals that she had collected and written down. (Although Leland’s first draft is preserved, Maddalena’s original manuscript is not, a fact that causes some historians to doubt Leland’s version of the *Vangelo*’s origin.) These he combined with other material on Italian witchcraft that he had collected, similar to what he published in such books as *Etruscan Roman Remains* (1892) and *Legends of Florence* (1896). It is likely, however, that Leland’s published

version is not merely a translation, but was reshaped to emphasize his own views on religion, on women, and on magic. Invocations of Catholic saints, for instance, which are often found in folk magic, do not appear in *Aradia*, the better to emphasize its claim to carry the message of a counter-religion to Catholicism.

Leland's *Aradia*, although published in a small edition, became a significant factor in the British Pagan Witchcraft (Wiccan) revival of the 1940s. One of the best-known invocations, the Charge of the Goddess, was based on an invocation of *Aradia* from the Gospel, and the goddess herself was invoked into the ritual circle and into the person of the priestess by that name. Leland's works figured in the new Wiccans' claim to be carrying on "the Old Religion," and *Aradia* itself became a popular self-chosen magical name. Other writers returned to Leland's books as sources in attempts to recreate a revived Italian pagan religion. *Aradia*'s position as patroness of young lovers and social rebels continues to inspire some contemporary Pagan witches who combine religion with political and environmental activism.

Architecture

Architectural projects are located in the crossing of nature, culture and human subjectivity. Houses are necessary for human existence and survival, and building is one of the most elementary processes where human beings form nature. The notion of architecture refers to a conscious and critical act through which places, houses, gardens and environments are planned, designed, built and used. Architecture offers spatial images of the relationship between nature and culture as well as “stages” for their dynamic encounters. The built environments of every cultural period reveal the self-understandings of a population, its views of nature, its spirituality and its ultimate concerns.

The history of settlements and cities could be fruitfully regarded as a history of built religion. In antique culture, for example, the city was a symbol of the cosmos. Premodern people lived in a vertical, rotary and richly symbolic world, where the location of buildings and their relations to each other represented a complex spiritual geography. Asian cultures developed settlements in regard to ecological needs where geomancy was used as a spiritual planning and construction theory. Sacred places have been marked through sacred architecture. Richard Sennett has shown how the city plan of a culture expresses its image of the human body and Yi-Fu Tuan has shown how “topophilia,” the love of a place, constitutes a genuine force of human living.

In its early phase, Christianity did not develop a specific style of architecture itself, but it used both open space in landscape and Hellenistic and Jewish building types like the basilica and the synagogue for its liturgy. Augustine in particular used the image and metaphor of the “city” in his interpretation of God.

The medieval gothic cathedral might be regarded as the most influential Christian sacred architecture where the vision of the salvation of God’s whole creation could be materialized. Nature was culturally transfigured into a built encounter of heaven and Earth in glass and stone. Through the flow of light from heaven down to Earth, God’s presence here and now could be experienced with all human senses. The smooth distribution of colored light from above enlightened a space for liturgical motion in drama and music. As an expression not just of the religious, but also of the moral, ecological and social self-understandings of medieval European culture, the cathedral still represents a unique monument. Its architecture was an “*imago mundi*” of its time, showing the beginnings of the modern transformation of experienced space into mathematical geometrical space as well as the significance of the temporal quality of life in the Middle Ages.

The construction of buildings is a highly material affair that made it easy for architects to relate to the growth of environmental consciousness. The awareness of resources and local use of materials has always been a part of local architecture, even if the consequences of industrialization dissolved the tight connections of places, local materials and buildings, and neglected this awareness. Different approaches of ecologically conscious architecture were developed during the 1960s. The influential “critical regionalism” embedded architecture in local and regional identities including their environmental qualities. Christian Norberg-Schulz developed an influential concept of architecture as the “art of place” where architects should respect the “genius loci,” the spirit of the place. Victor Papanek points to the future need of linking ecology and ethics to each other in all design and architecture. An intensified academic discourse on ethics and architecture emerged in the 1990s, even if enlightenment philosophical aesthetics still dominates our images of beauty. Concepts of natural/environmental aesthetics have been developed by Anglo-American and German thinkers where the ecological design of architecture has also been reflected. A notion like “atmosphere” (G. Böhme) makes it possible to leave the subject/object-split behind in favor of an open perception and reflection of the inner and outer, human and natural qualities of a place and space.

The academic discourse on religion and architecture has mainly concentrated on historical objects. Information on built images of nature and the holy might be easily collected from Religious Studies and its many historical investigations. The challenge for the future of this field is to rediscover the old and to invent new syntheses of the aesthetic, ethical, religious and ecological in the microcosm of architecture.

Contemporary architecture itself reveals a strong search for the spiritual and material in building. Tadao Ando, for example, develops projects and objects where the spirit of the place communicates with elements from different religious and cultural traditions in an optimistic pluralism where houses are constructed in an extreme minimalist use of natural resources. Ando’s architecture is motivated by a vision where inter-religious encounters contribute to the happiness of human beings in harmony with themselves in nature, and where buildings should be interpreted as “refuges and islands for the soul.”

Several creators of modern architecture are intensively at work with the shaping of encounters between the inner and outer environment of human beings as well as eclectically interpreting and integrating spiritual traditions from old and new religions. The field of study of architecture, nature and religion needs to be cultivated in order to support this process.

Ariyaratne, Ahangamage Tudor (A.T.) (1931–)

Ahangamage Tudor Ariyaratne, the founder and President of the Sarvodaya Shramadana movement, was born on 5 November 1931 in the village of Unawatuna, near the town of Galle, Ceylon (now Sri Lanka). Early in his career, Ariyaratne served as a science teacher at Nalanda College in Colombo. There in 1958 he organized a series of work camps for his students in a remote village called Kanatoluwa. From these first work camps, the Sarvodaya movement evolved. Influenced by Gandhian and Buddhist ideals, Ariyaratne chose *Sarvodaya* as the name for the movement, a term that had been coined by Mahatma Gandhi to mean “the uplift of all.” Ariyaratne, following Buddhist ideals, translated *Sarvodaya* as “the awakening of all.” From the outset, the Sarvodaya movement had the goal of building a society whose value system would be based on the Gandhian values of truth, nonviolence, and self-denial. Ariyaratne said his aim was to create a “nopovertry, no affluence society.” This aim represented both an interpretation of the Gandhian ideal and an application of the Buddhist Middle Way to social and economic life.

In working to actualize this kind of social revolution, both Ariyaratne and the Sarvodaya movement have advocated policies that have supported nature and the environment. Ariyaratne has argued that the law of nature ranks alongside the law of dharma, and that both of these forms of law have greater authority than the law of the state. The Sarvodaya movement has sought a holistic and integrated form of development and has included respect for nature as a key element in this development. In Sarvodaya’s list of the Ten Basic Human Needs, it accords the first place to “A clean and beautiful environment.” Ariyaratne was influenced by the work of E.F. Schumacher and has followed his “Small is Beautiful” approach to economic development. Following this philosophy, the Sarvodaya movement has been in the forefront of ecological and environmental activism in Sri Lanka for over two decades. Its members have promoted appropriate technology and sustainable development and have operated several model farms where these approaches have been tested and applied. Ariyaratne has also organized demonstrations to preserve the natural environment, such as the one he led to oppose a tourist hotel that was being built in a semiwilderness area. Ariyaratne has viewed his work for the environment as related to his work for society, such as Sarvodaya’s peace campaign. In a Buddhist sense, he regards all these facets of development to be interrelated and the movement has sought to awaken society to this truth.

For his development work and his peace activities, Ariyaratne has received numerous international awards. In 1969 he received the Magsaysay Award for Community Leadership from the Philippines, in 1982 he received the

King Boudouin Award for International Development from Belgium, in 1992 he received the Niwano Peace Prize from Japan, and in 1996, the Mahatma Gandhi Peace Prize from the Government of India. Ariyaratne has continued to lead the Sarvodaya Movement toward the goal of peace and social liberation for all people. His work for spiritual, social and ecological awakening has influenced many people outside of Sri Lanka, such as Joanna Macy and the Buddhist ecology movement in the West.

Arrernte Increase Ceremonies (Central Australia)

The Arrernte country of Central Australia is dry and semi-arid, being comprised of red sand dunes and plains, mountain complexes, and intermittent creeks and streams whose occasional flows soak into their sandy beds or flood out into deserts. The Arrernte people (Aranda, Arunta) are comprised of a number of closely related Aboriginal language and dialect groups, and today use the town of Alice Springs as their regional center. Alice Springs was originally established in 1871 as a relay station and post office on the Overland Telegraph Line.

The function of the Arrernte Increase Ceremonies is to catalyze the healthy increase or reproduction of various animal, plant or meteorological phenomenon, which constitute totems in the indigenous religious belief system. These ceremonies were brought to international attention between 1894–1912 through the collaboration of Walter Baldwin Spencer, the Foundation Professor of Biology at the University of Melbourne, and Frank J. Gillen, the post and telegraph stationmaster at the Alice Springs Overland Telegraph Station. Gillen was also the district Sub-Protector of Aborigines and a student of Aboriginal culture under the local Arrernte Elders. The two made an intensive study of Central Australian Aboriginal peoples and published a number of volumes, which were to be of immense and long-standing influence on European scholars of anthropology, sociology, psychiatry and religion. Gillen was the first to translate the Arrernte concept of the “Altyerre” to the English “Dreamtime.”

Spencer and Gillen asserted (1927: 145) that “Mbanbiuma” was the widespread term for these ceremonies among all of the Arrernte tribal or language groups, while “Intichi-uma” was the name specific to the Central Arrernte around Alice Springs. However, there are further names for these constructs among the different Arrernte language and dialect groups.

Spencer and Gillen (1927: 148–74) described in detail the Arrernte increase ceremonies for the Witchetty Grub, Emu, Hakea Flower, Mulga tree, Manna, Honey-ant, Rain, Kangaroo, and the bulbs of “Irriakura” (*Cyperus rotundus*) plant. There are, however, many more species which collectively represent the natural resources of the Central Australia landscape and which are the respective subjects of increase ceremonies. Spencer and Gillen asserted, “taking the tribe as a whole, the object of these ceremonies is that of increasing the total food supply” (1927: 147).

The increase ceremonies are believed to have been passed down for many generations from Ancestral Beings. Through their ritual actions, the participants believe they connect with the Altyerre or Dreamtime dimension, and renew a spiritual energy linking this dimension of the ancestors with the world of mortal humans. Aspects of the travel of the Ancestral Beings are retold or re-enacted through song, ritual, and artworks with musical accompaniment (boomerang and/or clapstick percussion). Elaborate decorations of ochres and feathers are applied to bodies, ground paintings and ritual artefacts, including wooden shields. Some sculpted or assembled objects are constructed specifically for particular rituals.

Each ceremony pertains to one predominant ancestor and is usually performed by enacting a ritual for each of the constituent sites along the travel route of the ancestor. Each ritual portrays what the ancestor experienced at that site, and a widespread practice is to perform one of these rituals per day. For some sites, a traveling ancestor encounters and interacts with a second travelling ancestor, perhaps exchanging something (an anatomical feature, a language, or a firestick, for example). Where two traveling ancestors met at a site, the corresponding ceremony often involves two ground paintings joined together, with two sets of actors from adjoining countries, reflecting the shared ritual responsibilities. At still other sites, the ancestor did not travel, but was stationary at the site.

Arrernte ancestors, people, sites, totems, rituals are all classified into a number of social categories (“apetherre”) called “sections” and “subsections” by anthropologists, and “skins” in English by Arrernte people. A clan of Arrernte people are ritually responsible for a set of sites (a country) and totems of the same skin identity. Thus a clan of “apwerle” and “kemarre skin” people may have a set of

Rain sites in their country and they would perform rainmaking ceremonies. Associated totems might be certain species of frogs, lightning, certain species of trees believed to be “lightning trees,” several bird species which are said to be “rainmakers” and whose feathers are used in rituals, and types of clouds including the wispy cumulus clouds (“babies” that grow into big rain clouds).

The sacred and secretive objects recorded by Spencer and Gillen as “churinga” (1927: 99) are still used in many of the restricted increase ceremonies, being stored in secret, camouflaged hiding places in the landscape at or near their sacred site. These objects (“tyerrengge”) are believed to have been born in the Altyirre or Dreamtime. When young men are initiated into the ritual cult they are allowed to hold these objects and draw on their perpetual powers. Their initiation involves being sat on the ground paintings and instructed in a process of revelation.

Little anthropological research on ceremony occurred in Central Australia after the work of Spencer and Gillen in the 1890s, the exception being the writing of Professor Theodore Strehlow, originally from Hermannsburg Lutheran Mission. When younger Arrernte men had not been fulfilling their religious duties and certain ceremonies were dying out, despairing Arrernte Elders (especially West Arrernte) entrusted Strehlow to hold their sacred objects. Most of these objects have since been deposited in the

Strehlow Centre, a restricted-access keeping-place in Alice Springs. However with the advent of the Australian Government's *Aboriginal Land Rights Act (Northern Territory) 1976*, various groups of Aboriginal people in the Arrernte nation have revealed their increase ceremonies and disclosed their sacred objects from secret hiding places in restricted court settings in order to win their land claims; thus demonstrating that these ceremonies and their belief systems remain in various parts of Arrernte lands, and continue to be a virile component of Aboriginal religion (and politics).

Spencer and Gillen's books contain innumerable photographs of men dressed in their feather-down and ochre body paint-up, performing near or on the sacred ground paintings and with a variety of decorated sacred objects. The contemporary Arrernte have imposed a restriction on these books being sold or even displayed in Alice Springs bookshops, libraries or museums due to the Aboriginal Law forbidding these images and their associated knowledge to be seen by uninitiated men or women. Interestingly, the visual elements and patterns of these sacred designs have, since the 1970s, been adapted to create the internationally famous "dot-art" style of Aboriginal desert painting.

Art

In everyday speech, people often make a contextual distinction between the words “nature” and “environment.” The environment is thought to be scientific and complex. It is viewed as a territory staked out by scientists and defended by environmental activists against degradation and despoliation. Nature, however, evokes a different set of storied descriptors – ones far more positive and personal. Typically, the descriptors associated with nature commingle nature, beauty, and divinity. A Muslim might, for example, cite the beauty of nature as evidence for the existence of a creator beyond human comprehension; whereas, an Algonkian elder could speak of the “great mystery” evident in nature’s beauty and know, thereby, *manitou* animated the universe.

Despite fire, flood, tornado, or other catastrophic natural events, nature – in popular imagination – is good, beautiful, and approachable. Art affirms and informs our soul-stirring experiences of nature – even if the tent was leaky and the happy campers bug-bitten. In North America, American artist Ansel Adams’ (1902–1984) photographs of Yosemite fund the efforts of environmental protection groups seeking to defend wilderness areas and national parks from the encroachment of industrial developers. Exhibitions of French artist Claude Monet’s (1840–1926) paintings of his gardens at Giverny draw long lines of visitors to galleries everywhere, inspiring many to grow their own tossed and tumbled flower gardens. Dutch artist Vincent Van Gogh’s (1853–1890) painting of a starry night is still among the most popular of art reproductions one might find in a university student’s bedroom. All three artists hoped to create in their work something of the revelatory knowledge they had experienced in nature. The popularity of their widely reproduced work today suggests they succeeded. Nature, depicted in their landscapes, is heroically beautiful, a dazzler. Theirs is a profoundly religious view of nature, rooted in a pantheistic appreciation and supported by the nineteenth-century religious philosophy of transcendentalism. Among artists these are not unusual viewpoints. For many – be they artist atheist, deist, or theist – nature itself is experienced as sacred, soulful; in German theologian Paul Tillich’s (1886–1965) terms, nature may even be the ground of being.

The interrelationship of art, religion, and nature is an ancient one. On the walls of hidden caves and rock shelters the world over, human and nonhuman transformation imagery abounds. It is evidenced by the well-known Ice Age imagery found at such European archeological sites as Trois Frères and Lascaux in France or Altamira in Spain. Painted and sculpted animals are shown alive, alone or in groups. The animation of the Paleolithic imagery may suggest human and animal were believed to share personhood. They might transform themselves from one to the other by putting on or shedding an

outer “skin.” Hybrid imagery of human and nonhuman was also possible – a bird-headed woman, a wolf-headed man, for example – just as in later years the Egyptian iconography of Sekhet, lion-headed daughter of Isis, will transfer to Mark, the lion, one of the four Christian evangelists. Aspects of Nanabush, the Great Hare trickster figure of the North American Anishnabe, survive in Tex Avery’s irrepressible imagery of Bugs Bunny. Such imagery attests to an old and intimate understanding of the relationship of human and nonhuman realms in the natural world. Once, not that long ago, what was called “sacred” was entirely natural and a part of the natural world; the “sacred” was not supernatural.

The intimate relationship of our long-ago ancestors with nature was one obtained from a close and careful observation of the nonhuman world around them. Our forebears observed the way a weaver bird stitches a nest together, how the ant tunnels into the Earth, how herds of animals and flocks of birds arrive and depart in relation to counts of the moon and turns of the seasons. Long-ago humans saw flowers bend and turn toward the sun, then close at end of day. People observed birth, death, and transformation in the surrounding world as natural and sacred events. Knowing these events in their own lives, they adopted and adapted construction techniques observed in nonhuman realms and amalgamated the imagery into an encoded material art.

We see those forms today in ancient artifacts that survive in anthropological collections. Although the surviving objects and images are varied in form and number, the subject matter is not encyclopedic in scope. Not all animals, plants, insects or other aspects of the nonhuman, natural world were transmuted or reified into pictorial imagery. Only some things were seen in those special terms, then recorded and transformed into visual imagery.

How were the subject choices made by the artists? Perhaps the answer lay then, as it does now, in the revelatory experience of nature we term today “artistic vision.”

Artistic Vision

Artistic vision is much more than a good idea that propels the artist into the studio. A nature-centered artistic vision is revelatory; some connection is being made by the observer – the artist – with a hidden reality. Whether the vision be as simple as light glinting off a leaf, or the glance of a bird, the flicker of fish, the fact the artist observes something via vision obligates the artist to record it via art in order to show to others what has been shown to the artist. The observation enters into an artist’s field of vision haloed, or highlighted, by further meaning the artist imparts to it. When artists try to explain the effect of visionary obligation on their work as artists, they speak of the experience as one of becoming a “medium.” Not infrequently, the artist subsequently becomes learned in the Earth sciences. Artists draw on the resources of science

– botany, geology, astronomy, physics, etc. – to deepen their understanding of their visions. Earth-centered visions, no different than deity-centered visions, can be

life-changing. The eminent historian of religion, Mircea Eliade, located revelatory experiences under the heading “hierophany.” A hierophany, according to Eliade, might be experienced as theophany or kratophany, or display aspects of both.

A theophany of nature is a revelatory experience associated with named deities located in nature. The ancient Egyptian artist, for example, could depict Nut, the sky, as a slender woman whose starry body arches across the night sky. Hathor might be shown as a cow, or as a cow emerging from a mountain, or as a woman bearing the beautifully curved horns of a cow upon her head. In context, each different image would be understood as displaying some aspect of the powers attributed to Hathor. When Mary, the mother of Jesus, is shown in her aspect as Queen of Heaven, she wears a crown of twelve stars and stands upon the crescent moon. The image continues a primal association of the moon and sea with the feminine, and entirely natural, rhythms of fertility. The so-called “Venus of Laussel” displays the same primal association. It is the best-known of the three Laussel bas reliefs on this theme (one is now lost).

Unlike the theophany, the kratophany of nature, according to Eliade, is a sacred power manifested by means of a particular person, place, or thing. Kratophanies are more diffuse hierophanies and present different situations for the artist. In Peterborough, Ontario, for example, ancient Anishnabe artists used hammerstones to beat visionary drawings by the hundreds into a limestone outcropping. Their petroglyphs are the records of place-specific visions located in nature at that rock. Today the Anishnabe of the region call that place “*Kinomagewapkong*,” “the teaching rock.” The rock is used today by Anishnabe elders to tell the stories of their people to the children. Canadian artist Jennifer Dickson’s work is also of storied places. She travels the world over studying and photographing old gardens. In some places she has experienced site-specific visions. The photographs Dickson makes are study documents, just as are the Anishnabe limestone glyphs. Meditating upon the photographic images in her studio, the artist creates paintings, photo-etchings, serigraphs, and complex photographic suites that suggest visions to be known in these places. Although Dickson lectures widely, she never speaks of her own visionary experiences; nonetheless, people have approached the artist and told her they, too, know the gardens are sacred. Upon seeing Dickson’s art, they felt prompted to travel, as a pilgrim might, to the very places that inspire her work.

Artists who attempt to map their experiences of a beautiful, powerfully animated world in art, do so in the belief their work can and must communicate important, sacred visions to another, to those who see the artwork. The concept of “mapping” is important here. In a religious work of art, the artist asks the viewer to look closely at the work. Looking closely enough to see the work as the artist intends it to be seen is not easy for many today. It is a learned skill. Looking closely requires the viewer to slow down, to consider every color, every line, form, shape, texture to be found in the material reality of the composition. Each part of the image is intended to convey some aspect of the visionary event, the initiating visionary knowledge. One learns to “read” a painting or a sculpture as a map (and one must learn to read those, too). Reading an

artistic image with care allows the viewer's mind to trace the visual choices the artist has made. The painting begins to come alive; it "works" on the viewer's mind. The free associations prompted by looking closely animate the image. The painting may, if the imagery is clear enough, live for years in memory. That is why a Byzantine-rite nun in Ukraine, for example, knows the icons she paints are as truthful a representation of heavenly reality as she can make them; her images are painted prayerfully in response to religious vision. This is also why Vincent Van Gogh's "Starry Night" became one of the iconic paintings of our time. It, too, is honest work.

Sacred Geographies

Some depictions of sacred realities located in nature constitute sacred geographies. These maps are constructed landscapes which include the Earth and the entire universe insofar as it matters. They are cosmographies that account for the origin of the world and of human beings within that world. For the Ojibway priest of the Midé society, a set of sacred birchbark scrolls depicts the mythic journey of bear across the world. The people of central New Guinea knot *bilum*, intricately knotted carry-all bags, to continue the creation of the world. Each time a bag is knotted – and they are knotted continuously by women and by men – the people's specific connection with the powers of the Earth is knotted into place again. In North America, over the course of several days, singers of the Dineh (Navaho) people construct intricate sand paintings in order to realign someone whose life-world has become unbalanced and shaky with all of creation, with all of the cosmos. Tibetan Buddhist monks also construct equally intricate mandalas of colored sands. Theirs are world prayers for healing.

When the medieval European cartographer inscribed "there be monsters" on a fifteenth-century parchment map of the known world, the map-maker's warning alerted viewers to the existence of unknown worlds. Among those worlds was Eden, thought to be a real place with real rivers and animals, from which Adam and Eve, the first parents, had been expelled. Eden was located somewhere beyond the place of the monsters. It was as specific a place as the Christian heaven, itself often depicted as a beautiful walled city with twelve gates.

In India, a fifteenth-century Jain map depicted the order of the world as one centered on a sacred mountain in the middle of a circular continent, the whole circumscribed by two rings separated by oceans; each of the rings was also a continent. A fourteenth-century Japanese map of the world emphasized the importance of Mt. Sumeru, a sacred mountain. American engineer, scientist, gadfly and public intellectual, Buckminster Fuller (1895–1983) devised a *Dymaxion Airocean World* map which not only corrects the proportional flaws of the more usual flat Mercator-type map, but also brilliantly shows the land masses of the world as truly interconnected with one another – and not as continents dramatically separated by oceans. Fuller was a visionary committed to the problem of translating mathematical nature into an "everreinspiring conceptual

intimacy with the Universe,” as he wrote in the catalogue for the Cooper-Hewitt Museum’s inaugural exhibition, *MANtransFORMS*, New York City, October 1976. Fuller had helped design and organize that, too.

The Golden Section

In addition to showing the relationship of parts of nature to one another, maps also measure space. In the West, one system of spatial proportion became, and continues to be, preeminent, if not ubiquitous. It is called Pythagoreanism. Nothing anywhere else – not the Japanese *tatami* system of spatial measurement nor the Chinese system of *feng shui* used to balance or harmonize complementary qualities found in nature, nor even Buckminster Fuller’s *dymaxion* principle of doing more with less – has been as pervasive an influence on international art and design as the Pythagorean system of spatial proportion. It remains so today. Most people have no idea why doors and windows, pieces of paper, computer screens, and a host of other ordinary objects look the way they do. The “why” is found in Pythagoreanism.

Pythagoreanism is based upon the work of the early Greek thinker and scientist, Pythagoras (sixth century B.C.E.) and his followers. It is both religion and mathematics. Pythagoras observed that all of nature could be understood as a relationship of number – whether the relationship was that of notes sounded by a plucked string or the movement of the planets in the firmament above. The key Pythagorean numerical relationship is expressed by the Greek letter Φ (Phi). It is equivalent to 0.618, also called the “golden number.” The golden number is found in nature as a ratio of part to whole and can be drawn as rectangle, pentagram, five-pointed star, and spiral endlessly. In any size, the ratio of part to whole remains steady: it is 1:1.618. In 1202, the Italian mathematician, Fibonacci, demonstrated that a spiraling sequence of prime numbers in which each number is the sum of the two preceding is also an illustration of Φ . Moreover, the Fibonacci number series is observable almost everywhere in nature – in the way petals form on a daisy, for example, or the turns of a conch shell. Only in crystals is it not found. During the European Renaissance, artists became reacquainted with Pythagoreanism and quickly adopted the mathematical principles as tools to help them create compositions depicting a sacred world hidden in nature. Northern European artists traveled to Italy to learn the mathematics of proportion and perspective from Italian teachers. One can see the result of their studies in the harmonic similarities of relationship displayed in the compositions of two otherwise different artists such as the Italian artist Alessandro Botticelli (1445–1510) and the German artist Albrecht Dürer (1471–1528). Artists continue deliberately to invoke the Pythagorean proportional system in their compositions. Canadian artist Dawn Dale, for example, constructs floral mosaics from flower petals she scavenges from her neighbors’ gardens. Dale’s mosaics illustrate rather literally and with punning intent both the mathematics and the source of Pythagoreanism. Once each golden section and

spiral has been formed and seen by others, Dale dumps the whole into a compost heap. The following year there will be more flowers and flower petals. The artist uses only scavenged, recyclable materials for all of her artwork.

Somewhere between 46–30 B.C.E., the Roman architectural historian Vitruvius wrote a treatise on architecture, *De architectura*, based on the work of the Pythagoreans. The text became famous during the Renaissance and has been a touchstone for architects ever since – up to and including those of the Bauhaus and the architects of the “Chicago School.” Because the proportions of the human body mirror ratios extant in the universe, Vitruvius argued buildings must also be built in proportion to the human body in order to create a harmonious and natural whole.

Vitruvius’s treatise was published in Rome in 1486. An Italian translation was prepared in 1520 under the direction of the Italian artist Raphael (1483–1520). Another Italian artist, Alberti (1404–1472), studied Vitruvius’s work closely, then wrote his own treatise on architecture, *De re aedificatoria*. Alberti’s work was hugely influential in the compositions of Brunneleschi (1377–1446), Bramante (1444–1514), Michaelangelo (1475–1564), and Palladio (1508–80). Palladio’s own treatise on architecture in harmony with nature then became the standard for nearly 200 years. Thomas Jefferson (1743–1826) studied Palladio’s work and responded to it with designs for the Virginia State Capital, the University of Virginia campus, and his own home Monticello. All of Jefferson’s architectural work, like that of other Vitruvian-influenced builders, was intended to create a built environment of serenity and natural beauty. That is why the neo-classical building, with its stylized, porticoed entrance and central plan dome, became so popular on university campuses and government complexes everywhere.

We see a diligent attention to the mathematics of proportion and the science of light in the work of Western artists from the sixteenth century onwards. French artist Nicholas Poussin’s (1594–1665) *The Burial of Phocion*, for example, has little to do with grief or mourning. The painting is a mathematically perfected surface of golden sections, multiplied into an endless series of infinite ratios. By the twentieth century, the artist’s concern to learn and portray for others the underlying structures of nature had become highly formalized in the color and compositional theories associated with both theosophy and anthrosophy. In art one finds this thinking underpinning the emergence of a variety of artistic “-isms,” including, precisionism, cubism, orphism, luminism, pointillism, and so forth. All are attempts by artists seeking to portray a perfected, hidden reality of nature.

The well-known drawing of a man arranged within a square within a circle by Italian artist Leonardo da Vinci (1452–1519) is the artist’s own illustration of the Pythagorean ratios as established by Vitruvius. The same drawing is reproduced today as a popular screen saver on computer monitor screens which are, themselves, designed in the ratio of the golden section. Another adaptation of Leonardo’s drawing accompanied one of the far-reaching rockets sent into outer space in the American space program. The NASA drawing depicted figures of a man and a woman in relation to the universe. The proportions were, of course, Pythagorean in origin.

The Garden

With the ascendancy of Christianity in Europe, much of the Greco-Roman admiration of nature was lost. The Romans had painted beautiful scenes of gardens and Arcadian idylls on the walls of their villas and townhouses. The medieval Christian did not. Unlike the Roman farmer who lured the local deities to a particularly enchanting wooded glade by placing a bit of sculpture there, the medieval Christian viewed the woods as a place of robbers and bears. Nature as subject/matter for art had dropped right out of the tradition of painting, as did the ancient Egyptian and Greco-Roman practice of including pleasure gardens in their domestic architecture. The garden, such as it was in the medieval period, was there to be a source of kitchen foods and medicinal herbs.

Art historian Kenneth Clark notes in *Landscape into Art* (1949) that when Italian poet Petrarch (1304–1374) stumbled to the top of a mountain, the poet – overcome by wonder at what he saw – reached into his knapsack and pulled out a copy of Augustine’s *Confessions*. Petrarch evidently felt he needed guidance to understand the scene before him. In Augustine’s writing, Petrarch read that only the human soul could be thought truly wonderful and beautiful. He felt duly chastened. Nevertheless, Augustine’s dour view was under challenge throughout Europe.

Returning from the East, crusaders and traders were bringing with them new ways of writing, thinking, and building. The Islamic tradition of the garden as a bit of *paradise* (“paradise” itself a word of Avestan origin from the ancient Persian) was among those radically inviting new ideas from the East. Devout Muslims built beautiful, geometrically ordered gardens in which flowers and water served as specific reminders of Allah’s compassion and love of beauty, and of the beauty that awaited the faithful in heaven. The Islamic garden must have been an astonishing sight to the medieval Christian soldier. In Christian Europe, there had long been a severance of art from nature and religion. The traditional commingling of nature, beauty, and divinity was shattered for roughly 1000 years (500–1500). What little had survived was deeply shadowed. However, by the time of the Renaissance, the elite of Europe were finding the Islamic garden a model well worth emulating. So, they did, often using Pythagorean proportions in the designs.

In Asia the garden was designed to be an architectonic site where one might observe the teachings of religious practice. Daoist thought brought to perfection the Chinese garden as an art form that stressed the virtue of age. Old stones – very old stones that looked as weathered and ancient as the mountains featured in paintings of the Chinese *literati* tradition – were prized features of the Chinese scholar’s garden. The scholar could stroll through the garden, wearing an embroidered robe depicting the heavens and the earthly seasons, before commencing upon yet another painting of a stylized landscape whose composition would express the religious and philosophical views of nature inherent in Daoism and Buddhism. The painting would then be discussed in detail by other practitioners of the *literati* tradition. This art tradition has flourished

for centuries, from the thirteenth-century Yuan dynasty to the present-day in Chinese communities worldwide.

In Japan, the garden also served as an art form for reifying religious practice and making visible religious paradox. Two main forms had developed by the fourteenth century: the wet garden and the dry garden. The wet garden incorporates the sound and sight of water into the design; the dry garden does not. Both forms incorporate a path which requires the viewer to look variously at aspects of an asymmetrical design – as the path turns up, down, and around changing one’s point of view slowly and deliberately. The garden is a set-aside ground of ritual beauty. Following the path soon brings the visitor to a contemplative state of mindfulness. Viewing places provide stops along the way: here might, for instance, be the place to watch the moonrise. To the Western mind, the Japanese garden is enchanting. American artist Isamu Noguchi (1904–1989) built his first Japanese-style wet garden at the Paris headquarters of UNESCO. Noguchi designed the garden for the specific purpose of providing delegates attending UNESCO sessions with a quiet place for reflection and retreat from contentious meetings. The most famous of the dry gardens is the monastery garden of Ryoan-ji in Kyoto, Japan. Designed in accordance with the austere aesthetic principles of Zen, Ryoan-ji consists of an enclosed space of raked white gravel. Upon the gravel fifteen stones have been placed precisely. That is all. Ryoan-ji is a garden for sitting meditation. The path to be followed is in one’s mind. The artist is traditionally thought to have been a Zen monk named Soami. Ryoan-ji was built around 1480 during the Muramachi period when painting, calligraphy, and ceramics were all art forms deeply influenced by the austere religious practices of Zen Buddhism.

The Landscape in Painting

Just as the garden was rediscovered by Christian Europe after a long hiatus, so was the possibility of the landscape as subject matter in painting. In fourteenth-century Siena, Italy, the Lorenzetti brothers, Ambrogio and Pietro (both ca. 1319–1348?) painted an imposing allegorical fresco, *Good and Bad Government*, incorporating scenes of the countryside. *Good and Bad Government* depicts a world in which good government is coeval with a pleasant and bountiful agricultural countryside and bad government is not. The Lorenzetti frescoes were painted in the thoroughly secular new city hall of Siena. Another century would pass before the landscape appeared again in European art. Its role was minor in the composition. The aspect of nature shown by the artist was usually a pleasant view seen from the safety of the other side of a wall or through a window looking out. Not until the rise of the industrial age, with its polluting cities and breakdown of peasant and yeoman culture in the countryside, would artists begin to paint landscapes as sites of religious vision. Concomitantly, landowners begin to landscape their estates into parklands with cultivated “views” – typically,

Arcadian. In this economic and intellectual climate, ideas of religious utopianism and transcendentalism took hold, and artists were no exception.

By the late eighteenth and nineteenth century, many European and North American romantic artists, by walking in the woods, clambering up mountain trails, and traveling to exotic places, had begun to practice a form of art based on deeply felt experiences of nature they called “the sublime.” The artists portrayed their vivid encounters with nature in poem and painting as evidence of a natural divinity extant in the uncultivated world. The German artist Casper David Friedrich (1774–1840) typifies this approach. His painting, *The Cross in the Mountains* (1807–1808) may be the first landscape hung over an altar as the altarpiece. The painting had been commissioned for a private chapel. At the time it was thought extreme, if not sacrilegious. Today Friedrich’s work is viewed as deeply religious. A hundred years later North American artists continue to be inspired by wilderness as the foci and loci of kratophany in their religio-aesthetic practice of art. The earthwork is the recent, and most dramatic, expression of this religious art.

The Earthwork

Beginning in the early 1970s and continuing to the present-day, a diverse group of artists, working independently of one another, have taken up the task of making the shape of the Earth itself visible – not as an arid or occult mathematical construct, but as a lived place of experiential wonder and awe. Canadian artist Marlene Creates and British artists, Richard Long and Hamish Fulton, for example, walk long distances for days on end. Each has made walking the Earth part of the work they do as artists. Sometimes each one photographs small impermanent structures that they make on site to mark a place where each has been. Marlene Creates walked around the island of Newfoundland. Sleeping upon the ground in her sleeping bag, the imprint of her body could be seen on the soft Earth in the morning. She photographed these places. The photographs are as tender as an old heartache.

In some instances, the artists are retracing old nomadic trails. In the American southwest, for example, American artists Charles Ross and James Turrell are each building a naked eye observatory at sites that ancient people honored, too. Turrell has shaped and smoothed an extinct volcano in Arizona. Ross was led by vision to a particular place in which he believed he would feel a connection with the precession of the Earth’s axis. He found the site to be at the top of a mesa in New Mexico. Neither artist knew that they would find the records of an earlier people in these places, too, but each one has. Each artist’s work is different from the other, yet each is intent upon making visible to others site-specific, religious visions the artists have known at those places. Their visions are instances of a powerful kratophany. They take direction for the work they do from vision and dream, and have done so for many years. In this they

are no different from many of the other artists whose work can be truthfully described as an Earth-centered, religious relationship with nature.

Religious Landscapes as Architectonic Sites

Religious relationships with nature produce different sorts of landscapes reified in material culture and art as architectonic sites. There are four main types, although neither excludes ideas associated with any of the other three. Habits of thought and practice associated with each of the organizations of land can and sometimes do overlap.

Landscapes of “extreme order” are ones in which the social and mythic values of that landscape exist whether the viewer is there or not. These are situations where land is owned and can be inherited. Rights of property are highly important. One must seek “right-of-way,” for example, to walk the land if it is not yours. In art, the English country scene depicting the lord of the manor and all he owns is a pictorial document of the religious idea of “dominion” – that land is there to be used, exploited, owned, and that Christian, especially Protestant, virtue will be rewarded with prosperity. Australian Aborigines also have highly structured views of land. Their landscapes must be “sung” in order to keep them alive. Unsung land dies. Women and men inherit the landscapes, the songlines, for which they are responsible. Individual songlines provide one with a place in the world and a heritage of origin in the land. The songline is property that can be transferred to another.

Landscapes of “seasonal order” are ones in which the participants in this landscape align themselves with the land in response to regular changes of season and other cosmic forces. Some groups are nomadic and move their herds of sheep, for example, from high to low pasture seasonally. Others are hunters and foragers. In winter they live in small family groups. At the end of summer, families gather to tell the stories and exchange news. The religious ideas of life lived in a seasonally ordered world produce a nature-based art which may take two forms: highly portable and personal art or permanent and communal work. The medicine bundle of a North American Cree shaman, for example, is highly portable. It is a small altar that allows the stories animating the objects within to be told whenever and anywhere the bundle is opened. So, too, are the beaded patterns on moccasins or the ornaments on a baby’s cradle board. They tell of encounters with an underwater panther or thunderbird. For the cattle-herding Ngoni-speaking peoples of southeastern Africa, a carved wooden headrest is not only practical – a place to lay one’s head for sleeping – but it is also a religious implement. The carved, wooden headrest provides the means for communicating with one’s ancestors in dreams. Moreover, the wooden headrest acknowledges and acclaims the cow in its patterned carvings, the source of wealth and well-being.

People who value the seasonal landscape have also marked their gathering places in monumental ways. Long ago, the people of the Adena culture in North America

made effigy mounds of animals in widely scattered places. The various peoples who built the monumental burial mounds and other megalithic structures of Europe, Africa, and Asia also gathered seasonally in these places. In a sense the seasonal monumental landscape can be thought of as a centering site of pilgrimage for a people. One might go on pilgrimage to a sacred place, but no one would own that place to the exclusion of others. A contemporary example of the seasonal landscape is the earthwork sculpture constructed by the American artist, Robert Smithson (1928–1973) in 1970. *Spiral Jetty* was built by Smithson at a site along the shore of the Great Salt Lake, Utah, to record a vision he had seen there. In that place, the artist saw the water become red, spinning before his eyes. The jetty is more than 450 meters in length. It is usually underwater, becoming visible only every few years when the lake waters recede. Photographs of the jetty and the story of Smithson’s vision have made the site, nonetheless, a place of pilgrimage for many because, like all sacred sites, something sacred happened here once, and it may happen again.

The architectonic landscape of “porous order” is even more fluid. It might be a site demarcated by standing stones, for example, or a Shinto (*kami-no-michi*) torii gate encountered along a pathway. In this landscape parts of the Earth are experienced as site-specific collecting points of a visionary sacred order. The sites are marked with the lightest hand. One sees through, into, and around. Sometimes one sees above and below into a tripartite universe at that place. Canadian artist Kathleen Gillis, for example, uses the old European technique of dowsing, or waterwitching, to map various sites she wants to know better because she feels they are important – even if the reason is no more than the way the grass grows at that place. Gillis never makes claim as to what she is measuring. She charts on a grid the way the divining rods turn and spin, first one way, then another. The artist says she knows only that she is measuring loops and spirals and turnings in the Earth we should not be ignoring, and we need to be aware of them. Gillis’ “found patterns” often become motifs in her drawings, paintings, and sculpture.

Canadian artist Robin Campbell has been living in Japan for many years in order to work on a complex of art inspired by two sacred mountains – Mt. Hiei and Mt. Ichijo. Campbell calls her body of work “prayers for the well-being of mountains and their forests,” or “prayerful interventions.” Like many other artists working today to create an Earth-centered sacred art, it has been Campbell’s experience that sacred meanings, even fugitive ones, lie within the cognitive mapping schemes of sacred sites.

These meanings can be retrieved through a close analysis of the site’s visual and spatial configurations, its cognitive map – even if the site has been forgotten or despoiled. As part of Campbell’s religio-aesthetic practice, the artist leaves ceramic offerings to the *kami* she finds along the paths of the two despoiled, yet still sacred, Japanese mountains she has come to know so well.

Lastly, the “symbolized microcosm” constitutes a fourth overlapping category of architectonic site. In 1965–1978, the American artist Alan Sonfist built a series of small parks throughout the boroughs of New York City. At each site, the artist built

a living landscape mimicking the one that had been there 300 years earlier. Here, one found balsam pine, not the imported, exotic dandelion. The series, entitled *Time Landscape*, collapsed time. The labyrinth, the Lakota sundance lodge, the medieval cathedral, and the Baha'i temple are all good examples of built spaces in which the architectonic order of the space itself is a mirror of a sacred, cosmic order located in nature or some part of nature – perhaps even in a fish.

Art and Science

In 1984, American artist Betsy Damon was flattened to the ground by an astonishing vision of water as a sacred, elemental force. She saw water as healer, water as life source and the ruination and loss of water everywhere. In her vision she also saw a “living water garden” and knew one day she would build that garden. The artist did not know where and she surely did not know how. Damon’s life and art changed at that point to become one centered on water. Damon started by forming a group of artists and scientists who would talk to one another about water and see what happened from there. The group called themselves “Keepers of the Waters.” In 1993, the city of Chengdu, China, committed to the restoration of its riverfront, asked Damon to design a park. Keepers of the Waters agreed to take on the project and do more: the park would be designed to restore the river water. Work began in 1996 and was completed two years later. Today Cheng-du’s Living Water Garden is a park of 24,000 square meters, cleaning and purifying river water through a natural cleansing system of aeration and filtration, using microbiological and botanical interactions. The park’s overall design was modeled by Damon on the shape of a carp, a fish honoured in Asia for courage and endurance. The carp is emblematic of a virtuous, long life. A *feng shui* expert consulted with the artists and engineers every step of the way to ensure the “fish would see with clear eyes.”

Sometimes, as in Cheng-du, the landscapes of ancient sacred sites go missing and must be mapped again to be seen. For her doctoral dissertation fieldwork in mythological studies in the 1990s, American artist Adrienne Momi assembled a group of Czech artists to work with her at a known, but unexcavated, Neolithic site in the Czech Republic. Using non-invasive mapping and other visualization techniques, the collective of artists worked for two years to learn the site’s sacred dimensions – as they might once have been known. Momi began the cognitive mapping of the site by walking. Coming across the field, she “felt” as though she were walking upon a sacred site. With relatively little problem, the scientists in charge of the area were willing to give Momi and the artists collective permission to cognitively map and explore the site because, as the supervisor of the site explained, he, too, has had the same sort of feeling when he is excavating a site. Each group’s work, both directors felt, would prove to be explanatory and complementary of the other.

UNESCO and the World Heritage List of Cultural Landscapes

In 1972 the United Nations' Convention for the Protection of the World Cultural and Natural Heritage was signed into international law. The convention is charged with protecting natural and cultural sites of "universal," that is, world-wide, significance. The key mechanism for enforcing the provisions of law pertinent to world culture is simply the naming of sites to the World Heritage List. Criteria are narrow and only countries that are signers of the convention may nominate sites for review by the List committee. Cultural landscapes must qualify in at least one of three categories: those landscapes built intentionally, such as parks and gardens; those which evolved through human interaction with the natural environment, even if the site was abandoned, such as an ancient temple complex; and, lastly, landscapes having powerful sitespecific religious and artistic associations. In every one of these categories, the importance of artists' work in pointing to, mapping, and interpreting sites named to the World Heritage List is acknowledged and encouraged. The convention regularly schedules meetings of geographers, ecologists, architects and artists, historians and ethnologists to examine the parameters constituting a "cultural landscape."

In 1998 UNESCO extended the question even further by convening a symposium of scientists and representatives of indigenous peoples to ask if "natural" sacred sites could serve as "indicator sites" for environmental health. Among the many scientific proposals presented and examined, two noted the importance of artists, even non-indigenous artists, working at sacred sites. The reasons were similar: artists work to render hidden realities visible and comprehensible to others. Like other sacred arts, the so-called environmental artist's work has a message: he or she seeks to redirect our attention to the physical environment around us because it is there the artists have found themselves standing in sacred places.

Conclusion

When we think of the relationship of art, nature, and religion as one where the artist is charged with illustrating sacred text or scripture, we thereby run the risk of leaving nature out of the picture entirely and we mistake what it is that the best artists do. The best artists are not skilled illustrators. The best artists are efficient and skilled visionaries. They are very good map-makers and finger-pointers. Many artists have the capability to translate their visionary encounters with nature so that others may see, too. Some do this work superbly. They have been working for years with scientists in order to make the sacred nature of the Earth, as they conceive it to be, more visible to the rest of us. The hand of the artist has left a visible record of nature as a sacred realm of being since the beginning of human history. For the visionary, Earth-centered artist,

the words “environment” and “nature” are *not* separable concepts and commitments. It is the opposite. “Environment” and “nature” are inseparable.

Art of Living Foundation

The Art of Living Foundation is an international nonprofit educational and humanitarian organization dedicated to creating peace from the level of the individual and fostering human values within the global community. To date over 2 million individuals in over 140 countries have participated in the Foundation's educational and humanitarian programs, which eliminate stress, create a sense of belonging, restore human values, and encourage people from all backgrounds, religions, and cultural traditions to come together in celebration and service.

One of the most important aspects of the Foundation's work is its strong focus on human values in the international arena. This approach calls for a broad and holistic vision that honors the spiritual source of our existence and the interconnectedness and interdependence of all forms of life.

Spiritual and humanitarian leader, Sri Sri Ravi Shankar, founded the Art of Living Foundation in 1982. Today, the Foundation's educational and humanitarian programs are living examples of the truth that the great spiritual traditions possess common goals and values. Sri Sri Ravi Shankar's simple message of love, practical wisdom, and compassion continues to inspire people from all walks of life, encouraging everyone to follow their chosen religious or spiritual path while honoring the path of others. "The only true security that can be found in this world," says Sri Sri Ravi Shankar, "is in the very process of giving love" (Art of Living brochure, 1991).

Human Values and Peace

The work of the Art of Living Foundation is based on the conviction that only by honoring the human and spiritual values which are shared by cultures and traditions everywhere in the world, can we, as a global community, truly achieve our highest human potential. Many people identify themselves primarily with their nationality, race or religion ("I am an American," or "I am a Muslim"), without first experiencing and identifying themselves as a member of the larger human family and its divine or universal source. Education in the human and spiritual values common to all people removes these limitations in each of our minds and provides a practical basis for global peace and cooperation.

Our planet is a living organism, which possesses a rhythm and an innate knowledge of managing itself. We need to realize and move in its rhythm. When this rhythm is disturbed, greed, anguish, stress and disease result. The current crisis in our global

environment is only a projection of our limited minds, clouded in the stress and strain of separation from one another and our common source. We begin to solve the problem by returning to this common source and the values which surround it (Art of Living Foundation position paper delivered at World Summit on Sustainable Development, Johannesburg, South Africa, 2002).

The Art of Living Foundation achieves this goal through both individual and group participation in *sadhana* (spiritual practices), *satsang* (coming together in knowledge) and *seva* (service to others).

Spiritual Practices

The Art of Living Foundation offers a variety of educational programs that teach powerful transformational techniques to expand awareness and dissolve stress. These courses are offered all over the world and are approximately fifteen to twenty hours in length. During the Art of Living Courses, one learns practical and effective techniques that can be practiced at home for just a short time each day.

Breath

Attention to the rhythms of the breath and their effect on health was part of the ancient knowledge of the art of living. One of the main techniques taught on the Art of Living Course is the *Sudarshan Kriya*, a unique breathing technique developed by Sri Sri Ravi Shankar. The *Sudarshan Kriya* uses specific rhythms of the breath to calm the mind and produce profound physical and emotional cleansing. This effortless practice triggers the system to eliminate stress and emotional blocks, which has a profound effect on the whole individual, as well as his relationship to his environment and to others around him.

We need to do a cleansing process within ourselves. In sleep, we get rid of fatigue, but the deeper stresses remain in our body. Sudarshan Kriya cleanses the system from the inside. The breath has a great secret to offer (Sri Sri Ravi Shankar, 1994, quoted in section on “Breath” at the Art of Living website).

Meditation

We gain from our efforts in life. Yet, there are some things that effort cannot accomplish. Meditating is the delicate art of doing nothing – letting go of everything and being who we are. It provides the mind with a much needed, deep rest (Sri Sri Ravi Shankar, Art of Living website).

A natural and graceful system of effortless meditation, *Sahaj Samadhi* meditation as taught by the Art of Living Foundation, allows the conscious mind to settle deeply into

itself. When the mind settles down, it lets go of all tension and stress and centers itself in the present moment. It is only in the present moment that we find true happiness, those moments when we are free from regrets about the past or anxiety about the future. *Sahaj* means natural. *Samadhi* means enlightenment. Without effort, our inner nature is available. *Sahaj Samadhi* meditation is a profound technique that teaches the art of letting go: relax, rejuvenate and recharge.

To bring out the spiritual dimension in life, it is wise to use certain tools that have already been established. In ancient times, people went deep into the understanding of the Self and brought out spiritual practices that help one to remain centered in the Self. The tools they developed have been handed down over the centuries, and hasten progress on the spiritual path. “In the practice of Sudarshan Kriya and Sahaj Samadhi Meditation you can directly experience the vastness of the Self” (Sri Sri Ravi Shankar, from “Breath and Meditation,” Art of Living Website).

Breakout Box: Shankar, Sri Ravi on Consciousness, Nature, and the Art of Living

Our environment begins in our mind, in the way we connect with ourselves, our world and one another. Without a deeper connection to ourselves, this world and the diversity of life that exists within it, appears separate from us and as an entity to be exploited and consumed. When we recognize life as a part of the wholeness that includes ourselves, then it becomes something to honor and respect – something sacred.

Who can stop polluting the Earth? Someone who is aware, someone who knows, who can understand, who respects the Earth. To respect the Earth needs a big heart. A certain level of awareness, of awakening is essential. When you start respecting the living things then you can start respecting inanimate things too. (Sri Ravi Shankar, from a talk on “Consciousness and the Environment,” July 1995, Art of Living audiocassette.)

Animals are sacred and birds are sacred. Actually, it is very difficult to say what is not sacred in creation. Everything that exists on the planet, we understand as *prakriti* and *purusha*, which is so sacred. *Prakriti* is the concept and *purusha* is the spirit. It is not just the spirit that is sacred, but that vessel or instrument through which spirit manifests itself is also sacred.

Why have we forgotten the sacred nature of life? It is because we have moved away from the spirit. All of nature lives with the spirit but we have moved away from the spirit. We are living in a small, little, conceptual world rather than in a real world. We need to bring into our realm three things and they are the three Cs.

The first “C” is cosmology. Every child should know something about this cosmology. Our Shastras say the universe is 119.5 billion years old. Knowledge of cosmology increases our sense of awareness and our sense of the sacred. Every cell in our body is a recycled material. Everyone who is sitting here is recycled material. We are all recycled material. Water is recycled and the soil is also recycled. They come again and

again in many forms. Every time we come back, we come back to purify, to create more purity.

The second “C” is our care for the environment, which is a part of this cosmology. Our care and concern for the environment and our compassion in general for everything in life are one, because life manifests as our environment.

The third “C” is commitment. When these three Cs come together, they form one Big C, which is Culture. We need to feel a commitment to this planet, which is our home. If this Big C doesn’t happen then another C – Corruption – comes into the picture. Corruption doesn’t allow you a cosmic view of life. Indeed it is another more subtle form of pollution.

Don’t think that pollution or the environment is only related to living things. It is also related to subtle things. If you are in a room and you are angry, agitated and depressed, anyone who enters in the room feels more depressed because the environment you have created causes that effect. Everyday we are polluting our environment – just by not being like a child. A child is upset, but the next minute he is happy. But for you to come back to your normal state, it takes time – a week or a month. If you are upset, to smile again takes such a long time.

We are also polluting our environment with negative vibrations. When we walk in the city area where there is violence or drugs, there is such a heavy feeling. The whole vibration is so bad that we want to run away from that place. When we drive through an area where there is a school, or a temple or a place of worship, there is lightness in the atmosphere. So our minds also cause pollution through vibration – through a pattern.

Understanding cosmology and environment is an understanding of life within the context of the universe. Within this context there are spiritual practices which we can do, including meditation, yoga and breathing techniques, so that we remember the vastness of space and time and come to the present moment able to make a commitment to ourselves and the world around us. This commitment becomes stronger when taken in this larger context of time and space. Compassion, Care, Cosmology and Commitment in life – all these things integrate and sustain the wholeness in life that we are all looking for (Sri Ravi Shankar, from a talk, “Consciousness and the Environment,” New Delhi, India, 2003).

Coming Together in Knowledge

To be in knowledge is to have a broad vision of life. Wisdom lies in knowing that the whole world belongs to you (Sri Sri Ravi Shankar). Each week, groups of Art of Living participants all over the world come together for evenings of celebration made complete by the sharing of knowledge. These gatherings are called *satsangs*. When people come together in knowledge, the mind is automatically uplifted out of its normal functioning to something more profound – to an expanded consciousness.

One important aspect of an Art of Living *satsang* is the weekly group practice of *Sudarshan Kriya*. Anyone who has completed an Art of Living course anywhere in the world can join with other practitioners weekly and enjoy the practice of *Sudarshan Kriya*. The foundation also sponsors ongoing group knowledge programs where people come together to discuss ancient knowledge and wisdom as it relates to daily life.

Service to Others

Suffering has many faces. In some parts of the world, people live in squalor and abject poverty, without proper sanitation or housing. Unhygienic conditions, as well as the lack of proper education about health and hygiene, give rise to disease and poor health. In other parts of the world, people have achieved a decent standard of living, but experience suffering of a different kind: dissension, disharmony, stress, violence, crime, environmental decimation and other social ills. In still other parts of the world, war has simply eradicated the social fabric, leaving chaos and great suffering in its wake. There is a pressing need for healing at all levels. For all these situations, the Art of Living Foundation and its sister service organization, the International Association for Human Values (IAHV), offer programs designed to alleviate suffering and transform society.

The 5H program is one such program. The aim of the 5H program is to uplift individuals, families, communities and nations so that the finest human qualities are nurtured and the full potential of human life can be expressed throughout society. Ultimately, the long-term goal is a worldwide social transformation, where poverty, suffering and disease are eradicated, and where peace, harmony and appreciation of nature prevail.

The 5H program takes a holistic approach to social transformation by focusing on five main areas: Health, Hygiene, Homes, Human Values, and Harmony in Diversity. The 5H program teaches a profound respect for the natural world, and allow communities in the developing world to find a greater balance within their own physical environment in a variety of ways, including basic sanitation projects such as water purification and recycling systems. All these programs promote traditional human values by creating a sense of belongingness in the participants, which in turn strengthens their connection with the natural environment.

The Foundation's participation in forums at the United Nations and the World Health Organization underscore its commitment to find a set of universally recognized human values, and apply this set of values in the just allocation of the world's resources. As a founding member of the United Nations Human Values Caucus, and strong proponent for the recognition of the spiritual foundation of all existence, it is not surprising that the Foundation would be involved in the World Summit on Sustainable Development. In fact, it was the Foundation's representatives at the summit who were instrumental in bringing the NGO-community together to call for a more

values-based environmental approach from the U.S. delegation. The Foundation also sent delegates to the World Economic Forum and the first World Social Forum in Porto Allegre, Brazil, as well as hosting its own conference in Bangalore, India.

Delegates representing more than thirty-five countries attended the World Conference on Spiritual Regeneration and Human Values, a five-day event sponsored by Art of Living Foundation and IAHV. The opening panel discussion was entitled, "Spirituality and Sustainable Development." The conference, which featured spiritual, political, social and environmental specialists, opened a new doorway for dialogue and presented innovative approaches to the increasingly urgent problem of sustainable development.

Understanding and experiencing the human spiritual values common to all nations and cultures is the necessary first step in creating a safe and secure future for us all. As long as we are trapped in an identity that forces us to compete or conflict with others for finite resources, a genuine dialogue cannot begin. In this critically important planning session, there can be no "we" and "they," only the larger "we" of one family on this planet, sharing a common destiny. Education can overcome the prejudice of our limitations and move us toward a genuine sense of belongingness – a belongingness not only to each other but to the planet itself (From a paper delivered at the World Summit on Sustainable Development, Johannesburg, South Africa, 2002).

The Art of Living Foundation approaches environmental sustainability on the individual level as well. As an important part of the Foundation's Service programs, local chapters all over the world mobilized teams to participate in environmental clean-up programs and various Earth Day activities. A few examples:

College students from Southern California joined together to celebrate Earth Day with a yoga session in a local park. Their theme: A clean environment starts with me.

In Arizona, volunteers joined their local health food grocers and participated in community festivals to raise awareness of organic farming and our connectedness to the Earth.

In Bangalore, India, hundreds of volunteers took on the task of cleaning up a 15-kilometer stretch of highway as well as offering free development workshops to thousands of local villagers in the area as part of the clean-up project.

These examples demonstrate the Foundation's unique emphasis on combining service and environmental responsibility as a spiritual and values-based solution to global sustainability.

The real revolution in planetary development will come only when we make the expansion of the consciousness of the individual the basis for sustainable community and environmental development. This approach helps us to tap our own deeper resources of joy and strength, enabling us to move beyond limiting concepts of self and other, into a larger sense of our mutual interdependence and belongingness. With this awareness we move naturally into taking responsibility for the effects of our actions and the needs of the larger community. As more and more people move into this deeper sense of connected awareness, then recognition of the Earth as a living being – and our interdependence with it – will follow naturally. That is the Art of Living.

John Osborne

Asante Religion (Ghana)

Like all African traditional religions, Asante religion is based on some firm pillars. It consists in the belief of *Onyankopon*, who can be described as a creator God, responsible for everybody and everything in the universe, on Earth and under the Earth. He is eternal, loving, good and just. However, he is described more in terms of what he does for his creatures, especially human beings, than what he is in himself.

He is Provider of Life (*Oboadee*), the Giver of the Sun (*Amowia*), the Giver of Water (*Totrobonsu*), the Comfort of the Afflicted (*Abomubuafre*), the Grandfather (*Nana*), the All-Knowing (*Birekyirehunade*), the Self-Loading

(*Atoapoma*), etc. He is the central reality of Asante religion. He is dependable (*Twereduampon*).

He has created myriad spirits, some of them essentially good, others essentially malignant. Some of these spirits remain in their natural habitat (the forest and the wild) while others are domesticated and worshipped. The domesticated spirits are good; they are generically known as *abosom* (singular *obosom*) but each one has its own specific name, like *oboo*, *mmee*, *hunuhata*. It is not only the domesticated spirits, however, that are worshipped. Some also are worshipped in their natural dwelling places such as mountains, trees, rivers. They are obviously not the visible object one sees but the invisible part of that object. These tutelary spirits are good to human beings. They bless human beings spiritually and physically; they prevent diseases, death and calamity in general; they divine the future; they protect their adherents from danger, both spiritual and physical. They can be male or female. They have a well-developed priesthood but the sex of the minister does not depend on the gender of the spirit. In other words, both priestesses and priests serve spirits that are supposed to be male and they equally serve spirits that are supposed to be female. They provide medicine against diseases. They also act against the evil spirits.

They represent *Onyankopon* as his children and superintendents and they reflect aspects of *Onyankopon* such as creativity, wisdom and truth. There are also *abosom* for functions regularly performed by human beings such as hunting, farming and fishing.

These *abosom* apart, we also have spirits that have been human before. Ancestors (*Nananom nsamamfoo*; singular: *Nana saman*) form an important part of Asante religion. To be an ancestor, one must have died; one must have been an adult before death. Adulthood here is almost synonymous with marriage. One must have died a natural death. Death resulting from an unclean disease like leprosy and a tragic event such as accidentally being shot, during childbirth, suicide, accusation of witchcraft (*bayie*), debars a person from being regarded as an ancestor. One who fails to satisfy any of

these conditions can only roam about as a frightful ghost (*samantwentwen*), whom people dread.

The royal ancestors, namely those who have been heads of clans or village communities or district communities, paramount chiefs, and the King of Asante (*Asantehene*) are accorded special honor. Honor can be given to the ancestors in many ways. Children are named after them; when one is eating, one must put a morsel of the food on the ground and pour a little water for the ancestors. Libations are poured to the ancestors and prayers are offered to them but the most important and distinctive feature in ancestor veneration is the institution of royal festivals in their honor. Every chief celebrates one such festival every 42 days, 9 times a year. It is called *Adee*. In ancestor veneration, the head of the group, be it the clan, the village community, the paramountcy or the nation, is the intermediary between the living and the dead.

The Asante have a way of preserving the memory of their royal ancestors. They consecrate a dead royal person's stool, placing it in the stools room and venerating it. Ancestor veneration is so prominent among the Asante that the religion was given the misnomer "ancestor worship" by foreigners.

Besides *Onyankopon*, *Nananom nsamamfoo* and the *abosom*, Asante traditional religion shows itself in all manner of ways. The belief in witchcraft (*bayie*) is as strong here as it can be anywhere. The use of magic (*aduro*) to effect wonderful things, good or bad, still continues. Spiritual poisoning is believed in; totemism is very strong; taboos regulate the Asante's life; traditional medicine, both mystical and physical, is resorted to. *Onyankopon*, *Nananom nsamamfoo* and the *abosom* are the norms of morality.

Inseparable Relationship with Nature

Let us begin with the Earth (*Asaase Yaa*). The Earth is believed to be the female counterpart of *Onyankopon*. When sacrifices are made or libation is poured, *Onyankopon* is first called upon and then *Asaase Yaa*. *Asaase* means the Earth. It is personified as a woman born on a Thursday (*Yaa*). That is why on Thursdays work is forbidden on the Earth. *Asaase Yaa* must be given a rest. A drum language puts it all beautifully: "*Asaase Yaa*, whether we live or whether we die, we depend upon you." The drum language is saying something more than that we are walking on the Earth and that when we die we will be buried in the Earth. It is picturing the Earth as a true mother who supports her children in everything. *Asaase Yaa* is the one that gives us everything we need and require to live. We build on *Asaase*; we farm on *Asaase*; our food products come from *Asaase*. The trees that we use for various purposes are given us by *Asaase*; the rivers whose water we use are given us by *Asaase*. The air itself is from *Asaase*. We walk on *Asaase* to do everything we do. The mountains are on *Asaase* and the mountains form part of the sacred places of religion.

Some of the most powerful *abosom* are connected with mountains – *Mim Boo*, *Abofoo Mmee* are all elevated places whose sacred nature is accepted and respected by Asante

religion. For the Asante, the greatest *obosom* is the River Tano, but the River Tano takes its source from *Asaase* and ends on *Asaase*.

The animals we hunt, even the birds of the air all depend upon *Asaase*. The trees that we venerate as sacred trees are all on *Asaase*. There are some creatures that are held in high respect and esteem, so also are there trees that are supposed to be very powerful. Their spirits come from *Asaase*. There are some *abosom* that are not yet domesticated; they use natural objects found on *Asaase* as their shrines. And even the domesticated ones are based on the *Asaase*, and so whereas *Onyankopon* is the creator of everything, Asante religion would hold that *Onyankopon* has made all the things we need, while we see and require *Asaase* for safe-keeping, and it is from *Asaase* that we receive it.

Asaase is not herself an *obosom*, in the sense that we do not offer sacrifices as such to *Asaase*. But the treatment of *Asaase* leaves us in no doubt that *Asaase* is a key element in Asante religion; indeed *Asaase Yaa* is second only to *Onyankopon* in everything.

It is for this reason that *Asaase* has many taboos. In Asante religion, *Asaase* abhors murder of any kind. Even when a person is killed in war, the killer must cleanse himself ritually to appease *Asaase*. *Asaase* abhors blood. Certain sexual acts, such as having intercourse in the bush, are believed to be repugnant to *Asaase*.

Asaase is so sacred that in the land-tenure system of Asante, land should never be sold. Land is only given in trust to people to farm or to build on. And this explains why nowadays it is very difficult for the government to acquire land for what it believes to be development projects. *Asaase* is never sold and so one can never acquire land as a personal property. *Asaase* belongs entirely to the ancestors and the living have only the usufructuary use of the portion given them.

There are things on Earth that also enjoy the character of sacredness in Asante religion. I have already mentioned some trees and some animals. They form a very important part of Asante religion. The *O sese* (*funtumia* species) tree, from which the famous Asante stools are made, is so sacred that before a carver touches it, he has to make an offering to it. Such animals as the *tromo* (bongo) and the *kwaduo* (duyker) are also sacred and must not be molested. In the case of the *esono* (elephant), when a hunter kills one, Asante religion demands that the hunter sings a song from where he has shot the elephant to the town and everybody who hears that song, which is a mixture of wailing and joy, knows that a big tree has been felled. Several religious rituals are performed before the animal is cut up because it is supposed to be a very powerful creature in the religion of the Asante.

Apart from the individual items in the vegetable and the animal world, the Asante believes strongly in totemism. Totemism is a belief system whereby the Asante is convinced that he has relationships with certain objects of the vegetable world and of the animal world. It is believed that these objects are related to the human being. Therefore, they must be treated with respect and love. These totemic relationships exist between certain trees and their fruits and individuals; they may exist between

certain animals and individuals. They may exist between animals and the clan or trees and the clan; they may exist between certain trees or certain animals and certain groups of people; they may be the result of an injunction by an *obosom*. And so in Asante, we have such relationships between individuals, clans and groups of individuals and such objects as yam, cocoyam, pythons, snails, antelopes, duykers and so on.

The totemic relationship implies that one must not in any way molest one's totem. Before you cut down a tree, you must know that it is not your totem; before you shoot an animal, you must be certain that you are not shooting your totem; otherwise you may be shooting your brother or sister. If one shoots and kills one's totemic relation accidentally, then it is imperative that the offender apologizes and gives a proper burial to the animal, the type of burial one would give to a human being. Totemism and totemic relationships naturally bring about taboos. If you cannot kill an animal, then obviously you cannot eat the flesh of the animal and, in Asante religion, it is supposed that if one is not vigilant enough and one eats the meat of one's totem, one would be greatly perturbed by all kinds of boils, even carbuncles.

The transition from totemism to taboo, therefore, is not difficult. You taboo an animal; in other words you do not eat or molest or probably see an animal because that animal is your totem. And so you hear people saying they taboo yam (*mekyiri bayere*). Naturally, totemic taboos form only a small percentage of the totality of taboos, many of which do not have direct bearing on Asante religion and nature.

The relationship between Asante religion and nature is also manifested in the many sacred groves in which people are buried, especially royal personages. These groves cannot be touched. Sacred groves are sometimes the only sign of the formerly forested area of Asante that one sees when one goes to a village in Asante these days.

In Asante, there are many spots of historical importance and significance that are held in high esteem and venerated with yearly or more frequent offerings. In the Essumeja traditional area, there is supposed to be a hole in a forest that is easily about one square mile in area. It could be much more but its sacredness prevents it from being entered by ordinary people or being surveyed. There is supposed to be a hole in this forest called *Asantemanso* (the source of the Asante nation) from which the seven clans of Asante were supposed to have emerged. Every year, the chief of Essumeja holds a festival in November to commemorate the historical event that brought about the Asante nation.

At the beginning of the festival are seven pots. On these pots, a cow is sacrificed at the start of the festival. Anybody can take as much of the cow as he or she can carry. But between the place of the sacrifice and the village is a river. Before people cross the river, anybody can pounce on them and deprive them of the meat they have cut from the cow. But once you cross the river, the meat is for you. While the sacrifice of the cow is being made, the chief's emissaries disappear into the forest where they go and sacrifice a sheep at the hole that is said to be guarded by a leopard.

In the Offinso traditional area, we have a place called *Tutuampa*. This is a place where in the past people went and drowned themselves in a lake when, during a war,

they were totally deceived into thinking that they had lost the war and that the enemy was next door to destroy them when actually, they had won it. This lake has remained sacred up to now.

The Adansi traditional area has the *Adansi Bona* which is located in a thick forest which, again, is not open to the public. A yearly festival is held in honor of the *Adansi Bona* and sacrifices are made to the object in the forest.

It has been mentioned that the Tano River is the greatest *obosom* of Asante. The source of the Tano River is never without water, and it is the water from that source that is used to purify the King of Asante and the Golden Stool of Asante. The Golden Stool, as is well known, is the symbol of Asante unity. It is the object that was used to rid the Asante of the oppression of the Denkyira in the seventeenth century. Indeed, the River Tano, which now separates the Ashanti Region of Ghana from the Brong Ahafo Region, is so sacred to the Asante that the word *Tano* itself is often used in place of the word *obosom*.

Besides the prohibition of desecrating such places in Asante, bans are placed on hunting in certain periods of the year. There may be bans on the collecting of snails or fishing in a particular river; it may be considered wrong to catch fish from a certain river. All these laws are couched in religious terms, so that they are linked very closely with the religion of the Asante. But in some cases, if you examine the rationale for such bans, you would realize that there is a great deal of pragmatism in them. Obviously, during certain periods of the year, one is not allowed to fish in certain rivers because if fishing were to go on incessantly, there would come a time when all the fish in the river or the lake would be depleted.

One of the greatest natural bodies of veneration is Lake Bosomtwe. Scientifically, Lake Bosomtwe is a crater formed a thousand years ago. No river flows into it and it has no outlets. It is about 26 miles in circumference and has recently become a tourist attraction. It is supposed to be one of ten such lakes in the world. Until recently, Lake Bosomtwe was considered so sacred that one could not use a motorized vehicle on it, including fishers. Unfortunately, motorized boats are now allowed to use the Lake.

Asante traditional religion considers medicine as one of its essential elements. Medicine consists in diagnosis of physical illness and the application of prescribed medication. In this, Asante traditional religion uses natural means. It uses mostly the leaves of trees, their barks, their roots and their seeds. These are prepared in all kinds of ways and applied to a patient in all manner of forms – orally, rectally, ocularly, auricularly, through cuts on the body, nasally, vaginally, through the penis, through marks purposely made on the body, and so on, all depending on the type and the occasion of the malady. Sometimes the medicine is boiled and the hot vapor from it inhaled. Nature comes into the picture very prominently.

Because physical phenomena are supposed also to have their spirits, Asante traditional religion believes in the spirits of trees, of rivers, of mountains, of different kinds of animals and so on. In the night, for example, when one drives over a bridge, one would take care to blow the horn so that if an unwary spirit of the river is sitting on

the bridge for respite, he would be warned and quickly go back to the river to escape danger.

Asante religion also believes in the existence of certain abnormal creatures in the forest. Some of them are monsters, like ogres and some of them dwarfs. They live their natural life and are engaged in their activities in the forest. Asante religion, therefore, can be described as a religion that respects nature, depends upon nature and protects the environment.

Asceticism

Asceticism is a universal phenomenon in the world's religions. Space does not permit a survey of asceticism in different traditions, nor any attempt at an integrated theory of asceticism. This entry discusses asceticism and nature specifically, and the ethical relevance of asceticism, understood as the opposite of greed, to the environmental crisis.

When the assertion is made that asceticism is a universal phenomenon, this refers to a recognizable set of practices that lessen or deny altogether the fulfillment of basic human needs and desires. Ascetic practices primarily include fasting, sexual abstinence, reduction of sleep, and poverty or non-possession. They may also include speaking little or observing silence, seclusion, and endurance of discomfort such as extremes of heat or cold. The lifelong asceticism of the monk or renunciant is often taken as a model, but need not be paradigmatic. The practices may be undertaken for longer or shorter periods, and may be more or less rigorous. The term "ascetic" derives from the Greek *askesis*, meaning "exercise" or "practice" such as the training of an athlete. While asceticism is not exactly the same thing as contemplative practice, it is very often held to be necessary for it or to help it.

Beyond this elementary picture, complications ensue. Many diverse accounts have been given of the reasons for and the nature of ascetic practice. These have dealt *inter alia* with the reconfiguration of power relations in the ascetic's departure from prevailing social structures, the deconstruction of the "body," the formation of a new "body," conserving and increasing different kinds of energy, the relation of the ascetic and the erotic, analogies to martyrdom, winning the sympathy of deities, overarching ideologies of body-spirit dualism or "world-rejection," and the discipline of self-mastery for moral freedom and illumination. We cannot consider here the merits of these interpretations, but should observe that they display the great variety of ideologies and goals attendant on ascetic practices in different cultural contexts, while the practices themselves remain identifiable.

There are significant associations between ascetic practices and the natural world. Ascetics have long sought out places in the midst of nature such as the forests or Himalayan caves of India, the mountains of China and Japan, the mountaintops or woods of the vision quest of Native Americans, and the desert birthplaces of Christian monasticism. Two reasons suggest themselves. Negatively, ascetics say they must "flee" from human society and its distractions and corruptions, away from cities, towns and farming communities. The remote place proves to be the less "civilized" or more "wild." Positively, landscape works upon the consciousness of the practitioner. Literature by

ascetics testifies that the beauty of nature gives joy and tranquility and reminds the ascetic of the Creator, and that stark landscapes recall death and foster fearlessness and humility. The ascetic, having removed many other objects of attention, is open to the presence of the land and able to acquire an intense sense of place. Places frequented for many years by ascetics in turn acquire sacredness within a particular religious world of meaning.

Also notable is the intimacy ascetics are often said to develop with animals. St. Francis of Assisi preaching to the birds is the best-known example; one might also mention the bear befriended by St. Sergius of Radonezh, or the rampaging elephant stopped in his tracks by the Buddha's loving-kindness. While Francis had a "burning tenderness" for all living creatures and habitually spoke to them, some ascetics, such as those in Japan or the Americas, attest that by listening they come to understand the languages of animals and birds, even plants. This connection, while familiar in hagiography, is not yet well investigated. Ascetic and contemplative practices, especially in a natural setting, may mitigate not only the social ego but also the human species-identification. Thus asceticism can be linked to concrete experience of the community of all life so prominent in environmental ethics.

Asceticism may also be seen as striving for a state of nature in the practitioner's own person. A "natural asceticism" is described not as self-mortification but the use only of those things necessary to life. The natural state is simplicity free of the non-essential. A "natural" state in other senses is sought by the ascetics who actually imitate animals, for example in their way of acquiring food (as in some Indian yogas), or by nakedness, or aspire to an Edenic natural state in which the new body will be like the body of Adam before the Fall.

Ascetic disciplines have important practical consequences. Overconsumption is one major cause of the destruction of the environment. Fasting or a limited diet and the practice of voluntary poverty achieve reduced consumption as an immediate result. Population increase is another critical factor in the crisis. The celibate's relinquishment of procreation provides a contrast to the pronatalism that even today contributes to population growth, so that the Dalai Lama has said not entirely in jest that the solution to the population problem is "more monks and nuns." Religions, however, also affirm a "normal asceticism" to be practiced by all their adherents and not only a specialized group. The fast of Yom Kippur, normative in Judaism, lasts a single day. The fast of Ramadan is required of all Muslims and, like the Christian Lent, lasts one month. While demanding, it is less extreme than the fasting of some Sufis in history who were fulltime ascetics. Examples can be multiplied of temporary abstinence. Ascetic struggle is widely seen as beneficial for all, and need not be excessive. On the continuum of practice, extreme asceticism is at the opposite end from uncontrolled craving. Moderate or natural asceticism, simplicity, frugality and moderate enjoyment occupy the middle of the continuum. The systems of ascetic practices in the world's religions contain a rich store of psychological knowledge of desire and restraint, and their states of transformation, as well as an array of practical methods. Ascetic tradi-

tions offer abundant resources for the development of environmental ethics, deserving further exploration.

Astrology

Astrology is an astral form of divination that is traced to the ancient Mesopotamians and Egyptians. Its essential features became established in the seventh century B.C.E. when it prospered as the Neo-Babylonian state religion. Astrology flourished for irregular intervals under the Romans, and in the second century Claudius Ptolemy developed the tropical system that the West employs today. Although our understandings of the cosmos have been superseded by the astronomical discoveries of Copernicus and Galileo, Western astrology continues to follow the Ptolemaic perspective that considers the Earth the phenomenal center of the universe. It was this system that subsequently was brought to Spain by the invading Moors in the ninth century. From there, it developed into a permanent part of the West's cultural legacy. Astrology became popular in France during the reign of Catherine de Medici (1547–1559), while in England it had been practiced by Bede, Alcuin, Roger Bacon (ca. 1214–1294) and, in the seventeenth century, by the magician William Lilly, whose ceremonial circle for the evocation of spirits consisted of astrological symbols. The legend of Faust in Germany portrays him as an astrologer as well as a sorcerer.

In 1816, James Wilson published his *Complete Dictionary of Astrology* in England. Shortly afterwards, various astrological works appeared under the pseudonym of Raphael (Robert C. Smith, 1795–1832). By far, however, it was the theosophist Alan Leo (William Frederick Allen, 1860–1917) who laid the foundations for the present-day understanding of this “science of the stars.” As a professional astrologer, Leo founded the journal *Modern Astrology* and authored numerous books on the subject. In the course of the twentieth century, through its links with theosophy, astrology became the *lingua franca* of the 1960s counterculture as well as the New Age movements that have descended from it. Its use of the astronomical phenomenon of the precession of the equinoxes has become the seminal framework within which the New Age of Aquarius has been heralded. In the New Age context, “star wisdom” has emerged as an elevated form of astrology. This study stresses the importance of eclipses and recognizes, through the keys of an astrological metaphor, the “Cosmic Christ” in the etheric realm of the Earth's body. From the more pagan understanding, on the other hand, the stars become tangible transcendentals, and, as such, they may be considered as real influences on human life or as symbolic metaphors for a synchronistic dynamic.

The key point of departure for the casting of an individual's horoscope is the person's place and time of birth. In casting a person's natal horoscope, the result is a presentation of the positions of the planets and luminaries (sun and moon) relative to the person at the time of his or her birth. In other words, following Ptolemy, as-

trology is a geocentric understanding that takes the individual's terrestrial nativity as the center of the entire cosmos. From this perspective, astrology promotes an interdependent and interconnected picture of the universe as an organic and interrelated whole. Employing the magical principle "as above, so below" by which the microcosm is thought to mirror the macrocosm, astrology seeks an understanding and prediction of earthly, personal and spiritual events through a study of the stars. This is pursued by considering the placements of the planets and luminaries against the twelve astronomical signs (or constellations) of the zodiac and whether these solar system bodies form mutual conjunctions or significant angles *vis-à-vis* the Earth – namely, 90° squares or 180° oppositions as learning obstacles and 60° sextiles or 120° trines as harmonious and favorable influences for the individual or event concerned. Astrology presents a particular organic model of the cosmos that balances the natural, the human or cultural and the mythic. The zodiac consists of seven signs that are animal (four natural, two domesticated, one – Capricorn – ambivalent), three that are human, one that is a human cultural creation: the scales of Libra, and one (possibly two depending again on Capricorn) that is imaginary or fanciful. Together, these represent astrology's understanding of the organic or natural balance cosmos. The planets that move through the zodiac, named by the Babylonians as the "wanderers" and considered to be visible deities, have for the West assumed the names of the Classical gods. The complex of astrological symbolism represents a way of interfacing the mythic with the actual.

With the advent of the empirical sciences, astrology has received increased criticism and attack. Some astrologers maintain that the behavioral characteristics and eventual propensities predicted by the system have been acquired through years, even millennia, of observation. However, astrological interpretation appears instead to derive from an *a priori* matrix relationship between personality archetypes (e.g., mercurial, jovial and saturnine characteristics) and numerology or numerical symbolism. Science condemns this last as superstition, but contemporary spirituality in turn tends to reject the restricted and narrow province of science as applicable to Earth-based traditions with their corollary of emotional and intuitive understanding. On the other hand, astrology must also face antagonism from traditional mainstream Western religions. In particular, canonical Christianity considers that whatever of the supernatural is not "of God" must, by default, be "of the Devil." Foremost among these "satanic arts" is astrology.

Being far from a new or recent interest and, despite being superseded by more sophisticated and predictable systems of explanation, the symbols and terms of astrology have entered into and become part of the cultural register. As modern chemistry follows from alchemy, so too has astronomy been the child of astrology. The astrological/ astronomical heritage has been an inevitable part of humanity's desire to know its place in the universe and understand macrocosmic/microcosmic connections. In the surfeit of choice that has come to characterize the contemporary West, the familiar and methodological are becoming supplemented and sometimes replaced by the exotic and superstitious. Many are turning to forgotten and discarded spiritual vernaculars in an attempt that might be interpreted as stemming from a desire for more colorful

and mystically laden symbols and notions. Astrology is at the forefront of this popular interest – combining as it does the familiar with the obscure.

Newspaper horoscope columns began to appear in the late 1930s. Since that time, they have become a regular feature in the daily tabloids and the weeklies. Whether we judge such columns to be serious or not, whether they are intended to be humorous, whether they simply offer guiding principles and advice that some readers can incorporate into their lives, and whether any of these “Star” pages are based on actual astrological considerations, the fact remains that the daily horoscope has become an accepted part of vernacular culture. Everyone reads one of these columns at some point, and some people actually rely on them and use them. Reporting on Christopher French’s investigations into the psychology of the paranormal at London’s Goldsmith’s College, Senay Boztas claims that “about 75% of people read horoscopes and one in five believes them.” While the majority may not take them seriously, they are nevertheless an accepted part of popular discourse. But inasmuch as this is true, the daily and weekly horoscope page is the tip of the iceberg of astrological esotericism.

Of course, at the much deeper levels we encounter “serious astrology” in the sense of the pursuit of a codified system of horoscope casting and interpretation – a process that is subject to standard empirical testing, confirmation or disconfirmation. But in the context of understanding marginal and/or esoteric practice and its mainstream appeal, it is not the validity of astrology that is here the issue but rather the role that astrology plays in demotic and cultural discourse. Contemporary spirituality speaks in its own language, it has an increasingly identifiable vocabulary, and a large part of this dialogue is grounded in the terminology and concepts of astrology.

In the sense of secularization as representing the process by which the world is being gradually deprived of its sacral character, astrology, nature religion and even New Age do not fit the expected scenario of Western humanity’s rejection of magical images. But as Hill points out, “Interest in astrology seems to be an area of considerable importance even in the most technologically advanced areas of Western society” (1973: 247). The final suggestion is that astrology plays a key role in new forms of religion that attempt to “keep the world sacred.” Erik Davis explains that “people inhabiting all frequencies of the socio- economic spectrum are intentionally reaching for some of the oldest navigational tools known to humankind: sacred ritual and metaphysical speculation, spiritual regimen and natural spell” (1998: 2). For Davis, along with such ancient disciplines as alchemy and numerology, astrology represents a viable way of organizing knowledge.

It is in the human desire for “order” – especially in an increasingly chaotic world – that astrology becomes meaningful to both religion and nature. Its renaissance may in fact be a spontaneous collective organization of reality that allows integration above and beyond the randomness and conflicting tumult of an urban and bureaucratic life that has lost touch with the tides of nature. The tidal ebb and flow, the effect of the sun and moon and, possibly – at least in a psychic/emotional sense

– the other planets as well, is the root idea of the astral that has a growing bearing on contemporary needs for positioning within a world of change. This relevance is reflected both in the emergence of academic study of astrology (Bath Spa University College, Southampton University, the Kepler College of Astrological Arts and Sciences, etc.) and innovative spiritual experimentation such as Findhorn’s “astroshamanism” workshop that employs the astrological chart as a tool for exploring nonordinary realities. As a contemporary social and spiritual means to re-enchantment, astrology represents a denial of the strictly mechanical for the intuitive and inspirational.

In conclusion, astrology provides a framework in examining the central issues of religion and nature for three different reasons: (1) natal astrology and paganism share a concern with locality, (2) the Earth-based orientation of astrology resonates with present-day nature religions, and (3) astrology’s seeking for truths within both the mundane and the transcendental and how these relate to geo-economic, geopolitical, humanitarian, ecological, technological, philosophical and mystical questions engage fully with the forum of contemporary spiritual dialogue. Astrology seeks answers to the meaning of life as well as the how of life. It provides a pragmatic structure that is commensurate with all religions that remain open spiritual methodologies rather than inflexible collections of dogmas and prescriptions.

Astronauts

Between 1961 and the first years of the twenty-first century more than 430 humans in spacecraft have blasted into orbit and beyond, seeking greater knowledge of the moon, the solar system, and the universe. But for these astronauts (who fly in spacecraft belonging to the United States) and cosmonauts (who fly in Soviet or Russian spacecraft), now from over 31 different countries, it seems to have been the experience of seeing the beauty and variety of the Earth from space that has most altered their consciousness of themselves, their home planet, and their place in the cosmos. The experiences and photographs, particularly of the early space explorers, gave birth in many of them to a global consciousness and enhanced awareness of their love for humankind, for nature, and for the Earth as a whole. This is exemplified in the book *The Home Planet*, which was conceived and edited by Kevin W. Kelley for the Association for Space Explorers. For many space explorers, deep religious convictions helped them realize their goal of spaceflight, and for others, personal religions evolved and in some cases became movements. American Edgar Mitchell, the sixth man on the moon in 1971, retired in 1972 and in 1973 founded a movement known as the Institute of Noetic Studies, which focuses on scientific study of interconnections through consciousness and the integration of science and spirituality.

Mitchell noted, “We went to the moon as technicians; we returned as humanitarians” (Kelley 1988: 137). Cosmonaut Oleg Makarov, after reviewing communications between cosmonauts and mission control, discovered that “no one has been able to restrain his heartfelt wonder at the sight of the enthralling panorama of the Earth” (Kelley 1988: viii). Cosmonaut Yuri Gagarin, the first human to orbit and see Planet Earth from space on April 12, 1961, remarked in awe: “The Earth is blue.” Following the initial wonder, many have been struck by a strong sense of the commonality, interdependence, and interconnectedness of humans, what astronaut Russell L. Schweikart referred to as “the golden thread that connects us all” (Kelley 1988: vi). On 20 July, 1969 Commander Neil Armstrong and fellow astronaut Edwin “Buzz” Aldrin successfully landed on the moon, and Armstrong, the first human on the moon, made the now-famous statement:

“That’s one small step for [a] man; one giant leap for mankind.” Upon looking at the Earth from space, Mexican astronaut Rodolfo Neri Vela said that seeing oneself as one more person among millions and millions who lived, live, and will live on Earth, one inevitably thought about existence and how we should live to enjoy and share our short lives as fully as possible (Kelley 1988: 83). Syrian cosmonaut Muhammad Ahmad Faris referred to the Earth as “indescribably beautiful with the scars of national boundaries gone” (Kelley 1988: 77) and cosmonaut Yuri Artyukhin noted, it is not important in

which lake you see pollution slicks, or near which continent a hurricane arises, “you are standing guard over the whole of our Earth” (Kelley 1988: 71). Indian cosmonaut Rakesh Sharma’s awareness was also heightened, though he observed that one need not undertake a space flight to see beyond manmade boundaries and prejudices.

American astronaut Russell L. Schweikart described the sight of Earth as a visual embrace with all the life with which you are connected. Most know, he noted, that the life systems of the planet are interrelated, that our human future depends on the well-being of the rainforest and the salt marsh. The journey into space, though, he said, somehow takes this knowledge beyond the intellectual realm and makes it intensely personal (Kelley 1988: v). Watching an orange cloud form from dust storms in the Sahara, ride air currents, and settle over the Philippines with rain, cosmonaut Vladimir Kovalyonok truly understood that “we are sailing in the same boat” (Kelley 1988: 70), so much more interconnected than we imagine.

Many spoke about our as-yet, unfulfilled responsibilities to nature. Cosmonaut Yuri Glazkov reflected, “Nature’s limitless kindness, all she has amassed for billions of years, has made us strong and powerful, and how have we answered this goodness?” (Kelley 1988: 84). Bulgarian cosmonaut Aleksandr Aleksandrov observed that regardless of national origin, “We are all Earth’s children, and we should treat her as our Mother” (Kelley 1988: 109). Vietnamese cosmonaut Pham Tuan remarked that the separation had allowed us truly to see our “long-suffering Earth” and insisted that we must “ensure that we do not bring even the slightest harm to the natural world” (Kelley 1988: 185). Especially when spending long stretches of time in space stations, crew would choose to listen to nature sounds rather than music, noted cosmonaut Anatoli Berezovoy, and according to cosmonaut Georgi Grechko, sought tranquility in their tiny “oasis” of oat and pea plants (Kelley 1988: 105, 107). Residents on space stations, including Cuban cosmonaut Arnaldo Tamayo Méndez, the first Hispanic in space in 1980, returned to Earth and the “good life” with a renewed joy and appreciation to be on land, to feel wind, and to see greenness and life” (Kelley 1988: 112, 127).

Space explorers have developed a profound appreciation and love not only for humans and nature, but also for the Earth as a whole, our life support system, a “small pearl in a thick sea of black mystery” (Kelley 1988: 42). Space has no sound, no smell, no atmosphere, and no color whereas here on the Earth these features and richness, beauty, and life abound. Invoking adjectives such as precious, valuable, vulnerable, and ineffably beautiful and fragile, their common understanding of the imperative to protect the Earth emerged saliently. Cosmonaut Aleksei Leonov said the Earth “must be defended like a holy relic” (Kelley 1988: 25). Chinese-American astronaut Taylor Wang reflected that our new appreciation of the Earth should make us become her protectors rather than her violators and that he himself could not help but love and cherish her (Kelley 1988: 60).

In addition to spiritual insights and renewed appreciation for nature, many astronauts experience their journey as an extension of their religious identity. In the tragic 16day mission of the most recent space voyage which ended on 1 February 2003

when the Space Shuttle Columbia broke up upon reentry into the atmosphere killing all aboard, the seven crew represented seven different religious traditions: Kalpana Chawla, the first Indian woman in space (Hinduism); William McCool (Christianity – Roman Catholicism); Ilan Ramon (Judaism); Rick Husband (Christianity – Charismatic); Laurel Salton Clark (Unitarian Universalism); David Brown, (Christianity – Episcopal); and Michael P. Anderson (Christianity – Baptist, African-American). Payload specialist Colonel Ramon, the first Israeli in space, while not particularly religious on the ground, believed it important to mark the Sabbath in space, carried the Torah and objects from the Holocaust, and commented “I feel I’m representing the whole Jewish people.” A CNN reporter wrote that it was the wonder of life that inspired Laurel Clark most during the space trip. Talking about the silkworm cocoon that she had seen hatch in orbit as part of an experiment, Clark remarked, “Life continues in lots of places, and life is a magical thing.” United States Senator John Glenn, Jr. of Ohio, the first American astronaut to orbit the Earth (1962), went into space again after 36 years and at the age of 77 became the oldest human to voyage in space. Broadcasting from aboard the Space Shuttle Discovery on 1 November 1998, he stated: “I don’t think you can be up here and look out the window as I did the first day and see the Earth from this vantage point, to look out at this kind of creation and not believe in God. To me, it’s impossible – it just strengthens my faith. I wish there were words to describe what it’s like . . . truly awesome.” James Irwin became a minister after his experience in space. Whether religious in traditional ways or not, the experience of being an astronaut consistently seems to give people a larger and deeper sense of purpose, sometimes religious, and appreciation of the preciousness of life and the gifts of the Earth.

Rather than being chosen or deserving of the privilege of spaceflight, astronaut Schweikart spoke of feeling humbled and perceived that as a “sensing element” on behalf of humanity, he had a responsibility to share his experience and communicate his intensified relationship to the planet and all its forms of life (Kelley 1988: 144). Many others also felt a personal responsibility to extend this “precious” awareness of connection. In 1985, dozens of astronauts from around the globe came together to form the Association of Space Explorers to share their perception of the world and express their desire that all the peoples of the world unite to safeguard “our common and only, fragile and beautiful home” (Kelley 1988: ix). In 1988, editor Kelley compiled *The Home Planet*, a collection of astronaut observations and stunning photographs taken from space, to share more widely their experiences and their conviction that, as Donald Williams observed, “the things that we share in our world are far more valuable than those which divide us” (Kelley 1988: 139). The compilation also conveys the sense that any predicament, disagreement, or obstacle can be overcome if we just understand that, as German cosmonaut Sigmund Jähn said, “humankind’s most urgent task is to cherish [the Earth] and preserve it for future generations” (Kelley 1988: 140). Their moving reflections continue to be echoed today in the experiences of a new age of space travelers and succeed in deepening awareness of the “great beauty, incredible wonder,

and unfathomable mystery of our lives” (Kelley 1988: xiii) in this small blue, life-filled planet in an ever-expanding universe.

Athavale, Pandurang Shastri (1920–)

Pandurang Shastri Athavale is a Vedic scholar, philosopher, and social reformer who sought to revive the values and insights of an ancient Indian culture that affirms the value of nature, the self, and other persons. He is the founder of a spiritual and social movement known as Swadhyaya, which addresses contemporary ecological, economic, and social issues in the light of teachings from the *Bhagavadgita* and other ancient sources. The work of the Swadhyaya movement in areas of environmental concern exemplify the relevance of Indian religious traditions in contemporary ecological issues.

Born to Brahman parents in the village of Roha near Mumbai, Athavale's early education was directed by his father and grandfather, both Vedic scholars. Instructed from an early age in classic literature, history, Eastern and Western philosophy, as well as in English, Hindi, and Sanskrit, he took a deep interest in ancient religious texts. When in his late teens he came with his parents to Mumbai, he spent lengthy sessions in the library of the Royal Asiatic Society occupied with such subjects as physiology, sociology, and psychology. At 22 he began delivering lectures on the *Bhagavadgita* at a center known as the Srimad Bhagwad Gita Pathshala, which his father had founded in 1926. His lectures drew attention because of their capacity to relate the teachings of the ancient tradition to the contemporary world. He observed that in the modern age religion has been reduced to the observation of rituals divorced from the fabric of life, but that neither science nor modern social philosophy has adequately addressed the need for community and mutual support. His answer was inspired particularly by his reading of the *Bhagavadgita* and its doctrine of the indwelling presence of God. This doctrine, he said, instills respect for oneself, for nature, and for others regardless of caste, position, or status. It teaches that all persons are divine brothers and sisters in the family of God, and evokes the response of grateful, active devotion. With this response, class conflicts should disappear opening the way for a divine community based on mutual respect, reverence for nature, and cooperation.

In 1954 Athavale (or Dadaji, meaning elder brother, as he is affectionately known to his followers), was invited to present a series of lectures at the Second World Religions Conference in Japan. There the question arose whether a single community lived by the ideals he discussed. Refusing offers of positions in philosophy and religious studies in the United States, Europe, and Japan, Athavale returned to India to make such a community a reality. He established centers for child development (Bal Sanskar Kendra)

that met on Saturdays to instill the values contained in the ancient tradition. In 1956 he established an institution called the Tattvajnana Vidyapeeth or center for philosophic knowledge, offering a two-year course for collegeaged students in Eastern and Western Philosophy, and Vedic religion. Other educational experiments followed. Continuing his lectures at the Srimad Bhagawad Gita

Pathshala he emphasized that devotion (*Bhakti*) is not confined to ritual acts, but includes the offering of one's time and skills to God. In 1957 he challenged 19 of his young followers to bring this message to the villages of India where socialist publications were undermining traditional religious beliefs. What came to be called devotional visits (*Bhaktipheri*), in which participants establish genuine connections with village people, became the principal means to spread his teachings.

Working together, Swadhyayees (adherents of Swadhyaya) of differing castes and classes demonstrate how devotion (*Bhakti*) can be a social force to address problems of ecological degradation, inequality, and poverty. They have expressed their devotion in voluntary projects of forestry, farming, fishing, water resource management, and other areas that have directly improved the lives of over twenty million people.

Pandurang Shantri Athavale has been the recipient of a number of prestigious international awards, including the 1996 Ramon Magasaysay Award for Community Leadership, and the 1997 Templeton Prize for Progress in Religion. He is recognized by over 100,000 Indian villages touched by his teaching as the purveyor of an ancient wisdom that effectively addresses contemporary ecological, economic, and social problems.

ATWA

ATWA (an acronym for both “Air, Trees, Water, Animals” and “All The Way Alive”) represents the uncompromising ecological mandate propounded by the infamous American convict Charles Manson (b. 11 November 1934) and a number of his most loyal associates.

The exact origins of ATWA are obscure, although related ecological beliefs appear to have been present among Manson and his associates during the late 1960s. After having spent most of his early life behind bars for a string of criminal offenses ranging from auto theft to check fraud, Manson was paroled in 1967 and found a welcoming environment in the burgeoning counterculture. Together with a small retinue of disaffected young people, he took flight from the “madness of the cities” and established a communal colony at a ranch in the Santa Susana Mountains outside of Los Angeles, California. The group began to make survivalist forays into Death Valley in order to scout out more remote areas of the desert, and in September 1969 some members attempted to thwart nearby road developments by deliberately setting an expensive piece of Earth-moving equipment on fire. This early act of “monkey wrenching” – occurring a number of years before the concept would be popularized by Edward Abbey, Dave Foreman, and other radical environmentalists – was a key factor that caused the encampment of Manson associates to come under scrutiny from local law-enforcement authorities.

A study of contemporary testimonies reveals that Manson discouraged meat eating while advocating a primal understanding of the natural world which included totemistic identification with various animals. Speaking to *Rolling Stone* in 1970 after his arrest in connection with the Tate/LaBianca murders, he stated:

Have you ever seen the coyote in the desert? Watching, tuned in, completely aware. Christ on the cross, the coyote in the desert – it’s the same thing, man. The coyote is beautiful . . . He hears every sound, smells every smell, sees everything that moves. He’s always in a state of total paranoia, and total paranoia is total awareness (Manson in Lombardi 1972: 362)

Asked what he would do if released, Manson replied:

I would go out into the desert. The desert is magic

. . . Nobody ever wanted me and nobody wants the desert . . . I’ll live in the desert, like a coyote. I know where every waterhole is, and every berry and fruit that’s edible . . . The desert is God’s kingdom (Lombardi 1972: 362, 371).

In the years following Manson’s conviction and imprisonment with a life sentence, his close associates Lynette “Squeaky” Fromme and Sandra Good became increasingly

active in their efforts to raise awareness of the present system's failure properly to steward the Earth. In what was apparently a desperate attempt to draw attention to this message, Fromme was apprehended after pulling a 1914 military issue .45 handgun on president Gerald Ford in 1975 in Sacramento, California. Shortly afterward Good was arrested for conspiracy to mail death threats to hundreds of corporate polluters under the aegis of the IPCR, or "International People's Court of Retribution," which may have been a precursor to ATWA. Good served a ten-year sentence and was released, while Fromme is currently serving a life sentence.

By the early 1980s Manson and his supporters were primarily using the term ATWA, which usually stood for "Air, Trees, Water, Animals," to represent their ecologicalspiritual worldview. The name clearly refers to the elements of the biosphere that are crucial to human survival; these can also be closely equated to the four cardinal elements in ancient Hermetic philosophy: Air, Earth, Water, and Fire. ATWA is not represented by any formal organization or membership. In contrast to mainstream environmental groups with bureaucratic structures and tendencies toward compromise, ATWA is a state of radical consciousness, a way of thought and action that seeks to completely redress not just worldwide industrial pollution and ecological imbalance, but also the perceived unnatural evils of media control, consumerism, feminism and patriarchy, overpopulation, and racial intermixing. In blunt language, ATWA's proponents emphasize the unity of life on Earth, which is often spoken of in religious terms. Manson has stated that "Ecology is god, for without it we are dead forever." This perspective informs both the urgency and the moral fervor of statements such as the following from Sandra Good:

You are either working for ATWA – life – or you're working for death. Fix it and live or run from it and die . . . ATWA is ATWAR with pollution. ATWA is a revolution against pollution. ATWA is a holy war ("Access Manson" website).

The representatives of ATWA believe that the devastation of the Earth can only be halted and reversed by a oneworld government with the vision and military power to enforce this goal. It is further implied that Manson is one of the few people possessed of the necessary degree of understanding and insight to articulate the course for such solutions.

Despite the passage of time, Charles Manson maintains his status in American popular culture as a perennial outsider to the "Establishment" and continues to attract interest from new generations of young people. Over the years, aspects of his philosophy have been adopted by radical enterprises ranging from the ultra-left June 2nd movement to revolutionary National Socialists. While Manson's ideas often reach a wide audience through various websites, music releases, and occasional media interviews, only a few outside of his immediate circle appear to have understood the centrality of ATWA to his worldview.

Au Sable Institute

The Au Sable Institute of Environmental Studies was developed out of the Au Sable Trails Camp for Youth, Inc., a Christian youth camp begun in northern lower Michigan in 1958. It was transformed into the Au Sable Institute in 1979 by the camp's Board of Trustees and developed by them and their consultant, Calvin B. DeWitt, whom they appointed Director in 1980. The Institute received national public attention with its first Au Sable Forum in the summer of 1980, with this and subsequent forums producing a pattern of thinking, research, and publication that helped to develop the concept of environmental stewardship in secular and religious communities. In these forums, scientists, theologians and practitioners integrate findings on major environmental issues, produce formative publications, and issue influential statements such as the Oxford Declaration on Climate Change produced by 70 leading scientists and ethicists at Climate Forum 2002.

Au Sable was founded to make the little-known concepts of earthkeeping and environmental stewardship part of public life, college and university education, and practical action. Large universities and environmental organizations seemed to neglect religion. And liberal arts colleges, churches, and Christian missions had great potential for contributing here, and yet were not doing so. Consequently, the Institute selected evangelical colleges and universities and their associated churches and denominations as its focus, and in partnership with them developed curricula that would engage them in environmental studies with the Institute. The number of these partners had grown to 60 by 2003.

By 1996 program growth brought "Au Sable Pacific Rim" in the Pacific Northwest as a second campus, while the Michigan campus became "Au Sable Great Lakes." And new sites were established in south India, east Africa, and south Florida in partnership with Bishop Heber College, the African Institute for Scientific Research and Development, and Educational Concerns Hunger Organization, respectively. Students now use a combination of any of these sites to gain certification in four areas of Environmental Studies and also may earn a post-baccalaureate Stewardship Ecologist diploma. Faculty come from institutions linked with the Institute, from state and private universities, and various agencies to teach stewardship-based and faith-based courses in environmental studies in threeand five-week courses. Graduate students at Wisconsin, Michigan and Cornell work as Au Sable Graduate Fellows to assure that their stewardship education keeps abreast of their graduate studies.

Research is fostered by the Institute among the faculty of Participating Colleges, and natural scientists, theologians and ethicists from around the globe. A major outlet

for this research is the Au Sable Forum and its publications. Institute students are educated for careers in environmental research, teaching, and practical stewardship, with a strong emphasis on developing leadership.

Institute education and research is joined with a wide array of services to the communities it serves, including outdoor education for area schools, meeting spaces for environmental organizations, native plant production, environmental conflict resolution, and assistance to faithbased communities. An example of the last of these is illustrated in *Between Heaven and Earth*, a public television film account of faith-based stewardship on Tangier Island in the Chesapeake Bay.

The Au Sable Institute, while faith-based, is not defined by boundaries that set it apart, but instead by its central core of values that are biblically, ethically, and scientifically based. This structure – of a focus without boundary – has resulted in productive relationships with evangelical, mainline, Orthodox, Roman Catholic, and Jewish scholars in particular, and also with Muslim, Buddhist, Hindu, Sufi, Sikh, Navajo, and Oneida scholars. In conducting its work, however, the Institute strongly adheres to its core in biblical evangelical Christianity.

Funding for Au Sable is from tuition and fees and a substantial endowment to which contributions are made by philanthropic individuals and organizations. The endowment provides for a full program of scholarship and fellowship support for college and university students and in other ways supports Institute operations.

Aurobindo, Sri (1872–1950)

Sri Aurobindo is recognized in many capacities, as scholar, poet, political leader, philosopher, psychologist, Indologist, literary critic, journalist, mystic and sage. Indian by descent and Western by upbringing and education, Sri Aurobindo moved from being a leading political figure in India's struggle for liberation from British rule to become an indefatigable pioneer of spiritual transformation. He wrote prolifically, from his own experience, setting out a unitive framework in terms of which both to interpret reality and participate creatively in its transformation. His work recognizes the multi-levelled nature of reality and its vastness, as well as the nature of the interrelations between the different levels and gradations, and the pattern of the dynamics by which change comes about. His understanding of transformation includes the integration of polarities which are often regarded as irreconcilable opposites – for instance, consciousness and matter, inner and outer, religion and science, East and West, spirituality and socio-political commitment – in pursuit of a goal that respects the differences and is global in its application. Underlying his work is his principle of coming to knowledge of the truth through investigation, by direct experience. While deeply rooted in Hinduism, he saw himself as transcending all religion, and spoke instead of spirituality, where “spiritual” means “to become divine in consciousness and act, and to live inwardly and outwardly, the divine life.”

The overarching aim of Sri Aurobindo's teaching, as of his spiritual practice, was the transformation of consciousness, mind, life and matter toward divine consciousness and divine life, not in some “religious” otherworldly heaven, but right here in this world. Seeing nature as a whole and everything in it manifoldly interconnected, this transformation of consciousness includes what he calls “the radical and integral transformation of nature.” The principle he consistently worked with is that the outer or lower nature is changed from within and from above. This change is called *integral* because there is no rejection of the lower levels but rather the significant elements in them, the deep structures, are included and integrated in the higher.

Steeped in the traditional philosophical systems of Hinduism, particularly that of *advaita vedanta*, and through practice having largely recapitulated the aims of the traditional yogas, Sri Aurobindo saw his work as both a reconciliation of the achievements of the rishis, seers and yogins up to that time and as an empirical endeavor toward what he considered to be the next stage of evolution, which would be the establishment in human life of the next highest level of consciousness. He called this level the supramental or supermental, indicating that it is supernormal to our present prevalent state of awareness.

In presenting his philosophical framework for this evolutionary transformation (in *The Life Divine*) and the correlative spiritual practice (in *The Synthesis of Yoga and Letters on Yoga*), Sri Aurobindo interpreted “nature” in a wide sense to denote not only nature as environment, or nature as in the natural sciences, but as all of reality, which he saw as evolving integrally toward divinity through the evolution of consciousness. In his map of reality, nature (*prakriti*) comes into being dynamically, moment by moment, through the living consciousness and active power of the Divine. In this dynamic, the higher nature (*para prakriti*) is moment by moment bringing into being (manifesting) the lower nature (*apara prakriti*). Lower nature consists of mind, life and matter separated in consciousness from the Divine and characterized by ignorance. Between the Divine and the lower nature is the creative supraor supermental, which is both a plane of being and a realm of consciousness above the present mental consciousness. Sri Aurobindo held that as long as we are “in ignorance,” that is to say, as long as we have not realized the dynamic presence of the higher nature, we are subject to the lower nature which appears to be mindless and, as it were, working on automatic; life as we lead it according to nature at the moment is only half-conscious. But nature, as he experienced it, has this amazing secret urge to self-transcendence and this urge impels all levels, from nature as sheer physicality to nature as advanced humanity. As we evolve spiritually we become aware of the higher nature and seek to come into contact with it. We can ascend to the supramental consciousness and, most importantly, it can descend into us, and such an ascent and descent can transform the lower nature of mind, life and matter.

In Sri Aurobindo’s teaching, spirit is “involved,” albeit unconsciously, in every aspect and level of matter, life and mind, which is “the lower nature.” In contrast to the materialism of Darwinian evolutionary theory where consciousness is said to have evolved out of matter, Sri Aurobindo holds that consciousness/spirit is evolutionarily prior to matter and is creative of all that is. Physical nature is the material base for the evolution of consciousness and, as consciousness evolves, so the nature of the physical will be transformed, through each of its levels right down to, and including, the cells of the body. Left to itself, nature will evolve spontaneously, naturally and slowly, according to the truth of the energy at work in it. Sri Aurobindo understood his own contribution to be literally an acceleration of the natural evolutionary process. When one person consciously speeds up her or his own evolutionary development, this accelerates the whole process. In his particular case, by his integration of the knowledge and spiritual practice that had been achieved before him, Sri Aurobindo experienced himself as being at a fulcrum in the evolution of consciousness where he was able not only to access the higher supermental consciousness by ascent of his own awareness upwards, which others had done before; he also understood himself to be working specifically and practically with the “bringing down” of this higher consciousness, the aim being not just to experience it but to establish it in human nature.

Mapping reality in this way, Sri Aurobindo includes “nature” and the human person in one interpretative framework, which sets out the multi-leveled interconnections

between them and indicates what has to happen for the transformation of both. Given the vedantic principle that the Self is in everything and everything is in the Self, that we are in everything and everything is in us, Sri Aurobindo explains the meaning of this “in,” in relation to the structure of evolutionary transformation. All things are arising moment by moment and at this moment of their arising either they can come into being according to the old patterns and dynamics of their being and activity, or they can come into being new, transformed. “Nature is complex unity and not a collection of isolated phenomena,” the levels “may be said in a sense to exist in one another” and there is mutual modification going on all the time; change in one level results in potential change in all the others. And because, at the deeper levels of the being, all persons mutually indwell one another, change toward more unitary levels of consciousness in one person can make it easier for change to be effected in others, as well as in the environment. Recognizing that change can be detrimental as well as for the better, he emphasizes the need for each person to undertake the inner work responsibly, in the awareness that inner change and outer eventuate together. Further, Sri Aurobindo holds that when a sufficient number of people are committed to participating consciously in transformation toward the higher “integral spiritual consciousness,” the process will accelerate the natural evolutionary process. The correlative changes in the material base of consciousness entailed in this transformation (the cells and systems of the body, rippling out through the environment in its vastness) are natural and ultimately inevitable since consciousness and matter are not two poles of a dichotomy but rather are two levels of the one reality, arising co-dependently, moment by moment. Such structural interdependence in nature, as well as part/whole mutuality, is currently finding corroboration in aspects of contemporary quantum physics.

In Sri Aurobindo’s work there are incisive promptings for the Western theological enterprise, including clues, for instance, as to how the dangerous dualism between creation and salvation, and that between nature and grace, can be overcome, and along which lines eco-theology needs to be further developed. Sri Aurobindo’s theoretical framework, formulated in the Eastern context, was paralleled in many respects by the evolutionary theology and spirituality of the Jesuit paleontologist, Pierre Teilhard de Chardin, in the West. Sri Aurobindo’s teaching on nature and spirituality, with its vision of a new consciousness, a new person and a new world, prefigures recent developments in transpersonal psychology and transpersonal studies, and his influence is seen in many contemporary writers. Ken Wilber, for instance, is one of the leading transpersonal theorists whose position is influenced by him to such an extent that Sri Aurobindo is now coming to be regarded as one of the pioneers of transpersonal psychology, and this is leading to the recognition of his work as a transpersonal psychologist in its own right.

Sri Aurobindo’s work is being continued in the Sri Aurobindo Ashram in Pondicherry, India and in the international community of Auroville about five miles away, as well as in various communities worldwide. Being transcultural, beyond any one religion, and therefore global in its applicability, Sri Aurobindo’s teaching is taking

shape in a variety of contexts and giving form to new developments. International unity, for instance, he envisioned as the result of the interior urge to unity in what he calls “the will in Nature” (as the next stage on from family and national unity), as well as being the result of human endeavor and organization. This means that work toward international unity needs to be done concurrently on both the interior level in our moving beyond separative, egoic consciousness to deeper, unitary supramental consciousness, thereby extending our sense of self to include the natural world, and also on the levels of the current economic, environmental, technological, political and social realities. All levels are being created and upheld by the same Spirit and the potential is therefore present for all to come into being differently. Working on both the transformation of consciousness and on change in these manifold outer levels, *integrally*, is seen to be what differentiates the Aurobindonian approach from others. Within the Sri Aurobindo Society, which has many branches and associations in India and throughout the world, there are numerous institutions pursuing these goals, including, for instance, the Integral Consciousness Center, the Sri Aurobindo Foundation for Integral Education and Research, the Sri Aurobindo Foundation for Integral Health and Research and the Sri Aurobindo Institute for Applied Scientific Research. The latter pursues innovations in alternative energy sources and appropriate technology projects. The California Institute of Integral Studies in San Francisco, founded by the late Dr. Haridas Chadhuri, is an example of an institution where the influence of Sri Aurobindo’s teaching is being extended and from which it is widening internationally.

Auroville

Auroville is an international community founded in 1968 in the Indian state of Tamil Nadu. Its 1600 inhabitants representing over 35 nations reside in over 80 settlements spread across 20 square kilometers. It has gained international attention for its work in ecological restoration, and its implementation of low-impact life strategies. Its objective is to realize Sri Aurobindo's vision of human unity.

Sri Aurobindo (1872–1950), the Indian nationalist leader and mystic philosopher, rejected ways of yoga that lead away from temporal existence. The visible world, in his view, is the scene of a spiritual evolution by which the Divine Consciousness is to be progressively realized within material reality. After an active career as a political organizer and writer from 1902 to 1910, Sri Aurobindo arrived in Pondicherry surrounded by a handful of disciples. Gradually others joined. Eventually a community was organized for their maintenance and spiritual guidance. In 1914 a woman, named Mirra Alfassa (born in 1878 in Paris to an Egyptian father and a Turkish mother) arrived in Pondicherry and in time became Aurobindo's spiritual collaborator. From 1920 Mirra Alfassa, who Aurobindo called The Mother, came more and more to direct the material affairs of the community. In 1926, when Sri Aurobindo went into seclusion, he placed her in charge of what had become the Sri Aurobindo Ashram. From then until his death in 1950, Sri Aurobindo devoted himself to his spiritual discipline and writing.

Under the guidance of The Mother, the ashram grew into a many-faceted community. During the 1960s, it attracted many young people from Western Europe and America, who were searching for spiritual meaning and community. While Aurobindo wrote about communities that would practice his yoga, and while the Mother expressed the aspiration for such a community as early as 1954, it was not until 1968 that she founded the community known as Auroville, the "city of dawn." She conceived of it as a laboratory for the materialization of a new consciousness which Sri Aurobindo taught, a place where people of different ethnic, religious, cultural, and national backgrounds could live and work together in the spirit of mutual respect and collaboration, devoted to the discovery and practice of a Divine Consciousness they believed to be seeking manifestation. According to Aurobindo, human unity is to be achieved not by imposition or conformity but through the realization of a divine reality within which all persons are one. He taught that genuine human unity was possible only when people live not from the ego but from their essential being, which is identical with this reality.

The physical layout of Auroville centers upon an impressive architectural achievement called the Matrimandir, a spherical structure 100 feet in height, for quiet reflec-

tion and concentration. Containing at its center a large crystal globe illuminated by natural light and surrounded by meditation rooms and these by gardens, it was for The Mother “a living symbol of Auroville’s aspiration for the divine.” Radiating from the center, four zones are planned, each focusing on an aspect of community life: industrial, cultural, residential, and international. These are to be surrounded by a green belt. While much of the land needed for this plan remains to be acquired, the master plan envisions a population of 50,000.

The Mother guided the development of the Auroville community from its inception until she died in 1973. In December of 1980, after a period of conflict between the Auroville community and the Sri Aurobindo Society, the Government of India temporarily took over management of Auroville’s assets and undertakings. In accordance with the Auroville Foundation Act, passed by the Indian Parliament in 1988, it vested these assets and undertakings in an autonomous institution called the Auroville Foundation.

Following the thought of Sri Aurobindo, The Mother conceived of Auroville as a community that would practice meditative yoga, but also Karma yoga, an active yoga of work. While the thought of Aurobindo and The Mother entails a philosophy of nature that has profound implications for an environmental ethic, the early work of the Aurovilians was ecological by necessity. To realize their vision of human unity, it was first necessary to restore the ecologically degraded environment to productivity. With prodigious effort, the community planted trees, and built and repaired bunds, and checked dams. They learned and implemented traditional methods of watershed and land management. Today the community is embraced by rich forests. It is also home to the largest concentration of renewable energy technologies in India. Aurovilians are involved in research in land restoration, renewable energy systems, organic farming, and appropriate building technologies, as well as in education, health, and the arts. The community has undertaken programs of outreach to some 40,000 people who live in the surrounding area, establishing day and night schools for village adults and children. They are involved in Youth Groups and Women’s Groups in the villages in order to articulate and address local issues. Auroville doctors and workers support healthcare in the region with dental services and medical centers in a number of villages and offer classes in nutrition and hygiene. The Auroville community has addressed the falling underground water level in the area by encouraging water conservation measures and by ambitious projects to repair the massive system of rainwater tanks constructed in the twelfth and thirteenth centuries. They are also learning from local farmers about indigenous trees with which they are replacing the exotic species hurriedly planted in the early years of Auroville.

While Auroville has received international recognition for its achievements, there is no group more critical of the shortcomings of Auroville than the Aurovilians themselves. They point out that Auroville is not yet sustainable, and that with little representation from Africa, East Asia, South America and the Caribbean it is not yet fully international. They suggest that while various nationalities live and work effectively

in Auroville, differences in cultural perspectives remain a challenge. Thirty-five years after its founding, Auroville remains a work in progress.

Australia

In Australia's national imaginary settler *identification* with the indigenous landscape – a commitment often implicated in *reconciliation* with the descendants of Australia's original human inhabitants – has served to sacralize local place and stimulate cultural identity. While a coterie of interests (e.g., miners, farmers, environmentalists, Aborigines, tourists) continues to compete for definition and use, Australian *landscape* remains complicated territory. Yet, the collaborative concerns for sustainability, reconciliation and reenchantment apparent in the recent discourse and practice of artistic, scientific, religious, activist and regional communities indicate revision of colonialist practice. Despite continuing regimes of unsustainable growth and negligent land management, the last decade of the twentieth century saw the popular acknowledgment of unconscionable historical “truths” and commitments to the adaptive, ecological and spiritual sensibilities perceived necessary in the quest for settler legitimacy and the apparent fashioning of a “new Dreaming.”

From British settlement of Sydney Cove in 1788, Australia's landscape had been peripheral to the imperial centre, wild to the civilized, an empty, often cruel, wasteland. Claiming a land without owners, an apparent *terra nullius*, settlers were committed to *occupying* the continent: exploring, “discovering” and mapping its interior; “improving the landscape” through domestication strategies, acclimatization societies and other incidences of ecological imperialism documented in Eric Rolls' classic *They All Ran Wild* (1969) and William Lines' *Taming the Great South Land* (1991). As the newcomers “settled” the land with domesticated animals, pests, pathogens and weeds, committing to rampant resource extraction through land clearing and grazing, triggering severe salination and the decline in biodiversity in a land possessing poor soils, a stressful and unreliable climate and a fragile and interdependent ecosystem, much of Australian history post-1788 is a story of settler triumph and despoliation. From outback to alpine country, the battling bush pioneer is celebrated in this history. For instance, the cattleman, as depicted in Banjo Patterson's 1895 *The Man from Snowy River and Other Verses*, became lionized as the archetypal noble frontiersman. That the bush hero's exploits happened to displace and dispossess Australia's indigenes, often through brutal and oppressive measures, is largely elided in this history.

Postcolonialist perspectives have emerged amid a shifting consciousness, wherein, for instance, white “settlement” became reenvisioned as “invasion,” resource frontiers have been made into protected “heritage” sites, and the narratives of “noble” stockmen made subject to revision in the wake of conservation, native title and reconciliation movements. Such approaches have been triggered by a growing awareness, not only of

postsettlement history, but also of the “deep time” of prehistory. Thus while Stephen Pyne’s *Burning Bush: A Fire History of Australia* (1992) and Tim Flannery’s *The Future Eaters: An Ecological History of the Australasian Lands and People* (1995) attend to the reality of landscape, occupied, exploited and carefully managed for millennia, Rolls’ *Australia: A Biography* (in two volumes – 2000 and 2002) popularizes the geological genesis and even cosmological origins of *Gondwana* (The Great South Land). Such work, Tom Griffiths writes, recognizes nature as “an actor in history, as more than a static, physical base, as more than a cultural construct” (2000): “For 45 million years Australia has wandered in isolation across the Southern Ocean, carrying with it an ark full of ancient life forms” (Flannery, Australia Day 2002 Address). Geological and archeological findings provided evidence of human antiquity on the continent, through, notably, the uncovering of the world’s oldest known human cremation at Lake Mungo (NSW) in 1968 (the “Mungo Woman’s” remains subsequently returned to indigenous authorities). By contrast to the unoccupied “margins of the empire” to be subdued, peopled and modeled on England, or the “wilderness” championed by urban conservationists, the perception that Australia is (and was) a “humanised realm saturated with significations” (Stanner in Rose 1996: 18), a landscape already *imprinted* by those recognized as Australia’s “First People,” flourishes amidst competing perceptions. This growing consciousness has led, for example, to historian Greg Denning’s estimation that 42,000 years ago “our first people reached the southernmost point of the continent we call Australia” and, furthermore, that:

For 42 millennia all parts of this land – its rivers, its desert, its coastal plains, its mountains – have been imprinted with the human spirit. It has been filled, I would like to say, with language. Language encultures the land. Language brushes the land with metaphor. Language gives the most deserted place a history. A litany of names on the landscape beats fast, beats slow, dances in the dust, whispers in the silence (Denning 1999: 11).

Amidst the celebration of the continent’s human antiquity, we find an acknowledgment of continuing Aboriginal occupation, of living practice, and, moreover, of the requirement for intercultural exchange in the responsible management of landscape. Though far from dominant, dialogue with Aboriginal authorities is perceived as critical in establishing appropriate relationship to place. Aboriginal (and Torres Strait Islander) peoples not dispossessed of their cultural and religious heritage have, over several decades, imparted an awareness of what earlier anthropologists had referred to as a “spiritual kinship with the land,” of the celebration of life, connectedness and continuity constituting *The Dreaming*, which has been ultimately linked to “Law,” “holding” rights to country, and to that which anthropologist Deborah Rose calls an “ecological poetics of connection.” While in Aboriginal cosmologies, ancestral Dreaming beings created animals, coastal systems, deserts, forests, Alpine ranges, etc., ancestral power inheres in the natural environment, and is indeed actualized in the daily lives of Aboriginal people: in their patterns of health and sickness, in “totemic” relationships, implicated in rituals, such as “increase” and “mortuary” ceremonies, in a network of

sacred “sites,” and in the songs, painting and rock-art that maps and brings to life mythological land and seascapes.

For Aboriginal people, country is intimately connected to personal and cultural identity. Thus, for the Yolngu, Lardil and Yangkaal peoples of northeastern Arnhem Land, and North Wellesley Islands of the southern Gulf of Carpentaria, flora and fauna, bodies of water, and particular places, embody deceased ancestors and reflect genealogy and family obligations. Introducing their concept of *kanyininpa* (“nurturance”), Fred Myers has commented that for the Pintupi of the Western Desert, the practice of “looking after country” is inseparable from “growing up” people, as places “contain the vital essence and identity of human beings” (Myers 2000: 97). Based on her research of the Yarralin in the Victorian River District of the Northern Territory, Rose (1996) suggests that the prevailing message in the Aboriginal worldview is that country is a “nourishing terrain.” Those who neglect country (land and sea) may upset structures of interdependence, risking the well-being of those who depend on it for their physical and cultural survival. This understood framework of responsible placemaking is suggestive of the wealth of indigenous ecological knowledge.

The continuing history of dispossession notwithstanding, a curious historical dynamic has manifested amounting to cross-appropriation. For instance, while the “indigenization” of Christianity has revealed a process of accommodation on the part of Aboriginal people of settler society and lifeways, the contemporary adoption of indigeneity (Aboriginal religious beliefs and practices) reveals legitimacy strategies undertaken by settler Australians as part of that which Rose identifies as a “revitalization” movement, also referred to by Morton and Smith (1999) as “eco-nationalism,” whereby the land is perceived to be the source of spiritual authenticity and cultural redemption.

The remainder of this overview fleshes out this redemptive “movement.”

In recent history, “movement” commentators like historian Peter Read, author of *Belonging: Australians, Place and Aboriginal Ownership* (2000), have documented the desire for a “deep relationship” to country, a legitimate sense of *belonging* apparent in the contemporary landscape practices of non-Aboriginal Australians. In his *Hunters and Collectors: The Antiquarian Imagination in Australia*, historian Tom Griffiths (1996: 5) documented processes by which settler Australians have come to “foster emotional possession of the land,” whereby harboring respect for preexisting Aboriginal associations was the condition for *becoming* Australian. In recent decades, there has been much engagement with the capacity of local place to shape, to *nativize*, to render its settlers *chthonic citizens*, who, like indigenes past and present, adapt, or are assimilated to, the conditions of country – a country which, as eco-philosopher Freya Matthews suggests, literally “infiltrates” identity. Making an important contribution to local environmental philosophy, for Matthews, in the metaphysics of “letting things be,” place becomes interwoven with the identities of settler Australians. Moreover, in time “a place can, if we commit to it, come to accept us. We become its people. The land, or place, claims its own . . . we become native to our world” (Matthews 1999: 125). Furthermore:

Born into this intimately companionable land that has for so long been singing along, humming along, with its inhabitants, non-Aboriginal Australians might also, if we collectively pause to feel the resonance of the endlessly poetic communiqués that surround us, rediscover, in a contemporary context, some of the fundamental aspects of the Aboriginal relation to the world (Matthews 1999: 135).

Amounting to *resacralization*, the poetics of such inhabitation is a feature of the Australian arts. According to Janet Dyne (1998), exploring and articulating their place in a vast and ancient country, various poets (notably Judith Wright, Francis Webb and Les Murray), novelists, and other artists came to highlight “the overwhelming *presence* of the land, writing a humility before it.” In their “radical openness” to it, non-Aboriginal artists have been “written” by the land. And while such “openness” might parallel that evident in the work of Aboriginal writers and poets like Kath Walker (Oodgeroo Noonuccal) and Bill Neidjie, the language channeled by non-Aboriginal artists is rudimentary (1998: 123). Thus, while the Australian arts demonstrate that the poetics, politics and techniques of “loving the land” have long begun, “reconciliation will require a poiesis, a Dreaming” (Dyne 1998: 130) which remains in its infancy. In his impassioned Australia Day 2002 Address, zoologist and historian Tim Flannery exclaimed that the nation stood to grow through its adaptation to country:

Australia – the land, its climate and creatures and plants – is the only thing that we all, uniquely, share in common. It is at once our inheritance, our sustenance, and the only force ubiquitous and powerful enough to craft a truly Australian people . . . [A]fter 214 years of exposure to Australian conditions, the supposedly dominant Anglo culture is no longer truly “Anglo.” Instead it has been steeped in the dye of Australia and it is beginning to transform into something else (http://www.australiaday.com/au/tim_welcome.html).

Flannery’s inspired narrative suggests that recognizing the errors of the past and reconciling with landscape affords settler *indigeneity*. Indeed, settler-Australian reconciliation with a complex of landscape (especially the outback), indigenes and the unconscious, is regarded by the prominent Australian proselytizer of reenchantment, David Tacey, as a process of *indigenization*. In his popular *oeuvre*, *Edge of the Sacred: Transformation in Australia* (1995) and *Re-enchantment: The New Australian Spirituality* (2000), Tacey argues that while the arrogance of the dominant masculine ego ensures settler Australia’s separation from the land (ultimately “huddled” in cities built “on the edge of the sacred”), the potential for “unsettlement” nevertheless remains. As non-Aboriginal Australians become “more sensitive to place . . . psychospiritual traffic starts to move from the land towards us” (2000: 137). The “indigenizing project” identified by Tacey manifests in contemporary practices, organizations and events mediating connectedness, identity and purpose. It is detectable, for example, in committed activist organizations, electronic “Trance Dance” events and Raves, Australian Paganism, where adaptation to seasonal variations and indigenous biota sees local Pagans countering imposed myth cycles and ritual symbolism relevant to the northern hemisphere, and in urban spaces such as Melbourne’s CERES which promotes “urban reinhabita-

tion,” and is the site of the spring “Return of the Sacred Kingfisher” festival where European and Aboriginal mythological elements are adopted in a poetic and practical dialogue with the land, in a performed “commitment to home place” led by Aboriginal custodians. And the sensibility is hardly marginal as indigenization is detectable in the growing identification with native flora and fauna among urban dwellers, in regional land rehabilitation projects like Landcare, or in the mass pilgrimage to natural heritage sites and national icons like The Great Barrier Reef, Uluru or the Tasmanian southwest wilderness.

While efforts by non-indigenous Australians to “get closer to nature” often rely on a essentialized and primitivist Aboriginality not dissimilar to that endorsed by New Age spokespersons, the different projects advocated by Tacey and Matthews advance in concordance with recognition of the suffering of land and people, admitting of a sense of shame and a desire for reconciliation. In much discourse or “dialogue,” sacralization is consequent to *sacrifice*. It is perceived that a restoration of sacrality to *both* Aboriginal and non-Aboriginal people will be consequent to giving indigenous caretakers “some of our moral and legal authority over land” (Tacey 2000: 125). For the Jungian, Tacey, the sacrificial project is one of individuation, the process by which Australia will achieve spiritual maturity, a *national ensoulment*.

But the sacrificial “fight for country” of the present is a revision of earlier commitments where “king and country” were defended by loyal subjects of empire. In the work of Flannery and Tacey, the first steps toward antipodean legitimacy, toward “individuation,” and the nation’s potential to adapt and grow, is greatly assisted, if not dependent upon, the wider acknowledgement of past and present injustices experienced by Aboriginal people and local ecology. A solemn ecological awareness is being raised on the belief that, as in the poetry of Judith Wright, “[t]he wounds we have inflicted on the land and on its first peoples have also wounded us” (Brady 1998: 6), and in the perception that, as the shameful acts of the past persist in the present, Australia remains diminished as a nation. If one experiences kinship with place, with country, then one will mourn its passing, and, moreover, will be moved to sacrifice; to care for country. The process of identification is thus a powerful catalyst for altering relationship to place, for assuming custodial duties, adopting caretaking practices constituted in part by Western ecological philosophies and management practices borrowed from and endorsed by Aboriginal authorities.

In recent history, a shift in the consciousness of Australia’s non-Aboriginal population has occurred, with evidence of atonement for social and economic behavior long signifying foreignness to, and detachment from, country. Assisted by the raising of an ecological consciousness and the emergence of the “era of reconciliation,” evidence of deep identification and dialogue with local place can be found in variegated acts to conserve, reclaim and defend landscape, and in the adoption of custodial sensibilities by non-indigenous Australians. Knowledge of the simultaneous “suffering” of indigenous people and place has, in contemporary Australia, inspired a nascent cultural, political and spiritual commitment to inhabiting landscape, to belong to this place.

Australian Poetry

The task facing people settling into a hitherto unknown place is not merely economic. They also need to imagine themselves into existence, to transform “chaos” into “cosmos,” as Mircea Eliade puts it. This task was particularly challenging for the European newcomers to Australia. Its First Peoples had lived intimately with the land and celebrated it in song, story and dance for thousands of years. But to the settlers it appeared strange, even weirdly frightening, unlike anything they had known. With flora and fauna long extinct elsewhere, it seemed to hark back to primordial times and somehow seem “contemptuous” of the “trim utilitarian civilization” they had brought with them. Here the Book of Nature seemed closed and they saw only “the strange scribblings of Nature learning how to write” (Clarke in Turner 1968: 101–2).

They believed then that they must “tame” the land and turn it into “a New Britannia in another world” (Wentworth in Turner 1968: 12). With its emphasis on order and reason, the culture the settlers brought with them lacked the impulse to explore its strangeness. So the first poets wrote in the Augustan mode, imposing its style on the unfamiliar landscape and it was not until the 1840s that, empowered by Romantic notions of the sublime, poets like Charles Harpur and, in the next generation, Henry Kendall, responded to what was actually before their eyes: the vast plains, the primeval forests, and the wild splendor of storms and bushfires. Naming this new world, however, was still a way of asserting dominance over it. Thus Kendall’s “Bell Birds” sees “the silver-voiced bell-birds” in terms of an English spring, singing “in September the songs of the May-time” (in Heseltine 1972: 69).

Essentially their concern was with reportage and, as Rodney Hall remarks, “a camera prevents miracles from happening” (Plunkett 1994: 6). Nature was to be conquered and rendered fruitful, not revered. Where its otherness was registered as in “The Creek Of The Four Graves,” part of Harpur’s unfinished epic of settlement, it brings death and is associated, significantly, with the Aborigines, “hell’s worst fiends burst howling up / Into the death-doomed world” (in Heseltine 1972: 59) who set upon an exploring party as they sleep around their campfire.

In the ballads, the folk poetry of settlement were even more determinedly secular. Their focus was on the human struggle to subdue the land, which far from being sacramental, figured as an antagonist or as a backdrop to this heroic struggle. On the one hand, the galloping rhythms of ballads like “The Man From Snowy River” exulted in triumphing over its dangers, while on the other, the interior could be seen as the

place of death and defeat: “Out on the wastes of the Never Never / That’s where the dead men lie” (Boake in Heseltine 1972: 92–4).

The gap between the human and natural worlds was widening. As it did, so the poetic imagination at the end of the nineteenth century looked to the future, turning its back on the “Dreaming” of the ancient land and the cultures of its First Peoples. The task, as Bernard O’Dowd put it in his sonnet celebrating Federation in 1901, was to transform this “last sea-thing dredged by sailor Time from Space” (In Heseltine 1972: 95) into a prosperous society in which, in Henry Lawson’s words, “there ain’t no fore and aft” (Lawson 1967: 261).

At the beginning of the twentieth century, however, Christopher Brennan struck a metaphysical note. His work had little influence at the time and his personal life was a disaster, but later poets like Judith Wright saw him as a seminal figure: “last Symbolist, poor hero / lost looking for yourself, / your journey was our journey” (in Heseltine 1972: 403).

He saw “Man . . . [as] the Wanderer on the way to the self and believed that his/her task was to take up into himself the whole world that is outside . . . and the whole world that is within” (Prose in Heseltine 1972: 45–6).

In the 1920s, Hugh McCrea, influenced by the painter Norman Lindsay, explored a vein of Nietzschean Vitalism, populating the bush with the nymphs and satyrs of Greek legend. At first Kenneth Slessor, the major poet of the 1930s, followed. But as he matured he confronted the actual rather than an imaginary landscape, sensing in it the traditional menace – “[S]omething below [pushing] up a knob of skull, / Feeling its way to air” (Slessor in Heseltine 1972: 149) – and his elegies, “Five Bells” (156–8) and “Beach Burial” (159) explore the No-Thing-Ness which had haunted the colonial imagination. R.D. Fitzgerald took a similar direction, writing about the horrors of the convict era in “The Wind At Your Door” (In Heseltine 1972: 178) and of primordial time in his long “Essay On Memory.” A.D. Hope, too, rejected the complacencies of “secondhand Europeans,” “Whose boast is not, ‘we live’ but ‘we survive’ / A type who will inhabit the dying Earth,” setting out a journey into “[t]he Arabian desert of the human mind” (in Heseltine 1972: 190) which he pursued throughout his long career. The Jindyworobak Movement led by Rex Ingamells also turned inwards attempting to draw on Aboriginal culture. But their poetry did little more than attach Aboriginal names to non-Aboriginal feelings about the land.

World War II, however, marked a transition. For the first time, non-Aboriginal Australia was threatened with invasion, and poets, such as David Campbell, Douglas Stewart, William Hart-Smith and Roland Robinson, realized how much the land meant to them and wrote about it with affection and ease. But the key figure was probably Judith Wright, managing to articulate what many Australians were feeling as death seemed to “marshal up his armies around them” (279) and the trains thundered north with guns, waking “the young men from a dream, scattering like glass / the old men’s sleep” (12) and awakening in them a sense that the land and its story was their “blood’s country” (280).

Wright was significant also because of the “feminine” feeling she brought to a tradition that had been largely “masculine,” concerned with struggle and conquest. Setting love, pregnancy, and birth in the context of the energies of the natural world, she brought a new sensibility to bear, prepared to listen to the land as to her own body and to let it speak through her. In this way for the first time in poems like “Bora Ring” (Wright 1994: 8) and “Nigger’s Leap, New England” (Wright 1994: 15) the story of the land’s First Peoples, “[t]he night ghosts of a land / only by day possessed” (Wright 1994: 354) became part of the tradition. Later poets like Les Murray were to follow. But even more significantly, Aboriginal poets, led by Kath Walker (later Oodgeroo Noonuccal) began to make their voices heard.

This was to open out areas hitherto taboo, forbidden to profane experience because of the spiritual danger attached to them. James McAuley exulted these dangers in the metaphysical explorations of “The Incarnation of Sirius” (in Heseltine 1972: 291–2) and “Celebration of Divine Love” (293–6), but also in the personal bleakness of “Pieta” (301) and “Because” (302). But the poet who was most extreme and most compelling in this exploration was perhaps Francis Webb. Troubled by mental illness and besieged by images of terror, he forged a language to explore deserts of the mind which matched the physical deserts of the interior which had so long daunted the poetic imagination.

On a less monumental scale, later poets like Gwen Harwood, Randolph Stow, Robert Adamson, Vivian Smith, Rodney Hall, David Malouf, Chris Wallace-Crabbe and Philip Hodgins (who wrote about his progress toward death from leukemia) continued this exploration and, nearly always, nature was part of it. While not formally religious, their work nevertheless is about a discovered homeland of the sacred.

Les Murray is perhaps the best known of these poets, celebrating this discovery by creating a legendary Australia, what he calls a “Vernacular Republic,” which encompasses ordinary people, giving their experience a sacral quality. He also brings to bear on the land a sensibility akin to that of traditional Aboriginal cultures, celebrating its power which many found so frightening in the past. More recently and in similar vein, John Kinsella created and exulted in a savagely powerful landscape which in his case, however, is almost too strong for its human inhabitants.

The history of the exchange between poetry, nature, and the sacred, then, has been a difficult one. For lack of it Australians have made many mistakes in their relationship with the land and perhaps also with one another and themselves. But if, as Heidegger says, it is poetically that we live on Earth, then the poets have contributed in no small measure to bring about a change and achieve the imaginative task of settlement.

Autobiography

Autobiographical texts offer a fascinating window onto the intersections of religion and nature in the actual lives of individuals. In particular, the autobiographical concern with moments of change and development over the lifecourse allows readers and scholars to explore the particular pathways by which nature comes to shape or to possess personal religious meaning. How does the unique trajectory of each individual's life shape her or his construction of religion, nature, and the relationship between the two? How are religion and nature intertwined with all the other areas of a person's life – psychological development, family, social and cultural influences, historical circumstances, and personal beliefs and values? When and how in a person's life can religious traditions shape environmental experience – and when and how can religious traditions themselves be transformed by particular experiences of nature? Under what circumstances can natural beings and objects themselves function in a religious manner? Addressing these and other questions, the representative autobiographical texts discussed below illustrate the role of nature in selected religiously charged moments across the individual's life-course. (The authors discussed are from the United States except where noted.)

1. *Childhood*. In his “Ode: Intimations of Immortality from Recollections of Early Childhood” (1807), the English poet William Wordsworth provides the *locus classicus* of the idea of a special relationship between religion and nature in childhood. According to Wordsworth, “Trailing clouds of glory do we come / From God, who is our home:

/ Heaven lies about us in our infancy!” Recently present to God, the child can discern God's presence in “meadow, grove, and stream, / The Earth, and every common sight,” and thus is “Nature's Priest.” This special sensitivity to the divine in nature fades as the child grows, but even in adulthood provides the “master light of all our seeing” and the basis for religious strength and artistic creativity. Along with shaping Wordsworth's own autobiographical reminiscences in *The Prelude* (1850), these ideas subsequently have been reflected and reinterpreted throughout English-language culture and memoir. According to conservationist John Muir's recollections of his childhood in Scotland and America in *The Story of My Boyhood and Youth* (1913), “the natural inherited wildness in our blood ran true on its glorious course as invincible and unstoppable as stars”; the book emphasizes the tension between this natural childhood faith and the distorting influence of humanity (especially the repressive childrearing of Muir's father). Similarly, writer Mary Austin's *Earth Horizon* (1932) highlights her childhood awareness of a deeper and truer self, “I-Mary,” encountered exclusively in solitude outdoors or with books. More recently, in an important revision of the Wordsworthian tradition, the

supernatural or divine element has dropped out, leaving a direct religious relationship between children and nature. In her *Ecology of a Cracker Childhood* (1999), naturalist Janisse Ray recounts her family's idiosyncratic "creation story," in which each child was not born of human parents but rather found hidden in the leaves of some domesticated or wild plant; cradled in pine needles at birth, Ray would survive childhood poverty, isolation, danger, and ugliness in part through an intimate connection with the longleaf pine ecosystem that characterized her rural Georgia surroundings.

2. *Education and mentors.* Apart from (or along with) innate divinity, wildness, or ecological connection, many children come to a close connection with nature through education, often under the guidance of special teachers or mentors. Canadian naturalist Farley Mowat's *Born Naked* (1993) recounts the awakening of his sensitivity to natural beings ("the Others") with the crucial help of a long line of companions, teachers, and mentors, from the nameless, outcast "Marsh Boy" to the naturalist uncle who arranged and funded Mowat's first scientific exploration at age 16. For British ethologist Jane Goodall, the romantic and religious influences surrounding a favorite pastor of her teenage years infused her subsequent emotional life in subtle and mysterious ways; moreover, her *Reason for Hope* (1999) emphasizes the importance of mentors during adulthood, from renowned anthropologist Louis Leakey to the chimpanzee she called David Graybeard, who chose

(consciously, Goodall thought) to invite her into a mutual exploration of his world. In non-Western societies, education and mentoring often take place through family and cultural tradition. In *The Names* (1976), writer N. Scott Momaday must tell the stories of his Kiowa, Cherokee, and white forebears as the integral center of his own origin; when he begins to emerge as an individual, beginning at age twelve, Momaday's existence is further shaped profoundly by the landscape and culture of the Jemez pueblo where he then lived, along with the continued presence, stories, and art of his immediate family. Stressing more explicitly intellectual and ethical dimensions, Mahatma Gandhi's *Autobiography* (1927) explores the future political leader's lifelong pursuit of truth, *satyagraha*, in various familial, social, and personal circumstances, with the treatment of animals and other living beings serving at many key points as a challenge and touchstone of his moral and religious development.

3. *Insight and conversion.* In adulthood, the natural world often serves as a setting or object of spiritual insight or conversion. Puritan theologian Jonathan Edwards, recounting his conversion in his "Personal Narrative" (1765), portrays the joy and power of his connection with God as reflected in the "sweetness" of his heightened perception of the natural world. In other memoirs, such as John Muir's *My First Summer in the Sierra* (1911), conversion is understood not so much with respect to God as to the divinity and beauty within wild nature itself: "We are now in the mountains and they are in us, kindling enthusiasm, making every nerve quiver, filling every pore and cell of us." An equally powerful but more ambiguous environmental awakening takes place in writer Jean Toomer's semi-autobiographical *Cane* (1923), in which the Washington, D.C.-born protagonist's encounter with the red dirt and smoky sunsets of

Georgia evokes a visceral sense of connection with his Southern and African blood and heritage. Moving beyond the human, Aldo Leopold's *A Sand County Almanac* (1949) includes the famous autobiographical vignette "Thinking Like a Mountain," in which an encounter with the "fierce green fire" in a dying wolf's eyes crystallizes Leopold's transformation from trigger-happy young hunter to environmentally aware ecologist.

4. *Commitment to place.* With or without such moments of conversion, an adult decision to commit oneself to life in and with a specific place can carry profound religious roots and meanings. The first half of *A Sand County Almanac* illustrates Leopold's increasing awareness of and commitment to a specific patch of land, his "shack" in central Wisconsin, over a full calendar year, in a mutual relationship of education and healing; this genre of the "observation of the country year" constitutes a major tradition within American nature writing, from Susan Fenimore Cooper's *Rural Hours* (1850) and Henry David Thoreau's *Walden* (1854) to Sue Hubbell's *A Country Year* (1986) and others. For memoirists such as Wendell Berry (*The Long-Legged House*, 1969) and David Mas Masumoto (*Epitaph for a Peach*, 1995), a return and recommitment to a family farm allows the possibility of healing soil, self, and society by (in Masumoto's words) "trying to farm in a new way, working with, and not against, nature," grounded in family tradition and local wisdom but open to new knowledge and challenge from the wider world. Less ecological, more aesthetic, poet Kathleen Norris's *Dakota* (1993) parallels the spiritual influence of the harsh, sparse, beautiful landscape of the northern plains with that of ancient and modern monastic life; within both settings, one has a chance to be "alone with the Alone." Whether understood through explicitly religious language and traditions or not, commitment to place offers a spiritual center for life, an opportunity for "making a home in a restless world" (the subtitle of Scott Russell Sanders's *Stay- ing Put*, 1993).

5. *Affliction, death, and healing.* In many lives, religious power and solace emerge with special poignancy at times of affliction and illness, and the natural world can provide both context and content for such encounters. To be sure, in the Christian and Jewish traditions (from Job on), natural events (drought, storm) or landscapes (desert, wilderness) are themselves metaphors or vehicles of affliction at the hands of an angry, judgmental, or inscrutable God; Mary Rowlandson, in her *Narrative* (1678) of captivity by Native Americans during King Philip's War, recounts her trials and hardships in the "vast and desolate wilderness" outside the towns of the English colonists. However, "even as [God] wounded me with one hand, so he healed me with the other," and sometimes this healing comes through the natural world, as she becomes increasingly adept at foraging for food and medicinal herbs. In much recent memoir, the natural world becomes more straightforwardly positive as a place of solace and healing: in Sally Carrighar's *Home to the Wilderness* (1973), as a source of emotional healing from a series of childhood and young adult stresses and traumas. In *Refuge* (1991), Terry Tempest Williams attempts to turn to the beloved birds and landscape of the Great Salt Lake as source of strength and solace in the face of her mother's cancer and eventual death; her quest is complicated, however, because the natural environment is

itself undergoing change and damage as the result of both natural and human processes. Moreover, until the probable radioactive origin of the cancer from atomic bomb tests is revealed, Williams and the reader are led to consider cancer and death as themselves natural processes, to which the spiritual response is conformation, not opposition. As with all these texts (and lives), a brief summary can scarcely capture the complex layers of meaning and mystery of engagement with nature at such personally and religiously charged moments of human existence.

6. *Encounters with environmental damage.* As

Williams suggests, in the modern world nature is not only a cause or context of human affliction but is itself also subject to affliction at the hands of humans, and encounters with environmental damage can serve as moments of religious meaning and ethical transformation in individual lives. Often this takes the form of an awakening to environmental activism, as in Lois Gibbs's *Love Canal* (1982), the near-archetypal account of a regular citizen moved to political action to defend her family and neighborhood from toxic industrial pollution. For Jane Goodall as for Katy Payne (*Silent Thunder*, 1998), unorthodox scientific study of chimpanzees and elephants, respectively, fosters a sense of personal relationship with individual animals and communities; when outside forces lead to the drastic culling of these animals, these scientists' careers and lives are sharply reoriented toward overt activism. By contrast, other activist autobiographies – for example, those of Janisse Ray and David Brower (*For Earth's Sake*, 1990) – do not center on dramatic awakenings but rather on lifelong concern with beloved yet threatened landscapes (Southern longleaf pine forests and Western mountain wilderness, respectively). Whether arrived at through dramatic transformation or gradual development, environmental concern and activism can itself constitute a religious practice or center, giving strength, direction, and meaning to an individual's life. Here as at the other moments of the life-course discussed above, a variety of specific factors – historical circumstance, psychological development, cultural context, individual creativity, and other-than-human presence – merge in the creation of a unique personal and religious reality.

Ayahuasca

Ayahuasca is a word from the *Quechua* linguistic family of Andean-Equatorial South America. It means “vine of the soul” and refers both to a large forest liana (*Banisteriopsis caapi*), and a strong decoction (tea extract) made from its woody parts, or with one or more other plant admixtures. The most usual addition to the brew are leaves from the shrub *Psychotria viridis*. These plants are endemic to the Amazon Basin, where they are part of a much larger *plantas maestras* or “teacher plants” tradition native to that part of the world. Such plants – many of which have emetic, purgative, cathartic, dream-inducing and/or visionary effects – are used to facilitate states of consciousness that are believed to open into the worlds of spirit.

In the typical *ayahuasca* preparation, the molecular basis for this lies in the betacarboline complex (harmine, tetrahydroharmine, etc.) and the indole dimethyltryptamine (DMT). These are part of a structural group that includes neurotransmitters, molecules used to effect internal communication in the human body. In *ayahuasca*, these dialogues are deepened and expanded to include all manner of elemental, plant, animal, ancestor, and deity. These then appear less as an “other,” and more as participants in the metabolisms of yet larger bodies, such as regional ecosystems, or the Earth itself.

Such organismic cosmologies are common to many indigenous peoples. These often suggest the existence of a reality *a priori* to material existence, one of mythic causality in which all beings are mutually transformative and exist as ontological equals, as “persons.” Dialogues with such a world are effected through imaginal exchanges (dreams and visions), dance, prayer, song, and their attendant feeling states and sensory awareness. These describe the body’s capacity to converse with what is presumed to be the affective life of the natural world. *Ayahuasca* allows access to this generous bandwidth of communication, and its repeated use cultivates familiarity with the ecology of souls that inhabit it.

Sophisticated eco-cosmologies have therefore evolved among Amazonian peoples around the use of *ayahuasca* and other *plantas maestras*. These tend to order such practical activities as healing, divination, procreation, and hunting within the concept of an all-encompassing fertility circuit. This view understands the world to be nourished by a finite supply of vital force that must be equitably shared. Human greed, waste, and disrespect can easily disrupt this flow, and the repercussions are thought to express themselves in personal and social ills. Spirituality and medicine are thereby integrated into various social norms that tend to preserve ecosystem integrity. Examples include food, sex, and hunting taboos, and the cultivation of kinship relations with plants and animals.

The world of nature as revealed by *ayahuasca* typically appears as a society, a culture of spiritual relations. The teachings of *ayahuasca* are acts of healing, remediations in energy flow and balance whereby one “becomes” the lessons. One so healed may then enter into transformative relations with larger organizing forces, with greater ecosystemic intelligences, which in turn tend to increase human self-consciousness, inspiration, revelation, and sense of mission. When these traits are understood within the context of spiritual evolution, *ayahuasca* takes on a religious significance. These traits are often understood as promoting spiritual evolution and thus contribute to *ayahuasca*’s religious significance.

The idea of healing body and soul is often central in religion in diverse contexts, and one can conjecture that the supplication of humans to the healing power of nature is the source of much of what we know as religion. In this regard, the role of plants and fungi in the origins of religions has been explored by a number of authors. Perhaps the most well-known example is *Soma*, the mysterious plant (or fungus) recounted in the Hindu RigVedas as a vehicle of religious ecstasy.

Plant-inspired religions can be understood as acts of guidance by an elder community of species to a younger one, the human. They are concerned with successful cocreative relations within the community of nature and the organismic and spiritual growth that these bring about. Such religions allow the initiate to cultivate an expanded sense of self, whereby one’s actions in the world are reviewed in experiences of right or wrong, heaven or hell. This often results in a greater awareness of, and respect for, the spiritual ecologies that govern the world.

Such understandings were lost to much of religious life as humanity civilized itself into increasingly monospecies (exclusively human) social arrangements and dialogues. Politicizing, intellectualizing, and influences that move divinity off-planet have all played their roles in denaturing the religions that have coevolved with Western industrialism.

However, a reformation of plant-inspired religions has been occurring since the late 1800s. These often come of syncretizing influences in places of sudden and disruptive culture change. Examples include the evolution of the use of peyote (*Lophophora williamsii*) into a pan-Native American religion; and the creation of churches that employ iboga root (*Tabernanthe iboga*) in colonized central west Africa. Similarly, *ayahuasca*-based churches were born in the Amazon basin with the influx of colonists and forest extractivists.

In the late 1920s, a rubber tapper named Raimundo Irineu Serra, or Master Irineu as he came to be called, had a series of visions in the forests near Acre, Brazil brought on by his use of *ayahuasca*. In these he was visited by the Queen of the Forest in the guise of the Virgin of Conception. Through her he received the doctrine of a new religion based on spiritual healing. *Ayahuasca* took on the name of *Daime*, after the invocation *Dai-me Amor, Dai-me Luz . . .* (“Give me Love, Give me Light”), and the religion became known as *Santo Daime*. Master Irineu moved to the nearby town of

Rio Branco in 1930, and there began to cultivate this religion with a small group of adherents.

A number of hymns began to be received by church members in the form of “singing murmurs,” which were considered to be gifts from higher worlds. They invoke an eclectic pantheon that includes Old and New Testament figures and various saints, spirits of sacred plants, forest animals, devic presences, and heavenly bodies. These, along with accompanying musical instruments and formalized dancing, became an important part of church ceremonies and source for doctrinal development.

As the religion grew in Brazil, it spread from rural caboclo (mixed-blood river dwellers) communities into new settings and populations. These include the urban middle class, health professionals, and intelligentsia, as well as more marginalized groups, such as drug addicts (the churches have become well-known for their work in helping people to overcome addictions), counter-culturalists, and the urban poor. This growth stimulated the formation of sects. For example, the *Barquinha* (“little boat”) group emerged in the 1950s; it accommodates aspects of the very heterogeneous *Umbanda* (mediumist) spiritualism.

Yet another rubber tapper, Jose Gabriel da Costa, encountered the use of *ayahuasca* with native Indians in the forests bordering Bolivia and Brazil. In 1961, he founded the U.D.V. (*União do Vegetal*), which soon spread into the urban south of Brazil. Among the more hierarchical and organizationally sophisticated of the *ayahuasca* religions, the U.D.V. stresses a less active service, with long periods of silence interspersed with conversational sharing.

Despite differences, all churches share similarities that derive from the integrative nature of *ayahuasca* itself. It is considered a sacrament, and like its predecessor *soma*, a divinity, both Christ’s blood, and a forest spirit. The replacement of the bread and wine Eucharist with *ayahuasca* brings an eco-spiritual force into communion with Christian saints and their prescriptions of love, peace, charity, and fraternity. By unifying the naturalized and the civilized, it appears to work as a bridge over the 500 years of culture clashes wrought by the colonialist enterprise. In this way, it births new cultural forms of indigeneity, ways of belonging to the land that reflect the needs of the various peoples brought to it.

A notable example is the 1982 founding of a community called *Vila Céu do Mapiá* (Mapia) by *Santo Daime* church members. Located in a large forest reserve in the Brazilian state of Amazonas, Mapia is intended as an ecological-communal social laboratory where the teachings received through the *Daime* can be practiced in daily life.

The world affirmed by *ayahuasca*, and indeed by all teacher plants, tends to run contrary to that enacted by industrial-growth cultures. Hence, those individuals that convert often become less amenable to mainstream mores, values, and ways of life. The media in Brazil and elsewhere have observed this, and in recent years have accused the churches of contributing to the breakdown of society; this by inducing its followers into acts of fanaticism, such as leaving one’s city life and disappearing into the forest.

Antipathy to the forces of change unleashed by sacred plants is likewise reflected in the modern War on Drugs. Under international pressure, Brazil added *B. caapi* to its list of controlled substances in 1985. Following a series of appeals and investigations it was removed from the list with provisions in 1987, and fully exempted in 1992. In that year, its legitimacy was celebrated with *ayahuasca* ceremonies featured as part of the inter-religious vigil of the Global Forum section of the Earth Summit conference in Rio de Janeiro.

As the use of *ayahuasca* spreads outside of Brazil, it continues to run into prohibition policies. In recent years, the churches in Europe and the U.S. experienced a number of seizures and arrests. Many court cases are pending, though a decision on 21 May 2001 in the Dutch court acquitted the *Santo Daime* church under the constitutional right to freedom of religion.

Modern ayahuasca religions are born both of the sylvan cosmos and a humanity sundered from that world. They therefore have great implications during this era of ecological crisis. To reestablish communicative relations with medicinal plants is to reconnect with a perennial source of assistance to humans. What such plants can do for individuals, they can do for communities; in this way they engender healing cultures. This process continues in Brazil (e.g., the Centro de Cultura Cósmica has recently sprouted from both Santo Daime and the U.D.V. influences) and in other areas of the world, where such movements are more covert.

These religions are prophetic in considering themselves microcosmic realities of a future-healed Earth, yet for them, the future is now. They presume that as more people awaken to this reality, a relational indigeneity appropriate for the times will become increasingly accepted as a new cultural norm, and the planetary crisis will then pass. This vision is millenarian in scope, and suggests the inevitable evolution of a heart-opening ecotopia. To this end, a Daime hymn sings of a “new life, new world, new people, new Earth.”

Aztec Religion – Pre-Columbian

In accordance with other meso-American traditions, the Aztecs experienced “nature” in all its complexity not as a mere mundane entity out there, but rather as deeply connected with superhuman powers and beings, manifesting themselves in countless aspects of the surrounding world and a sacred landscape. Earth itself, for example, could be viewed as a grand living being, and in pictorial manuscripts it is often depicted as a monstrous caiman with devouring mouth(s); hills are conceived as vessels containing subterranean waters, with caves as sacred entrances. But from the beginning of creation and the origination of life, human activity and destiny is intertwined with an unstable interplay of living cosmic forces, according to the Aztec cosmovision, and human coping had to take place through a variety of ritual forms, since nothing would grow, nothing would endure, if “our Mother, our Father, Lord of Earth and Sun” would not be nourished continuously by ritual and sacrifice.

1) Sacred Topography: From Mythic Origins to a New Center of the World

Narrative accounts from the Precolumbian Aztec tradition trace the history of the “*Mexica*” back into mythic beginnings. As in other mythic records, especially of culturally and linguistically related peoples of the Uto-Aztecan language-family, the creation(s) of human beings – or life, generally – took place in the subterranean bowels of Earth: the Mexica are said to have finally “surfaced” at, or through, “seven caves” (*Chicomoztoc*). Other sources speak about a primordial dwelling on an island called “*Aztlan*” (“White Place”, “Place of Dawn/Origin”), and from this mythic location, probably somewhere in northwestern Mexico, they started a long migration (ca. 200 years) southward in the eleventh/twelfth century. Roughly echoing the traceable history and dissemination of the *Nahuatl*-speaking Aztecs from North to South, these legendary wanderings led them via Coatepec (the mythic birthplace of the important tribal and warfare numen *Huitzilopochtli*, “Hummingbird of the Left” or “South”) and the ancient Toltec City of Tollan finally to Lake Texcoco (Tetzcoco) on the central plateau of Mexico, where they first dwelled near Chapultepec, and then in Tizapan. Upon *Huitzilopochtli*’s divine advice, the new and final residence Tenochtitlan (the center of today’s Mexico City) was established on a small island in Lake Texcoco during the fourteenth century. Within a very short time, this shaky Aztec settlement expanded into a gigantic metropolis absorbing Tlatelolco on the neighboring island, with allied

city-states on the shores, and manifested itself as the center of an impressive empire stretching already from coast to coast in the early sixteenth century.

Especially the culture-contact with the (remnants of the) Toltecs, generally admired as “the” grand culturegiving predecessors, had a major impact on the wandering Mexica, who would now look back on their former lifestyle as that of rough “Chichimecans,” of pure hunters and gatherers. Now, upon their arrival at Tenochtitlan, they applied the construction of *chinampas* (the famous “floating gardens”) for an abundant cultivation of crops on the muddy shores and lagoons, for example, and they adopted the Toltec sacred architecture in building huge pyramidshaped temples. The natural location of Tenochtitlan in the middle of a salty lake also proved strategically safe for the originally small bond of Mexica, especially since the island had fountains supplied with fresh water. But with the fast growth in size, water supply became a problem for the “Tenochca” (another name for the Mexica); accordingly, an impressive aqueduct from the springs of Chapultepec was constructed. On the other hand, dikes had to be built and foundation walls had to be raised, since Tenochtitlan and Tlatelolco had been subject to severe floods every now and then during the rainy season.

2) Cosmology, Divination, and Calendar

The communal life of the Tenochca, as well as the construction of their society, was deeply intertwined with religious and cosmological beliefs. Similar to other Amerindian and meso-American traditions, the Mexica believed that other worlds (“suns”) had existed before this “fifth sun.” Complex ritual strategies on all societal levels had to safeguard life in all its forms from the lurking dangers of chaos and destruction – dangers which, obviously, had already ruined the grand city-states of the past (Teotihuacan, Tollan). Therefore, one finds a strong notion of omnipresent peril, sometimes even pessimism, in Aztec poetry, and a strong sense that the life cycle of this sun and of the rich center of power and life in Tenochtitlan might also come to an end in the near future.

Therefore, divination, astrology and the general interpretation of “frightening omens” (*tetzauitl*) were important means to be warned of possible imminent perils. The famous “Book XII” of Sahagún’s *Historia General* gives an impressive account of such “bad omens” preceding the arrival of the Spanish conquistadors (cf. opening paragraphs of *Broken Spears*). Before the start of any important enterprise, one would consult the “counters of days” (*tonalpuhque*), special priests with sound knowledge of calendars and astrology. With reference to the vigesimal (based on the number 20) system of the *tonalpohualli* (“day count”) calendar, one had to be careful, for example, that the baptismal ritual of a newborn child would not fall into one of the “bad” days: the “sprinkling of the head with water” (*nequatequilitzli*) was postponed, accordingly, until a good combination of one of the 20 day-signs and numbers (1–13) was at hand.

Based on their astronomic tradition, the Aztecs knew the solar year of 365 days (*xihuitl*), but the logical combination of 20 day-signs and 13 numbers led to an artificial *tonalpohualli*-cycle of 260 days (perhaps an allusion to the human period of pregnancy?), which served basically as a divinatory tool as explained in the “Book of the Days.” The synthesis of both *xihuitl* and *tonalpohualli* resulted in 5 “superfluous, useless” (*nemontemi*) days per year – which were strongly associated with misfortune (18 portions of 20 days = 360; plus 5). Shifting 5 days per year, the start of every new year would move only between 4 (out of the 20) day-signs, resulting altogether in a logic period or “age” of 52 years (13 numbers \times 4 day-signs = 52), before another distinct 52-year “cycle” would commence. And at the end of every such “age,” it was always possible that this world might now arrive at its termination and annihilation: this was the fear during the final dark night after the last five *nemontemi* days of an age, when all the fires had been extinguished, and when new lifegiving fire had to be “drilled” on the chest of a sacrificed human with the trembling hope that the sun might eventually have enough power to rise again – for another age.

3) A Pantheon of Life-sustaining Forces and Divine Beings

Life is perceived as continuously endangered in the Aztec cosmos, but as a guidance for coping with the hassles, challenges and dangers of life and nature, the Mexica developed a differentiated, cumulative “way of life” or “religious tradition” (verbal nouns of “to live” and “to be,” like *nemilitztli* or *tlamanitiltztli*, are used to denote the normative tradition of “culture-religion-law”). And their huge pantheon of numina, divine powers or gods (*teotl*) indeed covers all aspects of cosmic forces and powers of nature with its polymorphic and often overlapping hierophanies. Some of the numina have a special, prominent status – like Huitzilopochtli and the important raingod Tlaloc, worshipped together on Tenochtitlan’s huge double-pyramid “Templo Mayor.” Others serve specific functions – like Yacatecutli, “Lord in front,” revered almost exclusively by the wandering merchants. In some cases, the highest source of life seems to transcend the polytheistic pantheon, and it can be addressed with singular or dual names: One striking name is *Ipalnemoa(ni)*, “(the one) through whom one is living” (Life Giver), or *Tloque Nauaque*, “omnipresent one.” In dual form, one can speak of *Ometecutli Omeciuatl* (“Lord and Lady of Duality”), denoting the ultimate ground of life and growth, as well as the great celestial source of the human “soul”: “We, being subject servants, from there our soul comes forth, when it alights, when the small ones are dropping down, their souls appear from there, Ometecutli sends them down” (Sahagun in Lanczkowski 1984: 39). Such a divine source can also be addressed as “old,” “true” or “sole God” (*icel teotl*), or as “Father and Mother” of all gods/numina: “Mother of Gods, Father of Gods, old God, inside Earth you dwell, surrounded by jewels, in blue

waters, between the clouds, and in the sea” (Lanczkowski 1984: 40). A binary aspect of the divine source of being and of natural sustenance is “Lord and Lady of our flesh” (*Tonacatecutli Tonacaciuatl*), bringing forth corn and all life-sustaining food.

Reflecting their prominent status in veneration, some of the more concrete personal numina in the polytheistic pantheon could also be addressed with such predications, be it the Trickster *Tezcatlipoca* (“smoky mirror”) the firegod *Xiuhtecutli* or the famous *Quetzalcoatl* (“feather serpent”). But it is also important to note that the “borders” of the Aztec numina are often permeable, as well as the borders between divine and human nature (i.e., between a god/numen [*teotl*] and its living human representative, the so-called “image” [*ixiptlatli*] or “god-carer” [*teopixqui*; generally translated as “priest”]). In many instances, the *ixiptlatli* is truly *identified* with the god/numen: he not only wears the attributes, but he actually “is” Huitzilopochtli, Tlaloc or Xipe Totec (etc.), he “is” the *numen praesens* – the actual earthly impersonation of god. This so-called “nagualism” (from azt. *nahualli*, “disguise”) implies a simultaneous existence of the human nature with the divine being, power, or person (as well as with certain mythologically important animals, like the jaguar). This becomes apparent in the mythic accounts of the Aztec wanderings under the leadership of the “first” *Huitzilo-pochtli*, where human and divine aspects obviously merge, or in the narrations around the famous (originally Toltec) numen and priest-king *Quetzalcoatl* of Tollan, who had a strong impact on Maya traditions as well. But in the case of captives who were to serve as human sacrifices, it is also reported that they did in fact represent the numen as “true” and “living god” until their ritual death. This becomes most evident in the case of the *Toxcatl*-ritual. In this ritual a captive served as living *ixiptlatli* for *Tezcatlipoca* for a full year. He was actually venerated and adored as “Lord” and living *Tezcatlipoca* during this time, but with the end of the year he was ritually killed and immediately replaced by a “new image” of god.

4) The Preservation of Nature Through Ritual and Sacrifice

Since the cosmic order is “shaky” according to the Aztec cosmovision, humans have to preserve and safeguard this cosmos and its life-sustaining forces by continuous ritual practice. An obvious, worldwide representation of the natural forces of life is blood, and this view is very dominant and consequential in the Aztec case. As in their paradigmatic myth, when the old gods had to sacrifice themselves in the darkness of Teotihuacan, when they had to shed their own blood in order to get the fifth sun moving, in the same way it is necessary for the Mexica to keep “sun” Tonatiuh moving by a repetitive and ceaseless supply with the so-called “precious liquid” (*chalchiatl*) of human blood. Likewise, several individual rituals of repentance or protection implied ritual woundings for the drawing of blood (e.g., in the ears). To be sure, blood sacrifice was not the only

form of ritual; the Aztecs also used flowers, burnt offerings, copal resin (incense), dance and music, but as the term *chalchiuatl* already implies, human blood was supposed to be the most “precious” and efficient life-sustaining offering. The extreme numbers of ritual deaths, handed down via Spanish sources appear definitely exaggerated, but there can be no doubt that human sacrifice was an important, significant and – at least in the beginning of the sixteenth century – quite abundant ritual method to keep the forces of nature alive. For example, a special ritual warfare, the so-called “flower war” (*xochiyaoiotl*) had to be institutionalized on contractual basis between the city-states of the Aztec empire, simply to meet the increasing demand for supply with captives for sacrifice.

As in other cultures, such human sacrifices seem to be dominant in cases of divine beings associated with the powers of fertility, sun, rain and vegetation.

The tribal god *Huitzilopochtli* clearly carries solar traits (apart from warfare), and his myth tells of a primordial sacrifice, when he killed his lunar sister *Coyolxauhqui* and smashed her at the bottom of “serpent hill” (*Coatepec*), a myth which had to be ritually performed and reactualized on *Huitzilopochtli*’s festival (excavations at the bottom of *Templo Mayor* uncovered a huge relief plate with her smashed body).

The distinct sun-god, however, was “Sun” *Tonatiuh*, often depicted with red face and body. Burnt offerings, flowers, and especially human sacrifices were used to keep “Sun” on course. *Tonatiuh* was supposed to dwell in the “house of the sun in the sky” (*ichan tonatiuh ilhuicac*), a paradisiacal place and a very attractive postmortal region. In Aztec faith, the form of afterlife was solely determined by the form of death, and not by any moral behavior. All warriors who died on the battlefield and all the ritually sacrificed ones would be allowed into this solar paradise – as well as all women who died during confinement, since they were looked upon as warriors “acting in the form of a woman.” They accompany the sun daily, and after some time they would be transformed into various beautiful birds or butterflies: like hummingbirds, they would be sucking the flowers in the sky and on the Earth.

Tlaloc is the second most important god of the Aztec pantheon, representing Earth’s fertility through water and rain. Accordingly, his nature – as well as that of his wife *Chalchihuitlicue* – was ambiguous, like the nature of water itself (fertilizing or flooding). As in the case of *Tonatiuh*, another distinct postmortal region was associated with this deity in the rain-cloudy hills (*tlalocan*): All people who died in floods or thunderstorms (e.g., by lightning), or in connection with festering wounds (i.e., liquid), would proceed into *Tlaloc*’s paradise with permanent summer and abundant vegetation.

A Song of Sorrow – *icnocuicatl*

We know it is true that we must perish, for we are mortal men.

You, Giver of Life, you have ordained it...

We wander here and there in our desolate poverty. We are mortal men.

We have seen bloodshed and pain, where once we saw beauty and valor. We are crushed to the ground, we lie in ruins in Mexico and Tlatelolco, where once we saw beauty and valor.

Have you grown weary of your servants, are you angry with your servants,

O Giver font-family:”Bookman Old Style”,”serif”;mso-hansi-font-family: Calibri;mso-hansi-theme-font:minor-latin;letter-spacing:-.6pt’> of Life?

5) Earth’s Vegetation, Plants and Flowers

Within the agricultural context of Aztec society, the different forms of vegetation – as well as their divine representations – had a prominent status in ritual. The god *Xipe Totec* (“Our Lord Flayer,” “Our Flayed Lord”), generically representing spring and vegetation, was mostly depicted wearing a flayed human skin – a lucid symbolic representation of Earth’s new “skin of vegetation” in spring, but also a clear hint to the ritual flaying of human victims related to this godhead. Such bloody rituals took place on the festival *Tlacaxipeualitzli* (“flaying of people”), where captives were skinned and their hearts were cut out, presented up to the sun in order to “nourish” the sun, while the living “images” or “impersonators” of Xipe Totec, called *Xipeme*, would walk around, wearing the skin of the flayed ones. Among the female deities, those of Earth, fertility, sexuality and destruction are the most important. There are Mother of Earth or “Mother of Gods” (*Teteo- innan*) deities, such as the old (Huastecan) Earth deity *Tlazolteotl* (“Eater of Filth”), associated with procreative powers and lust, and important in rituals for repenting adultery, fornication, etc., *Xochiquetzal*, representing love and desire, and associated with flowers and festivals, or *Coatlíque* (Huitzilopochtli’s mother), with devouring, destructive aspects. *Tlazolteotl* can also be depicted with a flayed human skin (like *Xipe Totec*), and her *ixiptlatli* was ritually flayed in the “thanksgiving” festival of autumn, where she – after meeting with the sun – gave birth to the corn god in a ritual drama.

Several major plants were personified by special numina. The culturally important maize (*cintli*), for example, had male and female divine representations, like “Corn God” *Cinteotl* (or *Centeotl*) and, among others, *Chicome Coatl* (“Seven Snake”), a prominent goddess and generic embodiment of edibles. Goddess *Mayauel* represented agave and, together with other specific pulquenumina, its fermented product, pulque (*octli*). But as a matter of fact, the Aztecs were very rigid in allowing access to alcohol, its abundant use being restricted to elder citizens. Apart from feathers (esp. of the beautiful Quetzal bird) or jade, flowers (*xochitl*) were of special aesthetic and metaphoric significance in the Aztec culture. Cultivated in rich abundance and serving as a common ritual donation, flowers were not only synonymous with “joy,” but also with “songs.” Hence, the flower theme appears in many lyrics (*Cantares Mexicanos*), especially in

the “flower song” (*xochi-cuicatl*) and “bereavement song” (*icno-cuicatl*) dealing with death, impermanence and the re-creation of life through music and dance.

6) Underworld, Death and Tenochtitlan’s Final Destruction According to Aztec cosmology, all the “normal” dead – even the great kings – had to go to Mictlan, a subterranean place of unattractive afterlife with dark and rather frightening features. The inevitable destiny of this “mysterious land,” or “land of no return,” inspired many songs:

No one is to live on earth . . . Will you go with me to the Place Unknown? Ah, I am not to carry off these flowers, singer that I am. Be pleased. You’re hearing my songs. Ah, singer that I am, I weep that the songs are not taken to His Home, the good flowers are not carried down to Mictlan, there, ah there, beyond the whirled ones (Cantares Mexicanos, cf. Bierhorst 1985: 225).

In several of these songs, the vulnerable nature of life on Earth and the inescapable character of death appear, combined with the sense of a deep remoteness of God:

We will depart! I, Neçahualcoyotl, say: “Be cheerful!” Do we truly “live” on earth? Not for all time on this earth, but only for a little while. There is jade, too, but it crushes, even gold breaks, ah, Quetzalfeathers crack. Not forever on this earth . . . What does Ipalnemoa [Life Giver] say? Not any more, in this moment, is he, God, on his mat. He is gone, and he left you behind as an orphan . . . (Cantares Mexicanos, cf. Bierhorst 1985: 185).

With the final destruction of Tenochtitlan/Tlatelolco by the Spanish in 1521, the Aztec empire and “cosmos” was literally coming to an end. Sahagún’s long-lost document on the interreligious “dialogues” (*colloquios*) between twelve Franciscan brothers and several Aztec nobles and priests in 1524 contains a moving paragraph where the Mexica, before entering into a bold response, are putting their own annihilation together with the recent “Death of God”:

What is it now, what should we say now? . . . Are we something? Only unimportant subjects we are, full of earth, full of excrements . . . We are perishable, mortal. Well then, let us die! Well then, let us perish

– even the gods have died as well! (Sahagun 1949: 101).

Back to the Land Movements

American “back to the land” movements and practices span the historical period of the mid-nineteenth century to the present, with notable peak periods occurring at the turn of the century, from the late 1920s through the Depression, after World War II (particularly in the late 1960s and early 1970s) and again in the mid-1990s. The significance of these activities (often too diverse and individualistic properly to be termed “movements”) is best understood, first, in terms of a broader history of the cultural construction of nature that bears briefly noting.

Intellectual History

The idea that a pastoral or wilderness setting can serve as a morally purifying force is an ancient one. In different historical, cultural and religious contexts, the retreat to nature (or wilderness, or “the land”) appears in different forms, is acted out in particular ways (usually through a self-conscious reduction of human needs and a simplification of daily life) and is often understood to be a means of both personal and cultural reform. From biblical texts to Virgil’s *Eclogues* and medieval theological writings, Western religious and philosophical concepts of nature, while ambivalent, have included attention to the natural world as the appropriate context for inner contemplation and, at times, for the creation or reformation of community.

The long-standing theme of nature as the site of spiritual retreat, as a proper place for personal, moral reformation, and as a context for the modeling of new forms of community (over against the social status quo) all reappear in the American context where, from the time of the first colonial settlements, “uncivilized” nature was simultaneously conceptualized as a demonic wilderness to be conquered, an unsullied garden of Eden to be enjoyed and a physical and spiritual testing ground where God’s “afflictions,” as well as God’s grace, could be directly experienced. While the Puritans sought to control nature more than to commune with it, their understandings of their divinely-ordained “errand into the wilderness” helped shape later American responses to nature, including the desire to leave settled environments and live “close to nature” as a form of spiritual challenge and renewal.

Beginnings

Henry David Thoreau can be said to be the first authentic “back-to-the-lander” in two senses. First, although his retreat to the woods was temporary, he was the first influential thinker and writer to advocate (and enact) a retreat to the woods as being *itself* a form of spiritual reformation. Prior to Thoreau’s experiment at Walden, American Christian thinkers had seen pastoral and wilderness settings as appropriate *contexts* for direct, personal experience of the divine presence (although the leaders of Christian institutions emphasized that private retreat into the woods should not replace the communal, public hearing of the Word in official church meeting-places). Thoreau was the first known writer, however, to make a post-Christian argument in favor of dwelling close to the land as an alternative to both the social and religious conventions of his day. In Thoreau’s reading (and experience) of nature, nature is no longer a setting or metaphor for Christian narratives of fall and redemption, but is *itself* interpreted as a means of personal and spiritual growth. Secondly, Thoreau’s retreat to Walden is historically a modern response to the growing threats of industrialization, urbanization and commercialism in the mid-nineteenth century. His own efforts were mirrored by other Transcendentalists and religious liberals of the time, whose communal experiments at Brook Farm (West Roxbury, Massachusetts) and Fruitlands (Harvard, Massachusetts) also praised the moral benefits of living in pastoral settings and engaging in manual, agricultural labor. Such cultural gestures of going “back” to the land or “out” into nature could not resonate meaningfully until American culture had “progressed” sufficiently to be seen as drifting away from its rural roots or, in those settings still primarily agricultural, falling prey to the growing mercantilism of the day. While retreat to nature for moral and spiritual reform has a long history, “back to the land” efforts are distinctly modern and are defined by the very modernity against which they pose themselves.

The Transcendentalist gestures of going “back to the land” – from Emerson’s largely “armchair” call for an original response to the universe to actual ventures such as Brook Farm and Thoreau’s two-year experiment at Walden

– established cultural precedents that have remained highly influential into the twenty-first century. From Thoreau’s time to the present, back to the land practices have carried forward several prominent themes that emerge from *Walden*. Among these are: the phenomenon of conversion to nature, resistance against materialism and consumerism, a vision of nature as being primarily beneficent and advocacy of a life lived close to nature as being crucial for human psychological and spiritual growth. More problematically, one also finds in Thoreau, a certain intellectual and social elitism that enables him to praise voluntary simplicity (because he has the means to embrace it) and to elucidate a range of meanings from nature that are shaped by the intellectual circles he frequented. Back to the land gestures of yesterday and today continue to have a social location that tends to be that of the more economically privileged classes or of the intellectual elite.

Religious Resonances

Among homesteaders from the nineteenth century to the present, recognizably Thoreauvian themes continue to circulate. The decision to go back to the land is often expressed as a post-Christian (or post-Jewish) conversion experience where a previously “meaningless” life in the city or suburbs (often including an unfulfilling religious upbringing) is dramatically left behind for a rural experience involving experiments with self-sufficiency, particularly in terms of food and shelter. Sometimes, as in the case of Wendell Berry (Christian) or Gary Snyder (Zen Buddhist), a religious identity remains important, but is understood or defined in consciously ecological terms.

In creating a new life, back-to-the-landers often understand nature as both the economic and spiritual focus of daily practice. Nature is understood to set the terms for the conduct of life and is given priority as a source of meaning and authority. While back-to-the-landers (or “homesteaders” as they often call themselves) rely on nature as a resource for daily needs – and thus occupy a different cultural space than wilderness preservationists – they tend to pursue means of interacting with nature that have a minimum impact. Many garden organically, some use only hand-tools and materials found on-site, while others take advantage of developments in solar and wind power in order to live “off the grid.” In many homesteaders’ writings (and many homesteaders, like Thoreau, are also writers), attention is paid to the symbolic dimensions of daily labor in nature. Work such as splitting wood or carrying water is valued as a kind of ritual practice, voluntarily pursued for the sake of the personal transformation and the “lessons” (about nature and the self) to be learned. These ways of living also resonate symbolically as a response against the outside culture that has been left behind and is seen as comparatively corrupting and empty of spiritual significance.

Caveats

Some distinctions should be made between back to the land practices where “getting close to nature” is the primary impetus and related rurally located movements. Some Christians also call themselves back-to-the-landers, for instance, and constitute a growing population of partially self-sufficient families that grow their own food and home-school their children. While a reverence for nature – as God’s creation – is often part of daily life, however, the impulse behind Christian efforts at self-sufficiency is the desire for a retreat from the influences of a secular, non-Christian society. While homesteaders share some interesting points of agreement with self-sufficient Christian families (such as a desire for simplicity, an affection for country life and a critique of American materialism) homesteaders’ pursuit of a life lived close to nature recognizes nature *itself* as the primary source of meaning.

Similarly, in both the nineteenth and twentieth centuries, going “back” or “out” to the land has been a persistent aspect of a wide variety of communal experiments.

From the Oneida community in New York and the first Mormon settlements of the reimagined Holy Land of Salt Lake City, Utah in the nineteenth century, to counter-cultural intentional communities such as The Farm and Twin Oaks in the 1960s and 70s, communal experiments have praised country living, adopted self-sufficient agricultural practices, expressed the importance of a commitment to a particular geographical place and have advocated simplicity in diet, dress and social life. Here again, however, these efforts often celebrate rural life as a *context* or *resource* for other kinds of social, religious, or political experiments, rather than pursuing living close to nature itself as a primary goal. Overlap in the goals and practices of various experiments in rural self-sufficiency make the boundaries of “back-to-the-land” practices and movements somewhat blurred, but “back to the land” efforts should not be seen as synonymous with every rural communal or family-based self-sufficiency experiment.

Historical and Sociological Dimensions

The number of contemporary North America back-to-the-landers is difficult to determine, though one estimate suggests close to a million actual practitioners (and as many as fifty million expressing interest in “simpler lifestyles”). More importantly, perhaps, homesteading experiments have had a long history of promotion by intellectuals and cultural reformers who have had a significant impact on American thought, even if they have not produced the hoped for grand transformation of culture.

John Burroughs (1837–1921), who is best known as a bird enthusiast, amateur naturalist and nature essayist, was among the first modern homesteaders who (unlike Thoreau) made a *permanent* shift from an urban, literary life in Washington D.C. to a rural farming life in West Park, New York. Having built his own house on the Hudson and established a grape farm, he later (1896) built a more rustic retreat known as “Slabsides,” in which he practiced the arts of plain living, cooking over an open fire, drawing water from a spring, taking daily outdoor rambles and writing of the virtues of his experiences. At a time of rising industrialism and urbanization, Burroughs’ essays, particularly his praise of the simple life in “What Life Means to Me” helped to draw thousands of visitors to his cabin, seeking a taste of the back-to-the-land experience. Burroughs’ views of nature were scientifically informed (he embraced the theories of Darwin), yet he feared that science would render nature absent of meaning and argued for a “Gospel of Nature” in which nature would be seen a vital, mysterious, beneficent force that could redeem humanity and set the terms for a virtuous life. At times, Burroughs argued that God and Nature were virtually equivalent, while in other, more Emersonian modes, he saw Nature as a book to be read, with divine “lessons” lying behind nature’s physical surface. In either approach, however, he sought to divest God of any supernatural significance, while investing nature itself with a divine, moral and mystical sensibility.

A different kind of back to the land ethic was preached at the turn of the century by Bolton Hall (1854–1938), a prominent lawyer and a follower of the Single Tax program of Henry George, which sought to make land accessible to rich and poor alike. Son of the prominent, Fifth Avenue, Presbyterian minister, John Hall, Bolton Hall mixed progressive Christian thinking with other social and religious movements (including Eastern traditions). While Hall put his religious training to use by authoring liberalized versions of the Shorter Catechism, the Bible and Jesus’ parables, he simultaneously advocated a liberal, rational, pluralist version of Christian social reform that centered on making land available to all for self-sufficient gardening. For the poor, access to the land would be the first step in economic self-improvement, while daily contact in nature would physically and spiritually purify those harmed by city living. For the well-off, the prospect of “a little land and a living” was less an economic necessity, but more a means of renewing the self and escaping the materialism, greed and pace of the city. In Hall’s view, living “naturally” was a crucial antidote to the evils of urbanism. While his particular version of back to the land – articulated in books such as *Three Acres and Liberty* (1907) and *A Little Land and a Living* (1908) – was intended to be not far from the city, Hall’s Vacant Lot Associations and related programs locate themselves on a continuum of back to the land projects that saw self-sufficiency as both an economic solution to class inequity and a psycho-spiritual solution to urban anomie.

A generation after Hall (and with family connections to Hall and his work), the marketing executive Ralph Borsodi (1888–1977) took Hall’s vision a step further in 1920 when he left New York City to establish a seven-acre homestead in Suffern, New York. Like Hall, Borsodi was concerned with the problem of distribution, as well as the physical and psychological health hazards of the city. Drawn to the model cottage industry as a way for rich and poor alike to live healthfully and rurally, Borsodi used his own homesteads and home-based schools as laboratories for self-sufficiency. While praising the spiritual virtues of living off the land, however, Borsodi also embraced technology more than some of his predecessors and heirs. His vision was to use labor-saving devices as tools in the service of homestead efficiency, while other back-to-the-landers shunned technology as interfering with their projects of “getting close to nature.” Borsodi’s experiments were reported in his *Flight From the City* (1933) and his ideas were popularized in Depression Era, federally sponsored homestead resettlement projects, though most of these eventually faltered on political grounds. Together with his protégé, Mildred Loomis, Borsodi founded The School for Living which had several iterations in various locations and now remains in operation at the Heathcote intentional community in Maryland. Mildred Loomis carried on the School for Living projects and became known in the seventies as the “grandmother” of countercultural back to the land projects.

In the same period as Borsodi’s retreat to Suffern, the prominent screenwriter and novelist Louis Bromfield purchased a farm in Ohio in order to fulfill nostalgic longing for a simple, rural life of a kind he had earlier experienced in France. While more

conservative politically than Hall and Borsodi, and working more clearly in the tradition of the gentleman farmer than the self-sufficient retreatant, Bromfield radicalized the agricultural norms of his day by insisting on organic practices and articulating an ethic of “nature knows best.” Like Burroughs, Hall, Borsodi and others, Bromfield articulated a kind of theology of the soil, wherein he conceptualized agricultural work as a more authentic means (when compared to Christian doctrine and practice) of experiencing immortality. Bromfield often spoke of the “religion of the good farmer” who, by virtue of labor in the soil, exhibits the greatest faith in the “Grand Plan.”

Perhaps the most widely known back-to-the-landers are Helen (1903–1995) and Scott (1888–1988) Nearing, prominent vegetarians and socialists who left New York City for Pikes Falls, Vermont in 1932 and later launched a new homesteading project in Harborside, Maine in 1952. The Nearings began their projects without much fanfare, although Scott had once been an economics professor and a lecturer of national prominence, while Helen was familiar in vegetarian, artistic and Theosophical circles. With the publication of their *Maple Sugar Book* (1950), *Living the Good Life* (1954) and, especially, the republication of *Living the Good Life* in 1970, the Nearings became widely known as advocates for “sane living in an insane world.”

Like Burroughs in his time, the Nearings became representative symbols for the spiritual benefits of living close to nature and away from a materialist society. Helen’s Theosophical background (which included a belief in reincarnation and a reverence for the sacred in nature) and Scott’s early Social Gospel convictions (including, like Hall and Borsodi, a concern for social inequity and an interest in Georgist principles) together shaped their back to the land experiments which centered on organic gardening, strict vegetarianism, pacifism, anti-materialism and a staunch work ethic.

Countercultural youth flocked to the Nearings in the sixties and seventies and adapted some of their principles while resisting others. While some back-to-the-land efforts in this period were short-lived or part of broader communal experiments, a core group of “baby-boomer” back-to-the-landers have continued to live rurally and practice relative self-sufficiency through growing their own food and producing local crafts.

From the 1990s to the present, a renewed interest in homesteading has sprung to life, coming in large part out of explicitly environmental concerns and in conversation with broader cultural movements such as efforts in voluntary simplicity. The Nearings’ homestead, now a non-profit organization, The Good Life Center, draws thousands of visitors each year. Publishing ventures such as *The Mother Earth News*, *Countryside*, and, more recently, Chelsea Green Publishers continue to meet a demand for both philosophical and “how-to” aspects of back to the land experiments. Similarly, contemporary writers in the back to the land tradition (such as Wendell Berry, Gary Snyder, Anne LaBastille and Gene Logsdon) continue to attract an enthusiastic audience.

Throughout over a hundred and fifty years of back to the land efforts, hundreds of personal testimonies have been documented in first-person essays and narratives, with many more experiments virtually unreported and unknown. Even those who were prominent in their time have often been overlooked, the result being that “back to the

land” has been associated primarily with countercultural interest in “communing with nature.” The larger story of back to the land movements, however, shows the persistence of this cultural practice in the face of the rise of industrialism and the market in the nineteenth century, and consumerism, ecological degradation and continued social inequity in more recent periods. While individual back to the land practices vary according to the rigor of self-sufficiency pursued, the extent of rural life, the embrace of technology, the practice (or not) of vegetarianism and so on, a reading of nature as an alternative source for spiritual growth and satisfaction is remarkably consistent. Nature is regularly seen as a beneficent force, a source of personal inspiration and as a moral guide for responsible, daily living in the modern world.

Bahá'í Faith

The Bahá'í faith began as a reform movement in nineteenth-century Islam, but quickly became an independent religion. It has a background in esoteric Shi'ite Islam, especially the Shaykhi school and the messianic Babi movement that roiled mid-nineteenth-century Iran. The Bahá'í faith favors peaceful approaches to resolving social problems and adopts a progressive attitude to modernity. Its founder, Mirza Husayn 'Ali Nuri (1817–1892), known as Bahá'u'lláh (“the Glory of God”), taught the unity of the great religions, the oneness of God, the unity of humankind, greater equality between the sexes, avoidance of virulent nationalism, and the need for global institutions and a world-embracing outlook in the modern world. Despite Bahá'u'lláh's generally favorable view of modernity and technology, he critiqued nineteenth-century European civilization for going too far in its militarization of society and its urbanization. There is a biographical element in his thinking about greenery, since he was an aristocrat whose family possessed extensive estates in the lush Mazandaran province of Iran south of the Caspian Sea, where they vacationed away from their mansion in bustling Tehran. In 1868 Bahá'u'lláh was exiled by the Ottomans for what were seen as his heresies to the pestilential little port city of Akka on the Levantine coast, and he complained of its dusty, desolate aspect. “Bahá'u'lláh loved the beauty and verdure of the country,” his son reported. “One day [in circa 1877] he passed the remark: ‘I have not gazed on verdure for nine years. The country is the world of the soul, the city is the world of bodies’ ” (Esslemont 1980: 35). Thereafter he bought a mansion outside Akka that had greenery and a garden. The prophetfounder of the Bahá'í faith saw nature as theophanic. He wrote,

Nature in its essence is the embodiment of My Name, the Maker, the Creator. Its manifestations are diversified by varying causes, and in this diversity there are signs for men of discernment. Nature is God's Will and is its expression in and through the contingent world (Bahá'u'lláh 1988: 142).

He also laid stress on showing kindness to animals, and placed restrictions on hunting to excess. Bahá'u'lláh was by no means a Luddite, approving of much in modern science, including medicine, but he was appalled by the urban poverty he saw in Istanbul. He wrote,

If carried to excess, civilization will prove as prolific a source of evil as it had been of goodness when kept within the restraints of moderation . . . The day is approaching when its flame will devour the cities (Bahá'u'lláh 1976: 342–3).

He also denounced the “infernal” war engines of the late nineteenth century and warned, “Strange and astonishing things exist in the Earth but they are hidden from the

minds and the understanding of men. These things are capable of changing the whole atmosphere of the Earth and their contamination would prove lethal” (Bahá’u’lláh 1988: 69).

Bahá’u’lláh’s successor as leader of the religion, his eldest son ‘Abdu’l-Bahá (1844–1921), was a product of late nineteenth and early twentieth-century modernity. He laid less stress on nature as the sign of an inscrutable God, and was more prone to speaking of it as governed by laws and as an object that human intelligence and science could master and shape. He contrasted “nature,” which he saw as wild and unruly, with human cultivation of it, which bestows order and harmony. He unreservedly approved of technological advances that allow human beings to master nature.

The third leader of the religion, ‘Abdu’l-Bahá’s grandson Shoghi Effendi Rabbani (1897–1957), began his ministry in 1921 after studies at the American University in Beirut and Oxford. In a letter of the early 1950s to the New Earth Luncheon in London, he spoke of the need for protection of the physical world and of the heritage of future generations, and approved of the work of organizations such as Men of the Trees, which among other things fought desertification in Africa, as “essentially humanitarian.” The British environmentalist, Richard St. Barbe Baker (1889–1982), who had founded Men of the Trees, became a Bahá’í in 1924 and worked for both movements.

From 1963 the head of the Bahá’í faith has been an elected body, the Universal House of Justice. It has praised environmentalism but in evangelical style has stressed that the Bahá’í principle of unity is essential to accomplishing environmental goals. It wrote in 1981 that

Until such time as the nations of the world understand and follow the admonitions of Bahá’u’lláh to whole-heartedly work together in looking after the best interests of all humankind, and unite in the search for ways and means to meet the many environmental problems besetting our planet, the House of Justice feels that little progress will be made towards their solution (Research Department 1989: 14–15).

The Bahá’í International Community, the religion’s nongovernmental organization observer at the United Nations, wrote that the maturation of humankind “will ensure the creation of binding legislation that will protect both the environment and the development needs of all peoples” (Bahá’í International Community 1995: n.p.). Prominent Bahá’í biologist Arthur Dahl has been active in

U.N. environmental forums (Dahl 1990).

Despite these occasional mentions, and despite the devotion of some individuals such as Baker and Dahl, environmentalism is not a principle that the Bahá’í organization especially foregrounds. The Bahá’í authorities in Haifa have been criticized for their extensive building works on Mt. Carmel by Israeli environmentalists who worry about their effect on the Bay of Haifa. On the popular level, environmentalism and apocalypticism are interlinked, since some Bahá’ís expect “cities” to “evaporate” in a supernatural or environmental disaster. Neal Chase, a sectarian Bahá’í “under the Provisions of the Covenant,” predicted ecological and urban catastrophe on a number of occasions in the 1990s.

Bahá'í Faith and the United Nations

The Bahá'í Faith has a long-standing relationship with the United Nations, including support of international efforts for the protection of the environment. Since the Bahá'í teachings for world unity and peace, based on the writings of Bahá'u'lláh (1817–1892), include principles of collective security to be implemented by a federated world government with executive, legislative and judicial branches, Bahá'ís have long supported efforts to establish international organizations. 'Abdu'l-Bahá (1844–1921), the son of Bahá'u'lláh and leader of the Bahá'í Faith after his passing, wrote an encouraging letter on Universal Peace to the Central Organization for a Durable Peace in The Hague in 1919. An International Bahá'í Bureau was established in Geneva in 1925. A petition concerning the seizure of Bahá'í property in Iraq was taken to the Permanent Mandates Commission of the League of Nations in 1929 and its decision in favor of the Bahá'ís was adopted by the Council of the League of Nations.

Bahá'ís were present at the founding of the United Nations in San Francisco in 1945, an event that confirmed a prediction in 1912 by 'Abdu'l-Bahá that the first flag of universal peace would be raised in that state. Individual Bahá'ís and Bahá'í communities around the world have been active supporters of events such as United Nations Day and Human Rights Day, often collaborating with local UN offices and other organizations.

The formal relationship of the Bahá'í International Community (BIC) and the United Nations began with its accreditation to the UN Office of Public Information in 1948, after a national Bahá'í organization was accredited the previous year. Consultative Status to the United Nations Economic and Social Council (ECOSOC) was granted in 1970, and accreditation to UNICEF in 1976. The Bahá'í International Community maintains offices in New York and Geneva to oversee its relations with international organizations. An affiliation with the United Nations Environment Programme (UNEP) began in 1974, with the BIC participating regularly as an observer in UNEP Governing Council sessions starting with the first session in 1973. Formal representation with the United Nations Centre for Human Settlements was established in 1985.

As the United Nations increased its involvement with non-governmental organizations, Bahá'í activities at the UN have grown accordingly. The BIC has been active in, and on occasions has chaired, the Committee of Nongovernmental Organizations (CONGO) in New York. With the frequent persecutions to which Bahá'ís have been subjected in Iran and other countries, the Bahá'ís have been particularly interested

in the work of the UN to protect human rights, and active with the Commission on Human Rights, which has passed numerous recommendations concerning the rights of Bahá'ís to practice their religion.

The environment has been another area of interest at the UN. The Bahá'í teachings contain many references to nature as a reflection of divine attributes, and to ecological principles of interconnectedness and reciprocity. Preservation of the ecological balance of the Earth is a major priority for global cooperation. Bahá'í International Community delegations therefore participated actively in the UN Conference on the Human Environment (Stockholm, 1972) and its NGO Environment Forum, as well as the World Population Conference (Bucharest, 1974), the World Food Conference (Rome, 1974), and the Conference on Human Settlements (Vancouver, 1976). Active involvement with the UN in the economic and social areas has continued across a wide variety of issues from narcotic drugs and crime prevention through youth and women to the law of the sea, and numerous statements and reports have been presented to the UN as contributions to its consultative processes. With the major round of UN conferences in the 1990s, Bahá'í participation grew accordingly, and the BIC established an Office of the Environment for this purpose. Both the Bahá'í International Community and various national communities were active in the preparatory process and at the UN Conference on Environment and Development (Rio de Janeiro, 1992), with the BIC as one of 13 NGOs selected to present a statement at the

Earth Summit itself. A large delegation also participated in the World Social Summit (Copenhagen, 1995). At the World Summit on Sustainable Development (Johannesburg, 2002), the BIC again sent an active delegation and distributed a statement. In addition, two Bahá'í-inspired organizations, the International Environment Forum and the European Bahá'í Business Forum were also accredited to the Summit and organized various parallel activities. The International Environment Forum, a professional organization founded in 1996 with members in over 40 countries, organized seminars on Indicators of Sustainability (as part of the Science and Technology Forum), Education and Values for Sustainable Development, Integrating Science in Local Communities, and Multiple Dimensions of Globalization.

The Bahá'í International Community has issued many statements for UN conferences and on other occasions giving the Bahá'í perspective on topics relevant to the UN. These are widely appreciated for the substantive contributions they make to international debate. Some of the most significant concerning the environment and sustainable development are “A Bahá'í Perspective on Nature and the Environment” (1986), “The Bahá'í Statement on Nature” (1987), “Environment and Development” (1990), “The Prosperity of Humankind” (1995), “Valuing Spirituality in Development” (1998), “Sustainable Development: The Spiritual Dimension” (2001) and “Religion and the United Nations: Convergence or Divergence?” (2002). Two have been specifically concerned with needed reforms in the United Nations itself (“Proposals for Charter Revision,” 1955, and “Turning Point for All Nations,” 1995). The international governing body of

the Bahá'í Faith also issued a declaration to the peoples of the world on “The Promise of World Peace” in 1985.

The Bahá'ís have long tried to demonstrate the positive contribution that religion can make to the work of the United Nations. They participated in the Summit of Spiritual Leaders at the UN held as part of the Millennium Summit in 2000. The Bahá'í statement to the World Summit on Sustainable Development (2002) specifically calls on the UN to stop ignoring the religions in its work, both because of the positive contribution they can make to sustainable development, and because religious fanaticism is a major threat to world peace. It proposes that the UN create a formal consultative structure similar to that for indigenous peoples, to which all religions that renounce fanaticism would be invited.

Bahuguna, Sunderlal (1927–)

Sunderlal Bahuguna is one of the best-known leaders of the Chipko Movement of Northern India, a peasant movement for the protection of local forest resources from outside contractors. For his articulation of environmental values he is recognized as India's first guru of environmental consciousness. In recent years he has been associated with the protest against the construction of the Tehri Dam, in the Indian State of Uttar Pradesh.

In early 1973, in the Chamoli district of Uttar Pradesh, an organization concerned with local employment made a request to the state forest department for an allotment of ash trees for the production of agricultural implements. The forest department denied their request but permitted an outside contractor to fell a nearby forest to produce sporting goods for the export market. The local people resolved to hug the trees in order to stand in the way of the axe intended to cut them down. Here, the movement known as Chipko (meaning "to hug") was born. Sunderlal Bahuguna underlined the moral foundation of this movement with foot marches, fasts, and discourses on the religious significance of the forests. He argues that his ecological vision of a harmonious relationship with nature is rooted in the soil of Indian religion, in which mountains, rivers and trees are the objects of worship. In 1981, accompanied by a small group of followers, Bahuguna undertook a *padyathra* (or foot march) of 4870 kilometers through the foothills of the Himalayas. Reminding the people of an understanding of nature embedded in their religious heritage, he shared the Chipko story at every stop and raised awareness of the exploitation to which their forests and their own lives were being exposed.

During his involvement with the Chipko movement, Bahuguna was repeatedly arrested and jailed. His nonviolent strategies (*satyagraha*) reflect the influence of Mahatma Gandhi. Born in 1927, Bahuguna was imprisoned at age 17 for his involvement in India's freedom struggle. After independence he became general secretary of the local unit of the congress party. Eight years later, he doubted whether party politics could bring about the social changes needed for the well-being of the hill people. While organizing adult education for untouchables and protests against the sale of liquor, he came to know Sarla Behn, one of Gandhi's two European disciples. She introduced him to her co-worker Vimla Nautiyal, who later agreed to her marriage to Bahuguna on the condition that he renounce political life.

After their marriage in 1956 they settled in the village of Silyara, where Bahuguna saw the wealth of the forests in the form of timber logs being carried to the plains. He began organizing labor cooperatives to prevent loss of local income to outside contrac-

tors. In 1977, with the visit of Richard St. Barbe Baker, Bahuguna came to recognize the global dimensions of the loss of forest resources, and that labor cooperatives would not in themselves prevent the destruction of forest wealth. In May 1978, he took a pledge to devote himself to the protection of the Himalayan environment in all aspects. In August of 1981, he arrived at the UN World Energy Conference in Nairobi with a load of firewood on his back to draw attention to the precarious state of the world's forest cover.

There has been no cause with which Bahuguna has been more identified than the struggle against the Tehri Dam, a hydro-electric power project located in a seismically active region of the Himalayan foothills. If completed, it will displace about 100,000 people from land they have worked productively for many generations. For Bahuguna, the project is a desecration of the Himalayan environment. He states that when the Ganges flows in her natural course she benefits all, irrespective of caste, creed, color, poverty or wealth. When she is dammed, she loses her social character.

Bahuguna has led acts of nonviolent protest that have sometimes halted construction on the dam. Best known are fasts of up to 74 days. He insists that a fast is not a hunger strike. Its motivation must not be anger or manipulation but only devotion to God. Arguing that we have identified progress with affluence for the few, he states that his duty is to warn that this promise stands on a mistaken view of reality. With a review of the project still pending, Bahuguna now lives in deliberate *satyagraha* in a small *kuti*, or hut, on the banks of the Bhagirathi River, not one hundred yards from the site of the proposed dam. If the waters rise, Bahuguna's *kuti* will be the first human dwelling to be submerged.

Baltic Indigenous Religions

The indigenous nature-oriented religion of the Baltic peoples – the Latgalian, Latvian and Lithuanian, as well as the extinct Old Prussians and Yotvingians – survives today partially under Christian auspices. In the Baltic worldview, people, animals, plants and life are interconnected. Humans are not separate from nature. Spirit or divinity dwells in everything. The belief in *darna* (Latvian *saskan*, *a*) seeks life in harmony with oneself, society, and nature. Following a historical overview, this entry tracks current beliefs and practices, some of which received a Christian veneer while others continue as ethnic customs: the deities, reverence for nature, and the holidays. Lithuanian names are used, except as indicated.

The record of the Baltic Old Religion before the introduction of Christianity is fragmented and incomplete due to the lack of internal historical documents. Information that is available comes from archeological records and foreign chronicles, the latter of which are often prone to superficial knowledge, misunderstandings, and misinterpretations. The Balts practiced two recorded variants of an animistic pantheistic religion. The peasantry focused on the Earth, farming, hunting/fishing, and the cycles of nature, while the knights, nobility, and royalty centered on the sky, hunting, and on martial powers. The peasant oral traditions preserved *dainas* (songs and hymns), myths, and traditions. Old Prussia and Lithuania both had medieval kingdoms that officially professed their pagan traditions.

Christianity was introduced and officially adopted on a different time-line in each part of the Baltic region, from as early as the tenth century to as late as the fourteenth century. Compared to the rest of Europe, this happened very late: Lithuania was, in fact, the last European country to accept Christianity. Proclamation of Christianity as the state religion did not include the conversion of the peasant population. In Lithuania, Latvia and Prussia, the popular form of Baltic religion survived until the sixteenth century when Reformation and Counter-Reformation missionaries began to proselytize the peasantry.

This belated development allowed many popular religious traditions to survive until near-recent times. The peasant religion gradually contracted, losing its public communal character in favor of a narrower family focus. The churches occasionally campaigned against and even persecuted “Pagan” practices. In the eighteenth century, many sacred groves in Latvia were felled and the last oak shrine in the Lithuanian capital Vilnius was closed. At the same time, reliable internal and external records of the Old Religion were produced and grew in number as time progressed.

Various autochthonic beliefs and practices were incorporated into Christian traditions in the eighteenth to nineteenth centuries while others survive to this day as folkloric or cultural traditions. The proliferation of parishes and churches in the nineteenth century (they more than doubled, disproportionate to population growth) indicates that the peasantry accepted Christianity in this era, without abandoning pre-Christian practices. The national awakening movements of the late nineteenth century revived and propagated the then extant elements of the Old Religion which have, as a result, endured to the present. In the twentieth century, the Latvian Dievturi, Lithuanian Romuva, and Baltic Byelorussian (Yotvingian) Krywya established themselves to profess Baltic religion. Latvia officially recognizes Dievturi as a traditional Latvian religion.

The Christian Godhead assumed and retains many attributes of the Baltic heavenly god Dievas (Latvian Dievs, Prussian Deywis), whose name he also borrowed. He raises magnificent twin white steeds and grows rye. He has created many features and inhabitants of the Earth. He is readily invoked directly, without an intercessor, in contrast to Christian practice.

The weather and justice god Perkūnas (Latvian Pērkons, Prussian Percunis) lives in the clouds between the heavens and the Earth. Throwing his ax causes thunder and lightning. Anything struck by lightning as well as natural stone bullets and axes are sacred amulets. Large hills and oak trees are revered as sacred to Perkūnas and many geographic phenomena bear his name. Under Christianity, his characteristics transferred to the prophet Elias and St. George, yet he also retained a popular independent stature as well. People still pray to him for good weather. His wooden statues are very popular and are sometimes blessed by Christian clergy.

The golden solar Divine Mother goddess Saulē (Latvian Saule, Prussian Saûlê) bears light and life. The moon, the planets, and the stars live in her home. Out of respect for her rising and setting, work stops at dawn and dusk. Saulē rides in a carriage pulled by the twin steeds of Dievas in summer, a sleigh pulled by nine-horned reindeer in winter, and sails by boat at night. Folk art is resplendent with solar imagery and Saulē is celebrated at the Solstices. Under Catholicism and Orthodoxy, Saulē' s characteristics merged with the Christian Mother of God.

The silver lunar god Mēnulis (Latvian Mēness, Prussian Mêniks) protects orphans, the oppressed, and the dead that travel the Milky Way. He rides his own white steed. The rising moon, especially the new moon, is respectfully greeted. The lunar calendar determines many agrarian, fertility, and social practices. Mēnulis and Saulē were once married, but Perkūnas divorced them because of Mēnulis' infidelities with the morning star. Saulē protects their daughter the Earth by day, and Mēnulis by night. In folk art, Mēnulis always accompanies Saulē. Under Catholicism, Mēnulis coalesced with the Lithuanian Catholic patron St. Casimir.

The Mother Earth goddess Z̄emyna (Latvian Zemes

Māte) was the main deity of the Baltic peasants. The Earth bears humans, nourishes them, and embraces them at death. The word for "human" literally means "earth-

ling” in several Baltic languages. Morning and evening devotions still include praying to and kissing the Earth, which – even under Christianity – is popularly believed to forgive sins. The Roman Catholic Pope John Paul II, who has a Lithuanian grandmother, kisses the ground whenever he disembarks from a plane. Farms are blessed in the name of the Earth and offerings of bread and harvest fruits are made to her, also under Christianity. No one may hit the Earth or spit on her. Large hills and boulders are especially revered, serving as pilgrimage destinations, and have sacred names. Megalithic ritual circles are scattered throughout the Baltic. Closely related to the Earth, the protective hemp and linen god *Vaiz̄gantas* transformed into the Lithuanian *Rūpintojēlis*, the worrying Christ, after the conversion to Christianity.

The Latvian *Jumis* represents naturally occurring twins, such as double grains, fruits, nuts, etc. He and the Lithuanian *Rugys* (Prussian *Rugis*) propagate fertility, living outdoors in the summer and in the granary in winter. Both appear as an old linen-clad man carrying a bushel of grain ears, wearing yellow or golden boots and a crown.

Laima (Latvian *Laima*) is the human Divine Mother goddess. Her tree is the linden. In cultural traditions, she accompanies human life from birth to death, and is invoked at name-givings, weddings, and funerals. *Laima* sometimes has a single sister, the fate goddess *Dalia* (Latvian *Dēkla*), and a second sister, the death goddess *Giltinē* (Latvian *Kārta*). *Laima* has a Latvian and Latgalian bovine counterpart, the cow and milk goddess *Māra*.

The fire, hearth, and home goddess is *Gabija* (Prussian *Panike*) and her fire altar is the *aukuras* (Latvian *ziedoklis*). Fire rituals are a national rite and the flaming *aukuras*, with or without attendants in folk costume making offerings, is a national symbol for both Latvians and Lithuanians. In the countryside, hearth fires are put to bed at night, woken in the morning, prayed to, and fed at every meal time. Fire is reverently handled; mistreating fire is considered a sin even under Christianity. Traditional name-giving, wedding, funeral, house-blessing, and other ceremonies still involve hearth-fire rituals. Folk and modern art frequently depict *Gabija*, fire symbols, and the *aukuras*. Under Catholicism, *Gabija* merged with St. Agatha, also known as St. *Gabija*.

The chthonic god *Velnias* (Latvian *Velns*, Prussian *Pickuls*) propagates agricultural fertility and animal husbandry, as well as raises wild animals. His element is water, his tree is the evergreen fir, he lives in low-lying wetlands, and many places are named after him. Due to his Shamanic origins, *Velnias* is part-human and part-animal and can transform into many animals. He participates in the creation of the world and interferes in the creativity of *Dievas*. He constantly struggles with *Perkūnas*, defending himself with large boulders that are scattered throughout the Baltic. He is a very popular character in folklore and art. Christianity unsuccessfully tried to conflate *Velnias* with its own Satan.

Velnias and *Perkūnas* control earthly and heavenly waters, respectively. Water is holy, and many springs, rivers, and lakes have sacred names. Groves bordering such bodies of water are also hallowed. Bodies of water may not be polluted. Deep, large

lakes are gateways to other worlds. Amber comes from a destroyed castle in the Baltic Sea. Rainwater collected from boulders is currently used for blessings as natural holy water, even under Christianity. Springs with healing abilities are pilgrimage destinations. The Aglona church in Latvia, with its miraculous Mother of God icon, is built at such a spring in a Latgalian sacred pine forest.

The human being has three parts: the body that returns to Earth, the life-force that returns to life, and the spirit or *ve'le'* (Latvian *velis*). Unembalmed corpses in wooden caskets and cremated remains in clay urns are buried directly in the Earth, typically in forests and atop hills. The goal is to enable the body to return to nature as quickly as possible. Life continues for the *ve'le'* in this world. The living pray to *ve'le's* and converse with them, even under Christianity. The Baltic version of Catholic purgatory has been conflated with Baltic beliefs about wandering *ve'le's*. A *ve'le'* can migrate into a tree or another plant, an animal, a bird, or wander around lost. Brothers become oaks, fathers poplars, grandmothers linden, and women birches. Trees that grow on graves bleed instead of ooze sap when cut. The *ve'le'* eventually travels to Dausos (Latvian Aizsaule, literally beyond the sun), which is on a high hill beyond seven fields, forests, and lakes. Dausos has become the Baltic form of Christian heaven.

Trees and plants are living beings that feel pain just like people and animals. Forests were dedicated to deities. Trees are still worshipped, and wooden shrines – now with Christian statues – are placed in trees. Traditional homes are wood cottages. Sacred trees (oak, linden, ash, fir, pine, rowan, juniper, absinth, and elder) have specific ritual as well as secular uses, in addition to prohibitions. The poplar is the world tree, uniting the underworld with the Earth and the sky, the dead with the living and generations to come, and the past, present and future. Lithuanian multi-tiered totems of the world tree called *koplytstulpis* dot the countryside. These were Christianized with the addition of Christian symbols and statues.

Snakes represent the endless renewal of life. The Lithuanian word *gyvate'* means poisonous snake, life, vitality, and vital capacity. The Latvian black snake goddess Melna C~ u~ ska lays the cosmic egg. Her male counterpart is the grass-snake god Z~ altys (Latvian Zalktis). The Vilnius Perku~ nas temple kept grass-snakes in underground chapels, even after it was converted to a church.

Grass-snakes are household gods and pets. In folklore, maidens breast-feed grass-snakes, while cows nurse snakes. Killing a grass-snake brings bad luck; dead grasssnakes have to be buried. The snake dance of traditional weddings blesses the newly-weds, even under Christianity. Ophidians are particularly vivid in folk art. Z~ altys always accompanies Saule'. In Christian art, ophidians decorate crosses and lie at Mary's feet.

The myth of “Egle', Queen of the Grass-Snakes” is enormously popular and has inspired numerous art works, including opera, drama, ballet and movies. The king Z~ altys fell in love with Egle', forcing her into marriage. They had four children and spent many happy years together in his kingdom at the bottom of the sea. When Egle' visited her parents, her brothers learned the secret of her return from her youngest daughter and killed Z~ altys. Egle' transformed herself into a pine tree, her sons into an oak, an

ash, and a birch, and her remorseful daughter into a weeping willow. Winter solstice eve *Ku- cios* (Latvian *Kuc'u* or *Bluka vakars*, Yotvingian *Kutia*) has become Christmas Eve. It is the most important Lithuanian folkloric and religious holiday. As in ancient times, families make amends, bless their fields and themselves, commemorate the dead, and share a ritual meal of rebirth once the evening star shines. Solstice day *Kale'dos* (Latvian *Ziemassve'tki*, Yotvingian *Kaliady*) has split into Christian Christmas and secular New Year's. Baltic cosmological straw "gardens" have become Christmas tree ornaments. Relatives and friends visit with blessings, a Yule log is burned, tears of the past are eaten, and a ritual meal is shared.

The summer solstice *Rasa* (Latvian *L'igo*, Yotvingian *Kupalle*) has melded with St. John's Day. It is the most important Latvian folkloric and religious holiday. Herbs are collected and herb poles are erected to protect gardens and fields. People disguise themselves with wreaths of oaks, lindens, and flowers, seek the magical fern blossom, and light as well as set adrift bonfires to accompany *Saule's* midnight sailing. In the morning, people bathe in the dew for health and prosperity, as well as herd their livestock over the embers of the bonfires. The dew is collected and saved as medicinal water.

Both equinoxes involve several holidays. Pre-spring *Uz'gave'ne's* (Latvian *Meten, i*) includes the symbolic burning of winter in the effigy of a witch. People dress as animals, ancestors and supernatural beings. Spring culminates with *Velykos* (Latvian *Liieldiena*), now Christian Easter. *Ve'le's* are invoked for blessing and protection. People ritually hit the Earth with poles to wake her up. Wands called *verbos*, made of medicinal herbs and flowers, as well as pussy willow sprigs are exchanged. These replace palms on Palm Sunday. *Margutis* eggs (Latvian *liieldienu ola*) are skillfully and complexly decorated. They depict cosmological and natural imagery, especially *Saule'*, the Earth, evergreens, and snakes.

Fall holidays give thanks for the harvest. The rye represents the endless renewal of life. It is treated as a longexpected and honored guest. Bread from the first shafts of the harvest is baked and ritually shared. *Jumis* dolls and crowns are made of the last shafts and carried in procession. Yotvingians hold a candle-lighting ceremony with prayers and offerings to the fire. Fall culminates with *Velines* (Latvian *Ilgi*, Yotvingian *Dzyady*), which commemorates the dead. Cemeteries blaze in candlelight.

The autochthonous worship of and reverence for nature in her many forms is a living tradition for the Baltic peoples. Many underlying customs and beliefs have successfully retained their Baltic characteristics and identity under Christianity. This specifically includes reverence for nature and the belief that nature is sacred, which starkly contradicts Christian teaching. Baltic forms have also received Christian explanations (i.e., new meanings). Baltic symbols have been used to both replace and enhance Christian ones. For these and similar reasons, the question of Baltic-Christian syncretism is still open in the scholarly literature. Many more Baltic religious elements persist as folkloric or cultural customs, enhancing the national ethnic identities of the Baltic peoples.

Bartholomew, Ecumenical Patriarch (1940–)

The spiritual leader of the over 300 million Orthodox Christians worldwide, Ecumenical Patriarch Bartholomew

- who has widely become known as the “Green Patriarch”
- has assumed unique and challenging initiatives among religious leaders in environmental concern and care, proclaiming that degrading or destroying the biological diversity of God’s creation is no less than sinful.

Bartholomew’s tenure has been characterized by international and inter-Orthodox outreach, as well as by ecumenical and environmental commitment. Born in 1940 on the island of Imvros, Bartholomew graduated from Halki Theological School near Constantinople, received a doctorate at the Pontifical Oriental Institute of Rome, and served as personal secretary to his predecessor Patriarch Dimitrios.

In 1989, Patriarch Dimitrios established September 1st as the annual day of prayer throughout the Orthodox world for the protection of the environment. Since his election in 1991, Patriarch Bartholomew has undertaken several innovative ecological projects, organizing an *Inter-Orthodox Conference* in Crete (1991) and *five eco-logical seminars* held at the Theological School of Halki (1994–1998) to raise awareness among Orthodox leaders and institutions.

In 1997, Patriarch Bartholomew became the first worldwide religious leader to denounce environmental abuse as a sin against God, humanity and nature. In 2002, he proclaimed the refusal to treat creation properly as a gift of communion with God and one another as humanity’s original sin (see excerpts).

In 1994, Patriarch Bartholomew also formed an international *Religion, Science, and Environment Committee* to raise public awareness and to promote dialogue on an interdisciplinary, an interconfessional, and an interreligious level. Together with the World Wildlife Fund for Nature and the European Commission, the Committee has to date organized *four sea-borne symposia*: in the Mediterranean Sea (1995), in the Black Sea (1997), along the Danube River (1999) and on the Adriatic Sea (2002) with the participation of scientists, theologians, journalists, and politicians. The Halki Ecological Institute was an educational workshop launched in 1999 and resulting from the second symposium. A future international and ecumenical symposium is scheduled for the Baltic Sea (2003).

Bartholomew in his own words

I. Excerpt from the address by His All Holiness Ecumenical Patriarch Bartholomew at the Environmental Symposium in Santa Barbara CA (8 November 1997)

If human beings treated one another's personal property the way they treat the environment, we would consider that behavior anti-social. We would impose the judicial measures necessary to restore wrongly appropriated possessions. It is therefore appropriate to seek ethical and legal recourse, where possible, in matters of ecological crimes.

To commit a crime against the natural world is a sin. For humans to cause species to become extinct and to destroy the biological diversity of God's creation; for humans to degrade the integrity of earth by causing changes in its climate, by stripping the earth of its natural forests, or destroying its wetlands; for humans to injure other humans with disease; for humans to contaminate the earth's waters, its land, its air, and its life, with poisonous substances: these are sins.

In prayer, we ask for the forgiveness of sins committed both willingly and unwillingly. And it is certainly God's forgiveness which we must ask for causing harm to his own creation. Thus we begin the process of healing our worldly environment . . . as persons making informed choices in both the integrated whole of creation, and within our own souls...

We must be spokespersons for an ecological ethic that reminds the world that it is not ours to use for our own convenience. It is God's gift of love to us and we must return this love by protecting the world and all that is in it . . . Let us renew the harmony between heaven and earth, and transfigure every detail, every particle of life . . . Amen.

II. Excerpt from the address by His All Holiness Ecumenical Patriarch Bartholomew during the award ceremony for the Sophie Prize in Oslo, Norway (12 June 2002)

Our original privilege and calling as human beings lies precisely in our ability to appreciate the world as God's gift to us. And our original sin with regard to the natural environment lies – not in any legalistic transgression, but – precisely in our refusal to accept the world as a sacrament of communion with God and neighbor. We have been endowed with a passion for knowledge and wisdom, which opens before us boundless worlds of the microcosm and the macrocosm, and presents us with boundless challenges of creative action and intervention. The arrogance that destroyed the Tower of Babel, through the misuse of power and knowledge, always lurks as a temptation. The natural energy wrought by the sun as a blessing on the earth can prove perilous when profaned by the hands of irresponsible scientists. The interventions of geneticists, which arouse

enthusiasm in their potential, have not been exhaustively explored with a view to their side effects.

We are not opposed to knowledge but we underline the importance of proceeding with discernment. We also stress the possible dangers of premature intervention, which may lead to “the desire to become greater than the gods” (Euripides), which the classical Greeks described as “*hubris*.” Such discord destroys the inner harmony that characterizes the beauty and glory of the world, which St. Maximus the Confessor called “a cosmic liturgy.”

In 2002, the Ecumenical Patriarch also co-signed the joint Venice Declaration of environmental ethics with Pope John Paul II. In the same year, Patriarch Bartholomew was awarded the prestigious Sophie Prize in Oslo, Norway, for his pioneering environmental vision and initiatives.

Bateson, Gregory (1904–1980)

The work of Gregory Bateson, anthropologist, psychiatrist, biologist, sociologist, and philosopher, is a highly original and thought-provoking contribution to the interface of a number of different academic disciplines. While psychologists use his concept of “double-bind” (a kind of communicative entanglement of two persons), New Age authors refer to his philosophical and ecological concepts as testimony for their own thoughts. The latter is due to Bateson’s time at the Human Potential Center, Esalen, in the last years of his life, where he developed as a leading light for New Age science debates (Bateson himself never accepted his being associated with the New Age, though).

As far as the issue of nature is concerned, Bateson’s most important ideas can be seen in his concept of mind and substance, which is part of a larger systems theory. Making use of C.G. Jung’s notion of the two worlds, *pleroma* and *creatura*, Bateson argues that the former is the realm of undifferentiated causal relations, whereas the latter views the same phenomena in a contextual way that makes visible the differences. The *creatura* is analogous to “mind.” It is the world, seen from a certain perspective. If mind in general is characterized as such, the question arises, what does its relation to individual “minds” look like? Here, Bateson introduces a cybernetic model. The individual “me” is not limited to body or sensual perceptions, but must be addressed as a subsystem of the encompassing mind system. It is a unity set up by an analysis of the circumstances and not explainable by intrinsic characteristics. Furthermore, the individual mind’s unity is identical with the unity of evolutionary survival; it cannot be separated from the surrounding lifecosystems.

This perhaps is the most radical consequence, because it puts the relations between humans and nature in a context of mutual dependence. When “mind” is immanent to the ecological system, human thought and action have a decisive impact on the whole of nature. Conversely, humans are totally dependent on nature, and human survival is linked to the survival of nature. Therefore, Bateson advises a fundamental new orientation in several disciplines: ecology and psychology have to acknowledge that the human mind transgresses the borders of its body and is present in ideas and artifacts that can even survive the physical death of a person (Bateson here talks of an “ecology of ideas”). Theology, likewise, has to overcome the dichotomy of transcendent versus immanent deities and can approach humans as part of the gods, who need the human mind just as humans need the gods.

In sum, Bateson calls for a substantial shift of paradigm, because otherwise humans will be destroyed within a short span of time. It is this claim that made Bateson an

influential thinker in contemporary nature discourse, environmentalism, and the New Age.

Beat Generation Writers

Although the expression “Beat Generation” refers to a literary avant-garde and aesthetic sensibility which roughly extended from the late 1940s to 1973 in the United States, the high point of Beat writing coincided with the decade of the 1950s: not only was it in those years that the novelists and poets concerned produced some of their most groundbreaking works, but it was also in that decade that, as marginal bohemians, they developed a countercultural stance which would pave the way for the anti-war protests and youth rebellion of the 1960s. As precursors, the Beats participated in the shift from modern to postmodern sensibilities, a shift contributing to the reemergence of an ecological consciousness in postindustrial societies and to the growth of hybrid religious forms like Western Buddhism and the New Age.

Historically speaking, “Beatness” has been presented as a literary and sociological reaction against the moral strictures of the anti-communism of “McCarthyist” society (i.e., that of the famous anti-communist crusader Sen. Joseph McCarthy), as well as a rejection of the “sanitized” and conformity-oriented forms of religious practice that prevailed in the early 1950s at the expense of personal mysticism. Defying the traditional socio-economic stratifications and religious divisions of American society, the Beat Generation brought together a number of individuals who had no chance of fitting into the middle-class, heterosexual, Protestant, family-oriented, and consumerist mainstream of the United States immediately after World War II. The first core of Beat Generation writers emerged in New York in the mid-forties and initially revolved around authors like Jack Kerouac, Allen Ginsberg, and William Burroughs. A second center for the Beat avant-garde developed in parallel on the West Coast; originally coinciding with the so-called San Francisco Poetry Renaissance which had formed around poets like Kenneth Rexroth and Robert Duncan. This second group included

Gary Snyder, Philip Whalen, Michael McClure, and Lawrence Ferlinghetti as core figures. The two wings of the Beat Generation merged around 1953, when Kerouac and Ginsberg moved to the San Francisco Bay Area. In the process, the Orientalism and ecological awareness of the California-based writers fused with the urban sensibility and the experimental, “spontaneous” literary form of the East Coast Beats. Toward the end of the fifties, the group started to fragment, in part due to some of its members’ voluntary exile from the U.S. for several years.

Despite the wide range of temperaments in what appears on the surface to be a fairly heterogeneous group, the Beats were linked by their rejection of the growing technocratic and technological orientation of American society and of the post-war affluence based on the cycle of work, production, and consumption. As defined by Kerouac, the

oppositional stance of “Beatness” was nevertheless a combination of despondency and optimism, of feeling “beaten down” and “beatific.” On the one hand, these writers felt defeated and marginalized by the materialism and social conformism of their society, while on the other, they also reaffirmed the sanctity of the individual and his/her ability to break through the socially and linguistically conditioned self to a more “authentic” kind of being and mode of perception. Hence the Beats developed a *subjective religion* which denied any gap between the sacred and the profane as well as between the immanent and the transcendent. Beat spirituality at times bordered on a kind of monism in which every phenomenon could be seen as the manifestation of a non-theistic Ultimate Reality. Beat writers therefore non-judgmentally immersed themselves in the material world and in the present moment as gateways to the sacred. Besides subjectivity and immanentalism, another main characteristic of Beat mysticism was the redefinition of the ideal of the American Frontier as a “Frontier of the Mind”: in their attempt to explore more “authentic” forms of perception. Any avenue likely to help the individual transcend the barriers of the socially and linguistically conditioned self deserved to be tested: hallucinogenic drugs, experimental writing, jazz improvisation, Buddhist meditation, and reconnecting with the ways of archaic societies still in touch with their agrarian roots or shamanic heritage. The Beat approach to the sacred resulted in a *hybrid* and *detraditionalized* religiosity which was not only situated at the intersection between modernity and postmodernity, but which also contributed to a reassessment of the concepts of “n/Nature” and “s/Self.”

In their refusal of the regimentation and hyperrationality of post-World War II society, most Beats continued to uphold the values of so-called humanistic expressivism and to believe in the perfectibility of the individual toward his/her “authentic” nature. They thereby failed to embrace the relativism of postmodernity. However, the Beats also seriously distanced themselves from the various forms of dualistic thinking inherited from modernity, especially the ones positing a rigid divide between subject and object and between the One and the many. Although they did not reject all forms of essentialism, the Beats nevertheless seriously questioned the Enlightenment paradigm of the stable self at the center of Nature, a nonhuman world which just exists to be appropriated and mastered by the human subject. Three important influences led them to transgress this view and to posit a fluid self which could harmoniously fuse with its environment: 1) their experimentation with hallucinogenics; 2) their interest in Buddhism – Zen most especially

– and in its fundamental concept of “e/Emptiness,” which sees any phenomenon, the human self included, as devoid of substance and permanence, and which fundamentally postulates a dynamic interrelatedness between all the components of reality; and 3) the pre-industrial ecological awareness found in First Nations myths and cultures, which equate the natural with the sacred and emphasize the underlying unity between different types of creatures, thereby lifting the duality between the human and the nonhuman, the sentient and the nonsentient.

In their attempt to transcend “inauthentic” perception, the Beats’ exploration of various sources of “non-dual” consciousness would lead them to collapse the boundary between self and nature in two – often complementary – ways. On the one hand, these writers would try to investigate the “self” in its natural state by observing the unfettered activity of the naked mind, an activity bespeaking the fundamental “Emptiness” of a subject amounting to nothing more than the sum total of perceptual fragments. This first avenue would especially be pursued by authors like Kerouac, Ginsberg, and Whalen, who, to use the phrase coined by the latter, attempted to produce a “graph of the mind moving” on the page and to record perceptions registered in both their simultaneity and discontinuity. On the other hand, instead of privileging the contemplation of the “naked mind,” certain Beats would favor the observation of “naked Nature” on the basis of the fundamental interconnection that exists between the self and all other biological systems. This synthesis between environmental and mental ecologies – a synthesis which partly intersects with animism – finds its strongest expression in Snyder’s and McClure’s work. By attributing a non-central position in the universe to the human subject and by replacing the notion of “class solidarity” with the one of “solidarity between species,” Snyder and McClure include the concerns and transhumanism of the Deep Ecology movement in their writing. McClure focuses on the self as biological organism and on its lowest common denominator with the most elementary forms of life. Snyder equates the “mirror of the mind” with the “mirror of Nature” in a poetic practice which deems that the self can find a reflection of its inner wilderness in the actual one of the natural world. His verse often presents the subject dissolved in nature recorded in its very suchness and minute particulars.

Whether they preferred to redefine the link between self and “Nature” by immersing themselves in “naked perception” or in the “completely Other,” the Beats developed an *ecopiety*, to borrow a term borrowed from Snyder scholar Patrick D. Murphy, which stresses nonduality and experimented with writing techniques capable of rendering the insubstantiality of the self as well as the field of energy of which both the human and the nonhuman partake. As heirs to the American Transcendentalists, the Beats could not leave the subject entirely behind, but they nevertheless seriously questioned the view of the individual inherited from the Enlightenment. As important transition figures between the modern and postmodern moment, the Beat writers cultivated a vision which progressively merged Romanticism and Orientalism with ecocritical writing.

Bennett, John G. (1897–1974)

John G. Bennett was a research scientist who discovered more efficient methods for burning coal, thereby enhancing productivity and reducing pollution. He also was an intellectual who in the four-volume *The Dramatic Universe* formulated a “cosmic context” for integrating the discussion of environmental ethics. This cosmic context required, he believed, two additional dimensions to explain the natural world: a fifth dimension of eternity (unlimited potentiality) and a sixth dimension of hyperaxis (repetitive natural processes which science calls “knowledge”). He also postulated an ideal hidden seventh dimension of values beyond nature which is the source of meaning, purpose, beauty, goodness and obligation. These ideal values are difficult to define because they can only be apprehended by *feeling*. He believed that the purpose of life is to reconcile the natural world of facts with the ideal spiritual world of values through conscious healing actions which create harmony and realize the true purpose of history. Decisively influenced by George Ivanovitch Gurdjieff and his doctrine of reciprocal maintenance, Bennett believed that all entities exist to serve a larger whole. Moreover, humanity exists to serve the evolution of the Biosphere, the planet Earth, and the solar system.

Bennett’s thought appeals to those who appreciate his attempts to integrate all knowledge and experience through a consistent use of terms. His detractors consider his work to be unempirical, divisive, and unduly abstract. His primary life-work was a prolonged effort to express the need for “work on oneself” in order to facilitate personal and social evolution. This effort took the form of many books and tapes that explained the intricacies of such work. This work did not seem to be directly related to environmental issues, however, although Bennett did lament contemporary attitudes of materialistic exploitation and endeavored to demonstrate an intimate evolutionary relationship between human beings and all other species. His thought provides a ground that some today are using as a basis for environmental concern and action. For example, the passionate efforts of deep ecologists such as John Seed anticipate a radical reformulation of moral philosophy in the twenty-first century – ideas that Bennett anticipated in volume two of *The Dramatic Universe: The Foundations of Moral Philosophy*.

Berman, Morris (1944–)

Trained as a historian of science, Morris Berman's wideranging work explores what he considers "the basic fault" in human life: an experiential dualism that has crippled human beings and resulted in the destruction of the natural world. Through three closely reasoned volumes – *Reenchantment of the World*, *Coming to our Senses*, and *Wandering God* – he developed an analysis of this dualism and the many failed attempts to escape it, and proffered a way out.

Berman began with the Scientific Revolution in *Reenchantment of the World*, arguing that its distinction between meaning and value on one hand, and facts on the other, consolidated a much deeper schism between body and nature, and the mind and reason. He contrasted the worldview of alchemy out of which modern science was born with the scientific worldview. Alchemy, he argued, was not just the search for gold, but for grace. It was, he wrote, an effort to unify the mind, emotion, the erotic and the spirit through the practice of transforming metals; in alchemy there was always a material and psychic equivalent. Not so in science, where the transformation of metals was eventually achieved through application of a mechanical worldview, but without the spiritual practice and psychic integration. Berman argued that this disembodied science – rejecting inner experience as "merely subjective," the body as mechanical but also the source of irrational passions, and nature as something dead – rationalized and enabled human suffering and the degradation of living systems. The wedge driven between subject and object is not new, he argued, but with the Scientific Revolution it was assumed to be a fact of the universe, not culturally imposed. This denial of the imposition makes it invisible, Berman concluded, obscuring it as the source of the many problems it causes.

Building on the work of Wilhelm Reich, Karl Polanyi, and to some extent Freud, and anticipating the views of neurobiologists such as Antonio Damasio, Berman asserts that the cognitive and intellectual always rests on the affective. Denying this relationship does not only mean that we are unaware of the centrality of our emotions, but means also that our emotions are devalued and denied; and when our emotions cannot find their natural expression they re-emerge in distorted forms. Our emotions may be out of mind, Berman noted, but our body knows what our mind does not. The Cartesian view holds only the conscious to be real. Freud, according to Berman, sees the unconscious as real, but the source of the irrational – it must be made conscious and thus brought under the control of consciousness. Following Reich and Bateson, Berman believes that the solution to the split between mind and emotion (body, unconscious) is to make the boundary permeable and thereby the personality whole.

Religion cannot solve the problem, Berman argued in *Reenchantment of the World*, because it has become part of it. Protestantism, he believes, has settled for secular salvation, a kind of Cartesian grace ultimately based on transforming nature into commodities. Catholicism and some other denominations are hostile to the body and the erotic and thus cannot accept the whole personality. Mysticism, though it embraces the unconscious, rejects critical thought, and therefore cannot accept and integrate the whole person. Humans are left alienated from themselves and nature.

In *Coming to our Senses* Berman further refined his analysis of the nature of the basic fault, or dualism, and traced its origins to the Neolithic. Building this time on the work of D.W. Winnicott and other object relations theorists, he argued that a near universal narcissism pervades all civilized cultures. Narcissism arises, according to object relations theory, when the human infant is not valued for itself. This gives rise to the creation of a false self as the infant tries to entice care givers, and thus to a profound personality split. The split is repressed, and the false self, unable to meet the organism's needs, is condemned to an endless compensatory quest. For Berman the failure of human parents to provide adequate nurture is part of a larger process. As humans try to control nature as the result of the transition from hunting and gathering to agriculture and pastoralism, he argues (following Paul Shepard) that we lose wild nature's nurture. A domesticated nature cannot nurture, and without adequate nurture we cannot find our real selves.

From the neolithic down to the present, Berman argued, that which has been lost and repressed but always carried in the body – the repository of the unconscious – continually reemerges. This periodic reemergence is not part of any ideological heritage, though it finds historically specific expression. Rather it is simply the longing for wholeness that asserts itself again and again, often through heresy. Berman argues that heresy is often an attempt to reclaim experience (the body) in the face of the dominant, mind-focused orthodoxy.

It is in *Wandering God* that Berman offered a way to overcome the “basic fault”: we must resacralize our perception of the world and learn to “live in the question.” We must live without ideology and formula, including religion. Berman pointed to the intense (and sacred) experience of everyday life of the Mbuti pygmies. At home in the benevolent forest, magic and ritual are seen as egotistical and anti-social. The Mbuti do not cling to things and they do not fear death. The movement of the hunter-gatherer assuages the anxiety of self-awareness.

Berman recognized that we cannot simply return to a hunter-gatherer existence. “Living in the question,” he argued, means living with the tension of universalizing thought and the tribal particular. It means reestablishing the material basis for resacralizing the Earth by lowering human population, living in smaller groups, actively controlling those who aggressively strive for power, and improving childrearing. For Berman it is the institutionalization of accumulation that breeds social hierarchy *and* the vertical conscious that separates heaven and Earth, which causes us to lose our home in the world.

Berry, Thomas (1914–)

From his academic beginning as a historian of world cultures and religions, Thomas Berry grew into a historian of the Earth and its evolutionary processes. He sees himself not as a theologian but as a “geologian.” Berry began his career as a historian of Western intellectual history. His thesis at Catholic University on Giambattista Vico’s philosophy of history was published in 1951. Vico was trying to establish a human historical science of the study of culture and nations comparable to what others had done for the study of nature.

Influenced by Vico, Berry gradually developed a comprehensive historical perspective in periodization and an understanding of the depths of our contemporary crisis due to the ecological destruction caused by humans. Eventually he saw the need for a new mythic story to extract humans from their alienation from the Earth. Berry described this alienation as pervasive due to the power of the technological trance, the myth of progress, and human autism in relation to nature. With his books, *The Dream of the Earth*, *The Universe Story*, and *The Great Work*, Berry aimed to overcome this alienation and evoke the energies needed to create a viable and sustainable future.

After completing his graduate work, Berry spent 1948–1949 in Beijing studying Chinese language, philosophy, and religion. There he met Columbia professor and Confucian scholar, Wm. Theodore de Bary. Upon returning to the States they founded the Asian Thought and Religion Seminar at Columbia. Berry taught Asian religions at Seton Hall (1956–1960), at St. John’s University (1960–1966) and at Fordham University (1966–1979). He founded a Ph.D. program in the History of Religions at Fordham and wrote books on *Buddhism* (1966) and on *Religions of India* (1971).

What distinguished Berry’s approach to world religions was his effort not only to discuss the historical unfolding of each of the traditions, but also to articulate their spiritual dynamics and contemporary significance. Confucianism has had special significance for Berry because of its cosmological concerns, its attention to nature and agriculture, its interest in self-cultivation and education, and its commitment to improving the social and political order. With regard to Confucian cosmology Berry has identified the important understanding of the human as a microcosm of the cosmos. Essential to this cosmology is a continuity of being between various levels of reality – cosmic, social, and personal. Berry sees this as similar to the ideas of Pierre Teilhard de Chardin, Alfred North Whitehead, and other contemporary process thinkers.

Berry also drew extensively on Native American and indigenous traditions for rethinking the dynamics of human–Earth relations. Berry’s appreciation for indigenous traditions and for the richness of their mythic, symbolic, and ritual life was enhanced

by his encounters with the ideas of Carl Jung and Mircea Eliade. Jung's understanding of the collective unconscious, his reflections on the power of archetypal symbols, and his sensitivity to religious processes made him an important influence on Berry's thinking. Moreover, Mircea Eliade's studies in the history of religions were influential in Berry's understanding of both Asian and indigenous traditions.

In formulating his idea of the *New Story*, Berry is particularly indebted to the thought of Pierre Teilhard de Chardin. During the 1970s Berry served as president of the American Teilhard Association. Berry derived from Teilhard an appreciation for developmental time. As Berry observes, since Charles Darwin's *Origin of Species* we have become aware of the universe not simply as a static cosmos but as an unfolding cosmogenesis. The theory of evolution provides a distinctive realization of change and development in the universe that resituates the human in a vast sweep of geological time. With regard to developmental time, Teilhard suggested that the whole perspective of evolution changes our reflection on ourselves in the universe. For Berry, the *New Story* is the primary context for envisioning the immensity of cosmogenesis.

Berry also derived from Teilhard an understanding of the psychic-physical character of the unfolding universe. For Teilhard this implies that if there is consciousness in the human and if humans have evolved from the Earth, then from the beginning some form of consciousness or interiority is present in the process of evolution. Matter, for both Teilhard and Berry, is not simply dead or inert, but is a numinous reality consisting of both a physical and spiritual dimension. Consciousness, then, is an intrinsic part of reality and is the thread that links all life forms. There are various forms of consciousness and, in the human, self-consciousness or reflective thought arises. This implies for Berry that we are one species among others and as self-reflective beings we need to understand our particular responsibility for the continuation of the evolutionary process. We have reached a juncture where we will determine which life forms survive and which will become extinct.

Berry's approach is comprehensive in terms of cultural history and world religions, while Teilhard's is scientifically comprehensive. These two approaches come together in Berry's book, *The Universe Story*, written with the mathematical cosmologist Brian Swimme. Together they relate the story of cosmic and Earth evolution along with the story of the evolution of *Homo sapiens* and the development of human societies and cultures. While not claiming to be definitive or exhaustive, *The Universe Story* sets forth an important model for narrating the Epic of Evolution.

The Universe Story was based on Berry's ideas first articulated in 1978 in an article titled "The New Story." As he pondered the magnitude of the social, political, economic, and ecological problems facing the human community, Berry observed that humans are in between stories. The coherence provided by the old creation stories was no longer operative, Berry asserted, proposing instead the new evolutionary story of how things came to be and where we are now as a comprehensive context for understanding how the human future can be given meaningful direction. Berry stated that to communicate values and orient human action within this new frame of reference

we need to identify basic principles of the universe process itself. These, he suggested, are the primordial intentions of the universe toward differentiation, subjectivity, and communion. Differentiation refers to the extraordinary variety and distinctiveness of everything in the universe. Subjectivity is the interior numinous component present in all reality. Communion is the ability to relate to other people and all life forms due to the presence of both subjectivity and difference. Together these create the grounds for the inner attraction of things for one another. For Berry these are principles that can become the basis of a more comprehensive ecological and social ethics that recognizes the human community as dependent upon and interactive with the Earth community. This new ecological orientation suggests that humans are a subset of the Earth, not dominant controllers. In light of this perspective, nature is here not solely for our use but as grounds for communion with the great mystery of life.

This *New Story* arose from Berry's own intellectual formation as a cultural historian of the West, who also studied and wrote about Asian religions and indigenous traditions. His intellectual journey culminated in the study of the evolution of the universe and the Earth, which he saw as an epic story. Berry suggests that this story provides a comprehensive context for orienting human life toward the "Great Work" of our time, namely, creating the grounds for the flourishing of the Earth community.

Berry's idea of the universe story has been critiqued by those influenced by post-modernism as having the potential to be a dominating or hegemonic metanarrative. Their concern is that such a story may not allow for the inclusion of diversity. In particular, they feel that creation stories from various cultures will be lost within such a large-scale narrative of evolution. Berry's own studies and writings on other religious traditions suggest that he is sensitive to this issue; he suggests that the new story context gives a new validity and even more expansive role to earlier stories. Another critique arises from those concerned about using science as a basis for a unifying story inspiring human meaning. They see science (in combination with technology) as creating an objectifying view of nature, which robs nature of its sacred qualities and is thus partly responsible for creating the current environmental crisis.

On the other hand, Berry's influence has been widespread and diverse both within academia and beyond. This ranges from scientists such as mathematical cosmologist Brian Swimme, cell biologist Ursula Goodenough, animal behaviorists Marc Bekoff and Barbara Smuts, and geologists George Fisher and Craig Kochel. It includes ecological economists like Richard Norgaard and David Korten and ecodesigners such as Richard Register and David Orr. In the field of racism and environmental justice Carl Anthony and Barbara Holmes cite the importance of Berry's unifying vision of the story of the Earth. The deep ecologist John Seed, and others promoting the universe story as the "Epic of Evolution," such as the ecologist

E.O. Wilson, also draw inspiration from Berry.

Berry has had a particularly strong influence with a large number of Catholic nuns and their religious orders. There is now an organization called "Sisters of Earth" which serves as an umbrella group for these nuns. One who has spearheaded Berry's ideas

among these nuns is Sr. Miriam Therese MacGillis, the founder of Genesis Farm, a community-supported organic farm in Blairstown NJ based on the universe story. Various educational institutes have been established which have also been inspired by his ideas. These include two in Oakland, California; one directed by Matthew Fox and one by Jim Conlon. A journal called *EarthLight* also focuses on key aspects of Berry's ideas. For nearly 20 years at the Cathedral of St. John the Divine in New York, Dean James Parks Morton was deeply influenced by Berry's perspective and invited

Berry to serve as a Canon at the Cathedral. At the same time, Paul Winter began to perform his Earth Mass and his solstice celebrations at the Cathedral also with enormous inspiration from Berry's writings and talks. Thus the range of people and institutions influenced by Berry's ideas is already significant and continues to grow as people seek a larger context for grounding their own work for the environment.

Breakout Box: SP Thomas Berry on Religion and Nature

Religion, we might say, is born of the awakening of human consciousness to some numinous presence experienced throughout the natural world, a presence that brings the world into being, sustains the world in existence, and enables the world to unfold in all its magnificence. In the midst of this florescence we awaken with an overwhelming sense of wonder as we look out over the landscape. There we see the meadows with their flowers, the forests with all their woodland creatures. We listen to the singing of the birds and feel the flow of the wind as it strikes our faces. All this is freely spread out before us for our delight and understanding even while it sustains and nourishes our physical well-being.

The awe we experience in our awakening consciousness is the beginning of the religious reverence and gratitude we experience for that abiding Presence that brought all this into being. From that primordial moment until the present, humans have understood this inner Presence as the guardian, the teacher, the healer, the source whence humans were born, were nourished both physically and spiritually, were protected and guided. It was the destiny to which we returned.

Over the centuries, human communities, from the tribal level to the great classical civilizations, have dedicated their high intellectual efforts to providing some understanding of, and some intimate relation with this Presence, in what we refer to as their “religion,” the “binding back” or relating of all phenomenal reality to the origin and sustaining power whence it came.

These civilizations have dedicated their architecture, their arts, and their literature to providing rituals whereby we integrate our human activities into that great cosmic liturgy expressed in the daily and seasonal transformations of the natural world. Everywhere we find the human project validated by its intimate relation to this comprehensive context.

The meaning world of American Indians in a special manner revolved around nature rituals developed to bring this numinous Presence ever more profoundly into their lives. With the Plains Indians, their primary initiation ceremonial was the vision quest whereby the young person would fast and pray for four days at some isolated place, pleading for the understanding and the strength needed to deal with the challenges of adult life. At this time, the one fasting would receive some sign or some guiding vision that would determine the manner in which the difficulties of life should be dealt with throughout the future.

With the Iroquois, the Great Thanksgiving Ritual at harvest time was the high moment of their year’s celebration. This occasion celebrated the covenant of the Great Peace in a ceremonial that confirmed the bonding together of the original five tribes of the Confederation. In this ceremony, expressions of gratitude were offered to the various natural forces at work in their lives: the Earth Mother, the Waters, the Fish, the Plants, the Trees, the Animals, the Birds, the Winds, the Sun, the Moon, the Stars. Then, at the end, final thanks were offered to the Creator whose benign Presence brought all things into being and sustained them throughout their existence.

With the Omaha peoples, the new-born child would be taken out under the sky and presented in turn to the Powers of the Heavens, the Powers of the Atmosphere, the Powers of the Earth, and the Powers within the Earth. In each case, the Powers would be addressed and then the birth of the infant would be announced with the petition that the Powers would protect and guide the child throughout the course of the child’s life. In North America, the universe was a sacred space recognized by the Pipe Ceremony. In this liturgy, the Pipe was offered to the four directions, to the heavens above, and to the Earth below, a process establishing a sacred center where authentic community affairs were carried out.

While such religious intimacy with the natural world found consistent expression with earlier tribal peoples, it was also found in classical civilizations: in the Near East, in the Asian world, and in the American civilizations of the Maya, Inca, and Aztec. In each case, the natural world was addressed, not as an “It” but in personal terms – as “Thou.” In China, court rituals required that the emperor alter the color of his garments with each seasonal change. The music of the court was altered to suit the seasons. The emperor moved to the appropriate room in the palace. So we could outline the ceremonial sequence whereby the various communities integrated their human affairs with the daily and seasonal changes in the natural world.

Such integral association with the natural world is found also in the Christian world up through the medieval period. From the decline of Rome to the brilliant medieval civilization, the transition was carried out successfully by dedicated religious persons who integrated Christian belief and ritual with the great cosmic liturgy of the natural world. This was the force that created Western civilization from remnants of the Classical Mediterranean world combined with the energy and the traditions of incoming tribal peoples of central Eurasia.

Few civilizations have been so totally integrated with the great cosmic liturgy as was Medieval Europe. This integration we see with total clarity both in the architecture and symbolism of the great cathedrals and in the colorful rituals that were enacted there almost continuously. It is seen especially in the great poem of Dante Alighieri (1265–1321), *The Divine Comedy*. Here the natural world is seen as primordial scripture, a scripture predating the Bible. The opening language of the Bible itself repeats the creative words that brought the natural world into being. Only when there is a natural world can communication pass between the divine and the human. Indeed humans have no conscious interior spiritual world unless it be activated by the outer world of nature. The natural world and the divine, these were mutually explanatory. Thus the great medieval teachers began their writings with observations on how these two scriptures, the natural and the verbal, explain each other. This we find with special clarity in the brief essay of Saint Bonaventure entitled *The Mind’s Road to God*. So, too, the daily ritual was coordinated with the diurnal cycle of the sun’s rising and setting. Dawn and sunset, the rise and setting of the sun, the passing from night into day and day into night, these were recognized as moments of special presence of the divine and the human to each other. These are the intimate moments of the day when, as individuals or as families, we offer prayers of thanksgiving and petition to that primordial divine source whence all things come.

In the evening parents and children are especially intimate with each other.

The Christian liturgy, referred to as the “Divine Office” or the “Divine Worship,” was considered the framing context for daily life. The word itself “liturgy” is derived from two words meaning “public work” or “public activity” because such recognition of the divine was considered society’s primary daily activity. The carrying out of this “primary public work” was assigned principally to monks, men who, since early Christianity, had daily ritually chanted the psalms of the Bible and sung sacred hymns, composed later

by persons such as Saint Bernard (1090?–1153) and Saint Hildegard (1098–1179). In this context, the term “work” has more affinity to artistic or musical production than to the activities of an ordinary day-laborer.

Besides the daily insertion of the human project into the day–night sequence, there was the even more dramatic seasonal cycle whereby the springtime renewal of life after the winter quiescence was celebrated throughout the society. This festival, known in the Western world principally as the Easter Resurrection festival, was determined in its time of celebration as the first Sunday after the first full moon after the spring equinox. The religious calendar of Christians depended on these dates determined by the position of the sun and the moon in relation to the Earth. The other most solemn Christian festival, known as “Christmas,” was celebrated at the winter solstice, the time when the sun was lowest in the sky. The date celebrated is 25 December because that was considered by the Romans as the solstice moment. This was the time for celebrating the meeting of the divine and the human in the person of Christ.

While such moments of the diurnal and seasonal cycles in the natural world determine the larger context of religious celebration in much of the world, there are other more intimate aspects of personal spiritual life developed in intimate association with nature. In the Western world, for example, we find personalities such as hermits living in uninhabited regions regarded as sacred. In India, their counterparts are forest dwellers or homeless wanderers. In Buddhism there are also monks living in the depths of the natural world.

Even earlier shamanic personalities entered psychically into the profound depths of the natural world and there obtained guidance and healing for tribal communities in moments of stress, when they are hunting or when they are ill. While this activity of shamanic personalities is more primordial than the activities of later religious personalities such as the priest or sage or yogi or guru or prophet or saint, it does carry a deeply religious aspect.

Few things stand out more plainly in our secularbased industrial civilization than the diminishment and neglect of both the religious life and the natural world. Religion is reduced largely to social work and personal pieties. Nature is reduced to decoration or vacationing or tourist entertainment. The natural world is swallowed up in big gulps by monstrous mechanized shovels that can lift an immense quantity of soil in a single scoop, all to do away with the natural contours of the land and prepare it for some building project or for laying down great quantities of asphalt for highways and parking lots. Wildlife is diminished both in its diversity of species and in its numerical count.

When we inquire as to just how such a situation antagonistic to religion could have arisen, we must go back to the fourteenth century, to the Black Death, a plague that struck Europe in the years 1347–1349, a period when, it is said, a third of Europe’s population died in two years. The difficulty was that the people had no idea of germs. Since they had no idea of what was happening, they considered that some great moral fault had occurred. The world had become wicked. God was punishing the world. The great urgency was to do penance and be redeemed out of the world.

A penitential spirit spread over Europe. Spiritual preaching insisted on detachment from the natural world. New themes appeared in art, scenes where Christ is depicted with right arm raised, condemning began preaching the need for repentance for sin, for detachment from the natural world, a turning toward a spirituality of severe interior discipline. Then, the sixteenth century saw the rise of Protestant Puritanism. In the seventeenth century, Jansenism, the Catholic phase of Puritanism, appears throughout France and then throughout Europe.

An even more devastating assault on the natural world came with René Descartes (1596–1650) and his teaching that the world is divided between mind and matter. What is not mind is simply matter, to be known by mathematical measurement. In this manner, the entire natural world was desouled. The song of the birds became simply mechanism. The entire planet became a vast soulless edifice. The numinous Presence, formerly perceived throughout the natural world, disappeared. Biologists turned against any teaching of “vitalism” – the view that the natural world is an ensouled world, a world of living realities, a world of spontaneity and communication, a world of numinous Presence.

This situation set the stage for the industrial, technological, commercial, financial world to identify planet Earth as a vast natural resource to be used, not as an intimate presence to be communed with. Nothing remained of nature that could provide a basis for religious experience. The Great Cosmic Liturgy with its daily elevation of life to sublime levels of participation has now been gone for four centuries. Even so, Western religious traditions have survived throughout, if in a diminished role. Ancient liturgies still proclaim the magnificence of the divine Presence throughout the universe. Yet now, in the opening years of the twentyfirst century, as industrial civilization collapses on itself, we see that its amazing success has been more fragile, and its survival more transient than we expected.

The powers of nature begin to reassert themselves. Human communities everywhere are protecting remaining wilderness regions and fostering a return to the primordial world of nature. The saying of Henry Thoreau (1817–1862) is now heard more often: “In wildness is the preservation of the world.” This return to the natural world is at the same time a manifestation of the survival of religion and a support for the renewal of religion throughout the Earth.

Even in the officially secular society of America there remain two moments when official recognition of a religious or some higher power is required in the public life of the society: the moment of induction into public office when the official must swear on the Bible, or to some higher power in the natural world, to faithfully administer the laws of the state. The second moment is in court when a witness must swear in reference to some transhuman reality to tell the truth in the witness to be given.

One other moment occurs here in America when we return to nature in its wilderness form, go to it for the healing of our inner world. Always there seems to remain in the human soul an awareness of some divine presence in the wilderness regions of the

world, a presence that can provide relief from the anxieties of existence in an industrial dominated society.

Perhaps the person in America who best personifies the religious tradition of Western civilization in its most intimate relation to the natural world is John Muir (1838–1914). He spent the greater part of his life after 1860 wandering through the fields and woodlands of Northern California and recording his experiences there. Brilliant compositions, his writings can be considered so many songs to the indwelling sacred presence of the Yosemite Valley along the Merced River.

In 1892, this region was set aside, in the tradition of Yellowstone National Park, as too precious a region to endure the intrusion of developers. Along with all the devastation inflicted on the North American continent these, and some two hundred other natural regions of this continent, have been set aside to be kept in their natural state forever in recognition of the absolute need that humans have for such experiences of the natural world.

Thomas Berry

Berry, Wendell (1934–)

Perhaps Wendell Berry's greatest contribution to contemporary discussions about the significance of nature in American culture is his refusal to be subjected to easy categorization. While thoroughly Christian, he is an outspoken critic of institutional religion and while his ethics are biblically based, his writing embraces the wisdom of Buddhism and other religious traditions, especially when such wisdom may be put to use in keeping human hubris in check. Though "liberal" in his ecological thinking, his emphasis on the virtues of the small community and on the importance of marriage (in both family structure and as a guiding metaphor for responsible agricultural work) strike some as "conservative." His defense of traditional gender roles and the practice of tobacco farming disarms some critics, while his clarion call to "eat locally" has helped push interest in organic foods and small-scale agriculture beyond the early dominant tendencies to dismiss these growing movements as minor, countercultural concerns.

Born in 1934, Wendell Berry grew up in Kentucky and received both his undergraduate and master's training at the University of Kentucky. He subsequently taught in the English department at Stanford University, traveled to Europe on a Guggenheim Fellowship and later joined the Faculty at New York University. In both California and New York he became acquainted with the Beat Poets and formed a particularly strong friendship with Gary Snyder. While pursuing his writing career where it took him, Berry also began to feel the pull of his native region. In 1961, on the eve of departing for a literary fellowship in Paris, Berry started to reflect on the value of developing a commitment to a particular place, which began with time spent at a rustic outpost, known as "the Camp," near his boyhood home. Here Berry first articulated to himself, and later to his readers, the virtue of "belonging" to a particular natural locale, a virtue and goal he explicitly conceptualized as a "spiritual ambition." Berry's developing ethic and aesthetic of "staying in place" soon led him to prioritize a bioregion over a potentially nomadic literary life. In 1965, at the age of 31, Berry moved to his farm in Port Royal, Kentucky where he has farmed ever since.

Several of Berry's essays speak directly to the relationship between Christianity and ecology in particular, as well as to the complex interweave of religion and nature more generally. In his 1990 essay, "God and County," Berry asserts one of his fundamental religiously informed principles for ethical living: that we are "unrelentingly required to honor in all things the relation between the world and its Maker and [that] . . . we ourselves, as makers, should always honor that greater making" (Berry 1990: 95). Berry sees in the Christian tradition the theological roots for responsible Earth stewardship, but fears that the institutional Church, because of its dependence on what

he elsewhere calls “the little economy,” is necessarily (and negatively) implicated in the very economic and institutional structures that threaten the health of the planet and the flourishing of small, local communities.

Berry extends some of these ideas further in his (1992) “Christianity and the Survival of Creation” when he acknowledges that historically “the evangelist has walked beside the conqueror and the merchant” (Berry 1993: 94) in the intensive exploitation of land and indigenous cultures that has marked the last five centuries of American history. In one of his characteristically blunt statements, Berry proclaims that “The certified Christian seems just as likely as anyone else to join the military-industrial conspiracy to murder Creation” (1993: 94). At the same time, Berry insists, a genuine reading of the biblical tradition reveals a clear injunction that the Earth belongs to God and that destruction and abusive possession of the land is a violation of the biblical principle that humanity is a temporary “sojourner” on the land, which is divinely created. Destruction of nature, in Berry’s reading, is “not just bad stewardship, or stupid economics . . . [but] the most horrid blasphemy” (1993: 98).

While Berry’s consistent elucidation of the notion of a genuine “economy” lends a strong sense of moral gravity and urgency to his work, the other most prevalent theme in his writing is the concept of pleasure, rooted in the divine injunction to take pleasure in God’s creation. In essays such as “The Pleasures of Eating,” “Economy and Pleasure,” “Getting Along with Nature,” “Going Back (or Ahead) to Horses,” and “An Excellent Homestead,” Berry leavens his more direct moral injunctions with exempla (often clearly modeled on the genre of the biblical parable) taken from his daily life on the farm or in the company of like-minded friends and neighbors. Turning the individualistic concept of the pleasure-principle on its head, Berry argues for the “simple” pleasures that can be found in dissenting from the dominant, consumerist culture through work close to nature and dedicated to local communities.

Berry’s extensive body of fiction and poetry can be seen as extensions and elaborations of his prose essays, though set in a different key. The novels shift in historical setting and in the characters that occupy center stage, but are linked by tradition and bioregion with the majority of the stories focusing on the fictional community of Port William, which borrows extensively from Berry’s observations and experiences in and around Port Royal. Of particular note is the revised version of *A Place on Earth* (1983), in which the main character of the drama is Port William itself. Berry’s poetry is especially evocative, revealing his rich mining of the biblical tradition and his creative blending of that tradition with his own experiences of work and play upon a particular piece of land. His *Farming: A Handbook* (1967) and *Sabbaths* (1987) are especially important in this regard.

The scholarly work on Berry (primarily coming out of literary disciplines) has tended to be more laudatory than critical. As mentioned above, Berry’s writing was negatively received (beginning with a series of exchanges in *Harper’s Magazine*) when he defended his choice to avoid computers (and thus, the power companies on which they rely) by relying on his wife Tanya to type and finalize his manuscripts. Both feminists

and defenders of technological innovation criticized Berry for being neo-Luddite in his outlook on tools, as well as patriarchal in his view of women. Berry countered these criticisms with a strong defense of the intimacy with nature that a cultivated resistance to technology affords, as well as an argument for intimacy in marriage which is nurtured by the sharing of household labor, which, in Berry's context, includes both farming and writing.

Berry also came under fire in the 1980s from deep ecologists who (following the arguments of Lynn White Jr.) tended to categorize Christians as necessarily "shallow ecologists" who participated in a tradition whose legacy toward nature was a destructive one. Berry's fiction, poetry and essays all argue against this critique, sometimes subtly, by example, and sometimes directly, as when Berry makes distinctions between institutional Christianity (which he sees as often implicated in capitalism and industrialism) and the ideal Christian life (which he argues rests on a model of stewardship and a vision of sustainability for future generations). Berry also draws on key concepts in the Hebrew Bible/Old Testament, such as the Sabbatical and Jubilee years, which speak directly to divinely ordained principles of rest and renewal for the land. These concepts, while utilitarian in some respects, also emphasize that land cannot be "owned" by humans, but only borrowed, a concept that (without using theological language) is also upheld in the writings of deep ecologists.

Beyond deep ecologists in particular (who in their early writings were particularly hostile to Western religious traditions), Berry's work has not been warmly received by a larger collection of ecocentric (also called biocentric) writers and activists. The complaint, not always directed at Berry *per se*, involves a long-standing tension between environmentalists who uphold the intrinsic value of all species and who rail against anthropocentrism and utilitarianism, and agriculturalists who defend human interests in theory and who, in practice, interact with nature in "instrumental" ways.

Berry's reply to this critique is to emphasize the way that work on the land, the pleasure gained from such work and the knowledge of biological processes that emerge from daily contact through agriculture all contribute to the farmer (or related workers) developing an ethic of responsibility for and sense of mutuality with the natural world. For Berry, this sense of interdependence with the land ultimately involves not only biological knowledge, but also relational knowledge and spiritual knowledge. For Berry, while the practice of farming may appear "anthropocentric," responsible farming that contributes to the health of both land and people is ultimately a communitarian act, good for people and good for the long-term health of the planet. Again, Berry's stance is ultimately theocentric, rather than biocentric. While taking a position that places comparatively more emphasis on human values, he shares with the ecocentrists a view which ultimately deemphasizes human interests in the face of the health of "Creation," which includes both human and natural communities.

Bestiary

The Bestiary is a medieval catalogue of animals that thoroughly entangles categories of the natural and the supernatural. The fabulous phoenix resides alongside the mundane pelican, yet both are emblems of Christ: the phoenix for the resurrection (the phoenix is immolated, then rises from its ashes), and the pelican for the passion and compassion (the pelican tears at her own breast to feed her chicks with her blood). The Bestiary evokes the worldview of its time, presenting nature as a book, or code, which reveals society, psyche, and the divine.

It would be anachronistic to look into the Bestiary for a description of nature as conceived in modern terms. It is not simply that the Bestiary applies moral lessons to nature, rather, it is that nature is intrinsically and radically a book that spells out the human and divine encounter. Consider the Orphan Bird, who lays her eggs on the water to determine which egg will produce the best chick to be flown joyfully to their father. The bad eggs sink, hatching on the floor of the sea, where they live in darkness and grief. This fanciful description is allegorical theology: one shall be saved and taken up to God, while all the unworthy sink into Hell. Bestiaries are not rudimentary natural histories or preposterous biological texts, although they contain information, observed or fabulous, about animal behavior. In the Bestiary, however, correspondence to biblical text and traditional tales carries more authority than does empirical observation. Folk etymologies unveil the secrets of nature; language itself enfolds nature. Bestiaries record mainly mammals (what is generally meant by *beasts*), but also reptiles, fishes, and birds, insects, an occasional tree or stone, sometimes humans, even a mermaid (or siren). Numerous editions begin with a version of the Genesis creation narratives and fall of humanity.

The primary source for the Bestiary is the *Physiologus* (“the naturalist”), a late Classical compilation of animal behavior and attributes presented as Christian allegory. Aristotle’s and Pliny’s zoologies, fables such as Aesop’s, and especially Isidore of Seville, whose encyclopedic *Etymologies* (ca. 600), influenced the formation of the Bestiary. Most consistently, scriptural references give weight and authority to these animal characterizations.

A number of commentators have worried about the naturalism problem: “there seems every reason to believe that the Bestiary represented secular learning as well as homiletic device, and that it was, for the most part, taken very literally, at least until the twelfth-century revival of popular preaching” (Cronin 1941: 194). Early in the twentieth century, the influential and learned M.R. James complained,

But for its pictures I do not think the Book could possibly have gained or kept any sort of popularity. Its literary merit is nil, and its scientific value (even when it had been extensively purged of fable and reinforced with sober stuff) sadly meagre (1931: 1).

(Actually, no illustrated Bestiary had been located until it was well on its historical way; in the eighth or ninth century, its worthiness came before its illuminators.) James condemned the Bestiary for failing to conform to his own vision of nature (and literature); and despite his admiration for what he thinks of as the factual world, he could not resist in a public presentation comparing a marmot-type animal – the voracious, fat, deceitful female

– and the abstemious, skin-and-bones male, to married couples known to him (James 1931: 7). For the sake of his misogynist humor, he falls back on the medieval method of type over test, that is, the exemplary over the empirical. In contrast to James, Brunsdon Yapp has claimed, “bestiaries are not, as they are generally held to be, merely compendia of old wives’ tales and religious symbolism, amusing or boring according to your taste, but documents that are important for any serious history of medieval science” (George and Yapp 1991: 28). If the focus of the Bestiary might have been literal, well, then, it would be wise to apply the most prevalent device of the Bestiary itself – the etymological: *literal* derives from *letters*, not mere factuality. To ask the Bestiary to be principally a zoological investigation is to ask the wrong questions of it.

Bestiaries were copied, translated, conflated, and embellished for a millennium. Their pages were rendered into stone, window, and sermon: the lion sleeps with its eyes open; the hare changes sex at will; the hedgehog rolls on the ground, spearing fruits to carry home to its young. The beaver (*castor*), whose testicles make excellent medicine, bites them off and throws them down before the hunter, who then leaves him alone. If another hunter appears, the beaver stands upright to show the hunter he is wasting his time.

The Christian task was to return to the Paradise that the first couple lost. After all, the prelapsarian condition is true nature and the fallen condition is against nature. The Bestiary calls out from the two sides of nature – that of Eden and that of corrupted time. This catalogue, without narrative or chronology, emblematically recapitulates the entire sacred history: that humans were there with the beasts, in collusion with the beast they fell, and in consequence they all suffer the curses of work, pain, and death, and through these, find redemption.

The Bestiary came to be one of the most copied, translated, illuminated, preserved, and disseminated manuscripts of medieval Europe. The nature of nature in the Bestiary is allegorical, a guidebook to theological meaning. The *Physiologus* was the naturalist’s compendium with a theological vision. With Isidore’s encyclopedia of origins, the Bestiary’s world moved more decidedly toward word. Book upon book, the beasts travel by means of false etymology and fable and analogy, over language barriers and sense, and end up being much more than mere references to the natural. There is an equation among these figures of beast, soul, sex, and text.

When a tiger's cubs are snatched from the lair, the tiger, in a rage, pursues the hunter. About to be caught, the hunter throws down a glass ball. Catching her reflection in the ball, the tiger mistakes it for her child, and stops to pick it up. Furious, she goes after the hunter again, and he throws down another glass ball, and again she is fooled by the mirror, "because the memory of deception is overcome by her maternal instinct" (in Barber 1993: 29). She circles the sphere and tries to nurse her image, as if to suckle her cub. (Social construction prevails over biological imperative in the Middle Ages!) The story is for those who can distinguish between a glass ball and a tiger cub, between a tiger's reflection and a tiger. Yet the medieval reader took the text of a tiger as a reflecting globe of the animal, and the animal – nature – as a mirror of divine reality.

Bhagavadgita

The *Bhagavadgita* (200 B.C.E.–200 C.E.) constitutes chapters 23 to 40 of the sixth book of the great Indian epic the *Mahabharata*. The *Mahabharata* tells the story of the conflict between two groups of cousins of the Bharata clan, the Pandavas and Kauravas, the war between them and the aftermath of the war. The *Bhagavadgita*, meaning "Song of the Lord," is a conversation between one of the Pandava brothers,

Arjuna, and the god Krishna. The conversation takes place just as the great battle is about to start. Arjuna, recognizing relatives, friends and teachers in the army of the enemy, finds himself unable to fight, but Krishna convinces him that to fight is a moral duty

(*dharma*). Krishna explains several central doctrines of Hinduism to Arjuna: the idea of the eternal separation of the self from the mortal body and the repeated rebirth of the embodied self; the three paths to salvation (*jnanayoga*, *karmayoga* and *bhaktiyoga*); devotion to Krishna; the doctrine of *svadharma*, that is, the performance of one's duty for duty's sake; the doctrine of the fourfold *varna* system; the world as part of Krishna/Vishnu; and the doctrine of *avatara*.

Even though the Vedanta schools of Hinduism considered the *Bhagavadgita* one of its three foundations (the others being the *Upanishads* and the *Brahmasutra*), and many of the Hindu philosophers and theologians wrote commentaries on the text, the *Bhagavadgita* does not seem to have been widely popular before the nineteenth and twentieth century. That several of the leading figures of the Indian freedom struggle wrote commentaries on the text and applied its teaching to contemporary political problems, might have contributed to its popularity. Such modern interpretations often contrast sharply with the classical understanding of the text. Many Hindus now consider the *Bhagavadgita* their most important religious text. The first translation into English, by Charles Wilkins, was published in 1785. Westerners' affection for the *Bhagavadgita* has made it the most translated text after the Bible.

Environmentalists have found several ecological themes in the *Bhagavadgita*: The world as the body (*deha*) of God; the duty of preserving the world (*lokasamgraha*); the simple and non-materialistic lifestyle of the ascetic (the *sthitaprajna*); and the idea of the unity of all living beings. The *Bhagavadgita* narrates that Krishna allowed Arjuna to see his transcendent form. Arjuna then saw "the whole world with all beings" (11.7), the universe itself, in Krishna's body. This vision of the world as God's body was the inspiration for the famous theologian Ramanuja (1017–1137) who made the image of the world as the body of God a central element of his theology, and has recently been evoked by environmentalists.

The expression *lokasamgraha* (3.20, 3.25) has also been reinterpreted in an environmental context. This expression was favored by modern political Hindu thinkers such as Bal Gangadhar Tilak (1857–1920) and Sarvapalli Radhakrishnan (1888–1975) and interpreted in a political fashion to mean that one should act for "the welfare of the world." An environmental interpretation of *lokasamgraha* means that one should act for the preservation of the ecosystem.

The *Bhagavadgita* was Mahatma Gandhi's favorite book. Gandhi repeatedly stated that the last twenty verses of chapter two constituted the core of the *Bhagavadgita*. These verses describe the *sthitaprajna*, "one whose mental attitude is disciplined." He is the ideal person, since, according to Gandhi, control and non-attachment constitute the essence of religion. A *sthitaprajna* is free from greed, is calm and non attached. Attachment is the cause of desire and anger, while the withdrawal of the senses from the

objects of the senses leads to the abandoning of all desire and to peace, argues Krishna in the *Bhaga- vadgita*. The *sthitaprajna*, at peace with his surroundings, living a simple life with insignificant material consumption, has inspired environmental thinking. The *sthitapra- jna* can function as a critique of the materialistic lifestyle based on greed and suggest a style of life that is “simple in means, rich in ends,” as it is stated in deep ecology. The founder of deep ecology, Arne Naess, often quotes *Bhagavadgita* 6.29 in his writings, a verse he believes expresses the ultimate goal of his ecosophy. *Bhagavadgita*

6.29 tells about a person who sees himself in all beings (*sarvabhutastham atmanam*) and sees the same everywhere (*sarvatrasamadarshana*). Self-realization writes Naess, “insinuates a philosophy of oneness as does chapter 6, verse 29 of the *Gita*,” and this verse expresses, according to Naess, self-realization in its absolute maximum. Traditional commentaries on the *Bhagavadgita* 6.29 give a quite different interpretation, because the traditional salvific goal of Hinduism is freedom from the world (*samsara*) and not merging with *samsara* as favored by Naess’ ecosophy.

Biblical Foundations for Christian Stewardship

As one of our earliest texts, and one that is ethically based, the Bible contributes to stewardship of the most robust kind – stewardship that is developed interactively between people and changing environments over long periods of time. A number of foundations or principles for stewardship can be gleaned from the Bible. These have often guided Christian people. The following are particularly prominent and important.

Reciprocal Service Principle

Service by creation to people must be reciprocated with service back to creation. Stewardship does not allow taking without giving back. Instead it returns creation's service with returned human service that is given in appreciation, gratitude, and care. This principle comes in part from Genesis 2:15 where Adam is expected to *'abad* and *shamar* the garden. The Hebrew word *'abad*, usually translated *cultivate, tend, or till*, literally means *to serve* and is translated as such in *Young's Literal Translation*. Interestingly, the Bible does not state that the garden serves people. Instead, it stresses that human beings must serve the garden. Thus, the garden's service to us must be returned with service of our own. Ours is a con-service – a service *with*. It is *reciprocal service* between people and other creatures: it is con-service, *con-servancy*, and *con-servation*.

Earthkeeping Principle

Earth and its provisions for the great variety of living creatures must be respected and maintained as God's provisions, even as they sustain us. The biosphere is a remarkable system whereby the Creator sustains human beings and all of life. It therefore must be recognized by people as a great household that must be the subject of "housekeeping." It must be kept in good order, intact and functioning well. The second Hebrew word cited above from Genesis 2:15 is *shamar*, a word used also in the blessing of Aaron (Numbers 6:24): "the Lord bless you and *shamar* you." This word means *to keep*, not in a preservationist sense (for which there is another word, *natsar*), but in a dynamic sense; it is not the kind of keeping done for pickles in a jar or animals in

a zoo, but the kind of keeping one does when maintaining a long-distance runner or animals in nature. Keeping in the *shamar* sense of keeping means that the runner is kept by “putting it through its paces,” and the animal is kept by preserving its habitat.

Fruitfulness Principle

Human beings may take of the fruit of creation but not destroy the capacity of creation to be fruitful. The capacity of living things to be fruitful is the basis for all life and it must be preserved, even as the produce of creation might be consumed. The best-known biblical passage on this is “the world’s first endangered species act” of Genesis 6 through 9. Noah’s faithful action preserves the lineages of creatures by preserving their capacity to reproduce. This principle is powerfully expressed in Ezekiel 34:18, “Is it not enough for you to feed on the green pastures, must you also trample them under your feet? Is it not enough for you to drink the pure water, must you muddy the rest with your feet?” The plants of the pasture may be eaten and the pure water may be used to quench thirst, but the capacity of the pasture to produce good forage and the stream to produce pure water must be preserved.

Sabbath Principle

Human beings must provide for creation’s and every creature’s sabbath rests; creation and the creatures must not be relentlessly pressed. Every creature, animate and inanimate, must have its regular times of rest so they, in their own peculiar ways, can “enjoy” their being, refresh themselves, and recuperate from having to give and to get. The reason given by the Bible is that after creating the heaven and Earth, God rested (Genesis 2:2–3). As people and their animals are to take their Sabbath rests one day in seven, the land must do so one year in seven (Exodus 23; Leviticus 25 & 26).

Peaceable Kingdom Principle

Human beings must first of all seek the peaceable kingdom that incorporates every creature, rather than seeking selfinterest. All the blessings that flow in creation and human society should be the products of seeking the integrity of creation and society as the number one priority. Seeking creation’s integrity and social integrity first is the real route to society’s and creation’s fulfillment. If this is done as a matter of priority, the other things people need will be provided (Matthew 6:33).

Practice Principle

Human beings must put knowledge of what is right and good into practice, rather than confining such knowledge to human minds and publications. It does absolutely no good to know what is right and good if people do not put this knowledge into practice. The creation and human society benefit not from sequestering such knowledge but by applying this knowledge to achieve and maintain creation's and society's integrity (Ezekiel 33:31–32).

In its commentary on the failure to put biblical teachings into practice, the Bible observes that people often do not do the good they would like to do, and end up doing the bad things they really do not want to do. This is “the human predicament” and comes from human arrogance, ignorance, greed, and aggression. It is to these that the Bible offers a comprehensive solution taught by the Bible and summarized in the concept of *stewardship* (cf. Russell 1994).

Bigfoot

At the boundary between civilization and nature, between the known and the unknown worlds, stands a shaggy giant. Bigfoot, Sasquatch, the abominable snowman. Whether unknown primate or mythological beast, this creature's presence in our imaginations raises sensations of fear, curiosity, and holy awe. To some, an alleged sighting of Bigfoot would show merely that not all secrets of the natural world are known. To others, such an apparition would be an irruption of other dimensions of existence into everyday life, a supernatural message from a potent protector of wild lands.

Stories about large, shaggy ape-like creatures have been reported in the Americas, Europe, and Asia over many centuries. For example, the monster Grendel in the Anglo-Saxon epic poem *Beowulf*, a huge "wild man" living in a desolate swamp, can be seen as a sort of Bigfoot (Wallace 1983: 100). Typical reported contemporary encounters involve fleeting glimpses of a huge but shy shaggy giant with a nauseating odor. Bigfoot is often said to make whistling and crying sounds that cannot be confused with those of coyotes, mountain lions, owls, or bugling elk.

The alternate name "Sasquatch" comes from *saskeha-vas* in the Salish language family of the Pacific Northwest. In the Klamath language of northern California, the mysterious giant is called "Omah." In the Himalayas, a similar creature is called the "yeti" or "abominable snowman." The giant has been compared to and equated with Bukwus and Dzonuqua, the Wild Man and Wild Woman of the woods for the Pacific Coast Kwakiutl tribe. Puget Sound tribes told of the Seehtlks, a group of reclusive and hairy people living in the Cascades, inhabiting the border between the human and animal worlds. Elsewhere in North America, the Algonkian Indians told of Windigo, a wild cannibal giant, while indigenous residents of Alaska's Kenai Peninsula have stories of Nantiinaq, who can change from its Bigfoot shape into those of other creatures. Other shaggy giants have been reported in Nepal, Tibet, Mongolia, and Siberia. Europeans also had "Wild Man" stories, not to mention the half-animal Pan and the satyrs, all living on the margin of civilization and embodying the energies of surging life, vegetation, and wild-animal reproduction.

Alleged sightings of live creatures or discoveries of their footprints have been made in most wooded areas of North America. In a 1924 incident, miners working near Mount St. Helens in southwest Washington state said they had shot at a giant ape-man and then had been attacked by its companions. The dead creature was said to have fallen into a gorge, which has since carried the name Ape Canyon. Perhaps the most famous claim of a Bigfoot encounter came on 20 October 1967 when two freelance Bigfoot searchers, Robert Patterson and Roger Gimlin, reported encountering a solitary giant

along Bluff Creek in Del Norte County, California, in the state's northwest corner. The 952 frames of 16 mm film that Patterson shot have been extensively analyzed without a definite conclusion whether they show a person in Bigfoot costume or an actual unknown North American primate. The name "Bigfoot" originated in the same locale, after huge footprints were found in a logging road bulldozed into virgin forest in 1958.

The greatest collection of Bigfoot sightings comes from the area between Northern California and Alaska, particularly the Cascade Mountains, where a variety of native tribes told stories of hairy giants in the forests. A nineteenth-century paleontologist, Othniel Marsh, described carved stone heads with ape-like features, found in the Columbia River basin, predating contact with American settlers.

Washington State University anthropologist Grover Krantz, after examining the "Patterson film" and hundreds of casts of purported Bigfoot footprints and other evidence, concluded that an unclassified primate lives in the Cascadia bioregion of North America. He placed it within the genus *Gigantopithecus* and suggested that it was identical with *G. blacki*, a giant prehistoric primate known from fossil remains discovered in China and India that date back roughly 500,000 years to the Middle Pleistocene era. Based on the size of the jawbones found,

G. blacki was half again as large as a gorilla, with males weighing about 350 kg (770 lbs) and females about 250 kg (550 lbs). Based on its teeth, *G. blacki* was probably omnivorous but primarily vegetarian. Likewise, Krantz argued, the generally solitary and nocturnal Bigfoot would eat much the same foods as a black bear, being primarily vegetarian but scavenging meat when it could. In his view, it probably does not hibernate, however.

If Bigfoot were proven to exist in the United States, it undoubtedly would be protected as an endangered species. Some, such as Peter Byrne, have insisted that, if found, no Bigfoot should be killed, even for scientific research (Pyle 1995: 193). In 1969, Skamania County, Washington, passed an ordinance defining the "Wanton Slaying of [an] Ape-Creature" as a felony (later changed in 1984 for legal reasons to a misdemeanor). Although it has been suggested that the ordinance was something of a joke, it remains in effect.

More recently, Gordon Krantz suggested that the more bizarre Bigfoot hunters have been secretly financed by timber companies. If the timber companies can thus discredit all Bigfoot researchers, serious wildlife biologists would not waste their time looking for an unknown animal. For if Bigfoot were discovered to exist, large areas of public land would probably be declared off-limits to lumbering and mining in order to protect its habitat (Krantz 1992: 233).

Bigfoot can also be seen as an embodiment of wilderness and as its guardian. In the words of naturalist David Rains Wallace, "Giants seem to have originated as a way of giving human form to all that is titanic and inchoate in nature" (1983: 137). As guardian of wilderness, Bigfoot is more potent than the bureaucratic Smokey Bear. To tell stories of even a mythical Bigfoot is to admit to the sacred and uncontrollable powers of nature. Perhaps Bigfoot's association with loggers in the Pacific Northwest

represents our moral ambivalence toward cutting trees (or hunting or mining), even when such activities are described as economically or spiritually necessary.

While there is no “religion of Bigfoot” (although some New Age thinkers connect outbreaks of sightings with prophesied “Earth changes”), Bigfoot dwells permanently in the contemporary spiritual landscape. Both fierce and protective yet gentle and reclusive, Bigfoot personifies our own ambiguity about the sacrality and nature of wilderness.

Biocentric Religion – A Call for

Throughout the history of the human species, there has been a need for, and a continual quest for, a philosophy to rely upon, to have faith in, something to provide meaning, comfort, and answers to questions that have no answers.

When there is a need for a philosophy to justify existence it is called religion. It can be defined as a collection of ideas designed to give the appearance of substance to an illusion. All the religions of humanity are nothing more than a mask covering the face of nothingness.

Thus all religions are merely masks. A quest for meaning can never move behind the mask without negating the meaning of the mask.

Another way of describing religion is as a socially acceptable collective mass psychosis.

Gertrude Stein once remarked, “The answer is that there is no answer and that is the answer.”

We are finite creatures living in a universe of infinite space, time, dimension and undiscovered realities. The finite mind is incapable, and will always be incapable, of comprehending the infinite. We cannot finite the infinite.

Religion throughout human history has been the attempt to interpret infinity in finite terms. Since this is an impossibility, religion as a means of truly understanding the nature and meaning of existence is doomed to failure. The most that religion can accomplish is to provide a crutch for the weak or lazy-minded to absolve guilt or to negate inquiry, and to serve as justification for the exercise of baser instincts like aggression, territoriality, ethnic cleansing, bigotry, or sociopathic perversions.

An examination of all the world’s major religions presents one very obvious flaw. They are all anthropocentric in structure. In a world populated by tens of millions of species of living things, all of humanity’s major religions focus exclusively on the superiority and divinity of the human species. All of them center themselves on a human being, be it a Christ, a Mohammed, a Buddha, or gods whose forms are human. For example – Yahweh, Allah, or Krishna. Even the Hindu and Egyptian gods with the heads of elephants, jackals, and other animals still utilize the human form as the basis of the body concept. Extra arms, animal heads, or the addition of wings are merely attachments to the human form.

It is understandable that religion emerged with the evolution of primates and hominids. Primates are social creatures and tribal by nature.

The hominid primate became successful by building upon the tribal social structure and perfecting it through the introduction of a hierarchy that molds, rewards,

and punishes its members. Tribal identification manifests itself primarily in aggressive territoriality. Territoriality breeds hostility to those outside the tribe and conformity fosters allegiance of the members within the tribe. Failure to conform is punished by being ostracized, banished, imprisoned, or killed.

The entire history of humanity is made up of offensive and defensive confrontations between tribal entities. This has evolved to the situation in the present day where the entire planet has been carved up into territorial domains ruled by tribes. In fact there is not one square inch of land on Earth that is not claimed by a human tribe. This obsession has become so extreme that, as an example, even a tiny remote uninhabitable outcropping of rock in the Southern Ocean is claimed by Great Britain and named Scott Island. People have even attempted to establish countries on abandoned oil platforms.

Thus it should not be a surprise to see an established religion having its God promise specific areas of land to a particular tribe. Such territorial establishment in the name of the divine is justification for the eradication of another tribe that disagrees with, or is ignorant of, the specific religious proclamation. The adherents of this particular philosophy see the genocide of the Canaanites by the Israelites under Joshua as legitimate murder.

Joshua was absolved of any guilt because he acted under the orders of a mythical being created for the express purpose of supporting tribal organization and expansion. This trend has continued through the centuries.

We saw German soldiers in World War II wearing belt buckles emblazoned with the words "*Gott mit Uns.*" In the present, we see suicide attacks in the name of Allah with the call of Jihad answered by a call for a Christian Crusade by the President of the United States.

Christians absolve themselves of guilt by proclaiming that their God was a man in mortal form who died for the "sins of humanity." This is all well and good, but what exactly are the sins of humanity?

Christianity does not examine what the sins are, choosing to ignore them. But having had Christ die to have these vaguely defined sins forgiven, Christians have continued to wage war on both humanity and nature for two thousand years. Christianity brilliantly fabricated a belief system to forgive all transgressions thereby absolving the human conscience of blame for tribalistic expansion. The genocide of the American Indians was justified and rationalized because these were unbelievers who had sinned by not believing in a Middle Eastern thunder god.

Christianity has itself split into numerous different tribes like Catholic, Protestant, Mormon, Methodist, and so many more.

Islam, Judaism and Buddhism have also splintered into tribes, as have all other religions. The reason for the splintering is primarily to justify a tribe's change of direction on political or ethical grounds. Anglicanism was created to justify the divorce of a British King. Reform Judaism was created to justify Zionism. Existing religions are sometimes altered or new religions created to accommodate what is essentially a per-

sonality cult. Examples are the Mormons under Joseph Smith, the Branch Davidians under David Koresh, or Scientology created by L. Ron Hubbard.

The one thing however that has been consistent and unchanging has been that all of humanity's religions are based on monkey-god spirituality. They all revere the anthropocentric concept, and the gods are all of human form. This is not surprising because humans created all the gods. What is surprising is that we still have not evolved out of this anthropocentric quagmire. And it is this failure to let go of the anthropocentric that will be our undoing. Even the belief in humanism, while denying a god, still projects humanity as central and looks for salvation through human science and logic.

Upon the altar of our monkey gods, we have been sacrificing species of plants and animals, and we have sacrificed our own children. For this reason, it is fitting that the foundation of the three great religions of Judaism, Christianity, and Islam begin with the Sumerian patriarch Abraham, who was willing to sacrifice his son Isaac to his God.

The adherents of these three religions continue to this day to sacrifice the living for the benefit of their belief systems.

For this reason we are in the midst of the largest mass extinction of species to occur in the last sixty-five million years. For this reason, we have stolen the carrying capacity of all other species and placed it under the domination of one species – ourselves. For this reason, we pump chemical pollutants into rivers, lakes, and our oceans. For this reason, we thoughtlessly expand our own numbers like lemmings racing toward the cliff of ecological disaster.

If we step back and look at ourselves objectively, what do we see? What I see is an overly self-glorified, conceited, naked ape that has become a divine legend in its own collective mind.

We exist in a world where we have collectively dismissed practically every other species, giving thought only to those species that we have enslaved and labeled domestic. Our domestic cattle now outnumber all other ungulates combined. Our domestic dog and cat populations are greater in number than all the world's seal, wolf, lion, tiger, and jaguar populations combined. We have destabilized practically every ecosystem on Earth with the introduction of exotic species and the sheer weight of our ever-expanding human populations. We have created environments for the mutation of viruses by strengthening viral immune systems and removing natural limitation factors. By removing traditional hosts for some species of virus, we have offered ourselves as a new host for them to infect, and thus we have viral species jumping from species to species to survive, and many are attracted to our great numbers.

Our myths, religions, philosophies and beliefs have failed us. We forget that if the planetary ecosystem is weakened, we humans are also weakened. We forget that we are hominids, and hominids have not been overly successful, we being the last surviving species of hominid primate.

Our species possesses a great ability to forget and to adapt, and our selfishness allows us to ignore the consequences for the future of our actions in the present.

We have adapted to impure water. In 1970 clean water usually still came from a tap. Today we buy it in bottles and its value per liter is nearly four times that of gasoline. As fish species decline, we utilize advertising to make what was unappealing two decades ago into something worthwhile today. For example, the turbot was a fish with no commercial value when cod, haddock, and halibut were in abundance. Today it is turbot, mussels, or Pollock on the menu of Parisian or New York ritzy restaurants, and the traditionally more valuable fish have been forgotten. We are adapting to diminishment.

In 1950 the world's human population was three billion. It is today over six and a half billion, having doubled in a generation. The majority of these six and half billion are now under the age of twenty-five and this means another doubling by 2050 to thirteen billion and by 2100 to twenty-six billion. Yet the consequences of this are not even mentioned in the mass media because our religions call for the sanctity of human life and preach continued expansion as we replace quality of life for all species on Earth with quantity of human life to cover the planet. And despite the call for the sanctity of human life, we continue with the global mass slaughter of other humans through warfare, famine, disease, and civil strife.

What we need if we are to survive is a new story, a new myth, and a new religion. We need to replace anthropocentrism with biocentrism. We need to construct a religion that incorporates all species and establishes nature as sacred and deserving of respect.

Christians have denounced this idea as worshipping the creation and not the Creator. Yet in the name of the Creator, they have advocated the destruction of the creation.

What is true however is that we can know the creation; we can see it, hear it, smell it, feel it and experience it. We can also nurture and protect it. We cannot and we will never know the true story of the creation, most likely because there never was a creation. There is, always has, and always will be the infinite.

I reject the anthropocentric idea of custodianship. This is an idea that once again conveys human superiority, and quite frankly, we have always been lousy custodians.

Religions are based on rules, and we already have the rules in place for the establishment of a religion based on nature. These are the basic Laws of Ecology. It is a fact that throughout the entire history of the Earth, all species that have not lived within the bounds of the natural ecological laws have gone extinct. Those that have lived within the bounds have flourished with the exception of interference by other species that have upset the balance for all.

The first is the Law of Diversity. The strength of an ecosystem is dependent upon its diversity. The greatest threat to the planet's living species in the present is the escalating destruction of biological diversity. The primary reason for this can be found in the next three laws.

The second law is the Law of Interdependence. All species are interdependent upon each other. As Sierra Club founder John Muir once said, "When you tug on any part of the planet, you will find it intimately connected to every other part of the planet."

The third law is the Law of Finite Resources. There are limits to growth in every species because there are limits to carrying capacity of every ecosystem.

The fourth law of ecology is the Law that a Species must have Precedence over the interests of any individual, or group of individuals of any other species. This means that the rights of a species to survive must take precedence over the right of any individual or group to exploit the species beyond the law of finite resources.

What does this mean for humanity? It means that every human action must be guided by what potential consequences it will have on diversity, the availability of resources to all other species, relationships with all other species, and the rights of all other species.

The protection, conservation, and preservation of the Earth should be the foremost human concern. We must look upon the Earth, her ecosystems and species as sacred. Anthropocentric culture has taught most of us to look upon anthropocentric beliefs as sacred. Thus it is considered blasphemy to spit upon the Black Stone in Mecca or to vandalize the Wailing Wall in Jerusalem or to desecrate a marble statue in the Vatican. If any person were to do any of these things, they would be dealt with quickly and violently, and anthropocentric society would applaud their murders or punishment as justifiable. Yet when loggers assault the sacredness of the forests of Amazonia, humanity says very little. When the Taliban destroyed two 800-year-old manmade Buddhist statues in Afghanistan, the world was outraged, yet there has been relatively little protest over the wanton destruction of 3000-year-old living redwoods and sequoia trees in California.

We must develop a philosophy where a redwood tree is more sacred than a human-made religious icon, where a species of bird or butterfly is of more value and deserving of more respect than the crown jewels of a nation, and where the survival of a species of cacti or flower is more important than the survival of a monument to human conceit like the pyramids.

With the laws of ecology as a foundation for a new biocentric, ecocentric worldview, we can then look at providing a sense of identity. Religious identity has been primarily tribal, dividing people into groups or cults at odds with each other. A biocentric identity is something completely different because it is all-encompassing.

An acceptance of interspecies equality allows a sense of planetary belonging. To be part of the whole is to be free of the alienation caused by an individual species like our own becoming divorced and alienated from the biospheric family of life.

With this revolutionary approach to forming a new religion, we have rules and we have a sense of belonging. Since the membership is multi-species and encompasses all ecosystems, there is no need for a church. The planet becomes its own church and the philosophy is uncontainable.

One thing however is left to make such a new story possible. That is a legacy, a reason to live and a reason to create and nurture.

That reason can be found in the Continuum.

The Continuum is a biocentric concept, understood by many indigenous cultures. It is living within the understanding of the connectedness of all things. All that came before and all that will come later are also one and the same. Past, present, and future are different stretches of the same river. Like the molecules of water in a river, the living beings of the past remain connected to the living beings of the future through the living beings of the present.

Anthropocentrism has taken humans out of step with the flow of time. There is no longer a connection to their ancestors nor do they feel kinship with their own children of the future. Kinship with all other species has virtually disappeared.

The Continuum is the guide for navigating the river of life. Without the Continuum, life has no direction and runs counter to the Ecological Laws guaranteeing ecological disorder.

A biocentrically oriented human naturally takes an interest in the people and species of the past. Anthropocentric people give little thought to the deeds and lives of their grandparents or in many cases, even their parents.

A biocentric perspective allows a vision into the future for it conveys an understanding of the connection to tomorrow. Thus thought is given to the consequences of actions for generations to come because the knowledge of consequences is real. What we do today will determine the state of the planet a thousand years, ten thousand years, and a million years from today. The biocentric person loves not only the child of his or her own loins but also the baby, child, and adult who is birthed by the woman, who is reality by virtue of a direct link between the now and tomorrow.

Born of the Earth, we return to the Earth. The soil beneath our feet contains the material reality of the ancestors of all species. Without the collective, expired lives of the past, there would be less soil. For this reason, the soil itself is our collective ancestry, and thus the soil should be as sacred to us.

The water of the Earth is the blood of the planet and within its immensity will be found the molecules of water, which once enlivened the cells of our ancestors of all species. The water you drink once coursed through the blood of the dinosaurs, or was drunk by Precambrian ferns, or was expelled in the urine of a mastodon. Water has utilized the lives of all living things as part of its planetary circulatory system. All life contains water. Therefore water is sacred.

The air that we breathe has passed through countless respiratory systems and thus has been chemically stabilized by plants and animals. Without the lives that have gone before, there would be no air to breathe. The life of the past has nurtured the atmosphere. Therefore the air is sacred.

In fact, the air, the water, and the soil form the trinity of sacredness in a biocentric perspective.

Our lives in the present should be sacred to the living beings of the future.

I am advancing this idea of a new religion because we need to return to the garden of the natural world. We need to revolt against anthropocentric thought, this matrix-

like cloak of homo-oriented values that mold our perceptions of our world in such a complex and perverse manner.

It is anthropocentric religious beliefs that have shaped us for nearly ten thousand years. But ten thousand years is nothing compared to the history of our species. Yes, these ten thousand years have given us technology, comfort, and superiority. It has also given us genocide, specicide and ecocide. The price has been high.

But now we are in a unique position to retain the positive discoveries of our venture into anthropocentrism and to reject the negative. The negative is primarily anthropocentric religious beliefs.

If we remove tribalism and anthropocentrism and if we adopt the guidance of the Continuum and live within the Laws of Ecology, we will find ourselves on a planet living harmoniously with millions of other species who we can, and should, call fellow Earthlings.

Biodiversity

The scientific concept of biodiversity has revolutionized biology, conservation, and related arenas in Western society since the 1980s. Biodiversity refers to the variety, variability, and processes of life at all levels from the genetic to the biosphere. However, usually the focus is on the number of species in an area or biome. (Biome refers to similar types of ecosystems, such as tropical rainforests.)

Many biologists, although operating mainly if not exclusively within the framework of Western science, variously recognize the mutual relevance of biodiversity and religion. As David Takacs writes:

By activism on behalf of what they call *biodiversity*, conservation biologists seek to redefine the boundaries of science and politics, ethics and religion, nature and our ideas about it. They believe that humans and other species with which we share the Earth are imperiled by an unparalleled ecological crisis, whose roots lie in an unheeded ethical crisis. *Biodiversity* is the rallying cry currently used by biologists to draw attention to this crisis and to encapsulate the Earth's myriad species and biological processes, as well as a host of values ascribed to the natural world. An elite group of biologists aims to forge a new ethic, in which biodiversity's multiplicity of values will be respected, appreciated, and perhaps even worshipped (1996: 9).

Takacs identifies spiritual value as among the several different kinds of values of biodiversity, based on interviews with numerous prominent biologists (1996: 254–70). Most of them, speaking as scientists, would not admit to being religious in the sense of ascribing to any particular religious tradition or organization. However, many of them admitted to having extraordinary experiences during their field research in nature that they variously identified as a sense of wonder, awe, joy, exhilaration, tranquility, reverence, mystery, or spirituality. (Most distinguish between religion as a social institution and spirituality as an individual experience.) Takacs concludes:

Some biologists have found their own brand of religion, and it is based on biodiversity. The biologists portrayed here attach the label *spiritual* to deep, driving feelings they can't understand, but that give their lives meaning, impel their professional activities, and make them ardent conservationists (1996: 270).

Closely related is the phenomenon of biophilia, a profound affective bond with nature.

The above approach is a radical departure from the nearly exclusive emphasis of most environmentalists for some two centuries on material factors for sustainable natural resource and environmental use, management, and conservation, including science, technology, economics, government, politics, and education. Since the late 1980s, how-

ever, there has been a growing realization that, while material factors are necessary to consider, they are not sufficient. Increasingly, many biologists and others add spirituality as the most important factor of all, because it can generate a far more profound appreciation and respect for nature. For example, Takacs notes that most of the biologists he interviewed think that: “If the value of biodiversity were felt not merely in the pocket or in the brain but in the *soul*, then the most effective, permanent conservation ethic imaginable might result” (1996: 256; cf. Wilson 1992: 343–51). Although recent, this approach is not completely new. The writings of pioneer naturalists and environmentalists, like Henry David Thoreau (1817–1862), John Muir (1838–1914), and Aldo Leopold (1887–1948), clearly reveal that their communion with nature was spiritual. Yet any spiritual approach appears to have been suppressed, if not eliminated, from the work of most naturalists and environmentalists until recently.

Arguably scientific concepts like biodiversity and biophilia are a Western rediscovery of the ancient ecological wisdom and corresponding practices of many traditional cultures. In many ways, and to varying degrees, most indigenous societies have developed worldviews, attitudes, values, institutions, and behaviors that usually promote sustainable use of biodiversity and often enrich it as well. The sustainability of most indigenous societies is evidenced by the fact that they and the ecosystems in their habitats survived for centuries or even millennia.

Religion, when an integral component of the sociocultural system, can serve as a mechanism for symbolically and ritually encoding the uses of biodiversity for sustainable subsistence and conservation practices. Religion may reinforce behaviors that variously limit the harvesting of plants and animals by species, stage in the life history of individual organisms, time, and/or space. For example, among Aborigines in Australia, traditionally the societies of humans and other beings are integrated, as are the natural and supernatural components of their world. This is reflected in their practice of totemism, a socio-religious system of beliefs, values, attitudes, and rituals regarding nature in which individual and/or group ancestry is believed to derive from certain animal or plant species. Behavior toward these totemic species is accordingly reverential, rather than exploitative and destructive. Totemism extends kinship to nonhuman species with affective bonds (biophilia), spiritual obligations, and reciprocity.

Similarly, in Amazonia, traditional indigenous cultures each developed a set of faunal prohibitions or food taboos on a somewhat different combination of animal species. Logically, the net result of hundreds of cultures each prohibiting a somewhat different combination of species as totems or taboos probably resulted in a widespread and long-term system of species refuges. In effect, even if inadvertently, this would promote biodiversity conservation by relieving human predation pressure regionally.

In addition to taboos or restrictions on particular species, most traditional indigenous societies and many others set aside whole areas as sacred places. These merited special reverence and rules for any use, and consequently, many most likely functioned as nature reserves or biodiversity refuges for a multitude of species. Among other natural phenomena, sacred places range from single trees and their surroundings to

groves of trees and even entire forests, the latter often coinciding with mountains also considered to be sacred.

While the mutual relevance of religion and nature, or more specifically spirituality and biodiversity, is often asserted with only logical arguments, textual interpretations, and/or anecdotal evidence from library research, a growing number of field studies are systematically and empirically testing and verifying specific hypotheses. For instance, a recent report by Bruce Byers, Robert Cunliffe and Andrew Hudak (2001) demonstrates that in the Zambezi Valley of northern Zimbabwe in southeastern Africa, deforestation in sacred forests is at least 50 percent less than that in their secular counterparts. Some 133 species of native plants occur in these sacred forests, whereas they are threatened, endangered, or extirpated elsewhere in Zimbabwe. In this case, spiritual values have helped to protect biodiversity as Byers et al., succinctly explain:

In the Shona language the word sacred, *inoera*, is an adjective describing a thing or place. Sacredness has the connotation of being life sustaining, such as providing food, fruit, or water. The concept is closely linked with rain, and the fertility of the land. A sacred place (*nzvimbo inoera*) is a place where spirits are present; it has certain rules of access, as well as behaviors that are not allowed there (taboos) (2001: 193).

While Byers and his colleagues only examined sacred forests, they allude to the sacred geography of the Zambezi Valley landscape by noting that many other kinds of sacred places also exist, including certain trees, pools, rivers, mountains, and even mountain ranges. They conclude that biodiversity conservation strategies which link the conservation of culture and nature are more likely to be effective than top-down government and/or international approaches which ignore traditional beliefs, values, and institutions.

The diversity principle recognizes the general geographic coincidence between high concentrations of both biological and cultural diversity, usually in the tropics and especially rainforest areas. (Cultural diversity includes diversity in languages and religions.) The countries that biologists and environmentalists identify as megadiversity countries also have high concentrations of cultural diversity: Mexico, Brazil, Congo, Indonesia, and Papua New Guinea. Such regions of high diversity are, however, increasingly threatened by external forces, eroding both biological and cultural diversity.

One cause of biodiversity erosion is economic, stemming successively from European colonialism, industrialization, economic development, and more recently, globalization. The impoverishment of the wealth and vitality of nature is in no small measure caused by the progressive objectification and commodification of biodiversity, ecosystems, and landscapes as economic resources with the concomitant desacralization of nature.

Another source of biodiversity erosion is rampant and coercive missionization, especially from Christianity and Islam. Because religion is often the single most important force providing cohesion in a sociocultural system, changes in religion can precipitate changes elsewhere in the system, and even its disintegration, which in turn impacts on ecological relationships. Christians and Muslims, when fanatics, have usually sup-

pressed, if not destroyed, the sacred beliefs, practices, and places of people they considered to be pagans or infidels.

Such considerations lead to the conclusion that the historical ecology of the transformation of Animism by Christians, Muslims, and others – when they consider their own religion to be the exclusive truth and become expansionist and destructive – is part of the history of biodiversity erosion. A correlate is that the promotion of biodiversity conservation depends to a considerable extent on genuine respect for religious freedom together with the maintenance or restoration of traditional spiritual ecologies including sacred places in nature. Greater tolerance and appreciation for other religions as humankind's wisdom can be facilitated by increasing all of the following – knowledge about them, recognition of their commonalities, and interfaith dialog. Of course, the history of inter-religious conflicts and violence from ancient times to this day in many parts of the world indicates just how great the challenges are. There is also the obstacle of the frequent discrepancy between professed ideals and manifest actions of adherents to any religion.

The above discussion is not intended to leave the impression that all indigenous cultures and religions are always in some kind of benevolent harmony with their natural environment, although clearly, to varying degrees, most have been and many continue to be. Also this is not to imply that religions such as Christianity are necessarily detrimental to biodiversity conservation. For instance, the exemplary biophilic ideas and actions of Christians like St. Francis of Assisi (1182–1226) and Albert Schweitzer (1875–1965) in their reverence for all life are noteworthy, albeit exceptional. Also, the Shona provide an example wherein those who are Christian may still respect traditional sacred places. My main argument is that there are multifarious connections between biodiversity and religion which really need to be explored in a far more systematic and penetrating manner for practical environmental as well as scientific, intellectual, and spiritual purposes. Whether those connections are positive or negative, adaptive or maladaptive, also needs to be assessed as holistically, objectively, and empirically as possible in specific cases. The future of humankind and biodiversity depend on such explorations and understandings.

Biodiversity and Religion in Equatorial Africa

Biodiversity is a concept used to describe the variety (in terms of species or genetic variability) that exists among living organisms and the environments (ecosystems or biomes) in which they are found. Equatorial Africa is known for being one of the most biologically diverse regions on the planet, due to its tropical climate and high rainfall. Of particular interest are the rainforests: from the Congo basin to the coastal forests of western Africa, the rainforests are teeming with life. It is estimated that there are over 8000 different plant species within the rainforests of equatorial Africa, of which 90 percent have not even been identified by scientists. Central Africa gave rise to many species that are endemic to that particular region, for example the Okapi (an animal related to the giraffe family), one of 52 species endemic to the Democratic Republic of the Congo (DRC); and Okoumé, a type of tree found only in Central Africa. These habitats, be they rainforest or savannah, that house these diverse species have long been the reservoirs of water, fuel and food to the humans that have lived around them and survived from the resources found there.

Fossil evidence indicates that humankind lived in Africa as long as 120,000 years ago. How has this rich and varied landscape with its flora and fauna shaped human concepts and responses to our own role in this realm of biodiversity? Africans in the countries that comprise equatorial Africa have affected the rainforests of today and the rainforests have shaped Africans' religious responses to the wildlife inhabiting them. This is apparent in myths which explain their environment; in terms of resources in medicinal uses of plants and animals; in taboos against hunting and eating of certain animals; in reverence or veneration of certain sacred sites or plants and animals; and in ritualistic and sacrificial use or symbolic representation of certain types of plants and animals.

Animals and plants are venerated and feared in a rich tapestry of folklore and myths. Some myths seek to provide an explanation for the existence of an animal, the way an animal behaves or has certain characteristics. In many African belief systems incorporated into myths, a common character that appears is the trickster, who is variously thought of as being in the form of the hyena, spider or jackal. In Cameroon, there is a myth that seeks to provide a reason for elephants' intelligence by explaining that one day a human was transformed into the form of an elephant, and thus created a new species that still had the intelligence of a human. Elephants' behavior is used

to back the story up: elephants wash themselves with their trunk as humans do with their hands.

Muti (variant *muthi*) is a Zulu word meaning traditional medicine. In Muti parts of plants and animals are used as ingredients, either for their actual medicinal properties or symbolic properties. Despite the Zulu etymological derivation, Muti practices are found right across equatorial Africa. Even the word itself has in some cases been adopted to refer to these practices. In the case of animals, this may include using hair, teeth, meat, bones, tail, fat, feces and glands. These parts are often ground up and applied to the body or imbibed by the person seeking the spiritual or physical cure. Similarly, all conceivable parts of plants are put to use in Muti practices. These particular parts of plants and animals will be specifically chosen as they will be thought of as possessing the desired attributes or qualities. An example of a medicinal use of Muti is the African potato (*Hypoxis hemerocallidea*), which has long been used in traditional medicine as a cure for illnesses such as tuberculosis and sexually transmitted diseases. This particular plant has been verified by scientists as having curative properties. An example of a spiritual or magical use of Muti is the use of the horn of a black duiker, which has been known to be used in order to pinpoint the identity of thieves. Animals are also ritually sacrificed for ancestral veneration or placation of a deity. Different deities may require a certain type of animal to be sacrificed to them, or the purpose may dictate the choice of animal. While in itself morally neutral, cases of humans being murdered for Muti parts, and rarely as sacrifice to a deity, are known throughout sub-Saharan Africa.

Many taboos against hunting or killing of certain animals exist. For example, the bonobo in the DRC up until the 1980s was mostly protected because there existed a taboo held by many, including the people in the village of Wamba. The villagers believed that they must not eat bonobo meat as bonobo had once been their brothers that had become separated from their human relatives and had gone to live in the forest. Unfortunately, since the 1980s, starvation has taken precedence over religious taboos and this creature is now being hunted prolifically for meat. The way an animal is associated with particular powers or forces in traditional folklore has in some cases had a powerful effect on the way that species is treated, and whether it thrives or strives in equatorial Africa.

The rainforest is often thought of as a sacred place, which is revered and feared equally in traditional belief systems. It may be a place where the long dead, the unknown spirits, are believed to live. This concept of the rainforest as an object of fear may have been generated because of the dangers humans face when inside it. In the rainforest, humans may hunt and may be hunted. In remote places, such as the forest, the desert and savannah, where humans may feel disempowered, fear is accounted for partially by the presence of other forces inhabiting these places. Quite often, the dead would be buried in sacred groves in the forest. This gave the rainforest a sense of otherness and made it a natural boundary between the living and the spirit world. In some Ghanaian traditional beliefs, the lesser gods and ancestors dwell in the

forest amongst the trees. Some of the Bantu tribes believed that the dead came back in animal form; the Atonga tribe of Malawi, for example, thought that the chiefs of the tribe came back as lions.

There is no word or concept for “nature” in any African language that doesn’t include humans within that framework. For example the word *bomoi* in the equatorial language Lingala translates as “life” and is used to describe all human, animal and plant life, just as the term “biodiversity” includes all variety of life forms. Africans, naturally, are themselves an intrinsic part of “nature.” They are not separate from it, as they belong to it. Respect for, and fear of, biodiversity permeates their belief system to the core. It is shown in abundance in their practices, in their stories, myths and day-to-day existence.

Bioneers Conference

Kenny Ausubel launched the Collective Heritage Institute and the Bioneers conference in New Mexico in 1990, moving it to the San Francisco Bay area three years later. In partnership with his wife Nina Simons, Ausubel has created a respected forum for the exploration and dissemination of practical solutions to the global, social and ecological crisis, each grounded in and informed by indigenous and other forms of green spirituality. By their definition, “bioneers” are any of the many “biological pioneers” dedicating their lives to the healing and restoration of self, society, and the intricate fabric of life.

Their stated purpose has been to (1) optimize effective action by building bridges among diverse communities and cultures that otherwise operate separately, enhancing collaboration on a variety of culturally appropriate approaches to restoration; (2) develop an active faculty of bioneers, introducing them to each other’s work to foster cross-pollination of ideas, strategies and networks; and

(3) disseminate environmental solutions to the public, to professionals and to the media to cultivate grounded optimism, encouraging and equipping people to take action and engage more effectively in ecological restoration.

The presenters are visionaries and practitioners from diverse cultures and fields: authors, activists, conservation biologists, ecocentric economists, innovative organic gardeners, designers and educators. Their common emphasis is on the interrelatedness of all things, and the responsibilities of conscious kinship. The audience is inspired and empowered to act by the powerful personal stories of humanity’s physical and spiritual connection to the rest of the living world. Bioneers believe that individual, social and environmental imbalance are inseparable; and that any successful technical and legislative remedies must be accompanied by a change of heart, a shift in societal values, and a deepening holistic or ecocentric spirituality on the part of the larger population.

Bioneers was cited by the popular U.S. publication *Utne Reader* as one of “Fifteen Ideas to Shake Up the World,” and since 2000, a public radio program entitled “Bioneers: Revolution From the Heart of Nature” has aired worldwide on New Dimensions Radio.

Jesse Wolf Hardin

Biophilia

A flicker of movement catches the corner of my eye as I tap electronic letters on the computer screen. I sit before the desk, facing the large window looking east, on the third floor of the tall house. It always feels a little like being in a tree-house, perched high among the tall oaks marching from the neighbor's house through mine on to the next. The first tree lords over the others – four hundred years old, twenty feet around, branches resembling entire trees. The pistils hang like tassels in the brisk morning air, leaves barely emergent, and I can still see between the tangles of branches out onto the horizon. In the distance looms the large vertical trap rock. Along its base a meandering river winds a path to the nearby ocean.

I struggle to keep my mind on the shimmering light of the monitor's glow. Deadlines and commitments draw me back into the screen's reality. But, a second flicker passes among the branches, distracting me again. Glints of animation on the move, dancing within and between the flowering tassels. I cannot resist the temptation to look, and rushing for my binoculars, I remember the time of year. Warblers on the move. Reproductive fever urging tiny birds northwards in great waves, irresistibly seeking their ancestral breeding grounds. Returning to the desk, I scan the canopy, frustrated now by the absence of movement. Then, remembering their diminutive size, far smaller than the symbol of spring they occupy in my mind's eye, I slow down.

Again I catch the flicker of movement. Skipping along new leaves and branches among treetops. Closing in, I find and then capture my visual prey. A chestnut-sided warbler! Then another. A third. A magnolia and a blackburnian! Restless spirits of arresting color and exuberant life ceaselessly on the move. Absent yesterday, they take possession of the trees today as if the forest can hardly exist without them.

I stare at the colors and glorious patterns. A motif of rich sienna arches along the white body of the chestnutsided, a brilliant yellow capping its head. The blackburnian blazes in brilliant orange, edged by an emphasizing black; the magnolia in bright yellow and black striping, calling for attention.

But these warblers signal much more than beauty to me. The motion, the eruption of energy, the ghostly specter

– all suggest the restless and expansive character of spring, a time of fresh creation. I welcome, too, their practical role in the cycling of nutrients, their complicated contribution to the continuity of associated plants, their place in a stream of ecological functions and processes on which all life, even my own, ultimately depends. From a more immediate perspective, I am reassured by their contribution to protecting trees of the northern forest, sources of timber and paper, from insect damage and disease.

These migrating wonders also rekindle an elusive youth. Seeking them indulges my passion for discovery, excites my curiosity, feeds my desire for adventure. Today I pursue the feathered storm from the window, but tomorrow I will be in the forest and along the river. There might even be, as there has been, risk and danger in probing where I should not, and sometimes entering the dark forests will call forth a foreboding I never can entirely mute. Their quick beauty represents a fundamental element of their appeal, but they also engender an inquisitive impulse, a competitive urge to find, locate, and identify, a willingness to confront the uncertain and the unknown.

I thrill at their reappearance, but an underlying lament lingers about a future lacking this spirited reminder of the glory and wonder of the returning spring. Great gaps of cleared and converted forest already fragment vast swaths of wintering, migratory, and nesting grounds. Annual counts suggest population declines of various species. Ecological adages from the past echo inside my head: Rachel Carson (1962) and the specter of a “silent spring,” Aldo Leopold (1966) and the reminder to “think like a mountain.” A world without warblers would be mute and barren, lacking the richness of sound, color, the promise of hope, rebirth, and transcendence. Their exuberant passage reaffirms connections with the miracle of tenuous life. Their diminution contracts our tiny world of organized and purposeful matter and spirit; without them, the edge of a more universal deadness and dissolution advances.

The red cliff, the winding river, the spreading floodplain, lacking the wonder of life the warblers signify, offers but a stony silence. The warblers transform this deadness of rock, soil, and water into a fountain of energy and animation. Through them I discern a living essence in the forest and the mountain and the river. Through them I recognize a vibrant core that converts this heap of inanimate matter into an ecological super-organism, not exactly alive, but organized and, most of all, giving rise to life. The warblers represent one tiny thread among the many countless chords of relationship that bind the human experience to the great tapestry of life amidst and joining non-life. Standing at the pinnacle of creation, we should have recognized by now that the apex is only as strong as its base.

As I shut down the computer, my eye catches another flicker of movement. A black and white warbler, less obviously colorful than the others, but striking contrasts nonetheless seductive. I am drawn in. Along with the bird my eye skips from tassel to branch to flower. Among the branches, I am carried by the wind, my self taking wing. My backyard becomes a place of enchantment. My bounded universe becomes an entire world. Along with the warbler, my mind and spirit soars among the treetops. Like the warbler I bathe in the warmth of the early spring. Blazing a trail to the north woods, dissipating remnants from the winter’s weariness, reigniting hope for another year, the warblers lift and inspire me.

This story recounts a brief moment, like many such epiphanies, when the invisible processes of creation became fleetingly revealed in a passing moment of brilliance and exuberance. Embedded within this anecdote is the idea that human physical and mental well-being is nurtured and enhanced by the quality of our experience of the natural

world. Such experiences, both personal and informed by scientific inquiry, suggest that an ethic of regard for nature can be found at the intersection of an empirically based science and a deeply held spiritual faith in the value of creation. They have also led me to conclude that an environmental ethic can be identified based on an expanded understanding of human evolutionary selfinterest that connects human spirituality and morality with physical and material well-being, each indicative of the human dependence on the health, beauty, and integrity of the natural world. Stories like those of the warbler intimate an environmental ethic derived from an aesthetic appreciation, emotional connection, intellectual challenge, spiritual reverence, and more, for nature, and that each perspective is related to human evolutionary fitness.

The idea that people possess a genetic inclination, grounded in the quest for individual and collective fitness, to attach physical, emotional, intellectual, and moral meaning to nature, has been labeled “biophilia” (Wilson 1984; Kellert and Wilson 1993). From my perspective, this affinity is reflected in nine basic values of the natural world (Kellert 1997), each connected to the anecdote of the warblers and illustrative of an instrumental ethic of care and responsibility for nature.

An aesthetic value underscores the physical attraction and beauty of nature. This perspective has been instrumental in developing the human capacities for recognizing and promoting order and organization, developing ideas of harmony, balance, symmetry, and grace, and in evoking and stimulating curiosity and imagination. Few experiences in human life exert as consistent and powerful an impact as the beauty and physical attraction of nature. Even the most hardened criminal when suddenly exposed to a beautiful sunset or even a blackburnian warbler would likely be unable to resist some degree of aesthetic appreciation. This largely involuntary response has developed and persisted because, like all human biological tendencies, it fosters a range of adaptive benefits linked to its consistency and intensity. Beauty in nature inspires and instructs, providing a prototype and a template for action. Through mimicry and ingenuity, people capture analogous expressions of excellence and refinement in their lives. The spring warbler provides a glimpse of perfection in a world where chaos, frailty, shortcoming, and death are far more pervasive and normative. People also favor landscapes that enhance safety, sustenance, and security (e.g., ones with water, which foster sight and mobility; and that have bright flowering colors and other features that, over evolutionary time, have proven instrumental in human survival). The human aesthetic for nature is fundamentally an act of attraction, of being drawn to the most “information-rich” environment people will ever encounter. In being so attracted, people nurture their tendencies for wonder and curiosity that lead to exploration, imagination, creativity, and discovery. And, in this recognition of beauty, they become ethically inclined to defend and protect this source of wonder and inspiration.

A dominionistic value reflects the inclination to master and control the natural world. Adaptive benefits include an enhanced sense of independence and autonomy, greater safety and security, and a willingness to take risks, show resourcefulness, and cope with adversity. People hone their physical and mental fitness through subduing

and mastering nature. We no longer rely on besting prey or eluding menacing predators or surviving in the wild, but the strength and prowess derived from physical and mental competence in confronting nature remains instrumental in our physical and mental well-being. By demonstrating the capacity to function under difficult and challenging circumstances, we emerge surer and more confident of ourselves. Seeing and observing warblers hardly constitutes a test of survival, but by finding, locating, and “capturing” this visual prey under somewhat novel and demanding circumstances, one affirms the ability to persevere, succeed, and master challenge and the unknown. Self-confidence and self-esteem develops through demonstrating the ability to succeed in the face of adversity. And, the object of this enhanced well-being can become the recipient of greater appreciation, admiration, and ethical regard.

A humanistic value reflects strong affection and emotional attachment to the natural world. The development of such feelings enhances the human capacities for intimacy, companionship, trust, relationship, and the giving and receiving of affection. The natural world has always been a focus of human affection, especially bonding, affiliation, and companionship with other creatures, but also by the occasional identification with certain plants and landscapes. These subjects of pronounced affection provide the chance for closeness, connection, and the expression of feelings that suggest at times even a sense of love and kinship. Isolation and aloneness constitute heavy burdens for a highly social species like our own. People typically crave companionship and affiliation, and emotionally identifying with elements of nature can provide a valued means for establishing strong relationships and expressing and receiving affection. We covet responsibility for others and, in turn, gratefully welcome their seeming devotion and allegiance. This feeling of connection is powerfully evident in our ties to domesticated animals, but also to charismatic wild species like elephants, bears, and sometimes with familiarity and cultivation, even warblers. And, we cherish and protect these subjects of affection and attachment, extending to them ethical standing and a willingness to defend their interests and well-being.

A moralistic value reflects a spiritual and moral affinity for the natural world. Benefits associated with this perspective include a sense of order, meaning, and purpose, a feeling of shared moral conviction, and an enhanced inclination to treat nature with kindness and respect. Nature is a source of deep and persistent spirituality and religious inspiration, in part, due to a sense of underlying and fundamental connection of nature with humanity. Despite incredible variability in the natural world – 1.7 million classified species, an estimated 10–100 million extant species, the disappearance of nearly all species that ever existed – most people are astonished by a fundamental commonality uniting most of life as we know it. The great majority of creatures share common molecular and genetic features, analogous circulatory and reproductive structures, and parallel bodily parts. This and more, much intuitively grasped, suggests a remarkable web of relationship connecting a fish in the sea, a warbler in the treetops, and a human in the modern metropolis. This unity and relation provides a sense of meaning and order, and a cornerstone of spiritual and religious belief in a world where disorder and

disconnection are far more common. When we discern universal pattern in creation, we give shape to our existence. Through shared moral conviction in an underlying harmony and purpose in life, we acquire strength, a sense of cohesion, and feelings of mutual commitment. These spiritual and moral sentiments prompt the view that, at the core of our existence, lies a fundamental logic, worth, and even goodness. Faith and confidence emerge through the recognition of a unity transcending one's individuality, separateness, and aloneness. This perspective fosters an inclination to protect and preserve the natural world. We conserve nature as much because of moral and ethical belief as because of any calculated materialism or regulatory fiat. When people discern a fundamental relation between themselves and creation, they inevitably temper their tendencies to harm and destroy its constituent parts. Even a tiny warbler can become the means for discerning the splendid and sublime, a pathway for divining harmony, meaning, and grace. A naturalistic value emphasizes an interest in close and direct contact with the natural world. Adaptive benefits include enhanced tendencies for exploration, discovery, and imagination; increased self-confidence through demonstrating skill and competence; greater calm and peace of mind by heightened awareness and spatial and temporal immersion in nature. Intimate relation with the many rhythms and details of the natural world engender curiosity, imagination, and an interest in exploration and discovery. Every creature is like a "magic well," the more one explores and draws from it, the more is revealed in an endless flow of wonder and curiosity. People mine physical, emotional, and intellectual ore from deep and detailed immersion in nature's rich tapestry of shapes and forms. In the process, they achieve physical fitness and mental acuity, an expanded inclination for adventure, and an enhanced capacity for reacting quickly, resolving new and challenging situations, and exploiting and consuming with efficiency. This intimacy with nature can generate a clearer sense of priorities, a greater strength and resolve, and improved feelings of self-confidence and self-worth. Pursuing warblers offers a chance for deep and timeless involvement, a respite from the modern temper that all too often is marred by transience, tenuous relation, and conflicted identity. One feels, as a consequence, gratitude, appreciation, and an ethical inclination to defend and protect this source of physical and mental security.

A negativistic value reflects the tendency to fear, avoid, and sometimes disdain aspects of nature. Adaptive benefits include avoiding harm and injury, minimizing risk and uncertainty and, more positively, nurturing a sense of awe and respect for nature's power. The natural world has always been a persistent source of some of our deepest fears and anxieties. Sharks, snakes, swamps, fierce storms, large predators, and more, often elicit much anxiety and fright. Avoidance and fear of nature can provoke irrational and highly destructive acts although, more typically, these inclinations are moderately and rationally expressed. Avoiding certain creatures and environmental circumstances can prevent harm, injury, and even death. When reasonably manifest, advantages accrue in isolating and on occasion eliminating threatening aspects of the natural world. Human well-being has always depended on skills and emotions acquired

through a healthy distancing from potentially injurious elements in nature. Lacking this awareness, people often behave naively, constructing structures where they do not belong or ignoring their inevitable vulnerability before uncertain and powerful forces. We should not presume our fears and aversions of nature always provoke contemptuous or destructive tendencies. Deference and respect for nature can arise as much from appreciating and recognizing its capacity to defeat and destroy us as from feelings of affection and allegiance. Awe and respect combine reverence and wonder with fear, a knowing recognition of the “luminescence of power” in nature. The natural world stripped of its strength and prowess often becomes merely an object of amusement and condescension. Species and habitats utterly subdued rarely provoke much admiration, humility, and respect. Warblers in an aviary evoke little of the meaning and admiration as do ones spied in the wild even at some personal risk.

A scientific value of nature underscores the knowledge and understanding people derive from the empirical study of nature. Functional advantages include increased intellectual and cognitive capacity, enhanced critical thinking and problem-solving abilities, and greater appreciation and respect for maintaining natural process and diversity. People possess a universal need to know and understand their world with authority, a tendency independent of culture and history where intellectual prowess is facilitated through the study and observation of nature. What the natural world offers all humanity is a varied and always stimulating context for developing critical thinking skills, problem-solving abilities, and analytical capacities. Observing and comprehending natural diversity avails countless opportunities for acquiring knowledge, developing understanding, and honing evaluative aptitudes. These cognitive capacities develop in other learning contexts, particularly in a modern world of advanced electronics and communications. But, the natural world provides an especially accessible and engaging source for pursuing intellectual competence, especially for the young and inquiring mind. Moreover, over time and simply by chance, the knowledge and understanding obtained from studying and observing nature yields practical and tangible gains. Examining any portion of the natural world expands the realization of how much we can learn from even obscure organisms and natural processes. The more we know and understand these creatures and environments, the more astonished we are by the extraordinary ingenuity of the biophysical enterprise. Knowing warblers well increases not only our knowledge but also elevates our ethical regard for them and ourselves.

A symbolic value reflects nature’s role in shaping and facilitating human communication and thought. Adaptive benefits include enhanced capacities for language acquisition and taxonomy, psychosocial development, and the ability to communicate through image and symbol. People employ nature as raw material for expediting the exchange of information and understanding among and between our kind. We accomplish this through metaphor, analogy, and abstraction, and by employing language, story, myth, fantasy, and dream. Nature as symbol is especially instrumental in language acquisition. Learning language depends on the developing capacity to render ever more refined distinctions, categories, and taxonomies. The young encounter in

nature numerous, readily available, emotionally salient, and especially distinguishable objects for learning to differentiate and classify. When young children's reading materials are, thus, examined, we encounter a world replete with animal characters and images of nature. Symbolizing and fantasizing nature further assists in confronting difficult maturational dilemmas of identity and selfhood, authority and independence, order and chaos, good and evil, love and sexuality in a disguised yet tolerable and often instructive manner. We do this through children's stories and fairy tales, legends and myths, totems and taboos, fantasies and dreams. These images use metaphor and narrative to confront and address enigmatic, complicated, and often painful issues of conflict, need, desire, meaning, and purpose. People also employ natural imagery in the language of the street, in the metaphor of the marketplace, and sometimes in great oratory and debate. Moral discourse exploits the imagery of nature for powerful and evocative communication. We argue abstractly but we often depend on natural images and symbols to advance forcefully our ethical and moral discourse. Nature provides a substrate for symbolic creation analogous to how genetic variability offers a biochemical template for laboratory discovery. Each uses nature's clay to mold and fabricate solutions to life. Warblers may be mere birds, a speck of animate matter here today and gone tomorrow. But, at a much deeper level, they are the coda for capturing ineffable moments of unity and connection with the rest of creation.

Finally, a utilitarian value underscores the material and commodity benefits derived from nature. Advantages include enhanced physical security associated with agricultural, medical, and industrial productivity, various ecosystem services such as pollination and decomposition, and the self-confidence and self-esteem obtained from demonstrating craft and skill in exploiting the land and its resources. Despite this utilitarian significance, modern society often prides itself on having achieved material independence from the natural world through domesticating the wild, eliminating natural competitors, and converting untamed land into cultivated and artificial landscapes. This belief is an illusion, however, as even today, people rely on natural process and diversity as an indispensable source of basic food stocks, medicines, building and decorative supplies, and other commodities. Moreover, healthy ecosystem functioning sustains all life, including our own, through basic life support functions such as oxygen and water production, nutrient cycling, seed dispersal, etc. This utilitarian dependence on nature will likely greatly expand in the future due to rapid developments in molecular biology, genetic prospecting, and bioengineering, allowing people to exploit countless genetic solutions to survival fashioned over millions of years of evolutionary trial and error. Even in the absence of necessity, people continue to exercise their utilitarian dependence on nature as a wellspring of physical, mental, and spiritual well-being. We reap practical benefits from these activities, but as importantly, nourish our passion for extracting with skill a portion of our sustenance from the land. Beyond the obvious practical gains, we also harvest physical and mental fitness, and affirm our connection with ancient cycles of energy, matter, and spirit. Warblers help us see how soil,

stone, water, air, and matter are a “super-organism” of flowing and related nutrients, including ourselves.

The nine values of biophilia – the biological inclination to affiliate with nature – reflect the richness of the human reliance on the natural world for physical, emotional, intellectual, and spiritual sustenance and security. They intimate how by degrading the natural world we diminish our capacity for experiencing beauty, meaning, and significance in our lives. Ethical regard for nature derives not just from feelings of moral concern and compassion or from a recognition of ensuring human material wellbeing, but from a broader recognition of how nature shapes the human body, mind, and spirit. As Henry Beston once suggested:

Nature is a part of our humanity, and without some awareness and experience of that divine mystery man ceases to be man. When the Pleiades and the wind in the grass are no longer a part of the human spirit, a part of very flesh and bone, man becomes, as it were, a kind of cosmic outlaw, having neither the completeness and integrity of the animal nor the birthright of a true humanity (1971: vi).

Bioregionalism

Human beings cannot avoid interacting with and being affected by their specific location, place or bioregion. Despite modern technologies, we are not insulated from the natural world. Bioregionalism is both a philosophy and social activism that favors a small-scale, decentralized, and place-based approach to life. As a diverse movement, bioregionalism celebrates the organic interconnectedness of Earth systems – from wetland to creek, from creek to watershed, from watershed to river basin. Bioregionalism has also been influenced by a diversity of voices in social and ecological movements that support the spiritual, sacramental, psychological, and biophysical connections between human beings, the human awareness of place and community, and the understanding of nature as part of a larger circle of animals, plants, and insects.

Contemporary bioregional thinkers include Peter Berg, Gary Snyder, Freeman House, David Simpson, Doug Aberley, Jim Dodge, David Haenke, Stephanie Mills, Kirkpatrick Sale, Daniel Kemmis, among others. It is important to note that the movement is not limited to a circle of intellectuals, academics or visionaries. The movement is first and foremost a call for action or activism in support of a renewal of civic responsibility and ecological stewardship with respect to communities of place. There are scientists, poets, nature writings and community activists who support place-based economic and political relationships. Imaginative works of all kinds have emerged that focus on the importance of place, the region, and community in human relationships that shape political, economic, and religious practice. One's region of nearness, the ecosystems and social institutions that we depend on for survival and well-being, can be understood as a bioregion whose boundaries are defined by a combination of ecological and cultural factors. A bioregion is often reflected in indigenous or aboriginal religious practice, such as the celebration of the return of *totem* salmon in dance and story, the language spoken and songs of important places and landmarks, or in the form of mimetic rituals of animism or nature writing.

As a lifestyle, bioregionalism stands in stark contrast to the command-and-control structures that we have placed on the landscapes. Political, economic, and administrative structures of the state or county do not often reflect the ecology of organic systems of relationships, such as the ecosystemic relationships between native species, their habitats, the transboundary nature of pollution transported by the currents or winds, and the changing of the seasons. Instead, bioregionalism focuses on the emerging and organic forms of human relatedness, ecological design and the patterns and interdependencies of living systems, and the need for regional economies that support place-based inhabitation.

Critics of bioregional theory often point to the heavy emphasis in natural laws and the general reductionist approach to political power in human society. Critics charge that bioregional thinkers are ecological determinists who put too much faith in the laws of nature to change social institutions. Political power, for example, is not defined in terms of the limits of nature or the boundaries of place and community. War and other human realities rarely take into account the importance of diverse places to people or the general ecology of violence over a region's resources.

Yet, critics often fail to understand the diversity of the movement – the movement is as much a sensibility as it is a science. It combines spiritual practice with ecological understanding and local knowledge of places, animals and watersheds. To be bioregional means to respect and care for the natural world that exists in a place, such as a watershed or mountain range or river basin. Bioregionalism is not a new idea but can be traced to the aboriginal, primal and native inhabitants of the landscape. Long before bioregionalism entered the mainstream political and social lexicon, indigenous peoples practiced many of its tenets. The place-based lifestyle of bioregionalists is first and foremost found in the ancient and native traditions that embrace the poetry, storytelling, mythmaking and religious practice of a sacred bond and common heritage that human beings share with specific landscapes, seascapes, and regions. In indigenous practice, the region of nearness, which is the place inhabited, includes a broader circle of animals and plants that are part of the language spoken, religious and cultural practice, and local or regional knowledge of ecosystems. This knowledge of the ecology of a place is passed on from one generation to another by various mimetic practices or oral traditions. Indigenous culture is a result of a system of primordial connections with others.

The significance of place and the region is found in the voice of the sacred landscape, which is culturally manifested in a totem, song, dance, or ceremony of earthly renewal and the human homecoming. There is no separate life; we must learn from the other inhabitants of our distinct places and communities.

Unfortunately, this early bioregional knowledge is threatened today. Nearly 90 percent of the indigenous languages and knowledge systems will be lost by 2020. The stories of place, the local knowledge of plants and animals, the sacred and spiritual dances and songs of a region that have been practices for thousands of years may be lost soon. It is the hope of contemporary bioregionalism that social justice will prevail, and that the bioregional ecology, biodiversity, and local knowledge of the present will not be lost or forgotten.

In the industrial age, the gathering of food, raising a family, and the development of a community have become functions of various nation-states and other large-scale institutions and bureaucracies. Contemporary bioregionalism has emerged as a diverse movement that opposes industrialism and globalism. As both a place-based ecological philosophy and a regionally oriented social movement, bioregionalism is a response to the dramatic ecological and cultural decline that is caused by the prevailing modes of consumption and production in largescale industrial society. It is important to note,

however, that bioregional activism is as diverse as the landscapes we inhabit; the voices of bioregional theory and practice are diverse.

As an ecological philosophy, bioregionalists support local economies of scale, place-based activism, native species protection, social and environmental justice, and rejoice in the interconnections and interdependencies between human beings and the circle of animals, plants, and insects that define a more than human community or home.

As a diverse movement, bioregional activists defend the natural values that are carried by ecosystems, and the relationships, links, and connections between native species that are supported by these ecosystems. For example, the proliferation of watershed-oriented groups in the United States is a reflection of a new movement and ecological identification.

Bioregionalists stress the importance of becoming “native” to the place. Becoming native to a place requires an act of “reinhabitation” to support the self-propagating, self-nourishing, self-governing and self-fulfilling qualities of living-in-place. A self-organizing community is composed of biotic and abiotic entities, such as a common watershed, biota, landform and biogeography. The boundaries of a community are based on the relationship, interaction and connection between human beings, the soils, waters, plants and animals.

The word “community” provides a convenient way of approaching questions of local economy and bioregional ecology. The word community derives from the Latin “munus,” which has an extremely interesting range of meanings, including service or duty; gift; and sacrifice. The word community, in other words, is a metaphor for the practice of the exchange of services. As individuals, we are bound by a community-based relationship that supports mutual obligation and the exchange of gifts.

The goal of bioregionalism is to reimmerge the practices of human community (religion, art, theatre, institutional building) within the bioregions that provide their material support. In this sense, bioregionalism is as much a movement that can be found in rural lands as urban centers. It is a performative, community-based activity based on social learning and cooperation, and can be a therapeutic strategy to expose ourselves viscerally to local ecosystem processes, such as the nature of the watershed or the path of a neighborhood creek, and to foster a human homecoming with other life forms.

Bioregionalism and the North American Bioregional Congress

Bioregionalism is a green political philosophy which can be considered a branch of Radical Environmentalism. Rather than stressing or prioritizing direct action resistance to environmental degradation, bioregionalism stresses the development of environmentally sustainable lifestyles and local political action and the development of new, political structures within particular ecoregions. Bioregionalism traces its roots to (1) ecological understandings of different regional types; (2) anthropological studies of the different lifeways that have evolved in such places which show that humans can live together without repressing either each other or nonhuman life forms; and

(3) diverse religious perceptions and traditions believed to be environmentally friendly, especially indigenous ones and those originating in Asia.

Although bioregional ideas began to gather into a social force in the late 1960s, fueled by the publication of Gary Snyder's *Turtle Island* (1969) and a series of articles by Peter Berg and Raymond Dasmann, it was not until 1984, when David Haenke organized the first "North American Bioregional Congress," that a national, institutional form emerged. This initial congress was held in Missouri, with subsequent ones following every two years. Its preamble provides a good sense of this emerging subculture:

Bioregionalism recognizes, nurtures, sustains and celebrates our local connections with: land; plants and animals; rivers, lakes and oceans; air; families, friends and neighbors; community; native traditions; and systems of production and trade. It is taking the time to learn the possibilities of place. It is mindfulness of local environment, history and community aspirations that can lead to a future of safe and sustainable life. It is reliance on wellunderstood and widely-used sources of food, power and waste disposal. It is secure employment based on supplying a rich diversity of services within the community and prudent surpluses to other regions. Bioregionalism is working to satisfy basic needs through local control in schools, health centers, and governments. The bioregional movement seeks to re-create a widely-shared sense of regional identity founded upon a renewed critical awareness of and respect for the integrity of our natural ecological communities (Davis 1986: 12).

From the beginning these congresses expressed affinity with deep ecology spirituality, formally adopting the deep ecology principles of Arne Naess "almost intact," according to John Davis, then an editor of the *Earth First!* journal. Davis's attendance and enthusiastic report shows the natural affinity between bioregionalism and radical environmentalism. Davis noted a similar affinity between bioregionalism and

ecofeminism, citing as evidence feminist author Judith Plant's assertion at this first congress that deep ecology and ecofeminism were fully compatible. Plant would soon edit or co-edit a number of books fusing bioregional, deep ecological, and ecofeminist ideas.

During the second NABC, held in northern Michigan in July 1986, a proposal from MAGIC, "the Committee for . . . Mischief, Animism, Geomancy, and Interspecies Communication" was adopted by consensus. It was drafted primarily by David Abram who would later write the influential animism-promoting book, *The Spell of the Sensuous* (1996). At that time Abram also wrote periodically for *Earth First!* The proposal was to have nonhuman representatives at the next Congress: "one for the four-legged and crawling things, one for the flying people, one for our swimming people, one for our swimming cousins, and one (very sensitive soul) for the myriad plant beings." The statement affirmed, in a way that underscores the belief in interspecies communication shared by some prominent bioregionalists:

It is a very delicate, mysterious process whereby these representatives are recognized . . . we hope that the four representatives will be chosen not just by human consensus but by non-human consensus (Abram, Hannon, and Wells 1986: 9).

Abram also asserted, further illustrating the mystical perceptions animating some involved in this movement, that

Bioregionalism is inevitably, unavoidably, involved in magic processes. Many individuals . . . are beginning to feel strange sensations, sudden bursts of awareness, communications from other dimensions, [indeed,] The body itself [is] waking up [and these] communications from other embodied forms of sensitivity and awareness [have been] too long ignored by human civilization (Abram, Hannon, and Wells 1986: 9).

The Third NABC was held in British Columbia, Canada, in 1988. It began with ceremonies drawn from Native American cultures (a friendship dance) and the wiccan/pagan tradition (a spiral dance, which had been popularized and on this occasion was led by Starhawk). Abram, who previously was the driving force behind the resolution to recognize four participants representing our "non-human cousins," afterward described how this process went leading up to the 1988 Congress: "Several of the intermediaries had prepared for months beforehand," he wrote, "through both study and empathy, to begin to identify with other species, at least to the point of being able to keep faith with these other modes of awareness while still listening . . . to the human bioregionalists" (Abram 1988: 12). During the meeting, he recalled,

. . . standing, or crouching, in each of the four directions, these individuals acted as potent witnesses . . . when the needs of their fellow species were violated. At one strong moment, a woman speaking eloquently . . . for fluid beings angrily interrupted a compromising proposal by the water committee, startling the assembled circle into momentary silence, and moving us all toward deeper mindfulness (Abram 1988: 12).

This kind of process resembled the Council of All Beings, which was itself influenced by Buddhism, and which by 1988 had been spreading widely around the country, mostly sponsored by radical environmentalists. Indeed, the third bioregional congress

ended as these newly invented rituals sometimes do when, “The gathering culminated with a rollicking masquerade dance, an ‘all species ball,’ under the full moon on the last night . . . in a full moon ritual [with] chanting” (Abram 1988: 12). Abram also noted “creative friction” as Native Americans and their ceremonies “collided and then jived with wiccan and pagan” ones. This understated but hinted at the tensions that oftentimes result from the divergent ritual practices found among practitioners of nature-based religions. Indeed, despite enthusiasm for the presence of nonhuman intermediaries and newly created ritual processes designed to summon them, during NABC II and III, a spirituality committee could not agree on bioregional spirituality. David Haenke, for example, after the second Congress, complained about the “contrived” character of some of the ceremonies and of the “tendency for some to impose pagan pomp” upon others. He expressed worry that such insensitivity could hinder “bioregionalism’s ability to reach out beyond its hippie and back-to-the-lander base” (in Zuckerman 1989: 7). Such concerns intensified after the 1996 “Turtle Island Bioregional Congress” in Mexico (the acronym had changed temporarily from the NABC to the TIBC). Haenke and Phil Ferraro, who had invented an “Institute for Bioregional Studies” in Canada, both agreed in an email discussion group devoted to bioregionalism that the biocentric and practical ecological lifestyle issues central to it were in danger of being overwhelmed by pagan, “rainbow,” and New Age spirituality and ritualizing, as well as by a naive belief that such ceremonies could themselves effect Earth healing. Ferraro, who had studied Social Ecology with Murray Bookchin in Vermont, then expressed an additional criticism obviously influenced by Bookchin’s understanding of deep ecology:

This is something that has always concerned me with bioregionalism’s ready acceptance/allegiance to deep ecology, which is a self-described religion, highly anti-intellectual, that relies more on intuition than history and more on ritual than political action (in Taylor 2000: 68–9).

While many who consider themselves social ecologists share neither Ferraro’s simplistic caricature of deep ecology and still others embrace its overtly spiritual forms, these reactions show the contested nature and difficulties inherent in constructing new forms of earthen spirituality and politics. This is to be expected given the plural religious and social milieu from which these forms both emerge as well as struggle to find suitable habitat.

Biosphere Reserves and World Heritage Sites

Many of the most special places on our planet enjoy the status of UNESCO-listed world heritage sites or biosphere reserves. (Established in 1946 to promote global educational and scientific cooperation, UNESCO is the United Nations Educational, Scientific and Cultural Organization.) While neither international system of protected areas systematically employs the religious dimensions of these places as criteria for their designation, positive steps are being taken to recognize and protect the sacred places valued by indigenous and traditional peoples that lie within their boundaries. Unfortunately, the dominant interpretative framework assumed by the national and international agencies responsible for administering the world heritage and biosphere reserve networks neglects their more contemporary religious meanings. This suggests that a fertile field of research awaits practitioners of religious studies and the humanities with more critical and symbolic approaches to the relations between nature and religion.

We owe the biosphere reserve and world heritage systems of protected areas to the creativity with which UNESCO, and other United Nations agencies and member organizations set about the task of addressing the global ecological crisis in preparation for the 1972 Stockholm Conference on the Human Environment.

UNESCO's Man and the Biosphere (MAB) Program, launched in 1971, early decided to make one of its major themes an international network of "biosphere reserves" that would "conserve for the present and future use the diversity and integrity of biotic communities of plants and animals within natural and semi-natural ecosystems, and to safeguard the genetic diversity of species on which their continuing evolution depends." A creative aspect of the new system was the decision not to use conventional methods of segregated landscape protection, but to pursue preservation, scientific research and education in close cooperation with local communities so that they might have a constructive role in environmental protection and in return grow in their capacity for regional sustainable development. The ideal biosphere reserve is organized by a pattern of three concentric zones: a strongly protected core area, consisting of minimally disturbed and freely evolving ecosystems characteristic of one of the world's terrestrial or coastal/marine regions; a buffer zone surrounding the core in which traditional land use, recreation and research activities can take place; and an outermost transition area where the work of the biosphere reserve can be related to the needs and resources of local communities. As of December 2001, there were 411 biosphere reserves in 94

countries. Many of the world's great national parks, such as Amboseli in Kenya, have been incorporated into biosphere reserves in order to facilitate more sustainable relationships with their surrounding human communities. The biosphere-reserve concept is dynamic and continues to evolve. Recently it has been suggested that the world's first "urban" biosphere reserve be established in Chicago with a reversal of the typical pattern of concentric zones – the highly urbanized central core would be encircled by envelopes of natural and restored environments.

The Convention Concerning the Protection of the World Cultural and Natural Heritage, generally known as the World Heritage Convention, was adopted by UNESCO in 1972. It established an international system of protection for architectural and other cultural artifacts, physical and biological formations, and natural habitats of "outstanding universal value" from the point of view of history, art, science, or conservation. Thirty years later the Convention had 167 States Parties, and 730 properties (563 cultural, 144 natural, and 23 mixed) from a total of 125 countries inscribed on the World Heritage List. World Heritage sites include such outstanding historic and natural areas as the center of Florence, Italy, Ngorongoro Conservation Area in Tanzania, and Machu Picchu in the Peruvian Andes. As in the case of the Galapagos Islands, where international concern made a decisive difference in Ecuador's determination to sustainably manage the park, World Heritage listing aspires to be not only "words on paper" but also a useful instrument for action by international and local agencies to preserve threatened sites and species.

While cultural sites associated with ancient religious traditions – such as Lumbini, birthplace of Lord Buddha in Nepal, or the Vatican City in Italy – have long qualified for World Heritage status under the criterion of "places directly or tangibly associated with events or living traditions" of universal significance, not until recent years has serious attention been paid by UNESCO to natural areas that are perceived as "sacred" or otherwise religiously significant to indigenous local communities. The way was opened for this development by the addition of "cultural landscapes" as a category for World Heritage status, and by the growing recognition in both systems of the beneficial effects that certain mythic and ritualistic meanings have had on the preservation of biodiversity. Examples include the Kaya sacred forests in Kenya, which have long enjoyed the protection of tribal ritual practices and as a consequence hold up to 75 percent of Kenya's endemic species, now being considered for World Heritage listing; and the Changbaishan Biosphere Reserve in China, whose forest ecosystem retained its integrity for centuries because of the legendary belief that it is the place of origin of the Korean people. Policies are now in place to encourage attention to the role of traditional religious and knowledge systems in sustaining healthy ecosystems and modeling sustainable ways of life.

This attitude is now widely shared throughout United Nations agencies with environmental missions, and it has helped advance the cultural survival of indigenous peoples. Nonetheless, the anthropological perspective that has helped facilitate the shift in policy assumes a gulf between the worldviews of "premodern" and "modern"

societies. Non-Western, indigenous and traditional local communities are perceived to live by communally shared “intangible” religious, aesthetic and moral values, many of which involve practices and perceptions affirmative of nature’s sacrality or cosmic importance. Westernized secular and urban cultures are judged to live by “tangible” economic, scientific and other material values and these are the prominent reasons advanced for protection of these special natural areas. Most positive evaluations of the ecological role of traditional beliefs in preserving sacred places are advanced for scientific and social purposes that are extrinsic to the beliefs themselves.

This dualistic perspective does not do justice to the humanistic and naturalistic religious qualities that have played a critical role in motivating the establishment of the biosphere reserve and world heritage systems, nor to the confessional religious beliefs – Christian, Muslim, Ba’hai, and Buddhist, among others – that have motivated some of their most ardent advocates.

There are a number of ways of thinking about the contemporary religious meanings of these areas. First, the modern wilderness movement, which has inspired the protection of many core areas of biosphere reserves and spectacular World Heritage natural areas, perceives wilderness as sublime “sacred space.” Wilderness is typically associated with mountains, deserts and oceans, but with the coming of the modern ecological consciousness, there has been a growing perception of a variety of relatively undisturbed natural landscapes, from rainforests to natural preserves in close proximity to urban settlements, as “sacred” in quality. Interpretations among the world religions of wilderness as a place of contact with transcendent powers have contributed to these more contemporary meanings, as have a variety of old and new interpretations of the extraordinary spiritual qualities of wild animals.

Second, many of the UNESCO-protected areas, such as South Africa’s Robben Island, set aside to commemorate the “victory of the human spirit, of freedom, of democracy, over oppression,” are associated with the civil religions of the host countries. In the case of the United States, where both Yellowstone National Park and the Statue of Liberty are world heritage sites, there is an integration of natural and cultural civil religious values. Mount Kenya biosphere reserve merges indigenous tribal perceptions of a sacred mountain with twentieth-century civil religious perceptions of the mountain as a shrine of national independence.

Finally, if we interpret religious perspectives as those that symbolize comprehensive visions of creation, alienation and redemption, then it is possible to see the outlines of a global religious vision in UNESCO’s effort to transmit to future generations the “universal values” of our evolutionary origins (Galapagos World Heritage site), the worst of human history (Auschwitz Concentration Camp World Heritage site) and the promise of world justice, peace, and ecological sustainability (Amistad International Peace Park in Central America). When UNESCOMAB publishes a book entitled *Man Belongs to the Earth*, and when the signatories of the World Heritage Convention pledge themselves to “hold in trust for the rest of mankind” those parts of the world heritage that are found within their boundaries, we are being presented with an emergent

global ideal very much in keeping with the spiritual vision portrayed in such twenty-first-century declarations as the Earth Charter.

In this light, UNESCO's definitions of biosphere reserves as "demonstration sites of harmonious longlasting relationships between man and the natural environment," and World Heritage sites as "standardsetters for the conservation of the environment as a whole" suggest an interpretation of these areas as anticipatory fulfillments of a transcendent coevolutionary destiny for humankind, sacred centers to which all the world's peoples can make pilgrimage.

Birch, Charles (1918–)

Dr. Charles Birch (1918–) is an Emeritus Professor of Biology, having been previously Challis Professor of Biology at University of Sydney, Australia. He has authored nine books, including his influential collaboration with John Cobb, and sixty publications on science, religion and human existence, and in 1990 he was a joint recipient of the Templeton Prize for progress in religion for 1990.

Birch has been described as “Australia’s leading thinker on science and God.” He describes himself as a panexperientialist, holding a monistic doctrine claiming that the mental and the physical are two aspects of the same phenomenon. Using a Whiteheadian process interpretation of biology, he rejects a solely mechanistic model of life and biology for an ecological model. “There is an ecology of God which we can think of as God’s internal relations with the creation” (Birch 1993: 62). Reality is not merely things, but relationships and these relationships involve subjectivity. If every living creature is a subject, then each has intrinsic value to itself and to God, in addition to any instrumental value. The difference between entities is one of degree. Since there is a difference in degree, there is a hierarchy of intrinsic value and a corresponding hierarchy of rights. Furthermore, “internal relations are tied up with the idea of feelings” (Birch 1990: 76).

God is the supreme synthesis of these feelings, which are nature at any moment, and is no spectator. The implication of this is the extension of compassion, justice and rights to nonhumans.

Bishnoi (Rajasthan, India)

The Bishnoi of Rajasthan, India, have lately come to the attention of diverse scholarly and activist communities as an example of an ecologically aware people who for generations have been practicing environmental conservation, holistic science, and what today would be termed wise resource management. The origins of this community, found largely in the region around the city of Jodhpur and neighboring districts of western Rajasthan, go back to the fifteenth century; there are smaller communities of Bishnoi in Uttar Pradesh, Madhya Pradesh, and Haryana.

The boy who would later be known as Bhagwan Jambheshwar, the presiding deity of the Bishnois, is said to have been born around 1451–1452 to a Rajput family in the village of Pipasar in the Mawar area of Rajasthan. According to folklore, local traditions, and vernacular literatures, Jambaji (as he is popularly known) had an uncommon attachment to nature. Some say that he was disenchanted by the struggles over political power between Hindus and Muslims, and sought ways not only to reconcile them but also to put before them an example of a heightened moral sensibility; others say that a long period of drought moved him to seek protection for all animals and plants.

Over time Jambaji articulated twenty-nine principles of morality and conduct, and the sect of Bishnoi (*Bish*= twenty; *no/noi*=nine) takes its name from those principles, rather than, as some have erroneously supposed, from attachment to the god Vishnu. Jambaji stipulated that no trees were to be felled, and hunting was forbidden. His followers, some of whom may have thought of Jambaji as an incarnation of Vishnu, were also enjoined to have compassion for all living beings, give up all intoxicants, swear by the tenets of *ahimsa* (nonviolence) and *satya*

(truth), and adhere to a vegetarian diet. Legend has it that flora and fauna flourished wherever Bishnois were to be found, and that even in times of severe hardship and drought, the black buck and the Indian gazelle could count upon food and water. Moreover, the customs of the Bishnoi point to an attempt on the part of Jambaji to forge a more syncretic movement, characteristic of the wave of *bhakti* (devotion) sweeping India at that time: thus, though the Bishnois worshipped Vishnu, they adopted the Muslim practice of burial of the dead. Jambaji could not countenance the idea of felling a tree to obtain wood for the funeral pyre.

Jambaji passed away in Mukam in Bikaner district, most likely around 1537. His profound humanity, spiritual sincerity, and dedication are believed to have earned him a large following; temples in his honor sprouted over large parts of western Rajasthan. The Bishnois grew in strength, and stories of their relentless, even aggressive, dedication to the preservation of animals and plants, even at the cost of their lives, were

widely circulated. In 1604, two Bishnoi women from Ramsari village, Karma and Gora, are believed to have sacrificed their lives in an effort to prevent the felling of *Khejri* (*Prosopis cineraria*) trees, which in Rajasthan are treated with the reverence that the banyan and *peepal* (*ficus religiosa*) command elsewhere in India. In the Bishnois' embrace of trees can be found the precedent for the famous Chipko movement in contemporary India, where again women hugged the trees to resist the depredations of loggers and contractors.

A number of later episodes in the history of the Bishnois similarly point to their fervent reverence for trees. Around 1643, the Bishnoi Buchoji is thought to have given his life in protest against the felling of trees for the purpose of propitiating the goddess Holi. Most famously, as almost all narratives are agreed, scores of people from the Bishnoi village of Khejreli were killed in 1730 as they clung to the trees that were being axed at the orders of Maharaja Abhay Singh of Jodhpur. The ruler was apparently in need of wood for the lime kiln for his new palace; led by the Bishnoi woman Amrita Devi, the villagers attempted to resist by hugging and encircling the trees. But, like soldiers elsewhere, the king's men were determined to follow orders. Three hundred and sixty-three Bishnois had given up their lives before, drawn by their cries, Abhay Singh came to the scene of the massacre and had it halted.

In the martyrdom of the Bishnois can be read a narrative of resistance to Rajput or upper-caste domination, though the story is far more often adduced as an illustration of the conservational ethic and wisdom of the Bishnois. Bishnoi villages have been described as oases in the desert: trees abound, and deer roam around with abandon. Each village has a stock of millet and water for the use of deer in time of drought. The Bishnoi are said to believe that they will be reincarnated as deer, which may in part explain the sanctity extended to animals; certainly

Jambaji, according to folklore, is thought to have instructed his followers that the black buck was to be revered as his manifestation. But whatever the particular association between nature and divinity in Bishnoi thinking, the pragmatism of the Bishnois must not be overlooked. The much-revered *Khejri* tree, in particular, plays a crucial role in the desert ecology: it provides food, fodder, and building materials. Thus, in the cosmology of the Bishnois, though trees are viewed as intrinsically venerable, their (what might be termed) reasonable usevalue is not overlooked.

It is probable that the worldwide attention lavished upon the Chipko movement has also had the effect of recalling earlier chapters in India's environmental history. Bishnoi narratives themselves suggest that environmental awareness and activism were first pioneered by women. Though no one is prepared to suggest a continuous and unbroken history from the Bishnois to the Chipko movement, ecofeminists might reasonably argue that in India at least the Earth has traditionally been viewed as the receptacle for all living beings, and that an assault upon nature is nothing less than an attack upon the dignity of women. Wherever women have been custodians of nature, ecofeminists argue, there the principles of fecundity and the sanctity of life have been upheld. Doubtless, the history of the Bishnoi points to other interpretations: thus some might

locate the reverence for the forest in India's traditions of retreat and the valorization of the hermitage as a place for the acquisition of philosophical learning and spiritual insight, while others might see in the story of the Bishnois a morality tale about the ecological knowledge and wisdom of societies which have not been contaminated by the ideologies of growth and profit. Whatever view one might adopt, the Bishnois of India furnish a striking instance of a people whose relationship to nature seems marked by intimations of an admirable and not so easily emulated conviviality.

Bison Restoration and Native American Traditions

Buffalo (the popular name for *Bovidae bison*) have been important to humans in North America since the latter first populated these lands 12,000 to 30,000 years ago. Ranging originally from the eastern woodlands to the desert southwest and northward into the subarctic, buffalo made human life possible – serving as both food and the source of raw materials for clothing and tools. Humans hunted them on foot using various techniques based on the opportunities offered by culture and landscape. Effigies in the shape of bison have been discovered that are thousands of years old, which are evidence for their use in religious ritual. Written records becoming available after the European colonization provide numerous accounts of the importance of buffalo, economically and spiritually, to many tribes across North America, and include detailed descriptions of ceremonies and social events dependent upon the buffalo. Some native languages highlight the animals' practical and symbolic importance by emphasizing the etymological links between the animals and the sacred, as in the Lakota terms for buffalo, *tatanka*, and the mysterious powers animating the world, *wakantanka*.

The importance of buffalo to the Indians of the Plains thus cannot be overstated. For thousands of years it was the most important prey animal upon which humans depended, to the point that their basic material culture can be described as hide-based rather than wood or vegetal-based. This means that hide was used as the basic material to create goods produced from alternate materials in other regions of North America. The return of horses – following sixteenth-century Spanish incursions into the southern plains – and their diffusion across the region over the next two hundred years, enabled native peoples to become even more efficient hunters, enlarging their lives and enriching their cultures from the success of the hunt. Their population increased because food was more abundant and people were better fed. Horses made transportation of goods easier and buffalo-hide teepees became larger to house bigger families. The strength of the buffalo economy was also its eventual weakness, however, as overhunting and a deliberate post-Civil War U.S. military policy of bison extermination drove Plains tribes to succumb to their confinement on prison-like reservations in the 1870s and 1880s.

The dislocation of Plains tribes from their original lands, the forced imposition of Euro-American culture and the aggressive proselytization of Christianity, disrupted the linkage between land and the sacred that has shaped all Indian religions. On the Plains, the death of the buffalo, for many Indians and certainly for the land-hungry

whites, meant the death of a form of culture. Lakota holy man turned tribal police officer and deacon George Sword, for instance, spoke for a significant portion of his generation, when he said in 1896 that he chose a new name and determined to adopt the new white ways after it became clear that the whites could not be moved. However, the fundamental sense of connection with the land and its nonhuman inhabitants that underlay buffalo culture did not completely vanish from Plains communities. During the oppressive decades of the reservation era, some tribal members – Christian as well as traditionalist – retained that knowledge of land–life connection and the multiple ways in which it can be celebrated and respected in religion or moral code.

Thus, despite the negative consequences of colonization (i.e., social disorganization, kinship fragmentation, and the loss or transformation of many religious and cultural practices) today the buffalo remains a strong image and icon for many tribes, particularly in the Plains and Southwest. Images of the buffalo appear as art, posters, school logos, sport team names, sweat shirts, etc. Legal surnames still incorporate the word for some families in a system created during the early reservation period, and personal names that include the word in a native language are still acquired either by inheritance as a family name, clan name, by accomplishment or in a religious experience such as a vision quest or sun dance. The buffalo as a source of religious power and reverence remains important for many tribal peoples, whether reservation or urbandwelling families, and possession of tanned buffalo robes or items from buffalo products are prized possessions. Some contemporary ceremonies require buffalo items for efficacious performance such as the use of a buffalo skull and/or tanned hide in sun dances, hide headdress and cuff in Pueblo buffalo dances, and skulls in many private rites that are performed by families outside public view. Buffalo religious power is always positive and usually expressed in terms of health, fertility, success or healing in various combinations of importance in different tribal settings. A few families who own sufficient acreage even acquired small numbers of buffalo for their own use or enjoyment, although this is not commonplace. Some individuals express a sense of loss because there are no longer free ranging buffalo and make trips to public parks where they can visit herds. The birth of white buffalo calves to Indian and non-Indian families is interpreted by some as a sign of positive change and returning strength to native traditions. Individuals make trips to visit these animals, to pray and leave offerings as religious acts.

A gradual reassertion of Indian identity began in the 1960s and has remained on the upsurge for over four decades; the buffalo has been part of this cultural and political resurgence. Many native people felt it was time to establish tribally owned buffalo herds on Indian land and bring the animals and the land back to health and by extension the well-being of tribal people. By 2003, 47 Indian tribes had established tribally owned and managed herds on reservations for the use and welfare of tribal members with a collective number of over 8000 animals. Buffalo meat and hides are available at no cost to tribal members for community events that require communal meals. The ability to serve buffalo at feasts completes cultural practices in ways that serving cow

does not. Native American participants believe that the spirit of the buffalo is present at the event and bestows its health and wellbeing on those who partake of the meal. Participants report they feel better nourished and healthier after eating meals in which buffalo meat is a major part. Tribal artists use buffalo products in their work, which is given to others or sold to generate income. Some members of the Lakota, Crow, and Kiowa and probably others as well visit the herd privately and can be seen in meditative repose, watching them. Buffalo shed their winter coat in the spring and the “shed hair” falls to the ground or is caught in bushes on the grazing lands where it is gathered for use in rituals or domestic purposes. Some use it as padding in their pipe bags or for small pillows. As in the past all parts of the buffalo are used for food, hide and tools.

Environmental degradation on the Plains is commonplace due to overgrazing by cattle and sheep, which are more destructive to the grasses and the land than buffalo unless kept at a proper carrying load per acre. Teachers on the reservation grapple with changes in the landscape by taking school groups to visit the buffalo herd to learn about its traditional cultural and ecological importance. They learn about other animals that used to be common there such as prairie dogs, black-footed ferrets, and other grassland native creatures. Many contemporary Plains Indians believe that the restoration of the buffalo will aid in the recovery of the land to its original healthy condition before the advent of Euro-Americans. Indian communities have been impacted by a dramatic increase in diabetes and heart disease due to high-fat diets, overweight and sedentary lifestyles over the last 40 years. As a result a healthy diet has become an important community issue and the buffalo is part of this discussion. Buffalo meat is lower in saturated fat than cattle and is being marketed nationally as a healthier food choice for those who want a low-fat diet but still want to eat meat. Some Indian tribes are raising buffalo in part as a commercial venture and selling to food suppliers who market it nationally. Simultaneously, Indian medical professionals encourage native people to take the same advice and switch to eating buffalo instead of cattle as well as other aspects of the traditional diet. Some EuroAmerican ranchers are raising buffalo commercially as a substitute for beef in response to new concerns about high-fat diets, and Indian tribes are taking advantage of this new market and selling meat nationally. Some contemporary Native Americans interpret the obvious link between modern diets and lifestyles and resultant disease as another sign of the failure of contemporary life and the superiority of traditional values and lifestyles.

Many communities have established summer culture camps for their youth where they learn about traditional values and ways and are taken to visit the tribal buffalo herd. Where possible the herd is kept in distant pastures with no paved roads, so it takes some effort to reach them and discourages casual visitors. When approaching the herd, prayers are said to honor and appease the animals and to remind humans of their reliance on these animals in the past and the present. While many of these children are from Christian families, the linkage between the natural world and humankind, often expressed in terms of respect, is stressed as the proper way in which to approach

all of the landscape and its inhabitants. The inherent sacred nature of the Earth is believed to be manifest in these visits and it is hoped that the children will take this away with them and observe it in the rest of their lives, no matter what religious faith they may observe. Practitioners of traditional Plains religions are usually sanguine about simultaneous participation in Christian faiths although the reverse is not true. Nevertheless, the land–human relationship found in all native religions, and embodied so clearly for Plains people in the buffalo, is intact and being taught in subtle but deliberate ways to future generations of Indian people. In the words of a Lakota song – “Buffalo Nation, the People are depending upon you, so we pray you will be healthy” (www.intertribalbison.org).

Black Elk (1863–1950)

Nicholas Black Elk is the most famous American Indian religious thinker of the twentieth century. He was a member of the Oglala tribe of the Lakotas (popularly known as the Teton or Western Sioux). In his childhood and youth he participated in the traditional buffalo-hunting way of life, then witnessed the wars of the 1860s and 1870s between the Lakotas and the U.S. Army and the destruction of the buffalo herds by the early 1880s. In 1881 he settled on the Pine Ridge Indian Reservation in southwestern South Dakota.

Outwardly, Black Elk's life differed little from his contemporaries and may serve as representative of the experiences of the first generation of reservation Lakotas.

In other ways, however, Black Elk was exceptional. His life was shaped and guided by powerful and transcendent visions that placed on him a spiritual burden to serve his people as a holy man (called "medicine man" in English) and a healer. He is the only Lakota holy man of his generation to preserve a detailed record of his life and thought. In 1931 he told his life story to John G. Neihardt, who fashioned the material into a book, *Black Elk Speaks, Being the Life Story of a Holy Man of the Oglala Sioux* (1932). In 1944 Neihardt interviewed Black Elk again concerning tribal history and traditions, using the material in a historical novel, *When the Tree Flowered* (1951). The full transcripts of both sets of interviews, representing as closely as possible Black Elk's own words as translated into English, then written down by Neihardt's daughters, were published as *The Sixth Grandfather: Black Elk's Teachings Given to John G. Neihardt* (DeMallie 1984). During winter 1947–1948 Black Elk related to Joseph Epes Brown an account of Lakota religious rituals that was published as *The Sacred Pipe: Black Elk's Account of the Seven Rites of the Oglala Sioux* (Brown 1953). In short, the documentary record dictated by Black Elk is unparalleled for American Indians, and his teachings, embodied in these books, have come to stand as representative of American Indian spirituality.

Black Elk told Neihardt that at the age of nine he had received a vision from the Thunder-beings, the powers of the West, and was taken to meet the Six Grandfathers, the spiritual embodiments of the powers of the natural universe – the four directions, the sky, and the Earth. The vision embodied a Lakota concept of ecological relatedness, including Earth and sky, land and water, fourleggeds and wingeds, all enclosed in a great circle of life at whose center stood a flowering tree, a symbol of regeneration, at the point where two roads crossed the circle: the red road from south to north representing life and harmony, and the black road from west to east representing warfare and destruction. The vision gave Black Elk the complementary powers of the circle,

powers both to heal and to destroy. As a child, he made no use of these powers, but, at the age of seventeen, he felt himself called by the Thunder-beings to enact his vision publicly in order to validate and activate the vision powers. In 1881, while his people were refugees living at the U.S. army post of Fort Keogh, Montana, Black Elk sponsored a Horse Dance, in which riders on variously colored horses dramatized his vision of the Six Grandfathers. That winter Black Elk settled on the Pine Ridge Reservation, the only place where the daybreak star herb that he saw in his vision, a primary source of his healing power, was to be found. The following spring he fasted and sought another vision. Again the Thunder-beings came to him, after which he began his career as a healer.

Changing times led Black Elk to question his religious practices. In 1886, when Buffalo Bill came to the Pine

Ridge to recruit a group of Oglalas for his Wild West Show, Black Elk decided to join in order to learn about Euro-Americans. He was gone for more than three years, traveling first to New York, then to Europe, including England, France, and Italy. During the trip he became a Christian and began to read the Bible as translated into the Dakota language. Far from home, he felt no connection to the spirits that had formerly given him his power and he found value in Christian teachings. But when at last he returned to Pine Ridge in 1889 he learned that some of his people were practicing a new ceremony, the Ghost Dance, which originated with the Paiute prophet Wovoka. The Ghost Dance was a millenarian movement promising that the Lakota dead would return to life, the buffalo would be restored, and the non-Indians would be destroyed. It was the ritual itself that attracted Black Elk to the new religion. The sight of the circle of men and women dancing around a sacred tree seemed to Black Elk the embodiment of the flowering tree of his great vision. He turned back to his vision powers for guidance, finding them once again strong after his return to Lakota country.

The Ghost Dances ended the next year with the unprovoked massacre of two hundred or more Lakota men, women, and children at Wounded Knee Creek by members of the Seventh U.S. Cavalry on 29 December 1890. The Ghost Dance shirts worn by participants failed to deflect the soldiers' bullets as the ritual leaders had promised. Hope for the millennium ended.

Black Elk continued to perform healing ceremonies using his vision powers. In 1904, however, he put them aside and joined the Roman Catholic Church, in which he was baptized Nicholas. His decision to join the Church was likely pragmatically motivated, since churches provided access to money, goods, and services. At the same time, Black Elk's earlier experience with Christianity may have led him to choose this as the better path for his family. He served as a catechist and for a time as a missionary to other Indian tribes.

Beginning in 1961 with the paperback reprinting of *Black Elk Speaks*, the book was adopted by the environmental movement as an exemplar of American Indian spiritual and ecological sensitivity. Younger American Indians of many tribes, particularly in

urban settings, turned to *Black Elk Speaks* for spiritual guidance, to such an extent that Vine Deloria, Jr., writing a foreword to the 1979 reprint edition, characterized the book as an American Indian bible. Because of the universality of Black Elk's vision in which he perceived the world as a great circle, and his characterization of the holy as embodying all living things, the vision has spoken to many different audiences.

Black Elk's teachings have had a profound influence on late twentieth-century thought, particularly at the juncture between environmentalism and spirituality. But they have also engendered controversy, particularly concerning the relation between Black Elk's characterizations of traditional Lakota beliefs and religious rituals and his acceptance of and participation in Christian religion. Neihardt and Brown made no mention of Black Elk's Catholicism. In publishing the interview transcripts, DeMallie (1984) discussed Black Elk's life as a Catholic catechist, and in telling her life story, *Lucy Looks Twice*, Black Elk's daughter gave her perspective on her father as a Catholic religious leader (Steltenkamp 1993). A critical literature has developed that attempts to disentangle Christian and traditional elements from Black Elk's religious teachings. However, Black Elk can best be understood as an individual who spent his entire life seeking religious knowledge to benefit his people. As a young man he found it in traditional religion, and later, when he traveled in Europe, he found strength in Christian teachings. After the failure of the Ghost Dance, Black Elk apparently relied more and more on Catholic teachings until he finally stopped the practice of traditional rituals altogether. But this should not be confused with lack of belief. Black Elk's descriptions of Lakota religion incorporated more and more Christian symbols and values as his life progressed, revealing an increasing syncretism of Lakota tradition and Christianity. In old age he performed traditional Lakota religious rituals for the edification of tourists, not merely for amusement, but to demonstrate that there was goodness and value in the old ways, different as they were from Christianity.

Black Mesa (New Mexico)

In the autumn of 1969, I spent a month in the Huichol Indian village of San Andres de Coahimiata in a remote region of the Sierra Madre Occidental of western Mexico. I was conducting field recordings of Huichol music and documenting their annual peyote fiesta, as well as their construction of musical instruments. It was during this time that I realized that traditional cultures are endangered by the spread of industrial monocultures whose paradigm is dominated by an economic imperative and growth for its own sake.

On returning to the United States, I resigned as music director for the Center for Arts of Indian America and co-founded the Central Clearing House in Santa Fe, New Mexico. The Clearing House was committed to gathering and providing information about threats to the natural environment occurring throughout the American Southwest. In early April 1970, National Park Service historian Bill Brown informed me of a massive coal strip mine to be situated atop Black Mesa, a land formation located in northern Arizona bearing the largest coal deposit in that state. Black Mesa is sacred to both Hopi and Navajo Indians. The ancient Hopi villages are situated on the three southern promontories of Black Mesa, a land form considered to be the body of the female mountain by the Navajos.

Brown and I explored the surface of Black Mesa from both truck and airplane. We learned that the coal from Black Mesa was to be delivered to two electrical generating stations, one to be located on the banks of Lake Powell near Page, Arizona, the other already constructed in Laughlin, Nevada.

Subsequently, I visited my old friend and Hopi elder David Menongye who resided at Hotevilla on Third Mesa. David had heard nothing of this and asked if I would speak before an assembly of Hopi elders, to which I agreed. Sixty-three elders gathered in the Second Mesa village of Shungopovi in mid-April. I presented the few facts that I had at my disposal. The Hopi Tribal Council chaired by Clarence Hamilton, and represented by John Boyden, a Salt Lake City attorney who served as the Hopi Tribe's legal counsel, had signed a lease. It allowed the Peabody Coal Company of East St. Louis to strip-mine Black Mesa. Coal would both be hauled by special railway to the power plant at Page, and be transported by water drawn from wells tapping the ancient Black Mesa aquifer, then pumped through a slurry pipeline for 273 miles to the Mojave power plant in Laughlin.

The coal commanded a very low price, and the Hopis were to be paid \$1.67 an acre foot for some of the purest water in America. Three acre-feet is the equivalent of

approximately one million gallons, or a one acre pool three feet deep. This water was to be pumped at the rate of two thousand gallons per minute, twenty-four hours a day.

The traditional Hopis were enraged that these negotiations had taken place without their knowledge. Many of these elders spoke little or no English. After a discussion, David Menongye asked if I would help serve as a bridge to the world of the Bahannas, or white people, to end this mining, which violated the Hopi's spiritual relationship to Mother Earth. I agreed, and on 17 April 1970, my friends Jimmy Hopper, Bill Brown, John Kimmey and I founded the Santa Fe chapter of the Black Mesa Defense Fund. We were soon joined by Terrence Moore, Philip Shultz, Caroline Rackley, Tom Andrews, Hannah Hibbs and a host of volunteers. For the next three years, we did everything in our power to stop what we considered to be the rape of Black Mesa, but to little avail. We worked closely with the Native American Rights Fund of Boulder Colorado, a law firm devoted to serving Native Americans. We also worked with traditional Navajos and many others throughout the American Southwest and beyond to try to thwart the juggernaut of corporate America as they ravaged the land making every attempt to convert Black Mesa into money.

Research revealed that the underlying purpose for the Black Mesa strip mine was to fuel the Navajo Generating Station capable of a 2000 megawatt generating capacity. About 25 percent of this electricity was to be used to pump water from Lake Havasu downstream on the Colorado River to the central valleys of Arizona. This massive public works project is known as the Central Arizona Project (CAP). The water was ostensibly to be used for agriculture, but over time became far too expensive for farmers, and is now used for development in Phoenix and Tucson.

It should be recalled that the original proposal for supplying the electrical needs for the CAP would require that two dams be constructed near either end of the Grand Canyon to generate hydro-electric power. David Brower and the Sierra Club called on the American public, and public opinion indeed thwarted the proposed dams. The obvious alternative was to mine coal from Black Mesa to fuel the Navajo Generating Station near Page, Arizona.

In the meantime, traditional Hopis were being represented in the world at large by Thomas Banyacya with whom I traveled throughout the United States on speaking tours wherein Banyacya revealed his interpretation of the Hopi prophecy of coming disaster in the face of "the march of progress." In his lecture, Banyaca referred to a cloth rendering of the ancient petroglyph situated near Old Oraibi that bespeaks of the Time of Purification. The rendering portrayed the tools given to the Hopi by the Great Spirit, Massau. This was followed by two roughly parallel paths. The upper path was that of the White Man and revealed two white men and one Hopi that had assumed the ways of the White Man. This path finally peters out. The lower path reveals the way of the traditional Hopi and is strong and enduring. Both World Wars I and II are represented, as is the coming of World War III followed by the time of purification. Banyacya said that the White Man was doomed because of his faith in technology

over that of the way of the Great Spirit. Only those would survive who followed the traditional Hopi way and the path of the Great Spirit.

In my own lecture, I spoke of the necessity for understanding the facts surrounding the strip-mining of Black Mesa, and attempted to rally university students to protect endangered environments using whatever means were available short of harming fellow humans. I called the Central Arizona Project the perfect model of total environmental degradation, which included:

- the polluting of aquifers with seepage from strip-mined Earth;
- devastation to landscape through massive strip-mining of coal;
- marring of landscape by the construction of the coalbearing railroad across the once pristine Kaibito Plateau;
- the befouling of the air of the American Southwest with smoke emanating from the coal-fired power plants;
- the depleting of the Navajo aquifer beneath Black Mesa;
- the march of the electric powerlines extending from Page to Lake Havasu;
- providing water from the Colorado River to Phoenix and Tucson, cities located in the fragile ecosystem of the arid Sonoran Desert.

All of this would result in the utter disruption of both Hopi and Navajo traditional cultures which would bear the brunt of devastation to air, land and water in their sacred homelands in the heart of the Colorado Plateau.

In early 1971, my wife Katherine and I were invited by traditional Hopis into the *kiva*, or subterranean sacred ceremonial chamber at Hotevilla on Third Mesa. Present were twenty or so male elders including David Menongye, Thomas Banyacya and John Lansa, husband of Mina Lansa, then the *kikmongwi* or traditional leader of Old Oraibi. Throughout the day, they related their collective point of view, which they asked me to write down and publish. The following two quotes are excerpted from what was published in *Clear Creek Magazine* in 1972:

The Black Mesa area is a sacred place. The Hopi knew it to be the spiritual center of the whole continent that contained the heart and soul of the Earthmother. The Great Spirit had granted them permission to live in that sacred place, to pray for balance and harmony, and to live within the life plan that the Great Spirit had taught them. The Hopi people still live there in the Black Mesa area, and the traditionalists still follow the teachings of the Great Spirit.

The Hopi look to the Earthmother for food and nourishment, for it was from the womb of the Earthmother that the Hopi and all living creatures emerged in the beginning. The animals and plants, the eagles and people are all kept alive through the power of the flow of Nature. The inter-action between all living things – the relation of rocks to the land, the flow of water, the dance of yellow butterflies in the cornfields – all this marks the balance of Nature.

The Hopis are stewards of the land. In their *kivas*, they perform rituals and ceremonies so that Nature will work in balance with people. These ceremonies are reflections of the teachings of the Great Spirit, which the Hopi received at the time of

emergence from the lower world. They achieve a state of mind through which they perceive that those early beginnings and the present are all the same, that time is not just a linear passage from the past to the future, but rather a continuum in which the annual cycles with their ceremonial events touch each other in reaffirmation of meaning.

In the words of Hopi elder John Lansa as translated by Thomas Banyacya,

There is a spiritual seeing of things that can't be explained. There are shrines in the spiritual center, which are markers for spiritual routes which extend in all four directions to the edge of the continent. Through our ceremonials, it is possible to keep the natural forces together. From here at the spiritual center, our prayers go to all parts of the Earth. Our prayers maintain the balance that keeps all things well and healthy. This is the sacred place. It must not have anything wrong in it. It must never be defiled. We want it organic the way it has always been. Leave the land in the hands of the Hopi to take care of everything for all the people. We know how to farm. Only people who know how to grow things will survive. Through prayer, people can develop in their own way as the Hopi have.

On the one hand, Black Mesa was seen as an enormous coal deposit, the strip-mining of which would result in great economic gain to resource extractors, land developers, politicians, and other corporate beneficiaries. On the other hand, the sacred heartland of an ancient traditional culture was to be utterly desecrated and defiled. The Hopi deity Massau was in direct conflict with Mammon, the hidden deity of corporate America over the fate of the precious landscape of the American Southwest. A hidden villain in this scenario was the Hopi's general counsel, John Boyden who was suspected of and later revealed to be quietly representing the Peabody Coal Company of East St. Louis at the same time.

Within their cultural milieu, the Hopi are sophisticated and knowledgeable with regard to subsistence farming in one of the continent's most arid landscapes. Hopi spirituality and ceremonial practices help them remain aligned with the seasons and allow them to recognize that which is sacred within the flow of nature. The presence of the Black Mesa mine has greatly disturbed the natural balance of both Hopi culture and the ecosystem.

In the spring of 1972, David Menongye, Thomas Banyacya, two younger Hopis, Katherine and I were scheduled to attend the first United Nations Conference on the Human Environment in Stockholm, Sweden, in an attempt to bring the Black Mesa debacle to global attention. The Hopis had refused to secure United States passports on the grounds that they were citizens of the Hopi Independent Nation, not the United States of America. My wife and I fashioned passports bound in tanned deer hide that bore the inscription, "The bearer of this passport is a citizen of the Hopi Independent Nation. This passport is valid as long as the Sun shines, the water flows, and the grass grows." David Menongye blessed the passports with corn pollen and affixed an eagle feather to each one. It took a fair amount of time at LAX, but finally a pilot from Scandinavian Airlines agreed to take us to Stockholm. Ultimately, the passports

were stamped by Swedish authorities, thus validating them in the eyes of international bureaucracy. They were later stamped in Denmark.

In Stockholm, Hopis and Navajos met with members of other traditional cultures from around the world establishing a network that continues to today.

But the strip-mining of Black Mesa was begun and continued into the twenty-first century. Water continues to be pumped out of the Black Mesa aquifer. A new generation of Hopis and Navajos use every legal means at their disposal to thwart this pumping as Hopi springs and Navajo wells run dry. This environmental catastrophe now fosters growth in the major cities now located in the Sonoran Desert, a fragile landscape ill-prepared to absorb so many humans. The Central Arizona Project, originally conceived as an irrigation project, has become the means by which population centers in Arizona continue to metastasize over the land.

In the meantime, Hopi and Navajo culture-bearers fight so that their home habitat and their spiritual values may survive.

The human species is an invasive species. The mining at Black Mesa has many parallels globally. Traditional cultures that have evolved within habitat are gravely endangered by invading outsiders intent on extracting non-renewable resources located in homelands native to others. Peoples whose sensitivities and sensibilities are finely honed to home habitat are being displaced not only by extractors, but more also by the dominant monoculture which attempts to reeducate people native to place into a paradigm commensurate with that of the more dominant culture. Thus cultural diversity is disappearing. As cultural diversity and its attendant affiliation with the spirit of place disappear, the intuitive ability to perceive the sacred quality of the biotic community seems to atrophy. Finally, the perception of reality is restricted to a “nuts and bolts” point of view that excludes the mystery, the *numen*, the meaning.

Imagine a collaboration between indigenous peoples whose understanding of native habitats is contained within their lore, music and ceremony, and biological scientists who well understand that extermination of species tolls the knell for habitat. Imagine thinking in terms of watershed boundaries rather than geopolitical boundaries. Or that the Earth is a living organism rather than a body of real estate to be divided among the most powerful humans. Or that we are honored to be members of the biotic community of our planet Earth rather than considering ourselves to be dominant and separate. The result could combine knowledge and wisdom of specific homelands in such a way as to foster reciprocity between humanity and habitat, and thus reinvoke the Spirit of Nature in our daily lives.

Blackfoot Cosmos as Natural Philosophy

Our ancestors were strong, powerful and were well equipped with survival skills. They taught us to live in harmony with nature, the animals and the birds. They taught us that the land belongs to the Creator and that we belong to Mother Earth. Our legends teach us lessons (Rufus Goodstriker (Piinakoyim) in Zaharia and Fox 1995: 97).

The group of closely related nations of the Algonquin linguistic stock known as the Blackfoot Confederacy is comprised of four divisions: the Southern Piegan, or Blackfeet, of Montana; the Northern Piegan, or Blackfoot, of Alberta; the Kainah, or Bloods; and the Siksika, or “Blackfoot” proper. Loosely organized in mobile social units described as “bands” in the anthropological literature and relying on the buffalo as its economic base, the Blackfoot Confederacy controlled a vast terrain stretching from northern Alberta and western Saskatchewan in Canada down into the high prairies of Montana in the United States. In 1833, their numbers were estimated to be nearly twenty thousand people (Maximilian 1906). Devastated by epidemics and unequal military struggle with colonial powers, the Blackfoot Confederacy suffered a steep demographic decline at the turn of the twentieth century, which was partially offset by a gradual postWorld War II population increase that brought the confederacy’s numbers to about fifteen thousand enrolled members in 1990. Deprived of a bulk of their territorial possessions, the present-day Blackfoot resist a high unemployment rate, lack of proper medical care and bureaucratic interventions through an intensive focus on communal values, personal integrity, local knowledge, and cultural revival, including that which represents a strengthening of the Blackfoot philosophical universe.

Throughout the world, Native peoples seek to be aware of, in communication with, and hopefully synchronized with, the rhythms of the natural world. In the Blackfoot context, spiritually “knowledgeable” or “powerful” people are those who know how to do this. The purpose and structure of stories, teachings, and practices emphasize this point. *Mokakssini*, the Blackfoot word that approximates *epistemology* – referring also to notions of awareness of total being, and knowing – is founded upon deep knowledge of the environment, the cosmos, and all of life, and is rooted in spirituality. Blackfoot teachings consider humans to be part of a delicate harmonious relationship with both the Earth and the heavens, wherein the Sun, Moon, the planets and stars – called *Spumatapiiwa* (“*Sky People*”) – have spiritual as well as physical properties. The natural

harmony of the Blackfoot universe is easily disrupted unless humans remember their responsibility to maintain it.

The spiritual practices that are related and relayed to humans in Blackfoot stories hold valuable lessons for seeking deeper knowledge via awareness of the interrelationships between humans and the rest of their environment. Preparations to increase one's awareness during a vision quest or by participation in the Sun Dance, for example, are not simply about the preparation of the mind (i.e., psychological), but rather to bring into harmony, to synchronize the whole human, with the "whole," the "multiverse." Blackfoot vision traditions are central awareness-seeking sources contributing to the rich body of Blackfoot knowledge. This tradition survives as an immensely systematic, purposeful, adaptable, creative, holistic, strong teaching format that is a viable format for achieving its ends of knowing oneself and one's relationship to the rest of the world.

Dynamic movement, interaction, and interdependence grounded in reciprocal relationship, responsibility to oneself, to one's family and relatives and culture are intricate webs of reciprocity tying together all facets of one's life, and continuity of "the people" are major themes in traditional stories. The stories connect the land and the Blackfoot spirit through transfer, awareness, and transformation that are the root of *mokakssini*. Philosophically, the oral tradition shows the importance of the way Blackfoot story traditions speak to the sacredness of place at the level of dialogue with all members of the universe, extending to the stars and planets. Such exploration of the role of imagination in traditions is a continuation of native intellectual and philosophical traditions, where metaphor and analogy have primary roles in the formulation of adult learning and human cognition. Similarly, creative cognition is described as recurring thinking that incorporates ongoing symbolic constructions, affective images, and nervous signals within an immutable pattern of traditional teachings. Its main constituent, however, is so sophisticated that it is refined to schemata – customary ways that indigenous peoples organize, perceive, and think about the hallowed environs that envelope and convey sacred reality: a separate way of being, a different way of observing the world, and an altered perception of time, space, and image. This reality incorporates in its structure of knowledge the metaphysical principles of the subjective experience most often denounced as superstition and ignorance by non-native lay people, Christian dogmaticists and positivist scholars. For example, native dreams, visions and ritual observances have been under discursive, psychological and institutional attack since the time of the first missionaries in the New World. In this reality, learning and consciousness are circular, which addresses the timelessness of human spirit and the constancy of the inexpressible, as revealed in the transformations between the source of life and all those who share that life, including humans (Standing Courage 1995).

A first step in seeking knowledge/power is to thoroughly cleanse oneself, spiritually, physically, and mentally, to be ready to be "open" to receive knowledge/power/awareness. Mails (1973: 61) describes this as a process of opening oneself up, to help oneself be as receptive as a "channel." One significant purification ceremony given to the Blackfoot from the Star People is the sweatlodge. Another is burning sweetgrass

incense. The sweatlodge prepares one to receive teachings (power), and is a mechanism of transformation with the goal of enabling communication between the different realms of existence. It is for this reason that the sweatlodge is part of a larger process of preparation for learning.

The vision-seeking component of the quest is part of a long process of preparation, of opening oneself up to knowledge of the world and the universe. A vision quest is not taken lightly and requires much meditation and preparation, which is designed to prepare the seeker to tolerate the demands of such an effort and thereby assist in a successful outcome. The educational process this follows teaches that every single step of the preparation for seeking a vision must receive as much attention and goodwill as the actual quest. The follow-through on visions also requires much concentrated effort. In a testimony given by Smoking-Star to anthropologist Clark Wissler, sweatlodge and vision-seeking experiences appear as parts of a coherent ceremonial whole still found among Blackfoot religious practitioners:

My uncle told me it was time to seek power. This meant that I must fast and sacrifice, seeking a vision. So I took my other Crow horse to old Medicine-bear, a shaman, offered him a pipe, and made my request. My instruction took many weeks. I was introduced to the sweathouse and other ceremonies, learned how to make the pipe offering, to cry for power and so forth. At last all was ready and old Medicine-bear left me alone on a high hill to fast, dance, and pray. Each evening and morning he came and, standing far off, exhorted me to greater efforts. By the third day I was too exhausted to stand. That night I lay on my back looking up at the sky. Then I saw the Smoking Star [the star who smoked my pipe]. And as I gazed it came nearer and nearer. Then I heard a voice, "My son, why do you cry here?" Then I saw a fine warrior sitting on the ground before me, smoking my pipe. At last he said, "I will give you my power. You are to take my name. You must never change it. Always pray to me and I will help you." The next morning when old Medicine-bear came and stood afar off I said, "Something has been given me." Then he prayed and took me home. In due time he heard my story, composed a song for me, gave me a small medicine bundle and announced my new name. I was now a man of power (in Wissler 1922: 51–2).

Blackfoot traditions such as the sweatlodge, incense burning, pipe smoking and vision quests recognize the role of transformation of elements (between rock, water, air, etc. in the sweatlodge), like the transformation of the people involved, for change and release of spirit. The mutual contributions by rock and water and people in this process reaffirm the unity of physics and the spiritual relationship that exists between all that is.

The native interpretation of nature converges with Western dialectics in its emphasis on struggle, variety, and creativity (Simon 1990). The indigenous conception of the cosmos as oriented in all directions, rather than simply above, places emphasis on bringing humans together with all of nature (which includes the "supernatural"). Blackfoot stories, and their lessons about a way of life, demonstrate a fundamental order to the cosmos that contains necessary balancing elements of disorder or noncompliance

with Blackfoot ideals (for example, cycles of Twins bear this out in every stage of creation). Humans do not control the energies of the universe, and while these energies are very powerful they are influenced by our action or inaction, as the case may be. Blackfoot stories relate concepts of time, space, and distance that are uniquely tailored to the Blackfoot sense of belonging and relatedness to the landscape and all in it, and to a unity with the universe and events in it. Humans share a role in creation because we can, and should, interact with and renew these energies, *natoyi* (Creator's energy), every day.

The ontological relatedness shared by humans and the rest of the universe emphasizes the caretaker role of humans. Stories emphasize unity, a sense of belonging and give purpose to life through community-oriented action and growth. This is demonstrated in myriad ways, ranging from the structure of the Sun Dance to lodge encampment tipis and sweatlodges, and in the centrality of the circle in the traditional Blackfoot social life. The stars and planets and Earth are round, as are living things on Earth. The path the sun travels is a circle, the seasons comprise a circle, as do the four stages of life: babyhood, childhood, adulthood, and old age.

The Sun Dance is the largest annual renewal ceremony of the Blackfoot, with preparations running throughout the year and involving the coordination of the sacred and other societies and the Blackfoot community at large. The expression Aka-wah-kiapik-sis-tsiko ("the sun is going home") refers to the sun's movement up the horizon as summer progresses. Traditionally, the Sun Dance was held when the sun arrived "home" during the summer solstice. Blackfoot tradition requires that a woman must first vow to sponsor the Sun Dance, and it cannot take place without this initial step. She must be considered a "good" woman – honest, loyal, kind, and willing to sacrifice for the community, her "children." Her commitment and honesty are crucial, for if she is dishonest and vows to sponsor the Sun Dance, she puts the entire community at risk. Dancers also make vows and prepare at length to participate. Other community members participate at various levels, including praying for those who are sick, fasting, and giving thanks for another year. Some participate by getting painted or by simply observing. At all levels of participation, the organization and function are infused with spiritual expression found in dreams, visions, and teachings from stories. These are replicated in language, social and geographic organization (e.g., organization of clans and societies in encampment circle), manifestations of sacred beings in various forms (e.g., paint, clothing), dance, and song. There is much significance in every act at every level of the ceremony. The center pole, for example, to which offerings are tied, is called the "enemy," and war songs are sung during its construction. In giving thanks for another year of life, the Blackfoot "conquer" death, starvation, sickness, etc., and live to see another year. Offerings are made to the sun in appreciation and in prayer for another year of health, happiness, and safety.

The role of caretaker or responsible keeper of the relationship among the members of the various levels of the world belongs to humans in various indigenous creation cycles. Stories create a connecting link; they support the ideology of balance and oneness

with nature and oppose the ideology of separation, dichotomization, manipulation, or domination of nature. Learning about the environment and maintaining existence is part of a circular order. Hence, it is a strong sense of place and homeland, an intellectualism rooted to the knowledge received from nature, a holistic approach to survival, strong kinship relations, and great diversity in reaction to the physical and metaphysical worlds that form distinct national identities (Fixico 1993).

Blackfoot stories, ancient and modern, are replete with references to the pity and gifts that are granted by spirits who *reside in nature*. This is the key to understanding *mokakssini*: awareness of *pii-tsa-tap-tsi*, all the “magical,” “mysterious,” “powerful” forces in all of nature, including the stars and planets, and of our relationship to them. Attention to and respect for their powers, together with humility and responsibility, help humans survive. Humility in the face of so many forces more powerful than humans, and the responsibility to attend to these powers helps humans to respond to the web of relationships that already exist (in nature – the land and sky) into which humans are born. To grow as human beings, to mature in accordance with the circle of development, is to follow patterns of development outlined by the stars and planets, especially the sun. The reciprocal nature of this responsibility is that in order to grow spiritually, and to mature as a human being, one must know the patterns of the universe and make oneself available to learn from them by following their example.

By modeling human growth and interaction on the patterns of the cosmos, patterns of sharing, generosity and honesty are reinforced because of the context that we all share the same breath, universe, energies, etc. These assist the survival of the people because we must care for each other as we care for ourselves. The metaphysical communion demonstrated in the Blackfoot stories influences the social life in that it: promotes awareness of social interdependence; is inconsistent with exploitation; and teaches the wisdom of living close to the Earth that is replete with life and meaning if we can tap into it. This respect for life includes, for individuals, a combination of mind, soul, body, and spirit, the four components of ontological dependence; and responsibility is about recognizing and taking care of the interdependence.

The intervention of the Canadian and American colonial powers into Blackfoot life is interpreted by the Blackfoot as the disruption of the natural order to be counteracted and healed through several major collective actions: the repatriation of sacred objects from museums and private collectors, the education of the young in the Blackfoot language, the perpetuation of ceremonial cycles, and the protection of the land against the encroachments of large-scale industries. During the 1990s, several types of ceremonial bundles (beaver, medicine pipe, and sundance related objects) were unconditionally returned, as in the case of the United States’ museums such as the Smithsonian and Peabody, or lent, as in the case of some Canadian museums, to the Blackfoot Confederacy. One motivation for recovering bundles and other articles is the importance placed on the wholeness of the community, which is unlikely without the complete sets of bundles. The traditions given to the Blackfoot by the visions, stars, original people, and animals are disjointed, missing parts, sets, songs, or sections; their continuation is

further complicated by the death of knowledgeable elders. The nonphysical elements (i.e., spiritual) are believed to come back to the community through more traditional means such as the language, or by truly believing in and practicing the traditions, and through prayer. The traditional teachings are fading away as younger generations propose changes to them and knowledgeable elders pass on. Suggested changes to ceremonies occur, which have to be corrected by elders, and fewer and fewer young people know the songs. Recognizing the difficulties of maintaining the Blackfoot traditions includes acknowledging that younger generations have a crucial role in maintaining the teachings. Elders and younger learners of the traditional Blackfoot way have hope that the teachings will continue; as tribal societies gain new members, elders continue to participate in their traditional role as teachers and transfers take place. The longevity of Blackfoot traditions is often explained by elders with reference to the power of their structure and their “spirit” or “shadow”: as long as the Blackfoot persist in practices that unite these two aspects of their traditions, the teachings will survive. The oneness of spirit and matter is demonstrated by the struggle that the Blackfoot have waged over the years protecting one of their beloved vision-quest areas in the heart of the Montana reservation, known as Badger-Two Medicine, against its use by oil-drilling companies. The beauty of these grasslands can also be appreciated outside of religious contexts by the enthusiasts of hiking, fishing, horse packing, camping, hunting and cross-country skiing.

Blake, William (1757–1827)

William Blake was born in London on 28 November 1757 to a well-established hosier and his wife. Blake's childhood was filled with visions of wonder; as a boy, he often saw throngs of angels and spirits in trees and throughout London. When Blake was four years old, he looked at the window of his childhood room and saw a vision of God looking back at him. Four years later, he reported to his father that he had witnessed a tree full of angels on one of his sojourns in London. His father threatened to punish him severely for lying, but the young Blake determined to maintain these visions as the basis for his own developing theology.

Prior to his career as a published poet, Blake received training in the visual arts both at drawing school and as an apprentice to a master engraver. The skills acquired during this period appear in the many engravings he created to accompany his poems. These illuminated manuscripts radically changed the face of publishing in the late eighteenth century, and they also opened new doors for Blake to express his prophetic vision.

Blake is perhaps best known for his two-volume collection of poems, *Songs of Innocence* and *Songs of Experience*. It is here, also, that he best articulates his own religious ideology and its relationship to the natural world. Though the two books were published several years apart (1789 and 1794 respectively), Blake intended that the illuminated manuscripts be read together, as they reveal what Blake called the "two contrary states of the human soul." In the first volume, Blake's personae are small children motivated by love and peace. Because these children maintain an immediate and unmitigated relationship with the natural world, Blake contends, they use their imaginations more freely and actualize the divine within the natural world. Adults, he argues in *Songs of Experience*, lose the ability to appreciate nature and, thus, are further from God.

To understand this triangulation of the natural world, the child-like perceiver, and the divine, we need first to understand Blake's own theology. Blake began his adulthood as a devout follower of Emanuel Swedenborg, a Swedish scientist and theologian. Blake eventually came to reject Swedenborg's doctrine, however, as it deemphasized the epistemological and theological merits of sensory experience and the role of the imagination. He determined, then, to create his own mythology based on an egalitarian idea that salvation can be arrived at through the human imagination.

Blake's account of the imagination is one based in the philosophies of Locke and Hume. Like these modern philosophers, Blake held that the only reality is one created through perception. The imagination, then, is our ability to manipulate or synthesize

these perceptions into thought. Blake's theory stipulates that the degree to which we use our imaginative powers is the degree to which we are able to achieve the divine within this lifetime.

Like other Romantic poets, Blake held that nature is an imperative component of this construction. In the wellknown introduction to *Songs of Innocence*, Blake reveals that the inspiration for his poems and their underlying theology comes from an encounter with an angel in the verdant valleys of England. The angel, a metaphoric embodiment of Blake's deceased brother Robert, tells Blake to pipe a song of love and rural tales. The poet responds by making a "rural pen" from a reed and sitting down to tell the story of children's unadulterated love of the natural world. Other poems in the collection expand upon this connection between a child's perceptions of the natural world and the divine. The poems of *Songs of Experience* reveal the darker side of nature without imagination and, thus, without God.

The culmination of these ideas appears in one of

Blake's last poems, *Jerusalem*. Here, he argues against the materialism of society by suggesting that we return to a more edenic life and connection with the natural world. His powerful illustrations reify this message through whimsical accounts of angels resting on sunflowers and god-like figures at once harnessing celestial fire and relying upon the natural world for their power.

Though critics of Blake – both past and present – often accuse the poet of relying upon overly simple meter and reductive Christian imagery, much of Blake's writing evinces a far more sophisticated spirituality, albeit one taken from the pages of the Old and New Testament. Part of this criticism stems from Blake's sometimes uneasy alliance with other Romantics: while his account of the self and its ability to find inspiration in the natural world allies him nicely with other Romantics, his commitment to articulating a mythology based on a biblical God and celestial hierarchy differentiates him from many of his pantheistic contemporaries.

Blavatsky, Helena Patrovna (1831–1891)

Helena Patrovna Blavatsky (née Hahn) was a writer, spiritual teacher, and co-founder of the Theosophical Society. Of aristocratic Russian background, Helena Petrovna married Nikifor Blavatsky in 1849, but soon left him to wander the world in search of spiritual truth. According to her own account, she spent several years in Tibet studying under Mahatmas (highly evolved teachers) who remained her guides thereafter. She came to America in 1874, settling in New York and becoming a U.S. citizen. There, in conjunction with Henry Steel Olcott and others, she founded the Theosophical Society in 1875. In 1877 her first book, *Isis Unveiled*, was published. Then, in 1878, she and Olcott departed for India, where she remained until 1885. Those were years of rapid growth for the Theosophical movement, but also of much controversy related especially to a critical investigation of her by the Society for Psychical Research, published in 1884. Returning to Europe in 1885, she resided in London after 1887. Despite failing health, she published several more major works before her death in 1891: *The Secret Doctrine* in

1888, *The Key to Theosophy* and *The Voice of the Silence* in 1889.

The fundamental theme of Blavatsky's teaching and writing was recovery of what she often called the Ancient Wisdom: primordial lore about the emergence of the universe and the interaction of material and spiritual aspects of the world and human nature. She believed that in recent centuries this wisdom has been largely obscured by dogmatic religion and as well as doctrinaire materialistic science, being preserved only in a scattering of esoteric groups and in reservoirs of ancient truth like Tibet. However, certain adept teachers, also called Mahatmas or Masters, were prepared to instruct select candidates in the path toward this almost forgotten learning. These adepts, in Blavatsky's eyes, were largely real persons living in out-of-the-way places on Earth but able to communicate psychically with one another and with students like herself.

Blavatsky's theosophy centers around what might be called an enhanced naturalism. The universe, she said, works by law and evolves naturally out of original oneness from within. But, in contrast to the prevailing scientific view, as she understood it, the scope of that process includes consciousness, which has coexisted with matter eternally and is evolving with it. Thus, in more picturesque terms, the essential "core" of each individual is the monad or pilgrim, an entity of refined consciousness traveling from life to life,

world to world, and state to state as it descends into the realm of experience and ascends upward again toward unity.

The influence of Blavatsky and her Theosophical Society is difficult to assess precisely, but is being increasingly recognized as a significant element within twentieth-century modernism. The tribute she paid to Eastern and other suppressed religions and cultures in the heyday of European imperialism by describing them as important custodians of ancient wisdom played a role in subsequent spiritual revivals and national independence movements from Ireland to India and Sri Lanka. Theosophy was no less important in popularizing Eastern religious concepts such as karma and reincarnation in the West. Some aspects of her philosophy hinted at forthcoming insights in relativity, quantum, and evolutionary theory. More narrowly, her work has had a powerful impact on all later occult, esoteric, and “New Age” ideologies. So far as nature is concerned, Theosophical emphasis on the coevolution, and so kinship, of all life has tended to counter the privileging of humanity alone, though Blavatsky herself did not develop nature-oriented aspects of the teaching as much as other, later Theosophists.

Boff, Leonardo (1938–)

Leonardo Boff is the first Latin American liberation theologian to situate social and political liberation within a broader ecological framework. Although liberation theology did not begin with concern for the environment, but rather, as Boff himself phrased it, with “concern for the oppressed sons and daughters of the Earth,” his works of the early 1990s express his reconception of liberation around ecological models. Boff argues that the logic leading dominant classes to oppress the poor also results in the exploitation of nature. Reflecting on the Latin American experience, Boff discerns an interrelatedness between the ecological, human, social, and spiritual aspects of life.

Leonardo Boff was born 14 December 1938 in Concórdia, Santa Catarina, Brazil. Following philosophical and theological formation, he entered the Order of the Friars Minor (Franciscans) in 1959 and was ordained to the priesthood on 15 December 1964. In 1971 he obtained his doctorate in Munich, Germany, writing a dissertation on the Church (supervised by Joseph Ratzinger). On his return to Brazil he served for 22 years as professor at the Franciscan institute at Petrópolis. He has also served as visiting professor at numerous universities, including Lisbon, Basel, Salamanca, Heidelberg and Harvard, and holds honorary doctorates from Turin and Lund. Boff pioneered the development of Brazilian liberation theology, was active in the formation of ecclesial base communities, and has consistently defended human rights. From 1970 to 1985 he was senior editor of *Editora Vozes*, and coordinated the publication of the collection *Theologia e Libertação* and of the Portuguese edition of the *Collected Works of Carl G. Jung*. He also served as editor of *Revista Eclesiástica Brasileira* (1970–1984), *Revista de Cultura Vozes* (1984–1992), and the international journal *Concilium* (1970–1995).

Boff gained worldwide attention in 1985 when he was summoned to the Vatican to explain sections of his book, *The Church: Charism and Power*, which questioned certain teachings of the Roman Catholic Church. His subsequent silencing eventually led to his resignation from the priesthood in 1992. He was Professor of Ethics, Philosophy of Religion, and Ecology at the State University of Rio de Janeiro (UERJ), from 1993 until his recent retirement.

Boff’s liberation theology took an ecological turn in the late 1980s and early 1990s. According to Boff, just as conventional ecology developed unrelated to social context, liberation theology had been articulated without reference to the natural world (Boff 1994: 245). Boff’s early environmental writings show the influence of Latin American social ecology that grew following the United Nations first international conference on the environment in Stockholm in 1972. Following the work of Carlos Herz and Eduardo Contreras of Peru and Eduardo Guaynas of Uruguay, he argued for a “social ecology

that is capable of articulating social justice” (1994: 239). According to Boff, theologians must speak of “ecological sin.” The commandment “Thou shall not kill” for example, refers to biocide and ecocide as well as to direct killing (1994: 245).

Ecology and Liberation, published in Portuguese in 1993 and English in 1995, was Boff’s first book articulating an ecologically oriented liberation theology. Although he still claimed that the “social project is social ecology,” in *Ecology and Liberation* he argued for a “holistic ecology” because it is “theological by nature” (1995: 7, 11). In this and following works, he showed the influence of the South African philosopher Jan Smuts as he articulated a holistic ecological model. Drawing on the spiritual traditions of Francis of Assisi, Teilhard de Chardin, as well as Augustinian, Bonaventuran, Pascalian and existentialist traditions and the “new physics,” he called for a merging of ecological and theological concerns. Elements of a liberation theology that protect the poor and the Earth, according to Boff, include Christian panentheism (“everything in God, God in everything”), a sacramental view of creation, and a doctrine of the Holy Spirit that provides a model of reality as energy. Boff further articulated this theological and ecological holism, focusing on the Amazon of Brazil as a concrete case, in his 1995 book, *Cry of the Earth, Cry of the Poor* (English translation 1997). In this volume he articulated an ecology-based cosmology, rooted in evolutionary processes, in which sin is defined as “breaking connectedness” (1997: 85). Influenced by Brian Swimme, Thomas Berry, Meister Eckhart, and Teilhard de Chardin, Boff finds God within the “cosmogenic process of the universe” (1995: 146). According to Boff, without a spiritual revolution, the new paradigm of connectedness is impossible, resulting in further damage to the Earth, including the

Amazon, “temple of the planet’s biodiversity” (1995: 87).

As a founder of liberation theology, Boff’s concern has always been with the poor and oppressed of the world. In his early writings, the oppression of the poor was exposed through social scientific (Marxist) analysis, evaluated in the light of faith, and then actively opposed. In Boff’s later writings he articulated an “ecospirituality,” claiming that the plight of the oppressed and the Earth are connected.

Bohm, David (1917–1993)

In the 1980s, recognized physicist David Bohm presented the so-called “holographic paradigm,” which was the result of thirty years of research into quantum mechanics and its philosophical implications. While his early work had been focused on the strictly scientific aspects of quantum mechanics – although from the beginning he refused to separate science and philosophy – Bohm’s perspective changed when he met the Indian thinker Jiddu Krishnamurti in 1961. His *Wholeness and the Implicit Order*, although presented as a “work in progress,” became highly influential in the modern philosophy of nature and the debates on holism. In this book, Bohm presents a theory that describes the phenomenal world as the “unfolding” of a more fundamental “implicit” order. This implicit order is characterized by an unbroken dynamic wholeness – a “holomovement” – that comprises both matter and consciousness.

In later publications, Bohm expanded his theory, describing a hierarchy of orders beyond the implicit (the super-implicit order, the generative order, etc.) and presented a theory of “soma-significance,” which intends to reconcile the domains of matter and meaning. As can easily be recognized, his later thought carries strong metaphysical and mystic connotations. This led to a kind of alienation from the “traditional” physicists and, simultaneously, to a broad appreciation by those in philosophical, theological, and esoteric fields of discourse. While Bohm did not engage in direct political or environmental activities, his influence is nevertheless important because he provided those endeavors with a theoretical holistic framework that can easily be attached to environmental concerns.

Bon (Tibet)

Tradition relates that the Bon religion was introduced from heavenly realms by a Buddha-like figure, sTon-pa gShen-rab, some 20,000 years ago. It spread into the Kingdom of Zhang-zhung (western Tibet) and then into Tibet itself. Bon was embraced as the national religion until its position was usurped by the introduction of Buddhism, which coincided with the collapse of the Tibetan empire during the eighth–eleventh centuries. As Buddhism established itself in Central Tibet, Bon consolidated in the eastern provinces and border regions, where it continues to this day.

Recent scholarship suggests that such traditional accounts err by using the word Bon to describe what are really two quite distinct religious entities: the preBuddhist religion of Tibet, and the religion of sTon-pa agShen-rab, and that careful differentiation needs to be made between the two.

The Bon of dynastic Tibet pictured the natural world as populated by countless deities and entities, the most powerful of whom, the bTsan (“Mighty”) gods were linked with the monarchy and were perceived as being largely remote from mundane activities. Of more immediate concern to humans were the lesser entities that were held responsible for disasters such as crop-failure and disease. Thus a major role of the Bon priests of this period was to mediate between the people and these many “lesser” gods and demons. This mediation typically involved identifying the spirit involved and the reason for its actions, and then determining the measures necessary to persuade it to desist. Such measures might entail the offering of food and prayer, although in ancient times it frequently required an animal sacrifice (on rare occasions human sacrifices were apparently also undertaken).

The historical origins of the Bon of sTon-pa gShen-rab remain obscure, but one theory suggests that it was a genuine – if unconventional – Central Asian form of

Buddhism (flavored with Indo-Iranian religious beliefs) which was introduced to Tibet at about the same time as “conventional” Buddhism entered from the south. Naturally its introduction to Tibet required that it reach some accommodation with the autochthonous religion. This was largely achieved by subsuming it: as in “conventional Buddhism” many of the significant local deities were “oath bound” (dam-can) to defend and protect the new religion and merged into its pantheon.

As Bon and Buddhism evolved in Tibet their similarities increased, and many of their religious aims and practices became all but identical. In larger Bon monasteries monks are educated in a way reminiscent of the dGe-lugs-pa sect of Buddhism, and follow the Vinaya (monastic code), which abjures the taking of any life and espouses the practice of vegetarianism. Practitioners of both religions aim to achieve byang-chub

(“awakening”) and to attain liberation for all creatures from the cycle of suffering and rebirth.

The relationship between contemporary Bon religion and the natural world therefore largely mirrors the experiences of the dGe-lugs-pa, although the ancients’ respectful fear of their surroundings continues to inform the more popular aspects of their religion. Again, as in Buddhism, there is often a considerable difference between the highly sophisticated type of religion taught and practiced at the main monasteries, and that of the village lamas who, like their forebears, continue to play a mediating role between the common people and the gods and spirits around them. Encounters with the “village” form of Bon, coupled with confusion between contemporary Bon and the preBuddhist religion of Tibet, have caused many commentators to describe Bon as fundamentally “shamanistic.” Common though it is, this appellation is highly questionable and has been rejected by senior Bon clerics. There is no doubt that contemporary Bon includes practices which may be called “shamanistic,” but it must be said that similar practices are equally evident in other forms of Tibetan Buddhism to which the term “shamanistic” is never applied as a blanket label.

Book of Nature

“The Book of Nature” refers to the Christian concept of nature as a book, written by the hand of God and serving as a companion volume to the book of Scripture. With reference to this concept, the devout Christian is understood to be a faithful, attentive reader, studying both creation (the physical world made and sustained by God) and the Word (the Christian Bible, understood as the revealed word of God). For traditional Christian thinkers, the book of the Bible takes precedence as the source of revealed knowledge of God which serves as a means of grace for the faithful. The book of nature is secondary, a source of natural knowledge of God, available to human reason, but lacking a means of knowing the transcendent aspects of the divine. The art of reading the book of nature also lacks the requirements of faith and the possibilities of spiritual transformation that comes through divine revelation. Contemplation of nature may lead to the growth and refinement of one’s knowledge of God, but it is only God’s active work of self-revelation and grace that can perform the work of redemption on human beings. Studying the book of nature, however, has a certain democratic function because it is available to lettered and unlettered, churchd and unchurchd alike. Thus, attention to the book of nature may lead one to grow closer in knowledge and love of God, the Creator, and thus can spiritually prepare an individual for God’s redemptive work.

The importance of examining creation to understand the character and attributes of God is an ancient religious theme that informally reaches back to Rabbinic Judaism, as well as to earlier Ancient Israelite religious expression. The concept of “thinking back” from nature to God also draws on the Greek Platonic and Aristotelian traditions of reasoning by starting with the order of nature in order to then establish the character of divine beings or, in Plato’s case, of ideal forms. The traditional Christian view of creation builds on its Jewish heritage and its Hellenistic context, while also elaborating the concept of the Word (*Logos*) as the means through which physical creation is brought into being. The *logos* of scripture is thus conceptually linked to the physical world, which is also interpreted as a form of divine speech or divine text.

In the history of Christian thought, the notion of nature as a “book” finds vivid expression in the writings of Augustine of Hippo (354–430) who claimed that reading the book of nature directly was a more valuable means of knowing God than reading theological texts (though not more valuable than reading scripture itself). The metaphor of the book of nature persists into the twelfth century where the notion of nature as a book is reinvigorated by

Alain de Lille (1128–1202) and Thomas Aquinas (1225–1274) who both emphasized the inherent orderliness in and purposive aspects of nature. For Aquinas and Lille, nature is a system of fixed laws and secondary causes that reveal an intelligent creator and “Unmoved Mover” (God) who sets the forces of nature in motion.

Medieval scholastic theological discourses on creation and the “argument from design (in nature)” for the existence of God were complemented by more popular theological and literary traditions that emphasized each aspect of nature as having symbolic significance with respect to God’s character or the aspirations of virtuous Christians. Medieval emblem books and bestiaries described the natural world through a Christian theological lens, with animals representing particular vices, virtues or doctrines, such as the goat representing the sin of lust, the glow worm symbolizing the light of the Holy Spirit and the caterpillar representing the resurrection of Christ. In sixteenth- and seventeenth-century Europe, the popularity of emblem books grew such that texts about the (symbolically Christian) natural world developed side by side with ever more popular representations of nature as a Christian text. In this same period, natural theology reached new heights of popularity, influencing the development of natural science, first as a means of acquiring greater knowledge and understanding of God and later as a discipline in its own right, with or without reference to a divine creator.

In the American setting, the view of nature as God’s book flowered in the context of a new environmental setting that was both bountiful and frightening to European colonial eyes. This new physical surround, coupled with a long-standing intellectual tradition of “reading” nature, led to a rich theological and literary production emerging from the contemplation of nature’s meanings. The tradition of the book of nature persisted in both liberal and orthodox Protestant thought. The Puritan leader Cotton Mather urged his readers to walk in the “Publick Library (sic)” of nature in order to read about the character of God, and Jonathan Edwards saw in nature “images and shadows” of the divine, interpreting thunderstorms and rainbows symbolically, as had the emblemists before him. Later, in liberal theological contexts, the tradition of interpreting nature slowly became divorced from traditional Christian theology. The rise of deism in the seventeenth and eighteenth centuries fostered attention on nature itself with a concept of God as a great Architect or Watchmaker, and nature as a building or machine that, once set in motion by God, contained laws and processes that could be independently understood and, ideally, controlled. Deism itself created a precedent that led some to a wholly atheistic reading of nature’s book, with the hope and expectation of discerning nature’s own laws and processes and nothing more. This intellectual shift may have led to a greater scientific knowledge and appreciation for nature, but also established the groundwork for the intellectual and physical control of nature that has led to technological innovation, but also ecological destruction.

In the late eighteenth and nineteenth century, and in partial reaction to the Enlightenment view of nature’s book, philosophers and writers participating in the rise of Romanticism in Germany and England also propagated the notion of nature as

a “book,” revitalizing the notion that nature contained hidden messages and meanings, though no longer those of Christian doctrine. For the European Romantics and the American Transcendentalists, nature could be “read” for insight into the (often post-Christian) divine, but was also studied for knowledge of the self and as a means of cultivating the imagination. The Romantic ideal of the Poet-Seer posited a visionary who was specially equipped to “read” nature and then, through use of the Imagination, transform the messages of nature into literature that would bring “nature’s book” to the attention of other readers. In this context, nature still served as a kind of cryptogram, but the message was no longer strictly theological, but more broadly metaphysical, existential and psychological.

The Romantic tradition has played a vital role in developing a legacy of nature appreciation in Europe and America, although the legacy is a complex one and not wholly positive. Among the negative legacies are the connections made (particularly in the nineteenth and early twentieth centuries) between Romantic nature appreciation and certain forms of European nationalism. The Fascist movement in Germany is the darkest example of the ways in which pastoral themes in the art and literature of German romanticism were exploited to nationalistic purpose. The pursuit of a redemptive and “pure” rural Germany was linked to the concept of establishing a pure German race. German Romanticism was one of many “background theories” in the growth of National Socialism, but it is undeniable that anti-Semitism developed hand-in-hand with popular celebrations of German country life. The concept of the book of nature, then, was not always beneficent.

Contemporary eco-theology has revived interest in nature as a “book” to be studied. Twenty-first-century eco-theologians recognize, however, that too much attention to nature’s book without attention to divine creative forces historically played a role in the rise of Enlightenment science that fostered a mechanistic and sometimes destructive attitude toward the natural world. Aware of this history, writers such as Sallie McFague, James Nash, John Cobb and Calvin Dewitt argue for the careful study of nature as a way to foster both knowledge and reverence for nature, but they also rearticulate modern versions of older Christian theological themes in which nature as “text” must always be seen in reference to its divine author. At the same time, these theologians also welcome a certain closing of the distance between the author and the book. Their collective emphasis on divine immanence and action in creation suggests an author who is still producing and revising the text, a stance which resonates with – rather than stands against – much modern scientific thinking.

In the realm of ecological activism, also, the concept of “The Book of Nature” continues to be employed. The Religious Campaign for Forest Conservation, for instance, sponsors “Book of Nature” retreats that invite Christians and Jews to spend time in wilderness settings and discern what the wilderness might teach, as mediated by the religious traditions and orientations of participants. Such retreat experiences build on earlier American traditions of “open air” religion, including the founding of organizations (such as the Boy Scouts, the YMCA and Jewish camping associations) that use

outdoor settings to foster religious insight and moral character. More recent experiential workshops, however, are often explicitly directed not only at gaining religious insight *through* nature study, but also at harnessing such insights for the sake of environmental protection. While the concept of nature's book is an ancient one, it clearly continues to be revitalized and reinterpreted (particularly with ecological emphasis) in religious thought and practice today.

Boston Research Center for the 21st Century

The Boston Research Center for the 21st Century (BRC) is an international peace institute established in 1993. Its founder, Daisaku Ikeda, is a Buddhist peace activist and President of Soka Gakkai International (SGI), an association of Buddhist practitioners active in 163 countries. The Center brings together scholars and activists in dialogue on common values across cultures and religions, seeking in this way to support an evolving global ethic for a peaceful twenty-first century. Human rights, nonviolence, environmental ethics, economic justice, and women's leadership for peace are focal points of the Center's work.

The BRC has actively supported the development of the Earth Charter, a people's treaty with Earth that would effectively expand the moral community to include all living beings. Through published consultations on early drafts of the Charter with environmental lawyers, women leaders, and Buddhist scholars, the BRC helped to strengthen Charter language on such issues as demilitarization, gender equality, family protection, and the interdependence of all beings.

When Daisaku Ikeda founded the Center in 1993, he envisioned an institution drawing inspiration from three particular features of the Buddhist approach to life. These philosophical commitments have been at the heart of the BRC's educational mission: a commitment to dialogue as the most effective means of creating peace, a belief in awakening the inner resources of the human being in order to transform society, and a view of the natural universe that works against anthropocentrism by emphasizing the relatedness and interdependence of all life.

Bougainville (Papua New Guinea)

Bougainville (Papua New Guinea) is the easternmost island of Papua New Guinea (PNG) to the north of Australia. Its people are part of the wider Melanesian cultural area, but they have close cultural and ethnic ties with the neighboring Solomon Islands. Bougainville was first colonized by the Germans in the late nineteenth century, but after World War I it was ceded to Australia and became part of the wider nation now known as Papua New Guinea. Bougainville came to world attention in the 1970s with the extraordinary open-pit Panguna mine operated by CRA, a subsidiary of the Australian mining company, Rio Tinto. With the independence of Papua New Guinea from Australia in 1975, the new government creamed off over half the mine's profits for the nation as a whole, leaving Bougainvilleans dissatisfied. Since 1990 the mine has stopped due to a civil rebellion (1990–mid-2001), which began with the destruction of the mining machinery by the local people reacting against environmental damage by severe pollution, destroying the life system for all those who lived downstream from the mine along the Jaba River.

Like most indigenous peoples, Bougainvilleans have a strong sense of spiritual affinity with nature and the interrelationship of all its parts. Also, with their matrilineal societies, Bougainvilleans have an added sense of kinship to nature and its resources. Therefore any development that damages these foundations is felt as deep sacrilege.

During the civil rebellion, Ona was the front man. Outwardly supported by the Marist-oriented Catholic community, but in reality strongly influenced by Damien Damen, Ona was a revered elder figure who believed in and promoted Bougainville as a sacred island called M[e']jekamui, and so he stood for the protection and rights of its people and environment. Little known during the years of unrest (and associated with "cargo cult" activity), Damien emerged as a final figure in contributing to the peace process.

As distinct from the effects of the mine, the war on Bougainville has resulted in despoliation of garden lands and town environments, but not so much on forests. The displacement of people to offshore atolls has also caused problems. On the Cateret Islands east of Bougainville the land area has seriously diminished, these developments amounting to the first United Nations-observed swamping of arable atoll land by rising sea levels. If global warming was here having its effects, this was mainly because protective reefs were dynamited for fish to feed extra mouths

– those of the displaced persons.

Hitherto, religious bodies in the post-rebellion context have concentrated on the handing over of weapons, peacemaking ceremonies, and a general peace with justice. But PNG's granting of autonomy to Bougainville (2002) has allowed the island's government, along with NGO and church agencies, to attend to environmental questions. The Panguna mine, policed by remnants of the Bougainville Revolutionary Army (backing Ona and Damen), is still closed. Current political consensus in Bougainville is that it should remain so.

Brazil and Contemporary Christianity

Brazil, with over 170 million people, is one of the geographically largest countries in the world. It is a country made up of considerable regional, ethnic, and economic diversity. This diversity is clearly reflected in the plurality of religions found in Brazil. This plurality of religions in Brazil includes several African-Brazilian religions, Judaism, Islam, Spiritism, Pentecostalism, Historical Protestantism, and Roman Catholicism. Although the religious make-up of Brazil is changing rapidly, as for example Pentecostalism and charismatic movements of various sorts grow in leaps and bounds, Roman Catholicism remains the dominant religious group in the country. Indeed, the Roman Catholic Church in Brazil is the largest Roman Catholic Church in the world.

Well known in recent decades for its many excellent theologians who were instrumental in the development of the theology of liberation, for its thousands of popular Base Christian Communities, and for the defiance of the military dictatorship in the 1970s and 1980s by much of its hierarchy and many church members, Brazilian Catholicism is not well known for its environmental thought. And yet the country of Brazil contains a precious and vast array of natural habitats and wild spaces well known to environmentalists around the world. Such places include the Amazon River basin with its incredible diversity of plants and animals, the Pantanal, and the coastal rainforests which are now almost entirely destroyed.

The environmental thought of the Catholic Church has developed largely in relation to other social and ethical themes which are prevalent in daily life and dominate Brazilian consciousness. Such themes include the landtenure patterns in Brazil which result in a relative few owners of large pieces of land and millions of rural peasants who have no land to farm at all, and many millions of urban poor who endure substandard housing and sanitation, poor or nonexistent health and education provisions, and who often can find no employment. Another ethical theme is that of the plight of Brazil's indigenous populations which are steadily dwindling through violence and disease as their lands are encroached upon by loggers, ranchers and farmers, and as what were once remote areas come under the embrace of significant capitalist expansion.

Because environmental thought has developed largely in relation to such themes, Christian environmental thought in Brazil means not only and often not even primarily the flora and the fauna of the Pantanal or the Amazon, but open sewers and cardboard houses, deforestation-caused mud slides that cause many deaths in the rainy season, dengue fever and polluted water. This approach is characteristic of Brazilian popular

social movements with interest in the environment, and also of those organizations of the Roman Catholic Church which work with them. Thus environmental issues are often embraced not merely on their own merits but also as directly linked to the well-being of the urban and rural poor of Brazil.

An example of an organization that takes this integrated approach is the CPT (*Comissão Pastoral da Terra* or the Pastoral Land Commission). The CPT is a Catholic organization which was established some decades ago by the Brazilian Council of Roman Catholic Bishops. The CPT was established as an organization to work with issues of land and the peasants who work the land. The CPT deals directly with peasants and the questions that concern them. Those environmental issues which are integrally related to other issues such as justice for landless peasants, their ability to earn a sustainable living off the land, rural violence against them, and their political rights, are the issues with which the CPT may become involved. Thus, for example, it may become involved in the protection of the sustainable fishing practices of the poor against the voracious and unsustainable capabilities of large commercial fishing fleets. Or, the CPT may become involved in teaching sustainable farming practices to farmers who have recently gained access to land to farm, and who will quickly exhaust their land if they do not learn sustainable habits. Or again, the CPT may be active in educating rubber tappers in the Amazon so that they do not destroy the trees which produce the rubber. Similarly, the wellknown secular mass social movement in Brazil – The MST

– (*Movimento Sem Terra*, or the Movement of the Landless), which is supported by the CPT as well as many other organizations, some of which are also related to the Roman Catholic Church, deals with environmental issues which emerge as part of its efforts to secure, through a wide variety of methods, land for the landless.

Several theologians well known specifically as liberation theologians, who have for many years related Catholic theology to the political and economic justice concerns of the poor in Brazil, began in the 1990s to turn their attention to environmental issues and to theologies of creation. Two such Brazilian liberation theologians, Leonardo Boff and Ivonne Gebara, are now doing very creative theological work which addresses directly the environment. They do not let go, however, of the classical themes of liberation to which each has contributed so much. Each of these authors also continues to enrich his or her theological thought about the natural world, and the human place within it, with significant methodological innovations.

Of course while the dominant themes of the Brazilian context – both the social and the environmental – shape to a considerable extent the theological reflection on the environment, the larger context also shapes this reflection. Thus the importance of human care for the natural world as care for God's creation, often expressed by the Pope, and the environmental interests of other parts of the Catholic Church from contexts beyond Brazil may play a role in shaping Brazilian Catholic environmental thought. A similar role is played by Brazilian participation in the larger arena of international Christian theological conversations, as well as interaction with secular thought and participation in secular social movements.

Breathwork

The term “breathwork” refers to a broad array of practices and exercises that work specifically with the process of respiration. Practical techniques to intensify, control, or withhold the breath have been utilized for centuries in many cultures to awaken deeper levels of consciousness and spiritual awareness. Although breathwork has traditionally been practiced in a spiritual, religious, or therapeutic context, it has a strong capacity to awaken insights and awareness about nature, the Earth, and the mysteries of life itself. Hence, applications of breathwork are rapidly growing in ecological contexts.

Breathwork has a vast history in religious practice. Nearly every spiritual and religious tradition around the globe has utilized breathing exercises in one form or another. Examples of traditions that emphasize breathing practices include Kundalini Yoga and Siddha Yoga (*bastrika*), Raja Yoga and Kriya Yoga (*pranayama*), Tibetan Vajrayana Buddhism, Sufism, Burmese Buddhism (*tummo*), and Daoism. More subtle forms of breathing disciplines are also found in Theravadan Buddhism (*vipassana*), Zen, and certain Daoist and Christian practices. In all these cases, skillful breathing exercises serve to awaken interior levels of conscious awareness in the practitioner, and some practices activate powerful healing energies in the psyche.

In contemporary Western culture, Wilhelm Reich was perhaps the first to recognize the power of breathwork practices, and his clinical work revealed that psychological defenses and physiological tensions are often closely associated with restricted breathing. Since Reich’s pioneering work, breathwork has emerged in a variety of contemporary forms. Numerous professional associations have been formed to promote and facilitate various forms of breathwork, including the Association for Holotropic Breathwork and the International Breathwork Foundation. Over the past two decades, breathwork has experienced growing application in ecological circles. Australian rainforest activist John Seed began utilizing breathwork in his retreat programs for activists in the early 1990s. The Satyana Institute in Colorado has introduced breathwork to environmental activists in many regions throughout the United States, holding annual breathwork programs for environmental leaders in Colorado and Idaho. As one environmental leader Matt Baker characterized his breathwork experience, “it allowed me to let go of preconceptions, to root myself, and to experience deeply who I am” (Baker 2001: 3). William Blake once observed that “The tree, which moves some to tears of joy, is in the eyes of others only a green thing which stands in the way” (1906: 259). The latter perspective is epitomized in a timber executive’s remark that trees are nothing but stumps with stacks of money on top. Breathwork and similar transpersonal or shamanistic practices have an uncanny power to transform such mechanistic perceptions of nature, and

awaken in the breather a lived experience of the sacred mystery that inheres in every life form. In breathwork, trees are frequently experienced as Blake perceived them: a living embodiment of the unperturbed, centered, timeless consciousness of life itself, far beyond the turmoil of the world.

Readers unfamiliar with breathwork may understandably find it difficult to imagine that merely working with something as seemingly simple and ordinary as the breath could have much effect. Yet breathing practices are powerful methods for awakening deeper dimensions of consciousness and awareness, which is why they have been employed extensively in spiritual traditions. In the words of psychiatrist Stanislav Grof, “Unless one has witnessed or experienced this process personally, it is difficult to believe on theoretical grounds alone the power and efficacy of this technique” (Grof 1988: 171).

Breath is intricately fundamental to life, and thus to work with breath is to work with the intimate spirit and mystery of life itself. In many languages this is reflected etymologically, where the word for “breath” and “spirit” are the same, or have the identical root. *Prana* in Sanskrit means both spirit and the energy of breath. *Pneuma* in ancient Greek has the same double meaning, as does *ruach* in Hebrew. The Latin *spiritus* also meant both breath and spirit, and has come down to us in English as the root of spirit and respiration.

Western Breathwork: Holotropic Breathwork

Perhaps the most clinically developed and tested mode of breathwork in the West today is known as Holotropic Breathwork, developed by psychiatrist Stanislav Grof and his wife Christina. The Grofs and their colleagues experimented for several years at Esalen Institute in California with many different kinds of breathing practices – drawn from ancient spiritual traditions as well as contemporary psychology. From this foundation, the Grofs developed the Holotropic methodology, and they have trained hundreds of practitioners around the world. The term “holotropic” means moving toward wholeness or totality of experience (derived from the Greek *holos*, “whole,” and *trepein*, “to move toward”).

The Holotropic technique combines sustained rhythmic breathing with evocative music and focused bodywork. The practice typically activates an “inner journey” in the breather, a form of introspective exploration in which breathers become aware of deeper dimensions of their own consciousness, often evoking experiences of tremendous insight, healing, or psychological or spiritual significance. As usually practiced, Holotropic breathwork is generally done in pairs in a group context, supported by carefully selected music. Each “breather” has a designated “sitter” who gives undivided attention to the breather, and provides logistical or emotional support as needed. The sitter’s role is crucial, and often proves to be a powerful and moving experience in its own right. Trained facilitators oversee the process, and provide focused body work and

other individual interventions when necessary. Breathers lie on mats with their eyes closed and breathe intensively, and the sessions generally last between two and three hours.

Outwardly, the process of breathwork may at first seem to be a deliberate activation of the respiratory syndrome known as “hyperventilation.” Yet among the Grofs’ key findings – after conducting intensive breathwork sessions with more than 30,000 people – is that this traditional clinical understanding of rapid breathing is fundamentally mistaken. The Grofs conclude, faster breathing extended for a long period of time changes the chemistry of the organism in such a way that blocked physical and emotional energies

. . . are released and become available for peripheral discharge and processing . . . It is thus a healing process that should be encouraged and supported, and not a pathological process that needs to be suppressed, as it is commonly practiced in mainstream medicine (Grof 2000: 192).

Two principles are of central importance in Holotropic Breathwork. First, there is no “correct” or prescribed experience that breathers are supposed to undergo. The innate wisdom of each individual is recognized as the authority or guide for the breathwork session, so that each participant’s inner process is honored and supported in its natural unfolding as non-directively as possible. The second principle is that emotional and physical expression is encouraged during the breathwork session, including the release of painful or negative emotions that normally might be repressed or avoided. A sense of spontaneous psychological and/or physical healing often occurs naturally as a consequence of full experience of such emotions or unconscious material that had been previously blocked. After breath sessions, people often report a sense of expanded awareness, fresh insights, an open heart, and renewed creative energy.

Breathwork Experiences

Participants’ experiences in breathwork are often quite vivid and psychologically impacting, spanning a broad spectrum of personal, psychological, archetypal, spiritual, and mystical dimensions. These experiences may include unresolved personal issues, past traumatic physical or emotional experiences, birth memories and experiences, death and rebirth sequences, awakening of compassion or ecological consciousness through identification with other beings or life forms, and a wide variety of transpersonal and mystical experiences that touch mythological, archetypal, and universal dimensions.

Grof has mapped out a general classification of these diverse experiences into what he calls a “new cartography of the human psyche” (Grof 1988: 1). Breathwork experiences are grouped into three broad domains of qualitative character: biographical, perinatal, and transpersonal realms. The biographical realm refers to the breather’s personal life history, the perinatal realm refers to experiences relating to birth and

death, and the transpersonal realm relates to experiences that transcend ordinary space, time, and personal identification, including mythological and spiritual experiences. Of particular interest is a whole category of experiences relating to ecological consciousness and the natural world. Experiential identification with animals is not uncommon and can be extremely authentic, including direct insights into physiological sensations, instinctual habits and drives, and detailed perception of the natural environment from within the animal's perceptual framework. Some of these insights have been later verified in the research literature by people who had no prior knowledge of them. Identification with plants and trees are also common, as well as rivers, mountains, oceans, and the Earth itself.

The rich breadth and depth of breathwork experiences is analogous to what emerges in deep meditation, dreamwork, and contemplative spiritual disciplines, all of which entail non-ordinary states of consciousness. Such experiences can have a profound potential healing or transformative effect on consciousness. Grof emphasizes that modern Western society is the only culture in the world that has held the view that people can transform their limited consciousness and psychological or spiritual perspectives by simply thinking about or analyzing them. All other cultures – both ancient and contemporary – recognize that some form of non-ordinary state of consciousness is essential to catalyze the development of expanded awareness and authentic spiritual insight.

When done in groups, breathwork serves as a powerful catalyst for the dynamics of group process, and often opens the group to deeper shared perceptions of life and nature. This happens in several ways. First, breathwork facilitates deep inner work within each individual, often characterized by new insights or healing experiences. Second, the process naturally cultivates a unique form of bonding and intimacy between the breather and sitter, which often becomes a powerful dimension of the overall experience. Third, the breathwork process creates a subtle field of collective presence and “healing energy” in the group – often quite palpable – that enables all participants in the group to bear compassionate witness to one another and to the larger context of which they are a part. This intensified bonding experience often extends beyond the immediate human community to include larger circles of life, including ancestors, other life forms and ecosystems, and a palpable sense of interconnection with the Earth and the cosmos.

Breathwork and Nature: Some Examples

Three examples are given below to illustrate how breathwork can awaken ecological insights and profound experiences of the natural world.

1) A scientist had been intensively researching the habitats of elk for an ecological protection campaign, and attended a retreat where he experienced breathwork for the first time. During his breathing session, he suddenly experienced himself transformed

into an elk. He vividly felt himself as a large elk, galloping across a high mountain meadow amidst a herd of fellow elk. This experience was so uncanny and viscerally compelling, he reported, that in some real sense he had somehow actually become an elk during that time, and he described feeling “elkness” as his own very being. In this non-ordinary state of transpersonal identification, he had a flood of insights into what elk actually experience living in the wild. Similar experiences of identification with animals and plants and even the entire Earth are widely documented in breathwork literature.

2) A woman experienced herself in breathwork as the Great Mother Goddess, Mother Earth, and then from this shifted into the following experience of planetary consciousness:

The experience of being Mother Earth then changed into actually becoming the planet Earth. There was no question that I – the Earth – was a living organism, an intelligent being trying to understand myself, struggling to evolve to a higher level of awareness, and attempting to communicate with other cosmic beings.

The metals and minerals constituting the planet were my bones, my skeleton. The biosphere – the plant life, animals, and humans – were my flesh. I experienced within myself the circulation of water from the oceans to the clouds and from there into little creeks and large rivers and back into the sea. The water system was my blood and the meteorological changes – the evaporation, air currents, the rainfall, and the snow – ensured its circulation, transport of nourishment, and cleansing. The communication between plants, animals, and humans, including modern technology – the press, telephone, radio, television, and the computer network – were my nervous system, my brain.

I felt in my body the injury of the industrial insults of strip mining, urbanization, toxic and radioactive waste, and pollution of air and water. The strangest part of the session was that I was aware of rituals among various aboriginal peoples and experienced them as very healing and absolutely vital for myself. It seems somewhat weird and bizarre to me now, when I have returned to my everyday rational thinking, but during my experience it was extremely convincing that doing rituals is important for the Earth (in Grof 1988: 66–7).

3) The final example illustrates how breathing practices have the potential to open the heart, and release the practitioner from ordinary consciousness into the vast expanse of mystical or spiritual rapture:

It felt like I was on a ride as I twisted and turned, always pushing forward. I heard the music but did not feel connected to the group or the room. Then it began to feel like birth. I pushed and pushed – through this small narrow tunnel, with much effort. After what seemed like a long time I finally pushed through this place. And then I just exploded out – into the most love I have ever felt. I cried and cried in love and profound gratitude. It felt very sacred. Here I relaxed into expansiveness and love. There was no sense of body, no me. Only love. (This account of the breathwork experience, as is the first one, is drawn from the author’s client files.)

Breathwork provides a profound vehicle for in-depth exploration of the spectrum of human and ecological consciousness. Breathing practices span a vast array of specific techniques that have not been touched upon here. The literature on breathwork is extensive and profound, yet no words can substitute for actual experience, and readers who wish to experience breathwork are advised to seek instruction and guidance from competent practitioners. The sages who developed breathwork maintain that the deepest secrets of breathing practice can never be conveyed in words or concepts. As the Indian mystical poet Kabir muses:

What is God?

He is the breath inside the breath.

Will Keepin

Breeding and Contraception

The natural environment has always set the outer limits for human fertility. Archeologists and anthropologists who examine Cro-Magnon, Neanderthal and early Neolithic artifacts suggest that concern for fertility, both in animals and plants as well as in humans themselves, was central to early human religions. Following the agricultural revolution, as human settlements became larger and more complex, religions also became more complex, with rituals and deities connected with a broader range of human productive activities. Specific deities were worshipped as guardians of human fertility, others as mistress or master of animals, some as the embodiment of natural forces such as storms, rivers and springs, and yet others as goddesses and gods of grain and other crops. Virtually all religions until relatively recently in human history have tended to pronatalism as a result of human insecurity during millennia of fairly substantial fluctuations in human population levels. Until the modern period, human population expanded and then contracted in response to famines, epidemics and wars, increasing only incrementally over long periods of time. While some religious cults of the late Neolithic prescribed castration for the priests of some individual deities, pronatalism was the standard for the masses, though of course specific groups and families periodically limited fertility to the level of resources available.

Evidence for deliberate human control of fertility begins in societies with written records. The most common ancient practice of fertility control around the world was certainly infanticide. Many local religious traditions accepted infanticide, though under circumstances that varied from group to group. Among Vikings, for example, newborns were formally presented to fathers that they might decide whether the child would live or die; weak or defective children were frequently exposed, and the necessity for their deaths was legitimated in religious myths. In some societies such as ancient Arabia, female infanticide was common, both as a way of limiting the population of some nomadic bands, and to spare families the expense of raising daughters. The story of Onan in the Hebrew Torah demonstrates that primitive contraceptive practices such as *coitus interruptus* were used in the ancient world. Some parts of the ancient Gnostic movement espoused celibacy in the belief that incarnation, and materiality itself, corrupted the soul and prevented it from unity with divine energy. Buddhism and, later, Christianity introduced the idea that monastic celibacy, in order to devote one's self totally to the pursuit of salvation, was the most perfect vocation. Neither religion expected all to take up this superior path; for both religions, those who chose the secular path linked to materiality had chosen limited (and in Buddhism, illusory)

goods over ultimate good; in both traditions, reproduction and supporting monks/nuns were among the highest goods in the householder path.

Of all world religions, Christianity has been most involved in and divided over how excess fertility should be treated, in part because the Christian West faced the demographic transition around industrialization first. By the beginning of the first millennium, the Romans, with the subsequent approval of Christianity, had largely replaced infanticide with child abandonment as more civilized and moral than infanticide. Both infanticide and abandonment had clear practical advantages. They did not endanger the health of mothers as did all the known forms of abortion (e.g., ingestion of poisons, insertion of sharp objects into the uterus, and trauma to the woman), they allowed for sex selection as abortion did not, and they were much more effective than either *coitus interruptus* or the contraception potions, sponges and condoms of the day. Parents abandoned children at higher rates in times of famine, war or other disasters, but the poor regularly abandoned unwanted children, as did rich families who did not want a surplus of heirs to divide the family resources. For the first millennium and a half the rate of abandonment in Christian lands was estimated as between 10 and 20 percent of live births.

Christianity never condemned the practice of abandonment, but rather embraced it as the moral way of dealing with excess fertility within the domestic household. Christian bishops and theologians consistently taught that the celibate vocation of priest, monk or nun was the superior path, but took for granted that most lacked the moral discipline for forgoing sex when they desired no more children, much less for total celibacy. Clergy sometimes criticized families with means for their unwillingness to share those means with latter-born children, but were generally understanding of the desire to safeguard family legacies. In contrast to Church acceptance of abandonment, abortion and contraception were consistently treated as sinful, as murder, and as the fruit of earlier sin. They were understood as practices of prostitutes, adulterers and fornicators because abortion, necessary to back up undependable methods of contraception, was so dangerous that only those most desperate to avoid public notice of pregnancy would resort to it when abandonment offered an easy escape from parenthood.

By the eighth century, Christianity offered an alternative form of abandonment by taking into its monasteries and convents children (oblates) donated by their parents to the Church. Oblation became formalized by the Middle Ages. Child oblates generally took vows as monks and nuns when they reached adulthood. Between the ninth and the sixteenth centuries, around 10–15 percent of the population of Europe were celibate monks, nuns and priests, a significant percentage of whom had been oblates.

Oblation began disappearing between the fifteenth and sixteenth centuries, but even at its zenith it never replaced abandonment. By the late Middle Ages, beginning in Italy, European municipalities (often assisted by religious institutions) operated foundling hospitals that took in abandoned children. Records of these foundling hospitals indicate that few foundlings lived to adulthood. In many, fewer than a quarter survived their

first year. A prominent feature of foundling hospitals was the wheel, which offered the abandoned child protection from the elements and the abandoning parent anonymity. The parent placed the child in the bed between two spokes of the horizontal wheel outside the building, and rotated the wheel until the child was brought to the attention of the staff inside.

By 1700, urbanization (often forced by the displacement of rural workers), the rise of industrialization and its terrible working conditions, and the beginnings of the demographic transition (due to improved nutrition and epidemic control) together all served to increase poverty and family size, at the same time that the Church ended oblation. Consequently, by the early nineteenth centuries many cities of Europe saw 30 to 50 percent of their live births abandoned to foundling hospitals, where the majority died.

The modern movement to control fertility through contraception in Christian Europe began in Catholic France. Birth rates began falling in the late eighteenth century among French middle and upper classes. The most popular contraceptive method was *coitus interruptus*, though a series of refinements in condom design increased condom appeal and effectiveness. By the twentieth century, the contraceptive movement had spread to the French working class and to middle/upper classes throughout Europe. In response, both Protestant and Catholic authorities intensified their invective against both contraception and abortion. For the first time, they clearly distinguished between abortion and contraception, instead of treating both as sins against life. Contraception became a sin against nature, and abortion a (mortal) sin against life. Clerics condemned both acts as selfish crimes against God. Beginning in the 1930s, one Christian church after another approved contraception for an ever-expanding list of circumstances, both personal and social; by 1990 many churches had approved recourse to abortion in hardship cases. By 2000, even the Catholic Church had significantly reduced pronatalist rhetoric, urging smaller families in recognition of environmental crises and the need to share resources, though it retained its ban on both abortion and artificial means of contraception, which greatly complicates implementation of fertility control.

There are no explicit teachings on contraception or abortion until late in the Buddhist tradition. As elsewhere infanticide and abandonment were widely practiced throughout Buddhist Asia but not explicitly religiously approved. Buddhist teaching on the interrelatedness of all aspects of reality and the need for compassion for all living things supported condemning abortion as denying fetuses the opportunity to pursue the path to nirvana, making their souls await another incarnation. Thus many Buddhists have seen abortion as creating bad karma for the aborting woman. Few Buddhist authorities today discourage contraception, though in the past, religious awareness of souls awaiting rebirth was one factor in promoting pronatalist attitudes. At the same time, today as in the past, religion is only one factor in voluntary decisions for contraception, and seldom the determining factor. Despite Buddhist teaching, Buddhist Japan has had for half a century one of the highest abortion rates in the world; some Buddhist shrines even provide rituals which reconcile aborted fetuses with their par-

ents. But widespread recourse to abortion in Japan was initially a response to living conditions following Japan's defeat and occupation in 1945. Lack of natural resources, high population density and economic prosperity today have helped Japan's fertility rate sink to 1.2 children per woman; fertility rates in other Buddhist countries have also decreased rapidly since 1970. The Chinese, whose Buddhism was integrated with Daoism and Confucianism, have strongly supported the very successful One-Child Policy (which brought the total fertility rate to 1.8 children per woman) as not only an expression of civic responsibility, but also, for some, a reflection of Buddhist respect for the interrelatedness of all things.

In Islam, the prophet Mohammed banned the common practice of female infanticide and established a pronatalist policy that supported the expansionist early Muslim state and eventually characterized the Muslim tradition. Most Muslim authorities today forbid abortion, but some only forbid abortion after the fourth month, following Qur'anic treatment of damages for causing miscarriage, in which loss of a fetus is only accounted loss of a person after the fourth month. Islamic authorities today support use of contraception for purposes of family planning, and some in recognition of environmental crisis. There are no religious objections to specific contraceptive methods, but many religious authorities are leery of both Western pressure for population control, which they see as neocolonialist, and possible connections between contraceptive use and both sexual immorality and changes in women's familial role. Dramatic fertility drops in most Muslim nations over the last forty years indicate that historic pronatalism is giving way to new situational pressures.

While Hindu philosophy provides the same basis for prohibiting abortion (delaying the reincarnation of waiting souls) as Buddhism, abortion has not been seriously problematic in Hinduism. High rates of infanticide due to extreme poverty cast abortion in a comparatively benign moral light. Contraception has had a great deal of religious support, especially among the educated, where the status of women is less linked to fertility. As in China, one problem resulting from success in lowering fertility rates under pressure from traditional son preference is widespread use of sex-selective abortion, and the resulting shortage of females in the population, which Hinduism has done little to address. Government support for general access to both contraception and abortion both reflects and influences Hindu religious thought on the matter.

Judaism has traditionally taught that males have a duty to reproduce, but the most common ideal of family size has been one son and one daughter. Contraception is not problematic except for a few politically motivated pronatalist Orthodox since the Holocaust. Abortion is accepted by Reform and Conservative Jews, but not generally by the Orthodox.

In the twentieth century, all religions were challenged to shift from inherited pronatalist traditions to more socially responsible contraceptive traditions in an ecologically-threatened world overpopulated with humans, some of whom overconsume and many of whose welfare requires expanding their level of consumption. That shift, well advanced but not complete, has not been easy.

Brigit

Across Ireland, hundreds of springs issue from nearbedrock sources, providing a constant flow of clean water that has, from prehistory to the present, been associated with spiritual and physical healing. Many of these springs are named for Saint Brigit. There is scholarly contention about the historicity (indeed, even the existence) of the saint, said to have been born of a pagan father and a Christian mother at the start of Ireland's Christian era (ca.

450) and to have become abbess of the important clerical center of Kildare after being accidentally ordained to the priesthood by a God-intoxicated St. Mel. Many symbols connected with Saint Brigit – an endlessly abundant cow, self-igniting fires, ogham script – originally were associated with a Celtic goddess of the same name, while the name of her city includes the syllable (-*dara*) for a pagan sacred grove. Yet a number of early texts describe an abbess who brought acclaim to Kildare through her saintliness. The figure of Brigit appears a prime example of what Irish archeologist Proinsias MacCana calls the “extraordinary symbiosis” of paganism and Christianity in Ireland.

Holy wells dedicated to other saints (some unknown except for at the site that bears their name) are similarly believed to have carried pre-Christian nature worship into the common era. Most wells are dedicated to feminine figures, although a few are named for Saint Patrick, famous for bringing the word of Christ to Ireland, whom folklorist Máire MacNeill contended was a substitute for an earlier male divine hero. Whether the well divinities were originally Celtic or derived from the deep pre-Celtic strata of Irish culture is impossible to tell. Evidence suggests holy wells were sites for inauguration by the Celtic *tuath* (a word that means simultaneously a people and its territory); drinking the waters of the holy well symbolically wed the king to the regional goddess. That Celtic water-worship is known from other parts of Europe does not disprove pre-Celtic ritual use of the holy wells, suggested by the connection of some to the shadowy prehistoric hag goddess, the Cailleach.

Folklore surrounding Irish holy wells emphasizes the necessity of keeping the water source clear of refuse. Should anything impure be thrown into the water – legends often name cattle viscera as the offending substance, although filthy laundry was another culprit – the well would disappear. Usually, the well moved over to a competing district, its departure marked by lighted processions of invisible companions. Such folklore has a strong ecological message, for a region's most reliable pure water source was thus appropriately hedged about with prohibitions against pollution. Similarly, anyone who dared to fence off a holy well from public use was subject to punishment by the well

itself, which would thereafter poison any member of the family or herds of the offender who drank its waters.

Wells were honored in various ways, most especially in the “pattern” or yearly ritual visit. Each site required specific actions that might include walking a specified number of circuits, hanging rags called clooties on nearby trees, or placing a pebble at a specified place. These patterns were held on various dates, often corresponding to the old Celtic feasts of winter’s end (Imbolc, 1 February) or harvest (Lughnasa, 1 August). Dawn visits to the wells on these days brought the faithful into contact with numinous power, which could be trapped in the well water gathered at that time. A fish seen within the well or leaping out of it on these ritual days betokened good fortune.

Although during the mid-twentieth century, some holy wells fell into disuse, a contemporary revival has focused attention on their maintenance. Especially significant has been the influence of the Sisters of Saint Brigit (Brigidines) in Kildare. Since returning in the 1990s to the site of their historical formation more than 1500 years earlier, the Sisters have worked to draw the devout back to the ancient holy wells, of which there are more than thirty in the Kildare district. Defining Brigit as a bridge figure – both pagan and Christian, neither Catholic nor Protestant – the Sisters have worked with local ecological and civic organizations to revive old customs like the plaiting of Brigit-crosses from green rushes and the keeping of vigils on Brigit’s feast day at the Kildare wells. Working with local environmental groups, the Brigidine Sisters and their lay associates, the Cháirde Bhríde (“heart of Brigit”), have assisted in the reclamation of several wells covered over by developers. The annual Kildare festival of Lá Féile Bhríde, Brigit’s 1 February feast day, includes ecological awareness lectures and demonstrations as well as rituals and arts events.

Britain (400–1100)

The various post-Roman inhabitants of Britain – British, Pictish, Anglo-Saxon, Viking – practiced versions of “nature religion,” in that they held polytheistic beliefs focused on diffused, often undeveloped cult sites in the landscape. These beliefs, unlike similar ones in recent traditional societies, have left only the most tenuous physical traces or written comment, the latter by ecclesiastics concerned not only to blot out remnants of paganism, but even to downplay the assimilation of traditional rituals into popular Christianity. This is not evidence that allows some of the central questions of this encyclopedia to be answered or even asked. Yet a careful piecing-together of the fragments, guided by judicious use of comparative anthropology, takes us some way toward setting the early religions of Britain in a wider context.

The religions of Celtic Britain (ca. 200 B.C.E.–350 C.E.) involved cults of natural, especially watery places, with widespread archeological evidence for sacred springs and wells and for ritual deposits in rivers and pools. During the Roman occupation, many cult sites were of course monumentalized by temples and shrines (and eventually churches), but after 400 these often-massive stone buildings had reverted to a state of dereliction, which made them more akin to natural features. Although it is conventional to envisage only contrast and conflict between the native British populations and the Germanic invaders, Romano-Celtic cults (which may often have survived within the nominally Christian societies of the West) had much in common with those of the Anglo-Saxons who settled eastern and central Britain during the fifth and sixth centuries. Around 550 the British monk Gildas observed contemptuously that Romano-Britons had “heaped divine honours on mountains, hills and rivers,” (Gildas 1978: 17, 90), and so probably did the AngloSaxons. In English place-names, the element *hearg*, “shrine,” usually occurs on hilltops, and the Germanic gods Woden, Thunor and Tiw tend to be associated with earthworks, woods and groves. As elsewhere in north European mythology, ash-trees were often sacred. Some domesticated animals such as horses or goats may have had a totemic function, which may explain the placenames (Swineshead, Gateshead, etc.) suggesting animalheads set up as landmarks. Occasional references in texts to ravens as birds of augury or ill-omen may be reminiscences of their association with Woden. Occasional wells and springs have names suggesting paganism or magic, such as the “augury (*freht*) well” of Fritwell (Oxon.). All this suggests a religion of natural places, and the few plausibly identified cases of humanmade shrines all come from the last decades of Anglo-Saxon paganism.

As sites of “nature religion,” genuinely natural features should probably not be distinguished too sharply from ancient monuments. The people of post-Roman Britain

lived in an environment articulated by varied landmarks, which we can classify either as geological features or as the remains of prehistoric and Roman structures. These distinctions, obvious to us, would have been much less so in early medieval perceptions. A hill or rock might have been set down by a god or giant; a barrow might be the tomb of a primordial hero-ancestor or the lair of a dragon; one Anglo-Saxon poet described the colossal ruins of Roman Bath as “old work of giants.” Any such features could have been the foci of legends, magical beliefs or religious cults that took little or no account of our own boundary between the natural and the archeological. For dwellers in an old landscape, “nature” embraced all its perceived former users – natural or supernatural, human or monstrous.

The first literary sources present a dichotomy between the safe, welcoming core of human habitation and its ominous, untamed peripheries. The latter (as for instance in the Mexican communities studied by anthropologists) seem to have contained a range of access-points to the underworld and to supernatural states of existence. Some were unequivocally negative. The conception of the desolate mere or pool which houses demonic beings, and leads down to the infernal regions, is widespread in later folklore and is classically described in the eighth-century English epic *Beowulf* (lines 1355–72):

They are fatherless creatures, and their whole ancestry is hidden in a past of demons and ghosts. They dwell apart among wolves on the hills, on windswept crags and treacherous keshes, where cold streams pour down the mountain and disappear under mist and moorland.

A few miles from here a frost-stiffened wood waits and keeps watch above a mere; the overhanging bank is a maze of tree-roots mirrored in its surface. At night there, something uncanny happens: the water burns. And the mere-bottom has never been sounded by the sons of men. On its bank, the heather-stepper halts: the hart in flight from pursuing hounds will turn to face them with firm-set horns and die in the wood rather than dive beneath its surface. That is no good place.

Ancient burial-mounds – perhaps lairs of dragons such as that described again in *Beowulf* (lines 2210f) or implied by such place-names as Drakelow – might be no better places. But we should qualify the Christian branding of all autonomous supernatural forces as necessarily evil. It seems very likely that the elves, goblins, and spirits (*ælf*, *shuca*, *puca*) occupying such sites as Ailcy Hill, Shuklow, or Pug Pit were ambiguous powers capable of being propitiated and enlisted as well as angered. Norse mythology offers the positive conception that the dead man or spirit in a burial-mound can give strength, wisdom or understanding to the living. This belief may be reflected in the widespread re-use of ancient burial-mounds as late Anglo-Saxon sites of assembly and judgment, and in reformers’ attacks on magic at unhallowed graves where “the dead man will rise up and speak.”

The clearest sign that the inhabitants of post-Roman Britain saw prehistoric barrows in a positive sense, as sites of supernatural power or ancient authority, is the widespread and deliberate use of them for new, sometimes high-status burials. Among the native British, this seems to have been a continuous practice (known for instance

from several sites in Wales); in the developing society of the immigrant Anglo-Saxons it was only common during the late sixth and seventh centuries, a transitional phase between their adoption of monument-building and their conversion to Christianity. At Yeavinger (Northumberland), a ritual and royal complex of ca. 590–630, a Neolithic stone circle and a Bronze Age barrow were adopted as the west and east foci of the site, and both were used for burials. Some barrows of seventh-century Anglo-Saxon warriors, set on crests overlooking large tracts of territory, recall Irish and Welsh references to a belief that the dead can be guardians or sentinels over the lands of their kin, ready to repel encroachers.

While these practices were not in any direct or conventional sense Christian, it is just as misleading to call them unequivocally pagan. In the British west, they existed in a nominally Christian culture, and the AngloSaxons adopted them precisely when kings and aristocrats were on the threshold of conversion. This was an age of political consolidation, in which great kingdoms took shape and great lineages emerged. Monument-building, whether pagan (as at Yeavinger), territorial (as with the crest-sited barrows), or Christian (as with royal monastic foundations), was the work of new elites aiming at more centralized power and a tighter grip on the landscape and its resources, and to whom the hierarchical structures of the Church must have seemed correspondingly attractive. It was certainly Christian institutions which now began, with their church buildings, their complex monastic sites and their hierarchies of authority, to erode the religion of natural places, but it is arguable that they only did so to the extent that broader social and political changes pushed in that direction.

“Since Anglo-Saxon times the Christian Church in England had stood out against the worship of wells and rivers,” wrote Keith Thomas in his *Man and the Natural World*, “the pagan divinities of grove, stream and mountain had been expelled, leaving behind them a disenchanting world, to be shaped, moulded and dominated” (Thomas 1983: 5). There is some truth in this statement, but it oversimplifies. If in theory Christianity was inimical to “nature-religion” by insisting on a rigid binary contrast between good and evil, it was in practice flexible enough to, for example, attach a biblical rationale to indigenous supernatural forces: *Beowulf*’s identification of monsters with the tribe of Cain, and with the giants mentioned in Genesis 4, is a case in point. And if it claimed a monopoly in mediating divine power through officially designated people and places, it could (as many anthropological studies have again shown) be remarkably assimilative and inclusive of traditional beliefs and rituals.

In the case of Britain, understanding has been clouded by the myth of a “Celtic Christianity,” in tune with the spiritual qualities of the natural world, to be contrasted with a more hierarchical “Catholic Christianity” which was unresponsive or hostile to them. In so far as this is based on more than post-Reformation polemic, it reflects differences between the conventions of Irish/Welsh texts and English ones, and between the later folkloric cultures of the British and the English zones. Whereas the experiences of ascetic saints in the wilderness bulk large in early Irish texts, the earliest English ones are dominated by didactic and prescriptive works keen to suppress all deviance;

whereas Ireland, Wales, and the Western Isles preserved a rich culture of vernacular belief into the era of folklore collectors, only pale reflections survived in England. We can, however, piece together enough fragments to see that these contrasts are to a large extent the effects of convention and survival.

It is certainly true that mastery over the natural world figures largest in the lives of Irish and Welsh saints, who ward off the rain, drive back the sea, command wild animals as tame ones, give sanctuary to hunted beasts, and use the elements to punish their adversaries. But the English material employs similar motifs. The stories of St. Cuthbert's command over birds, fishes and sea-beasts around Lindisfarne doubtless reflect his and his hagiographers' Irish background, but in another sense are simply reflections of the wild geography and fauna amidst which he passed his life. The Kentish princess-saint Domne Eafe wins as much land for her monastery as her pet hind (deer) can run around; mowers who mock the Sussex ascetic Cuthmann are punished by perpetual rain in their meadow, and a woman who curses him by being blown into the air and dashed to Earth. And our few traces of English religious folklore are not so different from the Welsh. As late as the 1680s, for instance, a naturalist could observe casually of a Staffordshire village:

I come at length to the Trees; amongst which some will needs have St. Bertram's Ash, that growes over a spring which bears the name of the same Saint, in the Parish of Ilam, to be of a different undescribed species from all others; and indeed it has a narrower sharper leaf, than ever I saw any; but whether this may not be ascribed to the age and decay of the tree,

I much suspect. However it be, 'tis certain the common people superstitiously believe, that 'tis very dangerous to break a bough from it; so great a care has St. Bertram of his Ash to this very day (Plot 1686: 207).

Different parts of Britain experienced basically the same course of development, though at different times and speeds: the partial assimilation of traditional dispersed sites to vernacular Christian ritual, followed eventually by their eclipse in the face of an official religion focused more and more on church buildings. The first islands of bounded and controlled sacred space were therefore the earliest church sites, though their character varied between regions. In the west, little communities of British clergy or monks (characteristically with place-names in Llan) became thick on the ground during the sixth and seventh centuries, but would coexist for more than a millennium with a landscape of natural cult sites. In the Anglo-Saxon kingdoms, the process was slightly later and more centralized, producing during ca. 670–730 a more spaced-out network of relatively wealthy monasteries founded by kings and nobles. Monastic rhetoric set up a contrast between the pollution of the untamed wilderness and the holy civilization of monasteries founded within it. Bede describes how, in the 650s, the missionary Cedd: chose himself a site for a monastery (Lastingham in the North York Moors) amid some steep and remote hills, which seemed better fitted for the haunts of robbers and the dens of wild beasts than for human habitation, so that, as Isaiah says, "In the habitations where once dragons lay shall be grass with reeds and rushes,"

that is, the fruit of good works shall spring up where once beasts dwelt or where men lived after the manner of beasts (in Colgrave and Minors 1969: 286–7).

In a similar vein, the founder of an early eighth-century Northumbrian minister was urged by a learned ascetic to site it on a small hill:

This hill thorn bushes cover on top with thick leaf. Cut these away with scythes, O brother, and remove them with all their seed from the expanse of the smooth top just mentioned, and then found in that place a fair church for God . . . An evil band [i.e., of demons?], an object of wrath, rushing this way and that in their fleetness, often approached and hid in the thick bushes . . . But thanks be to the Lord, that in our time these places have through him deserved such great joys, and to exchange new inhabitants for their former ones (Æthelwulf 1967: 12–13).

But if the holy monastic core had to be purged of unregenerate nature and lurking demonic forces, the

British and English churches seem in practice to have been remarkably accommodating of the traditional ritual periphery. The complaints of eighth to eleventh-century reformers should be read less in terms of Christian versus pagan than of central versus local, or metropolitan versus vernacular: reading between the lines, it is clear that many local priests collaborated with their flocks to build a rich and syncretic Christian popular culture. Thus a complaint in 747 that the Rogationtide processions to bless the young crops were being celebrated “mixed with vanities

. . . or levities or vulgarities, that is in games and horseraces and huge feasts,” (Haddan and Stubbs 1871: 368), shows that this imported ritual had already fused into indigenous rites of spring. In the 790s, objections to “false prophets” inducing people to “leave the churches and seek hilly places where they worship not with prayers but with drinking-bouts” (Dummler 1895: 448–9) suggest a popular Christianity operating in the open landscape. The repertoire of amulets found in seventh-century graves ranges from the presumably magical (such as wolf-teeth and cowrie-shells) to crosses and cross-marked metal capsules. As late as the tenth century, the recipes known as “elfcharms” and “leechdoms” show an extraordinary fusion of traditional magic and herbal remedies with mainstream liturgy, sanctioned by at least some ecclesiastics.

In the wider landscape, “natural” cult places could be made acceptable by a Christian rebranding. Crosses standing at focal points such as hilltops, crossroads or near houses were the obvious and sometimes direct successors of tutelary trees or standing stones: the name of Rudstone in Yorkshire, where a huge prehistoric menhir [standing stone] still stands in the churchyard, means “cross-stone.” Innumerable holy wells (in English as well as British areas) were associated with St. Mary, St. Helen, or local saints. Hagiography was a vehicle for myths attaching saints to landscape features which could “still be seen to this day”: wells which sprang up where saints prayed or wept; ash-trees which sprouted where they planted their staves; the stone where St. Cuthmann sat to tend sheep; the hair which grew from the turf where St. Wigstan was killed. Many such features, however, remained unincorporated, surviving for centuries in a folkloric limbo that was neither Christian nor pagan. The “ash-tree which the foolish call sacred” stood

on the boundary of Taunton (Somerset) as late as ca. 1000; many holy wells seem to have been “holy” just because they were used for cures or auguries rather than through any overt Christian connection.

What made the first real inroads into British “naturereligion” was not Christianity as such, but the Christian dimension to changes which transformed the face of Britain, as of much of Europe, during ca. 900–1100: a strengthening of local lordship, a coalescence of agrarian communities and settlements, and a demarcation of landrights which left less and less space for cult detached from social and legal obligations. One manifestation – notably in the British west – is the “development” of open-air foci such as wells and cemeteries by building chapels over them; another – notably in the English south and east – is the building of new churches by manorial lords next to their own manor-houses, with graveyards where all tenants were obliged to be buried. Just as Christian burial became restricted to authorized sites, so ancient earthworks on the margins were now further demonized by being used for the unhallowed burials of executed criminals and other outcasts. The late Anglo-Saxon poem *The Wife’s Lament* seems to describe the plight of a damned spirit pent in a desolate barrow: “among a thicket of trees under an oak-tree is this earthen dugout.”

Thus – though the process was a very gradual one, uncompleted even at the Reformation – the religion of untamed nature gradually gave way to a religion of buildings that were always someone’s property. It is emblematic that when, around 1080, Bishop Wulfstan of Worcester went to dedicate a new church, he ordered its owner to fell a luxuriant but overshadowing nut-tree, the only proper course where “nature had not provided enough room” (Winterbottom and Thomson 2002: 94). The future lay with those who, like the homilist Ælfric around 1000, were outraged that people should bring their offerings to an earth-fast stone, and also to trees and to well-springs, just as witches do, and will not understand how foolishly they act, or how the dead stone or the dumb tree can help them, or give them health, when they themselves never stir from the place (Skeat 1881–1885: 372–4).

Transcendentalists’ love of nature was given concrete shape by several experiments in rural communal and reclusive living. The largest, longest-lived, and best known of the Transcendentalist-oriented intentional communities was Brook Farm, founded by George Ripley at West Roxbury, Massachusetts, then several miles outside of Boston, in 1841. Ripley’s chief goal was to combine intellectual and manual labor in a cooperative setting involving simple and fulfilling living. The experiment attracted some of the greatest creative minds of the day, including Nathaniel Hawthorne, whose *Blithedale Romance* is based on his communal experiences there, and Isaac Hecker, who later founded the Paulist Fathers as a Catholic religious community. Other notable Transcendentalists, including Ralph Waldo Emerson, Margaret Fuller, and Henry David Thoreau, were visitors.

Rural romanticism was strong at Brook Farm. The general expectation was that residents would divide their time between physical and intellectual tasks, as would the young students at the school that the residents operated.

Although farming and animal husbandry were practiced on a daily basis, the intellectual and cultural interests of the members dominated communal life.

In 1845, after a reorganization, residents built a large “phalanstery” as a single dwelling for all members, but it was destroyed by fire just as it was being finished in 1846 and the following year the community was disbanded.

Brower, David (1912–2000)

In 1966 the American magazine *Life* described David Brower, then the executive director of the Sierra Club, as the “country’s No.1 working conservationist” (27 May 1966). When Brower died at age 88, he was widely regarded as the most influential environmental leader of the twentieth century.

Born in Berkeley, California, Brower became a Sierra Club member in 1933 and witnessed a growing and significant alteration of the Western landscape. His skill at rock climbing – he made seventy first ascents of peaks in the Western United States – took him to remote and beautiful areas that permanently impacted his crusade for environmental protection. Brower remarked in *Let the Mountains Talk, Let the Rivers Run* (2000) that “the mountains first talked to me through poets,” but later, he would hear the talk directly. Not too sonorously from the thunder, cascading water, or falling stone, but musically enough from the jay’s complaint, the kookaburra’s laugh, the coyote’s howl, pines answering the wind, fallen leaves answering our shuffling feet, and the lilting notes of a stream, hermit thrush, or canyon wren completing the symphony (2000: 139).

Brower, like John Muir before him, believed the answers to life’s questions lay in wilderness, even echoing Muir’s famous line that everything in the universe is “hitched” together: “Darwin discovered that all life on the planet, from people to plankton, was part of a complex blanket spread over the globe. There can be no pulling of one thread in that blanket, without nubbing the weave, or worse, unraveling the fabric” (2000: 53).

Brower was elected to the Sierra Club board in 1941 and became the Club’s first executive director in 1952. In a decade and a half, he built its membership from 7000 to 70,000 and propelled the Club into greater political activism, especially in the fights against big dams proposed for Dinosaur National Monument and the Grand Canyon. In his role as editor and publisher of the Sierra Club’s exhibit-format books, he also put the breathtaking landscapes of America on countless household coffee tables, allowing people to own in book form an iconography of wild places in need of protection.

For any given battle, Brower had a knack for choosing the appropriate phrase or sentence to characterize what was really at stake and to effectively undermine an opponent’s best arguments. Sometimes he did so by employing sacred imagery in order to awaken public consciousness. Such was the case in one particularly memorable advertisement that was published in the *Scientific American*. The ad likened the Bureau of Reclamation’s desire to build two massive dams in the Grand Canyon to a plan to flood the Sistine Chapel in order to get tourists closer to the ceiling.

After being fired as executive director of the Sierra Club following disputes with the board of directors, Brower founded Friends of the Earth in 1969; two years later, he initiated international partnerships in environmental activism by establishing Friends of the Earth groups abroad. Never slowed by controversy, Brower also founded Earth Island Institute in 1982 after being forced to resign from Friends of the Earth due to internal financial difficulties.

With unparalleled dynamism and a flare for the oneliner, Brower traveled the world, stumping for the environment with an eye always directed toward the future. He playfully referred to one speech that he frequently gave as The Sermon. In it, he articulated an evolutionary narrative by utilizing the creation story common to the Abrahamic traditions. Dividing the six days of Genesis into 660-million-year blocks of time, Brower would reach the climax of his narrative's "sixth day" with a challenge to the hubris of human beings:

At three minutes before midnight, man appeared. At one-fourth of a second before midnight, Christ arrived. At one-fortieth of a second before midnight, the Industrial Revolution began. We are surrounded with people who think that what we have been doing for that one-fortieth of a second can go on indefinitely. They are considered normal, but they are stark, raving mad (McPhee 1971: 79–80).

John McPhee, in *Encounters with the Archdruid*, compared Brower to an environmental Billy Graham, concluding that "Brower's crusade, like Graham's, began many years ago, and Brower's may have been more effective . . . [Brower] thinks that conservation should be 'an ethic and conscience in everything we do, whatever our field of endeavor' – in a word, a religion" (1971: 83).

Depending upon his audience, Brower sometimes employed other metaphors drawing on Judaism and Christianity. In a video statement to the San Francisco Conference on Christianity and Ecology, Brower admonished his listeners to lead the way in the common task of bringing "peace on earth" through "peace with the earth." He continued:

One of my standard comments that I like to make when I talk about religion is that I would like to see Moses go back up the mountain and bring down the other tablet. The Commandments he brought down deal with how we should treat each other. They say nothing about how we should treat the earth. The other tablet should be there, and if it is not, let us try in the Church to imagine what it should say (Brower 1990, www.creationethics.org).

Brower inspired thousands of people worldwide and showed how well-articulated, well-publicized, hardhitting campaigns to protect nature could triumph over well-financed development schemes. Two of his most significant achievements were to expand the environmental movement globally and to challenge some modern technologies. His criticisms, for example, contributed to the

U.S. government's refusal to finance a supersonic commercial aircraft.

Brower's uncompromising outlook was criticized by some. "I have been called a druid enough, even an archdruid," Brower once said (2000: 22), referring to McPhee's book

in which developer Charles Fraser used the term in a pejorative manner to dismiss certain conservationists that he believed sacrificed people's interests for the sake of trees (1971: 95). While Brower never appeared upset by the moniker, he countered the blanket characterization, saying in an oft-quoted quip, "I do not blindly oppose progress. I oppose blind progress" (2000: 78).

As great a visionary and environmental advocate as Brower was, his major weakness was lack of management skills and financial discipline. Managerial and interpersonal dynamics played a role in his leaving both the Sierra Club and Friends of the Earth.

One of Brower's greatest regrets was his failure to stop construction of the enormous Glen Canyon Dam on the Colorado River, a project that inundated under Lake

Powell what he later considered to be some of the most spectacular scenery in North America. The hard-earned lesson he took from the loss stayed with him the rest of his life: "Never give up what you haven't seen (unless they be chlorofluorocarbons). And don't expect politicians, even good ones, to do the job for you. Politicians are like weather vanes. Our job is to make the wind blow" (2000: 27). In 1996, Brower helped build a coalition effort, institutionalized in the Glen Canyon Institute, to drain Lake Powell and allow the great river to flow freely once again.

Brower left a strong message for the twenty-first century as he likened the Earth to a patient on an emergency room table needing CPR – conservation, preservation, and restoration. At Brower's memorial service, one of his four children, Kenneth, fondly recalled that growing up in the Brower family meant that their religion was wilderness. In the last years of his life, Brower articulated this explicitly:

To me, God and Nature are synonymous, and neither could wait the billions of years before man arrived to decide what to look like . . . I like mystery, the unending search for truth, the truth of beauty. I would have no use for pearly gates and streets of gold if canyon wrens were not admitted (2000: 176).

Brown, Vinson (1912–1991)

Vinson Brown of California was a naturalist and anthropologist, a publisher and author of 37 books, with a lifelong interest in and appreciation for Native American cultures and beliefs. In addition to writing a number of nature guides, science handbooks, and works on science and religion, he collected and published legends, dreams and stories of the spiritual quests, values, prophesies and visions of different Native American tribes. As a member of the Bahá'í Faith, he was particularly attracted to visions of a future world of peace and unity, and he worked to revive and encourage Native American beliefs and spirituality. He inherited from his father the pipe bag that was supposed to have belonged to the famous Lakota (Sioux) chief, warrior and holy man Crazy Horse (1842–1877), and was its keeper for forty years. With another Bahá'í of Inuit background, William Willoya, he wrote *Warriors of the Rainbow: Strange and Prophetic Dreams of the Indian Peoples* in 1962, including his own childhood dream of proud Indian warriors marching into the sky like a multicolored rainbow, symbolizing the revival of Native American cultures. This book was taken by the first Greenpeace activists on the old fishing boat they chartered to protest nuclear testing in the Aleutians, and it so marked them that it helped to form the Greenpeace philosophy and vision, symbolized by the naming of one of their ships the *Rainbow Warrior*.

Buber, Martin (1878–1965)

Martin Buber was one of the twentieth century's leading Jewish philosophers and theologians. He is known primarily for his seminal existential work *I and Thou* (1923), where he defines the world based on two primary words, or relations, "I–Thou" and "I–It." The world of the I–It is the everyday world of unequal human interaction; the world of the I–Thou is the encountered world of relation between persons characterized by mutuality and openness. This later relation is possible not only between humans but also with God and other natural entities.

Though sometimes opaque, the possibility of an I–Thou relationship with nature was fundamental to Buber's ontology of human existence. From the perspective of I–It, a natural object, such as a tree, is a mere object of inquiry. But, "It can, however, also come about, if I have both will and grace, that in considering the tree I become bound up in relation to it. The tree is no longer It" (Buber 1958: 7). Buber claimed however that the possibility of an I–Thou relationship with nature did not necessarily imply some form of animism.

Buber's work has been most influential on those environmental thinkers concerned with a redescription of human ontology (or being) as part of rather than apart from nature as key to forming a new environmental consciousness. Arne Naess has drawn inspiration from Buber's work claiming that the deep ecological approach ". . . also entails a transition from I–It attitudes to I–Thou attitudes

. . ." (Naess 1989: 174).

Buddha

The Buddha lived more than two thousand years ago in northeastern India. The religion he established spread throughout all parts of Asia and is now widely practiced in Europe and North America as well. The biographies of the Buddha include the *Jataka Tales* and the *Buddha Carita*. The reception and transmission of these stories shaped the later Buddhist tradition. By examining key elements of the life-story narratives and select examples of tales about his past-lives, themes can be examined that serve to underscore how the life of the Buddha might be perceived as providing a paradigmatic example of a lifestyle attuned to ecological sensitivity. We must keep in mind that the pressing issues that have prompted the modern environmental movement did not exist at the time of the Buddha, particularly the threat of global warming, increases in cancer rates due to chemical pollution, and diminishing biodiversity worldwide. Furthermore, it could be argued that the ascetic emphasis within Buddhism would tend to ignore social problems of this nature. However, the Buddha did deal in his teachings with illness, with the need to ensure a clean water supply, and did note that increased agriculture and urbanization was in the process of radically altering India's once-pervasive forest environment. By examining these aspects of Buddha's life and teaching, as well as discussing his emphasis on compassion, the life of the Buddha might be seen as providing the beginnings of an ecologically friendly fable.

The *Buddha Carita* of Ashvaghosha, which dates from about 100, includes a marvelous story of the pre-birth existence of the Prince Siddhartha Gautama, who would grow up and eventually become the Buddha. Having endured countless births in preparation for this auspicious role, he took the form of a white elephant and lived in the Tusita Heaven, a realm that intersects with the earthly realm high in the Himalayas. On Earth, his mother, Queen Maya, had been married for quite some time to Sudhodhana, the chieftain of Kapilavastu, a town in the foothills. She reclined during the midsummer festival, fell into a dreamy sleep, and awakened in the Tusita heaven where the white elephant entered her side. This story contains the seeds of several environmental themes. Continuity between animal and human life can be seen in the future Buddha's incarnation as an elephant. An attention to place bears great importance, with the sacred Himalaya Mountains taking on the important role of joining heaven and Earth. A third sensitivity to nature can be found in the importance of the seasonal festival, indicating an attunement with the rhythms of nature.

Although the birth of the future Buddha was greeted with great excitement, 21 days later his mother died. In an effort to heed the advice of his Brahmin advisors,

King Sudhodhana exerted great effort to shield his son from any pain or suffering. Sudhodhana married Maya's sister, making certain that Siddhartha received the best of care and love. He also protected his son from the heat of summer by bringing him yearly to the summer palace in the mountains, and from the cold of winter by moving to the winter palace at a lower elevation. Only once in his childhood, during an agricultural festival when he was seven years old, did Prince Siddhartha receive a glimmer of the grimmer aspects of life. He witnessed a farmer commandeering a plow pulled by some exhausted oxen. As the man wiped his brow, Siddhartha felt sorrow at his exhaustion. He saw that the yoked beasts were thirsty and uncomfortable. He also watched as the plow ripped apart the squirming bodies of worms and, given these three conditions, great compassion arose within him. This formative childhood moment, arising from a feeling of connection with other forms of life and the Earth itself, established a pattern of concern and compassion that came to characterize his later teachings as the Buddha.

At the age of 29, after a prosperous career as scholar, soldier, husband, and father, the young prince encountered the realities of old age, sickness, and death. He also learned about the life of world renunciation, having observed the graceful demeanor of a wandering mendicant. He opted to give up the life of royalty and embarked on a successful six-year quest in search of life's ultimate meaning. The transition from palace to subsistence entailed a lifestyle totally dependent upon the kindness of strangers, who provided food to itinerant seekers. Siddhartha learned to live on a minimum of food offerings, and for a period of time nearly starved himself to death. After recovering his strength and regaining the legendary 32 marks that portended his imminent perfection (lustrous skin, long ear lobes, and so forth), he took resolve one night to achieve his goal of totally understanding and eradicating the source of his discomforts (*dukkha*). Through the various watches of the night, his past karma assaulted him, with his inner demons taking the outer form of a nemesis named Mara. A host of animals came to Siddhartha's aid, cheering him on as he battled Mara's weaponry. Finally, a legion of hundreds of thousands of elephant-mounted soldiers marched on Siddhartha from all four directions. A tremendous tumult arose while Siddhartha meditated under the Bodhi Tree, the tree of enlightenment, frightening away all the deer and rabbits and birds and other animals who supported him. Left utterly alone, the soon-to-be-Buddha reached out to Mother Earth herself, who heaved forth with a tremendous earthquake, swallowing the numerous enemies. Amid the joyous cries from his animal companions, Siddhartha attained a state of omniscience, fully comprehending the origin of his woes and escaping forever the clutches of ignorance.

The Buddha's quest for liberation placed him in raw intimacy with nature. His wanderings from town to town afforded him first-hand knowledge of the geography and topography of northeast India. His ultimate spiritual victory took place within the context of a tree, under which animals of all varieties urged him onwards in his inner struggle. The Earth itself bore witness to his resolve to gain full self-understanding. After his enlightenment, the Buddha maintained his wandering lifestyle, moving from

place to place to give teachings to thousands of people throughout northeast India. His teachings emphasized a philosophy of interconnectedness (*pratit- yasamutpada*) that espouses a causal relationship between our current state of life and our past actions (*samskaras*). The present depends upon the past and sets the conditions for the future. By understanding our place in this web of causality, we can move toward self-knowledge and transcendence. Key to this process is the taking up of vows to improve oneself and seeking to benefit others through loving kindness (*maitri*).

Having gained *nirvana* at the age of 35, the Buddha wandered and taught for 45 years. Starting with his first sermon in Sarnath, across the Ganges River from the sacred city of Banaras, he espoused four great truths: the world is suffused with suffering (*duhkha*); this suffering has a cause in the form of past *karma* linked to desire (*trishna* or thirst); this desire can be stopped (*nirodha*) by meditation and ethical behavior; and that if one follows the eightfold path (*marga*) of right thinking, right action, right livelihood, right effort, right concentration, and so forth, one can gain release. During his lifetime, 500 individuals (*arhat*) are said to have successfully achieved *nirvana*.

One of the primary tools employed by the Buddha in his teachings was the telling of parables based on his past lives. After his death, these were gathered together in the form of 550 birth stories known as *Jataka Tales*. More than half of these include times when the Buddha had taken nonhuman births, including the story of when he was a hungry tigress who fed her own flesh to her starving cubs, when he was a clever bird who advised the cuckoo to stop making such a fuss, and when he was a clump of grass who saved a noble tree and the plants and animals it sheltered by making the tree appear diseased and disfigured, sparing it from the king's axmen who planned to harvest the tree as the center pole for a new palace, and many other stories. This extensive and remarkable literature operates on three levels. First, it spins fascinating tales about times long ago. Second, in the telling, the Buddha would relate the story to the present moment, identifying the past lives of his various associates as other characters in the stories. Third, he would use these stories to encourage moral behavior. Building on his knowledge of the habits of animals as well as human behavior, he would expose the foibles of the human condition, and provide an antidote for misinformed or ignorant behavior.

The death story of the Buddha has long prompted controversy about his dietary habits. Two accounts have proliferated. Both stories claim that he succumbed to a stomach ailment prompted by bad food. One account says he ate pork; another claims he was poisoned by a mushroom. One group of Buddhists, particularly in Southeast Asia, ascribe to the bad-pork theory, saying this practice would be consistent with the Buddha's refusal to reject food offered in good faith. This would indicate his solidarity with people from all walks of life, regardless of caste, a key point in his rejection of the Brahmanical social hierarchy. Another group of Buddhists, now found primarily in China, assert that the Buddha was a strict vegetarian, in keeping with his repeated remarks decrying the excesses and cruelty of animal sacrifices performed by

the Brahmins. Regardless of the cause of death, the Buddha's final words of wisdom affirm the need to be attuned to the evanescent nature of nature: "All conditioned aspects of reality perish; strive diligently for liberation." This persistent insistence on the changeability and by extension emptiness of phenomena inspires in the mind of the Buddhist compassion for living beings. Knowing that all things will eventually perish, the

Buddhist seeks to provide comfort to all beings through correct behavior.

Though the dates and particulars of the Buddha's life are shrouded with some uncertainty, with scholars placing his dates as early as the sixth and as late as the fourth century before the Common Era, the Buddha has served for more than two thousand years as an archetype for the meditative life. In his teachings, he assesses the human condition in relation to the continuum of life forms, past and present. He urges his followers to abide by precepts that respect the human body by urging people not to take intoxicants or engage in inappropriate sexual activity, and to respect the lives of others by abstaining from killing, lying, and stealing. He developed a radically simple lifestyle for his monks and nuns, requiring his followers to live frugally with only one change of clothes, taking only two meals per day. His monastic disciples renounced all luxuries, while his lay disciples were urged to abandon their attachments to material wealth. The examples of the Buddha and the other renouncers of India set forth what might be construed as an inherently eco-friendly lifestyle. The minimal consumption modeled by the Buddha can be interpreted as a calling for doing with less, being content with the bare necessities, and seeking truth through the cultivation of self-understanding rather than the accumulation of material possessions. If applied with thought and consideration in a modern modality, these very principles could be enacted in such a way as to reduce harmful emissions into the atmosphere, to commit oneself to eating health-inducing foods, and to protect endangered life forms.

Buddhadaṅsa Bhikkhu (1906–1993)

Until recently, Thai culture has been entwined with streams, rivers, forests, and rice fields. Born in 1906, in a small rural town of southern Siam (as Thailand was then known), young Ngeum Panich (later Buddhadaṅsa Bhikkhu) grew up with nature permeating his life, learning its secrets as a temple boy when sent into the forest to collect medicinal herbs.

Later, when he sought to express how the Dhamma, that which the Buddha honored above all else, is much more than teachings and doctrines, Buddhadaṅsa Bhikkhu did so in terms of nature (*dhammajati*). This made perfect sense to him living in a forest monastery and to most of his compatriots, not yet alienated from nature by modern industrialism.

In his expression, Dhamma is nature, encompassing everything without exception. There is no “supernatural.” Even God, should s/he/it exist, would be part and parcel of nature. Humans and our productions are nature, too. All of these are governed by the Law of Nature (Dhamma as natural order), the fundamental impermanence, conditionality, and selflessness (essencelessness) of all things (dhammas). Within the orderliness of Dhamma-Nature, all things have their duty (or function) of the moment, which is Dhamma, too. With humans, Dhamma-Duty becomes conscious and moves toward transcendence. Finally, how each momentary duty is carried out brings natural fruits. When humans misconceive, resist, or turn natural duties into selfish pursuits, the result is suffering (*dukkha*). When we carry out such duties conscientiously and unselfishly, the result is well-being (*sukha*). Duty on the highest level, when the momentary duties are subsumed in the fundamental duty of our lives, bears fruition in *Nibbana*, the ultimate Dhamma or nature, experienced as liberation from all egoistic states.

Nature is thus intimately linked with the core of Buddhist teaching and practice. Nature is “sacred” (*saksit*) and most powerful. However, it is not trivialized as benign or always good. In each moment, nature can be stressful or relaxing, pleasant or painful, clinging or liberated, depending on how the mind performs its duty of seeing things as they really are (Dhamma as Truth) and letting go of any clinging to them as “me” or “mine.”

This perspective on nature is not mere wordplay or idealism. Buddhadaṅsa Bhikkhu saw in the Buddha’s life an ongoing intimacy with the physical dimensions of nature that nurtured and expressed his realization of Dhamma or nature in the spiritual dimension (not that linguistically distinguished dimensions are actually distinct). All the major events of the Buddha’s life took place outdoors. He was born in a park

(Lumbini), had an experience of profound contemplative tranquility and insight into impermanence beneath a tree at his father's plowing ceremony, left home and experimented with spiritual practices in the wild margins of the Ganges valley, was awakened in a solitary place beneath a tree next to the Nerañjara River, usually taught outdoors, wandered throughout the Ganges watershed over his renunciate lifetime, and died in a grove of Sal trees on the way to Kusinara. Further, the Buddha *is* Dhamma both as intimate inseparability with nature and its highest conscious expression.

Thus, Buddhada-sa Bhikkhu saw a vital role for undomesticated forest wats and "wild monks" (*phra theuan*). The institutional and customary forms of Buddhism found in cities and villages are entangled in economic and political forces, thus mixed up with greed, hatred, and delusion. The original bhikkhus of the Buddha's time lived on the margins between society and wilderness, regularly visiting both. This ideal lives on in the forest wats not yet domesticated by Bangkok's rich and powerful. Throughout his life (he died in 1993), Ajarn Buddhada-sa skillfully avoided such entanglements.

His teaching included regular commentary on science as it developed in his lifetime. He raised and carefully observed fish, chickens, birds, and dogs, leading to discussions on the instincts. In the 1950s, he predicted that Thailand's forests would disappear (unfortunately he was right) if modern development policies continued. Local monks heard his message and began to work with villagers to set aside bits of forest for conservation. Later, monks and their villagers in other parts of the country were also inspired by his Dhammic ecology message and calls for spiritually based development.

In the 1970s, as US-backed military dictators killed thousands of alleged "communists," Buddhada-sa Bhikkhu asserted that Buddhism was fundamentally "socialist." While his understanding of socialism critiqued the "bloody-minded" versions of Marx, Lenin, and Mao, Buddhada-sa Bhikkhu was adamant that nature was a "cooperative" and argued for "Dhammic Socialism" for the rest of his life. This helped create more social space and safety for advocates of socialism and progressive social change.

In the forests and other natural places where the impact of human desire is weak, we can begin to listen to the truths that the leaves whisper and rocks shout.

The Silent Mind Can Listen to Grass Speak

Lord Buddha, once enlightened, with silent mind hears revelations from the myriad things,

As if clamoring to report through themselves that there is nothing at all worth grasping

And clinging to as "I," "myself," or "mine."

Never dream of owning any of them – what foolishness!

Taking these selfless things to be "I" or "me" brings only sadness, soreness, and sorrow.

Even the rocks, sand, soil, trees, and grass sound this song through every nook and cranny;

Yet, the busy-minded don't understand or suspect that everything sings out Dhamma's lesson.

With silent mind one hears even the leaves of grass counseling each other with this beautiful, witty fact:

“All beings may dance at ease in the breeze with minds left silent by laying to rest all things.”

(Verse accompanying a wall painting in the Spiritual Theater at Suan Mokkh, Chaiya, Surat Thani, Thailand.)

Buddhahood of Grasses and Trees

The doctrine about the attainment of Buddhahood by insentient beings such as grasses and trees (*caomu chengfo* in Chinese; *so^o moku jo^o butsu* in Japanese) was originally developed within medieval Chinese Buddhism as an extension of the Buddha-nature theory. By removing essential distinctions between sentient and insentient objects, the doctrine expands the universality of Buddhahood by affirming that even plants partake of the perfection of Buddhahood, thereby valorizing the phenomenal realm and highlighting the inherent worth of mundane things that comprise the everyday world. The belief that all “sentient beings” are endowed with Buddha-nature implies that every creature in the universe inherently possesses a seed or potential for the attainment of Buddhahood. By the Tang period (618–907) that became an established tenet of the Chinese Buddhist worldview. Some exegetical traditions even went further by interpreting the Buddha-nature as an enlightened essence endowed with all spiritual perfections and sublime qualities that are characteristic of Buddhahood. According to such a point of view the intrinsically enlightened essence constitutes the true nature of each person, which implies that fundamentally everybody is already enlightened even though he/she/it might not be aware of that.

In both India and China it was widely accepted that the general category of sentient beings incorporates other forms of life in addition to humans, including animals and various classes of beings that populate the different realms of existence described in Buddhist cosmologies. The inclusion of members of the plant kingdom to the category of those who can attain enlightenment was a distinctive Chinese development that was an upshot of intricate philosophical reflections on the nature of reality. In formulating the theory of Buddha-nature of insentient things (*wuqing foxing*) Chinese Buddhist thinkers drew on doctrinal tenets derived from canonical texts, such as the true character of all things (dharmas), the universality of Buddha-nature, and the pervasiveness of the Middle Way. Although that became an established doctrine within certain circles in East Asian Buddhism, by and large most Buddhists retained the traditional understanding of Buddha-nature extending to all living beings, but not necessarily to plants.

The idea that insentient objects such as plants possess Buddha-nature appeared for the first time in the writings of Jizang (549–623), the reputed founder of the Sanlun school and a leading Chinese advocate of the *Madhya-maka* (Middle Way) doctrine of emptiness. According to his writings on the subject, the Buddha-nature of insentient objects comes into play when perfected sages view the objects in their environment in light of their all-encompassing wisdom and enlightened vision of reality. From that

perspective all things are nondual in terms of the subject/object distinction, and it is thus possible to assert that grasses and trees, along with sentient beings, possess Buddha-nature, without presuming that insentient objects can actually practice Buddhism and manifest the traits of a Buddha. A similar line of reasoning was adopted and further developed by Zhanran (711–782), a major thinker of the Tiantai school. In his writings Zhanran called for dissolution of the sentient versus insentient distinction, and asserted that in time all beings will reach the precious realm of Nirvana. This issue was also debated within other Buddhist traditions, most notably by the Chan/Zen school and by Esoteric/Tantric Buddhism.

The notion of enlightenment for grasses and trees also exerted notable influence on Buddhist thought in Japan, where it effected the shaping of positive attitudes toward the natural world and found lyrical expressions in numerous works of art. Echoes of it can be found in the writing of Do^o gen (1200–1253), the famous Zen patriarch, who argued that even insentient beings preach the Buddha's Dharma. In a poetic voice, Do^o gen's writings maintain that mountains and rivers realize completeness and actualize the ancient Buddhist path, and that nature is sacred and a source of precious wisdom. According to Ku^o kai (774–835), the founder of the esoteric Shingon school, the cosmic Buddha Maha^o vairocana and the six elements that constitute the world (which also implies plants) are perfectly interfused, and Mahavairocana and the universe coexist in a state of non-dual harmony. Similar sentiments are echoed in some of the classical Noh dramas and the poems of Saigy^o (1181–1190), which reveal a profound sense of nature appreciation and a tendency toward leveling of distinctions between the world of nature and the human realm.

Buddhism

The Buddha and Early Buddhism

The most elaborate source for our knowledge of the early Buddhist attitude toward nature are the so-called canonical texts. To what extent the earlier layer of the canonical texts (sermons of the Buddha, code of monastic discipline, certain verse collections) actually goes back, in substance, to the Buddha himself (whose lifetime is now, by most scholars, situated somewhere between 500 and 350 B.C.E.) is controversial. It is, hence, preferable to take these texts as documenting norms, attitudes and conceptions concerning the natural world that were current among Buddhists during the first few centuries of Buddhism. But before doing so, it may be appropriate to throw a glance at the role nature plays in the biography of the Buddha, which, to be sure, consists of legendary elements to an extent that is difficult to determine precisely, but even so tells us something about the Buddhist view of nature.

Nature in the Biography of the Buddha

The best-known facet in this connection is probably the bo-tree, the tree (*Ficus Religiosa*) under which the Buddha (“the Awakened One”) attained awakening (*bodhi*), which became an object of veneration in Buddhist countries and represents the awakened one in early Buddhist art. Trees figure in other crucial moments of the Buddha’s life as well: under a tree he was born, under a rose-apple tree he had, in his youth, his first experience of deep meditation, and under twin *sal* trees (*Shorea Robusta*) he passed away. This role of trees is not surprising since trees were the easiest available shelter from sun and rain for wandering ascetics. But perhaps one should also not lose sight of the fact that trees, especially big trees, were regarded as numinous beings, or as inhabited by powerful spirits, nor should reminiscences of pre-Buddhist mythology and symbolism lightly be excluded. What is perhaps still more instructive is that the rose-apple tree under which the Bodhisattva (i.e., the Buddha before his awakening) had his first experience of deep meditation is in some versions (Taisho vol. 3: 467b24 and 475b26) stated to have bent its twigs in order to protect the meditating Bodhisattva from the burning sun. The twin *sal*-trees under which the Buddha passed away burst into blossom out of season. The soteriologically important events in the Buddha’s life are accompanied by an earthquake, and the Earth goddess testifies to his spiritual achievements. Thus, even the vegetable kingdom and the elements are

depicted as paying homage to the (prospective) savior of the world and testifying to his superiority. No wonder that even sentient beings act in a similar way: not only the gods but, for example, also the mythical snake king Mucilinda who protects the Buddha from a thunderstorm by surrounding him with his body and covering him with his hoods. Even dangerous animals like the furious elephant Na^ṭla^ṭgiri, who was released in order to kill the Buddha, are tamed by his benevolence or miraculous power. In the Mahayana version of the Great Sermon on the Buddha's Passing Away, the audience present at the Buddha's death-bed comprises not only men and gods but also all kinds of animals, wailing at the decease of the protector of the world, as can be seen in Far Eastern pictorial representations of the scene.

While these examples may suffice to show how the legendary biographies exalt the Buddha or Bodhisattva by depicting nature, even insentient nature, as paying homage to his charisma, there are also passages describing how the Bodhisattva's awareness of suffering in nature, especially in the animal kingdom, arouses his compassion. In his youth, he heals a goose wounded by his cousin Devadatta. When watching a ploughing ceremony, he perceives how the worms thrown out of the ground are swallowed by frogs, how these are then devoured by snakes, which in their turn are seized by birds of prey (Taisho vol. 3: 467b18–23). On the other hand, the place where the Bodhisattva is going to attain awakening is described as a lovely spot with a beautiful grove and a transparent river. According to yet another text (Papanicasudani II, 80–1), the Bodhisattva was careful to avoid emotional involvement in both the lovely and the horrible aspects of nature.

Nature in Early Buddhism

The central concern of early Buddhism is, according to the canonical texts, the attainment of liberation from suffering, both in this life and thereafter. Future suffering is looming in view of the idea of recurrent rebirth (*samsara*), which means that after death one will, directly or via a stay in heavenly or dismal world spheres, be born again and again in this world. The main cause for rebirth is “thirst” (i.e., attachment, or greed, hatred and delusion). Liberation is thus achieved by complete detachment, by abandoning all unwholesome emotions. The path leading to detachment comprises morality (*siḷa*), meditation and insight. Its practice is considered to be at least considerably facilitated by becoming a mendicant (monk or nun). Lay followers were mostly content with improving the prospects of their rebirth, for which morality is equally essential.

The first moral “precept” is abstention from killing animate beings (*paṇa*). Since animate beings include not only men but also animals, the first precept is a strong basis for *animal ethics* in Buddhism. The disciplinary code for mendicants explicitly states that even small animals up to ants or borderline cases like minute creatures in the drinking water should not be injured. As for lay followers, in the majority of the

tradition the precept lacks such a specification. It is mostly persons who make a living by killing larger animals that are criticized – butchers, hunters, fowlers or fishermen – or persons who perform bloody animal sacrifices. To be sure, even in the case of lay followers the precept is not qualified, and hence ideally means not to kill *any* animal. But it seems that at least part of the early tradition did not want to insist too much on this in the case of lay followers in order to keep the precept practicable for them, leaving it to the individual to decide to what degree he or she could observe it.

In some contexts, the person observing the first precept is characterized as one who is embarrassed (at violence?), full of sympathy (*dayapanna*), and concerned with the welfare of all animate creatures, and the person counteracting the precept is qualified as cruel, with no sympathy for animate creatures. This makes clear that the precept is not just abstention from killing, but presupposes, at a certain level at least, a mental attitude of empathy and concern. The precept therefore does not merely preclude the killing of animals but also all kinds of injury and torture. A similar attitude is cultivated, by mendicants and also by lay people, in connection with the so-called “unlimited” (*appamana*) meditations, which start with a boundless radiation of friendship or benevolence (*metta*) and compassion (*karuna*). Though the primary function of these meditations is to purify the meditator’s mind from ill-will and cruelty or to entail heavenly rebirth, it is natural that they can also manifest themselves in spontaneous acts of help, as feeding hungry animals or freeing a trapped animal out of compassion. Still, the basic attitude is rather to leave animals in peace and cultivate a mental attitude of compassion and benevolence toward them.

The precept to abstain from killing is not inculcated by a personal God. In the canonical texts of early Buddhism, it is often motivated by the *karma doctrine*, according to which those who keep the precepts are automatically rewarded by a desirable rebirth, whereas those who counteract it run into a dismal state. A different motivation is by reference to the *Golden Rule* (i.e., that just as oneself dislikes being killed and suffering, so also the other animate beings).

Violation of the precept not to kill or injure animate beings is considered karmically or spiritually detrimental only if committed *deliberately*, for only in such cases is killing conditioned by an evil drive. Still, mendicants are not allowed to wander about in the rainy season because they would, even unintentionally, trample small animals to death. On the other hand, a mendicant is not prohibited from eating *meat* provided that he has not seen, heard or suspected that the animal was killed particularly for him.

In contrast to Jaina sources, the earlier layer of the Buddhist canon is fairly reticent regarding the status of *plants*. There is no explicit discussion of the question whether they are to be included in the realm of sentient beings or not, nor are they expressly excluded. There are even a few passages, especially in old verse texts, which speak of mobile and stationary animate beings that should not be killed or should be treated with benevolence. One verse text (Suttanipata 600 sqq.) expressly lists herbs and trees among the classes of animate beings (*pana*). Mendicants are expressly prohibited from injuring plants and seeds. Hence, plants may have been regarded as a kind of borderline

case, and mendicants were enjoined to treat them with care in order to be on the safe side and because, as the canonical code of monastic discipline states, people considered plants to be living creatures. A similar reason is also given for the prohibition to dig in the Earth. At any rate, plants, let alone the elements, were hardly understood to be included in the animate beings envisaged by the first precept, especially as far as lay followers were concerned. Yet, even the latter may not damage plants without motivation because Buddhism has incorporated the idea that at least some plants, especially large trees, are inhabited by deities or spirits. The tree deities have to be asked for permission before the tree may be felled. Similarly, other areas of nature like rivers or the Earth (but also cities, etc.) are sometimes believed to be inhabited by local deities.

Buddhist animal ethics is concerned with animals as sentient individuals, not with the protection or conservation of species, ecosystems or biological diversity. It is thus to be distinguished from *ecological ethics*, which does not seem to have been much of an issue at the time of early Buddhism. Still, the acceptance of the protective presence of deities in trees and other forms of nature may, perhaps, be called a “mytho-ecological” conception. And since Buddhist animal ethics implied preventing Buddhists from wanton killing of wild animals and (perhaps less successfully) from fishing and hunting, protection of wild species may well have been a collateral effect. In the case of the emperor Asoka, the moral exhortation not to kill animals actually ended up in the legal protection of certain species. Other Buddhist virtues too, like curbing greed, being content with little, or mindfulness, may well have contributed, somehow or other, to counteracting ruthless exploitation of natural resources.

In connection with ecology, many modern authors point to the principle of *paticca-samuppada*, which is often rendered as “interdependent co-origination.” But one should be careful not to interpret later developments or modern patterns into early Buddhist concepts. Originally, the term hardly means anything but “origination in dependence,” in the sense that things that arise do so on the basis of specific conditions, not at random. The primary purport of this principle is to clarify the basic conditions of suffering, both in this life and on account of rebirth. Still, already in the canon we find the idea that human spirituality and moral behavior may entail fundamental changes in the external world. According to the *Aggañña-sutta* (Sermon on Things Primeval), in the beginning of the world period, the increasing greed of the primeval beings triggers a deterioration of the primeval state of the world, which again entails a further corruption of those beings. According to other passages, immoral behavior of people and especially of kings entails drought and hence famine.

Even if these processes are interpreted in ecological terms, it would still be important to know what kind of state is regarded, by the sources, as ideal or as deterioration. To be sure, in the context of a spirituality of radical detachment from the world, *any* state would have to be considered unsatisfactory (*dukkha*) simply on account of its impermanence, which ultimately pervades even the most stable forms of nature, like mountains, rivers and oceans (Theragatha 1133). In the highest goal, *nirvana*, all

mundane phenomena are transcended (Udana 8.1). But this does not exclude that from an intramundane point of view there is a gradation of more or less agreeable situations. Actually, the primeval, ideal state in the *Aggannya-sutta* is not a colorful paradise but an as yet undifferentiated state of darkness covering a uniform mass of water, with auto-luminous uniform beings hovering in the air and “feeding on joy” – a state reminiscent of the heavenly sphere from which those beings had descended.

In other texts, however, the ideal state is often described, in a more realistic perspective, in terms of a thoroughly civilized world: densely populated, one village so close to the other that one can hear a cock crowing, with eighty thousand big, wealthy cities full of people. And wilderness is frequently characterized as dangerous, weird and disagreeable. What is appreciated is rather cultivated nature: groves, gardens, wells, artificial ponds (the construction of all of which is declared to be meritorious). In this connection, one may occasionally even come across a description in which beautiful plants and innocuous animals form part of the ideal surrounding, and sometimes there is even an explicit appreciation of diversity of species. This predilection for a domesticated world is not confined to Buddhist scriptures and may have been the current ideal of the majority of people at that time. But it was not the only one. For the sake of meditation and the attainment of spiritual perfection, Buddhist mendicants are frequently advised to resort to the wilderness (*aranna*), as a place of solitude and “undisturbedness.” To be sure, in this context, too, the texts do not ignore the fact that life in the wilderness may be dangerous and full of hardship. But this is now taken as a challenge to intensify one’s effort. And there are passages, especially in the Elders’ Verses (*Theragatha*), where the mendicant in the wilderness, having become free from fear and desire, describes himself as truly happy and even enjoying the beauty of his natural surrounding. Thus, in this strand of the early Buddhist tradition, wilderness is evaluated positively because it is the most suitable place for spiritual perfection. Besides, in more popular texts like the *Jatakas* (legendary stories of the Buddha’s earlier incarnations) the abode of the hermit living in solitude is, just as in Hindu sources, sometimes described as an idyllic place of natural beauty and biological diversity, similar to the abovementioned description of groves and gardens.

The ambivalent evaluation of the natural environment has a certain parallel in the evaluation of *animals*. Though as sentient individuals they must not be killed or injured, existence as an animal is largely regarded as unfortunate, as one of the evil forms of rebirth (*duggati*), in contrast to rebirth as a human. Animals are, on the whole, subject to much more suffering; in the natural world, the weaker is devoured by the stronger, and domestic animals are exploited and tortured by man. Besides, animals are mostly regarded as morally and, especially, intellectually inferior to man, to the extent of not being capable of attaining liberation unless they happen to be reborn as humans. One of the reasons for this kind of emphasis on the wretchedness of animals (which is common-place in non-Buddhist traditions as well) was obviously to deter people from committing immoral actions that might entail rebirth as an animal. In more popular texts like the

Jatakas, however, animals are described quite differently: as being both unhappy and happy, stupid and prudent, bad and good, thus more similar to humans, just as in fairy tales. In this strand, animals are even capable of self-sacrifice or may impart moral admonition. Under the influence of holy persons radiating benevolence, they abandon their natural enmity and aggressiveness, not only toward the holy man but even toward each other: a utopian vision of peace with and within nature. This strand is not specifically Buddhist either, but it was buddhized by identifying protagonist animals with the Buddha in his former births. In this form, it permeated Buddhist-edifying literature and art and exercised a considerable influence on the feelings and attitudes of lay Buddhists.

Postcanonical Developments in Mainstream Buddhism (“Hinayana” Schools)

In the various schools developing from canonical Buddhism, the conceptions and attitudes concerning nature do not seem to have fundamentally diverged from those of the canonical period, but several aspects were clarified or elaborated. Thus, in the canon of the Sarvastivada school (which had its center in northwest India) even lay followers are expected to expressly resolve not to kill *animals* even up to ants, and we hear of an officer who just like monks carried a strainer in order to avoid killing animalcules when drinking water. In later texts of the same school it is explicitly stated that one should not even kill noxious animals. Later sources also discuss such questions as the relative gravity of killing a human or an animal, and a big animal or a small one. As for motivation, there are passages where an attitude of benevolence or even affection toward all animate beings is based on the idea that in the course of the beginningless *samsara* every sentient being has already been one’s father or mother or another close relative (an idea already found in the canon but not used there for this purpose).

An important development is that *plants* are now expressly excluded from the realm of sentient beings. Hence, there is no rebirth as a plant. According to the Vinaya (code of monastic discipline) of the Sarvastivadins (tr. into Chinese in the early fifth century), the rule that mendicants should not injure plants was nevertheless justified because plants are inhabited not only by spirits but also by animals (i.e., plants are understood as microecosystems, the destruction of which would kill the animals they harbor).

In Sarvastivada texts, origination in dependence (*pratitya-samutpada*) was elaborated in such a way that everything is regarded to be dependent on everything else, though most entities are conditions of most other entities merely in the very weak sense of not obstructing their origination. Another explanation is by taking into account even remote, indirect connections.

In the post-canonical period, the ideas of the canonical period about the structure of the world and about its cyclical dissolution and reemergence were systematically

elaborated. Actually, our earthly, natural world is just a small segment of a mainly mythological cosmos. The Sarvastivada school aptly distinguishes between the “world” consisting of sentient beings (*sattva-loka*), comprising humans, animals and mythic beings, and the world as a receptacle (*bhajana-loka*), comprising the material environment including plants. The “receptacle world” is produced by the common karma of sentient beings. When their karma, periodically, improves, they gradually all ascend to higher, heavenly realms, and the earthly, natural world dissolves. When the good karma of sentient beings is exhausted and they are about to return to lower spheres, the natural world reemerges. Hence, it does not seem to be highly valued. This is clearly true of animals. Since animals are a lower, unfortunate form of existence, the presence of many animals on Earth and few humans is an indication of a period of deterioration. On the other hand nature can also be helpful for spiritual practice. Contemplating the growth, flowering, fruiting and decay of plants, or the sprouting, withering and falling of leaves, is suitable for strengthening insight into impermanence.

Early Indian Mahayana

Roughly around the beginning of the Common Era, a new movement appears to have formed, the most important characteristic of which was to praise or recommend the career of a *bodhisattva*, a person who is not content with his own liberation from *samsara*, but aspires to becoming a Buddha in order to reestablish the Doctrine after it has gotten lost, thereby saving innumerable beings from *samsara*. The resolve to strive for Buddhahood is said to be motivated by compassion and benevolence.

These attitudes also strongly inspire a *bodhisattva* to succor sentient beings, including animals, even in mundane difficulties. Thus, the *bodhisattva* Jalavahana (“Water Bringer”) is praised for having organized a transport of water to a pond where ten thousand fish were threatened by desiccation (*Suvarnabhasottama-sutra*, ch. 17). In line with the stories of self-sacrifice in the *Jatakas*, a *bodhisattva* may even feed starving animals with his own body (*Suvarnabhasottama-sutra*, ch. 18). On the other hand, his liberality should not extend to giving away, on request, animals for slaughtering, or land inhabited by many animals if this would lead to their being injured (*Bodhisattvabhumi*, ch. 9).

Some texts offer a metaphysical foundation for universal compassion and benevolence by pointing out that the true nature of all beings is one and the same. According to others, Buddhahood is, in a hidden form or as a latent disposition, present in all sentient beings, including animals. This implies that even animals must be treated with respect, just as the Buddha. Several texts of this current proclaim abstention from meat eating. One of these texts actually uses the presence of hidden Buddhahood in animals as an argument. Another argument adduced in this connection is the idea that in the course of beginningless *samsara*, even animals have formerly been one’s own close relatives, yet another reason is the incompatibility of meat eating with the

attitude of benevolence (or affection, just as for relatives or one's own children) toward all sentient beings.

Though, on the whole, the old precepts remained valid in Mahayana as well, according to some texts a *bodhisattva* was, under certain circumstances, allowed or even expected to transgress the precepts and even to kill. Yet, in contrast to some strands of Tantric Buddhism, early Mahayana sources seem to contain little or no evidence for a killing of *animals* out of compassion, making sure that they are reborn in a more favorable form of existence.

As for the natural world as such, Mahayana texts, too, do not exhibit a particular interest in it. They are rather concerned with fantastic visions of myriads of world systems, housing innumerable Buddhas. Besides, there is a strong tendency to regard the phenomenal world as void and illusory, or as nothing but a representation in the minds of sentient beings. The emphasis on mutual dependence in Indian Madhyamaka ("Teaching the Middle Way," one of the two prominent schools of Indian Mahayana) hardly intends to lay bare the structure of the natural world in the sense of modern ecology, but rather aims at deestablishing the alleged (ultimate) reality of the entities envisaged. And the vision of universal interpenetration in the *Gandavyuha-sutra* seems to point to an "experience of a higher, expanded reality" (Ph. Granoff) quite different from our natural world with its imperfections and limitations. In Mahayana Buddhism, too, the ideal world, like *Sukhavati*, the "paradise" of the Buddha Amitabha, is depicted as densely populated and full of palaces, with trees and flowers being made of jewels, and with no animals except artificial birds. It is of no importance whether such descriptions are to be understood literally or metaphorically; in any case they reflect people's conceptions about the ideal world and the belief that animal existence is something unfortunate. Still, we can also find instances of the view that the wilderness is suitable for meditation (e.g., *Bodhicaryavatara*, ch. 8). Besides, *bodhisattvas* are said to adopt, intentionally, rebirth as an animal in order to direct their congeners toward a better destiny and, finally, liberation. According to some texts, mere listening to their message, or to the name of the Buddha Amitabha, is sufficient to place even insects on the way to salvation.

Buddhism – East Asian

Buddhism in East Asia began to take root in China after the fall of the Han Dynasty (206). After centuries of influence by Chinese thought and values, especially Daoist, new Chinese Buddhist schools developed, such as Huayan and Chan (Japanese: Kegon and Zen). These schools spread to Korea and Japan (as well as Vietnam), where other important schools and movements arose, such as the esoteric sect of Shingon in Japan. The result was forms of Buddhism that differed in substantial ways from South Asian Buddhism (even in its Mahayana forms).

The ecological significance of East Asian Buddhism is wide-ranging and profound. But that significance is also ambivalent because Buddhist doctrines, values, and practices can undercut as well as support ecological concerns. Here we will limit ourselves to a few major aspects that are important to a philosophy of nature and ecological practice: the nature and value of the phenomenal world, the self and its relationship with nature, and moral feelings and action in response to the world.

Before we do so, it is worthwhile to point to one very general trend of East Asian Buddhism: nondualism. Earlier Buddhism, especially Indian Mahayana, had nondualistic tendencies, but East Asian Buddhism tended to emphasize it and apply it more broadly and consistently. Nondualism became more a general approach applied to various doctrines rather than one particular doctrine.

Obviously, one of the aspects of greatest ecological significance is the view of the reality and value of the natural world. While it is inaccurate to describe Indian Buddhism as “world-denying,” it did not tend to cultivate a strong valorization of the phenomenal world. The Chinese tradition, on the other hand, has tended to emphasize the reality and value of the natural world, and this is true of Chinese Buddhism as well.

Huayan Buddhism developed the most comprehensive

– and intellectually challenging – metaphysics, one that is particularly significant for an ecological philosophy of nature. One aspect of this significance is its view of the relationship between phenomena and absolute reality. Huayan insists that there is in actuality no difference between the absolute and phenomena. Ultimate reality is not some transcendental One but this very world, and phenomena are themselves the absolute. The Huayan master Fazang (643–712) attempted to explain this aspect of reality to the Chinese Empress Wu with his analogy of the golden lion. We can intellectually distinguish the lion shape from the gold, but in actuality there can be no such shape without the gold that is shaped. Similarly, gold always has a shape, whether it is a lion, a temple, or a blob. So too, the phenomenal world is the ever-shifting form

of the absolute. Huayan thus offers a fully nondualistic view of the relationship between the absolute and phenomena.

A similar argument was made concerning the relationship between the whole of phenomena and the parts. In a conventional view, there can be a whole (let's say a barn) separate from the parts (rafters, paneling, etc.). From this perspective, there are pieces of wood, nails, etc., and then there is a barn and each part can be replaced and still have the "same" barn. Huayan, however, says that there is no whole separate from the particular parts. A rafter is the barn, just the same as my arm or leg is my body. Each part *is* the whole. If a rafter or my arm were replaced, says Huayan, we would have a new barn and I would have a different body. Nothing is relegated to the status of being "merely a part" that the whole can do without. Thus Huayan spoke of *li shi wu ai*: the mutual non-interference of the absolute and phenomena.

Huayan is most famous for its views of the relationships among phenomena. The Chinese term that summarizes the Huayan view is *shi shi wu ai*, the mutual "non-interference" among all things. The basic point is an emphasis on the unqualified interdependence and interpenetration of all things. The classic image used to represent interpenetration is Indra's net, which is described in the *Gandavyuha Sutra*. In this image, the universe is considered to be a vast web of many-sided and highly polished jewels, each one acting as a multiple mirror. In one sense each jewel is a single entity. But when we look at a jewel, we see the reflections of every other jewel, each of which contains the reflections of other jewels, and so on in an endless system of mirroring. Thus in each jewel is the image of all other jewels, as well as the entire net as whole. The jewels interpenetrate each other. Yet each one contains the others in its own unique way in its distinctive position, and so they are distinct.

Another way that East Asian Buddhism analyzed the world was in terms of Buddha-nature. In Indian Mahayana Buddhism there developed the idea that all sentient beings have the Buddha-nature. In East Asia this perspective was expanded in three principal ways. The first was to increase the range of what was included. Over time, plants were seen as having Buddha-nature: the dualism between plants and animals was dropped. In the case of the Japanese Shingon master Ku^o kai (774–835) and Zen master Do^o gen (1200–1253), even inanimate objects such as rocks and roof-tiles were included – any other view would be dualistic between biotic and abiotic phenomena.

The second development concerned the level of realization. The original view was that all beings had Buddhanature in a latent or germinal form. In East Asia the idea of "original enlightenment" developed, which meant that everyone's Buddha nature was actually fully developed. The problem was that we do not realize this Buddhanature because it is obscured, like clouds covering the full moon. In line with such a view, the world was conceived of as fully realized, perfect just as it is. The point is not that the world satisfies our notion of the good and beautiful. This "perfection" is nondualistic: all things and conditions are of unqualified reality and value, even those that involve suffering.

The third development is the relationship between Buddha-nature and beings. Traditionally things were said to possess Buddha-nature, as they would other qualities. For Do⁻ gen, such a view involved a dualism between the being and Buddha-nature. Instead, all things *are* the Buddhature. There is nothing that is not Buddha-nature.

Such a radically positive valorization of the world was put in other terms as well. The world is seen as the very body of the Buddha. Mountains and rivers were considered a sutra (Buddhist scripture) and the birds sing the dharma (Buddhist truth). Particular regions, especially mountains, were seen as mandalas (a symbolic representations of the cosmos). While Buddhist metaphysics are universalistic, often it is the natural world that is thought of principally as the unsullied embodiment of ultimate reality. Theoretically cities were included, but they are also sites of craving, aversion, and delusion, something not found in nature.

Two main results of such a radically nondualistic metaphysics have particular bearing on ecological philosophy. One is that the world is conceived of holistically as a net of relationships, rather than as a collection of individual things. This is not a monism in which the reality of individuals disappears but rather a relational holism in which individuals are distinct but interrelated within a whole. The second result is that this world and each individual thing in it is given unqualified reality and value. There is no transcendental world and no abstract One separate from this world of redwoods and woodpeckers. There are no independent parts that we can devalue for the sake of other parts or the whole: everything has unlimited value.

But such a radical nondualism also seems to undercut ecological concern because it apparently invalidates any type of distinctions. Is toxic waste Buddha-nature the same as a redwood tree? If the rainforests are completely destroyed, would not what remained also be the body of the Buddha? This issue is too complex to respond to fully here, but it would involve the recognition that the nondualism of Buddhist metaphysics does not stand alone. There is also the Buddhist analysis of the *effect* of actions, involving the acute realization of suffering, along with the Mahayana tradition of combining compassion with wisdom. Similarly this metaphysics needs to be joined with the Buddhist analysis of the *motive* for actions, including the Buddhist critique of craving, aversion, and delusion: the distinction between enlightened and unenlightened motivations remains. The combination of nondualism, compassion, and psychological critique can form a powerful and complex basis for an ecological ethics.

In addition to metaphysics, East Asian views of consciousness and the self have substantial ecological import. The Indian Mahayana school of Yogacara spoke in terms of “consciousness only.” This does not refer to subjectivism or idealism, which would involve an acceptance of the subject–object duality and then a one-sided erasure of the objective world. Instead, there is a dissolution of the subject–object split. This perspective of nonduality between subject and object was developed more fully in China, both as a metaphysical claim about reality and as a psychological ideal for the practitioner.

Metaphysically, our dichotomy between a subjective consciousness and an objective reality is false. So what is there? Because our thought patterns and language assume a split between them, even Buddhists tend to speak either in subjective or objective terms (the “One Mind” or “reality-as-it-is”). It would be more accurate to say that there is only “reality-consciousness.” This is the True Self: the universe as a whole in this moment of experience.

Psychologically, the subject–object split is a delusion that leads to cravings and aversions. If we believe that there is a world separate from our self, there will be things “out there” we desire and things we fear and hate. The ideal is to attain a state of mind in which this delusion falls away and one experiences reality directly. Meditation techniques seek to cultivate “concentration and insight,” an intense focus on the world that leads to a sense of absorption in what we experience; there is no longer any sense of an “I” separate from what is being experienced. The ideal of direct perception and the practice of concentration and insight resonated with certain practices and ideals in Daoism and Confucianism, and they greatly influenced the poets and painters of East Asia. They also have significant appeal to contemporary people seeking a way to become more intimate with nature and transcend the sense of alienation from the natural world.

Another sense of the self is at work in East Asian Buddhism. We are Buddha-nature, although it is covered up by greed, hatred, and delusion. As we come to realize our inherent Buddha-nature, we naturally feel compassion toward those who suffer. And that compassion naturally leads to action in response to suffering. Buddhism, especially Zen, borrowed from the notion of spontaneity (*jiran* and *wuwei*) earlier developed by the Daoist Zhuangzi (ca. 300 B.C.E.). Zhuangzi held that we have an innate disposition to respond to the world in a harmonious way, and this is only short-circuited by intention and reason. To this idea Chinese Buddhism added the concern for suffering and the feeling of compassion.

Such a complex sense of the self can form the basis of an unqualified valorization of the natural world and a context for moral emotions and action. Rainforest activist John Seed has famously said that he is not an altruist attempting to help something out there; he is the rainforest naturally responding to its own destruction. Such an idea is an authentic extrapolation of this East Asian Buddhist perspective. This clearly is not a form of conventional Western ethics, based on moral reasoning about how the individual ought to respond to the world. It is an intuitive and spontaneous ethic of identification with the world. However, an eco-Buddhist taking this approach would need to explain how such an ethic could deal with complex ecological issues in a sufficiently informed and sustained way.

On the level of feelings, the bodhisattva ideal of compassion for all beings has been a hallmark of East Asian Buddhism and is a potentially rich source for ecological ethics. However, compassion can be interpreted in various ways, including some that are not conducive to environmental concern. Compassion could be limited to spiritual suffering and not include physical pain or emotional distress, let alone social injustice

or environmental degradation. It has been argued that if Buddhists focus on such “non-spiritual” suffering (e.g., hunger or homelessness), their compassion will be ineffective. Even those living in comfort are burdened with cravings and aversions, attachments and dissatisfactions. The goal, this argument holds, should be to develop Buddhist wisdom, in which case physical pain will no longer cause aversion, emotional distress will not arise, and one will not be attached to the ever-present ills of the world. To be ecologically and socially relevant, a Buddhist would need to insist that the range of compassion includes pain, deprivation, and fear.

Similarly, the issue of the range of compassion is crucial. Even if one were to feel compassion for conventional suffering, if the scope is limited the significance of compassion will be limited as well. Does compassion refer only to or primarily to humans, or to animals as well? What about an ecosystem such as the rainforest? Does compassion extend to the generations of beings in the future? A “holistic” Buddhist ethics would need to insist – against the actual mainstream tradition of Buddhism – that compassion should be all-encompassing.

Another critical issue in the potential significance of East Asian Buddhism is the role of the social and structural level in one’s analysis and response. Traditionally, Buddhism has focused on the individual, both in terms of the analysis of the problem and the cultivation of the ideal. But in our age it has become evident that the cause of environmental and social problems is not limited to individual psyches; political structures and social forces stimulate and empower cravings, aversions, and delusion, and they cause great suffering for all beings. To be truly meaningful in dealing with environmental problems, the views and values noted above need to be applicable to the social and structural level. The apparently eco-friendly qualities of East Asian Buddhism have not been much of an environmental or social force in part because the religion has tended to either ignore or support harmful social structures. However, East Asian Buddhism’s emphasis on the interpenetration of all things seems to provide fertile ground for an extension of Buddhist critique and compassion to social systems, leading to a holistic and engaged Buddhism.

Buddhism – Engaged

The genesis of the term “engaged Buddhism” can be traced to Vietnam in the 1960s. As the Vietnam War escalated, many of the Buddhist monks and nuns did not know what to do.

“Should we continue to practice in our monasteries,” they asked themselves, “or should we leave the meditation halls in order to help the people who are suffering under the bombs?” One of the monks, Thich Nhat Hanh (b. 1926), tells what happened: “We decided to do both – to go out and help people and to do so in mindfulness. We called it engaged Buddhism” (1991: 91).

Today, engaged Buddhism is practiced by adherents of disparate backgrounds in many parts of the world. There are Asian, Western, and global forms of expression. Rather than shun mundane existence (*samsara*), engaged Buddhists seek to bring the teachings and practices of traditional Buddhism to bear upon the problems of this world. They believe that it is possible to advance along the spiritual path – and to help others advance – in the midst of the conditions and travails of this life. True liberation must include the social and political dimensions of freedom as well as the spiritual. True awakening cannot be for oneself alone.

One of the most important streams of engaged Buddhism is ecological Buddhism, which reinterprets Buddhist concepts and practices in light of the present environmental crisis. Perhaps the greenest of the great world religions, Buddhism affirms interdependence as an essential attribute of reality, a vision that resonates deeply with an ecological worldview. Practices such as mindfulness, compassion, and restraint acquire new meanings in a time of ecological peril. The principal goal, enlightenment, yields an experience of oneness that dissolves the boundary between “self” and “environment.” Although green Buddhism is not yet a coherent movement, it shows considerable promise. As the search for ways to live more lightly on the Earth intensifies, Buddhism may contribute significantly to the shared task of reshaping human–Earth relations.

Some form of engaged Buddhism can be found today in nearly all of the Buddhist and formerly Buddhist countries of Asia. A leading example of a Buddhist-inspired rural development program is Sarvodaya Shramadana in Sri Lanka. Founded in 1958, the program supports education, agriculture, health measures, and local industry in over 10,000 Sri Lankan towns and villages. The spiritual merits of voluntarism and self-help are emphasized: Sarvodaya Shramadana literally means “all awaken through volunteer service.” A.T. Ariyaratne (b. 1931), who founded the organization, continues to serve as its president.

Thailand has produced two internationally recognized leaders of engaged Buddhism. The scholar-monk Buddhadaṃsa (1906–1993) asserted the relevance of time-honored Buddhist doctrines in the modern world, and he opened his forest monastery, Suan Mokh, to all arrivals. Sulak Sivaraksa (b. 1932), a layman, founded the International Network of Engaged Buddhists in 1989. Thai monks have devised a method of forest protection, “ordaining” endangered trees into the monastic community (*sangha*), a practice that has become an important expression of Buddhist environmentalism. Thai women have taken the lead in a movement to rebuild the Buddhist order of nuns and restore full ordination for women. Although it seems paradoxical to call a movement to strengthen monasticism “engaged,” in a patriarchal culture the demand for equal treatment of nuns becomes a form of social activism.

Tibetan Buddhists were thrust involuntarily into the political realm when China occupied Tibet in 1959. In 1960 the Dalai Lama (b. 1935) established a government-in-exile in India. Since then he has become a leader of Buddhists worldwide and an exemplar of engaged Buddhism. The Dalai Lama advocates compassion and universal responsibility as means of social transformation, and he extols peace of mind as the key to world peace. He has also urged the protection of Tibet’s natural environment. In 1989 he was awarded the Nobel Peace Prize in recognition of his principled adherence to nonviolence.

Although Buddhism disappeared from India nearly a thousand years ago, in the twentieth century millions of former “untouchables” embraced Buddhism as a vehicle of religious and political emancipation. Initially led by

B.R. Ambedkar (1891–1956), this movement has had its greatest impact among the urban poor. In Taiwan, the leading engaged Buddhist organization is the Tzu Chi Compassion Foundation, launched in 1966 by the nun Shih Cheng-yen (b. 1937). Mobilizing several million volunteers, Tzu Chi operates a hospital, a medical school, a nursing school, and a university. The group also sponsors medical and social relief efforts in more than twenty countries around the world. In Japan, Buddhist sects founded in the nineteenth and twentieth centuries have generally been more engaged than long-established schools such as Zen. Soka Gakkai and Rissho Koseikai have been active internationally in the areas of education, peace, and the environment.

In the West, aspects of engaged Buddhism have been embraced by people from all walks of life. Most Western Buddhists are lay people with a preference for flexible institutional affiliations, so patterns of participation vary widely. Many contemporary Buddhists regard the family and the workplace as valid arenas of engagement, a notable development in a tradition that originally emphasized monasticism. Poet-activist Gary Snyder (b. 1930) states, “The natural unit of practice is the family” (1980: 136). The Vietnamese monk Thich Nhat Hanh, who now has an international following, asks, “If you cannot serve your wife or husband or child or parent, how are you going to serve society?” (1987: 75)

The most representative engaged Buddhist organization in North America is the Buddhist Peace Fellowship (BPF), founded in 1978 by Zen teacher Robert Aitken (b.

1917) and others. Based in Berkeley, California, BPF serves as a network for Dharma centers, affiliated chapters, and individuals. Contributions from about 4000 members support an office, a modest staff, and *Turning Wheel*, a quarterly journal. In 1995, BPF inaugurated the Buddhist Alliance for Social Engagement (BASE), in which small groups of volunteers endeavor to integrate service, social action, study, and Buddhist practice. BPF members typically favor a non-sectarian, non-proselytizing approach, sometimes called “Buddhism with a small b.” Just as Buddhists often become active in non-Buddhist organizations (such as the Sierra Club), non-Buddhists are welcome to participate in ostensibly Buddhist forms of engagement (such as meditation at a nuclear site).

The stated goals of the Buddhist Peace Fellowship are:

- Provide BPF members and the wider community an opportunity for socially engaged Buddhist practice.
- Alleviate suffering and promote human rights internationally.
- Participate with activist communities in vigils, demonstrations, and other actions.
- Develop resources and guidelines to address issues of misconduct and discrimination within Buddhist communities.
- Promote the development of Buddhist social analysis.
- Network among Buddhists, social justice workers, faith groups, and other allies.

No single issue has consistently dominated the agenda of engaged Buddhism in the West. Western Buddhists have aided communities of Tibetan exiles in Nepal and India, financed mobile medical teams on the Burmese border, and conducted campaigns to free unjustly imprisoned monks in Vietnam. Within their own countries, Americans and Europeans have established hospices for the terminally ill, conducted “street retreats” to deepen understanding of homelessness, and spoken out against the excesses of consumerism. The plight of people in jail has drawn increasing attention in recent years. Activists representing virtually all of the major streams of Buddhism work for prison reform, oppose the death penalty, offer chaplaincy services, and help inmates set up meditation groups. In 1967, a prisoner in Texas was put in solitary confinement for expressing interest in Buddhism. He filed a lawsuit, and ten years later the Supreme Court ruled in his favor, thereby affirming freedom of religion for prison inmates.

Nuclear weapons and nuclear waste have prompted responses ranging from participation in watchdog groups to acts of civil disobedience. Buddhists have demonstrated regularly at the United Nations, the Nevada Nuclear Test Site, and the Concord Naval Weapons Station in California. One of the planks of the Dalai Lama’s peace plan for Tibet (1987) is “the abandonment of China’s use of Tibet for the production of nuclear weapons and dumping of nuclear waste.” Scholar-activist Joanna Macy (b. 1929) developed a vision of nuclear guardianship in which radioactive waste would be monitored with utmost care, generation after generation, rather than buried in ecologically harmful ways. Thich Nhat Hanh has declared, “Nuclear waste is a bell of mindfulness” (in Badiner 1990: 220).

The relation between traditional Buddhism and engaged Buddhism can be framed in various ways. Some participants and observers contend that Buddhism has been engaged throughout its history; they cite, for example, the vital role of temples in Asian villages. Others hold that the contemporary turn toward engagement is indeed a directional shift, yet it remains authentically grounded in Buddhist tradition. A handful of critics, rejecting both of these views, argue that engaged Buddhism is an *inauthentic* departure from traditional Buddhism.

With few exceptions, present-day engaged Buddhists embrace cardinal Buddhist teachings such as the Four Noble Truths, the goal of awakening, and the necessity of actual practice. Insight into no-self (*anatta*) is considered the true foundation for selfless action in the world. The traditional vow to save all beings has acquired new urgency and concreteness as ecological degradation becomes more obvious. Building on this base, several groups have composed additional sets of precepts or intentions. One such document, the Buddhist Peace Fellowship's statement of purpose, can also be read as a declaration of the key tenets of engaged Buddhism:

- Recognize the interdependence of all beings.
- Meet suffering directly and with compassion.
- Appreciate the importance of not clinging to views and outcomes.
- Work with Buddhists from all traditions.
- Connect individual and social transformation.
- Practice nonviolence.
- Use participatory decision-making techniques.
- Protect and extend human rights.
- Support gender and racial equality, and challenge all forms of unjust discrimination.
- Work for economic justice and the end of poverty.
- Work for a sustainable environment.

Buddhism – North America

During its 2500-year-old history, Buddhism has evolved across a wide range of physical and cultural geographies. From the Theravada traditions in tropical South and Southeast Asia, to the Mahayana schools in temperate and climatically diverse China and Japan, to the Vajrayana lineages in mountainous Tibet – the Buddhist teachings have been received, modified, and elaborated in many ecological contexts. In the twentieth century, these teachings have been transplanted to North America where they immediately encountered the Western environmental movement and American attitudes toward nature. Across time, Buddhist understandings about human–nature relations have been based on different teachings, texts, and cultural views. In North America the teachings toward nature are still evolving. Yet even in this brief history some trends are apparent.

Buddhist Environmental Philosophy

American Buddhist environmental teachers and writers at the beginning of the twenty-first century have emphasized five primary arenas of practice and philosophy in relation to nature and an environmental view: interdependence, nonharming, mindfulness, nondualistic views, and detachment from self.

The *law of interdependence* or mutual causality promotes an understanding of nature as relational, dynamic, and constantly changing. Each phenomenon in nature is seen as dependent on a multitude of causes and conditions. These causes include not only physical and biological factors, but also historical and cultural factors (i.e., human thought forms and values). The *Avatamsaka* or Flower Ornament Sutra uses a teaching metaphor, the Jeweled Net of Indra, to communicate the infinite complexity of the multicausal universe. This cosmic net contains a multifaceted jewel at each of its nodes, with each jewel reflecting all the others. If any of the jewels become cloudy (toxic or polluted), they reflect the others less clearly. Engaging interdependence in an environmental context includes examining conditioned beliefs and thought patterns regarding the natural world such as objectification of plants and animals, the impacts of materialism, and environmental racism.

Buddhist ethical guidelines are based at the core on *nonharming* or minimizing the suffering of others. The first precept, “not killing,” has been discussed in relation to environmental dilemmas regarding food, land use, pesticides, pollution, and cultural economic invasion. The second precept, “not stealing,” has been applied to global trade

and corporate exploitation of resources. “Not lying” brings up issues in advertising and consumerism. “Not engaging in abusive relations” covers a broad realm of cruelty and disrespect for nonhuman others. Nonharming thus applies to environmental abuse of plants, animals, rivers, rocks, and mountains as well as to human abuse based on race, class, or gender discrimination. This teaching of ahimsa is congruent with Western schools of ecophilosophy which respect the intrinsic value and subjective experience of each being.

Mindfulness practice, a natural support to Buddhist environmentalism, is being taught in a range of ecological contexts. Walking and sitting meditation are used to cultivate a sense of centered presence and alertness. Such mindfulness generates appreciation and respect toward the natural world, with practices related to food and eating, time and place, and personal well-being. Mindfulness students are encouraged to make every effort not to cause suffering to others, including plants and animals.

Buddhist texts emphasize a strong relationship between intention, action, and karmic effects of an action. Most political battles play out as confrontations between apparent enemies: loggers versus tree defenders or housewives versus toxic polluters. From a Buddhist perspective, such dualistic polarizing destroys spiritual equanimity. A *nondualistic* or inclusive perspective, offering kindness to all parties, is seen as more effective, even while defending firm moral boundaries against harmful actions. A Buddhist orientation to nondualism can help to stabilize a volatile situation and establish new grounds for negotiation.

A Buddhist approach to environmental activism tends to be nonheroic or detached (i.e., not motivated primarily by the need for ego identity or satisfaction). One does what is necessary in the situation, not bound by the need to reinforce one’s ideas or to have it turn out a certain way. Small “b” Buddhist environmentalists have been able to act as bridge-builders in hostile or reactive situations by toning down the need for personal recognition. Buddhist teachers emphasize the power of *kalyana mitta*, or spiritual friendship – acting together in mutual support to help others practice the Dharma and take care of this world.

American Buddhist environmental ethics are often seen as virtue ethics, developing consciousness and a sense of responsibility to act compassionately for the benefit of all forms of life. Mahayana schools in North America emphasize the path of the *bodhisattva*, one who vows to serve others until all the world’s suffering is extinguished. Tibetan schools reinforce this vow by encouraging people to treat all sentient beings as possibly having been their mother in a former life. Environmentally oriented Buddhist teachers encourage students to be ecologically accountable for their actions, from eating food to using a car to buying new clothes. Through following the fundamental precepts, environmentally oriented Buddhists can practice moderation and restraint, simplifying needs and desires to reduce suffering for others.

Brief History

In the last few decades, Buddhism in North America has engaged environmental issues drawing on principles of Buddhist philosophy and practice. Inspired by forest monks in Thailand and resource exploitation in Tibet, American Buddhists have taken up environmental campaigns as spiritual practice. Various individuals and centers have initiated actions as well on behalf of animals, wilderness protection, and reducing consumption.

In the 1970s, as the environmental movement grew, a number of Buddhist centers became established in the West. Some confronted ecological issues in their own backyards. Zen Mountain Monastery in New York faced off with the Department of Environmental Conservation over a beaver dam and forestry issues. Green Gulch Zen Center in northern California developed water-use agreements with Golden Gate National Recreation Area and its farming neighbors. At a time when vegetarianism was rare, many new centers refrained from meat eating, often with awareness of the associated environmental problems, and some made efforts to grow their own organic food. Zen student Gary Snyder, among other early voices for Buddhist environmentalism, used his writing to popularize the connections between Buddhist training and ecological activism.

In the 1980s Buddhist leaders explicitly addressed the environmental crisis and incorporated ecological awareness in their teaching. In his 1989 Nobel Peace Prize acceptance speech, His Holiness the Dalai Lama proposed making Tibet an international ecological reserve. Vietnamese peace activist and Zen monk Thich Nhat Han spoke to thousands of Americans about “interbeing” using ecological examples. Zen teachers Robert Aitken in Hawai’i and Daido Looi in New York examined the Buddhist precepts from an environmental perspective.

In North America, the topic of Buddhism and Ecology was picked up by Buddhist publications, conferences, and retreat centers. The Buddhist Peace Fellowship produced a substantial packet and poster for Earth Day 1990. The first popular anthology of American Buddhism and ecology writings, *Dharma Gaia*, was published by Parallax Press that same year. Buddhist magazines such as *Tricycle*, *Shambhala Sun*, *Inquiring Mind*, *Turning Wheel*, and *Mountain Record* devoted whole issues to the question of environmental practice. These were followed a decade later with the comprehensive anthology *Dharma Rain: Sources of Buddhist Environmentalism*.

In 1990 Middlebury College in Vermont hosted a conference on “Spirit and Nature” in which the Dalai Lama stressed his commitment to protection of the environment. At the 1993 Parliament of the World’s Religions in Chicago, Buddhists gathered with

Hindus, Muslims, pagans, Jews, Jains, and Christians from around the world to discuss the role of religion in responding to the environmental crisis. Parallel interest in the academic community generated ten major conferences (and subsequent academic volumes) on religion and ecology at Harvard University; the first, convened in 1996, focused on Buddhism and Ecology.

The practice of Buddhist environmentalism has been explored by socially engaged Buddhist teachers including the Dalai Lama, Sulak Sivaraksa, Thich Nhat Hanh, and American abbots John Daido Looi, Philip Kapleau, and Bernie Glassman. To cultivate motivation for environmental work, activist Joanna Macy developed experiential teaching methods based in meditation techniques and the Buddhist law of co-dependent arising. Working with John Seed, a Buddhist rainforest activist, they created the “Council of All Beings” to engage people’s imagination on behalf of all beings. Thousands of councils have now taken place in the United States, Australia, New Zealand, Germany, Russia, and other parts of the Western world.

Buddhist Environmental Activism

Examples of green Buddhism in North America are uncommon yet inspiring to many and proliferating. More and more American environmentalists have taken up Buddhism and more students of Buddhism have become concerned about the environment. In northern California, a group named the “Ecosattvas” has been protesting the logging of old-growth redwoods. For one event, they created a prayer flag covered with human handprints as a testimony of solidarity with resisters. Some members made a pilgrimage into the Headwaters Forest to bury a Tibetan treasure vase with gifts and prayers on behalf of the redwoods.

Moved by the suffering of animals in research cages and factory farms, Zen students in the San Francisco area formed a Buddhist animal rights group. Drawing on principles of nonharming, they educated Buddhists about the plight of lab monkeys, beef cattle, and endangered parrots. A Berkeley-based study group protested the storage of nuclear waste below ground, creating instead a model based in Buddhist spiritual practice of “nuclear guardianship” for above-ground storage containers. Zen student and artist Mayumi Oda organized Plutonium-Free Future to stop shipments of deadly plutonium to Japan.

Some Buddhist environmental activism has focused on structural analysis and the creation of alternative visions. In 1997 the Soka Gakkai-affiliated group, the Boston Research Center for the 21st Century, held a series of workshops on the people’s Earth Charter and published a booklet of Buddhist views on the Charter’s principles. Members of the Buddhist Peace Fellowship and the International Network of Engaged Buddhists started a “Think Sangha” to undertake systemic analysis of global consumerism. They collaborated on conferences to promote “Alternatives to Consumerism” such as moderation and lifestyle simplification.

Green Gulch Zen Center and Spirit Rock in northern California, and Zen Mountain Monastery in New York, have already demonstrated a serious commitment to the environment through land and water stewardship efforts, vegetarian food practices, and ceremonies which include the natural world. Zen Mountain Center in Southern California has been carrying out resource management practices such as thinning for fire breaks, restoring degraded forest, and limiting human access to some preserve areas. Zen teacher Bernard Glassman has developed environmentally oriented small businesses which employ local street people, sending products to socially responsible companies such as Ben and Jerry's.

A number of Buddhist centers have offered lecture series, classes, and retreats based on environmental themes. Zen Mountain Monastery holds "Mountains and Rivers" retreats featuring canoeing, nature photography, and haiku. Ring of Bone Zendo at Kitkitdizze leads backpacking sessions in the Sierra Nevada mountains. Green Gulch Zen Center co-hosts the "Voice of the Watershed" series with Muir Woods National Monument. Manzanita Village center in southern California teaches mindfulness through deep ecology practices, gardening, and nature observation.

Individual Buddhists as well are taking small steps to align their actions with Buddhist practice. Many are turning to vegetarianism and veganism (refraining from consuming any animal-produced food) as compassionate eating choices for animals and ecosystems. Others are committed to eating only organically grown food to support healthy soil and farming. Some Buddhists have joined support groups for reducing credit card debt and car dependence. Many students find that environmental awareness and personal change flow naturally from a Buddhist practice commitment.

Conclusion

Is there a Buddhist ecospiritual movement in North America? Not in any obvious sense, at least not yet. No organizations have been formed to promote Buddhist environmentalism; no clearly defined environmental agenda has been agreed upon by a group of self-identified American Buddhists. However, environmentally concerned teachers are emerging, and Buddhist students of all lineages are drawn to their writings and ideas. There is a strong conversation developing among Western and Eastern Buddhists, asking both practical and philosophical questions from this emerging perspective. With environmental issues as a mounting global concern, Buddhists of many traditions are creatively adapting their religious heritage to confront these difficult issues.

Buddhism – Tibetan

Two generalizations characterize Tibetan Buddhist attitudes regarding nature. First is the conviction, common to all forms of Buddhism, that ordinary perceptions and conceptions regarding nature and all other elements of the phenomenal world are not accurate; in fact they are highly misleading and spell doom for those who do not know better. Second is the teaching, characteristic of Vajrayana Buddhism as practiced in Tibet and elsewhere, that to one who is thoroughly trained, the phenomenal world appears as it is – a sacred universe filled with divine beings. In Vajrayana thought, “nature,” as such, cannot be found independent of how it appears to sentient beings who perceive. Thus, one cannot really talk of a Tibetan Buddhist view of nature, but must talk instead of some of the ways in which nature appears, dependent on the relative skill of the meditator.

To many who follow Tibetan Buddhism, whether ordinary people or advanced meditators, nature appears as a splendid display of mountains, sky, and streams, filled with delightful wild animals and flowers. Tibet’s awesome landscapes easily foster such impressions. Many a Tibetan meditator has spent years living in isolated caves, delighting in the solitude and beauty that are said to enhance the difficult meditation practices typical of Tibetan Buddhism. The most beloved records of such experiences are found in the songs of Tibet’s greatest poet, Mila Repa, who was one of the most important figures in the history of Tibetan Buddhism as well. Many Westerners, partly influenced by such Tibetan writings and partly influenced by travelers’ reports and photographs, also imagined traditional Tibetan culture to be especially reverential toward nature.

Such uncomplicated appreciation of nature and its virtues is not, however, the whole story for Tibetan Buddhism. Simply because the phenomenal world appears to be so attractive, peoples’ attitudes toward it are often deluded and dangerous. Though the predominant form of Buddhism in Tibet is Vajrayana Buddhism, which teaches that it is possible to experience the phenomenal world as sacred, more basic Buddhist teachings are considered to be a necessary foundation for that experience. These more basic teachings emphasize that the phenomenal world is a complete and total matrix of interdependence; nothing stands outside that interdependent matrix and everything within it is interconnected. This central Buddhist concept has been taken up with enthusiasm by some environmentalists because it presents a more realistic assessment of humanity’s status in the natural order and of the impact of human actions upon the environment.

In and of itself, interdependence, as understood in Buddhism, is neutral; it is simply a description of how things work. The usual human reaction, however, is to defy the

implications of interdependence. Instead of appreciating the flow of interdependent forces in the cosmos, humans conventionally want to control and direct that flow based on self-centered desires for personal security, pleasure, and permanence. Because of this mistake, this desire which cannot possibly be fulfilled, the phenomenal world becomes the arena for suffering. Much classic Buddhist teaching (the four noble truths) crystallizes around these few simple sentences, which are said to go so much against the grain of usual human hopes and desires that they are extremely difficult fully to comprehend and accept. Regarding a Tibetan Buddhist understanding of nature, the implication is that humans experience a great deal of frustration and unhappiness in their relationships with the world of nature, but such frustrations do not occur because of a problem with how nature works. Much Buddhist literature is filled with discussions of how unsatisfactory human life is conventionally, but those discussions are not meant to express lack of appreciation for nature, for life as it is given to us. They are meant to criticize conventional human attitudes toward nature, which make it impossible to appreciate nature because the phenomenal world does not conform with the usual human desires for pleasure, permanence, and security in any way.

Buddhist philosophical and meditative disciplines are meant to counteract such conceptual and perceptual mistakes about our own place in the scheme of things and our own ability to control how the phenomenal world behaves. On the one hand, conventionally, we wish to be at the center of the interdependent matrix of the phenomenal world, which brings nothing but sorrow and fruitless attempts to escape that phenomenal reality. Because of these Buddhist teachings, some commentators have seen Buddhism as largely “pessimistic,” regarding nature. On the other hand, if we accept interdependence and its implications for our individual projects, the phenomenal world explodes with brilliance and sacredness, which can now be appreciated. Herein lies the passage from experiencing nature as the arena of our suffering to experiencing nature as sacred world. Vajrayana teachings about the possibility of bliss in our present lives are all bound up with being able to effect this subtle transformation. Without the possibility of this transformation, Vajrayana Buddhist meditative and analytical disciplines would be meaningless.

In Vajrayana Buddhist understanding, the phenomenal world is “the palace of the deities” and all its inhabitants are “deities.” Furthermore, they have always been so; only an enormous conceptual mistake fosters a perception of the phenomenal world that results in the pursuit of personal security within that world. To say that the phenomenal world is the palace of the deities, and that its inhabitants, all sentient beings, are deities is not to say that mountains, sky, and streams change into buildings filled with immortal, powerful beings. It is to say that shorn of very common mistaken perceptions and conceptions, the phenomenal world is perfect as it is. Nature can easily be misperceived and misunderstood, but it cannot be improved upon, no matter how much human desires may lead us to think that nature would be better if it afforded us security, permanence, and ease. Furthermore, in its perfection, it is ungraspable

by word or thought and does not need to be declared beautiful, ugly, or anything else. This is what Mila Repa meant when he sang his songs of delight in his mountain caves.

Burial Practices – Prehistoric

It is difficult to know when humans began to dispose purposefully of their dead, because the chances of archeologists discovering or recognizing the earliest such practices are slim indeed. However, in recent years, what appears to be the earliest known evidence for some kind of funerary ritual has come to light in northern Spain. The Sierra de Atapuerca, near Burgos, comprises a wide variety of early dwelling sites, dating back about a million years. Some 1600 feet inside the Cueva Mayor, an enormous cave, there is an extraordinary site called the Sima de los Huesos (Pit of the Bones). Excavations in the pit since 1990 have recovered hundreds of bones belonging to humans dating to the Middle Pleistocene period, between 200,000 and 300,000 years ago. In fact, this pit contains more human remains from that period than all other sites combined. What is particularly remarkable is that all the bones of the body are present – including small hand and foot bones, while sieving of the sediments even recovers the tiny bones of the inner ear.

This pit has revolutionized knowledge of *Homo heidelbergensis* (archaic *Homo sapiens*), a transitional species between *Homo erectus* and Neanderthals. Although only about 2 percent of the pit's deposits have so far been excavated, almost 2000 bones have been found, which come from at least 33 individuals, and perhaps 50. Males and females are equally represented, and most are adolescents and young adults aged between 13 and 22, with more than 30 percent between 17 and 19; the youngest is about 4 and the oldest 35. Since less than a quarter of these individuals lived beyond their early twenties, they cannot represent a full population, and it is likely the older people were disposed of elsewhere. It appears that over several generations bodies were carried into the cave from an entrance, now lost, near the pit, and tossed into the shaft in a form of mortuary ritual that may point to some embryonic religious belief. The absence of herbivore bones and stone tools indicates that this was not a dwelling site, and the lack of carnivore damage suggests that the bones were not left there by predators.

The subsequent early humans, the Neanderthals, who occupied parts of Eurasia from ca. 200,000 to 25,000 years ago, are generally recognized as having carried out the first true burials – mostly, but not exclusively, found in caves and rock shelters. Debate still rages about whether some Neanderthal burials are not better interpreted in terms of natural processes such as rockfalls, but the vast majority of specialists are sure that the Neanderthals did bury some of their dead. As far as one can tell, they rarely placed objects with the dead, although one famous burial at Shanidar cave, Iraq, is thought to have been accompanied by flowers.

The appearance of anatomically modern humans (*Homo sapiens sapiens*, or Cro-Magnons) – in Africa by 150,000 years ago, and in Eurasia after ca. 35,000 years ago – is eventually marked by an abundance of clearly deliberate burials, often associated with red ochre, and accompanied by grave goods such as implements, ornaments and portable art objects. They occur in caves, rock shelters and the open air, while the newly discovered decorated cave of Cussac, in the Dordogne (France), dating to ca. 25,000 years ago, has human skeletons laid out on its floor.

Naturally, the earliest burials do not necessarily denote any kind of religious belief, or a concept of an afterlife; some may simply have involved the disposal or concealment of the deceased for convenience or to avoid odors or the attentions of nature's scavengers. However, once grave goods appear, it is fairly clear that such beliefs are probably present in some form.

Burning Man

Burning Man is a festival started in 1986 as a small gathering of friends on a San Francisco beach. Before long it became too large and chaotic to escape the attention of city police, necessitating its move to the desert. It began when Bay Area artist Larry Harvey burnt a wooden effigy at the end of a relationship and the “Burning Man” soon became an important rallying point for a small community of artists, musicians and interested onlookers. In 1990 Burning Man moved to the Black Rock Desert about 100 miles north of Reno, Nevada, near the tiny town of Gerlach. Black Rock Country, a small portion of the Great Basin, is surrounded by the Granite, Calico, Black Rock, and Selenite mountain ranges. Every year the festival attracted more participants, and as this happened, the organizers began to describe their vision for this event and established a few rules. While many observers understand Burning Man to be an art festival and an experiment with alternative forms of community, it is also a religious event for many participants and includes religious icons, altars, temples and shrines.

Burning Man is conducive to powerful religious experiences because it is imagined as a blank canvas, a frontier of possibilities and unrealized potential. On

Burning Man’s official website, Larry Harvey instructs festival-goers to “Imagine the land and the looming lakebed of the playa as a vast blank screen, a limitless ground of being.” And *Piss Clear*, one of Black Rock City’s newspapers, reminds festival-goers: “all that lays before us is the wide open playa floor. It is our palette and canvas, to create the world we can’t enjoy at home.” The land is thought of as something passive that must be shaped and given meaning by human hands, and at the same time as a living force to struggle against as well as to protect. In “Burning Man and the Environment,” an essay that is featured on the Burning Man website, Harvey explains the relationship between Black Rock Desert and the festival: “We have discovered a new land; it is a place, a home, a living Earth we can possess. And just as surely as our sweat will saturate this soil, it will possess us.”

By the year 2002 Burning Man had become a weeklong gathering of nearly 30,000 people that involved months of advance preparation and weeks of clean-up afterwards, most of the work done by volunteer crews. Every year a “Public Works” crew creates “streets” that mark out the half-moon-shaped city – “Black Rock City” – that comes to life as festival-goers arrive with camping gear, art cars, pavilions, art installations, and a range of temporary desert structures. The city borders the “playa” (a pre-historic lakebed), as a real city might develop along a lakefront. Out on the playa are large sculptures, including the Man, a forty-foot tall abstract wooden figure, and art installations, but no campers. Sculptures, shrines, altars, and installations are focal points

for ritual performances, usually scheduled at night. In 2001 the Temple of Tears was one of the most impressive examples of religious art at Burning Man and was constructed for rites of mourning and then burnt at the end of the festival. Concerts, performance art and other events are scheduled every day and night of the festival, but most festival-goers spend their hours wandering around the temporary city looking at art and costumed people, protecting themselves from the heat and sun, and visiting “theme camps,” which are a blend of campsite and interactive art installation. Most, but by no means all, participants were white, middle-class, “twentysomething ravers, fiftysomething hippies and thirtysomething computer whizzes,” as one participant described the community on the Burning Man website’s official “e-playa” bulletin board.

Burning Man organizers promote the notion that their community is impacted by and impacts the natural world. Nature is both a force to protect oneself against and an inspiration for creative activity. Much Burning Man literature details survival strategies for the desert environment where sand and rainstorms, scorching sun and intense winds are common occurrences. Storms wreak havoc on campsites and art work at the same time that they bring together participants in the common project of keeping their tents up and sheltering each other from the elements.

Many participants stress the inspiration they experienced being away from their urban homes and immersed in a world so obviously shaped by natural forces. The relationship of the Burning Man community to the desert environment has also been highly politicized, as some observers believe the impact of thousands of campers is detrimental to the desert. Consequently, organizers urge participants in every festival communication to “Leave No Trace.” Recycling camps, an alternative-energy camping area and clean-up crews encourage environmental awareness. Participants say they leave the desert feeling rejuvenated and transformed. But they also leave their marks on the landscape where clean-up crews spend weeks scouring every inch of the event site for debris and burn scars.

Burroughs, John (1837–1921)

John Burroughs was an American author, naturalist and farmer of the late nineteenth and early twentieth centuries. He is best remembered for his essays based on rambles in and around his home in West Park, New York, including such works as *Wake Robin* (1871), *Locusts and Wild Honey* (1879) and *Signs and Seasons* (1886). Burroughs wrote one of the first biographies of Walt Whitman and maintained a close friendship with him throughout his life. As Burroughs' popularity grew so did the attention of various luminaries of his day, which included friendships with Ralph Waldo Emerson, John Muir, Theodore Roosevelt and Henry Ford.

In literary terms, Burroughs was a lesser essayist than both Emerson and Thoreau. On the other hand, Burroughs took the Transcendentalists' writings and worked them through the sieve of his own pastoral experience, memories of his farming childhood, and reflections on his adult experiences on his own farmland. What emerged was writing that was second-hand in terms of intellectual influence but first-hand in terms of capturing the spiritual, aesthetic and practical dimensions of farming life.

In his youth Burroughs rebelled against farming, which he felt interfered with his desire to cultivate a literary life.

Once this writing life was safely launched, however, Burroughs felt increasingly restless in his Washington,

D.C. literary world. He found himself gripped with nostalgia for rural living, as well as captivated by a growing sense that to write about nature accurately he needed not only to go on extended rambles, but also to work on and in the soil itself. In 1872, Burroughs left his Washington home. Experiencing an almost mystical premonition of the appropriateness of a certain site on the Hudson, he purchased land and began to establish himself as a small-scale commercial farmer, while continuing to write and publish pastoral essays. It was this new Burroughs, not simply the biographer of Whitman, but the genuine "man of the soil" that began to attract a popular following.

Burroughs' conversion to a life lived close to nature led to an explosion of interest in the writing and person of Burroughs, from whom an increasingly urbanized middleclass culture could vicariously experience the spiritual refreshment of rural living. By 1905, Burroughs had made himself known (along with Theodore Roosevelt) as the voice of scientific realism in the "nature faker" controversy (involving the tendency of nature writers to wildly anthropomorphize animal characters in their writings). Burroughs' Darwinian stance enabled him to maintain credibility at a time when the first wave of "nature writing" was finding an audience, as well as occasionally losing its way.

But Burroughs was most celebrated as a man who practiced what he preached, who not only wrote, but farmed, camped out, walked for miles and lived a kind of early “back to the land” life in which Thoreau (according to Burroughs fans) had only dabbled. In the years after 1896, when Burroughs retreated to a rustic cabin known as “Slabsides” several miles from his larger home on the Hudson, his reputation grew as a “man of simplicity,” representing to the industrial world (and especially New Yorkers) the moral virtues of living close to the land. By the first decade of the twentieth century, John Burroughs Societies were springing up all over the country and Burroughs had to contend with thousands of visitors making the pilgrimage to Slabsides to see this prophet of simplicity in the flesh. In his best-known commentary on “the simple life” Burroughs wrote:

When I depart [from the simple life] evil results follow. I love a small house, plain clothes, simple living

. . . How free one feels, how good the elements taste, how close one gets to them, how they fit one’s body and one’s soul! To see the fire that warms you, or better yet, to cut the wood that feeds the fire that warms you; to see the spring where the water bubbles up that slakes your thirst, and to dip your pail in to it; to see the beams that are the stay of your four walls, and the timbers that uphold the roof that shelters you; to be in direct and personal contact with the sources of your material life . . . these are some of the rewards of the simple life (Burroughs 1908: 261).

Burroughs’ love of nature and his quest for simplicity were at the heart of his spiritual sense of self. Unafraid to be controversial, Burroughs’ wrote of his love of nature as a religious affection and once claimed, “I suppose I am an out-and-out pantheist. But I remember that Emerson says pantheism magnifies rather than belittles God” (in Renahan 1992: 298–9). But Burroughs’ religious orientation is a complex one: neither Christian, nor atheist; neither traditionally religious nor scientific in a strictly secular sense. Like other liberal-minded intellectuals of the mid-nineteenth century, Burroughs found himself negotiating a Christian heritage with an emerging Darwinian view of the world. For Burroughs, this negotiation took the particular form of developing a kind of religion of the natural world, one which took nature to be sacred. Sometimes Burroughs defined God *as* nature, while on other occasions he suggested that there is an intelligent force “behind” or “in back of” the natural world, which gives it meaning beyond that of the mere laws of mechanism.

Burroughs’ grew up in a religious household. His father was a fervent Baptist, steeped in the Reformed tradition and the doctrines of predestination. The young Burroughs, however, could not follow suit. While he attended a Methodist church in his youth, his attempt to nurture his own “religious feeling” through seeking salvation were foiled by his own rationalism. Ever the scientist, Burroughs could not affirm a divinity that he could not see, nor a salvation that he had not actually experienced. At the same time, however, Burroughs responded to the world with spiritual intensity. Reflecting in his journals in 1884 (shortly after his father’s death), he drew parallels between his father’s religiosity and his own nature-oriented spirituality. “I reckon it

was the same leaven working in us both,” he recalled. “Father experienced religion, I experienced Nature” (Burroughs 1928/1967: 106). Burroughs’ creative resolution of the tension between his father’s Baptist convictions and his own love of nature was to develop a view of nature that was Darwinian in its scientific realism and yet rich in sacramental and redemptive potential.

Burroughs’ vision of nature included his conviction that his readers should understand God as “a nature God in whom we really live and move and have our being, with whom our relation is as intimate and constant as that of the babe in its mother’s womb [and that this] is the God that science and reason reveal to us” (Burroughs 1920/ 1987: 33).

Burroughs’ vision of nature, of course, goes well beyond that of contemporary science, for in it, Burroughs articulates a kind of “theology of the soil,” which contemporary nature writers and back-to-the-landers often share. Such a working theology may reject traditional Judaism and Christianity, yet it affirms a spiritual continuity of life and indeed a vision of a world to come or everlasting life that science itself does not offer. As Burroughs’ put it, at the time of death, “My elements and my forces go back into the original sources out of which they came and these sources are perennial in this vast, wonderful, divine cosmos” (Burroughs 1920/1987: 172). Ultimately, Burroughs believed, nature itself could provide the redemptive function that so many sought in Christ, but to experience this redemption, a nature seeker needed to overcome the sway of traditional religion and the accompanying fear of the natural world:

This vital Nature out of which we came . . . and to which again we all in due time return, why should we fear or distrust it? . . . It looked after us before we were born; it will look after us when we are dead. Every particle of us will be taken care of; the force of every heart-beat is conserved somewhere, somehow. The psychic force or principle of which I am a manifestation will still go on. There is no stoppage and no waste, forever and ever (Burroughs 1901: 170).

Burroughs’ theology of the soil may seem radical when we consider his nineteenth-century context. His writing sounds more like that of today’s Wendell Berry, or of a modern, post-Christian seeker of life lived close to nature as an alternative to traditional religion. Yet Burroughs’ writing was far more popular in his own time and has enjoyed only a modest renaissance. Of the many things that we learn from Burroughs is that the delicate negotiation of science and religion, of nature and the sacred, of nature writing and of daily living in contact with the land has a long, creative history in American culture.

Butala, Sharon (1940–)

Saskatchewan native Sharon Butala (nee Le Blanc) has made her home in the Great Plains grasslands near the Montana border since the mid-1970s. Early in the 1990s, she began to speak publicly about a spiritual “apprenticeship in nature” that ultimately transformed her views, her writing, and her life on the prairies.

Although she invites comparison with Annie Dillard and Gretel Ehrlich, Sharon Butala is not primarily a nature writer. When she first turned her hand to writing in midlife, she concentrated her literary energies in novels and short stories about rural women and the physical and psychic landscapes they inhabit. Her own story finally emerges in *Perfection of the Morning* and *Wild Stone Heart*, land memoirs that weave meditations on spirituality, creativity and natural history with frank assessments of western Canada’s political and ecological divides. Generally, autobiography favors historical fact over “the truth of the imagination.” However, Butala’s ultimate allegiance, she confesses, is “to the latter.” That allegiance means she freely critiques standard cultural narratives, using dreams, visions and supernatural occurrences as interpretive tools. Butala’s memoirs, especially, are most compelling when she is attending to those places and moments in time where her inner and outer worlds converge.

For Butala, our rich interior lives are shaped by deep relationships with nature, and this intimacy yields profound changes in our psychic, spiritual and physical rhythms. Yet the authority to write out of her own remarkable experience has been hard won. After her second marriage, to rancher Peter Butala in 1976, and the move to his family’s isolated homestead in southwest Saskatchewan, she began the painful loss of identity as an educated urbanite. Poised between the demanding world of farming and ranching and a rich interior world, she turned to the landscape for solace and instruction. After a long struggle with depression, she emerged confirmed in her vocation as a writer: “I discovered that . . . writing . . . acts as the instrument of integration between myself and

. . . my home in the landscape” (1994: xvi). She likens this struggle to spiritual travail, and the fruits of this travail have nourished her considerably. Raised Roman Catholic, her religious orientation now includes an appreciation for native spirituality, Celtic mythology, Jungian psychology, and a firm grounding in intuitive, place-based knowing.

This award-winning author, former educational psychologist, teacher, mother, divorcee, visual artist, and transplanted rancher’s wife is now most at home in the wild prairie grasslands where sacred history, myth and imagination merge in the search for

truth. This quest for truth has propelled Butala far beyond formal avenues of learning. Inspired by aboriginal peoples who roamed these same fields for generations, Butala has become “an apprentice in the fields,” relying on the land as her guide. Decades of walking contemplation have sharpened her powers of observation and deepened her commitment to exploring truths of the past as well as the present. That commitment may be why Sharon Butala has become a leading voice in the call to balance conventional forms of knowledge with the wisdom and insight of an authentic spiritual life.

C

California Institute of Integral Studies

The California Institute of Integral Studies (CIIS), located in San Francisco, is a graduate school engaged in scholarship that explores human consciousness, spirituality, nature, and the cosmos. Founded in 1968 (originally as the California Institute of Asian Studies) by the Indian-born educator, scholar, and philosopher Haridas Chaudhuri and his wife, Bina, and accredited since 1981, the School offers doctoral and master's degrees in psychology, philosophy, religion, anthropology, and education, all of which stress holistic, activist-oriented learning focused on questions regarding humankind's relationship to nature and the larger universe.

The work of many of the Institute's faculty focuses on consciousness studies and social transformation. Several faculty members have been highly influential in the "greening" of religious studies and the New Age movement, and their work has fueled activism on the political, social, and environmental fronts for the past three decades.

Among the Institute's best-known instructors are: author Charlene Spretnak, a founding figure in the ecofeminist, women's spirituality, and Green politics movements; scientist Brian Swimme, who has written and spoken widely on the intersection of science and spirituality; Joanna Macy, a scholar of Buddhist philosophy, systems sciences, and ecological and social activism; Susan Griffin, an award-winning poet and author of books on ecofeminism and the relationship between spiritual and social conscience; and psychologist Ralph Metzner, a leader in the field of ecopsychology, ecological and indigenous worldviews, and sacred plant medicine.

A number of the Institute's courses and specialized concentrations focus specifically on the intersection between ecology and religion, exploring questions such as: the problematic split between humans and nature, body and mind, and self and world in Western thought; the interrelatedness among the denial of the sacred feminine, the disempowerment of women, and the violation of nature under patriarchy; the relationship between the domination of nature and the historical dominance of the North over the South in geopolitical relations; and how physical, psychological, and spiritual well-being are related to the health of ecosystems and bioregions.

The School's pedagogical philosophy emphasizes post-mechanistic, expansive new understandings of the evolution of the universe, the Earth as a living organism, and the interconnectedness of all life. The notion of "nature" is broadened to include the human mind and body, the Earth and its biosphere, and the larger planetary, stellar, and galactic realms. The contributions of indigenous wisdom, deep ecology, ecofeminism,

and women-centered spirituality to this emerging ecological, post-modern paradigm are given particular weight. As a part of their scholarly pursuit, students and faculty experiment with a variety of ways of knowing and inquiry methodologies that incorporate but go beyond rational empiricism to include heuristic and phenomenological approaches, and transpersonal methods involving such activities as dreamwork, prayer, intuition, attention to synchronicity, active visioning, and the use of altered states induced by various means, including sacred, plantbased medicines.

On the practical level, a number of faculty, such as anthropologist Angana Chatterji and environmental studies scholar Mutombe Mpanya, maintain active research agendas with numerous international environmental and development agencies around the world. Other faculty, such as religion historian David Ulansey, are spearheading organizations that are exploring innovative ways of creating an ecologically sustainable future. The work of these and other faculty provides opportunities, leads, and inspiration to students who wish to apply their own ecologically based scholarship to real-world settings. Courses emphasizing community-based social action and service learning similarly encourage activism.

Callenbach, Ernest (1929–)

Ernest Callenbach is best known for authoring *Ecotopia*. Born in 1929 in Williamsport, Pennsylvania, he received bachelor and masters degrees at the University of Chicago. His first book, *Our Modern Art: The Movies*, was published in 1955, and he served as the editor of *Film Quarterly* from 1958 to 1991. Inspired by the ecology and counterculture movements of the sixties, he wrote his first environmental book, *Living Cheaply with Style*, in 1971. He founded Banyan Tree Books in 1975 in order to publish *Ecotopia*, after 25 publishers had rejected it. He is married to Christine Leefeldt, with whom he has co-authored two books. Callenbach was a Scholar in Residence at the Elmwood Institute, and is a frequent speaker or consultant on environmental issues.

Replacing a wasteful, ever-growing, overly exploitative philosophy and economy with a human-scale, wholesystems, sustainable model is the overriding theme of Callenbach's work. This is not limited to technology or economics, but extends to politics, business, publishing and communication, community, individual lifestyles, and interpersonal relations. He has written several practical guides to various aspects of Ecotopian living. These include *Living Cheaply with Style* (1972, revised edition 2000), *The Ecotopian Encyclopedia* (1980), *EcoManagement: The Elmwood Guide to Ecological Auditing and Sustainable Business* (1993), *Bring Back the Buffalo: A Sustainable Future for America's Great Plains* (1996), and *Ecology: A Pocket Guide* (1998).

Callicott, J. Baird (1941–)

Born in Memphis, Tennessee in 1941, John Baird Callicott is one of the world's foremost environmental philosophers. Acknowledged both as a creative and rigorous scholar and as an eloquent stylist, he is also a provocative and sometimes controversial thinker. Callicott is perhaps best known for his work on the philosophical underpinnings of the Land Ethic of Aldo Leopold, the nature of intrinsic value, and the debate over the concept of wilderness, among other more purely philosophical topics. However, Callicott has also contributed significantly to the literature and discussion surrounding the connections between the world's various religious and cultural traditions and their environmental attitudes, ethics, and actions.

In the early 1980s Callicott was already exploring the connections between world religions and the newly emerging sub-discipline of philosophy known as environmental ethics. For Callicott, drawing upon the planet's religious insights offered a means by which to begin to remedy the planet's environmental woes. As Callicott himself put it,

Environmental concerns cross not only political boundaries, they also cross cultural boundaries. Hence, we need to articulate ecologically correct environmental ethics in the grammars of local cultures if conservation values and ethics are to be everywhere intelligible and agreeable (1999: 169).

Although Callicott views himself “as a quick-study, armchair scholar, mucking about with this sacred text and that, trying to conjure out of each an environmental ethic” (1999: 170), in many ways, his approach to unpacking the “grammars of local cultures” has come to typify much of the discussion surrounding the connections between religion and nature. The core of Callicott's contribution is a discussion of the links between the worldviews of various traditions and their environmental philosophy and ethics. This focus is demonstrated most completely in his *Earth's Insights*, a book Callicott fully expected to “incense” religious studies scholars “more expert and internally situated than I . . . to do a better job” (1999: 170). In general, Callicott gives us a model with which to begin to understand ethics and the connections between someone's or some group's worldview, values, ethics, and eventually their actions. Our various senses of the nature of reality and our place in it – or, our worldviews – inform our sense of value and hence our manifold ethical commitments. According to Callicott,

In sum, ethics are embedded in larger conceptual complexes – comprehensive worldviews – that more largely limit and inspire human behavior. And although idealistic, ethics exert a palpable influence on behavior. They provide models to emulate, goals to strive for, norms by which to evaluate actual behavior (1994: 5).

Hence, the various environmental ethics of individuals and groups is revealed through a careful examination of their metaphysical presuppositions.

Callicott operates under the conceptual exemplar which suggests that the inclusivity of a group's social commitments bespeaks the depth and breadth of their ethical commitments. Since the sense of social inclusion is correlative with the sense of ethical inclusion and commitment (*ala* the moral theory of Charles Darwin, David Hume, and Adam Smith), a group's environmental ethic is revealed not by focusing on the actions that they do or do not engage in, but by concentrating instead on how they construct their communities. Callicott's approach, then, moves us away from an unfruitful discussion and assessment focusing on the actions of various peoples and toward one centering on an unpacking and articulation of their worldview as a measure of their environmental commitment.

The application of this basic model is perhaps seen most clearly in the work Callcott has done in American Indian and Asian traditions of thought. While the dominant Western European worldview "has encouraged human alienation from the nature environment and an exploitative practical relationship with it," according to Callicott, "the world view typical of American Indian peoples has included and supported an environmental ethic" (1989: 177). In short,

The implicit overall metaphysic of American Indian cultures locates human beings in a larger *social*, as well as physical, environment. People belong not only to a human community, but to a community of all nature as well. Existence in this larger society, just as existence in a family and tribal context, places people in an environment in which reciprocal responsibilities and mutual obligations are taken for granted and assumed without question or reflection (1989: 189–90).

According to Callicott, disparate Asian religious traditions – from Daoism to Hinduism to Buddhism – also harbor and manifest environmental ethics: "Eastern traditions of thought represent nature, and the relationship of people to nature, in ways that cognitively resonate with contemporary ecological ideas and environmental ideals" (Callicott and Ames 1989: 279).

But how, then, do we explain the appearance of environmentally negligent behavior in many parts of the world where supposedly environmentally inclusive and ecologically resonating traditions dominate? Again, Callicott applies the basic model of connecting ethics with worldview to answer. To the extent that these traditions have been influenced or infiltrated by the Western worldview – whether it be via the infusion of Western technologies or ideologies – they manifest Western patterns of environmental indifference. The "massive and aggressive disruption of their belief systems" allowed for, even promoted, the acceptance of European technologies by American Indians. And, as Callicott argues, "to adopt a technology is, insidiously, to adopt the worldview in which the technology is embedded" (1989: 205).

The appearance of environmentally malignant activity in the Eastern world is *not*, according to Callicott, an indication that certain Asian traditions lack a social continuity with the nonhuman world or conceptual continuity with a basic ecological

framework; nor is it proof that there exists only a tenuous connection between worldview and ethic. Rather, for Callicott, it is an indication of the alteration of the Eastern worldview by Western thought. As Callicott (and Roger Ames) assert,

Technology is not culture-neutral any more than it is value-neutral. To adopt a technology is to adopt, like it or not, the matrix of presuppositions in which the technology is embedded . . . Asian environmental ills . . . are either directly caused by originally Western technology (e.g., heavy metals pollution) or aggravated by it (e.g., soil erosion) . . . contemporary environmental misdeeds perpetrated by Asian peoples today can in large measure be attributed to the *intellectual* colonization of the East by the West (Callicott and Ames 1989: 280).

Moreover, perhaps more deeply and universally, if there does exist a distinction between ethics and actions, between ideas/ideals and descriptions of behavior, then the ideas/ideals may serve not to *determine* behavior but to either accelerate or dampen the innate human tendency to exploit and transform nature. And, according to Callicott, there does exist in the East other, less naturefriendly worldviews such as anthropocentric Confucianism, militarism, and bureaucratism which vie for the ethical soul of the populace.

Finally, perhaps Callicott's most intriguing, and controversial, project within the realm of discussions about religion and nature is his search for coherence, uniformity, and monism in environmental ethics across the globe – both geographically and culturally. Callicott attempts to employ the land ethic of Aldo Leopold as the exemplar of a good environmental ethic. He often compares and contrasts the world's sundry religious and cultural traditions with the land ethic in an effort to generate what he refers to as a "grand narrative," a reconstituted and scientifically informed postmodern environmental ethic to help guide our environmental decision making and policy around the globe:

To construct a genuinely postmodern environmental ethic – an ethic that respects diversity and the wonderful variety of past human culture – we must try to bring the intellectual elements of the earth's many indigenous cultural traditions into a complementary and concordant relationship with those of postmodern international science (1994: 210).

This attempt, however, has met with resistance from various quarters. For example, Lee Hester, et al. refer to Callicott's approach as an "intellectual *coup d' état*," not properly respectful of the world's various cultural and religious traditions (2000: 274).

It is Callicott's hope, and his life's work, to attempt to forge a unified ethical vision; a standard of ethical behavior that will not only motivate a proper respect for nature, but that will at the same time also respect and tap into both the diversity and the uniformity of the Earth's various religious and cultural traditions.

Campbell, Joseph (1904–1987)

During the second half of the twentieth century, Joseph Campbell was a major influence upon the New Age consciousness which focused upon spirituality and often led to ecological activism. He was a valuable resource to those of a primarily mystical bent, positing a vast spiritual continuity across the eons and promoting a transhumanity such as has been imagined in many works of speculative fiction and progressive ecology.

Precisely when anthropology and religious studies moved away from universalizing concepts, Campbell was coming into prominence (along with, say, historian of religion Mircea Eliade) as a writer who trafficked less in the specific, ordinary, banal details of the current day, than in the non-ordinary and transcendental spirituality of perennial philosophy. He found continuity rather than differentiation, and commonality (universalism) rather than difference among world populations, and so set forth an ideal of a common world culture that was highly attractive to many. (*The Power of Myth* video series, produced in the United States by Bill Moyers, and released just after Campbell died, became one of American public television's most frequently repeated offerings.)

With respect to nature, Campbell was adamant about the direct influences of the physiological aspects of human existence, understanding rituals such as initiation to have life-shaping influences upon human development, the intimate touch of the baby at the mother's breast to influence just how the developing child might be responsive to the idea of a female creator figure or supreme goddess. Or how the image of the "cosmological human body" – my term (Doty 2000: 319–22) for the articulation of segments of creation from an aboriginal deity's bodily parts – might guide a culture in articulating its hierarchy of societal and natural roles. And of course the distinction between hunter-gatherer versus agriculturalist societies structured his earliest works (the four-volume *Masks of God*) as well as some of his latest (the *Historical Atlas*, volume 1 of which is entitled *The Way of the Animal Powers*, versus volume 2, *The Way of the Seeded Earth*). Today ethnographers tend to emphasize the overlapping of the two types of society.

"The natural" represented something strongly imprinted lastingly upon most cultures: it tended to merge with Campbell's own personal Republican conservatism, of the type in which a sort of social-Darwinian developmental model gets allied with capitalism. As opposed to the independent creation of cultural patterns within various separated societies, for instance, Campbell was enchanted with what anthropologists call "diffusion of styles." (See, for example, Campbell's *Historical Atlas*, where he capitalized upon studies tracking the influence of South Asian ceramics upon west-coastal South American civilizations.)

But perhaps the most lasting influence of Campbell's works is to be found in his delight in the new contours of possible future spiritual life demonstrated by outer-space explorations: he repeatedly treated "Earthrise" – the experience of seeing Earth from outer space – as the most important instance he'd ever known of, regarding all the cultures of the Earth as somehow integral to each other:

We are the children of this beautiful planet that we have lately seen photographed from the moon. We were not delivered into it by some god, but have come forth from it. We are its eyes and mind, its seeing, and its thinking (Campbell 1972: 266, and see "Earthrise" in Campbell 2001).

With the new view of the planet comes a hint of what's to come in religion (the "New Mythology") as well: "Our mythology now . . . is to be of infinite space and its light, which is without as well as within" (Campbell 1972: 266), and it "is to be of the whole human race" (Campbell 1986: 18). The need for ongoing care of the planet, the relativizing of human importance within such a framework, expressed by the late Campbell in *Myths to Live By*, became part of the New Age bible. Perhaps few other modernists (although of course Nietzsche, perhaps Kafka and Joyce) realized how many sea-changes had decimated traditional Western models of domination and technologization of nature, although Daniel C. Noel (*Approaching Earth*) did so in his generative reflections.

Campbell also anticipated the threat to traditional religious cosmology that "Earthrise" represented, and the subsequently reactive nationalism and xenophobia that developed toward the end of the twentieth century. Rather than looking for divine intervention from the stars, Campbell suggested, "We should see that the Earth and heavens [are] no longer divided but that the Earth is in the heavens . . . We can no longer look for a spiritual order outside our own existence" (Campbell 2001: 106–7). Indeed, "The Kingdom [of God] is here; it does not come through expectation" (107). In this way, Campbell contributed significantly to the emergence of this-worldly nature religion during the last decades of the twentieth century.

Canada

In Canada, the relationship between religion and nature has been troubled and uneasy. Lengthy, difficult winters in a sparsely populated land dominated by an immense wilderness of granite rock have meant a country more promising for resources such as furs, minerals, forestry, or water than for the development of agriculture. The assessments of the religious possibilities of the natural – to say nothing of what might be termed a full-blown “religion” of nature – have been fraught with dualities and contradictions. The natural world has been regarded, from the general viewpoint of European immigrants at least, as more hostile than benevolent, and the prevailing Christian valuations, particularly if one considers the foundational myths as developed through Cartesian egocentricity and technological culture, have been typically negative or doubtful.

Various estimates still place Christianity as the religion of 80–90 percent of the people of Canada, though that proportion is dropping with the increase of those professing “no religion” and with the growth of other religions, especially through immigration. The effects of the combined factors of secularization and religious pluralism (especially with the influence of traditions having Asian roots) will doubtless alter what has been the customary Christian view of nature in Canada. And, of course, that Christian view will itself undergo alteration either internally or through adjustments to new cultural factors. But it was probably the general historic stance of Western monotheism toward nature that Northrop Frye had in mind when he declared: “The Bible is emphatic that nothing numinous exists in nature, that there may be devils there but no gods . . .” (1991: 26). From this negative perspective, the natural world stands in opposition to, rather than facilitates, the established religious outlook, especially the ordered rationalities of the European Christianity imported into Canada. Christianity has generally tended to look to history, not nature, as the principal domain of revelation.

The realm of nature, if not precisely regarded as the abode of the demonic, is inhabited by powers frequently suspected of being antagonistic, chaotic, or indifferent. Canada’s natural environment has remained vast and forbidding, capricious and unpredictable, standing in opposition to humanity’s projects and aspirations, dwarfing and defeating the efforts of puny human beings to tame, domesticate, or impose their marks. Far from being an Edenic garden arranged for the habitation and enjoyment of human beings, the Canadian wilderness has been represented as “the land God gave Cain.” Even when Canadians have permitted themselves to regard the natural world as living rather than dead, more vitalistic than mechanistic, then the Canadian landscape

has often been conceived more as the realm of an “Ice Goddess,” rather than that of an Earth Mother.

Of course, the effect of European Christianity on Canadian views of nature has by no means been uniform throughout all denominations, across all regions of the country, nor even through all of the successive eras and stages of settlement. In addition, even many Christians have found their religion’s authorized stance toward the created order of nature to be something that they could not fully embrace. Here, as in so many other areas, a church’s stated position is not the final or sole arbiter of people’s outlooks and attitudes. Though the Bible as record of the mighty acts of God might be more reliable as a source of divine disclosure than the book of nature, nonetheless, romantic or even deistic views of a revelatory natural world have also had their place.

Among all of the possible religious influences shaping the Canadian view of nature, the greatest alternative to Western monotheism comes from the religions of First Nations peoples. Theirs is an outlook that sees the entire world filled with “persons,” some of them human beings and some other-than-human. The Aboriginal worldview, apprehending spiritual presences throughout the interpenetrating worlds of humans, of animals, and even extending to what others refer to as “inanimate” nature, tends to see the sacred as a living presence throughout the whole of reality. Indeed, “nature” as an isolable phenomenon capable of being analyzed (or even “appreciated”) from without is contrary to the Aboriginal modes of being in the world. John Badertscher rightly points out that First Nations peoples neither romanticize nor worship nor love nature, attitudes that make of nature a construct and requiring a distancing from it. Such views are based on the modern objectification of the nonhuman realm, an alienation then overcome through personification and reverence. Accordingly, contemporary pan-Indian spirituality is praised by environmentalists and feminists and neopagans alike for its high regard for the Earth and for giving a religious basis to a more harmonious way of living.

This “indigenous” religious outlook, says Northrop Frye, presents itself as an alternative to the “imported” religion of the Europeans. Frye claims that the possibility of understanding nature as “home” rather than merely as “territory” sets up other creative options. For example, the settler might develop a sense of belonging here rather than emerging as a potential colonizer or conqueror. Even more, if there is a fit between humanity and the rest of creation, then the natural environment can become something other than a setting for exploits, a storehouse of resources to be developed, or an emptiness to be filled with the objects of human manufacture and industry. Nature, that is to say, may have the potential to nurture and sustain humans. For if nature itself is conceived of as sacred then humanity need not look beyond the Earth for salvation or for hope.

Author Margaret Atwood, in this instance functioning as critic rather than novelist or poet, has proposed an influential summation of the typical Canadian attitude toward the natural, one that is implicitly religious because of the seldom articulated cultural ideologies originating and sustaining it. A generation ago Atwood published

her controversial examination of Canadian culture entitled *Survival*. What she was arguing there, in a manner both heuristic and polemical, was that “survival” – which Atwood reduced to the need just to endure and remain alive – is the central motif of Canadian culture. Furthermore, it happens that this struggle for survival ends more often in defeat than in triumph, so that failure has been felt to be the appropriate ending in Canadian literature. Simply put, the natural world as setting for this doomed struggle was unyielding and unreceptive. If the American organizing myth of the frontier generates feelings of excitement and adventure, and if in England the ideal that one’s home is one’s castle occasions contentment sometimes bordering on smugness, in contrast Atwood maintained that the Canadian symbol of survival created anxiety and disquiet.

Part of the angry reaction aroused in some quarters by Atwood’s account was no doubt because her portrayal seemed to cast Canada as a pathetic nation of victims and losers. Some argued that the struggle to survive, to retain one’s individuality, and to persevere against overwhelming odds are characteristic modern themes in the arts and cultures worldwide, and not just in Canada. Though not without gesturing toward the imagination of hopeful possibilities in the form of “jail-breaks and re-creations,” the note sounded in *Survival* nonetheless was at jarring odds with the growing Canadian pride and optimism after the centennial year of 1967 and in the midst of the era of Prime Minister Pierre Elliott Trudeau.

For all that, nature, and in particular climate, landscape, and geography, impinges powerfully on the Canadian consciousness, constitutive of character and values and other aspects of a national mythology. One Canadian scholar, Peter Slater, has persuasively advanced the case that nature, not history, is the source of whatever Canadian counterpart there exists to American “civil religion.” For there is no great political event of defining national and historical significance to be located within the story of Canada: none, that is, more or less equally accepted everywhere by all groups. As might be expected in a country of such pronounced regional divisions, the events celebrated in one place are ignored in others. The heroes of one group are the villains of another. That lack of a unifying foundational legend befits a nation whose fondest image of itself is a multicultural mosaic or kaleidoscope, rather than a melting-pot. The quest for a national identity, and for unity at the federal level, has been an ongoing national preoccupation.

The sacred story of Canada, Slater states, especially if one looks to the foundational informing patterns of biblical myth, is to be sought in setting rather than plot. What unites Canadians, therefore, is the land itself as domain and backdrop of this national experiment and not particular historical figures, whether generals, politicians, statesmen, or legislators. There is for Canadians no Moses who led a people out of slavery to the promised land. Nor any prophet who denounced the forces of Babylon. Nor a messianic savior whose sacrifice won redemption for faithful followers. Formed neither in the fires of military revolution nor even in less dramatic ways of throwing off the yoke of a foreign conqueror, Canada’s political history remains unexceptional and

unexciting. What stirs Canadian patriotic fervor are songs and images of rock, lake, and tree, or wide prairies and snowy fastnesses, of freely roaming wildlife, and of rocky seascapes and mountains.

It is perhaps no coincidence that the symbols by which Canadians represent themselves to one another and to the world are drawn from nature. The Canadian flag, brought in during the early 1960s, meant replacing the British Union Jack (of uncertain status and not universally approved) with a single stylized maple leaf having no political origins and no associations with any other nation. While a monarch domiciled in the United Kingdom still appears on all currency (and some stamps), her visage shares space on most coins (including the recently added one and two-dollar denominations) with wildlife such as the beaver, caribou, loon, polar bear, and a pair of maple leaves on the lowly penny. The Canadian national anthem, "O Canada," while it has undergone alteration and retranslation confusing to older singers, makes no reference to any historical event and person. Any debates surrounding it have focused on the repetition of "stand on guard," or whether "God keep our land" is too exclusively monotheistic, or on the sexism of "in all thy sons command." But its capacity to stir Canadian hearts surely resides in the opening line's reference to "our home and native land" or the nordicity of "the true North strong and free."

Canada has no alternative anthem to compare with "America the Beautiful" (unless one counts the Canadian version of "This Land is Your Land" with its substitution of Canadian place names, from Vancouver Island to Bonavista). But the Province of Quebec does have its own sacred song in the form of Gilles Vigneault's "Mon pays": "Mon pays ce n'est pas un pays, c'est l'hiver" ("My country is not a country, it is winter"). And, in fact, to single out winter as the defining ingredient of Quebecois consciousness, as if to suggest that a very season is the most salient characteristic of the conditions of one's homeland, is not so far from what most Canadians suspect is our most common preoccupation. The *Via Rail* magazine provided to travelers on board Canada's national railway system once featured an article suggesting that the national obsession of Canada is simply the weather. Whereas the French speak incessantly about food, and Italians about love, Canadians are fixated merely on the weather. In the late 1990s the top news stories for three years running were about weather: disastrous floods on the Saguenay and Red rivers, and a devastating ice storm in Ontario and Quebec.

Many songs of regional significance invoke geography and nature, as for example Newfoundland's "I see the boy that builds the boat" with its catalogue of island place-names, or the evocation of "the sea-bound coast" and "mountains, dark and dreary" in "Farewell to Nova Scotia," or the summer camp-song engraved on the memories of generations of Ontario teenagers, "Land of the silver birch, home of the beaver / Where still the mighty moose wanders at will." The prairies too have their songs of praise, as for instance Ian and Sylvia's "Four Strong Winds:" "Think I'll go out to Alberta, / Weather's good there in the fall." In the same vein, Gordon Lightfoot's "Alberta Bound" in its opening lines, "Oh the prairie lights are burning bright / The Chinook wind is a-moving in / Tomorrow night I'll be Alberta bound."

If climate, geography, or nature in general are unifying forces in Canadian consciousness, then it is little wonder that possible scarcity of natural resources such as water and natural gas and old-growth forests, the threats to wildlife species, the depletion of fish stocks, loss of sovereignty in Arctic waters, or encroachments on the 200-mile limits of coastal waters, all command large amounts of attention, from politicians to ordinary citizens. Again, it is little wonder that with a comparatively small population spread so thinly across an immense land, Canadians tend to pay special attention to that which unifies people and spans those distances. Asked to name a Canadian hero, most Canadians would be at a loss unless you were to mention the possibility of Terry Fox. This young runner who had already lost a leg to cancer performed the equivalent of a marathon per day during the spring and summer of 1980 in the effort to run, in his gimped one-legged lope, westwards across Canada. He had got almost halfway when the recurrence of the cancer to which he eventually succumbed forced him to suspend his attempt in northwestern Ontario. Since then, annually sponsored runs in his name have raised millions of dollars worldwide for research into cancer.

Alternatively, Canadians are anxious about transportation and communications in the far-flung reaches of their country. When Wilfred Cantwell Smith asked Peter Slater who might be the Canadian “Augustine,” Slater found himself having to name a thing rather than a person, and suggested the Canadian Pacific Railway. The CPR was the foremost achievement of Prime Minister Sir John A. Macdonald’s “national dream,” linking together the western reaches of Canada with the east. Canadians have been known to be the most frequent users in the world of the telephone (itself a Canadian invention), and today rank among the greatest users of the internet. Others might see as inordinate the concerns people in Canada have about any threats to their national airline or railway or broadcasting system, but for them these are the glue that “keep the country together.” With the death in 2002 of the popular Peter Gzowski, for a decade host of “This Country in the Morning,” a national three-hour CBC radio show, a wave of national mourning and reminiscence was set off to rival the death of the most famed sports figure or politician. Speaking of the way his program moved through the time zones from east to west, gathering up guests and stories along the way, Inuit singer Susan Aglukark likened Gzowski’s effect to a particular kind of Arctic wind that picks things up from one place and carries them along to another.

A full comprehension of the relation between religion and nature in Canada involves balancing the relative impact of the major religion’s (or religions’) official estimation of the natural world with the informal “folk” religiosity of people’s reverence for nature held even despite such teaching. Added to that, an interpreter must assess the attitudinal effects of environmentalism and nature mysticism in shaping a different consciousness. And, finally, the incalculable impact of various natural symbols and stories and songs must be factored in. The result, surely, is what might be termed a distinctive Canadian “aesthetic” of nature that is informed at all levels by religions and the religious. At one of these levels at least, most Canadians would understand or assume nature to be sacred, however much formal religious views would purport

the opposite. Their attachment to the geography of their homeland in all of its varied natural beauty, enduring the climatic contradictions of long cold winters and brief hot summers, and understanding the self in the context of nature's infuriating self-presentation of welcoming nurturance and hostile rejection has led to mixed attitudes of insecurity and respect.

Canadian Nature Writing

Given the immense importance of nature within Canadian culture, and especially within the literary imagination, many types and genres could be considered to be “nature writing,” from scientific treatises, memoirs, and exploration journals, through novels and short stories, and including all kinds of poetry from the epic to the short lyric. To be sure, a full account must include works of prose and poetry both in French and English, Canada’s two official languages. While this examination of prose written in English might seem unduly restricted, it does reveal broadly applicable trends and motifs. Furthermore, nature writing in Canada may be related to either explicit or implicit religion. If the natural world is comprehended under the aegis of a religious worldview already widely held and promoted by religious institutions, then nature writing in such a context is linked to explicit religion.

In this light older Canadian writing frequently detailed in unambiguous terms a savage and unforgiving natural world inhabited by forces opposed to the order of grace and to the divine transformation of the human. Less common, but equally explicit, was the religion of nature writing that set forth a human realm corrupted by human sin contrasted with an unfallen and benevolent world of nature. Two stories anthologized in *The Oxford Book of Canadian Short Stories in English* illustrate this plain and unambiguous portrayal of nature in the explicit religious context of nineteenth-century Canada. Nature writer Charles G.D. Roberts, in his story “Do Seek Their Meat from God,” contrasts the instinct prompting a panther to stalk a child with the providential urge that leads a father to save that child. In Susie Frances Harrison’s “The Idyl of the Island” a city-weary visitor from a nearby hotel comes upon a woman sleeping on a mossy couch in an edenic island setting, described in the most lyrically romantic terms. Up until a generation or so ago, the explicitly religious context of Canadian nature writing was a supernatural theism that placed the Creator outside of nature. The world of nature was either opposed to or allied with that transcendent realm of grace. At its extreme, nature might be portrayed in negative terms as the realm of darkness and demons.

In 1965 Alec Lucas, contributing a chapter on “Nature Writers and the Animal Story” to *Literary History of Canada: Canadian Literature in English*, set Canadian nature writing in the framework of Western literary history. Lucas showed how writing about the natural world, from biblical and classical texts through the medieval period, inevitably concerned itself with the human relationship to nature, and just as often, with the relationship of both the human and natural to the divine. Accordingly, animal fables amounted to commentaries on people and social relations, often allegorizing and

moralistic, and assuming dominion over nature that was provided for human benefit by God.

Though Renaissance humanism promoted close examination of the whole of nature, and included humans within nature, Cartesian logic and Newtonian physics fostered a rationalistic understanding of a mechanistic world. In the nineteenth century, though Romanticism's discovery of a moral order within nature gave way to Darwinianism, both movements restored human beings to the world of nature. Lucas outlines the contributions of pioneer writers and field naturalists to Canadian nature writing, suggesting that by the twentieth century nature ceased to be a source of moral law or evidence of the divine, but a unity including both people and animals. He traces the Canadian tradition of outdoors and animal stories, sometimes in the pastoral tradition, sometimes through natural history, that often advocated a return to nature to escape the evils of urban life and to refresh the spirit. Within all of the schools and genres that Lucas surveys and details, whatever estimate is given of nature tends to be made against the backdrop of Christianity in its various forms. The religion of nature is subordinated to a Christian worldview, or understood generally within the context of Western monotheism.

In the final paragraph of this informative and detailed essay published in 1965, Alec Lucas concluded that the zenith of nature writing "has long passed." Perhaps, he surmised, it was because the "literary vein has been worked out," or that after two World Wars the public had learned well the lesson that people and animals are "too much alike." In addition, Lucas supposed, urban dwellers were several generations removed from their rural forebears, and the physical sciences had replaced the biological sciences in the public imagination. Of course, from the vantage point of more than a generation later this pronouncement surely has to be reckoned as premature in the extreme. The 2002 volume, *Encyclopedia of Literature in Canada*, gives prominence to the persistent significance of nature in Canadian literature in articles on "Animal Story," "Ecocriticism," "Exploration Literature," "Landscape," "North," and "Science and Nature Writing."

Nature writing in Canada, in particular considered in relation to religion, can be said to have undergone a complete and unqualified renaissance. The obvious Christian use of natural phenomena as a means of evangelization, or of demonstrating a divine order discernable in creation, continues only as a relatively minor aspect of this genre. The materials from the Moody Bible Institute's "Sermons from Science" ministry are one ongoing Protestant evangelical example of nature understood from an explicitly religious perspective. Though "Sermons from Science" was the theme of one pavilion at Montreal's Expo 67, this kind of approach probably has been regarded as "too American" within the Canadian religious context, where "born-again" Christianity is much less prominent than in the United States.

Rather, the dynamism of this literary renaissance lies in the implicitly religious dimensions of nature evident in Canadian writing since the late 1960s. Such factors as the impact of a counterculture with its back-to-the land emphasis, the growth of

feminism stressing the human connection with nature, a suspicion of high technology, and the significance of the environmental movement were incorporated into a newly burgeoning Canadian literature in the 1970s. And, contrary to what Lucas foresaw, the study of the biological (or “life”) sciences returned to prominence over physics and chemistry. This implicitly religious nature writing derives from a nature mysticism or ecological worldview that discovers within the very realm of nature itself a sacred dimension or wisdom that is potentially illuminating or instructive. The watchword of this trend might be Wallace Stevens’ poetic injunction to seek everything within reality and nothing beyond it.

From a vast spectrum of nonfiction, some principal exemplars might be selected. David Suzuki, a geneticist and Canada’s leading environmentalist, is a worldrenowned broadcaster, lecturer, and writer. In books such as *The Sacred Balance and Wisdom of the Elders*, Suzuki proclaims a spirituality of nature that brings science under the auspices of indigenous ways of knowing that retain their cultural validity today. Saskatchewan novelist Sharon Butala in *The Perfection of the Morning* (1994), subtitled “An Apprenticeship in Nature,” explores how in her spiritual journey her soul found its home through daily contact with nature. Though Butala is more literary and less the environmental activist than Suzuki, like him she links her celebration of nature to native wisdom and to feminism. In a subsequent devotional book, *Coyote’s Morning Cry* (1995), she sets forth her “meditations and dreams” in a more direct presentation of her own religious insights as derived from the natural world.

Other literary naturalists, or writers having scientific interests, have similarly advanced a spirituality of nature through the medium of their nonfictional and semiautobiographical writing. Barry Lopez (*Arctic Dreams*), Harold Horwood (*Dancing on the Shore*), Richard Nelson (*The Island Within*), or the books of Farley Mowat might be cited as examples. Outdoor educator James Raffan in several books about canoeing relates the inner and mythic meanings of landscape to the Canadian spirit, as has Canadian Literature specialist John Moss whose *Enduring Dreams: An Exploration of Arctic Landscape* (1994) might be said to be a work of literary ecocriticism.

Because fiction, and especially the novel, has become the preeminent literary genre, the presence of nature writing of religious significance in the Canadian context must be highlighted in its various manifestations there. One great example is W.O. Mitchell’s *Who Has Seen the Wind* (1947), a novel that contrasts the explicit religion of a prairie town with the mystical aspects of a boy’s experience of nature as he grows up. Here implicit religiosity emerges as more vital, in terms suggestive of

C.S. Lewis’ account of *sehnsucht* in *Surprised by Joy* or Rudolf Otto’s *Das Heilige*. Margaret Atwood (*Surfacing*) and Marian Engel (*Bear*) in two novels of the 1970s portrayed the initiation of a woman in the Canadian wilderness, replicating a feminist version of an Amerindian vision quest. As in the case of nonfiction writings, novels that significantly render a spiritual vision of nature have often drawn upon the worldviews of First Nations peoples. A prime example is Rudy Wiebe’s *A Discovery of Strangers*, winner of the Governor-General’s award for English fiction in 1994, whose first chapter

represents the world as it appears to the northern animals in the nineteenth-century “Barren Grounds” that are its setting.

In this way contemporary Canadian fiction embarks on an aesthetic of nature that interrogates human nature as well. As religion in Canada has moved away from an older understanding of divine transcendence that places the locus of the sacred beyond the world, so Canadian literature has found within the immanent dimensions of nature a more proximate source of meaning. Northrop Frye has well described, in his comments on the Canadian cultural context, the deep ambivalence of Canadians toward nature, attitudes alternating between the extremities of terrified revulsion and warm devotion. In the last generation, Canadian writing has moved conclusively toward affirmation of nature as the matrix of human life, the fundamental context of our being in the world, and as a sacred source of knowledge about ourselves as part of the web of life.

Candomblé of Brazil

During the course of the Atlantic slave trade, roughly ten million forced African immigrants were brought to the Americas. As chattel slaves, Africans were no more encouraged to introduce their modes of subsistence and systems of belief than were cattle. Nevertheless, in spite of the horrific conditions of the Middle Passage, the brutal and dehumanizing conditions of plantation life, and the imposition of an oppressive social and political structure, Africans managed to transplant the foundations of their religions in the Americas. Haitian Vodun, known variously as hoodoo, juju, root work, and conjure in North America, has spread from its eighteenth-century introduction to New Orleans to the northeastern and southwestern United States. Bahamian Obea men, purveyors of magic and medicine, are found throughout the Caribbean, the southeastern United States, and Panama. Cuban Santeria, a New World Yoruba belief system that is particularly rich in African ethnobotanical knowledge, has diffused to Florida, New York, and California, and even as far as Venezuela and Spain. In Trinidad and northern Brazil, adherents to Shango sing the praises of a pantheon of nature gods introduced from Yorubaland. And Brazilian Umbanda, a syncretic belief system that draws considerable elements from Amerindian and spiritualist sources, is estimated to reach thirty million largely white, middleclass followers.

Among the list of diaspora religious introductions, none was more successful than Candomblé in Bahia, Brazil. The Candomblé religion represents a set of beliefs, practices, and cosmological traditions introduced by Yoruba slaves and freedmen to colonial and later imperial Brazil. Although African-derived religious ceremonies were reported throughout the nearly four centuries of Brazilian slavery, the first Candomblé *terreiros*, or temples of worship dedicated to the Yoruba deities, were not established until the early nineteenth-century in Salvador,

Bahia. Persecuted during most of their history, these humble shacks came to constitute islands of sacred space for the African *diaspora*; structured communities within which African spiritual traditions could survive and prosper in the new land. Just as importantly, Candomblé *terreiros* came to represent houses of healing – fertile habitats wherein African herbal medicine and magic could take root and, in time, hybridize with complementary Amerindian and European traditions.

Candomblé is loosely divided among various sects, or nations, each maintaining a unique sacred lexicon; chants, deities, offerings, liturgical plants and animals, and other traditional knowledge link them to their particular West African source area. Those encountered today include Candomblé de Ketu, Candomblé de Angola, Candomblé de Jeje, Candomblé de Congo, Candomblé de Ijexá, and Candomblé de Caboclo. With

a New World starting- point in the city of Salvador, Bahia, Candomblé ultimately diffused to most of Brazil's major and minor cities.

Candomblé cosmology represents an adaptive filtering of Yoruba oral traditions. Adherents recognize the existence of a supreme god, Olórun, the unknowable creator of all things. Olórun does not manifest during possession trance, nor is he worshipped by devotees. It is rather the *orixás* of the Yoruba pantheon, nature gods and goddesses serving as the earthly ambassadors of Olórun, who are directly linked to the everyday world of mortals. Roughly a dozen *orixás* are well developed and find devotees in the various *terreiros*. These include Xangô, Ogun, Oxalá, Oxóssi, Omolu, Ossâim, Iroko, Yemanjá, Oxum, Iansã, Nanã, and Oxumarê. Each is associated with distinct provinces of the natural world – water, atmosphere, vegetation, and Earth – and it is from these primary sources that they gather and impart their *axé*, or vital energy. The properties of their physical domain, in turn, correspond with a suite of personality traits. The *orixás* thus serve as archetypes for the range of behaviors exhibited by their mortal followers, embodying the strength and foresight of their adherents, as well as their weaknesses. Oxóssi, for example, is the masculine god of the hunt, whose temperament, as well as that of his adepts, is characterized by keen intelligence and curiosity. The female deity Yemanjá, on the other hand, is the warm, maternal, and emotionally stable goddess of the sea, as well as the patron saint of fishermen. Each archetype, in turn, is complemented by an appropriate array of taboos, offerings, sacred foods, preferred time of worship, icons, liturgical plants, and geographical locations. Oxalá, for example, the masculine god of creation and peace, is clothed in white from head to foot, prefers lofty locations, requires the sacrifice of chickens, doves, and female goats, and assiduously avoids horse meat, crabs, and salt.

However distant from the known world of the Yoruba, coastal Brazil nevertheless presented an array of physical and biological features similar to those to which they had previously attached cosmological significance. Oxum, goddess of fresh water, found a home in the region's deep perennial streams. Frequent thunderstorms suggested the presence of Xangô, god of lightning, while the accompanying rain and winds indicated the presence of his mythological wife, the unpredictable Iansã. Oxóssi and Ossâim, the hunter and the herbalist, found refuge in Bahia's broadleaf evergreen rainforests. Devastating smallpox epidemics, which swept across Brazil from as early as 1562 until the early 1800s, testified to the New World existence of Omolu, god of infectious disease. At least for the Yoruba pantheon, Brazil's tropical forest landscape presented nearly all the physical ingredients necessary for spiritual correspondence and substitution.

One of the striking processes that occurred in Candomblé was the syncretism of Yoruba *orixás* with the deified saints of the Catholic Church. For example, Oxalá is identified with Jesus Christ, Omolu with St. Sebastian, and Iansã with St. Barbara. On the one hand, since Catholic conversion had been going on in West Africa since the dawn of slavery, it is likely that the spiritual association between *orixás* and saints had begun centuries earlier. However, in nineteenth-century Brazil this spiritual blending process was amplified and codified. It appears to have represented both an intentional

strategy on the part of early religious practitioners to deceive their European masters, and a calculated tolerance on the part of Catholic authorities to lull Africans into conversion.

Candomblé *terreiros* are directed by the *pai* or *mãe-de-santo*, infrequently referred to by the Yoruba terms *babalorixá* or *ialorixá*. Literally translated as the father or mother-of-saints, the *pai/mãe-de-santo* represents the principal line of communication between the material world of mortals and the spiritual world of the deities. They also serve as community *curandeiros*, or healers, divining the source of medical and spiritual problems and prescribing culturally acceptable solutions. Trained in the arts of sorcery and conjure, the *pai/mãe-de-santo* can likewise negate the nefarious effects of black magic and, if called upon, employ the occult arts for their own ends or those of their clients. Other temple roles are occupied by *filhas* and *filhos-de-santo*, the Yoruba *iaô*, literally sons and daughters of the saints. In addition to doing most of the physical labor in the *terreiro*, one of their most important functions is to incarnate the deities during ceremonies via possession trance. This action, allowing the Yoruba gods and goddesses once again to dance and sing in the mortal world, serves to instill the individual as well as the *terreiro* with the elevated *axé* of the *orixás*.

The Candomblé religion is mostly focused on practical issues. It revolves around the resolution of the everyday trials and tribulations of human existence. Unlike religions of salvation, Candomblé is largely unconcerned with the afterlife. Although their cosmology clearly distinguishes between the world of mortals (*aiê*) and the world of spirits (*orun*), the focus of energy goes into solving earthy issues – prosperity, fecundity, spiritual well-being, and physical health.

Candomblé medicine, as practiced by the *pai/mãe-de-santo*, is characterized by a well-developed medical etiology. Practitioners are able to associate symptoms with specific illness, defined in the broadest possible sense, as well as prescribe culturally acceptable treatments. Although it is recognized that medical problems can “just happen,” illness episodes are often ascribed to a state of disequilibrium with the spiritual realm. Adherents and clients who fail to make timely offerings to their guardian deities, who indulge in excesses, and who neglect the preferences and prohibitions of the gods, chart a spiritual course that is fraught with health hazards. While healing ceremonies include a variety of approaches – spiritual cleansing, leaf whipping, teas, leaf baths, animal sacrifice, and others – the feature that ties them together is reliance on a sacred plant pharmacopoeia.

The sacred leaves of Candomblé are comprised of roughly two hundred species, native and exotic. They are gathered from kitchen gardens, leaf houses, disturbed habitats, and surrounding tropical forests. The African diaspora faced the obvious dilemma of continuing African-based herbal healing in an alien floristic landscape. They solved this biogeographical puzzle by various means, all related to the flexibility of their belief system. On the one hand, they were able to import a limited number of sacred African medicinal and spiritual species. Where this was not possible, they substituted taxonomically similar South American species for those that were left

behind in Africa. Most importantly, ethnobotanical flexibility was facilitated by the Yoruba medicinal plantclassification system brought from Africa, in particular, the belief in Ossâim, guardian of the sacred leaves and medicine.

Ossâim is the deity most intimately involved with health and healing. His domain is the forest and the field, wherever curative plants grow. Often in the company of Oxóssi the hunter, with whom he is said to trade medicine for meat, Ossâim is the dedicated but reticent steward of the vegetal realm. Among the Yoruba and their New World diaspora, his image is one of absurd physical disability – one eye, one leg, one enormous ear, and a humorous highpitched voice. Ossâim’s possession of the sacred leaves, according to Yoruba legend, was coveted by other deities who sought to share in his secrets.

There is a legend of rivalry between Ossâim, the *orixá* of medicine and leaves, and Iansã, the *orixá* of stars, winds, and storms. Everything began as a result of jealousy. Iansã went to visit Ossâim. Ossâim is very reserved, quiet, silent. Iansã wanted to know what he was doing. When Ossâim has the opportunity, he explains things. But Iansã is always rushed, she wants everything done immediately. She is always asking questions, and she needs to know everything that’s going on. When Iansã arrived at the house of Ossâim, he was busy working with his leaves. It happens that there are certain types of work with leaves that you can’t talk about, you need to remain silent. Iansã started asking, “What are you doing? Why are you doing this? Why are you doing that?” And Ossâim remained silent. “Alright, if you don’t want to tell me what you’re doing, then I’ll make you talk.” That’s when Iansã began to shake her skirt and make the wind blow. The house of Ossâim is full of leaves, with all of their healing properties, and when the wind began to blow, it carried the leaves in every direction. Ossâim began to shout “*Ewe O, Ewe O!*” [my leaves, my leaves!]. Ossâim then asked the help of the *orixás* to collect the leaves, and the *orixás* went about gathering them. And it happens that every leaf that an *orixá* collected, every species, he or she became the owner of that leaf (Voeks 1997: 117–18).

Scattered by the winds of Iansã, the sacred leaves drifted into the provinces of the other deities. Oxum collected leaves near her rivers, Yemanjá by the sea. Oxalá gathered white leaves, Exu those that burned and pierced the skin. Although Ossâim retained the mysterious power of the vegetal kingdom, each deity came to possess his or her personal healing flora.

The resultant correspondence of gods and leaves represents a fundamental element of Candomblé ceremony and ritual. For devotees who belong to one or another deity, healing may be mediated through recourse to the inherent *axé* of his or her guardian’s leaves. A healing tea or leaf bath for one of Oxum’s followers, for example, will usually include three or seven of Oxum’s personal species. A leaf whipping intended to clean the negative fluids from a devotee of Ogun will include some of Ogun’s leaves. As earthly embodiments of the Yoruba pantheon, the sacred leaves exhibit one or more features that link them with their corresponding deity. Most of these features are clearly evident; some are obscure or lacking entirely. For example, the archetypes

of the deities are divided according to temperament – masculine *orixás* are hot tempered and volatile, feminine *orixás* are cool and balanced. This opposition of hot and cold finds ready association among the healing flora. Some leaves maintain perceived heating properties; they are thin, hard, and if taken internally tend to produce sweat or increase blood pressure. Cool leaves are fleshy, moist, and produce cooling medicinal influences; they reduce blood pressure, break a fever, or calm anxiety. Further possibilities for correspondence are provided by the symbols, preferences, and prohibitions of the *orixá's*, their choice of color for clothing and sacred beads, offerings of food, icons, and geographical locations. The end result was that Yoruba priests and their descendents were able to incorporate a mostly alien New World flora into their medicinal and spiritual pharmacopoeia.

During the course of nearly four centuries, Africans were brought unwillingly to toil in the plantations and mining operations of their Portuguese captors. But in spite of the horrific conditions of the Atlantic crossing, the dehumanizing influence of slave existence, and the imposition of an alien and oppressive social and religious structure, Africans managed to transplant the roots of their indigenous belief system in New World soil. Although a host of features contributed to this diffusion, it was in the end cultural flexibility and adaptability that allowed Africans and their descendents to forge a novel African-derived belief system in the Americas.

Breakout Box: P Orixá Iroko

I went to Salvador de Bahia to learn about a tree, a tree that grows not up but down, a sacred tree. My interest in sacred trees has developed out of a desire to explore the cultures and traditions of people who still live with, and relate to, nature in a spiritual way. This tree, the *game-leira*, is sacred to the Candomblé tradition, a prominent religion in northeastern Brazil. I had not been in Brazil long when an invitation came to attend a ceremony for the *orixá* Iroko which manifests through the *gameleira* tree. It was to be held at a *terreiro*, a house of Candomblé on the outskirts of the city of Salvador. That evening I stepped onto the leaf-strewn floor of the *terreiro* and watched a Candomblé ceremony unfold. As the participants and attendees filtered into the room, this unfamiliar place filled with an air of warmth and kindness. When the rhythm of the drums picked up and the ceremony began, I understood immediately that even if what I witnessed that night passed outside the realm of my usual reality, the experience would be a positive one.

Through the rest of the evening and in fact throughout my stay in Bahia, the presence of this kindness and that rhythm pervaded my experiences. That evening I listened to the drummers and their complex change of rhythm. I watched the swirl and sway of the dancers, barefeet below dresses and drapes of yards and yards of beautiful material, feet bared and in contact with the Earth. I felt the building of

energy as the *pai de santo* (the spiritual leader of the *terreiro*) sang his call and the dancers responded as they moved around and around the room. This energy, the force in Candomblé they call *axé*, was everywhere.

Understanding Candomblé is all about understanding what *axé* is and how it is accessed to maintain right relationships within one's entire universe – person to person, person to community, person to nature, starting with the conduit of all these relationships: person to *orixá*. While the structure of Candomblé with its pantheon of *orixá*, associated entities and rituals can seem very complex, its central concept, *axé*, is not. *Axé* is the vital force that exists in all things; it animates all things. It is the energy of “being.” This vital force is found everywhere, but in everything it is not the same. Each different type of energy has a different lesson. For instance, every plant has *axé*, and understanding the different healing properties of each plant is to understand the *axé*. Leaves and plants are of tremendous importance in Candomblé. They are used to heal the physical body but there is also a plant-*orixá* association that comes into play in the proper maintaining of the spiritual self. When there is a disruption, an imbalance spiritually or physically, what has been disturbed, displaced or disregarded needs to be brought back into balance. The *orixá* are necessary to help human beings access the forces around them.

Asking questions and questioning a belief system are two different things – but the first is sometimes mistaken for the last. People are often sensitive about discussing religious beliefs. The day after the ceremony I interviewed Pai Valtinho, the *pai de santo* of the *terreiro* Axé Ibá Faromin. I thought my inquiries into this religion would not go easy but I was wrong. Although Pai Valtinho noticeably stiffened when the word “interview” came up, his whole persona changed when it was explained that I was interested in religions that have a strong relationship to nature. What I learned quickly in my conversation with Pai Valtinho was that all *orixá* are associated with elements of nature. Each *orixá* has different characteristics associated with an elemental force. These forces have different lessons to teach, and each can help an individual in need of guidance in a different way.

It is important to pay attention to these forces, Mãe Detinha instructed me. “It is important to keep your two feet in contact with the earth,” she looked at me intently, “feel the earth.” We were sitting in one of the houses incorporated in the compound of the *terreiro* Axé Opô Afonjá, one of the older *terreiros* in Salvador. It was founded in 1910 and now sits in a beautiful spot on a small hilltop in the district of São Gonçalo. The compound is not just a *terreiro* but a school where they educate children from the local community. Aside from their lessons, the children learn the Yoruba language and they learn about Candomblé. In the compound each *orixá* has a small house or temple, freshly painted in the colors associated with that *orixá*. All except Iroko, the place of Iroko is a huge tree, the gameleira. The tree has an *Oja* tied around it, the same wrap of white material that is worn by the human initiates of the *orixá*. Mãe Detinha made sure I understood that not all gameleiras were sacred. They do not venerate the tree as a tree but as a vehicle for the manifestation of the sacred. Likewise when

an orixá manifests through an initiate, that person does not become a deity, just a conduit for a sacred force. To try to explain or commit to paper what any of the *orixá* represent is to enter into a situation where a thousand asides would not quite cover the variations of language, the variations in Candomblé traditions, the variations that continually evolve in a culture of oral traditions. After reading the fieldwork of many anthropologists, all with varying descriptions of Candomblé, the *orixás*, their characteristics and the practices associated with each, I understood exactly what Pai Valtinho meant when he said to me at our meeting – “I can only tell you what I know.” The variations in myth and the mutations of the *orixá* might cause confusion to those outside the religion but this complexity has much to do with the room this religion gives to adaptability, progression and the changing reality of its followers and their oral tradition. What does not change is the basic tenet of maintaining a “right relationship” with one’s world, and the concept of *axé*, these are a constant. In regards to Iroko the constant amid the varying details and descriptions seems to be that Iroko is time universal. Mãe Detinha addressed my confusion regarding Iroko sometimes being referred to as Loko or Tempo in different traditions. She explained that Iroko, Loko and Tempo are really the same *orixá*, their identity only slightly different, as human beings are one from another, but the same as all humans are the same. Iroko holds the awareness of each person’s destiny, understands the justice in destiny, sees what is not seeable on a human scale. Iroko represents, so to speak, the “big picture.” To look to Iroko for guidance one must understand that the resolution that comes might not be the one sought but it will indeed be the correct unfolding of one’s destiny. Pai Valtinho explained to me that the force of Iroko, or any *orixá*, is not positive or negative. How someone reacts to that force, however, can result in a negative outcome if that person disregards the *axé* of their *orixá* because in doing so that person is acting against his or her own true nature.

The tree of Iroko is never planted. A *terreiro* can be built around or near an existing gameleira, but Iroko is not brought to a place chosen for it – destiny places this tree. Destiny is to be respected. The telling of the origin myth of Iroko will vary in detail but the premise is the same. Iroko did not originate from the earth but started life as a seed dropped from the sky; Iroko grew from the heavens down to the earth. Mãe Detinho, after telling me her idea of the myth, explained that the gameleira does, in fact, grow not up but down. The gameleira is what is called a strangler fig. A strangler fig usually sprouts in another tree as an epiphytic vine. As it grows it often encloses the host tree with its roots, ceasing the growth of the tree or eventually killing it. Wherever it germinates, whether in another tree, on a ledge or atop a humanmade structure, the roots will search for the earth and keep growing downward until they reach the ground. Once rooted, affixed to the earth, the tree will proceed in its growth upward, often becoming a rather massive and beautiful tree.

There are endless lessons to be found in nature, and the orixá’s representation of these forces is a way to access these lessons. The gameleira, like nature as a whole, is powerful, destructive, though at the same time benign and life giving: both pre-

dictable and unpredictable, constant and yet never the same. In looking to the wisdom of Iroko or one of the many other *orixá*, the emotional impact the natural forces have on us as human beings becomes an everyday awareness. There is Ossain who is associated with leaves, herbs and healing; Xango, fire, justice, the warrior; Iansã, wind and storms, strength; Oxum, fresh waters, beauty/vanity; Iemanjá, the ocean, motherhood. Acknowledging this energy, this *axé*, spiritually integrates us into our world, our surroundings, instead of separating us from them.

On one of my last days in Bahia I attended a program at the *terreiro* Axé Opô Afonjá that brought together people from other Candomblé terreiros around Bahia. One man, in expressing the importance that Candomblé held for him, ended his testimony with a word of caution saying “If we destroy our forests, pollute our waters, there can be no Candomblé.” In this statement the understanding of what is at stake, what is to be lost in a spiritual way, is strong. No matter who our god or gods are, this valuation of nature in a spiritual sense, this emotional connection, might be what is lacking for those on this planet who do not take seriously the more pragmatic lesson of nature.

The lessons of science are not sinking in; we know that we cannot survive as a species unless we still have oxygen to breathe, untainted soil to till and clean water to drink, yet, being fully aware of this, we continue to do damage to our only life-support system. It is possible that the lack of emotional connection to the rest of nature, as Carl Jung suggests in *A Man and his Symbols*, that causes us to feel lost in the cosmos will lead us to being lost *to* the cosmos – permanently. Or perhaps there will come a moment in time when nature once again becomes sacred to us all and our spirituality brings us back to being one entity, showing us how to have a right relationship with our surroundings, with our community, with one another.

Cannibalism – Paleolithic

Cannibalism – the eating of human flesh by humans – has often been claimed to exist in different periods of the human past, usually on the flimsiest of evidence. In recent years, a better understanding of taphonomy (i.e., what happens to bones between being buried and being unearthed by archeologists) as well as greater familiarity with the huge variety of funerary rituals around the world, and a more objective assessment of the facts, have helped to weed out many claims for prehistoric cannibalism, while at the same time new claims have been put forward which rely on more plausible evidence than before.

At the northern Spanish site complex of Atapuerca, near Burgos, the recently discovered bones of a human ancestor called *Homo antecessor*, dating to perhaps a million years ago, bear abundant cutmarks which have been interpreted as evidence for cannibalism, and it is difficult to disagree with this inference. It is known that cannibalism can occur in other species, including the chimpanzee, our closest relative, and it is also known that among humans it occurs today in cases of starvation or lunacy, so there is no reason to deny its possible existence at times in prehistory. And at such a remote point in prehistory, when we have little idea what our ancestors were like or how they lived, there is no reason to doubt the presence of this practice, and there is absolutely no evidence for any kind of funerary rituals or other secondary treatment of the dead, so no alternative explanation for the cutmarks is conceivable in the present state of our knowledge. They are most likely butchery marks, and hence an indication of consumption of human flesh by other humans.

However, Atapuerca also presents the earliest evidence in the world – ca. 200,000 to 300,000 years old – for some kind of funerary ritual. Ethnographic and ethnohistorical records all over the globe show clearly that a huge variety of often bizarre funerary practices has existed, some involving cutting, smashing and burning of bones, either shortly after death or long afterwards when bodies are exhumed and subjected to this kind of phenomenon. The archeological record contains many instances from different periods, stretching back into prehistory, which can plausibly be attributed to such practices. And Atapuerca demonstrates that all human remains from 300,000 years ago onward therefore need to be interpreted with great circumspection, since funerary rituals are henceforth an ever-present possibility, and indeed are one of the distinctive marks of humanity. Naturally, in such a remote and early period, when one is dealing with beings so utterly different from ourselves in many ways, yet also so similar to us in others, it is impossible to be sure whether the Atapuerca disposal of the dead was

definitely ritual – nevertheless, it is one of the most enduring features of archeology that anything which is difficult to explain in more mundane terms must be “ritual.”

In order to decide whether human remains were produced by cannibalism or by funerary activities (or warfare, etc.), there are two main categories of argument. The first is the presence of human bones with marks of cutting, smashing or burning, and fruitless attempts have been made to isolate specific criteria by which one might recognize cannibalism, but none of them is truly diagnostic, and alternative explanations are always available. The second is the presence of human bones mixed with animal bones, with similar marks and treatment; since the animal bones are obviously the remains of food, the same must apply to the human bones – this argument has recently been presented in new claims for Neanderthal cannibalism in Europe. However, things may not be so simple, since the people who left the archeological record were humans, capable of all kinds of complex and odd behavior patterns. The human and animal bones are not necessarily the results of the same phenomenon, so one must avoid jumping to simplistic and “obvious” conclusions.

The data are always ambiguous, as can be seen clearly in a couple of Neanderthal examples. At Krapina, a cave in Yugoslavia, the hundreds of fragments of Neanderthal bones unearthed in 1899 were first attributed to a cannibal feast; but modern reanalysis of the bones showed that most of the damage to them could better be explained by roof falls, crushing by sediments, and the use of dynamite in the excavations; while cutmarks on some bones most resembled those made during funerary practices.

At the Guattari Cave at Monte Circeo, Italy, the skull and jawbone of a Neanderthal were found in 1939 in a ring of stones on the cave floor. The hole in the skull’s base was enlarged, and there were fractured areas around the right temple. This was seen as a clear case of ritual cannibalism, with the brains being extracted through the hole. However, modern analysis suggests that the “ring of stones” was natural, caused by a landslide, while other remains in the cave indicate that it was a hyena den. The marks on the skull are fully consistent with being caused by hyenas, which may have taken the head from a buried body in or near the site.

Therefore, many early claims for cannibalism have been effectively debunked. The possibility remains that the practice may have existed occasionally, not merely in the remote times of *Homo antecessor* but much later among Neanderthals and even modern humans, but the evidence is always ambiguous, and must be assessed very carefully and objectively, rather than with wishful thinking and a love of melodrama, as has so often been the case in the past.

Capra, Fritjof (1939–)

Theoretical physicist Fritjof Capra is one of the most influential protagonists of “New Age science.” His *Tao of Physics* made the issues of global environmental crises and the requirement of a “new thinking” in science and society known to a wider public. In this book, Capra dwells on the parallels between quantum mechanics and Oriental mysticism – a parallelism that became almost canonical in New Age discourse, regardless of its validity. Furthermore, he refers to physicist Geoffrey Chew and his so-called “bootstrap philosophy,” which appears to be very similar to Leibniz’s “monadology.” Using the concept of selforganized individual entities, Capra develops a philosophy of nature that comprises both science and the humanities, leading from theory to action, from fundamental laws to dynamic events, and from separateness to mutual connect- edness.

In the following years, Capra was heavily influenced by the systems theory of Gregory Bateson and he adjusted his former concept accordingly. In *The Turning Point*, it was no longer the bootstrap philosophy or the model of quantum mechanics that grounded his argument, but the holistic and ecological “systems view” of reality, which he presents as the common denominator of both modern science and ancient mysticism. According to Capra, Western society is in need of a new paradigm, because the old mechanistic Newtonian and Cartesian paradigm has led modern society to an alienation from, if not a total destruction of, nature. This old paradigm is in a state of decline and the global crises are reaching their culminating point. At the same time the new holistic paradigm is emerging rapidly, bringing forth a society that is “holistic,” open to spiritual dimensions of life, and healthy for all its members. The juxtaposition of those two paradigms serves as a master key to interpret almost every part of contemporary culture.

Generally speaking, Capra’s books are an easily accessible compilation of two authors’ more complicated ideas, namely Ilya Prigogine’s and Gregory Bateson’s. While he interprets their thinking in great detail (and sometimes eclectically), he omits references to the “founders” of systems theory, like Ervin Laszlo. This is also true for his latest major book *The Web of Life*. Here, he establishes what he calls the “Capra-synthesis,” consisting of his former contributions and an additional application of H. Maturana and F. Varela’s so-called “Santiago Theory,” which Capra describes as a parallelism of learning and living, of knowledge and creativity. He also includes concepts of deep ecology and sustainability.

Capra’s impact on New Age discourse, on environmentalism, and recently also on the countermovement against uncontrolled globalization has been decisive. Actively

supporting political and economic efforts to arrive at a “holistic” and sustainable culture, he is founder and president of the *Elmwood Institute* and the *Center for Ecological Literacy* (founded in 1995) in Berkeley, California, an ecological think-tank dedicated to fostering new concepts and values for a sustainable future. Furthermore, he is lecturer at the influential Schumacher College in Dartington, Devon (United Kingdom), an international center for ecological studies. His course titles include “Life, Mind and Society” (2002) and try to integrate deep ecological concerns into a general systems theory of culture.

Caribbean Cultures

Beginning in the late fifteenth century, Europeans (mainly Spanish, French, British, and Dutch) colonized the Caribbean in order to exploit its natural resources. First they unsuccessfully mined for gold, and later massively cultivated sugar and other cash crops for self-enrichment. They also established Christianity as the dominant religion in the islands. The native peoples of the region, mainly Tainos and Caribs, succumbed to disease and other horrors wrought by the European conquest, such that within three generations of Columbus' first visit in 1492 their numbers had dwindled from several million to a few thousand. With the demise of the indigenous population, Europe turned to Africa for a replacement labor force, and over the next 350 years, nearly five million Africans were enslaved and brought to the Caribbean.

The Caribbean Basin consists of more than 7000 islands, most of which are part of the West Indian Archipelago. The Archipelago stretches from the Straights of Florida nearly to Venezuela, and separates the Caribbean Sea and Gulf of Mexico from the Atlantic Ocean. Roughly one-fourth of these islands are inhabited, with the majority of the region's forty million people presently living in the Greater Antilles (Cuba, Haiti/Dominican Republic, Puerto Rico, and Jamaica). Most Caribbean people are of African descent, while European languages and religions have also largely shaped the region's living cultures. With the twentieth-century influx of Chinese and Indian indentured laborers, the Caribbean has become a region of even greater cultural and religious diversity, a region wherein every major world religion has either carved out a niche or gouged out a crater.

Nature in Taino Myth and Ritual

The Taino migrated to the Caribbean from what is today Venezuela as early as 300 B.C.E. and were the first native Americans encountered by Europeans in the late fifteenth century. Their religion was based upon a rich mythology and shamanistic interpretations of nature and divinity. As José Oliver notes, "Taino were keen observers of the rhythms of nature . . . [and] strove to maintain harmony, or at least coordination with the motion of nature . . ." (Oliver 1997: 140). In Taino myth, Yaya's (the godhead's) first act of creation was to crack open a gourd out of which spilled an ocean teeming with fish. A mountain grew out of the sea, and humans, animals, and vegetal life lived with the fish in a primordial realm in which they all communicated in a sacred language. Because of this, and because fishing was central to material Taino sustenance, fish came

to symbolize the vital force within nature. This force was understood by the Taino to be either creative or destructive, and they sought to tap it through the creation and worship of *zemis*, or smooth triangular stones or bones. Besides zemi cults, Taino religion also featured cults of deities who were associated with various forces in nature. The very word “Hurricane” in English derives from the name of the Taino god of one of nature’s most awesome displays of force, Huracan. Among the religion’s most popular deities was Atabey, the fertility goddess who also rules the seas. Maintaining as best as possible harmony with such spirits and the forces of nature was the core of Taino religion. The means to this harmony were often determined and prescribed by shamans, or *zemichis* (“seers of zemis”). Shamanic trance and possessions were induced by meditation, chanting, and the ritual smoking of hallucinogenic cohoba seeds mixed with tobacco leaves. So important was this practice in Taino religion that archeologists have uncovered a great variety of ritual smoking paraphernalia in the Greater Antilles.

Despite the disappearance of Taino people from the Caribbean, Taino culture lives on in the islands more vibrantly than scholars usually acknowledge. For one thing, Taino lived with Africans in the sixteenth and seventeenth centuries’ maroon communities that emerged in mountains throughout the Caribbean in resistance to enslavement. This is an essential fact in Caribbean religious history because maroon communities were the site of religious activity that has been as influential as any other in shaping Caribbean identity and consciousness. For two illustrative examples of this legacy, we may turn to Boukman’s experience at Haiti’s Bwa Kayman in the late eighteenth century, and Leonard Howell experience at Jamaica’s Pinnacle in the mid-twentieth, which have indelibly marked Vodou and Rastafarianism respectively. Herein the refuge of nature, and especially the wilderness, cooperated with indigenous and African resistance to colonial and post-colonial oppression, and contributed forcefully to the creation of Caribbean religious culture. Wilderness, resistance, and religion are thus deeply intertwined in the Caribbean imagination, and the Taino deserve recognition as the founders of this tradition of *Marronage*.

Christianity, Slavery, and Sugar

The European conquest of the Caribbean benefited from Christianity’s sanction, first in Catholic and later in Protestant form. Enjoying the papal legitimization of a series of fifteenth and sixteenth-century papal bulls, the Spanish and French monarchies vowed to baptize unchurched Africans in exchange for the God-given right to enslave them. The presumption that God wills Christians’ domination of nature and of other peoples was reflected in the symbolism and mythology of post-Reformation Iberian Catholicism. To the Spanish, for example, it was the Virgin Mary who brought them to the Americas, hence Columbus’ arrival on a boat christened “*Santa María*.” The Virgin Mary had long been European Catholicism’s ruler of the seas (e.g., *Stella Maris*;

Our Lady of the Navigators), thus making her the logical patroness of the European conquest of the Caribbean and all of Latin America.

Yet, it was not so much European religious zeal as capitalistic greed that fueled the colonization of the “New World.” Initially the Spanish hoped to extract massive amounts of gold from the Caribbean Earth, but they failed. So, instead they aggressively exploited the rich soil of Caribbean plains to produce sugar. In the French colony of Saint-Domingue alone, there were over 2000 plantations on the eve of the Haitian Revolution in 1789, most of them over 1000 acres in size. In all, colonial Caribbean sugar plantations received more than 40 percent of all African victims of the transatlantic slave trade, and were providing well over half of all sugar consumed in Europe.

Nature in Afro-Caribbean Religions

West and Central African slaves and their descendants managed to preserve the spirit of traditional African religion despite Europeans’ administrative measures to prohibit them. In adopting Christian symbolism and belief, Africans and their descendants established a rich, diverse, and still-thriving culture of religious syncretism in the Caribbean. In Catholic colonies like Saint-Domingue and Cuba, where French and Spanish missionaries baptized and evangelized slaves, Africans took saints like the Virgin Mary and Saint James to be manifestations of spirits from their homeland, whose New World cults were transformed accordingly. Because the Catholic “pantheon” was so structurally congruous with African pantheons (each consisted of a single distant creator God and lesser, yet more familiar, spiritual beings or the living-dead) Catholic colonies proved the Caribbean’s most fertile soil for the growth of African-derived religions like Haitian Vodou and Cuban Santería.

Nowhere is African culture more vibrant in the Caribbean than in Haiti, where West and Central African religious traditions mated with Iberian and French Catholicism to breed the religion of Vodou. In Vodou, spirits (*lwa yo*) and ancestors (*lemò yo*) live in nature, and many of them embody natural features and forces. Maintaining or restoring harmony with them is Vodou’s primary concern, and nature provides the best media and mechanisms to ensure this harmony. For instance, spirit-embodying trees surround temple compounds and provide the material for sacramental drums used in communal possession ceremonies. Also, leaves are essential to the religion because herbalistic healing is one of Vodou’s primary functions.

Vodou is thus firmly rooted in nature, and many *lwas* are associated with natural phenomena. The serpent-rainbow *lwa* Dambalah Wedo, for example, lives in waterfalls; Ogun is the spirit of metals; Agwe is the *lwa* of the sea, and so on. The dead are also forcefully present in nature, being understood as living either under the ground, across the water, or in the forest. Trees and the forest (like the sea, animals, and other natural beings or forces) have “*nam*” (soul) and are thus prominent in Vodou’s rich symbolism and mythology.

Santería likewise focuses upon spirit and ancestor cults and is deeply sensitive to nature. For humans, harmony with such deities (*orishas*) and the dead (*los muertos*) is essential to a life full of *ashé*. Olodumare, the single creator god, infused *ashé* (vital force) into all of creation. *Ashé* is the healing force of herbs, the animating force of the wooden and animal-skin drum, and the whirl of the possessed dancer: The ocean's *ashe* is present, for instance, in ritual dance for Yemaya, the beautiful goddess of the sea.

Like Vodou, Santería teaches that the spirits and the dead live in the natural wilderness (*el monte*) and that we can best communicate with them through possession, sacrifice, and divination. The West African divination system known as *Ifá*, which is identified with the *orisha*

Orunmila, has been marvelously preserved in Santería. In *Ifá*, nuts, shells, and chains, are cast, read, and interpreted by ritual specialists called *babalawos*. *Babalawos* commit thousands of myths (*patakis*) to memory and use them, as directed by *Ifá*, to communicate their interpretation and advise believers on life. *Patakis* are replete with nature symbolism and often prescribe offerings or sacrifices (*ebó*) that require animals, plants, music and dancing for the *orishas*.

Beginning in the seventeenth century, British and Dutch colonialism established Protestantism as a major religion in the Caribbean. African religious traditions on mainly Protestant islands did not survive as intact as Haitian Vodou and Cuban Santería. There is nonetheless a distinctly African spirit that pervades West Indian Christianity, especially in Pentecostal and Revivalist forms, whose spirit possession, drumming, dancing, and speaking in tongues are clearly rooted in traditional African religion. Also rooted in Africa, belief in sorcery (*obeah*) and in ritual specialists who combat it is widespread in the Protestant Caribbean.

In twentieth-century Jamaica, Ethiopianist interpretation of the Bible found scriptural prophecy of the return of God to Earth as an African king. This inspired the African focus of Jamaican Rastafarianism, which emerged from a confluence of Ethiopianism, Garveyism, and Revivalist Christianity. As a result, Rastas believe that Jah (God) has returned to the Earth in the person of King Hailie Selassie I, who was crowned King of Ethiopia in 1930.

Rastafarianism reveres nature as Jah's self-expression and gift to humanity, and thus as sacred. Rasta's symbolic color triad of red, gold, and green reflects this, as green represents the vegetation of Africa and Jamaica. The religion is strongly influenced by this reverence for nature, as Rastafarian biblical exegesis demonstrates. For example, the ganja herb was first grown on the tomb of King Solomon, and its use for communion with Jah is encouraged in the Book of Genesis ("And the Earth brought forth grass, and herb yielding seed after his kind

. . . and God saw that it was good" [1:12]) and in Psalms ("He causes the grass to grow for the cattle, and herb for the service of man" [104:14]). Besides its uses in healing, ganja is smoked for meditation and communal rituals called Nyabingi, and

thus the ganja herb, along with the Lion of Judah (Hos. 5:10–14), is a dominant symbol in Rastafariansim.

Conclusion

In spite of the wide diversity of Caribbean religious cultures, taken as a whole the region's people generally share a deep sensitivity to nature as an expression of and gift from God. From the Taino to the Rastafarians, Caribbean believers have always viewed God, spirits (or the Holy Spirit, the *lwas* or the *orishas*) and the dead as manifest in nature. Understanding, communing with, and living in harmony with the sacred is thus only possible because of nature and the eternal living force, or *ashe*, that inhabits it.

This rooting in and respect for nature of Caribbean religious cultures has not, however, ever inspired broad environmental activism anywhere in the Caribbean. Deforestation, one of the region's most pressing environmental concerns, is the result of poverty, a force that overpowers Caribbean people's deep reverence for nature. At the local level, trees considered to be the homes of spirits in African-derived religions like Vodou and Santería, are spared the axe, while Rastafarians decry the exploitation of nature as another crime committed by Babylon, or the White oppressor. Yet these religions are generally made up of the region's poor, whose daily struggle for survival makes any threat to Caribbean ecosystems (though obvious to everyone) seem a tertiary concern at best. Christian missions, meanwhile, have throughout the islands financed soil conservation and reforestation projects, although their efforts have had a relatively weak impact overall and cannot atone for Christianity's economic sins that have for five hundred years underlied the Caribbean's environmental degradation.

Carson, Rachel (1907–1964)

Rachel Carson certainly deserves the title, “Mother of the Environmental Movement.” Her book, *Silent Spring*, published two years before her death in 1962, was a clarion call to the world to balance the needs of humans with the needs of the Earth.

Born in rural Springdale, Pennsylvania, Carson had a life-long interest in the natural world. Her mother taught her a love for nature that informed all her writing, from her first book, *Under the Sea Wind* (1941), to her last, *Silent Spring* (1962), a work that started a global movement to save a planet that was well on the way to being destroyed by industrial and governmental policies that ignored the delicate balance required in humans’ dealings with nature. In only twenty years between her first and last book, Carson explored and translated the oceanic world for millions of readers around the globe, challenged the most powerful corporations and the male-dominated scientific community, and laid the groundwork for an ecofeminist movement that highlighted the interconnectedness of every part of the natural world. Her theories about nature and about the obligations of the scientific community undermined long-held beliefs about linking the control of disorderly nature and the control of women.

In 1925 Carson began her scientific training at Pennsylvania College for Women (later renamed Chatham College), under the mentorship of Mary Skinker, a biology teacher. Skinker’s influence on Carson was tremendous; it was she who encouraged Carson’s scientific interest, helped her get a place in graduate school at Johns Hopkins, and mentored her in her struggle to enter the maledominated scientific community.

In the summer of 1929, before Carson entered Johns Hopkins, she received a scholarship to work at the Marine Biological Laboratory at Woods Hole in Massachusetts. Living on the ocean was not only a thrill to the young scientist, but that summer focused her graduate studies on marine biology, the subject of *The Sea Around Us* (1951) and *The Edge of the Sea* (1955). Her enduring interest in, and reverence for, the sea was as close as Carson came to a philosophy of life. She saw in the oceanic world what she referred to as “material immortality,” the slow accretion of new life from the old.

After finishing her Masters of Arts in Marine Zoology in 1932, Carson taught briefly at the University of Maryland. The death of her father and the Depression forced her to look for more financially secure employment, and she began working for the U.S. Bureau of Fisheries (later the Fish and Wildlife Service). After a brief stint in Chicago during World War II, Carson returned to Washington and became General Editor of *Conservation in Action*, a series of pamphlets put out by the Fish and Wildlife Service. She also had begun to study the effects of DDT on the environment and suggested to

Reader's Digest an article on the deleterious effects of the chemical on the environment. The magazine rejected her proposal, and it took another ten years before Carson was able to focus on DDT. Before becoming engaged with research on the use of pesticides, Carson focused on two books about the sea, *The Sea Around Us* and *The Edge of the Sea*. These two books, especially *The Sea Around Us*, illustrate the most powerful themes in Carson's work: a religious reverence for the sea, the womb of life, and a belief in the connectedness of all living things. The sea, she believed, was the generator and the grave for all: the alpha and omega of the planet. The life of the sea controls the life of the land and thus human life, an axiom that Carson believed should humble human beings.

After the enormous success of her two books about the sea, Carson turned once again to the issue of the chemical poisoning of the environment. During the late 1950s, the *New Yorker* had a weekly column called "These Precious Days," a "fever chart of the planet Earth, showing Man's ups and downs in contaminating the air, the sea, and the soil." Carson collected all these columns and noted the rise in Strontium 90, the rise in pesticide use, and the rise in cancer rates around the world. Humans were, she concluded, poisoning the Earth and themselves.

While universities around the United States were doing studies that showed alarming consequences from the use of pesticides, the U.S. Department of Agriculture insisted that, with precautions, the chemicals would have no adverse effects on humans or wildlife. Into this conflict Carson brought her skill as a researcher and her passion as an environmentalist. She also experienced the ways in which government controlled the truth. The Department of Agriculture and several chemical companies that had large governmental contracts set out to destroy Carson's reputation when *Silent Spring* came out and when the book was widely heralded as "a plea for reason and balance in the use of pesticides." Vesicol Chemical Corporation tried to have Houghton Mifflin suppress the book before publication, and Monsanto chemical company questioned Carson's credentials as a scientist and discounted her as a "hysterical woman." When CBS showed "The *Silent Spring* of Rachel Carson," Carson was attacked on air by Robert White-Stevens of American Cyanamid, claiming that her book was a series of gross distortions. On the contrary, even today no one has been able to document an error in *Silent Spring*.

In the opening chapter of the book, the reader is returned to a pristine rural landscape that experiences sudden death and decay. From there the book begs for a considered and selective approach to the use of pesticides. Carson questions whether any civilization can wage relentless war on life without destroying itself, and without losing the right to be called civilized.

Carson's concern for the balance of nature, for the respect for the wilderness, and for the place of humans in the magnetic chain that binds all life, made her deeply conscious of the ways in which seemingly minute causes produce mighty effects that no human being can escape.

Cartesian Dualism

– See Descartes, René – and the Problem of Cartesian Dualism.

Casas, Bartolomé de las (1485–1566)

Bartolomé de las Casas was a Dominican friar, born in Seville, Spain, who after an experience of conversion in 1514 spent the rest of his life defending the rights of the indigenous peoples of the New World. His devotion to justice, expressed in pointed, indignant, and prodigiously documented critiques of the Spanish colonization, as well as numerous crusades to the canonical courts, and court hearings on the conquest, earned him the name “defender of the Indians.” He was also a major theologian of peace, and arguably one of the founding fathers of anthropology, ethnography, and what can also be called “nature writing,” for his works abound in anthropology and ethnographical descriptions of the natural world of the Indies.

He wrote extensive and passionate histories of the inequities committed by the Spanish in their conquest of the new world. Both his *History of the Indies* and the

Apologetic History, totaling six hefty volumes, still constitute the wealthiest sources of information about the culture and society of the Indians of the New World. Yet, these works were only published three hundred years later. A summary, however, was published during de las Casas’ lifetime under the title of *Very Brief Account of the Destruction of the Indies* (1552). This became a sixteenth-century best seller, translated into six European languages and undergoing many editions shortly after its publication. Such was the fervor and vivid nature of de las Casas’ descriptions of the devastation of the Indies that it is alleged that this book became the source of the so-called “black legend” imputed on the Spaniards, who having suffered defeat in history were haunted by a divine curse because of their sinfulness, savagery, and unjust treatment of the Indians.

His treatise *De único vocationis modo* (*The only Method of Attracting All people to the True Faith*) (ca. 1534–1537) became the inspiration for Pope Paul III’s encyclical *Sublimus Deus* (1537), in which the rationality of the Amerindians is proclaimed as a manifestation of God’s sublimity. Because of his defense of the Indians’ right to be treated on the same terms as the other European nations of his day, de las Casas’ work is also thought to be a precursor of the international declaration of human rights and the idea of an order of law that applies to all human beings regardless of race, class, gender, or religion. In chapter 48 of his *Apologetic History* we find the rudiments of an international declaration of human rights.

In a famous debate with Juan Ginés de Sepúlveda in Valladolid, de las Casas confronted and refuted the Aristotelian-derived “right” to wage war and enslave the Indians. In the treatises prepared for his encounter against Sepúlveda, de las Casas developed and defended a prophetic, Christian, and theological humanism that laid down the foundations for a radical and pacifist democratic ethos that enshrined the unity of all humanity. The publication of his complete works in a critical edition, numbering thirteen volumes, made available for the first time in complete and unabbreviated form carefully crafted treatises and legal briefs on behalf of the Indians.

De las Casas’ work is characterized by its tenacity and unwavering nature. His defense of the Indians was a vocation and calling. Above all, his work reveals his active advocacy for pacifism. Furthermore, it is a theologically grounded pacifism (i.e., to wage war is contrary to the gospel and the Christian teachings, notwithstanding the long tradition of using Aristotle, Augustine and Aquinas to develop a theory of “just war”). Both the tenacity of his vocation and commitment to pacifism are rooted in his boundless love for the Indian.

This love in turn led de las Casas to give himself over to a prophetic activism that was guided by Christian utopianism. Being a witness to the plight of the Indians, he was an engaged advocate and he clamored for justice on their behalf. These elements gave shape to what has been called a “Lascasian” prophetic humanism. As the “protector of the Indians” he is also considered the father of Christian humanism, witness to the inhuman violence of the conquest and sinful extermination and exploitation of the *encomienda*, the Spanish institution by which Indians were given over in care to the Spanish conquistadors.

Along with the priceless documentation of the “destruction” of the New World that detailed extensively a then unknown, voluptuous, and unique fauna and flora, de las Casas has bequeathed humanity a gospel of prophetic humanism that is framed by five tenets. First and foremost, de las Casas consistently departed from popular Christian doctrine regarding the dignity of the human being, a dignity that was, for him, enshrined and exemplified in human rationality. *De hominis dignitate* describes human beings’ irreducible and unalienable capacity to reason, to persuade and to be persuaded. Second, in de las Casas’ view, the Indians were not the least of humanity and creation, but rather its exaltation. The Indian was a superlative human, the exemplar of God’s humility and magnificence, and so was their environment and surrounding world, which de las Casas compared with paradise. Most of his major treatises and histories of the New World contained descriptions of the mountains, rivers, trees, fish, fruits, bays, etc., because de las Casas thought that the cultures of the Indians could not be separated from their environment. De las Casas argued on behalf of the Indians’ basic human condition, and this included defending the world that they tended and in which they lived in dynamic relationship. In de las Casas, then, we find an explicitly articulated theology and missiology that for the first time combines reverence for the dignity of human beings along with their “natural environment,” without which human beings

would not be able to live and flourish. At the same time, this natural environment is seen as the expression of the creative and nurturing culture of the Indians.

Thus, the chronicling of the destruction of the Indies was not just a narrative about the devastation of the Indians but also of their habitat. De las Casas' work also stands in a critical and contentious relationship to the works that engaged in the so-called "debate on the nature of the New Indies," a debate among sixteenth-century theologians, historians, and evangelizers, which tried to establish the immaturity and incompleteness of the new world, and consequently, the need for European Christians to intervene and take over a continent they argued was being wasted. It is this aspect of de las Casas' work that has made him the supreme apostle of the poor for liberation theologians, as Gustavo Gutiérrez has argued. The third pillar of Lascasian prophetic integral humanism is his unequivocal and unqualified defense of the freedom of all human beings, a freedom that cannot be sullied by or mortgaged to the promise of salvation or task of evangelization. Rationality as the supreme expression of human dignity, as well as the freedom to pursue that human vocation, culminate in the right of selfdetermination for all peoples. This right is complemented by the realization that evangelization can only be undertaken peacefully and by way of rational persuasion of the peoples to be evangelized. After five hundred years of critical reception, in many cases skewed by the ideological struggles about the right of Spaniards to colonize and evangelize the New World, and only after the appearance of his complete works during the last decade of the twentieth century, a richer and more comprehensive understanding of his prophetic work can now be undertaken. He is the patron saint of the Indians, but also the father of a thoroughly Christian universalism and pacifism that remain unsurpassed and that still projects a utopian vision worth witnessing.

Castaneda, Carlos (1925/31?–1998)

Carlos Castaneda is a “father” of the New Age movement through his series of books detailing Yaqui Indian shamanism. Castaneda remained an enigmatic figure who avoided being photographed, interviewed or recorded. His autobiographical information is also controversial with conflicts concerning his place of birth (Cajamarca, Peru or São Paulo, Brazil) and other details of his early life. In 1951, however, he moved to the United States and began studies in anthropology. He received his Ph.D. from the University of California, Los Angeles in 1973.

Allegedly meeting Don Juan Matus in a Nogales, Arizona Greyhound bus station in the early 1960s, Castaneda described him as a *nagual* or master sorcerer (a “man of knowledge”) of mixed lineage: a Yuma Indian mother and a Yaqui Indian father from Sonora, Mexico.

When he was ten, Don Juan was taken to Mexico by his parents who were subsequently killed in the YaquiMexican wars. He then grew up with relatives in southern Mexico. According to Castaneda, at the age of 20, Don Juan met Julian Osorio, a son of European immigrants, who had himself been initiated by *nagual* Elias Ulloa into a lineage of *brujos* that reputedly went back 25 generations. Becoming part of this tradition, Don Juan eventually acquired four disciples: Taisha Abelar, Forinda DonnerGrau, Carol Tiggs and Carlos Castaneda. He taught a series of body movements described as “magical passes.” Castaneda claimed that Don Juan bequeathed to him everything he knew about his lineage of sorcerers. Toward the end of his life, Castaneda developed the “magical pass” of Don Juan into a modern practice dubbed “*Tensegrity*.” In this blend of meditation and movement exercises, the individual is depicted as a “luminous egg” that contains about 600 “assemblage points” or places where awareness shift can occur. As a process of depersonalization, *Tensegrity* seeks to break through the restrictions of ordinary cognition to understand the dynamics of pure energy.

Critics have insisted that Castaneda writings are essentially fictions, and many have doubted that such a person as Don Juan ever existed. Nevertheless, Castaneda’s first book about his alleged experiences, *The Teachings of Don Juan: A Yaqui Way of Knowledge* (1968), in which he vividly describes the spiritual and pharmaceutical adventures he had under Don Juan’s tutelage, proved to be an enormous success by answering to an emergent subcultural desire to employ non-rational approaches to reality. He pursued these portrayals of “non-ordinary reality” with a series of further works: *A Separate Reality: Further Conversations with Don Juan* (1971), *Journey to Ixtlan: The Lessons of Don Juan* (1972), and another half-dozen books in which he promoted Don Juan’s interpretation-free *seeing* or “stopping the world” as a replacement to belief

without experience. The huge success of his books (8 million copies in 17 languages) caused Castaneda to become increasingly reclusive. Even his death was not revealed until two months afterwards.

The importance of Castaneda's works, however, lies in their shamanic stress on the need to be inaccessible and elusive and, as a "spiritual warrior," for a person to become completely one with his or her environment. From this perspective, it is incumbent upon the individual to be flexible and unencumbered by sentimental emotions or past history. The message of Don Juan and Castaneda is perhaps best summed by Alan Watts' evaluation: "By not separating ourselves from nature, we return to a position of dignity."

Cathedral Forests and the Felling of Sacred Groves

“Cathedral forest” is becoming a commonplace reference to ancient or old-growth forests, from the ancient rainforests of South America and the “Cathedral Grove” of Vancouver Island to the giant Redwoods of the Pacific Northwest and the great Hemlocks of Cathedral State Park in West Virginia. Old-growth forests are, of course, highly valued for their great biological diversity. They are also prized as well for their aesthetic and spiritual values. The enormous trees of cathedral forests are often described as “majestic,” offering an ancient beauty distinguished from secondary-growth forests and tree farms. The light that filters down through the branches and leaves has been likened to the light pouring through the stained glass windows of the great medieval cathedrals. Conversely, the pillars and branchlike vaults of the gothic cathedrals also convey the grandeur of old-growth forests.

The term “cathedral forest” reflects a widespread contemporary and ancient experience of forests as sacred. As Bryant’s poem “Forest Hymn” describes, “The groves were God’s first temples” (in Schama 1995). Indeed, for millennia trees have been a location for prayer, worship, and divine revelation. In Shechem, Hebron, and Beersheba, altars were built to Yahweh under sacred oak trees. Pillars called Asherim were used in the ancient Isrealite worship of Yahweh and his consort Asherah, a tree and fertility goddess. Pillars also harbored the souls of sacred trees in the Mycenaean cult. Furthermore, Vitruvius wrote that the columns in Greek and Roman temples were modeled on tree trunks. The temples of Greece were thick with columns, and oftentimes possessed an adjacent, sacred grove. The forest origins of temple architecture are portrayed in the tree-trunk tapering of the classical column. Robert Pogue Harrison discusses the symbolism of Greek and Gothic columns and suggests “if a single column once symbolized a sacred tree, a cluster of columns may well have symbolized a sacred grove” (1992: 178).

From the eighteenth and nineteenth centuries, many texts argue that Gothic architecture was modeled on the forest, with its “ribbed vaults” depicting interweaving tree branches, the aisle down the nave of the cathedral resembling the path in a forest of ancient trees. Consider the story of Chartres Cathedral, built in 1194. Medieval tradition says it was built upon the site of a Druidic sacred grove, explaining the ceiling’s name – “the forest” (in Branner 1969: 104). In this way, Gothic cathedrals involve worship in stylized groves.

As Chartres Cathedral was built upon the site of a Druidic sacred grove, the Christianization of the empire meant countless cathedrals and chapels would replace sacred groves destroyed in the forced conversion of Earth-revering peoples. Yet, this violence did not begin with Christians. The book of Deuteronomy prescribes the cutting of the Asherim (Deut. 7:5; 12:3) in its assertion that Yahweh alone was God. The historian Tacitus gives an account of the Roman takeover of the island of Mona, a Celtic Mecca for British Druids. The Romans cut down their sacred groves and broke their altars.

The Christian empire reenacted the tradition of destroying sacred groves. Hagiography describes legends of monks working to root out paganism by forcing newly converted Christians or outraged pagans to decimate their sacred trees and groves (Glacken 1967: 310). On Monte Cassino around 525, St. Benedict cut down a sacred grove and destroyed the temple to Apollo in order to convert the people in the surrounding area to Christianity. In place of the grove, he built the first monastery. In 772, Charlemagne felled a popular Irminsal (giant column) representing the Anglo-Saxon tree of the universe. The most recounted story is that of St. Boniface, who sometime shortly after 722, cut down the Oak of Thunor (also referred to as Thor or Geismar) located on the top of Mount Gudenberg, near Fritzlar, Germany. Upon the first few blows, the sacred tree of the Saxon thunder-god split into four parts. Described as a miracle, many in the crowd were converted since the feared god did not respond with any great power or harm. Boniface used the tree to build a chapel to St. Peter on the same spot.

In spite of this violent past, naming these forests “cathedral forests” now exalts the few old-growth forests left on the planet. This history of cathedral forests nonetheless reveals a continual tension between disrespect and reverence for ancient forests. The desacralization of the forests provided an avenue for economic exploitation.

Many of the trees in Ireland were cut down to eradicate Celtic worship, which also justified using the wood to build the imperial fleet. The imperial habit continues into the present as conservative religious groups, such as the Acton Institute for Religion and Liberty, refer to the “anti-idolatry” actions of St. Boniface as a champion for today’s capitalist venues of deforestation. In contrast, other religious groups, such as the Religious Campaign for Forest Conservation, follow a Christian and Jewish tradition that loves and honors forests as the creation of God. In this view, sacrality need not imply idolatry. As religious studies scholar Belden Lane has emphasized, “for every story about saints who cut down trees . . . there are two stories of saints living in hollow oaks.” The ancient and continued sense of the sacred in such groves and the allusion to these ancient forests in architecture of Gothic cathedrals inspires Christians, Jews, and Pagans to work to save the few remaining cathedral forests.

Cathedral of St. John the Divine

More visibly perhaps than any of other religious institution, the Episcopal Cathedral Church of St. John the Divine in New York City has been at the forefront of the greening movement in American religion. The world's largest gothic cathedral, the mother church of the Episcopal Diocese of New York and the seat of its bishop, the Cathedral has created vanguard programs to bring together scientists and diverse religious leaders to address environmental problems, while promoting experiments in green liturgy and congregational sustainability, and introducing green architecture and creation-affirming aesthetics into traditional worship space. In the last three decades of the twentieth century and into the twenty-first Century, the Cathedral as an institution has provided solid leadership on environmental issues and sent a strong message to Christian and non-Christian faith communities alike about the pressing need to prioritize the Earth's ecological problems.

The strides the Cathedral community has made toward greening theology, worship, and institutional infrastructure, fostering institutes and conferences, commissioning ecospiritual artwork, developing learning programs, and implementing recycling programs, are largely attributed to the leadership role played by the former Cathedral Dean, The Very Reverend James Parks Morton. When he began his 25-year tenure as Dean of the Cathedral of St. John the Divine in 1972, Morton set about cultivating an intellectual community of what he called "cultural evolutionaries" – philosophers and futurists such as environmental author William Irwin Thompson and John and Nancy Jack Todd, the co-founders of Ocean Arks International, an organization that develops natural purification systems for contaminated water (Ausubel 1997). By 1975, Morton's encounters with microbiologist René Dubos and Passionist priest and "geologist" Thomas Berry, in particular, had helped fundamentally shift Morton's views on "man's relation to the Earth as it had been spelled out in the Judeo-Christian traditions" (AtKisson 1990: 16).

Morton began to make major changes at the cathedral in accordance with this new shift in thought. Morton held that, like the great holy places and sacred centers of the world, the Cathedral ought to be a great microcosm of the community – but the whole life community, not just the human community. An "Earth Shrine Habitat," which included the flora and fauna from the local bioregion (blue crabs, striped bass, and mussels) as a "tapestry of sacred biodiversity," was installed in the Cathedral's nave (Naar 1993). An "ecology trail" was put into place, which wove together various sacred sites inside and outside the Cathedral and which celebrated the wonders of creation, honored humanity's sacred connections with the planetary community and promoted

good stewardship. Innovative liturgical experiments and artistic expressions devoted to what Morton called “sacred ecology” flourished. The Cathedral of St. John the Divine soon became popularly known as the “Green Cathedral.”

What is more, throughout the decades of the 1970s to the 1990s, Morton invited a steady stream of environmental and scientific leaders to be guest speakers in the cathedral pulpit. Figures such as physicist Amory Lovins (founder of the Rocky Mountain Institute, which is dedicated to the development and implementation of alternative renewable energy sources), British scientist and Gaia theorist James Lovelock, and *Earth in the Balance* (1992) author, former Vice President Al Gore.

In 1990, with direction from Paul Gorman, the former Vice President of programs at the Cathedral, and led by the now-deceased astronomer Carl Sagan, a collective group of senior religious leaders and prominent scientists formed the Joint Appeal by Religion and Science for the Environment (JARSE) “to put forward a scientifically informed theological and moral response to the global environmental crisis” (Logan 1992). In 1991, the JARSE organization took up residence at the Cathedral of St. John the Divine and convened a summit meeting on the environment to foster collaboration between religious and scientific communities on addressing environmental concerns. In the fall of 1993, again under Gorman’s direction, the National Religious Partnership for the Environment evolved, which placed four major religious groups (the National Council of Churches, the U.S. Catholic Conference, the Evangelical Environmental Network, and the Coalition on the Environment and Jewish Life) into conversation with one another about issues such as environmental stewardship, eco-justice, and sustainability.

The Cathedral at St. John the Divine is also headquarters for numerous other organizations and programs working on environmental issues. The Gaia Institute (founded in 1984), for instance, works to translate Gaian theory into “on-the-ground” ecological practice and is responsible for the Cathedral-based “Urban Rooftop Greenhouse Project,” which promotes sustainable urban living and the greening of cityscapes. The Cathedral has become home to a recycling center for the Upper West Side of New York City and has hosted programs that help congregations conduct “Earth audits” to determine their level of resource use or “ecological footprint” and to find ways to reduce the size of that footprint.

Ecological consciousness is even being built into the very structure of the Cathedral, which increasingly reflects its stated “architectural commitment to sacred ecology.” Completion of construction at the Cathedral has been painstakingly slow (the building has been under construction for over 100 years) and has been set back at various times by capital shortages and a fire that occurred and was contained in 2001. Nevertheless, the commissioned south transept will take the form of a greenhouse “bioshelter” which has been designed to embody a “profound communion between nature and humanity.” Plans also include the addition of a solar tower to the Cathedral’s green architectural plan.

Inside the building, the Cathedral's "Ecology Trail" brings the outdoors in and honors creation as a living part of the worship space. The trail begins at the west end of the Cathedral at the "Creation Window," where images of the sun and its planets evoke the cycles of birth, death, and resurrection from the dawn of time. In the north side of the Cathedral hangs a Native American medicine wheel dedicated to healing the land of the Americas and giving thanks to the continent's "First Peoples." (An annual Native American Thanksgiving service of reconciliation is held at the Cathedral.) In the nave, there is a fallen walnut tree that has been split in two and rejoined, forming the "Peace Altar." A banner created by artist Frederick Franck hangs above the altar and depicts humankind in all its diversity. Other stops along the trail include the "Religious Life Bay" or the "Earth Bay," which features a fossil of a giant mollusk shell. The spiral or nautilus configuration of the mollusk shell represents the unfolding sacred history of creation. Here, pilgrims along the Ecology Trail are invited to meditate on their relationship to the Earth and its creatures.

The Cathedral has become perhaps most famous in recent years, however, for its innovative liturgy, in particular its annual Festival of St. Francis Animal Blessing and the accompanying "Gaian Mass." During the Gaian/Earth Mass, first performed by Cathedral artist-in-residence Paul Winter and his Consort in 1981, clergy bless everything from family dogs and cats to monkeys and llamas, even birds and bluegreen algae. The giant doors at the front of the Cathedral are opened for the occasion, and a great African elephant leads the procession of creatures down the nave to the altar. Participants sing hymns of praise to the Earth and liturgical dancers perform to celebrate and honor creation. Like the Day of St. Francis, the winter and summer solstices are also recognized as "Earth holy days" or festival days within the Cathedral's liturgical calendar and are celebrated with concerts featuring Paul Winter's music. These celebrations consistently draw more than 3000 participants.

Despite these successes, being on the "cutting edge" of sacred environmental work has not been easy. The Cathedral and its deanship (Morton left in 1997 to found The Interfaith Center of New York) have faced various accusations from within and outside the Church that the community's programs promote "paganism," "animism," or "New Age" worship. Still, the Cathedral's innovative green liturgies and environmental programs have stood the test of time. As the "greening" of theology, worship, and ministry has become more mainstream and accepted within a diverse range of denominations and religious communities across the U.S., Canada, and beyond, much of this early criticism has faded (except from the most conservative of sectors). The Cathedral-based National Religious Partnership for the Environment, for instance, now represents over 100 million American church and synagogue members who have acknowledged a moral and ethical responsibility to the care of creation. The Cathedral is thus operating today in a very different context than it was during the 1970s – one in which inspiring an ecological consciousness among the faithful and their leaders is not the uphill battle it once was. In any survey of the "greening movement" in American religion, it is critical to note that this more receptive and Earth-conscious climate among congre-

gations largely exists now precisely because of the watershed effects of the Cathedral of St. John the Divine's early programming and policy risks on the larger religious landscape.

Caves – Sacred (Thailand)

Buddhist monks and nuns dwelled and meditated in caves in northern India some 2500 years ago. Subsequently this practice spread with Buddhism to other parts of Asia. The sacredness of a cave usually discourages, if not completely excludes, the human use of the animal species in it, and to some degree, around it. Bats are usually the most important fauna in caves. They are also keystone (critical) species in forest and other ecosystems as pollinators, seed dispersers, and insect predators while they forage widely at night. An ecological connection between Buddhist practices in sacred caves on the one hand, and on the other, the conservation of bats and the maintenance of the ecosystems in which they forage seems not only plausible but quite likely. Given the antiquity, multitude, and widespread distribution of such sacred caves in many parts of Asia, they are probably a significant force in environmental and biodiversity conservation, even if previously unrecognized as such.

The use of caves for religious practices by individuals and groups goes back in time for millennia in India. The Buddha dwelled and meditated in caves, forests, and other kinds of sites, practices which became common for Buddhist monks and nuns during his lifetime and beyond. Whenever Buddhism expanded into other parts of Asia, this use of caves spread as well.

Thailand provides a good example of this phenomenon. The earliest known use of caves by Buddhists in Thailand dates back to at least the sixth to seventh centuries. At least 112 Buddhist sacred caves have been identified in Thailand by Christophe Munier (1998). Furthermore, it is likely that there are many more caves in Thailand, hundreds if not thousands, given the combination of several limestone mountain ranges which run from north to the south through the western portion of the country, together with the heavy tropical monsoon rainfall with some acid content that can slowly erode these soluble carbonate rocks over long periods of geological time.

Caves serve monks and nuns as a secluded, quiet, and peaceful place for monastic life, meditation, and chanting. They may also be used as reliquaries and tombs. A holy person occupies a cave for only a few days or for months or even years. In Thailand and elsewhere, sacred caves typically contain rows of several sizes of seated statues of the Buddha in the meditation posture, and often a huge reclining statue of him as well. In some caves, stalactites are also worshipped when they resemble figures associated with Buddhism. Bat colonies also inhabit many caves. Bats (Order *Chiroptera*) are one of the largest and most widely distributed groups of mammals (Class *Mammalia*) in the whole world and also in Thailand. There are nearly 1000 species of bats in the world comprising about one quarter of all mammalian species. Like other mammals, including

humans, bats are warm blooded, hairy, give birth to live young, and nurse their young with milk. Bats are found on every continent except Antarctica. In Thailand, 107 species of bats have been identified thus far, 38 percent of the 280 species of mammals in the country. Bats are common in most terrestrial ecosystems in the nation.

Bats roost in a variety of places, depending on the species, and some roost mainly or exclusively in caves. Some bat colonies are the largest concentrations of mammalian populations on Earth with thousands or even millions of individuals. In Thailand, at the minimum,

27 species of insectivorous bats and four species of frugivorous bats roost in caves, although not necessarily exclusively.

Keystone species, like bats, play a disproportionate role in an ecosystem and the extirpation of a population or extinction of a whole species would precipitate farreaching ecological changes. Frugivorous bats are especially important in pollination and seed dispersal, while insectivorous bats are significant in controlling insect populations. Distances flown in foraging vary with the type and availability of the preferred resources. In tropical forests, bats fly over long distances to locate and feed on trees with appropriate fruit, some making nightly roundtrips of 40–50 kilometers between their cave and fruitforaging areas.

The majority of the species of bats worldwide (70%) and in Thailand (83%) are insectivores. Bats are the only major predator limiting the populations of nocturnal insects like rice-hoppers and mosquitoes. Insectivorous bats consume large quantities of insects; a single colony of bats can consume hundreds of tons of insects annually.

Bats are especially vulnerable. They are the slowest reproducing mammal in the world for their body size, most species producing only one offspring annually. Many bat species are rare, occurring in few habitat types and with restricted geographical ranges. Major factors threatening or endangering bat populations and species include: habitat destruction (roosting locations and depletion of critical food resources); poisoning from chemical pesticides; and human overexploitation (for food, tourism, and other economic uses).

On the other hand, there are economic uses of bats that do not harm them. For example, bat droppings accumulate on the cave floor of large colonies. This guano is a highgrade fertilizer that is gathered for sale by some villagers who are therefore concerned with protecting the bats. Indeed, the temple of Khao Chong Pran, in Ratchaburi, has a cave housing more than two million free-tailed bats (*Rhinopoma hardwickei*). Every two weeks local villagers are allowed to collect the guano, and the income earned is used by the monks to support a school and various development projects.

Sacred caves usually discourage, if not completely exclude, the molestation or exploitation of the fauna therein and nearby, thus effectively promoting the conservation of roosting bats. This in turn helps guard their role as keystone species in forests and other ecosystems which may be a long distance from the caves. Sacred caves are a component of a very ancient, widespread, and diverse system of sacred places through-

out Thailand that have far-reaching significance for environmental and biodiversity conservation.

Celestine Prophecy

The *Celestine Prophecy* is a 1993 adventure novel by New Age author James Redfield (1950-) that spent over three years on the *New York Times* bestseller list, establishing itself as the most widely read spiritual novel of the 1990s, rivaled only by Tim LaHaye's evangelical Christian apocalyptic "Left Behind" series. The book tells the story of the discovery in Peru of an ancient manuscript that provides a series of nine insights that transform the lives of those who learn about them, presaging an era of heightened spiritual awareness, promising, in turn, a utopian New Age. Following the stunning commercial success of *The Celestine Prophecy*, Redfield followed up with a number of other books, including two novelistic sequels, *The Tenth Insight* (1996) and *The Secret of Shambhala* (1999).

The main worldview elements in these novels are conveyed through the experiences and words of their characters, who increasingly develop their spiritual acumen. In the following sections these themes are briefly summarized and then illustrated in the words of the characters in the novels.

Humankind's Destiny and the New Age

The universe has both an earthly and a spiritual "afterlife" dimension. Both are interdependent and coevolving, connected by divine energy which makes positive evolution in both dimensions possible and mutually dependent. This energy travels between the earthly and spiritual dimensions through "portals," which people consciously working on consciousness evolution can increasingly perceive. Through these portals it is possible to receive teachings from ancestors and other loving presences, and empowerment for the divine, human mission. This mission is to raise positive, loving energy to such an extent that heavenly and earthly dimensions come into alignment, inaugurating a utopian New Age. Realizing this mission is nothing less than the human destiny. As put by various characters:

Our destiny is to continue to increase our energy level. And as our energy level increases, the level of vibration in the atoms of our bodies increases . . . we are getting lighter, more purely spiritual . . . Whole groups of people, once they reach a certain level, will suddenly become invisible to those who are still vibrating at a lower level. When humans begin to raise their vibrations to a level where others cannot see them . . . it will signal that we are crossing the barrier between this life and the other world from which we came and to which we go after death. . . . At some point everyone will

vibrate highly enough so that we can walk into heaven, in our same form (Redfield 1993: 241–242).

The human destiny is, therefore, “to realize that we’re all here to bring the Earth dimension into alignment with the Heavenly sphere” (Redfield 1996: 183). To do this we must open the portals between these dimensions. One way to do so is through human love making:

The act of lovemaking itself opens up a portal from the afterlife to the Earthly dimension . . . Sexual culmination creates an opening into the Afterlife, and what we experience as orgasm is just a glimpse of the Afterlife level of love and vibration as the portal is opened and the energy rushes through, potentially bringing in a new soul . . . Sexual union is a holy moment in which a part of Heaven flows into the Earth (Redfield 1996: 80).

Another way is through especially powerful natural sites, namely, those that have not been destroyed through unconscious human enterprise. This possibility was signaled early in *The Tenth Insight* when a Native American indicated that his ancestors “believed this forest was a sacred midway between the upper world and the middle world here on Earth” (1996: 8). Another character later confessed that forests and other “natural areas are sacred portals” between the afterlife and earthly dimensions, and asserted that it is critical to keep “majestic, cathedral forests” with their irreplaceable “diversity of life, and [the] energies, inherent in a hardwood forest that had matured for centuries” from being converted to tree farms (1996: 208).

Spiritual Consciousness Change and Biocultural Diversity

There are diverse spiritual tributaries to this emerging New Age, including “Franciscan Spirituals,” Gnostics, and mystics in the Western world, Eastern religious avatars of enlightened consciousness, Native Americans, those striving to reduce human suffering, such as participants in the human potential movement (a recent book Redfield co-authored with Esalen co-founder Michael Murphy [Redfield, Murphy and Timbers 2002]), and environmentalists and others sensitive to nonhuman life. The flourishing of both biological and cultural diversity is not only an end, in the Celestine worldview. The envisioned consciousness change is dependent upon both biological and cultural diversity, for both contribute insights and critical energies to the awakening of the human species, upon whom the unfolding New Age most depends. This provides a strong rationale for environmental activism and solidarity with indigenous cultures, the latter of which, in the Celestine worldview, are often more attuned to animals and nature, one of the key sources of spiritual insight.

In part because natural sites are portals between worlds, it is in the spiritual interest of humankind to protect such places and biological diversity. We need these species “not

because they are part of the balanced ecosphere, but because they represent aspects of ourselves that we're still trying to remember" (Redfield 1996: 221), including our ultimate destiny. Redfield believes that one of the obstacles to the envisioned transformations is that "few of us have experienced the mysteries of the wilderness" (Redfield 1996: 222). For consciousness to awaken, humans must continually refine their spiritual sensitivity, and the prospects for this depend on nature. Healthy forests, for example, provide more dynamic energies and greater potential for transdimension communication and thus need reverent protection. Moreover, "the truth is that evolution is the way God created, and is still creating" (Redfield 1993: 236), and since consciousness change is an aspect of evolution, it is logically dependent on the protection of natural habitats.

Oracles, Intuitions, and Dreams

Critically important for the evolution of human consciousness is the development of our intuitive capacities. To the spiritually perceptive person, people and animals are oracles, continually crossing our paths, pointing out the proper direction for us, or otherwise providing important lessons to enhance our own spiritual evolution.

People can certainly be oracles, for "the Manuscript says we will learn that sudden, spontaneous eye contact is a sign that two people should talk" (Redfield 1993: 208), for "if we are observant about who we talk with, then we get the messages we desire as a result" (Redfield 1993: 208). The ability for others to be oracles for each other is especially powerful "in a group when all of the participants know how to interact in this way" (Redfield 1993: 212).

In their own ways, nonhuman animals are oracles too, for "When an animal shows up in our lives, it is a coincidence of the highest order" (Redfield 1996: 218), and in *The Tenth Insight* the reader learns the symbolic meanings and lessons to be learned from a number of animals encountered during the story.

The spiritual epistemology also requires that we develop and trust our own dreams and daydreams, another intuitive pathway through which spiritual insight appears. "Compare the story of the dream to the story of your life" (Redfield 1993: 164), the Prophecy declares, for dreams are to guide us, they "come to tell us something about our lives that we are missing" (Redfield 1993: 166). Moreover, not only dreams, but also everyday "thoughts or daydreams guide" the spiritually intuitive individual (Redfield 1993: 168). To recognize such things as messages "we must take an observer position. When a thought comes, we must ask why?" (Redfield 1993: 169)

Within the Celestine worldview, then, there are few if any coincidences – for the divine dimension is always trying to break through to us, awakening our consciousness. Of course, the healthier the energetic lines of communication are between earthly and heavenly realms, which is in truth dependent on the health of the natural world, the greater potential there will be for the full flowering of our intuitive capacities.

Additionally, according to *The Tenth Insight*, it is critical to maintain an optimistic and hopeful outlook, “so that we [can] finally remember the truth that our life experiences are preparing us to tell, and bring this knowledge to the world” (Redfield 1996: 234).

Between the Times

As with most millennialism, there are difficult to resolve internal tensions and ironies. It is not easy, for example, to reconcile the strongly stated value of the Earth’s living systems with an envisioned mass “ascension” from the physical realm into a spiritual one. It is interesting that, despite taking significant steps toward a nature-related religiosity, the *telos* seems to be more about transcending this world than living fully in it, unlike some nature religions. Indeed, one does not find prevalent here the language of “belonging” and “connection” to the Earth that is found in many other religions that consider nature sacred in some way, including much of the spirituality that inheres to environmentalism.

Those who postulate that nature has intrinsic value would likely complain that Redfield views nature as valuable only in an anthropocentric, instrumental way, as natural resource, to be used to promote human spiritual well-being. They might conclude that consequently, such a worldview cannot provide a strong rationale for environmental protection efforts, for personal evolution trumps all other concerns.

Redfield would likely view such complaints as typical of the kind of polarizing thinking that must be overcome with positive, conscious energy. He certainly would argue, on the contrary, that the health of the planet depends on the kind of consciousness change envisioned in his novels and promoted in his nonfiction books, and rejoinder that personal and collective evolution are mutually dependent. He might well also quote one of his characters to the effect that a spiritual approach, producing human consciousness change, is *the* way to save the planet’s biota:

Once we reach the critical mass . . . and the insights begin to come in on a global scale . . . we’ll grasp how beautiful and spiritual the natural world really is. We’ll see trees and rivers and mountains as temples of great power to be held in reverence and awe. We’ll demand an end to any economic activity that threatens this treasure (Redfield 1993: 224) . . . And we’ll understand . . . that the natural areas of the Earth have to be nurtured and protected for the sources of the incredible power that they are . . . As the human race evolves spiritually, we will voluntarily decrease the population to a point sustainable by the Earth. We will be committed to living within the natural energy systems of the planet. Farming will be automated except for the plants one wants to energize personally and then consume. The trees necessary for construction will be grown in special, designated areas. This will free the remainder of the Earth’s trees to grow and age and finally mature into powerful forests. Eventually, these forests will be the rule rather than the exception, and all human beings will live in close proximity to this kind of power (Redfield 1993: 227).

Here then is the Celestine's vision of transformation and the reharmonization of life on Earth, one that is ultimately optimistic about humans and their technology. Cross-fertilized with environmental and personal existential concerns, the result is a powerful earthen spirituality that resonates with millions of people largely unconnected with mainstream religions. Others involved in green religious production are critical of or suspicious of such New Age ecospirituality – radical environmentalists, for example, are generally critical of New Age anthropocentrism, optimism and technophilia, and would dislike these aspects of Redfield's thought. Nevertheless, his books suggest that New Age spirituality may well be turning a darker shade of green, encouraging rather than hindering environmental activism.

Redfield himself has been actively engaged in a number of environmental causes, working with the Washingtonbased environmental group Save America's Forests, and has participated in the Global Renaissance Alliance (GRA), a New Age organization devoted to peace and positive social change. Such works have earned him a number of humanitarian awards since 1997.

Celtic Christianity

God be with me, God within me, God behind me, God before me, God below me, God above me,

God where I rest, God where I rise...

(from the Old Irish prayer, “The Cry of the Deer”).

The term “Celtic Christianity” is generally used to describe an approach to the sacred that developed in Celtic lands from around 500–800. Its philosophy is often said to include a perception of Deity immanent in creation, and consequently, a reverence for nature and reluctance to accept the doctrine of original sin. Some scholars, such as Mary Low, believe that these elements result from a high degree of “cross-pollination” between Christianity and paganism in Celtic lands (Low 1996: 4–22). The distinctiveness and very existence of Celtic Christianity continues to be hotly debated by Celticists, theologians and laypeople alike.

The most detailed sources on Celtic Christian theology are Irish, because most of the oldest native written sources on Celtic traditions are Irish. While we cannot be sure that this distinctive Irish theology reflects that of Celtic Christianity as a whole, later traditions found in works such as Alexander Carmichael’s collection of prayers and invocations from Scotland, *Carmina Gadelica*, seem to reflect similar cosmological views.

One early Irish manuscript described a wondrous tree with “its upper part above the firmament, its lower part in the Earth, and every melody in its midst.” It grew down from a single root, with innumerable roots coming from it below. There were nine branches full of singing white birds, “every branch more beautiful than that above” (Low 1996: 102–3).

The tree is Christ, who is above all beings, yet born of the Earth. The tree’s melody is perfected bliss in the depths of divinity. Its single root is the Godhead, the roots described branching from the single root are the apostles, disciples, and saints. The nine branches are the nine angelic orders, “with each order more noble than that before it.” The birds are the souls of the just. After his description, the writer invoked God’s mercy, that “those of us who dwell together here . . . may dwell among the branches of that tree” (Low 1996: 102–3).

The cosmological symbol of the “World Tree” linking creation’s realms from the heavens to the underworld appears in many cultures. The downward-growing tree, rooted in heaven, appears in the *Upanishads*, the *Kabbalah* and Norse tradition, so while this is a Christian text, the idea of God as a downward-growing tree is much older (Low 1996: 103).

This archaic cosmological symbol depicts a God who is *in* his creation, as well as above it. The Irish theologian, John Scotus Eriugena (d. 877), said that God is Essence, but transcends essence, he is Intellect, but beyond intelligence, he is Substance but above substance. Creation is the emanation of God into form. All created things, from humans to plants to thoughts are *theo-phanies*, or manifestations of God. Creation *ex nihilo* is actually creation *ex Deo* (Moran 1989: 236).

The idea that God created the universe from itself is completely logical. After all, if there was only God in the beginning, what else did it have to use? While the logic is simple, the implications are complex.

The first is that God is immanent in all form. This is an extension of *animism*, the belief that all things have spirit. But it goes beyond that. God is compassionate in the literal sense – a co-sufferer *with us* in all we experience. God's sacrificial role is vast.

In this view of creation, life is not something God *did to us*. Rather, it is something we did to ourselves, since we were one with God when the decision to create the universe was made. There is risk on all sides. Even God doesn't know how it will turn out. Eriugena called the doctrine of predestination, the idea that God knows who will go to heaven or hell, "stultifying, crude and insane," in part because any being that can fully comprehend itself is finite – and the minds of God and humanity are infinite (Moran 1989: 189).

The view of creation *ex Deo* also goes some way to explaining the often noted Celtic discomfort with the idea of original sin. The British or Irish theologian, Pelagius (d. 418), asserted that Adam's sin harmed only himself and that human nature is indestructibly good. If we are made from God, how could our essence be sinful? Evidence of this view is also found outside theology. Some tales place figures from the pagan past such as the Tuatha Dé Danann in a sinless Otherworld, classifying them as "neutral angels," or branches of humanity who avoided the fall.

John Carey noted that this rapprochement between Christian and pagan traditions represents only one strand in a complex culture, but "is a notably interesting strand, reflecting a mentality for which I know of no close parallel in medieval Christendom." The Irish scholars and bishops sought to create a hybrid culture "both wholly Irish and wholly Christian" (Carey 1999: 10–11).

The points above show clear *qualitative* differences between fifth-century to medieval Celtic Christianity and Christianity elsewhere in this period, despite some scholars' opinions to the contrary.

Just as it seems that the Irish in particular would simply not accept a faith in which all their gods and ancestors were either demonic or damned, it seems that the Celts would also not accept a "fallen" world. Animistic cultures see matter as the densest level of spirit, not something separate from it. If all substance is made from God, then it cannot be profane.

It also follows that God can be experienced through nature. Eriugena, in his *Aulae Siderae* said: "If anyone with pious heart raise the wings of his mind . . . Entering the

harmony of things with wisdom as his guide / He will perceive with the clear sharpness of reason / All places, all times, filled with the God-Word” (O’Meara 1988: 185).

The experience of God through form can also lead us beyond form. Eriugena said that we can experience *theosis*, or deification, through contemplation (Moran 1989: 148, 253). In *theosis*, we experience the melody within the great tree, “the perfection of bliss in the mystic depths of divinity.”

The experience of God with us and *within us* means that the physical world is not “lower” than the spiritual world. Remember that the nine branches of the great tree are the nine heavenly orders, “with each order more noble than that before it.” The single root of Absolute Deity is in heaven, but the tree grows downwards. Therefore, the loftiest of the divine orders *is that which touches the Earth*.

Celtic Spirituality

It is widely assumed that Celtic spirituality epitomizes and promotes a particular reverence for, understanding of, and relationship with nature. Many conceptions of Celtic spirituality are predicated upon the image of the Celt as inherently spiritual and intuitive guardian of that which is “lost but longed for” in contemporary society in a respectful, symbiotic and sacred relationship with nature. This characterization may be contested, but it is hugely influential. Any blanket pronouncement on the nature of Celtic spirituality is fraught with difficulty, due to the potential breadth of understandings of the term Celtic. If linguistic evidence is taken as the basis of defining the extent of Celtic culture, it stretched from Scotland in the north to Tuscany in the south, from Portugal in the west to Galatia (Turkey) in the east. Many involved in Celtic spirituality now prefer to concentrate on those areas where the “insular Celtic” language group (including Breton, Cornish, Irish, Manx, Scottish Gaelic and Welsh) survived into the nineteenth century and continues in both traditional and revived usage.

The term “Celtic spirituality” in twenty-first-century parlance covers a huge variety of belief and praxis and involves a wide range of contemporary spiritual seekers – Christian, New Age, (Neo) Pagan, Druid and non-aligned. Current Celtic spirituality looks back to two main forms of “historic” Celtic religiosity, pre-Christian Celtic religion and Celtic Christianity. On the assumed basis of a common Indo-European heritage, some link pre-Christian Celtic religion (particularly Druidry) with Hinduism and Buddhism, while those who regard Celts as Europe’s “native peoples” look to contemporary indigenous religions for inspiration. In contemporary Celtic spirituality, Celtic Christianity is generally characterized as gentle, tolerant, meditative, egalitarian, world affirming and holistic, and it is assumed that many of “the old ways” survived either overtly or covertly within it.

Leaving aside the provocative views of some archeologists and anthropologists who question the existence of an identifiable, self-aware and coherent Celtic culture prior to the eighteenth century, Celtic spirituality – both preChristian and Christian – is regarded by many as identifiable in form and substance across many centuries.

Sources and Speculation

Most sources of evidence do not come handily labeled with the precise intent and worldview of their originators and subsequent users, allowing for a great deal of interpretive flexibility.

Written sources in relation to pre-Christian Celtic spirituality are problematic, for as oral tradition was central to Celtic-speaking peoples at this time, no contemporary “insider” literature exists. The earliest accounts of Druidry (regarded by many as Celtic nature religion *par excellence*), for example, come from classical authors rather than practitioners. It is only after Christianization that Celtic myth, history, story cycles, poetry, etc. go into written form in various languages, and it is thus difficult to gauge the age, authenticity and original purpose of much of this material. The presence of pre-Christian material in literature produced in a Christian context has also been used as evidence to suggest the continuance of older ideas and ways (such as reincarnation and reverence for nature) alongside the new religion. The Arthurian myths, powerful sources of inspiration for many modern spiritual seekers, are seen to epitomize such blending, with Merlin as Arthur’s Druid, and the physical condition of the land being closely connected to the moral and spiritual state of the nation.

There is a tendency to regard all “Celtic literature” (whether early to late medieval written material or oral tradition collected in the eighteenth, nineteenth, and twentieth centuries originally in a variety of Celtic languages) as uniformly “ancient” and pan-Celtic in provenance. It thus provides rich sources of speculation and extrapolation in relation to belief and practice. In Celtic myth and poetry people see evidence of a special relationship with and awareness of nature, a detailed knowledge of the natural world (expressed, for example, in herbal lore) and a blurring of boundaries between the human and nonhuman.

Art and Artifacts

Celtic art is frequently seen as instructive of Celtic relationships with nature. Artifacts such as jewelry, weapons, mirrors and metal vessels from various European archeological sites, and the distinctive high-quality artistry of manuscripts, stonework and metalwork in the early Christian period can be analyzed for clues to the worldview of their crafters. In the unbroken lines of Celtic interlaced knot-work patterns some see evidence of holism, the continuous cycles of nature, and possibly reincarnation. In the spectacular zoomorphic ornamentation of manuscripts (crafted by Christian scribes) some see evidence of shape shifting and interconnectedness between the human and nonhuman world. However, there is obviously scope for a variety of interpretations and inferences. On the Gundestrup Cauldron (dated to the first century B.C.E., found in a Danish peat-bog), for instance, there is a horned human-like figure sitting surrounded by animals and grasping a snake in one hand, a torc (metal collar or armband) in the

other. Whereas this has often been interpreted as the Celtic horned god Cernunnos, some are now more inclined to see the figure as a shaman.

Sacred Sites

The precise purpose, significance and date of prehistoric structures such as Stonehenge and Avebury are uncertain, as is the extent to which they were made or used by Celts or “proto-Celts.” However, many feel that the symbolic significance of the stone circle as eternal, egalitarian and encompassing, and the idea that worship is appropriately conducted outside in communion with nature accords with their understanding of Celtic spirituality. Whether temples, sacred (and in warlike times, neutral) space, or sophisticated solar and astrological observatories, the stone circle (ancient or newly constructed) has become a significant focus for modern Celtic ritual.

Archeological evidence indicates highly localized deities connected with specific places, springs and rivers. Some regard contemporary Celtic spirituality’s topophilia (strong attraction and attachment to particular places) in relation both to pre-Christian and Celtic Christian sites as a continuance of that tradition. In the pre-Christian period there was much activity connected with water, and certain trees were revered. It is widely assumed that many such Celtic sacred sites were Christianized; holy wells, for example, continued to be a significant feature of Celtic Christianity. Thus, in self-conscious restoration or continuance of Celtic tradition, offerings are frequently left at what are considered sacred sites and natural features such as springs and trees, with tree and well dressing an increasing activity. While some modern Pagans continue to revere local Celtic gods and goddesses (such as Sul in Bath), many now regard the various ancient Celtic deities simply as aspects of the universal sacred female; to this extent there may be a tension between the local and the global, the ancient and the modern. Burial mounds are now regarded by some Celtic practitioners as representations of the womb of Mother Earth, and used in rituals specifically for women, or used seasonally for remembering and relating to ancestors, death and rebirth.

The Celtic Calendar

Many Celtic spirituality practitioners observe the so-called “Celtic” or “eight-fold” calendar of Samhain/Hallowe’en (31 October), Imbolc/Candlemas (2 February), Beltane/ May Day, Lughnasadh or Lammas/Harvest (1 August), summer and winter solstices, and spring and autumn equinoxes; the belief that the Celtic year started on November 1st is widespread. Following this “Wheel of the Year” is thought to foster awareness of nature and the seasons, and the cycle of life, death and rebirth; customs have been “revived” or invented and rituals are frequently performed in relation to

it. Although the veracity and antiquity of the “Celtic calendar” are questioned and practitioners of Celtic spirituality in the Antipodes and elsewhere have to reverse or remodel it to suit local conditions, patterning and celebrating the year on this model is regarded as a significant means of expressing a Celtic closeness to the natural world.

Celtic Spirituality and Environmental Action

Celtic spirituality has been utilized both to foster and give expression to environmental concern. Some Celtic practitioners have felt impelled to act as protectors and protesters, particularly where ancient sites and landscapes have been under threat. In the British “Road Protest” movement, for example, some protesters (predominantly Pagan or non-aligned) self-consciously drew on Celtic myth and music for inspiration, and constructed rituals around the eight-fold calendar. Certain trees within protest camps were named and particularly honored, their well-being closely identified with that of the activists. While some Druids felt disinclined to be involved in political matters, others visited and held rituals at the protest sites to lend moral support.

Conclusion

Contemporary Celtic spirituality owes much to Romanticism and primitivism, as well as late twentieth/early twenty-first-century religious trends and environmental concerns. Nevertheless, by drawing on sources such as sacred sites, folk custom, Celtic art and artifacts and myth and literature from a variety of Celtic languages and periods, many spiritual seekers are today (re)constructing models of respectful, self-aware and appropriate engagement with nature in the contemporary world.

Centre for Human Ecology (Edinburgh, Scotland)

The Centre for Human Ecology originated with the Centre for the Study of the Future founded in 1972 by the biologist Professor C.H. Waddington in the University of Edinburgh. In the early stages of the Centre's history, pioneering attempts were made to secure a cohesive view of the implications of environmental policy and research for the global ecosystem in the face of the exponential growth and fragmentation of biological and environmental sciences. These concerns consolidated around human ecology-defined systemics of resources, environment and development (PRED), and later, as the relationship between the social environment and the natural environment, and as the study of human community.

The Centre for Human Ecology gained greater political prominence during the last decade of the twentieth century under the joint leadership of its Director, Ulrich Loening, and its Teaching Director, the radical Scottish community activist, Alastair McIntosh. While the interdisciplinary methodology was developed and applied in the teaching and research of both tutors and students in the core programme offered by the CHE, the Master of Science degree in Human Ecology of the University of Edinburgh, the personal, political and, above all, the psychospiritual implications of this holistic approach shifted increasingly from theory into practice with controversial consequences. A series of high-profile campaigns, in particular the action which eventually led to the inhabitants' buy-out of the Isle of Eigg and the Harris super-quarry public inquiry, in which the Teaching Director played a leading role, increased tensions both within the CHE, and between the latter and its host institution. McIntosh employed Celtic shamanic and bardic techniques in the empowerment of his Quaker commitment. Members of the

CHE continue to represent many shades of religious opinion and practice, ranging from Christian Episcopalian, Findhorn Foundation-affiliated "New Age," Western Buddhism, and radical ecofeminism, to Scottish and Irish "Nature Religion" centered on reverence for the God/Goddess.

Throughout the late 1980s and 90s successive British governments sought through the 1988 Education Reform Act and the subsequent *Dearing Report on Higher Education* to bring all aspects of education under ever tighter centralized control. Educational aims and objectives were required to accord a central role to generic marketable skills and "total quality" management systems applied to the production of graduates

with uniform, programme-specified skills and competences. This rationalization of education does not easily tolerate innovative and opened shamanic teaching methods directed toward the informed and critical interrogation of the commercial forces accelerating global degradation; such teaching became deviant and institutionally suspect. In addition, British universities were obliged to seek out commercial and industrial sources of funding for their core teaching (and not solely their research activity). The consequence was a tendency in universities to ensure that nothing was sanctioned which might damage income flow.

In the period from 1990 to 1996 the struggle between the CHE and the University of Edinburgh attracted international attention, and a *New Scientist* leader of 4 May 1996 described the University as “a narrow kirk” and the CHE as “a tradition of fearless inquiry.” Within the CHE itself a parallel and passionate discussion took place between advocates of radical resistance and of compromise. Whilst Principal Sir David Smith sought to defend the freedom and continued existence of the CHE, his successor in 1995, Sir (later Lord) Stewart Sutherland presided over its closure in 1996 in a blaze of publicity. In effect, radical epistemology won out, but at the ultimate price. Such, however, was the loyalty and commitment of a number of the graduates that the organization was relaunched as an independent organization with charitable status and its MSc degree validated by the Open University (Britain’s largest higher education provider). The core elements in the CHE MSc Programme in Human Ecology comprise scientific ecology, the social and psychological aspects of ecological thinking, and the motivation of human ecological activism, with particular emphasis upon the role of communities in relation to place and environment, including the spiritual underpinning of human community. The CHE now experiences an unavoidable creative tension between nationally enforced criteria of “Quality” built around the practices of efficiency, uniformity, predictability and control (demanded as the price of official validation), and a teaching programme that incorporates aspects of deep ecology and ecofeminism, and which also draws upon Scottish and Celtic spiritual traditions.

The struggle of the CHE to survive is recorded with poignant intensity in Alastair McIntosh’s book, *Soul and Soil*. The role of the CHE as a pioneering organization is indisputable; many of its original analytical insights and practices have become part of the widely distributed armory of the informed environmental movement. Indeed this very success now poses intensified questions as to the future of human ecology with which the CHE is now fully engaged.

Cetacean Spirituality

In the last part of the twentieth century, human perceptions of cetaceans (large whales, dolphins and porpoises) went through a sea-change. These mammals have always been special. They are a part of creation myths of indigenous people on ocean coasts; singled out for special notice in the Old Testament; celebrated in song, story, ritual, and art from Ancient Greece to Hollywood; and greedily hunted over centuries for human food, oil, whalebone and other products. Twentieth-century whaling technology had led to large reductions of numbers of whales, and even the endangerment of many species.

Then the tide began to turn.

In the 1960s, John Lilly's investigations revealed the extraordinary structure of the brain of the Bottlenose dolphin (*Tursiops truncatus*), leading him to speculate that the species was highly intelligent in ways that humans could measure. While still controversial, his ideas encouraged communication studies with dolphins, which are still ongoing.

In the decades between 1960 and 1980, a series of events occurred which caused a reversal from the hunting of whales and dolphins to the celebration and protection of them. These events – communication studies, the discovery of whale songs, a worldwide whale conservation effort, and whale watching – led, by century's end, to a belief held by many people that some cetacean species are spiritual beings with a message for humanity. A belief system is in the making.

During this time, Bottlenose dolphins began to be displayed in aquaria, principally in the United States, where they were trained to accomplish a repertoire of tricks for delighted audiences. The same species then was used as the star of a long-running, popular television series, "Flipper," which further influenced the general public to accept Lilly's claim of their special intelligence.

In 1972, at the United Nations Stockholm Conference on the Human Environment, a resolution was passed calling for an end to commercial whaling. It took another 14 years for that event to occur. Though incomplete, and challenged by a few nations where whale and dolphin hunting still occurs, from 1986, a worldwide moratorium on commercial whaling was agreed upon by countries signatory to the international whaling treaty. The impetus for an end to commercial whaling came from members of environmental groups in their millions who supported a "Save the Whales" campaign.

Also in the early 1970s, scientists Roger Payne and Scott McVay published their findings on the mysterious songs of the humpback whale (*Magaptera novaeangliae*). The eerie but beautiful music of this species caught the public imagination and led to

its incorporation into popular and classical music, and to further speculation about intelligence in large whales.

Another watershed event happened in the 1960s and early 1970s. In the United States, in California and Massachusetts, fishermen began to take tourists out to sea to watch the whales that moved through or fed and bred along their coasts. Whale watching grew exponentially, and, by the end of the century, had spread widely around the world. In 1991, approximately four million people watched whales every year. By 2002, an estimated ten million whale-watchers would spend an estimated US\$1 billion on tours, travel, food and hotels in 87 countries and overseas territories.

Whale watching is now a thriving business from the Arabian Sea to the bays of Ireland, from the Mediterranean off Gibraltar to the Bahamas, from the frigid waters of Iceland to South Africa, from Japan and the Philippines to Ecuador, Argentina, Belize and the Caribbean islands.

Interacting with great whales at sea touched many people profoundly. Jonathan White interviewed Roger Payne who mused:

. . . when you encounter a large species like a redwood or a whale, it introduces awe into your life. And awe is a very rare but very important experience. It's what started the major religions. Experiencing awe in the hands of the wild can cause you to feel the same essential ecstasy (in White 1995: 296).

So remarkable is this awe that guidelines drawn up for whale-watch tour operators specifically suggest that in the first close-up approach to whales, a guide or naturalist should stop talking and "encourage silence so that each watcher can have a personal encounter with the cetacean" (IFAW, WWF and WDCS 1997: 11).

Perhaps it is this "awe," coupled with continuing investigation into and speculation about cetacean's intelligence and complex societies, which gave rise to the idea that some whale species and most dolphins are sentient, even wise, beings from whom humans can learn much. Those who feel a kinship with cetaceans imbue them with a spiritual dimension. Books, films, television programs, websites, and spiritual tourism expound on the notion that whales, and dolphins especially, can and will teach humans meaningful things about life, if only we are open to the message. (An internet search in 2002, using the keywords whales+spirituality, yielded 8870 websites.)

Researcher and musician Jim Nollman studies communication with dolphins using sounds and music, recording and sorting through the messages, seeking a rebus, a language interface. In *Dolphin Dreamtime* he speculates:

...a period of time spent with free-swimming cetaceans can provide a transformational experience for human beings. This is the concept we call: the dolphin as benefactor . . . Such an experience has already proved itself . . . [and] . . . serves as an intellectual provocation, a source of joy, and, especially, a profound connection with the natural world . . . We transcend the power of dolphins as flesh and blood animals, and so, engage them as metaphor: a bridge capable of returning us to the ways and means of Gaia (Nollmann 1990: 205).

Besides whale watching and viewing cetaceans in aquaria and oceanaria, there are hundreds of other ways to interact with cetaceans. There are meditation retreats, places to swim with wild dolphins (really and virtually in cyberspace), and study tours to attempt communication. One such program, WildQuest Tours, based in the Bahamas, raises expectations in their internet brochure:

Many people have experienced that contact with these sentient beings has therapeutic effects on our physiology and our spiritual/emotional state. When they interact with humans in their native environment, dolphins seem to revel in obvious joy. Swimmers often report a feeling of deep relaxation, even bliss...

Millions of people annually chase the whales simply to be in their presence: to watch. The whales have, in general, responded by being watchable, making friendly approaches to boats, even allowing physical contact. There is sincere concern that this new form of 'hunting' for the whales disturbs some groups during mating and calving seasons, and may disrupt their migratory patterns. The emerging cult of whale/dolphin spirituality will doubtless need to establish guidelines for ethical interaction.

Award-winning author Suzy McKee Charnas could be speaking for millions of people when she eloquently describes her spiritual encounter with a humpback whale in Alaska:

I remembered Kit [a channeler] telling me that golden light projected from the mind and heart is a gift and a blessing that every sentient being can receive . . . All my energy, all my will boiled into a fierce longing to communicate that image, that recognition of the gift of joy that had been given to us with such exuberant liberality. I focused this visualized globe of light and tried my best to drive it across a half-mile of water and straight to the heart of the invisible giant swimming somewhere . . . And up he came, shooting almost entirely clear of the surface, a curving, living blade of jubilant energy. In a suspended instant I saw – with my eyes, with my mind? – something like a long, low-arching rainbow spring into being between him and us, a tensile curve of brightness hanging suspended not far above the sea, streaming slanted sheets of brilliance down the quivering air (Charnas 2001: 181).

Channeling

Channeling is an increasingly popular form of extrasensory perception (ESP) and one of the most controversial expressions of alternative spirituality. It has been defined as “the use of altered states of consciousness to contact spirits – or . . . to experience spiritual energy captured from other times and dimensions” (Brown, 1997: viii). Following J.B. Rhine’s parapsychological experiments at Duke University in the 1930s, four basic types of ESP have been recognized. Each, moreover, has biblical precedents: telepathy or mind-to-mind (subconscious-to-subconscious) communication (1 Samuel 28, Matthew 17:1–9), precognition or seeing into the future (Matthew 2:1–2, Acts 1:15–26, 11:28, 21:1–13), clairvoyance or perception of the world beyond the senses and without the aid of any other recognizable mind (John 4:16–29), and psychokinesis or mind over matter – including spiritual healing (2 Kings 5:1–27, Acts 3:3–11). Consequently, the existence of psychic experience is not a recent phenomenon, but is detectable throughout the ancient civilizations of the Fertile Crescent and Greece. We also witness it in the Puritan and Wesleyan counter-reactions to late seventeenth-century Deism that denied the validity of any intercourse with spirit entities. Apart from astral travel, which relates to the experience of the conscious self outside the body, mediumship in particular appears to be a form of clairvoyance and/or telepathetic communication with beings not of the empirical world.

Two figures have been instrumental to the pursuit of parapsychology in contemporary times: Emmanuel Swedenborg (1688–1772) and Franz Anton Mesmer (1734–1815). Although an established scientist in Sweden, following a series of conversations and visions concerning angels, Swedenborg abandoned his career to publish sixteen works based on his paranormal discourses. He denied the Lutheran doctrine of physical resurrection and argued instead that the soul passes directly into conscious spirit existence upon death. He also promulgated an exact “law of correspondence” between the physical and the spiritual. His teachings have been preserved and promulgated by the Church of the New Jerusalem, first established by disciples in London. Overlapping with Swedenborg, Mesmer was a Swiss-Austrian physician who practiced in Paris. He developed a philosophy of magnetic healing and hypnotism for which he was denounced by the French Academy in 1784 – eventually dying in disgrace. Students, however, brought mesmeric ideas to America where the clairvoyant, Andrew Jackson Davis (1826–1910), under their influence, not only claimed visionary conversations with Swedenborg and the Greek physician Galen but also developed the propensity to perform magnetic healing.

Unlike Mesmer who explained the “law of correspondence” as mediated by a universal magnetic fluid, Davis abandoned belief in animal magnetism and concentrated instead on the power of mind and mental suggestion. He is considered the seminal influence behind the emergence of American Spiritualism in the nineteenth century, although the phenomenal popularity of the séance as a religiosocial gathering developed with the “Rochester Knockings” – the alleged communication through rapping sounds by Margaretta, Catherine and Leah Fox with the ghost of a murder victim in their Hydesville, New York home in 1848. Despite the ensuing Spiritualist movement “scandal” of 1888 and Margaretta’s recantation of her recantation the following year, the movement continued to flourish and produced such “channeled” works as John Newbrough’s *Oahspe* (1881/2) and Levi H. Dowling’s *Aquarian Gospel of Jesus Christ* (1908), fostered the establishment of the Society of Psychical Research (London, 1882) and the American Society of Psychical Research (1884), and culminated with the formation of the National Spiritualist Association of Churches in 1893. One of the more renowned figures to emerge in the Spiritualist wake is Edgar Cayce (1877–1945), the “sleeping prophet,” whose messages concerning health and spiritual metaphysics were alleged not to derive through an intermediary “spirit guide” but by direct access to the akashic dimension in which all events of the cosmos are recorded.

The New Age development of the concept of channeling, however, begins with the publication by Jane Roberts (1929–1984) of *The Seth Material* (1970) and *Seth Speaks* (1972) – Seth reputedly being “an energy personality no longer focused in physical reality” (*vide* Newport 1998: 163). Apart from such Theosophists as Helena Petrovna Blavatsky, Alice Bailey and others, Roberts opened the way for the channeling renaissance and the likes of Ruth Montgomery, Virginia Essene, Mrs. J.Z. Knight (Ramtha), the “receiver” of the *Urantia Book*, Helen Schucman (*A Course in Miracles*), Ken Carey, Pat Rodegast, Penny Torres, Jach Pursel, and those who channel the collective entity known as “Michael.” Following theosophical influence, New Age channeling differs from the mediumistic enterprise of Spiritualism that seeks contact with deceased but previously known humans (friends or kin) and concentrates instead on what it considers more evolved discarnate forms such as deities, ascended masters, bodhisattvas and/or extraterrestrials. New Age channeling is more universally concerned with personal identity and growth unlike Spiritualism’s preoccupation with “proving” the existence of an afterlife and seeking personal reassurance that it will in all essentials be similar to life on Earth. Both movements, however, have been dominated by women, and both express a willingness to suspend disbelief in order to open the self for spiritual insight. Analytic reasoning is rejected in preference for the emotions and bodily centering. Moreover, both Spiritualistic mediums and New Age channels tend to cherish democratic improvisational spirituality over formal religious hierarchy and control.

Critics argue that channeling is simply a means of contacting, extracting and developing subliminal constructions and understandings from the deeper, hidden recesses of one’s self. Indeed, Roberts herself always questioned whether “Seth” was not merely an aspect of her own psyche. Viewing the contemporary development against the an-

tiquity of the prophetic and oracular tradition, channeling may represent a natural technique of harvesting the output inherent between multiple selves or parts of the individual. For the channel and the audience of adherents to his or her “transmitted wisdom,” it is ultimately incidental from where the information derives – the medium’s unconscious mind, a discarnate entity, spirit, deity or space brethren. It is the message itself that is important – perhaps giving the lie to Marshall McLuhan’s assertion that the medium *is* the message, because, despite the huge numbers of channels that have appeared in the late twentieth and early twenty-first centuries, there is a remarkable similarity between their individual messages – leading one to conclude that channeling is a nonlinear social response to lacunae perceived on one level or another within the collective milieu.

While most channeled messages have been saturated in the Gnostic and New Thought transcendentalism of the “American metaphysical movement” of which New Age is a derivative constituent, not all channeled entities need be ethereal thought forms from “higher dimensions” but can include nature spirits as well. Among the more famous instances of these last concerns, there was the channeling of Dorothy Maclean and Eileen Caddy, two of the founders of the Findhorn Community on the north coast of Scotland, with *devas* – various plant, species and landscape spirits – and the advice received that resulted in the successful production of enormous vegetables (both in size and numbers) from what had originally been the inhospitable terrain of their caravan park. In general, the forces worked with in nature religion, pagan and goddess spirituality contexts are more therapeutically emotional than the safer and kinder entities of New Age channeling. New Age nature spirits are allegedly encountered in what is known as a “vortex” sites – places such as Mt. Shasta, the Tetons or Sedona as magnetic attractors of spiritual energies from other parts of the planet or universe. Nevertheless, New Age comes close to Neo-paganism when it embraces nature mysticism in the name of Gaia and seeks to communicate or channel the Earth as a conscious, living organism.

Chaos

Chaos appears in many mythologies, including the Greek from whom the word is derived, as an undifferentiated primordial state or an abyss of mystery. Although mythic chaos was not necessarily disordered, that meaning fixed itself upon the word by the European Middle Ages when it emerged as an antonym for order and clarity. Enlightenment science, seeking to eliminate the confusion associated with chaos, did not see it as an object of study. But that changed in the mid-twentieth century, when mathematician Benoit Mandelbrot articulated a geometrical order that stressed erratic self-similarity and scale over the cleanly abstract forms of Pythagoras. Then the non-linear equations of Edward Lorenz showed that minor variations at the beginning of a process could through interaction create large differences at the end (the so-called “butterfly effect”).

From these two theories, the science of chaos was born. Now more often called dynamical systems or complexity theory, chaos theory has proven useful in discussion of turbulent systems (weather, earthquakes) as well as of periodic or cyclical events (the stock market, population growth). Challenging Newton’s theory that large effects can only be created by large causal forces, chaos theory shows that small effects, iterated through a system, can have stunningly large effects.

At the same time that chaos was emerging as a subject of serious scientific inquiry, it was also reappearing as a theme in the arts, most notably in the trilogy of novels by Robert Shea and Robert Anton Wilson called *Illuminatus!*, in which followers of Chaos and of the goddess Eris (the Greek goddess who threw the golden apple that led to the Trojan War) were pitted against fanatically orderly (but ever-elusive, conspiratorial and therefore also chaotic) opponents. Together the two forces made up the “sacred chaos,” the universal balance that demanded both order and disorder.

Shea and Wilson were inspired in part by the satirical pseudo-sect called the Discordians, who claimed to worship Eris. Although often described as a neo-pagan religion, Discordianism is rather a form of social commentary that derides conventional religion without offering any ritual or organizational alternative. Early Discordian associations were the Erisian Liberation Front and the ParatheoAnametamystikhood of Eris Esoteric, the first invented by Kerry Thornley (“Ho Chih Zen”), the second by Gregory Hill (“Malacypse the Younger”). Both were inventive writers of “tracts” that promoted anarchic Romanticism, complete with ecstatic experience, often brought about through drug use. The tradition continues in the popular Church of the Sub-Genius that alleges to worship J.R. Dobbs (“Bob”) and derides conventional religion for interfering with nature’s order, especially anarchic and unconstrained sexuality.

More seriously, chaos theory has been embraced by those seeking spiritual metaphors based in contemporary science. Notably, literary scholar John Briggs and physicist David Peat have articulated “life lessons of chaos” that resemble religious principles. Change, they argue, comes about through small actions iterated through a system; thus something as apparently inconsequential as recycling can have great ultimate results. The application of systems thinking to ecology has also been articulated by physicist and religious theorist Fritjof Capra, who describes a “web of life” of which humankind forms a part; unlike early Christian apologists who interpreted the Garden of Eden story as describing humanity dominating nature, systems thinkers envision humans as both effecting and affected by nature.

Recently, “chaos magic” has been offered as a way of linking the discoveries of science with the precepts of ceremonial magic. At its simplest, chaos magic means creating spontaneous rituals that draw from multiple symbolic sources (Western magic, Chinese Daoism, Tibetan Buddhism), interpreting the magical precept of “nothing is true, everything is permitted” to mean that creative effort makes meaning from the flux of possibility. The philosophical influence of post-war existentialism here combines with an acknowledged focus on the Dionysian worldview articulated by Frederich Neitzche, whose comment that “you must have chaos within you to give birth to a dancing star” is often cited by chaos magicians like Phil Hine. This fusion of nihilism and creativity brings contemporary chaos magicians back to the original mythic meaning of the word, for to the Greeks formless chaos was the birthplace of the universe.

Chaos, Creation and the Winter Garden

The gardening life reveals many secrets about beginnings, endings and our existence in between. From December's descent into dark (and the blankness that comes after revels and shopping sprees), chaos arises, battles of gods and elements, the primordial stew out of which order and disorder separate while Being and non-being unify. This is the unity we call "holy." Across the months, we reel along nature's rhythms from infinite to finite and back again.

In winter, massive, dramatic weather recalls the first creation, reenacted year after year, chaos marking the first bubbles of beginning. A Chinese primordial myth as old as 200 B.C.E. tells us, "In the beginning there was Chaos. Out of it, pure light built the sky . . ." Then the dimness shaped the Earth and together, sky and Earth, yang and yin, bred the Thousand Creations. In his *Metamorphoses*, Ovid (43 B.C.E.–18 C.E.) wrote, "Before the ocean, or Earth, or Heaven, Nature was all alike, a shapelessness, Chaos, all ruse and lumpy matter . . ." This, like the frozen, then mucky, thawing garden, is "land on which no one can stand." Echoing a Pelasgian creation myth, ca. 3500 B.C.E., Ovid speaks of how the fundamental forces for life are polarized and out of control.

The Tungus, native to Siberia, saw creation as "Fire on the primordial ocean. In time the fire vanquished the power of water and burned part of the ocean . . ." The oldest Japanese chronicle, the *Kojiki*, or "Records of Ancient Matters," compiled in 712, and including the earliest Shinto nature worship, outlines the lengthy, wondrous process of creation: "When Chaos began to condense, but force and form were not yet manifest, and nothing was named, who could know its shape?"

The Hindu Rig Vega questions the origins of all things long before material life was so much as a gleam in the creators' eyes. Buddhism speaks of the universe, like the days of the year, expanding, contracting, dissolving, then re-evolving, again and again, forever. All existence depends upon this marvelous, indescribable cycle. The Chinese sage, Lao Tzu, who taught that quietism and nonaction is action in accordance with nature, wrote, "The Tao, the way, stands alone / never changes . . . / Mother of the World . . . / The way that can be named is not constant." In winter, the weather not only mirrors the world's beginnings as it struggles toward new fecundity, but the garden's hibernation demands quietude, indeed endurance, from the gardener, requires patience with the season, which demands careful observance of oneness and eternity and the germination, then ripening of all creatures.

In creation myths worldwide, out of chaos, and diverse divine adventures, the forces of nature gradually sort themselves into mountain, ocean, valley, river. Tree, herb, shrub, grass, grain. Fish, peccary, cricket, deer, human, wolf, bird. All are part and parcel of the same Earth, none more or less.

Winter seems to portray the cosmic dance, the universe in flux moving toward an eventual miracle of birth, the trickle of a stream that grows into a river, an infant sliding out from between its mother's legs, a sapling. The Ainu, aboriginal peoples of Japan, describe the world's beginnings in terms any gardener can relate to when confronting the first hints of spring: "In the beginning, the world was slush. Waters and mud were stirred together. All was silence and cold and there was no bird in the air."

The process of conception is accomplished in many ways. Life springs from the limbs and blood of a dead god. It ascends from a god's vomit or from the semen of a masturbating god. It is conceived by the copulation of masculine and feminine, and Father Sun mating with Mother Earth. It crawls – a snake, a dragon, a worm, a spider – up from underground. It emerges from an egg at the bottom of sea, or from a seed in dark, moist soil. It is trial and error, everlasting improvisation.

Creation accomplished, but never completed. Chaos goes on, creating, re-creating, like the turn of the seasons. The weather will change and again change; the elements persevere as warriors in the great primeval battle. Wind combats rain; ocean combats shore. Evolution, ongoing modulation and alternation, the sacred is never static, obeys no rules.

With the creation, flora and fauna establish themselves and discover the systems by which they can survive. First attempts are the subject of folklore worldwide – how the bear lost its tail, how the bird got wings, how mountains were formed, how corn came to the people. In all these tales, and in actuality, each one's life is woven with and dependent on others.

The garden emphasizes the contrast between the outside world and the inner. We work in the garden in order to immerse our souls in the great labor of creation, in order that our spirits, through our bodies, our hands and feet, can embrace soil, root, leaf, loam, flower, bark – all that is present. To garden is be conscious of our place on Earth, in the cosmos, in the eye of the divine. To dance in sync with "now," and therefore grasp and move in unison with "always."

The garden can only mimic that divinity and act as accessible holy ground, which we can attend to and visit daily to remind us of vaster powers. In the garden, it is possible to cultivate, in shelter, a sense of place on Earth.

With our labors – reaping, weeding, watering and harvesting – with ritual, rites of seasons, the building of community around the garden, it is possible to renew a greater sense of place within nature, as did our ancient forbears.

Chaos, the dark, silent abyss from which all things came into existence, is huge and terrifying. In winter, it can be as if we are truly experiencing this time/non-time before the world came into being. The actual, nonmaterial spiritual world lies beyond

the garden walls. It is in wilderness, in sensuous, generous magnitude, in tides and volcanoes, passion and vitality, that perfection – “god,” “Chaos” – exists. Within the garden it is contained, as on a small stage, visible to us, but nevertheless uncontrollable. Within the garden, in safety, we experience the ongoing mystery of creation.

In the spring, the formless matter from which the cosmos was created slowly takes shape above ground again. The offspring of chaos, Eros, the embodiment of nature, harmony and creativity, composes into green, while Eros’ sibling Tartarus, the lowest region of the underworld, cooks up another winter.

Chávez, César (1927–1993) – and the United Farm Workers

César Estrada Chávez initiated a dynamic process of labor strikes, demonstrations, and boycott strategies that intertwined religious traditions, civil rights, and environmental justice. His lifelong efforts to address injustices against Mexicano farm workers centered on his founding the first successful farm workers' union in U.S. history: the United

Farm Workers Association, known today as the United Farm Workers Union, AFL-CIO.

From his upbringing as a migrant farm worker, Chávez observed labor organizing. After serving in the U.S. Navy 1944–1946, Chávez married Helen Fabula in 1946, and relocated to the farm-worker barrio of *Sal Si Puedes* (Get Out If You Can) in San Jose. A pious Catholic, Chávez assisted barrio priest Fr. McDonnell, who introduced him to the environmental philosophy of St. Francis of Assisi and the Church's ideas of union organizing; particularly those inspired by the Catholic papal encyclical *Rerem Novarum*, Pope Leo XIII's doctrine on labor justice. Chávez also absorbed Ghandi's teachings on nonviolent organizing and strategies of *moral jujitsu* – always keeping one's opponent off balance. Chávez became further influenced by Ghandi's interpretation of the boycott to achieve nonviolent action en masse. Together, these influences brought the ties of spiritual, ecological, and social justice beliefs, making Chávez one of the foremost historical figures of the environmental justice movement.

In Sal Si Puedes, he met several lifetime-organizing influences like Fred Ross of the barrio-based Community Service Organization (CSO). Ross' tactics and their link to Saul Alinsky's nonviolent tenet throughout the programs sponsored by the Industrial Areas Foundation, including the CSO, appealed to the inexhaustible spirit for social justice that drove Chávez. He became a vital CSO director by the late 1950s; and had become closely tied with his most trusted career associate, the gifted labor-contract negotiator Dolores Huerta. In 1962, Chávez resigned from the CSO, to found the first grassroots farm workers union in the United States. In 1965, nearly 150 farm worker delegates, agreed on the official name the National Farm Workers Association (UFWA).

By 1968, the public had become acutely aware of the danger of pesticides, particularly DDT as a result of the legacy left by Rachel Carson's *Silent Spring*, which decried the agricultural industry's destruction of species and their habitats. Chávez studied the health and ecological impacts of pesticides with deep concern for the farm workers. Carson had focused mainly on the ecological destruction, and contributed a

few chapters to the human impacts, naming the general public and more specifically miners, farmers, scientists, and spray-pilots as the direct human victims of the poisons. Chávez raised greater social consciousness about realities of farm workers who experienced the most intense harms of pesticide use. Chávez drew upon the interconnection of social justice and ecological sustainability. This was pronounced when Chávez and the UFW joined with the California Rural Legal Assistance and the Environmental Defense Fund to ban DDT. Although this united effort has been described as a “marriage of convenience” between labor and environmental groups, it was Chávez who kept the attention on ecological and human impacts and residual dangers in our food, even after the ban on DDT led to less ecologically damaging pesticides and the subsequent easing off by environmental groups. Aldrin, deieldin, endrin, parathion, TEPP, and other pesticides presented extreme dangers to the farm workers despite the impression that they were more environmentally safe than DDT, which often meant a more continuous and extensive application. Pesticide issues have been constantly addressed in the UFW newspaper *El Malcriado*, and the case against pesticides grew into vigorous labor campaigns, such as the 1975 Agricultural Labor Relations Act, a legislative action to ensure collective bargaining, supported by then California Governor Jerry Brown. Later legislative attempts, like California’s Big Green initiative in 1990, the breadth of which extended to protect redwoods and farm workers, displayed the historical pattern of collaborative efforts between the UFW and environmental groups. Today pesticide issues remain a priority for UFW-CIO’s campaigns, not only in the U.S., but also extending to many global locations where farm workers face the same hazards that Chávez addressed.

Chávez must also be recognized for his ability to emphasize the religious significance of human suffering, sacrifice, and penance as a means for lifting the faith of followers. The demonstrations, strikes, and long marches were viewed as spiritual pilgrimages. On 16 March 1966 Chávez led the most renowned of the UFWA pilgrimages in a 25-day march covering 250 miles from Delano to Sacramento. The event began as a UFWA support for Filipino workers against the Di Giorio Corporation, and grew into a fight for Mexicano workers with national media attention and sympathy. Imagine farm workers, clergy, and supporters led by the famous image of the UFWA, the black eagle on a red background (the colors meaning *Huega!* or “strike” in Mexicano tradition) and banners in patronage to The Basilica of The Virgin of Guadalupe: the symbol representing the Mexican religious heritage grounded with pastoral and environmental values. To Chávez, the march was a pilgrimage and union of socio-religious significance: “a trip made with sacrifice and hardship as an expression of penance and of commitment – and often involving a petition to the patron of the pilgrimage for some sincerely sought benefit of body or soul” (Hammerback and Jensen 1998: 40). Soon after the March on Sacramento, when the UFWA engaged a struggle against Perelli-Minetti vineyards, which contracted with the Teamsters as a strikebreaking strategy, Chávez began his signature of long fasts, an expression of his devotion to *La Causa*, his life of sacrifice and penance.

Chávez's career involved many close ties to individual clergy and church organizations, such as the California Migrant Ministry. His actions drew dramatic response from the various churches. At times these would be controversial, as in an early experience of his in which while working closely with a Pentecostal preacher in Madera, a

Catholic priest rallied with McCarthyist fervor to have Chávez condemned as a Communist. However, most responses would be historical events like bridging the traditional gulf between the Catholic and Protestant Churches. Influenced by the papal encyclicals and drawn to *La Causa* of Mexicano workers, respectively, the Churches united in support of the farm workers' struggle.

César Chávez inspired people with the affect of a spiritual leader as much as a political one. At a time when Mexicanos lamented the lost *Mexicanidad* ("soul"), Chávez embodied a humility and spirit for social justice in the Mexican religious and pastoral heritage. His strategies appealed across Mexican economic classes, and he introduced a new labor perspective to the civil rights movement, reflecting Mexicano identity in its best light. A testimony to Chávez's personification of the lost *Mexicanidad* is reflected in his genuine appeal to sacrifice, penance, and desire to make a world change toward social justice. On 23 April 1993, during one of these appeals involving one of his many fasts, César Chávez died in his sleep. Of his many accolades for his service to human dignity, in 1991 he received the Aguila Azteca (The Aztec Eagle), Mexico's highest award presented to people of Mexican heritage contributing to its legacy beyond the Mexican borders. In 1994, Chávez posthumously received the Presidential Medal of Freedom, the highest civilian honor in the United States.

Chinese Environmentalism

In recent years the number of non-governmental organizations (NGOs), or social organizations (*shehui tuanti*) as they are preferably called in China, has increased enormously. Non-governmental organizations are a relatively new phenomenon in one-party state China, where the all-pervasive government traditionally used to take care of virtually all aspects of public and private life. The rise of NGOs can be witnessed in several fields, but environmentalism represents one of the most vibrant and dynamic sectors of non-governmental activity. The high interest among certain groups of Chinese citizens in environmental protection as a field for active participation (as compared to other fields) contributes to the growth of green NGOs. Possible explanations for citizen involvement in the environmental field are its alleged political innocence, the occurrence of environmentally induced health risk or the large media attention for environmental topics. A less pragmatic explanation could be that the typical “Chinese” perception of nature, based on traditional religions, encourages environmental activism.

A Chinese Perception of Nature?

Chinese religions have in common their holistic worldview and sense of the cosmos as a unity. Interrelatedness between humans and their environments are at a philosophical level especially emphasized in Daoism and Buddhism. Many Western scholars have studied traditional Chinese religions as potential sources for renewal of the environmental and ecological discourse in the West. The holistic character of Daoism and Buddhism is often thought to encourage respect and care for nature.

But it can be questioned whether a holistic worldview in which nature is an intrinsic part of the wider cosmos actually favors human respect for the environment. The Chinese have always operated with the idea of human life as belonging to the spontaneously self-generating life processes of nature, without beginning or end. According to Ole Bruun, this might have prevented them from assigning an intrinsic, independent value to nature separate from its benefits to humanity. There appears to be some support for this argument. Paolo Santangelo studied literature and paintings of Ming-Qing times searching for the nature conceptions of Chinese artists. He finds two ways of interpreting nature: (1) as a metaphor that expresses human emotions and (2) as an opportunity for aesthetic pleasure and/or religious contemplation. He concludes that the Chinese (artistic) perception of nature is characterized by a “humanization of nature,” bearing hardly any relation to “real” nature and environment.

This is also reflected in the Chinese practice of fengshui, which stresses that the environment should be “harmonized,” but exclusively so for the purpose of personal benefit. Great concern is expressed for the immediate nature; how to bring it to bear positively on human fortune, whereas the distant, the invisible or other people’s nature are not included in Fengshui concerns. Fengshui optimizes the use of natural powers, almost to such an extent that nature does not only contain resources, but is a resource *per se*.

Environmental NGOs and Chinese Religion

The reality of resource depletion and environmental degradation is at the source of NGO-development in China. Research into several environmental groups (mostly located in Beijing) points out that the founders of environmental NGOs judge the negative environmental side effects of human activity not only from pragmatic, but also from moral and ethical points of view. However, the employed moral arguments seem not typically derived from Chinese belief systems. Also in practice, Chinese environmentalists appear not to be typically Chinese in their approach of and view on environmental issues. Environmental concerns that inspire activism all over the world are equally important and evident in Chinese NGOs. An example of this non-typical Chinese framing of issues forms the appeal for an Anti-Animal Abuse Law, published in the August 2002 International Newsletter of “Friends of Nature,” one of China’s most renown NGOs:

In China domestic animals live solely to feed humans. If we use them, we should at least let them lead natural lives and not torture them . . . In the late twentieth century most countries in the world including those in Asia, Africa and Latin-America enacted Anti-Animal Abuse Laws . . . Now it is widely believed that a civilized country should establish humane laws for the benefit of animals; cruelly killing and destroying life is incorrect and human’s basic responsibility is to care and promote life (Author’s translation).

Instead of referring to traditional Chinese culture and religion, global morality is drawn on to question the treatment of animals in Chinese society. In general, it seems safe to conclude that China’s better-known environmental groups are not driven or inspired by typically Chinese or religiously inspired nature perceptions. Perhaps this can be (partly) attributed to the problematic position of religious beliefs and practices during certain periods of the Communist regime. Especially during the Cultural Revolution Chinese citizens were allowed limited space to engage in religious contemplation, which might have driven religiously inspired man-nature perceptions from the practical consciousness.

It is nevertheless true that religious practices sometimes do play a role in environmental protest in China. The social anthropologist Jun Jing, for example, describes two cases in which rural victim interest groups become engaged in direct environmental protest. The first case involved a decades-long protest movement against a fertilizer

factory in Gansu province. The second case involved the first confirmed protest movement against local population resettlement for the Three Gorges Dam project on the Yangzi River. Jing concludes that the interest groups in both cases operated within a traditional “cultural and symbolic life world” in which funeral symbolism, morality tales and cosmological beliefs – such as the worshipping of goddesses and deities – played an important role in mobilizing participants and providing ways for them to express dissatisfaction. In the Gansu case, temples dedicated to the “fertility goddess” were reconstructed as a reaction against the factory’s threat to physical health. The protesters against the Three Gorges Dam Project wore traditional funeral gowns to enforce their claims.

Although religion seems to have little influence on the environmental perception and activities of NGOs, traditional (folk) religion appears of more significance for less formalized environmental interest groups.

Chinese Traditional Concepts of Nature

Chinese culture encompasses a quarter of humanity and the major part of East Asia. At its heart is the oldest continuous religious tradition for which we have written records, going back well over three thousand years. The religious practices and ideology expressed in these documents are integral with archeological finds of ritual paraphernalia which indicate that this religious understanding was already present in the Neolithic Age of East Asia, long before the development of writing.

Recent archeology indicates that Chinese civilization had at least two centers several thousand years ago: a millet-based culture in the north, and a rice-based culture in what is now central and southern China. The two fused slowly together, and China as a single cultural entity reached its present boundaries around two thousand years ago. (The present political borders maintain those of the Manchurian Empire which collapsed at the beginning of the twentieth century and include a number of autonomous regions in which Chinese culture is not the dominant tradition.) Each region had somewhat different practices surrounding the essential aspects of religion discussed below, although these differences are as yet unclear. But even today, there are minor variations in religious practices, such as grave designs, between northern and southern Chinese culture.

Early Chinese civilization, particularly in its northern homeland, had more than frequent lack of rain to hamper agricultural development. The wide Yellow River (Huangho) which runs through the midst of it is so named because it is thick and turgid with a powdery, yellow soil it picks up at its origin in the west. Northern China is in large part a level plain and the river has a tendency to flood in the spring. People lived along its shores and early began to build dikes, both to contain the floodwaters and for irrigation. Because the large amounts of soil carried by the river settled to the bottom, the river tended to fill its bed between the dikes, requiring them to be raised higher and higher. Eventually the riverbed was higher than the surrounding land. Thus, when the dikes broke, flooding was massive, at one time leading to the mouth of the river moving five hundred miles from where it was before the flood. China's mythic culture heroes are those who oversaw the building of the dikes. Chinese culture did not understand this as conquering nature but working with it. If the dikes failed, this was due to human error, not an errant nature. Nature was understood as numinous and to be propitiated rather than controlled. This attitude toward nature continues to perme-

ate traditional Chinese culture to this day but not those contemporary developments influenced by Western industrial globalization.

The Essentials of Chinese Religion

Chinese religion focuses on family to the degree that some scholars have called it “familism.” The understanding of family exists on two levels: the nuclear family, which in China would be multi-generational and include uncles and aunts; and the clan, which includes all those who understand themselves connected to the clan no matter how distantly in the past the clan can be traced. To put it another way, the clan consists of all of those with the same surname; and there are but a hundred surnames for the billion and a quarter Chinese. Clans are patrilineal; the religious life of a woman lies primarily within the home of her husband’s family. On death, she will be worshipped along with her husband on the altar in the home of her son’s family.

The primary religious ritual consists of the offering of food and wine to the deceased of the family, which is then eaten by the living members of the family. This sacrificial ritual is, in effect, a periodic family banquet to which the dead of the family are the honored guests. The primary locus for this ritual is in the home for the immediate family and the clan temple for the immediate sub-clan founders and most honored of the sub-clan ancestors. The eldest of the family and clan, male and female, function as the chief priests of this religious construct. This pattern, save for details, has remained unchanged for several thousand years to the present. For at least the last two thousand years, this was the religious pattern of all classes of society, from the Imperial family to the lowly peasant. Not only religion, but social and political structures and concepts were also based on the concept of family.

Ideologically, this means that the most important sources of the numinous; the primary spirits to whom religious practices are addressed is the family in and of itself. Traditionally, as well as today, the Chinese do not understand themselves as primarily individuals, as is in the modern West, but members of a social unit, particularly family and clan. Chinese do not put themselves first and foremost, but put primacy on their families, and after family, other social units of which they are a part.

For the last thousand years, similar offerings were also made to non-family dead who have become deified, including Daoist and Buddhist deities. Deities are predominantly ghosts who have been recognized and treated by humans as deities because of their demonstrated benevolence through possessing humans. In China, both ancestral spirits and deities can be spoken to and touched because of their presence through spirit possession when there is need to communicate with them.

There are also a large group of numinous entities that in essence are nature spirits to which sacrificial offerings are also made. Sacrificial offerings are generally of incense, wine and food, which are left in front of the images, whether of the deified dead or anthropomorphized nature spirits, long enough for the spiritual essence to be eaten

by the deities. Afterwards, the material aspect is usually eaten by those making the offering.

Religion and Nature

From 2200 years ago until 1911, China had an imperial government. The theoretical justification for the position of Emperor was that only he and his consort, symbolically the Father and Mother of the People, could sacrifice to the ultimate cosmic parents, Sky-Earth (*tiendi*). This was because the Emperor was the Child of Sky (*tienzi*), for his ancestors, having been the most powerful personages while alive, remain the most powerful spirits when dead. Accordingly, for anyone else to sacrifice to SkyEarth amounted to treason, as such an act was a claim on the imperial prerogative. Imperial lineages tended to trace the clan back to a spirit progenitor, usually a nature spirit.

A second ideological approach to the understanding of Sky-Earth, arising out of early Daoist thought, was stimulated by the ecstatic experience of nothingness (the mystic, zero, void experience): Before anything exists, there is nothingness (an actual experience, not a philosophical supposition). As one returns from the ecstasy of nothingness there is a “somethingness” that is at first singular, termed the “Dao” for lack of a descriptive word. Our minds automatically differentiate, so the perception of the Dao leads to discrimination, to the one becoming many. At first the one becomes two, and these two are the progenitors, through continued division, of all that exists. With regard to cosmogony, the “two” exits in dual modes. As the malefemale pair, Sky-Earth, they are the parents of all physical manifestations; from Sky-Earth, humans receive their bodies. As the female–male pair, Yin-Yang, they are the source of energy; from Yin-Yang, humans receive their life force (*qi*).

Originally, the imperial altar to Sky-Earth was a single one, but nearly five hundred years ago, the altar was divided. One can still visit the imperial altars in Beijing, where they are now public parks. South of the imperial palace, on one side of the straight road leading to it, is the Altar to Sky, a round – the symbol for Sky – altar of three layers made of white marble. North of the palace is the Altar to Earth, a three-layered, large square – the symbol for Earth

– made of Earth. Balancing these two altars, to the east and west of the palace are, respectively, the Altar to Sun and the Altar to Moon. Across the thoroughfare from the Altar to Sky are a complex of altars, including an Altar to Sky Spirits (specific constellations and planets) and an Altar to Earthly Spirits (specific mountains and rivers). To the east of the entrance to the palace was the Clan Temple of the imperial clan and to the west, the Altar to Soil and Grain. The latter is similar to the Altar to Earth with but a single layer, and signifies the imperial rule over the land of China.

In summary, the entire cosmos, all of nature, was understood to be numinous. The various components of the cosmos were perceived to be individual deities: Sky, Earth, Sun, Moon, Stars, Planets, specific mountains and rivers, and fertile Soil. All received

sacrificial offerings in elaborate ceremonies of which the Emperor and his consort functioned as the chief priests. The Emperor, at least once in his reign, almost always made a pilgrimage to Mount Tai (“Great Mountain”) to make offerings to the mountain on its summit, and also directly sacrificed to other geographic deities. Mount Tai remains a favorite pilgrimage and tourist site. Government officials, representing the Emperor, made offerings to lesser mountains and waters.

The ritual sacrifices carried out by the Emperor and government officials were not essentially different from those of the general population; they differed primarily in scale and scope. The most important nature spirit is Earth, who is differently conceived depending on function. Some aspects of Earth are not actually nature spirits, examples being the Lord of Earth, once a female deity, who is now a male bureaucrat in charge of the dead souls residing in the ground, and the Lord of Place, a protecting deity of a locality. But known simply as Mama Earth, she is the Earth itself deified. For farming families, Earth is the generative couple, Grandmother and Grandfather Earth. Their images are found on the family altars in farmhouses and in shrines built on the edge of farmland. Also deified are very old trees and unusual rocks, as well as streams, lakes and waterfalls. It is common to find a red cloth tied around such trees or a simple container for incense at their base.

Aside from offerings to nature spirits, nature plays a major role in religious practices in two further regards: divination and geomancy. Again, divinatory practices in China are as old as we can trace back the culture. Originally, they seem to have been techniques to gain advice from the clan dead, but divination took on philosophical understandings that were based on nature. For the last three thousand years there has been a concept of *tienming* (Sky-pattern). Until recently, the concept was misunderstood in the West, with Sky understood as a male, anthropomorphic, quasi-monotheistic deity on the order of YHWH; hence, *tienming* was interpreted as God’s commands: “the Mandate of Heaven.” But the Chinese understanding of *tienming* is the star-pattern of the Sky, intimately connected to astrology-astronomy. *Tienming* means the way of the cosmos, the way of nature. Humans, to be successful in their endeavors, should attempt to attune themselves to the natural order. Divination can be used to aid in determining the way the cosmos is going. Deities can be appealed to for assistance in these endeavors, but only if success fits within the natural pattern. Nothing can help if what is desired does not fit the natural order.

A second practice relating to nature in these regards is *fengshui* (literally: “wind & water”) or geomancy. The success of a family depends on the comfort and spiritual power of the deceased members of the family. Aside from the offerings made at funerals for the comfort of the dead, equally important is the situation of the grave with regard to the pattern of Earth. Specialists situate graves in a complex process that takes into account direction, slopes and running water. A properly situated grave places the dead into a comfortable and spiritually potent situation, thus increasing their power to assist the family through being in accord with Earth’s power. *Fengshui* is also used to situate buildings for the same purpose, particularly large businesses, such as modern banks.

Fengshui adds a physical harmony with nature along with the behavioral harmony with nature made possible through divination.

Religio-aesthetics

From 2500 years to approximately 1000 years ago, Chinese society underwent a transformation that led to a shift from an elite based on heredity to one based on education. A high degree of literacy has been one of the traits of aristocratic status as far back as we can trace Chinese civilization (the majority of Chinese were functionally literate long before the modern period). Different from eastern Mediterranean civilizations, there was no separate priesthood. The original aristocrats were not only warrior-rulers but priests of the clan-based religion. Hence, the king and later emperor, with his consort, were the chief priests not only of their clan, but also of China itself. Writing, from its inception seems to have been based on the use of brush and ink, rather than a stylus, and the written language never lost its pictographic roots in becoming logographic, rather than alphabetic. In essence, this meant that by 2000 years ago, the elite were highly educated government officials who were not only historians and philosophers, as well as ritual specialists, but masters of the brush.

When the first major Chinese empire, contemporaneous with the Roman empire, collapsed eighteen hundred years ago, one of the failed attempts at reform, a revolutionary, communistic, religio-political movement, continued as a purely religious organization. This was the Daoist Church, consisting of hereditary priests in a hierarchical system who performed auxiliary rituals connected with the ancestrally focused Chinese religion for the population as a whole. It grew literally alongside Buddhism, then becoming domesticated in China. One of the features of this Church was spirit (automatic) writing. This practice arose from a number of factors coming together: spirit possession present in China from the distant past, the concept of *ziran* (spontaneity/nature – to which we shall return) of Daoist thought from at least 2400 years ago, and the long experience with the writing brush. Spirit writing was the source of a religio-aesthetic that was the basis of the Chinese cultural approach to nature thereafter.

Ziran is essentially untranslatable. Literally, it means that which arises out of itself. From the cosmogonic standpoint, it refers to the self-generation of the world (nature), as described above, in a creation that is continually arising from nothingness. On the individual level, it means that we create ourselves from the material of Sky-Earth and the *qi* of yinyang. The term provides the essential understanding of nature, that everything natural (including humans) is self-creating. This is a far different understanding of nature from that of the West, where nature is understood to be created by a monotheistic God for use by human beings. Hence, *ziran* is also translated as “nature.”

The spirit writing of the early Daoist Church was done by a person in trance who was possessed by a deity. It allowed a deity to directly communicate with humans through writing. Writing, since its inception in China, had primarily been used as a means to communicate with the spirit realm. Now it was also a means for the spirit realm to communicate with humans. Since the writing was by a person in trance, it was done in a spontaneous fashion, similar to the then-common quick writing as opposed to a deliberate careful writing (equivalent to our informal handwriting as opposed to formal hand printing). This style of writing stimulated a new style of quick writing based on an aesthetic of spontaneity. The writing ideally takes place without conscious thought. Being spontaneous (*ziran*), it was one with nature (*ziran*) in and of itself.

This aesthetic, which linked the wielder of the brush to nature itself (virtually a possession by nature rather than a deity), became the primary religious activity of the elite when not in office. This accorded with the dual religious orientation of the elite based on a distinction between occupation and avocation that had already been present for several hundred years and continues into the present. When in office, the elite carried out state rituals, similar to the clan ritual practices in clan temples and family rituals carried out in the home; and their ideology was that of *rujia* (the ever-changing ideology of the civil-service system, mistranslated as “Confucianism” in the West). When out of office – whether due to vacation, retirement, or exile – their religious practices were linked to their spontaneous use of the brush, based on Daoist (*dao**jia*, not the Daoist Church, *dao**jiao*) ideology. These activities are called the “Three Treasures”: poetry, calligraphy and painting. Preferably, they took place in elaborate gardens, and the elite surrounded themselves, when possible, with signs and objects of nature.

The focus of these *ziran*-oriented activities is *shanshui* (“mountains & waters,” usually but imprecisely translated as “landscape”). *Shanshui* embodies the Dao; it is the quintessence of nature. Mountains are the solid essence, and rivers the fluid essence, of the Dao. As such, the subject matter focused the mind on the Dao, and *shanshui* is used for that purpose in Daoist and Chinese Buddhist meditation practices. But *shanshui* is not a metaphor for the Dao; it *is* the Dao. Hence, many of China’s poet-artists hiked in the mountains.

One well-known fourth-century poet, Xue Lingyun, involved with early Buddhism, invented a mountainhiking shoe with removable studs. He concluded a poem with the lines: “Observing this [*shanshui*], the realm of humans vanishes; / In a flash of enlightenment, everything falls away” (Paper 1995: 169). This relationship of poetry, nature and mysticism, never ceased. Mao Zidung begins a poem, “Ascending Mount Lu,” where he had his summer home and an old center for Buddhism and Daoism until the monasteries were destroyed by Christian missionaries, with the lines: “Single mountain peak floats beside Great River [Yangtze]; / Briskly ascend fourhundred verdant switchbacks” (Paper 1995: 159). He ends the poem with references to and metaphors for ecstatic religious experiences. Buddhist monasteries and Daoist temples were built on the most scenic mountains where they continue to serve as hostels for those who

seek to immerse themselves in nature, whether or not the traveler is oriented to either of these traditions.

Professional painters also focused on *shanshui*, but their purpose was not to stimulate ecstatic experiences in themselves while painting but to create windows into nature for their urban, elite clients. By a thousand years ago, the elite, given their expertise with the brush, began themselves to paint. Their favorite subject matter was *shanshui*, but their purpose was not to represent nature, as did the professional painters, but to express themselves naturally by relying on spontaneity. This religio-aesthetic is expressed by a contemporary painter, Hong Shiqing, who was commissioned by a fishing commune to create art from the natural shoreline rocks of an island. Hong quickly used his brush on large rocks, following their natural lines, to create images of sea creatures. These painted lines were then deepened by stone-cutters. Hong wrote of these works that he “utilizes spontaneity [*ziran*] to beautify nature [*ziran*],” that his “artistic creations must become a single entity with great nature/spontaneity [*ziran*]” (Paper 1995a: 191–3). Since the end of the Cultural Revolution (see below), calligraphy and painting have become pastimes of ordinary people – factory workers, etc. – with government encouragement.

The understanding of *shanshui* as the manifestation of *ziran* and the embodiment of the Dao was all-pervasive in elite Chinese culture. It not only encompassed literature and the visual artist, but music as well. The musical instrument of the elite, the *qin*, was an archaic, fretless, stringed instrument of thick wood with a tiny soundbox. Never an instrument of performers, it was used for personal meditation, and the favored musical theme was again *shanshui*. Furthermore, the elite created whole environments based on *shanshui*, gardens of all sizes whose purpose was to create an actual atmosphere of mountains and waters. The focus of the garden is extraordinarily eroded rocks whose appearance captures the essence of the fundamental characteristic of the cosmos: change within permanency. The city of Suzhou is famed for its gardens, which are now open to the public and easily visited.

The oldest Chinese text, the *Yi* (Changes), is a divination manual that also, with the addition of appendices, became a philosophical text that emphasized that the only constant in the universe is change itself. Rocks and stones with water-worn holes and contours or interesting striations demonstrate change in permanency. Such stones became icons of nature in all of its religious understandings. Not only did the gardens emphasize bizarre rocks, so also did miniature tray landscapes, and unique rocks were mounted on pedestals and treated as *objets d’art*. Slices of rocks exhibiting remarkable striations were framed as paintings and inlaid into furniture. Bowls of stones under water, to bring out their colors and vibrancy, were placed on tables. And the most intimate objects of the literati, the “seals” with their names, came to be made of special stones that captured the spirit of nature. Although the elite lived in an urban culture, they strived for an environment that intimated nature wherever they turned, and these attitudes became pervasive among the Chinese as a whole.

Conservation and the Impact of the West

The earliest Chinese texts on political philosophy understood that an economy in which all would have sufficiency was essential for popular support of the government, and that the basis of a stable economy includes conservation measures. Two thousand four hundred years ago, Mengzi (Mencius) was writing about regulating the mesh size of nets, so that small fish would have a chance to grow to adult size, that animals should only be hunted at certain times of the year so as not to interfere with reproduction, and that the taking of lumber in wooded areas should be controlled. Mengzi and later political philosophers, not usually successfully, were also concerned that the wealthy did not waste resources through unnecessary conspicuous consumption. They promoted an understanding of socio-economics in which the public weal (*gong*) was the good, and private utilization of resources (*si*) was evil.

Until the mid-twentieth century, Chinese farming tended toward very small plots intensively cultivated, particularly in the wet-rice agricultural areas. The welfare of the farm family was dependent on these plots, so they were carefully tended, with great respect paid to the numinous aspect of Earth.

China's population remained relatively stable until the introduction of indigenous American foods in the sixteenth century by the Spanish, when, as in many places elsewhere in the world, the human population exploded.

These foods included highly nutritious ones such as corn, which replaced millet in the north, beans (save for soybeans which China long had), peanuts and potatoes, as well as condiments, such as hot peppers and tomatoes. In the last three and a half centuries, China's population has increased tenfold. The effects of this enormous population in a large area with but limited arable land always subject to massive flooding, combined with rapid, unregulated industrialization in the second half of the twentieth century, has been disastrous to the natural environment.

A second aspect of relations with the West that led to serious environmental problems has been Western imperialism. Five centuries ago, China was vastly superior to the West in technology, living conditions, health and economics. The last, Manchurian, dynasty was one of foreigners from the Chinese standpoint. As the seemingly inevitable dynastic decline set in after several generations, it was exacerbated by the distance between the Manchurian rulers and the Chinese government officials. China rapidly weakened in every regard at a time when Europe was beginning its imperialistic expansion. By the mid-nineteenth century, European and American powers found it economically advantageous to push opium on the suffering population. When the Chinese government tried to stop the trade, Western powers forced two wars on the Chinese. Each time China lost through the declining government's ineptitude. The resulting peace treaties gave Europeans and Americans ever increasing opportunities to exploit China economically and territorially, with no consideration for the environmental damage they were creating. As well, the treaties exempted Christian missionaries and Chinese converts from both criminal and civil laws, allowing them to run rampant over the people, again

with no concern for tradition or the environment. Ultimately, the Manchurian regime collapsed, leading to a half-century of civil war and a massive invasion by Japan.

The Chinese Communist Party eventually won the civil war against the corrupt Nationalist Party, which was supported by the United States. With China in ruins from a century of warfare, the new government was further handicapped by an embargo that the United States placed on China, not only with regard to its own trade, but also to trade with all the nations it could control. For a while, China was allied with the Soviet Union, also recovering from the massive destruction of the Second World War. But China, which had an indigenous understanding of Communism far different from that of Stalin, eventually broke with the Soviet Union. China was left entirely to its own resources to rebuild its economy and militarily resist the United States and the Soviet Union, with which it fought on both its eastern and western borders.

China attempted to pull itself up by its own bootstraps in the “Great Leap Forward” of the late 1950s, which resulted in a major industrial and agricultural disaster, massive starvation, and extreme environmental degradation. After a few years of improvement, the attempt to end corruption in the government with the Cultural Revolution, from the late 1960s to the late 1970s, led to a collapse of all aspects of the culture. Worse, it left a generation of uneducated Chinese, ill-equipped to improve China’s situation in the modern world, and a generation cut off from all cultural and religious roots. The attempt during the Cultural Revolution to eradicate traditional Chinese religion and society simply led to a cultural abyss and a distraught populace. Since that time, with a lessening of governmental planning and the end of the attempt to quickly reform humans into a communist ideal, at first slowly and then ever more quickly, there has been a resurgence of Chinese industry, agriculture, education, culture, and traditional religion.

From the early 1950s, agriculture and industry were formed into larger and larger communes. As large-scale industry was relatively new to China, this was not a major disruption from tradition. For agriculture, it was a different situation. In traditional China, intensive agriculture led to an intimate relationship between farmers and the land, although this often degenerated as landlords displaced farmers owning their own land until socioeconomic collapse led to a new dynasty whose first act was usually to redistribute the land to the farmers. Largescale agricultural communes, along with government sponsored Soviet-style atheism, led to a distancing of farmers from the land. Not only did agricultural production decline, so also did the land itself, as intensive care for the land in combination with treating the land as numinous ended. (The exception is far northern China, where the introduction of large-scale use of tractors and combines in the wheat-producing area led to greater efficiency.) One of the first acts of the government after the collapse of the Cultural Revolution was to break-up the communes and redistribute the land to the farmers.

The doubling of the population from the beginning of the present government in 1950 to the early 1980s gave planners pause. It was realized that continued growth would make economic improvement impossible. The human numbers would simply

destroy the environment. China became the first nation seriously to attempt to solve population growth on a national scale. Indeed, the goal was not simply to stabilize the population, a quarter of the world's, but to reduce it. Thus began the "One-Child" policy that received popular, albeit grudging, support. But the one-child policy is in direct conflict with Chinese religion, with its focus on the patrilineal family, in which the continuation of the family through the male line is *the* religious imperative. The one-child policy thus led to female infanticide or abandonment, which the government has had great difficulty in eradicating. Changes are slowly taking place, such as some people intuitively reconceiving the family as continuing bilaterally (descending either through the male or the female) given the one-child policy, although it is far too early to predict how effective these changes will be. Without stabilizing the population, however, no conservation measure can have any long-term effect.

The aftermath of the Cultural Revolution was a shift from a socialist to a capitalist-type economy with few of the controls and supports now to be found in the West (where these controls have also begun to disappear with globalization). The end of the American embargo has led to investment from Taiwan, Japan and the West. China understands that not only is major development necessary to catch up with the West, but also its only means of competing with the West, given the history of Western imperialism in China, is to become economically as strong as the West. Such rapid economic development means that environmental considerations are outweighed by economic growth. The pollution created by China's massive industrialization is affecting the entire planet. On the west coast of North America, there is frequently a dirty haze that originates in China.

Where traditional Chinese culture continued, as on Taiwan, there is a growing environmental movement, which recently halted the building of a nuclear electrical generation plant. In the industrial environment of the Mainland and the post-industrial environment of Taiwan, while traditional *shanshui* arts continue, its religious underpinnings are harder to find. Globalization and capitalism, with the singular focus on immediate profit for its own sake, leaves no room for environmental considerations, let alone the understanding of a numinous nature. The desacralization of nature on Mainland China is, in effect, deicide, the end of conceiving Earth as a nurturing, female deity on whose bounty human life depends and to whom is due reverence and gifts in recompense for her own. Yet the resurgence of traditional religion has the potential to change these attitudes toward nature, and voices trying to protect the environment are being increasingly heard. Hence, the relationship between nature and religion in China is in a state of flux.

A Note on Chinese Religion

It is necessary to clear up a common Western misunderstanding of religion in China. In the late sixteenth century, Jesuit missionaries created a trinitarian model for reli-

gion in China flowing from a then-recent Chinese term, *sanjiao* (Three Doctrines). The term was found in the expression “the three doctrines are one”; that is, that different ways of thinking in China are harmonious and complementary. The Christian missionaries instead used this term to mean that there are three exclusively different religions in China, with all that would mean in Christian culture: Buddhism, Daoism, and “Confucianism,” the latter a Western fabricated religion based on the ideology of the government’s civil service system (*rujia*). These three so-called religions actually excluded the vast majority of Chinese religious practices, including all of the religious practices discussed above. These practices are now termed in the West “folk” or “popular” religion, implying it is the religion of the uneducated masses, rather than the religious practices of all classes, including the elite. Chinese culture, despite its geographic and demographic size, is uniquely homogeneous, given regional variations. A single culture requires a single religious foundation, and for China, this is Chinese religion.

Chipko Movement

The Chipko movement evolved in what was then the Uttarakhand region of the Indian state of Uttar Pradesh to fight commercial logging and deforestation in the Himalayan foothills. In Hindi “chipko” means “to cling” or “to embrace,” referring to the “tree-hugging” that has been employed to keep trees from being felled. Accounts of the Chipko movement’s earliest protests differ, but deforestation has a long history in the Himalayan foothills, predating the incorporation of the area into British India in the early nineteenth century. However, under the colonial state commercial logging severely impacted the area; road and railroad construction further deforested the land – the wood was used for railway sleepers, for instance – and led to landslides, erosion, and floods that claimed many victims and caused extensive damage. After India’s independence from Britain in 1947, Himalayan deforestation accelerated under governmental policies that encouraged the extraction of natural resources on an unprecedented level. The deforestation and consequent destabilization of the hill communities have forced men to migrate to the plains to look for work. Women have had to spend more time and travel longer distances to find firewood, fodder, and water.

In 1973, the villagers of Gopeshwar successfully resisted outside logging interests, partly by embracing the trees the loggers were trying to cut down. Notable Gandhian activists Sunderlal Bahuguna and Chandi Prasad Bhatt, leaders of the Dashauli Gram Swarajya Sangh, were instrumental in organizing nonviolent resistance to logging that spread throughout the region. A pivotal event occurred in 1974 when the men of Reni village decided to take their protest against the logging of their forest to the authorities. While the men were in town the loggers tried to cut down the trees, but the women of the village, led by 50-year-old Gaura Devi, forced the loggers to turn back. She is reported to have told the loggers, “This forest is like our mother. You will have to shoot me before you can cut it down.” Subsequent to this protest, the chief minister of the state set up an investigative committee which came to the conclusion that the deforestation of the Alakananda valley had largely contributed to the devastating flood of 1970; a few years later, another committee similarly declared itself in agreement with the villagers, who had long held a grievance that the irregular tapping of *chir* pines for resin, in contravention of the practices which stipulated the nature of the cuts, endangered the trees. On the recommendation of the committee, the forest department soon revoked contracts for all resin-tapping in the forests; and as the nonviolent, grassroots Chipko movement spread to other villages of the Himalayan foothills, the commercial felling of trees was finally banned in 1980. Although men like Bahuguna and Bhatt have been leaders of the movement, women have been the dominant force in the struggle to

resist commercial exploitation of the forests, sometimes going against the men in the villages to save the trees. A number of commentators have even described Chipko as a “feminist” movement, and some see a particular association between the Mother Earth and the feminine principle, especially in Hindu thinking, but these views are described as a form of romanticism by some scholars who also point to the participation of men and children in most of the Chipko agitations. Before the Chipko movement began, women in the Himalayan foothills region had campaigned against alcohol consumption by their menfolk, which causes severe financial and domestic problems. The anti-alcohol agitations were so successful that alcohol was banned in several Uttarakhand districts. Women’s groups have subsequently formed in most of the region’s villages and serve as the educational and activist core of many local ecological efforts. There appear to be many concrete if inexplicable manifestations of women’s involvement: for instance, though the survival rate of saplings in government plantations was about 10 to 15 percent, in the afforestation camps led by Bhatt and his followers this rate was 65 to 80 percent, and showed an appreciable increase following the greater involvement of women. Whether women were more careful in planting the saplings, or did so with greater love, are matters of speculation.

The Chipko movement has spread to other parts of India, and has drawn international attention to indigenous, nonviolent resistance to powerful governmental and commercial forces of environmental degradation. *The First Citizens’ Report* (1982), published by the late Anil Aggarwal, founder of the Delhi-based Centre for Science and Environment, dwelt on land, water, and forests, in a clear acknowledgment of how Chipko had brought these ecological issues to the fore. The world’s attention was never preciously focused on the ecological crises afflicting the Himalayan region. The Chipko movement is commonly viewed as challenging Western notions of economic development that destroys the natural environment and further impoverishes the poor, promoting instead environmentally sound ideas of sustainable development and the empowerment and self-determination of the local people. But many who have studied the Chipko movement have pondered how far the activists and villagers were inspired by the philosophical and religious traditions of Indian thinking, and whether it is productive to think of Chipko as an application of the fundamental ideas of Hindu philosophy. There are some reports, for instance, of verses from the *Bhagavadgita* being recited at the agitations, and of the circulation of stories from the *Bhagavata Purana*, which chronicles the life of Krishna and his exemplary resistance against the tyrannical exploits of the king Kamsa. Some scholars find in the history of the Bishnois of Rajasthan, among whom the veneration for plants and animals is widespread, a precedence for the

Chipko movement, but the resistance to commercial forestry has a long history.

Christ, Carol P. (1945–)

In attempting to understand the religious basis of the Chipko movement, and get a different grip on the continuing debate on whether Hindu spiritual traditions aid or debilitate ecological awareness and activism, it may be useful as well to distinguish briefly between the philosophical views of its two most well-known advocates. Chandi Prasad Bhatt, who is active in the Alakananda Valley, has argued that forest officials, contractors, and their local collaborators represent an ideology of development which is hostile to rural self-empowerment and self-reliance; he also promotes the use of alternative technologies that hold out the promise of self-reliance, ecological stability, and humane development. Sunderlal Bahuguna, who works mainly in the Bhagirathi Valley, is equally critical of commercial forestry but more resolutely opposed to modern industrial civilization. As Ramachandra Guha has suggested, Bahuguna operates mainly in the prophetic mode, and through his marches, speeches, occasional writing, and public fasts he has not only reached wide segments of the population, but resonated with them in ways peculiar to Hindu sages. Bahuguna's own charisma and asceticism recall to mind the nonviolent activism of Gandhi. Though the precise Hindu elements in the moral thinking and conduct of Bhatt and Bahuguna may not always be transparent, that the movement originated in an area held as sacred by Hindus, and was led by those who drew their inspiration in part from Gandhi, created some of the conditions for its success.

Theologian (feminized term derived from Theologian) Carol Christ directs courses in goddess spirituality and sponsors pilgrimages to sites of ancient goddess-worship in Greece. She has also held academic positions in the United States. Christ criticizes Christian mainstream traditions as too patriarchal to be reinterpreted from a feminist perspective. As an alternative, Christ constructs a theological perspective reclaiming ancient goddessperspectives as a source of inspiration. Christ also criticizes Western views of nature as characterized by dichotomies that cause the oppression of nature. She claims that modern Western culture lacks roots in a geographical location, thus causing spiritual emptiness. However, in rural Greece Christ noticed a heritage of folk religion centered on seasons and nature. These perspectives, she suggests, help to illuminate the need for alternative rituals that celebrate the interrelatedness between humans and Earth while giving thanks to the gifts of nature manifested by each season.

Christ is inspired by the findings and interpretations of archeologist Marija Gimbutas and understands goddesses of ancient Greek religion as reminders of more ancient gender-equal goddess religion, later deformed by patriarchy. According to Gimbutas, the figurines and symbolic paintings from the European Paleolithic and Neolithic were centered on goddess civilization. Based on this and other findings, Christ emphasizes religious ideas focused on the goddess as giver and taker of life, symbolized by animals such as birds, bears, snakes, fish and hawks, and the female body as a central metaphor for the creative powers of the Earth.

Christian Art

Since Christianity began as a sect of Judaism, the earliest followers of Jesus of Nazareth met at the Jewish temple in Jerusalem and at synagogues. Finding themselves in theological and ritual conflict with other worshippers at these sites, they began to meet in private homes, which were not constructed or decorated as religious buildings. The first two centuries of Christian activity have thus left little distinctive art. Dating from the third century or later, most of the earliest surviving Christian painting is found in the catacombs of Rome, Italy, and is similar to tomb decorations from non-Christian sites. Christians adopted Hellenistic and Roman iconography, including visions of pastoral calm, for depicting Christian themes, such as Christ as the Good Shepherd. Carvings of grape vines adorn early Christian sarcophagi as symbols of eternal life. The leaf covered human faces (Green Men) associated with spiritual rebirth in the cult of the Greek god Dionysus, later appear on Christian church portals as symbols of resurrection.

Several dominant themes in Christian art have historically contemplated the meaning of nature, including: God's creation of the cosmos, the golden age in Eden, Noah's ark and the rescue of the animals, the coming era of peace in God's kingdom, the spiritual value of solitude in wilderness, the transience of the material world, the passage of time and the seasons, birth and the initiation of life, resurrection and renewal of humans and the universe, God's rule over the cosmos, and God's continuing presence in nature. Early Byzantine art, of the eastern Mediterranean region, for example, often emphasizes God as Creator. The sixth-century Church of St. Catherine at Mount Sinai in Egypt has thirteen beams across the ceiling of the nave (central worship area), six of which bear floral or faunal designs. The carvings depict such varied creatures as peacocks, an antelope, ibexes, a tiger, an elephant, a camel, a turtle, fish, a crab and an octopus. One beam is entirely dedicated to the Nile River, and displays both a wreathwrapped cross and two crocodiles attempting to swallow oxen. Byzantine artists associated the agriculturally productive waters of the Nile with the gathering of the waters described in Genesis.

Byzantine art intentionally portrayed the beauty, complexity, and diversity of the Earth and oceans, thus it encouraged naturalistic rather than abstract depictions of animals and plants, while simplifying to retain the symbolic content of the images. During the fifth and sixth centuries, natural history became a popular theme for floor mosaics in ecclesiastical buildings. The mosaics incorporate a great variety of living forms, ranging from ducks, to lions, to birds of prey, to hares. For Byzantine Christians, even the least important of creatures reflected the mind of the Creator.

As Christianity spread into northern Europe, Christians continued earlier pagan motifs, such as the backwardlooking or entwined animal figures of Celtic art. An extant high cross, from an early Columban monastery at Moone, Ireland, has a row of animals on one face, and the major figure of Christ on the arms of the cross is topped by a dolphin. The Irish *Book of Kells* contains ornamented words formed of animals biting or grasping each other, including an eagle with a mackerel in its talons.

Medieval Christians constructed bestiaries, with illustrations of real and imaginary animals, such as lions and unicorns. Bestiaries present the animal kingdom as a reflection of Christian doctrine, give each species an allegorical significance, and relate animals to biblical texts, such as John 1:29 – “Behold the Lamb of God.” Medieval illuminated manuscripts also depict animal friendships with humans, such as the prophet Elijah fed by ravens or a monk humanely removing a thorn from a lion’s paw. Lacking a developed theory of perspective and purposefully accentuating the size of important figures, like Christ, medieval painters constructed landscapes where humans and buildings are larger than major natural features, such as mountains. The simplified and disproportionate representation of trees, peaks and rivers, should not be interpreted as indifference to nature, but rather as a combination of pre-scientific technique and a focus on the saints and biblical subjects.

In the twelfth and thirteenth centuries, gothic architects increased the “divine” light entering church sanctuaries by raising the height of the walls and windows. Inspired by the liberal arts, Christian artists turned to the fields and forests to study form in nature. Accurate carvings of native flora decorate the capitals and altar screens of gothic cathedrals, such as those in Rheims, France, and Naumberg, Germany. The “root of Jesse,” where Christ originates from a giant twining vine or tree carrying his ancestors as branches, the seven days of creation, Noah’s ark, and Christ symbolically renewing all life by dying on a green cross are frequent themes in gothic stained glass.

Concentrating on perspective and fostering scientific naturalism, Renaissance painters placed religious figures in pastoral, or even mountainous landscapes. Giovanni Bellini surrounded *St. Francis in the Desert* (ca. 1480) with peaceful animals and a productive agricultural milieu. A heavenly light source originating just outside the scene, and reflecting the Christian concept of divine transcendence, illuminates the saint and unites him with the surrounding landscape. The wilderness, rather than being a harsh or forsaken environment, overflows with God’s presence. Geology, the atmosphere, and natural processes fascinated Leonardo da Vinci. In his *Madonna of the Rocks* (ca. 1483) and *Virgin of the Rocks* (1508), a painting intended to elicit solemn meditation, he placed Jesus and John the Baptist as toddlers, the Virgin Mary and an angel in a wet, rocky grotto with stalactites and stalagmites. Leonardo utilized the misty landscape displaying the cyclical processes of evaporation and condensation of water, to reflect the cycle of human emotions involved in prayer and intercession, and the cycle of redemption in human birth, death, and resurrection.

During and following the Renaissance and Reformation, European art diversified, and although Christian patronage continued, explicitly Christian subjects became less

dominant. Natural imagery, however, remained critical to theological expression. Titan's *Noli Me Tangere* (ca. 1510) sets the risen Christ in a pastoral countryside, as he instructs Mary Magdalene not to touch him. The alignment of Christ's body with trees and hills not only adds grace and substance to his form, it also enhances the message of triumph over death by fully incorporating the crucified one in a living landscape. Caspar David Friedrich captures the panentheistic spirituality of German Romanticism in *Cross on the Mountains* (1808) by placing Jesus' cross on a rocky pinnacle supporting scattered coniferous trees and bathed in the red and gold of an intense sunset. Jean-Baptiste-Camille Corot, a major influence on the French Impressionists, caught the moment of divine salvation from earthly trials in *Hagar in the Wilderness* (1835). A master of landscape and light, he paralleled a desperate Hagar and dying Ishmael with succulent desert plants, resisting the droughty environs. An angel, appearing like a small cloud, heralds divine provision of water in the form of a desert spring. American and English painters of the nineteenth century utilized collections of peaceful animals to express Protestant millennial theology and apocalyptic expectations. Edward Hicks in the *The Peaceable Kingdom* (several versions ca. 1840) and Junius Stearns in *The Millenium* (1849) depict children and domestic animals surrounded by wild animals and predators, reflecting the prophecy of Isaiah 11:6 that in God's kingdom the lion will lie down with a lamb and a child shall lead them. Photographer William Henry Jackson captured a natural feature that appears as a cross on a mountain in Colorado in his *Mountain of the Holy Cross* (1873), a subject also painted by Thomas Moran (1875).

Today, many viewers too closely associate Christian art with Madonnas and crucifixions, and miss the Christian intent of many compositions focusing on apparently natural or rural subjects. Peter Paul Rubens' *Landscape with a Rainbow* (1636–1637) is a panoramic view of grain fields, cattle on a road, and waterfowl in a stream backed by a lush forest. A rainbow crowns the wispy clouds in a glowing sky. For Rubens, the peaceful and productive countryside is the fruit of both proper husbandry and God's benevolence. The rainbow is a sign of the continuing covenant between God, humanity and nature.

In the nineteenth century, the American Hudson River Valley School often incorporated Christian allegory in their works, and favored subjects such as Noah's deluge where they could represent dynamic natural processes and God's power in wave-washed rocks, and a storm-tossed ark. Less obvious, however, is the roadside cross nestled among massive mountains and majestic tropical forest in the center of Fredrick Edwin Church's *In the Heart of the Andes* (1869). Church combines scientific accuracy in his carefully painted, recognizable species of tropical plants, birds and butterflies, with equally carefully placed patches of light illuminating the cross and a village church as well as the icy heights of the cordillera. For Church, the scene captures all of God's creation from the wet, lowland tropics to the freezing high latitudes. Divine light diffuses through the landscape, and the high, snow-capped peak in the background represents God's transcendent and ineffable presence. In representing Christian ideals, the Hud-

son River Valley painters often jettisoned all human religious artifacts, and allowed the glory of God to infuse a brilliant red sunset, or divine majesty to emanate from massive blue-green icebergs. Thomas Cole in *The Oxbow, View from Mount Holyoke, Northampton, Massachusetts* (1836) details an actual bend in the Connecticut River and captures both the wilderness and frontier settlement as a rainstorm passes overhead. To remind the viewer that God is present in this harmonious setting, Cole subtly shaped small openings in the forest on background hills into the Hebrew letters for “Noah,” which also spell “Shaddi,” meaning God the Provider, when turned upside down.

Not all artists producing Christian art are Christians, nor are all Christian works European or North American. Marc Chagall, who was Jewish, designed a spectacular series of stained glass windows (1976–1979) for a church in Mainz, Germany, including images of the creation. Modern Japanese and Chinese Christians have adopted the styles of Asian art to present scenes such as Christ stilling the tempest, with the frugal brush strokes and misty backgrounds typical of Buddhist painting. Contemporary carver, Stanley Peters, has utilized the Pacific Northwest Native American eagle totem, with outspread wings, to portray Christ crucified on a large wooden cross. Christian art will continue to borrow from and influence other religious traditions and artistic movements as it pursues the aesthetics and spirituality of nature, and provides thoughtful reflection on the meaning of all life.

Christian Camp Meetings

Camp meetings are generally associated with the religious revivalism of the nineteenth century, particularly as manifested in frontier regions immediately west of the Appalachians. They arose from two European sources. Both Presbyterianism in Scotland and Methodism in England developed ritual practices in which great crowds of people came from miles around and gathered for days. For Presbyterians, this took the form of huge sacramental feasts where a sense of sacred immanence was elicited. Methodist orators proclaimed that certainty of salvation was experienced through a direct relationship with God. These practices set the stage for later American developments where huge groups of believers set up temporary residence in natural settings for purposes of worship.

Many Presbyterians and Methodists settled in the American colonies. After the American Revolutionary War, itinerant preachers crossed the Appalachians and Alleghenies. From their western slopes, thick forests stretched to the horizon and beyond. Not surprisingly, images of wilderness filled the religious rhetoric of circuit riders. American forests were compared to the wilds of the Sinai. Experiences of Hebrews in the latter were likened to those of Christian believers in the former. Presbyterian and Methodist evangelicals were not alone; Baptist and Lutheran ministers were active on the frontier as well.

One of the most active and influential preachers of all was a Presbyterian named James McGready. By 1800 the sacramental feasts hosted by him and his colleagues were attracting hundreds of people. Because their numbers exceeded the capacity of churches and barns to hold them, a tradition developed of holding meetings in the woods. These events were characterized by powerful emotional outbursts and by the use of wilderness imagery to intensify religious experience. The famous 1801 Cane Ridge meeting in Kentucky provides an example. As one participant recalled:

In consequence of so great a collection of people, it frequently happened that several preachers would be speaking at once . . . Nor were they at a loss for pulpits: stumps, logs, or lops of trees served as temporary stands from which to dispense the word of life. At night, the whole scene was awfully sublime. The ranges of tents, the fires, reflecting light amidst the branches of the towering trees; the candles and lamps illuminating the encampment; hundreds moving to and fro, with lights or torches, like Gideon's army; the preaching, praying, singing, and shouting

– all heard at once . . . Sinners falling, and shrieks and cries for mercy, awakened in the mind a lively apprehension of that scene when the awful sound will be heard, "Arise, ye dead, and come to judgement!" (Redford 1868: 365).

The description of the camp setting as “awfully sublime” strongly suggests that Romantic ideas were present in addition to biblical imagery. Fitted to the American wilderness environment at places like Cane Ridge, Romantic personal encounters with the sublime were combined with and mediated through the religiosity of Methodism and Presbyterianism.

Word of the Cane Ridge meeting quickly spread. Soon, these events were commonly attracting between three and five hundred strong, with others skyrocketing to ten thousand or more. Recognizing that camp meetings could not remain the haphazard affairs they had been, church leaders began publishing guidelines for camp layouts by 1810. Tents were to form a core, with streets running between them. A place for general assembly was left open, and a pulpit or speaker’s platform erected. Framing and intertwined with the whole were trees. Neither in the tents nor the forest alone, but only through their combined effect, was the environment for religious experience created.

In 1839 the *Western Christian Advocate* compared camp meetings to the Jewish Feast of Tabernacles. Writing nearly twenty years later, Reverend B.W. Gorham also linked the Feast of Tabernacles with camp meetings. Such references continually linked contemporary Christian camp meetings to imagery of Israelites in the Sinai wilderness. Sites by this time were becoming more permanent. Wooden cabins replaced cloth tents. Yet, these structures were still referred to as “tents.” To protect public gatherings from inclement weather, large open-sided buildings called “tabernacles” or “arbors” were constructed. Camps were transformed into villages in the forest. During the late nineteenth and twentieth centuries some became towns in the woods.

Today, permanent encampments exist across the United States. Although camp meetings became almost completely a Methodist phenomenon by the 1840s, now virtually all denominations make use of such retreats. Their layout hearkens back not only to the American frontier and biblical wilderness rhetoric, but also to European beginnings. Christian camp meetings and their emphasis on direct experience of God through nature remain a vital part of America’s religious fabric.

Christian Environmentalism in Kenya

In Kenya, little exploration has been done on the relationship between religious beliefs and environmental matters. Indeed, the religious significance of the environment seems to be sidelined in official development plans and strategies. In ecclesiastical circles, not much has been said or written concerning the Church's social and physical involvement in environmental matters. However, there are cases where churches have become involved in environmental activism, and religion has also been part of the campaigns of Professor Wangari Maathai, a well-known crusader on environmental matters in Kenya. In some of these instances influences from indigenous traditions has been apparent.

The Catholic Church has been at the forefront in fighting environmental degradation and particularly atmospheric pollution in Kenya. This is well demonstrated by the concerted demonstrations and protests that took place in the early 1990s against environmental pollution in Thika town. Thika, one of the three most industrialized urban areas in Kenya, happens also to be one of the most heavily polluted places in the country. Several industries located in Thika threaten the health of residents. They include KEL Chemical, which manufactures various chemicals including Sulphuric Acid and Sodium Superphosphate (SSP) fertilizer, several textile factories, Kenya Leather Industries, British American Tobacco, and Bulleys Tanneries. The factories were generating atmospheric pollution, creating offensive smells, and discharging tons of toxic effluent into the nearby Thika River, harming aquatic life and endangering the lives of water consumers downstream. There was also solid waste pollution from the Thika Municipal garbage sites, the home to hundreds of stray pigs which come to feed on mounds of rotting industrial and municipal refuse. There were also poorly disposed hospital instruments, expired drugs, syringes and needles. These garbage heaps draw all sorts of scavengers including vultures, dogs, cattle, goats and even human beings.

Several Catholic parishes draw their congregations from the lower income housing estates of Thika, which were particularly impacted by the pollution. The Church had raised the issue with the local authorities in vain. In early 1990 parishioners decided to act more decisively. Led by their priests (Father Gregory Macharia, Father Micheal Schrode, Father Ndikaru wa Teresia and Father Max Stater), the parishioners of St. Mulumba and Makongeni parishes staged a peaceful procession to the industrial sites, where they held prayers between two wooden crosses erected to demonstrate their protest. The reaction of the government was momentous. The President of Kenya

(Daniel arap Moi) intervened and ordered the authorities concerned to move in and rectify the problem. An environmental committee was constituted to look for a solution to the problem. The KEL factory was shut down and ordered to fit its workers with protective garments and boots. Scrubbers were also to be installed in the exhaust system in order to minimize the toxic elements that escape into the air. Although other factories have continued to pollute the town's environment, at least they have put measures in place to minimize the level of pollutant elements that find their way into the air and rivers. The priests, particularly Father Ndikaru wa Teresia, have continued to crusade for a safe environment in the town.

The second case is that of Father John Kiongo of Limuru Parish, Kiambu, Kenya. Father Kiongo is a credible Catholic crusader in the battle against environmental degradation. His environmental vision is based on biblical expositions (particularly Genesis 1:29) where humanity is believed to have been commissioned to be stewards of God's creation on Mother Earth. To him, environmental negligence is due to sheer ignorance. He exhorts all categories of people, particularly Christians, to conserve the environment and even perfect it. Having been inspired by these biblical passages, Father Kiongo established a tree nursery in 1990. He bought seedlings from local people and gathered samplings of indigenous trees from the local forests. His aim has been to demonstrate to other people that something positive can be done to salvage the environment. His purpose is twofold. Firstly, through his plans to create awareness and educate fellow Christians on the need to preserve the environment. Secondly, he seeks to preserve the indigenous trees, which he correctly believes are very important to the local community in areas of medicines, fuel, fencing, artistic beauty and human and animal foodstuffs. Besides, these trees are an important component of African traditional culture and heritage, which is threatened by extinction. Christians in Limuru have benefited significantly from this environmental mission by Father Kiongo. Many have become conscious of the need to conserve the environment by planting trees. His nursery has been commended highly by agricultural extension officers, diocesan development coordinators, the forest department and heads of various schools, who have brought students to see for themselves.

The third case is that of Professor Wangari Maathai, who is a household name in the area of environmental conservation in Kenya, with particular reference to the conservation of forests. She has used various church forums to sensitize Kenyans on the need to conserve trees as a natural heritage. She is perhaps best known as coordinator of the Green Belt Movement, which encourages people to plant trees in rows around church and school compounds and plots of farm land. Such planting of trees "dresses up" these naked compounds with belts of green trees, hence the name "Green Belt." Professor Maathai has also led public demonstrations against the excising of forests in Kenya's limited water catchment zones. She is also on record as the most important voice in the protests that effectively stopped construction of a sixty-storied skyscraper in Nairobi at a public utility park. Professor Maathai was also a prominent participant in the joint prayers in Nairobi in 1999, which were called by church leaders of all

denominations to protest peacefully against the allocation of Karura forest to private developers. The demonstrators carried twenty tree seedlings, which had been blessed by the Catholic Archbishop, the Anglican Archbishop and the General Secretary of the National Council of Churches of Kenya at a service held at Uhuru Park, Nairobi. This demonstrated the concerns of the Christian community about the degradation of the forests. In some of the above instances, influences from traditional African heritage are evident. For example, Christian protests against excising of forests by certain greedy politicians echo indigenous traditions whereby nobody owned forests individually since people and animals collectively belong to the forests. There was no dichotomy between the sacred and the secular. Both religious and political leaders were accountable to God in the way they related to his creation at large. Secondly, Christian demonstrations against environmental pollution bear witness to traditional African spiritual wisdom and philosophy, which was based on the maintenance of balance between humans and the environment. The collective community good and sacredness of life provided the moral foundations of human rights and respect for God's creation in general. Thirdly, the ritual blessing of tree seedlings by church leaders is a reflection of indigenous African rituals, festivals and celebrations that were conducted to bless forests, rivers, shrines, land and harvests. There was a close partnership between humanity and nature.

Christian Fellowship Church (Solomon Islands)

The Christian Fellowship Church is an indigenous Church of New Georgia in the western Solomon Islands. Beginning in the 1950s as a movement of separatism from the Methodist Mission and led by “wayward” Methodist pastor Silas Eto (ca. 1905–1984), the movement was constituted as a separate Church in 1960, the strongly charismatic Eto by then being known as Holy Mama (*mama* being an affectionate term for “father” in New Georgia). With strong doctrines of communalism preached by Holy Mama, to the extent that the Church has overall control over the customary lands and natural resources of several dozen adherent villages, the CFC has maintained the dual face of sectarian isolationism and fierce independence. In the 1970s multinational giant Unilever extended logging operations into CFC-controlled areas; meanwhile Australian conservationists campaigned in the area. Strong opposition to logging arose, ultimately involving CFC leadership and villages in the downfall and departure of Unilever logging from the Solomons in 1986. After the death of Holy Mama, his senior sons J.D. Tausinga and

I. Rove have attained key roles in national politics and in the spiritual continuity of the CFC, acting unpredictably toward nature conservationists and loggers alike. On the one hand, Eto’s fusion of Melanesian custom, old-style Methodism, and concern for local autonomy has kept alive traditional respect for the forests and seas, and newer beliefs about God’s creation. Such respect and a corresponding environmental commitment have been reinforced by Australian input from the Rainforest Action Group. On the other hand, the drive to make the Western Province count in the national Solomon Islands economy, and modernist approaches to development, have pushed politicians representing CFC interests into concession with Korean and other logging companies. CFC, having been an important religious voice for environmental conservation, faces hard choices in the twenty-first century.

A Christian Friend of the Earth

Editor's Introduction: Dr. Brent Blackwelder, President of Friends of the Earth U.S., which is part of Friends of the Earth International, the world's largest environmental advocacy network with member groups in seventy countries, delivered the following talk at the Marble Collegiate Church in New York City, in February 2003. While there is certainly great religious pluralism within environmental groups such as the SIERRA CLUB, WILDERNESS SOCIETY, and FRIENDS OF THE EARTH, (for another example from a Friends of the Earth activist see the entry SALVADORAN REFLECTION ON RELIGION, RIGHTS, AND NATURE), leaders from such groups increasingly reach out to religious groups as part of their efforts to galvanize support for environmental causes. Blackwelder's talk provides a synthetic example of such efforts.

As the son and grandson of Episcopal ministers, I have always been moved by a spiritual concern for God's great creation. The rampant pollution of air and water in the 1960s convinced me on the first Earth Day in 1970 that the great moral challenge of our time was to reverse the widespread degradation on the Earth. I began writing my doctoral dissertation in philosophy on duties to animals, but I also linked up as a volunteer that year with Friends of the Earth and the League of Conservation Voters. As a result of that volunteering, I ended up doing environmental work, helping to set up new organizations like American Rivers and the Environmental Policy Institute and to expand the effectiveness of other groups.

The involvement of most denominations in environmental issues has increased over the past thirty years, especially during the last ten years. The National Religious Partnership for the Environment, headed by Paul Gorman, has been a great catalyst and a great blessing, bringing together Jewish, Protestant, and Roman Catholic efforts to care for creation. Most recently, the presence of former Congressman Bob Edgar, a great environmental champion, at the head of the National Council of Churches of Christ is welcome news. The increasing involvement of religious organizations is reflected in what some of today's most well-known religious leaders have said:

Faced with the widespread destruction of the environment, people everywhere are coming to understand that we cannot continue to use the goods of the Earth as we have in the past . . . The ecological crisis has assumed such proportions as to be the concern of everyone (Pope John Paul II).

It is not right for us to destroy the world God has given us . . . We Christians have a responsibility to take the lead in caring for the Earth (The Rev. Billy Graham).

Care of the environment constitutes a most urgent question for each and every human person . . . From this, we conclude that . . . to commit a crime against the

natural world is a sin. For humans to cause species to become extinct, to destroy the biological diversity of God’s creation, for humans to degrade the integrity of the Earth by causing changes in its climate, stripping the forests, or destroying wetlands – these are sins (Patriarch Bartholomew II, Eastern Orthodox Churches).

I want to share with you some of the verses I find most inspirational and most instructive about our duties to God’s great creation. One of my favorites is from the Sermon on the Mount where Jesus marvels at the beauty of a flower: “Consider the lilies of the field, how they grow. They toil not; neither do they spin. Yet I tell you, even Solomon in all his glory was not arrayed like one of these” (Matt. 6:28–29).

My central message is that we need all major religions today in order to halt the alarming destruction of all the Earth’s magnificent ecosystems and to begin the challenging process of restoration and rehabilitation. The strength of environmental organizations in the U.S. and worldwide is not sufficient given the rapid pace of destruction. By looking at the Jewish and Christian underpinnings for environmental stewardship, we can see how strong this foundation is and exactly why religious organizations can make such a difference.

Religious Basis for Environmental Stewardship

The Great Creation

The duties of environmental stewardship flow first from the core belief that God has created the universe and, second, from our duty to love our neighbor as ourselves. These two fundamental tenets of our faith mean that caring about the environment is not merely an option, not just one more thing on a list of socially correct behavior or something we discuss about giving a “yes” or “no” to. As the Rev. Steve Huber of St. Columba’s Episcopal Church puts it: “God calls us into a relationship of loving, caring, and faithfulness. The way we fulfill our part is in our relationships to others and the rest of creation.”

The Judeo-Christian tradition calls for strong, active stewardship of creation and places special responsibility on humans. In Genesis 2:15 we read that God put Adam in the Garden of Eden to “tend and keep it.” The Hebrew word for “tend” is *shamar*, which means to guard and watch over. Throughout the creation story in the first book of Genesis, God observes the various stages and calls them not merely “good” but “very good.”

Throughout the Psalms we find exaltations of the magnificence of creation: “The Earth is the Lord’s and the fullness thereof, the world and all that dwell in it” (Psalm 24:1).

You make springs gush forth in the valleys; They flow between the hills, giving drink to every wild animal . . . By them the birds of the air have their habitation . . . The high mountains are for the wild goats; the rocks are a refuge for the badgers . . .

O Lord, how manifold are your works! In wisdom have you made them all; the earth is full of your creatures. Yonder is the sea, great and wide, which teems with things innumerable, living things both small and great (Ps. 104:10, 18, 24, 25).

Saint Paul echoes this theme: “For in him all things were created, in heaven and on Earth, visible and invisible” (Col. 1:16).

In the book of Job there is an eloquent summary of the wisdom and greatness of creation:

But ask the animals, and they will teach you, the birds of the air, and they will tell you, Ask the plants of the earth, and they will teach you, and the fish of the sea will declare to you. Who among these does not know that the hand of the Lord has done this? In his hand is the life of every living thing and the breath of every human being (Job 12:7–10).

The diversity of creation is celebrated in Genesis: the Lord has made all kinds of trees grow out of the ground, trees that were pleasing to the eye and good for food (Gen. 2:9). Let the waters bring forth swarms of living creatures, and let the birds fly above the earth across the firmament of the heavens (Gen. 1:20).

Writers of the Hebrew Bible were particularly impressed by the great sea monsters. “So God created the great sea monsters and every living creature that moves, with which the waters swarm” (Gen. 1:20). “Yonder go the ships, and Leviathan which thou didst form to sport in it” (Ps. 104:26).

The theme of God’s caring for all of his creation is picked up in the New Testament in several places: “Are not five sparrows sold for two pennies? And no one of them is forgotten before God?” (Luke 12:6) “And not one of them will fall to the ground without your Father’s will” (Matt. 10:29).

Some have asked why there is not more discussion of environmental issues in the New Testament. Concerns about environmental destruction do not appear in the New Testament in large part because the New Testament is covering a short period of time in which the fundamental subject concerns the challenge Jesus is making to the Jewish authorities about the hypocrisy of the scribes and Pharisees. The region was not facing ecological collapse. Rather the key matter on the mind of Jesus was the failure of the official Jewish religious leaders of the day. Given the absence of substantial specific scripture on environmental problems in the New Testament, a good way for Christians to seek guidance is to ask the question of what Jesus would do in our circumstances today.

Throughout the last 400 years much of this scripture I have cited was avoided or downplayed by exploiters of natural resources who seized on the King James translation as giving humans “dominion” over creation. George Bernard Shaw observed that the Devil can quote scripture to suit his own purposes, and the polluters and the greedy have certainly done that. The most glaring example used by those who try to assert that the Bible is antienvironmental comes from the use of the word “dominion” in Genesis. “Dominion” is a poor translation of the Hebrew “kivshu” which, although it implies a form of control that humans certainly have over the rest of nature, is more accurately

translated as “steward” and can be thought of in the way a gardener has responsibility for the care, the nurturing, and the survival of his garden. Furthermore, those who cite this verse conveniently overlook the preceding and following verses which extol all of creation. They have taken a verse which provides a responsibility directive and turned it into a green light for exploitation. God’s concern for all animals is manifest in this very story, as he says: “to every beast of the Earth and to every bird of the air and to every thing that creeps upon the Earth . . . I have given every green plant for food” (Genesis 1:30).

A second example comes from those citing the verse “be fruitful and multiply” as giving humans carte-blanche to procreate. These individuals are in for a surprise if they read the preceding verses, because God first gives this blessing to all the animals – the fish, the birds, and the beasts. Thus, the blessing given to humans to flourish is conditional upon our not impairing this very same blessing already given by God to other living creatures.

In Genesis 9 the story of Noah’s ark ends with the covenant being established not just between God and Noah, but with all of the animals on the ark. “Behold, I establish my covenant with you and your descendants after you, and with every living creature that is with you, the birds, the cattle, and every beast of the Earth with you, as many as came out of the ark” (Gen. 9:8–10). We have here the first Endangered Species Act. The choice of how we treat other living things is not optional. They are an integral part of the great creation.

Love Thy Neighbor

Pollution disproportionately impacts the poor and minorities. Around the world major exploitation of natural resources by various oil, mining and timber transnational corporations has left people with ruined fisheries, polluted water and contaminated land. The whole development of the environmental justice movement draws from the biblical message of loving your neighbor, not poisoning your neighbor. We are paying the price for heavy use of pesticides and other carcinogenic material. According to the American Cancer Society, by 2050, some form of cancer is now projected to hit one in every two men and one in every three women,

As we think of our neighbor, we must consider how our actions affect all of those around us. The first biblical example of pollution affecting a neighbor can be found in Ezekiel 34:18–19 where we read:

Is it not enough for you to feed on the good pasture, but you must tread down with your feet the rest of your pasture? When you drink of the clear water, must you foul the rest with your feet? And must my sheep eat what you have trodden with your feet, and drink what you have fouled with your feet?

Warnings of unwise land use can be found in the Old Testament. From Isaiah we have the first message about sprawl: “Woe unto you who lay house to house and field

to field until there is no room in the land” (Isaiah 5:8). A slightly different translation is: “Woe betide those who add house to house and field to field, until everyone else is displaced, and you are left as sole inhabitants of the countryside.”

Churches can provide a powerful counter to the greedy exploitation of natural resources without regard to the consequences for those directly impacted or for future generations who will be living with toxic dumps, degraded water, and depleted fisheries. Let us next look specifically at what churches can do.

What can religious organizations do about the environmental crisis?

Modern life separates us from the consequences of our actions. This is particularly true for city dwellers like myself. We need to ask how our choices for energy, food, and transportation affect other people and God’s creation. Several examples of imaginative action by church groups illustrate the potential for both individual and group action.

In California the Rev. Sally Bingham started a program called Episcopal Power and Light, trying to get churches to consider purchasing their electricity from renewable sources of energy like wind. There is now an Interfaith Power and Light effort underway. This is especially important in the United States because we as a country are the biggest emitters of global warming gases whose climate altering impacts will be felt most harmfully on the poor of the world. As the Rev. Bob Edgar said, “It is only right that those who cause a problem be the ones who rectify it. It is not fair that restrictions be placed on the poor to make up for damage, past and present, caused by the conduct of the rich.”

I have participated with several Roman Catholic orders in protesting the energy policies of Exxon/Mobil which for years has funded efforts to prevent action to curtail emission of greenhouse gases. These orders hold substantial amounts of stock. At one annual Exxon shareholders meeting I attended with them in Dallas, the Chairman and Chief Executive Officer Lee Raymond attempted a propaganda campaign by noting that thousands of scientists had signed a letter saying the science about global warming was shaky. One of our group had to point out to Mr. Raymond that among his highly touted scientists were members of the Spice Girls and some actors from the cast of MASH. Raymond was embarrassed and could only reply that all Exxon’s material for the meeting was supposed to be peer-reviewed.

One of the most creative environmental campaigns initiated by churches is called “What Would Jesus Drive?” Religious leaders have picketed SUV dealerships, run full-page newspaper ads, and led protests. At a press conference in Detroit, a group of nuns parked four energyefficient hybrid cars in a row to spell out the four-word question: “What Would Jesus Drive?”

Separation of urban areas from food production has prevented many Americans from knowing about one of the greatest sources of cruelty to animals and one of the most flagrant sources of pollution. Gigantic factory farms, which also receive substantial government subsidy, sometimes crowd over 1000 pigs into a building and do not allow them to lie down. Massive amounts of manure inevitably break loose from lagoons and kill fish. These unsustainable factory farms with their horrible stench and cruelty to animals are a plague of biblical proportions on rural America.

The whole notion of caring for the land is laid out in chapter 25 of Leviticus where the need for a Sabbath for the land is discussed. “Six years shall you sow your field and six years you shall prune your vineyard, and gather in its fruits; but in the seventh year there shall be a sabbath of solemn rest for the land . . .” (Lev. 25:3–4). The notion of caring for the land is missing in much of industrial agriculture. Of course there have been plenty of individual farmers who have been terrible stewards of the land, but the scale of destruction and poisoning of farmland by chemical-intensive industrial agriculture today is immense.

The industrialization of farming and the unexamined pursuit of “cheaper” food have led to a shocking situation. In Proverbs we read: “A righteous man has regard for the life of his beast.” In Romans, Saint Paul wrote: “If your brother is being injured by what you eat, you are no longer walking in love” (Rom. 14:15).

There are many, many ways organized religion can make a decisive difference in environmental battles. Churches need to be alert to the ways the Tax Code encourages the pollution of creation and the poisoning of our neighbors. The code offers major subsidies to coal, oil, and gas mining operations of far greater magnitude than any subsidies for renewable energy or conservation. Half of the states in the United States exempt pesticides from sales tax. Of special concern are the tax breaks for gas-guzzling sport utility vehicles (SUVs). SUVs cost the

U.S. Treasury more than \$10 billion because they are exempt from the gas-guzzler tax imposed on automobiles. Small business purchasers of very large SUVs are, moreover, allowed to write off much of their cost in the first year. Would Jesus drive an SUV?

Conclusion

Religious organizations can play a decisive role in reversing the desecration of the Earth. First, they bring a large and dedicated group of people into the struggle. The environmental movement does not have sufficient membership and clout to win. Second, churches can provide a powerful moral force and presence. The independent moral voice is especially important because some of the largest polluters have well-financed lobby efforts and make large political campaign contributions. Furthermore, they have funded anti-environmental groups who carry out disinformation campaigns such as Exxon’s attempt to thwart action on global warming. The disinformation campaigns

by major corporate polluters try to portray mainstream environmental organizations as selfish, caring more about animals than people, or as scientifically ignorant. When the churches participate in environmental battles it is harder for the polluters and their front groups to persuade the public and politicians with specious arguments.

In this day and age when there is malicious propaganda everywhere, church participation in the environmental struggle can provide crucial leverage and perspective, while drawing large numbers into the debate providing moral force and clarity. This spells political clout and a chance to restore and heal the Earth. David Brower, founder of Friends of the Earth, had a goal for the twentyfirst century of CPR for the Earth. God's creation is like a patient in the emergency room needing CPR – conservation, protection, and restoration. Christians can and should play a critical role in providing such CPR to this wounded Earth.

Christian Nature Writing

Does the art form known as nature writing include distinctively Christian perspectives and expressions? If one means by this a literary genre that espouses Christian doctrines about the natural world, the answer would almost certainly be “no.” If, however, one is referring to writing that attends to and reflects upon the natural world in light of Christian symbols, images and motifs, then the answer must surely be yes. Writers whose work might well be included within this framework include such relatively early figures as Gerard Manley Hopkins, William Blake, John Muir, and Gilbert White. Among contemporary writers, one might include the work of such varied writers as Annie Dillard, Denise Levertov, Thomas Merton, Pattiann Rogers, Norman Maclean, Barry Lopez, Terry Tempest Williams, Czeslaw Milosz, and Wendell Berry. While certainly not uniform in their approach to religious questions, nor simply or easily identifiable as Christian writers, these writers do give sustained attention to Christian symbols and images as part of a larger endeavor of trying to understand the natural world and our place in it. In doing so, they make a distinctive contribution to the more encompassing focus of spirituality that characterizes nature writing as a whole.

Incarnation is one of the motifs arising from the Christian tradition that informs the work of many nature writers. Incarnation here refers to the central Christian mystery of God’s indwelling in human flesh in the person of Jesus Christ. The early Christian tradition quickly seized upon the cosmological implications of this idea, taking the incarnation of God in Jesus to mean that all matter – the entire cosmos – is suffused with God’s presence and therefore holy. To experience the world through the lens of the incarnation is to experience it sacramentally, to see living beings as infused with an inherent sacrality. In Thomas Merton’s monastic journals, kept over a period of 27 years while living at the monastery of Our Lady of Gethsemani in Kentucky, and in occasional writings such as “Day of a Stranger” and “Rain and the Rhinoceros,” one encounters a body of work expressing a profound understanding of the incarnation. One sees this in his lyric descriptions of the landscape surrounding his hermitage (partly influenced by his study of Zen Buddhism); in his sense of the redeeming character of the monastic rhythm of manual labor and monastic prayer (*or et labora*); and in his understanding of the monastery (and the monastic life) as a locus of resistance against the forces of oppression and alienation, whether ecological or racial or social.

One can see a related but distinct sensibility in the work of poets Pattiann Rogers and Denise Levertov. For Rogers, a sensitive and scientifically exacting observation of the life process of particular plants and animals (and of the unfolding universe

itself) informs and is informed by a subtle re-reading of classic Christian ideas such as grace, sin, redemption, and incarnation, creating a fresh, original and compelling “natural theology.” In Levertov’s poetry, especially her later work, one sees an insistent attention to the spiritual significance of attention to and “encounter” with the palpable world. Such encounters can occur, in Levertov’s work, with the wild world – a heron in a lake or the vision of Mt. Ranier appearing and suddenly disappearing behind a bank of clouds. Or it can happen in the ordinary domestic sphere, as in that moment when you pick up an old kitchen knife and unexpectedly find yourself in the presence of your mother, long dead now, who also held and cherished this knife. Here is a profound poetic evocation of sacrament, the experience of ordinary physical reality transfigured, mediating and making present a larger reality, a larger presence, spirit.

A second motif appearing in the work of writers influenced by the Christian spiritual tradition is the importance of cultivating attention – understood as a kind of prayer – as a necessary spiritual practice. In the Christian tradition, it is the practice and discipline of prayer that helps move the seeker from an occasional awareness of incarnational, sacramental reality to a more abiding state of awareness. Here prayer refers not to dialogue with a transcendent and disembodied being, but simple attention to the One whose presence suffuses and sustains every living thing. In the nature writing tradition, one often encounters a quality of attention to the natural world that is so rich and encompassing that it seems almost indistinguishable from what Christian mystics would call deep, contemplative prayer. Certainly the Christian spiritual tradition is not alone in asserting the importance of paying close attention to the ordinary (nor has it always lived up to its own ideals in this regard). One notices a similar sensibility at work in the work of writers for whom Buddhism provides inspiration and meaning (e.g., Gary Snyder, Gretel Ehrlich). The same could be said of indigenous writers such as Linda Hogan, Simon Ortiz, and Leslie Marmon Silko. But there is in writers who draw upon Christian images and symbols a distinctive way of thinking about the art of attention.

Consider Barry Lopez’s evocation of icebergs in the far north, pages of delicate description devoted to trying to capture the subtle and shifting color, the shape and texture of these massive structures. And the difficult challenge of trying to talk about the light reflecting off these giant shards of ice, and how it affects one to stand in the presence of such light. The struggle to notice and describe it fully and accurately (the light itself and one’s response to the light) leads, for Lopez, to an unexpected comparison

– between the light radiating off of the icebergs and the light pouring through stained-glass windows in medieval cathedrals. It would not be fair to say that Lopez, in making this comparison, “baptizes” the icebergs. He respects their mysterious presence too much to allow any such reduction of their meaning. But he does engage the question of meaning, in particular what it means to us to stand in the presence of these icebergs, with the help of a tradition of art and theology and spirituality that comes from another world entirely, that of medieval Christendom. To really see anything, suggests

Lopez, one must be prepared to risk an imaginative leap, an unexpected metaphorical association – in this case, the association between the theology and spirituality through which medieval Christians expressed the wonder and beauty and magic of light and the luminous light of icebergs. Such a rhetorical move can be understood, I think, as part of a discipline of attention and imagination aimed at cultivating a sense of mystery, of the sacred in the natural world. That Lopez uses Christian images and symbols to grasp the presence of mystery in a northern landscape does nothing to limit or circumscribe the meaning of this landscape. Rather, it opens it up to be discovered anew. In turn, given the reciprocal manner in which metaphors always work, such a meditation on those cathedrals of ice may well lead readers to reflect differently on the Christian spiritual tradition that gave rise to the medieval cathedrals. Here we see a process of reflection that has the potential to fire the imagination to see and encounter the natural world and the world of Spirit with new eyes – not unlike the process of contemplative prayer described by those who stood gazing up at the light of the medieval cathedrals.

Still, the natural world is not only light and beauty. Nature writers and poets who have been shaped by the Christian tradition reveal an extraordinary sensitivity to the reality of suffering and evil in the cosmos. Annie Dillard’s famous description in *Pilgrim at Tinker Creek* of a frog being devoured alive by a water bug is more than a casual allusion to “nature red in tooth and claw”; it is an entrée into a sustained and harrowing inquiry into the moral shape of the universe, into the question of God’s justice. When toward the end of *A River Run’s Through It*, Norman Maclean asks about the meaning of his brother’s sudden and violent death, his love affair with Montana’s Big Black Foot River takes a turn toward a question as old as it is intractable: What kind of world is this, where death and suffering crush us with such seemingly random and careless power? The work of Czeslaw Milosz, a native of Lithuania who has long struggled with the Catholic tradition in which he was raised, echoes similar concerns in his work – the undeniably sacramental beauty of the world vying in the poet’s imagination with the darkness and sheer weight of nature (and history) upon our existence, the tension between them being (finally) irresolvable.

To see and experience the living world through the lens of the Christian spiritual tradition is, for writers and poets such as these, a continuous moral, aesthetic, and spiritual struggle. It is an opportunity to see the world transfigured; but it also imposes certain obligations, the most important of which may well be to bear the wounds of a broken but still luminous cosmos.

Christian Theology and the Fall

The Christian doctrine of the Fall, heavily inscribed onto the text of Genesis, first exalts and then denigrates nature. Many find the garden itself a positive image of earthly existence: God plants Eden with an abundance of beautiful trees, good food, and rivers; humans are created out of the Earth to tend to the Garden. After Adam and Eve eat the forbidden fruit, however, nature becomes corrupt and humans sinful, as they are introduced to hardened labor, shame of their nakedness, and knowledge of their eventual death. The original harmony between nature, humans, and God is broken, leaving a transcendent God, a sinful humanity, and a degraded Earth in a state of mutual alienation.

As there is no concept of “the Fall” in the Hebrew scriptures, there remains a question as to its origin. The “Fall” interpretation of Genesis first appeared during the intertestamental period, an era of political oppression and internal conflict for the Jewish people which contributed to the apocalyptic belief in a corrupt world. In the apocalyptic Jewish text 1 Enoch (2 B.C.E.–1), a tale of angelic “watchers,” based on Genesis 6:1 is invoked to describe a cosmic descent into sin. The watchers, or satans, are angels who rebel against God and literally “fall” to Earth from heaven. They mate with women who give birth to the nephilim, “fallen ones,” who bring evil into the world. Enoch claims that humankind was created immortal, pure and righteous, but because of human knowledge, taught to them by the leader of the satans, Azazel, humanity became unrighteous and subject to death (54:6; 8:1).

The Jewish conceptions of fallen angels emerging at this time hint of a Hellenistic dualism that valued heavenly immortality over mortal earthly existence. In the *Phaedrus*, Plato describes immortal heavenly beings who lose their wings, falling to the Earth into mortal bodies.

The Christian Jew Paul blends both apocalyptic and Platonic conceptions into his cosmic Fall based upon a dualism of flesh and spirit, physical and spiritual, Earth and heaven. “The first man was from the Earth, a man of dust; the second man is from heaven” (1 Cor. 15:46–47). Paul directly couples Adam’s sin with death; from the human capacity for evil stems all mortality (Rom. 5:12–21). Ultimately, the cosmos as a whole is “subject to its bondage to decay” while awaiting its liberation into the immortal celestial body (1 Cor. 15:35–50).

Church Father Irenaeus avoids a cosmic Fall, limiting Pauline sin to the human realm. Irenaeus suggests that nonhuman creatures continue to obey God’s will: nature retains its goodness even after the Fall. Augustine further intensifies an anthropocentric interpretation of the Fall that indirectly exonerates the nonhuman creation. For him,

the creation is full of goodness and beauty which demonstrates the nature of the Creator, who is beauty itself. Human choice is the origin of the Fall. The curse blemishes human life alone: suffering and death are inherited by all humans (original sin) as punishments from God.

Throughout rabbinic literature, the notion of any original Fall remains only peripheral. Nor does Islam espouse original sin: the expulsion, caused by Satan's deception, was pardoned, having no ramifications for the rest of humanity or the natural world.

By the period of the Reformation, the Christian view of the Fall turned decisively against nature: originally created by God for the service of humanity, nature became cruel, ugly, and painful, after the Fall. Eden was a joyful reflection of God's blessing, for John Calvin, but afterwards "the inclemency of the air, frost, thunder, unseasonable rains, drought, hail or whatever is disorderly in the world are the fruits of sin" (Calvin 1948: 177). Similarly, Martin Luther asks: "And what of thorns, thistles, water, fire, caterpillar, flies, fleas, and bedbugs? Collectively and individually, are not all of them messengers who preach to us concerning sin and God's wrath?" (Luther in Kinsley 1996: 112). Whereas for Luther, the despair of nature can motivate us to seek redemption in Christ, for Calvin, the will of God manifests in all of nature, in each drop of rain, so that despite the fallen aspects of nature, the glories of God's providence rules all things for the benefit of the saved. At the time of the Reformation, belief in the Fall also contributed to early modern attempts to discipline unruly nature. Elaborating on his Calvinist upbringing, Francis Bacon claimed that science and technology can correct nature's fallenness and regain the dominion over creation that humanity had in Eden.

In the twentieth century, the Fall remained an important theological category. In the tradition of Calvin, German Theologian Jürgen Moltmann found a perfect "primordial" knowledge of God in paradise that "now only exists in rudimentary form" due to the problem of sin and a corrupted natural world. However, these "traces of creation-in-the-beginning" anticipate the deathless and sinless perfection of the glory of the world to come. Reinhold Niebuhr rejected his Lutheran tradition by accepting death as inevitable to our status as creatures. Evil is not in nature but results from human freedom, for Niebuhr. The fall of Adam and Eve symbolizes human freedom to wield both creative and destructive powers or good and evil in the world. Sin arises, for Niebuhr, when humankind makes destructive use of its freedom due to self-centered attempts to become godlike and overcome human finitude.

Christian Ethicist Max Stackhouse represents a contemporary strain of the reformed (namely Calvinist) tradition, endorsing the notion of a fallen natural world harboring evil. Though creation does embody an original goodness, all of nature, for Stackhouse, has indeed fallen and requires human constraint. Echoing Bacon, he argues that human intelligence and technology must be used to cure nature's brokenness and bring fallen nature nearer the intent of the Creator. In contrast, eco-theologian John Clateworthy condemns such attempts to "fix" nature, rejecting the idea that it is "fallen," and emphasizing that science and technology have wrought too many destructive consequences.

Hence, contemporary theologians find the doctrine of the Fall problematic in our age of the ecological crisis. For Rosemary Radford Ruether, belief in a fallen nature has permitted neglect of the planet and rejection of our relational intimacy with plants, animals, and the Earth through a disrespect for the death cycle of life. Brazilian theologian Ivone Gebara believes finitude and tragedy has and will always be a part of life on Earth. Hence, original sin, for her, did not cause a fall into mortality. For Gebara, primal sin comes from the organized attempts of humans to escape mortality and vulnerability, through the monopolization of power over animals, the land, and other humans.

Biblical scholar Lyn Bechtel explores the scriptural underpinnings for such an ecological ethic. The *ha-adama/ha-adam* wordplay – “Then Yahweh God formed the Earth creature [ha-adam] from dust from the Earth [ha-adam]” (Genesis 2:7) – demonstrates an “intimate relatedness” between Earth and earthling based upon the land. Originally united with the Earth, humans are separated from the native ground at birth. Adults work with the Earth, produce food, (2:5; 3:23) and eventually will return to union with the Earth upon death (3:19). Bechtel argues that the Hebrew text, far from implying a doctrine of Fall, suggests an earthly transition of maturation through birth and death.

There are other contemporary theologies that also affirm the workings of nature, but through alternative constructions of the Fall. In process theology, every level of reality has a degree of freedom, giving it the power to turn away from the divine will. Nature is fallen due to the occasions in which God’s lure has been rejected.

Process theologian Jay McDaniel, when thinking about how the Fall explains violence and suffering in nature, critiques the anthropocentrism of the traditional doctrine, as well as the assumption that violence and suffering are solely the result of disobedience to divine will. The predator–prey relationship evolved long before humans emerged on our planet. There was no time in existence when the Earth was free from violence. McDaniel gives the example of a grey whale being attacked and eaten by a group of orcas. The death of the grey whale is valuable to the marine ecosystem, giving sustenance to the orcas and other marine creatures feeding off the grey whale’s body. Creatures cooperated with God’s lure, creating the predatory form of sustenance, dubbed by McDaniel the “fall upward.” God lured more advanced forms of life into existence and this involved a risk that creatures would experience increased pain as they increased in opportunities for enjoyment.

A human-initiated Fall, however, does seem to resonate with scholars who liken Eden to the age of the hunters and gatherers. The foraging lifestyle of hunters and gatherers treated nature as home and the Earth as alive and sacred. As there was no sense of separation from the Earth, foraging communities were somewhat innocent, like Adam and Eve. Agroecologist Wes Jackson finds “the Fall” in the very transformation from hunting and gathering to the agricultural mode of life. Human evils such as systematic warfare, patriarchy, slavery, and ecological ruin, arose during this era. Farming, set-

lements, and population growth rapidly displaced animal habitats, alienating human from nonhuman species.

Korean ecofeminist, Sun Ai Lee-Park, also highlights a distinctive human role in the Fall. For her, the destruction of the rainforest represents the tree of good and evil, which signifies the restrictions and limitations imposed upon humanity against the taking of every tree. The transgression takes place not just in deforestation, but also by the World Bank who has been taking the Korean people from their land into factory production. The transgression of the tree of good and evil causes death as eco-death, says Lee-Park.

The concept of the Fall arises as either a human or a cosmic event, in both historical and contemporary scholarship. The Pauline notion of “fallen creation” reappears during the Reformation and in the contemporary reformed tradition. Recent scholarship however, also critiques the cosmic fall for encouraging estrangement from Earth ecosystems. Some scholars reinterpret a distinctively human “fall” from harmony with nature, others deconstruct the Fall altogether, so as to affirm natural forms of death and suffering as integral to the process of nature.

An examination of the current Eastern Orthodox literature on nature, ecology and the environment will show from the outset a recurrent feature. This concerns the clear demarcation between Eastern and Western Christianity (Roman Catholic as well as Protestant) as entire religious and cultural complexes in relation to these issues. It is believed that the historical development of these two parts of Christendom presented certain differences in theology and ethics, which had an immediate impact upon the way Eastern and Western Christians began to see and to treat nature. Given the fact that monotheistic religions and especially (Western) Christianity have been blamed (L. White) for fostering anti-nature attitudes and for being responsible to a large extent for

the contemporary ecological crisis, many Orthodox thinkers tried to dissociate Eastern Orthodoxy from its Western Christian counterparts.

For these Orthodox, the whole problem is closely connected to the rise of the Western worldview in modern times in the wake of the Renaissance, the Reformation, the Scientific and Technological Revolution, the Enlightenment, and the Industrial Revolution. Western Christianity played, albeit in many cases indirectly, an instrumental role in the appearance of this culture, which later acquired almost planetary dimensions. Two main characteristics of this development were individualism and dualism. Individualism saw humans as self-sufficient and static beings without real communion with one another and respect for the surrounding physical environment. The orientations and the needs of the individual held priority in the values system of modernity. Passing into a utilitarian and egoistic society of self-adoration was the normal consequence of this. Furthermore, dualism provided individuals with several Manichean polarities that created a barrier between the spiritual and the material and between humans and nature. In this context, knowledge of nature was identified with its control and subjection. Nature was desacralized and seen as an inanimate machine working according to standard laws that could be fully explored. Moreover, nature was falsely considered an endless source of wealth for the satisfaction of individual needs and wholesale exploitation. By identifying having with possessing and controlling, and by believing in continuous progress, modern humans began uncritically to exploit natural resources to produce and to consume at a growing rate. This optimism has been largely destroyed in the course of the twentieth century by various serious events including the world wars and the rise of nihilism. The quest for alternative worldviews and more holistic spiritualities (from the Far East) was but only a sign of the many deadlocks of the modern Western civilization.

By contrast, Eastern Orthodoxy offered another understanding of human beings in relation to God and nature beyond individualism and dualism. The ontology of personhood, based on the loving community between the three persons of the Holy Trinity, serves as a prototype for another kind of human existence. The latter is not viewed in a utilitarian and individualistic way, but as a harmonious coexistence with nature, which is the gift of God to humans. The person signifies relationship, nearness and unity, while the individual stands for distance, separation and alienation. From this holistic perspective, humans are the stewards and not the masters of creation. They have to take care of it, to transform it and to give it back to the Creator. This presupposes an eschatological understanding of nature, which is not going to be destroyed but to be transfigured. In this way, humans, as representing a micro-cosmos, are an integral part of creation, which should not simply be subjected to systematic exploitation, utilitarian needs, bare materialism and consumerism.

Furthermore, nature is not an object (i.e., something lying outside of and opposite to humans), which must be thoroughly subjected to human reasoning, power and control. Rather it should be seen as a living organism, the house, in which humans live and work and which deserves particular protection, care and reverence (cf. Gen. 2:15). Knowledge

means in this context a loving and holistic union with nature. In order to achieve a harmonious coexistence with nature and to overcome ecological crisis, humans have to articulate a new hierarchy of values toward nature. This implies the development of a new ethos of self-sacrifice toward nature. The latter suffers the consequences of the original sin too, which has destroyed the previous paradisiacal conditions. In the end, nature must be transformed by humans according to the prototype provided by Jesus Christ during his earthly life and symbolized in the sacrament of the Holy Eucharist. In addition, humans must develop a spirit of ecological asceticism by setting a new agenda of life and their real needs beyond self-centered utilitarianism and consumerism. Human control of nature should not be equated with its domination, but with a responsible *diakonia*, a service for the sake of the whole creation. This is the new ethos, the new stance and the new mentality, which Orthodoxy conveys to the modern materialistic global culture and which cannot be simply codified in legal frames and political programs.

This Orthodox understanding of nature and solution to the modern ecological impasse, based mostly on biblical and patristic sources, raises however the question concerning their applicability, namely the extent to which these ideas have really influenced the attitudes of Orthodox cultures toward nature. This is because if one examines these cultures in Eastern and Southeastern Europe, one will realize – curiously enough – that environmental conscience is usually far less developed among Orthodox than Western Christians. This means also that the above Orthodox ideas, apart from being too theoretical, do not accurately depict historical as well as contemporary reality. Although there is enough truth in the argument that the Western world has historically played a crucial role in the present environmental degradation, the way the whole issue is taken up by Orthodox thinkers is misleading. This is because they usually are apologetic toward Eastern Orthodoxy and intend to show its authenticity and consequently its superiority over Western Christianity. Thus, the existing serious discrepancy between theory and practice in this issue, along with other arguments, show the relativity of the sharp demarcation between Eastern and Western Christianity.

Christianity (1) – Introduction

Christianity has been commonly characterized – indeed, demonized – in recent decades as an anti-nature religion that has contributed to ecological indifference and degradation. This ecological complaint against Christianity has some merit, as many Christian interpreters have acknowledged. An adequate introductory overview of Christianity and nature, however, must also explore evidence for ecological sensitivity in Christian history, and conclude with the prospects for the development of ecological consciousness in this religious tradition.

The gist of the ecological complaint against Christianity is best stated in an influential essay by cultural historian Lynn White, Jr., “The Historical Roots of Our Ecologic Crisis” (*Science*, 1967). White argued that Christianity, “the most anthropocentric” of religions, “bears a huge burden of guilt for our crisis,” and “we shall continue to have a worsening ecologic crisis until we reject the axiom that nature has no reason for existence save to serve man.” Unlike many of his imitators, however, White was “a churchman” who called for a reformed Christianity. This essay not only spurred some environmentalists’ reactions against certain alleged Christian “axioms,” but it also provoked ecologically oriented reexaminations of the tradition by Christian theologians and ethicists.

On the one hand, the bulk of the ecological complaint is essentially true. Throughout Christian history, in diverse places, times, and forms, the dominant theological and ethical strains have been oblivious or even antagonistic to nature, especially untamed nature (as opposed to domesticated nature, such as sheep and olive trees). Anthropocentrism and dualism have been prime features of these interpretations of the faith. Often dichotomizing, rather than integrating, the spiritual and the material, soul and body, grace and nature, humanity and nature, the main strains usually have devalued or disdained “the world” as an alien, even demonic, place, and have sought to transcend it for the sake of spiritual elevation and otherworldly salvation. The biosphere has been perceived generally as theologically and ethically trivial – the stage and scenery for the divine–human drama, which alone has redemptive significance. The focus has been almost exclusively on human history, ignoring the reality that human history is rooted in and continually shaped by natural history. Nonhuman nature has been interpreted mainly as a composite of “things” – “raw materials” or “capital assets” – that have instrumental value for human economic and other needs, without regard for the moral claim that living “objects” are really an astonishing diversity of “subjects” struggling for space and sustenance in complex interdependencies. Humankind has been viewed as an ecologically segregated species, designed for dominion – managerial mastery, including

a divinely sanctioned right to exploit nature's bounty, with the main restriction being the long-term conservation of the resource base for future generations. Indeed, Christians have commonly believed that the Earth – in some versions, the universe – was created solely for “man.” Many also have argued that nature itself is “fallen,” cursed with deformities and asymmetries, not merely abused by the sins of fallen humanity. Consequently, some have suggested, nature should be “converted” to conform to the divine design, which often meant, in effect, technological transformations. These views and values have contributed directly and indirectly to environmental negligence and abuse in Christian history.

On the other hand, the ecological complaint is an overgeneralization. It overlooks the number and significance of dissenting opinions in Christian history, and underestimates the tradition's capacity for ecological reformation. Christianity is anything but a moral monolith; it embodies multiple strains of thought and practice, often with radically different emphases. The signs of what Paul Santmire calls the “ecological motif,” emphasizing human rootedness in nature and celebrating God's presence in the biophysical world, are widespread. The varied voices for ecological sensitivity in Christian history are mainly minorities and are often muted and ambivalent, but they are still present, persistent, and sometimes prominent.

The classical voices for Christian ecological consciousness can be heard in many forms –for instance, in prayers, hymns, poetry, protests, theologies, norms, and legends. They include the opposition of Puritans to cock-fighting and bear-baiting, and the resistance of medieval bishops and people to the destruction of ancient forests and fens. They also include poets such as Gerard Manley Hopkins and William Blake and theologians from Irenaeus to

H. Richard Niebuhr and Hildegard of Bingen to Joseph Sittler. The virtues affirmed by a religion can also be ecologically revealing. For instance, the norm of frugality, which many modern environmentalists advocate as an essential constraint on ecologically destructive prodigality and as an essential component of sustainable lifestyles, has been a central virtue in nearly all the Christian tributaries, Protestant, Catholic, and Orthodox. Some of the legends of the saints – especially the warm relationships with other animals among the Desert Fathers, the Celtic saints, and St. Francis – also illuminate the values of the saints' admirers. St. Francis can be regarded as the epitome of Christian love in an ecological context, but he did not exist in a vacuum. He was the foremost of a cloud of witnesses who preceded and followed him. The heroic figures and their exploits that a people remember and celebrate are not morally irrelevant; they are indicators of the values and virtues to which that people aspire.

Theological affirmations also show some ecological consciousness. For example, the mainstream interpretations of the doctrine of creation have affirmed the goodness of the natural order as the work of a loving God, the imitation of whom requires care for the Earth. In the doctrine of the incarnation, many theologians, especially paradigmatic Orthodox interpreters such as St. John of Damascus, recognized the sanctification of matter. In Christ, God entered into solidarity not only with humanity, but

also necessarily with the whole biophysical world of which humans are representative embodiments, the microcosm of the macrocosm. Similarly, the concept of the sacramental presence of the Spirit was understood to confer dignity on materiality, since it implied that the natural world was the holy habitat of God. The Orthodox, prominently, and some Protestant reformers, including John Calvin, Martin Luther, and John Wesley, peripherally, preserved the ancient hope of deliverance from death for all creatures, thereby affirming the ultimate unity and value of all life. Indeed, the idea of resurrection has been understood as the affirmation of the body, of materiality. The biblical idea of dominion has been used by many in the modern era as a religious rationalization for environmental exploitation and manifest destiny, but it was interpreted mainly through most of Christian history as a divine mandate against the tyrannical abuse of the rest of nature and for benevolent care. Wesley and some other divines, for example, interpreted dominion as the mediation of God's blessings to otherkind. Apparently, not all Christian axioms have been part of the ecological problem.

Contemporary Christian environmentalists contend that there is no major obstacle inherent in the Christian faith to the development of ecologically sustaining theologies and ethics. An ecological reformation of Christianity is necessary and possible, they claim, by reinterpreting Christian teachings in the light of ecological wisdom and other cultural borrowings. These claims seem defensible. Moreover, Christian churches have strong precedents and capacities for reevaluating and reforming theologies and ethics. *Semper Reformanda* – Always to Be Reformed – has been a Protestant motto, and similar ideas can be found in other Christian traditions. Indeed, one of the important characteristics of contemporary Christianity is the emergence of an ecological reformation that is building firm foundations for ecological integrity in Christian thought and practice, as many of the Christianity-related entries in this encyclopedia illustrate.

Christianity (2) – Jesus

Since Jesus stressed the authority of the Hebrew Bible (which for Christians became the Old Testament) (Matt. 5:18), he implicitly affirmed its teachings on nature. He did not rescind the ecological ethics of the Law, although he was less strict about ceremonial laws. All foods are clean and do not defile a person (Mark 7:19). He touched the sick to heal them, rejecting ceremonial uncleanness laws found in the Hebrew Bible (Mark 1:40–45; 5:25–34). Jesus appreciated the beauty of nature (Matt. 6:28–29) and showed respect for nature in his parables, which are rich in nature imagery. Through his upbringing in rural Galilee he learned about God’s care for creation by observing fruit trees, flowers, birds and fishermen and by working as a carpenter.

Jesus affirmed the scriptures teaching that God created all things (Mark 10:6; 13:19; Matt. 19:4). The world and matter are not eternal (Matt. 24:21, 25:34; John 17:24). Nature reflects the activity of God and does not operate independently (Matt. 5:45; 6:26–30; Luke 12:6). God is a loving Father who sustains and cares for all creation. God gives life to all beings (John 5:17; 6:33; Luke 24:38) and provides food for animals, birds and plants (Matt. 6:26–30; Luke 12:6). Since he loves all people, he causes the sun to shine and rain to fall on both righteous and wicked people (Matt. 5:45; cf. Ps. 50:11; 104:14, 17). As “Lord of heaven and Earth,” God is worthy of praise and obedience (Matt. 11:25; Luke 10:21). The resurrected Jesus has “all authority in heaven and Earth” (Matt. 28:18).

Nature provides ethical lessons. God’s provision of sun and rain for the wicked is a model for loving our enemies (Matt. 5:44–45). Since God provides for the needs of

What Would Jesus Drive?

“What Would Jesus Drive?” began as a slogan on a protest sign in 2001, and within two years had emerged as a full-fledged campaign highlighting North American religious opposition to global warming, perhaps the largest and most visible Christian environmental drive in history.

In the winter of 2001, Boston-based activists centered around the Harvard Divinity School, the Massachusetts Climate Action Network, and the Coalition for Environmentally Responsible Economies (CERES) began organizing a series of small demonstrations against the proliferation of gas-guzzling sports utility vehicles (SUVs). On Sunday, 3 June 2001, in a driving rainstorm, approximately 100 protesters paraded along an “auto mile” in the Boston suburb of Lynn, led by a number of clergy. Dan Smith, asso-

ciate pastor of Hancock United Church of Christ in Lexington, Massachusetts, carried a sign with the slogan “What Would Jesus Drive?” (Smith and protest coordinator Bill McKibben had concocted the slogan as a play on the widespread admonition among evangelical Christians, WWJD, or “What Would Jesus Do?”). “I hope it will at least encourage folks to think twice, and possibly pray about this decision, as they would about many other hard choices they make,” Smith told reporters. Noting that the parking lot of his suburban church was often filled with SUVs on a Sunday morning, he added “I love the people who drive them, but I feel we could all be better informed about the consequences of our decisions as consumers and Christians” (author’s recollection).

Widespread media coverage, including a full-page account in the *Christian Science Monitor* with the headline “What Would Jesus Drive?” and a feature on ABC News, spread the idea in religion-and-environment circles, and soon it was appearing on handmade buttons. (A protest in western Massachusetts later that summer, convened by the group Religious Witness for the Earth, featured signs reading “What Would Buddha Drive?”.)

A year later, in the fall of 2002, a much larger circle of religious environmentalists embraced the slogan as the centerpiece of their global warming campaign, using the catchphrase in a television organizing campaign that blanketed cities in four midwestern and southern states. The campaign began with a caravan of nuns driving hybrid electric vehicles, each carrying the slogan on a bumper sticker, to a meeting with top executives of U.S. automakers and the United Autoworkers labor union. The campaign included participation from the National Council of Churches and, interestingly, the Coalition on the Environment and Jewish Life. The most significant boost, though, came from organizing by Evangelicals for Social Action and the Evangelical Environmental Network. “We have confessed Christ to be our savior and Lord, and for us that includes our transportation choices,” said the Rev. Jim Ball, organizer of the EEN. “Most folks don’t think of transportation as a moral issue, but we’re called to care for kids and the poor, and filling their lungs with pollution is the opposite of caring for them” (*The Guardian*, 14 November 2002).

In a campaign discussion paper prepared by the two evangelical groups, an array of scripture passages were cited in support of the groups’ stewardship message. Particular attention was paid to the scientific prediction that global warming caused by American consumption of fossil fuels will impact most severely many of the world’s poorest people, particularly those in low-lying areas of the tropics.

Some conservative commentators attacked the campaign – one writer at *Forbes.com* declared that Jesus would drive a “4 ´4 pickup with crew cab” in order to keep his followers safe and negotiate tough Galilean roads. Wags suggested that scripture indicated Jesus might instead favor Hondas (Acts 5:12 – “the Apostles were in one Accord”). But the car companies listened more respectfully than they had to secular environmentalists. The largest impact of the campaign may be simply that it marked the start of more aggressive, scripturally based environmental campaigning by North American Christian activists. After a decade of bureaucratic resolutions from different denomina-

tions decrying global warming and other environmental ills, activists seemed finally to have hit on a slogan that captured the public imagination and crystallized the moral choices inherent in environmental issues.

Bill McKibben

See also: Biblical Foundations for Stewardship; Christianity (7i) – An Evangelical Perspective on Faith and Nature; Evangelical Environmental Network; Jesus and Empire; Restoring Eden. animals and plants, humans should trust God to provide for their material needs and reflect this in prayer for daily bread (Matt. 6:11, 25–33).

Jesus used nature metaphorically. The people of God are sheep that God cares for (Mark 6:34; John 9:36, 10:15) and those who would destroy them are wolves (Matt. 10:16; John 10:12). Jesus is the good shepherd who gives his life for his sheep (John 10). He is the bread that gives eternal life (John 6:25–40). The Holy Spirit is the water that gives life (John 4:14).

Many parables utilize nature to teach spiritual truth. Parables featuring seeds, weeds, wheat, yeast, fish and trees teach about the kingdom of God (Mark 4; Matt. 13; Luke 13:6–9; 21:29–30). Varied results from sowing seed in different kinds of soils illustrate diverse responses to Jesus' message (Mark 4:1–8, 13–20).

Jesus used natural objects to illustrate moral and spiritual lessons. Bread and wine were sacramental symbols of the new covenant instituted through Jesus' redeeming death on the cross (Mark 14:22–25). He made an unfruitful fig tree wither as a visual parable of judgment on people unresponsive to God (Mark 11:14; cf. Luke 13:6–9).

Jesus was comfortable with the material world (Mark 2:16), yet he was not consumed by it. One's priority should be to seek God's kingdom (his reign and presence) and righteous character above money and material possessions (Matt. 6:19–24, 33; 13: 22; John 6:27). Material things are not evil in themselves, but the pursuit of possessions is not the highest good. "What profit is there if a person gains the whole world and loses his soul?" (Mark 8:36). If a person trusts God and pursues God's kingdom and righteousness as first priority, God will provide his basic material needs (Matt. 6:33). We should thank God for providing for our material needs (Matt. 14:19; Mark 14:23).

All created things have worth in God's eyes. Nature has intrinsic value whether it provides human benefits (sheep, Matt. 12:11) or has little utilitarian value to humans (grass, sparrows, Matt. 6:26; 10:29–31). Even rocks glorify God (Luke 19:40). God knows what happens to sparrows and provides for them (Matt. 6:26; 10:29–31). Nevertheless humans have greater value than animals and plants (Matt. 6:26, 29; 10:31; 12:12), since humans are created in God's image (cf. Gen. 1:26). Jesus healed many people, but there is no record of his healing an animal. However, he taught the moral imperative of properly caring for animals (Luke 13:15; Matt. 12:11).

Several of Jesus' teachings have indirect implications for environmental stewardship. Leadership involves service of others, not power over others or an excuse for oppression (Mark 10:42–44). Hence human dominion over nature (cf. Gen. 1:26, 28) should be exercised for the good of creation, not the selfish destruction of nature. The parable of the talents and the parable of the wise steward imply the Earth is a stewardship for

which humanity is accountable to God (Matt. 24:45–51; 25:14–30). The Earth belongs to God not humanity (Matt. 11:25; cf. Ps. 24:1), and humans will be judged on the condition in which they return God’s possessions (Matt. 25:27).

In the Lord’s Prayer, Jesus teaches his followers to pray that God’s kingdom will reign fully on Earth (Matt. 6:10; Luke 11:2). Although God is Lord of heaven and Earth (Matt. 5:13; 11:25), human and demonic evil cause many things not to be as God intended them (Matt. 4:24; 10:7–18; 12:22; Mark 3:20–27; Luke 13:16). The Lord’s Prayer asks that God’s purposes be fulfilled in both physical and spiritual realms.

Miracles show Jesus’ divine power, glory and authority over nature and encourage faith in Jesus (Matt. 8:23–27; 14:22–33; Mark 2:10–11; 4:37–41; Luke 8:22–25; John

2:1–11; 9:30–38). He performed creation miracles such as multiplying loaves and fish to feed the hungry and transforming water into wine (Mark 6:34–44; 8:1–9; John 2:1–12; 6:1–13). Simply by speaking a word, he calmed storms (Mark 4:39–41; Matt. 8:23–27), much as God created with a word in Genesis 1. He healed numerous diseases with a touch or word (Matt. 4:23–24; 8:8) and raised the dead, including a man who had been dead four days (Matt. 9:18–25; 11:5; Luke 7:11–15, 22; John 11:38–44).

The return of Christ will be preceded by cosmic disasters, including earthquakes, plagues, famine, changes in the courses of astronomical bodies and the darkening of the sun and moon (Matt. 24:27–30; Mark 13:24–27; Luke 21:11, 25–27). Heaven and Earth in its present form will pass away (Matt. 5:18; 24:35). This does not imply the destruction of the world, but the transition to God’s universal reign over creation (Matt. 13:37–43). Although Jesus does not explicitly refer to a new or transformed Earth as do some NT authors, there are hints that there will be a perfected Earth after Jesus’ return. The righteous will eat and drink with Jesus in the consummated kingdom (Matt. 26:29; Luke 22:29–30). The humble will inherit the Earth (Matt. 5:5), a broadening of the promise in the Hebrew Scriptures that the righteous will inherit the land of Israel (e.g., Ps. 37:11). The dead will be resurrected bodily to face eternal rewards or punishments (Luke 14:14; John 5:21–29; 11:24–25). This implies the righteous will enjoy some type of physical existence in the eternal age, although different than the present physical life, since there will be no death or need for human procreation (Luke 20:35–37).

Christianity (3) – New Testament

The New Testament (NT) presupposes the Old Testament (OT) teachings on nature and occasionally quotes OT nature passages (Matt. 5:17; Acts 3:21; 7:49; 2 Pet. 3:13; Heb. 1:10; 2:5–8). God created “heaven and Earth,” gives life to all creatures and sustains creation. Nature is not to be worshipped. It witnesses to God the creator who alone is to be worshipped. Nature has value because God created it and sustains it. Jesus’ incarnation and bodily resurrection show that matter is not inherently evil.

The NT focuses on the reconciliation of humanity with God and the resulting ethical implications. Yet it also promises the final redemption of the material creation. Redemption involves the reversal of the damage caused by the human Fall on both humanity and nature.

Synoptic Gospels

God created all things (Mark 10:6; 13:19; Matt. 19:4; 24:21; 25:34). God is Lord of heaven and Earth (Matt. 11:25; Luke 10:21) and the resurrected Jesus shares this authority (Matt. 28:18). God is actively involved in nature. He gives life to all, lovingly cares for animals and plants, and provides sun and rain to meet human needs (Matt. 5:45; 6:26–33; Luke 12:6; 24:38).

Nature has intrinsic worth, apart from its benefits to humans (Matt. 6:26; 10:29–31). The value and goodness of matter is shown by the narratives of Jesus’ birth, which stress his physical incarnation in human flesh (Matt. 1; Luke 1:26–38; 2:1–7; 3:21–37). Jesus used bread and wine as sacramental symbols of his sacrificial death (Matt. 26:26–28; Mark 14:22–25; Luke 22:19–20).

Nevertheless, some aspects of nature are not as God originally intended due to the human Fall and demonic influence. Disease, death and natural disasters are negative aspects of nature that Jesus overcame through miracles (Matt. 4:24; 12:22; Luke 13:16). Jesus’ miracles show his divine power and authority over nature and encourage faith in him (Matt. 8:23–27; 14:22–33; Mark 4:37–41; Luke 8:22–25). He performed creation miracles such as multiplying loaves and fish to feed the hungry (Mark 6:34–44; 8:1–9). He calmed storms by speaking a word (Mark 4:39–41; Matt. 8:23–27), much as God created by speaking (Gen. 1). Many miracles are local reversals of the curse from the Fall that brought death, disease and hardship (Gen. 3:14–19). Jesus healed diseases (Matt. 4:23–24; 8:8) and raised the dead (Matt. 9:18–25; 11:5; Luke 7:11–15, 22). The miracles are a foretaste of the new creation, which will have perfect harmony in nature

and no death or disease. The multiplication of loaves and fish anticipate the super-productivity of nature in the new creation predicted by the OT prophets (Mark 6:34–44; 8:1–9; cf. Isa. 11:6–9; 25:8; 30:23–26; 66:17–25). Jesus’ healings and resurrections of the dead confirm his identity as the Messiah in fulfillment of scripture (Luke 7:18–23; Matt. 8:16–17). By touching the sick, Jesus rejected the Jewish tradition that the diseased are ceremonially unclean (Mark 1:40–45; 5:25–34).

Jesus frequently used nature in his teachings about spiritual truth. He drew ethical lessons from nature (e.g., Matt. 5:44–45; 6:11, 25–33). He used nature parables and metaphors to teach spiritual truth and to call people to faith (Mark 4; 6:34; Matt. 13; 10:16; Luke 13:6–9; 21:29–30). Since God providentially cares for animals, people should trust God for their needs (Matt. 6:25–33; 14:19). Although material things are not inherently evil, they should not preoccupy a person (Matt. 6:19–24, 33; 13:22). The pursuit of God’s kingdom and righteousness is the highest priority (Matt. 6:33).

As in the OT, cosmic signs accompany significant redemptive actions of God in history. A divinely appointed star guided the Magi to the newborn Messiah-King

(Matt. 2:1–11). When Jesus died on the cross, there were earthquakes and some righteous dead were resurrected, affirming that Jesus is the Son of God (Matt. 27:51–54). The resurrection of Jesus was accompanied by an earthquake (Matt. 28:2). The return of Christ will be preceded by cosmic disasters, including earthquakes, plagues, famines, changes in the courses of astronomical bodies, and the darkening of the sun and moon (Matt. 24:27–30; Mark 13:24–27).

Jesus was resurrected with a physical body of “flesh and bones” that could be touched, embraced and eat fish (Matt. 28:9; Luke 24:39–43). Yet his body was transformed (Mark 16:12) so it could pass through doors, disappear and sometimes not be recognized (Luke 24:15–16, 31, 36). Jesus’ resurrected body was a foretaste of the future transformed physical world and the resurrected bodies of believers. Although heaven and Earth in its present form will pass away (Matt. 5:18; 24:35), some type of future physical creation is implied. After Jesus’ return, God’s kingdom will encompass the whole Earth (Matt. 13:37–43; cf. 6:10). The righteous will be resurrected to eternal blessing (Matt. 26:29; Luke 14:14; 22:29–30) and will “inherit the Earth” (Matt. 5:5). There will be physical aspects to the kingdom, such as eating and drinking (Matt. 26:29; Luke 22:29–30), but believers’ bodies will be transformed since there will be no more death or need for human procreation (Luke 20:35–37).

The Gospel of John

Although John’s Gospel and Epistles focus on spiritual life, they do not denigrate the material world. In contrast to docetic and Gnostic views, matter is part of God’s good creation and is not inherently evil. Jesus, the eternal Word of God, became physically incarnated in a human body made of flesh (John 1:14; 1 John 4:2–3). John

stresses the physical, human aspects of Jesus, including fatigue, tears and hunger (John 11:33, 35, 38; 19:28).

Jesus was resurrected with a physical body that could be touched and could eat fish (John 20:17, 20–28; 21:9–14). Yet his body was transformed to transcend normal human limits so he could pass through closed doors (John 20:26). Jesus' resurrected body is a foretaste of the resurrection bodies of believers, whom Jesus will raise physically to eternal life, yet without disease or death (John 5:28–29; 6:40; 11:24–25). This implies a physical dimension to the eternal life of the righteous.

The eternal divine Word of God created all material and spiritual things (John 1:3; 17:24). The Gospel's prologue (1:1–14) echoes the Genesis creation narrative, where God created by speaking, "let there be . . ." (Gen. 1:3, 6, 9, 14, 20, 24). The Father, the Son and the Holy Spirit all give life, both the physical life of all beings (John 1:3–4; 5:21) and the eternal spiritual, resurrection life of believers (John 5:21; 6:33, 63; 20:31).

Nature metaphors abound in Jesus' teachings. Jesus is the bread that gives eternal life (John 6:25–40). The Holy Spirit is the water that gives life (John 4:14). God's people are sheep that Jesus tends (Mark 6:34; John 9:36; 10:15) and those who would destroy them are wolves (Matt. 10:16; John 10:12). Jesus is the good shepherd that gives his life for his sheep (John 10).

Miracles demonstrate Jesus' power, glory and deity and can build faith in him (John 2:1–11; 9:30–38). Miracles met physical needs, such as hunger (John 2:1–11; 6:1–14), and healed diseases, such as blindness and lameness (John 5:1–11; 9:1–41). Jesus overcame death by resurrecting a man who had been dead four days (John 11:38–44). He demonstrated his creative power by changing water to wine and multiplying bread and fish. Miracles also have symbolic significance: the wine points to the superabundant productivity of nature in the new creation (John 2:1–11). The multiplied bread points to Jesus as the manna that provides eternal life (John 6:31–39, 48–51). The resurrection of Lazarus anticipates the resurrection of the righteous to eternal life (John 11:23–25, 43; cf. 5:28–29).

God's values strongly contrast with an earthly, materialistic perspective. The command not to "love the world" (1 John 2:15) does not refer to the physical planet, but evil moral values in rebellion against God (1 John 2:16). References to the "world" as the planet are never negative (John 17:15, 18; 21:25). More often, "world" either refers to all people, whom God loves (John 3:16), or to people and values opposed to God (John 14:17; 15:18–19).

Acts

God is creator of heaven and Earth and everything in them (4:24; 14:15; 17:24). God sustains nature, directs its operation and gives life to all creatures (14:17; 17:25, 28). Nature witnesses to the existence of God and shows that only God the Creator

should be worshipped (14:15–17). He designed Earth as a habitation for humanity and provides human physical needs through nature (17:26).

God is Lord over all creation (7:49; 17:24). Christ ascended to heaven and reigns as Lord over all things (3:21). When Christ returns, all creation will be “restored” as promised in the prophets (3:20–21; cf. Isa. 11:6–9; 65:17–25; 66:22). Nature will not be destroyed but the damage from the Fall will be removed.

The Apostle Paul

Although he never met Jesus during his earthly lifetime, the Apostle Paul wrote many letters to the Churches he was helping promote his understanding of the meaning of Christianity. By so doing, he became the most influential theologian of the biblical writers. His thought is rich with reflection about nature and how it fits into God’s work.

God created all things (Rom. 1:20; 11:36; Eph. 1:4; 3:9; Col. 3:10; 1 Tim. 4:3–4). God gives life to every creature and sustains creation (Rom. 11:36; 1 Tim. 6:13). All things exist to bring glory to God and Christ (Rom. 11:36; 1 Cor. 8:6; Col. 1:16).

Paul’s view of creation, nature and the material world is Christocentric. Christ is the agent of creation, the source of life and the sustainer of all things (1 Cor. 8:6; Col. 1:16–17). Christ, who is the fullness of deity and existed prior to creation (Col. 1:15, 17, 19), created all material and spiritual things (Col. 1:16). All things were created for Christ (Col. 1:16) and his power “holds everything together” (Col. 1:17).

The resurrected and ascended Christ reigns as Lord over all things (1 Cor. 15:25–27; Phil. 3:21; Eph. 1:18–23) and is supreme above all creation (Col. 1:18). One day, all created beings in heaven and Earth will acknowledge the lordship of Christ (Eph. 1:10; Phil. 2:10–11). In the end, death will be destroyed and all creation will be subjected to God (1 Cor. 15:25–28). Paul expands Isaiah’s vision that every knee will bow to God (Isa. 45:23; 66:23) to include the entire created order. There is no barrier between the material and spiritual creation, since everything is under the rule of God and Christ, who sums up all things in himself (Eph. 1:10; 4:10; 1 Cor. 15:28). Paul is not negative about the physical world, including the human body. Through the incarnation, God’s eternal Son took on a real physical body, while fully retaining his deity (Rom. 1:3; Phil. 2:5–8; Col. 1:19, 22; 2:9). This affirms that matter is not evil. Each part of nature, including plants, animals and astronomical bodies, has a unique glory consistent with God’s design (1 Cor. 15:38–41). Nothing is unclean in itself, including all foods (Rom. 14:14, 20; cf. 1 Cor. 6:12). The Lord is for the body and the physical body should be used to honor God, since the Holy Spirit indwells Christians, whose bodies belong to Christ (1 Cor. 6:13–20; Rom. 6:13). Hence fornication, gluttony and other bodily sins dishonor Christ (1 Cor. 6:15; Phil. 3:18–19). Paul’s negative references to “the flesh” do not refer to the material body, but to the sinful nature inherited from Adam, which inclines all people toward evil (Rom. 5:11–21; 7:18; Gal. 5:19–21). Setting one’s

“mind on things above rather than things on Earth” (Col. 3:1–2), means focusing on moral and spiritual values rather than sinful desires (Col. 3:5–17; cf. Phil. 3:19–20). The “earthly members” that believers are to consider dead are evil desires, greed, pride, etc. (Col. 3:5–17; cf. Rom. 6:1–14; 13:14).

Paul asserted that nature reveals the existence of God and basic aspects of his being (Rom. 1:19–20). Reflection on nature suggests that the world was created and that God alone should be worshipped. There is a clear distinction between the Creator and creatures. To worship any created thing is to deny God the glory that is his due as Creator (Rom. 1:21–23). Worshipping any aspect of nature or images of birds, animals or humans is to give created things the place the Creator rightfully deserves in human hearts (Rom. 1:21–32). Nature gods are really demons and should not be worshipped (Rom. 1:23, 25; 1 Cor. 8:5;

10:19–22; Gal. 4:8). When anything is substituted for the transcendent God, the basis for ethics is also undermined (Rom. 1:24–32), Paul believed.

Since God is to be honored above all else, the spiritual takes priority over the physical dimensions of life. Idolatry is more than merely worshipping animal carvings. It includes anything that becomes the supreme focus of life other than God (Phil. 3:19; Eph. 5:5; Col. 3:5). One should discipline the body (1 Cor. 9:25–27) and not be mastered by physical desires (1 Cor. 6:12–13). Material things are not evil, but the love of money and material things should not consume a person, lest they replace God as the basis of security (1 Tim. 3:3, 8; 6:9–10, 17; 2 Tim. 3:2). No food or drink defiles (Rom. 14:2, 6), but preoccupation with food is imbalanced and Christian dietary freedom should be exercised with consideration for others (Phil. 3:19–20; Rom. 14:14–22; 1 Cor. 8:1–13). Sex is God’s good gift to be enjoyed within marriage and practiced with selfcontrol (Rom. 13:13; 1 Thess. 4:3–7; Gal. 5:19). The physical life has value, but it must be subject to the Spirit since people are not merely animals dominated by biological drives.

The Fall brought significant changes to nature. Nature no longer functions as God originally intended, due to human sin. Both physical and spiritual death came from Adam’s sin (Rom. 5:12–14, 17; 8:20–21; 1 Cor. 15:21–22; cf. Gen. 2:17; 3:8ff.). As a result of the Fall, creation was “subjected to futility” (Rom. 8:20), an allusion to the curse on the ground and pain in childbirth (Gen. 3:16–19;). Nature is now in bondage to corruption, decay and death (Rom. 8:21). Nature is not fallen, but it is a victim of human sin. Creation groans and suffers, longing to be set free from bondage to decay (Rom. 8:19–21).

Through his death on the cross, Jesus conquered sin and death so those who believe in him will have eternal life (1 Cor. 15:22, 57; Col. 1:20–22; 2 Tim. 1:10). Yet death will not be finally vanquished from creation until Christ returns (1 Cor. 15:23–26, 53–56). Jesus took away the sting of death (1 Cor. 15:54–56), but neither nature nor redeemed humanity have yet experienced the full implications of Christ’s death. Through the cross, Christ will reconcile both spiritual and material things to God (Col. 1:20–22). The reconciliation of humanity to God is part of God’s larger work of reconciling all

things to himself (Col. 1:20–22). All things will be restored to the proper functioning that God intended (Rom. 8:19–23).

The credibility of the Christian message rests on Jesus' resurrection in a physical body, not as an apparition (1 Cor. 15:4–8, 14–17). Jesus' resurrected body is a foretaste of the redeemed creation and the resurrection bodies of redeemed people (1 Cor. 15:20, 45–49; 2 Cor. 4:14; Phil. 3:21). Since believers are united with Jesus' resurrection, they too will rise from the dead (Rom. 6:5; 1 Cor. 15:21; Phil. 3:11). At Jesus' return, God will transform the bodies of believers into imperishable bodies like Christ's resurrected body (Phil. 3:21; 1 Cor. 15:50–57; 2 Cor. 5:1–5). Like Jesus' resurrection body, the resurrection body of believers will be physical, yet with a spiritual origin and character, glorious and eternal, and not subject to death and decay (1 Cor. 15:42–44; 2 Cor. 5:2, 4; Phil. 3:21; Rom. 8:18–19). This "spiritual body" (1 Cor. 15:44) will be suitable for dwelling in a creation set free from bondage to decay (Rom. 8:21). The eternal state of believers will not be a disembodied soul dwelling in heaven (2 Cor. 5:4). The entire person will be saved, not just the soul (1 Thess. 5:23).

The present form of this world will pass away (1 Cor. 7:31) and a new age will come (Eph. 1:21), in which creation will be perfected. Christian hope includes the deliverance of creation from bondage to corruption and futility (Rom. 8:20–21; cf. Gen. 3:15). The present suffering of creation is like birth pangs bringing a more perfect world (Rom. 8:22). Nature eagerly awaits the resurrection and glorification of the children of God at Christ's return (Rom. 8:19), when the entire creation will be set free from bondage to decay and will share in the glorious liberty of redeemed humanity (Rom. 8:21, 23).

Although believers are a "new creation" in Christ and have a transformed inner character (2 Cor. 5:17; cf. Eph. 2:10; 4:24), the culmination of the new creation is still future. Nature will be transformed (Rom. 8:20–21), believers' will be resurrected to glorious, imperishable bodies (Rom. 8:23; 2 Cor. 5:4), and death will cease (1 Cor. 15:20–24, 54–55). God gives the Holy Spirit to believers now as a guarantee of this glorious future (2 Cor. 5:5).

Paul sees solidarity between nature and humanity. Since God gave humanity dominion over the Earth (Gen. 1:26, 28), nature suffers when humanity is not rightly related to God and nature will be perfected when humanity is redeemed. The human Fall enslaved all creation to corruption and death (Rom. 5:12–14; 8:20). When the redeemed children of God are glorified at the end of history, nature will share in this glory (Rom 8:19, 22–23).

Peter

Since God is the creator of the world (1 Pet. 1:20; 2 Pet. 3:5), he seeks its purification and perfection. The "day of the Lord" will bring a "new heavens and Earth," in which nature will be perfected and righteousness will abound (2 Pet. 3:10–13). "The heavens will disappear with a roar, the elements will be burned up and the Earth . . . will be

laid bare” (2 Pet. 3:10, cf. 12). There are two ways to understand this: (1) This world will be destroyed and God will create a new, perfect world. (2) The present heavens and Earth will be renewed, purified and perfected. Several factors support the second interpretation: Burning is a frequent biblical symbol of judgment and purification (e.g., Matt. 13:20, 40; Luke 3:17). The passage uses similar destruction and re-creation language concerning the Flood (2 Pet. 3:5–7). Both the eschatological fire and the

Flood bring judgment on ungodly humans. In this sense the world was “destroyed” by the Flood and a new world was formed (vv. 5–6). Jewish apocalyptic writings also use similar new Earth/age language to refer to the perfection of creation. The new creation is “new” in its moral perfection and harmonious operation. In either interpretation, nature will be transformed and perfected.

Hebrews

God created everything (1:10; 3:3–4; 4:3; 11:3). He did not fashion the material universe from preexisting matter (11:3). The agent of creation was the Son of God and the word of God (1:2, 10; 3:3–4; 11:3), an allusion to Genesis 1 (cf. John 1:1–3). Jesus sustains and upholds creation by his powerful word (1:3).

Humans are exalted above nature (8:7), although materially they are part of nature. The author cites Psalm 8:4–6 (which echoes Gen. 1:26, 28), to show that God placed nature in subjection to humanity (Heb. 2:5–9). Yet sin corrupts the human relationship with nature and makes the dominion over nature flawed and incomplete (2:8). But Jesus, the first of a new race of humans, was exalted and has subjected creation to himself (2:9). The Son of God became fully human (“flesh and blood”), yet without sin (2:14, 17; 4:15).

Although Hebrews emphasizes spiritual salvation in heaven (11:10, 16; 12:22–23; 13:14), it looks forward to a redeemed nature and a restored human relationship with nature. In the “world to come” (the new Earth), the human relationship to nature will be perfected and the ideal of Gen 1:26, 28 and Psalm 8 will be fulfilled (2:5). In eternity, redeemed humans will not be merely glorified spirits, but will also have resurrected bodies (6:2; 11:35).

Revelation

God created all things in heaven, on Earth and in the sea (4:11; 10:6). God is “Lord of the Earth” (11:4). Every creature was made to glorify and worship God. John foresees the time when all creatures will worship God the Creator and Jesus Christ. Every creature in heaven, on Earth, and in the sea will join humans and angels in worshipping God and Christ (4:11; 5:13). The prophetic promise that all humans will bow before God (Isa. 45:23; 66:23) is expanded to include all creatures.

Nature is frequently used symbolically in the apocalyptic vision to describe Christ, God's presence in heaven, extreme forms of evil, divine judgments, and the eternal blessings of the righteous (e.g., 4:5–7; 5:6; 6:1; 10; 13; 21–22).

Revelation focuses on eschatology. Due to the extreme evil of people who rebel against God in the last days, God will bring judgment through disease and environmental disasters, such as earthquakes, storms, intense heat, plagues and famine (16:1–21; 18:8). The OT shows a similar pattern of divine judgment on sin through nature (e.g., Gen. 6:5–8; Ex. 7–12; Isa. 10:16–18; Jer. 14). Since humanity was given dominion over nature (Gen. 1:26), God's judgment on human sin affects nature.

At the climax of history, the righteous will be bodily resurrected to reign with Christ, never again to experience death (20:5–6). After Christ's return and the Final Judgment, God will create a new heaven and Earth (21:1). He will remove the damage caused by sin to the created order. Although it is difficult to determine whether some aspects of nature in the apocalyptic vision are symbolic (e.g., 21:1, 23), nature plays a part in the new creation. There will be a new Earth with rivers, springs and fruit trees with year-around productivity (21:1, 6; 22:1–2). All creatures will worship God (4:11; 5:13). There is some ambiguity about whether certain aspects of nature will be in the new creation. For example, there will be no sea (21:1, probably symbolic), yet sea creatures will praise God (5:13). God will "make all things new" and perfect nature (21:4–5). Death, disease, pain and suffering will not be a part of the new order (20:14; 21:4), since the curse on nature from the Fall will be removed (22:3). There will be a return to the ideal conditions of nature in the Garden of Eden and redeemed humans will have unrestricted access to the tree of life and water of life (21:6; 22:1–5, 14, 17, 19).

Christianity (4) – Early Church (Fathers and Councils)

The early Christian tradition expresses a profound ambivalence regarding the natural world. On the one hand, it affirms continuously the goodness and spiritual significance of the natural world, an affirmation rooted in two central convictions – that the world as created by God is good, and that the Incarnation of God in the person of Jesus Christ has transfigured all created matter. On the other hand, the early Christian tradition expresses genuine suspicion regarding the dangers of the wrong kind of attachment to the things of this world. At times, this suspicion expressed itself as a fear of, even revulsion toward material reality, toward embodied existence, toward the cosmos as a whole. However, there were also times when this suspicion of the world was understood in broader, more symbolic terms, a way of articulating the need to resist values believed to be antithetical to the Gospel. Much early Christian theological reflection, as well as the liturgical and spiritual life of the community, was affected by this deep-seated sense of ambivalence toward the living world.

Early Christian theological reflection unfolded within a highly charged climate of debate in which one's sense of God was directly and deeply affected by one's sense of the world and vice versa. Irenaeus of Lyons, for example, who in the second century articulated one of the early Christian world's most emphatic and systematic expressions of the created world's goodness and value, was responding in part to the work of certain Gnostic thinkers who held to a deeply pessimistic view of the created world and of the malevolent demiurge who was understood to be responsible for having created it. According to Irenaeus, the Christian doctrine of the incarnation allowed no such pessimistic view of the world. For Irenaeus, the incarnation or enfleshment of God in Christ meant that the entire material world had been transfigured and was a kind of sacrament through which the eyes of faith could see the very light of God. In the process of affirming this truth, Irenaeus preserved for Christians not only a sense of the goodness and integrity of the created world, but also the goodness and integrity of God who created and sustains it. Another kind of conversation, between Christianity and Greek philosophy, also affected how the early Christian community viewed the world and God's relationship with the world. For well-educated, philosophically sophisticated Christians such as Clement and Origen of Alexandria, the integration of Christianity into a Platonic philosophical framework was necessary if the Christian faith was to be seen as coherent and meaningful within the Greek-speaking world of Late Antiquity. But

their brilliant synthesis also meant accepting certain aspects of Platonism's hierarchy of values and its de facto dualism (material realities, being corruptible, occupied a lower place in this hierarchy than non-material or spiritual realities, which through their kinship with God, the supreme Spirit, were seen as having eternal value and significance). The result was a profound and creative new articulation of Christian theology and spirituality. But it came at a cost. The suspicion of or aversion toward the physical world that one often senses in these and other writers leaves one uncertain about how successful they were at incorporating a fully incarnational Christianity into their thought-world and practice.

Augustine of Hippo (354–430), writing in Latin, largely accepted this Platonic dualism of matter and spirit as part of his understanding of Christian theology and employed it to articulate two important ideas that had vast influence upon the subsequent Christian tradition. The first was that the spiritual life has to do primarily if not exclusively with the interior life of the human being, an idea that effectively relegated the nonhuman phenomenal world to secondary status. The second was his deeply pessimistic attitude regarding human nature and the physical world (rooted, some have argued, in the influence of Manichean thought and its radically pessimistic attitude toward the physical world), an attitude that made it difficult for him to affirm what for Irenaeus had been axiomatic: that the world and everything in it is good.

This pessimism also manifested itself in Augustine's complex attitudes toward human embodiment and sexuality. As Peter Brown has demonstrated so clearly, this was a pessimism, or perhaps one should say ambivalence, shared by many early Christians. Part of this ambivalence had to do with what one might describe as a failure of the imagination – an inability (from our point of view) to incorporate sexual desire fully into an understanding of a life oriented toward God. Or to use the terms that Margaret Miles employs in her creative re-reading of Augustine's *Confessions*, one could say that this ambivalence had much to do with the way Christians came to understand pleasure. For Augustine, the only “true pleasure,” the only pleasure that lasts, is found in God. This necessitated casting a suspicious eye upon all desires and objects of desire less than God. Augustine was not the first to articulate these ideas. Nor can one lay at his feet all the worst excesses of later Christian ascetic ideas and practices. But his brilliance in articulating a powerful but narrowly circumscribed notion of pleasure became part of the very pulse of subsequent Christian thought for centuries to come, contributing to the Christian tradition's ongoing ambivalence toward “the things of this world.”

The synthesis of Christian and Greek philosophical thought also contributed significantly to the Christian community's ability to articulate how and in what ways God's presence could be felt and encountered in the world, to the development of a distinctly Christian cosmology. Central to this Christian cosmology was the idea of the *logos* or Word of God. The prologue of the Fourth Gospel had already expressed clearly the idea that Christ the *logos* had played a crucial role in the creation of the cosmos: “When all things began, the Word already was. The Word dwelt with God,

and what God was, the Word was . . . Through the Word, all things came into being” (John 1:1). Tertullian (ca. 160–225), Clement of Alexandria (ca. 150– 215), and other early Christian thinkers took this idea and, drawing upon the Stoic’s profound sense of the *logos* as the very animating principle of the cosmos, developed it into a coherent Christian cosmology. Responding to those who claimed that God is remote from the created world, Tertullian cited the Stoics who, he said, remind us “that God [through the *logos*] permeates the world in the same way as honey in the comb” (Tertullian in Colish 1990: 19). Elsewhere, Tertullian addresses the question of how the divine *logos* can be said to permeate the sensible world without losing its divinity: it is like the sun’s relations with its own rays, he says, which are a portion and extension of their source. Both analogies draw upon the idea of *logos* as a generative principle immanent in the cosmos. According to Clement of Alexandria, the *logos* has three distinct but related dimensions. It is utterly transcendent, being identical with the totality of the ideas or powers of God. It is also the principle or pattern of everything that has been created. And it is the *anima mundi*, or world soul, the law and harmony of the universe, the power which holds it together and permeates it from the center to its most extreme boundaries.

Such ideas contributed significantly to the capacity of Christians to believe in and experience God’s presence in the created world. Nor were such ideas limited to the sphere of philosophical and theological reflection. They reached into nearly every aspect of Christian life and thought, including art and architecture, biblical commentary, mystical experience, ascetic practice, music, and poetry. In the *fiat lux* of the Genesis creation account and in the luminous gold background of ancient Christian and later Byzantine mosaics, *logos* comes to expression through light. According to Irenaeus, the word that speaks through the cross also gestures forth across the cosmos: because [Christ] is Himself the Word of God . . . who in His invisible form pervades us universally in the whole world, and encompasses its length and breadth and height and depth . . . the Son of God was also crucified in these, imprinted in the form of a cross on the universe (Irenaeus in Ladner 1995: 99).

One finds exquisite artistic expression of this idea in the Mausoleum of Galla Placidia in Ravenna. There, the cosmic cross appears on a dark blue shallow dome in the midst of stars arranged in concentric circles, an image whose diminishing size toward the center gives one the impression of gazing into a heavenly vault.

The same *logos* that sustains the cosmos rises up to meet us, suggested Origen of Alexandria (ca. 185–254), in the most intimate depths of religious experience. For Origen, one of the privileged places of such encounter was the reading of scripture. Here the *logos* comes as an ardent lover who kindles within us a passionate love for the world: “If a [person] can so extend his thinking as to ponder and consider the beauty and grace of all things that have been created in the Word,” he claims, “the very charm of them will so smite him, the grandeur of their brightness will so pierce him as with a chosen dart . . . that he will suffer from the dart Himself a saving wound, and will be kindled with the blessed fire of His love” (1957: 29). Here is a sensual, palpable

logos, present to us, says Origen, much as touch, fragrance, sound, vision, and taste are present to us.

Within the Christian monastic tradition, tasting and chewing upon the *logos* became a way of life. For the monks of the Egyptian desert, the *logos* arose from the silence as a powerful and numinous presence. To ruminate, digest and absorb such a word into the very marrow of one's being was to be brought into the very presence of the Holy One. Nor was the natural landscape of the desert itself an insignificant part of this process. According to Athanasius's *Life of Antony*, the Word of God not only beckoned Antony to withdraw into the desert, but called him to a particular place – a wild and beautiful spot in the remote Arabian desert known simply as “the inner mountain.” Such a powerful pull did it exert upon Antony's imagination that, upon seeing it for the first time, he “immediately fell in love with the place.” The entire subsequent Christian tradition of monastic stability, or devotion to place, owes much to this early sense that places are alive with the power of the *logos*, that they do indeed speak to us with a particular voice, that rumination upon the word and the spirit of the place are integral elements in the larger rhythms of the spiritual life.

Still, as a whole, the early Christian tradition remained ambivalent toward “the world.” Early Christians clearly lived with a profound sense of the world's goodness and beauty and some of their most creative theological work reflects the desire to understand their relationship to a God who is present to them in and through the things of this world. Yet, they also knew themselves to be “strangers” in this world, not entirely of this world. Clearly the development of this sense of life in the world as a kind of exile owes much to Platonic, Manichean or Gnostic influences; but at its root, it is a principle arising out of the Gospels themselves. And in that context, at least, it had more to do with allegiances than with a sense of the inherent evil of the world. Jesus's disturbing question to his followers, “God or Mammon?” had a lasting effect upon the Christian imagination. To become a disciple of Jesus was to struggle with the question of to what or whom one was to give one's allegiance, to consider carefully what or whom was deserving of that allegiance. It was to raise questions not so much about the inherent goodness of the world (in the sense of God's created order) but about the problematic and deeply compromised character of existence (the order governed by “principalities and powers”). In that sense, the Christian notion of being “strangers” to this world carried within it the seeds of a healthy and necessary skepticism regarding the ordering of power in the world. But it also carried within it the seeds of a different and more problematic orientation: a suspicion of created matter and a commitment to a radical interiority that made it difficult if not impossible to cherish the created order as spiritually significant. The legacy of this problematic denial of the world within early Christianity is still very much with us. Any honest evaluation of the ancient Christian tradition needs to reckon with it seriously. But we must also be prepared to acknowledge the creative cosmological vision found within early Christianity. Whatever suspicions the Christian community may have felt toward the world, it also expressed

a profound and enduring love for the living cosmos and a sense that its sustaining energy was rooted in the Word of God.

Christianity (5) – Medieval

Medieval Christian thought has been routinely criticized for its pervasive theme of human dominance over nature. A perceived split between nature and supernature results in a sharp dichotomy between biophysical reality and a transcendent, spiritual reality. Furthermore, the latter is identified with the image of God in human beings, often to the exclusion of the body. However, closer attention reveals a tragic ambivalence that begins with Augustine and continues in the scholastic tradition of Thomas Aquinas. Theologians within the Eastern Christian Church, like John Scotus Eriugena, wrestled with the distinction between nature and grace to the extent that they adopted Western premises. Of course, medieval Christianity also includes individual mystics whose piety included an intimate reverence for nature. Francis of Assisi (1182–1226) will be examined as representative, although female mystics like Hildegard of Bingen (1098–1179) and the nuns of Helfta (thirteenth century) deserve to be heard as well. Despite the medieval opposition between creation and Creator-God, the synthesis of God, nature, and man was tenuously retained until the late Middle Ages. What began as an expression of reverence for nature ended in nature's availability for divinely ordained human disposition.

The roots of Western medieval Christianity are found in Augustine of Hippo (354–430) in North Africa. His wonder at the drama of the natural world was interpreted through the Neoplatonic notion of divine immanence. His awe and wonder at the world's beauty was expressed in terms of the Greek notion of the One pouring itself out into the world. Thus, God's presence in the universe affirmed and sanctified nature rather than transcending and negating it. Augustine broke from Origen's heresy (condemned by the Fifth Ecumenical Council in 553) that the natural world "fell" into its physical/material state by the sin of Adam and Eve. Indeed, Augustine writes of the beauty and grace of nonhuman things. Augustine's understanding of nature was not, however, consistent. In an argument against the Pelagians, who thought that good works led to the City of God, he contradicted himself. At stake were the issues of human self-sufficiency and divine omnipotence. Augustine took the position that human nature was wounded by the sin of Adam and Eve, and divine intervention was required to restore right relationship with God. Additionally, Augustine's background in Manicheism (a Persian ascetic sect with strong dualistic tendencies) contributed to an emphasis on the salvation of the human soul alone. Augustine did not posit the dichotomy of pure nature and supernature, which would be prevalent in Christian thought. However, his concept of grace as a cure for sin and his concern for the human soul were enough to initiate this later split.

John Scotus Eriugena (ca. 810–877) combined Augustine’s medicinal notion of grace with an otherwise Eastern Christian theology. (Eastern Christianity tends to see creation and salvation as a seamless movement, unbroken by the Fall. Dualism between nature and supernature is a Western problem.) Eriugena’s text *The Division of Nature* retained the Neoplatonic concept of theophany, God’s self-manifestation in the world. In his detailed discussion of animals, birds, and plants, he evinces an understanding of nature as a wondrous display of God’s very self. However, for him, theophany tends to be formal. Divine selfmanifestation occurs primarily in the eternal reasons or forms of things rather than in their actual material existence. Eriugena echoed Origen in seeing the physical embodiment of all things as a result of human sin. Deification was available only to the human spirit and to the ideal essences of nonhuman things.

Francis of Assisi’s life (1182–1226) was a celebration of nature’s sacredness. The divine presence in nature, including human nature, was best accessed by a life of poverty and renunciation of the self. His *Canticle of the Sun* called on the heavenly bodies to praise the Lord. His sermon to the birds, his “little sisters,” instructed them in God’s abundant love. For Francis, the divine and the natural worlds were not at odds; nature and scripture were one. Nature was infused by divine grace and the idea that the natural world could exist in isolation from God’s fecund goodness was foreign to him. For Francis himself, nature was God made visible.

Yet, Francis is known primarily through Bonaventure and Dante. In their interpretations, the hierarchical overflowing of the divine into the natural world does lead to a privileging of humanity. Bonaventure, especially, views humanity as the exemplar of nature and as alone destined for reunion with God. Nonhuman creatures find their perfection in humanity, whose spiritual nature, alone, will return to God.

Such ambiguity is continued in the scholasticism of Thomas Aquinas (1225–1274) who developed Augustine’s view of nature and the divine as a united reality. Nature is fulfilled by and oriented to God. God’s goodness and abundance is manifested in the natural world. Given his Aristotelian background, it was no accident that Aquinas was the author of five proofs of the existence of God from natural theology. Reasoning from the causality, existence, motion, complexity, and design of the natural world, he believed God’s existence was a rational conclusion. His arguments expressed his conviction that only an omnipotent, omniscient, good God could create such a world. Nevertheless, Aquinas combined the Aristotelian premise that nature could be studied in abstraction from God with the Augustinian interpretation of Christ’s incarnation as a cure for sin. Together, these two themes contributed to the growing distinction between nature as “pure nature” and the supernatural. The biophysical world was, at least in theory, separable from the spiritual world. Later scholastics, such as Duns Scotus (d. 1308), allowed for the possibility of the actual existence of pure nature, distinct from and unfulfilled by supernature.

The nominalist William of Ockham (1285–1349) brought this nascent division to full bloom. Out of reverence for God’s infinite transcendence, he distinguished between God’s absolute power (*potentia Dei absoluta*) and the actual created order as willed

by God (*potentia Dei ordinata*). Because God had the power to create anything and any truth he wanted, nature was no longer anchored by divine rationality. Practically speaking, this meant that knowledge was gained through observation of what was actually there; the presupposition of a harmony between divine reason and the natural order was annihilated. Nature was irrevocably severed from God. For the first time, “pure” nature was seen as a completely separate reality from the divine. With the evacuation of sacredness from nature, Thomas Bacon was able to justify human dominance as God’s original intention for humankind. Thus, medieval theology set the stage for Enlightenment figures like Galileo, Descartes and Newton. These thinkers continued the reduction of reality to extension and its expression to mathematical formulation. Human knowledge of and approach to nature had fundamentally changed. The world only existed insofar as it was forced into quantifiable categories, its meaning dependent on human action.

Medieval wonder at the natural world contains the seeds of the misguided justification of human dominance over nature. Christian theologians like Augustine, Eriugena, Aquinas, and Francis of Assisi articulated the awe they experienced in the only concepts available to them: concepts of creation, hierarchy, and the classical concept of God. The tragedy lies in that the logical development of their thought, particularly in Ockham’s nominalism, resulted in a world devoid of sacredness and available for unrestrained human consumption.

Our contemporary interaction with nature is irrevocably shaped by a religious and cultural history so pervasive that it cannot be simply jettisoned. A deeper understanding of medieval Christianity may allow us to understand ourselves, constructively reinterpret the tradition, and face a future fraught with ecological dangers.

Christianity (6a) – Roman Catholicism

With approximately one billion adherents at the turn of the twentieth century, Roman Catholicism is the largest branch of Christianity. Catholicism's history has been marked by shifting emphases regarding God's and humanity's relationships to the natural world. From its Hebraic origins, early Christianity affirmed the goodness of all of God's creation and understood humanity both as a part of the community of creation and as its very apex and crown. However as Christianity spread across the Mediterranean world, it encountered and accommodated itself to potent Platonic and neo-Platonic philosophical systems emphasizing the transcendence of the spiritual realm over the world of embodied reality. The cosmological model of emanation pictured creation coming from God's being and goodness overflowing into a "great chain of being," and dominant streams of early Christian theology adopted this model.

On the one hand, this world-picture affirmed the rich relationality – the chain's "links" – between God, humanity, and the rest of nature. It emphasized that humanity is a part of the community of creation and it affirmed that even the "lower levels of creation" are graced, precious, sustained in being by God, and contribute in their own way to the "perfection of the universe." It affirmed an "ontology of participation" in which God alone is "necessary being" and all of creation is understood as sustained in existence by its participation in, and dependency on, God's energy and goodness. This view helped foster across the centuries Catholicism's rich sacramental sensibility. On the other hand, this world-picture emphasized the hierarchical ordering of the diverse levels of being in the universe and viewed humanity as the apex of creation, enjoying God's grant of "dominion" over the rest of nature. Historically this stress on hierarchy supported affirmations of God's transcendence, humanity's unique creation in the *imago Dei*, and humanity's rights to use the rest of nature to serve its ends. Often the stress on hierarchy became so dominant that balance was lost and the traditional understanding of humanity as a part of creation became attenuated. Nonetheless, because dominant traditions of patristic and medieval theology placed such a stress on God's creation and governance of the universe, a potent creation-centered frame for understanding human life was retained even if the emphasis on hierarchy pulled toward the enunciation of a strong anthropocentric ethical focus.

One can see this ambivalent construal of the natural world in the flowering of Catholic theology in the medieval period. A wide number of theologians, monks, and mystics gave expression to a strong sense of God's presence amidst the world of creation,

and yet this cosmological frame of thought was joined to a strongly hierarchical view of the order of being which in turn supported a stress on the distinct role and value of the human. A wide range of important medieval thinkers placed an emphasis on creation. John Scotus Eriugena (810–880), for example, translated the Pseudo-Dionysian corpus, and in his own work, *On the Division of Nature*, gave an extensive elaboration of the Platonic world-picture. Hildegard of Bingen (1098–1179), a German Benedictine abbess, integrated cosmology, creation and the incarnation, and the Celtic Saints preached extensively about God's grace in nature.

Down through the centuries the Church's monastic orders have functioned as important reminders to the broader church community of God's presence in nature. The monastic orders stretch back to the founding of the Benedictine order by Benedict of Nursia (ca. 480–547). Even though monasticism is popularly associated with austerity, ascetic practices, and an other-worldly ethic, the monks' typical retreat from urban centers often led them to establish their monasteries in rural or wilderness areas. While serfs typically did the bulk of the agricultural work required to sustain the community, the monks themselves frequently participated in agricultural labor.

Indeed, Benedict's Rule, which shaped the practices of his and many other orders, called for integrating prayer and daily labor. This rhythm tended to balance the other-worldly tendencies of monastic spirituality with an inner-worldly appreciation of the gardening, land-clearing, forestry management and sustainable agricultural practices required to sustain the communities. While clearly affirming an other-worldly stance, Catholic monasticism also has sustained a deeply respectful engagement with the fields, woods, gardens, animals, and surrounding countryside – and a sense that humanity and the rest of creation are partners in a common project of honoring the Creator. Many Catholics continue to find inspiration in the strong affirmations of the goodness of the natural world now voiced by many of today's monastic communities.

Two giants of the Medieval Church – Francis of Assisi (ca.1181–1226) and Thomas Aquinas (1225–1274) – deserve special attention because their life work and writings continue to shape Catholic reflection about God's and humanity's relationships to the natural world. The stories of Francis' rejection of his father's wealth and conversion to a life of poverty, of his irrepressible joy, his charity, his preaching to birds and animals, his stigmata, and his founding of the Franciscan Order all continue to inspire. Francis was a nature mystic who felt deeply the intimacy of God's presence throughout nature and stressed humanity's kinship with the animals, fish, and birds. He was committed to a life of preaching and he drew on scripture, especially the Psalms, for vivid and concrete language about birds, animals, stars, and planets. He emphasized the close bonds between humanity and the rest of creation by invoking personalistic and familial terms of address – “Brother Sun,” “Brother Wolf,” and “Sister Mother Earth.” The various orders that have branched off from the original Franciscan trunk have been generally energetic in recent years in promoting ecological responsibility. Pope John Paul II in 1979 called attention to Francis' example by naming him the patron saint of ecology.

Thomas Aquinas' works are also read today with interest by Catholics concerned about ecological degradation. His *Summa Theologia* and other works well display the "chain of Being" model's affirmations that God is manifest throughout the order of creation and that the human and all other living entities participate in the common good of the universe. Thomas' works hold unique authority in modern Catholic thinking because Pope Leo XIII (1878–1903) in his encyclical *Aeterni Patris* (1879) officially adopted Thomism as the foundation for theological education in Catholic seminaries, colleges and universities. Likewise Leo, in his encyclical *Rerum Novarum* (*The Condition of Labor*) (1891), drew on Thomas' understanding of the natural law to address the sufferings of the poor and exploitation of working people occurring in the industrializing countries of Europe and North America. Leo condemned with equal vigor the unfairness and meanness of unfettered capitalism and the revolutionary excesses of socialism's call for the abolition of the private ownership of property. Leo appealed to the natural law heritage to argue for a "middle way" between capitalism and socialism that affirmed both the priority of the common good over that of the individual and the existence of certain natural rights, like the right to own property, to join in workers associations, and to receive a just wage for one's work. *Rerum Novarum* is generally credited as a major advance in the papal social encyclical tradition.

Leo's endorsement of Thomism as the Church's "official" theological vision encouraged a revival of interest in Thomas' works. While neo-Thomists have long focused on Thomas' hierarchical stress of human superiority over the rest of nature, increasing attention is now being directed to his use of a second organizing principle in his thinking, one that focuses on the "whole community of the universe" (Aquinas 1948: 2:996; *ST*, 1a, 2ae, q.91, art.1). Whereas the dominant interpretation has given a human-centered reading of Thomas, his writing on creation develops a second scale of value in which the individual is subservient to the good of the species, and that good is likewise held as subservient to the common good of creation. God is the ultimate common good of all existent entities, but the next highest good is the good of the universe as a whole, a good that surpasses that of any one species including the human. Thomas accepts that the human is uniquely created in the *imago Dei*, but he holds that all other creatures also bear a "likeness" of their Creator (Aquinas 1948: 1:231; *ST*, 1a, q.44, art.3). Thomas rearticulates the neo-Platonic principle of plenitude that holds that because God is maximally good and powerful, God pours out God's being into a maximally rich universe characterized by a maximal diversity of levels of being. For Thomas, the diversity of species is a mark of God's sovereign grandeur and expansive generosity. As he put it: "[T]he principal good in things themselves is the perfection of the universe; which would not be, were not all grades of being found in things" (Aquinas 1948: 1:124; *ST*, 1a, q.22, art.4). Increasingly these passages are being read as providing a theological condemnation of human practices that promote habitat destruction and species extinction. To kill off a species is to tear the fabric of God's creation.

Even as Pope Leo XIII appealed to the Thomistic natural law heritage to affirm a distinctive Catholic social ethic critical of the excesses of both capitalism and communism,

dominant streams of Catholic thinking in the twentieth century became influenced by existentialist and phenomenological currents of thought stressing humanity's unique subjectivity, freedom, and historical agency. Many French thinkers, like Emmanuel Mounier, Jacques Maritain, and Etienne Gilson, and Germans, like Dietrich von Hildebrand, gave shape to an emerging Catholic movement known as "Personalism" which centered ethical reflection in the distinctive worth and unique value of the human person. Likewise Karl Rahner, Bernard Lonergan and others called for a "turn to the subject" and away from Thomistic metaphysics and notions of the natural law. Lonergan called on Catholic thinkers to shift from the "classicist worldview" and embrace "historical mindedness." In rejecting metaphysics and ontology, increasing numbers of Catholic thinkers came to accept a sharp dualism between humanity and the rest of nature. Many Catholic thinkers in recent decades meant that the "turn to the subject" also functioned as a turn away from nature and the order of creation. But in falling silent about nature, much modern and contemporary Catholic thinking too easily accommodated itself to accepting the ruling understanding of nature as a "thing" or a "field or resources" that is sustained by the dominant consumptive and productive practices of industrially advanced society. Pope John XXIII (1958–63) called the Second Vatican Council (1962–65) to help the Church respond more adequately to the "signs of the times." Many wanted the Church to ease its traditional condemnation of artificial birth control and John XXIII called a commission to study the issue. After John's death the commission recommended to Pope Paul VI that he end the condemnation of birth control. Paul, however, sustained the traditional condemnation in his encyclical *Humanae Vitae* (*On Human Life*) (1968) and this triggered an ongoing controversy. The Pope relied heavily on biologically-based, natural law reasoning to condemn artificial birth control as a violation of the natural end or purpose of intercourse and to affirm that the rhythm method of natural family planning is permissible because it involves no impediment to "natural processes" and is in accord with the natural cycles of women's fertility. Many who rejected the Pope's conclusion likewise came to reject the natural law method used to reach that conclusion. They felt it reductionistically read ethics directly from the physical ordering of biology or nature. Many liberal thinkers sought to revise Catholic ethics by centering moral attention on persons in their full relationality with other persons, not on the physical structure of the sex act.

John Paul II became pope in 1978 and his distinctive personalist ethical emphases have long had a powerful influence on Catholic thinking. Before his rise to the papacy he received his doctorate in philosophy and was strongly influenced by Edmund Husserl's and Max Scheler's phenomenological perspectives. While John Paul II continued to appeal to the natural law tradition to justify his continuation of the condemnation of birth control, his main critique of birth control drew its energy from his phenomenological account of the human person. He held that birth control's wrongness lies primarily in the intent to block the "full donation" of persons in the act of love. Its wrongness, then, lies more in its violation of relationality between persons than in some violation of the "order of nature." Thus, while sharp disagreement continues between those

who condemn and those who would accept birth control, many in both camps shifted away from natural law reasoning and embraced a focus stressing God's relationship to persons and their responsibilities to each other.

With both conservatives and liberals "turning to the subject," it is not surprising that there emerged a general turning away from nature and creation. The heightening of the intensity of the focus on the human often was accompanied by an attenuation of an appreciation of our embodied animality as members of a species dependent, like all other species, on the well-being of the Earth's ecosystems. Though some Catholic liberals and conservatives continue to invoke the natural law tradition, they generally see it as based in principles drawn from "human reason," not some "order of nature." In this fashion, the dominant view in the last three decades of the twentieth century understood the tradition as human-centered, not creation-centered.

Pope John Paul II's 25-five year pontificate, for example, marked a clear progression from an early endorsement of a flat-out domination of nature, to an acceptance of a dominion ethic, and finally to an acceptance of a more ecologically informed, stewardship approach. Even if one wished the pace had been quickened, he will be remembered as the pope who first addressed ecological issues. Long accustomed to focusing on social justice issues, the Vatican found it difficult to integrate ecological sustainability into its long-standing social justice agenda. While many environmentalists' voices have been raised in concern about rising global population and its impact on ecosystems, the church hierarchy's response was to argue that overconsumption by rich societies is the key ecological problem and that increased development of poorer societies is the best path toward global population stabilization. While there is some merit in the Vatican's view, still it seems that the Vatican came to ecological issues with hesitation, due both to its controversial position against birth control and because of the Pope's personalist perspectives. By the early twenty-first century, the clash between the United Nations' population agenda and the Vatican lessened, however, as the United Nations began to emphasize the expansion of girls' educational opportunities and the promotion of families' and women's healthcare as the most effective means of achieving reductions in average family size over time. While the Church and the United Nations remained in confrontation over the latter's encouragement of birth control, this new approach, stressing education and healthcare, was one that most in the Vatican could embrace as a matter of social justice.

John Paul II's encyclical *Laborem Exercens (On Human Work)* (1981) illustrates both his personalist philosophical agenda and how it tends to polarize the human sharply from the rest of nature. He celebrated the dignity of human work, but did so by contrasting human agency and subjectivity over against nature's passivity and "objectivity." Through work humanity "subdues" and "dominates" the Earth and thus fulfills the mandate of Genesis. The Pope held technology as an almost unqualified "ally" in humanity's transformation and domination of the natural world. Repeatedly the nonhuman world is depicted as a sphere of resources. John Paul II did acknowledge, however, that "the heritage of nature is limited and that it is being intolerably polluted."

But this was a passing point that failed to check his general celebration of the ongoing domination of nature (Pope John Paul II 1981: 7).

John Paul II's 1987 encyclical *Sollicitudo Rei Socialis* (*On Social Concern*) was the first encyclical to give more than a mere passing reference to emerging ecological problems. In this encyclical his main agenda was to call for the social and economic development of peoples, but he did acknowledge limits to humanity's dominion over the Earth. He noted that we have "a certain affinity with other creatures" and that we were placed "in the garden with the duty of cultivating and watching over it" (John

Paul II 1987: 52 [sec. 29]). But he failed to break out of an anthropocentric focus and repeatedly insisted that the "goods of creation" were meant to serve the good of all of humanity (secs. 39, 42, 76, 86). While this encyclical marked an important turning point, still the Pope repeatedly depicted the natural world as a field of resources waiting for human transformation and use.

The Pope's fullest articulation of concern for emerging ecological threats was promulgated in January 1990 in an address titled: "The Ecological Crisis: A Common Responsibility." In it he moved from a stress on dominion to articulate clearly the importance of recognizing strict stewardship obligations. Catholics have a "serious obligation to care for all of creation" (Pope John Paul II 1989: 13), he stated, adding that the ecological crisis is a moral issue and a "common responsibility" of all peoples. He strongly condemned the overconsumption of the industrialized rich societies and asserted that this is the primary cause of ecological degradation.

Bishops' Conferences in many nations built on the Pope's early steps and promulgated an array of important pastoral letters on ecological concerns. Most move beyond the Pope's generally human-centered ethical perspective and articulate a stewardship ethic rooted more deeply in an acknowledgment of humanity's participation in, dependency on, and responsibilities owed to, creation. In 1988 the Filipino Bishops wrote an important letter that noted many connections between human suffering and ecological degradation. They held that the defense of the Earth is the "ultimate pro-life issue" and called on the Church to overcome its "neglect" of the "ecological crisis" (Bishops of the Philippines 1996: 317). Likewise the American Bishops in 1991 wrote "Renewing the Earth" in which they drew on the Hebrew Scriptures to remind us that we inhabit a "sacramental universe" in which God's presence sustains all creation. They called on Catholics to acknowledge their "kinship with all that God has made" (US Catholic Conference 1996: 229). They sought to expand the traditional notion of the common good to include the "planetary common good" even as they argued that the "love of neighbor" now requires that we "extend our love to future generations and to the flourishing of all Earth's creatures" (US Catholic Conference 1996: 239).
