Paganism – Contemporary

Paganism labels a set of religions centered on the celebration and veneration of nature that understand and engage it in one way or another as sacred. To fully understand the natural dimension of contemporary Paganism we must apprehend its origins and diversity. Scholars who study such religion generally use “Pagan” or “Paganism” (with a capital P) to denote a religion as identified by its adherents, and “pagan” or “paganism” (lower-case) to refer to more general phenomena such as the pre-Christian religions of ancient Europe.

The origins of the name and of the revival of Paganism in the twentieth century arise from earlier cultural trends and movements. Many Pagans think that “pagan” derives from a Latin word meaning villager or “country-dweller” as opposed to a city-dweller. They associate it not only with rural and traditional values, but also with being close to nature or the land. Of course, this makes it difficult to speak of classical Roman “paganism” since that term must refer to temple-based religious observances in cities and towns. In reality the term originally meant something more like “parishioner,” a member of a community living in a particular place – rural or urban – who is therefore obligated to respect sacred places and people in that area. The term “paganism” was created by Christians in the fourth century in order to contrast (negatively) their religion with the religiosity they hoped to replace.

The mere addition of “-ism,” however, misdirected attention from cult (the performance or observance of traditionally defined duties toward persons, places and powers worthy of respect) toward beliefs about deities. Despite this, the polemics of the medieval churches against popular religion, including beliefs about anti-Christian activities, maintained a focus on actions rather than ideas, at least as the locus of transgression. With the Enlightenment and Romanticism, the body and its needs and desires became associated not with temptation and sin but with the possibility of good and health. The meaning of “nature” altered from “not yet sanctified” to “as it should really be.” Thus “pagan desires” could be valorized as noble and worthy. This exemplifies trends that resulted in the creation of a set of religions, the members of which called themselves Pagans.

In the early to mid-twentieth century Gerald Gardner and companions declared themselves to be members of a Pagan Witchcraft religion. Their ideas were rooted in academic understandings that the alleged witches persecuted in the sixteenth and seventeenth centuries had been continuing ancient pre-Christian fertility religions. However, alongside the theories of Margaret Murray about such witches, and the musings of Robert Graves about the inheritance of Celtic knowledges, were other forms of

real but diffuse connections with the ancient religions of Europe. Ronald Hutton has documented four such connections: high ritual magic (ceremonial engagements with “supernatural forces and beings,” such as among Hermetic orders and the Rosicrucians), hedge witchcraft (e.g., the low-level folk magic of “cunning men” and Horse Whisperers), the general love affair of the Christian centuries with the art and literature of the ancient world, and folk rites. Thus, Gardner and the Witches that gathered with him blended aspects of previously esoteric ceremonies (e.g., those that invoked elemental beings and guardians of the directions) with the use of herbal remedies, veneration of classical deities (e.g., the Moon and/or Earth as Goddess), and seasonal and lunar festivals. Immediately, therefore, their spirituality focused attention on human relationships with the Earth, places and physical reality.

Witchcraft was not the only form of Paganism to be revived or created. In almost every century since the Roman invasion of Britain there have been claimants to the title “Druid.” Until the twentieth century most such Druids were Christians of one sort or another. There were exceptions such as the Gallic-inspired polytheism of Breton Druids since the period of the French Revolution. In the second half of the twentieth century, however, a plethora of mostly Pagan Druid Orders formed. They share with Witches (or Wiccans as some name themselves) a calendar including eight annual seasonal/solar festivals alongside those marking phases of the lunar cycle, a delight in ceremony, and a reverence for nature that sometimes results in environmental activism. Witches and Druids now tend to name deities from ancient Celtic cultures, although some venerate a more eclectic pantheon. It is partially true that Wicca and other Witchcraft traditions are mystery religions enabling the discovery and expression of the individual’s higher self in relation to nature, whereas Druidry is a more public or accessible nature religion encouraging a wider population to celebrate.

A third group of Pagans name themselves variously Heathens or Ásatrúar, “those who honor deities.” They are inspired by Germanic, Norse, Icelandic and/or AngloSaxon cosmologies and literatures. They too engage in magic and ritual, celebrate seasons and venerate deities.

While there has been considerable feminist influence on the various Paganisms, this is most explicit in Pagan branches of Goddess Spirituality and in versions of witchcraft such as that of the Reclaiming covens initiated by Starhawk in San Francisco. Similarly, many Pagans have been influenced by shamanism. Some Heathens, for example, are experimenting with trance techniques and performances rooted in understandings of ancient literary references to “seidr.” Both feminism and shamanism have affected the celebratory practices of Pagans and have sometimes encouraged even more direct encounters with nature, including environmental direct action. Paganisms of various other kinds have been revived in different parts of Europe, typically drawing on knowledge of ancestral literatures and traditions and blending them with environmentalism and other contemporary concerns.

Each Pagan tradition, or “path,” is divided into myriad local, regional or global affinity groups and networks of various kinds. Sometimes a focus on a particular deity

or pantheon distinguishes a group from others. Sometimes a particular teacher or initiator introduces alternative ways of working magic that attract attention and result in the formation of a new lineage of groups. Sometimes a group's stress on a particular sacred place, or the intensity of their commitment to a threatened ecosystem, leads them to identify more strongly together than they do with any previous affiliations. Shifts to different countries, climates, cultures or continents causes significant changes in style or flavor (e.g., "Wicca" refers to a restricted group of covens in the UK, but is a more general term in North America). Only occasionally do such Pagan diversities result in hostilities between groups over morality, politics, and other issues. Generally, Pagans celebrate diversity in self-identity as they do in ecology. Certainly no central authority or hierarchy has emerged that is persuasive to or representative of all Pagans. However, more localized hierarchies can develop when charismatic leaders and powerful inner circles are criticized by others in the community. At such a time small groups may split off and begin their own Pagan communities. In this way the larger Pagan culture remains fluid and malleable, allowing for participants to follow their preferences for community structure and leadership style.

One of the preferences some Pagans exercise is to conduct rituals alone as what are termed "Solitary" Pagans, or to participate in discussions and rituals with other Pagans over the internet as well as, or instead of, in face-to-face groups. The internet has also provided new means of net- working and of experimentation with ritual and identity, but generally speaking it simply replicates the modes of affiliation and discourse typical in pre-internet Paganisms. The common ground among all Paganisms is literally physicality or nature. As ever in religions, it is primarily in relation to engagement with the common ground that diversity is most evident. For Pagans, then, the key questions are about ontologies and epistemologies of other-than-human beings and places and appropriate modes in which humans might relate to them.

It is not irrelevant that the contemporary revival of Paganism has emerged from and is rooted in European cultures and landscapes. Even if Pagans and others are wrong about the origins of the word, it is important that "Pagan" is linked with countryside rather than wilderness. That is, traditional paganisms enabled people to make religious sense of living and working with places and their surrounding community of life. They did not demand pilgrimages that transcended ordinary reality by long treks to distant places less altered by humanity. Indeed, it is doubtful that such true wildernesses have existed anywhere in Europe for a very long time. Even in North America, Africa and everywhere else inhabited or visited by humans, "wilderness" has sometimes been created recently by evicting previous occupants. Everywhere, the Earth is at least partially the result of human interaction with other life and other influences. Thus Paganisms can engage powerfully with the world as it is. Sometimes Pagan celebration of nature takes place in the heart of cities, sometimes it requires confrontation with economic interests transforming ecologically diverse ecosystems, sometimes it encourages organic husbandry, and sometimes results in evocative and playful ceremonies. However, it is certainly true that most Pagan celebrations involve journeys to woodlands,

coastal areas or other more “natural” locations. For example, most large Pagan festival gatherings in the U.S. are held in forested areas where the emphasis on getting away from the city to commune with nature is emphasized.

The most obvious sense in which Paganism is centered on the celebration of nature is in its various calendar festivals. The majority of Pagans celebrate a cycle or wheel of eight annual solar/seasonal festivals marked by the two solstices, two equinoxes and the four intervening “quarter days” that mark the beginnings of northwest European seasons. These festivals provide opportunities not only to acknowledge the relationship of Earth and sun, and to celebrate the changing seasons of the natural world, but also to focus attention on individual and communal human life cycles. At summer solstice, for example, Pagans might honor the sun at the height of its (his or her) powers, conduct marriages or other rites of love and commitment, facilitate carnivalesque celebrations of summer, and conduct the energies of the season (and of places) toward the enhancement of the well-being of all life.

The names given these festivals by particular groups of Pagans concomitantly links them to ancestors, reinforcing understandings that challenge modernist individualism, suggesting links with indigenous religions, and reinforcing divergences within the broader religion. The centrality of seasonal celebrations (especially when they require some adjustment to suit local/regional seasonal variations – and temporal ones in the case of the Southern Hemisphere) always insistently roots Paganism in positive engagement with this-worldly rather than transcendent realities.

A focus on this world is true too, however, of Pagan dealings with deities. Although the Christian theological dichotomy transcendent/immanent is referred to by Pagans in discussion with other religionists, their own discourse suggests very different conceptions of the relationship between deity and physicality. Along with many members of polytheistic religions, many Pagans understand that while discrete deities are beings in their own right they may also manifest themselves within various other physical modes. These might include statues or artistic representations, but more commonly deities manifest themselves within particular humans. Thus a central rite of Wicca is “Drawing Down the Moon” when the Goddess, whose reality is incarnated in the moon is invited “into” a priestess, who then speaks words and perform actions taken to be those of the Goddess. (Pagans often speak of “the Goddess” without necessarily meaning that there is only one divinity, or of “the Goddess and the God” without meaning that there are only two.) Again, this fluidity of form and permeability of boundaries is indicative of Pagan notions of the nature of persons. Even while celebrating nature “as it is,” Pagans understand that what is visible is not the whole story. The divine is accessible in material, indeed in human, form. Everyday, ordinary life is taken up into divinity and demonstrated to be important and worthy of celebration. Transcendence (the divine) does not transcend the mundane, but rather returns celebrants to their daily lives with renewed insight into the value of ordinary material.

This Pagan polytheism is allied to a pervasive animism, seen in practices that aim to establish respectful communication with a wide range of significant other-

than human living beings. For example, Pagan festivals might include veneration of particular deities, but they will almost certainly acknowledge the importance and invite the participation of other celebrants in the “natural” world. Trees and rocks are commonly understood to be persons in some sense, but Pagans also claim to encounter elemental beings (of Earth, air, fire and water) and those named, by various folk traditions, “faeries” or “elves.” Acknowledgement of the priority of the “spirit of place” and other inhabitants of particular places again grounds Pagan environmentalism in engagements with material reality and the everyday world.

Reincarnation has become popular among Pagan and in wider cultural notions of what might happen after death. In the Pagan version reincarnation is not considered to entangle people in the unpleasantness of physicality, animality and sensuality that cannot be escaped. Far from proffering a solution to such “problems” Paganism celebrates embodiment. Physical nature in all its forms is “good” and Pagans rarely speak as if being human were preferable to any other kind of embodiment. In considering environmental threats, some Pagans might actually say the opposite: it would be better not to be human if being human required such assaults on all other life. The Pagan answer to that problematic equation of humanity with eco-pollutant is to encourage respectful action toward the world. No manifesto details what this must mean for all Pagans, let alone all humanity, but inspiration and encouragement is offered toward the pursuit of an adjustment of human control over the world. Many Pagans believe that if Earth were understood to be humanity’s permanent home (whether because of the sense of reincarnation as continuous embodiment within Earth’s ecosystem or for whatever other this-worldly ontology) and embodiment our eternal state, this should provide a solid foundation for a more respectful and humble participation in the processes of being than is currently typical of humanity.

One of the ways Pagans try to facilitate this kind of participation is through the practice of magic. Various definitions of magic have been inherited from esoteric and traditional sources, but the most common are “the art and science of causing change according to will” and “the art and science of changing consciousness according to will.” Both of these indicate that nature (human and beyond) is malleable and that it is, at least sometimes, permissible to manipulate it. Both definitions require ontological similarity between human intention and other purposeful agencies or powers in nature. That is, particular expressions of human will (when sufficiently and appropriately empowered, expressed and performed) can cause changes either in the magical practitioner or in that which they wish to change. For most Pagans, magic’s plausibility is rooted in a metaphysics of relationship (inter-influence or inter-dependence between humans and other life). Certainly, Pagans typically hedge the teaching and performance of magic around with ethical injunctions (e.g., the Wiccan Rede) which says that so long as none is harmed it is permissible to enact one’s true will (once that is known of course). Warnings are often offered that magic is just like all other actions in that it causes results for the magician as well as beyond them, and that care is required in the statement of intention (uncertainty might lead to chaos). Pa-

gans usually share wider cultural vilification of those who might use magic to harm others (a perspective that underlies most traditional ideas about witchcraft, and thus is somewhat uneasy in this case). The notion that magic is effective also indicates that there are powers in nature that might be controlled, with some effort, for the benefit of others.

Magic and embodiment also invite consideration of sexuality. In the Wiccan “Great Rite” a high priestess and high priest make love as Goddess and God (some do so symbolically rather than “in true,” and now always in private). This sacramental sex has roots in the ancient mystery religions of Eleusis and Isis, but also and more importantly in pervasive Pagan understandings of the goodness of sex, desire, bodies, physicality and the natural world. Paganism celebrates life as generated by ordinary sexual processes of evolution, and encourages people to value sexuality positively, and sometimes even as sacred. Pagans do not find religious problems in that which is “natural,” nor do they offer a religious solution in denial of desire and embodiment. Instead, its “problems” are perceived threats to the diversity of life, and its “solutions” are the rediscovery of the goodness of the natural.

Tendencies central to Pagan self-understandings might lead to suspect interests. For example, respect for ancestral traditions has led some Pagans toward racist notions of ethnicity and identity. Or perhaps it is that some discourse about ancestors or ancestral tradition dovetails with elements of racist essentialisms that use constructions of the past to claim “authenticity.” Such tendencies and temptations are rejected by the majority of Pagans. Many Pagans also reject any belief in a devil or evil-principle, sometimes asserting that Satan is actually part of the monotheistic or specifically Christian pantheon. However, some do find “Satan” useful to symbolize the “dark side” of nature, its forces and processes of death and decay. Even in such discourse, however, these processes are not demonized but revered as vital for the continuity of life. Most Pagans find plenty of scope in non-Christian cosmologies for such discussion, some referring to the “dark side of the Goddess” or to Kali as creator and destroyer. It may also be important to note that Satanism is properly considered a self-religion, whereas Paganism is a nature religion.

Paganism is, therefore, the label for a diversity of spiritual movements and practices focused, in a variety of ways, on the celebration of nature. These certainly include festive gatherings and ceremonies, but might also entail eco-activism and ecologically sensitive lifestyles. Few if any of these practices and lifestyles are unique to Pagans, however, and it is the particular accretion of worldviews and lifeways that define something as Pagan rather than something else. Diversity itself is essential to the self-understanding of most Pagans, both when they think about what “nature” means and how it might be encountered and engaged, and when they think about the character of their religion. Even in uses of the internet, fantasy literature, imaginative storytelling and ritualizing, Pagans pursue greater intimacy with the ordinary, physical world. Indeed, even encounters with deities, which in some religions might encourage the transcendence of embodiment and physicality, are experienced as invitations to be more rather

than less human and, thereby, natural. Paganism is world-affirming even, or especially, when it confronts what it perceives as threats to ecological diversity or the sanctity of natural life. Its engagement with physicality re-enchants the world not as resource or environment but as community. Its spirituality does not efface or conflict with physicality but finds it not only meaningful but also worthy of celebration and even revelatory of that which is sacred and of lasting value. In these and other ways, Paganism intersects with significant currents in contemporary society (environmentalism, feminism and postmodernism for example). Its selfconstruction and presentation encourages the perception that nature is more than a context for self-discovery, it is engaged with as a community of co-celebrants.

Paganism – Mari (Mari El Republic, Russia)

Mari El is an autonomous republic of Russia located approximately seven hundred kilometers from Moscow. The ethnic Mari, formerly known as the Chermis, who speak a Finno-Ugrian language, represent 43.3 percent of the republic's population. Beyond Mari El, the Mari peoples are found also in Bachkorostan, Tatarstan and Udmourtia as well as in the areas of Nijny Novgorod, Kirov and Sverdlovsk.

Upon the rediscovery of its indigenous pagan traditions at the end of the 1980s, the Mari El Republic underwent a nationalist reawakening. By granting legal status to longstanding religious traditions, the 1997 Russian law concerning freedom of religion promoted Mari Paganism as well. Nevertheless, the Mari have encountered difficulties. Despite some Soviet efforts, the Mari pagan tradition had never been suppressed, but at the same time it had also never been officially registered (largely because the Mari do not use houses of worship), and this has made it difficult for the tradition to gain recognition despite the 1997 law.

Mari spirituality is intimately connected to a respect for the natural order. The conception of nature has always been one of alliance rather than domination. Each aspect of the natural world is considered a base for perpetual regeneration. An ecological tradition has emerged for the Mari out of their reverence of nature. Their relationship with the natural manifests in all facets of life. For instance, since the sacredness of water is emphasized, the Mari will not wash their clothing in the rivers. Springs and groves are highly important and constitute places where above all one must behave with dignity. Seasonal considerations play a central role in how the people organize their lives. Though less dependent on hunting today, in former times it was believed that the pursuit of game at inauspicious moments would increase the likelihood that the hunter might be killed by an offended forest spirit. Protective traveling songs insured the vitality and benefit of both the rider and his horse. Overall, animals and humans were considered as equals, and weather was forecast through the appearance of animals. In ritual, animals would have been sacrificed – a practice that appears still to be current. While the Mari relationship with animals has changed in many respects from what it once was, reverence of vegetation remains much the same as in former times. For the Mari, plant life may be understood as the most direct form of divine incarnation. This is especially true of trees, and tree-worship focuses in particular on the birch, lime and oak – associated, respectively, with women, maidens and men. Un-

derstood as divinities, offerings are made directly to trees. They are reputed to be able to heal disease, influence weather and augment the harvest. Treeworship may also be hierarchical: some trees become commemorative foci to which offerings are made; others are considered to be ancestors. These last, though presents are rarely offered, are appealed to in difficult times. It is forbidden to cut them down. Mari worship is centered on the grove where strict rules apply concerning swearing, spitting and harming trees physically. During festivals, the people don new clothes to come to the grove. Such *loci religiosi* are approached as areas for healing, consolation, comfort, renewal and the solving of domestic problems.

Today, Mari Paganism recognizes approximately three hundred sacred groves. In a country of 23,000 square kilometers and a population of about 700,000, there are around one hundred priests.

Today, the principal opposition to indigenous Mari spirituality comes from the Russian Orthodox Church, which holds Paganism to be dangerous. The Orthodox repression has been mitigated to some extent by the 1997 law that guarantees respect for all religions. Although many Mari are Orthodox, the government supports Paganism and recognizes it as an official religion alongside both Orthodoxy and Islam. While Orthodoxy is understood as part of the hegemonic Russian pervasiveness, Paganism is seen as a cultural factor that supports autonomy against the Russian government. Nevertheless, Mari El nationalism is not activist, but adopts a more passive approach for change to occur naturally and harmoniously. Within the Pagan community itself, however, rivalry between various leaders has caused a degree of friction and difficulty. Despite the “double-faith” situation and predominance of Orthodoxy in Russia, many Christian and Pagan rituals have become associated. By not constructing its edifices directly on the old places of worship but simply near to them, the Church has not engendered the same animosity it has elsewhere in Europe

Consequently, regardless of the difficulties encountered with official registration, there is more tolerance for Paganism in the former USSR republics than in other European states. In Western Europe, with the exception of Iceland and Norway, Paganism is generally ignored and cannot hope at the moment to obtain official recognition.

By contrast, in the republics of Iceland and Norway, it is an offense to criticize Pagan representatives openly. In Eastern Europe, the situation for Paganism becomes even more favorable when it is perceived to augment national identity. From the ethnic perspective within the Mari El Republic, monotheism is seen as non-indigenous and foreign. Since independence, Paganism has come to reinforce ethnic identity. In this regional/ethnic interface between Paganism and local identity, the Mari Republic’s evolution may provide some interesting clues as to the future development of European Paganism/neo-paganism.

Paiute Culture

The Paiute (meaning “Water Ute”) are among the oldest identifiable American Indian cultural groups within North America and are ultimately related through the widely distributed Ute/Aztec language group to such other groups as the Shoshone, Ute, and even Meso-American groups such as the Aztec. The Ute/Aztec language and cultural grouping extends from southern Idaho and Oregon to the Valley of Mexico and is thought to comprise the original population of the Great Basin and neighboring areas. Their prehistory has been well-studied and is the subject of numerous monographs and research reports compiled in the “Great Basin” volume of the *Handbook of North American Indians* (Volume 11). Their culture has also been the subject of much theoretical speculation because of their close dependence on a challenging environment and they are sometimes compared to the Eskimo of North America and the Bushmen of Africa in this regard. For example, Julian Steward and other neo-evolutionists within anthropology have attempted to classify them as representative of the earliest examples of human culture due mostly to their hunter-gatherer mode of subsistence, limited population, and patrilocal band organization.

The Paiute are divided by anthropologists into Northern and Southern Branches who together occupy large portions of the western and northern Great Basin, an arid region of about 200,000 square miles in the Western United States ranging from Utah across Nevada’s southern tip to the Mojave Desert in California, east to the Wasatch Range, west to the Sierra Nevada, and north into southern Idaho and southern Oregon. Traditional Paiute subsistence is based on seasonal exploitation of riparian, lacustrine, and the oasis-like marshy areas within the Great Basin. For example, the northernmost groups of Paiute in the Great

Basin enjoyed access to the aquatic resources of the Columbia and Snake river systems, while the Paiute of the central Great Basin enjoyed access to the resources of such lakes as Pyramid Lake, with the Southern Paiute depending more on oasis and marshy area resources. Traditionally, the Paiute followed a semi-nomadic but very predictable foraging/gathering migratory pattern, moving from temporary settlement to temporary settlement according to a schedule determined by the availability of foods as they ripened and became available for harvest. In spring they depended on roots, seeds, fowl, the spawning runs of fish available at various rivers throughout the northern Great Basin, and various mammalian and avian species. Summer followed with harvesting of other seeds, grasses, berries, roots, small and large mammals, and various bird species. In autumn the pine nut (piñon) harvest was a major focus of both ceremonial and subsistence activity along with the hunting and storage of meat

from deer, antelope, mountain sheep, and elk. During the fall and winter, the rabbit drives were especially productive and often resulted in a very productive harvest, in some cases equaling the harvest of anadromous salmon encountered among Northern Paiute. Antelope were also taken through collective activities. The piñon harvest is still a time of great celebration and social interaction with much celebration of this important resource throughout much of the Great Basin including the Ute, Shoshone, and Washoe as well as the Paiute. Proper respect for the piñon is necessary lest the resource itself not be regularly available. Indeed, there is considerable evidence that the piñon harvest is not always available, and that the Paiute have sometimes blamed themselves for having caused such shortfalls through moral infractions and breaking of taboos. The piñon harvest in the Great Basin continues to be accompanied by extensive ceremonialism expressing such necessary respect.

Most traditional Paiute settlements were relatively small, except for a few large ceremonial gatherings associated with harvest of the piñon, anadromous fish, rabbits, and antelope drives. The people spent most of their time in smaller local groups generally limited to several related families whose subsistence needs did not exceed the carrying capacity of the local resource base. Leadership was largely determined by kinship and family position with elders exercising a dominant influence in family affairs. Collective activities such as hunting, gathering, and fishing were cooperative and led by elders. Sometimes shamans were influential in deciding where and when to go for subsistence resources because of their knowledge of the floral and faunal spirit world.

Traditional Paiute religious life focuses on a continuing search for ways of healing and promoting abundance and fertility of the resources on which they depend. Both groups and individuals depend on a number of ceremonies in order to achieve these ends. The vision quest and shamanism along with the sweatbath are principal ceremonies, but the first fruits (thanksgiving), the Sun Dance, and ceremonies associated with various life-crisis events such as birth and death all contribute to the rich religious life of the Paiute people. Spirit power acquired in dreams, visions, and sometimes inherited, is sought by virtually everyone, even though the shaman was a principal specialist in this regard. Illness was traditionally thought to be caused by the breaking of taboos, by sorcery and, in some cases, by soul-loss. Nature is thought to be permeated by a supernatural power or force called *puha* which is thought to animate all of nature and its creatures. Understanding *puha* and being able to deal with it constructively is a major concern of shamans. Shamans often visit certain sacred places scattered throughout Northern Paiute territory where they spend several days in prayerful contemplation in order to prepare themselves to deal with their responsibilities. Shamans deal with a variety of supernatural beings routinely addressed in rituals, including such spirits as the Sun and Moon, Thunder, Wind, Clouds, Stars, and other faunal and floral spirits. The peyote plant, although not native to the region, is greatly celebrated as a spiritual teacher who, if followed, will guide its users to moral and productive lives. Prayers to the rainbow and to lightning help the people secure protection, knowledge, and spirit power. The influence of the environment in the worldview and religious life of the

Paiute is nowhere more evident than in their rich mythology which routinely stresses the presence and importance of various animal figures such as Coyote, Wolf, Owl, Eagle, Turtle, Insects, Bear, Hawk, Chickadee, Bluebird, Antelope, Deer, Elk, Weasel, Porcupine, Bat, Sage Hen, Snake, and Spider. Other environmental features appearing in Paiute mythology include water, rivers, lakes, mountains, roots, piñon nuts, fire, stars, sun, and moon. Spiritually related activities reflected in the mythology include hunting, fishing, gathering, marriage, death, conflicts with such monsters as Cannibal, Rolling Rock, and Water Babies, as well as explanatory stories concerning the origins of the culture, death, birth, pregnancy, and sexuality, all with various references to the natural environment. A major principle in the environmental beliefs of the Northern Paiute is the idea of reciprocity, in which for anything taken from nature there must be a corresponding expression of respect and thanksgiving. Even the smallest environmental resource taken requires a compensatory expression of thanksgiving if the resource is not to be offended and, therefore, make itself unavailable in the future.

Paiute beliefs in an afterlife vary throughout the Great Basin but still reflect the life and environment they have known when living. Some believe that souls journey to an underworld where night is day and day is night but life is otherwise as it is on Earth. Others believe that the soul goes to another world associated with the Milky Way.

Certain traditional accounts depict an afterlife in which hunting and gathering are always successful, with much time for dancing, gambling, and other social pursuits. Other accounts are much less clear as to the nature of the afterlife which, among Northern Paiute, is thought to be located in the one of the most important of the cardinal directions.

Paleolithic Art

It is clear that Paleolithic art – or at least some of it – must be religious, but debate has always raged about what kind of beliefs lay behind its imagery. It is self-evident that these supremely talented artists, who mastered a very wide range of media and techniques, were remarkable observers of animal anatomy and behavior, and could convey a great deal of detail with a few simple strokes. They were a part of the natural world, they lived among the animals which gave them food and raw materials, and therefore one might expect their fellow creatures to loom large in their mythology, their creation tales, and their religious beliefs.

Can one, however, gain any concrete insights into their particular beliefs from their imagery? Unfortunately not, and the never-ending series of interpretations that has been imposed on the same data bears witness to this. For example, there are a small handful of “therianthropes” in Paleolithic art (i.e., figures combining human and animal traits) and they have been seen variously as “horned gods,” “sorcerers,” and “shamans”; but of course, many historical peoples are known to have a concept in their creation myths of a remote time when animals were people, or vice versa, so it is perfectly possible that these Ice Age depictions may represent mythical ancestors of this type – or simply imaginary beings, or some other concept that escapes us entirely. The fundamental problem is that we are grappling here with the world’s oldest art, from a completely alien culture that is so far removed from us in time that we may be completely misinterpreting its art. But archeologists must always cling to the hope that, since these people were fully modern humans identical to ourselves, as far as we can tell, then we can perhaps use this identity as a rough guide to their thoughts and intentions. Accordingly, a whole series of generalized interpretations has been applied to Paleolithic art, since it became clear that “art for art’s sake” was an inadequate explanation for much of it. Far from being a random collection of pretty animal pictures, or an Ice Age bestiary, Paleolithic art comprises – for about 20,000 years – basically the same restricted range of animals, almost always adults drawn in profile, with very few scenes, no groundlines, no landscapes. There are rules involved – some species are often found in association, others never. There are comparatively few human depictions, although they were perfectly capable of drawing them, so their puzzling absence suggests that representing them was forbidden or – more likely – simply irrelevant to what the artists were trying to do. There are scores of human female figurines – the famously misnamed “Venuses” – which Russian archeologists have traditionally interpreted as mother or ancestor-figures.

The theory of “sympathetic magic,” inspired by ethnographic accounts of some Australian Aborigines at the end of the nineteenth century, claimed that artists drew animals that they wanted to kill (sometimes with spears or arrows depicted on them), or animals which they hoped would copulate and reproduce, thus becoming plentiful. These theories of “hunting magic” and “fertility magic” reigned supreme for the first half of the twentieth century, but neither of them holds water – animals marked with supposed “missiles” are found in only a handful of caves, and by and large the artists were not drawing the animals which were their staple foods. There is not a single clear hunting scene in the whole of Paleolithic art, nor a single clear depiction of copulation, among the many thousands of animal images.

Another ever-popular notion has always been that of the caves being used for the initiation of boys into manhood, or of girls into the mysteries of womanhood – an appealing and plausible idea, but there is no hard evidence to support it. We also know that music and sound played a role in certain caves – some contain “lithophones” (i.e., stalactites which were clearly struck repeatedly to make sounds [some are even marked with paint]), while, in others, tests suggest that the best art was placed in the zones with the best acoustics. However, while evocative, the existence of music making in the caves does not necessarily involve religion.

The early decades of the twentieth century also saw the application of notions such as totemism and shamanism to Ice Age art; and since these were hunting peoples closely involved with animals, one cannot deny that some traits of these belief systems might have existed at this remote time; but alas we have absolutely no way of proving it. Rather than impose our own preferences and pet theories on this art, extrapolating wholesale from modern times, it is more honest to let the art speak for itself, and to deduce what one can from its location and content. The prominence of cave art (as opposed to the numerous portable art objects) has often led scholars to see it all as mysterious and religious, but the recent discovery that they were also decorating rocks along rivers and on mountainsides suggests that cave art was not typical of the period – instead caves are merely the places where the art has been best preserved – and open-air art looks inherently less mysterious and sacred than figures in total darkness; yet we know from the ethnography of Australia and elsewhere that open-air art can be just as dangerous, powerful and taboo as anything hidden underground. In the absence of the artists we can never know the precise meaning of Paleolithic art, but we can at least deduce with some certainty from its location and content that much of it sprang directly from religious beliefs that involved animals, either literally or metaphorically.

Paleolithic Religions

It is impossible to know, from sparse archeological evidence, when the first stirrings of some kind of religious feelings and beliefs arose in our ancestors, but it is probably safe to assume that they involved mysterious or impressive aspects of nature – the heavenly bodies, the weather, earthquakes and fire, echoes, the surrounding fauna and flora. In particular, for hunting peoples, it was likely to involve the large and/or ferocious animals which inspired feelings of awe, such as the mammoth and woolly rhino, the bears and big cats. At the same time, in common with many hunting peoples of the historic period, they may also have felt a special reverence for the species which provided them with the bulk of their food and raw materials – deer, horse, bison and so forth, depending on the environment and climate.

Other than the collection of exotic objects and fossils – which in itself indicates a close observation of nature – there is very little in the archeological record of the first and longest period of humankind's existence, the Lower Paleolithic (ca. 2.5 million to 200,000 years ago), which can plausibly be interpreted as religious in nature, although the earliest possible funerary ritual dates to between 300,000 and 200,000 years ago at Atapuerca. It is only with the arrival of Neanderthals, ca. 200,000 years ago that a few tantalizing clues can be found to some kind of religious feeling – not only the presence of real burials, but also other remarkable phenomena: for example, in 1940 the Middle Paleolithic site of El Guettar, in Tunisia, yielded a carefully made heap of hundreds of spheroid stones mixed with more than 3000 flint tools, 236 mammal teeth and some broken bones. This fully intentional deposit has inevitably been interpreted as “ritual,” since it is difficult to envisage a functional purpose for its existence. Recently, a stone and bone “mask,” from Neanderthal times, was found in the French site of La Roche-Cotard; clearly intentionally shaped and modified, it is undoubtedly an art object, a “proto-figurine,” but it could also be interpreted in religious terms.

Conversely, a great deal of ink has been wasted for decades on a supposed cave-bear cult, mostly associated with Neanderthals, but also sometimes with Cro-Magnons, based on discoveries of bear skulls and bones inside caves in the Alps and elsewhere. The supposed arrangements of the bones led many scholars to see them as evidence for veneration of this species. However, the gradual improvement in knowledge of taphonomic factors (i.e., what can happen to bones between the death of the animal and their unearthing by archeologists) eventually made it clear that most if not all such cases were completely natural, largely produced by the bears themselves blundering about in the dark, and breaking, disturbing and rearranging the bones of their prede-

cessors. One cannot completely rule out the possibility of a Stone Age cave-bear cult, but the basis for its existence has now been virtually reduced to wishful thinking.

It is in the Upper Paleolithic (ca. 40,000 to 10,000 years ago), with fully modern humans, that the evidence for religious beliefs becomes both abundant and crystal clear, particularly through cave art, but also in the number and complexity of human burials, many of which are associated with red ochre, and which often contain beads, seashells, stone or bone tools, or pieces of portable art. The very existence of grave goods is a strong (though by no means infallible) indicator of a belief in an afterlife; Neanderthal burials are sometimes apparently accompanied by animal bones, horns or antlers, which may or may not be meaningful grave goods highlighting the huge importance of animals to these people; but the variety and abundance of goods placed with the Cro-Magnon dead are eloquent testimony to the prominence of religious belief.

How can one be sure that some cave art is religious? Although numerous theories have been put forward about its motivation, there is one fundamental reason why we can be sure that religious beliefs of some kind played a major role in the production of some imagery. The certainty lies in the location of some of the art; for while much of it is “public” (i.e., is easily visible) and even deliberately made accessible to other people, some of it is quite the opposite – hidden away in nooks, crannies, tiny chambers that are only reachable by crawling, or up vertiginous chimneys. These figures were not for public consumption, but were extremely private, made and presumably offered to whatever deities, spirits or ancestors the artist was trying to communicate with. In the French cave of Pergouset, there is an engraved horse head that even the artist never saw, since one cannot insert one’s head into the niche where it was drawn – this is the ultimate in private religious art. In certain caves, such as Pergouset or Le Tuc d’Audoubert, it seems to have been the arduous journey into the cave to make the imagery that was important, not perhaps the images themselves, which may have been some kind of offering. And in the Pyrenean cave of Les Trois Frères, a small natural side-chamber is dominated by an engraving of a lioness (the chamber has been dubbed the “lioness chapel”) and, in crevices between stalagmites beneath the figure and all around the chamber, very special objects were deposited – animal teeth, flint tools, seashells – which can only be interpreted as votive offerings.

In short, the location of some cave art, together with some extraordinary data like the carefully placed objects in Les Trois Frères, make it very clear that there was a very strong motivation behind some cave art which can plausibly be considered as religious; and in view of the content of the art, it is reasonable to suppose that the religions of the period were directly derived from natural phenomena and certainly involved animals in some way, thus focusing on the relationship between Paleolithic people and the natural world.

Paleolithic Religions and the Future

All interpretations of Paleolithic religions are conjectural. One reason is the paucity of evidence. The term “Paleolithic religions” is itself questionable, since there is no evidence for systems of belief and practice resembling today’s religions. Another problem is imposing interpretive schemes, such as the association of religion with the supernatural, on the deep past. The transition from orality to literacy is a further complication. Today’s religions are the creations of literate people who acknowledge nature primarily as an economic resource. Paleoreligion was the creation of primary oral people living in close proximity to and intimate familiarity with nature.

Nevertheless, there are several possibilities for interpreting paleoreligion’s implications for the future. These include conjectures grounded in an evolutionary framework, especially the evolutionary environment, those grounded in archeological data, such as prehistoric burials, cave painting, and artifacts such as the Venus of Willendorf, and those grounded in identifying so-called primitive survivals of paleoreligion in contemporary Aboriginal culture.

Interpretive frameworks

Interpreted through the lens of evolutionary biology, paleoreligion appears to have been a powerful if uncertain force mediating interaction between humans and their environment. The gene-shortage problem precludes explaining the complexities of human behavior on a genetic basis. Thus, imaginatively evolved forms of religious belief were almost surely involved in directing practices such as the hunting of game or the burial of the dead.

Other interpretive paradigms, such as ethnography and mythoarcheology, reconstruct Paleolithic “worldviews” on the basis of archeological evidence. Various artifacts including cave paintings are interpreted as manifesting a spiritual awareness of connections between humankind and nature. Through such readings it appears that paleopeople were invested in the myth of the eternal return, maintaining ceremonial cycles and ritual practices believed to ensure the continuing cycle of nature’s bounty. Another interpretation is that paleo-people believed in a Great Mother who held humans to her nurturing bosom.

A third interpretive approach studies the religious practices and beliefs of contemporary Aboriginal cultures for clues revealing earlier forms of consciousness. The study of Australian Aborigines, as well as contemporary tribal people of the American Southwest, are particularly suited to such interpretation.

Implications for the future

An interdisciplinary synthesis perhaps mitigates the weakness of single-factor interpretive approaches. If the beliefs of paleoreligionists in the myth of eternal return or the Great Mother weakened the environment so that subsistence was undercut, then the beliefs would be extinguished. Further, the survival of tribal people (e.g., Hopi, Havasupai, Western Apache) in relatively harsh environments such as the desert Southwest appears to confirm the efficacy of some religious beliefs and practices. Apparently some paleoreligions had adaptive value, encouraging harmonious and sustainable relations with the environment. So viewed, paleoreligion has positive implications for a modern world facing pervasive environmental exigencies that elude narrowly technical solution. Given the assumption that paleoreligion encouraged harmony with rather than domination of nature, then its cultural utility appears to lie in what has been termed post-historic primitivism. Paleoreligion thus becomes a source for reweaving a modern cultural fabric that is out of balance with nature. Going back in time is not possible. Rather the effort is to learn from the deep past in ways that inform adaptations to present-day environmental exigencies.

However appealing the idea, a definitive argument does not support this conclusion. An alternative explanation is that paleoreligion had little or no influence in regulating interactions between humans and their environment; indeed, evidence indicates that humans hunted some species to extinction at the boundary of the Paleolithic and Neolithic. Paleoreligion thus appears ecologically inconsequential; the constraining factors on environmental exploitation were not religious beliefs and practices but small populations, primitive technologies, and the absence of permanent human settlement.

The present essay cannot resolve such a division of opinion. Yet given that various interpreters of biblical and other world religions believe their faith has a crucial role to play in shaping the future, then paleoreligion may also play a role. But why? The answer is not intuitively obvious. Partly it lies in the continuing interpretive challenge posed by the discovery of Paleolithic strata in the nineteenth century. And partly it lies in the twentieth-century realization that human beings are language animals. If the pervasive ecological dysfunctions of the modern age are rooted in narratized religious traditions that separate the spiritual and material, then paleoreligion, surely a system of belief more attuned to the connections between humankind and nature, has relevance to the future. Can contemporary people, steeped in textual religiosity now several thousand years old, somehow recover religious sensibilities that connected rather than separated them from the web of life? Only time will tell.

Palmer, Martin (1953–)

An Anglican theologian by education, Martin Palmer, director of the International Consultancy on Religion, Education & Culture (ICOREC), has played a leading role in several projects involving religious traditions in environmentalism and conservation. In particular, he has built a close relationship between the World Wide Fund for Nature (WWF) – and its patron Prince Philip – and all the major religious traditions, leading to a series of summit meetings of religious leaders on religion and conservation, and declarations issued by the different religions concerning the environment and respect for nature. Among the outcomes of these activities have been the Network on Religion and Conservation and the Alliance of Religion and Conservation. Martin Palmer is author and editor of several books on religion and conservation.

Panentheism

– See Pantheism; Process Philosophy; Process Theology.

Pantheism

Pantheism relates to the question concerning transcendence and the place of deity – whether it is within or beyond space and time. It contrasts essentially with theism that holds that the personality and being of god (God) transcend the universe. For pantheism, the universe as a whole is god or, in feminist “theological” terms, goddess. In this sense, pantheism is to be distinguished both from deism, which still holds a personal god to be creator of the world but neither immanent in nature nor revealed through history or by religious experience, and from atheism as the complete rejection of belief in god’s existence. Pantheism is also known as “cosmotheism,” which either ascribes divinity to the cosmos or simply identifies god with the world, and as “acosmism,” which is the fundamental denial of the existence of the universe as distinct from god. Consequently, pantheism is also to be contrasted with “panentheism” or the doctrine that god/goddess includes the world as a part of his/her being but not the whole of it. In other words, and especially from the acosmic view, god is none other than the combined forces and laws that manifest in the existing universe. In general, the pantheistic position holds that all is god rather than that god is all (theopantism).

Pantheism is often understood as a form of monism, but it may also be either dualistic (as in the ditheism of Zoroastrianism and Manicheism, the bitheism of contemporary Western Paganism or the dyotheism of mind and matter as divine) or pluralistic (as in the polytheism of classical paganism, Shinto, etc.). Monism holds that there is only one kind of metaphysical substance or ultimate reality. Idealistic or spiritual monism explains matter and its phenomena as modifications of mind. This is basically a form of Gnosticism. Materialistic monism, on the other hand, resolves mind into matter, while a third form of monism considers there to be some underlying substance or ultimate reality of which matter, mind and their phenomena become its manifestations or modifications.

One Western philosopher most associated with pantheism is Benedict Spinoza (1632–1677) who employed the terms *natura naturans* and *natura naturata* to express the integral reality of god and the world. Before Spinoza, however, these designations were employed by the Arabian philosopher Averroes (1126–1198), the German cardinal Nicholas of Cusa (1400–1464) and the Dominican monk Giordano Bruno (1548–1600) who was burned at the stake for his conversion to a naturalistic/mystical pantheism. Averroes argued for the co-eternity of a universe created *ex nihilo*. For Bruno, god and the universe were two different names for the same thing. He referred to god

– ineffable, whole, transcendent and one – as the *natura naturans*, the creative essence of all things. The infinite division and manifestation of this infinite potentiality

are the worlds, orders, objects and events of the *natura naturata*. Bruno saw this world-process as an oscillation between the out-going of divine nature – culminating in the rational human mind in which searching for common denominators represents the turning point – and its return into itself. Before Bruno, another Dominican monk, Meister Johannes Eckhart (ca. 1260–1327), was forced to defend himself against charges of pantheism in his mystical teachings in a famous ecclesiastical trial in 1326. The trial culminated with Eckhart’s retraction when the charges were considered proven. He was not executed as were others with similar views, but after his death the following year, Pope John XXII condemned 28 propositions from Eckhart’s works.

Spinoza proposes a substance monism in which the physical and mental series are both themselves modes of absolute reality. In his metaphysical system, god and nature are one and the same substance. Spinoza’s god, as a being who is not separate or independent from the universe, has no personal qualities. While Spinoza’s “god-intoxicated atheistic” monism has been questioned as being truly pantheism, his god contrasts radically with the personal entity of theism by conforming nonetheless to the essential impersonal nature of a pantheistic godhead. In Spinoza’s understanding of a god-nature (*natura naturans/natura naturata*) identity, all things interact, universal standards of absolute quality transcend individual sentience and relations, and the infinite order’s innate harmony supersedes all rules of morality. He advocates an *amor intellectualis Dei*, the calm contemplation of the changeless within change.

Apart from the various theories of god/goddess/the godhead (theism, deism, pantheism, atheism), the world’s major religions themselves are either Abrahamic, dharmic, pagan or secular. Pushed further, the various theological understandings reduce finally to an ethical/metaphysical position that rests on either the immanent perception of paganism or the transcendental one of Gnosticism. The Gnostic position is distinguished by its denial of the ontological and/or axial reality of the physical world – in other words, the viewpoint of idealistic monism. It subscribes to what Catherine Albanese designates as a “nature is illusion” theology rather than to what we could understand as a fundamentally pagan stance, namely, “nature is real.” From the dharmic position of Hinduism, the *natura naturans* and *natura naturata* equation becomes a falsity. Instead, all phenomenal reality is an illusion (*ma⁻ya⁻*), and the only reality is the inscrutable Brahman, the not-this/ not-that. Consequently, while Hinduism advocates a pantheism of sorts, it is a transcendental pantheism even if all is god. But for the individual who perceives reality as absolutely non-differentiated, with no separation of self from the all (*atman = Brahman*), the cosmos can be approached only through a type of solipsistic pantheism. This approach necessitates the cultivation of utter detachment from the illusions of apparent existence. All dharmic religions stress the development of emancipation from each and every desire, and even when, as with Buddhism, the tangible world may be accepted as ontologically real, it is still without axial reality or value. From an Abrahamic perspective, by contrast, the impersonal godhead or Brahman is understood as a void of absence, even negativity. With Buddhism, especially inasmuch as it represents what we could assess to be a “Protestant” form of

Hinduism, there is no “god” to begin with: it assumes an essentially atheistic theological position. Consequently, especially in its Christian forms, Abrahamic religion posits in response to solipsistic pantheism a transcendental personal god that stands “outside” nature and/or the material world and is its fully autonomous creator. From the theistic perspective, god and nature are ontologically separate and distinct. The Abrahamic religions do not deny the metaphysical reality of the world, but inasmuch as they adopt what is still essentially a Gnostic position, though this world may be the “gift” of the creator god, it is not an end in itself but more an impediment to obtaining or regaining a state of transcendental and/or heavenly grace. This positing of an external god becomes the Christian and Islamic means to break or break through the deadlock of solipsistic isolation. The nullification of the “iron cage” of solipsism is dependent on what the Christian refers to as faith – that is, an absolute faith in its posited god. The ultimate Christian and Islamic rationale is evangelistic: if the entire world were to be “converted” to their particular Abrahamic perspective, the validity of the Christian or Islamic positing of an external creator that ends solipsistic imprisonment would be confirmed and vindicated.

Among the major Abrahamic faiths, Judaism represents a more theologically schizophrenic position. There is no attempt to evangelize the world, for Judaism is essentially an ethnic or tribal identity. In this sense, it is closer to paganism. But secondly, in what is again a pagan position, Judaism accepts the ontological reality of the world. There is no ostensible denial of the tangible until we reach the more esoteric and mystical developments of the Kabbalah. But in mainstream Judaism itself, without the possibility of either reincarnation or an Elysium-type otherworld, all hope is centered on the tribal survival of the Jewish ethnos itself rather than on any kind of personal immortality. As Judaism has historically continued to move away from its pagan origins toward a centering on its god as a transcendental being, its pagan retention of accepting the world as a cherished and acceptably pleasurable tangible reality edges Judaism toward the most schizophrenic theological position, even if it escapes the radical ethical stance between good and evil that unbalance its Christian and Islamic sister or daughter religions.

The contrasting religious ideal-type to both the Abrahamic and dharmic as well as secular (atheist, agnostic and/or mechanical) constructs is, of course, the pagan. *Vis-à-vis* the supernatural (whether god, gods, the godhead or even goddess), there are both secular pagans and pagan pagans. There are also dharmic pagans – especially people who fuse pagan and Buddhist spirituality and/or practice, while most of vernacular Hinduism is itself pagan in contrast to its “official” theological Gnostic doctrine of Vedantic Brahmanism. And of course, there are even Abrahamic pagans or pagan possibilities and/or elements (e.g. theophagy, veneration of saints, reverence toward an aerolith, worship of Asherah, etc.). But in considering any pantheistic understanding of nature cherished as divine or sacred, we are by default virtually focused on paganism – whether that pantheism includes the supernatural (pagan paganism) or denies it (secular paganism). The distinction between the two lies with the former

position entertaining the supernatural as a transontological reality that perhaps operates chiefly through metaphor and synchronicity, if not traditional magic as well. In other words, the supernatural refers to the dimension of autonomous, non-empirical dynamics, though here not one that is considered to be a telluric or cosmic prerequisite. The more secular pagan position tends to follow Spinoza and understand the divine totality, that is, totality as divine, in terms of purely causal relationships, and it approaches the sacred more as a value than as a metaphysic.

Spinoza's philosophy combines immanentism and rational mysticism, and it ultimately represents a methodologically inspired modification of Plotinus. Its pantheism of substance (*natura naturans*) and emanation (*natura naturata*) is an endless series of mechanical diffusion and mutation. More organic forms of pantheism are to be found in the metaphysics of naturalism. Like pantheism, naturalism holds that all experience of temporal and spatial reality occurs within and as a part of nature. Notions of the supernatural are avoided. In other words, all reality is nature, and the ultimate is to be found within the framework of nature and not outside it. To the degree that Spinoza's substance (*natura naturans*) is to be understood as god, he advocates what could be classified as a spiritual or idealistic form of naturalism. His nature is akin to either spirit or mental categories. Materialistic naturalism, in contrast, centers on matter or the matter/energy continuum as the metaphysical fundament. Along with these traditional schools of naturalism, there are also neutral and dynamic understandings – the former sees reality as static entity and relation; the later, as process and energy that are neither mental nor physical. As proponents of descriptive or neutral naturalism, John Dewey (1859–1952), George Santayana (1863–1952) and Justus Buchler (1914–1991) relate the source of potentiality to the material substrate in its very beingness. Numinosity becomes purely a derivative of human projection, and nature is reduced to a series of causal sequences. Its essential humanism in which religious goals derive from social action latently assumes an extra-natural vantage from which to make its judgments on the limits of nature's transformative possibilities and any denial of the unlimited potencies that can emerge from nature's hidden depths.

A more contemporary understanding of naturalism and interpretation of the potencies of *natura naturans* and emerging and emerged orders of *natura naturata* understanding are provided by Robert Corrington. Positing that there can be nothing beyond or outside nature, Corrington argues that notions of an extra-natural, omnipotent, omnipresent, self-conscious creator and sustainer are examples of anthropomorphic projection and hubris. He calls for a categorical foundational analysis to replace traditional theological romanticism and wish fulfillment. From his perspective, the *natura naturans* or what he calls "nature naturing" is the unconscious of nature – one that relates to the orders of the world and universe of astrophysics in the same way that the human unconscious relates to personal consciousness. A fold of nature is an intensified product of nature naturing and not a conscious or superhuman agent of awareness and purpose. Corrington stresses the basic divide that exists between the two halves of an all-encompassing nature that is impossible to define. He is par-

ticularly critical of the “militantly selfdefensive Western monotheisms” (Corrington 1997: 18) in which a posited linear and self-centered god is thought to bring its own other into existence out of nonexistence and then exercise absolute dominion over it. A creator god has no genuine other. Instead, for Corrington, the sacred is simply nature’s most important manifestation, the dimensions of which need to be understood post-anthropomorphically if theology is not to be merely a gender, race or class autobiography. There is “nothing whatsoever outside of nature. The sacred is in and of nature and cannot outstrip nature” (Corrington 1997: 10). Nevertheless, despite human projections that exteriorize elements of the personal and collective unconscious, Corrington’s pantheism or what he terms “ecstatic naturalism” recognizes the sacred in the numinous folds of semiotic plenitude that emerge or are ejected from *natura naturans*. Like humanism, Corrington’s naturalism rejects any notion of supernaturalism, but unlike humanism, it will not deny but instead affirms “the utter supremacy of the transfiguring potencies of nature” (Corrington 1997: 53). His lexicon is comfortable with such terms as “numinous,” “manic,” “sacred,” “divine,” “extra-human,” “epiphany” and “transpersonal”; it rejects “magical,” “supernatural,” “talismanic,” “holy” and even “spiritual.” Nevertheless, for Corrington, there is the erotic and transordinal spirit – a generic spirit that belongs to nature and not to Christianity. This spirit is “self-othering in the sense that no sign or interpretant can ever envelop it” (Corrington 1997: 161), but it is not a consciousness because it has no center of intentionality. It is always subaltern to nature and located within nature natured. While nature in both its dimensions contains every conceivable type of infinite, spirit for Corrington expresses only one main kind of the non-finite.

The ultimate understanding of pantheism and the relation between the divine and nature rests not only in its distinction from theism but also from the theological framework of panentheism and the process theologies of Alfred North Whitehead (1861–1947) and Charles Hartshorne (1897–2000). Spinoza’s monism is usually accepted as the classical form of pantheism: a totally deterministic reality and a god bound by actuality. Panentheism attempts to reassert the godhead as the totality of both actual and potential being. But unlike the “god is all” stance of pantheism, panentheism (“all in god”) is closer to the theopantic position of “god is all.” In other words, this view asserts that all things are within the being of god, but god is not subsumed or “exhausted” by all things and is additionally something other than the world or cosmos itself. The chief difficulty with the panentheism god is that it appears to be a reversion to theism’s timeless and impassible god that simply adopts much of the language of pantheism – especially in its process theology position that sees god as “embracing” the world and lovingly seeking to lure all things toward their maximum aesthetic satisfaction. This notion of god “luring,” the idea of god as the ideal which draws things (back) to himself/itself, that is, god as the last cause or goal, was first presented by Aristotle and reintroduced into contemporary thought by Whitehead. But what Whitehead has done is to reject Spinoza’s notion of substance and replace it with process (a series of events in space and time). But unlike Spinoza’s god who is bounded by actuality, Whitehead accepts that

actual occasions provide the fundamental constituents of reality but that the universe at any moment consists of an infinite number of actual occasions. Each occasion is a result of all those that have preceded it but also is something new. For Whitehead, the radically new always exists. Since present newness allows for unpredictability, there is always an open future – bypassing or avoiding Spinoza’s deterministic universe. His god is not omnipotent or omniscient in knowing the future but only in knowing all that there is to know. But inasmuch as Whitehead’s world is process, it is holistic and organic. And this world/god is, according to Hartshorne, infinitely self-surpassable.

Another thinker within the school of process naturalism is Robert Neville. Like Averroes, he continues the argument of *creatio ex nihilo*, and like Spinoza, he understands the created world as fully determined. But unlike most of the earlier process naturalists, he dismisses the tendency to overly romanticize the human traits within certain orders of nature to the detriment of others. Nevertheless, he is persuaded to affirm the strong link of an independent god to the bound totality of the created world. Unlike the process theologians who privilege creativity itself and have no need for a creator god, Neville sees god and creation unfolding together in the act of world creation – an act in which god overcomes its own transcendence and becomes immanent in the created order as a governing central logos. In traditional process naturalism, the created world (*natura naturata*) becomes part of the divine augmentation process. For Neville’s process theology, the world is dependent on god’s absolute infinite sovereignty, and this god must become in some sense finite if it is to be involved in the world it has created. On the other hand, in Corrington’s ecstatic naturalism, once the *natura naturata* has been ejected or spawned from the unconscious of nature, it is an autonomous foundling with “no direct link to the inaugurating and unruly ground” (Corrington 1997: 119). In place of determination and obligation, there is total independence and availability and, as such, the possibility of perennial renewal.

To summarize, the panentheism of process naturalism wishes to place the divine beyond nature as much as within it. In contrast, the pantheism of ecstatic naturalism asserts simply that there is nothing outside nature/the world/the cosmos. While most naturalisms eschew the notion of a supernatural, they may still hold to an understanding of an immanent preternatural. The opposite of naturalism is not supernaturalism but rather antinaturalism or idealism. However, unlike Corrington’s ecstatic naturalism that simply dismisses the magical, in a dynamic pantheistic naturalism, there is the possibility that the supernatural/preternatural might arise as various aporias that open up *within* the natural. To whatever extent the numinous exists or comes to exist within a pantheistic understanding, it is an emergent from nature rather than some antecedent or *a priori* teleological factor. While pantheism *à la* Spinoza may be mechanical, naturalistic understandings of pantheism hold the world or cosmos to be organic, interconnected, in some way monistic and most likely enchanted.

Pantheist Association for Nature – PAN

The Pantheist Association for Nature is a religious conservation organization, founded in 1998, to spread Pantheism and encourage environmental action. Members of the small internet-based association “celebrate the wonder, beauty, and divinity of Nature . . .” Premising the sacrality of nature, PAN sees Pantheism as a wellspring of ecological consciousness, and holds that when people view nature as sacred, they may more readily treasure the natural world which sustains all life.

The PAN website posts articles on Pantheism, biographies of individuals animating to the religion, recommended readings, quotations, holidays, suggestions for activism, and links to environmental organizations.

Based in Southern California, PAN conducts local hikes and engages in conservation projects, such as the restoration of endangered native plant habitat in coastal San Diego County. With members spread across the United States and overseas, and free of group infrastructure, PAN seeks mainly to inspire individual belief and action

Inspiration and joy abound in nature, according to the organization’s Tenets of Faith, which cite pantheist author and American conservationist Joseph Wood Krutch:

Faith in wildness, or in Nature as a creative force puts our ultimate trust, not in human intelligence, but in whatever it is that created human intelligence

. . . By aligning ourselves with Nature, by having faith and trust in its creative energy, we join hands with infinite power and find our greatest peace.

Papua New Guinea

Despite a great diversity in language and other cultural traits, the indigenous population of the Melanesian island nation of Papua New Guinea holds in common ideas that anchor their traditional life-worlds in the land. Mythic knowledge pertains to origins of various environments by actions of deities, or the taking possession of them by the first ancestors – that came from above, or from under, or along the ground, usually providing in the process some means for sustaining life. In the present time, the more recent ancestors play a complementary role in supporting peoples' livelihoods in the closeness of environmental space and in the societal order they share with humans. An envisaged cosmos of such finite attributions entails highly terrestrial values and the common location or habitation of many spiritual powers in the landscape. Only a representative number of cultures can be considered.

Diverse mythic themes concerning primeval events set forth the bonding of life and Earth. According to the traditions of the Chimbu in the highland area of the country, life came out of death, since the pigs, epitomizing social well-being, emerged from the ground where the first slain ancestor was buried. By comparison, the Iatmul on the Sepik River perceive the interrelations of environs and persons mediated through totemic bonds and authenticated by claims to the deeds of mythic ancestors on their primeval overland migrations. Far to the south, the Bedamini and Gebusi of Western Province share in a cosmic geography reflecting their neighborly relations along the Kum River with the image of an upstream power over downstream life. Bedamini mythic ancestors had mortally wounded a lower-world woman because she had intruded on their space; and they utilized her discharges (like urine) for forging features of their landscape (like rivers), and buried her corpse to enhance the fertility of the ground. The Gebusi, on the other hand, recount that their proposed marriage union with people in trees and the sky (as equivalent to the above, the upstream, and, ultimately, the better because more powerful) was rejected with devastating effects for their forebears so that only one primeval couple survived. On the other side of Papua New Guinea, we find that, within their three-tiered world, the Jupna of Madang Province conceive of a deity of the upper plane, who bestowed with the flow of the Jupno River the environs and humans. Ultimately the deity *is* the river, with its potency diminishing from upstream to downstream (where the dead reside).

The landscape itself holds the legacy of the roots and past. The Chimbu know the location of the primeval events to which they relate in the grand pig-killing rites by designating the holy of the holies of the ceremonial grounds as the grave of the slain mythic ancestor. As for the Iatmul, funerals are important occasions for reciting the

primeval migrations of their first ancestors, thus asserting their identity with past events on the land. And according to traditions of the Wamira of Milne Bay Province, the early ancestors turned into stone at the end of their time and remain as features of a bygone era in the landscape.

With their conceptions of space people feel integrally connected with their environment. They typically visualize spatial relationships as expanding from the residential area to the entire environs. Going from center to periphery, feelings of security are strongest around the hamlet and ceremonial grounds, slightly less on utilized land, and weak in the bush and other areas of limited control. Such feelings about space express themselves in religious attitudes. A good relationship with one's forebears, for example, apparently often demanded physical proximity and was seen to be essential to human health and economic success. Thus the Binandere of Oro Province buried their dead under the house to secure their cooperation in horticulture and hunting, and they lit a fire there to make them comfortable, which had the added advantage of keeping roaming malevolent spirits and sorcerers away. The Chimbu, interring the dead near the grounds of the ceremonial pig-kill, called on the ghost to share the house fire on the day of a funeral – an expression of bereavement but also the initial step of securing a close relationship. The Wamira went further by imaging a supporting dead sitting at the elbow of a relative.

In contrast, certain sacred places, especially on boundaries or distant from hamlets, were considered dangerous. The spirits inhabiting them could however be dealt with ritually, as for instance, the cyclopean being at the great, upthrust rock of Elim Bari, on the edges of Chimbu and Siane cultures: the belief that he causes too much dryness or wet weather leads these peoples to kill pigs in his vicinity. Such place spirits are called in Tok Pisin: *masalai*, and they are usually dangerous only when you tread on their grounds. Over unknown centuries such beliefs protected many parts of the environment from human interference.

Again, feelings about space are expressed in poetic modes and semantic nuances. It has been shown of a number of cultures that some parts of “nature” are gendered male and others female, and that one responds to the cosmos accordingly. It has been shown of the Eastern Highland Gimi that male and female chants respond to each antiphonally by appealing to these associations in the environment. With the Foi in the Southern Highlands the naming of individual people invokes such preconceptual associations.

People had to redress their ideas of the world from the early colonial times on, and many societies displayed great flexibility in accommodating alien influences on their living space. The newcomers were initially identified in the familiar cosmos and often made welcome, as returning ancestors, or, with the interesting case of MiklouhoMaclay, the Russian naturalist residing in the Madang region in the 1870s, as “the man from the moon.” Comparably, Lutheran missionaries into the Yupno Valley in the 1920s as well as explorers into the highlands a decade later were identified with light-skinned sky dwellers. However, the emerging expectation of a partnership that honors reciprocity

was never fulfilled in the colonial relationship with administrators, missionaries, and planters, and so people reconceived them as an intrusion into their space and made adjustments. As with others in early contact times, the Binandere found that the ever-so-important proximity of the deceased relatives was severed because of governmental requests to change burial sites – turning one’s back on the dead meant diminishing yields of yam and game. But the Wamira ably made qualified adjustments to their Anglican creed; even into the 1980s they still regarded the taro garden as a sacred place, and perceived personal success as resting upon good relationships with one’s forebears. In the highlands, a region characterized by competing Christian mission influences, the Chimbu were at first supported by the Catholics (over against the Lutherans and the Seventh-day Adventists) in seeing some continuity between their traditions and the new creed. By signifying the ceremonial grounds with the crucifix and accepting a modified version of the pig-kill, the Church gave way to syncretic meanings of the ritual and its relation to the ground. In various other regions the coming of missionary influence was sacralized with unexpected candor into what became space transformed into modern Christian or sometimes secularized land.

As these processes of change unfolded, there also emerged grassroots movements serving foremost to forge new power relations with their colonial counterparts. Embedded in their discourses was much newly acquired knowledge of the world. In the Madang region it was affirmed, by variously correlating a celebrated myth of the unequal brothers with Christian ideas and foreign lands, that the center of power had shifted to Australia, to Sydney in particular (or Heaven above Sydney), where western commercial goods were made. Manam Islanders saw themselves living on the opposite side of the world from the whites within a rather complex modern cosmos; and they located the “unknown land,” which holds the mysteries of life, beyond the German and English abodes. At the same time, highlanders as well as seaboard dwellers reinvested the influential recent ancestors and their abode with new significance in a changed world, and they sought to obtain for themselves the allegedly efficient ways whites had of extracting the riches from indigenous graveyards. With the colonial pacification and communitydevelopment programs after World War II, the perception of power centers on Papua New Guinea’s own soil grew. Take the Gebusi case: the presence of colonial officialdom induced a change from their previous feeling of dependency on the upstream-living Bedamini to a downstream one, located at the administrative offices. This particular change is supported by visions of a downstream and underground source of wealth.

Inland populations had much of their early experience with the outside world through migrant employment, as did the Huli of Southern Highland Province from the 1950s on. They used the term *nambis* (Tok Pisin for seaboard) as their general spatial metaphor for dealing with all foreign people (including state authority), modern technology, and commodity – these being peripheral to their own power and land. The gold discovery in the 1980s at Mt. Kare gave adjacent landholders like the Huli access to surface and alluvial gold, and the idea emerged that the mythical snake under

this mountain sheds her skin as gold. Arising from a high incidence of illness on the goldfields, the Huli came to connect gold to their all-pervasive idea that pollution was traditionally associated with women, and they now took the handling of gold to be polluting. Mt. Kare as an established sacred site fitted as a microcosm the metaphor of *nambis* because of the Huli's lack of control over access to gold, thus providing evidence for the concept of disempowerment through land development. We see, then, that rapid socio-religious change has produced varied adjustments in Papua New Guinea in terms of approaches to religion, nature, and the environment.

Parliament of the World's Religions

“We condemn the abuses of the Earth’s ecosystems,” states the Declaration of a Global Ethic issued by the 1993 Parliament of the World’s Religions [POWR]. The Declaration went on to declare respect for “the community of living beings, for people, animals and plants, and for the preservation of Earth, the air, water and soil.” Nearly all of the religious leaders present at the POWR endorsed the Declaration, drafted by Catholic theologian Hans Kung. The 1993 Parliament brought spiritual leaders from many traditions to Chicago for nine days of discussion, debate, and rituals designed to address the ethical challenges of a globalizing world. The event was organized by the Council for a Parliament of the World’s Religions [CPWR], founded in 1988 by monks from Chicago’s Vedanta Society with the purpose of marking the centennial of the 1893 World Parliament of Religions.

The 1893 Parliament is widely recognized as the inaugural event of the modern interfaith movement. An auxiliary congress of the Chicago Columbian Exposition of 1893, the Parliament offered a spectacle of interfaith cooperation as spiritual leaders of many of the world’s traditions represented their faiths to a curious audience of

North Americans. Numbering among the speakers were Buddhists and Hindus from abroad as well as Catholics, Jews, and a variety of Protestants from the United States. The Parliament’s Anglo-American organizers hoped the event would demonstrate the compatibility of the world’s great religions, yet the event was not without conflict. Some Asian delegates used the occasion to denounce Christianity’s exclusivist claims and the Church’s complicity in colonial and imperial ventures.

The 1993 POWR drew around 7000 delegates interested in exploring spiritual responses to violence, war, economic, and ecological crises. Among the sessions dealing with ecological concerns was “Cosmic Beginnings and Human Ends,” a symposium on science and religion that included biologists Lynn Margulis and Michael Dolan on the Gaia hypothesis and theologian Mary Hunt, who offered feminism as a bridge in discussions between theology and science. Other sessions featured Jay McDaniel on the dialogue between Buddhism and Native American traditions; Mary Evelyn Tucker, John Grim, and Stephanie Kaza and McDaniel on Worldviews and Ecology; Charlene Spretnak and Finley Schaef of the North American Conference on Christianity and Ecology, which organized several sessions, on eco-communities; Thomas Berry and Schaef on Ritual in an Ecological Age, as well as sessions on lifestyle and consumption, women and the Earth, theological education, and religious institutions as Creation Awareness Centers.

Organizers of the 1893 Parliament excluded Native Americans and representatives of African tribal traditions, and there were no official delegates from New Thought or other marginalized American religious groups. By contrast, the 1993 Parliament was far more expansive in its embrace of religious diversity. In addition to representatives of the major world religious traditions, there was a large and influential contingent of Earth-centered traditions, including indigenous people and neo-pagans. The Parliament was “the coming-out party for Pagans and Witches into the community of the world’s religions,” in the words of Andras Corban Arthen, director of the New England EarthSpirit Community. The Church of All Worlds, The Wiccan Covenant of the Goddess, and a variety of Druids played an important role in the Parliament’s consideration of ecological issues. Neo-pagans sponsored a Full Moon ritual during the Parliament, attended by over 500 delegates and other observers. The influence of Earthcentered traditions also extended to the “Parliament of the People,” a group that met outside the Parliament’s formal sessions to discuss strategies for ushering in a new age of harmony and cooperation between spiritual traditions.

The 1993 POWR was not without conflict as Hans Kung and others insisted the Declaration was not an attempt to create a uniform world religion or a moral ideology to be imposed upon the people of the worlds. Rather, it was an effort to discover and identify “a common set of core values” that its signatories believe lie at the heart of every religious tradition. The CPWR plans to reconvene Parliaments of Religion roughly every five years. Subsequent ones were held in Cape Town, South Africa, in 1999 and Barcelona, Spain in 2004. In Barcelona, special attention was focused on water, one of the world’s greatest environmental challenges, and strong efforts were made to enlist support for the Earth Charter, in the hopes that CPWR could help to promote it to the United Nations.

Pauli, Wolfgang (1900–1958)

Among the most distinguished physicists of the twentieth century, Wolfgang Pauli, winner of the Nobel Prize in 1945, deserves special attention, because his thinking on the interface of natural sciences, philosophy, and psychology very much stimulated later generations. Astonishingly enough, his work is not as appreciated as that of his colleagues, Einstein, Heisenberg, or Bohr. It is only recently – especially in the context of “New Age science” and discussions about holism and religious dimensions of science – that Pauli has been rediscovered.

Quantum mechanics has far-reaching implications on the concept of nature. It refutes the Newtonian paradigm of determinism, causality, and objectivity. Contrasting Bohr and Einstein, who both tended to underrate the revolutionary consequences of quantum mechanics, Pauli was fully aware of the fact that now the observer played a significant role in every experiment. Empirically discernible reality is dependent on the observer’s place and subjective condition. Thus, the freedom of the observing person implies that the human psyche cannot be separated from the physical image of the world. Pauli was radical in his conclusions and argued that there is no objective reality. Instead, reality consists of rational and irrational elements. Not everything, therefore, can be explained with rational theories. That the physical world is not fully determined and not even necessarily built on causal relations, Pauli proved with his famous *Pauli Principle*, which says that the distribution of an atom’s electrons (i.e., their mutual exclusion) is always *a-causal*. From here it is but one step to today’s “chaos theory.”

The metaphysical dimension is an integral element of physics itself. In a letter to Markus Fierz, Pauli wrote in 1952 that the singularity of the experiment and its nondeterminacy is a return of the *anima mundi* (“soul of the world”), which had been forced away in the seventeenth century. This notion already hints at the intriguing dialogue Pauli had with Carl Gustav Jung. Besides the alchemical connotations of modern science, it was the concept Jung called “synchronicity” that was a major topic of their conversations. It became part of a book they published together in 1952. While the psychologist referred to synchronicity as “a-causal parallels” or “symbolic coincidences,” the physicist explained the same phenomena with the doctrines of quantum mechanics. What both scholars shared was the conviction that matter and mind are by no means separate domains.

Pauli’s impact on contemporary Western nature discourse has been indirect. His ideas were popularized by

C.G. Jung, F. David Peat and others who laid special emphasis on the unity of mind and matter or, subsequently, of the human and the cosmos. In so doing, these ideas have been utilized in order to sacralize both nature and the human soul.

Payutto, Phra Dhammapitaka (1939–)

Acknowledged to be one of the leading scholar-monks in contemporary Thailand, P.A. Payutto whose current monastic title, Dhammapitaka, was conferred in 1993, was ordained at the age of eleven in 1950. Only one of four novice monks to pass the ninth and highest level of the

sangha Pali curriculum since its inception, he received higher ordination and the monastic name, Phra Maha Prayudh Payutto in 1961. He graduated with first-class honors from Mahachulalongkorn Buddhist University, and later served as its deputy secretary-general as well as abbot of Phra Phirain monastery in Bangkok. His major contributions to the scholarly study of Buddhism include two Pali dictionaries, editorial leadership in the newest edition of the Thai Pali canon and the Mahidol University CD-ROM Pali canon, and his magnum opus treatise, *Buddhadhamma: Natural Laws and Values for Life*. In addition, he has written extensively on a variety of subjects including Buddhist education, Buddhism and science, Buddhist economics, Buddhism and the environment, as well as Buddhist doctrinal topics. For his outstanding contribution to Buddhist scholarship and education, he has received several honorary doctorates and in 1994 was awarded the UNESCO Peace Education Prize.

In the early 1990s, Payutto addressed the question of the relationship between the Buddhist *sangha* (community of monks) and forests in reaction to what he saw as an excessively political response by some monks to extensive deforestation in northern Thailand and the encroachment by government and private enterprise on traditional village forest management in the northeast. In these talks that were later printed as essays, Payutto makes a case for forest preservation on the grounds of the example of the life and teachings of the Buddha, the traditions of early Buddhist monastic practice, and the development of Buddhism in Thai history. He bases his position on the doctrinal view that overcoming mental defilements (*kilesa*), one of the central teachings of Theravada Buddhism, requires separation (*viveka*) from the confusions, anxieties, and stresses of the getting-and-spending world that typify much of our lives; and, that during the time of the Buddha the forest was the preferred environment for the solitude required for achieving this state of mind. From a historical perspective, he argues that beginning with the thirteenth-century Thai kingdoms, forest monasteries have been essential to the organization and practice of Buddhism in Thailand. Consequently, for

the government not to support forest monasteries would contradict a practice that has defined Thai Buddhism from its early beginnings.

Unlike some Buddhists who consider such philosophical concepts as dependent co-arising (*paticca samuppada*) and universal Buddha-nature (*dhammadhatu*) to provide a biocentric ecological argument for the preservation and conservation of nature, Payutto supports a more human-centered position that values the forest, or nature more broadly construed, as the ideal venue for the pursuit of Buddhist spiritual goals and moral values. He offers both doctrinal and historical justifications for his position, arguing that from a Buddhist perspective forest preservation rests on a religious rather than an ecological basis. It is a position that supports conservation on the grounds that an unspoiled natural environment best promotes Buddhist spirituality and has always held a prominent place within monastic traditions. At the same time, however, his position problematizes the activist role of Thai conservation monks who have politicized the role of the *sangha* in Thai society. Implied in Payutto's position, which relies upon a religious and historical justification for conserving natural environments like forests, is a critique of politically active monks who, in his opinion, jeopardize the spiritual goal of Buddhist practice. In contrast to the close interrelationship between the human community and nature in the Buddhist tradition, Payutto ascribes modern global environmental destruction to the dominant Western worldview – flawed, in his view, by three erroneous beliefs: that humankind is separated from nature, that human beings are masters of nature, and that happiness results from the acquisition of material goods. For Payutto, conservation and preservation of the natural environment cannot be achieved simply by more astute public policy and better enforcement of conservation laws, but only by demanding a paradigm shift: an ethical transformation not only of the prevailing attitude toward nature, but also toward our fellow human beings and our personal life-objective. Advancing the Buddhist position that right view leads to right action, Payutto contends that until the right view prevails and human beings are seen as part of nature, the worldwide trend toward environmental degradation will continue.

Payutto regards three Buddhist ethical values as central to a more positive environmental philosophy. These include the teachings of *gratitude and loving-kindness* which acknowledge all sentient beings as bound together in a mutual and universal process of birth, old age, suffering, and death. This *empathetic sense of mutuality promotes cooperative and helpful actions* rather than competition and hostility. Furthermore, Buddhism teaches that *human happiness depends on the natural environment*. First, nature engenders in us a sense of happiness and well-being; and, second, by carefully observing the processes of nature we are enabled to grow in mental concentration, attentive awareness, and ethical wisdom.

Peat, F. David (1938–)

In many publications, F. David Peat contributed enormously to the popularization of theoretical issues of quantum mechanics and modern science. His thinking is very much influenced by David Bohm, but also reveals the imprint of Ilya Prigogine's and Rupert Sheldrake's holistic theories. Most recognized is his metaphysical expansion of the concept of *synchronicity* that was first introduced by physicist Wolfgang Pauli and psychologist C.G. Jung. This model makes use of the indeterminacy and simultaneity of phenomena as described in quantum mechanics. Peat, for his part, does not restrict himself to the holistic implications of synchronicity but elaborates a full-blown spiritual and metaphysical view of nature and reality, which is both imaginative and speculative. As a result, Peat expects a coming transformation of man and society that will lead to a new integration of matter and mind, of nature and human beings.

Penan Hunter-gatherers of Borneo

The equatorial island of Borneo is characterized by a remarkable degree of cultural and economic diversity – from the material opulence of Brunei Darussalam’s royal family to the traditional farming and foraging peoples that occupy much of the island’s vast interior. These latter subsistence societies, once infamous for their headhunting raids, are divided roughly between nomadic huntergatherers and settled swidden (shifting, slash-and-burn) agriculturalists. Cultivators are mostly concentrated along the main rivers, whereas foraging groups inhabit hilly, interfluvial zones. Forest farmers, such as the Iban, Kayan, Kenyah, and many others, live in traditional longhouses.

Their agriculture focuses on hill rice cultivation supplemented by snare hunting and fishing. Hunter-gathering societies, on the other hand, usually referred to as Penan or Punan, concentrate(d) their efforts on blowpipe and spear hunting of bearded pigs (*Sus barbatus*) and other forest game, as well as the preparation of sago starch from *nangah* (*Eugeissona utilis*), a wild, clump-forming palm. Because both types of subsistence groups collect a variety of non-timber forest products for food, fiber, and medicine, and because some Penan engage in occasional crop cultivation, strict division between one mode of subsistence and another can be arbitrary.

The Penan inhabit the interior regions of the island, reaching to the coast only in East Kalimantan, Indonesia. They are believed to consist of two disjunct populations – the Eastern and Western Penan. Distributed in Sarawak in East Malaysia, Kalimantan in Indonesia, and Brunei Darussalam, these two sub-groups exhibit distinct differences in language, group size, foraging range, nomadic characteristics, and degree of social organization. Both sub-groups of Penan are undergoing many of the sociocultural changes that are affecting other indigenous societies in Borneo, including accepting wage-earning employment, intermarrying with non-Penan cultivating groups, absorbing lexical elements from nearby settled groups, and converting to Islam or Christianity. Many distinctive Penan cultural elements are either being or have already been abandoned, including living in huts, men wearing loincloths, men with distended earlobes, use of penis pins, and plucked eyelashes and brows. There are probably less than 10,000 ethnically distinct Penan remaining, and less than 1000 living as nomadic forest foragers.

The cosmology of the Penan is surprisingly generic and poorly defined, at least compared with that of neighboring, small-scale agriculturalists. Some groups report the existence of a high god named Peselong, as well as a pantheon of lesser deities. For many other Penan, however, the concept of a high god does not exist. Rather, the spiritual universe is perceived to be populated by illdefined animist spirits, ghost-like

entities that constitute the non-material essence of animate and inanimate beings and objects. There is no particular hierarchy or order of importance to the spirit realm. Some entities, however, perhaps by virtue of their inherent salience or perceived power over the lives of the Penan, are afforded more respect. These include, for example, Baléi Liwen, the lightning and thunder spirit. Because bad weather is probably the greatest impediment to hunting success and is perceived to be a source of illness, this entity is the most frequent recipient of offerings, including in the past blood sacrifice. Baléi Tepun, the tiger or leopard spirit, stands out because it represents the fiercest predator in the local forests. Baléi Berungan, the rainbow spirit, is associated with the spirits of the dead. There is also a Baléi Ja'au, the giant or monster spirit, which is not exactly malevolent, but is generally threatening because of its size.

Beyond the named spirits, all natural entities in the Penan's tropical forest world – trees, mammals, birds, physical features, and humans – are believed to possess a spiritual essence. Even the Penan's traditional material possessions, such as blowpipes and sleeping mats, are seen to embody the spirit of the tree or rattan from which they were fashioned. Only recent additions to their material culture, such as longboats, longhouses, and other adopted goods from sedentary farming groups, are lacking a spiritual existence.

Humans are believed to possess three distinct souls (*sahe*) or spirits – one in the pupils of the eyes, one in the hair, and one in the trunk of the body. When a person dies, the three *sahe* make the journey to the afterworld, an unspecified region where the souls of the dead reside. The afterworld is seen as an other-worldly refuge from hunger and sickness, a forager's paradise with the promise of abundant food and reliable hunting. To assist in these activities, the Penan are buried with a few important possessions, including a blowpipe, poison darts, and a small quantity of food.

Like many other traditional societies, the Penan ascribe many of their health problems to disturbed relations with the non-material world. Whether spirits are the harbinger of good or bad luck to the lives of the Penan depends to a certain degree on their ability to maintain a state of equilibrium with the spiritual realm. Although spirits by their nature are neither benevolent nor malevolent, each has the power of retribution if offended or not properly propitiated. Taboo violation, in principle, represents one such spiritual offense. Women, for example, are prohibited from consuming reticulated python during pregnancy, as to do so might lead to health problems. However, the Penan are actually quite flexible in terms of food acceptance, certainly compared to neighboring groups, and very few wild foods are tabooed. In any case, food taboos are neither strictly adhered to nor rigidly enforced.

The Penan, like other Bornean peoples, attribute good and bad luck to the activities of certain omen birds. Species such as *pengiyuh ngereah*, the red-naped trogon, is seen to bring bad luck if it is seen or heard to fly from right to left across a person's path. The person should abandon what he or she is doing and return to the camp immediately. The same is true for good-luck birds, such as *pengiyu buah* (orange-breasted trogon), which portends good fortune when it flies across a person's path

from right to left. Divination and other means of spiritual revelation appear to be poorly developed among the Penan. The use of shamanism and the specialized role of a shaman-healer are not known at present. Neither are trance or spirit possession as a means of communicating with the spiritual realm presently employed. Whether this was true in the past, or is a product of cultural erosion, is not clear. The

Penan do recognize the existence of people with the ability to receive dream messages during sleep. These are not drug-enhanced experiences, as the Penan appear to be wholly ignorant of any mind-altering, psychoactive plants. Rather, these are simply prophetic dreams that suggest to the “dream reader” the nature of a problem, often health or hunting related, and a possible solution. Any person in the group, male or female, might possess this ability. He or she is said to be born with this capacity, having been selected by the spirit world as a conduit of useful information. There is no apprenticeship or initiation into the role; nor is there any particular status associated with the position.

As one of the last surviving tropical forest huntergatherer groups, the Penan have been the subject of considerable speculation regarding their relations with nature. For example, the long-held notion that the Penan are descendants of the island’s original forest nomads has recently fallen out of favor. The prevailing view is now that foraging societies in these and other moist tropical landscapes have always been culturally and materially dependent on the presence of agricultural groups. Based on the assumption that the carrying capacity of tropical forests was never sufficient to sustain a purely huntingand-gathering lifestyle, the Penan’s foraging mode of subsistence is believed to have developed only after cultivating societies were present on the island.

There have been many anecdotal accounts of the Penan’s superlative knowledge of the plant kingdom. Indeed, because the ability to recognize, cognitively classify, utilize, and manipulate plant species was prerequisite to group subsistence and survival, it follows that the Penan, whose livelihoods depend completely on their knowledge of the forest, should maintain a profound knowledge of their primary forest habitats. Nevertheless, it now appears that several factors served to limit the Penan’s quantitative knowledge of the plant world. For example, because their migratory way of life allowed for few material possessions, the Penan did not develop a deep lexical understanding of timber species, for which they had little use. Likewise, because their low population density translated to a relatively disease-free environment, the Penan failed to develop the kind of deep understanding of the rainforest pharmacopoeia exhibited by their cultivating neighbors. Overall, the breadth of Penan ethnobotanical knowledge, as indicated by number of named taxa and perceived useful species, is several times less than that of small-scale farming groups. This surprisingly shallow knowledge of most plant species, however, is compensated for by “substantive knowledge” of those few wild resources essential to their foraging mode of subsistence.

The concept that most defines the Penan’s relationship with nature is *molong*. This philosophy addresses both the necessity of sharing within the group and the need for conservation of a limited resource base. Indeed, much of the Penan ethic is contained in

the often-repeated phrase *mai belabih*, meaning “don’t be greedy.” For a society whose survival depends so intimately on the providence of the forest, inappropriate means and levels of resource exploitation have obvious direct consequences for all. *Molong* is closely associated with management of the native sago palm, the Penans’ starch staple. Although not planted, wild sago is carefully husbanded in order to achieve maximum long-term yield. Older stems are harvested and processed, but the younger stems, *wvud*, are marked and protected for future exploitation. To harvest sago unsustainably would be greedy and reckless, and it would threaten the material survival of the group. It would also represent an offense to the spirits of the forest, upon whose beneficence the Penan likewise depend.

Perelandra

Perelandra is a nature research center in Jeffersonton, Virginia, founded by Machaelle Small Wright in 1977. Named after the book with the same name by C.S. Lewis and similar in spiritual orientation to the Findhorn Community in Scotland, Perelandra is best known for its garden. In maintaining the garden, as well as in developing flower essences and other health aids, Wright practices a “co-creative science” in which she learns from the energetic intelligence of nature how to achieve the natural balance that enables living things to grow and thrive.

Situated within the broad Theosophical lineage, cocreative science involves communicating with the devas, or the “architects,” and nature spirits or the “builders,” associated with particular plants, animals, and places to discover, for example, what to plant, where and when as well as how to deal with problems such as insect infestations, depleted soil conditions, and other ecological imbalances.

On a larger scale, Wright seeks to make Perelandra a model of environmentally responsible human behavior. In the 1997 edition of her book *Behaving as if the God in All Life Mattered*, Wright wrote that, if humans are to heal the Earth of the damage we have done, we need to be open to “the reality of energy behind form and the consciousness contained in that energy” (1997: 224). The work at Perelandra shows that healing nature does not mean human withdrawal from nature, but rather, conscious pursuit of what Wright calls the Involution/Evolution Balance between what nature provides, on one hand, and human purpose and direction, on the other.

Perennial Philosophy

The key idea in perennial philosophy is that behind all the diversity of human thought a perennial truth is discernible and is preserved and transmitted in the various mystical/contemplative teachings and practices that are the energizing core of the several great religious traditions. Perennialist metaphysics claims that behind the seemingly infinite variety of phenomena is one divine spirit that manifests itself hierarchically and over time expresses every possibility. Perennial truth is about that one underlying reality. The human “organ” through which the transcendent truth of the unity of all being in its infinite diversity is discerned is the intellect (what Ken Wilber calls “the eye of Spirit”) and is itself divine. Our human consciousness, then, is divine at its source, a source to which we can return with successful training on an esoteric path. Since there is one underlying sacred, even divine, reality, all of nature is divine, sacred, and holy, manifesting itself in its appropriate position in the hierarchical “great chain of being.” Nature’s worth infinitely exceeds its monetary or utilitarian values. Modernity denies that perennial truth, which is a spiritual flaw, and our ecological crisis, say perennialists, is the result of that spiritual flaw.

At the level of surface structure, the conceptual frameworks used to articulate perennial philosophy vary. The influence of Platonic or neo-Platonic, Aristotelian or Thomist, Advaita or Madhyamika, or even Hegelian sources is prominent in one or another version. The starting points are revelation and metaphysical insight. The perennial philosopher typically intuits a cosmos emanated into many grades of being or created in multiple ontological levels arranged on a hierarchical scale downward from what might imperfectly be termed the Most Perfect Being (*ens perfectissimum*), or That One (*tad ekam* in the Rig Veda), or simply the One. Perennialists favor mystically grounded metaphysics to articulate perennial wisdom. One task of a perennial philosophy is to understand the immense variety of beings, including nature, in their place in this all-encompassing ontological hierarchy. The counterpoint is to be able to discern the One behind the veils of each phenomenon. Divine intellect grasps the divinity of all beings within all the gradations of being. That is, when our minds have become sufficiently transparent for the One to come through as divine intellect, we can see with that Eye of Spirit, the ultimate One-ness of all being in its graded diversity of manifestation.

Perennialism affirms an originating conscious unity that is prior to all distinctions, to all “saying,” and which can be perceived in all of its hierarchically organized levels of being only by intellect. Historian of ideas Arthur Lovejoy reviewed the uses of this kind of cosmogonic model in the West in his classic study *The Great Chain of Being* (1938).

This narrative of origins is to be contrasted with the modern scientific notion of a Big Bang which explains the evolution of the physical universe and, finally, results in the emergence of life and awareness on this planet. For perennialists, who reject Darwin's narrative of evolution since more cannot come from less, the purest consciousness is present at the beginning and its pristine truth is transmitted at the origins of human religions. The inherent sacrality of all nature is a key constituent of that truth.

The History of the Idea of a Perennial Philosophy

Three instances of the idea of a perennial philosophy have been particularly influential. The first and earliest known use of the term was in the Latin title (*De perenni philo- sophia*) of a manuscript edited by Vatican librarian Augustinus Steuchus (1469–1549) and presented to Pope Paul III in about 1540. It was an anthology of extracts from works of Classical thinkers selected to confirm the truth of Christian teachings. The second was in a letter of

1714 from Gottfried Leibniz (1646–1716) to Remond de Montmort. Leibniz aspired to a method of analysis that could distinguish the diamond light of truth from the dross and that would yield something like a perennial philosophy (*perennis quaedam philosophia*). After Leibniz the term fell out of use due to the rise of experimental sciences that proceed from different assumptions about how to obtain reliable knowledge. It reappeared in the twentieth century in another anthology, *The Perennial Philosophy* (1945) edited by Aldous Huxley (1894–1963). This third instance represents the term as referring to the highest common factor among traditional doctrines and as reflecting a set of convergent insights gleaned from the world's great mystics who experienced the ultimate and attempted the impossible – to speak of it.

Perennialism Today

Within the context of the current ecological crisis, contemporary perennial philosophy has much more to say about nature and ecology than earlier sources do. Contemporary perennialism has two tracks, Traditionalist Perennialism represented by Rene Guenon, Frithjof Schuon, Huston Smith, and Seyyed Hossein Nasr, and neo-Perennialism represented most effectively by transpersonal theorist Ken Wilber. All of them agree that modernity in its reductive scientism has blinded us to the inherent sacredness of nature, a belief also held by deep ecologists. Neo-Perennialist Wilber, however, argues that deep ecologists are as reductive as the modernity they criticize.

Contemporary perennial philosophers make clear that the perennial truth is not a concept built up by induction after gathering and comparing the doctrines of the different religious traditions and reports of the experiences of their great mystics. Instead it is intuited directly through divine intellect. This is why the Traditionalist School

prefers the specific term perennial wisdom (*sophia perennis*) to the generic term perennial philosophy – in order to place emphasis on the distinctive capacity of the human being for transcendental wisdom. In essence the human is distinguished by intellect which is the presence of divinity within each human being waiting to be uncovered. It is distinct from reason and affords discernment or knowledge of the sacred unity of reality that is attested in all authentic esoteric expressions of tradition.

The historian of religion Huston Smith interprets the world's major religions as great wisdom traditions that preserve both the popular (exoteric) and the virtuoso or spiritual elite (esoteric) versions of a single primordial truth. It is on the revelation of that primordial truth that each tradition is based. The only way for one to approach that single primordial truth is to enter into the orthodox disciplines, practices, and doctrines of one or another of those authentic traditions. Smith was born in China where his parents served as Methodist missionaries, and he first came to the United States for higher education. He remained for a university teaching career during which he also apprenticed himself to a Vedantic Hindu monk, then to a Zen Buddhist roshi, and finally was initiated into the lineage of Sufi Muslim sheikh and perennial philosopher Frithjof Schuon.

Seyyed Hossein Nasr is the most important contemporary representative of the Schuon (or Traditionalist) lineage for issues concerning religion and nature. An Iranian-born Islamic philosopher with Sufi training, he studied at MIT and at Harvard where he received a Ph.D. in the history of science with a thesis on Islamic cosmology in 1958. He recently completed a distinguished career as University Professor at George Washington University where he taught perennial philosophy, history of Islamic science, and philosophy of science. He has produced a number of publications resulting from his concern about the environmental crisis. Notable among them are *The Encounter of Man and Nature* (1968) and *Religion and the Order of Nature* (1996).

Neo-Perennialist Ken Wilber is an independent scholar and a prolific writer who represents an orientation within perennial philosophy that differs from the Traditionalist approach of the Schuon lineage, one that is “evolutionary” rather than “devolutionary.” Wilber attributes potentially positive value to scientific, technological, and cultural innovation. Moreover, he agrees with Max Weber that the modern differentiation of the spheres of arts, morality (which includes religion) and science has given conceptual space for the emergence of core modern values of equality, freedom and justice, democracy, gender equality, separation of Church and state, etc.

Traditionalists do not endorse Wilber's assumption that the history of human consciousness is evolutionary but do share the same basic analysis that a spiritual failure is the crucial component of the environmental crisis. For Nasr, modernity renders us insensible to the sacrality of all nature by its exclusive focus on reason to the exclusion of intellect or “the eye of Spirit” which has as its field transpersonal and metaphysical realities. When the transcendent dimensions of being are denied, nature becomes a commodity with only utilitarian worth, no longer a divine manifestation of intrinsic value. Nasr regards the reign of quantity effected by the absolutizing of materialist

science as an utter catastrophe. This modern idolatry of science and technology is accompanied by an idolatry of the mind, especially reason, which leads to idolization of everything human, with the unwarranted conclusion that all of the planet exists simply as a set of resources to be used for the fulfillment of any human desire.

For Wilber, who sees the scientific enterprise as a necessary stage in the evolution of consciousness, the extremes of scientism are seen as a distortion of important aspects of modernity that should not divert us from the important gains of modernity in the evolution of consciousness. In psychological terms, scientism is a symptom of a kind of dissociation that is particularly associated with modernity, and the current ecological crisis is its inevitable consequence.

The Perennialist Diagnosis of Modernity and the Ecological Crisis

Traditionalists claim that in the founders and prophets of the great religious traditions we find the full pristine flowering of human consciousness through all levels. Students of esoteric paths within their guardian exoteric traditions may be able to approximate the spiritual level of the founders and prophets, but as time passes the tradition tends to move away from its primordial source; time brings devolution. Modernity is the nadir where reality has become utterly distorted by the removal of spirit from the reality-map. Healing can happen only by a return to a premodern orthodoxy that preserves the wisdom born of intellect, a spiritual intuition that is superior to reason and without which reason is blind. Only rare individuals can accomplish this return, and then only from within a vital orthodox tradition. This is how the Traditionalists understand themselves and the larger crisis within which environmental disaster is an obvious symptom.

The Traditionalist picture of the origins of religion is mirrored metaphysically as the cosmos emergent by involution, the eternal One pouring into all levels of reality. The appropriate movement of creation is in the direction of a return to the Absolute. Human consciousness inherently is oriented toward evolution in this sense, in other words, the return to the One. The return has as its final stages the mystical journey that is practiced in the esoteric paths of authentic traditions. The metaphysical suicide, perpetrated by scientism, has resulted in the loss of access to perennial wisdom and has produced the current ecological disaster. Human consciousness, when reduced to reason and disconnected from its spiritual root and source in intellect, is the basis for a scientism that assumes that whatever the senses do not respond to cannot be real. Deep ecology also criticizes modernity and especially its scientism as invalidating the most profound experiences such as love, compassion, and mutual understanding.

Wilber's evolutionary perspective on the development of human consciousness distinguishes him from the Traditionalists. He acknowledges that modernity has brought

many important gifts in the process of evolving human corporate consciousness, including our efforts to abolish human slavery, to achieve gender equality, and to break the power of the myths that justify cruelty and the subjugation of one group by another. On the other hand, he agrees with Traditionalists that the spectacular success of technology based on modern science has left us with a cosmology in which only matter really matters, where only what can be measured is regarded as real, where only the exteriors and observable behaviors are valued. Wilber calls this scientific cosmology Flatland.

Traditionalist Perennialist and Neo-Perennialist Prescriptions

The way out of Flatland-thinking, according to Traditionalists, is to revive traditional religions and regain access to authentic paths to transcendence by recovering, retrieving, or recreating orthodoxies that do not allow a rogue scientific reason to judge and limit them. One thing that is not clear about the Traditionalist prescription is how the genuine gains in freedom, equal justice, etc., would be maintained if their ideological support in modernity were withdrawn. For Wilber the Traditionalist solution represents a regression.

Wilber acknowledges that deep ecologists are in touch with their spiritual hunger and that they correctly understand the ecological crisis as a spiritual crisis. But their resistance to seeing the hierarchical ordering of reality prevents them from understanding the uniqueness of human nature in relation to environments. Once consciousness evolved self-awareness, humans as a species took unprecedented control over their environment. Wilber characterizes eco-philosophies that view humans as just another ingredient in the ecosystem as dangerously naive retrograde romanticism. In a sense, human consciousness contains its ecosphere rather than being contained by it as simply part of the ecosystem. Uniquely, humans are capable of generating alternative conceptions of the ecosphere and then transforming the ecosystem on the basis of them. His assessment of anti-hierarchalism is that it is a dangerous denial of the reality of the cosmic process. It also denies the ultimate goal of humans to attain a return to the One through integration of deeper states of consciousness.

Traditionalists and Wilber would agree that denial of transcendence robs any ecological philosophy, including deep ecology, of sufficient depth. To make the inner transformations that would enable us to stop our selfdestructive, even suicidal, corporate behavior would require an understanding of a greater range of ontological dimensions. In addition to what science can tell us about the external dynamics of the natural crisis with the eyes of flesh and mind, according to Wilber, we need to know what can be seen in profound introspection by means of the eye of Spirit.

Traditionalists believe that modernity has devolved rather than evolved, has moved us away from a sacralizing vision of God, humanity and nature that was natural to traditional and primordial cultures. Wilber, on the other hand, criticizes ecological thinkers who look to some earlier culture as the ideal, after which all went wrong. Ecofeminists look back to goddess-centered cultures, before the plow displaced women from their function in horticulture. Ecomasculinists look back to hunter-gatherer cultures. Wilber considers these nostalgias to be instances of the pre/trans fallacy (i.e., to mistake regression toward pre-personal developmental levels for growth toward transpersonal stages). Thus, from his “evolutionary” point of view, the Traditionalist School within perennial philosophy also looks back to less evolved cultures to solve problems of a relatively more evolved culture, and Wilber asserts it is no help to attempt a return to a culture where myth reigns, no matter how it might be symbolically reinterpreted today.

As one step toward the healing of modernity’s dissociative consciousness, Wilber advocates a marriage of science and religion. But he means religion denuded of all the myths, dogmas and rituals that fail the truth tests of empiricism. He proposes a “perennial religion” comprised of essential truths held in common by the world’s religious traditions. Traditionalists would point out that Wilber’s “perennial religion” is limited by its dependence on an empirical search for common beliefs, doctrines, and transformative practices. They would doubt that it could succeed in the absence of discernment that proceeds from intellect and must inform any comparison among traditions that will properly value the distinctive importance of their myths, doctrines and rituals. Traditionalists are convinced that the return to orthodoxy and its esoteric paths is a necessary if not sufficient condition for attaining the level of consciousness at which human behavior could and would change with respect to nature and ecology.

Wilber, who rejects the myths and dogmas of orthodoxies as obstacles to the evolution of consciousness beyond modernity, claims that human consciousness must evolve beyond modernity in the same way that all evolution happens, by transcending and including the prior stages. To transcend modernity would be to include the best of modernity while healing the dissociations. He believes that can happen if humanity is guided by an adequate reality-map, which he claims to provide, and will use tools from traditional paths, which may no longer function as a whole for those who can no longer inhabit a traditional religious worldview, but nevertheless can serve as tools for transformation without the mythic, dogmatic accessories. Tools from transpersonal theory as well as a whole host of therapeutic modalities can be integrated in such a way as to replace the traditional paths that were so interwoven with the metanarratives of the traditions.

Some environmental activists criticize mystical approaches to the environmental crisis as other-worldly and useless, but they have yet to respond to the claim of perennial philosophers that every form of activism is based on metaphysical assumptions and that if the assumptions are inadequate, then the activism will be inadequate. For perennial philosophy, participation on a path of spiritual evolution is an absolute pre-

requisite to having access to the intellectual vision that can enable discernment of the spiritual dimension and significance of the planet.

Peyote

When the Spanish conquistadors first arrived in what is now Mexico, they discovered that the native inhabitants attributed sacred qualities to three plants: a mushroom (*Teoanacatl*); a vine belonging to the Morning Glory family (*Ololuqui*); and a small, spineless cactus (*peyotl* or *Lophorora williamsii*). The Aztecs referred to the last of these, *peyotl* or peyote, as “the flesh of the gods.” This carrot-looking cactus produces small “buttons” that contain at least nine alkaloids known to have psychoactive properties when ingested by humans in either their green or dried state. Together, these alkaloids (of which mescaline appears to have the most profound effects) induce an altered state typically characterized by initial nausea, general stimulation, inability to fix attention, and visual hallucinations – particularly kaleidoscopic displays of color.

Peyote has historically been ingested in structured, ceremonial settings. Although the precise meaning of peyote ceremonies varies from culture to culture, peyotism (the ritual ingestion of peyote) is thought to bring persons in touch with power – both natural and supernatural. First and foremost, peyote is regarded as a potent medicine. Tribal shamans use the power of peyote to divine the causes of illness. Shamans frequently have their patients ingest peyote to bring them the power necessary to effect a cure. Peyote has also been used to obtain visions and the supernatural power that comes from close connection with guardian spirits. Peyote-induced visions are also helpful for various forms of divination such as determining a prey’s location, predicting the outcome of a battle, or finding lost objects. And, too, peyote is used to induce a trance that facilitates tribal dancing rites. Although the power obtained through peyote ceremonies can be put to many uses, it invariably reinforces social understandings of the ideal relationships between humans and both the natural and supernatural orders of life.

Peyote use has continued in many parts of Mexico up to the present day, most notably among the Huichol who live in the central Mexican states of Jalisco, Nayarit, Durango, and Zacatecas. The Huichol’s ceremonial use of peyote begins with the “peyote hunt” for suitable plants. This is an annual pilgrimage under the strict direction of an experienced *mar’aakame*, or shaman, who has special relations with Hikuri, the Peyote-god. Rituals of confession and purification prepare pilgrims for the hunt. Throughout their quest they must be celibate and form a cohesive and classless community. Pilgrims must renounce all ego, pride, resentment, or hostility. The arduous trek (though in more recent times pilgrims travel in cars) to the ancestral regions where peyote is bountiful further prepares participants for their quest to forge closer relations with the spirit world. Under the *mar’aakame*’s direction, pilgrims collect pey-

ote buttons and ritually ingest them in a fire-lit ceremony. The peyote elicits beautiful lights, vivid colors, and visions of peculiar animals. The meaning of these sensations is provided by the *mar'aakame* who integrates them into the layers of belief that comprise the Huichol worldview. The peyote experience is said to effect a total unification at every level, to kindle communal love, to bond persons to the way of their ancestors, and to give participants a direct experience of a spiritual realm that surrounds the everyday world. In this way Huichol peyote ceremonies structure a return to a mythic past of purity and spiritual power.

Peyote was rarely used north of the Rio Grande prior to 1890. But the forced segregation of Native Americans onto government reservations strained tribal cultures in a way that fostered the rapid spread of peyotism in the United

States. Between 1890 and 1920 the use of peyote became more prevalent in the United States, but its meaning varied depending on the tribal context. In the Southwest, with the Mescalero Apache being the prime instance, peyotism remained fairly close to its Mexican roots. Shamans assumed responsibility for directing participants' experience with the powers unleashed through the ceremonial ingestion of peyote. Peyote ceremonies were principally used for ceremonial doctoring, although they might occasionally be used for divination purposes such as locating an enemy, predicting the outcome of some undertaking, or finding lost objects.

Plains Indians in Oklahoma, Kansas, Nebraska, South Dakota, and Wisconsin gradually altered the peyote ceremony in such a way as to shift the focus from the shaman to every participant's quest for power. The peyote ceremonies that continue to this day throughout the western United States typically follow this pattern and seek to help persons establish harmony with supernatural power. These all-night ceremonies are held in a traditional tipi, with the door facing east. Preparation for the ceremony begins with rituals pertaining to the acquisition of peyote, either by sending individuals to Mexico or, in more recent times, by purchase and delivery through the U.S. Postal Service. Once acquired, the peyote is blessed through prayer and consecrated for use in bringing health to all who will ingest it. Any member of the peyote cult may rise to the position of ritual leader, often known as the "roadman." The leader is assisted by a drummer, a fireman, and a cedar man.

The precise order and content of the ceremony varies by tribe and the idiosyncratic preferences of the leader, but invariably begins with the leader's prayer to the power of peyote. The other participants follow the leader's lead and begin praying silently to the "earth-creator" or "earthlord." Following these initial prayers, participants begin to eat the dried buttons of the peyote plant, followed by drumming and singing. The leader's initial song, chanted in a high nasal tone, implores "may the gods bless me, help me, and give me power and understanding." Throughout the night more peyote buttons are eaten (while most members eat about twelve buttons throughout the night, some may consume as many as thirty) and prayer intensifies. Ceremonial dancing is usually an integral part of the ceremony, particularly in Mexico and the American Southwest. Quiet meditation, prayer, and the quest for personal visions predominate in the Plains.

The principal purpose of the peyote ritual is to obtain power. The use of peyote thus overlaps considerably with other traditional methods of obtaining power such as the medicine dance or the vision quest. The power generated by ingesting peyote is therefore often understood to be capable of curing illness. Typically the leader will offer prayers that petition God to cure participants in need of healing. Cures of almost every kind have been attributed to the power generated in peyote ceremonies. Other participants seek to use the power of peyote to procure a personal vision. Still others eat peyote to increase their powers of concentration and introspection.

Peyote rituals also emphasize preaching and moral instruction. Moral lectures are commonplace. Participants admonish one another to forgo vices, particularly in regard to abstaining from alcoholic beverages. Weston La Barre observed that it is typical for participants to pray aloud, with affecting sincerity, often with tears running down their cheeks, their voices choked with emotion, and their bodies swaying with earnestness as they gesture and stretch out their arms to invoke the aid of Peyote. The tone is of a poor and pitiful person humbly asking the aid and pity of a great power, and absolutely no shame whatever is felt by anyone when a grown man breaks down into loud sobbing, during his prayer (1975: 48).

This emphasis upon preaching and moral repentance escalated when Christian elements were incorporated into the peyote ceremony in some tribal settings (particularly among Plains groups). The Bible was introduced to the liturgical format of the peyote “singing” as early as the 1890s. Prayers once made to Indian spirits were redirected to the Christian God. Although most of the formal characteristics of the peyote ceremony persisted, their meaning changed in ways reflecting Native American cultures’ progressive accommodation to white Christian culture: the fire in the peyote tipi became associated with the Light of Christ; the water drunk at midnight became associated with Christ’s alleged midnight birth; the roadman’s gestures to the four directions became a way of announcing the birth of Christ to all the world; and the meal eaten in the early morning became a sacrament for all those who are saved in Christ. In essence, the Christianized peyote rituals synthesized the religious heritages of Native Americans and Europeans. Peyotism thereby fostered the belief that the Great Spirit and the God of Christianity are one and the same. This Great Spirit created the universe and controls the destiny of every person and all events. The Great Spirit put some of his supernatural power into peyote which can have the same redemptive or sacramental power that other Christians avail themselves of when consuming bread and wine. In this way peyotism sustains fundamental Indian concepts about powers, visions, and native modes of doctoring while yet permitting eclectic appropriation of Christian teachings. To be sure, however, many versions of peyotism have eschewed any connection with Christianity. For example, peyote use among the Mesalero Apache has led to an intensification of native values and traditions. And, as many Native Americans have in recent years become more concerned with preserving their cultural heritage, the appeal of

Christianized versions of peyotism has weakened somewhat.

Peyotism never lacked for critics. The most persistent opposition came from white officials who viewed it as contrary to the goal of assimilating Native Americans into white, middle-class culture. One major line of argument against peyote use was that it was allegedly injurious. Despite evidence to the contrary, peyote was said to be both physically and morally debilitating. A more important objection was more political in nature. The rapid spread of peyotism reinforced traditional culture and amplified nativistic tendencies among American Indian populations. Both Christian missionaries and officials in the Bureau of Indian Affairs were disturbed by the cultural threat posed by this overt continuation of native tradition (and the pan-Indian solidarity that it celebrated and fostered). By 1907 BIA officials began orchestrated attempts to pass anti-peyote legislation. Native Americans responded by organizing small religious organizations that claimed peyote use should be tolerated as part of America's time-honored commitment to protect the freedom of religious practice. In 1918, the "Native American Church" was incorporated in Oklahoma and soon developed into an intertribal peyote church that stretched throughout the western and central United States. Subsequently reorganized as the "Native American Church of North America," this group has been largely successful at influencing state courts to respect their legal right to use peyote in religious ceremonies.

The Native American Church eventually obtained religious exemption from drug laws in 27 states. In 1990, however, the United States Supreme Court ruled against the exemption of peyote from the government's "war on drugs." By a narrow 5-4 margin, the Court emphasized the need to safeguard society from the chaos that could conceivably erupt if individuals are free to act however they please simply by claiming that these actions are part of their personal religion. Writing for the four dissenting members of the Court, Justice Blackmun noted that there is no evidence that the religious use of peyote has ever harmed anyone. He noted that the Native American Church's use of peyote is so ritually structured that there is no real concern for health and safety. In sum, Blackmun maintained that "peyote simply is not a popular drug; its distribution for use in religious rituals has nothing to do with the vast and violent traffic in illegal narcotics that plagues this country."

In a series of legislative acts including the Religious Freedom Restoration Act of 1993, the federal government has put statutes in place that specifically permit the Native American Church to use peyote in its religious ceremonies. This legal protection is not, however, afforded to non-Indian groups. Many Anglo-Americans have sought to emulate Native American spirituality and have consequently come to believe peyote is essential to their spirituality since it helps them establish harmony with nature. The Peyote Way Church of God is an example of a group of approximately eighty (and largely non-Native American) persons who pursue experiences of the Holy Spirit through the sacramental use of peyote. State and federal courts have ruled against such groups, maintaining that their use of peyote does not qualify for an exemption from the government's drug-enforcement laws.

In more recent years, peyotism has been instrumental in reinforcing commitment to environmental activism. Peyotism is a sacrament. The ceremony thus heightens awareness of the spiritual beauty residing within nature and consequently fosters a commitment to protecting nature from human defilement. Furthermore, peyote itself is an endangered species. The popularity of peyotism, particularly among white, Euro-Americans who have harvested large quantities of the cactus, has threatened both Hui-chol culture in Mexico and the cactus species itself. While there is considerable irony in the fact that a sacrament resulting in greater connection to nature has created an environmental threat, it remains a fact that peyotists are acutely aware of the plant kingdom's precarious situation. It should also be pointed out that while Native American peyotists speak of their sense of connection to nature, they now generally receive their peyote from the United States government. The traditional ritual of gathering peyote has thus been thoroughly severed from the ceremony in which it is ingested. Many Native American peyotists have therefore lost some of their traditional Earth connection. It is thus not uncommon for white, Euro-American "converts" to peyotism to evidence more environmental concern than their Native American counterparts.

In sum, peyotism has performed a variety of religious, cultural, and environmental functions over the past hundred or more years. Religiously, peyotism helped sustain native ritual traditions amidst the encroachments of white Christianity. The peyote cult offered to heal and to protect its members through the worship of a supreme "earthcreator" who for all intents and purposes is identical with the God of Christianity. The peyote button – like sacramental bread and wine – provided a material vehicle for availing oneself of regenerating power. Peyote is understood as a "medicine," a "power," a "protector," and a "teacher." The peyote ceremony deepens subjective feelings of personal relationship to a sacred power, yet does so in a carefully orchestrated ritual that ultimately assists individuals to subordinate their personal desires to group goals and values. And although peyote is combined with almost as many theologies as it has users, it has almost universally fostered such culturally valued ethical traits as love, hope, charity, ambition, and honesty. And, finally, peyotism is frequently a catalyst for intensified concern for the environment. The entire peyote ceremony reinforces a sacramental view of nature, leading participants to care for the healing of Earth.

The Philippines

There are at least seventy traditional culturo-linguistic groups in the Philippines Islands. Their languages belong to the Malayo-Polynesian group of languages, which have spread from the Indian Ocean right across the Pacific Ocean. Extensive religious change has occurred during modern times in lowland regions, and although the populations there fall into large groupings with customary and language distinctiveness (Tagalogs, Cebuanos, Ilocanos, Illongos, etc.), these are now overwhelmingly Catholic Christian (and accepting the label Filipino).

There is a sizable Muslim population in Mindanao composed of three major ethnolinguistic groups – the Maranao in Lanao, the Magindanao in Cotabato and the Tausug in Jolo. The current Christian–Muslim conflict goes right back to the beginning of the Spanish colonization of the Philippines: when Lopez de Legazpi undertook the conquest of Luzon in 1570 his chief opponent then was Rajah Soliman who had settled in Manila.

Mountain peoples apart from the Maranao in Mindanao were little impacted by either the process of Islamization or Christianization. The reason is fairly simple; they lived in inaccessible places both in Northern Luzon and in the forested highlands of Mindanao. Over almost three and a half centuries of conquest Spanish rule was never established in these areas.

Today these tribal people (or *lumads*) usually live in great poverty on the margins of Philippines society. The cultures of the *lumads* are under tremendous pressure at the beginning of the third millennium. Many anthropologists fear that, within a few decades, many of the *lumad* languages and cultures will disappear because they will have lost their forest lands.

Beginning in the 1930s wave after wave of lowlanders from the central islands and Luzon have migrated to Mindanao and dispossessed the tribal peoples of their lands. Different understandings between lowland Filipinos and tribal people about land and land ownership facilitated this dispossession. Most tribal societies have complex (*adat*) laws governing land use and ownership. None would subscribe to the notion of private property. The lowlanders who were Christians understood the notion of private property and sought legal titles for their newly acquired lands. It is worth pointing out that private property is not a prominent tenet of the Judeo-Christian tradition. Most of the ideas about land and private property came from Roman Law rather than the Bible. The code of Justinian in the fifth century gave people the right to *jus jutendi*, *jus fruendi et jus abutendi* – the right to use, to enjoy the fruits of and even the right to abuse property. These values in relation to land were taken on board by many

lowland Filipinos. When a tribal chieftain gave a lowlander some land in return for a sack of rice the lowlander immediately sought ways to get a legal title to the land which precluded tribal people ever using the land again for hunting or slash-and-burn agriculture (*kaingin*). Ironically many lowlander Filipinos now realize the *lumads* embody many of their own traditional values in regard to religion and the environment so that by hastening the demise of the *lumads* they put their own culture in jeopardy. For example, the traditional religions are “classically” animistic: all of the environment bears a numinous quality, and all waterways, plants and trees are connected to the spirit order.

Furthermore, one must seek permission from the appropriate spirit before taking anything for human use, as for example, when a tree is cut down. If one contravenes any of these taboos a malign spirit can bring trouble and sickness to the erring person and his or her family. In any case there are malign spirit presences in eerie places, such as cliffs, caves, springs, and the headwaters of springs and rivers. Trespassing in them is to be avoided.

The spirits of both place and ancestry are invoked in group ritual life, as in sowing and harvesting. For some ethno-linguistic groups certain places have a special “sacred” quality. For the T’boli people of South Cotabato Lake Sebu and Silutonn are associated with many of the most important origin myths of the tribe. The *buklug* (or thanksgiving ceremony) is a very important mechanism for uniting disparate groups of the Subanon people in managing a fragile tropical rainforest environment in the highlands of northwest Mindanao.

The christianization of the Philippines began after Legazpi claimed the islands for Spain from 1564, and over the next 300 years Spanish power consolidated. Christianizing processes involved a superimposition on the underlying primal religious pantheons; but the world remained full of spirit presences. Because the introduced “divine” was a distant, often fear-invoking presence, devotion to saints filled a religious void. Colorful fiestas to the saints picked up from where primal prosperity festivals left off. With such a symbiosis, the effects of religious change on the environment were not considerable. Even into the 1920s the islands’ rainforest, which is the Philippines’ defining ecosystem, was still intact. Considering it is now down to 10 percent one has to ask what happened.

In 1898 the Philippines were ceded to the United States after the Spanish American War. Population increases soon presented themselves under the new order (the nation’s population has risen exponentially from ca. 6 million in Spanish times to ca. 85 million at present). Opening up the forest areas as frontiers of development was an early characteristic of United States’ rule: John “Black Jack” Pershing (Brigadier General of the Philippines, 1906–1913) approached the Mindanao rainforest like the “wild west,” and his regime treated the inland peoples as if they did not exist. Church programs before the Second World War were also overwhelmingly in favor of helping the Christian lowlanders to cut the forests and open up land, especially for rice growing. In this

frontier situation the mountain people and their culture were despised and almost always seen as inferior.

During the years the Philippines were prepared for independence (with a Commonwealth being established by 1935), and after the trauma of World War II (with an independent Republic being declared in 1946), the development myth was heavily promoted and the opening up of Mindanao was received positively throughout the nation. Neither those on the left nor right of politics had time for the environment. The former constantly called for better land distribution, which would mean more pressure on the wilderness; and when the right triumphed under the authoritarian Ferdinand Marcos (President, 1965–1986), foreigners colluded with Filipino magnates to expropriate the islands' resources.

The Catholic Church, which suffered a setback in influence after the collapse of Spanish rule, began to take the plight of the *lumads* more seriously in the wake of the Second Vatican Council, stressing cultural diversity and the championing of downtrodden peoples. By the mid- 1980s Columban Father Sean McDonagh, who at that time lived with the T'boli, began a program of activism in an attempt to get the environment on the Church's agenda. Initially most Church personnel were nonplussed by his concerns. However by the late 1980s the country's clerical leadership was persuaded by his arguments concerning the irreversibility of damage to rainforests, including the weakening of the islands' originally high level of biodiversity and the destruction of many species. Indeed, irresponsible human impact of the natural world was now having a noticeable effect – typhoons devastating forested areas and generating uncontrollable floods – as the environmental inroads had gone beyond a point of no return.

This marriage of creation and liberation theology in the Philippines helped stop some so-called development initiatives like the building of a massive hydro-electric dam in the tribal area of Northern Luzon and in the T'boli area of Lake Sebu. It also helped insure that the nuclear power plant which was built at enormous cost at Bataan was never put into production. These were high-profile development projects during the Marcos dictatorship.

With the collapse of the Marcos regime, in 1986, President Cory Aquino picked up the first Pastoral Letter about ecology ever formulated by a Catholic hierarchy entitled *What is happening to our beautiful land?* The Department of Environment received teeth to liaise with local groups about their environmental problems and their solutions. Hard decisions, however, continue to present themselves. Rio Tinto, a multinational mining company, spent a number of years in the 1990s prospecting for gold and copper in the Suban-on area of Zamboanga in Mindanao. Concerted efforts at the local and international level have led to a declaration by Rio Tinto in 1999 that they would not seek mining applications in the Philippines. Other companies like Victoria Gold, operating under the banner of Far South East Gold, took over the effort to gain permits to mine in the tribal areas of Northern Luzon and Mindanao. In most of these situations church groups – Catholic and United Church of Christ – worked actively with tribal peoples to protect their ancestral lands from further degradation

through illegal logging or mining. Unfortunately the future does not look too bright from many of the tribal peoples of the Philippines. Much more needs to be done by the local and national government if their unique cultures is to survive and thrive in the twenty-first century. The loss of even one of these ethnolinguistic groups will be a tragedy, not just for that community but for the Philippines and the whole of humanity. We need cultural and linguistic diversity if the human species is to blossom in the future.

Philosophy of Nature

Philosophy of nature, often called in Latin *philosophia naturalis* (already by Seneca, d. 65) or in German *Natur-philosophie*, is the term used for a scrutinization and systematization of the natural world, the processes, dynamics and generative powers of nature, and the relationship between human cognition and “nature.” In its long history from antiquity through today, philosophy of nature was closely related to “natural philosophy” (i.e., the exact sciences, on the one hand, and metaphysics on the other). The latter often has far-reaching implications for religious attitudes toward nature, especially when idealistic, transcendental, or pantheistic models are applied. The major and most influential periods of philosophy of nature are the pre-Socratics, the Renaissance, and nineteenth-century German idealism, although this should not dismiss the contributions of other periods as marginal.

From antiquity through the eighteenth century, empirical, “scientific” natural philosophy, and the speculative, metaphysical philosophy of nature, formed a unity. The Ionic philosophers and pre-Socratics (eighth–fifth centuries B.C.E.) were the first to speculate about the four elements, the (atomistic) structure of matter, the mathematical harmony of the cosmos, the relationship between substance and power (energy) and between the organic and the un-organic. Prominent figures were Anaximander (610–546 B.C.E.), Pythagoras (ca. 580–500 B.C.E.), Parmenides (fl. ca. 540–480 B.C.E.), Heraclitus (ca. 544–483 B.C.E.), Anaxagoras (ca. 500–428 B.C.E.), and Empedocles (483/2–424/3 B.C.E.). In this period the terms *physis* (as “nature” or “matter”) and *cosmos* (as the order of matter or “world”) were coined. Despite disagreements in details most of those early philosophers regarded humans as part of an all-inclusive *physis*. This is true either for the atomists with their analogy of microcosm and macrocosm, for Heraclitus who attacked any kind of anthropocentrism, and for Empedocles who described the differentiation between death and birth as meaningless and ridiculous constructions.

Plato (427–347 B.C.E.) and Aristotle (384/3–322/1 B.C.E.) systematized major earlier currents of thought.

Whereas Plato spoke of *physis* as an effecting (active) and a passive force (*Phaidros*, 270 D), at other times combining it with the idea of ideal being (*ousia*, cf. *Gorgias* 465 A), Aristotle depicts *physis* as the (inner) principle of change (*Physics* III 1, 200b 12). This is the essence of all being. He goes on and speaks of a double nature, one being matter (*hylê*), the other form (*morphê*).

In late antiquity and within the scholastic context of medieval philosophy, influential differentiations were introduced. One of them is the difference between the generative,

active power of nature (*natura naturans*) and the “generated” result of that process (i.e., visible nature [*nat-ura naturata*]). This important differentiation was first developed by the Arab philosopher Averroes (Ibn Rushd, 1126–1198), and it found its way into the scholastic philosophy of Albertus Magnus (d. 1280), Thomas Aquinas (d. 1274), and Roger Bacon (d. 1294). *Natura naturans* was described as the divine principle of creation, standing – like God himself – somewhat behind created nature. The “book of nature” (derived from “Holy Scripture”) thus was a revelation of transcendental, sacred truths to be deciphered by man. Consequently, the exact sciences were a means to contribute to Christian theological discourse. In this perspective, (created) nature was not itself divine but only a mirror of the divine.

During the Renaissance this model changed markedly. Although there are close relations between them – a fact that is often neglected by scholars of religion and science

– two major currents can be differentiated. On the one hand there was a rebirth of the ancient philosophy and religion, resulting in an enthusiastic appraisal of pantheistic and “holistic”-vitalist concepts. Especially within the neo-Platonic milieu of fifteenth-century Italy, esoteric and hermetic doctrines were molded that described nature as a living being connected to humans in various ways of correspondences (one prominent figure was Marsilio Ficino, 1433–1499). On the other hand, a development took place that is often referred to as the “scientific revolution.” Two publications can be addressed as the cornerstones of this shift of paradigm. In 1543 Nicolaus Copernicus (1473–1543) published *De revolutionibus orbium caelestium* (“On the Celestial Bodies’ Revolution”) containing his thesis that the Earth is not the center of the cosmos but revolves around the sun. And in 1687 Isaac Newton (1643–1727) put forward his mechanistic theory of physics and mathematics in his seminal work *Philosophiae naturalis principia mathematica* (“Philosophy of Nature’s Mathematical Principles”; note that Newton does not speak of “science!”). Further major contributors to the new paradigm were Tycho Brahe (1546–1601), Johannes Kepler (1571–1630), Galileo Galilei (1564–1642), and the philosophers René Descartes (1596–1650) and Thomas Hobbes (1588–1679). The mechanistic model roughly had four characteristics. Nature was identified as a human artifact; it was described as analogous to a lifeless machine; mechanics was now identified with the whole of physics; the mechanistic model was considered the only valid, “scientific” way of explaining nature and cosmos, hence all disciplines (philosophy, psychology, medicine, law, politics, etc.) had to be adjusted to the new paradigm. The implications of this development were conceptualized in the eighteenth century. Now a distinction was made between *physica speculativa* and *physica empirica* that led to the modern concept of empiristic science as a separate discipline in contrast to philosophy of nature as mere speculation and metaphysics. It was Immanuel Kant (1724–1804) who worked out the first comprehensive critical theory of nature, which comprised both a mechanistic theory of science and a complementary theory of the organic (i.e., the biological aspect of nature). *Natur-philosophie* in the strict Kantian sense is characterized by a reduction of visible or measurable forces to a small set of

general prior forces. Forces that transcend the scope of pure reason are to be excluded from philosophy.

This assumption was harshly refuted by philosophers of the early nineteenth century. A nucleus of the new direction was the University of Jena (Germany), where Friedrich Wilhelm Joseph Schelling (1775–1854) elaborated a full-blown theory of nature. His concept had a considerable impact on later Idealism and Romanticism because it combined a critical rationalistic method with holistic and vitalist explanations of nature as a generative force (*natura naturans*). Biocentric perspectives and pantheistic sacralization of nature – prominent within the European and North American context in the middle of the nineteenth century – cannot be explained without Schelling’s strong impact, although the philosophy of Georg Wilhelm Friedrich Hegel (1779–1831), who spoke of nature as the “expression” of the Absolute into material form, superposed it for some time.

Due to the success of empirical science and growing industrialization, the later nineteenth century led to a decline of any speculative philosophy of nature, and a lot of people announced its death, analogous to the “death of metaphysics.” But this was a dialectic process, and between 1900 and 1930 there was a rebirth of holistic, monistic and vitalistic concepts. Interestingly, scientists of physics and biology were the driving force in this development. Biologists like Ernst Haeckel (1834–1919) developed a monistic pantheism (he also coined the term “ecology”), and the scientific revolution that was initiated by Albert Einstein’s General Theory of Relativity, along with the succeeding Quantum Mechanics, led to a growing suspicion of mechanistic and deterministic explanations of nature. Now a speculative debate emerged on the fringes of physics, philosophy, and psychology – for example, the dialogue between Carl Gustav Jung and Wolfgang Pauli or the “Copenhagen Interpretation” of Quantum physics – which again brought up the issue of “matter and mind,” among others.

The so-called “New Age science” is a direct follower of this new philosophy of nature. Speculations related to “Quantum mysticism” as well as to romantic theories were combined in various ways with practical religious attitudes. “Deep Ecology,” “Transpersonal Psychology,” or nature-based spirituality in general are by no means isolated phenomena of modernity. They are deeply grounded in Western philosophy of nature.

Pilgrimage to Sripada (Sri Lanka)

The annual pilgrimage to the sacred mountain Sripada (h. 7415 ft), located in the Sabaragamuva Province of southwest Sri Lanka, is undoubtedly a unique religious experience both for Buddhists and non-Buddhists. Commonly known in Sinhala as Sripada, the mountain pilgrimage site of the historical Buddha's footprint is filled with intense religious piety. For centuries, Sripada has functioned as one of the 16 active ancient pilgrimage sites in Sri Lanka. As a sacred site, it combines the sacred mountain pilgrimage with pious Buddhist practices such as reciting the virtues of the Buddha, while also incorporating religious and mythological beliefs to help the pilgrim understand the relationship that exists between the Buddha and Sri Lanka. It is a place of devotional religiosity combined with nature worship: an important facet of this pilgrimage is having a glimpse of the rising sun from the top of Sripada.

The earliest literary record of Sripada's existence and its religious significance for Buddhists in Sri Lanka comes from the fifth-century Pali chronicle, the *Mahavamsa*, written by Mahanama. The *Mahavamsa* (15:96–7) treats

Sripada as a sacred mountain purified by the visits of two Buddhas – Konagamana and Gotama – and in particular, Konagamana's visit as an attempt to save Sri Lanka from drought. The *Mahavamsa* records that during the Buddha's first visit to Mahiyangana, the deity Sumana of Mt. Samanola attained the status of stream winner, the first of the four paths to liberation. Since Sumana desired an object of worship, on that occasion, the Buddha gave him some of his hair to be used as a relic. In his third visit to Kelaniya, accepting Sumana's invitation, the Buddha rested a day at the foot of Mt. Samanola and left his footprint on its peak.

As a pilgrimage site, Sripada has a long history. The thirteenth-century *Pujavaliya* records that Parakramabahu II requested the minister Deva-Patiraja to clear the path to Mt. Samanola (Buddhaputra Thera 1930: 745). The *Culavamsa* (26:27) supports the *Pujavaliya*'s account by maintaining that the minister cleared the path, removing obstructions, building rest-houses, and constructing bridges. The *Pujavaliya*'s account even gives ideas about the nature of pilgrimage by mentioning that pilgrims from 18 provinces visited as groups.

Various episodes suggest Sripada's symbolic importance as a sacred shrine and its visible importance for the practice of many religious communities who dwell in Sri Lanka. While Buddhists consider Sripada the locus of Gotama Buddha's footprint, Hindus regard it as that of Siva, and Muslims as that of Adam, from which it derives one of its names, Adam's Peak.

The annual pilgrimage to Sripada lasts for five months from the full moon of December to the full moon of May. During this pilgrimage season, thousands of Buddhist devotees and non-Buddhists climb this mountain throughout the night with or without religious motivations. While there are two pilgrimage routes to Sripada, most pilgrims prefer the Hatton route which extends for six miles over the longer and more difficult Kuruvita/ Ratnapura route.

The night pilgrimage on the Hatton route attracts a large number of pilgrims of various ages and social backgrounds. While some use public transportation to reach Maskeliya, most pilgrims use private coaches since they come as groups, as was the traditional custom in the past. After dinner, pilgrims start climbing Sripada with the aim of reaching its peak by dawn to see the rising sun. On the pilgrimage route, there are several resting places which devotees use for performing specific rituals. For instance, Sitagangula is a river-crossing station where the pilgrims purify themselves by washing their bodies in the cold water. Crossing the river and cleaning the body with water clearly demarcates the journey from the profane world to the sacred. Indikatupana is another interesting station where devotees do needlework. Traditionally, this station may have been a place where pilgrims mended clothes which were torn during the pilgrimage.

There are certain taboos in this pilgrimage. Senior pilgrims advise novice members to protect themselves against possible dangers caused by abusive words. Unprotected speech may result in people getting lost in the journey. In particular, it is important not to offend the mountain deity. However, the taboos do not prevent the use of positive words. In the Sripada pilgrimage, pilgrims are highly active in making jokes, using good humor, and extending greetings to other pilgrims. One can also observe the devotees who recite devotional quadrants. These activities remove the boredom and make climbing more comfortable. The Sripada pilgrimage is highly entertaining and filled with intense devotional religious activities related to nature.

Pinchot, Gifford (1865–1946)

Gifford Pinchot is known primarily as a forester and progressive politician in early twentieth-century America. Generally acknowledged as the first professional forester in the United States, Pinchot also emerged as a major figure in the Progressive and Republican Parties, leading to his election as governor of Pennsylvania in the 1920s. His work in forestry and progressive politics crystallized in his leadership of the movement to conserve natural resources, countering years of unrestrained exploitation of nature. Pinchot, sometimes called the “apostle of conservation,” helped to cast conservation as a moral crusade for social reform.

Pinchot was born in 1865 in Connecticut to a wealthy Huguenot family from Pennsylvania with business ties to New York City. As a youth, Pinchot was immersed in the widespread evangelical Protestantism of his time. He read religious classics, attended Presbyterian services, taught

Sunday School, and was class deacon at Yale, responsible for conducting the religious activities of the class, such as weekday prayer meetings. Upon college graduation, however, Pinchot declined a religiously oriented job with the Young Men’s Christian Association and instead cultivated his love of the outdoors, pursuing a career in the not-yet-established profession of forestry.

As an adult, Pinchot was involved with the Episcopal Church, but more important than institutional affiliation was his exposure to the social reform currents of evangelical Protestantism. He may be seen as part of a generational cohort that one historian has called “ministers of reform,” who eschewed the Protestant ministry but invoked Protestant values to push for social reform. Pinchot’s writings and activities revealed the influence of the then-popular social gospel, sometimes referred to as “the Progressive movement at prayer.” Social gospelers, eager to build the kingdom of God on Earth, sought to apply Christian principles to the myriad social problems arising from industrialization. Pinchot’s choice of location in setting up his forestry consultancy office disclosed his early conception of forestry (and later, conservation) as part of the broad movement for social reform. He opened his New York forestry office in the United Charities Building, the well-known headquarters in the 1890s for mission and tract societies, organizations fighting to end child labor and poverty, women’s rights groups, and consumer rights groups, among others.

Pinchot’s pioneering research in the vast woods of the Vanderbilt estate in North Carolina launched his forestry career. His work there formed the basis of his groundbreaking exhibit on scientific forest management at the World’s Columbian Exhibition in Chicago in 1893. Pinchot advanced as a national figure in forestry, and was ap-

pointed Chief Forester of the U.S. by President McKinley in 1899, a position he held until dismissed by President Taft in 1910. Taking advantage of his close friendship with Theodore Roosevelt, Pinchot combined forestry with issues of irrigation and land reclamation and developed the conservation of natural resources as a primary domestic policy of Roosevelt's presidency. The 1908 White House Conference of Governors on the Conservation of Natural Resources, masterminded by Pinchot, was a high point for conservation as a national movement, and led to historic conservation policies, a national inventory of natural resources, and later, joint conservation agreements with Canada and Mexico.

Pinchot's popularization of the term "conservation of natural resources" revealed his utilitarian approach to nature. While an outdoorsman throughout his life, and a one-time camping companion of John Muir, Pinchot was, nonetheless, wedded to ideas of scientific management, efficiency, and economic benefit in relation to nature. Never an absolute preservationist, he sought to apply scientific principles to the maintenance and use of forests and rivers for the good of humankind. His typically progressive concern for "the greatest good for the greatest number for the longest time" thrust him into battles against monopolistic corporate abusers of the land and cast him as a crusader for the public good.

Pinchot's devotion to the public good was steeped in democratic idealism and was informed by the social gospel emphasis on relieving economic exploitation. Pinchot linked monopolies and economic inequality to the ruinous exploitation of nature and argued for moral reform. His rendering of conservation was a blend of applied science (his forestry background) and applied religion (the social gospel influence) that became a hallmark of the Progressive Era.

Pinchot's autobiography, *Breaking New Ground*, completed shortly before his death in 1946, serves as a significant history of American forestry and conservation. It documents Pinchot's practical, utilitarian approach to nature, and perhaps more important, it registers his religiously based emphasis on the use and care of nature and its resources as a moral issue.

Planetary Dance

In April of 1998 and 1999, the Institute for Deep Ecology, in conjunction with the Tamalpa Institute, put on a workshop entitled “Embodying Nature: An Experience in Deep Ecology.” The workshop took place at Mountain Home Studio in Kentfield, California, which is located at the home of Anna and Lawrence Halprin on the slopes of Mt. Tamalpais in Marin County, California.

The workshop represented the first collaboration between the Institute for Deep Ecology and Anna Halprin, who is one of the pioneers in Modern Dance as well as a leading figure among those who integrate the expressive and healing arts. The dance workshop, which I attended and here describe, conjoined and culminated in the annual Planetary Dance, which included people not in the original workshop. The Planetary Dance was a separate event from the workshop, with its own history of development, which I describe below.

The two faculty persons for the workshop were Anna Halprin and Ken Otter. Anna Halprin has been a major figure in the world of modern dance for much of the second half of the twentieth century. Ken Otter is one of her students-turned-instructors at the Tamalpa Institute, and he is also active in deep ecology work, and has taught workshops through the Institute for Deep Ecology. Anna Halprin has developed over the course of several decades a movement-based process whereby a person is enabled to experience their personal embodiment of the natural world.

Each day of the workshop began at Mountain Home Studio with warm-ups and movement rituals designed to bring the participants into a deeper awareness and ease with our own movement vocabulary and inner dialogue. The afternoon session involved movement work out on some of the trails on the slopes of Mt. Tamalpais, a short walk from Mountain Home Studio.

On the first day of the workshop, the participants became acquainted with the environment of the dance studio and the environment of the backyard and a trail along one slope of Mt. Tamalpais. Movement exercises in the studio served to move participants from a mode of rational intellectualizing to a mode of physical sensing and feeling. This then set the stage for a hike and blind trust walk along the mountain trail in the afternoon. Participants took turns in pairs leading one another along the trail, and utilizing other sensory modalities in experiencing the trail.

The second day of the workshop moved more deeply into bridging the work done in the studio with the work done on the mountainside. Anna Halprin explained that the work was designed to break down the artificial boundaries between the participants’ selves – their bodies – and the natural environment.

The major intention of the third day was to alter our consciousness into a state of pure awareness for its own sake. It was explained that our experiences of being in nature, being with nature rather than against it, involved reconnecting with the state of pure awareness.

The final day of the workshop took place entirely at Mountain Home Studio. There was no afternoon session on the mountain. The focus of the morning work was to provide a structure wherein people could incorporate and integrate the experience of the workshop with their lives and work outside of the workshop. During the afternoon we were shown the score for the Planetary Dance, which was to take place the next day on Mt. Tamalpais.

Halprin understands her work to be about this process of rediscovering the mythical and sacred aspects of dance and community. She also understands human community to be a part of the natural or ecological community, and so all dances for healing of the human community are also dances for healing of the greater natural community of which the human species is a part. Out of this commitment to the sacred and mythical aspects of dance, Halprin developed the Planetary Dance.

The Planetary Dance had its origins in 1981 when Anna and Lawrence Halprin started together with a group of people a project they called "A Search for Living Myths and Rituals through Dance and the Environment." This project occurred at the time that a murderer was stalking the trails of Mt. Tamalpais. They found that the myth that was engaging their community most deeply at that time concerned the feelings of fear, anger and betrayal concerning the presence of the killer on the mountain.

The Halprins worked with members of the community to develop an indoor performance ritual in a theater space at the College of Marin, at the base of Mt. Tamalpais, and an outdoor performance ritual the next day on the slopes and trails of Mt. Tamalpais. The performances enacted a mythic story of the apprehension of the killer and the return of the mountain to a state of safety.

Significantly, a few days later the police received an anonymous tip leading to the apprehension of the alleged killer and the end of the killings. However, upon the advice of Don Jose, a Huichol shaman who was visiting the Tamalpa Institute, the dance ritual was continued for another five years. From that initial project, they decided to hold a community dance ritual focusing upon various environmental and social concerns. Over the years, the ritual has been simplified to the point that it consists primarily of a sunrise walk to the top of Mt. Tamalpais and then a gathering for the dance/run at a clearing somewhere on the slopes.

The dance space itself has evolved over many years to be a large circular space. The dance consists of three concentric circles with drummers located in the center. There are four points around the circle, corresponding to the four cardinal directions, from which people enter the circle. As they enter the circle, they declare their intentions by shouting out for whom or what they were running, and then proceeded to run counterclockwise. At some point, they can move into the next circle, which moves

slower and clockwise. The inner circle moves counterclockwise again and the pace is a walk. At some point, people can move out of the inner circle and stand facing the drummers. If a person wants to leave the circle, they need to move up through the concentric circles, in the appropriate direction and at the appropriate speed, and then stand around the space, or at its peripheries.

The power of the Planetary Dance lies in the conjunction of stated intentions, directed physical engagement with the landscape, performative ritual, and communal focus. The Planetary Dance functions as a performed prayer. It is analogous to cultures that dance for healing, or rain, or for bountiful crops. Although there are no specific claims made concerning any particular religious worldview, the strong ritual structure of the Planetary Dance suggests strongly the spiritual underpinnings of the dance. Many scholars of religion have noted the distinction many people make between *religion* as an institution and *spirituality* as being the expression of moral values and deep personal experience. This suggests that the Planetary Dance is a performed expression of the spirituality of the persons involved, many of whom have been associated with Halprin and the Tamalpa Institute. This particularly provides an example of Anna King's description of *spirituality* as being "a term that firmly engages with the feminine, with green issues, with ideas of wholeness, creativity, and interdependence, with the interfusion of the spiritual, the aesthetic and the moral" (King 1996: 345). Halprin has traveled around the world and established Planetary Dances in many different countries, so there will be a number of dances going on simultaneously, often on the weekend closest to the spring equinox. Out of this is developing a global community of persons who share this spirituality with its particular ecological and moral vision and its performed and aesthetic expression.

Plastic Medicine Men

“Plastic medicine men” is a term that refers to people who falsely claim to be indigenous spiritual leaders. Some plastic medicine (wo)men make no claims to be indigenous, but do make false claims about being mentored by a spiritual leader. One prominent example is Lynn Andrews, the author of several books, including, *Medicine Woman*, and *Jaguar Woman*. She claims to have been mentored by a Cree Medicine Woman, Agnes Whistling Elk. However, her book describes a hodgepodge of pan-Indian cultural practices, and no one by the name of Agnes Whistling Elk lives in the community Andrews claims to have visited. Some plastic medicine (wo)men actually claim to be indigenous, such as Brooke Medicine Eagle and Dhayani Yahoo, although the tribes in which they claim membership do not recognize them. And finally, some plastic medicine (wo)men actually are recognized members of a native nation, but they do not have the authority within their tribe to act as a spiritual leader. One of the most famous such figures was Sun Bear, who became famous on the New Age lecture circuit, but whose teachings were generally denounced by native communities.

The appropriation of Native American spiritual/cultural traditions by white society has a long history in the U.S. – from colonists dressing as Indians during the Boston Tea Party, to the YMCA sponsoring “Indian Guide” programs for youth. In contemporary society, this practice of “playing Indian” is particularly notable in the New Age movement in which American Indian spirituality, with its respect for nature and the interconnectedness of all things, is often presented as the panacea for all individual and global problems. An industry has developed around the selling of sweatlodges or sacred pipe ceremonies, which promise to bring individual and global healing. Consequently, it has become economically profitable for peoples to market themselves as spiritual leaders. While there is not a monolithic opinion on this practice or on particular plastic medicine (wo)men, many native nations and organizations, such as the Traditional Circle of Elders, have publicly denounced this phenomenon. Hopi, Cheyenne, and Lakota elders have also issued statements against it. One Oakland-based group named SPIRIT exists only to oppose spiritual appropriation. Indian nations are even using the legal apparatus of intellectual property rights to file lawsuits against those who make a profit by stealing Indian culture. Unfortunately, these attempts have been largely unsuccessful to date because native traditions are considered “public” property under current U.S. intellectual property rights. Ironically, because copyrights are not granted to communities, individuals can actually appropriate native songs, traditional medicines, etc. that are considered part of the public domain, claim intellectual ownership over them, and deny native communities use of these same traditions.

On the surface, it may appear that native spiritual appropriation is based on a respect for Indian spirituality. Consequently, it often comes as a surprise to many nonIndians that native communities have become increasingly vocal in opposing this appropriation. One reason for this conflict between those who appropriate native religious traditions and native communities is that many non-Indians often hold essentially Christian assumptions about how all spiritual practices should operate. One common assumption is that indigenous religious traditions are proselytizing traditions – that is, native spiritual leaders want non-Indians to know about and to practice native spiritual traditions. Unlike Christianity, however, native spiritualities depend upon the land base that gave rise to them; they cannot easily be transplanted to another geographical area. Many ceremonies must be performed at specific locations.

Christian colonizers in the U.S have had a very different relationship with the land than native people. Christians have often regarded the land as something to controlled and subdued. Christian understandings of land are reflected in Genesis 1:28:

God blessed them, and God said to them, Be fruitful and multiply, and fill the earth and subdue it; and have dominion over the fish of the sea and over the birds of the air and over every living thing that moves upon the earth.

Because Christian traditions have often regarded land simply as something for human use, it generally does not figure prominently in religious practice. By contrast, because native peoples regard the land as their relative, it is critical that land be respected ceremonially. Just as the land provides for the people so that they can live, so must the community care for the land ceremonially so that she can live. As a result, unlike Christianity, native traditions are not proselytizing. Traditions are seen as applying specifically to the land base from which they arise; they do not apply to peoples from other lands.

Because Christianity is a proselytizing religion, its adherents generally attempt to “spread the Word” to as many potential followers as possible. The desire is to inform as many people as possible about the Christian religion so that individuals will want to convert to the faith. Also, because Christianity often emphasizes the individual believer’s relationship to God, it is important that every individual understand the doctrines and practices of the faith. Native traditions by contrast, often stress communal rather than individual practice. Consequently, it is not always necessary or even desirable for every member of a nation to engage in every ceremony or to have the same level of knowledge about the spiritual ways of a tribe. The reason is that all the members know that the spiritual leaders are praying for the well-being of the whole tribe. As Supreme Court Justice Brennan once stated in defense of Indian religion: “Although few tribal members actually made medicine at the most powerful sites, the entire tribe’s welfare hinges on the success of individual practitioners” (in Smith 1999: 13).

It is not always necessary for all members of a tribe to be equally knowledgeable about all ceremonies, and because, as mentioned previously, the ceremonies only apply to the people of a specific land base, in many cases, ceremonial knowledge must be

kept secret. Consequently, many tribes prohibit non-tribal members from coming to their lands when ceremonies are performed. The New Age image of the all-wise shaman going on the lecture circuit to teach indigenous traditions is antithetical to the manner in which native traditions are actually practiced. To make these acts of spiritual appropriation even more problematic, most plastic medicine people charge for their services. True spiritual leaders do not make a profit from their teachings, whether it is through selling books, workshops, sweatlodges, or otherwise. Spiritual leaders teach the people because it is their responsibility to pass what they have learned from their elders to the younger generations. They do not charge for their services. Indeed, they generally do not describe themselves as spiritual leaders at all. They are just simply known as such by the community. To quote one native activist, “if someone tells you they are a spiritual leader, they’re not.”

Pogac̣nik, Marko (1944–)

Born in Kranj (Slovenia) in 1944, Marko Pogac̣nik has become one of Europe's most important spiritual teachers in landscape and Earth healing. Schooled as a sculpturist, he became known as an artist, landscape planning adviser, and geomancist. Among other things, he designed Slovenia's coat of arms after the country's independence in 1991. He is a teacher at the School for Geomancy "Hagia Chora," which was founded in Germany in 1994– 1995. Since the 1980s, the core of his activities has involved Earth-healing projects and applying the principles of geomancy. Pogac̣nik has developed his own distinctive methods based on his spiritual experiences, but has sought to make them measurable and replicable for other geomants. He believes that with the turn of the millennium the Earth began a major evolutionary transformation process and he has engaged himself in planetwide actions around this theme.

Pogac̣nik's basic idea is the multidimensionality of Earth and landscape: the physical forms of Earth phenomena – from individual life forms to landscapes – are intimately connected with different levels of non-material dimensions which are essential for the maintenance and health of the web of life. He distinguishes three such dimensions: a "structural" or "emotional" dimension through which the etheric life-forces nourish all levels and forms of life; the vital-energy dimension which distributes life-power over the Earth's surface to keep it and its beings alive; and the dimension of "planetary consciousness" which imbues the Earth's phenomena with intelligence and through which these phenomena communicate with the universe. All these dimensions are inhabited with a large variety of spiritual beings from angels and archangels in the higher spheres to elemental nature spirits connected to individuals, he believes. By meditating, dreaming, receiving visions (which he says come through his daughters Ajra and Ana as well) and by interpreting experiences such as sickness in his own life, Pogac̣nik communicates with this spiritual world and receives indications on how to diagnose and restore the Earth where it has suffered from human destruction.

Pogac̣nik has organized many landscape and Earth healing projects that involve many people. His workshops include meditative practices with color visualization, songs and dances, etc., as well as the placing of art objects, especially *lithopuncture*: the placing of large needleshaped stones at selected spots to remove energy blockades and restore energy flows. He also applies "cosmograms" – engraved on the stones or cast in bronze plaques – designed to transmit cosmic signals to the place. As his scope gradually expanded from local to planetwide projects, he increasingly emphasised individual and group exercises to maintain the Earth's energy balance during her

current transformation process. Such practices are explained in his latest books and on the internet.

Pogac̣nik's influence has grown through his books, which describe his various projects and perspectives. His project at Thüringen Castle Park in Germany, for example, was reported in *To Heal the Earth* (1989). In *Nature Spirits and Elemental Beings* (1995) he described the elemental beings that he believes inspire plants, animals, and human beings, and are connected with the Earth's higher-level dimensions, especially the so-called "landscape temples," namely, energy patterns transmitting the higher impulses from the universe to the lower dimensions of the Earth. *The Secret of Venice* (1997) and *Healing the Heart of the Earth* (1997) provided detailed accounts of the cosmos – Earth relations and healing work in Venice and elsewhere. In *School of Geomancy* (1996) he described all these views and methods in a more systematic way.

In *The Landscape of the Goddess* (1993) he discussed a major spiritual principle, the "Landscape Goddess," which he discovered in the geomantic structures of landscapes, architecture, and art, and which he considers the long-suppressed mythical Goddess worshipped in the ancient past. He perceives the Goddess in three aspects: the (white) Virgin Goddess representing wholeness; the (red) Mother Goddess standing for creativity; and the Black Goddess instigating transformation. This trinitarian and female goddess is elaborated in *The Daughter of Gaia* (2001), where Pogac̣nik looks back on three decades of personal, revelatory experiences, describing what he sees as the reemergence of the feminine principle and ways to reconnect with it in human individuals, cultural history, the animal kingdom, and in the sacred dimensions of the landscape.

In *Christ Power and the Earth Goddess: a Fifth Gospel* (1998) Pogac̣nik claims to discover, using his intuitive powers, heretofore unrevealed messages woven into the texts: a "Fifth Gospel" referring to the Earth's transition to the next stage of evolution. Instead of a doomsayer's prophecy, it offers perspectives of love and nondualistic wholeness between humanity and its spiritual environment. In *Earth Changes, Human Destiny* (2000) he linked the Revelation of St. John to the current transition process. Earth changes are now appearing on the physical level, and human participation (through practical exercises) is essential to facilitate them.

Pogac̣nik's interpretation of the world has affinity with the one posed by Rudolf Steiner. However, he derives his views largely from his own experience. He aims at art and healing, not at science, not even at spiritual science. His books provide stories not studies. He does not claim that his observations are the ultimate truth but that they are just a new layer of truth destined to be revealed in our epoch. His view is apocalyptic in that the world's future is at stake, but he sets his hope in humanity's choice to accept the message and act by it on its own free will – the primordial gift to us at the beginning of the Christian era. Although Pogac̣nik's charismatic personality attracts many people to his gatherings, there is as yet no organized movement of followers behind him. But his influence is far-reaching and appealing to those who per-

ceive a connection between their own personal development, the restoration of nature's sacredness, and the spiritual development of the planet as a whole.

Pollution Beliefs in South Africa

Illness and misfortune among all South African Bantuspeakers is traditionally believed to be caused by one of three main agencies – ancestral displeasure, witchcraft/sorcery and, to a much lesser extent, the Supreme Being. In all these cases the causal agent is conceived of as an intelligence. But there is a further possible cause of indisposition, this time working independently of human and spiritual volition, that is the result of individuals' being in a dangerous state, through no fault of their own. These states have strong negative aspects and may be described as pollution. They are all mystical in nature and must be removed as quickly as possible by rituals or medicines. They are typically highly contagious, especially to those close to the sufferer.

The way in which pollution is conceptualized differs somewhat between the four main cultural categories – Venda, Tsonga, Nguni and Sotho – present in South Africa.

Among Venda, certain purifications are performed after the birth of twins, after an abortion and following a homicide or death. There is evidence of a fear of “heat” (see below), as when twins are killed and buried in damp Earth to “cool” them, but generally the removal of pollution consists of the use of medicines and washing, which is suggestive that the condition is thought of as dirty. Among Tsonga, the following are the four main causes of pollution: the menstrual flow, the lochia (vaginal discharge after childbirth), death and the birth of twins. People contaminated by these states are regarded as being temporarily marginal to society and are subjected to various taboos, particularly regarding sexual intercourse. The pollution is removed by a ritual sexual act, performed without seminal emission, or smoking and steaming in medicinal vapors, aspersion and scarification with medicines.

Among the Xhosa-speaking Cape Nguni, pollution is termed *umlaza*, a form of ritual impurity connected with both the sexual functions of women and with death. Among the Mpondo, for instance, a woman has *umlaza* during her periods until she washes after the flow ceases; after a miscarriage, for approximately one month after the death of a husband, or child; and after sexual intercourse until she washes. A man is polluted for a month after the death of a wife or child. *Umlaza* is dangerous to cattle, men and medicines (whose strength they nullify), and also to sick people. A polluted person may not approach a diviner. It thus appears that the Mpondo, like the Venda, think of *umlaza* as dirt that must be washed away. Zulu-speakers, on the other hand, described pollution as “blackness” (*umnyama*). It can occur either in the environment, which can be contaminated by the “undesirable tracks” of people, in elements discarded in healing, by the action of witches, or, much more commonly, it can inhere in people at certain times. *Umnyama* is typically associated with a person who has recently

given birth, a menstruating woman, and, in the past, with a girl who became pregnant before marriage. As among Cape Nguni, in all these cases the main danger is to men, whose virility suffers through contact with the woman. "Blackness" can also be caused through contact with a corpse or with a homicide. The *umnyama* caused by the death of a homestead head was removed, in the past, by the ceremony of

"washing the spears," at a ritual hunt: that of a widow by washing. But the main technique used by Zulu to expel pollution is the use of enemas and emetics; some state that men should perform, as a prophylactic, the ritual act of vomiting daily if they work at places where many people come together. There is some evidence that "heat" is also a form of pollution among Zulu, but it is a minor one. Such references as there are in the literature merely refer to the smoldering "anger" of men – to the sexual act, which is itself thought to generate a dangerous heat.

But it is among the Sotho-speaking peoples that the concept of pollution has reached its greatest elaboration in South Africa, and here the metaphor used for conceptualizing the condition is heat (*fisa*). Literally translated *fisa* means a state of hotness, but associated with it are certain other states, each with a specific name, caused either by "heat," or through contact with a sinister and contagious force known as "shadow." The application of the term *fisa* clusters round the following areas: death of a close relative, certain types of sexual contact, pregnancy. The connection with menstruation does not seem as strong as with the Nguni, but perhaps the most dreaded cause of *fisa* is a miscarriage for, if the fetus is not ritually buried, it might affect the whole country. The ethnologist-missionary H.A. Junod, writing in 1910, describes how his Sotho parishioners told him that when a woman has a miscarriage and conceals it, drought would strike the country. "This woman has committed a great wrong. She has spoiled the country of the chief" (Junod 1910: 140). Other states of *fisa*, also broadly associated with heat, are *makgoma*, a highly contagious state, affecting twins in the womb, which is caused by an abortion or by someone eating of the first-fruits before they are first "bitten" by the chief; *magaba*, especially connected with feverishness in children; and *sefifi* ("darkness"), caused by the "shadow" of dead people that can be picked up while traveling.

It is not surprising that Sotho pollution medicines and rituals should all stress coolness and use cooling media. This includes pouring cooling water on the ancestral shrines, and variations of this theme, such as watered gruel and beer. Anti-*fisa* rituals, in addition, use chyme (the green undigested stomach contents of slaughtered animals) and ash and soot (themselves the "detoxified" result of fire), which can be drunk in infusions, used in washing, poured onto shrines, or used in steaming and aspersions. A possible reason for the difference between Nguni and Sotho practice is that the former live in the eastern, well-watered parts of South Africa, while Sotho inhabit the high inland plateau where precipitation decreases steadily toward the west until the Kalahari desert is reached. The appropriateness of "heat" to symbolize misfortune is thus clear.

Polynesian Traditional Religions

Fanning out from the Lau Islands in eastern Fiji to Hawai'i in the northeast, and from Aetoroa (New Zealand) in the southwest in an arc across to Rapanui (Easter Island), Polynesia is well known for its commonalities of Austronesian languages, its hierarchized societies, and its peoples' propensity to image the world vertically from heaven to underworld. Lexical equivalents of nature are usually lacking, but covered by words for "world," which can often denote Earth as distinct from heavens (e.g., Samoan *lalala[n]gi* [earth/land] *vis-à-vis* *la[n]gi* [heavens] and *lalulela[n]gi* [underworld]), while terms to denote what is "beautiful" (e.g., Samoan *aulelei*) can apply to places as well as humans and artifacts.

Polynesian creation stories reflect an intense interest in the role of "departmental deities" whose province can be sky, Earth, forest, wind, sea, volcanoes and the underworld. Of the creator figures, Ta'roa/Tangaroa/Tane is most renowned; as offspring of sky and Earth, he often draws up the island world from the sea and is involved in a separation of sky from Earth (as, for example, the Maori Tane, who, becoming chief of the gods, is lord of the forests and also creator of humans). The gods typically have ranking and genealogies, and apart from the deities or guardians of the Underworld, one generally looked heavenward for blessings of the departmental gods. The rainbow, as in Hawai'i, could be a sign of answered prayers from above.

District, tribal or place deities, of lesser rank but important for day-to-day dealings, were usually related to local fertility and agricultural productivity, with signals from on high – the rainbow (itself a deity), lightning, even meteorites – betokening group survival in working the land without mishap and fighting off enemies. Special places, including stones, valleys, mountains, ancestral burial sites, and ancient landing-places were revered, and visitors sang their way into them with appropriate chants. These chants not only evoked gods and their associated roles in the cosmos, but also special sites, and features of beauty (flowers, plants, shells, pools, etc.). Ritual pleading would take place at sacred spots where offerings were made (items of a deceased person, for example, would be thrown into the crater of Kilauea, on Hawai'i Island, with a priestly plea made after a pig was killed so that the beloved one should become an ancestor in "volcanic manifestation" [*e lilo i pele*]).

Ancestors, especially those of nobles (or of the chiefly, warrior and priestly castes) mediated between the community of the living and realm of the greater spirits. They were genealogically related to the gods, and their division into male and female applied to the gods as well. All living (as against inert) things were divided into male and female, and primeval Earth (e.g., Papa-tua-Nuku of the Maori, or Vari "the Great

Mother” for the Manganians) was the generatrix of proximate and usable things. This has commensurability with the frequent presence of a powerful queen or female chief at the top of the social scale in Polynesian traditions. Gods and spirits could take on other living and thus human forms, however, which meant that women were vulnerable to being taken by them sexually. Various lesser beings could bear trouble (by causing women to abort) or show protection by appearing as animals, birds, etc.

Concerning land, it was normally possessed by kin groups (e.g., Samoan: *'aiga*) rather than individuals, though sometimes senior chiefs or monarchs could lay claim as the head of a territory's ramage (or as descendant of that person who led the first-arriving canoe in the distant past). Land was meant to be distributed to every family, and available resources required everyone's duty of care to support populations in small territories. Exchange of necessities was complemented by gift-giving of ceremonial items (e.g., mats at feasts), and the flow of produce toward the top of the social hierarchy nonetheless meant that at great feasts the pigs killed and foodstuffs arranged in grand festal display were to flow back down even to the less well-off commoners (as the Hawaiian king would announce, for instance, at the Makahiki New Year festival). Land exploited for sustenance and the circulation of produce, moreover, always needed the help of local gods or tutelary deities, and the fertility of animals and gardens was an expression of their *mana* (spirit-power) and those attending to them, just as victory signaled good relations with the war god[s]. Human hunting, however, could put animal species at risk in fragile environments, as is notoriously known in the case of the great, flightless moa birds, killed to extinction for meat and feathers by the prehistoric inhabitants of Aetoroa (New Zealand). In war, moreover, enemies' gardens could be vulnerable, and in one rare and notorious case, that of Rapanui or Easter Island, a tribal (or civil) war resulted in the mass destruction of forests.

Given the sense of environmental expanse, connections between religion and nature were sometimes reflected in a broad geocosmic awareness. The Tongans, for example, forged imperial-looking influences to the west. They recognized the largest of their home islands, Tongatapu, to be very sacred (*tapu* being cognate with *tabu*) and the location of the most powerful (and arbitrating) chiefdom, indeed kingship, while the two other nearby Tongan island groups recurrently fought each other. Tonga's far-flung and fragile empire, which was held together by canoe fleets and lasted from the eleventh to the nineteenth century, came at a cost to the environment, with many large trees, especially from forests on Fiji and Niue, being felled for vessels. The fertile, productive resources of Tongatapu, however, which lay outside the worst conflict zones, were crucial for the survival of Tongans as a whole. The coming and going of the commoners on the face of the Earth, for example, illustrates the connection between religion, upholding the empire, and land. The term *fonua* means the grave of a commoner, the placenta linking a new-born to the Earth, and the nurturing of the Earth itself. The graves of kings and nobles, however, are called *langi* (sky), for only the ruling class proceeded to the heavens at death.

All Polynesians had a sense of arriving originally at their islands from a great distance, and their notions of a far-off “spiritual homeland” (most often called Hawai’iki) betokened much more than localized cosmologies. So did their understanding of the stars – spirit-beings related to sun, moon, etc. – by which they navigated and calculated time (as the Maori held). After all, trading expeditions had to be planned and braved to make exchanges on the far side of huge oceanic stretches.

Myths allow us to infer that those whose canoes arrived first, called anthropologically the first ramage, earned ruling and noble status thereafter.

The known order in Polynesia had its horrific and tragic sides. The Underworld was feared and sometimes associated with volcanoes. In various contexts going to the Underworld rather than to a heavenly beyond could depend on whether you managed to follow the correct procedures on your spirit-journey straight after death, giving the appropriate gifts to demons of the dead (a Marquesan belief), or perching at the last on the right rock (as Raiateans of the Tahitian group held).

Among some groups we hear of the legendary Maui, who in Maori myth takes on the sun, the volcano goddess Mahu’ike, and meets his match with the Ancestress of the Underworld, seeming in his daring to symbolize the need for heroic struggle against environmental dangers. As a sad contrast, we find how all commoners in pre-Christian

Tonga were expected at death to become mere vermin – to eat the soil – with only the nobles privileged with escape from such a fate.

Polynesia – New Religious Movements

Upon contact with the outside world (especially from 1800 onwards), various adjustment movements arose in the Polynesian islands in response to traders and their new goods, the missionary message, and colonial intrusions. Because of the relative “vertical” orientation of Polynesian traditional cosmologies, the world being universe as sky, Earth, and Underworld, the islander leaders of these movements often presented themselves as mediators between heaven and Earth. European goods and their outsider bearers were commonly thought to have descended from the sky (hence, for example, the Samoan word for the missionaries and all whites after them: papala[n]gi – sky beings). The power these new leaders were alleged to receive, though, was to counter the unwanted influences that accompanied the dramatic changes overtaking smaller-scale societies. In almost every case, the new God taught by the missionaries was accepted as the greatest source of power – and also protection (an important theme in Polynesian indigenous religions). The old deities were powerless to prevent post-contact changes; the new God was turned to ward off the worst consequences of interaction with intruders, these problems including threats to land and environment. Thus even if some movements were pro-traditionalist and anti-missionary, they nonetheless appropriated the new God within a syncretic platform to try ousting the whites (as with the Tahitian Mamaia movement, which was overcome in battle by the proMission monarch Pomare IV in 1833). In virtually all Polynesian movements supreme power from above was sought to protect or recover land from the external settlers’ pretensions. Whether they took up arms in this cause or not, and whether some of these movements were more successful than others, religious hopes and ideals to secure the spiritual bases of their homelands were crucial for all of them.

Among various new religious movements, indigenously originated churches have emerged in Polynesia. In Tonga, of central importance in Polynesian history for having forged a widespread maritime empire, we find that the first known independent church in the whole Pacific was born. This was the Free Church of Tonga, initiated by the victorious secular chief Taufa’ahau (King George Tupou I), who used Wesleyan missionary legitimation of his monarchy to ward off threats of British annexation. In 1852 he capped off his skilled defenses with a forced succession to the sacred kingship called the Tu’i Tonga. Being only a “secular” chief, he needed to take over the role of Tonga’s most sacral figure, who monitored military conflict and the circulation of produce in the whole island group from Tongatapu Island. The Tu’i Tonga was crucial

in controlling ceremonies of fertility and assessing the relative availability of produce, especially on land, and he could impose a taboo on specified foods if any was scarce (with food restrictions also applying at other times, as when the Tu'i Tonga died).

By absorbing the secular and sacred rules, King George preserved the political autonomy and relative religious unity of Tonga, and cultivated the traditional ideology of fonua, that the Earth is sacred like the womb of all. The requirement to care for the Earth is symbolized by the placenta being buried in the land designated for a child or his family, and by graves being built of coral standing above the Earth itself. This ideology, however, could be said to be more a vehicle for continued royal and aristocratic control over most of the land than a groupconscious new religious program of eco-sustainability.

Because of the persisting royal rule, we can take the Tongan case to the present time. The royal family and nobility have been sponsors of new crops advocated by outsiders and in the end were mainly responsible for new styles of land management and its attendant ecological problems. A crisis, having to do with soil quality, arose by 1970 (because of banana plantations). The evident vulnerability of Tongan soil, together with the obvious stranglehold over most land by nobles, has led to much debate. Tonga is a scene of incessant religious debate, in which Christian theology and traditional values have been constantly debated, yet, as exposure to the rest of the world has increased, democratic and more radical Christian ideas about the just distribution of land have begun to subvert old preconceptions. Interestingly, the Catholic Mission had first established itself on Tongatapu, and a line of chiefs always claimed succession as the true Tu'i Tongas. A quiet claimant in recent times (yet a man clashing with the current king over the nobility's unjust wielding of power) was the famous Catholic bishop Patelson Finau (1934–1993), famous for advocating a nuclear-free and ecologically sustainable Pacific. He held that Tonga's inequitable land policies were inappropriate in the democraticizing world, and socio-theologically inexcusable. That huge parcels of land are not given out to the people, on the other hand, could be defended as a form of land care, with nobles keeping a great deal of ground fallow or unexploited for produce.

Surveying post-contact religious movements among other Polynesian islands, we find that in Samoa during the 1860s there emerged a series of freelance preachers in different localities of the countryside, often claiming access to God or Jesus from above, and with hopes of an abundance of material blessings. The epithet "Joe Gimlet movement" covers these urgencies. Yet they also preached protection of local lands. The fact that Samoa's chiefly system was characteristically decentralized made it susceptible to outside control (to the Tongans, Germany, New Zealand and the United States in turn). These local impetuses, especially in Western Samoa, warned against selling or relinquishing land and thus in the long run contained the effects of colonialism (at least on West Samoa). Others were not so fortunate and virtual occupancy by outsiders has resulted. The Maori fought two well-known wars with the British (the worst occurred during 1843–1844 and 1864–1865), while the royal Hawaiian house, siding

with the Church of England, attempted a last-resort revolt to prevent the takeover of the American White Cartel and their environmentally exploitative sugar plantation schemes in 1894, but failed. Religious leaders in such protests, and most noticeably Maori prophets in and after the wars, were champions of both religious separatism and the shoring up of native land. Their protest activity finds continuity in contemporary movements for independence or autonomy. The Hawaiian Sovereignty Movement combines both these causes, and believes Hawai'i's autonomy will secure a better environmental future and a safeguarding of remaining sacred sites. In expressions of this movement various grassroots activities awaken a sense of the traditional spirits of the land among tourists and the non-indigenous population on the islands. Much further to the south, we discover a new religious wave less identifiable as a movement, but which has brought currents of neo-traditionalist sentiment and indigenous Christian organizations together. This wave developed over the last half century and is the "cult of Io." In certain Maori traditions Io is represented as a distant Supreme Being far beyond layers of other gods and departmental deities. The long vernacular texts, needed to help scholars decide one way or another about the traditional basis for such claims, are only now being edited. Before their publication views have ranged from accusations that the Theosophical Society had unduly influenced a positive evaluation of the "Io cult," using it to promote its neo-Gnostic emanation theory, on the one hand, to arguments like that of the Dominican Michael Shirres that Io conducts one to the very heart of Maori cosmic mysticism with its intense sensitivity to the beauties and significances of nature. By 2000 the so-called

"Io cult" had spread, and it has been gaining popularity on the Cook Islands. Across the Polynesian region, also, the appropriation of the term *natura* to replace vernacular equivalents is often to make the point that indigenous Polynesians are more attuned to nature and its needs than most outsiders (who are usually doing business there, and commonly hold secular and profiteering attitudes and agendas).

Polytheism

Polytheism is the consideration that there are many gods. It holds that divinity is numerically multiple. In its original or fundamental sense, polytheism represents a celebration of the plurality of nature. Also known as “multitheism,” it relates to “myriothemism” (belief in a countless number of gods) and “henothemism” (a term coined by Max Müller to denote either the belief in one god without excluding belief in others or, more precisely, the tendency among some peoples to make different gods in a pantheon supreme one after the other – attributing to each one in turn the attributes of the others). Polytheism is contrasted chiefly with monotheism (belief in only one god) and more broadly with theism itself – especially in its psychotheistic sense that god is pure spirit. Consequently, there is the tendency for polytheism to conform to or include physiotheism that ascribes physical form to deity – especially as the veneration of the physical powers of nature. In many respects, it resembles animism.

There is a prevailing affinity for polytheistic conceptions of divine reality to be grounded in a pantheistic understanding of cosmic actuality, but this need not invariably be the case, and polytheism might in some circumstances be understood as a sub-category of theism itself that posits the godhead to be transcendent. From a social evolutionist perspective, the polytheistic way of thinking is seen as the beginning of reflection that has had two historical results: “One was in the direction of pantheism and absorption in the One; and the other in the direction of monotheism and victory over the many” (Oman 1931/1950: 407). But in a less strictly Eurocentric analysis that accepts polytheism as *sui generis*, it is to be argued that there are two fundamental philosophies of polytheism: the monistic and the radical. The former argues for an underlying unity behind proliferation and differentiation. It holds that behind the plurality of gods, there is a fundamental, singular reality from which the many descend or emanate. Radical polytheism, by contrast, is pluralistic in an ontological sense. It comprehends there to be several if not many ultimate substances. Such a doctrine was held by the Ionian philosophers in their consideration of fire, air, Earth and water as fundamentals. It also appears in Leibniz’s hierarchy of monads as well as in the arguments of Johann Friedrich Herbart’s realism and William James’ pragmatism.

But apart from philosophical metaphysics, polytheism in practice has appeared to be a spontaneous perception that springs from direct or intimate contact with a natural environment. It has traditionally appeared among peoples largely or originally unaffected by Western civilization and industrialization: indigenous tribals of Africa, Asia, Oceania and the Americas; the competing cultures of Hinduism, China and Japan; and in the various Afro-Latin diasporas. Typically understood as nature

worship, at least in its seminal appearance, early polytheisms represent appreciations of the blessings produced by the natural environment as well as the fears of its dangerous elements. The gods were almost invariably personifications of direct natural powers, but as they proceeded in time to become increasingly spiritualized, they simultaneously were humanized and their nature origins have often become less apparent. In an overall sense, polytheism in both its naturalistic and humanistic forms tends to resist the rationalism of pantheism but accepts nonetheless the basic understanding of the non-transcendental immanence of deity, while at the same time it retains theism's notion of divine personality (in this case, multiple) whether as a reality, a metaphor or both.

The resurgence in contemporary Western Pagan polytheism is to be seen as part of the personalization that Stewart Guthrie understands as the essence of religion. Against the power imbalance between the macrocosm and microcosm, Guthrie argues that religion is an attempt to humanize the universe. Projecting a personal deity as author or at least as a co-inhabitant of the universe allows humans to perceive an increase in the odds for survival and even prosperity. Even the medieval serf, by addressing the landowner as "lord" or "seignior," was seeking the possibility that a human face remained on the other end of power disparity and hence the hope for concomitant compassion and understanding. In the subsequent dynamic transformations of the West through the rise of capitalism, Max Weber predicted a steady increase of society's bureaucratization. In the resultant situation, the polytheistic response may be understood as a possible reaction to the enormous augmentation of modernity's impersonal bureaucracy and technological depersonalization. In this context, nature becomes the paradigm of successful interaction and interdependence between a plurality of quasi-autonomous forces. Whether for reasons that seek succor against overwhelming odds or simply the emotional comfort to be found in a cooperative multitude, personifying pluralistic cosmic conditions results in polytheism.

Consequently, the multiplicity suggested through a polytheistic perspective is in part a recognition of the ambivalent position of nature *vis-à-vis* humankind. For instance, the core deities of the proto-Indo-Europeans comprise a "heptatheon" (a pantheon of seven figures) that is suggested through such metaphors as the sun, moon, Earth, bright sky, dawn, fire and lightning. In contrast to these divine prototypes, these same peoples posited a range of antithetical entities (anti-gods or *asuras*) whose chief symbols are the volcano, the drought and the tempest. In other words, the proto-Indo-European employed the diverse natural panorama to express theological understandings of the negative and positive sides of divinity as well as a "force" or "forces" opposed to both. The relationship of Indo-European polytheism to pantheism is also ambivalent: expressing on the one hand that divinity is not the all of what is, and yet, on the other, that the "asurian" as the personification of the primordial void does not ontologically exist. It is instead an "operative nonexistent."

But apart from the nexic prototypes of most if not all pantheons being nature, the challenging interface of polytheism revolves around the issues of idolatry, the one ver-

sus the many, and enchantment. Some of the greatest minds of the twentieth century (e.g., Max Weber, Aldous Huxley) have engaged the pragmatic values of polytheism as a conceptual framework. While traditional theology tends exclusively to seek the abstraction alleged to be behind concrete manifestation, an organic idolatry is polytheistic and finds the sacred not only in the ethereal but in and as nature throughout. It may be difficult to ascertain fully the historic revulsion to idolatry, but suspicion suggests that it springs, at least in part, from a human fear of impermanence. A beloved grows old and eventually dies. Even a highly revered stone *lingam* will wither over time and crumble. Any tangible embodiment is precarious and vulnerable. But nature (from *natus* “born”) comprehends not only birth but the passing as well. Nature is the celebration of the complete cycle as well, when it is time, a letting go. To find the divine in the full natural round is polytheism to its core.

If Isaiah 44 and Galatians 5 as well other biblical passages condemn idolatry because of a preference for a non-spatial being that stands over or beyond all telluric phenomena, Huxley argues nevertheless that there is no conceivable way to demonstrate whether the godhead is one or many. For him, both are true, but he questions whether both are equally useful. For Huxley, monotheism and polytheism are rationalizations of distinct psychological states: people for whom a unifying urge predominates worship one god; those who are consciously aware of diversity within the world and themselves, worship many gods. Ontologically, “though the ‘real’ existence of the deities of any pantheon may be doubted, the existence of the internal and external diversity of which they are symbolical is undeniable” (Huxley 1936: 16). Huxley sees that polytheists honor instinct, passion, intuition and variety – the very antitheses of abstract knowledge concerning the general and uniform that allows the explanations, predictions, organizations, practicalities and efficiencies upon which modern life depends. All the same, any worship of a perfect One is the worship of an abstraction and the equivalent of worshipping nothing at all. Instead, “To live, the soul must be in intimate contact with the world, must assimilate it through all the channels of sense and desire, thought and feeling, which nature has provided” (Huxley 1936: 35). Yet, as Weber explains in describing the contemporary condition of the hegemony of rationalized structures in a denatured world,

We live as did the ancients when their world was not yet disenchanting of its gods and demons, only we live in a different sense. As Hellenic man at times sacrificed to Aphrodite and at other times to Apollo,

. . . so do we still nowadays, only the bearing of man has been disenchanting and denuded of its mystical but inwardly genuine plasticity (1958: 148).

Whereas Karl Marx speaks of alienation and Emile Durkheim of anomie, Weber is concerned with disenchantment: the spiritual wasteland achieved by dogmatic and totalized rationality. “The fate of our times is characterized by rationalization and intellectualization and, above all, by the ‘disenchantment of the world’ ” (Weber 1958: 155).

Influenced by Weber, Huxley claims that out of experiential knowledge of the world's diversity and "of the inner diversity of the human spirit, the poetic imagination of man extracts the deities of polytheism" (1936: 36). A monotheistic perspective or a "maimed version of polytheistic ritual . . . represents only a part of the psychological and cosmic reality," while a true pantheon includes "every dionysiac reaction to the world, every corybantic participation of individual energies with the energies of living nature" (1936: 36). As Weber sees it, polytheism encourages an evaluative critique of our mechanical world: the iron cage of disenchanting rationalization. It allows for healthy choice-making, while its nemesis is the dogmatic, one-dimensional and anti-enchantment monopoly of monotheism.

As Weber is arguing optimistically for the receding night of modernity and the dynamics of re-enchantment, Huxley calls for a new religion to replace the predominant monotheism of the present age – "either because it feebly believes in a decaying Christianity, or else secularly and irreligiously monotheistic, with the unitarianism of science, of democracy, of international capitalism" (1936: 37). He is considering the plight of the individual and society, whereas today we can include the ecological peril of the planet, the diminishment of its resources and the growing loss of an organic self-sustainability. But Huxley sums up the need for a pluralistic spirituality that "will have to be all, in a word, that human life actually is" (1936: 40). For "even in its worst days," Huxley explains, "polytheism never degenerated, as monotheism has done, into bloodless religious spirituality on the one hand, and an irreligious worship, on the other, of no less bloodless intellectual abstractions and mechanical efficiency" (1936: 38).

Nevertheless, as Alkis Kontos indicates, recovery of our essential plasticity does not occur in the bosom of Nature; it takes place in the iron cage of modern culture . . . The spirits and gods of the enchanted world of the past, the world of Nature, now surface as impersonal forces, abstractions, ideas and ideals; ultimate values (1994: 240).

This amounts to an evocation of a new polytheism for a re-enchanting future. But while for Kontos, "Nature is no longer the horizon upon which the humanly meaningful can be projected, . . . for we have lost Nature forever" (1994: 229), and "Dynamic and self-confident, the modern soul stands before a disenchanting world, aware of its inadequacies, ready to seek its amelioration, never intoxicated with the illusion of omnipotence, never paralysed by despair and resignation" (1994: 238), we might still keep in mind Robert Corrington's insistence that there is nothing beyond nature. It is all that is – including the mechanized, dispassionate iron cage of modernity as well as Weber's polytheistic firmament and the organic stabilizing foundation for the primitive, the peasant and the ancient Greek. "Polytheism is only irrational when . . . we regard its theology as its essence" (Oman 1931/1950: 401). What is polytheism's essence is its affirmation of diversity and choice. In today's world the threat to an impoverished, diminishing nature and its elimination *vis-à-vis* urban encroachment and short-sighted management of the environment constitutes a reduction of human choice let alone of healthy sustainability. The current Western emergence of "nature religions," spir-

itualities that ground in natural metaphor and celebration of whatever is conceived as the “unspoiled,” represents a spontaneous challenge to the loss of spiritual democracy within a world without an organic sense of direction. The modern/ postmodern polytheisms are reactions to ill-conceived monopolies and are attempts to renegotiate through rituals and social service with long-neglected numinous powers of both nature and human culture. Polytheism *qua* polytheism seeks neither mystical retreat nor conquest of the one over the many but instead the cooperation between different interests and realities. When it grounds itself in a naturalistic pantheism or acosmic polydaemonism, it values both nature and civilization as sacred and worthy of unadulterated protection.

Population and Consumption – Contemporary Religious Responses

Environmental scientists maintain that the chemical balance of the atmosphere is being upset by the introduction of alien chemical species and the increased flow of greenhouse gases. The Intergovernmental Panel on Climate Change predicts a doubling of carbon dioxide and other greenhouse gases late in the twenty-first century drastically altering the Earth's climate. Although the atmosphere is self-cleaning, its self-cleaning is too slow to cope with the excess gases pumped into the atmosphere by our industrial development. As a consequence, we face the greenhouse effect that threatens human, animal and plant welfare. This is a problem we have created for ourselves and which population increase will make worse. Some suggest that the rise of the world's population, together with accompanying increasing levels of consumption, is rapidly outstripping the Earth's carrying capacity so that the very survival of humans, other species, and the quality of our environment are in question. Recently the 58 National Academies of Science from around the world called for zero population growth within the lifetime of our children and for changes in production and consumption patterns. Current demographic projections show a population increase of unprecedented magnitude continuing well into the twenty-first century.

At the 1992 Rio Earth Summit sponsored by the United Nations, the developing countries of the South responded to the developed countries of the North on this issue saying that the problems is not one of overpopulation in the South, but of excessive consumption of the Earth's resources by the well-off few in the North. For example, a baby born in Europe or North America will likely consume thirty times as much of the Earth's resources (and produce thirty times as much pollution) as a baby born in a developing country. But even this generalization is too simple, for there are increasing numbers of well-off people in developing countries such as India and China who consume at the same unsustainable level as those in developed countries. Also, although consuming less per capita, Asia's 3.2 billion people consume more of the Earth's resources than the 0.3 billion people in North America. What religions think about population and consumption is important for it is clear that religions can and do shape people's attitudes to nature, to fertility, and to the just sharing of the Earth's resources.

It is only recently, partly in response to growing concerns regarding population and consumption, that the various religions have had to question their sources with regard to the interaction of humans with nature. For example, the advent of eco-theology

in Christianity has made nature and environment new, “cutting-edge” topics. In the Hindu context, Vandana Shiva offers a similar critique. What responses do religions offer?

In the Jewish tradition the mystical thought of the kabbalists suggests that humans must learn to limit themselves – their rate of reproduction, their use of natural resources, and their production of fouling wastes. As humans, we are to pattern our behavior after the example God gives in the creation of the world. If God is omnipresent then, reasoned the kabbalists, the only way God could create the world would be by an act of *tsimtsum* – of voluntary withdrawal or limitation so as to make room for creation. Similarly, we as humans must limit our reproduction and our wants, so as to make room for coexistence with our environment in this and future generations. If we humans are everywhere, our presence would herald the end of the great diversity of nature. The Jewish “exile” metaphor suggests that we humans find ourselves in a difficult diasporic condition in the twenty-first century, one that demands we take seriously the need to limit our population and consumption out of respect for the other communities of plants and animals with which we live as sojourners within nature.

Some scholars judge that Christianity has had a major responsibility for fostering much of the world’s excessive consumption and overpopulation. Yet within Christianity there are strong forces at work transforming its mainstream into a self-critical force for justice, peace and the maintenance of the integrity of nature. The ecology of the planet cannot be separated from population and social justice concerns when seen through the lens of Christian feminist theology. In this context, the traditional Christian opposition to fertility control is being critically examined in relation to the looming crisis of overpopulation. Christian thinkers are recognizing, however, that it is overconsumption by the developed countries and classes that is both polluting the environment and depriving the developing countries of the resources they need. This leads to the radical conclusion that well-off Christians should reduce their own reproduction and resource consumption so as to make room for the migrating poor, and out of respect for our balance with nature. This is seen as a responsible practice of fertility in relation to others and nature. It also challenges the traditional patriarchal family patterns basic to many Christian cultures. Such teaching is in line with the teaching of the Hebrew prophets who maintain that humans and nature are required to live together in justice, and with the teaching of Jesus that one must love one’s neighbor in need (e.g., as did the Good Samaritan). Christians today are realizing that their neighbor’s welfare is strongly affected by the way they treat the environment and by the number of children they produce. The resulting ethic is one of interdependence with the rest of creation.

Some Muslims see natural disasters such as floods, hurricanes, and earthquakes as warnings from God that people are embarked upon a fundamentally wrong course of action, and that the disasters the greenhouse effect threatens might be similarly understood. When seen as a “wake-up” call from God, the greenhouse effect resulting from excessive consumption by humans poses a serious dilemma to Muslims around the world, but particularly to those Muslim countries such as Saudi Arabia, whose

economy has come to depend upon the heavy use of oil. For such countries, and for the world at large, Islam's view of humanity as the "custodian of nature" (*Khalifa*) poses critical questions. As Muslim scholar, Nawal Ammar, points out, the Qur'an teaches that humans, as custodians of nature, are free to satisfy their needs *only* with an eye to the welfare of all creation. The harmony and beauty God gave nature must be respected by humans in their stewardship of nature. Thus the use of natural resources must be balanced and not excessive. No one owns nature, therefore humans must share natural resources and population pressure will dictate limits to consumption so that there can be just access to resources by all. While fertility control is generally forbidden in the Qur'an, some Muslims now suggest that fertility control may be acceptable if seen as part of the self-discipline required from humans to avoid upsetting the divinely established balance of nature. A Buddhist scholar, David Loy, has argued that when a functional definition of religion is adopted, the global market economy is seen to be the most powerful contemporary world religion. Today, he suggests, the market economy is rapidly binding all corners of the globe into a worldview with "consumerism" as its dominant valuesystem. This new world religion threatens to overwhelm both the valuesystems of the traditional religions and the environment that sustains us. Rather than putting a brake on our excessive growth in consumption, the global market appears to do the reverse. More and more natural resources are needed to fuel the ever-expanding global market, leaving less for future generations and producing more climate-altering greenhouse gases. To the religion of the market, the challenge of the population explosion does not pose a problem. It simply creates a larger market to be "developed," which, of course, entails more exploitation of the Earth's already overexploited ecology. The Buddhist response, Loy explains, offers a way in which we may be unhooked from the religion of consumption and gives equal place to the need to discourage excessive reproduction. The key question is what values and practices would convince people to consume and reproduce less when they have the technological capacity to consume and reproduce more? Buddhism has focused on meditational techniques that have the power to transform one's consumerism into "the middle way." Meditational practice allows one to actualize the central Buddhist teaching of the interconnectedness of everything in one's daily life. This doctrine has potential implications for one's response to the ecological challenge of today. It means that our individualistic sense of identity can be expanded, through meditation, until one experiences a "we-self" in which we are connected to everything and everything to us. Reality is seen as composed of a web-like causality in which everything affects everything else in some way; everything (including humans, animals, plants, Earth, air and water) is interdependent.

From such a Buddhist perspective, the urge to consume more and more and the urge to reproduce are both equally serious problems. Both spring from egocentric motivations and produce results that seriously damage nature. Meditation on the interdependence of humans with nature can result in the negating of selfish desires for children or material possessions when having them would harm other persons or the

environment. In terms of our language of rights and responsibilities, the rights of other beings

(including animals and future generations) must not be infringed upon by our excessive reproduction and consumption; and we are responsible not to harm other beings unnecessarily through our reproduction and consumption. All of this happens when *trishna*, or desire, is renounced through meditation. Happiness, from the Buddhist perspective, comes when the self-centered greed for more of everything, including children, is given up. Then limits to consumption and reproduction, such as our current ecological crises may require, are experienced not as personal loss but as normal and pleasant in the interdependent matrix of nature.

The above is a modern interpretation of Buddhist thought in response to the challenges of population pressure and excess consumption. While this approach has yet to be adopted in many largely Buddhist societies that have historically maintained high birth rates, it does offer a new and hopeful response.

From a Hindu scholar's perspective, Vasudha Narayanan notes the close connections between teachings in the Hindu epics and *puranas* on *dharma* (righteousness, duty, justice) and the ravaging of the Earth. When *dharma* declines, humans take it out on nature. It is in the *dharma* rather than the *moksa* or enlightenment texts that Narayanan finds resources for a Hindu response to the problems of population pressure and excess consumption. She searches out *dharma* texts with helpful teachings and matches up *dharma* practices in which present-day Hindus are engaged. She finds many teachings condemning the cutting down of trees and supporting the planting of trees

– even to the goddess Parvati teaching that one tree is equal to ten sons! Hindu temples such as the Tirumala-Tirupati temple in South India are showing great initiative in fostering the *dharma* of tree planting by giving out about 100,000 saplings a day to pilgrims for them to plant when they return home. This practice is more powerful than it may seem, since the Tirumala-Tirupati temple is the richest in India and carries considerable dharmic clout with Hindus at home and in diaspora communities. In Hindu texts trees – like cows – are recognized as preservers and sustainers of life and therefore appropriate symbols of God. Turning from trees to rivers, Narayanan notes that rivers also occur in *dharma* texts as sacred purifiers of pollution, with the Ganges as the prime example. Observing that the rivers of India are rapidly being dammed and fouled by both industrial and human wastes, Narayanan points out that it is the women of India who lead the fight against these practices. Some successes have been achieved such as the protest led by Ms. Medha Patkar resulting in the stopping of the Narmada river dam project. Women have also led the way in pressing Hindu dance into the service of ecology.

Turning to the population problem, Narayanan observes that *dharma* texts that emphasize the duty of procreation were formulated during periods when epidemics and famines kept population levels down, child mortality was high and death came early. Now, with modern medicine, India's population has rapidly increased to levels

that are causing serious ecological damage. However, in certain states, such as Kerala, where girls are educated and women are employed at all levels; reproduction is at the replacement rate only. Thus, the key may be the seeking out of texts such as those in the *Upanisads* that set forth the education of girls and women, as well as examples in the epics and *puranas* of women who do not conform to the patriarchal dharmic ideals espoused in those texts. Regarding consumption, Narayanan notes that Hindu texts are replete with the dangers of futility of possessions. Yet consumerism is rapidly taking over India in the name of modernization. Even worse, perhaps is the use of the dowry system as a way of fulfilling greed for consumer luxury items. While the Hindu theological response is showing some success in producing positive ecological practices, it seems to be losing ground to desires for excess consumption.

Regarding their response to the issues of population and consumption, there is much in common between the Aboriginal traditions and Chinese Religions. Aboriginal scholar Daisy Sewid-Smith maintains that although Aboriginal traditions place a high value on the sacredness of life, contraception and abortion have historically been practiced to maintain an ecological balance. Methods employed included birth control by sexual abstinence during periods of war, hunting or spiritual quest, and the knowledge of medicine people who specialized in contraceptive medicines and techniques. Overall guidance in such matters is provided by the Aboriginal sense of needing to live in interdependence with nature – to maintain a state of equilibrium between humans and their natural environment. This ethic also guided the Aboriginal approach to the consumption of material resources – aided by the lack of a notion of private property which seems basic to much contemporary consumerism.

Chinese Religions should be seen as divergent from the traditional pronatal approaches of most religions. As the scholars of Chinese thought, Jordan and Li Chuang Paper, show, during China's early history the concern was with underpopulation, therefore the sources offer little guidance regarding overpopulation. However, during the past three centuries, overpopulation and its negative impact upon the environment have become a matter of serious concern. With the possibility of a doubling of the population every generation, China in 1980 adopted a one child per family policy. This policy is widely practiced and appears to have the support of the people, who see overpopulation as a threat to the future of the globe and to family well-being. The success of this policy in controlling population growth is especially remarkable as it clashes directly with the fundamental imperative of Chinese

Religion, namely the continuation of the patrilineal family. If the one child is not a son to conduct the family rituals then, according to traditional Chinese Religion, the parents, the grandparents, etc., will cease to exist upon the last son's death and the family will come to an end. However, changes are occurring which suggest that a genderneutral family is developing, in which a daughter or a son could perform the rituals required for the continuation of the family and the support of those in the afterlife. This would enable Chinese Religion to support the one-child policy and its goal of preventing overpopulation from disrupting the balance (*tao*) of nature.

Population, Consumption, and Christian Ethics

The United Nations projects that the world's population will grow by 50 percent from approximately six billion in 2000 to nine billion in 2050. Virtually all of that growth will be in the nations of the developing world. Concerns have been expressed that this continued growth in the world's population will further endanger the planet ecologically. Representatives of developing nations, however, have insisted that any attention to population policy be conjoined with examination of ecologically ruinous consumption patterns among citizens of developed nations. This entry summarizes recent Christian ethical reflection on population and consumption issues by Rosemary Radford Ruether, Sallie McFague, John Cobb, Jr., and James Nash.

The area of population policy has gone through some significant changes in recent years. Since the failure of ill-conceived and invasive policies in the 1960s, a narrow focus on population control and contraceptive technologies has been largely rejected in favor of placing population programs within the broader context of development policies, and to a lesser extent, women's reproductive rights and health. In addition, more attention has been given to the ecological impact of population growth and consumption patterns.

In the past, ethicists have evaluated population policies that contain various types of incentives, disincentives, and forms of coercion by considering their impact on four primary human values: freedom, justice, general welfare, and security or survival. While responsible moral evaluation of specific population policies involves reflection on all four of these primary values, ethicists have arranged these values in different orders of priority. For example, some have made the values of general welfare and security/survival subordinate to the more fundamental values of freedom and justice. Others have taken the opposite approach and have emphasized that without a fundamental measure of general welfare and security it is impossible to experience the values of freedom and justice. This difference in the ordering of primary moral values is reflected in recent Christian ethical reflection on population and consumption issues. Rosemary Radford Ruether has argued that it is vital to ground population issues in a broader context of social and economic justice. Arguing that population growth is rooted in poverty and injustice, Ruether insists that one essential dimension to this task is the need to narrow the gap between the rich and the poor. Linking population and consumption issues, Ruether argues in *Gaia and God* that the "high consumption of the wealthy" and the "low consumption of the many" are not separate but interdependent realities

caused by global economic systems that benefit the affluent few and harm the numerous poor (1992: 89). Ruether also insists, however, that another essential dimension of population policies must be the goal to improve the status of women and to empower them in terms of moral agency. She is convinced that population policies that do not place a priority on improving the status of women and their moral agency will be abusive to women and also will not work. Ruether acknowledges that “(h)umanity has no real alternative to population control,” but she argues that the best way to avoid a doubling in the world’s population is by addressing the twin challenges of poverty and patriarchy

(1992: 263–4).

Sallie McFague makes similar arguments in her work, though she has focused more on the ecological challenges posed by rapacious rates of consumption in wealthy, industrialized nations. McFague argues in *The Body of God* that those most responsible for global ecological degradation are “first-world, usually white, usually male, entrepreneur(s) involved in a high-energy, high-profit business” (1993: 4). More recently, McFague argues in *Life Abundant* that the high-consumption lifestyle of North American middle-class Christians is not only sinful, but also evil because it “lies at the root of the systemic structures that make the wealthy richer and the poor more impoverished” (2001: 117). The primary remedy she offers is the virtue of frugality and a theology of sacrifice. She implores Christians with means to live more simply so that others may simply live. McFague acknowledges that these appeals to character formation will be insufficient by themselves to close the gap between the rich and poor, but she believes that cultivation of the virtues of frugality and sacrifice is a necessary part of any solution. Once fundamental attitudes change, then new policies can be conceived that will reduce poverty, population growth, and overconsumption along with their negative ecological impacts.

Another important figure in discussions of population and consumption issues is John Cobb, Jr. On the consumption side, Cobb has worked hard to offer conceptual foundations and workable policies for a more just, peaceful, and sustainable world. Cobb’s contributions to population issues have varied quite significantly, however, according to his chosen dialogue partners. For example, *The Liberation of Life*, which Cobb co-authored with Charles Birch in 1981, articulates the moral foundations for a population policy that bears a striking resemblance to the consensus emerging in the international community today. In league with Ruether, Birch and Cobb recommend that population growth must be seen in the larger context of the process of development and that the real key to lower fertility rates rests with improvement in the lives of women. In 1989, however, Herman Daly and John Cobb offered a controversial proposal for population stabilization in *For the Common Good*. In a chapter devoted to population policy, Daly and Cobb consider “transferable birth quota plans” in which governments would issue birth rights certificates to parents to sell or use as they deem fit on an open market. One of the criticisms of their proposal, however, is that on an unequal economic playing field the poor would be faced with the terrible option of hav-

ing to sell their fundamental right to bear children in order to purchase fundamental necessities like food, clothing, and shelter. Daly and Cobb acknowledge that one of the weaknesses of this plan is its inability to assure “just distribution” of births and they do not think that current demographic circumstances are serious enough to warrant the use of the plan now, but they do believe that the plan should be held in reserve “should present demographic trends reverse themselves” (1989: 251).

Like Cobb, James Nash has offered similar realistic sentiments in his work. In *Loving Nature*, Nash consistently links his treatment of population and consumption issues, referring to both as manifestations of “anthropocentric imperialism” (1991: 211). Nash argues that contraception must serve as the centerpiece of a morally adequate policy aimed at curbing population growth. This would include the fundamental right to information and education about birth control as well as access to various means. In addition, Nash also emphasizes that a morally adequate population policy will need to be part of a broader goal of increasing socio-economic justice and sustainable development. But Nash’s concerns about *effectively* lowering the rate of population growth also lead him to propose criteria for evaluating population polices that seek to do more than just inform and enable voluntary family planning. Nash’s willingness to consider more coercive means of regulating human fertility flows out of his rights-based approach to a Christian environmental ethic. Cutting against the increasing international emphasis on reproductive rights and the United Nations Declaration of Universal Human Rights, Nash argues that humans do *not* have the right to reproduce, although they may have the right not to be *forced* to reproduce. In his discussion of the relationship of human rights to human environmental rights, Nash argues in *Loving Nature* that “(s)ecurity and subsistence rights always impose limits on other citizen’s freedoms of action” (1991: 50). Thus, Nash is able to support the limitation of human reproductive freedoms on the grounds of ecological security and couches such action in terms of ecological justice.

In my own work, I have sided primarily with Ruether and her dual emphasis on social and economic justice as well as the importance of improving the lives of women. I share her confidence that development oriented toward the needs of the poor and social reforms designed to improve the status of women are good in their own right and are also effective means to achieve global population stabilization. A survey of recent demographic data indicates that, when female literacy, education, and reproductive health rates increase, fertility rates decline. I also agree with Cobb, however, that simplistic approaches to development have not worked and will remain “unworkable” until the failed paradigm of development as economic growth is replaced with a new paradigm of sustainable development. Until it becomes clear, however, that this alternative approach has been tried and has failed, I will remain reluctant to abide much discussion of various forms of coercion in population programs, although I do believe there is a place for carefully monitored incentive packages.

Power Animals

The particular consciousness that fosters spiritual experience and religious form evolved through direct and significant experience with the natural world, including a special relationship with what have become known as “animal guides” or “power animals.” Of these, first and foremost may have been the bear. The bear cult of the Paleolithic is one of the oldest of human traditions, growing out of the Neanderthals’ systemized veneration of the giant cave bears they competed with for shelter and food. Archeological evidence indicates the first human burials coincided with the earliest use of altars and shrines, and the rituals of appeasement, gratitude and wonder that must have attended them. The bear in particular retained its religious significance among the early Celts, the tribes of Siberia, and the surviving traditionalist Ainu of northern Japan.

For most of human existence connection to the realm of spirit, vision and power was commonly believed to come through intimate relationship with plant and animal intermediaries. Totemism can mean a clan or tribe identifying with the ancestors of a certain species, but it can also refer to personal affiliation with a particular “animal of power.” In this case the person heeds what he believes to be its instruction and example, and through ritual communion or interpenetration seeks to make its abilities, penchants and wisdom his own. Totemism may have developed not so much out of envy of the superior speed or strength of other creatures, as from a deep and abiding identification with them.

Among many Native American tribes, members wore several names during their lifetime, such as one denoting what clan and lineage they belonged to, another extolling their deeds or skills, and still another proclaiming their personal animal guide. The carved Haida wolf hat, the Kwakiutl totem pole and the costumes of Hopi Deer Dancers are representative of power animals, specifically species the people depend upon on for sustenance or inspiration.

Like our various ethnic animist and pantheist ancestors, a percentage of contemporary environmentalist and Pagan communities look to the more-than-physical world for essential lessons, assistance and alliance. The “New Age” approach often involves picking an animal that the person would most want to be like, either from reading about the habits of animals, or by drawing a card and image from a shuffled “medicine deck.” For some Pagans and ecospiritualists one’s power animal is not their favorite, but rather that species that seems to call to them from dreams, or manifests itself in their life and actions. Unlike the sky-god religions of “civilized” cultures, these groups draw from terrestrial sources for direction and sense of purpose. It could be said that

the animal “spirits,” however ephemeral, are both substantive and natural: embodied contextually, organically, energetically and spiritually in nature.

To the “deep” or spiritual ecologist, direct observation of and interaction with other life forms is considered the best way to explore and exploit their valued gifts. Through example if not design, these “others” can encourage a fateful return: to authentic and sentient self, and to intimate reciprocal relationship with place. In this totemic journey one may go beyond unconscious symbiosis with other life forms and enter into a personal and committed relationship with specific advisory totems. To some, the acceptance of “kindred spirits” as guides must include a pledge fully to utilize their gifts and lessons, acting for the good of the whole with all the joy and resolve that could be expected from the honorable totems themselves.

Prairyerth Fellowship

The Chicago-area-based Prairyerth Fellowship is a prime example of the kind of dynamic religious experimentation and entrepreneurship that has found fertile ground within the spiritual ecology movement. Prairyerth was founded in 1998 as a lay-led Unitarian Universalist (UU) fellowship focused on healing and harmonizing with the Earth. The fellowship maintains a special spiritual identification with its local bioregion and gets its name from an old geological term for the soils of North America's central grasslands. "Prairyerth" is essentially the word for the American Prairie ecosystem and, for fellowship founders, this was the perfect image to describe the nature of their nascent spiritual community – "an independent network of plants, animals, people, fire, earth, and sky that forms the richest, most nurturing soil in the world." Prairyerth's descriptive literature, found on its website, explains that like the prairie itself: "We seek renewal through the interdependent web of life. We too spring from the land that nourishes us." Members affirm a special bond of union that states in part: "We pledge ourselves to a fellowship that recognizes the Earth as home, that acknowledges the unity of life while affirming each entity as a unique and irreplaceable resource in the web of all existence" (www.prairyerth.net).

The fellowship itself is governed by four councils each with its own responsibilities: the Council of Wisdom, the Council of Earth, the Council of Healers, and the Seventh Generation Council. Each has two members who represent the council on the Board of Trustees. Rather than hire resident religious specialists and administrators (ministers or priests), the Prairyerth community seeks to empower each individual to play an active role as spiritual leader within the community. Fellowship members rotate responsibilities for planning and facilitating worship and ritual, such as seasonal celebrations or coming-of-age ceremonies. Others organize community programs that reinforce the Prairyerth principle of harmony with nature through children's and adult education workshops and prairie restoration projects. Fellowship members have a special interest, however, in learning about Native American healing traditions and in supporting efforts that support the cultural viability of local tribes and conserve Native American sacred sites and burial grounds.

Because Prairyerth's worship is fundamentally Earthcentered in focus, its members do not congregate on Sunday mornings as do most UU churches. Prairyerth's members instead gather for fellowship and celebration at the new or full moon, in accordance with the cycles of Earth and sun that mark solstices and equinoxes, and also gather to celebrate traditional planting and harvesting festivals. The meeting place for such gatherings is flexible and adapts to the type of worship event, migrating indoors (where

space is rented from local Unitarian Universalist churches) or outdoors to special places in nature, depending on climate and ceremonial needs. "Prairie animals too migrate," Prairyerth's website points out, citing the example of the buffalo.

The fellowship accepts members from all different religious traditions and encourages "a free and responsible search for truth and meaning." Inspiration for its basic stated community values (harmony with nature and respect for the interdependent web of life) stems from a variety of sources, but the legacy of Ralph Waldo Emerson and Henry David Thoreau (both associated with the roots of the Unitarian Universalist tradition) has played a significant role, as have a number of historical and contemporary Native American holy people. The membership body of the fellowship extends throughout 12 different states; similar groups within the Midwest have likewise adopted the "Prairyerth" image and operate under Unitarian Universalist Association (UUA) affiliated status. One such fellowship is the "Prairyerth Zen Center" in Topeka,

Kansas, which emphasizes spiritual connection to the local bioregion and is also a recognized UUA affiliate.

Prakriti

Prakriti was the word the speakers of the languages of North India chose to translate the English word “nature,” and these days, many English-speaking persons from India perceive the words as synonymous. *Prakriti* was originally a Sanskrit word and it has a range of meanings. It is an important philosophical and theological concept in the Hindu religious tradition.

The meaning of the word *prakriti* in the early Sanskrit texts is “that which precedes,” “original form,” “the first” and “the model.” It means “normal,” and “health.” *Prakriti* means also “material cause,” “the producer of effects.” In the plural it means “productive causes,” “constituents,” and “parts.” *Prakriti* is the source from which the things of the world are produced, but it has also come to refer to all the products of *prakriti*, that is, nature as a whole. *Prakriti* is a grammatical feminine. This has purely grammatical reasons (Sanskrit nouns made by adding the ending -ti to the root are generally grammatically feminine). Two common synonyms of *prakriti*, *pradhana* and *avyakta*, are neuter.

As the material cause of the world, *prakriti* is a process having two aspects, dissolution and manifestation. The world dissolves into *prakriti*, but it also becomes manifest from it. These two aspects of *prakriti* were explored by different religious traditions. Among renunciant groups the dissolution of the manifestations of *prakriti* by means of meditation and knowledge was seen as the method for the individual to gain release from rebirth (*moksha*). Later, in other religious groups, *prakriti* as the creative principle became an epithet of the Goddess and *prakriti* was worshipped as a divine feminine principle.

The renunciant view of *prakriti* was systematized by the ancient Samkhya and yoga schools of religious thought. Samkhya and yoga are salvific systems, that is, the goal of their practice is release from rebirth (i.e., to realize the absolute separation of the principle of pure consciousness [*purusha*] from the principle of matter [*prakriti*]). This is attained with the dissolution of the manifestations of *prakriti*. *Prakriti* is an independent principle. It is also eternal, an object of consciousness, common to all, unconscious, productive and interdependent.

That everything in the world is interdependent does not mean that nature is perceived as harmonious. Nature is filled with incompatible species, that is, what is food for one individual is another living being’s death. According to Samkhya and yoga, no enjoyment is possible without causing injury to other beings; suffering is therefore a basic characteristic of existence. As a response to this, Samkhya and yoga emphasize restraint and non-injury. To aim for the dissolution of the manifestations of *prakriti* of

the individual into their material cause and the separation of *purusha* from *prakriti*, is the ultimate act of noninjury. Even if the goal of the renunciants is release from the world, the renunciants in India often stay at places of striking natural beauty. Likewise, the centers of the Hindu saints and renunciants often have beautiful gardens and they are described in the classical Hindu texts as earthly paradises. The descriptions of the natural beauty and harmony of these places are meant to convey the ideal of renunciation. As a result of the advanced spiritual state of the humans living there, their presence does not disturb the peace of nature. The views of Samkhya and yoga of the material principle and consciousness as two independent principles and of the principle of consciousness as the ultimate source of freedom from pain, therefore, generate an attitude of renunciation favorable to the nondestruction of nature. Through non-attachment and withdrawal humans minimize their impact on the natural world. Renunciation and non-attachment are not only important to the renunciants, but are also fundamental values of the Hindu culture at large. These traditional values have increasingly been challenged by consumptive attitudes promoted by the modern economic value system. The institution of renunciation has however retained its strength.

Hindu theologians inherited the concept of *prakriti* as the material cause of the world from the Samkhya and yoga systems of religious thought. The principles of matter (*prakriti*) and consciousness (*purusha*) were transformed into cosmological and divine principles. *Prakriti* as the material cause of the world was understood as dependent on the divine principle and was personified as a goddess. In Hinduism ultimate reality is often seen as bipolar, as the union of a male and female divine principle. The dualism of matter and consciousness of Samkhya and yoga was transferred to the divine couple. Only some of the attributes of *prakriti* were transferred to nature as a goddess. Most important were the attributes of being productive, diverse and interdependent. By being personified, consciousness was also transferred to *prakriti*.

According to one Hindu sacred story, at the beginning of creation the highest God divided himself into two, a male and a female half. The female half, called *prakriti*, divided herself further into other goddesses. Women are also said to be incarnations of this divine *prakriti*. In all the modern languages of India derived from Sanskrit, women are called *prakriti* or seen as symbols of *prakriti*.

Prakriti in the senses of goddess and women, and at the same time as a synonym of the English word “nature,” has been promoted by feminist environmentalism in India as an alternative to, and a critique of, what is perceived as “the Western concept of nature” and to promote “goddess ecology” and feminist environmentalism. One of the foremost spokespersons for this brand of environmentalism, Vandana Shiva, asserts in her book *Staying Alive* that “feminism as ecology and ecology as the revival of Prakriti, the source of all life . . . are the powers of political and economic transformation” (1989: 7). The famous Chipko movement, which has protected traditional use of the forest against industrial interests, is in many respects a women’s environmental movement and is seen to exemplify the close relationship between *prakriti* and women. For the women of the Chipko, writes Vandana Shiva, “the nature they protect is the living

Prakriti” (1989: xix). This Indian concept of *prakriti*, as a living female power, is by Shiva contrasted to the Cartesian concept of nature as passive, mechanistic, inferior and separate from human beings. Indian women are seen as protecting nature as *prakriti*, a “feminine principle from which all life arises” (1989: xviii) against those who view nature as dead matter and only a resource for industrial use.

Prayer and the Contemplative Traditions

In the world's religions there are many kinds of prayer. Two general types are "prayers of address" and "contemplative prayer."

Prayers of Address

In prayers of address, the divine reality – understood as a multifaceted mystery in which the whole of the universe is enfolded – is addressed as a subject who is capable of hearing and responding to the petitions, praises, lamentations, questions, and feelings of those who pray. According to Hinduism this divine reality has many names and faces, such that particularized gods and goddesses can be seen as prismatic colors through which its uncreated light shines and becomes visible to human beings. Thus prayers of address can be addressed to the uncreated light itself (God) or to its particularized energies (gods and goddesses). These prayers may be communicated in words, but they can also be communicated through music, dance, ritual, and inner longings or, as the New Testament puts it, "sighs too deep for words." The latter idea suggests that some forms of prayer may not be conscious or focused, but rather dim and preconscious, expressive of deeper aims toward satisfactory survival, of which the one doing the praying is unaware. Prayers of address occur when these deeper aims are given expression, either consciously or unconsciously, and released into a larger divine context. This larger context can be conceived in a variety of ways: pantheistically, supernaturalistically, panentheistically, monistically, and otherwise. Beyond the various conceptions is the more general feeling, felt by many in the act of praying, that someone or something is listening.

This impulse to communicate with something vast and mysterious – a larger yet listening context in which the whole of the universe is nested – is thought in modern times to be restricted to human beings who consciously believe in the divine realities at issue. When the rest of nature is conceived in strictly mechanistic terms, as if devoid of any capacity for the self-expression of interior states, it is assumed that other living beings do not pray in an addressive way. However, in many religions traditions it is believed that other living beings are endowed with psychic properties of one sort or another, and studies in cognitive ethology bear this out. This opens up the possibility that they, too, each in their way, release sighs too deep for words into a divine reality, in

which case they, too, “pray” in their ways, albeit without the kinds of explicit intention characteristic of conscious human prayer. This would mean that when the Psalmist speaks of all living beings as praising God in their own way, it is possible that indeed they do so. It would also mean that conscious human praying is an expression of, not an exception to, a kind of activity found throughout much of the natural world. Thus addressive prayer can be seen as adding to a chorus of nonhuman voices, each of whom has already been praying, in its own unique way, for millions of years. It is not an un-natural act or a super-natural act, but an ultra-natural act.

Contemplative Prayer

The phrase “contemplative prayer” comes from the Christian tradition, but it names a kind of praying that occurs in many world religions, sometimes (in Asian contexts) under the rubric meditation. In a Christian context, there are two kinds of contemplative prayer: contemplation of nature and contemplation of God. Contemplation of God can be compared to the state of consciousness one enjoys while sitting beside a person with whom one has been in love for many years. In the sitting together, there is no need to be anywhere else or to say anything, because both partners are already where they want to be. In the case of contemplative prayer, the beloved is the divine reality itself, and this reality is present within the very soul of the one who rests in the silence of the moment. There is no place to go and no need to say anything, because God is in the silence or wordless listening itself, as an embracing and compassionate context.

While this experience may seem distinctively human, it is perhaps not unlike the feelings that are known by mammalian embryos within the womb: a sense of being fully protected and immersed in a safe and wordless whole. It is no accident that, in some traditions, such prayer is understood as a returning to that more innocent and womb-like consciousness that preceded a fall into dualistic consciousness.

This spirit of being present in the moment – of wordless listening – can also occur in ordinary waking consciousness and in relation to the rest of creation. In the Orthodox Christian tradition, as explained by Kallistos Ware, this occurrence is called the contemplation of nature (1995: 90). According to Ware, this way of being present to nature involves two sensibilities simultaneously. One is a wordless attention to what Zen Buddhists call the sheer suchness – the as-it-isness – of each blade of grass, each face, each frog, each pond, each mountain. This attention is both relaxed and aware, and it is often accompanied by a sense of grateful amazement, or pure appreciation, for the pure existence of what is, as it is. In addition, the contemplation of nature involves an awareness that each individual creature is, its own way, a prism through which the divine reality is beheld, not unlike the way (described above) that the gods and goddesses are understood in Hinduism as such prisms. Thus, when a person gazes into the eyes of, for example, a wolf, the uncreated light of the divine shines through

those eyes, even as it is not exhausted by those eyes. The wolf is seen as a vessel of holy mystery.

Analogous forms of “nature contemplation” are found in many religious traditions around the world, ranging from indigenous sensitivities to individual living beings being carriers of divine wisdom, to Buddhist emphases on mindful awareness of trees and stars, to Islamic emphases on the whole of creation being a sign (aya) of Allah. These kinds of experiences can also be an important part of scientific observation, whether within or apart from accompanying beliefs in God, as exemplified by what one science writer, Ursula Goodenough, calls a willing assent to what presents itself for observation, combined with a more general sense of amazement or appreciation for what is given.

Some speculate that the capacity for relaxed yet alert attention in the present moment – for a contemplation of nature – has parallels in pre-agricultural periods of human history and also in other forms of life. Perhaps the early experiences of hunters and gatherers required wordless alertness in the stalking of prey and the gathering of herbs, and these sensitivities then gave rise to what we now call contemplative prayer. Additionally, capacities for relaxed and alert attention seem to be part of much animal life. The eighteenth-century British poet Christopher Smart wrote a long poem in praise of his cat Jeoffry, who, for Smart, displayed an implicit knowledge of the divine reality while in rest and sleep, leading one interpreter, Edward Hirsch, to speak of Smart’s intuition of “divine catfulness” (Hirsch 1999: 68–9). If Smart is right, then, a contemplation of nature, like the prayers of address noted above, is a unique evolutionary expression of, not exception to, states of consciousness that are found throughout nature. And if Hirsch is right, then human appreciation of ways in which God is present in other forms of life, as illustrated in a sense of divine catfulness, is itself one form of contemplative prayer.

Prigogine, Ilya (1917–2003)

Ilya Prigogine, a Belgian scientist of Russian descent, has contributed considerably to the contemporary discourse on physics, nature, religion, and the humanities. Although Prigogine, who won the Nobel Prize in 1977 for his work on the thermodynamics of nonequilibrium systems, writes in a very sophisticated scientific style, his books gained enormous influence in a wider New Age context, albeit in a somewhat refined manner.

The starting point to understand Prigogine's theory is his new reading of thermodynamics. Newtonian dynamics are purely mechanical and treat time as reversible, while classical thermodynamics talk of an "arrow of time" that moves to increased entropy and loss of energy. Prigogine refutes both models and proposes his theory of *dissipative structures*. Dynamic and open systems that are far from equilibrium (like organic systems), he argues, bring forth new orders of higher complexity. In so doing, they do not follow universal laws, but develop according to their own systems' dynamics. And what is more, such open systems advance in constant exchange with the environment (dissipation) and are able to repair themselves on their evolutionary path (this process is totally different and much more complex than Darwin's paradigm had suggested). Prigogine's well-accepted discovery was the birth of a new discipline: *Synergetics*. Although living organisms are the most obvious examples of this – contrasting apparently "closed systems" like a clock-work, Prigogine, like other adherents of systems theories, maintains that dissipative structures can also be found in human artifacts that show a considerable capacity for self-organization. Consequently, he applies this model to social systems and human interaction. In this view, the human place is *within* nature, since human culture is a subsystem with countless interrelations to neighboring systems. Hence, humanity's role is neither domination nor stewardship, but involvement and empathy.

It is important to note that dissipative structures do not necessarily tend to gain a state of increased structure, but they just reach higher orders of instability and fluctuation.

Indeed, similar to other philosophies (cf. Schelling or Bergson), it is the *becoming* and not the *being* which is essential for Prigogine's theory. Therefore, he is critical of the belief in cosmic harmony or eternal laws and looks at the universe as always endangered, fragile, and uncertain. This attitude brings Prigogine in opposition both to scientists, who strive for a simple structured "Grand Unified Theory" (Steven W. Hawking, for instance, whom Prigogine sees as clinging to the old paradigm of "being"), and to teleological models prominent in New Age science. There is no "telos," Prigogine

argues: instead of being a simple consequence of the present, future must be addressed as a lively process with a cornucopia of possibilities.

The theory of dissipative structures and the interdependence of natural and social subsystems – hence, the entanglement of mind and matter in self-organizing systems – leads to the assumption that small systems are able to influence the overall structure of nature and the universe. Humankind and even the individual are no longer passive objects but acknowledge their responsibility and power to influence the whole system. This in particular has attracted New Age thinkers who at the same time played down the more disconcerting features of Prigogine's theory, like his refutation of teleological or causal assumptions, which goes along with his notion of contingency and the possibility of failure. Hence, Prigogine has gained a selective reception by authors like Erich Jantsch, Fritjof Capra, David Bohm, and even Marilyn Ferguson, all of whom brought into his theory a more mystical and teleological understanding.

Primate Spirituality

On 14 July 1960 I arrived, for the first time, on the shores of Gombe national park (it was a game reserve then) to learn about the behavior of wild chimpanzees. Little did I think as I snuggled into my tiny camp-bed on the first night, that I was launching what is today the longest uninterrupted study of any group of animals, anywhere. Or that the chimpanzees would provide me with information that would help us to redefine our relationship with the rest of the animal kingdom and to redefine what it means to be human.

The great apes (chimpanzees, bonobos, gorillas and orang-utans) have brains more like ours than those of any other living creatures. They are capable of intellectual performances that were once thought unique to us, including recognition of the self, abstraction and generalization, and cross-modal transfer of information. They have a sense of humor. They can experience mental as well as physical suffering. They use more objects as tools for a wider variety of purposes than any other creature except ourselves. And they modify objects for specific purposes, thus showing the beginning of *tool-making* – an ability once thought to differentiate humans from the rest of the animal kingdom. Moreover, across their range in Africa, chimpanzee communities show different tool-using behaviors which, as they are passed from one generation to the next through observation and imitation, can be defined as primitive cultures. Chimpanzees form affectionate, supportive and enduring bonds between individuals, especially family members, which may persist through life – they can live more than sixty years. They are capable of true altruism. Sadly, also like us, they have a dark side. They are aggressively territorial, and may perform acts of extreme brutality and even wage a kind of primitive war.

Clearly, then, there is no sharp line dividing humans from the rest of the animal kingdom. It is a very blurred line, and differences are of degree rather than kind. This leads to a new respect for the other amazing animal beings with whom we share Planet Earth. We *are* unique, but we are not as different as we used to think. The main difference is, perhaps, our extraordinarily complex intellect, and our ability to communicate ideas by means of a sophisticated *spoken* language, by the use of *words*. It should, however, be noted that apes in captivity can be taught to understand and use more than 300 signs of the American Sign Language as used by the deaf. They can communicate with these signs not only with their trainers but with each other. They can also learn to communicate using a variety of lexigrams and computer symbols. They can use these language skills in many contexts once they have been acquired.

Many theologians and philosophers argue that only humans have “souls.” My years in the forest with the chimpanzees have led me to question this assumption. Day after day I was alone in the wilderness, my companions the animals and the trees and the gurgling streams, the mountains and the awesome electrical storms and the star-studded night skies. I became one with a world in which, apart from the change from day to night, from wet season to dry, time was no longer important. And there were moments of perception that seemed almost mystical so that I became ever more attuned to the great Spiritual Power that I felt around me – the Power that is worshipped as God, Allah, Tao, Brahma, the Great Spirit, the Creator, and so on. I came to believe that all living things possess a spark of that Spiritual Power. We humans, with our uniquely sophisticated minds and our spoken language that enables us to share and discuss ideas, call that spark, in ourselves, a “soul.” Is not the same true for a chimpanzee? Or any other sentient, sapient being? It is most unlikely, however, that any animals other than ourselves care – or are capable of caring – as to whether or not they possess immortal souls!

Often I am asked if the chimpanzees show any signs of religious behavior. I think perhaps their “elemental” displays are precursors of religious ritual. Deep in the forest are some spectacular waterfalls. Sometimes as a chimpanzee – most often an adult male – approaches one of these falls his hair bristles slightly, a sign of heightened arousal. As he gets closer, and the roar of falling water gets louder, his pace quickens, his hair becomes fully erect, and upon reaching the stream he may perform a magnificent display close to the foot of the falls. Standing upright, he sways rhythmically from foot to foot, stamping in the shallow, rushing water, picking up and hurling great rocks. Sometimes he climbs up the slender vines that hang down from the trees high above and swings out into the spray of the falling water. This “waterfall dance” may last for ten or fifteen minutes.

It is not only waterfalls that can trigger displays of this sort. Chimpanzees “dance” at the onset of a very heavy rain, reaching up to sway saplings or low branches rhythmically back and forth, back and forth, then moving forward in slow motion loudly slapping the ground with their hands, stamping with their feet, and hurling rock after rock. Twice I have seen them perform thus during the first violent gusts of wind, presaging a storm. And sometimes a chimpanzee charges slowly along a stream-bed, picking up and throwing rocks as he goes.

Is it not possible that these performances are stimulated by feelings akin to wonder and awe? After a waterfall display the performer may sit on a rock, his eyes following the falling water. What is it, this water? It is always coming, always going – yet always there. What unseen strength suddenly produces the great claps of thunder, the torrential downpour, the savage gusts of wind that bend and sway the chimpanzees clinging to their nests at night? If the chimpanzees had a spoken language, if they could discuss these feelings among themselves, might not they lead to an animistic, pagan worship of the elements?

When I arrived at Gombe I had no scientific training beyond A-level biology. Louis Leakey, who had proposed the study, wanted someone whose mind was “unbiased by the reductionist thinking of most ethnologists” of the early 1960s. Thus it was not until I was admitted to a Ph.D. program at Cambridge University that I learned that one could only attribute personalities, minds and emotions to *human* animals. It was acceptable to study similarities in the *biology* of humans and other animals, but comparisons should stop there. How fortunate that I had been taught otherwise, throughout my childhood, by my dog, Rusty! The challenge was to express my findings in ways that would, eventually, change the view of human uniqueness that was held not only by scientists, but also by Western philosophers, theologians – and a vast percentage of the general public.

It has been a hard battle, and it has by no means been won. There are still pockets of resistance – resentment even, mostly from those who exploit animals. Because once we accept that we are not the only beings with personalities, feelings, and minds that can know suffering – that there are other sentient, sapient beings out there – all manner of ethical concerns clamor for our attention. If animals have feelings and can suffer, what about those subjected to intensive farming, trapped for fur, hunted for “sport,” experimented on for medical research and the pharmaceutical industry, used in the circus, advertising, and other forms of “entertainment,” the pet industry, and so on? That we also inflict massive suffering on other human beings does not lessen the suffering of the animals, nor does it lessen the cruelty of our behavior toward them. Instead it brutalizes us. How did the world come to be this way?

One explanation for cruel behavior is ignorance. So often people simply do not realize the suffering endured by millions of animals. Other people are brainwashed into accepting cruel practices because, they are told, that is the way it has to be. They become numbed, “all pity choked by custom of fell deed.” Others try to deny what they suspect is going on because they cannot bear the suffering but they lack the will to try to do anything about it, or feel helpless. Or they are inhibited by social pressure, or they do not want to be classified along with “crazy” animal activists.

There is a deeper and more disturbing reason underlying the prevailing view of animals as “things” rather than as individual beings whose lives have value in and of themselves, beyond their potential value to humans. In the original Hebrew text of Genesis chapter 1 verse 26 God gave man “v’yirdu” over his creation, and this has been translated as “dominion.” But many Hebrew scholars believe that the true meaning of the word is to “rule over,” as a wise king rules his subjects, “with care and respect.” A sense of responsibility and enlightened stewardship is implied. St. Francis understood. But throughout the Judeo-Christian world today animals are typically regarded as mere *things*, to do with as we will so long as it is for, or might be for, human good.

This attitude is so often fostered in our children. I was lucky, for my early fascination with animals, common to most children, was nurtured by a very perceptive mother. When I was 18 months old she found me in bed with a handful of earthworms. Instead of scolding me she just said quietly, “Jane, if you keep them here they’ll die. They need

the earth.” I gathered up the worms and toddled with them into the garden. Thus her gentle wisdom guided my early exploration of the animal world. And I was taught that most important lesson – respect for all forms of life.

Children quickly learn from those around them, especially from those they love, and those they admire. From an early age children are attracted to animals and easily learn to be kind to them. But they can also learn to treat animals with indifference or cruelty. In most Western households children discover that the animals chosen to share their homes are to be loved but that it is acceptable to kill “pests” – such as insects, rats, and mice. They learn that it’s okay to kill animals for food or for their skins. Many learn that it is “manly” to shoot them for sport. And children are often told that animals don’t have feelings like ours, that they don’t feel pain in the same way. This is how teachers persuade sensitive students to kill and dissect an animal. Thus our children typically come to accept the status quo. Only a few have the perspicacity or the courage to protest the system.

Nowhere is our lack of stewardship seen so clearly as in the way in which we are systematically destroying the natural world. The Western materialistic lifestyle is spreading throughout the planet as a result of globalization. In the wealthier sections of society there is terrible over-consumption, which has led to unprecedented, unsustainable demands on decreasing natural resources. More and more forests are cut down and soil erosion and desertification follow. More and more pollutants are released into the environment – synthetic chemicals, fossil-fuel and methane emissions. The protective ozone layer is under attack. Global climate is changing. The ice is melting at the poles. Animal and plant species that took millions of years to evolve are becoming extinct. Floods and draughts, hurricanes and tornadoes, are getting worse. We are tinkering with the genetic make-up of our foods. The threats of nuclear, biological and chemical warfare are horribly real. And environmental destruction and exploitation by the wealthy has led the economically poor people of the developing world into a vicious cycle of overpopulation, poverty, hunger, and disease. Ancient cultures, which allowed people to live in harmony with their environment, are being swept away.

In this frightening world we are losing our old connections with Mother Earth, connections so important for our psychological development and spiritual wellbeing. When we destroy or pollute areas of wilderness we are harming not only the ecosystem, but also the individual animal beings who live there. From their perspective we are committing acts of terrorism.

I went past a beautiful wooded area just last week and saw a sign board announcing that it had been sold. The trees would soon be gone, replaced by houses and tarmac and lawns spread with pesticides, adding to the urban sprawl. Into my head came the words:

This land has been bought by the Developers. The small creatures go on with their lives, Not knowing.

As our numbers increase, and as our technology enables us to destroy and pollute with ever-greater speed, we face losing nature itself. God help us then, for in this world

everything is interconnected. We are but one part of a complex web of life, each piece of importance in the scheme of things. And, to our own peril, we are destroying piece after piece. In this changing world, thousands have become spiritually sick, stranded with no sense of meaning or self-worth. They have lost their religion; they have lost God; they have lost hope.

We have indeed come dangerously close to the point of no return. Yet there is still hope. It is only recently that people around the world have admitted and faced up to the terrible environmental and social problems. The human brain has created amazing technology – 100 years ago the idea of people on the moon, for example, would have been considered science fiction. So now, faced with the destruction of life on Earth as we know it, human brains are struggling to find ways in which we can live in greater harmony with the natural world. More and more of us are trying to leave lighter footprints as we move through life – we are beginning to realize the difference it will make if each one of us “walks the talk.” And nature is amazingly forgiving: places devastated by us can once more become beautiful if we give them a chance, and animal and plant species on the brink of extinction can, with protection and captive breeding, get another chance. Young people, when they understand the problems and are empowered to help, have enormous energy and enthusiasm as they try to make their world a better place.

There is growing determination to do something to improve the lives of those living in poverty, to rectify the horribly unequal distribution of wealth around the world. More and more young people are questioning the valuesystem of materialism as they search for meaning in their lives. We have begun to realize that human health, both physical and psychological, is dependent on the health of the planet, that only when we reestablish our connection with the natural world and with the great Spiritual Power, can body and mind, heart and soul, once again function as a whole.

It is good news that the indigenous people are coming into their own. They have endured decades of bitter persecution – they were killed by the hundreds of thousands and their traditions brutally suppressed. Yet against all odds, in spite of the risk of punishment and even death, many of the elders, the spiritual leaders and shamans, the medicine men and women, secretly held onto their cultures and their beliefs. And now they are joining forces around the globe reaffirming the connectedness of all life and the spiritual power of the Creator. They are reminding us that, as St. Francis said, the winged ones and the finned ones and the four-footed ones are indeed our brothers and sisters, that their lives matter too.

As we enter this twenty-first century, theology and science seem to be entering into a new relationship. Some of the latest thinking in physics, quantum mechanics and cosmology are coming together in a new belief that Intelligence is involved in the formation of the universe, that there is a Mind and Purpose underlying our existence. For my own part, the more science has discovered about the mysteries of life on Earth, the more in awe I have felt at the wonder of creation, and the more I have come to believe in the existence of God.

Prince Charles (1948–)

Prince Charles, the Prince of Wales, eldest son of Britain's Queen Elizabeth II and heir to the British throne, is also the future head of the Church of England and thus holds the title "Defender of the Faith." He has been described as a super-ecumenist. His strong friendship with the Afrikaner naturalist Laurens van der Post (1906–1996) resulted in the latter becoming godfather to Charles' eldest son, Prince William. Like van der Post, the Prince of Wales has been influenced by the ideas of Carl Jung. He keeps a dream journal and allows himself to be directed by synchronicity. In March 1977, he visited the tropical jungles of Kenya for three weeks in what has subsequently been described as a period of isolated spiritual initiation.

Prince Charles follows in the tradition of the Royal Family's interest in Spiritualism and spiritual healing. He augments allopathic medicine with homeopathy, and, on 14 December 1982, in his role as President of the British Medical Association, he made a critical noteworthy speech to the society that focused on the sixteenth-century German physician Paracelsus in which he stressed the importance of examining the unorthodox but perhaps divinely inspired consideration of cosmic unity. He lampooned science's estrangement from nature and the allopathic view of the human body as a mere machine. In this talk, he advocated the need to understand illness as a disorder of the total person that involved body, mind and spirit as well as self-image and one's relation to the cosmos. He suggested that "the whole imposing edifice of modern medicine, for all its breath-taking successes is, like the Tower of Pisa, slightly off balance" (in Dale 1986: 206). Since the early 1980s, Prince Charles has consistently promoted the development of a holistic and sustainable relationship between humanity, ecological preservation, organic and vegetarian or demi-vegetarian diet, architecture, education and spirituality. In his BBC Radio Four address on 10 May 2000, although framing this talk in a more traditional understanding of a "sacred trust between mankind and our Creator," the Prince echoed the salient features of current nature-religion sentiment. He spoke about the need for "a sacred stewardship of the earth," and he deplored "the prevailing approach which seeks to reduce the natural world to a mechanical system." Recognizing that modern science is forced to rule out the existence of the sacred as a nuisance that can be evaded or at least manipulated, the Prince of Wales argued instead that we need, in place of the science of manipulation, a science of understanding – one that sees science as a part of nature and not something opposed to it. He proclaimed, "We need to rediscover a reverence for the natural world and to understand the reciprocity between God, man and creation." This must be founded upon "humility, wonder and awe over our place in the natural order." Since "the earth is unique, and we have a duty

to care for it . . . we must restore the balance between the intuitive and the rational scientific mind.”

Prince Charles’ appeal speaks to the emergent form of popular spirituality that we find not only in nature religion, New Age and goddess spirituality but also in more innovative developments across the Christian mainstream. The central chord in this appeal and the emergent spirituality it reflects is a denial of a civilization and nature opposition. The Prince of Wales has long emphasized that culture is to be situated *within* the natural and not be posited as something antagonistic to it.

The Process

The Process Church of the Final Judgement emerged in London in the 1960s, oriented toward four gods: Jehovah, Lucifer, Satan, and Christ. Each represented a different psychological orientation toward nature. Founded by two former Scientologists, Robert and Mary Anne de Grimston, the Process initially was a psychotherapy intended to realize human potential.

In 1966, two-dozen core members lived in a ruined coconut plantation on the Yucatan coast, which they named Xtul (pronounced *schtoul*), gathering food from nature and experiencing unprotected the wrath of Jehovah in the form of a fierce hurricane. Some members who were uncomfortable with Jehovian control sought Luciferian liberation in free love, and they conceptualized nature as a nurturant source of pleasure. Later, Satan joined the pantheon as a dual deity, whose lower aspect represented bestiality and whose higher aspect represented spiritual detachment from the biological realm. Finally, Christ entered in 1971 as the spirit of reconciliation for the other gods, unifying spirit with body and harmonizing humanity with nature.

In the early 1970s, the Process established itself in several North American cities, employing a dazzling array of rituals and spiritual techniques in what proved to be a vain attempt to transcend the limitations of mundane existence. In a schism, the major faction rejected polytheism in favor of Jehovah-worship, becoming the Foundation Faith of the Millennium. At the end of the decade, the Foundation moved to the American Southwest to reestablish roots in nature.

From the beginning the Process was anti-vivisectionist. It possessed several large dogs who peacefully slept through the rituals, and the experience at Xtul had created a special awareness of nature. Today, under another name, the group maintains a large animal sanctuary and promulgates a spiritualized orientation toward nature over the World Wide Web.

Process Philosophy

Most Western philosophy, especially since Descartes, has depreciated the natural world. Descartes viewed everything except the human mind as mere matter. Some philosophers, materialists, took this merely material world as the whole of things and understood even human experience to be a part of it. Hume, in contrast, taught that we have no access to any world other than the sensory data that constitute our empirical experience. Kant responded by emphasizing the activity of the human mind in creating its world. To this day most philosophy and much religious thought are deeply influenced by these views. They contributed to providing a context in which the degradation of the Earth was little noted until recently.

Another strand in Western thought has been naturalism. It gained ground through the influence of evolutionary thinking, which implies that human beings, including human experience, have come into being through natural processes and are part of nature. Today it is sometimes called “constructive postmodernism.” Whereas materialists took the fact that humanity is part of nature to justify their belief that there is nothing other than mere matter, naturalists argued that a nature that includes human experience is far richer than that.

Process philosophy is a form of philosophical naturalism, to be distinguished from both Humean empiricism and Kantian idealism as well as materialism. Hume and Kant both took the epistemological standpoint and assumed the primacy of sense experience. Accordingly, they separate the human knower from the natural world or even deny independent existence to that world. Naturalism locates human beings in the context of a nature affirmed to be fully actual apart from human knowledge. For naturalistic thinkers, human experience grows out of nature; it does not create or constitute it. Materialism affirms the reality of the natural world but describes it in such a way that it cannot contain the human knower.

Naturalism holds that since nature is inclusive of all things, it is much richer than matter (as described in the Western tradition). Nature includes subjectivity as well. Since evolutionary thinking teaches us to see continuity throughout the whole of nature, many naturalists hold that there is some element of subjectivity in all actual entities.

Process philosophy shares this view, and it further emphasizes that all the ultimate actual entities should be understood as events. Each of these events is something in and for itself, a subject, as well as something for all subsequent events, an object. A sequence of such events constitutes a process. Events and processes make up the world. Since personal experience is a process made up of momentary human experiences, we

can gain some notion of what other creatures are like through examining our own experience.

Alfred North Whitehead provides the fullest account of this processive world. To deal with the problems that led to idealism and empiricism, he developed an alternative doctrine of causality and showed how it explained that in fact our experience is not cut off from the natural world in the way both of those schools imply. Whereas Hume had reduced causality to a regular succession of sense data, and Kant taught that it is an inescapable category of thought imposed on sense data by the mind, Whitehead argued that it is immediately felt in all experience. One momentary experience arises out of previous ones. In the moment in which we hear the end of a musical phrase, the earlier chords still resonate. The earlier experiences are taken up into the later ones. This relation Whitehead called a physical feeling or prehension, and he took this inclusion of the past in the present as the key to understand causality in the natural world. The immediately preceding states of the brain are also causally efficacious in informing our present experience. They are causally affected in turn by events in other parts of the body, and these by events in the wider world. Of course, there is a great difference between these events as they are for themselves and the way they are experienced in high-grade human experience. Human experience interprets and organizes the multiplicity of influences into a unified creation. It is creative, as Kant emphasized. But the real initiatory influence of the natural world remains, and there are connections between our experience and the world out of which it arises.

One who understands human life as part of a larger system of natural events should be highly receptive to knowledge about the details of this interconnectedness. Although the ecological crisis was not present to Whitehead's own consciousness, other process thinkers, such as Charles Hartshorne and Bernard Meland, were among the first philosophers to become concerned, and process thinkers continue to be involved at both practical and theoretical levels.

Process philosophy locates intrinsic value entirely in what an actual entity is in and for itself. Because it attributes subjectivity to all actual entities, it attributes value to all as well. But apart from animal experiences, these actual entities are, for the most part, the elementary constituents of natural objects such as waterfalls and forests, not the complex objects that inspire awe in human observers. Their contribution to our enjoyment is their instrumental value for us. Furthermore, viewed in terms of intrinsic value, some actual entities have far more than others. A dog's experience is of greater value than that of a flea, and the flea's, than that of plankton. So far as we know, on this planet, the greatest value is to be found in human experience. On the other hand, plankton may be of greater instrumental importance for life on the planet than dogs or human beings. Instrumental value must be considered very seriously in judging what actions to take.

Because of its high appraisal of human value, and its denial of intrinsic value to complex systems as such, some persons with intense ecological concerns criticize process philosophy. It calls for concern for other creatures quite apart from their instrumental

value for human beings, but it recognizes that lesser values must often be sacrificed for greater ones. It seeks synergistic solutions, but often it must engage in efforts to find the best compromise possible among competing interests. It does not lend itself to absolutes.

Whitehead believed that actual entities are not only shaped by influences from the past but also have some ability to constitute themselves. This led Whitehead to reflect on the source of creative novelty, and he called this "God." This God is not the omnipotent creator of all things who predetermines the outcome of events. Instead, God is the lure toward novelty and the reason that there is freedom and responsibility in human life.

God is present in all creatures and all creatures are present in God. This means that all the joy and suffering in the world is also included in the divine life. This heightens the desire to inflict as little suffering as possible and to enhance positive experience, both among human beings and among other creatures.

An experience is more valuable according to the extent of diversity that it can integrate. Therefore, the presence of diversity in the human environment is an important contributor to value in human experience. Biodiversity is needed both within and among ecosystems. Since the divine experience also attains its richness through the contrasts of many diverse elements, love of God undergirds the conviction that human beings have responsibility to avoid further destruction of the complex living systems of the planet. For process thinkers, God rejoices in the multifariousness of the world and the vast diversity of species. This applies also to differences among human individuals and cultures.

The Protestant Ethic

The Protestant ethic had a profound impact on the emergence of capitalistic societies and the way in which they treated the natural environment. In the first comprehensive study of the significance of this ethic for the growth of capitalism, Max Weber, in *The Protestant Ethic and the Spirit of Capitalism*, sought to establish a relationship between Calvinistic religious beliefs and a capitalistic mentality of which the bourgeoisie from Calvinistic churches were the leading exponents. While there have been various criticisms of his position, what is often missed is that Weber was not claiming that religion was the *only* important factor in the rise of capitalism, but that he was singling out this religious element for examination in *his* explanation.

According to Weber, these religious beliefs produced a certain type of personality with a high motivation to achieve success in worldly terms by working diligently to create and accumulate economic wealth. But this wealth was not to be pursued for its own sake or enjoyed in lavish consumption, because the more possessions one had, the greater was the obligation to hold these possessions undiminished for the glory of God and increase them through relentless effort. A worldly asceticism was at the heart of this ethic, which gave a religious sanction to the acquisition and rational use of wealth to create more wealth.

This notion of the Protestant ethic was of particular importance in American society as capitalism developed. It was an ingenious social and moral invention that offered a moral framework for the early stages of capitalism, emphasizing both the human and capital sources of productivity and growth, and in this sense offering the first supply-side theory. It emphasized the human side of production through hard work and the aspect of the calling, but it also advocated that people should not only work hard, but that the money they earn in the process should also be put to work. Inequality was thus morally justified if the money earned on capital was reinvested in further capital accumulation which would benefit society as a whole by increasing production and creating more economic wealth.

The Protestant ethic proved to be consistent with the need for the accumulation of capital that is necessary during the early stages of industrial development. Money was saved and reinvested to build up a capital base. Consumption was curtailed in the interests of creating capital wealth. People dedicated themselves to hard work at disagreeable tasks and justified the rationalization of life that capitalism required. All of this was a major shift away from the behavior and general type of conceptual frame that informed medieval agrarian society.

Embedded in the Protestant ethic is the moral imperative both for the maximization of production and for the minimization of consumption. The new ethic thus pressured equally toward effective production and efficient consumption, which while sustaining maximum productivity, also maximized savings and potential investment capital. But, of perhaps even deeper significance is the fact that while the Protestant ethic contained a moral limit on consumption in the interests of generating more economic wealth and building up a capital base to increase production, it made the pursuit of wealth an end in itself, and allowed for exploitation of both humans and nature in the interests of increasing economic wealth. In a practical sense, this ethic may have served as a moral cover for behavior motivated by nothing more than greed. While obviously consumption had to increase with the production of more and more goods and services, the emphasis was on the production of wealth rather than consumption.

And, as religious ties were loosened, as the Protestant ethic gave way to the more general work ethic, even a religious justification lost its moorings and with it whatever moral constraints on consumption it may have provided. With the purposes and meanings provided by this moral matrix no longer relevant to a consumer culture that emphasizes instant gratification and increased consumption, not only production but also consumption became ends in themselves divorced from any broader or larger moral purposes. Thus there has been progressively more waste produced needing disposal, more pollution generated, and more resources used, all to support a growing consumer culture.

The Protestant ethic thus constituted a moral framework that informed the development of capitalism and provided a legitimacy for its existence by offering a moral justification for the pursuit of wealth and the distribution of income that were a result of economic activity within this system. This ethic contributed to rapid economic development and exploitation of resources, both human and natural, in the interests of increasing economic production. Weakening of this ethic and its inherent restrictions on consumption resulted in both production and consumption becoming ends in themselves, with little or no thought given to the environmental consequences of such activities. This ethic emphasized the accumulation of material capital and provided no restriction on the depletion of natural capital, and this disregard of natural capital pervaded the consumer culture to which it contributed. Only in recent years, when the consequences of such depletion of natural capital could no longer be ignored, have environmental concerns emerged as important considerations.

However, environmental concerns about resources that are becoming more and more depleted and waste material that is becoming more and more difficult to dispose of run headlong into the cultural values related to increased consumption and immediate gratification. The ethics of production, consumption, and economic growth, with their own self-justifying ends, seem on a collision path with an environmental ethic related to conservation and preservation of the environment. These conflicts take many forms, whether it is the protection of an endangered species versus the logging industry bat-

ting over further logging of public lands, or preservationists versus the mining industry over setting aside more public lands in trust for future generations.

Many people are turning to nature itself for selfgratification, finding meaning in closeness to the natural environment and viewing it less in instrumental terms. As a result, more and more people are seeking to preserve parts of nature in something of a pristine state, and use resources in a sustainable manner in order to leave something for future generations. Business organizations themselves are slowly beginning to focus on sustainability concerns and their impacts on resource usage and the natural environment. An environmental ethic tied to the enrichment of human existence in all its fullness and recognizing our ties to nature has the potential to bring both the concerns of individuals seeking less materialistic self-gratification in nature itself, and pressures from the marketplace, to direct production and consumption toward more sustainable paths, into an evolving relationship that can provide a new moral framework for capitalism. The Protestant ethic with its emphasis on material capital and exclusion of natural capital from moral concern is further eroding in the face of growing environmental concern.

Proto-Indo-Europeans

The focus of contemporary Indo-European Studies is on the proto-Indo-European (PIE) substrate of European and Indian culture. Since the recognition of similarities between Sanskrit, Greek and Latin by two Jesuits working in India (Stephens in 1583; Coeurdoux in 1767) and the final recognition by Sir William Jones in 1796 that the Gothic, Celtic and Persian languages also appeared related to the other three, Western scholars have sought to determine who were the original Indo-Europeans, from where do they come, what was their original lifestyle and what were their earliest beliefs. While the proto-homeland remains to be definitively located, the most convincing argument has been put forward by Marija Gimbutas as the lower Volga steppe of Kazakhstan. She identifies the original PIE culture-bearers with the chalcolithic culture known by its distinctive earthen mound or barrow (Russian *kurgan*). These first appear in approximately the second half of the fifth millennium B.C.E. The Kurgan peoples were semi-nomadic but characterized by small settlements of fortified hilltop villages. They had domesticated the horse, and they practiced at first a mixed farming and herding level of transhumant economy.

In the late eighteenth and early nineteenth centuries, the foundations of the science of philology were established – with Friedrich von Schlegel coining the term “comparative grammar.” It was, however, the German linguist Franz Bopp who first considered the designation “Indo-European.” Eventually, the Indo-European languages have come to be understood as including the IndoIranian, Hellenic, Italic, Celtic, Germanic, Baltic, Slavic, Anatolian and Tocharian branches along with such isolates as Phrygian, Armenian, Thracian, Illyrian and Albanian. Today, approximately half the world’s population speaks an Indo-European tongue as its first language. In searching for cognates or words shared between these various languages, the Indo-Europeanist seeks to establish the PIE lexicon. We find here common words for “horse,” “cattle,” “wolf,” “bear,” “salmon,” “oak,” “beech,” “birch,” “willow,” “boat/ship” and “snow,” but not for “rain,” “sea,” “tiger,” “lion,” “palm,” “olive,” “cypress” or “vine.” Through such matching and eliminating, the Indo-Europeanist endeavors to fuse the disciplines of archeology and comparative linguistics in order to determine where the PIE originated and how she/he lived. Included in this quest is the attempt to understand Aboriginal spiritual perception and religious practice. Agricultural and husbandry terms are also detectable in the proto-vocabulary, and these in turn raise questions for contemporary scholars concerning the impact of the Indo-Europeans on the environment.

Among the major synthesizers behind understanding PIE society and its worldview is Friedrich Max Müller. The foundation for his comparative mythology is the equa-

tion of the Vedic Dyaus with the Greek Zeus. Müller argued that without a means by which to express abstract concepts, the PIE resorted to analogies based on nature. For Müller, the central ancestral symbol is the sun. Others who followed in his footsteps posited different mythopoeic foundations. In place of Müller's solarism, for Adalbert Kuhn, it was meteorological; for Georg Hüsing, lunar; for Angelo de Gubernatis, animal allegory; for Johannes Hertel, pyric; for Friedrich L.W. Schwartz, wind symbolism; and for Ludwig Preller, celestial. Together, the consensus suggests the underlying impetus of naturalism. Certainly, the etymology behind Indo-European theonyms derives principally from the phenomena of nature – with the derivatives from the recoverable root of **dyêus* (the “daytime or bright sky” – from **dei* “to shine”), the dawn-goddess designation from **awes* (“to shine”), the earth-mother *nomen* from **ghdem* (“earth”) and **sawel* (“sun”) being the most ubiquitous.

In the twentieth century, however, it became fashionable to designate the methodology of Müller and his colleagues as the “older comparative mythology” in contrast to the “new comparative mythology” of Georges Dumézil (1898–1986). The French sociologist, a student of Emile Durkheim, successfully managed to restore Indo-European studies as a legitimate area of investigation and research following the demise of Müller's solar mythology. Dumézil, however, repudiated the anthropology of James Frazer and sought a Durkheimian sociological understanding of PIE culture rather than the naturalism of Müller. For Dumézil, PIE society was a tripartite division of three classes: a first or sovereign function of priests and judges, a second or warrior function of the nobility, and a third consisting of farmers and craftsmen. Following Durkheim, Dumézil has sought to identify the various deities as projections or collective representations of the different levels of social organization. In this way, he has divorced the ancestral PIE gods from what otherwise would appear as their naturalistic base of origin.

The Dumézilian hegemony over Indo-European studies has appeared to have passed its peak. At the Sixth UCLA Indo-European Conference in 1994, Bernfried Schleratt (Freie Universität, Berlin) rejected Dumézil on the basis of a selective, manipulative and contradictory methodology. An emergent third approach to Indo-European studies consists of a revaluation and updating of Müller's comparative methods rather than their outright repudiation. Increasingly, a nature-based IE perspective denies many of Dumézil's specific correspondences between Indian, Iranian and European deities. Dumézil ignored underlying hypostases that at some early point must have been recognized and must be accounted for within the proto-society. In general, it would seem the French sociologist has been influenced by Christian or, more broadly, Levantine thought that relegates both the natural and the supernatural to the status of “other.” In this, he falls within the gambit of postmodern criticism that seeks to expose intertextual tendencies that marginalize or neglect the excluded other. Inasmuch as contemporary nature religion is an attempt to re-recognize nature and understand the natural within a sacred context, it is a spirituality that follows in essence a postmodern agenda. Resisting Hegel's attempt to reduce all to the logic of the same, contemporary

nature-oriented spiritualities incorporate the other through their stress on celebration of difference and multiplicity.

Nevertheless, a central Western paradigm – one rooted in proto-Indo-European and, more specifically, Hellenic understandings – posits the natural as the wild and untamed that surround and perpetually threaten the hard-won yet precarious domain of civilization. Among one of the clearest and most influential contemporary articulations of the culture versus nature construct is the civilization thesis of Freud. One of the questions for today’s scholars in this context concerns how much the Indo-Europeans expanded through conquest (Gimbutas’ patriarchal warrior theory) and how much through the spread of agriculture (Colin Renfrew’s “wave of advance” hypothesis involving the gradual spread of farming). While archeologists are increasingly rejecting the first, the second has so far not received serious consideration by Indo-Europeanists. Implicit in how the West looks today at its prehistoric past is the consideration of environmental change brought about by Neolithic economy. Terms for grain (possibly designating wheat or spelt) have wide distribution. More restricted are such reconstructions for rye and barley – suggesting increased regional differentiation and ecological transformation after the original dispersals. The clearest indication of the intimate connection between Neolithic spirituality and economy remains the Latin verb *colere* which designates both “to till the earth” and “to worship.” Its past participle *cultus* gives rise to the English words *agriculture*, *cultivation* and *culture*.

It is obvious that the rise of farming techniques and the production of food surplus radically altered primordial natural conditions. How much the ensuing environmental changes can be attributed to Indo-European migration and how much to a “wave of advance” from the Levant or some other center are still open and unanswered questions. What is clearer, however, is that an unbiased understanding of the PIE spiritual heritage and worldview, one freed from the reductionism of Dumézil and politicizing of Gimbutas alike, has the potential to resituate humanity’s rupture from nature with a more holistic perspective. Accordingly, PIE ideology posits a double duality or, more accurately, a dichotomy and a polarity. In the former, creation as the natural and human worlds is perceived as perpetually threatened by the primordial void of chaos. In Indo-European terms, this is mythically depicted as a cosmic contest between divine and asurian (anti-divine) forces. Chaos is considered as that which endeavors to undermine and annihilate the perpetual round of nature, but inasmuch as the cosmic void is itself an empty nothingness, the proto-Indo-European appears to have understood it as ultimately an operative nonexistent. On the other hand, the binary existence to which it is opposed comprehends the continually realigning natural dualities of the positive and negative, dark and light, female and male, and spiritual and material dimensions of reality. This primordial IE paradigm that seeks accord and respect with the world that is, while no less searching for that supernatural other that has enticed humanity since the beginnings of time, is one that frames itself in the rhythms and metaphors of nature. The relevancy of this PIE understanding to today’s over-accelerating and

viable-horizon-diminishing world suggests a reassessment of the point where the natural and spiritual intersect.

Psychonauts

Shamans and psychonauts are individuals who choose to embark upon a voyage of discovery into the universe of the mind. Such a journey is initiated via a variety of means by which a perspective shift, an altering of normal consciousness, occurs leading the subject into states of ecstasis. For psychonauts, the vehicles chosen for such an Odyssey are predominantly entheogens (plant sacraments or shamanic inebriants evoking religious ecstasy or vision; literally the term means becoming divine within) and alchemical alkaloids derived from visionary-inducing vegetation that grows throughout the world.

The German chemist, Arthur Heffter, was the first to gain the title of *psychonaut*, a name given to him by Ernst Jünger in his logbook of personal drug experimentation *Annäherungen: Drogen und Rausch (Drugs and Inebriation)*. Heffter was defined in this way as a result of his self-experimentation with the four pure alkaloids that he had isolated from *peyotl* in the late 1890s. His ingestion of these alkaloids revealed mescaline hydrochloride to be the active entheogenic principle of *Lophora williamsii* (*peyotl/peyote*), and his experience marked the world's first "trip" with a purified chemical compound. As a result of this, the Heffter Technique now refers to human self-experimentation with psychoactive compounds otherwise known as the psychonautic bioassay.

Psychonautic bioassays are usually grounded in the sphere of science and attempt to shed light on questions pertaining to pharmacology, posology (the study of drug dosages), cognitive psychology, ethnomedicine and anthropology. However, scientific experimentation with entheogens may also lead into mystical insight and experience thereby facilitating access to the visionary worlds frequently inhabited by shamans, artists and ascetics. In this way *psychonauts* are by no means confined to the methodology of Western science, and their inner voyages may bridge many worlds.

Entheogenic substances such as mescaline, lysergic acid diethylamide (LSD) and psilocybine were all discovered by *psychonauts*, chemists evaluating their chemicals via bioassays. If these had not taken place a great number of valuable psychoactive drugs would have been disregarded or put on the shelf, perhaps not to be reinvestigated for years. A prime example of this was Albert Hoffman's discovery of LSD. On the basis of animal tests in 1938, pharmacologists at the Sandoz laboratory determined that LSD was of little pharmacological interest, and it was due to a peculiar presentiment that Albert Hoffman returned to it five years later. In 1943 he repeated the synthesis of LSD but had to leave the laboratory due to an onset of strange physical and psychological symptoms. Assuming that it may have been the result of the substance he was working

on, he conducted a series of self-experiments. The outcome of these led to his discovery of the most potent psychoactive substance known at that time.

Until the U.S. prohibition of LSD and a number of other psychoactive compounds in the late 1960s, scientists, psychoanalysts, artists, writers and musicians alike embarked on psychonautic journeys into the unknown. Many believed and publicly claimed that they were gaining insight into the workings of the mind, the creative process and the spiritual realms previously inhabited only by those capable of having spontaneous mystical experiences. The creative activity of such individuals has contributed to the study of ways in which people may experience transcendence and the effect that this can have on their lives.

One such pioneer, the English novelist and critic Aldous Huxley, wrote about his experience with mescaline in his book entitled *Doors of Perception*. He stated that the entheogenic experience had the potential to “shed light on unsolved riddles such as the place of mind in nature and the relationship between brain and consciousness.” He also suggested that such insights might bring one closer to understanding the worlds of the visionary, medium and even the mystic.

However, such a subjective approach to the study of pharmacological, psychological, and religious phenomena is still considered controversial and hotly debated. The question of whether it is ethically and religiously defensible to use mind-altering drugs to help us understand religious, spiritual and artistic phenomena still rages. Yet, despite prohibition and moral arguments, the employment of shamanic inebriants for spiritual purposes is extraordinarily widespread. Ceremonies and rituals that involve the subjects entering an altered state of consciousness can be found both historically and presently throughout the world, with particular prevalence in South America, Siberia, Asia and Central West Africa.

If as Weston La Barre asserts, “there were shamans before there were Gods,” then the origins of religion could potentially be explored within the context of shamanism. Thus, psychonautics, while a comparatively new term, is certainly not a new phenomenon; indeed, it could be considered integral to the study of religious phenomena.

In the scientific field, the study of psychoactive compounds has been limited due to the legal steps taken by authorities around the world in the late 1960s and the media attention that has consistently highlighted the abuse of such substances. Such attention has meant that government funding has been difficult if not impossible to obtain and many scientists have not wished to jeopardize their careers by exploring such a controversial area of research. The subjective experience (the psychonautic bioassay) is still largely disqualified and while pharmacological studies on animals may be useful in determining toxicity, they reveal very little of the psychoactive effects of the drug on the central nervous system and the impact the experience has on the subject over time.

Ethical procedures for human testing of psychoactive agents have been admirably established and followed by Alexander T. Shulgin and colleagues, whose self-testing of over 100 novel psychotropic agents is described in his and his wife Anne Shulgin’s 1991

book, *PIHKAL: A Chemical Love Story*. Such psychonautic bioassays are carried out to produce a total clinical evaluation of (novel) psychoactive compounds. The subjective experience is recorded and levels of activity carefully monitored with a number of different doses of the drug in question being examined. These experiments are carried out by a team of volunteers who are experienced at entering and being in altered states of consciousness. The experimenters are fully aware of the risks and returns to be expected.

Whatever the motivations for the exploration of mindaltering substances, there are a number of prominent features of the experience commonly shared. Psychonauts report seeing the world brilliantly illuminated, objects seeming to “shine from within” (Huxley). The sensation of seeing the world with fresh eyes, with a “naked intensity” (Huxley), unclouded by everyday abstractions is often described and the intensification of colors and reports of sensing the innate nature of things are experiences shared by shamans, mystics, artists and psychonauts alike.

Following his experiences with LSD, Hoffman wrote that the most valuable spiritual benefit gained was the “experience of the inextricable intertwining of the physical and spiritual.” This fundamental fusion of spirit and matter has been upheld by the traditional shamanic worldview throughout history but was undermined by the emergence of Cartesian dualism embodied by Western science.

Psychonauts such as Huxley, Hoffman, Wasson and Ott have reported that theentheogenic experience could enable individuals to transcend the dominant materialistic worldview, breaking down the dualistic notions of body *versus* soul and culture *versus* nature. Through direct experience individuals are describing that which quantum physics is now teaching us – that everything is energy, and matter a hallucination resulting from the mechanisms of our everyday perception.

It has been argued that the assumption that humankind is separate from the rest of nature and superior by way of mind, has led to the subjugation of other life forms and the exploitation and destruction of the Earth. Experiencing and appreciating the unity of life directly and perceiving the life-force and energy of both animate and inanimate things can therefore potentially awaken a greater ecological sensitivity and concern for the survival of the biosphere. Ironically, the subjective experiences resulting from many psychonautic bioassays carried out for Western scientific purposes point towards this unified worldview, thereby building a bridge between science, shamanism, and environmental concern.

Pure Brethren

The *Ikhwan al-safa*, or “Pure Brethren” were an anonymous group of philosophers who lived and worked in Basra during the tenth century. Among their many treatises is one that gives a lengthy argument for animal rights, entitled *The Case of the Animals versus Man Before the King of the Jinn*. In this unusual work, representatives from the animal kingdom bring a court case against the human race whom they accuse of abusing their position. The animals point out that before the creation of man they roamed the Earth in peace and harmony, in what might be called “natural balance” in contemporary language.

The Brethren’s view of the natural world is striking for its exceptionality in the context of tenth-century Muslim society. They were a radical group, as indicated by their choice to remain anonymous, and in subsequent centuries, only the heterodox Sevener-Shi’i or Isma’ili sect, identified today with the Aga Khan, adopted their writings as authoritative.

Puritans

The English Puritans who arrived in New England in the early seventeenth century brought a complex of beliefs about their purposes in the “New World” and what they would encounter there. They also brought understandings about human physiology and morality – their bodies and souls – that would determine their attitudes toward and interactions with this unfamiliar landscape. Both frightened and exhilarated by anticipated engagement with the environment and inhabitants, the colonists’ abstract, often conflicting ideas about New England became concrete realities in their actual exchanges with new terrain, climate, foods, plant and animal life, and humans. By the end of the seventeenth century, these exchanges had produced permanent alterations in Anglo-american bodies and the New England landscape.

Committed to the rigorous theology of Swiss Protestant reformer John Calvin (1509–1564), New England Puritans, like John Winthrop, governor of the Massachusetts Bay Colony, and Boston minister John Cotton, believed themselves to be the “New Israel,” divinely chosen to fulfill God’s plan for bringing the twin beacons of civilization and Christianity (“culture”) to New England’s savage, heathen “wilderness” (“nature”). They also believed that God was leading them to America to “possess the land” and harvest its natural resources for profit. Typical of early modern European attitudes about “foreign lands,” Puritans viewed the American environment as both dangerous and fertile, threatening and exotically enticing. Employing biblical metaphors, colonists like William Bradford, governor of Plymouth Colony, imagined it as the abode of Satan, a “howling wilderness” containing “wild beasts” and “savage and brutish men.” But, according to historians Perry Miller and Peter N. Carroll, when intentionally subdued through the civilizing labor of clearing forests, cultivating fields, and building permanent fences, dwellings, and “godly” communities, it would become an Edenic “garden,” producing untold riches. Such biblical rhetoric invested the New England landscape with potent sacred meanings, furthered by the belief that God communicated directly with his people through the natural world. Conflating spiritual morality and worldly economics, Puritans carefully read “divine providences,” like a large haul of cod or crop destruction by locust infestation, as indications of God’s pleasure or anger toward his chosen ones.

Religious metaphors about the New England landscape were brought to ground when English men and women set foot on American soil and physically engaged its environmental elements – both its remarkable abundance of lumber, game, fish, and furs and its frightening dangers of uncharted forests, wolves, unfamiliar foodstuffs, and native Algonquians, described by travel writers and colonists like Plymouth’s Edward

Winslow. Puritans held two models of their physical relationship with the environment, derived from the ancient Galenic system of the humors and from a Calvinist theology of the body, that shaped their understandings about how the wilderness might cause alterations in their bodies and souls and how they, in turn, would alter the wilderness landscape.

From Calvin, Puritans had inherited an emphasis on *eupraxia*, or “godly industry,” which they understood, in part, to mean hard, physical labor to domesticate the savage wilderness into a civilized landscape. Using organic metaphors of domesticated seedlings, as historian John Canup has noted, they intended to “plant” themselves in the wilderness, that is, to labor in establishing plantations, cultivating and ordering the landscape according to English notions of godly civilization, and exploiting its natural resources for profit. However, the image of planting, of sending roots into the soil and absorbing environmental elements, was more than metaphorical; Puritans understood it literally, as well. According to standard early modern medical theory, based on the humoral system developed by Roman physician-philosopher Galen (ca. 129–210), the human being was a complex moral and organic entity composed of fluids, particles, and qualities – the humors and spirits – in constant, but ideally balanced, flux and flow. The four humors and their related personality temperaments corresponded to the four elements – earth, air, water, and fire – which provided all matter with forms and properties

– heat, moisture, cold, and dryness.

Because human bodies were constituted by the same elements and properties as all other material things, the boundaries between soul, body, and the surrounding environment were unstable and permeable. According to historian Carolyn Merchant, through exchanges among elemental, humoral, and spiritual qualities, human physiology and moral character were understood to be continuously and directly influenced and altered by climate, weather, air quality, foods and drinks, and, as in Calvinist *eupraxia*, the amount of physical exercise one pursued. Thus, the colonists believed that living in a new country would inevitably cause their bodies and souls to absorb qualities of that environment; without vigilance, they could become wilderness creatures, their English godliness replaced with a “savage” character, like that of the native inhabitants and those “Indianized” Englishmen who shed the constrictions of civilized society to live among the natives.

Fears that the wilderness would negatively affect English bodies came true during the first years of colonization, when many died for lack of skill in negotiating the new environment. But Puritan leaders like Bradford argued that it was *because* they had experienced threats to their health, like changes in air, food, and drink, that God supported them in those early years and ultimately caused them to prosper; rigorous wilderness life was held up as morally and physiologically superior to the “civilized” lives of those still in England. Eventually, colonists discovered that New England actually offered an exceptionally healthy and prosperous climate, which permanently altered Anglo-american bodies for the better. With regular access to animal protein,

unpolluted air, and fresh water, they lived longer and grew taller than their English counterparts, women were more fertile and produced more twins, and there were fewer infant mortalities.

The inherent tension between images of the “savage” wilderness as physically and morally dangerous and images of the wilderness as the land given by God to his people as their “possession” was resolved as Puritans promoted the “godly” body as one that rigorously labored to cultivate and domesticate the environment. Such diligent, civilizing activity was seen as a balancing mechanism, protecting colonists from the detrimental moral effects of life in the “savage” wilderness. Despite Puritan leaders’ struggles to maintain close-knit communities and limit expansion into the wilderness, colonists’ desires for economic gain pushed the frontier westward, eradicating the “savage” influences of wolves, Indians, and uncharted forests, privatizing wilderness land, and harvesting and commodifying New England’s natural resources, as noted by environmental historian William Cronon. Over the course of the seventeenth century, the “wilderness” was transposed into a fruitful “garden” and the New England environment permanently altered.

Pygmies (Mbuti foragers) and Bila Farmers of the Ituri Forest (Democratic Republic of the Congo)

The Mbuti hunter-gatherers of the Ituri Forest in the Democratic Republic of Congo consist of perhaps about 30,000 people in all, and are one of the many Forest Peoples throughout the Central African rainforest region, peoples often grouped under the term “Pygmies.”

Understandings of the Mbuti have been strongly influenced by the anthropologist Colin Turnbull’s classic study of the Mbuti (1961, 1965, 1983). His study is built on the notion of a structural opposition between the Mbuti hunter-gatherers, living in harmony in the world of the forest, and the world of the road, where the Bila village farmers are described by Turnbull as fearing the surrounding forest and – in clearing their fields – are forever battling against their forest environment in order to survive. Turnbull characterizes Mbuti cosmology as being founded on trust in their benevolent forest which is regarded as both mother and father to them; and he characterizes Bila cosmology as being centred in their fear and mistrust of the forest, in fearing and seeking their ancestors’ intervention, and in fearing witchcraft and sorcery. In Turnbull’s eyes the Mbuti’s fragile forest of Eden will inevitably be broken by the intrusion of modern forces.

The Mbuti (“Pygmies”) have played an important part in many debates about human nature and the nature of culture. In earlier debates they were often seen as representing the earlier or inner nature of humanity. This is evident in looking at the writing of the diffusionists such as Father Wilhelm Schmidt, who argued that religion has always been central to human existence, and that the idea of God is derived from the Pygmies, who were themselves the original cultural circle. In arguing this, people such as Father Paul Schebesta were reacting against the biologists’ assertion that primitive man had no religion. In the preface to Schebesta’s *Among Congo Pygmies*, Gerald Griffin stated that “previous explorers” maintained that “they had discovered a race that had no religion and no conception of the soul as a separate entity from the body,” and so: fastened on this pseudo-discovery as bearing out their contention that primitive man had no religion. Dr Schebesta . . . shows how these little African

gypsies, who . . . are the nearest approach in primitiveness to the wild animals on which they prey, have a definite religious cult and ethical social codes of their own (Griffin in Schebesta 1933: 5).

Schebesta himself later goes on to say that, although “the Christian onlooker gets the impression that the Bambuti are actually a race devoid of any religious cult. This impression [is] an utterly fallacious one” based on “the lack of external demonstrations in the Bambuti religion” (1933: 162). His image of the Mbuti as possessing true religion, totally unlike the “superstitious belief in witchcraft and magic which they have picked up from the negroes” (1933: 162), is an image which is consistently and powerfully reworked by Turnbull, who sharply differentiates between the Mbuti’s pure experience of their sacred forest and the Bila villagers superstitious ancestor worship and fear of the forest.

Turnbull dwells on the advantages of Mbuti life over Bila life, and makes an absolute opposition between their cosmologies. The following passage makes clear that to him the contrast between villagers’ fear of – and Mbuti respect for – the forest, has nothing to do with historical circumstance and everything to do with the essential nature of these two cultures: instead of acceding to the natural, the villagers with their superior technology combat it; and instead of respecting the supernatural in the sense that the Mbuti respect it, the villagers oppose it with fear, mistrust and occasional hate. They people the forest with evil spirits, and they fill their lives with magic, witchcraft and a belief in sorcery. The forest achieves the establishment of two virtually irreconcilable systems of values (Turnbull 1965: 21).

Turnbull’s, research, however, coincided with the most effective period of Belgian colonial domination, which treated the villagers and the Mbuti very differently. The Mbuti were allowed to move through the forest freely, while the Bila were forced to move their villages to the roadside and to pay taxes in the form of maintaining the roads, feeding immigrant labourers, and growing cotton to pay as a form of tax. Having to manipulate the Mbuti into working their fields to help produce the required cotton, was the last in a long chain of exploitative extractive relations emanating from commercial decisions made in Europe, and made possible by colonial control. A preoccupation with Turnbull’s structural opposition obscures the dynamic movement between forest and village which is central to both Mbuti and Bila identity – prior to the effective imposition of Belgian restrictions, since independence, and even under Belgian control as is evident in Turnbull’s own writing.

Current Anthropological Understandings

Anthropologists such as Tim Ingold and Nurit Bird-David have invoked Turnbull’s analysis to draw a sharp contrast between hunter-gatherers’ and farmers’ cosmologies, and to suggest that such hunter-gatherers experience the forest as a sharing partner, their relationship with each other and with the forest being characterized by trust.

Clearly the Mbuti do work very hard to establish co-operation and trust in their relationship with each other and the forest; through such practices as demand-sharing, the cooperative nature of the net hunt and child care, and the central *molimo* ritual. However (contra Turnbull) the forest is not seen by the Mbuti as a separate “god-head” from whom they worship and seek blessings. The forest is seen as continuous with human life. There is no division between a transcendent forest and the human realm, rather when they are calling the forest *ema*, *epa*, *tata* (mother, father, grandparent) they are calling on their own and all ancestors who have become and are the forest. All that is past is present and is available in relationships entered into through ritual and everyday relations.

Thus there is a continuity between the world of humans and the world of nature which is evident in the nature of the hunt, the *molimo*, and in beliefs about the forest, beliefs which can be summed up in the image that the forest is alive in the form of the ancestors who are themselves the ancestors of all who are alive today – both human and other creatures. There is not; therefore, the division between humans and the rest of nature upon which many in the West base their notion of a universal opposition between culture and nature, with ritual always being seen as the attempt to impose control on nature.

The central *molimo* ritual can take place nightly in Mbuti hunting camps and involves endless singing between the camp and the voice of the forest/ancestors that arrives in the camp in the form of a trumpet, a hollowed-out tree carried into the camp by the youths. The *molimo* tends to either emerge out of a relaxed and abundant state in camp, or be a response to conflict, to someone trying to exert control over others, to a death or disharmony or bad hunting. As it progresses, it gradually tends to draw the camp deeper and deeper into more complex harmonies demanding and echoing the complex cooperation required in the hunt. Rather than being about transcending and controlling the forest or other people, the *molimo* is about restoring cooperative relationships between all members of the camp and between the camp and the forest/ancestors, to ensure both the camp’s wellbeing and that the relationship with the forest is well, which will inevitably lead to a good hunt. However the *molimo* is not in any way an attempt to secure “the transcendental support of the forest” (contra Collier and Rosaldo 1981: 301), for the forest is not experienced as transcendent, as separate from human interaction with it. For both the Bila and the Mbuti there is a continuum, rather than an opposition, between the living and the ancestors, and the ancestors and the forest.

In considering the environment as a living rather than an inert entity, Ichikawa makes the important point that Bird-David’s portrayal of a hunter-gatherer “cosmic economy of sharing” with the environment fails to include Mbuti experience of the negative aspects of “nature”: “while the forest may sometimes be called ‘father’ or ‘mother’ and described as a ‘womb,’ it is also conceived to be a place ‘where dead ancestors roam’ ” (Ichikawa 1992: 41).

This passage comprehensively highlights the broad range of Mbuti experience of the forest. However, rather than recognize the importance of the “ancestors as forest,” Ichikawa instead leaves them to occupy simply a negative intrusive role. On the contrary, for many Bila, as well as for the Mbuti, they address the forest and the ancestors in the same breath because they are, for them, the same being. Thus the Mbuti experience ambivalence in their relationship with the forest, but they generally work within the *molimo* to make the relationship good. For the Mbuti, restoring harmony in their relationship with the forest inevitably means restoring harmony among themselves; for the forest is inhabited by the living and the dead, it is alive with those who are living and those who are now both ancestor and forest. Thus the qualitative distinction and opposition we in the West habitually make between the living elders and the ancestors does not hold for the Bila and the Mbuti. Furthermore, the division we habitually make between people (whether ancestors or living) and their environment (in this case the forest), also does not hold for the Mbuti, nor, to a certain extent, for the Bila either.

Thus, the ancestors should not be understood as being elevated to a place that is outside and opposed to “nature” and the living human community. The full range of negative and positive Mbuti beliefs about the forest, and the full range of their extractive and respectful relations with both it and the Bila, make sense when understood within the context of the forest/ancestor complex. For the Mbuti and the Bila, the aliveness of their environment is experienced and expressed through their interaction with it, and through the awareness of their ancestors inhabiting the forest both in the past and in the present, a form of inhabiting in which they and the forest become indistinguishable. In a key passage describing Mbuti religion, Turnbull himself hints at this interpretation when he describes *keti* as “spirits, human and animal, who are not necessarily the spirits of the dead but may be independent manifestations of the forest, and who are disembodied only in that they are invisible to the Mbuti” (1965: 249). The ambiguity in this passage – about who the *baketi* are – mirrors Ichikawa’s insistence on broadening our understanding of Mbuti experience. The implications of Turnbull’s ambiguity here are in strong contrast to the sharp and explicit distinction he customarily makes between village ancestor worship and Mbuti forest worship. In this passage the spirits of the forest are *both* human and animal, *both* spirits of the dead and independent manifestations of the forest, *both* invisible and embodied.

The Mbuti listen to the spirits, normally in the form of their own ancestors but also in animal and other forms, who come to them in dreams telling them such things as where to hunt, or that they must not hunt on a certain day but should stay in camp. Ancestors also arrive in a far more disruptive role when they enter one of their living relatives in a form of spirit possession, often angry because their relative has not behaved properly. This happened both to Bila and Mbuti young women during my fieldwork. In both cases the *molimo* trumpet, representing the forest/ancestors, entered the camp to deal with the angry ancestor in the individual. And in both cases male and female Mbuti elders, dialoguing with the *molimo*, linked the need to restore

harmony to the individual with the need for the *molimo* to bless and restore good fortune to the hunt: the *molimo* being referred to both as the spirit or animal of the forest, and as a powerful ancestor. One Mbuti elder explained it like this:

Ketyo batata abaano-ba suba ndula...

Keti na ndula beko-o kadi, kabakatani, kadi tu. (The spirits of the ancestors are in the forest. Spirit and forest are one, inseparable, one always.)

Justin Kenrick

Q

Quaker Writers in Tasmania (Australia)

The island state of Tasmania (previously Van Diemen's Land) is situated 40 degrees south in the path of the Roaring Forties. It was known as Trowenna and Loutrouwitter by its Aboriginal tribes, comprising roughly nine dialect groups, each band having a spiritual affiliation to its own territory. Because of its geographical isolation the island was selected as a penal colony when white settlement to Van Diemen's Land began in 1803. Naming and function created the conceptual debris of a landscape of the damned situated alongside Romantic constructions of the landscape as Paradise. Quaker settlers brought with them a pragmatic Romanticism and Christian stewardship in their concern for indigenous rights and penal reform.

Practical romanticism was evident in The Friends' opposing war, refusing to bear arms, pay tithes, take oaths, and asserting individualism and equality. As a result many Quakers were imprisoned, giving rise to their interest in penal reform. The status of Van Diemen's Land as a penal colony was for them less a deterrent than a missionary opportunity.

"The First Publishers of Truth" as the Quakers or Friends were originally called fostered a vernacular approach to the study of English which included geography and history. The emphasis on the natural sciences and the essay form produced personal and interdisciplinary nature writing. In addition, natural history education served Quakers in their stewardship of the land. Farming was new to many in the colony, and though climate and soil appeared similar to England's, Quakers willingly experimented with rather than replicated agrarian practices.

In 1828 free settlers Francis Cotton (1801–1883) and Anna Tilney (1800–1882) homesteaded on the east coast, then occupied by the Oyster Bay tribe. The social activism and anti-slavery movement of the Evangelical Quakers created ambiguity for the Cottons once situated among convict and indigenous populations. A 5000-acre land grant meant Cotton benefited from convict labor; consequently, his was not a leading voice in the antitransportation movement. In addition, pastoralist claims conflicted with the hunting claims of indigenes whose geosophical or spiritual links to place were hardly recognized. The scientific view of the land that was a result of Quaker education in natural history did not, however, extend to an anthropological view of Aborigines. Quaker belief in the presence of God within all people led to the foundation of the Aborigines Protection Society (1837) patterned after William Penn's response to the treatment of

Native American Indians. Cotton recorded Aboriginal myths, and his attitude toward the indigene influenced his thirteenth child, Joseph (1840–1923), who recalls meeting the last full-blood male Tasmanian Aborigine, William Lanney (d. 1869). Oral accounts of Aboriginal Dreaming were later published in *Touch the Morning: Tasmanian Native Legends* (1979) by Jackson Cotton, Joseph’s grandson.

One story, “The Beginning,” attributed to Timler (“high priest” of the Big River tribe) is a creation story about the island’s Dreamtime inception. The cosmology is anthropomorphized – the sun Moinee is the spirit of Trowenna, an island created out of grief and pain due to the loss of Moinee’s wife, Vena, who disappears when the iceberg she is on melts. The myth reveals an ice-age climatology beyond human memory, while ascribing to the island an emotional temperament which will be borne out historically in its white-settler appropriation as a penal colony and in its displacement of the indigenous population.

Woreddy (d. 1842) of the Nuenone (Bruny Island) people, tells the story of Moinee creating the first man. Moinee’s brother, Dromerdene, takes pity on man whose tail prevents him from sleeping. Dromerdene cuts off the tail, creating delineation between human and nonhuman. When man stretches the tail, creates a spear “and straight away set off to hunt,” hunting becomes a natural extension of human–animal relationships though symbolically the spear exists as a reminder of their interrelatedness.

Jackson Cotton attributes authority to the stories by appealing to Quaker truth-speaking, though the recovery of myths is marked by unconscious reinvention. For instance, Timler’s *Genesis* story contains Aboriginal and Greek cosmologies; the title of Woreddy’s story “The First Blackman” signals colonial Otherness absent in the complementary story of the first *white* man, Adam.

Quaker presence in the colonies increased after the 1832 visit of missionaries under concernment, James Backhouse (1794–1869) and George Washington Walker (1800–1859). It was while “standing in the nursery ground at Norwich” that Backhouse experienced his calling to Australia. In *A Narrative of a Visit to the Australian Colonies* (1843), an important botanical work, Backhouse describes contacting the government, advocating the return of Aboriginal hunting grounds. After visiting Port Arthur penal settlement Backhouse urged the government to grant garden plots to prisoners as a reward for good behavior and as a deterrent to scurvy. In his dealings with the human and nonhuman, he recorded a moment when nature afforded him an opportunity for reform as soldiers tormented sharks in the spirit of revenge:

We succeeded in convincing the men that they were wrong in giving way to this spirit, and that it was their duty either to kill the sharks by the most speedy means or to liberate them, as they had as much right to take the baits, as the soldiers had to take the fish; seeing that in so doing, they only followed an instinct given by their Creator (Backhouse 1843: 42).

Quakers’ reputation of probity and truth-speaking served them well in business. In 1884 draper William Levitt Wells (1853–1918) and Elisabeth Lidbetter left England to settle in the renamed Tasmania. Published posthumously, *Immense Enjoyment: The*

Wells Journals 1884–1888 demonstrates how *experience* of nature conflicts with the literary pastoral as a metaphor for refuge. The chain of economy extends from the resource value of parrots (as pets, and pests, robbing Wells of his peaches) to their being skinned for wallets, or eaten for their flesh which is like “roast beef.” Hunting provides a meal, or material for the taxidermist’s needle to feed the scientific minds of Wells’ children.

Half a century later, the novel *Huon Belle* (1930), by Isabel (Charlotte) Dick (1881–1959) offers an ecofeminist perspective on economic and intrinsic values of the land. Dick’s great-grandfather William Shoobridge (1781–1866) pioneered methods of hop growing. Another relative, Louis Shoobridge, campaigned to preserve Russell Falls. As a result, in 1885, Mount Field National Park became one of Australia’s first National Parks. The title *Huon Belle* conjoins topography and anatomy in its reference to a local mountain, and character, Virginia Lee. In nineteenth-century terms she is a “natural” child, and homeless. She marries the orchard owner, whose husbandry toward her and the orchard is equally flint-hearted and profit-driven. She secures this material *oikos* because of her use-value as property and labor, but refuses to be cut off from her *genius loci*, the mountain, which becomes symbolic of inviolability. Virginia, a reconstructed Eve, becomes legal owner of the apple orchard. The patriarchal order is replaced by the primacy of feminized and productive nature. The subsequent partnership of Virginia and Simon Peter (God’s Rock) is marked by shared reverence for the mountains, and joint ownership of the revered text, Thoreau’s *Walden* (1854).

Kelsey Aves’ essay collection *Hither and Thither* (1996) discusses conservation and Quakerism. Aves (b. 1907) migrated with his wife, Margaret, in 1940; both became Quakers in 1952. President of the Field Naturalists Club, he published two cassettes about the Tasmanian environment, “Songs and Calls of 64 Tasmanian Birds” and “Under the Blackwood Tree.” He credited *The Nature of the*

Physical World (1935) by Quaker scientist Sir Arthur Eddington with providing a connection between mysticism and wisdom that helps “to bring us back to Earth.” Aves’ migrant status initially colored his receptivity to the bioregion: in “On Learning to Love” he had to “learn to love the rainforest.”

Fellow migrant Clive Sansom (1910–1981), was born in England, married Ruth Large, and migrated in 1949. His publications include ten poetry collections; four verse dramas, a work of fiction, and educational texts. Although Sansom’s mental landscape was informed by the land he left behind, he became a strong advocate for the land in which he now lived. In 1950, he campaigned to stop the reestablishment of sealing on Macquarie Island. The London *Times* printed his letter, and international condemnation halted the sealing ship. He campaigned against the flooding of Lake Pedder (1972), an ancient alpine lake. The campaign failed but gave rise to The United Tasmania Group, the world’s first green party. In 1976 Sansom became one of the (then-Tasmanian) Wilderness Society’s founding patrons.

The belief that Tasmanian Aboriginals were extinct explains their lack of representation in early to midtwentieth century Quaker nature writing. Notions of what con-

stituted Tasmanian Aboriginality, along with its impact on Native Title, were being contested by the offspring of nineteenth-century white sealers and abducted Aboriginal women. The Hydro-Electric Commission's plan to flood the Franklin River, and, consequently, Kuti Kina Cave, an Aboriginal sacred site, helped publicize their cause. Sansom spoke against the flooding of this last wild river, but died the year before the successful "Fight for the Franklin" campaign. His final publication *Francis of Assisi* (1981) is fitting given the suggestion that Francis be "patron saint for ecologists" (Lynn White, Jr.). In the section "The Creatures" he wrote, "Our universe is tangled, strand with strand; / And brain-bound man, he little knows how much / That web is trembled by a single touch" (Sansom 1981: 64).

The Qur'an

The Qur'anic approach to nature differs from that of two major approaches: the biocentric and the anthropocentric. One can most appropriately designate the Qur'anic approach as theocentric. One Qur'anic verse expresses this: “[God] is the creator of everything” (6:102). Without him the heavens and the Earth will collapse: “Surely, God holds Earth and heaven from collapsing. If they collapse, no one can hold them after Him .. .” (35:41). Being the sole creator God is the center of everything; in the Qur'an all things point to him. Sovereignty belongs to God only (12:67). Among God's creatures, man is the most conscious. Although, man is the most powerful and independent of God's creatures, the Qur'an explicitly states that God is man's creator: “Lo! We create man from a drop of semen to test him; so We make him hearing, knowing” (76:2).

According to the Qur'an, nature is a mirror of God's beautiful names. The whole of creation is the reflection of God's name *al-Khaliq* (The Creator) (13:16, 15:28, 35:3, 38:71, 39:62, 40:62, and 59:24). It is not just randomly created, it is wonderfully designed: “you can see no fault in His creation” (67:3). Concerning this wonderful design, the creation of man is emphasized. According to the Qur'an, God has shaped humanity, nature, and all of his creation in the most beautiful manner (64:3). So perfectly arranged is God's creation, that everything from plants to human beings is a miraculous work of art. Therefore, there is no absurdity in nature.

The Qur'an refers to nature as a sign or verse. There are two types of signs (*aya*^t) of God. One is the Qur'anic verse. Each verse is considered an “ayah” or a statement from God. The second is nature; each part of nature is also considered an “ayah” or a “sign” of God. According to the Qur'an, there are limitless signs of God. The water which God sends down from the sky, the ordinance of the winds and clouds are signs (2:164). They are not created in vain: “We created not the Heaven and the Earth and all that is between them in vain” (38:27). In the heavens and the Earth are signs for believers; the creation of humans is a sign, likewise the changing from night to day, and the provisions God sends from the sky, and thereby sustains the Earth, are signs, statements, or messages from God (45:3–5). Accordingly, the Qur'an speaks of nature not for the sake of itself but for the sake of its Creator. Thus, the Qur'an indicates that nature has a divine characteristic, as it is a reflection of God. The Qur'an does not detail the physical structure of natural phenomenon, but instead, focuses on the purpose of such phenomenon, which is designated by its creator. When the Qur'an talks about the sun, it does not describe it as a physics book would, but describes it as a “dazzling lamp” for humanity and thus emphasizes that the sun is a sign of God's mercy toward humanity (78:16).

The main purpose of creation, according to the Qur'an, is to serve as a sign of God and to reflect God's beautiful names. In this regard, a fly and an elephant serve the same purpose, shoulder to shoulder, and the fly is worth no less because of its smallness. In the teaching of the Qur'an an atom is no less a sign of God than a mountain, because both are his handiwork. In the Qur'an over 99 names of God are mentioned. Chapter 59 contains over 13 names of God: the Knower of the invisible and visible, the Beneficent, the Merciful, the Sovereign, the Holy, the Peace, the Keeper of Faith, the Guardian, the Majestic, the Compeller, the Superb, the Creator, and the Modeler (59:22–24). All these names at different levels are seen in the mirror of nature. For example, life is very precious in nature. The source of life is one. According to the Qur'an all living creatures reflect God's name al-Hayy (The Living One). (For references to al-Hayy see 2:255, 3:2, 20:111, 25:58, 40:65). The Qur'an frequently expresses the need for humans to recognize the beautiful names of God reflected in nature: "Lo! In the creation of the heavens and the Earth and in the difference of night and day are signs of His sovereignty for men of understanding" (3:190).

Nature is also Sunnat-Allah (The Way of God). The Qur'an indicates that there is consistency in nature, which reflects the unchangeable laws of God (33:62). Only via miracles can the consistency of natural law be interrupted. The Qur'an gives examples of this, such as the miracles of Abraham, Moses, and Jesus (21:69, 27:12, 5:110). Abraham was thrown into fire, but fire did not burn him. According to the Qur'an Abraham was saved because, God said "O fire, be cool and peace to Abraham" (21:64). Moses was able to turn his staff into a snake (27:12). Jesus made birds, by breathing into them to give them life (5:110). Miracles, such as these, are, according to the Qur'an, intended to present evidence of the truthfulness of God's messengers. Despite such miraculous events, which interrupt natural law, there is a consistency of cause and effect which God has enacted. Human beings are, therefore, required to follow the laws of nature. Islamic scholars interpreting the importance of following the laws of nature say that the punishment of disobedience is urgent (it will come in this life), as well as the reward. For example, cold weather will make the person sick if the appropriate measures are not taken.

The Qur'an offers evidence that creation was purposively designed: "And verily we have beautified the world's heaven with lamps" (67:5). "He it is who appointed for you the night that ye should rest therein and the day giving sight. Lo! Herein verily are signs for a folk that heed" (5:67). According to the Qur'an, human beings are to recognize that God's creation is structured for them, and they should therefore be aware of cosmic events, such as the sunrise and the sunset: "... celebrate the praises of [their] Lord ere the rising of the sun and ere the going down thereof. And glorify Him some hours of the night and at the two ends of the day .. ." (20:130).

As it is seen in the above verses, humans have great responsibility to see the signs, which are presented in nature – in other words, the meaning of the verses of nature. Accordingly, God has placed humanity at the apex of creation. Humans are to serve as vicegerents of God, and to them nature is subjugated: "He it is who hath placed

you as viceroys of the Earth and hath exalted some of you in rank above others .. .” (6:165). The high position of humans gives them great responsibility as the supervisors of nature and as the addressees of God’s message. Although in the value pyramid of creation human beings are at the apex, sometimes because of corruption they are considered to be lower than animals (7:179). In the teaching of the Qur’an, animals do not bear the responsibilities that humanity does, because they are not given reason and consciousness. However, they have the right to be protected and are not to be abused.

The Qur’an stresses the importance of animals as a part of the natural environment and the responsibility humanity has toward them. The Qur’an even equates them with humanity in terms of creation. The following Qur’anic verse forms a paradigm as far as the human relationship with animals is concerned: “There is not an animal in the Earth nor a flying creature flying on two wings but they are communities like you” (6:38). This verse indicates that the community of animals is similar to that of people, and therefore places a heavy responsibility on humans to care for animals. Several Qur’anic chapters are named after animals. For example, there are Qur’anic chapters entitled “The Cow” (Chapter 2), “The Cattle” (Chapter 6), “The Bee” (Chapter 16), “The Ant” (Chapter 27), and “The Spider” (Chapter 29). According to the Qur’an, the provisions given by God are to be shared by man and animals (80:32). Animals are intended to benefit humanity and caring for animals is to be viewed as a way of receiving God’s bounty. Therefore, the Qur’an asks people to treat animals kindly. In the story of a Qur’anic prophet, Salih, people are required to share their water with the she-camel of the prophet, which is called “the she-camel of God” (na^ˉqat Allah). Salih, the messenger of God, requests that the people allow her to drink, and the people deny this request and send a base man to kill the camel. Having killed an animal, without reason, the people are destroyed by lightning (17:5, 69:59, 91:11–15).

According to the Qur’an, animals have a sophisticated language of communication. One verse speaks of an ant that warns its fellow ants to take shelter in order to avoid being stepped on by the army of Solomon (27:18). Solomon is taught, by God, to understand the language of birds (27:16). According to the Qur’an, Solomon considered this ability to be a blessing from God and a sign of his favor. Animals also serve as the companions and mounts of humans, as the Qur’an says “We have created from them of our handiwork, the cattle ... so that some of them they have for riding .. .” (36:71–72). This verse illustrates that because animals are also the creation of God, and they benefit humans, humans have a responsibility to care for and protect them. The purpose of animals and that which humans may use them for is specified in the Qur’an. Animals may be used as mounts or for food, but they are not to be abused or wasted. Islamic law, which stems from the Qur’anic teaching, prohibits cruelty toward animals, such as loading animals beyond their capacity. The prophet of Islam is said to have rebuked a person for trying to make a camel carry too heavy a burden. Also, Muhammad, following the revelations of the Qur’an, declared the holy site of Mecca to be a Haram, which can best be understood in modern terms as a National Park,

in which it is criminal to kill so much as an insect or to uproot a plant. Some Muslim mystics have even been known to tie bells to their shoes, in order to warn small animals in their paths that might otherwise be crushed underfoot. This tradition is still essential in Islam, during hajj (pilgrimage). For example, Muslims are not allowed to cut grass during this time, in the area of Haram. They are not allowed to kill living creatures, including insects. If they happen to act in such a manner during hajj, they perform penance for this unlawful action.

Just as the Qur'an stresses the importance of protecting animals, it also stresses the importance of respecting other aspects of God's creation of nature. Many Qur'anic chapters take their names from natural elements, such as "Thunder" (Chapter 13), "Light" (Chapter 24), "Star" (Chapter 53), "Iron" (Chapter 57), "Date Trees" (Chapter 16), "Cave" (Chapter 18), "Sun" (Chapter 91), and "Moon" (Chapter 54). Natural elements in the Qur'an are presented in a variety of contexts. There are some natural elements, which are referred in nearly every page of the Qur'an, such as Earth, which is mentioned nearly 500 times in the Qur'an. Water, Sun, Moon, Stars, and Sky are also among the frequently mentioned elements. For example, water is presented as a gift from God or a helper sent by God from the sky to help fruits grow in order to provide sustenance for humans (2:22, 14:32, 16:65, 20:53, 22:63). The Qur'an also refers to water as a tool of cleanliness for humanity (8:11). In a different context, water is the "ground" of God's throne (11:7). Water can also serve as a tool of punishment and destruction, as in the story of Pharaoh (29:40) and of Noah (11:40–44). Although water can be a tool to destroy life, it is also, according to the Qur'an, the source of life (21:30). Pure water is a gift to those in paradise, while contaminated water is a punishment for nonbelievers: "Hell is before him and he is made to drink a festering water .. ." (14:16). Similarly, Earth is also a "cradle" for humanity (20:25). At the same time, however, it is a tool of punishment that swallows non-believers, such as Korah, a wealthy man who opposed God and was consumed by the Earth because of his non-belief (29:40). Earth glorifies God, and suffers when inappropriate things are attributed to God. For example, the Qur'an indicates, "the heavens are torn and the Earth is split asunder and the mountains fall in ruins, that ye ascribe unto the Beneficent a son .. ." (19:90–91). The Earth is treated as a living creature, when the Qur'an says, "And the heaven and the Earth wept not for them [the non-believers] .. ." (44:29).

The Qur'an gives examples of the bounties of God seen in nature. There are many examples of nature's modification for the benefit of humanity. The Qur'an laments the lack of human understanding, saying,

Have they not seen how We have created for them of Our handiwork the cattle, so that they are their owners and have subdued them unto them so that some of them they have for riding, some for food? Benefits and diverse drinks have they from them. Will they not then give thanks? (36:71–73).

The following verse wonderfully illustrates the benefits of natural elements for man:

Let man consider his food. How we pour water in shower. Then split the earth in clefts. And cause the grain to grow therein. And grapes and green fodder and olive-trees and palm-trees and garden-closes of thick foliage and fruits and grasses. Provision for you and your cattle (80:24–32).

Again and again the Qur'an reveals the things that God has created for the benefit of humanity: "And We have given you (mankind) power in the Earth, and appointed for you therein a livelihood .. ." (7:10). Ten verses in chapter 78 are dedicated to listing the things that God has created as a gift for humanity. For example, Earth is to serve as a cradle for humans, the mountains are to serve as protections, sleeping is to provide a rest, night is to be like a covering garment, and day is to be a time of work, and the sun is to be a dazzling lamp (78:6–16). Thus, "clouds heavy with rain" is another phenomenon that the Qur'an mentions as from God's mercy:

He it is who sends the winds as tidings heralding His mercy, till when they bear a cloud heavy with rain, We lead it to a dead land, and cause water to descend thereon and thereby bring forth fruits of every kind (7:5).

The Qur'an speaks of nature as related to the divine. That is to say, the Qur'an wants to open the veil of nature covering the hands of God, and thus make understood the ultimate reality of God, beyond cause and effect. Humanity, in turn, is expected to reflect and be thankful for all the bounties of God. This thankfulness necessitates that humanity act responsibly as God's viceroys and protect nature. Humans must utilize the bounties of God carefully and without waste, in order to express their thankfulness.

Therefore, all types of pollution are prohibited by the Qur'an. For example, the Qur'an says that "the wasteful are the friends of Satan" (17:27) and "God does not like the wasteful" (10:83). Wasting includes any misuse of natural resources. The Qur'an teaches people to use resources economically; this teaching is so strong that a person may not waste water, even if he or she lives next to the ocean. Also, noise pollution is to be prevented by the Qur'anic command "Don't be arrogant in your walking on Earth. Be humble, lower your voice. The most detestable voice is that of an ass" (31:18–19). Pollution of the body, as well as of the environment, is prohibited by the Qur'an. The Qur'anic teaching of cleanliness is very compatible with the modern hygienic process of preventing disease and promoting healthcare. For example, the Qur'an asks believers to wash their faces and their hands up to the elbows, clean their hair, and to wash their feet before prayers. If people are unclean they are not to approach prayer until they purify themselves (5:6). Muslims are expected to perform the prescribed cleansing before each of the five daily prayers. According to the Qur'an, if someone comes from the water closet, they are asked to clean themselves with water (5:6). A woman at the end of her monthly period is asked to bathe, and she is to refrain from sexual intercourse during this time (2:2). Even the Qur'an itself is not to be touched but by clean people (56:79). God loves those who are clean (200:22, 9:106). The tool of cleanliness is primarily water, thus the natural element of water has a special significance in the Qur'an. The Qur'an also stresses the importance of preserving a clean environment. For example, Abraham and Ishmael are asked to clean

the house of God (2:125). Humans are also directed to preserve the cleanliness of their outdoor environment. The Qur'an indicates that the natural world is to be kept from pollution, because God sends rainwater to clean the Earth: "We send water from the sky as a cleaner for you" (25:48). Thus the Qur'an suggests a clean environment.

The Qur'anic paradigm of such environment is found in the description of paradise. The Qur'anic name for Paradise is Jannah (garden); it is filled with trees, rivers of milk, flowers, and fruits. The basic description of Paradise is a place under which rivers run. Therefore, the environment of Paradise is one of water and greenery (2:25, 3:15). Even the fruits of Paradise are eternal (9:21). There are beautiful springs (44:52). The Qur'an, by describing the beauty of Paradise, stresses the importance of environment. This description is intended to serve as a model for earthly abodes. For example, modern Islamic architecture is influenced by the Qur'anic description of Paradise, as being without a sun, or direct source of light, and having only indirect light. Modern Islamic architecture attempts to utilize indirect light, while blocking harsh direct light. The Qur'an does not give any information about the location of Paradise. It does say that Paradise is located in the world of the unseen, a realm parallel to our own. It is understood that this world can be seen after the end of this physical life. It says it is an abode of righteous people; those who do good deeds toward humans and nature. To create a paradise-like environment on Earth complements the Muslim desire for Paradise. The destruction of nature affects the Muslim's entry into the final abode of Paradise. Destruction of nature on Earth is unlawful according to Islamic tradition. This might serve as an obstacle for one's entry into Paradise. Having a paradise-like life on Earth is not an obstacle on the path to Paradise after death; on the contrary, it is a preparation for that future life. People should thus make this Earthly environment as beautiful as possible.

According to the Qur'an, nature is not eternal. The end of nature is a kind of punishment for humankind, but is also an appointed time, which God has promised to bring. The end will be in the form of a natural disaster described in the Qur'an. For example, the Qur'an says, in a chapter entitled "Earthquake," that "the Earth will be shaken with her final earthquake" (100:1). The sky will be torn away and mountains will become like discarded wool (81:11). The hills will move, the sun will cease to shine, and the stars will fall (81:1, 2). The planets will disperse and the moon will split (82:2, 54:1). Seas will be poured forth and will rise (81:6, 82:3). According to the Qur'an, the Earth will be replaced with another "Earth" different from this one (14:48). This will be a transformation from the transient world to the eternal world. It is understood, from Qur'anic verses, that all of these things will occur because of the corruption of humans. By polluting the Earth and wasting the bounties of God, humans hasten the Earth's end. However, another Qur'anic verse offers hope if God's creation is respected and protected by humanity: "If they do right, they will not be punished" (11:117). There is an Islamic tradition (8:33; 17:15) which indicates that as long as people are obedient to God, this system that God created in the universe will continue. In this way there would be no destruction. It is believed that the destruction

of preIslamic nations resulted from their disobedience toward God. If they had obeyed God, then the result would have been different; there would have been no destruction. This is a general principle, understood from an overall picture of the Qur'an. However, there are also several verses which discuss the appointed time for the end of this worldly life. This is not because it is a terrible fate to expect; it is instead referring to the end of the period of the test. This life is a test, and when this period ends, people will be either rewarded or punished. The reward will come in the afterlife. Muslim traditions, when speaking of the end of this life, say that God will take the lives of all believers in him, in an easy and beautiful way, in order not to destroy the Earth upon them. They will not have to face the destruction of the Earth. When they are resurrected, they will find themselves in a changed, eternal place. The destruction is not a punishment; it simply serves to end one period, while ushering in the beginning of a new, eternal life. To clarify further, according to Qur'anic traditions, the Earth has been created as a house for humanity. Humans are responsible for the upkeep of this house. It is a ship which takes humanity to the land of eternity. Humanity is in a perpetual state of motion and travel. The ship, then, is well protected in the ocean of space. If the Earth is ever destroyed so too will the lives of humans be destroyed. Life on Earth is a test for humanity. The Qur'an mentions a huge earthquake, but it is not meant to be a punishment for humanity. There is an element of irony here. A Qur'anic verse indicates that the end of time will occur during a time of human corruption. Although this happened because of human free will, God knew beforehand that this would occur. There are several matters intertwined, namely human free will, God's destiny and the destruction of the Earth. This change is apparently a punishment which occurs as a result of corruption. For real believers, however, it is symbolic of a change to a better reality. God is thought to act with wisdom, according to various laws and principles. In the world to come, God's name al-Qadir will be dominant. As a result of this, everything will occur simultaneously. According to the Qur'an, there are signs for the final Hour (47:18), as there is prophetic tradition (Muslim, al-Fitan, 39–40). Where ten signs of the Hour are listed, the final of these signs is the rising of the sun from the west. This marks the end of the test, with a positive change occurring for those who pass. The Qur'an describes this end in the following verses: "And the garden (Jannah) will be brought nigh to the righteous and hell (al-Jaheem) will appear plainly to the erring" (26:90– 91).

R

Radical Environmentalism

Radical environmentalism most commonly brings to mind the actions of those who break laws in sometimes dramatic displays of “direct action” in defense of nature. Such action – which may involve civil disobedience and sabotage, some instances of which involve risks to people – have generated criticism and vilification of these movements. Radical environmentalists are sometimes labeled terrorists and believed to harbor, and hope to develop, weapons of mass death. The focus on their tactics, real and imagined, often obscures their religious motivations as well as their ecological, political, and moral claims. Not all radical environmentalists engage in illegal activities, of course, and many specific tactics are controversial within these movements, especially those which might entail risks to living things, including human adversaries. While the embrace of direct action and support for extra-legal nature defense is an important common denominator in radical environmental sub-cultures, it is even more important to understand radical environmentalism as a cluster of environmental political philosophies, and corresponding social movements, which claim to understand the roots of the environmental crisis and offer effective solutions to it. In this sense radical environmentalism includes not only groups like EARTH FIRST! AND THE EARTH LIBERATION FRONT, but also bioregionalists and green anarchists, deep ecologists and ecopsychologists, ecofeminists and participants in the feminist spirituality movement, Pagans and Wiccans, anti-globalization protestors and some animal-liberation activists.

Radical environmentalists can be recognized by their diagnoses and prescriptions regarding the environmental crisis. Their diagnoses generally involve a critique of the dominant streams of occidental religion and philosophy, which are said to desacralize nature and promote oppressive attitudes toward it, as well as toward people. Prescriptions generally include overturning anthropocentric and hierarchical attitudes (especially capitalist and patriarchal ones). Accomplishing this is generally believed to require “resacralizing” and reconnecting with nature (which is usually gendered as female, as in “mother earth” or “mother nature”), combined with direct-action resistance to oppression in all forms.

Reconnection and consciousness transformation can be facilitated in a number of ways. Most important among these is spending time in nature with a receptive heart, for the central spiritual episteme among radical environmentalists is that people can learn to “listen to the land” and discern its sacred voices. Other means of evoking and deepening a proper spiritual perception include visual art (appearing in tabloids or photography presented in public performances), which appeal to one’s intuitive sense

of the sacredness of intact ecosystems, and music, dancing, drumming (sometimes combined with sacred herbs or “ENTHEOGENS”), which can erode the everyday sense of ego and independence in favor of feelings of belonging to the universe, or even kindle animistic perceptions of interspecies communication.

Many radical environmentalists can accurately be labeled “nature mystics.” And many of them express affinity with religions they generally consider more nature-beneficent than occidental religions, such as those originating in Asia such as Buddhism and Daoism, religious beliefs or practices surviving among the world’s remnant indigenous peoples, or being revitalized or invented anew, such as PAGANISM and WICCA. Paganism and Wicca are considered to be (or to be inspired by) the Aboriginal nature religions of the Western world, which have been long suppressed by imperial Christianity and Islam.

Sometimes newly invented nature spiritualities, such as JAMES LOVELOCK’s Gaia hypothesis or THOMAS BERRY’s Universe Story (and the corresponding EPIC OF EVOLUTION), have become new, free-standing religious movements which promote radical environmental ideas. Other times, stories without an immediately apparent religious theme, such as ALDO LEOPOLD’s epiphany about the intrinsic value of all life, including predators, upon seeing the “green fire” die in the eyes of a she-wolf he had shot, have become mythic fables incorporated into poetry, song, and movement ritualizing. Regularly, newly invented songs, myths, or nature-related ritual forms are grafted onto already existing religious forms in the constantly changing religious bricolage that characterizes countercultural spirituality in general, and radical environmentalism in particular. Increasingly, nature-related spiritualities birthed and incubated at the margins of countercultural environmentalism are escaping these enclaves and influencing both mainstream environmentalism and institutional religion, and arguably, even institutions like the United Nations, and the UNITED NATIONS’ “EARTH SUMMITS.” In such ways radical environmental spirituality has, despite its marginality, become a significant social force.

Whatever the nature of the hybrids and new religious amalgamations, the religious alternatives to occidental monotheisms that characterize radical environmentalism are thought to harbor environmentally friendly values and to promote behaviors that cohere with them. These alternatives promote not only a sacralization of nature but a kinship ethics wherein all life forms are considered family in the journey of evolution. Within this kind of worldview, all life deserves respect and reverent care.

Not all participants in radical environmental movements, of course, consider themselves “religious,” and this includes many scientists and CONSERVATION BIOLOGY pioneers who have supported certain radical environmental groups and initiatives. Participants who do not consider themselves religious usually say this is because they equate religion with the Western, institutional forms that they consider authoritarian and anti-nature, and have thus rejected. Nevertheless, such figures rarely object to and almost always rely on metaphors of the sacred to express their conviction that nature has intrinsic value (value apart from its utility for humans). They likewise commonly

describe environmental destruction as “desecration” or “defilement.” Even though some participants in these movements consider themselves atheists, this generally means they do not believe in other-worldly deities or divine rescue from this world, not that they disbelieve that there is a sacred dimension to the universe and biosphere. And they often characterize as “spiritual” their own connections to nature and ultimate values.

Certainly religious studies scholars can identify features of these movements that are typical of what they call “religion.” They have myth, symbol, and ritual, for example. The myths usually delineate how the world came to be (cosmogony), what it is like (cosmology), how people fit in and what they are capable of (moral anthropology), and what the future holds. Whatever the variations may be, radical environmentalists share an evolutionary cosmology and cosmogony – they generally derive their view of the unfolding universe from cosmological and evolutionary science and their understandings of humanity from primatology and anthropology. Their apocalyptic view of the present – namely that human beings are precipitating a massive extinction episode and threatening life on Earth – are gathered from contemporary environmental science. They differ widely over whether, how, and when there might be a reharmonization of life on Earth, based on differing perceptions about human beings and their potential for changing in a positive direction.

Toward the envisioned, needed changes, radical environmentalists have invented new forms of ritualizing, such as the COUNCIL OF ALL BEINGS, to promote proper spiritual perception. Such ritualizing functions in a typically religious way, drawing devotees and intensifying commitment. Moreover, movement stories and rituals express ethical mores and social critiques that are essential to the action repertoires of the movement.

Although such stories and ritualizing promote solidarity and ethical action, radical environmentalism is plural and contested, both politically and religiously; it is characterized by ongoing controversies over strategies and tactics, as well as over who owns, interprets and performs the myths and rites. Nevertheless, certain core beliefs, values, and practices make it possible to speak of “radical environmentalism” in the singular, as a complex and plural family; for there are some critical ideas and beliefs that unify these groups, at the same time that there are penultimate ideas and practices that produce various and different tendencies, priorities, and practices.

Views generally shared by radical environmentalists are depicted in the chart below, “Binary Associations Typical of Radical Environmentalism” (adapted from Taylor 2000: 276).

Shades of Radical Environmentalism

Differing stresses on the relative importance of such elements lead to differing priorities and factions among radical environmentalists. Among the most militant and

bestknown branches of the radical environmental tree are EARTH FIRST! AND THE EARTH LIBERATION FRONT, which are discussed separately in more detail elsewhere in this

Binary Associations Typical of Radical Environmentalism

Good Bad

Foraging (or small-scale organic horticultural) societies Pastoral and agricultural societies

Animistic, Pantheistic, Indigenous, Goddess-Matriarchal, or Asian Religions

Monotheistic, Sky-God, Patriarchal, Western religions Anthropocentrism (promotes destruction)

Biocentrism/Ecocentrism/Kinship ethics (promotes conservation) Reason (especially instrumental) Intuition Mechanistic & dualistic worldviews

Holistic worldviews Centralization

Decentralism Modern technology

Primitive technology Globalization and international trade

Regional self-sufficiency Hierarchy/Nation-states/Corruption/Authoritarianism

Anarchism/Bioregionalism/Participatory democracy Pragmatism Radicalism encyclopedia. They tend to be among the most apocalyptic in their view of the human role in causing species extinctions and the most insistent that political systems are corrupt, dominated by corporate and nation-state elites, who cannot be reformed and must be resisted. Other branches of radical environmentalism have their own distinctive emphases, but in reviewing these branches it is important to recognize the extent to which they are engaged in a reciprocal process of mutual influence, often sharing religious and ethical ideas, political perceptions, and tactical innovations.

Green Anarchism, Daoism, and Paganism

Green anarchists and social ecologists focus on hierarchy as the chief cause of social and environmental calamity. Anarchists exposed to radical environmental thought rather easily adopt environmental and animal liberationist concerns, as anthropocentrism and “speciesism” are obviously oppressive, hierarchal value systems. (Speciesism is a term coined by Richard Ryder and spread widely by the Animal Liberationist philosopher Peter Singer to liken the oppression of animals to racism or sexism.) Moreover, because small-scale, indigenous societies are viewed as more ecologically sensitive and less(or non-) hierarchal, they and their supposedly animistic nature religiosity are often held in high esteem. Indigenous societies are therefore viewed, and increasingly so, as religious and ethical models for a post-revolutionary world.

This is a remarkable development given how much anarchist thought was birthed in Europe and has long had a decidedly anti-religious ethos. In European anarchist thought, religions have often been viewed as the instrument of rulers used to legitimate and maintain oppressive regimes. Early in the emergence of radical environmentalism, figures like the social ecologist Murray Bookchin were harshly critical of the nature mysticism he believed typical among radical environmentalists; this was an unsurprising critique given anarchist history.

Increasing numbers of anarchist thinkers, however, such as John Clark, have countered that religions such as Daoism, and many minority sects within larger religions, have promoted environmentally sensitive forms of anarchism. Meanwhile other anarchist thinkers, such as John Zerzan, who promotes a type of anarchoprimitivism, express increasing openness to considering non-hierarchical, nature-spirituality as an important resource for the struggle to overturn industrial civilization (telephone discussion with Zerzan, October 2003). And this kind of anarchism has become increasingly influential within the radical environmental milieu, including within Earth First! and the Earth Liberation Front. Moreover, certain streams of Paganism and Wicca have adopted anarchist ideology or had members promoting it enthusiastically, from the DONGA TRIBE and DRAGON ENVIRONMENTAL NETWORK in the United Kingdom to the CHURCH OF ALL WORLDS in

Northern California. Perhaps best known in this regard has been the Wiccan priestess and author STARHAWK, whose RECLAIMING collectives by early in the twenty-first century had spread beyond the San Francisco Bay area, gaining adherents and sponsoring events at a wide variety of locations throughout the United States and Western Europe. Indeed, Starhawk's long-term work within the antiglobalization movement has both drawn Pagans and Wiccans into it while also exposing other anti-globalists to this kind of anarchistic, radical environmental Paganism.

Bioregionalism

BIOREGIONALISM is a rapidly growing green political philosophy that by the turn of the twenty-first century boasted over a hundred regional organizations in the United States, and conservatively, at least several thousand adherents. Jim Dodge, an early proponent, explained in an early treatise that the term comes “from the Greek bios (life) and the French region (region), itself from the Latin regia (territory), and earlier, regere (to rule or govern).” A bioregion, therefore, as “life territory” or “place of life,” can mean, “perhaps by reckless extension, government by life” (1981: 7).

The three tributaries to bioregionalism are thus, according to Dodge: “regionalism” (with regions defined by one or another set of ecological criteria), “anarchism” (meaning “political decentralization, self-determination, and a commitment to social equity”), and “spirituality” (with its key sources being, “the primitive animist/Great Spirit tradition,

various Eastern and esoteric religious practices, and plain ol' paying attention") (Dodge 1981: 7–9).

Put simply, bioregionalism envisions decentralized community self-rule ("participatory" or "direct" democracy), within political boundaries redrawn to reflect the natural contours of differing ecosystem types. Its goal is the creation (some would say "remembering" or "borrowing") of sustainable human societies in harmony with the natural world and consistent with the flourishing of all native species.

Bioregionalism is animated by two central convictions:

1) people within a given ecological region can, by virtue of "being there" and "learning the land" (its climate patterns, native flora and fauna, water systems, soils, and even its spirits), better care for and build ecologically sustainable lifeways than can people and institutions placed further away; and 2) if local communities are to revision and construct sustainable and just lifeways, a fundamental reorienting of human consciousness is needed – at least this is the case for modern, industrial humans. As with other branches of radical environmentalism, this reformation of consciousness includes a "deep ecological" valuing of the natural world for its own sake. Usually this deep ecological conviction is tied to a perception that the land is sacred and its inhabitants are kin to whom humans owe reverence and care giving. Moreover, we should listen to and learn from the land and its inhabitants. As the bioregionalist poet Gary Lawless put it in *Home: A Bioregional Reader* (1990),

When the animals come to us, asking for our help will we know what they are saying?

When the plants speak to us in their delicate, beautiful language, will we be able to answer them?

When the planet herself sings to us in our dreams, will we be able to wake ourselves and act? (in Taylor 2000: 50)

Not only Lawless and Dodge express affinity with animism or Gaian spirituality; so have most of the pioneers of the bioregional movement. Some of them wrote books that convey such spiritual perceptions which, they believe, have affinity with the spirituality of indigenous peoples – for example GARY SNYDER in *Turtle Island* (1969), David Abram in *The Spell of the Sensuous* (1996) and Freeman House in *Totem Salmon* (1999). Snyder's book was especially important, breaking ground by promoting both animistic spirituality and a bioregional sensibility, thereby significantly contributing to another wave of America's countercultural BACK TO THE LAND MOVEMENTS. And *Turtle Island* was one of the first books to use the term "biological diversity" (1969: 108) and to champion its importance, placing Snyder among the earliest proponents of deep ecological and radical environmental thought.

Although bioregionalists share the ecological apocalypticism common within radical environmental subcultures, they tend to be somewhat more hopeful than their more militant brethren that the worst of the suffering brought on by environmental degradation can be avoided. Instead, they generally tend to take a longer view, believing that

by working on alternative visions and models for spirituality, livelihoods and politics, they can point the way toward a sustainable future.

Ecopsychology

ECOPSYCHOLOGY is both a distinct enclave within radical environmentalism and a significant contributor to its spirituality and religious practice. Ecopsychology can be traced at least as far back as the publication of *Nature and Madness* (1982) by the influential ecologist and environmental theorist PAUL SHEPARD. Gary Snyder and Shepard are probably the most influential scholars of radical environmental and deep ecology theory in America. In their own ways they both provided critical spadework for bioregionalism, ecopsychology, and neo-animism, all of which are closely related, and reinforce a radical environmental worldview.

Put simply, ecopsychology considers human alienation from nature as a disease born of Western agriculture and its attendant monotheistic religions and dualistic philosophies. It offers as a prescription diverse therapeutic and ritual strategies, including WILDERNESS RITES OF PASSAGE and

RE-EARTHING processes, as well as workshops in BREATHWORK and Spiritual Activism.

Interestingly, ecopsychology has had increasing intersections with the psychodynamic therapy of Carl Jung and the therapeutic schools known as Humanistic and Transpersonal Psychology. James Hillman, one of the leading figures in Jungian, archetypal psychology, for example, took a surprising ecological turn with the publication (with Michael Ventura) of *We've Had a Hundred Years of Psychotherapy and the World's Getting Worse* (1993). This complemented a growing number of books (for example by Theodore Roszak, Warwick Fox, David Abram, Roger Walsh, Ralph Metzner, and Andy Fisher) promoting earthen spiritualities, therapies, and ritual processes – pantheistic, Gaian, animistic, indigenous, and shamanistic – as antidotes to human alienation from nature and as a means to foster an environmental renaissance.

On-the-ground evidence of the blending of ecopsychology with a radical environmental-style deep ecology was evident in 1993 and 1995 at two conferences sponsored by the International Transpersonal Association, the first in Ireland, the second in Brazil. Both conferences included an eclectic mix of proponents of New Age spirituality and transpersonal psychology. The Ireland gathering featured figures known for working at the intersection of consciousness, spirituality, and New Age spirituality (Ram Dass, Stanislav Grof, and Roger Walsh), radical environmentalists, especially those who had worked with indigenous peoples (David Abram, Alastair McIntosh, and Erik Van Lennep) and indigenous environmental justice advocates (Winona LaDuke, Millilani Trask, and others) and the Indian ecofeminist and anti-globalization leader Vandana Shiva.

The psychologist Ralph Metzner, who was the driving force behind these two conferences, labored to build bridges between these therapeutic, New Age, and radical environmental sub-cultures. His own nature-spirituality began with his participation with Timothy Leary in some of the earliest LSD experiments at Harvard. But he found in the 1990s that his bridge-building efforts had limits. A number of Transpersonal Association Board members felt he had taken the organization too dramatically in a radical environmental direction. Nevertheless, he continued to work toward the transformation of human consciousness that he considered a prerequisite to environmental sustainability, including helping organize a conference in San Francisco in the year 2000, this time sponsored not by the International Transpersonal Association, but by the California Institute of Integral Studies. Titled “Ayahuasca: Shamanism, Science and Spirituality,” the conference was devoted to the use of entheogenic plant medicines (and in particular to the Ayahuasca plant used for spiritual and medicinal purposes by a number of Amazonian peoples). Metzner had come to believe that, if taken in proper spiritual and therapeutic contexts, sacred plants like Ayahuasca can play a positive role in transforming human consciousness in ways that promote deep ecological spirituality and ethics.

The suspicion of some transpersonal psychology advocates (like those on the International Transpersonal Association board) toward radical environmentalists is reciprocated by radical greens who view with suspicion the emphasis on personal experience that is prevalent among ecopsychologists. Many radical environmentalists feel the critical thing, once one understands the environmental crisis and the accelerating rate of species extinction, is to resist the destruction. Such activists may be sympathetic to and even influenced by the nature spirituality in ecopsychology but critical of what they take to be its self-indulgent tendencies. Such mutual suspicion is likely to be longstanding and keep these groups from forming strong strategic alliances. Nevertheless, there is substantial worldview agreement, and significant mutual influence, between ecopsychologists and other radical greens.

Ecofeminism and Feminist Spirituality Movements

This general worldview agreement is true also for ECOFEMINISM, which, like green anarchism and bioregionalism, is especially critically of hierarchy, but stresses a particular kind, patriarchy, as the most fundamental cause of environmental decline and interhuman injustice. Some ecofeminists have been harshly critical of at least some radical environmentalists, particular in the early years of the Earth First! movement, viewing it as led by boorish and sexist men. But generally speaking, these criticisms have come more from individuals outside of these movements than inside of them. Radical environmental groups are so deeply influenced by both anarchist and feminist ideals and individuals that they are vigilant against behavior that appears to be

hierarchical or sexist, indeed, to the point that some activists believe this and other anthropocentric concerns have distracted the movement from its biocentric mission.

The basic proposition of ecofeminism, that a “logic of domination” is at work in modern civilizations which subjugates women and nature, is quite widely accepted within radical environmental sub-cultures. This provides a solid ground for collaboration between ecofeminists and other radical environmentalists. It may be that it was the affinity for such ideas within radical environmental sub-cultures that drew ecofeminists to them in the first place. It is certainly true that aggressive environmental campaigns were looked upon favorably by many ecofeminists, drawing many of them and their ideas into the movement. Whatever dynamics were most responsible, ecofeminist perspectives have been influential and sexism has been taken seriously within the radical environmental milieu.

Animal Rights and Animal Liberationism

In their most influential, early articulations, “animal rights” and “animal liberation” philosophies, as articulated by Peter Singer or Tom Regan, were not articulated in religious terms. These ethics have not, generally speaking, been considered close kin to radical environmentalism in the philosophical literature. Yet there are interesting intersections both religiously and ethically between animal-focused and radical environmental activism and ethics, as well as significant differences. As explained in ENVIRONMENTAL ETHICS, the apprehension of the value of animals, and the affective connection to them, can be understood in spiritual terms by participants in these movements and such spirituality sometimes leads to the development of ceremonies to express and deepen such perceptions, as is the case with Tom Regan.

The key to understanding whether animal liberationists fit in a radical environmental camp, of course, depends on how one defines radical environmentalism. One prerequisite seems clear: radical environmentalism must be biocentric or ecocentric; the good of whole ecosystems and well-being of habitats must take precedence over the lives or well-being of individual sentient animals. As unfortunate as it may be, there are many cases where a moral agent cannot have it both ways. With animal rights or liberationist perspectives, there is no reason to value organisms which there is little reason to believe can suffer (plants or amoebas for example), or to prefer the lives of individuals essential to the survival of an endangered species over those who are not. Radical environmentalists but not animal liberationists approve of hunting, for example, in cases where killing is the only effective means to reduce the populations of animals threatening endangered species. These are intractable differences.

Yet in the cross-fertilizing milieu of radical environmental and animal liberationist sub-cultures, there are many causes in which collaboration is not only possible but common. Such encounters rarely if ever cause a narrowing of ethical concern among the radical environmentalists to an exclusive concern for sentient animals, although

environmentalists often adopt a vegetarian or vegan lifestyle out of revulsion for the ways animals raised for food are treated. Such encounters more often facilitate the broadening of ethical concern among animal liberationists toward an ecocentric perspective. Moreover, as animal liberationists move toward greater collaboration with radical environmentalists and become engaged with them, those who continue in such collaborations tend to shift their activist priorities toward issues that have more to do with the protection of wild, endangered animals than with protecting domestic animals. Animal activists rarely, however, abandon entirely their activism on behalf of domesticated animals and generally retain their lifestyle choices, such as veganism, even if they become more biocentric in their overall ethical outlook.

In addition to a biocentric outlook, radical environmentalism also involves a political ideology harshly critical of current political arrangements if not of nation-state governance itself. Here, participants in animal liberation movements are as diverse as other radical environmentalists, from those who retain hope that their movement of conscience will precipitate effective political reforms, to anarchists who believe the entire system must be torn down.

Animal rights and liberation movements, then, prompt some radical environmentalists to add to their array of concerns, sentient, domestic animals, and in a reciprocal way, often provide new activists for biodiversity protection campaigns. And they are often influenced by the religious metaphysics of interconnection and kinship ethics often found in the increasingly global environmental milieu. Nevertheless, a philosophical line between individualism and holism limits the extent to which animal liberationist sub-cultures belong to radical environmental ones, despite the efforts of some activists, such as Animal Liberation Front activist Rodney Coronado, to unite these sub-cultures.

Breakout Box Begins: Rodney Coronado and the Animal Liberation Front

The Animal Liberation Front (ALF), which was founded in the United Kingdom in 1976 and has spread to many other countries in Europe as well as having a strong presence in the United States and Canada, can be considered, in many but not all ways, to be a radical environmental group. One of the ALF's most notorious activists, Rodney Coronado, has worked hard to build bridges between radical environmental, animal liberationist, and anarchist sub-cultures, especially in North America. His activist career illuminates the affinities and limits to the fusion of the Animal Liberation Front and radical environmentalism.

Moved and angered by the suffering he witnessed when viewing a television documentary about the Canadian harp seal hunt when he was 12 years old, Coronado immediately contacted and sent money to Captain Paul Watson of the Sea Shepard Conservation Society, who was featured in the film directly resisting the sealers. Seven

years later, in 1985, Coronado volunteered as a crew member, and a year later in a Sea Shepard-supported mission, he helped destroy a whaleprocessing station and sink two whaling ships in Iceland.

After this Coronado became a spokesperson for the Animal Liberation Front, and in 1988 attended the national Earth First! Rendezvous. There he flew anarchist and ALF flags, which helped to escalate already present political and ethical tensions, which showed the fault line between the animal liberationists, like Coronado, and biocentric activists including meat-eating ones like Earth First! co-founder Dave Foreman, who took pleasure in grilling steaks near these vegan activists.

Coronado would soon launch an aggressive campaign against the fur industry, infiltrating it to capture images of the suffering animals, releasing minks from their cages (with ceremonial blessings from a Blackfoot medicine woman who “smudged them off” as they were sent “into the wild world for the first time”), and beginning in 1991, torching the facilities of a number of industryaffiliated researchers. Coronado eventually served four years in prison for a 1992 arson attack on the office of a Michigan State University researcher for which the ALF had claimed responsibility. After his release from prison Coronado worked periodically for the *Earth First!* journal, contributing significantly to its increasingly militant and anarchistic character, and began to travel regularly to promote radical environmental and animal liberationist activism at university campuses and other venues. He became a visible and charismatic activist working at the intersection of animal liberationist and radical environmental sub-cultures.

Coronado considers himself an indigenous and spiritual natural rights activist, promoting freedom both for domestic and wild animals, as well as indigenous and other oppressed peoples. An activist of Pascua Yaqui Indian ancestry from the Southwestern United States, he believes that the destruction of life comes from the same, dominating mindset of the European conquistadors; consequently the liberation of nature, animals, and human beings, are mutually dependent:

I never became first an environmental activist, then an animal rights activist and then an indigenous rights activist. I always was a natural rights activist because I believe everything in nature has a right to exist (Wolff 1995: 24).

Moreover, Coronado claims that spiritual power depends on its connection to the power of Earth, its spirits, and animal relations:

As an indigenous person, I’ve had to relearn that fighting for the Earth as Earth First! does is a very old, sacred and honorable duty. It’s one where I’ve learned that we can be the most effective when we take advantage of the knowledge and power our enemies know nothing of. They have laughed at this kind of thing for hundreds of years, and I’m glad they don’t get it. They never will, but I’ve seen the Earth spirits. I pray to them and have had them help me carry out successful attacks against the Earth’s enemies. I know that when I was out there on the run, it was they who protected me and warned me of danger . . . Spirituality [is] . . . a kind of road map one uses to successfully navigate through life . . . When who you are and what you are is about the Earth, you learn that your own true power can only come from the

Earth. That's what Geronimo and other great warriors knew. Only when we believe in our own power more than that of our enemies will we rediscover the kind of power the Earth has available to us as warriors. My power comes from the very things I fight for (interview in *Earth First!* 23:3 (2003), online).

Indeed, "Anarchism" itself, Coronado believes, "is grounded in spirituality, in listening to the Earth and her creatures" (public talk, the University of Florida, March 2003). And thus for Coronado, anarchism, animal activism, and Earth liberation are all grounded in an animistic episteme, a religious thread common to radical environmentalist groups.

Despite his efforts to fuse animal, anarchist, and Earth activism, Coronado believes that if a choice must be made between an individual animal (including a human animal) and the health of an ecosystem or the survival of a species, he would prioritize the latter (author's interview, Fresno, California, February 2003). He would insist, however, that while such a concession might occasionally be a tragic necessity in the short term, the long-term struggle is to make such tragic choices unnecessary and a thing of the past. Even so, Coronado's viewpoint suggests that while radical environmentalists, anarchists, and animal liberationists will often find common cause, the difference between spiritual holism and empathetic individualism will prevent these groups from a thoroughgoing fusion.

Bron Taylor

Criticisms and Responses

There are as many criticisms of radical environmentalism as there are differing ideas, emphases, factions and priorities within these movements and adversaries to them. Some of the criticisms come, of course, from those who profit from resource extraction of various sorts, who sometimes label vandalism, verbally abusive behavior, or even civil disobedience as "ecoterrorism." But criticisms also come from other environmentalists as well as a wide variety of religious actors, social justice advocates, and political theorists.

Some of the typical arguments are not directly or obviously related to religion. For example, environmentalists and liberal democrats Martin Lewis and Luc Ferry, claim that these movements are atavistic, primitivist, and Luddite; offer no realistic way to live in the modern world; and are anti-democratic, refusing to abide by decisions arrived at through democratic processes. Others argue that these movements are counterproductive to building sustainable societies because they do not value and support science, which is a critical foundation for environment-related public policies, but is already assailed by religious conservatives and hardly needs its credibility further eroded in the public mind by radical greens.

Some in the less developed world, such as Ramachandra Guha, have criticized the effort to protect wilderness and biodiversity as elitist, misanthropic, and callous to the

needs of the poor. As radical environmentalism turned its attention to globalization, some multinational corporations piggybacked on such criticisms, arguing that the aversion of radical greens to biotechnology and free trade reflected a pernicious elitism that is callous to the needs of growing human populations.

Meanwhile, religious conservatives from the Abrahamic traditions often view these Pagan or quasi-pagan movements with suspicion or worse, as agents of dark, demonic forces. It is not uncommon for corporations, perhaps especially in rural communities with religiously conservative workers, to fan such fears among them in order to galvanize support during resource-related controversies. Some writers on radical environmental movements contribute to such fears. In *Earth First!: Environmental Apocalypse* and subsequent articles, Martha Lee asserted that some radical environmentalists represent violence-prone forms of religious millenarianism. Gary Ackerman, Deputy Director of the Chemical and Biological Weapons Nonproliferation Program at the Monterey Institute of International Studies, concluded even more chillingly that the likelihood is increasing that one or another radical environmental group will deploy weapons of mass death to promote their cause.

Social scientists and political theorists sympathetic to environmental causes have, more judiciously, focused on radical environmentalism's typical presuppositions, diagnoses, prescriptions, and tactics. They often find these simplistic and counterproductive.

Radical environmentalists widely presume, for example, that a transformation or "resacralization" of consciousness is necessary for radical action to occur. But scholars who have studied grassroots environmental movements globally have found that direct-action resistance to environmental degradation has also been undertaken by those whose religious traditions are Abrahamic or whose value systems are anthropocentric. Moreover, the common radical environmental belief in the importance of consciousness toward a spiritual biocentrism and away from monotheisms does not fully appreciate the extent to which all religions are malleable and change in response to changing and exigent circumstances.

The radical environmental prescription to decentralize political arrangements by abolishing nation-states has also been sharply criticized by a number of political theorists, including Andrew Dobson, Dan Deudney, and Paul Wapner. Another critic, Andrew Bard Schmookler, criticized green anarchism not only in general in *The Parable of the Tribes*, but also right in the pages of the *Earth First!* journal. He asked how good people can prevent being dominated by a ruthless few, and what will prevent hierarchies from emerging if decentralized political self-rule is ever achieved. One does not have to believe all people are bad to recognize that not all people will be good, he argued, and unless bad people all become good, there is no solution to violence other than some kind of government to restrain the evil few; moreover, those who exploit nature gather more power to themselves, and therefore, there must be institutions to restrain that growing power. While Schmookler agreed that political decentralization could be beneficial, it must be accompanied by a "world order sufficient [to thwart]

would-be conquerors” and “since the biosphere is a globally interdependent web, that world order should be able to constrain any of the actors from fouling the Earth. This requires laws and means of enforcement” (1986: 22). There is no escaping government or the need to deal with power, Schmookler concluded, because “our emergence out of the natural order makes power an inevitable problem for human affairs, and only power can control power” (1986: 22). Schookler’s analysis challenged not only the decentralist social philosophy of radical environmentalism and much green political thought, but also the prevalent hope that a return to smallscale, tribal societies, with their nature-based spiritualities, would solve our environmental predicaments.

Radical environmentalists would or could respond to the battery of criticisms they typically face along the following lines. To environmentalists who assert that they hurt the environmental cause they could point out, accurately, that many mainstream environmentalists, even some who denounce them publicly, share their sense of urgency and feel that radical tactics contribute significantly to the environmental cause, in part by strengthening the negotiating positions of “moderate” environmentalists. To those who call them terrorists they could ask them to produce the bodies or document the injuries that would prove the charge. To those who use anthropocentric and monotheistic environmentalism to dispute their insistence that a wholesale change in the consciousness of Western peoples is needed, they could offer the rejoinder that spiritualities which consider nature sacred and displace humans as the center of moral concern provide more consistent and powerful motivations for environmental action than other religious ethics. And to those who criticize willingness to break laws, they would certainly respond that reformist, politics-as-usual, and centralized nation-state governance have not slowed environmental degradation and species loss, and would accuse their critics of complacency and of promoting anemic responses that promise nothing but more of the same.

The more thoughtful among them acknowledge that they do not have all the answers and that some of the criticisms need to be taken into consideration. But they would nevertheless insist that the primary moral imperative is to halt the human reduction of the Earth’s genetic, species, and cultural variety. And they would claim that direct-action resistance is a necessary, permissible, and even morally obligatory means in the sacred quest to preserve life on Earth.

Rainbow Family

In the summer of 1972, while hippie back-to-nature idealism was still in full bloom, a crowd of some 20,000, mainly young counterculturists, gathered near Granby, Colorado, for a several-days-long “gathering of the tribes” inspired by some of the legendary hip music festivals (especially the Vortex Festival near Portland, Oregon, in 1970), the San Francisco “Be-In” of 1967, rural hip communes, and other such countercultural phenomena. The gathering would have no central stage, no paid or featured entertainers, and no fee for admission. It would be free-form and self-defining, although the original organizers did proclaim that the fourth and last day would feature a silent meditation for world peace. A remote wilderness location was chosen to emphasize close contact with nature and rejection of contemporary urban life.

Although there were no initial plans for a second gathering, one was held rather spontaneously the following year in Wyoming, and by the third year (in Utah) the Rainbow Gathering had become an annual event. In 1976 the Rainbow Family, as participants were by then calling themselves, decided to have the festival always occur on the first seven days of July. That time-period remains the heart of the festival, although participants, including those who volunteer to provide set-up and clean-up, are typically at the site for at least two months.

The Rainbows, whose core principles are egalitarianism and non-hierarchical organization, insist that the Family have no leaders and no formal structure. Decisions, for example, are made at the Gatherings by consensus by a council consisting of anyone who wants to attend. No one is excluded from joining. Some dedicated, long-term participants, however, have devoted considerable energy to perpetuating the Gatherings. Over the years they have published various newsletters and now maintain several Rainbow websites. In the absence of leaders, “focalizers” help provide direction and continuity for Rainbow activities. A Magic Hat passed at gatherings as a collection plate gathers funds that are used for publishing Rainbow manuals and periodicals, providing necessary supplies for the Gatherings (including, in some cases, trucked-in water), and other miscellaneous expenses. Rainbows, however, are generally expected to bring all of their own supplies, including food, to use and to share. Money is disdained at the Gatherings, although a lively barter economy flourishes.

Although there is no official theology or ideology among the Rainbows, many of them espouse neo-pagan or other nature-based spirituality. Admiration and appropriation of American Indian spirituality is widespread. The use of entheogens or natural psychedelics (psychoactive mushrooms, peyote) is common and held to be a natural way to explore ultimate reality. Nature-affirming ceremonies are believed to foster

human interdependence and deeper respect for the Earth. Although most Rainbows explicitly disavow political activism, Earth First! and other radical environmental groups are represented and often draw new recruits from those attending.

Rainbow Gatherings are always held on public land, and the Rainbows have steadfastly refused to seek official permission for their events, which attract tens of thousands of participants. That refusal has led to repeated confrontations with public authorities. Colorado Governor John Love ordered that the road to the first gathering be blocked, but a crowd of some 4000 marched up to the roadblock chanting and singing, insisting on their right to gather peacefully on public lands. Finally Love relented and the Rainbows walked several miles to their chosen site. Opposition from local residents and public officials typically precedes each year's Gathering, although some rural towns appreciate the influx of business that 20,000 or more visitors bring. Nudity is common at the Gatherings, and it spawns both denunciations from local residents and crowds of voyeurs.

Nudity is just one facet of the oneness with nature that Rainbows have always considered central to their quest. Although the large Gathering crowds would be expected to take a heavy toll on wilderness resources, elaborate advance preparations seek to minimize any damage. A month or more before the Gathering begins an advance guard shows up to prepare the necessary facilities, including carefully contained latrines. Others remain at the site for several weeks afterwards systematically erasing nearly all traces of human impact. During the gathering participants are exhorted to observe basic rules of cleanliness and sanitation and to protect streams and lakes from contamination. Even the critics of the Rainbows concede that their land stewardship has been exemplary. During the

1994 Gathering near Big Piney, Wyoming, a forest fire broke out nearby, and thousands of Rainbows joined bucket brigades that helped extinguish it.

Some critics, however, maintain that no gathering that large can fail to have a serious adverse impact on the environment, and the open nature of the gatherings means that some who attend will engage in destructive behaviors of various kinds. Although marijuana is the substance of choice at the gatherings, alcohol and other more destructive drugs sometimes lead to problems.

The large, national Gatherings in July have led to a variety of other Rainbow events, mainly Gatherings in other countries and smaller regional Gatherings in the United States. Dozens of such events now take place annually.

Rainbow Serpent (North Wellesley Islands, Australia)

The Lardil and Yangkaal people are coastal hunter-fishergatherers who occupy the North Wellesley Islands of the southern Gulf of Carpentaria in northern Australia. Their cosmological and cosmogonic belief system has developed and evolved from their dependence upon the sea for their survival. They employ the classical elements of Australian Aboriginal religions combined in a culturally distinctive system of knowledge with a strong marine environmental basis.

A body of Lardil and Yangkaal sacred knowledge deals with the Dreamtime histories that tell of the creation of the North Wellesley environment by Ancestral Beings. *Maarnbil*, *Jirn Jirn* and *Diwal Diwal* were the human colonizers of the country and seas, and all subsequent Lardil and Yangkaal people descend from this trio. The coastal systems and various offshore features were all physically made by *Maarnbil*, *Diwaldiwal* and *Jirn Jirn*, and contain a wealth of geography, resource places, campsites and religious sites. The perimeters of the islands, although consisting of natural components, are seen from the Lardil and Yangkaal viewpoint to be artificial.

Of the different coastal place types, "Story Places" have the most complex set of properties. They are marked neither by artifacts nor structures, and even their natural characteristics are not necessarily outstanding visually, yet within local cosmology, their invisible properties are very powerful. The ancestors *Maarnbil*, *Jirn Jirn* and *Diwildiwal* were the original creators of these sacred sites, but further properties have been added by subsequent supernatural beings. Each Story Place is believed to be inhabited by a separate spiritual entity that generates energies at the site. These beings reproduce at these sites, whether they are inside the ground or under sea. Aboriginal people are able to catalyse processes of reproduction or fertility by performing simple ritual actions or songs at these places. Some sites are said to generate plant or animal species, while others produce meteorological phenomena. The energies of the spiritual occupants of each Story Place are supplemented by the energies of *Thuwathu*, the Rainbow Serpent. The domain of the invisible energies of *Thuwathu* and his agents is in the marine and littoral systems. Changes in the health of humans and in environmental activity (cyclones, storms, lightning, waterspouts and strong winds) are believed to be caused by activating energies in this saltwater environment. The spiritual entities act as agents for *Thuwathu* by monitoring the actions of humans and inflict *markirii* sickness upon those who do not adhere to specified behavioural rules.

Story Places are also believed to connect into another time dimension. According to Lardil belief, the Dreamtime is a second spatial universe that somehow split away from the material world of everyday human existence at some time in the remote past. The Dreamtime coexists in time with the material environment, but is situated in a separate space dimension that is not visually accessible under normal circumstances. Although there are believed to be two separate universes, there are places where the properties of one overlap with the properties of the other. Connections between these two universes occur via dreams and Story Places.

The aggregate of Story Places are the geographical sources of Lardil sacred knowledge. By frequenting a Story Place, individuals may receive gifts of knowledge via dreams from unseen people in the Dreamtime dimension. The nature of this knowledge appears to be qualitatively different at each particular Story Place. Knowledge received in a dream at such a place is likely to deal with the nature of the local Story Place inhabitants. The Lardil believe that to maintain a balanced system of communal knowledge, it is essential to have contributions of knowledge imparted in dreams in the vicinity of each and every Story Place. The basis of knowledge, and hence social authority, can be seen to lie in social geography, through the association of patriclan groups to Story Places.

The spiritual inhabitant of each Story Place is regarded as possessing some human qualities, and these entities are also associated with the unseen people of the area (reincarnated ancestral spirits). The local residents of the area (the patriclan) are also said to share the energies of the Story Place being. These energies are also transmitted from the Story Place to humans who are born or conceived near the Story Place, or who preside over and regularly occupy the local area. These humans then possess a close identity with their Story Place and its occupants. The totemic entities thus provide personal subjective links into a coexisting religious world, and render everyday life experience both profound and personalized.

The system of religious knowledge has thus evolved to explain marine environmental changes and transformations. This belief system involves a configuration of human and environmental elements that are believed to be interconnected in a variety of ways, often via systems of environmental signs and indices, as well as through a spatio-temporal model of the universe and notions of visible and invisible phenomena. In addition the model carries with it, codes of behaviour or “laws,” providing preferred norms of social and territorial behavior. Identity is defined within a cognitive domain of place-specific knowledge and invisible properties of place.

In Lardil cosmology, people, places and natural species are seen as interdependent, each with a set of beliefs consistent with the other. The Dreamtime universe forms a fourth interdependent domain, and links into this world can be found in the landscape.

In the late 1990s, marine Story Places and their religious properties were presented as evidence in the Federal Court of Australia by the Lardil and Yangkaal in order to win claim of rights to their seas under the *Native Title Act 1993*. This claim stems from their

concern about threats to the marine ecology by mining projects and commercial fishing practices and the need to enforce indigenous environmental management practices.

Rainforests (Central and South American)

In the neotropics, the interrelationships between religion and nature are appreciated by many people, but especially by indigenes. This entry first surveys the forests including the correlated cultural diversity as the context of indigenous religions, next discusses the Maya as an illustration of spiritual ecology, and concludes by considering the disruption to both indigenous religions and nature from European colonization to globalization.

After four billion years of evolution on Earth, life reached its greatest diversity and complexity in tropical rainforests. Half of all life on the planet is in these rainforests, whether measured by number of species (biodiversity) or sheer weight (biomass). This is remarkable because tropical rainforests are concentrated on only 6 percent of the Earth's terrestrial surface. About half of the world's rainforests are in Central and South America.

Tropical rainforests are the most luxuriant plant communities on Earth. They are found where climatic conditions are ideal for plant growth; that is, high mean monthly temperature ($>26^{\circ}\text{C}$) and mean annual rainfall ($>1,800$ mm) throughout or during most of the year. They contain up to ten times as many species in the same area as temperate forest. Beyond the Equator plant communities are susceptible to greater stresses like seasonal drought or cold.

Diversity in its manifold expressions is the single most important characteristic of tropical rainforests. They exhibit diversity in plant structures, such as lianas (vines), epiphytes (plants that grow on top of other plants), and large roots that buttress the trunks of giant trees up to 50 m tall which emerge above the forest canopy (top). Diversity occurs as well along the vertical microclimatic and microenvironmental gradients from the forest floor through the strata (layers) of vegetation into the canopy, as sunlight, temperature, and wind increase upward while humidity decreases. Gaps created by natural tree falls allow the penetration of sunlight which stimulates heavy new plant growth on the ground. Collectively, forests gaps produce a mosaic of patches of vegetation at different stages of succession or development. Thus, tropical rainforests are also dynamic ecosystems that vary through space and time.

In general, in regions where biodiversity is high, so is the diversity of cultures (including religion), and vice versa, something called the diversity principle. This correlation is probably more than coincidental. Diversity within and among tropical rainforests

offers more opportunities for niche differentiation; that is, different adaptations to the wide variety of habitats and resources, although the natural environment is not the only factor in cultural and associated linguistic and religious creativity and variation. In the neotropics there is a multitude of local variations in indigenous technology, economy, customs, religion, and language reflecting variations in geography, environment, history, and other factors. It is estimated that at the time of European contact more than a thousand distinct cultures existed in South America and more than a hundred in Central America. Neotropical countries that contain both large areas of rainforests and unusually large indigenous populations are Belize, Guatemala, Ecuador, Peru, and Bolivia. Many of these indigenes retain at least some elements of their traditional religion.

On the surface the relatively uniform traditional technology of indigenous peoples throughout neotropical rainforests appears simple, principally bow-and-arrow hunting; hand gathering of wild plants and small animals; fishing with bow and arrows, spears, and plant poisons; and swidden horticulture. The latter involves cutting a small section of forests with axes and machetes (large bush knives); burning the debris after it has dried out during the dry season; and then planting crops in holes made with a pointed stick. However, technological sophistication cannot be judged on the basis of tools or material culture alone, but also involves knowledge and skills which can be complex, especially in a natural habitat with such high diversity. With low population density, high mobility of sub-groups, and a rotational system of farming and foraging (including trekking), most of these indigenous societies are sustainable, with any environmental impact allowing natural regeneration to proceed at a normal rate. Furthermore, these highly adaptive techno-economic systems allowed ample free time for the elaboration of complexity in other aspects of culture, especially in ceremonies, rituals, oral literature, arts, and symbolism. Thus, the neotropical rainforests have provided inspiration as well as habitat and refuge for numerous and varied indigenous cultures, including their religion.

In particular, animism, a belief in multiple spiritual beings and forces in nature, is an integral component pervading indigenous daily life as well as the socio-cultural system and its ecology. Moreover, the basic holistic principles of a viable spiritual ecology are apparent in most traditional indigenous societies, including those in neotropical rainforests. These principles variously emphasize that the arenas of humans, nature, and the supernatural comprise a functional, spiritual, and moral unity through their interconnectedness and interdependence. The awesomeness, mysticism, and powers of an enchanted nature require appropriate respect, reverence, and reciprocity. Humans are embedded in nature's kinship and spirituality, and this they affirm and celebrate through cycles of ritual as well as myths and symbols. Accordingly, traditionally for most indigenous societies, religion promotes and maintains the dynamic equilibrium within and between the social and ecological systems. Whenever disequilibrium arises it is treated as much if not more spiritually than otherwise.

These and other sound principles of spiritual ecology are reflected in many traditional indigenous cultures, including those residing in neotropical forests. For instance, collectively the Maya are the second largest indigenous population in the Americas with some 7.5 million people. They live in the northern sections of the lowlands of the Yucatan peninsula and in the central highlands of the state of Chiapas in southern Mexico as well as in portions of the Central American countries of Belize, Guatemala, Honduras, and El Salvador. There is also a Mayan diaspora in North America. Some 28 different Mayan languages are spoken. Mayans range from lowland into the highland wet and dry forests with tremendous variation in their ecology, cultures, languages, and histories. However, the core religious principles which are more or less common to most Maya are outlined in the sacred text called *Popol Vuh* which was written down after initial contact with the Spanish. For the Maya, the natural and supernatural realms are intimately interconnected and interdependent. For instance, animals and plants were created first by the supreme deity, and thereafter the animals helped create humans from the sacred corn plant. Consequently, the relationship between humans, animals, and plants is supposed to be one of respect, caring, and cooperation. Many Mayans demonstrate profound reverence and compassion for animals and plants in their habitat through their daily activities as well as sacred stories, rituals, chants, and prayers. When trees are cut down to clear an area for a swidden, for example, the farmer requests pardon from the guardian spirit of the forest. Spirituality permeates the beings and things in the forests; nature is far more than merely a resource or commodity. However, many Mayans simultaneously embrace the Christian religion, especially Catholicism, blending it with their native religions.

Lacandons of Yucatan remain the most traditional Maya, but in the 1990s in Guatemala and elsewhere a movement arose to revitalize Mayan cultural and religious beliefs, values, and practices, including the use of sacred sites for rituals such as particular caves, hills, or mountains. However, Mayans also have to struggle with the disruptions created by Western influences which are often contrary to their traditions and ecology, including civil wars in most countries of Central America during the 1960s–1980s. The 1994 Chiapas rebellion is just one recent symptom of their continuing struggles.

Indigenes surviving in neotropical rainforests as sanctuaries as well as habitats are descendants of some of the original spiritual ecologists. Many maintained relative balance and harmony within their society and between their society and the ecosystems in their habitat, despite political, economic, and other depredations of up to five centuries of Western colonialism. The neotropical rainforest as a whole was not endangered 500 years ago, but it has progressively become so as a result of Western abuses, especially in the last half of the twentieth century. This is not to assert that all indigenous societies are always in ecological equilibrium. For example, there are some Mayan areas where overpopulation and over-exploitation led to deforestation and other problems prior to European contact. Also some portions of Mayan forests are anthropogenic, with unusual concentrations of useful trees like ramon, breadnut, sapodilla, and avo-

cado. However, the net trend for most indigenous societies has been toward balance and harmony with nature. It is unlikely to be otherwise, given the awesome depth of their environmental knowledge and their intimate daily interaction with their habitat combined with their nature religions. Only when their circumstances change substantially and they have no economic alternatives are they likely to deplete resources and degrade land irreversibly, especially under Western influences. But indigenous spirituality is antithetical to the generally anthropocentric and egocentric environmental ethics of colonial and industrial societies which usually attempt to segregate, objectify, and commodify nature as merely a material resource.

Because of the intimate interconnections among the rainforest ecosystems and the indigenous societies which reside in them, any threat to one is likely to be a threat to the other as well. Moreover, these generally adaptive systems are being endangered by maladaptive ones, first with European colonialism, then after national independence with internal colonialism, and in the most recent decades with economic globalization. Because native religion is often the most crucial factor promoting social as well as ecological harmony and balance, missionization can be most disruptive spiritually, culturally, and ecologically.

Indigenous societies likely to survive colonial contact possess these attributes: geographical and economic marginality; balance between separation and integration (not assimilation); attachment to ancestral lands, selfsufficiency, and self-determination allowed by a democratic state respecting multi-ethnicity; a stable or increasing population; memory of pre-contact and contact history in combination with a conscious countercultural strategy opposing colonials; common identity with meaningful and resilient traditions including their own religion; and political organization and mobilization as well as networking with other indigenous organizations and relevant environmental and human rights non-governmental organizations.

The Kogi provide a case in point. They are descendants of the Tairona culture who survived the incursion of the Spanish in 1514. The Kogi have persisted in the Sierra Nevada de Santa Marta in Colombia because of their tenacious determination to maintain their own cultural autonomy as well as the geographic protection of the rugged terrain of their mountain habitat. This habitat varies ecologically with increasing altitude from tropical rainforest to savannah to alpine meadows and glaciers, a microcosm of the climatic zones of the world in some respects. The Kogi envision themselves as living at the heart of sacred Mother Earth. They practice environmental stewardship through a series of material and ritual cycles of exchange conducted from the sea coast to the mountain top which are supposed to maintain the vitality and fertility of their diverse ecosystems. Much of this exchange is directed by their priests who also determine which elements from the outside world are accepted or rejected. The Kogi are also alarmed by what outsiders, who they call younger brother, are doing to the detriment of the ecology of the planet. For example, they see one result of global warming in the melting of glaciers high in their mountains. They attempt to address these threats through their cosmology and rituals as well as by warning outsiders.

Economic, social, spiritual, and environmental health are all interrelated and interdependent. The indigenous societies remaining in the refuge of the rainforests of Latin America and elsewhere provide alternative heuristic models or adaptive repertoires for others to consider in designing sustainable, green, and ecocentric economies, societies, and spiritualities if they are to have any healthy future.

Ereira, Alan. *The Heart of the World*. London, England: Jonathan Cape, 1990. the setting of one of the most successful programs of ecological, economic, and social restoration known in India in recent years. It is a key example of the application of Hindu religious teachings to social and ecological reform. The transformation was the result of the leadership of Kishan Baburao Hazare (b. 1940), a local villager known affectionately as Anna (elder brother) Hazare, and the influence upon him of the religious thinker and reformer, Swami Vivekananda (1862–1902).

Before 1975 the village of about 1500 people was stricken with poverty and social disintegration. Sources of irrigation had dried up. Agricultural production was inadequate and drinking water was scarce. Lack of sanitation afflicted villagers with water-borne diseases. Villagers borrowed heavily from lenders in neighboring villages. Unable to repay, their debts increased, leading to hopelessness, alcoholism, and violence. Social barriers isolated the 16 Harijan families. The village survived on profits from the sale of illegal alcohol to neighboring villages. Few children attended school. Religious life in the village had lost all meaning. Villagers had removed wooden parts of the temple to fuel the liquor stills.

Anna Hazare came to Ralegan Siddhi as the child of a family whose fortune had been dissipated by relentless economic pressures. As a young man, he joined the army where he began to question the meaning of life. Uncertainty over whether life was worth

living eventually drove him to despair. He had fully decided to end his life when in a railway station bookstall he encountered a short collection of the thoughts of Swami Vivekananda. He testified later that here for the first time he discovered the meaning of life: that life is meant for service to God through service to others. While Hazare spent his annual leaves in Ralegan Siddhi and witnessed the continuing degradation of his village, the works of Vivekananda gave new direction to his life. While driving a military truck during the 1965 war with Pakistan, an attack by enemy aircraft left most of his colleagues dead. He believed that God had given him a new life and the opportunity to put the thoughts of Vivekananda into practice. He took a vow not to marry but to remain in the army until he was eligible for a pension. He returned to Ralegan Siddhi on his retirement in 1975.

Because he believed the restoration of the village could not proceed without a moral and spiritual awakening, Anna Hazare began with an effort to renovate the dilapidated Yadavbaba Mandir, the village temple. With Vivekananda, he believed that God is everywhere, but that the temple is crucial to village life because it is here that children first learn the important values of life. Because he used his own retirement fund for the restoration of the temple, his work attracted the attention of villagers. The temple became his venue for teaching the religious ideas of Vivekananda, and the application of these ideas to community problems. Preaching purity of mind, purity of action, and the value of self-sacrifice, Hazare's teaching addressed the hopelessness and apathy that immobilized the village. He also related the villager's received sense of the sacredness of land and water to an understanding of the material benefit these provide when cared for with conscientious effort. Hazare's most influential teaching was that selfless work is worship. Impressed by his initiative, the people gradually began to contribute their labor to the project. As work progressed, Hazare brought singers and storytellers to the temple who supported his teachings with songs and stories from the religious tradition. Such temple meetings became the foundation for the Gram Sabha, or village assembly, that eventually became the principal decision-making body of the village.

By means of the organization of voluntary labor as service to God, the villagers undertook a watershed management plan to restore irrigation and agriculture, and provide drinking water at the village level. During the process, the temple became the focus of the restoration effort. It was at a meeting in the temple that the villagers collectively resolved to close the liquor dens and impose a ban on alcohol consumption in the village. Because the decision of the village had been made in the temple, it had the force of a religious commitment.

The restoration of the moral fabric of the community brought about significant results. With wells viable throughout the year, irrigation dispersed to productive fields, and drinking water distributed to a faucet in every household, the village now exports more agricultural products than it imported in the days before the restoration began. Following the thoughts of Vivekananda, Anna Hazare holds that nothing has fractured Indian society more than the caste system and the practice of untouchability. With Hazare's leadership, social barriers were removed and people of all castes came together to cele-

brate community life. Villagers have built houses for the Harijan families, and helped them repay their debts. For the past several years, the honor of leading the procession in the village bullock festival, once the subject of bitter contention, has been given to the Harijan community, integrating them within the religious life of the village.

The restoration of Ralegan Siddhi is now being replicated in other villages in Maharashtra and beyond. Young people selected from these villages undergo training at Ralegan Siddhi to provide leadership for similar programs in their own villages. Hazare challenges them with the analogy of the grain of wheat that has to sacrifice itself to give birth to a swaying field of grain. The transformation of Ralegan Siddhi was the result of the mobilization of a village through a religious and moral awakening that empowered the people to address conditions of material, social, and ecological decay.

Raphson, Joseph (1648–1715)

Cambridge intellectual Joseph Raphson originated the terms pantheist and pantheism. Historians know little of Raphson's life; not even an obituary has been found. Born in Middlesex, England, he attended Jesus College Cambridge and graduated with a Masters degree in 1692. Raphson gained membership in the prestigious Royal Society in 1691 on the strength of his first book, *Analysis Aequationurn Universalis* (1690). Raphson also wrote a mathematical dictionary (1702), and other works, including *De Spatio Reali seu Ente Infinito* (1697) in which he penned the words “pantheos” and “pantheismus.”

Many sources name John Toland as the originator of the word pantheist. But Raphson's citation predates Toland's first recorded use of the term by eight years. Toland had read Raphson's *De Spatio Reali* and commented upon the book, which strongly suggests he picked up the word from Raphson. (Toland still deserves notice for the first use of pantheist in an English-language publication.)

Stephen H. Daniel, Professor of Philosophy at Texas A&M University, discovered Raphson's terms and made the connection between Raphson and Toland in 1994. According to Professor Daniel, “it is now clear that Raphson, not Toland is the person who coined the terms pantheist and pantheism; he just happens to have been writing in Latin at the time” (personal communication with author).

De Spatio Reali delineates two pantheistic outlooks. In one, God comprises nature, the material cosmos, as ultimate reality. Raphson labels adherents of this view panhylists (from the Greek pan = all + hyle = wood, matter) because they believe everything derives from matter. He equates panhylism with atheism. In the other, God comprises space, the overarching element, as ultimate reality. Raphson calls followers of this view pantheists (from the Greek pan = all + theos = god) because they believe in “a certain universal substance, material as well as intelligent, that fashions all things that exist out of its own essence” (Raphson 1697).

The noted Jewish philosopher Benedict Spinoza (1632– 1677), who wrote perhaps the most rigorous exposition of pantheism in all philosophic literature, never employed the terms pantheism and pantheist because they had yet to be conceived. He died just twenty years before Joseph Raphson contributed these valuable and now universally used words to posterity.

Rappaport, Roy A. (“Skip”) (1926–1997)

Roy A. Rappaport, one of the leading ecological anthropologists of the twentieth century, was born in New York City. Known as “Skip” to his friends and colleagues, he earned his undergraduate degree in hotel administration from Cornell University and during the 1950s owned and operated an inn in Lennox, Massachusetts. In 1959 (at the age of 33) Rappaport sold his inn and enrolled at Columbia University where he studied anthropology under Marvin Harris, Harold Conklin, Margaret Mead, Conrad Arensberg, and Andrew P. Vayda. Rappaport always insisted that the anthropologist who most influenced his thought was Gregory Bateson, who he first met in 1968. Bateson introduced Rappaport to systems theory and encouraged him to look at evolution and adaptation as informational processes.

Between 1962 and 1964, Rappaport conducted fieldwork among the Maring of Papua, New Guinea, primarily among the Tsembaga clan cluster. His most important contributions to ecological anthropology are tied to his minute observations and precise measurements of the activities of 204 Maring speakers during 1962 and 1963. In 1964, Rappaport presented a seminal paper “Ritual Regulations of Environmental Relations among a New Guinea People” at the Detroit meeting of the American Anthropological Association. The paper was later published in the journal *Ethnography* and has been widely reprinted. It contains, in abbreviated form, almost all the ideas that were to occupy Rappaport throughout his professional life. Rappaport’s 1966 Ph.D. dissertation served as the basis for *Pigs for the Ancestors*, which set new standards for the collection and presentation of anthropological and ecological data. Rappaport’s goal in *Pigs* was to transcend cultural materialism and functionalism by focusing on the adaptive value of ritual in maintaining carrying capacity, the persistence of species, human nutritional well-being, and the frequency of warfare in small-scale societies. He identified ritual as *the* major mechanism for regulating peace and warfare among the Tsembaga Maring. *Pigs* is one of the most cited books in the history of anthropology and is required reading for graduate students. It is cited in almost every introductory text.

Pigs for the Ancestors is a wide-ranging work. It covers ritual and its effects, human population and ecosystems, information and meaning, and introduced the use of systems theory to ecological anthropology. Rappaport suggested that ecological systems regulate themselves through feedback – like a thermostat. All parts (pigs, humans,

yams) within a system are subject to the regulatory forces of the whole. In the case of warfare among the Maring, the *kaiko* ritual – a ceremonial slaughter of pigs to ancestral guardians – serves as the major regulator. Rappaport postulated that the Maring would not go to war as long as their accumulated debts to the ancestors remained unpaid. Instead, they spent their energies and resources amassing more and more pigs. But eventually the number of pigs (and the labor required to tend them) became intolerable, and a *kaiko* would be held to restore the ratio of pigs to people. *Kaiko* also provided much needed protein and facilitated the distribution of “pig surpluses in the form of pork throughout a large regional population” (Rappaport 1968: 18).

The 1968 edition of *Pigs* generated tremendous controversy among anthropologists, biologists, and ecologists. Some early critics faulted Rappaport for what they saw as his *naive* functionalism, while others accused him of reductionism and/or environmental determinism. A major issue of contention was Rappaport’s rejection of “culture” as the primary unit of analysis. Rappaport’s model, borrowed from the biological sciences, focused on human populations – not cultures. He saw humans as a part of nature. This did not set well with a number of social anthropologists (notably Marshall Sahlins and Robert F. Murphy) who argued that instead of studying human activities as a part of nature, human activities should be studied apart from nature. Marxist anthropologists (notably Eric Wolf and Jonathan Friedman) accused Rappaport of ignoring cultural change among the Maring. Rappaport’s approach, they asserted, could only work for a closed system, but the Maring in 1962 had already been very much influenced by contact with outsiders – including missionaries and anthropologists. Were an anthropologist to observe a *kaiko* ceremony in 1954 or 1968, would he or she have come to the same conclusions as Rappaport (cf. Friedman 1994)?

Rappaport took these criticisms to heart, but never altered his basic systems approach. A second edition of *Pigs* appeared in 1984 to answer critics. It is nearly twice the length of the first edition and includes ten appendices of raw data. Rappaport’s goal in the 1984 edition was to allow other scientists to view and critique his observations. He also deposited his personal papers (including his New Guinea field notes from 1962–1963 and 1981–1982) in the Mandeville Special Collections Library at the University of California-San Diego (MSS 0516). *Pigs* introduced one of Rappaport’s key findings in human ecology and religion; most notably, what he saw as an occasional contradiction between “operational” and “cognized” environments. By contrasting the “operational” environment – which he saw as being governed by the immutable laws of the physical universe – and the “cognized” environment – which he defined as “the sum of the phenomena ordered into meaningful categories by a population” (Rappaport 1979: 6), Rappaport greatly advanced the study of both rituals and ecology. He emphasized that the “cognized” environment differed from the “operational” environment because “cognized” environments are less bound by physical laws. Rappaport argued passionately that the relationship between culturally constructed meanings and values and organic well-being should be the central concern for all ecological anthropologists.

In 1979, Rappaport published a collection of his papers entitled *Ecology, Meaning, and Religion*. This collection gives an indication of Rappaport's catholic interests and highlights his desire for their integration. He recognized early on that *Pigs for the Ancestors* was only a "beginning" since it represented treatment of the relationship between ritual and ecology from only one of many possible perspectives. An important essay "On Cognized Models" (included in the 1979 collection) attempts to go beyond what Rappaport saw as his earlier, crude attempts to establish the relationship between religion and ecology in *Pigs*. He felt that his earlier efforts had overemphasized organic and ecological functions to the exclusion of cultural understandings. This signaled a dramatic shift in his thought from functional to structural concerns.

Another pivotal essay in *Ecology, Meaning, and Religion*, "The Obvious Aspects of Ritual," outlines the consequences of ritual's outwardly distinctive features; especially, how stereotypical behaviors counter the human potential for lying and deceit. According to Rappaport, two obvious aspects of ritual are that: 1) it constitutes an invariant sequences of acts and utterances; and 2) its participants are required to perform according to these invariant sequences. Ritual thus imposes standards of conduct which go beyond the will of individual participants and demonstrates participants' clear and public acceptance of conventions as they literally "act" them out. For Rappaport, ritual constitutes the foundation of all convention and is the basic "social act." Ritual establishes the possibility of trust and truth, and it provides a place where "the unfalsifiable supported by the undeniable yields the unquestionable, which transforms the dubious, the arbitrary, and the conventional into the correct, the necessary and the natural" (Rappaport 1979: 217).

Rappaport's work articulates a middle ground in which he attempts to give equal weight to evolutionary processes and the constraints of convention. He was not an idealist. But he did not see himself as a cultural materialist either (e.g., Marvin Harris). He situated ritual precisely at the juncture between embodied acts of individual behavior and the disembodied meanings of sacred symbols, but refused to grant priority to either.

In 1965, Rappaport joined the Anthropology Faculty at the University of Michigan where he remained for over thirty years. He served as chair of the Department of Anthropology and was President of the American Anthropological Association from 1987 to 1989. As AAA President, he attempted to bring anthropological findings to bear on social issues of the day. Ecology was always a major focus. Rappaport served as a consultant for the State of Nevada on the advisability of storing nuclear waste at Yucca Mountain and was a member of the National Academy of Sciences Task Force dealing with the leasing of off-shore oil rights.

From 1991 until his death, Rappaport was head of the Program on Studies in Religion (PSIR) at the University of Michigan. He regularly offered the course Anthropology 448/Religion 452: "Anthropology of Religion: Ritual, Sanctity, and Adaptation." Many of his Anthropology 448 students have themselves made important contributions to ecological and anthropological studies of religion; notably, Ellen Messer, Susan Lees,

Fran Markowitz, Peter Gluck, Melinda Bollar Wagner, Michael Lambek, Aletta Bier-sack, and Jim Greenberg.

While heading PSIR, Rappaport embarked on what was to be his last major study published as *Ritual and Religion in the Making of Humanity*. He began writing the book after having been diagnosed with lung cancer. It was published posthumously. In *Ritual and Religion*, he attempted to establish a new set of categories for the study of religion and provided a comprehensive and erudite analysis of ritual forms. *Ritual and Religion* has been favorably compared to Emile Durkheim's classic *The Elementary Forms of Religious Life* published in 1912. Both Durkheim and Rappaport were deeply concerned with the issues of social order and persistence. Critics have pointed out that Rappaport's theory is incomplete because he pays scant attention to religious pluralism or religious conflict. But what sets Rappaport's study apart from other studies is that it is not only "about" religion but is in itself also a profoundly religious book. *Ritual and Religion* makes a strong case for religion's central significance in human evolution and argues convincingly for the reconciliation of religion and science. Rappaport boldly asserted that human survival depends on developing a postmodern science thoroughly grounded in ecology, and concluded that ritual should be the major focus of religious studies because ritual is the "ground" where all religion is made.

Rappaport was not a religious man in the usual sense; indeed, he was distrustful if not hostile toward many forms of organized religion. Nevertheless, he was sympathetic toward religion, perhaps because he so adamantly "believed" his own findings concern-ing ritual among the Maring. Ultimately for Rappaport, the primary question was not *if* religion is true, but *of what* is religion true?

Rastafari

Rastafari originated in the 1920s and 1930s in Jamaica, especially among poor black men migrating into Kingston from Jamaica's rural regions. From there it expanded into a global movement with a broad spectrum of beliefs and practices. Generally, Rastafari do not identify themselves according to doctrinal positions. Furthermore, the central ritual of the movement is "reasoning" – a process of ongoing talking and thinking out concerns. "Reasoning" is relatively amorphous and lends itself to a fluid range of intellectual positions and practices. Additionally, the social locations and characteristics of Rastafari vary tremendously. Consequently, the relationship of Rastafari and nature is best seen not in doctrines or practices, but rather in a range of themes running through diverse strands of the movement. The themes that best reflect where nature and ecology fit into a typical Rastafari worldview are "Babylon/Zion" and "Ital."

Babylon/Zion

The Rastafari symbols Babylon and Zion express a difference between the world as it is generally experienced and the world as it truly is and could be experienced. At the same time, Babylon and Zion concretize this worldview by symbolizing geographical locations: Babylon is the city, the West, the colonized world, the U.S. and Britain, and other locations of suffering; Zion is the countryside, the forest, Africa, and other places where one is free. Babylon in particular is also used adjectivally to refer to problems corrupting the world (e.g., the system of forces in society that conspire to maintain humankind in captivity might be called the "Babylon Shitstem" – that is, the Babylon System).

Babylon is seen to be rife with corruption and injustice, greed, competition, jealousy, racism, war, and death. Babylon chokes out life by killing or blinding us to the "I," the divine within. Zion is a world of promise, the world as it could and will be: harmonious, flourishing, natural. The more concrete connotations of Babylon and Zion remain stamped by the early Rastafari experiences of transition from countryside to city, and the radical revaluations of blackness, African heritage, and colonial oppression that continue to undergird the whole movement.

Life in Babylon disconnects man [sic] from one another and nature through "downpression" (oppression). Thus, nature is invisible in Babylon except as it is reintroduced through positive lifestyle choices that undo "downpression." Life in Babylon is a constant struggle, perhaps best expressed through cultural images, such as the descriptive

song titles of the late Jamaican reggae singer and Rastafari, Bob Marley: Babylon is a “Concrete Jungle,” a “Rat Race,” and a “War.” “War” sets to music a speech (dated by some to 1968 and by others to a 1963 speech to the UN) by the late Emperor of Ethiopia Haile Selassie, whom some Rastafari regard as divine. In it, Selassie warns that man’s condition will be perpetual war until the time that “the color of a man’s skin is of no more significance than the color of his eyes.” Racism is endemic in Babylon, and the true horror of racism is that it hides the divine within from all men.

In Zion a man [sic] can be a man, true to the “I” in himself, in others, and in the world. In Zion, interactions are guided by truth, not deception, and they renew and rejuvenate rather than destroy. In Zion, no man suffers because of his skin color, and blackness can be embraced. For some Rastafari, Zion necessarily implies a return to Africa (or Africa’s metonymic representative, Ethiopia), where an Ital life is possible. For others in Babylon, Zion is approached as best as can be through an Ital lifestyle marked loosely by behaviors ranging from vegetarianism to working solely for oneself. For others again, an Ital life is lived by retreat to the bush or forest, or in communes, of varying size, or alone, growing one’s own food, organically, in communion with the natural environment. At the furthest extreme, some Rastafari (e.g., “higes knots,” “earth men” or “Nomn Te”) totally reject anything associated with Babylon, going so far as to refuse to touch money, to wear shoes or Western clothes (wearing grass clothes or sacks instead), to eat anything processed, to step on pavement, or to participate in any way with the world.

It is important to note that these ways of experiencing, apprehending or approaching Zion are not necessarily mutually exclusive, and many Rastafari understand and participate in Zion in various ways at different times in their lives.

Ital

The Ital lifestyle can be understood as the ethos of Zion, and it is this ethos that shows the most direct connections of Rastafari to nature and ecology. The basic characteristics of an Ital lifestyle are a reverence for life and a belief that human beings are at their best when connected to nature. For example, an Ital diet is typically vegetarian, grown organically, with minimal processing. Rastafari tend to reject chemical fertilizers, pesticides, or genetically engineered crops because: they destroy life in the longrun, they are ultimately unhealthy for humans, they promote economic dependence on corporations and firstworld nations, and they dismantle traditional relations with the land and traditional knowledge of crops, crop cycles, lunar planting and harvest cycles. Rastafari farmers tend to value traditional modes of planting and cooperative farming because they preserve the relationship of the farmer to the land and to tradition.

For similar reasons, many Rastafari primarily use “bush medicine,” or traditional herbal cures, when sick. These bush herbs are given by the Creator as food and medicine for humans, a claim supported with biblical references (e.g., Gen. 1:29, giving plants to

people for food; Rev. 22:2, suggesting ganja (marijuana) as the “healing of the nations”). Significantly, many Rastafari prefer to grow their own ganja, or buy only from other Rastafari, and reject on principle the extra-potent hybridized varieties, especially when these are understood as having been developed in North America.

The characteristic Rastafari hairstyle, dreadlocks (matted hair), also reflects reverence for life. According to many Rastafari, one ought not cut one’s hair or shave one’s beard because the growing hair signifies life and strength, and life cannot be stopped and ought not be hidden. Among many Rastafari, contraception and abortion are rejected for similar reasons.

Ecological Ethic

Rastafari frequently read and are influenced by the Bible, especially the Hebrew Bible. Yet the ecological ethic among most Rastafari cannot be said to be based on a dominion theology or a stewardship model of ecology. Moreover, though many Rastafari do long for Zion, and experience profound renewal from sojourns in Zion, the use-value of land for agriculture and the value placed on self-determination among Rastafari, mitigate against an ethic that values land for recreation.

In general, the tendency of Rastafari to see the divine throughout the natural world leads to the strongest affinities between Rastafari and those ecological ethics which see inherent value in all of nature. Yet these ecological affinities will also continue to exist with a certain amount of tension, for Rastafari history tells us of the special value Rastafari place on human self-determination and liberation. Nature is valuable, but the value of nature cannot be imposed on humans from outside or it will ring false; attempts by first-world nations to impose an ecological ethic on Rastafari will be rejected simply because they come from outside, regardless of profound affinities at the level of content.

Richard C. Salter

Rastafarian Activism

Rastafarian beliefs have directly inspired activism within the green movement. Rastafarians have been involved in Green Parties and a range of environmental groups, especially those concerned with animal liberation. In Britain the Rastafarian poet Benjamin Zaphniah has written verse promoting a vegan diet and raised funds for groups such as Friends of the Earth. In the United Kingdom the Jamaican poet Brian Wilson founded Friends of MOVE to support the Philadelphia-based radical group. Friends of MOVE mobilized green activists, anarchists and Rastafarians to campaign for the release of U.S. political prisoner and MOVE supporter Mumia Abu-Jamal.

They also took part in direct-action protest with Earth First! on a range of issues including road construction.

Perhaps the best-known Rastafarian green activist is the New Zealand Member of Parliament, Nandor Tanzcos. Elected in 1999 for the Green Party, he has pioneered the campaign for the legalization of cannabis in N.Z., spearheaded the Wild Greens direct-action group who famously raided laboratories growing GM crops and is a leading advocate of multicultural ecology. His activism started in the 1980s in Britain and included a stay at Molesworth peace camp. Nandor's spiritual beliefs are closely linked to his anti-capitalism. Nandor argues that the Rastafarian principle of *Ital* provides an alternative to capitalism,

It begins with private ownership – the idea that people can own the Earth, as if fleas could own a dog . . . Ital is the opposite of that. Ital is natural livity. I&I say that the land is from the creator, creativity is from the creator, life is from the creator. So how can a person own any of that, in any true sense?

He conceptualizes *Ital* as a means of opposing consumerism, noting, “Capitalism is also built on selfhatred. Consumer society depends on us being unhappy with who we are . . . Natural hair, natural smell, natural living – that is ital, that is dread. Babylon hates this, because it cannot be commodified.” Nandor argues that there is an affinity between his religious beliefs and his activism, “So I am a Rasta. I am also an MP for the Green Party. Both these ways of being are about natural law, about social justice, ecological wisdom, peace and true democracy.” Indeed the links between Rastafarianism and green political activism are based on a shared sense of nature as sacred and the pursuit of social justice as morally obligatory.

Raves

From the late 1980s in Britain and subsequently elsewhere around the globe, youth have danced *en masse* to the syncopated rhythm of electronic “house” or “techno” (or “tekno”) musics, which, with the assistance of psychotropic lights, hypnoblobic video and alterants (especially the entheogen MDMA, or “ecstasy,” LSD and nitrous oxide), have enabled altered states of consciousness. In what are arguably crucibles of contemporary youth spirituality, all-night endurance dancing within the context of these “raves” is variously claimed to facilitate transcendence of the self, communion between participants and/or a deep somatic relationship with the natural environment.

A clandestine pleasurescape, the rave has been described as “an overwhelming yet depthless barrage of the senses that transforms the dancefloor into a magical megasurface” (Hutson 1999: 58). While consistent with experiences occasioned by traditional underground or even “club” events, the description becomes especially applicable to “raves” celebrating celestial events and seasonal transitions (e.g., moon cycle, solstices) held in outdoor locations (where dance floors are positioned in bushland, forest, beach or desert), facilitated and attended by Pagans, travellers and other practitioners and affiliates of earthen spirituality. This is certainly the case for “Trance Dance” or “psytrance” (psychedelic trance) events, themselves influenced by traveller’s full moon parties held in Goa, India, during the 1980s. Trance Dance rituals may incorporate fluorescent décor, fractalized mandala projections, altars, chai tents, totemic installations, sacred geometry, earthworks, large speaker stacks positioned at the cardinal points and “trance” music – a metronomic four-quarter beat overladen with exhilarating arpeggios, infused with “ethnodelic” samples (e.g., didgeridoo, djembe, sitar). Sonorous and sensual, such events are celebrated as “no spectator” style odysseys with a celebrated climax (“rebirth”) at sunrise.

While raving and techno-music culture became subject to commercialism and government regulation from the early 1990s, anarcho-spiritualists have consistently advocated the interfacing of *technology*, *ecology* and *spirituality*. Editor of *Evolution* magazine (originally *Encyclopedia Psychedelica*) and founder of the London dance club Megatripolis, Fraser Clark, was particularly influential in articulating this convergence. Having coined the term “zippie” (Zen Inspired Pagan Professional) to describe “a new kind of hippy who rejected the sixties Luddite pastoralism and embraced the cyberdelic, mind-expanding potential of technology,” Clark evangelized rave as “the expression of a new Gaia-worshipping ecoconsciousness” (Reynolds 1998: 167). The idea that Britain would be revitalized by a fusion of the House and Green movements was articulated on Clark’s compilation album *Shamanarchy in the UK*. Not inconsistent with the view

that raves are “programmed” by digital technicians (DJs and other cyber-engineers) possessing “techno-shamanic” qualities, Clarke optimistically viewed the rave as a contemporary form of “tribal shamanism.” Similarly, for influential scholar of ethnopharmacology and radical historian Terence McKenna, as shamanic dance ritual, raving was part of the natural psychedelics-led “archaic revival” which will end alienation from the “Gaian supermind” (McKenna 1991).

The work of anarcho-mystic Hakim Bey (aka Peter Lamborn Wilson) has been heavily drawn upon in forging the primitivist–extropian alliance at the heart of such a worldview. Throughout the nineties, Bey’s *Temporary Autonomous Zone* (1991), or TAZ, was the poetic benchmark in conceptualizing an appropriate horizontal, nonmodified dancescape for the exploration of psychedelic spirituality. The free outdoor rave-TAZ became a new tech-savvy anarcho-liminal utopia wherein inhabitants claim to achieve that which resembles a peak experience, or union, with co-liminaries *and* nature. Throughout the nineties, numerous inspired *techno-tribes* emerged in Europe, North America and Australia to pursue the desired “revival” through the facilitation of such events. A futureprimitivism was early exemplified by London “terratechnic” sound system, Spiral Tribe, who believed they were connected to prehistoric nomadic tribes and that techno was the new “folk music.” The Spirals believed free parties were shamanic rites, which using the new musical technologies in combination with certain chemicals and long periods of dancing, preferably in settings with spiritual significance, could reconnect urban youth to the Earth with which they had lost contact, thus averting imminent ecological crisis (Collin 1997: 203–4).

These strands impacted upon the development of a global “techno-pagan” or cyber-spirituality movement for whom the rave assemblage would facilitate the return to “forgotten tribal roots.” It was well received in San

Francisco, where experimentation into the psychedelicspirituality-technology interface was particularly advanced. There, Full Moon parties and events operated by the New Moon collective and other rave communities were prevalent throughout the nineties.

In Australia, “bush doofs” were early facilitated by the likes of Electric Tipi on the northern coast of New South Wales, and later GreenAnt in Victoria and Dragonflight in Queensland. In a proactive and reconciliatory atmosphere, Australia has also seen a strengthening alliance between radical environmentalism, ecospirituality and rave culture manifested in *dance activism*. Popularly dubbed “Free NRG,” this post-rave movement has seen youth rise to challenge mining and forest industries, and defend sacralized landscape (“country”) threatened by natural-resource developers. Emerging in 1995, anarcho-spiritual technotribe Ohms not Bombs, became alarmed by current levels of non-renewable energy consumption and patterns of Earth destruction. A key objective of “Free NRG,” they argue, is “tuning technology with ecology, DJing our soulforce into the amazing biorhythms of nature” (www.omsnotbombs.org). Furthermore, with “co-created magic,” they have declared this land is returned to the ancient and magical indigenous chain of wisdom. If we unite our purpose a massive

healing can be set in motion . . . Help institute a sound system for all, join the Earthdream, support Aboriginal sovereignty, and help dance up the country in rave-olution (www.omsnotbombs.org).

An annual “tech-nomadic” carnival of protest touring through Central Australia, Earthdream (www.beam.to/earthdream) emerged in 2000 as the proactive millenarian event of the techno-spiritual movement. Over a period of four or five months during the winter, a series of free party “teknivals” and intercultural anti-uranium mining protests are held on Aboriginal lands – with the full cooperation of traditional owners – including a major event held on the winter solstice. Exemplifying a contemporary strategy of reenchantment, Earthdreamers actively participate in native landscapes.

Earthdream exemplifies the immanent *communing* potentiated by the geodancescapes of the rave/post-rave. Participating in the dancescape – through dancing, through *ecstasis* (“raving”) – is a means of temporary inhabitation, rendering possible an enduring relationship with place. Commentators expound upon the spiritual potential of Trance Dance as a ritual of communion. For instance, psy-trance pioneer Ray Castle asserts that outdoor trance events “celebrate an experiential celestial electro-communion – a participation mystique – with the numinous oneness and interconnectivity of all creation” (Castle 2000: 146). According to proponent of Chaos Magick, Kathleen Williamson, while sounds produced by the likes of Castle constitute “the new epic poetry,” Trance Dance “is the ‘coming of age’ ritual which Western culture has long forgotten.” According to Williamson, “tekno anarcho-activists” understand “the power of the gnosis of trance,” using techniques to “direct the energy of the dance.” While music is significant in achieving “transcendence” or “inner-knowledge” in such contexts, trance artists have also “buried crystals under dance areas” and have investigated “the symbology and iconography of ancient magickal and spiritual traditions.” Moreover, in “reviving lost traditions,” the dance rite constitutes an answer to modern distancing from natural world rhythms:

Our convenient industrial cultures have practically negated our direct relationship with the earth and its seasons and cycles, and it seems that there is less and less reason to rely on, let alone investigate our instinctual being. Our experiences with sound, psychedelics and the dance ritual are the stirrings of communicating via the ebb and flow of the earth’s rhythms and letting it seep into our collective emotions (Williamson 1998).

In tracing the collective paroxysm of Trance Dance to its putative Pagan or “tribal” origins, Australian fluorescent “rainbow warrior” Eugene ENRG (aka DJ Krusty), reveals a chthonic dimensioned dance philosophy. Characteristically, it is believed that “energy,” located in and channeled from the Australian landscape, is responsible for the ecstatic states associated with Trance Dance. For Krusty, a dancer’s body can “become a conduit for energy”:

I think there’s a sense of the spirit of the land. [For instance] this land we now call Australia has a real spirit to being stomped. And if you’ve ever watched Aboriginal dance, its very much about stomping the earth . . . And if you watch techno . . . It’s

very much about stomping the earth . . . [It] brings energy into the body, Earth energy into the body (interview with the author, 30 December 1997).

Moreover, within contemporary trance discourse, beyond the “homeopathic” consequences for the individual and the community said to derive from both sound and landscape, it is believed that such dancing performs a somatic connection to, and enables a spiritual relationship with, the natural world.

Raymo, Chet (1936–)

Chet Raymo was born 17 September 1936 in Chatanooga, Tennessee, and became Professor of Astronomy at Stonehill College in North Easton, Massachusetts. Beginning in 1985, Raymo wrote a weekly science column for *The Boston Globe*. He has also published more than a half dozen books addressing the connection between spirit and science.

Although Raymo's upbringing was religious, he found himself increasingly drawn to the beauty of science, finding the features of the universe more readily understood in terms scientific than religious. As a child, he was often wakened in the middle of the night by his father. They would go together into the dark yard to study the starry night skies; he would later characterize these midnight excursions as having a profound influence on his life as his youthful scientific curiosity came into conflict with his religious upbringing. Yet while science offered him knowledge and understanding, it did not offer the comfort and tradition he had found in religion. Only through his exposure to such mystics as Julian of Norwich, Thomas Merton, and Teilhard de Chardin was a world revealed that allowed both science and religion a place.

Place is central in Raymo's books, beginning with *The Soul of Night* (1985). By 1999 he had come to understand that the teachings of science could not contradict his religious faith; that faith is based not on dogma but on love; and that "knowledge is a prerequisite for love" (1999: xv). Further, he argues, science allows us "to participate in an evolutionary drama larger and richer than ourselves, in which the human soul awakens in the course of deep time to a new season of consciousness and intelligence" (1999: 46). He notes, for instance, that as a trained astronomer he fully understands the make-up of a comet, can plot its course around the sun, its trajectory across the sky. But none of that knowledge can diminish his spiritual joy in the presence of the comet. "Knowledge and wonder and celebration," he writes, "went hand in hand in hand: the archetypal religious experience" (1998: 239).

Raymo writes of his life as a continual process of "relearning how to pray" (1999: ix). Rejecting the selfcenteredness of his childhood prayer – "the vain repetition of 'me, Lord, me' " (1999: xiv) – he prefers to meditate upon natural phenomena as a catalyst for his spirituality. His is not a ritual-bound spirituality, though; Raymo lives well outside the New Age. Nor does he follow Stephen Jay Gould's imperative that science and religion ought always to remain entirely separate realms of understanding. In the world as Raymo understands it, God and nature serve one another; the kind of knowledge offered by science does not impede, but rather enhances, a religious or spiritual experience of nature. Both in his books and in many of his weekly columns,

Raymo seeks to show the mystery of the natural world; thus while he does not write explicitly about “the environment,” he guides readers into that natural mystery in the understanding that by doing so they will come to value nature for its own sake.

In exchanging the dogma of his childhood religion for a mature vision of spirit as an elemental part of the natural world, Raymo echoes two writers with whom he is most often compared: Loren Eiseley and Annie Dillard. Raymo speaks, though, with a unique voice, one informed by the ancient stars in the night sky, the differently ancient stones of the Irish coast and the long traditions they represent – a voice content in the knowledge that science and religion have equal roles in the cosmos and in his own life.

Reclaiming

“Reclaiming” is an ecofeminist Witchcraft community and spiritual organization. While the Reclaiming *tradition* is a specific feminist branch of contemporary American Pagan Witchcraft, the Reclaiming *community* refers both to the local Witchcraft community in the San Francisco Bay Area of California and to the women and men, primarily in North America and Western Europe, who identify with this tradition. The tradition arose from a teaching collective within the San Francisco community, founded in 1979 by the Jewish author, feminist and activist Starhawk and her circle of friends. In 1980 the collective, which by then ran an ecofeminist “school” in Witchcraft, decided to name its work *Reclaiming – A Center for Feminist Spirituality*. Within a few years Reclaiming became a well-established institution on the Pagan scene in Northern California. Twenty years later, Reclaiming has recruited more than fifty teachers/leaders and probably has adherents in the tens of thousands.

According to Reclaiming Witches, the values of their tradition stem from an age-old “magical consciousness” that sees all of life as sacred and interconnected, and any living being as a dynamic composition of matter, energy and spirit. The natural world is venerated and ultimate spiritual authority is believed to reside within each and every

person. Reclaiming works with both female and male images of the divinity, although the goddess symbol is usually preferred. To name life-generating powers “Goddess” is meant to be a continual reminder of what they value the most, namely life brought into the world, and not an act in which gender narrowly is attributed to divine reality.

Reclaiming’s deep spiritual commitment to the Earth and to the well-being, justice and equity of all people has attracted people to the community who seek to combine spirituality with political activism – often with a strong ecological mission and a desire to convert Witchcraft into green activism. Although a “metaphysics of interdependence” is manifest in this Witchcraft community, there are aspects of their worldview that also are critical of much green “deep ecology” spirituality and activism. They do, for example, claim a radical notion of power that includes both ecological and social structures: even though all beings have a share in the same life-generating powers and therefore are equally valuable in terms of their “powerfrom-within,” people are valued as having a higher worth than worms. Also, political action is regarded as impossible without rating and choosing one alternative before another. To take the name “Witch” is itself an act of choosing, of ethically separating out from immanent reality an identity more preferable than another. Furthermore, religious devotion involves more than political activism to a Witch: there are mystical and initiatory aspects of practicing Witchcraft that challenge every person to mature and grow.

In 1994 Reclaiming incorporated as a nonprofit religious organization and in 1997 it reorganized to accommodate its membership that had grown by then to several thousand followers in the U.S., Canada and Europe. The San Francisco Reclaiming collective dissolved itself and was replaced with a local “Wheel” and a transnational “Spokes Council.” A statement of core values, the “Reclaiming Principles of Unity,” guided the process of reformation. A Reclaiming *tradition* was thus defined for the first time, not in terms of a theology, but in terms of a worldview and methodology. By this careful move, Reclaiming came to augment the position that feminist Witchcraft is not necessarily a new religion, but perhaps rather a new spiritual (and magical) practice.

Even though the old Reclaiming community in San Francisco has a new organizational heart, the ideological continuity between 1980 and today is clear. When Reclaiming was founded, Starhawk and friends interpreted Witchcraft in terms similar to those of Z Budapest: as the claiming back (re-claiming) of an ancient, goddessworshipping religion in which nature was viewed as sacred and women believed to hold honorable and powerful positions. But unlike Budapest’s lesbian and separatist *Dianic* interpretation, Starhawk wanted to introduce a feminist version of Witchcraft to both genders and emphasize its environmental and political implications. From the very beginning and in alignment with their brand of feminist-anarchism, the collective decided to organize in independent working cells in order to teach classes or publish a newsletter, and to make all decisions through a consensus process. They also decided to teach within the structure of ritual and always keep at least two teachers in every class. This was meant to give the students an ideal experience of how a small ritual

unit, a coven, might function and to make transparent how a community of equals ideally might work.

The primary work of Reclaiming is to empower individuals and communities with visions of a new culture and new magical-practical tools to help bring it forth by means of classes, workshops, summer programs (“Witchcamps”) and public rituals. They are announced regularly in the *Reclaiming Quarterly*, Reclaiming’s own magazine for Witchcraft and magical action (printed in 2000 copies). Three core classes have been taught since 1980. The first class, “The Elements of Magic,” teaches how humans are interconnected with the natural world and how ritualizing basically means interaction with the four elements (air, fire, water and Earth) in terms of moving energy. In the second class, “The Iron Pentacle,” the students work with a notion of the human body as a microcosm mirroring a larger macrocosm and how bodily energies can be used for healing purposes. In the third class, “The Rites of Passage,” the students learn to see the human life-course as a sacred manifestation of birth, growth, initiation, repose, death and decay. In all Reclaiming classes, students also learn about Goddess spirituality, the ethical foundation for the practice of magic, and how to create their own rituals. The three core classes are a prerequisite to become initiated – an event which in Reclaiming is customized to the individual seeker. A hallmark of the Reclaiming tradition is that initiation does not lead to any sort of entitlement. Neither is it required for teaching, running a coven or officiating at public rituals.

Reclaiming offers public rituals to celebrate the Witches eight high holidays (sabbats) in a so-called Reclaiming-style – ecstatic, improvisational and with many priests and priestesses that take different roles at rituals – and the community has in particular become famous for the annual *Spiral Dance* ritual. Starhawk wrote the ritual script herself to celebrate and promote her first book (with the same title) in November 1979 and the event has, since then, become a permanent institution. The ritual celebrates and mourns the intertwining of life and death, and the ritualists pledge to remember those who have died from violent deaths in order to fight for peace and justice. The *Spiral Dance* is regarded as Reclaiming’s annual gift to the larger San Francisco Bay Area Pagan community, and draws 1500–2000 celebrants.

A major reason for the growth of the Reclaiming community both inside and outside of San Francisco has been Starhawk’s influential writings – in particular *The Spiral Dance* (1979), which in 2000 had sold more than 300,000 copies – and the spread of “Witchcamps.” These have been offered to students outside San Francisco since 1985 and their curriculum is usually a condensed version of the three core classes mentioned above. Issues such as community building and sustainable living may be raised, as well as training for nonviolent direct political action. Reclaiming tradition Witchcamps are today organized throughout the U.S. (Georgia, California, Florida, Michigan, Missouri, Pennsylvania, Texas, Vermont, Virginia), Canada (Vancouver) and Western Europe (Germany and England). Between fifty and a hundred people attend each one of these Reclaiming-identified camps. This means that more than a thousand people go through Reclaiming’s “educational system” every year without becoming members of the San

Francisco community, being part, rather, of radical environmentalism's diverse sub-cultures.

Reclus, Elisée (1830–1905)

Elisée Reclus, a leading nineteenth-century French intellectual, was one of the foremost geographers of his age and a major figure in anarchist political thought. He is most widely recognized for his *New Universal Geography* (1876–1894) a massive 19-volume, 17,000-page work that has been called the greatest individual achievement in the history of geography. His final work, *L'Homme et la Terre* (Man and the Earth) (1905–1908), a 5-volume, 3500-page synthesis of geography, history, anthropology, philosophy, and social theory, is perhaps his most enduring contribution to modern thought. Beginning with the statement “Humanity is Nature becoming self-conscious,” [my translation] it is a sweeping account – a kind of anarchist “Grand Narrative” – of the history of both humanity and the Earth, and shows Reclus to be one of the most important precursors of contemporary ecological thought, and of social ecology in particular. Reclus is most widely known today for his place in the history of both geography and anarchist theory. However, through his influence on Kropotkin, another famous anarchist geographer, and on later thinkers such as Patrick Geddes and Lewis Mumford, he has remained a significant figure in regionalist, decentralist and communitarian thought.

There are two sides to Reclus’ story of humanity and the Earth. One is his depiction of the process of human selfrealization in dialectical interaction with nature. He showed how the natural world shaped human development as humanity transformed and contributed to the unfolding of nature. Reclus contended that historical progress has resulted from mutual aid and social cooperation. Accordingly, he believed that the full self-realization of humanity will depend on a social revolution that embodies such practices in a free, egalitarian, anarcho-communist society. Moreover, he held that the fate of the Earth will hinge on humanity’s ability to establish social institutions that express a deep concern for the natural world and for all living beings on the planet.

The other side of Reclus’ narrative focused on the long history of domination that has impeded human progress, alienated humanity from nature, and increasingly devastated the face of the Earth. Although he devoted much attention to the domination of human beings through such institutions as the centralized state, capitalism, patriarchy, and racism, he was unusual among social theorists of his era in making the human domination of nature one of his central themes. He was an early critic of the ecological devastation resulting from ruthless industrialization and technological rationalization, he decried the destruction of ancient forests as early as the 1860s, and he was a tireless advocate of ethical vegetarianism and of the humane treatment of animals.

Reclus' survey of human history included extensive discussion of religion and its effects both on society and on humanity's relationship to nature. He traced the origins of religion to tribal societies in which the shaman was both a teacher who conveyed knowledge based on observation of the real world and also a priest who expressed fantasies concerning an illusory world. He contended that as a result of this heritage, society's traditional outlook has been a confusion of myth and reality, truth and falsehood. He held that as knowledge of society and nature progressed, science and religion increasingly diverged, and in the modern period entered a period of war with one another. Reclus believed that in this struggle science must ultimately triumph and reveal religion to be a relic of past ignorance and superstition.

Reclus stressed the influence of nature on the development of the great world religions. In his view, the monotheism of the Ancient Near East reflects in part the austere character of that region, with its geographical uniformities, its hot, dry climate and its harsh sunlight. He contrasted this unifying vision to the unity-in-diversity expressed in Indian religion, contending the latter reflects the sub-continent's vast ecological diversity of forests, mountains, and rivers, and its extremes of climate. The history of religion is thus for Reclus a clear expression of the dialectic between humanity and nature.

Reclus believed the founders of the great religions often had metaphysical and moral insights that conflicted starkly with later religious institutions. He argued that throughout history, religion has been transformed into an ideology at the service of forms of domination such as patriarchy, statism, militarism, capitalism, racism, and repressive morality. He saw Buddhism as the classic case of such a transformation. He contended that the Buddhist teaching of compassion for all sentient beings had revolutionary social implications, and that the Buddhist appeal to direct experience was a radical challenge to all ideologies and institutions. These liberatory dimensions of Buddhism were lost, however, when its practice was reduced to a code of personal morality, the Buddha was declared a god, and the dharma became an official state religion. A similar process, he said, was used later by Constantine to "kill" Christianity. He noted an even more extreme conflict between ideology and practice in the case of the Jains, observing that their respect for nature, and indeed for all forms of life (which would today be called "biocentric egalitarianism") did not prevent them from becoming an elite group that exploited the masses.

Despite Reclus' professed atheism and secularism, there is an implicit, but very significant, religious undercurrent in his work. He sometimes wrote in a pantheistic vein of the experience of nature as involving a loss of the ordinary sense of selfhood and a merging with the surrounding environment. In some works (for example, his *History of a River*, 1869), he expressed not only an intense love of nature, but also something close to the experience of union with nature typical of nature mysticism. Furthermore, at times he referred to his own philosophy as a kind of humanistic religion based on the pursuit of the good of the whole. He held that such a commitment to a larger good was the positive core of ancient religions, and that, although it has been

largely betrayed by institutionalized religions, it is still put into practice by their more enlightened and compassionate adherents of these traditions.

Reclus thus saw religion as significant in three areas. First, he looked upon institutionalized religion as a negative social force insofar as it has been a powerful ideological support for systems of domination of humanity and nature. Secondly, he held that religions have had a positive dimension to the degree that their founders and some of their followers have expressed values based on feelings of solidarity and a concern for a greater whole. And finally, Reclus himself expressed a certain religious impulse founded both on his ethical concern for the larger good of humanity and nature, and on his immediate experience of a kind of spiritual union with nature.

Redwood Rabbis

The redwood forest of America's Pacific Northwest is one of the ecological and spiritual treasures of the world. In the 1820s, settlers of European descent encountered two million acres of dense forest and pristine waterways. At the turn of the millennium, only 4 percent of that primeval ecosystem remained, islands of old-growth reserves in a vast sea of second and third-growth timberland frequently subjected to clear-cutting, burning and herbicide use.

Jewish settlers made their way north from San Francisco to remote Mendocino and Humboldt Counties in the early nineteenth century, and by the 1980s the region had become home to a small progressive Jewish community, culturally predisposed to environmental activism. Many of the region's environmental organizers, scientists and attorneys are of Jewish descent.

In 1985 MAXXAM Corporation of Texas acquired Pacific Lumber, a timber company whose 200,000-acre holdings included nearly 20,000 acres of virgin oldgrowth, the largest remaining unprotected stands of ancient redwoods, among them the Headwaters Forest. MAXXAM tripled the rate of logging ancient groves, rapidly felling some of the largest and oldest living things on Earth to make luxury products – premium lumber for siding, decking and hot tubs. For nearly twenty years the redwood forest has been the locus of public demonstrations, litigation, legislative initiatives, and direct-action civil disobedience. Public concern extends beyond loss of the majestic trees themselves to degradation of the ecosystem caused by loss of forest canopy and root strength, leading to increased soil erosion, landslides, aggradation and pollution of streams, and destruction of fish habitat. In 1997 a mudslide originating on MAXXAM clear-cuts destroyed several homes downslope and numerous residential wells have been befouled by sediment; lawsuits brought by residents have been settled out of court.

Working together as the Redwood Rabbis, the three Jewish religious leaders in the region invoked the Talmudic principle of *bal tashchit* that forbids destruction of resources. In rabbinic legend Adam is told: "Do not spoil and desolate My world, for if you do, there will be no one after you to repair it" (*Midrash Ecclesiastes Rabbah* 7:28). In September 1996 Rabbis Lester Scharnberg and Naomi Steinberg addressed approximately 8000 people rallying at the edge of Headwaters Forest; the rabbis were among over 1000 people arrested for acts of nonviolent civil disobedience.

In January 1997 Rabbis Margaret Holub and Naomi Steinberg organized *Tu BiShevat in the Redwoods*, an observance of the midwinter full moon New Year of the Trees. Over 250 people braved rainstorm and flooding to gather at a local Grange Hall to hear environmental presentations and a teaching by eco-theologian Rabbi Arthur Waskow.

A break in the storm allowed participants to travel to a nearby park to celebrate the traditional New Year of the Trees *seder* (ritual meal) of tree-borne fruit while seated on the ground beneath ancient trees. As the ritual ended, the rain resumed and more than ninety participants drove to the outskirts of Headwaters Forest for the holiday custom of planting trees; redwood saplings were planted on creekside timber company property as an act of peaceful civil disobedience and effort to stabilize the stream bank.

Through ongoing public speeches, articles, lobbying and direct action, the Redwood Rabbis attempt to inform the public and influence political developments toward the protection and restoration of the redwood forest. The Redwood Rabbis' efforts have been reported in Jewish and non-Jewish press in the United States and Israel.

Jewish ethics include the obligation of *tokhechah*, delivering rebuke to wrongdoers. The Talmud states that the obligation of rebuke extends not only to individuals, but also to the community, and even to the whole world; if one does not fulfill the commandment of rebuke, one accrues the guilt of those that might have been reformed (Shabbat 54b). In this spirit, the Redwood Rabbis have engaged in years of effort to communicate with MAXXAM owner Charles Hurwitz, a generous donor to the Jewish community in his native Houston, Texas. The rabbis have appealed to the timber tycoon through correspondence, telephone, private and public meetings. In an open letter in California and Houston Jewish press, the Redwood Rabbis called on Charles Hurwitz to make a *t'shuvah sh'leyimah*, a complete change of direction, and dedicate himself to sustainable forestry practices and restoration efforts. The rabbis added words of encouragement from nineteenth-century Chassidic master Rabbi Nachman of Bratslav: "If you can spoil, you can fix." Although Pacific Lumber has been cited for approximately 400 violations of the Forest Practices Act since 1995, MAXXAM absorbs the minimal fines and has not acknowledged responsibility for environmental damage. In *The Jerusalem Report* columnist Gershom Gorenberg observed,

. . . the Redwood Rabbis are right to treat their cause as a Jewish one. Arguing "I own it," Charles Hurwitz posits the absolute sovereignty of the individual, and the complete license of private ownership, limited at most by the law of the land but not by ethical demands. But in Judaism, the individual is not sovereign. God is. He owns the earth. Human beings have, minimally, the duty of tenants to care for the Landlord's property. More stringently, they bear the obligations of caretakers, put in this world – as is said of Adam and the Garden of Eden – "to till it and guard it." A caretaker doesn't destroy the Landlord's rarest treasures, doesn't stand and watch it happen (*The Jerusalem Report*, 14 November 1996).

In September 1998 an Earth First! activist was killed near Headwaters Forest when an irate logger felled a tree in the young man's direction; one of the Redwood Rabbis delivered a eulogy at the young man's funeral. Two other lives have been lost in "tree-sit" accidents in the bioregion. In addition to drawing attention to the plight of the forest and streams of northern California, the Redwood Rabbis bring forward the following questions in Jewish and interfaith discussion: are religious communities morally obligated to take an active role in environmental protection and restoration?

Are products derived from non-sustainable practices ethically acceptable? Do religious communities and leaders have a responsibility to deliver rebuke to co-religionists who contribute to pollution and environmental destruction? And, how can we acknowledge natural resources as spiritual resources?

Re-Earthing

Awakening to the Earth

As I look back, I see two waves, spirit and the Earth, that have sculpted my life. Or are they perhaps just two sides of the same wave?

Spirit emerged from a life-transforming LSD session in London in 1972 which blasted me out of the life I had been living up till then, out of a failed marriage and my job as a systems engineer at IBM. Suddenly the life I had been living lost all its meaning and appeal and I followed an overwhelming urge to start afresh with a clean slate. The following year found me on the road in India for the first time, studying Tibetan meditation with Lama Yeshe and Zopa at Kopan monastery in Nepal and vipassana meditation with Goenka at the Burmese Vihar in Bodh Gaya.

I arrived back in Australia in August 1973 after a fiveyear absence. The 1960s didn't really reach Australia until the early 1970s. Lots of young people went back to the land then, especially around the small town of Nimbin in northern New South Wales and I immediately gravitated there upon my return.

My friends and I started offering meditation retreats to the burgeoning New Age community, and by 1976 we had built the Forest Meditation Centre. Then, twenty of us bought 160 acres of forest nearby, sloping down to Tuntable Creek, and started Bodhi Farm. We dedicated ourselves to caretaking the meditation center, organic gardening, social action, and looking after each other. It was a beautiful time. Before a hole in the sky made us fear the sun, we worked naked in the gardens and bathed in the pure water of our creek. We planted fruit trees, delivered our own babies, and built our dwellings. We shared vehicles. One day a week we sat in silent meditation together, one day we met in council. My son Bodhi was the first born there in 1977, quickly followed by seven or eight others, including two sets of twins, and so we became known in the district as Baby Farm.

My awakening to the Earth took place four or five miles from Bodhi Farm, at Terania Creek, in 1979, when a couple of hundred hippies staged what was, as far as I know, the first direct nonviolent action in defense of the rainforests anywhere in the world. This was the biggest turning point in my life. I think now that we were successful because we were so naive and innocent and unaware of precedents. A film from that period shows a policeman with a happy smile on his face sitting by the forest having his bald head massaged by a young hippie woman. Another shot shows a band of tie-dyed minstrels standing in front of a bulldozer in the rainforest singing songs of

love and peace. People climbed high into the trees and lay on the ground in front of the dozers. Hundreds were arrested, but there was not a single incidence of violence.

Perhaps it was all the sitting in meditation. But I felt as if the rainforest could speak to me and was asking me to give it voice. It was as if I had been plucked from my human throne and suddenly found myself a commoner, a plain member of the biota as Aldo Leopold called it, with a burning desire to awaken humanity to the folly of sawing off the branch that we are sitting on, unraveling the biological fabric from which we too are woven. If we enter the rainforest and allow our energies to merge with the energies we find there, I found, a most profound change in consciousness takes place. As I wrote in *Thinking Like a Mountain* (a book I wrote with Joanna Macy, Arne Naess and Pat Fleming in 1986), I realized that our psyche is itself a part of the rainforests. "I am protecting the rain forest" becomes "I am part of the rainforest protecting myself. I am that part of the rainforest recently emerged into thinking."

It took a number of years, countless demonstrations, press conferences, leaflets, and many people willing to sit in front of bulldozers and go to jail. But eventually 70 percent of the people of New South Wales came to agree with us, and the government established a series of national parks. To protect the remaining rainforests in 1981 we formed an organization, the Rainforest Information Centre (RIC).

From the Rainforest Information Centre to Earth First!

In response to our success, however, Australian logging companies began to look offshore, and in 1983, community representatives from the Solomon Islands contacted RIC for aid in resisting the same logging companies we had fought, as well as Malaysian and Japanese companies. In the years that followed, RIC volunteers provided technical, financial, and political support to defend forests and communities in the South Pacific, Asia, South America, and Russia.

In 1981 North American poet Gary Snyder visited Australia and we took him for a walk through Terania Creek.

As he learned about our actions in defense of the rainforests he said he was reminded of a new group that had formed in the United States called "Earth First!" Armed with Gary's introduction I contacted Earth First! Founder Dave Foreman and was soon writing for their journal.

In 1984 I was invited by Earth First! activists to the U.S. With Foreman and another of Earth First!'s founders, Mike Roselle, we spent two months bouncing around in the back of an old Volkswagen bus, conducting "road show" performances made up of music and storytelling, promoting our biocentric vision and direct-action resistance to deforestation. We ended our tour in San Francisco at a venue where Gary Snyder read a poem about Terania Creek and Randy Hayes announced the formation of a new

international organization, the Rainforest Action Network. The years that followed were full of activity: direct action to save forests and wilderness, boycotts of Mitsubishi and other transnationals, support for indigenous people in their struggles. Yet it was clear that the planet could not be saved one forest at a time. For each forest we were able to spare, a hundred were lost. The Earth is not a rock with resources growing on it; the Earth is alive, and to try to protect it by preserving a tiny patch of wilderness here and there is something like trying to keep humans alive by preserving representative samples of skin here and there.

Consciousness Change and Re-Earthing Ritualizing

To protect the Earth, to protect ourselves, we had to change the way we saw both the Earth and ourselves. We had to change our consciousness. Unless we could address our underlying spiritual disease, no forests would be saved for long. But how, I wondered, are we to identify and understand the spiritual malaise that leaves modern humans so lonely and isolated and no longer able to hear the glad tidings of the Earth which is our home? How are we to heal the great loneliness of spirit that finds us unable to feel loyalty and gratitude to the soil, which has fed and nourished and supported us without pause for 4000 million years?

Searching for an answer, I turned to the indigenous people who lived more or less in harmony with the Earth for hundreds of thousands of years. When we look at indigenous cultures, we may notice that without exception ritual affirming and nurturing the sense of interconnectedness between people and nature plays a central role in the lives of these societies. This suggests that the tendency for a split to develop between humans and the rest of nature must be very strong. Why else would the need for such rituals be so universally perceived? It also suggests the direction we must search for the healing of the split: we need to reclaim the ritual and ceremony which were lost from our culture a long time ago, and to our amazement we find that this is incredibly easy to do. Working with the Buddhist activist Joanna Macy, we developed a ritual to address our contemporary situation. The Council of All Beings, as we called it, began with mourning for what has been lost, the acknowledgement of rage and anger. Using guided visualization, movement, and dance, we reexperienced our entire evolutionary journey. We made masks to represent our animal allies and give voice to these voiceless ones, invoking the powers and knowledge of these other lifetimes to guide us in appropriate actions and empower us in our lives. We see that the pain of the Earth is our own pain and the fate of the Earth is our own fate.

The Council of All Beings was just the first of the “reEarthing” rituals that we developed in the years that followed, searching for processes that resonated for modern humans while fulfilling the function that such ceremonies had done for all indigenous cultures without exception since the beginning of time.

In the Council of All Beings we remember to speak on behalf of the animals and plants and landscapes with whom we share the Earth. In another of our new processes, “The Timeline of Light,” we recapitulate our entire evolutionary journey, the five billion years since the Earth was born and before that, the eight or nine billion years since the birth of the universe itself. When we enact this story as our very own creation myth, when we recall that every cell in our bodies is descended in an unbroken chain from the first cell that emerged on the Earth, then a wonderful new perspective opens up in our lives and a fierce loyalty for life may arise that cuts through the conditioning and habits that trap us, and empowerment may blossom to serve the Earth.

Staying Connected

It takes a certain discipline, of course, to stay connected, to continually hear the Earth’s voice. For many years, it had been my custom to seek guidance from the Earth. I would lie down in the forest and cover myself in leaves and say, “Mother, I surrender to you,” and then I would deliberately allow all my energies to sink into the Earth. In 1992, the instructions I received in response to my prayers and meditations changed, and from that point onward, all that I received went like this: “John, finish what you’ve started. Don’t start anything new. Leave space for me, Gaia,” Sometimes this message would come while I was sitting quietly in nature. At other times, at the end of a weekend workshop, the last exercise would be for each of the participants (including myself) to write a letter to themselves which started “dear (your name), this is your mother, Gaia,” after that the instructions were just to keep writing without stopping, without thinking and just see what came out. Previously I had received all kinds of practical advice about projects to undertake, or new directions for my work. Now, this was all that came through: “John, finish what you’ve started. Don’t start anything new. Leave space for me. Gaia.” I felt that Gaia was telling me to take time to seek deeper answers to my questions about how the perennial spiritual thirst of humanity could be aligned with the need to address the ecological crisis. It was time to purify myself. It was time to visit some of the projects that I had helped initiate and support but had never seen with my own eyes. It was time to visit my beloved India and weave once again the spiritual warp and ecological woof of my life.

With all the projects that were underway, it took me about three years to hand over the last pieces of my work and return to India, my spiritual home, in search of nourishment and vision. Meanwhile, all the psychological aches and pains, which had mysteriously vanished when my Earth service was all-consuming, now returned. I finally had time on my hands again.

So I returned to India in 1995 searching for some resolution to the spiritual crisis that had begun for me a few years earlier. I decided to spend some time with the 86-year-old Advaita teacher, Poonjaji. I was hoping that meditation and *satsang* dialogues with him would help me to understand the connection between my work to save the planet

and spiritual work. I felt a great need to join my activist side with my contemplative side, and I hoped Poonjaji could help me. He had found enlightenment fifty years before as a disciple of Sri Ramana Maharshi, perhaps the greatest Hindu sage of his century, on the sacred mountain Arunachala in the southern Indian state of Tamil Nadu.

Poonjaji, or Papaji as he was affectionately known, had many Western devotees who believed that he was also a fully enlightened master. Some 200 of us from all over the world crowded the hall Satsang Bhavan four mornings a week. Behind him on the wall were portraits and photos of Ramana. We handed him letters (his hearing was failing) with our spiritual questions which he would read and answer. I was interested in exploring with Papaji the relationship between the human spiritual quest and the ailing Earth. I had been wondering how, as long as people look on the Earth as *maya*, illusion, and as an obstacle to realization, as is generally the case in religions originating in the East, we could find the intense spiritual will necessary to make the tremendous changes in our values, lifestyles, and institutions, and in our very consciousness, that would prevent the continued destruction of the Earth?

Lucknow seemed an unlikely place to search for enlightenment. Noisy, highly polluted, and hardly conducive to a spiritual quest. Still, some of my closest friends had reported that a great opportunity existed there while this great sage was alive. There I would hang out with the other seekers, listening to stories from people from around the world. Once I visited the sad remnants of a forest nearby and prayed for direction, for renewal, for Gaia to call me once again, but I felt frustrated and full of doubt.

I found myself fascinated by Shiva, the Hindu god of creation and destruction, and tried to find out as much about him as possible. For Shivaratri, the anniversary of Shiva's wedding, I caught the train to Varanasi where that wedding had taken place. Millions of pilgrims crowded the festive city, and I watched the *naga babas* naked, ashcovered, dreadlocked *sadhus* carry their tridents down to the Ganges to purify themselves.

While there I came across an interview with Vandana Shiva, the Indian feminist ecologist and writer, who spoke about the river goddess Ganga and Shiva. She said that the power of the goddess was so strong that if she landed on Earth she would just destroy. It is symbolic of the way we get our monsoon rain. It comes so strong, that if we don't have forest cover, we get landslides and floods. So the god Shiva had to help in getting the Ganges down to Earth. And Shiva laid out his hair, which was very matted, to break the force of the descent of the Ganga. Shiva's hair, Vandana concluded, is seen by many in India as a metaphor for the vegetation and forests of the Himalayas.

When I returned to Lucknow three days later, I wrote to Papaji twice about these concerns. The first time his answer was mostly mysterious to me and left me unsatisfied. So I plucked up my courage and wrote again a couple of weeks later:

Dear Papaji, Lakshmana Swami once said that, since God had chosen to manifest as the world and everything in it, one could worship God by having respect for the world and all the life forms it contains.

For many, many years, Papaji, it has been my privilege and joy to worship God in this manner, to feel the living Earth play my life like a musical instrument. A couple of weeks ago, when I first wrote to you at satsang, you said this: “To the man speaking of Mother Earth I say: To help Mother Earth means you stand and shout at the top of your lungs.”

I have shouted long and hard, Papa. I shouted in front of bulldozers and was thrown in jail. I made films and a book, which was translated into 10 languages, and conducted workshops around the world, donating the proceeds to the work, raising hundreds of thousands of dollars for the protection of Nature from the Amazon to New Guinea.

For the last 15 years Papa, the Earth worked through me and I was tireless and full of joy, but eventually the impurities of ego and the conditioned mind began to rise again until, a couple of years ago, the Earth asked me to hand over what I had been doing to others and purify myself for the next task that she has for me. And here I am.

This time Papaji looked directly at me and said in his deep voice:

When you take care of your mother then you will get some prize. When you are helping the Earth, then you are helping everybody who’s living on the Earth

– plants, animals, and men. And now you have a reward: that the work will carry on. You may now sit quiet, and she will give you something in the way of peace. So, my dear friend your work is very good. I bless you for this task that is in hand, and let me tell you, both sides can happen simultaneously: Work for the good of the Earth and the people. And for your own good do something else. They needn’t interfere with each other. Stay for some time before sleep and in the morning and sit quietly for five or 10 minutes. The rest of the time you may give for the world, help those who need your help.

What a blessing it was to feel Papa rekindle the flame inside me which had been wavering and doubtful. I could not yet know how, but I knew that from this turning point it would begin to flare forth once more.

And indeed, over the following years my work was renewed: fundraising on behalf of activists and cuttingedge projects around the world; in Ecuador to protect the Amazon headwaters from the ravages of the oil industry; a film I produced with David Attenborough and Olivia Newton-John to help protect the endangered forest species on New South Wales and the reforestation of Arunachala.

Shiva’s Mountain

My retreat with Papaji was drawing to a close, but there was still one place I had to visit: the great mountain Arunachala, in Tiruvanmalai, 18 hours south by train.

Nearly ten years before, in 1987, I had received a letter from Apeetha Arunagiri, an Australian nun residing in the Sri Ramana Ashram at the foot of Arunachala. She wrote that when Ramana had arrived there, the holy mountain was clothed in lush forest and one might even meet a tiger walking on its flanks. Now little grew there but thorns and goats. Terrible erosion trenched Shiva's sides, and torrents of mud attended each monsoon. She had heard about our work for the forests. Could we please help her to reclothe the sacred mountain?

I had composed a reply to Apeetha, encouraging her in her efforts but pleading that we had no competence in reforestation or the rehabilitation of degraded landscapes

– our mission was the protection of intact ecosystems. But it was no use, I couldn't send the letter. Ramana's smiling face, which I had first seen smiling from the back of his book *Who Am I?* in London in 1970, kept popping up before me. So we raised some money and sent it to Apeetha. Through her efforts a local NGO was born, the Annamalai Reforestation Society. The following summer solstice I was facilitating a Council of All Beings workshop at John Button's shack at Sundari community in northern New South Wales. John was a permaculture designer and tree-planter who was heading for the deserts of central Australia to become involved in a tree-planting project. For some reason I asked him if he would like to try this in the deserts of Tamil Nadu instead. He asked for details, and when I mentioned Ramana, his face turned pale and he told me that he was a long-time devotee of Ramana.

Since that time, John and his partner, Heather Bache, helped organize the rehabilitation of Arunachala. The space between the inner and outer walls of the vast 23-acre temple complex has been transformed from a wasteland into the largest tree nursery in the south of India. Hundreds of people had received environmental education, and a 12-acre patch of semi-desert was donated to the project and transformed into a lush demonstration of permaculture and the miraculous recuperative powers of the Earth.

Hundreds of Tamil people have now been trained in reforestation skills – tree identification, seed collection, nursery techniques, watershed management, erosion control, sustainable energy systems. Shiva's robes are slowly being rewoven. Furthermore, hundreds more have been trained in the techniques of permaculture, inspired by the Annamalai Reforestation Society's model farm.

The train finally rolled into Tiruvanamalai and I was able to visit Arunachala myself and see the tremendous work that had been done to revegetate the sacred mountain. Upon my arrival I discovered that many people there believe that to walk around the base of Arunachala is the fastest way to enlightenment. Each full moon, tens or hundreds of thousands of devotees and pilgrims do so. It upset me to see the indifference with which most of these folks regarded our work. Most were oblivious, but some even complained that the newly planted trees interfered with their view of the sunset. A great deal had been accomplished by the Annamalai Reforestation Society, but how much more could be achieved if only the pilgrims would realize the unity of the spirit and the Earth!

What if their worship of Shiva included devotion to his physical body, Arunachala? Imagine if they lent a hand to the planting and maintenance of the trees as part of their devotion? The greening of the mountain would be accelerated. I was giving talks and lectures in the town and I began to challenge the ecological indifference I found and to propose to the pilgrims that surely the act of worship and respect of watering the young saplings that were weaving themselves into robes to cover his nakedness was an even faster route to liberation than circumambulating the mountain.

A week later I was stricken with remorse. How could I be so presumptuous as to make such claims without having even asked Shiva? So one morning I climbed the mountain and found a quiet place among the trees to meditate and pray and apologize. After some time I opened my eyes to a noise. Some monkeys had appeared from the young forest. Slowly they filed past and stood guard while scores of their tribe came into view, and then they began to relax.

They groomed each other, they made love, mothers breast-fed their babies, children played and cavorted, utterly unself-consciously living their everyday lives in my astonished and grateful presence. I saw a new-born infant cautiously explore the ground, leaving the safety of her mother's body for what seemed to me the first time, and leaping back and climbing her fur at the slightest noise or disturbance. I had never felt more accepted by the nonhuman world. I knew that Shiva had answered my prayer, had acknowledged my efforts, and was giving me his sign of approval.

It doesn't really matter what symbols we use – Shiva, Gaia, Buddha, God. What we need now is for the followers of all faiths to turn their allegiance to the Earth. What matters is that we refuse to be drawn to one or the other of the great polarities: spirit and Earth. We must neither reduce everything to spirit, from where it appears that the material world is some kind of illusion, nor reduce everything to the material, so that it looks as if spiritual seekers are abdicating responsibility to care for the creation.

Reichel-Dolmatoff, Gerardo (1912–1994) – and Ethnoecology in Colombia

Gerardo Reichel-Dolmatoff, anthropologist, ethnographer, archeologist, ethnoecologist, ethnohistorian and ethnoastronomist, carried out extensive research in Colombia (South America) among the Amerindians of the Amazon (Vaupes), Caribbean coast (Uraba, Guajira, Sierra Nevada), Pacific Coast (Choco), Andean and inter-Andean areas, and in the savannah area of the Llanos.

Reichel-Dolmatoff was one of the founders of Colombian anthropology and archeology. As an ethnographer he lived for decades among indigenous peoples and was a staunch defender of Amerindian peoples. The author of over 20 books and 300 articles on prehistoric and contemporary Amerindians, Reichel-Dolmatoff also was a member of scientific institutions such as the National Academy of Sciences of the United States, the Academy of Sciences of Colombia, the Third World Academy of Sciences, and the Linnean Society of London, among others.

Reichel-Dolmatoff's anthropological work contains detailed ethnographies on dozens of Amerindian cultures and contributes significant theories and methodologies. For example, he analyzed indigenous shamanism, cosmologies and worldviews as templates for socioenvironmental analysis and conservation, and related these to specific religious systems, modes of subsistence, socio-political structures, medicine, art, philosophies, and ethics that are used by communities to achieve long-term environmental and social well-being. He largely documented this among the Tukano Indians of the Northwest Amazon (Vaupes) and among the Kogi Indians of the Sierra Nevada de Santa Marta on the Caribbean coast.

Reichel-Dolmatoff pioneered archeological research in many Colombian regions and produced the first interpretive overviews of the millenarian cultural evolution of Colombia. He discovered, among others, early formative sites in the Caribbean area, which documented the (then) most ancient pottery of the Americas that was related to the origins of sedentary subsistence and agriculture tribal societies 6000 years ago.

In addition, he analyzed the symbolism of material culture, and particularly of gold-work, crystals, basketry, ceremonial items, and vernacular architecture – such as the Amazon *maloca* communal longhouse or the Kogi temple – advancing new theories on the shamanism and the cosmologies underlying such objects and artifacts of memory.

His work emphasized the great values of indigenous cultures for their wise, respectful, and ethical modes of balancing community well-being with socioenvironmental sustainability. He contrasted these to ecocidal and ethnocidal non-indigenous cultures and insisted that they halt the destruction of Amerindian societies.

Life and Work

Reichel-Dolmatoff, who became a Colombian citizen in 1941, was one of the founders of Colombian Anthropology in the 1940s under the direction of French ethnologist Paul Rivet. During the 1940s and 1950s Reichel-Dolmatoff was a member of the National Institute of Ethnology, creator and Director of the Magdalena Ethnological Institute, a professor at the University of Cartagena and founding member of the Colombian Institute of Anthropology. During those two decades he carried out ethnographic research among the indigenous groups of the Guahibo, Pijao, Yuko, Chimila, Chami, Kogi, Ika, Sanka, Embera, Noanama, Cuna and Guajiro, among others. He also engaged in archeological excavations in the Andean, Atlantic and Pacific regions and lower Magdalena area.

In his two-volume monograph, published in 1949 and 1951, of the Kogi Indians (Chibcha speakers) of the Sierra Nevada de Santa Marta, and a series of other publications, he investigated Kogi spirituality from an emic (insider/ folk/vernacular) perspective through concepts such as “sewa,” “yuluka,” and “aluna” that indicated the profound indigenous understanding of nature and society in cosmological context and their application for sound socioecological management. Because the Kogi hold that their society is part of a world that lies between four skies and a netherworld of four underworlds in a multileveled and interconnected cosmos created by the Great Mother, he analyzed how the use of natural resources involves ritually “asking permission” to the supernatural Guardians, Owners or Lords of the resources, as well as an effective “payment” in “Thought” and in action to restore ecosystem balance. Reichel-Dolmatoff underlined how the “Mama” shaman-priests guided these agricultural mountain individuals and collectivities to reach a “balanced” life within nature, and he described Kogi life as sober, dignified and respectful of the environment and communal conviviality. He studied dozens of other indigenous cultures which shared many of these features, though the struggle of the Kogi to maintain their traditional cultures he found unique.

Linking his archeological, anthropological and ethnohistorical investigations of the Sierra Nevada region, Reichel-Dolmatoff made the first regional and diachronic analysis of the area to investigate biocultural dynamics among indigenous peoples and mestizo (1961) peasant communities. He contrasted the modes by which they conceived, used or abused nature. Indians respected nature, underused resources or replaced them, and balanced resource extraction with population control or sustainable conservation, while making material and spiritual “payments” to the Guardian “Owners” of nature.

Non-Indians, he found, generally exploited and destroyed nature and other peoples, and specifically despised Indians and their forms of resource management.

Reichel-Dolmatoff not only made the first stratigraphic excavations in the area, but also established chronologies and typologies and interpreted the cultural dynamics occurring in mountain, desert, rainforest and coastal ecosystems of northern Colombia. He created and directed a museum in Santa Marta where he highlighted the great value of the prehistoric and contemporary Amerindian cultures and their social and ecological wisdom. This was unprecedented in Colombia.

In 1963 he founded and chaired Colombia's first Department of Anthropology (Universidad de Los Andes, Bogota). During the 1960s he engaged in fieldwork in the Vaupes area of the Amazon among the Desana Indians (Eastern Tukano speakers) and other Amazon peoples. His publications on Desana cosmology, shamanism, social organization, ethnoastronomy, ethnobiology, art, narcotics and hallucinogens (or entheogens), vernacular architecture and the symbolism of "maloca" longhouse; and on native concepts of territory and ecosystem, pioneered a new era of Amazonian structuralist anthropology.

In 1973 he became affiliated with the University of California Los Angeles as Adjunct Professor. Between the 1970s and 1990s he continued ethnographic research and developed ethnoecology as a category of interpretive anthropology requiring intercultural and interdisciplinary research. Among the Kogi and the Desana (Tukano) Indians he expanded analyses on socio-environmental management, ethnoecology, shamanism, cosmology, worldview, ethnoastronomy, mythology, art, material culture, ritual, and on neurocognition, ethnopsychology, ethnomedicine, pharmacology, and environmental anthropology. He studied the role of hallucinogens and narcotic plants in shamanism (1978b, 1975) within their social and religious contexts to reinforce ecological decision making, and he analyzed the myths, rituals, and altered states of awareness they engaged. He examined the hallucinatory imagery during the ritual intake of *Banisteriopsis* and indicated how the visualization of phosphenes (universal optical perceptions) were interpreted with shamanic cultural codes to correct socio-ecological malfunctioning. He made exceptional analyses of the modes by which shamans guided communities in their use of narcotics, hallucinogens, altered states of awareness and experience of the sacred in order to reenchant biosocial existence within a grander cosmic context in such a way as to promote respect for all forms of being and sentience. Based on a paradigm that Reichel-Dolmatoff termed "Cosmology as Ecological Analysis" (1976) in the Huxley Memorial Lecture, he examined Amerindian cosmologies as templates that are used to generate updated ecological analysis and accountability, and which are applied for sustainable resource use. He related cosmologies to subsistence patterns, environmental management strategies, population density, dispute-settlement mechanisms, and to an ethos of shared responsibility among neighboring cultures to control socio-environmental imbalances and lead a peaceful coexistence. Portraying the Desana as pragmatic peoples and profound thinkers who are efficient planners with highly adaptive behavioral rules to manage rainforest ecosystems, and who recreate

effective institutions and coherent belief and value systems to do so, Reichel-Dolmatoff explained the importance of their ecological eidos and ethos, indicating the importance of the coherence of their socio-political, economic and religious systems.

Between the 1970s and 1990s Reichel-Dolmatoff developed the field of ethnoecology and demonstrated the importance of indigenous ecological knowledge and traditional ecological skills. He emphasized the importance of apprehending the Indians' own concepts and understanding of their ecological practices and beliefs.

He demonstrated how Amerindians consider their universe or cosmos to be composed of a network of skies, Earth, and underworlds which are interconnected by common forces of energy, "Thought," spirit, or matter, deemed to exist in a finite quantity and which require permanent and careful management. Each of these levels of the universes is believed to have supernatural Guardians who are "Owners" of parts of nature and of resources with whom shamans negotiate human existence by exchanging, or not exchanging, quotas of these finite forces. Thus, for Reichel-Dolmatoff, the conceptual dualism or opposition between nature and society is not extant among Amerindians such as the Kogi and Desana, and this cultural awareness that echoes the laws of nature, he concluded, is common wisdom among other indigenous societies in spite of their threatened cultures and territories.

Reichel-Dolmatoff conducted his research in collaboration with his Colombian wife, anthropologist and archeologist Alicia Dussan. He died in Bogotá in 1994 after dedicating more than fifty years to studying the religious and ecological values of Amerindian peoples, and to disseminating the relevance of the indigenous cultures of Colombia.

Nature and Society among the Kogi and Desana

Reichel-Dolmatoff's research among the Kogi Indians of the Sierra Nevada mountains, and among the Desana and Tukano Indians of the Amazon rainforest, pioneered research methodologies and theories of relevance for ethnoecology, shamanism, cosmology and worldviews, and he indicated how their communities used these to live balanced lives based on sound social and environmental management. While analyzing how these Amerindians consider that their society is embedded within nature, the world, and the cosmos, he explored the relevance of the indigenous ethics of care and respect for all forms of existence. He highlighted that this awareness was the result of acute observations and millenarian experimentation upon the ecosystems and of human activity within these.

Reichel-Dolmatoff held that the Desana's beliefs and practices are grounded in their cosmologies and worldviews. He demonstrated how cosmologies are used by shamans to monitor human activities in particular rainforest ecosystems in the Amazon and he analyzed the indigenous concepts, terms, symbols, principles, practices, and socio-ecological codes to do so. Interpreting how shamans seek to make calibrations between the microcosmos and the macrocosmos in rituals throughout the year and in individ-

ual rites of passage, as well as in subsistence practices such as foraging or agriculture, or in medicinal practices and in conflict management, Reichel-Dolmatoff showed how Desana shamanism correlates seasonal socioecological dynamics within the larger ecological, climatic, meteorological, astronomical and cosmic referents to monitor the place of human agency within. These cosmic linkages engage a three-leveled universe (sky, world, underworld) composing a closed system that is connected by circuits of limited energy, spirit and matter where the birth or death of one being affects others. In the shamanic geography and topography, these linkages are projected in sacred sites (hills, caves, rapids, spaces demarcating founding acts in cosmogenesis and ethnogenesis), in the borders and centers of ethnic territories, and in sacred spaces in each maloca longhouse.

Desana Indians reiterate their care of and respect for the beings and forces that compose the world and cosmos. Through shamans and elders they “ask permission,” and pay the Masters (Jaguar-Shamans) or “Guardian Spirits” of the animals, plants, soils, winds, waters, and of seasons, skies, earths, and underworlds, to use resources and to harmonize their lives with new seasons, years and eras.

Thus before the Desana Indians hunt tapirs or deer, for example, the shaman “asks” the Guardian Spirits or Master of the Animals for “permission” to hunt. The shaman ritually negotiates with the Master in their abodes deliberating how to replace the predatory activity, though it is termed also as a form of courtship and exchange. The shaman, consuming coca, tobacco, or hallucinogens, also “flies” across the different levels of the cosmos and across diverse ecosystems as a bird, or may roam as a jaguar or some other predator to negotiate with the Owners of nature and the universe in order to “retrieve” lost souls of sick or dying people, or to punish other humans for overutilizing resources.

The shamans “repay” the Owners of nature for any resources that are to be exploited, and they seek to replace the “energy” or “spirit” in exchange for human lives of people who are to be sick or die, while promising to prevent the future overutilization of resources by all the people of his community who are held to constitute a single unit of socio-ecological responsibility. The shamans continually induce the community, which lives together in a maloca longhouse, to respect the limited availability of matter, energy and spirit, and they permanently seek to solve conflicts over resource use, while collectively men and women do so along gender lines. According to Reichel-Dolmatoff, the symbolism of the maloca communal longhouse also reflects the architecture of the interconnected three-leveled cosmos to remind each community that it is a sentient part of the world and universe. The Desana thus consider their societies to be a part of nature, and that all ecosystems are embedded within the planet and the cosmos, according to Reichel-Dolmatoff (1971, 1976, 1978a, 1979, 1986, 1989, 1981, 1990, 1996a, 1996b, 1997).

All ecosystems are correlated to grander cycles of the world, skies and underworlds, deemed to be affected not only by the energy of the sun and by climatic and astronomical changes, but by the forces of ancestors and spirits. The territories that belong to

ethnic groups are also categorized in cosmological terms, and their rivers, mountains, and sacred sites, have cosmological connections to the skies and underworlds.

The different neighboring groups who share environmental responsibility are likewise inscribed into the symbolism of their territories, and the structure of pan-tribal organization and of marriage alliances and of reciprocal exchange of goods and services are reflected in the symbolism of the landscape to engage kin and allies in joint resource management.

The Desana's own categories and classificatory codes pertaining to ecosystem structure and function are coded according to energy levels and to sensorial categories such as color, smell, shape, or such, and through the imagery of a sexualized polarity, according to Reichel-Dolmatoff. Territorial boundaries that refer to the six phratries (kinship groups) that compose the twenty Tukanoan tribes, and the three exogamic units (one is the Desana) are related to the imagery of hexagonal crystals that correlate to the sky, Earth, and underworld, and to astronomical referents (delimited by Pollux, Procyon, Canopus, Achernar, T3 Eridani, and Capella with Epsilon Orion in the center). Altogether this shamanic topography codifies specific cultural behaviors in demarcated spaces to avoid socioenvironmental malfunctioning, though the cosmology implies an enchanted universe. Using these shamanic references, the Desana men and women manage resources at local and pan-regional scales, recreating their semisedentary life as foragers and shifting cultivators through the concerted conservation, use or redistribution of goods, services, or marriage partners among allied groups intent on enhancing communal coexistence, restricting the mismanagement of natural resources, reducing social violence and fomenting environmental conservation for future generations.

Among the Kogi of the Sierra Nevada mountains, Reichel-Dolmatoff analyzed how their cosmology and worldview permeates both ceremonial and daily life and their wise and austere use of natural resources. He investigated their concepts of the universe to understand the overall scheme through which they managed biocultural resources within their religious systems, and the symbolism of cosmogenesis and ethnogenesis.

The shape of the Kogi cosmos is believed to be composed of nine layers (four skies above, four underworlds below, and this world in the middle – the latter is the flat disc of the spindle used by the Great Mother to demarcate Kogi territory). The skies, Earth and underworlds are believed to be affected by the path of the sun between solstices and equinoxes, and by the path of the moon and other astronomical phenomena, as well as by meteorological, climatic, hydrological and other environmental dynamics which the Kogi monitor while alluding to their communication with the Lords, Masters, Fathers and Mothers of the universe, resources, and to their ancestors. This model of the cosmos is reiterated in the symbolism of the Kogi territory, and it is also expressed in the layout of villages, in lithic astronomical observatories, in the architecture of their village temples, as well as in certain objects of material culture and in the symbolism of the human body. These mnemonic devices are used by the Kogi as “polymetaphoric thought patterns,” according to Reichel-Dolmatoff (1987: 78), to interpret how to achieve a life

of “completeness” or to achieve spiritual depth and high-ranking. “Mama” priests and elders use them as references to counsel individuals and communities to achieve a transcendental existence. With ritual ceremonies, dream analysis, divinatory practices, pilgrimages, confessions and meditation, they guide people toward an austere and balanced life.

Reichel-Dolmatoff analyzed how the model of the Kogi cosmos is projected in the symbolism of the architecture of their temples. The four skies are represented in the four rafters of the roof, and the world is represented in four hearths that indicate a sacred square that is delimited by the path of the sun between solstices and equinoxes (since the temples are also used as astronomical observatories). According to lineage affiliation, each Kogi sits by one of the four hearths to discuss the “laws of the ancestors,” changing places throughout the year. A series of invisible and inverted temples are held to exist in the dark underworlds (with a black sun), which represent invisible but important realities.

Reichel-Dolmatoff demonstrated that this symbolism projects the form of the cosmos with key features of astronomy, geography, ecology, and social and political organization, linking past, present and future generations. According to Reichel-Dolmatoff, the symbolism of the

Kogi weaving loom corresponds to that of the temple, linking the structure of the cosmos to that of Kogi territory within the Sierra Nevada mountain environment and to the intermarrying Kogi lineages, and past with present and future generations, reminding the Kogi to reject material accumulation and promote the acquisition of wisdom, and the goal of socio-environmental sustainability in the short, mid and long term.

The deep religious tradition of the Kogi and their quest to master the “balance” of mind and spirit and a balanced life, and their self-reference as the “Elder Brothers” who are the custodians of the world and universe because the white peoples or “Little Brothers” have forgotten their responsibility toward nature, led Reichel-Dolmatoff to investigate the many lessons the Amerindians have for the contemporary world. He urged Colombians and international forces to respect the cultures, lands, spiritualities, cosmologies, and modes of life of Amerindians such as the Kogi who are truly engaged in sustainable development and in concert with the laws of nature. According to Reichel-Dolmatoff, the “ideological foundations of Kogi culture and society” (1987: 75) are exemplary and he states

I truly believe that the Kogi, and many other traditional societies, can greatly contribute to a better understanding and handling of some of our modern dilemmas, and that we should consider ourselves fortunate to be the contemporaries of a people, who, perhaps, can teach us to achieve a measure of “balance” (1987: 112).

Reichel-Dolmatoff’s last three books, *The Forest Within* (1996a), *Yurupari: Studies of an Amazonian Foundation Myth* (1996b), and *Rainforest Shamans* (1997) offer an overview of his understanding of the Amazon Indians in relation to nature. For the Kogi Indians, this overview appeared previously in his monograph on the Kogi and

notably in articles such as “The Loom of Life: A Kogi Principle of Integration”; “Some Kogi Models of the Beyond”; “The Great Mother and the Kogi Universe”; and “Cultural Change and Environmental Awareness.”

Conclusion

Reichel-Dolmatoff pioneered anthropological, archeological and ethnoecological research in Colombia. He analyzed the modes by which Amerindian social, political, economic, religious, philosophical, medical, artistic, and ethical systems were used by diverse indigenous societies to sustainably manage biocultural resources and live in community-based bands, tribes and chiefdoms. He indicated how Amerindians planned resource use, demographic density, land and water use, and managed residence and subsistence patterns for sustainable resource conservation, and he indicated that these dynamics could only be understood within their cosmological and shamanic contexts.

According to Reichel-Dolmatoff, Amerindian conservation of resources is calculated within short-, midand long-term frameworks, and engages collaboration between local, regional and pan-regional contexts that are sentient of the interdependent linkages among all living beings and forms of existence across humanity, the biosphere, world, and cosmos. The Amerindian calibration of resource-use follows a millenarian shamanic tradition that avoids ecocide and foments communal conviviality, and these practices echo the Amerindian understanding that they form part of nature, and explain why they deem ecosystems to be linked to forces in the skies, Earth, and underworlds in order to foster sustained resource conservation. Reichel-Dolmatoff demonstrated that among traditional contemporary indigenous cultures there is no concept of a separate existence or opposition between nature and society nor motifs to dominate or exploit a subordinate domain of nature and peoples, and he analyzed the role of these lessons of Amerindian shamanism, cosmologies and worldviews in the making of the biological and cultural diversity in Colombia, while defending the indigenous peoples’ rights to their cultures and lands.

Reichel-Dolmatoff was one of the first scholars to recognize and interpret what is now called “Traditional Ecological Knowledge,” “Indigenous Knowledge Systems” and “Ethnoecology.”

A Religio-Ecological Perspective on Religion and Nature

If the study of religion is a science, as the German term *religionswissenschaft* posits, then some of its methods should allow a degree of predictability. One such approach is that of religio-ecology. The method was developed by the Swedish scholar, Åke Hultkrantz, who pioneered a social scientific comparative study of religion. The approach was stimulated by the anthropological method of cultural ecology, developed by William Sanders, as a means to study the evolution of Mesoamerican urbanism from its earliest roots.

In essence, religio-ecology is an approach to the study of religion that considers religion in the context of a culture's ecological *gestalt*, including the various relationships between humans (social, economic, political, etc.), as well as the relationships of humans to animals, plants, climate, terrain, geography, etc. Although religio-ecology was initially used to examine Native American religious traditions, especially those in gathering-hunting and horticultural-hunting situations, if the methodology is valid, then it should be applicable to all cultures in all stages of development, including contemporary societies. To demonstrate this hypothesis, as well as the possibility of generalized predictability, a half-dozen religioecological paradigms will be briefly examined with regard to the religious and other understandings of nature, with a focus on animals: gathering-hunting, horticulturehunting, herding, agricultural, industrial, and postindustrial cultures.

Among contemporary humans maintaining gatheringhunting cultural traditions, the entire cosmos is understood to be numinous (having an aura of sacredness), including animals and plants, particularly those on which human life, in various ways, depends. These understandings may, to a degree, be read back into the earliest human cultures, as they accord with Paleolithic art in their representation of animals and, rarely, humans. Such cultures understand that the world is a family in which humans are inferior members. Every encounter with a nonhuman being is with an entity that is simultaneously a natural and a spiritual being. Sought after animals and plants, gifts of the Earth mother, in various guises, must be supplicated to offer their individual lives so that pitiable humans may live. Every act of hunting larger animals, as well as gathering plants, sea creatures and smaller animals is ritualized. Predatory animals are spiritual models for the human hunters, and the dog is a hunting companion, whose sacrifice, as well as that of the human-like bear, is essentially a substitute for human self-sacrifice to the numinous realm. Shamanistic trance enables humans intimately to interact with

theriomorphic spirits (spirits in animal form). When plants are domesticated with the development of horticulture, the gathering-hunting religious understanding of the cosmos continues. The domesticated plants, however, understood as daughters of Earth, gain ritual preeminence over animals, as do the roles of females, who primarily carry out the gardening. Those animals that are domesticated are no longer understood to be spiritual entities superior to humans, but members of the human community ranging from quasi-children to pets, whose every slaughter is a ritual sacrifice. Hunted animals continue to be supplicated and treated with considerable respect as in the gathering-hunting religio-ecological niche. But the shift from semi-nomadism to semi-settled living-patterns leads to a closer relationship with the matrilineal-matrilineal family and clan dead. This begins a transition from theriomorphic and plant spirits to anthropomorphic spirits (spirits in human form). Outside of the Americas, this led to a shift from shamanism to mediumism, as the living members of the clan sought the advice of the clan dead.

Semi-nomadic gathering-hunting cultures that domesticate migratory herding animals, most recently occurring among reindeer hunters of northern Eurasia, underwent a major shift in the religious conception of the particular animal or animals on which their economy depends. No longer individual numinous entities, the domesticated herds as a whole are understood to be a gift from their female numinous superior. Gifts of sacrificed animals from the herd are in turn offered to her. The human hunter shifts to the role of the “good shepherd.” Animal predators are no longer spiritual role models for human hunters but enemies of the herded animals, for whose welfare humans are responsible. As hunting activities shift to herding, those ritual activities associated with shamanism are no longer generalized among the population as an essential aspect of hunting and gathering but become concentrated among ecstatic religious specialists. The horticultural-hunting religious understanding of animals and plants continues with the rise of agriculture, but there are significant socio-economic transformations. The majority of males shift from hunting-raiding-trading roles to farming, while females continue their gardening/nurturing roles. With the average male no longer expert with hunting weapons, warrior specialists supported by surplus agricultural productivity tend to become the hereditary elite of a stratified social order, and the matrilineal-matrilineal pattern tends to shift toward a patrilineal-patrilineal pattern in consequence of the increased importance of the male roles. When warriors become the rulers, this patrilineal pattern tends toward patriarchy. Warriors also become ritual specialists, or a separate caste of female and male priests develops. The spirit realm now consists of ancestors, divinized ghosts, and/or anthropomorphic deities who were not previously human. These deities are understood in hierarchies modeled on the now-stratified human socio-political structures. An offshoot of this development, which occurred in one culture, becoming the basis for Western civilization, is for the male chief of the divinities to be considered the sole divinity of the culture, the “king of kings.”

With a patrilineal social stratification between elite males who use weapons and the majority of males who wield farming implements, hunting of large animals becomes

the prerogative of the elite as ritualized practice for warfare, also ritualized. Hence, undomesticated animals are treated as respected human enemies. Domesticated animals continue to be slaughtered solely in sacrificial rituals, but these rituals tend to be carried out by professional ritual specialists who are separated from the raising of the animals, no longer understood as quasichildren. Save for the Religions of the Book (Judaism, Christianity, and Islam), aristocrats play a major role in these sacrifices, which comprised primarily the offering of food and alcoholic beverages to the spirits. But the aristocrats tend to distance themselves from the actual slaughtering of the animals for the meat dishes; the killing and butchering being left to professionals. Remnants of this pattern continue in Western culture in the Jewish and Islamic ritualized slaughter of animals by religious specialists.

The concentration of hunting activities among the elite as an avocation serves to create a disjunction among the general populace from the undomesticated world, leading to the concepts of wilderness and wild animals. Culture distinguishes humans from animals, as well as humans of different cultures, now understood as “wild” humans or barbarians. Humans no longer relate to wild animals as sacred beings but as savage beasts to be tamed and/or killed. Spanish culture maintains a resplendent version of both these archaic perspectives – taming and killing – in the highly ritualized *corrida des toros*, although the modern ritual in itself is not of great antiquity.

With agriculture, the relationship between humans and animals falls into four distinctive categories. For the elite, animals are 1) pets, either playthings or facilitators for human hunting; 2) working domesticants, particularly the horse, used for warfare and hunting, that become romanticized along with warriors toward the ends of these periods; 3) domesticated animals for ritualized consumption; 4) or wild beasts, often found in royal hunting parks, ritually hunted with the same weapons used in warfare. The peasants raise the domesticated animals, ritually slaughtered and eaten by the elite, although peasants rarely have the opportunity to eat these animals themselves. As they are responsible to the elite for their welfare, predatory animals are feared by the peasants for their predations and killed when possible. Game animals (notice our language in this regard) are forbidden to them, being reserved for the elite; peasants who are caught hunting these animals are liable to be executed. The middle class fall somewhere in between, of course, depending on their status.

In the transition from horticulture to agriculture, the understanding of plants changes from revered spiritual relatives to desired entities whose sole purpose is the nourishment or other use of humans, or undesired entities, such as weeds, which hinders the growth of the farmed plants. Similarly, animals also change from revered spiritual relatives to entities whose sole purpose is to feed or be of other use to humans, entities who threaten those animals, or entities that can be killed for practice in preparation for warfare. Of course, there are many cultural variations and moderate exceptions to this pattern.

In India, for example, cows became a special case, due to the unusual, virtually exclusive, dependence on them for animal protein (milk and milk products), edible oil

(clarified butter), traction (draft animals) and fuel (dried dung). Hence, the concept of cows in India is closer to the understanding of animals in horticulture-hunting traditions than agricultural societies. But in India, hunting still tends to be reserved for the hereditary aristocracy or the new aristocracy modeled on the former British colonizers, save for remnant pockets of horticultural-hunting villages in the interior mountains.

Further changes in socio-economic structures leads to increasing distance from the earlier human patterns in these relationships. As industrial manufacturing desacralized metals, clay and wood, so the spread of industry over agriculture led to the desacralizing of Earth, plants and animals in every regard. It is to be noted that this process begins in Christian cultures that had long since limited the numinous to the male Sky and understood the female Earth, as well as human females, to be the locus of evil. Industrial manufacturing and the spread of industrial practices to agriculture also led to the increasing urbanization of the population, further distancing the average person from an intimacy with domesticated plants and animals, save for pets, which tend to be understood as quasi-humans rather than animals, and ornamental plants. Agribusiness factory production of meat and grain leads to animals and grain plants no longer understood as beings, let alone as relatives or gifts from the sacred realm. Undomesticated animals now are neither sacred entities nor respected enemies but anthropomorphized, desacralized fantasies: the “Bambi” syndrome.

Only among the anachronistic remnants of the European aristocracy or their industrial-era replacements (factory owners, etc.) does hunting continue combined with respect for and acknowledgement of a special nature of hunted animals (who cannot be accorded numinous status in monotheistic traditions). Non-urbanized Euroamericans, lacking a hereditary aristocracy, maintain hunting as a ritual of Americanism which renews their connections with a mythicized “pioneer” past and wilderness onto which is projected a sacred aura of pristine purity.

In the post-industrial world, where virtual reality is increasingly replacing normative reality, the traditional real world is becoming transformed into a realm of fantasy, and experience in nature *qua* nature is being replaced by actual (e.g., dirt bikes and “personal water craft”) and vicarious thrills. Animals become valued with no understanding of their life cycles and ecological situations and are understood to be utterly divorced from food. Cellophane-wrapped meat is not understood, from either the emotional or the religious standpoint, to come from living animals, just as factory-manufactured, cellophane- wrapped bread or pasta is not understood to come from living plants. The various traditional ritual relationships with animals and plants completely disappear to be replaced by concepts of “cuteness”; wild animals are perceived no differently than non-working pets. Hence, campaigns are mounted against hunting in general, regardless of potential disastrous consequences for noncompetitive herbivores in terrains where natural predators have been exterminated, and hunters become the epitome of evil.

The distancing of humans from animals, plants, and Earth in post-industrial cultures becomes absolute. Theriomorphic and plant spirits, once replaced by anthropo-

morphic spirits, are for an increasing number of contemporary Westerners now replaced by alien spirits from cosmically distant sacred realms. The North American spiritual journey into romanticized wilderness has been superseded by fantasized alien abduction.

Religious Campaign for Forest Conservation

The Religious Campaign for Forest Conservation (RCFC), established in 1998, is a coalition of religious persons primarily identifying themselves as members of Christian or Jewish faith traditions who seek a “right relationship” with forests and the promotion of “religious values” in regard to forest conservation. The campaign is coordinated by Fred Krueger in Santa Rosa, California and is managed by a steering committee of members associated with local congregations in many parts of the United States and with prominent environmental, religious, academic and commercial institutions, such as the Commission on Environment and Jewish Life, Christians Caring for Creation (Los Angeles, CA), the Religion, Environment and Economics Project (London), the Franciscan Environmental Network, Department of Earth Literacy of St. Mary of the Woods College (St. Mary of the Woods, IN) and Larand International, to name a few.

“Right relationships” are said to entail an apprehension of responsibility understood as the exercise of “correct dominion” in regard to forests specifically and the whole of creation generally. “Rightly understood,” the RCFC argues, “dominion binds the person back to God and requires justice, humility, stewardship, wisdom and concern for Creation’s ultimate end. To understand dominion as an unbridled right to domination is wrong.” “Correct dominion” is further appreciated as an embodiment of one’s duty to God. As the RCFC summarizes, “The forests belong first to God; we are its stewards” (creationethics.org, 9 January 2002). In this regard, the definition of “correct dominion” follows closely several other elaborations, particularly those offered by James Nash and Eric Katz, among others.

The RCFC argues that the “excessive material and financial focus,” which is prevalent in Western society at large and which has promoted forest degradation, corresponds to a “deadening of spiritual sensitivity” that has become embodied as a failure to exercise “correct dominion.” It argues that this “deadening of spiritual sensitivity” has become increasingly prominent since the Enlightenment. Further, “commercial activity,” primarily logging, is said to be “unraveling the integrity of forest systems.”

The RCFC insists that while wood products are clearly needed, harvesting of timber should not occur “at the expense of the integrity of Creation [or] the health of its life support systems.” To this end, the RCFC advocates harvesting timber on private property and rejects doing so on federal lands and in state forests. It calls for the reform of management practices on private lands by advocating an end to the cutting and harvesting of old-growth forests, an end to clear-cutting, an end to logging in

riparian zones and on “steep or unstable slopes” and an end to practices that convert natural forests to “monoculture plantations.” It also calls for the use of 100 percent post consumer recycled paper, a reduction in packaging and modifications in construction methods so as to ease the demand for forest products. Justice is seen as working toward “not only corporate profits, but also decent, health-giving jobs and the long-term survival of our biodiverse forests” (Krueger 2000a: 15) in a manner consistent with “correct dominion.”

The RCFC emphasizes and values the role that forests play in regard to the maintenance of clean water, the regulation of carbon dioxide levels and climate, the opportunities forests provide for eco-tourism and the spiritual/ psychological benefits that are provided to persons by forests. Moreover, forests are seen as a source of “wisdom” and inspiration.

The RCFC has made significant contributions in regard to forest conservation. It has actively supported various legislative initiatives and has engaged in extensive lobbying campaigns, both in Congress and with senior administration officials particularly at the Departments of Agriculture and Interior. Additionally, the organization coordinates a program titled “Opening the Book of Nature,” a series of retreat experiences held at various locations designed to assist participants in experiencing and articulating the spiritual significance of forest conservation. The RCFC also reports that its own intensive work with World Bank officials has resulted in the granting of a significant loan to Mexico for reforestation. As a result of its efforts, the RCFC anticipates additional World Bank reforms that are consistent with forest conservation. Assessments of the reasons for the organization’s success are a matter of speculation, but it can be said that its appeal to tradition plays a major role.

While the RCFC affirms a sense of “interconnectedness and interrelatedness” (Krueger 2001: 35) within the whole of creation, the notion of “correct dominion” is nonetheless maintained as an integrating paradigm. Consistent with the conception of “correct dominion,” the RCFC emphasizes, “Wilderness is a system of knowledge by which we are led deeper into an understanding of God’s truths” (Krueger 2001: 34). Given that forests are then appreciated instrumentally as a vehicle for the apprehension of wisdom by human persons, an affirmation of natural law, in some sense, seems to be implicit in their work. If so, this affirmation suggests a reformulation of how natural law can be conceived, perhaps in a manner akin to that which has been recently suggested by Nash, a reformulation that entails moving away from anthropocentrism and, correspondingly, involves the understanding that “moral responsibilities are discovered by reflecting not only on human nature but also on our interactions with the whole of nature” (Nash 2000: 228).

The RCFC has clearly met with success as an activist organization in regard to the conservation of forests. To this end, its apprehension and articulation of “correct dominion” has played a central role. That conception, however, invites important questions which relate to how “right relationships” can be understood among persons in relation to God, to nonhuman entities in the created realm and to one another. As Eliz-

abeth Johnson suggests, differing paradigms may effectively incorporate an awareness of past understandings within the Christian tradition in both positive *and* negative ways so as to prompt a rejection of hierarchal paradigms that, following Johnson, limit the apprehension of “another kind of godly order structured according to genuine interdependence and mutuality” (2000: 12), a structural understanding that as she suggests, seems more consistent with the certain observations from contemporary science. Johnson’s emphasis on “genuine interdependence and mutuality” is consistent with contemporary understandings such as the “partnership ethics” of Caroline Merchant (1995: 217) and ecofeminist philosophical insights such as those expressed by Val Plumwood among others. Differing paradigms of this sort may also provide an effective platform from which to engage in Christian environmental activism and may prompt further investigation in regard to the notion of “right relationships” within the whole created realm as well.

The Religious Environmentalist Paradigm

In environmental studies it has commonly been assumed that there exists a fundamental connection between a society's management of natural resources and its perception of nature. With the publication of "The Historical Roots of Our Ecologic Crisis" (1967) Lynn White was among the first to focus more narrowly on the relationship between the state of the environment and religion, postulating a direct linkage between the two. He blamed mainstream Christianity – in particular Judeo-Christian cosmology of man's mastery of nature – for the environmental ills facing the world today.

Since the publication of White's paper it has become fashionable to read ecological insight into religious dogmas and practices. Within much of the environmental movement there has been a tendency to appeal to traditional, religious ideas and values rather than to ecological science and technology in the face of environmental problems. Religious ideas and values have come to play prominent roles in environmental discourse. The Danish anthropologist Poul Pedersen has termed this approach the "religious environmentalist paradigm" (1995).

One early example of this approach was the meeting held in Assisi (Italy) in 1986 to mark the 25th anniversary of the World Wildlife Fund (later renamed the World Wide Fund for Nature), ending with the Assisi Declaration (WWF 1986). More recent examples are the series of conferences on religion and ecology held at the Center for the Study of World Religions at Harvard University, the associated "Forum on Religion and Ecology" as well as many entries to this encyclopedia.

Two sources have particularly inspired scholars and laymen alike in the construction of the religious environmentalist paradigm, namely East and South Asian cosmologies (particularly those of Daoism, Buddhism and Hinduism) and indigenous traditions (first of all American Indians). These have given fuel to the images of "noble oriental" and "noble savage," respectively. What religious dogma has been to the construction of the former, traditional ecological knowledge (TEK) – alternatively indigenous, folk, local or practical knowledge – has been to the latter. But, unlike a narrow, scientific understanding of "ecology," TEK is intimately connected with religious beliefs and values. For good reasons the human ecologist Fikret Berkes called his book on TEK and indigenous resource management *Sacred Ecology* (1999).

Asian and indigenous concepts of nature are not less complex than their Western counterparts, and it is therefore dangerous to generalize. Nonetheless, whether looking

at indigenous traditions or Asian religious creeds, scholars of such worldviews have almost invariably stressed that they are what Christianity allegedly is not, namely, ecocentric and monistic, promoting a sense of harmony between human beings and nature. Christianity in contrast is portrayed as anthropocentric and dualistic, promoting a relation of domination rather than harmony. By focusing on how these traditions are different from Western ones, non-Western religions meet the demand for new ecological paradigms that unite man and the environment as parts of one another.

Everything is Interconnected

One of the most common and enduring stereotypes in environmental literature on non-Western religions is that they are organic-holistic where everything is interconnected through cosmic webs. Human beings are not seen as something outside and above nature but as interconnected and integrated within nature. This preoccupation with interconnectedness is, for example, clearly expressed in the subtitles given to the Harvard volumes on nonWestern religions:

Hinduism and Ecology: The intersection of earth, sky, and water

Buddhism and Ecology: The interconnection of dharma and deeds

Confucianism and Ecology: The interrelation of heaven, Earth, and humans

Daoism and Ecology: Ways within a cosmic landscape

Jainism and Ecology: Nonviolence in the Web of Life

Indigenous traditions and ecology: The interbeing of cosmology and community

But ...

Christianity and Ecology: The well-being of Earth and Humans

Islam and Ecology: A Bestowed Trust

Judaism and Ecology: Created World and Revealed Word

This idea of interconnectedness is expressed somewhat differently in various non-Western traditions, but they are all claimed to be ecocentric rather than anthropocentric and nondualistic or monistic rather than dualistic. People are seen as intimately united with nature.

Scholars of Indian religions often quote from the Bhagavadgita that the person of knowledge “sees no difference between a learned Brahmin, a cow, an elephant, a dog or an outcaste,” and in East-Asian Buddhism the distinction between the animate and inanimate has gradually been erased to the extent that mountains, stones, mist and the sound of blowing winds have become sentient beings, and thus in possession of Buddha-nature (*dharma*). In Japanese Shinto one talks about *kami*, i.e. a divine power or spirit that resides in anything which gives a person a feeling of awe or spiritual experience, a notion shared with many indigenous traditions around the world. As everything may have Buddha-nature or has the potential of harboring divine powers, all creatures,

animate and inanimate, are – at least in some contexts – on the same level. There is thus not a sharp line, as in much of JudeoChristian thinking, between humans and the rest of nature. Here we encounter worldviews where “nature” corresponds to the cosmic whole, i.e. the totality of existing phenomena. In such views nature and the “universal principle” might be inseparable and intrinsically linked.

Jainism tells us that everything possesses *jiva* or lifeforce, and in Chinese cosmology the notion of *qi* (*chi*’i) or vital force not only permeates everything from rocks to heaven, but may even be seen as the very substance of the universe. *Qi* is thus seen as the cosmological link between all beings and all events, giving rise to the Chinese notion of “cosmic resonance” (*kan-ying*), whereby otherwise independent events are mutually influencing one another. The interconnectedness has also a temporary aspect, through the laws of cause and effect (*karma*). Common to Buddhism, Hinduism and Jainism is the notion of reincarnation. In Jain thought all are souls entrapped in different states of karmic bondage, a notion that may lead to an ascetic life and a reverence for everything. But whereas Jainism holds that plants and animals must first be reborn as human beings before entering a state of eternal, blessed solitude, *kevala*, Eastern Buddhism holds that even plants can escape the suffering of rebirths and enter directly into *nirva*na. Beliefs in reincarnation can also be found among indigenous hunters, as among the Cree Indians of

North America who believe that killed animals will be reincarnated if rituals are properly performed.

Few, if any, of the above claims are controversial. But what many religious environmentalist writers have done is to clothe these observations, and many more, in the language of ecology and environmental ethics. According to some of the participants at the Harvard conferences, the notion of *karma*, for example, is taken to entail an environmental moral responsibility, often seen as binding individuals to the environment. To locate human beings with animals, plants and stones is in this discourse supposed to foster a deep reverence for nature, encouraging us to think “like a mountain,” a notion borrowed from the American ecologist Aldo Leopold. And seeing the universe as a dynamic, ongoing process of continual transformation is, according to one of the editors of the Harvard series, precisely the “organic, vitalistic worldview which has special relevance for developing a contemporary ecological perspective” (Tucker 2003: 218).

Critical Voices

However, many observers have questioned the truth of the myths of the ecologically noble Other, whether they are savages or Orientals. The Indian sociologist Ramachandra Guha (1989) objects to attempts to turn Oriental religions into ecocentric religions. He views this Western appropriation of oriental religions as yet another expression of the need of Westerners to universalize their messages and to uphold a false

dichotomy between the rational and science-oriented Occidentals and the spiritual and emotional Orientals. Others have argued that the concepts “ecocentric” and “anthropocentric” themselves are creations of the Cartesian worldview with little relevance to non-Western traditions, which may be one or the other depending on the context.

Many skeptics have pointed out that traditional practices are not necessarily benign to the environment. Historical ecology has indicated that indigenous peoples both in Polynesia, Europe and North America may have hunted a number of endemic species to extinction. Native North Americans have been reported to kill indiscriminately, although their environmental values are based on humanistic notions and morality toward nature where animals have intrinsic value. And early agrarian civilizations in, for example, China and Japan experienced serious deforestation and erosion long before industrialization, despite allegedly “environmental-friendly” religions such as Daoism, Buddhism and Shinto. The Chinese and Japanese managed to correct the situation, whereas the prehistoric Maya and Indus civilizations seem to have been unable to halt depletion of their forests. Hence it is certainly far too simplistic to blame all ills in non-Western societies in terms of Westernization and modernization.

We need to tread cautiously when inducing ecological practices from philosophical traditions. Discrepancies between theory and practice are common, as L. Holly and

M. Stuchlik argued in 1983 and the geographer Yi-Fu Tuan asserted in his critique of the Lynn White’s thesis in 1968. Tuan warned us not to assume *a priori* that people’s attitudes and norms toward nature are mirrored in their actual behavior. This is important not only because we, as those before us, often are ignorant of the effects of our practices, but also, as Eugene Hargrove has reminded us, because “moral principles and precepts are normative, not descriptive. They do not, in other words, describe how people actually behave; rather they prescribe how people – again often generally and obliquely – ought to behave” (1989: xx). Moreover, attitudes and norms do not merely serve as guides for our behavior, they serve to rationalize and legitimize behavioral choices already made.

Skeptics have accused religious environmentalist writers for selective readings of religious texts and practices and for ignoring beliefs and practices potentially harmful to the environment. But, writing about the situation in South Asia, Lance Nelson (1998: 5–6) asserted, “the negative outcomes of religious teachings that can be used to rationalize environmental neglect are probably greater than the positive influence of those that encourage conservation and protection.” Russel Kirkland made a similar point regarding Daoism. This situation is probably equally true for the whole of East and Southeast Asia, and most likely with all religious teachings. Worldviews and cosmologies are in this perspective not seen as coherent constructions but full of contradictions, making them vulnerable to interpretation and reinterpretations. It might be argued that it is precisely this ambiguity that makes religions versatile and adjustable to changing circumstances. That worldviews are ambiguous and harbor contradictory views and values on nature, and that there are discrepancies between people’s attitudes toward nature and their actual behavior, ought not to surprise anybody. It is

probably less trivial than the organic-holistic perspective, where everything is seen to be interconnected and changing, in itself might be part of the problem rather than the solution many advocates of the religious environmentalist paradigm want us to believe. Several arguments have been offered to this effect.

First, it has been argued that an organic-holistic view implies that there is no clear distinction between nature created by gods and artifacts created by people. In other words, artifacts and nature are not opposed, and nature becomes everything around us whether it is a river or teapot, a mountain or heap of garbage. Litter or a vending machine is just as much a part of nature as a crane or a pine tree. They may all harbor Buddha-nature, be potentially the abode for a spirit, be permeated by *qi* or possess *jiva*. Writing about Japan, the French geographer Augustin Berque stated that there “it can be natural to destroy nature” (1997:143). In more general terms, without some distinction between nature and humanity, we can hardly be held responsible for the adverse effects our activities may have on the environment. This does not inhibit human intervention in nature but rather opens the way for a utilitarian approach to it. Thus, an organic worldview that explicitly recognized the unity of the natural and social worlds may fail to give rise to sound environmental practices and may even contribute to the environmental problems.

Second, seeing nature as dynamic implies that it is not regarded as something unchanging or absolute but as a process of something becoming, or entering into, a certain state. Nature is situational or contextual, and this view allows for multiple concepts of nature to coexist: the wild and threatening nature which sometimes plays havoc with people and landscape, or nature in its most cultivated form: a garden, a dwarfed tree (*bonsai*). It is argued that it is in this latter idealized form that nature is most appreciated, at least in East Asia. It is appreciated because it is cultured, which means that it is brought into people’s social universe. It has been argued that human assistance is often necessary in order for things to appear in their real “natural” state, and even that the important thing is not the manifestation of nature itself but the idea about nature.

Third, the notion of *karma*, which underlines the dynamic character of many Asian religions, is intimately connected with a search for liberation from an endless cycle of death and rebirth. In viewing nature as a process, where everything decays and dies only to give birth to new lives in an endless cycle, one may arrive at the conclusion that natural objects acquire little value in and of themselves. In Hinduism, Jainism and Buddhism there is a strong tendency to withdraw from the world of suffering (*samsara*) to escape into some kind of blissful void (*kevala*,

nirvana), and many scholars have therefore stressed the world-denying features of Asian religions that encourage people to turn their backs on the world. In such a perspective nature becomes irrelevant, which is hardly the best starting point to address the issue of environmental destruction.

Finally, it has been argued that when nature is seen as immanently divine, as it is in animism, this leads to a “love of nature” relationship. But the close relationship

between people and spirit also enables people to entice spirits to move from their abodes in order to utilize the locations in question for other purposes. Before the construction of a house can commence, for instance, ground-breaking ceremonies can be performed. Moreover, it is recognized that it is the nature of things that one organism feeds upon another, creating relations of indebtedness in the process. Human beings are considered to become indebted to nature when exploiting it, but can “repay” harm that has been inflicted upon nature, animate or inanimate, through offerings. Memorial rites have been reported for Japanese as well as indigenous hunters throughout the world. A divine nature is, therefore, by no means a guarantee against environmental degradation, as has often been claimed.

If its critics are right, why then, one may ask, has the religious environmentalist paradigm acquired such a prominent position within the environmental discourse?

There may be several answers to this question. Images of the Other do not only help us define ourselves but also serve as a powerful, internal cultural critique. Kay Milton has even claimed that such images are fundamental to the radical environmentalist critique of industrialism (1996: 109).

The paradigm can, moreover, help people to carve out new roles for old religions. This is true not only for Western eco-theologians who are busy searching the Bible and other Christian texts for ecological insight, but even more so for non-Westerners. Pedersen suggests,

By offering to the world what they hold to be their traditional, religious values, local peoples acquire cultural significance. When they speak about nature, they speak about themselves. They demonstrate to themselves and to the world that their traditions, far from being obsolete and out of touch with modern reality, express a truth of urgent relevance for the future of the Earth. This achievement, with its foundation in appeals to imagined, traditional religious values, represents a forceful cultural creativity which would not have worked by the invocation of “pure” ecology or environmentalism (1995: 272).

This opportunity to acquire cultural significance should no doubt be applauded and encouraged. Two warnings are nonetheless in place. First, the religious environmentalist paradigm’s notion of the ecologically noble Other has occasionally contributed to chauvinism and even nationalism among indigenous peoples themselves. Second, and more important, by using images of the Other in cultural critiques of modernity, it becomes imperative to stress what the Other is not, namely modern. Only by being “authentic” – that is “uncontaminated” by modern ways – are they noble and worth our consideration. Corrupted by modern ways they become fallen angels. In the hands of some environmentalists, as Beth Conklin and Laura Graham concluded in their study of ecological politics and Amazonian Indians, the notion of the ecologically noble Other locked them in an “ethnographic present” of more idyllic pre-modern days.

Religious Naturalism

A working definition of religious naturalism was developed online in 2003 by members of a religiousnaturalism internet discussion group on religious naturalism. The statement, a modification of the Campion statement of self-understanding generated by the Institute on Religion in an Age of Science, is as follows:

We find our sources of meaning within the natural world, where humans are understood to be emergent from and hence a part of nature. Our religious quest is informed and guided by the deepening and evolving understandings fostered by scientific inquiry. It is also informed and guided by the mindful understandings inherent in our human traditions, including art, literature, philosophy, and the religions of the world.

The natural world and its emergent manifestations in human creativity and community are the focus of our immersion, wonder, and reverence. We may describe our religious sensibilities using various words that have various connotations – like the sacred, or the source, or god – but it is our common naturalistic orientation that generates our shared sense of place, gratitude, and joy. We acknowledge as well a shared set of values and concerns pertaining to peace, justice, dignity, cultural and ecological diversity, and planetary sustainability. We may differ on how these concerns are best addressed, but we are committed to participating in their resolution.

Several of the terms and concepts included in this statement are described in more detail below.

Naturalism

“Naturalism” is most commonly used to describe a philosophical lineage that starts from the framework of materialism – the universe is constructed from matter and energy

– and articulates philosophical propositions within that framework. Given that our scientific understanding of the material world has undergone a vast expansion since the naturalism project was launched, and since philosophical responses are framed in cultural contexts, much of the thought that would be included in a historical treatise on naturalism would not resonate well with present-day understandings (this is true as well, of course, of other philosophical traditions). To release the term “naturalism” from its historical constraints is not to release it from the fundamental impulse of the naturalism project, however, which is to perceive and construct meaning systems based on what is known of the natural world.

What is known of the natural world has generated a recent and profound transition, moving from facts-about-physics (quanta) or facts-about-biology (genetics) to a sweeping integrated story – the Epic of Evolution – that deeply informs us about who we are (symbol-manipulating primates, social, mortal, creative, members of ecosystems) and how we got to be here (the Big Bang, nucleosynthesis, biological evolution, brain evolution, emergence). This shift has in turn enlarged the scope of the naturalism project: the challenge is not only to construct meaning systems based on a knowledge of, say, quantum uncertainty or genetic specification, but also to construct meaning systems that emerge from the new meta-narrative itself.

Religious Naturalism

Loyal Rue defines a religious orientation as that which offers personal wholeness and social coherence, and suggests that this is accomplished in traditional religions via metanarratives that indicate how-things-are and which-things-matter. The adjective religious can be said to encompass three spheres of human experience. 1) The *interpretive* sphere (akin to theological) describes responses to the big questions raised by the narrative (e.g., Why is there anything at all rather than nothing? Does the universe have Plan? Purpose? How do we think about death?). 2) The *spiritual* sphere describes inward responses to the narrative, responses such as gratitude, awe, humility, and reverence, responses that for some are best accessed in community with others. 3) The *moral* sphere describes outward, communal responses to the narrative such as compassion and fair-mindedness and respect.

Religious naturalism is best thought of as a generic term for mindful religious approaches to our understandings of the natural world. As such, it does not represent a detailed system of religious beliefs. Instead, the specificity shifts to, and resides within, the religious naturalists themselves.

Religious Naturalist

Religious naturalists are anchored in and dwell within their understandings of the natural world. They find their primary religious orientation within that narrative/perspective and develop mindful religious responses to it – interpretive, spiritual, and moral. These responses are then transfigured into emergent valuations that are called religious orientations and beliefs. Importantly, these valuations and beliefs may deeply overlap with those espoused by existing ethical and religious traditions: the substitution of one meta-narrative for another does not necessarily alter the human impulse toward common spiritual and moral sensibilities; rather, it influences how we get there.

Religious naturalists holding shared orientations and beliefs may go on to associate as more focused communities, albeit this possibility has not yet become widespread.

These communities may, for example, develop art and ceremony that honor and celebrate their understandings of the sacred, and may commit to engagements in social and environmental activism. Such communities may coalesce within existing faith traditions, or they may come to stand alone. Examples include the World Pantheist Movement (www.pantheism.net), the Teilhard Association (www.teilhard.cjb.net), and the religious naturalism interest group of the Institute on Religion in an Age of Science.

Religious Studies and Environmental Concern

The establishment and growth of Religion and Ecology as a new area of study can be attributed in part to its instigation by scholars who feel morally and ethically compelled to address serious environmental problems. That religion itself has been implicated as a catalyst of environmental decline has prompted such scholars to examine the relationships among human cultures, religions, and environments. The *Encyclopedia of Religion and Nature* is, of course, one manifestation of the effort to understand such relationships. But it is hardly the first example of interest in religion and ecology among religious studies scholars, and some of this interest is more than analytic, it is itself religious. Indeed, especially since the mid-1960s, there has been intense scholarly interest in the relationships between human cultures, religions and environments, not only among religious studies scholars, but also among philosophers who have been pioneering the field of ENVIRONMENTAL ETHICS. Some ANTHROPOLOGISTS have also focused attention on ECOLOGY AND RELIGION and have been developing a field known as ECOLOGICAL ANTHROPOLOGY. A good starting point for the study of religion and nature is to review the range of scholarly approaches to understanding the relationships between cultures, religions, and environments. Here we focus on the role played by religious studies scholars in religion-related environmental studies and activism.

Religion and Ecology in the American Academy of Religion

In 1989 and 1990 David Barnhill (then a professor of Buddhism and Environmental Studies at Guilford College) and Eugene Bianchi (a professor of Christian Theology and specialist in Roman Catholicism at Emory University) teamed up to propose a religion and ecology “Consultation” to the American Academy of Religion, an important academic association devoted to the study of religion. The consultation was approved and held its initial sessions in 1991. The Christian process theologian Jay McDaniel, and the Buddhist scholar and deep ecology activist Stephanie Kaza were among the group’s earliest supporters, both of whom were engaged in their own scholarly and activist work toward environmentally friendly religion. Demonstrating strong interest

from Academy members, in 1993 the Consultation became a “Group,” a status which it has maintained to this writing.

The religion and ecology initiative represented a concerted effort to focus scholarly attention on the religion variable in human/ecosystem interactions. Some of the scholarly work presented there clung strictly to historical or social scientific analysis. The majority of the group’s presentations, while they might have been involved in or taken such work as their starting point, have also had a normative, ethical dimension.

Some participants explored how the world’s dominant religions could be “mined” or “reconfigured” to promote environmentally sustainable lifeways. Others, influenced by perspectives articulated during the emergence of ENVIRONMENTAL ETHICS and RADICAL ENVIRONMENTALISM, promoted the revitalization of cultures and religions they considered to be environmentally benign (such as indigenous, pagan and animistic ones), but that had been declining in the face of what the presenters considered the world’s dominant, imperial religions (especially the monotheistic ones). Still others proposed or endorsed recent religious innovations (such as the “Universe Story,” “EPIC OF EVOLUTION,” ECOFEMINISM, and various

NEW RELIGIOUS MOVEMENTS including WICCA) as correctives if not antidotes to anthropocentric religions that view the Earth instrumentally and consequently degrade it. Yet others advanced an EARTH CHARTER in order to capture and deploy religious ethics in a way that would promote a new environmental ethics, one that would consider the preservation of biological diversity a sacred duty, while simultaneously valuing cultural and religious diversity.

Within the wider American Academy of Religion, critics of the religion and ecology group have argued that religion and ecology scholars are more engaged in green religion and “missionary” work than in scholarly analysis. Such criticisms are likewise addressed to other ethically or religiously engaged groups in the AAR and reflect a wider fissure within it. For some scholars of religion, religious studies should promote religious tolerance and thus a more humane world, and therefore to promote the “greening” of religion, or to participate in it, would be appropriate modes of academic engagement. For others, such as Donald Wiebe (1999) and Russell McClutcheon (2001), who analyze in complementary ways the religiosity animating much of what is called “religious studies” today, the task of the discipline is properly to analyze religion rather than to defend or engage in it.

The conflicting responses of those in the religion and ecology group reflect this fissure. Some are apparently not involved in religious production or environmental ethics. Others unapologetically defend the normative religious or ethical dimension of their work and the group’s attention to it, arguing that the world cannot afford to have scholars sit on the sidelines in the struggle for sustainability.

The differing approaches and tensions reflect the plural identity in the religion and ecology field to date, which has scholars engaged in both analytic and normative work. This said, most participants and observers of the AAR’s Religion and Ecology Group would acknowledge that much of the work of its affiliated scholars is animated, at

least in part, by environmental concern. And some of the participants would certainly understand themselves to be “engaged scholars” involved, in one way or another, in the struggle to “green” religion and ethics. (The word “green” is now used not only as an adjective but also as verb and adverb in a linguistic innovation that signals environmental action.)

Religion and Ecology Beyond the Academy

Outside of the American Academy of Religion, the contributions of religious studies scholars to the greening of religion is more transparent and less controversial. These contributions have been substantial and driven by a sense of environmental urgency, an impulse which predated the controversy of the LYNN WHITE THESIS. America’s premier twentieth-century conservationist Aldo Leopold, for instance, urged the revisioning of ethics and religion toward a biocentric axiology in the 1940s, as Curt Meine, his biographer, reminds us in this encyclopedia. As Leopold asserted in 1947, when it comes to conservation, “philosophy, ethics, and religion have not yet heard of it” (Flader and Callicott 1991: 338).

Philosophy, ethics and religion have now all heard plenty about nature – beginning perhaps with a number of little-known conferences that focused on religion, ethics, and nature during the 1970s and 1980s. Several of these occurred as the disciplines of environmental ethics and CONSERVATION BIOLOGY got off the ground. But two events deserve to be singled out for dramatically increasing public and especially religious attention to environmental ethics.

The first, in 1986, was inspired in part and influenced by religion scholar and Roman Catholic priest THOMAS BERRY, and held at the Basilica di S. Francesco in Assisi, Italy, during the WORLD WIDE FUND FOR NATURE’s twentyfifth anniversary celebrations. Leaders of the five world religions who had been invited issued the “Assisi Declarations on Religion and Nature,” which set forth religious obligations to nature and spurred additional discussion and statements among and from other faiths in the subsequent years.

The second was a “Spirit and Nature” conference held at Vermont’s Middlebury College in 1990. It featured the Dalai Lama and a number of prominent religious leaders and scholars who had previously focused attention on religious responsibilities toward nature. The conference was followed by a similarly titled American Public Television broadcast and widely distributed video (produced by the well-known journalist Bill Moyers), and a book (Rockefeller and Elder 1992). All three “spirit and nature” manifestations promoted the idea of nature protection as a fundamental religious duty.

The driving force behind this conference was Steven Rockefeller, a Middlebury comparative religion scholar with a Ph.D. from Columbia, who also happened to be a practicing Buddhist born of one of America’s wealthiest and most politically prominent families. No doubt Rockefeller’s background and connections help explain the

success of the conference. More importantly, the conference was successful because it reflected and captured a growing environmental concern among a wide variety of religious individuals and groups, and it evoked and inspired more of the same. The conference was capped by an interfaith religious service that included the voices of whales and other creatures, brought to the congregation through the medium of Paul Winter's music, itself an expression of contemporary nature religion.

In the subsequent years, Rockefeller and a number of other religious studies professors would become even more deeply involved in promoting a fusion of environmental concern and religious ethics.

The “Religions of the World and Ecology” Conferences

The next most significant development along these lines was a series of conferences, hosted by The Center for the Study of World Religions at Harvard University with support from diverse environmental, religious, and animal welfare groups. Entitled “Religions of the World and Ecology,” the conferences occurred between 1996 and 1998. Like the “Spirit and Nature” conference, these were followed by publications. Between 1997 and 2004, ten Harvard University Press books appeared, constituting an impressive series bearing the same title as the conferences. The volumes explored what the series editors decided were the world's major religious traditions: Buddhism, Christianity, Confucianism, Daoism, Hinduism, Indigenous Traditions, Jainism, Judaism, Islam, and Shinto.

The conferences were organized and the book series edited by two Bucknell University Religious Studies Professors, Mary Evelyn Tucker and John Grim, both of whom had been inspired by the work of Roman Catholic theologian PIERRE TEILHARD DE CHARDIN, as well as by Thomas Berry and his protégé [philosopher and mathematician] BRIAN SWIMME, who together became the most influential religionists promoting the consecration of scientific and evolutionary narratives, which they called *The Universe Story* (Swimme and Berry 1992). They and others moved by these narratives have been involved in grafting these new sacred stories onto existing and new religious forms, sometimes monotheistic ones (such as when Christians celebrate the “Universe Story” linking it to creation through ritual performance), sometimes not (such as can be found in ritualizing of the EPIC OF EVOLUTION, and in the COUNCIL OF ALL BEINGS as presented in the work of Buddhism scholar/activist JOANNA MACY and the deep ecologist JOHN SEED).

Tucker and Grim have been instrumental in promoting the Universe Story through their long service as Vice President and President (respectively) of the American

Teilhard Society. The Society was founded in 1964, Thomas Berry himself serving as its president during the 1970s. Grim assumed the presidency in the early 1990s, and

continued well into the twenty-first century. Tucker called the Society the “Seedbed for Thomas Berry” in a 2003 interview (31 January in Bucknell, Pennsylvania; this paragraph and its quotes are gleaned from this same interview). Tucker and Grim, her husband, were well placed to know, for they had facilitated the society’s role in this regard. For example, Tucker assembled a number of Berry’s essays and presented them to a publisher in the early 1970s, which led eventually to the publication of Berry’s influential *The Dream of the Earth* (1988), which would sell over 70,000 copies. For another example, the new journal *Teilhard Studies* (winter 1978) devoted its first issue to Berry, entitled “The New Story: Comments on the Origin, Identification, and Transmission of Values.” Tucker and Grim were also been active in the AAR’s Religion and Ecology Group and instrumental in the development of the journal *Worldviews: Environment, Culture, Religion*, which commenced publishing in 1997, providing additional venues for promoting a sacramental sense of the Universe’s evolution. They have worked to draw the broader religion academy’s attention to the Earth Charter as well, which also conveys such spirituality.

As important as an inspiring universe or other religious worldviews might have been in fostering the emergence of “religion and ecology” as a sub-field of religious studies, the field was driven as much by an apocalyptic reading of the current state and likely near-future of the planet. Tucker and Grim, for example, began the series foreword of “Religions of the World and Ecology” with a strikingly apocalyptic tone:

Ours is a period when the human community is in search of new and sustaining relationships to the earth amidst an environmental crisis that threatens the very existence of all life-forms on the planet . . . As Daniel Maguire has succinctly observed, “If current trends continue, *we will not*” (Tucker and Grim 1997: vi).

Although some may think the extinction of *Homo sapiens* is a real, near-term possibility, few scientists share such a view, let alone fear that “all life-forms on the planet” will go extinct. This suggests that the framing of these volumes may be grounded more on an apocalyptic faith than biosphere science. Scientists increasingly do, of course, express alarm about the extent and rate of environmental degradation. It should be no surprise that this would fuel apocalypticism. Indeed, some future scenarios do envision the end of the world as we know it, even suggesting this has already occurred, as Bill McKibben problematically did in his best-selling *The End of Nature*. He did so by conceptually extracting humans from nature, for humans can only end nature if they are not a part of it. This illogical feat McKibben accomplished with little criticism, which was made possible by the apocalypticism of the age. We might, nevertheless, have wished for a more judicious framing of McKibben’s book, which had much otherwise to commend it, as well as the Harvard series, which despite such framing, will properly be understood as a benchmark for a certain type of engaged religion and ecology scholarship. And on a human level, the apocalyptic framing is understandable, for soberly presented ecological prognostications are certainly frightening enough to warrant such fears.

What is even more important to the current religion and nature discussion is the claim by Tucker and Grim in the introduction that the environmental crisis is grounded in defective religious perception, “We no longer know who we are as earthlings; we no longer see the earth as sacred” (1997: xvii). This implies not only that the Earth is sacred, but that earlier humans had a different and superior religious sensibility toward nature than modern humans.

Whatever the truth of such assumptions, they certainly make comprehensible why Tucker and Grim, and the other scholars who share such presuppositions, have labored so assiduously in developing the “Religion and Ecology” field. They hope to rekindle a sense of the sacredness of the Earth, which they consider a prerequisite to restoring ecological harmony. Indeed, a fundamental premise of most of the ferment occurring under the “Religion and Ecology” is a global, green-religious reformation.

The introduction to the Harvard series made this clear: Religious studies scholars could contribute significantly to the quest for sustainability by identifying and evaluating

[t]he *distinctive ecological* attitudes, values, and practices of diverse religious traditions . . . Highlight[ing] the specific religious resources that comprise such fertile ecological ground: within scripture, ritual, myth, symbol, cosmology, sacrament, and so on (Tucker and Grim 1997: xxiii).

The objective of the conference series was thus to establish a common ground among diverse religious cultures for environmentally sustainable societies, while treating individual traditions as resources to be mined for the envisioned religious reformation. Many if not most of the scholars writing for the Harvard Series seemed to share the objective of its editors, striving to uncover and revitalize the green potential of the religions they were analyzing. This encyclopedia provides many examples of scholars deeply involved in this process. Perhaps one of the more interesting is that of J. Baird Callicott, a protégé of Aldo Leopold, and one of the world’s pioneers of the field of environmental ethics. As if taking a cue from Leopold’s above-mentioned lament that philosophy, ethics, and religion have had little to do with conservation, Callicott has tramped worldwide pursuing cultural and religious resources for Leopoldian land ethics. Perhaps the foremost expression of Callicott’s religion-related work is *Earth’s Insights: A Survey of Ecological Ethics From the Mediterranean Basin to the Australian Outback* (1994), a project he pursued although, as he discloses in NATURAL HISTORY AS NATURAL RELIGION in this encyclopedia, he regards most religions as superstitious. He nevertheless hopes they can be made to promote conservation ethics that cohere with ecological science.

Breakout Box: Critical Perspectives on “Religions of the World and Ecology”

Since its inception, the issue of “engaged” scholarship has been a focal point for intense debate within the field of Religion and Ecology. The sharpest criticism has come from those who charge that scholarship incorporating ethical concerns and thus an “environmental agenda” ultimately compromises the critical acumen associated with distanced scholarship. These are not idle concerns, but they were not easily resolved, nor were they foremost in my mind when in 2001 I was asked to evaluate the Harvard book series during a Religion and Ecology Group session at the American Academy of Religion meeting in Denver, Colorado.

After first acknowledging the monumental contribution of the Harvard Series, I expressed a number of reservations about the way it was framed and some of the tendencies found in the published articles. Three of these are worth repeating here, for they reflect some of the concerns that led to this encyclopedia project, which is itself an exercise in religious studies, and was designed to remedy lacunae in the inherited “religion and ecology” field as it had unfolded in its initial decades.

The first criticism was that the “Religions of the World and Ecology” enterprise was not as inclusive as it sounded, for its main conferences and book series focused only on those religions labeled “world religions.” To their credit, the series included indigenous religions, which until recent decades had not been studied as a related religious type in venues like this. But the “world religions” category is problematic in itself and any list of religions so labeled will be difficult to maintain against criticisms. Scholars increasingly recognize that the contemporary multi-religious world decreasingly fits into tidy and conventional religious categories such as “world religions.” Moreover, the conferences and books drew primarily on scholars and figures closely associated with, if not committed to, the traditions under scrutiny. This left much nature-related religiosity out of sight, including individuals and groups engaged in nature-focused spirituality, such as many environmentalists who are not involved in any formal, established religion but who often consider nature to be sacred in some way, as well as Pagans, Wiccans, and some New Age devotees, who consider a perception of nature’s sacredness to constitute the very center of their religious worldview.

Although such lacunae were pointed out to the conference organizers early enough to remedy the oversight, and despite a sympathetic hearing and a recognition by them that there were significant gaps, nothing was done to make the conferences and book series more inclusive. Many scholars and religionists aware of this episode traced it to anti-Pagan bias and/or a desire not to offend mainstream religions, especially the conservative monotheistic ones that have typically ridiculed Earth-based religions and sometimes even repressed their practitioners. Even if a lack of funding made rectifying the oversight difficult, leaving the original decision in force represented a choice, one that reinforced the original omission.

A second criticism was that embedded in the series was not only a clear bias toward mainstream traditions but also one favoring the mainstreams *of* these traditions. The “World Religions” format established a structural and conceptual hurdle that made it difficult to attend fully to the critically important dynamic of religious bricolage. On the one hand this obscured the important dynamic of hybridization in the contemporary greening of religion. It also undermined the desire for “creative re-visioning” that was set out as a goal in the “Series Foreword” by (Tucker and Grim 1997: xxii) by casting implicit suspicion over such hybridization, seeing it as somehow impure compared to the existing traditions. This kind of tone was present in many of the contributions in the series, largely because so many of them were entrusted to scholars who were experts in their tradition’s texts; even when critical, they tended to remain loyal to what they took to be the text’s original meanings. Some of the authors ridiculed those engaged in what they considered inauthentic religious innovation, that is, at least, when they did not ignore popular religiosity and social movements altogether in favor of textual and worldview analysis.

In short, the series, by privileging the mainstream in its choice of its speakers and contributors (with a significant exception in the Indigenous conference and book, which paid substantial attention to contemporary grassroots engagements, and a few other notable exceptions) did not consistently look to the margins, where religious innovation tends to be most intense, arguably providing more fertile ground for new religiosities, including greener ones. Even when such religious production was charitably evaluated as possibly of some environmental utility, it was clear that many of the scholar-elites writing in these volumes considered such innovations to be “misunderstandings” and “misappropriations.” This may have well served “political correctness” or religious orthodoxy, implying that only people with a certain background can or ought to interpret a tradition, but it was not good religious studies. Critical religious studies recognizes the critical role that hybridity and boundary transgression plays in the history of religion and that for non-devotees, ethical judgments about such transgressions will have to rely on concerns other than faithbased belief regarding what constitutes a “pure” strain of an extant tradition. In summary, assumptions that often accompany textual and worldview analysis often discount popular, nature-oriented spirituality, making them invisible, and this kind of analysis has been the priority of the Harvard series, and indeed much of the religion and ecology field.

A third criticism was the idealistic (namely ideafocused) premise of the entire enterprise. Tucker and Grim in their series foreword insisted, quoting Lynn White, that “Human ecology is deeply conditioned . . . by religion” (in Tucker and Grim 1997: xvi). But this claim unfortunately assumed that which needs to be a central *conundrum* and subject of a scholarly inquiry into the relationships between religion and nature. It would have provided a better starting point for the religion and ecology series to turn this premise into a question: “*Is environmental action conditioned by religious attitudes about nature?*” Then, if an affirmative action were to follow, we could then push deeper, “If environmental behavior is so conditioned, how does this work within

the immensely complex ecological and political systems in which we are all embedded?” Certainly many of the entries in this encyclopedia question the idealistic premise of this series and the majority of the inherited “religion and ecology” field. Some of these suggest, on the contrary, that it is environments which decisively shape religions, not vice versa, and that over the long run, the only religions that will endure will be those proving “adaptive” within their earthly habitats.

In these areas of criticism – undemonstrated idealism combined with a narrow focus and privileging of religious mainstreams – and in a number of other problematic assumptions conveyed by this series and much of the “religion and ecology” field, two differing approaches to the field can be discerned. One is activist in its priorities and chief orientation. It seeks to turn religions green while being careful not to offend religious majorities and mainstreams. For an activist, even a scholar-activist, this is an understandable choice, for to the extent that religious worldviews influence behaviors and thus impact ecosystems, the ones held by more people will be the most important environmentally. Another approach places the priority on simply understanding the relationships between *Homo sapiens*, their religions and other cultural dimensions, and their livelihoods, environments, and so on – which is no simple task! This effort may also be motivated by environmental concern and it is certainly not value-neutral – many of its scholarly practitioners hope that the answers to such critical inquiry can help guide both environmental activism and public policy. But the approach endeavors to bracket value assumptions in an effort to prevent them from occluding understanding of the role of religion in nature.

Although these can be distinct approaches, in the real world these approaches, and those engaged in promoting them, sometimes, inevitably, intersect. Tensions between these approaches can even operate synergistically, helping to illuminate together the religion and nature terrain better than either would in isolation. Nevertheless, it is time for scholars involved in this interesting field of inquiry to exhibit greater self-reflexivity and transparency with regard to the approach they are engaging in, alerting the reader to when they are engaged in this approach, and their rationale for such choices. This would lead to greater clarity and would help guarantee that the inevitable tensions that accompany scholarly inquiry will be creative and productive as the field evolves.

“Culminating Conferences” and Targeting the United Nations

After the World Religions and Ecology conferences at Harvard that focused on religious traditions, two “culminating conferences” were held, producing or contributing to three significant trends: 1) the spreading of spiritualities in which the evolution of the universe and life on Earth is considered a sacred story; 2) the wider extension of green forms of mainstream religions; and 3) the greening of international institutions.

The first culminating conference, “Religion, Ethics, and the Environment: An Interdisciplinary Dialogue,” occurred on 17–20 September 1998 at Harvard University. The focus of this conference was cosmology, environmental ethics, and the world religions. Speakers included Thomas Berry, the entomologist and biodiversity advocate

E.O. WILSON, and J. BAIRD CALLICOTT, all of whom have in their own ways promoted the consecration of scientific narratives. Steven Rockefeller also spoke. Since the Vermont “Spirit and Nature” conference, Rockefeller had become a critically important facilitator of the Earth Charter process. The Charter, intended for United Nations ratification as a sustainability strategy, is a remarkable document claiming that all life has intrinsic value and expressing reverence for the miracle of life, while calling the nations to understand, in one way or another, that preserving the Earth is a “sacred trust.”

The second culminating conference took place on 21 and 22 October 1998, and brought the themes of the earlier conferences, including the sense of the sacredness of the universe, right to the United Nations (the second day was held at the American Museum of Natural History). This conference illuminated the role of religious studies scholars in the Earth Charter initiative, and indeed, one of the sessions was devoted specifically to “charting the course” for the Earth Charter.

One of the speakers was Oren Lyons, a professor of Native American Studies at the State University of New York at Buffalo, and the “Faithkeeper” of the Turtle Clan, Onondaga Nation, one of the traditional nations of the HAUDENOSAUNEE CONFEDERACY. In 1991, Lyons himself had participated in another important extension of nature spirituality into the culture’s mainstreams, through a Bill Moyers public television program based on a conversation with Lyons. Mary Evelyn Tucker was another speaker at the United Nations, bringing the message she was taking from the overall conferences, that religions were indeed turning green, sometimes in dramatic and decisive ways. Her experiences of this perception she discussed several years later in *Worldly Wonder: Religions Enter Their Ecological Phase* (2003). Thomas Berry and Brian Swimme were also presenters, bringing their reverence for the universe directly to the conference, and kindling substantial interest. The first day at the United Nations drew an overflow crowd including many United Nations employees, and 1000 people attended the sessions at the Natural History Museum.

Perhaps even more importantly, a number of prominent figures associated with the United Nations spoke and endorsed the overall effort to green religion and ethics, including Maurice Strong, who reportedly first hatched the Earth Charter idea while serving as the Secretary General of the United Nations Conference on Environment and Development. This conference was held in 1992 in Rio de Janeiro and became known simply as the “Earth Summit.” Adnan Amin, the Executive Director of the United Nations Environmental Program, also articulated his support for the overall effort to promote a global environmental ethics and politics congruent with it. A few years after this meeting at the United Nations, in 2002, on the occasion of the United Nations’ World Summit on Sustainable Development in Johannesburg (which was the official follow-up meeting to the Earth Summit), Steven Rockefeller played the leading role in promoting the Earth Charter. The Charter received respectful mention from a number of world leaders, but no formal attention on that occasion.

This discussion has demonstrated that ideas and initiatives, incubated if not birthed by religious studies scholars, have played important roles in the greening of religion and environmental ethics. They are, moreover, beginning to influence global environmental politics, bringing to them an important and sometimes innovative religious and ethical dimension.

The Forum on Religion and Ecology

Mary Evelyn Tucker and John Grim developed the conferences to encourage scholarly work in the service of greening the world’s religions, to promote a sense of the sacredness of the universe and evolutionary narratives, and to support related ethical initiatives including the Earth Charter. To continue such efforts they also used the conferences to spawn a long-term initiative, which they called the “Forum on Religion and Ecology.” Known to many by its acronym, FORE, the organization was, according to its website, established to help develop “religion and ecology as an academic area of study and research in universities, colleges, seminaries, and other religiously affiliated institutions.”

A number of religiously affiliated colleges and seminaries have been developing religion and ecology as specialties, and in 2003, the University of Florida, a state-sponsored, secular institution, inaugurated the first “Religion and Nature” emphasis as a central part of its new Ph.D. program in Religion. Such developments – occurring both in religious and secular institutions – suggest that the field of religion and ecology began emerging from its infancy in the early years of the twenty-first century. The differing approaches, confessional/ethical on the one hand, and historical/social scientific, on the other, will sometimes be in tension, but this is likely to be a creative one. Sometimes the differing approaches will be blended in creative scholarly hybrids. Taken together, the various approaches will produce diverse kinds of scholarly work as the field is further constructed.

Restoration Ecology and Ritual

Ecological restoration is the active attempt to return a landscape or ecosystem such as a prairie, a wetland or a lake to a previous condition, usually regarded as more “natural.” This is done through the alteration of soils, topography, hydrology and other conditions, the introduction of extirpated or otherwise missing species of plants and animals, and the elimination or control of species not present in the historic, or model landscape.

Although restoration has existed in its modern form since early in the twentieth century, for most of that time it was merely a curiosity represented by only a scattering of projects, and playing no significant role in conservation thinking or practice. Only since about the mid-1980s have conservationists begun to take restoration seriously. This development has been accompanied, or perhaps to some extent driven, by the growing recognition of the value of restoration as a conservation strategy, a technique for basic ecological research, a way of experiencing and learning about landscapes and ecosystems.

At the leading edge of this ongoing discovery of restoration are practitioners who have begun to explore its value as a context for the creation of ceremonies and rituals to explore and celebrate the relationship between humans and the rest of nature. The value of restoration as a basis for performance, ritual and other forms of expressive action arises from its essentially active nature.

Preservation, for example, despite its importance as a conservation objective, entails an essentially non-active relationship with the landscape, and offers few opportunities for expressive action in direct relationship with the land and other species.

Restorationists, in contrast, participate in evocative activities such as the gathering and sowing of seed and the reintroduction of animals, which provide occasions for celebration. They also participate in psychologically problematic activities such as the burning of vegetation and the “control” – that is, usually, the killing – of unwanted species, and in the contamination of “nature” by these and other intentional human activities.

The negative feelings aroused by activities of this kind are no doubt one of the reasons why environmentalists ignored and even resisted restoration for so long. But they are also the reason why restoration is so valuable as a context for exploring and defining the terms of our relationship with the rest of nature in a non-sentimental, psychologically and spiritually comprehensive way.

One way to explore the potential of restoration as a performing art, or as a context, occasion, or basis for ceremony, ritual and other modes of expressive action is to

consider parallels between the “act” or “story” of restoration and other performative genres. Of these, perhaps the most obvious is dramatic reenactment. Restoration is, after all, a kind of time travel, which may be undertaken and understood variously as an attempt to reverse, repeat, alter or obliterate history. Thus the practice of restoration has been imaginatively linked with historical reenactments in events such as the annual Trail of History days at Glacial Park, site of a landscape-scale restoration project near Richmond, Illinois.

Another performative genre that parallels the practice of restoration in suggestive ways is pastoral art, which explores the relationship between humans and the rest of nature through action carried out in the field of tension between them. In classic forms of literary or dramatic pastoral, such as Thoreau’s *Walden*, or Shakespeare’s *A Midsummer Night’s Dream*, this usually involves movement across the landscape, typically a double action of withdrawal from civilization (represented by a city, factory, court or the like) in the direction of nature (represented by a garden, or a wilderness, natural area or pastoral landscape) and then an ultimate return. The restorationist, however, performs this pastoral “experiment,” in a very different way, not by moving from one place to another, but by attempting, in effect, to remove culture from nature by modifying a single place. This variation on the pastoral design has important environmental implications, not least because it dramatizes the possibility of the redemption of the city, and also because it provides a constructive alternative to the essentially consumptive use of the natural landscape modeled by “retreatants” such as Thoreau or Edward Abbey.

Restoration also offers close parallels with traditional rituals of initiation. In particular, the task of copying – rather than imaginatively imitating – the model or “given” landscape provides an occasion for the radical selfabnegation or setting aside of the will characteristic of some traditional rituals of initiation (see, for example, Grimes 2000). When properly developed, this may serve as an opportunity for achieving membership in the biotic community, a paradigm of relationship long favored by environmentalists. At an even deeper level of engagement, restoration provides a context for confronting the most problematic aspects of life, including the killing of plants and animals and the exercise of a kind of hegemony over entire ecosystems. Since it opens up the possibility of offering back to nature some recompense in nature’s own kind for what we have taken from it, it also opens up the possibility of a kind of redemption in our relationship with nature through a ritual offering back to it, rather in the manner of the institution of ritual sacrifice characteristic of many traditional and pre-modern cultures.

At the present time, restorationists have made some progress toward the realization of these imaginative possibilities. Ritual in the context of restoration efforts currently ranges from the informal and minimally selfconscious bagel breaks and sharing of stories during workdays to more ambitiously conceived forms of ceremony and ritualization. In Lake Forest, a suburb of Chicago for example, the burning of brush piles resulting from the clearing of exotic species in rare oak savannahs has become the oc-

casation for an annual festival featuring a parade of bagpipes, linking the city's cultural history with its biotic past and future. Other restorationists, like the San Francisco practitioner Amy Lambert or the Mt. Horeb, Wisconsin environmental artist Barbara Westfall, have used restoration projects as the occasion for the creation of installations or performances designed to explore and enhance the meanings generated by these projects (see *Restoration & Management Notes* 10:1 [1992], 59).

Others have used restoration projects and events as occasions for special ritual events such as weddings, or seasonal events such as solstices or equinoxes, illustrating ways in which meanings inherent in the task of restoration resonate with those of traditional events such as certain holidays, festivals and occasions of life-crisis and transition.

These developments are of special importance for environmentalism because they represent the value of reflective action rather than deduction and argument in the development of meanings and other environmental values. Since environmentalism, regarded as a religious endeavor, has arguably been rather "top-down," or "theological" in its approach to the formation of values and attitudes, an emphasis on ritual as a source of values and a context for conscience formation may prove to be of fundamental importance in the development of an environmental religion based on values that truly emerge from the experiences of groups of people in particular places.

Restoring Eden

Restoring Eden is a nonprofit organization working to reestablish nature appreciation and environmental stewardship as a core value within the Christian community. Headed by Peter Illyn, an evangelical Christian minister, Restoring Eden creates simple, heartfelt messages that target Christians in churches, universities and communities in an effort to raise up grassroots environmental advocates.

Illyn became an environmentalist during a 1000-mile llama trek through the Cascade Mountains of Oregon and Washington. As he recalls the experience,

One night, while camping in an alpine meadow, I watched a herd of elk come to graze. As I stood in the moonshadow, I saw a bull elk raise his head, snort and then bellow out a loud rutting call. I was overcome by the primal wildness around me. I finally understood, though dimly, the scripture in Genesis where God, after creating the wild animals, stated that it was “good.” But two days later my llamas and I followed the trail into a massive clearcut. There were no trees left standing, no birds flying, no elk rutting. It had the quiet desolation of an abandoned battle field.

According to Illyn, while sitting there on an ancient fir stump, doing his daily Bible reading, he came upon Proverbs 31:8, which states that we should “speak out for those who cannot speak for themselves.” Brokenhearted by the devastation he saw from horizon to horizon he prayed, “Lord – who speaks out for your forest, your elk, your salmon?” “It was at that moment,” he tells his audiences, “two days after seeing the elk, that I decided to become a voice for creation.”

Illyn states that he went into the mountains a minister but four months later came out as an environmentalist, committed to preaching the biblical call to love, serve and protect God’s creation. To further that commitment, in 1996, he founded Christians for Environmental Stewardship, to identify and network a church-based grassroots movement. In 2001, the organization’s name was changed to Restoring Eden.

A cornerstone of the work is assertive outreach efforts. According to Illyn: “Our goal is to be unapologetic, yet winsome in our advocacy. Our message is simple, ‘God is a good God, God made a good Earth, God calls us to be good stewards.’ ” Illyn and the others drawn to Restoring Eden recognized that the agents of change in the Church are seldom the pastors in the pulpit, but instead are the layleaders in the pews, and they focus on their potential.

The goal is to organize these lay-leaders into a grassroots voice willing to speak out about the goodness of creation in Church and in the political arena. Restoring Eden representatives’ table at Christian rock festivals, start environmental clubs in Christian colleges, and host student lobby-training events in Washington, D.C. They

have come to the defense of protecting endangered species, protecting wild forests from road building, and have lobbied to prevent the U.S. government from permitting oil drilling in the Arctic Refuge.

Through this activism, Restoring Eden has developed important partnerships with indigenous Christians working to protect their tribal land and subsistence economies and cultures. These partnerships have taken Illyn on speaking tours of tribal communities in Papua New Guinea and Alaska. He held workshops there with tribal leaders to confirm that a true biblical land ethic is similar to their traditional tribal land ethic – take only what you need, be thankful for all you have and see the connections and interdependencies. Often referring to themselves as “bellybutton” Christians, these tribal communities still see their umbilical cords connected to their “mother,” the Earth. This is contrasted with a commonly held land ethic within the modern Church that believes God made the Earth for us, so take as much as you can, as fast as you can.

On these speaking tours, Illyn operates within the Christian tradition as a traveling evangelist. Prior to his mini-crusades, Restoring Eden volunteers and local environmentalists arrange for a meeting hall, contact media, and place posters up throughout the community.

Billed as “The Theology of Wild,” Illyn creates a biblical message of nature appreciation, environmental stewardship and political activism. The sermons advocate for native habitats, wild species and the rights of indigenous cultures.

According to Illyn,

Scripture is clear that humans have been given both the privileges and the obligations of stewardship. While we have the right to eat from the fruit of creation, we do not have the right to destroy the fruitfulness thereof. It is our sacred duty to love, serve and protect the rest of God’s creation. We are foolish and narcissistic to think this creation was all about us.

Restoring Eden’s goal is to establish a three-part strategy to make hearts bigger, hands dirtier and voices stronger. To get the heart involved it uses the traditional, but forgotten, spiritual discipline of nature appreciation to help people see the wonder, wisdom and whimsy of God revealed in nature. It gets hands involved through environmental restoration service projects and inventorying their lifestyle choices. Finally, the organization’s voice becomes stronger through public advocacy and political activism.

Illyn finds that getting Restoring Eden’s message can be difficult for some. The occasional negative reactions are usually based on differing political and religious understandings. Among the absurd but too common political responses he has heard are assertions that environmentalists are part of a conspiracy by supporters of the United Nations to create a one-world government and take over land in the United States. The religious arguments include claims that Christians need not be concerned with this Earth, because, as Illyn remembers hearing them, “God is unconcerned about the state of nature”; “God made the Earth for humans – he expects us to use the Earth and the sooner we use it up, the sooner Christ will return”; “God can re-create any species that go extinct”; “the Earth is not our home – I’m heaven bound!”; and per-

haps most commonly, “Preaching the salvation message is the only important work of Christians – all else is a distraction.” Sometimes an apocalyptic expectation plays an important role in devaluing environmental concern, “My Bible predicts that things are going to get worse, no matter what we do.” Such assertions are often accompanied by claims that environmentalists “worship the creation instead of the Creator” and promote un-Christian “New Age” or “Pagan” worldviews.

Reflecting on the challenges, in 2003 Illyn stated, while our work is still controversial and viewed with suspicion by some, we are winning the argument that environmental concern is appropriate for the church. But so far we’re losing the argument that such concern for creation should be a high priority.

Many Christians have been taught that evangelism is all that matters. But according to Illyn, “the Great Commission found in the Gospel of Mark is to preach the good news to *all* creation. Habitat destruction and species extinction is not good news for creation.” Illyn passionately speaks out for the goodness and integrity of nature and believes that Restoring Eden can help Christians realize that environmental stewardship is an important Christian duty. According to Illyn, “If you love the Creator, you must take care of creation.”

Rewilding

The long-term preservation of nature depends on a sustainable shift in the way we perceive and thus act upon the world around us – the return to conscious, authentic being, which I call “rewilding.” Wildness could be described as a condition of dynamic wholeness and authentic expression. In our case this means oneness with our bodies, needs, desires, sensations, instincts and dreams

. . . and with the natural world of which we are an integral part. Rewilding is the intentional restoration of wholeness: the integrity of entire ecosystems as well as the integrity of our individual beings.

In wilderness restoration we intentionally work to repair the torn ecological fabric, remove the invasive and the artificial, encourage the flourishing of every native form, protect against its dismemberment or destruction, and contribute to a state of continuous flux and balance. In personal rewilding we do much the same, mending our individual ecologies, the connections between our bodies and souls, hearts and minds. We purge any lies our societies may have taught, and those illusions that fear has wrought, while learning to express every aspect of our essential native selves. We do what we can to protect against distraction and dissolution. We strive for balance in our lives, and in our relationships to both the human and more-than-human world.

Alexander Marshack described humanity as a “persistent flowering of an ancient reality.” The rewilding of the self is neither a retreat to the past nor transformation into something new. Instead, it is a re-formation, the reinhabitation of original form. It is being who we really are: the act of simply being. It is the uncomplicated if difficult cessation of all pretense, artifice, conditioning, labeling, distraction, manipulation, domination, preoccupation with the future, suppression and repression. Rewilding is both a beautiful flowering and an essential coming into self.

The rewilding of the self begins with the rewilding of the body: reimmersion in the sensorial field, engaging every aspect and element of the world around us – and every experience – with every one of our atrophied senses, refamiliarizing ourselves with the feel and function of our flesh. The senses take us into ourselves, even as they reach out and thereby enlarge us. The wild body is fueled by passion, the passion to experience miraculous, finite life. Its rewilded sexuality is an ally of immediacy, moving us beyond objectification and back into the intensity of the moment, responding directly to fete or foe, task or poem. The rewilding of the psyche involves the reawakening of primal mind, restoring the sense of wonder and awe to its rightful place as a determinant of the human/nature relationship. As such, rewilding is a socio-religious experience as

much as a personal epiphany or practice. It results not only in awakened ecocentric spirituality but also in social and political action.

The rewilded person is resonant with, protective of, and responsive to the natural world. Such persons act as activists and advocates for wilderness, which they recognize as our original home, the playground of evolution, and the formative context for a wilder humanity. Only since the 1900s has wilderness been looked at as a place to visit, a sequestered island of undeveloped Nature surrounded by a developed and depleted landscape. For most of our upright existence, humankind has lived with/in the flesh and flux of wilderness. As an extension of inclusive nature, we are a product of it. Our species was shaped by the nourishment and challenges of a wild life, responding to the constantly changing situations of a natural world. The way adrenaline speeds our heart and fuels our muscles when we sense danger, and the way love jerks us around whether we're ready for it or not, are both dynamics developed in our wild past. For several hundred thousand years we were integral rhythmic elements in the wilderness concerto. Judging by the attitudes and behavior of both our primate relatives and many existing "primitive" peoples, humans were likely blissfully engaged in the sensorial field whenever not hungering or actively being preyed upon. And whether we were ecstatic nature mystics or not, we were natural elements of a well-functioning whole – contributing to both the flowering and balance of what remains an incredible, evolving composition. We must bear in mind that the entire world, in all its wholeness, was not so long ago wilderness. And out of that authenticity, vibrancy and wholeness we were born. A wild Earth may yet be a necessary condition for the highest manifestation of human and nonhuman potential. It is the sacred source, the cauldron of creation on whose behalf the "wilder" makes his or her stand.

Like a growing number of anarchists, deep ecologists and indigenous peoples, author Derrick Jensen finds nothing absurd about either the possibility or necessity of dismantling the existing structures and paradigms of our techno-industrial civilization. "It just seems like a lot of hard work, done by a lot of people in a lot of places in a lot of different ways," he tells us. What's absurd is "the possibility of allowing this inhuman system to continue" (Jensen 2002: 588). Certainly, the dichotomy between wilderness and civilization is not a quandary to be solved, but rather, a choice to be made. Everyone, at some point in their lives, makes a deliberate decision to desensitize in a deal for comfort, to live in confinement rather than face the uncertainties of nature, to acquiesce to outside powers in order to avoid the demands of responsibility, to allow the destruction of wilderness and human wildness in exchange for the technogratification of our times. It's a matter of how we judge what is truly valuable in life. To determine something's worth a "wilder" asks: Is it freely and gracefully embodying its own nature? Is it real, authentic, and intensely itself? Does it contribute to diversity, wholeness/holiness, interdependence and balance? Does it sing, laugh, resonate? *And can you dance to it?*

Inspirited Gaia whispers in every river and shouts from every granite peak: reclaim and reinhabit! Revere and resacrament! Resist and reshape! Re-member . . . and rewild! And we respond, with both our bodies and souls.

For all the difficulties of rewilding in this day and age, it is a shift that provides immediate rewards. Life presents all its flavors only to the wild, only to those who dare. In our reconnection to self and place, Earth and Spirit, we function as will-full conduits for the ancient ways, conscious receptors and transmitters of Gaian consciousness. In this great manifesting and gifting, we become the newest and most grateful members of the wild covenant, the response-able inheritors of the legacy and duties of the sacred wild.

Rexroth, Kenneth (1905–1982)

Kenneth Rexroth was an American poet, translator, and cultural critic. Raised in the Midwest, he settled in California where he became a major figure in the San Francisco Renaissance and influenced the development of poets such as Gary Snyder and Allen Ginsberg. Three of his distinctive contributions are his blending of Catholic and Buddhist spirituality, a sweeping knowledge of world literature, and his affirmation of the interrelatedness of nature, mysticism, the erotic, and the political. This complexity resulted in some of the most compelling and socially significant nature poetry in the English language. Central to his vision of nature is a deep sense of radical interrelatedness within a vast universe. He frequently drew on Huayan Buddhism's image of Indra's Net, in which all phenomena are likened to mirrors reflecting each other. "Doubled Mirrors" concludes with the narrator discovering the source of many tiny points of light: "Under each / Pebble and oak leaf is a / Spider, her eyes shining at / Me with my reflected light / Across immeasurable distance" (1966: 224).

Equally important is his realization of the flux of life. This theme exemplifies both the traditional Buddhist emphasis on impermanence and the Japanese aesthetic of *aware*, a bittersweet realization of the ephemerality of all that is beautiful. This sensitivity is evoked when he exhorts his daughter to "Believe in all the fugitive / Compounds of nature, all doomed / To waste away and go out" (1966: 241).

This ongoing flow of time contains brief eternities. In "May Day," he contrasts his vision to workings of the men of power who "are pushing all this pretty / Planet . . . / . . . nearer and nearer to / Total death." Despite his apocalyptic view, he can affirm to his daughter that "we have our own

/ Eternity, so fleeting that they / Can never touch it, or even / Know that it has passed them by" (1966: 331).

Rexroth's nature poetry emanates a this-worldly mysticism in which the natural world is itself sacred, a view reinforced by his interest in Tantric Buddhism. "The holiness of the real / Is always there, accessible / In total immanence" (1966: 248). To apprehend this sacrality, one needs to drop the cravings, aversions, and delusions of the ego and realize the contemplative flame that burns in each of us. His mysticism is also erotic: the body too is sacred and sexual love is one of the principal means of realizing the holiness of the real. Some of his finest nature poems are also intense love poems.

His sense of an interrelated and sacred world was the foundation for a deeply moral vision and engagement in radical social movements. He combined the traditional Buddhist critique of normal consciousness with a condemnation of the devastating power of

social structures that manifests and reinforces the distortions of the ego. In particular he denounces the hierarchical, authoritarian politics and acquisitive economic systems of the modern nation-states. The state “lives by killing you and me” (1966: 241) – i.e., by extinguishing our contemplative flame and severing our organic relatedness to the natural and social worlds. In numerous poems he combines exquisite sensitivity to nature and an incisive awareness of human suffering and evil.

Rexroth’s ethical mysticism was formed early in life by his commitment to social justice, a Quaker-influenced ideal in a free community of responsible persons, his readings in Christian mysticism, and his view of Christ as a model for feeling “unlimited liability” for the ills of the world. Later in life his social and ecological concerns became increasingly influenced by the Mahayana Buddhist ideal of the bodhisattva, who vows “I will not enter Nirvana / Until all sentient creatures are saved” (1968: 292–3). Unqualified compassion enables the bodhisattva to hear “the crying of all the worlds” (1968: 292) and effortlessly move to help those in distress – an ideal most subtly developed in his masterpiece, *Heart’s Garden, Garden’s Heart* (1967), a long poem written in Japan.

Ritual

By some accounts ritual behavior is utterly natural, “hardwired” into the structure of the brain and nervous system, a function of our biological or animal “hardware” rather than of our cultural “software.” Even if one tries to escape explicit rites, tacit ritualization nevertheless emerges unbidden. So, for instance, if we do not initiate youths into adulthood, they will, perversely in all likelihood, initiate themselves. By this account, all habitual behavior, perhaps even all social behavior, is ritualized. Ritualizing and dramatizing are universal, givens in human nature. Our very biosocial being is dependent upon these twin foundational activities. Even if people avoid formal rites and refuse to attend stage plays, they cannot escape ritualizing and dramatizing. They permeate human actions the same as they do the mating and aggressive behavior of birds and fish.

By other accounts, however, ritual is a most unnatural activity, not at all the sort of behavior one *cannot help* doing. Ritual is not like eating, sleeping, digesting, and breathing, or even copulating and speaking. Ritual is optional – one can choose *not* to engage in it. Whereas being alive requires eating and sleeping, it does not require ritualizing. Even if one claims that humans and other animals exhibit an inherent urge to ritualize, responding to that urge is optional, and because it is optional, ritual is cultural rather than natural.

The dichotomy, cultural versus natural, is familiar. It is a staple of Western thought, typical of its dualistic tendencies. And ritual is not the only human activity to be hoisted onto the horns of this perennial dilemma. But the dilemma is easy to overstate, thus rendering it a false dualism. There are ways around the problem; a third, less polarized view is possible. For instance, one might argue that it is perfectly natural for humans, given their upright postures and large brains, to be cultural. Or one might observe that cultural activities, when sustained for a sufficient time in the right environmental niche, can have genetic, which is to say, evolutionary, consequences. In other words, even though a noticeable cultural/natural divide characterizes much human behavior, this great divide is not impassable. It is a membrane rather than a wall. The distinction between things cultural and things natural, in this third view, is relative rather than absolute, making it conceptually possible that ritual, like language (but unlike digestion) is both natural and cultural, a cultural edifice, if you will, constructed on a natural foundation.

If this is the case, the question, then, becomes: what is this natural foundation? If brains and tongues and ears lay the groundwork from which human languages sprout and then diversify, what is the bedrock upon which human rites are built? The question

is really two: 1) How essential is ritual to being human? and 2) By what basic biosocial means does ritual operate? Is ritualizing just one activity among many others, and doing it or not doing it like the decision to wear green rather than red, or like opting to ride bikes rather than paddle canoes as one's hobby? Is the choice merely aesthetic, a matter of taste or personal preference? Or does something larger, grander, and greater depend on the choice to ritualize or not?

Examined historically and crossculturally, the consensus answer to the question would seem to be that participation in certain specific rites is an indicator of whether one is truly human or not. The view that ritual is merely optional or only decorative is anomalous in human religious and cultural history. It is an attitude mostly recent and largely Western. The questions: Who is truly human? and What is truly natural? have often been answered: the truly human people are those most truly in tune with nature, and those most truly in tune with nature are those who dance this particular rhythm in this particular ritual dance. So the natural, the human, and the ritualistic are, in the final analysis, one.

If one were to allow a minor variation in the nature question – thus, What is truly natural, or supernatural? – the threefold equation would account for almost every religious tradition the world has known. In short, ritual participation (or not) has been utilized as a primary behavioral indicator not just of who “we” (as opposed to “they”) are, but of who is truly human and what is truly natural or supernatural.

This equation generates a peculiar torque in our thinking about rites. On the one hand, a rite is a cultural human construction. People make it up, revise it, and evaluate it. Politics and economics swirl about it as they do about any other human activity. On the other hand, the gods delivered it or the ancestors bequeathed it. A rite is not a work of fiction. It has no author, and no one dreamed it up out of his or her imagination. The popular mind-rites, especially religious ones, are above critique and debate. Those who evade the revealed sacred liturgy are unnatural and inhuman. Do it or die.

The contemporary form of the ritual conundrum is slightly different from the more historic form. The older form was: Which rite (thus which tribe, which nation, which tradition, which people) is the right one? The question seldom posed a real option. If you were a so-and-so, you knew your own ritual system was the right one.

The newer form of the ritual question is: To ritualize or not? Being born into a society with a divinely given rite is no longer the norm. Instead, this rite and that one seem equally plausible (or equally implausible). Besides, who wants to fight and die for a way of performing cultural ideals, all of which are relative anyway?

Rites typically (although not always) express associated cultural myths, predications of what is real and not, what is worthy and not. For cultures in which the question is, “To ritualize or not?”, the dominant myth is scientific and technocratic. Scientists, it is believed, study nature, things as they really are, not supernature, things as they might, or should, be. So we who are steeped in such cultures look to theory, fact, and

evidence to warrant our decisions and evaluations. We resist labeling these “myth” even though they work in much the same way as more obviously mythic myths do.

And what does current scientific myth say about the necessity, or lack of it, to ritualize? First of all, it is seriously out of scientific fashion to talk as if human behavior issues from an urge, instinct, or drive. The current way of speaking of something as built-in is to say it is “encoded” in the genes, the DNA. But, of course, genes and DNA do not account for *everything* any more than the old drives and instincts or the older gods and spirits did.

Environment and natural selection are today’s other costar actors. Together, DNA, environment, and natural selection make us who and what we are. And we are embodied, be-brained, mammalian, bipedal homonoids. Some of us ritualize and some do not. So the question is not ‘Do we ritualize?’ but ‘Should we?’ The ritual question is morally and practically driven. The long form of the current existential ritual question, then, is: Should humans ritualize in order to be attuned to nature and thereby avoid planetary destruction?

Why would it ever occur to anyone to pose the question this way? There are two reasons: 1) ethnographic social science is presenting rich traditions in which rites are understood to be the primary means of being attuned to the environment; and 2) psychological and anthropological science is tendering theories which claim that ritual activity synchronizes the halves of the brain, thereby diverting human tendencies to make war on their fellow “conspecifics,” thus making us better stewards of the Earth’s deep structure.

The import of the ethnographic testimony is that ritual participants the world over believe their rites enable them to live in synchrony with the natural world, especially animals and plants, sometimes even rocks, mountains, bodies of water, and specific places. This ritual sensibility is not characteristic of every ritual system, but it is typical of many of them, especially the local, smaller-scale ones. In these, people behave with humility and receptivity. They are, they confess, not more powerful than other creatures, and the human task in life is not only to use the creatures but also to be receptive to their teachings. In the ritualized world presented by ethnographers, what we in the West think of as nature (as opposed to culture) is peopled. Animals and plants and places are people too. So the nature/culture divide either does not exist or it is much less pronounced. In rites, animals and plants and places are addressed with respect as equals or even superiors.

The ethnographic evidence is that ritual participants believe they attune themselves with rites to the natural/supernatural world. Some non-participants believe this too, and they wish the Western technocratic world were more ritually saturated than it is. But – and this is an important “but” – animals and plants are also treated in ritually rich cultures as food. Albeit with apology, song, and prayer, they are killed or harvested, then distributed and eaten – either that or avoided altogether. Animals, like exceptionally generous people, give themselves to hunters, and hunters are the kin of animals. But hunters also track, stalk, study, and strategize. The ritual attitude, then,

does not preclude a pragmatic attitude. Prey are persons, but they are also targets for arrows.

The ethnographic evidence, then, reminds us that rites are not foolproof; the game become angry, which is to say, the game are sometimes shot out and the fields overharvested. Although rites attune, they do not do so perfectly or completely. Thus, not all native people in every place and time have been “natural ecologists.” Rites not only attune participants to nature, they insulate people from nature. Rites can become ends in themselves or tools for wreaking environmental and social havoc. Everything depends on which people at which times in which specific places of nature are engaging in which kind of ritualizing. In the current Western scientific and technocratic world, true believers, of course, look with some skepticism on the claims of ethnographically presented ritualists. At best, their testimony is soft rather than hard evidence. At best, ethnographic reports present stories, beliefs, descriptions, occasionally even hypotheses, or theories, but not proven facts, which is to say, demonstrated and replicable ones. So the best one can claim, and still honor the sacred tenets of scientism, is that certain ritual practices *may* have survival value. They *may* enhance the adaptability and thus the longevity of the human species on the planet

Earth.

We must reiterate the “may” as long as we have not eliminated the alternative, namely, that deeply ritualized human life can become more one-dimensional, stereotyped, and inflexible than non-ritualized human life. In short, rites *may* make us humans maladaptive. If “stereotypy” (to use a term explicitly used in one theorist’s definition of ritual) were ever a ritual virtue in some other place and time, it is, in the Darwinian universe that most encyclopedia-readers inhabit, most definitely a vice. Loss of postural and gestural diversity and flexibility would not stand us in good stead with Natural Selection, the reigning deity of the current, almost inescapable Darwinian myth. Loss of bodily flexibility, like loss of cultural and biological diversity, would jeopardize human health and longevity. If ritualizing implies rigidifying, we are courting earthly extinction rather than planetary salvation by engaging in it. So the answer to the question, “To ritualize or not?” depends on how we define ritual, or, if not that, then on which kinds of ritualizing we practice and which kinds we forgo.

Anthropologist Charles Laughlin and psychologist Eugene d’Aquili, along with their colleague John McManus, have articulated some of the strongest theoretical arguments in favor of ritual’s adaptive import. If they are right, ritualization is more natural (in the sense of having more survival value) than is non-ritualization. In their view ritual, which emerged evolutionarily along with encephalization, is crucial for both the control and the transformation of consciousness. Rites employ various driving mechanisms such as drumming, chanting, dancing, ingesting, ordeals, and privations as means of retuning, or returning balance, to the autonomic nervous system. Ritual activity facilitates the entrainment (penetration and embodiment) of symbols into the human system.

More specifically, ritual practices facilitate simultaneous discharge of the excitation (ergotropic) and relaxation (trophotropic) systems. Laughlin and company posit a drive toward wholeness in all biological systems, and consider rites a primary means for achieving both social and neuropsychological wholeness. They stop short of claiming that rites are the *only* means. Since they say many of the same things about both play and contemplation as they do about ritual, it seems that ritual is not the exclusive agent of wholeness, unless, of course both play and contemplation are conceptualized as kinds of ritual. In any case, for Laughlin and associates it is neither the “natural” nor the “supernatural” that takes precedence but rather the holistic. In the end, Laughlin, d’Aquili, and McManus espouse a wedding of what they call “mature contemplation” (in my view, a species of ritual activity) and neuroscience as the most holistic (in an older vocabulary, “natural”) form of consciousness.

Their claims are less appropriate to some kinds of ritual and more appropriate to others, especially those at the top and bottom end of the scale, for example, trance dance and meditation. These require, respectively, either sustained exertion or else the stilling of physical and mental activity. More than mainline worship and liturgy, these kinds of ritual activity evoke the extremes of the autonomic nervous system, thus facilitating the “crossing over” that these theorists treat as the primary virtue of ritual.

Another anthropologist, Roy Rappaport, is intent to restore ritual’s authority, hoping it can close the maws of several great beasts: desertification, ozone depletion, species extinction, and environmental degradation. Against the Goliath of quality-denying, “monetized” epistemologies rooted in cost-benefit analysis, which he clearly considers maladaptive, he marshals the slingshot of ritual, hoping its emphasis on complementarity and reciprocity can displace the forces of disintegration. Rappaport is more willing than most anthropologists to admit that the very idea of ecology is as much a religious conception as it is a scientific hypothesis. Ecological ideas encourage the preservation of the world’s wholeness in the face of pervasive fragmenting and dissolving forces. For Rappaport, the idea of an ecosystem, not just as a scientific hypothesis but as an active intervention, is a guide for how to behave in the world. He actively calls for ritual performance grounded in the concept of the ecosystem. For him, ritual performance is not merely a means for humans to illustrate ideas about the world. Rather, ritual is the way the world itself tries to ensure its own persistence.

But much ritual is in the custody of the so-called world religions. They claim to have a repository of wisdom, much of it ritualistic, that can help save the planet from ecological destruction. But the large-scale, multinational faiths have been slow to mobilize, and they are typically saddled with environmentally hostile or indifferent myths, ethics, and rites.

Religious leaders are now scouring the scriptures in search of images that might inspire ecologically responsible behavior. The big religions are defending their traditions against attacks that blame them for the sorry state of the environment. In self-defense, they launch criticisms of economic greed and human failure to exercise stewardship of the land.

The monotheistic traditions bear a large share of the blame, because of their entanglement in Western ideologies of natural domination and dualistic separation. The truth is that none of the large-scale religions has resources adequate to the crisis. None of the “world” religions is an Earth religion. The non-local religions are in no better shape than the multinational corporations. Because so much pollutes the spiritual environment, cleaning it up is every bit as urgent and challenging as cleaning up the physical environment.

Assuming religious leaders were to take a more creative and critical ritual initiative, what might an eco-rite look like? Clear-cutting in Thailand has become so extensive that monks began preaching about the suffering of trees and land. In the 1970s, after his ordination, Phrakhru Pitak noticed the deforestation around his home and the consequent damage to watersheds and local economies. He started to preach against the destruction but found that the villagers, even those who believed him, went home from temple services only to continue clearing the land. Moral admonition was not enough. So in 1991 he ordained a tree, wrapping it in monk’s robes. To down an ordained tree would be to kill a sentient being and incur religious demerit.

At first the monk led people in sprinkling holy water on the trees. Later he upped the ante by requiring village leaders to drink holy water in front of a statue of Buddha by a tree. This way, community leaders ritually enacted their identification with the tree, and thereby pledged themselves to its protection. Sometimes, posted on an ordained tree would be a sign saying, “To destroy the forest is to destroy life, one’s rebirth, or the nation.” Sincere Buddhists do not want to tamper with their rebirth.

This improvised ritualizing is now attracting upstanding citizens. As a result, the Thai debate is no longer purely political but also moral and religious. The metaphoric act of ordaining trees has made it so. If trees have Buddhanature, to saw one down is to slice yourself in half. Now, it costs moral and religious capital to lay low the ancestor-teacher trees. Ritual is a primary means of ensuring that moral behavior does not become merely moralistic, that instead, it is embodied and enacted.

Ritualizing and Anthropology

Ritual is a term rooted in nineteenth-century Western scholarship on the anthropology of religion that has been used to categorize and describe certain types of religious behavior. There is no single, universally agreed-upon definition of ritual. Nineteenth- and early twentieth-century scholars tended to define ritual as a patterned set of actions intended to bring about changes in the relationship between humans and supernatural agents, such as gods or spirits. In the late twentieth century, scholars began to view ritual more as a process than an object: a formalized response intended to bring about change that religions and cultures apply to a particular situation. Rituals are an important part of cultures and religions, and mark secular as well as sacred occasions.

Types of Rituals

French ethnologist Arnold Van Gennep identified two principal types of rituals, both tied to natural cycles: *rites of passage* and *rites of intensification*. Rites of passage involve transformations in the life cycle of an individual. They typically occur around times of personal transition, such as birth, puberty, marriage and death. Initiation rites for shamans, healers, priests and priestesses are also considered rites of passage. In some religions, rites of passage involve the temporary isolation of initiates from the rest of society. Among the Plains Indians in North America, for example, young men often underwent a period of fasting, physical trials and retreat during which they would seek the guidance of nature spirits, who would appear to them in visions offering wisdom. Since Amerindians generally viewed their relationship to nature as reciprocal and contiguous, obtaining the protection of spirit guides was an important part of attaining maturity. In other indigenous traditions, young people underwent initiation in groups. Among the Mbuti of Central Africa, young initiates were taken away from their villages to a men's house, where elders instructed them on hunting techniques and the ways of the forest spirits. During the period when initiates are isolated and undergoing instruction and testing, they are said to be *liminal*, or in a threshold state betwixt and between social categories. The liminal stage is characterized by social equality and a temporary suspension of everyday norms of behavior, a condition anthropologist Victor Turner called *communitas*. Usually, upon completion of the rite of passage, initiates are reunited with their communities in a ritual of reintegration that celebrates their new status. While rites of passage serve an important function in the life of the individual, they are also important for the community, in that they help groups come to terms

with changes in their members' life cycles. This is particularly true of birth and death rites, where the subject cannot participate fully in the ritual.

Rites of intensification mark important transitions in the life of a community. There are two types: *calendrical* or *year-cycle rites* and *rites of crisis*. Year-cycle rites center around important times in a community's seasonal calendar which often coincide with environmental changes – for example, the transition from winter to spring. They often mark crucial agricultural events such as harvest and planting times, or the seasonal migration of herd animals. Calendrical rites repeat yearly, and often involve a prolonged period of celebration which includes secular as well as religious aspects. There may be music, dancing, feasting and dramatic performances that enact myths associated with the seasonal cycle. Often, these celebrations are thought to be necessary for the continuation of the natural cycle. Rites of crisis, in contrast, are held in response to a crisis in the community, such as a drought, plague or other drastic event. In many religions, these events are often understood as being the result of disharmony between humans and nature. Rites of crisis serve to restore the relationship to a state of balance.

All rituals communicate through symbols, and many of these are rooted in the natural world. They act out important stories or ideas, often by bringing together a number of symbolic opposites in culture in a meaningful way. Participation in rituals helps communicate these concepts to the community, and brings the community together in recognition of their shared values. Because rituals enact important values, they can also become points of contention and strife, especially when religions are undergoing rapid change. Some rituals reverse social norms through a process called *symbolic inversion*, in which important symbols are literally turned upside down or mocked. Ultimately, though, even such rites of reversal tend to uphold the existing social system by demonstrating its limits.

Ritual and Nature

Since the early nineteenth century, scholars have recognized a relationship between rituals and the natural world. Among the earliest observers of ritual was the German linguist Max Müller (1823–1900), who theorized that rituals originated as poetic dramatizations of natural and celestial phenomena, especially what appeared to early peoples as the movement of the sun in the sky. Since early humans depended on the sun as a source of light and heat, and feared the darkness, Müller hypothesized that they developed rituals as a way of attempting to control these natural phenomena. Later, anthropologists such as Edward

B. Tylor argued that rituals were rooted in the belief that natural objects had a soul and could interact with humans, a notion he called *animism*. Tylor's disciple James G. Frazer (1854–1941) argued that rituals in all cultures enacted the death and resurrection of the divine king, whose life was connected to the fertility of the crops and herds and the prosperity of his people. Frazer's theory led to the emergence of the

myth-ritual school, a group of early twentieth-century scholars who applied Frazer's idea of death and rebirth not only to rituals, but also to many forms of folklore such as folktales, myths and legends, folk drama and even children's games, which they thought had derived from rituals. For the myth-ritualists, almost all forms of expressive culture enacted the seasonal cycle of death and rebirth of crops and vegetation. Despite many scholarly criticisms of Frazer and the myth-ritual school, these theories continued to hold sway until well into the mid-twentieth century.

By the 1960s, scholars were becoming more aware of how cultures were uniquely adapted to their environments. This led to the emergence of new ways of interpreting the relationship between rituals and nature. Anthropologist Roy A. Rappaport pioneered the idea that rituals could regulate cultures' relationships to their environment. In his study of the Maring-speaking Tsembaga in New Guinea, he found that a complex ritual cycle involving warfare with neighboring groups, the raising of pigs and the cultivation of gardens helped to maintain ecological balance, ensured a fair distribution of land and protein among people living in a territory, limited the frequency of fighting between neighboring tribes, and helped create alliances between groups. Rappaport's work inspired a generation of scholars to examine rituals' function not only in creating social cohesion, but also in ensuring that human groups did not exceed the carrying capacity of their ecosystems. For example, Gerardo Reichel-Dolmatoff examined the hunting rituals of the Tukano Indians of the northwest Amazon basin, in Colombia and Venezuela. He concluded that many of the prohibitions and rites surrounding hunting actually restricted hunters' activities in a way that ensured that the Tukano would not exhaust the supply of game in their ecosystem, and would be able to continue to survive within their territory without causing environmental degradation. The Tukano did not see themselves as existing apart from nature, and their myths and rituals ensured that humans could maintain a certain quality of life only if other organisms in their natural environment were also permitted to live and develop. In yet another study, O.K. Moore found that the divination practices of the Naskapi of the upper Labrador peninsula served to ensure that these arctic peoples hunted throughout their territory, rather than concentrating their efforts in only a few areas and thus overhunting the herds. These studies and many more like them helped to change anthropological perspectives on the relationship between nature and ritual by examining the ways rituals actually function in the material world. While scientists believe they may not function in the way their practitioners believe they do – namely, by regulating relations between humans and the supernatural world – they may, in some cases, have quite specific ecological and economic functions that maintain the balance between humans and their environment.

It is important to note, however, that not all myths and rituals function to maintain harmony between humans and their ecosystems, nor do all pre-industrial peoples ritually regulate their relationship to their environment. The Bible, in which Yaweh gives human beings "dominion" over nature, has been criticized as justifying the voracious exploitation of nature that has characterized the emergence of colonialism and

capitalism in the West. And archeologist Mark Raab has demonstrated that Indians living along the southern coast of California before colonial contact overhunted fish and shellfish to the point of causing their own famine and near-extinction. Therefore, the relationship of each ritual system to nature must be carefully examined before drawing conclusions about ritual's function *vis-à-vis* the natural world.

Rock Art – Australian Aboriginal

Aboriginal people of Australia have a rich heritage of carving and painting on rocks, extending back well more than 20,000 years. Rock art, Australia's oldest surviving art form, expresses the Aborigines' social, economic and religious concerns through the centuries. In the form of petroglyphs (carvings) and pictographs (paintings), rock art is found across the continent. It served a variety of functions, and provides the earliest illustration of Aboriginal beliefs, technologies and activities. Australia is a particularly rich region for rock-art research because it is one of the few areas where the art is still being produced, which has facilitated the work of anthropologists in collecting some of the myths and meanings associated with the art. We know that as humans, our relationship with the world is deeply affected by the images we use to understand and express our place in nature and the cosmos. By combining ethnographic field research and archeological findings we can begin to interpret the cultural significance of prehistoric rock art in Australia.

Various regions developed particular styles of art, and Aboriginal rock art is often classified by these main regional types. Continuity of motifs within regions and across time is attributed to the extreme conservatism of Aboriginal religion. Some of the earliest known Aboriginal rock art lies underground, in the limestone caves of the southern portion of the continent. Perhaps the bestknown depository of parietal designs is Koonalda Cave, where the markings consist of finger meanders (made by sets of parallel finger strokes executed on the soft and pliable areas of the cave wall) and incised lines scratched into the harder surfaces. The prehistoric use of torches in Koonalda resulted in deposits of charcoal near dense concentrations of the finger flutings. Associational dating with the charcoal indicates that this artistic development in Australia occurred about 20,000 years ago.

Another common type of rock art in South Australia is called Panaramitee after a site containing many petroglyphs of this classification. Panaramitee rock engravings are also found in portions of the Northern Territory, New South Wales, Tasmania, and Queensland. They were made by pecking away the dark, patinated outer surface that forms on exposed rocks, to reveal the lighter, unweathered rock underneath. Circles, tracks, tectiforms, and meanders predominate.

The Kimberly region in northwestern Australia offers interesting examples of the relationship between rock art and mythology. Aborigines claim that some of the paintings in the central Kimberly district contain the spirits of the Ancestral Beings known as *Wandjina*, the preeminent Ancestors in the religion of this region. When a Wandjina completed his Dreamtime actions he turned himself into a picture containing his

spirit and power. Each clan in the Kimberly region has a number of totemic species or objects associated with its Wandjina. Hence, in addition to paintings of Wandjina, many of the caves contain representations of kangaroo, eagles, fish, and various plants. A significant component of the Wandjina cult was the duty of each clan to retouch the paintings in its caves, thereby ensuring a supply of the natural species represented there. The Pilbara region of Western Australia has the largest concentration of petroglyph sites in Australia – perhaps millions of individual figures. The large numbers of human figures at these sites show a highly stylized and developed art form, and a great degree of creativity. Some are fairly accurate representations of humans with wellproportioned bodies, while others are biomorphs; part human and part animal, apparently representing Dream- ing beings.

The rock shelters of sub-tropical Arnhem Land hold an abundance of varied and skillfully executed examples of rock art. The two most general pictograph styles in Arnhem Land are the X-ray and Dynamic (sometimes called Mimi) paintings. Both tend to be basically naturalistic, yet their differences in form and subject matter are striking.

The Dynamic style is generally simpler in design than the X-ray art, yet its elegance is remarkable. The anthropomorphs depicted in the Dynamic art are Mimi spirit people, the beings responsible for teaching the Aborigines to paint. Dynamic-phase figures are often slender and shown in action – dancing, fighting, hunting, and running. They are monochrome paintings, and are said to have been made by the small Mimi spirits. X-ray pictographs, generally larger and polychromatic, are usually representations of people and animals, and unlike the Mimi paintings, are essentially static pictures. The X-ray art is so called because it illustrates not only the body of a subject, but some internal organs and skeletal features as well; the heart, lungs, stomach, and backbone of an animal are often depicted. One of the most pervasive and distinctive contexts in which this art was created was through the practice of increase rituals at sacred sites.

The pigments used to create these and other rock paintings throughout Australia were primarily derived from pulverized minerals, often mixed with a natural binder such as tree resin or animal fat. Various shades of red and yellow ochre were utilized, as well as white pipeclay and black manganese. Charcoal was used often, as were brushes, probably made of human hair, bark, feathers, or a twig chewed at one end to loosen the cellulose fibers.

Many of the rock shelters of Arnhem Land contain painted images considered of vital religious importance to the Aborigines. Since it was believed that the act of creating or retouching a painting could release the spirit of the subject, these acts were often considered a necessary component of ritual. The practice ensured the preservation of the paintings, but with the breakdown of many aspects of traditional Aboriginal culture repainting has ceased, and the designs are slowly fading away. There have been some historical examples of rock-art production in the region, and the artists claimed that the placing of clan designs in rock shelters is an assertion of rights over the site, as well as an effort to keep religious tradition alive.

Scattered around the vicinity of Laura in the southeast Cape York Peninsula of far northern Queensland are some of the best-preserved pictograph galleries of the world. Hundreds of adorned shelters and caves are scattered throughout the hills and valleys of this region. The majority of the Cape York rock paintings are human and animal motifs representing totemic animals, mythological beings, game animals, and an assortment of human figures.

In the Carnarvon Ranges of south-central Queensland, the stenciling of hands and cultural material objects was a highly developed rock-art technique. The stencils are often arranged in intricate patterns, which form large murals of a dozen or more paintings within a single composition. They were made by pressing a hand or object against the rock and splattering paint around it to produce a negative imprint. The expression of physical and spiritual connection appears to have been an important feature of this art.

Thousands of petroglyph sites occur near Sydney, where numerous exposures of sandstone form large, horizontal rock pavements. The petroglyphs depict humans and animals, mythical beings, tracks, weapons, and various non-figurative motifs. The most unusual feature of this art is its scale. The large, flat rock surfaces enabled the Aborigines to depict their subjects life-size or larger; there are human figures and kangaroos measuring over seven meters, eels over ten meters long, and full-size whales. The huge scale suggests that some of these engravings may portray mythological Dreaming beings.

Rock art in Australia was once a prolific expression of social and material culture and religious thought. Through rock art, the Aborigines communicated ideas and concepts that were at the center of a complex set of cultural beliefs. While symbolism is inseparable from Aboriginal art, it should be understood that rock art was essentially utilitarian; it was one medium through which the powers of the Dreaming were brought to bear upon everyday affairs.

Rock Art – Batwa/Pygmies (Central Africa)

The central African hunter-gatherer rock-art zone has been termed the “Schematic Art Zone” by J. Desmond Clark. Nearly 3000 hunter-gatherer rock-art sites have been found within this zone and some 90 percent of these comprise superimposed layers of massed, finger-painted, geometric designs. The other 10 percent of sites comprise highly stylized and distorted animal forms plus rows of finger dots. Both seem to have a history extending back many thousands of years.

While the geometric art always dominates, the two traditions go together as a pair: they co-occur across a huge area and are regularly found close by, but in only a handful of cases can they be found together in the same site. They seem to be kept near, but apart. Both are found in the same overall distribution, in an area that encircles the central African rainforests and includes: Angola, Zambia, Malawi, northern Mozambique, the Democratic Republic of Congo, southern and western Tanzania, western Kenya, Uganda, Congo and the Central African Republic. The dominance of geometric rock art makes this area immediately distinctive from the other hunter-gatherer rock-art regions in Africa all of which, by contrast, contain a high percentage of brush-painted animals, humans and human-animal confections. Little research has been conducted on this art tradition and it is therefore still poorly understood by comparison with hunter-gatherer rock art in other parts of Africa.

Throughout most of central Africa, the pre-farmer hunter-gathering populations have gone and they exist today only in the archeological deposits and in oral traditions. Modern central African Bantu-language speakers remember these people as the Batwa (a word that is used widely in eastern, central and southern Africa to refer to any autochthonous hunter-gatherer people). They are described by many groups, and across a wide geographic area, as “short-statured, dark-skinned and hairy.” In those areas close to southern Africa they are remembered as being immediately distinctive from the San (or Bushmen). The rock art supports this division: it is entirely different from San rock art. The dividing line between southern African San rock art and central African Batwa rock art follows the Zambezi River and the Anglo/Namibia border. The archeological remains also show strong divergence along this same line. The later Stone Age lithic technologies vary to such an extent that they have been given different names: those in southern Africa are known as the Wilton/Smithfield whereas those of central Africa

are known as Nachikufan. The cultural distinctions between central, southern Africa hunter-gatherers are thus profound.

The only surviving groups of central African Batwa are the so-called forest “Pygmies.” Genetic studies appear to confirm the archeological division between the ancestral heritage of these groups and that of the southern African San. Geneticists suggest great antiquity to the division between the San and the Pygmies, perhaps with a divergence in excess of 40,000 years. Pygmy groups are known to have occupied many sections of the central African “Schematic Art Zone” even into historical times, and it is probable that the full former distribution of these groups can be recognized from the distribution of the art. Certainly, elements within recorded Pygmy traditions help us to understand central African rock art.

Pygmy traditions, such as those recorded by Colin Turnbull amongst the Mbuti, are dominated by two major ceremonies. The Mbuti call these *molimo* and *elima*. *Molimo* is organized by men and *elima* by women. Both ceremonies traditionally take place in a clearing in the forest and involve singing around camp fires for night after night, sometimes for as long as a month. *Molimo* is often held after the death of an important member of the group or in the case of a violent argument; *elima* usually marks important women’s occasions such as coming of age. Turnbull describes how the songs in both ceremonies seek to bring out the spirit of the forest. In *molimo* the spirit of the forest literally comes out and its unearthly song can often be heard encircling the campfire in the darkness (the song is in fact sung by a boy through a special *molimo* pipe).

Turnbull argues that the purpose of calling out the spirit of the forest in these ceremonies is to restore harmony within the camp and the forest. He argues that the Mbuti see this state of harmony as essential to allowing the dead to be released back to the forest and to giving health and fertility to the girls. Smith and Blundell argue that it is these same concerns that underlie central African Batwa rock art. The stylized animal depictions mark the symbols and concerns of the ceremony of *molimo* (specifically the calling of the spirit of the forest) and the geometric designs represent the symbols and concerns of *elima* (specifically fertility and rain divination). They argue that this is why the two arts are found locally separated, and yet are together within the landscape. The arts were made by different groups within the same society and, together, they form a conceptual whole.

Rock Art – Chewa (Central Africa)

The ancestors of the Chewa and Nyanja peoples of central Africa were among (and adjacent), the most prolific of Africa's Bantu-speaking farmer rock artists. More than 400 Chewa rock-art sites have so far been found spread across central Malawi, eastern Zambia and neighboring areas of Mozambique. Nearly 70 percent of the known sites fall within the Dedza-Chongoni hills of Malawi and it seems that this was a core area for Chewa art.

Chewa rock art divides into two separate art traditions: the art of nyau and the art of chinamwali. As is typical of rock-art traditions made by Bantu-speaking peoples, the primary color used is white and this is applied thickly by daubing. In rare instances where the art is especially well preserved, black finger-painted decoration may be seen executed over the primary white design. The white pigment is a form of powdered clay, which can be dug out of most riverbeds in this area. The same pigment is used in traditional house decoration today. The black pigment is powdered charcoal. Both pigments seem to have been mixed using only water, as neither is tightly bonded to the rock surfaces. Rock engravings (also known as petroglyphs) are unknown in these traditions.

The art of nyau is a tradition belonging to Chewa men. Nyau rock art is comparatively rare and fresh-looking when compared with chinamwali rock art. Only a few dozen sites are known. It depicts a range of masked men and, in particular, larger animal basketwork figures. These are readily recognizable as the elaborate masked characters that still perform in the ceremonies of the nyau closed association. While the subject matter of the art is known, the art is no longer created today nor is the rationale behind it remembered.

It has been argued that the nyau art tradition belonged to the specific historical context of the nineteenth and early twentieth centuries, a time when nyau was forced to become an underground movement because of its suppression by Ngoni invaders, missions and the colonial government. According to this explanation, the art served as a mnemonic device, helping to teach young initiates about the construction and meaning of large nyau structures that could not be made in this troubled time. The art went out of use when the suppression of nyau ended and initiates could once again learn by making and using the real structures. The need for the rock art was thus removed.

The art of chinamwali is far more numerous and, judging by the many layers of superpositions – more than a dozen at some sites – it is a tradition that has a far

greater antiquity than nyau art. It seems likely that this tradition of art has been passed down from the time of the earliest ancestors of the Chewa in this region, more than one thousand years ago. This, therefore, is traditional Chewa rock art. This art has been linked to Chewa women and to the girls' coming-of-age ceremony: chinamwali. The painted symbolism is thought to revolve around concepts relating to water and fertility. It contains many instructive messages that teach and remind those attending chinamwali how to behave and conduct themselves.

Similar designs to those in the rock art are modeled in clay and used in chinamwali and similar ceremonies in a number of places within central Africa. These designs each have a name, a dance and an instructive song and the image helps the young girls to remember the varied and complex teaching of the ceremony. The subject matter of these designs and their form suggest close parallels with Chewa rock art. It seems likely that the images in the rock art were also linked to song and to dance. Chinamwali rock art is no longer created today, but some of the shelters containing this art are still used for chinamwali ceremonies. There are indications that the secret meanings of many of the designs are still understood, but there has been no published confirmation of this to date.

Rock Art – Hadzabe/Sandawe (Eastern Africa)

Within central Tanzania is a localized tradition of brushpainted hunter-gatherer rock art that stands apart from the predominantly finger-painted geometric rock art of other parts of central Africa. The southern boundary of this art follows the southern limits of Kondoa and Singida districts and the northern boundary is Lake Eyasi. The length and breadth of this distribution does not exceed 200 kilometers. This art is by far the most regionally confined of all African hunter-gatherer rock arts. Within this same region is a finger-painted rock-art tradition executed in yellow/white. This art was made by Bantuspeaking farmer groups within boys' initiation ceremonies. (I am concerned here only with the older hunter-gatherer art.)

The brush-painted hunter-gatherer art of this region has been known since the early 1900s, but was made famous by the work of Ludwig Kohl-Larsen, Henry Fosbrooke, Eric Ten Raa and Mary Leakey. The art contains depictions of a wide variety of animals and a few birds and reptiles. It is painted in an unusually varied collection of manners of depiction ranging from outline, through linear, dotted and gridded fills, to partial and fully filled forms. Humans are depicted in these same manners in a range of standing, bending and “floating” postures, sometimes with bows, and often with large and bizarre head forms that may or may not reflect the wearing of headdresses. A few humans are painted with animal heads. Early researchers tried to sequence the manners of depiction, but more detailed recent studies by Fidelis Masao and others have found that the proposed sequences are flawed. There are too many conflicting overlays when one collects together the evidence from a large number of sites. It now appears that variety in manner of depiction is one of the characteristics of this art tradition.

The distribution of this art matches closely the historically known distribution of the only two click-speaking groups in eastern Africa: the Hadzabe and the Sandawe. It is widely believed by researchers and claimed by the groups themselves, that it was the ancestors of the modern Hadzabe and Sandawe that made the rock art. There has been much debate on the relationship between these groups and the southern African click-speakers such as the San (Bushmen). Linguists now see the languages as highly divergent and recent genetic evidence suggests that these groups may have diverged as long ago as 70,000–100,000 years before the present. These are therefore two of

the oldest populations on Earth and the fact that they both speak click-languages is suggestive about the nature of the first languages.

As with most African hunter-gatherer rock arts, it appears that the art was part of traditional religious practice. Ten Raa, working among the Sandawe, records three instances in the mid-twentieth century when he witnessed Sandawe people creating rock art. Through this personal experience he connects some of the art with hunting magic and some with an ecstatic cult called simbó. In simbó, dancers use vigorous movement and hallucinogenic beer to attain an ecstatic state. In this state the Sandawe say that people become lions. David Lewis-Williams has argued that many of the bizarre head forms, many of the postures, such as the floating posture, and the depiction of therianthropes (animal-people) link much of the central Tanzanian rock art to this ritual experience of altered states of consciousness.

Rock Art – Northern Sotho (Southern Africa)

In addition to its celebrated hunter-gatherer rock art made by the San (or Bushmen), southern Africa has a number of later rock-art traditions made by Bantu-speaking farmers. The most extensive of these traditions in terms of area covered and number of sites is the rock art of the Northern Sotho. This art is found spread across the greater part of northern South Africa.

Northern Sotho rock art is easily distinguished from San rock art both by its color and by its form. It is predominantly executed in white and was applied thickly onto the rock by finger (in contrast to the polychrome brushwork paintings of the San). Occasionally, red and black pigments are also used, usually as decoration over the primary white design. The white used is a form of powdered clay found in many riverbeds in the area. The choice of white as the dominant color is characteristic of rock-art traditions belonging to Bantu-speaking agriculturists. Reflecting this, these arts have become colloquially known as the “late whites.”

Northern Sotho art is found in its greatest concentration in the more remote hill areas of Limpopo Province, South Africa. Areas particularly rich in this art include the Soutpansberg and Waterberg mountains as well of the Makgabeng plateau. In total, nearly 300 sites with Northern Sotho rock art are currently known.

The art divides into an earlier and a later period. The early art depicts a range of wild animals such as elephant, zebra, lion, rhino, kudu, hyena and hippo, but the dominant subject is the giraffe. Almost all of the art is concealed in large rock shelters in remote and secluded mountain areas. These places are the traditional venues for the secretive Northern Sotho boys’ initiation practices. Elders in some areas acknowledge a link between this art and tradition initiation practices, but they state that, while some of the painted sites are still used for initiation ceremonies today, the tradition of creating rock art has ceased. It seems that each painted animal carried a particular instructive and symbolic message within the boys’ initiation ceremony and indications as to how this symbolism operated survive in the continued use of animal symbolism within modern initiation practices. Within the modern initiation lodge, for example, the fire is sometimes referred to as the lion cub, the magic tree as the giraffe, the cairn of stones as the hyena and the structure under which food is placed as the elephant. Many of the instructive songs learnt by the initiates are also concerned with these same animals. The secret teachings in these songs are often unclear to the initiates,

but concealed within this complex structure of animal imagery are social messages that become progressively understood through life with age and experience.

In the latter half of the nineteenth century, the rock art underwent a dramatic change. The intrusion of white settlers into the region brought taxes, land clearances and conflict. A series of wars to subdue Northern Sotho traditional leaders left many homeless and destitute. At this time whole communities fled to the hill areas. Many of the old initiation sites became refuge settlements. A new form of rock art developed at this time dominated by depictions of steam trains, soldiers, settlers and guns. The images capture a people's tragedy, but served a more important purpose. They poked fun at the troublesome new intruders and through this pointed humor served to overcome some of the terrible stresses of the times. The art marks the origins of protest art in northern South Africa – ordinary people protesting their right to land and selfdetermination, and fighting the destruction of their traditional structures and cultural values.

Rock Art – Sintu

Throughout much of south-central and southern Africa there extends a finger-painting tradition associated with Bantu-speaking groups. In the countries of Zaire, Zambia, Malawi, Angola, Botswana, Zimbabwe and South Africa, this art form most often occurs where there are rocky outcrops on boulders and in shelters and caves. An expression of a primal religion, this art form can be considered a cultural complex, which is both religious in character and strongly linked to nature. In this artistic tradition we find highly schematized depictions of abstract zoomorphic and anthropomorphic figures, fantastic beings, abstract symbols, signs and smears which can be linked to human sexuality and procreation. It is also associated with traditional rulers, rainmaking, initiation, diviners, secret societies, and to society in general. The overriding concern, however, is for the fertility of man, beast and land, all of which impinge directly upon human society and welfare.

This artistic tradition differs greatly from Khoisan rock art in execution, intent and meaning, having been painted with a finger, or perhaps a stick, unlike Khoisan brushwork. It also has a much wider distribution extending from East Africa down to the northern South Africa, with isolated examples evident as far south as the Eastern Cape, yet it is less understood and far less researched. Early dates of 1800 BP have been suggested for the oldest depictions, but they may be older.

Sintu rock art is highly symbolic, reflecting and reinforcing ritual action, group structure, beliefs regarding nature and the wider cosmos. The manner in which the motifs and symbols are perceived and manipulated reflect people's attempts to manage natural and supernatural forces that impinge upon their physical and conceptual worlds.

In many parts of Africa caves and shelters are favored by ritual specialists for rainmaking and other religious activities, and many of those shelters given ritual status are decorated with paintings. This is almost certainly linked to widespread beliefs in Bantu-speaking Africa that holes, hollows and rock shelters are entrances to the ancestor-world and that, through these special points, communication with the ancestors and deities is possible. Supernatural beings are held to control the elements, and so it is here that appeals are made and offerings offered. Painted shelters are often used for rainmaking, thus linking sacred points with climatic phenomena.

Naturalistic and abstracted zoomorphic symbols, such as crocodiles and snakes, are associated with concepts of kingship, divinership, initiation and rainfall, but most importantly, with fertility and procreation. Many such motifs not only occur in the finger paintings but are also used as educational diagrams during initiation.

Bantu-speaking groups stress institutionalization of passage in which initiation is an elaborate affair emphasizing fertility. Not only do finger paintings form part of this iconography, but so also do schematic and naturalistic figures, masks and costumes of fantastic beings. In these societies, greater emphasis is placed upon hunting than among patrilineal cattle-complex groups. Here the killing of prey is associated with male sexuality, indicating that wild animals, as a communal concept in finger paintings, are yet another expression of fertility.

As a rule, African worldviews are unified, phenomena within them fading into one another, creating a holistic structure of both the physical and conceptual worlds, so that each becomes indistinguishable from the other.

The art expresses a liminality of interaction among the principles that govern the mundane world. Here, in shelters and caves, fantastic beings live and are represented in the rock art and iconography, often with exaggerated features, such as exceptionally elongated necks, as an expression of their liminal status.

Diviners are prominent figures in finger paintings. They perform the rainmaking and fertility ceremonies and are the masters of initiation. They communicate with the ancestors in caves and shelters. Like the initiation event, and like the shelters, diviners are liminal, and it is their very ambiguity that entitles them to control the elements through the ancestors.

It is significant that the finger-painting tradition is widespread among groups who depend upon hunting and upon the fertility of game. The preeminent threats to hunting-based agrarian economies are drought and other natural disasters that reduce animal and plant populations. The positive expression of fertility may be seen as the ultimate symbol of well-being, and a manifestation that the social and natural order are operating smoothly. These conceptual associations permeate throughout different levels of society, and are believed to be reflected in the fertility of males and females entering adulthood.

Rock Art – Western United States

Scattered across the immense and often empty expanses of the desert southwest in North America is a vast collection of imagery pecked, rubbed, or scratched (commonly referred to as petroglyphs) and sometimes painted on stones: the legacy of a people long gone. These ancient, mystifying images, collectively termed rock art, are the portrayal of a world we can now only faintly imagine, a representation on stone of the experience of America's first human discoverers, the hunter-gatherers of prehistory.

Although the Bering Strait theory of migration is anathema to certain tribes of Native Americans, evidence continues to surface to support this idea; also, the very likely ocean routes by boat must be more strongly considered. The indisputable fact is that people did come, many great waves of them, by land, by sea, from many different origins. The various waves of migration streaming across the land bridge brought with them not only their tools for survival and their meager possessions; they also brought their ideology, their customs and beliefs, and their ancient forms of religion: animism couched within a framework of shamanism. Many of their rockart images, though not all, were related to shamanistic themes, and images of birds are especially conspicuous; “. . . birds are the most common and most obvious symbols of shamanic transformation and magical flight” (Hedges 1976: 84). And in this myriad of imagery, if we pause and look closely, we can see the expression of “art and religion, twin mirrors of human thought” (Turpin 1994: 76).

Bird images in particular stand out in the iconography of shamanic rock art, whether in the explosive beginnings of Paleolithic cave art or the prehistoric rock art of the hunter-gatherers of North America. From the “bird-on-a-stick” image in Lascaux cave to the Egyptian *ba*, to the paintings along the Pecos River, the bird has appeared repeatedly as a metaphor for the human soul, and “There is no other symbol of the shaman's power of flight, his most essential magic capability, as logical and powerful as that of the bird” (Wellman 1976: 101).

These early people wandering across North America were completely immersed in the natural world; it sustained them and it destroyed them, and from its deeper dimensions they acquired their magic and their power. Religion, magic, and spirituality were expressions of the same thing.

The close relationship between men and animals, and the shaman's ability to share in the occult powers of the animal world is one of the major messages of shamanism in general . . . Birds in particular symbolize shamanic flight. Becoming a bird allows one to take the ecstatic journey to sky and beyond, and in many places in the world, bird elements are commonly incorporated into shamans' costumes. In rock art, birds fly over

and around the heads and toward and away from the bodies of the anthropomorphic forms (Schaafsma 1994: 53).

Some of the rock-art styles, especially the older, painted ones, are noticeably replete with bird imagery, often in conjunction with snakes. (The overworld and the underworld.) This is especially true of the Barrier Canyon style of south central Utah and the Pecos River paintings of southern Texas and Northern Coahuila, Mexico. Other styles, such as the petroglyph images in the Wind River Range, Wyoming, are noted for their “owl-men” or “birdmen,” and the Basketmaker II rock art of the early Anasazi (Colorado plateau, 200 B.C.E.–400 C.E.) has hundreds of images of anthropomorphic figures with ducks on their heads, or, more commonly, ducks as heads.

These bird images can be so prevalent in certain styles that they become the central theme.

One of the core beliefs of modern shamanism, the “bird-like flight of the soul” (Furst 1977: 2) is a major theme of the Archaic Pecos River pictographic style, an elaborate body of polychrome art painted by hunters and gatherers that occupied the arid lands of southwestern Texas and northern Mexico. Depictions of ascending, descending, and soaring anthropomorphic figures are augmented by a number of flight metaphors, such as birds, wings and feathers . . . These many illustrations of magical flight confirm the importance of religious ecstasy in Pecos River ritual . . . In fact, it can now be said with some security that magical flight, derived directly from the trance experience, is the dominant theme in Pecos River style art (Turpin 1994: 73, 82).

Among the petroglyphs of Pueblo peoples of New Mexico are numerous portrayals of the roadrunner, and sometimes just its odd, elongated, X-shaped footprint is displayed as a metaphor for the whole bird. “The mere presence of the roadrunner track in prehistoric rock art was strongly indicative that the roadrunner and/or its track had religious significance in the prehistoric southwest” (Schaafsma 1989: 26).

Owls, parrots, cranes, ducks, roadrunners, turkeys, eagles, quail, herons, woodpeckers, hummingbirds, hawks, to name only a few, were part and parcel of the prehistoric pantheon. And while “birds of all kinds were associated with shamans,” (Whitley 1994: 25), certain birds held particular significance to specific groups of people. The duck, for example, continues to be revered in the Pueblo world as a messenger to the spirit world. Likewise, the prehistoric Pueblo world held the duck in great esteem, as is evidenced not only in the many images for ducks *per se*, but notably in the Basketmaker II anthropologic images known as “duck heads.”

The duck is a magical being and a great shape-shifter (these figures often have distended hands and feet, an indication that shape is being transformed); it can walk on land, lay eggs in the rushes at water’s edge, and tend to its nest in an earthly way. It can also fly up into the sky where the cloud-beings live, its power of flight so easy, so natural. And, most magically of all, not only can it swim and float on water, it can also dive under the water – and come back up again! To a people who likely saw puddles and ponds as an entryway to the underworld, this must have seemed the epitome of magic.

Other water birds such as cranes or coots or herons (or their footprints) are also widely represented in the prehistoric rock art of the desert southwest, not surprising in cultures that were trying to eke out an existence in places where the rainfall was often far below the prerequisite 14 inches a year that are considered minimum for human survival. With the idea of supplication for rain, it is no wonder that water birds images are so prevalent, as are those of clouds, frogs, tadpoles, and fish. Images of turkeys were often associated with rain also, as these birds tended to reside in the mountains where there was more water, next to springs and streams, just as they do today.

It is a logical extension of bird imagery that bird feathers and bird parts served as a metaphor for the whole bird, and there is a long tradition brought forward into the present of using bird feathers in connection with sacred ceremonies, altars, prayer bundles, dances and rituals, and shamanic costumes. "Of all life forms found as decorative motifs in Pueblo art, the bird has undoubtedly enjoyed the most widespread use. Bird designs occur abundantly on prehistoric and historic culture materials from the Pueblo region" (Wellman 1976: 97).

Bird imagery in the Rio Grande style rock art is quite often generic (depending on the site); that is, the idea of birds is presented, though no effort has been made to suggest a specific kind of bird. And just as often, a specific bird image may dominate a site, such as raptors in Tenabo, New Mexico, the duck-men of the San Juan River area in southeastern Utah, the star-faced birds of prey in the Galisteo Basin in north central New Mexico, or the owl-men of Dinwoody Lakes, Wyoming.

And there are some sites that are wonderfully and inexplicably anomalous, such as the premier rock-art site of Three Rivers, in southern New Mexico. This remarkable site, with its many thousands of petroglyphs pecked into the basaltic lava along a hogback rising above the desert floor, hosts at least fourteen separate, identifiable species of birds, as well as birds with eggs in their bodies, bird migrations, seasonal portrayals and even a bird embryo, where the oval shape of the rock forms the egg. Most of the images are portrayed alone, and a few seem to have an overt shamanic context, though certainly the wide variety of images has generated numerous, often conflicting interpretations.

Unraveling the mystery of the many different bird species represented at Three Rivers is an appropriate metaphor for the study of the larger world of rock art. Not only by learning to live with the mystery without having to explain it rationally on our own terms, but also by accepting it as the essence of the magic inherent in rock art, and learning, each in our own way, how to celebrate (and protect) that mystery, may we come into a true contact with the many people who left them there so long ago.

Rock Climbing

Can rock climbing be understood as a religion? As a practitioner and a scholar, I think it can. Surely it entails a sensation of transcendence, an experience of raw nature, and calls forth a kind of reverence. Climbing offers a respite from the constraints of the horizontal world, recreating the *axis mundi* with each new ascent. While such sentiments convey aspects of what I feel when I climb, they serve only to obscure what I see as a scholar. As much as I'm prone to romanticizing my choice of leisure pursuits, here I want to approach climbing with a critical eye, still under the broad category of religion. This entails a shift to ritual. If we view climbing as ritualized behavior, we move beyond platitudes and speculations about the "beliefs" of climbers to analyze the social processes and practices they perform.

Climbing is almost wholly ritualized. This will become readily apparent to anyone who attempts to invent the sport *de novo*, as I did in my hapless early teenage years.

Armed with a bike lock, leather gloves, and an old sailing line, my friend Dan and I decided to "go climbing." Before we had much of an opportunity to kill ourselves, Dan and I were approached by some "real climbers" who, while chuckling the we-know-better laugh, took us under their wing and initiated us into the esoterica at the heart of the sport. In language and gestures meant to close the gap between our ignorance and their "reality," we were taught about the acquisition and use of proper ritual paraphernalia (ropes, carabineers, and anchors), appropriate regalia (climbing boots, designer clothes), ritual speech ("on belay"), sacred texts (guide books and various "how to" texts written by "founding fathers"), ongoing revelation (climbing magazines), sacrificial rituals (leisure blood letting by way of cuts and bruises – "badges of honor" – and the occasional involuntary corpse offering), salient ethnic distinctions (sport climbers, traditional climbers, alpine climbers), relevant ancestors and deities (local heroes), heretics (heroes from somewhere else), and most importantly, levels of salvation (grades of difficulty) and ethics (aesthetics – "good style"). More than this, we learned that "real climbing" is established around certain pilgrimage sites (Yosemite being Mecca and Jerusalem both), and only the apostate (independently minded climbers) or the visionary (sponsored climbers) venture beyond the sanctioned and sanctified cathedrals. However, meeting the needs of practitioners who can't always and everywhere engage "pure tradition" (going climbing), climbers have invented traditions to match their late capitalist predilections (climbing gyms with espresso bars and interactive websites that successfully reproduce the social milieu – which is garden-variety, pecking-order calibration – of the "really real").

Now, lest my critical view be taken as cynicism, let me point out the positive attributes of climbing as ritual. There is more *communitas* in climbing circles than there are bad dissertations on liminality – which is to say heaps. Climbing is about bonding, and bonding quite beyond the structures and constraints of everyday life. If there was ever “serious play,” this is it. At the level of rope mate, trust is paramount and all ascents are dually authored and doubly experienced. Beyond the sacred duty to one’s partner (holding his or her rope), climbing bonds extend like fractals, taking in ever-greater numbers of people yet linking them in the most intimate ways. Moreover, the very ritualism of climbing is so explicit and marked that it constitutes the primary identity of most adherents. This makes climbers remarkably visible and sympathetic to one another (intra-ethnic strife aside). Thus, to speak personally, I am certain that I have more in common – in terms of passions, appetites, ideals – with climbers from, say, Thailand, than I do with my neighbors. So it is that climbers can travel the world and have ready-made communities waiting to accept them. So, while climbers fashion themselves as radicals, independents, and iconoclasts, what I

find revealing in our ritual analysis is that it is precisely the sub-cultural homogeneity of climbing – produced and reproduced through ritual practices – that renders climbing the social phenomenon it is.

Turning to the sharper edge of my critical knife, I want to address the relationship of climbers to nature by way of exposing one particular class of rituals to analysis: the first ascent. Climbers most often take the first ascent to be the epitome of the sport. It represents the “best and purest” form of climbing. Adventurous, bold, committed, visionary, self-less: these are common ways first ascensionists fashion themselves, and most climbers endorse this discourse through consumption of it. As a first ascensionist myself, I’ve participated in this rhetorical economy, and I think many of the claims and aspirations surrounding first ascents are sincere and harmless. However, I would insist that the quest for the perfect route (climbing’s Holy Grail) by climbers as a whole and the quest for ego gratification by individuals have caused climbing to manifest itself in rather imperial ways. New climbing areas are sought with the fervor of New World explorers, and the consequences to nature (and sometimes natives, as with disputes between climbers and Indians at Devils Tower and Cave Rock attest) are similar in effect, but certainly not in scale, to those of their symbolic predecessors. Trails are cut, vegetation is removed, machinery bolts are drilled into the rock for anchors, erosion exacerbated, and litter is left by climbers “developing” new climbs.

I would also call attention to symbolic features of first ascents that strike me as dubious and revealing. These are signaled by the metaphor often chosen by climbers to describe establishing a first ascent: authorship. Climbers speak as if the act of climbing a rock somehow brings it into being – and so it does, for a certain social world. Beyond this, authorship is viewed to convey moral possession of the route to those who established it. In other words, subsequent climbers are to repeat the route by way of the standards of the first ascensionists, and any modification of the route (the addition of new anchors, for example) requires consent from its “authors.” Moreover,

first ascensionists very often understand their act as one that confers entitlement in another sense. Quite literally, climbers have a long tradition of claiming the right to naming based on the first ascent. Even if a rock feature had a name before an ascent, climbers will re-christen the rock upon climbing it. And, in ways reminiscent of the Reformation, climbers will, on occasion, dispute the legitimacy of an ascent, registering their view by climbing it themselves and renaming it upon success. Route names enter climbing discourse swiftly and indelibly, eventually becoming recorded in guidebooks, often along with the “author’s” name. In this way, first ascents are perhaps best viewed in terms of apotheosis – human beings reaching for the gods in order to become them. As with so many human projects to transcend our limitations, in the game of climbing nature often becomes a means to our ends – even while we purport to be worshipping it.

Yet, if we grant certain ego needs and failures to our kind, perhaps we can view climbing – and things like it – as simultaneously muddled and miraculous. On the latter side, climbing, for all of my skepticism, still affords the chance to gain a celestial view from a terrestrial perch. Doing so, climbing allows for an oceanic experience that inspires a caring rather than a conquering attitude toward the rock. And it must be said that within the climbing community there has always been a vocal environmentalist element. These climbers – from the very beginning of the sport – have maintained a “clean” ethic, seeking to leave no trace on the rocks they ascend. Moreover, their sensibilities extend to the broader context of public land use. Such climbers and the action groups they form and support have been instrumental in advancing low-impact approaches to nature.

Rolston III, Holmes (1932–)

Leading environmental philosopher, ethicist, and theologian, Holmes Rolston III is widely recognized as the “father of environmental ethics” for his central role in developing environmental ethics as a modern academic discipline. Throughout his distinguished career, he has helped make explicit the ethics of nature that have been implicit in philosophical and sacred writings since ancient times. Born in the Shenandoah Valley of Virginia on 19 November 1932, Rolston’s multidisciplinary educational career included a childhood spent in contact with nature, an undergraduate degree in physics (Davidson College, 1953), a divinity degree (Union Theological Seminary, 1956), a Ph.D. in theology (University of Edinburgh, 1958), and later a masters in philosophy of science (University of Pittsburgh, 1968). He wrote the acclaimed books *Philosophy Gone Wild* (1986), *Environmental Ethics* (1988), *Science and Religion: A Critical Survey* (1987), *Conserving Natural Value* (1994), and *Genes, Genesis and God: Values and their Origins in Natural and Human History* (Gifford Lectures, University of Edinburgh, 1997– 1998) (1999). He edited *Biology, Ethics, and the Origins of Life* (1994), and in 1979, helped found the now-refereed professional journal *Environmental Ethics*. Additional works include 80 chapters in other books and over 100 articles, a number of which have been used in college courses and have been translated into at least a dozen languages. A founding member of the International Society for Environmental Ethics (1990) and delegate to the

United Nations Conference on Environment and Development (Rio de Janeiro, Brazil, 1992), Rolston has lectured on all seven continents, consulted with dozens of conservation groups, received numerous awards including the 2003 Templeton Prize for Progress Toward Research or Discoveries about Spiritual Realities, and currently serves as University Distinguished Professor of Philosophy at Colorado State University, his professorial post since 1976.

For four centuries following the Enlightenment and the scientific revolution in Europe, Western philosophy promoted an almost exclusively anthropocentric focus, perceiving nature as mechanistic and only having value in relation to human uses and preferences. In the early 1970s, Rolston acknowledged that nature had instrumental or use-values for medicine, agriculture, and industry. He went further, though, recognizing that nature had other values – aesthetic, ecological, educational, historical, recreational, scientific, economic, and religious – as well as intrinsic value. Fundamentally, he argued, organisms (including plants, animals, and humans), species, ecosystems, and the Earth have intrinsic value just for the fact that they have evolved and survived for millions and billions of years. Each level also has systemic value (value associated with

processes and capacity to produce) that is interwoven with instrumental and intrinsic values. Rolston posits that for all of these reasons and more, humans have ethical obligations to the environment.

An ordained Presbyterian pastor like his father and grandfather, Rolston frequently draws on the Bible, emphasizing in writing and in lectures its implied guidance on environmental ethics. He likes to think of the “swarms of living creatures” brought forth from land and sea (Gen. 1:20, 24) as early references to biodiversity and notes that when God reviewed the display of life he found it “very good.” According to Rolston, the story of Noah’s ark illustrates that God wills for species to continue (Gen. 6:19) and the rainbow is God’s sign re-establishing “the covenant . . . between me and you and every living creature that is with you, for all future generations” (Gen. 9:12–13). In addition to the ecological, intrinsic, aesthetic, instrumental, and religious values implied in Genesis and Matthew 6, Rolston highlights biblical passages that speak to economic and other values, as well as human responsibilities.

Rolston promotes the idea that ethics are for people, but not only about people. To whom much is given, much is required, and humans have a rich and ancient inheritance, the Earth and biosphere, to steward. Rolston says that perhaps we make our deepest error “forever putting ourselves first, never putting ourselves in place in the fundamental biosphere community in which we reside” (2000: 83). Through his writings and lectures, he attempts to instill a more profound sense of civic and environmental responsibility, calling upon people to live up to their duties as *Homo sapiens*, the so-called wise species.

Roman Britain

The inhabitants of Britain at the time of the Roman invasion in the year 43 were Celts. Archeological evidence from temple sites coupled with place-name evidence and inscriptions dating from the Roman period emphasize the importance of features in the landscape such as hills, springs and groves of trees, the last associated with the priestly caste of the Druids whose name is thought to have been derived from the oak tree. Although the art of the pre-Roman period was largely abstract, it included striking images of animals, among them horses, bulls, stags, boars, ravens and waterfowl, all of which were evidently held sacred.

The infusion of Roman ideas did not in any way weaken this empathy with nature, for the Roman cult had long peopled the countryside with its own deities of the wild. Thus the sanctuaries kept holy in the Iron Age often continued to be religious centers even if the deities venerated there were now addressed in Latin and assumed a Graeco-Roman appearance. At Buxton in Derbyshire was a temple dedicated to Arnemetia, whose name derives from the word “nemet” which means a sacred grove. There was another “nemet” at Nymphsfield in Gloucestershire, where the word has even been preserved in the modern English name; it may have been attached to an Iron Age and Roman-period sanctuary, recently excavated and located just over the parish boundary at Uley. A final example is preserved in the name of a deity venerated at Nettleham, Lincolnshire called Mars Rigonemetos – Mars, King of the Sacred Grove.

The name of Buxton was formerly *Aquae Arnemetiae*, showing that *Armenitia* was a goddess of a spring as well. Even more famous was *Sulis Minerva* of Bath, *Aquae Sulis*, who presided over thermal springs. Another goddess-nymph, called *Coventina*, had a more local cult at Carrawburgh just outside one of the forts on Hadrian’s Wall. Sometimes the name of the presiding deity of a spring has been lost but archeology has revealed a complex of temples at Springhead in Kent that attest the same feeling for flowing waters. It is likely that the sources of many rivers had sanctuaries and the actual names of some rivers imply veneration, for instance the River Dee (*Deva*) in Cheshire, whose name is cognate with the IndoEuropean word for goddess; the river gave its name to the fortress at Chester.

Many temples lay on hilltops or ridges, including the temple at Uley mentioned above, and those at Lydney, also in Gloucestershire but on the northern side of the River Severn; Maiden Castle, above Dorchester, Dorset; Pagans Hill, Somerset; and Lowbury Hill, Oxfordshire.

Such sites, placing the gods firmly in the natural world, find their reflection in furniture and objects connected with cult, as virtually all deities are connected in

some way with the beneficence of nature. Jupiter is often attested by columns that are embellished with scale-like ornament perhaps representing the bark of trees. A capital from one of these, from Cirencester, Gloucestershire, has half-length figures of Bacchus, his consort Ariadne, a Silenus and a figure of Lycurgus with a vine, all emerging from the fronds of the richly embellished Corinthian capital. Another column, represented only by an imbricated shaft from Wroxeter, Shropshire, has inset figures of Bacchus and a cupid. Bacchus was Jupiter's son and seems to have been regarded as a major power in untamed nature. Here, on the two columns cited, he literally supports the majesty of Jupiter himself.

Mercury, god of flocks and herds, was popular among pastoralists. He was venerated at a number of temples including one at Uley, Gloucestershire, where one image shows him as horned, thus in a sense identifying him with the beasts he looked after.

A similar theriomorphic identification is to be seen in the case of the deity known as Apollo Cunomaglus, the second part of his name being a Celtic word meaning "hound-prince." He is mentioned on an altar from Nettleton Shrub, Wiltshire, but seems to be represented in other reliefs from the Cotwold area including Chedworth, Gloucestershire, as well as on a votive bronze plaque from Gloucester, in both cases accompanied by a hound.

Hounds would appear to have been the familiars of Nodens at Lydney, but instead of being identified with Apollo, Nodens was here assimilated to Mars, generally venerated in Britain (except in the official cults of the Roman army) as a protective, countryside deity rather than as a war god. The marine imagery on a mosaic set in the cella of his temple and on certain pieces of metalwork suggest he may have been connected with the mouth of the Severn below his hill, but he was also closely associated with the iron-rich waters of his healing spring. There may also have been a hunting aspect.

One epithet used for Mars (as on a votive plaque at Barkway, Hertfordshire) is Alator, "hunter," and it is likely that Mars Cocidius, venerated at Bewcastle, Northumberland, was likewise venerated as a hunting deity.

Silvanus too had a similar function, and one of the most instructive of altars, from moorland near Binchester, County Durham, is dedicated "to unconquerable Silvanus" by a cavalry officer, because the god had helped him "to take a very fine boar which none of his predecessors had been able to bag."

A gentler aspect of nature is represented by so-called mother goddesses (Matres), who in many instances are shown holding fruit or bread rather than actually nurturing children. They are sometimes depicted in triads, thus tripling their power, as is the case of the Matres Suleviae on reliefs from Cirencester, but on occasions a single goddess is shown. A relief at Daglingworth calls her Cuda and it is possible (as suggested by Stephen Yeates) that she was the mother goddess of the Cotswold Hills. On several reliefs she is accompanied by three votaries or minor godlings wearing the distinctive woolen, hooded coat (the *birrus britannicus*) made in the region. Such representations emphasize the relationship between economy and divine aid.

Some of the most attractive evidence for the veneration and awareness of nature is associated with sophisticated, literate people nurtured on the classics. The villa-owners of Britain loved myth and the themes of many of these were closely associated with the natural world. Not surprisingly the wine god Bacchus with his panther was the theme of a number of mosaics, Bacchus being venerated as a deity who could overcome even death with his lifesaving wine. In the Cirencester region, a type of Orpheus mosaic was evolved in which Orpheus accompanied by a hound, or just possibly a fox, occupies a roundel all to himself while animals circulate in friezes around him. The inspiration for these wonderful floors may have come in part from the local hunter god. Venus, water-nymphs and the seasons were also very frequently shown on mosaics.

In one remarkable mosaic found at Hinton St. Mary, Dorset, a bust of Christ occupies a central roundel. Flanked by pomegranates he, like Bacchus, is lord of nature. Four busts representing seasons (?) in the corners, and lunettes with, in one case, a tree of life, and in three others, a hound chasing a stag, present a striking variant on the Orpheus theme.

Perhaps the most successful and integrated expression of a literary, sophisticated approach to nature in religious cult belongs to the gold and silver treasure from a pagan temple at Thetford, Norfolk, dedicated to Faunus. Faunus was an obscure deity of the wild, from the countryside around Rome (Latium) and he was previously known mainly from Roman poets such as Virgil and Horace. Here, at Thetford, he was given local Celtic epithets inscribed on silver spoons dedicated to him such as Medugenus (meadbegotten) or Cranus (guardian of buried treasure). As he had animal-like ears he was called Ausecus (prick-eared), and a representation of his head, goat-like and with little horns and large gem-set ears, ornaments the bezel of a gold ring. Faunus' father was Picus ("the woodpecker"), and it is no surprise that another gold ring has a bezel composed of a pair of woodpeckers, pecking at a wine bowl whose brimming contents are suggested by an inset purple amethyst. The names of the votaries such as Silviola, whose name is derived from "silva," a wood, and Agrestis, whose name means "countryman," remind us of the pervasiveness of the natural world even among the most refined society of the province.

Roman Catholic Religious Orders

There are references in the New Testament to unmarried men and women who served the local communities in special ways. Later, this celibate tradition continued as some Christians went into the deserts of Egypt and Syria to live their commitment in solitude. These men and women were variously called “hermits,” “anchorites” and “The Desert Fathers.” In the wilderness, they found a peace and tranquility that was conducive to prayer, contemplation and reflection. Saint Anthony (d. 350) said that, in creation, he could read the word of God.

Demonic powers also resided in the desert. The anchorites saw their presence in the wilderness as a process of re-creating an earthly paradise, of reestablishing the dominion over all life that existed before the Fall. The stories of encounters with wild animals illustrated their spiritual power. The monk Florentius had a bear as a companion. The animals taught the hermits what was poisonous.

Their spirituality was to encounter a strange territory and move from conflict to harmony, to merge the natural with the supernatural until the two were indistinguishable. This spirituality influenced Celtic spirituality where the theme of voyage or pilgrimage provided a heightened awareness of the natural environment. Celtic spirituality, in turn, influenced Saint Francis of Assisi.

Some men and women of the desert gathered disciples around them and formed communities. These groups became the “cenobites” and their communities came to be characterized by vows of poverty, chastity and obedience. The members choose not to own anything, to live as celibates and to obey their abbot or abbess.

Today, there are several thousand orders and congregations in the Roman Catholic Church. Many use a rule that has been influenced by one of the four largest orders: the Benedictines, Franciscans, Dominicans and Jesuits. Since the 1960s, the Maryknoll family has developed a particularly contemporary response to environmental issues.

The Benedictine Tradition

The Benedictine view of nature is grounded in the monastics’ commitment to a specific place, their efforts to be self-sustaining and the rhythm of their daily prayer. Early in the sixth century, Saint Benedict of Norcia wrote a series of guidelines for living together as a religious community. The Rule of Saint Benedict was used by his immediate followers and was also adopted by many existing communities. It became

the principle guide for most religious orders before the Middle Ages. Saint Scholastica, Benedict's sister, founded a women's branch.

The Rule is characterized by a commitment to a specific monastery, a daily order that includes chanting psalms and canticles in the chapel seven times a day, manual labor, private prayer, simplicity, frugality, humility, obedience and hospitality. The routine of prayer and the focus on frugality shaped the monastics' view of nature.

The collection of psalms and canticles is called "The Divine Office." The psalms themselves, coming from the Old Testament, contain many images of nature that are meant to express the majesty of God revealed in the grandeur of creation. Chanting the office seven times a day embeds the images of nature in the monastics' minds and gives a rhythm to their lives. The routine places time against the backdrop of eternity. The Office of Lauds, chanted at sunrise, is constructed to view creation and redemption as two aspects of the same divine activity.

Some time each day is to be spent in labor. The things of the house, buckets and spades; and the things of the Earth, trees and plants, are to be respected. Work is seen as an act of co-creation or ongoing cooperation with the Creator.

The view of nature within the Benedictine tradition reflects a basic Christian position. There is both a natural and a supernatural order. The supernatural order is not opposed to, but is above nature. Devotion to the spiritual life does not destroy but perfects and elevates the natural order. Creation will also be delivered from slavery and corruption. God remains distinct from his creation, but the universe has a dynamic structure. It is dependent on God and is constantly being created by God in conjunction with those creatures who cooperate.

There were also other perspectives in Europe between the fifth and thirteenth centuries. A neo-Platonic view exaggerated the distinction between the spiritual and the natural order to a point where the natural was disdained. From the eighth century on, there was also a rationalism that sought explicit explanations for everything. These trends would have influenced individual Benedictines, but did not affect the basics of Benedictine life.

Hildegard of Bingen (1098–1179) was a Benedictine nun who wrote treatises on theology, philosophy, cosmology and medicine and then wrote music to illuminate her vision. She saw human nature as a microcosm that contains the entire creation within it. Because they are so closely interconnected, the natural elements and humanity affect each other. Because of sin, creation turns against humans. In Christ, we can restore the balance. Hildegard saw music as the highest form of praising God. Through music, we integrate body, mind, heart and spirit and thus celebrate heavenly harmony here on Earth.

The Benedictine monasteries were a major means of preserving and spreading Western civilization in the centuries of transition from the Roman Empire into the Middle Ages. Towns grew up around monasteries. The monastic schools provided one of the few means of education and the monks both developed and taught agricultural techniques.

The early development of Europe consisted in cutting back forests and reclaiming wetlands for agriculture. The monks were at the forefront of this movement.

As Europe approached the Middle Ages, a need for reform arose. Feudal lords were appropriating monastic revenues. The recitation of the Office had expanded in length, manual work decreased and the rule was interpreted rigidly. Besides monastic reform, several popes called for reforms on a larger scale within the whole Church. One need was a concern for apostolic life, for the care and education of people.

One monastic reform came through Saint Robert of Molesne (d. 1111) and Saint Bernard of Clairvaux (d. 1153). They broke with the mainstream Benedictines and founded the Cistercian Order at Citeaux in France. By this time, much of Europe had become farmland and the Cistercians moved out into wilder country. Their writings expressed a sense of movement from wilderness to paradise. They still followed the Benedictine Rule.

Whereas the Desert Fathers saw beauty in an unspoiled wilderness, Saint Bernard emphasized the beauty of labor in preparing the fields. There should be a profound harmony between the natural beauty of the site and the monastic life set within it. Once nature has become fertile and purposeful, it takes on the utmost significance. Irrigation channels and waterways within the monastery provide sport and food for fish, refreshment for people, nourishment for gardens and a means of cleansing. Humanity and creation achieve perfection together because of human efforts to tend and organize the environment and creation's willing response to humanity's guidance. Creation repays human care by aiding people physically and spiritually. They are partners in a common effort.

Cistercian monastic architecture was medieval and reflected the simplicity and balance of the monks' lifestyle. The floor plan and the monastery's position within the environment were meant to reflect the harmony of creation and the presence of the divine within creation. Light, space, shape and texture were used to reflect this sense.

Because the Cistercians became involved in work away from the monastery, a reform within the Cistercian community began in the sixteenth century and developed until 1892 when a group of Cistercians became independent. The new group was centered at La Trappe in France. This reform revolved around a stronger emphasis on contemplation rather than apostolic activities. The group is known as The Order of Cistercians of the Strict Observance. They are commonly called "The Trappists." Thomas Merton was a Trappist and his writings have greatly influenced contemporary understandings of the relationships between prayer, justice and the environment. Today, there are 1400 communities worldwide who follow the Rule of Saint Benedict.

Over the last thirty years, contemporary currents and attitudes toward nature have influenced monasticism. In an effort to understand present thinking, a survey was sent out to 52 Cistercian and Trappist monasteries in 14 countries. An effort was made to distribute the questionnaire to every third person. 147 questionnaires were returned. What follows is a summary of their responses.

When asked if their sense of the sanctity of creation had grown during their years in the monastery, all but three said it had. Two of the remaining three responded that they had always had a strong sense of nature as sacred.

To the question asking what people or published materials had influenced their view of creation, about half indicated specific books and authors. The Bible was the most frequently mentioned influence, followed by Jesuit Teilhard de Chardin, Trappist Thomas Merton, Franciscan Saint Francis of Assisi, Passionist Thomas Berry, Saint Paul, William Wordsworth, Matthew Fox, Orion Magazine, David Thoreau, Julian of Norwich, Rachel Carson and Trappist Charles Cummings who wrote a book entitled *Eco-Spirituality*.

To the question, “What do you see in the Benedictine and Cistercian tradition that contributes to an ecological perspective?” the strongest response was the Rule of Saint Benedict itself, especially a sentence that says that the monastic should reverence all things as if they were the sacred vessels of the altar. Living in a natural setting, working the land, experiencing the seasons, and loving the place were also frequent answers. In addition, there were many mentions of their lifestyle and a daily order that stresses simplicity, silence, solitude, prayer, the rhythm of the liturgical year and the liturgy itself.

One question asked, “Would you please detail any concrete action that your monastery is taking that would reflect a concern for the environment?” In response, many mentioned recycling. Most made reference to responsible farming methods that include organic gardening, erosion control and the use of environmentally safe chemicals. Some mentioned significant proactive measures. The Trappist Monastery at Conyers, Georgia, converted 700 acres of land from swamp into wetlands. A Trappist monastery in Indonesia has dedicated a quarter of their land as a natural reserve. A monastery in Australia has been replanting five kilometers of river frontage damaged by overgrazing since 1840. The Trappist Monastery at New Melleray, Iowa, publishes a quarterly newsletter with a strong environmental focus. The monks at Vina, California took action against a nuclear power plant and are founding members of Dear Creek Conservancy. The Trappistine monastery at Whitethorn in Northern California was instrumental in stopping a dam on the Mattlele River and preserving 1200 acres of old-growth redwoods as the “Sanctuary Forest.” Members of the monastery sit on the board of directors. While most Trappist monasteries are involved in some farming, the sisters at Whitethorn are more focused on preserving a natural environment. Monasteries in Ireland, New Zealand, Hong Kong, Canada, Iowa, Oregon, Nigeria and Eritrea have undertaken extensive reforestation projects. A monastery in Cameroon is replacing eucalyptus they planted fifty years ago because eucalyptus absorbs too much water from the land. The Trappists in Utah have been working for 53 years to preserve 120 acres of rangeland. Several other monasteries reported working with local conservation groups and several have received awards for their work in conservation.

When asked if the environment is one of the major concerns of our times, 98 percent said yes. To the question, “Does the Bible clearly call us to a reverence and respect for the earth?” over 90 percent said that it does.

The Franciscans

The Franciscan view of nature flows out of the nature mysticism of their founder, Saint Francis of Assisi. As Western civilization entered the Middle Ages, a new prosperity created capitalism and a middle class. There was also a universal call for reform within the Catholic Church. A significant mode of that reform came in the person of Saint Francis of Assisi (1182–1226) and his founding of the Franciscan Order. The order was approved by edict of Pope Innocent III on 16 April, 1209.

With the Benedictines, very little is known about the personality of Saint Benedict. It is his written rule that has shaped the order, but with Francis, his personality and charism dominate and is hard to capture in a written rule. The Franciscans became the first of a different type of order. They are friars and mendicants, not monks. Like the monks, they have a distinctive habit (robe) and chant the psalms and canticles of the Bible in common. But unlike the monks, they have a strong emphasis on apostolic work, on preaching and serving people in a variety of ways. They move easily from place to place and are not bound to a particular monastery.

Francis’ father was a wealthy cloth merchant who also bought up small farms and expelled the tenants. Francis reacted dramatically to his father’s lifestyle and attitude. He saw power, prestige and possessions as leading to violence and so he embraced humility, poverty and the cross. Much of his life was spent alone in nature like the Desert Fathers and the Celtic hermits. In this liminal position, he had a direct and mystical experience of God in creation.

What is unique to Francis is that he is the first known person within the Christian tradition to exhibit a nature mysticism. Previous ascetics were ambivalent. They saw the natural world too much as the realm of demonic powers. For Francis, his union with nature became a mode of God’s communication of himself to humanity and humanity’s union with God through a perceived presence in the physical world.

There is a charming fresco by Giotto in the Basilica at Assisi. Here, Francis is seen preaching to birds. The famous incident illustrates the Saint’s sense of the interdependence he saw in creation, an interdependence that called for respect and obedience. The birds praise God with their song. They each have autonomous worth and beauty and yet are brothers and sisters performing their divinely allotted function. The birds respect Francis because he is also a servant of God. Their response encouraged him to sustain his new perspective and to carry his preaching to people. By implicitly humanizing creation through affective links, Francis made it easier for others to share his bond with creation. It was Francis and the early Franciscans who introduced the use of the crèche, the manger scenes that dramatize the Christmas event.

The legend of the wolf of Gubbio tells of a hungry wolf that was terrorizing a town. Francis went out and preached to the wolf and then preached penance and peace to the villagers. He was thus able to convince the people that the wolf was simply hungry and needed food. He forged a covenant wherein the people agreed to respect the wolf and provide him with food.

Like the monks before him, the psalms and canticles from the Bible shaped Francis' expressions. But unique to Francis, is the influence of the songs and lyrics of the troubadours. The troubadours were wandering musicians who composed and sang love songs. Here, Francis spiritualizes the mistral's interplay of natural setting and human experience, an interplay that elicits love and joy. Francis embraced and expressed the chivalric values of beneficent magnanimity and deference to all.

Like the ascetics before him, Francis also saw nature as allegorical. He had a particular affection for worms because there is a passage in the New Testament where Christ says, "I am a worm and no man." So Francis would carefully pick worms up off the road and place them in safer places. He saw Christ in the worms. The sun is like God because it is beautiful in itself and it gives light.

The clearest illustration of the Franciscan view of creation can be found in Francis' Canticle to Creation. The hymn praises the four elements; fire, air, water, and earth, which were seen as the components of all life forms. In the Canticle, he expresses the intrinsic goodness of the created world, the interdependence of all life, and his passion for beauty and peace. Because we call God "Father," creation becomes our brothers and sisters. He calls for a fraternal model, rather than a model of stewardship. We are to be detached from creatures in order not to possess them. Francis goes so far, at times, as to say that we should even obey animals. The Franciscans were a dynamic argument against the Cathars; a heretical group at the time who held that "the spiritual" had been created by a beneficent divine power and the natural world by an evil one.

Francis forbade his followers to cut down a whole tree. Part needed to be left intact so that new sprouts could bud. Until recently, a Franciscan needed permission from the provincial before cutting down a tree. Francis spent the last years of his life in the wilderness.

Saint Francis represents a watershed in the development of Christian views of nature. Some spiritualities after him flow from him. Others, such as the Rheinland mystics, continue a neo-Platonic tradition.

The Saint of Assisi fulfills Arne Naess' definition of a deep ecologist because he emphasized the diversity and intrinsic value of creation and because he addresses the need to reform behaviors that threaten to destroy entire ecosystems. On Easter Sunday, 1980, Pope John Paul II proclaimed Saint Francis of Assisi the patron saint of ecology, following the suggestion 13 years earlier by Lynn White, Jr., in his seminal article in *Science*.

Today, Franciscan men and women continue their founder's work by focusing on the changes of hearts and minds needed to live in balance. Franciscan Keith Warner trained in geography and worked for a reforestation cooperative in the Pacific Northwest that

planted over 600,000 trees. He is on the steering committee of the California Sustainable Agriculture Working Group and has lobbied with The Religious Campaign for Forest Conservation. Warner also campaigns against what he calls “Birdbath Franciscanism,” a superficial and romantic view of Francis depicted in flower-garden statuary. He sees his founder as much more ecologically radical.

Father Richard Rohr, also a Franciscan, founded and is director of The Center for Action and Contemplation in Albuquerque, New Mexico. The center’s aim is to seek a balanced life by bringing together the worlds of spirituality, psychology, social action and environmental concerns. Former Franciscan Leonardo Boff is a Brazilian and a major figure of liberation theology. In *Ecology and Liberation* (1995) and *Cry of the Earth, Cry of the Poor* (1997), he brings together poverty, ecological degradation and liberation. For Boff, the fate of the rainforest and the fate of

Amazonian Indians are inseparably linked.

Franciscan sisters run Michaela Farm in Oldenburg, Indiana, where their aim is to seek and teach skills in organic food production and to foster a simple lifestyle in harmony with the Earth. Sister Rita Wienken has similar objectives with her Franciscan Earth Literacy Action Center on 500 acres in Tiffin, Ohio.

The Dominicans

The Dominican view of nature is based on the fact that they were founded to combat a heresy advocating that the natural world was evil. On 17 January 1217, just eight years after Pope Innocent III approved the rule of Saint Francis, Pope Honorius III ratified the constitutions for the Dominican Order. Like the Franciscans, the Dominicans are friars. They work outside the monastery and were founded to combat the Albigensian heresy.

The Albigenses espoused a form of Manicheism, a cosmic dualism, holding that the devil was actually a rival god who created matter. The soul is imprisoned in matter and the objective is to liberate the soul. Therefore, they discouraged marriage and saw death as the final release. For them, Christ was not the Son of God but an angel with a corporate appearance. The first objective of the Dominicans was to restore a Christian view of creation.

The Dominicans call themselves “The Order of Preachers.” But “preaching” here is not restricted to a discourse on Sunday morning. They see their charism as closely following the Old Testament definition of a prophet as one called by God to speak for God. They say of themselves that their objective is to contemplate and to share the fruits of their contemplation. Like the Franciscans, the first Dominican priests were friars. They worked outside the monastery and were founded to combat the Albigensian heresy. Today, the Dominican family includes sisters and lay people.

Fra Angelico (1400–1455) was a Dominican and a painter who continued the work of Giotto in giving more natural shape and color to works of art.

Dominican Saint Thomas Aquinas (1225–1274) is considered the greatest of the medieval philosophers and theologians. His *Summa Theologica* is built on Aristotle and provided a synthesis of theology up to that point in time. Saint Thomas presents the knowledge we get from revelation, our experience and our capacity to reason as compatible and complementary ways of knowing. He set the stage for the later development of the scientific method.

A recent movement within the religious orders of women in the United States is to convert the lands that once served as novitiates, mother houses and schools into organic farms and ecological learning centers. The Dominican sisters have been at the forefront of this movement and Genesis Farm is their flagship.

Founded by Sister Miriam Therese MacGillis and the Dominican Sisters of Caldwell, New Jersey, the farm focuses on learning and teaching a new cosmology. They also sponsor a large, community-supported biodynamic garden. Their teaching is built around the works of Thomas Berry, Brian Swimme and a section of Saint Thomas Aquinas' *Summa Theologica*. In Part I, Question 47 of his *Summa*, Aquinas says that God is most fully revealed, not through one species only, but through the whole universe because one creature alone could not adequately represent his goodness.

Genesis Farm uses the structure of a story. The universe is a series of unfolding stories. Humanity needs to listen to the stories and individuals need to see the story of their lives in the context of the universe of which they are a part. MacGillis also uses the image of a punchbowl on a table surrounded by glasses. Each glass is a religious or ethnic tradition that holds some wisdom. When the glasses are emptied into the punchbowl, the wisdom is not lost but enlarged. The families who sponsor the organic garden at Genesis Farm are presently founding a grammar school where their children can progressively learn the stories of the universe.

The Dominican sisters also operate Sophia Garden in Amityville, New York and Siena Spiritual Center in Water Mill, Long Island. They have similar farms and learning centers in Springfield, Illinois; Ponchatoula, Louisiana;

Blacklick, and Bath, Ohio; Houston and Boerne, Texas; Plainville, Massachusetts; St. Catherine, Kentucky; and Pawnee Rock, Kansas. The Dominicans' *EarthLinks* in Denver, Colorado endeavors to link people, especially the economically poor, to each other and nature through hikes, garden projects and school programs. Sister Mary Ellen Leciejewski, based at the Dominican hospital in Santa Cruz, California, works full time on issues related to the impact of health services on the environment. She says, "Our ecological commitment is integral to our healing mission. There is a profound connection that exists between healing the individual and healing the planet." The Dominicans also run an ecological farm in Benin City, Nigeria.

The Jesuits

Saint Ignatius Loyola, the founder of the Jesuits, had a vision, while praying on the banks of the Cardoner River in Eastern Spain, of God's abiding presence in all of creation. He later had a second vision of Christ carrying a cross for the salvation of the world. Putting the two visions together, he developed a series of meditations and contemplations called *The Spiritual Exercises*, in which, a person is guided to enter the vision of God's presence in and love for the world. From there, one moves to a deeper realization of where and how God might be calling that person to serve.

The Jesuit order itself was founded on 15 August, 1534 at Montmartre in Paris. Pope Paul III approved their constitutions in 1540. With the Jesuits, a third type of order comes onto the scene. The Jesuits were to have no special clothing and did not pray the Liturgy of the Hours in common. Their lifestyle and daily order was to focus on what one Jesuit writer called "a mysticism of service."

From their beginning, Jesuits have been involved in education, scholarship and the foreign missions. Early Jesuits were colleagues of Galileo and over thirty lunar formations bear Jesuit names. Athanasius Kircher (d. 1680) was a major link between medieval and modern science. Jiri Kamel, a Czech Jesuit (d. 1706), sent drawings and specimens of insects and plants from Manila to the Royal Society of London. He recognized strychnine in a type of bean and camellia tea is named after him. Christopher Clavius (d. 1612) designed the Gregorian calendar and introduced the decimal point to mathematics. The Jesuits introduced geometry and Western astronomical instruments to China in the seventeenth century.

Teilhard de Chardin (d. 1955) was a French Jesuit paleontologist. He was concerned with the split between his spirituality and what his fellow scientists were saying about the universe's evolution toward entropy. He developed a schema wherein he saw the possibility that the universe was rather evolving toward a deeper spiritual unification.

Gerard Manley Hopkins (d. 1889) was an English Jesuit poet and artist. He was acutely aware of the beauties of creation and coined the word "inscape" for what he saw as the unique and particular quality of each object in nature. The experience of the particular, of the "deep-down" beauty, leads to an experience of the transcendent. He had a Wordsworthian feeling for nature coupled with a sense of nature as an expression of God. The squalor of industrial towns and the oppression of the working class horrified him. His sonnet, "God's Grandeur," begins with the lines; "The world is charged with the grandeur of God. It will flame out, like shining from shook foil; it gathers to a greatness, like the ooze of oil crushed." He then goes on to describe how the Industrial Revolution has damaged the Earth. But he ends the poem by saying,

And, for all this, nature is never spent. There lives the dearest freshness deep down things. And though the last lights off the black West went – Oh, morning, at the brown brink eastward, springs – Because the Holy Ghost over the bent world broods with warm breast and with ah! bright wings.

He poetically expresses the heart of Jesuit spirituality.

Today, Jesuit John Surette is co-founder of *Spiritearth* in Arlington, Massachusetts. The educational center is built on the principle that an openness and reverence before the universe allows community to form and justice to flourish. The center would like to see humanity enter an ecozoic era. Another Jesuit, Al Fritsch trained as a chemist, worked for Ralph Nader's Center for the Study of Responsive Law and then founded Appalachia Science in the Public Interest in Mt. Vernon, Kentucky. The center is devoted to the notion of sustainability and has developed solarenergy applications, organic gardens, artificial wetlands and dry-composting toilets. Members of the center are helping to develop ginseng as an alternative crop to tobacco and extensive lumbering in Appalachia. The center has conducted over 200 assessments in 34 states and consulted in Haiti, Peru, and the Dominican Republic. Fritsch would like to see a 12-step program addressing people's addiction to material things.

The Jesuits have assisted sixty religious groups in ecological improvements to their property. Jesuits also teach ecology, sustainability and ecospirituality in their many educational institutions.

Maryknoll

The Maryknoll order is a younger group within the Catholic Church and their approach to nature is uniquely modern. They were founded early in the twentieth century as an American foreign missionary society of priests, brothers and sisters. Today, they include lay-people and call themselves the Maryknoll Family.

Working in South America, they experience extensive exposure to liberation theology and as that movement started "turning green" in the early 1990s, so did they. Maryknoll founded Orbis Press, whose publication list includes books on the environment.

Maryknoll lay-people are involved with CEDICAM in Oaxaca, Mexico. The organization works with Indian campesinos and encourages reforestation and crop diversification throughout the Mixteca Alta region. This group has established tree nurseries in 22 farming communities and has planted more than 150,000 trees.

Maryknoll sisters run the Center for the Integrity of Creation in Baguio, The Philippines. The area is threatened by excessive logging. The Center focuses on education for biodiversity and sustainable development.

Maryknoll Father Herb Gappa runs an anti-erosion and tree-planting project in the Shinyanga District of Tanzania. Maryknollers are also working to conserve green space and diversify agriculture in Barquisimeto, Venezuela. In Chile, they develop ecological education units for high schools in Linares, work in the Spirituality and Ecology Center in San Nicolas, provide workshops on spirituality and ecology in Santiago and develop an awareness of the illegal seizure and logging of native trees in Chol Chol. The logging has led to a drop in the water table. Hazardous chemicals and pesticides have also been introduced.

Other Religious Orders

There is a strong movement today to network, to link and affiliate. A project or center might not be staffed exclusively by members of one order. Individual religious from different congregations join local and national conservation groups. The Maryknoll project in Baguio, The Philippines, includes on its staff members of the Redemptorist and Divine Word orders. The Sisters of Charity, Religious of the Sacred Heart and Passionists have projects and centers similar to those run by the Dominicans.

The Global Education Association is an international network and resource for ecologically related issues. Within GEA, The Religious Orders Partnership includes more than 150 orders. Their aim is to cooperate in using their resources of schools, universities, healthcare facilities, community services, retreat centers and churches to further a concern and care for the Earth. Most religious orders include ecology within their programs for social justice.

Roman Catholicism in Latin America

Roman Catholicism has long been the religion of peasant farmers in Europe and Latin America, and thus the tradition's ritual practices, annual calendar, and many cognitive and moral beliefs are closely linked to natural cycles and landscapes. The Church does not, however, have a long tradition of explicit theological and moral reflection about the natural world. While this is probably true of most branches of Christianity, the strongly humanistic emphasis of Roman Catholic social thought has arguably slowed the development of debates and theory-building within that tradition in comparison, for example, to Eastern Orthodoxy and some Protestant denominations. In the Roman Catholic tradition, God's work from creation to salvation focuses on human good, and nonhuman nature serves mainly as a backdrop for human action or as a means to human ends. Nature appears to have little intrinsic (non-instrumental) value, but is valuable insofar as it contributes to collective human well-being. This carries the potential risk of justifying almost any exploitation of natural resources that appears to serve human wellbeing.

Recognizing some of the tensions in the Catholic humanist approach to nature, in recent years Catholic thinkers in the First and Third Worlds have been reworking attitudes toward the natural world. Important differences in perspective and emphasis distinguish Catholic environmental philosophy from different cultures, but they are also united by some overarching themes. First and most important, Catholic thinking about the environment almost invariably contends that God created nature in order to serve human dignity and the common good, not individual profit. Creation is a gift of God, intended for the well-being of all of humanity. Greed, expressed in consumerist culture and unrestrained capitalist economics, leads to overexploitation of both nature and persons, ultimately destroying both human and natural communities. In consequence, people are called to serve as wise and careful stewards of the natural world. Humans are entitled to use natural resources, but this use must be moderate and in the service of the common good rather than individual profit.

These emphases lead to a close link, in most Catholic work on the environment, between environmental and social problems. In Latin America, this means that Catholic thinking about the environment often takes up the themes of social and economic justice. For example, a pastoral letter issued in December 2000 by the Apostolic Vicariate of the department of Petén, Guatemala, titled "The Cry of the Forest in the Jubilee Year: Between Agony and Hope," asserts that "It is not possible to speak of ecology

without taking justice into account. It is not possible to defend the conservation of the forest apart from the advancement and life of the poor” (*El Grito de la Selva en el Año Jubilar*, 9).

Bishops in other parts of Latin America have taken up similar themes. In an April 2000 Pastoral Letter, the Bishops of Northern Mexico denounced the socially and environmentally destructive consequences of forest exploitation, concluding that

The protection of the forests requires urgent measures . . . The forest is not mere food for industry . . . The forest is a giver of life for its inhabitants. For these reasons we appeal to the conscience of everyone and urge all Christians to take responsibility for preserving the life on this planet that God has entrusted to our care. All of this makes it our obligation to . . . denounce the ecological devastation we are witnessing (http://conservation.catholic.org/bishops_from_around_the_world.htm).

And a statement from the Church in the Dominican Republic asserts that

Human sins against nature redound always to the detriment of humankind itself . . . It is not right that those who have greater resources, whether countries, cities, groups, or individuals, should lean toward excessive consumption which, in addition to being a provocative insult to the poor, is an evil misappropriation of natural resources necessary for the have-nots of the world ([http:// conservation.catholic.org/bishops_from_around_the_world.htm](http://conservation.catholic.org/bishops_from_around_the_world.htm)).

Similar themes emerge in the environmental writing of Latin American liberationist theologians, such as the Brazilian Leonardo Boff, who gained international prominence in the 1970s and 1980s for his arguments in favor of democratization within the Church, among other themes. In the 1990s, Boff has turned his attention to ecological themes, insisting that, “The very same logic of the prevailing system of accumulation and social organization that leads to the exploitation of workers also leads to the pillaging of whole nations and ultimately the plundering of nature” (Boff 1997: 110–11).

This destructive system must be replaced with “a nonconsumeristic type of cultural practice that is respectful of ecosystems, ushers in an economy of what is sufficient for all, and fosters the common good not only of humans but also of the other beings in creation” (Boff 1997: 113). Boff contends that excessive consumption by some harms both the poor and the natural world; the solution requires both more restraint in human use of natural resources and a more equitable distribution of the goods they make possible.

In addition to theological explorations, Catholics in Latin America are addressing environmental problems in grassroots organizations and pastoral projects. Many dioceses and parishes have formed “ecological committees.” These take different forms and emphasize different issues, depending on the setting. In many urban areas, primary concern is with issues of “environmental justice,” such as waste disposal, sanitation, and air and water quality. In rural areas, attention often focuses on problems related to agriculture, such as soil erosion, reliance on chemical pesticides and fertilizers, and exhaustion of water resources. Latin Americans, Catholic and other, devote less attention to issues such as biodiversity and wilderness protection than do environmentalists

in North America and Europe. This emphasis stems both from the urgency of social and economic inequities and also from the dominance of a perspective in which environmental problems are significant in relation to human needs and interests. The Roman Catholic tradition has contributed substantially to this humanistic worldview. There is some evidence of the emergence of more “biocentric” ways of thinking, especially in regions with large wilderness areas remaining, but this remains a minority perspective within Latin American environmentalist thought and activism.

Roman Natural Religion

The close association of Roman religion with the natural world is apparent from the various versions of the Roman seasonal calendar ranging from the popular “farmer’s calendar” to the much more formal listings of sacrifices and other observances which had to be undertaken by various priestly colleges on behalf of the state. In all cases the purification of the fields, sowing, growth of plants and harvest were central to the pattern of the year, as indeed was the securing of the fecundity of flocks and herds. It is not surprising that this seasonal cycle is so widely celebrated by poets (such as Virgil, Horace, and especially Ovid, who wrote a long poem, the *Fasti*, detailing the festivals month by month); it is also apparent in works of art often described as sacro-idyllic as there is always a religious component, such as representations of shrines and divine images, in Roman portrayals of the countryside.

Many aspects of this religion depended on deities who were the personifications of natural phenomena. Ceres, though later equated with the Greek Demeter, was simply the process of growth; Vesta was the controlled fire of the hearth; Jupiter, with his epithet Fulgur, was the thunderer. The most famous and long-lived of Roman festivals, the Lupercalia, celebrated in February, came to celebrate the myth of Romulus and Remus at the wolf’s cave. But the identity of the god to whom the festival was dedicated was no longer really known, though the rites, which included the sacrifice of goats whose skins were put on by otherwise nude runners who would lash out with thongs believed to bring fecundity to the childless, were held in high regard until the end of the fifth century. It was clearly a purification ritual like the April festival of the Parilia, which was concerned with flocks and herds and was symbolized by Pales, a goddess of whom little is known.

Not surprisingly, a grove of trees was often regarded as the dwelling place of a deity, often Mars, who would certainly need to be propitiated if anything were done to it. Cato in his book on agriculture describes the procession and sacrifice that the farmer would have to make if he wished to thin the grove. Evander in Virgil’s *Aeneid* (viii, 351–2) describes the woods covering the Capitoline Hill as “the abode of some god.” In his *Fasti* (iii, 295–9), Ovid mentions another wood in Rome, a grove by the Aventine, dark with enormous holm-oats, where the viewer would exclaim, “this is the home of deity.” It is not surprising that later Diana, goddess of hunting, had her Roman home here. Ovid, however, associates the spot with more localized rustic deities, saying that Faunus and his father Picus, who was the woodpecker and son of Mars, often came to drink at the spring here. Springs, sacred to major deities such as Neptune or Minerva, or some more localized water deity, or to the nymphs, were widely venerated throughout the

Roman world. Typical examples were the springs of the nymph Arethusa at Syracuse in Sicily, and of Sulis, equated with Minerva, at Bath in Britain.

This identity of the divine and the natural worlds meant that nature was frequently employed to interpret the will of the gods. Thus by observing the song and feeding habits of birds, augurs could foretell the future. A related phenomenon is recorded at Tiora near Reate, where according to Dionysius of Halicarnassus (*Roman Antiquities* 1.14.5), at an oracle of Mars, a woodpecker tapped-out on a post responses to questions put by the enquirer. Most important was the study of bird flight across the sky, as this could be divided into sections, each with a meaning. The Etruscan art of haruspicy, in which the haruspex (literally the “gut-gazer”) looked at the heart, intestines and liver of sacrificed animals, at first sight could not have been more different from bird-watching but, as is demonstrated by a bronze model liver excavated at Piacenza, carefully marked out in sections, this too could be related to the sky map of the augurs used similarly in divination.

The religious person would look out for omens, which might well be connected with animals, some of which were sacred to specific deities. There are many stories of Jupiter’s eagle giving succor and hope to Roman armies; but Juno’s peacocks and geese, Apollo’s corvine, Minerva’s owl, Mercury’s cockerel, Diana’s deer, the serpent of Aesculapius, the ant of Ceres, the dolphin of Neptune, the panther of Bacchus, and the lions of Cybele, are all familiar in literature and art. Sometimes the animal is so closely associated with the deity that the two are virtually interchangeable, a process known as “theriomorphism.” Dea Artio, the bear goddess attested by a figurine from Berne in Switzerland, has a name derived from that of the name for bear. Another goddess originating in the Celtic world was Epona, who can be identified with the horse. In the case of Aesculapius, serpents and hounds lived in his sanctuaries and helped the healing process of the sick by, for example, licking the sores, wounds and swollen limbs of votaries.

In art, this naturalistic religion was prettified and made polite, providing the basis for the idealized view of nature in so much Western Art where fauns (originally godlings of the countryside around Rome) and satyrs gamboled in woods and fields and where Priapus, who developed from a phallic pillar, became a somewhat risqué symbol of sexual activity. The sacro-idyllic landscape was developed, if not invented by a certain Studius who lived in the reign of Augustus. In landscape paintings of this time, as well as in other works of art such as silver plate and gems, we find temples and sacred columns as well as images of Venus or Priapus set in idealized countryside. Venus keeps her place as the garden goddess but is now very much identified with the Greek love-goddess Aphrodite. Both aspects are very much to the fore in the elegant fourth-century poem, *Pervigilium Veneris* (“Venus’ eve”), which celebrates both love and fertility.

Outside the essential domesticity of the estates and gardens celebrated by writers and artists, nature had a darker side, one that needed to be taken by human effort. In myth this is symbolized by the deeds of heroes such as Bellerophon who slew the fire-breathing Chimaera, Perseus who vanquished the sea monster, and, above all, Hercules

who killed savage lions, boars, bulls and monsters in a series of Labors. This attitude to a hostile nature beyond the world of humankind, partially at least, explains one of the contradictions in the Roman psyche between the gentle appreciation of the divine in nature, which had such resonance with pantheist eighteenth-century writers, and the savage barbarities of the Roman arena. The venationes (plays) staged at the Roman Coliseum and other amphitheatres celebrated the dominance of Rome over “the other.” The “ludi” (games!) were part of the annual cycle of religious festivals in the calendar; they were attended by priests and by the Vestal Virgins. It is clear that despite the obvious dominance of popular entertainment, there was an element of sacrifice here: Rome was offering up the fruits of nature to the gods.

It could be claimed that the introduction of the amphitheatre was relatively late in date, not appearing until the late Republic, but the attitude toward nature as essentially savage is to be found in the Lupercalia. It is also apparent in a famous ritual at the grove of Diana at Aricia beside Lake Nemi. This grove was presided over by a priest, a runaway slave who obtained his office by plucking a bough from a certain tree and then challenging the reigning priest to mortal combat. This curious priesthood was investigated by the famous anthropologist, Sir James Frazer, which started him on his magnum opus, *The Golden Bough*. Although not all of his deductions would now be accepted (for example, his belief that the rites celebrated a single Mediterranean Great Goddess), the cult was almost certainly earlier than its Hellenization and originated in the pattern of death and rebirth which could be observed in nature. The priest, challenged and cut down by his rival, literally died for the goddess, who in classical times was called Diana.

Roman religion cannot be limited to Rome or even Italy, and it is often difficult to decide where Roman religion ends and those of other peoples in the Empire begin. From Britain to Syria the ancient traveler would find many similarities in attitudes to natural features, mountains and mountain passes, rivers, caves and groves, but also local differences. The second-century Greek rhetor, Lucian, describes the superstitions of a Roman senator, Rutilianus, who would only have to see a rock smeared with holy oil or with a wreath laid on it to fall on his face before it. He became the dupe of a charlatan named Alexander, who set up an oracle in which the responses were given by a serpent called Glycon, at Abonoteichos in Asia Minor.

The more or less contemporary guidebook to Greece written by Pausanias was intended for the sophisticated Roman traveler and is full of accounts of a god-filled countryside and rites available to the pilgrim. Nature could be both benign and brutal but it was never regarded as simply secular. At Patras in the sanctuary of Laphrian

Artemis, live animals were rounded up and thrown alive onto an enormous bonfire in honor of the deity (Pausanias: VII,18,6). To modern eyes this is incredibly cruel, and a reminder to those who over-idealize the Greeks, that the “Roman” amphitheatre did not signify a unique distinction between the two peoples in this matter. We can also recall that the maenads, servants to Dionysus, tore animals limb from limb in their trances and in doing so were in a sense identified with wild nature. However,

other information, for example in Pausanias, has a more gentle charm, describing a countryside of hills, islands and woods peopled with gods who are part of beneficent nature, and which belongs much more to the sacro-idyllic world which we meet in many Latin poets and can observe in depictions on wall paintings, engraved gems, and other works of art.

Religion and Nature in Art

Excavation at Pompeii has found the remains of many gardens, and these, together with frescoes from the Campanian cities and Rome, and engraved gems from throughout the Empire showing the natural world, provide a fascinating body of visual evidence of how ordinary inhabitants of Italy approached the divine around them. It is clear that all landscapes were regarded as having a divine aspect, as does the Christian landscape of southern Europe today with its shrines and churches – everything from the Lararium, which brought the Lares into the front hall, to the garden with its marble figures of Priapus, Venus goddess of gardens, or Mars, associated with Venus in love but also with sacred groves. The peristyle of the House of the Marine Venus, with one painted panel showing the birth of Venus (her physiognomy and coiffure perhaps based on those of the lady of the house) and another a statue of Mars in front of garden plants and birds, was only part playful; these were deities seriously regarded as bringing peace and order to nature.

A panel of landscape on this painting is in fact a “sacro-idyllic landscape,” with shrines interspersed with people. Such landscapes, generally with herdsmen, satyrs and nymphs, are highly distinctive and often of high quality, especially in the Augustan period when they were popular as symbols of the return of peace, and are to be found in stuccoes, paintings and marble relief sculpture. One of the carved panels of the screen wall of the Ara Pacis, begun in 13 B.C.E. and completed in 9 B.C.E., shows a figure of Italy suckling two babies in a rich landscape with a stream, a cow and a sheep grazing, and crops ready for harvest. Another depicts Aeneas sacrificing a white sow with her piglets at Lanuvium in a rustic landscape in which there is a temple of his household gods, or Penates. The rich acanthus scrollwork of the pilasters and lower part of the screen inhabited by nesting birds and buzzing insects reinforces the importance of harmony in nature to the Roman ethos. Moreover, on the interior of the screen wall, hanging garlands filled with fruit reinforce the message of the fecundity of a peaceful nature that Augustus and his advisors wished to convey to the Roman people.

In Classical Greek times, Dionysus was, although powerful, a destructive and menacing god. His satyrs often represented untamed nature and were in consequence themselves wild and menacing. There is a tendency, well shown on Roman-period engraved gems, for Roman satyrs to be genial quaffers of wine or players on pan pipes and thus to exemplify the pastoral ideal; they often appear with offspring and if maenads are

shown, the sexual relations between male and female tend to be decorous. Frequently these country spirits make offerings on altars in front of little statues of Priapus or Pan, which must have existed in actuality in garden and parkland settings. Dionysus, generally known as Bacchus in Roman times, presided over the vine and the feast and would also be very much at home in a villa setting as is shown by the famous fresco in the Villa of the Mysteries; here the cult scene is shown as taking place in the house, but connections with the great outdoors were to be found in bacchic symbols in the painting, such as the phallus, the organ of generation, which is being uncovered by one maenad, and the nude female maenad-dancer who brings to mind the wild freedom of the god's followers in the myths of the god. Moreover, elsewhere in the house, there were panels depicting sacrifice in a rustic landscape.

The very frequent appearance of such themes on personal objects, such as signet rings, is noteworthy. Satyrs, cupids and countrymen making offerings to the gods of the countryside, doubtless reminded the wearer of his or her obligations to the gods and genii loci, who looked after fields and gardens. Popular themes of animal life, groups of cattle, panthers, goats, eagles, deer, dolphins and ants are equally symbols of the complex relationship, secular and religious, between man and the gods, either as sacrifices or as familiars of deity.

Roman Religion and Empire

The great ancient Mediterranean empire of Rome provides examples of the ways in which religion determined attitudes to nature, but also of the tendencies of business and politics to circumvent religious sanctions regarding treatment of nature. The amorphous deities of early Roman religion were considered to govern the domestic activities of household and agriculture, but also the wild natural forces they perceived in the forests, waters, weather, and wildlife. The Romans regarded certain features of the landscape, such as springs, groves, and mountains, as sacred. Their rituals and ceremonies were deeply involved in agriculture and the round of the seasons. In the years between 200 B.C.E. and 200 C.E., the Romans were deeply influenced by Greek attitudes to the gods and nature, so that their ideas of the gods became more anthropomorphic. At the same time, a growing Roman orientation toward practicality and desire for profit and control weakened the traditional sanctions that had given a modicum of protection to the natural environment.

Like Greece, Italy was part of the Mediterranean environmental zone, with a hot summer and relatively mild winter, but with more rainfall on average than Greece. The Roman Empire, however, embraced the entire Mediterranean area and extended beyond it into Western Europe. Such a vast area contained a variety of ecosystems from deserts to high forests.

Roman religion followed its own course even though it shared some sources with Greek religion, and in later times eagerly adopted Greek myths and religious practices. Early Roman gods were formless spirits or presences, sensed as *numina*, mysterious presences in the natural world, not as anthropomorphic as the Greek gods, although Romans accepted Greek portrayals of the gods from the late Republic onward. Any natural phenomenon could be seen as the result of a god's operation. Therefore any human activity that affected the environment could be seen as attracting the interest of or provoking the reaction of some god or goddess, and ought to be undertaken with caution.

Since nature was full of gods, natural events could serve as the medium for discerning their intent. To a skilled Roman augur, birds of many kinds, singly or in groups, bearing prey or flying free, on the left or on the right, displayed the plans of gods. In the sound of thunder or the rustling of leaves those who knew how to listen could hear the gods' words.

Roman gods were extremely numerous. Their hierarchy ran from great deities like Jupiter the thunderer to local spirits of springs like Juturna. Roman religion had an agricultural flavor, reflecting the observances of farm families who depended on the

orderly cycles of nature for subsistence. The Romans possessed gods of the farmhouse and storehouse (*penates*) and of the fields (*lares*). A god or goddess was the growing spirit of every major crop, such as Ceres of grain and Liber of wine. Every activity of the farm had a deity to be invoked for its success, such as Vervactor for first plowing, Repacator for the second, Imporcitor for harrowing, Insitor for sowing, and even Sterquilinius for manuring. On the margins lurked Silvanus and other wild gods of the forests. Romans were not without reverence for wild places, and personified mountains like “Father Apennine” as gods, but agricultural themes dominated their religion.

Religious worship and appreciation of natural beauty are reasons given for the ascents of high mountains recorded in Roman times. Rome’s most famous mountaineer was the Emperor Hadrian, who ascended Mount Casius in Syria by night to see the sunrise and to make an offering to Zeus. He narrowly escaped being struck by a bolt of lightning that killed the sacrificing priest. High mountains were places where the gods could be worshipped.

Sacred groves in Italy were as ancient, numerous, and widespread as in Greece. The Latin words for them were *nemus* (grove), and *templum* (a space marked out). The latter is the root of the word “temple.” The Romans never forgot the motive that had created them: religious awe. Virgil said that when they saw the old tree-covered Capitoline Hill, the rural folk who lived around it exclaimed, “Some god has this grove for his dwelling!” (Virgil, *Aeneid* 8:351–52). Seneca remarked,

If you come upon a grove of old trees that have lifted their crowns up above the common height and shut out the light of the sky by the darkness of their interlacing boughs, you feel that there is a spirit in the place, so lofty is the wood, so lone the spot, so wondrous the thick unbroken shade (Seneca, *Epistles* 4.12.3).

The numerous Roman religious festivals followed the calendar of activities of the ancestral farm, from the hanging of the plow on the boundary marker in the Compitalia in January to festivals of Saturn and Bona Dea, deities of the soil, in December. Sacrifice was usually in the form of the slaughter, cooking, and eating of domestic animals, although wild animals were sometimes offered. Bloodless sacrifices, such as the pouring of wine, oil, milk, or grain, or the presentation of fruit, cakes or cheese, were also made. Sacrifice was a gift to the gods in expectation of benefits, or in thanksgiving for them. The Latin phrase was *do ut des*, “I give (to you) so that you will give (to me).” The animal or substance sacrificed often represented the god. Since the number of victims was sometimes in the hundreds, the effect on the environment through killing animals, consuming fuel, and releasing smoke must have been considerable. Sometimes sacrifice was used as a way to avoid the environmental protections that religion afforded to sacred places. For example, Cato the Elder advised landowners to make a handy prayer “to the god whom it may concern” for permission to cut down trees in a sacred grove (Cato, *On Agriculture* 139–40).

Pliny the Elder, taking a different view, complained that people abuse their mother, the Earth, but should know better. Lucretius had claimed that Earth was growing older and weaker, and therefore less able to reward human labor. The idea that meager crops

could be blamed on an aging Earth was attacked by the agriculturist Columella, who placed the blame for nature's infertility not on senescence or changing climate, but on poor husbandry. A good farmer knows how to restore soil to fertility, but those who misuse the land should not be surprised when the result is diminishing crops and sterility. Horace scorned landowners who were neglectful of their land.

To what degree did the religious ideas held by the Greeks and Romans about nature affect their practical treatment of the Earth and its living inhabitants? There is no simple answer. Hunters spared some animals, particularly the young, because gods were thought to punish their killers. Prohibitions against cutting trees saved them in sacred groves. Animism provided an enchantment of nature that made people think twice before harming it. However, the undeniable fact that the natural environment suffered considerable damage at the hands of the Greeks and Romans remains to be explained, and it was more than one would expect from people who worshipped gods of nature and regarded much of the landscape as sacred.

Religion permeated all levels of society, and the beliefs of common folk preserved older practices. The environmental orientation of ancient religion was toward preservation of the natural order. Still, it is characteristic of human beings to evade religious prescriptions when it is in their perceived self-interest. It is possible that tree worshippers might have preserved a few sacred trees while they were cutting down whole forests, if they needed wood for fuel. Some of the mystery religions taught the oneness of human beings with the universe and nonviolence toward other forms of life, but they also stressed purity of soul and escape from the physical world, and therefore neglected the natural environment. Religious doubt increased in later classical times, and Christianity weakened the older nature religion.

Ancient religion could have provided constructive environmental attitudes. But these would not have been effective in conservation without knowledge of the workings of nature and the effects of human actions upon it. There were places where a body of practical knowledge of interactions with the Earth, the result of centuries of trial and error, survived. For example, the practices of subsistence farmers reflected adaptations to the limits of ecosystems they had to live within or perish. They took care of the land as long as their lives were not disrupted by war, which unfortunately they often were. It would have been difficult, however, to decide which practices would bring the best results when an environmental problem first appeared or was exacerbated from a tolerable level to an intolerable one.

It seems, therefore, that the course environmental problems took in the ancient world was not chiefly the result of the religious concepts of the natural world held by the Greeks and Romans. It was also the result of the technology they inherited and developed, the population levels they reached, the agricultural and other economic measures they took to feed, clothe, and shelter themselves, and the patterns of their rural and urban lives. Only through studying the interaction of all these factors will it be possible to gain understanding of the ecological failure that underlies the decline of ancient Mediterranean civilization.

Romanies (Gypsies)

If religion is popularly perceived – as it so often is – to include a place of worship, a clergy and a set of holy scriptures, then it is easy to understand why observers such as Hoyland, Roberts, Morwood, Greenfeld, and others should have reached the conclusions which are quoted below:

I never could meet with anybody that pretended to say what their private faith and religion may be (Hoyland 1816: 25).

They have, as a people, no religion (Roberts 1836: xvij).

The lack of religious ideas, and the want of a peculiar system of worship among the Gypsies, constitute remarkable features in the history of this strange people (Morwood 1885: 281–2).

They cannot be said to have a religion of their own (Greenfeld 1977: 52).

If, on the other hand the usual dictionary definition is adhered to, such as *Webster's* “belief in a divine or superhuman power or powers to be obeyed and worshiped as the creator(s) and ruler(s) of the universe [and the] expression of this belief in conduct and ritual” (1966: 1228) or *Encarta's* “particular institutionalized or personal system of beliefs or practices relating to the divine” (1999: 1516), then it is clear that they were wrong.

Romanies, often incorrectly referred to as “Gypsies,” descend from a migration out of India in the early years of the eleventh century. This exodus was prompted by a succession of raids led by Mohammed of Ghazni between 1000 and 1027 in his attempt to spread Islam into Northern India. The Hindu response was to assemble military forces known as Rajputs, conscripted from various language groups, though ones close enough to share the same genetic descent. The linguistic nature of the Romani language strongly suggests that it began as a composite military lingua franca (under the same circumstances that gave rise to the Urdu language), and for which the name *Rajputic* has been proposed. This only later crystallized into an ethnic mother-tongue when the troops and their camp-followers reached Anatolia and began to marry within the group and produce new generations of children. Because the first written account of the appearance of Romanies in the Byzantine Empire dates from 1054, we can assume that it was reached within fifty years or less of leaving India. If so, it was over two centuries before their descendants finally entered Europe – again because of the spread of Islam, this time toward the West.

It is not difficult to understand why outside observers were uniformly convinced that Romanies have no religion. Apart from there being no tangible evidence – a sacred text, a temple or a priest for example – Romani society is tightly closed to

outsiders, considerably reducing the opportunity to observe cultural behavior at close quarters. Ethnographers attempting to enter Romani households report being kept at arm's length by various means, even by being met at the door with feigned epileptic seizures or frightening explosions of profanity. But it is one of the aspects of Romani religious belief which keeps that barrier in place.

So entrenched is the idea that Romanies lack religion that it has become a part of European folklore: the story that "the gypsies have little or no, if any, religion . . . their church was constructed of curds or lard and the dogs ate it" (de Peyster 1887: 58) is widespread. Block repeated it half a century later: the gypsies, it is said, once possessed a church of their own built of cream cheese. On one occasion, however, when they were particularly hungry, they ate the church and for this reason are now without a national religion (1938: 234).

Because Romanies come ultimately from India, it is in Hinduism that the roots of their religion are to be found. However, awareness of this has become lost over the centuries and is only now being relearned by Romanies today. Likewise the daily cultural behavior in which Indian-based spiritualism (called *Rromanipen*) manifests itself so clearly is not recognized as such; asked what his religion is, a Romani is likely to say Orthodox or Roman Catholic, Mormon, Muslim or Bahá'í or any one of the nonindigenous faiths acquired, voluntarily or not, since arrival in the West.

Woodcock, like so many others, was wrong when he wrote that

The gypsies . . . are utterly without religious impressions . . . they brought with them no Indian idols . . . nor indeed Indian rites or observances, for no trace of such are to be discovered amongst them (1865: 84).

While Kounavine claimed to have found Brahma, Indra, Lakshmi and other Hindu deities continuing to be worshipped by name among Romanies in Russia, this has been shown to be fabricated. Nevertheless other connections with Hinduism are in evidence, although the names of only three deities have survived: Sara-Kali, Vayu and Maruthi. Shiva's trident, called *trishula* in Sanskrit, changed its role from Hindu symbol to Christian symbol and has become the Romani word for "cross" (*trus^ul*). This probably happened when the migration first reached Armenia; in the Lomavren language *trusul* means both

"church" and "priest." Similarly, *ras^aaj* "(Christian) holy man" represents a shift of meaning from Sanskrit *aroseya* "of a (Hindu) holy man." The word for "God" is Devel, (from Sanskrit *devata* "divinity," compare Hindu *dev*), while the Devil is known as *o Beng* (from a Munda root meaning a malevolent spirit).

The description here is specifically of beliefs found among the groups of Romanies classified as Vlax (Wallachian), from the dialects of Romani they speak. Vlax Romanies emerged as a distinct group in the Balkans during the five centuries of their enslavement there, where their social and physical isolation enabled them to retain traditions lost elsewhere. While each group maintains more or fewer of these, the present account must not be interpreted as descriptive of all Romani populations everywhere.

Some Romani groups in Europe today appear to maintain elements of Shaktism or goddess-worship; the Rajputs worshipped the warrior-goddess Parvati, another name for the female deity Sati-Sara, who is Saint Sarah, the Romani Goddess of Fate. That she forms part of the yearly pilgrimage to La Camargue at Stes Maries de la Mer in the south of France is of particular significance; here she is carried into the sea just as she is carried into the waters of the Ganges each December in India. Both Sati-Sara and St. Sarah wear a crown, both are also called Kali, and both have shining faces painted black. Sati-Sara is a consort of the god Śiva, and is known by many other names, Bhadrakali, Uma, Durga and Syama among them.

The names of two Indian deities have been preserved in some Romani riddles. Reference to the Vedic god of the wind and the air, Vayu (also called Marut), is retained in a number of these: *Kana hulavel peske bal o Vajo, legenisa- vol e c̣ar* (“When Vayu combs his hair, the grass sways”), *Amaro Vajo hurjal tela savorrenge podji, aj konik naṣti t’astarel les* (“Our Vayu flies under everyone’s petticoats, and no one can catch him”), *O pharo vurdon e Vajosko cirdajlo ekhe ṣele grastendar kaj phurden ande’l rrutunja* (“Vayu’s heavy wagon is pulled by a hundred horses blowing through their nostrils”); the answer to each is *e balval* “the wind.” In Indian theology the task of Vayu’s son Maruti (also called Hanuman) is to tear open the clouds and let the rain fall, and in Romani the expression *marutisjol o Devel* means “the sky [*lit.* “God”] is growing overcast.” The reference to a hundred horses may also be of Vedic origin; there are several references in the scriptures to the *avamedha yajña* or “horse sacrifice,” whereby in ancient India the king would release one hundred horses to roam freely through his kingdom. Stopping them or blocking their path was forbidden.

The female spirits or fates, in Romani called the *vursi- torja*, hover in its presence three days after a child is born to determine its destiny and to influence the choice of name the parents will decide upon. They may be compared with the Indian *matrka* or “little mother” spirits who also possess a baby’s destiny at the time of its birth. The red thread (the *loli dori*) tied around a new-born’s ankle or wrist and worn for two or three years afterwards to guard against the *jakhalo* or “evil eye” reflects the protective properties of that color, which is also worn or painted on the body in India.

The burning of one’s possessions after death and even, among some populations at least into the twentieth century, the ritual suicide of the widow has striking parallels with *sati* in India.

Time spent in the non-Romani world (the *jado*) drains spiritual energy or *dji*. Sampson (1926: 257) gives the various meanings of this word as “[s]eat of the emotions, heart, soul; temper, disposition, mood; courage, spirit,” comparing it to Sanskrit *jiva*, Hindi *ji*, “life, soul, spirit, mind.” In some dialects it has the additional meaning of “stomach.” One’s spiritual batteries can only be recharged by spending time in an all-Romani environment – in the normal course of events, in family homes. It is in the area of spiritual and physical well-being (*baxt*) that the Indian origin of the Romani people is most clearly seen.

In the preparation of food, and in one's personal hygiene and deportment, it is absolutely essential that a separation between "pure" and "polluted" conditions be maintained. A pure state is achieved by maintaining spiritual "balance" or what is called *karma* in India (and in Romani *kintala*, or in some dialects *kintari* or *kintujmos*) in one's life and avoiding shame (*ladz'av* or *ladz'*), being declared unclean or, in extreme cases, being shunned by the community. Maintaining balance or harmony pleases the spirits of the ancestors (the *mulé*), and they are there to guard one and help one to do it, but if they are displeased, they will mete out punishment by way of retribution (*prikaza*). Depending upon the nature of the transgression, this may be mild (e.g., stubbing one's toe) or so severe as to involve sickness and even death. The consequences of *prikaza* underlie the universal Romani belief that nothing is an accident; that nothing happens simply by chance.

The penalty for extreme pollution is being banished, or made an outcast, and an out-caste, from the community, which may or may not imply a state of pollution, can be imposed also for other reasons (e.g., disregard for territorial claims). Being in a state of pollution is literally to be "smeared" (i.e., with menstrual blood). This can be contrasted with being "dirty," but only from physical dirt.

Prikaza brings bad luck (*bibaxt*) and illness (*nasvalipe*), and it can be attracted even by socializing with people who are not *vuz'e* (*vuz'o* "clean"). Non-Romani people are not seen as *vuz'e*, which is why Romanies avoid contact that is too intimate. But this is not an inherited condition of non-Romanies, it is because these cultural practices are not maintained. A non-Romani woman who marries into a Romani family is expected to adopt them, and in doing so becomes in that context *vuz'i*.

The Ayurvedic concept of ritual purity and ritual pollution, so central to Romani belief, existed in the eleventh-century caste system and continues to exist today; thus members of the same *jati* (sub-caste) may eat together without risk of contamination, for example, but will become polluted if they eat with members of other *jati*; and because the *jatis* of one's associates might not always be known, contact between the mouth and the various utensils shared with others at a meal is avoided, just to be on the safe side. In conservative Romani culture, liquids are poured into the mouth from a container held away from the lips, so that the rim of the vessel (the *kerlo*) is not touched; smoke from a shared tobacco pipe is drawn through the fist clenched around its stem, again to avoid making contact with the mouth. The surest way not to touch utensils used by others is to eat with the fingers, and every one of these habits is to be found among Romanies today.

Like the Rajputs, some Romani groups divide foods into "ordinary" and "auspicious" or "lucky" (*baxtalo*) categories (the Rajputs' terms for these two categories mean "cold" and "hot," though these have nothing to do with either temperature or pepper); this distinction reflects the close relationship between food and health, a particular ingredient being not only beneficial to the physical self but also to the spiritual. "Auspicious foods" include those which are pungent or strongly flavored, such as garlic, lemon, pickles, peppers, sour cream and so on. The use of red pepper in some traditional Romani

dishes is typical of Rajput cuisine particularly, and such food is called *ito* or “piquant” in one Romani dialect. Also in common with Indian culinary behavior is the practice of not preparing dishes far in advance of their being eaten, and of not keeping left-over food. Dishes set for the dead at a *pomana* (wake) table or a *slava* (saint’s day) table are eventually disposed of by being offered to passers-by, never just thrown away. There are very many customs associated with food and eating: potatoes (*kolompirja*) are not eaten at a *pomana*; there cannot be an even number of chairs at a *pomana* table; greens (*zelenimata*) are not eaten while one is in mourning, or expecting a baby, and so on.

Because access to physicians and hospitals is only sought in extreme cases due to their polluting association, safeguarding the health of the community *within* the community is of special importance. Like groups in northern India such as the Banjara, some Romani populations distinguish illnesses which are natural to the group; these are such things as heart complaints, rashes, vomiting, hiccups, insomnia or irritability, from those which are the result of overfamiliarity with the *jado* or non-Romani world. These latter include, for example, all sexually transmitted diseases. For such afflictions, a non-Romani physician needs to be consulted; but for “Romani afflictions,” traditional cures are provided by a *drabarni* or female healer. This is the same as the Hindu *siana*. The root of the word *drabarni* is *drab* which means “medicine” (from Sanskrit *dravya* “medication,” compare the Hindi word *darb*). It is also the root of the verb *drabar*, which is usually translated in English as “to tell fortunes,” but which from the Romani perspective means “making well.” When speaking English, Romanies prefer to call this skill brought from India “advising” rather than “fortune telling,” for which another verb, *duriker*, exists.

If it is necessary for a person who has contracted a *gadz’ikano nasvalipe* to be admitted to hospital, relatives and others will go to him, often in considerable numbers, to provide *dji* and help restore balance. “Relatives, their relatives, and friends of a Gypsy flock around his hospital bed because [of] their culture” (Anderson and Tighe 1973: 282); only recently have hospital administrations begun to recognize this as cultural behavior and to accommodate it. Depending upon the nature of the non-Romani affliction, the individual may be declared defiled; not visited in hospital but instead banished from the community. This is invariably the response when this is, for example, syphilis, AIDS, or other such disease. Infections of this kind are a clear indication of a too-personal involvement in the nonRomani world, since it is assumed that they could never be contracted within the ethnic community.

Romanies and Other Religions

The journey across the Middle East took place too rapidly for Islam to have had an impact on Romani spiritual belief, as well no doubt because it was the religion of an enemy people. There is no linguistic impact at all directly from Arabic, and none from Persian religious vocabulary. Nevertheless there are hundreds of thousands of

Romanies throughout the Balkans and Turkey who are Muslim, having converted, or having been converted, during the centuries of Ottoman rule in the area.

Zoroastrianism existed in northwest India at the time of the exodus at the beginning of the eleventh century, and in Persia through which that migration passed, and a number of writers have suggested that Romanipen has acquired at least some aspects of that religion, particularly its dualism and the significance of fire. It is unlikely that this was the case, however, given the circumstances of early Romani history, the time and location involved, and the fact that these are also characteristics found in Hinduism.

There are numbers of Romanies who profess the Jewish faith, though in each documented case it has been the result of conversion following marriage to a Jewish spouse. Reportedly, during the Second World War several Romani–Jewish marriages took place in a concentration camp (and known as the “marriage camp”) close to the Serbian border, though the fate, and religious persuasion, of any survivors is not known.

Christianity was first encountered in Armenianspeaking Anatolia, at the eastern end of the Byzantine Empire. The Romani words for “Easter,” “co-father-in-law” and “godfather” are of Armenian origin, all concepts specific to Orthodox Christianity. Whether it was adopted at that time or not is unknown; in the Christian Byzantine Empire professing Christianity clearly brought benefits to the outsider Romani population, and later presenting themselves as Christian penitents and pilgrims in Europe was also a means of distancing themselves from the Muslim threat. But in Ottoman Turkey, being Christian was a liability, and the seriousness with which either religion was embraced is open to question.

In Europe, it was often the Church that was most openly hostile to Romanies. In 1568 Pope Pius V banished them from the entire realm of the Holy Roman Empire, and priests in the Eastern Rite church could be excommunicated for performing Romani marriages. Monasteries in the Romanian principalities were reportedly the cruelest of all toward their slaves, and in Western Europe, Romanies were routinely forbidden from entering churches to worship, and had to listen from outside through the windows. Such incidents are not entirely unheard of today.

Some Romani groups in France relate the story of how Christianity first came to their people. Originally, they say, the woman leader of a group of Romani metalworkers who lived along the Rhône and whose name was Sara saw a boat on the river which was sinking. In it were Saint Mary Salome, Saint Mary Magdalene and Saint Mary Jacobi, the three Marys who comforted Jesus as he died on the cross. Sara was expecting this since she had seen it in a dream, and she waded out into the water and threw out her cloak which became a raft, and which enabled the three Marys to reach the riverbank safely. As a reward, they made her their servant, and converted her to Christianity. This story, however, seems to originate in European, rather than Romani, tradition. Generally speaking, the Romani population of an area will claim to follow the predominant religion of that area: Protestant in Protestant lands, Roman Catholic in Roman Catholic lands and Orthodox in Orthodox lands.

In the early 1950s in northwestern France, a Breton evangelist named Clément le Cossec began preaching Pentecostal Christianity to Romanies in that region, and it spread rapidly through France and Spain, then the rest of Europe, and to North and South America. Today, “Born-Again” Pentecostalism is the fastest growing and most widely found religion among Romanies. It has been suggested that there are two main reasons for this: first, that it is a church that tells its congregants that they are loved, a personal aspect not characteristic of more formal churches, and a message not formerly heard by Romanies. Second, that, compared with the Roman or Orthodox churches, it is easy to become a pastor, and to establish a church of one’s own. There are today hundreds of Romani churches, with pastors and congregations who are Romani, who preach in Romani and who even have Romani-language evangelical radio programs and who distribute Romani-language sermons on audiocassette tapes. Significantly, the growth of “Born-Again” Christianity has caused a split in the Romani population, some of whom believe it is a major factor in the loss of traditional *Rroma-nipen*. One successful Pentecostal church in Dallas, Texas, developed a program that has deliberately integrated references to dualism, balance, ancestral spirits and other aspects of *Rromanipen*, which do not conflict with Christian doctrine, stressing parallels rather than differences.

There are Romanies who have embraced Mormonism, and the Bahá’í religion has acquired numbers of converts, especially in Spain. But with the exception of those completely assimilated to the non-Romani world, whatever religion may be professed, it will exist syncretistically with more or fewer elements retained from the original set of beliefs and practices which find their origins in India.

Romanticism and Indigenous Peoples

Romanticism with regard to indigenous cultures has its roots in the edenic episode wherein nature and culture were rent apart in the generative moment of the Western narrative. As a taxonomic device, this separation has most often functioned in favor of “culture” and its putative bearers: “culture” defines the “properly human,” and it is that which allows humans to claim a certain stewardship over nature. Configured historically by way of imperialism, this taxonomy also distinguishes between people of God (saved) and people given over to nature (fallen). Whether we choose to map this relationship according to the coordinates offered by Augustine, Columbus, or Andrew Jackson, for example, the results will largely be the same. Native peoples – cultural and categorical “others” – become the inverse and absence of “civilization.” Lacking spirit, reason, and private property, among other crucial markers, natives are viewed as children of nature. Redeeming them (if indeed they are human and redeemable) entails converting them away from the world, lifting them up, as it were, from their earthly condition.

And yet the very taxonomy put into place by the edenic myth has an historical alter ego. As if unwilling to wait for the apocalypse – the mythological or technological rectification of history – many Westerners have sought to return to the garden by means of a shortcut. Ironically, this path is found precisely through the romantic recoding of the dominant taxonomy. Whether drawn from public discourse or scholarly treatises, we might distill a set of categorical oppositions concerning the relationship between romantic desires and the decidedly less romantic modern condition:

Nature ~ Culture
(source of redemption) ~ (liability, a state of decay) Past ~ Present
Hunting/agriculture ~ Industry/global economy Rural ~ Urban
Communal ~ Private

In romantic thought, what is striking about this set of oppositions is the way each term in the right-hand column is understood to be a corruption of the left-hand one. The remedy, then, is to chart a return to the former (if sometimes fictive) state by whatever means available. What is relevant for our purposes are the channels through which this symbolic “return” is navigated. As strong as nostalgic sentiments might be, actually traversing any of these categories is, at turns, impossible, impractical, or frankly undesirable. What is needed is a stand-in: a scapegoat symbolically and

metonymically linked to nature who can perform an eternal return to the garden. Enter the native.

Whether in tandem with real political agitation or in place of it, indigenous peoples have been looked to as an environmental and spiritual panacea by people around the globe in their retreat from the perceived failures and implications of modernity. Surely there are positive aspects to this phenomenon, as there is much to be learned from native traditions, particularly in terms of resilience and creativity. And one might add that it is high time that native peoples be celebrated rather than denigrated. It should be noted, however, that the degree to which Indians were “the first ecologists” is a hotly contested issue. Defining, defending, and denying the Earth ethic of Native Americans has become an academic blood sport. Quite beyond the historical and institutional concerns of this debate, I would call attention to several ideological aspects of romanticism that are problematic. First, romanticism is reactionary and escapist: romantic views of indigenous peoples spring from other peoples’ needs and desires, not from an appreciation of indigenous people in their own right. Second, romantic tendencies are predicated on a kind of social evolution model, even while its valuations are ostensibly reversed from the imperial pattern. Native peoples are looked to as an antidote to modernity precisely because they are understood – however uncritically – to inhabit the social past, specifically as anachronistic representatives of an imagined natural past (which explains why Native American exhibits are frequently located in natural history museums). The ramifications of such a view are anything but comforting. Third, romanticism reifies the very traditions it exalts, paradoxically suffocating that from which it seeks inspiration. Romantic images portray tradition as fixed, stable, uncontested and, linking us back to our earlier points, anti-modern. To imagine tradition in this way eliminates the prospect that the people romanticized will be heard when they speak in their own voice – even when it comes to speaking about those things which matter to them most, like the land and nature itself.

The narrative I have painted in broad strokes is, of course, distorted in significant ways. Observing this, we want to acknowledge that most people do not imagine or inhabit the world in ways so divided. Most of all, the dichotomy as stated obscures real political efforts of people and groups to heal and sustain nature in ways that neither depend upon the Western narrative nor the burdening of indigenous peoples as surrogate messiahs. That said, the romanticization of native peoples remains – indeed, it seems to escalate with every year and with each new environmental crisis. Complicating the picture, many indigenous people have willfully engaged this discourse, sometimes as authors.

Romanticism in European History

Romanticism has long been recognized as a major trope in modern environmental thought and practice. Romanticism, however, was a complex, diverse, changing historical movement. Our present conceptions of Romanticism tend to be defined as much by critics and subsequent commentators as contemporary articulations by Romantic figures. Even the representations of Romanticism within academic studies are the products of different readings from different historical and theoretical positions, and seldom free of polemical overtones. As de Man has noted: “From its inception, the history of romanticism has been one of battles, polemics, and misunderstandings: personal misunderstandings between the poets themselves; between the poets, critics, and the public; between the successive generations” (de Man 1993: 4). Contested are not only the meanings of Romanticism, its very boundaries, origins and influences, and who might be considered a Romantic, but also its conception of nature, its relationship to religion and its relevance to modern environmentalism.

An emblematic text of European Romanticism has long been Wordsworth’s *The Prelude*. It is precisely this emblematic status of the poem that gives contestation over its appropriate reading such significance. The poem is an account of the poet’s formation as a poet, from his childhood experiences of nature to his mature vision of the sublime. Abrams reads Wordsworth’s poem as part of his program for the secularization of inherited theological ideas, for a “natural supernaturalism.” The “high argument” of *The Prelude* is that the heights and depths of the mind of man are to replace heaven and hell, and restore the lost paradise; we need only to unite our minds to nature in a holy marriage, and paradise is ours (Abrams 1971: 17–140). Hartman gives central place to the cultivation of the imagination in Wordsworth’s poem, attending particularly to the role that “spots of time” – places in nature and time, and in creative time – play in this cultivation. The spirit that lurks in spots of time renews the poet *vis-à-vis* nature; as the *genius loci* or the indwelling spirit of a place, it also acts as spirit inspiring the genial powers of the poet. But for Hartman, the spots of time bring the poet closer to his imagination, not to nature, and the transference of significant experiences to nature acts solely to allow such events, such moments, to reach through time. *The Prelude* is an exercise in soul making, the development of the imagination and the formation of a poet, in which nature takes a secondary role (Hartman 1964: 208– 59). McGann, in contrast, sets out to expose the ideology within Wordsworth’s poetry, and within such readings of his poetry. McGann is critical of Wordsworth for finding consolation in nature when he should be worrying about the economic realities of the rural life he idealizes. He reads Romantic poetry as an escape from or even suppression of socio-

political conditions (McGann 1983: 81–92). These readings of Wordsworth have been highly influential.

Recent critics, however, have found in *The Prelude* both a Romantic ecology and an important religiosity. Bate, for example, argues that Wordsworth's pastoral poetry, highlighting the life and beauty in nature, and finding poetry not only in language but also in nature, has a permanent, enduring power – it is a language that is “ever-green.” By fostering an emotional communication between human beings and nature, a love of nature leading to a love of humankind, Bate contends that Wordsworth's poetry offers a political model for modern environmentalism, an “ideology” based on a harmonious relationship with nature that goes beyond, and in many ways deeper, than the neo-Marxist political model to which McGann appeals (Bate 1991: 12–35). Prickett, on the other hand, challenges Abrams' reading, arguing that *The Prelude*, given its historical context, displays not so much the language of secularization as religious revival. Pointing to the relative absence of God from neoclassical literature and critique, and more generally from public life at the end of the eighteenth century, Prickett finds Wordsworth's poem striking for its overtly religious language. Abrams represents Romantic poets as rhetorically adorning the robes of prophets who through the illumination of the mind of man and its communion with nature could restore paradise on Earth. Thus Wordsworth represented himself as the chosen son for his time, the poet now replacing the priest. But

Prickett contends that this claim is not simply the poet's retention of the rhetoric of the religious tradition he sought to displace. He argues that we need to take seriously Wordsworth's claims for the religious calling of the poet, and reads *The Prelude* as a pious account of divine election modeled on St. Augustine's *Confessions* (Prickett 1986: 95–104).

The Prelude closes with an image of the poet's ultimate confrontation with nature, the divine and himself; climbing Mount Snowdon, he emerges from a fog to confront a terrifying alpine vista – brooding masses of hills and the dark sea receding into infinity, a chasm of raging waters. The experience of the sublime is the response of the viewer to such a vision that transcends the powers of understanding and imagination, with fear giving way to pleasure as the mind is expanded to encompass what previously seemed beyond comprehension. For Wordsworth, the imagination matured through “spots of time” has the power and autonomy to grasp the whole and dwell in the infinite. An alternative image of such a scene of a wanderer arrested by an infinite alpine landscape is offered by Friedrich's famous 1818 painting “Wanderer above the Sea of Fog.” In this image the view remains veiled in part by the fog, which, in addition to heightening the role of the imagination, fragments the visible, eradicates the connecting ground and renders the scene insubstantial. The unusual, distorted perspective only finds its connection in the central figure of the wanderer, which orders and mediates our view of the landscape. This large, central figure with his back to us, viewing the scene, reminds us that the sublime lies not in the object viewed but in the subjective effect on the viewer; it is the experience of nature that is depicted in the painting, how we

as viewers participate in what we see. The *Rückenfigur* thus leads us to reflect on our own views of nature. Friedrich's landscapes are natural scenes infused with the divine, yet not explicitly; the divine is both present and absent. His landscapes also represent the alterity of nature, a nature the human subject is not able to appropriate. Indeed, a chasm stands between the wanderer and the landscape before him, a disjunction in the planes of the painting. Whereas in Wordsworth's poem the divine power of the imagination enables the poet to feel at home in the infinite, in Friedrich's image the play between proximity and distance, familiarity and estrangement, revelation and concealment, serves to depict the longing for unity with the infinite rather than its realization.

These images of the experience of the sublime depict on a grandiose and abstract scale what was a concrete and common experience of Romantic figures – a sense of alienation from oneself, from society, from the divine, and from nature. Reflection on this sense of alienation was also a critical consciousness of the limits of all knowledge and experience. Romanticism has often been depicted as a form of idealism in which all is resolved into the human subject. Certainly Romantic thinkers were acutely aware of the role of the mind in knowledge of the world. Yet they were also aware of the impossibility of a full representation of the material world or the divine, of their irreducible otherness. Reflection on the alterity of nature was an acknowledgement of its potent presence, that the material world cannot be wholly abstracted into conceptual knowledge, that nature is at once impenetrable and the ground of all being. Poetic renderings of nature articulated the ultimate indecipherability of nature's script, and hence the need for a continual creative reading and writing, rereading and rewriting, as an unending exploration of its elusive meaning.

Historically, these reflections were not so much a reaction to Enlightenment thought as a development of it. Romanticism has significant continuities with the critical philosophies of the Enlightenment and their radical questioning of social, political and religious institutions, and of traditional systems of thought. Its expression of the impossibility of complete systems of thought or perfect works of art, of the fragmentary nature of all human production, is an extension of Enlightenment critical tendencies. The experience of the French Revolution, in particular, its promise and its failure, was pivotal to its preoccupation with the tensions between illimitable aspiration and actual limitation. The eighteenth century's discrediting of traditional authorities and certainties, its faith in intellectual, moral and material progress, its faith in humanity and earthly happiness, generated an atmosphere of optimism about new freedoms and new possibilities for individuals and society as a whole that was formative for many early Romantics. The failure of this promise, and the violence unleashed by the Revolution and its aftermath both in France and elsewhere in Europe, led to a conception of modernity in which a sense of crisis, a sense of alienation from nature, the self and society, and a sense of the infinite gulf between the ideal and its realization was central. Many poets used the metaphor of the Fall for this crisis, but now figured as a secular history of the individual and humankind, with the current suffering alleviated by the

hope of redemption through communion with nature or a strengthened imagination. The celebration of “country” so characteristic of Romanticism was also an eighteenth-century theme – the glorification of the countryside and local places in opposition to the metropolis, of indigenous experiences of nature and culture as opposed to universal truths, of the songs and lore of common folk as opposed to elites or aristocrats. But many Romantic exaltations of country life were written from the distant perspective of privilege rather than direct experience, or ignored the physical and social hardships endured by country folk. Moreover, in the aftermath of the revolutionary wars the love of country often turned into the love of nation and virulent forms of nationalism.

What is not contested is the privileged place of the artist in Romanticism. As the example of Wordsworth shows, Romanticism saw artists cease to be representatives of religious and political powers, and assume the authority in their own right to speak in the name of the concerns of humanity. Bénichou argues that in France the dethronement of former spiritual powers and the elevation of the self to the highest level of critique and edification begun in the eighteenth century led in the Romantic period to the investment of writers with high social function and spiritual power, what he terms the consecration of the writer. In Germany, Schiller gave aesthetics a political role, arguing that an aesthetic education alone is capable of exciting and refining feelings, of cultivating sensibility, so that citizens could take pleasure in the form of things and thus be ready to act according to rational principles rather than out of self-interest. It is through beauty that the human being achieves freedom. Friedrich Schlegel argued that by possessing an element of divinity in his soul, the poeticizing philosopher or the philosophizing poet is the modern prophet. But for all the discussion of artists and their productions, few artists managed to live from their art alone and their aesthetic manifestos did not translate into real political power.

One area where artistic genius and the role of imagination did come to be especially valued was in the study of nature. Kant drew parallels between the judgment of art and the judgment of organic nature in his 1790 *Critique of Judgment*. Schelling developed Kant’s philosophy of nature, making a powerful argument for all of nature and each natural product to be conceived as organic, as a complex, dynamic organization of formal and material principles. Schelling held that what is essential to art as well as to the organism is the creative or productive activity of relating matter and form, the real and ideal. It is the *dae- mon*, the creative spirit or indwelling element of divinity that is part of the nature of all human beings that is alone able to comprehend the productive, synthetic forces of art and nature. But although the study of nature during the Romantic period emphasized the correspondences between the hidden forces of nature, the imaginative genius within human nature and divine creator, it would be oversimplifying their insights to label such philosophies of nature pantheism. Romantics were acutely aware of the gap between infinite aspiration and its actualization, and of the limits of articulation, and often resorted to metaphor when approaching what defied definition, whether it be the absolute or the fundamental forces of nature.

Indeed, the greatest danger in reading Romanticism is confusing the figural with the literal. Perhaps the continued contestation over Romanticism arises from its excessively figurative expressions, from its deceptive play with language, and from its unusually reflexive and ironic critical positioning. Confronting the boundaries of human comprehension and language, even as they had a vision of what exceeded such boundaries, Romantic works are often difficult to engage and hence it is understandable that their significance has been variously construed. As Bate and Oerlemans convincingly demonstrate, however, critical engagement with Romantic works can be an important stimulus for reflection on nature and religion of particular relevance to the concerns of modern environmentalism.

Romanticism in European Literature

European Romanticism's complex understanding of the word "nature" must be seen against the background of the eighteenth century and the growth of the industrial city, which gave rise to a new understanding of the beauties of nature as these ceased to be a mere backdrop to human activity and became the place where human beings could be closest to themselves and to God. Appreciation of the grander landscape beauties of nature and a fascination for the "sublime," encouraged by the popularity of artists like Salvator Rosa (1615–73), resulted in a new "aesthetics of the infinite" that coincided with changing religious views of nature.

Behind the Latin tags *natura naturans* and *natura naturata* lie roots extending as far back as Classical times, but now revived in complex ways. The latter consists of the "forms of nature," laid out to be investigated and observed. The former, literally "nature naturing," is nature experienced as active, dynamic and constantly changing. It refers to that animating principle that gives life to the objects of nature, which may remain at the disposal of God, or else be regarded as a pantheistic "presence" or a "power of harmony" that in Wordsworth's "Tintern Abbey" "rolls through all things" without God's help. For the Anglican priest John Keble, however, the Book of Nature is precisely to be "read" as an indication of the workings of God. In Keble's poems in *The Christian Year* (1827), nature is a book "which heavenly truth imparts" to the Christian "reader." In a very different Romantic portrayal of Christianity, Chateaubriand's *Genie du Christianisme* (1802), drew his experience of nature from his visit in 1791 to America, where the "cultivated fields" of Europe, which "everywhere meet with the habitations of men," are replaced by virgin forests and the "abysses of cataracts" where alone the unknown "Supreme Being manifests himself to the human heart" and we can find ourselves solely with God. Nature is only truly appreciated where it has escaped the destroying hand of human cultivation.

In the *Lyrical Ballads* (1798), Wordsworth claimed to be writing in the "real language of men," deliberately giving attention to rustic life lived "among the natural abodes of men, Fields with their rural works" (*The Prelude* XIII, 102–3). It was here that the poet sought to recover the roots and affections of human nature. For the young Wordsworth, at least, and certainly for Shelley and Rousseau, human nature is fundamentally good, and most truly discovers itself as it recovers an affinity with nature that the city-dweller has lost. Though their aspirations remained highly idealized, the Romantic poets at least abandoned the classical literary conventions of Theocritus

or Virgil, so beloved of the eighteenth century, and donning their walking boots gave minute attention to “the mighty world / Of eye, and ear,” and “the beauteous forms / of nature” (“Tintern Abbey”). Yet, at the same time, they were not blind to the heartlessness of nature’s creatures, and Keats, even while he celebrates the “flowers gay / Of periwinkle and wild strawberry,” laments the “fierce destruction” wrought by the shark, the hawk or even the “gentle robin” as “ravening,” as it attacks the worm. For William Blake, this same worm is a canker which destroys the rose by its “dark secret love.” Nevertheless, though we live in a fallen world (an acknowledgment which awaited the advent of Darwinian theory later in the nineteenth century), still, for some Romantics the goodness of nature is seen as a proof of the goodness of its creator, while for the pantheistic Wordsworth (Lucy, though her name is not mentioned in the brief lyric of 1799, “A slumber did my spirit seal”), death returns us to an absolute unity with the natural world of rocks, and stones, and trees. Blake, who can “see a World in a Grain of Sand” (a remarkable though probably unconscious echo of Julian of Norwich’s hazel nut that is the whole of creation), also sees heaven in a rage at a caged bird (“Auguries of Innocence”).

It is typical of the Romantic awareness of the active principle in nature (*natura naturans*) to be conscious also of the universal in the tiny specifics of natural things, a symbolic acknowledgement of what Coleridge calls “the translucence of the Eternal through and in the Temporal” (*The Statesman’s Manual*, 1816). At the same time, and concurrently with German Idealist thought, Coleridge and Wordsworth celebrated the shaping spirit of the imagination, recognizing the mind’s power to participate in the creation of what we see in a noble interchange of nature and the human. In Coleridge’s words, “we receive but what we give / And in our life alone does Nature live” (“Dejection: An Ode”). In an ancient tradition, drawing upon both Greek mythology and Judeo-Christian thought, the German philosopher of Romanticism, Friedrich Schelling, claims a profound kinship between the human spirit and nature. In his *Ideas for a Philosophy of Nature* (1797), Schelling affirms “we do not want that nature only accidentally correspond to the principles of our spirit.” Thus for the poet Novalis (1772–1801) the true being of nature and the true being of humans are analogous and one, each revealing the truth of the other. Goethe’s young Werther, at the beginning of *The Sorrows of Young Werther* (1774) writes, with absolute truth,

My whole being is filled with a marvellous gaiety, like the sweet spring mornings that I enjoy with all my heart. I am alone and glad to be alive in surroundings such as these, which were created for a soul like mine.

Even at his death, Werther remains one with nature and the Eternal One: “Through the storm clouds flying by, I can still see a few stars in the eternal sky. No, you will not fall. The Eternal One carries you in his heart as he carries me.”

For Goethe and Romanticism there is no final reconciliation between the spirit *in* nature, of which we are a part, and nature *as* spirit, often seen in terms of the ancient Mother-Goddess, and there is a complex, eclectic coming together of Christian theology and mythological references. Later in nineteenth-century literature, the Moth-

erGoddess may be personified in such figures as Mother Carey in Charles Kingsley's *The Water Babies* (1863), a parable of the purity of nature set against the life-denying city as the chimney sweep Tom becomes conscious of his grimy body, falls into a river and is transformed into a water-baby.

But there is more to Goethe's view of nature than *Wer-ther*. He was also fascinated with scientific observation of plants, animals, rocks, light and color, holding an idea of evolution that, unlike Darwin's later theory, is nonlinear. For Goethe, what evolves in nature is timeless, a spiral development of endless motion, at the heart of which is a central Romantic concept – polarity: the idea that natural processes live by the interaction between opposites. Without this, as Blake said, there can be no progression. The Romantic fascination with science and nature (which often fed a highly mythological viewpoint), finds a later devotee in John Ruskin (1819–1900), who approached art entirely through nature. In some ways a successor to Wordsworth, Ruskin took a far more intelligent interest in nature, and, with his strict religious upbringing, regarded nature, like Keble, as a holy book. He sometimes described himself as nature's priest. As he looked at the minute particulars of nature, Ruskin was both a poet and a scientist, and, like Goethe and the artist Turner, he was fascinated by the quality of light and color. Ruskin regarded nature as a moral being, for both good and ill, objects in nature often "speaking" to us as moral tutors. In *Modern Painters* (vol. 5), the pine tree has "a tremendous unity [which] absorbs and moulds the life of a race. The pine shadows rest upon a nation."

The complex Romantic view of nature has continued to influence our thinking. Aware, long before Darwin or Tennyson's evolutionary version of "Nature red in tooth and claw," of the cruelty in nature, Romanticism nevertheless regarded nature as a primary source of our education and was deeply aware of the dangers of our neglect or destruction of its delicate balance. In the symbiosis between nature and the human spirit, the destruction of the former, symbolized, for example, by the albatross in Coleridge's "Rime of the Ancient Mariner," was also, inevitably the demise of the latter.

Romanticism – American

American Romanticism is the general term used to encompass the intersections among several philosophical, theological, political, and artistic movements that occurred in the United States during the middle of the nineteenth century, a period characterized by American territorial expansion and industrialization on the one hand, and sweeping religious and social reforms on the other.

Like its earlier European counterparts, American Romanticism represented a reaction to the eighteenth-century Enlightenment values of order, rationality, scientific method and urbanity. While not fully rejecting the gains of the Enlightenment – which included a critique of orthodox Christianity and religious “superstition” that many Romantics shared – Romanticism sought to reinvigorate those aspects of human knowledge and experience that the Enlightenment had pushed aside. These included: attention to mysticism and psychological supernaturalism and a thematic emphasis on the value of the imagination, sentimentalism, natural spiritualism, and pastoralism.

A prominent theme in this intellectual and artistic movement was a renewed attention to nature, not simply as a system of laws to be interpreted (an Enlightenment trope) but as a source of spiritual and psychological renewal. Like the British Romantics (such as Wordsworth and Coleridge), the American Romantics saw experience in nature as a means to return to a childlike state of innocence, unsullied by civilization. Regained innocence, in turn, could lead to a higher level of insight into the nature of the good, the true, and the beautiful (and for some, also, the nature of God). The responsibility of the Romantic artist was not only to advocate for such a return to nature, innocence, and moral purity but also to convey it to others through poetry, essays, paintings, and related arts. Because the American landscape was already steeped in symbolic associations (America as “the new Eden” or “New Canaan”), it is not surprising that the American Romantics would emphasize the uniqueness of American nature in particular. Such emphasis built on the already established symbolic importance of American nature, while also contributing to the Romantic agenda of shaping a new national identity.

American Romanticism is traditionally thought to have begun in the late 1820s and to have ended by the 1860s, the period of the Civil War (1861–1865). Several important historical events and trends were associated with these middle decades of the nineteenth century. Perhaps most importantly, the Romantic era saw a movement away from

– and calls for a return to – the Jeffersonian values of agrarian republicanism that had dominated during the preceding Federalist period. Thomas Jefferson had argued

that the moral, spiritual, and national integrity of American culture rested upon the citizenry's relationship to the natural landscape and its gentle cultivation, and he had imagined a nation of small farmers. By the 1830s and 1840s, however, industrialization had begun to spread across the American landscape in the form of railroads, steamboats, and agricultural machinery. According to historian Leo Marx, this led to a consciousness of what has been called the "machine in the garden" – the recognition that the utopian and rural values of early American identity were being challenged by industrialism, expansion, and urbanization.

The middle of the nineteenth century also marked a change in American self-perceptions in two important ways. Perhaps most importantly, the question of slavery and abolition became increasingly urgent as the economic and social climates of the urban North and the agricultural South diverged radically and as the opening of the western frontier shifted the balance of political power. At the same time, the territorial expansion of the United States westward also changed the way Americans came to understand and to construct their identity. During this period, characterized by the philosophical imperatives of expansion known as "Manifest Destiny" and shaped by the war with Mexico from 1846–1848, the settlement of the American west was advancing rapidly, so that by 1893 Frederick Jackson Turner could claim that the frontier was closed and that it had irrevocably shaped what it meant to be an American. In the "Frontier thesis," Turner had completed the idealization of the west that had begun during the presidency of Andrew Jackson (1828–1836), and the settlement of the west brought with it new mythologies, stereotypes, and images of progress. American Romanticism may be understood as an alternatively nostalgic and progressive response to these shifting values and as an effort to negotiate the tension between different models of the American relationship to the landscape.

These changing attitudes toward the American landscape and its relationship to national identity are reflected in the art of the Romantic period, particularly in the works of a group of painters known as the Hudson River School. Established during the 1820s and working until about the 1850s in the United States, these painters represented in their images the tensions surrounding American attitudes toward nature and the unsettled wilderness. While earlier paintings of the American landscape had emphasized the aesthetic tradition known as the picturesque, in which the harmonious balance of natural and human elements was central, the Hudson River painters introduced the more complex dynamics associated with the sublime. The sublime had been a central theme of European Romanticism since the 1780s and was used to explore the mind's encounter with objects that overwhelmed the understanding. According to its most important theorist, the English writer Edmund Burke (1729–1797), the sublime was an experience characterized by feelings of fear and anxiety in the face of something awesome – particularly wild and rugged landscapes such as the Swiss Alps, Niagara Falls, or, later, the American west.

While elements of the sublime are present in the work of many painters associated with the Hudson River School, including the works of Asher B. Durand (1796–1886),

paintings such as Thomas Cole's (1801–1848) *The Oxbow, the Connecticut River near Northampton* (1836) are considered representative examples of the movement. In this image, Cole captures the contrast between a calm and cultivated pastoral valley and the threat posed by the encroachment of the wilderness, and the painting has been read as symbolizing the Romantic tension between nature and human endeavor. "Luminists" such as John Kensett (1816–1872) continued this tradition of Romantic landscape painting from the 1840s–1880s, focusing on subjects associated with maritime scenery. Most importantly, as the nineteenth century progressed, painters began to create images of the American west that drew upon the visual language of the sublime. Artists such as Albert Bierstadt (1830–1902) and Thomas Moran (1837–1926) helped to mythologize and, therefore, ultimately to preserve areas of the Rockies and the west by helping to create support for the conservationist movement (1850–1920) and for emergence of the National Parks in the 1870s; yet, by representing western America as "virgin" territories, they also reflected the very conditions of "Manifest Destiny" that placed these landscapes in jeopardy of development.

This tension between civilization and wilderness can be seen in the literature of American Romanticism as well, but in these works the dynamic is often internalized. In other words, the contrasting aspects of the landscape often come to symbolize a conflict within the national psyche, which imagined American identity as simultaneously a product of the frontier and of emerging industrial capitalism. Romanticism emphasized the individual encounter with the natural, moral, and spiritual world, and one of its central concerns was the process of self-knowledge. Writers often described this encounter with the self in very different ways, however. Some Romantic writers, such as Edgar Allan Poe (1809–1849), Nathaniel Hawthorne (1804–1864), or Herman Melville (1819–1891), focused on the wild or "savage" drives to power, domination, and cruelty within human nature, and their works often engaged themes of supernaturalism, psychological disturbance, or the Gothic. The classic example of American Romanticism in this vein is Melville's novel *Moby Dick* (1851), which focuses on Ahab's encounter with a natural world that takes on the characteristics of his own mind and its pathologies.

While authors such as Melville emphasized the sublime or Gothic mode of Romanticism, other authors represented the American psyche and the progress toward cultivation of the landscape more positively. Writers such as James Fennimore Cooper (1789–1851), Henry Wadsworth Longfellow (1807–1882), and David "Davy" Crockett (1786–1836) offered images of Anglo settlers and frontiersmen transforming and taming the American wilderness, and these works connected American national identity with the characteristics of the "noble savage." The term "noble savage" was first popularized in the eighteenth century by European philosophers such as Jean-Jacques Rousseau (1712–1788), and it was used as part of the language of colonial encounter to describe indigenous peoples such as the American Indians in ways that idealized them as simple, uncivilized, and close to nature and to natural religion. During the nineteenth century, Anglo writers hoping to create a new literary tradition and to define their own national

voice came to assimilate these same “savage” values into an image of American political identity as grounded in a reverence for and personal connection to the landscape, even as individuals participated in its conquest and appropriation. Davy Crockett’s *Auto-biography* (1834) and the mythology that surrounds him, for example, reveal the powerful legacy of Romanticism on American culture during this formative century.

Finally, the American Romantic period was also associated with a group of writers and philosophers known as the Transcendentalists. This group included writers such as Ralph Waldo Emerson (1803–1882) and Henry David Thoreau (1817–1862), and the movement later influenced or involved important nineteenth-century nature writers such as Margaret Fuller (1810–1850), Oliver Wendell Holmes (1809–1894), or George Perkins Marsh (1801–1882), founder of the conservationist movement. A central theme of Transcendentalism was the idea that complete human experience could only be achieved through harmony with nature and through participation in the universal consciousness ascribed to the living universe. In formulating its ideas, the Transcendentalist movement drew upon several theological and philosophical traditions, including pantheism, Unitarianism, Platonism, and the increasingly available translations of Eastern religious traditions. The literary texts most closely associated with Transcendentalism include Emerson’s *Nature* (1836) and Thoreau’s *Walden* (1854).

American Romanticism, then, describes a formative period in American cultural history, during which the landscape and its wildness again came to represent a particular source of spiritual, moral, and national vitality. If the previous and first generations of Americans had viewed the wilderness as an obstacle to be overcome in the cultivation of democracy and as a space to be conquered and tamed as one of the conditions of stable nationhood and national identity, the Romantics came to see the matter differently. For the American Romantics, the wilderness came to symbolize an empty space, the very vacancy of which allowed for the projection onto it of an idealized and powerful vision of national identity. Preserving the wild and the mythologies that characterized the wilderness as “empty” allowed the American landscape to become the scene in which the moral, spiritual, and political conflicts of Romanticism were forged and resolved.

Romanticism – Western toward Asian Religions

Although some of the pioneers of the environmental movement, notably Henry David Thoreau, were interested in and sympathetic to Asian religious ideas, it was not until the 1960s that the idea that South and East Asian religions are more likely to promote beneficent behavior toward nature became widespread amongst scholars, adherents of those religions, and the public. The idea became popular at a time when environmentalists began to argue that the severity of the environmental crisis demanded a deep and radical change in attitudes rather than scientific or technological fixes.

The perception that scientific and technological intervention in natural processes was a part of the problem, rather than a solution to environmental degradation, was reinforced by the publication of Rachel Carson's *Silent Spring* in 1962. Carson's belief that "whenever we substitute something man-made and artificial for a natural feature of the earth, we have retarded some part of man's spiritual growth" (Carson 1998: 160) found ready acceptance in the counterculture of the period. In 1967, Lynn White argued in an influential article that the roots of the ecological crisis were to be found in Judeo-Christian conceptions of divinely legitimated human mastery of nature. Moreover, White argued that "Marxism, like Islam, is a Judeo-Christian heresy" (White 1996: 189) and that therefore, both shared Christian axioms. Alternative values or an alternative spirituality that could promote a less damaging relationship with the environment had therefore to be sought outside the Western religious tradition in, amongst others, the religions of South and East Asia.

Although each of the major South and East Asian religions has found advocates for the environmentally positive values of the tradition, by far the most significant have been the claims made for Buddhism. White already identified Buddhism as offering the best chance to rethink humanity's relationship to nature, although he remained doubtful of its viability in the West. As Buddhism has attracted more Western converts, the claims made for its environmental credentials have grown. Martine Bachelor and Kerry Brown write, "at its very essence, Buddhism can be described as an ecological religion or a religious ecology" (Bachelor and Brown 1992: viii) and Alan Sponberg makes the claim that "Buddhism is an environmental ethic" (Sponberg 1997). Other prominent Buddhist environmental thinkers and activists, such as Gary Snyder and Joanna Macy, have made comparable claims. Rather more sober estimates have been offered by Ian Harris and Lambert Schmithausen. It is, however, the strength of some

of the claims made for Buddhism's environmental credentials, and their similarity to some other Western claims about Buddhism (for example, Rita Gross's claim that "Buddhism is feminism" [Gross 1993: 130]), that may indicate that they owe more to Western interests than to anything that is the case about Buddhism. To demonstrate this, it is worth conceptualizing these claims within the longer history of Western perceptions of Asian religions, and of Buddhism in particular.

Although as early as 1710 the Jesuit writer J.F. Pons had connected the Chinese who revered the Buddha, the monks of Japan and the Lamas of Tibet with the Buddhists reviled as atheists in India, it was not until the 1840s that speculations about the possible African or central Asian origins of Buddhism were finally replaced by a consensus among European scholars that India was the birthplace of Buddhism. Once the question of the relative priority of Buddhism and Brahmanism had been settled in favor of the latter (by about 1850) the idea that Buddhism was to Hinduism as Protestantism was to Roman Catholicism (or, more rarely, as Christianity was to Judaism) became irresistible to northern European authors. The late-nineteenth-century vogue for Buddhism, especially in England, owed much to contemporary revulsion for Hinduism and to anti-Catholic polemic. Philip Almond quotes the Unitarian James Freeman Clarke, who insisted that despite the apparent external resemblance of Buddhist and Catholic ritual, "deeper and more essential relations connect Brahmanism with the Romish Church, and the Buddhist system with Protestantism. . . . Buddhism in Asia, like Protestantism in Europe, is a revolt of nature against spirit, of humanity against caste, of individual freedom against the despotism of an order, of salvation by faith against salvation by sacraments" (Almond 1988: 74).

Just as the Buddha was represented as the ideal Protestant for a certain northern European, anti-Catholic audience, so he was represented as an agnostic among those doubting Victorians for whom the term was coined in 1869. The idea that the Buddha was an agnostic may be found among both scholars sympathetic to Buddhism, such as T.W. Rhys Davids, and those who were more hostile. That this was another projection arising from intra-European debate may be demonstrated by considering David Snellgrove's comments on the absurdity of applying the term "agnostic" to the Buddha, who is consistently presented in Buddhist sources from the earliest period as omniscient.

The best-known attempt to say something of a general kind about Western perceptions of Asia remains Edward Said's *Orientalism*. For Said, Orientalism is characterized by the conviction that the Orient is above all different, that which the West is not. This gives rise to a series of oppositions that configure Orientalist perceptions of both self and other. Where the West is rational, active, disciplined, masculine and free, the Orient is irrational, passive, degenerate or lascivious, feminine and subjugated – all ideas that can be abundantly documented in relation to early European perceptions of Asia and its religions. Said's work has been subject to extensive correctives – there were always exceptions to the perception of the Orient as entirely "other." For the British, India's "martial races" were masculine, and Buddhism has been seen as a rational, even a scientific, faith. Nevertheless, the best evidence for thinking that ecological concern

in the West has simply extended this binary logic by adding another series of oppositions to it (where the West is environmentally destructive and polluting, the Orient – and its religions – are environmentally affirming and beneficent) is the uniformity and vehemence of the claims made on behalf of Asian religions. Indeed, these claims have been made on behalf of all the major South and East Asian traditions and arise not from the overwhelming weight of evidence of practical or doctrinal environmental concern among

Asian religions but rather in spite of the (at best) inconclusive nature of such evidence. This strongly suggests that the key reason for the emergence of such claims has been the Orientalist perception of such religions as fundamentally “other.” As the West came to perceive itself as environmentally destructive and, following White, to attribute that to its religious formation, this Orientalist logic dictated that Asia – and its religions – being “other,” had to be seen as environmentally beneficent. Moreover, as was the case with other Orientalist perceptions, the idea that Asian religions are environmentally beneficent has been readily adopted by adherents of those religions, the more enthusiastically because this perception lacks the derogatory associations of some earlier perceptions of Asian religions despite depending on the same logic of difference.

Rousseau, Jean-Jacques (1712–1778)

Jean-Jacques Rousseau, a leading Enlightenment thinker, was perhaps most famous for his appeal to the “state of nature” as an ideal in whose light the general distortions of modern society could be measured and remedies proposed. Rousseau was a passionate critic of what he perceived to be the artifice, false consciousness, and inequality of modern society, and he advocated strongly the need to recover natural feeling, virtue, natural compassion, freedom, and equality. He placed such trust in “nature” because he trusted nature’s God.

Born a Calvinist, Rousseau converted to Catholicism as a young man, and later adopted deist views rejecting revealed religion in favor of “natural religion” based on the evidence of God’s existence that reason discerns in the wondrous order and harmony of the system of nature. He elaborated in detail an educational agenda aimed at protecting the natural feelings and growing virtue of young people by having them first engage the challenges and constraints posed by the natural environment, rather than the alienation, prejudice, and competitiveness thrust at them by society. During his last years of life, he turned for comfort to the study of botany and to walking in the countryside. His last book, *Reveries of a Solitary Walker* (1782) described ecstatic periods of direct contemplation of the “great pageant” of creation. This work was widely read and gave impetus to the Romantic Movement’s general reverence of the nature and celebration of natural feeling. Rousseau was a watershed figure of the eighteenth century whose writings did much to popularize a growing sense of reverence for nature.

Rousseau followed the lead of classic Christian theologians and deist thinkers in seeing proof of God’s existence in the harmony, order and motion of the system of nature. Rousseau drew on Christian and deist views regarding God’s providential dominion over the world and on humanity’s “fall,” combining these into a powerful narrative of original goodness, societal corruption, and proposed paths of recovery and renewal. He broke with the Christian notion of original sin and located the Fall not in human nature, but in human history. Armed with these themes of creation and Fall, Rousseau could launch a harsh indictment against societal alienation and injustice and still affirm hope in humanity’s fundamental goodness and potential.

Born and raised in Geneva, Rousseau received no formal education, but his father gave him a love of nature and of books. He was apprenticed to an engraver, but he soon left, and was taken into the home of a Swiss baroness, Madame de Warens, who

became his patron and lover. Under her guidance Rousseau converted to Catholicism, enjoyed years of undisturbed study of philosophy and literature, and grew in his appreciation for the beauties of nature. At the age of thirty he moved to Paris, developed a close friendship with Denis Diderot (1713–1784), the pantheistic French philosopher, and met many other philosophers. He achieved notoriety in 1750 with the publication of his essay, *Discourse on the Arts and Sciences*, which sparked controversy by arguing that progress in the arts and sciences distorted human life by pulling us away from the essential goodness, contentment, and virtues found in the “state of nature.” This argument clashed with a central assumption of the Enlightenment, namely, that progress in reason and science directly promotes human well-being and moral virtue. After publishing a *Discourse on Inequality* (1755) that developed his account of societal evolution, Rousseau moved out of Paris to the country home of a benefactor. There in rapid succession he wrote his masterworks: *Julie, or the New Heloise* (1761); *Emile, or On Education* (1762), and *The Social Contract* (1762). The first, a novel about romance and love and their conflict with duty, became the most widely read work of fiction in France for a number of years. The second became a recognized classic of educational philosophy. *The Social Contract* became a landmark of political theory. Its stress on popular sovereignty and freedom gave voice to aspirations that anticipated the ideals of revolutionary France. Many critics, however, noted the irony that Rousseau, who could not tolerate the demands of family life and abandoned his five children to a public orphanage, could write so eloquently of love, personal duty, and the importance of children’s upbringing.

Rousseau’s fullest account of his views on religion is found in *Emile*, in a section titled the “Profession of Faith of the Savoyard Vicar.” In it the Vicar explains that when we ponder the marvelous order, harmony, and motion of the physical universe we can only conclude that there exists a rational and benevolent power who wills this universe into existence and sets things in motion. As he says: “I perceive God everywhere in His works. I sense Him in me; I see Him all around me” (Rousseau 1979a: 277). As God is good, so is all God’s creation, including humanity itself. Religious belief thus provides Rousseau with basic confidence for trusting nature’s goodness and purity. Rousseau thus affirms the essential goodness of humanity even while stressing the history of human corruption. As he put it in the opening of *Emile*: “Everything is good as it leaves the hands of the Author of things; everything degenerates in the hands of man” (Rousseau 1979a: 37). For Rousseau, the path out of societal “sin” lies not in some special divine grace, but rather in recovering our original goodness.

Both *Emile* and *The Social Contract* were condemned in Paris and Geneva by religious and political authorities who viewed the books as subversive. Rousseau fled France and lived for a number of years at the mercy of benefactors. Anxiety ridden and often paranoid, he worked on his *Confessions* and retreated into the solace of the botanical studies and countryside walks. His *Reveries*, published posthumously, describe him as feeling rejected by friends and society and yet experiencing a sense of “peace and contentment” arising from a sustained contact with nature and its simple

plant life. Walks in which he observed the “great pageant of nature” gave him a sense of the “unity of all things.” Such encounters promote an “expansive soul.” “I feel transports of joy and inexpressible raptures in becoming fused as it were with the great system of beings and identifying myself with the whole of nature” (Rousseau 1979b: 108, 111, 112). Walks amidst nature gave him a pure “feeling of existence” (Rousseau 1979b: 89).

Many in Rousseau’s lifetime dismissed him as an apostle of “primitivism” and this caricature is alive and well even today. This view arises from readings of Rousseau’s *Discourses* where he fails to clarify exactly how we are to recover the “state of nature.” In places he does seem to call for a return to the practices of a primordial “golden age.” However in *Emile* Rousseau makes clear that such a return is neither possible nor desirable. He states directly that his aim in education is to protect young people’s natural feelings and virtues from premature bending under societal pressure so that when they reach adulthood they may join society with their emotional integrity and sense of moral responsibility healthy and uncorrupted. Emile, the boy, is to live in the countryside amidst nature, so he will grow “naturally” and be well prepared to enter marriage and society in adulthood. The “state of nature,” for Rousseau, functions less as a claim about historical origins than an assertion about fundamental human capacities to recover natural integrity, simplicity, and virtue.

Rousseau’s naturalism anticipates in important ways our ecological understanding of humanity as a part of the natural world. The anthropologist Claude Lévi-Strauss among others admired Rousseau’s insights in his attempt to understand humanity’s evolutionary history. Rousseau’s expansive sense of identification with the rest of creation anticipated a similar emphasis found in today’s deep ecology movement. Likewise, while Rousseau followed the general anthropocentrism of classic Western ethics in placing humanity as the crown of the natural world, he extended basic “natural rights” to animals and thus anticipated the core moral principle upheld by today’s animal welfare movement. Years before British utilitarian philosopher Jeremy Bentham famously made the same point, Rousseau held that natural compassion urges us both to refrain from harming not just other humans, but also “any other sentient being” except in cases of true necessity. Humans are bound by strict duties toward animals who enjoy “the right not to be needlessly mistreated” (Rousseau 1988: 7).

In addition Rousseau’s analysis offers insight into some of the contemporary societal dynamics that increase ecological degradation. For example, his understandings of inequality and how it shapes social structures and psychological dynamics shed light on forces that promote overconsumption and ecological degradation. Similarly, his critique of education anticipated the concerns of ecologically concerned people who fear that modern advertising promotes unsustainable lifestyles. Rousseau’s suspicion of socially inflated wants and his affirmation of the simple, virtuous life are as timely now as they were in his day. For all of his eccentricities and faults, Rousseau remains a seminal figure in eighteenth-century Western philosophy and letters challenging many aspects of modernity by an appeal to nature’s goodness as it comes from the hands of the divine.

Rubber and Religion (Belgian Congo)

The Belgian occupation and exploitation of the Congo (1885–1960) was one of the most brutal chapters in world history. At the infamous Berlin Conference of 1884–1885, European powers carved up the African continent into colonial possessions, and the King of the Belgians, Leopold II, was granted sole control of the vast Congo River Basin. A devout Catholic and self-promoting “philanthropist,” Leopold founded The Congo Free State (1885–1908) and vowed to bring civilization to its people, which for him meant bringing Christianity to save “pagan” souls. In reality, the Congo Free State was a colonial slave system designed to exploit two of Central Africa’s most precious natural resources: its people and its land, first for rubber and ivory and later for minerals. Catholic missions played an integral role in this system, providing moral sanction and local manpower for the plunder, making this form of religion a tremendously destructive influence on the region’s environmental and social history. On the other side of the struggle, however, Protestant missionaries brought the horrors of the Congo Free State to the world’s attention, while indigenous Congolese religious movements like the Kimbanguist Church rose in staunch resistance to white occupation. Thus religion was a central force in both the establishment of and resistance to Belgian rule in the Congo and its concomitant environmental and social destruction.

Roughly the size of the United States east of the Mississippi River, the Congo Basin is dominated by a network of rivers and tributaries that flow into the one of the world’s greatest rivers, the River Congo. This riverine system generously nourishes the immense Central African Rain Forest, which is bordered to the north and south by rolling savannah and to the east by the Ruwenzori Mountains and the great lakes of the Rift Valley, the birthplace of humanity. The original inhabitants of the region, often incorrectly referred to as “Pygmies,” count as descendants the baMbuti and the baTwi, who today still live in the Congo’s rainforest much like their ancestors did since at least 2000 B.C.E.: living in small kin-based clan units, hunting, gathering, and praising the forest for providing them with the gifts of life. Appreciation of these gifts in the form of dance, song, and prayer remain the ritual emphasis of their religion. One of the most painful ironies of Central African history is, therefore, that a foreign religion, Catholicism, would join forces with Leopold in the massive plunder of this forest and its indigenous peoples who so venerated it.

By around the year 1000, Bantu ethnic groups had migrated from north of the forest to the Congo Basin, eventually becoming the region's dominant peoples, with large and complex centralized kingdoms forming as early as the fourth century. The Bantu brought with them monotheistic religions that were centrally concerned with the dead and local nature spirits, which, for instance, the baKongo call *basimbi*. Certain *basimbi* reside at local springs or other significant topographical features. A key difference between their worldview and that of the Congo Basin's indigenous peoples was the Bantus' deep-seated fear of sorcery. Bantu religion is in fact largely concerned with the negotiation of sorcery (i.e., with detecting it, combating it, and healing those who are afflicted by it).

Generously funded by Leopold from 1874 to 1877, the Englishman-turned-American Henry Morton Stanley explored the Congo Basin to locate both the source of the River Congo and the famous English Protestant missionary and explorer David Livingstone, from whom no one in Europe had heard in five years. Upon finding Livingstone, Stanley triumphantly returned to Europe, and Leopold promptly hired him to establish commercial relations with local Congolese chiefs and a series of trading stations along the River Congo. Leopold's foray into "The Scramble for Africa" thus began to unfold as European powers looked to the African Continent to provide natural resources for the Industrial Revolution. Like Leopold, most Europeans involved in the Scramble liked to think of themselves as having higher moral purpose, hence the spread of civilization was linked to Christian missions and the abolition of the Afro-Arab slave trade in East Africa.

With the invention of the pneumatic tire, rubber immediately became a key natural resource for a rapidly industrializing Europe. Merely six years after Leopold founded the Congo Free State, his personal colony was producing one-tenth of the world's rubber, upwards to 6000 tons a year. How this was accomplished is one of the most violent and tragic stories in African history. Local chiefs had signed away their lands in treaties that they could not read, while Leopold aggressively sent administrators and missionaries to oversee his plunder of the Congo, ordering them to "neglect no means of exploiting the produce of the forests." To do so, the Belgians enslaved thousands of Congolese, razing their villages and forests to clear land and provide labor for rubber plantations. Symbolic of this great injustice, the *chicotte*, a whip made of strips of dried hippopotamus hide, was liberally used to beat Africans either to work or to death. Along with severed African hands, the *chicotte* would become the symbol of colonial oppression in the Congo.

Resistance to such oppressive and violent domination was of course to be expected. Hence Leopold arranged for the formation in the Congo of *La Force Publique*, a standing army of African mercenaries and forced conscripts under Belgian command. This notoriously brutal force of some 19,000 soldiers served to ensure that Leopold's greed would be satisfied with abundant exports of rubber and ivory. In order to swell the Force's ranks, the King of the Belgians had Catholic missions double as boot camps for

thousands of child soldiers. Some were orphans; many others were quite simply slaves. In 1890 Leopold wrote,

I believe we must set up three children's colonies. One in the Upper Congo near the equator, specifically military, with clergy for religious instruction and for vocational education. One at Leopoldville under clergy with a soldier for military training. One at Boma like that at Leo . . . The aim of these colonies is above all to furnish us with soldiers (Hochschild 1999: 133–4).

In time, many other "children's colonies" were founded by Catholic missionaries, whom Leopold heavily subsidized. Thousands of Congolese became orphans as a result of La Force Publique's brutality. These children were sometimes forced to march hundreds of miles to Catholic missions for military inscription. One priest described the fusion of military and religious symbolism reflective of this horrific arrangement: "the children marched in front, the soldiers following . . . During Mass . . . at the moment of the elevation of the host, 'present arms!' was sounded by bugles" (Hochschild 1999: 134). Discipline and order were of course maintained by liberal use of the *chicotte*, exacerbating the already inhumane conditions for African children on the Congo Free State's Catholic missions. Between malnutrition, disease, beatings, and long marches, over half of the colonies' children perished. Yet even this was lent a glaze of ecclesial sanction, as seen in the commentary of one mother superior:

Several of the little girls were so sickly on their arrival that . . . our good sisters couldn't save them, but all had the happiness of receiving Holy Baptism; they are now little angels in Heaven who are praying for our great king (Hochschild 1999: 135).

These "little angels" were among some 10 million Congolese who perished in Leopold's Congo Free State, more than half the region's entire population. The Congolese interpreted such oppression in other religious terms, looking to nature to render divine justice, as expressed in their singing:

O Mother, how unfortunate we are!... But the sun will kill the white man, But the moon will kill the white man, But the sorcerer will kill the white man, But the tiger will kill the white man,

But the crocodile will kill the white man, But the elephant will kill the white man, But the river will kill the white man (Hochschild 1999: 139).

Some whites also cried out against the rampant humanrights abuse in the Congo Free State. E.D. Morel was a high-ranking Belgian administrator during the early phase of Leopold's plunder of the Congo. Outraged by the brutality of the occupation, Morel quit the regime and sought to alert the world to the grave injustice of the Congo Free State. His cry was echoed by numerous Protestant missionaries in the Congo Basin, who, unlike Catholic missionaries, were independent of Leopold's regal authoritarianism. In 1904, Morel founded with British Protestant missionaries John and Alice Harris the *West African Mail*, a newsletter that publicized the horrors of Leopold's

Congo. Among their more influential readers, Bertrand Russell wrote,

The only men in the Congo who could not be silenced were Protestant missionaries . . . To take one instance out of many, Joseph Clark, of the American Baptist Missionary Union wrote: on March 26, 1896: “This rubber traffic is steeped in blood . . . The lake is reserved for the king – no traders allowed – and to collect rubber for him hundreds of men, women, and children have been shot” (Russell 1934: 454).

The world took note, and in 1908 the Congo Free State was annexed from Leopold by the Belgian government and renamed “The Belgian Congo” (1908–1960). Central African prophets (Kikongo: *bangunza*) had by then reinterpreted Christianity to denounce white rule, recasting indigenous notions of sorcery into modes of understanding and denouncing colonialism. The most important of these was Ngunza Simon Kimbangu, whose rapidly blossoming movement was so threatening to the Belgians that he was imprisoned in 1921 and given 120 lashes. Many of his followers were exiled to other parts of the Congo Basin, which only served to spread the movement into an international multi-ethnic religion that today counts some 5 million adherents. After Kimbangu’s death in prison in 1950, his son Joseph Diangiende was declared the leader of the Church of Jesus Christ on Earth through the Prophet Simon Kimbangu (*l’Eglise de Jesus Christ sur la Terre par le Prophete Simon Kimbangu*: EJCSK). EJCSK holds that Kimbangu was God’s apocalyptic messenger who prophesied the end of white rule, the establishment of the kingdom of God, and the second coming of Christ. The Church was formally recognized by Belgian authorities in 1959, one year before Congolese independence. Since 1970 EJCSK has been a member of the World Council of Churches.

Rubber Tappers

In the year 1839 Charles Goodyear perfected the vulcanization process for rubber, thus creating an immediate worldwide demand for rubber. The Brazilian Amazon, and in particular, the upper Amazon region and the state of Acre, holds the world's largest natural rubber tree stands. In the late 1870s, immigrants from the northeast of Brazil, driven by droughts in the northeast region and drawn by the promise of riches from collecting rubber, provided the labor for extracting, or "tapping" latex. They became known as *seringueiros*, or rubber tappers. The rubber "boom" ended with the domestication of rubber trees in Southeast Asia in the early 1900s. However, another wave of northeastern migrants, known as *soldados do borracha*, or rubber soldiers, came to the region during World War II as the axis powers cut off access to rubber plantation production in Southeast Asia and the upper Amazon once again became the world's source of rubber. This second "boom" ended at war's end, but rubber tappers remained and still ply their trade.

Northeastern migrants brought to the Amazon a strong Catholic faith without indigenous religious influence. The names given to *seringais*, or rubber forest areas, such as São Pedro, São Vicente and São Francisco do Iracema, themselves demonstrate the strength of the Catholic tradition brought by the rubber tappers. However, upon their arrival, the rubber tappers did not wholly impose their religious traditions on the local population, but rather their religious traditions were modified by the new sociocultural and environmental conditions of life in the Amazon. Many of the beliefs of rubber tappers today are of mixed influence, with Catholic traditions influenced by the Amazon folk beliefs held by *caboclos*, or mixed-race river-dwelling populations, and indigenous populations that inhabited the region. Some of these folk beliefs have European origin and were brought by Portuguese settlers in the early seventeenth century. Santo Daime, a religion founded by a rubber tapper in the 1920s which involves the drinking of *ayahuasca* as its sacrament, also reflects this mixing of Christian and indigenous beliefs, as well as African influence. Thus, like the religious beliefs of other Amazon populations, the formation of rubber tapper religious beliefs should be looked upon as a "continuous process" (Galvão 1952: 169), one that retraces their cultural background and adaptation to the Amazon environment for over a century.

The most widespread folk beliefs adapted by many rubber tappers are: *mãe seringueira*, the mother of the rubber tree; *panema*, a hex that prevents rubber tappers from killing game; and *cabloquinho*, father of the forest. Smith (1996) provides an excellent description of *mãe seringueira*, a short, long-haired woman with bleeding arms and legs, that appear to have been cut by a tapper's knife. *Mãe seringueira*

appears to those who overexploit her rubber trees. Although regular, measured cuts can be made during the tapping season, “*mae de seringa* becomes upset when people abuse her children,” namely, cut her trees excessively or too deeply, causing the trees to die (Smith 1996: 132). Smith recounts the story of a rubber tapper, in debt to his patron and needing greater rubber production to pay it down. *Mãe seringueira* appeared to him as he was angrily overtapping the trees. Explaining his situation, *mãe seringueira* agreed to provide him the latex he needed if he “would leave her daughters alone” (Smith 1996: 132). He was also told to tell no one about the agreement. However, the following year, unable to keep silent about their accord, the rubber tapper died of a poisonous snakebite, attributed to his broken promise.

Panema is another common belief among Amazon folk peoples. A rubber tapper’s “repeated failure” in hunting “that cannot be explained by natural causes” is attributed to *panema*, a hex that contaminates both the individual and their weapon (Galvão 1952: 108). Although *panema* is sometimes referred to as “bad luck,” “. . . it is not merely an occasional failure of fortune, but an incapacity,” sustained over time (Galvão 1952: 108). Galvão noted that this can occur for various reasons. For example, the consumption of game by a pregnant woman is one common source of *panema*. “Ill feelings or jealousy among friends over food” may cause that friend to experience *panema* (Galvão 1952: 108). A rubber tapper in Acre, Brazil stated that one can get *panema* if one shoots an animal and then cannot find it, thus it dies unconsumed by the hunter (Weigand 1997). A tapper may be stricken with *panema* if his wife sleeps while he is hunting, or if “he hunts with dogs on Thursdays, the day belonging to *Caipora*,” the father of the game (Almeida 2002: 123 [our translation]). Methods to cure *panema* may involve the use of plants collected in the forest or grown in home gardens in “smoke” and water baths.

Cabloquinho is described by a rubber tapper in Acre as a “magical boy-like creature, one meter tall and owner of all wild game” (Weigand 1997: 55). *Cabloquinho* punishes hunters who exploit wild game for pleasure or commercial gain. If a rubber tapper hunts every day, beyond consumptive needs, *cabloquinho* may become angry and beat the hunter. Rubber tappers in Acre noted that he may inflict physical pain on both the hunter and their hunting dogs to the point of unconsciousness. One rubber tapper stated that his brother was hunting a peccary when a small boy appeared and touched him on the head before he was able to shoot. The man passed out and when he woke up his ammunition was gone and he felt poorly. The rubber tapper’s belief in *cabloquinho* is similar to the more generalized Amazonian belief in the *curupira* legend. Thus, *mãe seringueira*, *panema* and *cabloquinho* illustrate tapper conservation behavior and rationale in using forest resources.

The Santo Daime religion, founded in the 1920s by

Raimundo Irineu Serra, a rubber tapper living in the Southwest Brazilian Amazon state of Acre reflects the melding of Christian, indigenous, and African beliefs. The Santo Daime ritual is centered on the consumption of ayahuasca, a drink made from the psychotropic vine plant *Banisteriopsis caapi*. While drinking ayahuasca, Serra

experienced a series of visions during which he encountered the “Queen of the Forest . . . a woman whom he identified with the Virgin Mary” (Mizrach 2003: no page number). It is through these visions that the tenets of Santo Daime, “reincarnation, salvation and protection of the rainforest” were developed (Mizrach 2003: no page number). Hymns and rituals that accompanied the consumption of ayahuasca focused on “enlightenment and healing” (Mizrach 2003: no page number). Today Santo Daime ritual still centers on the drinking of ayahuasca with the chanting of hymns and rhythmic dancing. Although still practiced in small forest communities of southwest Amazonia, it is primarily urban-based, with a growing network of followers in major urban centers in southern Brazil as well as in Europe and the United States.

In addition to its spiritual role, the Catholic Church has also played a critical role in the rubber tapper’s struggle for social justice, most notably in the state of Acre. In the 1970s, as the rubber tappers came under increasing pressure from ranchers to abandon their landholdings, the Catholic Church, through the establishment of *Comunidades Eclesiais de Base* and the teaching of liberation theology, became an organizing force for poor landholders in their confrontations with ranchers. The Church supported union organization and educated rubber tappers of their land rights. During *empates*, nonviolent confrontations with workers hired by ranchers to deforest areas where rubber tappers lived, rubber tappers recited prayers, such as *Pai Nosso do Seringueiro* and *Ave Maria do Seringueiro*, to ask God for liberty and justice.

Today, the Catholic Church continues to play an important role in rubber tapper community development in the forest, serving as a base for community organization and social action. In addition, annual festival days celebrating Patron Saints, such as San Sebastian, the Patron Saint of the cities of Rio Branco and Xapuri in Acre, remain important religious holidays to the rubber tapper population. Throughout the 1990s, evangelical churches have also established a growing presence in many forest communities. Future research should examine how different religious beliefs among forest families may be creating new community customs and shaping natural resource use.

In the state of Acre, the state “Forest Government,” elected in 1998, is incorporating rubber tapper traditions and beliefs in innovative policies for forest management. These policies are part of a broader state development vision referred to as “neoextractivism,” which emphasizes the role of traditional peoples in conserving tropical forests while improving their economic well-being.

Ruether, Rosemary Radford (1936–)

Rosemary Radford Ruether is a leading ecofeminist voice. She seamlessly connects feminism, liberationist thought, and concern for the Earth.

Ruether's ecofeminist approach has been a longstanding and vital part of her constructive theological work. Her ecofeminist commitment emerged organically out of her recognition of the connections between human domination of the Earth and human interspecies domination: men over women, "First World" over "Third World" peoples, whites over people of color, rich over poor, Christian over non-Christian, and other forms of oppression. Her influential book *New Woman/New Earth* (1975) made her the first Christian liberation theologian to articulate those relationships explicitly.

Ruether's theology demonstrates thorough historical knowledge. She explores the historical traditions of Jewish and Christian scriptures, Greek philosophy, Ancient Near Eastern worldviews, mainstream as well as marginalized Christian theologies, and more contemporary philosophies of romanticism, liberalism, and Marxism. Her nuanced approach balances incisive critique of elements in these sources that contribute to sexism, racism, and environmental degradation with the reclaiming of liberating aspects of the same sources. *Gaia and God* (1992) expands the sources of her constructive thought to include the new, scientific "creation story."

Ruether's work illuminates the systemic nature of patriarchal, hierarchical, and environmentally destructive attitudes and behaviors. Equality of women with men is not enough if both continue to dominate nature. Bridging the gap between rich and poor countries cannot be accomplished by raising the worldwide consumption rate to the unsustainable levels of northern rich nations. She calls for transformation of religious symbols and cultural values, and also for a radical restructuring of power relationships within societies and globally. To accomplish this restructuring, Ruether builds alliances with others who are struggling for eco-justice and justice in human relationships. The book *Women Healing Earth*, which she edited, includes essays from Third World women about the impact of globally destructive environmental practices and political policies on their lives, their communities, and the natural world around them.

Her far-ranging critique of patriarchal values in Christian thought and in Western social/ecological practice is made more valuable by her concrete pictures of a different way to live. Her books include imaginative portrayals of how life might be different if

men and women lived in mutual harmony with each other, in sustainable communities that did not oppress the Earth or privilege one culture over another. In these communities she calls for shared childcare and use of renewable resources, for egalitarian relationships and widely available mass transit. She enticingly describes life in such a place, where people “watch sunsets . . . plant seeds in soil. . . . The sun rises every day. Con Ed sends no bill for sunshine” (1983: 266). Rosemary Radford Ruether’s groundbreaking connections between the human domination of nature and the subjugation of some human groups by other human groups have been a key influence on liberation theology, the feminist movement, and the ecological movement. She untiringly speaks out for the continued struggle for liberation for the Earth and for women and men of all classes and races, cultures and religions.

Rumî, Jalaluddin (1207–1273)

Rumî, the greatest Sufi poet of Islam, was born in 1207 in Balkh, Afghanistan. The Muslim world honors him with the title of *Maulana* (Our Master). His uniqueness lies in that he based his anthropocosmic worldview on the principle of love. It is this aspect of his deep vision of the universe, and the place of humanity in it, which attracts environmentalists and provides them with a new perspective to see the deeper dimension of reality.

When Rumî was twelve years old, his family left Balkh to escape the Mongol invasion. For four years, the young Rumî traveled extensively in Muslim lands, encountering majestic mountains and beautiful plains, visiting major cities, and meeting well-known Sufis and scholars of the time. His family performed pilgrimage to Mecca and finally settled in Konya, Anatolia, then part of Seljuk Empire.

Rumî's first teacher was his father, who was an authority in Islamic theology. However, Rumî found theology and classical learning unsatisfyingly occupied with formalism. At this juncture, he had a life-changing meeting with Shams-i Tabrizi, who would become his spiritual mentor. Through his friendship with Shams, Rumî discovered love as the dynamic force of universe. When Rumî died on 17 December 1273, Jews, Christians, and Muslims alike attended his funeral.

God and Creation

For Rumî, God the Cosmic Ego created the material world *ex nihilo* – out of nothing – and never ceases to create new things. Everything has been created with a specific order, duty, purpose, and meaning. There is no lifeless matter in this system; all matter is alive, albeit at various gradations of being. According to Rumî, “earth, and water, fire and air are alive in the view of God, though they appear to be dead to us” (Sharif 1995: 827). He cautions: “never think the earth void or dead; it is aware, it is awake and it is quivering” (Harvey 1994: 56).

Theocentrism is the key concept to understanding Rumî's anthropocosmic worldview. God is the goal of Rumî's thought. For Rumî, God wants to be known, so he manifests himself out of his eternal qualities. Two of God's attributes are especially relevant in this regard: God is the Nourisher of all realms and beings, and as such, he *creates* and *sustains* out of love. Furthermore, God is not a static Absolute, but a perpetually gushing fountain of eternal life, manifesting his Majesty, Wisdom, and Knowledge through the universe. Consequently, in the cosmic system as Rumî sees it,

everything happens according to a great plan formulated by Divine Will and Wisdom. Even bees build their houses by inspiration from God. So, a colorful and living world reveals itself in his poetry. While everything is related and connected to each other, everything also has a special space, meaning, duty, and importance.

The cosmos, thus, becomes a meaningful book and precious piece of art which manifests “the attributes and qualities” of its owner. Furthermore, the whole world – fish and moon, atom and sun alike – has been created to worship and love God, and to express its constant adoration in an intoxicated dance. Therefore, Rumi, “teaches his readers to contemplate this aspect of the ever-active God, who shapes the world according to a plan that He alone knows” (Schimmel 1992: 82).

For Rumî, human beings are not outsiders and strangers in a hostile and brutal natural environment. Rather, the whole world is a majestic garden, in which every flower has its function and represents various states and aspects of human life; every leaf on a tree and every bird in a bush offers praise and thanksgiving for God’s greatness and sustenance. Every leaf and tree is a messenger from nonexistence, proclaiming the creative power of God, talking with long hands and green, fresh tongues. Not only does Rumî listen to the constant praise uttered by the flowers and all other creatures, but he also visualizes them in the various positions of prayer. A plane-tree, for example, is opening its hand in prayer just like as a believer would do. The clouds, on the other hand, are pregnant from the ocean of love. The morning breeze is a fitting symbol for the life-giving breath of the Beloved that causes twigs and branches to become intoxicated and dance.

Animal symbolism is also prominent in Rumî’s poetry. Says Rumî, animals are not at all “machines or automata,” as Cartesian philosophy would have us believe. Even the wolf, rooster, and lion know what love is. Therefore, Rumî was very sensitive and kind to animals, as many anecdotes attest. For example, when he was walking, he would not drive a sleeping dog from his path, but rather would wait until the poor creature got up. Moreover, Rumî did not restrict his compassion and love to large animals but embraced every created thing.

The whole of Rumî’s poetry can be regarded as admiration of eternal Beauty as reflected in the cosmos. Therefore, he often uses a mirror as a symbol for the created world, which reflects the eternal Beauty of God. Since the natural world is a mirror of divine beauty, God is closer to human beings than their jugular vein. Rumî sees his Loving God’s signs everywhere, and he never tires of repeating the marvels of God’s creation – the result of the unceasing Divine Will and Power.

Rumî is regarded as an outstanding evolutionary thinker, although not a mechanical or biological evolutionist like Darwin and Spencer. While Darwin presented a biological view of the creation of higher species by blind urges of struggle for existence and life’s adaptation with environment, Rumî comprehends the whole process of evolution in a grand system. Instead of explaining it by mechanical dynamics, he resorts to love as the fundamental urge that creates attraction and affinities: “All atoms in the cosmos are attracted to one another like lovers, everyone is drawn towards its mate by the

magnetic pull of love” (Sharif 1995: 828–9). The heavenly movements are waves in an infinite ocean of love. If cosmic love were not there, all existence would freeze and shrink into nothingness. The organic would refuse to merge and emerge into vegetation, vegetation would not be lifted into animal life, nor would life ascend toward the mind and spirit. In short, without love, nothing would move. It is clear that Rumî developed a different understanding of evolution as assimilation rather than annihilation, one that is based on love and interdependence instead of conflict and survival of the fittest. His theory of evolution can be compared with Bergson, who also argues the creative and evolutionary dimension of life. But while Bergson views this creative evolutionary process as devoid of goal and meaning, Rumî, on the other hand, regards God as the ground and goal of all existence, thus of evolution (Sharif 1995: 829).

Love as a Dynamic Force

For Rumî, a force – a secret energy – lies beneath the spiritual and material world, informing the invisible, progressive change in the universe (humanity included). This force is love, and it originates in God and moves toward God. According to Rumî, love is the positive energy that is responsible for interaction between particles, thus connecting everything with everything else in the universe. So, everything in the universe is interdependent.

Furthermore, says Rumî, since the love arouses every sense, increases the power of intuition, and leads to insight, love is superior to intellect in human life. In daily social life, for example, love has an important practical function: it solves disputes, eliminates selfishness and egotism, and draws aside all veils from the mind. Thus, not only is love basic and necessary for a religious and ethical life, but also for the sustainability of the cosmic order. In a nutshell, Rumî presents a deep and comprehensive understanding of the interdependence and interrelatedness of humanity and the natural world. In so doing, he affirms the reality of the world and dignity of all life, particularly of human life, which has become self-conscious and conscious of its divine origin and goal.

Humanity

Humanity is the central figure in God’s creation and, therefore, is the vicegerent of God on Earth in the sense that it is up to human beings to take care of the whole system. The whole creation is a gift from God and a sign of his creative power. Since God creates and sustains all ecosystems, human beings must interact wisely with the natural world and use its natural resources with care, nurturing a relationship with it founded on love and compassion, which is the essence of all reality.

To conclude, spirituality, rationality, and universal morality have found a healthy synthesis in Rumî’s thought. In his system, God, the universe, and humanity are em-

braced in a single all-encompassing vision, the vision of creative love. Although six centuries old, Rumi's notions are relevant to present environmental concerns.

Russian Mystical Philosophy

Orthodox Christianity had held the official status of state church in pre-revolutionary Russia, but its rivals were numerous and included Christian sects of a Protestant derivation as well as mystical and occult systems of a syncretic religious orientation. Russian esotericism and occultism have given the world such famous names as Theosophy founder Helena Blavatsky (1831–1891), Georgy Gurdjieff (1870s–1949) and his student Pyotr Ouspensky (1878–1947), and Nikolai and Elena Rerikh, all of whom brought Eastern-derived spiritual systems to the West. The mystical element is abundant in the work of many prominent Russian philosophers, such as Vladimir Soloviev, Vassily Rozanov and Nikolai Berdyaev. Less well known in the West but extremely influential in Russia were such mystical and “cosmicist” thinkers and visionaries as Nikolai Fedorov, Dmitry Merezhkovsky, Pavel

Florensky, Konstantin Tsiolkovsky, Aleksandr Chizhevsky, Velimir Khlebnikov, Daniil Andreev, and Georgy Gachev. In recent decades, Lev Gumilev, Alexander Dugin, and others have provided an intellectual foundation for the emergence of a variety of strains of Russian ethnonationalism, radical traditionalism, Eurasianism, and right-wing spiritual ecology, most of which are based on ideas regarding the connections between nation or ethnicity, nature, and spiritual or cosmic destiny.

The tradition of Russian mystical philosophy has been characterized by several traits and themes. These include:

- 1) a propensity for mixing Christian and pre-Christian mythological motifs; 2) a strong social, and often messianic, orientation, evidenced in an intent to inspire the whole nation and to organize it into an ideal societal body; 3) a cosmic dimension, oriented both to a planetary and even extra-planetary future and to the exploration of invisible spiritual worlds; 4) the idea of a global destiny for Russian civilization, based on the premise that its location between Europe and Asia ideally situates it to become the keeper of a universal wisdom combining the best of East and West, and holding forth the promise of Russia becoming the first “post-historical” nation, fated to experience the suffering and illuminations imposed on the world by the struggle of Christ and anti-Christ; and 5) an interest in the notion of a feminine spiritual essence, variously conceived as the Divine Wholeness, Sophia, “the Eternal Feminine” (*Vechnaia Zhenstvennost*), or “The Soul of the World” (*Dusha Mira*).

Cosmism

One of the most popular terms in contemporary Russian philosophical discussions, *cosmism* has come to designate both a particular movement or trend and the principal quality and legacy of Russian philosophy on the whole. Cosmism literally refers to a “cosmic orientation” of thought. The cosmos, in this perspective, is seen as the object of thought, but thought is also considered as a part of the cosmos, both a cognitive reflection of cosmic reality and a constitutive force of cosmic evolution. This philosophy of active evolutionism presupposes the possibility and necessity for the human mind to regulate and transform the laws of nature. Cosmism explains historical, social and psychological processes by the influences of cosmic energies and asserts a reciprocal dependency of the fate of the universe on human consciousness. It is thus a holistic, anthropocentric, teleological and frequently utopian tradition of thought, which sees humanity as in the process of developing a “planetarian consciousness” which could guide the further evolution of the universe and lead to its ultimate perfection.

The roots of cosmism can arguably be found in Eastern Christianity. While Catholicism had a principally historicist and more activist orientation, Orthodoxy is generally considered to be more concerned with the cosmic or vertical dimension of reality. Within the Orthodox tradition, the foremost aspiration of a Christian is seen to be the “deification of the creature,” presupposing the transfiguration not of only human flesh but also of the entire substance of the universe and of all living entities. Russian Orthodoxy was built on the foundation of an agrarian economy, and inherited from its pre-Christian substrate both a dualistic worldview of light and darkness and an intense sense of participation in the cyclical processes of nature, contrasting with the linear, historical imagination of the more urbanized West.

Perhaps the first monument of Russian cosmism is the so-called *Golubinaia Kniga*, or the *Book of Depth*. This book presents popular Christian beliefs, as expressed in religious folk songs, as a huge matrix of cosmical elements. For example, it says that human meditations derive from heavenly clouds and draws numerous other parallels between human life and the workings of the universe, thus anticipating the basic presupposition of contemporary cosmism – that humanity and the cosmos are symbiotically joined. In a conventional sense, however, the founder of Russian cosmism is considered to be Nikolai Fedorov (Fyodorov, 1828–1903). The religious thrust of Fedorov’s project is the reversal of all natural laws, death being one of them, in order that humanity may manifest God’s omniscience and omnipotence. Christianity, for Fedorov, is primarily the religion of resurrection, and the moral task of humanity is not to wait for the Last Judgment, but to follow the example set by Christ and endeavor to make bodily resurrection possible on the Earth, to transform the entirety of human existence into a humanmade and continuous Easter, using whatever technological resources we can muster.

Following in Fedorov’s path, Konstantin Tsiolkovsky (1857–1935), commonly honored as the “father” of the Soviet space programs, developed a philosophy according

to which all physical matter is animate and sentient, and every atom a living and conscious entity. Two basic ideas of cosmism, the recognition of the universe as a living organism and the active regulation of natural forces through means such as genetics, owe their prominence to Tsiolkovsky. If Fedorov were primarily a religious thinker and Tsiolkovsky a hybrid scientist-visionary, Vladimir Vernadsky (1863–1945) represents the strictly scientific end of the cosmicist spectrum. He originated several new disciplines in the natural sciences – among them biochemistry, geochemistry, and integrative geoscience – and was the first scientist to theorize the geologic role of living matter, and the increasing influence of plant, animal and human life on the evolution of planetary structures. Together with French thinkers Eduard Le Roy and Pierre Teilhard De Chardin, Vernadsky developed the concept of the “noosphere,” the collective body of human thought incorporated into the biosphere as an active factor in its transformation. In his view, the geosphere organically overlaps with the biosphere, which in turn grows into the noosphere. Thought is a form of energy and an active factor of geological evolution that allows humanity to cooperate with nature as a complementary part of a living and thinking organism.

Though cosmism, like all other non-Marxist and “idealist” teachings during the Soviet period, was rejected by official ideology, it nevertheless enjoyed a privileged status. Fedorov’s project for the resurrection of the dead was implicitly incorporated into some undercurrents of Soviet ideology, as manifested most strikingly in the construction of Lenin’s mausoleum, which was designed to preserve his body until technology could resurrect him. In spite of the atheism of Marxism-Leninism and the religiosity of Fedorov, the two systems are compatible inasmuch as both attempt to give immanent realization to transcendental aspirations. The imperative of both ideologies is technological progress that will lead to the mastery by humankind of the blind forces of nature. Both systems criticize capitalist civilization for its social inequality and materialistic obsessions, which appears in Marxism as the greediness of the bourgeoisie and in Fedorov as the dictatorship of fashion, which Fedorov considered to be corrupt and “feminine.” Both strive to overcome individualism and egoism, valuing labor instead as the highest moral duty, since the task of humanity is to subordinate nature to teleological and creative reason.

In recent years, Russian cosmism has been reinvigorated by an increased interest in environmental matters, giving rise, in the writings of Svetlana Semyonova (the most prominent follower of Fedorov), Nikita Moiseev, Fyodor Girenok, and others, to a scientific strand that could be considered the Russian equivalent of the environmental holism of James Lovelock, Gregory Bateson, and other “New Paradigm” scientists. Here, cosmism has been influenced by ideas of negentropy, the anthropic principle, and the Gaia hypothesis.

Gumilev's Biocosmic Theory of Ethnogenesis

The son of poets Nikolai Gumilev and Anna Akhmatova, historian and ethnologist Lev Gumilev (Gumilyov, 1912–1990) has been one of the most influential voices in recent popular Russian ecological and cultural thought. Influenced most by the “Eurasianists” of the 1920s–1930s, for whom Russia was a distinct world civilization embodying the combined virtues of Asia and Europe, and by the Earth scientist Vernadsky, Gumilev developed a “theory of living matter,” according to which the organic substance of life determines the formation of both inorganic and superorganic (rational) layers of the global ecosystem, including the biosphere and noosphere. In his most important work, *Ethnogenesis and the Earth's Biosphere* (*Etnogenez i biosfera zemli*), Gumilev applies his theoretical model to the development of ethnic groups, or *ethnoi*, proposing that each ethnos undergoes an organic evolution through which it develops a sense of deep connection with its geographic environment. The key factor for development of an ethnos is “passionality,” or the “passionate drive.” Whereas most people, for Gumilev, are motivated by a desire for self-preservation, a select proportion are “passionaries” who devote their lives to particular goals and charge the larger society with the energy of action. In contrast to this life-affirming energy, necessary for any creative development and associated with the growth of an ethnic group living in harmony with its environment, Gumilev argues that ethnic mixing leads to a dangerous loss of that organic connection with the natural environment, a turn to abstract thinking, and ultimately an entropic degeneration into an inert or “vacuum” state. Another danger, for Gumilev, is represented by the “parasitic ethnos” or “chimera,” which develops outside of any environmentally symbiotic context and, when it becomes lodged within the territory of a “benign” ethnos, threatens it with destruction from within. (Gumilev stops short of blaming the Jewish diaspora for the misfortunes of Russian and other ethnoi, but this allusion is implicit in his writings.) Needless to say, Gumilev's assumption of ethnic essences goes against the grain of Western scholarly thinking on nationalism and ethnicity, and his thought bears an obvious resemblance to fascist notions opposing communities of organic solidarity against dangerously rootless “cosmopolitans.” Yet he remains an extremely popular cult figure, influential even on elite Russian conceptions of nature and society.

Rerikh (1874–1947), his wife Elena (1879–1955), and followers of their synthetic spiritual philosophy alternately known as *Agni Yoga* and “Living Ethics” (*Zhivaya Etika*). A mixture of Theosophical occultism, millennial beliefs about Russia's role in a coming world transformation, beliefs in “vital energy” and the power of art to channel this energy, and parareligious revisions of official Soviet ideology, these ideas now inform a broad network of centers and groups, found in every major Russian city today. The teachings of Ukrainian-born nature mystic and ascetic Porphirii Ivanov (1898–1983) have also found a large audience of followers scattered across the former Soviet Union, and have even been incorporated into the official educational curriculum of Kazakhstan. Rejecting materialism, Ivanov advocated a “system” of living in close

harmony with nature, including twice-daily cold bathing in natural waters, regular barefoot walking in the outdoors, weekly waterless fasting (from Friday evening to noon Sunday), abstinence from smoking and drinking, and an altruistic demeanor in all activities. With its focus on natural health and rejuvenation and its mixture of personal virtue ethics, rural communitarianism, millenarian optimism, and rejection of worldly power, Ivanov's teaching represents the latest in a long tradition of Russian (and East Slavic) nature religion. Similar ideas and practices have mixed with cosmicist thinking, Asian spiritual trends, occultism, and strands of Orthodox belief, to produce much of the diversity of alternative religion in Russia today.

Other Developments

In the post-Soviet context, various streams of nationalist and anti-globalist thought have emerged at the forefront of Russian popular philosophical discourse. Paralleling

Western civilizationalist thinkers such as Samuel Huntington, with his argument that global conflicts of the future will be based on the "clash of civilizations," Russian neoEurasianists, radical traditionalists, and defenders of "Orthodox civilization" oppose the commercial empire of the "Atlanticist" West, claiming that a Russian-led Eurasia harbors a more proper balance between the spiritual and material worlds. Frequent reference is made to the rather loose notion of "ecology of culture," which draws on Gumilev's ideas about ethnos as a biological phenomenon, as well as the more conventional views of cultural and historical preservationists such as the cultural historian Dmitry Likhachev.

Beyond vague pronouncements about the necessity of environmental protection, however, nature remains muted in most current Russian philosophy, playing second fiddle either to the quest for a Russian national (or civilizational) identity or to a more speculative cosmism. Beliefs in the sacred destiny of Russia and in the power of specific landscapes (such as the Ural mountains), however, have been spread through the work of artist and theosophist Nikolai

Rustlers Valley (South Africa)

Rustlers Valley was established as a community in 1991 under the guidance of Frik Grobbelaar in the eastern highlands of the Free State, South Africa. Rustlers community does not embrace any particular religion but rather draws from religious practices worldwide where they seem appropriate to our world vision. Our world vision is primarily shaped by a belief in the value of diversity and freedom of thought – no method, no guru. This approach derives from the recognition that all religions arose in isolation from one another due to the experience of religious feeling in the individual human breast. We therefore see all religions as garbled human attempts to cater to this feeling. We see this feeling as the only legitimate basis for religion. Living in one of the most beautiful valleys in the world we see the expression of divinity in nature all around us and attempt to enhance this with simple reverence in everyday cultural behavior. By reverence I mean living in the constant awareness of nature's beauty and bounty. To this end we use sweatlodges, ayhuasca ceremonies, drumming circles, traditional healing methods and the upliftment of our surrounding community through the creation of a food-rich environment. We use a permacultural approach which includes organic farming methods but is more like an adaptation of nature by concentrating plants that are useful to the human community while maintaining nature's patterns and strategies.

Rustlers believe society is undergoing a fundamental transformation. A new world-view is being born and whether this birth is to be an easy or difficult one will depend largely upon the individual. It is our aim to assist the individual to cope with and contribute to the birthing process. The goal is to embrace the hopes, transform the fears and discover the magical behind the mundane to encourage the individual to achieve his/her highest level of spiritual awareness.

Rustlers runs permaculture design workshops at the Lodge twice a year and has hosted annual music festivals for the last decade with a view to spreading this awareness. Neighboring Rustlers Valley is Mautse (the valley of the ancestors) which we believe is one of the oldest sacred places in the world, as our valley has had human occupation for a hundred thousand years and this sacred site was inherited by the current indigenous people from the Bushmen who were here before them. Mautse is currently occupied by traditional healers or "Sangomas" who are teaching us about the collection and use of medicinal plants.

Sustainability is our primary value as it applies to the species and to our community and to this end we are creating a model for sustainable African existence, promoting the conservation of all energy including human effort and the use of renewable natural

resources. We have a living seed bank of the 280-odd vegetables that are still available on the planet and we use the production of our gardens in our restaurant.

Rustlers Valley works in conjunction with Food and Trees for Africa to promote permaculture in disadvantaged schools and communities throughout South Africa to supplement school feeding schemes and poverty alleviation projects.

Rustlers considers the recognition and integration of nature's bounty to all the people of the planet as a great spiritual healing that will aid the birthing of a new worldview and therefore a new world. The various rituals that we use, such as the sweatlodge at full moon, are meant to assist in the shifting of paradigms through the experience of one's own personal power and sense of well-being in the universal context of one's connectedness to all else.

S

Saami Culture

In Sápmi, the traditional settlement area of the Saami (earlier: Lapps) in central and northern Norway and Sweden, northern Finland and northwestern Russia, nature is varied. There are steep costal mountains and fiords, spruce forests, areas with tundra (a word that originated with the Saami), swampy grounds, the Scandinavian mountain chain, valleys with birchwoods, and many rivers intersect the area. In these different types of biotic communities, the Saami have developed various economies. Fishing in the sea, in lakes and in rivers, hunting for game and game birds, reindeer herding, stock raising and farming have all been traditional Saami means of subsistence.

The different Saami groups in this large area have until the last century lived rather isolated from one another and there are, therefore, great regional differences in culture. Depending on where in Sápmi they live, these differences have made Saamis relate themselves to nature in various ways, but, at the same time, some ideas are and seem also earlier to have been common all over Sápmi. With the help of sources from the western parts of Sápmi during the late seventeenth and early eighteenth centuries and oral traditions collected during the nineteenth and twentieth centuries, it is possible to outline some of the traditional ideas about nature, at least among the reindeer-herding groups that the majority of the sources describe.

Since the landscape is no neutral room, but loaded with meanings, parts of the landscape – mountains, brooks, stone boulders – can function as symbols. Every landscape can be said to consist of both the natural formations and the cultural constructions that add symbolic values to some of these formations. In traditional Saami thought, certain places were regarded as connecting links between our world and the otherworld. These were the lakes where the *noaidi*, the most important ritual specialist, was regarded as being able to travel to the world of the departed, mountains where different types of subterranean beings were regarded as living, burial places of humans and of bears, stones that men smeared with fish fat or the blood of sacrificed reindeer, and the fireplace in the tent or cot (*goahti*) around which women poured out milk or gravy. In all these places rituals were performed. For the nomadic, reindeer-herding groups, there was a concentration of places for rituals and especially sacrificial sites in the area around the tree limit (*orda*) where the reindeer stay during both the mating season in autumn and calving in spring.

The year was traditionally divided into two halves, the dark (when in some areas the sun never rises for two months) and the light (when in some areas the sun never sets for two and a half months). During the dark winter, the Saami navigated with the help of the stars and many had a good knowledge about constellations and movements of

the celestial bodies. The importance of nature also permeates Saami language, which is well known for its rich terminology for different types of snow, reindeer, and so on. Attitudes to and interpretations of nature are also embedded in Saami place-names. They are very often descriptive and indicate the physical character of the place or the occurrence of animals there. Also, several of the names of the months convey similar messages: March is “the swan month,” April “the month with frozen crust on the snow,” and May “the reindeer calf month.”

During the era of the indigenous religion, there were ritual ceremonials when several reindeer or other animals were sacrificed, for example during the Great Autumn festival in late September, but those occasions were exceptions. The daily ritual activities and also the *rites de passage* took place in and near the tent, which as the center of the cosmos represented safety in contrast to the wilderness (*meahcci*) in the periphery, where all kinds of dangers – wolves, wolverines as well as evil spirits – threatened herds and humans. One important aspect of nomadic cultures such as the Saami herding groups is their dynamic adaptation to the landscape. Every time the tent was moved to a new site, the center of the cosmos moved as well as the center of ritual life. Therefore, the dynamics of traditional Saami conceptions of the landscape lay in the tension between the sacred places that were stationary in the landscape and the movable sacred places related to the tent.

Saami traditionally also reckoned with another landscape, located beneath and behind the one we can see when awake. It was important to be able to orient oneself also in this invisible landscape (visible only in dreams) where the departed ancestors and different types of spiritual beings were considered to be living. To take one example, the South Saami related, according to sources from the 1720s, that there was a category of beings called *saajvh* that could be inherited, sold, and bought. Status in South Saami society at that time depended on how many *saajvh* a person owned. Many could tell about visits to these beings in the mountains where they lived and about how the *saajvh* had helped them in difficult situations.

Even more important than the *saajvh* were the ancestors. They were socially alive, regarded as members of the family and lived in a world beneath the surface of our world. They could help in hunting, fishing and reindeer herding, they could guard the children and they often gave messages in dreams. For example, when a woman was pregnant, it was ancestors who suggested the name of the child.

For Saami hunters “a respectful attitude to the animal, and the proper treatment of its remains after it has been killed and eaten” was extremely important (Hultkrantz 1994: 357). This meant, for example, that the remains after the meals were placed in special bone deposits. Also, many of the divinities were related to nature. Sun (*Beaivi*) and Moon (*Aske* or *Mánnu*) received sacrifices as well as thunder (*Hovrengaellies*, *Átjá*, or *Dierpmis*) and the divinities for water, snow and ice, migratory birds, etc. A hunting god and a god for the reindeer were responsible for different sources of livelihood. In addition to the rituals directed toward these divinities, there were also rituals for many types of spirits in animal form. The ritual specialists had to relate themselves

to spiritual birds, fishes, reindeer bulls, and in the south, every child (or, according to another interpretation, the boys in the families of the ritual specialists) received a special tutelary spirit called name-fish (*nimmeguelie*) in connection with the naming rituals. This fish helped the person through life's difficulties and prayers were directed to it. Another type of spiritual being was the rulers (*hálddit*) who guarded plants and animals and ruled over areas in nature. The most important of the "rulers" was the bear, which was regarded both as an animal and as a spiritual being. It was the bear that was responsible for what we today would call the ecological balance in nature, and in order to safeguard that balance a bear festival was celebrated in springtime. Before, during and after the hunt there were strict rules and the whole hunt was ritualized. When the bear was taken to the settlement, there was a bear feast during which several chants were performed, the most important of which was the bear chant in honor of the animal. The meat was carved from the bones and boiled in a certain order. The men ate some parts of the bear in a tent that had been erected for the occasion, the women and children had other parts in the ordinary tent. During the feast it was important that no bone was broken, because all the bones were to be buried in an accurate order, whereas the skin was used in a game that decided when and by whom the next bear was going to be killed.

To sum up the indigenous religion's relation to nature, one could with Hultcrantz say that even if there were differences between hunters, fishermen and pastoral nomads (and farmers – I would add), indigenous religion in all its forms has been "close to nature in its expression and well adapted to environmental demands" (1994: 367). This is clearly shown by the Saami chants, the yoiks, in which nature and animals are the two most common themes, apart from human individuals. In yoiks about landscape "the localities are always mentioned by name, and by means of their names have an individual quality and power of association; a complex of memories, legends and traditions is linked to each one of them" (Ruong 1969: 17). After several hundred years of missionary work, animal sacrifices, rituals performed for the indigenous divinities, and many other aspects of the traditional religion were abandoned. In most regions this happened during the eighteenth century, in some areas a century later. However, knowledge about the traditions of the ancestors was transmitted to younger generations and many of the spiritual beings related to nature were more or less integrated into contextualized Saami forms of Christianity. Today, most of the Saami are as secularized as the majority populations in Norway, Sweden, Finland, and Russia, but many young Saamis show a keen interest in the indigenous religion and attend courses to learn more about this important part of their cultural heritage. Some individuals and groups, inspired in some cases by Native American friends, or in others by the neo-shamanism of Michael Harner, have also tried to revitalize parts of the indigenous religion. At the same time, the condemning attitude of the church has changed, opening space for rekindling interest in their indigenous religious traditions. The yoik and the traditional drums, for example, which were heavily condemned by clergymen during the seventeenth and eighteenth centuries, have been used in religious rituals again. This time they are used

in Christian contexts and symbolize respect for Saami cultural values. There have also been services of reconciliation where bishops have asked forgiveness from the Saami for how the Church acted during the time of religious confrontation. When it comes to Saami rights to self-determination and as this regards land and water in Sápmi, however, the national churches have not, as of the early twenty-first century, taken clear sides with the Saami.

To use Rochon's words, many Saamis still have "a deep sense of dependency and reliance upon the natural environment," but their concept of nature, based as it is on ecological principles, "has been so drastically manipulated that in many instances this concept is difficult to practice" (1993: 54). The damming of rivers, devastation of forest land, mining, tourism, the use of pasture-lands and hunting-grounds for the European space program or as artillery ranges, and the Chernobyl catastrophe, have all created many problems for the traditional Saami economies and especially for the reindeer breeding which needs large pasture areas for the herds.

The Saami have not been passive onlookers to this process; quite the opposite. The fight against a hydro-electric project in the early 1980s, for example, was decisive for Saami political mobilization. In that case, environmentalist groups and Saami organizations were on the same side of the conflict. In other cases, they have taken opposite stands. This is especially the case in what is usually – because of lack of knowledge about the long Saami cultural history in the area – called "Europe's last wilderness." This "wilderness" is however a cultural landscape, because the Saami have, as Beach put it, "been instrumental in creating their environment which some conservationists wish to label as purely natural" (1994: 183).

Disagreements between the Saami and environmentalists have also occurred over nuisance predators. Environmentalists from the urban regions in the south of Scandinavia and other parts of Europe have in general little understanding for Saami claims for a reduction of the number of predatory animals in the areas used for reindeer herding, even though wolves and wolverines harm the herding economy. The Saami, who base their lives on traditional economies have, through their chosen parliaments, begun to tackle the many environmental issues they face. But since these parliaments have still not been given any authority over land and water in Sápmi, it is difficult for them to get their proposals approved at the level of the nation-states they inhabit.

Sabbath-Jubilee Cycle

Consistent with Ancient Near Eastern practices of debt cancellation and economic renewal during the two millennia prior to the Common Era, the Hebrew Bible records a set of interlocking practices of social and economic redemption. Built into the liturgical calendar of an agricultural society, this Hebraic Sabbath-Jubilee cycle proposed the periodic economic justification of relations among humans and, secondarily, with regard to the land's productivity. Three distinct movements – the Sabbath day of the week, the Sabbatical every seventh year, and the Jubilee every fiftieth year – were built into the cycle. The attempt to proclaim a Jubilee year was revisited by the authors of the Christian gospels as that which occasioned the ministry of Jesus; in these texts, the Sabbath-Jubilee tradition associated the liberty promised by God with redemption from economic injustice and with unburdening the land from Roman and Herodian temple-state constructions. The vision encompassed in the Sabbath-Jubilee cycle was most summarily articulated in the refrain of Isaiah 61:1–2 as good news for the politically and economically oppressed, liberty for enslaved persons, and release for debt prisoners. Poetic elaborations of the same practice envision it as an occasion of “new creation,” of a “new earth” (Rev. 21:1).

Historical Context and Hebrew Biblical Background

The Hebraic Sabbath-Jubilee cycle was prefigured in Babylonian and Assyrian “clean slate” legislation. Indeed, edicts announcing the forgiveness of debts extend back to third millennium B.C.E. Sumer. Palaces and temples, often having traders in their employ, were the first major creditors of the ancient world, engaging in forms of corporate enterprise. Agrarian debts – an economic structure secondary to these trade enterprises – accrued most typically when crop failures prevented farmers from delivering the royal and/or temple tithes. Because agrarian debt alienated farmers from the land via land forfeitures, depopulated the countryside, catalyzed wage labor and debt bondage, and therefore occasioned a disruptive economic polarization in a population, rulers periodically restored a basic population distribution pattern of widespread self-support on the land. The Hebrew Bible echoes such a concern in the prophetic complaint of Isaiah against wealthy individuals “adding house to house” and so irresponsibly depopulating the land (Isa. 5:8). Broad-scale debt forgiveness or “clean slate”

legislation was probably declared when economic conditions warranted or on such civic occasions as the inauguration of a new ruler or the building of a new temple.

Given “the land” as the primary unit of life in Hebrew thought (“the land” being a collective term inclusive of humans, plants, animals and the terrain), the Sabbath-Jubilee system named for the Israelites a way of living its equitable distribution and its stewardship. Having an allotment of land, the broad space in which bodies take place and the generations of life unfold, grounded the notion of freedom for these people who traced their lineage to former slaves. Once divided according to clan, tribal and household size and need, the family apportionment was made inalienable. Such ties to place theoretically promised human self-sufficiency and sustainable soil management. Further, these laws guaranteeing the distribution of land suggested how God was to be honored as Lord and Liberator. To the extent that human welfare was secured through a subsistence allotment of the land, claiming Yahweh as Sovereign had distributive justice as its socio-ethical consequence.

Hebrew biblical documents suggest some innovation in the ancient pattern of “clean slate” legislation. Removing the control from the king, it placed the practice of “proclaiming liberty . . . the year of the Lord’s favor” (Isa. 61:1–

2) within the terms of a cyclical liturgical calendar. According to the calendar, the *Sabbath* or *Sabbatical year* (Ex. 23:10–11; Lev. 25:1–7, 18–22; Deut. 15:1–18), which was to be celebrated every seventh year, rested the land by allowing Earth to remain fallow, trees and vines unpruned. Humans were to feed upon the harvest of the sixth year, while allowing the poor and animals to forage volunteer grains and fruits. The removal of the agricultural demarcation between wild and domesticated animal as also between weed and cultivated crop allowed for the freedom of animal and plant, while revitalizing seed stock. Deuteronomy 15 also names this “the year of remission,” and Ezekiel “the Year of Liberty” (Ezek. 46:17; see also Ex. 21:2–6). During this year of amnesty, debt and human servitude among the Hebrews themselves would be canceled or redeemed by other family members. Nehemiah 10:31 hints at the continuing practice of this Sabbatical year phenomenon during the fifth century B.C.E.

As a year of liberty throughout all the land, the *Jubilee* or fiftieth year in the cycle was to be a once in a lifetime liberative transformation of all relations (Lev. 25:8–17, 23–55 and Num. 36:4). After every seven sabbatical year cycles, all land reverted to its original pattern of tribal, clan and household distribution. Forgiveness of debt and return to the ancestral land prevented the development of a landed aristocracy, since the sale of land amounted to a lease which could not exceed the life of a generation. The Jubilee also spelled a second year of freedom for the nonhuman constituents of the land community – hence, no cultivating of the soil was to be undertaken, no sowing of seeds was to practiced, neither any pruning nor harvesting. Textual citations averring to the practice of Jubilee range from that of the prophet Jeremiah (34:8–

15) in the late seventh century B.C.E. through the work of the prophet Isaiah (61:1–11) to the time of the Maccabees (1 Macc. 10:43, 15:8) in the late second temple period of the first century B.C.E. While these texts do not record direct ecological

ramifications from the practice of Jubilee, Ezekiel 47–48 gives poetic and visionary elaboration to such – as does Revelation 21 in the Christian testament.

Historically speaking, the notion of keeping every seventh day as a *Sabbath day* (Lev. 16:31; 23:3; Ex. 23:12; 35:2–3) may have been the last aspect of the cycle to develop and probably should be read in tandem with the

Sabbatical year inasmuch as it reiterates sabbatical concerns on a more regular, if less extensive scale. Two interrelated traditional memories have been melded into the practice of the Sabbath day – the liberation from slavery via the Exodus from Egypt (Deut. 5:12–15) and the sense of restful, creative fulfillment associated with the seventh day in the priestly creation account (Gen. 1). By suggesting that God's rest was built into the rhythm of the Earth as a law of natural time, this commandment deactivated the obsessive aspects of labor, which as psychic compulsion or economic condition can otherwise become as obsessive as enforced slavery within urban or marginal agricultural situations. Inasmuch as rest breaks the instrumental use or objectification of any and all members of the land community (people, animals, slaves, and Earth), keeping the Sabbath day anticipates the Sabbatical and Jubilee years.

Christian Biblical & Theological Considerations

That Rome was the first empire in at least two millennia to refuse debt cancellation may be most significant for understanding the demands for a Jubilee situated at the beginning of the Christian testament. At the time of Mary and Jesus, Jews in Galilee were living at the intersection of several colonizing political institutions – the Pax Romana, the Hasmoneans, and the temple-state of Herod Antipas; how Jews, especially peasants, experienced this Roman-introduced “state of peace” was quite distinct from how Romans themselves thought of their policy. Indeed, Jews of Galilee apparently experienced the Herodian construction of Tiberias along with the Roman architecture of basilicas and aqueducts as, among other things, interfering with the flow or “liberty” of their naturalized sacred cosmology. Consequently what happens to Jesus could be read as the reaction of political, economic, and religious powers to the reintroduction of a demand for a baseline of just relations within the land.

While the celebration of the Sabbath-Jubilee cycle may not have always followed the precise pattern as codified by Israel's priests, the expectations of Jubilee seem close to the surface when reading the Christian gospels. Isaiah (61:1–2) called the Jubilee the “year of the Lord's favor,” and this hope for an alternative to the socio-political and economic pattern of empire and temple was taken up by Luke as the framework for Jesus' ministry (4:18–19, but also 1:46–55). While Luke's evocations of Jubilee appear most textually prominent, Matthew as well as Luke transmits this demand in petitionary form in the Lord's Prayer (i.e., “forgive us our debts” [Matt. 6:12]), and in the telling of the parable of the unforgiving servant (Matt. 18:21–35; Lk. 7:40–43). The Hebraic tradition of debt redemption, within which the gospel writers set Jesus'

ministry, recognized that “forgive us our debts as we forgive our debtors” had to do with the transaction of properties, with the restitution of peoples to place so as to assure self-sufficiency and more sustainable practices. If the Lord’s Prayer carries such a prophetic memory as the Sabbath-Jubilee practice, the ancient baptismal claim from the Pauline tradition (i.e., “In Christ, there is neither [slave, Jew, male] nor [free, Gentile, female]” [Gal. 3:28]), may also recollect the rescinding of structural demarcations in the year of Spirit’s amnesty.

In summary, Sabbath-Jubilee suggested an economic practice of the redemption of human livelihood. This restoration of a person to his/her allotment of subsistence sustenance served as a baseline of what was construed as justice. The redemptive cycle periodically interrupted distinctions (e.g., free/slave, rich/poor) which might otherwise be leveraged into enduring systemic oppressions. Unlike later strains of Christianity which articulated the hopes for a “new earth” via apocalyptic cataclysm and the consequent amelioration of all that represented “fallen nature” (e.g., death, transience, temporality, finitude), these cyclical practices recognize that human social and environmental relations do tend to drift towards inequality, but can also be rectified through a change of human social behavior. Suggesting that the Sabbath names what was seen as the equilibrium of shalom or well-being with the Earth, this liturgical cycle oriented one to the nature of work, the goal of human life, the way of living with Earth and other Earth creatures. It suggested a practiced harmony that denied neither the flux nor disequilibrium of systems, but nevertheless took seriously the charge to secure the welfare of the poor. Today we recognize that such a redemption from indebtedness among the poor of the world would also entail ecological redemption of the devastated lands to which the poor have been marginalized. To cite but one example of how economic indebtedness can be related to ecological devastation: the 33 African countries classified as heavily indebted suffered 50 percent more forest loss than non-indebted African countries (Friends of the Earth). Reconsideration of these ancient practices has recently inspired several environmental programs – namely, the UN Environmental Sabbath, Jubilee 2000, and the reclamation of weekly Sabbath as a practice of Earth healing.

Sacramental Universe

Sacramental moments are experiences of the loving and creative presence of the Spirit. Creation flows from divine vision and is the locus of the human experience of divine presence. People perceive signs of the Spirit in creation, signs that might or might not be acknowledged but which nonetheless link innermost human being with divine Being. People have moments of engagement with the Spirit when they are open to the loving and creative presence of the Spirit in evolutionary creation.

In Christian churches, *sacraments* traditionally have been religious rituals, mediated by a member of the clergy in a dedicated, human-constructed sacred space, which are visible signs or symbols of an invisible experience of God's "grace" – divine presence expressed in relational love – in significant life moments. Recently, pristine places also have come to be viewed as *sacramental* because they reveal the Spirit's loving creativity in their biodiversity, textured topography, and provision of food, water and shelter for the community of life.

The term "sacrament" in the Catholic Church usually is applied to seven church rituals, presided over by a priest in a church building. These rituals, derived from teachings and actions of Jesus, were formalized by the Council of Trent (1547–1563). There have been exceptions to this reserved use of the term. For example, the Vatican II document *Lumen Gentium* called the Church a "sacrament"; and Pope Paul VI stated that "the poor are a sacrament of Christ," a theological expression of the teaching of Jesus in the Last Judgment story in Matthew's Gospel (Matt. 25:31–46).

In 1991 the U.S. bishops, in their national pastoral letter *Renewing the Earth*, said that creation as a whole is sacramental. They declared that "The Christian vision of a *sacramental universe* – a world that discloses the Creator's presence by visible and tangible signs – can contribute to making the Earth a home for the human family once again." The bishops of Alberta, Canada, in their 1998 pastoral letter *Celebrate Life: Care for Creation*, taught

Catholics see creation in a *sacramental* way. The abundance and beauty of God's creation reveals to us something of the generosity of the Creator. God is present and speaks in the dynamic life forces of our universe and planet as well as in our own lives. Respect for life needs to include all creation.

These church teachings state that the whole of creation can be sacramental for the person of faith, revealing God's grace – offering presence and life – conferring productivity. The sacramental universe teaching has scriptural bases in passages such as Wisdom 13:5: "from the greatness and beauty of created things their original author, by analogy, is seen"; and Acts 17:28: "in God we live and move and have our being."

A sacramental place is naturally a *commons*: a home shared by all the members of the community of life. In it, their food and habitat needs are integrated, their competitive needs are balanced, their relationships are interdependent, and their associations are consciously or unconsciously collaborative. The commons is the locus of engagement of the biotic and abiotic communities, internally in their respective modes of being and engagement and externally in their interaction with each other. The commons is the place in which dynamic natural history evolves, diversifies and complexifies, and the base from which cultural history develops in all its intricacy.

In the Bible, human property in land and goods is part of a human commons (Acts 2:44 describes how the early Christian community “had all things in common”), which is to provide for human needs. In a complementary way, the Earth is a commons: shared space and the source of life-providing goods for all creatures. The Earth commons, then, is not intended solely for humans’ use and enjoyment, although as part of the biotic community they share in its benefits; it is being created to provide for all creatures as they live related to and dependent on each other in complex ecosystems.

The *sacramental commons* is creation seen as the locus of the interactive presence and caring compassion of the Spirit. It implies that people are called to integrate the spiritual meaning of “sacramental” and the social meaning of “commons” and engage in concrete efforts to restore and conserve ecosystems: to care about and care for creation as a whole, and to care about and for the members of the biotic community.

The “sacramental universe” becomes localized in the “sacramental commons” when Creator Spirit and created spirits consciously engage each other in sacred space, which is every place in creation. People in their spiritual center experience sacramental moments in sacramental places of a sacramental commons in the sacramental universe. As “sacrament,” a place at special moments is revelatory of God-immanent; as “commons,” a place at all moments is a sign of the creativity of God-transcendent, while simultaneously providing the natural goods necessary for the well-being of the community of all life. In acknowledging a “sacramental commons,” people express an appreciation of the sacredness, integrity, and lifesustaining qualities of creation.

Ethical conduct and ecological consequences flow from sacramental understandings of cosmos and commons. Christians who acknowledge the creative, communicating and community-creating immanence of the Spirit in creation, recognizing thereby the revelatory power of creation as a whole and of the biotic community within it, treat Earth and Earth’s inhabitants with reverence and respect. In understanding that the Spirit intends that Earth’s goods meet the needs of all Earth’s creatures, they avoid consumerism and exploitation. In viewing creation holistically, they act responsibly toward those who are strangers in space, time and species, not solely the human “neighbors” who have the most noticeable claim on their concern, but also otherkind and pristine nature that comprise the variant forms of the community of creation ever emerging from the creative power and loving presence of the Spirit. Within this consciousness, generational and intergenerational responsibility are fostered, the limits on

Earth's liveable space, productive places, and available goods are respected, and space, places and goods are shared equitably.

The Sacred and the Modern World

An increasing concern of mine is the use and misuse of the idea of the sacred in the modern world. During the great disaster of the twin towers and Pentagon we constantly heard from the media of many things we “hold sacred,” among them our respective freedoms, but other more mundane things. While we certainly needed reassurance that we were the good guys, even when we learned that we had trained most of the terrorists to kill Russians and that we had been a major supporter of the Taliban, the idea of holding things sacred has such a typical American individualist ring that the words now mean very little. We use the phrase to cover all our activities and seem to believe that our attachment to things gives them a sacred validity they would not otherwise have. Contrast this attitude with those of the people of the Middle East, many of whom have no hesitation in sacrificing themselves for beliefs they hold sacred. We can hardly be accused of understanding what the word means in its larger context.

I had previously encountered this flippant American attitude when discussing the sacred nature of the Devils Tower or Bears Lodge to an audience of environmentally conscious people. I explained that several Indian tribes had discovered a feeling of the sacred there and had learned to do ceremonies that enhanced the lives of the people and animals that recognized its power. During the question-and-answer session following my presentation I was, as one might expect, confronted by a husky young man who argued that people should be able to climb the mountain any time they wanted because they held mountain climbing sacred and it was one of the greatest challenges they could face.

In America, religion is easy. We approach it like people at a swap meet, changing and exchanging beliefs to fit our current mood or understanding, seeking a bargain or hoping to find instant reality so that we can confirm the validity of our way of life. It never occurs to us that the way we use religious terminology says much of the depth of our understanding. We act as if we were primarily responsible for the creation and manifestation of the sacred. In other words, in holding things sacred we endow those things with our personal energies, and we believe that we have experienced the same kind of feelings that our ancestors had when they used the same words. Using this logic it is safe to say that we do not believe the sacred exists except for when we call it into being.

I tried, rather unsuccessfully I might add, to distinguish for the young mountaineer the difference between intuiting the sacred in nature and proclaiming a site to be sacred to an individual. Quite obviously if we are able to bestow sacredness then religion in America is a matter of individual choice and not a case of apprehending the

mysterious power that seems to be the ground of everything. The Sioux, Cheyenne, and other tribes who perform ceremonies at Bears Lodge do so because they have had experiences so extraordinary that they understand it as a place of reverence.

Many years ago I encountered a book that has been seminal in all my thinking: Rudolf Otto's *The Idea of the Holy*. In it Otto analyzes the constituent elements of the experience of the Holy: *mysterium tremendum fascinans*. The great mystics of all world traditions and the shamans and medicine men of hundreds of smaller groups have testified to the feeling of finitude and helplessness followed by recognitions of compatibility and peacefulness and the absolute emotional certainty created in their beings by this experience. It is mysterious, upsets our intellectual beliefs with a devastating display of energy, and remains with the individual as a fascinating, attractive presence and reminder that there are dimensions to life we cannot possibly imagine.

We need only call to mind Samuel in the Temple hearing a voice, Isaiah confronted with the majesty of a divine throne room, or Black Elk riding with the thunder beings or entering the tipi where the Six Grandfathers gathered to begin to understand that the sacred is a powerful presence when it descends on a human being. The majority of people experiencing this *mysterium tremendum fascinans* report not simply a feeling of insignificance, but their great hesitancy in placing themselves in a situation where they might encounter the sacred. Most people have several preliminary encounters with voices or omens and they pray that they will not be chosen and set aside from their communities to become a holy person. It is unquestionably a burden and it may be an overwhelming burden.

Our popular conception of the sacred can hardly compare with the body of data we have describing the experience of the sacred. In previous decades we used to require of people becoming priests and ministers to have a "call" from God before they enter into the religious life. Anyone describing a call from God in picturesque terms today would certainly be rejected for ordination or employment in our religious institutions since such an experience would be so far outside the mainstream of rational religion as to be threatening to established doctrines and dogmas. We fail to notice that once ordained, whether by an institution or via personal conversion, people representing religion today have no hesitancy in announcing that they have personally talked with God, even as they are measured for the best clothing and ordering an expensive car.

A religious vocation used to imply another realm standing in judgment of our familiar natural world. It had a purpose and direction that guided us in spite of our errors and shortcomings. Those people who received a vocation were destined to become the fulcrum points in a larger historical scenario that was moving toward a celestial conclusion. We were, in a sense, co-creators of the future along with the mysterious presence that provided us with clues and insights into the nature of religion and reassured us that we would ultimately be justified. Revelation was the continuous presence of the sacred to which we were obedient.

Basic religious experiences can be almost anything from the rapid hypnotic heartbeat of fundamentalist hymns to the contemplative moments spent staring onto the

Grand Canyon, from ecstasy to a near-comatose state of reflection. Unfortunately we are not inclined in this society to probe any deeper and while we may be properly called aesthetes, I doubt if we have any profound sense of religion in the old classical sense since we stand in awe of nothing and know not of how to contact the truly sacred. A new factor has recently emerged that may invoke substantial changes in the way we view the sacred. For several decades, we have seen the rise of “Near Death Experiences” (NDE) that seem to speak of the continuity of life with data we have not before considered.

In the typical NDE, people facing a severe health crisis, or experiencing a traumatic event such as an automobile accident, find themselves floating above their bodies as the scene unfolds below them. Patients report having unusual powers in this state of being which include being able to walk or fly through physical things, objects, and full command of their thought processes, often wondering what had happened to them. A significant number of people report a tunnel-like landscape in front of them at the end of which is a strong white light, brighter than they have ever seen, and feel an intense desire to move toward it. Often a relative or friend who has passed on earlier greets them.

Most of the literature, and there is an impressive number of books by competent doctors now, concentrates on proving that we have an immortal soul or that there is no judgment placed on our lives, although some people say they were asked to review their lives to that point. Depending on the doctor’s range of patients reporting this phenomenon, Jesus greets some people; others see no identifiable religious personality at all. Scientists rejecting NDE experiences have claimed that they can reproduce all the significant elements of these events by probing certain parts of the brain with electrical impulses. No one, however, has been able to reproduce the sequence of the phenomena of NDE. Whether such experiences prove the existence of the soul is irrelevant to me. More important is the fact that people are told they must return to their physical lives because they have not yet accomplished their mission in life.

In religion we often talk about the religious “mission” of the founder and his disciples as if it were something preordained, and NDE seems to validate that concept. Tribal societies were based on a similar idea – that each individual had a specific path to walk – and vision quests were a regular part of seeking this path. One might not be given powers to use in one’s daily life, but certainly from all reports no one who made a sincere effort to establish a relationship with the higher powers went unacknowledged. In the NDE case, it seems certain that a predetermined life is the standard for everyone, not just outstanding religious personalities, and the mission may simply be one of caring for family and friends, exercising a certain trade or profession, or acting as a friend to assist others in accomplishing their life’s mission.

In Sidney Kirkpatrick’s new biography of Edgar Cayce, he reports a dream Cayce had in 1941 while giving a reading. In Kirkpatrick’s words, Cayce was permitted to visit a great hall of records, which housed bound volumes of recorded events both past and future. The records not only told of what was, but what might have been.

According to this dream, had he not married Gertrude Evans, she would have died of tuberculosis in 1906. And Edgar himself would have died, in 1914, from a debilitating stomach condition (Kirkpatrick 2000: 81).

In *Plenty Coups*, the life story of a Crow Indian, Plenty Coups had a vision in which he found himself staring at an old man who was bent, gray and very debilitated, and as the picture became clear in his mind, he realized that this pitiful old man was himself in the far-distant future. Cayce had alternate life scenarios; Plenty Coups saw the result of his life's journey.

We have sometimes involved ourselves in discussions of the omnipotence of God and asked how, if he is allknowing, we can have free will to choose. Cayce's dream of the bound books suggests that the decisions we make do have profound consequences and that we may be cocreators of the world as it moves into the future. Apparently we can create the future course of events since every decision has some definite alternatives that are realized by our choice. Life, then, has meaning every step of the way.

Everyone with a scientifically bent mind will certainly object to including this kind of data as religious because it cannot be duplicated in a scientific experiment. It is good to get the narrow scientific minds safely on the sidelines when we examine this data because they reject everything that does not fit the materialistic paradigm. There are many things in life that cannot be repeated because they are unique to ourselves or part of a process of growth that cannot be duplicated. There is an old Victor Herbert song "Toyland" that insightfully states that once we pass Toyland's border we cannot return again. Thus our first adolescent crush, our first effort to swim, the time we recited a poem in kindergarten, when we had our first child, when a parent died, almost the whole spectrum of things we experience have a quality all their own and cannot be duplicated by a white-frosted scientist.

How then, do we recapture the sense of the sacred in our lives? If choices are important and, once made, they project particular paths of activities, we can maximize the choices available to us by recognizing that we are helping to create the coming historical scenarios. It seems to me likely that Near Death Experience may be the manner in which the sacred mystery of the universe is reaching out to us. Certainly in a highly urbanized society we cannot be expected to find a place of isolation and open ourselves to this mystery. The sacred may be offering us a new chance to understand the meaning of life. Patients reporting on NDE say their lives and their view of how they were living were permanently changed by the experience.

Today in the study and practice of religion we have abandoned traditional concepts and treat religion like a strange form of sociology. We have very little empirical data to examine so we simply increase our efforts to study obscure points in various traditions. What insights we could gain if we took the phenomena rejected by science and institutional theologians and asked deep and probing questions of it. We would soon learn considerably more about our world.

Sacred Geography in Native North America

“Portals to the sacred” is an expression I use to convey belief common among Native Americans that there are specific places that possess great sacredness, and this concept illuminates the ritual functions of sacred sites in Native North America. Such “portals” should not be viewed as limited in size or scale. Some may be large in their geographical extent while others are limited in size. Likewise, use of the portals concept must include the understanding that they are not only positioned in geography but also positioned in time, such that they become sacred “time/spaces.” Although the concept of the “sacred” is employed widely in recent discussions of sacred geography, no satisfactory definition of this fundamental idea has been offered.

Basic ethnographic research concerning American Indian concepts of sacred geography is sparse. The recent collection of papers edited by Christopher Vecsey (1991), the *Handbook of American Indian Religious Freedom*, stemmed from this absence of research but must be regarded as only a beginning. Research on this topic is abundant for many cultures of Asia, Europe, the Middle East, and Mesoamerica (e.g., Townsend [1982] and Vogt [1965, 1969]), but with few exceptions (e.g., Harrington’s 1908 “The Ethnogeography of the Tewa Indians”) is a subject largely undeveloped for most regions in North America and northern Mexico. Based on what published sources are available, the following trends seem most common.

In addition to being vital to ritual practice, sacred geography in Native North America is a source of religious meaning in group identity and group cohesion. Sacred sites in Native North America are invested through ritual with complex layers of religious meaning. Tribal religions in Native America differ from most other world religions in their conceptions of the sacred and in their conceptions of sacred geography.

Definitions of the Sacred

In his *Elementary Forms of the Religious Life*, Durkheim defines the sacred as follows:

A religion is a unified system of beliefs and practices relative to sacred things, that is to say, things set apart and forbidden beliefs and practices which unite into one single moral community called a Church, all those who adhere to them (Durkheim 1947: 47).

Fundamental to this definition is the distinction Durkheim draws between the sacred and the profane:

The opposition of [the sacred and the profane] manifests itself outwardly with a visible sign by which we can easily recognize this very special classification, wherever it exists. Since the idea of the sacred is always and everywhere separated from the idea of the profane in the thought of men, and since we picture a sort of logical chasm between the two, the mind irresistibly refuses to allow the two corresponding things to be confounded, or even to be merely put in contact with each other . . . The sacred thing is *par excellence* that which the profane should not touch, and cannot touch with impunity. To be sure, this interdiction cannot go so far as to make all communication between the two worlds impossible; for if the profane could in no way enter into relations with the sacred, this latter could be good for nothing . . . The two classes cannot even approach each other and keep their own nature at the same time (Durkheim 1947: 40).

This classic distinction does not fit American Indian conceptions of the sacred in Native North America, because the sacred is not viewed as a domain set aside, distinct, and forbidden as Durkheim suggests. Instead, the sacred is an embedded, intrinsic attribute lying behind the external, empirical aspect of all things, but not a domain set aside or forbidden. The situation is both more complex and more subtle. For example, among the Lakota this embedded, intrinsic attribute is *wakan*; among the Algonkians it is *manitou*; among Ute-Aztecs it is *pu'ha*; among the Sahaptians it is *weyekin*; and among the Salishans *su'mesh*. In this large region, accessing the sacred is a primary goal of ritual and entails actually entering into sacredness rather than merely propitiating it. Whereas certain cultures tend to create their own sacred space and sacred time somewhat arbitrarily by special rituals of sacralization, American Indians of North America more often attempt through ritual, visions, and dreams to discover embedded sacredness in nature and to locate geographical points that permit direct access to it in order to experience it on a personal level. Unlike Durkheim, Eliade's view of hierophanies is somewhat more compatible with American Indian views of sacred geography. Citing Eliade, Carrasco says,

In Eliade's view, all religions are based on hierophanies or dramatic encounters which human beings have with what they consider to be supernatural forces manifesting themselves in natural objects. These manifestations transform those objects into power spots, power objects, wonderful trees, terrifying bends in the river, sacred animals. The stones, trees, animals, or humans through which a hierophany takes place are considered valuable, full of mana, things to be respected and revered. Human beings who feel these transformations in their landscape believe that a power from another plane of reality has interrupted their lives. Usually, they respond with a combination of great attraction and great fear. Their lives are deeply changed as a result of this encounter with *numinous places* (Carrasco 1979: 203).

Sacred Geography in Native North America:

General Features

It is the rule rather than the exception that American Indian ritual life is inextricably linked with access to and ritual use of sacred geography. Traditional American Indian spiritual leaders generally assert that the geographical locations of rituals are vital to their efficacy; unless rituals are performed in their proper times at their proper geographical locations they will have little or no effect. Although there are significant differences among American Indian religions, they generally share the following characteristics central to understanding American Indian sacred geography:

1) A body of mythic accounts explaining cultural origins and cultural history, which depend upon the geographical area. These describe a prehuman or precultural time dominated by heros, tricksters, other mythical figures, and animals indigenous to the area.

2) A special sense of the sacred that is centered in natural time and natural geography.

3) A set of critical and calendrical rituals that give social form and expression to religious belief and permit the groups and their members to experience the events of their mythology in various actual geographical ritual settings.

4) A group of individuals normally described as shamans or priests who teach and lead the group in the conduct of their ritual life.

5) A set of ethical guidelines establishing appropriate behavior associated with ritual and extensions of ritual into ordinary life.

6) Reliance on dreams and visions as the primary means of communicating directly with spirits and the sacred. These and oral tradition are the primary sources of sacred knowledge.

7) For individuals, the major goal of ritual is gaining the spiritual power and understanding necessary for a successful life by engaging the sacred at certain special times and in certain special places.

8) For groups, a belief that harmony must be maintained with the sacred through satisfactory performance of rituals and adherence to sacred prescriptions and proscriptions.

9) A belief that while all aspects of nature and culture are potentially sacred, there are specific places that possess great sacredness, which I term "portals to the sacred."

10) In their religious life, American Indian groups of Native North America are rarely hierarchically organized; nor do they favor the tightly constructed hierarchical mythologies or philosophies developed by priestly elites of either the Old or New World agricultural societies; calendrical reckoning of ritual life is somewhat less important among hunting groups of Native North America.

11) The sacred sites of Native North America are more numerous, more diverse, and less geometrically patterned than is seen among religions of Mesoamerica and the

Old World. This reflects the diversity of cultural groups in Native North America who are not often unified into only a few major religious systems of the types found in the Old World and Mesoamerica.

12) Mountains and other points of geographical sacredness are not so often at the center of religious life in Native North America as in the Old World or in Mesoamerica. Nor are mountains identified as frequently with the state, with society, or with the group as in Mesoamerica and the Old World. This probably again reflects the diversity of cultural groups in most of Native North America as well as the general absence of large-scale political and religious systems.

13) Generally, hunting groups in Native North America seek the *intrinsic* or embedded sacredness of nature and do not often force their notions of sacredness onto the land in the manner of the pyramid builders and Earth sculptors we see in both the Old World and Mesoamerica.

14) Ritualists in Native North America are generally shamanic unlike the priestly figures encountered in the more complex religious systems of Mesoamerica and the Old World. Priests are more often identified with large-scale political and religious systems that encompass various cultural groups.

15) Sacred sites are numerous and include the following types (see Walker 1991): a) Shrines, vision-quest sites, altars, and sweat-bath sites that serve as ritual settings. b) Monumental geographical features that have mythic significance in a group's origins or history. Included are mountains, waterfalls, and unusual geographical formations such as Pilot Knob, Kootenai Falls, Celilo Falls, and Mount Adams. c) Rock-art sites such as pictograph and petroglyph panels. d) Burial sites and cemeteries. e) Areas where plants, stones, Earth, animals, and other sacred objects are gathered for ritual purposes or where sacred vegetation such as medicine trees serve as objects or centers of ritual. f) Sites of major historical events such as battlefields where group members died. Sites where groups are thought to have originated, emerged, or been created. Pilgrimage or mythic pathways where groups or individuals retrace the journeys and reenact events described in myths and in the lives of mythic and other figures. Lakes, rivers, springs, and water associated with life and the vital forces that sustain it. j) Areas or sites associated with prophets and teachers such as Smohalla, Handsome Lake, Sweet Medicine, and others.

Ethnographic investigation of several hundred sacred sites suggests strongly that they are an essential feature of American Indian ritual practice. Without access to them, practice would be infringed or prevented altogether in certain cases. Likewise, all known groups possess a body of beliefs concerning appropriate times and rituals that must be performed at such sites. The more important a sacred site is in the ritual life of a group, the more numerous symbolic representations it will have in art, music, and myth. It has also become clear in this review that sacred sites also have very diverse functions in that they serve to objectify key cultural symbols, illustrate dominant religious metaphors, and sustain patterns of social, economic, and political organization. Sacred sites can also serve as indicators of cultural unity as seen among the various medicine wheels

described by the Arapaho and their neighbors of the Northern and Central High Plains. In general, sacred sites lend concreteness to the less visible systems of linkages within and among different cultural groups. Sacred symbol systems, when superimposed on geography, give to geography a significance and intelligibility similar to relatives such as father, mother, or simply kinsmen. Through ritual, sacred sites function to create a conceptual and emotional parallelism between the objective order of the universe, the realm of the spirits, and the intellectual constructs of American Indian cultures. They are portals between the world of humans and the world of spirits through which sacred power can be attained and spirits contacted. Such sites give order to both geographic and social space, and by thus ordering natural space and time they give order to all that exists.

Sacred sites involving a conjunction of geographical, social, seasonal, and other t

ransitions enhance opportunities to access the sacred. In observing these *conjunctions of multiple transitions*, I have been struck by the parallel-ism of these ideas with those of Arnold Van Gennep concerning rites of passage (1960) and others who have demonstrated that the rites of passage in the human life cycle are ritually celebrated as times of great sacredness in the life of the individual. From this perspective, the sacred may be more easily experienced as individuals go through life-cycle transitions, especially when such transitions are conjoined with other transitions such as “first game” or “first fruits” rituals that may coincide with additional transitions such as equinoxes and solstices. Similar transitions in the lunar cycle in which the first quarter, second quarter, third quarter, and full moon are seen as paralleling the human life cycle in birth, adolescence, marriage, and death are further transitions in nature that may coincide with transitions in the lives of individuals and communities. In Native North America the conjunction of multiple transitions provides heightened opportunities for accessing the sacred, especially at points of geographical and environmental transition such as mountaintops, waterfalls, cliffs, and other breaks in the landscape.

Conclusion

From this view, therefore, sacred sites and sacred geography among cultures of Native North America function as fundamental ingredients of ritual. Points of geographical transition are joined with multiple transitions in the seasons, the sun, the moon, the life cycle of the individual, and the rhythm of community life to form conjunctions of multiple transitions that become especially powerful access points to the sacred or hierophanies. This view of sacredness and sacred geography stresses the embeddedness of the sacred in all phenomena, distinguishes between the general sacredness of all things and the specific sacredness of access points or portals to the sacred. It also notes the importance of conjunctions of multiple transitions in the individual life cycle,

in nature, in community, and in tribal life, and how such multiple transitions help establish the times of greatest sacredness and ritual efficacy of sacred sites. It rejects the Durkheimian view that the sacred is a domain set aside or forbidden, and agrees more with the view of Eliade (1964, 1969, 1972) that the sacred can be accessed and experienced directly through ritual practice at appropriate times and in geographical locations.

Sacred Groves of Africa

Sacred groves, which may be forest patches, clusters of trees and even individual trees, are recognized by many African ethnic groups; this recognition often implies that “the community has established a covenant with deities or other sacred entities to refrain from certain uses of the environment” (Lebbie and Freudenberg 1996: 303). Any attempt to do more than list well-known examples of sacred groves, for example, by providing a classification of these sites according to various criteria, runs into many problems. By their very nature, sacred groves are objects of fear and respect, about which people are reluctant to share information with outsiders. In the early years of colonial rule knowledgeable local community members hid much arcane information from colonial officers and missionaries; more recently, many elements of traditional belief systems have been lost, so published sources, of whatever date, are likely to have incomplete information. Even in the post-colonial era, traditional custodians of the groves may deny outsiders the right to enter, as two Nigerian scholars, Okafor and Ladipo, discovered in 1992 when they carried out a study of fetish groves in southern Nigeria. Attempts to analyze unwritten and evolving belief systems also have to cope with the perception that the sacred essence of the groves may be based on several properties, and that some of the groves have multiple functions.

Lebbie and Freudenberg (1996), Michaloud and Dury (1998) and Laird (1999) provide useful short overviews on the significance and function of sacred groves, and readers interested in sacred groves in Africa would also do well to pay attention to some of the extensive literature on Asia. Unlike in Asia, sacred groves in Africa are not typically the site of an actual temple structure; an exception is the sacred grove at Oshogbo (Nigeria), which has over recent decades been the site of considerable architectural and sculptural development, much of it inspired by Suzanne Wenger, a Yoruba priestess of Austrian origin. In Africa, sacred groves may be revered as the residence of a deity, as is the grove of the goddess Numafoa in the Nanhini area of southern Ghana. Another grove particular to a deity is the Pinkwae grove in central Ghana, home of the Afiye god whose powers enabled the Katamanso people to defeat the Ashantis in battle. In Anloga, southern Ghana, the Nyiko grove held the shrine to Nyigbla, the Anlo’s war god.

Groves may also be revered as the home of ancestors or other benevolent or malevolent spirits. Rituals in the *kaya* forests of coastal Kenya begin with the erection of small grass houses for the spirits, known as *vitsimbakazi* in the local Mijikenda languages. The Kikuyu believed that trees possessed spirits capable of interfering in human affairs, and when clearing land, people had to leave a large and conspicuous tree at intervals to

absorb the spirits from the trees that had been cut down. This tree was not supposed to be cut or allowed to fall without a ceremony transferring the spirits to another tree.

Some groves are burial sites of certain ancestors or revered elders; Kaya Kinondo in Kwale District contains the grave of Nkomboza, a distinguished female rainmaker and clan ancestress. In North Pare, Tanzania, many clans keep their ancestors' skulls in sacred forests, which are also believed to cause rain. In Benin there are graveyard forests where people who have died from accidents or infectious diseases are buried, while in Moyamba District of Sierra Leone there are forests where fetuses removed from the bodies of women who died while pregnant are buried. These forests are controlled by women and their flora and fauna are considered abominable, never to be harvested, particularly by men.

Sacred groves may be located at particular sites, such as mountaintops or ridges (for example among the Kikuyu of central Kenya, as described by Castro and other authors) or along and around bodies of water which themselves may also be sacred. To the west of Anloga in southern Ghana lies the Blolui pond, the home of a powerful goddess, which was formerly surrounded by a thick, dark grove. In such cases the presence of a sacred grove affords protection to the natural vegetation in environmentally sensitive areas such as steep slopes and river banks, contributing to soil and water conservation and reducing the risk of environmental degradation.

While some sacred groves are set apart from human settlements, they can also be located within or close to villages. Trowell and Wachsmann describe Karamoja and Teso villages in northern and eastern Uganda as having an "*Abila*, or central tree, round which are little shrines and stones for sacrificing to the gods and where the hunter places his spears in preparation for the hunt" (1953: 78). In the Oromo region of Ethiopia trees such as *Euphorbia can- delabrum* are planted around churches and on graves because "it is believed that trees on a grave look like the flesh of the dead person and serve as statues" (Kelbessa 2001: 44). Every living Oromo has their own *dakkii* tree, which is a symbol of peace and stability, the abode of spirits, and a link between *waaqa* (God) and the individual. In some areas, fences are built around these trees, which may be of a variety of species.

Historic or prehistoric events may explain the sacred nature of certain groves, for example, stories of community origin. The Mijikenda believe that their ancestors originated from a northern homeland and migrated southwards several centuries ago to the areas they presently occupy. Threatened by aggressive enemies, they made their first homes in heavily fortified villages, surrounded by thick forest. Their security was further ensured by the presence of *finjo*, sacred objects essential to community well-being that were buried in the forest. The Mijikenda moved out from these villages as their population increased and security improved, and today the former settlement sites have been reclaimed by forest, but the respect for the groves as the historical homes of each of the nine Mijikenda communities remains. The Asantemanso sacred grove in central Ghana is believed to contain the cave from which the seven clans of the Ashanti tribe originated. Mbewe ya Mitengo in the Lower Shire Valley of southern

Malawi is a sacred grove that is said to have been the capital of the Lundu state in the early seventeenth century, and is still used for sacrifices today. Most of the sacred forests in Mpigi (central Uganda) are historical sites, such as the former site of the home of an important leader, the burial site of an important clan member, or the site where an ancient leader had planted a tree. Sacred groves may be former battlegrounds, such as the Pinkwae grove in central Ghana, the site of a battle between the people of Katamanso and the Ashantis in 1826; the spirits of those who died in the battle are believed to dwell there, as well as the Afiye god.

In many pre-colonial African societies, sacred groves had political and economic importance. Among the Kikuyu, the *ituika* ceremonies that marked the handing over of ritual power from one generation to the next were held in the sacred groves. Sacred groves may serve as monuments to the legitimate land tenure of the communities that surround them. Communities make both socio-cultural and material use of sacred groves. Some ethnic groups hold initiation rites for young men and/or women in the groves, which are convenient sites for the periods of seclusion that many such rites involve. The groves may be the meeting places for secret or semi-secret societies, which are responsible for controlling access to the grove and use of its natural resources. The Mende people of Moyamba District, Sierra Leone, have separate groves for the men's (*poro*) and women's (*sande*) secret societies. In some places regular community rituals and celebrations are held in the groves, while elsewhere rituals are only held when particular needs arise, for example, when there is a risk of drought, disease or war. The Mijikenda believe that if appropriate rituals are held in the kaya forests, involving sacrifices, eating of ceremonial food, drumming, dancing and prayers by the kaya elders, rain is sure to follow within a few hours. Rituals may be open to all community members, or restricted by age, gender, ethnicity, menstrual status or other criteria. However, not all members of a kin, ethnic or community-based social group may recognize the sacredness of a particular grove, and certainly neighboring groups may not recognize them as such.

People may visit sacred groves on their own or to consult with healers or spiritual leaders when faced with individual or family problems. In central Kenya women might rub the sap of sacred fig trees on themselves, to increase their chances of having children. At the sacred grove of Edinkra, the goddess of Nkoranza in Ghana, offerings are placed on the roots of a particular large tree and a man may tie a string round the trunk of the tree to remind the goddess to "bear him upon her back as a mother does her child" (Kyeremeh 1996: 3). In July 2001, offerings to the royal ancestors at Mbewe ya Mitengo were made in response to the serious illness of one of the local leaders.

Use of the material resources of a sacred grove may be totally forbidden, as in the sacred groves of central Kenya. Similarly, in northern Ghana,

The cutting of trees in the sacred grove for any purpose is strictly prohibited except in rare cases whereby prior permission may be sought from the custodians to cut parts of trees for medicinal and other specific purposes. Also the gathering and use of even dry wood from the groves for fuelwood is a taboo (Telly 1998: 2).

No plant material can be collected from the Nkodurom sacred grove in central Ghana, nor can people hunt in the grove. In other cases there is a partial ban, which allows sustainable use of timber, non-timber forest products, wildlife and water resources. Mukamuri describes how the local chiefs responsible for the *rambotemwa* (“refuse to cut”) sacred woodlands of the Karanga people of southern and central Zimbabwe made sure that the trees were not cut, but women were allowed to collect deadwood and some hunting was allowed. In coastal Kenya traditional healers, including women, collect medicinal herbs from the kaya forests, though there are particularly sacred areas within these forests, which even they would not normally approach. Some Mijikenda also claim that in the past women were allowed to collect dead wood from the kaya forests for domestic use. As with participation in rituals, entry to the grove to extract resources may be restricted to certain groups, or limited according to a daily, weekly, monthly or seasonal schedule. At Nkodurom nobody is allowed to enter on a Thursday, which is believed to be the day of rest of the original fetish priest of the grove. Visits to Kaya Kinondo are not permitted by the elders during two days at the new moon, on the fourth day (“chipalata”) of the Mijikenda four-day week, or early in the morning and after 5 p.m., when the gods and spirits are resting.

Certain plant species may have sacred status, whether or not they are growing in a sacred grove. Falconer names two trees *Okoubaka aubrevillei*, *Chlorophora (Milicia) excelsa* and a liana (*Spiropetalum heterophyllum*) as sacred to many communities in her study area in southern Ghana. In Buganda, central Uganda, individual trees are said to have the ability to prophesy, including one called *Kaindu*, and a forest called *Nakalanga*. Among the Banyoro, also of central Uganda, a sacred tree called *kirikiti* is used to make drums played at the royal court. Among the Kikuyu of central Kenya, the *mugumo* tree (*Ficus natalensis*) is the most significant sacred tree, though other species of *Ficus* may also be sacred. According to Castro “A single tree within a grove often formed the focal point of ceremonies” (1990: 279), but he goes on to say “not every fig tree was sacred, nor were figs always found in the groves.” The Shona of Zimbabwe recognize several species of sacred trees; individual ancestral spirits are believed to dwell in large specimens of *Parinari curatellifolia*, which is also used for rainmaking festivals. Another example from Zimbabwe is *Gardenia spatulifolia*, which protects against witchcraft and lightning, and a tree called *muminu* whose removal from a field is said to precipitate fighting between spouses or during a beer and work party. In parts of South Africa, the *marula* (*Sclerocarya birrea*) has sacred status, but also material value, in that its fruits may be stored or made into beer. The Oromo recognize *bokkuu* or scepter trees, under which officials of the traditional courts sit. No branches may be cut from them, and it is not even permitted to collect dry animal dung from around these trees.

However wood can be cut from these trees for roasting meat during certain rituals.

Sanctions on those who break the regulations on entry or use of the grove’s resources range from social (often involving payment of a fine to the elders responsible for the grove) to supernatural. Since some groves are seen as repositories of community fertility

and power, transgression can lead to disaster for a whole community as well as for individuals. Mijikenda men and women interviewed around Kaya Chonyi, Kilifi District in January 2002 warned that destruction of the kaya would lead to crop failure, disease and poverty. Among the Oromo, it is believed that people who cut the *bokkuu* trees illegally will die soon. Around the sacred groves in northern Ghana, “It is believed that food cooked with firewood from a sacred grove could result in the death of those who eat the food” (Telly 1998: 2). People who enter prohibited forested areas of Mount Mulanje in Malawi are believed to disappear completely, or return after a month or two deaf and dumb. The Karanga of Zimbabwe believe that lion spirits chase people who flout the taboos of the *rambotemwa* sacred woodlands. In Kirinyaga a person who encroaches on a sacred grove has to pay a goat to the elders. People who intrude into the Nkodurom sacred grove are arrested by the traditional guards and sent to the local chief for the imposition of a fine that will pacify the gods and spirits; this may include a cash fine, several bottles of alcohol, and a sheep to be sacrificed. Offending individuals or families may also be subject to social sanctions such as isolation from community members or, as a last resort, curses imposed by particular elders.

The current status of sacred groves varies widely across Africa and even within one country or ethnic group. Groves were powerful metaphors of social, moral and ecological order, and their rituals affirmed orderly meanings of social and ecological interaction. The impact of new belief systems, in particular Islam and Christianity, has been instrumental in weakening the indigenous belief systems that protected sacred groves, and contributing to the chaos of rapid social, political and ecological change in colonial and post-colonial Africa. Greene quotes the German missionary Carl Spiess as rejoicing over school children’s apparent loss of respect for a fallen sacred tree, the “Tree of God” in the Anlo region of southern Ghana, in 1927. A comparable event occurred in northern Kenya in January 2002, when a minister of the Assemblies of God church in Laikipia District led his followers in cutting down and burning a sacred fig tree. The tree, locally called *oroteti*, had been the site of offerings and prayers by local elders during recent severe drought years. When the minister refused to make the required payment of a goat and local beer for the elders to cleanse him, they cursed him through traditional chants and threatened to kill him.

In the town of Anloga, the original site of the Nyiko grove is now a police station, erected by the colonial government; the shrine was moved to the outskirts of the town but the trees at the new location were cut down in the early 1960s in order to build a secondary school. Kaya Fungo, the sacred grove of the Giriama sub-group of the Mijikenda of Kenya, was destroyed by British colonial forces on 4 August 1914 in response to Giriama resistance to colonial policies such as taxation and labor recruitment. As vividly described by Brantley,

The elders watched silently as the main trees and gates were blown up, all the dwellings and trees inside the kaya burned, and the entrance dynamited and barricaded. Next day, it was reported, they went away quietly to their homes. British officials

thought the matter was closed . . . But despite the outward calm, anger was simmering (1981: 111).

Hostilities escalated, culminating in a one-month military campaign during which the British forces burned at least 5000 houses and killed over 150 Giriama. Kaya Fungo was reopened in 1918 and regained some, although not all, of its traditional power. In recent decades destruction of the kaya forests has been harder to resist, occurring incrementally as the result of pressure for land for settlement and farming and the increasing demand for timber and firewood (Nyamweru 1996). Younger people have moved away from the indigenous belief systems and, driven by joblessness and poverty, are less likely to resist such destruction and may even participate actively in it. However, there have been numerous occasions, quite well documented in the Kenyan press, where elders have, sometimes successfully, resisted attempts to take over the groves and convert them to private property for commercial development. Newspaper stories headed “Elders protest destruction of shrines” (*Daily Nation*, 9 July 1992), “Elders threaten to curse government” (*Daily Nation*, 14 April 1994), “Elders urge Govt to preserve sacred land” (*Daily Nation*, 1 August 1997), and “A sacrifice to thank the gods” (*Daily Nation*, 4 July 2001), testify to the continued activity of some elders’ groups and the position of these sacred groves as highly contested resources, as well as to the interest of the Kenyan media in this issue.

Other groves are still largely intact, where pressures are less intense and the traditional belief systems continue to discourage people from entering the groves for destructive purposes. Even though population pressure and competition for land has caused the destruction or drastic reduction of many sacred groves in Kirinyaga, “respect for tradition has caused many landowners, including devout Christians, to preserve some groves” (Castro 1990: 286), and many of the groves referred to in earlier paragraphs are still in existence. In some areas where they survive, sacred groves and the belief systems that sustain them have become the focus of attention, and sometimes material support, from national and international conservation organizations such as the Environmental Protection Agency of Ghana, the National Museums of Kenya, the World Wide Fund for Nature (WWF) and UNESCO. The continued survival of the groves demonstrates the contribution of local management and indigenous knowledge systems to environmental conservation. Examples of successful collaboration between local communities and international agencies include CIPSEG (Co-operative Integrated Project on Savannah Ecosystems in Ghana) which ran from 1992 to 1996, focusing on three sacred groves in Northern Ghana (Schaaf 1998: 146), and CFCU (Coastal Forest Conservation Unit), which began in 1992, located in coastal Kenya and working to conserve the kaya forests (Nyamweru 1996: 20). Optimal strategies for collaborating with local communities to ensure the survival of these culturally and environmentally important sites are still being worked out, though differences of interests between various groups of local, national, and international stake-holders makes this a complex and challenging project. Volumes such as those edited by Ramakrishnan et al. (1998) and Posey (1999) provide an excellent introduction to this dynamic field of debate.

Sacred Mountains

As the highest and most impressive features of the landscape, mountains have an extraordinary power to evoke a sense of the sacred. Their imposing peaks, the clouds that gather about their summits, the dramatic play of light on their slopes, the waters that issue from hidden springs, these and other characteristics combine to imbue them with an aura of mystery and sanctity. In that mystery and sanctity, people of diverse backgrounds, both traditional and modern, experience a sense of a deeper reality that gives meaning and vitality to their lives.

As sacred expressions of a deeper reality – however that may be construed – mountains have become associated with the deepest and most central values and beliefs of cultures and traditions throughout the world. Mount Sinai occupies a special place in the Bible as the imposing site where Moses received the Torah and the Ten Commandments, the basis of law and ethics for much of Western civilization. The remote Himalayan peak of Mount Kailas, rising aloof above the Tibetan Plateau, directs the minds of millions of Hindus and Buddhists toward the utmost attainments of their spiritual traditions. The Hopi of the American Southwest revere the San Francisco Peaks of Arizona as the abode of the katsinas, ancestral rain deities on whom they depend for their very existence.

The sacredness of mountains manifests itself in three general ways. First, certain peaks are singled out by particular cultures and traditions as places of special sanctity directly linked to their deepest values and aspirations. These mountains – the ones traditionally known as “sacred mountains” – have well-established networks of myths, beliefs, and religious practices such as pilgrimage, meditation, and sacrifice. Primary examples would be Mount Kailas in Tibet and the San Francisco Peaks in Arizona.

Second, mountains that may or may not be revered in themselves are frequently associated with sacred persons or contain sacred sites and objects such as temples, monasteries, hermitages, stones, springs, and groves. Great numbers of people, for example, visit pilgrimage shrines located in mountainous regions, such as the Hindu shrine of Badrinath in the Indian Himalaya or the mountain monastery of Montserrat in Spain. Singling out this role of mountains, a passage in the *Mahabharata*, the religious epic of ancient India, describes a Himalayan peak as a “refuge of hermits, treasury of sacred places” (*Mahabharata* 3.43.21–25).

Third, mountains in general commonly awaken in individuals a sense of wonder and awe that sets them apart as places imbued with evocative beauty and meaning, frequently spiritual in nature. Many tourists, hikers, and climbers today go to the Alps in Europe or the Sierra Nevada in California for aesthetic and spiritual inspiration and

renewal, often regarding them as expressions of important cultural values enshrined in works of literature and art. Such peaks function for them as personal sacred mountains.

People of different cultures generally experience the sacredness of mountains through the particular views they have of them, such as the mountain as center of the universe or source of life. These views or themes differentiate the experience of the sacred and provide a framework for exploring the many different ways in which mountains function as sacred places in diverse cultures and traditions around the world. We will examine here ten of the most important and widespread of these themes.

Height

Many people revere mountains as high places. As the highest mountain on Earth, Mount Everest has assumed the status of a sacred mountain in the modern world. Its summit symbolizes for many the highest goal one can strive to attain, whether one's pursuit be material or spiritual. Because of its importance in the West as the ultimate high place, the Tibetan name of Mount Everest, Jomolangma, is almost always mistranslated in Western literature as "Goddess Mother of the World." Foreigners assume that for the Tibetans and Sherpas the highest mountain must be the home of a supremely important deity. In fact, Jomolangma is short for Jomomiyolangsangma, the name of the Tibetan goddess of Mount Everest, one of the Five Sisters of Long Life and a relatively minor deity, invoked for worldly benefits, such as longevity, food, and wealth.

Center

An extremely important and widespread theme is that of the mountain as center – of the cosmos, the world, or a local region. A number of Asian mountains, such as Mount Kailas in Tibet and Gunung Agung in Bali, are patterned on the mythical Mount Meru or Sumeru, which stands as a cosmic axis around which the universe is organized in Hindu and Buddhist cosmology. Meru itself is said to rise from the depths of hell to the heights of heaven.

Many mountains in East Asia, Japan in particular, are viewed as centers of *mandalas* – circular spaces and arrangements of deities used in Buddhist meditation. Some, such as Mounts Koya and Omine, are treated as *mandalas* themselves, their peaks, trees, and other natural features regarded as parts of a sacred circle representing the divine space of a visualized deity with whom a meditator identifies himself or herself.

In North America the highest peak of the Black Hills, known to the Lakota as Paha Sapa, appears as the center of the world in vision quests by religious leaders such as

Black Elk. Delphi on the slopes of Mount Parnassus played a central role as the site of the Omphalos or navel of the ancient Greek world.

Power

Many sacred mountains, including those viewed as centers, are places of awe-inspiring, often dangerous, power. The way to the awesome summit of Mount Olympus was blocked by doors of clouds and darkness controlled by the

Horae, goddesses of time entrusted with protecting the sacred mountain. Maori warriors crossing the plateau beneath Mount Tongariro in New Zealand used to avert their eyes from its summit for fear of provoking a blinding snowstorm.

The power of mountains can assume various forms. The five principal sacred mountains of China enshrined the political authority of the emperor to rule over the four quarters of his empire, supported by the mandate of Heaven. The earliest annals of Chinese history say that the legendary first emperors of China performed sacrifices on a mountain in each quarter of the empire in order to establish their sovereignty over the princes of the realm. Frequent storms made the jagged peaks of Olympus a dramatic setting for vividly displaying the power of Zeus, king of the gods and deity of thunder and lightning. The molten lava of Kilauea in Hawai'i embodies for many Hawaiians today the fiery energy, both destructive and creative, of the volcano goddess Pele.

Deity or Abode of Deity

In many traditions the power of mountains derives from the presence of deities. A poem from the earliest collection of Japanese poetry refers to Mount Fuji as "a god mysterious." In other traditions, a mountain may be regarded as the seat of a divine power. Traditional Kikuyu of Kenya revere Mount Kenya or Kere-Nyaga as the resting place in this world of Ngai or God. Dry paintings used by Navajo singers in healing rituals will sometimes depict the four sacred mountains of the Navajo in the form of hogans, traditional homes of the Navajo people.

As deities or abodes of deities, mountains frequently play important roles as divine guardians or protectors. People invoke their power to protect livestock, crops, religion, the local community or even the state. Like the gods of many other peaks in Tibet and Himalayan border areas, the "country" god of Mount Khumbhila is revered as a warrior deity who watches over the Sherpa region of Khumbu, warding off the forces of evil. Herds of yaks, goats, and sheep fall under his protection. In the Andes, mountain gods are considered protectors of llamas and alpacas as well as wild vicuñas.

Temple or Place of Worship

Deities are frequently associated with the widespread view of the mountain as a temple or place of worship. Members of many traditional societies revere sacred peaks as temples in which their deities reside. Tibetan Buddhists, for example, view Mount Kailas as the pagoda palace of Demchog, the One of Supreme Bliss, a tantric deity embodying the ultimate Buddhist goal of enlightenment. Many temples in India are modeled on the idealized form of the sacred peak and bear the name of Kailasanatha, Lord of Kailas – a reference to Shiva, the Hindu form of the supreme deity who dwells on the mountain.

Mountains may also take the form of places of worship, viewed or imagined as altars, shrines, churches, and cathedrals. Here a deity does not necessarily reside in or on the peak, but rather the mountain provides a special setting for making contact with a divine presence through prayer, ritual, or contemplation. Just as Christians revere churches as sacred places of worship but do not regard them as objects of worship in themselves, so the same applies to mountains for many followers of monotheistic religions.

The view of mountains as places of worship plays an important role even in modern secular societies and is reflected in the names of numerous groves, valleys and peaks. John Muir, the founder of the Sierra Club and a key figure in the genesis of the modern-day environmental movement, wrote of Cathedral Peak in the Sierra Nevada of California that he would climb it “to say my prayers and hear the stone sermons.”

Paradise or Garden

Modern societies also share with traditional cultures the view of mountains as gardens and paradises. The Muslim Kirghiz of western China, for example, believe that the snows on the summit of Muztagh Ata, one of the highest peaks in the Pamir, conceal an earthly paradise that goes back to the time of the Garden of Eden. The Buddhist Dai people of southwestern China regard the flora of their Holy Hills as the gardens of the gods. Mount Athos, a mountainous peninsula in northern Greece that serves as the monastic center of Orthodox Christianity, is known as the “Garden of the Mother of God” – a reference to the role of the Virgin Mary as the patron saint of the holy mountain.

Many in the modern world view the untrammled environment of mountains as a pristine paradise that preserves the purity of creation. Mountain meadows and wildflowers tend to evoke such views: one of the most popular destinations for visitors in Mount Rainier National Park in the United States, for example, is Paradise, a flowering meadow close to the glaciers.

Ancestors and the Dead

A major theme frequently linked to conceptions of paradise as the otherworld is the view of mountains as divine ancestors and places of the dead, often involved in origin myths. Traditional Chinese beliefs hold that the spirits of the dead go to the foot of Tai Shan. Mount Koya, the center of Shingon Buddhism, has one of the most impressive graveyards in Japan. East Africans traditionally bury their dead facing sacred peaks like Kilimanjaro and Mount Kenya.

Many peaks in New Zealand, including Aoraki, or Mount Cook, are revered as the frozen ancestors of the Maori who came to the islands in legendary canoes. According to the origin myth of the Korean people, they are descended from the union of a sky god and a bear woman on the sacred mountain of Paekdu. The natural features of Uluru, or Ayers Rock, in Australia record the formative activities of the Dreamtime Ancestors of the Pitjantjara and Yankunjatjara tribes.

Identity

As divine ancestors and places of origin, mountains provide many societies with their sense of communal identity and cohesiveness. In the Bolivian Andes, the metaphor of Mount Kaata as a human body unites the various communities who live on its slopes into an organic unit that has been able to resist all efforts to break it apart into smaller administrative subdivisions.

At intra-tribal gatherings, Maori ritually identify themselves by first stating their tribal mountain, followed by their river, or lake, and then their chief. One clan of the Yakutat Tlingit has Mount St. Elias, or Washetaca, the second highest peak in Alaska, as its crest or totem. The Armenian people regard Mount Ararat, a volcano in eastern Turkey believed to be the site of Noah's ark in the Bible, as the symbol of their national and cultural identity.

Source

People throughout the world look up to mountains as sources of blessings – most notably, water, life, fertility, healing, and general well-being. Mountains such as Ausangate in Peru, Tlaloc in Mexico, the Himalayan Range, and the San Francisco Peaks in Arizona are revered as abodes of weather deities, places of springs, and sacred sources of rivers and rain-clouds on which societies depend for their very existence.

Sacred mountains also provide the blessings of fertility and healing. Today, great numbers of elderly women climb Tai Shan to make offerings to have grandchildren if their daughters or daughters-in-law have been infertile. Female shamans in Japan and Korea routinely climb sacred mountains to charge themselves with healing powers and conduct rituals for their patients. Traditional singers or medicine men go to the

four sacred mountains of the Navajo in the southwestern United States to collect medicinal herbs and pebbles; they also invoke these mountains in rituals and sand paintings intended to restore a sick person to health and harmony. In Europe and North America, there is a tradition of putting sanatoriums, particularly for tuberculosis, on mountains, based on the idea that the mountain air and environment have special curative properties.

Much of the modern appreciation of mountains derives from the perception of them as sources of spiritual and physical well-being. Jean-Jacques Rousseau, the French philosopher who played a major role in transforming European attitudes toward the Alps in the eighteenth century, wrote:

In effect, it is a general impression experienced by all men, even though they do not all observe it, that on high mountains, where the air is pure and subtle, one feels greater ease in breathing, more lightness in the body, greater serenity in the spirit (Rousseau 1976: 45).

A century later John Muir exhorted Americans to:

Climb the mountains and get their good tidings. Nature's peace will flow into you as sunshine flows into trees. The winds will blow their own freshness into you, and the storms their energy, while cares will drop off like autumn leaves (Muir 1901: 56).

Revelation, Transformation, Inspiration, and Renewal

The final theme to consider is that of the mountain as place of revelation, transformation, inspiration, and renewal. Mount Sinai plays a prominent role in the Old Testament as the imposing site where God reveals the Torah and the Ten Commandments to Moses. In the New Testament, Jesus is transfigured on a mountain and revealed there as the Son of God. Muhammad received his first revelation of the Qur'an in a cave on Mount Hira.

In China and Japan mountains are regarded as such ideal places for meditation and spiritual transformation that the Chinese expression for embarking on the practice of religion means literally "to enter the mountains." Hua Shan, the most spectacular of the five principal sacred peaks of China, was a favorite haunt of Daoist hermits intent on transforming themselves into immortals. North American Plains Indians, such as the Lakota and the Crow, seek out high places for vision quests that give them spiritual power and determine the course of their lives.

The mountain monasteries and hermitages of Mount Athos in Greece have the primary function of providing an environment conducive to pursuing the Orthodox path of spiritual purification and illumination. The monk or hermit who follows this path to its goal is transformed, in the words of Saint Symeon, the New Theologian, into: ". . . one who is pure and free of the world / and converses continually with God

alone; / He sees Him and is seen, loves Him and is loved, / and becomes light, brilliant beyond words” (Syméon in Bernbaum 1998: 114).

Many people, both traditional and modern, seek out mountains as places of artistic inspiration and spiritual renewal. Kuo Hsi (Guo Xi in Pinyin), one of China’s greatest landscape painters, wrote of the reason for painting landscapes: “The din of the dusty world and the confines of human habitations are what human nature habitually abhors; while, on the contrary, haze, mist, and the haunting spirits of the mountains are what human nature seeks (His 1935: 30–1).

Interest in the Alps for scientific, artistic, and mountaineering reasons developed when philosophers and poets such as Rousseau, Goethe, and Shelley began to extol their spiritually uplifting qualities. Inspired by the ideas and sentiments of such writers and their successors, many Europeans today flock to mountains like the Alps and the Pyrenees, seeking spiritual nourishment and inspiration from views imbued with transcendent power and mystery lacking in their everyday lives. In the United States, John Muir, a major figure in the genesis of the modern-day environmental movement, founded the Sierra Club primarily to preserve the natural environment of mountains such as the Sierra Nevada as places where people could go for spiritual and physical renewal.

Each of these themes or views brings together different ideas, images, and associations to evoke the experience of a deeper reality. Tibetan pilgrims, for example, view the peak of Mount Kailas as the pagoda palace of Demchog. The two images fuse in their minds so that the mountain becomes the palace. This fusion of images awakens the experience of something that imbues Mount Kailas with an aura of sanctity. The pilgrim becomes aware of a divine presence emanating from the mountain.

The process works a little like the fusion of two slightly different photographs of a scene in a stereoscopic viewer to trigger a vivid perception of the third dimension inherent in each two-dimensional picture. The scene that looked flat suddenly seems to pop open with depth – in the case of a mountain like Kailas, a luminous depth full of meaning and significance for the pilgrim who reveres it as sacred.

The juxtaposition of images and associations also acts like the resonance of notes in a chord of music. Hearing the different tones resonate together creates a harmony, a sound with a quality that no note can produce by itself. In a similar way, a sense of the sacred issues from the resonance of images and associations in a view of a mountain, not from any single one of them. For followers of religious traditions, however, the fusion or resonance of cultural and spiritual associations in a view of a sacred mountain does not just create an effect: rather, it reveals an underlying reality present but hidden from usual awareness.

For the sake of simplicity, we have examined each theme or view by itself. But in actual practice, they do not appear in isolation. They come in clusters linked to each other in complex ways. The power of a sacred mountain, for example, may come from a deity whose abode lies on a high place at the center of the universe from which lifegiving waters flow. The more themes that gather like clouds around a peak, the

more associations they bring to bear on it, making the mountain resonate with deeper meaning and significance.

Sacred Sites in England

The issue of “sacred sites” links Pagans, Druids and other practitioners of “alternative” religions with heritage management and policy-makers. The issue is of site preservation versus site-use, and the lines are not clearly drawn. The best-known British prehistoric sites are Avebury and Stonehenge, but sites number in the thousands, and Pagan interests in “using” stone circles, prehistoric barrows or standing stones as sites of worship are increasingly becoming evident not only in traces of “use” expressed through offerings, but in the pressure put on local government and heritage management to recognize the value of even remote sites as contributors to a spiritual as well as an archeological heritage.

In 1998, 16 percent of people visiting Avebury expressed “spiritual motivation” as their reason with a further 11 percent giving “personal meditation” as the purpose of their visit. At the summer solstice in 2002, English Heritage facilitated “managed open access” allowing an estimated 23,500 people into the Stonehenge environs, the third consecutive year such an event has occurred. Such events in Britain and elsewhere display so-called “sacred sites” are a focus of increasing attention and tension, suggesting that such interest warrants serious academic scrutiny.

There are theoretical and pragmatic on-site issues of how British archeological sites (primarily those of prehistoric origin) have been renamed “sacred sites” by contemporary Pagans who engage with them “spiritually” and by heritage management itself, which has had to negotiate these issues. David Miles (Chief Archaeologist, English Heritage) has said that he accepted “Seahenge” was a “sacred site.” And Clews Everard, site manager until 2003 at Stonehenge, has referred to the stones as a “sacred site,” suggesting this term might be used to develop dialogue between the interest groups involved in summer solstice access negotiations. These issues are of timely concern to the archeologists who excavate and interpret sacred sites, the heritage managers who curate them, anthropologists interested in constructions of identity in contemporary Britain, local communities, the hospitality industry and, of course, Pagans themselves.

To “outsiders,” Pagans’ interests in the past may initially appear laughable, trivial, inauthentic and romantic: on the latter point at least, some Pagans may indeed romanticize the past in order to “reenchant” their lives in an increasingly secular society. On closer inspection, it is clear that Paganism is far more complex than the tabloid stereotypes imposed on it: Pagans are deeply committed to their religion and take their engagements with “ancestors” very seriously. We consider Pagans’ interests in the past must at least be taken seriously and engaged with by those whose professional interests lie with the past and its representation.

Not all Pagans engage with sacred sites, not all sites are perceived to be “sacred,” and it is not only Pagans who are interested in them. But for those Pagans who do engage with sites (most famously Druids), they treat such sites as places where the presence of ancestors, gods, goddesses, wights and other nature/spirit beings is felt most strongly, and where communication with these “other than human persons” is particularly effective. Rituals and ceremonies are often conducted at these sites during auspicious times of the year, including at the eight festivals comprising the “wheel of the year,” at various phases of the moon, and for Pagans local to sites, on a day-to-day basis. Such rites happen at hundreds of sites across the country, and while some may leave no trace of their occurrence, others may have a significant impact on sites. At an extreme, instances of graffiti and fire damage have been linked by some to Pagans, and a group named “Friends of the Stone” ignited an ersatz napalm-like substance at Men-an-Tol in Penwith, Cornwall. Such incidents are atypical of Pagans generally who tend to have reverence for sacred sites and tend also to respect the “preservation ethic” of heritage discourse. To show their respect for the other-than-human-persons at sites, some Pagans leave votive offerings, increasingly in some places, from flowers and mead to more enduring “ritual litter” such as candles, incense and crystals. Such material remains of Pagan rituals are common in West Kennet long barrow near Avebury, and at a wide variety of other “sacred sites,” especially stone circles. In the end, someone has to clear up these remains: until recently, this job fell to National Trust and English Heritage site curators, but whether locally or through such groups such as SOSS (Save Our Sacred Sites) and ASLaN (Ancient Sacred Landscape Network), Pagans are now active in site litter-clearance and the promotion of suitable site etiquette – the maxim encouraging others to “leave only footprints” being borrowed from the U.S. wilderness movement.

Pagan engagements with the past extend beyond the day-to-day use of sites for ceremonies with potentially greater implications for what archeologists do and how sites are curated. Pagans tend to approach sacred sites as part of a wider sacred landscape, and often this sacredness is seen as inherent in the place itself – the *genius loci*, power spot or wight is not deemed a construction of human imagination, but as extant *a priori* in the landscape. This worldview is in part inspired by indigenous conceptions of landscapes and has implications for archeological theorizing, which tends to take the opposite view, that landscapes are a *tabula rasa* that becomes encultured by humans. There are clear differences of opinion over how sacredness is constituted. The “sacred sites” constitute through a Pagan discourse of a “living landscape” that may be very different for the concept of “sacred site” constructed in the discourse of a heritage manager. At the very least, this indicates it is imperative that a singular meaning of “sacred site” is not set in stone but that sacredness continues to be problematized and theorized. In a further instance of how Pagan and heritage views conflict, Pagans may argue *the sacred site itself* has a view on how it should be managed. Such a point of view grates with rationalist and heritage management, which may write off the idea

completely. Yet to do so is short-sighted; the attitudes of Pagans cannot be ignored, as the example of a British reburial issue demonstrates.

The politics of the reburial of prehistoric human remains and associated artifacts is well known as a “hot topic” in, for example, the U.S. and Australia, but, currently, it is also having ramifications in Britain, with the return of not only remains but also artifacts (e.g., a Ghost Dance shirt brought to the U.K. by Buffalo Bill returned to the Lakota by Glasgow’s Kelvingrove Museum). British Pagans, drawing on such indigenous claims, have been calling for the reburial of Britain’s own “indigenous” prehistoric remains. Many Pagans identify themselves as spiritually allied with the prehistoric peoples who built “sacred sites.” Rites at megalithic tombs in particular, involving perceived direct communication with prehistoric “ancestors,” prompt these Pagans to feel a responsibility to ancient peoples once interred there, and to the sites themselves. So, not only are contemporary Pagans collaborating with site managers in site welfare (litter collection or removing chalk graffiti) but they have also, more contentiously, begun to address issues of “ancestor welfare”; concerns over the archeological excavation and storage of human remains and artifacts.

British Druid Order member Davies expresses this concern:

Every day in Britain, sacred Druid sites are surveyed and excavated, with associated finds being catalogued and stored for the archaeological record. Many of these sites include the sacred burials of our ancestors. Their places of rest are opened during the excavation; their bones removed and placed in museums for the voyeur to gaze upon, or stored in cardboard boxes in archaeological archives . . . I believe we, as Druids, should be saying Stop this now. These actions are disrespectful to our ancestors. When archaeologists desecrate a site through excavation and steal our ancestors and their guardians . . . It is a theft . . . We should assert our authority as the physical guardians of esoteric lore. We should reclaim our past (Davies 1997: 12–13).

This view clearly has an indigenous-inspired tone to it. Many Pagans, neo-shamans in particular, draw inspiration from indigenous peoples around the world, and in Britain some refer themselves as “new-tribes.” More theoretically, we are discussing Pagans as the “new indigenes.” Davies outlines how Pagans can get directly involved in this issue:

I speak for the ancestors and guardians of the land, those spirits not currently represented in the archaeological record . . . The Druid or Pagan shaman can use their gifts as harmonic bridges to communicate between the realities of archaeology, land developers and Pagan Druids . . . Druids should join together and encourage debate between archaeologists and museums in the reburial issue (Davies 1998: 10–12).

At first glance, individual Pagans and Pagan groups do not agree upon core beliefs or practices, let alone centralized spiritual beliefs concerning disposal of the dead. Nonetheless, in “the time of tribes,” the reburial issue is gathering momentum and coherency. Stonehenge, within the context of its Management Plan and proposals of a tunnel to replace part of the nearby A303, is currently a focus for Pagan concerns

over the excavation of human remains. Druid Philip “Greywolf” Shallcrass, asked a National Trust representative:

. . . if there was any possibility that priests used to working with the spirits of our ancestors . . . could make ritual for the spirits of the dead[?] . . . He expressed his personal sympathy to the idea. Inspired by this initial contact, I wrote a letter to some appropriate folk in English Heritage and the National Trust. In it, I expressed my concern that any burials found might simply end up in boxes in a museum basement. I asked for access to burials on site when they were uncovered, for permission to make ritual before burials were removed, and also whether it would be possible to re-bury the ancestral remains after a suitable period of study (author interview).

More recently, negotiations have moved forwards. After meetings with the liaison group established to discuss the future of Stonehenge, Greywolf had this to say:

I’ve come to focus on respect and reburial as my primary reasons for being involved in the talks . . . I have been, and will continue asking for any remains that are found to be treated with respect and then returned to the Earth as near as possible to their original burial sites, preferably with any accompanying grave goods and with suitable ritual (author interview).

While indigenous communities elsewhere can demonstrate genetic or cultural links to satisfy the law, focusing on the extent to which Pagans can claim British prehistoric remains as “theirs” is to miss the point, for two reasons. First, the issue here is one of respect and reburial rather than repatriation: most Pagans do not claim to be exclusively related to the ancestors. And second, the issue here is not one solely of academic discourse versus public understanding, of authenticity versus inauthenticity, or validity/invalidity. Rather, it is of multivocality and forms of knowledge and power within a diverse postmodern or late-modern society. More conservative archeologists may assume they have the power to charge Pagans with inauthenticity because scientific archeological claims are perceived to be more objectively substantive. But positivist dichotomies (authenticity/authenticity, validity/ invalidity, etc.) and staunchly empiricist approaches are incompatible with contemporary reflexive archeologies and with current social research methods generally. While it is not required of us that we agree with Pagan claims to the past, in the current post-processual climate of archeology at least, there is need for archeologists, heritage managers and others to be reflexive and transparent, and for them to open up their research/data to external scrutiny. So the issue is really whether archeologists are prepared to address such pluralities and engage with them dialogically, rather than dismiss them as fringe and eccentric.

Sacred Space/Place

Landscape, space, and place are three concepts that merge together to create the human experience of the environment. Space is the most basic concept of geography; it is the three-dimensional extent in which objects and events occur. Landscapes and places are both contained within space. Landscape provided the taken-for-granted backdrop for human activity and behavior. It is the most visible but least consciously felt aspect of regional character; it is an assemblage of sensory information, which generates a seen and felt experience of the world. Not only are there practical economic bonds between peoples and landscapes, there are also powerful religious, social, and psychological bonds. It is through these bonds that people develop affinities with particular locales and develop a sense of place.

Part of the human quest for meaning involves the ordering of landscape into places, and all cultures have separate, dedicated, hallowed spaces. Places are discrete units of meaningful space, and are fundamental expressions of human involvement with the world. They are distinguished from landscapes not in their scale, but in their qualitative experiential dimension. Whereas landscape is part of any immediate encounter with the world, place is further distinguished through symbols and affections. Places focus landscapes around human intentions and are sources of inspiration and insight; they are centers of cultural and personal meaning.

A “sense of place” begins with interactions between people and the world and develops out of a symbolic constitution of the environment within which we exist. It involves a blending of intellect, intuition, and imagination. On one hand people feel what it is like to be at a place, and on the other hand people intellectually grasp the meaning of a place. A sense of place unfolds, then, through the application of religious, moral, and aesthetic discernment of specific locations. Place is a universal marker of identity in relation to the landscape, although expressions of this association vary culturally.

Geographical places become sacred or symbolic when they conjoin human social facts with those of nature. A sacred place, then, is a charged meeting ground between person and the other. People in diverse parts of the world have long utilized natural places in their quest to connect with the numinous. Through mythological interpretation of landscape and place, geography is transformed into cosmology. People experience discrete places of power, and these culturally defined sacred places offer a nexus between humans, the physical environment, and deities. Sacred places are symbolic, transcending their immediate physical forms; they are unique parcels of the Earth, which aid in the transformation of self.

Sagan, Carl (1934–1996)

Astronomer, author, educator, and television personality,

Sagan was one of the few scientists of the late twentieth century to achieve celebrity status. Through various media, notably his best-selling books and the enormously successful Public Broadcasting Service series *Cosmos* (first aired in 1980), he achieved worldwide fame for his lucid and often entertaining explanations of advanced scientific concepts. A self-proclaimed religious skeptic dedicated to the scientific method and the empirical verification of all truth-claims, Sagan was firmly in the tradition of Western scientism. Nevertheless, he often used religious language to frame his discussions of the aims, methods, and content of modern science. Among other things, Sagan affirmed the role of the imagination in the shaping of scientific inquiry, most conspicuously in his career-long quest to find extraterrestrial life forms. He also eloquently celebrated the sense of awe and wonder evoked by modern views of nature.

Background and Career

Sagan was born in New York City in 1934 to Jewish parents. Although exposed to Judaism as a boy, after his bar mitzvah he largely abandoned normative Jewish thought and practice, including the belief in a personal God, in favor of a career in science. An excellent student, he was voted “Class Brain” in his high school and went on to earn advanced degrees in physics and astronomy at the University of Chicago. As a working scientist, Sagan’s projects included studies of the atmospheres of other planets, theoretical works on the possibility of extraterrestrial life, and advisory roles for various NASA missions. From 1968 until his death he was a professor at Cornell University where he served as David Duncan Professor of Astronomy and Space Sciences and director of the Laboratory for Planetary Studies. Politically, Sagan was an unabashed liberal who regularly supported feminist, environmentalist, and arms control causes. No stranger to controversy, he figured prominently in public debates over nuclear weapons policy and missile defense during the Reagan era. Unlike most of his peers, Sagan had a flair for publicity.

His ideas on space science and the origins of life began appearing in newspapers and national magazines when he was still a graduate student. Later, his accessible writing style and media-friendly demeanor helped make him a household name. His first nominal success was a book coauthored with Soviet scientist, I.S. Shklovskii, *Intelligent Life in the Universe* (1966). His real breakthrough, however, came in 1973, when he

published *The Cosmic Connection* to wide acclaim, and made the first of 26 guest appearances on *The Tonight Show* with Johnny Carson. Further recognition came in 1977 when his best-seller on the evolution of human intelligence, *Dragons of Eden*, won the Pulitzer Prize for non-fiction. Subsequent books on hominid evolution, space exploration, pseudo-science, and religion also met with critical and popular success. *Cosmos* was the apogee of Sagan's public career and established him as a cultural icon. Estimates suggest that half a billion viewers watched the series during the 1980s, and the book version became the top-selling scientific book of all time. His novel *Contact* (1985), a fictional account of a scientist who successfully communicates with aliens, was made into a movie starring Jodie Foster (released in 1997). Sagan's rangy interests and high public profile got mixed reviews in the scientific community. He was denied tenure at Harvard in 1967. In 1992, after a rancorous debate, the prestigious National Academy of Science voted against his nomination for membership – in part, because some members felt his scientific work had not been substantive enough to warrant inclusion. Two years later, however, the same body awarded him its Public Welfare

Medal for his popular writings.

Scientism and Religion

Sagan was perhaps the leading advocate of scientism of his generation and consistently argued for both the superiority of science to other forms of knowledge and the necessity of greater public understanding of its “delights” and “social consequences” (Sagan 1993: 14). Much influenced by philosopher Karl Popper, he regarded true science as that which could be formulated into testable hypotheses and thus potentially proven wrong, or “falsified.” Much of his criticism of traditional religions (as well as pseudoscience and metaphysics) was that they resisted challenge, testing, and revision and thus were not as fully selfcorrective as science. Sagan believed that the ethical values that sustained science included “a delicate mix of openness and skepticism,” democracy, education, “decency, humility, and community spirit” (Sagan 1996: 431, 434). Because so many religions were “steeped in an absolutist frame of mind,” he hailed the strict separation of Church and state as one of the great achievements of the American Constitution and a crucial step in the emergence of free inquiry (Sagan 1996: 432).

Paradoxically, Sagan often enlisted the aesthetic and emotive language associated with religion to make his case for the authority and sufficiency of science. For example, he peppered his popular works with quotations from religious texts ranging from the Bible to the Mayan *Popol Vuh*. In *The Demon-Haunted World: Science as a Candle in the Dark*, he asserted that the very “act of understanding is a celebration of joining [and] merging . . . with the magnificence of the Cosmos.” Through science individuals grasped the “intricacy, beauty, and subtlety of life,” and the contemplation of scientific

ideas produced a “soaring feeling” that combined “elation and humility.” Cumulatively, science assumed transcendent qualities, becoming the “transnational, transgenerational metamind” of the modern world. Furthermore, if one defined “spirit” so as not to imply anything immaterial, science was “not only compatible with spirituality,” it was “a profound source of spirituality” (this paragraph’s quotes from Sagan 1996: 29).

In ethics also, Sagan mingled scientific ideas and traditional religious language. In *The Cosmic Connection*, he argued, given our common evolutionary heritage, that “spiders, salamanders, salmon, and sunflowers are equally our brothers and sisters,” and that “the time has come for a respect, a reverence, not just for all human beings, but for all life forms” (Sagan 1973: viii). Conceptually, ethical progress followed the “identification horizon” – the process of extending the Golden Rule to more and more categories of beings. In turn, this ethos supported environmental activism and conservation efforts.

Critique

Perhaps the most common criticism of Sagan was that his optimistic scientism was naive – particularly in light of the persistent social and political strife of the twentieth century. The devastation wrought by modern warfare, genocides, purges, and nuclear proliferation suggested to many that faith in the goodwill and rationality in human nature, even when scientifically informed, was misplaced, even dangerous. One detractor noted that Sagan’s dedication to the “spirit of geometry” led to him exclude “non-scientific modes of thought – the very tools needed to understand history and apply its lessons to the present” (Royal 1986: 29). For others, the beneficial effects of scientific knowledge seemed unlikely to mollify what ailed the restless modern spirit. After seeing *Cosmos*, novelist Walker Percy, a Roman Catholic, wrote a wry rejoinder, *Lost in the Cosmos: The Last Self-Help Book*. In it, he jibed, “once everything in the Cosmos . . . is reduced to the sphere of immanence, matter in interaction, there is no one left to talk to except other transcending intelligences from other worlds” (Percy 1983: 173).

As biographer Keay Davidson has noted, Sagan was a man “troubled by grand dichotomies” – a “prophet” who was simultaneously a “hard-boiled skeptic”; a “boyish fantasist” who insisted on “ultrarigorous” analysis; a visionary and cerebral “merchant of awe” whose life was one of hectic schedules and driving ambition (Davidson 1999: 1, 333). His polished persona as a public intellectual belied a complicated personal life, which included two messy divorces, marijuana use, and accusations of arrogance and egotism. With religion too, Sagan was a man of considerable paradoxes. Perhaps the most widely read doubter of received traditions in recent American history, he nonetheless could impress even his critics with encyclopedic knowledge of scriptural traditions, and could forge alliances with religious groups (including the Vatican) who held similar views on environmental issues and arms control.

Overall, Sagan was more than just a genial critic of supernatural beliefs, he also imagined a world liberated, expanded, inspired and ethically invigorated by scientific knowledge and inquiry. In the words of his wife and collaborator, Ann Druyan, he envisioned humanity “conscious, wise, compassionate, energetically curious, eternally skeptical; [and] immune to the manipulations and intimidations of the powerful.” By embracing its “utterly decentralized place in the fabric of nature, space, and time,” human culture would be “secure enough at last to embrace the wonder inherent in this reality, [and] awakened to our responsibilities as a link in the generations past and future.” In doing so, Sagan advanced nothing less than “a new sense of the sacred” by giving sustained public voice to the “spiritual high that is science’s overarching revelation – our oneness with the cosmos” (this paragraph’s quotes, Druyan 2000: 25–7).

Saharan Pastoralists

The territories of Central Saharan pastoral nomads are not bounded spaces, but are a mosaic of water-points, grazing areas, places for social and ritual events, each having symbolic value and chosen to fulfil religious and economic needs within the cultural landscape. The nomadic pastoralists of the Central Sahara today: Tuareg (Kel Tamacheq) and Toubou (Teda, Daza, Zaghawa) are Muslims. Islam, however, is a veneer that overlies an earlier animist belief in spirits, and these pre-Islamic survivals are merged with Islamic rituals. Spirits inhabit pools, trees, mountains and other natural features of the landscape. While the pastoralists move across their exploitation territories, these spirits need to be placated. This can be done by sacrifice, adding a stone to a cairn at the top of a col (a saddle at the head of a valley), refraining from killing the crocodiles (water spirits) that live in the pools (Toubou), or marking the tree, *Maerua crassifolia*, where spirits live (Tuareg). Alternatively, with the latter, stones can be thrown at the tree to scare off the spirits.

A particularly strong belief, which seems pervasive, is in the fire spirits, which are believed to be controlled by endogamous castes of blacksmiths. These smiths practice curing possession rituals among the Tuareg, where the smith becomes the embodiment of the fire spirit. Such rituals may have considerable time depth. In the Tassili n'Ajjer of southeastern Algeria, rock art that is possibly 4000 years old shows a scene with ritual specialists working with fire, observed by "wavy-line" cattle. These "wavy-line" cattle are found in other scenes that appear to be of a narrative nature, depicting pastoral activities.

Rock-art studies elsewhere in the world (e.g., Australia, South Africa, the Americas) indicate that the art is a reflection of deep meaning (i.e., religious beliefs) and has usually been drawn by ritual specialists as part of ceremonial or transcendental experience (shamanism). The art may depict specific events, but is rarely purely narrative in intent. Thus the "wavy-line" cattle may well have been symbols of a more basic religious nature. Cattle are wealth to pastoralists, but they play a much greater role in society than purely economic. Among African pastoralists, cattle are often seen as living representatives of the ancestors, and human/cattle lineages parallel each other in marriage exchanges, with the genealogy of both being well known to all the herders.

Markings on cattle in both paintings and engravings on rock walls are a common theme from the Central Sahara all the way to the Red Sea. Concentrations of these paintings in the main mountain massifs of the Sahara (Tassili n'Ajjer, Hoggar, Aïr, Tibesti, Ennedi) may well have been identity points in the landscape, as would have been (and are) cemeteries where holy men were buried. The tracks connecting rock-art

sites, cemeteries and places where spirits lived, along with the water and pasture basic to any herding strategy, would constitute a landscape of belief repeated in stories and myth passed down from generation to generation.

Intentional burial of cattle as part of ritual is first documented in the Western Desert of Egypt at Nabta Playa, dated to between 6500–5500 years ago. This predates the Badarian civilization of the Nile Valley and may well have been a precursor of the later cattle goddess cult of pre-Dynastic Egypt. Such cattle burials are also found in Saharan sites of Niger.

Cultural contact over large distances among pastoralists is well attested today (viz. Fulani and Tuareg distributions across the Sahara and Sahel). Archaeological data suggests that similar connections go back to Neolithic times, more than 7000 years ago. It is across this belt of the Sahara that the pre-Islamic survivals exist. If the rock art and cattle burials are any indication, then these Saharan belief systems predate their appearance in North Africa or the Nile Valley. Rather than seeing the Sahara as a cultural backwater absorbing attributes of more “advanced” people, we might suggest that this was an area of innovation.

Salvadoran Reflection on Religion, Rights, and Nature

A few decades ago when I was in primary and high school, the Jesuits taught us the importance of becoming God's messengers by defending religion, particularly because of the threat imposed by communism. I remember we were taught about how the devil inspired Martin Luther to attempt to destroy the Church, the saint inquisition and the infallibility of the pope. Of course some stories like Galileo's left some of us confused.

In those days the teachings seemed to be oriented to defend religious rituals – that was the divine duty – and the key idea was that the next life was more important than this one. Genesis stated that all things are here for man's use and man has domination over all things. I remember we, the students, felt the divine obligation to bring flowers to the Virgin Mary in May and take communion every day, and also the need to become crusaders. A few years after finishing high school, the same Jesuits that warned us about communism were being accused of being communists themselves by the powerful Salvadoran oligarchy. This happened because in their religious teachings these Jesuits were including as a central religious duty the defense of the human being and his or her dignity. New questions were asked such as: Why are people poor? Is it not a social sin when few people in our society have so much and most people have so little, sometimes not even enough to live as a human being? What should a Christian do when we are faced with these circumstances? If all of us were made in the image of God, is it not God who is suffering in the flesh of the poor? Are we not obliged by divine duty to try to change all this?

These human-centered religious teachings, often labeled as theology of liberation, encountered fierce opposition by the ruling economic class, the government, and even by some priests. At this same time the archbishop who had been sympathetic to these new teachings was replaced because of old age, and a new archbishop was appointed in 1977. This new archbishop was "Monseñor" Oscar Romero. Romero was favored by the government and the ruling oligarchy as a religious intellectual. They thought he would get the Jesuits back into teaching the importance of bringing flowers to our Holy Mother, keeping chastity until marriage, and accepting reality as the will of God.

A few weeks after "Monseñor" Romero was appointed, a friend of mine, the Jesuit Rutilio Grande was killed. This was when Monseñor showed who he really was.

I remembered attending Rutilio's funeral and Monseñor Romero's questions were: How can anybody kill a priest? How can anybody kill a person that is helping poor people? How can anybody kill a messenger of God?

Monseñor Romero must have forgotten for a moment that 2000 years ago the same evil forces had killed the Son of God, and what was happening here only showed that not much had changed.

The three following years until Romero's assassination were something unique and exciting in El Salvador. To be at the Sunday masses with Monseñor Romero gave many of us the impression it was Jesus Christ preaching. If for some reason I could not go to a Sunday mass I always had a radio to listen to it.

I remember the day before he was murdered, I attended the Sunday Mass, crowded as usual, and Monseñor Romero was as inspired by the Holy Ghost as ever. I remember I saw the U.S. Ambassador Robert White, attending the Mass also, surrounded by his bodyguards and his car running at one of the church entrances, waiting for him just in case. That day I was scared because the previous Sunday Mass somebody left an attaché case at the church with 72 dynamite candles, which fortunately did not explode. After the Mass, there was the usual press conference given by Monseñor Romero. I then had the chance to talk to him briefly. He asked me for my reaction to what he said during the Mass and also told me that in the middle of his homily the national communications office had blocked the telephone lines so that his homily could not be transmitted outside of the country. The next day Archbishop Romero was killed.

Most of us felt what Ignacio Ellacuría, the president of a Jesuit-run university, said once: the Saint Spirit passed through El Salvador in the figure of Monseñor Romero. A few years later Ellacuría and other Jesuits, my high school teachers, were also killed.

What this experience has taught us is that religion does not need to be the opium of the people, as some religious people have made it seem in the past. I remember during the war in El Salvador, some priests were blessing the army weapons and of course it was very hard to tell poor peasants that the weapons killing them were sacred. What Monseñor Romero taught us is that religion, when rightly interpreted, is a force of liberation. God does not want people to suffer, God wants people to have life and have plenty of it. As Romero said, "There is much of God in the earth and it cries out when some people hoard it unjustly. I raise up my voice to say: do not worship your wealth."

While I am writing this, 23 years after Romero's death, the social conditions, in most places, have not improved. Poverty and violence keep increasing, now aggravated by something else: the destruction of nature.

It is common knowledge that there are environmental problems. Universities and institutes are talking about it and the general public perceives it as the price we have to pay for the good of our civilization. But the problem is that such a price is not paid equitably everywhere and for some people in some regions of the world, it might be unfair and too high a price.

If we compare a southern Country like El Salvador with the northern countries of Europe, USA or Japan, we see that, in the northern countries, the environmental problems are incorrectly perceived by politicians, the general population and sometimes even the scientific establishment. Their discussion of environmental problems remains mostly in the ecological or biological domains, or at the scientific or resource policy

levels, since they are not seen as having a considerable impact on the performance of the society. Scientists talk of the disappearance of animal species or the destruction of the ozone layer, activities the impact of which, though affecting the health and well-being of people, is not felt in a direct way and may therefore go unnoticed.

In a country like El Salvador, the situation is rather different. The environmental problems are at the same time social problems in the sense that the average citizen feels them in a direct way. They are becoming political problems because of the violence they generate. When we talk about ecological problems, we are talking about a lack of water to drink. Water with unacceptable levels of pollution leads to the most common causes of childhood death in the country. When we talk about climate change, we are talking about the “El Niño” phenomenon that upsets crop cultivation because of too much or too little water, leading to famine in the country, or we might be talking about Hurricane Mitch that left 12,000 people dead in Central America.

In many countries or regions in the south, the environmental destruction has reached such levels that what were once considered gifts from God, like air, water or food, are now the main sources of death. In El Salvador for example, the leading causes of death are infectious respiratory diseases, coming from air pollution, followed by gastrointestinal diseases coming from water and food pollution. In other words, the most dangerous things that a human being can do in El Salvador is to breathe air, drink water, or eat food.

So the structural violence that Archbishop Romero focused on is not just generated by the social sin of unjust distribution of wealth but also by the mismanagement or lack of natural resources, and their wastes. Water is becoming a source of violence. Sometimes communities fight among themselves over access to a given water spring. Other times the battle is between the local population and the government, when some government agency attempts to take the water away from a rural place to satisfy industry or city demands. This lack of water is even becoming a source of conflict not only in El Salvador but also between many neighboring countries, for example Israel and Jordan.

Environmental destruction in the southern countries is of no surprise, when we realize that the management of natural resources follows the logic of profit and not the logic of the societal well-being or the logic of nature (ecological). Resources are exploited in order to obtain the largest possible profit, irrespective of how much the environment is deteriorated or society is affected.

This state of affairs is something that will be made worse by the current corporate-led globalization. The whole idea behind corporate-led globalization is to remove all possible obstacles or barriers to the “free” flow of capital and goods, so that the corporations can keep up the exploitation of resources. Corporations are interested in profits, and governments, most of the time, follow these corporation guidelines or in the best-case scenario simply do not oppose them.

To facilitate this globalization, the governments of the world, motivated by international capital, have established the World Trade Organization (“WTO”) with the

objective of facilitating international trade, above any other concerns. There are environmental and social regulations regarding trade that corporations pay lip service to, but according to WTO rules and practices, even if the liberalization of trade brings the displacement of jobs or the pollution of a river, the WTO will favor trade. There is an example in Mexico where a municipality that rejected wastes from a transnational corporation was fined several million dollars by the WTO. The reality is that we live in a social system where the short-term profit of transnational corporations is more important than the medium and long-term benefit of society and nature.

We thus live in a world economic system that intrinsically violates human rights. For example, our system promotes the consumption of goods. Anybody has the legal right to consume as much as he or she wants, limited only by the wealth that he or she possesses. This consumption of goods means, among other things, consumption of resources like oil. Much energy is required for the production of goods and their transportation from the production site to the consumption place. It is scientifically established that the exhaust emissions coming from oil consumption generate carbon dioxide that contributes to climate change, which in turn takes people's lives in other parts of the globe. This means that our present economic system promotes the unlimited consumption of goods by some people, which at the same time damages other people, therefore violating their rights.

The problem is not consumption *per se*, because nature has the capacity to process wastes and transform them into useful products. The problem is overconsumption where wastes, such as gas emissions, exceed the capacity of nature to process them, thus generating problems. In this mode of thinking coming from current societal values, it would be inconceivable to limit the consumption of goods to any sectors of the population, even though such consumption generates suffering to other population sectors.

Some of the most important "rights" in our society are the right to private property, and accumulation of wealth, whether or not that "right" negates other people's most fundamental human rights, like the right to live healthily and in a decent way. The following is article 17 from the Universal Declaration of Human Rights: "(1) Everyone has the right to own property alone as well as in association with others . . . (2) No one shall be arbitrarily deprived of his property."

When anybody starts a production unit for example, the law allows the privatization of profits coming from that enterprise, but at the same time the law allows the enterprises to pass some of the costs of production, like the impact generated by garbage or gas emissions, to society, such that many costs are socialized. Why are oil companies allowed to privatize the revenues coming from oil exploitation and consumption and at the same time not required to assume the costs coming from those activities, like pollution of water bodies, destruction of forests or climate change? In the way our society functions, corporations are reaping the benefits of the generation of this socio-ecological debt. Therefore corporations are mostly responsible for the existence of that debt.

The violation of human rights takes many other forms. For example, consider oil again. Every time a new oil well is opened in Colombia, to meet industrial energy demand, there are always people killed, sacred places and forests destroyed and local indigenous populations displaced. A similar situation is developing in the Ogoni land in Nigeria. Thousands of Ogoni people have been killed, many others displaced and tens of thousands live in a pollution nightmare, just to keep the oil running from their wells, motivated by the profit mentality of the transnational oil corporations. The same happens to millions of people displaced by the construction of hydro-electric dams to generate electricity to produce goods, sometimes consumed by people living on the other side of the planet. Looking at this rationale of our economic system of “privatization of profits and socialization of costs,” which has prevailed for centuries and remains to this date, we can deduce that an ecological and social debt has been generated. The people who consume more resources owe this socio-ecological debt to the people who consume fewer resources. In political terms this means a socioecological debt owed by people from the overconsumptive North to people from the South. North does not only mean people from the northern countries but also includes upper and middle economic classes from the southern countries that also overconsume. Likewise the South also includes lower economic classes living in the northern countries.

People from urban areas also owe this socio-ecological debt to people from rural areas, because the urban way of life, cities and industries, have always been developed and kept functioning at the expense of rural places. Taking a look at history, starting with the periods of colonization and continuing with interactions between races and sometimes between countries, it can be seen that this socioecological debt is also owed by white people to indigenous and colored people all over the planet. Considering our basic gender division and the relationship of exploitation and inequity that has always existed, it must also be realized that men owe this socio-ecological debt to women.

The way our generation and previous ones have misused the resources of the planet means that our generation owes a socio-ecological debt to future generations. Finally, we are just one of the many species that exists and shares the space of the planet. One of the most important differences between human beings and all other living creatures, which amount to between 5 and 30 million species, is that all species take from nature only what they need to survive, except human beings. Humans have developed a social system with a set of values that promotes an ever-increasing consumption of resources and by doing so generates violence to other species that are also part of the creation. Therefore, *Homo sapiens* have a socio-ecological debt to the rest of the creation.

Looking at this social behavior from a religious perspective, there is a basic question that comes to mind. How can human beings claim respect for a Creator and supposedly follow divine laws, when this same human being respects neither the creation nor the creatures that are part of it?

It is unfortunate to realize that there has been little effort by the major religions to consider environmental aspects and the defense of creation with her corresponding creatures as central to religious duty. It is time that a second chapter be written in

liberation theology, to include the defense of nature. On one hand, creation is the will of the Creator, and that by itself generates a religious duty, but on the other hand, the destruction of creation also means the destruction of human beings. Polluted water kills people, so does climate change. As the commandments state: Thou shall not kill. It is everyone's responsibility to take that seriously. This means thinking about the consequences of overconsumption, where products come from, and what that means to the people who provide those products. Be a conscious consumer.

Samia Culture (Western Kenya)

For Samia people of western Kenya, like most African peoples, nature is filled with religious significance. The invisible world of god and spirits is symbolized or manifested by natural phenomena, and people see “that invisible universe when they look at, hear or feel the visible and tangible world” (Mbiti 1969: 56–7). Nature, the bountiful source of life, is also unpredictable, dangerous and powerful. It is “wild.” For humans to live in their social world, they must – through work and rituals – have appropriate relationships with the natural world and the spirits that inhabit it. Hard work turns wild bush into farmland, producer of food and sustainer of life. Rituals and other religious practices make wild nature more beneficent and orderly.

Samia live around the northeastern shores of Lake Victoria, in a land of steep hills, undulating valleys, and open plains – all lushly green in rainy seasons, rusty brown in dry seasons and droughts. The hills are dotted with trees, roadsides are lined with invasive non-native perennials such as lantana and tithonia, and everywhere there are people, houses and cultivated fields. The Samia in their home area numbered about 75,000 in the 1999 census, though many Samia, especially men, are away as migrant laborers. The Samia are a sub-group of Kenya’s second or third largest ethnic community, Abaluyia.

In the late nineteenth century, before colonial rule was imposed, only a small proportion of the land was cultivated. There were few people and many animals such as elephants, crocodiles, hippos, hyenas and leopards. People farmed and herded cattle, fished and hunted. A century later, in post-colonial Kenya, to see elephants and other such animals is rare, hunting is illegal, and with a greatly increased population (more than doubled from 1969 to 1999), the balance between cultivated land and bush has shifted heavily toward cultivation. Today many people do not have enough land to practice the traditional shifting cultivation with bush fallow, a system that renewed soil fertility. Marginal lands are cultivated, deforestation and erosion are growing problems, and, increasingly, farms are too small to be economically viable. Bush that harbors monkeys is cleared because monkeys, great destroyers of crops, may no longer be legally hunted. Fuelwood and thatching grass are scarce. The pre-colonial sustainable subsistence economy and the integrated socio-political-religious-moral system in which it was embedded have been fragmented and, often, replaced by imported ideas and behaviors.

Like their nineteenth-century forebears, contemporary Samia are farmers and cattle herders; unlike their ancestors, they are implicated in the global political economy. But they still wrestle daily with the land and keep an eye on the weather. Because of the

tropical climate, many activities take place outdoors all year round. Like Gikuyu in central Kenya, Samia “are daily and hourly in the most intimate contact with Nature” (Kenyatta 1953: 241). The natural world is all around, and the contemporary Samia social and symbolic world is a fabric woven from both human and natural environments, indigenous and Christian cosmologies.

Samia cosmology has a high god, *Were*, creator of the world and everything in it. *Were* resides in the sky, invisible and all-powerful, the ultimate giver of life and all prosperity. He manifests himself in natural phenomena: sun and moon, rain, rainbows, thunder and lightning. Earthquakes are *Were*’s sign that general bad behavior needs to be corrected. Ancestral spirits (*emisambwa*) are active in their descendants’ lives; they are intermediaries between living people and *Were*. Homesteads had an ancestral shrine of small stones and little mud-houses placed before the senior wife’s house. Here people sacrificed meat and beer to their ancestors and prayed for blessings or for help in a crisis. Sometimes the sacrifices were to placate an angry, hence dangerous spirit. Just before sunrise each day, the oldest male in a homestead went outside and, standing by the shrine, spat to the east and asked *Were* for blessings for the day; at sunset, he spat to the west and asked *Were* for blessings for the night. Diviners and spirit mediums interpreted events and recommended ritual or practical redress. Rainmakers ritually directed nature’s powers to produce rains, destructive or beneficial, and even drought. Sacred trees were meeting places for ancestral spirits; the trees were given names and were not to be cut down; the ground around them was swept clean. Today some huge, old sacred trees are cut down for fuelwood or to make charcoal, and anyone who has an ancestral shrine probably hides it in their house, as most Samia are at least nominal Christians, and some – the born-again “saved” people (in a crossdenominational movement of religious revival) – are adamant that these shrines, rainmaking paraphernalia and other such things are Satan’s and must be destroyed.

Christian ideology has centered on matters of faith, on sin and salvation. Christian churches in Samia have concentrated on educational and health programs, not environmental issues. A rare exception was the work of Sr. Marianna Hulshof, a Medical Mission Sister who, for nearly thirty years, showed people in Samia how to farm in ecologically more sensitive ways. She did this by practical demonstrations, not by religious rhetoric. Samia have not embraced a “protect the environment” ethos; rather, they deal with their environmental problems individually and pragmatically, sometimes with help from government agriculture and forestry extension agents or in response to directives delivered by government administrators.

Few people follow the old religion in its entirety, yet many aspects persist. Diviners, spirit mediums and herbalists are still consulted – along with priests, doctors and government officials. Ancestral spirits remain active in family life, visiting their kin in dreams or making themselves known through illness. Everyone, saved or not, insists that the dead must be placed in the Earth of their own homes, making generational continuity visible, placating angry spirits and opening oneself to blessings from the

spirits. Every Samia person's connections to kin and claims to identity and land are mediated by ancestors' graves, the land itself and the spirits inhabiting it.

Wildness continues to figure in Samia life through everyday experiences, as people move between homestead, farm and bush, and the categorical and symbolic distinctions Samia make between wild and human. The homestead, a physical expression of social life, is a clearly defined moral space, marked by houses, graves, and formerly, ancestral shrines but now by Bibles, crosses and pictures of Jesus. Hedges surround many homesteads, marking off the homestead as "inside" and the land, cultivated and bush, as "outside." Inside is the world of humans, who behave properly, work hard, and are responsible and orderly.

Yet there are interpenetrations, fluid boundaries, ambiguities. Ancestral spirits are betwixt and between, no longer human, yet not wild – except for the bad spirits known as *esikhieno*. Humans go into the bush to make use of its resources such as thatching grass, poles and stones; wild animals such as monkeys, mongooses and snakes come into the homestead. Cattle, sheep and goats who spend the day on grazing lands return to the homestead for night-time security, yet they – like all animals – are wild, even though they are closely implicated in human social life through their ritual roles and use as food, gifts and bridewealth. Thieves, who are humans turned wild, enter homesteads secretly to steal, and the power of witchcraft or an evil ancestral spirit may cross the boundary. Anyone who goes out of the homestead at night runs the risk of meeting a hyena or leopard, or *omulosi*, a person who travels with an animal familiar and creates minor disturbances in homes. Storytellers still tell of the mysterious wild beasts who enter homesteads in human form and then eat the inhabitants. Thus, though the bush and its animal population have been greatly diminished, wild things still enter the homestead, humans go into the wild, and the notion of wildness continues to resonate in Samia thought and ritual action.

San (Bushman) Apocalyptic Rock Art

Southern African San or “Bushman” rock art is currently most adequately understood as an outward shamanistic expression of relationships that the San had with each other, with non-San, with an ordinary outer world, and with an extra-ordinary spirit world. For approximately 30,000 years, San rock-engravings and rock-paintings helped connect these co-dependent, parallel, and immanent worlds. San rock-art sites were thus points of breakthrough, and what we call “images” were for the San actual spirit world beings emerging from their home behind the rock. Unlike representational or even symbolic art forms, San rock art represents a radical departure from image making where representation and reality fuse seamlessly.

Similarly, what we call “nature” was for the San a deeply cultural entity that contained the entirety of human experience and that required constant custodianship. Over the last two thousand years, the character of San rock art changed to accommodate immigrant black farmers and KhoeKhoen herders. No longer was the landscape custodial – it became for these immigrants a commodity whose prime function was to provide an economic base for their existence. For a time the landscape’s bounty and the San’s revered spiritual status allowed the San custodial ethic to cautiously coexist with the imperialistic ethics of KhoeKhoen herders and black farmers. But this uneasy “truce” could not last, and in the last 600 years, images of weapons and scenes of conflict between different groups of people became alarmingly frequent. The arrival of White colonists in the mid-seventeenth century violently increased the hunger for a suddenly finite landscape. When the San realized that “their” land was being taken for granted and that they were being pushed off, it appears that they used rock art as a visible statement of their armed and political resistance by indelibly marking their homes in bright and local pigments. This war lasted 300 years but eventually the superior weaponry and rapacious body politic of the colonists took their toll. In 1875, Dia!kwain, a man who barely survived this war, told the story of *The Broken String* in an attempt verbally to articulate his disbelief at how his unbreakable connection with inner and outer landscapes had, in fact, been broken:

“People were those who broke for me the string. Therefore the place does not feel to me as the place used to feel to me. The place does not feel pleasant to me” (Bleek and Lloyd 1911: 236–7). From physical resistance the San turned, one last time, to a similarly ailing spirit world for deliverance. They tried to coax potent but dangerous spirit world beings into the outer World by painting their grotesque and bizarre likenesses on

rock walls. Never-beforeimagined frightening phantoms appear in an ephemeral and ghostly white paint, often with enigmatic lines emanating from their misshapen heads. Many marauding dogs representing the powerful trickster god's/Kaggen's "dogs of war" endlessly pursue deformed human figures that represent the Qobé or non-San. These distorted paintings appear to reflect a dislocated self-image and a sense of worldly alienation.

Determined by pigment analyses and study of 645 San rock-painting sites, these paintings date between 1750– 1850. In the hotly contested southeastern southern African landscape, this eschatonic or apocalyptic art appears to be an attempt by the San to reclaim their worlds by banishing, by supernatural means, those who did not share their custodial ethos. But the boundaries between inner and outer worlds seem to have become rigid and distant and it appears that not even the most powerful shamans could now bridge this divide. Nor does it seem as if spirit world beings were able to break through the rock and deliver the San from their suffering. Fortunately, the San did survive this Apocalypse. Today about 140,000 San live in Angola, Botswana, Namibia and South Africa. They have remained connected to their spirit world and are helping non-San discover this ancient yet ever-relevant spirituality.

San (Bushmen) Religion

The domain of nature looms large in the lives of the Bushmen (or San). Their natural environment is today primarily the Kalahari of southern Africa, a semi-desert plain with summer rains and winter droughts, and, as recent as a century-and-a-half ago, also included the mountainous grasslands of the northwestern Cape, as well as other regions of southern Africa. As hunters and gatherers, San men and women are intimately involved with their natural environment, its animals, plants, seasons, climatic cycles, wind, weather, and sky. These impact closely on how, when, and where the people forage; they dictate the seasonal cycle of population dispersal and aggregation. Their loose kinship, marriage and leadership institutions, their egalitarian social and gender relations, exchange patterns, notions of territoriality and values of sharing and reciprocity are all affected to varying extent by the people's adaptive lifeways. Religion, too, is intimately linked to nature, so much so that some researchers see in it an "ideology of foraging," that is, a mindset that is congruent with the production mode and social patterns of a foraging people.

Before turning to the nature component of Bushman religion (the main theme of this brief account), it should be noted that San religion addresses itself also to the social domain, in the ways all religions do. Like myths everywhere, Bushman myths, too, explain and validate the social order, while ritual enacts, reinforces or defuses basic social processes, values and conflicts. The Bushman healing dance is a case in point: as the people's central ritual, the trance dance plays out such things as intraand intergroup sharing, social and gender equality, exchange and kin networking, "ludic" conflict resolution, leveling and cooperation, all of them key structural and ideational elements of Bushman band society. Moreover, the dance becomes an arena for the moral, emotional and creative interplay between the individual and the community, enacting thereby one of the basic structural characteristics of this fluid and loosely organized society – the juxtaposition of the individual to the group and the balance between individualism and communalism.

The element of nature most prominent within Bushman religion is animals. Plants receive far less symbolic elaboration in Bushman myth and ritual, while stellar and meteorological phenomena may be salient features of the myth and lore of some groups (especially the /Xam). An example for the second is the !Kung mystical concept of *n!ow*, the mystical and magical connection of some persons to the wind and rain at their birth, which is dramatically evident also at the person's death, through the unleashing of a mighty wind or rainstorm.

As a hunting people the Bushmen are intellectually and emotionally attuned to animals, especially the game species and the animals that prey on them, the carnivores, in whom the Bushmen see resourceful fellow hunters, one of whom, the lion, they hold in special esteem (so much so that one group, the !Kung, have established a pact of mutual respect and avoidance between themselves and the lions). A sympathetic bond links a hunter to his quarry, which may be palpable, expressing itself through bodily sensations, which the /Xam called “tappings” and experienced in those parts of their body that correspond to the distinctive markings of the prey animal (for instance, on their head, face or eyes, corresponding to the hunted springbok’s horns, black facial stripes and back hair). When tracking a wounded animal, the hunter had to refrain from certain actions – such as uttering the animal’s name (using its secret name instead), or from drinking and sleeping, lest he invigorate the pursued animal.

Another powerful expression of human-animal identification was the vigorous mimetic “eland dance” a number of Bushman groups performed at the occasion of a girl’s first menstruation. It was performed outside the girl’s hut, by old men and women, and its steps and choreographed routine were the courtship behavior of the eland, the Bushmen’s premier antelope and game animal, because of its bulk, fat and tractability, as well as its mystical association with rain, fertility and health. Inside her menstrual hut, the girl herself, among the /Xam, became a metaphorical eland, drawing the animal toward her, allowing it to be shot by hunters. At male initiation, on the occasion of the young man’s “First Buck” ceremony, the eland was once again a portentous presence. Through a variety of acts of contagious magic, a palpable bond was established between the /Xam young hunter and the eland, such as being covered with eland fat and having “eland medicine”

– the animal equivalent of *n/om* – rubbed into medicinal cuts.

An especially dramatic and profound expression of animal-human identity is transformation, of a human, metaphorically, spiritually and experientially, into an animal. This happens most elaborately during the trance dance, the universal and principal ritual of the Bushmen. To the women’s chanting and rhythmic clapping, one or several healers will dance themselves into a trance state, around a large fire, that is kept lit throughout this nightlong curing ritual. In trance a dancer activates the healing potency (which the !Kung call *n/om*) that resides in his stomach and with it he heals the sick person or persons at the dance (as well as administering, in the spirit of sharing, general palliative treatment to all of the spectators). When he finally collapses, his spirit leaves the dancer’s inert body, to fly away, in search of supernatural assistance from the spirits, in his curing task. At one point in their trance experience, some dancers may undergo animal transformation, either into antelopes – ideally elands, that may sprout wings flying heavenward – or into lions. Such “lion experiences” are capable of absorbing a dancer so forcefully that he might feel his “lion-teeth forming and his lion-hair growing.”

Therianthropic, man-animal beings also figure prominently in the myths and tales of the Bushmen (while animals are prominent also in Bushman rock art, some of

which presents splendid, polychrome depictions of game antelopes, especially elands). The “Early Race” that inhabited the mythic age were, for the most part, such beings – animals who had certain of the anatomical and behavioral patterns peculiar to the species – such as the antbear eating ants and burrowing, or the wasp having a slender waist. Yet, they were also persons; so much so, in fact, that a storyteller will point out that if you came across such beings today, you would not think that they were anything other than people. Yet they could also be a zebra, a lion, a gemsbok, elephant or ostrich; you only need to look more closely and you will see that they are animals. Animals to the Bushmen are evidently more than just bearers of certain anatomical traits – stripes, mane, horns, trunk or long neck. They can be identified by means of non-physical, subcutaneous attributes, drawn from the animal’s inner being rather than its exterior form.

There were also humans in the mythic age, as well as animal or human trickster beings, well suited, because of their quixotic and ambiguous nature, to the inchoate conditions of that first order of existence. Other types of being were sun, moon and some stars, who were persons in the mythic past – some of them living on the Earth – before being cast in the sky. The early humans were flawed; they had, so the Nharo storytellers remark, “no customs.” Their lives were marred with social and moral transgressions. One common transgression, in /Xam mythology, was the breaking of menarcheal taboos by a girl in seclusion, who was punished by the mysterious rain-divinity *!Khwa*, usually by being transformed, along with all of her hapless band members, into frogs. Their material belongings reverted to their natural state (from digging sticks to shrubs, leather cloaks or jackal tail swats to antelopes or jackal). Thus, the boundary between human and animal and culture and nature was porous in the mythic age and the distinction between ontological realms precarious.

Another problem of the “Early Race” of people (as well as of the animal-people), which is the subject of tales found in all Bushman and Khoe Khoe groups, is in-law tension. One of its manifestations was the murder of the wife of one of the band’s men and the eating of her flesh, the perpetrators all the while convincing themselves – and the reluctant husband – that what they were eating was in fact meat, not a person, and that their band member had “married meat.” This symbolic equation of women with meat (or game), meat (and fat) with sex, and hunting with sex and marriage, is a pan-Khoisan notion. Beyond its expression of in-law tension, it stands as another forceful expression of human-animal identity.

Through an act of creation, by either a wise animalperson (such as the Anteater-Woman or the Kori Bustard, among the /Xam and !Kung, respectively), or god or the trickster, the early order became transformed. The human component of the therianthropics shriveled and they became fully animal (although retaining, in some cases, vestigial humanness within them, to this day). In some cases, the reverse happened, so that the early man-animal, in shedding its animal component, became and remained a person. This, among the /Xam, is what happened to the springboks of the “Early Race.”

Through ideas of this kind – humans and animals of today being the animals and humans of the mythic past, women as meat, the ontological fluidity of humans and animals and culture and nature – Bushman mythology provides the symbolic and cosmological basis for an ideology which links humankind closely to nature. That ideology is underscored further by mystical notions and ritual practices of sympathy, between hunter and quarry, a person and the weather, and the transformation of an initiate or shaman into an animal. Bushman religion, being thus informed with the beings and forces of nature, provides the ideological underpinnings for a way of life that is closely attuned to the natural environment.

Sanders, Scott Russell (1945–)

Scott Russell Sanders' religious vision is grounded in Quaker traditions he first encountered as a graduate student in England. "Quakers are mystics," he says in *The Force of Spirit*, "but homely and practical ones, less concerned with escaping to heaven than with living responsibly on Earth" (2000: 155). Sanders' essays and fiction seek ways of living responsibly on an Earth torn by violence, greed, and environmental degradation. In *The Force of Spirit* Sanders says too:

All the names we use for the fire at the heart of matter are risky – God, Yahweh, Creator, Allah, Manitou, among countless others – for each comes freighted with a long, compromising history. From all the possible names I favor *spirit* because the word seems to catch the lightness, radiance, and windlike subtlety of the power that I seek (2000: 3).

As an essayist and writer of fiction, Sanders explores his relationship with spirit, especially the flashes of illumination it provides him in moments of silence on the mysterious border between nature and civilization.

One can glimpse Sanders' growing preoccupation with matters of the spirit in the titles of his essay collections: *Stone Country* (1985), *The Paradise of Bombs* (1987), *Secrets of the Universe* (1991), *Staying Put: Making a Home in a Restless World* (1993), *Writing from the Center* (1995), *Hunting for Hope: A Father's Journeys* (1998), and *The Force of Spirit* (2000). There is great violence at work in the world Sanders describes. His essay "At Play in the Paradise of Bombs" in the 1987 volume, for example, describes life on a military reservation in northeast Ohio, where he spent some of his formative years. This Ravenna Arsenal becomes a metaphor for our modern predicament. We all live, says Sanders, in a "fenced wilderness devoted to the building and harboring of instruments of death" (1987: 4). His essays, novels, stories, even his children's books, can be read as attempts to understand how we came to inhabit such a grim place and how we might transform it by attending to spirit.

With the exception of a few short stories set in the twentieth century, most of Sanders' fiction takes place before or after our own time. One might expect a writer who almost became a physicist to try science fiction, and Sanders has published three sci-fi novels: *Terrarium* (1985), *The Engineer of Beasts* (1988), and *The Invisible Company* (1989). In *Terrarium* people have moved into fabricated enclosures on the ocean because civilization's toxic by-products were about to destroy wild nature. Like the rebels in Ernest Callenbach's *Ecotopia* novels, the protagonists in *Terrarium* seek to create an alternative to the technocratic, totalitarian society they inhabit. Instead of

threatening nuclear blackmail, as Callenbach's characters do, the rebels in *Terrarium* rely on memory of place, sexual love, and ceremonies similar to Quaker worship.

Sanders' historical fiction includes *Wilderness Plots* (1984), *Wonders Hidden: Audubon's Early Years* (1984), and *Bad Man Ballad* (1986). Humanity's troubled relationship with nature is at the heart of all three books. *Wilderness Plots*, for example, is a collection of very brief tales, based on fact, about the people who settled the Ohio Valley. With the stark, unembellished quality of folktales, these brief narratives offer a view of nature that is anything but sentimental. "Embryo Town" tells of a failed attempt to impose civility on a frontier that fosters greed and violence. "Profit and Loss" recounts the story of Daniel Cross, who doubles his wealth in a day by selling a wagonload of oats and then is eaten by wolves.

Sanders' writing is a search for the disciplines at the core of culture and the sacred power at the heart of creation that might allow us to find our way beyond the violence, greed, and destruction that mar our history.

Santa Fe, New Mexico

Founded in 1610 by the Spanish, the area surrounding the city of Santa Fe, New Mexico was for centuries the home of the Pueblo Indian tribes of the Rio Grande valley. The city itself was developed on the site of a Pueblo Indian ruin known as *Kaupoge*, or “place of shell beads near the water.” The five elements of mystical religions are amply in evidence in the landscape surrounding the city: volcanic, mountainous country forged by *fire*; vast stretches of *earth*, so rich in iron ore that it appears painted; *water*, from the nearby river the Rio Grande; the *cielo grande*, or vast open sky and clear *air*; and *space*, represented by the canyons and ancient standing-stone ruins of the Pueblos that line the Rio Grande to the west of the city. The location of Santa Fe along ancient migration lines from Central America to the north and more modern transportation lines from the eastern United States, situate it as a symbolic crossroads.

The modern era and its union of cultures can be traced to the settlement of the Native American lands by Spanish soldiers, political officials, and Franciscan missionaries. Translated from the Spanish, Santa Fe means “City of the Holy Faith.” Like the Mexican ancestors who settled in the area following the Spanish conquest, the contemporary Hispanic Catholic population reveres the Lady of Guadalupe, a manifestation of the Virgin who appeared to the Indian Juan Diego in 1531 at Tepeyac, near Mexico City, and spoke to him in his native language, Nahuatl. The Chapel of Our Lady of Guadalupe in Santa Fe was built in 1795 and her feast day is celebrated annually on December 12.

Another religion to appear in New Mexico was the

Brotherhood of Penitents, *Los Hermanos Penitentes*. Primarily composed of men, the Penitentes practice regular flagellation with whips made of local weed and carry heavy wooden crosses to emulate the Passion of Jesus Christ. The religious practices of the Penitentes derive from the landscape, where harsh desert conditions and absence of rain symbolically underscore the ways that human existence can mirror the suffering and privation of Christ. The Brotherhood of Penitents appeared in New Mexico in the early nineteenth century, but in the twentieth century, due to public scrutiny of the rather brutal practices of the group, the society began to hold secret meetings. The group is still active in the region.

Native and Christian beliefs coexist in Santa Fe, making the city and its environs a haven for anthropologists who seek to examine the relationships between native religious practices and Christianity. In the early decades of the twentieth century, the city became a destination for tourists interested in discovering “authentic” and “primitive” cultures in the American West. In the 1920s and 1930s, the Fred Harvey

Company drew affluent easterners to New Mexico by combining train travel with motor car excursions through Native American villages. Travelers were escorted by female guides who had been trained in anthropology and literature at Eastern American universities. Tourists were able to learn about the culture and history of the southwest, but were also entertained by native dancers and artisans. The development of US Route 66 in the 1930s meant that more visitors could easily reach the high desert country of northern New Mexico, and the city quickly grew from a religious and trade outpost along the Camino Real and the Santa Fe Trail to the modern capital it is today.

Santa Fe is currently home to many modern naturebased philosophies, metaphysical religions, and spiritual practices. Religious groups holding meetings in Santa Fe today represent Eastern and Western spiritual traditions, and alternative religious groups that emphasize the relationships between mind and body. Vision quests and stone circle meditation retreats are common among women's spiritual groups, some of which are connected to Wicca and some to Eastern religions such as Buddhism. The popularity of the site may be linked to theories of sacred space. As Paul Devereux writes, "We need to go to the moors, deserts, forests and mountains, the remaining wild places of our world [to find] the caves, springs and mountain peaks recognized and selected as natural places of power by traditional peoples" (1992: 15). Places like Santa Fe and its surrounding wild spaces "embody *perennial* knowledge" (Devereux 1992: 15).

This religious history and the ensuing twentiethcentury reputation for the city as a place of social tolerance and human rights activism have resulted in the city becoming a spiritual center. The location of Santa Fe in the foothills of the Sangre de Cristo (Blood of Christ) mountains gives it an incredible natural beauty, allows the city to draw from the powerful associations of mountains with spirituality, and engenders an intense sense of responsibility for wild places and natural resources conservation among the local population. While the Navajo ascribe sacred qualities to Blanca Peak in the Sangre de Cristo Mountains to the east of the city, environmental activists fight to restrict the incursion of housing developments and roads into the foothills. Many environmental groups are based in New Mexico, such as the Forest Guardians, the New Mexico Wilderness Alliance, and the Amigos Bravos (Friends of the Wild Rivers) whose special province is the Rio Grande. With its big sky, a visual reminder of divinity, its rivers, the root of life, and its sacred mountains, Santa Fe is the center of a natural religious world, a sacred space on the North American landscape in America.

Santal Region (India)

India is home to a large number of indigenous tribes known as *adivasi* (early inhabitants), *vanavasi* (inhabitants of the forest), *vanajati* (castes of forest) and *paharia* (hill-dwellers). Among these various tribal groups, the Santals constitute “the largest homogenous scheduled tribe in the country” (Troisi 1978: 24). According to the 1991 census of India, the Santals numbered approximately

4.2 million, largely concentrated in the three Indian states of Bihar, West Bengal, and Orissa. A sizeable number are also found in Assam, Tripura, Meghalaya, Bangladesh, and Nepal. Santal folklore describes the tribe as a wandering race. Although there is no consensus among either scholars or the Santals themselves about their original habitat, by the mid-eighteenth century large numbers of Santals were found in the Chotanagpur tribal belt in central India, who eventually migrated to the Rajmahal hills in the state of Bihar. Reportedly, the British government officials engineered this migration in order to clear the virgin forests and create human habitations as the Santals were renowned for their jungle-clearing skills. Since then the tracts of the Rajmahal hills have been considered the heartland of Santal life.

The Santal religious consciousness and its more concrete expressions (such as myths, rituals, and sacrifices) revolve around a large number of both benevolent and malevolent supernatural beings and spirits called *bongas*, who are believed to conduct the course of nature, human events, and ultimately human destiny itself, and with whom the Santals seek to live in close fellowship. In addition to these spirits, they believe in a number of impersonal powers residing in or connected with natural objects which are not worshipped but controlled through exorcism or magic exercised by the ritual specialist. The *ojha* (diviner) is the minister of white magic since his ministrations are beneficial to society, whereas *dan* (witch or sorcerer) is the minister of black magic. The *ojha* is believed to have the power to deal with the spirits, superior knowledge of common substances and objects, and the ability to diagnose the causes of misfortunes and/or sudden illnesses and prescribe appropriate ritual remedies through magical spells (*mantar*), incantations, and oil divination (*sunum bonga*). In contrast, the *dan* is capable of influencing the evil *bongas* and causing societal misfortune. The office of the *ojah* is reserved for men and a woman claiming to be an *ojah* is suspected to be a witch. Unlike other Indian tribes, the Santals believe that only women practice witchcraft.

The Santal Sacred Grove

The sacred grove and the tree-cult associated with it are widespread among Indian tribal groups. The Santals are no exception. Typically, the Santal sacred grove, known as *jaherthan*, is a cluster of five trees – four sal trees locally known as *sarjom* (*shorea robusta*) and one *mahua* (*bassia latifolia*) tree – believed to be relics of the primeval forest. Each tree in the grove represents one of the five principal spirits of the tribe: *Maran Buru* (great mountain), *Jaher Era* (The Lady of the Sacred Grove), *Moreko-Turuiko* (five-six), *Gosai Era* (a female spirit), and *Pargana Bonga* (boundary spirit). Usually located at the end of the village, the exact location of the *jaherthan* is determined by the first settlers of a Santal village after careful divination in which the principal spirits of the tribe themselves are said to demarcate the site through a human medium.

As the abode of the national spirits and as the locus of community worship, the *jaherthan* is the most auspicious sacred space for various ritual, cultural, and social celebrations. Religiously, it is the preeminent site of interaction between the Santals and the supernatural world. Socially and culturally, the grove also serves as the locus where an individual Santal's identity is constructed, celebrated, and reinforced insofar as major life-cycle ceremonies involve some form of ritual performance at the sacred grove. According to Santal belief, failure to “remember” the spirits (*bongas*) at such occasions would bring disastrous consequences such as epidemics and death.

A number of taboos – gender-specific as well as generic taboos – govern Santals' attitude to the sacred grove. The most important gender-specific taboo concerns women's participation in the ritual activities at the sacred grove. As a rule, women are not permitted to be present when sacrifices are offered nor can they eat the flesh of animals offered to the grove spirits. While women are specifically excluded from ritual activities at the sacred grove, all Santals are forbidden to “cut any of the sacred trees in the *jaherthan* or collect fallen branches” (Troisi 1978: 227). The sacred character attached to the grove and the accompanying taboos instill in the Santals a sense of reverential fear for the spirits and a concomitant respect for the natural environment.

Santal Religious Culture: Seasonal Festivals and Rites

The Santal fellowship with the spirits (*bongas*) is most prominent in their seasonal festivals and calendrical rites that are intimately tied to the agricultural cycle. The Santals observe seven annual community festivals that involve ritual offerings, libations, and blood sacrifices – typically fowls – dedicated to the sacred grove spirits. The *sohrae* (harvest) festival, celebrated in December–January after the harvest is gathered, and the *baha* (flower) festival, held in February–March when the *matkom* trees begin to blossom, are the two most important festivals. The seasonal festivals help to ensure the

protection of the benevolent spirits as well as to ward off malevolent spirits. Prior to these festivals, the village priest (*naeke*) is subject to a series of ceremonial taboos and interdictions that typically include purificatory baths, fasts, penance, and abstinence from sexual intercourse intended to ensure the efficacy of the rites and the proper propitiation of the spirits of the sacred grove. Large-scale drinking, singing, drumming, and dancing are characteristic of these seasonal festivals. The seasonal festivals offer important clues to Santal religious culture and its core values. First, they reveal the Santal recognition of the presence of the spirits in the natural order. Second, they demonstrate the Santal dependence on the spirits for societal stability and wellbeing. Third, they afford an opportunity for the Santals to celebrate the lordship of the spirits over their life, habitat, and fields. This is most evident in the *baha* festival and the offering of the first-fruits of *matkom* flowers to the spirits. Until the spirits are properly propitiated, the flowers can neither be harvested nor eaten. Finally, they reveal the community's desire to live in harmony with nature.

Santal Material Culture

The Santal religious worldview and culture translates into a material culture that values close kinship with nature. As an agricultural community, most Santal villagers grow the rice and vegetables necessary for domestic consumption, procuring other necessary items at the weekly market in the neighboring town several miles away from their homes. Walking is the most conventional way of getting to and from the marketplace (*hatia*), although occasionally bicycles may also be used. In addition to providing a social outlet for intra-village and inter-family fellowship, the custom of walking to the marketplace minimizes Santal dependence on motorized vehicles. Even after walking several miles to the market, Santals are wont to purchase only what is urgently needed. This is due, in part, to their cultural attitude and in part to a lack of storage and refrigeration facilities.

Related to their frugal lifestyle is the Santal tendency to conserve and recycle. Since there are limited industrial resources in the region, the Santals make maximum use of the products they design from raw materials collected from their physical and natural geography. For example, almost every Santal village in West Bengal has bamboo groves from which baskets and other household items are made. Their domestic utensils are generally made of copper, brass, or clay. Furthermore, Santal women tend to reuse old saris and dhotis to tailor children's clothes. Often an entire village shares a single well or pond. Given the limited supply of water, Santals make diligent use of available water. All in all, the Santals demonstrate an ethic of conservation and a certain respect for the land in which they live since their personal and social identity is intimately connected to their physical space.

The third feature of Santal material culture is its reliance on tribal herbal medicinal system. While the Santals view most diseases as unnatural, ascribing them to the

agency of certain evil spirits which they believe can be counteracted through religious medicine, they also acknowledge the natural causes of ordinary illnesses. The Santal curative system utilizes medicines made from a large number of plants, herbs, and natural objects. Bodding records a list of 305 Santal prescriptions for various human diseases and 15 veterinary medicines. Whereas the village medicine man (*rarani*) is believed to have good knowledge of roots and herbs and their medicinal power, most adult Santals also have a basic knowledge of this “root medicine” (*rehet ran*). Since they regard nature and vegetation as a valuable resource for cure, Santals are careful not to destroy the vegetation, partly out of selfinterest and partly out of reverential fear for the spirits permeating the universe.

Santeria

The mystical worldview of Santeria, like that of its cultural ancestor, the religion of the Yoruba-speaking people of Southwestern Nigeria, is characterized by a highly personalized view of nature. The Yoruba-speaking people, called in Cuba *lucumis*, were brought to that island beginning with the sixteenth century. However, at the end of the eighteenth and throughout the first three-quarters of the nineteenth centuries, due to the expansion of the sugar and coffee plantation enterprise in Cuba, the number of imported slaves grew dramatically. Among them, the Yoruba-speaking were over-represented because it was a time when civil wars were ravaging their homeland, thus turning its inhabitants into easy prey for the slave traders.

In Cuba, Yoruba slaves and their descendants were able to preserve their religion, language, mythology, dances, legends and music. This factor was important in also preserving and transmitting the important relationship between Santeria's beliefs and nature.

In the merging of cultural traditions that took place in the cultural history of Cuba, borrowing and reinterpretation were common in the process that resulted in a new Cuban product. As such, the Yoruba religion in Cuba was placed in contact with other religious beliefs and practices. In the merging process that ensued, the transplanted Yoruba religion borrowed from the Mediterranean Catholic and the European, Kardecian, and Spiritualist beliefs and practices that were prevalent on the island. It also borrowed from beliefs and practices from other African ethnic groups. The Afro-Cuban religion that emerged as a result of these merging processes is commonly called Santeria, or Regla *Lucumi* or Regla de *Ocha*.

Central to the religion of the Yoruba people and of Santeria believers is the belief in supernatural power and energy called *ashe*, and its sources and manifestations. *Ashe* is primarily manifested in important *orishas*, or gods, who are the personification of the generic forces of nature (thunder, lightning, volcanoes, the sea); other *orishas* are patrons of important human activities such as hunting, farming, and smithing. Moreover, *ashe* is manifested in the lesser *orishas* who dwell in rocks, stones, streams, shells and other natural phenomena; it is also manifested in revered ancestors, and in consecrated stones, images, necklaces and all sorts of amulets.

Ashe is power that can be manipulated and controlled by magical means to be used to do good as well as harm. Worship is geared to secure the *ashe* necessary to deal with daily problems, to survive and propagate. Magical and spiritual means are directed to engage the goodwill of gods, who are the sources and manifestation of *ashe*, but who also require human assistance, and so they are constantly demanding to be fed and

taken care of. This worldview is in consonance with a value orientation based on an intuitive-sympathy-with-nature stance, rather than the control of nature by scientific and pragmatic means, the value orientation prevalent in Western culture.

Whereas *Ashe* is manifested in all natural phenomena, it is especially present in those related to the Earth. According to McKenzie, “Yoruba religion in the nineteenth century would seem to be a religion of the Earth rather than of the sky” (1997: 38). This statement is validated by Lydia Cabrera’s Afro-Cuban informant, “*Los Santos estan mas en el Monte que en el cielo*” (“The saints, or personalized supernatural beings, are in the wilderness rather than in the sky”) (in Cabrera, *El Monte*, Havana: Editions Chichirekù, 1954, author’s translation). El Monte, the wilderness, is the equivalent of planet Earth, which is inhabited by all kinds of supernatural beings: gods and spirits who constantly intervene in human affairs, thereby causing illness, misfortune, death or conversely good health and fortune.

This Earth-centric stance is reflected in the perception that gods and spirits, the sources or receptacles of magical power or *ashe*, animate most earthly inorganic natural phenomena such as the mountains, volcanoes, rocks, stones, the water in streams, rivers, the sea, and the oceans. Organic natural phenomena are viewed in a similar way. Animals, particularly snakes, snails, lizards, and birds, especially vultures, as well as trees, especially when growing in groves, plants, and herbs are also perceived as receptacles or manifestations of supernatural beings, the *orishas* and spirits, imbued with *ashe*.

On the other hand, atmospheric phenomena, such as lightning, thunder, rain, tornadoes, the wind, which so greatly impact the lives of earthly dwellers, are also perceived as animated by anthropomorphic supernatural spirits, who are also considered important sources of *ashe*. Rainbows are especially admired and revered, though not as much as the more dynamic and destructive atmospheric phenomena. Meanwhile, celestial bodies such as the Sun, the Moon and the Stars, although seen as magnificent manifestations of the greatness of the creation of the Supreme Being, Oludumare, are not objects of religious interest. Finally, *ashe* is also manifested in humanmade symbolic and consecrated objects, such as amulets, which are perceived as receptacles of this power.

Among Afro-Cubans this mystical worldview persists when confronting untamed nature, wild animals, and/or plant life. In Cuba, *la ceiba*, siguaraya, and the royal palm tree are perceived as particularly potent receptacles of the sacred. This belief is evident in the words of Lydia Cabrera’s informants and documented in her monumental work *El Monte*. It is in this wilderness where trees, plants, and herbs subjectively interact with humans.

Plants and animals have a distinctive personality and display the whole gamut of human emotions and nature, as demonstrated in the testimony of Florencio Baró. A child of slaves, Baró was born and raised in Carlos Rojas, a town well known in Cuba as one of the cradles of Santeria. He described the magical ambiance of his native town where wild vines and weeds grew, filling the empty lots with mystery and silence. In his

own words: “Anything can be *brujo*” (can have supernatural power, can have a spirit) (interview with the author, 1991).

One of the most important functions of Yoruba religion and its cultural descendant, Santeria, is to serve as a health system, providing practitioners the means of diagnosis and treatment for all kinds of ailments. As in traditional Yoruba religion, in Santeria herbalism assures survival and adjustment, which was especially true during the nineteenth century when access to medical care in Cuba was very limited. However, during the last century the role of santeros as pharmacists was deemphasized. Santeros placed greater reliance in medical prescriptions and treatment rather than in their own medicine derived from their knowledge of the healing power of herbs. Consequently, the wilderness in Santeria started to lose importance as a receptacle and source of supernatural power.

In current times there has been a trend for Santeria to flourish in large metropolitan areas where the wilderness is absent and natural phenomena is less threatening than in rural villages and towns. Thus, even though *ashe* remains integral to Santeria’s beliefs and practices, the awesome and mystical view of nature in the ambiance of Santeria is being lost.

Saro-Wiwa, Kenule Beeson (1941–1995) and the Ogoni of Ogoni

Born in the southern village of Bori, Ken Saro-Wiwa was one of Nigeria's most recognized and accomplished citizens. An Ogoni leader from Ogoni, he was tried and hanged for challenging what he considered to be genocide perpetrated against the indigenous minorities of the Niger River Delta by the petroleum industry and their political allies.

Saro-Wiwa's life was punctuated by careers as a teacher, civil servant, publisher, television producer and dramatist. He is the author of over forty major works, including novels, volumes of poetry, essays, plays, journalism, short stories and children's books. From 1985 to 1990, Saro-Wiwa created, wrote, produced, financed and marketed Nigeria's most popular situation comedy, *Basi & Co.*, watched weekly by 30 million Nigerians. Winner of the Goldman Environmental Prize and the Right Livelihood Award in 1995, he was nominated for the Nobel Peace Prize prior to his execution.

Always environmentally conscious, Saro-Wiwa adopted the plank of environmentalism as a strategic tool to promote the Ogoni cause. "The visit to the United States (1993) sharpened my awareness of the need to organize the Ogoni people to struggle for their environment," Saro-Wiwa wrote. "A bit of research and thinking of my childhood days showed me how conscious of their environment the Ogoni have always been and how far they went in an effort to protect it. I had shown this consciousness all along" (1995: 79).

Jailed under the *Treason and Treasonable Offenses Decree* promulgated in 1993 by President Gen. Ibrahim Babangida, Saro-Wiwa wrote (from prison) poetry that widely echoed the sentiments of the minority delta peoples:

Ogoni is the land The people, Ogoni

The agony of trees dying In ancestral farmlands Streams polluted weeping Filth into murky rivers

It is the poisoned air Coursing the luckless lungs Of dying children

Ogoni is the dream Breaking the looping chain Around the drooping neck of a shell-shocked land

(widely circulated prison poem).

“The land and the people are one and are expressed as such in our local languages,” according to Dr. Owens Wiwa, Ken Saro-Wiwa’s brother.

The Ogoni have always respected nature, and this informed the struggle for the environment. There are lots of names for the spiritual trees, sacred rivers and lakes, and the traditions are very important. When people are ill, they revert back to indigenous beliefs and folklore (personal communication, Dr. Owens Wiwa, 2003).

The Ogoni number some 500,000 people today, a minority among a 300 minority and three majority (Yoruba, Igbo/Ibo and Hausa-Fulani) ethnic and religious groups in Nigeria. They live on the coastal plain of the vast mangrove estuary of the Niger River. The floodplain is home to some seven million people, grouped by nation, ethnicity and clan, including: the Ijo, Urhobo, Itsekiri, Isoko, Efik, Etche, Ibibio, Andoni, Ikwere, Ogoni, Isoko, Edo, and Kwale-Igbo. These tribes’ relationships to religion and nature are complex and difficult for outsiders to understand.

Like other affiliated linguistic groups in the delta, the Ogoni connection to the environment is defined in spiritual and ritualistic terms, where Earth, soil, water, trees, plants and animals are sacred. (Despite the catastrophic spiritual, ecological and cultural devastation in the delta, this section is written in the present tense to reflect the prevailing attitudes, practices and beliefs.) Certain sacred groves and forests are revered: burial grounds for good and evil people; sacred boundaries between neighboring communities; family heritage forests. Ancient and enormous African oak, Iroko and cotton trees, animals and plants are worshipped. Customary laws have always existed; formal legislation to protect nature proliferated after 1850, and historical accounts of willful or accidental injury to wildlife document punishment by death. Sacrifice and ritual cleansing are daily events used to placate and honor nature spirits and deities. Priests and priestesses hold sway over the delineations and durations of sacred spaces.

Rights of habitation and ownership of communal spaces are intermittently transferred to animals: where the sacred Odumu (royal python) finds a home, it is the legal owner and community law recognizes its rights (until it vacates).

The concept of animal libertarianism has been practiced among the communities of the Niger Delta since antiquity . . . The people do not hunt animals for sport; rather, they are categorized in accordance with value – religious, ecological, social and economic . . . Infraction could result in fines, expensive ablution and atonement rites, and ostracism from the age group or the community as a whole . . . Shell’s right to explore and produce hydrocarbon (a right now seriously challenged by all communities of the Niger River Delta) does not preclude the rights recognized to be enjoyed by persons, animals, and other living and nonliving things (Okonto and Douglas 2001: 215–25).

During his final activist years (1989–1995), Ken SaroWiwa championed the cause of the Ogoni people in international arenas; toward the end he expressed his indigenous consciousness by addressing Ogoni audiences only in his native Gokana language. In 1991, Saro-Wiwa organized the Movement for the Survival of Ogoni People (MOSOP), and was elected President *in absentia* in 1993; MOSOP sought to reclaim economic

rights and protect the environment against the petroleum ecocide that had already claimed the Ogoni mainstays of fishing, farming, hunting and gathering. In 1992, Saro-Wiwa delivered the *Ogoni Bill of Rights* in person, with his book, *Genocide in Nigeria: The Ogoni Tragedy* (1993) during a speech to the UN Unrepresented Nation's and People's Organization (UNPO) in Geneva, Switzerland. Saro-Wiwa called for an end to the petroleum corporation's occupation of Ogoni, for political autonomy and international attention to the devastation of the delta's ecology.

"The extermination of the Ogoni appears to be policy," Saro-Wiwa stated.

National ideas of national independence, the fact of Africans ruling Africans in nations conceived by and for European economic interests have intensified, not destroyed, the propensity of man to subject weak peoples by force, violence and legal quibbling to slavery and extinction (1995: 98).

After 1992, Saro-Wiwa was relentlessly harassed and prevented from speaking abroad. On 4 January 1993, the first annual Ogoni Day, Saro-Wiwa organized some 300,000 Ogoni in a nonviolent celebration, with music, dance and a rally at each of the seven Ogoni kingdoms. Elaborate masks worn by revelers attested to the indigenous cosmology; "people are supposed to believe what the masks represent" (personal communication, Dr. Owens Wiwa, June 2003). Masks (masquerade) are used as expressions of mysticism and power, and to validate the people's beliefs. "To Shell and the Nigerian government, my brother was a dangerous and irresponsible terrorist" (personal communication, Dr. Owens Wiwa, June 2003).

Saro-Wiwa's detention diary, *A Month and a Day* (1995), expresses his evolution as an Ogoni nationalist: "My worry about the Ogoni has been an article of faith, conceived of in primary school, nurtured through secondary school, actualized in the Nigerian civil war in 1967–1970 and during my tenure as member of the Rivers State Executive council, 1968–1973" (1995: 49). Saro-Wiwa first wrote on the Ogoni as an exploited minority in *The Ogoni Nationality Today and Tomorrow* (1968). In 1970, Ogoni leaders petitioned the Nigerian military government protesting the expropriation of delta life by multinational petroleum corporations. The result at every stage, Ogoni supporters claim, was corruption, deceit, propaganda and violence, against the backdrop of the theft of natural resources (Okonto and Douglas 2001).

Competition between Islam (north) and Christianity (south) fueled by the military government has led to widespread pogroms and communal violence in Nigeria. The persecution of Christians and their churches in the delta provoked an international Christian solidarity movement (1990s). An equally frequent phenomenon is the dogmatic use of religion (Christianity and Islam) to justify punitive and repressive military operations. This phenomenon has been prevalent amongst delta oil communities.

As an example: "Grace be unto you and peace from God our Father and from the Lord Jesus Christ," begins a memo (21 December 1995) from the commander of the Rivers State Internal Security Task Force, charged with "wasting operations" in Ogoni (read: raping, torturing, killing), to Ogoni clergy. "Let us pray for Ogoniland and the

Ogonis, even with the following passages in our mind: Luke 18:1; 1 John 5:14, 15; 1 John 8:21, 22.”

Raised a protestant, Saro-Wiwa attended church infrequently; but he read the Bible constantly while imprisoned (personal communication, Dr. Owens Wiwa, June 2003). His writings are infused with the symbolism of Islam and Christianity, though he admonished or lampooned these major faiths (and the blind or confused faith of followers) as often as he praised them for attributes in them that he admired. Biblical references were also common, often in the context of biting satire. His writings were equally contradictory about traditional village life, tribal beliefs, indigenous cosmology and paganism; in contradistinction were his confusions about modernity and the “comforts” and “benefits” of Western civilization.

He wrote: “The Christian church, as I have said, has a powerful hold in Ogoni, and the arrival of the Pentecostal churches at a time of serious economic difficulties had led to even more people seeking solace in religion . . . it was making the people not seek answers to their problems . . . [t]he Pentecostal churches tend to be one-man outfits out to exploit the people. They lack the strength of the organized Churches, which I definitely admire (1995: 152).

On 22 May 1994, Saro-Wiwa was arrested and imprisoned on charges of murder stemming from what was widely regarded as a military frame-up. In an irregular trial convened by a special military tribunal, Royal/ Dutch Shell bribed two prosecution witnesses, Ogonis who recanted in exile. Lawyers for Royal Dutch/Shell attended and presented briefs at the hearing. Saro-Wiwa’s defense team of high-profile lawyers resigned in refusal to add legitimacy to the proceedings. A posthumous United

Nations fact-finding mission documented the extensive irregularities. Amnesty International and Human Rights Watch condemned the trial.

By the time of his death, Saro-Wiwa was a living manifestation of the Ghandian philosophy of *Satyagraha*. Given the opportunity to escape Nigeria, even by the jailers of the cell that held him, Saro-Wiwa refused to abandon his people. “I have devoted my intellectual and material resources, my very life, to a cause in which I have total belief, and from which I cannot be blackmailed or intimidated,” he read, from his final defense statement. His last words to the tribunal cited the Quran (Sura 42, verse 41): “All those that fight when oppressed incur no guilt, but Allah shall punish the oppressor.” On 10 November 1995, Ken Saro-Wiwa and eight Ogoni men were hanged in a shallow pit at Port Harcourt, Nigeria. His last words were “Lord, take my soul, but the struggle continues.”

Protests and repression continued into the twenty-first century, often taking unique spiritual forms. The Ijo Youth Council (1999) initiated “Operation Climate Change” as a vehicle to raise environmental awareness through non-violent protest.

Tapping the veins of Ijo culture, it sought to bring the pains and travails of the people to national attention through the “Ogele,” a traditional Ijo dance where stories, song and mime are deployed to chastise the erring, heal the wounds of the injured, and

invoke the spirit of the ancestors to cleanse the land in a festive atmosphere of drink and merriment (Okonto and Douglas 2001: 146).

Sarvodaya Shramadana Movement

The Sarvodaya Shramadana Movement began in 1958 as a series of youth work camps held to assist depressed villages in Sri Lanka. The work camps, which came to be called *Shramadanas* or “donations of labor,” were organized by Dr. A.T. Ariyaratne. Ariyaratne eventually led the volunteers who participated in these Shramadanas to form a new society dedicated to Sarvodaya, or “the awakening of all.” Arising in the context of the post-colonial Buddhist renaissance in Sri Lanka, Sarvodaya articulated a vision of a new social order based on Gandhian and Buddhist ideals. From the Gandhian heritage, Sarvodaya adopted the ideal of selfless service and nonviolence as guiding principles of a socio-economic order. Sarvodaya interpreted these Gandhian influences through its Buddhist heritage in Sri Lanka and became one of the first examples of what later came to be called “socially engaged Buddhism.” From Buddhism it drew upon the ideal of “awakening” or “liberation,” construing this ideal as a process of dual liberation: the liberation of the individual through the liberation of society. Sarvodaya’s interpretation of this process of liberation critiqued the image of Buddhism popularized by Weber and other Westerners that regarded it as a world-denying religion. Sarvodaya’s description of how liberation takes place through the process of working in society to assist others is expressed through its saying, “We build the road and the road builds us.”

Sarvodaya spells out the interdependent nature of awakening and development by specifying six levels of human awakening: personality awakening, family awakening, village or community awakening, urban awakening, national awakening and global awakening. Sarvodaya’s view of the awakening of society on these levels constitutes a sweeping reinterpretation of the nature and process of social and economic development. Sarvodaya’s model of development is “people-centered” and has as its primary aim “human fulfillment” rather than the creation of material wealth. The economic ideal of the social order Sarvodaya seeks is described as one of “no poverty and no affluence.” For Sarvodaya, development is an integrated process involving six elements that reinforce each other to bring about the best society. In this process the reform of the social, economic and political elements of a society should take place in conjunction with the reassertion of its spiritual, moral, and cultural factors. Sarvodaya pursues this program of integrated development and social reform by emphasizing Buddhist spiritual values such as loving kindness (*mettā*), compassion (*karuṇā*), sympathetic joy (*muditā*), and equanimity (*upekkhā*).

Employing this ideal of an integrated development founded on spiritual values, Sarvodaya has established a program of village development that has sought to provide

alternatives to the kind of capitalistic, materialistic development promoted by the government and multinational agencies. In Sri Lanka, Sarvodaya works through a network of district centers and local Sarvodaya societies in over 11,000 villages. Through these groups it seeks to construct from the grassroots up what may be called a form of dharmic civil society that is not driven by the desires of the market but guided by the spiritual values of the Buddhist dharma. As one of the largest non-governmental organizations in Asia, Sarvodaya facilitates a variety of services to empower the people at the village level including programs of village pre-schools, relief and rehabilitation, village banking and micro credit, appropriate technology and sustainable development.

Sarvodaya's integrated approach to development weaves together themes such as economics, spirituality and ecology. Explaining that according to Buddhist teachings all things and all beings are interconnected, Ariyaratne has placed great emphasis on the preservation of nature and the environment. Sarvodaya has sought to promote methods of sustainable agriculture and has established the Sarvodaya Institute for Biodiversity Conservation. Sarvodaya has also opposed government and multinational development plans that endanger the environment. For example, Sarvodaya organized a large demonstration to oppose the government's scheme to build a tourist hotel in an area that was both a semi-wilderness area and a Buddhist sacred area. Sarvodaya argued that such a large hotel would adversely affect the cultural and moral environment of the community, disrupt the ecological balance of the semi-wilderness area where one of the last wild herds of elephants in the country lived, pollute the water supply and infringe on the sanctity of an ancient, sacred Buddhist shrine.

The Sarvodaya Shramadana Movement has also been one of the major voices for peace during the long-running conflict in Sri Lanka. Sarvodaya has organized peace marches and peace meditations since the conflict erupted in 1983. In that year, Sarvodaya organized a massive, Gandhian-styled peace march from the southern tip of Sri Lanka to the north. Although that first march was eventually stopped short by the government, Sarvodaya went on to organize further peace marches and peace meditations. In March, 2002, Sarvodaya held a peace meditation attended by 500,000 people at the ancient Buddhist sacred city of Anuradhapura. Through the peace meditations and marches Sarvodaya has sought to create a critical mass of spiritual consciousness for peace and social transformation.

Satanism

With the foundation of the Church of Satan in 1966, Anton LaVey gave a rational, coherent voice to what had previously existed mainly as a fiction. In prior centuries, the myth of Satanism was used by Christian authorities to control those who might stray from church doctrine. It led to some disgruntled individuals adopting this fictitious adversarial religion in an attempt to resist the hegemony of the self-anointed servitors of Jehovah. These rebels used the tales of the clerics as a template for their practices; hence historians note the emergence of actual Black Masses, as well as the structured debaucheries of the Hellfire clubs. The renegades worshipped God's opponent in an attempt to gain from him what they thought Yahweh had denied them in the here and now. Still, they remained within the Christian paradigm that saw life as transitory, a preparation for either reward or punishment in an afterlife outside of nature.

With the publication of *The Satanic Bible* in 1969, Anton LaVey defined Satanism from the perspective of a practicing Satanist. For the first time, Satanism was presented as a structured philosophy in an above-ground manner via a mass-marketed text. This new religion, rooted in Epicureanism and Nietzschean iconoclasm, rejected Christian definitions, and discarded the dualism that had been a part of Western belief systems since the advent of Zoroastrianism. This Satanism was not "Devil worship." Instead, it embraced the Prince of Darkness, not as God's equal-but-opposite adversary, but as the central archetype of a philosophy promoting personal freedom. Satan, the symbol of the liberated self, is externalized in ritual – a natural behavior of our species – and seen as an extension of the Satanist's psyche or volitional essence. LaVey determined what he called the "unvarnished truth" about the nature of the human animal, and deemed it to be the foundation for this religion that sees nothing sinful in the beast called Man. He understood that beauty and monstrosity are part of the range of our species, and thought that only by accepting these extremes could a final philosophical synthesis be made that is consistent with the normal, healthy state of the human animal. His Satanism attempts to preserve and celebrate, rather than alter or suppress, humankind's natural state of being.

Most significant to this new doctrine is its axiom that man is solely a "carnal" being. To the Satanist, flesh is reality and spirit is fantasy. Satanism thus eschews all spirituality as fiction – rejecting anything posited to be outside of nature as illusion or delusion. There are no gods or devils, angels or demons. Most Satanists thus deny the possibility of any afterlife.

Nature, to the Satanist, is all that exists – the totality of the objective universe. It includes all things organic and inorganic and the processes that govern their existence.

Nature exists in and of itself, is inherently self-coherent, and does not require an exterior author. It cycles eternally, from “Big Bang” to “Big Crunch.” This recurrent expansion and contraction, emergence and extinction, is accepted by the Satanist, with no need to posit a supernatural “escape clause.” Satanists understand that nature is neither benevolent, nor malevolent – it is indifferent. They pragmatically live in harmony with its mechanisms, collectively called “The Law of the Jungle,” without trying to impose contrary human idealism over them. To Satanists, these laws must be understood and obeyed if the intent is to move elements of existence in the direction of their will.

Satanists see themselves as their own gods, but they have not deluded themselves that they are or will become actual deity figures. Each individual Satanist is simply the center of his own subjective universe. The Satanist bears the responsibility for creating his own hierarchy of values that determines what he considers to be pleasure and pain. The goal of a Satanist is to enjoy his life to the fullest.

It follows that Satanism offers to each individual his own birthday as his highest holiday. Beyond that, since understanding and embracing the flow of nature is of paramount importance, the days upon which the seasons change – the equinoxes and solstices – as well as the midpoints between these days that are defined as climactic points for the seasons, are celebrated as holidays.

While LaVey’s philosophy is man-centered, it does not elevate the human species above the other organisms with whom it shares the globe. Man is just another animal, one small part of the fullness of nature. Satanists appreciate the natural order of the Earth’s ecosystem and oppose human activities disruptive to this harmonious structure. Most Satanists strongly empathize with nonhuman animals and thus many choose to support organizations that work toward the preservation of species threatened by humankind. Such pernicious behavior, far worse than any found in those animals who follow their instincts, arises in man because his own instincts have often been warped through the acceptance of unnatural spiritual doctrines.

Satanists condemn such doctrines for inhibiting the instincts of the human animal, perverting these naturally existing mechanisms. Satanists think they are born to their philosophy because they are animals whose instincts remain intact. Individuals with damaged or repressed instincts are seen as being likely to embrace supernatural religions, as they do not feel a part of nature. They are “spiritual,” not “carnal,” and thus not born Satanists. The conversion of one type to the other is not deemed possible.

In the early 1970s, a small group of members of the Church of Satan began to adopt the idea that a supernatural entity existed, whom they called Set. In 1975, led by Michael Aquino, they left the Church of Satan to found the Temple of Set. Today this remains the only significant offshoot of the Church of Satan, and even though their membership is generally numbered in the hundreds, this organization has developed a consistent philosophy and a body of literature. While these Setians initially saw themselves as “evolved Satanists,” their direction from the start was in contradistinction to the philosophy of the Church of Satan. To the Setian, Set exists as a supernatural

entity, one with whom members of their Priesthood claim they can “commune.” The essence of Setian doctrine states that Set caused the intelligence of the human species to manifest itself, and that this conscious act is counter to the inertia of nature. Set is thus the God of the “non-natural,” one who promotes individual consciousness in opposition to the collective blending that is thought to be the mechanism of nature. The followers of Set are named his “elect” and are considered to be special among the human species. Through the process of “Xeper” (pronounced “kheffer” – an Egyptian word meaning “to become”) Setian initiates attempt to willfully evolve into a god-like state. Such is not expected to occur in a single lifetime, and so the isolated consciousness of the individual Setian attempts to “Remanifest,” essentially to reincarnate, to continue the process of evolution toward a Set-like final state.

Clearly, this is not congruent with the philosophy of the Church of Satan. Setians have recently dropped their claim to being Satanists, and are generally viewed by those who examine fringe religions as being a Thelemic religious organization, derived from the concepts advanced by Aleister Crowley. The Temple of Set considers itself to be part of the Left Hand Path – which Setians define as those religions that seek to isolate individual consciousness from nature, as opposed to the Right Hand Path, which they see as those religions whose adherents seek unity with their deities.

Most recently, the internet has proved to be an avenue for the spread of contemporary Satanism. The Church of Satan itself maintains a presence, as does the Temple of Set. However, primarily because of the use of Satanic imagery by popular musicians, Satanism has recently attracted a diverse group, including many young people who are generally drawn by its imagery, rather than the philosophy itself. This interest is both fueled by and manifested on the internet.

The ease of making a website has led the many fascinated by Satanism to create sites that are an amalgam of materials, including literature from the Church of Satan, the Temple of Set, and numerous other traditions from Eastern and Western occultism that have no relationship with the ideas espoused by these two organizations. Because the authors of these sites are not scholars, and often their research is limited to what they have encountered by chance, these web-based collections of concepts are not necessarily internally consistent. The possibility exists that another philosophy could emerge online, also calling itself “Satanism,” which might develop a body of literature and an internally coherent philosophical position.

The philosophy of Satanism as defined by Anton LaVey continues to be embraced by those individuals who agree that man is just another animal, that he is a part of nature, and that being alive, it is his own prerogative to determine his values. To these Satanists, the individual plays the natural role of furthering his species in the niche it has evolved to fill. He decides that he will maximize his pleasures, both intellectual and physical, during that treasured span of his one and only life. In the process, he appreciates his kin, the other living beings with whom he shares the Earth, who are viewed as colleagues in the struggle for exuberant life.

Sauna

Sauna, a Finnish and Sami word for a building in which to bathe for cleansing body and mind, has become somewhat varied, even with commercial meanings in communities without a history of sauna culture. As an inseparable part of Finnish identity, sauna has been part of the Finnish life cycle for thousands of years – and continues to be so, both in Finland with 2.2 million saunas for 5.2 million people – and among expatriate and emigrant Finns.

Sauna as a log building comes from Finnish-related and Slavic peoples living in Northern Eurasian forest territories. Throughout its traditional area it still is a place for ablutions conducive to hygiene and health, but also a part of their ethnic religion and cultural habits. Although the sauna as a building and as a heated construction has undergone various changes, it has been adapted into new milieus. Also, in urban environments, many sauna habits and rituals have shown remarkable strength not only to survive but even to be revived as a part of socially shared group behavior among youth, adults, and environmentalist societies.

There are bathing habits reminiscent of Finnish sauna behavior on other continents (e.g., Roman, Turkish, or Celtic bath; Japanese *furo*; and the Native American sweat-lodge, such as the Lakota *inipi*). What is spiritually common to them is the feeling that bathing in the steam of *löyly* is not only a cleansing experience, but also one touching the very soul. The spirit of *löyly*, greeted in charms, is the main element in the folk belief related to Finnish sauna with birch switches and its healing effects. *Löyly* is a more ancient word than sauna, being a FinnoUgric word referring not only to the steam issuing forth from the stones, but also to a human soul. The word goes back some 6000 years to the shared ancient vocabulary of the Finno-Ugric peoples.

What the baths of these three continents have had in common with the passing of time has been their connection to human life and their rites. On the other hand, they have also played a part in solving various crises. In *inipi*, *furo* and sauna, the spirit and the body are purified – recreated, as it were, to enable the person to face the challenges life presents. There are religious epics on the sauna in the oral traditions (e.g., in Japanese Buddhist texts, Native American Indian initiation songs, and in the *Kalevala*, the Finnish national epic).

The core of sauna is *kiuas* (i.e., stones in a hot heap), around which, the sauna in a depression in the Earth, and subsequently, the smoke sauna were created. There were numerous stages through which the development passed from mere heaps of stones covered by skin or cloths to the present electrically powered sauna stove in private home apartments or hotels. The public sauna was a part of Finnish city culture before

its almost complete disappearance from the Helsinki street scene after World War II. In Tokyo the *furo* is faring better; public facilities for this amount to well over a thousand.

The Finns assumed the task of propagating sauna at an early stage. Around the year 1638, the Delaware New Sweden Colony was established on the eastern seaboard of America, with several hundred Forest Finns among the inhabitants. What was typical of the pioneering tradition of the first habitation was that the settlers built a smoke cabin. The so-called pioneer house on the west coast was no more than a smoke sauna, a log house that served frequently as a model for other inhabitants of the area. The propagation of sauna has continued to this day, with the construction of saunas at their postings being among the first tasks of Finnish UN peacekeeping forces.

Sauna is the Finns' national symbol, just as the *furo* symbolizes the modern Japanese way of life, and the *inipi* the new consciousness of Native American identity. Symbols are important, even more so for the small nations compelled to exist under pressure to change from the major cultures. Sauna is one of the Finnish words recently to be borrowed by other languages. Along with the Finnish, sauna has made its way all around the world, even if not in complete agreement with the rest of the world in the matter of sauna manners.

The sauna has been a sacred place for Finns. According to the weekly routine, there usually was only one visit to sauna, on Saturday evening. Moreover, to heat a smoke sauna for several sessions was a whole day's operation, an operation demanding its own expertise in the selection of kindling, the laying of the kindling, the adding of firewood, and above all an unhurried approach; whoever heated the sauna and bound the birch switches had to have time. The taking of sauna itself entailed a certain ritual which was observed with religious zeal. A proverb has it that one should conduct oneself in sauna as in church – reverently. Going to sauna and partaking of it were social behaviors governed by many rules of conduct: not to be rowdy, curse, gossip, speak evil, break wind or make a noise in sauna.

It is a Finnish custom to greet the *löyly* spirit before entering or mounting the benches. The recipient of this prayer-like salutation was not primarily the sauna building, but rather the spirit of the sauna or the *löyly* itself. Adults and older children were expected to bless themselves as they entered sauna. It was prepared for the sacred space and the delicate nature of the situations; people were naked, the pores of the human body were open and exuding sweat, defenseless against the evil eye and envy. When a sauna was inaugurated, reference was made to the power of Väinämöinen the wise man who is the central figure in the *Kalevala*; the *löyly* itself was said to be "Väinämöinen's sweat."

Löyly, the vapor rising from the water splashed over the stones of the sauna stove, establishes a connection between the sauna or sweat shed and the Hereafter. The steam arising from the stove, like the smoke issuing from the open fire, the door of the smoke sauna, the flue or chimney, established a symbolic connection between the sacred space of the sauna and its people (microcosmos) and the sphere of the Hereafter and its inhabitants (macrocosmos). An individual healing event occurring within the

sauna and concerning the health of an individual is linked to the entire universe. It is easier for an individual to recover when he knows that his ailment is part of that universe. Myths are based on a connection to the gods, the departed and to spirits, which are recounted and incanted in the *löyly* of the sauna, or by the campfires. As mentioned above, the word *löyly* is of Finno-Ugric origin. It does not only refer to the steam rising from the sauna stove as it does in Finnish or Estonian (*leil*), but one of a person's souls, linked as it is throughout life to breathing. The Hungarian *lélek* is such a soul. The word encompasses the span of a human life, which in old beliefs was held to last from the first breath to the last. Thus "departure of *henki* 'breath' " (which in Finnish is synonymous with the word for spirit) was thus the end of physical life, the perceptible sign of death.

However, *löyly* is only one of the appellations among the Finno-Ugric languages for "soul." Another is *itse* "self," in Hungarian *iz*, which circumscribes social rather than physical life and death. The "self" of a person has a different lifespan from *löyly*. A person acquires this at a later stage than *löyly*, and it lasts longer. A child acquires the status of "having a self" when s/he acquires a name. He is deemed to have a social existence, his name endows him with a right to inherit, and, among the Saami, with his own reindeer mark of identification. The "self" does not expire when the spirit departs, but only two to three years later. Then the person is dead as an individual. Finnish *henki*, (Estonian *hing*), refers to the third soul, which, according to superstition, is immortal. In the world of shamanhood, the spirit refers to the soul of the shaman traveling outside the human body in various forms, generally as an animal, a fish, a snake, a bear, a reindeer, or a bird to the realm of death.

The sauna was generally the first building a Finnish settler built, thereby also designating the limits of his forest, hunting, fishing and slash-and-burn farming. Building a sauna involves knowledge of timberwork construction, the right type of wood and choice of felling time. As in all buildings with a fireplace of some sort, according to folk belief, there was a spirit watching to see that customs were observed and infringements punished. Thus, the first person to light a fire had to be chosen with care, as it was he who would, according to the superstition, assume the position of *saunatonnttu* or spirit of the sauna.

Peaceful heating of the sauna and the correct way of making birch switches was taught by one generation to the next. Expertise in the effects of taking sauna is a special doctrine of traditional Finnish-Karelian folk medicine, of those versed in cupping, bleeding, and healing joints. When a healer was called to sauna or when an injury was being healed in the home circle, very special attention had to be paid to the heating of sauna and to other operations. Alder should be used for the logs. This would ensure greater efficacy of the cures effected in sauna. The familiar proverb encapsulates the effect of sauna: "What tar, alcohol or sauna cannot help is fatal indeed."

Long ago there was a custom in central Finland to lay a table for the spirits of the farmhouse kitchen. While the people of the house bathed, the spirits took to the table. There are many ways in which sauna has been connected to the progress of

the agricultural year. Many of the main occupational tasks were performed in it: the softening of flax, the smoking of meat, the brewing of beer and the like in the malt sauna. The annual procedures, lasting for days, were connected to the younger and older family members spending time together with folk poems and songs: erotic songs might be sung in time to the job at hand, yarns were spun, tales told, riddles solved, and the message might well be an erotic one.

For the Finns sauna has been a sacred place to which they go for purification at all crucial points in their existence from birth to laying out of the dead. The rituals at such times are exclusively the women's province. Only in such cases in which the current transition from one state to another is considered by the community to be infelicitous for one reason or another – for example if the child or patient is very sick – would the intercession of a male witch, sage, or folk healer be called for. This is then a crisis situation requiring the most potent religious leader of the locality or family, a woman or man to restore order through remedial procedures.

Until the 1930s, Finnish women mostly gave birth in sauna. The midwife was referred to as the “sauna wife” and the mother-to-be as the “sauna woman.” “Sauna time” among the womenfolk might last as much as a week before the child was triumphantly carried into the farmhouse. This marginal situation was associated with precautionary measures against diseases and the evil eye, as a child who was “without self,” having no name, and a woman before the churching, six weeks after the birth, was deemed “unclean,” both were considered to be in a precarious state.

Upon reaching adulthood, women went to sauna. Girls of marriageable age were bathed and slapped by older women with the birch branches to incantations on procuring love. Traditional Finnish wedding ceremonies involved the bathing of the girl to be given in marriage by her family, the *antilas*. This was done in the sauna by the married women of the family. After the ablutions, the girl's hair, which had so far been worn loose, was plaited and a “wife's cap” placed on her head together with the other symbols of a married woman. In the sauna, in the company of women, the girl was also initiated into how different life would be at her husband's place and what it would be like under the eagle eye of her mother-in-law. She was then completely “away from the paternal home” to which she could only return the August after the birth of a son to visit relatives.

For women, there were more transitions in the sauna than for men: from girl to bride, from bride-to-be to a girl given in marriage, from a girl given in marriage to a wife, from a wife to a “breeding” mother, then to one who suckled an infant. Various functions became attached to various individuals regarding the sauna rituals in the extended family.

Sauna may also be connected to funeral rites. In some rural areas there was a custom that after death the corpse was carried into the sauna on a board where women of the family who specialized in the task washed it. In family-oriented communities it was important that all those with a role in the rituals, those who washed the body, the wailing women, those who spoke the words, and those who made the coffin, should

all be family members. If someone was requested to perform such a function, it was tantamount to a last wish, and it would be improper to decline. Once the corpse had been washed with soap reserved for that purpose, it would be dressed and lifted onto a layingout board in the threshing building.

Ancient Finnish folk tradition indicates consistently that the conception of mixed bathing in sauna, assumed by the rest of the world, is only regionally valid. In most communities men and women had their own turns. Sauna taken in a family group is a more recent phenomenon. Earlier, the farmer would take sauna with his farmhands once the work in the fields was done, while the farmer's wife would go to sauna with the maids after milking. Since the men's turn was first, the women's turn on the eve of the Sabbath might well continue into the Sabbath. Sunset was a delimiting factor until it was superseded by the clock. When the church bells rang at six o'clock in the evening to announce the Sabbath, the women should have left the sauna.

In the Finnish folktales, sauna is a "hard place" and people were afraid to go there alone. Finnish folk beliefs contain many stories about first-hand experiences of encountering the spirit of the sauna in which the spirit has been felt to be "hard." Such an apparition was believed to be a punishment for infringements against the Sabbath. The narrative tradition confirms men's and women's sauna turns. When they had had their sauna, there began a third turn, that of the spirit of the sauna. In most cases, the person experiencing something is a lone woman or a group of women bathing together. Sometimes, it is a question of an obviously erotic dream; the last woman to go to bathe falls asleep on the bench and feels or sees a hairy male creature who comes to throw water on the stones or comes to caress her.

As with the home, the threshing building, the cowhouse or other building with a fireplace, the spirit of the sauna is the first to kindle a fire. Thus, the people of the house would try to find a "nice, mild" person, a kindly old woman or man, to ensure good sauna luck. When the spirit of the sauna is seen, a resemblance is reported with the first person to kindle a fire. This is in accordance with the ancient belief in the playful, blithe child – the most suitable person for a good sauna spirit.

Savages

Structurally speaking, savages – whether noble or ignoble – are category violators. Ideologically speaking, savagism – again, whether of the noble or ignoble variety – is a discursive device in the service of cultural criticism. In the case of “savages,” taxonomic violations – especially imagined cannibalism and incest – are emphasized as a way to mark the differences between “civilization” (proper society: + God and + institutional constraints on human appetites) and “natural man” (– God and – institutions, a veritable Hobbsean war of all against all) and to justify whatever means necessary to redeem the latter category to (the interests of) the former, whether as ends – converted human beings – or as a means to an end (i.e., converted into labor). In the case of the noble savage, cultural criticism is internally leveraged. Here ideological struggles are against “society” itself, with noble savages – à la Montaigne and Rousseau, for example – serving as the counterpart to and antidote for the corruptions of “civilization.” While thumbnail, this schema of savage/noble savage holds in some permutation or another from Herodotus to the American novelist Fenimore Cooper. What remains to be specified is how savagism reverberates to the present and with what ramifications for how we understand the intersection between religion and nature.

Here I will limit my comments to the North American context, where savagism persists to the present, particularly in some government policies (continued paternalistic treatment), social practices (Indians facing explicit racism), and media images (one acute example is the character Zach Provo, played by James Coburn in *The Last Hard Men*, who is a particularly smart but depraved “halfbreed”). However, in all of these realms the noble savage has gained ground on the ignoble savage, as reflected in increasingly proactive legislation, softened public sentiment, and romantic Hollywood films, for adults and children alike. The primary characterization of Indians in this mode is as stewards and priests of nature: Indians have become eco-shamans of the contemporary world. This phenomenon has two basic sources: non-Indian and Indian authors.

Historically, non-Indian authors of noble savagism emphasized aspects of native cultures that could be construed as rejoinders to European social constraints, whether at the level of the body, community, property, or the land. Thus, drawing upon native traditions, authors of noble savagism celebrated Indians’ putative naturalness, especially as reflected in dress, demeanor and sexuality, “original” democracy, communal property, and connection to the land. In this way, historical noble savagism operated by means of selective interpretation and strategic distortion of existing Indian tradi-

tions. Modern noble savagism, by comparison, is less concerned to construct itself in relation to “tradition,” and looks instead to already circulating images of “the Indian” that might be refashioned to fit the times. This is particularly true in the representation of Indians as environmentalists. Non-Indian authors of this persona have not, on the whole, worked from the ample resources of Indian traditions concerning care for the Earth. Whether images are cast by way of crying Indians, fictive chiefs’ speeches, or new age books, the icon of the noble environmentalist is a product of modernity, even while being a critique of it.

Complicating this picture is that native people are coparticipants in modernity. Not only do they inhabit the present, they shape it. Most significantly, Indians have exerted their voice in the symbolic economy. In particular, Native Americans have gained unprecedented agency in the control of images of themselves. Whether by way of tribal museums, congressional hearings, or mass media, in the last several decades Indians have responded to centuries of savagism (of both varieties) by insisting upon their representational autonomy. One aspect of this has been by way of tremendous cultural revitalization, as tribes and nations have expressed their identities and aspirations in the idiom of local traditions. Here, to be sure, land and nature are emphasized. Land is simultaneously the source of creation (both in the sense of autochthony and as ongoing creation), loss (by way of removal or desecration), and hope (the source and site of future generations). That is, land is frequently spoken of as timeless, in the sense of a geographical synchrony wherein past, present, and future coalesce in and as nature. Maintaining tradition – that which links the generations – is predicated upon maintaining proper relations with the land. It must be said here that such figurations of the land, while building upon ancient religious traditions, constitute an oppositional discourse leveled against the forces and threats of antinative interests. Unlike non-native noble environmentalism, however, here agitation is not a response to abstracted disaffection with the modern condition, but is a response to proximate and concrete impediments to daily life.

Another aspect of Native Americans taking control of self-representations raises new sets of issues. If tradition-centered concern for the land is inwardly focused, we need to describe outwardly focused claims by Indians about the land and nature meant for non-native audiences. This distinction is not in the service of distinguishing between sincere and insincere or authentic and inauthentic claims. Rather, my analysis of inwardly focused and outwardly focused speech is in recognition of the multiple audiences of “tradition.” All speakers will modify their speech according to audience in order to achieve desired rhetorical effects. Neither “tradition” nor Indians stand outside of this dynamic; to imagine that they do is to participate in another form of savagism cum essentialism.

When addressing non-native audiences, contemporary Indian orators frequently assume the posture of the noble environmentalist familiar to consumers of the non-native incarnation of the image. In order to reach audiences, Indian speakers often adopt stereotypical images of themselves. This is a lesson native peoples have learned from

years of interacting with the dominant society. In the contemporary context this means appearing according to script as eco-shamans. If our analysis ended here, however, we would have failed to see this as a form of resistance to dominant culture, not a capitulation to it (recognizing, however, that “sell-outs” exist). Resistance is waged insofar as adoption of dominant images entails adaptations of them. Specifically, the noble environmentalist takes on a militant edge, appearing as an ecowarrior. This enables native speakers to confront members of the dominant society in forceful and blunt moral terms.

Speaking outwardly as moral warriors, native orators often invoke nature in a schematic way. To paraphrase:

We are born of nature, our mother. From time immemorial we have had a sacred pact to care for nature. While society has grown away from nature, we have maintained our relationship to her, preserving vital knowledge in the process. Doing so, we have sacrificed self-interest and economic gain. Now we are in crisis because the dominant society has taken advantage of us. Tradition, religion, and language are in decay, and we face cultural extinction as a result. At the same time the world itself is in crisis. The Western ethos has run its course, exhausting nature in the process. The only remedy is for native people to use our knowledge and ritual practices to restore the Earth for the good of all humanity. This situation had been prophesied repeatedly. We are here today to show you that we can heal nature from the damage you have caused her, but only if you first begin to heal the damage you have caused us.

This discourse does a variety of things. Primarily, it signals a desire on the part of Indians to have their moral and political voices registered and seeks to extend the moral authority of the native speaker over the non-native audience. This discourse implicitly – and sometimes explicitly – relies upon feelings of guilt and spiritual inadequacy on the part non-natives, using vulnerable emotional states of the audience as a platform upon which to construct and advance moral claims in a religious idiom. Specifically, moral claims are framed in reciprocal terms: we care for you at the spiritual and cosmic level (by maintaining the Earth); in turn, you must care for us by making sure our political and economic grievances are addressed.

Whether spoken by Hopi representatives to the United Nations, a Ute leader to journalists, a Crow religious leader to museum officials, or by a Lakota political activist to college students, to give some examples, this discourse operates as a kind of strategic essentialism. Insofar as speakers traffic in the dominant culture’s stereotypical images, and to the degree that this discourse functions as a modality of cultural criticism, outwardly focused Indian self-representations participate in the rhetorical economy of noble savagism. Recognizing this, we nonetheless want to point out some important respects in which nativeproduced noble savagism differs from the non-native variety. First, and most importantly, this discourse – however much it is stereotypical and therefore redolent of nonnative discourse – is spoken by native people about themselves. Moreover, this version of the noble environmentalist is a form of cultural criticism engaged in by people who are and are not members of the society in question: issues

of citizenship and sovereignty pervade this discourse. Finally, even when spoken in the most general and stereotypical terms, this discourse is defined by its concrete sources and sub-texts. One needs to cultivate an ear for how local concerns are made audible to general audiences through this language. For example, in a recent presentation a self-proclaimed “Indian elder” spoke to college students generally about the “desecration of the Earth” and, simultaneously, he gave voice as a Dineh rancher to specific frustrations: his reservation faces regular environmental degradation and so few people seem to care.

Schelling, Friedrich Wilhelm Joseph (1775– 1854)

The work of Friedrich Wilhelm Joseph Schelling is one of the most comprehensive and elaborated philosophies of nature to date. Its influence was enormous, not only on the romantic philosophy of nature, but also on today's nature discourse. Schelling, the colleague of Fichte and Hegel, strove from the beginning to overcome what has been described as the difference between the idea of ontological substance and Transcendental philosophy. Transcendental philosophy asks for the conditions of *cognition* of nature and, consequently, considers the perceiving subject, the active consciousness, as the uniting factor (this was elaborated by Immanuel Kant). In contrast, Schelling defines *Naturphilosophie* (philosophy of nature) as a discipline that asks ontologically for the uniting factor within active nature itself, thus considering nature to be the productive power of its evolution. Nature as an *active category* can only be recognized by transcending its single products – the material world – and looking behind the process of its evolution. To illuminate this, Schelling uses the famous distinction between nature as a mere *product* and object of empiricism (*natura naturata*) on the one hand and nature as *productivity* and subject (*natura naturans*) on the other hand. For Schelling, philosophy of nature deals only with the latter. It tries to find out how nature brings forth its materially given products. The term *natura naturans* designates the aspect of a “living becoming.” It contrasts with the study of dead being. The generated, material objects are of importance only insofar as they allow conclusions about the principles of “becoming” that lie beneath them. Hence, Schelling argues against a mechanistic concept of nature that is limited to empiricism, and for an organicist model that has become prominent again in the twentieth century. In this perspective nature is not characterized by stability but by a continuous destruction and reproduction of its products, thus bringing the blind and chaotic productivity into evolutionary form.

With this concept Schelling argues against both Kant and Fichte. In contrast to Kant's contention that the only authority for judging nature lies in the observing subject, Schelling conceptualizes nature as an independent and self-organized entity that can be known by humans through empathy and open-mindedness. This is crucial, because Schelling here overcomes the Cartesian dichotomy of *res extensa* (the extended, material realm) and *res cogita* (the realm of thinking). And in contrast to Johann Gottlieb Fichte, who saw nature as a dead object, Schelling holds the position that the dichotomy between humans and nature has to come to an end. He complains that in his

time nature had been (theoretically) reduced to a mere mechanism and (practically) had been forced under human interests, a species that does not shrink from destroying nature. Schelling asserted that this mechanism and exploitation would lead not only to nature's but also to humankind's death.

Against those tendencies, Schelling's philosophy advocates principles of empathy and connectedness, and after 1804 these ideas grew stronger in his work. Schelling argues that the only way truly to recognize nature is to acknowledge nature's familiarity and correspondence with a person's own mind and to approach it with a trait of inner love. To be sure, this aspect of his philosophy mostly influenced Romanticism and Transcendentalism, but it is important to note that Schelling's philosophy did not confine itself to philosophy of nature. Instead, it is integrated in a whole framework of an "absolute system of philosophy," which comprises philosophy of mind (*Geist*) and history, on the one hand, and philosophy of art and religion, on the other. This kind of "meta-philosophy" was the joint project of Schelling and Hegel after 1801. Despite their different approaches and results, both shared an interest in establishing a consistent idea of nature and its formulation in a logical concept.

School of Living

Ralph Borsodi, a vigorous critic of industrial civilization, began to advocate a back-to-the-land ethic when he and his wife left Manhattan for a rural acreage in 1920, and his 1933 book *Flight from the City* was a widely read manifesto of decentralist agrarianism. His first large-scale attempt to work out a cluster of small self-sufficient acreages was undertaken at Dayton, Ohio, under government auspices in the 1930s, but he clashed with federal authorities and soon began a similar private project, called Bayard Lane, near Suffern, New York. Borsodi's vision entailed simply-built homes on lots of perhaps two acres (leased, not purchased, to deter speculation) on which residents would engage in subsistence farming and gardening as well as various creative and artistic endeavors. Borsodi called it a School of Living because residents would learn great lessons in life through their mundane activities.

Borsodi's work was outwardly secular in nature, although undergirding it was a quest for individual spiritual fulfillment, moral values, and creativity. His work was part of the larger decentralist movement, a loose grouping of rural idealists who, particularly in response to the economic travails of the depression, sought a return to simple living. Some parts of the decentralist movement, such as the Catholic Rural Life movement, were explicitly religiously oriented, and spiritual seekers of various stripes were represented in many decentralist programs, including Borsodi's.

In the late 1940s, Borsodi's work was revitalized by his disciple Mildred Loomis, who founded a new School of Living in Ohio and then at Heathcote Center in Maryland. Like Borsodi's, Loomis' work was largely secular, but her American Indian-inspired sense of the interrelatedness of all beings provided a spiritual underpinning to it. Several other projects based on Borsodi's thinking emerged as well, and his ideas influenced government depression-era resettlement projects in which clusters of small-acreage tracts were provided for impoverished farmers. Among those influenced by Borsodi's teachings of self-sufficiency and organic gardening were J.I. and Robert Rodale, who visited Bayard Lane and whose magazines, *Prevention* and *Organic Gardening*, spread Borsodi's message much further than he ever had managed to do alone.

Schumacher, Ernest Friedrich (1911–1977)

E.F. Schumacher was a prophet of reverential ecology. His attitude to nature differed from those of utilitarian environmentalists who value the natural world because of its usefulness to humankind: they say, “we need to protect the forests, conserve biodiversity, keep the rivers clean and farm the land organically because these are the necessary ‘resources’ for the good health of human beings.” But such pragmatic proclamations are, according to Schumacher, “metaphysically blind.”

Much of the environmental degradation and depletion is caused by the arrogant conviction that human beings are in charge of the Earth, Schumacher argued. He rejected the anthropocentric view that animals, forests, rivers and all the other forms of life are there purely to serve human interest, as well as the belief that there are no constraints upon how far human beings should go to control nature and pursue human desires.

In the context of religious and spiritual understanding of the phenomenal world Schumacher realized that behind the myriad manifestations of life, the creation is a seamless whole. From bacteria and butterflies to mountains and cosmos, including humankind, all are part of an interconnected unity of life. This ever-unfolding, and everevolving process of the universe is embedded in the principles of reciprocity, participation and mutuality. Life nourishes life and in return life is nourished by life. There is an everlasting balance of belonging at work. There is a meaningful and intricate relatedness within existence, which maintains the cosmic connectivity and continuity. There is an inbuilt natural justice and ecological ethics, which hold together this symbiotic, systemic, and selforganizing Earth community. Schumacher’s vision of wholeness in the cosmic order repudiated the notion of progress based on the human versus nature and spiritual versus material split.

E.F. Schumacher came to ecology from economics. When he was in Burma (now Myanmar), advising the government there on economic development, he came across the Buddhist view of wholeness and spirituality, which he came to believe underpinned the economy of that country. Inspired and enlightened by the Burmese experience he wrote his classic essay “Buddhist Economics” where he questioned the claim that “economic laws are free from metaphysics or values” (1999: 37). Schumacher realized that in Buddhist economics “the maximisation of human well being was dependant on the minimisation of material consumption” (1999: 41).

This encounter with the East was shattering as well as transforming. Schumacher changed from an agnostic intellectual to a spiritual seeker and saw the creation through the eye of the sacred. The Buddhist notion of nature spirituality made him realize that nature is not merely a mine to meet the material needs of human societies obsessed with economic growth. Rather, the natural world is a web of sacred relationships of which human communities are an integral part – endowed with a responsibility to act ethically, nonviolently and reverentially.

Schumacher came to believe that all creatures of the Earth have a right to be and live. He believed that in order to live in harmony with the natural process and to sustain a socially just and economically fair world order our technologies must be appropriate, our organizations small scale, and lifestyles simple. “The essence of civilization,” said Schumacher “is not in the multiplication of wants but in the purification of human character” (1999: 39).

E.F. Schumacher was born in Bonn, Germany in 1911. He came to Great Britain in 1930 as a Rhodes Scholar to read economics at New College, Oxford. He went through a variety of careers including, teaching, business and journalism. Eventually he became the head of statistics in the National Coal Board of Britain.

In 1970 Schumacher founded the Intermediate Technology Development Group, which pursued the path of economic development on a human scale leading to spiritual fulfilment. For him technology was a complementary dimension to sustainable agriculture. He became the President of the Soil Association and he campaigned for compassionate and organic methods of farming.

Schumacher published his seminal and best-selling book *Small is Beautiful: Economics as if People Mattered* in 1973. His second book, *A Guide for the Perplexed*, which spelled out more clearly his coherent and spiritual worldview, was published in 1977. In both these books, Schumacher urged his readers to shift their attitudes toward nature from utilitarian and managerial to a reverential and participatory paradigm. Coming from a religious perspective, he saw the natural world not merely as a resource to be mined for human use and managed well for future generations; rather he took a Hindu and Daoist perspective in which humanity is an integral part of the phenomenal world and participates in it as a process of coevolution. This holistic context integrated nature, humanity and religion, and provided a cohesive understanding which underpinned Schumacher’s philosophy.

Schumacher died in September 1977 in Switzerland. Immediately after his death the E.F. Schumacher Societies were established in Great Britain and the United States. These two organizations hold prestigious Schumacher Lectures every year.

The speakers and teachers giving Schumacher Lectures and teaching at Schumacher College have included Ivan Illich, Amory Lovins, Fritjof Capra, Hazel Henderson, Wendell Berry, Gary Snyder, Rupert Sheldrake, Vandana Shiva, Dr. A.T. Ariyaratne, Joanna Macy, Arnes Naess, James Lovelock, Kathleen Raine, James Hillman, Thomas Berry, Alastair McIntosh, John Seed, Starhawk, and many others.

Topics and themes covered include deep ecology, ecopsychology, holistic science, care of the soul, politics of compassion, Buddhist economics, nature spirituality, Earth democracy, organic living, sustainable development, bio-diversity and indigenous cultures.

In 1991, Schumacher College was established at Dartington, Devon, UK, in order to carry forward and explore a way of life which is ecologically sustainable, socially just and spiritually fulfilling. *Resurgence* magazine, to which he was a regular contributor, continues to develop and disseminate Schumachian philosophy around the world.

Schweitzer, Albert (1875–1965)

In terms of intellectual achievement and practical morality, Albert Schweitzer has been described as probably the noblest figure of the twentieth century. Born in 1875, he was brought up at Gunsbach in Alsace. His intellectual achievements span four major disciplines. Schweitzer learnt the organ under Charles-Marie Widor in Paris and published *J.S. Bach, le musicien-poete* in 1905. He studied theology and philosophy in Strasbourg, Paris, and Berlin, and published major works of New Testament scholarship, most notably *The Quest of the Historical Jesus* (1906; trans. 1910). In 1896 he made his famous decision to live for science and art until age 30 and then devote his life to serving humanity. Accordingly, despite his international reputation as a musician and theologian, Schweitzer turned to medicine and qualified as a physician. By 1913 he resigned his posts as principal of the theological college in Strasbourg and preacher at St. Nicholas and founded the hospital at Lambaréné, Gabon where he stayed until his death in 1965.

By 1952 Schweitzer had become a legend in his lifetime: his work in Lambaréné captured the public imagination, earning him the Nobel Prize for peace. But Schweitzer considered his most meaningful contribution, the one for which he wished to be remembered, to be his ethic of reverence for life (*Ehrfurcht vor dem Leben*). Although the concept of reverence for life is known, it has been subject to a range of distortions and so it is important to confront these in order to understand what Schweitzer meant by these three words.

The first distorting lens is *legalism*. Contrary to many commentators, Schweitzer does not propound reverence as a moral law, but rather as ethical mysticism. Ethical mysticism begins with a personal reflection on the self in the finite world that binds humans with nonhuman life and God (often referred to as the infinite Will-to-Live). For

Schweitzer, the most immediate and comprehensive fact of consciousness is that “I am life which wills to live, in the midst of life which wills to live.” The direct, experiential identification of one’s individual will-to-live (life) with other life, and through life with God, is foundational to his ethical mysticism. Though his mysticism starts from the individual subject (“I am life which wills-to-live”), it extends to a generalization on the world (in the midst of other wills-to-live). Crucially, Schweitzer returns to the finite manifestations of life and presents human moral action as the locus of mystical relation: in loving selfdevotion to other life we realize our spiritual union with God.

The second distorting lens is *inviolability*. Many commentators have assumed that reverence for life upholds the moral inviolability of all life. It is true that Schweitzer

sometimes writes in such a way as to invite this misunderstanding. The ethical person is one who:

. . . tears no leaf from a tree, plucks no flower, and takes care to crush no insect. If in the summer he is working by lamplight, he prefers to keep the window shut and breathe a stuffy atmosphere rather than see one insect after another fall with singed wings upon his table (1987: 310).

At first sight the sheer practical impossibility of these injunctions presents itself. But what Schweitzer offers here are not *rules* but rather *examples* of the type of action expected from one who upholds reverence for life. Indeed, the very word “reverence” (*Ehrfurcht*) indicates that he is not depicting obedience to moral law, it being concerned rather with a new temper of mind.

The third distorting lens is *inconsistency*. Since Schweitzer defines reverence as an absolute ethic which enjoins responsibility without limit toward all that lives, it is perhaps not surprising that reverence is judged to entail inconsistency in practice. Indeed, Schweitzer is not immune from such charges since, for example, he notoriously had fish caught to feed his sick pelicans. Such inconsistencies are made more glaring in the light of his rejection of any moral hierarchy: the ethics of reverence for life makes no distinction between higher and lower, more precious and less precious lives.

Schweitzer is often interpreted at this point as suggesting that no form of life should ever be destroyed and that all creatures, humans to microbes, should have the same moral worth. It is doubtful whether this was his intention. Rather what he is doing is rejecting here the long tradition of hierarchy that places humanity at the top of the pyramid of descending moral worth. Schweitzer readily and regrettably admitted that it is sometimes necessary to make choices between various forms of life. But what he wanted to emphasize was the essentially *subjective* (anthropocentric) nature of these declarations.

Having clarified aspects of Schweitzer’s thought, it is now possible to indicate three of his contributions to religio-ethical thought.

The first contribution concerns *service to life as practical mysticism*. In contrast to most mystics, Schweitzer maintains that union with the divine is achieved not through contemplation, but primarily through service to other life: it is through the community of life, not community of thought, that I abide in harmony with the infinite Will. This is the mystical experience of ethics. In short, the phenomenon we call life is not something put here for our use or pleasure; we are part of life and our role is to enhance and serve each and every manifestation of it.

Schweitzer’s second contribution concerns his *protest against an anthropocentric view of creation*. In a 1919 sermon he questioned whether humans should be considered the goal of creation: “The purpose of nature, with her thousands of appearances of life, is not understood as merely the presupposition of man’s existence . . . and humanity may not conceive of itself as the purpose of the infinite world” (1988: 40).

Schweitzer's rejection of the elevation of humans in the universe suggests a transformation of our relationship to other life: we are to perceive each manifestation of life for *itself*, and no longer for *ourselves*.

Building on these insights, Schweitzer challenges the idea that humans' sole responsibility in the world is to take care of their own species. In his exegesis of the parable of the Good Samaritan, he seeks to expand our understanding of neighbor:

What is the sort of love toward God which compels us to be kind to others? What does love for our neighbour mean? . . . The presupposition of morality is to share everything that goes on around us, not only in human life but also in the life of all creatures (1988: 119).

Schweitzer's reading of the parable develops Jesus' refusal to limit the extent of neighbor love by extending the category of neighbor to include all life: reverence does not draw a circle of well-defined tasks around me, but charges each individual with responsibility for all life within his reach and forces him to devote himself to helping that life. Schweitzer reads the parable as a metaphor for moral inclusiveness that corresponds analogically to nonhuman species. Similar to Jesus' rejection of a racially restrictive criterion of neighborly discrimination, Schweitzer counters the limiting structures of communal proximity by highlighting humans' participation in the community of life.

The third contribution concerns *non-injury to life as the central ethical imperative*. A man is truly ethical, Schweitzer writes, only when he obeys the compulsion to help all life which he is able to assist, and shrinks from injuring anything that lives. The time is coming when people will be astonished that humankind needed so long a time to learn to regard thoughtless injury to life as incompatible with ethics (1987: 310).

Schweitzer regarded traditional philosophy which restricted ethics to human-to-human relations as spiritually impoverished. He was deeply critical of animal experimentation, opposed sport hunting, and eventually embraced a vegetarian diet. His hospital at Lambaréné was a model of ecological responsibility: he went out of his way to preserve trees and flora, reused every piece of wood, string, and glass, and rejected modern technological developments which would have resulted in environmental degradation. As he saw it, his life *was* his argument.

To reverence life and to serve it: this is the heart of Schweitzer's commitment. His personal and intellectual legacy continues to hold strong moral appeal and serve as an inspiration for a wider ethic of life. In the words of Rachel Carson: "If during the coming years we are to find our way through the problems that beset us, it will surely be in large part through the wider understanding and application of his principles" (1962: 2).

Science

Nature is both a scientific and a religious challenge. Nature must be evaluated within cultures, classically by their religions, currently also by the sciences so eminent in Western culture. Religious persons often find something “beyond,” discovering that neither nature nor culture are self-explanatory as phenomena; both point to deeper forces, such as divine presence, or Brahman or Emptiness (*sunyata*) or Tao underlying. Religions often detect supernature immanent in or transcendent to nature, perhaps even more so in human culture, though some religions prefer to think of a deeper account of nature, perhaps enchanted, perhaps sacred.

1. The Physical World: Matter and Energy

Science over the last four hundred years has opened up a vast extent of physical nature in space and time, unavailable to humans when the classical religions were formed. Once only speculative, cosmology has become science – and with mixed religious results, both from the vastness of the universe and from the naturalism, or secularizing, characteristic of science. Earth is lost out there in the stars; humans are dwarfed and shown to be trivial on the cosmic scale, as well as on the microscopic scale, (nothing but) the motion of atoms, molecules, biochemistries. Science seemed progressively to rob both our planet and the humans on it of any special place. But then the physical sciences took an unexpected turn.

Astrophysics and nuclear physics, combining quantum mechanics and relativity theory, have more recently been describing a universe “fine-tuned” for life. Physics has made dramatic discoveries at astronomical and submicroscopic ranges, remote from ordinary, native-range experience. The universe (this universe at least) originated fifteen billion years ago in a “big bang” and has since been expanding. From the primal burst of energy, elementary particles formed, and afterward hydrogen, the simplest element, which serves as fuel for the stars. In the stellar furnaces all the heavier atoms were forged. Some stars subsequently exploded (supernovae). The heavier elements were collected to form, in our case, the solar system and planet Earth.

In the last half-century, physics discovered that startling interrelationships are required for these creative processes to work. Theory interrelates the two levels; astronomical phenomena such as the formation of galaxies, stars, and planets depend critically on the microphysical phenomena. In turn, the mid-range scales, where the known complexity mostly lies (in ecosystems and human brains), depend on the in-

teracting microscopic and astronomical ranges. If the scale of the universe were much reduced, there would not have been enough time for elements to form. If the expansion rate of the universe had been a little faster or slower, then the universe would already have recollapsed or the galaxies and stars would not have formed.

Change slightly the strengths of any of the four forces that hold the world together (the strong nuclear force, the weak nuclear force, electromagnetism, gravitation), change critical particle masses and charges, and the stars would burn too quickly or too slowly, or atoms and molecules, including water, carbon, and oxygen, or amino acids (building blocks of life) would not form or remain stable.

These results have been summarized as the “anthropic principle” (an unfortunately anthropocentric term), which argues that the universe has been programmed from the start and in its fundamental dimensions for the subsequent construction of stars, planets, life, and mind. There are non-theological, naturalistic ways of interpreting these discoveries, but a plausible interpretation is divine design. Whatever one makes of these anthropic claims, the most complex events known are found on Earth in biological systems, and the most complex of all is the human mind, pursuing its science or its religion. In a handful of humus, which may have in it ten billion organisms encoding a billion years of evolutionary history, there is more coded information (trillions of “bits”) than in all of the stars. In the trillion neurons of the three-pound human brain, each capable of hundreds or thousands of connections with the others, there is more operational organization than in the Andromeda galaxy (so far as we know). The number of possible circuits in the brain exceeds the number of atoms in the universe. So we must turn to origins on that Earth, resulting in such a mind.

2. The Biological World: Life

Biology also has developed at two scales, the range of the very small and that of big-scale history. Molecular biology, discovering DNA, has decoded the “secret of life” (once ascribed to the Spirit of God). Evolutionary history has located the secret of life in natural selection operating over incremental variations across enormous timespans, with the fittest selected to survive. At native ranges, life takes place in ecosystem communities, where the competition remains, but also with many interdependencies, and also mixtures of order and disorder.

Over evolutionary time, speciation began with the simple and resulted in the complex, from microbes to persons. As with physics, the two levels have been theoretically interrelated. The genetic level supplies variations, does the coding of life in DNA, and constructs molecular proteins. Organisms cope at their native-range levels, inhabiting ecosystems, and across evolutionary time, species are selected and generated as they track changing environments.

In ecosystems, organisms are both challenged and supported. Every organism is what it is where it is; the “skinout” environment as vital as “skin-in” metabolisms.

Early ecologists favored ideas such as homeostasis and equilibrium. Contemporary ecologists emphasize more of a role for contingency or even chaos. Others incline to emphasize self-organizing systems (autopoiesis), also an ancient idea: “The Earth produces of itself (Greek: *auto- matically*)” (Luke 4:28). Some find that natural selection operating on the edge of chaos offers the greatest possibility for self-organization and self-transformation.

The process is prolific, but no longer fine-tuned. To the contrary, evolutionary history can seem tinkering and makeshift at the same time that, within structural constraints and mutations available, it optimizes adapted fit. In contrast to the astrophysics and microphysics, in the middle-range earthbound natural history, there is much openness, emergence, surprise, struggle, loss, gain, or wandering. Natural selection is thought to be blind, initially in the genetic variations bubbling up without regard to the needs of the organism, some few of which by chance are beneficial, and also in the evolutionary selective forces, which select for survival, without regard to advance. Many evolutionary theorists insist that nothing in natural selection theory guarantees progress; most doubt that the theory predicts, or even makes probable, the long-term historical innovations that have occurred. Others think that the creative results are inherent in the system.

Though dominant throughout biology, evolutionary theory has proved quite problematic itself (independently of any religious agenda). There are disagreements involving the relative degrees of order and contingency, repeatability, predictability, the role of sexuality, competition and symbiosis, the extent of social construction in evolutionary theory, the evolutionary origins of mind, especially the human mind, differences between nature and culture. The theory is, in many respects, incomplete.

Fundamentalist theology denies (much or any) evolution and sometimes seeks to prevent its teaching in public schools. Others construct an evolutionary theism, emphasizing the continuing vital creative processes over time, the ascent of life from the simple to the complex, the increase of information, the effective and efficient results of genetic creativity and natural selection, producing a quasi-design, the production of more out of less over the millennia. Increasing knowledge of the sophistication of molecular structures has led some to look for intelligent design there. Evolutionary speciation generates and tests novel kinds, a cybernetic process employing open innovation and selection, with analogues in rational thought, including the logic of science, where novel theories are generated and tested.

Asian religious traditions interpret natural history as appearance (*maya*, illusion) spun over Brahman, or as a spinning world (*samsara*) spun over Emptiness, *sunyata*. As with the monotheists troubled by the character of the evolutionary process, Asian traditions too may have difficulties knowing how much of the phenomenal world to embrace, and how much to see through or transcend.

By Buddhist accounts life is suffering, *dukkha*, driven by thirst, *tanha*, which seems biologically compatible; although what becomes of nature in *nirvana*, with desires extinguished (extinction), remains problematic. Taoism is the most naturalistic of the

classical faiths, though critics find the ever-oscillating, complementary yang/yin inadequate to explain the historically developing natural history. Native faiths find an enspirited world; they may loosely embrace evolutionary history. They struggle to make their animistic or personalist accounts of animals and plants compatible with those of zoology and botany.

Struggle and suffering, and life renewed in the midst of its death and perishing are central themes in Christianity. In the Psalmist's metaphors, life is lived in green pastures and in the valley of the shadow of death, nourished by eating at a table prepared in the midst of enemies. In the letters of Paul, the creation is groaning in travail, with the labor of giving birth (the original meaning of "nature"). Jesus suffers and dies redemptively. Although non-moral, natural history is "cruciform" even before humans arrive; and in all creating of life there seems to be struggling through to something higher.

Though biologists are typically uncertain whether life has arrived on Earth by divine intention, they are almost unanimous in their respect for life and seek biological conservation on an endangered planet. Earth's impressive and unique biodiversity war-rants wonder and care. Anciently, the Hebrews marveled over the "swarms" of creatures Earth brings forth in Genesis 1.

3. Nature and Culture: Human Life

Nature has generated only one species capable of cumulative transmissible cultures. Nature and culture are classical opposites, or complements (as are nature and super-nature). By nature humans are "born that way"; by nurture humans learn to become civilized. Humans have a dual inheritance system. In one meaning (recalling Latin etymology, *natura*), "nature" refers to everything generated or produced. For metaphysical naturalists, perhaps for methodological scientists, nature is all that there is, without contrast class. Humans evolved within nature and break no natural laws.

Still, culture differs from nature. Humans are nurtured into an inherited linguistic and symbolic system, a worldview, by which humans communicate, perpetuate, and develop their knowledge. This cultural genius makes possible the deliberate and cumulative, and therefore the extensive, rebuilding of nature. Humans reshape their environments, rather than being themselves morphologically and genetically reshaped to fit their changing environments. Humans come into the world by nature unfinished and become what they become by nurture.

Religious persons find their traditions vital in such nurture, and absent from nature.

Critics may object to distinguishing so sharply nature from culture (too "dualist") on grounds that culture is already present in animals, and also that nature remains a strong determinate in human affairs. If by culture is only meant transfer of acquired (and non-genetic) information from one generation to the next, culture is present in various social animals: chimpanzees (who imitate tool using), even in warblers (who

imprint songs or migration routes). In classical anthropological meaning, however, culture requires intentional teaching of language, beliefs, skills, morals, laws, customs, arts, worldviews, religions – all historically transmitted over generations.

In that classical sense, culture remains distinctive to humans and is the dominant determinant in their affairs. Information in nature travels intergenerationally on genes; information in culture travels neurally as persons are educated into transmissible cultures. The determinants of animal and plant behavior are never anthropological, political, economic, technological, scientific, philosophical, ethical, or religious. Animal imprinting and limited transmitting of acquired information notwithstanding, humans gain a deliberated modification of nature that separates humans in their cultures from wild nature, increasingly so in high-technology cultures. Recently decoding our own genome, humans stand at the threshold of rebuilding even their own genetic nature.

Animals are not in this sense nurtured. Without some concept of teaching, of ideas moving from mind to mind, from parent to child, from teacher to pupil, a cumulative transmissible culture is impossible. Though language “comes naturally” to humans, what is learned has been culturally transmitted, using a specific language. The content learned during childhood education is that of an acquired, non-genetic culture. These cultural traditions are the locus of the generation and transmission of religious faith. In that sense religion is a phenomenon of culture, not nature.

4. Worldviews: Causes, Meanings, Values

Humans are only part of the world in biological, evolutionary, and ecological senses, their nature; but *Homo sapiens* is the only part of the world free to orient itself with a view of the whole, to seek wisdom about who we are, where we are, where we are going, what we ought to do. Religious persons claim that, with due admiration for the successes of science discovering causes in nature and culture, science leaves the ultimate value questions still unresolved, those assigning meaning and value. One needs a scientifically informed worldview, but the ultimate value questions remain as acute and painful as ever. There is no scientific guidance of life.

Nor can humans simply follow nature. Nature does not teach us how we ought to behave toward each other. Compassion and charity, justice and honesty, are not virtues found in wild nature. There is no way to derive any of the familiar moral maxims from nature: “One ought to keep promises.” “Do to others as you would have them do to you.” “Do not cause needless suffering.” No natural decalogue endorses the Ten Commandments.

Although nature is not our moral tutor, there may be goods (values) in nature that humans ought to respect and conserve. Animals, plants, and species, integrated into ecosystems, may embody values that, though non-moral, count morally when moral agents encounter these. And, even if one is in doubt about divine creation, or sacred nature, or intrinsic values in nature, there is little doubt that humans and their planet

have entwined destinies. Sustainable development has been a recent focus, pleasing economists, developers, and humanists, who find that ecologists and conservation biologists continually caution that what most fundamentally must be sustained is the biosphere.

Humans, if uniquely the wise species, are also uniquely the species that needs redemption. Religions may celebrate creation, or struggle with what to make of evolutionary history. But the real business of religion is salvation, mending the perennial brokenness in human nature. Ultimately such salvation is beyond the natural, perhaps supernatural, by the grace of the monotheist God, perhaps in some realization of depths underlying the natural, such as Brahman or *sunyata*. Meanwhile, whatever the noumenal ultimate, humans reside in a phenomenal world, which they must evaluate, and in which they must live, hopefully redeemed or enlightened by their faiths.

Humans sin, unlike the fauna and flora. Religion is for people, and not for nature, nor does salvation come naturally; even the earthly good life is elusive. Christian and other ethicists can with considerable plausibility make the claim that neither conservation, nor a sustainable biosphere, nor sustainable development, nor any other harmony between humans and nature can be gained until persons learn to use the Earth both justly and charitably. Those twin concepts are not found either in wild nature or in any science that studies nature. They must be grounded in some ethical authority, and this has classically been religious. The Hebrews, for instance, were convinced that they were given a blessing with a mandate. The land flows with milk and honey (assuming good land husbandry) if and only if there is obedience to Torah.

Scientists turning to environmental policy often appeal to ecosystem management. Such management connects with the idea of nature as “natural resources” at the same time that it has a “respect nature” dimension. Christian ethicists note that the secular word “manage” is a stand-in for the earlier theological word “steward.” Ethicists have frequently thought of ethics as a social contract; environmentalists add that ethics needs also to be a natural contract, human responsibility for this marvelous planet on which we reside. Humans need a land ethic. Anciently Palestine was a promised land. Today and for the century hence, the call is to see Earth as a planet with promise.

Science Fiction

Science fiction is a very diverse category of culture that has explored myriad ways in which religion can relate to nature. Strictly defined, science fiction is the traditional literature that arose around a cluster of magazines, beginning with *Amazing Stories* in 1927 and *Science Wonder Stories* in 1929. More broadly defined, it also includes speculative fiction from any time period or publication source that concerns the human implications of science and technology. Science-fiction movies and television programs are often distinguished by the term “sci-fi,” but in an increasingly multimedia culture they also must be considered.

Alien Environments

The Mars novels by Edgar Rice Burroughs and the *Dune* novels by Frank Herbert both concern desert planets with hostile environments. For Burroughs, religion is a parasite, while for Herbert it thrives symbiotically with nature. *A Princess of Mars* and *The Gods of Mars* by Burroughs depict Barsoom, an arid world a million years after the fall of a great civilization, in which life is barely sustained by ancient canals and atmosphere factories that may be disrupted at any time by warfare between feudal states. The priesthood of the Holy Therns exploits the superstitious Martians, and it does nothing to solve the chronic problems of social and environmental decay. In *The Master Mind of Mars*, an amoral scientist provides immortality to the wicked priestess of an anti-scientific religion, by transplanting her brain into the stolen body of a young woman, in order to get money to carry on his research. Far from promoting harmony with nature, these religions exploit the gullibility of desperate people struggling to survive in a hostile environment.

Frank Herbert’s *Dune* novels about the desert planet Arakis also concern religious scheming in a feudal society, but the result is quite different. Centuries ago, a jihad cleansed the galactic empire of computers and artificial biotechnology, so the spirit that would have gone into technological innovation has been diverted into symbiotic experiments with nature. The Bene Gesserit, a women’s cult, has been carefully controlling bloodlines for generations to breed a messiah. Human computers, called mentats, accelerate their minds with the spice *melange*, and space navigators employ this psychedelic to guide spaceships between the stars. The spice also prolongs life, so it is the most valuable substance in the universe, and it can be found only on Arakis where it is produced by titanic sand worms. A woman’s love for a man causes the Bene Gesserit

to lose control of their breeding program, their son launches a fresh jihad, and his son becomes an immortal “god” emperor who is gradually metamorphizing into a mutant worm.

On Barsoom, the people living closest to nature are the Green Martians, exemplified by the character Tar Tarkas, who is too courageous to rely upon religion to assuage fear concerning his own death. But he mourns the death of the woman he loves, so he undertakes a long pilgrimage to the area that the common religion of his planet claims is the land of the dead. There he discovers not his beloved but the unnatural Therns and the monsters they employ to kill deluded pilgrims who enter their realm.

On Arakis, the people living closest to nature are the Fremen, apparently descended from Arabs, who have a demanding faith that helps them survive in the hostile environment. When the perfidious Harkonnens overthrow the Atreides aristocrats who rule the urban areas of Arakis, young Paul Atreides flees into the desert. Bene Gesserit breeding, the psychedelic effects of the spice, and a series of ordeals transform him into Muad'dib, the messiah prophesied by Fremen religion. The manipulative religions of Dune are amoral rather than evil, and they possess real supernatural powers derived from their symbiosis with nature.

Alien Messiahs

Extraterrestrials with apparently magical powers abound in science fiction, and some of them are greeted as messiahs when they come to Earth. They seem like gods, in part, because foolish Earthlings cannot rule themselves wisely, and because what is natural on an alien world seems supernatural here.

The Alien, by Raymond F. Jones, imagines a future age in which human society is disintegrating and individuals have lost all hope. A wave of hysteria called the Howling Craze sweeps through the cities, as people mass in the streets and vent their despair by weeping and emitting animal cries of pain. Government leaders last only a few months in office, either quickly impeached or committing suicide, and the populace longs for a superhuman messiah. In the Asteroid Belt between the orbits of Mars and Jupiter, scientists discover a time capsule that has preserved the body of Demarzule, leader of an alien civilization, with instructions on how to restore him to life. A religious movement believing Demarzule to be the divine savior seizes control. When Demarzule awakens, a few scientists realize he is the Hitler rather than the Jesus of his species. They flee across the universe in search of an antidote to this evil faith. On a distant world, a friendly alien must sacrifice his life so a gland that confers supernatural ability can be transplanted into a scientist and he can destroy Demarzule.

Stranger in a Strange Land by Robert A. Heinlein concerns Valentine Michael Smith, a human being who was raised by Martians. First glimpsed in Heinlein's earlier novel, *Red Planet*, the Martians are an ancient and wise race who keep themselves aloof from the first human voyagers to their planet. Therefore, humans do not know that

Martians have mental powers that allow them to disincorporate any matter, and thus have the power to kill. Valentine Michael Smith is sent to Earth as a spy, unaware of his mission to help the Martians decide whether to destroy humanity. His Martian psychology naturally gives him remarkable powers to gratify people's desires, and a communal religious cult quickly assembles around him. Ultimately he must decide whether to defend himself against fanatics, or become a martyr.

Allegories and Prophecies

Science fiction is a suitable vehicle for religious allegories, of both conventional and radical kinds. For example, *A Canticle for Leibowitz* by Walter M. Miller and *Out of the Silent Planet* by C.S. Lewis are both Christian allegories of humankind's exile from the Garden of Eden. Miller's novel follows a religious order in the centuries after a nuclear holocaust, exploring the difficult question of whether humanity can long survive if it tries to conquer nature by means of atheistic science. Lewis imagines that a Christ rules the planet Mars, where three intelligent species live amicably in an Eden, and Earth is the only planet on which humans have become estranged from God and thus from nature.

The *Star Wars* series created by George Lucas, and the *Babylon 5* series by J. Michael Straczynski depict fictional cults that have interesting relations with nature, and might in future become real. The Jedi Knights of *Star Wars* are noble warriors with psychic abilities, rather like Knights Templar who have been trained in Zen Buddhism. Their power comes from The Force, which is based in microorganisms found in varying quantities within each living cell, and that spiritually binds the universe together. *Babylon 5* depicts a bewildering variety of cults, some belonging to alien planets and others newly arisen on Earth, but all are primitive reflections of the fundamental reality of nature. God is not a supernatural entity apart from nature. Rather, intelligence evolves from nature as the way in which the universe becomes conscious, and the most advanced intelligent species are in the process of evolving into gods. Billions of years ago, the First Ones evolved in the universe. Most of them departed to seek spiritual destinies on higher planes of existence, leaving the galaxy under the control of two highly advanced but imperfect races, the Vorlons and the Shadows. These two battle over the lesser races for two diametrically opposite principles: order and chaos. Ultimately, humanity must defeat both of these semi-divine influences and proclaim that our species no longer needs gods to rule it.

As allegories, science-fiction stories may shape the reader's subconscious orientation toward both religion and nature. However, it is also possible that the fiction may occasionally become fact. The small Church of All Worlds is partly based on Heinlein's *Stranger in a Strange Land*, and the influential Church of Scientology was founded by a science-fiction author. Many stories, including the *Dune* and the *Star Wars* series, describe religious orders that employ mental training regimes to achieve enlightenment

and spiritual power. Science fiction is increasingly shaping popular culture, so real religions patterned on fictional ones may increasingly appear over the coming decades, and science fiction will become a selffulfilling prophecy. Thus, fiction becomes a realistic venue for exploring the complex relationship between religion and the natural environment.

Scientology – In Two Scholarly Perspectives

In 1950, author and explorer L. Ron Hubbard announced the discovery of Dianetics, which he said was a new science of mental health, and four years later he established Scientology, a new religion dedicated to human spiritual advancement. Although Scientology builds upon some of the same spiritual principles common to traditional religions, it was developed during the scientific era and thus takes advantage of extensive research and technological development.

A clear distinction must be drawn between Hubbard's fiction and his Scientology writings, because his stories are free imaginative explorations rather than religious scriptures. However, two themes connect his science fiction to his work in Scientology: a conception of the Earth as one planet among many in a vast universe of nature, and the conviction that ordinary people can accomplish great things if they seek to gain knowledge and serve humanity. Occasionally the fiction touches upon important environmental issues, such as natural resource depletion in the novel *Battlefield Earth*.

The Church of Scientology considers humans to be spiritual beings, not merely animals, systems of chemical compounds, or stimulus–response mechanisms. Nonetheless, the condition of a person's body is an important factor in that individual's awareness and ability. A body polluted by toxic chemicals, radiation, or other harmful factors can prevent the individual from achieving spiritual betterment. Therefore, an important part of Hubbard's religious research was the discovery of methods for purifying the body.

Scientologists believe that radiation and chemical toxins become lodged in a person's body, chiefly in fatty tissue, and can affect the person adversely even years after the original exposure. The purification program has three chief elements: exercise to stimulate the circulation, sauna to sweat out the accumulated toxins, and a nutritional regimen including specific vitamins, minerals and oils.

The nutritional regimen does not radically alter the individual's usual diet, but supplements it with vegetables and sufficient liquids to offset the loss through exercise and the sauna. Over the course of the program, a precise mixture of vitamins is gradually increased, with close monitoring especially of the niacin ingested. In addition to other minerals, a calcium-magnesium drink called "CalMag" is an important part of the program. The intake of oils is required to replace some of the toxin-ridden fat that the program aims to clear out of the body.

In the view of Scientologists, the use of non-medicinal drugs is unnatural and harmful, and drug addiction is a highly destructive force in contemporary culture. A rehabilitation program called Narconon has been based on Hubbard's purification and communication technology, designed to handle problems of withdrawal and assist people in overcoming the effects of addiction.

Scientologists believe that spirit is potentially superior to material things and can accomplish miraculous changes in the physical universe if freed from the continuing effect of past traumas, transgressions and aberrations. Drugs, radiation, and toxic chemicals not only leave physical traces in the body, in their view, but also affect the individual's mind through powerful memories called mental image pictures that can cause harm when restimulated by later experiences. Thus, the body-oriented purification program is a preparation for a comprehensive series of Scientology processes intended to deal with problems of the mind in order to liberate the spirit.

In its regimen designed to achieve total spiritual freedom, Scientology employs a form of counseling called *auditing* to move the individual up a gradient toward advanced states of *clear* and *Operating Thetan* (OT). A Clear is a person who no longer suffers the ill effects of a reactive mind, that portion of the mind which works on a purely stimulus-response basis. In OT, a Clear becomes refamiliarized with the abilities that belong to his or her fundamental nature.

Scientologists consider psychiatric practices to be unnatural and harmful, especially psychosurgery, electroshock, and drug treatment. Thus, the Church of Scientology has been active in efforts to reform the mental health professions and to make people aware that human beings are not mere biological mechanisms but are by nature spiritual.

Over the half-century of its existence, the Church of Scientology has grown into a worldwide movement, communicating its religious beliefs in more than fifty languages and active in over a hundred countries.

If one believes comments by Scientology's founder, L. Ron Hubbard (1911–1986), the creation of Scientology's forerunner, Dianetics, related directly to his efforts to improve the success of people who explored nature. The "original goal" of Dianetics, he stated in *The Explorers Journal*, "was to provide expedition commanders and doctors with a therapy tool which would increase the efficiency of personnel and reduce incidence of personnel failure" (Hubbard 1950: 52). Hubbard himself had undertaken several questionable marine explorations, but by 1950 he was claiming that the realm of the human mind was the last great frontier "capable of producing some adventures scarcely rivaled by [African explorer David] Livingston[e]" (Hubbard 1950: 1).

The mind, it seems, replaced nature as an exciting realm for Hubbard's exploration. Nevertheless, in Dianetics and Scientology, Hubbard did develop a set of concepts (called "dynamics") that supposedly identified urges or drives of life. In Dianetics, Hubbard identified the fifth of seven dynamics as being concerned with an individual's affinity for life. By 1956 he refined the dynamics to include eight dimensions, with the fifth one involving "the urge toward existence of the animal kingdom," which includes all flora and fauna (Hubbard 1979: 37). The sixth dynamic involved "the urge toward existence of the physical universe," what Hubbard called "matter, energy, space, and time" (Hubbard 1979: 38). Consequently, in the context of these two dynamics, Scientologists are able to place themselves within an environmental framework.

Throughout his corpus, Hubbard frequently discussed what he called the "environment," but he used the term in the broadest possible sense to refer to "all conditions surrounding the organism from the first moment of present-life existence to death, including physical, emotional, spiritual, social, educational, [and] nutritional" (Hubbard 1951: II, 293). Hubbard rarely discussed the natural world in his major ideological works, unless one includes his lectures and writings about possible radiation poisoning from the environment caused by nuclear bombs. This material reflected widespread fear during the 1950s of nuclear war and contamination, and Hubbard claimed that he had developed a program that would reduce the effects of radiation on the body.

In 1959 and 1960, Hubbard carried out a series of "experiments" (although they were never scientifically published), which "proved" that plants felt pain and feared death. He also experimented with the effects of heated soil on plant growth. For years afterward, media accounts about Scientology carried a picture of a pensive Hubbard looking intently at a vine-ripening tomato that he had hooked up with clamps and wires to the galvanometer (called an E-meter) reputedly used by his organization to identify negative incidents in members' current or past lives. These experiments, however, did not become part of Hubbard's lasting contributions to Scientology.

One of the few lasting images of the natural world in his ideology involved volcanoes, which appeared in Hubbard's 1967 cosmological statement about how soul-like entities (called thetans) forgot previous negative experiences from past lives as they were about to enter new ones. According to Hubbard, 76 million years ago an evil warlord named

Xenu (or Xemu) rounded up people on the overpopulated planets that he controlled, sent them to a planet called Teegeeack (which was Earth), placed them in (or near) volcanoes, and exploded hydrogen bombs in craters. Their souls (thetans) survived, but out of fear these thetans grouped together as clusters and continue to attach themselves to bodies. Upper-level Scientology courses supposedly allow people to detach these “body clusters” and thetans from themselves, which is supposed to advance their own developmental progress.

As environmental awareness grew in society-at-large, Scientologists received media attention for their clean-up efforts on beaches, along roadsides, and in urban centers – activities that the Church of Scientology International praises on its own website. In 1998, for example, one special Scientology project in Clearwater, Florida, involved relocating a 100-year-old oak tree. Moreover, in September 2001, The Church of Scientology was among approximately 65 “customers” named by the Los Angeles Department of Water and Power for having made “green power” purchases from renewable energy sources (Los Angeles Department of Water and Power 2001).

While acknowledging that Scientologists share concerns about nature and the natural environment with the wider society, it remains true that the organization attempts to use members’ environmental efforts to extend Scientology’s “technology” into society. For example, in a secular booklet of moral aphorisms that Hubbard wrote in an attempt to gain recognition of his name, Hubbard instructed his readers to “Safeguard and Improve Your Environment.” Yet the unsophisticated level of his thinking about the environment and the natural world resulted in simplistic advice: “There are many things people can do to help take care of the planet. They begin with the idea that one should. They progress by suggesting to others that they should” (Hubbard 1981: 38, 45). Nevertheless, Scientologists hope that non-Scientology organizations will reprint this booklet and distribute it widely, thereby attracting attention to its author (i.e., Hubbard) and stimulating interest in Scientology and his other works. Along these same lines, Scientologists and a Scientology organization had close connections with an environmental group named “Cry Out,” and the principal of a Los Angeles-area elementary school canceled the group’s planned activities for her students when she realized that its booklet was printed by Hubbard’s literary agency, Author Services, Inc., and contained a song that Hubbard wrote.

It seems unlikely that “nature” or “the natural environment” ever will be a significant aspect of Scientology’s ideology. A stated purpose of the organization ostensibly is to remove the impact of negative experiences (called engrams) from people, and in many instances their removal (so the group claims) has medical benefit. Concerns, therefore, about nature are secondary (at best), since they are far outweighed by counseling and health issues.

Scopes Trial

In 1925, Tennessee passed legislation against teaching in state-supported schools “any theory that denies the story of the Divine creation of man as taught in the Bible, and the teaching instead that man has descended from a lower order of animals.” The American Civil Liberties Union announced that it would defend any teacher prosecuted under it. George Rappleya saw this as an opportunity to both test the statute and bring national publicity to Dayton. He found support among local school officials and attorneys and science teacher John Scopes agreed to be prosecuted.

Efforts to ban teaching evolution began in the early 1920s. The rise of Christian fundamentalism in the early twentieth century was a reaction against religious modernism, including the “higher criticism” that asserted the Bible is the product of human experience and that God works through history rather than revelation. Some fundamentalists were appalled by modernist efforts to reinterpret the scriptures to conform with scientific understanding. The rapid growth in public school attendance and the exposure of children to rationalism and science, especially Darwinism, seemed a threat to the religious influence of families.

Tennesseans were not uniformly opposed to teaching evolution; many found the statute an embarrassment. At its annual meeting held in Memphis shortly before the trial began, the Southern Baptist Convention voted down an anti-evolution proposal offered by its fundamentalist wing. Even the chief prosecutor questioned the wisdom of the law under which Scopes was charged.

The trial received a major public relations boost when William Jennings Bryan and Clarence Darrow volunteered their services. Bryan, a well-known populist and former U.S. Secretary of State, was a social progressive, religious conservative, and anti-evolution leader. However, he had not tried a case in decades and contributed relatively little to the prosecution’s legal work. Darrow was one of the most famous trial lawyers of his day and an outspoken agnostic. He and Bryan had cooperated in progressive social causes, but were bitter opponents on religious matters. Although he did not lead the defense, Darrow played a major role in the trial.

Scopes admitted that he broke the law, but argued that evolution did not conflict with the biblical account of creation. The presiding judge, however, would not allow the jury to hear expert testimony to this effect. The prosecution argued that the only relevant issue was that Scopes broke the law. There were, though, larger issues. Politically, the prosecution argued that majority views should determine what is taught in public schools. The defense supported academic freedom and the authority of science.

On a religious level the case embodied the ongoing conflict between fundamentalism and religious modernism.

Each day's session was opened with a prayer delivered by fundamentalist clergy. The judge overruled the defense's objection to this practice and the defense presented a petition from modernist clergy requesting that some prayers be delivered by non-fundamentalists. The defense argued that "we have an opportunity to hear prayer by men who think that God has shown His divinity in the wonders of the world, in the book of nature, quite as well as in the book of the revealed word." This eventually became the practice as fundamentalist and modernist clergy alternated in delivering the prayer.

Darrow called Bryan as an expert witness on the Bible. Eager to defend his faith before the staunch agnostic, Bryan endured a grilling on his belief in the unerring literalness of the Scripture. Darrow questioned him on such points as whether Jonah was actually swallowed by a fish, Joshua made the sun stand still, and the days of creation were 24 hours long. Bryan made a poor showing and eventually agreed that the days could have been periods of indeterminate length, thus opening the door to interpretation beyond biblical literalism.

The following day the judge struck Bryan's testimony from the record. At this point, the defense recommended a verdict of guilty and Scopes was fined \$100.00. On appeal, the Tennessee Supreme Court found the statute to be constitutional, but overturned the conviction on a technicality. The statute was not repealed until 1967.

The Scopes trial captured the nation's attention and highlighted the issues, but it did not slow fundamentalist anti-evolution efforts. Other states passed similar legislation and fundamentalists later developed new strategies to introduce "creation-science" and intelligent design arguments into classrooms. Although these efforts have been rebuffed, the conflict continues.

Ernst Myer pointed out that the Darwinian Revolution actually involves a complex collection of social and intellectual changes. These include accepting the geological concept of time, that the Earth has undergone great change, and that evolution is not linear and progressive but adaptive to present circumstances. It took nearly 250 years for these views to be incorporated into biological theory and the process is still underway within the lay public. The Scopes trial was part of this ongoing process.

Many religious people, organizations and denominations have found ways to reconcile scripture and the book of nature. However, the anti-evolution fundamentalists' efforts to reinterpret nature to conform it to their understanding of the Bible promotes a distorted understanding of nature, ecological processes and biological diversity. In addition to retarding environmental understanding, they also promote the unfortunate belief that there is an essential conflict between religion and the vision of nature provided by science. Those who believe that God speaks through nature, as well as scripture, find this notion short-sighted.

Scotland

As the glaciers of the last ice age finally left Scotland as a bare and empty landscape about 10,000 years ago, pioneer species such as hazel and birch started to recolonize the land, the now-extinct wolf, bear and lynx returned, and people resettled (Edwards and Ralston 2003). These people left their mark in megalithic structures typically erected some 5000 years ago, such as the lunar-aligned Calanais Standing Stones on the Isle of Lewis. Such monuments are often found in beautiful places. Some probably had astronomical and ritual functions. Little can be said about this with certainty, but one claim that can be made without question is that they represent art. As such, the ancient sites have been described as “the longest show running”; a doorway to the imaginal realm where nature and the imagination intersect. The standing stones accordingly testify to a tripartite link between community, spirit and place and, as such, in all probability, to the early presence of nature religion – namely, the understanding that the spiritual realm interpenetrates and animates the natural world.

Scotland’s original Pictish inhabitants may have had a matrilineal structure, but little is confidently known about them. The Romans were largely kept out of Scotland; they built two defensive walls to keep the Picts back. According to Tacitus’ *Agricola* (ca. 98), the Pictish chieftain Calgacus said of the Romans:

Harriers of the world . . . they make a desolation and they call it peace . . . We, the noblest souls in all Britain, the dwellers in its inner shrine, had never seen the shores of slavery and had preserved our very eyes from the desecration and the contamination of tyranny: here at the world’s end, on its last inch of liberty . . . Then let us fight as men untamed, men who have never fallen from freedom.

During the second half of the first millennium the Scots of Dalriada, originating from Ireland and speaking Gaelic, subsumed whatever had gone before with patriarchal chieftain structures based around the extended family or “clan.” Irish-Scots’ Celtic monasticism, resting on a Druidic “Celtic Old Testament” base, embodied a rich nature spirituality.

These Irish roots were later used to assert, before the Pope, Scotland’s claim of right to be a nation free of Anglo-Norman suzerainty. English invaders based their claim to control Scotland on Geoffrey of Monmouth’s “translation” of the *Historia Regum Britanniae* of 1135 – parts of which were probably Geoffrey’s own creation, as he later claimed to have lost the original manuscript. The *Historia* maintained that Britain was named after Brutus of Troy who had arrived in the twelfth century B.C.E. after pillaging France and Africa, inspired by an oracular man- date to dominate “the

round circle of the whole Earth.” Geoffrey claimed Brutus had cleared Scotland or “Albany” of Picts and giants, giving it to his youngest son, Albanactus.

During the Wars of Independence (1296–1424) with England, Edward I used this myth to legitimize his colonizing conquest of Scotland. As embellished in the Hollywood movie, *Braveheart*, William Wallace and King Robert the Bruce drove the English out. However, to consolidate Scotland’s free status they required papal recognition. This was achieved through the Declaration of Arbroath, 1320, a remarkable document that drew on Irish charter texts to trounce Geoffrey’s Brutus myth (Ferguson 1998).

The Declaration links Scottish origins to ancient Scythia by the Black Sea, as described, for example, in the *Irish Book of Invasions* (ca. 1168 in final form). This portrays the Scots coming from Scythia to assist Nimrod with building the Tower of Babel, their leader learning all 72 languages of the world after its fall, his being summoned as Pharaoh’s linguist while the Israelites were still in slavery, his marrying Pharaoh’s daughter (“Scota,” hence “Scotland,” implying that the Mother of the Nation was black), his reconstructing Gaelic from the 72 languages (hence Gaelic’s sometime designation, “the language of Eden”), his people providing the Israelites with bread and wine on the eve of their Red Sea departure, and then later, having received Moses’ blessing, completing a 440-yearlong migration via Spain to Ireland, and from there, according to the *Scotichronicon’s* account (ca. 1449), on to Scotland, bringing as proof of their peregrinations the Stone of Destiny – Jacob’s pillow from the original Genesis 28 version of Stairway to Heaven. Scottish nationhood is thereby symbolized by a holy stone, returned in 1996 from Westminster Abbey to Edinburgh Castle. This *axis mundi* stone, we might note, originally symbolized the connection between heaven and the land that Jacob was given; and that in a context where God pronounced blessing on all the world’s peoples.

Revealingly, the Declaration of Arbroath locates sovereignty of the Scottish people not in the sovereign, but in the “Community of the Realm” which is “the community of Scotland.” As such, and consistent with the principle that only God can own the land (Leviticus 25), Scotland had a King or “Queen of Scots” as distinct from a “Queen of Scotland.” Resonant with the spirit of Calgacus, the Declaration asserts, “It is in truth not for glory, nor riches, nor honors that we are fighting, but for freedom – for that alone, which no honest man gives up but with life itself” (Scottish Records Office, 1320). And while Scotland might have had its “Auld Enemy” in the English, the importance of loving the enemy was constitutionally embedded in the Declaration’s modification of Galatians 3:28 (“There is neither Jew nor Greek, slave nor free, male nor female, for you are all one in Christ Jesus”), asserting that under “the

Church of God,” there is “neither weighting nor distinction of Jew and Greek, Scotsman or Englishman.” Thus Scottish identity is generally considered to be civic rather than ethnic: at its best, a person belongs inasmuch as they are willing to cherish, and be cherished, by a place and its peoples.

While the nobles of Scotland as the medieval signatories to the Declaration looked to Rome (and successfully so) for recognition of national sovereignty, the Scots Reformation parliament of 1560 repudiated Rome. Protestants saw late medieval Catholicism as having been lax to the point of almost being “pagan.” It is perhaps to the imperative of asserting narrow puritanical rectitude in order to give boundary and faith-based justification to spiritual revolution that we can trace the origins of the neglect, and even fear, of both nature religion and mysticism that has characterized much mainstream Reformed Church religious discourse in Scotland through until the late twentieth century.

That said, John Calvin, the benchmark of Scots Presbyterian Protestantism, was not averse to the love of nature. His *Institutes* (III:XIV:20) speak of the Creation as that “beautiful theatre” in which we might do well “to take pious delight.” Similarly, the formative 1647 *Westminster Shorter Catechism* affirms that “God executeth His decrees in the works of Creation and Providence.”

However, the seventeenth century, under James VI, who became James I of a “United Kingdom” with England in 1603, saw organized religion applied as an instrument of inner (psychological) and internal (within the British Isles) colonization. As with James’ policy in Ulster, muscular Protestantism was indoctrinated through, for example, his 1609 Statutes of Iona and in the 1616 education act. These helped to propagate a Protestant ethic of transcendental deferred gratification such as Max Weber would have recognized as the hallmark of the early-modern mindset.

In Ulster, James’ policies wronged the indigenous Catholics and wrong-footed the poor Scots Protestants who he “planted” there. In Scotland, the underlying imperial and mercantile ethic of his policies attacked indigenous bardic politics and laid the ground for the 1707 Union of Parliaments, by which Great Britain emerged as the world’s foremost exemplar of neo-Roman presumptions of Empire. Following the Jacobite uprising of 1745, British forces in the Battle of Culloden near Inverness (1746) crushed clan power, and key markers of indigenous culture such as the wearing of the tartan kilt were proscribed. Robert Burns, the national bard, was to say of this era in his poem, *Strathallan’s Lament* written in 1787: “The wide world is all before us / but a world without a friend.”

With the indigenous leadership now either compulsorily Anglicised or crushed in the remote Highland centers of resistance, land became valued as a commodity rather than for the number of people it could support. Improved breeds of sheep, and demand for wool from the Napoleonic wars, triggered the “Highland Clearances” in which perhaps some half-a-million people were directly, or indirectly from economic pressure, forced off their native territories until the passing of the Crofters Act in 1886. Ironically, displaced indigenous Scots often colonized other native people’s territories, the oppressed in some cases becoming oppressor. Much of rural Scotland became, in effect, one of the world’s first casualties of what would now be called “globalization.”

As with the famine in Ireland, many ordinary pious peasants internalized their oppression as punishment from God. At Croick, a congregation huddled in the churchyard

awaiting the arrival of their emigrant ship scratched on a windowpane, “The people of Glen Calvie, the sinful generation.” The 1712 Patronage Act had permitted landlords to appoint clergy within the established Church of Scotland. Some of these preached a gospel focused only on a transcendent pie-in-the-sky-when-you-die salvation. As if in antithesis to nature religion, the Earth was portrayed as a realm that had been corrupted with the sin of Adam. It was portrayed as fallen in its own right, rather than merely enduring the consequences of Adam’s Fall. The Earth as Christ’s “footstool” (Matthew 5:35), the very seat of the immanent presence of God, was overlooked. It was too often presumed that when Jesus condemned “the world” he included nature, rather than, merely, the corrupted human sociological order known as “worldliness.”

Accordingly, the oppressed were, to the landlord’s convenience, encouraged to write the world off rather than to discern and seek to redeem it. In any case, Calvin’s double-predestination suggested that, ultimately, destiny fell outside of human control. It was mainly to break with patronage under the influence of an emerging liberation theology that the Church of Scotland split in the 1843 “Disruption.” In an effort, not always successful, to embody spiritual freedom, the Free Church of Scotland emerged as a more truly Presbyterian or grassroots alternative that recognized the authority of “Christ as Lord” unmediated by any landlord. One of the Disruption’s practical consequences was to give spiritual legitimization to the land reforms that took place at the cusp of the nineteenth–twentieth centuries, and which preserved agrarian “crofting” communities.

Amongst the peasantry a strong nature religion – expressed as awareness of the immanence of God and through supernatural belief and totemistic animism – is continuously evident. However, much of this has been caricatured as residually “Papist,” (as with most of Carmichael’s great nineteenth-century collection, the *Carmina Gadelica*), or of the faerie faith, and therefore merely superstitious (as with the Rev. Robert Kirk’s seventeenth-century *Secret Commonwealth*). Recent work, such as that of the American Gaelic scholar, Michael Newton, and the Scots historian, James Hunter, reflects a continuous close engagement between people and nature expressed in the bardic tradition often outside of or on the margins of the mainstream church. As a generalization, this represents human society as resting on the bedrock of ecological community under the Providence of God. Nature transfigures humankind in a grounded transcendence, thus the motto of Stornoway in the Outer Hebrides is “God’s Providence is our inheritance,” and the great twentieth-century Gaelic poet, Sorley MacLean, writes in *An Cuilithionn* (The Cuillin): “Beyond the lochs of the blood of the children of men / beyond the frailty of plain and the labor of the mountain . . . / beyond guilt and defilement; watchful / heroic, the Cuillin is seen / rising on the other side of sorrow” (in Hunter 1995: 175).

In the late twentieth century, a few activists, including the present author, used the above analysis of history in an effort to reintegrate nature, spirituality and a bardic politics in the public life of a Scotland developing a “devolved” or semi-detached relationship with the rest of the “United Kingdom.” The Isle of Eigg Trust, established in 1991, successfully enabled the residents of a Hebridean island to revolt and rid

itself of its landlord and establish a democratic community land trust. This in turn helped stimulate flagship land-reform legislation in the Scottish Parliament, which was reestablished in 1999.

Similarly, when the Isle of Harris was threatened by multinationals wanting to make it a center for European production of roadstone with perhaps two massive “superquarries,” theological testimony against violating the integrity of the creation was made by a panel that included Scotland’s leading Calvinist, the Rev. Professor Donald Macleod, and the then-warrior chief of the Mi’Kmaq First Nation in Nova Scotia, a Sacred Pipe Carrier.

Attention was drawn in the public inquiry through the Mi’Kmaq testimony to the need for “defense of Mother Earth.” Scripture passages such as Genesis 2:15, Proverbs 8, Job 38 and Romans 8 were invoked to argue that it is not creation that is fallen (and therefore treated as fit to have its national scenic areas ravished), but humankind. Professor Macleod noted that the function of the creation is to reflect the majesty of God and that “to spoil the creation is to disable it from performing this function [giving rise to] the consideration that rape of the environment is rape of the community itself” (Macleod in McIntosh 2001: 234). Accordingly, the present writer concluded, an appropriate relationship with nature is one of *reverence*. This is not *pantheism* – God as nature – but it should be understood as, *panentheism* – God being present in the creation as, for example, in Job or Hebrews 1:3.

The Scottish Government that, in the previous year, had abolished feudalism, rejected the superquarry in 2000. The “harriers of the world” may hover yet in the guise of globalization, but the spirit of Calgacus, increasingly expressed through nonviolent direct action, remains strong in fighting, as Tacitus described it, “desecration and the contamination of tyranny: here at the world’s end.”

Scouting

Founded during the Progressive Era, the early Scouting movement in the United States embraced the era's widespread beliefs in Darwinism, in the restorative power of nature, and (for the boys) in the spiritual dimensions of physical activity ("muscular Christianity"). Lord Robert Baden-Powell founded the Boy Scouts in England in 1908, and in 1910 a group of men already active in youth work in the United States gathered in New York City to found the Boy Scouts of America (BSA). Juliette Gordon Low created the first troop of Girl Scouts in 1912, and by 1915 the Girl Scouts of America (GSA) was incorporated. Although technically not part of the "Scouting" movement, the Camp Fire Girls, founded by Luther and Charlotte Gulick in 1910 and incorporated in 1912, shared Scouting's ideas and approaches to building nature-based recreational programs for children and adolescents.

Ernest Thompson Seton (1860–1946) played a central role in bringing into the BSA ideas about the relationship between nature and religion. Seton had been experimenting since 1903 with his own youth program, "Woodcraft Indians," based on American Indian lore, and he brought that experience to the BSA in 1910. Seton wrote a good many sections of the first *Handbook for Boys* (1911), including sections on "woodcraft," and he held the title "Chief Scout" until his falling out with the BSA in 1915.

By the turn of the century, Seton had already established strong credentials as both a naturalist and an artist. Although Seton wrote scientifically sound and wellrespected books on North American wildlife, he was best known as the author of a number of books of animal stories, such as *Wild Animals I Have Known* (1888). In his stories, Seton gave his animal characters intelligence, emotions, and even a sense of ethics. Although he was sometimes criticized for these stories, Seton defended them as based on scientific observation of animal behavior in the wild. Seton was a committed Darwinist, but his Social Darwinism resembled Peter Kropotkin's view of cooperation and "mutual aid" in nature, rather than the Spencerian view that brutal competition was the natural state of things. Accordingly, Seton's stories are full of animal cooperation and altruism. Although Seton had been developing these ideas over decades, he finally summed up his case for the moral lessons of nature in his 1907 book, *The Ten Commandments in the Animal World*, where he argues (using numerous examples from his observations of animals) that the Ten Commandments are "fundamental laws of all highly developed animals" (Seton 1925: 4).

When Seton turned to creating programs for young people, he brought into this work these same Social Darwinist ideas also found in the Social Gospel movement. Seton and other Darwinist reformers believed that they could intervene in the process

of evolution and steer society toward more just and more spiritual (as opposed to material) ways. He read and agreed with G. Stanley Hall's (1844–1924) Darwinist approach to the evolutionary psychology of the race and of the individual child and, like Hall, Seton believed that male early adolescence was a particularly magical period when the boy's natural instincts could be turned to spiritual matters and to selfless service to others.

Seton held up the American Indian as a model for American character, spirituality, and physical fitness. He built his original youth program around Indian lore, and when he resigned as Chief Scout in 1915 (in a dispute with the leadership) he reestablished the Woodcraft Indians as a co-educational group in competition with Scouting. Seton thought that American Indian religions were the perfect model for human spirituality and ethics. Seton had moved from the East to settle in Santa Fe, New Mexico, in the early 1930s to create The College of Indian Wisdom, a training institute for leaders in the Woodcraft Indians and other youth organizations. During these years Seton continued publishing the Woodcraft League's monthly *Totem Board*, where Seton tried out the ideas he finally condensed into one book – *The Gospel of the Redman* (1937) – where the Christ-like qualities of the great Shawnee Chief, Tecumseh, come to represent the merging of American Indian religions and those qualities Seton thought best in Christianity. Not surprisingly, the American Indian's religion in Seton's account relied heavily upon ideas about nature, so Seton was thoughtfully weaving together ideas about male adolescence, spirituality, American Indian religions, and the ethical lessons from the animal world.

Many of Seton's ideas about nature and spirituality survived in the BSA handbooks and programs after his departure, but some of the other founders also had their own ideas about the ways religion and nature came together in Scouting. Three of the founders – Edgar M. Robinson, John L. Alexander, and James E. West – had extensive experience in the Young Men's Christian Association (YMCA), and they brought from those experiences a firm faith in the power of "muscular Christianity." While that philosophy energized the late nineteenth-century commitment to athletics as a means to socialize young men in ethics and morality, Scouting went even further than the YMCA in viewing nature as the playground for the spiritual and ethical training of young men. The "Acadian myth" in the United States is the longstanding narrative that a "return to nature" will save Americans from the debilitating, polluting, and demoralizing effects of urbanization and (later) modernization, and we see in the handbooks and other literature of Scouting this enduring mythological idea of "going into the woods" for spiritual renewal (Schmitt 1990).

The founders and authors of the early BSA handbooks included religion as an important ingredient in the Scouting program. The Twelfth Point (and last) of the Scout Law is that "A Scout is Reverent," and in the 1950s the BSA created a special category of Religious Awards so that the boy could learn more about his own religion and provide service to the congregation as an extension of his service to the community through Scouting. All mention of religion in the BSA materials, however, addresses

more traditional understandings of religion. The BSA never formulated explicit ideas of a “nature religion” in these materials; those ideas appear far more often in the BSA publications about nature and in oral comments by Scout leaders (e.g., Scoutmaster’s “sermon” in Mechling 2001: 18).

Under the rubric “woodcraft,” the study of nature has always been a part of the Scouting program. In the Boy Scouts, boys must learn about nature for a range of badges, beginning at the lowest ranks and extending to Eagle Scout, the highest rank. Boys earn merit badges on topics running from the most general, such as “Nature” and “Environmental Science,” to specialized merit badges in such fields as bird study and reptile study. The pamphlets for these badges are usually written by experts in science, but even these publications convey the sense of awe humans have in the presence of nature. If the modern “ecological consciousness” has a religious or spiritual dimension to it, then we see evidence of this in the BSA publications.

The religious or spiritual dimensions of the study of nature in Scouting are subtle but unmistakable. The notion of “stewardship,” an idea borrowed from religion by conservationists in the Progressive Era, pervades Scouting’s ideas about nature. These are the “conservationist” ideas of people like Gifford Pinchot, Teddy Roosevelt’s Secretary of the Interior, rather than the “preservationist” ideas of John Muir in the same period. William Temple Hornaday (1854–1937), who directed the New York Zoological Park from 1896 to 1926 and who was in the circle of Seton’s friends, is remembered in the BSA with the William T. Hornaday badge and medals for boys who undertake projects representing “distinguished service in natural resource conservation,” evidence of responsible stewardship over nature.

Although the social and cultural impetus for Scouting came from the pervasive sense of a “crisis” in white masculinity in turn-of-the-century Great Britain and the United States, some reformers thought that the ideas of the movement, including ideas about nature and religion, were also applicable to girls. Like Seton, the Gulicks created the Camp Fire program around American Indian lore and took care in designing campfire rituals meant to impart to girls the spiritual and service aspects of their lives as young women. Crafts and camping were part of the Camp Fire program from the beginning, sharing in the “Acadian myth” of the beneficial effects of having girls experience nature. Juliette Gordon Low’s ideas for the Girl Scouts (1912) did not rely upon American Indian lore for their program, but Low and her colleagues were just as committed to the view that teaching girls self-reliance for the twentieth century should include woodcraft skills. Seton created still another opportunity for girls with his Woodcraft Girls, an organization paralleling his Woodcraft Boys, with its own handbook, *The Woodcraft Manual for Girls* (1916). All three of these organizations – the Camp Fire Girls, the Girl Scouts of America, and the Woodcraft Girls – were feminist organizations in their cultural context, as they aimed to take young women beyond the domestic sphere and give them knowledge and skills, including campcraft and woodcraft. In these movements’ requirements, rituals, and excursions into the wilderness we see the same wedding of nature and spirituality so prominent in the boys’ movements.

Scything and Erotic Fulfillment

Ivan Illich has drawn attention to the “vernacular” as those practices and values that, like our vernacular (or native) tongue, are learned in family and community by oft-unconscious processes of social osmosis rather than through formal schooling. It is striking that vernacular activity in the satisfaction of fundamental human needs is typically rich in synergistic layers of meaning. Indeed, as development practitioners and “modernizers” have discovered to their cost, it is often the case in vernacular communities that “implicit meanings of local practices” will outweigh the superficially presented reason for doing things in a particular way. For example, stories abound in Africa of newly installed water pumps being broken by young men. Only then was it realized that having the young women walk to the distant well was an implicit but unspoken opportunity for courtship.

One of the most striking characteristics of much vernacular work is its relationship to rhythm – both as an outcome (for example, in work song), and as an organizing principle aiding the process. This emerges, for example, in walking, rowing, riding, cycling, milking, weaving, spinning, pounding corn, hauling on anchor chains, ropes and fishing lines, casting with a fishing rod, making music, repartee in discourse, varying forms of intercourse, rocking the baby, and in reaping with sickle or scythe.

The ability to “enter into the swing of things” in work, as in sport, is commonly the touchstone of right technique. Chant, song or dance, often in unison with co-workers, may be concomitant to such an extent that some cultures have built up considerable bodies of work-related folk songs. These are songs not necessarily about work, but rather, embodying the rhythm of work. Thus, for example, the American-born Scottish ethnomusicologist, Margaret Fay Shaw, says of the weaving of Harris Tweed fabric in the 1930s: “Those were the days when a wearer could regard his homespun from the Hebrides with the thought of the songs and gaiety that went into the making of it” (Shaw 1986:7).

The wielding of a scythe – a sickle mounted on a frame to allow full-body engagement in harvesting grass and grain crops – is a paramount example of rhythmic vernacular work, and one that is currently generating fresh interest for its Zen-like meditative nature. In his seminal work, *The Scythe Book*, David Tresemer refers to the obviating effect of rhythm and resultant work song on the passing of time, maintaining that, “The main function of these chants and charms and songs was to coordinate the breath and scythe stroke and to ‘deceive the tedious time. And steal unfelt the sultry hours away’ ”(Tresemer 2002: 60).

He sees this phenomenon as being spiritually transcendent, thus concluding his treatise with the paragraph:

It is my desire on this land, in the context of this small farm, to know the best use of my body, and to move with the scythe as an extension of my body – in relationship with the grass, and in a team of mowers – in the process of developing my own communion with the divinity that creates the task and all its parts (Tresemer 2002: 103).

In *The Scythe Must Dance*, a technical addendum to the second edition of Tresemer's work and widely cited on the internet, Peter Vido likens the correct swing of the scythe to "The practice of T'ai-Chi Chuan, with its emphasis on the executing of smooth motions and while in a reflective state of mind, it is a beautiful – even if idealistic – model" (Tresemer 2002: 169). He too, in his closing paragraph, transcendently elevates the art, quoting a school essay by eighteen-year-old Hannah Sawyer of Kingfield, Maine. She writes:

Scything is simple; it is relaxing too. It is no wonder the people of yesteryear had very little problem with stress. The quiet rhythm melts away tension; swish, cut, swish, cut, swish . . . If I close my eyes it is easy to imagine myself back in time – a bird singing to the sky, the wind whispering to the trees, the splash of a horse pawing the water, the lowing of a cow calling her calf. Would you like to time-travel? I'll teach you how (Tresemer 2002: 181).

I myself grew up on the Isle of Lewis off Scotland, knowing how to hone and handle a scythe for the making of hay and silage to feed our cow. I observe that, today, it has become a near-extinct and hard-to-get tool, driven out by the hegemony of the "trimmer" – the name given in Britain to pernicious petroleum-powered pestilences with rotating nylon whiplashes that brash the grass. Walk a meadow or woodland path that has been trimmed, and you step among the scrappy carnage of flayed vegetation and scuffed ground. By contrast, tread a scythed path, and the vegetation is cleanly cut and laid to the side in pleasing swathes that avoid messing one's footwear. Rarely is the turf damaged because, as the Thai Buddhist Monk Ticht Nhat Hanh puts it in a quotation at the leading website dedicated to the art, "Whenever I see anyone cutting grass with a scythe, I know he is practicing awareness." Indeed, it was a personal meditation on trimmed versus scythed meadow paths in Scotland that inspired me with "The Scyther's Prayer": *May my death be the clean cut of an honest scythe, and never the thousand lashes of an accursed trimmer!*

Time and death wield a scythe because harvesting is both the fulfillment, and the transcendence, of them both. As Sir James Frazer suggested in *The Golden Bough* (1994), the practice of reaping connects humankind with the Corn God or the King of the Woods, and with the Earth Goddess. It is back into her sacred body, the Earth, that the sky god or King seasonally meets his nemesis, as at Diana's Grove of Nemi. To consciously reap the life-force (which can be symbolized by mistletoe or the "Golden Bough") with a hand sickle or scythe is therefore to participate in the perpetual archetypal cycle of life, death and rebirth.

To Frazer, this insight connected the Christian story with a much wider body of world mythology. As he concludes his seminal if professionally controversial and much-disputed yet remarkable work:

Our long voyage of discovery is over [and] once more we take the road to Nemi. It is evening, and as we climb the long slope of the Appian Way up to the Alban Hills, we look back and see the sky aflame with sunset . . . over Rome and touching with a crest of fire the dome of St. Peter's . . . The place has changed but little since Diana received the homage of her worshippers at the sacred grove. The temple of the sylvan goddess, indeed, has vanished and the King of the Wood no longer stands sentinel over the Golden Bough. But Nemi's woods are still green, and as the sunset fades above them in the west, there comes to us, borne on the swell of the wind, the sound of the church bells of Aricia ringing the Angelus. *Ave Maria!* Sweet and solemn they chime out from the distant town and die lingeringly away across the wide Campagnan marshes. *Le roi est mort, vive le roi! Ave Maria!* (Frazer 1994: 714; translatable as, "The king is dead, long live the king! Praise be the Mother of God!").

Frazer's work may have fallen on stony ground when the relationship between Christianity and fertility became a shunned field of study. Nonetheless, it cannot escape notice that in the Last Supper before his "Passion," Christ, the Mahavatan embodiment of God incarnate (and so carnal), offers bread – risen from reaped corn – in memory of eternal communion with his body. The spirituality implicit in the biblical Song of Solomon, Proverbs 8, Luke 7 and Matthew 11 thereby finds conjugal fulfillment in this "feast of love," this "communion of the saints," that realizes heaven as the fulfillment of the erotic.

Sea Goddesses and Female Water Spirits

Water is not just regarded as a resource to be managed or exploited or as the source of natural metaphors, but as having an identity on its own. Such an identity has been, in many cultures, personified in the figures of female water deities.

Images of transcendental women surface worldwide – in the lakes, seas, rivers and springs of every continent. Nearly always of great beauty and ambivalence, they are seen as both seductive and threatening; as bringers of salvation and – at the same time – damnation; and – just like their element, water – as life-giving and life-taking, too.

Deities of the water, water spirits and mermaids cannot be seen only as a projection of attitudes toward women or just as a metaphor for male desire for and fear of the female. The following suggest the multiplicity of meanings inherent in a wide range of conceptualizations of sea goddesses in specific local and historical contexts and in connection with particular social practices.

Examples drawn from Europe, Africa, Brazil and Indonesia will focus on rites that are performed at present and which seem to be of growing significance. This reveals local strategies for dealing with the extraordinary, unpredictable and challenging element, water.

Europe – Sirens, Sprites, Melusine and Undine

Each epoch in Europe constructed its own characteristic version of women in the waters. Aphrodite or Venus, the goddess of beauty, unbridled love and creative fecundity, can be linked to pre-patriarchal social structures. In contrast to her, sirens – half-bird, half-woman – seem like dark, strange and uncanny creatures who are full of sensual temptation for Odysseus, whom they try to deflect from his road home. In the post-Homeric era, the sirens lose their threatening characteristics, although in the Middle Ages they come to embody a direct threat to the male, Christian mode of being because they distract from the word of God and promise carnal desires and earthly pleasures. The sprite with her fish's tail moves to the front of the stage. While she is also a seductive creature she is a split being: Her form is human above and animal below. She is wild, but unreachable because of her sexual inadequacy, however in the course of time she is depicted in an increasingly harmless fashion. In early modern times, mermaids with one or two tails – the latter classified as Melusines – frequently

appear in churches as well as in book illustrations and decorative folk art. This leads to the gradual supplanting of the wild, sexualized and demonized Melusine by the diminished child-woman Undine. The Undine is never a mixed form, but rather a different one in the sense of embodying a living, immediate naturalism.

The Romantic period sees a multitude of gushing literary variations on this figure. The Undine shares the Melusine's neediness. She needs a man, not only to make her human, but also, through marriage, to gain a Christian soul. After getting it, she is characterized by submission and humility and is similar to the figure of the little mermaid in Andersen's fairytale. Desexualization, devotion and silent sacrifice are central to the tale's bourgeois ideal of motherhood, because the little mermaid dies before she has a chance to seduce the prince.

The death of females by drowning, especially that of Ophelia, takes on a great fascination around the end of the nineteenth century. The lifeless, floating female body represents an increasing deindividualization, while, at the same time, the Undine becomes merely an "art nouveau" ornament. Today, we have Barbie dolls with fishtails and the Lorelei on T-shirts as examples of mass consumer products. Just as nature has been turned into a useful but lifeless object lacking the divine, so the mermaid has degenerated into a commercial sex object and a "harmless" piece of kitsch.

But, simultaneously, the sea even nowadays can provoke impressions of open space, power, eternity, movement, metamorphosis, change of shape and color, and orgasmic waves.

Africa: Mami Wata (Mammy Water)

In Africa water and floods are unpredictable forces, potentially benevolent, but also harmful. The widespread polymorphous figure of Mami Wata (Mammy Water, oscillating between spirit and goddess) is actively worshipped in many African countries between Senegal and Tanzania. In West African cosmology the Mami Wata spirits (there is also Mami Wishnu, Mami Lakshmi or Mami Gabriel) are among the most popular and they are said to possess great mystical powers and authority. They are also known to extend their wrath and anger in the form of torrential rain, floods or lightning. These powerful spirits are usually depicted as mermaids of exceptional beauty or as snakes. Their history seems to be closely connected with colonialism. As there is a definite influx of prints from Europe and India, in the 1980s and early 1990s foreign influences in the iconography of Mammy Water were seen as central in the scientific interpretations of this figure. Mami Wata has many traits of a white woman or fashionable lady of Western style and, as offerings for her mainly consist of things associated with foreigners (a means of symbolic appropriation of their world), her followers appear to be selecting fragments from experiences of foreign cultures and investing them with new meanings. Today Mami Wata religious practice is interpreted as concerned predominantly with the articulation and expression of African

social realities and in particular with social change. Other authors observe hybridity in the mixtures of African, European, Hindu and occult elements. Thus, Mami Wata is connected with colonialism, migration, globalization, with literacy, education and increasingly with new media (cf. the Mami Wata websites in the internet). Strangely enough, there are no interpretations of Mami Wata as an icon for environmental protection or as a guard for aquatic ecosystems.

In any case, the idea of an underwater world with splendid palaces and immense riches is a counterimage to the real world. Mami Wata includes aspects of ancient water – and snake spirits: In the Igbo context, in southeastern Nigeria, the royal python companion refers to the rainbow deity that controls the waters of the sky and unites them with the waters on Earth. Hence Mami Wata and the rainbow serpent are an inseparable pair. In West and Central Africa the river deity Mami Wata is linked with notions of irresistible female sexuality and with modernity in urban life.

Women make up the majority of her adherents, both as priestesses and as adepts of the cults. Her worshippers attest to the goddess' healing powers, benevolence, beauty, mystery and local origins. She can enter people through possession. Possession cults have often been modes of cultural resistance and means to domesticate male and alien powers. Therefore possession by water spirits can be interpreted as an embodied critique of colonial, national, global or religious hegemonies.

But the local meanings differ. For instance, in Igbo religion Mami Wata has a particular significance as a local strategy for dealing with the extraordinary, unpredictable, abnormal, nonconformist, challenging and/or innovative elements and events in nature. Another example is Zaire, where Mami Wata gradually lost her sacred aura and became a symbol for the prostitute. Association with her is seen as immoral because the wealth she provides is not shared. Thus, we can see her as a complex concept of multidimensional divinity and appropriation of nature.

Brazil: Iemanjá

In the Afro-Brazilian religion of Candomblé, the Sea Goddess Iemanjá (Yemanjá), brought by the slaves from West Africa to South America, is the revered mother of all the gods (Orixás, personifications of the forces of nature). According to the legends, Iemanjá (the waters) married Aganju (dry land). From this marriage Orungan (the air and the heights) was born, but, in the absence of his father, Orungan had sex with his mother, Iemanjá. From this, Iemanjá died and from her womb all the other Orixás were born. Therefore she is considered the mother of all of them. During the era of slavery, Iemanjá was a source of resistance and part of black cultural identity. Under the cloak of Catholicism, she was venerated as the Virgin Mary. But she also took on some aspects of the Indian Yara. As mother of the fishes, she guarantees fertility, and at the same time, there is a notion that she becomes the devouring mother and lover of fishermen killed at sea. Thus fishermen's wives beg Iemanjá to look after their

husbands, whereas their husbands are more likely to ask for a beautiful woman or a new boat. The place where petitions are made can be a temple, the beach or the sea. As gifts, Iemanjá, like Mami Wata in Africa, receives cosmetics, combs, clothing, embroidered cushions, rice powder, flowers, jewels, perfumes, honey – donations toward her beauty and erotic seductive power.

In Candomblé, more and more people of all colors and social classes come to the priestess for help and advice on general questions, relationships, family problems and health matters. People pay homage to Iemanjá in great public feasts, especially in the cities of Rio de Janeiro (8 December), Salvador de Bahia (2 February) and Porto Alegre. Celebrating the beginning of a new year the faithful take their offerings to the goddess, asking that their wishes be fulfilled.

Alaska: Sedna

According to the peoples of northern Canada and Greenland, known as Inuit, the Sea Spirit and mythical Goddess of the Sea, Sedna, on the bottom of the ocean, is the mother of all animals. According to one of the many versions of her legend, Sedna was a young girl who did not want to marry. Finally her father forced her to marry a dog, but afterwards he felt sorry for her and drowned the dog. After her husband died, Sedna was unable to support her children and herself. She had to send her children away and returned to live with her parents. One day, a bird, disguised as a man, sought Sedna in marriage. She accepted and went to live with him. But soon Sedna discovered that her new husband was not a man but only a fulmar. When Sedna's father visited her, he convinced Sedna to leave with him in his boat. Unfortunately the fulmar caught them, and with his wings created an enormous storm, which threatened to overturn the boat. Terrified, Sedna's father tried to throw the girl overboard to her husband, but she grasped the boat's side. In fear, the father cut off Sedna's fingers until she fell into the sea. It is said that Sedna resides at the bottom of the sea with the seals and other sea animals that were created from her fingers.

In contrast to the other sea goddesses, Sedna is not depicted as beautiful. Her hair and body gets dirty and ugly when humans break taboos or behave in bad ways. Then she holds the animals back and sends storms or diseases. Therefore a shaman will undertake an underwater journey to comb her hair and wash her after he has defeated her in a fight. This causes her to let the animals go. More recent research revealed that this shaman can also be a woman. In this case, the interpretation of symbolical sexual subjugation of women (by male shamans) (Zumwalt 1984) becomes obsolete, and the fertility as well as the moralistic aspect of Sedna comes more to the fore. In her image, the behavior of people and the cycles of nature, the weather and the fertility of the animals, are closely connected.

Indonesia: Ratu Kidul

Ratu Kidul is the Queen or Goddess of Java's Southern Ocean. She is the ruler of all spirits, and she appears in the old texts and in the oral traditions of both the Javanese courts and ordinary people. In contrast to the abovementioned figures, she is not first and foremost a mother goddess in connection with fertility but her central characteristic is the legitimization of political power. From the early seventeenth century onward, she has always been regarded as the consort of the Sultan (from the eighteenth century onward, of the Sultans of both Surakarta and Yogyakarta), supporting him and defending his realm. Implicitly the marriage meant that the ruler was approved and sanctioned by the primordial powers of the Sea. The significance of this relationship has been waning along with the declining positions of these courts in present-day Java. On the other hand, at present, ordinary people can and do ask her for help with all kinds of troubles. Spiritual and material goals become inseparable. Ratu Kidul is an ambiguous figure too: she can be the source of luck, welfare and healing as well as of illness, death and destruction. There are manifold adaptations to both modern life and Islam in imaginations of her, and the quality of her persona depends on the context in which it is presented.

Nevertheless Javanese popular belief in Ratu Kidul is still very vivid.

Seattle (Sealth), Chief (ca. 1790–1866)

Chief Sealth (or Seattle as he is commonly called today) was an influential chief of the Salish-speaking indigenous peoples whose lands included the Puget Sound region of what is now Washington State. Born sometime around 1790 from a Duwamish mother and a Suquamish father, and dying in 1866, this namesake of present-day Seattle was chief during the coming of the “Boston Men” (American-European settlers from the east coast of the United States), and maintained mostly cordial relations with them throughout his life. By nearly all early accounts, Sealth was an able chief and spokesman for the Salish, whose existence centered on the rich tidelands and estuaries that surrounded Puget Sound.

However, his fame today – especially in popular culture

– is due mainly to the modern environmental movement, specifically to their appropriation and revision of a speech Sealth allegedly gave along the Seattle waterfront, probably in 1854. The earliest account of the speech, recorded by Henry Smith in the *Seattle Sunday Star* in 1887, comes from Smith’s recollections and diary fragments – the latter never found. In Smith’s account, Sealth contrasts the white culture with his own: the former apparently favored by God, the latter rejected, with the white religion given by an “angry God” and hence incomprehensible to his and other tribes.

Most pointedly, the speech records Sealth as contrasting the Christianity of the whites (with its stark separation of Heaven from Earth) with his tradition’s reverence for the land, hallowed by the very real presence of his people’s ancestors. Regarding these sacred ties between the ancestors and the tribe’s land, the chief warns: “the dead are not altogether powerless.”

The modern legend of Chief Seattle and his “Speech,” however, is not primarily due to Smith’s account – with its authentic Salish ties between Earth and religion – but due to significant embellishments added by whites more than a century later, most notably from the pens of poets and screenwriters. In the past thirty years or so, in fact, many revisionist versions of Sealth’s speech have appeared: quoted at Earth Day celebrations, highlighted at a World’s Fair, used by political parties and “Green” political candidates, appearing in a Smithsonian exhibit, and penned even into children’s books. Thanks to the massive information-exchange capabilities of the Internet, Sealth’s speech

– in seemingly infinite variations – is everywhere, from websites touting survivalist themes, to the home web pages of indigenous peoples.

In most of these accounts, Sealth is portrayed as fundamentally questioning not only an upcoming treaty with the U.S. government, but the very notion of private property itself: “How can we buy or sell the sky?” He also bemoans witnessing the “slaughter of the buffalo,” despite the fact that bison are not indigenous to the Pacific Northwest, and the great slaughter of buffalo would not occur until a decade or more after Sealth’s death. Thus, most scholars acknowledge that much of the text of “Chief Seattle’s Speech” was in all probability not uttered by Sealth along the Puget Sound waterfront in 1854. Smith himself was known as something of a poet, and in the Victorian era it was common for writers to add rhetorical flourishes as they saw fit; but unless authentic documents are forthcoming, we are likely never to learn what exactly Chief Sealth uttered that so impressed Henry Smith.

Despite the difficulties in determining where Sealth’s words stop and modern embellishments begin, Chief Sealth and his “speech” remain powerful and influential for two significant reasons. First, the authentic core of his speech points toward a land ethic and religious tradition which refuse to objectify nature, and which count ecological respect as a matter of course.

Second, the appropriation and adaptation of Sealth’s powerful words, and the linkage of this text to the modern environmental movement, are reminders of the ever-present human impulse toward religious syncretism, the combination or synthesis of different elements from two or more seemingly disparate traditions. Many Native Americans are angry at how some groups of the majority culture have employed Sealth’s speech, lifting it out of the specific Duwamish and Salish cultures from which it came. They view this appropriation as yet another example of theft. Others, however, look at the resultant text, not primarily in terms of historical accuracy, but of whether it expresses the truth of the results of persistent environmental degradation.

Sedona

One of the most celebrated of New Age “power spots,” this small town in scenic north-central Arizona has been a hub of New Age and metaphysical activities since at least the late 1970s, when California-based psychic and self-help guru Dick Sutphen began touting it as a power center and psychic Page Bryant identified seven specific “energy vortexes” in the area. Stories about extraordinary phenomena and about the area’s healing energies circulated rapidly through the 1980s, and by the early 1990s the number of healing centers, New Age bookstores, crystal shops, and psychic channelers had multiplied far out of proportion to the town’s population of ten thousand or so. Groups based in the area have included ECKankar, the Rainbow Ray Focus Group, the Aquarian Concepts Community, the Center for Advanced Energy Healing, and the Aquarian Educational Foundation.

Cradled in its other-worldly red rock surroundings, the town has become a spiritual melting pot of New Age millenarianism, neo-shamanic Earth spirituality, and post-traditional metaphysical and Theosophical occultism. Some of Sedona’s channelers regularly contribute to the journal *Sedona: Journal of Emergence*, which has become the flagship of the American channeling community, with its millenarian beliefs in extraterrestrial contact, interdimensional portals, light-bodies and stargates. For some of Sedona’s psychics and ecospiritualists, the colorful rock formations, steep-walled canyons, and piñon pine-juniper forests that surround the town are an energetically active and psychically catalytic wilderness rich with mysterious energy “portals” and spiritual presences. At the same time, the rate of real estate and tourist development has turned Sedona into one of the prime tourist sites of the U.S.

Southwest, attracting close to five million visitors annually, and into one of the most expensive places to live in the country, with several environmental conflicts resulting from pressures of development, sewage, land use, and related issues. Sedona’s New Age popularity may ultimately not save it from the “Aspenization” or “Californication” that has become the trap of many a picturesque town in the American “new west.”

Seed, John (1945–)

John Seed is an Australian environmental activist who, along with Joanna Macy, has done more than any other figure to spread globally deep ecology spirituality and ritual. Motivated in part by long-standing Buddhist practice, in his native Australia he founded the Rainforest Information Centre in 1979 (and by 1984 the World Rainforest Report). In subsequent years, while he has continued political work to protect forests and forest peoples, he has increasingly prioritized his spiritual work. He believes that the environmental crisis is so grave that only a miracle can save the Earth and that a prerequisite for this is the complete transformation of human consciousness along deep ecological lines. Given this conviction, he has put a high priority on creating and teaching ritual forms that evoke in participants a perception of the sacredness of the Earth and feelings of kinship and moral responsibility toward the entire community of life.

Born in 1945 in Budapest Hungary, Seed arrived in Australia at the age of five and recalls that the bushland and coastline around Sydney laid the foundations for his later love of nature. From 1973 to 1979 he steeped himself in Buddhist meditation and helped build a meditation center and community in the bush of northern New South Wales. After withdrawing to the forest, however, the deforestation sweeping the world found him, and he participated in direct-action campaigns in the Nightcap Range NSW (1979–1981), Franklin River Tasmania (1983–1984) and Cape Tribulation Queensland (1985–1986). Each of these campaigns led to the protection of rainforests and the creation of national parks that eventually received World Heritage listing.

In 1980 Seed met bioregionalist Gary Snyder who was reading poetry in Australia. Snyder mentioned to him the recently formed Earth First! movement in the United

States, which was also involved in civil disobedience to save forests. Seed hooked up with these activists and during the summers of 1984 and 1985 started doing “road show” performances with Earth First! co-founders Dave Forman and Mike Roselle in the U.S. These performances used songs, slide shows, and lectures, to spread deep ecology spirituality and build direct-action ecological resistance in the U.S. (Seed is an accomplished song writer who has produced several albums of environmental and children’s songs.) Seed and Roselle would help Randy Hayes invent the Rainforest Action Network in 1984, which quickly established itself as one of the world’s most important environmental non-governmental organizations.

In 1987 Seed co-produced a television documentary for Australian national television about the struggle for the rainforests, which was subsequently shown in many countries around the world. Shortly thereafter he pioneered a number of important

projects to protect rainforests in South America, Asia and the Pacific. One of the earliest and most innovative was in Papua New Guinea, providing portable “Wokabout sawmills” to indigenous peoples as a means to conduct sustainable tree harvesting. This was seen as a way to resist deforestation by showing forest peoples an alternative to industrial forestry, which destroys cultural and natural diversity. By the turn of the century he was investing a great deal of time in Ecuador, helping to establish and demarcate forest reserves there, both to protect their ecological integrity and the forest peoples who depend on them. Religious and spiritual organizations, including The Australian Council of Churches and the Foundation for Deep Ecology, have supported his work.

Seed is the source of an aphorism now commonly expressed in radical environmental circles, “I am the forest, recently emerged into consciousness, defending myself,” a perception that first came to him while engaged in direct-action resistance to logging, when he felt himself “no longer acting on behalf of myself or my human ideas, but on behalf of the Earth . . . I was literally part of the rainforest defending herself” (Seed, et al. 1998: 6). But Seed is probably best known for helping create and widely disseminating the Council of All Beings. He has also developed “Re-Earthing” and other workshops that can be considered Earth-revering rituals. The Re-earthing workshops draw on breathwork practices grounded in Yoga and other religious traditions originating in India. Other rituals, including some that are often used as preliminary exercises in the Council of All Beings, consecrate cosmological and evolutionary narratives; such ritualizing has affinities with the Epic of Evolution and draws on the work of Thomas Berry.

Seed has conducted such rituals and trained others to do so widely, not only in his native Australia and the U.S., but also throughout Western Europe, Poland, Russia, Slovakia, Mongolia, India, Thailand, Japan, Chile, Ecuador, and Canada. This work has spawned environmental protection groups and projects including the Anammalai Reforestation Society in Tamil Nadu, India which has been engaged since the late 1980s in the reforestation of the sacred mountain Arunachala.

Seed often teaches at countercultural enclaves or spiritual retreat centers such as the California Institute of Integral Studies, the Esalen Institute and Omega Institute (Rhinebeck, New York), Findhorn, Naropa University, and Schumacher College. He also lectures widely at mainstream universities in the U.S., Australia, Europe, and Asia. Awarded the Order of Australia Medal in 1985 by the Australian Government for his conservation efforts, in 2003 he has been writing and producing videos, including *On the Brink*, which captures well the apocalyptic expectation which, combined with his deep ecological spirituality, fuels his passionate Earth activism.

Seeds in South Asia

In South Asia's predominantly agricultural society, seeds as the source of food and life are generative not only of economic and nutritional value, but also of multiple poetic and religious meanings. Seed imagery is pervasive in Hinduism's earliest sacred texts, and retains its importance into the current era. Actual seeds are present as auspicious offerings in numerous rituals of varied purpose; moreover, ritual actions surround farmers' practices of saving and planting seeds. In the late twentieth and early twenty-first century, conflicts have swirled around the production and marketing of seeds. These include issues of biodiversity versus monoculture; of local control versus multinational corporate production; and most recently of the economic and environmental benefits and hazards of genetically engineered seeds. Seeds thus retain potent symbolic value in multiple and changing contexts through millennia of South Asian history.

The common word for seed in Hindi and Sanskrit is *bij*

(or *bija*). From its earliest uses in ancient India this term encompassed a semantic domain similar to that of seed in English: its meanings range from the actual germ of plant life to human or animal semen, and expand to include any primary cause. Particular to Sanskrit usage, however, is the association of seed with the power of sound. *Bij man- tra* denotes the mystical letter or syllable essential to an oral spell used to evoke a particular deity.

Hinduism's oldest scriptures, the *Vedas*, pose homologies among seed, milk and other potent substances including butter, and the nectar of immortality – homologies that persevere throughout later Sanskrit literature as well as in vernacular sources. In popular devotional oral traditions, a seed planted and sprouting is a common metaphor for religious knowledge that may come from a guru or the lord, and take root in the human heart.

Because of its close association with semen, seed as male is sometimes identified as part of a cultural complex that disadvantages women. Women may be likened to fields – giving nourishment and growth to seed, but having no great part to play in the final product – whether determining its form or possessing its fruits. However, some South Asian esoteric traditions, such as those of the Bengali Bauls, describe women's menstrual blood as “female seed” whose potency is equal to or greater than that of males. Both male and female seed may be ritually conserved to increase spiritual power and knowledge, or depleted through ordinary sexual intercourse to produce children.

A Sanskrit agricultural treatise called *Krishi-Parashara* prescribes a procedure for prayerfully sowing seeds in which, “The farmer with a pure and concentrated mind and after meditating upon Indra [the god of rain],” sows three handfuls of moist seeds on an

auspicious day – thus ensuring prosperity in the future year (Bhattacharya 1976: 293–4). Farmers throughout India have traditionally performed similar rituals to initiate the planting season, before it is time to sow actual crops. In the wake of technological change in recent decades, these practices have waned.

Besides rituals explicitly incorporated into the agricultural work cycle, many other Hindu rites involve seeds. For example, in Rajasthan, the worship of the goddess Sitala Mother (who presides not only over rash and fever disease but over fertility of humans and farms), precedes the monsoon planting season by at least two months. All the women who participate in Sitala’s worship on her festival day will go behind her shrine and plough miniature fields in the dirt with their fingers. In these fields they plant seeds for each of the coming season’s crops, seeds that have been offered to, and blessed by, the goddess.

Folktales also associate seeds with divine female beings. In Bengali folklore, Lakshmi, the goddess of prosperity, comes disguised as an old woman and gives rice seeds to a poor widow, thus blessing her household with abundance. Throughout India, Lakshmi is associated with grain and grain seeds in iconography and folklore.

Vandana Shiva, one visible and vocal spokeswoman in India’s environmentalist movement, explicitly compares the seed today to the spinning wheel during India’s Independence movement, declaring that seeds today have become the “site and symbol of freedom.” According to Shiva, seeds offer a unique conjunction for issues of cultural and biological diversity (Shiva 1999: 67). In 1999 the “seed satyagraha” movement (echoing Gandhi and nationalism) successfully opposed Monsanto’s proposed introduction of seeds with genetically engineered sterility (known as “terminator” or “suicide”) to the Indian market. Meera Dewan’s *Eternal Seed*, a documentary film released in 1996, unites both ancient religious significance and modern activist politics to present the ongoing potency of seeds in South Asian rituals and lives.

Senoi (Malayan Peninsula)

Senoi refers to a cluster of Aboriginal or hill-tribe peoples of the Malayan Peninsula (including the Semai, Temiar and Jah Hut). They have long been classified as Negrito (being dark-skinned and with relatively crinkly hair) and they share a linguistic affinity within the Austro-Asiatic family of languages. They received worldwide attention in the 1950s when crosscultural psychologist Kilton Stewart projected the Senoi (more particularly the Ple-Temiar people) as the most socially stable or “hygienic” society on earth, because their lives were governed by day-to-day attention to dreams. In the following decade anthropologist Robert Dentan reported on the Semai as a remarkable “Non-Violent People of Malaya.” The question at issue here is whether the absence of violent crime in Senoi cultures, and the ideal of avoiding anger and hostile actions as the mark of group identity, translates into non-violent approaches to nature.

It was Stewart’s point that the Senoi recognized threats in the external world both socially and environmentally. They formed semi-nomadic groups constantly struggling to establish garden land against the inroads of bamboo jungle, fearful fauna (such as tigers), and meteorological phenomena violating the normal order of things (such as thunder squalls). As for the socio-spiritual world, there was always the danger of quarrels, of causing offenses (by breaking taboos, for example), or disturbing what may be called “nature spirits.” Outer events were coped with through victories achieved in the inner world of dreams: children were taught that humans reproduce the fears and tensions of “the socio-physical environment” inside themselves, and that settling problems in their dream states (conquering “fearful emotions,” overcoming “hostile images”) allows “powers of the other world” to be harnessed for achieving a cooperative and trouble-free life when awake.

Stewart’s idealizations of the Senoi, however, proved premature, and some have even questioned her claims about regular dream “classes” in Senoi family life as a hoax. Whatever the extent of exaggeration, reassessments must be made. Although the Senoi were not in any technological position to harm their environment and never adopted any patterns of fixed routines of labor to modify its influence over them to any great extent, they were highly anxious within it about spirit-related diseases and death, and, despite assumptions about “familiar and regularly recurring phenomena” – even certain claims at rainmaking – they showed themselves more genuinely frightened about unpredictable weather changes than possessing confidence and organizing ability to handle nature’s forces. One might concede that they were in a better position to cope through fostering dream-sharing sessions, but in no way more extraordinary than most other small-scale traditional cultures that invest in the instructive power of oneiric

life. It has turned out that their dreaming has not made them less susceptible to the enticements of modern technology and consumer products in more recent years, and, during the communist insurgency of the 1950s, “the dream people” were not averse to taking up modern arms in their own defense against outsiders (or against each other, when the fighting generated intertribal hostilities).

Serpents and Dragons

From time immemorial humankind has been fascinated but also frightened by snakes. Their quick locomotion in spite of lack of legs, their poisonous bite, and their way of catching their prey by alleged hypnotization set them apart from men and animals. In all continents they are treated with fear and awe. In Western countries they are regarded as the enemies of humankind and, according to the order of the Lord (Gen. 3:15), man shall bruise the serpent's head while serpents shall bruise man's heel. In Genesis the snake is the tempter and representative of evil; in Matthew 10:16, however, it is an epitome of wisdom: "So be wise as serpents!" This ambivalence has governed the human relation to snakes: hatred and destruction on the one hand, admiration and deification on the other.

Qualities and habits of snakes probably gave rise to some of the snake beliefs and cults. The sloughing of skin by snakes was taken as an ability to rejuvenate and a sign of eternal life. The Gilgamesh epic in the Babylonian version of about 1200 B.C.E. explains the origin of this skill: the hero went to the underworld to obtain the plant of immortality. On the way back to Uruk the snake stole and ate it. Gilgamesh could not revive his friend, but the snake turned young again and again. In folk belief and folktales we meet snakes which possess medicines to restore life and health. First of all, they know the antidotes to snake bites. The Lord advised Moses to make a bronze serpent and set it on a pole, and whoever was bitten by a snake could look at it to be restored (Num. 21:9). Similar places of snake shrines were frequent in antiquity. In Greece they were devoted to Aesculapius, the god of medicine. He was portrayed as a bearded man with a staff; around which a snake coiled. This staff of Aesculapius has remained the emblem of the medical profession until today. In Southern Africa, the healer received his potencies of healing from a (mythical) snake during his initiation, and he led this to a patient to "lick" him. Until recently certain snakes were believed to have a stone in their forehead. This so-called snake-stone was regarded as a safe remedy against a snake bite. You only had to apply it to the puncture and the stone would draw out all the poison. As these cannot in fact be found in snake heads, clever businessmen have sold manmade imitations.

Another characteristic of snakes is their sudden disappearance into the ground. Therefore it is believed that they have connections to the underworld and the world of the dead from which they gain extraordinary knowledge. They were consulted as oracles. Delphi, the most important oracle of early Greece, was inhabited by the dragon Python. The priestess Pythia sat at a crevice from which rose an overpowering steam and told what she learned during a state of altered consciousness. In many countries,

particularly among the Bantu-speaking peoples of Africa, a snake which comes to the house is a reincarnated ancestor who inspects his family. He may help or he may punish. Because of similar ideas, some people in Central and Northern Europe fed house snakes as protectors of the welfare of the family. The clash of these ancient concepts and modern ideas is illustrated by a widely known story. A little child used to share his food with a snake that crawled out of the basement of the house. When the parents happened to watch it they thought that the child would be bitten and killed the snake. Within a short period of time the child lost its strength and died.

In West and Central Africa kings lived in a mythical relationship to snakes, mainly pythons. At their residence they had temples in which pythons were kept. These serpents were served by a special priestess who was at the same time the serpents' wife and the king's wife. The peace in the region, the prosperity, the health of cattle, the regularity of seasons and the abundance of game in the country depended upon the pythons' well-being. After the king's death he was believed to turn into a python. The poisonous cobra at the crown of the kings of Lower Egypt was venerated in prehistoric times as the attribute of the goddess Uto in her temple in the Nile Delta. Later it became the Uraeus snake, a symbol of sovereignty, but originally it was a guard of the king which defended him and destroyed his enemies merely with its poisonous breath. Similarly the Nâga snake king protected Buddha and spread his seven heads over him because in deep meditation he had not noticed the approaching thunderstorm. Generally it was believed that snakes guarded treasures, therefore their representations served to guard vessels and buildings. They possess gold. The snake of the folktales, particularly the snake king, has a golden crown. He may give it as a present to the kind maid, but whoever tries to steal it is vehemently persecuted. This tradition is blended with belief in the snake stone. Frequently the snake stone is thought to be a very precious stone, like a diamond. Typically, the thief is killed by the furious snake, but sometimes he succeeds in escaping; as with the Counts of Lynar in Northern Germany, who explain their heraldic animal by this event. A Nigerian story tells how the shining stone of the snake became the moon.

Snakes are closely related to water, for they can live in water as well as on the ground, and creeks and rivers resemble their shape. Snakes found in water are regarded as its personification, and even little ones are frequently not killed, in case the water should disappear. Water also should not be polluted or the snake will leave and the fountain dry up. In the urban cemented water basins in Nepal symbolical snakes of stone take their place. On the other hand, the snake of the river or pond might cause floods. People who drown are said to be pulled into the water by the snake. It either punishes their wrongdoings and breaking of taboos, or it catches them by trickery. First of all, women have to be careful when approaching water. The snake of the river is in close connection to rain and rain-clouds. It might go up to the sky or come down with heavy rains. In various parts of the world, especially Australia and Africa, the rainbow was regarded as its representation and thunder and storm were said to be caused by the snake. As the water supply depended on the goodwill of the serpent, drought-stricken

countries made sacrifices; in extreme droughts they sacrificed young girls who were driven into the water until they either drowned or were killed by crocodiles. This was euphemistically called their “marriage” to the snake.

The memory of such sacrifices lived on in Southeast Africa until the twentieth century in reports of girls’ initiation ceremonies as well as in Mexican legends about the wells of Chichén Itza being hardened by the skeletons of youths found in the big cenote.

The legend of St. George is a Western example of the concept. St. George fought against a dragon and saved a princess who had been delivered to it so that the country might get water.

Snakes were representations of venom, treachery and evil, but also of eternity and rejuvenation, of healing and wisdom, of ancestors and the underworld, of riches and royalty, of protection and, according to their phallic shape and their connection to water, of fertility of individuals and of countries. In most cases they combined several aspects. Therefore it is difficult for present generations to comprehend the full meaning of ancient snake cults. In addition, we have to take into consideration a continuous development over the millennia.

Snake cults flourished among American Indians, Northern Africa and Southern Asia. They were connected with living snakes like those of the Hopi pueblos. Poisonous snakes are used in twentieth-century fundamentalist churches of the southern U.S. by “snake handlers” to prove their faith.

The female figures of ancient Crete who hold snakes in their hands (1500 B.C.E.) are generally regarded as snake priestesses or goddesses. In Burmese cults, girls danced with living cobras and “kissed” them at the climax of the rite. West African snake cults were exported to the Americas by slaves and kept on in Vodou traditions. In India, many snake cults are still alive, some turned into tourist attractions: the snake-charmer allegedly lets his snake dance to the tunes of his pipe, though the deaf snake only obeys his movements. Such snake-charmers were already known in biblical times. Psalm 58:4–5 warns that the wicked have venom “like the deaf adder that stops its ear, so that it does not hear the voice of charmers or of the cunning enchanter.” Snake-charmers in Europe who freed the country of snakes either turned into the sinister exorcists of legends similar to the Pied Piper of Hamelin or venerated saints of the Roman Catholic church (St. Dominicus at Cocullo, Italy; St. Aper at Krautersgersheim, France).

Next to natural snakes, and often blended in the traditions, are mythical snakes of gigantic size, such as the snake of the river (Loch Ness monster) and the rainbow snake. The most famous American example is the Mexican Quetzalkoatl, the Feathered Snake, which, besides many further aspects, is related to weather and storm. In cosmogonic imagery, a giant snake surrounds the Earth. According to the Eddic tradition of Iceland, Thor will battle this Midgard Serpent at the end of the world. The Indian God Vishnu rested on the Naga ananta snake and while dreaming created the world. Mythical serpents frequently have additional attributes: they may have seven heads or the head of another animal or of a human being. Such mixed beings probably

were amalgamations of related concepts; for instance the giant snakes of the Namibian Brandberg paintings with the head of another local rain animal, the giraffe (2000–4000 years old). On the Celtic silver kettle found in Gundestrup, Denmark, the god Cernunnos is represented holding a big snake with a ram-head in his left hand. Closely related to the serpent is the dragon, an intensification of the gloomy aspects of snakes. It combines characteristics of crocodiles and further animals but first of all is imagined as a snake. St. Michael fought against “the great dragon, that ancient serpent” (Rev.

12:9). Viking ships had dragon heads at their bows to scare their enemies; the name of St. Olaf’s ship was, however, “urmr lange,” “long snake.” On the other hand, medieval depictions of the temptation of Eve might show the snake in the shape of a dragon, thereby stressing that it is not a natural snake that is purported but the symbolic associations, the imagery of Satan and evil.

From a contemporary point of view, man should not bruise the heads of all snakes. Some, like the python, are legally protected and the trade with their skin is prohibited.

Sexuality and Ecospirituality

The Earth is not only a living world but a sexual one as well, making love to itself through its diverse constituent parts from the autoerotica of single-cell beings to libertine bonobos to monogamous birds. There is an implied sexuality in the way mountain flowers attract the piercing beaks of hummingbirds, and the opening of hardened rock by probing river waters. It is perhaps this intercouring that weaves together so-called opposites into a single, contiguous whole: male and female, desert and rain. The cooing of mated rock doves and the cries of a mountain lion in heat, give voice to an imperative that is the very fuel of evolution.

The essential connection between humankind and nature was held to be self-evident, and holy, throughout most of our history and prehistory. It was a bond essential to our survival, and was therefore ritually celebrated, as evidenced from the carving of voluptuous “Venus” figurines by early *Homo sapiens* to the revels of Dionysus’ Greece and the phallic maypoles of ancient Britain. The eroticized Diana and Artemis find their counterpart in Pan, the lusting, hoofed god of nature and his American Southwest counterpart Kokopelli, the sexually nonambiguous “hump-backed flute player” found carved in rocks at ceremonial sites.

As I write this I am part of a society that tends to glamorize and commercialize sex, while different elements simultaneously suppress and pervert it. Contemporary civilized populations, regardless of the country, seem to be increasingly divorced from both the intimacies of nature and their own natural sexuality. Contributing factors may include the ascension of religions unnaturally denouncing sexual desires during the Middle Ages, the demographic shift from agrarian and frontier communities to urban centers that continued accelerating throughout the nineteenth century, and now the trend toward virtual reality (erotic video, internet “fantasy” rooms, etc.).

Some contemporary Pagans, practitioners of Tantra and students of the Goddess movement, believe that sexual ecstasy (from the Greek *ekstasis*: to be taken beyond the narrowly defined self) can lead them beyond the fears and preconceptions of the rational mind, and open them to the experience of the sacred. They see sacred sexuality as a means for healing the rift between humans and nature, between the hungry body and the fearful mind. More obviously, they believe, sexual experiences have the ability to reseat one back in present time, in the immediacy of life and the primacy of the sensual and emotional self. In this way, reclaiming a connection to one’s sexual being, and to this sexually enlivened Earth, may be seen as an element of both an environmental mission and spiritual assignment.

During the counterculture movement of the 1960s, sexuality was again celebrated, and at times, reconsecrated, even viewed as a sacrament. This was continued to a degree in the 1980s and 1990s by some adherents of deep ecology and ecospirituality. Like the global alternative movement the Rainbow Tribe, the radical environmental group Earth First! was known for its erotic exchanges, especially during the annual gettogether known as the “Round River Rendezvous.” In this context sexual sensibility and activity aided the suspension of conventional psychological, moral, and societal restraint, and often served the participants’ personal rewilding and sensory immersion in the body-nature.

Reacting to what they see as alienation from the Earth, harmful serial monogamy, prudery and sexual dysfunction, some social and environmental activists are experimenting with new forms of relationship. These include “polyamory,” a term coined by Morning Glory Zell in 1992 to describe being consciously, carnally involved with more than one other person at a time. “Polyfidelity” has since been used in print to refer to sexually exclusive groupings of three or more. In the literature on contemporary alternative sexuality, authors including Oberon RavenHeart regularly refer to recreating a more natural, natureoriented sexual dynamic as part of the process of ecological and interpersonal healing.

A correlation has been repeatedly made between the rape of women or boys and that taking-by-force we call environmental destruction, in texts as diverse as Derrick Jensen’s *The Culture of Make Believe* and Susan Griffin’s *Woman and Nature*. On the other hand, ecosopher (in other words, ecological philosopher) David Abram has written that a new environmental ethic will result from “a rejuvenation of our carnal, sensorial empathy with the living land that sustains us,” and that it is only through “our direct, sensory interactions with the land around us that we can appropriately notice and respond to the immediate needs of the living world.” Author Terry Tempest Williams has called for an “erotics of place,” a purposeful interpenetration of the sensate landscape, as have I. In our own ways we have asserted that a deep sensual and spiritual intimacy with a specific area of land is the cure for both psychological estrangement and the desecration of the natural world.

Sexuality and Green Consciousness

The confluence of religion, sexuality, and nature is virtually universal though diverse. Ecofeminist theory contends that the shape this confluence assumes under the dominant patriarchal and monotheistic mode is at the heart of the environmental crisis. Here I will explore this argument and outline an alternative “Green consciousness,” spirituality and cosmology – in the sense of the ‘green’ put forth by the twelfth-century revolutionary mystic Hildegard of Bingen – the elemental, implicitly sexual, and divine source energy of life, causing action, fructification, flowering, growth, creativity, healing, and moistness. Green consciousness resists the linked degradations of sex, women, racialized and/or sexualized others, animals, and elemental nature and puts forth an *earthy*, that is, an explicitly sexual, deliberately dirty and immodest spirituality.

Environmental perspectives have emerged from all major religions. Yet, arguably, their hegemonic beliefs support environmental abuse, beginning with the notion of the all-powerful, immutable, human-identified and celibate male god, “The Omnipotent” in Roman Catholic terminology. This notion not only legitimates the dominion of those who claim to be his representatives, but fragments underlying unities. In the social version of this theology, an omnipotent “master” is placed on top, with degraded “others” defined by their supposedly negative qualities, forming a succession of oppositional and hierarchical dualisms including: male/female, culture/nature, light/dark, rationality/desire, civilization/savagery, high/ low, spirituality/sexuality, thought/feelings, work/sensuality, immutability/change.

The “master” denies and represses the second part of the dualism, projecting these attributes onto “others” – the wild, animals, tribal peoples, women, lesbians and gays, a working class, a racialized people, and denies his dependency on those he strives to subordinate (e.g., wives, slaves, nature) (Plumwood 1993: 41–8). “He” (this is a masculine subjectivity but the role can be played by women) demonizes and even seeks to destroy those “others” who evoke in him simultaneous feelings of recognition and alienation, desire and fear, worship and hatred. This pattern underlies racial and sexual slaveries, heterosexual normativity, imperialism, and environmental devastation.

Fear – of “nature” and its inherent commonality, diversity, and flux, experienced externally but also internally in the body, particularly through experiences of sex and death – is one cause of this projection. A master consciousness only feels comfortable in monocultures (sexual, religious, ethnic, biological). The ideal human environment becomes a sterile one, dominated by plastic, concrete, steel. The ideal human becomes one made in the image of the artifact or machine.

Though Old Testament-based religions (Christianity, Judaism, and Islam) sometimes celebrate nature as reflecting the divinity of God, nature is not generally understood as itself divine, or even intelligent and active. In Genesis, humanity is granted dominion over nature, man is granted dominion over women and animals. God is transcendent over, not immanent in the world. As nature is degraded, reason must rule over desire, and those aspects of human beings that seem the most natural, our sexual organs, become a locus of shame, seen as “dirty” (like the Earth), hairy, smelly, instinctual (like animals) and wild, not susceptible to will and reason (something that particularly riled St. Augustine). Characteristically, the elite stigmatize the oppressed as more sexual and animalistic than they. Womankind is viewed as the incarnation of sexual desire and disorder and in need of subordination. For much science and many religions, animals are no longer magical, numinous and divine, but soulless and inferior. Of course, in Hinduism as well as many indigenous religions human beings have no special authority over creatures, but, rather, ethical obligations to them.

Writing from a Native American and gynocentric perspective, essayist, poet and novelist Paula Gunn Allen cautions: “A society based on body hate destroys itself and causes harm to all of Grandmother’s grandchildren” (1990: 53). Loathing of the body and attendant sexnegativity also cuts us off from knowledges and revelations otherwise inaccessible. Mircea Eliade understands that sexuality’s “primary and perhaps supreme valency is the cosmological function . . . [E]xcept in the modern world, sexuality has everywhere and always been a hierophany, and the sexual act an integral action (therefore also a means of knowledge)” (1969: 14). For example, in the Tantric tradition bodily desire, pleasure, and sexuality lead to enlightenment.

One of the knowledges that sexuality can bring is a loss of ego and a sense of communion. In many religious traditions, nature – the vast forces and beings not made by humans and outside of our control – is the divine transforming other with whom we connect, paradigmatically sexually. The *hieros gamos*, Greek for “sacred marriage” or “sacred sexual intercourse,” refers to a ritual sexual union between deities, an interchange with parallels in such cosmic meetings as sky and Earth, north and south. The *hieros gamos* also can happen between a divinity and a human. In Sovereignty Goddess stories from pre-Christian Ireland, an ugly hag guarding a well requests sexual intercourse from a group of brothers. Only one accepts her invitation. As they copulate, she transforms into a fertile beauty and bestows upon him blessings and the right to rule. In the sacred stories of Southwestern American Indians, wilderness is associated with sexuality and embodied in a spirit being (female or male) who seduces a human into sexual interaction. This intercourse is understood as directing the awesome power and energy of our human sexuality – the preserve of wilderness in human beings – into socially useful channels. The coming together of person and spirit may lead to the birth of magical children, the discovery of rich sources of food or water, or the gift of a specific ceremony (Smith 1987: 178).

Such stories recall the Garden of Eden tale and suggest the need for a positive reevaluation of Eve’s interchange with the Old Serpent.

Contemporary feminist thinkers reclaim orgasm as a conduit to knowledge of the sacred. Mary Pellauer writes that orgasm allows her to melt into existence [as] it melts into me. I am most fully embodied in this explosion of nerves and also broken open into the cosmos. I am rent open; I am cleaved/joined not only to my partner, but to everything, everything-as-my-beloved (or vice versa), who has also become me (1994: 156).

Beverly Clack sensibly realizes that this account is of “particular importance to a world facing an ecological disaster which has arisen precisely through human unwillingness to be identified with the natural world” (2000: 129).

Mary Daly’s “elemental philosophy” is based in an identification with the natural world and elemental spirits. In her view, a continuing patriarchal warfare against elemental spirits takes modern forms in technological depredations (e.g., nuclear weapons threaten the final burning of the Earth anticipated in the gospel of Peter). Daly recognizes elementals as “spirits, angels, and demons . . . manifesting the essential unity and intelligence of spirit/ matter” (1984: 11).

Pagans and or/tribal people generally respect nonhuman “persons” (including animals, plants, waters, the sun, moon and stars and even objects) as well as *daemons* (energies animating elemental phenomena). These beings

– commonly known as gnomes, fairies, trolls, nymphs, and so on – are neither phantasmal nor “supernatural” but an intrinsic part of nature who interrelate with and influence human life (sometimes for good, sometimes for bad) and to whom humans have obligations. In patriarchal religious traditions, daemons are seen as invariably wicked. In 1967 Lynn White called attention to the ecological benefit of animist systems: “By destroying pagan animism, Christianity made it possible to exploit nature in a mood of indifference to the feelings of natural objects” (1996: 189). However apt the criticism, White misses the intersection of sexuality into this meeting of religion and nature, for nature *daemons* along with sex/fecundity goddesses were associated particularly with the sin of lust. Worship of “filthy” *daemons* and “immodest” goddesses was deplored (as in Augustine) and “the celebration of fertility as a dimension of the sacred was identified in the Christian mind with obscenity and evil” (Power 1996: 53). Islam similarly linked goddesses of desire, fecundity, generation, and sexual reproduction with wicked demons. When Mohammed received a revelation naming three local goddesses as intercessors for humans with Allah, he soon attributed this revelation to Satan.

The pagan nature god with his horns, green and sometimes even grassy flesh, protruding tongue (as if in the midst of orgasm), and serpentine and goaty nature is recast as Satan. Misogyny, sex-loathing, demonization of the *daemons*, and nature-hating converged in the fifteenth-century religious/pornographic imagination of female witchcraft based in an insatiable “carnal lust” which led them to sexual trysts with Satan. Contemporary Wiccans affirm green values and celebrate sexuality as participation in the life-giving force of the goddess.

An early banner of the environmental movement is a photograph of the Earth as seen from space. “Love Your Mother” is the accompanying text. Historically, the image of the Earth as a nurturing mother has worked to forestall abuse of the Earth (Merchant 1980). The word “nature” is from the Latin word *nasci*, to be born. The soil of the Earth is understood as the goddess’s flesh; its depths or “bowels” her vulva/womb. Female deities represent the Earth and the teeming life of nature. *Yoni* symbols (shells, fruits, caves), the Milky Way, mountains, ocean, and fruitbearing trees also are seen as re-presenting the body of goddess. This divinity is understood sometimes as a mother but more frequently as a lover.

Masculine sacrality is understood through symbols of a fertilizing sky god, through fire and digging sticks, and through natural symbols (*lingam*), recalling the penis as generative. The basic processes of fructification in nature are understood as akin to human coitus, as the meeting of female soil with masculine heavens or the inverse (the Egyptian sky-goddess Nut and the male Earth Geb). Of course, a green sexual cosmology does not incorporate solely heterosexual and procreative meanings but recognizes homosexuality and gender diversity as utterly natural and necessary to cosmic processes. The biologist Bruce Bagemihl (1999) documents animal homosexuality and explores the ways that non-heterosexual and nonprocreative human and animal sexualities have been respected by many indigenous peoples for embodying exuberance, essential to forces of fertility. Sacred homosexual meetings also can be found in nature: In ancient Babylon the most powerful water for purification purposes was found where the mouths of the Tigris and Euphrates met (Johns 1926: 467). In Babylonian, Eliade tells us, the same word means both “source of a river” and “vagina” (1969: 41); the potent meeting of these sacred rivers at their source can be understood as a veritable Lesbian *hieros gamos*.

Currently, the greediest and ontologically neediest societies demand ever-greater infusions of oil, coal, nuclear power and resources from the rest of the world. Monica Sjöö and Barbara Mor find religious significance in the energy crisis: “The patriarchal West cannot solve its energy problems because our minds and spirits were long ago cut off from the real source of energy, or creative power . . . the sexual-spiritual source of cosmic ecstasy” (1991: 412). Desire is the force that is most akin to divine powers. In Sumerian myth, the “sex goddess” Inanna gives forth the “desire that generates the energy of the Universe.” This energy is known in Hindu cosmology as

Shakti, the feminine primordial energy, which is the substance of everything, pervading everything, vivifying everything. The manifestation of this power, this energy, is called nature (*Prakriti*). Humans participate in erotic energy through sexual desire as well as creativity, prophecy, intellection, political activism, growth, love, and transformation.

Religious traditions more ancient than the patriarchal often do not hold to a duality between man and woman or between person and nature. They often recognize a primal feminine principle, the inexhaustible source of fruitfulness or greenness, the cosmic matrix from which all are born and to which all return at death. This principle

– that of activity, diversity, and creativity exists “in nature and women, as well as men” (Shiva 1988: 48). Patriarchal cultures still recognize this feminine principle (e.g., as Mother Nature or Mother Earth), but degrade it. Ecofeminism finds important parallels between the conceptualizations and treatments of women, racialized groups, and the underclass and conceptualizations and treatments of the non-human world. “Mother Nature,” for example, is cast as the allforgiving dark mother or “mammy,” perpetually willing to provide unpaid service and clean-up after oppressive children; the sexual slave, forced and reproducing against her will; a nagging and even mad mother whose warnings and rages can be ignored. The Sovereignty/Earth Goddess becomes the pornographic object to be spread, surveyed, mapped and even snuffed. The Sex/Love Goddess becomes the whore to be had, the spicy/dark other to be eaten (Hooks 1992); the virgin to be raped, the slut to be used; the witch or *femme fatale* to be chastened; the exotic primitive to function as “unnamed presence of difference, body which awakens within a space of exotic fauna and flora,” upon whose flesh “the conqueror will write the body of the other and trace his own history” (deCerteau 1988: xxv).

Along with imperial conquest, scientific knowledge gravitates toward the language of sexual violation. Merchant traces the characteristic metaphors of the scientific revolution: mastering, interrogating, disrobing, and penetrating nature as a female form. The twentieth-century language of nuclear physicists similarly relied upon rapist images, seeing themselves as investigating the “most intimate properties of matter,” tearing away “the veils,” and so on. As that technology reached apocalyptic capacities, popular nuclear metaphors emerged centering on father–daughter incest and serial sex murder (Caputi 1993: 117–40).

Arguably, the colonization and exploitation of natural resources begins with the enslavement and exploitation of the erotic force. As H.A. Williams understands it, this mind/body split and subsequent enslavement of the genitals is at the root of environmental disaster:

Being in hell, the place of undead, they are always somehow planning and threatening their revenge, they may in the end catapult us into nuclear catastrophe . . . The body deprived of Eros inevitably becomes the champion of thanatos (1972: 33).

Williams, however astute, does not take into account the ways that patriarchal cultures construct men as violence objects, and women and those identified as feminine (including some men) as targets for that apocalyptic sexuality. Mary Daly describes this sexuality as “phallic lust,” the deadly dis-passion that prevails in patriarchy – the life-hating lechery that rapes and kills the objects of its obsession/aggression . . . dismembering spirit/ matter, attempting annihilation . . . Its goal is the obliteration of natural knowing and willing, of the deep purposefulness which philosophers have called final causality (1984: 2).

Its undoing can be found in the release of “Pure Lust,” the force of vigor and fertility in nature, the Green source of natural knowing: “pure Passion: unadulterated, absolute,

simple sheer striving for abundance of be-ing. It is unlimited, unlimiting desire/fire . . . intense longing/ craving for the cosmic concrescence that is creation” (Daly 1984: 3).

Many thinkers call for a renewal of an Earth-based religion. Roger Gottlieb outlines a spirituality based in deep ecology that emerges in resistance to environmental destruction, one that is both passionate and spiritually orientated, one that seeks mystical communion with the Earth and its many beings, and recognizes not dominion over but kinship with those beings. Of course, once we recognize environmental devastation as a form of sexualized violence, we must add to this project by calling for an explicitly sexual/animalistic/and elemental cosmology; in short, one that gets down, one that is *earthy*.

Green consciousness/cosmology celebrates erotic expressions based in sexual sovereignty (consensual and non-exploitative, based in the equality of lovers and a context of social justice), revels in our animal souls and our sexual flesh, both female and male. Carol Christ (1997:

91) has claimed that “In the language of the Goddess, the female body is an important metaphor for the creative powers of the earth body.” But what of the male body?

Currently, a distorted and objectified notion of the male body is the hidden metaphor for God (“The Omnipotent”). Peeking beneath the robes of the familiar fatherly and most high god (that is, the most removed from the Earth), we find him to be modeled upon a fragmented and fantastical organ – the phallus (a permanently erect/potent penis) – to signify supreme dominance. Of course, the phallus is not a true reflection of the male body. The real, fleshy penis is sometimes hard but more often soft. When the fantastical phallus becomes the metaphor for divine power, power becomes synonymous with weapon-like power over, separation and not connection. But when the actual penis, with capacities for both hardness and softness and its knowledge of and respect for receptivity, darkness, and quiescence, becomes a metaphor for sacred power, James Nelson argues, we arrive at a model of relational power, a “generative power, the power of an open energy system” (1994: 206).

In Lacanian psychoanalytic theory, the phallus represents power, authority, the ability to hold rational sway over desire, to control. It ordains individuation and separation from the mother, which we can understand not only as the actual mother, but also as the matrix, the source, the cosmic yoni, the mother/nature. Human separation from the matrix has produced some technological marvels and consumer goods, but also is responsible for ontological loneliness, alienation, an obsessive orientation toward sex, fear of death, and an appetite for destruction.

Rather than the phallic imaginary of omnipotence, green consciousness proposes *cunctipotence*. *Cunctipotence* is an archaic English word that means “all-powerful” (*Oxford English Dictionary*) and one that some linguists etymologically link to the ancient, but now “obscene” word *cunt*. The “cunt” is obscene to patriarchal religion most particularly because it recalls the outlawed feminine principle, the matrix and source of all life. The Sanskrit word for cunt is *yonī*, with various related meanings, including

“vagina, uterus, source, origin, spring, home.” *Yoni* is derived from *yu* (join, unite); *yon* is “what joins or unites.” A cunctipotent imaginary connects; it reattaches the disembodied phallus to the biological body, where it becomes the fulsome, relational penis. It recognizes the kinship, not the opposition, of the cunt and penis. Cunctipotence connects the genitals to the mind, the body to the land, and human to nonhuman being. The “*all-powerful*” defining cunctipotence bespeaks not “power over,” but participation in the interconnecting power of the all, the commonplace, the whole.

The Yoruban concept of *Aché* refers to “the power to make things happen, the breath that bestows life” (Monroe 1993: 127). *Aché* is power that “passes through us, is used by us, and must be replenished by ritualistic means” (Teish 1985: 63). Green consciousness recognizes that we must nurture the Earth, feed the green as it feeds us. We do this through prayer, creativity, exuberance, and desire, and through respecting the sacredness of our bodily processes including orgasm, eating, excretion, respiration and finally death. The patriarchal Christian tradition, spearheaded by Augustine, deems both sexual desire and death to be essentially “unnatural,” the consequences of original sin. Yet, life and death are “twin beings, gifts of our mother” (Allen 1990: 52). Through death we return to the matrix and become once again dirt/earth, a fate or purpose that green consciousness embraces.

The teleology of the religious condemnation of fertility/ desire/lust is a sterile world, marked by pornographic objectification, sensory deprivation, contamination, and extinction. Hildegard of Bingen knew that the “fertile Earth is symbolized by the sex organs, which display the power of generation as well as an indecent boldness” (Bingen 1987: 114). Green consciousness reclaims what patriarchal morality has branded as indecent and boldly affirms the sacredness of lustful, safe, just, and sovereign eroticism, humanity’s kinship with the elemental world, and the divinity of nature.

Shakti

In the religions of the Indian sub-continent, shakti is a cosmological principle of power, the life-force of the universe, specifically denoting cosmic creation and divine procreation, and more generally any form of power or energy. The development of this concept is quite complicated, as it is found in a variety of philosophical, grammatical, mythological, and ritual texts beginning with the earliest literature. Shakti develops as the link between a cause and an effect, such as in the order sustained by the fire sacrifice; it is also conceived of as a dynamic force inherent in nature. Shakti comes to be seen as the female force that acts together with the male force to create and sustain the cosmos. Sometimes shakti is associated with the principle of materiality or nature (*prakriti*) in opposition to the male principle of pure consciousness (*purusha*). When personified, shakti is always embodied as a goddess: she is the consort of the male god who needs his shakti to act in the world, as in the interdependent pair Shiva–Shakti, wherein Shiva without Shakti is a *shava* or corpse. Shakti is also seen as the independent, supreme divinity, the complete Absolute, the ultimate source as well as the cause of creation, elaborated most explicitly in the literature of certain Hindu and Buddhist Tantric schools.

The highly influential sixth-century Sanskrit text the *Devi-Mahatmya* is the earliest exposition of the theology of the goddess as the Great Goddess, or *Devi*. In this text the Goddess, or Shakti, gathers up the powers of all the gods to kill the demons and protect the world. She is portrayed as the eternal, ultimate reality, the power that creates, maintains, and destroys the universe. She is greater than the male gods and beyond all attributes, but she is also embodied as the Goddess who responds to people and events in concrete, specific ways. Shakti is the basic material from which all creation is manifested, and the universe itself; she is also the active force present in all things, including human beings. It is widely held that women, because they are female like the Goddess, contain more shakti than men. Shakti is a power that can be increased, such as through devotion to a chosen deity.

In various versions of a central myth, a grief-stricken Shiva wanders the Earth with the dead body of his beloved wife on his shoulder, until the gods relieve him of his burden by dispersing pieces of the Goddess' body throughout India. In this system of *shakti pithas*, or places of power, certain geographical places enshrine parts of the body of Shakti, especially mountains, caves, rivers, and other bodies of water. People make pilgrimages to these sacred places, which are seen as *tirthas*, or “crossings” between the human and divine realms. In this way local goddess shrines are integrated into the body

of the Great Goddess, Shakti, and the Earth, particularly the Indian subcontinent, is unified as a repository of sacred power.

Shamanism – and Art

Shamanism is a complex construct. It is a religious approach of personal orientation and personal authority, or self-autonomy. In shamanic worldviews, the Earth is a place, a source of power, reality, and supra-reality above and below this ground of being. The Earth is itself sacralized. Shamanism is therefore “Earth-centered.” In this context, Earth, nature, and world are often used interchangeably.

Strictly speaking, shamans do not make art. They make the tools of their trade and they record the maps and imagery of their visions in various permanent or impermanent ways. Thus, the shaman makes masks (or directs others in the making of masks), drums and whistles (to obtain and control trance state), and clothing, containers, and other examples of material culture. The objects are all made for non-ordinary reasons and each object is in itself a container of sacred powers. The shaman also inscribes imagery on rocks, on skin, on wood, metals, shells, and other materials in public or hidden places. The imagery and the objects are all documents, maps, and facilitators of non-ordinary realities for the shaman and the shaman’s community.

In Australia today, one may find ancient images of *Wandjina*, the ancestral beings, upon rock walls. The images look as fresh as if they were painted only last month, which is quite possible. It is the practice of the Aboriginal peoples of Australia to repaint ceremoniously and correctly the ancient images of their Wandjina. Not only are their Ancestral Beings sacred and powerful, they are actually alive inside the paintings. The paintings are not representations; they are powers transfigured. What are the Wandjina doing inside those paintings? Perhaps, say the people, the Wandjina are resting from their primordial Dreamtime work.

Use of Visual Patterns

No typology yet exists for so-called “shamanic” art, nor is there likely to be one. The use of radiances, skeletal motifs, or polka dots (to indicate gateways) are not sure indicators of shamanic art. They are simply motifs. Symbolic context is required. For example, the motifs found in the art of the Tukano, a people of the Amazon forest, are very like the neurological visual patterns, or phosphenes, they see after the ritual ingestion of a local hallucinogenic substance. The meaning of these motifs, and the meaning of the visions is, however, culturally controlled and specific to the Tukano. The same phosphenes could be “seen” by nonTukanos ingesting the same drink, but the motifs would be essentially meaningless. Exhaustion, stress, hunger, pain, illness are

all well-known mundane sources of intense neurological visual patterns. “Seeing stars” is one thing, and it is another. Neither meaning excludes yet another meaning.

The heart of the shamanic experience is its originality and its personal authority. Its content is culture-bound only in that something is said or done about the experience. In order to understand the shamanic vision, then, one must use the cultural categories at hand. Each image is the mapped solution of a problem, a question asked. For example, the designs used on the *huilpil* – the embroidered blouses of the Mayan women – are owned by the woman who initially dreams the design. Huilpils made by copying the designs of another woman, even to preserve the design against tropic rot, are locally recognized as uninspired, unsuccessful work no matter how finely the garments have been stitched. The dream authenticates the art.

The Romanian historian Mircea Eliade ably described the shaman as a “specialist in the sacred . . . pre-eminently an ecstatic.” In a small-scale, traditional society the shaman is dancer, poet, artist, storyteller, healer – psychically and physically – and, perhaps most importantly, mediator. The shaman mediates – between this world and other worlds, between one person and another, between here and now, and then and what will be. The shaman’s talents are considerable and the responsibilities heavy.

As a “specialist in the sacred,” the shaman’s knowledge of sacred realities is not knowledge of a reality *out there*. The shaman’s sacred reality is better thought of as a hyperreality, or a supra-reality, even as a sur-reality. The sacred reality the shaman knows is a reality located in this world. It is an ecstatic experience of place, of nature, of realms of being – of an upper world and lower world. These worlds are always accessible from this world, this plane of reality. In the traditional societies where shamanism is found, afterlife beliefs do not predominate as they do in societies with belief systems emphasizing creator gods and stories of personal salvation.

Cosmological designs and function

The shaman’s moral task is one of rebalancing and harmonizing imbalances. To do this, the shaman uses controlled trance states in order to create a unitary way of seeing the world. The shaman knows any part of the world seen clearly, seen clearly enough, reveals the whole. Thus, the drum is often an important tool that the shaman will use to obtain a controlled trance state in order to travel to another hidden reality.

Among the Saami of northern Scandinavia, the shaman’s use of a drum to induce a trance state for both himself (or sometimes, among the Saami, *herself*) is well documented. Typically, the drum is painted with a centered sun motif and depicts a tripartite arrangement of the universe. The Saami do not worship the sun. Their cosmological universe is one with three levels. The figures on the shaman’s drum are a cognitive map reminding the shaman’s ego-soul which way to travel; in addition, the drum is inscribed in such a way that it can be used as a seasonal calendar. Thus, for

those observing the shaman's trance state, the drum's imagery interprets the time and place of the vision for the shaman's public.

The Haida nation of the northwestern coast of Canada value "coppers" as cognitive maps of the ego-soul's journeying. The coppers are, indeed, made of copper, can be quite large, are collected, and are publicly displayed as wealth. They appear to be shields of a sort, axially oriented. The coppers are interpreted as forms symbolizing the human being facing the sun, thus, the copper creates an axis joining three levels of the universe.

The hunting masks of the Inuit of the Bering Sea are renowned for their inventive, expressive character. Each one is a form first visualized by the shaman before it is translated into a carved mask under the supervision of the shaman, who also supervises the mask's ritual destruction after it has been danced. The masks are not carved in duplicate. They are, however, stylized according to local understanding. How else could the shaman's unique vision be communicated to the carver and the community? Thus, the use of holes, polka dots, and hoops on the masks is readily understood by members of the community to represent openings. The openings allow the shaman and food to flow between levels of the universe. The shaman has petitions to make to Tungh'ak. The shaman wants to be fed on behalf of the community. Tungh'ak must release the seafood through an opening.

The visionary experience of the shaman *always* includes the place upon which the shaman stands, the Earth. Often the sun's position matters, too. The Navaho world, for example, is bounded by four sacred mountains. In the sacred geography of the Navaho, the names of the mountains are known; it is not known which geological chunks of terrain carry the sacred names. It does not matter, either, because the world itself *is* known, and the world is home to the Navaho whose nation today is found in the American southwest.

Similarly, among the Saulteaux of north-central Saskatchewan, Canada, there was once a custom of erecting small wooden figures, called *Manitokanac*, on the prairie landscape. Not much is known about them, but it is obvious each of the particular placements serves to orient and center the otherwise endlessly flat landscape. One famous Saulteaux shaman explained, "they can make a home out of the world. This is their power."

On the whole there is little literature on the material culture of shamanism and less on the shaman as artist. The sad state of scholarship in this area is perhaps explicable only if we realize that few anthropologists have been trained in the analysis of material culture as visual documents and few art historians have been trained in cultural anthropology. The objects on display in museum exhibition cases are silent. The stories they once told to the shamans who fashioned them are unknown.

Shamanism – Ecuador

In Ecuador, the most common terms that people use to refer to local shamans are the Spanish words, *curandero*, meaning healer, or *brujo*, meaning witch. However, there are many other words, which vary according to ethnic group and language, which can also be used to describe traditional religious practitioners. A significant number of native Ecuadorians in the Amazon and Andes speak some dialect of Quichua and, accordingly, use the Quichua word, *yachaj*, for medicine person or religious specialist meaning “he who knows” derived from *yachana* “to know or learn.” Since Quichua has historically functioned as the primary indigenous trade language throughout highland and lowland Ecuador, we will employ *yachaj*, rather than “shaman,” as the general term to refer to native tradition’s specialists. Throughout Ecuador it is the *yachaj*’s responsibility to forge a network of alliances with the souls of the ancestors and the living forces of nature of the Sierra, Costa and Oriente regions on behalf of his or her home community.

Ecuador is a country characterized by extremes. Approximately the size of the state of Colorado, Ecuador is located on the western-most bulge of the South American continent and is divided into three distinct climactic regions – Costa, Sierra, and Oriente – by the Western and Eastern Andean Cordilleras. The tropical effects of the Equatorial belt, combined with extremes in altitude from sea level to the frozen peaks of the active volcanoes (which rise to 20,700 feet on Mt. Chimborazo), and radical variations in rainfall, result in an extraordinary multiplicity of plant and animal life. Across this rugged and varied country, highland and lowland indigenous ethnic groups have created overlapping religious responses to the diverse geographic realities that confront them. In each community it is the *yachaj*’s role to form crosscultural and cross-creatural alliances in order to attract or repel energies that support or impede the circulatory flow of natural resources in and out of their home place.

In the Sierra, *yachajs* may form primary alliances with the spirits of the living mountains known as *cerros* or *urcus*, living and dead *yachajs* throughout the country, and Catholic saints. The mountain usually courts the potential *yachaj*, drawing the person to bathe in springs, which act as eyes, mouths, or doors to the inner mountain world. Once inside the *cerro*, the *yachaj* encounters parallel cities filled with Andean plants, animals, and minerals along with the human dead and the unborn. His role as *yachaj* works to bridge his community on the outside with this world inside the mountain. All creatures are born out of the mountain and return to the mountain upon death. The *yachaj* draws on his alliance to the *cerro* in order to direct the flow of life-giving and life-taking energies. The *yachaj* persuades the mountain to feed

and care for its people properly by singing to it and feeding the mountain offerings of *chichi* (beer made from maize or manioc), cigarettes, rum, flowers, guinea pigs (*cuy*), and sometimes, llamas or sheep. If this relationship of exchange falls out of balance, the mountain may grow hungry, jealous or angry and may “eat” the people in landslides, earthquakes, or floods, through drowning or falling accidents, or may erode their energies through illness.

In order to draw the mountain energy toward his own community, the *yachaj* must secure the *cerro*'s attention away from rival *yachajs* and neighboring communities. Within this closed circulatory system of limited resources, *envidia*, or envy, becomes the primary cause of illness and misfortune as *yachajs* effectively attempt to wrest *suerte*, luck or energy, from one powerful person or place in order to redistribute it to another. The way that the *yachaj* accesses and then distributes these mountain energies determines whether he becomes known as a healing or killing *yachaj*: a *curandero* or a *brujo*.

The competitive relationship between *yachajs* can become deadly. Because of this, in the Oriente, *yachajs* must learn how to fend off spiritual darts – known to the Quichua as *biruti* and to the Shuara as *tsentsak* – which are sent by rival *yachajs*. He must know how to guide counterattacks and remove *biruti* or *tsentsak* from the bodies of his clients. In order to specialize in spiritual weaponry, *yachajs* from the Napo Runa in northeastern Ecuador go to “school” inside the Colaurcu hills, which they say are made up of many rooms. Inside the hills the *yachaj* chooses his *biruti*, his own personalized spiritual weapon that might be a *chonta* dart, razors, needles or syringes.

For the Napo Runa and the Canelos Quichua, a *yachaj*'s training also includes fasting, sexual abstinence and drinking *ayahuasca*, a bitter drink prepared from a hallucinogenic vine of the *banisteriopsis* genus. The *ayahuasca* enables the *yachaj* to journey into the spirit world where he engages the powerful *supai* or spirits of the mountain, rivers and forest. These may include *Amasanga*, the spirit master of all souls who appears as a black jaguar or *Sungui huarmi* (also known as *Yacu mama*), and water spirit woman who guides the *yachaj* through her fish-, dolphin and anaconda-filled world. Ranked according to the length of their training and the proven strength of their power, the *sinchi yachaj* works with many spirits and has the power to draw on their help at crucial moments. The most powerful *yachaj*, a *bancu*, literally the seat of spirits, has trained since childhood and has formed extensive alliances with mountain and river *supai* and with living and dead *yachajs* throughout the region.

Once a *yachaj* has established strong alliances with the spirits of his home place he may periodically leave home to fortify his power by training with neighboring *yachajs*. Alternately, he may travel to regional healing centers that emerge from clusters of renowned *yachajs* working in tandem with powerful natural sites. In the Sierra the most famous healing centers in the north include the Otavalo Runa near Imbabura Mountain and the Quito Runa near Carapungo on the outskirts of Quito; in the west, the Tsachila on the coastal Andean slopes near the city of Sto. Domingo de los Colorados; in the east, the Salasacas near the Volcano Tunghurahua, and in the far south, the Cañaris near

the city of Cuenca. In the Oriente powerful healers abound in the Native Amazonian communities of the Napo Runa, the Canelos Quichua, the Achuar, Shuar, Cofán, and Siona-Secoya, among others.

Yachajs who want to extend their power to others can exchange stones as a sign of their mutual alliance. Throughout Ecuador the *yachaj's herramientas*, or curing tools, include shaped stones, such as pre-Colombian axheads, or unusually formed stones or crystals that hold spiritual power. In the Sierra the stones form direct, metonymic links to specific mountains and, like a wedding ring, serve as iconic proof of the marriage between *yachaj* and mountain. As the basis of the *yachaj's mesa*, the stones serve as homing devices for the spirits traveling to assist the *yachaj* in curing sessions. In the wet decaying jungle of the Oriente, stones represent permanence and function as attractive homes for spirits and ancient souls. The Napo Runa refer to these stones as *rumi* that may project light or contain suggestive figures of horses or saints. The Canelos Quichua say that these stones are like living soldiers and that the *yachaj* “with his phalanx of animated shaman’s class stones is like the center of a military formation.”

An experienced *yachaj* possesses an extensive collection of these stones acquired in the course of his travels as gifts from other *yachajs*, the *cerros*, and various spirits (including Catholic saints). The initial acquisition of a stone can serve as a calling to the vocation. The number of stones in a *yachaj's* bundle offers concrete proof of the network of connections at his or her disposal. So too, the sudden loss of a stone signals the loss of the alliance that the stone represents and a drastic diminishing of the *yachaj's* power.

Shamanism – Neo

“Shamanic discourse” in North America made a decisive new step in the 1960s. Within the context of the so-called “New Age” movement, the figure of the shaman as a religious specialist became an indication of a new understanding in humanity’s relation to nature and the ability to access spiritual levels of reality. Shamanism was no longer regarded as a spiritual path limited only to “classical shamanic cultures.” Instead, the Western rationalistic and mechanistic attitude toward reality and nature was increasingly replaced by a holistic and animated one. This led to a “sacramental view of reality” in which shamanism, like Buddhism, became something considered available to everyone – even to those in urban contexts in which people are largely estranged from nature.

Both practitioners and scholars alike refer to this emergent phenomenon as “neo-shamanism,” to be differentiated from the revitalization of traditional shamanism that has taken place in countries like Mongolia, Tuva, or Korea. Despite its complexity, several characteristics are discernible:

1) With the seminal work of Carlos Castaneda, the popularization of academic knowledge became an important feature of neo-shamanism. Most major shamanic protagonists hold a degree in anthropology, which they try to combine with their spiritual practice outside academia (e.g., Michael Harner, Joan Halifax, Nevill Drury, Steven Foster, Jonathan Horwitz, Felicitas Goodman, Gala Naumova). Furthermore, this interaction between academic research and religious practice began to affect “classical, indigenous shamanism” inasmuch as native people could read ethnographic accounts and react to anthropological systematization.

2) Neo-shamanism is closely related to Western concepts of nature and religion. Although Euro-American conceptualizations of what we now call “shamanism” are indebted to Western discourses from the seventeenth century, new developments allowed for a new description of shamanism. Among these are the Deep Ecology movement, transpersonal psychology and so-called “New Age science.” While neo-shamans tend to refer to deep ecology as “spiritual ecology,” transpersonal psychology places emphasis on the “higher self” and altered states of consciousness. “New Age science” builds on earlier philosophy of nature themes such as holism, non-determinism and pantheism.

3) From both religious and sociological points of view, neo-shamanism often shares its concepts and practices with various neo-pagan groups. Much of the spiritual background of neo-shamanic ritual practice, including Wiccan chants and rituals of natural magic, have developed from Native American traditions, on the one hand, and from Celtic and other North European religions, on the other.

4) Neo-shamanism, in its more New Age emphasis, tends to deny the reality of intrinsically nefarious spirits. Jonathan Horwitz expresses a perspective similar to New Age when he proclaims that the spirits of cancer and AIDS might be encountered as revoltingly ugly, but are not evil and can be appealed to as respectable entities in the process of extrication. By contrast, in their environments of origin, shamanic practices tend to approach a spirit of illness as something to be killed and destroyed or at least boomeranged back for the destruction of its sender.

5) Neo-shamanism, in general, is oriented toward personal and spiritual empowerment among practitioners. It is less likely to be community-oriented and community-grounded than traditional shamanism.

6) Comparing neo-shamanism with indigenous shamanisms, we can note that in the former there is little attempt to master the spirits. In fact, the aim is to give power directly back to the people and thereby eliminate the specialist altogether. In Horwitz's explanation, the "new shamanism" is a spiritual discipline that enables one directly to contact and use the spiritual dimension of the universe – one which is based on the animistic understanding that everything that exists in the physical plane contains spirit power. But Horwitz prefers to see this process as a shamanic revival rather than as "neoshamanism." Still, he recognizes that there is much confusion of the peak experience as the goal rather than simply the doorway. Consequently, an important difference between traditional shamanism and neo-shamanism is the acceptance of negative realities by the former and its engagement in forms of spiritual warfare, and the denial of evil and the need to fight it rather than love and transform it by the latter.

Nevertheless, *vis-à-vis* contemporary Western paganism, the shared overlaps that do occur make it difficult to draw a clear line between neo-shamanism and other phenomena of contemporary nature-based spirituality. In this light, it might be more appropriate to speak of a neoshamanic field of discourse, in which definitions, identities and concepts are negotiated among different groups. People like Michael Harner describe shamanism as "technique" rather than religion; Wiccans, witches, or crystal therapists may refer to themselves as shamans because of this term's more positive connotation; Native Americans might attack neo-shamans as attempting to colonize indigenous culture. "Authenticity" becomes a major issue not only with respect to "indigenous wisdom" (can a "Caucasian" urbanite partake in a native spiritual tradition?), but also concerning academic authority (can specialists discriminate "real shamanism" from its "hybrid" forms, or can neo-shaman academics "know both sides," etc.?).

While different neo-shamanic groups may exhibit a detectable "family resemblance," it is possible – and perhaps advisable – to discern between both wider and narrower senses of neo-shamanism. For the latter, Carlos Castaneda's books served for many as a primary reference tool. Another major figure is Michael Harner who coined the term *core shamanism* and initiated the "Foundation for Shamanic Studies."

Shamanism – Neo (Eastern Europe)

Neo-shamanism has emerged since the early 1970s following the publication of Mircea Eliade's book on shamanism, a milestone that received either full anthropological and historical support or, on the contrary, outright rejection. Coupled with Carlos Castaneda's vision quest, the "archaic technique of ecstasy" has become the solid ground based on which many seekers and supporters all over the world have begun to rejoice and celebrate their newly found spirituality. Thus, it has much to do with New Spirituality and New Age religious phenomena connected to Eliade and Castaneda and a host of anthropological studies on the subject (P. Furst, A. Wallace, I.M. Lewis, and A. Hultkranz), but especially the work and activity of Michael Harner. The latter has been more influential than others by introducing the possibility of the collage of neo-shamanic practices to Eastern Europe – often emphasizing South American tribal worldviews and their close relationship to Eurasia – and initiating several individuals and small groups into the secrets of shamanic power.

Shamanism, however, is different from neoshamanism, for the latter term is reserved here for only those religious and psychic practices that are part of the New Age phenomena and may or may not trace their roots to classical shamanism. However, as many neo-shamanic practitioners argue, Eurasian tribal shamanism, its culturally diverse definitions notwithstanding, is a precursor of their art, a practice of syncretism revitalized by poets, painters, musicians and even scientists. This may be one of the reasons why the following terms are often evoked for neo-shamanism: urban shamanism or shamanizing, shamanic trancing, crosscultural shamanism, shamanic spirituality, world shamanism, and even techno or cybershamanism. It also freely combines regional or cultural aspects such as Celtic, Norse, Berserk, Siberian, Amazonian, and European. (Berserk is a regional form of present-day shamanism that utilizes archaic Nordic techniques, especially trancing, that is connected to nature and wildlife preservation.) Interestingly, the scholarly world has also responded to this challenge: European witches (Carlo Ginzburg's *benandanti* for instance), ancient Greek magicians, werewolves and positive vampires are also known to possess shamanic attributes.

Neo-shamanism in Eastern Europe

In Eastern Europe, neo-shamanistic phenomena may be connected to the collapse of the Iron Curtain, and with it, the dismantling of Soviet domination throughout the former East bloc. This was followed by an instant reemergence of religiosity along with new forms of spirituality. It should be mentioned, however, that in certain instances rural practices, with some shamanistic elements, managed to survive Soviet atheistic ideology. Soviet atheistic Marxist-Leninist ideology, aside from a few state religions, did not tolerate overt religiosity or communitarian church affairs. In the vacuum created by the dismantled state institutions, religions emerged with vehemence. From North Asia and Siberia, to East Central Europe, from the Baltic republics, to the Balkan Peninsula, traditional folkways have been utilized to establish cultural continuity and national preeminence. Coupled with the neoshamanic world are national myths of Pan-Slavic unity, the pagan-Slavdom, the remembrance of prehistoric empires and ruling dynasties (Dacians for Romanians, Scythians for Hungarians), and homogeneous peasant traditions that bespeak of cultural longevity and the existence of an ancestral terrain that are all coupled with elements from nationalist imagery.

Although neo-shamanism varies from country to country – and Siberia and parts of Russia are especially unique in that there is a conscious attempt to rely on previous (i.e., traditional tribal, shamanic practices – there is a fairly homogeneous ideology and symbolism. In Hungary, Romania and Bulgaria, for instance, historical and folkloric sources serve as sources of inspiration. More often than not, neo-shamanic séances are not so much recreated as imagined and created by the practitioners. Often, late nineteenth and early twentieth-century folkloric elements (songs, dance steps, pieces of clothing, etc.) are utilized as substitutes to create “authentic” versions of native shamanistic performances. Yet, the core doctrine holds that nature is sacred and that shamanism must create harmony with nature, people and the universe. Moreover, neo-shamanic believers do not negate other religions and gods, but seek to find common elements for unity. In their practices they often use the water from natural springs, ignite sacred fires, and drink libations made of herbs and medicinal plants; they also locate sacred groves and previously utilized religious sites for their shamanizing rituals.

In Lithuania, for instance, the remaking of Lithuanian identity is oriented toward neo-paganism – *Romuva* as it is called – with its re-creation of pre-Christian rituals and faith. In Hungary, a former electronic engineer has registered his own shamanic church and school (Táltos iskola), an educational camp where one can gain first-hand knowledge of holistic healing, fortune telling, and supernatural phenomena. Such formal schooling is also coupled with the explanation of an alternative national history not readily taught in formal schools. Compulsory state education, for instance, does not allow for alternative views of ancient history, an area the neo-shamanic practitioners take for granted. For instance, the Scythian and Hunnish archeological remains and historical sources are viewed as direct evidences of Hungarian connections. Novices are required to pass through several stages, or levels, to advance in their spiritual training.

Folklore, songs, and knowledge of Hungarian peasant art, runic writing and history are essential constituents of the shamanic training.

In post-Soviet Siberia, new shamans emerge among the elites, mostly those with university and college education, bringing back long-lost spirituality, lifeways and practices. Among the Buryat-Mongols a specific shamanistic institution (the Golomt Center for Shamanist Studies) serves this quest; in Tuva and Udmurtia, practicing shamans are commonly featured in local media. In SakhaYakutia, artists openly declare their shamanic family heritage or their quest to attain shamanic powers. Well-known Siberian artists with shamanic powers are often featured attractions in European festivals and artistic shows. The Sakha (Yakut) dancing and singing ensemble, known as Katylyk, or alternately the Udmurt (Votiak) artist Olga Alexandrova, performing in various Hungarian, Baltic or Western cities, provide not only a lively context to connect neo-shamanism to its traditional precursor, but also reinvigorate interest in shamanistic consciousness and knowledge. Because of the linguistic connection to the Finno-Ugric peoples and languages, Siberian artists and performing groups – Hanty, Mansy, Mari and Udmurt – are frequently featured events in Hungary.

No other explanation serves better the fundamental connection that exists between neo-shamanism and the natural environment than the Buryat Mongolian credo quoted on the Buryat homepage:

From the traditional Buryat point of view, the world is not a dead place, but vibrantly alive with spirits and souls in every thing and in every place, also that all animals and plants have sentient souls much like ourselves. For that reason respect for the spirits of nature and living things shaped a religion and life ethics that minimizes negative impact on the earth. For that reason also, for the many thousands of years that man has lived in Siberia there was minimal negative impact on the environment until the current time. This is a way of life which is radically different from that of European peoples, whose philosophy considers most of the world to be lacking sentience and useful only for exploitation ([http:// www.buryatmongol.com](http://www.buryatmongol.com)).

In this sense traditional and late twentieth and early twenty-first-century shamans are wholly similar. They see, as well as reveal, the fundamental unity of nature and culture. Neo-shamanism differs fundamentally, however, from classical (tribal and prehistoric) shamanism in that it is anchored not to a single culture, people or time and space. It can be found today in milieus where it never existed before; it can possess complexes that never have been previously utilized. Another major difference is the social environment from which novices are selected and into which they are initiated. A collage of symbolic paraphernalia is also symptomatic of neo-shamanists. Urban shamans often use incantations with no real songs or words. As the claim goes, the feeling, rhythm and spirituality are what matters. Rock musicians, however, often invoke images and texts imitating tribal lore or those that are considered by them to be shamanistic. Similarly, in dancing – which could reflect some borrowed steps and figures from tribal dances – connection to indigenous dance forms is neither a requirement nor an important aspect. The neo-shamanic world borrows elements

from European folkways, mysticism, Buddhism, JudeoChristian beliefs, Yoga, Wicca, Daoism, the occult and Paganism. However, as neo-shamanic intellectuals themselves argue, these religious ways could also trace their roots to the more archaic shamanism(s). Neo-shamanists are also concerned with present-day affairs. Specifically, to them all current evils – breakdown of societal values, unbridled capitalism, industrialization and modernization, pollution and the degradation of the natural environment, consumerism, Westernization, poverty, crime, and loss of morals as well as peaceful existence – must be fought with new spiritual strength and vigor. This is based on “traditional values,” love of nature and animals, and a holistic way of living. In the neo-shamanic worldview, practitioners find both explanations for the past and solutions for the present ills of the world.

As practiced in Eastern Europe, neo-shamanistic belief is mildly anarchist. It is predicated upon the belief that the post-communist and postmodern era is fraught with increasing injustices and inequalities. Their worldview is both liberal and communitarian in that it places the individual – the shaman with powers – at the center to assist the community and work for its welfare. Believers also claim that the present world is out of balance; there is no central harmony any more and political regimes and states are natural enemies of groups with alternative views and marginal positions in society. Neo-shamanic ideology is also based on utopian consciousness for it argues that the present-day realities are harsher than ever before and that paradise on Earth can only be experienced, or achieved, in a magical world of our own creation. Consequently, the neo-shamanic constitutes a cultic milieu that readily accepts magic, science and half-belief at its base.

Regardless of the claims to authenticity, the specific features of neo-shamanism include four important components: 1) spirit mediation or communication to reach the desired aims; 2) healing and initiation rites to conduct various services; 3) the healthy symbiosis between nature and the biosphere; and 4) a culture of rejuvenation that concerns both the individual, the collective, and the Earth. Neo-shamanistic belief is separated from its more archaic form by the very fact that neo-shamanic rituals are now everyday occurrences that do not necessarily require sacred sites, secrecy of affairs or blood-letting through animal sacrifice. In fact, most neo-shamanic rites avoid “hurting the natural world.” Neo-shamanists in Eastern Europe may perform in artistic clubs, university surroundings, corporate offices or urban tenement houses. Neoshamanic religion is also highly diffuse so it may be extended into rural revitalized neo-pagan events, healing rites and syncretic nationalist revival movements. In its more extreme forms neo-shamanic ways may be utilized for nationalistic or political propaganda. Aside from Western and Northern Europe, in the Ukraine, Russia, and Hungary such extremist versions have been recorded recently.

Shamanism – Southern Peruvian Andes

In the southern Peruvian Andes, at an average height of 4500 meters above the sea, live small groups of shepherds who raise large herds of alpacas (*Llama pacos*), llamas (*Llama glama*) and sheep. Their traditional religious life is centered on the charismatic figure of the *altomisayoq*, a practitioner who plays the role of a mediator between humans and supernatural beings, and is capable of influencing the course of events. Generally speaking, he may be called, according to anthropological categorization, a shaman.

There appears to be several popular religions rather than a unique and distinctive one in these traditional societies. Depending on the informant, or on the circumstances, one can be referred to one cosmology or another in order to explain natural or social phenomena. Beyond Christian and syncretic explanations (such as for instance the myth of the “three ages of humanity”), lies a coherent group of beliefs, centered on the spirits of mountains, called *apu*. According to the people, these *apu* are the genuine “creators” of the Andean world. Many myths explain the way fauna and flora species were “created” and scattered in the valleys by the *apu*. Mountains are natural borderlines in the Andean space, and species distribution may be different according to valley geographical features. *Apu* control, in the day-to-day life, natural and social phenomena – they are godfathers of recently born children, and a myth says they taught women the art of weaving. Thus, *apu* are the ultimate explanation of natural and social features, and, at the same time, they are part of this world. The “creators” fully belong to their “creation.” Within this immanence, shamanic dialogue is possible.

Apu, though, are not the only spiritual entities in this cosmological view: they are rather situated at the top of a hierarchy of spirits, which do not hold any supernatural power by themselves. Generally speaking, traditional Andean shepherds consider that everything in the world owns an *animo*. The word *animo* itself is derived from the Latin “*animus*,” which came to their ears through Spanish colonization, but it has a much broader meaning. *Animo* apparently refers to both the vital strength and what we could call the essence of all beings, whether they are humans, animals, vegetables, or even minerals. Each being has a different, particular, *animo*, which is also related to the *apu*, whose *animo* stand at the top of the hierarchy. The term *animo* reflects, therefore, the interdependency of all beings, as well as their specificity.

In order for these societies to communicate with the *apu* and other supernatural beings, an intermediate is needed. This is the role of the *altomisayoq*, who appears to

be mainly a priest, a medicine man and a fortune teller. He directs collective propitiatory ceremonies, offered up to the *apu* or the *pachamama*, the goddess-earth, cures sicknesses and tells the future. Although he can communicate with all beings, natural or supernatural, through their *animo*, his interlocutor is, above all, the *apu*. In order to become a shaman, one needs to be selected by one *apu*, and survive a strike by lightning. Novices then go through a long process of initiation, conducted by elder shamans. At one point of this initiation period, they often find, in wild places, the tools of their trade, like small copper bells, which they use to call the *apu*, or strange anthropomorphic or zoomorphic stones, full of supernatural powers. These are gifts of the *apu* itself. Apprentices learn the healing powers of plants, and conjuring tricks. This initiation process culminates with the ritual bath in a *qocha* (a mountain lake), where the shaman-to-be calls his tutelary *apu*, who answers in a guttural voice that seems to come straight out of the mountain's heart. Therefore, the shaman's legitimacy eventually relies on the will of the *apu*.

Direct communication with supernatural beings is scarcely deemed necessary. Collective propitiatory ceremonies do not need such communication powers and can be directed by a *pampamisayoq* (a practitioner of an inferior rank). The same stands for fortune telling, which many perform by observing the features and distribution of coca leaves, poured over a small patch of *wachala*, a traditional piece of clothing. Even when it comes to healing, direct communication with supernatural beings such as *apu* or *soq'a machu* may not be considered compulsory: in that case, the healing treatment will consist of offerings to the spirits responsible for the disease as a means of appeasing them. The traditional healer, be he *altomisayoq* or *pampamisayoq*, brings together these offerings on a square cloth, ties it up from its angles, and burns this bundle, called a *despacho*, on some neighboring hill.

Nevertheless, in some cases, direct communication with spirits may be considered necessary. This communication is not the result of extrasensory perception faculties held by the shaman. On the contrary, the communication process always occurs in the world of day-to-day perception. Since spirits are part of this world as well, a conjunction between them and human beings is possible *here and now*. The *altomisayoq* are the only practitioners capable of such direct communication, because of the tools inherited from the *apu*. Shamanic communication flows from the *apu*, to the shaman. Shamans call for the *apu*, using, as a call sign, their small copper bells: thereafter, it is the *apu* which comes to answer the shaman's questions, in the form of a dove or condor, getting into the room through an open window, and then speaking freely, in a low-pitched or high-pitched voice. Those in attendance hear the sayings of the *apu* as clearly as the shaman does.

One can say traditional shepherd societies in the southern Peruvian Andes still share one coherent cosmology, centered on the *apu*, which for this reason we may call an *apu*-logy. It refers us to very ancient beliefs and practices. It determines the relationship that these societies still hold with natural phenomena, for the *apu* are ultimately responsible for the course of events in the natural world. For instance, the

good health of domestic animals depends on the will of the *apu*, and needs retribution in the form of a *despacho*.

Finally, one can say that part of this *apu*-logy is a sort of theory of knowledge (an epistemology in the broad sense), within which the shaman's performance is legitimate. We can shed light upon this theory of knowledge through a patient analysis of beliefs and religious practices of these societies.

Shamanism – Traditional

Shamanism is the art and science by which one purposely shifts perspective. There are different means by which perspective-shift is achieved (meditative/contemplative techniques, use of entheogens, abstinences, fasting, sleepdeprivation, other austerities, and/or utilizing an illness or fever), but the initial impulse is auto-induced rather than imposed upon the individual by others. Shamanism refers primarily to the techniques employed for achieving changes in consciousness – especially ecstatic consciousness – and secondarily to the body of religious thought and practice in which the personage of the shaman plays a central role.

The terms “shaman” and “shamanism” have increasingly developed into three fundamental applications. The first and most narrow understanding applies the designations to specific institutions among the Tungusic peoples of Siberia. This would be the original import of the terms. Secondly, the label of the “shaman” has become extended to practices among other peoples that reveal similar animistic or quasi-animistic understandings of nature – whether these peoples are indigenous (American Indian, African), national entities (Japan, Korea, Mongolia) or contemporary (New Age, modern Western Paganism). In this wider and more generally used sense, shamanism designates any religious system centered on “a religious specialist who has great powers derived from ecstatic experiences in which he or she has contact with sacred forces” (Smart 1989: 38). Consequently, the term “shaman” as a generic is applied alike to the North American “medicine person,” the Latin American *curandero*, the Japanese *miko* and the practitioner of Michael Harner’s “core” shamanism. Lastly, the expression of “shaman” has come to refer to various New Age and neo-pagan practices in general in which the individual seeks to shift his/her conscious perspective for purposes of health, deeper understanding, ecstasy and social concern – including increase in environmental sensitivities. Consequently, shamanism in the context of its relationship to religion and nature may be loosely classified as traditional, New Age, urban and psychonautic. As distinguishable sub-sets of traditional shamanisms, we have individual geographic expressions ranging from Ecuador, Alaska and Lapland to Nepal and Mongolia.

Possibly Immanuel Velikovsky was the first to use the term “shaman” in the more contemporary sense. The German *Schamane* had been adopted from the Russian *shaman* which, in turn, had been received from the Tungus-speaking peoples’ *s’aman*. However, the designation appears among the now-extinct Tocharian peoples of Central Asia as *s, ama⁻ne* as well as the Indian Prakrit vernacular as *saman, e*. These are to be traced to the Sanskrit term for “ascetic,” namely, *s’raman, ás*. In other words,

the term is not originally indigenous to the peoples to whom it retains its primary association.

Pivotal roles in the development of the West's understanding of shamanism have been played by the Russian Sergei M. Shirogokorov and the Romanian Mircea Eliade. Shirogokorov's seminal work is the *Psychomental Complex of the Tungus* (1935). Earlier, in 1923, he published his *General Theory of Shamanism among the Tungus*. Another important early work is Knud Rasmussen's *The Intellectual Culture of Iglulik Eskimos* (1929). Eliade's classic originally appeared as *Le Chamanisme et les techniques archaïques de l'extase* in 1951. This was subsequently translated by W.R. Trask in 1972 as *Shamanism: Archaic Techniques of Ecstasy*.

In Siberia, shamanic spiritualism is found among approximately thirty different ethnic groups – with the Yakuts being the largest numerically. The traditional economy is based on reindeer herding. The spirit of the immediate location is believed to enter the stove. Here, with the lighting of the stove, the fire-spirit is offered the first mouthful of food. Recognized spirit places in Siberia include graves, umbilical markers (burial sites of umbilical cords), rivers and mountains. Most shamans were liquidated by the Soviet authorities, and today the resurgence of shamanist elements among the local people is facilitated more by ethnologists, film-makers and the like than by the few surviving traditional shamans in an area roughly the size of the Republic of India and holding a population of approximately one million.

There are countless variations between individual and particular tribal shamanic practices. Nevertheless, there are also certain universal features or patterns that allow it to be considered an identifiable and independent phenomenon in itself. Its basic idea appears to be the institutionalization of a socially recognized intermediary who liaisons between the world of pragmatic realities and the more subtle realm of spirit. From a religious perspective, shamanism is a loose federation of cosmologies. But it is always strictly contextual – relating to the religion and society in which it occurs. Yet despite its many forms and the variety of roles it serves, a certain range of cosmology, religion and society is recognizably conducive to belief in the shaman as someone who specializes in trance techniques during which (one of) his/her soul(s) leave(s) the shaman's body to enter the otherworld. Whether among indigenous peoples of Australia, Siberia, South America, Central and Southeast Asia, sub-Saharan Africa or elsewhere, there appears to be remarkable similarities between particular elements of shamanic mythologies and techniques.

In traditional shamanisms, the shaman's entire endeavor is shaped by his or her role *vis-à-vis* the community. Deliberately sending forth one's free-soul, exploring the spiritual realms of the otherworld, being beyond the boundaries of the norm and of normal behavior is, in a Western cultural context, to be mad, insane or schizoid. And in the indigenous understanding of soul-duality, if a person's dream-soul does not "return" to the waking body, the person's deranged state is a form of mental illness – one that invariably is followed by physical disability as well. For the ordinary person, soul-loss is considered an accident or misfortune. For the shaman, by contrast, the very propensity

for entering an altered state of consciousness is his or her trade. But it is still not the *raison d'être*. The purpose instead is the community welfare.

In navigating the dangers of the world of spirit, within the condition of an altered state of consciousness, even for the experienced shaman there is the risk of soul-loss. It is the very social function of the shaman that provides his or her way back to this world. Community service becomes the anchor that prevents the shaman from becoming permanently lost in the otherworld. So while the mediumship of the shaman is what allows a community an access to the spiritual without which there is the danger of collective madness, it is the community itself and the shaman's duty to serve it which provides the shamanic safeguard against the specialist becoming imprisoned perpetually in the world of purely analogical and magical effervescence. It is this aspect that is essential in all indigenous forms of shamanism.

Following Shirogokorov's seminal work in the 1930s, Russian scholars tend to associate shamanism with spiritual healing as its most salient feature. The West, by contrast, under the influence of Eliade, considers the key aspect of shamanism to be its "techniques of ecstasy." This last is more conducive to the wider application of the term to various magico-religious elements found among many non-literate peoples as well as in some world religions. Nevertheless, the healing aspect of the shamanic vision quest is virtually an inevitable feature all the same.

The shaman, therefore is someone who participates directly in spiritual dimensions in the roles of healer, diviner, clairvoyant and/or psychopomp. For example, the role of the Chinese traditional shaman, designated *wu*, whether male or female, is typically that of seer, healer and keeper of justice in Chinese villages in the context of the popular traditions and/or Daoism. In an induced trance state, the shaman is believed to leave the body and visit other worlds. The purpose of shamanic journeying, therefore, is to convey sacrifices to the gods, to escort the dead to their next destination, to acquire knowledge to heal illnesses, and to return with prophecies. The shaman's duty is both to instruct people on a proper course of action and to cause good things to happen. The shaman's overall function is to ensure, maintain and/or restore his/her people's proper relationship with the natural environment and with the spiritual realm as it manifests itself through that environment. The shaman may also bestow fetishes or sacred objects in the form of feathers, ritual rattles, special drums or ceremonial pipes. These, in turn, are venerated and employed to ensure harmony. Their pragmatic import is to assist their users to be mindful and vigilant concerning the preservation of holistic equilibrium.

The principal means of communicating with the spirit world by the shaman is through the utterance of special words and by rhythmically beating a sacred drum. With the help of healing spirits, the shaman is believed to overcome malignant powers. Shamanism only exists when communication between this world and the spirit world is not deemed to be possible on the part of ordinary persons. Since the shaman's role is one of intermediary, he or she is often found in cultures in which a high god is believed to have receded and become inactive in the affairs of this world. This relates to the "loss

of communication” mythology between human beings and spirits at the close of the primal era. In the void which ensues with the high god’s absence, numerous ancestor spirits and spirits of nature come to intervene, and it is these beings with whom the shaman becomes an adept in communicating and controlling.

In the traditional context, the would-be shaman responds to a call. In some cases, the profession is hereditary. Normally, however, there is a reluctance to assume the shamanic mantel. While he or she is often highly respected and revered, there is also great fear attached to the shaman who usually lives a relatively isolated life. At first, the candidate undergoes a powerful but spontaneous spiritual experience – one that generally coincides with sexual maturity. This is usually an illness, often mental, which is nevertheless an empowering experience. In many tribal societies, it is not uncommon for many people to suffer an episode of schizophrenic-type illness lasting perhaps six to nine months. Unlike in the West where the mentally ill are sequestered and institutionalized, in the indigenous environment, these people are comforted and integrated as much as is possible into the social framework. Most people eventually recover and assume normal lives thereafter. But those who are deemed to have extra insight and dream-capacity may instead be selected for shamanic training. When viewing contemporary Western forms of shamanism, it is important to keep in mind that traditional shamanic training is often a prolonged and difficult ordeal which, if the candidate succeeds, is followed by an initiation that incorporates themes of death, dismemberment and reconstitution.

Consequently, in the traditional context, there is almost invariably a discernible shamanic trajectory beginning with the call, crisis or initial illness and followed by the training and culminating in initiation and transformation. The shaman then acquires a “spirit-animal” or familiar, demonstrates the shamanic performance and experience of trance, and eventually returns or “re-incorporates” and dispenses knowledge. He or she may finally bequeath implements and information to apprentices. For Western neo-shamans, however, this trajectory is much less rigorous if it exists at all in the first place. While traditional shamans are often initially reluctant to assume the shamanic mantel, for neo-shamans the choice to pursue this path is almost invariably a personal and private preference. Moreover, this decision is rarely made in connection to a supportive social community but reflects the atomization of Western society. Much of the training is selftraining, though this can be augmented for some New Age shamans who participate in various eco-tourist opportunities and pursue occasional ecstatic experience through South American *curanderos* in the Amazonian rainforest or the mountains and jungles of Peru, Bolivia and Ecuador. For those who do not pursue this psychonautic route, there are the augmentative options of New Age workshops. However, among the more controversial issues to arise for Western would-be shamans is the question of appropriation of cultural property. Many Lakota Indians, for instance, condemn the theft of Amerindian artifacts (e.g., dream-catchers) and practices (e.g., participation in sweatlodge ceremonies) as threats to the identity and precarious survival of Native Americans.

Russian scholars have argued that the traditional shaman is an individual who suffers from certain nervous disorders or forms of hysteria – especially in the severe Arctic environment. Others see shamanism as the development of skill in epilepsy. The training and initiation that the shaman receives constitutes in effect a cure. For the traditional shaman, the distinctive feature becomes an ability to control ecstasy and enter trance at will. The shaman is deemed by his or her community to have achieved a great mastery of the natural and psychological dimensions. Typical signs of the traditional shaman's extraordinary superhuman powers include the ability to walk on red-hot coals or even swallow them, to remain unscathed by boiling water, to undergo physical mutilation – including the cutting open of their stomachs which then heal instantly – to release themselves from bonds, and to exercise kinesis.

Nevertheless, despite the various demonstrative signs of the shaman's abilities, it is the ability of certain individuals to communicate with spirits that is the core aspect of traditional shamanism. This feature is closely linked to hunter-gatherer societies and therefore probably of great antiquity. This near universality of shamanism allowed Ninian Smart to surmise that it is ancestral to both the magical or numinous (*bhakti*) and the contemplative or mystical (*dhyâna*) forms of most subsequent religious formation. For Smart, shamanism is an early phenomenon which stretches back deep into prehistory. The shaman is one who encounters numinous beings and the *mysterium tremendum*. He or she is also one who prepares for inner vision and the development of inward narrative through solitude and asceticism. Among its other offshoots are the practice of magic, the development of healing techniques and possibly the creation of epic and lyric poetry. Consequently, the shaman's traditional roles are those of healer-physician, psychopomp, animal-charmer, prophet, sacrificial priest, lawyer, mythologue, epic singer, and keeper of the tribal calendar.

Shamanism – Urban

Urban shamanism represents the practice of perspective shift within an urban environment and with the purpose of regaining a pantheistic perception. Varieties include New Age, new Pagan, techno-cyber, rave, psychonautic and environmental warrior forms. The underlying question for the urban shaman concerns locating or constructing the sacred from the profane and determining how and when objects and places become charged with holy power. In the urban context, the shaman attempts to implement what Max Weber referred to as the reenchantment of the world. Enchantment is magic, and the urban shaman endeavors either to re-see the world as innately sacred or, actively, to imbue the world with a ubiquitous magical spell. In a sense, urban shamanism represents the attempt to look at one's home turf as if a visiting foreigner.

All urban shamans, whether New Age or new Pagan, access or relate to at least some aspect of nature, the rural and/or the untamed wild, and their task then becomes one of extending the inherent enchantment of the natural to the urban, to see and feel the urban as also natural. The urban shaman may learn to view the teeming life of a metropolitan center as a municipal jungle, a human beehive or ant colony and/or a restructuring akin to the reshaping work of a beaver. In principle, the construction of human habitation differs little from avian fabrication of a nest or an animal's burrowing its shelter. But whereas the bird tends to install its nest *in* the tree, the human might create his/her home by *destroying* the living tree. Because of these extreme differences and the consequential environmental impact, the urban shaman attempts to develop vigilant consciousness and readdress the balance of natural production and formation, on the one hand, and the impinging costs of metropolitan transformation, on the other.

As with the traditional shaman, the urban counterpart is involved with a perpetual practice of divination in the form of interpreting by signs and wonders. The shaman may resort to such technologies of augury as reading the tarot, consulting the *I-Ching*, casting cowry shells or lots, constructing a horoscope or deciphering the supernatural as it presents itself in the intensely reshaped human environment of the city. Instead of the emblems and vehicles of the divine that are more readily found in the natural or rural setting, in "reading the spontaneous," the urban shaman may be forced to resort to the employment of icons from the cultural mythological register that adorn corporate/governmental buildings and public spaces. The miraculous is no less sought in the cosmopolitan locale than it is in the woodlands through the synchronistic and the unexpected and unpredictable coincidence.

Unlike the traditional shaman, the urban counterpart in today's metropolitan world is less apt to have a supportive community behind his or her practice. At best, today's

Western shaman may form confederative associations with other shamans in the pursuit of his trade. To remain a shaman, shamans form tribes rather than institutions. Nevertheless, even without conscious community support, the urban shaman seeks to serve his or her wider neighborhood through channeling or opening awareness of the numinous and by inseminating greater sensitivity to the need for sustainable holistic balance. The urban shaman is no less a guardian of the gateway, and in this function, he or she serves the wider community as an educator *par excellence*, one who leads others out from ignorance. While New Age or core-shamans may be more involved with personal growth and enlightenment, the Pagan shaman's principal concern lies instead in combating the "demons" of societal imprisonment, industrial pollution and environmental insensitivity. Even the psychonaut, while pursuing entheogenic and psychotropic changes in awareness, more often than not grounds this pursuit in holistic concern and the further aim of social reform. As with shamans worldwide, the contemporary urban shaman serves the wider community as a vehicle to wider perspectives and as an inspirer toward increased imagination for people in general. He/she also endeavors, in general, to remain sensitive to issues of appropriation. As Dan Noel argued, with its emphasis on the "imaginal" (as opposed both to the imaginary and to Jung's archetypal), the power and process of imagining becomes a workable way *not* to appropriate from other cultures.

In its more nuanced general sense, urban shamanism is to be distinguished from New Age neo-shamanic expressions ranging from the "Higher Self" orientation of Patricia Telesco, the adoptive Hawaiian shamanism of Serge Kahili King, the guided imagery of Michael Harner's "coreshamanism" and the "we must love the spirit of AIDS" approach of Jonathan Horwitz and/or the Native American transplantation of Leo Rutherford. The urban shaman is more independent and individualistic, unconcerned with "lineage" labels, less apt to employ New Age jargon, and more directly preoccupied with "earth-revelations" and "nature-connections" within the metropolitan environment. Practice tends to center on the "arts" of invisibility and flight as well as the cultivation of vigilance and service.

Urban shamanism is also intimately connected to the various forms of techno-shamanism (viz., rave trancedance, cyberspace ritual, online gender-swapping, technomysticism, multi-media/high-tech multi-sensory celebration, emergent artificial intelligence). In this sense, it is part of the growth in the West of noninstitutionalized, individually constructed varieties of spirituality or what Thomas Luckmann (1967) calls "invisible religion." For the techno-shaman, "the postmodern world of digital simulacra is [considered] ripe for the premodern skills of the witch and magician" (Davis 1998: 188). The indigenous understanding of a natural world infused with animistic forms of life has been transferred to the "alive" technological world of the metropolitan environment. This fundamental notion of the spontaneous *deus ex machina* or the emergent organism – whether biological or technological – is increasingly underpinned by explanations based on "complexity theory" being developed at such think-tanks as the Santa Fe Institute. Organisms of digital technology, such as computer viruses and

“bots,” suggest a technical world that lies steadily beyond human control as, in many essentials, does the natural world. The contemporary techno-shaman approaches such possibilities more often than not as akin to magical effervescence. The techno-shaman or technopagan, along with zippies (Zen Inspired Professional Pagans), cyber-crusties and techno-hippies tends to integrate shamanic and technical thought processes as ways to encounter and incorporate the spontaneous natural with the fruits of techno-urban development.

It is nevertheless important to keep in mind that the urban shaman invariably grounds his or her practice in the natural world – whether the rave’s conclusion with greeting the rising sun, whether the development of ecological awareness and recycling practice, or whether through timing according to lunar or other natural cycles. The urban shaman has become more often than not an eco-warrior in one form or another. He/she may participate in road protest movements, in campaigns to save woodlands and/or other natural sites, or in demonstrations against multi-national corporations and international agencies perceived as heedless contributors to environmental destruction. The emphasis in urban shamanism is no longer upon the healing aspect of traditional shamanism as it applies to individuals, it is instead upon healing as it pertains to a community as a whole. While individual curing still persists, the contemporary urban shaman is primarily concerned with healing the estrangement between his/her society and the natural environment.

Sheldrake, Rupert (1942–)

Biologist Rupert Sheldrake has become a famous author of “New Age science,” since he proposed his controversial theory of “morphogenetic fields” in the early 1980s. The “hypothesis of formative causation” postulates the existence of invisible organizing fields that are able to transmit information to seemingly independent parts of reality (e.g., to the genes of other members of the species on another continent). This is made possible by what Sheldrake terms “morphic resonance.” Although his theory has been refuted by the majority of empirical scientists, a set of independent experiments show it to be at least not improbable. Like Wolfgang Pauli’s doctrine of “synchronicity,” the concept of morphogenetic fields is able to explain phenomena that seem to be mysterious to traditional physics and biology. If the theory’s propositions were accepted, the consequences would totally change our view of nature and the cosmos. Therefore, Sheldrake elaborates a neovitalist, holistic theory that is empirical at the start and purely metaphysical in its implications. In the end, the universe for Sheldrake is a conscious and creative power, which brings forth morphogenetic fields. All single, yet resonating, entities take part in this cosmic “dance” of creativity, including the human mind.

As can easily be imagined, this proposition enthralled environmentalists and theorists of ecological concerns. First, it provides an explanation for the mutual dependency of all levels of nature; second, it places the human in a cosmos of encompassing energy and the vitality of cosmic intelligence; third, it appreciates all forms of life – humans, animals, and plants – as equally intelligent and therefore as carrying intrinsic value. All three conclusions are crucial elements of “deep ecology.”

Shepard, Paul (1925–1996)

Paul Shepard was an ecological thinker and father of the field of human ecology. Until his death in 1996, he was Avery Professor Emeritus of Human Ecology at Pitzer College and Claremont Graduate School in southern California. Shepard should be considered one of the most original thinkers in contemporary history insofar as his work explored the primordial relationships between being human in a more-than-human world of animals, plants, and insects. Shepard's work influences the thinking of deep ecologists, bioregionalists, wild-lands advocates, and environmental philosophers.

Shepard's exploration of the path toward a more intimate and compassionate treatment of the living world we inhabit can be found in his books *The Tender Carnivore and the Sacred Game*, *Thinking Animals*, *Nature and Madness*, *The Others: How Animals Made Us Human*, and his

final book *Coming Home to the Pleistocene*. In this last book Shepard wrote,

Everything I have written since [the early 1970s] was influenced by what I uncovered in my research on *The Tender Carnivore*: our perception of animals as the language of nature in *Thinking Animals* and *The Others*; the "natural" way of childrearing in *Nature and Madness*; and the bear as a dominant sacred animal connecting people ceremonially to the earth in *The Sacred Paw* (Shepard 1998: 2–3).

Shepard's work was founded on the theme of the bioecology of early and present-day hunter-gatherer societies, and the cultural dynamics, religious practice, and psychology of mythmaking, ceremonial dance and storytelling of tribal peoples. At one time, nature spoke and a detailed knowledge of place and ecology was passed on from generation to generation by oral tradition through myths – each myth of a particular place and a people frames human belief structures and religious practice in a context of ancestors and intergenerational communion. Human beings lived within a "sacred geography" of place and political understanding that consisted of a deep and shared vision of place, terrain, and the sacred plants, animals, and insects that are embedded in "a phenology of seasonal cycles." "During prehistory," Shepard believed, which is most of the time that humans have been on earth, the dead and their burial places were venerated and mythic ancestors were part of the living present, the dreamtime ones whose world was also the ground of present being. Ignore them as we will, they are with us still (1998: 8). array of mimetic dances, rituals, songs, ceremonies, and chants that celebrate the interdependence and relationship with others. For the many he influenced, Shepard provides the foundation for a new (old) way of interacting with the more-than-human world; his scholarship places human beings with nature as an equal participant. Nature is more than a mere simulation of industrial production, something

more than an “environment” to behold, being a wondrous world of interconnections that cannot be forgotten. For others more critical of Shepard’s work, the return or renewal of the hunterprimitive cultural identification and worldview is impossible, given our technological and scientific understandings of the world. Moreover, critics of Shepard’s central thesis believe that it is based on a form of ecological determinism, as if the natural laws of ecology and genetics are the sole determinants of our way of being in the world.

The influence of his ecological thinking continues to shape new ways of relating to the natural world and human beings. As Shepard put it,

In the face of predominant anthropocentric values, the vision of natural humankind seems eccentric, regressive, even perverse. Our idea of ourselves embedded in the context of the shibboleth of growth places us at odds with the notion of kinship with nature. When we grasp fully that the best expressions of our humanity were not invented by civilization but by cultures that preceded it, that the natural world is not only a set of constraints but of contexts within which we can more fully realize our dreams; we will be on the way to a long overdue reconciliation between opposites that are of our own making (1998: 5–6).

In examining the lifeways and ecological knowledge of tribal societies, Shepard informed us that the best expressions of our humanity can be found in the prehistorical

Further Reading

Michael Vincent McGinnis cultures that precede industrialization and globalization. We can recover a shared ecological identity, Shepard argued, if we recover the sense of wonder and delight that comes with being human in a greater circle of animals, plants and insects.

Shepard’s emphasis on the link to our more Pleistocene ecological roots has drawn a mixed response from intellectuals and philosophers. Shepard explored the foundation of human interaction with the natural world. His central thesis was that our relationship with the greater circle of animals, plants and insects – in short, the landscape – is a product of our shared genetic heritage, which has been formed by various religious, animistic, sacred, and institutional practices. Since the dawn of the Pleistocene period, being human has always been shaped by a shared ecology of identity, which is reflected in an

Shiva, Vandana (1952–)

A prominent Indian physicist turned environmental thinker and activist, Vandana Shiva criticizes the dominant Western model of science and development and details its social, ecological, economic, and political impacts. She claims that, since the Enlightenment, the sanctity of this model of scientific knowledge and economic development has replaced the sanctity of life. The current development paradigm, which Shiva refers to as “maldevelopment,” effects an epistemological colonization by denying the value of other traditions of knowledge. In contrast to the exclusion and exploitation of the anti-life “maldevelopment,” Shiva highlights the knowledge and productivity of indigenous people and Indian cosmology as sources of renewal and sustenance of life.

In *Staying Alive: Women, Ecology and Survival in India* (1988), Shiva details the difference between the goals of Western development and the productivity of Indian women. Western development treats nature and women as a resource to be used for the accumulation of capital; whereas women in sustenance economies share in partnership with nature, using their holistic and ecological knowledge for social benefits and sustenance needs.

The recovery of the feminine that Shiva recommends in *Staying Alive* includes both the knowledge inherent to women’s activities of producing life and providing sustenance and the productive feminine force of Indian cosmology. According to this cosmology, nature is an expression of a creative feminine principle (Shakti) and a masculine principle (Purusha). A dialectic of the two allows the creation and renewal of life. Maldevelopment “ruptures the co-operative unity of masculine and feminine” and renders nature and women as passive objects (1988: 6). According to Shiva, cosmological harmony provides a basis for ecological thought and action in India.

In her other writings, Shiva explores more fully the various forms of violence effected by Western science and technology. She argues in *The Violence of the Green Revolution: Ecological Degradation and Political Conflict in Punjab* (1989) that modern science and technology is the source of violence in politics and ethics. To dispute the assumption that science and technology inhabit an objective, value-free domain, Shiva details the connection between political instability and agricultural practices which deplete genetic diversity, soil fertility and water supplies.

Most recently, Shiva has explored the challenges of globalization and increasingly centralized agriculture and natural resource control. *Stolen Harvest: The Hijacking of the Global Food Supply* (2000) chronicles the effects on food production of seed patent laws and genetically engineered food. She sees the dwindling biodiversity in food production as a threat to a global food supply and as a means of further disen-

franchising indigenous people and the poor. Similarly, in *Water Wars: Privatization, Pollution, and Profit* (2002), Shiva argues that greater democratization of water and other natural resources is necessary to promote sustainability and to address the causes of inter-ethnic and inter-religious hostilities and violence.

Shiva frames the issues of globalization and natural resource rights within the context of Indian religious and spiritual traditions. Water, for example, is sacred in India. She explains in *Water Wars*, “[R]ivers are seen as extensions and partial manifestation of divine gods” and that Rigvedic cosmology associates the possibility of earthly life with the release of the heavenly waters of India, god of rain.

Some of her critics counter that globalization and technologically advanced agriculture can promote expanded economic opportunities for many of the world’s poor. Others believe her feminist religious ethics is grounded on an untenable view that women are inherently closer to nature than men. Nevertheless, she has become an influential and sought-after spokesperson for the international anti-globalization movement in particular, and for green politics in general. Her influence was recognized in 1993 when she was awarded the Right Livelihood Award, known by some as the Alternative Nobel Peace Prize. In addition to contributing regularly to the work of the International Forum on Globalization (formed and funded in part by activists with the San Francisco-based Foundation for Deep Ecology) she is the Director of the India-based Research Foundation for Science, Technology and Natural Resource Policy.

Shona Women and the Mutupo Principle

When the British entered the territory of present-day Zimbabwe around the turn of the nineteenth century, the Shona and Ndebele viewed and experienced the world through the Mutupo principle. The foundational basis for the Mutupo principle is the relationality of all of existence. The principle focuses on fostering the primary relationships between animals and humans, animals and the deity, humans and humans, nature and humans, deity and humans, women and men, the dead and the living. It attempts to enumerate and approximate the ideal mode of life, which assures a sustainable future for all of existence. In this worldview women and nature are prominent participants who are viewed as equals in all matters concerned with shaping the future destiny of a people. Shona praise poetry is an example of oral sacred literature deriving out of the Mutupo worldview. It shows that, at the turn of the nineteenth century, women were givers and receivers at every level of their society.

The relationship between the clan and its Mutupo is axiomatic in the Shona worldview. This relationship is not only understood as the vantage point from which one experiences and comes to know the world, but it is also the source of a moral code that governs the nature of relationships in existence. In its myth, the Mutupo principle creates a cosmology that is non-anthropocentric, but at the same time celebrates as unique the experience of being human, female, and male in the universe. To the Shona, the mention of one's Mutupo evokes sacral meaning. It resonates with every dimension of human experience, such as worship, security, justice, love, community life, romance, praise, dance, learning, motherhood, beauty, the living, the dead, and the yet-to-be-born.

The substance of Shona praise poetry is the recitation or celebration of an individual's commendable acts. Using classical, bold, flattering, metaphoric language, one's heroic acts are described. Designed to affirm and sanction the tenets of egalitarian relationships in human living, the giving and receiving of Shona praise poetry is not an exclusive male preserve/privilege. Neither is it only for the strong and powerful. In this tradition women are givers and receivers of praise poetry, so are the weak and the powerless. An overriding theme in this wisdom literature is that the web of life is sustained by a reciprocal balance of giving and receiving. Acts of self-giving became heroic acts, symbolizing beauty, truth, joy, freedom.

The function of praise poetry is not only social but also psychological. For Shona women the social function is critical in that it is an affirmation of gender equality in

the politics of bonding and solidarity. At the psychological level, praise poetry inspires and affirms the personal worth of the individual. The bold flattery and metaphorical language of Shona praise poetry celebrates commendable acts done by an individual for others. This exercise is also meant to invoke from deep within the individual an awareness of their potential and capacity to shape personal and communal destiny. Praise poetry places an individual's personal accomplishments and triumphs in a historical scheme of a people's destiny in the universe.

It is important to realize that the recitation of praise poetry does something to the poet and the receiver. Highly charged with diction, with powerful, startling metaphors, its effect is reciprocal. It confers status on both the individual who uses it and the one who receives it. It raises the individual to the level of the victor one celebrates. Praise poetry does not merely say something, it does something, psychologically and socially.

At the individual level it serves to build the self-esteem of its object, creating a sense of identity and worth in that person. Mutupo praise poetry is used to excite, delight and affirm. Shona women as agents shaping personal and communal destinies were subjects of this sacred literature. They were expected to give of self, as much as they expected to receive in the web of existence. Even in matters of intimacy, they celebrated the art of giving as they did of receiving. For example, excerpts from love praise poems for the Tembo Mazvimbakupa (Zebra/Lion) celebrate giving and receiving equally for both woman and man:

Hekani Matendera Maita VaMupanedende Zvaitwa Mupiyaniwa

Muuya wangu munakunaku Anenge muvsisivi wouchi Kagwedu kenya kana sarara
pasi Maita VaMuroro

Hakani VaNyemba, Mubvana wa Chivazve.

Well done Zebra!

Hail, you who gives permission.

Thank you, Your Highness, generous giver.

My deepest gratitude, to you the interlaced one, My elegant, exceedingly beautiful woman, Who is like distilled, liquid honey.

Even my little piece of juicy steak is surpassed! Thank you You Muroro,

Hail, you who belongs to the Nyemba Dynasty, You mother of my child, yet forever daughter of Chivazve clan.

Male Tembo Mazimbakupa

VaChipanegombe, mombe njuma, Mukanditi, "Siya amai, Tizoswera tichirezvana"

Nanhasi nyama tinongodya, Nehorwe zvoze zviripo, Uchi tinongotamba nahwo,
Maita Matendera.

You who give by the big ladle, you hornless bull, You invited me, "Leave your mother,

So that we can spend our days in each other's arms."

To this very day we are feasting on meat. Francolins we have aplenty.

As for honey, we are swimming in it.

You have performed wonderfully, Matendera. (Pongweni 1996: 126-34)

Mutupo praise poetry as a source among many encapsulates the Shona views on women in society. In this blueprint, women are to be givers and receivers at all levels of social experience. In this worldview all existing entities – women, men, nature, deity, animals – attain freedom and bliss through giving and receiving.

Shoshone (Western North America)

Western Shoshone territory extends from what is now northern Wyoming into eastern Nevada and central Idaho, part of the North American cultural area known as the Great Basin. Great Basin cultures were based on water, the most vital component in a primarily desert region. The traditional Western Shoshone were also a nomadic people acclimatized to this diverse environment, seasonally harvesting such foodstuffs as seeds, berries, roots, piñon nuts, and other plant foods growing at known locations. Group names were commonly derived from geographic features and especially predominant local food resources.

Bighorn sheep were the most important hoofed mammal in the economy. Hunters monitored bighorn movements to determine the best spots in which to construct hunting blinds. The Western Shoshone also hunted dove, mockingbird, sage hen, quail, waterfowl, and rabbits, another important source of food and fur harvested seasonally. Black-tailed jackrabbits were found throughout Western Shoshone territory; white-tailed rabbits were scarcer. Two species of cottontail were also taken, as well as pocket gophers and ground squirrels. Antelope were generally hunted by communal driving. The Western Shoshone hunted both antelope and rabbits in an alternating schedule, giving them time to recover. The drives were one of the few occasions during which large groups of people gathered for festivals. Festivals, which generally included the Round Dance, were held whenever food was abundant. Although primarily performed for pleasure, the Round Dance afforded opportunity for courtship and, in various localities, was thought to produce rain. During drives headmen, referred to as chiefs or directors, served only as long as their expertise was needed. To help with the drive a shaman could magically entice the animals along a V-shaped runway to the center of a corral constructed of brush, stone, and poles.

Western Shoshone spirituality is interwoven throughout their lives and culture. Their spirituality provides them with a direct link with the supernatural, and spiritual power is gained through visions and dreams. There are three kinds of Shoshone shamans: specialists who cure specific ailments; individuals whose powers only benefit themselves; and those with general curing ability. There are also two types of dreamed power: one involving a spirit helper, an animal or bird or natural object; another power acquired in dreams carried the ability to be expert in other conventional roles such as hunter, gatherer, warrior, etc.

Dr. Richard Stoffle has completed some of the best and most recent ethnography on Great Basin peoples that focuses on the principles underlying their cultures. A primary foundation of Western Shoshone culture is the concept of power, how it flows in the

world, and what humans should do to maintain a balance with it. Supernatural power is viewed as the best explanation for the cultural significance of all things, how these things relate to one another, and how they are intellectually integrated. The Western Shoshone employ the concept of a living universe, a universe that is alive in the same way that humans are alive. It has physically discrete elements as well as power. A few general statements can be made about power:

1) Power exists throughout the universe, but like differences in human strength, it varies in intensity from element to element.

2) Power varies in its uses; it determines what different elements can do.

3) Power is networked. Different elements are connected, disconnected, and reconnected in different ways, occurring largely at the will of the elements with the power.

4) Power derives from the moment of creation and permeates the universe like spiderwebs ramifying power relationships between humans and the environment into one spiritual conformity.

5) Power exists and can move between three levels of the universe: upper (where powerful anthropomorphic beings live); middle (where people now live); and lower, where monsters reside.

Power disperses through networks of relationships among the elements of the universe, including types of air, water, rocks, minerals, topographic features, plants, and animals. Each element and its types make their own relationships, much like people do and for similar reasons of purpose and attraction. Elements have different personalities, intensities, and relationships with people and other elements, relationships that resemble spiderwebs. At various points in the web power gathers, producing powerful places which humans recognize and employ in rituals. Power flows like water and often follows water, yet they two are not identical. Human intervention can alter these networks of power; thus, the Western Shoshone are very concerned about the proper uses of natural resources (elements) of their environments. Improper uses can result in loss of access to such resources. Therefore, the Western Shoshone believe they must establish respectful relations with their environment and its resources in order to survive and maintain the balance of the universe. Every Western Shoshone child is admonished to explain his or her actions before touching, picking, hunting, or otherwise disrupting the element's balance: "do not move a stone without asking its permission"; "a plant will not give medicine or nourishment unless you explain why it will be picked"; "animals killed without their permission will not give themselves to a hunter again"; "never speak loud on the mountain or throw rocks in the water"; and "think of why things are as they are before you change them for personal needs." Rituals accompany all changes in relations between humans and elements of the universe in order that an essential balance be preserved.

For the Western Shoshone the physical and spiritual interactions among people, places, and resources create a phenomenon which anthropologists now call the cultural landscape, an idea that people, through repeated interactions with their surroundings, develop images or ideas of the land and share an understanding of its form and content

that is transferred over generations. In the cultural landscape of the Great Basin of the Western Shoshone, power moved over the open deserts, along a web of waterways and connected the mountains to the sky and the depths of the Earth. Establishing and maintaining spiritual relationships between the elements in the Basin enabled the Western Shoshone to develop a nomadic lifestyle able to follow the waxing and waning of resources, to utilize their diverse landscape, and to maintain an essential balance of respect for the resources that enabled survival in a very challenging environment.

Siam's Forest Monasteries

Forest monasticism has been established in Siam, currently called Thailand, for at least eight centuries. According to the historical record, this tradition was transmitted from Sri Lanka in the thirteenth century. Since then the Siamese *Sangha* (monastic order) has been categorized into village dwelling (*gamavasi*) and forest dwelling (*araññavasi*). While the former were entrusted with the task of studying scriptures, the latter were concerned primarily with practicing meditation.

The tradition of forest monasticism can be traced back to the time of the Buddha, who regularly admonished the monks to live in seclusion and practice meditation for the sake of enlightenment. Many monks developed the custom of forest wandering and living in caves for intensive periods of practice. Although permanent monasteries were eventually established where monks could settle for long periods, many of them were built in the forests, far from the villages and towns. Over time, these forest dwellings developed into a distinct tradition, one quite different from village dwelling.

In forest monasteries, monks are expected to live austere and to observe the monastic code (*Vinaya*) strictly. Contact with the outer world is discouraged, except for daily alms rounds in nearby villages and occasional teachings, while periodic wandering in remote forests is an important part of the spiritual training of such monks. The forest is conducive to meditation practice because its solitude not only brings calmness to the mind but also helps develop insight into the profound nature of life and the world. According to the Buddha, the external nature or environment is inseparable from the inner nature of mind. Contemplating the true characteristics of the former can lead to the realization of the latter's true nature, and thus enlightenment.

Forest monasticism in Siam faded into obscurity 200 years ago for various reasons, including the attempt to rationalize Buddhism in response to modernity. It was not until the 1960s that forest monks drew the attention of and won respect from modern, urban, educated elites. This was due to the growth of the forest monk movement led by Ajaan Man Phurithatto (1870–1949). Throughout his monastic life Ajaan Man, along with his disciples, wandered extensively in the forests and penetrated into remote areas, many of which were never visited by Buddhist monks before. Many of his disciples later built forest monasteries in various parts of the country. With their strict practice and spiritual achievement, respect toward forest monks spread extensively through the villages, then into the cities and eventually even Bangkok.

Buddhadasa Bhikkhu (1906–1993) is another major contributor to the revival of Siamese forest monasticism. His monastery, Suan Mokkh, in the south of Thailand, has been a distinguished attempt to restore monasticism as practiced in the Buddha's

time when monks were close to nature, meditated amidst nature, and developed insight from nature. He also combined scripture study and social awareness with meditation practice, instead of the sole focus on meditation followed by most forest monks.

During the past few decades, forest monasteries have increased in number. They are frequented by people from all walks of life who come with different purposes ranging from practicing meditation to merit making and seeking amulets and sacred objects from the forest monks who are believed to possess supernormal powers.

Apart from their spiritual value, forest monasteries in Siam nowadays play a significant role in ecology. Amidst the widespread deforestation, forest monasteries are rare places where forests have been preserved. Many forest monks not only conserve forests in their own temples, but have also become leaders in protecting community forests in various parts of the country.

Sierra Club

Founded in 1892, largely through the labor of John Muir in order to protect the wildlands of California's Sierra Nevada Mountains, the Sierra Club has become a recognized name worldwide for its efforts in conservation. Though steering a course free of any formal religious affiliation, the organization has nonetheless been influenced in its decisions and bolstered by the strength of its founders' and members' religious perceptions, beliefs and identities.

It was Muir's mix of sacred metaphor, along with a perception of the aesthetic, spiritual and intrinsic value of wilderness, which served as a fundamental inspiration for the Club. The mountains were the "cathedral" that John Muir trafficked, and nature was forever his house of worship, as he described in *My First Summer in the Sierra* (1911): "In our best times everything turns into religion, all the world seems a church and the mountains altars" (Muir 1987: 250). His pilgrimages in the Sierra Nevada Mountains led him to champion their protection, for they were his place of revelation, where God became visible:

Every hidden cell is throbbing with music and life, every fibre thrilling like harp strings, while incense is ever flowing for the balsam bells and leaves. No wonder the hills and groves were God's first temples, and the more they are cut down and hewn into cathedrals and churches, the farther off and dimmer seems the Lord himself (Muir 1987: 146).

Remnants of Muir's Protestant upbringing are still evident in such passages and he continued to use metaphors borrowed from Christianity throughout his life. Recent scholarship, however, has found his religious beliefs had more affinity with pantheism, animism, and Daoism, although during his time, Muir's religious sentiments remained largely unknown, leading Stephen Fox to conclude:

Muir lived in a Christian society and wrote for a Christian readership. Not wishing to offend, he generally kept the precise nature of his religious ideas to himself, confining them to journals, letters, and private discussions (Fox 1981: 80).

This may help to explain why for Muir and later generations of the Sierra Club, the spirituality of the movement has been complicated and often obscure, perhaps especially to outsiders, more the subject of conversation around campfires during wilderness outings than in Club publications and position papers.

Muir was, of course, a fervent evangelist for what has been called the "out-of-doors gospel of wilderness." Attentive readers of his writings have long perceived something other than orthodox Christianity animating them. Muir trekked through what he called a "terrestrial eternity" in the California hills, urging those who shared his vision to join

him in proclaiming, not a kingdom in heaven, but a kingdom of Earth. For Muir, the sacred was woven into earthly life, and he expressed this famously in his metaphysics of interdependence:

When we try to pick out anything by itself we find that it is bound fast by a thousand invisible cords that cannot be broken to everything else in the universe. I fancy I can hear a heart beating in every crystal, in every grain of sand and see a wise plan in the making and shaping and placing of every one of them. All seems to be dancing to divine music . . . (John Muir Papers, University of the Pacific: Journal, 27 July 1869, in Fox 1981: 291).

This worldview was echoed a century later in *The Sierra Club: A Guide*:

The history of the Sierra Club is the history of an idea . . . Wild places are not just inconvenient parcels of land to be exploited for human use; they are

– along with humans themselves – integral parts of a universe in which everything is hitched to everything else. That was John Muir’s creed, and it is what we believe today (Carr and Foster 1989: 48).

While such metaphysics of interdependence have animated the Club for generations, its mission statement evolved with the times, along with new challenges and perceptions. The Sierra Club’s mission, as signaled in its incorporation documents, was: to explore, enjoy, and render accessible the mountain regions of the Pacific Coast; to publish authentic information concerning them [and] to enlist the support and cooperation of the people and the government in preserving the forests and other natural features of the Sierra Nevada Mountains (in Cohen 1988: 9).

At the time, the notions of “rendering accessible” and “preserving” worked in tandem, and the primary interest of the Club was to create and maintain national parks as “scenic resources” as opposed to economic properties. More importantly, the parks were to be sites of spiritual insight. As Muir once put it, “The clearest way into the Universe is through a forest wilderness” (Muir 1954: 312), and this sort of perception undergirds his and much of the Club’s subsequent spiritual epistemology: to hear the divine music, one must pilgrimage into wilderness.

The Sierra Club therefore became famous for its “outings” (also known as High Trips) – backcountry excursions into the stunning wilderness areas of California – trailblazing, mountaineering, and seeking direct communion with nature. The outings functioned not only to bind together the community of faith but also to evoke a reverence for wildlands and empower members to ethical action, namely, the defense of wild places. Indeed, for Muir, domestication of sheep, humans, and other animals was a form of desecration. When describing wild mountain sheep Muir glowed; but tamed sheep he dismissed as “hooved locusts.” Likewise, he passionately believed that the “the gross heathenism of civilization,” which destroys “nature, and poetry, and all that is spiritual,” could be purged from the body by “a good hard trip” (in Fox 1981: 13–14), for what both men and sheep need is “a little pure wildness” (in Oelschlaeger 1991: 200).

The outings thus offered not only adventure but also spiritual therapy for humans who had become spiritually impoverished by domesticated lives in oppressive, profane

cities. “Service trips” were later added to help clean up or restore wildlands desecrated by those who visited them without the proper wilderness reverence and ethics. Empowered by the wilderness, Muir and his progeny returned to the city and struggled to influence government land-management practices.

The Sierra Club’s first major public battle, led by Muir, involved plans to dam Hetch Hetchy valley in Yosemite National Park in order to provide water for the city of San Francisco. The United States Forest Service Chief, Gifford Pinchot, and other “progressive conservationists” favored the dam, which they considered a “wise use” of public land for the benefit of all. Muir viewed the dam as a sacrilege and its proponents as “temple destroyers” (in Cohen 1988: 28). Muir died a year after losing the battle to save the valley from inundation, but the Sierra Club gained a reputation as a strong voice contesting the unrestrained rush toward economic development by asserting that the nonmaterial benefits of nature outweigh the social benefits that might result from such desecration.

Many ironies inhere to the Club’s preservationist philosophy and spirituality. Fighting to keep the National Parks immune from ski resorts, dams and timber interests has often involved compromises in which the Club agreed not to contest the projects outside of park boundaries, oftentimes sacrificing these areas before realizing the consequences. The rise of automobile use in post-war America, which brought more visitors to the Parks to experience these scenic wonderlands, delivered a different type of tourist who demanded new roads and amenities that compromised the terrain. In 1951, partly in response to these trends, the Club mission statement was altered: “rendering accessible” became “preserve.” This reflected anxiety about the impacts of the growing number of tourists, as well as the long-standing ambivalence of mountaineers and wilderness lovers toward those outside of the wilderness church. As Linda Graber observed, “wilderness purists,” including Sierra Club members, “resent the outsider’s presence in sacred space because his ‘inferior’ mode of perception” leads such a person to “desecrate wilderness” (Graber 1976: 28, 81).

Throughout the 1950s in the United States the very idea of wilderness management was being reformulated, and the Club was instrumental in this process. In 1949 Aldo Leopold’s classic, *A Sand County Almanac*, was published and reviewed in the Sierra Club *Bulletin*. Dave Brower, who would go on to be a crucial and controversial figure in the Club, attributed his change in outlook from recreational ideas of wilderness to ecological ideas of wilderness directly to his reading of this book (Cohen 1988: 117). The *Bulletin* itself, under Brower’s leadership, also changed its emphasis, from articles about outings to issues of wilderness policy. Biennial wilderness conferences, beginning in 1949, were hosted by the Sierra Club and brought together several conservation groups and government organizations to hammer out common strategies and goals. Bestor Robinson, a Sierra Club member and member of the advisory committee to the secretary of the interior at the time, recognized two different philosophies emerging among participants at these conferences. For some, “the sole function of wilderness is to contribute to the inspiration and wellbeing of people,” while for those more in

synch with Muir himself, “wilderness itself has a personality – a soul – and should be preserved for its own sake” (in Cohen 1988: 128).

Brower, whose term as executive director began in 1952, and Richard Leonard, a long-time member and Club President in 1953, spearheaded another campaign reminiscent of the Hetch Hetchy battle, calling for the protection of Dinosaur National Monument in Utah in the face of another dam proposal. While the Club argued that the dam was not the only economic alternative, a central aspect of the campaign was to portray Dinosaur as a sacred place. The religious nature of the language used is evident in Brower’s plea to Congress:

The axiom for protecting the Park System is to consider that it is dedicated country, hallowed ground to leave as beautiful as we have found it, and not country in which man should be so impressed with himself that he tries to improve God’s handiwork (in Cohen 1988: 182).

Wallace Stegner was successfully recruited to edit a photographic book about the site to sway popular support and advertisements were placed in newspapers. These sorts of publications would become a powerful tool of persuasion for the Sierra Club in the future – particularly notable was the stunning landscape photography of Ansel Adams, who was himself motivated by his spiritual connection to the land. The victory at Dinosaur was considered a “David over Goliath” event (Cohen 1988: 160), and the Club achieved recognition as a political force to be reckoned with. However, because the Club did not oppose projects outside of National Parks or Monuments at the time, it did not fight the proposal to build a dam at Glen Canyon on the Colorado River. This decision was later lamented by Brower, who vowed never again to restrict his concern in such a way, thus marking a further broadening of the mission of the Club.

Many of the disagreements between the Sierra Club and the government, including a decisive break with the United States Forest Service in 1960, had much to do with nature-as-sacred religion. Sierra Club members such as Brower, among others, believed that in saving the wilderness, they were protecting the only thing that, in the final analysis, could save humankind (Cohen 1988: 257). According to Nancy Newhall – who wrote the text to complement Ansel Adams’ breathtaking photography in the Sierra Club’s *This is the American Earth* (1960) – America still held Edenic possibilities and in the freedom of wildness there were “answers to more questions than we yet know how to ask” (Newhall in Cohen 1988: 258). Club publications began to attract critical acclaim and some reviewers recognized their religious dimensions. John B. Oakes of the *New York Times*, for example, wrote about *This is the American Earth* that, “Essentially it is a song of praise to the Earth, a prayer and supplication for its endurance. We can use such songs and prayers” (in Cohen 1988: 259).

The Glen Canyon Dam taught difficult lessons. When proposals for further dams in the Grand Canyon were submitted, the Club responded with a barrage of advertising, both in the form of new books and newspaper ads taken out in the *Washington Post*, the *Wall Street Journal* and the *New York Times*. Responding to the supposed recreational benefits of lakes for Canyon tourism, one memorable Sierra Club advertisement in the

summer of 1966 asked: “Should We Also Flood The Sistine Chapel So Tourists Can Get Nearer The Ceiling?” (poster reproduced in *The Sierra Club: A Guide* (1989: graphics insert). This kind of publicity resulted in the rapid growth of club membership and enhanced the Club’s reputation for challenging commercial interests and government policy. The Sierra Club’s publishing program continued to play an important role in the latter decades of the twentieth century by publishing not only ecological texts but also works by prominent figures promoting nature spirituality of one form or another, including books by Thomas Berry, Wendell Berry, Jerry Mander, Theodore Roszak, and Paul Shepard.

As Club membership became more geographically diverse, advocacy efforts expanded to include a wide variety of environmental issues, such as population growth, energy use, pollution, and human rights. In the late 1990s, the Club began to recognize the potential alliance between religious institutions – particularly Christian ones, whom Club leaders had previously written off as unimportant – and environmental protection. In 1997, for example, Carl Pope, who was then the executive director of the Sierra Club, attended a symposium at the University of California campus in Santa Barbara. On this occasion, Bartholomew I, the patriarch of the Orthodox Christian Church, broke new ground in labeling environmental degradation a sin. In his address to those gathered, Pope apologized for the failure of environmental activists to reach out to the religious community. He later wrote,

After all, many of the environmental challenges we face today are moral ones. The sin of pride tempts us to imagine that the world exists for our use alone, and Mammon, the god of greed, leads us down the path to environmental destruction (Pope 1998: 14).

Pope also compared environmental issues to the social changes brought about during the civil rights era in which religious organizations led the way. “Yet,” he stated, for almost 30 years most professional environmentalists stubbornly, almost proudly, denied the need to reach out to the religious community . . . We failed to realize – as some eminent scientists now tell us – that science and religion offer two distinct approaches to knowledge, and that neither has a monopoly on the truth . . . We acted as if we could save life on Earth without the same institutions through which we save ourselves (1998: 14).

Indeed, some Club members have joined their activism and their faith, as is evidenced by various collaborations on urban sprawl, calls for ending commercial logging, political lobbying, and promotion of renewable energy. One example of such collaboration, from a recent article in the Sierra Club Newsletter, noted that priest and Sierra Club member Father Charles Morris conducted a dedication and prayer ceremony for the installation of solar panels and a wind turbine (Heim-Jonson 2001).

No group is immune from criticism, and the Sierra Club has often been criticized sharply from within the environmental movement and from without, and internal debates are likewise often fierce. One long-standing external critique applies not only to the Sierra Club but to the wilderness ideal itself: that the notion of a pristine wilderness absent of humans inappropriately separates human beings from nature. This separa-

tion occurs not merely in an abstract, philosophical sense. It separates some humans physically, as with the National Parks model that the Sierra Club helped to spawn, which facilitated the removal (sometimes by murder) of Aboriginal peoples from their land. Moreover, critics argue, with the globalization of the National Park's wilderness ideal and model, deracination from the land and cultural genocide has often followed the development of wilderness-oriented National Parks. Many contemporary Sierra Club and National Park advocates, however, recognize the validity of such criticisms and are now promoting community-based models of environmental protection that promote both biological and cultural diversity. The United Nations' biosphere reserve model, which endeavors to incorporate rather than exile people while protecting biologically sensitive areas, suggests that the criticisms of the inherited wilderness ideal have been undergoing their own globalization.

Other criticisms are explicitly or implicitly religious. Some critics of the Club argue its members care more for nature than people and even promote an irrational if not pagan spirituality that is an affront to God. Meanwhile some avowedly Pagan environmentalists believe the Club has strayed from Muir's spirituality and uncompromising passion to preserve wilderness. Such perceptions have contributed to the emergence and proliferation of radical environmental groups, such as Earth First! and the Earth Liberation Front. This has also served to inspire internal reform movements in the Club that endeavor to return to and revitalize the original charismatic vision of the Club's founder.

The most important of these revitalization movements has been the "John Muir Sierrans," which was founded in 1993 and funded in part by David Brower through organizations he launched after being ousted from the Sierra Club. Led by Chad Hanson (who eventually served on the Sierra Club board) and David Orr, the John Muir Sierrans ran a slate that helped turn the Club in a more radical, biocentric direction. They won membership approval for a strong position against commercial logging on public land in 1996, despite strong opposition from figures they considered the conservative "old guard" of the Club. And trying to reverse the earlier, much lamented capitulation over Glen Canyon, they even urged the draining of Lake Powell, which had been created by the Dam. Moreover, they pushed strong, uncompromising positions across the environmental spectrum, in ways considered misguided, divisive, and counterproductive by more pragmatic Club members. By the turn of the twenty-first century, however, the Sierrans and other biocentric activists, such as David Foreman (co-founder of Earth First!) and Captain Paul Watson (of the Sea Shepherd Conservation Society) had come close to controlling the Sierra Club board. This reflected a large increase in membership support for strong if not radical positions, and arguably, for biocentric spirituality.

In the early twenty-first century internal Club politics continued to be divided largely along the lines of those who considered themselves pragmatic (some of whom were more theistic in their religious sensibilities and anthropocentric in their axiology) and those who confessed that nature is sacred and believed that compromise is cow-

ardly and taboo. Another fault line persisted between environmentalists with a strong social justice agenda, who considered morally wrong many approaches to population stabilization and reduction, including antiimmigration policies, and more biocentric activists, such as Paul Watson, who argued that nonhuman life should not suffer because anthropocentric social justice agendas hinder strong advocacy for policies that would reduce human numbers.

Criticisms from environmental radicals both inside and outside of the Club have helped push it to take increasingly strong positions in defense of the Earth's biodiversity. Left unclear is whether the Club's new-found interest in building bridges to religious communities – many of which have strong anthropocentric, social justice-oriented concerns – will broaden the Club's appeal and influence or exacerbate internal tensions, some of which are religion-related. If the latter dynamic proves decisive, nature-related religion could, ironically, weaken the Club's environmental protection efforts.

Sierra Treks

Begun in the late 1960s, Sierra Treks exemplifies a new form of environmental concern within evangelical Christianity. The letterhead of Sierra Treks' parent organization, Wild Hope, proclaims Wild Hope's Sierra Treks and Littlefoot Expeditions' programs to be "Wilderness Trips for People" and "People Trips for Wilderness." Combining environmental concern with Christian faith, this small outdoor/public lands advocacy group combines strong belief in the value of wilderness with the idea of God as Creator/Redeemer.

Started in 1968 by Robin Wainwright for the Mount Hermon Association, an evangelical camp and conference center in California, Sierra Treks initially combined wilderness camping/fishing trips with evangelistic Bible studies. Given Wainwright's Boy Scout background and Mount Hermon's conservative Christian ideology, trips until 1973 were open only to boys. Sierra Treks expanded and developed its more advocacy-oriented environmental mission under the leadership of Dave Willis, hired as the program's director in 1972. Willis brought a Sierra Club and Outward Bound approach to Sierra Treks, as well as a developing Christian faith that led him to a Bible-based theology that recognizes God's love for all creation.

In 1973, Sierra Treks expanded to include both girls and coed wilderness trips. The activities of all Sierra Treks continued to be modeled after Outward Bound courses. Greater expansion occurred in 1974 when Willis began hiring staff shaped by the environmental movement and progressive evangelical Christianity. Sierra Treks began offering winter mountain courses in 1976 and winter desert treks in 1980. Over the years Sierra Treks has offered courses for colleges, seminaries, churches, women's groups, couples' groups, high school and junior high students, youth-at-risk, seminars for rock climbers, trips for the hearing-impaired, and others. Trips have been in the Sierra Nevada Range in California, the Cascade Mountains in Oregon and Washington, Joshua Tree National Monument in California, the Oregon/California Siskiyou Mountains, and elsewhere.

Sierra Treks and Dave Willis left Mount Hermon in 1983. By 1985 Sierra Treks added a sister organization, Littlefoot Expeditions, that offers custom trips for targeted individuals to endangered wildlands. Politicians, government officials, environmental leaders, media representatives, and foundation staff have all participated in Littlefoot Expeditions, becoming allies in ongoing efforts to protect the areas they visit by experiencing those areas personally. Many years of Littlefoot trips in southwestern Oregon's Soda Mountain backcountry led to President William Jefferson Clinton's June 2000 proclamation of the Cascade-Siskiyou National Monument.

The nonprofit organization Wild Hope was formed in 1988 to incorporate both Sierra Treks and Littlefoot Expeditions. Sierra Treks remains the “Wilderness Trips for People” branch in which students participate in OutwardBound-type wilderness trips encouraging Christian faith development. According to Dave Willis, Sierra Treks believes in the “value of a wilderness experience for its own sake, while attempting to point to a God who is faithful to all creation.” Littlefoot Expeditions remain the “People Trips for Wilderness” branch, emphasizing public lands advocacy. During the late 1970s and early 1980s, Sierra Treks ran up to thirty wilderness trips per year. As Willis has become more involved in wildlands advocacy, more Littlefoot Expeditions (and fewer Sierra Treks) have been offered.

The environmental concern common to both the trip program and the advocacy branch combines a deep belief in the value of wilderness with an all-creation theology. This theology proclaims hope in a Creator/Redeemer God whose faithfulness to humanity is inseparable from faithfulness to all creation.

Sikhism

According to Sikh tradition, after many years of traveling throughout India and preaching Sikh doctrine, Guru Nanak, the first Sikh Guru, founded and settled in the town of Kartarpur in modern-day Pakistan. Here he put into practice his teachings about honest labor, truthfulness, and charity by taking up a life of tending land. The Guru's first disciples followed their master's teachings and example and like him many became farmers. Though one discerns in these traditions no overt statements about nature itself, clearly there are implications which have become manifest in today's Sikhism. Nature (*qudrat*) and all of its manifest glory is one of the most obvious creations of Akal Purakh (God) and as such must be responsibly tended with care and respect.

Over the centuries land and nature have directly provided many Sikhs their livelihood. Such reverential attitudes toward these thus require no concise positions or statements as these are familiar enough to be taken for granted. Indeed, within the normative Sikh Code of Conduct finalized in 1945 and published in 1950, the *Sikh Rahit Maryada*, as well as within earlier, eighteenth and nineteenth-century Sikh *rahit* literature from which the *Rahit Maryada* derives, such statements are altogether absent. This is worth pointing out as even today congregations of Sikhs throughout the world often refer to the *Rahit* literature to position themselves *vis à vis* other Sikh congregations or the state on such controversial issues as Sikh identity and abortion among others.

Sikh thoughts toward nature may nevertheless be distinguished from within the principal source of Sikh theology, the *Adi Granth*, the Sikh scripture, in which we find the hymns of the Sikh Gurus. I do not mean to reduce Sikhism to its scripture, of course, but an "ecological exegesis" of the *Adi Granth* has nevertheless provided many

Sikhs a number of ways with which to begin addressing the dawning environmental crisis. This is logical from the Sikh perspective as it is a firm Sikh belief that the scripture is not merely a book bound with the wisdom of the Sikh Gurus but that within its pages one can discover the mystical presence of Akal Purakh. In many symbolic ways in other words the scripture is alive and must be treated with the respect accorded to both living, human gurus as well as that bestowed upon the eternal Guru or God. Its more popular title therefore is the *Guru Granth Sahib*, the *Granth* as the eternal Guru. And so it comes as no surprise that every pamphlet or article delineating Sikh attitudes toward ecology begins here.

As a farmer in his later years, Guru Nanak's hymns abound with scenes from the agricultural rhythm of the year, particularly scenes reminiscent of seeding and harvest

times. Sensitive to natural beauty Guru Nanak speaks of deer living and eating in the forest, of swimming fish, birds singing in the mango trees, and of snakes slithering along the ground (*Guru Nanak, gauri bairagan* 19; *Adi Granth* 157) all of which contribute to the wonderful ecological balance established by Akal Purakh. The eternal Guru is himself described in ecological terms:

“He is the Master Blossomer, He who has made the world bloom; He makes the Universe blossom forth, fresh and green. He binds together [and separates] both water and land. Great is [the glory of] the Lord Creator” (*Guru Nanak, Siri Rag* 28:1; *Adi Granth* 24).

In this light it is thus logical that natural scenes illuminate the first Guru’s theology and are deployed as more than just symbols. It is through nature that one may discover the mystical presence of Akal Purakh who is not just the Creator but is also immanent throughout creation. Human beings are intimately connected to nature and the entire cosmos in this cycle as within them too the pious Sikh may experience the presence of the eternal Guru. Guru Nanak’s hymn in *rag dhanasari*, for example, implies as much in its symbolic ritual of *aarti*, the waving of lamps in the presence of a divine image. Here the natural universe participates in the worship of Akal Purakh:

The skies are the dish; lamps are the sun and the moon. The stars are pearls; the breeze, incense. All the world’s vegetation form the flowers offered [to the divine]. What a wonderful *aarti* ceremony! O You who eliminate all fear. This is Your *aarti*. The unstruck melody is the sounding of the temple drum (*Guru Nanak, Dhanasari aarti* 9; *Adi Granth* 663).

The unstruck melody refers to the “celestial music” that resounds throughout both humanity and nature. It is often compared to the *shabad*, the “word” or the divine self expression of Akal Purakh which is “heard” at the height of the Sikh spiritual discipline, *nam simran*. Nature therefore is not just valued for its worth to humans but has intrinsic value unto itself. As such nature must be revered and protected. Failure to do so in Guru Nanak’s thought is tantamount to sin and ignorance of the true nature of reality.

How these ideas influence everyday Sikh practice toward the environment should be straightforward but it is not. On the one hand, human beings have a moral responsibility to protect and nurture the environment. As Guru Nanak claims in one of his most famous hymns, “Truth is indeed the highest of virtues. Higher still is living truthfully” (*Siri Rag Ashtapadian* 14:5; *Adi Granth* 62). As Akal Purakh, the ultimate Truth, permeates the natural world, which is his creation, it is incumbent upon all Sikhs to strive toward maintaining and preserving this Truth. Yet, on the other hand, Sikh farmers have perhaps benefited the most of all Indians from the large-scale introduction of harmful pesticides and chemical fertilizers which engendered the Green Revolution of the 1960s and 1970s, a clear contravention of the *Adi Granth*’s insistence on the preservation of nature. Indeed, to this day it is very common to see the use of such chemicals in the fields of the Punjab.

Even during the Green Revolution, however, a number of Sikh and non-Sikh voices rose in protest against the chemical introduction and the so-called benefits of the Green Revolution. Of these none were louder than that of Puran Singh (1904–1992). A Sikh, Bhagat Puran Singh was often discovered outside the entrance to the Golden Temple in Amritsar handing out literature dealing with a number of contemporary, interrelated issues. The one for which he is today legendary is the care of India's disabled, destitute, poor, and sick. To support his concern for these marginalized groups he founded the All-India Pingalwara Charitable Society in 1947 against the backdrop of the horrors of Partition. Today this institution and Puran Singh (often referred to as India's Mother Theresa – though technically Mother Theresa was an Indian!) are both internationally recognized.

Puran Singh's interest in saving the environment began, according to his own admission, in the 1920s in light of India's increasing deforestation. It was at this time that he recognized, in part through the hymns of the Gurus and his own interests, the interconnectedness of all life and the harmony of the universe. A self-professed Gandhian Sikh, especially in his rejection of harmful technology (i.e., motor cars, etc.) and a prolific writer, many of Puran Singh's pamphlets deal with the environment and its degradation and offer solutions to its restoration. One solution which is outlined in his pamphlet *Apane Viah* (Our Marriages) is celibacy. It must be noted however that celibacy was promoted not within the Gandhian program of purity and bodily control leading to national control but rather because celibacy would eliminate an increase in the population which would therefore lessen the strain on natural resources.

Among his better-known works is *Khatre di Ghanti* (The Death Knell). This pamphlet of just over sixty pages informs Sikhs of the harm engendered by modern technology, soil erosion, pollution hazards, and deforestation. In this he often makes reference to the hymns of the Gurus underscoring Guru Nanak's dictum in his famous composition Japji that "the Earth was created as a dharamsala, an abode of righteousness" (Guru Nanak, Japji 34; Adi Granth 7) which must remain undefiled, in order to persuade Sikhs particularly and people in general to protect the environment and adopt less harmful technologies (bicycles as opposed to automobiles or scooters, for example, and home-spun khadi cloth for clothing as opposed to textiles manufactured with harmful dyes). Pollution in these pamphlets is thus equated with sacrilege and waste tantamount to disrespecting the eternal Guru and his creation (*Khatre di Ghanti*, 11).

After his death in 1992, the All-India Pingalwara Society has continued to champion Puran Singh's views and thus easily leads the way amongst Sikh institutions in broadcasting concerns about environmental degradation. It does this through conferences and seminars, which take place both within the Amritsar institution and within surrounding villages; through the celebration of Environment Day during which members of Pingalwara visit village schools to instruct children on environmental protection; and through the printing of numerous pamphlets by leading Indian and European environmentalists in Punjabi, Hindi, and English. The works of Sunder Lal Bahuguna

who began the protest against the construction of the Tehri Dam in the Indian state of Uttar Pradesh may be cited as example.

The pioneering work of Puran Singh and Pingalwara and the clear message of the Adi Granth notwithstanding, little has been done from the Sikh perspective regarding environmental protection nor as yet has a formal Sikh position, one sanctioned and mandated by the principal Sikh religious institution, the Shiromani Gurdwara Prabandhak Committee, been enunciated. Yet all the sources for such a policy and the lifestyle to which it gives voice are very much available.

Silko, Leslie Marmon (1948–)

A key figure of the Native American literary renaissance of the 1970s, Leslie Marmon Silko was born in 1948 in Laguna Pueblo, New Mexico, of Laguna, Mexican, and EuroAmerican heritage. Silko grew up in the storytelling tradition of the Pueblos and writes from a worldview based in communal values and a belief in the sacredness and interdependence of all life forms. In her essay collection *Yellow Woman and a Beauty of the Spirit* (1996), Silko observes that her writing “begins with the land.” The Earth, she says, is “the center of a spider’s web,” and “[h]uman identity, imagination and storytelling” radiate from that center (1996: 21).

Silko’s early poetry and fiction, collected in *Laguna Woman* (1974) and *Storyteller* (1981), and her first novel *Ceremony* (1977) are centered in Laguna and reflect the inseparability of Pueblo people, stories, and land. *Ceremony*, now a classic of twentieth-century American literature, tells the story of Tayo, a mixed-blood World War II veteran who returns to Laguna spiritually fragmented and culturally alienated. Through a ceremonial reimmersion in the land and the sacred stories and beings that inhabit it, Tayo is restored to wholeness and heals his community, which had been devastated by the effects of uranium mining and the creation of the atomic bomb.

Silko’s subsequent novels address themes of global dislocation. The apocalyptic epic *Almanac of the Dead* (1991) retells the 500-year history of the conquest of the Americas, the dispossession of its native peoples, and their continuing resistance. *Almanac* traces the roots of that violent history to the philosophical, religious, and scientific discourses of Western patriarchy that split human from nature, body from spirit, and dismember the world to produce consumer goods and atomic bombs. The novel ends as armies of indigenous people gather to retake the stolen land, prophesying the “end of all things European.” However, as Silko tells interviewers, the retaking of the Americas is a metaphor for a global spiritual awakening already underway that will reconnect humans to the Earth.

If *Almanac of the Dead* diagnoses Western culture’s ills, Silko’s 1999 novel *Gardens in the Dunes* offers a cure. A historical novel set at the turn of the twentieth century, *Gardens in the Dunes* suggests how humans may participate in Earth’s recovery from the devastation of colonial and capitalist greed. Seen through the eyes of a young Indian girl, the gardens cultivated in the desert by her Colorado River tribe and those she experiences on a European tour with the white couple who foster her constitute an extended metaphor for the reverent, reciprocal relationships between humans and nature that can restore human contiguity with the world. The novel also heals breaches between EuroAmerican and native cultures, drawing parallels between

the indigenous spiritual traditions of the Americas and those of pre-Christian Europe and Gnostic Christianity. Dissolving boundaries between spirit and matter, nature and culture, Silko's work calls for humans to reinvent their relationships with nature and to participate in the creation of a new, more balanced world.

Sittler, Joseph A., Jr. (1904–1987)

Joseph Sittler, an American Lutheran theologian, was a pioneer in relating Christian theology to environmental concerns, giving an ecological reinterpretation of the traditional theological language of “nature and grace.”

Born in Upper Sandusky, Ohio, in 1904, Sittler served as a Lutheran pastor before embarking on a teaching career which brought him in 1957 to the University of Chicago Divinity School, where he taught until his retirement in 1973. At the time of his death in 1987 he was

Distinguished Professor in Residence at the Lutheran School of Theology, which now houses the Sittler archives. Sittler’s 1954 article, “A Theology for Earth,” and his 1961 address to the World Council of Churches Assembly in New Delhi, “Called to Unity,” are both landmarks in the history of ecological theology. In the former, he argues that the theology of his time had “repudiated” the Earth, and that a theology that acknowledges the significance of the nonhuman world is needed if we are to care for the Earth rather than “use [it] as a godless warehouse or to rape [it] as a tyrant.” In the latter, he calls for a “Christology of nature” that would overcome the Western dualism of nature and grace and bring the material universe itself into the sphere of redemption.

He carried forward and developed these themes in later writings. His sermon “The Care of the Earth” (1964) asserts that “abuse is use without grace” and contrasts an “economics of use only” which destroys the Earth and degrades human life, and an “economics of joy,” in which receiving the world “sacramentally” makes possible also its intelligent use. “Ecological Commitment as Theological Responsibility” (1970) proposes an ecological understanding of grace as “built into the whole constitution of the world” of nature and society as the basis for an environmental ethic. That essay also contains his provocative assertion that environmental degradation is “blasphemy,” because it denigrates the grace inherent in creation.

His most comprehensive statement is found in *Essays in Nature and Grace* (1972), which traces the theme of nature and grace through the Bible, the theology of the Eastern and Western churches, the Enlightenment, and into the modern period and the environmental crisis. The impact of Eastern Orthodox theology on Sittler, and his attentiveness to the artist’s “unaccredited witness” to creation as a “theater of grace,” are evident in this book.

Although he was not a “systematic” thinker, and his published output consists of a few slim volumes and numerous articles scattered among scholarly journals and church publications, Sittler had a profound influence on the following generation of

“eco-theologians” (e.g., H. Paul Santmire and John B. Cobb, Jr.). While theological interest in ecology has perhaps to some degree “caught up” to Sittler, his focus on the doctrine of grace remains distinctive and illuminating, and his writings continue to be fresh and evocative invitations to explore the depth and breadth of the relationships between nature and grace.

Sivaraksa, Sulak (1933–)

Sulak Sivaraksa, Thailand's prominent lay Buddhist social activist and author, is widely known as a major figure in the international engaged Buddhist movement. In 1961, upon his return to Thailand from England where he completed university and law degrees, he became a publisher, university lecturer, and founding editor of the *Social Science Review*, Thailand's leading intellectual journal until 1976 when it was suppressed by the government. In 1971 he organized the Komol Keemthong Foundation with the help and support of Sanya Dhammasakti, chief justice of the supreme court, and Dr. Puey Ungaphakorn, rector of Thammasat University and governor of the Bank of Thailand. Its purpose was to inspire young Thais to dedicate their lives to social justice and the common good rather than solely the pursuit of their own personal gain. The Foundation was the first of many non-governmental organizations (NGOs) Sivaraksa has inaugurated. Prominent among them are the Thai Inter-religious Commission for Development (TICD) and the International Network of Engaged Buddhists (INEB), sponsors of the tri-annual publication, *Seeds of Peace*; the Santi Pracha Dhamma Institute (Institute of Peace, Democratic Participation, and Justice); and the Spirit in Education Movement. Through these and other organizations and networks, Sivaraksa has devoted his life to the pursuit of economic and educational reform, social and environmental justice, human and civil rights. He also founded the Sathirakoses-Nagapradipa Foundation, which promotes cultural, educational, and artistic projects, and numerous publications including the *Pracharayasara* journal, the intellectual successor to the *Social Science Review*. Sivaraksa has authored hundreds of essays and articles in Thai and several collections of essays in English, most notable among them are: *Seeds of Peace: A Buddhist Vision for Renewing Society*, *A Socially Engaged Buddhism, Religion and Development*, and *Siamese Resurgence: A Thai Buddhist Voice on Asia and a World of Change*. An abbreviated version of his Thai autobiography was published under the title, *Loyalty Demands Dissent: Autobiography of an Engaged Buddhist*. The American Friends Service Committee nominated him for the Nobel Peace Prize and he is the recipient of the Right Livelihood Award, regarded internationally as the "alternative Nobel."

In numerous writings, Sivaraksa has spoken forcefully on the issue of environmental destruction, especially in his own country. Equally important are organizations and movements he has created to promote environmental preservation and environmental justice. Most of the NGOs founded by Sivaraksa include an environmental agenda but for one, in particular, the preservation of the natural environment is uppermost. *Sekhiyadhamma* (Students of the Dhamma), is a network of Buddhist monks working in

their communities to preserve local environments, principally forests that are essential to village economies. Their efforts are both educational, teaching villagers better ways to conserve natural resources, as well as political, protecting local social, cultural, and natural environments from the encroachment of commercial, industrial, and urban development. On the outskirts of Bangkok, Sivaraksa has established a conference center, the Wongsanit Ashram, to exemplify the ideal of simple living close to nature or, as he fondly quotes Gandhi, “living simply so that others may simply live.” The Ashram serves as a center for the practice of a mindful, non-consumerist, other-regarding way of life.

Like one of his spiritual mentors, the noted Thai monk, Buddhadasa Bhikkhu, Sivaraksa grounds his environmental ethic on a holistic understanding of the Buddhist principle of interdependent co-arising conducive to a deep respect for nature. This knowledge of inter-becoming, a term he borrows from Thich Nhat Hanh, is achieved through the development of mindful awareness and leads naturally to an empathetic identification with and compassionate action toward all life forms. On this foundation, Sivaraksa builds a guide for compassionate action using traditional Buddhist teachings – the Four Sublime Abodes (love, compassion, sympathetic joy, equanimity), the four Bases of Sympathy (generosity, kindly speech, life of service, impartiality), and the five precepts (*sila*). For example, he applies the first precept against killing to the structural violence engendered against the poor and the natural environment by global corporate power.

Sivaraksa brings to his environmental agenda a sharp critique of governmental and commercial exploitation of nature at both global and Thai national levels. Applying the principle that power corrupts and absolute power corrupts absolutely, he believes that the global economic structures of free-market capitalism facilitate the concentration of wealth and power at the expense of the poor and the environment, a scenario that he characterizes as structural violence. Free-market capitalism also creates a culture of consumption driven by greed, selfishness, and acquisitiveness rather than promoting the qualities of simplicity, responsibility, and care that are essential to the preservation and conservation of nature. He finds in the culture of consumerism the illusion of autonomous, individualized selves undermining both human community and the mindful-awareness of the interdependence of human beings and nature.

Sivaraksa idealizes the rural Thai environment of relatively small self-sustaining communities living in harmony with the natural environment, not in a naive, antique sense, but as a practical example of a more humane, caring, and harmonious society. Rather than unrealistically advocating a return to a pre-modern, less complex era, he forges alliances and networks among people from many walks of life – academics, laborers, farmers, activists, civil servants, and even the business community – dedicated to the building of a more democratic, egalitarian, inclusive, and compassionate society. He strongly supports the Assembly of the Poor that emerged as a nonviolent, grassroots democratic force in Southeast Asia in the mid-1990s with nearly as halfmillion members in Thailand. At the core of the Assembly are urban and rural agricultur-

ists and manual laborers with support from the middle-classes. In recent years he has challenged numerous government and private projects that have dislocated villages or undermined traditional ways of life and the communities that support them. These projects include hundreds of dams constructed without prior consultation with local populations geared mainly toward making abundant water supplies for industries at the expense of small-scale agriculture; the destruction of local forests in north and northeastern Thailand for the promotion of commercial enterprises, especially wood-pulp eucalyptus plantations; and land loss around followed by subsequent pollution of Songkhla Lake, Thailand's largest inland body of water.

Sivaraksa's Buddhist environmental philosophy owes a special debt to the thought of Buddhadasa Bhikkhu and Thich Nhat Hanh. Yet, in contrast to their more reflective and contemplative styles, he aggressively fights in the trenches for the cause of human and environmental justice. On 6 March 1998, he was arrested during a sit-in protest against the construction of the Burma–Thailand Yadana pipeline in Kanjanaburi province, south Thailand. Typical of Sivaraksa's style as an engaged Buddhist, he was putting his life on the line to protest both human rights abuses and the pipeline's potential for ecological damage.

Sjöö, Monica (1938–)

Monica Sjöö is a Swedish ecofeminist, political activist, author and visual artist. She is known as one of the foremost thinkers of the reemerging Goddess religion. Her most influential publication, co-authored with Barbara Mor, *The Great Cosmic Mother: Rediscovering the Religion of the Earth*, traces the historical roots of Earth-based Goddess religions and the violent oppression of these traditions by patriarchal cultural forces. The book includes 44 of her paintings. Sjöö's research draws on archeological, cultural and religious sources in a global perspective.

Sjöö's journeys to Neolithic sacred sites provide inspiration for her work. These journeys took her to southwest England's ancient sites where she has lived since the late 1950s. Involved in the feminist, anarchist and anti-Vietnam War movements in Sweden and Britain in the 1960s, Sjöö states that her "political activism always grew out of my spiritual understandings of the Earth as the living Mother because the Goddess is injured wherever there is injustice, wanton cruelty, poverty, and pollution" (1987: xix).

Some of her earliest images, "God Giving Birth" (1968) and "Women's Mysteries" (1971), led to the publication of her first pamphlet in 1975, in which she begins to explain her concepts of the Great Mother as the generative force of the universe. Sjöö's work is also influenced by the deaths of her two sons – one from cancer, one killed by a car.

During the 1990s Sjöö's writing critiqued the gurus of New Age religion. In *Return of the Dark/Light Mother or New Age Armageddon?*, she contrasted the New Age focus on transcending Earth and ignoring political activism, which exacerbates Earth's destruction and exploits indigenous spiritualities, with ancient and reemerging Goddess cultures. Sjöö's visual art has been exhibited throughout the United States and Europe; she has contributed to myriad journals, and has led workshops at conferences and festivals throughout the world.

Sky

This entry considers 1) the position of the sky in our perceptual environment and its religious symbolism, 2) skygods, 3) the personification of celestial objects, and 4) the disenchantment of the sky in the modern era.

1) The sky is a rich source of religious meanings and symbols. In our perceptual environment it is “the above,” a realm of infinity, brightness and purity, something “other” than humanity’s environment on Earth. It is a source of water and thus fertility and life. Not only does the Bible mention a sphere of water beyond the heavens (e.g., in Gen. 1:77, Job 38:37), but in many cultures sky-dwelling deities have been propitiated for rain. The sky is a source of wind, thunder and lightning. These are symbols of power and death. Thus, Odin, the Germanic god of storms and tempests was said to reside in the sky. In the daytime, the sky may be shrouded in clouds or may radiate a gleaming blue light. In Hinduism and in Mahayana Buddhism this blue was understood as a symbol of purity of mind and spiritual enlightenment. At sunrise and sunset the sky often abounds in warm, red hues. Greek mythology linked these colors to Iris, the goddess of dawn and twilight.

In the day and at night, the sky is the arena for celestial bodies and phenomena: sun and moon, stars, Milky Way and the planets are commonly seen. These were often regarded as divine or mythical beings (particularly sun and moon) or even the spirits of deceased humans (e.g., among sea-nomads in Southeast Asia). East and west, being the directions of sunrise and sunset, are often imbued with particular meanings. In India, east is considered as an auspicious direction, west as inauspicious. These meanings have influenced sacral and domestic architecture. Rainbows, eclipses, comets, meteor showers, auroras and supernovae are rare and have been impossible or difficult to predict. They are the subjects of a rich mythology and have often been regarded as harbingers of extraordinary events, misfortune or droughts. While the sky’s cloud covering may seem to change at random, the motion of sun and moon, and the apparently perpetual revolution of the starry night sky are manifestations of regularity. These seasonal changes in the appearance of the starry night sky parallel annual climatic change.

When brought into relation to the human body, the sky, in being “up” or “above,” may be linked to the head as the center of consciousness and mind. Similarly, it may express ideas of hierarchy: divinity as being distinct from, and usually superior to, humans. If deities in a pantheon can be localized in the environment, the superior ones tend to be in the sky. Earthly rulers may claim to derive their power from these sky-gods. Examples are the Inca (Peru) and the Mongolian ruler Genghis Khan. But

even in monotheistic religions, God may be thought to reside “above” in the sky. In Christianity, for example, this is where the Bible (Gen. 11:5) and the Lord’s prayer locate God.

The sacrality of the Earth has been often understood to derive from the sacrality of the sky. Meteorites in particular, which have literally fallen from the sky, may become centers on Earth where sacrality is manifest, which may otherwise be peculiar to the sky. The Qa’bah in Mecca (Saudi Arabia) is probably the most famous example. According to a ninth-century text, this particular meteorite fell through a hole in the sky. As such, the Qa’bah symbolizes the permeability of sacrality at this place.

2) The belief in sky-gods is, or has been, common to many cultures. These beliefs vary from conceptions that are impersonal or barely personal to anthropomorphic ones. While the material sky has been claimed to be identical with these deities (e.g., in ancient Babylonia, among the Ewe of Ghana or in old China), in other cultures the sky has been considered a space in which the sky-gods reside (e.g., Zeus in Greek mythology). Foucart (1920) considers the universality of sky-gods and the uniformity of their essential characteristics as the “logical consequence of the constant uniformity of the primitive system of cosmogony” (1920: 581). He notes that in many cultures skygods have been considered as the creators of the world. If considered the sole agent of creation, the sky-god is usually understood as being male (as in many pastoral societies), but sometimes as female (e.g., the Egyptian goddess Hathor). In other (often agrarian) cultures the world is created in the union of a (male) sky-god and a (female) Earthgoddess. Examples are the Polynesian myth of Rangi and Pepe, and the Greek myth of Ouranos and Gaia. The separation of sky and Earth after the act of creation is a common mythological subject. For example, a myth of the Ewe (Ghana) relates that a cooking fire lit by their ancestors caused the sky-god Mavu to feel a burning sensation in the eye and to withdraw thereupon.

Historians of religion have advanced a variety of ideas about the role of sky-gods in belief systems. Wilhelm Schmidt argued that primitive monotheism stems from the idea of a supreme sky-god. This hypothesis has resulted in a long-lasting debate that remains unresolved. Mircea Eliade notes the tendency of sky-gods to disappear from cults. In general, they become less and less important in ritual and sacrifice. In some cultures, the sky-gods are pleased with their creation and perhaps even tired of the hard work involved (cf. the mythology of the god Puluga on the

Andaman islands in the Indian Ocean). While skygods may sometimes remain at the head of a pantheon (e.g., the Zoroastrian Ahura Mazda), in other cases they have been replaced by a sun-god. In general, Eliade remarks, sky-gods show little interest in the concern of humans and thus they are often replaced by active deities with more proximity to human life. He also notes, however, that the sacredness of the sky and the stars usually remains unchallenged.

3) The attribution of religious, mythical or symbolic meanings to the visible sky or objects discernible therein is known in virtually all cultures. In an abstract way, the blueness of the sky has been related to the skin color or the dresses worn by sky-gods.

Examples are the blue-skinned Tengri (Mongolia) and Mavu of the Ewe (Ghana), who was claimed to wear a blue robe adorned by white clouds. In a number of cultures, sun and moon are imbued with an amazing variety of meaning. They often appear as husband and wife or as siblings and are linked to myths of creation. Among the planets, Venus has been commonly linked to divine or mythical beings. The Pleiades (a conspicuous cluster of bright stars in the constellation Taurus) is probably the most widely identified constellation around the world. Their first visibility in the eastern evening sky (October) marks the beginning of the rainy season in many equatorial regions. At first sight, the night sky may seem like an arbitrary distribution of stars. However, akin to a projective Rorschach test used by psychologists, the patterns discerned in the sky may be considered as projections of symbols which are, or have been, important to a culture. Thus, the symbolism of Greek mythology and everyday life is still inscribed into the sky as seen through (knowledgeable) Western eyes.

4) The disenchantment of the world in the modern era has been debated at least since Max Weber first published *The Protestant Ethic and the Spirit of Capitalism* in 1905. Not only have the physical sciences progressively restricted the realm of divine influence. Celestial phenomena and objects could also now be understood by a unified physical theory. Scientific progress has affected the perception of the sky in a profound way. It came to be looked at as a wasteland, a mute witness to human doings and wrongdoings (e.g., in expressionist poetry). The twentieth century has brought human appropriation of the sky into focus. In the 1920s, a British engineer used diesel fumes to inscribe advertisements into the blue sky (first for the *Daily Mail*, then for “Lucky Strike”). Already in 1893, at the Chicago World Exhibition, slides had been projected onto clouds. Then came the jet trails. In the 1960s, air pollution emerged as a global problem. The discoveries of the Antarctic ozone hole and of global warming have left no doubt about our influence on the sky. Once the abode of deities, it has come apparently under human control. Such a viewpoint is enforced by international law: up to an elevation of 83 kilometers the sky has been declared the territory of any sovereign state.

Slavic Neo-Paganism

Slavic neo-paganism is a scholarly term for a very broad category of religious groups that see themselves as the legitimate continuation of the pre-Christian religious beliefs of their Slavic ancestors. This legitimacy is largely based on perceived “natural” ways of being for Slavs as a whole or as separate historical nations, which include concepts of intimate ties with certain landscapes and geographical areas as well as broader notions of humanity’s place in the natural environment.

Although most Slavic neo-pagan groups are familiar with the scholarly category of “neo-pagan,” very few are quick to use it about themselves. They often prefer labels such as “the native faith” (Czech: *rodná víra*, Polish: *rodz-ima wiara*, Ukrainian: *ridna vira*) or “Slavism” (Russian: *Slavianstvo*). Unlike neo-pagan groups in English-speaking countries, neither magic nor feminism are important parts of Slavic neo-paganism, although they may be present.

Belarus, the Czech Republic, Poland, Russia, Serbia, Slovakia, Slovenia and Ukraine all have documented Slavic neo-pagan movements of larger or smaller sizes. In all of these countries, neo-paganism remains a small minority of the population (under 0.5 percent) and is usually marginalized as a New Religious Movement by the dominant churches and the population at large, regardless of claims of ancient traditions. Some of these countries may also contain even smaller autochthonic non-Slavic neo-paganisms (vigorous Finno-Ugric neo-paganisms in Russia, Baltic Prussian neo-paganism in Poland) as well as a few scattered representatives of imported Western neopaganisms (Asatru, Wicca and Druidism). Slavic neopaganism may also be found amongst Slavic émigrés, especially from Ukraine and Russia.

A number of neo-pagan groups were founded throughout Central and Eastern Europe in the 1920s and 1930s. They typically built on a base of nineteenth and early twentieth-century Romanticism which, along with colorful speculation about the primordial religions of Europe, made influential assumptions about the “noble savage” and the primacy of nature. Although this burst of activity was not limited to the Slavic peoples (important Germanic and Baltic groups were founded at this same time), one of the first organized and explicitly religious groups to appear was the Polish “Święte Koło Czcieli Świątowida” (The Holy Circle of Worshippers of Swiatowid) in 1921. Many of these groups did not find favor with the communist authorities after the Second World War and their leaders either fled their home countries (as did Volodimir Shaian from Ukraine) or were sent off for lengthy prison terms (as was Jan Stachniuk of Poland).

Elements of Slavic neo-paganism were echoed under communism, including nationally televised (non-Christian) seasonal holidays and the encouragement of Slavic rituals among the scouting movements. With the “fall” of communism after 1989, Slavic neo-paganism blossomed again, drawing into its ranks a new generation. Although surviving members of the pre-war organizations often returned from exile, Slavic neo-pagan groups have retained a younger demographic than similar groups in Western Europe.

The radical immanentism of Slavic neo-paganism (as opposed to the transcendentalism of the dominant Christian Churches) is a key factor in understanding its complex assumptions about what are “natural” ways of being. Explicit worship of divine beings that correspond to natural phenomena, such as the god of thunder, Perun, or the goddess of Earth, Mokosh, are only part of their return to an immanent Sacrum. The blood-ties of families, the Nation (and sometimes the Race), the sovereignty of the State, traditional folkways, traditional language, the seasonal turn of the calendar and biodiversity are all examples of things that may be considered sacred. It is interesting to note that the god Rod (literally: “birth” or “kin”; related to concepts of “native” and “nation”) is considered the highest of the gods, the “God of gods” by some Ukrainian neo-pagans, and the goddess Slava, the eponymous mother of the Slavs, is accorded vast importance by the controversial *Book of Veles*.

This has led some outside observers to argue that all Slavic neo-paganisms are fundamentally nationalistic or based on ethnic chauvinism. Such authors assume that all other concerns are secondary or insincere smokescreens for their true goals. Other authors have emphasized the strong current of environmentalism, while discounting the nationalists as a minority radical fringe. The reality lies somewhere between the two, as the Slavic neo-pagan celebration of the physical world can take on many different overtones even in close proximity. Typical is a Slovak neo-pagan magazine that contains an article on dwindling wolf populations, a tutorial on how to sew a traditional Slovak shirt, and a political protest against EU membership as dangerous to Slovak sovereignty, all on the same two-page spread.

The immanent-environmental current in Slavic neopaganism often sets itself explicitly in conflict with the emphasis put on transcendence in Christianity, blaming it for the degradation of the environment and humanity’s alienation from nature. Jan Stachniuk and Volodymyr Shaian were particularly vehement in the 1930s in their condemnations of Christianity as a dangerous distraction from the realities of this world. By the end of the twentieth century, many Slavic neo-pagans were also familiar with Nouvelle Droite spokesman Alain de Benoist’s arguments that Christianity was “unnatural”, even if they were not familiar with similar lines of thought from the more left-oriented neo-paganisms in the English-speaking world.

In some cases, Slavic neo-pagans seem to prescribe a sort of turning back of the clock as the cure to modern ecological ills. Many Slavic neo-pagans are ardent medieval reconstructionists, meeting for festivals in which they dress in medieval clothes and demonstrate pre-Christian handicrafts. Many are also keenly interested in archeology, history and folklore survivals. “Do-it-yourself” is often preferred to “store-bought,”

as is the homemade wine produced by the congregation in Kaluga, Russia, for ritual purposes. The legacy of nineteenth-century Romanticism is felt strongly in the assumption that modern consumerism and technology is decadent and meaningless when compared with the ancient Slavic arcadia. Extreme Luddite variants, however, are rare and the comfort that many Slavic neo-pagans have with modern technology is visible in websites dedicated to their interests.

Slavic neo-pagans may be found as staunch supporters of the “secular” ecological movement, and the ecological movement often returns the favor by borrowing neo-pagan imagery in their publications and neo-pagan ritual in their events. However, neither side of this equation could be said to hold a controlling interest in the other’s activities. Notably, other than some small-scale organic farming, there have been no attempts to create exclusively neo-pagan environmental initiatives such as sustainable housing, recycling programs or nature preserves outside of the framework of the broader environmental movements of the various Slavic countries.

Slavic Religion

“The Slavs,” like “the Celts,” are a modern construct. Since languages spread not only vertically, through ancestry, but also laterally, through conquest, diffusion, assimilation, and other means, “Slavic religion” refers not to the religion of a single transhistorical community of “Slavs,” but to the multiple religious practices of Slavic speakers. That caveat aside, archeologists generally consider Slavicspeaking cultures to have emerged in the territory between the Dnieper and Vistula rivers in Eastern Europe sometime in the first millennium B.C.E. Over the course of the midto late first millennium and early second millennium, accompanied by territorial migrations to the north, east, and southwest, Slavic-speaking tribal groups combined, transformed, and differentiated into the peoples known today, commonly distinguished into three language groups: East Slavs (Russians, Ukrainians, Belarusans), West Slavs (Poles, Czechs, Slovaks), and South Slavs (Slovenes, Serbs, Croats, Macedonians, Bulgarians).

The reconstruction of pre-Christian Slavic religion draws on three primary types of sources. Written sources include classical writings, Arab travel accounts, Christian teachings (generally aimed at discouraging pagan practices), and medieval chronicles. Archeological sources are plentiful, though debates continue over the identification of Slavic and non-Slavic cultures, the extent of migration and diffusion as opposed to autochthonous development, and so on. Finally, folklore and ethnography, drawing on a wealth of oral and folk traditions, including epic poems, fairytales, ritual songs and dances, have provided scholars with plentiful material from which to reconstruct preChristian beliefs, since many of these are thought to have continued in modified and fragmentary forms as late as the beginning of the twentieth century.

The earliest known beliefs of the Slavs reveal strong affinities with neighboring linguistic groups, especially Balts, Indo-Iranians, and Thracians. Linguistic and structuralist approaches (such as those of Vyacheslav Ivanov and Vladimir Toporov) have convincingly identified an Indo-European substrate underlying Slavic beliefs. Following from the work of philologist Georges Dumézil, this includes a tripartite conception of the social order (priests, warriors, and farmers-commoners), the duality of a sky god and his adversary, and worship of the sun, fire and light, and ancestors. More controversially, archeologist Marija Gimbutas has argued that Slavic pre-Christian beliefs represent a mixture of Indo-European patriarchal ideas and an earlier, “Old European” stratum of matrifocal, Earth-centered imagery and practice, the latter reflected in a widespread reverence toward the Earth, sometimes personified as *Maty Syra Zemlia* (Russian/Ukrainian: “Mother moist Earth”). Other scholars, such as Boris Rybakov, emphasize the slow evolution of Slavic religion from simple animistic beliefs

in life-giving spirits (Ukr. *berehyni*, or protectresses) and life-threatening ones (*up-ryi*, or vampires), ancestral cults, and personifications of fertility and communal order (*Lada*, *Kupala*, *Rod*, and others), to the “higher mythological” pantheons of the late pre-Christian era.

Slavic peoples considered the world to be animated by a wide variety of spirits, ranging from those that inhabited the rivers and waters (such as *mavkas*, *vilas*, and *rusalkas*), forests (Russian: *leshny*, Ukrainian: *lisovyk*, or “he of the forest”), fields, and households, to personifications of illness, climatic forces, abstract principles (such as fate, bad luck, and the community or *Rod*), and souls of the dead. Typically, springs and wells, rivers, groves of oaks and other trees, the rounded tops of hills, and raised flat areas overlooking rivers, seem to have been held with particular reverence. Some scholars have sought to explain fairytale characters, such as the East Slavic *Baba Yaga* (the Old Hag) or *Koshchei* the Eternal, as relics of ancient gods or goddesses, but these can perhaps more parsimoniously be explained as products of the folk imagination.

Calendrical rituals were commonly connected to the periodic return of the ancestors, the comings and goings of nature spirits, and the agrarian fertility cycle. Seasonal festivals display a rich semiotics of agricultural and ancestral symbolism: decorations of greenery to welcome the return of the ancestors or nature spirits in springtime, food set aside for the souls of the dead and sheaves of grain and bundles of straw representing ancestors during winter rites, and so on. Late nineteenth and early twentieth-century calendar customs show a synthesis of pagan and Christian elements, typical of the peasant religiosity that scholars have called “double-faith” (Russian: *dvoievierie*). The Christmas period is marked by *Koliada* rites: the lighting of fires, processions of masked carolers performing ritual theatre and offering greetings and wishes for a bountiful harvest, offerings of food and drink to the “visitors” (representing the ancestors). Fire and water figure most prominently in springtime and midsummer rites, often centered around such figures as Yaryla (or Yarovit), Kupalo, and Marena. (The names vary among different ethnic groups.) Kupala’s festival, celebrated at midsummer (St. John’s Day in its Christian incarnation), included ritual lighting of fires, bathing, divination, songs, dances, and, traditionally, the dressing and sacrifice (by burning or sinking in water) of an effigy representing the deity.

Analysis of Slavic folklore has allowed researchers to reconstruct the archaic mythological image of the Slavic

World Tree, a three-tiered vertical structure whose levels correspond to a heavenly world, represented by birds, sun and moon; an earthly world represented by bees and humans; and an underworld represented by chthonic creatures such as snakes and beavers. This structure is arguably preserved in late-pagan statuary; for instance, a four-sided temple statue found near Zbruch in western Ukraine includes, in its top level, representations of distinct deities facing the four cardinal directions, a human *khorovod* or ritual community in its middle level, and a three-headed underworld figure (most likely Veles) holding up the world.

Numerous remains have been found throughout Slav-occupied territories of temples with upraised platforms, frequently located on hills, with wooden or, less frequently, stone statues of deities: some with three or four heads facing the cardinal directions, some holding a drinking horn or decorated with emblems such as sun symbols, incised horse figures, and the like. Twelfth-century chronicles name several deities as having been worshipped in Prince Volodymyr's (Vladimir's) late tenth-century imperial capital, Kyïv (Kiev). The most prominent of these was Perun, god of thunder, law and war, associated with oak trees and groves, and commonly identified with the Germanic Thor. Veles, or Volos, god of horned livestock, wealth, and the underworld, is thought by some to have been his adversary (the duality being analogous to the Indian gods Mitra and Varuna, locked in an eternal combat between sky and underworld). This is attested perhaps by the fact that he was excluded from Volodymyr's temple atop the Kyivan hills, but worshipped in the lower merchant's town of Podol below. Other deities reflect an unmistakable Iranian (Scythian or Sarmatian) influence, while the female Mokosh was likely a fertility goddess. Svarog and Dazhbog both clearly contain elements of sky and sun gods known from other Indo-European speaking peoples. Most of these deities can be traced back to earlier forms as personifications of natural forces.

It seems probable that Volodymyr's pantheon was established in the decades preceding Christianization in an attempt to cement together a religion appropriate to a growing empire. By 988, Volodymyr himself rejected that religion in favor of Byzantine Christianity. Late pagan practices continued in isolated and more northerly areas, most notably at the temple-stronghold at Arkona on the island of Rügen (now in Germany), destroyed by the Christian Danes in 1168. Despite intense efforts, however, beliefs and practices changed slowly in rural areas. Gods were replaced by saints (Perun by St. Elijah, Veles by St. Blasius, Yarylo by St. George), pagan festivals by Christian feast days, sacred sites by churches, and magical and divinatory practices were accommodated to new understandings.

Smuts, Jan Christiaan (1870–1950)

A brilliant student, he spent only four years at school before being awarded the Ebdon Scholarship to attend Cambridge University. He was deeply influenced there by the philosophical and sociological thought of the German professor H.J. Wolstenholme, and in addition completed a manuscript on the American Walt Whitman (unpublished, entitled “A Study in the Evolution of Personality”). His studies and especially his reading and study of Walt Whitman, moved him from his earlier pessimistic Calvinism to a more optimistic view of humanity, to conceiving of human personality as a process of becoming, and as the supreme part of nature.

Arising out of his own war experiences of personal and national conciliation and his scientific work in biology, he developed a philosophy of the relatedness of all things, and coined for it the term holism. The kernel of the idea of holism came from his earlier study of Walt Whitman and it developed in the light of Darwin’s understanding of evolution. Smuts rejected mechanist and materialist views and held that through a holistic evolutionary process, cosmic individuation was in process, extending from the inorganic through to the spiritual level. Thus he held that the whole of being was moving toward greater freedom, recognition of its relatedness, and personalism. Holism influenced his politics, in that he was an internationalist, rather than a nationalistic leader – a unifier of Afrikaans and English-speaking South Africans; a founder of the Union of South Africa, the League of Nations, the British Commonwealth, and the United Nations. His United Party lost to the Afrikaner Nationalist Party in 1948 and, leaving politics, he died on his farm Irene at Doornkloof, on 11 September 1950.

Jan Smuts served as Attorney-General of the Zuid Afrikaansche Republiek, Boer General, South African Prime

Minister, international statesman, scientist (botanist),

President of the South African Association for the Advancement of Science, Fellow of the Royal Society (and its President), Rector (St. Andrew’s, Scotland), Chancellor (Cambridge University), and philosopher. He was born in the Cape hamlet of Riebeeck West on 24 May 1870, and it was here that he acquired his deep, mystical love of nature and, in particular, mountains.

He came from a devout Dutch Reformed Church family deeply influenced by the evangelistic piety of Dr. Andrew Murray. His mystical appreciation for nature he traced to a mystical experience he had when he climbed the peak of Riebeek Kasteel and later, in 1923, he related the significance of “The Spirit of the Mountain” at Maclear’s Beacon on Table Mountain. Such was his love for mountains that one of the paths to the summit of Table Mountain that he often climbed is named for him. In later life he was influenced both by the teachings of the Society of Friends (Quakers) and the mystical theories of Evelyn Underhill.

Snakes and the Luo of Kenya

Influenced by Western Christianity's diabolization and Freudian phallicization of snakes, many Westerners otherwise concerned with animals, animal rights, endangered species, ecology, and ecofeminism have not expressed similar interest in or impassioned concern for snakes. Joluo (Luo people) of Kenya, in contrast, display keen interest in snakes, particularly pythons. Luo are one of the largest ethnic groups in Kenya, with a population of over 3 million. They are related to Lwoo (Nilotic) people of Uganda and the Sudan, with whom they share some batrachian, piscatorial, and serpentine symbolism. Luo are now predominantly Christian, with affiliations divided among Roman Catholicism, various Western Protestant groups, and membership in African-instituted churches. Several thousand are Muslim. Movement between various denominations is not uncommon and commitment to some indigenous spiritual beliefs coexists with these other affiliations. Historically Luo have been an "agrigo-pastoral-fishing people." Their homeland since their migration from the Sudan, which followed along the Nile and its tributaries for much of the time, has been around Lake Victoria. One of their auto-appellations for themselves is Jonam, "the people of lakes and rivers." Their interest in snakes who flow their footless forms through several elements can be linked to their history, ecology, and cultural background.

The type of poisonous snakes found among Luo include rhinoceros vipers, Gabon vipers, puff adders, several types of cobras, boomslangs, mambas, hissing sand snakes, and blind snakes. Non-poisonous snakes include African rock pythons, egg eaters, brown house snakes, wolf snakes, green grass snakes, and file snakes. Some people will use *buya*, a word for weeds and *tond bungu* (rope of the forest), as euphemisms for snakes (*thuol*, *thuonde*), hoping to avoid calling snakes other than the python to them. Snakes tend to keep their distance from humans but occasionally venture onto paths, fields, termite mounds, pit latrines, and other places where snakes and humans meet.

In the past, big snakes, sometimes said to be cobras, were held to have control of wells. Neglect of the big snakes was believed to lead to drought. Some Luo placed offerings to the snakes by dry wells so that the wells would produce again. It was said that snakes had occasionally even demanded the sacrifice of a virgin (or an old woman substitute) in exchange for water. Cobras, along with hyenas and leopards, are clearly associated in Luo thought with night-runners ("night-witches") who are said to cast spells to harm neighbors under the cover of darkness. Black mambas are believed to dislike having humans look at them. Before becoming Christian or Muslim, some Luo made sacrifices to mambas as compensation for disturbing them. The ashes of mambas are still used in medicines made by some doctor-diviners for clients involved in bitter

disputes with others. Cobras and mambas are male symbols in Luo thought because of their shared capacity for being dangerous, poisonous, and bitter. If a pregnant woman has a dream with a cobra or black mamba in it, indigenous beliefs hold that this predicts she will give birth to a son.

Luo tend to distinguish pythons from other snakes and to want to have pythons nearby. Prohibitions on humans killing pythons are widespread in Africa, and found among Luo. Pythons' preferred habitat is savannah but they can also be found in or close to water. Pythons are the largest and most aquatic of Africa's snakes. Bodies of water are a female symbol for many ethnic groups around the world, including Luo. Pythons are highly dimorphic; females are much longer and heavier than males. While the saying "power is eaten whole" has been applied to men involved in African politics, the trope has applicability to pythons. Male and female pythons have structural features which enable them to consume animals larger than themselves. Their food includes hare, baboons, jackals, antelopes, porcupines, wild and domesticated pigs, calves, sheep, goats, dogs, doves, water fowl, fish, chickens, rodents, and snakes of other species. Since rodents are responsible for high annual loss of stored grain which is used to make the Luo staple, *kuon* (stiff porridge), pythons feeding on rodents counterbalance predation on domestic livestock. Pythons have the "maximum internal capacity" of all of Africa's snakes. A male python slowly digesting a large meal can resemble a pregnant human female.

Female pythons are highly prolific in the number of eggs they produce each pregnancy. They brood over their eggs protectively. They are not receptive to males while doing this. Their greater size and the position of their cloaca makes forced insemination impossible. While their maternal care is not lengthy, female pythons show the greatest parental care of all snakes. Luo have some interest in male pythons but more in females. This can be linked to beliefs about women's reproductive, healing, and spiritual powers. One Luo term for the uterus (*nyiseche*) is the plural of a word for the Supreme Being (*Nyasaye*). The womb can also be called *nyasach dhako* (the "godliness" of a woman). The Luo inflection of patriliney, polygyny, and the houseproperty complex makes each mother the head of her own house and of the matricentric segment that comes from her womb. Polygyny enables a long post-partum taboo and period in which women, like their python counterparts, are not receptive to males.

Luo make a distinction between people and animals, but this anti-Linnaean line can waver. Some Luo contend that the prohibition on killing pythons, which is still largely observed, exists because of the Luo belief that pythons were once people. It is said that some women had sought out doctor-diviners for medicine so that the women could be transformed into female pythons. In the present when a python is seen encircling flora, it is said to be signaling to humans that "the best" healing medicine is there. Before they became largely Christian, Luo built shrines at places where pythons stayed and made offerings concerned with increase. Men would pray at the site for a productive wife, women for children. Both would ask for rain and good yield for crops. Milk, which was something commonly offered to pythons, is a word in Luo homophonous

with their word for creation and creative powers. Today, Luo no longer build python shrines but continue to respect pythons. Pythons are still linked to the old boons as well as success in business and elective politics. The prohibition on killing pythons is still honored by most Luo. Respect for pythons, like that for ancestors, persists along with belief in imported religions. The effort of clerics to link pythons with the diabolic still meets resistance.

Certain pythons are believed to be larger and to have greater spiritual powers than other pythons. *Kit Mikayi* (Stone of the First Wife), a “natural” megalithic formation of several rocks located about 17 miles from the city of Kisumu, is believed to have sacred python protection. Luo oral narratives recount that Kit Mikayi came into being during a storm and earthquake that occurred where a first wife had gone to reflect, after her husband had rejected her for their child’s nursemaid, whom he had taken as a second wife. The first wife, her husband, the second wife, and her child are believed to have been turned into the megalithic formation. One or two pythons are said to guard it. Of those who believe there are two pythons, some speak of a male–female pair. More Luo believe there is a pair of females or one female python, regarding “all snakes responsible for blessings” as female. The python stays in a large pool in the interior of the rock formation. Some say its waters, like those that drip from the rocks, have healing properties. A few hold that the python guards both water and new wealth, contending there is also a pool of petrol inside the rocks protected by the python. People still leave offerings at the site for the python. Nyamgondho and Lwanda Magere, two Luo men who are the subjects of Luo oral narratives, and who met unhappy deaths because they did not treat a first wife well, are said to have come to the python-protected monument as unhappy ghosts, hoping to make redress for their errors. Luo political leaders have visited Kit Mikayi and its environs into the late twentieth and even the twenty-first century, recognizing that the multiple powerful images attached to the site remain central in Luo consciousness, and are a resource to be drawn upon for each generation. Members of several churches including Legio Maria, an African-instituted Catholic church, visit Kit Mikayi. Some Legios contend that Mary, a protector of women, provider of healing, and proponent of the use of holy water (“Mary’s medicine”) came to Kit Mikayi and increased the healing properties of its waters, making them holy. Some Luo contend that the pool of water in which the python lives goes all the way to Lake Victoria, where the python goes to drink and to visit other snakes. People say the python sometimes flies through the air to get to Lake Victoria accompanied by bats, the flying mammal.

In indigenous spirituality, Lake Victoria is seen as the home of powerful possession spirits who can take the form of pythons or, as is found elsewhere with snake symbolism, rainbows. When they rise from the lake to pierce the sky, their activity is believed to bring rain. Unlike ordinary rainbows, those of the python-rainbow spirits are held to be visible to devotees from dusk into deep night. Three of these python-rainbow spirits, Mumbo, Sumba (Sumba Adongo), and Rabudi, had devotees who came together in early anti-colonial political-religious movements. They grew their hair into long, “wild”

or “snake-like” locks. Mumbo was gendered as male; Sumba and Rabudi as female. One of Mumbo’s titles was *Min Rech*, “the Mother of Fish.” Maternity is so highly valorized by Luo that *Min* (Mother of) is an honorific that can be applied to that which is deemed “the best, biggest, most important, or preeminent,” regardless of gender. While all three movements died out before colonialism’s end, possession by Mumbo and Sumba has persisted. Sometimes called a consort of Mumbo, Sumba has been seen as a powerful python-rainbow spirit in her own right. She is regarded as the leader of other female possessive spirits. Her female devotees carry flywhisks, symbols of leadership throughout Africa. Ideally, bristles for Sumba’s flywhisks come from the tail of a waterbuck. Nyawigoluwe, who dwells above Lake Victoria, is a spirit whose rainbow character is more developed than her snake-side. Nyalkoi is a snakespirit with an affinity for water spouts.

Nyang’idi, the “daughter-messenger of God,” is a python-spirit whose home is Lake Kanyaboli, the largest of the three Yala swamp lakes. Luo have believed she periodically leaves her lake to visit families in the area. If properly welcomed, she will let people touch her. She is said to bless those who present her with food such as hens, cocks, and milk with rain and good yield. One origin legend states Nyang’idi is the mistreated elder wife of a Luo leader who had left her behind on his migration into Yimbo. She turned into a python whose peregrinations took her from Lake Kanyaboli to her husband’s Yimbo home as well as other areas of “Luoland.” While there have been periodic accounts of her being stoned and killed as she moves around the countryside, Nyang’idi has reappeared over the decades. As with the python who guards Kit Mikayi, Nyang’idi can be seen to embody the understanding that the “outsider” women upon whom Luo patrilineal homes and the female-headed farming system are so dependent can be transformed rather than crushed by abuse. Luo women who find powers and resources within themselves have proven themselves capable of casting off husbands and unhappy lives for new opportunities, much as pythons periodically shed their skins.

Omieri (also called Omweri) is yet another prominent python in Luo life. She is associated with Nyakach location, and in 1987 she was accidentally burned by men who had been clearing land. She was brought to the Kisumu Museum, whose animal specialists tried to save the burned python. Omieri finally died from her injuries. She was given a funeral and coffin as though a person had died. In

1999, the National Museums of Kenya exhumed Omieri and built a special display for her at the Nairobi Snake Park attached to the National Museum. This exhibit was part of the Museum Society’s 1999 Arts Festival. Stories of Omieri’s “fantastic divine powers” were recounted at the display’s opening, and subsequently reported in Kenya’s press. In March 2003, after the advent of full multiparty democracy in Kenya with the election of Mwai Kibaki as President on the National Alliance Rainbow Coalition ticket, Omieri was sighted in Nyakach brooding over her eggs. The election, which brought Luo out of the political cold after long-standing political opposition to the Daniel Arap Moi and Jomo Kenyatta regimes, and the return of Omieri shortly thereafter, were linked

in the minds of Luo. The NARC Minister for the Environment made a promise in Kenya's Parliament that Omieri would be protected by the new government through the efforts of a committee guided by officials of the Kenya Wildlife Service and National Museums. Omieri again received extensive coverage in the Kenyan press. This time she also made her way into internet discussion lists for Kenyans, online sites devoted to snakes and spirituality, the BBC, and American and other international newspapers. For many Luo, this python who has fascinated so many is not the "daughter" of the old Omieri who "died" of her 1987 injuries, but the same snake as the old Omieri, who was herself the same as the python of Kit Mikayi, Lake Kanyaboli, and the female pythons of Lake Victoria. Snakes are a perduring symbol for Luo.

Snyder, Gary (1930–) – and the Invention of Bioregional Spirituality and Politics

Gary Snyder is one of the most influential green poets and prose writers of the second half of the twentieth century. He became one of the leading intellectual architects of several green religious movements, including bioregionalism and green anarchism, deep ecology, ecopsychology, radical environmentalism, and what could be called neoanimism. Yet for some he will always be most known as one of the “beat poets” during the second wave of the San Francisco Poetry Renaissance of the 1950s and 1960s. What distinguished him and fellow poets Michael McClure and Kenneth Rexroth from the rest of the beat movement was a deep sensitivity to nature, a perception of its sacredness and “intrinsic value.” In those and the following years, Snyder’s influence grew throughout environmentalist sub-cultures and the counterculture more widely.

Born in San Francisco and raised on a farm in Washington near Mt. St. Helens and Mt. Rainier, three long streams of his life may be traced to his early years. First, his childhood experiences encouraged both a profound reverence for wild nature and a concern about its destruction:

From a very early age I found myself standing in an indefinable awe before the natural world. An attitude of gratitude, wonder, and a sense of protection especially as I began to see the hills being bulldozed down for roads, and the forests of the Pacific Northwest magically float away on logging trucks (1977: 15).

And this wonder involved what for Snyder has been an enduring perception.

I was born a natural animist. It wasn’t a moral or intellectual thing, from early childhood, I felt the presence of other beings, and I enjoyed being out in the woods right back of our farm . . . I think most kids are natural animists (unless otherwise cited, all quotations are from author’s interview with Snyder in Davis, California, June 1993).

Second, Snyder had friends with the left-anarchist Industrial Workers of the World and a grandfather who “soapboxed for the Wobblies” when he was a young adult (1990: 124), and such ideology left an imprint that would emerge in his political writings. Third, he graduated from Reed College with a degree in literature and anthropology, which undergirded much of his future poetry, prose, and activism. Snyder worked a variety of outdoor jobs as a young man, including one as a logger and another briefly

with the United States Forest Service after college, a position from which he was dismissed due to his association with leftists during the anti-communist purges of the time.

A New (Old?) Religion and Politics

Snyder's anthropological studies helped draw him to both Native American and East Asian religions, leading him to once contend that they constitute "one teaching" (1980: 67). But finding American Indian cultures inaccessible to non-Indians, "its content, perhaps, is universal, but you must be Hopi to follow the Hopi way" (1980: 94), he chose to study Buddhism intensively, which he did for twelve years beginning in 1955, especially focusing on Zen Buddhism in Japan. In Buddhism he found metaphysics of interdependence and kinship ethics with the nonhuman world that resonated with his own animistic perceptions. But while he also found teachers of "Buddhist anarchism" and formed a commune with fellow anarchist Nanao Sakaki while in Japan, he was disappointed with the more prevalent martial and bureaucratic Buddhism that he encountered there, concluding that world religions primarily function to "reinforce the societies they are in" (1980: 2).

Upon his return to the United States his lifework really began, as he sought to integrate religion and politics into a new, bioregional spirituality that he hoped would, over time, reconnect humans to nature and nudge them to develop ecologically sustainable spiritualities and political arrangements. Snyder first came to public attention as a beat poet, and to those in the know, as the model for the character Jaffe Ryder in Jack Kerouac's *Dharma Bums* (1958). He was deeply influenced by these enclaves, which he described later as rich "with anarchist and Wobblie connections and full of anti-authoritarian leftists." Yet Snyder's influence soon began to extend beyond those enclaves and into environmentalist sub-cultures and the counterculture at large. This was in part because he was offering something innovative, both spiritually (an earthen spirituality to a culture feeling alienated from nature and anxiety about this) and politically (an alternative to an impersonal, technocratic, centralized nationstate).

Buddhist-Animist Spirituality and Deep Ecology

Once back in the United States, fed by and feeding the countercultural ferment of the time, Snyder began to develop and promote a distinct religious perspective and became a major contributor to the "deep ecology" movement, which also expresses a reverence for the Earth's living systems and asserts that nature has inherent value. He concluded that in Western cultures it is probably more politically astute to promote "deep ecology" rather than Paganism (or perhaps even Zen Buddhism). Yet he nevertheless contended in discussions with deep ecology proponents that Zen expressed deep

ecological ethics with unsurpassed philosophical sophistication. This is certainly one reason that Buddhism has remained central to his identity. In 1973, he called himself “a practicing Buddhist, or Buddhist-shamanist” (1980: 33), and twenty years later, after first indicating that he considered himself a “fairly orthodox Buddhist,” he also labeled himself a “BuddhistAnimist.”

Clearly, his enduring animist identity is as central to his nature spirituality as is his Buddhism. When asked in 1993 about interspecies communication, which he had periodically alluded to, he told a story about a woman named Ella, an Irish Mystic he knew in the 1950s, who once accompanied him on a walk in Muir Redwoods, north of San Francisco. Hearing the song of a yellow crown warbler, Ella turned to him and reported that this song was a special gift to her from that bird. Reflecting on this and my follow-up questions about what animism meant to him and what an animistic perception was like, Snyder answered

Its not that animals come up and say something in English in your ear. You know, it's that things come into your mind . . . Most people think that everything that comes into their mind is their own, their own mind, that it comes from within. It may come from someplace deep within or less deep, but everybody thinks it comes from within. That's modern psychology. Well, some of those things that you think are from within are given to you from outside, and part of the trick is knowing which was which – being alert to the one that you know was a gift, and not think, “I thought that.” Say [instead], “Ah, that was a gift!” . . . I have a poem about a magpie giving me a song (Magpie's song). That's just one [example]...

And like many environmentalist proponents of animism and Buddhism, Snyder criticizes monotheistic religions. Reflecting on the metaphysics of interrelatedness, which permeates his writing, Snyder said

Interrelatedness is a commonsense observation. We should remind ourselves that ordinary working people, traditional people . . . notice that things are connected. What's not common is the mind–body dualism that begins to come in with monotheism. And the alliance of monotheism with the formation of centralized governance and the national state, that's what's unnatural, and statistically in a minority on Earth. The [most common] human experience has been an experience of animism. Only a small proportion of people on Earth have been monotheists.

Snyder's spirituality and politics are thus linked in his dual critique of monotheism and nationalism. Arguing that these “do seem to go together” he concluded,

Jews and Muslims are the only pure monotheists, Christians hold to it in a very qualified and tricky way . . . Everybody else in the world is a multifaceted polytheist, animist or Buddhist, who sees things in the world [as alive].

It easy to understand why Snyder liked the influential article and book by Christopher Stone, “Should Trees Have Standing?” (1972, 1974), which argued that trees should be represented in the courts and other democratic processes. Reflecting on Stone's argument, Snyder noted that he had long resonated with the “animistic idea that you can hear voices from trees” and commented that this makes it easy to move

from the idea that trees should have standing to “nonhuman nature has rights.” Snyder came to understand that his own role as a poet was to promote such rights and to speak for the nonhuman world, “to speak for these things, to carry their voice into the human realm” (1980: 74).

For Snyder, these are sacred voices, although he periodically has cautioned against overuse of the word “sacred,” noting that this term can devalue what it signifies. Yet his work unambiguously conveys his reverence for life. Indeed, a central theme in Snyder’s writings is the sacramental nature of life itself, even the process of eating, and eventually, being eaten.

Eating is a sacrament. The grace we say clears our hearts and guides the children and welcomes the guest, all at the same time . . . (1990:184). To acknowledge that each of us at the table will eventually be part of the meal is not just being “realistic.” It is allowing the sacred to enter and accepting the sacramental aspect of our shaky temporary personal being . . . (1990: 19). And if we do eat meat it is the life, the bounce, the swish, of a great alert being with keen ears and lovely eyes, with foursquare feet and a huge beating heart that we eat, let us not deceive ourselves . . . (1990: 184).

Such a reverence he brought forcefully into poetic movements and the counterculture in general, first in the western United States, then much more broadly.

Anarchism, Bioregionalism, and Radical Environmentalism

While Snyder’s spirituality resonated with many in the environmental movement and Western countercultures, he has been equally influential in promoting radical environmental ideas and decentralism in green social philosophy. Specifically, he helped pioneer the green social philosophy now known as “bioregionalism,” which promotes decentralized participatory democracy within the contours of different (reconfigured) ecosystem types. Bioregionalism, for Snyder, represents an “exercise of ignoring the presence of the national state” if not an effort to overturn it outright, although he views this not as a violent, short-term revolutionary ideal, but as an evolutionary hope dependent on a transformation of consciousness.

As with his spirituality, Snyder’s bioregional perspective was deeply influenced by his understanding of Native American cultures. His reading in the 1950s of the studies of Anthropologist A.L. Kroeber, who concluded that Native American cultural zones paralleled regional ones, was especially influential on his thinking. Equally so was the anarchist writer Peter Kropotkin, whose thinking Snyder was introduced to in the early 1950s “as part of the poetry and political circles of San Francisco culture.”

Reflecting on such tributaries, bioregionalism drew, according to Snyder, on the history of anarchist thought . . . [on the conviction] that we do not need a state, and that the state or government is *not* necessarily synonymous with the social order and organi-

zation inherent in society. By *anarchism* I mean a nonviolent political philosophy that finds order in the possibilities of a free society, and not in the imposed order of a state structure operating with a monopoly on violence . . . not . . . wild-eyed bomb throwers . . . So North American bioregionalism is an extension of anarchist thought, combined with much appreciation of American Indian culture areas, the recognition of the virtues of decentralization, and the insights of “field ecology” (Woods and Schoonmaker 1985: 115–16).

From such sources and many discussions occurring within the cultural underground of the United States, Snyder and other bioregionalists surmised that small-scale societies, which live for a long time close to the land in specific ecoregions, can best figure out how to live there properly, both culturally and ecologically, listening to the land itself, and learning good environmental manners. Fairly rapidly, such ideas grew into the bioregional ideal, especially once a now-obscure figure, Allen Van Newkirk, invented the term in 1975. Snyder and the actor Peter Coyote, as well as Freeman House and Peter Berg (both of whom founded bioregional organizations and wrote widely in support of such ideals), for example, brainstormed together many of the ideas and tropes of the emerging movement – such as “reinhabitation,” the idea of reinhabiting land after being away and estranged by it in order to learn to live there sustainably. Snyder and McClure may also have coined the slogan “Back to the Pleistocene,” believed to have first appeared in print in an interview republished in *The Real Work* (1980: 57), which would later be adopted by Paul Shepard, one of the premier theorists of both ecopsychology and radical environmentalism. In the early 1980s, the slogan was used by Dave Foreman, one of Earth First!’s co-founders, and in a new kind of primitive marketing, it soon adorned T-Shirts and bumper-stickers. That Snyder also put the Australian Buddhist and rainforest activist John Seed in contact with Foreman in the early 1980s further illustrates Snyder’s influence on the evolution of radical environmentalism. Seed became one of the world’s leading proponents of deep ecology spirituality and radical environmental action. Indeed, close reading of Snyder’s *Turtle Island* (1969), which was awarded a Pulitzer prize in 1975, reveals nearly every idea and theme that would later erupt and find expression in the 1980s in the radical environmental movement, including the idea that industrial civilization is like “a cancer . . . eating away at the breast of mother Earth” (1969: 104–5). The radical environmental novelist Edward Abbey, who was familiar with Snyder’s writings, would further promote this metaphor, proclaiming through one of his characters in *The Monkeywrench Gang* that modern society’s obsession with growth represented “the ideology of the cancer cell” (1975: 186).

Criticisms and Rejoinders

Despite Snyder’s respect for Native Americans and what he believes are their nature-sympathetic cultures, some Indians have criticized him. In *The Remembered Earth*

(1979) the Cherokee critic, Geary Hobson, criticized Snyder for “inadvertently” starting a “white shaman fad” with some poems “in which the poet speaks through the persona of an Indian shaman” (Hobson 1979: 105). Hobson was easier on Snyder than many others in his article, acknowledging Snyder’s appreciation for Indian culture and that he was “one of the finest poets in America . . . when he is not pontificating about Indian things” (Hobson 1979: 107). But he clearly felt that Snyder and others should leave Indian things alone, so that “contemporary Indian writers” could speak for themselves, and certainly not assume the persona of a shaman. One of his contributors, the American Indian novelist Leslie Marmon Silko, was harsher, arguing that Snyder was a willing participant in a “two-part” attack on Indians, first by assuming in a racist way, along with many other white poets, that he could understand the mind of an Indian and express it in poetry; and secondly, by borrowing widely from Indians in his book *Turtle Island*, even its title, while failing properly to acknowledge “this land he is occupying . . . is *not* his land” (Silko 1979: 215). Silko takes offense that ethnographers and artists, including Snyder, then collect royalties on what she considers “plagiarized materials” (1979: 212).

While Snyder received some of the earliest criticisms of cultural theft from indigenous voices, by the mid-1980s, most of such criticism shifted to those in the New Age movement who fabricated an Indian identity to sell books or profited financially by selling “Native American” ceremonies or other experiences.

But Snyder had understood his spirituality in shamanic terms, so the criticisms cannot be considered off-target, even for those who do not find them compelling. Snyder himself did not duck the issue or distance himself from his worldview, which he saw as cohering with shamanism. In a 1979 interview that brought up the criticisms in Hobson’s book, Snyder responded directly. Shamanism comes from powerful experiences and wisdom that flow from making contact “with a totally nonhuman other” (1980: 154), he contended, “that is what I’m talking about when I talk about shamanism, which is a worldwide phenomenon and not limited in a proprietary sense to any one culture” (1980: 155). No one bothers Native American writers who speak in genres derived from European culture, Snyder continued, concluding,

As artists we are all free to write about anything we like. And if it is inauthentic it will show up sooner or later. If it really works, then people will trust it (1980: 155) . . . The practice of shamanism . . . at its very center is a teaching from the nonhuman, not a teaching from an Indian medicine man, or a Buddhist master. The question of culture does not enter into it. It’s a naked experience that some people have out in the woods (1980: 156).

For Snyder, then, authenticity resides in the experience; and the value of ritual rests in its power and efficacy. The emergence of new truths and practices are possible because they can be learned from the dynamic, changing, multivocal Earth, and time will judge their authenticity.

Gary Snyder’s work has also been criticized for its anarchistic, bioregional social philosophy. Some consider such ideology naive and utopian or devoid of a concrete

strategy for bridling either corporate power or nationstates themselves. Others assert such social philosophy cannot adequately address global issues, such as the destruction of marine fisheries or atmospheric pollution. The political theorist Robyn Eckersley, in *Environmental-ism and Political Theory* (1992), criticized anarchistic and bioregional thinking for assuming humans should take their cues from nature, arguing this would actually produce a world where the strong dominate the weak. Eckersley also argued that local communities often oppose ecological flourishing, so promoting regional autonomy often makes little ecological sense. Another political theorist, Dan Deudney, agrees that vesting political autonomy in a bioregion will often not serve either equity nor environmental well-being, arguing that bioregionalism has not explained how it could keep resource-rich bioregions from dominating those less well endowed.

Snyder views such criticisms as based on a misunderstanding of what anarchism means and on a *caricature* of bioregionalism:

Nobody ever said that anything was going to be autonomous, or that we were going to live [exclusively according to] bioregions. We're talking about theatre. Everybody has to get this into their heads. This is theatre, mythology, visionary praxis. This is forming a new society on the shell of the old. It doesn't mean the old society goes away, but it means you have some alternatives with which to act on the old. And nobody is thinking literally – aha! bioregions! autonomous nations! – or anything like that. There is a whole fluid way of looking at community relationships and jurisdictions. None of that is a useful discussion in terms of twenty-firstcentury politics.

Here and elsewhere Snyder's rejoinders indicate that he is not a naive utopian who is expecting to see the nationstate fall in the near future, ushering in an ecological new age. Yet he remains hopeful that bioregional spirituality and politics might, "nullify some things or lead to joint management committees between government managers and local people," and that such developments could provide valuable models for an environmentally sustainable and socially just future.

Snyder complains that critics intend "to demolish something that was never created, a theory or proposal that doesn't exist" and fail to apprehend that "bioregionalism is an educational proposal to see where we are." But if people could begin to see bioregional spirituality and politics in this way, Snyder thinks, "we might begin to see some cultural effects [and] then, we might see political effects."

Conclusion

For decades Snyder has been traveling widely from his home in the Sierra Nevada foothills to deliver lectures and poetry readings around the world, sometimes upon the occasion of receiving one of the numerous literary awards he has won. Since 1985, he has also influenced many college students as a professor in the English Department and Nature and Culture program at the University of California, Davis. Meanwhile, in no small measure because of his influence, watershed protection groups have swept

across America and local green coalitions in a number of instances have taken over regional governments, including in Snyder's home county.

If Snyder is correct that the proof is in the pudding, then it appears there is something ecologically and socially salutary to be found in the emergence of bioregional politics in America. And if he is correct metaphysically, then there will always be hope because the land and its creatures will always be speaking their truths, and all humans have to do is learn to listen.

I'm not really worried about what white people are going to do on this continent. If anybody lives here long enough, the spirits will begin to speak to them. It's the power of the spirits coming up from the land . . . That's what taught us, and it would teach everybody, if they'd just stay here. The old spirits and the old powers aren't lost; people just need to be around long enough to begin to [let them] influence them.

Snyder recalled this "elegant . . . if overly optimistic" view from a Crow Indian Elder during a 1985 interview (Woods and Schoonmaker 1985:116). In doing so he showed his ability to temper hope with cautionary realism and a sense that living long and attentively in place will be needed if humans are to reharmonize their lives with the wider natural world.

Social Construction of Nature and Environmental Ethics

Recent scholarly arguments about the “social construction” of various elements of human experience build on long-standing debates in Western philosophy, with roots in William of Ockham’s nominalist claim that there is no intrinsic link between words and what they signify. Nominalism makes clear the disjuncture between things and the terms we use to describe them, and thus provides the crucial insight for theories of the social construction of nature: there is no intrinsic, universal quality that is captured in the terms we use. Instead, those terms are conventions of particular cultures and times, intelligible because of the meanings and values of those cultures. Developing this insight in relation to social institutions and meanings, Peter Berger and Thomas Luckmann argue in *The Social Construction of Reality* (1966) that society is built up by activities that express meaning, such as language and ritual.

Theories of social construction have influenced religious studies in many ways, particularly through the appropriation of sociological approaches, such as that of Berger and Luckmann, which perceive religious rituals, symbols, practices, and texts as key elements in a culture’s creation and maintenance of social meaning and legitimation. In the study of religion and nature, the idea that nature is socially constructed has been important in light of debates among theologians and philosophers who believe that nature has objective, even divinely ordained, value prior to any human activity, on the one hand, and those who argue that the significance of natural processes and entities arises from human, rather than “natural” or sacred, processes.

Contemporary scholarship includes a wide range of social constructionist approaches, including Marxian, Foucauldian, deconstructionist, and feminist perspectives. Most of these contend that categories such as sex or race are not universal or natural, but instead depend on particular cultural contexts for their power and significance (Haraway 1991; Peterson 1999). Scholars in various disciplines have also applied this insight to the natural environment. They suggest that, not only are such clearly human phenomena as race socially constructed, but that this is true also for the wild or nonhuman. In this view, cultural contexts influence the ways people interpret and value nature and the diversity that results in understandings of moral responsibilities toward nature.

In the growing literature on the social construction of nature, it is possible to identify two distinct, though not necessarily contradictory, ways in which nature can be viewed as socially constructed. First, different individuals, times, and societies “construct”

particular versions of nature insofar as they interpret it in different ways in and through cultural categories and values. Many scholars insist that this type of construction is universal and unavoidable: we cannot experience nature except through the lens of meanings assigned to it by particular cultures and periods. As English literary critic Raymond Williams has noted, “the idea of nature contains, though often unnoticed, an extraordinary amount of human history” (1980: 67). Conceptions of nonhuman nature are historically and culturally determined, and there is no single, essential “nature” that people in all places and times recognize as such. This insight has been elaborated in contemporary ethnographic work, which shows that dominant Western ideas of nature and wilderness often make no sense in different cultural contexts. This meaning of the social construction of nature might more accurately be described as *construals* or interpretations rather than actual “constructions” of nature. What is “constructed” in this sense is not natural entities or objects but rather their meanings in particular contexts.

There is a second sense of the social construction of nature, however, in which nature is seen as being literally, physically created or changed by human activity. Some social constructionists argue that most of what is called natural, from city parks to rainforests, has been shaped by human actions. Very little of the world remains “natural,” of course, if natural means free of human intervention. Such intervention includes not only the obviously inhabited areas but also many places commonly viewed as wilderness. For example, Europeans have sometimes viewed lands occupied by indigenous people, especially in the Americas, as untouched by humans, even though hundreds of generations of human inhabitants have helped shape forests, fields, and waterways. Modern industrial cultures, of course, have had much more far-reaching effects on the nonhuman world. This leads British philosopher Kate Soper to assert, “In our own time the human impact on the environment has been so extensive that there is an important sense in which it is correct to speak of ‘nature’ as itself a cultural product or construction” (1995: 152).

This view of the social construction of nature can inform an evaluation of the varying environmental impacts of different forms of life, from those that remain invisible to outsiders, like the hunting, gathering, agriculture, and forestry practiced by pre-Columbian peoples in much of North America, to those with obvious, and undeniably negative, consequences for both humans and nonhumans, such as the paving, clear-cutting, and burning of modern industrial societies. This perspective also challenges the erasure of native peoples, whose “invisibility,” evidenced by the apparent absence of marks of their habitation, has helped justify exploitation of the lands they occupied. Further, awareness of human impacts on the environment is an important step toward critical analysis of those impacts and possible solutions.

Just as awareness of the ways that nature is physically shaped by human cultures enriches environmental ethics, so does an understanding of the symbolic construction of nature. The recognition that interpretations of nature are culturally mediated can challenge established ways of thinking about the nonhuman world and human relations

to it. Understanding the diverse ways that nature is humanly shaped in both physical and symbolic ways can help avoid dualistic visions of an eternal, universal, and unmediated nature as the realm of physical relations counterposed to a human realm ruled by symbols. Most importantly, perhaps, both versions of social constructionism remind us that nature, culture, and religion, in their myriad forms, interact with each other, in our minds and also in the physical world.

Despite their benefits, social constructionist interpretations of nature carry certain risks. These are most notable in writings that suggest that the nonhuman has been “invented” by humans and human culture. If all nature is constituted by human interpretation or intervention, for example, then there is no basis for evaluating one environment as better or worse or for resisting certain forms of human intervention in nature. Against this “hard” version of social constructionism regarding nature, several writers have offered a qualified or “soft” realism. Soper argues that while it is true that any distinction we make between the reality of nature and its cultural representation is itself conceptual, it does not follow that “there is no ontological distinction between the ideas we have of nature and what the ideas are about” (1995: 151). Soper argues that there is a nature out there, although she remains agnostic about our capacity to “know” this nature. Holmes Rolston III, one of the earliest philosophers to focus attention on environmental ethics, defends a “harder” realism regarding nature. While acknowledging that “All human knowing colours whatever people see, through our perceptions and concepts” (1997: 38), Rolston believes that we can still know nature “out there” in a (relatively and locally) accurate manner. Thus, commenting on Neil Evernden’s description of nature as “a category, a conceptual container” (Evernden 1992: 89), Rolston contends that we invent the category nature and put things into it because “there is a realm out there, labeled nature, into which things have been put before we arrive” (Rolston 1997: 42). The word “nature” thus emerged in response to the need for a “container” to match the non-human “forces and processes” that exist prior to and apart from human intervention. Even if terms like “nature” are not universal, they may still have real referents, which we can come to know in a meaningful way.

For many religious thinkers and practitioners, nature has objective reality because it reflects divine powers and processes. To believe that creation has value or meaning only as a result of human activities, in such religious perspective, is thought to entail arrogance about the power and significance of humans in relation not only to nature but also to transcendent or sacred dimensions of life. Thus for the study of religion and nature, strong versions of social constructionism might need correction not only from naturalistic perspectives but also from theological ones. The goal might be to appreciate but not overestimate the significance of human symbolic and discursive activity in regard to nature.

Social Ecology

Social ecology is a contemporary social theory that investigates the interrelationship between social institutions and the natural world. A major project of social ecological analysis has been its attempt to demonstrate that local, regional and global ecological problems are created by authoritarian, hierarchical and exploitative social institutions. As a political ecology, social ecology has been concerned with promoting social changes that could end exploitation and domination within human society and establish an ecologically sound relationship between humanity and the natural world.

Philosophically, social ecology has adopted a holistic and dialectical position, while its politics have tended toward communitarianism, decentralism, anarchism and libertarian socialism. Its dialectical roots can be found in the tradition of Hegel, Marx and critical social theory, while its holistic and organicist dimension is in the tradition of thinkers such as Elisée Reclus and Lewis Mumford. Political theorist Murray Bookchin is its best-known contemporary proponent. Although some have used the term generically to describe all leftist political ecology, and there is also a rather eclectic interdisciplinary academic field of social ecology, the present discussion focuses on social ecology as a political ecology with a libertarian and communitarian social perspective.

Social ecology has gained widest recognition through the writings of Bookchin. Although Bookchin once expressed sympathy with various forms of spirituality, he and his collaborator Janet Biehl have over the past decade developed a strongly anti-spiritual and anti-religious position. On the other hand, some commentators (such as David Watson, Joel Kovel, and John Clark) have argued that various forms of ecological spirituality are not only compatible with the values of social ecology, but also can make an important contribution to its further theoretical development.

In his earlier work, Bookchin emphasized the ecological dimensions of many spiritual and religious traditions. He praised the nondualistic worldview of tribal societies (and specifically their concept of the “way”) for uniting custom, morality, sensibility and nature. He suggested that animistic imagination offered modern society an outlook that is not only complementary to that of science but also more “organic” than the latter, and looked forward to a “new animism” based on a respect for and symbiotic relationship with other living beings. He also praised the libertarian, communitarian and ecological values of various radical Christian sects from the Middle Ages and early modern periods. And he wrote of a *telos* and a “latent subjectivity” in substance that led it to develop in the direction of mind and intellect, concepts that from the stand-

point of mainstream philosophy have obvious connections with idealist metaphysics and spirituality.

Beginning in 1987, Bookchin began to attack what he saw as irrationalist, anti-human, regressive tendencies in the Deep Ecology movement. His criticism soon broadened into a general indictment of what he typified as “mystical” and “spiritual” ecology. For example, he characterized ecofeminist Goddess spirituality as an attempt to depict women as naturally superior to men and to replace male chauvinism with female chauvinism. In addition, he condemned “mystical ecologists” for a multitude of evils, including rejecting political activity, fostering passivity and fatalism, promoting neo-Malthusianism, encouraging anti-immigrant feelings, exalting irrationality, opposing civilization and technology, devaluing humanity, and believing in an illusory “pristine” nature unaffected by human beings.

Some have questioned the objectivity of such attacks. It has been pointed out that in dismissing ecological thinker Thomas Berry as “misanthropic,” Bookchin cites Berry’s reference to humanity as a “demonic presence” while failing to note that this depiction of human destructiveness was part of a larger discussion recognizing humanity’s capacities for joy, wonder, and celebration of the universe. Bookchin’s use of such selective quotation and the kind of sweeping generalities mentioned above have led critics to charge that his attacks on spirituality and religious thought are without scholarly merit.

Bookchin’s collaborator Janet Biehl is also a harsh critic of spiritual and religious thought. Biehl contends that theistic spirituality places people in a condition of dependence and subservience and turns ecological politics into a form of “therapy” that makes meaningful political action impossible. However, she focuses her attention heavily on non-theistic feminist, and especially ecofeminist, spirituality. She maintains that many ecofeminists idealize Neolithic Goddess religions and the cultures that produced them, thus promoting irrational beliefs and distorting the history of societies that were in many ways repressive and hierarchical. More generally, she criticizes ecofeminist spirituality (which she characterizes, even in its pantheistic and panentheistic versions, as “theism”) as a form of superstition with politically reactionary implications. Thus, she has attacked spiritual ecofeminists, including the well-known writer and political activist Starhawk and ecofeminist theologian Carol Christ, for adopting a spirituality that rejects any idea of historical progress, denies the possibility of development in nature, uses obfuscatory metaphors, and fosters fatalism and political passivity.

Despite the campaign by Bookchin and Biehl against spirituality and religion, a number of theorists who are sympathetic to social ecology as a general perspective have argued that it is compatible with certain spiritual and religious traditions. Joel Kovel, for example, argues that social ecology should pay attention to what can be learned from mysticism, which he holds to be in touch with a primary, pre-linguistic relationship to nature that is unavailable through ordinary consciousness. Kovel rejects what he sees as an overly simplistic ecological outlook that conceives of the relationship between nature and humanity purely in terms of “unity in diversity.” He contends that

such an outlook, which has been advocated by Bookchin, overlooks the irreducible negativity within human experience and the necessary tension between humanity and the larger natural world. Kovel distinguishes between an *ego* that is associated with domination of the other, rationalization of experience, and dualistic splitting of the self, and *spirit*, which refers to the individual's experience of relatedness to larger and deeper realities, including the whole of humanity and the whole of nature. The concept of spirit, according to Kovel's formulation, expresses a negation of the dominance of the ego and connects the problem of human emancipation to the question of humanity's relationship to larger realms of being. In Kovel's view, an awareness of this connection was at the core of the insights of Lao Tzu, Jesus and Gandhi.

In making a case for a "deep social ecology," David Watson argues that the spirituality of many tribal societies has embodied a view of reality that is more social and more ecological than that of civilization. Watson contends that social ecology must pay more careful attention to the voice of nature as expressed in the myths, rituals and shamanistic practices of tribal peoples. He sees tribal spirituality as an integral part of the egalitarian, cooperative nature of these societies. Watson cites examples, including the Hopi salt expedition, of rituals that are not mere practical or instrumental activities, but are also an expression of the quest for a harmonious relationship with nature and the sacred. According to Watson, animistic religion contained greater truth than the classic modern scientific and technological worldview. He notes that contemporary science has confirmed the animistic view that humans are physically and psychologically continuous with nature.

In arguing for a radically dialectical social ecology, John Clark argues that part of the task of a social ecology is to investigate the physical, psychological and ontological aspects of humanity that link it to other living beings, to the Earth, and to a primordial ground of being. He contends that some concepts of "spirit" have been a means of expressing humanity's relationship to the constantly changing, non-objectifiable reality of nature and to its deeper ontological matrix. He argues that social ecology is compatible with a spirituality that expresses wonder and awe at the unfolding of the universe's potentiality for realized being, goodness, truth and beauty. Furthermore, he finds in such spirituality an implicit critique of the abstract conception of selfhood and dogmatic rationalism found in some versions of social ecology.

Social ecology is at present associated strongly with Bookchin's theoretical position. Consequently, some who have explored the affinities between social ecology and spiritual and religious thought have subsequently gone so far as to disassociate themselves entirely from social ecology as a theoretical and political tendency. Thus, the future relationship of "social ecology" to spirituality and religion will depend in large part on whether the term will primarily connote adherence to Bookchin's system of "dialectical naturalism," or whether it will increasingly refer to a theoretically more diverse tradition founded on a common problematic for inquiry.

Social Science on Religion and Nature

Religion: Good or Bad for the Environment?

“We shall continue to have a worsening ecologic crisis until we reject the Christian axiom that nature has no reason for existence save to serve man.” So argued historian of technology and medieval/Renaissance scholar Lynn

White, Jr. (1967: 1207), who effectively set the terms of debate over religion and environmental concern for the last three and a half decades. White did not mince words – “Christianity is the most anthropocentric religion the world has seen” (1967: 1205) – and his powerful condemnation of Christianity as the ultimate cause of Western environmental crisis prompted the coming out of allies, as well as the inevitably countervailing response as believers, sympathizers, and reformers scrambled to bring out Christianity’s greener hues.

Most scholarly commentaries on Lynn White’s bald thesis have fallen somewhere between the two poles of attributing either outright guilt or utter innocence to religion – scholars generally prefer, rightly or wrongly, to complexify such matters – yet none has come close to the stature of White’s 1967 publication. An early collection of top scholars of the era included arguments running parallel in some ways to White’s thesis, qualified rejections of White’s equation of Christian theology solely with dominion over nature, and a prototypical complexification argument claiming that capitalism, democracy, technology, urbanization, wealth, population growth, and resource tenure have all had environmental impacts on the Earth, with religion (in particular Judeo-Christianity) bearing only tenuous connections to this suite of causes. More recent responses have included philosophical and theological developments of the connection between religion and environment, attempts to bring science, religion, and environmental concern into closer dialogue, and inquiries into the ecological dimensions of a broad array of world religions and spiritual traditions.

Enter social scientists into the fray – after all, White’s argument, and the counter-arguments of White’s opponents, are empirical claims concerning social and cultural reality, and thus could in theory be tested by means of rigorous, often quantitative, social science methods. Perhaps the debate over religion and environment would be settled by means of controlled empirical studies, or analysis of data from existing stud-

ies, using the powerful statistical methods social scientists routinely deploy. Perhaps science can help us decide whether White's thesis is correct.

This is the aura of science, but not the reality. Social science has done a tremendous service to the study of religion and environmental concern, but it has failed to deliver the conclusive chapter to the story. To understand why, we must first consider how social science approaches this topic, then examine applications of social science to the environmental dimensions of organized religion as well as the religious dimensions of environmentalism.

The Social Science Approach

The world sketched by White is one in which what he termed the "marriage" of Western science and technology, not entirely consummated until the mid-nineteenth century, has wreaked environmental havoc in recent generations at a hitherto-unknown scale. The roots of these two institutions in Christian thought are deep: White traces the development of a distinctly scientific form of natural theology back to the thirteenth century, and large-scale technology back to the eleventh century, though with much earlier ties to the Christian doctrine of mastery over nature. By way of a causal model, then, White's argument moves from culturally-diffuse *ideas* inherent in Christianity to the powerful *institutions* of science and technology to the environmental *impacts* so obvious today.

The world sketched by a good deal of quantitative social science is rather stark in comparison to White's world. Not only is the timescale reduced to that for which data can be generated – in the case of surveys, the last several decades at most – but the societal complex of differentially powerful persons, ensconced in and carrying forth a wide realm of cultural and political institutions, often turns into a relatively undifferentiated mass of individuals. Virtually all social science tests of the White thesis operate in a world of self-reporting minds, participating – willingly or reluctantly, self-aware, self-deceived, or intentionally deceptive – in surveys designed to capture salient individual-scale characteristics. This rather ubiquitous doctrine of methodological individualism thus leads to a quite different causal model, which statistically aggregates patterns between the self-reported religious and environmental characteristics of *individuals*. *Ideas* are culturally diffuse only to the extent that a certain number of individuals claim to share them; *institutions* do not effectively exist; and *impacts* are assumed to follow based on expressed intent or concern of individuals – a not altogether convincing surrogate.

The challenges faced by social scientists, who wander this depauperate world in hopes of illuminating the much richer, though far less quantitatively tractable, world to which White referred, are understandably immense. Their strategies have been ingenious, and their accomplishments impressive. At the heart of their project have been three methodological questions concerning how to measure individual religiosity,

environmental concern, and the relationship between the two. Though the common assumption is that individual religiosity is well described in terms of theological beliefs, religious scholars running from Otto (1923) to Eliade (1959) to the present have emphasized that religious experience and practice are equally if not more relevant. Thus have followed innovative means of characterizing religiosity as a function of individual beliefs, belonging, and behaviors. More directly relevant has been the desire adequately to capture the religiously based idea White blames for environmental destruction: examples have included notions central to White's thesis, such as dominion-over-nature, or related religious characteristics such as fundamentalism, and conservative eschatology. Similarly, individual environmental concern is best captured by a variety of measures, including attitudes and beliefs, policy concerns, and behaviors, though these items do not necessarily produce a consistent picture. Yet many of these factors are omitted in social science analyses due to data restrictions or the view that not all are relevant.

Once the measurement of religiosity and environmental concern has been addressed, the question remains as to how to characterize their relationship. The obvious point of departure is correlation: do individuals who score higher in certain religious characteristics also score higher in certain environmental characteristics, and vice versa? Yet correlation is not causation: if A (in this case, a religious characteristic) and B (an environmental characteristic) are correlated, perhaps A caused B, but perhaps B caused A, or perhaps C (possibly a demographic characteristic such as income or education) caused A and B. Most social scientists translate the White thesis into their world as A (religiously based attitudes toward nature) causes B (lack of environmental concern). Few social scientists are concerned that perhaps B causes A (since A is arguably more general than, and thus includes, B); yet there are two exceptions. If one means not "environmental concern" but "the natural environment," the latter certainly has been assigned causal properties in socio-biological and related accounts. Additionally, if one considers A and B in at the institutional scale of organized religion and environmentalism, there is some evidence for the "greening" impact of the latter on the former in recent decades. Nonetheless, a remaining concern is that A and B may jointly derive from C. Thus most studies proceed from simple correlations to regression analyses in which demographic and other factors are added as "controls" – a method of effectively holding C constant to determine whether A has any independent effect on B. This method appears to be much more rigorous than the simple correlation, and has revealed a number of very important complications to the White thesis. But it should be remembered that, given the effective disappearance of institutions (not just science and technology, but, for instance, language and politics) and the reliance upon sample surveys, religion and environmental concern are understood as dimensions of individual human thought and action, alongside potentially complicating demographic and other dimensions of individuals. Even if, in the social science world, A does not seem to cause B, White's world may remain relatively unexamined.

Religion and Environment

There have been many empirical social science studies of the White thesis, but a small number of themes emerges from this literature. The first is that the connection between religion and environmental concern – as evidenced in surveys of sampled individuals – may be statistically evident, but it is substantially weak, especially when demographic (e.g., age, education, gender, social class) and other controls are taken into consideration. The weakness of the religion-environmental concern association has led some of these social scientists to declare the White thesis null and void, and others to reserve judgment until further studies sort out currently unsolved puzzles – as but one example among many, religiosity as defined by behavior appears negatively to influence environmental attitudes, but it positively influences environmental behavior. What is unarguable, however, is that not one single social science study has provided powerful and unqualified vindication of the Lynn White thesis.

The second theme is the theoretical point that, in regards to the relationship between religion and environmental concern among individuals, things are more complicated than they seem; or, put less generously, White's thesis is conceptually simplistic. For instance, several studies have called for some form of denominational disaggregation of Christianity, arguing that religiously based ideas of nature are by no means uniform across the spectrum, and some social scientists have joined other scholars who have argued that there are more ideological options available to Christians than the stark opposites of dominion over nature versus unity with nature.

A third, and quite provocative, theme is that ideas of dominion, and even related attributes of theological fundamentalism, may not be fundamentally religious – or, more broadly, religious affiliation may not itself be strictly religious. If so, White may be barking up the wrong tree in placing sole blame on Christian theology. As just noted, a whole suite of ideas of nature may be theologically available to Christians; perhaps, as these social scientists argue, certain ideas are mobilized by certain religious groups as a part of broader political agendas, and individuals accept these ideas as a part of their political – not merely religious

– commitments. This in part explains why political orientation is often a stronger predictor of environmental concern than religiosity. Religious identity may thus play an important role in providing individual support (or opposition) to the larger political-economic project of the domination of nature.

Environment as Religion

The above has assumed that religion and environmental concern are, as A and B, separable entities. Yet what if A and B are coextensive? Rather than consider whether religion has implications for environmental concern, some social scientists have taken a different tack in examining religious dimensions of environmentalism itself, or even

more broadly, to explore whether something like nature religion exists. To many people, this phenomenon should be called nature spirituality, since the very term “religion” denotes organized religion, yet characteristic features of religion are indeed found among those for whom nature, not God, serves as sacred locus. Catherine Albanese notes four varieties of nature religion in American history: the Transcendentalist legacy inherited by contemporary environmentalism, metaphysical forms of spiritualism (e.g., Theosophy) reaching to contemporary New Age practices, a revitalized emphasis on bodily healing and well-being grounded in nature, and Enlightenment-style natural religion and natural theology, expressed in peculiarly American forms such as pragmatism. The broad concept of nature religion thus includes, but moves far beyond, environmentalism *per se*.

Empirical work in environment as religion is relatively scarce, however. Most exists in the form of qualitative interviews, which have revealed strong religious dimensions of environmental thought and practice. One major study of American environmental values suggested significant and diverse connections with religion, ranging from nature as “God’s creation” to a source of spiritual experience.

But how widespread is this phenomenon? Some indication comes from a question on nature sacredness included in the 1993 International Social Survey Programme (ISSP) environment module, which asked respondents to state whether to them nature is sacred as created by God, inherently sacred, or important but not sacred. Given these three options of transcendent sacredness, immanent sacredness, and non-sacredness, nearly one in four U.S. respondents agreed with immanent sacredness, a strong support of nature religion which raises to nearly two in five (a plurality) among members of environmental groups.

One quantitative study of British responses to the ISSP question discovered that those supporting immanent sacredness in nature scored highest in questions of environmental and scientific knowledge. This finding runs contrary to allegations that nature religion threatens to rob environmentalism of its grounding in scientific rationality. Using other variables from British responses, two scales were constructed, one representing a respondent’s “romantic” (anti-scientific, spiritual) inclination, and the other representing a “materialist” (pro-science and economy) stance. Though a negative correlation would be expected there was actually little correlation between the two, and in fact those who scored high on the materialist scale also tended to score high on the romantic scale.

Further social science research on environment as religion may offer a new set of perspectives on the White thesis. Preliminary results from a nationwide survey we administered during spring and early summer 2002 to slightly over 1000 adult Americans suggest that attitudes toward nature sacredness may be a defining feature of American environmental concern. Fifteen candidate statements on nature sacredness were narrowed down to six in a pilot survey. These six statements were included in the final survey, which together with extended respondent interviews indicate that transcendent sacredness and nonsacredness are opposing positions (i.e., two poles on the

same underlying factor), but immanent sacredness is a relatively separate factor: those who believe that nature is inherently sacred thus may or may not (despite possible logical contradictions) ascribe to transcendent sacredness or non-sacredness.

Of these three positions on nature, responses regarding immanent sacredness proved to be quite strongly associated with environmental concern among adult Americans. We measured environmental concern in three ways: selfidentification as environmentalist, average concern for a suite of six environmental issues, and average participation in six sets of pro-environmental behaviors. Correlations between immanent sacredness (as measured by a factor score of three related variables) and these three measures of environmentalism are given in Table 1. The table gives results of both zero-order (i.e., uncontrolled) and partial correlations controlled for demographic characteristics, political orientation, and theological fundamentalism. For demographic background, we included age, gender, income, and educational level; political orientation was indicated by self-rating on a liberalconservative scale, and theological fundamentalism involved belief regarding the Bible as the literal word of God. Zero-order correlations are somewhat stronger in all cases, but the reduction following correction for demographic, political, and theological characteristics is minor. The strong association between belief in nature as sacred locus and environmental concern thus cannot be explained in terms of underlying demographic, political, or theological characteristics. In short, nature religion is a phenomenon in its own right, and closely linked with contemporary American environmental concern.

These correlation results are corroborated by a regression analysis, in which demographic, political, and theological characteristics were entered in successive blocks prior to the inclusion of the immanent sacredness factor. Results, using each of the three measures of environmental concern as dependent variable, are given in Table 2. Even following introduction of these other candidate explanatory characteristics, immanent sacredness alone accounted for between 41 and 59 percent of total variance explained in environmental concern. The closest runnerup, political orientation, explained between 29 and 43 percent, and much of this is due to its inclusion in the model before theological fundamentalism, which is highly correlated with political orientation and thus would have absorbed more of the variance if it were included first. (It is worth noting that, even in the strongest case, only about 20 percent of total variance in environmental concern was explained by all of these characteristics combined; environmentalism is thus by no means fully explained by them.) Beta weights (standardized measures of relative importance) of immanent sacredness also were much higher than political orientation, theological fundamentalism, and demographic characteristics.

These preliminary results admittedly suffer from the same limitations of social science analysis noted above. Yet they suggest that American environmental concern is more closely tied to nature religion, in which nature serves as sacred locus, than demographic background, political orientation, or degree of theological fundamentalism. Religion and environment are connected in broadly the manner White suggested, but not necessarily in the manner explored by most social science studies. It is thus

possible that environmental concern will ultimately be aided both by the progressive greening of institutional Christianity, *and* the growth of religious expressions rooted primarily in nature and not Judeo-Christian theism. White’s preferred “patron saint,” Saint Francis of Assisi, may well have felt at home in both camps.

Conclusion

The social science literature on the relationship between religion and environment has concentrated preponderantly on the “Does religion influence environmental concern?” interpretation of the White thesis as noted above, and primarily in the context of Christianity in the United States. While this literature has suggested important complications and elaborations of the White thesis, it has generally been inconclusive. A second interpretation, where environmentalism itself is a form of religion, is promising as suggested by the results of our study and others, yet requires further social science elaboration. And other interpretations have scarcely been explored: as but one example, it is quite possible that Protestantism has played a decisive role in nature–society relations in the West, though whether that role has been religious or more broadly cultural, and positive, negative, or both is open to debate.

—Independent variables entered as blocks in sequence as above. Note: Political orientation and theological fundamentalism highly correlated ($R = 0.343$), thus order of entry into regression reduces explanatory power of fundamentalism this area has been not only the relative paucity of qualitative studies, but also the virtual absence of coordination between quantitative and qualitative research. Both are important, and play complementary roles: quantitative research tends to be *extensive* in that it seeks generalities across populations, whereas qualitative research tends to be *intensive* in that it seeks depth of understanding in particular groups or individuals. Qualitative studies are also well suited for analysis of institutional forces, and not simply individual attitudes and behaviors. Our recent study mentioned above involved a dual, extensive-intensive methodological approach, in which approximately ten percent of all survey respondents were contacted afterward for open-ended interviews. The principal advantage of this dual methodology is that quantitative and qualitative data are linked by respondent; each component can thus directly shed interpretive light on the other.

What is needed is for social scientists to recognize in their analyses that the world of religion and environment is more than one populated by sampled individual survey respondents. Social science has brought great rigor to the religion-environment question,

but at the expense of a highly simplified domain. It could well be, as social scientists have generally argued, that the Lynn White thesis is limited; whether or not this is true, social scientists have not yet offered a conclusive indictment nor a compelling alternative. In their absence, popular culture is deluged with right-sounding proclamations on religion and environment; bookstores are overflowing with new titles. Lots of sweeping theories are being advanced. Many have rather naively suggested that the solution lies in nonWestern religious traditions, despite the evidence of serious ecological problems faced in non-Western parts of the world. Social science offers an important empirical check on these notions, but only if it remains mindful of its current limitations and works harder to develop a fuller theoretical and methodological base.

The task is huge, as huge as the scope of religion and nature–society relations. No wonder social science has not yet offered the conclusive word on White’s argument! As White himself admitted, “There are many calls to action, but specific proposals . . . seem too partial, palliative, negative . . . What shall we do? No one yet knows” (White 1967: 1204). Though some have ventured that, given this confusion, “It would probably have been better if the Lynn White debate had never occurred” (Hargrove 1986: xvii), academic research on the relations between religion and environment has surely been enriched. The “ecologic crisis” that so concerned White is still a concern for many of us today; we all want solutions. Yet, to the extent that any solution lays claim on the empirical reality of humans and their relations with the nonhuman world, social science will play an indispensable role.

Soelle, Dorothee (1929–2003)

Dorothee Soelle is a pioneering figure in German Lutheran theology. She has made significant contributions to post-Holocaust, feminist, and liberation theology from the 1970s to the present. Ecological concerns are reflected throughout her theology, poetry and political activism on behalf of anti-nuclear, anti-war, and anti-capitalist causes. Soelle criticizes traditional Christian theology for conceiving of God as the transcendent ruler of the world who subordinates weak, sinful human beings to “his” omnipotent will, and for conceiving human beings as dependent on God for salvation which implies human passivity in the face of global injustice.

In contrast, Soelle develops the idea of God’s suffering with creation. Her panentheistic theism conceives God as immanent wherever sharing and community, rather than domination, occur among living beings. God is a transcendent force enabling persons to heal, forgive and move toward freedom from ideologies of self-interest and profit. She defines sin as a social, not purely individual, phenomenon. Influenced by Karl Marx, Soelle identifies the remedy for sin as the salvation of creation from exploitation, alienation and injustice. She rejects Christian otherworldly understandings of salvation centering on heaven and the immortality of the soul. All of creation can manifest the reality of God’s presence, including the beauty of nature, human actions and political action against the exploitation of the human body and nature. Salvation entails the survival and flourishing of all life forms and the ethical awareness that human beings are co-creators with God. Nature is the site of a mystical I–You relation reflecting the non-personal dimension of the divine in beauty, form, and radiant light. Combining an aesthetic and political perspective on nature, Soelle equates faith with resistance against exploitation, and stresses a mystical participation in reality that binds together nature, humanity and God.

Sohappy, David (1925–1991) – and Salmon Spirituality

The relationship between religion and nature, and the quest for justice that links them, is exemplified in the story of David Sohappy, Sr., a spiritual leader and healer who fought for human and treaty rights in the Northwestern

U.S. and beyond. While Martin Luther King, Jr., marched for civil rights for African Americans, and Cesar Chavez fought for Mexican American farmworkers' rights, David Sohappy led the Indian ("Native American") fishing rights struggle. He was a Wanapum ("River People," after "*Che Wana*," the "Great River" as the Columbia was first known) seeking to restore rights guaranteed by the 1855 Fort

Yakima Treaty. In the treaty, the region's native peoples were forced to cede some nine million of their ten million acres of land to the federal government, but reserved exclusive fishing rights on their reservations, as well as rights to hunt, to gather roots and berries, and to fish at "all usual and accustomed places." David Sohappy noted that in the treaty, "We gave to non-Indians the *privilege* to fish for salmon to feed their families, while we retained the *right* to fish. A privilege can be regulated, a right cannot" (interview by author, 1988). Reflecting on his people's longevity on the river, he observed that, unlike archeologists, the Wanapum did not have to dig in the ground to know their history: it was preserved in their ceremonies. He declared that it has been evident through history that "fishing is our way of life" (interview by author, 1988). The salmon were special to the Wanapum. The first catch of the season was celebrated with a great feast of thanksgiving in which the whole community shared, and all subsequent catches ensured fresh and smoked fish for subsistence purposes and trade with other peoples.

Native peoples' fishing-rights struggles initially attracted little attention outside of the Columbia River region, until David Sohappy's successful suit against the Oregon Fish Commission and the Oregon Game Commission was upheld by the U.S. Supreme Court in "Sohappy vs. Smith" in 1968. A complementary ruling by federal judge George Boldt in 1974 in "U.S. vs. Washington" stated that native fishers were entitled to 50 percent of the catch on the Columbia.

Populations of fish species and sub-species had continually increased over the approximately ten thousand years that native peoples had lived and fished on the Columbia River. Scientists estimate that some 16 million salmon swam upriver in the 1880s. But in the twentieth century, overfishing by the fish factory industry severely depleted migrating salmon populations in the Pacific Ocean, while mining, logging,

other industrial operations and the construction of hydro-electric dams eliminated spawning grounds and habitat for the fish; the dams also impeded the flow of salmon smolts downriver toward the Pacific Ocean, and the return of mature salmon upriver to spawn at their birthplaces. In the past quarter-century in particular, more than a hundred species and sub-species of salmon were rendered extinct. In this context, David Sohappy sought to save the salmon and his people.

David Sohappy was born near Harrah, Washington on 25 April 1925 and raised in a traditional Wanapum family. He attended a few years of elementary school until he was taken out so that he would not lose his native heritage and way of thinking. He grew up in the pacifist Washat or “Seven Drums” religion, some of whose members became “dreamers,” visionaries who lived at times alone along the Columbia and were sought out for spiritual guidance and sometimes for practical advice on where to fish for salmon or hunt for deer. He worked to support his birth family, did military service, married Myra and had several children, and worked at different jobs. When he was in his thirties, he had fallen into the Columbia and felt a hand pull him out. A voice told him that his work was not yet finished. On another occasion, he heard a voice tell him that he was to be a spiritual leader. He would say later of these and similar experiences:

If the Creator wants you to know something he'll tell you. We never see the Creator, only hear him. I was asleep at one time and I heard this voice tell me, “Listen to this, here is a chant you have to repeat all the time” (Sohappy letter to Hart, 1987).

He and his wife, Myra, joined the Feather Religion, a stricter version of Washat, and become healers. He observed that

When we go to our services to help heal people we pull down the power of the universe. People that can see, can see it coming. You've got to go the way you're supposed to all through your life. If your worst enemy comes over and asks you for help, you've got to help him. As long as you're asked to help, then you've got to help (interview by author, 1988).

David became recognized as a Dreamer who had been called by the Creator to teach, to heal and to struggle for justice. He was following the ways of his great uncle Smohalla, a Washat prophet who had led a resurgence of native spirituality in the late 1800s. During David's healing ceremonies, his patients felt a magnetic force coming from his hands; it was said of him also that he had power to control storms and other natural forces. Referring to his role as a Dreamer, he said “We're told in a dream what's going to happen. You hold services and tell people, ‘Here's what I dreamt, here's what we have to do next’ ” (interview by author, 1988).

During World War II, the River People were forcibly relocated from some of their lands, with little warning by the federal government, so that the Hanford Nuclear Reservation could be established for nuclear weapons development. Today Hanford is known as the most polluted place in North America because of its radioactive sectors and the chemical toxins that are seeping into the Columbia River from its storage sites.

When the Dalles Dam was constructed in 1957, its backed-up waters covered over Celilo Falls, the largest native fishing site in North America. The Dalles and other dams covered native villages, burial sites and petroglyphs. The federal government promised “in lieu” sites to replace the flooded villages and fishing places, but the sites were never constructed. Native fishing was restricted to Zone 6, some 113 miles between the Bonneville and McNary dams: the amount of fish Indians might catch was reduced by ocean factory fishing and by non-native fishers (commercial and sport) in the five zones downriver. David Sohappy and other River People occupied Cook’s Landing as their “in lieu” site, and sought to have a permanent fishing village there. He observed wryly later: “They keep trying to tell me that we were only supposed to stay there temporarily. I told them that I’m on this Earth only temporarily, and so is everything else.” He noted further, “We’re supposed to have our own community, our own beliefs, our own longhouses, the traditions that have come to us” (interview by author, 1988). When federal and state governments tried to restrict the rights of the River People even after his successful court cases, David Sohappy used civil disobedience to fight for those rights. He fished openly and sold fish at the site of an old riverboat dock, Cook’s Landing in Washington, which he and other Wanapum had occupied in the 1960s.

In 1982, David Sohappy, Sr., his son, David Jr., and other native fishers were arrested for fishing illegally and selling their fish to undercover agents in an operation the federal government called “Salmonscam.” Initially, they were indicted for catching 40,000 fish. The fish were missing from Zone 6, based on the first fish count at Bonneville Dam and the second upriver at McNary Dam. It was discovered later that most of the fish had gone up different rivers to spawn because of effluents from aluminum plants along the Columbia, and were not missing after all, but David and the others still went to trial. They were prosecuted under the Lacey Act Amendments, introduced into the U.S. Senate by Washington’s Senator Slade Gorton, whose family owned a major seafood company, while “Salmonscam” was already underway. David was accused ultimately of selling 317 fish to the federal agents, convicted in federal court in 1983 and sentenced to five years in prison. In his trial and appeal, David was not allowed to invoke provisions of the 1855 Fort Yakima Treaty or of the 1978 Indian Religious Freedom Act to justify his activities. The Ninth Circuit Court of Appeals turned down his appeal in 1985.

David and the other fishers were tried and acquitted in Tribal Court in 1986, but the federal government demanded that they remain in federal prison. In his trials, and throughout his appeals, David declared that his people’s ancient religious laws, which included teachings about fishing responsibly for salmon, took precedence over the federal and state laws that denied him his fishing rights:

Lots of people couldn’t understand what I was talking about when I told them that I follow Unwritten Laws. They didn’t understand. I told them I follow a law that is higher than any written law. So they told me, “So you’re above the laws!” I said, “I didn’t say that, I follow a law that is higher than any written law.” Their laws can’t stop me. Their laws can’t stop the storm (interview by author, 1988).

When he taught Washat traditions, David Sohappy spoke about honoring all creation: “Water, the Mother Earth, the Sun and the Wind: without any of these there would be no life on Earth . . . The belief is that if we don’t honor these things we will have no more; everything will fade away” (interview by author, 1987). His major focus was on his people’s responsibilities to be faithful to their religious beliefs. The Wanapum were to respect the salmon, pray to the salmon spirits, act responsibly toward the salmon, and express gratitude to the salmon for providing food for the people. “The salmon was created for the people to have for their own food . . . We are taught that if we honor our food, it will come back. If we stop, it won’t come back” (interview by author, 1988).

While in prison, David Sohappy suffered a stroke (an event initially denied by prison officials, who declared that he was suffering from the “hysterical paralysis” which native peoples sometimes have when confined), and his physical condition deteriorated. Human rights groups around the world urged his release, including at United Nations International Human Rights Commission meetings in Geneva, Switzerland through interventions by Myra Sohappy. Then Senator Daniel Inouye, Chair of the

U.S. Senate Select Committee on Indian Affairs, used his political influence to secure David’s release in May 1988 after he had been imprisoned for twenty months. On his release, he said, “My life is for the salmon. After my work is done, I will move on” (*Treaty Council News*). His health was poor, and after resuming life at Cook’s Landing with limited activity, he suffered another stroke and was hospitalized in Toppenish, Washington. He died there when struck by a third stroke on 6 May 1991.

His people and other natives of the Americas remember David Sohappy as a powerful spiritual leader and healer, as well as a courageous champion of natural rights and the rights of nature.

Soka Gakkai and the Earth Charter

Soka Gakkai is a lay Buddhist organization founded in Japan in 1930 as an educational reform movement by school principal Tsunesaburo Makiguchi (1871–1944) and inspired by the teachings of Nichiren Buddhism. Makiguchi was committed to the development and happiness of each individual student and affirmed the symbiotic relationship between the individual and the environment in his 1903 book, *Jinsei Chirigaku* (The Geography of Human Life). Key principles of Nichiren Buddhism and the Lotus Scripture that guide Soka Gakkai practice are *engi* (the dependent co-origination of all things), *esho funi* (the oneness of life and its environment), and striving to fulfill one's Buddha-nature in this life on Earth.

While all Buddhists teach the balance of wisdom and compassion, Nichiren (1222–1282) is famous for adding the virtue of courage that inspires members of Soka Gakkai to be socially active. Makiguchi died in prison for not cooperating with the military government, and in the 1960s Soka Gakkai formed a political party that became the third largest in Japan by the year 2000. But SG activism and growth has been controversial among established religious groups.

Soka Gakkai spread worldwide in the 1960s and formed Soka Gakkai International (SGI) in 1975. SGI grew to 12 million members in 180 countries and territories by 2002. The emergence of the Earth Charter was seen by SGI as a modern expression of the Buddhist teaching of the interconnectedness of all life. As a result, SGI members have globally sponsored discussion of the Earth Charter, and ecological consciousness has become an integral part of SGI teaching.

SGI has an affiliated research center in Brazil, the Amazon Ecological Research Center, which undertakes tree planting and agroforestry as well as environmental education. SGI also co-sponsored an Earth Council video, *A Quiet Revolution*, which illustrates the importance of grassroots action to rehabilitate the natural environment. SGI organizations are involved in numerous practical initiatives such as energy-saving campaigns, tree-planting activities, environmental exhibitions, and recycling projects. In addition, SGI members in several countries undertake regular “clean-up” campaigns in their local areas.

When SGI-USA built a retreat center, most of its acreage was designated as a permanent nature reserve and it was named the Florida Nature and Culture Center. Because of the role of corporations in damaging nature, an educational Round Table seminar was organized by SGI at the World Bank in Washington, D.C. in April 1998, followed by regular Earth Charter Dinner Dialogues in Washington since March 2001. SGI-USA has presented the Earth Charter at interfaith activities as a common ground

that can be shared by all spiritual traditions, and organized a presentation at the World Parliament of Religions held in South Africa in 1999. SGI-USA also sponsored Earth Charter Community Summits in 12 locations in 2001, and by 2002 over 60 local SGI-USA district meetings had discussed the Earth Charter.

In 2000 SGI co-sponsored an “Earth Charter Asia Tour” with exhibitions, panels, and youth forums in the Philippines, Thailand, Singapore, Malaysia, Hong Kong, Korea, and Japan. In response, SGI-Philippines held a Waste Management Seminar on Earth Day, 2001, and in 2002 their women’s peace forum discussed the relevance of the Charter to peace. In Thailand, the “Before It’s Too Late” environmental exhibit toured nine cities and was seen by 180,000 people. In Malaysia a recycling project was cosponsored, and SGI has developed an Earth Charter exhibition. Beginning in 2002 a regular column called “Love the Earth” was started in Hong Kong SGI’s magazine to give information on the Earth Charter. In Korea the Charter was promoted in seminars and photo exhibitions were organized by the SGI student division. In Japan, an environmental group was formed by SGI members in Osaka called KEEP. SGI members in the Netherlands, Australia, France, South Africa and Belgium are also actively promoting the Earth Charter.

Institutionally, SGI has developed several specialized organizations to develop further its mission to promote peace, culture, and education. The Boston Research Center for the 21st Century (BRC) was founded in 1993 by SGI as an affiliate organization. In 1997 the BRC began a program of environmental awareness focused on the Earth Charter that resulted in a series of conferences and several booklets, namely, *Buddhist Perspectives on the Earth Charter* (1997), *Women’s Views On the Earth Charter* (1997), and *Human Rights, Environmental Law, and the Earth Charter* (1998). Also, in 2001 Soka University of America was opened in California on a site surrounded on three sides by a 4000-acre nature preserve.

“Soka” means “to create value,” and Daisaku Ikeda, president of SGI, emphasizes the value of nature in his writings and in his photographic exhibits. He emphasizes that education at its best involves an inner transformation of values to enable people to recognize their kinship with the environment and build a lasting peace.

At the World Summit on Sustainable Development in Johannesburg in August/September 2002, SGI’s proposal for a decade of education for sustainable development was included in the Summit’s agreed-upon Plan of Implementation, SGI co-produced the video *A Quiet Revolution* on local ecological initiatives, and SGI linked with the Earth Charter Initiative for “Educating for Sustainable Living with the Earth Charter.” By 2002 study of the Earth Charter and ecological responsibility had become important elements of SGI practice worldwide.

Somé, Malidoma Patrice (1956–)

Acknowledging the sanctity of nature is the centerpiece of Malidoma Patrice Somé's message. In his own words, "[n]ature is the foundation of indigenous life" (1998: 37) and

[i]f you peek long enough into the natural world – the trees, the hills, the rivers, and all natural things – you start to realize that their spirit is much bigger than what can be seen, that the visible part of nature is only a small portion of what nature is (1998: 47).

Malidoma Somé is a shaman of the Dagara culture of West Africa, a former college professor with two doctorates, the founder of the nonprofit organization, Echoes of the Ancestors, and an active voice in the Men's Movement. According to Somé, opening one's sensitivity to the intricacies of nature allows one to experience the natural environment in a more intimate way, ultimately allowing one to utilize its placid, powerful and healing traits. Proper rituals and communal support bolster the power and healing that nature provides to the enlightened individual. It leads the adherent to reunite with the vast forces of the universe that were unleashed during one's birth, or as a Dagara elder once said, to return to one's own center.

Somé's message challenges the machine, monetary, and textual culture of the West. He presents the indigenous culture as fit to embrace the salubrious power of nature, because it recognizes the spirit behind nature. The reliance on modern technology for spiritual fulfillment fosters an internal struggle within the Western spirit. To the Dagara, this type of chasm needs to be mended. A ritual is the typical procedure to reconnect the individual with his or her self, ancestors, and the spirit world, in order to realize one's own life purpose.

The *Baor* ritual – initiation – is the essential step for a Dagara male to reunite his spirit with his corporeal body. The neophytes are required to perform particular exercises that strengthen their awareness and adjust their sensitivity to the natural environment of the bush. These tasks are performed divinally and individually under the auspices and guidelines of the elders and their ancestors, and typically lead to the participants entering into a transcendental state. Out-of-the-body experiences allow the spirit to have the necessary maneuverability to connect to the individual soul. The ability to *sense* and *feel* one's environment is central to success in the Dagara world because it enables one to enter into the sacred realm of the spirit.

Somé was an atypical participant in *Baor*, because at the age of four, he was taken away by French missionaries and sent to a Jesuit school and seminary for 15 years. He walked back to his village at age 20, indoctrinated with colonial Christianity. *Baor* is

a dangerous undertaking in which all aspects of the body are vigorously challenged – every year there are participants that never return to their families. Somé was especially disadvantaged because he was considered “initiated” into the white man’s world, therefore his ancestral spirit had withdrawn from his body. Analytical thought, especially literacy, suppresses the ability to access certain traditional knowledge, because it occupies a space within one’s psyche that is reserved for something else (Somé 1994: 178). Of particular importance to Somé was his experience during the “tree exercise.” This event enlivened his ability to *feel* his surroundings in an animated way, rather than just see them in a mundane level. After two tedious days of staring at a *yila* tree, he eventually came to realize its sacrosanct character as he saw a vision of a green lady composed of a green fluid, from the inside out, whom, in her embrace overcame his body with an immeasurable amount of love. This green lady is symbolic of Mother Nature, a conscious embodiment; Somé believes that the relationship between Earth and humans is represented in an intimate mother/child bond of nurturing and love. Thus, humans have a natural spiritual link to the Earth.

These apertures into the otherworld are commonplace in the Dagara experience; there is little distinction between the physical and metaphysical. Going into the other realm is a conduit to understanding, and entering these other realms is ritualized in a communal setting, yet all participants have their own personal experiences, from which they can draw their own personal meaning.

Somé’s is a crucial voice to describe to Westerners the relationship between religion and nature in Dagara culture because of his dual citizenship in the modern and traditional worlds. His popularity is evidenced by the diverse circuits that embrace his work. At “spiritual” retreats he promotes the need for elders in the industrial society. Grief ceremonies, ritual initiations for boys and girls, connecting with the ancestors training, and anger-management courses, are among the activities that he encourages under the theme of finding identity and balance.

Somé speaks out to the gay audience by comparing their secondary position in the West with their primary position as “gatekeepers” of the Dagara tribe’s relationship with the gods and the spirits. Some women’s conferences and groups have placed him among their speakers or added him to their required reading lists. Somé’s wife, Sobonfu, also conducts seminars and workshops on the relevance of indigenous ideas and practices to modern problems.

According to Somé, the indigenous cultures of Africa are ideal places to seek pacification and restoration with nature because they are formatted to coordinate with their natural environment. The Dagara rely on each other to survive in the harsh environments of certain places. Somé extends this reciprocal relationship through his work in the Western world. He shares the wisdom of the Dagara, in exchange for the supply of necessary resources like the construction of water reservoirs and the means to fight extreme poverty and sickness to preserve indigenous culture. Moreover, he asserts that indigenous African spirituality can provide a necessary model for people of

industrial cultures to develop their own spiritual awakening and healing in their own ritual, communal, and natural environments.

Southeast Asia

Southeast Asia is a vast, diverse, complex, and dynamic mosaic of interacting religions and ecologies. Geopolitically, the region encompasses all of the countries East of India and south of China. The region is usually divided into two major parts: the mainland or continental parts include Vietnam, Laos, Cambodia, Thailand, Burma (Myanmar), and peninsular Malaysia; and insular (island) parts include the Philippines, Singapore, Brunei, Indonesia, and parts of Malaysia.

Southeast Asia is extraordinarily rich in biodiversity as a result of being a crossroads, the prevalence of tropical forests, and insularity. Biologists refer to Southeast Asia as the Oriental realm, but it is heavily influenced by the adjacent biogeographic realms of the Palaearctic (mostly East Asia), Ethiopia (northern Africa into the Middle East), and Australia. Each of these three realms has a distinctive natural history including a combination of plant and animal species. The three realms overlap in Southeast Asia. The natural vegetation cover of Southeast Asia is composed mostly of varieties of tropical forest. (Cambodia is the only country in the region with extensive savannahs or grasslands.) Insularity is another important factor. For example, Indonesia is composed of 13,677 islands, and the Philippines of 7100 islands. Geographical isolation, a prime characteristic of islands, stimulates speciation through adaptive radiation as populations competing for limited resources develop distinctive niches. Thus, it is no coincidence that within Southeast Asia, the country with the highest biodiversity is Indonesia. It contains over 20,000 species of plants, 515 mammals, 1519 birds, 270 amphibians, and 600 reptiles. A significant number of these species are endemic; that is, limited in distribution to parts of Indonesia and not found elsewhere.

Cultural diversity refers to the number of cultures in an area and is often estimated by the number of associated languages. Religion, as part of the socio-cultural system, is also part of cultural diversity. In general, there is a correlation between cultural and biological diversity. In areas where cultural diversity is high, so is biodiversity (number of species). In areas where cultural diversity is low, so is biodiversity. Exceptions occur, but this diversity principle reflects a general tendency. As a related generalization, diversity is highest in equatorial regions (especially tropical rainforests), and lowest in polar regions. Indonesia illustrates the diversity principle. It has not only the highest biodiversity in Southeast Asia, but also the highest ethnic, linguistic, and religious diversity. No less than 672 different languages are spoken in Indonesia, most associated with a different ethnic group, and many of these with their own distinct religion.

In Southeast Asia, cultural identity is usually closely related to a particular geographic place and one or more biomes. (A biome is a category of similar ecosystems,

such as lowland tropical rainforests.) Indeed, to some degree each culture is a distinctive adaptive strategy for relating humans to their natural environment. Technology, economy, religion, and other components of culture as an adaptive system are all intimately related to the ecosystems in the habitat of a society. Accordingly, in characterizing cultures in Southeast Asia these general types are often recognized – coastal fishers and traders, lowland wet-rice agriculturalists along river floodplains and valley bottoms, and swidden (shifting) horticulturalists and foragers (hunter-gatherers) in the hill and mountain forests. The great rivers of mainland Southeast Asia are the Irrawaddy, Salween, Chao Phraya, Mekong, and Red. These rivers not only supply water to rice paddies, but together with land and sea routes also link the different regions within Southeast Asia and beyond through extensive networks of trade and commerce. The distinctive systems of food production in Southeast Asia are correlated with sharply contrasting levels of population density (individuals/square kilometers): foragers (less than 1), swidden horticulture (dozens to a hundred), and wet-rice agriculture (hundreds to over two thousand). The highest population densities are associated with rice farming on the rich soils of volcanic islands like Java in Indonesia. The higher the population density, the greater the complexity of social, political, and religious institutions as well as other aspects of culture. Furthermore, higher levels of population density cause greater environmental impact through more natural resource extraction and consumption with resulting waste and pollution.

As societies deplete their own natural resources, they must extend their reach to those of other areas through trade or conquest, and states do this far more than any other kind of society. The state, or civilization, is a variety of culture which includes some combination of a centralized government, bureaucratic administration, police and military, cities, monumental architecture, writing, craft and other specialists, and social stratification (socioeconomic classes). The earliest states in Southeast Asia began around 500–1 B.C.E. However, only later, starting around the eleventh century, did the famous theocratic cities develop such as Borobudur, Angkor Wat, and Pagan, located respectively in Java, Cambodia, and Burma of the present day. They were among the societies heavily influenced by the spread of the Hindu religion and other aspects of culture from India.

Throughout insular Southeast Asia, the most important form of political organization was often connected with controlling trade and commerce, and the independent harbor principalities headed by chiefs, rajas, or sultans with small territories focused on river estuaries or seaports along the coasts. International commerce developed in Southeast Asia by the first year of the Common Era and flourished from the fifteenth century onward. China was the main market, until European colonialism began to change the dynamics of the political economy in the sixteenth century. For millennia, sporadic wars were fought for the control of routes of trade and commerce, such as the many conflicts between Burma and Thailand.

Religious conversion often accompanied the expansion of trade and commerce from South Asia, with Hinduism and later Buddhism spreading into most parts of mainland

Southeast Asia, and Islam into much of insular Southeast Asia. The introduction of a new religion may have influenced local and regional ecology significantly, but this possibility requires further research.

It is noteworthy that rapid population growth did not begin in Southeast Asia until the eighteenth century or even later. For example, in Thailand, as late as 1825, the population was less than one million, whereas today it is more than 60 million. In the past, the fact that traditionally most Thai males became monks for some period of time, ranging from a few months to years or even a lifetime, combined with the fact that monks are supposed to be celibate, must have helped reduce population growth. However, future population growth in Thailand, and elsewhere in Southeast Asia, is likely to continue well into the next century before it stabilizes, thus putting increasing pressure on the land and resource base, on the ability of the environment to absorb waste and pollution, and on economic, social, political, and religious institutions.

In many parts of Southeast Asia, there have long been occasional tensions and conflicts between the highlanders and lowlanders, the former marginalized in almost every way, and the latter more powerful economically, politically, and militarily. Throughout the region today with increasing population, the need for agricultural expansion, and national security concerns, the highlanders, who usually live in border areas between countries, are often victimized, including through military attacks, involuntary labor, forced relocation, and pressure for conversion to Theravada Buddhism as the dominant state religion, such as in the case of the Karen along the border between Burma and Thailand. For instance, in Thailand the highlanders compose only about 1 percent of the national population, but occupy nearly 20 percent of the national territory. Accordingly, they are destined to continue coming under increasing pressure from lowlanders and the state in the future. As another example, in contemporary Vietnam, economic development in the highlands is controlled by the lowlanders, often with negative impact on highland societies and their environments.

Religion is an extremely ancient, pervasive, and powerful force in society, politics, and history. Furthermore, traditionally religion is usually the primary means whereby the individual and society as a whole orient to the world, find meaning in life, and are guided and motivated. There is a remarkably rich diversity of religions in Southeast Asia.

The mainland is predominantly Buddhist and mostly of the Theravada sect, while the insular portion is mainly Muslim, except for the Philippines which is 80 percent Catholic, a reflection of its long Spanish colonial history. Underlying these mainstream religions, however, are elements of the prior indigenous religions of animism, a belief in multiple spiritual beings and forces in nature. Hinduism has flourished mainly in Bali, and Hindu influences remain in the popular religion of many in Java, southern Sumatra, Cambodia, southern Vietnam, and Thailand. People of Chinese ancestry in Southeast Asia may practice aspects of Confucianism, Daoism, and/or ancestor worship in addition to, or instead of, other religions like Buddhism. Thus, whereas in Western societies an individual usually ascribes exclusively to only one religion, in

Asian societies an individual may actually practice more than one religion without any sense of incongruity.

The Indonesian island of Java illustrates the complexity of religion in Southeast Asia. Islam is the main religion of Indonesia. However, on Java, orthodox Islam is mainly practiced by the merchant class, urban bureaucrats emphasize forms of Buddhism and/or Hinduism, and animism is common among farmers and others in rural areas. Furthermore, in Southeast Asia there are enclaves of Muslims in countries that are otherwise dominated by another religion, as is the case for the Malays in southern Thailand and the Cham in Cambodia.

The impact of European colonialism has been more economic and political than religious in Southeast Asia. Christianity has not been as influential there as it has elsewhere in places like Latin America. Nevertheless, today there are millions of Christians in Indonesia and Vietnam as well as in the Philippines. In addition, new religions have developed, or old ones have been revived and revised. For instance, Cao Dai emerged in Vietnam in the early twentieth century as a mixture of Confucianism, Daoism, Buddhism, and Christianity. In part it was a reaction against French colonialism and was outlawed, although now it is an officially accepted religion. Because religions are different in the way they relate to nature, these changes in religion may have ecological consequences, and this possibility needs to be researched.

Religious differences may allow different ethnic groups to coexist in the same environment by promoting niche separation rather than resource competition. For instance, in southernmost Thailand, it is common to find adjacent Buddhist and Muslim communities who use the same environment differently mainly because of their religion. As an illustration, Buddhists exploit a far wider spectrum of wildlife species than do Muslims who consider many species to be unclean and taboo.

Religion can also contribute to nature conservation. For instance, in many parts of Southeast Asia there are individual trees, groves, and forests that are believed to be sacred. Consequently, resource exploitation in such sites may be significantly reduced or even avoided or prohibited entirely. Whether intentionally or inadvertently, sacred places in nature may serve as conservation areas that protect some species as well as portions of ecosystems and landscapes. As a case in point, caves associated with Buddhist monks are considered sacred. Bats which roost in these caves during the day fly far beyond them in feeding at night and are important agents in pollination, seed dispersal, and insect population control. The sacred status of caves may help protect the bats in them and thereby the ecological functions of the bats. However, in many regions Christian and Islamic missionization has threatened or even destroyed sacred places in nature as pagan, and therefore diminished or eliminated any value they might have had in conservation.

The people on the island of Bali in Indonesia remain mainly Hindus, but practice a syncretic religion that also includes elements of animism and Buddhism. Temple priests function through rituals as regulators of the flow of water for irrigating wet-rice paddies. The water is derived from a sacred lake in the volcanic mountain at the center

of the island. Also temples in Bali, Thailand, and other places in Southeast Asia often provide sanctuaries for macaque monkeys and/or other species. The animals and plants in temple yards are protected by virtue of their association with the sacred space.

The subject of the relationships between religion and nature has barely started to gain attention in the last two decades in Southeast Asia. However, there have been some significant public initiatives. One is the Siam Society international symposium in Chiang Mai on culture and environment in Thailand. The main conclusion reached by the Thai and foreign participants was that Thailand is experiencing serious environmental degradation because of a decline in adherence to its culture and religion through uncritically and unselectively embracing so-called modernization. In another regional symposium, international participants at the Buddhist Institute in Phnom Penh, Cambodia, explored the environmental crisis and environmental ethics from the perspectives of the Buddhist, indigenous, and Islamic religions. Such initiatives may be indicative of an emerging realization that spiritual ecology has some practical potential to contribute to the reduction of environmental problems in Southeast Asia.

While “modernization” has contributed to the secularization of societies in many ways, religion still remains important in the lives of most Southeast Asians. It is really quite amazing that religions have persisted for millennia under such very different circumstances, yet they have obviously provided meaning and useful guidance in the lives of many people to this day.

At the same time, however, there is the perennial obstacle of the discrepancy between ideals and actions. The core principles of Buddhism and Hinduism can be applied in ways that are environmentally friendly. For instance, both share the ideal of *ahimsa* or avoidance of harming other beings. However, in practice there is natural resource depletion and environmental degradation or even destruction throughout most parts of Southeast Asia. Such discrepancies are nothing new, but have intensified with the pressures of the accelerated growth both in population and materialist consumerism, especially in recent decades with economic development and now globalization. Accordingly, today one of the greatest challenges is for individuals, communities, and nations to identify and more closely follow the ideals in their religion in ways that are most conducive to developing more sustainable and greener societies that conserve, promote, and enhance biodiversity and ecosystem vitality instead of degrading them.

Space Exploration

Loren Eiseley called the return to Earth from space “the last miracle” in his book *The Invisible Pyramid* (Eiseley was a renowned paleontologist at the University of

Pennsylvania; the most well received of his eloquent popular writings on evolution was *The Immense Journey*). But that is not the first thing that needs to be said in a discussion of space exploration, religion, and nature. So let me return to Eiseley’s important insight later on. I want to begin, instead, with astronaut Michael Collins’ comment about the Apollo program: he said it was all about leaving. It is hard to avoid the conclusion that space exploration entails the abandonment of the Earth and its nature, leaving them behind in a technological thrust onward and upward. Surely technology, not nature, has been the emphasis of space exploration, and arguably technology has always been about surmounting nature. Of course, an other-worldly religious orientation in the West has helped to generate such an Earth-denying agenda on the part of technology, so that a film with a fast cut from Gothic cathedral spires to Cape Canaveral gantries would not lack semantic continuity. And Loren Eiseley’s book title suggests an even longer history for our superhuman drive to be up, up, and away.

To be sure, the technological mission was eventually meant to *supplant* the spiritual priorities that fueled it, based as it was on scientific perspectives that scarcely allowed for gods in heaven above, let alone in Earth’s sacred groves. Thus it was entirely consistent with such perspectives when a Soviet cosmonaut derisively observed the lack of angels visible along his flight path transcending terrestrial skies. By the same token, the U.S. astronauts’ Christmas reading from lunar orbit sounded sincere but sentimental – and seriously out of keeping with the mechanistic attitudes they were triumphantly embodying. In spiritual terms their accomplishments were rather a defilement of whatever sacred attributes either the Earth or the moon were thought to possess by more traditionally religious cultures.

Even the mediating image of the garden, representing a more gentle technology in relative attunement with nature, is jettisoned by our recent rocket launches into space. Buckminster Fuller’s “Spaceship Earth” idea – described in the inventor and philosopher’s 1969 work *Operating Manual for Spaceship Earth* but made public by Fuller even earlier – had already imagined our home planet as a totally technological environment, and a mechanistic vision was no less dominant in dreams of a future in space: gardens completely surrounded and tightly controlled in floating biospheres; space colonies on the moon or Mars, allowing only a life-sustaining minimum of neo-nature, purged of all wildness; “terraforming” fantasies in which heavenly bodies would

be scarified in an engineer's caricature of earthly ecology. A 1979 article by George Woodcock summed up these technohorticultural visions as "the garden in the machine," reversing Leo Marx's earlier notion of American environmental history as "the machine in the garden."

Surely, however, venerable American archetypes of advancing frontiers and Manifest Destiny continued to shape the efforts of NASA as well as the eloquence of John

F. Kennedy in pursuing the space race with the Soviet Union, which propelled us to the moon. Woodcock's essay appeared in a special issue of the *Michigan Quarterly Review* commemorating the tenth anniversary of the first lunar landing. Most of the articles and poems in the issue noted the emphatically technological auspices of the space venture, along with the unreflective if not robot-like behavior of the astronauts, trained to a technical perfection which excluded, with rare exceptions, any philosophical or poetic, let alone religious, musing on their unique experiences in space.

Several contributors to the issue decried this response to space exploration as dehumanizing, but all noted the focus of NASA and its astronauts on finding the factual information and acting on it efficiently, with seldom a thought given to the romance of the journey. The exceptions were indeed rare: Edgar Mitchell returned from space a spiritual seeker with transpersonal psychology interests and founded the Institute of Noetic Sciences; James Irwin splashed down as a Christian evangelical who started a "High Frontier" ministry. These two responses were in stark contrast to the military overtones of the "New Frontier" competition with the Soviets or the later "Star Wars" dreams of missile defense. Mitchell and Irwin saw something sacred in space but also turned back to look at the Earth. And, through the media, so did we.

Certainly it was the view of Earth afforded us by space exploration that led to Loren Eiseley's "last miracle." Of course, this view suggested different things to different onlookers. Some, like President Carter, saw its message as laudably pacific but largely political: no national boundaries were visible on the Earth from space. Others found this an incitement to mystical dreams of Oneness. Some were struck aesthetically by the beauty of a blue-and-white planet that looked like a precious jewel or Christmas tree ornament. May Swenson, in her poem "Orbiter Five Shows How Earth Looks from the Moon," found a dancing woman, a temple celebrant, in the outlines of clouds and continents.

In this poetic perception we begin to get intimations of archaic spirituality, Earth-oriented rituals, myths, and ceremonial sites which once involved reverence for the immanently sacred that aligned us with nature and its cycles. Even popular films with space themes hinted at this deep sense of terrestrial reconnection, as I pointed out in my 1986 book, *Approaching Earth*. The black monolith, modeled on Stonehenge, in *2001: A Space Odyssey*; a Mayan temple that provided the rebel base in the first *Star Wars*; and the Native American sacred mountain serving as the rendezvous point for earthlings and aliens in *Close Encounters of the Third Kind* all bespoke earthly imperatives which counterbalanced the spacefaring quests of the films' main characters and the Space-Age culture they represented. In each case, through these ancient religious rallying sites, a

closeness to terrestrial nature seemed the surprising accompaniment to an ostensibly outwardbound focus.

It is fair to say that a renewed connection to nature did not occur in any specific and full-blown way to the Earth's outer-space onlookers until the *Whole Earth Catalog* emerged with the famous photograph on its cover and a message of ecologically sustainable living in its pages. Here a green consciousness was blended with a techie sensibility: technology can yet return to heal the Earth it has sought to abandon.

Still, the whole-Earth photo was pivotal, even miraculous, in reorienting our attention toward the terrestrial environment. When the first Earth Day was proclaimed in 1970 following a decade of manned space flight and the

first lunar landing, Earth and its nature became the most significant discovery – or rediscovery – of the Space Age. It seems more than a coincidence that 1970 was also the year that *The Invisible Pyramid* was published.

Loren Eiseley's post-Apollo vision, set forth in this text with the same eloquence he had displayed in *The Immense Journey*, involved his having been shown Halley's comet in the night sky when he was a small boy in 1910. He knew that Halley's would be returning in 1985, and he saw that return – which he did not live to witness – as a metaphor for the conscious and caring re-entry he felt a technological culture in the Age of Space needed to make into the green world, the “sunflower forest,” of nature's processes. With characteristic evocative power, *The Invisible Pyramid* set forth his hope for this “last miracle” of technology, the realization of earthly nature and its tending as the first priority of space exploration.

The attitudes of the 1970s in many ways followed the lead of Earth Day and Eiseley's hopes, replacing the attitudes of Earth-denial in the 1960s. In 1974 Lewis Thomas' *The Lives of a Cell* envisioned the Earth as a fragile onecelled organism within which human beings are a kind of nervous system. A year later English geochemist James Lovelock presented his “Gaia Hypothesis,” a more scientifically grounded version of Thomas' metaphor, in an article that was succeeded in 1979 by his book with the arresting subtitle *Gaia: A New Look at Life on Earth*.

Lovelock, with biologist Lynn Margulis, had taken his inferences from observing the surface of Mars in work with NASA and applied them to the Earth. He proposed that the latter was an autonomous being creating and adjusting the organic conditions, from the atmosphere to human life, for its own continued existence as a global biosphere. Lovelock got the name for his hypothesis, the pre-Olympian Earth goddess of ancient Greece, from his neighbor in England, the novelist William Golding.

And it has to be said that, at least initially, the Gaia Hypothesis resonated more positively (if often vaguely) with aesthetics and spirituality than with strict science. In fact, Lovelock was taken aback by the outpouring of agreement from those who knew little or nothing about ecology as a science.

Nevertheless, this proposal further underscored the terrestrial reconnection that space exploration had quite amazingly begun to foster: not only was this a redirection of our attention, but also, for many, a reenergized reverence for nature. Sally Ride, the

first U.S. woman in space, may have had the extraction of “natural resources” more in mind than a Gaian spirituality, but it was evocative for her to speak in favor of a “Mission to Earth” a few years after the last lunar landing in 1972. The testimony of contemporary literature, too, was for the most part supportive of earthward rather than of spaceward ideals, as Ronald Weber concluded in 1985 in his *Seeing Earth: Literary Responses to Space Exploration*.

By 1986, on the other hand, several reassessments tempered any totally upbeat view of our Space-Age rebirth as eco-earthlings. In the papers from a conference on ecofeminism, Yaakov Jerome Garb raised questions about whether our vantage point from outer space represented “perspective” or, after all, “escape.” He deconstructed the whole-Earth photograph to find an alienating distance, a literalistic image, and a disturbingly univocal sign of the “one-true-story.” Peter Bishop weighed in with a Jungian critique of “the shadows of the holistic Earth,” fears of immensity, loss, and fragmentation hidden in our SpaceAge fantasies of environmental harmony and order. I contributed a milder warning with a piece called “Getting Back to Gaia,” a prelude to my *Approaching Earth* book, in which I pointed out Lovelock’s ignorance of the implications of the name he borrowed for his hypothesis – and the consequent need for a non-scientific sophistication about the myths and metaphors at play in our Space-Age reconsiderations of Earth lest these be lost in exclusively cybernetic strategems.

The explosion of the *Challenger* space shuttle that same year was another disquieting factor, turning us away from space exploration and toward earthly agendas, to be sure, but offering a reminder that our reconnection could be tinged with tragedy.

In the end, though, as appraised from the dawn of a new millennium, when millionaire Dennis Tito has just returned from orbit with an “ordinary citizen’s” reiteration of the inspiration the whole-Earth view gave him to be a born-again earthling, the most striking lesson to retain from our first forays into space is clear. They eventually provided the angle of vision that galvanized a new environmentalism, including an emergent ecofeminism, which “greened” most religious expressions, while perhaps as well specifically promoting a resurgent neo-paganism. Admittedly these movements have not swept aside the arguably patriarchal politics of pollution and exploitation. But space exploration provided a new start, and new hope, for the forces seeking ecological sanity and spirituality in a technological future.

Or perhaps it was Earth herself who was calling us back, teaching us that at the height of our highest technological leap beyond her bounds, our humanness required a seemingly outmoded grounding in the dark wet soil of home, Eiseley’s ancient sunflower forest. A miracle indeed – a last one, we are well-advised to imagine, in that it is, finally, a remarkably positive legacy from the end of the troubled century when we first ventured into space.

Spinoza, Baruch (1632–1677)

Few thinkers have been as controversial, both in their lifetime and long after, as the philosopher, theologian, and Torah scholar Baruch (or Benedict) de Spinoza, usually referred to simply as Spinoza. At the age of 23 (on 27 July 1656) Spinoza was excommunicated from his synagogue in Amsterdam, in the ceremony known as the *cherem*, for his denial of the personal immortality of the soul and his doubts about the divine origin of the Torah. He was put under a ban that forbade any member of the congregation from communicating with him or reading any of his future publications. During his subsequent years as a self-supporting lens craftsman living in the southern part of the Netherlands, Spinoza experienced a more subtle form of censorship and was often accused of being an atheist for his anti-supernaturalism and his affirmation of the power of reason to disclose the nature of God. While he was able to get one of his works published in Latin, he had to modify his main work, *Ethics* (published posthumously in 1677) to get it ready for a Dutch language edition. Specifically, whereas in the Latin version Spinoza equated God and nature (*Deus sive natura*), in the sense of power but not in the sense of materiality, in the intended Dutch version he felt that he would have to drop out this correlation with nature. In his political and hermeneutic text *Theological-Political Treatise* (published in 1670) the correlation of God and nature is more boldly asserted, but again, in the sense that each is the power and the manifestation of being as infinite substance.

In the eighteenth and nineteenth centuries, the charge of Spinozism, which carried the taint of pantheism and even atheism, would appear when thinkers of the Protestant left struggled to articulate a more naturalistic conception of the divine. A famous instance occurred when the German Reformed theologian Frederick Schleiermacher (known as the grandfather of liberalism) was accused of importing this dangerous non-biblical and heretical doctrine into the church in his 1799 *On Religion: Speeches to Its Cultured Despisers*. Schleiermacher, while publicly affirming the influence of Spinoza on his thinking, was able to deflect this charge and get his early work past the censor. Yet decades later Schleiermacher's colleague at the University of Berlin, G.W.F. Hegel, strongly criticized any hint of Spinozism in religion – going so far as to say that Eastern religion was actually a form of Spinoza's pantheism because of its alleged corollary belief in one substance. For Hegel, Spinoza's substance was devoid of spirit or self-consciousness and thus could not be a worthy religious object. Even in the twentieth century both Jewish and Christian theologians have often had to tread lightly around any affirmation of the clear pantheism in Spinoza's *Ethics*. Yet Spinoza's positive impact on the Enlightenment, with its quest for a universal religion,

and Romanticism, with its hunger for the hidden abyss of nature, can be measured by the courageous ways in which a few major thinkers of this period revived the study of nature as a religious theme in its own right.

It is often assumed that Spinoza lived an isolated life that was cut off from contact with the creative minds of his time. In fact, he frequently entertained visitors of distinction in his home and was fully aware of what was taking place in the major universities of the Netherlands and beyond. He engaged in lengthy correspondence with noted philosophers and scientists and was able to answer some of the first criticisms of the pre-published manuscript version of his *Ethics*. He was an early champion of the ideas of René Descartes, and continued to teach the Cartesian philosophy to private students who visited him from Leiden University during the period in which such thought was effectively banned from Dutch universities – further damaging his reputation in the eyes of both Jewish and Christian theologians. Yet his championing of Descartes was not unquestioning, especially concerning the ideas of soul and substance.

For Descartes, the world is constituted by two fundamentally different modes of substance, whose interaction is somewhat shrouded in mystery even though he held that there may be a link between them through the pituitary gland in the brain. On one side is extended substance, which exists in three spatial dimensions and can be plotted on a three-axis (x,y,z) coordinate system. This is the realm of matter that can be analyzed using the principles of a mechanistic physics. On the other side is non-extended substance, the realm of mind, which has no spatial traits and is not located within any type of coordinate system. Non-extended or thinking substance provides direct evidence of its own existence through a process of introspection and self-conquering doubt of external reality. From a self-evident foundation of pure internal intuition consciousness can establish both its own immortality and the existence of a perfect deity.

For Spinoza, this dualism produced severe problems that he set out to resolve in his own metaphysics of substance. Unlike any manifest order within the world, substance is that which bears traits, while not having traits of its own; that is, “A substance is prior in nature to its affections (*Ethics*).” Yet for Spinoza there could only be one substance, not two or more. The one infinite substance has an infinite number of affections or modes, only two of which are immediately knowable by us; namely, the physical and the mental modes. Consequently, contra Descartes, there is one substance with two known modes, not two separate substances with a dubious connection. Mind and matter were simple, different modalities of the one nature or God. Further, Spinoza distanced himself from the atomism implicit in Descartes’ vision of nature and affirmed a deeper unity that he denoted by the Latin and medieval term “*natura naturans*” or nature naturing – somewhat akin to his use of the Latin concept of *conatus* or striving. Given the principle of unity in his fundamental ontology, Spinoza argued that the most basic value of life, and the foundation of ethics, was the intellectual contemplation of the divine infinite substance. Spinoza did not have any personal or social religious practices that pointed to an experience of the holy as a part of nature, but he did

articulate a kind of liturgy of the mind that sought a deep parallelism between the human understanding of the infinite (via two of its modes) and the infinite substance itself. By rejecting supernaturalism and any notion of a personal immortal soul, Spinoza came very close to a kind of nature mysticism in which the distance between the human individual and the divine is overcome through the human instrument of reason. This model provides no place for special historical revelation or for the sacredness of any text, as neither is necessary for the intellectual contemplation of God as nature.

Specifically, Spinoza argued that God (as nature) was unique, a necessary existent, the necessary cause of all things, and was devoid of will or intellect. Further, all things, no matter what their attributes, have their being in and are sustained by God. Again, the distinction between a creator and its creation is denied since both dimensions of nature are part of the same infinity. Interestingly, Spinoza's form of pantheism is necessitarian and denies anything like free will (both in God and in human beings). One implication of this is that, ". . . all final causes are nothing but human fictions (*Ethics*)." God as nature has no lack in its infinite reality and hence can neither have nor hold forth any unfulfilled goals. This view of the divine puts Spinoza on the opposite side of the divide from contemporary process perspectives, which affirm teleology and incompleteness in the divine and in the human order as it relates to the divine.

For centuries the epithet "Spinozism" has been a term of rebuke, yet very few thinkers have actually probed into the meaning of so-called Spinozism and into its key role in the evolution of our understanding of nature. While Spinoza has had little impact on contemporary ecofeminism, he has had a strong influence in two areas of thought that are of growing importance. In the French postmodern milieu he has appeared as a crucial dialogue partner and goad to the reflections of Gilles Deleuze who developed a non-linguistically centered ontology of nature and its inner dynamisms. This has opened up an avenue of reflection that is not ensnared in the stultifying debate between French structuralism and deconstruction. In the revival of classical Euro-American pragmatism, which rethinks the late nineteenth and early twentieth century texts of Charles Sanders Peirce, John Dewey, and William James, there is now a movement to unfold a metaphysics of nature that has clear and conscious ties to Spinoza. Among thinkers who have acknowledged this tie are Justus Buchler, Don Crosby, Jerome Stone, and this author. Process metaphysics is less open to a dialogue with Spinoza because of the latter's perceived eternalism and static view of the one infinite substance. However, insofar as process thought focuses on the extensive continuum, creativity, or the Platonic container, it may find itself more open to an appreciation of the power of Spinoza's key concept of *nature naturing*. By compelling us to take the concept of immanence with the utmost seriousness, Spinoza makes it possible for us to unfold a fully radical and consistent naturalism that neither romanticizes nature nor leaves it in the hands of an alien creator God.

Spirit and Nature

A theological term analogically borrowed from early natural sciences – namely, stoicism and Platonism – Spirit remains intimately correlated to a culture’s philosophy of nature. Insomuch as the philosopher William James once observed that “[r]eligion is our manner of acceptance of the universe” (Goodenough 1998: 47), a given culture’s sense of embeddedness or, conversely, self-exclusion from ecological systems may be deduced from its articulation of spirit. Despite the affiliation of dust and spirit in the creation stories of the Hebrew Bible, predominant correlations of Spirit and nature in the twenty centuries of Western Christianity have tended to legitimate an aversion of the Earth through the evocation of Spirit’s transcendence.

Early Semitic stories, like many indigenous cosmologies, employed the concept “spirit” (in Hebrew, *ruach*, translated as “breath” or “spirit”) without substantively pulling the sacred out of the ecological matrix. Spirit, rather than forcing the value of life to stand away from or against nature, conspired with the physical: quite simply as the air is indivisible, so the breath (spirit) of life that God breathes into the first human is indistinguishable from the human’s own breath (Gen. 2:7). Among the Jesus movements of the first century, “Spirit” was a predominant name for the experience of the immanent power and presence of God, that which promised the renewal of creation. During the first centuries, Christian theologians, philosophically girded with Platonic and Stoic dynamic materialism, capitalized upon Spirit as causal agent or efficacy of the sacred. Yet, two significant tidal turns in Spirit’s affiliation with nature transpired during these transitional centuries: 1) Spirit was, given its later Semitic affiliation with prophetic word and textual inscription, increasingly construed as a human, rational phenomenon; and 2) the apocalyptic cosmology of communities politically resisting the Roman empire, which had seemingly returned the Earth to “waste and void” (see Gen. 1:1–2), construed Spirit as another viable life region to which they might immigrate. Later Christian theologians read “the fall” of the Earth not as Earth’s conscription by empire, but as an ontological devolution of matter itself. Quite simply, nature, having once been a paradise, wasn’t itself any more, but had taken on qualities averse to life in the Spirit

– namely, transience, temporality, and suffering.

While Stoicism and Platonism considered Spirit to be the most refined, purified form of matter, with the onset of neo-Platonism in the fourth century, “spirit” (*pneuma*, in Greek, affiliated with “air” or “wind,” and “*spiritus*,” in Latin, meaning “breath”) came rather to designate that which was by definition immaterial. To invoke Spirit as the causal agent of a “new Earth” (Rev. 21) henceforth signaled Christianity’s revulsion

toward the conditions of finitude, spoilation and mortality. These psychic aversions were simultaneously visited as the occasion of women's subjugation, since (according to Aristotelean sensibilities) while man rationally ensouled, the human woman bequeathed to it its flesh-body. Consequently Spirit, Western Christian theologians up to this twenty-first century have claimed, liberates nature from its "bondage to transience" (Rom. 8:21), its temporal and finite constitution. Spirit's promised "second birth" through baptism lifted "man" out of the history of the animal, organic body, a conviction which has consequently legitimated Western culture's ignorance of and indifference to ecological limits.

Where Spirit was affiliated with human reason, as it has been in Cartesian rationalism, the concept of Spirit can hide humanity's tendencies toward ideological control of nature. Christianity's primary distinction between the sacred and the world, typically invoked as the distinction between "the Creator" and "the created," easily led to Descartes' distinction between the thinking mind and objective bodies of matter. As Divine Spirit was absolutely transcendent over the creation, so the human mind or "spirit" assumed its governance over the material world. This rationalistic aversion to the Earth, carried forward as modernity's cosmological spirit-matter dualism, was accompanied by the fifteenth to eighteenth-century persecution of those who practiced a vitalistic worldview – herbalists and witches, but also so-called pagans and heathens.

This early modern dualism was countered by the late modern immanent Spirit of Hegelian Idealism in which Spirit dynamically catalyzed cosmic becoming – as evidenced in the modern notions of history, progress, evolution, and development. Nevertheless, Hegel's idealist philosophy – because Spirit was still platonically configured as the inverse of gravity – has had a similar history to that of Cartesian dualism. Both philosophical postures effectively open a psychic fault line between humanity and Earth. To be sure, some twentieth-century theologians have defended this as a necessary distinction between the Creator and the creation. Indeed some theologians like Nicholas Berdyaev have affirmed Western technology for instrumentally interrupting humanity's temptation to commune with elemental spirits, and other theologians have affirmed technology's capacity for rehabilitating "fallen" or devolved nature, for alleviating suffering, death and toil, and for reclaiming the Earth as paradisiacal garden. Still others, like French philosopher Luce Irigaray, critique this stance, asserting that two life economies are thereby created – a metaphysical and capitalist superstructure of immaterial spirit that disregards the Earth, including the human body, and a material substrate to which this superstructure denies spiritual value. In such an assessment, spirit-matter dualism, like its idealist parallel, constitutes a social technology – namely, ways of relating to the Earth that legitimate androcentrism and the commodification of natural resources, at the same time occasioning ecocide, genocide, and the suppression of Earthkeeping peoples.

If neither the Cartesian dualism nor philosophical idealism encouraged humanity to live well with the Earth, modernity has – from another perspective – been viewed as a time of "disenchantment" or "despiritualization." Phenomenologically speaking, be-

lief in a “supernatural” world of Spirit forms when humanity’s sense relations have been psychically truncated, such that belief comes to be seen as replacing direct or immediate experience. Modern commitments to instrumental rationalism and methodological objectivity presume that human consciousness is neither organically given nor emergent from sensuous participation in the field of life relations. Neither allows room for sacred value within the material world. Because mechanistic materialism assumed Spirit to be superordinate to nature – or, “supernatural” – and because rationalist empiricism dismissed claims to supernatural phenomenon, Spirit itself seemed during modernity to become irrelevant.

Nevertheless, given twentieth-century physics and revised cosmologies based upon them, it has become possible to think about Spirit without recourse to supernaturalism and therefore without abandoning care for the Earth. Given its valence as a term of energy and vitality, Christian theologians, like Jürgen Moltmann, Mark Wallace and Elizabeth Johnson, have been reconstructing the notion of Spirit with the goal of greening Christianity. Philosophical theologians, like Thomas Berry, consider Spirit to be an emergent order of nature – as the Transcendentalists also seem to have contended. Process theology’s relational ontology allows theologians to think an immanent order of Spirit, which, while active in cosmic becoming, is nevertheless distinct from and respectful of the world’s own creativity. In yet other suggestive proposals, Spirit, analogically like the quantum vacuum or the vessel of the Tao, pours forth the rare, fragile and wonderful flowering of a material universe, such that – now inverting Platonism – we experience the material world as privilege.

Spirit and Nature Walking Paths

Early in 1998, a group of central Vermont environmentalists, activists, and naturalists from a variety of faith backgrounds, began planning a series of woodland paths that they called “Spirit in Nature.” The trails, eventually located on the spine of the Green Mountains just a few hundred yards from the poet Robert Frost’s summer home in Ripton, Vermont, wind through the forest past intermittently spaced “sayings” of various religious traditions, designed to foster reflection and insight for visitors. Inspired by the success of the nearly eight miles of Vermont trails, other groups in different parts of the country have begun to adopt the idea, building permanent or temporary versions of the paths.

Paul Bortz, a Unitarian Universalist minister, left his pulpit in 1996 and began pursuing his vision of a union between faith and environmentalism. Bortz, an accomplished organizer, moved to the Middlebury area where he married Catherine Nichols, pastor of the local Episcopal church. Together they began forming the initial nucleus of the group, drawing on local church members and also students and faculty from nearby Middlebury College, which boasts the nation’s oldest environmental studies department. The college eventually leased the group the land it needed to proceed with construction of the trails.

There are now nine trails winding through the beaver meadows, abandoned apple orchards, and riverbanks that mark the site. They represent the Bahá’í, Quaker, Jewish, Muslim, Pagan, Unitarian Universalist, Christian, Hindu, and Buddhist traditions; there is also an interfaith path. All end at a common “sacred circle” furnished with benches and used for occasional ceremonies.

Spirit of the Sage Council

Unique in its origin and inspiration, Spirit of the Sage Council was brought together by the ancient whisperings of a most sacred plant of indigenous people of the Americas – White Sage (*salvia apiana*). Operating from a small office in Pasadena, California and a historic farmhouse in Carthage, North Carolina, it seeks to preserve sage scrub habitats wherever they occur, and the indigenous cultures and religions that depend on them.

Endemic to portions of Southern California and Baja, Mexico, the sacred White Sage dominates the less than 2 percent remaining of the Riversidean Alluvial Fan Sage Scrub natural community in the United States. Globally imperiled, this habitat continues to be greatly threatened by human settlement and commercial enterprise. As a nurse, student of natural medicine and indigenous healing methods, I first became “familiar” with the ethnobotanical use of native sage in Lakota Inipi ceremonies conducted by Wesley Black Elk and his father Wallace and cousin Stephen Red Buffalo in the 1980s. As a participant in the ceremony, the sacred sage is not only for cleansing of the bodies of “two-legged” people but also for healing the mind and spirit.

The spiritual connection I made with the sage led me to other indigenous people. I felt as though, whether in waking hours or during sleep, that the Sage spirit took over my life and led me from one person to another who would help protect its areas of residence. Through my connection to the sage, I became extremely sensitive, feeling threats to the sage’s existence like a threat to my very own.

In 1986 a commercial harvester, Alfred “Red Sky” Saverilli came into my life and showed me where to find and how to recognize the White Sage. I felt intoxicated and delighted any time I was with the White Sage in the wild. As I began to recognize the plant from miles away, the internal dialog with my sage familiar became stronger.

I sought out the remaining descendants of the indigenous Shoshone “Gabrielino” people to discuss the threats to the White Sage habitats and eventually was steered to Vera Rocha, who some considered Chief. Meeting with her and her husband – the tribe’s spiritual leader – Manuel Rocha, we decided quickly to form a group to protect the sage. When I asked them what the conservation group should be named, Manuel Rocha said, “It is the Spirit of the Sage that has asked for our help and we have heard it.” Vera Rocha added,

There has been too much destruction – of the Sage, of our Land and the people keep taking till the Sage can give no more. It is time now for us to give back to the Sage. We need to get people to come together that want to help protect the Sage. We can have our own council meetings for the Sage.

Over the years as the health of the Gabrielino elders diminished and Manuel Rocha passed on, I assumed much of the work in consultation with Vera Rocha. We have worked through diverse venues, and in alliance with a variety of groups (including the American Indian Movement, Earth First!, The Green Party, the Rainforest Action Network, the Nation of Islam, and the Azteca Mexica's) to convince decision-makers of the cultural and biological significance of sage habitat. Tactics used have included direct-action blockades against destructive practices and survey stake removal, public education, and lawsuits.

The Spirit of Sage Council has been recognized for its cutting-edge work based on the Endangered Species Act, especially in Southern California, where, in part in response to the Council's work since 1990, the U.S. Fish & Wildlife Service and California Department of Fish & Game began to give the conservation of Coastal Sage Scrub natural communities their highest priority. Coming from the place of respect and reverence for the Earth, the work of Spirit of the Sage Council has directly led to the preservation of over 2000 acres of Coastal Sage Scrub habitat in Southern California, and has set up a nonprofit land trust to receive and manage lands protected through lawsuits.

Part of the argument the Spirit of Sage Council has made is that development that destroys the sage habitats also endangers the culture and religion of the Shoshone Gabrielino Band and other indigenous peoples. We also believe that our connection to Earth and Spirit guides our decisions. The sage even led us to challenge plans by the Los Angeles Catholic Archdiocese to build the largest cathedral in the United States on a site that had indigenous burial remains.

Spretnak, Charlene (1946–)

Charlene Spretnak's work, as a writer, a teacher, and an activist, flourishes at the meeting place of feminism, green politics, spirituality, and ecological postmodernism. Spretnak suggests that the modern worldview, shaped by the Enlightenment, is giving way to an emergent world-view that connects bodies and nature, a view she refers to as "the real." Her work is groundbreaking as it moves to connect spirituality and activism in pursuit of this paradigm shift.

Born 30 June 1946 in Pittsburgh, Pennsylvania and educated at St. Louis University and the University of California, Berkeley, she was inducted into the Ohio Women's Hall of Fame in 1989 and teaches at the California Institute of Integral Studies. Her earliest works focused on women and religion. *Lost Goddesses of Early Greece* explored pre-Hellenic Goddess mythology, and provided creative, feminist retellings of these myths. With *The Politics of Women's Spirituality* she brought together a collection of writings addressing the intersection of feminism, religion, and politics, including works by many of the most influential feminist theologians, such as Carol Christ, Mary Daly, Naomi Goldenberg, and Starhawk.

Perhaps her best-known book, *Green Politics*, coauthored with Fritjof Capra, explored the holistic, nonexploitative ideology of the German Greens and how such politics could be brought to the United States. With this holistic approach in mind and with the goal of carrying on the vision of the German Greens, Spretnak co-founded in 1984 the Committees of Correspondence, named after grassroots groups that existed in the United States during the Revolutionary War.

The Spiritual Dimension of Green Politics and *States of Grace* returned Spretnak's writing to a more overtly spiritual focus. Her call to the reader is not to any new or even specific religion. She herself has practiced Vipassana meditation, and has appeared in the Canadian film *Full Circle*, which showcases environmental concerns and women's spirituality. Spretnak urges others to turn to the resources within one's own existing tradition that mesh with a post-humanist, postmodern, and post-patriarchal worldview. She devotes considerable attention to all three of these theoretical constructs, in both these books and later writing, to clarify her unique understanding of their meaning and practice.

More recently her essay "Radical Nonduality in Ecofeminist Philosophy" and *Resurgence of the Real* examined the importance of paying attention to body, nature and place. She suggested a move beyond modernism, not to deconstructionist postmodernism, but to what she calls ecological postmodernism. In "Radical Nonduality" Spretnak questioned the tendency of deconstructionist postmodernism to deny any "unitive

dimensions of being.” She then presented a theory of ecological postmodernism that includes a relational ontology, thus questioning the deconstructionist idea that there is “nothing but social construction in human experience” (1997: 427).

Her scholarly analysis in *Resurgence of the Real* is supplemented at the end by a fictionalized account of how her visions for the future are no mere flights of fancy, but concrete possibilities for an integrated world honoring the significance of nature, gender, and spirituality in sustainability.

St. Katherine's Monastery (Mt. Sinai, Egypt)

The spectacular fortified monastery of St. Katherine, often described as “the most perfect relic of the 4th century left in the world,” still looks much as it did on completion in

565. It is located at the foot of Mt. Sinai in the central Sinai desert, Egypt, has been continuously inhabited since the fourth century and is the oldest Christian monastery in the world in continuous existence. The monastery derives its name from the third-century Christian martyr St. Katherine (or Catherine) whose relics were found on the nearby summit of Mount Katherine (Gebel Katherine). The monastery itself is believed to be built on the site of the Burning Bush, where God spoke to the prophet Moses, in the shadow of Gebel Musa (Mount Sinai) where Moses received the Ten Commandments. Its construction started in the year 337 when the Empress Helena, mother of Emperor Constantine (under whom Christianity became the official religion of the Roman Empire in 313), decreed that a monastery was to be built on the site. The original building became a refuge for increasing numbers of hermits and pilgrims, and between 537–562 the Emperor Justinian expanded its site by adding two churches and building the great walls and fortifications that still stand today. The monastery walls, built of dressed granite, rise to a height of 20 meters in places and are 2–3 meters thick. Inside them, the monastery covers an area less than 70 ´ 80 meters with a multilevel labyrinth of living quarters, twelve chapels, an icon gallery, hospice, ancillary buildings and the famous library, second in historical significance only to that of the Vatican in Rome. Famous sites within the monastery include Jacob's Well, which never dries up and is supposedly where the prophet Jacob met his future life, as well as the descendant of the original Burning Bush (much vandalized for cuttings) and St. Catherine's Church, built between 542–551 in memory of Justinian's wife, and famous for its wonderful sixth-century doors and 12 enormous pillars covered in icons.

The monastery has survived for centuries as a Christian oasis in an Islamic state as a result of a legend which said that the Prophet Mohammed himself was once kindly received there. In return he issued a letter protecting the monastery for ever, a copy of which can still be seen in the gatehouse entrance. Continuous protection by Roman emperors, Islamic conquerors, Napoleon and various middle-eastern governments account for the survival, unlooted, of the great treasures of the monastery including its spectacular collection of 2000 of the most important icons in the world. The 5000

books and 300 valuable manuscripts in the library have steadily accumulated since the sixth century and are written in Greek, Arabic, Syrian, Georgian, Armenian and Slavonic languages and are now housed in the spacious new concrete library building, constructed between 1930–1942 and occupying most of the southern side of the monastery. Until its removal in 1859 by Constantin von Tischendorf, the library also included the *Codex Siniaticus*, the oldest and most complete Greek manuscript of the Bible ever found, now in the British Museum in London.

During the Crusader period (eleventh–twelfth centuries) the site became a major pilgrimage center, but since medieval times the size of its monastic community has steadily declined. However, it is still a working monastery whose community of around 25 monks start their day of prayer and devotional work with matins at 4 a.m. and liturgy until 7:30 a.m., finishing with evening prayer between 3–5. The Sinai monastic order, independent since the sixth century, observes the Canons of the Eastern Orthodox church under the control of an archbishop of Sinai. The community works in partnership with local Gebaliya Bedouin communities, the descendents of workers of Slavic origin imported in the sixth century by Justinian to construct and protect the monastery. The monastery still operates a guesthouse, offering simple accommodation for pilgrims and those on retreat, but it has now also become a major leisure tourist destination.

During the period 1600–1920, both people and supplies entered the monastery only via a basket drawn up on a ten-meter-long rope over the north wall. Until the 1960s, it probably received less than fifty visitors a year. By the year 2017, it is thought that this may reach half a million a year. The development of St. Katherine's as a tourist destination postdates the Israeli occupation of southern Sinai which took place between 1967–1979, and is related to the rapid expansion of beach resorts such as Sharm el-Sheik on the nearby Red Sea coast. In 1996, mindful of concerns over the lack of protection for the environment and buildings of St. Katherine's, the European Community made a grant of 6.5 million *ecus* which financed a study of the area, and helped create the 4300-square-kilometer St. Katherine's Protectorate, forming an integral part of the southern Sinai protected area system. The St. Katherine's Protectorate includes not only Mt. Sinai itself but many other religious cultural and archeological sites in the surrounding landscape, such as the valley of Wadi Hebran, supposedly the place where the Israelites camped to wait for Moses to return from Mount Sinai with the Ten Commandments. The development of this system of protected areas was instrumental in getting World Heritage status for the monastery and surrounding landscape, finally achieved in 2002.

Concerns for the future revolve around the issue of managing the growth of tourism to the site. Currently, the monastery is open without charge five days per week (except weekends and church festivals) and it now receives nearly 100,000 tourists each year, 80 percent of whom are day-trip visitors and many of whom stay less than half an hour. This is projected to rise to 500,000 visitors by 2017, placing severe pressure on the fabric of the monastery and the ability of its inhabitants to maintain their normal

routines. In addition, the area around the monastery is increasingly popular with hikers, many of whom climb Mt. Sinai (Gebel Musa) which, at 2285 meters overlooks the entire area. St. Katherine's still remains a center for pilgrimage, a place of retreat and a combination of working monastery, museum and art gallery – much as it has been for 1500 years – but unless visitor numbers can be controlled it is difficult to see which of these functions will remain in the future.

Starhawk (1951–)

Starhawk is an ecofeminist activist, author and Witch, and a founding mother of the Reclaiming Witchcraft tradition in San Francisco. Starhawk, who was born in 1951 of Russian Jewish descent with the given name Miriam Simos, met Witchcraft in the early 1970s. She was first introduced to Z. Budapest's *Dianic* Witchcraft tradition and later (in 1975) initiated into the Faery tradition by Victor Anderson. The Witches' magical view of the world as a living being made a profound impact on her. Her feeling was not that of hearing something new but of finally being given names and interpretive frameworks for experiences she already had. She also felt empowered by the concept of a religion that worshipped a goddess – the immanent life-force. This hermeneutic distinction between direct experience and cultural symbol has been fundamental to her theological and political thinking ever since, and guided her major work as leader for a new non-dogmatic version of neo-pagan Witchcraft and as a political activist.

The inauguration of her work manifested textually in 1979, when *The Spiral Dance: A Rebirth of the Ancient Religion of the Great Goddess* was first published. It manifested practically in 1980, when she and her coven-sisters founded *Reclaiming*, a center for feminist spirituality and a “school” in Witchcraft. Both in *The Spiral Dance* as well as in other publications such as *Dreaming the Dark* (1982), *Truth or Dare* (1987), *The Fifth Sacred Thing* (1993), *Walking to Mercury* (1997), *A Pagan Book of Living and Dying* (1997), *Circle Round: Raising Children in Goddess Traditions* (1999), and *The Twelve Wild Swans: A Journey into Magic, Healing and Action* (2000), Starhawk interprets neo-pagan Witchcraft as “earth religion,” argues for its environmental and countercultural potentials, presents a manual of ritual and magical action and establishes a historical horizon for the practice of contemporary goddess worship.

According to Starhawk, all modern Witchcraft traditions have their spiritual roots in the tribal religions of Europe some 10,000 years ago. Therefore, in spirit, they are related to the surviving shamanic “Earth religions” of the contemporary West, including those of Native Americans, African Americans, the Sami and the Inuits. She has also adopted Marija Gimbutas' disputed thesis that the old Europeans originally worshipped a Great Goddess as divine giver of life, death and fertility, and her son-lover, the Horned God. The fall and regeneration of this Old Religion is comprised by Starhawk as follows: Neolithic Europeans celebrated the immanent life-force and the cycles of the seasons, and their religion provided tools to establish bonds between individuals, the community and the Earth. Just as religion was goddess-centered, society was woman-centered and organized around the mother and her kin as a basic social principle. These matrifocal and matrilineal cultures were egalitarian, peaceful, just and

creative, and laid the foundation of our civilization. In time, patriarchal warriors corrupted the cultures, either by internal warfare or through invasion. This long-lasting event conquered or drove out the matrilineal goddessworshippers and laid the foundation for oppressive societies and patriarchal religions in Europe. But goddess religions continued to live in folk customs, esoteric traditions and among those persecuted as Witches. Finally, in the twentieth century, the Witches' Craft has again emerged from hiding.

Even though scholars have criticized Starhawk for having invented an erroneous historical lineage to contemporary Witchcraft, the narrative has been important in the building of (Reclaiming) Witches' identity. It also gave a platform from which feminist Witches or goddessworshippers could perceive themselves as freedom fighters from any patriarchal religion, and reach out to other oppressed people, such as Native Americans, without necessarily being accused of having colonialist intentions: by claiming heritage to a common symbol system, such as the four directions/elements, the concept of the circle and reverence for the Earth, they could create bridges based on commonality, not just difference.

Yet, Starhawk's approach to tradition is fundamentally eclectic and anchored in a radical analysis of power: she insists on the freedom of thought, belief and style of organizing to any Pagan group or person and believes that non-hierarchy is the only ethical leadership structure that may support a view of the world that sees the Earth and everything living as interconnected and interdependent. Her version of Witchcraft is also famous for having reduced the role of the Horned God in favor of the Goddess – the argument being, that to value Goddess above God is not narrowly to define or rank gender, but a means to continually be reminded that what is of value is life brought into the world.

In addition to doing the “work of the Goddess” as teacher, writer and ritualist, Starhawk is a community builder, perma-culturer, political organizer and activist, campaigning in particular for environmental, feminist and anti-war issues. In the 1980s she participated in and trained people for large anti-nuclear actions and was arrested several times as a civil disobedient, both in the Diablo Canyon and Livermore Lab actions in California. During the 1990s she has been active in the antideforestation campaigns, especially in the redwood biome of California. In 2000 and 2001 she joined the antiglobalization movement, both as organizer and activist, and was at the forefront in the large demonstrations against a neo-liberalist world economy in Seattle, Washington and Genova (Italy). Through all these activities she has had a major influence on groups such as Earth First! and those whose primary work is nature protection. She has also been important for the growth of goddess spiritualities and neo-paganisms in general and for the cross-fertilization between feminist and non-feminist Witchcraft traditions; by 2001, *The Spiral Dance* had sold more than 300,000 copies.

Steiner, Rudolf (1861–1925) – and Anthroposophy

The relationship between nature and the spiritual side of humanity occurs increasingly within an arena dominated by a rationalistic objectivity based on sense perceptions and critical thinking. The religious dimension can vary from the Cathari view that nature is evil to that of animism, which sees spirit in all aspects of nature. Rudolf Steiner argued for a distinction between religion resting on dogma or belief and spirituality founded on a complementary perception that augments the physical senses. Steiner claimed to have this direct apprehension superseding received revelation, dogma or even simple belief. Born in Kraljevec, Lower Austria, now Croatia, at an early age he became extraordinarily aware of the non-obvious energies within vegetable and animal life describing an insight into nature beyond the normal purview of the senses. He came increasingly to perceive two worlds: an outer, ever more technical one, and a subtle world of formative forces. He was interested in both, and his quest was to bridge the two. The results of his initial efforts of inquiry culminated with the publication of *The Philosophy of Freedom* in 1895. In this work, he stresses the possibility of experiencing thinking as a spiritual activity rather than as an epiphenomenon of the brain. Upon this basis, he subsequently developed his “spiritual science” as the scientific investigation of spiritual worlds.

As Steiner matured he became ever more involved in the social, artistic, educational and scientific issues of his time and, in particular, the potential contribution spiritual science could make. Having graduated in mathematics, chemistry, and natural history he earned a Ph.D. in philosophy and acquired considerable academic respect by the end of the nineteenth century. However, knowing that the academic establishment would shun him, he nevertheless decided in 1902 to begin speaking openly about his spiritual observations. He became General Secretary of the German Branch of the Theosophical Society until 1912 when he independently founded the Anthroposophical Society dedicated to developing a scientifically based esotericism. He also developed what he termed *eurhythmy* – a system of rhythmical body movements and silent gestures portraying poetic speech, song and music. Deeply affected by the First World War and the social/spiritual questions it raised, he re-founded the Anthroposophical Society in 1923 on the basis of his spiritual science and sought to bridge the inner and outer worlds as a means toward finding an authentic humanity.

Steiner’s spiritual science endeavors to cultivate additional forms of perception beyond those based solely on the senses. He wanted to treat non-ordinary perception in

a scientific manner and hoped to revolutionize humanity's relation to nature. Steiner's spiritual science, instead of constituting a religious approach to spiritual affairs, is meant to be a scientific method that compliments the spiritual. The mission of the Anthroposophical Society is to promote spiritual science and facilitate its application to various practical fields of endeavor. Its worldwide membership is now over 50,000, and it sponsors approximately 10,000 institutions such as schools, colleges, artistic groups, homes for those with special needs, clinics, medical practices, farms, research institutes, etc.

Highly influenced by Goethe, Steiner edited the German poet's nature writings. His own nature-inspired research attempted to delineate a spiritual coevolution of humanity, Earth, nature and what Steiner designated the nine hierarchies of angels and archangels. Steiner proposed a symbiosis between the spirituality of both nature and humanity and felt that angels are not only instrumental in the development of the Earth but also in our evolving along with it. On a practical level, there are consequences for agricultural practice, and, foreseeing the results of a purely materialistic approach, Steiner founded "bio-dynamic agriculture" in 1925. This is a nonchemical organic method of farming that enlists spiritual agencies (or beings) claimed to be active in nature and cooperates with these health-giving forces to improve food and, consequently, the health and spiritual potential of consumers.

Steiner's methodological approach to nature as a spiritual manifestation seeks cooperation in exchange for exploitation. Its goal is a spiritually based ecology founded on natural interdependencies and the spiritual interworking of creative beings.

Stevens, Wallace (1879–1955)

Nature, for the great American poet Wallace Stevens, is variously that which Is, that which is constructed by imagination, at times consoling, at times impersonal and remote, sunny south or frozen north, a “firecat” in one of his first lyrics, “Earthy Anecdote,” and a bird’s “scrawny cry” in one of his last poems, “Not Ideas about the Thing but the Thing Itself.” Stevens’ entire literary production might be thought of as a poet’s circling of the object of attention, noting the changes that occur as one moves each degree of the circle, changes colored also by the passage of time and the shifting qualities of consciousness.

In these kaleidoscopic exercises, Stevens is at his most intense when considering the extremes, nature as given and nature as construct. One of Stevens’ most celebrated poems, “The Idea of Order at Key West,” is at base a singing contest between a woman and the ocean. In the end, the woman’s song proves not simply superior to the monotonous song of the sea, but winds up consuming nature altogether:

And when she sang, the sea, Whatever self it had, became the self

That was her song, for she was the maker. Then we, As we beheld her striding there alone,

Knew that there never was a world for her

Except the one she sang, and singing, made (Stevens 1997: 106).

Here, and in many other poems, including the oftenanthologized “Anecdote of the Jar,” Stevens echoes Oscar

Wilde’s cynical Vivian in “The Decay of Lying” who wittily observes that the more he knows of art, the less he cares for nature. Nature is always sending ants to picnics whereas art can selectively remove such nuisances. If anything, Stevens is even more outrageous than Wilde, suggesting that nature is not simply a nuisance but a vanished memory, that which is utterly consumed by imagination and then forgotten.

Equally intense is the Stevens who attempts to possess nature without interference by the imagination and its attendant illusions. As the poet moves to this “green apogee” (1997: 323) of the circle, he supposes it possible to capture the elusive prize, the world seen rather than the world *as* seen. With the icy mind of the snow man who sees “nothing that is not there” as well as the “the nothing that is” (1997: 8), the poet seeks to “trace the gold sun about the whitened sky / Without evasion by a single metaphor” (1997: 322).

The poet’s victory, however, is soon seen as an achievement in rhetoric rather than reality: “. . . the absence of imagination,” he discovers, “had itself to be imagined”

(1997: 428). And so the poet begins his movement down from the apogee, through each measured degree, in the “ambiguous undulations” (1997: 56) of intricate and endless circling. The poet’s function is to articulate these oscillations and, if prodigiously gifted, “help people to live their lives” (1997: 661).

In the end, the poet becomes something of a secular priest who constructs a new religious reality watched over not by the old angels who, it turned out, came to nothing, but new, necessary angels of “reality,” completely understood as fictional creations, and in whose sight we “see the Earth again” (1997: 423) as it is, changing, imperfect, tragic and lovely, the site and source of all pleasures and all pains, and all of paradise that any of us will ever know.

Stewardship

The term “stewardship” derives from “steward,” one who looks after property belonging to another, such as a household or estate. It has been increasingly used in Judaism, Christianity, and Islam as a basis for a religious environmental ethic. (It is, however, generally considered to be alien to Eastern and indigenous traditions.) In this usage, human beings (individually or collectively) are the “stewards,” God is the “owner,” and the “property” is the created world (or that part of it which humans can affect). Humans are thus responsible for rightly using and conserving natural resources as gifts from God, or for caring for creation on behalf of its Creator.

How typical such a view has been in past Western religious thought has been a matter of some dispute. The idea that humans are stewards of the Earth is not stated explicitly in the Bible, but can be supported by the injunctions to “have dominion” (Gen. 1:26) and to “serve and keep” the Garden of Eden (Gen. 2:15), and in the example of Noah (Gen. 6–9). Scriptural warrants are also found in the recurring themes of God’s “ownership” of creation (e.g., Ps. 24:1) and Providential care for it (e.g., Ps. 104), as well as human accountability in the covenantal relationship binding God, the Hebrew people, and the land (e.g., Lev. 25:1–7). Similar grounding can be found in Sura 2:30 of the Qur’an, where Allah says to the angels, “I am placing on the Earth one that shall rule as my deputy.”

The explicit use of the concept finds historical precedent in the Protestant reformer John Calvin’s interpretation of Genesis 2:15: “. . . Let everyone regard himself as the steward of God in all things which he possesses. Then he will neither conduct himself dissolutely, nor corrupt by abuse those things which God requires to be preserved” (Calvin in DeWitt 1998: 32). According to the English Chief Justice Matthew Hale,

In relation therefore to this inferior world of Brutes and Vegetables, the End of Man’s Creation was, that he should be the VICE-ROY of the great God of Heaven and Earth in this inferior world; his Steward, Villicus, Bayliff, or Farmer of this goodly Farm of the lower World whose charge is “to preserve the face of the Earth in beauty, usefulness, and fruitfulness” (Hale in Glacken 1967: 481).

In recent usage, stewardship terminology has served a hortatory function, urging believers to environmental concern and engagement, and an apologetic function, countering claims that the biblical idea of human dominion over nature sanctions environmental rapacity. It has also had a polemical function, in controversy with those who hold more ecocentric views of the human–nature relationship as well as with those who continue to assert a more aggressively anthropocentric understanding of human “dominion.”

Ecocentric critics argue that stewardship implies an “absentee God” and a desacralized creation; it separates human beings from the rest of nature, inflates their importance in creation, and exaggerates their competence to manage or improve the biosphere. Defenders of the concept of stewardship have replied that environmental concern only makes sense on the assumption that humans have a unique kind of power and responsibility. Some appeal to the moral conviction that human beings are of greater value than other species, and affirm the transformation of nature as part of humanity’s divine calling. Some share many of the ecocentric critics’ concerns, but believe that the concept of stewardship is flexible enough to accommodate them. They affirm the nonhuman creation’s independent (though not necessarily equal) value for God, and define stewardship as loving service to the creation, rather than as simply the management of resources for long-term human benefit. They understand stewardship primarily as the protection of the Earth rather than as its improvement, and as deepening humans’ involvement with nature rather than detaching them from it.

Others, while using the language of stewardship, believe that the views of stewardship presented by religious environmentalists are inimical to human interests, a threat to economic freedom and individual property rights, and overly pessimistic about technological and market-based solutions to environmental concerns. It is possible, however, to minimize the need for moral or legal constraints on the human use of nature to such an extent that “stewardship” becomes a mere euphemism for exploitive domination in pursuit of short-term economic gain.

Stewardship is likely to remain a persistent but contested concept within theological environmental ethics. The simplicity and familiarity of stewardship make it both understandable and appealing to many religious people outside the environmental movement. At the same time, it is both adaptable and elusive, subject to contrasting interpretations. Critics sometimes concede that it is at least an improvement over irresponsible exploitation and that it may have its uses; proponents may allow that it needs to be complemented by other understandings of the human–nature relationship.

Stone Circles

Stone circles are a special manifestation of raised or upright stones (*menhir*, *peulvan*, *orthostats*) in contrast to isolated standing stones as well as those aligned along a straight axis. They are associated in particular with the British Isles but may be found elsewhere, such as the two stone circles forming a figure eight on the island of Erleanic off Brittany near Carnac or the sepulchre circles of Sine-Ngayene in southern Senegal. This last is a necropolis, and the idea of the British stone circle is sometimes conjectured to be a derivative of the stone kerb surrounding various megalithic collective tombs. However, the British structure is clearly related to the henge monument: a special type of stone or timber ceremonial circular edifice enclosed by earthen banks with one or more entrances and sometimes a ditch or ritual pits inside or outside the bank. The earth-banked henge is found only within the British Isles. Those containing stone circles are known as circlehenges. Archeologically, “stone circles” proper have no ditches. They evolved as separate from the henge in the late Neolithic times (ca. 3200–2200 B.C.E.), some associated with stone rows or avenues and some appearing in group-clusters (Stanton Drew and Avebury being perhaps the foremost examples). Avebury, for instance, “consists of a huge bank and inner ditch, with four entrances, enclosing a stone circle round the ditch, with inside it two smaller circles and a ‘setting’ at the north entrance” (Wood 1963: 131). There are 702 extant stone circles in Britain and 261 in Ireland. An identifiable type is known as the recumbent stone circle. These are found in northeast Scotland (Aberdeenshire, etc.) and consist of two tall standing stones flanking a recumbent “altar” stone in the southern arc with the remaining stones progressively diminishing in size.

The purpose of stone circles for their builders is not known. Some are obviously funerary, but most are described as ritualistic in the sense that, while often involving much organization and labor in their construction, they reveal no apparent purpose or logical function. Many are aligned to natural features and were possibly used for solar, lunar and astral observation. In contemporary times, the conjectured calendrical function of the stone circle has given rise to a field of study known as archaeoastronomy, which nevertheless retains a dubious status within the branches of the more established sciences. As Hutton points out, none of the late Neolithic and early Bronze Age monuments “displays any synchronization of the Earth with heaven as stunning as that at Newgrange” (1991: 118).

Some of the more renowned circles include the cross circle of Callanish in the Scottish Hebrides, the Ring of Brodgar at Stenness in the Orkneys, the Abor Low henge of approximately fifty recumbent stones in Derbyshire, Keswick Carles of Castlerigg in

Cumberland, the Rollright Stones of Oxfordshire and the Nine Maidens of Boskednan in Cornwall. Unique, however, is the complex of Stonehenge, built in several stages from possibly 2600 to 1800

B.C.E. and culminating with the horseshoe arrangement employing the trilithon (two orthostats capped by a horizontal lintel). Following the Druidic renaissance first promoted by antiquarian William Stuckeley (1687–1765) and Edward Williams, a.k.a., Iolo Morgannwg (1747–1826), the Albion Lodge of the Ancient Order of Druids first met at Stonehenge on 24 August 1905 for a mass initiation. Stonehenge has been ever since associated with the contemporary Druid movement – particularly in association with the summer solstice.

The modern-day use of stone circles relates to the discipline of geomancy that Pennick defines as “The detection of various subtle qualities of the land and place, and the modification of those qualities so as to harmonize human activity there with the inherent natural character of the place” (1990: 189). For Hutton, while the circle might be an obvious unit of sacred space mirroring the sun, full moon and bounds of the horizon, “Earth mysteries” adherents tend non-critically to reflect “an intense sense of the romance and beauty of the prehistoric past and an equally profound impulse to identify personally with it” (1991: 118). This usually translates as an intense distaste for the present world and its ecological shortcomings. But whether the stone circle provides or not an access to redeeming ancient gnosis, to a connection with the “golden age of the Goddess” or one with ley-line “Earth energies,” its “sacred space” encapsulates what Van Gennep refers to as liminality – here as a tangible place of transition in which the contemporary spiritual seeker might contemplate and/or incorporate the numinous dimension that refreshes humanity’s ultimate link with mystery and nature.

Stonehenge

Stonehenge is an arrangement of large standing stones within a circular enclosure located on Salisbury Plain in southern England. It is one of the most visited ancient or historical monuments in Europe, and is recognized by UNESCO as part of a World Heritage site. Among the visitors are many with “spiritual” reasons for being there, although there is considerable variation in what this might mean.

While ancient arrangements of stones are far from rare in Western Europe, Stonehenge is unique in being the only megalithic circle with lintel stones above its standing stones. This makes Stonehenge instantly recognizable, even iconographic of ancestral and sacred places, and perhaps contributes to its immense popularity.

Visitors currently approach Stonehenge from a busy road and find it on chalk grassland. An interested visitor would have to walk around neighbouring sheep-pastures to see it against the skyline. The best place to do so is from within an embanked processional avenue leading to and from the enclosing circular bank and ditch around Stonehenge. From within the circles of stones themselves that avenue is a key part of the site’s orientation toward midsummer sunrise.

Most visitors to Stonehenge devote almost all their attention to the stones rather than to the many other interesting features of the surrounding landscape (including burial mounds, and linear, circular and monumental earthworks). There are heated debates and tense rivalries about how to interpret Stonehenge. Almost all that is agreed upon is descriptive facts about the origin of the stones (most were brought from near another circle at Avebury, some twenty miles away, while others came from southwest Wales) and the order in which they were arranged and rearranged over a lengthy period over four thousand years ago. For some interpreters Stonehenge is solely an ancient monument of archeological importance, for others it is primarily a sacred temple that should be devoted largely to spiritual activities. But there are many alternative positions between these polarized positions. For insight into the contested debates about Stonehenge’s interpretation and usage see Chippendale, et al. (1990), Bender (1998), and Wallis and Lymer (2001). For a fine example of interpretation rooted in the disciplines of sacred geometry, sacred geography and archeo-astronomy see Dames (1992).

John Michell has said that Stonehenge is a model of the cosmos and therefore, just like the cosmos, it can provide evidence for any theory one might hold. Certainly there is common ground in the understanding that Stonehenge has something to do with the summer solstice sunrise. What this meant to those who erected and re-erected the stones may not be certain, but it is a key to many current visions of the place. For many

centuries (and perhaps without a break since it was constructed) people have found Stonehenge to be a significant place from which to observe and celebrate that sunrise. Arguments have been offered for observations of other significant sunrises and sunsets, moonrises and moonsets, various planetary and stellar phenomena, and eclipses.

Archeological excavation has revealed further dimensions of the monument, including cremation burials and offerings within mounds and holes within the site. When the visitors' car-park was being improved a series of postholes were uncovered that proved to be evidence of the earliest human change in the landscape, long pre-dating the construction of the stone circle. Three white painted blobs now mark the location of enormous wooden posts erected in what was then a clearing in a forest. Only rarely is attention directed to this earliest ancestral engagement with the natural environment, one that swiftly led to the clearing of the forest and the evolution of extensive grasslands. In short, Stonehenge has been and continues to be a prime location for considering human relationships with the cosmos and the immediate environment.

By way of example, Stonehenge is the focus of considerable interest for Pagans and other nature-celebrants. Gatherings at each of the eight festivals vary in size, now reaching tens of thousands at midsummer. Access to the center of the site has been a matter of conflict, but seems now to be negotiable. In 1973 Wally Hope and companions initiated the first Peoples Free Festival at Stonehenge, seemingly reviving Stonehenge's medieval fairs and carnivalesque games. For weeks surrounding successive summer solstices increasing numbers of people gathered. Many came principally to hear music, some to experience the last flowering of 1960s "flower-power." But Wally's vision of a tribal gathering to reestablish respectful relationships with the Earth and the land affected many. After his somewhat mysterious death, and especially after his ashes were scattered in the center of Stonehenge in 1976, Wally's name has frequently been invoked reverently. Wally became ancestor to many who had never met him in life but had found the festival to be conducive to engagement with liberative, socializing and environmentalist lifeways. Some of Wally's possessions (e.g., a flag) and the box that once contained his ashes have been part of many ceremonies. Statements he issued that encouraged everyone to act respectfully toward the Earth are reprinted and repeated by many within the festival and countercultural movements.

The banning of the midsummer gathering between 1985 and 2000 effectively diffused a large gathering across Britain and generated many smaller seasonal festivals elsewhere. It has also resulted in much wider popular knowledge about solstices and equinoxes. Meanwhile, various direct, action groups concerned with ecological issues (e.g., those protesting new roads and quarries) benefited from experiences gained in campaigns to regain access to Stonehenge for festivals. With a return to a more tolerant approach to the summer gathering, it is clear that what might once have been a hippy gathering is now more diverse and popular. Stonehenge continues to be the location for rites of passage (including child-namings, weddings, and the scattering of ashes) as Druids, other Pagans, and many diverse celebrants continue to engage with a diffuse popular spirituality that variously honors cosmic and environmental connections.

Debates about the concerns of the tourism and heritage industry and of religious visitors continue to demonstrate that perceptions of sacrality, and appropriate responses toward it, are problematic.

Storytelling and Wonder

In the prosperous land where I live, at this dangerous and delicious moment on the cusp of this new millennium, a mysterious task is underway to invigorate the minds of the populace, and to vitalize the spirits of our children. In a strange and curious initiative, parents and politicians and educators of all forms are raising funds to bring computers into every household in the realm, and into every classroom from kindergarten on up through college. With the new technology, it is hoped, children will learn to read much more efficiently, and will exercise their intelligence in rich new ways. Interacting with the wealth of information available online, children's minds will be able to develop and explore much more vigorously than was possible in earlier eras – and so, we hope, they will be well prepared for the technological wonders of the coming century.

How can any child resist such a glad initiative? Indeed, few *adults* can resist the dazzle of the digital screen, with its instantaneous access to everywhere, its treasure-trove of virtual amusements, and its swift capacity to locate any piece of knowledge we desire. And why *should* we resist? Digital technology is transforming every field of human endeavor, and it promises to broaden the capabilities of the human intellect far beyond its current reach. Small wonder that we wish to open and extend this dazzling dream to all our children!

It is possible, however, that we are making a grave mistake in our rush to wire every classroom, and to bring our children online as soon as possible. Our excitement about the internet should not blind us to the fact that the astonishing linguistic and intellectual capacity of the human brain did not evolve in relation to the computer! Nor, of course, did it evolve in relation to the written word. Rather it evolved in relation to orally told stories. Indeed, we humans were telling each other stories for many, many millennia before we ever began writing our words down – whether on the page or on the screen.

Spoken stories were the living encyclopedias of our oral ancestors, dynamic and lyrical compendiums of practical knowledge. Oral tales told on special occasions carried the secrets of how to orient in the local cosmos. Hidden in the magic adventures of their characters were precise instructions for the hunting of various animals, and for enacting the appropriate rituals of respect and gratitude if a hunt was successful, as well as information regarding which plants were good to eat and which were poisonous, and how to prepare certain herbs to heal cramps, or sleeplessness, or a fever. The stories carried instructions about how to construct a winter shelter, and what to do during a

drought, and – more generally – how to live well in this land without destroying the land’s wild vitality.

So much earthly savvy was carried in the old tales! And since there was no written medium in which to record and preserve the stories – since there were no written books – the surrounding landscape, itself, functioned as the primary *mnemonic*, or memory trigger, for preserving the oral tales. To this end, diverse animals common to the local Earth figured as prominent characters within the oral stories – whether as teachers or tricksters, as buffoons or as bearers of wisdom. A chance encounter with a particular creature as you went about your daily business (an encounter with a coyote, perhaps, or a magpie) would likely stir the memory of one or another story in which that animal played a decisive role. Moreover, crucial events in the stories were commonly associated with particular *places* in the local terrain where those events were assumed to have happened, and whenever you noticed that place in the course of your wanderings – when you came upon that particular cluster of boulders, or that sharp bend in the river – the encounter would spark the memory of the storied events that had unfolded there.

Thus, while the accumulated knowledge of our oral ancestors was carried in stories, the stories themselves were carried by the surrounding Earth. The local landscape was alive with stories! Traveling through the terrain, one felt teachings and secrets sprouting from every nook and knoll, lurking under the rocks and waiting to swoop down from the trees. The wooden planks of one’s old house would laugh and whine, now and then, when the wind leaned hard against them, and whispered wishes would pour from the windswept grasses. To the members of a traditionally oral culture, all things had the power of speech...

Indeed, when we consult indigenous, oral peoples from around the world, we commonly discover that for them there is no phenomenon – no stone, no mountain, no human artifact – that is definitively inert or inanimate. Each thing has its own pulse, its own interior animation, its own life! Rivers *feel* the presence of the fish that swim within them. A large boulder, its surface spreading with crinkly red and gray lichens, is able to influence the events around it, and even to influence the thoughts of those persons who lean against it – lending their thoughts a certain gravity, and a kind of stony wisdom. Particular fish, as well, are bearers of wisdom, gifting their insights to those who catch them. Everything is alive – even the stories themselves are animate beings! Among the Cree of Manitoba, for instance, it is said that the stories, when they are not being told, live off in their own villages, where they go about their own lives. Every now and then, however, a story will leave its village and go hunting for a person to inhabit. That person will abruptly be possessed by the story, and soon will find herself telling the tale out into the world, singing it back into active circulation...

There is something about this storied way of speaking – this acknowledgement of a world all alive, awake, and aware – that brings us close to our senses, and to the palpable, sensuous world that materially surrounds us. Our animal senses know nothing of the objective, mechanical, quantifiable world to which most of our civilized

discourse refers. Wild and gregarious organs, our senses spontaneously experience the world not as a conglomeration of inert objects but as a field of animate presences that actively *call* our attention, that *grab* our focus or *capture* our gaze. Whenever we slip beneath the abstract assumptions of the modern world, we find ourselves drawn into relationship with a diversity of beings as inscrutable and unfathomable as ourselves. Direct, sensory perception is inherently animistic, disclosing a world wherein every phenomenon has its own active agency and power.

When we speak of the earthly things around us as quantifiable objects or passive “natural resources,” we contradict our spontaneous sensory experience of the world, and hence our senses begin to wither and grow dim. We find ourselves living more and more in our heads, adrift in a set of abstractions, unable to feel at home in an objectified landscape that seems alien to our own dreams and emotions. But when we begin to tell stories, our imagination begins to flow out through our eyes and our ears to inhabit the breathing Earth once again. Suddenly, the trees along the street are looking at us, and the clouds crouch low over the city as though they are trying to hatch something wondrous. We find ourselves back inside the same world that the squirrels and the spiders inhabit, along with the deer stealthily munching the last plants in our garden, and the wild geese honking overhead as they flap south for the winter. Linear time falls away, and we find ourselves held, once again, in the vast cycles of the cosmos – the round dance of the seasons, the sun climbing out of the ground each morning and slipping down into the Earth every evening, the opening and closing of the lunar eye whose full gaze attracts the tidal waters within and all around us.

For we are born of this animate Earth, and our sensitive flesh is simply our part of the dreaming body of the world. However much we may obscure this ancestral affinity, we cannot erase it, and the persistence of the old stories is the continuance of a way of speaking that blesses the sentience of things, binding our thoughts back into the depths of an imagination much vaster than our own. To live in a storied world is to know that intelligence is not an exclusively human faculty located somewhere inside our skulls, but is rather a power of the animate Earth itself, in which we humans, along with the hawks and the thrumming frogs, all participate. It is to know, further, that each land, each watershed, each community of plants and animals and soils, has its particular *style* of intelligence, its unique mind or imagination evident in the particular patterns that play out there, in the living stories that unfold in that valley, and that are told and retold by the people of that place. Each ecology has its own psyche, and the local people bind their imaginations to the psyche of the place by letting the land dream its tales through them.

How basic and instinctive is the imaginative craft of telling a tale! And yet how little we exercise these skills in the modern era. Of course, we’ll read a story to a child before sleep, but we won’t take the time to really learn to tell the story ourselves (without reading it), or to improvise a fresh version of an old tale for our neighbors and friends. We have too little time for such frivolities: a world of factual information beckons, a universe of spreadsheets and stock comparisons. If we crave entertainment, we have

only to click on the television or the computer, and straightaway we can synapse ourselves to any one of the rapidly multiplying video games and virtual worlds now accessible through the glowing screen. Surely this rich and rapidly shifting realm of technological pleasures is the niftiest magic of all!

Perhaps. Yet for all their dash and dazzle, the inventions of humankind can never match the complexity and nuance of the sensuous Earth, this breathing cosmos that *invented us*. The many-voiced Earth remains the secret source and inspiration for all the fabricated realms that now beckon to us through the screen. Let us indeed celebrate the powers of technology, and introduce our children to the digital delights of our era. But not before we have acquainted them with the gifts of the living land, and enabled its palpable mysteries to ignite their imaginations and their thoughts. Not before we have stepped outside with our children, late at night, to gaze up at those countless lights scattered haphazard through the fathomless dark, and sharing a story about how the stars came to be there. Not before they've glimpsed the tracks of coyote in the mud by the supermarket, or have sat alongside us on the banks of a local stream, dangling a line in the water and pondering an old tale about the salmon of wisdom...

Spoken stories, when we listen to them, or when we make them our own and tell them ourselves, wake us up to our immersion in a dreaming universe – to the vast and enigmatic story deliciously unfolding all around us. They induce us to taste the icicles dangling from the roof, and to smell the breeze, and to wonder: what's going to happen next?

Sufism

Sufism (Arabic: *Tasawwuf*) deals with the inward, esoteric, mystical, and spiritual dimensions of Islamic beliefs and practices. Historically, this aspect of Islam has given rise to diverse traditions of spiritual techniques, individual and collective rituals, metaphysical and Theosophical expositions, hagiographic writings, and mystical love poetry, as well as institutionalized forms of discipline, education, and mentoring – all of which have been collectively called Sufism.

The environmental movement in its present form is often perceived in the Muslim world as essentially Western in its form and origin, and is therefore linked with the bitter memory and continuing legacy of colonialism or with a perceived conspiracy to keep the Muslim world backward in the fields of industry and technology. In order to be effective in Muslim societies and communities, an indigenous Islamic environmentalism will have to be built on the basis of an eco-theology and environmental ethics that are recognizably Islamic. The rich traditions of Sufism offer invaluable resources that may be actualized for achieving this authenticity. However, Sufism's own legitimacy is often debated and contested by Muslims.

Contemporary Islamic revivalists and Muslim modernists share a tendency with early Orientalists that views Sufism with great suspicion. Revivalists find Sufism otherworldly and therefore incompatible with political activism; modernists find Sufism irrational and therefore unscientific; both agree with early Orientalists who maintained that Sufism was a foreign introduction to Islam. It has often been noted that Sufism arose in the eighth and ninth centuries in part as a reaction against the worldliness and materialism of imperial Islam on the one hand, and against an overemphasis on ritual and legal formalism on the other hand. The followers and sympathizers of Sufism contend that it represents the very soul of Islam; bereft of Sufism's vitalizing energy, Islam would be reduced to a bland set of rational propositions and legal rulings. Without denying that socio-historical circumstances and influences from Greek and neo-Platonic sources played important roles in its development, they insist that Sufism in its essence, inspiration, and goals is derived from the very foundations of Islam (i.e., the Qur'anic revelation and the Sunnah [or practice] of Prophet Muhammad [570–632]) and is therefore intrinsic to Islam.

It can be argued that Sufism in its essential sense – as the spiritual dimension of Islamic beliefs and practices – has always been an integral part of religious life in Muslim societies. The spiritual aspects of Islam were neither absent before the twelfth century, when organized Sufi orders started to play a major role in Muslim societies, nor were they ever confined within such orders. In other words, whatever Muslims believe,

experience, or perform as religious beings almost always has a spiritual dimension, even though this dimension is not always labeled or institutionalized in a distinctly identifiable “Sufi” form. It is the manifestation of this spiritual dimension of Islam in the beliefs and practices of Sufism as a more or less specialized discipline that represents, in some ways, a contested area. This is hardly surprising, for Sufism is not a simple and monolithic entity but a collection of rich and diverse traditions with numerous currents that sometimes compete with each other.

Distrust for Sufism among some Muslim jurists and theologians was originally provoked by certain varieties of Sufism that they saw as deviations from Islamic norms. In most cases, however, Sufis themselves have been the first to oppose such tendencies, thereby generating a tradition of self-criticism and internal reform within Sufism. For their part, Sufis have criticized what they viewed as the narrow perspectives of theologians and jurists in general, who, according to the Sufis, were unable to gain a personal apprehension of ultimate reality because of the limited reach of their exoteric disciplines. At the same time, many prominent theologians and jurists in Islamic history have been practicing Sufis as well. Perhaps the most influential of them was Abu Hamid Muhammad AlGhazali (1058–1111) who was among the first to defend the Islamic authenticity of Sufism.

Traditionally, a proper knowledge of Islam’s exoteric disciplines has been considered a prerequisite for embarking upon the Sufi path; this requirement, however, was not always followed in practice. According to the self-understanding of Sufism, its esoteric framework does not stand in opposition to Islam’s exoteric teachings but represents a stronger and more intensified inner experience of their truth. Such a personal apprehension of the nature of reality (*tahqiq*) is opposed to naive faith in ascribed beliefs (*taqlid*), and provides the vital energy for sincere and creative religiosity. Al-Ghazali notes that what is most distinctive about Sufism cannot be grasped by study, but only through immediate experience and personal transformation: “What a difference there is between knowing the definition of health and satiety, together with their causes and presuppositions, and being healthy and satisfied!”

At least part of the opposition to Sufism in Muslim societies has come from governments. Muslim (and later colonial) rulers often recognized that the strong bond of loyalty and commitment that typically develops between master and disciples in institutionalized Sufism, as well as the strong organization and motivation of Sufi orders, could be threatening to their political power. Institutionalized Sufism suffered some setbacks in recent centuries due to Islam’s encounter with Western modernity and consequent social transformations, as well as due to its patronage and control by colonial and post-colonial bureaucracies for political reasons; both have led to numerous adjustments and adaptations, or, according to critics, to Sufism’s degeneration in many cases into superstitious and exploitative forms of popular religion. Despite its contested nature, however, Sufism in its myriad forms continues to thrive in the contemporary world among Muslims belonging to diverse socio-cultural backgrounds. Perhaps an important reason for Sufism’s continuing influence and attraction lies in its ability

to address religious yearnings at a deeper existential level and to affirm and channel certain emotional states, a need that receives minimal attention in more rationalized Islamic disciplines like *Sharicah* (Islamic law) or *Kalam* (theology). Like most forms of human religiosity, Sufism has the potential both to serve and hinder the cause of the environmental movement. Optimistically speaking, Sufism's hold on the lives and imaginations of a large number of Muslims could very possibly make it one of the most powerful allies of the environmental movement. The realization of this potential will require the fostering of an ecological consciousness among those traditionally trained scholars and Sufi mentors who represent the best aspects of the Sufi tradition and who enjoy a widespread following. The development of an authentic "eco-Sufism" will also require an environmentally informed critical evaluation of classical Sufi teachings and practices. A deliberate effort will have to be made in order to identify those themes in Sufism that may contribute positively to Islamic environmentalism as well as those that might obstruct its development.

Sufi asceticism (*zuhd*) is a theme that can have both positive and negative consequences for the natural environment. In its extreme manifestation, asceticism can lead to an excessive otherworldliness and withdrawal from the world – an attitude that could lead to a disregard for the concrete social and ecological reality in favor of personal union with the divine. In its mild and moderate forms, however, asceticism can be an asset for Islamic environmentalism, with its potential for fostering spiritual discipline and combating the temptations of consumerism. Typically, most Sufi teachers would not recommend actually renouncing the world – which is seen as contrary to the vision of Islam – but would encourage the cultivation of a state of mind in which one is only outwardly involved with material possessions and concerns while focusing one's inner attention solely on God. This kind of asceticism often involves living at a subsistence level, taking from the material world only that which is unavoidable for living a life of spiritual and moral purity. Ideally, Sufis would be actively involved in family and community lives, in accordance with Islam's normative ideals, yet they would avoid acquisition of material possessions or enjoyment of material comforts for their own sake. This happy balance, if self-consciously cultivated at a mass level, can have far-reaching economic and ecological consequences. The attitude of Sufism toward nature may be explored through several themes, one of which is the doctrine of *Wahdat Al-Wujud*, or Unity of Being. Because of the complex nature of this doctrine, brief descriptions are inherently imprecise and potentially misleading. Nevertheless, Sufi ontology based on Unity of Being has important implications for an Islamic eco-theology, as it cultivates the sanctity and intrinsic worth of nature, irrespective of its utilitarian or instrumental value. A Sufi perspective informed by Unity of Being would approach nature with the knowledge that all things and phenomena are interrelated at the deepest ontological level, for they are nothing but the loci of the self-disclosure and self-revelation of the same Ultimate Reality. In Sufism, nature is often seen as being imbued with immense spiritual significance. According to the Persian poet Sacdi (d. 1292): "I love the whole cosmos, for the cosmos is from God." This approach can inculcate an extraordinary

love and fascination, as well as awe and reverence, for nature. Since everything in nature is a theophany, service to God's creatures is service to God and crimes against them are sins against God. At the same time, however, certain other – and perhaps less sophisticated – interpretations of the Unity of Being have led to the conclusion that the material world is a mere illusion with which enlightened human beings need not concern themselves. An ecologically conscious Sufism would have to guard itself against such tendencies.

The ecologically beneficial attitudes present in much of Sufism are yet to be translated into heightened environmental consciousness and activism. Even when recognized as environmentally relevant, such attitudes are likely to remain abstract ideals so long as they are neither supported by contemporary culture nor actualized in social institutions, both of which tend to inculcate environmentally destructive behaviors. Hostility against Sufism and the penetration of Muslim societies with

Western capitalism further restrict the effectiveness of such ideals in shaping concrete reality. The classical age of Sufism did not encounter the environmental crisis as it is being experienced now; at best, Sufism's approach to nature can be effective at an individual level, but the power of the collective order to shape individual consciousness and behavior has tremendously increased in the meantime, so much so that it even influences the hopes, fears, desires, and dreams of individuals living under its sway. Consequently, Sufism cannot contribute toward an Islamic environmentalism without making certain adjustments in its theoretical and practical focus, so that it becomes able to direct the spiritual and moral energy generated at an individual level into socially transformative channels.

Achieving a living experience of divine presence is both the goal of Sufism and a prelude to its higher aspiration, which is to find spiritual intimacy (*qurb*) with the divine beloved. The Islamic tradition identifies two ways of achieving this spiritual intimacy, which are by no means mutually exclusive. The first (*taqarrub bil-fara'id*, achieving intimacy through obligations) has a strong social dimension, for it emphasizes the fulfillment of one's duties toward God (*huquq Allah*) and God's human and nonhuman creatures (*huquq al-cibad*). The second (*taqarrub bil-nawafil*, achieving intimacy through supererogatory acts) has a strong individualistic element, for it emphasizes contemplation and private rituals of meditation, devotion, and worship. In general, Sufi thought and practice has shown a marked predilection for the latter way, sometimes at the cost of the former. In order for Sufism to become relevant to the environmental movement, and to movements for social justice in general, a shift of emphasis is needed in the direction *taqarrub bil-fara'id*.

This implies that Sufis, as real or would-be friends and lovers of God, will have to pay greater attention to alleviating the suffering of the creatures of their divine beloved. In other words, Sufism will have to focus its attention on the attainment of spiritual intimacy with God primarily through service to God's creatures – who constitute "God's family" according to a famous *hadith* – without devaluing individual worship. According to the Qur'an, the experience of divine presence can be sought in

the world of nature as well as within the human spirit; a shift of emphasis from the latter to the former may also help raise an ecological consciousness among followers of the Sufi path.

While Sufism has been criticized for its tendency to produce passivity, fatalism, and political quietism, its history simultaneously displays a remarkable engagement with social and political reality. For instance, virtually all nineteenth-century anti-colonial movements in the Muslim world revolved around Sufi orders and were led by Sufi masters. While Sufism is certainly not without its problematic aspects, it does contain significant resources that can be actualized for organized activism and movements for social change – a potential that needs to find worthwhile, authentic, and indigenous causes, an ecoSufism being one very important possibility.

Sun Worship

Worship of the sun as god, goddess or spirit has been a regular feature of indigenous and pagan religions from ancient to contemporary times. Solar deities appear among the peoples of Siberia, Africa and North America. Solar worship is also strongly associated with the ancient Egyptians, Japanese Shinto and Vedic Indians. The sun is still worshipped by Hindus today – either as Surya or under the later identity of Vishnu in the *Puranas*, especially his manifestation as Satya Narayan. In the pre-Christian and pre-Islamic Levant, we also find sun-gods as regular features of various worships. The Romans imported the cult of the Nubian sun-god Mandulis. Another import was Sol Invictus (“the invincible sun”), a Near Eastern sun-god brought to Rome during the Punic wars. In late imperial times, under Elagabalus, he was identified with Mithras and later became important for Julian. The Christian festival of Christmas represents a transformation of the original solstitial festival of Mithras/ Sol Invictus. For the earliest Roman, however, the sun was honored under the names of Vediovis and Sol Indiges (the indigenous sun of the Quirinal Hill).

As an Indo-European people, the Romans reflect the persistent sun worship found also among their linguistic cousins, namely, the Greeks, Hittites, Armenians, Slavs, Balts, Norse and Celts. As a male figure, the sun is usually considered a god of judgment. But the sun could equally be recognized as a goddess and progenitrix. In his *Masks*

of God, mythologist Joseph Campbell argues that the rise of the solar metaphor in worship reflects the development of consciousness as an emergence from the uroboric and lunar matriarchal matrix of Neolithic times (see further, Neumann 1954). A similar argument is put forward by Julian Jaynes (1977).

If the position of Amaterasu-O-Mi-Kami among Japanese Shinto represents the most developed solar cult in the world today, for the Mahayana Buddhists the name of the central *dhyānibuddha*, Vairocana, is also suggestive and signifies “coming from the sun.” Among contemporary Western nature religionists, the sun is likewise emerging as an increasingly important focus. But this development faces the onus of associations and abuses in the name of solar worship committed under the Third Reich. Based on the philological studies of Max Müller and Ernest Renan, the German *Volkstum-bewegung* developed a practice of sun worship that included nude sun-bathing and celebration of the solstices. It had been prompted by a popular sense of estrangement from nature in the face of early nineteenth-century urban industrialization and machinebased civilization. The *Völkische* movement turned toward pre-Christian beliefs in which ancient sun worship was considered more consistent with scientific modernism

than were the prevailing Christian and Jewish theologies. The contemporary Western Pagan solar focus and solstitial/equinoctial celebrations are based on similar reactions, but, unlike German “folk” paganism, the more liberal and/or left-wing spiritual bias of nature-centered religiosity rejects any notions of ethnic purity or eugenics. But whereas Wicca and Craft manifestations honor the Neolithic totality of light and darkness, Druidic and other reconstructed forms of Paganism, despite their use of stone circles, are decidedly post-Neolithic in their preference for solar orientation and metaphor. This last, similar to what occurs in Shinto worship, often involves ritually witnessing the rising sun. In the milieu of Pagan affinities and contemporary youth culture, all-night dance parties typically culminate at daybreak with ravers greeting the emerging solar orb. This suggests the possibility of convergence between traditional indigenous practice and spontaneous sun-worship developments in the Western world.

Surfing

To the casual observer surfing is an adventure sport not a religion. Such observers would certainly not expect that surfing might promote a veneration of life and a corresponding environmental activism. For many surfers, however, surfing is a ritual, a practice; a way of life that evokes experiences akin to what some scholars have labeled “oceanic” or mystical feelings of oneness with the cosmos. The perceptual alterations that come with surfing, many of its devotees confess, leads them to recognize their obligations toward the Earth’s living systems, especially “mother ocean.”

Certainly this is not the experience and ethics of all surfers, and popular culture often accurately portrays surfing not as a religious quest producing environmental sensitivity, but as a hedonistic sport sometimes so charged with ego that territorialism leads to brutal fights over the best waves. Meanwhile most religious studies scholars have largely ignored the practice. The popular image and scholarly disinterest has produced a widespread lack of understanding of surfing’s history, spirituality, and transformative power. Here two surfers, one religion scholar (Bron Taylor) and a founder of two nonprofit surfing organizations (Glenn Hening), go tandem in an effort to explain what surfing has to do with religion and nature.

Editor’s note: This co-authored entry is unusual because Glenn Hening is both a contributing expert as well as an important figure in the contemporary evolution of modern surfing and thus a subject of the analysis. It proved best to draw on his first-person writing in the first two sections, to co-author the third section, and for Bron Taylor to lead-write and quote Hening during the last three sections. The role of the writers in each segment is signaled in the subheadings themselves, and it should be understood that Taylor worked up this introduction and the entry’s framework.

The Endless Energy of Surf “Stoke” [Hening]

When I first wanted to be a surfer in the early 1960s, Mom and Dad said, “No way – you’ll just end up a beach bum.” And at the time, their fears were well founded, given the public image of surfing driven by the Beach Boys and the popular American television program *Gidget*. Now, four decades later, we’ve come a long way from the motion picture *Beach Blanket Bingo* to a discussion of surfing in this *Encyclopedia of Religion and Nature*. Or have we? Wild rites of passage, zealots wandering in the emptiness of nature, sacred objects and icons, vestments for holy rites, cloistered believers versus the great unwashed – sounds like surfing to me! And why? Because from
