J

Jackson, S. Wesley “Wes” (1936–)

Wes Jackson, a pioneer in modern methods of environmentally and economically sustainable agriculture, cofounded The Land Institute in 1976 and continues to serve as its president.

Jackson was born in 1936 on a farm in the Kansas River Valley near Topeka, Kansas. He earned a B.A. in biology from Kansas Wesleyan University in 1958, an M.A. in botany from University of Kansas in 1960, and a Ph.D. in genetics from North Carolina State University in 1967. He established and served as chair of one of the country’s first environmental studies programs at California State University at Sacramento. After returning to Kansas in 1976, Jackson co-founded The Land Institute with Dana Jackson.

Jackson’s work at the Land Institute has been devoted to research and teaching in the area of sustainable agriculture. His “eco-agrarianism” is founded upon the idea that agriculture should mimic the way that an undisturbed ecosystem operates in a given place. Thus, since the natural ecosystem of the Kansas prairie is a polyculture of grasses, mostly perennials, Jackson’s initial research at the Land Institute has worked at developing high seedyielding perennial grains and growing cultivated polycultures. His ideas have expanded to a vision of Natural Systems Agriculture (NSA) which encompasses not only agricultural techniques that are, in Jackson’s words, “native to this place,” but also a consideration of the economic and cultural feasibility (and necessity) of shifting to NSA.

While Jackson is highly critical of Western religious views – particularly Christian views – that uphold an instrumental view of nature as an object to be exploited for short-term human gain, he draws regularly upon biblical and theological imagery in advocating a biocentric worldview. For example, the title of an early collection of essays, *Altars of Unhewn Stone* (1987) recalls the Exodus 20:25 injunction that Moses build an altar of unhewn stone “for if thou lift up thy tool upon it, thou has polluted it” (in Jackson 1987: 9). In other words, the imposition of human technology upon nature is desecration. He likes to point out that the first commandment of the Bible is to “dress the land,” and he frequently speaks of his fascination with Mennonite and Amish farming practices as models (albeit flawed) of land *stewardship*. More recently in an essay, “The Changing Relationship Between the Tree of Knowledge and the Tree of Life” (2000), Jackson finds in the biblical story of Eden, both a metaphor for human alienation from nature and a possible solution to that alienation, viz., to humbly subordinate the fruit of the tree of knowledge (technological/scientific manipulation of the world) to the tree of life (nature’s wisdom).

More positively, as an evolutionary biologist, Jackson has been attracted to the thinking of process theologians such as John B. Cobb, Jr., and has participated in conferences with and sponsored by Cobb and the Center for Process Studies. Like Cobb, Jackson promotes a biocentric ethics based upon a panentheistic view of the fundamental interrelatedness and inherent value of all entities.

Jackson's work, writing, and speaking have gained international attention and earned numerous awards, including: a Pew Fellows Program in Conservation and the Environment (1990); MacArthur Foundation, MacArthur Fellow (1992); and the Right Livelihood Award (2000).

Jainism

Fundamental Jaina Views

The Jaina religion originated in India at least 2500 years ago. It is currently practiced by approximately four million persons in India and several hundred thousand others scattered across the globe. Jainism espouses a philosophy that emphasizes the pervasiveness of life forms and advocates a religious practice rooted in a nonviolent ethic. Jainism posits a living universe, uncreated, and eternal. In this sense, it can be deemed non-theistic. It holds a voluntarist stance, emphasizing that one's individual, self-generated karma determines one's present and future reality.

This worldview began with the teachings that informed the religious development of Mahavira, the great Jaina leader who lived during the same period as the Buddha, around the fourth century B.C.E. Mahavira himself is said to have arrived at his definition of life through direct observation:

Thoroughly knowing the Earth-bodies and waterbodies, and fire-bodies and wind-bodies, the lichens, seeds, and sprouts, he comprehended that they are, if narrowly inspected, imbued with life (*Acaranga Sutra* I:8.I.11–12).

The earliest known Jaina text, cited above, lists in detail different forms of life and advocates various techniques for their protection. The text states that “All breathing, existing, living, sentient creatures should not be slain, nor treated with violence, nor abused, nor tormented, nor driven away. This is the pure, unchangeable, eternal law” (I.4.1). The *Acaranga Sutra* mentions how to avoid harm not only to animals, but also to plants, by not touching them, and to the bodies that dwell in the Earth, the water, the fire, and the air. For instance, Jaina monks and nuns must not stamp upon the Earth, or swim in water, or light or extinguish fires, or thrash their arms in the air.

In the later philosophical tradition, Umasvati's *Tatt- vartha Sutra* (ca. 100) states that the universe is brimming with souls weighted by karmic material (*dravya*), many of which hold the potential for freeing themselves from all karmic residue and attaining spiritual liberation (*kevala*). These souls constantly change and take new shape due to the fettering presence of karma, described as sticky and colorful. By first accepting this view of reality and then carefully abiding by the five major vows (nonviolence, truthfulness, not stealing, sexual restraint, and nonpossession), the Jaina aspirant moves toward the ultimate goal of liberation. At the pinnacle of this achievement, all karmas disperse and the perfected one (*siddha*) dwells eternally in omniscient (*sarvajna*) solitude (*kevala*).

Umasvati explains how careful action will help ensure one's rebirth in a higher realm. Violent action might thrust one down into one of seven infernal regions or hells; auspicious action might elevate one to one of the eight heavenly regions. The highest spiritual action can only be undertaken in the middle realm, Earth or Jambudvīpa, by human beings. If effective, one's meditation and careful observance of nonviolence might release one into a state of perfection, the *siddha loka*, where one dwells eternally experiencing energy, consciousness, and bliss, while retaining one's sense of individuality, symbolically represented by ascent to the summit of one's own mountain peak.

According to Umasvati's *Tattvartha Sutra*, 8,400,000 different species of life forms exist (1994: 53). These beings are part of a beginningless round of birth, life, death, and rebirth. Each living being houses a life force or *jīva* that occupies and enlivens the host environment. When the body dies, the *jīva* seeks out a new site depending upon the proclivities of karma generated and accrued during the previous lifetime. Depending upon one's actions, one can either ascend to a heavenly realm, take rebirth as a human or animal or elemental or microbial form, or descend into one of the hells, as a suffering human being or a particular animal, depending upon the offense committed.

The Jainas were careful to observe and describe the many life forms that they hoped to spare. They catalogued them according to the number of senses they possess. Earth bodies, plants, and microorganisms (*nigodha*) are said to possess the sense of touch. Earthworms and mollusks are said to add taste to touch. Crawling insects add the sense of smell. Moths, bees, and flies add sight. At the highest realm, Jainas place animals that can hear and those that can hear and think, including reptiles, birds, and mammals. Santi Suri, a Jaina writer of the eleventh century, summarizes this assessment of different life forms in the *Jīva Vicāra Prakāraṇam*, a text of fifty verses. He makes clear that all forms of life, from clods of Earth to human beings, have "life, breath, bodily strength, and the sense of touch" (Suri 1950: 163). Hence, all must be protected.

Santi Suri's *Jīva Vicāra Prakāraṇam* lists types of life, frequency of appearance, and cites an approximate lifespan for each. For instance, he states that hardened rock can survive as a distinct life form for 22,000 years; "water-bodied souls" for 7000 years; wind bodies for 3000 years; trees for 10,000 years, and fire for three days and three nights (1950: 34). Each of these forms demonstrates four characteristics: life, breath, bodily strength, and the sense of touch (1950: 163). Earth, water, fire, air bodies, which comprise material objects such as wood or umbrellas or drops of water or flickers of flame or gusts of wind all contain *jīva* or individual bodies of life force. Moving from the elements to descriptions of plants, he lists various plant genres, with precise detail given for plants with fragrance, hard fruits, soft fruits, bulbous roots, thorns, smooth leaves, creepers, and so forth. Santi Suri includes passages that urge one to restrict the use of specific plants, with special attention paid to determining avoidance of doing harm to plants that harbor the potential for even greater production of life forms.

He then describes two-sensed beings, possessing touch and taste, which are said to live twelve years and include conches, cowries, gandolo worms, leeches, earthworms,

timber worms, intestinal worms, red water insects, white wood ants, among others (1950: 15). Three-sensed beings live for 49 days and include centipedes, bedbugs, lice, black ants, white ants, crab-lice, and various other kinds of insects (1950: 16–17). These beings add the sense of smelling. Four-sensed beings, which add the sense of sight, live for six months (1950: 35) and include scorpions, cattle-bugs, drones, bees, locusts, flies, gnats, mosquitoes, moths, spiders, and grasshoppers (1950: 18). At the top of this continuum reside the five-sensed beings, which add the sense of hearing and can be grouped into those who are deemed “mindless” and those who are considered to be sentient. This last group includes the denizens of hell, gods, and humans. Various lifespans are cited for fivesensed beings, which Santi Suri describes in great detail: land-going, aquatic, sky-moving, and so forth. The detailed lists by Santi Suri and his later commentators present a comprehensive overview of life forms as seen through the prism of Jainism. As such, they have presented a view of life that presages later environmental theory, resonating in its attention to detail with such writers as Aldo Leopold.

Jainism and Social Activism

The Jaina worldview states that the material world itself contains feelings and that the Earth feels and responds in kind to human presence. Not only do animals possess cognitive faculties including memories and emotions, also the very world that surrounds us can feel our presence. From the water we drink, to the air we inhale, to the chair that supports us, to the light that illumines our studies, all these entities feel us through the sense of touch, though we might often take for granted their caress and support and sustenance. According to the Jaina tradition, humans, as living, sensate, thinking beings, have been given the special task and opportunity to cultivate increasingly rarefied states of awareness and ethical behavior to acknowledge that we live in a universe suffused with living, breathing, conscious beings that warrant our recognition and respect.

The Jainas were quite assertive in making their minority religious views known in areas of India where they gained ascendancy. Many of the southern kingdoms of Karnataka offered protection and patronage to the Jainas, who won several concessions regarding public laws designed to encourage vegetarianism and discourage hunting (*Saletore*). Jainism exerted profound influence throughout this region from 100 to 1300. In the northern kingdoms of Gujarat, they experienced a golden era when Kumarapala (r. 1143–75) converted to Jainism. He encouraged the extensive building of temples, and under the tutelage of the Jaina teacher Hemacandra (1089–1172) became a vegetarian (Cort 1998: 100). He enacted legislation that reflected Jaina religious precepts regarding the sanctity of all life. In the north central area of India, Jincandrasuri II (1541–1613), the fourth and last of the Dadagurus of the Svetamabara Khartar Gacch of Jaina monks, traveled to Lahore in 1591 where he greatly

influenced the Mughal Emperor Akbar the Great. Akbar protected Jain places of pilgrimage and ordered noninterference with Jain ceremonies. Most remarkably, he forbade the slaughter of animals for one week each year (Babb 1996: 124). The Jainas tirelessly campaigned against animal sacrifice, which is now illegal in most states of India. Mahatma Gandhi, the most well-known leader of modern India, was deeply influenced by the Jain commitment to nonviolence and adapted it in his campaign for India's political independence from Britain.

For various reasons, it might seem logical for Jainas to become active in India's burgeoning environmental movement. The Jainas have been great protectors of life within India. They have inspired legislation to protect animals over the course of centuries, and have been influential in the modern government of India. Though the great struggles to ban ritual slaughter of animals and to free India from colonial rule have largely been won, Jainism is well equipped to face the new challenges faced by India as it continues to pursue a course of rapid industrialization.

Contemporary Jaina Environmentalism

The Jaina community has undertaken some steps toward including environmental issues within their religious discourse. L.M. Singhvi, a noted jurist and Member of Parliament, published a small book titled *Jain Declaration on Nature* in 1990. It quotes Mahavira's warning that observant Jainas must be respectful of the elements and vegetation: "One who neglects or disregards the existence of Earth, air, fire, water, and vegetation disregards his own existence which is entwined with them" (in Singhvi 1990: 7). Singhvi himself writes that "Life is viewed as a gift of togetherness, accommodation, and assistance in a universe teeming with interdependent constituents" (Singhvi 1990: 7). Stating that there are countless souls constantly changing and interchanging life forms, he goes on to note that "Even metals and stones . . . should not be dealt with recklessly" (1990: 11).

Several Jaina organizations have taken up the cause of environmentalism, regarding it as a logical extension of their personal observance of nonviolence (ahimsa). The Shri-mad Rajchandra Kendra near Ahmedabad announced in 1990 plans to operate a news service to "supply information on different Jain environmental projects and on ecology issues generally to the 450 Jain newsletters and magazines in India as well as abroad" (*Ahimsa Quarterly Magazine* 1991: 5). Reforestation projects have been underway at various Jaina pilgrimage sites, such as Palitana in Gujarat, Ellora in Maharashtra, and Sametshirkhar and Pavapuri in Bihar. At Jain Vishva Bharati in Rajasthan, a fully accredited university, the Ahimsa Department offers a specialization in ecology. In December 1995, the department co-sponsored a conference entitled "Living in Harmony with Nature: Survival into the Third Millennium."

Topics included the environmental crisis, ecological degradation, and unrestrained consumerism. A conference held at Harvard University in 1998 examined the topic

of Jainism and ecology, and included representatives and scholars of various sects of Jainism. These activities reflect some ways in which the tradition has been newly interpreted to reflect ecological concerns.

At first glance, the Jaina tradition might seem to be inherently ecologically friendly. It emphasizes nonviolence. It values all forms of life in their immense diversity, not merely in the abstract but in minute detail. It requires its adherents to engage only in certain types of livelihood, presumably based on the principle of ahimsa. However, if we look at both the ultimate intention of the Jaina faith as well as the actual consequences of some Jaina businesses, we might detect a need for in-depth critical analysis and reflection. First it must be noted that the observance of ahimsa must be regarded as ancillary to the goal of final liberation or *kevala*. Although the resultant lifestyle for monks and nuns resembles or approximates an environmentally friendly ideal, its pursuit focuses on personal, spiritual advancement. In a sense, the holistic vision of the interrelatedness of life is no more than an eco-friendly by-product.

In terms of the lifestyle of the Jaina lay-person, certain practices such as vegetarianism, periodic fasting, and eschewal of militarism might also be seen as eco-friendly. However, some professions adopted by the Jainas due to their religious commitment to harm only one-sensed beings might be environmentally disastrous, such as stripmining for granite or marble, unless habitat restoration accompanies the mining process. Likewise, how many Jaina industries contribute to air pollution or forest destruction or result in water pollution? The development of a Jaina ecological business ethic would require extensive reflection and restructuring, a tradition well known within the Jaina community. Nonetheless, the Jaina community, despite its relatively small numbers, is extremely influential in the world of Indian business, law, and politics. If Jainas speak with a united voice on environmental issues, their impact can be quite profound. Due to their perception of the “livingness” of the world, Jainas hold an affinity for the ideals of the environmental movement. The Jaina observance of nonviolence, as practiced by monks, nuns, and lay-people, has provided a model for a way of life that respects all living beings, including ecosystems. The Jainas are well suited to reconsider their traditions in an ecological light, particularly because of their successful advocacy against meateating and animals sacrifice, as well as their success at developing businesses that avoid overt violence. Many Jainas identify themselves as environmentalists. Through a rethinking of contemporary industrial practices, and concerted advocacy of environmental awareness through religious teachings and the secular media, the Jaina tradition might help bolster the environmental movement not only in India but also throughout the world.

James Bay Cree and Hydro-Quebec

For the James Bay Cree people of northern Quebec province in Canada, the watershed event was the decision in

1971 to develop the hydro-electric potential of their rivers. Facing one of the largest energy development projects ever built, the Cree people and their Inuit allies in the Hudson Bay area demanded recognition of their Aboriginal rights and went to court to assert their authority over the land.

The James Bay hydro project was a watershed event also for the evolution of Aboriginal land claims in Canada, and for the critique of large development projects. A powerful coalition of environmentalists and Aboriginal leaders, assisted by a well-publicized and prolonged court case in 1972–1973, was successful in initiating public discussion on some of the themes important in this volume: the role of humans in the environment, and the idea that humans can be a part of nature. The events triggered public discussion on the notion of a traditional ecology in which humans and nature are in a symbiotic relationship, with mutual obligations leading to “respect,” a central idea in the relations of many Amerindian groups with nature.

The Cree and the Inuit found not only a receptive public, but also a court sympathetic to their cause. They were successful in obtaining an injunction to stop development in 1973. However, this decision was overturned only a few weeks later by a higher court, forcing the Cree and Inuit to the negotiating table for the surrender of their Aboriginal claims and to open the way for hydro development. In 1975, the Cree and Inuit signed the *James Bay and Northern Quebec Agreement*, the first of the modern comprehensive land claims agreements in Canada. Under the *Agreement*, the Cree and Inuit obtained ownership rights to areas around their communities, exclusive hunting and fishing rights over a large territory, regional self-government powers, cash compensation and other privileges, in exchange for allowing Hydro-Quebec, the power company, to proceed with development.

The 1975 *Agreement*, signed under duress, left the Cree leadership with strong and ambiguous feelings about development. In the 1980s, the Cree allowed a series of alterations of the original hydro development plans. But in 1993, the Cree successfully fought and blocked a multibillion dollar extension of the James Bay hydro project, known as the James Bay II or Great Whale development after the name of the Grande Baleine (Great Whale) River which is to the north of the James Bay I development.

Subsequently, in 2001, the Cree leadership signed an interim deal for the development of the Rupert and Eastmain rivers to the south of the James Bay I development. The action triggered a bitter fight that pitted community leaders against one another,

with the chief of one of the directly affected communities, who was initially a key supporter, declaring, “I have little enthusiasm for going down in history as the Waskaganish chief who signed the death warrant for the Rupert River” (*Montreal Gazette*, 10 December 2001). As long as undeveloped hydroelectric potential exists in the region, these battles are likely to continue. But the important questions for our volume are, who are these Cree people who talk about rivers as if they were alive, and what is their belief system really like?

The eastern James Bay Cree are part of the largest Aboriginal group in Canada. Their lands cover a good part of the boreal forest zone that stretches across Canada, and part of the northern plains. The Cree groups of the boreal forest were traditionally hunters, and many of them still obtain a large part of their protein diet from the land. Their hunting ethics and belief systems are rich, and have been documented extensively by anthropologists such as Harvey Feit, Richard Preston, Adrian Tanner and Robert Brightman.

The central belief of the James Bay Cree and some other groups of the boreal forest is that animals make themselves available to hunters who treat them properly. Those who break rules of proper conduct are punished. This punishment usually takes the form of hunting failure, and it can be individual or communal. For example, the Chisasibi Cree believe that the disappearance of caribou from their area for some seventy years is related to a disastrously large and bloody hunt that took place in 1914 when the repeating rifle first became available (Berkes 1999).

The rules of proper conduct are expressed as practices to follow, such as practices of showing respect for the animal. For example, the bones of important animals have to be disposed of in certain ways, as in placing of beaver skulls on trees. Tanner lists the many ways in which the Mistassini Cree show respect for black bears, from hunter’s initial approach with an attitude of humility, to offerings made to the dead animal, to the butchering, consumption of the meat, and the disposal of the remains. Some of the rules are expressed as practices and attitudes to avoid. For example, it is widely believed that fish will avoid a person who boasts about his/her skills and previous successes. How do they know? Because the land is alive and animals are sentient beings.

Religion may be broadly defined as encompassing issues regarding the meaning of human life and engagement with transcendent powers, such as forces that impinge on people’s lives. Most Cree are Christians, but their “religion” in the above sense indicates a belief system that differs considerably from the mainstream Western society. The Cree believe in a nature that pulsates with life and meaning. Their ecology is spiritual, rather than impersonal and mechanistic. Landscapes “know” people, rather than people knowing the land. Animals control the hunt and can retaliate by “returning the discourtesy.” Humans, animals and other beings in the environment share the same Creator; hence, just as one respects other persons, one respects animals. Social relations such as mutual obligations and reciprocity are extended to nonhuman nature. Respect and humility are important, and

Cree culture is rich in rituals that symbolize respect and remind the hunter of his/her ethical obligations.

James, William (1842–1910)

William James, the oldest of five children born to Henry James, Sr., and Mary James, was immersed from his youth in the family's romantic hopes to find spiritual significance in the natural world. The elder James read the mystic Emanuel Swedenborg's works extensively, lectured widely on his idealistic solutions to contemporary religious and social issues, and firmly believed that the material world was a mere shadow compared to the reality of spiritual forces that would bring about a more righteous and democratic society. In his young adulthood, William resisted these spiritual insights, especially when he began his own career in the wake of Darwinism by studying chemistry, anatomy, physiology, and medicine at Harvard in the 1860s.

The young James did not remain satisfied for long with the scientific and secular insights that surrounded him during his first career steps in the New Psychology. A traumatic personal crisis signaled his return to the issues his father had taught because he felt repulsed by the notion that material nature possessed only mundane physical reality. Although he worked in mainstream professions, as a teacher at Harvard throughout his career and as a respected and popular psychologist, philosopher, and social commentator, his own commitments remained on the margins because of his drive to understand spiritual meanings in nature.

James' commitments remained fairly muted in his first major publications. He wrote his influential *Principles of Psychology* (1890) "from a natural science point of view," with comprehensive references to the experimental psychology of Europe and America and with a working assumption that reflected the scientific orthodoxy that mental life could be understood with physical explanations. However, his guiding motivation was to find the relation between brain and mind, between things material and impulses immaterial.

Those interests grew even as the psychology profession took an increasingly laboratory orientation in the 1890s. James quickly turned his attention to philosophy and to spiritual, psychical, and other exceptional experiences of human consciousness. He expressed his commitment to religious belief against the withering criticism of agnostics in his declaration of the importance of a "Will to Believe" (1895) in ideas that satisfy our need for commitment even when they cannot be empirically verified. He wrote *The Varieties of Religious Experience* (1902) to document the extraordinary depths of personal religion and to showcase the profound impact of belief on human saintliness and mystical insight. In the essays collected as *Radical Empiricism* (1912), James proposed to show the intimate relation between subjective ideas and empirical objects. In *A Pluralistic Universe* (1909), he argued for looking at the world in terms of the multi-

plicity of its empirical parts, without losing the sense of purpose derived from religious worldviews. James is perhaps most famous for his theory of *Pragmatism* (1907), which proposed that usefulness and practical action should be the way to measure the worth of ideas, and he was particularly interested in showing how pragmatism could endorse religion's ability to motivate and sustain.

In his work, William James did not dismiss science, but he proposed that its insights, along with those of religion, were all useful as paths for increasing our awareness of human possibilities embedded in our physical frames. With these commitments, he anticipated twentieth-century humanistic psychology and the flowering of personal spiritualities that have flourished across denominational lines in the last few generations. His influence is perhaps best expressed with the image he used in *The Varieties*: our normal waking consciousness is only a doorway to some other cosmic consciousness, of which we occasionally get glimpses, especially with the help of religious geniuses. And so, by the end of his life, James found a way to express his father's commitments in more secular terms; like a psychologist, he investigated the human mind in its relation to the brain, but with his spiritualist drive, he proposed that those physical, psychological facts are just a first step in comprehending profound spiritual meaning.

Japanese Gardens

Garden design has been a spiritual art form in Japan for a thousand years, one in which the Japanese have explored various conceptions of nature. Influenced by both Buddhism and Shinto, the aesthetic complexity of Japanese gardens has been seen as a sign of the Japanese reverence for nature. However, the relationship between Japanese gardens and what we call “nature” is complex and raises questions about the specific quality of love of nature in the Japanese tradition.

There are various types of artistic Japanese gardens. The first type we can call “symbolic.” Starting in the Heian Period (794–1186), gardens were constructed as representations of various types of spiritual realms. In some cases they suggested the paradise of Pure Land Buddhism. In other cases, influenced by Shingon Buddhism, they were topographic mandalas, cosmic diagrams of ultimate reality. Still other gardens suggested the fabled Daoist islands of immortals. In all cases the assumption is that there can be a direct correlation between the natural world and the divine, and that conscious human design can in a sense make the sacred present in the concrete world of trees and ponds.

In the medieval period (1186–1603), Zen Buddhism became the primary influence in Japanese gardens. A new form of garden developed, which we can call “microcosmic.” These gardens represent life-like scenes of nature in a miniature way. Perhaps the finest example is at the temple Daisen-in in Kyoto, where a composition of rocks about three-feet high suggests a huge mountain and a waterfall, with a narrow bed of gravel suggesting a river and isolated rocks serving as islands. There is also a large rock clearly signifying a boat. The scene presented is not one of some paradise distinct from this world but rather a realistic setting in the mountains. But religious reality is not absent because, as Buddhism’s Heart Sutra says, “form is emptiness and emptiness is form”: this very world is ultimate reality. The gardens are not merely clever miniatures but religious microcosms. They cultivate in the viewer a state of mind liberated from conventional assumptions about space and time, large and small, near and far.

Another garden form is the “dry landscape” (*karesan-sui*) or rock and gravel garden. The most famous example is at the Zen temple of Ryoan-ji. This garden is about the size of a singles tennis court and consists of a flat expanse of gravel broken only by five earthen mounds that hold a total of fifteen rocks and some moss. There are no trees or flowering plants. Some observers have said the mounds represent islands in a sea, mountain peaks breaking through cloud cover, or even a mother tiger leading her cubs across a river. But this type of garden is not realistic or representational. Because of that we might be tempted to call such gardens “abstract,” but they are

not abstractions from the concrete world of nature but rather elemental distillations of it. The basic components of Japanese garden design – rocks, plants, and water (in the form of flat gravel) – are concentrated into their most elemental form. As with the microcosmic gardens, the rock garden is meant to be viewed from a veranda of the temple bordering one of its sides. Meditation on the rocks and gravel is considered particularly conducive to the stillness and open awareness prized in Zen.

Late in the medieval period another form of garden developed in association with the Way of Tea (*chado*). The tea ceremony (*cha-no-yu*) developed out of the drinking of tea in Zen monasteries, a custom brought from China that helped meditating monks remain awake. Eventually, a highly ritualized form of serving tea to a few guests developed. The ceremony became a kind of choreographed dance of enlightenment. Each person brings to the occasion an absolute focus on the present based on a deep tranquility and a recognition of the unlimited value of every moment. The tea house is simple and natural, exemplifying the aesthetic ideal of *wabi* (aesthetic rusticity and tranquil appreciation of the simple and natural). The approach to the tea house and the ceremony needed to cultivate a spiritual state of mind, and tea garden (*roji*) developed in order to accomplish this. The garden does not function to display conventional beauty, but to nurture a meditative state of mind: it is spiritually therapeutic. It works by having the viewer walk through a garden that is highly subdued, usually only rocks, moss, and some evergreen plants organized in a subtly aesthetic way. Once the participant enters the tea house, the door is closed and there is no view of the garden, for now he is to focus all attention and value on the tea ceremony.

In the seventeenth century the “stroll garden” developed. As in the tea garden, the viewer walks through the landscape, but these are larger gardens in which spring blossoms and fall colors provide a rich but still subdued beauty. The most exquisite example is Katsura villa, just outside of Kyoto. Walking through the garden, the viewer encounters a variety of aesthetically composed scenes in a subtle rhythm of stimulation and quietness, turns and pauses. The garden exhibits the two major aspects of a Buddhist worldview: change and interrelationship. Subtle framing techniques emphasize the interrelatedness of rock, water, tree, and building, while stone steps and bridges tie together divisions in garden areas. Strolling through Katsura is like walking in a holy cathedral, a sculpture park, a landscape painting by Monet, and Walden Pond – all at once.

These various types of Japanese gardens demonstrate the beauty and religious significance of nature. But from a Western perspective we can ask whether they are “natural.” Japanese gardens are minutely maintained, with pine trees trained to appear like old trees growing on a mountain cliff (including tying branches to a pole and pulling them down so they are horizontal, as well as plucking older needles so the tree is very open). This approach to design we can call “formal naturalism.” It is formal because the design and the maintenance of the garden reflect a preconceived ideal of what a garden should look like – very little is left to grow on its own. But it is naturalism because the design is based on naturalistic principles. Rather than

the stiff symmetry of formal French gardens, Japanese stroll gardens display a more dynamic asymmetrical balance, and they are intended to reflect the essential nature of the objects.

Western observers have tended to distinguish “nature” from that which has been subject to human control, and in this sense Japanese gardens are certainly not natural. But we need to recognize the assumptions at work in Japanese aesthetics. In East Asian religion, the ideal is to act according to our nature, but our nature is obscured and distorted by our desires and delusions. Left by themselves, humans do not act according to their nature. It takes rigorous spiritual training to uncover our true nature. A similar idea is at work in garden design. The gardener training the pine tree is not distorting the pine but helping it manifest its true nature, which is exemplified by trees subjected to centuries of harsh conditions on a mountain cliff. In addition, nature and culture are not assumed to be separate spheres. Humans are part of nature, and culture is interrelated with nature’s processes. The question is whether individual behavior and particular cultural activities conform to nature’s ways or to human self-centeredness. Thus the “idealized” nature in Japanese gardens can be considered to be the true nature of nature.

There is, however, a significant limitation in Japanese garden aesthetics. As John Elder has pointed out, Japanese gardens tend to put high spiritual value on specific, often walled-in spaces. This concentration of value runs the risk of devaluing all that is outside the confines of a garden. The technique of “borrowed scenery” (*shakkei*) integrates the garden with its surrounding landscape (for example, by using trees in the garden to frame a distant mountain peak). In addition, Buddhism proclaims that all places interpenetrate and all of the phenomenal world is the Absolute. But for most viewers, the garden remains a special place of beauty and value, and the mundane world they return to when they leave the garden is left neither to our sense of natural wildness nor cultivated according to formal naturalism. All too often, it is subject to human exploitation and degradation.

Japanese Love of Nature

Renowned Buddhist scholar D.T. Suzuki claimed in *Zen and Japanese Culture* that Japanese demonstrate a unique “love of nature,” especially as conveyed through such arts as painting, landscape gardening, the cultivation of *bonsai*, and haiku poetry. Japanese religious traditions have shaped this “love” of nature, even though it is not necessarily as unique or thoroughgoing as Suzuki’s idealized representation made it out to be.

In the mythology set forth in the *Kojiki* (712) and

Nihon Shoki (720), heavenly *kami* create the Japanese archipelago, as well as basic forces and components of nature, many of which are *kami* in their own right. From early in their history, Japanese have regarded particularly awe-inspiring parts of their natural surroundings as *kami*. They have demarcated distinctive trees, rocks, waterfalls, and even entire mountains as *kami* or the dwelling places of *kami*. Through Shinto practices Japanese align themselves with benevolent *kami* (or placate malevolent *kami*), thereby harmonizing themselves with the life-sustaining energies that course through nature. Further, Shinto rites of purification serve to maintain or, if need be, restore harmony with those energies.

Buddhism has further influenced Japanese attitudes toward nature. Doctrines of rebirth have subverted rigid boundaries between humans and other parts of nature, as have doctrines of “Buddha-nature” (*busho*) and “original enlightenment” (*hongaku*) as a kind of innate buddhahood in not only humans but also other animals, plants, and even, to some exegetes, inanimate parts of nature. Cosmological schemes deriving from Kegon (Ch. Huayan) Buddhism have situated humans in a universe characterized by total interdependence. Zen Buddhists often claim that seated meditation (*zazen*) both reduces the epistemological distance between the practitioner and nature (hence the rhetoric of “becoming one” with nature or things therein) and eradicates entanglement in rational analysis and volitional effort, thereby fostering “naturalness” in the sense of spontaneity. In fact, the closest Japanese equivalent to “nature,” *shizen*, literally meaning “self-so,” or “in the manner of itself,” connotes spontaneity in the sense of things expressing themselves in accordance with their natures when not affected by human intervention.

Some writers have argued that these dimensions of Japanese religions generate both a love of nature and a firm basis for environmentalism. Upon closer scrutiny, however, the Japanese “love of nature” has distinct limitations.

First, the nature loved from the Japanese religioaesthetic perspective is nature *simplified* or *reduced* to its essence. It is a distilled, refined, and miniaturized nature,

evident in minimalist rock gardens, carefully pruned *bonsai* trees, the suggestive brush strokes in landscape paintings, and epigrammatic haiku poetry. This is stylized, not wild, nature. In fact, Japanese have usually gazed at wild nature – with all of its mysterious and often destructive powers – from a distance, as something to be avoided, pacified, or tamed.

Second, Japanese generally regard only awe-inspiring features of nature as sacred (in the sense of being *kami*), not nature more broadly, and hence rigorous protection of nature in Japan has not extended much beyond those special features.

Third, as an adverbial expression indicating a certain mode of being – whether of natural entities or human action – *shizen* exists in any biosphere, pristine or polluted, sustained or destroyed.

Japanese Religions

To trace how “nature” was experienced and expressed in the history of Japanese religions is no simple matter. It was not before the end of the eighteenth century, when the Japanese scholars of Dutch Learning (*Rangaku*) translated “*natuur*” into *shizen*, that the Japanese had for the first time managed to form a terminological equivalent for the Western concept of nature. It was during the Meiji (1868–1912) era that the categories of “nature” (*shizen*) and “culture” (*bunka*) were fixed in their verbal expressions in Japanese, not only as distinct but also as polarized conceptions. The term *shizen* had been borrowed much earlier from the Chinese, but the Chinese term (pronounced by the Japanese as *jinen*) was used to mean the spontaneous power of self-development as well as the results that came from that power. This idea is drawn from a Daoist point of view which is apt to perceive nature as a cosmic whole in which human as well as “divine” dimensions are integrated.

That the ancient Japanese did not have an equivalent term for the Western term “nature” does not necessarily mean that they had no recognition of the phenomenon, which is today called *shizen*. The Japanese, for most of their history, preferred terms such as *mono* or *ametsuchi* (*tenchi*), which are semantically more comprehensive than the term *shizen*. The term *mono* includes not only “things” but also “deities” (such as Omononushi, the great deity of the Miwa Shrine in Yamato), “souls” and “spirits”; and the term *ametsuchi* which literally means “heaven and Earth” is another alternative concept to refer to what the

Japanese now call *shizen*. With respect to the term *mono*, it has been repeatedly asserted by some scholars that the ancient Japanese recognized natural phenomena as manifestations of *kami* (deities), which opens up the possibility of comprehending nature as a plurality of *kami*.

According to Japanese mythology as narrated in the *Kojiki* (*Records of Ancient Matters*, completed in 712) and the *Nihonshoki* (also known as *Nihongi*, *Chronicles of Japan*, compiled in 720), natural phenomena are themselves the offspring of *kami*. This animistic view of nature might have been influenced by the beliefs of the peoples of the Jomon (ca. 4000 or 3000 – 250 B.C.E.) and Yayoi (ca. 250 B.C.E.–250) periods, and developed later into the religious tradition now designated by the term Shinto. In those texts, animistic spirits were individualized and deified as natural deities of, for instance, the sun (Hirume, the original name of Amaterasu), the moon (Tsukiyomi), the mountain (Yamatsumi), and the ocean (Wadatsumi). The *Kojiki* and *Nihonshoki* also indicate the worldview of early Japan, in which the dwelling place of the celestial deities (Takamagahara), the world of living beings (Ashihara no nakatsu kuni) and the

underworld of the dead (Yomi no kuni) are not detached but contiguous, so that the inhabitants of the three worlds can easily interact. The mythology in these documents tells that Omononushi, sometimes assuming a serpent form and at other times taking on human shape, married a human maiden, and became the tutelary deity of the Miwa clan. In this perspective, nature, human society and the spiritual world are so close as to be inseparable. From this point of view, Byron Earhart once described “the closeness of human beings, gods, and nature” as one of the characteristics of Japanese religions, saying that “mortals, gods, and nature form a triangle of harmonious interrelationships [that] is a cornerstone of Japanese religions” (Earhart 1982: 7–8).

This harmony might have originated from a Japanese cosmogony in which there is no creator god but rather a plurality of *kami* coming into existence one after another generated by other *kami*. This is manifested especially in the work of the divine couple Izanagi and Izanami, who came together to give birth to the eight islands of Japan and the various *kami* who came to populate the islands. It may be worth contrasting this procreation seen in the ancient Japanese myth to the Judeo-Christian cosmogony, which is focused on a single creator God. The contrast here seems clear, between what might be characterized as the “cosmogony of creation” in the Judeo-Christian tradition and the “cosmogony of generation” in the Japanese tradition. The “cosmogony of creation” is based on the notion of God as the single Creator, the transcendent origin of creation, while the “cosmogony of generation” as expressed in the *Kojiki* and *Nihonshoki* puts special emphasis on the notion of *musuhi* (the generative force), which is immanent in all beings.

In his analysis of the *Kojiki*, Maruyama Masao noted that, in addition to this contrast, the dominance of “becoming” (*naru*) is one of the characteristics of what he calls the “ancient substratum” of Japanese thought, a characteristic he opposed to the “artifice” or “making” (*tsukuru*) prevalent in the West. Although caution must be taken so as not to oversimplify these two ideal types, it nevertheless seems to be worthwhile to contrast “becoming” with “making” as illustrating the difference between the “cosmogony of creation” and “cosmogony of generation.” Maruyama, in this regard, took two deities, Taka-mi-musuhi-no-kami (“High Generative-Force Deity”) and Kami-musuhi-no-kami (“Divine GenerativeForce Deity”) as the most important in Japanese cosmogony. Both deities symbolize the power of “generation/ becoming,” by which various *kami* “naturally” come to existence one after another, which explains the immanent relationship among *kami*, human beings, and nature.

As to this “ancient substratum,” we should not overlook the Sino-Korean influences on Japanese views of nature, especially that of Daoism (*dōkyō* in Japanese). Scholars such as Fukunaga Mitsuji, Yoshino Hiroko, and Arakawa Hiroshi, for instance, have persuasively asserted the strong and comprehensive influence of Daoism as well as *onmyōdo* (the way of Yin-Yang) on the *Kojiki* and *Nihon-shoki*, especially in the section of cosmogony of those texts. Daoism, which emphasizes harmony with nature, was adopted by the ancient Japanese people and became part of the Japanese religious

heritage so that the Daoist cosmological theory provided the idiom for expressing ideas that were already a central element of Japanese indigenous religion.

It might be safe to say that Japanese religions, from the beginning, generated an intimate view of nature among the Japanese, teaching that nature is full of spirits and, therefore, not essentially dissimilar to human beings. This view of nature reached an apex in the Heian period (794–1192), when literary and aesthetic appreciation of nature pervaded among the Japanese, especially the noble class. The sentiment of the era is typically expressed in the phrase *mono-no-aware*, literally, “deep feeling over things,” which was used in the literature, prose and poetry of the era to express an empathic sentiment felt in experiencing beauty, melancholy, and ephemerality throughout nature and human life. This term also indicates the interrelationship between *mono* (things) of the outer world and *aware* (feelings) of the inner world, a spiritual and aesthetic ideal based on a sensitivity toward the harmonious world as a whole.

There is no doubt that the Japanese worldview, which conceives of nature as the totality of human and divine existence rather than the opposite of human culture, has been sustained and intensified by Chinese epistemologies conveyed by Daoism, Buddhism and Neo-Confucianism. It is not only in Japan but also in China (and Korea) that the unification of humanity with nature has become a religious, as well as artistic, ideal. Arguing that magic in Japan is a “natural” science at the interface of nature and culture, Josef Kyburz points out that the idea of fusion with nature, and, by extension, with the cosmic whole, has been pursued in Japanese (and Chinese) culture as “the absolute ideal of existence, as a way of life and, ultimately, as the realization of the cosmic Principle” (Kyburz 1997: 261), sophisticated by Daoism and Zen Buddhism. The former provided a concept for the cosmic principle (or “Way” – Chinese *dao*; Japanese *dô*), while the latter, emphasizing the identification of the soul with the universe, taught how to awake, through intense contemplation, a complete sympathy with nature, a sympathy in which humans and nature, present and eternity, life and death, are no longer contradictory.

The fusion of the animate and inanimate permeated Japanese culture so widely and deeply that natural phenomena such as mountains, rocks, stones, the sound of blowing wind and even the chirping of insects came to be regarded to have sensuous connotations which help humans to be aware of their own inner nature (or Buddhanature). Most religious sites in Japan, then, are not detached from their natural surroundings: rather, sacred centers such as Kumano and Ise, the buildings of which form a part of the landscape, have been regarded as a Pure Land or the Eternal Center of Heaven and Country, and have become centers of pilgrimage and devotion where the Japanese people from all strata of society visit.

Another example of the closeness of nature and humans, or the spiritual world and human society, is the continuity of *yama* (mountains, forests) and *sato* (village). It is well known among the Japanese folklorists that the most sacred mountains in Japan have two shrines: the *yama-miya* (shrine on the top of the mountain, the abode of the *yama no kami*, *kami* of the mountain) and the *sato-miya* (shrine at the foot of

the mountain, the abode of the *ta no kami*, *kami* of the paddies). This dual system is considered by Yanagita Kunio to be the prototype of ancestor worship of Japan. According to him, it has been believed throughout Japan that “in the spring the *Yama-no-kami* descends to the farming settlements and becomes the *Ta-no-kami* and ascends again into the mountains at the end of autumn to become *Yama-no-kami* once more” (Yanagita 1970: 74). This cycle of *kami* was so closely related to the cycle of four seasons and rice planting that

[i]f there was an idea that instead of crossing into the Buddhist Paradise, the souls of our ancestors remain in a quiet, calm place in our land to return at a fixed time each year, then instead of in early autumn when the rice stalks are starting to flower, would not that time be when [human beings] are preparing to plant rice seed beds and their hearts are sensitive as they hopefully await the return of the

Kami? (Yanagita 1970: 75).

Arne Kalland and Pamela Asquith also point out that *yama* denotes not only the “outside” of *sato* but the “inside” of the other world (or the spiritual world), a zone of transition. In this sense, mountains or wilderness, being “betwixt and between,” have been regarded as potentially dangerous areas inhabited by deities and spirits, and they, consequently, become ideal sites for religious exercises such as meditation and pilgrimage.

If we may imply an animistic view of nature in the expression “nature of life” (nature is full of life) and a pantheistic notion of nature in the expression “life of nature” (all nature can be seen as one holistic life), the worldview of the Japanese people can be seen as composed of two distinct dimensions, penetrating into each other from the ancient times to the present. The mythical and religious representations of nature in Japanese culture mentioned above have formed the Japanese concept of nature. The Japanese see nature as something that always contains harmony or order. Every natural thing, mountains and rivers, rocks and trees, thunders flowers and winds, and insects, can be seen as a living god, which altogether compose the harmonious cosmos.

As a part of the cosmos, humankind also should live harmoniously within nature, which is transitory and temporary like the cycle of the seasons. Not only nature but also human life are seen as temporary phenomena inescapable from the cycle of transmigration. The self of a person who prefers to live in close communion with nature, instead of opposing it, then, is dissolved in and assimilated with cosmic order, or the “true self.” The construction of capitals such as Nara and Kyoto is a notable example of the practical means to bring about the identification of human space and nature.

The natural order of the harmonious cosmos is, however, not always benevolent to human beings; it also easily becomes so malevolent and dangerous, represented by fierce deities such as *kami* of storm, thunder, and pest, as to cause disasters. To calm and soothe a malevolent *kami* (*aramitama*) and make it into a benevolent *kami* (*nikimitama*, or *nigimitama*) requires a ritual pacification. This ritual transformation of chaos into harmonious cosmos affects both nature and human society, because both are mutually reflected in each other.

As we have seen, Japanese religious traditions see nature as immanently divine, and, as a result, consider the correspondence between external beauty and internal equilibrium as axiomatic. Regarding nature as divine and sacred, the Japanese people did not consider nature as inferior or opposed to human beings. They preferred to live embedded in nature, expressed in such ways as flower arrangement, the tea ceremony, literati art works, and Zen painting, all of which, in this perspective, however, are not necessarily equivalent to nature as it is. Rather, nature, as religiously and aesthetically signified in the Japanese history, is a kind of abstraction of an idealized world including human beings as well as *kami*.

Since the middle of the nineteenth century, modern Japan has been eager to adopt and absorb Western scientific and technological ideas in which the concept of “human as subject and nature as object” is central (MorrisSuzuki 1998: 36). It brought the Japanese a disintegrated idea of nature: objectified nature as resources for national industrialization, and imagined nature as the “heart of the Japanese culture.” Both are symbolized in the phrase of *wakon yosai* (Japanese spirit, Western knowledge). The former idea of nature easily pushed the Japanese people into serious environmental degradations (massive pollution), while the latter has been emphasized more and more in the course of modern constructions of national identity as “anti-modern” and “anti-West.”

It has been said that a “love of nature” is an essential part of traditional Japanese culture. If so, how do we account for such environmental degradations as the Minamata disease and the *itai-itai* disease taking the Japanese “love of nature” into consideration? We must further contextualize the Japanese concepts of nature to clarify how nature (*jinen*, *shizen*) has been experienced, imagined, and idealized in Japanese history.

Jataka Tales

Jataka or “stories from the earlier births (of the Buddha)” is a collection of around 550 stories. They depict many of the former lives of the Buddha when he was a *bodhisattva*, a being on the way to become a Buddha. In many of his previous lives he was a human being, but interestingly, in many others, the celebrated founder of Buddhism, Siddhartha Gautama, was a noble and good animal.

Many of the Jataka stories belong to a literary genre that uses stories about animals to convey to humans lessons about life. In some of the Jataka stories animals are made to exemplify values celebrated by Buddhism such as loving kindness (*metta*) and compassion (*karuna*). Buddha as a gazelle is willing to give up his life to save a pregnant gazelle. His altruistic behavior persuades the king to abandon hunting altogether thereafter (story number 12). In another life the Buddha was a self-sacrificing rabbit, who jumped into the fire to give himself up as food for a guest (story number 316).

The Jataka stories illustrate the doctrine of rebirth. Each story is introduced by a “story of the present,” which narrates the circumstances in which the Buddha told the story of one of his previous lives, and ends with the Buddha identifying the persons in the story in their present rebirths. Although the doctrine of rebirth is generally accepted in Buddhism, most people have no memory of previous lives. Buddha, however, distinguished himself by being able to remember a large number of them. He was able, therefore, to remember many lives as an animal. This illustrates the Buddhist doctrine that humans and animals are part of the same rebirth realm; there is no absolute difference between humans and animals.

The Jataka text, which in the English translation makes up more than 1800 pages, is part of the Pali Canon of the Theravada Buddhists known as Tipitaka or “three baskets.” Jataka stories are, however, found in the texts of all the main Buddhist groups. The oldest of the Jatakas were composed from around the third century B.C.E., but many were composed several centuries later and the collection incorporated into the Pali Canon is from around the fourth century. Although it is a later part of the Pali Canon, it is one of the most popular ones. Themes from the Jataka were used to decorate the Buddhist monuments and are among the oldest motifs in the arts of India. Monks often use Jataka stories, in their sermons, to teach ethics to lay people. The purpose of the stories is to entertain and to

The Great Monkey Jataka (Mahakapijataka)

In the past when Brahmadata ruled in Benares, the Bodhisatta (later to become the Buddha) was reborn as a monkey. He came of age, complete in length and breadth, became strong and vigorous and lived in the Himalayas in the company of eighty thousand monkeys. On the banks of the Ganges a mighty mango tree (some say it was a banyan tree) was rising up like a mountaintop, with branches and forks with dense shade-giving foliage. Its sweet fruits with divine aroma and taste were as large as water jars. The fruits from one branch fell on the ground, from another into the Ganges, and from two other branches into the main trunk of the tree. The Bodhisatta while eating the fruits with the flock of monkeys, thought: "The fruit falling from the tree into the river will some day be a hazard to us." So that not even one fruit from the branch above the water was left, at the time of flowering when the fruits were no bigger than chick peas, he made them eat and throw away the fruits.

Nevertheless, one ripe fruit hidden in an ant's nest was not discovered by the eighty thousand monkeys. It fell into the river and was caught in the upper net of the king of Benares who was bathing for amusement with a net set up above and below him. When the king had played the whole day and was going away in the evening, the fisherman who was taking up the net saw the fruit, and not knowing what it was, showed it to the king. The king asked: "What is the name of such a fruit?" "We do not know, Sir." "Who will know?" "The forest workers, Sir." He had the forest workers called and learning from them that it was a mango, he cut it with a knife and had first the forest workers taste it, then ate some himself and thereafter shared some with his women and companions. The taste of the ripe mango pervaded, and remained in, the whole body of the king. Possessed by desire for the flavor, he asked the forest workers where the tree was, and hearing that it was on the river bank in the Himalaya, he had several boats joined together and went upstream by the route shown by the forest workers. Later (the exact number of days is not told), when they arrived at that place, the forest workers told the king: "Here is this tree." The king stopped the boats and went on foot with a large group of people. Having the bed prepared at the foot of the tree, he ate some mangos, enjoying the many marvelous flavors, and laid down.

They placed a guard in each direction and made a fire.

When the folks had fallen asleep, in the middle of the night, the Bodhisatta arrived with his flock. Eighty thousand monkeys moving from branch to branch ate mangos. The king awakened and seeing the flock of monkeys, woke up his men and called on the archers saying: "Surround these monkeys who eat the fruit so that no one escapes, and shoot them. Tomorrow we will eat mangos with monkey meat." The archers obeyed by saying "very well," surrounded the tree and stood with arrows ready.

The monkeys saw them and not able to escape feared for their lives. They came to the Bodhisatta and asked: "Sir, the archers have surrounded the tree and declare 'We shall kill those fleeing monkeys.' What shall we do?" and stood shivering. The Bodhisatta said: "Have no fear. I will save your life." He comforted the flock of monkeys,

climbed a branch going straight upward, went along another branch that stretched toward the Ganges, and jumping from the end of it one hundred bow lengths, he landed on the other side of the Ganges on the top of a bush. While coming down he measured the distance, saying “that much is the distance I have come.” He cut a creeper at the root, stripped it, and said: “So much will be fastened to the tree and so much will stay in the air,” and so estimated the two lengths, not considering the part bound to his own waist. He took one end of the creeper and fastened it to a tree on the bank of the Ganges. The other end he fastened to his own waist, and then jumped the length of one hundred bow lengths with the speed of a cloud torn by the wind. However, he was not able to reach the tree. Seizing a branch of the mango tree firmly with both hands, he gave the sign to the flock of monkeys: “Quickly step on my back and go to safety by means of the creeper.” In that way the eighty thousand monkeys escaped after first having greeted him and apologized. At that time Devadatta was also a monkey and in that flock. He said: “Now is the time to get rid of my enemy.” He climbed up a branch, gained speed, and fell on the Bodhisatta’s back. The Bodhisatta’s heart broke and a strong pain arose. Devadatta who had caused that great pain, went away, and the Bodhisatta was alone.

The king was awake and had seen all that happened to the monkeys and the Bodhisatta. He lay down thinking: “This is an animal, yet he brought about the well-being of his flock without regard for his own life.” When the day broke, being pleased with the Bodhisatta, he thought: “It is not right to destroy this king of the monkeys. I will bring him down in some way and take care of him.” So placing the row of boats below on the Ganges and making a platform there, he made the Bodhisatta come down slowly, laid him down on his back, dressed him in yellow robes, bathed him in Ganges water, had him drink sweetened water, and had his body purified and anointed with expensive oil. He put an oiled skin on a bed, made him lie there and sat down on a low seat. Then he spoke the first verse.

You made yourself a bridge for them, so that they safely crossed

What are you then to them, great monkey, and what are they to you?

The Bodhisatta heard him and spoke these verses to instruct the king:

I am the monkey’s king and lord, the guardian of the flock

When they were overwhelmed by sorrow and terrified of you

I jumped the distance, one hundred bows outstretched a thin rope of creeper was firmly bound around my waist impelled by the wind like the tearing of a cloud I jumped towards the tree unable to reach, I grasped at a branch and held it with the hands

And as I hung stretched between the creeper and the branch the monkeys together walked across on foot to safety

Therefore no fetter pains me and death will not cause me pain

Happiness brought I to those over whom I used to rule

This simile for you, O King, is made to show you clearly that of the kingdom, the draught bullocks, the army and the city is happiness to be sought by the knowing king

The Bodhisatta in this way instructing and teaching the king, died. The king calling his minister, said: "Give this monkey king a burial service like a king." He ordered the women to come to the funeral in red clothes with disheveled hair and with torches in their hands as the retinue of the monkey king. The ministers made a funeral pile with a hundred cartloads of wood. They performed the funeral of the Bodhisatta in a kingly manner. Thereafter they took the skull and came to the king. The king had a burial mound made at the place of cremation, had lamps lighted there, had it honored with incense and flowers, and had the skull inlaid with gold. He had the skull placed on the point of a spear in front of the burial mound and honored it with incense and flowers. Thereupon he went to Benares, had it placed on his own gate and had the whole city decorated. He worshipped it for seven days. Finally, taking it as a relic, and establishing a shrine, he honored it with incense and garlands as long as he lived. Established in the teaching of the Bodhisatta, he gave alms and did meritorious deeds, and ruling his kingdom with righteousness, he became destined to heaven.

Translated from Pali by Knut A. Jacobsen convey moral teachings. Several types of stories have been included in the Jataka: fables, fairy tales, anecdotes, short stories, sayings and pious legends. Many of Jatakas were not of Buddhist origin and many of them are also found in non-Buddhist Indian literature.

The Jataka stories contradict some of the classical doctrines of the Buddhist traditions about animals. An animal rebirth is usually considered bad (*durgati*) because animal life contains more suffering than happiness. Animals are unable to produce religious merit, they cannot progress effectively on the path to nirvana and they are not admitted as members of the *sangha* (community of monks). Critiques of the possibility of constructing a Buddhist environmental ethic usually neglect the Jataka stories. However, some of the stories tell about humans who are impressed with the altruistic acts of animals. They describe humans caring for animals and animals caring for humans. In one story Buddha in a previous life, as an ascetic, brought water to animals in a time of drought, and the animals in gratitude brought him food (story number 124). Some Jatakas describe friendship between animals, thoughts and deeds of humans are ascribed to animals, and some stories make animals seem similar to, or, even better than humans. The Jatakas might teach us to recognize the humanness of many animals, an implication of the Buddhist doctrine of rebirth.

Jeffers, John Robinson (1887–1962)

John Robinson Jeffers was born in Allegheny, Pennsylvania. His father, a noted seminary professor, sent him as a child to boarding schools in Switzerland for training in languages and literature – Greek, Latin, French, German, and English. Undergraduate studies at Occidental College in Los Angeles were followed by graduate studies in literature, medicine, and forestry at the University of Zurich, the University of Southern California, and the University of Washington. Jeffers married Una Call Kuster in 1913 and settled in Carmel, California, the following year. Twin sons, Garth and Donnan, were born in 1916. In 1919, Jeffers helped build Tor House, a stone cottage he and Una designed, on a barren bluff above the sea. The skills he learned as a stonemason were used throughout his life, first on Hawk Tower, which he completed in 1925, and then on additions to his home.

An earnest but unremarkable poet in young adulthood, Jeffers became a poet of great power. The transformation occurred in his early thirties, when he was building Tor House. Like other artists and intellectuals of his generation, Jeffers was shaken by the breakdown of civilization occasioned by World War I. Working outdoors day after day, however, with the vast ocean before him and the massive continent behind, helped him see beyond the world's sorrows and achieve a new understanding of humanity, nature, and God.

Humans, Jeffers came to believe, are not qualitatively superior to other forms of life. Unfortunately, however, most people believe otherwise. Indeed, anthropocentrism is so ingrained that when people think about the past, they think primarily of human history; when they think about the future, they dwell on human destiny; and when they think about the present, they privilege human needs. Narcissism, as such, is a mental disorder, the antidote for which is a recognition of the “transhuman magnificence” of the natural world. Nature, Jeffers asserted, is supreme. As he said in “The Place for No Story,” referring to the rugged landscape of the Big Sur coast, “No imaginable / Human presence here could do anything / But dilute the lonely self-watchful passion.” Earth itself, Jeffers believed, will outlast its present affliction – human dominion – and return to a state of wild beauty. Meanwhile, an appreciation of nature can lead to an experience of God, who is all there is:

We that have the honor and hardship of being human / Are one flesh with the beasts,
and the beasts with the plants / One streaming sap, and certainly the plants and algae
and the Earth they spring from, / Are one flesh with the stars. The classifications are
mostly a kind of memoria technica, use it but don't be fooled. / It is all truly one life,

red blood and tree-sap, / Animal, mineral, sidereal, one stream, one organism, one God" ("Monument").

Jeffers' pantheism has several unique features, the most significant of which is his doctrine of divine suffering. Whereas most theistic systems imagine God as a perfect being who, at an ultimate level, experiences eternal peace, in Jeffers' view God purposely endures unending torment. As he says in a letter to Rudolph Gilbert (29 November 1936), "If God is all, he must be suffering, since an unreckoned part of the universe is always suffering. But his suffering must be self-inflicted, for he is all; there is no one outside him to inflict it." Such a God, fierce as a hunting hawk, is not inclined to kindness. Indeed, "He has no righteousness / No mercy, no love" ("At the Birth of an Age").

The implications of this and other tenets of his vision were explored by Jeffers in seventeen volumes of epic, dramatic, and lyric poems written in a forty-year career.

Titles of major books include *Roan Stallion, Tamar and Other Poems* (1925), *Cawdor* (1928), *Thurso's Landing* (1932), *Be Angry at the Sun* (1941), *Medea* (1946), *The Double Axe* (1948), and *Hungerfield* (1954). Though always controversial – for his imputed misanthropy (he called his philosophy "Inhumanism"), his opposition to war, his tales of madness and cruelty, and his unyielding commitment to the principles of environmentalism – Jeffers had a profound impact on a wide range of readers, who found in him one of the few poets of the modern age who spoke authentically in the vatic mode. When David Brower was working with Friends of the Earth, for instance, he established a journal called *Not Man Apart*. The title came from the concluding lines of a poem by Jeffers, "The Answer":

Integrity is wholeness, the greatest beauty is Organic wholeness, the wholeness of life and things, the divine beauty of the universe. Love that, not man

Apart from that, or else you will share in man's pitiful confusions, or drown in despair when his days darken.

Jesus and Empire

It would be difficult to exaggerate the importance of nature in the teaching of Jesus of Nazareth and the canonical and extra-canonical traditions associated with his name. Scholarly debate continues concerning which of the particular sayings and actions ascribed to him accurately record his life and teaching. Nevertheless, there is general agreement that Jesus' invocations of the natural world to represent the "*basileia* (kingdom/ reign/dominion/rule) of God" and teachings associated with it, reflect Jesus' historical origins as a first-century Galilean peasant, his agrarian context, and the socio-political conditions of his day. Archeological excavations, literary testimony drawn primarily from the New Testament Gospels and other roughly contemporary literature, especially the *Gospel of Thomas*, and the first-century Jewish historian, Josephus, help to place Jesus in his social agrarian context.

In literary form and content, biblical and extracanonical witnesses to Jesus' connections with nature illustrate their continuity with pre-Common Era Jewish and Ancient Near Eastern traditions, especially those associated with the Hebrew Bible and intertestamental prophetic and wisdom literature. Thus, for example, the canonical Gospels draw on Hebrew tradition when they portray Jesus in natural landscapes associated with sacred Israelite history, especially the Exodus, and divine interventions on Israel's behalf (e.g., wilderness [Mk. 4:12–13; 6:31–44 par.; 8:1–10 par; Matt. 4:1–11 par.;

Jn. 6:1–15, 22–71; also 1 Cor. 10:1–5]; mountain [Mk.

3:13–19 par.; 6:46 par.; 9:2–10 par.; Matt. 5:1–7:28;

Matt. 28:16–20]; sea [Mk. 4:35–41 par.; 6:47–51 par.; Jn.

6:16–21]), thereby winning for Jesus pride of place in sacred tradition. These depictions coincide with profiles of other Jewish figures from first-century Palestine, the most familiar of which is John the Baptist (Matt. 3:1–6 par.; Jn. 1:19–34), who chose similar symbolically charged settings to express their self-understanding and divinely appointed historical role. Josephus comments that a variety of figures appeared in the first century leading followers into the wilderness "so that there God would show them signs of imminent liberation" (*Jewish War* 2.259; *Antiquities* 20.168; Acts 5:36–37). Many of these styled themselves after Moses, presumably in fulfillment of prophetic expectation (thus Deut. 18:18), and consequently were active in sacredly charged geographies. Thus, one led his followers to Mt. Gerizim, to initiate a Moses-inspired revolt against Roman overlords (*Antiquities* 18.85–87). Another, Theudas (Acts 5:36; Josephus, *Antiquities* 20.97–98), led a crowd across the Jordan River, imagining himself as Moses leading his people to liberation. Josephus (*Jewish War* 2.261–63; also *Ant.* 20.169–71) names "the Egyptian" as leading his followers "through the wilderness

to the Mount of Olives,” a place associated in the Hebrew Bible with the apocalyptic “Day of the Lord” (Zech. 14:1–4, 9). The Qumran Community chose to express geographically its religious political identity as the true people of God divinely nurtured in the wilderness to express its rejection of an allegedly corrupt Temple establishment.

While New Testament witnesses similarly deploy sacred landscape to express larger theological and political meanings of Jesus’ life, death, resurrection and teaching, it is unlikely that the historical Jesus deployed nature associations as programmatically as these contemporary figures. Nevertheless, the historical Jesus’ associations with nature are theologically and religiously charged. Whether in parables (e.g., Mk. 4:1–9 par.; *G.Th.* 9; Mk. 4:26–29; 4:30–32 par; *G.Th.* 20; Matt. 13:24–30; *G.Th.* 57;

Matt. 13:47–50; *G.Th.* 8; Lk. 12:16–21; *G.Th.* 63; Lk.

13:18–19 par; *G.Th.* 96; Lk. 15:3–7 par; *G.Th.* 107; Jn.

10:1–18; 15:1–7), wisdom sayings (Lk. 8:16 par; *G.Th.* 33;

Lk. 14:34–35 par.; Matt. 5:45; 7:9–12; Jn. 7:37; 8:12) and moral instruction (Mk. 11:23 par.; *G.Th.* 48/106; Lk. 6:43–45 par.; *G.Th.* 45; 6:47–49 par.; Matt. 6:19–34 par.; *G.Th.*

76; Matt. 17:24–27), prophetic and apocalyptic pronouncements (Mk. 8:11–12 par.; 11:12–14 par.; 13:24–29 par.; *G.Th.* 111; Lk. 12:54–56 par.; *G.Th.* 91; Lk. 13:6–9;

13:34–35 par.), discipleship instructions (Mk. 1:17 par.; Lk. 10:2 par.; *G.Th.* 73; Lk. 12:4–7 par., Matt. 10:16; Lk. 10:3) or more general descriptions of the typical rural settings of his daily life in and around Galilean towns and villages (e.g., Mk. 1:14–20 par.; 1:35–39 par.; 2:1 par.; 2:13 par.;

2:23–28 par.; 3:7–12 par.; 6:31–32; 6:53–55 par.; Jn. 6:15;

Lk. 6:17–19; 8:1 par.; 9:13–15 par.; 9:58 par.; *G.Th.* 86;

Matt. 9:35; Jn. 21:1–14), the natural world forms the indispensable backdrop for understanding the teachings and fate of the historical Jesus and later theological portraits of his significance.

These texts represent a complex history of development at the oral and written stages of transmission, often bearing the imprint of post-Easter/early Christian agenda. The historical Jesus’ representations of nature are best understood against a backdrop of economic and societal degradation of Galilean peasantry under the reign of Herod Antipas (ruled 4 B.C.E.–39), client of the Roman imperial regime and as a religious-political response to it. Jesus’ portraits of nature share with other pagan, especially Stoic and Cynic, critics of Roman domination an affirmation of life lived in conformity with nature as a means to nurture a dissident social identity. Jesus’ idiosyncratic proclamation of the kingdom of God and the representations of nature associated with it imply a pointed politics. This becomes especially clear once interpreted against the backdrop of propagandistic imperial celebrations of Roman rule as bringing about a peaceable natural and civil world order blessed by the gods (see for example, Virgil, *Eclogue* 4). Attention to political context corrects a too romantic interpretation of Jesus. Championed especially in the nineteenth century by Ernest Renan, and echoed regularly in contemporary reconstructions, such portraits celebrate Jesus as a rugged

“back to nature” individualist favoring unmediated access to God via the natural world over against the corrupt and artificial institutions of an established moribund Jewish religion. Scholars rightly criticize such interpretations for their anti-Judaism and anachronistic individualism. Relating Jesus’ interpretations of nature to his political context also resists an anachronistic translation of Jesus’ teaching into apolitical theological categories which, while relevant to the modernist secular divide between religion and politics, is foreign to ancient religion.

During Jesus’ lifetime, Galilee underwent radical social and economic transformation under the reign of Herod Antipas. Herod’s ambitious building and promotion of his Galilean capitals, Sepphoris and Tiberias (founded ca. 18), as philo-Roman cities, together with his creation of a mint, resulted in the monetization of an economy hitherto centered on material exchange and enabled the imperial administration to realize its goals of taxation and Roman control over the Galilean hinterland. Monetization drew elites to settle in Herod’s cosmopolitan cities and to govern their rural estates as absentee landlords, and simultaneously resulted in subsistence farmers losing ancestral land through debt and subsequent indenture. Many of Jesus’ parables present indebted rural peasants laboring under absentee landlords (Mk. 12:1–12; *G.Th.* 65; Lk. 19:11–27 par.; Lk. 12:41–46 par.; Lk. 16:1–9) who amass fortunes from surplus production (Lk. 12:16; *G.Th.* 63). Jesus reflects his economic setting when he deploys release from debt and generous loaning as potent religious metaphors (Matt. 6:12; Lk. 6:29–35; *G.Th.* 95; see also Lk. 3:11).

When considered against the straitened conditions of the Galilean hinterland, Jesus’ observations of nature to illustrate the abundance of God’s kingdom become especially pointed and counterpolitical. He reflects his association with Hebrew Bible and Intertestamental Wisdom traditions (especially Proverbs; Sirach; Wisdom of Solomon) – an early text represents him as an emissary of Wisdom (Lk. 11:33–35 par.; compare Wis. Sol. 7:27–28)

– in his instructional depictions of the natural world. In the beauty of the lilies of the field more glorious than the elite clothing of King Solomon (Lk. 12:27–32 par. *G.Th.* 36), and in God’s care of the natural world (Lk. 12:6–7, 24–26 par.), he discovers illustrations of God’s generous reign and freedom from material anxiety. The natural “commons” owned by all and none become sign of this reign and token of its hidden omnipresence, generosity, and potency (Lk. 17:21; *G.Th.* 3; 77; 113). This is in marked contrast to contemporary imperial representations of divinely appointed rule located in the splendor of cities and cultivated landscapes, which are controlled, owned, and manipulated by propertied, finely clothed elites (Matt. 11:8 par.; *G.Th.* 78). Jesus discovers in the divinely arranged natural world, which unconditionally and generously gives its gifts to all, the pattern for a renewed sociality rooted in the sharing of the Earth’s abundance (Lk. 11:5–8, 11–13 par.). The politics of unconditional generosity becomes especially sharp when interpreted against the backdrop of first-century codes of honor, patronage, and clientship designed to preserve traditional hierarchies and the power of social elites. Jesus inverts commonplace political associations of God’s

kingdom with the stately image of the cedar and oak tree (Ezek. 17:23; 31:10; Dan. 4:12) when he represents God's realm as the bush that bursts forth from a tiny mustard seed and gives shelter to birds (Lk. 13:18–21 par.; *G.Th.* 48). Jesus' self-portrait in the saying, "Foxes have holes and the birds of the air have nests, but the Son of man has nowhere to lay his head" (Lk. 9:58 par.) may be a further political burlesque addressed against the palatial splendor of "fox" Herod's (Lk. 13:82) glittering cities ("Sepphoris" is derived from the Hebrew word for bird). Jesus acknowledges that in the monetized Herodian world one is obliged to pay taxes to Caesar. But he subverts its larger religiopolitical claims by observing that it is finally to God that all is owed (Mk. 12:13–17 par.: *G.Th.* 100). This obligation arises from abundant divine provisions bursting forth from Earth (Mk. 4:1–9 par.; *G.Th.* 9), sea (Matt. 13:47–50; *G.Th.* 8), and sky (Matt. 5:45). Jesus' invocations of nature and his invitations to learn from its example thus become the means of challenging and contesting absolute Herodian/Imperial and religious claims on Jesus' listeners, and the social codes that keep Galilean overlords in power, and become exhortations to embrace a countercultural logic that anticipates unexpected social outcomes (Lk. 6:20–26, 27–31 par.; *G.Th.* 54; 69), subverts traditional hierarchies (e.g., Mk. 10:13–16; Lk.14:26 par.; *G.Th.* 55), and expresses a counterimperial order of God's beneficent reign (e.g., Lk. 14:16–24 par.; *G.Th.* 64).

Jewish Environmentalism in North America

Roots

Environmental and ecological issues have deep roots in Jewish civilization, going back at least to the commandments in Leviticus 25 to let the land rest and to other agricultural laws. The consciousness that such texts are connected to environmental issues is however new, and it remains a controversial phenomenon within parts of the Jewish community. Twentieth-century sources of inspiration include the works of Rabbi Abraham Isaac Kook (1865–1935), the pro-vegetarian mystic and chief rabbi of Palestine; Rabbi Abraham Joshua Heschel (1907–1972), who wrote paeans to the Sabbath and to the sense of place, wonderment, and nature in his numerous works; and A.D. Gordon (1856–1922), the theoretician of Zionist labor who emphasized spiritual unification with land. Starting from these expressions and from the appreciation of nature that has always been a part of the Jewish tradition from Psalms to Job to rabbinic midrash and medieval thought, Jewish environmentalism has sought to embrace the scientific and spiritual insights of ecology, and to transform Jewish practice based on these insights.

The Jewish environmental movement in North America was in many ways motivated by the revival of back-to-the-land values in the 1960s and 70s. However, whereas for the majority of the counterculture movement these values were an expression of 1960s radicalism, for Jews there was the additional and powerful influence of Zionist idealism, which since its inception also emphasized returning to the land. Especially after the 1967 Arab–Israeli war, which generated a huge outpouring of sympathy and identification with Israel among unaffiliated Jews, the motif of return to the land became a bridge that connected progressive Jewish activists with the Jewish community from which they were often estranged. For the decade and a half following, there seemed to be a profound harmony between environmental and Zionist values.

Tu biSh’vat – “Jewish Earth Day”

Perhaps most emblematic of this nexus of values is the growth of the primary Jewish environmental event to which most Jews have been exposed, the *Tu biSh’vat seder*, often labeled “Jewish Earth Day.” Falling in the early spring two full moons before

Passover, *Tu biSh'vat* (“the fifteenth of the month of *Sh'vat*”) generally coincides with the first sap rising in the fruit trees in the land of Israel. Because in rabbinic Judaism this day was labeled the “New Year for the Tree,” seventeenth-century mystics created a ritual meal or seder of fruit and nuts for the day that celebrated the “Tree of Life” that sustains the universe. The Jewish National Fund (JNF) applied these motifs in the 1950s to championing *Tu biSh'vat* as a day for planting trees in the land of Israel.

One of the early moments of awakening to environmental issues in the Jewish community came when rabbis and Jewish activists drew on the symbolism of the JNF campaigns to create the “Trees for Vietnam” reforestation campaign in 1971 in response to the use of Agent Orange by the U.S. In 1976, Jonathan Wolf in New York City created and led one of the first modern environmental seders, incorporating liturgy from the Kabbalists with information from Israeli environmental groups like Neot Kedumim (“Ancient Fields,” a conservancy group devoted to biblical species), and the Society for the Protection of Nature in Israel (SPNI). By the late 1970s, Jewish groups around the country were innovating rituals for *Tu biSh'vat* that connected biblical and rabbinic teachings with material from the Kibbutz movement or JNF and with current environmental concerns. In the 1980s dozens of homemade *Tu biSh'vat* liturgical books or *haggadot* modeled after the Passover seder were being used around the country to celebrate trees and to talk about local and national environmental issues, the Earth and ecology.

Pioneers

The pioneers of environmentalism in the Jewish community who began these innovations were a quirky lot that often focused on a strongly ideological reading of the tradition. Many of these figures, including Wolf, who founded Jewish Vegetarians of North America in 1976, were deeply committed to vegetarianism. Notable among this group alongside Wolf is Richard Schwartz, who published *Judaism and Vegetarianism* in 1982 and followed this with *Judaism and Global Survival* in 1984. Roberta Kalechofsky began turning out tracts on Jewish vegetarianism in 1985 through her press, Micah Books.

As with most things Jewish, a large part of Jewish environmental work has consisted of investing Jewish practice with ecological meaning through sermons, teachings, and books. Two early writers were especially influential, Eric Freudenstein (1970) and Rabbi Everett Gendler (1971). Rabbi Arthur Waskow has been one of the leaders in this area, starting with his work *Seasons of Our Joy* (1982), which follows the liturgical calendar through the changes in the Earth. Waskow’s work reached a wider audience than Schwartz’s, and was part of a trend now called “Jewish Renewal,” which involved uniting values associated with 1960s or New Age spiritual countercultures with Jewish practice. In the same year, Rabbi Robert Gordis of the Conservative movement published his article “Ecology in the Jewish Tradition,” while David Ehrenfeld, a scien-

tist affiliated with Rutgers University, organized the first-ever Jewish Environmental Conference with Rabbi Gerry Serotta of Rutgers Hillel (the Jewish campus organization). Ehrenfeld's seminal conference brought together most of the people mentioned in this section. Rabbi Everett Gendler also influenced a great many activists and teachers during this period, both through his teaching and his farming. In 1983, Waskow founded the Shalom Center, which over time increasingly turned its energy from nuclear weapons to environmental issues. The Shalom Center is now one of the primary organizations in North America and the world that promulgates an activist ecological understanding of Judaism.

Books

During the 1990s publishing burgeoned in the area of Judaism and ecology. In 1991 and 1992 the Melton Center for Jewish Education published two issues of its journal devoted entirely to ecology and the environment under the editorship of Eduardo Rauch. Rabbi Arthur Green's seminal work on the contemporary meaning of Kabbalah, *Seek My Face, Speak My Name* (1994), included discussions of both ecology and vegetarianism. Shomrei Adamah published numerous volumes during these years, including *Ecology and the Jewish Spirit* (1998). Waskow edited or co-edited the important collections *Trees, Earth and Torah* (2000) and *Torah of the Earth* (2001). The 1998 conference on "Judaism and the Natural World," part of the Religions and Ecology conference series produced by Harvard University, led to the publication of *Judaism and Ecology* (2003).

Careful readers of the many works that now exist will find much to criticize: the more scholarly material is often written by Judaic specialists who have not studied ecology, whereas much of the popular material is written with a superficial knowledge of Judaism. Nonetheless, there are valuable insights in all of the above-mentioned works.

Two books deserve special mention. The first is Jeremy Cohen's treatment of the use of the verses in Genesis about dominion in Christian and Jewish civilizations, "*Be Fertile and Increase, Fill the Earth and Master It*" (1989). While Lynn White popularly analyzed these verses to be the source of anti-environmental trends within Western civilization, Cohen marshaled exhaustive documentary evidence to argue that cultural and intellectual trends do not support White's thesis. The other important work is Evan Eisenberg's *Ecology of Eden* (1998), which examined the cultural significance of the biblical tropes of garden, mountain, and so on, in the light of ancient environmental crises faced by Mesopotamian civilization. Eisenberg, an independent scholar with broad interests in cultural evolution and musicology, also advocated increasing urban density as a method for minimizing the negative impact of the human population on ecosystems. Additional scholarly work in both North America and Israel, including articles by David Seidenberg and by Eilon Schwartz of the Heschel Center

for Environmental Awareness in Israel, focused on creating a theology of nature and an eco-theology of Judaism that taps into the sources and roots of the Jewish tradition.

Organizations

By the end of the 1980s, through the work of Wolf, Schwartz, Waskow, and others, substantial networks of people were involved in some activity that connected Judaism and ecology. Some of the most important work was done by “L’OLAM” (whose name means both “Forever” and “For the World”), which was created in Manhattan by Wolf under the guidance of Rabbi Saul Berman at Lincoln Square Synagogue, a liberal Orthodox shul and by Ken Amron of Conservative Congregation Ansche Chesed. L’OLAM expanded throughout the New York City region between 1984 and 1989 with the help of Susie Tanenbaum and others, growing from a social action committee to a network of over a thousand people from dozens of synagogues and organizations who cared about Judaism and environmentalism.

In 1988, Shomrei Adamah (“Guardians of the Earth”) burst on the scene as the first national Jewish organization devoted to environmental issues. Founded by Ellen Bernstein in Philadelphia, Shomrei Adamah produced guides to Judaism and the environment such as *Let the Earth Teach You Torah* (1992), which was one of the works that initiated the field of Jewish environmental education. Shomrei Adamah captured the imaginations of environmentally concerned Jews around North America and quickly supplanted groups such as L’OLAM on the national level. However, even as regional groups like Shomrei Adamah of Greater Washington D.C. (founded in 1990) sprung up to do grassroots organizing, the national organization pulled away from involvement with political issues, leaving a gap between national, institutional groups and grassroots organizations which would continue to be a source of tension even after national Shomrei Adamah ceased to be active.

Shomrei Adamah-DC and L’OLAM continued their activist work, but the tension between local groups and Bernstein’s organization kept resources from being developed and utilized in a unified and cooperative way. During this time, other regional groups like the Northwest Jewish Environmental Project in Seattle (NWJEP or NJEP), founded in 1997, took a decidedly different approach. While Jewish identification with the Earth and Jewish environmental activism had gone hand in hand up until then, these new groups focused on making nature a source of Jewish identity and explicitly deemphasized political activism. The roots of this approach can be traced back to Jewish hiking groups and to the national network of such groups, Mosaic Outdoor Clubs of America (founded in 1988).

In 1993, The Coalition on the Environment and Jewish Life (COEJL) was formed to bring the Jewish environmental movement into the mainstream. COEJL filled the vacuum left by Shomrei Adamah, working with other religion-based groups under the umbrella of the National Religious Partnership for the Environment (NRPE) to achieve

these goals. Unlike earlier groups, which were created by activists or organizational entrepreneurs, COEJL was founded by three institutions: The Jewish Theological Seminary (of the Conservative movement), the Religious Action Center (the lobbying arm of the Reform movement), and the Jewish Council for Public Affairs (previously the National Jewish Relations Advisory Council), the national umbrella for the Jewish Community Relations Councils that can be found in most metropolitan areas. Led from 1995 to 2003 by Mark X. Jacobs in Manhattan, COEJL's work was characterized by lobbying, national campaigns in coordination with NRPE, and the development of curricula such as "Operation Noah," which examined the theme of biodiversity in Jewish texts (1996).

To a large degree during the 1990s, the model represented by COEJL dominated Jewish environmental work. COEJL held annual national conferences that spawned regional networks, and COEJL subsequently began to provide money for staff to organize regional affiliate groups. By the turn of the twenty-first century there were over 25 such groups in the US and Canada, including Jews of the Earth in Boulder Colorado (founded in 1999), the Jewish League for Environmental Awareness in Ventura County California, and other similar groups. COEJL also established affiliate relationships with some independently founded groups like Shomrei Adamah-DC, though in some places, such as New York City, COEJL tried to develop its own networks independent of existing Jewish environmental groups.

COEJL's national conferences also attracted many locally focused environmental activists who were seeking community with other Jewish activists. Building a movement from these networks proved difficult for COEJL though because of tension between the direct action approach many activists favored, and COEJL's more institutional approach. While often this was a question of strategy, in some instances a more fundamental conflict arose, between those within Jewish institutions who emphasized using environmentalism as a way to connect Jews to Judaism, and independent activists who thought sustainability issues and ecology were paramount.

For most of the people involved with Jewish environmentalism, however, Judaism, environmental action and social transformation were all fundamentally important and interconnected. The movement for Jewish environmental education was one of the chief meeting grounds where these concerns were given equal weight. The Teva Learning Center, founded in 1995, has been the flagship of this movement. Under the leadership of Adam Berman and then Nili Simhai, Teva ("Nature") continues to bring committed activists and educators together with dayschool and Hebrew school students at sites in New York and Connecticut. Teva trained many of the people who started environmental programs or retooled traditional nature programs in schools and Jewish summer camps throughout Canada and the United States; through its trainings, it also played a critical role in disseminating the work of environmental educators and ecological thinkers. Several other camps and camping programs, such as Camp Towanga in California, also made contributions to this field.

Other Trends

While the mainstreaming of Jewish environmentalism sometimes led to the marginalization of certain types of activism, new projects continued to be initiated on the edges of the community. One of the last efforts undertaken by L'OLAM was the campaign to stop the Trans-Israel Highway, which according to activists would destroy huge tracts of land and push Israel's development toward an automobile-centered culture. This campaign, led from Israel by Dr. Uri Shanas and spearheaded in the United States by Corri Gottesman, along with many others, brought together a broad spectrum of Jewish activists who had a more overtly political approach than COEJL. In this same vein, one of the most innovative moments in Jewish environmentalism was the *Tu biSh'vat* seder of 1996 created by the "Redwood rabbis," Naomi Steinberg, Margaret Holub and Lester Scharnberg, in which a hundred Jewish activists trespassed onto land owned by Pacific Lumber Company to "illegally" plant redwood trees in civil disobedience against clear-cut harvest practices that have caused significant ecological and economic damage in Northern California. A number of activists like Ramona Rubin and Barak Gale graduated from these actions to other projects that challenged Jewish institutions to oppose corporate practices.

One of the trends in new Jewish eco-activism is "eco-Kashrut," which has been catalyzed at the discussion stage by people like Rubin in Santa Cruz California, and Rabbi Yitzhak Husbands-Hankin in Eugene Oregon, as well as by Arthur Waskow. All three have also been involved in campaigns against corporate globalization. The term eco-Kashrut, which signifies the inclusion of environmental and labor standards in the laws that determine what is kosher, was coined by Rabbi Zalman Schachter-Shalomi, a grandfather of the Jewish Renewal movement. Another trend is signaled by the term "ecoZionism," which attempts to connect Jews in North America to Israel through environmental issues or through involvement with green Kibbutzim (see below). In Israel itself, North American Jews, such as Devorah Brous of Bustan L'Shalom ("Orchard for Peace"), have played critical roles in many environmental organizations, and in all aspects of environmental work.

One important nascent phenomenon has been the blending of Native American and shamanistic ideas and rituals with Jewish practice in the teachings of people like Gershon Winkler in New Mexico and Gabe Goldman in the Northeast. Another trend has been the development of Jewish ecofeminism, which was first discussed in print in a special issue of *Bridges* journal called "Jewish Women and Land" (Fall 1995). Recent colloquia and academic panels in this area have been organized by Irene Diamond. Among the most significant contributions of any one individual are the environmental films of Judith Helfand, whose film about thalidomide and her family, "A Healthy Baby Girl" (1996) connected Jewish and health issues with the environment and corporate practice. Helfand subsequently produced "Blue Vinyl" (2001), a "toxic comedy" about the siding industry and its environmental impact, creating a model for bringing activism to the mainstream community.

The Land

While most Jewish environmental work focused initially on finding ways to celebrate the Earth through Jewish texts and ritual, a handful of people also began to experiment with intentionally living on the land as Jews. Rabbi Everett Gendler started an organic farm in Andover Massachusetts as a way to understand the cycle of nature within the Jewish holidays in the early 1970s. In 1970, a collection of *olim* (Jewish immigrants to Israel) from North America, Europe and South Africa, took over Kibbutz Gezer in Israel's coastal plain and turned it into a vegetarian environmental community. Mike Tabor organized a prototype communal farm in Pennsylvania called Kibbutz Micah in 1972 with the support of the Fabrangen minyan and Jews for Urban Justice in Washington D.C. Tabor grew up on one of the many socialist-influenced Jewish agricultural communities in North America that once existed in places such as Vineland New Jersey and Petaluma California, though there is little evidence that those earlier communities had a strong influence on Jewish environmentalism as a whole. By the 1980s other experiments in rural Jewish community, like Shivtei Shalom ("Dwellers in Peace") in Oregon, were underway. Many North American Jews were also heavily involved in the Green Kibbutz initiative in Israel, and remain instrumental in the ecological education programs of communities like Kibbutz Gezer, in central Israel, and Kibbutz Keturah and Kibbutz Lotan, both in the Negev desert. Most of the stateside intentional communities were short-lived experiments, with people often returning to urban areas afterward. The Jewish population that does live in rural areas has nevertheless become an important birthing place and testing ground for new forms of Jewish environmental work. Communities in New England, for example, have continued the tradition of the Conference on Judaism in Rural New England, founded 1982, for over twenty years, and synagogues in Northern California have supported their rabbis' and members' activism on behalf of forests. In 2003, the first new intentional Jewish farming community in many years was inaugurated in Western Massachusetts, under the leadership of the Lubavitcher community and the direction of Shmuel Simenowitz from Vermont. Calling itself Eretz Ha'Chaim ("The Land of Life"), this organic farm is also the fruit of a slowly growing trend within the Hasidic and ultra-Orthodox community to emphasize organic diet and healthy living.

Challenges and Conclusions

By the beginning of the twenty-first century, the Jewish environmental movement had made substantial inroads into the institutions of the Jewish community but the push to mainstream this movement appeared to have stalled. Numerous local chapters of COEJL failed to establish themselves, and growth into new synagogues has been slow. While the tension between mainstream organizers and grassroots activists re-

mains an issue, the greater challenge appears to be to find effective ways to transform communities and lifestyles.

The question of transforming lifestyles faces the entire environmental movement, of course. The Jewish community, however, faces unique challenges as well. One central issue, especially for outreach to the Orthodox community, is that environmental discourse often sounds “pagan” and is therefore regarded with suspicion. This struggle is partly a legacy of the nineteenth-century rationalists who interpreted Judaism as antithetical to “nature religion,” though the trend toward anti-biblical and anti-monotheistic rhetoric among some environmentalists reinforces these fears. Furthermore, the connection between Israel and the ecology of the land, which once strengthened Jewish environmentalists everywhere, has now become a point of serious conflict. While some people see the Israeli settlers as the ultimate expression of going back to the land, others perceive the diminution of human rights in the Palestinian territories as the ultimate desecration of the land. Moreover, the emphasis one finds in most Diaspora Jewish communities on the land of Israel and the state of Israel also diverts attention from land issues outside of Israel.

Despite such challenges, the past few decades have brought “the consciousness of the Earth” into Jewish ethical thought and ritual and will continue to exercise an influence over the evolution of Judaism. Whether these will lead to a transformation of the way people live in the Jewish community may well depend on two things: the development of a coherent and comprehensive ecological understanding of Judaism, and the development of broader social and technological trends that will allow our society as a whole to live in a sustainable way.

Jewish Intertestamental Literature

The theology and literature of Judaism in the Second Temple Period (ca. 200 B.C.E.–100 C.E.) was very diverse. Nevertheless many perspectives about nature were widely shared among various Jewish sects. The biblical view of nature is the foundation, but some concepts are further developed, particularly the eschatological hope for nature.

God’s Good Creation

Intertestamental Judaism continued the biblical emphasis that God created all material and spiritual things (2 Macc. 7:23; Sir. 18:1; 2 En. 48:5; T. Levi. 18:9). This is the starting point for a theology of nature. God created everything according to his wisdom (2 En. 33:3). He is the “author of beauty” (Wis. 13:3). He established the orderly patterns of nature, such as the paths of the heavenly bodies and the changing seasons (2 En. 48:4–5; 2 Bar. 21:4–11). Wisdom is present in all of creation, including heaven, Earth, and the netherworld (Sir. 24:3–7). Only God the Creator should be worshipped rather than any creature (Wis. 13; 15:18–19).

All of nature is good and serves purposes intended by God (T. Naph. 2:8; T. Iss. 3:8; Sir. 39:16–35). All creatures are “desirable” and “meet a particular need” (Sir. 42:22–23). This does not necessarily mean that all creatures are beneficial to humans, since God uses nature both to bless the righteous and curse the wicked (Sir. 39:22–28). God is praised for his beautiful creation (Sir. 33; 39; 43). The hope of a future bodily resurrection, particularly common among Pharisees, implies the goodness of the material creation (2 Macc. 7:11, 29; 1 En. 51:1–5; 2 Bar. 50:2–4; Sib. Or. 4.181–187). However, there is an ambivalence about the body for Jewish writers influenced by Platonic thought. Philo, for example, sees the spirit as superior to the body (*QG* 2.56).

God Sustains Creation

God is in control of creation and is actively involved in the operation of nature. He sustains creation and “holds all things together” (Wis. 1:7; Pss. Sol. 5:9–10). The way God providentially oversees nature differs in various works: 1) God directly causes natural events (Sir. 42:21–43:33; 1 En. 101:6). 2) Angels, acting as God’s representatives,

control weather, movements of stars and other aspects of nature in accordance with God's will (1 En. 75:1–3; 80:1; 82:7–20; 2 En. 3–6; 11–17). 3) God designed nature to be autonomous, yet obedient to his will (1 En. 2–5; 69:16–25; Sir. 39:28–31; Wis. 16–19).

Many works stress the consistent and perfect operation of nature. In apocalypses with a heavenly journey, the visionary learns the hidden secrets of the operation of the cosmos. The Astronomical Book (AB, 1 En. 72–80) describes the movements of the heavenly bodies in great detail. The unchanging patterns are completed “with precision” according to God's “commandments” (1 En. 72–75; 79:1–2; cf. Pss. Sol. 18:10–12; Sir. 16:27; 18:1–4). The

Book of Parables (BP, 1 En. 37–71) describes a cosmic covenant that God made to guarantee the consistent operation of the cosmos (1 En. 69:16–25).

Types of Intertestamental Literature

Jewish non-canonical literature from the Second Temple Period (ca. 200 B.C.E.–100 C.E.) is vast and theologically diverse. Variations in theological perspectives are due to different biblical interpretations, the growing oral Law tradition and varying degrees of Hellenistic influence. Many works are pseudepigraphical – written from the perspective of a great historical religious figure, such as Moses, Enoch and the Patriarchs of Israel.

There are several types of Jewish religious literature in this period: 1) *Histories* were often written with a polemical purpose: 1 Maccabees (1 Macc.) and 2 Maccabees (2 Macc.) describe the Maccabean revolt and exalt the Hasmonean priest-kings. Josephus' *Antiquities* (Josephus, *Ant.*) cover Jewish history from biblical times through the destruction of Jerusalem (70) to help the conquering Romans better understand the Jews. 2) *Wisdom literature* is patterned after biblical wisdom books, but reflects Hellenistic influences: Wisdom of Solomon (Wis.) and Ecclesiasticus/Wisdom of Jesus ben Sirach (Sir.). 3) *Apocalypses* were common because the occupied and oppressed Jews hoped for God's intervention at the end of history to bring deliverance from suffering and a golden age. 1 Enoch consists of five books written by multiple authors over 200 years: Book of Watchers (BW, chs. 1–36), Book of Parables (BP, chs. 37–71), Astronomical Book (AB, chs. 72–82), Animal Apocalypse (AA, chs. 83–90) and Epistle of Enoch (chs. 91–107). Other important apocalypses include 2 Enoch (2 En.), 2 Baruch (2 Bar.), 4 Ezra (4 Ez.) and Sibylline Oracles (Sib. Or.). 4) *Legends and expansions on biblical stories* often included significant apocalyptic sections: Jubilees (Jub.), Life of Adam and Eve (LAE), Apocalypse of Moses (Apoc. Mos.) and Tobit (Tob.). 5) *Psalms* show pious Jewish reflections on the conquest of Jerusalem in the first century B.C.E.: Psalms of Solomon (Pss. Sol.). 6) *Testaments* combine ethical wisdom and apocalyptic predictions in the form of the pseudepigraphical final words of a dying religious leader: Assumption of Moses (As. Mos.) and Testaments of the Twelve Patriarchs, including Levi (T. Levi.), Judah (T. Jud.), Issachar (T. Iss.), Zebulun (T. Zeb.) and Naphtali (T.

Naph.). 7) *Philo's philosophical writings and allegorical biblical commentaries* argue that Platonic and Stoic ideas can be deduced from the writings of Moses: *Eternity/De Aeternitate Mundi (Aet)*, *Creation/De Opificio Mundi (Opif)*, *Questions and Answers on Genesis (QG)* and *Life of Moses (Mos)*. 8) *Qumran sectarian writings* from the Essene community near the Dead Sea include biblical commentaries, apocalypses and ethical rules for the community: Thanksgiving Hymns (1QH), War Scroll (1QM), Manual of Discipline (1QS) and Cairo Damascus Document (CD).

Harry Hahne

The consistency and obedience of nature to God's design is an example for humans to emulate (1 En. 2–5; 101; Sir. 16:24–17:24). The luminaries “do not alter” their paths and “do not transgress,” unlike people who sin and rebel against God (1 En. 2:1–2; 5:3).

Creation shows God's glory. The wise person contemplates and understands the created order. Reflection on nature shows that God created nature, teaches ethical lessons, and encourages praise of the Creator for his glory reflected in nature (1 En. 101; Sir. 17:8–10; 43:1–5; Wis.

13; 2 Macc. 7:28). God's wisdom gives understanding of the cycles of nature, seasons, patterns of the stars, characteristics of various animals and healing virtues of plants (Wis. 7:15–22; 1QH 1:11–12; 1 En. 2–5).

The Human Relationship with Nature

The biblical theme that God gave humanity dominion over nature (Gen. 1:26–28) is prominent in Intertestamental literature (Sir. 17:1–12; Jub. 2:14; 4 Ez. 7:11; 2 Bar. 14:18–19). God commanded humanity to “cultivate much of the Earth and enjoy an abundance of its fruits” (Josephus *Ant.* 1:110). Since men and women were created in God's image, they are entrusted with responsibility over nature. “The Lord appointed him over everything as king, and he subjected everything to him in subservience under his hand” (2 En. 58:3). Dominion includes not only animals as in Gen 1:26, but even heavenly bodies which God created to serve people (4 Ez. 6:45–46).

But human dominion is not a license to exploit nature. Humans are accountable to God for how they exercise dominion over nature, comparable to how a governor responsible for a territory reports to the king (Philo, *Opif* 83–88; cf. 2 En. 58:3–59:6). Sira and Philo minimize the impact of the Fall on the human relationship with nature. Human superiority over animals continued after Adam's sin (Sir. 17:2–4; *QG* 2.56).

There are different views about whether God created the world for its own sake or for the benefit of humanity. Many works see all creatures as desirable and good for their own sake, even when they have no positive benefit for humans (T. Naph. 2:8; Sir. 39:16–35; 42:22–23). But some later works indicate that the world was made for the sake of humanity (4 Ez. 7:11; 2 Bar. 14:18–19), particularly the righteous of Israel (4 Ez. 6:55–59; 2 Bar. 15:7;

21:24; As. Mos. 1:12–17).

Land theology is important in this period, although not as prominent as in the Hebrew Bible. The land has great value and significance. The people of God have a special and profound connection with the land of Israel. The land of Israel is holy, blessed, good, and more precious than other lands because it is God's own possession (Wis. 13:3–7; Tob. 14:4, 5; Jub. 13:2, 6; 1 En. 27:1; 89:40; 2 Bar.

65:9–10; 71:1; Sib. Or. 3:266). Even in war the land must be honored (1QM 2). The biblical laws of Sabbatical and Jubilee years (Ex. 23:10; 25:4–6; Lev. 25:8–22) require the land to lie fallow every seventh and fiftieth year (1 Macc. 6).

Since the land is holy, God's people must be holy in order to dwell in the land (Jub. 15:28; 20:4; 50:5; Wis. 12:3–11; 1QS 1:5; 8:3). The land is defiled by the sins of those who dwell there (Jub. 7:33; 16:5–6; 23:18; 4 Ez. 9:19–20; 2 Bar. 44:9). Persistent sin causes God to remove his blessing from the land so it becomes less fruitful and even desolate (Jub. 23:18; CD 2:9–11; 4:10; 2 Bar. 62:4–5; 66:2–5). The Qumran sectarians believed that the land was unclean because of the disobedience of Israel to God. Hence God preserved the sect as a righteous remnant in the wilderness to purify and "atone for the land" (1QS 8:7, 10; CD 2:9–11; 4:10). Apocalyptic writings (including those at Qumran) look forward to an eschatological time of perfect righteousness, often associated with the messianic kingdom, during which the land will become superproductive (Pss. Sol. 17:26–28; 2 Bar. 71:1; 1 En.

90:20).

Apocalyptic writings extend land theology to include the entire created order. Human sin defiles the Earth (Jub. 7:33; 16:5–6; 23:18; 4 Ez. 9:19–20; 2 Bar. 44:9). Widespread evil prior to the Flood and in the last days causes profound changes to the natural order, such as altered seasons and changes in the growth of plants (2 En. 70:5–7; 1 En. 80; Jub. 23:14–16; 4 Ez. 5:1–13).

Because of the human dominion over nature and the close solidarity between the people and the land, God often uses nature to judge wicked people. Weather, famine, pestilence, wild animals and other aspects of nature can be instruments of judgment (Sir. 39; 43; Wis. 16:1–6; 1 En. 100:1–13; Philo, *Mos* 96–146). God uses suffering caused by nature to urge people to repent (Wis. 12:8–11). Throughout Israel's history, nature joined with God to defeat the enemies of God's people (Wis. 5:17–23). God punishes idolaters through the very creatures they esteem as gods (Wis. 12:27). Many writers anticipate a period of cosmic disasters and intense suffering that will precede the coming of the Messiah and the new age (Jub. 23:23; 2 Bar. 70:8; As. Mos. 10:5–6; Sib. Or. 3:672).

Ecological Responsibility

Many Jewish writings hold humans and fallen angels accountable for sins against nature. The stress on obedience to all the commandments of the Torah (Sir. 24:23; T. Jud. 26:1; As. Mos. 12:10; Tob. 4:5; 2 Macc. 6:8–

7:1) implicitly includes the commandments regarding responsible care for animals and the land.

Specific ecological sins are also described. Some social ethics lists include a concern for the treatment of animals (Sir. 7:22). “Have compassion on all, not only human beings, but also dumb animals” (T. Zeb. 5:1). Do not ignore the needs of an animal in distress, but have sympathy for its pain (Josephus, *Ant.*, IV.8.30). 2 Enoch has a strong concern for animal rights. The subjection of nature to humanity is balanced with an accountability to God for proper treatment of animals (58:3–59:6). “Human souls he will judge for the sake of the souls of their animals” (58:4). God will judge people according to how they have treated animals. During the judgment, animals will accuse the people who have mistreated them: “Every kind of animal soul will accuse the humans who have fed them badly” (59:6). Specific sins against animals include inadequately feeding domestic animals, improperly preparing animals before killing them for sacrifice, harm done to animals in secret, and “despising any of the Lord’s creatures” (52:6; 59:1–6). Sinning against an animal harms a person’s soul much like harming or murdering a human (59:1–5; 60:1).

Gentiles as well as Jews will be judged for sins against nature. God will judge people for abusing nature and for ungratefulness for God’s material provision. “You nations and tribes are guilty . . . because you have used creation unrighteously” (2 Bar. 13:11). God provides for the physical needs of people, but they are ungrateful and deny that the blessings of the natural world come from God (2 Bar. 13:12).

The wickedness of the pre-Flood era included ecological sins. In the *Book of Watchers* (BW, 1 En. 6–11), fallen angels (“Watchers”) and their offspring, the Giants, commit numerous sins against nature. In their insatiable hunger, they crave more produce than people can grow. As a result they eat people and “sin against birds, wild beasts, reptiles, and fish” (1 En. 7:5). The word translated “sin against” suggests a violent assault on the animal kingdom, since “they poured out much blood upon the Earth.” Their offense was not merely eating animals, which was not of itself sinful to most Jews. They committed an excessive and violent assault against the animals, so that they ate everything in sight. The proper balance of creation was upset so that animals and the defiled Earth itself cry out to God for release from oppression (1 En. 7:6; 9:3). The Flood was a divine judgment to cleanse the Earth of this wickedness.

Jubilees claims the ecological sins and other evil of Watchers, humans and animals resulted in the divine judgment of the Flood. Even animals are accountable for violating God’s design and thus were wiped out by the Flood (5:2–3). Humans were accountable for ecological sins when they “sinned against beasts and birds” (7:23–24). Jubilees also has a concern for the proper treatment of plants. In the instructions Noah gave his

sons after the Flood, he tells them not to pick the fruit of new plants for three years and to offer the fourth year's fruit as an offering to God (7:35–37). The reasons are both ethical and pragmatic: “you will be righteous and all that you plant shall prosper” (7:37). Proper treatment of plants is a moral and spiritual requirement that results in more productive crops as part of God's blessing.

Several writings show that the biblical laws of Sabbatical and Jubilee years were often followed during this period (1 Macc. 6; Josephus, *Ant.*, iii 12.3.282–283; Philo, *QG* 3.39; Jub. 50:1–4). During these special years the land was to lie fallow and no produce was to be gathered. The land should be treated with respect and care rather than used selfishly by humans. These laws show respect for the cycles of plant life and faith that God will provide material needs when people honor the land. In the Jubilee year, real estate is to be returned to its original owners, as a reminder that land belongs to God, not individuals.

The Effect of Sin on Nature

Although some works stress the perfect operation of nature, most see creation as corrupted by sin to some degree and at least partially changed from God's original design.

Wisdom books (Sir. and Wis. Sol.) and some heavenly journey apocalypses (AB; 1 En. 1–5) stress the perfection and consistent operation of nature. “Creation serves you who made it” (Wis. 17:24). Wisdom 1:14 says there is no evil in nature and no impact from evil spiritual forces. Sirach 17:1–12 modifies the Genesis story to minimize the impact of the human Fall on nature. Death was part of the original creation, not the result of the Fall (contra Gen. 2:17; 3:19). God created Adam and Eve to live only “a few days, a limited” time. God's pronouncement that humans would return to dust is not a punishment for sin (Gen. 3:19), but a part of God's original intention. The human dominion over nature was not diminished or changed by the Fall. AB stresses the perfect consistency of the movements of the heavenly luminaries and patterns of the weather (1 En. 72:1–80:1; cf. 1 En. 2–5; Sir. 16:27; 18:1–4).

In these works, everything continues as it has since creation, and human sin has not affected the operation of nature.

However, many works stress that creation was in some sense corrupted by sin, so it no longer operates entirely as it did before the Fall. This view is particularly common among apocalypses. There is a tension between God's reign over nature as his good creation and the cosmic disorder that sin introduces.

One major stream points to human sin as the cause of the corruption of creation. There are several views of the source of the damage to nature: 1) the Fall (Jub.; 4 Ez.; 2 Bar.; Ap. Mos.); 2) widespread evil in the pre-Flood generation (Jub.; 2 En.; BP); 3) human sin throughout history (BW; AB; 4 Ez.; 2 Bar.); and 4) increased human sin in the eschatological era (AB; Jub.; 4 Ez.; 2 Bar.).

In many Jewish writings, the human Fall had a profound effect on the natural world. Nature was profoundly changed when Adam disobeyed God, since humans were given dominion over nature (4 Ez. 7:11). This concept originates with Gen. 3:16–19, which describes the curse resulting from the Fall: death, pain of women in childbearing, and the curse on the ground resulting in the need of hard labor to grow crops (Jub. 3:24–25; 4:28; Apoc. Mos. 14:2; 25:1–3; 28:3; 4 Ez. 3:7; 7:15; LAE 26:2). Some works go beyond Genesis and ascribe all suffering, plagues, injuries, sickness, famine and even unpleasant weather to the Fall (Jub. 23:12–15; 4 Ez. 7:12–13; LAE 34:2; Apoc. Mos. 8:2). The nature of animals changed after the Fall, so they rebelled against human dominion (Apoc. Mos. 24:4–6) and lost the ability to speak (Jub. 3:28; 12:25–26).

Human sin throughout history also corrupts creation. It is not merely ecological sins that harm the environment, but also the overall spiritual state of humanity. Sin “defiles,” “spoils” and “pollutes” the Earth so that it needs cleansing (Jub. 7:33; 16:5–6; 23:18; 4 Ez. 9:19–20; 2 Bar.

44:9). Throughout Israelite history, the land was cursed or blessed depending on the sin or righteousness of those who dwelt in the land (Jub. 23:18; 2 Bar. 61:7; 62:4–5). In the pre-Flood generation human sin was so profound that “all the Earth changed its seasons and every tree and every fruit changed their seeds” (2 En. 70:5–7). The increase in sin in the last days will be accompanied by profound cosmic changes (1 En. 80; Jub. 23:14–16; 4 Ez. 5:1–3).

Due to the solidarity between humanity and nature, when humans sin, the natural world is corrupted and when the people of God are righteous, the land is prosperous. Several factors account for this solidarity: 1) Human beings were created from the dust of the Earth and thus share a natural, material dimension with nature (4 Ez. 7:62, 116; cf. Gen. 2:7). 2) In some works, the world was made for the sake of humanity (4 Ez. 6:55–59; 7:11; 2 Bar.

14:18–19; 15:7; 21:24). 3) Most importantly, God gave humanity dominion over nature. Thus, as in Genesis 3:15–19, when humanity fell into sin, nature suffered as well (4 Ez. 7:11). Nature is affected whenever humanity fails to live as God intended, since humanity is the caretaker of the world.

Another important stream explaining the corruption of nature is the fallen Watcher tradition. The seminal passage is 1 En. 6–11, which is an expansion of Gen. 6:1–4. The motif is also found in later sections of 1 Enoch (Animal Apocalypse [83–90], BP, AB), as well as 2 Enoch and Jubilees. The problems of a corrupt world are blamed on the fall of the angels (“Watchers”) rather than fall of the first humans. The sinful actions and teachings of the Watchers “corrupted” or “defiled” the Earth (1 En. 10:7–8, 20; 106:17; 2 En. 18:4). Their fall introduced death, disease, birth defects and psychological disorders to creation. It produced cosmic irregularities, such as aberrations in the movements of heavenly luminaries, earthquakes, crop failures and disturbances among animals (1 En. 6–16; 69:11–12; 2 En. 70:7). Even animals were corrupted by the Watchers and began to pervert the way of life that God intended, possibly indicating that some animals

became carnivorous (Jub. 5:1–3; 1 En. 69:1–15). In some works, these aberrations were corrected after the Flood (2 En.

70:7), but in others the effects were permanent (1 En. 69:12).

The material world is generally not considered inherently evil or “fallen” in Second Temple Jewish writings. Nature is usually a victim of the sins of humans or fallen angels. The personified Earth cries out in pain for release from the harm done to it (1 En. 7:6; 9:2; 87:1; 106:17; Jub. 4:3). Nature is corrupted and oppressed by sin, but it does not become evil itself. Nevertheless, in a few instances some parts of nature disobey God’s design and are held morally accountable (1 En. 17–36; 80; Jub. 5:2–20). But this is an aberration due to the influence of human and angelic sin in the pre-Flood era or the end of history, not the normal state of nature. Philo goes further than most writers of this period to emphasize the superiority of spirit over body (*QG* 2.56). Nevertheless, he does not go as far as later Gnostics, who see the material world as inherently evil.

The Redemption of Nature

The diversity in Jewish Second Temple literature is most marked in eschatology. In wisdom literature and other works that see no cosmic impact of sin, there is no need for the redemption of nature since creation already works perfectly (Pss. Sol. 18:10–12). Apocalypses that describe the perfect, hidden workings of nature (AB, BP) generally imply this will continue as long as the world exists. Despite the sins of the Watchers, the perfect cosmic patterns will continue “forever,” “unto eternity, till the new creation” (1 En. 69:16–26; 72:1). In this view, although there will be a new creation, it is not due to any defect or damage in the present creation. In wisdom literature, the world will be saved by increasing the number of wise people, rather than through an eschatological divine intervention (Wis. 6:24).

Yet a significant number of Jewish writings expect that one day God will deliver creation from the damage caused by sin. The prophetic hope of an eschatological “new heavens and Earth” (Isa. 65:17–22; cf. 11:6–10) was expanded during this period, particularly in apocalyptic literature. In the new age, the natural world will be redeemed and transformed into great glory.

There are several views of how the new creation will come: (1) God will create a new Earth (Apocalypse of Weeks [AW, 1 En. 91, 93], AB). (2) The present creation will be transformed (BW; Pss. Sol. 17). (3) Some works combine both ideas without resolving the tension (Jub.; BP; 4 Ez.; 2 Bar.). The primary focus is the character of the changes to nature rather than how God will bring them about. Sometimes “new creation” refers to the renewal and cleansing of creation rather than a destruction of the present world and the creation of a new one (4 Ez. 6:13–28; 7:30–31; 2 Bar. 32:1–6). Jubilees 1:29 defines “new creation” as the time when “heaven and Earth and all their

creatures shall be renewed.” Even Philo refers to a new creation without this world being destroyed (*Aet* 75–85).

There will be fundamental and permanent changes in the operation of nature in the new age. The damage done to nature by the fall of humans and angels and by ongoing human sin will be reversed. The curse on the ground from the Fall (Gen. 3:15–19) will be removed. Death, suffering and disease will be eliminated (1 En. 6:16; 45:4–5; 69:26–29; 2 En. 65:8–10; 4 Ez. 6:25–28; 2 Bar. 73:2–7) or humans will live extremely long lives (Jub. 23:26–28). Plants will produce many times their normal fruit without painful human labor (1 En. 10:17–22; 2 En. 8:2–7; 2 Bar.

29:3–8; Sib. Or. 3.744, 750). Wild animals will become tame and obedient and will no longer harm people (Jub. 1:29; 2 En. 58:4–6; 2 Bar. 73:6). The heavenly luminaries will become brighter and perfectly consistent in their movements (Jub. 1:29; AW). The description of the transformed creation evokes images of a return to Eden in which the last things will be like the first things or even greater (T. Dan. 5:12–13; T. Levi. 18:10–11; Ap. Mos. 28:4).

Many works expect the resurrection of humans, which affirms the value of the material realm to God (4 Ez. 7:32; 2 Bar. 32:1–6; 1 En. 51:1–5; 2 Macc. 7:11, 29; Ap. Mos.

10:2; Sib. Or. 4.181–187). The resurrected bodies of the righteous will be transformed into great glory (2 Bar. 51:3–5). Although some works emphasize the eternal spiritual existence of the souls of the righteous (1 En. 103:3; 2 Bar. 51:1–16), many promise a material dimension to the eternal state of the righteous. Their glorified bodies will enable the righteous to dwell on the transformed Earth (1 En. 51:5; Ap. Mos. 13:2–4; Sib. Or. 4.187–190). Even references to the souls of the righteous can be accompanied by descriptions of the transformed Earth and the expectation that the righteous will have access to both heaven and the new Earth (1 En. 45:3–6).

Nature will only be perfected when humanity becomes righteous and obedient to God’s will (1 En. 10:17; 45:3–6). This will happen either during a temporary messianic golden age (1 En. 91:13; Jub. 1:28–29; 23:24–30; 4 Ez.

7:29; 2 Bar. 29:3–8) or in the eternal new creation (1 En.

10:25–32; 91:16; 4 Ez. 7:31–33; 2 Bar. 44:12–15). Nature can only function as God designed when humanity lives as God intends, due to the human solidarity with nature and the human dominion over nature.

Jewish Law and Animal Experimentation

Judaism is fundamentally a religion of law and posits regulations governing virtually every facet of human endeavor. The ultimate source of this corpus of law is divine legislation transmitted through both the Written and Oral Law. To this were added numerous rabbinic enactments and decrees designed to prevent encroachment upon biblical prohibitions as well as to promote human welfare and the well-being of society.

In light of the comprehensive nature of the areas of conduct regulated by Jewish law, the apparent absence of normative regulations governing animal experimentation might well be regarded as indicative of the absence of serious ethical concern for the welfare of members of the animal kingdom. But this is demonstrably not the case, for, in Jewish teaching, there is no dearth of *nomoi* designed to protect and promote animal welfare. The most obvious example of a regulation having such an effect is contained in the verse “If you see the ass of him that hates you lying under its burden, you shall forbear to pass by him; you shall surely release it with him” (Ex. 23:5, see also Deut. 22:4). The selfsame concern is manifest in the prohibition against muzzling an ox while it threshes in order that the animal be free to eat of the produce while working (Deut. 25:4). Similarly, scripture provides that both domestic animals and wild beasts must be permitted to share in produce of the land that grows without cultivation during the Sabbatical year. Talmudic exegesis understands Genesis 9:4 and Deuteronomy 12:23 as forbidding the eating of a limb severed from a living animal. Jewish law teaches that this prohibition is universally binding upon all people as one of the Seven Commandments of the Sons of Noah. Sabbath laws contained in both formulations of the Decalogue reflect a concern which goes beyond the mere elimination of pain and discomfort and serve to promote the welfare of animals in a positive manner by providing for their rest on the Sabbath day: “But the seventh day is a Sabbath unto the Lord your God, on it you shall not do any manner of work . . . nor your ox, nor your ass, nor any of your cattle . . .” (Deut. 5:14). Even more explicit in expressing concern for the welfare of animals is the verse “. . . but on the seventh day you shall rest; that your ox and your ass may have rest” (Ex. 23:12). Nevertheless, it does not necessarily follow that a general obligation to be kind to animals, or, minimally, a duty to refrain from cruelty to animals, can be inferred from any of these biblical regulations or even from all of them collectively. These regulations have been understood by some of the Sages of the Talmud as establishing particular duties, not as expressions of a more general duty.

Yet, Judaism most certainly *does* posit an unequivocal prohibition against causing cruelty to animals. The Gemara, BT *Baba Metzi'a* 32b, declares that assistance not encompassed within the ambit of the commandment concerning “unloading” (*p'rikah*) a burden carried by an animal is required by virtue of a general biblical principle prohibiting cruelty to animals.

It is nevertheless probably incorrect to conclude that concern for “*tza'ar ba'alei chayyim*” (pain of living creatures) is predicated upon a legal or moral concept of animal “rights.” Certainly, in Jewish law no less than in other systems of law, neither the animal nor its guardian is granted *persona standi in judicio* (i.e., the animal lacks capacity to institute judicial proceedings to prevent others from engaging in acts of cruelty of which it may be the victim). In all likelihood, the rationale governing strictures against *tza'ar ba'alei chayyim* is concern for the moral welfare of the human agent rather than concern for the physical welfare of animals; the underlying concern is the need to purge inclinations of cruelty and to develop compassion in human beings. Thus, Maimonides, in *The Guide For the Perplexed*, (3:17) states that the duty with regard to *tza'ar ba'alei chayyim* is set down with a view to perfecting us that we should not acquire moral habits of cruelty and should not inflict pain gratuitously, but that we should intend to be kind and merciful even with a chance animal individual except in case of need.

The concern expressed in rabbinic sources is that cruelty to animals consequentially engenders an indiscriminately cruel disposition. Acts of cruelty mold character in a manner that leads to spontaneously cruel behavior. *Tza'ar*

ba'alei chayyim is forbidden because cruelty is a character trait that is to be eschewed. Practicing kindness *vis-à-vis* animals has the opposite effect and serves to instill character traits of kindness and compassion.

Since the concern is for the moral and spiritual health of the human agent rather than for the protection of brute creatures, it is not at all surprising that concern for *tza'ar ba'alei chayyim* is less than absolute.

The most obvious exception is the slaughtering of animals for meat, which is specifically permitted by scripture to Noah and his progeny: “Every moving thing that lives shall be food for you” (Gen. 9:3). Maimonides regards this exception as circumscribed by the provisions surrounding the requirement for ritual slaughter in order to eliminate pain.

Jewish law, at least in its normative formulation, sanctions the infliction of pain upon animals when the act that causes pain is designed to further a legitimate human purpose. This is evident from two rulings recorded in *Shulchan Arukh*. The Rema (R. Moses Isserles, 1530–1572) on *Shulchan Arukh*, *Yoreh De'ah* 24:8, rules that, prior to slaughtering sheep, the wool covering the area where the neck is to be slit should be removed in order to enable the act of slaughter to be performed in the prescribed manner. *Shakh* (R. Shabtai ha-Kohen, 1621–1662), *Yoreh De'ah* 24:8, extends the same requirement to the slaughter of fowl and requires that feathers be plucked from the throat of fowl prior to slaughter. Rema, *Shulchan Arukh*, *Even ha-Ezer* 5:14, states even more explicitly:

Anything which is necessary in order to effect a cure or for other matters does not entail [a violation] of the prohibition against *tza'ar ba'alei chayyim*. Therefore, it is permitted to pluck feathers from geese and there is no concern on account of *tza'ar ba'alei chayyim*. But nevertheless people refrain [from doing so] because it constitutes cruelty.

A somewhat modified position is espoused by R. Yosef T'umim, *Pri M'gadim, Orach Chayyim, Mishb'tzot Zahav* 468:2. *Pri M'gadim* reports that his advice was sought by an individual who maintained exotic birds in his garden and was fearful that they might take flight. The interlocutor sought a ruling with regard to the propriety of breaking "a small bone in their wings" in order to render them incapable of flight and prevent financial loss to their keeper. *Pri M'gadim's* response was negative for, in his opinion, "*tza'ar ba'alei chayyim*, other than in case of great need, is forbidden." Apparently, *Pri M'gadim* distinguishes between ordinary "need" or "benefit" and "great need" and sanctions *tza'ar ba'alei chayyim* only in the latter situation. In a similar vein, *T'shuvot Avodat haGershuni* no. 13 quotes a certain R. Tevel the Physician as declaring that *tza'ar ba'alei chayyim* cannot be sanctioned for purposes of realizing "a small profit."

There is also some controversy with regard to the nature of the need or benefit that is deemed to warrant causing pain to animals. *Issur v'Heter he'Arukh* 59:36 permits *tza'ar ba'alei chayyim* only for therapeutic purposes, including procedures necessary for the treatment of even non-life-threatening maladies. Thus, *Issur v'Heter* apparently regards *tza'ar ba'alei chayyim* which is designed to serve other needs (e.g., financial profit) as improper and forbidden.

Among latter-day authorities, R. Yitzchak Dov Bamberger is quoted by R. Jacob Ettlinger, *T'shuvot Binyan Tzion* no. 108, as asserting that Rema permits *tza'ar ba'alei chayyim* "only when there is need for medical purposes even for a patient who is not dangerously ill, but we have not found that he permitted *tza'ar ba'alei chayyim* for financial profit." Rabbi Ettlinger himself, however, distinguishes between "great pain" and "minor pain" and permits minor pain for other "definite" benefits as well. R. Eliyahu Klatzkin (1852–1932), *T'shuvot Imrei Shefer* no. 34, sec. 1, adopts an intermediate position in stating that Rema intended to permit *tza'ar ba'alei chayyim* for medical purposes or for purposes of similar importance and necessity, but not simply for the purpose of financial gain. Nevertheless, the majority of rabbinic authorities regard financial gain as a legitimate "need" or "benefit" which, at least as a matter of law, may be fostered even in face of resultant pain to the animal.

Despite his ruling that plucking feathers from a live bird for use as quills is permitted as a matter of law, Rema adds the comment that people refrain from doing so because of the inherent cruelty involved in this practice. The immediate source of both this caveat and the normative rules regarding the plucking of feathers is the fifteenth-century rabbinic decisor, R. Israel Isserlein, *T'rumat haDeshen, P'sakim uK'tavim* no. 105.

The talmudic source cited by *T'rumat haDeshen* is an anecdote concerning R. Judah the Prince related by the Gemara, B.T. *Baba Metzi'a* 85a. R. Judah suffered excruciating

ating pain for many years until the pain subsided suddenly. In the following narrative, the Gemara explains why the suffering was ultimately alleviated:

A calf, when it was being taken to slaughter, went and hung its head under Rabbi [Judah]’s cloak and cried. He said to it, “Go, for this were you created.” [In heaven] they said, “Since he has no mercy, let suffering come down upon him.” . . . One day Rabbi [Judah]’s maidservant was sweeping the house; some young weasels were lying there and she was sweeping them away. Rabbi [Judah] said to her, “Let them be, as it is written ‘And His tender mercies are over all His works’ (Psalms 145:9).” [In heaven] they said, “Since he is compassionate, let us be compassionate to him.”

Reflected in this account, and in the halakhic principle derived herefrom, is the distinction between normative law and ethical conduct above and beyond the requirements of law (*lifnim mishurat hadin*). In its normative law, Judaism codifies standards applicable to everyone and makes no demands that are beyond the capacity of the common man; but, at the same time, Jewish teaching recognizes that, ideally, human beings must aspire to a higher level of conduct. That higher standard is posited as a moral desideratum, albeit a norm which is not enforceable by human courts. Not every person succeeds in reaching a degree of moral excellence such that he perceives the need and obligation to conduct himself in accordance with that higher standard. Those who do attain such a level of moral perfection are obliged, at least in the eyes of Heaven, to conduct themselves in accordance with that higher standard. No human court can inquire into the degree of moral perfection attained by a particular individual and, hence, such a court cannot apply varying standards to different persons. The heavenly court, however, *is* in a position to do so and, accordingly, will punish a person who does not comport himself in accordance with the degree of moral perfection which he has attained.

R. Yechiel Ya’akov Weinberg, *S’ridei Esh*, III:7, hastens to point out that Rema’s cautionary statement with regard to normatively permitted forms of *tza’ar ba’alei chayyim* should not be construed as applicable to medical experimentation. In a short comment, *S’ridei Esh* rejects the application of Rema’s remarks to medical experimentation for what really are three distinct reasons: 1) moral stringencies beyond the requirements of law are personal in nature; a person may accept stringencies of piety for himself but may not impose them upon others; 2) elimination of pain and suffering of human beings takes precedence over considerations of animal pain; 3) the concern for avoiding pain to animals even when it is halakhically permitted to cause such pain is germane only at the cost of forgoing benefit to an individual but not when benefit may accrue to the public at large.

S’ridei Esh’s comments are in opposition to the view expressed by *Chelkat Ya’akov*, I:30, sec. 6, to the effect that, although medical experimentation upon animals is certainly permissible as a matter of law, nevertheless, in accordance with Rema’s caveat, it is proper to refrain from inflicting pain upon animals even for such purposes. More recently, a member of the Supreme Rabbinical Court of Israel, R. Eliezer Waldenberg,

Tzitz Eli'ezer, XIV:68, found no difficulty in supporting medical experimentation upon animals but urged that pain be minimized insofar as possible.

R. Judah Leib Zirelson, *Ma'arkhei Lev* no. 110, draws a much broader distinction between the conduct frowned upon by Rema and other uses to which animals may be put without breach of even the "trait of piety" commended by Rema. According to *Ma'arkhei Lev*, the crucial factor is the element of necessity. Quills may be removed from dead fowl as readily as from live ones. Hence, plucking feathers from a live bird is an entirely unnecessary act of cruelty, even though the act itself serves a human purpose. However, in a situation in which there exists a need which otherwise cannot be satisfied, it is not improper to cause discomfort to animals, and refraining from doing so does not even constitute an act of piety. R. Judah was punished, asserts *Ma'arkhei Lev*, because his sharp and impulsive remark was entirely gratuitous.

In conclusion, it may be stated that Jewish law clearly forbids any act that causes pain or discomfort to an animal unless such act is designed to satisfy a legitimate human need. Accordingly, all authorities agree that hunting as a sport is forbidden. Although many authorities maintain that it is not forbidden to engage in activities that cause pain to animals in situations in which such practices yield financial benefits, there is significant authority for the position that animal pain may be sanctioned only for medical purposes, including direct therapeutic benefit, medical experimentation of potential therapeutic value and the training of medical personnel. *A fortiori*, those who eschew the latter position would not sanction painful procedures for the purpose of testing or perfecting cosmetics. An even larger body of authority refuses to sanction the infliction of pain upon animals when the desired benefit can be acquired in an alternative manner, when the procedure involves "great pain," when the benefit does not serve to satisfy a "great need," or when the benefit derived is not commensurate with the measure of pain to which the animal is subjected. Even when the undertaking is designed to promote human welfare, there is greater justification for causing the swift and painless death of an animal than for subjecting it to procedures that cause suffering to a live animal.

Judaism recognizes moral imperatives that establish standards more stringent than the standard of conduct imposed by law. According to the view of most authorities, those moral imperatives should prompt humanity to renounce cruelty to animals even when the contemplated procedure would serve to promote human welfare.

Medical experimentation designed to produce therapeutic benefit to humankind constitutes an exception to this principle and is endorsed by virtually all rabbinic authorities. Nevertheless, as stated by R. Eliezer Waldenberg, it is no more than proper that, whenever possible, such experimentation be conducted in a manner such that any unnecessary pain is avoided and, when appropriate, the animal subject should be anesthetized.

Jewish Law and Environmental Protection

Jewish law or *halakhah* is a living legal tradition whose history reaches back to ancient biblical times. Like any other system of law, the course of the *halakhah*'s growth and development has been shaped by the practical issues facing its adherents. The modern preoccupation with environmental protection is largely a reaction to the dangers posed by relatively recent technological change. The *halakhah* was first codified around the year 200 in a legal compilation called the *Mishnah*. Rabbi Joseph Caro composed its last major codification, the *Shulchan Arukh*, in the sixteenth century. It is therefore hardly surprising that "environmental protection" *per se* does not constitute a well-defined category in Jewish law. Furthermore, in recent times the *halakhah* has nowhere achieved jurisdiction over questions of governmental policy such as land-use, emissions standards, etc. Of late, the *halakhah*'s creative energies have been devoted to solving pressing issues of personal importance to the faithful (e.g., medical ethics) rather than to forging theoretical stands on issues of state policy which would not be binding on any presently existing government. Nonetheless, traditional halakhic literature includes rulings and principles that offer a firm foundation for the development of a comprehensive Jewish law of the environment. A number of concepts and principles from Jewish law are of immediate relevance for environmental concerns.

Bal tashchit ("Don't destroy")

According to Deuteronomy 20:19–20,

When in your war against a city you have to besiege it a long time in order to capture it, you must not destroy its trees, wielding the ax against them . . . Only trees which you know do not yield food may be destroyed; you may cut them down for constructing siege-works. (New Jewish Publication Society of America translation. Unless otherwise indicated all subsequent quotations have been translated by the author.)

These verses are understood in Jewish law as prohibiting all *wanton* destruction of fruit trees, in times of peace as well as in war. Although *purposeful* destruction of fruit trees is permitted for various economic and other reasons, it has always been frowned upon and thought to bring misfortune. For instance, when Rabbi Ya'akov Emden (d. 1776) was asked whether a grapevine could be uprooted to allow for the

planned expansion of a synagogue, he suggested that they replant the vine elsewhere rather than destroy it outright.

The law against destroying fruit trees is seen as offering a biblical foundation for the legal principle of *Bal tashchit* (Hebrew for “don’t destroy”), a very broad prohibition of the wanton destruction of anything that may be of utility to human beings. *Bal tashchit* may be understood as placing an important limitation on usual notions of legal ownership. Mere ownership of natural resources does not allow one to waste them. This limitation reflects both the theological notion that all that exists ultimately belongs to God rather than to humans, as well as the ethical principle that one must avoid destroying resources that are potentially valuable to other human beings. In the words of the anonymous thirteenth-century *Sefer ha-Chinukh*, righteous people love peace and rejoice in the welfare of others . . . they would not destroy a single mustard seed in the entire world, they are distressed by any loss or destruction they see, and if they can save [something], they will save anything [that they can] from destruction with all their strength (commandment 529, in some editions 530).

Tza’ar ba’alei chayyim (“The suffering of living things”)

Tza’ar ba’alei chayyim is the Hebrew expression for the prohibition against causing unnecessary suffering to animals. Several biblical commandments are generally understood as involving this principle (e.g., helping with the unloading of an overburdened animal [Ex. 23:5], coming to the assistance of a fallen animal [Deut. 22:4], and the prohibition against muzzling an ox while it threshes [Deut. 25:4]). Rather than reflecting a concern for the interests of animals themselves, considerations of tza’ar ba’alei chayyim are usually seen as being ultimately educational in nature. They are aimed at discouraging cruelty and promoting the virtues of kindness and mercy among human beings. Nonetheless, tza’ar ba’alei chayyim frequently serves as factor in halakhic decision making, and several legal controversies have developed around its application. Rabbi J. David Bleich, a contemporary scholar, cites a spectrum of authoritative opinions ranging from those who would permit suffering to be caused to animals for the sake of financial gain, to those who prohibit the infliction of pain upon animals when the desired benefit can be acquired in an alternative manner, when the procedure involves “great pain,” when the benefit does not serve to satisfy a “great need,” when the same profit can be obtained in another manner, or when the benefit derived is not commensurate with the measure of pain to which the animal is subjected (1989: 236).

Some authorities permit animal suffering only for medical purposes. It should be pointed out that death, especially death caused by painless ritual slaughter, is not always viewed as involving suffering. While these considerations find their most obvious modern applications in connection with the ethical dilemmas of industrial farming and

animal experimentation, they may also extend to issues involving the treatment of animals in the wild (i.e., Judaism's longstanding abhorrence of hunting for sport).

R'shut harabim (“Public domain”)

Various halakhic rulings deal with the protection of public spaces. These are mostly concerned with the damages and fines that must be paid by those who compromise other people's safety by digging holes and creating other obstacles in public places. An anecdote quoted in the Talmud from the *Tosefta* (an ancient legal compilation of rulings not included in the *Mishnah*) may indicate how halakhic discussions of *r'shut harabim* may bear on modern worries regarding the misuse of public resources:

It happened that a certain man was clearing stones from his own property onto *r'shut harabim*. A pious man found him, saying, “Fool, why do you clear stones from a domain which does not belong to you onto your own property?” [The man] laughed at him. Some time later, after the man had to sell his field, he walked through the very same *r'shut harabim* [where he dumped the stones] and stumbled [on them]. He said, that pious man spoke well to me [when he said], “Why do you clear stones from a domain which does not belong to you onto your own property?” (BT *Baba Kama* 50b).

Hilkhoh sh'kheinim (“The laws of neighbors”)

The legal category known as *hilkhoh sh'kheinim* regulates, among other things, activities in one's own private domain, which may adversely affect people living in neighboring domains. It is a promising source for antipollution legislation in the *halakhah*. Summarizing some of these regulations, Moses Maimonides (d. 1204) wrote in his authoritative legal code, the *Mishneh Torah*,

One who made a threshing-floor within his domain, or set up an out-house, or does work producing dust or dirt and the like, must distance them so that the dirt or out-house odor or dust does not reach his fellow, in order not to harm him (*Kinyan, Hilkhoh Sh'kheinim* 11:1).

Similar rulings regulate noise and thermal pollution. Serious health hazards, including tanneries, graves, animal carcasses and permanent threshing floors, must be located at least fifty cubits (about 25 meters) outside of town.

Halakhic prohibition of environmental hazards and nuisances is not absolute but rather reflects a need to balance the conflicting interests of the various parties involved. For instance, in regard to noise pollution, the *Mishnah* states:

When a shop is in a courtyard, [a neighbor] may protest and say to him [i.e., to the shopkeeper], “I cannot sleep because of the noise of those entering and because of the noise of those leaving [your shop].” When [an artisan] makes wares and goes out and

sells them in the market, [a neighbor] may not protest and say to him, “I cannot sleep because of the hammer’s noise, or because of the noise of millstones, or because of the noise of children [being instructed by a teacher in his home]” (BT *Baba Batra* 2:3).

Here the neighbor’s need for quiet must be balanced against the artisan’s need to make a living, and vice versa. The technical details of traditional Jewish regulations of environmental hazards often reflect pre-modern conditions and pre-modern knowledge of environmental science and public health. However, the rabbis themselves have always been aware of the dynamic nature of the empirical foundations of their rulings. In regard to the measures required to avoid damage due to particular sources of noise, Rabbi Moses Isserles (d. 1572) wrote, “they should be estimated by artisans and experts.” Similarly, today’s halakhic authorities are usually quite willing to accept the validity of up-to-date scientific opinion in such practical matters.

For over two thousand years, halakhic scholars have worked at developing and refining a conceptual framework that strikes a balance between the various needs of individuals and communities and which defines the legitimate use of animals and other natural resources. A brief encyclopedic entry could not begin to relay the subtlety and sophistication achieved in halakhic discourse. Judaism can make a crucial contribution by applying the ideas and principles of the *halakhah* to the legal and ethical quandaries posed by contemporary environmental concerns.

Jewish Law and Genetic Engineering

How does the Jewish tradition relate to the modern phenomenon of genetic engineering? To answer this question, we need to understand how Jewish tradition views the natural world and human interactions with the natural world. Jewish tradition takes a very positivistic view of the natural world, stressing how each progressive step in the creation of the natural world was “good” in the eyes of God the Creator (Gen. 1:1–25). After the creation of man, with his free will and his ability to alter the creation, the Bible informs us that it was all “very good” in the eyes of God (Gen. 1:31).

Jewish tradition posits that humans were created, in the “image of God” (Gen. 1:27) to be a partner with God in mastering and perfecting themselves and the natural world. For example, the Bible commands humans to “replenish the Earth and subdue it and have dominion over the fish of the seas and over the birds of the air and over every living thing that moves on the Earth” (Gen. 1:28). Rabbi Akiva demonstrated to the Roman general, Turnus Rufus, that the works of man, as finishing touches to the creation, are better than the unfinished works of the Creator (*Midrash Tanchuma – Tazri’a* 19).

While Jewish tradition assigns humans the God-given obligation to manipulate nature in order to bring benefit to humankind and the world, it also recognizes that humans can negatively interfere with the creation to the point of destroying themselves and the natural world. God placed limits on human activities both in the form of the laws of nature and in the form of religious laws.

Where does genetic engineering fit in with the Jewish perspective on humankind and the natural world? Only recently have humans learned how to circumvent the natural laws in order to manipulate and transfer genetic material between different species. The ethical implications of this newfound “freedom” will be discussed further on. First, we will discuss the Jewish religious laws that are relevant to bioengineering. We will focus on two main categories of genetic engineering: 1) Medical procedures which can save and prolong human life; and 2) Procedures which can modify the characteristics of plants and animals allowing greater productivity, improved nutrient content and enhanced aesthetic qualities.

Beginning with the first category, Jewish tradition places supreme importance on *pikuach nefesh* – the preservation of human life. Judaism obligates its adherents to violate all prohibitions except for murder, idolatry or adultery to preserve human life. Therefore, the utilization of genetic engineering to save or prolong human life

is certainly permitted and may be required as long as the likely effectiveness of the procedure would justify the risks involved. Genetic engineering that constitutes a threat to human life is likewise prohibited. The second category, where *pikuach nefesh* is not a factor, is more complex, requiring further separation into halakhic (legal) and ethical perspectives.

Jewish Legal Perspectives on Genetic Engineering of Animals and Plants

The two areas of Jewish law most frequently encountered in genetic engineering of animals and plants are *kashrut* (prohibited foods) and *kilayim* (prohibition of mixing different species of plants and animals). Relative to genetic engineering, these laws are only concerned with the transference of genetic material across species boundaries, not within the same species. The *kashrut* laws, (Lev. 11:1–47) delineate between species of animals which Jews are permitted to eat and those which are not kosher. When genetic material from non-kosher species of animals are mixed with kosher species of plants and animals, does this render the receptor non-kosher? Rabbinic authorities consider genetic material that is separated from, or synthesized from, the parent organism to be essentially “inert,” in other words independent of the defining characteristics of the parent organism. Therefore, genetic material from non-kosher species is not itself considered non-kosher and does not render the new host organism non-kosher.

The biblical prohibition of *kilayim*, which forbids the mixing of different species of animals and plants, appears in Leviticus 19:19: “Keep my decrees. Do not mate different kinds of animals. Do not plant your field with two kinds of seed. Do not wear clothing woven of two kinds of material.” The prohibition of *kilayim* applies only to the act of mixing different species and does not forbid the usage of the products of this mixing (except for the prohibition on intermixing grapes with certain plant species, where it is forbidden to derive benefit from the product as well). Furthermore, according to almost all rabbinic authorities, the prohibition of *kilayim* applies only to Jews. Most rabbinic authorities rule that the prohibition of *kilayim* is restricted to the specific acts of interbreeding spelled out in Leviticus 19:19. Therefore, the non-sexual transfer of genetic material between different species of animals or between animals and plants is not prohibited. The transfer of genetic material between different species of plants is less clear, and there is some disagreement among rabbinic authorities as to the permissibility of performing certain types of genetic engineering on plants.

The legal allowances are consistent with the general principle that anything not explicitly prohibited in the Bible and Talmud is assumed to be permitted. In the words of the early nineteenth-century commentator Rabbi Yisrael Lifshutz, “Anything which we have no reason to prohibit is permitted, without having to find a reason for

its permissibility. For the Torah does not mention every permissible thing, but rather only those things which are forbidden” (*Tiferet Yisrael* on *Mishnah Yadayim* 4:3).

Jewish Ethical Perspectives on Genetic Engineering

Genetic engineering crosses God-created boundaries that were until recently closed to humankind. There is a great deal of uncertainty as to the effects (spiritual as well as physical) of genetic engineering on humans and their environment. As discussed above, the extreme importance placed on the preservation of human life may require us to cross these boundaries. The ethical implications of non-life-preserving aspects of genetic engineering are less clear.

Does genetic engineering in non-life-preserving situations violate the “spirit of the law” of *kashrut* or *kilayim*, or otherwise negatively interfere in God’s creation, even if it does not violate the letter of the law? One approach may suggest that it does. For example, the twelfth-century sage Nachmanides writes in his commentary on Leviticus 19:19 that one who mixes two different species is “changing and denying the Divine Creation of the world.” The thirteenth-century author of “*Sefer HaChinukh*” writes on the prohibition of mixing species, “all that God did is intended for the perfection of that which is needed in His world . . . and the species should not be mixed, lest it detract from the perfection and there won’t be (God’s) blessing.” The eighteenth-century German Rabbi Samson Raphael Hirsch writes in his commentary on the Bible:

[T]he Torah must consider this law (against mixing different species) which God implanted in the organic world of nature to be of the very highest importance for our human and Jewish calling, for it has interwoven consideration of it (the prohibition of mixing different species) in the whole of our life. Not only does it forbid us actual interference with this law by the prohibition of interbreeding animals and grafting trees, the unnatural crossing of species of plants and animals which are of different species in nature, but in our whole association with the organic world – as sowing and planting, at the use of animals for work, at using materials obtained from animal and vegetable sources for our clothes, and at the food we eat . . . It teaches us to keep such order that brings to our minds again and again the great law of “keeping species separate,” and its greater Lawgiver (author’s translation).

A second, more liberal approach finds less if any ethical objections. Most contemporary Jewish authorities take a permissive but cautious position on genetic engineering. Rabbi Dr. Avraham Steinberg, for example, believes that we should proceed with genetic engineering as long as it “does not violate halakhic prohibitions or lead to results that would be halakhically prohibited” (Wolff 2001: 9).

In conclusion, Judaism posits that the natural world, as created by God, started out as intrinsically good. Humans were given the mandate to perfect themselves and the natural world as a partner with the Creator. To fulfill this task, humans may manipulate the creation, but only within certain limitations – these being defined by

the natural and religious laws given by the Creator. The defining ethical criteria is that all of the permitted actions must bring the world closer to perfection and not further away. For the sake of preserving human life, genetic engineering is certainly permissible, and may even be obligatory. Aside from situations where human life is at stake, the majority of rabbinic authorities rule that most forms of genetic engineering do not violate the Jewish religious laws. There is disagreement as to the ethical permissibility of certain areas of genetic engineering. As genetic engineering continues to advance and expand around the world, there is a great need for further research and discussion among Jewish authorities in order to address the legal and ethical issues involved.

Jubilee and Jubilee 2000

Jubilee is derived from the Hebrew Sabbath laws and marks the seventh Sabbath year. While the Sabbath or Sabbatical year was a year of rest for the land (Ex. 23:10–12; Lev. 25:1–7) and loan forgiveness (Deut. 15:1–18), the Jubilee year aims to reverse the effect of debt slavery and debt-related land loss through slave redemption (Lev. 25:39–42) and land restoration every fiftieth year (Lev. 25:8–28). These practices stress divine ownership of the land, on which Israel is tenant, but which it does not own. There is, however, no extant historical evidence of such a national Jubilee and Jewish sources reveal considerable complexity on this issue.

The Catholic Church established a recurring Jubilee year beginning in 1300. The year 2000 was one such year. “Jubilee 2000” was a campaign of heightened calls for international debt relief supported by Catholic and many mainline Protestant churches. The movement became worldwide, ecumenical beyond the boundaries of established churches. Most of its local and grassroots leaders were women. After the year 2000, there are continued efforts for debt relief through follow-up campaigns. The rhetoric of “Jubilee 2000” and related initiatives foregrounds the welfare of human beings, but recognizes the existence of humans as densely interwoven with the land as well as the destructive side effects of large international debts on the environment. Some contemporary Jewish voices are reticent about Christian applications of Jubilee. Other voices have raised questions about the viability of complete debt relief. While there remain questions about the application and interpretation of the Jubilee concept, its concerns touch at the core of human and environmental exploitation.

Judaism

Judaism is the religious civilization that evolved out of the religion of ancient Israel, taking its shape as a scriptural religion during the Second Temple period (516 B.C.E.–70 C.E.). In subsequent centuries, Judaism developed in response to changing historical circumstances and through conversations with other civilizations, especially Islam and Christianity. A variegated religious civilization, Judaism has harbored diverse conceptions of nature, reflecting the socio-economic circumstances of the Jewish people, changing intellectual conventions and modes of thought, and the internal debate within Judaism about the meaning of being Jewish.

The Bible is the foundational document of Judaism. While the biblical text reflects events, cultic rituals, social legislation, prophetic teachings, historiography, and poetry of ancient Israel, the biblical text was edited in stages during the Second Temple period. Regarded as canonic scripture, the biblical text was believed to be divinely revealed and authoritative, a Torah or “divine instruction.” Given the complex process by which the Bible came into existence, the sacred text we have reflects both the life of ancient Israel during the First Temple period (roughly from 1200 B.C.E. to 587 B.C.E.), as well as the emergence of Judaism as a scriptural religion in the Second Temple period. Whereas in the First Temple period, ancient Israel communicated with God through sacrifices and prophetic oracles, in the Second Temple period communication was carried on increasingly through the study of God’s revealed Torah. Especially after 70 C.E., when rabbinic Judaism came into existence, the revealed Scriptures provided information about God’s created world and determined how one must treat the physical environment, nonhuman creatures, the human body, and other human beings. In Judaism approaches to God’s creation are framed through the prism of revealed scriptures.

Israelite religion was both a product of the Ancient Near Eastern milieu as well as a critical rejection of it. In the Bible, therefore, the Israelite God, Yahweh, is depicted both as part of nature, resembling other Ancient Near Eastern deities, as well as the Creator of nature who has complete control and power over nature. The degree to which God is or is not part of nature demarcated the boundaries between Israelite religion and the neighboring culture, since the worship of nature as a divine entity in itself was viewed by biblical prophets as idolatry. The tension between the belief in God’s transcendence, on the one hand, and the belief in God’s immanence, on the other hand, was never resolved in Judaism. It continues to inform Jewish thinking to this day, giving rise to diverse understandings of nature.

From the rabbinic perspective, the belief that nature is created by God means that the created world, or “nature,” is good and that underlying its multiple forms there is a fundamental unity. The biblical creation narrative in Genesis provides the general outline of the creative process: an undifferentiated reality becomes increasingly differentiated through the process of separation – the separation of light from darkness, upper from lower waters, land from sea, plant from animal life, humans from other animals, and finally, woman from man. The formation of boundaries in the act of creation is adduced by scholars as the rationale for the distinction between the sacred and the profane, the permitted and the forbidden in the legal parts of the Bible. Thus the prohibition on mixing different seeds in the same field, the interbreeding of diverse species of animals, the wearing of garments of mixed wool and linens, and the differentiation between clean and unclean foods are all traced back to the setting of boundaries at the moment of creation (Lev. 10:10–11; 19:19; Deut. 22:11).

Having created the universe, God continues to sustain it and govern it. Thus nature itself reflects God’s goodness, generosity, glory, greatness, and kingship. The greatest expression of God’s concern for the world is the revelation of the divine will in the form of Law to the Chosen People, Israel. The revealed Torah defines the ideal: what ought to be and what Israel should do in order to attain the ideal. The very revelation of the Torah indicates that although nature is good, it is neither perfect nor holy. Nature can be perfected and made holy, only when humans, who are created in the image of God, treat nature in accord with the will of God. In this regard, humans can be viewed as partners of God in the caretaking of nature.

The Hebrew Bible is the earliest articulation of the principle of stewardship toward nature. Created out of the Earth (*adamah*), the human earthling (*adam*) is also made in the “image of God” (*tzelem elohim*) (Genesis 1:26). As a created being, the human is part of nature, but as a recipient of divine command, the human is able to transcend nature by emulating God. The relationship between the human species and the natural world is, therefore, complex: on the one hand, the human species is privileged over other creatures, but, on the other hand, the human is given responsibility toward nature. If humanity is to emulate God, humanity must govern nature with intelligence and benevolence, as a good steward does, while never forgetting that God and not humanity is the true King of the universe. Thus the divine command to the first earthling “to fill the Earth and subdue it” (Gen. 1:28) should be understood as something other than a license to exploit and destroy the Earth, in light of humanity’s role in another verse which states that “The Lord God took the man and put him in the garden of Eden to till it and keep it” (Gen. 2:15). This verse spells the biblical understanding of the human task: only by observing God’s will can the human be a true steward of nature, ensuring the wellbeing of God’s creation. If originally, the protection of the Garden of Eden was a holy task, presumably to be accomplished effortlessly, after the sin, the tilling of the land was to be done with pain and suffering (Gen. 9:17–19), indicating the separation between the human earthling and the soil from which he was created.

The belief that nature is created by God facilitates interest in and reverence toward the natural world. The more one observes the natural world, the more one comes to revere the Creator. Psalm 19:1 expressed the point poetically: “The heavens are telling the glory of God/and the firmament proclaims his handiworks.” Psalm 148 depicts all of creation as engaged in praising God and recognizing God’s commanding power over nature. Nature also fears God (Ps. 68:9) and observes the relationship between God and Israel, expressing either sorrow or joy at the fortunes of the Israelites (Joel 1:12; Amos 1:2; Jon. 3:7–9; Is. a 14:7–8). No matter how much the Bible recognizes the majesty of nature the biblical text never revels in nature only for its own sake. Nature is not an end but always points to the divine Creator who governs and sustains nature in his goodness and generosity. The biblical emphasis on orderliness of creation explains why the Bible does not glorify wilderness and why the cultivated field is the primary model for the created universe in the Bible. The Bible does not despise wilderness (after all, the wilderness is the location of revelation), but the Bible clearly links the aridity of the desert with divine punishment and the dialectics of blessing and curse. The successfully cultivated land manifests the presence of God in the life of the people, and, conversely disloyalty to God incurs divine punishment in the form of loss of life’s necessities.

Descriptions of nature or figurative usages of nature’s forces to teach a religious lesson abound in the Bible. In one famous parable, fruit trees and vines willingly serve the human in ritual observance by providing oil, fruit, and wine (Judg. 9:8–13). Conversely, nature does God’s bidding when it serves to punish and destroy the people of Israel if they sin; ungodly behavior leads to ecological punishment. Since God is the sole Creator, it is God’s prerogative to sustain or to destroy nature (Ps. 29:5–6; Zech. 11:1–3; Hab. 3:5–8). Nature itself becomes a witness to the covenantal relationship between Israel and God and the ongoing drama of righteousness, chastisement, and rebuke. Mostly the Bible emphasizes divine care of all creatures: God provides food to all (Ps. 147:9); God is concerned about humans and beasts (Ps. 104:14–14; 15:16); God’s care is extended to animals that can be used by humans, such as goats and rabbits (Ps. 104:18) as well as to lion cubs and ravens that do not serve human interest. Because God takes care of animals, they turn to God in time of need (Ps. 104:21; 27; Job 38:41).

The people of Israel, with whom God entered an eternal covenant, are the paradigm of the stewardship of nature sanctioned by scripture. Various land-based commandments express the belief that God is the rightful owner of the land of Israel and the source of its fertility. The Israelites who till the land are but God’s tenant farmers who are obligated to return the first portion of the land’s yield to its rightful owner in order to ensure the land’s continuing fertility and the farmer’s sustenance and prosperity. Caring is extended both to vegetation and to animals. In war-time, fruit-bearing trees must not be chopped down while the city is under siege (Deut. 20:19). While this commandment indicates a human perspective, it also indicates that the Bible recognizes the interdependence between humans and trees, on the one hand, and the capacity

of humans to destroy natural things on the other. In terms of treatment of animals, the Bible prohibits cruelty to animals and commands instead that animals be treated with love; thus killing of a bird with her young is forbidden, as is the yoking of an ass and an ox together (Deut. 22:10). Some commentators understand this as a way to emulate God's attribute of mercy and follow the overarching commandment "Be holy as I the Lord am Holy" (Lev. 19:2). The prohibition to boil a kid in its mother's milk (Ex. 23:19; 34:26; Deut. 14:21) is also explained by later Jewish sources as an attempt to prevent cruelty in human beings.

The doctrine of creation is also the basis of the most unique aspect of the biblical approach toward nature: the notion of imposed rest – the Sabbath. Viewed as completion of the act of creation and a celebration of human tenancy and stewardship, the Sabbath imitates God's rest. Hence, on the Sabbath humans must neither create nor destroy and only enjoy the bounty of God's creation. As an "island in time," to use Abraham Joshua Heschel's apt phrase, the Sabbath disrupts the eternal cycles of nature, reminding the observer that nature is created by God and must be treated in accord with God's laws. The command to rest on the Sabbath is extended not only to humans but also to domestic animals (Deut. 5:13). In the Sabbatical year (*sh'mitah* or "release"), rest is extended to the land, illustrating the biblical connection between moral quality of human life and the vitality of God's created nature (Lev. 25:2ff.) On the Sabbatical year the land's produce is given to all creatures equally, not just the poor and servants, but also the stranger, and all the domestic and wild animals. In all times, the corner of the field, the gleanings of stalks, the forgotten sheaf, the separated fruits and the defective clusters are to be given to those who do not own land – the poor, the widow, and the orphan. In the Jubilee year (Yovel) a more extensive land reform is offered on the ground that "The land cannot be sold in perpetuity, for the land is mine, and you are strangers and sojourners with me" (Lev. 25:23). In the Jubilee year all slaves are to be freed and returned to their families (Lev. 25:11). By observing the Sabbath year the soil itself becomes holy and the person who obeys the commandments ensures the religious-moral purity necessary for residence in God's land (Lev. 26:3–12). According to the Torah and the rabbis, exile is conversely caused by failing to let the land rest (Lev. 26:14ff.). However, the institution of the Sabbatical year was itself a subject of dispute by the rabbis after the fall of the Second Temple in 70 C.E. and many further rulings were introduced to ease its economic hardships.

The Bible was edited and canonized during the Second Temple period, when the Near East was dominated by Hellenistic culture. The encounter of Judaism with Hellenistic culture was uneven: all Jews were affected by Hellenism, but not to the same degree. A major aspect of the encounter with Greek culture was the rise of Jewish philosophical reflections about the cosmos as a whole. The main question for the Judeo-Hellenistic philosophers was where can the Wisdom of God be found and how can human beings access it. Building on the Wisdom stratum of the Bible, Jewish philosophers identified God's Wisdom with the Torah and wondered whether Torah/Wisdom pre-existed the world or whether it too was created like the heaven and the Earth.

Aristobulus of Paneas (mid-second century B.C.E.) held that Wisdom/Torah existed prior to the heaven and the Earth and that God's power extends to all created things, and is therefore immanent in the world. The anonymous author of 2 Maccabees was the first to state that God created the world *ex nihilo*, thereby proposing a philosophical solution to a problem not yet recognized by the biblical text itself. The book of 4 Maccabees (first century B.C.E.) was the first Jewish text to cite the Stoic definition of Wisdom and identify it with the Torah. That notion, but without the Stoic reference, was also shared by Joshua, son of Ben Sira (early second century B.C.E.), the author of the Wisdom of Ben Sira. The identification of Torah and divine Wisdom entails that those who study Torah possess a deeper understanding of nature, and conversely, that the study of nature itself yields a deeper understanding of God's revelation.

Philo of Alexandria (ca. 15 B.C.E. – 40) elaborated these ideas in his doctrine of Logos. Echoing Middle Platonism, Philo envisioned the Logos as an intelligible world of Ideas, the paradigm of all things as well as their causes. The Logos is the first entity to be created by God in a nontemporal process. The physical world as we know it was created out of matter, but it is not clear whether matter itself is created or uncreated according to Philo. The immanent Logos produces the laws of nature, but since God created these laws, God can also change them, if God so desires. This claim makes miracles logically possible. In his prolific biblical commentaries, Philo interpreted the biblical text allegorically, thereby turning description of natural entities into abstract philosophical and/or ethical ideas. Thus, while Philo articulated a philosophy of nature, he had little interest in the description or the operation of the natural world itself.

The desire to understand how the natural world works is found in the apocalyptic literature produced by sectarian Jews from the third century B.C.E. to the second century C.E. While this literature has not been integrated into rabbinic Judaism, it indicates how interest in nature flourished among Jews during the Second Temple period. Thus, for the apocalyptic visionaries, divine Wisdom resides not in the perceptible world but in the heavens and access to Wisdom was to be given to individuals through revelatory experiences that “disclose” or “reveal” the mysteries of the natural world. A telling example is *I Enoch*, a collection of several apocalyptic compositions, the oldest of which dates to the third century B.C.E. The hero, Enoch, is depicted to have undergone experiences that transport him to the heavens, to places of light and fire that were not accessible to any other human. In the extremities of the cosmos, Enoch encounters angels, namely, “the leaders of the heads of thousands who are in charge of the whole creation and in charge of all the stars . . .” (chapter 75:1). These angels reveal to Enoch information about the structure of the universe and about God's government of history, answering questions which the Book of Job claimed to be out of reach of humans (Job 38), especially in regard to the punishment of the wicked (the “Fallen Angels” in *I Enoch*) and the reward of the righteous in the end of time. The revelations about the cosmos are intrinsically linked to eschatology.

Though the discourse on angels is an attempt to explain how the universe is ordered and how it works, the narratives are not intended as mere theory, but are directly

related to the calculation of the calendar, a hotly debated issue among the Jewish sects in the late Second Temple period. In *I Enoch*, a solar calendar of 364 days is presupposed and the primary goal of the composition, called “the Astronomical Book,” is to prevent sin due to calendar error. Enoch’s eyewitnessing and understanding of the heavenly bodies, under their angelic leaders, is meant to impart the right knowledge in this regard. In the “Animal Apocalypse” of *I Enoch* (chapters 85–91) the figures of biblical history are represented by animals, for example, Adam is a white bull; Cain and Able are black and red bullocks. These are not descriptions of the perceptible natural beings but a coded language about the political reality during the Maccabean revolt (167–164 B.C.E.), using animals as allegories. If read as a political allegory, this section in *I Enoch* states that ultimately judgment is at hand and that heavenly angels will dispose of the Gentile rulers as they originally disposed of the “Watchers.” Victory is in the hands of God and his angels and the resolution involves a resurrection beyond this life, even if it is located on Earth.

A different type of cosmological speculation is found in the anonymous *Sefer Yetzirah* (Book of Creation), whose time of composition was probably the first century, while the Jerusalem Temple was still in existence. Unlike *I Enoch*, here the mysteries of creation are to be found not in the extremities of the universe, but in understanding the linguistic process that underlies divine creation: God created the universe through speech. The units of creation are the twenty-two letters of the Hebrew alphabet and the ten *Sefirot*, the ten “extensions” or “depths” (*omqim*), which together constitute the thirty-two “Paths of Wisdom.” As a linguistic product, the cosmos is to be decoded not through biblical exegesis but through independent wisdom (i.e., *gnosis*) accessible to the sectarians who produced the text. While the obscure *Sefer Yetzirah* did not become part of standard rabbinic curriculum, its ideas would become the foundation for philosophic and kabbalistic speculations about the origin and structure of the universe in the Middle Ages.

With the destruction of the Temple in 70 C.E., the robust Jewish sectarianism came to an end, and the rabbis, the heirs of the Pharisees, became the sole interpreters of the Jewish tradition. A small scholarly elite, the rabbis articulated the ideology of dual Torahs – one Written, one Oral – both of which were believed to have been revealed by God to Moses at Sinai. As authoritative divine command, the Written Torah and the Oral Torah together constituted *halakhah* (literally, “the Path” or “the Way,”) signifying Jewish Law as a whole.

The rabbinic corpus encompasses conflicting attitudes toward cosmological speculations. R. Akiba and his disciples were reticent about them and considered the “Account of Creation” (*ma’aseh b’reishit*) esoteric lore that was “not to be expounded before two people” (Mishnah Chagigah 2:1). Speculations about “what is above, what is beneath, what is before, and what is after” were to be limited to a small elite (*Mishnah Chagigah* 2:1). By contrast, R. Ishmael permitted such speculations (JT *Chagigah* 2:1 77c). The rabbinic commentary on Genesis known as *Genesis Rabbah* includes extensive cosmological discussion. Ascribed to the sages Shammai and Hillel, who lived prior to 70,

Genesis Rabbah includes debates about the precise order of creation. According to the School of Shammai the heavens were created first, and then the Earth, while the School of Hillel maintained the reverse order (*Genesis Rabbah* 1:15). Likewise the School of Shammai maintained that the intention (“thought”) of creation was at night and the act by day, whereas House of Hillel maintained that “both intention and act took place by day” (*Genesis Rabbah* 12:14). By the second century, the dominant view among the rabbis was that “both were created together like a pot and its cover” (*Genesis Rabbah* 1:15) and that “the intention was both by day and by night while the fulfillment was with the waning of the sun” (*Genesis Rabbah* 12:14). In these speculations, special attention was given to the creation of light, since according to the biblical narrative the sun was not created until the fourth day. The anonymous sages opined that the luminaries were created on the first day, but they were not “suspended” until the fourth. Rabbi Jacob and R. Eleazar were of the opinion that the light created on the first day was a special light with which “one could see from one end of the world to the other” but it was hidden away and reserved for the righteous in the time to come because of the future corruption of the world in the days of the flood and the tower of Babel” (BT *Hagigah* 12a).

Unlike the apocalyptic literature that speculated about nature on the basis of revelatory experiences, the rabbis develop their ideas on the basis of close reading of the biblical text, on the assumption that the revealed text contains the Wisdom of God. Insisting on God as a sole Creator, the rabbis intended to refute the view, common among Jewish sectarians, that God was not alone in the creative process and that the angels were involved. The rabbis also rejected the notion, prevalent among the Gnostics, that the material universe was created by a lesser and evil deity. According to the rabbis, the angels were created by God (*Genesis Rabbah* 1:3; 3:8), and it is stated that “all agree that none were created on the first day, that no one should say that Michael stretched out [the firmament] in the south and Gabriel in the north, and the Holy One, blessed be he, made its measurements in the center.” The angels themselves were created either on the second day or on the fifth day (*Genesis Rabbah* 1:4).

In the rabbinic corpus knowledge of nature is subordinated to practical and ethical concerns. For example, observation of celestial bodies that several rabbis such as R. Yochanan ben Zakkai, Gam’liel II and Joshua ben Chananya were reputed to have was directly linked to calculation of the lunar-solar calendar. Astronomical information about the motions of celestial bodies, the four seasons, the planets, the Zodiac, and even comets is directly related to calendar. More importantly, the interest in nature is linked to the moral-religious vision of rabbinic Judaism: communication with God is possible only through Torah and requires the cultivation of the proper virtues through observance of divine commands.

The rabbis were concerned about the relationship between revealed morality (prescriptive law) and the laws of nature (descriptive laws), but even here one can identify diverse and conflicting views. One theme highlights the regularity of nature and its indifference to human concerns: “nature pursues its own course” (*olam k’minhago no-*

heg) (BT *Avodah Zarah* 54b). Accordingly nature is independent of the revealed Torah and the laws of nature are different from the laws of the Torah. A contrary viewpoint, however, holds that the natural world is contingent upon the acceptance of the Torah by the Jewish people; had they rejected the Torah, the world would have reverted to primeval chaos. The link between nature and the moral conduct of humans is expressed in yet a third view that original natural order was perfect but suffered a radical change as a result of human original sin (BT *Kiddushin* 82b). And a fourth view posits “the animals of the righteous” as models for human conduct. Presumably these animals do not sin, because they know intuitively what the law is and what is required of them, and they know how to apply the Torah to the world in which they live. Since the “animals of the righteous” live in perfect harmony with their Creator, humanity has much to learn from them, not only in terms of the principle of observing God’s will but also specific lessons (BT *Pesachim* 53b). Finally, there is a rabbinic teaching not only that animals observe the moral laws, but also that all of nature is perceived as fulfilling the will of God in the performance of its normal functions (JT *Peah* 1:1).

Biblical legislation served as the point of departure for the rabbinic sanctification of nature. For example, the protection of fruit-bearing trees in the Bible became the foundation of the rabbinic principle “Do not destroy” (*Bal Tashchit*). The biblical injunction was extended to cover all destruction, complete or incomplete, direct or indirect, of all objects that may be of potential benefit to humans. A sweeping legislation of environmental regulations is legitimized by appeal to this principle: the prohibition of cutting off of water supplies to trees, overgrazing of the countryside, the unjustified killing of animals or feeding them harmful foods, the hunting of animals for sport, species extinction and the destruction of cultivated plant varieties, pollution of air and water, overconsumption of anything, and the waste of mineral and other resources.

Similarly, the merciful treatment of animals is elaborated in order to produce the righteous personality that could stand in the proper relationship with God. Thus the prohibition on seething a kid in its mother’s milk becomes the basis of an elaborate system of ritual separation of milk and meat products, which are explained as an attempt to prevent cruelty in humans (*Deuteronomy Rabbah* 6:1). Merciful treatment of animals is but one way by which Israel is separated from the surrounding pagan culture and becomes a holy nation. Scripture forbids cutting of a limb from a living creation even to feed it to dogs, even in the case of animals that are not to be eaten at all because they are unclean. The rabbis interpreted this law as applicable to all humanity, not just the Jewish people. The rabbis prescribe particular modes of slaughter which are performed with a sharp, clean blade so that they will be swift and relatively painless. The concern for unnecessary suffering of animals (*tza’ar ba’aley chayyim*) illustrates how the rabbis interpreted the command “to be holy as I the Lord am holy” so that Israel could stand in a covenantal relationship with God.

Attainment of religious perfection concerns not just how one treats another human being, but also how one cares for the human body itself. The rabbis had much to say about the operation of the human body and the rabbinic corpus is rich in details about

the skeleton, the digestive organs, the respiratory system, the heart, the genitals, and other organs. The material includes both accurate description as well as fanciful material and it is totally lacking in graphic illustration. The discussion pertains primarily to physical disfigurements that disqualify men from the priesthood, with rules concerning menstruating women, and with other sources of ritual pollution. The rabbinic corpus also includes informative claims about embryology, diagnoses of diseases, and a host of medications and hygienic strategies for prevention of disease. Likewise, there is extensive detail about animal physiology as it relates to embryology, sacrifice, and other issues. The physician is viewed as an instrument of God, treated with utmost respect, and several Talmudic scholars were themselves physicians.

Precisely because the natural world is God's creation, the value of nature in Judaism cannot be simply utilitarian: the natural world does not belong to humans, but to God, and the world was created not for the sake of human needs but for God's sake. On the basis of Isaiah 43:7 the rabbis expressed this point succinctly when they stated that "Whatever God created, He created for His own Glory" (*Pirkei Avot* 6:12; BT *Yoma* 38a). The worship of God is expressed through the exclusive commitment to the Torah and its commandments. It is precisely because the rabbis made Torah study the highest value, that their attitude toward nature was complicated. On the one hand, the rabbis made the study of Torah a substitute of interest in nature, and on the other hand, it was from the Torah itself that one derives the values and ethical standards that guide one's treatment of nature.

The Judaism of the rabbis became normative after the redaction of the Talmud in the sixth century. During the Middle Ages, rabbinic Judaism underwent further changes as a result of the interaction between Judaism and two other civilizations: Islam and Christendom. In medieval Islam, Jewish life was profoundly transformed when Jews turned from agriculture to commerce, trade, arts, and crafts as part of a comprehensive process of urbanization. In medieval Christendom, the Jewish estrangement from the land was even more pronounced because feudal regulations excluded Jews from land ownership. Although in some parts of Europe Jews were granted estates as late as the thirteenth century, in general Jews were increasingly forced to engage in money lending, pawnbroking, and trade, merchandising and the sale of second-hand goods.

Frequent expulsions and voluntary migrations further estranged Jews from land cultivation, turning the agrarian past into a distant memory. No longer practiced, the prescribed land-based rituals of Judaism fueled the hope for the ideal messianic age in the remote future when the exiled people would return to the Holy Land. For two millennia Jews continued to dream about their return to the land while they waited for divine intervention to bring it about. Until that time, Jewish life was to be shaped by the norms of rabbinic Judaism, whose comprehensiveness enabled Jews to remain loyal to their religious tradition, despite the loss of political sovereignty and in the face of hostility and discrimination.

The comprehensive lifestyle articulated by rabbinic Judaism made the sanctification of nature a major concern of Jewish religious life. Ironically, it was precisely the comprehensiveness of rabbinic Judaism that enabled the Jews to live meaningfully outside the land of Israel and defer the return to the Holy Land to the remote messianic future. In this regard the Torah became a substitute for nature and the land of Israel became an ideal, spiritual reality. In daily prayers, the Jewish worshipper sanctified nature by expressing gratitude to the Creator “who in his Goodness creates each day.” The prayers recognized the daily changes in the rhythm of nature – morning, evening and night – and recognized the power of God to bring these changes about. Similarly, the blessings that Jews are required to utter when they witness a storm or observe a tree blossoming bear witness to God’s power in nature. Even the natural functions of the human body are blessed, as is food that God provides to nourish the body. By means of these blessings all acts from which the worshipper derives either benefit or pleasure are consecrated to God. To act otherwise is considered a form of theft (BT *Berakhot* 35a).

The consecration of nature through prescriptive acts was compatible with the attempt to fathom how the natural world works. In Islam during the ninth century, Jewish scholars were confronted once again with Greek philosophy and science, now available in Arabic translations. The desire to understand how nature works and how God governs his created world was now carried out in the context of Aristotelian and Neoplatonic philosophies. In general, the medieval study of nature was a bookish activity, dominated by the determination to understand the causes of things and it presupposed the standard Aristotelian-Ptolemaic cosmology of the Middle Ages.

In medieval cosmology, the Earth was in the center of a finite and spherical cosmos within which there was a sharp distinction between celestial and terrestrial realms. The former comprises concentric orbs and is made of refined ether; the latter comprises the remaining space, which is occupied by the Earth and its atmosphere and in things consists of various combinations of the Four Elements (Water, Earth, Fire, and Air). Both realms are made up of matter and form but they exhibit different types of motion: the heavenly bodies are engaged in unceasing, perfect, circular motion, whereas in the terrestrial realm things are undergoing constant change due to generation, growth, and corruption, constantly exchanging one form for another. All terrestrial processes are driven by the motion of the heavenly spheres which are living and intelligent, and possess souls. The intellects of the heavenly bodies are the Separate Intellects that emanate from God. (Whether God is the First Intellect or the First Cause outside the series of emanated Intellects was a debated issue among philosophers-scientists.) Among the earthly individuals, only human beings have the potential to perfect themselves because they, like God, possess an intellect, having been created in the “image of God.”

While medieval Jewish philosophers were genuinely interested in understanding how nature works, their reflections were not divorced from the study of the revealed Torah. Elaborating the notion that the Torah is identical with the Wisdom of God, the philoso-

phers presupposed that in principle there could be no genuine contradiction between the truth revealed in the text and scientific knowledge about the world; both were believed to manifest the wisdom of God. The order of the cosmos was itself the ultimate reality and the highest human task was reverently to perceive it. God is the supreme *telos* of the universe, the intelligent and intelligible apex of the entire cosmos, accessible through philosophy and through prophecy, which according to these philosophers was the ultimate cognitive attainment. Apparent conflicts between Judaism and science emerge either because a nondemonstrable scientific theory is adopted, or because the biblical text is not interpreted in accord with philosophy and science.

Moses Maimonides (1138–1204), the most influential of medieval Jewish philosophers, is a case in point. He equated the rabbinic “Account of Creation” (*ma’aseh b’reishit*) with the science of physics as taught by Aristotle and his medieval Muslim interpreters. Accordingly, for Maimonides the biblical creation narrative had to be understood as follows: “water” refers to undifferentiated primeval stuff. Parts of this “water” were given different forms, resulting in a fundamental division in the material components of the universe. The “upper waters” are equated with Aristotle’s hot exhalation, while the “firmament” (*raqi’a*) is the lower stratus occupied by the cold exhalation, and the “oceans” refer to the elemental waters found on Earth. However, most commentators on Maimonides in subsequent centuries understood the process of creation to refer to the stratification of the atmosphere, and read the biblical text in line with Aristotle’s *Meteorology*.

The Jewish rationalist philosophers did not agree on the interpretation of the creation narrative, but they agreed that the Torah is a philosophic-scientific text that manifests the laws by which God governs nature. Since God is absolutely one, in God there is no distinction between what God knows and what God does. Divine activities in the physical environment manifest divine wisdom and God’s continued care for the world, that is, divine Providence. The philosophers studied the natural world in order to understand the mind of God, emphasizing orderliness, stability, and predictability of nature. The human ability to understand how God works in nature was ascribed to the human capacity for reason, which the philosophers equated with the “image of God” mentioned in Genesis. By virtue of reason, humans are able to understand the orderliness and purposefulness of nature which the rationalist philosophers interpreted in accord with medieval Aristotelian cosmology and physics. The medieval philosophers regarded the study of God’s created world as a theoretical activity whose reward was the immortality of the rational soul, or the intellect. Through the study of nature the philosophers came closer to God and attained the ultimate end of human life – the knowledge of God.

Though Maimonides accepted Aristotelian science in regard to the sublunar world, he rejected Aristotelian astronomy as non-demonstrable knowledge. He also totally discredited the science of astrology and viewed it as a challenge to the Jewish understanding of human freedom. In the thirteenth century, however, other Jewish scholars were more forthcoming in accepting astrology and participated in its study along with

the study of astronomy in the court of Alphonso X, “the Wise” (1252– 1284). They were largely responsible for the construction of the Alphonsine Tables for computing planetary positions that remained popular until the mid-seventeenth century. As for the science of astrology, most Jewish philosophers/scientists in the thirteenth and fourteenth centuries accepted it as valid and practiced it to prognosticate future events and to heal the sick. The most sophisticated Jewish astronomer-astrologer was Levi ben Gershom (Gersonides) (1288–1344) who designed an instrument to measure the relative distance of celestial objects, the Jacob Staff, which remained in use by European navigators until the mid-eighteenth century. In the second half of the fourteenth century, Jewish philosophers, such as Isaac de Lates, Prat Maimon, Jacob Farisol, Nathanel Kaspi and Solomon ben Judah of Lunel, would apply the science of astrology to the interpretation of the biblical text in a concerted effort to show how biblical practices can be understood as mediums to draw the spiritual energy of the heavens to Earth, especially for the benefit of Israel. Some scholars who were engaged in the study of astrology, such as Gersonides, also insisted that the intellectual perfection attained through the knowledge of natural processes enables the intellectually perfect to transcend natural causality.

The assumption that natural phenomena must be understood in light of the Torah, since the Torah is the blueprint of creation, was shared by rationalist philosophers and by kabbalists alike, but the latter revived and elaborated the esoteric, quasi-scientific lore of the Greco-Roman period, especially the emanationist cosmology of the neoPlatonists. Focusing on the linguistic aspect of the creative act was the primary focus of the kabbalistic approach to nature. On the basis of *Sefer Yetzirah* and its cognate literature, kabbalists equated the “building blocks” of the created world with the letters of the Hebrew alphabet. Understood as units of divine energy, the various permutations of the Hebrew letters accounted for the diversity of nature. Nature, in other words, was understood as an information system, a linguistic text that could be decoded and manipulated by anyone who grasped its “grammar.” The one who knows how to decode nature because he possesses the knowledge of the invisible occult forces of nature created by divine speech, could understand and manipulate the physical environment and effect changes in it. Hence, Kabbalah, especially in the fifteenth and sixteenth centuries, was closely associated with magic, astrology, and alchemy. Furthermore, the one who decodes the mysteries of nature could affect and impact God’s inner life, reunifying the feminine and masculine aspects of the Godhead that were pulled apart by the Fall of Adam. Kabbalah yielded two seemingly opposing attitudes toward the natural world. On the one hand, kabbalistic texts abound with organic symbols that take their inspiration from the natural world. Organic symbols such as the Pomegranate and the Cosmic Tree captured the integrity and vitality of the Godhead which is beyond the ken of human, rational, discursive knowledge. However, precisely because kabbalists considered nature as a mirror of God, they were not as interested in the natural world as a physical reality and made nature into a symbolic system. The corporeal manifestation of this divine reality, namely, nature as we know through the senses, was even

regarded in many texts as evil, to be transcended and spiritualized. By interpreting nature symbolically and by textualizing nature, Kabbalah further alienated Jews from the natural world, denigrating the physical. On the other hand, by trying to understand the occult powers of nature, Kabbalah also manifested a “hands on” approach to nature, leading the kabbalist to engage in the manipulation of nature in order to cause rainfall, heal the sick, or ease childbirth. Much of what might be called magical ritual in Kabbalah involved asking for or creating the possibility of blessing and redemption, for the Jewish people and for the world. In both approaches toward nature, Kabbalah remained committed to the primacy of humanity in the created order, because the human is the primary manifestation of the image of God in the created order.

In the early modern period (sixteenth to eighteenth centuries), medieval Jewish Aristotelianism declined as a creative schema for the interpretation of Judaism, replaced by Kabbalah. During the sixteenth century, kabbalists in the Land of Israel (most of whom refugees of the Spanish expulsion in 1492) delved deeply into the mysteries of the origin of the universe. On the basis of a close reading of *Sefer haZohar*, the central kabbalistic text, Isaac Luria (1534–1572) fathomed the mysteries of life itself. The act of creation in Kabbalah reflects processes that take place within the Godhead. According to Luria, creation began with an act of self-withdrawal (*tzimtzum*) to make room for a non-divine reality; the world came into existence through a dialectical process in which divinity gives birth to itself with the active help of the human intention. The Lurianic cosmogonic myth focused on the conception, impregnation, birth, suckling, and maturation of the divine Gestalt in an attempt to explain the mystery of life and chart the moral task for human beings, especially Israel. According to Lurianic Kabbalah, the goal of human life is to liberate the divine sparks that are now trapped in the material “husks” or “shells” and thereby repair and restore the now imperfect divinity. The Lurianic speculations about the origins of life and the origins and destinies of human souls further removed these mystics from the empirical reality, even though kabbalists instituted new rituals based on symbolic meaning of natural objects such as fruits and vegetables.

Lurianic thought spread outside the land of Israel during the seventeenth century, although it was still known to a relatively few number of Jews. The complex cosmogonic myth, however, provided the ideology of the Sabbatean movement, a mass messianic movement whose messianic claimant, Shabbtai Tzvi (also “Sabbatai Zevi,” 1626–1676) challenged the authority of rabbinic tradition and even converted to Islam. In Sabbatean ideology, articulated by Nathan of Gaza, natural beings, such as serpents and crocodiles, are turned into mythical representations of the realm of Evil (the *Sitra Achna*). Presumably, the descent of Zevi into it, in order to destroy Evil from within, explains his dramatic mood swings, antinomian actions, and even his conversion to Islam. The symbolic approach to nature was even shared by Jewish philosophers-scientists in Renaissance Italy who availed themselves of new empirical knowledge about plants, animals, and minerals. Their massive new observations of the natural world were still interpreted within the linguistic doctrines of Kabbalah, and guided by the magical

belief that nature could be manipulated through the manipulation of language, a belief that Jewish scholars such as Judah Moscato and Abraham Portaleone shared with Renaissance luminaries, such as Marsilio Ficino and Cornelius Agrippa.

No less threatening a challenge to rabbinic Judaism came from the skeptic philosophy of Baruch Spinoza (1632–1677) in Amsterdam, a son of ex-conversos, who challenged the identification of Torah with Wisdom that was in place in Judaism since the first century B.C.E. For Spinoza, the Bible was a human document and not a revealed text. As such, the Bible had no true scientific information about God or about the material universe but only information about ancient Israel's political life and teachings about interhuman relations. Denying the ontological gap between the creator and the created world, Spinoza argued for the existence of one substance, which can be known either through extension or through thought. Spinoza's monism, which might have been influenced by Kabbalah as taught by Abraham Cohen Herrera, identified God and nature; it also challenged the possibility of miracles, including the miracle of divine revelation. Concerned with religious conformity at a time of great intellectual upheaval, the Jewish community of Amsterdam could not tolerate Spinoza's challenges and expelled him in 1656. In modern times, the Zionist movement of secular nationalism adopted Spinoza as its hero and formally lifted the ban on him, and Spinoza's monism helped inspire the deep ecology philosophy of Arne Naess. The upheavals and challenges of the seventeenth century did not destroy traditional Jewish life, but gave rise to another revival movement in Eastern Europe during the eighteenth century – Hasidism. On the basis of Lurianic Kabbalah, Hasidic theology treated all natural phenomena as ensouled: divine sparks enlivened all corporeal entities, and not just human beings. The divine sparks seek release from their material entrapment. Through ritual activity, the Hasidic master attempts to draw closer to the divine energy, the liberation of which will result not only in the sanctification of nature but also in the redemption of reality and its return to its original non-corporeal state. The worship of God through the spiritualization of corporeal reality (*avodah bagashmiyut*) became a major Hasidic value, complementing the general deemphasis on Torah study. Hasidic tales were situated in nature rather than in urban settings, encouraging the Hasidic worshipper to find the divine sparks in all created beings. Yet most Hasidic masters were not primarily concerned with the well-being of the natural environment or with the protection of nature. To reach their spiritual goals, Hasidic meditative practices attempted to dissolve the corporeality of existing reality (*bitul hayesh*) and eliminate the identity of the one who meditates on nature (*bitul ha'ani*). While Hasidic thought ranged from pantheism to acosmism, the spiritualizing tendencies of Hasidism were disconnected at the extreme from any concrete concern with the natural environment.

Kabbalah, Hasidism, and traditional Talmudism (which reached ever-greater intellectual sophistication in the early modern period) contributed to the bookishness of Jewish culture and to the alienation of traditional Jews from the natural world. It was this alienation from nature that the proponents of Jewish Enlightenment (*maskilim*) cited as the reason for Jewish backwardness and inability to integrate into modern

culture. For the advocates of Enlightenment, only a return to nature could facilitate the normalization of the Jews, which was the condition for their emancipation and integration into modern society.

On the national and institutional level, the extension of human rights to Jews in Western Europe in the early modern period was also in the interest of the modern nation-state and in accord with the principle of modern democracy. As a result of the emancipation, Jews could now enter the universities and turn their intellectual energies into the study of nature, at the expense of Torah study. Many Jews flocked to the newly discovered natural sciences such as chemistry and biology, which promised to improve the human condition through progress and accumulative knowledge. Some Jews converted to Christianity in order to be able to hold academic positions, and even those who remained nominally Jewish found in the scientific study of nature a substitute for traditional

Torah-study. In the nineteenth century individual Jews contributed immensely to a plethora of natural sciences but they did so as individuals and not as members of Israel.

In Hebrew literature of the nineteenth century, nature was often celebrated as the source of redemption for the deformed, uprooted, and “unnatural” Jew. The tension between the modern return to nature and the allegiance to sacred scriptures became most evident in the Zionist movement. For Zionism, the return of the Jews to nature was an integral part of the return of the Jews to their national home after two millennia of exile. Through the return to nature the Zionist movement was to re-create a new “muscular” Jew who derives vitality from the cultivation of the soil rather than from the study of sacred texts. Ironically, the return to nature necessitated first the conquest of nature, both of the physical environment and the human agent. As a backward province of the Ottoman Empire, Palestine was a place where the pioneers had to battle against nature, be it “wetlands” (*bitzot*) or “wasteland” (*sh'mamah*) as well as battle against their own physical weakness and inexperience in land cultivation. Through the conquest of nature, possession of the land was supposed to legitimize the Jewish claim for the land against the claims of another budding national movement

– that of the Palestinian people. The ongoing conflict between the two movements would be waged not only over the land itself but also over scarce natural resources, especially water. Even the act of planting trees, which was promoted by the Jewish National Fund (JNF) as a central patriotic ritual that would lead to the redemption of the land (*ge'ulat ha'aretz*), would become a point of conflict between Israelis and Palestinians. By the same token, the awareness that without water no nationalism can thrive has also led to innovative cooperation between Israeli and Jordanian governments.

The ideology for the Jewish return to nature was articulated by the spiritual leader of Labor Zionism, Aharon David Gordon (1856–1922). Settling in Palestine in 1904, he joined the agricultural settlements in order to create a new kind of Jewish life and Jewish person. He viewed humans as creatures of nature but warned that humans are in constant danger of losing contact with nature. For Gordon, the regeneration

of humanity and the regeneration of the Jewish people could come only through the return to nature and the development of a new understanding of labor as a the source of genuine joy and creativity. Through physical, productive labor humanity would become a partner with God in the process of creation. Rejecting the traditional Jewish focus on Torah study, Gordon viewed labor as a redemptive act, provided that the means humans employ are in accord with the divine order of things, that is, with nature. Gordon's "religion of labor" was a transvaluation of traditional Judaism.

In 1948 the State of Israel was founded in an act of defiance against the decimation of European Jewry in the Holocaust, the growing militancy of the Palestinian nationalism, and the British Mandate. The relationship between Judaism and nature came to the fore in the modern Jewish state. On the one hand, intimate familiarity with the landscape of the land of Israel, its flora and fauna, and concern for the preservation of the physical environment are very popular among secular Israelis. Nevertheless, activities related to the natural world have not usually been legitimated by appeal to the religious sources of Judaism. Even when the Bible is employed to identify plants and animals in the land of Israel, it is often not treated as a revealed text but as a historical document about the remote national past. There are, however, Jews who are anchored in the Jewish tradition who tend to link their love of the land of Israel to a certain religious nationalist vision rather than to love of nature. Their ideology finds support in the teachings of Abraham Isaac Kook (1865–1935), the first Chief Rabbi of the Jewish community in the Israel, who saw in secular Zionism the beginning of Israel's religious redemption. Religious nationalist parties now promote outdoor activities for their constituents, but these activities are rarely grounded in the sensibilities of the environmental movement.

Today there are many varied Jewish responses to environment issues. The State of Israel boasts a vigorous environmental movement, whose largest organization, the Society for the Protection of Nature (SPNI), was founded in the early 1950s as a nonprofit organization intended to protect the state's natural assets. SPNI serves as a focal point for all Israelis concerned with the quality of life and the preservation of the country's natural and historical heritage through a network of 25 field study centers located in various geographical areas throughout Israel. Through hiking and field study, SPNI attempts to consecrate nature, without particular reference to God. At the beginning of the twenty-first century a new nonprofit organization, "L'Ovedah ul'Shom'rah: Forum laS'vivah baYahadut" ("To Till and to Protect": Forum for Ecology in Judaism) was organized in order to involve the religious sector in Israel in environmental issues, and add a Jewish religious perspective to the current environmental discourse.

Whereas Israel supports a vigorous environmentalism, the creative weaving of Judaism and environmentalism is more characteristic of American Jewry. Jewish environmentalism in the U.S. combines several groups. There are Jewish baby-boomers who were disenchanted by the suburban synagogues in America, and found their spiritual solace in the environmental movement. Some of them wound their way back to Judaism in the 1970s and 1980s as part of the Jewish Renewal Movement. These activists at-

tempted to integrate their Jewish and environmentalist commitments by mining the Jewish tradition for its ecological wisdom, highlighting the agricultural origins of Jewish life in ancient Israel and urging Jews to reconnect with the rhythm of nature that was the basis of many biblical festivals. A second group is comprised of Jewish thinkers, rabbis, and educators who responded to the accusation that the Judeo-Christian tradition was the direct cause of the current environmental crisis. These apologetic responses showed that the accusations were based either on misunderstanding of biblical sources or a lack of familiarity with the rich post-biblical Jewish tradition. And a third group are Jews who devote their creative talents to the articulation of spiritual and political environmentalism, although their audience is not the Jewish community and their goal goes beyond the “greening” of contemporary Judaism.

Since 1970, Reform, Conservative, Orthodox, Reconstructionist, and Humanistic Jews created a lively Jewish discourse on ecology, proving that Judaism can be part of the solution of our environmental crisis rather than part of the problem. In 1993 the Coalition for Environment and Jewish Life (COEJL) was founded as an umbrella for 29 organizations in the institutional Jewish community that were interested in environmental issues. The mission statement of the organization blends moral principles (such as “environmental justice,” “responsibility toward future generations,” and “prevention of harm”), with democratic principles (such as “the citizens right to know,” “public involvement in decision making,” and “equitable distribution and responsibility”), and with public policy issues (such as “energy independence,” “governmental compliance,” and “US leadership in protection of global environment”). The legislative agendas that flow from these principles in regard to waste management, testing of consumer products, pollution prevention, energy conservation, global climate change, Endangered Species Act, protection of public lands, and sustainable development are all linked by COEJL to traditional Jewish sources.

One main inspiration for Jewish ecological thinking is Abraham Joshua Heschel (1907–1972). A scion of a Hasidic family who received modern university training, Heschel was rescued from the Nazis and settled in the U.S. in 1944. Until his death he inspired scores of alienated American Jews to find their way back to the sources of Judaism in order to heal the atrocities of modernity that culminated in the Holocaust. Heschel’s ecologically sensitive Depth Theology spoke of God’s glory as pervading nature, leading humans to radical amazement and wonder. It viewed humans as members of the cosmic community and emphasized humility as the desired posture toward the natural world. Recognizing human kinship with the visible world, Heschel celebrated God’s presence within the world but he also insisted that the divine essence is not one with nature. God is simultaneously transcendent and immanent. Under the directorship of Eilon Schwartz, an American-born environmentalist who settled in Israel, Heschel’s ecological teachings are being translated into concrete educational programs at the Abraham Joshua Heschel Center for Environmental Learning and Leadership in Tel Aviv. These programs impart ecological literacy, reverence to nature, democratic values, and communal activism. The leadership program trains Israelis of various pro-

fessional pursuits to implement the vision of sustainability in Israel and to address preservation of species, coastal destruction, wetlands, water and air pollution, and waste management.

These activities in the U.S. and in Israel clearly indicate that Jewish environmentalism does exist today. At the grassroots level, in particular, Jewish individuals are raising environmental issues and organize educational activities to bring the ecological insights of Judaism to the attention of other Jews. The festival of Tu biSh'vat, which celebrates the birthday of trees, is now celebrated in many communities as a "Jewish Earth Day," and Jewish newspapers regularly report on environmental issues in connection with this festival. There is also a growing body of scholarly literature written by rabbis, Judaica scholars, and educators that makes it possible to teach college-level courses on Judaism and ecology. Judaism is also represented in the inter-religious dialogue of religion and ecology. Nevertheless, in America environmentalism and ecological protection are still relatively marginal concerns of the organized Jewish community. Jewish collective concerns often focus on the physical and spiritual survival of the Jewish people rather than the survival of the Earth and natural habitats. Justifiably, Jews are preoccupied with the protracted Israeli–Arab conflict, relations between the State of Israel and the diaspora, Jewish–Christian dialogue, pluralism within Judaism, gender equality, and most recently the resurgence of anti-Semitism.

Ironically, the main challenges to Jewish environmentalism come from within. In Israel and in America, the religious sources of Judaism do not inform the identity of most Jews, and secular Jews do not appeal to them in their attempt to address environmental concerns. Furthermore, the Jewish ethics of responsibility presupposes a sense of belonging to a community which is larger than the individual self. But the successful integration of Jews into modern society entailed the disintegration of the Jewish community and the erosion of Jewish communal solidarity. In industrialized countries, social mobility meant accumulation of wealth often accompanied with a consumerist lifestyle that undermines sound ecological conduct. And if this were not enough, Jewish environmentalists themselves are not unanimous on the recommended course of action and its justification within Judaism.

Jews who come to environmentalism from a Jewish religious commitment face other challenges. Wishing to ground Jewish ecological thinking in the religious sources of Judaism they must come to terms with the discourse of contemporary environmental philosophy and ethics which is largely, albeit not exclusively, secular. Bridging the gap between these two discourses is not easy, since it requires considerable interpretative skills on the part of Jews and a willingness to understand Jewish legal and textual reasoning on the part of non-Jews. Religiously committed Jews must become familiar with a vast literature whose worldview and philosophical assumptions may not only conflict with the beliefs of Judaism but are also in some cases self-consciously neo-pagan. This is especially evident in nature-based feminist spirituality that promotes goddess worship in order to overcome the deterioration of nature allegedly caused by the "Judeo-Christian tradition." Likewise, the biocentrism of deep ecology stands in

conflict with the anthropocentric stance of Judaism, which is the basis of its ethics of stewardship and responsibility toward nature. Yet, traditional Jews can also find a nascent but growing environmental discourse that is inspired by religious values and sensibilities.

In conclusion, the Jewish tradition is rich with ecological insights and can make a distinctive contribution to the dialogue of religion and ecology. The principle “Do not destroy” can provide religious support for a range of environmental policies such as conservation of natural resources, prevention of water pollution, reforestation, proper disposal of waste products, energy conservation, recycling, and reduction of material consumption. All of these policies highlight human responsibility toward the physical environment and assume that humans are not the owners of the Earth and its inhabitants but only part of a larger interdependent whole.

Judaism and Sustainability

The Jewish tradition relates to motifs in many guises that recur in the modern sustainability discourse and the policies that eventuate from it. As defined in The World Commission on Environment and Development publication *Our Common Future*, sustainability policies aim to meet “the needs of the present without compromising the ability of future generations to meet their own needs” (1987).

A variety of classical Jewish sources offer a specific vision of “religious sustainability” (i.e., following divine commandments) as the main precondition for the physical and moral survival of humanity in general and the Jewish people specifically.

One aspect of this view is expressed in the biblical narrative of the separation of Abraham and his nephew Lot. They have too many flocks, herds and tents for the carrying capacity of the land (Gen. 13:5–13). When Abraham suggests that Lot choose grazing resources elsewhere, he selects the Jordan Valley, prime land due to the availability of water. Lot pitches his tents near Sodom, a town whose inhabitants are so wicked that it is destroyed by God (Gen. 18). Lot and his daughters just manage to survive by fleeing upon divine instruction (Gen. 19).

This narrative is one among many indicating that moral factors are even more important for sustenance than economic or environmental ones. A key biblical motif connected to this is that the endowment or withholding of rain depends on whether the Israelites fulfill God’s commandments (Deut. 11:17; 1 Kgs. 8:35–36; Isa. 5:5–6; Zech. 14:17).

The Jewish tradition also devotes much attention to the continued availability of natural resources. A biblical commandment forbids the Israelites to destroy fruit trees when laying siege to a city (Deut. 20:19–20). This prohibition is discussed in great detail in rabbinical literature, which extends it to all wanton destruction, including one’s own possessions. The Talmudic sage R. Zutra declares it forbidden to make uneconomical use of fuel (Bavli Shabbat 67b). The leading medieval scholar Maimonides states that it is preferable to give clothes to the poor than to put them with the dead in the grave (Maimonides, *Mishneh Torah*, Laws of Mourning 14:24).

The laws of the Sabbatical and Jubilee years prescribe rest for the land, which the Bible says is not human beings’ but the Lord’s (Lev. 25:23–24). This view is also expressed in the biblical narrative of the rejection of Cain’s sacrifice to God. His offering is defective because he does not offer the best from his crop and the “owner merits the best” (Gen. 4:3–5).

Several times the Bible mentions cycling and recycling, which are other important elements of the modern sustainability discourse. God tells Adam that he is dust and

that he will return to dust (Gen. 3:19); thus his body will become available again as a natural resource. The theme of humans seeing themselves as dust frequently recurs in the Bible (Ps. 3:16, 30:10; Job 10:9, 30:19, 34:15; Eccl. 3:16). Material recycling is found in the building of the tabernacle in the desert when, *inter alia*, the people's jewelry is recycled for making religious objects (Ex. 35:20–29).

Today awareness is growing that excessive consumerism endangers sustainability. Several classical Jewish sources view conspicuous consumption in a negative light. The Bible says that it may lead to idolatry or forgetting God (Deut. 8:12–14, 31:20, 32:15–18; Isa. 2:7–9,

22:12–14). Similar motifs appear in the *Mishnah*, an edited version of the oral laws passed down through the generations, which was compiled early in the third century. There the sage Ben Zoma says: “Who is rich? The man who is happy with what he has” (*Pirkei Avot* 4:1). The sage Hillel denounces gluttony, saying: “The more flesh, the more worms” (*Pirkei Avot* 2:7). A Talmudic source considers gluttony particularly inappropriate for sages (BT *Pesachim* 49a).

On the other hand, consumption based on normal use of the Earth's resources is encouraged. Those who have planted a vineyard without harvesting it are free from mobilization in times of war (Deut. 20:6–7). Maimonides considers moderation to be advisable and disapproves strongly of both extreme desires and asceticism, as we can read in Maimonides, *Introduction to Pirkei Avot*, Chapter 4.

There are also many aspects or motifs of dematerialization in the Jewish tradition. The invisible God who speaks to Abraham is non-material. The Ten Commandments forbid sculptured images (Ex. 20:4; Deut. 5:8). The Israelites are told to concentrate sacrifices in a single location, the Temple in Jerusalem. The Bible says repeatedly that these offerings are ineffective – even odious – if they are not accompanied by obedience to God (1 Sam. Ch.15; Isa. 1:11–13; Amos 5:22–25). After the destruction of the Second Temple in the year 70, this religious dematerialization goes further: prayer replaces animal sacrifice. The Talmudic sage Rabbi Elazar says that prayer is greater than sacrifices (BT *B'rakhot* 32b).

Another important motif – durability – emerges in the biblical narrative stating that the Israelites' clothing and footwear did not wear out while crossing the desert after the Exodus (Deut. 8:4, 29:4; Neh. 9:20–21).

Intergenerational equity is a central element of the modern sustainability discourse. In the Jewish tradition there are many references to the relative well-being of successive generations, including in the Ten Commandments (Ex. 20:5–6; Deut. 5:9–10).

Ancestral merit influences future generations. The merits of the Patriarchs and Matriarchs are frequently mentioned in pleas for mercy in the Bible and Talmud (Jer. 31:15–17). In the Talmud, later generations are often considered less meritorious than earlier ones (BT *Eruvin* 53a; BT *Yoma* 9b). The sage Rabbi Zera says: “If the earlier generations were angels, we are humans; and if the earlier generations were human, we are like donkeys . . .” (BT *Shabbat* 112b). Several rabbinical texts encourage the

planting of trees, which will benefit future generations (BT *Ta'anit* 23a; *Leviticus Rabbah* 25:3; *Yalkut Shim'oni* on *Kedoshim* 615).

Maintaining biodiversity, another important element of the modern sustainability discourse, is a frequently recurring motif in Jewish sources. Such a concern may be indicated by God's bringing all animals to the man in paradise to be given a name (Gen. 2:19–20). Through this “due diligence” action of taking an inventory of all creatures and giving them names their identity and specificity are recognized.

The tale of paradise shows that animals were not threatened by the first humans, who were vegetarian (Gen. 2:15–16). The narrative of Noah who, upon divine instruction, gathers specimens of all animal species into the Ark, is a further paradigm of biodiversity (Gen. 6–7). Neither will man and animals threaten each other in the Latter Days (Isa. 11:7–8; Hos. 2:20). According to the Talmud, all creatures have a place in God's world, irrespective of whether they are of use to humans (BT *Shabbat* 77b; BT *Avodah Zarah* 3b).

Reading the above texts together with many others illustrates how classical Judaism – in the framework of its theocentric worldview – relates to major elements of behavior and thought which reappear in the modern sustainability discourse.

Judaism and the Population Crisis

Jews are rightfully concerned about rapid population growth since many current global problems, including hunger, resource depletion, energy shortages, pollution, global climate change, poverty, and unemployment all have significant connections to population. However, there is also great concern in the Jewish community about reduced Jewish birth rates and assimilation. The National

Jewish Population Survey (NJPS) 2000–2001, which was released in September, 2003, estimated that there are 5.2 million American Jews, 5 percent less than the 5.5 million counted in the 1990 population study. It found the rate of intermarriage to be rising steadily, with 47 percent of Jewish newly-weds marrying non-Jews, a 4 percent increase from 1990. It also found that of all American Jews currently wed, one-third were intermarried.

How should Jews respond to population-related issues? Many Torah teachings stress the importance of having children.

The first commandment in the Bible indicates the duty of procreation – “Be fruitful and multiply, and replenish the Earth . . .” (Gen. 1:28). Later, this commandment was repeated to Noah after the flood had destroyed most of humanity (Gen. 9:1).

The blessing of fertility was extended to Abraham and Sarah (Gen. 17:16). Through Isaac, Abraham was to be blessed with seed as numerous as the stars of heaven and as the sand on the seashore (Gen. 15:5). This blessing was repeated to Jacob, in the early years of his life (Gen. 28:14) and also later (Gen. 35:11). The principal blessing that Torah personalities conferred on their children and grandchildren was that of fertility. This was true of Isaac’s blessing to Jacob (Gen. 28:3), Jacob’s blessing to Manasseh and Ephraim (his grandchildren) (Gen. 48:16), and Jacob’s blessing to Joseph (Gen. 49:25).

There are also many Talmudic statements that stress the importance of having children. For example, Rabbi Joseph said, “One who does not have children, it is as if he has diminished the Divine image, since it is said ‘In the image of God made He man’ (Gen. 1:27) and this is immediately followed by ‘Be fruitful and multiply’ (Gen. 1:28)” (Shapiro 1979: 71–2). The school of Shammai taught that the duty of procreation was fulfilled when one had two sons (since Moses had two sons), while the School of Hillel taught that one should have a boy and a girl, since we are to imitate God and the Bible states, “male and female created He them” (Gen. 1:27).

Despite these teachings, can Jews ignore connections between population increases and hunger, resource depletion, pollution, global climate change, and other current

problems? While Judaism emphasizes the importance of procreation, there are justifications in the Bible for limiting procreation when resources are scarce:

1. While in Egypt, Joseph had two sons during the seven years of plenty, but no additional children during the seven years of famine (Gen. 41:50). The biblical commentator Rashi, interprets this to mean that when there is widespread hunger, one should not bring additional children into the world.

2. According to the Talmud, Noah was commanded to desist from procreation on the ark, since it contained only enough provisions for those who entered the ark.

3. It can be argued that when Adam and later Noah were commanded to “Be fruitful and multiply,” the Earth was far emptier than it is today. Hence, the commandment may no longer apply.

Judaism teaches that those who have no biological children can give “birth” in other ways. For example, the Talmud states that if someone teaches Torah to his friend’s child, “it is as if he gave birth to him,” as it is written: “These are the offspring of Aaron and Moses . . .” (Num. 3:1). The Talmud points out that the verses which follow only list the sons of Aaron, yet the Torah calls them the “offspring” of both Moses and Aaron! This is because Moses taught them Torah, and through his teaching, states the Talmud, he became their spiritual parent.

There need be no inconsistency between working for Jewish survival and global survival, in the area of population growth. A Jew can have a large family and still help reduce poverty, hunger, and pollution by working for a more just, humane, and environmentally sustainable world.

A Jew who has few or no children can work for Jewish survival by striving to increase Jewish commitment through example, teaching, and writing. Judaism teaches that our good deeds can be our main offspring.

While helping Jews who wish to have large families, the Jewish community should also strive to create a more meaningful, dynamic, committed Jewish life, and also work for a global society that conserves resources, practices justice, seeks peace, and reduces hunger and poverty, thereby lessening people’s perceived need to have many children. Finally, while working for a more just and equitable sharing of the Earth’s abundant resources and improved conditions for the world’s people, we should also help make others aware that this is the most effective way to move the world to a more sustainable population path.

Jung, Carl Gustav (1875–1961)

The psychiatrist, psychoanalyst and self-named “analytical psychologist” Carl Gustav Jung was born on 26 July 1875 and died on 6 June 1961. Born near Basel, Switzerland, over the last sixty years of his life he lived, worked – and died – near the banks of Lake Zurich. Although he is often coupled with his one-time mentor Sigmund Freud (1856–1939) in discussion of his life and work, this association, although pivotal for Jung, lasted only from 1905 to 1913 and is grossly overemphasized in the extant literature. Jung’s “analytical psychology” is comprised of six separate but interconnected theories: 1) the complex theory (1902); 2) the theory of psychological types (1913, 1921); 3) the vitalistic theory of a biologically based phylogenetic unconscious (1909, but revised in 1916); 4) the theory of the collective unconscious, originally called “the Land of the Dead” (1916); 5) the theory of the dominants (1917), borrowed from the work of the neo-vitalist botanist Johannes Reinke, or Platonic archetypes (1919) of the collective unconscious; and 6) the principle of individuation (1916).

Jung’s own unique theoretical formulations about nature, human and otherwise, were in fact a major departure from Freudian psychoanalysis. Freud’s outlook was decidedly atheistic (“a godless Jew,” as he termed it), materialistic monist, and urban. He rejected religion and mystical experience as symptoms of mental disorder and his vast corpus of writings virtually ignores the place of the natural world in the life of human beings except as a source of fear and unpredictability (hence the neurotic need for illusory protection of religious concepts). Jung’s, on the other hand, was deeply rooted in the philosophy, magic and mystery cult initiatory practices of Hellenistic paganism, German Romantic science and its roots in natural philosophy (*Naturphilosophie*) and nature mysticism, vitalism (materialistic dualism), Aryan solar mysticism, and occult sciences such as alchemy, astrology, spiritualism, and divination (such as the *I Ching* and oneiromancy). Indeed, the theories and practices of Jung’s post-1913 analytical psychology are so deeply rooted in these nonscientific traditions that one scholar, Wouter Hanegraaff of the Netherlands, argues in his magisterial *New Age Religion and Western Culture*:

Esotericism in the Mirror of Secular Thought that Jung’s contribution consisted in his ability to present an esoteric worldview in psychological terms, thereby providing a “scientific” alternative to occultism. More importantly, he not only psychologized esotericism but he also sacralized psychology, by filling it with the contents of esoteric speculation. The result was a body of theories which enable people to talk about God while really meaning their own psyche, and about their own psyche while really meaning the divine (1996: 513).

As essentially a German Romantic esotericist, to use Hanegraaff's characterization, Jung believed in a non-Darwinian evolutionary process in which humans were at the biological and spiritual apex of the Great Chain of Being. Echoing his beloved Romantic natural philosophers (*Naturphilosophen*) Schelling and Goethe, Jung believed that living nature, in both its material and mental/spiritual mirrors of an underlying unitary reality or substance, manifested, or was shaped by, fundamental organic types known as "archetypes" (*archetypi*, *Urtypen*, *Haupttypen*, *Urbilden*, and so on). The dynamic forces of nature and mental/spiritual life emerged from the tension of essential polarities, and hence the internal logic of Jungian psychology is firmly anchored in this principle (conscious/ unconscious, extraversion/introversion, thinking type/ feeling type, ego/Self, anima/animus, and so on). Jung's main rhetorical device for presenting evidence – analogy – echoes those of ancient Greek philosophers and the German Romantic natural philosophers. Like the *Naturphilosophen*, Jung believed individual organisms and nature as a whole to be telologically ordered rather than a product of mechanistic causal forces. Nature was self-productive and organic, gestating and evolving, and Jung, like his Romantic forebears, often expressed opinions that hinted at his Spinoza-like belief that God and nature were one (*Deus sive natura*).

However, unlike Goethe and the other *Naturphilosophen*, Jung esotericized these concepts in unique ways. For example, from alchemy Jung adopted the belief that all nature, organic and inorganic, was "alive" in the sense that it was constantly evolving toward a more highly complex and perfected state of being. Jung believed that human consciousness coevolved with matter, and that through the distillation of psychological processes in individual humans not only nature, but also God, could be redeemed. Jung also believed in ideas associated with nineteenth-century German ideas associated with Aryan *Blut und Boden* (Blood and Soil) mysticism. As with heredity in the biological realm, the non-living geological world also had a kind of "memory" and could influence the form and behavior of biological entities, including humans. For example, Jung reinterpreted the erroneous observations of the early twentieth-century anthropologist Franz Boas about how the environment changes skeletal structure across generations as evidence that the blood/life-force of Native Americans in the American soil could actually make European immigrants to America look "Indian" within just two generations.

After being exposed to the neo-vitalist Gustav von

Bumke (1844–1920) in medical school in Basel in the late 1890s, and later to the works of neo-vitalists such as Johannes Reinke (1849–1921) and Hans Dreisch (1867–1941), Jung adopted his belief in vitalism, a form of materialistic dualism, in which it was believed that there were two rule books for the physics of matter, one for life and the other for non-life. Living things were animated by a special life-force (*Lebenskraft*) that Jung termed *libido*. Despite the total rejection of vitalism as a viable biological hypothesis by 1930, Jung never recanted his belief in it.

Jung, Carl – A Perspective

Jung was one of the most influential of early twentieth-century psychological interpreters of culture; Peter Homans credits him with articulating many of the most important issues in psychoanalysis. His intellectual contexts were those of many of early twentieth-century European intellectuals – including widespread interests in spiritualism, Gnosticism, alchemy, tribalism, and “natural beings” (*Naturvölker*). Most of his writings were extraordinarily packed with careful research and reflection, and their extent is remarkable. Even to try to catalogue the various ways in which he approached *Homo religiosus* (humankind as innately religious) could commandeer a huge volume (see the many relevant essays in his *Collected Works*).

While many entries in this encyclopedia refer to practical, everyday issues in what we lightly refer to as “the real world,” others relate to less immediately tangible ideas. Since Jung died in 1961, for instance, we cannot expect him to treat concrete ecological concerns that only arose later. Nevertheless, his name is often mentioned in New Age contexts, even within new-ecology circles, as having provided important underpinnings for *why* those with strong ecological agendas hold them. Consequently on the most important Jung website, mounted by Donald Williams, there is an extensive list of links to “Environment and Science” sites.

Jung’s somewhat Romantic primitivism – I am referring to his enchantment with primordial cultures of antiquity or with his own day’s Third World peoples he visited – highlighted important values regarding a highly idealized version of nature. While nature was represented somewhat simplistically and naively as “a patch of green or a blossoming tree” (Jung in Sabini 2001: 155), for the factory worker of mass society, it and the relationship of “primitive” cultures to nature were constant referents in his attempts to reconcile traditional (often ancient) and contemporary modes of human existence (see his work originally published as *Modern Man in Search of a Soul* [1933], and Meredith Sabini’s collection of Jung’s statements on nature).

Jung claimed that highly self-conscious and rational moderns have suppressed wrongly the voices of the unconscious, instinctual being-in-the-world that characterizes Natural Man. That suppression can be dangerous in that the *physical-biological-instinctual* has guided human existence for a far longer period within human existence than *rationality*. The latter may have to be revised extensively when nature/fate redresses the series of catastrophes that our age has unleashed: overpopulation, global military applications of technology such as the hydrogen bomb that can obliterate the majority of life forms within a day or two, or the unbridled pollution of air and water and indeed Earth itself, all in the supposed “natural” evolution of “progress.”

“Progress” in Jung’s own Modernist day often entailed a sort of capitalist individualism that has come increasingly to seem only a feature of greedy right-wing politics, so we need to be aware of the specific historical-sitedness of any mentor from the near-past. To be sure, for Jung, individualism – a developmental strengthening of the personal ego – was not the same as what he called *individuation*. That refers to intimate connection with an ultimately-self-transcendent archetypal *Self* that encompassed the millennial coextension of all humankind, always experienced within the specific social features of one’s own day and locale. While Jung has been tarred with the “Platonic idealism” brush, he was careful to stress the embodied manifestation of archetypes rather than Plato’s spacey abstractions.

This archetypal *Self* represented not a greedy “me first” attitude but a sense of participating in primary significances represented variously in literature, the graphic arts, drama, religion, attitudes toward nature, and dreams. Jung was not anti-social, but certainly gave priority over the society to the individual’s inner experience *within* a supportive commonweal. Indeed the social context was never left out of Jung’s thinking, even though his immediate therapeutic work was always with individuals (whose names were and mostly remain today strictly shielded, as compared with Freud’s hints and disclosures).

Jung was less interested in the anthropologists’ recovery of ancient lifeways (including religion and relationship to nature) than in the feeling dimension that learning about them could evoke. He felt confident that moderns could recycle the wisdom of the ancients in contemporary (and often primarily interior) manifestations, an opinion that deeply influenced Joseph Campbell. Frequently speaking out against urbanized configurations of Western society, Jung rejected their too-conscious manipulations of the human spirit (psyche). Too much consciousness or rationality, he suggested, might well lead to ignorance of the underlying *moral* consequences of developments within the natural and technological sciences – and some decades after Jung’s death, we can now recognize the results of such ignorance and overreaching on all sides of our culture.

Jung promoted a “back to nature” lifestyle (illustrated most frequently in terms of having a garden, as noted above) in his own (we now see: patrician) lifestyle at his weekend retreat at Bollingen outside Zürich, where he built by hand a stone tower, bas reliefs, and living spaces, and apparently appreciated being photographed in his shirtsleeves chopping his own kindling with a Swiss machete (shown in several “Here’s the Real Jung” publications).

Beyond the apparently shallow dimensions so played up in the biographies that worship “guru Jung,” however, it is pretty clear that Jung would have supported deep ecology as expressed by Gottlieb: “enlarging our sense of our own selfhood” (Gottlieb 1996: 518) and rejecting definitions that might separate “human beings from the rest of the natural world” (Gottlieb 1996: 517). But that world may be almost unintelligible to our own day that now trivializes or lacks appreciative connections to the traditional worlds of fairytale, myth, and folklore – even though such folk materials establish

(usually at a very young, impressionable age) basic cultural understandings of the relative merit of humankind within the world of nature.

Jung's references to dreams as "pure nature, needing human reflection and discernment" (Jung in Sabini 2001: 19) would surely strike participants in the social and natural science portions of the contemporary world as ridiculous. But Jung was less impressed with contemporary progress than with the continuity of civilizations across time and space, and especially with giving high priority to the ancient past (especially alchemy, where he found many profound psychological and religious insights), not the present – his emphasis representing a nostalgic aspect of many early twentieth-century thinkers that now seems increasingly suspect as colonialist. His refusal to shirk looking at the dark side of human personality and culture leaves him looking occasionally like a mischievous trickster, and may explain why institutional theologians were so suspicious of his thought with respect to religion, which they do not associate with humor.

A very large number of publications discuss Jung and spirituality/religion/psychology. In 1990, Murray Stein reflected that James Heisig's 1973 bibliographical essay had listed 442 items, but suggested that subsequently the quantity had increased by a factor of at least three or four (Stein in Moore and Meckel 1990: 3). Gottlieb is right on target in suggesting that Jung always emphasized the soul/psyche/spirit, often in a manner that made orthodox Christians uncomfortable, especially when he unveiled some of the vast symbolic networks present in the Mass or crucifixion (as in *Jung on Christianity*, ed. Stein 1999). Moore and Meckel note that Jung was tarred and praised simultaneously; an instance of the former: "in a recent fundamentalist Christian publication Jung and his school of psychoanalysis were excoriated as being dangerous enemies of Christianity" (Moore and Meckel 1990: 1); Richard Noll, from the position of history of science, treats Jung as being "a charismatic leader" (1994: 17) who set about to establish a mystery cult (1994: 141). Nonetheless, Ellenberger reports that the Protestant pastor at his memorial service praised him for "staying the overwhelming flow of rationalism [and for giving] man the courage to have a soul again" (1970: 678–9), and he has been extensively influential in the field of pastoral theology – the care of souls. A neo-Jungian thinker of much power, James Hillman, has grounded some of his pro-ecological writings in Jung's work.

David Tacey observes that Jung initially seems to be "antagonistic to Western religion, anti-church, and in favor of personal mysticism" – but he quickly adds that Jung was "far more complex than this populist perception" (Tacey 2001: 17). Indeed part of that complexity was that "the master did indeed cultivate the image of prophet and wise man actively and systematically," and thereby became "a mentor of the New Age whether we like it or not" (Tacey 2001: 30; see also David Tacey, "Jung and the New Age – A Study of Contrasts." The C.G. Jung Page, 1998. Accessed on 02.21.03). Certainly he had little appreciative to say about institutional Christianity: Charet notes that "instead of going to church on Sundays, Jung studied Kant" (1993: 127).

Tacey correctly understands the importance of Jung for New Age developments of what Jung called the "religious attitude" – which was of much more interest to him

than corporate religious institutions – what we today refer to as “spirituality” (2001: 102). Certainly this is the religiosity reflected in the volume that the 82-year-old Jung excluded from publication within his *Collected Works*; the partly autobiographical *Myths, Dreams, Reflections* (Sonu Shamdasani [1995] shows how greatly its original manuscripts and stenographic notes differ from the subsequently revised, edited, and expanded redactions into several languages).

This work has become “a spiritual document of our time”; it became the capstone myth about the founder of Jungian psychology (Charet 2000: 211). Just what Freud rejected, *Memories, Dreams, Reflections* emphasizes – but then for Jung, humankind is not just religious due to an inauthentic syndrome tinged with neurotic sexuality (Freud’s view), but “man is naturally religious”; Jung can refer readily to “the natural function of religion” (Ellenberger 1970: 724, 734). Within the last sentences in *Memories, Dreams, Reflections*, Jung writes that “there is so much that fills me: plants, animals, clouds, day and night, and the eternal in man. [. . . T]here has grown up in me a feeling of kinship with all things” (Jung 1973: 359).

The sphere of the religious is especially the realm where the huge transcendental and universal encounters with transpersonal forces/beings and their expressions occur: the realm of the archetypes and their manifestation in the peculiar historical contexts of all people. The range of New Age religious incorporations of Jung’s thought vary from the strictly-secular to those like the 25-year-old organization, Journey Into Wholeness, which understands “Jung’s psychology [as] an alternative to the rationalistic materialism of our culture to which even religion has fallen victim.” And “The Jungian–Christian Dialogue” promotes a meeting of Jungian psychology with Christian philosophy, theology, and spirituality.

For many “religious Jungians,” Jung’s “spirituality without religion” (Tacey 2001: 45) “merges almost effortlessly with ecospirituality, the worship of nature spirits, paganism, pantheism, and Wicca” (Tacey 2001: 179). But against the claims of Richard Noll’s *The Jung Cult: Origins of a Charismatic Movement*, others reject decisively claims that Jung sought to become the much-worshipped high priest of a psycho-religious cult.

Likewise, Jung’s own materials must now be carefully distinguished from those of the generations of Postand Neo-Jungians (largely excoriated in Tacey 2001: ch. 4, “American New Age Jungian Inflation”). Already in 1981 Marilyn Ferguson, in *The Aquarian Conspiracy*, reported a survey of New Age people who listed overwhelmingly Teilhard de Chardin and C.G. Jung as their most-important international spiritual idols. But Tacey, who provides this reference, is quite aware that what a few New Agers at most might have actually studied would be at best a few passages in *Myths, Dreams, Reflections*. And many applications feature the shoddy pop-psych represented by Casey’s *Making the Gods Work for You*.

Jung was a figure upon which many psychological projections have been made – especially rather negative projections upon Jung (“devilish!”) by various institutional religious establishments. In an essay written for The

C.G. Jung Page on the Web (1998), Tacey notes that there are then also ways in which one might “find the New Age to be non-Jungian or even anti-Jungian in a number of important respects.” Nonetheless, Jung’s vision of the universe and human psychology within it have supported many ecological visions stressing a “one-world” framework.

Kabbalah and Eco-theology

Jewish mysticism is fundamentally concerned with cosmology and cosmogony, the origins and the process of creation, and the holism of creation in all its aspects, as well as the processes within divinity that sustain the world. Jewish mysticism has taken many forms throughout history, but the tradition we call Kabbalah became fully crystallized in the thirteenth century with the publication of the *Zohar* (“The Book of Radiance”). Kabbalistic literature spans many centuries and is incredibly diverse and complex; here the focus will be on themes within Kabbalah relevant to eco-theology.

While the literature of Kabbalah is vast, certain themes are persistent. Kabbalah is founded on the idea that the commandments of the Torah are given for the sake of restoring or healing the whole cosmos and reuniting it with the Infinite. As such, Kabbalah is the primary thread within Jewish tradition that imagines a purpose for the Jewish covenant, and hence, an intention within the divine will that embraces the more-than-human world, beyond both Israel and humanity. As Seth Brody wrote, “The kabbalist’s goal is to become a living bridge, uniting heaven and Earth, so that God may become equally manifest above and below, for the healing and redemption of all” (1993: 153).

Two fundamental kabbalistic principles provide a strong foundation for Jewish eco-theology. One is that “there is no place empty of God,” (*leyt atar panui miney*) that is, the presence of God can be found in every single creature and being. The other is that “the whole world is blessed because of us” (*kula alma m’varkhin b’ginan*) that is, the actions of the righteous bring blessing to the whole of creation and to the Earth and all its creatures, as well as to God. Moshe Cordovero (1522–1570, Palestine) elucidated the meaning of this principle in his work *Or Ne’erav* (“Sweet Light”):

Being involved in this wisdom, a person sustains the world and its life and its sustenance. And this is what Rabbi Shimon bar Yochai [the main protagonist of the *Zohar*] explained in saying that “the world is blessed because of us” . . . for involvement with divinity causes cleaving, and when the human cleaves to the One who flows/guides the world, he causes the flow [of divine energy] necessarily, and

. . . causes to flow upon the world a great flow (1965: 32).

One of Cordovero’s most popular works, *Tomer D’vorah* (“The Palm Tree of Deborah”), sums up the human task as follows: “This is the principle: he should cause life to stream forth to all” (from the Hebrew, 1969: 21; see also 1974: 82). While there are many approaches to understanding Kabbalah, if one focuses on this principle, one finds a fertile ground in which to root contemporary Jewish eco-theology.

In addition to this foundation there are also several areas in Kabbalah which may be drawn upon for developing an ecological ethics, including views regarding the ethical treatment and moral standing of other animals and other species, the contemplation of the natural world as a revelation of divine presence, and the extension of the idea of God's image from humanity to creation itself.

On the cosmological level, a number of characteristics of Kabbalah are equally significant for contemporary ecological thought. The holographic complexity that characterizes most kabbalistic texts is resonant for any theology of nature that attempts to account for contemporary science. For ecofeminism, the kabbalistic emphasis on balancing or uniting male and female at all levels, and the acknowledgement of the feminine aspect of the divine, are also intriguing, even though these texts generally maintain gender hierarchy. Finally, the sensuous way that Kabbalah understands cosmogony is echoed in the significance attributed to playfulness in contemporary ecopsychology.

Sefirotic Play

The *Sefer Bahir* ("Book of Brightness," ca. twelfth century), the earliest articulation of what later came to be called Kabbalah, declares in a parable that when the king began building his palace (that is, when God began creating the world), a spring gushed forth. When he saw the spring, he said, "I will plant a garden, then I will delight (or "play") in it, and so will all the world" (§5, Kaplan 1989: 3). Creation is seemingly both God's act of delight or play, and a gift of delight to all the creatures.

The playful garden that the king planted is described later in the *Bahir* as the Tree of Life. This Cosmic Tree is defined in later Kabbalah as a particular pattern called the *Sefirot* (singular: *Sefirah*), which are together the image of God, or what Gershom Scholem (1991) called "the mystical shape of the Godhead." The *Sefirot* are regarded alternatively as divine attributes, essence, emanations, instruments or vessels; different perspectives are emphasized by different kabbalists. The kabbalists in general found God by tracing back the pattern of God's unfoldment (to borrow David Bohm's term) through the levels of emanation, from one *Sefirah* to the next, and from one world to the next. These levels represent the way in which divine energies such as love and judgment, male and female, hidden and manifest, and so on, are balanced and made manifest. Everything has within it the essence and image of those supernal levels. The unifying concept in Kabbalah is that the structure of each "holon" manifests the *Sefirot* and so bears witness to the image of God. ("Holon" is Ken Wilber's term for the way the nature of every being reflects the whole of what he calls "the Kosmos.") At each level and within each entity, the kabbalists saw the pattern of the *Sefirot*, in a manner that we might call fractal or holographic.

Holism

Kabbalah embraced a holistic view of the universe which called for the expansion of divinity into the physical world. Kabbalah represents the theological science (in the medieval sense of the term) that draws all the worlds, including dimensions of God and nature, into one realm, one whole. “Implicit is a notion of sacred cosmology . . . The kabbalists’ faith involves a hierarchy of worlds that are ontologically higher than the material world” (Krassen 1999: 137). The work of the kabbalist is to draw the higher worlds into the lower and to unite the lower with the higher.

This tendency is most pronounced in the radical cosmogony that some texts propose: the universe is regarded as the shards of an original creation that shattered while it was still in the realm of the divine, carrying “sparks” of divinity into what became the physical realm. Each of these sparks is some part of the divine that has been alienated from its root. Human beings provide the vehicle to repair this brokenness and reunite the sparks with the whole. Equally important, the process that begins creation is understood to be a contraction of God, called *tzimtzum*, which makes space for the world to emerge. Isaac Luria (1534–1572, Palestine) in particular used images of birth to describe this process, suggesting quite literally that the universe or nature is somehow commensurable with God in the way that a child is with its mother.

These tropes teach that the human purpose in creation is to unify all realms of being with and within the divine. The *kavanot* or opening incantations that kabbalists added to their prayers expressed this purpose: “for the sake of the unification of the Holy One and the *Shekhinah*.” One of the most beautiful expressions is found in the remarkable opening prayer of the original *Tu biSh’vat seder* (a kabbalistic ritual meal in honor of the Mishnaic New Year for the trees, interpreted as the cosmic Tree), which is found in the book *Chemdat Yamim* (“Treasure of Days”, seventeenth century):

O God who makes, and forms, and creates, and emanates the upper worlds, and in their form and pattern you created their model on the Earth below; You made them all with wisdom, upper ones above and lower ones below, to join together the tent to become one . . . And this day is the beginning of your works, to ripen and renew . . . May it be Your will that the merit of our eating the fruit, and meditating on the secret of their roots above, you will bless them, flowing over them the flow of desire and energy, to make them grow and bloom, for good and for blessing, for good life and for peace . . . And may the Whole return now to its original strength . . . and may all the sparks that were scattered by our hands, or by the hands of our ancestors, or by the sin of the first human against the fruit of the tree, be returned to sustain in might and majesty the Tree of Life. “Then the trees of the forest will sing out,” and the tree of the field will raise a branch and make fruit . . . (translated and abridged by the author; for a complete translation see Krassen 1999: 148–51).

The purpose of wisdom, i.e., Kabbalah, is to both recognize and reestablish the pattern of the divine image, called here “joining the tent to become one.” One way to understand the holism of Kabbalah in modern terms is to consider the idea of

the “more-than-human world.” This terminology was coined by David Abram to keep reminding us that “Nature” is not “out there” but also within, and that human society is part of the natural world. Conceptually, both God and nature are more-than-human; in certain moments, the distinction between the two is dissolved in the overwhelming power of being. This happens in Kabbalah through the sanctification of the world around us by holy acts. Every deed is an act of compassion for creation, as well as a fulfillment of *tzorekh gavoha*, the “need on high,” in the divine realm.

The Earth or Cosmos as Divine Body and Image

There are several themes in Kabbalah that relate to the idea that nature as a whole participates in divinity. *Shekhinah*, the “indwelling presence” which is the feminine dimension of divinity, is also called “the image which includes all images,” that is, the images of all creatures above and below (*Zohar* 1:13a). The *Shekhinah*, as the source of all divine *shefa* or overflow that reaches the lower worlds, is the image of God that is closest to the Earth:

R' Eliezer said to him: Father, didn't they learn above that there is no body and no substance? He said to him: My son, about the world-to-come it was said, for that is a supernal [i.e., purely immaterial] mother, but below there is the body of this world, which is the *Shekhinah* below (*Tikuney Zohar* §70, 131a).

The *Shekhinah* in some sense represents “Nature.” The Kabbalah's conception of nature, however, is vastly different from both science and Gaia-spirituality. Compared to classical scientific determinism, nature in Kabbalah is potentially free and self-willing. But, unlike what one finds in the neo-pagan celebration of nature as MotherGoddess, nature *Shekhinah* must become united with the worlds above and hence with the transcendent. Hence nature is creative but it is not self-creating. According to some texts, this unification ends with the feminine being reabsorbed into the masculine, while others depict the feminine attaining equal stature, “eye-to-eye” with the masculine.

Whatever these images mean on a practical level, they imply an ambivalent relation to the natural world, which is insufficient in itself and needs to be redeemed. For this reason, Elliot Wolfson (2002) doubts whether Kabbalah has value for eco-theology. Seth Brody, Daniel Matt, Arthur Green, among others, however, find these tropes to be powerful grounds for creating an “eco-Kabbalah.”

Kabbalah conceptualized the cosmos as both tree and as *Adam Qadmon* (“primordial human,” sometimes translated “divine *anthropos*”), thereby connecting the divine image, the tree, and the cosmos itself through Adam. While some texts connect *Adam Qadmon* primarily with the upper or originary realms only (especially with the crown *Sefirah*, *Keter*), others see it as the macrocosm which inscribes the divine image onto the whole of creation. The former dualistic perspective (discussed below) and the latter holistic perspective can sometimes be found in the same text. This complexity suggests

that a wholesale adoption of kabbalistic cosmology into a theology of nature cannot work without a re-reading of the texts.

Nevertheless, there were particular authors who consistently emphasized the inclusion of the Earth and the creatures in the divine image. Yosef ben Shalom Ashkenazi (fourteenth century Spain), for example, calls this “the secret of *Adam HaGadol* (the great Adam)”, explaining:

The human being should be called a small world, for in his form he is like all [the creatures of the world] – the human, formed of “the dirt of the ground” [Gen 2:8], included in himself the seal and structure and likeness and image of all ten *Sefirot* and all that is created and formed and made from them (1984: 36).

The Earth itself includes the seal and structure and image of God that became part of Adam. God’s image in Adam not only unites the whole of creation, but also carries within itself each created species and individual, that is, the entire diversity of creation. Isaiah Horowitz (1562–1630) similarly taught that God’s purpose in creating humanity was to unite the diversity of creation with God’s image: “ ‘The end of the thing’ [Eccl. 12:13] is Adam, who was created last . . . Adam was created at the end so that he could include everything in his image and likeness” (1996: 216).

God’s Image in the World

If the *Sefirot* are the soul of the world, then the substance of creation is sometimes treated as the body: “The ten *Sefirot* . . . are clothed in ten things that were created on the first day, and these are: skies and land, light and darkness, abyss and chaos, wind and water, the measure of day and the measure of night” (*Tikuney Zohar* §70:120a–b). At the same time, the pattern of the *Sefirot* at the highest level is the guarantor that every subsequent level is also an image of God. For example, the *Sefirot*, the angels, the animals of the Ezekiel’s chariot (human, lion, eagle, and ox), and the four elements are seen as manifestations of the same pattern at different levels (Horowitz 1996: 152).

Kabbalah also uses the letters of *Yod Heh Vav Heh* (which spell the holiest name for God, also known as the Tetragrammaton) to represent the structure of the *Sefirot*. Seeing these letters in a thing expresses the idea that God’s image or presence is manifest through that thing. For example, in *Tikuney Zohar* (a series of meditations on the first verses of Genesis, written in the style of the *Zohar*) each limb of the human body is an image of this name; each human being as a whole person is understood to be an image; and the diversity of humanity as one species is also an expression of God’s image, mapped on to *YHVH* (146a).

This trope was not limited to the human realm. The human species as a whole is further seen as one letter in the name formed by the spectrum of animal species represented in the chariot. Similar correspondences were drawn with respect to the bodies of other creatures like birds and fruit trees, and to other dimensions of the physical and supernal worlds like the colors of the rainbow, thereby relating various senses,

spectrums and dimensions to *YHVH*. In general, those creatures which were seen as uniting the upper and lower worlds represent an image of God in the world, along with those symbols of human culture whose explicit purpose was to create unification, like the Torah and the *Mishkan* or Tabernacle.

On the largest scale, the four letters of the name *YHVH* were seen as corresponding to the multi-level process of emanation, becoming well-defined in the Kabbalah of Moses Cordovero according to four worlds or stages of being: emanating (*Y*), creating (*H*), shaping (*V*) and acting (*H*). From this perspective, the entirety of creation, embracing all the levels, is conceived to be an image of God. While in general all creation is in some sense part of God, some texts emphasize that the lower creatures are essentially part of God's name. For example, the *Zohar* (in a later strata) explains:

In the secret of the ten *Sefirot*, all is included in this image of *Heh*. In this secret were created and fixed all these lower beings, and for this [reason] it's written, "Elohim said: Let us make/*N'SH* in our image as our likeness" [Gen. 1:27] – literally "let us make/*N'S* the letter *Heh*, with all these that are existing below and are united in her, in her image, truly (*Zohar Chadash*, *Sitrey Otiyot B'reishit*, "Secrets of the Letters of Creation").

When the physical dimension of being is not conjoined with the higher levels, then the final letter of God's name, the *Heh*, is as it were missing, and the image of God is diminished. While Kabbalah mostly focused on specific manifestations of the *Sefirot* and God's image, the image of God ultimately embraced the breadth and diversity of creation.

Rabbinic Roots and Modern Branches

Many elements found in Kabbalah are rooted in classical rabbinic texts. The raw material for kabbalistic cosmology includes the midrashic idea that the upper beings or heavens were created in God's image, as well as the idea that the human body is a complete microcosm of the Earth. A second-century esoteric teaching, a tradition known as *Shiur Qomah*, delved into ("The Measure of the Body") and held that God's body was similar in structure to the human body but measured in the ancient equivalent of lightyears. This tradition provided a critical element that allowed Kabbalah to make a connection between God's image and the physical cosmos. Even the expression "there is no place empty of God" is Talmudic in origin.

The classical texts, however, never made a connection between the structure of the cosmos, the human microcosm, and the image of God, and they explicitly stated that the lower beings or the creatures of the Earth were not created in God's image. Kabbalah, on the other hand, penetrated the boundaries between heaven and Earth and between upper and lower realms, projecting the image of God, either directly or through various analogues, onto the "lower beings."

Contemporary scholars such as Green and Seth Brody understand these texts to be the product of imaginations that embraced the diversity of creation; a paradigmatic text from the *Zohar* related to this theme has been translated by Matt (1996: 134). Krassen explains,

Nature is neither a source to be exploited for utilitarian benefits nor a sentimental vestige of the past to be romanticized by poets and naturalists. It is rather an ultimate link in a chain of divine manifestation that directly emerges from the divine source of life (137).

Other scholars like Hava Tirosh-Samuelsan doubt that the intention of Kabbalah goes beyond the play of textuality and linguistic interpretation. While the author of this essay supports the former view, in either case, Kabbalah provides a powerful model for any contemporary theologian wanting to express the religious meaning of our encounter with the diversity of life. Applying these principles to eco-theology, as Green and Arthur Waskow do, if the image of God is an image of the diversity of life, then God's image is diminished every time human beings cause another extinction.

Dualism and Repairing the Cosmos

According to some cosmologies, especially within Lurianic Kabbalah, the human of the Genesis story is born into an already shattered universe. This perspective led some kabbalists to a dualistic understanding of creation in which the connection between the Earth and *imago dei* is rejected. For example, in one *Zohar* passage, we read, "*Adam Qadmon*, even though his body is made from dirt, it's not from the dirt here . . . *Adam Qadmon* has nothing from this world at all" (*Zohar* 3:83a).

This cosmology could be characterized as a "dual Earth" theory, where the element from which the primordial human is created is entirely derived from an anti-physical (or ante-physical) Earth. Nevertheless, even though the image of God is not expressed through the ordinary physical universe, our human bodies still have the potential to express the divine pattern, and this can only happen in completeness in the physical world. (This position radically divided Kabbalah from medieval Jewish philosophy.) In Lurianic doctrine, this is called raising the sparks to their root in divinity and purifying them from their materiality, and is called *berur han'tzotzot*. Through this process, the original brokenness of creation could be repaired; this is seen as the purpose of our existence. Thus, whereas rejection of the natural world is a possible consequence of Gnostic dualism, even within the most dualistic interpretations of Kabbalah, the purpose of humanity is to be engaged with the physical world and to bring redemption to the entirety of creation.

Ethics

Because Kabbalah saw the redemption of the cosmos as something that could happen through every interaction with the world, some kabbalists developed an acute sensitivity toward other creatures, asserting for example that only one knowledgeable in Torah and engaged in the deepest contemplation of raising the sparks should be allowed to eat meat.

One of the foundations of kabbalistic ethics is that all creatures deserve and require respect. One seminal concept in Kabbalah is the idea of reincarnation; for many kabbalists this included the possibility that human beings could reincarnate as animals. But the seeds for this idea of respect are independent of the concept of reincarnation and can be found already in the classical rabbinic idea that everything has a place and one must despise nothing in the world. Cordovero, who developed this principle further than any other kabbalist, wrote:

One should train himself . . . to honour the creatures entirely, in whom he recognizes the exalted nature of the Creator who in wisdom created man. And so all creatures, the wisdom of the Creator is in them

. . . It is evil, too, in the eyes of the Holy One if any one of His creatures are despised. It is therefore written: “How great/*rabu* [diverse] are your works” [Ps. 104:24] – [this means] very important/*rav* ... (Cordovero 1974: 78; see also 71, 83–5).

Cordovero stressed that showing mercy and respect and bringing beneficence upon every aspect of creation is what it means to become like the Creator: “One’s mercy should extend to all creatures, neither destroying nor despising any of them. For the Supernal Wisdom is extended to all created things – silent, growing, moving and speaking [i.e., mineral, plant, animal and human]” (Cordovero 1974: 83).

The wisdom of the Creator is found in the pattern of the *Sefirot*. When a person imitates this pattern, they allow the influx of divinity to reach each and every being, according to Cordovero. He wrote that this principle has strong practical implications:

One should not uproot anything which grows, unless it is necessary, nor kill any living thing, unless it is necessary. And he should choose a good death for them, with a knife that has been carefully examined, to have pity on them as far as possible (Cordovero 1974: 84; see also 78).

Differing broadly from normative *halakhah* or Jewish law, Cordovero understood other creatures not in terms of human need, but rather in terms of the need of each living thing to fulfill its divine purpose. Human use must “elevate them higher and higher . . . for [only] then is it permitted to uproot the plant and kill the animal . . .” (Cordovero 1974: 78).

This deep understanding of ethics extended even to the interpretation some kabbalists gave to the prohibition against idolatry. Yosef Ashkenazi, who was quoted above, explained that the sin of idolatry is that it separates the worshipped thing from the divinity that comprises the whole:

Since all the existences, from the upper ones and the lower ones, all of them are tied into his great, mighty and awesome name, blessed and holy be, therefore he warned [Israel] to not worship them in separation from his name – only in the name of *YHVH* [as] one

. . . (1984: 148, 41b).

Here as elsewhere, the unity of being, which is concomitant with the presence of divinity in all being, is the root of the extraordinary proto-ecological sensibility displayed in Kabbalah.

Contemplation and Ritual

Kabbalists reconciled the unity of being with the diversity of creation by seeing every aspect of the world as simultaneously cloaking and revealing the divine. They found the *Sefirot* and the letters of God's explicit name everywhere, and reached the spiritual dimension of things by engaging with the traces of the divine in the physical world. This engagement happened mostly through the projection of language and text onto the world, and thus focused on ideas at least as much as it focused on phenomena. However, the Lurianic doctrine of raising the sparks also focused the mystic's consciousness on the depth within real physical things. Elevation of the sparks required direct contact with the physical world, through ritual and mystical intentions in any physical act. It engendered a deeper respect for the intrinsic value of other creatures and things than one finds in normative Judaism. The implication of kabbalistic theurgy (ritual or magic which operates on or affects divinity) was that proper intention and consciousness could reveal the divinity underlying all phenomena and unify phenomena with their source. The potential to create a phenomenology of holiness was made manifest by Chasidism in the eighteenth century. These ideas also inspired many Jewish thinkers, both in the Renaissance and the early modern period, to use Kabbalah to reconcile theology and science.

Some modern kabbalists gave full expression to the power of contemplating and understanding nature that is hinted at in Kabbalah. Abraham Isaac Kook (1865–1935, Palestine) wrote:

Contemplate the wonders of creation, the divine dimension of their being, not as a dim configuration that is presented to you from the distance but as the reality in which you live. Know yourself and your world . . . find the source of your own life, and of the life beyond you, around you, the glorious splendor of the life in which you have your being. The love that is astir in you – raise it to its basic potency and its noblest beauty, extend it to all its dimensions, toward every manifestation of the soul that sustains the universe . . . (1978: 207).

For Kook, the meaning of Kabbalah was found within the lived experience of the natural world. He wrote that from the knowledge of God, “there radiates . . . a love for the world, for all worlds, for all creatures, on all levels of their being. A love for

all existence fills the hearts of the good and kindly ones among creatures, and among humans” (1978: 226). Kook’s theology may even be called biocentric, in the broadest sense, as further evidenced by his encomiums on the theory of evolution. Kook gave a directive to his students to embrace the natural world in the words quoted above, a directive that may be realized in part by contemporary work that unites Kabbalah with ecology.

Conclusion

Looked at over the course of its entire history, Kabbalah is a process which has led to an increasing embrace of the more-than-human world as divine in all its aspects. No particular text or moment in the history of Kabbalah completes the manifestation of this potential, but the trajectory of Kabbalah’s evolution points in this direction. The cosmogonic, ethical and spiritual dimensions of Kabbalah are all fundamental to any eco-theology or theology of nature in Judaism.

Kalash Culture (Northwestern Pakistan)

Numbering approximately three thousand people, the Kalash are refugees scattered throughout roughly fifteen hamlets in the northwestern corner of Pakistan. Descending from the Indo-Europeans, they have dwelled in the mountains of the Hindu Kush for at least four millennia and have maintained indigenous pagan traditions. Through Muslim oppression at the end of the nineteenth century, most pagan people in Afghan's Kafirstan (formerly Nuristan – *kafir* meaning “infidel”) either perished or adopted the majority religion. Among the three communities that now inhabit the last Kalash valleys in Pakistan, the Chitralis and the Katis both converted to Islam. It is the Kalash alone who still maintain original festivals and customs that relate to spiritual perceptions embedded in the environment.

According to one Kalash myth that indicates the value placed in nature, it is said that at the beginning, a very long time ago, gods, spirits, humans, animals and plants lived together and spoke the same language. This is the Kalash way of portraying the interrelation between humans, nature and the gods as co-dependent. The interconnection between humanity and the environment is expressed through the idea of an original common language shared by all.

Kalash polytheism is centered on ten central figures: their father-god Koda (Sajigor or Imra), a war-god Gish/ Guisch, Imra's messenger Moni, a fortune-god Bag(u)isht, the god of peace Arom, the rain-god S(o)uteram, the winegod Inthr, the grain-goddess Dizane who also protects men in battle, the fecundity goddess Nirmali who protects pregnant women, and the goddess Kshumay/Kshoumaï who presides over the fertility of the goats. Through the gods' essential identity with nature, Kalash polytheism suggests a form of pantheism in which everything is considered divine, and life is not understood as something separate from nature.

However, for the Kalash the sacred is understood vertically with a value scale that concerns each domain of life determined by the people's mountainous habitat. At the top are the gods who dwell in the sky. They are followed by the mountain's summit where the fairies live. It is these who intervene in human life and allow the shamans to predict the future. For instance, through dreams they indicate where the hunter will find game. Various tales concern the intercourse between fairies and human beings, and a person who displays strange behavior may be considered to have been born from a human-fairy union. The mountain's mid-regions are understood as an intermediary

domain in which the sacred and the profane are mixed. Women are forbidden, and possibly this is a more recent custom that develops from Muslim influence. Nevertheless, women are still respected; they have rights and are free, even though they appear to have lost their former status. It is in this more liminal region where men engage in hunting and erect altars for the gods. Finally, as the lowest level, valleys represent the impure world par excellence. Here are the places for cemeteries and menstrual houses. While husbandry is the men's preserve and occurs in the higher habitats, the agriculture of the valleys is more the concern of women and is comparatively depreciated. The subterranean regions associated with roots, graves and, further, underground caves represent pollution in contrast to the ethereal heavens, so that the deeper one goes into the Earth, the more impure a state of being is involved.

This conception also determines the nobility of animals and vegetables themselves. For instance, goats are considered more sacrosanct than cows as they graze farther in the heights. The Kalash refuse to eat eggs and beef because of their impurity. These criteria are equally applied to the houses: chimneys are the most sacred place in a house as they are constructed in a wall which is built against the mountain. Similarly, the roof is the most sacred place of the goatshed. While the Kalash celebrate a great number of festivals, the spring celebration of Joshi in May is the most important. This is a time when men can reach the top of the mountain, kept by fairies during the winter, and try to obtain their benevolence. The *dehar* or shamans are said to have taught this code to men during the Golden Age.

The mountaintop is also the final this-worldly destination of the post-mortem soul. From here, fairies raise a bridge so that a horse may take the soul across to live in a golden house. It is difficult to know when this myth originated and whether it was influenced by Islamic culture. It is, however, reminiscent of some European developments, for instance the myth of Asgard in German and Scandinavian mythology.

In the importance of sacrifice to the Kalash, nature often plays a significant role. The chief sacrifice for the gods is the goat. From among the natural register, two plants are particularly important: the juniper, which is the only easily combustible plant that grows in the mountains, and the oak, which is considered holy. The oak's persistence and presence in the heights links it with the gods. It is used in fumigation and purification rituals.

For the Kalash, nature is central to their relationship with the sacred. They read the signs and portents embedded within the landscape as if it were itself a divine book. Their concept of religion is that of an open contract, and every year each individual renews his or her engagement with the gods of nature during the winter solstice. This renewal is not prescribed through inherited dogma but constitutes a voluntary act through which the individual accepts a personal responsibility for the community's relationship with the divine. Among the more important characteristics of individual life is the person's social behavior, with one of life's aims being the development of a generosity that future generations will recall.

The Kalash, however, are today in danger. Apart from the inroads of Islam, which has already influenced their culture, myths and customs, the Kalash must also face modernism and its accompanying ecological imbalance. The future of this small community is uncertain.

Kaphirintiwa – The Place of Creation (Central Africa)

According to Chewa and Nyanja tradition from Malawi and Zambia:

High above the clouds lived God Chiuta (the Big Bow), the only High God. Down below, the Earth was dry and sterile as there was no rain.

God Namalenga (the Creator) gathered the clouds together and covered the sky. God Mphambe (the

Lightning) made a flare of fire in the sky and thunder roared in the mountains of Dzalanyama. The lightning hit the rocks and broke them into pieces. The wind and rain swept the mountain top leaving a clean and soft surface; stones rolled down the mountain and sat at its foot to witness God's power. Then God Chiuta lit the rainbow across the sky, touching the clouds. In the pouring rain, with the sky wide open, God himself came down with man and woman and all the animals. They descended at Kaphirintiwa. They stepped gently onto the soft surface and walked on the Earth for the first time. Later this surface hardened and became rock and their footprints were left on the stones as witness for the generations to come . . . Plants and trees grew big and strong and so was formed the dense thicket of bush of Kasitu, the sacred grove in which the mother shrine of the Chewa prospered (Boucher 2003; for other versions of this story see Werner 1906: 70–1; Ntara 1973: 8–9; Schoffeleers and

Roscoe 1985: 19–20).

Schoffeleers and Roscoe have argued that this is the most ancient of the central African creation stories. Subsequent writers have suggested that it may have been passed down to farmer communities from the autochthonous hunter-gatherers. This could indeed be the case as oral traditions state that there was an ancient hunter-gatherer settlement at Kaphirintiwa and surface archeological observations have confirmed this. Kaphirintiwa has therefore been a special sacred place for as far back into prehistory as we are able to see. The Kaphirintiwa creation myth is filled with symbolic messages and observations upon how the current social order came to be. Schoffeleers and Roscoe have discussed these meanings, while here I focus on the place of Kaphirintiwa itself.

The site of Kaphirintiwa is not simply a mythical place. It lies on top of the Dzalanyama mountain range near to the border of Malawi and Mozambique. Kaphirintiwa itself is just inside Mozambique. When approaching the site from Malawi, about two kilometres before Kaphirintiwa is a sacred forest with a sacred pool. This is known

as “the gateway.” Here offerings must be left and only those who meet the conditions necessary for visiting Kaphirintiwa may pass beyond this point. The traditional conditions are that one should not have washed, shaved or engaged in sexual relations for seven days before the visit (the period of time may have been longer in the past).

Proceeding beyond “the gateway” the landscape opens up to a long upward slope of undulating rock. At the top of this slope is a second sacred forest known as Kasitu. Tradition states that it was in this forest that the first great central African rain shrine was founded on the site of an ancient BaTwa settlement (the BaTwa were the former hunter-gathering Pygmy inhabitants of the region). The shrine is no longer maintained and its exact original location within the forest is now forgotten. What is known is that the shrine persisted here for many centuries before it was moved down the mountain to Msinja in the fourteenth or fifteenth century. As at Msinja, there is a sacred pool near to Kasitu. Today, a traditional custodian still looks after the place and it is not unusual in times of trouble for people to travel to Kasitu today to make offerings.

Immediately below Kasitu to the west, on the Mozambiquan side of the Dzalanyama range, is a flat platform of rock with a group of egg-shaped rock monoliths at its centre. This is the place where it is believed that God, all the living creatures and the first human couple fell to Earth in the great thunderstorm. The platform of rock is pitted with shallow holes and it is these features that are said to be the impressions made when all of the feet fell into the soft rock. These imprints are evoked in the name Kaphirintiwa, which is translated “the hill that leaves traces behind” by Ntara (1973: 8).

Kapu in Early Hawaiian Society

Hawaiians were aware of the breeding seasons and the biological diversity of the fauna of their islands. This required keen observational powers and ability to recognize the importance of what was seen. These observational powers may have grown out of necessity. There is evidence that the first Polynesian settlers in Hawai'i had a negative impact on the ecology and landscape of the islands. These perturbations included extinction, presumably by overhunting (impossible to verify since Hawaiians brought with them the dog and the Polynesian rat). Thus of 11 species of large flightless birds of the Family Anatidae (ducks) only one remains today. Although many forest birds used for feather cloaks have also gone extinct since 1848, (e.g., yellow and black mamu for feather capes, yellow and black o'o used for feathered cloaks) these did so only after the introduction of mosquitoes and avian malaria which continues to drive native bird declines in the islands today. Techniques to take feathers but leave the birds alive had been developed and used for decades if not centuries.

Still, it is under the scenario of natural resource decline and loss that the *ho'o kapu* and Kahuna systems are likely to have coevolved. The importance of *kapu* is seen in the meaning of the original Royal Hawaiian coat of arms, on which are two *kapu* signs; two *poloulou* or taboo sticks (white balls with staffs) and a triangular flag (*puela*) lying across two *alia* or spears which is a sign of tabu and protection.

By the late sixteenth century, burgeoning native population densities of the islands (between 500,000 and 800,000 depending on the model used) required innovation to feed their masses. The only way to avoid further biological extinction problems was to enhance dependence on agriculture, aquaculture, marine resources and placement of strong *kapu* on taking of those resources to stop over harvest.

The *kapu* system of prehistoric Hawaiian culture served as a control on action. The term has the dual meaning of taboo on the one hand and sacred on the other. It is likely that the *kapu* system of prohibitions taught by the Kahuna arose for reasons concerning control of the common people, a need to provide warning about attitudes or behaviors considered dangerous to health or society in general, and a need to control access to the natural resource base of economic and survival importance.

The Kahuna were priest educators, overseers of what was passed on to the next generation and innovators of new technologies when called for. The Kahuna system of prehistoric Hawai'i served as an educational and technical arm of the culture similar to how technical schools serve modern Western Society. Examples are seen in the Kahuna who taught canoe building, *hale* (house) building, navigation, and farming or fishing

techniques among others. Associated with each endeavor were specific gods to whom one had to pay tribute, thought and prayer.

The spiritual taboo on activities important to everyday survival of the people and the culture gives insight into the strictness and rigidity of thought, and the harsh environmental conditions that had to govern the minds, spirit and bodies of those who created it. The conservation of this thought would occur through time if encoded and passed on from one generation to the next in chants, dances and as a part of the spoken folklore. Because it worked well to protect the culture against actions by members that hurt the tribe at large (e.g., overharvesting of fish), and because the island microcosm as the known physical universe of the tribe could be just as unforgiving, such finality of thought and decision seems justified. Remote and isolated island systems afford no easy escape so a loss of the culture or a significant portion of it might take place if the *kapu* were not observed rigorously over time.

Agriculture and aquaculture required a system to pass techniques and technology to the next generation. To verbally codify this knowledge system into the religious order of the day and frame it within *kapu* restrictions ensured its survival. Linking daily activities to *kapu*-based systems could do this. Examples are seen with regard to activities that followed the 29½-day Hawaiian lunar calendar. Planting, fishing, harvesting and even cloth making and prayer were observed on strict schedules. Thus, pre-contact Hawaiian culture became highly structured, governed by strict religious customs that helped protect the natural and political environment. For example, some days were simply “off limits” (*kapu*) for fishing. Upon fear of death, dismemberment and scattering of one’s *iwi* (bones) preventing one from finding peace as a *kupuna* or revered ancestor of the family, one did not fish on *kapu* days at all. Some months were also *kapu*, fishing was avoided in April and May for specific species. Only eight of the days in any month would be considered good for fishing. An exception occurred during the *Makahiki* (the winter months celebration for the primary god *Lono* and the period when the Chiefs collected the tribute as a form of taxation) when fishing in general was avoided. These harvest restrictions occurred during spawning periods, enabling the resource to reproduce and replenish itself, providing a continual food source.

The Kahuna related this special knowledge to the gods and to natural elemental forces the gods controlled. Examples can be seen in the teaching of the daily and monthly *kapu* and maintaining the rituals, and in special dietary restrictions such as the *kapu* ‘*ohi*’*a*, which forbade eating from certain food patches during a famine (were these seed sources that needed protection?). Women were generally under many more *kapu* than men, including many food restrictions considered to be embodiments of the primary male gods Kane and Kanaloa (pig, most bananas (*kapu mai*’*a*), many fish, coconuts, most foods used sacrificially). Women could not enter *Heiau* (places of public ceremony) or even household shrines, could not participate in central religious practices, and could not prepare or grow *kalo* (taro). Many *kapu* were set aside during the *Makahiki* along with war, sailing on the ocean, making of cloth (*tapa*), drum playing,

and farming. Even the *kapu* of the lunar cycle were set aside, *heiau* were closed and religious services were suspended.

But the dual *kapu-kuhuna* system collapsed in the postcontact world after the discovery of the islands by Captain James Cook in 1779. The collapse was driven by the introduction of Western cultural ways, including Western religions proselytized by priests who did not appreciate the unique cultural function of either the Kahuna or the *kapu* systems. The Hawaiian people themselves may have come to distrust the *kapu* system when they noticed that the breaking of strict rules by foreigners had no apparent consequence. In addition, foreign gods seemed stronger since foreigners had better technologies, clothing and tools. The reliance on Western law grew to dominate the culture.

Today, Hawai'i struggles with the loss of the culture and the *kapu* system and what this loss has meant for Hawaiian marine and terrestrial resources. There is no replacement of the religious context in which Hawaiian resource use and conservation took place. The result is a disconnection between conservation of limited resources, the current system of Western-based laws, and the growth potential and anthropogenic impact of large human populations. This has resulted in the Hawaiian Islands becoming known as a "hotspot" in scientific circles for species loss. Fully 28 percent; of all United States Endangered Species Act listings occur in Hawai'i, which is now a microcosm of what is happening in the world.

Kasama Spirit Sites (Northern Zambia)

Kasama town sits on top of a low sandstone ridge a few hundred meters above the forested plains of northern Zambia. Immediately east and west of the town, along this ridge, are areas of massed boulders. In places these boulders are so massed that they form a labyrinth of small and winding passageways. The densest areas of rock each have a name and these names refer to a series of spirits who are believed to dwell in the rocks, in the water sources and unusual natural features in the area. The Bemba who live in this area today refer to these spirits collectively as *ngulu*. There are more than a dozen *ngulu* living within a thirty-kilometer radius of Kasama town.

Beliefs in general spirits of natural forces and ancestral spirits are almost universal amongst Bantu-speaking groups throughout central Africa, but the *ngulu* are somewhat different. As noted by Andrew Roberts, these are not forces of nature or spirits of dead people: rather they represent the land in which they have their abode. The unusual nature of these spirit creatures may reflect an ancient origin. The Bemba say that they found these spirits already living in the area when they arrived (probably some time in the first millennium). If this is correct then the beliefs may have been passed down from the autochthonous hunter-gatherers of the area: the Batwa (or Pygmies). Some support for this comes from the fact that this area has more Batwa rock art sites than the whole of the rest of central Africa taken together.

Whatever their origin, each *ngulu* has a particular site of residence. Where this is a rock, it is usually in a group of boulders with a dark crevice between them. People will visit these places to speak with the spirits and it is believed that the spirits often answer. The reason for visiting the spirit is usually to ascertain and overcome the reason for illnesses within the family or for misfortunes. There is a hierarchy to the spirits, with some recognized as more powerful than others. The less powerful spirits, such as Mwankole, Sumina, Chama and Kaponyansuli can be approached with little preparation, but, to approach the more powerful ones such as Mwela, Changa and Mulenga (and formerly Chishimba), extensive preparations are needed. Traditional preparations include not shaving, not washing and abstaining from sex for a period of a week before the visit.

When visiting an *ngulu* people traditionally wear white cloth and bring white gifts such as flour, traditional beer, white beads and white clay called *mpemba*. Sometimes a white chicken will also be slaughtered. The descriptions of what happens when one

consults with an *ngulu* vary from person to person. Many people describe how, when they approach those *ngulu* who dwell in the rocks, the rocks will open up and they go inside and speak with the spirit. Sometimes people say that the *ngulu* appears in the form of an animal, bird or lizard. The python and other large snakes are among the most common forms described. All agree that particular *ngulu* do not stick to one form, each can take a variety of forms. Sometimes only the voice of the *ngulu* is heard. On other occasions *ngulu* may fail to appear at all.

The power of the *ngulu* is believed to extend beyond its place of residence. People are sometimes spoken to by the *ngulu* in dreams and, on rare occasions, people may be possessed by the *ngulu*. This reaching out of the power of the spirit is particularly true of the strongest spirits such as Changa. Today people continue to come from many hundred of kilometers away to give offerings to and to consult with the spirits around Kasama. One particular spirit, Mwankole, has become a place of pilgrimage for those afflicted with AIDS. In the mid-1990s a former Minister of Tourism was possessed by Mwankole and, following tradition, he went to the dwelling place of the spirit, cleaned it, and built a small grass-roofed structure in the site. Under this structure he placed a range of offerings to spirits. Sometimes such offerings will appease the spirit and the possession will end. At other times, as in this case, the possession leads to death.

As well as the personal interactions with the *ngulu* there is (or was) also a formal curatorial structure for the Kasama spirits. Each *ngulu* had a keeper who looked after its dwelling places, sweeping the area clean and so on. Only a few *ngulu* have keepers today. These local custodians fell under a spirit priest with the title of Kamima. Kamima was a key spiritual adviser to the Bemba paramount chief Chitimukulu. The position was inherited according to the matrilineal principle, and the village of the Kamimas is known even today by the name of the title. Kamima was charged with looking after all the *ngulu* and, before the rains each year, he had to conduct rituals at each spirit site in order of importance, culminating at Changa. The last time that these ceremonies were performed in their traditional manner was in the 1950s. Today the Kamima performs rituals only in times of particular need, or if requested by the Chitimukulu.

Kawabata, Yasunari (1899–1972)

Kawabata Yasunari was a Japanese novelist, short-story writer, literary critic, and aesthetic theorist. His youth was filled with loneliness and death. Both parents died when he was young, then the grandmother he lived with passed away, as did his sister, leaving him with his blind grandfather. At first he wanted to become a painter, but in school he studied Western and Japanese literature. His early story *Izu Dancer* (1927) was highly regarded, and *Snow Country*, his most celebrated book, was published in 1938 (and revised ten years later). In 1968, he became the first Japanese writer to win the Nobel Prize for literature. Four years later he died of an apparent suicide.

Kawabata's novels are distinctive in many ways.

Perhaps more than any other Japanese writer, he fused traditional Japanese aesthetics with a modern sensibility of alienation, ennui, and even depravity. His works display an exquisite sensibility to both nature's beauty and its spiritual dimension. His descriptions of the natural world are highly sensual, detailed, and realistic, yet they also have an ethereal character that suggests a deeper dimension: a metaphysical immensity and stillness that encompasses the human drama and elicits yearning and inexplicable sorrow. Much of the rich meaning in his novels is found in the mood and atmosphere evoked (as in the classical *no* drama) as much as the plot or characters. Commentators often note that the characters in his novels tend to merge with nature. At the same time, the characters often remain distant from each other, suggesting paradoxically both the failings of modern relationships and an ideal of a pure love heightened by yearning and unsullied by physical consummation. Indeed, one of his central themes is purity. But perhaps most of all, his writings are characterized by the joining of beauty and sadness (the title of one of his novels), both in his depictions of love and his aesthetic metaphysics.

In his Nobel Prize acceptance speech, *Japan, the Beautiful, and Myself*, Kawabata offered insight into his own aesthetics by commenting on qualities of classical Japanese literature and art. He praised the *Shinkokinshu*, the great thirteenth-century poetry collection, for its "elements of the mysterious, the suggestive, the evocative and inferential, elements of sensuous fantasy that have something in common with modern symbolist poetry" (1969: 44), words that astutely describe his own novels. This aesthetic is closely related to the ideal of *yu gen* ("mystery and depth"). Originally a Chinese Daoist term for the essential color of the universe (deep purple), it suggests the subtle and melancholy beauty of a reality that exceeds our grasp. This metaphysical dimension is not a separate realm: the natural world of form and color is never

negated or transcended but rather is enriched by a deeper reality to which it is always connected (similar to the Daoist notion of non-being).

In his Nobel speech, Kawabata extolled the classical aesthetic of *mono-no-aware*, a tranquil sorrow at the transience of what is beautiful and fragile, a sentiment found in his own works. He also pointed to the asymmetrical aesthetic of Japanese gardens as an art form that can suggest the vastness of nature. So too, the small, spare room used for the tea ceremony evokes limitless space, as well as the austere elegance of *wabi*. Throughout the speech, Kawabata also highlighted the significance of Zen Buddhism to traditional Japanese aesthetics and to his own.

His metaphysics of nature is seen in the famous opening scene of *Snow Country*, in which the protagonist, Shimamura, is startled to see the eye of a beautiful woman reflected in the window. Her eye merges with the mountainous background “into a sort of symbolic world . . .” (1956: 15). The train moves through a long, dark tunnel into that world as “the depths of night turned white with snow.” Whiteness, the traditional Shinto color for the ideal of purity, permeates the novel and is significant in part because “White is the cleanest of colors, it contains in itself all the other colors” (1969: 51). At one point the purity of white is set off against the color of *yu-gen*, displaying Kawabata’s ability to evoke simultaneously the erotic and the metaphysical: “The brightness of the snow was more intense, its seemed to be burning icily. Against it, the woman’s hair became a clearer black, touched with a purple sheen” (1956: 48).

Kawabata’s sense of the beauty of nature, the intimate relationship of humans to nature’s metaphysical dimension, and his use of classical literature are revealed in the final scene of *Snow Country*. A building is in flames amid the night snow. As the sparks rise to the sky, Shimamura gazes at the “terrible voluptuousness” (1956: 134) of the River of Heaven (the Milky Way), which the poet Bashō had made famous in a haiku. From the building, Shimamura’s lover Komako carries out another beauty who had entranced Shimamura from a distance. At that moment, “his head fell back, and the Milky Way flowed down inside him with a roar” (1956: 142).

Keepers of Lake Eyre (South Australia)

The Keepers of Lake Eyre (KOLE) are an intercultural collective maintaining an anti-uranium protest enclave at Lake Eyre in the South Australian desert. Part of a reenchantment-seeking radical ecology movement, KOLE members are generally young eco-pilgrims committed to the rights of Aboriginal peoples and the natural environment. Acting under the authority of inspirational Arabunna elder “Uncle” Kevin Buzzacott, their enclave (otherwise known as the Arabunna Coming Home Camp) is situated 180 kilometers north of Roxby Downs where Western Mining Co (WMC) work one of the world’s largest copper/uranium deposits. KOLE oppose WMC’s operation which constitutes a major threat to both arid lands ecology and Aboriginal culture in the Lake Eyre region. WMC’s growing demands on underground water sources in one of the driest regions on the planet has had a devastating impact on Aboriginal peoples (especially Arabunna and Kokatha) since such sources feed the precious springs around the Lake Eyre region essential for their cultural survival.

In 1997, the South Australian government handed WMC control of Aboriginal Heritage (sacred sites) over 1.5 million hectares of the state – in a region (Billa Kalina – the area between Coober Pedy, Maree and Woomera) already suffering the consequences of experiments conducted at the start of the nuclear era (atomic weapons testing in the 1950s), and sited to become a nuclear dumping ground (the planned national radioactive waste dump). Buzzacott’s Going Home camp was established on 26 March 1999 to coincide with the official opening of WMC’s Olympic Dam Expansion Project – a project licensed to draw up to 42 million litres of water per day from the Great Artesian Basin.

Water, bored by WMC to mine and mill uranium, lies at the heart of the matter. According to the KOLE website (www.lakeeyre.green.net.au):

Arabunna tell of a time, not long ago, when the springs flowed strong and there was enough water for everyone. Now the Land is getting drier and drier, the Kangaroos and Emus are scarce, there are fewer Custodians than ever and the Sacred Springs are dying, some have already gone.

As for Buzzacott, Lake Eyre “is hurting and it’s calling

. . . If you feel strong in spirit to save the Old Lake then be there. We invite you to come with your strong spirit.” Responding to the call, hundreds of inspired activists bestowed with the title “Keepers of Lake Eyre,” have gravitated to the region

surrounding the vast inland salt lake. KOLE formed in Adelaide in early 1999. Again, their web-site states that Keepers are “very recent additions to a long line of Custodians and Protectors of Lake Eyre,” and that their goal is to “support and further the upkeep of Arabunna Law [which] demands the protection of Arabunna Country, Culture, Spirituality and People.” Furthermore, Keepers are said actively to perform “the responsibilities we all have for Mother Earth and her life giving resources.”

Under the authority of Arabunna elders, proactive non-Aboriginal “custodians” are thus educated about the culturally significant Mound Springs, engaging in activities – blockades, vigils, fund raisers and educational workshops – through which their identification with, and attachment to, this threatened region is enacted. Through their rites and communities of protest, they commit to defending country that they have come to know and experience as sacred.

As an intriguing dimension to this story, the sacrality attributed to the region by inhabitants from diverse backgrounds, is extended to uranium itself – a reality reminiscent of other sites of environmentalist/Aboriginal solidarity, such as that which transpired at the now stalled Jabiluka project in Kakadu National Park opposed by the Mirrar. In these cases, far from being evil or malign, uranium is considered sacred – which is true so far as it remains untouched, “pure.” In such circumstances dialogue occurs between local mining, beleaguered indigenes attempting to maintain obligations toward country, and non-indigenous environmentalists who believe that unearthing uranium constitutes the violation of an environmental taboo. For both, uranium’s unearthing is dangerous – amounting to *deseccration*. Possessing a mixture of science and Aboriginal religion, they hold the view that uranium should not be tampered with, it must “stay in the ground” – its disturbance, removal and milling presaging disaster, sickness and ruin.

KOLE is one of many new intercultural alliances evidencing post-colonialist sensibilities in Australia. With their proactive ecologism effected under indigenous cultural and religious authority, the political and spiritual dimensions of their opposition to existing practices are inseparable. For non-indigenes, a level of custodianship is conferred. Activist Rufus describes his experience at the camp in 1999:

Every day we would sit around the fire and Uncle Kev would describe his vision of the future, or what he thinks are the steps we need to take to create the future that we want to live in. His ideas were progressive in the sense that anyone who comes out here to this bit of land and feels the spirit of the old lake and dances on the land, they’re welcome. And you feel the call to defend it (Interview with the author, May 2000).

Dwelling beside the Lake on and off since its inception, doing “whatever it takes to look after the land,” young environmentalists Marc and Izzy have become “Keepers of Lake Eyre.” According to “Uncle Kevin,” says Marc,

Lake Eyre is calling, and it’s calling us back. The old spirits are calling us to come and protect the country and look after the country. So we need to be there to make sure nobody comes in and stuffs up the country. So basically we sit on our hill that

overlooks Lake Eyre. We keep an eye on Lake Eyre (Interview with the author, May 2000).

Such activists have come to identify closely with threatened nature – establishing, through ethical action, a legitimate right to belong.

Kenya Green Belt Movement

The Green Belt Movement (GBM) is an innovative, community-based, development and environmental organization with a focus on community mobilization and empowerment for sustainable development and especially for environmental conservation. The movement seeks to improve the livelihoods of communities, alleviate poverty, and promote the rights of women, and it has done so by focusing especially on tree planting and environmental conservation. Professor Wangari Maathai founded the GBM in 1977. Her work and the movement received international acclaim when in 2004, at the age of sixty-four, she was awarded the Nobel Peace Prize.

Maathai initiated the movement under the auspices of the National Council of Women of Kenya, where she interacted much with rural women. During these interactions she realized that women were faced with a problem of insufficient fuel wood after years of woodland destruction to pave the way for cash-crop farming. It was therefore easy to craft together Green Belt Movement and work with rural women on a project that addressed their immediate need for fuel wood.

After 25 years of working with the Green Belt Movement, the founder/coordinator of the movement, Professor Wangari Maathai, was elected to parliament after the December 2002 elections. She was then appointed Assistant Minister for Environment, Natural Resources and Wildlife. The renowned environmentalist has gained world acclaim through her selfless contribution to local, national and global issues on environmental concern. She has been working very closely with other global greens and by the time of her appointment to the government, she was (and still is) a member of Mazingira Green Party which she helped to found. The Green Belt Movement is currently nurturing the Society of Greens project, through which it is working hard to capture the prevailing environmental awareness in Kenya.

The primary energy behind the movement is rural women, who work to save and protect their immediate natural environment and especially biological diversity of plants and animals threatened with extinction. Although women are the main driving force, men and children are also involved in the planting and caring of trees, especially on school compounds. Even then, men plant trees more as an economic investment for the future, while women and children plant trees to meet the currently felt needs of communities. These needs include wood-fuel, fencing and building materials, fruits for better health – especially for children – shade and aesthetic beauty. Traditionally, trees and nature in general were highly valued in African religion. In my community, with which I am very familiar, use of biodiversity was a specialized discipline where men and women had distinct relationships with all the various life forms. For instance,

when building or fencing, branches of trees or coppices of coppicing trees were cut by men, but not the whole tree. Women would only collect dead dry wood for firewood. *Ficus* spp. is especially valued for spiritual purposes and would not be cut down under whatever circumstances. A variety of other species were regarded as peace trees and therefore conserved for these purposes. Parts of these trees would be used in peace building, especially during tribal or clan conflicts.

Unfortunately, these cultural environmental ideals were lost during the colonial period when traditional religion was effectively phased out and replaced with the conventional religions. Most Kenyans today are Christians, and members of the GBM constituency are almost 100 percent Christian. It is for this reason that GBM uses the biblical story of creation to reach out to the hearts of communities and show them that God, after all, created human beings after all the other members of the living and non-living community because human beings could not survive without them. All vegetation, animals and birds, waters and the atmosphere can do very well without human beings. But human beings cannot live without each of these. This approach helps in enabling people to understand that even though the Bible says that human beings were given *dominion* over the rest of the creation, they must be disciplined in using the resources they have been endowed with since their eventual exhaustion means eventual death to human beings. And this effectively prepares people for a change in mindset from dominion to stewardship of God's creation. This again introduces a new jurisprudence where human beings consider themselves as co-creations of God with vegetation, animals and birds, and relearn to accord them due respect. This new jurisprudence is rooted in the indigenous way of life where people respected nature and viewed themselves as part of the greater whole of the universe. They controlled the way they extracted resources from their immediate environment and had their way of life (including spirituality) woven closely together with the environment. Although global warming is not a well-known issue or motivation among the rural women, trees also contribute as a carbon sink for greenhouse gases.

The religious teaching of the Green Belt Movement is informed by the fact that close to 90 percent of Kenyans are Christians, these having closed their eyes to their culture and embraced Christian spirituality completely. The dominant Catholic, Anglican and Presbyterian denominations are promisingly receptive to the teachings on environment and actually preach this in their churches. They also encourage their adherents to participate in activities that heal the Earth like planting trees in church compounds and on their farms. However, there has been marked indifference in some of the evangelical churches, who view the Green Belt Movement as controversial because it encourages people to think about the Earth as they think about heaven! Again this attitude is slowly waning as people are confronted by the harsh ecological realities of their actions embodied in constant droughts and famines, floods and landslides. All of these calamities are contributing to much destruction and loss of life.

GBM Approach to Development

The community-based approach of GBM enables it to address all people in the community, and in that way development efforts become a truly communal effort. Project implementation is done in close partnership with communities, which are provided with the financial and training back-up they need to improve their capacity. GBM also monitors, evaluates and reports on the progress of the project to donors and friends. Members of local communities provide labor, local expertise, knowledge and follow-up, which are valuable aspects of community involvement in project management. Communities are also partly responsible for the sustainability of projects.

Vision and Mission

The vision of the Green Belt Movement is to create a value-driven society of grassroots people who consciously work for continued improvement of their livelihoods. The mission is to mobilize community consciousness for self-determination, equity, justice, environmental conservation and improved livelihood securities (food, shelter, education, health, employment, and human rights), using both civic and environmental education and tree-planting projects as the entry point.

One of the unique attributes of the Green Belt Movement is that it is a value-driven organization committed to the principles and values of sound environmental management. Such values are well articulated by the Earth Charter, which resulted from the efforts of many sectors of civil society in the years after the United Nations “Earth Summit” in Rio de Janeiro in 1992. Many of the principles of the Earth Charter reflect the values and ethical philosophy of GBM. That is partly why GBM was happy to accept an invitation to promote the Charter in the African region. The values of GBM include: working to achieve accountability, integrity, commitment, transparency, reverence for life, and intergenerational responsibility. Others are the spirit of volunteerism and service to the common good, a deep desire for self-fulfillment and dignity, and a love for a greener, cleaner environment. Through its educational seminars, the organization also encourages a strong motivation for self-betterment, a thirst for self-knowledge and self-empowerment, and a desire to improve oneself. Other values include a personal commitment and dedication to serve communities. These values are not new; they are also shared by many organizations committed to development and societal transformation.

Core Projects

To achieve its vision and mission, GBM developed a program that incorporates Four Core Projects:

Tree planting on public lands

The objective of this project is to inculcate, within community members, the culture of planting trees as well as protecting local biological diversity of plants and animals and commonly owned resources such as forests, green open spaces, riparian and road reserves, wildlife and sites of cultural significance.

Promotion of food security at household level

The objective of this project is to assist communities in analyzing and understanding the threats to their food security as well as learning and practicing simple agricultural techniques. This would enable them to consistently provide adequate farm-sourced food of high nutrient value and variety to their households. The project aims at enhancing farmers' knowledge of local biodiversity, indigenous dietary principles, indigenous crops and their role in food security, organic farming and other techniques for improving productivity and food processing.

Advocacy and networking

The objective of this project is twofold. First, to bring actions of poor governance and abuse of the environment into the national and international limelight; secondly, to rally resistance against such anti-environmental actions and thereby stop violation of environmental rights. There is a strong synergy between advocacy and civic and environmental education, and therefore GBM adopts an integrated approach in the implementation of the two projects. When individuals and communities understand the causes and consequences of injustices (through civic and environmental education) they are driven to advocate a more equitable order – be it social, economic or political. Advocacy and networking is done both at the local and international levels. Within Africa, a Pan African Green Network has been formed, partly to promote green consciousness in the region. GBM has reached 36 organizations in 15 African countries where it is hoped that a strong environmental movement will eventually emerge, especially in Eastern and the Horn of Africa regions.

Civic and environmental education

The objective of this project is to raise awareness concerning primary environmental care so as to enhance knowledge, attitudes and values that support sustainable grassroots socio-economic and ecological welfare. The aim is to make people more responsible in matters affecting their livelihoods as well as those of the wider community. The course emphasizes the responsibility of the current generation to those in the future, the need for a self-regulatory jurisprudence and the principles articulated in the Earth Charter. This project also attempts to show the connection between culture and spirituality and environmental conservation.

Successes

The GBM has empowered local communities to implement activities such as mass action events to protest destruction of forests, privatization of open public green spaces in urban centers and the destruction of watershed areas. GBM has recorded much suc-

cess in advocacy work, especially in saving public open lands including Karura Forest, Uhuru Park, Gevanjee Gardens and Kamukunji grounds in Kenya. Local green belt womens' groups have also saved many local open spaces in the rural areas. GBM's persistent and consistent advocacy work partly contributed to the government's decision to introduce an Environment Management and Coordination Act (1999), which is a new law to protect the environment. A Forest Bill has been drafted and a Land Commission, which has finished its report and handed it over to the president, was established to look into Kenyan land laws and make recommendations.

At the end of 1998, GBM commenced an organizational development process and produced a strategic plan

(2000–2002). With that, Phase I (1977–1999) was closed. Phase I had facilitated the establishment of 6000 women tree nursery groups throughout the country, especially among farming communities. The groups mobilized over 100,000 rural women, who in turn mobilized their communities to plant trees, especially on their farms.

One of the major achievements of GBM in Phase I was mass planting of twenty million trees. Other achievements include the fact that many women no longer need to walk long distances to collect firewood since it is now produced on their own farms. Some women have also adopted energy-saving cook-stoves to promote family health and energy conservation. Such technologies particularly reduce respiratory tract diseases. The planting of many fruit trees has contributed to the betterment of nutrition and health, especially among children. Therefore, a firm foundation has been laid on which GBM will further achieve community development. For their extension work during Phase II, women will continue to be financially compensated by GBM, but this will be done through purchase of seedlings surviving after transplanting on public lands. This will generate some income for the women extension workers.

Conservation of Local Indigenous Biodiversity: The Current Focus

GBM decided to focus on planting of trees on public lands because these can easily be conserved to become *in situ* seed and gene banks. Also, the GBM emphasizes the benefits of conservation of biological diversity and effective carbon sinks. Since much of the local biological diversity is on public lands such as forests, local hills, riverbeds, highways, etc., it becomes necessary to educate the public that, contrary to popular opinion (influenced by system of governance), public lands, and the biological diversity in them, are a common heritage. These resources should therefore be protected and conserved and not allowed to be extracted or privatized by greedy and corrupt individuals at the expense of the common good of communities and future generations. To address the threat of lost biological diversity, soil erosion and seeds of food crops, GBM has encouraged women groups to form community networks, which are a culmi-

nation of many years of training and empowering communities, to take charge of their environment and their livelihoods. The networks represent a unique way of empowering communities so that they can protect forests and sources of biological diversity near them, collectively. Training of these networks has encouraged many communities to get involved in the protection of sites of interest near them, such as sacred forests, watersheds, catchment areas, indigenous food crops and wildlife. Kaya Forests on the Kenyan coast are one example of such sacred forests. The local people protect the forests with the assistance of the government, but the essential principles underlying the protection bid are cultural/spiritual. The local people still practice their spiritual and other cultural activities in the forests and these form the basis of the protection of the forests. Besides these networks, GBM also trains local leaders like the clergy (mainly from the Anglican and Presbyterian churches), progressive farmers, and teachers, so that they can work alongside the women networks. Activities of these networks also contribute toward poverty reduction, especially since poverty has become both a symptom and a cause of environmental degradation.

During Phase I, and despite GBM's persistent appeal to plant indigenous trees, plants and food crops, many farmers opted for exotic species of trees. This was because they perceived indigenous trees as having a disadvantage of delayed material benefits, due to slow growth. Communities also felt that some indigenous trees create large canopies that take up too much arable space on farms. Besides, farmers felt that indigenous trees are not as easily commercialized as the exotic trees introduced during the colonial era for quick commercial exploitation. Even then, this disadvantage is compensated by the value of the rich biological diversity, which indigenous species encourage under their canopy. Therefore, indigenous trees have a higher environmental conservation benefit. GBM continues to concentrate on planting them on public lands.

GBM has a great capacity to mobilize large numbers of community members to work for the environment on a voluntary basis, and indeed it is impossible to compensate women groups for all the extension work that they do. But much of that work is done through the spirit of volunteerism by the networks and tree nursery groups. In mobilizing thousands of people in the rural areas, GBM commits a lot of energy to environmental conservation and improvement of livelihoods.

Each network is being encouraged to establish a Community Environment Fund (CEF), which will sponsor environmental activities. Activities will include the local demonstration center, renewable energy-saving technologies, purchase of seeds and vegetative stocks, exchange visits, farm work and provision of water and other inputs. The network would also be able to facilitate training and exchange of information and advice among other actors. The CEF could also serve as a source of capital for innovative economic initiatives started by the members of the network. This would be cheaper than bank loans, which are often inaccessible to women and the poor without collaterals.

Conclusion

Individuals and communities can change their world by the little they can do to contribute to the greater whole. Green Belt Movement was recognized as a case of good practice in Johannesburg during the United Nation's 2002 World Summit on Sustainable Development. Through the film, *A Quiet Revolution*, the work of the

Green Belt Movement was further acknowledged, along with other initiatives in the world, for its capacity to mobilize the masses and their human resources to focus on changing their world for the better. In the decades to come the profile and influence of Wangari Maathai and the Green Belt model will certainly grow and spread even more widely as a result of the international attention brought on by the Nobel Peace Prize.

Khoisan Religion

The Khoisan peoples of southern Africa are click language-speaking foragers and herders, who have been in the region and have interacted with each other culturally and genetically for thousands of years. As a result, any clear ethnic, cultural or linguistic distinctions between the two groupings that comprise them – the hunting-gathering band-organized Bushmen (or San) and the cattle-keeping, clan-organized Khoekhoe (or “Hottentots” as they used to be called, pejoratively) – have become difficult to draw. A number of the Bushman groups speak either Khoe or Khoe-derived languages, such as the Hai//om of Namibia, who speak Nama (a Khoe language), or the Nharo (Naro) of Botswana, whose San language has pervasive Nama influences. A number of historical Khoekhoe groups of the Cape, who have now all disappeared, lost their cattle through ecological and political pressures and assumed a hunting-gathering economy and mode of production. Conversely, some Bushman groups of northern Namibia and Angola have acquired cattle. In the past, San also used to work as servants and herders for cattle-keeping Khoekhoe.

Religion is one of the cultural domains of the Khoisan peoples that reveals how closely interrelated the San and Khoekhoe have become over the course of their long-standing association. Here similarities and convergences outnumber differences, the latter reflective, in significant ways, of the two diverse socio-economic patterns of the herders and foragers. Thus, Khoekhoe ritual and myth include a concern with cattle; for instance, myths tell of how cattle were acquired by the Khoe people’s ancestors (and lost to the Bushmen) and fresh cattle dung was used in death purification ceremonies by the Nama (who had a strong concern with taboos and ritual danger). Khoekhoe myths also tell of early chiefs and warring clans, a theme absent from Bushman myth and belief wherein the concern is more with game animals and ritual aspects of hunting. The large, meat-rich game animals, the eland, gemsbok or giraffe, are the animals that are most prominent in San rock paintings and they stand at the symbolic and ritual center of the initiation ceremonies of numerous Bushman groups, as well as the trance-curing dance, as the source of n/om (the healing potency employed by the shaman-curer).

Despite such divergences in content and emphasis, however, the two people share one religious system. This is evident, more than anywhere else, in the two groups’ supernatural beliefs and in their myths and folklore, which, in her recent comprehensive catalogue of Khoisan folktales, the German folklorist Sigrid Schmidt treats as one oral tradition. The preeminent figure on the Khoisan mythological landscape is the trickster, who may be a human-like being – such as Haiseb (or Haitsi-aibib) of the

Nama or Paté of the Nharo – or he may bear the traits of an animal. He may assume these either sporadically, when he transforms himself into an animal – for instance, into a mantis, such as Kaggen (Cagn) of the /Xam – or his animalian traits may be a permanent aspect of his being, such as the pan-Khoisan Jackal, who is especially prominent in Khoe folklore. The Khoisan trickster was an ambiguous blend of mischievous or evil prankster, culture hero, protector and even god. In the last capacity he stood opposed to the Khoisan-wide creator god, whom the Nama called Tsui-//goab (“Wounded Knee”) and the Nharo N!adi (or Hise) and for whom the !Kung had as many as eight different names, each associated with different attributes. He is associated with the sky and the rain and, according to a widespread traditional Khoisan belief, his “village in the sky” is the destination of the souls of the dead.

The principal protagonists of the trickster were the people of the mythological past, who were either the early humans or animals with human traits and capabilities. They were beset by such social problems and moral shortcomings as food, greed, marital strife and in-law tensions. These converged in the widespread “woman-as-meat” story plot, that is, of a man coming to realize that his wife is a game antelope – that he has “married meat” – and subsequently killing and eating her for her meat, with the collusion of his relatives. This Khoisan-wide story is an expression of the symbolic equivalence of hunting with sex and marriage. The moon and other stellar bodies were frequently personified in Khoisan myths and were mystically charged, and the portentous story of the angry moon, who punished the hare-child for disbelieving and distorting the moon’s message to humankind of immortality, is one of the key myths in Khoisan mythology. Another shared story myth motif, and the basis for elaborate and especially melodramatic and frightful tales, is cannibalistic ogres threatening, chasing, killing and devouring humans, especially maidens.

In the sphere of ritual, male and female initiation rites are found among all of the Khoisan groups, although the degree to which they are ritually elaborated varies, with Khoekhoe favoring the male rite, through greater ritual elaboration, and Bushman groups favoring the female one. (Again, we may perhaps explain this difference in economic terms, as herding and foraging are economic patterns in which men and women, respectively, play the more prominent roles.) While the trance-curing dance appears to be exclusive to the Bushmen, its basic ritual and mystical modus operandi, of calling on the aid of the spirits of the dead, is pan-Khoisan. So is the transformation of spirits and humans into animals, a trait that is especially well developed in Bushman ritual and belief (and reflective of their closeness and their spiritual attunement, as hunters, to animals).

Commonality of the Khoisan religious tradition is evident also when one compares it to that of their Bantuspeaking neighbors. Here one notes two striking differences: the absence, in Khoisan religion, of witchcraft and sorcery beliefs and practices, and of any forms of ancestor worship; indeed, instead of worship, what one finds is an attitude of wariness or aversion toward dead persons, and proscriptions about uttering their names. Also absent are totemistic beliefs, which are found among some Bantuspeaking

peoples (for instance, the various Tswana tribes, neighbors to many Kalahari Bushman groups).

We should note, however, that some Bushman groups have adopted one or another of these elements of Bantu ritual and mythology, and the Nama-speaking peoples today, despite having retained their myths and tales and many beliefs, are all Christians (and have been for many generations). This reveals a basic structural element of Khoisan religion, resilience and adaptability, along with a certain lack of orthodoxy and tolerance of other beliefs. These traits are consistent with the structural qualities of flexibility, openness and resilience, which Khoisan – especially Bushman – societies have displayed for centuries and millennia.

Kimbanguism (Central Africa)

Kimbanguism originated in the Democratic Republic of the Congo (formerly Zaire), and has now spread to many countries in Africa and beyond. The movement takes its name from the founder Simon Kimbangu who was born in 1889 at N’Kamba, a small and isolated village in the Lower Congo, some 200 miles from the capital Kinshasa. He grew up in a church founded by the British Baptist Missionary Society. But in 1918 Kimbangu believed he received a call from God to go and look after his people, for God was telling him that the Europeans had been unfaithful to the call of Christ. On 6 April 1921 Kimbangu began his ministry of healing, and extraordinary scenes followed, with vast numbers flocking to N’Kamba to hear his message and to be healed. Kimbangu healed in the name of Jesus Christ, and stood up against local sorcerers. But the large numbers pouring into N’Kamba were too much for the Belgian colonial power, which feared a political uprising. A state of emergency was declared and in September 1921 Kimbangu was arrested, flogged, and sent into exile in Lubumbashi: 1500 miles from his home. He died in solitary confinement on 12 October 1951. The persecution of Kimbanguists was severe, but through trials and tribulations their following grew. The movement is now officially known as The Church of Jesus Christ on Earth through his Special Envoy Simon Kimbangu and is a member of the World Council of Churches.

According to his followers, Simon Kimbangu taught a very close respect for nature. Independent witnesses tell a variety of stories which substantiate this claim, and provide evidence that Simon Kimbangu’s approach was distinctive. Kimbangu stressed that human beings are themselves a part of nature. Flora and fauna are a part of the environment to which humans belong. As such, a special respect for nature is required. Animals are seen as close neighbors whilst plants are to be used with due deference. The indiscriminate destruction of the natural environment is not permitted.

Nowhere is Kimbangu’s own attitude to nature more clearly seen than in his teachings on the primate cousins of human beings. Kimbangu strictly forbade any of his followers from killing or eating other primates. The reasons he gave for this edict, which remain strictly enforced among his followers to this day, are instructive, and, while we must always guard against the dangers of anachronism, they mark him as a prophet in the area of primate conservation. Kimbangu used several arguments to support his claim that primates are our cousins. In the first place, he taught that we share a common ancestry with other primates. To kill a primate is to kill a cousin and such an act would be intolerable: indeed tantamount to murder. Second, Kimbangu pointed to the way that, when left to fend for ourselves in the forest, we mimic the

activities of our primate cousins. We are forced in survival to forage like them: indeed to become as them. This demonstrates, said Kimbangu, our commonality. Thirdly, he said that nowhere is the human-like quality of the primate world seen more clearly than when human beings, in their sinful activity, point a rifle at primates. For when this happens, primates look the hunter in the eyes, cower, bow down, and whimper in distress. They act, in other words, as humans. Fourth, Kimbangu taught that it is part of God's plan to unify humans and animals. One day we will lie down with the lion in peace, and this cautions us against treating nature as a servant instead of cousin. For all these reasons, Kimbangu strictly forbade the killing of primates. It is particularly interesting to note a predominantly nature-based, rather than theological, reasoning of Kimbangu in this regard. In a region well known for its eating of primate meat, Simon Kimbangu's teaching is all the more remarkable, and the taboo extends into the life of his estimated ten million followers today. Kimbanguists today are found in central west Africa, as well as Kenya, in the United States, and in the United Kingdom, Belgium, and France.

If the teaching and practice of Kimbanguists toward primates is unusual and instructive, then further examples of their positive attitude to nature can be seen. The holy mountain of N'kamba in the Belgian Congo is an example, seen elsewhere in African religions, of the importance of sacred place. Shortly after Kimbangu's death in 1951, his followers began constructing a temple on the site where his ministry had begun. The 37,000-capacity temple that now stands on the holy mountain was built with the help of ordinary believers, many of whom literally carried rocks and stones several kilometers to the site. At the same time as the building program, Kimbanguist followers went to strenuous efforts to maintain the environmental surrounds of the village. A number of sacred trees, important sites in Kimbangu's own ministry, and sacred groves, were preserved. And while there is an element of subjectivity in such remarks, N'kamba is a remarkable place: quiet and peaceful, full of lush trees, and a gentle breeze. Small wonder then that Kimbanguists themselves today proudly call the village "N'kamba New-Jerusalem." The village receives large numbers of visitors. Many of them go to bathe in a site where they believe there is holy water: and both this water, and the very soil from N'Kamba, is taken elsewhere for healing. This material dimension is thus an important theme of the movement. The whole site of N'kamba is seen as holy ground by the Kimbanguists and, as such, shoes are always removed around the village complex: a sign of respect not only for the prophet and his God, but also for the very land on which he and his followers walked. In this Kimbanguists mirror some traditional African religious attitudes to nature in which land and belief were inextricably linked. The fact that such an approach is now cause for some wonderment is testament to the severe environmental crisis now reaching Africa.

Another example of the close relationship of Kimbanguists to nature can be seen in their headquarters in Kinshasa. In the compound humans move alongside animals in a curious harmony: a stark contrast to the huge, bustling, and now pollution-ridden city of Kinshasa. A crane lives in the compound, for no other apparent reason than

that it looks beautiful and is an animal cousin. Other animals fare likewise. There are ponds with fish, which are regularly fed and which, it seems, are only used as a supply of food if necessary. A sermon preached by one of Kimbangu's sons, Papa Diangenda Kuntima, extolled the virtues of looking after animals. One day, stopping at a pond at the headquarters in Kinshasa, he began to throw bread into the pond to the fish, saying how important it was to feed and preserve the livelihood of fish and other creatures. Such attitudes are most unusual in modern Africa, particularly so in a country which has seen much of its population on the edge of starvation for a decade or more.

Kline, David (1945–)

David Kline, an Amish dairy farmer and writer, lives in Holmes County, Ohio. His vision of nature is rooted in the Anabaptist heritage which he describes in an essay: “God’s Spirit and a Theology for Living,” in *Creation & the*

Environment: An Anabaptist Perspective on a Sustainable World. Kline says:

If one’s livelihood comes from the Earth – from the land, from creation on a sensible scale, where humans are a part of the unfolding of the seasons, experience the blessings of drought-ending rains, and see God’s spirit in all creation – a theology for living should be as natural as the rainbow following a summer storm (2000: 69).

Kline’s first book, *Great Possessions: An Amish Farmer’s Journal* (1990), is a collection of natural history essays he wrote originally for *Family Life* magazine, an Amish journal read mainly within Amish communities. The essays, which describe wildlife on and around Kline’s 120-acre farm, are grounded, he says, in a belief “in nurturing and supporting all our community – that includes people as well as land and wildlife” (xxi).

Scratching the Woodchuck: Nature on an Amish Farm (1997), like the earlier book, includes short essays that explore the varied life forms on the Kline farm. In addition, Kline describes the joy he finds in the shared farm-work of a community made up of non-Amish neighbors, as well as the families in his own congregation. The exchange of labor that makes possible a kind of farming that does not depend on expensive technology reminds Kline, he says, “of a river – serene and beautiful, yet within its gentle flow is great strength” (204).

Kline’s writing examines the joys of simple living, informed by “plain” Amish values. He joined with friends, family members, and neighbors in the spring of 2001 to begin *Farming Magazine: People, Land, and Community*. In the magazine’s first editorial, “Letter from Larksong,” named for the Kline farm, he says, “the true test of a sustainable agriculture will be whether we can romance our children into farming.” To accomplish that, Kline says, farms must be profitable, farmers must not be overwhelmed with work, and farming must be fun. Much of Kline’s writing explores this fun, grounding his faith and hope in the songs of birds, the changing seasons, and the fellowship found in work done together for a common good. With his two books and *Farming Magazine*’s growing circulation, as well as increasingly frequent speaking engagements, Kline’s call for a spiritually grounded, sustainable agriculture has begun to reach well beyond Amish communities.

Klingenthal Symposia

In October 1995, Pax Christi, France, through its Commission on the Protection and Management of the Creation chaired by Dr. Jean-Pierre Ribaut, also Director of the Environment Division at the Council of Europe, organized the first in a series of symposia on Ecology, Ethics and Spirituality at the Klingenthal Castle in Alsace, France. These symposia aimed for a dialogue between scientists and representatives of different spiritual and ethical approaches, and were remarkable for the breadth of different perspectives they brought together, including Christian, Muslim, Jewish, Buddhist, Hindu, Shintoist, Bahá'í, Australian Aborigine, African Animist, Native Canadian, Brazilian and Peruvian Indian, Finish Sami, Materialistic Universalist and Masonic. Leading scientists shared their views and explored common interests with those on the spiritual side, or sometimes combined the two. The first symposium issued the Klingenthal Appeal calling for united efforts to inspire respect for nature and sustainable management of resources, harmonizing scientific, aesthetic and spiritual approaches. This first symposium was followed by a series of more thematic Klingenthal Symposia applying the same approach, on water, source of life (1997), soil, cultures and spiritualities (1998), trees and forests (1999), and animals and fauna (2001). Each explored the environmental and scientific challenges under the theme and the perspectives and contributions that each form of spirituality could bring to those challenges. The proceedings of the symposia have been published by the Charles Leopold Mayer Foundation for the Progress of Humanity.

Knowledge, Knowing and Nature

Among the complex interrelations between religion and nature a dynamic currently being recognized connects “knowledge,” “knowing” and “nature.” Three factors, 1) what is known at any time, 2) how we know it (epistemology) and 3) how we participate consciously in what we know, are all interconnected with the ongoing changes in the physical world. Knowing is dynamic and has efficacy. Recent philosophy of science has generated epistemologies (theories of knowledge) relating to how we know nature as seen from the perspective of the natural sciences. Religion acknowledges that in some ways we can know the divine and also the inmost reaches of the human person, as well as the outside world that we know as nature, so there are theological epistemologies. In recent developments “spirituality” has begun to be distinguished from “religion” as relating more centrally to the inner experiences of the self and the divine from which the religious traditions have arisen and on which their dogmas and institutions are based; thus a major focus within the academic discipline of contemporary spirituality concerns moment-by-moment experience of life, meaningfulness, wholeness and energy. Investigation of the kind of knowledge involved in this expanded knowledge base, along with how we know it, is leading to the recognition of spiritual epistemologies. Each type of epistemology corresponds to a view of the world, of nature, and of how we humans are related to nature: depending on the worldview held, so will be our implicit attitude and explicit action toward nature.

The Modern Period, through the dominant influence of the natural sciences from Newton onwards, has inculcated in us the sense that we know nature as outside of ourselves and as other than ourselves. This worldview is currently associated with much exploitation of nature. Faced with the now life-threatening issue of how to sustain a world that is ecologically unsustainable, many are reexamining the concept of nature and finding it not only more complex but more all-encompassing than had been assumed within the Newtonian worldview. The academic study of spirituality, still a relatively new field in 2003, is playing an important part in defining what nature is. The examination of the concept of nature is itself a factor in changing how we deal with nature. “Nature” is coming to be known as not only the external, physical/material environment, as investigated by the techniques of the natural sciences, but also as a much more complex reality with manifold depths and relationships yet to be discovered. There is increasing acknowledgement that we humans are part of nature, not separate from it: we are integral to nature and therefore inseparable from its future. Ecology recognizes this, highlights human responsibility for caring for nature and emphasizes that whatever degradation we inflict on nature impacts back on us. Theological world-

views and epistemologies on the whole corroborate this ecological perspective and it is becoming incorporated into popular thinking. But there is an urgent need to go beyond this and some have done just that. It is being recognized that between ourselves and nature there are not only the now obvious external and physical connections but also equally important interior relationships and activities. These internal relations are not superficially evident; they are not visible or detectable by what we know as objective “scientific” investigation. To know what nature is from the inside and so to understand and work with our internal connections with nature, we have to investigate who we are and what we can know of ourselves not only on the physical, biological, mental and psychological levels but also as spiritual beings. It is with this deeper investigation that spiritual epistemologies are generated, first in the form of modes of knowing the deeper levels of the human self and then, integrated with this, as modes of knowing the cosmic order. The results of such investigation “from the inside” are expressed in an expanded concept of nature, for nature itself is multidimensional, while the concept of “nature” is seen to be a human construct which changes in relation to what we know about it.

Western science has been successful in mapping, as it were, the configurations of nature, according to what it acknowledges as the physical world and using methods appropriate to that. Western psychology, up to and not including the Transpersonal Movement, has mapped the levels of the human person according to what it acknowledges as its field. These levels are seen now, from within this new field known as Transpersonal Studies, as the lower, or less-evolved levels of the human being. In the East primarily – although there are some striking Western examples also – the higher domains of the human person have been mapped meticulously by pioneers who have been there (i.e., the mystics, seers and sages, who have based their theories and teachings on their own experience). Significantly, there are criteria of verification appropriate to these teachings on a par with the verification criteria accepted within the scientific community. Data coming from these sources not only can, but now also needs to be, integrated with the Western “scientific” findings on the outer nature, to present a more complete, deeper and fuller understanding of what “nature” is.

According to the particular worldview or theory of existence one holds, so one will act toward the goal envisaged in that theory. Believing that material nature is the only reality (as in Western science), the goal, psychologically, is the development of the individual. Accordingly, the ego and its security (particularly the egos of dominant groups) are being prioritized, along with what appear to be the best social and material structures and institutions to support that goal. In the adult egocentric mode of existence, which is where most of us are, other persons and nature will by definition be experienced as other, as “not-self,” as potentially threatening and to be defended against, dominated, and eventually overcome; hence further division, exploitation and the prospect of self-destruction. By contrast, from a center of consciousness higher than the ego, as in the case of the explorers of the higher domains, other persons and nature are experienced as not other than the self. From the higher levels of awareness

the lower levels and domains can be integrated, and their structures and energies used consciously as instruments of the higher.

Integrating the findings of spiritual investigation, intelligence and creativity with the findings of the natural and human sciences extends the notion of consilience (E.O. Wilson) to open up new horizons and latent possibilities. With such a reciprocally enhancing and integrated worldview, knowing who we are in relation to nature, knowing what we know and participating consciously in what we know, we can identify where change is needed in ourselves and in what we are doing to nature. Articulating this next stage in the religion/nature dynamic itself generates both strategies for change and energy to implement them.

Kogi (Northern Colombia)

High in the folds of the world's largest coastal mountain massif, the Sierra Nevada de Santa Marta, on Colombia's Caribbean coast, live three Chibcha-speaking Amerindian groups: the Ijka (or Arhuacos); the Sanka (or Arsario or Wiwa); and the Kogi (more properly called Kaggaba). Of these, the Kogi/Kaggaba have remained the most "unacculturated," true to their traditions and beliefs, and pursuing an environmentally aware and instructive spirituality. They are, however, under increasing pressure from the outside world, yet they retain an intense commitment to isolation.

The Sierra (called Gonavindua, or "snowfields" by the Kogi) is a vast, three-sided pyramid, starting at sea level and rising to a staggering 5770 meters. Situated near the Equator, it has minimal seasonal temperature and rainfall variation. Altitude determines almost everything, from tropical rainforest below to snowfields and glaciers at its peaks. It is rather like the world in miniature, encompassing almost every known kind of natural environment – at each particular level. For the Kogi, this vast territory (covering 12,000 km² above a 300-meter level) becomes more sacred the higher one goes.

The 6000–7000 Kogi live a slightly austere and rigorous, but profoundly content and rewarding, life. They reside in isolated settlements in the 1000 to 2000-meter levels, with even more isolated homesteads at other levels, where they care for their sloping garden-fields of (depending upon altitude) plantains/bananas, beans, cucumbers, manioc, corn, and fruit trees. Animal protein consumption is minimal. Cotton is grown for their white garments; men weave the clothes, women weave baskets (for everyday carrying purposes as well as sacred ones). No shoes are worn as footwear is forbidden. The regular but tightly controlled use of the leaves of the sacred coca plant is a marker of manhood, a method of spiritual communication, and the mark of "civilization." (Chewing coca leaves as the men do has only a weak chemical affect, much like betel nut, and helps them to stave off hunger, handle altitude sickness, and supplement their diet).

This extremely self-sufficient lifestyle – with only carefully considered inputs (such as iron blades and spades) from the "outside" world – sustains the Kogi population, who are ruled by hereditary lords and sacred priests. The latter, the *Máma(s)*, the enlightened ones, are the focal point of life: the populace gear their lives and thoughts to assist them. The *Máma(s)* exist to look after them, but more importantly, to pursue the arduous and unremitting religious tasks of ensuring harmony and the continuation of all plant, animal and human life on Earth and indeed, the continuation of Earth (as a living entity) itself.

The *Máma(s)* follow the Law of Hába Gaulchováng (the Great Mother), who created all things in Alúna (“Thought,” a pre-conscious/conscious state that all *Máma(s)* aspire to regularly attain) in the depths of the vast primordial sea before Munsá (the “Dawning”/Creation). The material world, pre-created by the Thoughts of the Great Mother before the Dawning, must follow her laws of Nulúka/ Yulúka (“harmony,” “balance”) to continue. Acutely aware of the interrelationships between the weather, climate, plants, animals and humans, the *Máma(s)*, from their vast cosmos that is still nonetheless a miniature at the heart of the larger world, pursue regular and profound deprivation to attain the required levels of consciousness and purity. Such pursuit is necessary to perform the incessant prayer, oration and ritual gift-giving that ensure the protection and continuation of harmony and balance on Earth. The

Kogi sometimes call themselves the “Elder Brothers,” and assume that the innumerable societies of “Younger Brothers” outside of the Sierra around the rest of the conceived world know that their priests, the *Máma(s)*, are dedicated to essential tasks on behalf of all.

Learning to become a *Máma* is possibly the most arduous priesthood training of any society on Earth. Preferably chosen by divination, the young candidate (usually male but sometimes female) is ideally taken at birth (and certainly before reaching the age of five) and raised in almost complete darkness in a cave or specially constructed darkened hut, for two consecutive nine-year periods. Some, wanting to go deeper, may continue for a third nine-year period. Raised in a re-creation of the world of Alúna in a womb-like dark sea, the young *kuívi* (initiate, “abstinent”) is taught the Laws of the Great Mother, the rules and balances of the non-material and material worlds, and the *sewá* (“alliance” gifts/prestations) necessary for required harmonies.

Ritual postures, movements, chants, lineages, geography and the natural “sciences,” botany, biology, astronomy, meteorology, cosmogony and cosmology, religious and spiritual analogy, history, divination, confession procedures, ethics, dream interpretation, plant growth, animal behavior, sensory deprivation, healing, curing, medicine, time-cycle manipulation, ritual language – and many more topics – are taught and learnt. All of this occurs while seeing almost nothing and living on a special diet not far removed from perpetual starvation. Much of this intense training is likened to the Great Mother’s precreation in the darkness of Alúna of the *kalgushija* (“model,” “essence,” “image”) of all living things before their actual physical creation with the Dawning. But those who emerge from this training are very special, often gifted beyond normal human abilities and expecting to live to 90 years, which they believe is their allotted span. Coming out of their training darkness, once they make adjustments to the shock of the material world, another *Máma* will now present the young male with his *poporo* (the small gourd to contain slaked lime to accompany the taking of coca leaves), which is also a symbol of manhood and with profound religious significance that he must have with him at all times. He can then take a wife, and his life’s work can begin, not just for his people, but for all things in the world.

Kogi/Kaggaba society seems to stand slightly apart from many traditions of northern South America, and they themselves feel that they should remain so because of their strongly held beliefs in their unique and special position with regard to the essential balancing of elements necessary for the continuation of life on Earth. Although forming a fascinating amalgam of ancient pre-Colombian Tairona cultures from the coastal areas of northern Colombia, the Spanish conquest and eventual domination and destruction of the Tairona cultures in the sixteenth century forced survivors to retreat higher into the Sierra (around 1600), and into areas already peopled by Chibchaspeaking cultures. Tairona priests, *Noamas*, linked up with sacred *Máma(s)* high in the Sierra, and a modified sacred culture was developed, under the latter's control, which eschewed material cultural trappings, and hid golden objects from the intruding Spaniards.

In Kogi belief, disregard shown by the "Younger Brother" for the Laws of the Mother equals disrespect for maintaining the living world in good health. This disrespect and greed makes the *Máma's* work more difficult, and may lead, if not stopped, to the end of the world. This end could come in the form of fiery Teiku – a burning, sun-like fire/heat (Teiku is also the sun, who is also a *Máma*) which will create immense destruction (analogous to one early Kogi story which relates that some of the first ancestors appeared in the Sierra to escape an earlier fiery end). Today, the Kogi are under pressure of Christian missionization, but they still deliberately retreat into isolation in the belief that, through their life-way, they sustain the whole cosmos.

Koliada Viatichei

The Viatichi cultural center was established in Moscow in 1995 through the initiative of N. Speransky (a Ph.D. in physics and math), who goes by the pagan name Velimir. In the fall of 1998, the small Viatichi community, comprised of well-educated Moscow intellectuals, united with the Koliada community to form the larger Koliada Viatichei community. This is a faction within Russian neopaganism which strives to recreate a pre-Christian Slavic wisdom that avoids any alien influences and borrowings.

Speransky rejects as unacceptable for Slavs the esotericism and Eastern flavor of the popular teachings of Nikolai and Elena Rerikh. Likewise, he rejects Christianity for its historical connection to the “Semitic ideology.” Yet, unlike some other Russian neopagans, Koliada Viatichei is negative toward Nazism and criticizes it for its esoteric and occult bias. It also censures anti-Semitism as destructive. Speransky is skeptical toward any primeval “Aryan civilization,” treats Vedic literature as an alien heritage (while some Russian neo-pagans look to it as part of their own Slavic-Aryan roots), and rejects the *Book of Vles* as a forgery.

In their concerns for Russian traditional culture the Viatiches demonstrate a strong sense of Russian nationalism, alongside a conspiratorial view of the non-Russian world. They reject Western “technocratic civilization” as “destructive” and oppose it with Russian ancestral values and an ecological worldview. Paganism is identified as an ecophilic ideology which should be promoted at the state level. Speransky argues that salvation is to be gained through the maintenance of a careful and healthy relationship with the natural environment and through preserving the cultural heritage of one’s ancestors. Critical of high technology and consumerism, he foretells a collapse of Western civilization, followed by a clash between “white” and “yellow” races in the twenty-first century, and calls for a struggle against both Eastern teachings and Christianity in favor of a renewed Russian pagan faith. He praises “Russian folk Christianity” for its break away from the “Semitic ideology,” a break that is considered to have cleansed the “Russian faith” and made it healthy once again. Accordingly, this faith is destined to a final victory over Christianity, a victory which will lead Russia to a great future.

The Viatichi teaching is based on the Manichean idea of an eternal struggle between Good (Belbog) and Evil (Chernobog). Curiously, both gods are thought to have made a contribution to the creation of man, Chernobog building his body, and Belbog awarding him an everlasting soul. Hence, the belief is that humans have an inherently dual and divided nature.

Speransky recognizes variability in Slavic pagan beliefs, with each tribe having its own gods and sacred places. He argues that great thinkers have periodically managed

to integrate these beliefs into a uniform pantheon of Pan-Russian deities, but that this has always been followed by a collapse and dissolution. He believes that a new era is coming which calls for a restoration of a uniform system of Slavic beliefs. But this system should be polytheistic, to account for the complexity of the world with its multitude of good and evil forces. Nevertheless, a Russian “Great Goddess” – “Mother Earth” – is at the center of his teaching. Borrowed from Russian folklore, this idea of a close relationship between humans and a nourishing native soil is said to call up deep emotions toward the land and a willingness to defend it by all means. This Great Goddess is identified with the “Motherland-Russia.”

More recently, Speransky has developed an appreciation for Lithuanian neopaganism and has begun advocating its teaching of “*Darna*,” or “life in accordance with the Earth and with the ancestors, which provides a feeling of happiness and is welcomed by the gods.” Accordingly, he has revised his earlier dualistic views from seeing the polar forces as conflicting to a view that recognizes them as complementary and mutually reinforcing. His appreciation for prehistoric peoples and “folk culture” approaches a romantic conception of the “noble savage,” and he advocates self-restriction, refusal of consumerism, and a rural lifestyle, as the way to find a new balance between humans and nature. Not avoiding politics, however, he continues to warn that “Russia is pressed by a fatal evil,” and points out that pagans have to defend the Russian land, finding strength and energy in tradition and in the old Slavic gods who will ultimately determine the future.

Korean Mountains

The Korean peninsula is a rugged mountainous land, looking from the sky more like a storm-tossed ocean than a placid lake. The rivers that tumble out of those mountains usually do not have very far to go before they reach the ocean. The traces of their short journeys across the peninsula's rocky surface are much less impressive than the broad floodplains left behind by the rivers that shaped the civilizations of China and India. Mountains, more than waterways, have dominated the physical landscape the Korean people have inhabited for centuries. Mountains have dominated the religious landscape as well, shaping Korean concepts of nature and of how they should interact with it.

When Koreans look at mountains, they see not only mountains but also the sky behind and above them. Those mountains and the sky above them have inspired both reverence and apprehension in those who lived beneath them. Koreans believed that nature was filled with willful entities which could, for example, provide or deny rain when crops needed it and could send diseases to afflict humanity or cure those already afflicted. Since mountains and the heavens were the features of nature that Koreans found most impressive, it is the behaviors of mountain spirits and heavenly spirits that Koreans have been most anxious to influence through ritual. The oldest accounts of religious activity on the peninsula, going back almost two millennia, describe rituals honoring and imploring spirits in the heavens above and the mountains below.

Koreans have traditionally assigned different functions to terrestrial and celestial spirits. Mountain spirits, including not only mountain gods but also mountain-dwelling tigers and even particularly impressive trees or stones found on or near mountains, have often been enlisted to serve as tutelary gods for villages. Even today, despite the changes wrought by decades of modernization, it is still possible to find a rope placed around a particularly old and large tree on the edge of a village, or an informal altar formed from a pile of stones off to the side of a mountain path, to signal the presence of a guardian spirit. Moreover, most Buddhist temple complexes still include a small shrine to the local mountain spirit behind the main worship hall.

Until Christianity introduced Koreans two centuries ago to the notion of a God in heaven who cared for those on the Earth below, celestial spirits have tended to be viewed as too far above the human realm to be interested in maintaining an ongoing protective relationship with an individual human community. Though a few villages have adopted celestial spirits as tutelary deities, the gods of heaven, including such celestial bodies as the sun, the moon, the planets, and certain constellations, have usually been conceived more as judges and administrators than as protectors. The Big Dipper gods, for example, collectively determine how long human beings will live as

well as whether an unborn child will be male or female. There is often a shrine to the Big Dipper gods not far from the shrine to the mountain god in a Buddhist temple, but the Big Dipper shrine is for individual petitions for a change in fate and does not provide the same general protection to the shrine precincts that the mountain spirit shrine does.

Korea's folk religion assumes that rituals and prayers can persuade planets and stars, or at least the spirits they represent, to change a decision in a petitioner's favor. Neo-Confucianism, which began to dominate upper-class culture in Korea from the fifteenth century, denied that objects moving through the heavens possess the ability to make decisions. It also denied conscious intent to mountains, trees, and rocks. Nevertheless, Neo-Confucianism agreed that there is a strong link between the way humans and nature behave.

Neo-Confucian philosophers insisted that human beings were an integral part of the natural world and therefore human behavior affected the behavior of other natural objects and natural forces. If human beings acted in accordance with the patterns of harmonious interaction, which constituted the natural order, then nature would function in predictable and beneficial ways. On the other hand, if human beings pursued individual selfinterest at the expense of the common good, they injected disharmony into the universe. The result would be natural disasters such as earthquakes, floods, and droughts. The impact individual behavior could have on nature varied according to the political status of the individual actor. A king's selfish behavior was more likely to cause natural disasters or ominous phenomena such as an unpredicted comet or meteor shower than was the inappropriate behavior of a peasant.

In addition to providing spirits to be cajoled and worshipped, and portents to warn against inappropriate behavior, nature also provides settings for some religious activities. The indigenous Korean belief in mountain spirits combined with the imported Chinese belief in geomancy to make mountains a favored location for spiritual cultivation. Geomancy holds that there are invisible channels of energy beneath the Earth and that certain locations have particularly high concentrations of that energy. By the ninth century, Koreans were building Buddhist temples in foothill locations believed to be best situated to tap into that underground energy as well as gain the favor of particularly powerful mountain spirits. Though Neo-Confucians claimed to be skeptical of the power of mountain spirits, when they began establishing rural academies in the sixteenth century they too often selected locations on the lower reaches of mountain slopes. In the twentieth century, two mountains with particularly strong geomantic properties and guardian spirits, Mt. Kyeryong in the center of South Korea and Mt. Moak in the southwest, have attracted adherents of new religions in large enough numbers to concern the government.

These new mountain-based religions have not expressed much explicit concern over the state of the environment that surrounds them. Instead, Buddhists and Christians living in Korea's crowded cities (South Korea is now over 80 percent urban) have been at the forefront of the environmental protection movement. Since the early 1980s, Bud-

dhists emphasizing the traditional Buddhist respect for all forms of life and Christians emphasizing respect for all that God has created have joined forces with secular activists in a broad coalition called the Federation of Environmental Movements. Their focus has been less on protecting mountains *per se* than on protecting the waters that flow from those mountains and that are lifelines for all city-dwelling creatures.

Not all the gods Koreans worship are deified natural objects. Nor do all Korean religious activities take place in a forested mountainside. Nevertheless, any account of Korean religion that neglected the worship of stars and mountain spirits, the reliance on astronomical phenomena for moral guidance, or the appeal of mountain settings to the devout would be incomplete and misleading.

Krishnamurti, Jiddhu (1895–1986)

Krishnamurti was a religious teacher whose life reads like a legend, but is well documented. Born in a lower-middleclass traditional Brahmin family in a small town called Madanapalle in Andhra Pradesh (India), he was picked up in 1909 by the leaders of the international Theosophical Society in Adyar, Chennai. Mrs. Annie Besant, the then President of the society, predicted that Krishnamurti would be a world-teacher who would give a new interpretation of religion for the scientific age. She adopted him and sent him to England for education.

In 1922, Krishnamurti had his first spiritual awakening under a pepper tree in Ojai, California in the form of a mystic experience in which he felt one with everything around him. This mysterious “process” went on intermittently throughout his life and has been a subject of much conjecture. From 1922 to 1932 Krishnamurti went through an intense period of inquiry, questioning all the Theosophical teachings he had accepted until then and dropping what appeared to him to be false. In 1929, he dissolved the organization set up around him and returned all the properties donated for his work, saying, “I maintain that Truth is a pathless land, and you cannot approach it by any path whatsoever, by any religion, by any sect” (in Lutyens 1990: 78). The essential philosophic difference lay in Krishnamurti’s perception that there is no path to truth, which contradicted the Theosophical belief that all religions were paths to the same truth. Ironically, despite this parting of ways with the Theosophical Society, Krishnamurti became a world-teacher, lecturing and holding dialogues worldwide to convey his teachings until his death in Ojai, California in 1986. He also started schools for children to realize his vision of education. To him science and religion were two complimentary quests of humanity, the former for discovering the order that manifests itself in nature, and the latter for discovering order within our consciousness.

To Krishnamurti, religion is not belief in some concept of God, acceptance of a code of morality, or the performance of rituals; it is the flowering of virtue in the consciousness of a human being. Virtue is order in consciousness in which there is love, compassion, peace, nonviolence, happiness, joy and beauty. Since virtue is a state of consciousness, it cannot be practiced through will and decision. It arises, naturally, through the ending of the disorder that human beings experience as violence, fear, sorrow, and conflict. This disorder has a cause that can be perceived and eliminated since it is based on illusions created by our own memory and imagination. It can be ended through the perception of what is true and what is false. But truth is not merely an idea – it comes into being through a deep, undistorted and holistic perception of reality. This quest for truth is the essence of religion, for without it there is no wisdom

or virtue. Wisdom requires freedom from illusion, which comes from self-knowledge and not through the acceptance of ideas. In his words, “The ignorant man is not the unlearned but the one who does not know himself ” (1955: 17).

Truth does not come from an intellectual quest, but mysteriously, in a flash of insight. That is why it is pathless and is not dependent on a Guru. A Guru can point out the truth but cannot create perception in the disciple. The individual is both the teacher and the student and totally responsible for her or his own learning. Further, since truth is the unknown, it cannot be pursued or sought or spread through the word. One must keep the mind open and not block insight. This requires living with questions, without any conclusions, observing everything keenly like a true student wanting to learn about life by watching it, without interfering with what is taking place or judging it and without creating boundaries of what is possible and what is not possible. He called such a learning state one of choiceless awareness. It starts from the ground of not knowing and can be shared with fellow-inquirers in what he termed the art of dialogue.

Krishnamurti had a deep love for nature, which he considered an essential part of a truly religious mind. All Krishnamurti schools and centers are located in sites of tremendous natural beauty, because contact with nature creates a sensitivity which is conducive to a religious quality in the human mind. Krishnamurti maintained that there is a universal consciousness which connects all of nature, but we separate ourselves from it by living in a self-created, narrow, limited world of our own thoughts. To realize our oneness with nature, it is necessary to understand the thinking process and not let it become self-centered. He talked about the need to live with a silent mind which uses thought only when it is necessary and is not driven by it. He taught that there is an order and intelligence everywhere in nature and that the observer can learn to live in harmony with that order if he does not separate himself from the observed. There is disorder only in human consciousness and it originates from an ego-process that can be ended through self-knowledge. With the ending of disorder comes a natural order which is not enforced. The religious quest can thus be regarded as a quest for discovering what it means to live with a consciousness that is in complete harmony with the order of nature. He called it the art of living. Commenting on our relationship with nature, Krishnamurti wrote:

We never seem to have a feeling for all living things on the Earth. If we could establish a deep abiding relationship with nature we would never kill an animal for our appetite, we would never harm, vivisection, a monkey, a dog, a guinea pig for our benefit. We would find other ways to heal our wounds, heal our bodies. But the healing of the mind is something totally different. That healing gradually takes place if you are with nature, with that orange on the tree, and the blade of grass that pushes through the cement, and the hills covered, hidden by the clouds. This is not sentiment or romantic imagination but a reality of the relationship with everything that lives and moves on the Earth . . . If we could, and we must, establish a deep long abiding relationship

with nature . . . then we would never slaughter another human being for any reason whatsoever (Krishnamurti 1987: 80).

Krishnamurti pointed out that all disorder that we see in human society is a projection of the disorder in our consciousness and there can be no fundamental transformation in society unless the individual transforms his or her consciousness. Therefore self-knowledge is an essential requirement for all human beings and not merely a specialization for the religious person. Religion to him was something integral to daily life, which when separated from it becomes an escape:

It is our Earth, not yours or mine or his. We are meant to live on it helping each other, not destroying each other. This is not some romantic nonsense but the actual fact. But man has divided the Earth hoping that in the particular he is going to find happiness, security, a sense of abiding comfort. Until a radical change takes place and we wipe out all nationalities, all ideologies, all religious divisions and establish a global relationship – psychologically first, inwardly, before organizing the outer – we shall go on with wars. If you harm others, if you kill others, whether in anger or by organized murder which is called war, you, who are the rest of humanity, not a separate human being fighting the rest of humanity, are destroying yourself (Krishnamurti 1987: 60).

Kropotkin, Peter (1842–1921)

The Russian prince Pyotr Alexeyevich Kropotkin was one of the leading geographers of his time and a central figure in the history of anarchist thought. His ideas have had an enduring influence on decentralism, regionalism, and alternative technology, and later thinkers such as Patrick Geddes, Lewis Mumford and Paul Goodman have looked to him for inspiration. More recently, he has been recognized for his influence on the radical environmental movement and more specifically as the most important theoretical forefather of green anarchism. Kropotkin's most famous concept is the idea that evolutionary advances throughout the natural world are promoted best through mutual aid, cooperation, and symbiosis. His social theory, including his view of religion and other institutions, is grounded in this view of nature.

Kropotkin sought to refute the Social Darwinist idea that social inequalities are the result of a competitive "struggle for survival" that is inescapable because it is rooted in nature. He observed that animals have social instincts with evolutionary value, and that symbiotic activity is more useful for survival than competitive and antagonistic behavior. Similarly, he saw the "struggle for survival" in human society as being primarily a cooperative social project of adapting successfully to the challenges of the environment. Mutual aid is thus a "factor of evolution" both in nature and in human society. In effect, the social instincts of animal communities are raised to the level of rational action and moral choice in humanity. Ethics therefore has a naturalistic basis, for ideas of good and evil relate ultimately to that which either contributes to or threatens the survival and wellbeing of the community.

For evidence of the efficacy of social cooperation, Kropotkin cites the practices of tribal societies, free cities and cooperative communities over the ages. This history inspires his anarchism, which has as its goal a system of social cooperation free from the state, capitalism, and other forms of hierarchical, concentrated power. He envisions a future cooperative society rooted in a scientific understanding of nature and society that understands mutual aid between human beings as a continuation of the larger tendencies of natural evolution. He recognizes the destructive instincts of humanity as being every bit as natural as the cooperative ones, but he considers them to be anti-evolutionary forces whose effects should be minimized through benign environmental influences.

Kropotkin applies these ideas concerning evolution, science and ethics in his analysis of religion. He sees religion as having two opposed dimensions. On the one hand, it has expressed the human tendency toward mutual aid and solidarity, thus furthering social evolution. He sees the religious precept of doing to others as one would have

them do to oneself as only the developed form of the ethics that pervades nature. In his view, both Buddhism and Christianity differed from all previous religions by replacing cruel and vengeful gods with “an ideal mangod” who taught a religion of love. He credited Shakyamuni Buddha with introducing such concepts as universal compassion and kindness, love for one’s enemies, sympathy for all living beings, contempt for wealth, and the equality of all human beings. He saw Christianity as a very similar but “higher” teaching than Buddhism, noting that Jesus (unlike Buddha, who was a Prince) came from among the ordinary people, and early Christianity showed a strong identification with the oppressed. He also argued that although Buddhism and Christianity were a break with previous religions, they were merely universalizing principles that were practiced within tribal religion, which applied principles of love, equity, and disinterested generosity within the bounds of the tribe, and which had their natural basis in the evolutionary value of mutual aid. Kropotkin saw the other, anti-evolutionary dimension of religion in its role providing powerful (albeit declining) support for the system of domination, particularly in the case of Christianity. He contends that Jesus’ original message of universal love and social equality was deemphasized and thereby undermined by his later followers and scriptural interpreters and eventually destroyed with the establishment of a hierarchical Church (thus paralleling similar developments in Buddhism). Thus, Christianity was originally a revolt against the Roman Empire, but the Empire triumphed. Despite the egalitarian and communist tendencies of early Christianity, the Church became the avowed enemy of all such tendencies. In Kropotkin’s view, Roman law and the hierarchical Church were the two forces that undermined the spirit of the freedom and instilled authoritarianism in European culture.

At the same time, according to Kropotkin, Christianity profoundly shaped the European view of nature. In his view, the religions of Egypt, Persia and India (except Buddhism) saw nature as a conflict between good and evil. He contended that this dualistic “Eastern” idea influenced Christianity and contributed to the belief in a moral battle between good and evil within the person and in society. Such beliefs, he says, reinforced tendencies toward repression and persecution. Moreover, the Church condemned the scientific study of nature and supported revelation, as opposed to nature, as the sole source of moral guidance. Kropotkin conceded that within Christianity the importance of human social instincts and human reason in the discovery of moral truth were recognized in Thomas Aquinas’ philosophy, in Renaissance religious thought, and in other tendencies. However, he contended that on the whole the Church continued to stress the evil, fallen quality of both nature and human nature, and the need to look to God and revelation for salvation from them.

For Kropotkin, religion plays either a positive evolutionary role, to the extent that it continues tendencies in nature toward mutual aid and solidarity, or an antievolutionary one, to the extent that it allies itself with systems of domination. Furthermore, he saw a strong connection between the social functions of religions and their conceptions of nature. Religions that emphasize universal love and social equality generally

have a positive view of the natural world, whereas religions that are allied with social hierarchy and domination propagate highly negative views of nature and justifications for dominating it.

Krueger, Fred (1943–)

Fred Krueger is an Eastern Orthodox Christian who has been deeply involved in creating numerous Christian environmental organizations, coordinating interreligious conferences on nature and the environment, writing on

Christianity's ecological perspective, lobbying congress on forest issues, and facilitating workshops and backpacking trips in nature.

Krueger became involved in eco-theology through his involvement with a Californian new religious movement turned Orthodox quasi-monastic order, the Holy Order of MANS (HOOM), and a sub-group, the Eleventh Commandment Fellowship (ECF) dedicated to what the order's leader, Vincent Rossi, deemed the 11th Commandment: "The Earth is the Lord's and the fullness thereof: Thou shalt not despoil the Earth, nor destroy the life thereon" (see Nash 1989: 97 for a 1939 version of the 11th Commandment). Inspired by the ecological insights present in Eastern Christianity, the ECF's mission was to stimulate ecological thinking and action throughout Christianity. The group played a significant role in the first North American Conference on Christianity and Ecology (NACCE) in 1987, of which Krueger was a founding member. Following the conference, much of Krueger's (and the ECF's) energies were shifted to building NACCE as an organization.

Krueger left his role as executive director of NACCE and editor of their magazine *Firmament* in 1993 and became the director of the Christian Society of the Green Cross, a ministry of Evangelicals for Social Action in order to promote ecological concern among conservative Christians. Krueger was also part of the editorial board for the group's quarterly, *Green Cross*. When *Green Cross* became a part of the Evangelical Environmental Network, Krueger moved on to develop Opening the Book of Nature (OBN), a program whose roots lay in earlier ECF wilderness backpacking trips led by Krueger. Convinced that direct experiences of nature would help people of faith recover a lost spiritual heritage and convert them to an ecological viewpoint, these trips became the framework for OBN, one of Krueger's current projects. OBN programs (workshops, weekend wilderness retreats, ten-day backpacking trips) are designed to help Christians "discover the spiritual lessons in creation" (*OBN Newsletter*) and the value of wilderness.

Another Krueger-led group, the primarily Jewish and Christian Religious Campaign for Forest Conservation (RCFC), is the activist arm for OBN. Founded in 1998 it has supported forest conservation legislation, lobbied Congress, created important religious statements on the value of wilderness in conjunction with the Wilderness Society, and worked with the World Bank to protect the world's forests.

Krueger also publishes environment-related resources gathered from the pope, the Green Patriarch Bartholomew, and other religious figures. Through his publications and organizations, by drawing on nature-experiences as well as scripture, historical theology, early Christian figures, Orthodox saints, and “prophets” like George Washington Carver and John Muir, Krueger has spread the Christian ecological message to a wide range of Christians from selfidentified “tree-hugging, Jesus freak” evangelicals and Pentecostals, to urban Episcopalian psychiatrists, to an array of Catholics, Protestant, and Orthodox Christians.

Krutch, Joseph Wood (1893–1970)

During the 1950s and 1960s, Joseph Wood Krutch gained recognition as a nature essayist. His best-known books include *The Twelve Seasons*, *The Desert Year*, and *Voice of the Desert*. These writings marked a vocational shift for Krutch, who had previously distinguished himself as a theater reviewer and a Professor of English at Columbia University. Depicting a profound yet fragile spiritual kinship among living things, they also culminated a personal spiritual pilgrimage.

Krutch was born into a nominally Episcopalian family in Knoxville, Tennessee, in 1893. By his teen years, he was an agnostic with a budding interest in science. This interest flagged during Krutch's undergraduate years at the University of Tennessee because he increasingly sensed a conflict between scientific materialism and the values that Western humanistic traditions upheld as foundations of meaningful existence, such as individuality and free will. He turned to literature as a means of resisting scientific reductionism.

Krutch vigorously defended humanistic values while building his career as an essayist following graduate study at Columbia. In his first book, *The Modern Temper* (1929), Krutch asserted that to affirm the reality of consciousness, morality, and free will was to “live spiritually” in an age when traditional religion had apparently failed. This endeavor seemingly entailed alienation from other beings, as Krutch also wrote there that it was “better to die as men than to live as animals” (Krutch 1956: 169).

Krutch's spiritual vision soon became more expansive. Regular visitors from New York to the Connecticut countryside after 1925, he and his wife settled there in 1932 and became avid observers of animals and landscapes. The region inspired Krutch's first nature book, *The Twelve Seasons* (1949), which introduced his belief in the kinship of life with a recollection of perceiving an inscrutable but unmistakable joyfulness in the songs of frogs on a spring evening. This experience suggested to Krutch that evidence of the kind of mental life he valued exists throughout creation, and that humans and other animals “belong equally to something more inclusive than ourselves” (Krutch 1949: 10).

The Krutchs relocated to Tucson, Arizona in 1952, and most of Krutch's subsequent books treated environments of the American southwest. These works further developed the idea that manifestations of consciousness, emotion, and purposefulness in different creatures form a variegated sacred center in nature, which may redeem a robust sense of human potential.

Though Krutch called his faith “a kind of pantheism,” it falls short of pantheism because creatures whose lives appeared unconscious and programmed – notably ants

and dandelions – fall outside this sacred center. The prevalence of these creatures underscored for Krutch the tenuousness of mindful qualities and the need for their continual affirmation.

Krutch's faith is an anthropocentric naturalism that identifies the sacred not with nature's otherness or unity, but with parts of nature that sustained a cherished (and culturally specific) vision of humanity. His beliefs parallel some strands of modern naturalistic theology (especially as developed by empirical theologians of the Chicago School), and despite their limitations, present a suggestive contrast to the holistic spirituality of many nature writers.

L

Labyrinth

An ancient and pre-Christian symbol, taking the form of the serpent, spiral, cross, or knot, the labyrinth has recently experienced a resurgence of interest among New Age spiritual groups. Labyrinths are physical and metaphorical, favored by civilizations in Greece, Egypt, India, and Indonesia. They are also a favorite image of modernist writers, particularly philosopher Friedrich Nietzsche and Louis Borges. Lima de Freitas notes that, in modern times, the labyrinth represents “the existential dilemmas of modern urban man, who finds himself trapped in a prisonlike world and condemned to wander aimlessly therein” (1987: 411). The labyrinth symbolizes a path through which the soul must find its way. In *Geography of the Imagination*, Guy Davenport calls the labyrinth “a life symbol” for the twentieth century.

Labyrinths are found in a variety of physical settings; they are found as stone patterns and drawings in caves, entrenched into hillsides, cut into turf-mazes or trimmed hedges, carved into stone obelisks, and set into the floors of medieval churches and cathedrals. One of the most famous labyrinths is in the floor of Chartres cathedral in France, which has proved to be the basis for a special eponymous design, the Chartrain, a maze of four quadrants, eleven paths, and a center rosette set within a circle. The labyrinth can also be traced to the familiar Celtic knot design. The Hopi of the American southwest use the labyrinth in their Man in the Maze symbol to represent life’s journey.

While labyrinths are constructed by humans, they symbolize and explain natural processes that have been celebrated in ritual for centuries: birth, death, fertility, the sunrise and sunset, planting and harvest. They also are tied to female Earth deities, as the center of the labyrinth is a hole, an empty space that is filled when the penitent walks the path. It thus represents the womb.

In his study of maze imagery, Craig Wright points out that there are two basic maze designs: the *multicursal*, those mazes where a choice of path is necessary, and the *unicursal*, those with only a single path leading to the center (2001: 3). Like the cathedrals in which many of the Christian labyrinths are found, the labyrinth itself employs principles of sacred geometry in its construction and connotation. As George Lesser points out, sacred geometry presumes that the universe is created by God as a rational system “and therefore mathematical conception, the highest manifestation of divine wisdom, is imitated, in a mystic way, by the sacred building and its precinct which thus become a reflection of divine order, harmony, and beauty” (1957: 3). Geometric figures, such as the circle, the polygon, and the five-pointed star, are sacred because they refer to mystical numbers and symbolic concepts in numerology. The

basic shape of the labyrinth is a circle divided into four quadrants. These represent the cardinal directions north, south, east, and west. In the symbolic cross labyrinth, the vertical axis links the underworld to heaven. As with the cross in traditional Christian iconography, in the labyrinth the cross “reconciles opposed directions and divided drives at its center” (de Freitas 1987: 417). The Christian maze, found primarily in naves of French and Italian medieval churches, was approached and entered from the west. The penitent moves eastward, and the symbolism is potent – east is the dawning of the day, the spiritual rebirth in the faith (Wright 2001: 19). Typically, the Christian labyrinth contains eleven tracks within its circumference, symbolizing “sin, dissonance, transition, and incompleteness” (Wright 2001: 23). “It extends beyond the number of the Commandments,” writes Wright, “yet does not attain that of the Apostles or of the months of the year” (2001: 23). The center rosette is often construed to be a symbol of the Virgin Mary, writes Lauren Artress (1995: 58).

The knot shape represents Ariadne’s thread and memory. In Greek myth, Ariadne helped Theseus to escape the labyrinth of the Minotaur at Crete. When the thread is knotted, it must be unwound, thus it illustrates the difficulties that must be overcome in the soul’s movement toward salvation. The serpent shape, often found on prehistoric rock drawings, is most directly related to pathways and the promise of freedom or release at the end of the journey. The spiral labyrinth illustrates two basic movements, inward and outward. It can be associated with life processes of ingestion and energy. The spiral is also a powerful archetype that represents time, the cycle of the seasons, and the arc of life. Lauren Artress stresses that the spiral is “the whole.” Neo-pagan religions, such as Wicca, revere the circle in ritual. Women’s dream quests make use of dancing, chanting, dreaming, healing, and blessing inside the circle, often using candles, incense, or flower petals to connect to nature and her ancient and sacred powers.

The introduction to Wiccan teachings composed by Starhawk (Miriam Simos), *Spiral Dance* (1979), takes its name from the ritual clockwise cyclic dance around the perimeter of a sacred circle. Helen Raphael Sands writes that the spiral dance most often associated with the labyrinth is performed in a group in which the dancers link hands. Called “*Tsankonikos*, meaning ‘from Tsakonia,’ a town in the Peloponnese,” the dance is “connected with the labyrinth and *Geranos*, the Crane Dance that Ariadne is said to have taught Theseus on the island of Naxos after their escape from Crete” (Sands 2001: 70). Thus, it is clear from Artress, Starhawk, and Sands that the ancient symbol of the labyrinth has taken on a new life in women’s religious practices.

Ladakh Buddhism

The harvest lies in golden stacks in the terraced fields. Rooftops are bright orange with apricots drying in the sun. Across the valley, a monastery clings to the side of a mountain. Above, rocky slopes rise to the snows of a glacier. This is Ladakh or “Little Tibet.” I first came to this remote region in the Indian Himalayas in 1975. I found a culture so harmonious, so attuned to the needs of people and the environment, that it was unlike anything I had ever known. The Ladakhis exhibited an exceptional sensitivity in managing their environment and a keen awareness of their place in the natural order.

I had never before met people who seemed so emotionally healthy, so secure as the Ladakhis. The reasons are, of course, complex and spring from a whole way of life and worldview. But I am sure that the most important factor was the sense of being part of something much larger than oneself, of being inextricably connected to others and to one’s surroundings. The Ladakhis belonged to their place on Earth. They were bonded to that place through intimate daily contact, through knowledge about their immediate environment with its changing seasons, needs and limitations. They were aware of the living context in which they found themselves. The movement of the stars, the sun and moon were familiar rhythms that influenced their daily activities.

This sense of interconnectedness, in large part, emanated from the Ladakhis’ Buddhist beliefs and practice. Even today, everything in Ladakh reflects its religious heritage. The landscape is dotted with walls of carved prayer stones and *chortens*, fluttering flags whisper prayers to the winds and always, on some distant height, rise the massive white walls of a monastery. Buddhism has been the traditional religion of the majority of Ladakhis since approximately 200 B.C.E. Today all sects of Tibetan Mahayana Buddhism are represented, under the overall spiritual leadership of His Holiness the Dalai Lama.

The villages where I have lived are Buddhist, but in the capital almost half the population is Muslim. In addition, there is a small group of Christians numbering a few hundred. Relations among these three groups have changed in recent years, but when I arrived in 1975 they all showed profound mutual respect and an easygoing tolerance.

Emptiness and Interdependence

One of the central elements of Buddhism is the philosophy of *sunyata*. The use of the term “emptiness” or “nothingness” to define *sunyata* has led many Westerners to think of Buddhism as nihilistic. Yet, we are not being asked to deny the “existence” of the world, but to alter our perception of it. Tashi Rabgyas, one of Ladakh’s leading scholars, explained it to me like this:

Take any object, like a tree. When you think of a tree, you tend to think of it as a distinct, clearly defined object, and on a certain level it is. But on a more important level, the tree has no independent existence; rather, it dissolves into a web of relationships. The rain that falls on its leaves, the wind that causes it to sway, the soil that supports it – all form a part of the tree. Ultimately, if you think about it, everything in the universe helps make the tree what it is. It cannot be isolated; its nature changes from moment to moment – it is never the same. This is what we mean when we say things are “empty,” that they have no independent existence.

It is said that the universe is like an endless river. Its totality, the unity, does not change, yet at the same time it is in constant motion. The river as a whole exists, but you cannot say what it consists of; you cannot stop the

Ladakh Project

In 1975, Helena Norberg-Hodge established the Ladakh Project to help counteract the negative effects of conventional development in Ladakh. She eventually founded the International Society for Ecology and Culture (ISEC), which now has branches in the United States, United Kingdom, Germany and Ladakh. ISEC acts as the parent organization for the Ladakh Project, while also running a number of other programs aimed at promoting locally based alternatives to the global consumer culture.

The Ladakh Project has worked with thousands of Ladakhis in hundreds of villages to help strengthen and rebuild the local economy and cultural self-esteem. ISEC provides Ladakhi leaders with information about the impact of conventional development on other parts of the world while exploring more sustainable patterns of development in Ladakh itself, based on the use of local resources and indigenous knowledge. Genuine information exchange between cultures is part of what Norberg-Hodge calls “counter-development” – countering development myths with accurate information about its impacts.

ISEC’s “counter-development” work includes collaborating with a number of Ladakhi organizations, many of which ISEC helped to establish. With the Ladakh Ecological Development Group (LEDG), ISEC set up one of the largest renewable energy projects in the “developing world.” Through establishing the Centre for Amchi Medicine and assisting The Amchi Association, ISEC also been helping Ladakh’s traditional doctors, or *amchis*, to keep their ancient knowledge alive. ISEC also works closely with the Women’s Alliance of Ladakh (WAL), a rural women’s organization, which now has over 5000 members from around the region.

During the tourist season ISEC runs daily workshops as part of the Tourist Education Programme. The workshops are focused around a showing of the film *Ancient Futures* (an award-winning film based on the book by Norberg-Hodge) followed by a facilitated discussion. These workshops help tourists to see beyond surface impressions of Ladakh and associate the changes they see in their own communities with the same economic forces that are eroding Ladakhi culture and sustainability. ISEC also sponsors Ladakhi community leaders to come to the West on “Reality Tours,” which serve to balance the glamorized image of modern, urban life that is spread through advertising, television and tourism.

ISEC’s Ladakh Farm Project offers the opportunity for foreigners of all nationalities to live and work with Ladakhi families for a month during the summer. For participants, the project provides invaluable insights into both the strengths of the traditional culture and the forces threatening to undermine it. For Ladakhis, having

foreigners show such interest in their way of life reinforces a sense of pride in their culture, which, because of the widespread images of the Western consumer culture, many now look up upon as primitive and backward.

Similarly, these foreigners often reveal a growing interest in the West in spiritual values which also helps to strengthen Ladakhi self-respect. This work encourages the young people of Ladakh to maintain respect for their own religion, which in turn helps to counteract feelings of alienation and inferiority.

In part because of ISEC's work, a new sense of confidence has emerged in Ladakh and development is now seen in a different light; while in the world outside, the story of Ladakh helps to highlight some of the foundations necessary for a sustainable future for us all.

Helena Norberg-Hodge

flow and examine it. Everything is in movement and inextricably intertwined.

Living Religion

In traditional Ladakh, religion permeated all aspects of life, inseparable from art and music, culture and agriculture. People were deeply religious. Yet, from a Western point of view, they appeared strangely casual about it. This apparent paradox struck me particularly strongly in 1976 when his holiness the Dalai Lama came for a visit – the first one in many years. For months before, the sense of anticipation grew. People painted their houses, printed prayer flags, and stitched new clothes, they even dismantled their elaborate headdresses washing the turquoises and corals and refurbishing the felt backing with bright red cloth. It was to be the Great Wheel, or Kalachakra,

Initiation, performed on the banks of the Indus. Long before the event, villagers from all over Ladakh started streaming in, some coming by bus or truck, thousands more walking or riding for days to reach the capital.

By the middle of the week-long teaching, the numbers had swelled to forty thousand. The air was charged with intense devotion, and yet amazingly at the same time there was almost a carnival atmosphere. One minute the man in front of me was lost in reverence, his gazed locked on the Dalai Lama; the next he would be laughing at a neighbor's joke; and a while later he seemed to be somewhere else, spinning his prayer wheel almost absentmindedly. During this religious teaching – for many of those present, the most important event in their lifetime – people came and went, laughing and gossiping. There were picnics and everywhere children – playing, running, calling out to each other.

Attending the ceremonies was a young Frenchman named Mcleod Ganj who had studied Buddhism in Dharamsala, the Dalai Lama's residence in exile. He took his new religion very seriously and was shocked by the Ladakhis. "These people are not serious. I thought they were supposed to be Buddhists," he said scornfully. Even though I knew there was something wrong about his reaction, I was not sure how to respond. I too

had grown up in a culture in which religion was separated from the rest of life. It was something a small minority did on Sunday mornings, solemnly and seriously, but that was all.

In Ladakh on the other hand, the entire calendar is shaped by religious beliefs and practices. The day of the full moon, which always falls on the fifteenth of the Tibetan lunar month, is when the Buddha was conceived, attained enlightenment and died. Every other week of the month also has religious significance. The tenth day, for instance, marks the birthday of Guru Rinpoche, who brought Buddhism to Tibet from India. On this day villagers gather in one another's houses to eat and drink while reading religious texts. For *nyeness*, in the first month of the Tibetan calendar, people assemble to fast and meditate together in the *gongpa*, or monastery. On holy days, the family often prints new prayer flags. Cloth in the five holy colours – red, blue, green, yellow and white – is pressed onto inked carved wooden blocks. The new flags are placed on top of the old, which are never removed, but left slowly to disintegrate, spreading their message on the winds.

Every house is filled with reminders of the region's Buddhist heritage. The kitchen stove is decorated with *spallbi*, an elaborate knot with no beginning and no end – the knot of prosperity. It is one of the eight lucky symbols of Tibetan Buddhism, which are often depicted in frescos in the guest room. In addition to the prayer flags strung from corner to corner on every rooftop, there is often a large flagpole in front of the house. This *tarchen* signifies that the house chapel contains all sixteen volumes of the basic Mahayana text, the *Prajnaparamita*, or books of "perfect wisdom." On one of the exterior walls, you may also see a little balcony with three *chortens* (stupas) – one orange, one blue, and one white – symbolizing wisdom, strength and compassion.

Symbols from earlier indigenous religions have also been incorporated into present-day Buddhism. On the roof is a *lhato*, a little chimney of mud topped with a bunch of willow branches and a wooden arrow. This is for the protective deity of the house. It contains a vessel filled with grains, water and precious metals that are changed every New Year to assure continued prosperity.

The Role of Monasteries

On a broad societal level, monasteries provided "social security" for the community, ensuring that no one went hungry. If an individual family found itself with too many mouths to feed, any number of sons – usually the younger ones – became monks. In the monastery they were provided for by the community in exchange for religious services. The process of give and take between the monastery and village sustained a rich cultural and religious tradition.

On a number of occasions throughout the year, the monasteries are home to important ceremonies and festivals involving several days, even weeks of ritual and prayer. During Yarnas, which takes place in summer, the monks stay indoors for up to a month,

to avoid unwillingly treading on and killing insects. One of the biggest events of the year is the Cham dance, during which the basic teachings of Vajrayana Buddhism are enacted in theatrical form and an effigy of the enemy of all people – the ego – is ceremoniously killed. Hundreds, sometimes thousands, of villagers from all around would come to watch the monks dancing in splendidly colourful masks, representing various figures of the Tibetan pantheon, all of which have a deeper symbolic meaning.

Wisdom and Compassion

For me, the most profound expression of Buddhism in traditional Ladakh lay in the more subtle values and attitudes of the people, from the simplest farmer to the most educated monk. The Ladakhi attitude to life – and death – seemed to be based on an intuitive understanding of impermanence and a consequent lack of attachment. Again and again I was struck by this attitude in my Ladakhi friends. Rather than clinging to an idea of how things should be, they seemed blessed with the ability to actively welcome things as they are. The conception of reality was circular, one of constant returning. There was not the sense that this life is the only opportunity. Death is as much a beginning as an end, a passing from one birth to the next, not a final dissolution. Unlike in the West, “good and bad,” “fast and slow,” “here and there” were not seen as sharply different qualities. In the same way, Ladakhis did not think in terms of fundamental opposition, for instance between mind and body or reason and intuition. Ladakhis experience the world through what they call their *semba*, best translated as a cross between “heart” and “mind.” This reflects the Buddhist insistence that Wisdom and Compassion are inseparable.

Modernization

When I first arrived in Leh, the capital of Ladakh, it was a lovely town. It had only two paved streets and a motor vehicle was a rare sight. Cows were the most likely cause of congestion. The air was crystal clear, so clear that the snow peaks on the far side of the valley, 30 kilometres away, seemed close enough to touch. Within five minutes’ walk in any direction from the town centre were barley fields, dotted with large farmhouses. Though it was a district capital of 5000 people, Leh had the feeling of a village; everyone greeted each other.

In the last three decades I have watched the capital of Ladakh turn into an urban sprawl. Now the streets are choked with traffic, and the air tastes of diesel fumes. “Housing colonies” of soulless, cement boxes have eaten into the green fields and spread into the dusty desert, punctuated not by trees but by electricity poles. Piles of rusty metal, broken glass and discarded plastic packaging fill the gutters. Billboards advertise cigarettes and powdered milk. The once pristine streams are polluted, the water

undrinkable. For the first time, there are homeless people in Ladakh and crime is increasing.

This sudden modernization of Ladakh brought many economic changes which led to an increasingly centralized and urban society, and in which job opportunities became scarce and power was in the hands of a few. Competition for jobs and political representation therefore increased and this started to divide the previously peaceful Ladakhi society. Ethnic friction between local Buddhists and Muslims – unheard of previously – escalated to open violence in 1989.

The influx of Western influence also brought with it glamorized images in the media of a Western consumer culture. The impressions from films and advertisements were of a life with almost infinite wealth and leisure. This one-dimensional view caused young people to feel that their rural lifestyles were shameful and backward. This led to a rejection of their own culture and a desire to imitate the consumer culture.

In traditional Ladakh I knew a society in which there was neither waste nor pollution, a society in which crime was nonexistent, communities were healthy and strong, and a teenage boy was never embarrassed to be gentle and affectionate with his mother or grandmother. As that society begins to break down under the pressures of modernization, the lessons are of relevance far beyond Ladakh itself. We urgently need to steer toward a sustainable balance – a balance between urban and rural, male and female, culture and nature. The Buddhism that has shaped the culture of Ladakh – teachings of interdependence and wisdom and compassion – can help lead us in the right direction toward a more sustainable and harmonious future.

LaDuke, Winona (1959–)

Winona LaDuke is an enrolled member of the Bear Clan Mississippi Band of the Anishnabeg. Author, environmental activist, and two-time Green Party vicepresidential candidate, all of her numerous roles are directly informed by Anishnabe religion and culture. Hers is a land-based understanding of the world, and her particular land base is that of the forest of the White Earth Reservation in Northeastern Minnesota (USA). From her successful struggle against James Bay's hydro-electric development in the 1980s, to her ongoing reclamation of lost land for White Earth Reservation, LaDuke has become an international voice for indigenous environmental activism.

Born in 1959, in East Los Angeles, to Vincent (a.k.a. Sun Bear) and Betty (Bernstein) LaDuke, she left the west coast to get her Bachelor's degree from Harvard University in Native Economic Development, later receiving a Master's in Rural Development from Antioch College. It was at Harvard, at the age of 18, that she encountered and became active in Native American political activism. She is her father's daughter in terms of her identity and culture; she moved to the White Earth Reservation, where her father was born and raised, in 1981, where she has since remained, and immediately became involved in the community and its struggles. She eventually founded the Honor the Earth Fund, an organization that funds indigenous environmental activism, and the White Earth Land Recovery Project. Sun Bear became a spiritual guru of sorts, attracting a mostly white audience, while receiving criticism from some Native Americans who resented his capitalizing on their sacred ways. Like her father, she serves as a conduit between native and white cultures, most obviously as Green Party Vice-Presidential candidate in 1996 and 2000, and as a representative of indigenous communities around the world to white society. Yet, unlike her father, LaDuke believes that each culture and community must develop its own ways and stay true to them. While not explicit in any criticism of Sun Bear, LaDuke's own philosophy and practices betray a clear deviation from and disapproval of his behavior; for LaDuke, different communities can and should work together yet must always remain distinct.

LaDuke and the Anishinabe see the need for a diversity of perspectives; there is not even a single Native American perspective. To maintain its integrity and power, each community must have its own ways, which must be based on the land on which that community lives. LaDuke's religion and culture are directly related to her activism; she asks: How can a forest culture exist without a forest? As an Anishinabe, she believes activism should be community-based, that is, it should be land-based, a point argued in *All Our Relations: Native Struggles for Land and Life* (1999). As the title indicates,

LaDuke and the Anishinabe believe the entire natural world is related to humankind and is animate (i.e., alive and with spirit) and should be treated accordingly.

For LaDuke, indigenous worldviews and ways of life are fundamentally different from the dominant contemporary American worldview. The native worldview asserts the authority of what she calls “Natural Law,” which is the highest law, trumping all others. This “Natural Law” is cyclical and dictates a state of balance that results in sustainability, whereas “Industrial Law” is linear and ultimately destructive. In contrast to industrial society’s treating of symptoms alone, “Natural Law” advocates a systemic approach that searches out the sources of problems and recognizes the interconnectedness of all things. LaDuke sees the contemporary source of environmental and social problems as industrial culture’s insatiable consumption, and works to turn society away from that accumulation-based thought and conquest-driven behavior toward a system of conservation and harmony governed by “Natural Law.”

LaDuke is an advocate of decision making based on the teachings of the Six Nations Iroquois Confederacy, which stipulate that all actions should be considered in light of their impact on the seventh generation from now. The influence of this can be found in her own environmental activism and observed in her novel *Last Standing Woman* (1997), a recounting of seven generations of Anishnabeg.

Lake Pergusa (Sicily)

In the center of the Italian island of Sicily, in a place that was known in antiquity as Sicily's "navel," lies one of the world's most remarkable natural and cultural wonders: Lake Pergusa. A salinated body of water, it has turned deep red approximately every 15 to 20 years during the past century as a part of a dramatic biochemical cleansing process. Its reedy banks also serve as a major resting place for migrating and wintering birds coming from all over Europe.

Hailed in the literature for more than two thousand years as a marvel of flora and fauna, the lake was considered by the Romans to be the mythological spot where the goddess Persephone was abducted into the underworld, and was the site of an important religious center dedicated to the grain deity Demeter and her daughter Persephone during the period of Greco-Roman colonization of the island. Today, Lake Pergusa faces an environmental threat from an auto racetrack that has been built around its entire three-mile perimeter.

Natural History

Located in the Province of Enna, five miles from the mountain town of Enna in a vast grain-growing region of Sicily, Lake Pergusa is one of only two natural lakes that remain on an island that was famed in antiquity for its wetlands. From a geological standpoint, Pergusa's basin is tectonic in origin, meaning that it formed eons ago due to the sudden sinking of the Earth's rock layers. The lake is fed only by rainwater and tricklings coming from the subterranean levels, which carry minerals that make its waters slightly salinated and sulfurous. Italian scientist Sergio Angeletti has noted, "This lake represents a marvelous example in microcosm . . . of the formation of the ocean four to five million years ago" (Angeletti in Cimino 1985: 1).

The lake periodically undergoes a remarkable reddening phenomenon due to the presence of a red, sulfuroxidizing bacteria (*Thiocapsa roseopersicina*) that lives in its waters. During summer months of years in which the sulfur content reaches a critical level, the bacteria proliferate to such an extent that the lake's waters turn either partially or entirely a deep red color. Over a period of several weeks, the bacteria act to reduce the sulfur level; they, in turn, are eaten by a tiny, transparent crustacean, and the lake returns to its normal color. The phenomenon, which has only been documented since the twentieth century, was studied in 1932 by Italian scientist Achille Forti, who dubbed Pergusa "the lake of blood" (Forti 1932: 36–86). Sicilian environmentalists are

not sure whether this occurrence is part of the lake's natural cleansing process or a response to environmental distress, therefore it is not known how long the reddening has been taking place.

Lake Pergusa is a major wet zone in central Sicily and an important resting and wintering spot for migratory birds from all over the Mediterranean. The lake is the most important area in Sicily for the wintering of ducks and coots, hosting, on average, approximately 50 percent of the total number of water birds found in all other Sicilian natural lakes and artificial basins. Swans, herons, flamingos, and cranes, are among the many other water species that have made Lake Pergusa their home.

Religious History

The discovery of the archeological site known as Cozzo Matrice, whose name means "Hill of the Mother," has provided abundant evidence that Lake Pergusa was once the location of an important religious center dedicated to female deities going back at least as far as the Bronze Age. This plateau, located less than a quarter of a mile from the lake, has revealed ceramic material dating to as early as 4000 B.C.E., as well as a settlement featuring circular and elliptical huts overlooking the lake, dating to 2500 B.C.E. Such circular kinds of enclosures, which archeologist Marija Gimbutas has noted were constructed throughout Paleolithic and Neolithic Europe for ritual purposes to symbolize the "womb" of the female divinity, suggest that this site was probably sacred to a goddess or goddesses from very early times. A Bronze Age layer (ca. 1700–1300 B.C.E.) has furnished a great deal of cult-related material.

A later Greek layer, dating to the fifth century B.C.E., during the height of the Greek colonization of the island, has revealed the stone remains of a sanctuary and statuettes of the goddess Demeter, or possibly Persephone, as well as other sacred objects. At other villages near the lake

– Zagaria, Juculia, and Jacobo – statuettes representing Demeter and Persephone have also been found dating from the sixth to third centuries B.C.E. The religion dedicated to these two goddesses was characterized by elaborate festivals celebrating Sicily's agricultural cycle, particularly as it related to the production of wheat and barley, as well as mystery rites centering on the human seasons of birth, growth, death, and reincarnation. While Demeter was the goddess of growth and abundance, Persephone was a goddess of both budding spring and death/the underworld. Archeologists generally agree that the indigenous Sicilians at Lake Pergusa, and up in the nearby mountain town of Enna, easily adopted this Greek religion because it probably resembled their own native tradition.

In antiquity, Lake Pergusa was only one of many craters of water fed by underground streams that were a unique part of the Sicilian landscape. Regarded with fascination, such craters were associated with the underworld. The religious connection between Lake Pergusa and the nether realms is particularly strong in the work of Ovid, who,

writing in the first century during the period of Roman occupation of the island, named it as the precise place where the goddess Persephone (the Roman Proserpina) was separated from her mother, Demeter (the Roman Ceres), abducted by Hades (the Roman Pluto and lord of the underworld), and taken to his subterranean abode, where she became his bride.

In *The Metamorphoses*, Ovid further described Lake Pergusa as a remarkable place filled to profusion with water birds and wildly blooming flowers. The historical veracity of his description is confirmed by Enna's historian Enrico Sinicropi, who as recently as the 1950s similarly described the lake as "an Eden . . . part of a powerfully enchanted panorama where dream is easily confused with reality" (Sinicropi 1958: 72).

Many of Lake Pergusa's natural characteristics – its subterranean streams, water birds, and flowers – undoubtedly had deep religious significance for the ancient dwellers of Sicily, and provide clues as to why Lake Pergusa was probably considered a sacred spot associated with female divinity and the underworld from very early times. The water bird, in its various species, was considered an epiphany of female divinity going back to the Paleolithic and Neolithic periods all over the world. Flowers have also long been associated with the sacred feminine. Moreover, if the lake had been turning red in antiquity, it most likely would have been seen as a living manifestation of the "menstruation" of the female deity, much as appearances of red in nature have been perceived the world over from time immemorial. This element may have led to the lake's association with Persephone, a goddess also of young womanhood and menarche, or first menstruation.

Furthermore, sulfur, one of the minerals in the lake's waters, was considered by the Greeks to be a magical substance associated with the underworld that would drive away the spirits of disease. Sicilian commentator Francesco Potenza Lauria, writing in 1858, noted that Pergusa's waters had many medicinal qualities and could be used to treat afflictions such as hemorrhoids, rheumatism, and skin lesions. Since antiquity, sulfurous bodies of water all over the world have been bathed in and ingested by sick people to treat a host of maladies. One can therefore imagine that Lake Pergusa was similarly used as a pilgrimage site for healing and healing-related rituals.

Environmental History

Today, Lake Pergusa hardly resembles the Eden it once was. In 1957, the Province of Enna began constructing an auto racetrack, known as the Autodrome, around the lake's entire perimeter. Such a project violated laws prohibiting construction so close to a body of water. The concrete and asphalt barrier of the structure prevents the lake from expanding and contracting naturally.

Additionally, waters from the rock layers that would otherwise go to fill the lake basin are continually being drained by two large wells that were built by local authorities in 1963, as well as numerous wells from private houses that have been illegally

constructed around the lake in the last several decades. The lake has progressively become filled with sediment, vegetative residue, and polluting run-off from the Autodrome. Every year, it continues to dry up. Before 1860, its maximum depth was approximately twenty-one feet; today it is less than three. Its perimeter, which measured five miles at the beginning of the nineteenth century, is now less than three. Lake Pergusa is disappearing.

The wildlife around the lake is also in decline. Pollution, along with hunting and fishing, have resulted in the profound diminution of the populations of aquatic birds that nest there, as well as most of the species of fish that once filled its waters. Many of the species once found in and around the lake have disappeared.

A crusade to save Lake Pergusa began in 1980, when Maria Cimino, a Sicilian native and long-time resident of Enna, founded the Enna chapter of the World Wildlife Fund. Cimino has been working tirelessly to see that the lake is restored and that the Autodrome is removed from its banks, despite political resistance from the racetrack's promoters, who include local political decision-makers and – many citizens privately contend – those involved in organized crime. She has received anonymous phone calls threatening her with death unless she ceases her environmental activism, and has been the subject of unflattering graffiti on public walls.

Cimino successfully campaigned to have hunting prohibited at the lake and, in 1991, to have the lake and its environs declared a “natural reserve” of the highest status. However, for every victory she and a handful of environmental allies have achieved, there have been new setbacks. For example, in 1995, the regional government of Enna downgraded the status of the reserve from “total” to “special” in order to bypass certain laws. Illegal activity involving building around the lake has continued to be authorized by local politicians, and the regional Minister of the Environment has frequently neglected to intervene, despite protest by activists. Proposals that Cimino has submitted suggesting activities and projects for turning Lake Pergusa into an eco-tourist attraction have been ignored.

“I believe that Lake Pergusa is an immensely sacred place,” Cimino said to reporter Sylvia Poggioli, in a story on Lake Pergusa that ran on America's National Public Radio in March 2001. Cimino herself is a practicing Buddhist, as are several other activists working to save the lake. This small group has conducted several *Sur Ngo* ceremonies – Tibetan Buddhist offerings to the local spirits

– on behalf of the lake over the past several years. Since 1996, a growing number of Americans of Sicilian descent who are involved in the neo-pagan and women's spirituality movements have become interested in the lake as a sacred locale, as well, and have similarly conducted prayers for the lake's survival both on site and at various places in the United States. Among these individuals are Italian Americans who practice “stregoneria,” or Italian witchcraft, which many claim to be a survival of Italy's pre-Christian religions dedicated to Demeter, Persephone, and other Greco-Roman deities. One American scholar, Marguerite Rigoglioso, has organized an activist cam-

paign on the lake's behalf in the United States and has created a website to support the environmental effort.

Meanwhile, Cimino has persisted in her activism. In 2001, she created a "Scientific-Technical Committee to Save Lake Pergusa," which includes experts from many disciplines whose expertise could be applied to an eventual restoration project. The World Wildlife Fund Enna has submitted a request to the European Community to provide international funds for the lake's restoration, and Cimino's committee has solicited proposals from the Italian and international scientific and technical communities for projects to remove the racetrack and restore the lake basin and its vegetation. The committee is now seeking government approval and public and private funding to enact these projects.

The total desiccation of Lake Pergusa would be an environmental catastrophe for an agriculturally important island that, in the past two centuries, has already experienced the loss of many of its lakes, rivers, and springs – as well as much of its rainfall – due to deforestation. As Pergusa continues to shrink, the most important event taking place at the Autodrome may well be the race against time. Meanwhile, Persephone's sacred lake, which may well be claimed in part by the Mafia, serves as a striking living metaphor for the "abduction" of nature at the hands of the contemporary "underworld."

Marguerite Rigoglioso

Lakota

The Lakota, (known historically as the Teton, Sioux and Dakota) are composed of seven tribes: Oglala (They Scatter Their Own), Sicangu (Burned Thighs, also known as Brule), Oohenunpa (Two Kettles), Itazipco (Sans Arrows, Without Bows), Hunkpapa (End of the Camp Circle), Sihasapa (Blackfeet), and Mnicowojou (Planters by the Water). As they moved west out of Minnesota, they became nomadic hunter-gatherers whose resource base included a large number of game animals, particularly the buffalo, but also elk, deer, and other mammals, as well as seeds, fruits, roots, and tubers. They also traded or raided for agricultural products such as corn and squash with the native peoples to the east. The appropriation of the horse after European incursion to the Americas extended their geographical range and increased their food supply. Rifles increased successful hunting of fur-bearing mammals and allowed the Lakota to engage in the fur trade as early as the second half of the eighteenth century. This trade expanded as late as the 1850s.

Anthropology and Lakota oral tradition provide a variety of explanations for the origins of the Lakota and their geographical location on the Plains. According to Lakota oral history, the Lakota emerged from under the Earth in the Black Hills, the spiritual center of their universe, and were the first people in existence. The Black Hills, along with other locations, are therefore part of a sacred geography that encodes Lakota oral and written history and to which important pilgrimages continue to be made.

According to archeology, linguistics and ethnohistory, the Lakota, not yet differentiated into their current political configuration, came to the western Plains from what is now southern Wisconsin, southeastern Minnesota, and northeastern Iowa. They migrated to the Plains by the latter 1700s. The western migration of the Lakota was a response to European immigration that pushed tribes such as the Anishnabe (Ojibwa) further west as well as an attraction to abundant game, especially the buffalo, a key spiritual and nutritional resource with which they have a special relationship. The decline of buffalo numbers, as well as of other game and vegetal resources, was due to overhunting, deliberate destruction of food resources to restrict the movement of the Lakota and other Plains groups, and disruption of habitat and loss of grazing land through European immigration and then settlement.

This decline was apparent by the 1840s, and the buffalo all but disappeared from the Western plains by the time of the last hunt in 1883. At the same time the United States began restricting the Lakota to reservations in violation of earlier treaty agreements. Lakota lands were further diminished through government legislation (the Allotment

Act), which assigned specific amounts of land to individual Lakota and sold off “surplus” lands. This policy continued up until the 1930s.

The Lakota have no word for religion. Belief in and interaction with the sacred are not restricted to certain times, places, or activities, in contrast to Western belief systems in which sacred and profane are important binary oppositions. The Lakota held and continue to hold that all is sacred (*wakan*), although certain objects, activities, and even persons are imbued with more of this sacrality than others. This sacrality can also be sought and obtained by such means as prayer, fasting, self-sacrifice, and generosity. Thus, all of nature is sacred, while certain places, events, and relationships may be more sacred than others. Thus many contemporary Americans see the world in terms of sacred times and non-sacred times and attempt to draw a careful distinction between Church and state while Lakota do not make these divisions. To express these different worldviews, some Lakota say that Whites have “religion” while Lakota have “spirituality.”

The Lakota believed and continue to believe that maintaining moral bounds, expressed as doing things “in a good way” is key to success in hunting and in all of life’s endeavors. The Lakota did not and do not live in a world of total ecological harmony or mystical participation with all beings: rather they seek balance in the world through reciprocity. At the same time the Lakota remain highly pragmatic in determining causes for disasters in the world, such as the near-extinction of the buffalo, and seek remedies that will serve the needs of future generations.

According to Lakota oral history, the Lakota were granted their spiritual and social organization from a sacred person, the White Buffalo Calf Woman, who gave the people, at a time of starvation, the sacred pipe along with a promise to teach them the rituals and morality required for living as a united group. This pipe links the Lakota to the buffalo as generous relatives who would give their very lives to sustain their kin. The Lakota’s buffalo relatives would express familial generosity by providing food and many other useful products.

Religious revelation through personal quest, dreams, and visions remains an important part of this highly charismatic belief system. Thus Lakota spirituality is not a static set of dogma and precise rituals, locked in a past that can only be duplicated. Rather, it is a dynamic belief system, respectful of and linked to past practices but highly adaptive in addressing contemporary needs. Spiritual leadership comes through the spiritual and life experiences of individuals who take up these roles for the good of the community. Their authority is affirmed by their success in prayer, their good lives, and the allegiance of others who also seek the “*wakan*” (holy) through their leadership. While the belief system is unified by a common set of rituals and key symbols, there is freedom for individual variation and innovation, always monitored by elder spiritual leaders and general participants.

The key metaphor for Lakota culture is kinship or relatedness. Thus the term “to pray” is also the term used to address someone as a relative. The Lakota see their relationship to their relatives, whether through blood, marriage, or adoption as a sacred

responsibility. This kinship extends not just to humans but, most importantly, to the entire universe. Ritually, the Lakota re-create the sacred cosmos that is coterminous with the natural and supernatural world through marking out and praying toward the cardinal directions, the heavens and grandmother Earth (*unci maka*). Colored flags and the arrangement of participants in a circle make physical this cosmic map. Rituals call on “*wakan*” entities to help the participants in various tasks and trials. Voluntary suffering and flesh offerings are offered in exchange for this divine patronage. Lakota stress that spirituality should not be used to enhance one’s own prestige. Rather, spirituality and ritual should benefit relatives, and indeed the entire universe. One frequently hears prayers for the protection of creation, the cessation of pollution, the survival of endangered species, peace in troubled areas of the world, and harmony in the universe. Lakota will also frequently stress that all peoples pray to the same God, and, while maintaining their distinctive beliefs and rituals, also see a unity of all spiritual traditions expressed in their own spiritual hospitality. Lakota prayers are ended with “*Mitakuye Oyasin*,” a prayer for “all my relatives,” which includes the cosmos.

Lakota do not treat these religious aspirations as poetic spiritual expressions. Spiritual commitment must be carried out through action. They disdain outsiders who come to the reservation to engage in romantic spiritual escapism, because such outsiders are not enveloped in the Lakota kinship network sewn together by complex ceremonial and practical obligations and exchanges.

“Ecology” is a relatively recent formulation that does not appear as a social and spiritual movement in the early descriptions and transcriptions of Lakota beliefs as such. Throughout their history and especially during the period of White contact, the Lakota were certainly and acutely aware of issues now labeled as ecological. Some of the issues they faced were conservation of faunal and

floral resources, and, with the coming of Whites, new catastrophic diseases, diminution of their land base, reacquisition of resources such as water, timber and land, preservation of spiritual resources, and care for a rapidly increasing population.

The Lakota recognize that their beliefs and rituals have diffused to other native and non-native groups. In contemporary discussions of their own culture, Lakota move between the poles of universalism and particularism in dealing with the spread of their beliefs. For example, the four colors used in rituals to symbolize and mark out the four directions of the universe are also interpreted today to represent the four “races” of humanity: red, white, yellow and black. At the same time there is lively debate over how far non-Lakota and especially non-Indians should enter into the ritual life of the Lakota. Universalists argue that because the four colors are included in a sun dance or a sweatlodge or a *yuwipi* all people must be welcome; others hold that these “ways” were given particularly to the Lakota and can only properly be used by the Lakota. Particularists point to numerous examples of exploitation of Lakota rituals for money or individual prestige. Between the poles of exclusion and inclusion, particularist and universalist, there is a gradient: many Lakota welcome non-Indians provided they are respectful, do not try to assume leadership roles or try to control the ceremonies, and

do not begin conducting the ceremonies on their own. Some Lakota will give ceremonial leadership for specific rituals to non-Indians: others maintain a total prohibition of non-Indian involvement, excluding even the observation of spiritual events. Essential for participating in Lakota ceremonies are the relationships one has developed with the praying community. When one is welcomed at a ceremony, it is because of relationships that have already been established and which all parties wish to be strengthened.

Lakota spirituality is not restricted to interaction with spiritual beings or the classic rituals so well known to the outside world: sun dance, sweatlodge, vision quest, yuwipi, keeping of the soul, making relatives, lowanpi, throwing of the ball, buffalo sing. Belief extends to medicinal practices that combine practical cures with spiritual inspiration, to hunting, and even to warfare. Interaction with family members is a sacred duty; children, the elderly, and the disabled are traditionally highly sacred personages and are to be reverently cared for. Treaties, especially the Fort Laramie Treaty of 1868 are considered sacred, as are certain geographical locations. The illegal confiscation of the Black Hills cannot be compensated for by the U.S. government's offer of a monetary settlement; contemporary Lakota are to regain territory that is rightfully theirs, not because of its real-estate value but because of its spiritual meaning.

Participation in Lakota spirituality is increasing in visibility and number of participants as more and more

Lakota leave Christian denominations to return to Lakota practices or publicly combine both Lakota and Christian beliefs. The complex set of Lakota beliefs generally referred to as "traditional" stresses the connectedness of all reality and the importance of respect and generosity in dealing with a universe of relatives and relationships. At the same time, contemporary Lakota have inherited a daunting set of challenges including the traumatic legacy of nineteenth-century warfare; the loss of land and subsequent restriction to diminished reservation areas; forced assimilation and loss of language promoted by Church and state; and an increased population suffering from poverty, poor diet, new diseases, and alcoholism, with very little healthcare.

To address such challenges, Lakota spirituality incorporates not only rituals and prayer but also legal action by tribal agencies and grassroots groups dealing with sovereignty, environmental protection, forestry, water purity, and restoration of buffalo herds on reservation lands. Protests, political action, and alliances with individuals and groups who can assist them, provide an ongoing reinvigoration of Lakota spirituality and culture (elements which Lakota do not separate) on its path to wholeness. Today, the spiritual force of Lakota traditional practice combines with the pursuit of sound ecological practice to produce a sense of connectedness with and responsibility to a universe of interrelationships that should be honored and fulfilled with generosity. The goal of these interrelationships is summed up by the Lakota term *Wolakota*: to be in right relationship with all of creation. Through relationship the Lakota pursue a future of ecological integrity that is, at root, a spiritual endeavor to care for all relatives with generosity.

Lakota Sun Dance

Lakota people gathering for the annual Sun Dance of the Wakpamni Lake community on Pine Ridge Reservation in South Dakota would not be likely to say the words “nature,” “environment,” or “ecology.” These words would be perceived as terms belonging to the discourse of the dominant culture, and it would be routine for traditional Lakota people to suspect that such words would be employed to extend and maintain colonizing policies toward indigenous peoples and their plant and animal relatives. While Sun Dancers at Wakpamni clearly recognize that they are participating in a ceremony once belonging to nineteenth-century ancestors who lived as prosperous buffalo hunters on the northern plains, their participation in the Wakpamni Lake Sun Dance is no nostalgia trip, no reenactment of a once-glorious past. It is an intense engagement with the present in which their ancestral relatives such as the eagle nation and buffalo nation, along with the rock people and tree people, are fully interactive with the human community gathered for this renewal of life’s fundamental relationships. These contemporary-traditional Lakota people also know implicitly that the utilitarian ethos of the dominant culture, which is founded on the paired belief in individualist subjectivity and an objectified “natural” world, represents an outlook that is decidedly antithetical to the ceremonial meaning of Sun Dance. Therefore, Sun Dancing is an act of cultural and political resistance to the aggressive force of the dominant culture in the present moment, and it represents continuity with many past moments of such resistance.

The dominant North American culture perceives Lakota Sun Dancing as so utterly “other” that it serves as a primary signifier of an indigenous difference that is both exotically fascinating and fundamentally threatening.

Both Canadian and United States governments took legal steps to suppress Sun Dancing in the late nineteenth century, and full liberty to practice Lakota Sun Dancing was not regained until after the mid-twentieth century. Sun Dance represents the clash between the colonizing (“civilizing”) interests of European-derived cultures bent on conquest of the “land” and the holistic outlook of indigenous peoples focused on keeping kinship with their plant and animal relatives. The extraordinary revival of Lakota Sun Dancing since the 1960s indicates that this conflict between two lifeways is far from over.

Suppression of the Sun Dance in the 1880s and opposition to its renewal in the 1960s centered on the practice of piercing as ethically objectionable to the dominant culture

– it was considered barbaric. Piercing is performed most commonly on the flesh of the upper chest or of the upper back of male dancers and wooden or bone skewers are inserted through the pierced flesh. Thongs at the end of a rope are attached to the skewers and the rope is connected to the central tree (when piercing the chest) or to one or more buffalo skulls (when piercing the back). To dance until the flesh gives way is understood by the dancers to be a voluntary act by which a ritual reciprocity with the spiritual powers of the universe is carried through so that life-enhancing benefit ensues for the entire kinship system of the dancers – recognizing that such a system extends eventually to the whole created order. Lakota holy men told James R. Walker in 1896 that female dancers were not pierced. “A man or a woman or a child may dance. But for women and children the dance is done differently. They are not attached to . . . the pole as men are” (Walker 1991: 181). Contemporary female dancers often participate in the reciprocity of piercing by making a “flesh offering” of very small slices of skin taken from the upper arms and ritually presented at the sacred tree in the center.

The piercing of Sun Dancers dramatizes the “otherness” of the Sun Dance, and this “otherness” both attracts outsiders who wish to appropriate an exotic ritual for their own subjective adventures, and offends those for whom religion and ethics are cultural categories of European origin and for whom praying is not a matter of dancing and piercing but of thoughts and rhetoric. The implicit parallelism between the piercing of Sun Dancers and the crucifixion of Jesus as paired instances of vicarious suffering was apparent to nineteenth-century Lakota people, but abhorrent to the culture-bearers of a European Christianity representing the leading edge of “civilizational progress.”

The ethical character of piercing derives from a traditional understanding of hunting as a ritual transaction between related “peoples.” The buffalo people give away their lives to their relatives, the hunters, and the hunters are obligated to emulate their relatives, the buffalo people, with similar acts of generosity, including the ritual reciprocities enacted in the annual Sun Dance. The voluntary flesh-and-blood sacrifice of buffalo relatives is ritually acknowledged by the voluntary flesh-and-blood sacrifice of the Sun Dancers – the wounding of the piercing is a kind of death and the release from the skewers brings regenerative power to the community. Chased-by-Bears, a leader of nineteenth-century Lakota Sun Dances, told Frances Densmore in 1911, “A man’s body is his own, and when he gives his body or his flesh he is giving the only thing which really belongs to him” (in Densmore 1992: 96). Environmental ethics might be construed to be truly compatible with an ethic of piercing that keeps kinship with all the relatives of the environing world. Nevertheless, traditional Lakota people can readily suspect that the acquisitive voice of the dominant culture with its concern about strategies to preserve its dominance may govern even environmental discourse in the form of analyses, calculations, and predictions which are subjective projections by humans regarding orders of being perceived as dependent and subordinate. Unless this voice is perceived by Sun Dancers as the language of kinship or give-away, it is not understood to be truly ethical. To become ethical it must acknowledge that plant and animal relatives have their own moral voice, and this implies an awareness of the

sacredness of such kinship relations and a willing participation in the ritual acts which give embodied expression to this awareness and which sustain the interpersonal bonds of those kinship relations on a cosmic scale.

The ethics of kinship expressed in the give-away of piercing is crucially connected to the noetic dimension of visions and dreams. The classic instance of a Lakota dream-vision is related by Nicholas Black Elk to John Neihardt who published it in *Black Elk Speaks* in 1932. Black Elk's "great vision" came to him at age nine in connection with an illness. His dream-vision takes the form of a shamanic journey to a sky world above the mundane world of earthly existence. Dreams and visions are generically characterized by the power of metamorphosis through which beings and elements in the visionary experience change form in dramatic and revelatory ways. Black Elk's dream-vision is stocked with extraordinary metamorphoses. In an early episode he meets six "grandfathers" who embody the powers of the four quarters of the world along with sky above and Earth below. Each of the six instructs Black Elk, gives him gifts of power, and undergoes metamorphosis into an animal form – the sixth changing into a likeness of Black Elk himself.

In one of his dream-vision episodes, Black Elk describes how the camp of people he is leading transforms into "buffalo and elk and even fowls of the air" (in DeMallie 1984: 126). In an aside to his narrative, Black Elk explains to Neihardt that this metamorphosis means "that the Indian generations have dreams and are like unto the animals of this world. Some have visions about elks, birds, and even gophers or eagles. People will be like the animals

– take the animals' virtues and strengths" (1984: 127). Not only Lakota persons but all humans dream, and the universality of dreaming consciousness with its characteristic signature of metamorphosis fosters the recognition that our kinship relations extend well beyond the strictly human community. Lakota Sun Dancers understand that Sun Dancing engages these kinship reciprocities and opens the door of dreaming consciousness to a psychic depth beyond the merely human.

Many traditional Lakota people are concerned about the diffusion of their Sun Dance to locations beyond their reservations, so that the ceremony is being held in contexts outside the rootedness of a specific Lakota community. Another concern is the inclusion of people whose ancestry and cultural identity is European-derived. Such persons are politely but routinely excluded from becoming Sun Dancers at the Wakpamni Lake Sun Dance, whereas persons with indigenous ancestry from other North American peoples are readily accepted into the ceremony as Sun Dancers. These distinctions point to the way Sun Dance continues to sustain Lakota identity. Despite the end of buffalo hunting by the 1880s and the federal prohibitions instituted at that time, Sun Dance was such a critical factor for Lakota survival that it was maintained clandestinely for most of a century. Today, Sun Dancers continue to dance in the real world of kinship relations and of give-away reciprocities, so that the sacred relatedness of all the powers in the world is renewed. Moreover, Sun Dancing is a way of resisting the unreality of the world of commerce, industrial pollution, commodification of plant and animal

relatives, and corporate claims of responsible environmentalism. To permit persons of the dominant culture to participate as dancers in this ceremony would confuse the resistance character of Sun Dance and dilute its clarity as a cultural signifier.

Dominant-culture persons are not rejected altogether from the ceremony. At the Wakpamni Lake Sun Dance there are a number of roles that are open to male and female persons of European ancestry, including ritual roles. One of these is the handling and smoking of the sacred pipe handed out to the community from the dancers at intervals throughout the ceremony and which signifies the dancer-generated benefit being given away to the larger kinship circle. Another is the opportunity to make a “flesh offering” at the time that community members who are not dancers may offer sacrifice of themselves in the same form as with female dancers which involves small slices of skin taken from the upper arms and presented at the sacred tree in the center. In these ways, the universal scope of kinship relations expressed by the Sun Dance is ritually extended even to dominant-culture persons whose identity is potentially destructive for the kinship relations being renewed.

In an attempt to represent here the voice of Lakota Sun Dancers, it should be noted that they would, on grounds of sound historical precedent, suspect that the discourse operative in the *Encyclopedia of Religion and Nature* will more likely resemble that of the dominant culture than that of an indigenous culture. It follows from this assumption that a voice representing Sun Dance may be expected to justify in these pages its relevance to the environmental issues of said discourse. A suitable rejoinder to this expectation comes from Black Elk in another of his side comments to John Neihardt in 1931.

They [the white men] couldn't get along with us and they did not look after us. The birds and other animals are the only race that we really get along with. We, [the] Indian race, and the beings on this Earth – the buffalo, elk, and birds in the air – they are just like relatives to us and we get along fine with them, for we get our power from them and from them we live. The white people came on this continent and put us Indians in a fence and they put another fence somewhere else and put our game into it. When the buffalo and elk are gone, the Great Spirit will look upon the whites for this and perhaps something will happen (in DeMallie 1984: 127).

Traditional Lakota people would likely conclude that the dominant culture's addiction to a materialist trajectory featuring economic “growth” signifies a profound religious emptiness. Their prescription for this condition, following the religious and ethical logic of Sun Dance, would be a turning to new (or old) dreams and to giveaway dances in the hope of recovering kinship relations and the renewal of the world.

Land Institute

For more than 25 years, the Land Institute has pioneered research in sustainable agriculture, attempting to address (as their publications like to say) the problem *of* agriculture, as opposed to the problems *in* agriculture. That is to say, the Land Institute has been dedicated to the question of how to switch from an agriculture based upon extraction of the Earth's resources to an agriculture based upon preserving those resources.

Co-founded by Wes and Dana Jackson in 1976, the Land Institute's original research project is located on 28 acres of native Kansas prairie, near the city of Salina. Various areas of research include an internship program, a 150-acre Sunshine Farm project neighboring the Land's headquarters, a Rural Community Studies Project at Matfield Green (120 miles southeast of Salina), the annual Prairie Festival, as well as the institute's original and ongoing research in Natural Systems Agriculture. Recent grants in the 1990s have allowed the Land institute to become the center for a Natural Systems Agriculture project that will have worldwide reach.

Natural Systems Agriculture (NAS) looks to the "wisdom of nature" to provide clues for developing a sustainable form of agriculture. On the Kansas prairie, NAS attempts to mimic the natural polyculture of perennial grasses by cultivating plots of perennial grains that have been bred to produce seed yields comparable to monocultural annuals such as wheat and corn. This polycultural approach preserves the prairie ecosystem: it supplies its own nitrogen, eliminating the need to add petroleumbased fertilizers; it preserves moisture in the soil; it minimizes vulnerability to damage caused by insects and disease, eliminating harmful chemical controls; and it reduces soil erosion. In a word, NSA is a paradigm shift that moves away from the model of extractive economy to that of cooperation with and imitation of nature's wisdom. As the Land's website says (pun surely intended), "Natural Systems Agriculture would leave the ground unplowed for years and use few or no chemicals, solving many environmental problems at their root."

The goal of the Sunshine Farm is to run a productive farm, as much as possible, on the sun's energy. This is done by producing the energy needed to run the farm (e.g., electricity, fuel for tractors, and fertilizers), using wind, bio-diesel, and other solar energy sources on the farm itself, rather than importing energy produced by an extractive economy. One interesting dimension of this experiment is that the farm carefully monitors the amount of energy that goes into and out of the land in order to provide a truer accounting of the farm's environmental and economic impacts.

The Rural Community Studies program is conducted at Mattfield Green, a small town in tall-grass prairie country of Chase County, Kansas. Using a refurbished elementary school, the Institute hosts meetings and conferences to explore “ecological community accounting” that monitors the extent of reliance upon an extractive economy versus reliance upon an ecologically sustainable economy. In addition, the Rural Community Studies program has also developed “place-based” curricula that are being implemented in a consortium of three school districts, involving over 180 teachers and 2000 students.

The annual Prairie Festival is a public celebration and educational outreach event that invites scientists, environmentalists, philosophers, religionists, artists, and writers, to reflect upon and celebrate the meaning of the prairie in its agricultural, cultural, and spiritual dimensions. Many visitors camp at the Land Institute for the weekend and attend lectures, workshops, performances, dances, and an evening bonfire where all are invited to “meet, visit, and make music” together.

The underlying vision of the Land Institute can be found in its mission statement, which says in part,

When people, land, and community are as one, all three members prosper . . . By consulting Nature as the source and measure of that membership, The Land Institute seeks to develop an agriculture that will save soil . . . while promoting a community life...

Consciously shaped by the religious ideals of people like Aldo Leopold, E.F. Schumacher, and Wendell Berry, the Land Institute’s vision is one of the mutual interrelatedness of humanity and nature that affirms the intrinsic value of the ecosystem and human responsibility to learn from, honor, and preserve that value. Significantly, the Land Institute has been a major model and inspiration for other bioregional movements and their attendant spiritualities.

Landscapes

Landscapes that reflect religious beliefs do not easily lend themselves to categorical definitions. Part of the difficulty is that the words “religion” and “landscapes” each possess a long history and many meanings. Further, there is a wide range of phenomena to which the phrase “religious landscapes” may refer. Yet, if any universal traits exist, it is that such places tend to be material and express values embedded in them by individuals and groups. Values are generally transmitted and maintained through story. Many of these stories pertain to beliefs about the nature of the universe and the human place or role within it.

The term “religion” has been and remains notoriously difficult to define. Tylor and Frazer described it as a belief system. Freud saw it as illusion, while to Durkheim it was the source of social cohesion. Otto focused on the *mysterium tremendum et fascinans*. Here, the root of religion was understood to be “the holy,” something experienced by people through emotions of both fearful awe and reverent attraction. Geertz framed religion as a cultural system of meaning. Scholars have offered other definitions in addition to these.

A similar problem exists with “landscapes.” The word originated among Germanic peoples in medieval times or earlier, when *landschaft* were tracts of land primarily distinguished one from the other on the basis of kinship relations and customary law regarding land-use rights. This sense of community and connection to particular places was incorporated into paintings after the 1600s. While retaining traces of these earlier meanings, landscape generally came to refer to a picture of natural inland scenery or to the presence of such scenery in the background of a portrait or figure-painting. It was sometimes applied to intangible settings such as those of dreams or visions as well.

Religious landscapes may be comprised of natural features, built features, or a combination of the two. Some may be understood in terms of the sacred and profane, and some cannot. Some act as *axis mundi*, and some do not. This was a term frequently used by historian of religion Mircea Eliade to describe the idea of a center, generally conceived as a pole or line linking upper, earthly, and lower realms. Religious landscapes commonly link the local to the cosmological. They may be geographically fixed or mobile. Their scale may range from that of a country or region down to a household ritual space. Some, but not all, are the sites of contested identities. Here, in the process of struggling for dominance, groups may attempt to control the physical appearance of a specific place, including its symbolic content and meaning. And some religious landscapes, but certainly not all, express primarily religious beliefs.

Such landscapes may be comprised of natural features like rivers, groves of trees, mountains, or caves. There are Hindu conceptions of the Ganges, wooded locales important to “New Agers,” Shinto and Buddhist places associated with Mt. Fuji, and the subterranean labyrinth of paleolithic Lascaux, just to name a few. Lascaux dates from approximately 27,000 years ago, and is famous for its wall paintings depicting animals and humans apparently participating in ritualistic trance-states. Other landscapes, like those presented by temples, mosques, and churches, are fully fashioned by humans. Alternatively, natural and built elements may be interwoven, as at Stonehenge and Hua Shan, the latter of which is a mountain range in China with ancient and ongoing Daoist and Buddhist associations.

Sites may be designated as sacred in contrast to the rest of the landscape, which is considered profane. The word “sacred” derives from the Latin “sacer,” translated as meaning “to set apart.” “Profane,” also derived from Latin, refers to that which is in front of, and thus outside of a temple; due to its location beyond holy precincts, it is by definition not sacred. The ideas of Mircea Eliade play a key role here too. Drawing from work by scholars like Durkheim, he claimed that a dialectic or creative tension exists between the sacred and the profane, and that these categories of understanding and experiencing the world are common to all people. However, understandings derived from this particular cultural tradition cannot necessarily be generalized to other contexts. In most, if not all, Native American traditions prior to Euro-American contact there is no sense of sacred separate from profane; the entire world is suffused with spirit and/or permeated with spirits. A lack of division between sacred and profane exists in conceptions of Buddha-nature, the Dao, and Brahman, among others.

The overwhelming majority of religious landscapes manifest symbols of cosmological truths that are communicated through story, and many of these places serve as *axis mundi*. Winchester Cathedral is a geographically fixed site. Shaped like a Latin cross, its architecture is suggestive of the Trinity. It is also reminiscent of situations that unfolded upon Calvary Hill in Jerusalem – a city that serves as an *axis mundi* for Jews, Christians, and Muslims. One might look to the Lakota traditions for another example.

Tipis were traditionally set in circles called *tipospaye*, and each tipi itself was circular. The circle represented community, the cycle of seasons, the great dome of the sky, and the cycle of life. Although unlike Winchester in their mobility, each tipi and *tipospaye* was similar to it in that each was homologous to an *axis mundi*. It is important to note here that not all religious landscapes act as *axis mundi*. In *To Take Place* (1987), Jonathan Z. Smith convincingly challenges Mircea Eliade’s assertions in this regard by undertaking a telling examination of Australian Aboriginal myths and Mesopotamian ziggurats.

All landscapes by definition, and thus all religious landscapes, present a vista or scene to the eye. Their scale may vary widely. Ancient Chinese understood the vast territory they inhabited to be sacred. Across that land were mountains, altars, and other features associated with ontological beliefs. Nested within this widespread land-

scape were regional landscapes, and smaller places yet were framed within those. The Imperial City of any given time period contained its landscapes of cosmological beliefs, as did towns and villages. Households, too, encompassed religious landscapes. Typically these took the form of family shrines dedicated to ancestors.

Some places testify to contested identities. The Javanese temple of Borobodur stands as a case in point. It was built by a Hindu dynasty, with a layout and symbolic content reflecting its cosmology and social structure. When Buddhist kings succeeded in taking control of the area, they transformed the temple into a wonder of Buddhist iconography. However, the original edifice was not entirely destroyed in the process. Today, elements of both religious systems remain visible, literally etched in stone.

There are religious landscapes that do not necessarily reflect embedded values about the nature of the cosmos and the human place within it. What about when secular or profane space becomes sacred, as it has at former Nazi concentration camps, at places like Gettysburg and Wounded Knee, at the Oklahoma City or New York Towers terrorism sites, or when a mountain is transformed into a sculpture of famous American presidents? These are all deemed special and set aside as sacred, but not necessarily on the basis of spiritual experiences or ideas.

Religious landscapes are highly complex phenomena. Categorical definitions are problematic, and hence must be applied with caution. Taken as a whole, however, they may be generally understood as physical sites, as expressing convictions about the nature of the universe through story, and as sites of related human activities.

Law, Religion, and Native American Lands

The appropriation of North American native lands has been accomplished, as well as contested, over the last five centuries by means of complex culturally embedded assumptions concerning law, religion, and nature. While military conquest and outright theft have certainly played an important part in the loss of tribal lands, even more crucial have been the various legal and religious traditions animating the worldviews and negotiating positions of both colonizers and native peoples.

In the twentieth century, opposition to the legally secured control of native lands increased significantly. Tribal governments, individuals and intertribal groups frequently challenged the historic loss of native lands, employing strategies arising out of Congressional legislation, changes in the political climate, and their own marshalling of legal, political, cultural and economic resources. Since the passage of the American Indian Religious Freedom Act in 1978, a variety of claims invoking the sacredness of traditional lands have been brought both to the bar and into the channels of public opinion. These challenges to the means of American territorial expansion, or to what the Court of Claims in *United States v. Sioux Nation* (1975) referred to as “rank and dishonorable” action on the part of the government, have achieved limited success. Nevertheless, they raise a number of ongoing issues for the federal as well as tribal governments, not to mention the constituents they represent.

America’s legal expropriation of native lands has its roots in the worldview of Renaissance Europeans. When Christopher Columbus first reached the island he called San Salvador in 1492, he was careful to display the royal standards, offer a prayer of thanksgiving, and secure witness from his first officers that he “was taking possession of this island for the King and Queen.” The efficacy of the brief ritual employed to claim the island for his Castilian sovereigns depended on two assumptions about the Christian Church’s station in the world. First, since the Church was universal in scope – there being no other means by which humans could gain salvation – Catholic thinkers such as Pope Innocent IV also claimed that the Church held a universal authority over temporal affairs. This doctrine had already served in efforts to subordinate European political power to that of the Church, and during the crusades it gave justification to the conquest of Muslim lands by Christians.

Second, since Christians had a duty to reclaim Muslim lands in order to extend the domain of the Christian religion, they also had a duty to bring the religion to those in the newly discovered regions of the world, a point that Nicholas V emphasized well

before Columbus' first voyage. In *Romanus Pontifex* (1455), Nicholas connected the Church's goal of universal salvation with Portugal's exploration of new territory along the western coast of Africa.

This we believe will more certainly come to pass, through the aid of the Lord, if we bestow suitable favors and special graces on those Catholic kings and princes, who, like athletes and intrepid champions of the Christian faith, as we know by the evidence of facts, not only restrain the savage excesses of the Saracens and of other infidels, enemies of the Christian name, but also for the defense and increase of the faith vanquish them and their kingdoms and habitations, though situated in the remotest parts unknown to us, and subject them to their own temporal dominion (in Davenport 1967: 21).

For many Christian Europeans, although conquest was not in itself a just form of war, the retaking of the holy lands from the Muslims, and the spread of the gospel, were. Thus territory to be gained through crusade would be land reincorporated into Christian civilization.

As European exploration led to the Americas, this same doctrine of the Church as the provider of universal salvation shaped articulation of the "law of discovery." The only limiting factor, Alexander VI said in *Inter Caetera* (1493), on the claiming of land by one "Christian prince," was whether the land was already in "actual temporal possession of any Christian owner" (in Davenport 1967: 62). Even such staunch opponents of Spanish lust for gold as Bartolomé de Las Casas and Francisco de Vitoria understood the need for the extension of the Christian message to the New World by Christian princes. Vitoria, whose views appeared posthumously in *De Indis et De Iure Belli Relectiones* – "Lectures on the American Indians and the Justness of War" (1557) – was successful at least in countering prevailing views enough to persuade emperor Charles V that the Spanish should treat (negotiate) with Indians, rather than launch war against them upon failure to heed the *requerimiento* to convert to Christianity, as had been the case in the decades after Columbus' first landfall.

Undergirding the theory of the spread of Christian political power was also a theory of human nature, evident in the thinking of Spanish and Portuguese Catholics, but perhaps even more explicit among their Protestant English rivals – who made use not only of Christian ideas but also of the Germanic land laws inherited from the AngloSaxons. On this theory, the role of humans in a sinful world is to rise above their sinful inclinations through the discipline of work. Both biblical tradition and natural law theory endorsed the human transformation of nature. Columbus took pains to describe the people of the Indies as indolent, a point that continually frustrated him in his attempts to employ Indians as laborers in the gold streams, and evidently to minimize for him the horror of native loss of life as the islands underwent their rapid depopulation.

Although the Catholic French held much of North America for two hundred years, their own colonizing strategy, or lack of it, bypassed the acquisition of native land in favor of a general claim to royal title and offers of protection for the tribes, by which they maintained their dependence on native hunters and trappers. North America's

English colonizers, however, did employ the theory of the Christian use of nature, though glossing it in decidedly non-Catholic ways.

John Locke, in his *Second Treatise of Government* (1689), drew on both biblical exegesis and the Germanic freehold tradition that shaped the view of private property found in English common law, explaining that land was free, held in common and without explicit title, until it had been transformed by labor. This transformation by labor gave both right to the laborer and value to labor's results. As Locke expressed the Christian use of nature, labor also functioned as a divine mandate.

God, when he gave the world in common to all mankind, commanded man also to labor, and the penury of his condition required it of him. God and his reason commanded him to subdue the Earth, i.e. improve it for the benefit of life, and therein lay out something on it that was his own, his labor (Locke 1948: 17).

Thus, permanent occupancy, the transformation of natural resources into wealth through the application of systematic labor, and the individual holding of particular parcels of land, all became the normative markers of title in North America. The English accordingly saw nothing in the life-ways and subsistence economies of native tribes that gave them claim against the appropriation of land under the colonizer's flag.

In the early years of the American republic, a mixture of laws and practices kept the process for taking native land legally uncertain. Following the Revolution, New York State treated with the Oneida and other members of the Iroquois confederacy for the acquisition of several million acres in the western half of the state. Individuals also acquired land on their own, while the Trade and Intercourse Acts (1790–1802) mandated that states and individuals could not bypass the federal government's role in regulating trade with Indians. The discovery of gold in Georgia in the aftermath of the Redstick War (1813–1814), and the influx of white settlers onto Muskogee (Creek) land, created a social crisis in the south that spurred the development of legal doctrines having lasting effects on native land. Although the Northwest Ordinance (1787) had earlier held that “the utmost good faith shall always be observed towards the Indians, and their lands and property shall never be taken without their consent,” the confusion of law and the public's desire for southern land made Indian consent a malleable constraint.

On the one side, President Andrew Jackson – who defeated the Redstick Creeks in the 1814 Battle of Horseshoe Bend, and ended Muskogee resistance to white encroachment in the southeast – championed the right of the states to deal with Indian tribes as they saw fit. Jackson also employed a heavy hand in articulating the old doctrine of the Christian use of land. In his “Second Annual Address to Congress” (1830), for instance, while explaining the rationale for removing the Choctaws from their Georgia lands, he asked

What good man would prefer a country covered with forests and ranged by a few thousand savages to our extensive Republic, studded with cities, towns, and prosperous farms, embellished with all the improvements which art can devise or industry execute,

occupied by more than 12,000,000 happy people, and filled with all the blessings of liberty, civilization, and religion? (in Richardson 1901: 521).

In the hands of the populist Jackson, legitimating native lands appropriation thus became a simple exercise of common sense.

On the other side, Chief Justice John C. Marshall – often regarded as setting out an Indian doctrine antithetical to that of Jackson – played a singular role in establishing the legal mainstay of U.S. and tribal relations. Rather than championing Indian interests, however, as a strong federalist, he was most concerned to weaken the states rights position advanced by the Jacksonian Democrats.

In *Johnson v. McIntosh* (1823), which concerned conflicting claims to land acquired from the Piankeshaw tribe of Illinois, Marshall made clear that the English monarch's title to native land based on the doctrine of discovery had been taken over by the United States. The idea of Christian discovery acknowledged that natives at the time of discovery were sovereign nations, but this sovereignty was limited as a claim to title, since tribes did nothing more than occupy their lands. They thus fell short of the criteria for the possession of property that Locke and other Christians deduced from the Bible and natural reason. For Marshall, falling short of title still gave Indians rights of use and occupancy, but these rights were circumscribed, since their rights to complete sovereignty, as independent nations, were necessarily diminished, and their power to dispose of the soil at their own will, to whomsoever they pleased, was denied by the fundamental principle that discovery gave exclusive title to those who made it (in Cohen 1971: 292).

In trying to systematize the contending frameworks of law concerning Indians inherited by the United States, Marshall certainly could have reflected on the adequacy of the doctrine of discovery's theological underpinnings. He explicitly chose to avoid this task, however, saying "It is not for the Courts of this country to question the validity of this title, or to sustain one which is incompatible with it." Instead, if the principle has been asserted in the first instance, and afterwards sustained; if a country has been acquired and held under it; if the property of the great mass of the community originates in it, it becomes the law of the land and cannot be questioned (in Cohen 1971: 292).

As legal scholar Peter d'Ericco has commented, Marshall wound up "allowing power to justify itself" (d'Ericco 2000: 28). Marshall concludes as a legal positivist – encouraging subsequent Indian jurisprudence to rest complete with a narrow consideration of the constitutionality of government action.

In the years of national expansion the United States entered into 370 treaties with tribes, which Marshall framed in his second consideration of Indian lands as "domestic dependent nations" (*Cherokee Nation v. Georgia*, 1831). Marshall's oxymoronic term carried important implications. The federal government was to negotiate with tribes as it did with foreign, sovereign nations, but at the same time the federal government played the superior role in determining the interests and needs of its dependents, or "wards" in Marshall's terms.

Some 60 percent of the treaties ratified by the Senate provided for the transfer of lands. Although the superiority of Christian use slipped into the background as the explicit legal justification for these transfers, the sentiments were never really submerged among the American public, nor from the worldviews of those Americans administering the western reservations on which posttreaty Indians were confined after the Civil War. In restricting tribes to reservations, reform-minded whites had long hoped to instill Christian values, a national task Congress first undertook in the Civilization Fund Act (1819).

In the 1870s, this desire became explicit federal policy when President Ulysses S. Grant authorized the administration of western reservations by the various denominations. Virtually all Americans at the time saw the “Indian problem” as the perpetuation of Indian cultural patterns and land use incompatible with those of the larger society. One eager editorialist for the *Yankton Press and Dakotan* appealing to the broad public sentiment in favor of the 1874 gold rush into the Black Hills, wrote of the Lakotas:

What shall be done with these Indian dogs in our manger? They will not dig the gold, nor let others dig it . . . They are too lazy and too much like animals to cultivate the fertile soil, mine the coal, develop the salt mines, bore the petroleum wells or wash the gold. Having all these things in their hands, they prefer to live as paupers, thieves and beggars; fighting, torturing, hunting, gorging, yelling and dancing all night to the beating of old tin kettles (Jackson 1966: 8–9).

Reformers – unlike editorialists who advocated extermination or imprisonment for native tribes – believed that through education, technical training and religious indoctrination, the clash of civilizations could be ended, and the loss of life diminished. As Colonel Richard Henry Pratt – who oversaw the first post-Civil War experiments in Indian boarding schools – put it, reformers would need to “kill the Indian to save the man.” The complete intermixture of religious indoctrination with the development of agrarian and capitalist individualism common to the reformers’ aims is evident in the words of Congregational minister Lyman Abbott, who argued in 1885 at the third of the Lake Mohonk Conferences of Friends of the Indian that “The post office is a Christianizing institution; the railroad, with all its corruptions, is a Christianizing power, and will do more to teach the people punctuality than schoolmaster or preacher can” (Prucha 1978: 35).

The normative notion of the industrious, individual owner of property had its culminating impact on the loss of tribal lands in 1887, when Congress approved Massachusetts Senator Henry Dawes’s General Allotment Act. The act – which did not, initially at least, affect the lands of certain tribes, notably those of the Lakota (Sioux) on the Plains, the Cherokees and others removed to Oklahoma in the 1830s, nor the Pueblos in the Southwest – gave the president authority to subdivide treaty-designated communal lands on a fee-simple basis. Accordingly, following a 25-year agricultural apprenticeship, heads of household were entitled to 160 acres – the same size plot available to whites (following a five-year apprenticeship) under the 1862 Homestead Act – while other Indian individuals received smaller plots. The enormous surplus of

tribal lands remaining after subdivision was then offered to the American public. In theory the Dawes Act would promote the productive enterprise of Indian individuals and incorporate them into the life-ways of civilized society. In practice, within a short time it led to even greater land loss and impoverishment, as land-holders were pressured to lease non-used fee-simple lands to non-Indians, a practice resulting in the checkerboard patterns of use and ownership visible on many reservations today. Before Congress abandoned the allotment system in 1934, the act diminished treaty land by 86 million acres, some 60 percent of Indian lands held in 1887.

The tribes were certainly not passive in contesting the loss of their land base, and just as the encroaching whites employed in addition to organized violence a synthesis of religious worldview and legal mechanisms in order to gain control of native land, tribes relied upon a variety of symbolic, ritual and legal strategies to cope with that encroachment. Law itself was an arena in the conflict of native and European culture, and although in some places law governing land emerged through a process of translation between tribes and colonizers – as in the *pays d'en haut* of the upper Great Lakes prior to the Revolution – for the most part tribes found themselves required to accept, and to function within, the imposition of European legal philosophy. The mixture of Roman, Saxon and Christian traditions was being secularized by the seventeenth-century colonial era, and the emerging positivism conflicted greatly with tribal assumptions about law as consensus, as sacred, and as shaper of tribal identities and resource economies.

As Europeans made initial contacts with North American tribes, many engaged the colonizers with rituals of incorporation. By bringing gifts and offering hospitality, they extended to the newcomers the web of family relationships governing so many of their own tribes. Interesting to note, Columbus, who received numerous gifts from the Tainos and other islanders, consistently misrepresented these acts in his journals, often ascribing the native willingness to give to simplicity of mind, acknowledgement of a socially inferior position, or a child-like ignorance of the real value of both resources, such as gold, and the land itself.

Two crucial elements of the European and American notion of title: exclusive use and alienation through contract, proved quite foreign to the traditions of native tribes. Tribal lands were generally held in common, although members of more permanently settled Eastern or Southwestern tribes passed their cultivated fields on to individual family members – as among the Iroquois women who were the primary users of fields.

Crucial features of tribal cosmologies linked communal and individual well-being to the land. Tribes rehearsed their rightful occupation of particular territory through sacred accounts, which might depict – as with the Hopi – their ancestors' migration or emergence from under the Earth, or their creation from pieces of the Earth by a superhuman being – such as the Anishinabeg (Ojibwa) hero Nanabozho. Once given land on which to dwell, the ancestors in these stories are also often given instruction on how to uphold social relations and how to make a living on the land, instructions that emphasize the people's continued dependence on the benevolence of other life forms

or superhuman powers. Frequently, these instructions came from ancient figures, such as the Cheyenne prophet Sweet Medicine, or Deganawidah – the Iroquois Peacemaker – who brought from the Creator the constitution establishing the Haudenosaunee confederacy.

Tribes also developed a wide variety of rituals in order to mark these relations of dependence upon the land, which established or renewed their bonds when broken by human action, the passage of time, or mysterious causes. In addition, tribal members observed elaborate systems of proscription – taboos – governing the essential activities of hunting, planting and harvesting, and ensuring that individuals would not disturb the web of agreements by which animals and plants consented to offer themselves up to meet human needs. Through traditions of myth, ritual, community identity and moral action, then, tribes were often not easily inclined to see themselves in positions to sell land or extinguish title to other human beings, but rather as dependent upon the greater-thanhuman power embodied in the land.

Treaties for land transfer were typically troubled affairs, given the coercive tactics white negotiators frequently adopted in order to acquire signatures from some segment of a tribal community, and – by the 1820s – considering the military superiority that generally backed the U.S. design upon land. Only a small faction of the Cherokees, for instance, approved the signing of The Treaty of New Echota (1835), which divested them of their lands in Georgia, and resulted in their removal west of the Mississippi.

At the same time, tribes often took steps to incorporate treaties within their understanding of the sacred obligations binding them to the land. The Haudenosuane wampum belt marking such treaties as the first one signed at Fort Stanwix, New York (1768), extended to the British membership in the confederacy’s “covenant chain.” The widespread formalizing of treaty negotiations through the smoking of pipes, for the native participants at least, carried the promises aloft as prayers. Even contentious treaties, such as The Treaty of Medicine Lodge Creek (1867) with the Kiowas and Comanches, and The Fort Laramie Treaty (1868) with the Lakotas and Arapahos, came to define particular treaty-defined territory as a crucial aspect of tribal identity.

Apart from *Cherokee Nation v. Georgia* (1831), in which arguably the most successfully acculturated of the tribes failed to obtain the Marshall Supreme Court’s protection from white encroachment on treaty lands, Indians were generally unable to make good use of nineteenth-century courts to counter land loss. In addition to the cultural barriers impeding western tribal members’ mastery of legal arcana, in 1863 Congress also prohibited the Federal Court of Claims from hearing treaty-related suits. This required tribes to seek redress directly from Congress itself, which was seldom interested in reversing itself on questions of land, or in giving up its “sovereign immunity.”

Instead, tribes and factions in large numbers engaged in religious renewal to provide strategies to cope with the devastating consequences of land loss. Prophetic movements arose across the country between the Revolutionary era and the early twentieth century, inspiring political leadership and animating occasional militant campaigns. The prophetic movements, such as those of the Delaware Neolin in the 1760s, or the

Shawnee Tenskwatawa in the early 1800s, were grounded in the visionary experience of individuals who had learned from sacred beings that white domination did not necessarily entail the tribes' permanent alienation from traditional life-ways and territory. Military leaders such as Pontiac, Tecumseh, and Blackhawk, were inspired by these movements to resist encroachment, and in some cases formed broad pan-tribal alliances to stem the tide of settlers into the Ohio River valley and other contested eastern regions.

Others preached coexistence or isolation, and drew – like the Seneca prophet Handsome Lake at the beginning of the nineteenth century – on visions to help them articulate a revamping of traditional religious and cultural practices. In some cases, these movements targeted aspects of traditional culture: witchcraft, or women's leadership; in others they focused on white influence as the source of contemporary social turmoil and loss of land. Many, as with Wovoka – the Walker Lake Paiute leader of the Ghost Dance whose teachings spread across western reservations in the 1880s – blended traditional tribal theology with aspects of Christianity. As in the dominant society, apocalyptic visions were widespread, in which worldtransforming floods or fires restore Indians and animals and sweep away the whites too numerous for Indian bullets. In some cases prophetic teachings about the erosion of land or the loss of game animals could be incorporated within traditional individual and communal understandings of ritual. Since one function of rituals related to important agricultural or hunting resources was to petition for the annual return of the resource, some religious leaders turned to ritual solutions to restore land or game lost to American expansion. In other cases, such as that of Handsome Lake, although preservation of tribal lands was key to his message and politics, it receded under the power of his apocalyptic vision, where he foresaw believers in his *Gaiwio* – the “Good Word” – ascending to heaven following the destruction of the Earth.

In one of the last of these renewal movements, the Crazy Snakes, the charismatic Muskogee orator Chitto Harjo urged his militant followers to retain traditional culture and reject allotment. In addition to engaging federal troops in 1901, and the Oklahoma National Guard in 1909, Harjo's group also undertook legislative campaigns, Washington lobbying, and succeeded in securing a U.S. Senate investigation of allotment efforts in Oklahoma, though not in halting the subdivision of Muskogee land.

The legal status of Indians, as individuals and as members of distinct political communities, changed over the course of the twentieth century in ways that affected land questions. The Supreme Court held in *Lone Wolf v. Hitchcock* (1903) – in which Kiowa and Comanche plaintiffs complained that allotment could not proceed without the approval of three quarters of the adult male tribal members – that Congress had always exercised “plenary authority” over Indians. This absolute power was “a political one, not subject to be controlled by the judicial arm of the Government” (in Prucha 1990: 203). Thus Congress certainly had power to make and break treaties as it determined necessary, and this exercised power confirmed that the Allotment Act's subdivision of treaty lands was constitutional. In 1920 however, in acknowledgment of Indian service

in the First World War, Congress did approve jurisdictional acts for many tribes, waiving sovereign immunity concerning treaty claims, and offering tribes some theoretical means of redress before the Court of Claims.

Contradictory impulses shaped federal Indian lands policy making during the twentieth century. One was an explicit overturning of the Christian assumptions that had led to the acquisition of native lands and the dissolution sought for native cultures. The 1934 Wheeler-Howard Indian Reorganization Act, with its roots actually in the Hoover administration, mandated the most systematic reversal in Indian policy in American history. Under John Collier – President Franklin Delano Roosevelt’s appointment to head the Bureau of Indian Affairs – the federal government first advanced as goals the protection of tribal lands and culture. The Indian Reorganization Act ended allotment, restored surplus tribal lands not yet sold off to the public, and allowed for the purchase of additional tribal lands. Collier, who through exposure to the Pueblos had become a forceful advocate of Indian religious liberty and the necessity of preserving traditional cultures, saw tribal lands as a key ingredient to the health of Indian societies.

The “Indian New Deal” was contested by whites and by many tribes – such as the Navajos, who refused to implement some of its provisions – and subsequently judged harshly by those who argued that it remained a form of tribal domination. Nevertheless, it set the stage for a serious revision of the conditions under which Indians had been living since their first confinement to reservations, and sparked greater effort by Indians to master the legal and political machinery used to control their land.

The second impulse animating twentieth-century Indian policy was far more consistent with historical trends than was Collier’s New Deal. In the era after World War II, first the Eisenhower and then other Republican administrations replaced Collier’s policies of cultural preservation with “termination” or “emancipation.” For tribes such as the Klamath, Menominee and Potawatami, Congress made use of its plenary power to abolish trustee/ ward relationships, dissolve tribal status and end federal responsibility for Indian people – resulting in the “urban relocation” of one quarter of the native population by the mid-1960s.

The primary means Congress offered tribes to contest acquisition of their lands reflected both trends in federal policy. Collier’s hope to address the injustice of tribal land expropriation bore fruit only following his departure, when, in 1946, President Harry S. Truman approved the creation of the Indian Claims Commission (ICC) to make a final disposition of land claims. Tribes readily took the opportunity to bring their grievances forward. By the end of the commission’s original five-year mandate, all 176 federally recognized tribes and bands had filed at least one claim. By 1978, when the commission finally dissolved, it had examined nearly four hundred, and authorized restitution in over one-third of these.

While the ICC focused national attention on native land grievances, and the \$818 million it awarded the tribes was a significant sum in total if not per tribe or per capita, its very purpose – to settle grievances through financial compensation – conflicted with the land-restoration goals of many tribes. Unlike the seventeenth-century Manhattans,

who supposedly gave up their island for a few trinkets, tribal treaty negotiators often appreciated the value of the dollar – Cornplanter and Red Jacket, for instance, the Seneca rivals to Handsome Lake – each received cash grants and annuities as personal compensation for signing The Treaty of Big Tree in 1797. Others, like the Lakota Red Cloud, who argued to his dying days that the Black Hills were worth far more than any government official was prepared to offer him, held out for the largest sums possible for their people. Nevertheless, most Indians did not see the swap of land for money as an ideal market transaction. Many tribes took up the opportunity to file with the Commission because it was the only means available for addressing their concerns, and in hopes that it would be simply a first step toward restoration of some portion of their land base.

The case of the Western Shoshones illustrates the limitations facing tribes as they dealt with the Commission and the courts. The Western Shoshones’ Treaty of Ruby Valley, signed in 1863, was primarily a treaty of “peace and friendship,” in which the Shoshones agreed to allow the U.S. to develop telegraph and rail lines, establish outposts and engage in mining and farming on their lands – nearly 25 million acres comprising most of Nevada, and adjacent lands in Utah, Idaho and California. The treaty remains the only formal agreement worked out between the government and the Western Shoshones for the disposition of their land, yet clearly omits any provisions for limiting territory, qualifying title or establishing reservation boundaries. In spite of subsequent resource and urban development, the majority of Shoshone land remains within the public domain, since the federal government administers 87 percent of the state of Nevada’s land base.

Under advisement of the Bureau of Indian Affairs, members of the Temoak band filed the original Shoshone claim with the ICC in 1951 (*Western Shoshone Identifiable Group v. US*). The claim – which sought compensation for the “taking” of tribal land – remained unendorsed by most Shoshones and their tribal councils throughout its history, since they were not party to the claim, and the Temoak plaintiffs had no authority to represent other Shoshones. In 1962, the ICC ruled that although the U.S. had not signed any agreement dealing with the issue of Shoshone title, a history of “gradual encroachment of whites, settlers and others” had effectively deprived the Shoshones of any valid claim to continuing title. Accordingly, the Commission awarded the Shoshones, without interest, a figure based on an 1872 valuation of the land – a date with no significance in Shoshone history, but one that allowed the government to overlook the payment of royalties related to mining claims filed in the area under the 1872 General Mining Law.

Although the ICC lacked the necessary jurisdiction to settle questions of title, the courts have generally held subsequently that the ICC award for “taking” created the presumption that the land was actually taken. Shoshone organizers created the Western Shoshone Sacred Lands Association in 1974 in order to pursue the title question directly. In a ruling on the related case of Shoshone ranchers Mary and Carrie Dann (*United States v. Dann*, 1984), the federal district court held that Shoshone “aboriginal” title

remained good until the final 1979 Court of Claims hearing on the ICC award. For the Supreme Court in 1985, the only issue needing adjudication was simply whether or not the Shoshones – who had refused the award – had actually been paid and the government’s obligations therefore discharged. The Kafkaesque course of the Shoshone claim through the judicial system was acknowledged by the Court of Claims itself, which noted that “if the Indians desire to avert the extinguishment of their land claims by final payment, they should go to Congress” (*Temoak Band v. United States*, 1979).

The procedural focus in the courts’ consideration of the Shoshone land claim – or those of most other North American tribes, for that matter – have sharply limited the extent to which tribes can expect an adequate weighing of their arguments for a just solution to the appropriation of their lands. In the case of the Dann sisters – who have, since 1973, been charged with violating the Taylor Grazing Act (by not obtaining livestock grazing permits) on land their family has made exclusive use of since “time immemorial” – the courts have been content to reemphasize the assumptions about the relation of native people to their lands contained in Marshall’s “doctrine of discovery” and the Dawes Act, assumptions dependent upon the Christian worldview for their plausibility. The high courts’ legal positivism is an interpretive mechanism that has obscured the Christian grounding of federal Indian law, without abandoning it, or bringing it into any critical juxtaposition with the worldviews of Indian plaintiffs.

Another legal front in the contest over tribal territory opened in the aftermath of the civil rights era, one focused specifically on native claims about the sacredness of land. In 1978, as the ICC ended its work, Congress passed – with little debate and by a large majority – a law that seemed to many to open the door to some form of land control for tribes, and even its potential return. The American Indian Religious Freedom Act (AIRFA) noted the long history of religious persecution that had accompanied the U.S. policy of civilizing Indians and opening their lands, and required federal agencies to report on how they could ensure that they were not prohibiting Indians from the “free exercise” of their religion. The act specifically underscored the prominent role that land plays in native religious life; its promoted authors – like John Collier in the preceding generation – the belief that this was a role the federal government should respect as part of its trustee relationship to the tribes.

Although AIRFA’s sponsor in the House, Rep. Morris Udall, cautioned the leery that the law would have “no teeth,” many tribes and interested parties quickly filed land-related suits under the act. These cases reflected a broad range of concerns: prohibited access to ritually significant sites, resource development of sacred areas, insensitive administrative and management priorities. Some, such as the Navajo Medicine Men’s Association in *Badoni v. Higginson* (1980), the Eastern Cherokees in *Sequoyah v. Tennessee Valley Authority* (1980), and both the Navajos and Hopis in *Wilson v. Block* (1983), sought to constrain federal land agencies from damaging specific sacred sites; others – as with a group of Lakota and Cheyenne religious leaders in *Fools Crow v. Gullet* (1983) – aimed to prevent states from controlling Indian religious practitioners.

Common to all these cases, Indian plaintiffs argued that fundamental features of their religious liberty were threatened by government policy.

In some cases the land concerned – administered by a state parks department, or the National Park Service – was small in scale, and the impact of protecting Indian religious practice could be weighed against the interests of other visitors to the park. *Sequoyah*, however, with its challenge to the TVA’s flooding of the Little Tennessee River, and *Wilson* – in which Navajo and Hopi medicine men were concerned about the Forest Service developing a ski resort in the San Francisco Peaks – showed that AIRFA-fueled challenges might have a significant economic impact, and raised red flags on the part of development-minded politicians and resource industry groups, especially in the western states with their large acreages of multiple-use public land.

While AIRFA aided traditional Indian religious practice in some ways, the courts in general have rejected its ability to dictate land agencies’ management of “what, after all, is the government’s land,” as Justice Sandra O’Connor concluded in *Lyng v. Northwest Indian Cemetery Protective*

Association, 1988 (489 U.S. 439, 454). In the AIRFA land cases the courts have consistently chosen to read “religion” and “religious liberty” in a very restrictive sense. In *Sequoyah* the court concluded that Cherokee claimants were motivated by “cultural” and not religious concerns – in spite of the fact that the Tellico dam would destroy both a burial ground, and the ceremonial center of Cherokee life – the place of their emergence in this world. *Sequoyah* also established the courts’ practice of narrowing sacred land claims by maintaining that government infringement on religious liberty must stem from a directly coercive intent.

In First Amendment case law the courts have historically relied on several tests to determine whether government infringes on religious liberty: whether the affected religion is genuine, whether belief is sincere, whether government action causes a burden, and whether government exercises a “compelling interest” to override religious liberty. Traditionally, the courts have found indirect infringement sufficient to rule in favor of claimants, but in AIRFA cases – and not simply in the land cases – the courts have declined to restrict government infringement, even when – as O’Connor also noted in *Lyng*

– it would so clearly destroy an Indian religion.

Observers have remarked that the high court holds a normative view of religion as something best exemplified by Christianity, which consistently prevents it from recognizing the legitimacy of native religious practices and understandings foreign to mainstream American culture. In *Badoni*, for instance, the court held that Navajo rituals performed at Rainbow Bridge were not essential to Navajo religious life because they were held infrequently, and not attended by sufficient numbers of Navajos – as though weekly church services provided the justices with their template for viewing ritual. Perhaps the most telling expression of this majoritarian bias to advocates of Indian rights was Justice Scalia’s admission in *Employment Division v. Smith* (1990),

It may fairly be said that leaving accommodation [of Indian religious practice] to the political process will place at a relative disadvantage those religious practices not widely engaged in, but that unavoidable consequence of democratic government must be preferred to a system in which each conscience is a law unto itself (494 U.S. 872, 891).

With the courts so frequently unable to aid Indians seeking control of sacred places or the return of traditional lands, tribal and pan-tribal organizations have turned to political forums. The Shoshones, the Lakotas and others have approached Congress in the last couple of decades, with little result. In the Shoshone case, although Congress could consider the transfer of public lands back to the Shoshones, it has been unwilling to do so, given concerns for precedent, for the enormous wealth which modern gold mining has extracted from tribal land, and for the vast spaces necessary for Department of Defense and Department of Energy activities in Nevada.

Likewise, following the Supreme Court ratification of the Lakota ICC award for the taking of the Black Hills (*United States v. Sioux Nation*, 1980) – the ICC’s largest single award – the Lakotas were also unsuccessful in generating sufficient interest on the part of Congress. Black Hills Steering Committee coordinator Gerald Clifford was able to get a bill to Congress, sponsored by New Jersey Democrat Senator Bill Bradley, in 1985 and again in 1987. For Clifford and many other Lakotas, the return of the Hills was a religious cause. “Our first priority,” he said of the committee’s work “must be to keep faith with our sacred traditions. The Lakotas were placed around the Black Hills for a purpose by God . . . and it is a moral imperative that we reject the selling of land” (Lazarus 1991: 416). Bradley also framed his support in religious terms of embracing the nation’s highest values and respecting Lakota traditions, which many had come to say accounted for their origins as a people from beneath the Hills. The bill provided for the creation of a Sioux Nation National Park on public lands as well as for compensation in addition to the ICC award of \$106 million. Although the bill received the co-sponsorship of Senator Daniel Inouye, chair of the Senate’s Select Committee on Indian Affairs, Inouye said it would also need support of home state legislators in order for him to bring it to the committee, a support never provided in deference to non-Indian constituents interested in preserving the existing Forest Service multiple-use policy. Western states’ opposition to both the Shoshone and Lakota claims invoked the ironic threat of what Justice O’Connor framed as “de facto beneficial ownership of some rather spacious tracts of public property” (485 U.S. 439, 454) should Indians become able to dictate public lands policy to the larger society.

On a few occasions tribes have been successful in obtaining the return of sacred lands from the federal government, but this has generally required strong presidential endorsement of legislation, or the issuing of an executive order. President Richard Nixon, who replaced “termination” with “self-determination” as the goal of federal Indian policy in 1970 – prompted in part by Indian activists’ eighteen-month occupation of Alcatraz Island – responded to Yakama Nation appeals for the return of a portion

of Mount Adams, in 1972. The Washoe, Navajo, Havasupai and Warm Springs tribes also benefited from the reversal of government policy during the Nixon era.

Most widely noted at the time, Nixon intervened on behalf of the Taos Pueblo in their long-running struggle to regain control of Blue Lake, issuing a presidential order for its return in October, 1970. The lake – from which the Taos people emerged onto this world in mythical times, and which is the site of yearly pilgrimages, had been included in the Kit Carson National Forest, created by President Theodore Roosevelt in 1906. Its return – and Nixon’s personal interest in land restoration – encouraged native grassroots activists, tribal leaders and legal advocacy groups to persevere in the use of legal and political channels in spite of the ongoing obstacles presented by the courts and Congress. Nevertheless, tribes have found presidential support as difficult to obtain as congressional. The 500 thousand acres of land actually restored in the last few decades, when measured against the 110 million lost just due to allotment, might fairly suggest that the tribes face insurmountable hurdles in resolving the issue to their satisfaction.

In the years since Nixon, one finds even fewer bright spots. Congress did approve creation of the Zuni Heaven Reservation in 1984 (Public Law 98–498). President William J. Clinton was willing to use his authority – enacting Executive Order 13007, “Indian Sacred Sites” – to protect Indian land-based religious practice, although the courts have not yet weighed in on its ability to provide injunctive relief for sacred lands or to legitimate additional land-return campaigns. In addition, Congress has passed several laws in the wake of the judicial defeats trailing the AIRFA cases, such as the Native American Graves Protection and Repatriation Act (1990), the Religious Freedom Restoration Act (1994), and the National Historic Preservation Act (1996), which have offered some oblique protection, and if not land return, at least some potential of greater tribal participation in the management of sacred sites on public land.

Increasingly, though, tribes and native organizations have employed three additional strategies to promote land return, in an effort to bypass the limits of their ward-like reliance upon the federal legislative and judicial systems. First, native people have been able to marshal the post-1960s shift in popular culture to build a larger public consensus around the idea of land return. The Romanticist underpinnings of the 1960s counterculture and the 1970s environmental movement – invoking the noble savage tradition of real Indians as model human beings closer to nature than their alienated, urban Indian and non-Indian counterparts – provided native activists and cultural leaders with an opportunity to address wider and more sympathetic forums than in earlier periods. This has often merely resulted in the politics of celebrity gesture – such as Marlon Brando’s refusal of his 1972 Academy Award for “The Godfather,” in solidarity with the American Indian Movement’s occupation of Wounded Knee, South Dakota. Nevertheless, tribes have also been able to advance their arguments through celebrity-endorsed media ventures, as in Robert Redford’s narration of the two documentaries on the Western Shoshone claim, “Broken Treaty at Battle Mountain” (1974) and “To Protect Mother Earth” (1991).

Alliances with environmental groups have also developed in the last twenty years, overcoming some of the initial resistance to native land-use issues held by groups such as the Sierra Club. The Shundahai Network, for instance, coordinated by Shoshone elder Corbin Harney, is a grassroots organization combining the energies of west coast anti-nuclear advocates with proponents of Ruby Valley treaty rights, and devoted to civil disobedience, education and advocacy efforts at federal nuclear facilities such as the proposed Yucca Mountain waste repository site located in the middle of Shoshone territory.

In southern Arizona, members of the San Carlos Apache reservation in 1989 enlisted the “Apache Survival Coalition,” a broad network of outside support, to assist them in their opposition to the Mount Graham International Observatory – sponsored by the University of Arizona, and by international research institutions such as the Vatican Observatory, the Arceti Observatory and the Max Planck Institute. Conflicting agendas, and differing perceptions of what makes Mount Graham sacred among supporting groups and within the San Carlos tribe kept this network from providing sufficient unified political pressure to cancel the project, which the Apache Survival Coalition maintained would disturb the Gaans, elemental powers of the universe residing within the mountain (Taylor 1995; Williams 1998).

A second front has emerged as tribes and pan-tribal groups have obtained international attention. Bucking Justice Marshall’s presumption in *Johnson v. McIntosh* that tribal sovereignty does not extend to relations with foreign powers, delegates from the Iroquois, the Lakota, Western Shoshone and other tribes have appealed directly to international law in appearances before such institutions as the European Parliament and the World Court. As part of an emerging global movement of indigenous peoples, American Indians have also appealed to the Organization of American States and the United Nations – which has provided support for the development of non-governmental organizations, such as the American Indian Movement’s International Indian Treaty Council. Appearances before the UN Commission on Human Rights have led to the publication of scathing indictments of federal Indian policies. A 2000 ruling by the OAS’s InterAmerican Commission on Human Rights finds the United States in violation of several counts of international human rights law in regard to its dealings in the Western Shoshone Dann sisters. However, the limited extent to which the United States wishes to acknowledge the authority of international bodies over its internal affairs indicates the questionable short-term utility of these efforts. Should the global indigenous movement gain increasing international support, however, the United States may prove more amenable to tribal claims – just as it had to accommodate 1950s demands for civil rights in order to present itself as a principled opponent of communist totalitarianism.

More immediate as a strategy for land restoration, though less satisfying as a measure of justice, is the willingness of tribes to make increased use of the real-estate market. Alaska tribes since the early 1970s have fashioned themselves as corporations and used money obtained through the Alaska Native Lands Settlement Act (1971) to

purchase additional lands, and to develop their resources. Other tribes have also used ICC awards to purchase at current market values historically or culturally significant acreages. Eastern tribes were able to argue that the original Trade and Intercourse Acts made invalid land transfers, as the Penobscott and the Passamaquoddy did in 1980 against the state of Maine.

Nationally, the development of nonprofit land trusts has also served the aims of tribes. Organizations such as the White Earth Land Recovery Project in Minnesota, The Cultural Conservancy and the Trust for Public Land have provided the nexus of capital and real-estate experience to enable tribes to recover historically significant portions of their traditional lands. The Nez Perce have purchased traditional sacred lands in Oregon's Willowa Mountains to provide the basis for a tribally managed wildlife preserve. Other tribes, such as the Mashpee at Bufflehead Bay, are engaged in joint administration of refuge lands with state and federal authorities. In northern California the Sinkyone Intertribal Wilderness Area involves eleven coastal tribes, along with state conservation agencies and a land trust, in the creation of the nation's first intertribal land reserve. While these reserves are all small in scale, they speak to the seriousness of tribal aims, and to the long-term nature of tribal goals. In the most fundamental way, they are testimony to the failure of United States policy, which hoped through the instillation of Christian values and the insertion of native individuals into the marketplace to abolish tribal links to the land.

Students of Indian law have formed conflicting evaluations of the history of tribal land loss. For some, such as Wilcomb Washburn, the legacy of this history is not, when the American story is compared with those of other colonial powers, as bleak as it may seem on first count. Resistance, opposition, and some success in the courts and legislative halls of the conqueror show that the tribes have faced a more enlightened foe than they might have done. Others, such as Felix Cohen – famous for his comment that Indians, like Jews in Nazi Germany, function as “canaries in the coal mine” of the legal order – offer a somewhat darker reading of the tradition. On both of these accounts, however, the tribes remain dependent on the good graces of those outside their communities. That land remains a significant motivating force within these communities, however, is due less to public largess or legal achievement and more to the determination of the tribes themselves to retain the animating spirit they have long found in land.

Le Guin, Ursula K. (1929–)

Ursula K. Le Guin is known primarily for her science fiction and fantasy novels, but she also has written children's books, poetry, translation, and essays. These literary interests were formed by the intellectual and multicultural environment of her youth: her father was the famous anthropologist Alfred L. Kroeber who with her mother wrote the classic ethnography, *Ishii in Two Worlds* (1961).

Her writings exhibit some of the standard themes of science fiction and fantasy: the heroic quest, the possibilities and problems of technology, and the potential of magic and paranormal consciousness. But her work is distinctive and significant in a variety of ways. The imaginary worlds she creates have an uncommon anthropological richness. She is more concerned with detailing social psychologies and the intricacies of culture than presenting technological marvels. Indeed, she has described her work as “social science fiction.”

But it is more accurate to call it “ecosocial” science fiction because Le Guin is a master at revealing the relationship between culture and nature. She makes clear how the specifics of the natural world shape the societies that inhabit them, although not in a simplistic, deterministic way. Similarly, the political ideologies and social values of a society are shown to be directly related to their conception of and behavior toward the Earth. Her imaginary worlds exhibit a wide range of connections between nature and culture, and frequently her novels present two or more cultures in conflict over their relationship with nature. The reader thus comes to recognize various possibilities for healthy and destructive correlations between nature and culture.

The result has been numerous incisive critiques of contemporary social structures and their ideologies of nature. The most explicit critique is found in *The Word for the World is Forest*, written in response to the Vietnam War. In it, an aggressive and ultimately self-destructive Captain Davidson attempts to exploit an Eden-like setting populated by smaller native humans that live in harmony with nature.

In her view of nature and culture, Le Guin has been deeply influenced by Daoism. References to the *Daodejing* (*Tao te ching*) and the *Zhuangzi* (*Chuang Tzu*) are used to illustrate her view of natural harmony, her anarchist political philosophy, and themes such as dream and unreality. In *City of Illusions*, which takes place in future North America, the “Old Canon” that helps guide the protagonist is the *Daodejing*. There is also a “New Canon,” Thoreau's *Walden*, and people who follow the teachings of the two canons are called “Thurro-dowists.”

Feminism has been increasingly important to Le Guin's thought. She has been fascinated by the complexities of gender, most famously in *The Left Hand of Darkness*.

In that work, the Gethenian people are neuter until they undergo “kemmer” (estrus), at which time they may become either male or female. Since then Le Guin has become more deeply and outspokenly feminist, seen especially in *Buffalo Gals and Other Animal Presences* and her collection of essays *Dancing at the Edge of the World*.

Feminism has influenced Le Guin’s concern with the issue of the “Other.” Her work celebrates diversity in both nature and culture while at the same time recognizing continuity within “the community of all life.” Both a sense of absolute otherness and the denial of difference lead to destruction. Instead she affirms both difference and connection – among humans and between humans and nature. This is seen, for instance, in “Buffalo Gals,” in which Myra, a girl, is adopted by the First People (animals, particularly Coyote). She ultimately takes on a double personality in which both her human identity and her “animal” identity are retained.

This concern with otherness is tied to her “ethic of communication.” Communication with others, including those in the natural world, is possible and necessary. In particular, we need to overcome our “deafness” to those who have been given no voice, including women, children, so-called primitive people, and the wilderness (see “Women/Wilderness” in *Dancing* and the introduction to *Buffalo Gals*).

Her pacifist, anarchist social philosophy is found in a number of works. *Always Coming Home*, set in the future in California, is a pseudo-anthropological presentation of the Kesh, a simple, egalitarian society living in relative harmony with nature. In *The Eye of the Heron*, the People of Peace organize their society along explicitly Quaker principles. Le Guin has described her utopian views as *yin* compared to the *yang* of Western civilization (“A NonEuclidean View of California as a Cold Place to Be,” in *Dancing*). Such a utopia is based on a sense of communal identity rather than rational structure. Neither static nor progressing toward some end, it manifests organic and unpredictable process. It arises not from power centers but from margins. Imperfect, it is full of potential. As the subtitle of *The Dispossessed* makes plain, it is an “ambiguous” utopia.

Her Daoist, ecofeminist, and anarchist views are ultimately rooted in a vision of nature as deeply interrelated. Coyote, perhaps, captures this best in *Buffalo Gals*, where she sings “one of the endless tuneless songs that wove the roots of trees and bushes and ferns and grass in the web that held the stream in the streambed and the rock in the rock’s place and the Earth together” (Le Guin 1987: 56).

Leary, Timothy (1920–1996)

Timothy Leary is most famous for his promotion of the “nature religion” interpretation of psychedelic experiences. After earning a doctorate in psychology (UC Berkeley, 1950) and authoring a highly innovative and influential theoretical system (Interpersonal Diagnosis of Personality, 1957), Leary was appointed Lecturer at Harvard in 1959. Ambitious, idealistic, eager for an intellectual revolution, the brilliant young psychologist found his calling while summering in Mexico in 1960, when he ingested psilocybin mushrooms and underwent the first of his several hundred psychedelic voyages. Leary’s intellectual contributions were obscured by the social tumult that ensued, including Harvard’s controversial firing of Leary and his collaborator Richard Alpert in 1963, their subsequent campaign to “turn on” the world, arrests and legal battles, a dramatic escape from prison, exile abroad, and recapture, to name just some.

In brief, Leary believed that psychedelic drugs bring into consciousness neurological information that is ordinarily filtered from awareness. This information, encompassing all levels of structural organization within the nervous system (sensory, cellular, molecular, atomic), has existed for thousands, millions, even billions of years and retains an historical record that can reach awareness during psychedelic experience. For example, Leary proclaimed that on LSD one could experientially recapitulate biological evolution (encoded in neural DNA) back to life’s origin, and physical evolution (encoded in neural atoms) back to the Big Bang. Thus, psychedelic users could experience subjectively the same phenomena that scientists study objectively.

Leary contended that mystics who lived in prescientific times interpreted such experiences with nonscientific concepts. In a manner later popularized and developed by Fritjof Capra and others, Leary proclaimed that religious mysticism and scientific method often arrived at identical conclusions – with mystics using the language of supernaturalism. For example, whereas mystics interpreted past-life recall as reincarnation, Leary explained this as recollection of one’s evolutionary past archived in DNA. (Leary himself actually charted a family tree based upon LSD-induced past-life experiences.)

Resisting the temptation “to impose old models, premature theories,” Leary endeavored to modernize such models with the language of science. In this spirit, he “translated” the *Tibetan Book of the Dead* and the *Tao Te Ching* using the naturalistic concepts of science. His 1966 psychedelic version of the Tao, for example, included such poems as “The Serpent Coil of DNA” and “Prehistoric Origins of DNA,” and others paying homage to experiences of atomic energy and the sense organs.

When psychedelic drug use exploded into a mass phenomenon around 1964, it became clear that the drugs would soon be outlawed. Preparing a legal challenge to protect psychedelic drug use under the First Amendment right to free exercise of religion, Leary deliberately embraced the supernaturalistic language that previously he had resisted. Setting the stage for a legal showdown, Leary founded a religious organization (League for Spiritual Discovery), produced public “religious celebrations” in which he ceremoniously enacted the roles of Jesus and the Buddha, and wrote books and essays brazenly trumpeting supernaturalism.

Ironically, although Leary’s promotion of supernaturalism failed to persuade the jurors for whom it was intended

– his legal strategy, used to defend himself against marijuana charges, failed in 1966 and, on appeal, in 1967 – it did persuade legions of impressionable young seekers to imbibe the sacrament and interpret their experiences with the language, if not the concepts, of supernaturalism. Ultimately, Leary’s charismatic influence further enshrined psychedelic experience in the mysticism, occultism, and anti-scientific primitivism from which he had initially labored to wrest it.

Having failed to win legal protection on grounds of religious freedom, and disappointed at what he regarded as the anti-intellectual supernaturalism promoted partly by his own rhetoric, Leary upon release from prison in 1976 pointedly abandoned supernatural rhetoric and struck an almost confrontational scientism in his return to the public eye. Ever the prolific author, lecturer, and media celebrity, Leary helped popularize life extension, space colonization, and the computer revolution in his championing of his new calling, Science.

Although Leary never promoted activism to protect the natural environment, he blamed urban-industrialism not only for aesthetic and environmental pollution but also for alienating city-dwellers from the “cellular wisdom” he believed psychedelics revealed. Consistent with his style of addressing problems with elements of both avoidance

(passive) and approach (active), Leary’s favored remedy involved the theme of exodus. At the height of his influence in the mid-1960s, for example, Leary’s new religion counseled initiates to “drop out” of urban-industrial culture, adjoin as tribal colonies in intentional rural communities, supporting themselves through handicraft. The drop-outs would thus occupy a social-environmental niche left vacant by “Man’s lemming-like rush to the cities” and “the insane society of adults around you rushing to enslave itself to machines.” With his colleagues and friends, Leary attempted to establish colonies in Millbrook, New York, in Zijuatanejo, Mexico, and in several Caribbean island nations, but each project, opposed by government or imploding onto itself, was short-lived. (Upon release from prison in 1976, Leary transmuted the exodus theme in championing the cause of space migration, which involved leaving Earth to inhabit colonies in outer space.)

How history will judge Timothy Leary remains yet to be determined. In life, he often was condemned by conservatives as an irresponsible Pied Piper emblematic of all that was threatening about the cultural changes of the 1960s, dismissed by political leftists

as unserious and irrelevant to their cause of Socialist Revolution, and even distrusted by many in the otherwise sympathetic counterculture who suspected that his flamboyance and media savvy signified insincerity, attention-seeking, or snake-oil salesmanship. But the cultural changes of “The Sixties” have largely been assimilated, making Leary’s “radicalism” seem relatively mild by contemporary standards; with the fall of the Soviet Union and the left’s increased recognition of the practical challenges of maintaining a socialist cure that is clearly better than the capitalist ills for which it is prescribed, the leftist movements that promised imminent Revolution in the 1960s seem unserious and irrelevant themselves; and the personal demeanor that aroused excessive veneration in some and excessive doubt in others in the counterculture will exert diminishing impact, biasing posthumous judges less strongly than it biased Leary’s contemporaries and thus allowing his ideas to receive a fairer trial in the future.

Left Biocentrism

Left biocentrism or left ecocentrism (the two terms are used interchangeably), is a theoretical tendency which has been unfolding within the deep ecology movement since the mid-1980s. It has been called “the left wing” of the deep ecology movement. Left biocentrists (left bios) support the eight-point Deep Ecology Platform drawn up by Arne Naess and George Sessions. They see this Platform as a key component of the existing deep ecology movement, which should therefore not be subject to unilateral changes by any individual deep ecologist. Necessary changes to the Platform, so that it can evolve, must be sorted out collectively within the movement. Left bios see their work as endeavoring to strengthen the deep ecology movement. “Left” as used by left biocentrists, means anticapitalist and anti-industrialist, but not necessarily socialist. Industrialism is seen as having a capitalist or a socialist face. The future economic and political organization of an ecocentric society is seen as a subject of necessary and ongoing discussions.

Many left biocentrists (myself included) came to this perspective from a left-wing background. As we became aware of deep ecology we saw the importance of moving beyond the human-centered values (anthropocentrism) of the anarchist, social democratic, communist, and socialist traditions, and became aware of the need to put the Earth first. This meant to identify and express solidarity with all life. Some within this group of people had been working on a broadly defined “left” deep ecology path, but were using different names to describe it (e.g., “deep green theory” (Richard Sylvan), “radical ecocentrism” (Andrew McLaughlin), “revolutionary ecology” (Judi Bari), “green fundamentalism” (Rudolf Bahro), “revolutionary ecocentrism” (Ken Wu), etc.). All these left deep ecology supporters, and others not mentioned, would believe that although deep ecology pointed us in the needed new philosophical direction, it had yet to evolve a practical political program in opposition to industrial capitalism.

Others drawn to left biocentrism were responding to the theoretical and practical work done in its name, or were drawn to it because they opposed the “accommodating” stance of much deep ecology toward industrial capitalism. The influence of the internet has been important, not only for the dissemination and exchange of writings, but also for making possible a “left bio” discussion group, which in 1998 collectively produced a ten-point Left Biocentrism Primer. The Primer provides a starting point for left biocentrism, but it is also a work in progress, like that of deep ecology itself.

Left bios believe that the Earth belongs to no one and should be a non-privatized Commons. They call for a global redistribution of wealth, oppose economic growth and consumerism, and practice voluntary simplicity. There is a bioregional not a global

focus. Social ecology, eco-Marxism, and ecofeminism have important insights, left bios believe, but are nevertheless seen as unduly human-centered in orientation.

To facilitate collaboration left bios distinguish between “primary” and “secondary” contradictions. The primary contradiction resides in anthropocentric industrial capitalist society. Secondary contradictions over other issues, such as vegetarianism, remain but are accepted so that people can unite and focus on the primary contradiction.

Spirituality is also critical in left biocentrism. Point six of the Primer states:

Left biocentrism holds that individual and collective spiritual transformation is important to bring about major social change, and to break with industrial society. We need inward transformation, so that the interests of all species override the short-term self-interest of the individual, the family, the community, and the nation.

Left biocentrists believe that, in order to try and turn around the ecological “Armageddon” and to prevent the coming social disaster, a profound transformation is required in our relationship to the Earth. This will include resacralizing nature so that people come to see the Earth as alive and part of themselves. A future Earth-centered society will need to be organized around an ecocentric morality that has an essential spiritual or sacred dimension and is not based on economics.

The discussions among left biocentrists about what it means to advocate the resacralization of nature are ongoing and contentious. Some left bios, including myself, have been influenced by atheism or the Marxist tradition that sees organized religion as an “opiate,” while other left bios have some kind of relationship to various institutional religions. Left bios usually draw a distinction between “institutional religion” and “spirituality.” Resacralizing the Earth is seen as a concern with spirituality, not with establishing some new institutional religion.

Left biocentrism is interested in what should be our relationship to the spiritualities of Aboriginal cultures, in particular animism. The basic idea that the Earth is alive, and that plants and animals have their own intrinsic spirits and values, has in the past acted as a restraint on human exploitation. However, animism, which sustained hunter/gatherer societies over thousands of years, was still ultimately human-centered, perhaps a form of “deep stewardship,” and this did not prevent the now documented extinctions of fauna in the Americas, Polynesia, New Zealand, and Australia.

Deep ecology, which is not human-centered, must build on but go beyond an animistic “seventh generation” consciousness to resacralize *all* species on Earth.

Millions of people around the world use religion as their ethical guide. These religions help shape how people interact with the natural world through different cultures, and the place of humankind within these cultures. Religions differ in this regard and an important part of any deeper ecological work is endeavoring to understand this, so as ecologically to engage with existing religions. There are ongoing discussions on the differences between, as well as within, the Abrahamic and the Vedic religions in regard to ecological consciousness. Within deep ecology, for example, a number of writers have been influenced by Buddhism. The concern with self-realization in deep ecology seems analogous to the Buddhist sense of the interconnected self with the universe.

E.F. Schumacher, himself a Catholic, outlined in the early 1970s in his book *Small is Beautiful* what he called a “Buddhist economics,” seeking to move societies away from capitalist consumerism as a false identity basis, to an identity based on the cultivation of personal inner growth. The theoretical tendency of institutional religions is a concern for left biocentrism and has come more to the foreground with the prominence of a variety of religious fundamentalisms (e.g., Islamic, Christian, Jewish, Hindu) that seem lacking in any ecological awareness. Religious fundamentalists want to resacralize human societies, not the natural world. In order for industrial capitalism to commodify the Earth, Earth-based spirituality had to be undermined. Left biocentrists believe that addressing this is a crucial part of any engaged green politics in the twenty-first century.

Kocku von Stuckrad

Leibniz lived in a time of great revolutions. It was a time that brought about the fundamental paradigm shift related to the mechanistic theory of Isaac Newton. Leibniz, likewise, was striving for a scientific and even mechanistic model for interpreting nature, but he combined this attitude in an interesting manner with less deterministic and more organic explanations. Because Leibniz's system of thought is scattered in many small texts that are not sufficiently edited even today; and because Hegel had dismissed Leibniz's philosophy as arbitrary, haphazard, and incomplete – in fact, it is often said that Hegel's philosophy is the completion of Leibniz's – his thoughts have long been underrated, and it is only today that his ideas are newly appreciated.

At the center of his thinking lies the so-called *philosophy of monads*. The term “monad,” which Leibniz most likely took from cabbalist and vitalist Franciscus Mercurius von Helmont and Giordano Bruno, reflects the non-material essence of any living creature: God, the angels and every human's soul, the sensual ability of animals and plants, even microorganisms, are monads. Every monad is singular and different; there are no identical monads. Thus, Leibniz's fundamental idea is not a general one like “spirit” or “matter” but the individual itself. The individual monads are the only inseparable units of life and they follow their own plans. Leibniz says, “The monads do not have windows” (Leibniz 1898: 219) which means that they cannot be influenced from outside. The monads are, in a way, spiritual entities that are capable of developing and acting. What we see in the material world is not reality but mere illusion. The monadic reality lies hidden behind the empirically sensible. But since the monad owns a body, this body is a perfect representation of the hidden entity.

No monad can be distinguished or separated from its bodily appearance; even if the body dies, the monad lives on, at least in a sleeping form. The harmonic and exact relationship between monad and body connects Leibniz's metaphysics and his philosophy of nature. Thus, the Cartesian dualism of *res cogitans* and *res extensa* is overcome. Furthermore, the cosmos is conceptualized as a living creature, or, in Leibniz's words, “There is nothing deserted, nothing sterile, nothing dead in the universe” (Leibniz 1898: 257).

Another of Leibniz's conclusions is imperative: according to his theory, space and time do not exist independently of one another. Instead, they are idealized patterns

Leopold, Aldo (1887–1949)

In a 1947 address, “The Ecological Conscience,” conservation scientist and writer Aldo Leopold succinctly identified the dilemma facing those who understood the cultural significance of the emerging ecological worldview.

No important change in human conduct is ever accomplished without an internal change in our intellectual emphases, our loyalties, our affections, and our convictions. The proof that conservation has not yet touched these foundations of conduct lies in the fact that philosophy, ethics, and religion have not yet heard of it (in Flader and Callicott 1991: 338).

Leopold would soon thereafter incorporate the passage, in modified form, in his landmark essay, “The Land Ethic,” the capstone of his posthumously published *A Sand County Almanac*. “In our attempt to make conservation easy,” he would add, “we have made it trivial” (Leopold 1949: 210).

In a post-World War II world harshly awakened to the social and environmental impacts of new technologies, Leopold’s statement resonated with clarity. The conservation movement of the early twentieth century was roughly understood to be a response to destructive and inequitable resource-use practices, driven by short-sighted economics and lax (or nonexistent) governmental policies. Looking forward, Leopold identified the need to deepen that movement, to “touch the foundations of conduct.” In defining his land ethic Leopold sought to expand conservation’s scope, and so preclude its marginalization. For Leopold, conservation entailed more than just smarter resource management. It posed a fundamental challenge. It sought a closer “harmony” between people and nature, informed by science, woven into culture, inspired by ethics and spiritual insight. In the very act of compiling “The Land Ethic,” Leopold defined this challenge and broadened the conversation about the ethics of the human–nature relationship.

In the decades after its publication, “The Land Ethic” became a core text and starting point for those concerned with the ethical and spiritual dimensions of conservation and environmentalism. There is irony in the fact. Aldo Leopold was not a philosopher or theologian, and well appreciated his own limitations in posing such essential questions. Trained as a forester, founder of the then-new field of wildlife management, an innovative thinker in land management and conservation planning, Leopold only occasionally ventured into the higher conceptual realms of his work. When he did, however, he brought to the task his vast field experience, scientific understanding, extensive reading, abiding interest in history, and strong personal commitment to land

stewardship. Reticent on matters of the spirit, his life work as a conservationist and teacher nonetheless led him to the ultimate expression of “The Land Ethic.”

In his extensive published and unpublished corpus, Leopold rarely alluded to his personal religious beliefs. He grew up in Burlington, Iowa, in an ostensibly Lutheran family of German descent, but he was not a churchgoer. His wife, Estella, whom he met while working as a young forester in the American Southwest, was a devout Catholic, but the Church played a minor role in their married life and the lives of their children. How is it, then, that one of the key progenitors of environmental ethics came to develop such acute sensitivity to the moral aspects of conservation?

The biographer can only connect scattered dots: Leopold as a boy hunter along the Mississippi River in the 1890s, absorbing lessons of responsibility and respect for game from his father Carl (whom Leopold later memorialized as “a pioneer in sportsmanship”); Leopold as a student, struck by the statement of a Native American speaker, that “Nature is the gate to the Great Mystery” (“The words are simple enough, but the meaning unfathomable”) (Meine 1988: 35); Leopold as a young forester, watching the “green fire” dying in the eyes of a mother wolf that he and his colleagues had just shot, and sensing “something new to me in those eyes – something known only to her and to the mountain” (Leopold 1949: 130).

Late in Leopold’s life, his youngest daughter asked him directly about his belief in God.

He replied that he believed there was a mystical supreme power that guided the universe, but this power was not a personalized God. It was more akin to the laws of nature. He thought organized religion was all right for many people, but he did not partake of it himself, having left that behind him a long time ago (in Meine 1988: 506–7).

His son corroborated this view. “I think he . . . was kind of pantheistic. The organization of the universe was enough to take the place of God, if you like . . . The wonders of nature were, of course, objects of admiration and satisfaction to him” (in Meine 1988: 506–7).

Perhaps the closest Leopold came in print to describing his own spiritual stance came in an early essay, “Goose Music.” He asked, “What value has wildlife from the standpoint of morals and religion?” His answer referred obliquely to a boy . . . who was brought up an atheist, [but who] changed his mind when he saw that there were a hundred-odd species of warblers, each bedecked like the rainbow, and each performing yearly sundry thousands of miles of migration about which scientists wrote wisely but did not understand. No “fortuitous concourse of elements” working blindly through any number of millions of years could quite account for why warblers are so beautiful. No mechanistic theory, even bolstered by mutations, has ever quite answered for the colors of the cerulean warbler, or the vespers of the woodthrush, or the swansong, or – goose music. I dare say this boy’s convictions would be harder to shake than those of many inductive theologians (Leopold 1953: 171).

Leopold did not identify himself as “this boy”; he did not have to.

Although such expressions surfaced only occasionally in Leopold's writing, this abiding regard for the beauty, diversity, and healthy functioning of the natural world suffused his work as a resource manager, scientist, writer, and teacher over a forty-year professional career. As a product of the Progressive Era conservation movement, he caught the spirit of the times – the connecting of ethics and governmental policy through political reform, the respect for the role of science in the management of resources, the blending of social responsibility and personal commitment. As he advanced in the new U.S. Forest Service, Leopold had his youthful idealism tested and tempered. But he also found that work to be a rich source of insight, along with his broad-ranging literary interests.

By the mid-1920s, Leopold was working out his first extensive considerations of conservation philosophy. He was influenced in particular during these years by the Russian philosopher Pyotr Ouspensky, whose book *Tertium Organum* Leopold specifically drew upon in framing his own emerging ecological worldview. Ouspensky's near-vitalist notion of a living Earth (“‘Anything indivisible is a living being,’ says Ouspensky”) (Ouspensky 1920: 201) dovetailed well with Leopold's field-based appreciation of the complex interrelations of the landscape of the American Southwest. Fusing Ouspensky's holism with insights from his own ecological research, Leopold gave expression to his latent biocentrism:

Possibly, in our intuitive perceptions, which may be truer than our science and less impeded by words than our philosophies, we realize the indivisibility of the Earth – its soil, mountains, rivers, forests, climate, plants, and animals, and respect it collectively not only as a useful servant but as a living being, vastly less alive than ourselves in degree, but vastly greater than ourselves in time and space – a being that was old when the morning stars sang together, and when the last of us has been gathered unto his fathers, will still be young (in Flader and Callicott 1991: 95).

Leopold delivered these thoughts in a 1923 manuscript entitled “Some Fundamentals of Conservation in the Southwest.” Over the next 25 years he would return to the broader dimensions of conservation philosophy, intermittently but steadily, in a series of published and unpublished essays and addresses. Their titles provide a sense of the progression and extension of his thoughts in these years: “The Conservation Ethic” (1933), “Conservation Economics” (1934), “Land Pathology” (1935), “Engineering and Conservation” (1938), “Conservation Esthetic” (1938), “A Biotic View of Land” (1939), “Ecology and Politics” (1941), “Conservation: In Whole or In Part” (1944), “The Ecological Conscience” (1947). Weaving and reweaving themes involving the interrelated social, economic, political, and cultural aspects of conservation, and demonstrating the practical limits of the dominant utilitarian and anthropocentric approach to conservation, these writings were points along the way toward the synthesis of “The Land Ethic.” In these writings, Leopold rarely alluded directly to the religious “foundations of conduct.” Only with that final synthesis did he expressly issue his challenge to philosophers and theologians to join the effort.

Even as he was defining and testing his conservation philosophy, Leopold was putting it into practice as a scientist, teacher, policy-maker, and practitioner. Over the last twenty years of his life, he made basic contributions in a number of applied conservation fields. He brought ecological perspectives into the established fields of forestry, agriculture, range management, and soil conservation. He was the preeminent leader in the then-new field of wildlife management. He laid important foundations for the future practice of ecological restoration in both his professional work at the University of Wisconsin and in his personal commitment on his “sand county” farm. Of the latter he wrote:

On this sand farm in Wisconsin, first worn out and then abandoned by our bigger-and-better society, we try to rebuild, with shovel and axe, what we are losing elsewhere. It is here that we seek – and still find – our meat from God (Leopold 1949: viii).

Following publication of “The Ecological Conscience,” Leopold received a response to the essay from an academic colleague, Max Otto, a prominent Unitarian thinker with whom Leopold was acquainted in Madison, Wisconsin, where both lived. Otto’s remarks spoke well for a new generation of leaders, from varied faiths, beginning to focus on the same post-war dilemmas that Leopold identified in his essay.

I value . . . a quality in your paper which I can only call *spiritual*. You have a *philosophy of wildlife management* which is itself a philosophy of life . . . I’m sure that your argument is sound, and I wish religious people – *church* people, I mean – could see it to be part of religion to enlist in your cause. I’m afraid most of them do not see life in these terms (in Meine 1988: 500).

In the decades that followed Leopold’s death in 1948, more and more “religious people” would come to see “life in these terms” and would enlist in the cause of promoting closer harmony between people and the larger community of life. Into this conversation, Leopold injected insights from the revolutionary new science of ecology, while pointing out in clear terms the essential role that philosophy and ethics had to assume. With the publication of “The Land Ethic” in *A Sand County Almanac*, Leopold provided a bulwark against the trivialization of conservation.

Levertov, Denise (1923–1997)

Denise Levertov's lifelong concern with the experience of mystery began in childhood. Educated at home, Denise, and her older sister Olga, came of age in an eclectic religious atmosphere. Her father, a Hassidic Jew from Russia, converted to Christianity and immigrated to England to become a priest in the Anglican church. Her mother, raised a Welsh Congregationalist, descended from the Welsh tailor and mystic Angel Jones of Mold.

In 1948, Levertov immigrated to the United States and became a distinctive voice in the tradition of American poetry during the second half of the twentieth century. In the late 1960s, Levertov's active participation in the anti-war movement led to poetry explicitly engaged with the collective awareness of the war in Vietnam. In the 1970s, Levertov struggled to balance the drama of public injustice with an emerging interest in the affinities between her religious and ecological concerns.

Asked what the term "religious" meant to her (in a 1971 interview with William Packard) Levertov pointed to a sense of awe: "The felt presence of some mysterious force, whether it be what one calls beauty, or perhaps just the sense of the unknown" (in Wagner 1990: 19). During the 1980s, in a phase of her career devoted to a meticulous and sophisticated development of organic form, Levertov refigures this force in terms of the elusive but persistent mystery of the Christian Incarnation.

In the final books of poems – *Evening Train* (1992), *Sands from the Well* (1996) and the posthumous *This Great Unknown: Last Poems* (1999) – Levertov's celebration of the nonhuman world is inextricable from the intensity of her religious faith. As she insists in one of her essays from this period, "to witness nature is not simply to observe, to regard, but to do these things in the presence of a god" (Levertov 1992: 249). Levertov works toward a "conscious attentiveness to the non-human" as well as to "a more or less conscious desire to immerse the self in that larger whole" (Levertov 1992: 6). Eschewing the American impulse to recreate the self by returning to its primal source in nature – a position that, for Levertov, reinforces an inward, individualistic, and exclusive ethos – Levertov seeks mystical surrender. With art understood as an ongoing affirmation of faith in the unknown, Levertov suggests that the creative act of poetry affirms the possibility of *living with* the natural world.

Lilburn, Tim (1950–)

Tim Lilburn is a Canadian poet, essayist, and teacher of philosophy. Born into a Protestant working-class family in Regina, Saskatchewan, he was profoundly affected in his early twenties by the anonymous Middle English book of mysticism *The Cloud of Unknowing* and other classics of “negative contemplation.” He taught in Nigeria, worked for social-action projects, and became a Jesuit. In the late 1980s he left the Jesuit order, distancing himself from Catholicism but continuing to adapt ideas and terminology from its contemplative texts. He worked as a farm laborer for three years, and later became a teacher of philosophy and literature at St. Peter’s College in Saskatchewan.

Colorful, buoyant, wide-ranging from the vernacular and the hyperbolic to the lyrical and the elegiac, the poems in Lilburn’s three earlier collections show influences as diverse as Gerard Manley Hopkins and the Beats. In his next three collections, *Moosewood Sandhills* (1994), *To the River* (1999), and *Kill-site* (2003), his exploration of human struggles to interact with the natural world moves into the foreground. As dramatized in *Moosewood*

Sandhills, Lilburn spent two years living on the land, where he dug a root garden, slept in coyote dens and deer beds, wandered and watched. Themes of this book and his two subsequent collections have been elaborated upon in Lilburn’s collection of essays, *Living in the World as If It Were Home* (1999).

A key to Lilburn’s writing is a conviction that infinitude has wrongly been seen as belonging to divinity alone; for him a single blade of grass is also beyond comprehension, infinitely complicated. Moreover, our longing for the “stupendous manyness” and “apparently limitless play” of nature is analogous to our longing for divinity. “The eros for the world, I believe,” Lilburn has written, “unfolds in the same way as dialectic and the eros for God have been understood to unfold” (Lilburn 1999: ix). Lilburn sees *naming* as an inevitable part of an erotic longing for the world, but also as something to be doubted, truncated, and deemed incomplete, before it resumes. Steeped in the thought of Plato, the Desert Fathers, Gregory of Nyssa, and Gregory of Nazianzus, Lilburn has adopted a vocabulary from such sources (*ascesis*, *apophasis*, *penthos*), but he also often employs phrases such as “unspeakable otherness,” “intentionless idiosyncrasy,” “astounding particularity,” “fretful proximity,” “muted, protean regard,” “carefully attentive befuddlement,” “insistent and adoring incomprehension.” His poems and his essays are unique in their blend of fecund natural detail and radically adapted contemplative language. While their focus is not on particular environmental issues, they are fueled by a strong questioning of dangerous assumptions about human power and knowledge, and by an underlying advocacy of our need to move beyond centuries of

errorfraught interactions with nature. “Looking with care and desire,” Lilburn says in a note to *Moosewood Sandhills*, “seemed a political act” (Lilburn 1994: 9).

Lilburn has also served a valuable role in editing two anthologies of prose by poets poised on the intersections among literature, nature, ecology, and philosophy: *Poetry and Knowing: Speculative Essays and Interviews* (1995) and *Thinking and Singing: Poetry and the Practice of Philosophy* (2002).

Linnaeus, Carl (1707–1778)

Often called the “father of taxonomy,” Carl Linnaeus was a Swedish naturalist whose monumental *Systema Naturae* (multiple editions starting in 1735) established the basic strategy for the naming and classification of plants and animals used by Western science. He is thus one of the key figures in the development of modern biology. His philosophy of nature was strongly marked by the natural theology of his era (i.e., he understood nature as a comprehensive rational system that had been designed by an intelligent and benevolent God). Thus his prodigious efforts to collect and catalogue various species from around the globe, as important as they were to the scope and conceptual organization of modern biology, were regarded by him as profound acts of piety.

The son of a Lutheran minister, from an early age Linnaeus demonstrated an exceptional ability to observe and catalog details about natural phenomena. While preparing for a medical career, he began to study botany and aggressively pursued the collection and classification of European specimens. In 1735 he completed his medical degree and published the first version of what would become his most important work, *Systema Naturae*. A few years later, he became a professor at Uppsala where he practiced medicine among the Swedish aristocracy, expanded his studies of plants and animals, and developed elaborate gardens that illustrated his ideas. Students and admirers often assisted this process by sending him exotic specimens from their travels around the world. Although Linnaeus published books and essays on a wide range of topics, his most important works concerned classification. He would revise and supplement *Systema* over much of the rest of his life – notably adding materials on animals and non-European materials as they became available to him. Eventually, it became a multi-volume work that established Linnaeus as one of the leading naturalists of Europe.

Linnaeus’ famed system aimed to simplify the existing practice of using long Latin descriptions for plants and animals by substituting a shorthand strategy that consisted of a generic name and a specific modifier – or “binomial nomenclature.” Linnaeus also believed that the naming of species should be integrated into a larger system of natural order based upon common physical characteristics. To do so he created a multileveled system of classification that moved from the general to the specific. With some modifications and additions, this is still the basic classification system used by biologists today: Kingdom, Phylum, Class, Order, Family, and the two that name the organism, Genus and Species.

Like many of the era's naturalists, Linnaeus was an enthusiastic exponent of natural theology and would bracket his published works with biblical quotes and paeans to the Almighty. Typically, Linnaeus linked theology to the legitimization of natural science, the task of classification, and hopes for a better future. For example, in the preface to a 1753 study of plant species, he noted, the WORLD is the Almighty's theater . . . we must research these creations by the creator, which the Highest has linked to our well-being in such a way that we shall not need to miss anything of all the good things we need . . . [E]ach object ought to be clearly grasped and clearly named, for if one neglects this, the great amount of things will necessarily overwhelm us and, lacking a common language, all exchange of knowledge will be in vain (Linnaeus in Koerner 1999: 93).

Yet in spite of his Lutheran heritage and dutiful churchgoing, he was not orthodox in terms of belief. The theological faculty at Uppsala often accused him of conflating God and nature in ways that approached pantheism, and private writings exhibit doubts about doctrines such as the atonement, resurrection, and an afterlife. Thus he is perhaps best understood as a transitional figure whose rhapsodic theism in published works gives way to private doubts and naturalistic views of humanity that are in many ways decidedly modern.

For example, while Linnaeus largely recapitulated the medieval view that human beings stood at the head of the "Great Chain of Being" (i.e., the top of the hierarchy of organic life), he was a significant player in the process through which philosophical and theological concern for the "rational animal" (i.e., in classical and scholastic thought) became the study of a type of particularly clever ape under the aegis of natural history. In the tenth edition of *Systema Naturae* (1758), he introduced three of the enduring terms in the taxonomy of human beings – *Homo sapiens*, *Mammalia*, and *Primates*. Implicit in these categories was Linnaeus' conviction, articulated throughout his later writings, that there were no significant physical characteristics that distinguished human beings from apes. In a letter to a friend, he noted, "If I were to call man ape or vice versa, I should bring down all the theologians on my head. But perhaps I should do it according to the rules of science" (Linnaeus in Frangsmyr, et al. 1983: 172). Although more cautious than later biologists, his classification strategy ultimately took aim on one of the inherited conceits of the Western tradition, that human beings were outside of the natural system by virtue of their rational or spiritual qualities.

Subsequent generations have hailed Linnaeus as one of the great "system builders" in biological science whose achievements are analogous to Newton's influence on physics. In Sweden this reverence has been even more pronounced. During the nineteenth century, reverential biographers and public celebrations of his achievements elevated him to the status of national hero, and more recently, the country has undertaken the careful restoration of his beloved gardens in Uppsala. In England and America various Linnaean Societies continue to advance the study of nature. And of course, every student in a basic biology class pays a kind of tribute to Linnaeus by learning to name and categorize species using the basic principles that he established. In terms of religion,

the legacy of Linnaeus is more ambiguous. The theological beliefs that sustained his philosophy of nature would be deemed largely irrelevant to subsequent generations of biologists, particularly after the Darwinian revolution. Some religious conservatives, however, still invoke his ideas on the fixity of species to bolster their attacks on evolutionary concepts. On the more liberal side of things, the spirit of Linnaeus' natural philosophy is perhaps more influential than the content. At once scientifically rigorous and theologically reverent, his efforts remain a source of inspiration for at least a few *Homo sapiens* that also fancy themselves *Homo religiosus*.

Lopez, Barry (1945–)

Born in New York in 1945, Barry Holstun Lopez spent most of his first ten years in California, returning to the West after college at Notre Dame for graduate studies in folklore in Oregon. Deciding for a life of writing rather than an academic career, he settled on the McKenzie River in western Oregon. His writing is primarily in the genres of short stories and natural history essays; he has received literary awards for both and is one of the leading U.S. contemporary ecological writers.

Best known among his non-fiction works are *Of Wolves and Men*, *Arctic Dreams*, and the collection of essays, *Crossing Open Ground*. His fiction includes *Desert Notes*, *River Notes*, *Field Notes*, and *Winter Count*. Central to all his work is the landscape – whether of Oregon or other parts of the U.S. West or the Americas, the Arctic or Antarctic. Whatever the location, his work aims to create a palpable awareness of a landscape that is rich in details and in mystery, in facts and in meaning. In “Landscape and Narrative” he describes an external and an internal landscape.

The external landscape is the one we see – not only the line and color of the land and its shading at different times of the day, but also its plants and animals in season, its wealth, its geology, the record of its climate and evolution” (Lopez 1989: 64).

Both the external and internal landscapes become comprehensible only by understanding the relationships between and within them, which requires sensuous participation as well as mental reflection. It is the patterns that he believes inhere in these relationships that create a meaningful, trustworthy universe.

To draw the reader into the experience of a particular landscape, Lopez fills his books with scientific information about geography, plants, and animals, including their migration and socializing patterns; as well as information about humans: their mythic stories and artistic creations and their differences (e.g., between Eskimo and European orientations), their scientific research and technological developments, their expeditions – and his reflections on all of these. A *New York Times* review of *Arctic Dreams* said that it is “a book about the Arctic North in the way that *Moby-Dick* is a novel about whales” (Kakutani 1986). I think there are many ways in which this is not true. Although Lopez’s goal is certainly to discover more about humans through his explorations of the land, the landscape does not serve primarily as a springboard to reflect on human meaning; rather, it is only by deeply understanding the whole process of which humans are an interrelated part that they can come to understand themselves. He reports that as he traveled through the Arctic, he came to the realization “that people’s desires and aspirations were as much a part of the land as the wind, solitary animals, and the bright fields of stone and tundra. And, too, that the land itself existed

quite apart from these” (Lopez 1986: xxii). Humans can be understood, then, only as part of the landscape.

This land that exists apart from humans can be approached imaginatively, though not definitively. Lopez could be accused of anthropomorphism as he imagines what it would be like to be a wolf or when he says of migrating geese, “They flew beautifully each morning in the directions they intended, movements of desires . . . In that hour their lives seemed flush with yearning” (Lopez 1986: 158). However, rather than collapsing animals into humans, what he is trying to do is open our human imaginings to the full and rich *Umwelt*, or life-world, that a wolf has quite beyond our imaginings (Lopez 1978: 285) and enable us to allow for the mystery that geese too may have desires, not known by us.

Lopez seldom speaks directly about religion in relation to this quest for openness to the world, though his works are filled with a sense of “something more” (as Williams James defined religion), which one comes upon in the landscape, even though it remains elusive. Nor do his works invite a translation into religious tenants. Such categorization loses the rich reality of humans fully living in and with the landscape, within which the sacred reveals itself. He says he hopes his writing will “contribute to a literature of hope” (Lopez 1998: 14), which seems to depend on humans beings recognizing their place in and responsibility to the whole and the spiritual meaning that is rooted in the whole, which lies beyond human ability to comprehend or control.

Whatever evaluation we finally make of a stretch of land . . . no matter how profound or accurate, we will find it inadequate. The land retains an identity of its own, still deeper and more subtle than we can know. Our obligation toward it then becomes simple: to approach with an uncalculating mind, with an attitude of regard . . . To intend from the beginning to preserve some of the mystery within it as a kind of wisdom to be experienced, not questioned. And to be alert for its openings, for that moment when something sacred reveals itself within the mundane, and you know the land knows you are there (Lopez 1986: 228).

Lost Worlds

Remote, unexplored or allegedly “disappeared” regions of the natural and cultural world have been prominent subjects of mytho-poetic discourses throughout human history. The multifarious conceptions concerning “sunken cities,” “islands,” or “continents,” and similar “lost worlds,” have been (and still are) prominent examples for the construction of “utopias,” “paradises,” and “El Dorados.” They have led to influential motifs in colonial expansion or exotic imaginations about foreign countries and civilizations, and in many instances, evolutionary myths with historical, geographic or socio-political facets come into play.

In his dialogues *Timaios* and *Kritias*, the Greek philosopher Plato presented the famous account of a mythic island called “Atlantis,” using it mainly as an elucidation for certain socio-political ideals set in a once perfect and abundant commonwealth (Plato indeed used to incorporate mythic illustrations in his philosophical writings). Following this paradigmatic story, which includes a final destruction of the island with its spiritually declined population by nature catastrophes (flood and earthquakes), Atlantis gradually surfaced as one of the most popular mytho-geographical and nature-historical images in the utopian genres of the West. Following the corresponding literary output of modern Theosophic/ esoteric “visionaries” like Helena P. Blavatsky (*The Secret Doctrine* [1888]), Edgar Cayce (various clairvoyant “Readings” related to Atlantis) or James Churchward (*The Lost Continent of Mu, The Children of Mu*, both in 1931), and others, many of today’s esoteric traditions have incorporated the idea of sunken islands into their mythic topography and history of Earth’s past and future. Culture heroes of primordial times (the “Builders”) are associated with these sunken islands, and in many esoteric eschatologies Atlantis is supposed to “return” again one day from the bottom of the “Atlantic” Ocean (as well as its legendary companion “Lemuria” or “Mu” in the Pacific Ocean), when a millenarian harmony is finally to be restored on “Mother Earth”.

As in the case of Ignatius Donnelly’s prominent *Atlantis: the Antediluvian World* (1882), and up to the present time, countless attempts have been made to identify and locate Atlantis, and to relate the Atlantis-legend to other mythic accounts of various religious traditions in order to prove its historical truth – for example, to the mythic “Aztlan” of the Aztec mythic records about the origin of the “Mexicans.” Sometimes, the “lost world” mythology of Atlantis, Mu, Thule, and the like, is combined with the global dissemination of the whole human race – or at least certain “superior” parts of it, as in some strands of (Neo-) Nazi esotericism. A similar nativistic reconstruction of a “lost world” can be found in revisionist strands of Neo-Hindu thought, when

the ancient Indus Valley civilization is presented as “the” grand culturegiving (and supposedly “Vedic”) source for all humanity – with high technologies, and the like. Until today, innumerable books and web-pages are devoted to such “lost worlds” – themes or aspects thereof – including ideas about living subterranean or submarine remnants of the legendary “Atlanteans,” or even quite anomalistic ideas about an inhabited “hollow Earth” (cf. Childress & Shaver).

In the modern Space Age, however, the “lost world” idea is expressed not only in such “earthly” terms, but also on an interplanetary or even intergalactic level – especially in the modern fantasy (cf. H.P. Lovecraft) and science-fiction genres. Obviously, the frontiers of today’s “terrae incognitae” have moved more and more into outer space. However, Lucian’s (Lukianos of Samosata; ca. 120–180) eye-twinkling “records” in his *True Stories* – a collection of biting satires on the Greek utopian genre – relate miraculous “travels” by sailing ship to some kingdoms of the solar system and, thus, display quite an ancient prototype for contemporary science-fiction utopias and Star Wars-scenarios up in the skies.

With their spiritual reinterpretation of the Space Age cosmology, contemporary religious ufologies clearly display a postmodern “re-enchantment” of the heavenly reigns with “Angels in space suits” (see Clark 1998). Here, the earthly Atlantis/Mu-theme is often reappearing in particular association with “extraterrestrial” Space Aliens as primordial culture heroes who supposedly colonized these mundane regions with the use of superior technologies (space and air travel, genetic engineering, etc.), unknown energies, and paranormal faculties (cf. the once relatively famous Californian “Sunburst” community around Norman Paulsen in the 1980s). The impact of Charles Fort’s *Book of the Damned* (1919; with three follow-up volumes), propounding the idea that “we are property” of some superior Alien race, has additionally shaped this line of thought which is still very popular in modern religious ufologies (cf. “Ashtar Command” or Claude Vorilhon’s “Raëlian Religion”) and in various other esoteric cosmologies and “channelings,” as well as in the so-called “Ancient Astronauts” theories or “paleo-SETI” discourses of Erich von Däniken, Robert Charroux and similar “fringe” archeologists and “Fortean” students.

However, this seemingly contemporary tie between a superior scientific or technological control over nature and the Atlantis-theme (e.g., E. Cayce) can already be found in Francis Bacon’s *Nova Atlantis* (1626/27), where he describes a utopian island with an ideal commonwealth: in a wonderful socio-political setting, the scientists of “Bensalem” developed devices for “flying in the air,” as well as “ships and boats for going under water”; they also used scientific experiments to breed “new animals” and “perfect creatures” by hitherto unknown means, all in service to the inhabitants’ utilitarian needs (“Happy are the people of Bensalem”). Combining pious recourse to transcendence with an empirical and rational pursuit of truth, spiritually and scientifically “enlightened” reason is presented to serve “perfect” human hedonistic control over nature.

In a similar vein, most of the “lost world” myths idealize the “perfect society” in all dimensions – comprising justice on the societal and individual plane, economic well-

being and abundance, scientific and spiritual enlightenment, control *over* nature, and, at the same time, harmony *with* nature, as well as the use of advanced, but ecologically harmless (“green”) technologies and “free energies.” Despite apparently “modern” technological issues, this alludes strongly to the archetypal “once upon a time” image of the paradisiacal “Garden”: Its representation by mytho-logic is a ubiquitous religious method to stage important human ideals, norms, hopes, as well as paradigmatic warnings – even if the mythic reappearance of the lost paradise is put into an imminent, or distant, millenarian future.

In the end, therefore, the most successful search for Atlantis and its alleged siblings, once “forgotten” and “sunken” during the course of Earth’s natural history, will locate these “lost worlds” not so much topographically somewhere on the globe, but rather in the religious, mythic and utopian creativity of the human mind.

Lovelock, James (1919–)

James Lovelock, a professional research biologist and Fellow of the Royal Academy, is best known as the author of the Gaia hypothesis, a proposal that the Earth be viewed as a single physiological system. Lovelock began to develop the Gaia hypothesis in 1965 while he was working with NASA to test for life on Mars. Realizing that the lack of atmosphere was evidence of a lifeless Mars led him to recognize the vital importance of life in maintaining the improbable chemical balance of the Earth's atmosphere. Working out the details of this insight, he published a full argument for his hypothesis in his 1979 book, *Gaia: A*

New Look at Life on Earth. The initial response from the scientific community was mixed – some, such as the evolutionary biologist Richard Dawkins, denounced the hypothesis as unscientific. However, the effect on the popular imagination was strong, and the name Gaia quickly became identified with the emerging environmental movement – especially as it sought to address global issues. Lovelock continued to work on Gaia, using computer modeling to simulate global processes; and he set forth the complete theory in his 1988 book, *The Ages of Gaia: A Biography of Our Living Earth*. From the beginning he has had a number of allies in developing Gaia theory including the microbiologist Lynn Margulis, who identified the specific role of microbial life in maintaining homeostasis of the planetary system. Gaia theory has persisted and refined itself, and now has many adherents amongst other biological scientists in spite of its initial poor reception.

Gaia has had a particular appeal to religious thinkers. Lovelock reports that two-thirds of his mail related to Gaia theory asks about the relationship between Gaia and God. While Lovelock has been supportive of theologians and other religious thinkers using Gaia theory, he has personally taken a more reserved stance. He identifies himself as an agnostic and does not support the idea that Gaia theory provides warrant for the existence of a particular divinity. However, he has argued that the holistic aspects of Gaia theory inspire a sense of wonder and devotion to the Earth system and an understanding of the human role within it.

Lovelock is above all an independent thinker, as displayed by his often tense relationship with the environmental movement. Environmentalists have expressed concern that Gaia theory undermines the magnitude of the environmental crisis by suggesting that the selfregulation of the system will compensate for human destruction. Lovelock actually suggested that Gaia theory gives insight into how human actions disrupt not only local environments, but also the global regulation system itself. However, Lovelock has distanced himself from environmentalists who display suspicions of science

and technology, himself advocating primarily technological responses to environmental problems. He often credits the environmental movement with a dogmatism that undermines the free inquiry of science. While he was one of the first scientists to identify the quantity of chlorofluorocarbons (CFCs) in the Southern atmosphere, he found himself initially on the industry side of the ozone debate of the late twentieth century. As a result, he was cast as a lackey of industry. Although Lovelock later embraced the environmentalist side of that debate, he holds that he was motivated by clear science rather than political commitments.

Luo (Kenya)

– See Hyenas – Spotted; Snakes and the Luo of Kenya.

Lyons, Oren (1930–)

As Faithkeeper of the Turtle Clan of the Onondaga Nation, Oren Lyons has been a clear, persistent, and respected voice for the Haudenosaunee (Iroquois Confederacy), and for indigenous people throughout the world. He has effectively carried the message of an environmental crisis facing indigenous ways of life to larger human communities. His personal life story spans a wide diversity of experiences including athletics, hunting, fishing, painting, public speaking, activism, writing and serving as a traditional leader. He has had several careers including a tour of duty in the army, a commercial artist, a professor, and an ambassador to the United Nations for the Haudenosaunee.

Lyons, whose clan name is Joagquisho, was born in 1930. He was raised on the Onondaga Nation Territory in upstate New York. During his youth he learned Haudenosaunee ceremonial practices, which included their game of lacrosse. He also learned to hunt, fish and live fully with respect for the natural world. From 1951–1953 he was a member of the 82nd Airborne Division of the US Army. In 1957 he was the goalie for the undefeated lacrosse team at Syracuse University and made the All American Lacrosse Team, playing with Jim Brown, who would go on to profootball fame. After receiving his Bachelor of Fine Arts from Syracuse University in 1958, he moved to New York City to pursue a career as a freelance commercial artist. During this time he also worked for Norcross Greeting Cards, Inc., supervising 250 artists and technicians.

In 1967, at the request of Clan-mothers, he gave up his career and returned to the Onondaga Nation to be raised as a Faithkeeper of the Turtle Clan. The Onondaga Nation Territory, near Syracuse, is the Central Fire of the Iroquois

(or “Haudenosaunee”) Confederacy. The Haudenosaunee are the last remaining traditional indigenous government, still in charge of their lands, that is recognized by the United States. It is still run by the Longhouse system of clans, which are overseen by Clan-mothers, Clan-chiefs, sub-chiefs, and male and female Faithkeepers. From 1971 until the present he has been a Professor of American Studies at the State University of New York in Buffalo.

Lyons has been present at many of the most significant recent events for indigenous people. In 1972 he accompanied a peace delegation of the Haudenosaunee to the Bureau of Indian Affairs (BIA) headquarters in Washington, D.C., which had been taken over by the American Indian Movement (AIM). In 1973 he led a Haudenosaunee delegation to the Lakota Nation during the standoff at Wounded Knee. In 1977 he was instrumental in organizing a group of Native American leaders to speak at the United Nations in Geneva, Switzerland. This momentous event is the subject of the book *Basic Call to Consciousness*. He has continued his work at the UN and helped

to establish the Working Group on Indigenous Populations in 1982. He serves on the Executive Committee of the Global Forum of Spiritual and Parliamentary Leaders on Human Survival. He is a co-founder of the Traditional Circle of Indian Elders and Youth, which is an annual council of traditional grassroots leadership of Native American nations. In 1990 he was a negotiator between the governments of Canada, Quebec, New York State, and the Mohawk Nation over the crisis at the Mohawk community of Oka. He then led a delegation of seventeen American Indian leaders to meet with President Bush in Washington in 1991. In 1992 he organized a Haudenosaunee delegation to attend the United Nations Conference on Environment and Development in Rio de Janeiro. Lyons was a founder of the Haudenosaunee Environmental task force. In 2000, along with co-chair Henry Lickers, he won the EDA, Region 2 Environmental Quality Award of the U.S. Environmental Protection Agency. Also in 2000 he was a plenary speaker in the Global Environmental Youth Convention held in Lund, Sweden.

Oren Lyons has been featured in many important media events. In 1992 he was the subject of a one-hour documentary by Bill Moyers titled "Faithkeeper." He has appeared as a major speaker before the U.N. in New York and Geneva. He has appeared on Larry King Live and the Charlie Rose show and has been a featured speaker on various film projects including the acclaimed series "The Native Americans" produced by TBS in 1992. He wrote the story and script for the film *Hidden Medicine* that debuted at the Sundance Film Festival in 1999. In 2001 he sat down in public with the famous author and friend Peter Matthiesson to discuss "Perspectives on Spiritual Law and Human Responsibility" at the SUNY College of Environmental Science and Forestry and Syracuse University. Lyons is well known to some of the most respected entertainers in the film and music industry. He consistently uses his visibility to emphasize those things most urgent to him; namely the survival of indigenous people, their traditions and the perpetuation of creation.

He is known also for his lifelong commitment to the game of lacrosse. It was originally a Haudenosaunee game and is still played as a healing game among the Longhouse people. Since 1983 Lyons has helped organize the Iroquois Nationals Lacrosse Team, which has competed in the World Games. Over the last twenty years the Iroquois Nationals have steadily risen in the world rankings. The effect of their performance among the world's top teams has been an increasing pride among the Haudenosaunee youth. In 1993 he was inducted into the Lacrosse National Hall of Fame. In 1998 he was inducted into the Ontario Lacrosse Hall of Fame. In 2003 he was inducted into the International Scholar-Athlete Hall of Fame at the University of Rhode Island's Institute for International Sport.

In 1992 Lyons, along with John Mohawk, published his most important scholarly work titled *Exiled in the Land of the Free*. Through his efforts in educating America's leaders the U.S. Senate passed resolution #76 in 1987 which formally acknowledges the "contribution of the Iroquois Confederacy of Nations to the development of the United States Constitution." Founding Fathers Thomas Jefferson, George Washington and Benjamin Franklin counseled with Haudenosaunee leaders to discuss effective gov-

ernmental structures. Resolution #76 goes on to reaffirm the continuing government-to-government relationship between Indian tribes and the U.S. In 1992 he was formally recognized in the U.S. Senate for his work.

Lyons was awarded two honorary doctorates. The first in 1987 by the City University of New York Law School at Queens College, and the second in 1993 by Syracuse University. In 1994 he was given the First Annual National Museum of the American Indian Art and Cultural Achievement Award by the Smithsonian Institution. In 1995 he was given The Elder and Wiser Award for “Selfless efforts on behalf of the human family,” which was presented to him by Rosa Parks at the Rosa Parks Institute for Human Rights and Self-Development. For many years Lyons has been working with the business and government leaders in Sweden on their ambitions to become the leading nation in Europe on sustainable development. For his efforts in Sweden he was named Honorary Adult Friend of The World’s Children’s Prize for the Rights of the Child in 2002.

Lyon is currently Chairman of the Honoring Nations Advisory Board, which is a granting agency administered through the Harvard Project on American Indian Economic Development. He is also board-member of The American Indian Law Alliance; The American Indian Institute: the Traditional Circle of Elders and Youth; The International Lacrosse Federation (ILF); The Iroquois Nationals Lacrosse; The Global Forum of Spiritual and Parliamentary Leaders; The Institute for the Preservation of the Original Languages of the Americas; and the American Indian Ritual Object Repatriation Foundation.

Oren Lyons has spoken to world-famous environmentalists, artists, academics, businessmen, politicians, entertainers, and athletes in world forums. He is equally well known to traditional leaders among various indigenous communities all over the world. He has traversed this world with a critical eye on all that serves to degrade and destroy the natural world. His message of peace is that human beings can no longer afford to act irresponsibly toward creation; nor can people of the First World continue to disregard the messages coming from indigenous people. Lyons has listened to indigenous people from all parts of the Earth and his conclusion is that we have a very short time in which to turn our world from its present destructive path. Human beings are routinely defying the natural laws of creation – something that they can no longer afford to do. It will inevitably lead to our own destruction unless we can find a suitable response to the present malaise of the human spirit.

Philip P. Arnold

M

Maasai (Tanzania)

Historically, Maasai were semi-nomadic pastoralists who lived in Tanzania and Kenya. Nature and its elements have been and remain central to Maasai religion, even as Maasai lives and livelihoods have changed in response to colonialism, nationalism, development interventions, Christian evangelization, education and other processes. These processes have also exacerbated regional, social, cultural and thus religious variations among and within Maasai sections (large territorial groupings). Moreover, although many Maasai, in addition to keeping livestock, now cultivate small farms, work for wages, and pursue other modes of economic diversification, most still remember and uphold their long-standing history and ideals as semi-nomadic pastoralists. Their close customary relationship to and dependence on the environment for their sustenance and social reproduction was expressed in many aspects of their religious beliefs and practices, including: their concept of their deity (*Eng'ai*), their sacred symbols and colors, their holy mountains and trees, their attitudes toward wild and domestic animals, and their prayers and praise songs. Although many of their beliefs and practices continue today, this entry is written in the past tense to acknowledge the changing circumstances of their lives.

Maasai believed in one deity, Eng'ai (also spelled Ng'ai, Nkai, and Enkai), who was understood primarily, although not exclusively, in feminine terms as the divine principle that created and nurtured life on Earth. Eng'ai also meant "rain" and "sky," and was addressed through many metaphors such as *Noompees*, ("She of the growing grasses") and *Yieyio nashal inkilani* ("My mother with the wet clothes") that emphasized wetness, darkness, motherhood and growth, and thus reinforced the association of Eng'ai with fertility and femaleness. According to most myths and proverbs, Eng'ai resided in and was one with the sky, and had a dialectical relationship of mutual dependency with *enkop*, the land or the Earth: *Kerisio Eng'ai o Enkop*, "Eng'ai and the Earth are equal." Together, Eng'ai and humans, the Sky and Earth, created and nurtured life; there was a necessary unity and complementarity between them. All natural phenomena, especially those concerned with the weather, were attributed to the interventions of Eng'ai and read as expressions of divine power and judgment – rain as blessing, drought as displeasure, thunder and lightening as anger, rainbows as approval, and comets as portents of bad luck.

Both Eng'ai and humans had the ability, through their actions, to alter their relationship. This agency is evident in one set of myths that describe how, because of human jealousy and greed, Eng'ai ended the flow of cattle to Maasai from the sky and distanced (but did not separate) herself from them. The dynamic relationship

between humans and Eng'ai also shaped how Maasai understood and invoked Eng'ai in their daily lives, and the almost complete lack, at least historically, of a distinction between the sacred and secular worlds. Although most Maasai men tended to pray only on special occasions to Eng'ai, Maasai women prayed throughout the day, from the early morning when they milked their cattle to their last waking moment at night. During their prayers, women sprinkled some milk on the ground for Eng'ai, raised their arms and heads to the sky (sometimes clutching grass in their hands), and entreated her for continued protection, preservation, expansion and prosperity of the family and herds. Women also sang prayer and praise songs to Eng'ai when gathered together for chores and rest, or at ceremonies and celebrations. Through their prayer and songs, women maintained a daily, ongoing relationship with Eng'ai, and took responsibility for ensuring that Eng'ai bestowed continued blessing and bounty on their households.

In addition to the constant intercessions of women, Maasai also tried to influence and understand Eng'ai's actions through their *iloibonok* (*oloiboni*, singular), male ritual leaders who had the powers of prophecy and divination. According to Maasai myths, iloibonok were direct descendants of Eng'ai, beginning with the first *oloiboni*, Kidongoi, who became the apical ancestor of their sub-clan, Inkidong'i. They were always seen as "outsiders" to some extent, and their powers were viewed with a mixture of fear and fascination. There were major Iloibonok who had superior powers of prophecy and divination and large followings. They were called upon to appeal to Eng'ai in times of great crisis such as prolonged drought, warfare, or sickness, and some even served as Maasai "chiefs" during the early colonial period. In contrast, the minor Iloibonok usually did not prophesy, but performed divinations at the request of individual clients to investigate more mundane, everyday problems such as the occasional ill health of people and livestock. The primary method of divination was to shake stones and other objects from a gourd or horn, then analyze them with the complex Maasai numerology of auspicious and inauspicious numbers. Iloibonok also provided charms and amulets for various purposes such as to ward off sickness or to ensure the success of a cattle raid by junior men. Finally, in times of crisis and concern, Maasai men and women held elaborate ceremonies to entreat Eng'ai for help. These usually involved prayer and praise songdances, the ritual slaughter, roasting and consumption of cattle, the brewing and imbibing of honey beer, and special prayers using elements of nature associated with Eng'ai such as milk, honey, grass, and water (discussed below).

As pastoralists, Maasai were concerned with having sufficient grass and water to feed their livestock. Not surprisingly, then, grass and certain liquids (milk, spittle and honey) featured in their religious entreaties, practices and ceremonies as near-sacred symbols of and gifts from Eng'ai. Grass was a sign of welcome and peace. It was often held in the hands, tied as a sprig to one's clothing, placed in the neck of a calabash, or draped on someone's shoulders as they were being blessed. Milk, like cattle, was a gift from Eng'ai, and symbolically associated with women (who produced, processed and controlled its distribution) and fertility. It was sprinkled on the ground at the beginning of each milking, on humans from a calabash with grass in its mouth for blessing, and

offered to family, visitors, and even strangers. To spit on a person (usually their head or hands) or a thing (such as a gift) was to bless them or express reverence. New-borns were spat on constantly, elders spat into the hands of juniors to bless them and wish them well, and ritual participants often spat a mixture of milk and water on whoever was being honored, prayed for, or blessed. Honey signified the sweetness of Eng'ai, and honey beer was also often spat on people as a sign of blessing.

These and other natural elements were associated with and expressed in the meaning and use of colors in the Maasai religious cosmology. White (of milk, animal fat, and the white cumulus clouds that appear after a rain storm) was a sign of blessing, peace and contentment. White chalk was often used to draw special protective designs on the face, legs or torso of certain ritual participants; they were also sometimes anointed with animal fat. Maasai spoke of *Eng'ai Naibor*, the "White God," or the "God with the white stomach." A stomach was white and content from being filled with the milk that was Eng'ai's gift to Maasai. White beads also featured in Maasai beadwork.

Black (of the dark rain clouds) was a particularly holy color. Black cloth used to be worn by fertile women, and is still worn by people in holy or liminal states (such as newly circumcised boys and girls, or prophets and prophetesses) to entreat Eng'ai's special protection. Eng'ai was referred to as *Eng'ai Narok*, the "Black God," when she was being helpful, kind and compassionate. Black bulls were required for the sacrifices made at major age-set ceremonies and the dark blue beads (which were categorized as black) worn by married men and women marked the sanctity of their marital bonds. Charcoal was often used to make symbolic black markings and designs.

The meaning of red (of blood and ochre) was somewhat contradictory. On the one hand red clothing (formerly leather rubbed with ochre, now red cloth) and skin (achieved by rubbing a mixture of ochre and cow fat) were considered a distinctive marker of Maasai ethnic identity. As the color of blood, red signified kinship, life and vitality. On the other hand, red could express anger and destruction. When the actions of Eng'ai were seen as harmful and vengeful, she was called *Eng'ai Nanyokie*, the "Red God." Red was also associated with fire and the relentless heat of the dry season. Red for Maasai was, it seems, the color of power, which had the potential to be creative or destructive, or even both – destroying in order to create. Finally, many other nature-associated colors – the blue of the sky, the green of the grass, the orange of the sun – appeared in meaningful patterns and arrangements in the elaborately beaded ornaments, jewelry and clothing crafted by Maasai women. Thus Eng'ai was sometimes referred to as *Parmuain*, "Multicolored God."

Maasai also symbolically associated trees and mountains with Eng'ai. Trees and shrubs were called *olcani*, which also meant "medicine." The roots, bark and leaves of certain trees and shrubs were used as medicine to treat specific diseases. Since disease and death, like health and birth, were derived from Eng'ai, the power of *olcani* to heal and protect was understood as a divine intervention mediated through human knowledge and practice. In addition, *oreteti*, a species of parasitic fig tree, was believed to be particularly sacred. The *oreteti* tree spreads and grows by lodging its seeds in

the cracks and crevices of other trees. As a result, its branches extend in all directions and its many roots entangle and hang down in coils from the host tree from sometimes-great heights. Oreteti often have water in their trunks and fissures, its sap is a reddish color, and its leaves contain a milky white substance. Maasai saw these vertical thickets as links growing from the sky and Eng'ai down to the Earth and humans; they were therefore considered holy places where people could be closer to Eng'ai. Maasai men and women visited these holy trees either alone or in groups to pray, worship, and plead to Eng'ai for rain and other blessings. The leaves, bark and branches of the oreteti tree were also used in religious ceremonies and prayers.

Certain mountains also figured in Maasai religious cosmology and stories as the homes of Eng'ai or her descendants. Oldoinyo Orok, the "Black Mountain" (Mt. Meru) was recognized as holy and a home of Eng'ai. Oldoinyo Oibor, the "White Mountain" (snow-capped Mt. Kilimanjaro), was sometimes referred to as the home of the first human, Naiterukop ("She who creates the earth"). Oldoinyo Leng'ai, the "Mountain of God," is an active volcano that still spouts smoke and ash in the Rift Valley.

Its occasional eruptions signaled the wrath of Eng'ai. Nonetheless, ritual delegations of barren Maasai women (*olamal*), led by elder men, regularly visited Oldoinyo Leng'ai to pray to Eng'ai to bless them with children.

As part of their reverence for nature as Eng'ai's creation, Maasai also treated wild and domestic animals with respect. Cattle, of course, were prized as the primary source of food, social worth and Maasai identity. Each animal was distinguished by name, based on its colors, size, and other physical features. Goats and sheep were also marked as individuals, although with less fanfare and prestige. Historically, Maasai did not hunt or eat wild animals, including the large herds of wildebeest and zebra that roamed their plains. Lions, however, were hunted by junior men for protection and prestige. Snakes were usually left alone, and there was a belief that certain very prominent men returned as black pythons. Birds were never eaten, but certain species were killed so that their bodies and feathers could be used to create elaborate headdresses for newly circumcised boys.

Nature and all of its elements, as described above, were reflected and expressed in Maasai prayers and praise songs. As an example, take a woman's dance song recorded by Jan Voshaar and transcribed in his book *Maasai, Between the Oreteti-Tree and the Tree of the Cross*. The chorus invoked both Eng'ai and the Earth: "We pray to Eng'ai and Earth, iyioo. God of many qualities. O Multicolored God, let me (us) pass where the calf was slaughtered for rain, give me also someone to sit with." The ensuing verses mentioned sitting under shady trees, begged Eng'ai to give children to all women, and invoked "The oreteti tree of the white clay so sweet; Sweet at the time of ritual." One verse asked Eng'ai to "Give me that which is yellow and that which is white," referring to the first milk and the last milk of both mothers and cows. Another series of verses spoke of the duality and complementarity of Eng'ai and the Earth: "To the two expanses I pray; I pray to God's expanses that comes as equals" (1998: 226-7).

In conclusion, Eng'ai's relationship to humans was seen in and understood through nature. Since Maasai had no concept of the afterlife, they focused on leading good and holy (*sinyati*) lives in the present so that Eng'ai would be pleased and bless them with good health, children and cattle. The focus of their religious beliefs and practices was thus on maintaining the complementarity between Eng'ai and humans, between the sky (or heavens) and the Earth, and correcting – through daily prayers and ritual ceremonies – any transgressions or disturbances that occurred to this relationship.

In recent years, this relationship has been more difficult to maintain as the tremendous, cumulative losses of land and key water supplies to game parks, commercial agriculture, and settlers have converged with a long history of inappropriate development interventions to undermine pastoralism as a viable livelihood and to force Maasai to seek other ways of supporting themselves. Moreover, these colonial and post-colonial interventions have also privileged Maasai men as economic and political actors, thereby disenfranchising Maasai women from their historical rights and powers. In response to these dislocations, many Maasai women have embraced Christianity as a way to enhance their spiritual powers and critique what they perceive as the increasingly materialistic, secular and amoral practices of Maasai men. Maasai religious beliefs and practices have been encouraged, modified, disparaged, or prohibited, depending on the denomination and attitude of the missionaries and church involved.

Macy, Joanna (1929–)

One of the outgrowths of social and environmental activism in the late twentieth and early twenty-first centuries has been a reevaluation and reappropriation of the various religious traditions of the world. “Engaged Buddhism” utilizes Buddhist concepts such as codependent co-arising (in Sanskrit, *Pratītya Samutpāda*), compassion (*karunā*) and wisdom (*prajñā*) as a basis for ethical action in the world. Many Buddhist practitioners understand their relationship with the natural world in terms of interconnectedness and mutuality of being. These ideas are used to describe both experiences of unity with the natural world, as well as to provide an impetus for action on behalf of it.

Joanna Macy, one of the founders of the Institute for Deep Ecology, combines Buddhist teaching and practices with General Systems Theory in workshops and classes that she leads around the world in order to facilitate personal and social transformation, especially in regard to environmental issues. She promotes what she refers to as the “Great Turning,” from an industrial growth society, to a life-sustaining civilization.

Through working with Tibetan refugees, she became acquainted with Tibetan Buddhist monks and was formally introduced to Buddhist thought and practice. After returning to the United States, she pursued and completed a doctoral degree in which she explored the relationship between Buddhist notions of interdependence and mutual causality and systems thought (Macy 1991). She spent several years in Sri Lanka where she worked with Theravadan Buddhists of the Sarvodaya Shramadana Movement who were engaged in efforts to help rural villagers to become communally and ecologically self-sustaining. Buddhist insights and practices are found throughout her work.

Macy began to do what she came to call Despair and Empowerment work as a result of her involvement with the Nuclear Freeze and Disarmament campaigns of the 1960s through 1980s (Macy 2000). She developed group exercises and role-playing scenarios that were designed to enable people to acknowledge and express their pain, grief and despair for the world and then to harvest that passion and compassion to bring about the changes necessary to diminish or rid the world of those things which threatened it. Her book, *Despair and Power in the Nuclear Age*, as well as its revision (with Molly Young Brown), *Coming Back to Life: Practices to Reconnect Our Lives, Our World*, grew out of this work and contains a collection of these exercises and role-playing scenarios, as well as an explanation of some of the principles behind Despair and Empowerment work.

In Macy’s work, the notion of interconnectedness is what enables persons to feel pain for the world and one another, and is also the source of strength for addressing the crises facing the world:

I have been deeply inspired by the Buddha's teaching of dependent co-arising. It fills me with a sense of connection and mutual responsibility with all beings. Helping me understand the nonhierarchical and self-organizing nature of life, it is the philosophic grounding of all my work (Macy, www.joannamacy.net).

In Buddhism, the practice of meditation is to break through the illusions the mind creates about the nature of reality. Macy's work builds upon this idea through the use of role playing and exercises designed to help workshop participants to see the world as it is, not only its interconnectedness, but also the destruction of the environment and species extinctions. Her work is designed to cut through the illusions constructed by the individual mind and society that serve to deny the reality of the environmental crisis. But that practice is an engaged practice, addressing environmental and other social issues:

The vitality of Buddhism today is most clearly reflected in the way it is being brought to bear on social, economic, political, and environmental issues, leading people to become effective agents of change. The gate of the Dharma does not close behind us to secure us in a cloistered existence aloof from the turbulence and suffering of samsara, so much as it leads us out into a life of risk for the sake of all beings. As many Dharma brothers and sisters discover today, the world is our cloister (Macy, www.joannamacy.net).

Macy uses the imagination in the form of role playing and rituals in order to look closely at the actual conditions of the world. This use of the imagination is a way to move people beyond mental numbness to experience the reality of the global environmental situation. One example of this is the Council of All Beings, which Macy and John Seed developed to ritually reconnect human beings with other species and natural forces.

Magic

Magic is, broadly speaking, an attempt to violate the natural exchange of energy. It seeks an operative shortcut, the getting of more for an output of less. In this sense, the practice of magic appears to be anti-nature – especially the “demonic” magic of the medieval grimoires that seeks to suspend the laws of nature and accomplish super-human ends. Traditionally, magic represents a category of attempts to tamper with the natural flow. In this sense, it has an affinity with the efforts of technological engineering and civilization’s wish to tame or harness the natural world as a resource for exploitation.

But if magic represents a violation of the natural order, a transgression of the linear laws of equal exchange, contemporary science’s emergent theories of complexity argue that the cosmos is more alinear than linear. Complexity theory studies retrodictively the processes by which something becomes more than merely the sum of its constituent parts. In like manner, as magic seeks to generate power through ritual and spells, in principle the word when correctly spoken becomes more than itself. In the fullest sense, the word expresses the physical being or essence of the thing it describes. Consequently, magic may be thought of as a “science of the word” – a notion that appears to its fullest in the *logos* prologue to the gospel of St. John.

Another understanding of magic, apart from illusion for the purpose of entertainment, posits it as the production of effects in the world by means of invisible or supernatural causation. It may also be considered as action that is based on belief in the efficacy of symbolic forms. But once again, the essential idea remains the notion of securing something of greater value in exchange for something whose intrinsic worth is less. This need not necessarily involve the supernatural. For instance, for a nominal outlay of electrical energy and telephonic financial charges, two people on different sides of the planet can engage in conversation and as such may be considered involved in an act of magic. This allows recognition of how technology itself represents a violation of the natural law of exchange. For the Greeks, *techne* referred to the “art of craft,” and magic and technology were both the patronages of the god Hermes. As French theologian Jacques Ellul explains, *technique* is not only a reference to machines but also to “the logic of manipulation and gain that lay behind machines” (in Davis 1998: 144).

In its traditional sense, magic has limited concerns. These include the healing and preventing of disease, the finding of lost or stolen articles, identifying thieves and witches, gaining vengeance and the warding off of evil influences. An early distinction was made between magic and religion – with magic operating by constraint; religion,

through supplication. Following a structuralfunctionalist approach, the French sociologist Émile Durkheim (1858–1917) accepted a radical distinction between religion as a communal matter and magic as a non-congregational affair between a practitioner and a client. But Marcel Mauss (1872–1950), following a different line of structural-functional theory, in his *A General Theory of Magic* (1902), reasoned that magic is indeed a social phenomenon but one that makes use of a universal force or *mana*, an available spiritual power. In other words, for Mauss, magic or *mana* refers to the genuine effectiveness of things.

In contrast, and following what Graham Cunningham (1999) considers an emotionalist approach, Bronislaw Malinowski (1884–1942) denied Mauss and considered magic not as a universal force but as a power located within the individual magician. It amounts to a substitute technology in primitive society in which scientifically established knowledge is otherwise unavailable. Consequently, for Malinowski, magic is primarily a question of psychology: where knowledge or technology is lacking, it offers psychological relief. Malinowski also distinguished between religion and magic in which the Church is understood as the central community and magic as what exists on the fringes of communal activity. He argued that magical acts are expressions of emotion – particularly emotions that are connected to either possession or powerlessness. Such acts or emotions for Malinowski are in reality mental obsessions.

It is, however, the English anthropologist James G. Frazer (1854–1941), classified within the intellectualist school, who developed the distinction between magic and religion into one of progressive historical stages. For Frazer, magic is part of the earliest level of human development and arises from the human desire to control nature. It is, however, formulated on fallacious understandings of cause and effect. The successive stage of understanding reputedly develops with the realization concerning the ineffectiveness of magical rites and that the laws of magic do not really exist. Control of nature was then placed under the jurisdiction of supernatural beings (gods or spirits) beyond human control. Frazer called the moment when humanity turns to supplication of such forces as the beginning of the stage of religion. However, he posits a third stage, that of science, which is marked by the discovery of the correct laws of nature. As an evolutionist, Frazer expected that both magic and religion would cease to exist as science continues to develop.

Frazer argued that the two laws of magic are imitative and contagious. Imitative or homeopathic magic operates according to the “law” of similarity, that is, the belief that like produces like. Results are achieved through mimicry. In contrast, contagious magic is governed by the “law” of contact – the use of materials that have been in contact with the object of magic. Here, we find the belief that people can be influenced even by remote touch. To these two “categories” of magic, Frazer added a third, namely, the use of items that symbolize the intended object.

Another emotionalist discussed by Cunningham in theorizing magic is Sigmund Freud (1856–1939). One of the clearest contemporary articulations of the Freudian position is that of Faber (1996) who insists that magic in the hands of an adult signifies

a regression to infantile fantasy. Belief in magic is seen to root in what is considered the “primary narcissism” of the symbiotic stage of individual development. It amounts accordingly to a form of regressive fusion to the time of unconditional love between mother and child. However, in contrast to this psychological approach is that of the symbolists. Mary Douglas, in *Purity and Danger* (1966), claims that the tendency to dismiss ritualistic sacramental religions as magical and consequently not truly religious is a prejudice that selects the prophetic-Protestant model of inner experience as the paradigm of authentic religiosity. But symbolists consider that magic offers a workable framing of experience in a local context. Nevertheless, modern Western culture has shown an increasing tendency to distrust ritual or symbolic activity of any kind – including magic.

Interest and belief in magic have been present since the beginnings of Western culture. Manuals of magical recipes were formulated in the Middle Ages under the name of grimoires. These sought to conjure demonic entities in order to achieve ends that are beyond ordinary human means. Essentially, grim moiré magic seeks to suspend the laws of nature. This, in turn, developed during the Renaissance into hermetic magic in which a spiritual endeavor was added to the efforts of the magician who now sought to develop an internally personal divine nature. The modern history of magic begins with the late eighteenth century through the rise in Western Europe of dilettante interest in occultism and interaction with Freemasonry as well as the emergence of publicly recognized magical groups. Three literary works became seminal at this time: Ebenezer Sibley’s *Celestial Sciences* (1784), Francis Barrett’s *The Magus* (1801), and a work published by Count de Gebelin that connected the Tarot with the Egyptian *Book of Thoth*. Barrett’s work functioned as the textbook for the group that had gathered around him. It in turn influenced an ex-Catholic seminarian, Alphonse Louis Constant, who, under the name of Eliphas Levi, published in the 1850s *Dogma and Ritual of High Magic*, *History of Magic* and *Key of the Great Mysteries* that purportedly revived the entire Western magical tradition. Levi invented the terms *occultisme* (“hidden wisdom”) and *haut magie* (“high magic”) and claimed for magic both antiquity and potency. He insisted that magic is the only universally valid religion. Levi is responsible for rediscovering both the Kabbalah and the Tarot, and he is a foundational inspiration for Rosicrucians, ritual magicians and contemporary witches.

Levi had adopted the Freemasonic idea that the human race had been created as part of the divine. Consequently, the divine nature is arguably still present and something one can contact – chiefly by going back into the past, foremost to Egypt. In other words, Levi changed the concept of old magic that sought the gods into a search for self-knowledge and self-empowerment. His ideas, along with those of Freemasonry, Rosicrucianism and the magical formulas of Barrett, coalesced with the founding of the Hermetic Order of the Golden Dawn in the 1880s. This last, under the leadership of Samuel Liddell MacGregor Mathers, who assumed leadership in 1897, developed a ritualistic worldview system of Western *magick*. The Golden Dawn promoted the Hermetic principle of correspondence between the microcosm as the human being and

the macrocosm as the universe. Its standard practices involved invocation (the “calling down” into the self of a cosmic force) and evocation (the “calling up” of magical forces from the depth of the self). The Order taught that the trained will is capable of achieving anything, and this led to the contemporary understanding of magic as the changing of consciousness according to will (usually attributed to Dion Fortune). The Golden Dawn’s most famous member was Aleister Crowley (1875–1947) who formulated Thelemic Magic (from Greek *thelema* “will”).

Most modern magical groups have been inspired from the Knights Templar (a quasi-monastic, magical fraternity formed in 1118 to protect Jerusalem for Christian pilgrims) and the kabbalists (developing from ancient Hebrew sources in Babylon in the early Middle Ages and culminating with Moses de Leon’s thirteenth-century *Book of Zohar*). A third influence comes through the fourteenth-century *tarrochi* cards (Tarot). As a system of popular divination, Levi, Crowley and A.E. Waite combined the Tarot’s modern form with kabbalistic symbolism. Contemporary Western magic seeks the production of desired effects at will through harnessing hidden forces within the universe. Sybil Leek understands magic as the employment of various techniques (e.g., incantations) by which human beings can control and manipulate supernatural agencies and/or the forces of nature to produce a desired effect or result. Magicians and magical groups inevitably employ ritual as a tool to focus the concentration and power of the individual or group. They maintain an essential secrecy or “social invisibility,” employ hidden ancient wisdom, and retain roots in the pre-Christian world.

Implicit in much of the Western magical tradition is an anti-nature bias, the violation of the natural law of exchange or the laws of nature. Magical endeavor can be seen as the human wish to tamper with the natural flow. In principle, it differs little from the manipulation and control of technology – allowing the nature/culture or nature/technology or nature/magic divide that has been articulated by Freud in his *Civilization and Its Discontents*. Nevertheless, a counter-tradition can be traced again to the Middle Ages that understood “natural magic” in distinction to “demonic magic” – including the manipulation of people through curses (i.e., black magic). Consequently, opposed to demonic magic of both nefarious and exalted ends is the domain of natural magic – essentially, operation within the “laws of nature” as they are found and encountered. Del Rio, in his *Disquisitiones Magicae* of 1606, explained natural or physical magic as none other than knowledge of the deepest secrets of nature. In the Middle Ages, natural magic was essentially the science of the day.

Most traditional magical practice descends from NeoPlatonism as a system of spiritual development that can be traced through the Martinists, the Illuminati, the Rosicrucians, the Freemasons and the Golden Dawn. In contrast, many modern-day Witches and neo-pagans do not link magic with the supernatural. It is instead viewed primarily as a series of techniques that alter consciousness in order to facilitate psychic activity. Magic has become a psychological endeavor rather than a supernatural one. Along with modern-day ceremonial or thelemic magic(k), a more recent development is that

of Chaos Magick (Peter Carroll, Phil Hine) that employs a chaos paradigm and the individual image to obtain a state of gnosis.

In the cultural matrix of the West, the magician can assume the role of magus, wizard, sorcerer, thaumaturge and, more recently, shaman. The etymological origins of these various designations and their different historic trajectories allow us to understand a variety of different emphases. The magus or magician *per se* is concerned with power and its development *vis-à-vis* people, nature and spirit. The wizard, by contrast, pursues wisdom or knowledge rather than controlling or manipulating force in and of itself. The sorcerer is a “caster of lots,” which he or she engineers through techniques of enchantment or incantation. In many respects the sorcerer or enchanter is similar to the shaman – both engage with the other-world and its denizens, and both may do “battle” with spirit beings. But the shaman’s pursuit is always social and ultimately on behalf of his or her grounding community. With the sorcerer, on the other hand, magical work is solitary and motivated by self-interest. It is the thaumaturgist, however, who, as a “worker of wonders” is less the seeker after power, wisdom, control or conflict but essentially after the miraculous. And in contrast to *techne* or achieving psychological states of mind, *thauma* or the miracle reveals a further dimension of magic and one that opens it to the natural that may not automatically be apparent with the technological.

While the Greek term *thauma* is of obscure origin, its English equivalent “marvel, miracle” and cognates (“smile,” “mirror” and “admire”) reveal an underlying dynamic of appreciative reflection. The miraculous is not a denial or transgression of the natural but its mirror image. It introduces the possibility that the magical can be an integral part as well as counterpart to nature rather than an operative that contravenes fundamental natural laws. And as the etymological root behind the “miracle” complex suggests, magic as the miraculous engenders “smiling”; it is an occasion for “laughter.”

Magic, Animism, and the Shaman's Craft

Animism and Perception

Although the term “animism” was originally coined in the nineteenth century to designate the mistaken projection of humanlike attributes – such as life, mind, intelligence – to nonhuman and ostensibly inanimate phenomena, it is clear that this first meaning was itself rooted in a misapprehension, by Western scholars, of the perceptual experience of indigenous, oral peoples. Twentieth-century research into the phenomenology of perception revealed that humans never directly experience *any* phenomenon as definitively inert or inanimate. Perception itself is an inherently relational, participatory event; we say that things “call our gaze” or “capture our attention,” and as we lend our focus to those things, we find ourselves affected and transformed by the encounter – the way the blue sky, when we open our gaze to it, reverberates through our sensing organism, altering our mood and even the rhythm of our beating heart. When we are walking in the forest, a particular tree may engage our awareness, and if we reach to feel the texture of its bark we may find that our fingers are soon being tutored by that tree. If the bark is rough and deeply furrowed our fingers will begin to slow down their movements in order to explore those ridges and valleys, while if the trunk is smooth, like a madrone, even the palm of our hand will be drawn to press against and caress that smooth surface. Maurice Merleau-Ponty, in his classic work, *Phenomenology of Perception*, suggests that the primordial event of perception is always experienced as a reciprocal encounter between the perceiver and the perceived, an open dialectic wherein my sensing body continually responds and adjusts itself to the things it senses, and wherein the perceived phenomenon responds in turn, disclosing its nuances to me only as I allow myself to be affected by its unique style, its particular dynamism or active agency.

Merleau-Ponty's careful analyses of perception revealed, contrary to our common ways of speaking, that the perceiving self is not a disembodied mind but rather a bodily subject entirely immersed in the world it perceives. His later work underscored the reciprocity of perceptual experience by pointing out the obvious (yet easily overlooked) fact that the eyes, the visual organs by which we gaze out at and explore the visible field, are themselves entirely a part of that field; they have their own colors, like the color of the sky or the grass. Similarly, the hands with which we touch things are

entirely a part of the tactile field that they explore – since, of course, the hand has its own textures, its own smooth or rough surfaces. Hence, when we are touching another being, feeling the texture of a tree-trunk, or caressing a boulder with our fingers, we may also, quite spontaneously, feel our hand being touched *by* that tree, or our fingers felt *by* that stone. Similarly, when we step outside in the morning and gaze across the valley at a forested hillside, if we attend mindfully to the vision we will sense our own visibility, will feel ourselves *exposed to* those trees, perhaps even feel ourselves *seen by* that forested hillside. Perception, according to Merleau-Ponty, is nothing other than this reciprocity, this mutual reverberation and blending in which the surrounding terrain is experienced by me only to the extent that I feel myself caught up within and *experienced by* those surroundings.

Such a description neatly echoes the discourse of many indigenous peoples, such as the Koyukon people of central Alaska, who claim that they live “in a world that watches, in a forest of eyes” (Nelson 1983: 14). Oral, indigenous peoples from around the world – whether hunters or rudimentary horticulturalists – commonly assert that the land itself is alive and aware, that the local animals, the plants, and the earthly elements around them have their own sensitivity and sentience. They claim that the earthly world we experience also *experiences us*. And hence that we must be respectful toward that world, lest we offend the very ground that supports us, the winds and waters that nourish us.

If the phenomenological study of perception is correct, however, then these claims need not be attributed to a “projection” of human awareness onto an ostensibly inanimate and objective world; they are simply a way of speaking more in accord with our most direct and spontaneous experience of the perceptual cosmos. Far from being a distortion of our actual encounter with the material world around us, the animistic discourse of so many indigenous, place-based peoples is likely the most practical and parsimonious manner of giving voice to the earthly world as that world discloses itself to humankind in the absence of intervening technologies.

When the natural world is perceived not from the spectator-like position of a detached or disembodied intellect, but rather from an embodied position situated entirely *within* that world, one encounters no aspect of that world that is definitively inert or inanimate. “Animism” remains a useful term for this highly embodied, and *embedded*, mode of perception. In this sense, “animism” may be said to name a primordial mode of perception that admits of no clear distinction between that which is animate and that which is inanimate. Rather, every phenomenon that draws our attention is perceived, or felt, to be at least potentially animate. Each perceived thing has its own rhythm and style, its own interior animation. Everything moves – although, clearly, some things move much slower than other things, like the mountains, or the ground underfoot.

A short, haiku-like poem by Gary Snyder neatly illustrates this style of awareness:

As the crickets’ soft, autumn hum is to us so are we to the trees as are they to the rocks and the hills.

Each entity in this poem has its own dynamism, its own rhythm – and yet each rhythm is vastly different, in the pace of its pulse, from the others. Nevertheless each entity is also listening, mindful of the other rhythms around it.

To such an embodied, and embedded, perspective, the enveloping world is encountered not as a conglomeration of determinate objects, but as a community of subjects – as a relational field of animate, active agencies in which we humans, too, are participant.

Magic and Shamans

Such an understanding of the animistic style of perception common to indigenous, oral cultures is necessary for comprehending the vital role played by shamans, the indigenous magic practitioners endemic to such placebased cultures. For if awareness is not the exclusive attribute of humankind – if, indeed, every aspect of the perceivable world is felt to be at least potentially alive, awake and aware – then there is an obvious need, in any human community, for individuals who are particularly adept at communicating with these other shapes of sensitivity and sentience. The shamans are precisely those persons who are especially sensitive and susceptible to the expressive calls, gestures and signs of the wider, more-than-human field of beings, and who are able to reply in kind. The shaman is an intermediary, a mediator between the human community and the more-than-human community in which the human group is embedded. This wider community consists not only of the humans, and the other animal intelligences that inhabit or migrate through the local terrain, but also the many plant powers that are rooted in the local soils – the grasses, and herbs (with their nourishing and medicinal characteristics, their poisonous and mind-altering influences), the trees with their unique personalities, and even the multiform intelligence of whole forests; it consists as well of the active agency and expressive power of particular land forms (like rivers, mountains, caves, cliffs), and of all the other elemental forces (the winds and weather-patterns, the radiant sun and the cycling moon, storm clouds and seasonal patterns) that influence, and effectively constitute, the living landscape.

The magic skills of the shaman are rooted in his or her ability to shift out of his common state of awareness in order to contact, and learn from, these other powers in the surrounding Earth. Only by regularly shedding the accepted perceptual logic of his culture can the shaman hope to enter into relation with other species on their own terms; only by altering the common organization of her senses is she able to make contact and communicate with the other shapes of sentience and sensitivity with which human existence is entwined. And so it is this, we might say, that defines a shaman: the ability to readily slip out of the collective perceptual boundaries that define his or her culture – boundaries held in place by social customs, taboos, and especially the common language – in order to directly engage, and negotiate with, the multiple nonhuman sensibilities that animate the local Earth.

As a result of his or her heightened receptivity to the meaningful solicitations of the wider community of beings, the shaman tends to dwell at the very periphery of the human settlement, at the very outskirts of the village or the camp. The indigenous magician's acute sensitivities often render him unable to dwell, or even linger, in the midst of the human hubbub; only at the edge of the community is he able to attend to the exigencies of the human world while living in steady contact with the wider, and wilder, field of earthly powers. The shaman is thus an edge dweller, one who tends the subtle boundary between the human collective and the wild, ecological field of intelligence, ensuring that that boundary stays a porous membrane across which nourishment flows in both directions – ensuring that the human community never takes more from the living land than it returns to the land, not just materially, but with prayers, with propitiations, with spontaneous and eloquent praises. To some extent, every adult in the human community is engaged in the process of listening and attuning to the other presences that surround and influence daily life. Yet the shaman is the exemplary voyager in the intermediate realm between the human and more-than-human worlds, the primary strategist and negotiator in any dealings with these earthly powers. By his constant rituals, trances, ecstasies, and “journeys,” the shaman ensures that the relation between the human and more-than-human realms remains balanced and reciprocal; that the living membrane between these realms never hardens into a static barrier shutting out the many-voiced land from the deliberations of the human collective.

Further, it is only as a result of continually monitoring and maintaining the dynamic equilibrium between the human and the more-than-human worlds that the shaman typically derives his or her ability to heal various illnesses arising within the human community. Disease is commonly conceived, in such animistic cultures, as a kind of disruption or imbalance within a particular person, and yet the source of this disequilibrium is assumed to lie not in the individual person but in the larger field of relationships within which that person is entwined. A susceptible person, that is, may become the bearer of a *dis-ease* that belongs not to her but to the village as a whole. Yet the ultimate source of such community disequilibrium will commonly be found in an imbalance between the human community and the larger system of which it is a part. Hence the illnesses that beset particular individuals can be healed, or released, only if the healer is simultaneously tending, and “healing” the relative balance or imbalance between the human collective and the wider community of beings. The shaman's primary allegiance, then, is not to the human community, but to the earthly web of relations in which that community is embedded – it is from this that his or her power to alleviate human illness derives – and this sets the local shaman apart from most other persons.

The term “shamanism” is regularly used, today, to denote the belief system, or worldview, of such cultures wherein the shaman's craft is practiced. Yet this term is something of a misnomer, for it implies that the person of the shaman stands at the very center of the belief system and of the culture itself; it suggests that the shaman

is revered or perhaps even worshipped by the members of such a culture. Yet nothing could be farther from the case. We have seen that the shaman is quintessentially an edge-dweller, a marginal figure, one who straddles the boundary between the culture and the rest of animate nature. It is not the *shaman* who is central to the beliefs of that culture, but rather the *animate natural world* in all its visible and invisible aspects – the expressive power and active agency of the sensuous and sensate surroundings. And thus the worldview of such a culture is not, properly speaking, “shamanistic,” but rather “animistic.” It is first and foremost in *animistic* cultures – cultures for whom any aspect of the perceivable world may be felt to have its own active agency, its own interior animation – that the craft of the magician first emerges, and it is in such a context that the shaman (the indigenous magician) finds his or her primary role and function, as intermediary between the human and more-than-human worlds.

The Contemporary Magician

Finally, a few words should perhaps be said, here, about the role of the magician in modern, technological societies. After all, the modern conjuror’s feats with rabbits, doves, or tigers hearken back to the indigenous shaman’s magical rapport with other species. Indeed, virtually all contemporary forms of magic may be shown to derive, in various ways, from the animistic mode of experience common to all of our indigenous, hunting and foraging ancestors – to the experience, that is, of living within a world that is itself alive. Moreover, it is likely that this participatory mode of sensory experience has never really been extinguished – that it has only been buried beneath the more detached and objectifying styles of perception made possible by a variety of technologies upon which most moderns have come to depend, from the alphabet to the printing press, from the camera to the computer. In the course of our early education, most of us learn to transfer the participatory proclivity of our senses away from the more-than-human natural surroundings toward our own human symbols, entering into an animistic fascination with our own humanly generated signs and, increasingly, with our own technologies. And as we grow into adulthood, our instinctive yearning for relationship with an encompassing sphere of life and intelligence is commonly channeled beyond the perceptual world entirely, into an abstract relation with a divine source assumed to reside entirely outside of earthly nature, beyond all bodily or sensory ken.

Yet even a contemporary sleight-of-hand magician still makes use of our latent impulse to participate, animistically, with the objects that we perceive. Magicians – whether contemporary sleight-of-hand conjurors or indigenous tribal shamans – have in common the fact that they work with the participatory power of perception. (Perception is the magician’s medium, as pigments are the medium for a painter.) Both the modern sleight-of-hand magician and the indigenous shaman are adept at breaking, or disrupting, the accepted perceptual habits of their culture. The indigenous shaman practices this in order to enter into relation and rapport with other, earthly forms of

life and sentience. The modern magician enacts these disruptions merely in order to startle, and thereby entertain, his audience. Yet if contemporary conjurers were more aware of the ancient, indigenous sources of their craft (if they realized, for instance, that indigenous shamans from many native cultures already used sleight-of-hand techniques in their propitiatory and curative rituals), then even these modern magicians, too, might begin to realize a more vital, ecological function within contemporary culture.

In an era when nature is primarily spoken of in abstract terms, as an objective and largely determinate set of mechanisms – at a time when eloquent behavior of other animals is said to be entirely “programmed in their genes,” and when the surrounding sensuous landscape is referred to merely as a stock of “resources” for human use – it is clear that our direct, sensory engagement with the Earth around us has become woefully impoverished. The accelerating ecological destruction wrought by contemporary humankind seems to stem not from any inherent meanness in our species but from a kind of perceptual obliviousness, an inability to actually notice anything outside the sphere of our human designs, a profound blindness and deafness to the more-than-human Earth. In such an era, perhaps the most vital task of the sleight-of-hand magician is precisely to startle the senses from their slumber, to shake our eyes and our ears free from the static, habitual ways of seeing and hearing into which those senses have fallen under the deadening influence of abstract and overly objectified ways of speaking and thinking.

Yet perhaps such magic is also, now, the province of all the arts – the province of music, of painting, of poetry. Perhaps it falls to all our artists, today, to wield their pigments and their words in such a way as to loosen the perceptual habits that currently keep us oblivious to our actual surroundings. In any case, the craft of magic is as necessary in the modern world as it was for our indigenous ancestors. For it is only by waking the senses from their contemporary swoon, freeing our eyes and our ears and our skin to actively participate, once again, in the breathing cosmos of wind and rain and stone, of spiderweave and crow-swoop and also, yes, the humming song of the streetlamp pouring its pale light over the leaf-strewn pavement, that we may have a chance of renewing our vital reciprocity with the animate, manyvoiced Earth.

Maimonides (1135–1204)

Maimonides (Rabbi Moshe ben Maimun, also known as Rambam) is arguably the premier philosopher and theologian of Jewish history. As one of the most influential thinkers, Jewish, Christian or Muslim, of the medieval period, not only in theology but also in medicine and law, the ecological profundity of his work, long overlooked, is only beginning to be understood. Maimonides, uniquely in Jewish thought, challenged the primacy of humanity within the order of creation, asserted that there is complete equivalence between human and animal emotions, and believed that creation as a whole is the only dimension of being which has intrinsic value.

In his most important work, *The Guide for the Perplexed*, Maimonides suggested a model of the cosmos that is parallel to the Gaia hypothesis. Maimonides admonished his reader, “Know that this whole of being is one individual and nothing else,” adding that the whole of creation is “a single being which has the same status as Zayid or Omar,” in other words, endowed with a heart and a soul (1:72, 184). In keeping with Aristotelian cosmology, Maimonides emphasized that all of the spheres of the heavens were “living beings, endowed with a soul and an intellect” (2:4, 259), yet with respect to the entirety of being, all the other spheres were seen by him as mere organs of the whole, while the outermost sphere was the heart of the cosmos.

For Maimonides, the idea that the universe was an organic whole was a fundamental scientific fact. This, according to Maimonides, led to a direct understanding of God’s relation to the world, for “[t]he One [God] has created one being” (1:72, 187; see also 2:1, 251). Maimonides believed that in order to develop the intellect “in God’s image,” one needed to understand this truth scientifically by studying the more-than-human world.

I have already let you know that there exists nothing except God, may He be exalted, and this existent world, and that there is no possible inference proving his existence, may He be exalted, except those deriving from this existent taken as a whole and from its details (1:71, 183).

Maimonides’ emphasis on natural theology laid the foundation for the development of scientific method in the West. In contrast with the Kalam school and with most theologians of his time, Maimonides asserted that “demonstrations . . . can only be taken from the permanent nature of what exists, a nature that can be seen and apprehended by the senses and the intellect” (1:76, 231; see also 1:71, 179).

For Maimonides, this perspective also had direct metaphysical and ethical implications, for “the individuals of the human species, and all the more so the other species,

are things of no value at all in comparison with the whole [of creation] that exists and endures” (3:13, 452). His ideas about the wholeness of creation profoundly influenced the Church, especially Thomas Aquinas, as can be seen in *Summa Theologica* (1a, q.47, art.1, 1:246) and *Summa Contra Gentiles* (part 1, ch. 64, 3:213, paragraph 10; also 3:212, paragraph 9).

Maimonides rejected the idea that humanity was the final end of creation, rejecting also the idea that other creatures exist to serve human pleasure: “It should not be believed that all the beings exist for the sake of the existence of man. On the contrary, all the other beings too have been intended for their own sakes . . .” (3:13, 452). In this respect, his thought contrasts sharply with most other medieval Jewish thinkers, like Sa’adyah Ga’on or Bachya ibn Paquda. Maimonides held that this was the view delineated within Genesis itself, explaining the word “good” used in chapter one of Genesis to mean that each creature has something like intrinsic value (3:13, 453). The phrase “very good” (Gen. 1:31), indicates the overwhelming value of “the whole.”

Maimonides arrived at this interpretation after concluding that there can be no *telos* for creation: “[E]ven according to our view holding that the world has been produced in time, the quest for the final end of all the species of beings collapses” (3:13, 452). In a later chapter, he derived a remarkable conclusion from this idea: “[T]he entire purpose [of God’s actions] consists in bringing into existence the way you see it everything whose existence is possible . . .” (3:25, 504). This formulation, fundamentally congruent with Spinoza’s cosmology, is also compatible with those who understand evolution to be “directed” toward diversity.

Maimonides held that animals and humans were equal in their capacity to feel and imagine. This understanding was integral to his interpretation of the commandments:

It is forbidden to slaughter [an animal] and its young on the same day, this being a precautionary measure to avoid slaughtering the young animal in front of its mother. For in these cases animals feel very great pain, there being no difference regarding this pain between [humanity] and the other animals. For the love and the tenderness of a mother for her child is not consequent upon reason, but upon the activity of the imaginative faculty, which is found in most animals just as it is found in [humanity] . . . (3:48, 599; see also 1:75, 209 and 2:1, 245).

Some modern interpreters have downplayed this passage by emphasizing another passage where Maimonides states that the prohibition against causing pain to animals is meant to create good habits in people (3:17). However, he is clear in that passage as well that compassion is enjoined for individual animals. In general, and in contrast with other philosophers and theologians, Maimonides minimized the differences between humanity and other animals. Maimonides also explained that instrumental reason by itself merely makes human beings into very dangerous animals (1:7, 33). He further taught that the instruction to “dominate” in Genesis 1 was neither a commandment nor an imperative, but merely a description of human nature (3:13, 454).

For Maimonides the uniqueness of human nature is found in the capacity to apprehend the divine. This is humanity's perfection (1:1–2, 23–4) which only a few individuals reach. Yet even this quality, along with the “hylic intellect” (1:72, 190–1), makes human beings “merely the most noble among the things that are subject to generation,” since the spheres and the heavens far surpass humanity in their capacities (3:12, 443).

Much in Maimonides is also problematic for contemporary thinkers. As an Aristotelian, Maimonides had a strongly negative attitude toward the sense of touch (2:56, 371; 3:8, 432–3), which is incompatible with the phenomenological approach to the Earth that is taken by many eco-philosophers. In the same vein, he rejected imagination as inferior and espoused an intellectual elitism that remains controversial. Nonetheless, his rejection of anthropocentrism and espousal of a holistic cosmology are starting points for any eco-theology based on the biblical traditions. As we say in the world of traditional Jewish study, “From Moses [the prophet] to Moses [Maimonides], there is no one like Moses.”

Makapansgat Cobble

What can be regarded as the world's oldest known "art object" was found in 1925 in a cave at Makapansgat, South Africa. This small waterworn cobble of ironstone was clearly brought into the site from some distance away, and one can only assume that the Australopithecine (a type of fossil hominid) who did this around three million years ago was attracted not only by the cobble's reddish color – red is the color most attractive to both apes and humans (as was shown by Desmond Morris' experiments with Congo, the chimpanzee who liked to paint) – but also and especially by its entirely natural resemblance to a human face: one side has two symmetrically placed small cavities in it, like a pair of sunken eye-sockets, above a simple mouth. This "face" was in no way artificially manufactured, but its accidental resemblance to a face is so striking that it seems certain the object was noticed and brought back to a dwelling place as an important possession. This was a giant step for hominids – apparently they were seeing a face that was not a face, they were responding to an image, they were indulging in a primitive form of symbolism. The discoverer of the cobble, Wilfred Eitzman, a schoolmaster, speculated that it might have been "the god of these early people" or "their god or fetish."

In most primates, a direct stare denotes self-confidence and the possible prelude to an attack by an aggressive individual, so that monkeys become disturbed when they are stared at or even just presented with drawings of two eyes. Chimpanzees have been known to avoid looking at a toy with large black eyes, while gorillas see the twin discs of binoculars as a threat. In other words, the face pattern with two staring eyes has specific meanings. Where humans are concerned, it is known that up to the age of three months, an infant has a tendency to smile when presented with a full human face, even that of a stranger.

In experiments, copies of the Makapansgat cobble have failed to elicit any significant response from apes; but apes are not Australopithecines, and since even chimpanzees have been observed to wear blades of grass and to paint parts of their bodies with white clay, as well as to hoard objects and carry single stones for several days, one can hardly doubt that Australopithecines were capable of similar behavior and much more. It can never be proved that they saw a face in the Makapansgat cobble, but the balance of probability is surely that this stone was indeed seen as significant, since it was brought into the site; and that significance is most likely to have come not only from its color and shape, but also and primarily from its natural resemblance to a human face.

Makewana the Rainmaker (Central Malawi)

Makewana – literally meaning the mother of children, but intended to convey the meaning: mother of all people – was among the most powerful of central African rainmakers. Makewana presided over a rain/shrine complex that spread across much of central Malawi. Makewana was seen as having direct access to God; without her it was believed that there would be no rain and women would be barren. It is said that she could never cut hair because to do so would be to “cut the rain.” Her powers were so highly regarded that during the early part of the nineteenth century she received annual tribute from as far as modern Zimbabwe. The tribute was in the form of precious materials such as ivory, and it is said that Makewana slept on a bed of ivory tusks that was covered with dark cloths to hide its whiteness. Nothing near Makewana could be white as this would affect the coming of the rain.

Oral traditions state that the first Makewana was a priestess named Mangadzi Banda who is said to have been the mother of Mwali, the wife of one of the early Karonga chiefs. It is said that Mangadzi stayed at Msinja. If we accept this, we can put a tentative date on the time of Mangadzi. The Karonga chiefs were of the Phiri clan, a clan who are credited with founding the first Malawi state. A combination of oral traditions, chiefly lineages and archeological evidence, has been used to argue that the Phiri clan were a group who arrived in Malawi from Luba country (in the Democratic Republic of Congo) in the fourteenth or fifteenth century. Mangadzi must therefore have lived at least five hundred years ago.

Matthew Schoffeleers has argued that the rain shrine complex was already well established by this time and has made the compelling argument that, for many centuries before the arrival of the Phiri clan, a rain shrine system had existed under the control of Mangadzi's Banda clan. This could take the founding of the rain shrine complex as far back as the later centuries of the first millennium. Oral traditions state that the first rain shrine was on a mountaintop known as Kaphirintiwa and that it was only after many centuries that the shrine was moved down to the plain near Msinja where Mangadzi is said to have stayed. We can be sure that at Kaphirintiwa there would also have been a rain shrine and a rain priestess who would have conducted similar rites to those conducted in more recent times by Makewana, but we cannot be sure that these ancient Banda clan rain-priestesses were known by the name Makewana. I will confine myself here to what we know about the Makewanas who lived at Msinja

in recent times, but I expect that much of this will hold true even for the early Banda clan rain priestesses.

Makewana was a spirit medium, the keeper of the Msinja rain shrine and a prophetess. When one Makewana died, the people would wait, sometimes for many years,

Mbiriwiri – The Sacred Rainmaking Drum

Mbiriwiri – literally the drum of good tidings – is a sacred drum that was fundamental to the practices of rainmaking in the central Malawi rain shrine system.

There are a number of accounts of the origins of the drum. Almost all agree that it originally belonged to the BaTwa – the former Pygmy inhabitants of central Africa. Some say that it was taken from the BaTwa by force in battle, others that it was found lying near the sacred pool of Malawi a few kilometres from the shrine of Msinja. That it is extremely old is beyond question.

Mbiriwiri is a cylinder-shaped double-ended drum. It is made of wood and its tympanums are made from monitor lizard skin (*Varanus* sp.). The monitor skin is symbolically important: the creature is associated with and shares the name of the supreme god – Chiuta. It is believed to live in the sky above the clouds and its falling to Earth brings thunder, lightning and rain. Half way between the tympanums is a hole that is closed with a plug. The sides of the drum are decorated with geometric designs that are not understood today. The designs echo those in the BaTwa rock paintings of the area.

The traditional keeping place for mbiriwiri was a special hut at the Msinja rain shrine, in central Malawi. In this it was stored resting on two poles and covered with dark (ideally black) cloth. Each year it was covered with reddish oil. The drum was only taken out of the shrine to be beaten at the start of the rainmaking ceremony or for repairs. Only a special functionary called Tsang'oma – meaning the beater of the drum – was allowed to handle the drum. Another functionary, Kapanga Banda, was charged with providing new monitor lizard skin for the drum when needed.

To start the rainmaking ceremonies, Tsang'oma (which is here an inherited title and does not refer to a traditional healer) would be called upon to beat mbiriwiri. The ceremonies would then last some days and if rain had not fallen by the end of the ceremonies then Tsang'oma would be blamed. He would be taken to a rock called Dzanzi several miles from the Msinja shrine, bound and his head wrapped in a black cloth so that he could not see. He would then be placed in a natural hole in the rock and a sharpened stake of hardwood would be driven into the top of his skull and down as far as his chest or sometimes right through his body. A tooth was taken from the body and placed in mbiriwiri through the hole in its side. It is said that the drum makes a distinctive noise when moved and that this is the sound of many teeth rattling inside it. The rattle is likened to the name: mbiriwiri.

When Ngoni invaders sacked the shrine at Msinja in the 1860s it is recalled that the Tsang'oma of the time fled with Mbiriwiri to a place inside Mozambique. While it was in Mozambique it seems that he had a squabble and this led to the drum being thrown down onto a large flat rock and broken. The man who broke the drum was executed. The drum was repaired and the teeth were replaced inside it. Today the drum is kept at a new shrine at a village called Tsang'oma, in Malawi. Today the drum is still kept on poles and covered in a dark cloth. It is never brought out into the open as it is said that the drum has become too powerful, and that if it were taken out there would be no rain.

No Makewana could ever marry, as Makewana was the wife of God (Chiuta). When God came down to Earth to visit Makewana he would do so in his snake manifestation: Thunga. It is believed that Thunga most often took the form of the python and therefore pythons were kept in baskets within the shrine of Msinja. Once a year, at the culmination of the girl's puberty rituals (*chinamwali*), Thunga would ceremonially sleep with Makewana and thereby bring fertility to the young maidens. In this ceremony a man named Kamundi Mbewe would stand in for Thunga. Kamundi also could never marry. Makewana could never become pregnant as to bear a human child would prove her infidelity to Thunga. Any Makewana who became pregnant was therefore killed.

Makewana's hut was near the Msinja spirit shrine. The spirit shrine was a small round hut made out of grass that is said to have been a replica of the original shrine at Kaphirintiwa. Between the hut of Makewana and the spirit shrine was the hut of the sacred drum: Mbiriwiri. Around this sacred area was a large village made up of a network of functionaries who all serviced the shrine. It is said that no one at Msinja planted crops or worked so as to provide for their own needs; their sole job was to service the shrine. Their needs were provided for out of the tribute that was brought to the shrine.

Makewana was assisted in her duties by the Matsano – literally meaning the chief’s wives. The Matsano were a group of girls or women (oral sources disagree) who had felt the call to join Makewana. They lived in a series of huts behind the hut of Makewana. They were also known as the wives of God and were also not allowed to marry. Any man caught sleeping with a Matsano was put to death. Beyond the Matsano was the hut of Tsang’oma: the beater of the drum. It was the task of Tsang’oma to beat Mbiriwiri upon receiving Makewana’s command. This would be the signal for all to gather to witness Makewana prophesy or make rain.

The rainmaking ceremony was known as Mgwetsa. In this ceremony Makewana would go to a nearby pond called the pool of Malawi and she would submerge herself in the pool for three days. The area around the pool was sacred and only Makewana could go there. The trees around the pool could not be cut and no one was allowed to fish in the pool, drink or wash in it. All animals and birds around the pool were also sacred and protected. This pool is sometimes called the pool of the ancestors and it was thought to be one of the places where Thunga could appear. In the public part of the Mgwetsa ceremony Makewana and the Matsano (the exact role of the Matsano is contested) would dance and throw water into the air. Offerings, such as black animals, would be made at the shrine. It is said that there would be a torrential downpour even before the ceremony was complete. If rain did not fall then Tsang’oma would be blamed and killed.

The shrine complex declined in power in the late nineteenth century after it was ransacked by Ngoni invaders. Livingstone records that Msinja was in a very poor state in 1867 after repeated raids. At this time Makewana fled to the north. In the colonial period attempts to restore the shrine faced difficulties because the old tribute system that sustained Msinja could not be reestablished. A Makewana named Kandiwona is said to have appeared, but failed the tests and was therefore driven away. She remained in the area and married, but soon after burnt herself to death in her hut. Msinja is still a functioning shrine today though its influence is now limited and local. It becomes important only in times of drought. A recent keeper is a widow but she does not consider herself to be Makewana.

Mâldhâris of Gujarât (India)

A Mâldhâri (pronounced as Maa-l-thaa-ri, “th” as in *the*) is a semi-tribal pastoralist. The Mâldhâris are primarily based in the arid to semi-arid regions of Saurâshtra and Kutchchh, including the protected Gir wildlife sanctuary area, in the state of Gujarât, India. *Mâl* connotes precious wealth; here, it is implied for the wealth of livestock – mainly buffaloes, cows, sheep, goats, camels, and horses – and *dhâri* means the one who has, keeps, or raises such wealth. There are nomadic, semi-nomadic, and settled (non-nomadic) Mâldhâris. They have been known for raising high-quality and drought-resistant breeds of buffaloes and cows for their milk and its by-products.

The Châran, the Rabâri, the âhir, the Bharwâd, the MÉR, and the Kâthis are the major Hindu Mâldhâris. There are also a few Muslim Mâldhâris, such as the Makarâni and the Siddi, groups who earn their livelihood as Mâldhâris. They all have diverse beliefs, myths, rituals, and festivals. Thus, the Mâldhâris are primarily an occupational community rather than a singular religious or cultural group. However, it is this occupation and the resulting kinship, tangible and intangible relationship with livestock, spatial and biophysical transactions with place, traditional ecological knowledge, and myths that seem to tie them together. These themes also help us understand the relations between their religion (beliefs and values) and ecology.

While a large percentage of the Mâldhâris engaged with livestock rearing are illiterate, most of them, especially those living in the Gir wildlife sanctuary’s forest area and its fringes, are very knowledgeable about the region’s natural patterns and processes. Sharing of skills, stories, and social norms takes place through intergenerational interactions around daily chores and simple acts of leisure like sitting and conversing around bonfires in late evenings. Everyone in the household plays a significant role in subsistence activities and maintaining cultural traditions. Through such lifestyle they have developed a strong bond with their *mâl*, family, kin, other Mâldhâris, the land, and the plants and animals found in their local area. Such interactions and the resulting bond often translates into reverence for both their cherished *mâl* and nature, upon which their own way of life closely depends. Different Mâldhâri groups share many religious traits.

There are references of them in the Hindu volumes of the Vedas, the Purânas, the Ramâyana, and the Mahâbhârat. They mainly worship and attend rituals and festivities related to the Goddess *Durgâ* or *Bhawâni* who is worshipped in many different forms of local deities. They also worship Lord Krishna and, especially celebrate with grandeur his birth-date, *Janmâshtami*. In religious and cultural festivals they perform

with devotional songs, group dance called *garbâ*, and couple-group dance of *râs*. Their prayers and *aarti* (devotional offering) also acknowledge their reverence and gratitude for Mother Earth. For many Mâldhâris *bhom* or *bhoomi* (the land, Earth) is a very dear entity. They worship and value it; they understand that their socio-economic worth is dependent upon it.

Myths and stories surround the origins of this people. It is commonly believed that the ancestors of the Mâldhâris came to Gujarât and particularly to the Saurâshtra region along with Lord Krishna when he moved from VrindâvanMathurâ area (in the state of Uttar Pradesh in India) and established his rule with Dwârakâ as its capital (in the western tip of the Saurâshtra peninsula). This is significant since many Mâldhâris worship Lord Krishna (whose was also known as *Gopâl* – the protector and keeper of cows) as their *thâkur* (lord or figurehead) or *kul-guru* (clan or ancestral teacher). Another story claims that the Mâldhâris, as cattle herders, precede the times of Lord Krishna. It explains why they also worship Lord Shiva and Goddess Pârvati (or Bhawâni). According to this myth, Lord Shiva and Goddess Pârvati needed a keeper for their camel. Goddess Pârvati created a person out of clay under a *Samadi* (a Prosopis) tree and Lord Shiva gave life to it and was called *Sâmod*. He was married to an angel named Rai and their descendents are the Mâldhâris, particularly the Rabâris.

The underlying significance here is the deep-rooted, life-giving association with land and the nurturing capacity of trees or vegetation with the mythical overtones of gods, goddesses, and angels. Such myths provide a basis for reverence and continued faith in nature and power of supreme beings in giving life and sustenance. Such faith and values are then celebrated by the community in the folk-dances, especially *garbâ* and *râs*, performed with gaiety and music around an idol of the goddess during the nine-night festival of *Navarâtri*. Such faith in and connection with nature are also reflected in daily religious performance (*pujâ*) or family events around the year. Some Mâldhâris, especially the Chârans, are bards and folk-singers. They share much of their wisdom and experience through folklores and folk-songs. Many of these expressions also have mythological and spiritual dimensions revealing their veneration for nature and God.

As Hindus they follow the lunar calendar and associate their religious practices with the full or new moon and changing seasons. Such association with temporal cycles also link them to the cosmic events that help them remember their place and role in the larger universe. Based on their experience with natural and human-created calamities and change, they believe that the ecological crisis results from lack of faith and immoral ways. At the same time they also believe that in this impermanent world, only their good *karma*, the fruits of well-performed duties, will go with them (their soul) when they die. Such grand perspectives are often manifested in their reverential attitudes and ethical behavior toward land, animals, people, and life.

From cultural celebrations and rituals to social traditions and economic practices they link their *mâl*, the land, and gods or goddesses in a very intimate and often sacred manner. Often, they are seen as one and the same. What the Mâldhâris believe from a “religious” point of view is often reflected in their views on nature and its

quality. In a study on the Gir's resource management issues and landscape quality, when asked about their views on nature, they typically described "Nature" as mother, their "very own soul" and acknowledged that "everything" is due to her. They are especially captivated by the Gir's natural beauty and other values which, in turn, add to their respect for the land and attachment to their way of life. Many Māldhāris often pay respect to smaller shrines, trees, rocks, and some water-bodies of religious and cultural significance. A notable aspect of this relationship is their view that nature's diversity is key to their very survival and emotional bond with the place. This is often manifested in their folklores as well as daily rituals. Such bonding needs to be understood better as it may prove to be vital for nature conservation.

All these rich cultural, social, and spiritual traditions and beliefs do not necessarily reduce the issues that the Māldhāris engaged with pastoral activities today face. They are similar to other pastoralists like the Gaddis in the lower Himalayas of North India or the Maasai pastoralists of East Africa. With increased focus on industrialization and urbanization, harsh climatic patterns, financial debts, and lack of insurance or extension facilities, their way of life is being marginalized. Many Māldhāris continue to abandon their traditional pastoral vocation and, willingly or otherwise, adjust and survive in an urban-industrial economy that is alien and often degenerating to them. This often leads to social and kin disintegration. Women and children usually get the rough end of the deal.

The world is facing many resource problems as well as spiritual perturbation, and these seem to be linked. The microcosmic life and times of pastoralists in general and the Māldhāris in particular reflect this reality. The Māldhāris' way of life may also show a way out. Pastoralism brings these people in close contact with structure and functions of nature and nonhuman living beings. Time, intergenerational interactions, community interdependencies, stories and myths, rituals and festivals, disasters, uncertainties, simple joys, majestic settings, temporal rhythms, and relationship with the local and regional landscapes are the forces that hone their very body, mind, and soul. Therefore, a unique worldview and nature religion emerges that leads to ecological knowledge and valuable, environment-related skills.

Malthus, Thomas Robert (1766–1834)

Thomas Robert Malthus was an Anglican clergyman, educator, and essayist whose ideas have exerted a powerful influence on Western thought in a number of areas, most notably demography, political economy, and biology. His most famous and controversial work, *Essay on the Principle of Population* (first edition, 1898), is considered one of the seminal sources of classical economics and strongly influenced other disciplines as well, notably evolutionary biology. At the heart of Malthus' thought was a vision of nature that emphasized inevitable limits and persistent suffering, and as a clergyman he was obliged to contemplate the religious implications of this harsh conclusion. He did so by developing a distinctive theodicy, grounded in utilitarian thought, as well as an ethics of moral restraint aimed at controlling population pressures. And while some of Malthus' views reflect the parochial concerns of his church and era, his general interest in the relationship between nature and religion resonate in contemporary debates about environmentalism, economic development, and human values.

The Principle of Population, Nature, and Society

Malthus' most famous and enduring idea, the population principle, starts from two simple postulates. First, that food is necessary to human existence. Second, that the “passion between the sexes” stays at a constant level throughout human history. Recognizing that sexuality quickly begets children that must be fed, Malthus quickly builds to his famous principle – “the power of population is indefinitely greater than the power in the earth to produce subsistence for man” (1976: 21). Put in mathematical terminology, “population, when unchecked, increases in a geometric ratio . . . [s]ubsistence increases only in an arithmetic ratio” (1976: 118). Critics charged that Malthus did not have the statistical evidence to warrant such a precise mathematical equation, but his main point was well taken. Any population is naturally beset by a “struggle for existence” as various individuals and groups vie for limited resources. In human societies, Malthus argued that the principle of population frustrated any attempts at a comprehensive amelioration because population would always be racing ahead of society's ability to nourish itself. For even the most civilized nations, especially at the lower strata, life was beset by “checks” – disease, vice, starvation, natural disasters, and other forms of misery – that painfully brought population back to levels that could be

fed. Malthus thus opposed the optimistic hopes of reformers such as William Godwin, who felt that society free of crime, war, poverty, and disease could be achieved.

While Malthus believed that the population principle was a universal natural law, he recognized that its severity varied somewhat according to historical circumstances. In some societies, it brought on spectacular cycles of boom and bust, whereas in others it might only impact the lower classes during severe economic downturns. Ultimately, he hoped that his *Essay* would help decision-makers (government officials, parents, educators, etc.) put policies into place that would soften and reduce the checks, even though he felt very strongly that no society could completely eliminate them.

Nature then, for Malthus, was essentially composed of contradictory forces that vexed human existence (later thinkers like Darwin would apply this reasoning to all organic existence). On the one side was an expansive tendency linked to sexual reproduction that increased populations. On the other was limiting tendency (a finite food supply, the diminishing capacity of land to produce food) that led to deprivations, competitive struggle, and for many, early mortality. Small wonder that Thomas Carlyle would dub the classical economics that built from Malthus “the dismal science.” At the most fundamental level, nature guaranteed suffering and pain that even the most civilized and orderly societies could not eliminate.

The prescriptions to reduce suffering that Malthus offered made him a controversial and often reviled figure. He asserted that direct efforts to help the poor (welfare payments, etc.) were in vain because recipients tended to use the resources to have more children who ultimately would be vulnerable to the checks. Instead, he argued that the English poor laws should be reduced or eliminated and that “moral restraint” (sexual abstinence) ultimately would be a better curb to the population principle because it addressed the root of the problem.

Malthus and Religion

Malthus was educated during an era when many prominent British natural historians were Anglican clergymen. Although some of his early teachers came from dissenting traditions, his primary education (at Cambridge) and career (as a country minister in Surrey) were steeped in Anglican orthodoxy. Malthus’ thought was strongly marked by the era’s natural theology that argued “through nature up to nature’s God.” In the most general sense, natural theologians maintained that the natural world was the harmoniously and intelligently designed masterwork of a benevolent, caring, providential God.

But how could one reconcile the pain and suffering that extend from the population principle with the “power, goodness, and foreknowledge of the Deity”? Especially now that the scope of natural evil had been enlarged to include all populations, all societies? Malthus was much troubled by this problem and devoted two chapters of his *Essay* and later writings to developing a theodicy that encompassed the population principle.

According to Malthus, “The original sin of man is the torpor and corruption of the chaotic matter in which he may be said to be born” (1976: 118). Furthermore, life was to be considered the mighty process of God . . . for the creation and formation of mind, a process necessary to awaken inert, chaotic matter into spirit, to sublimate the dust of the Earth into soul, to elicit an ethereal spark from the clod of clay (1976: 118).

Thus the pressure articulated by the population principle was part of a great series of “excitements and impressions” by which the Creator, acting through “general laws;” awakened “sluggish existence.” At the level of human society, the cruel “checks” so seemingly incongruent with theism were the very means by which a benevolent God elicited thoughtfulness, preparation, diligence, moral excellence, compassion, and ingenuity – in short, those habits of mind and behavior that secured improvement. Ultimately, the rational thought and exertion developed to alleviate the “partial evils” brought by the population principle resulted in an “overbalance of good” that benefited society.

Malthus linked his theological views to a utilitarian philosophy holding that a good society maximizes pleasure and eliminates pain for the greatest number. Like other utilitarians, Malthus saw the gratification of passion and desire as the foundation of human happiness, and thus entirely natural and good, except when overindulged. Typical of Anglican utilitarianism of his era (which had little regard for birth control), Malthus felt that the greatest scope for pleasure would be secured by restraining and/or redirecting passion until sufficient resources could be secured to safely enjoy the pleasures of life, chiefly, family and moderate consumption. Thus throughout his writings, Malthus endorsed moral restraint, “dictated by the light of nature and expressly enjoined by revealed religion,” as the best means of addressing the population principle (1826: IV, 2, 19).

Anti-Malthusianism

Malthus’ ideas, particularly after they were used to legitimize the rolling back of legal reforms designed to ameliorate the condition of the poor, became anathema to a variety of religious and political movements that championed the less fortunate. Radicals like Marx and Engels argued that Malthusianism was not so much a natural principle as a political ideology that inhibited the development of a more just, caring, and egalitarian society. According to this perspective, poverty and want were not rooted in “natural” conditions but in the greed and political shortsightedness of the more privileged classes. Liberal responses were more complicated. While most joined the radicals in rejecting Malthus’ pessimism about comprehensive social amelioration, many, following the lead of John Stuart Mill, acknowledged Malthus’ basic diagnosis of the human condition. Thus many liberals differed from Malthus only insofar as they held out greater hopes for increasing the production of food and/or regulating population through birth control and family planning – thereby tempering and perhaps eliminating the cycles of misery that plagued human history.

The relationship of religion to these anti-Malthusian trends is varied and complex. Many of the radicals dismissed traditional religion (revealed and supernatural) and Malthusianism as allied forms of reactionary political ideology – and perhaps could look to the popularity of Malthus among socially conservative Anglican clergy as suggestive evidence of this alliance.

Others, especially Christian socialists and religious liberals, insisted upon the rejection or modification of Malthusian pessimism in the name of ethical duties to help the poor and reduce human suffering. Likewise, much anti-Malthusianism sentiment emerges out of the loosely codified faith in progress that emerged during the Enlightenment. Thus in various utopian schemes and economic philosophies, poverty and want are not permanent social conditions but technical problems that can be solved or market inefficiencies that can be corrected – thereby transforming a suffering world into a place of peace, plenty, opportunity, and surplus.

Malthusianism and Environmentalism

With the rapid increases in human population over the course of the twentieth century (and projections for the twenty-first) many economists, environmentalists, and policy specialists, especially in the “limits to growth” camp, have revisited Malthus’ ideas and used them to frame contemporary discussions of overpopulation and food supply. Although these efforts generally include a strong emphasis on birth control and eschew explicit theological content, they are often infused with a moral and prophetic urgency, reminiscent of Malthus. For example, American biologists Paul and Anne Erhlich have repeatedly argued that the world is overpopulated and that food production in many regions is already at full capacity or environmentally unsustainable. They contend that the basic solutions to this potentially disastrous situation will entail a fundamental shift in human values and attitudes, especially those that concern reproductive behavior, economic growth, technology, the environment, and conflict resolution. In a more general way, writers like John Rohe and Garrett Hardin use Malthus to introduce contemporary discussions of natural limits, overpopulation, economic planning, and environmental management.

Malthus’ ideas are still widely discussed and debated by environmentally concerned people of diverse religious faiths. Perhaps his views remain current because his population principle framed some of the central concerns of human existence in ways that are easily grasped, yet powerful in their implications. The causes of human suffering, the limits to population, the consequences of sexuality, and the hope for a just and sustainable economic system all find articulation in his writings. A conscientious prophet for some, a reactionary ideologue for others, Malthus continues to cast a long shadow over discussions of religion and nature in the modern era.

Mammy Water (West Africa)

Mammy Water is a Pidgin English name with different spellings (e.g., *Mami Wata*, *Mammywater*, *Mami Wota*, etc.) in West African coastal areas and near major bodies of water (e.g., rivers, lakes, and lagoons). The people refer to their highly localized divine waters as Mammy Water (e.g., Nigeria's late Igbo novelist, Flora Nwapa, and the Yoruba musician and artist, Twins 77). A scholar, Mrs. Chinwe Achebe, wife of the Nigerian author and Nobel Prize nominee, Chinua Achebe, asserted that:

Nne Mmiri is a female deity with variants of local names, e.g., *Idemili* . . . With the arrival of Europeans to this part of the world, "*Nne Mmiri*" became known as "*Mami Wota*" – a translation which enabled the local inhabitants to communicate the existence and exploits of this female deity to foreigners (Achebe 1986: 15).

Foreigners were slow to accept the notion of a water goddess. The conquerors of territories were more interested in the Earth than in water. Together with the English name, a chromolithograph depicting a woman with long hair and snakes was introduced in the 1920s, spread quickly, gained popularity and is commonly identified as Mammy Water. Furthermore, native artists utilize the foreign image, an African icon, in their own renderings of water spirits, adding to an academic controversy.

The Academic Discourse on Mammy Water

A psychiatrist indebted to Judeo-Christian and Freudian interpretations of the icon's snakes first explored connections between Mammy Water and mental illness in Liberia while unaware of indigenous links between Mammy Water and healing. Art historians largely ignored ethnographic detail, focused on the history of art objects, overlooked the existence of local water divinities, and following Salmons' influential article, speculated on the "cult's" foreign origins, pointed to the icon's importation, pondered on European or Indian affinities, and even considered possible New World sources (e.g., Vodun). Some social anthropologists have translated the snake symbolism into Marxist interpretations of socio-economic structures, or interpreted the religious practices as indigenous responses to modernity. Others emphasize African agency, literature, art, cosmology and cultural contexts, taking their clues primarily from African ethnography and meanings of the components: snake, woman, long hair, and color symbolism.

The Python

Mammy Water's serpents are loaded with Judeo-Christian and European-American gender symbolism. This, in turn, has distracted from alternative views. Comparative and historical studies of myth, ritual, iconography and symbolism reveal the snake as an ancient, significant, and recurrent theme, near-universally imbued with polar meanings (e.g., in the primordial snake of Babylon, the Egyptian hieroglyph, *djet*, classic Greek mythology, and Africa where pythons in particular are often linked to creation, mythical origins of the world, and regarded as sacred).

In South-East Nigeria, the python, imbued with religious symbolism, is regarded as a messenger of the gods (e.g., the lake goddess). An avenger of the divine ire, the python punishes an offender in Chinua Achebe's novel, *Anthills of the Savannah* (1986). A circle represents the python's association with death, but also circular time, reincarnation and eternity, in a chalk drawing by Palmer, a herbalist and water deity priest of *Egbema*, signaling the impending death of his patient moving to another stage of the eternal cycle of life and death.

Woman and the Color White

Africans sometimes say that Mammy Water is "white", "yellow", or "very beautiful." This has encouraged speculations on the foreign origins of not only the icon, but also associated beliefs in *The Spirit of the White Woman*. Mammy Water priests, instead, insist on healing, teaching to dance, and reconciling their clients with custom. The color white has special significance in West Africa: whiteness metaphorically indicates spirit involvement (e.g., in a new-born baby, or a dying person). White chalk cools the possessed mind and the feverish body, is awesome, mysterious, beautiful, and a symbol of femininity.

The color white signals birth and death, the transition from life to death, and vice versa in the eternal cycle of life, death and rebirth, delineating circular time. *Nzu*, white limestone/ chalk, found underwater, or white powder, is used in initiation ceremonies involving symbolic death and rebirth, to dedicate a person, or a body, as a medium to communicate with deities, and mark the crossroads between humans and spirits. A priest or diviner's eyes and the front heads of the congregation are painted white. White chalk is blown to the spirits, sprinkled on the ground in prayers and sacred Nsibidi drawings, and disperses like women leaving their ancestral home. Both water and whiteness are associated with childbirth, female fertility, transitions, and mobility. White (chalk) is a gift of the lake goddess and her favorite color: she prefers white in costume and sacrifice. Mammy Water's lightness and the portions of her dress and poster seen as white indicate spirit involvement. Initiates read the icon's gender and whiteness as "female divine water" – not to be mistaken for a racial feature.

Red and White

The white color is significant not only by itself, but also in combination with red. Yellow chalk, *edo*, defined as red, complements *nzu* and symbolizes virility. The combination of red and white in ritual expresses the complementary dualism of male and female, procreative powers, and the ideal balance of divine creation. The desired equilibrium of gender is embodied in divine pairs (e.g., in the shrine sculptures for the river goddess, Ava and her husband, near Nsukka) and expressed in the Igbo proverb, “If something stands, something else stands besides it” (Obioma Nnaemeka, personal communication). Mammy Water’s dress contrasts red and white, recalling the important theme of complementary gender, ritually symbolized (e.g., in the stark contrast of red blood on white chalk, of yellow and white chalk, and in costume). The combined use of the female icon and a chromolithograph of an Indian deity with three heads representing the male Mammy Water, or the water goddess’ husband, further emphasizes the dualism of male and female.

Long Hair

One striking feature of the Mammy Water icon is her long, uncut, unbraided, and wavy hair. Foreigners read racial features into this hairstyle. But in West Africa, unkempt and uncut “long hair” has its own significance. African hairstyles are highly developed and diverse, an essential part of the ideals of feminine beauty and male grooming. Great care is applied to coiffure, an intrinsic part of personal grooming.

Classic African sculptures represent humans as well balanced, composed, and well groomed. Images of humans with wild, long, or unkempt hair are rare. Yet, in real life, not everybody is as composed as in artistic imagery. Though rarely represented, people with dreadlocks are known as *Dada* and *Ajali* in Yoruba and Igbo. Their long hair transcends social norms of controlled beauty and signals danger, disease, death, witchcraft, forces of wilderness, water, or spirit dedication.

Yoruba children with dreadlocks, *Omolokun*, (children of the sea), are considered related to water spirits. The Igbo link a person’s dreadlocks to his destiny and extraordinary state of mind. A *Dada* is thought to be either “mad”, or a “prophet”, in touch with nature spirits outside of human society, often living an unusual life (e.g., as did Sunday, no longer cutting his hair, leaving it long, forever unkempt). More than a mere fashion, *Dada* is an expression of profuse existential crisis, physical, emotional, or both, at the brink of death, close to the spirit world, apart from ordinary human life. This may afflict anyone at any time in their life, even a child (e.g., when the river god Urashi re-incarnated a baby boy). Wild hair signals wilderness spirit involvement, the opposite of the human civilization and its well-groomed, cut, or shaven hair in men, and braided, plaited, cut, or combed hair in women. Long hair characterizes the water goddess herself.

Women with “Wild,” Long Hair

Long, “wild” hair, or dreadlocks have added significance for African women. A young maiden is adored, praised and flirted with. Adulthood and entry into womanhood mark a shift of ideals of beauty to that of a mature woman, a matron who acts, looks, and is looked at differently from an adolescent girl. This transition is often marked through initiation and a time in the fattening house. The “fattening house” or “fattening room” is a term used in South Eastern Nigeria and other parts of West Africa where large size rather than skinny women idealize traditions of female beauty. The “fattening house/room” refers to a part of female initiation (from girl to woman) whereby a maiden entering the stage of mature womanhood stays in a special hut, or room, for a period of time (e.g., a week) groomed and is given special, rich food, special education and training in housekeeping, female and child healthcare, hygiene, etc., in some societies accompanied by female circumcision (female genital mutilation), and initiation camp.

The move is not easy and not every woman lightheartedly identifies with the ideals of mature beauty, constraints of adult womanhood, marriage arrangements, and other social pressures. Some women are unable to meet gender norms (e.g., are barren, have lost all of their children, suffer, or revolt against life, marriage, a job, training, or other social expectations). They may trade ordinary life for esoteric involvement and dedication to Mammy Water. In Igbo cosmology, changing one’s destiny is possible with the aid of the water goddess who controls the crossroads between life and death, and in turn, requires religious commitment.

Mammy Water’s long hair is synonymous with a particular splendor, the “killer” beauty of *Ogbuide*, “She who kills with excess,” the gorgeousness of a young maiden, ephemeral as white chalk, yet equally powerful. Mammy Water’s long hair signals fertility, beauty, female power, dedication to divine waters, and often an inability or refusal to live an ordinary life.

The Deities and Their Priesthood

While the icon known as Mammy Water is clearly indebted to foreign influences, there is no doubt in this author’s mind that the deities collectively referred to as Mammy Water are indigenous, highly localized, and historically rooted in African cosmologies.

These divinities customarily have their own hereditary priests (e.g., via entitlement by virtue of seniority in a clan). But despite this prerogative, personal achievement must be qualified. Spirit calling, possession, or vocation are alternate avenues to individuals whose lineage does not own a title. Some have attained their status through vocation or possession, personal misfortune, sickness, healing and initiation. They are locally known as Mammy Water priests/esses.

Mammy Water and the Monotheistic Religions

The ideas of female divinities, multiple gods, divine nature, reincarnation and circular time are alien to the

Abrahamic religions, some of which are competing for the souls of the natives. As a result, Mammy Water and other indigenous beliefs and arts are under attack.

Mandailing People (Sumatra)

The Mandailing people in the northwest island of Sumatra are a clan-based society with an indigenous tradition of representative and consultative governance. They are well known for their ancient tree-bark books, their contribution to modern Malaysian and Indonesian literature as well as their ritualistic music of the Nine Great Drums. They practice an indigenized brand of Islam where customs and customary usage is considered close to religion. Their habitat ranges from well-irrigated highlands with volcanoes to marshy lowlands. Their tropical rainforest is rich in biodiversity with, among others, Sumatran tigers, rhinoceroses, serows and Rafflesia flowers. Their productive economy is based on paddy, rubber, palm sugar, cinnamon, coffee and gold mining. “Mandheling Coffee” is famous amongst coffee connoisseurs today. There are over 300,000 Mandailings in their homeland in Sumatra, with about equal numbers throughout the rest of Indonesia and an estimated 200,000 or so, in Malaysia. The Mandailing homeland is today called the regency of Mandailing-Natal (Madina), in the province of North Sumatra, Indonesia.

The environmental worldview of the Mandailing people is embedded in its language, folklore and cultural heritage. The great epic of the Mandailing people speaks of the elements, the sky and the Earth. The recitation of the epic invokes the Earth, water and habitat guardian. The storyteller employs five different types of languages to transmit the oral tradition, including that of the camphor-gatherers as well as proverbs and maxims.

The epic begins with, “Once upon a time in the primordial past, the plant kingdom flourished and its flowers and fruits were abundant . . .” The symbolism used in the epic which forms the essence of Mandailing ethics and governance point to a way of life that is intimately bound to the forest and natural habitat.

This close connection to the habitat they lived in is also reflected in place-names, which are named after rivers, trees, mountains and such. Names of soil types also reflect an intimate relationship with “nature.” For example, a fertile land is called green land.

Mandailing tradition defined the classical role of the Mandailing leader in naturalistic terms. The Mandailing nobleman is likened to the *baringin* tree, a place of shelter; its spreading roots a place of protection, its canopy a cover for the head. The nobleman’s acute sense of hearing is likened to the rhinoceros.

Traditional Mandailing society has a few key concepts on division of land resources, territoriality and jurisdiction, and the management of resources. Central to these are the notion of a politically unified territory held together by customary law that secures territorial integrity as well as control over resources.

This set-up has a defined territory, citizen and jurisdiction, governed by a council of nobles and elders representing clans, nobility, religious functionaries headed by a chief. The strong connection of a Mandailing to his or her territoriality is testified to by the fact that when two Mandailings meet, they first and foremost ask which territoriality the other is from.

Elements representing the animal kingdom feature prominently in the houses of the nobles and elders called “house with horns” or “house of ornaments.” The horns symbolize the sacrificial buffalo, sacrificed during ceremonial and ritualistic occasions.

In a typical Mandailing settlement, the chief’s dwelling and the council hall are far more important and significant than the mosque. These two customary buildings reflect the status of the settlement as an autonomous entity.

In the chief’s dwelling, the sacred Nine Great Drums are placed. They are played at customary ceremonies such as weddings and installations, and ceremonies to mark the death of the nobleman. The death of a tiger, described as the king of the forest, is similarly commemorated.

In Mandailing society, the management of the environment is tied to the origin of clans and settlement, social structure, system of land tenure, governance and sense of territory. Mandailing society in the past and up to this day is a rural, agrarian and pastoral society. The main agricultural activity is paddy planting. Ownership of a plot of paddy land is critical to Mandailing social life as it defines one’s standing and status in society.

In the Mandailing perspective, a territorial unit is only complete when it constitutes land and water. The land and water in a settlement is communally owned and its usage has to conform to the customs as well as the sanction of the council of nobles and elders.

The water systems in Upper Mandailing are a feat of traditional water management and engineering. An extensive irrigation system provides for religious, domestic, agricultural and other uses. As such, settlements are strung all along the streams and river banks, traversed by path and canals leading to the paddy fields. One can hear the water flowing twenty-four hours a day in a typical Mandailing settlement.

Mandailing settlements are always located near a spring, stream or a river, which is used for domestic, agriculture, fisheries and religious/ritualistic purposes. Each territorial unit has its own protected forest area, where agriculture, hunting and harvesting of forest products are prohibited. These are usually watershed areas, believed to be where the spirits lived.

Inspired by the traditional concept of protected areas, local communities in the Mandailing homeland have been overseeing the implementation of a river-protection program. The practice prohibits the harvesting of fisheries’ resources close to human settlements for a stipulated period. Implemented in seventy settlements, Mandailing has the largest river-protection scheme in the province of North Sumatra.

The income derived from the harvesting of river resources is used to pay for the development of social facilities such as schools, roads and mosques, providing educational scholarships and administrative salaries, charity toward orphans, the poor and invalids,

etc. The income generated by this community-based ecological resource-management program benefits the community directly.

Both mother and child “village republics” are autonomous in implementing their system of governance. The general rule is that the chief of the Nasution clan rules settlements in Lower Mandailing while the nobleman of the Lubis clan rules settlements in Upper Mandailing, but there are exceptions.

The Mandailing nobleman governs in council, in that he acts in concert with his counselors. The nobles and elders jointly carry out their duties and obligations of governance and customary laws, which cover not only social and ceremonial matters such as marriage but also matters of local governance such as division of new paddy lands, rights of water and pastoral land, and so forth.

Although the territorial units were terminated by the Japanese imperial army in the 1940s, which meant that the nobles and elders lost their territoriality and powers to function effectively in Mandailing society, it did not wipe them out of existence, and to this day, the nobles and elders still play a recognized role as arbiters of the customs, although their authority is circumscribed.

Manifest Destiny

Coined by New York journalist John O'Sullivan in 1845, the term "manifest destiny" played an important, contentious role in American territorial expansion during the nineteenth century, and has had a lasting but equally fractious impact on American self-understanding in years since. Components of the idea of manifest destiny have a long and influential history in the United States, appearing in the guises of religious and political discourse, as well as in both elite and popular culture before and after their constellation within O'Sullivan's editorial work supporting American annexation of Texas and Oregon. In its various usages, the term encompasses nature, geography and race as key determiners of American values and institutions. For its proponents, it has typically served to attribute a sacred quality to American lands, one achieved through the work of subduing both raw nature and "inferior" peoples.

The oldest, and perhaps most crucial, component to the idea of manifest destiny is millennial. Early European colonists, most consistently the Puritans of New England, drew frequently on the Bible's millennial traditions in order to frame both their own colonizing agendas, and their view of the new world landscape to which they had migrated. As a sacred enterprise, their establishment of Massachusetts settlements was an analogue of the Israelites' exodus from Egypt to the land of milk and honey. The *New Canaan*, to which God led English Puritans as his newly chosen people, was an appropriation of widely embraced English Protestant ideas correlating the Israelite and English monarchies. Thus the Puritans did not so much coin the analogy as they deprived England's establishment of the analogy's "proper" use. But while Church of England expositors had to make biblical language of the wilderness and the heathen tribes metaphors for papal power, the New England Puritans were able to carve out a Christian beachhead in real wilderness, "full of wilde beasts and wilde men," as the Plymouth colony's first governor William Bradford put it. Just as the establishment of Israel was necessary for the history of redemption culminating in the life of Jesus of Nazareth, New Englanders came to see their own wilderness enterprise as crucial to redemption's second phase. In a kind of divine balance of history, since – as theologian Jonathan Edwards calculated – the "other continent hath slain Christ, and has from age to age shed the blood of the saints and martyrs of Jesus," it was reasonable to conclude that God would use the newly settled one to bring history to its glorious end (in Cherry 1971: 56).

In the meantime, New Englanders transformed their physical surroundings, guided by the biblical injunctions of Genesis 1:26, and the Arcadian vision of a subdued and bountiful nature subject to human enterprise. At times, as in judge Samuel Sewall's

1697 musings on New England's millennial role, this vision of New World abundance stressed a notable harmony between humans, nature, and divine intention: "as long as nature shall not grow old and dote, but shall constantly remember to give the rows of Indian corn their education by pairs: so long shall Christians be born there, and being first made meet, shall from thence be translated . . ." (in Miller 1956: 215). By contrast, the wilderness itself was often cast as a satanic realm where the divine aim was subverted.

Following the revolution, America's millennial role of playing host to the divine work expanded from providing the example of right religion practiced in the testing ground of the wilderness, to encompass the development of divinely approved political and cultural institutions as well. When earlier Puritans drew on the Mosaic covenant to speak about God's blessing of New England with abundance, that blessing was dependent upon their maintenance of right religious doctrine. In his 1795 Thanksgiving sermon, preacher Thomas Barnard – with little of the Puritan's ground for self-doubt – could simply assert that "we (Americans) are a people peculiarly favoured of Heaven." Such "favour" was most visible in the many "publick blessings" of prosperity obtained from still-fertile lands along the Atlantic seaboard (in Tuveson 1968: 31). The agricultural, industrial and technological achievement of the early republic over nature – for millennialists such as theologian Samuel Taylor Hopkins – was evidence of America's unique place in the economy of salvation. Americans, he urged, should expect such divinely sponsored advance that in the days to come a very little spot will then produce more of the necessities and comforts of life, then [sic] large tracks do now. And in this way, the curse which has hitherto been upon the ground, for the rebellion of man, will be in a great measure removed (in Tuveson 1968: 61–2).

For Congregational minister Joseph Emerson (cousin of famed Transcendentalist Ralph Waldo Emerson), in 1818 the future promised such an easy marriage of human technology and divine intent in ensuring agricultural advancement that the chemist might little think "how much his labors conduce to bring on that happy state of things, that shall distinguish the Millennial period" (in Tuveson 1968: 68).

As Americans turned their territorial gaze across the Appalachians, they augmented biblical millennialism with Enlightenment ideas. Nature as the product of a rational deity justified their interest in the Mississippi River and its terminus in the Gulf of Mexico, in the peninsula of Florida, and even in Canada. As Samuel Adams put it in 1778: "We shall never be upon a solid Footing till Britain cedes to us what Nature designs we should have, or till we wrest it from her" (in Weinberg 1958: 22). Nature's intent for human beings, which Thomas Jefferson in the "Declaration of Independence" (1776) had framed as individual rights to life, liberty and the pursuit of happiness, could be expanded upon at the national level to include independence and security from the harmful plotting of other nations, such as France and Spain. For residents of Kentucky this meant "the natural right of the inhabitants of this country to navigate the Mississippi" and to develop the region's agricultural potential in accordance "with the immense designs of the Deity" (in Weinberg 1958: 25–6), and for Jefferson himself,

natural right offered a sufficiently elastic basis for delimiting expansion. When nature intended Americans use of the Mississippi, it must also have intended them a port, he said, since “the right to use a thing, comprehends a right to the means necessary to its use” (in Weinberg 1958: 27). Such elastic rights, to some, suggested the reduction to absurdity of arguments based on natural design. Nevertheless, they enabled Americans to envision themselves within the first few decades of the nineteenth century as a continental power, and – as geographic knowledge replaced myths of the “Great American Desert” – to brush aside the constraints of western mountain ranges and arid lands. Thus the idea that nations were created within natural limits found little to recommend it until Americans had stretched themselves “from sea to shining sea,” as a patriotic hymn put it later in the century.

Publisher John O’Sullivan’s phrase, “manifest destiny,” coined in his mid-1840s *Democratic Review* editorials favoring annexation of Texas and Oregon, quickly gained great rhetorical power as a wide range of politicians, religious leaders, land speculators and others took it up. Opponents of the notion were themselves divided about America’s course. Unitarian minister William Ellery Channing considered the original Texas revolt of 1836 “an act of criminality” in itself, but also a precedent, he wrote to Senate leader Henry Clay, since “we cannot seize upon or join to ourselves that territory, without manifesting and strengthening the purpose of setting no limits to our empire” (in Graebner 1968: 48). A decade later, diplomat Albert Gallatin, Ralph Waldo Emerson and a number of Eastern liberals opposed war with Mexico, but most were slow to term manifest destiny simply “political clap-trap,” or to deny its underlying view of Providence, as did the *National Intelligencer* (in Graebner 1968: 239). Congressional opponents, such as Representative Charles Goodyear, who in 1846 spoke of manifest destiny being a “robber’s title,” were basically intent on averting war with England, and softening U.S. claims to western Canada above the 49th parallel.

Ralph Waldo Emerson himself celebrated the energies expended in continent spanning, seeing “a sublime and friendly Destiny” guiding the human race across America, the future “home of man” (in Graebner 1968: 11). The construction of national railroads, binding people of one region with another, Emerson said, “introduced a multitude of picturesque traits into our pastoral scenery. The tunneling of mountains, the bridging of streams . . . the blowing of rocks, explosions all day . . .” were signs of national promise and potential, making it possible for the race to tap the vastness of the land, which would be “physic and food for our mind, as well as our body” (in Graebner 1968: 6–7). Even Henry David Thoreau, opposed to so many of his fellow-citizens’ endeavors, felt “Nature’s magnetism” pulling him along the same continental trajectory. “Eastward I go only by force,” he famously acknowledged, “but westward I go free” (Thoreau 1975: 667–8).

The biblical arguments remained effective political justifications throughout the period – and seemed by many expansionists to have been thought sufficient to make England abandon its own interest in Oregon. Former president John Quincy Adams argued in Congress that since England was a Christian nation, it was bound to respect

the relevance of Genesis 1:26–28 as the surest foundation of title. Whereas England only wanted Oregon for its Hudson Bay Company trappers, Americans claimed Oregon, Adams concluded, in order to “make the wilderness blossom as the rose, to establish laws, to increase, multiply and subdue the Earth, which we are commanded to do by the first behest of God Almighty” (in Graebner 1968: 109). But even those expansionists who did not draw upon biblical or Transcendentalist mandates spoke of America’s continental destiny with religious, ecstatic, fervor.

William Gilpin, first territorial governor of Colorado, was perhaps foremost – certainly most energetic – among expansion’s intellectual advocates. Gilpin’s writings, dependent upon the theories of the German explorer and naturalist Alexander von Humboldt, melded his scientific postulating about the “isothermal zodiac” – the global climactic belt within which empires had developed and moved ever-westward – with enthused descriptions of the American continent and the “pioneer army” he saw pushing across the Rocky Mountains in search of gold and fertile soil. The pioneer, for Gilpin, spearheads the vital portion of the “human current,” which bears with it the immortal fire of civilization revealed to man. This central current has reached the Plateau of America, up which it will ascend to plant the sacred fires over its expanse and shine upon the world with renewed effulgence. Such is the resplendent era and the gorgeous promise unveiled to humanity. The arrival of this is *now* announced by the indefinite gold production and pastoral power of the interior, domestic region of our continent and country (Gilpin 1974: 53).

Manifest destiny’s advocates could only go so far in making religious or scientific appeals, however. If the English and the Americans might be expected to establish consensual readings of scripture, ponder the isothermal lesson, or merely to submit to diplomatic resolution of the

Oregon dispute – which President Polk achieved in 1846 despite Democrats’ desire to war with England – this possibility was less expected of others who stood in the way of American expansion. In American dealings with Mexico, native tribes, and later with both Cuba and the Philippines, race thus became the key factor in determining the direction of achieving manifest destiny, and violence its often justified means.

As early as the 1820s, when Americans pushed into Cherokee and Choctaw lands, Christian land use seemed a practice that only Anglo-Saxons were capable of employing. Confronted by arguments that Indians were mere occupiers of the soil, and hence lacking any legal title to it, Cherokees and other southern tribes vigorously embraced the agricultural lifestyle and religion of encroaching Americans, and were then sued by the gold-hungry Georgians who wanted their lands – for violating treaty terms. As Governor Troup noted to the Georgia legislature during the debates leading up to passage of the 1830 federal Indian Removal Bill – which eventually solved the problem to the Georgians’ satisfaction – “by changing the mode of life of the aboriginals upon the soil of Georgia,” by causing “her lands to be separately appropriated for the purpose of tillage,” and by promoting “every encouragement to fixed habits of agriculture,” the federal government and the Cherokees “violated the treaties in letter and spirit, and

did wrong to Georgia” (in Weinberg 1958: 87). Efforts to “civilize” tribes were thus violations of “the laws of nature,” as one Georgia legislator put it, which “have fixed an insuperable barrier between the moral condition of the savage and the Christian” (in Weinberg 1958: 88).

The belief in Anglo-Saxon moral superiority gained ground as it was deployed not only in the taking of tribal lands, but also in conflicts with Mexico. Some supporters of the 1846 invasion of Mexico and the conquest of California envisioned Mexican citizens greeting American forces as liberators, and perhaps melding into the American population as their lands experienced the regenerative rule of republican institutions and the development of mineral and agricultural resources. The more prominent tendency after the war, as Florida’s Senator Westcott complained in 1848, was to reject the idea that the U.S. should receive not merely the white citizens of California and New Mexico, but the peons, negroes, and Indians of all sorts, the wild tribes of Camanches [sic], the bug-and-lizard-eating “Diggers” and other halfmonkey savages in those countries as equal citizens of the United States (in Horsman 1981: 276).

By the end of the nineteenth century, carving out national boundaries and dispossessing tribes from their lands ceased to figure in forward-looking American imaginations. The wilderness-transforming energy that white Americans attributed to their Anglo-Saxon roots – and which historian Frederick Jackson Turner’s 1893 essay “The Significance of the Frontier in American History” and President Theodore Roosevelt’s *Winning of the West* (1907) claimed was defining of national character

– seemed to have reached a terminus. However, AngloSaxon manifest destiny continued to shape American life. The push to open trade with Asia – key to Senator Thomas Hart Benton’s imperial vision as early as the 1820s – and even to acquire Asian colonies, spread widely. By the century’s end the vision was commonly accompanied by a racial justification of U.S. dominance in the Pacific. America’s 1898–1901 war in the Philippines against first Spain, and then insurgent Filipino nationalists, was cast by its supporters in the McKinley and Roosevelt administrations as a repetition of the frontier struggle. For Roosevelt, Filipinos were “Apaches,” playing the same role in thwarting national destiny as Geronimo (in Slotkin 1992: 121). For Senator Albert J. Beveridge, opponents of

U.S. military operations in the Philippines – arguing that whites could not successfully live in tropical environments

– erred in concluding that the Anglo-Saxon race therefore had no obligations there. On the contrary, he told the Republican National Convention in 1900, “the general welfare of the world” demanded American rule, otherwise this land, rich in all that civilized man requires, and these people needing the very blessings they ignorantly repel, should be remanded to savagery and wilderness. If you say this, you say that barbarism and undeveloped resources are better than civilization and the Earth’s resources developed (in Cherry 1971: 142).

The need to subdue nature, in the course of the twentieth century, lost some of its focus as a theme in American discussions of national aims. Manifest destiny, however,

did continue to be invoked, as in the arguments of President Woodrow Wilson for American participation in the First World War, and Franklin Delano Roosevelt for the Second. These weighings of America's unique responsibility had less to do with the conquest of nature, though, and more with what Wilson framed as the moral mission of American democracy. Nevertheless, America's mobilization in both wars was also nature's, since the country's abundant natural resources provided American factories with the material necessary to achieve victory. Although twentieth-century Americans did at times contest the implications of natural abundance, as in the conservation movement's debates about "finite" resources during the Gifford Pinchot era and then again in the 1970s, very few seriously advocated an overturning of the economic order that had been built on the basis of manifest destiny. Which is to say that Beveridge's 1900 challenge to antiimperialists – that consistency would require them to give "Australia back to its Bushmen, and the United States to its

Indians" – has rarely been accepted, other than by tribal advocates themselves (in Cherry 1971: 148).

But if subduing nature became a given in the twentieth century, popular culture has provided an enduring context in which the task can be reappropriated, its urgency rekindled and its achievements often commemorated. The American landscape is full of memorials to manifest destiny, none more striking than Colorado's Mount of the Holy Cross, which journalist Samuel Bowles was first to proclaim as a divine seal of approval upon American enterprise in *The Switzerland of America: A Summer Vacation in the Parks and Mountains of Colorado* (1869), and which Yellowstone explorer and artist William Henry Jackson first photographed in 1873. Made a national monument in 1929, the mountain's deep snow-filled couloirs offered several generations of pilgrims confirmation that nature itself spoke the gospel in America. Although its remoteness kept visitation at such low levels that the federal government removed it from the list of national monuments in 1955, and the permanent snowfields have subsequently melted in part, reproductions of the Jackson photograph and numerous paintings of the mountain circulated widely for long afterwards, and Climbers for Christ offered cyberspace images of the mountain at their website.

The remembered past, embodied in works of art and architecture, or in numerous historical and recreational sites, also preserves the vision of manifest destiny. Emmanuel Leutze's gigantic mural "Across the Continent, Westward the Course of Empire Takes its Way" (1864) hangs in the U.S. Capitol. Mass circulation prints of Fanny Palmer's "Emigrants Crossing the Plains" (1868), or John Gast's "Westward Ho" (1872) linked technology, American determination and divine inspiration – in Gast's case by means of a gigantic, gauzy-gowned Goddess of Liberty floating above westward-moving citizens, telegraph wire and law book in her hands. The homes of westwardpushing or western-raised heroes such as Daniel Boone and Abraham Lincoln, battle sites such as Wounded Knee, the Little Bighorn, and the Alamo; monuments such as the Jefferson Arch and Mount Rushmore; and consumer theme parks such as Disneyland; are all centers at which tourists absorb the spirit of manifest destiny. Innumerable annual "Pioneer Day"

celebrations – such as the “Laura Ingalls Wilder Days” in DeSmet, South Dakota – offer small-town and big-city residents the chance to connect heroic ancestral deeds with their communities’ needs of the present and hope for the future.

The preeminent icon of manifest destiny in the twentieth century was Hollywood’s archetypal American hero and most popular actor, John Wayne, who built much of his career reenacting the drama of manifest destiny. A brief consideration of his films shows the link between nature and national mission in twentieth-century guise. In Wayne’s westerns and war films, manifest destiny is represented as the just and overarching aim of the American people, while Wayne serves as its closed-mouth and hardfighting but morally virtuous agent. The Wayne persona is most at home on horseback, passing confidently across the land, or nestled rifle-at-the-ready, against rock, tree or sand – though as Gary Wills (1997) points out, he also fills the frame of the interior shots in *Stagecoach* (1939) with the ease of a man of nature. He has enough experience with indigenous people to be on speaking terms with them, and to know their habits and aims, but generally avoids familiarity, and even when preventing imperial violence – as in *Rio Grande* (1950) – he upholds the aim of civilizing the savage and making the land into a secure home for Americans. As a heroic figure he rarely approves of run-of-the-mill religious expression, telling the whore in *Sands of Iwo Jima* (1949) – with whom he drinks but doesn’t sleep – “Don’t get religion on me” when she offers to pray for him, and ridiculing the preaching of Ward Bond in *The Searchers* (1958). Nevertheless, he embodies the muscular Christianity advocated by Theodore Roosevelt for urban Americans growing soft in the aftermath of frontier conquest. He casually refers to God as “Sir” in *Rio Grande*, and “the man upstairs” in *Sands of Iwo Jima*. At the center of his character is duty, and rarely does it lead him into conflict with official American power. His most conventional religious gesture is his performance of perfunctory but heartfelt funeral services, in which he returns to the Earth either unfortunate subordinates or enemies fallen in his conflicts over soil.

Though Wayne worked with several directors, and played a variety of heroic roles, these portraits cohere in ways that consistently underscore the centrality of manifest destiny to his persona and to an understanding of America as an ideal. Consider, for example, the thematic overlap between *Red River* (1948) for Howard Hawks, his *Rio Grande* trilogy for John Ford (1948–50), his selfproduced *The Alamo* (1960), and such war films as *Flying Tigers* (1942), *The Fighting Seabees* (1944), *They Were Expendable* (1945), and *The Sands of Iwo Jima*. The westerns emphasize the righteousness of Wayne’s violence against Indians and Mexicans; the Pacific-based war films present racially uncomplicated portraits of the American fight against Japanese aggressors. But Wayne and his directors erase the historical gap between western conquest and Pacific war by a spatial assimilation; Texas, Arizona, a Pacific island, these separate pieces of Earth are the same under the sweep of Wayne’s gun. Overwhelmingly, Wayne’s violence – even that which is clearly brutal

– fulfills a fundamentally religious function, providing what Richard Slotkin (1992) calls “regeneration.” In *They Were Expendable* – the story of U.S. Navy patrol torpedo

boats in the opening days of World War II – the western and war story mix to provide a historical, or mythical, gloss on American possession of the Philippines. In one scene, when American defeat before the Japanese invasion appears certain, Wayne's Lt. Rusty Ryan talks with Dad Knowland, an old boat-builder who refuses to flee. He sits on the front step of his tropical homestead, rifle and whiskey bottle in hand, and tells Ryan: "I worked forty years for this, son. If I leave it they'll have to carry me out," while the background music provides a chorus of "Red River Valley" – a folk-song from the end of the nineteenth century that helped romanticize the American annexation of Texas lands south of the Red River. Music also underscores the righteousness of the American cause in the final scene, as the Civil War's "The Battle Hymn of the Republic" helps reconcile viewers to a shot of Wayne's boatless crew marching ragtag off to sacrifice themselves in the jungle. The familiar hymn enables viewer consent to the extension of America's redemptive role in the Pacific, as the land appropriated by one generation of manifest destiny advocates, and defended by another, is made meaningful through connection with the most important example of regenerative violence in American history – the chastened killing and massive dying that Lincoln declared "hallowed" at Gettysburg.

Howard Hawks' *Red River* connects the Western adventure with the biblical account of the Israelites crossing the Red Sea, a point which Hawks' screenwriter, novelist William Faulkner, emphasized obliquely to a journalist in 1955 during the filming of *Land of the Pharaohs*. According to Faulkner "It's 'Red River' all over again. The Pharaoh is the cattle baron, his jewels are the cattle, and the Nile is the Red River" (in Hillier and Wollen 1996: 2). In "Red River," Wayne, playing the historic cattleman Tom Dunson, blazer of the Chisholm Trail, establishes his claim to land below the river by shooting without clear provocation or much explanation a Mexican *vaquero*, who challenges Dunson's presence on land his boss had received as a grant from the King of Spain. Justification comes from sidekick Walter Brennan (Groot), who remarks "That's too much land for one man. Why it ain't decent. Here's all this land aching to be used and never has been. I tell you, it ain't decent." The perfunctory killing, the *vaquero's* brief burial, over which Dunson presides, and the branding of their small stock of cattle are sufficient to mark the land as home for the forward-looking Dunson, who plans to raise the largest herd in Texas and satisfy the American family needs for an abundance of beef.

In both films, American land, wherever it is, is home to American enterprise, violence establishes or maintains its original – and contextless – Anglo-Saxon appropriation, and American identity is framed as relentless, forwardlooking and violence-bestowing determination to hold this land in the face of threats from non-Anglos. These twin themes of appropriation and defense of the land overshadow almost any other in Wayne's films, to the extent that his muscular Christian hero rarely appears as a mere worker of the land. And in an age where manifest destiny is already an accomplished fact, his hero is out of step, harkening back to the time when nature's abundance was not yet assured, or still threatened by the nation's demonic foes.

Wayne's normative nostalgia often served to revive American ideals in challenging times, especially in films produced in the midst of the Second World War, or under the cloud of Cold War uncertainty, as were so many of his westerns. Their frequent reliance upon manifest destiny to establish the meaning of America's mission in the past and its role in the present ran up against the wall of defeat in Vietnam, however, a war which Wayne sought to reinvigorate in familiar terms with *The Green Berets* (1968). But the nature presented by southeast Asian jungles offered little that Wayne could depict as home for American enterprise. Sacrifice for soil comes through more successfully, however, as the Special Forces unit Wayne commands fights off a massive Vietcong siege of their central highlands compound, reversing the outcome of Mexican General Santa Ana's famous 1836 siege of the Alamo. Soil, sacrifice and the example of history mattered as well to President Lyndon Johnson, a Texan whose grandfather may have died at the Alamo, and to whom Wayne wrote in 1965 in support of Johnson's deployment of U.S. troops. For Wayne, the causes were the same, enabling him to use the justification his "Alamo" character, Davy Crockett, offered. "We don't want people like Kosygin, Mao Tse-tung, or the like" Wayne told Johnson, " 'gorin' our oxes' " (in Wills 1997: 228).

In the decades since, American popular culture has apparently abandoned Wayne's faith in manifest destiny and America's overcoming of geography through violence, though he remains Hollywood's most popular figure. Certainly the western saga, as a story of righteous conquest or personal and social redemption achieved through Anglo-Saxon subduing the land, has ceased to animate culture producers. Likewise, Anglo-Saxon racialism has lost its resonance as a public justification for resource extraction. Since Vietnam, Hollywood cameras have often captured war itself through a cynical lens. But the taming of the American landscape – the domestication of nature – that western expansionists first envisioned as the divinely commissioned destiny of the American people is reaffirmed through their endless journeying – moving, working, vacationing – over the country's vast transportation network, and their absorption of natural resources into the needs and designs of their daily lives. Bound by duty to wield a gun in defense of American enterprise, Wayne's characters rarely had time to share in the absorption of nature which this enterprise enables.

Perhaps this absorption has been secularized. However the forthright James Watt, Secretary of the Interior under President Ronald Reagan from 1981 to 1983, certainly viewed America's consumption of nature within a decidedly traditional religious framework. In telling Congress that "my responsibility is to follow the Scriptures, which call upon us to occupy the land until Jesus returns," he brought back into public life the millennial assumptions regarding the American land and the American mission that had so shaped the idea of manifest destiny to begin with (Klein 1981: 22). By the century's end that orientation had not lessened among the general public, though it was anathema to left-leaning journalists and environmental activists. In addition, the equation of moral purpose and political power that has guided America's role on the twentieth-century international frontier was still leading early twenty-first century

American policymakers to sound biblical echoes, as it led Albert J. Beveridge in 1900, to wonder “When nations shall war no more without the consent of the American Republic: what American heart thrills not with pride at that prospect?” (in Cherry 1971: 153).

A Manifesto to North American MiddleClass Christians

Preamble

It is time for an Ecological Reformation. The Protestant Reformation and Vatican II brought the importance of the human individual to the attention of Christians. It was a powerful revolution with many impressive religious and political results. But our current version of this model – the individualistic market model, in which each of us has the right to all we can get – is devastating the planet and making other people poor. This model is bankrupt and dangerous. We now need a new model of who we are in the scheme of things and therefore how we should act in the world.

The Individualistic Model

The model of human being as individual is deeply engrained in North American culture. Its goal is oriented to *individuals* – to their rights and desires. North American Christianity has also been focused on individual wellbeing, either as salvation of believers or comfort to the distressed. This model of human life supports that we are a collection of individuals who have the right to improve our own lives in whatever ways we can. We see ourselves as separate from other people, while acknowledging the right of others to improve themselves. But this is not a description of “the way things are”; it is a model, a *way* of seeing ourselves and nature. It is a way that is proving to be harmful to most of the world’s people and to nature.

There is very little public discussion of the key consequences of this model: climate change (global warming), the increasing gap between the rich and the poor, the extinction of other species, and the rapid decline in natural resources. We are being kept in denial about the seriousness of these major global issues by powerful business lobbies and timid politicians, *but also* by our own reluctance to disrupt the most comfortable lifestyle that any people on Earth have ever enjoyed.

The Ecological Model

The individualistic market model has failed us: it has limited religious viability and it is proving to be dangerous to our planet. We need another model of human life: we need an Ecological Reformation. An Ecological Reformation would base its model of human life on how reality is understood in our time. The picture of reality emerging from cosmology, evolutionary biology, and ecology today focuses on relations and community, not on individuals and objects. *We are all related*: we all came from the same beginning.

This story also provides us with a new model of human life. In this story, human beings are not individuals with the power to use nature in whatever ways they wish. Rather, we are *dependent* on nature and *responsible* for it. In a sharp reversal, we do not control nature, but rely utterly on it. The rest of nature does not, however, depend on us; in fact, if human beings were to disappear from the Earth tomorrow, all plants and animals would be better off.

Our radical dependence on nature means that we are also responsible for it. As the species currently laying waste the planet – and aware that we are doing so – we must accept responsibility for our actions. The ecological model of human life tells us not only who we are but also what we must do: it gives us guidelines on how we should act. In other words, it is a *functional* creation story, one that has practical implications for how we live at personal and public levels.

We could call these implications our new “house rules.” The common creation story tells us that the Earth is our home – it is where we evolved and where we belong. It also tells us what we must do for all of us to live decently and happily here. House rules are what one pins on the refrigerator as guidelines for sharing the space, the food, the resources of the home. The basic rules are: take only your share, clean up after yourself, and keep the house in good repair for future occupants. The ecological model comes with some definite house rules, clearly seen in the fact that “ecology” and “economics” come from the same word root having to do with laws for living in a household. The basic rule is that if everyone is to have a place at the table, the limits of planetary energy must be acknowledged. The house rules of our home set limits to growth – both of our consumer desires and the size of the human population. We need, then, to become “ecologically literate,” to learn what we can and cannot do if our home is to continue to exist in a sustainable way. We must fit our little economy into the Big Economy, Earth’s economy, if our economy is to survive.

Christianity and the Ecological Model

As Christians we need to do all this and more. This new model, which could be summarized by a version of Irenaeus’ watchword – the glory of God is every creature fully alive – provides Christians with new ways to say that God is *with* us on the Earth

and that God is *for* us, especially the oppressed. This new model suggests to Christians that the way to picture God's presence with us is the eschatological banquet to which all are invited, all people and all other creatures.

The ecological model, then, suggests a new vision of the "abundant," the good life. We must envision models of the abundant life based not on material goods, but on those things that really make people happy: the basic necessities of food, clothing, and shelter; medical care and educational opportunities; loving relationships; meaningful work; an enriching imaginative and spiritual life; and time spent with friends and in the natural world. In order to move toward this good life, we will need to make changes at every level: personal, professional, and public

– how we live in our houses, how we conduct our work lives, and how we structure economic and political institutions. It is a life that for us North Americans may well involve limitation and significant change in our level of comfort. Christians might see it as form of discipleship, a cruciform life of sacrifice and sharing burdens.

A Call to Action

The Ecological Reformation is the great work before us. The urgency of this task is difficult to overstate. We do not have centuries to turn ourselves around and begin to treat our planet and our poorer brothers and sisters differently. We may not even have the next century. But the scales are falling from our eyes and we see what we must do. We must change how we think about ourselves and we must act on that new knowledge. We must see ourselves as both radically dependent on nature and as supremely responsible for it. And most of all, we North American privileged people who are consuming many times our share at the table must find ways to restructure our society, our nation, and the world toward great equitability. Christians should be at the forefront of this great work – and it is a *great* work. Never before have people had to think about the well-being of the entire planet – we did not ask for this task, but it is the one being demanded of us. We Christians must participate in the agenda the planet has set before us – in public and prophetic ways – as our God "who so loved the world" would have us do.

Sallie McFague

Manser, Bruno (1954–2000) and the Penan of Sarawak

Born into a devout Protestant family in Basel, Switzerland, Bruno Manser was one of the foremost global campaigners for the indigenous Penan nomads of Sarawak, Malaysia, until his suspicious disappearance in Sarawak, on or around 25 May 2000. With a worldview centered on communal harmony and the veneration of nature, Manser was a firm believer and active practitioner of nonviolent civil disobedience. Gaining wide fame and attention in Europe, Manser and the nonprofit, Swiss-based Bruno Manser Fonds (in English, the Bruno Manser Foundation) campaigned fiercely and relentlessly for two decades to stop the decimation of tropical forests, to defend and institutionalize the rights of indigenous peoples to autonomy and self-determination, and to document egregious violations of basic human rights.

Manser was primarily focused on saving the indigenous Penan and their communal forests on the island of Borneo, and in this pursuit he was a formidable self-taught ethnographer, ethnobotanist, artist, writer, linguist, craftsman and photographer. His informal medical studies ensured his self-treatment and recovery from a lethal bite of a red-tailed pit viper while living in remote Penan territories in 1989.

One of three boys and two girls born to a factory worker, Manser's parents wanted him to become a doctor. Surrounded and nourished by the tempered wilderness of the Swiss Alps, Manser early on challenged the epistemological dictates of "civilization." An independent thinker from the start, at nineteen years old Manser spent three months in a Lucerne prison for conscientious objection to Switzerland's compulsory military service. While he was known to be aware of the Gandhian philosophy of Satyagraha, the extent of Manser's familiarity with the non-violent ideologies of Tolstoy, Thoreau or Martin Luther King is less certain.

Leaving prison in 1973, Manser lived for twelve years as a cowherd in a secluded Swiss alp, where he laid bricks, carved leather and kept bees. He wove, dyed and cut his own clothes and shoes. Mountaineering and technical climbing were regular pursuits. Foreshadowing later solo wilderness expeditions in Malaysia, Mexico, Congo (Zaire) and Alaska, Manser ventured alone into the Swiss mountains for long periods.

In 1984 Manser traveled with an English spelunking expedition to explore the Gunung Mulu National Park in Borneo. Afterward he traveled deep into the interior of Sarawak to find and live with the Penan. "In my search to understand the deep essence of our humanity," Manser said, "there grew in me the desire to learn from a people

who still live close to their source. At Swiss libraries I found almost nothing about the Penan of Sarawak, and so I said 'I want to go there' ” (personal communication, 1993).

From 1984 to 1989 Manser lived intimately with the Penan, mastering the Penan language, documenting the ethnology of the Penan and their natural environment. Manser adopted the Penan way of life absolutely, dressing in a loincloth, hunting with a blowpipe and bow and arrows, eating primates and snakes and the staple sago palm of the Penan diet. Manser's respect and sensitivity for the Penan gained him an unprecedented status in the egalitarian and non-hierarchical community of the last several hundred nomadic Penan.

Bruno Manser's total immersion in the Penan lifestyle became a source of much derision, humor and ridicule in the West, and his experience was often dismissed as "pure Hollywood" foolishness. "They called me 'white Tarzan,'

'medical school drop-out,' 'short-time hero'; they even said I had taken two Penan wives," said Manser (personal communication, 1993).

To those who investigated or knew his story, Bruno Manser was venerated. He was known and respected by Hindu, Buddhist, Islamic and Christian leaders, whom he often met with, at home and abroad. Manser's nonviolent protests (especially prolonged public fasts) drew the attention of Switzerland's churches: Catholic and Protestant leaders in Switzerland regularly dedicated services to Manser. An exemplary citizen, respected for his efforts to mitigate Penan suffering, Manser grew in stature, often portrayed as a moral beacon for religious stories, themes and dedications; for church services and celebrations (especially Confirmation); and for protracted rites where Bruno Manser was chosen as the focus of prolonged meditations. After his disappearance, the veneration of Bruno Manser increased significantly: school and church groups frequently request(ed) information from the BMF.

Absent any judicial recourse to the unrestricted logging that was increasingly devastating the remaining indigenous forests of Borneo, the Penan in the early-1980s instituted nonviolent blockades of logging operations, blockades that continued over subsequent decades. While their plight was mostly ignored and marginalized, the Penan persisted in attempting to further their indigenous rights to autonomy and self-determination through international forums, local actions and the efforts of Penan leaders both resident and exiled.

Bruno Manser's role in Penan blockades is uncertain. Living amongst the Penan from 1984 to 1990, a fugitive remaining in Malaysia without a visa, Manser catapulted the Penan story onto the world stage. He did not participate in logging blockades but the Malaysian and Sarawakian government nonetheless blamed him for Penan actions. In 1990 he left the Penan to campaign in Europe, Japan and North America to stop the logging of Penan territories. Manser correctly perceived that the economic policies of the already industrialized nations would determine the future of indigenous people like the Penan.

In December 1992 Manser led a twenty-day hunger strike in front of Marubeni Corporation headquarters in downtown Tokyo, Japan. In 1993 he led a sixty-day fast,

supported by forty hunger-strikers, in front of the Swiss Parliament. In 1996, Manser and Jacques Christinet hung huge banners on the auxiliary cable of the Swiss Kleinmatterhorn aerial cable car, a risky action for which Manser was criticized by some supporters. There were countless lesser actions, meetings with parliaments and corporate executives, and appearances at international conferences and before the United Nations. By 2000, Bruno Manser Fonds raised over \$10,000 to establish a mobile dental clinic for the Penan but the Malaysian government refused to cooperate and rejected the project.

In 2000, Manser privately confirmed that success in Sarawak had been “less than zero” (personal communication). He was deeply saddened.

Academics, newspapers and officials widely criticized and derided Manser, although the U.S. press ignored the Bruno Manser and Penan story altogether. Malaysian officials were hardened by Manser’s presence in Sarawak. Some environmental groups blamed Manser for inflaming the Malaysian government. Prime Minister Mahathir Mohammed blamed Manser for disrupting law and order. In a personal letter to Manser, Mahathir wrote:

As a Swiss living in the laps of luxury with the world’s highest standard of living, it is the height of arrogance for you to advocate that the Penans live on maggots and monkeys in their miserable huts, subjected to all kinds of diseases (Mahathir, 3 March 1992).

Mahathir responded to Penan blockades with the designation of Biosphere Reserves for the Penan (subsequently logged illegally). Dr. Mahathir in 1987 invoked Malaysia’s State Security Act to jail critics of the regime. The Act was also used to neutralize the Penan campaign: at the time of writing, over 1200 people had been arrested for challenging the logging; up to 1500 Malaysian soldiers and police had stormed barricades, beaten and arrested people; bulldozers had leveled nomadic camps; and the Sarawak government tolerated criminal gangs hired by logging firms to intimidate the indigenous people.

The government of Sarawak’s Chief Minister Tan Sri Abdul Taib Mahmud responded with military operations targeting Manser. Through his embarrassing investigations and reports, Manser gained the wrath of many timber companies. He evaded Malaysian security on numerous occasions to visit the Penan. Soldiers in Malaysia hunted him, and he was captured by soldiers, and escaped under gunfire, twice. Declared “enemy of the state number one,” a \$50,000 word-of-mouth bounty was rumored and widely believed to have been placed on Manser’s head: the source of the bounty remains unconfirmed.

Manser’s expedition to document the effects of logging and war on the Ituri pygmies in the rainforest of Congo (Zaire) in 1995 occurred amid widespread political upheaval and terror. Manser returned to Switzerland with a massive body of moving ethnographic photographs, later shown at expositions around Europe. His efforts to defend the Penan never ceased.

In 1999 Manser entered Sarawak illegally, and was arrested and deported after landing a motorized glider on the property of Sarawak's Chief Minister Taib Mahmud, where a group of Penan leaders, never welcome, were waiting to get a meeting with the Chief Minister. On 22 May 2000, on what became his last mission to Sarawak to meet with Penan friends besieged by logging, Bruno Manser disappeared without a trace on or after 25 May 2000. He was last seen by a Penan friend within two days' walk from the village of Bario, Sarawak, not far from the base of Batu Lawi, the venerated limestone spire. Within a year, the pristine forest where Manser disappeared was logged.

Throughout his life Manser quietly rejected the dogmatism of religion, especially his native Christianity. In contradistinction, Manser found his personal beliefs confirmed in alignment with aspects of Buddhism, Islam, Hinduism, Christianity and animism that he considered noble and sacred. Manser's spiritual coherence with nature was born in his youthful and mostly solitary explorations of the alpine environment; his coherence with animism was keenly furthered through his deep association with the Penan. Manser believed in following one's dreams, no matter the impediments or implications. With a very poignant understanding of the commonality of hopes and fears of human beings, Manser lived life in respect of all beings, and in respect of the unseen world, which he considered the base of all life.

In the Penan cosmology, Manser was known as *lakei Penan* – Penan man – signifying the respect the Penan held for their adopted brother. Manser's drawings and stories collected during his stay with the Penan are richly elaborated with tales of animal and nature spirits, and the concomitant superstitions and taboos. Manser documented oral histories from Penan elders and recorded and translated their interpretations of self, tribe and nature.

Manser's documentation of the Penan way was intimate and unprecedented. Sense of place is paramount in the Penan cosmology, where the geomorphology is intimately known and all natural objects (trees, rivers, animals, etc.) have creation stories or fables associated with them. Penan social and gender roles attest to a deeply spiritual and respectful cosmology absent of hierarchy. Manser's intimacy with, and acceptance by, the Penan enabled him to transcend the arrogance and ethnocentricity that characterize and inform (detrimentally) much anthropological research. He was painstaking in his efforts accurately to interpret the metaphysical and practical symbology of the Penan. Manser claimed that in his six years with the Penan he never witnessed an argument or expression of violence of any kind. He often spoke of the peace and violence of the forest, and the joys and sorrows of the Penan way.

In January 2002, hundreds of Penan gathered for a private commemoration of Manser with the ritual *tawai* ceremony ("think fondly of someone or something that is not here"). With taboos against speaking the names of the dead, the Penan will forever address Manser as *lakei tawang* ("man who has become lost") and *lakei e'h metat* ("man who has disappeared").

Marshall, Robert (1901–1939)

Robert Marshall was an Alaskan explorer, a relentless advocate for preserving samples of American wilderness, and the primary founder of the Wilderness Society. Marshall had a lifelong fascination with the exploration of unmapped wilderness and the enjoyment of the wilderness experience. This resulted in his exploration and initial mapping of the Central Brooks Range of Northern Alaska. As early as his undergraduate college days at the School of Forestry at Syracuse University, Marshall expressed sadness at the loss of wild conditions throughout North America. By the time he earned his doctoral degree in plant physiology, in 1930, he believed that if something were not done soon, no significant samples of American wilderness would remain. Thus, in 1935, with several others (most notably, Aldo Leopold and Benton MacKaye, the “father of the Appalachian Trail”), he founded the Wilderness Society, whose mission was to save as much American wilderness as possible. Marshall also financed nearly all of the Wilderness Society’s activities from 1935 to 1939.

Most of Marshall’s wilderness preservation arguments were designed to appeal to utilitarian values. He often referred to wilderness as a “resource,” and argued that a “balanced” approach to resource planning would have to include large amounts of undeveloped landscape. Perhaps this is not surprising because Marshall was trained as a forester and scientist, and had mainly to convince foresters and scientists. Like any effective communicator, he spoke in the language of his audience. As a result, his best arguments advocate wilderness for providing a unique human experience rather than for its value independent of humans.

On the other hand, there are important streaks of pantheism in Marshall, perhaps not well recognized even by himself. Most importantly, he viewed wild places as sacred. He was brought up in the Jewish faith, and once, at age 24, he took a long reflective walk in the mountains of Idaho for Yom Kippur, the Day of Atonement. On this hike, he spent three hours sitting on a rock in quiet contemplation. The setting, he reported, was conducive to the purpose, for “there was no wandering of thoughts to the chance of the Pirates in the World Series . . . nor even to the less frivolous subjects of pine production or the political situation.” He thus found himself forced to confess that in Temple . . . it has in the past been impossible to banish [trivial] thoughts from my mind, and, at best, fasting, hard seats and dull sermons are not conducive to deep thought. Therefore, I feel that my celebration of Yom Kippur, though unorthodox, was very profitable (Glover 1986: 81).

Wild nature, in other words, was Marshall’s temple, his sacred space. And the spiritual value of wilderness to him explains much about his enormous drive to preserve

it. In one of his most telling statements, he observed that, for people like himself, the wilderness experience “is absolutely essential to happiness. In the wilderness they enjoy the most worthwhile and perhaps the only worthwhile part of life” (Glover 1986: 96).

Thus Marshall’s religion, if he had one, was nature. A short statement he made to a friend after the death of his father, Louis Marshall, tells as much about his religious philosophy as he ever revealed.

Fortunately, I suppose due to the general philosophy I have about life and death I didn’t take [my father’s] passing as emotionally as you imagine. The significance read into death is of course an individual matter. Between the most glorious conceptions of heaven and the unbearable ideas about hell there is infinite room for divergence. Personally, I do not believe in any hereafter and my guess is that death means oblivion. Yet it is a perfectly inevitable event, and nothing which is inevitable seems tragic (Glover 1986: 110).

Death, in other words, though sad, was perfectly natural to Marshall, who spent enough time in wild nature to recognize the role of death in the natural, “inevitable” unfolding of events, and to realize, surely, that without death there is no life. All of which would be unremarkable had Marshall not lived in a culture obsessed with removing itself from nature by, among other things, denying death.

Still, Marshall’s spirituality remains obscure, hidden behind his rejection of the Judeo-Christian conception of God, his non-belief in an afterlife, his activism in secular issues like politics and civil liberties, his human-centered arguments for wilderness as a “resource,” and the perception that he was always in a hurry to get things done (as if he knew he had less than 39 years to live).

Perhaps, had he lived longer, he might better have articulated for himself and others the intuitive feeling of sacredness that drove him hard to defend wild places – even if his culture demanded he do so mostly in the language of human-centered, scientific rationalism.

Martial Arts

Caution: “Those who know do not talk, and talkers do not know”

Lao Tzu, *Tao Te Ching* 56 (R.B. Blakney, tr.).

The quasi-mythical origins of many Asian martial arts enfold them within a religious context and tradition. This is clear whether they are traced to Bodhidharma in the sixth century – who, legend has it, traveled from India to teach Buddhism in China and found the monks in such pathetic physical condition that he invented exercises to improve their health and self-defense capabilities – or linked to Cheng San-Feng, a thirteenth-century monk who introduced taijiquan as a “grand ultimate” method of internal martial art among Shaolin monks. From the beginning, the fundamental practices found in these martial arts bear a strong family resemblance in terms of ritual, discipline, and psychophysical effects to the fundamental practices of nearly every world religion.

Many Asian martial arts are explicit regarding their spiritual goals (enlightenment, embodying eternal principles in the apparent finitude of physical life) and methods (meditative standing and ritualized movement designed to produce spiritual insight). This is especially true of the so-called “internal” styles from China (like taijiquan, baguazhang, and xing yi) or Japan (like aikido and those which emphasize the perfection of character over fighting skills). In “harder” or “external” styles, which include Chinese “kung fu” forms probably best known to the West through popular stereotypes from martial art movies with names like *Preying Mantis*, *Tiger*, *Dragon*, and *White Crane*, the spiritual dimension is more implicit. The complex family trees of Okinawan karate and many of the Korean styles are included in this category. These styles stress fighting skills – but even those emphasizing the most brutal physicality eventually turn inward to consider, as integral to mastery, the psychospiritual aspects of their training. Whether internal or external, these martial arts achieve their physical aim (self-defense) and their spiritual aim (insight into the ground of existence) in the same way; by exhorting practitioners to move, and to exist, *naturally*.

Nearly all ritual practices in the Asian martial arts are informed by symbolic heuristics derived from nature. Typically, one begins by learning the series of movements characteristic of the particular martial art – just as in a monastery one begins to learn the correct postures for meditation, to bow in a specific way, to perform cycles of movement in yoga postures, or walk mindfully. The movements themselves often carry the names of animals or natural phenomena and these provide a kind of symbolic representation for the physical postures the practitioner attempts to emulate. In Tiger style the hands often imitate a tiger’s claws. The stance and finger placement in Preying

Mantis resemble a preying mantis as she stalks and then grasps her prey. Movements in taijiquan like Dragon Spits Out Pearl or Stork Cools Wings seem to adopt something of the animal to which they refer. “Long boxing” exhorts its practitioners to imagine striking with the pent-up force, the inertial density, of a great river (the name refers to the “long” distance the energy travels from ground, to leg, waist, shoulder, arm, hand, and finally into the opponent – as if with the “long” weight of a great river). But while the outward forms may bear some relation to animals, the identification is made for psychological ends.

Consider Wave Hands As Clouds – a movement common to most forms of taijiquan (in some topological configuration it is common to every martial art). There may be some sense in which the hands look like clouds waving back and forth but the name is more of an instruction to the mind than to the body. It is a kind of iconic template that brings body and mind together. Identification with the icon allows the practitioner to absorb the deeper significance for which the icon is a conduit or veil. Cloud Hands tells you to move fluidly and in rounded motions. This psychological suggestion – “wave my hands like clouds” – is exactly how the martial arts appropriate nature in order to cultivate, first, sound biomechanical techniques, second, effortless technique in movement, and then, as if by infection, effortless effort in every corner of life.

Animals and natural phenomena inform the physical and psychospiritual practices in most Asian martial arts but the religious end of identification with these structures lies in cultivating the internal energy called *qi* (or, under the old Wade-Giles system of transliteration, *ch’i*). The concept of *qi* requires an encyclopedia of its own but, just as many kinds of yoga attempt to cultivate and then use *prana* for spiritual attainment, the aim of most Asian martial arts is to cultivate and then apply *qi*. Cultivating one’s *qi* is the first step toward a spiritual understanding of one’s relation to one’s self and to the rest of the universe. In the language of meditative technique, identifying with the heuristics derived from nature makes it possible to cultivate *qi* because of the focus and concentration this identification creates.

Identification with these metaphors and beginning the process of developing one’s *qi* is a first step toward proper form. In martial arts practice, in sparring or grappling for instance, proper form means greatest biomechanical efficiency. Biomechanical efficiency makes it possible to relax or loosen the muscles, and the mind that moves them, and allow *qi* to flow. Once the *qi* is accumulated and put to work informing one’s movements the practitioner finds him or herself stronger and faster than any opponent. Using internal energy is said to be infinitely greater than mere physical strength. Oddly, cultivating and using *qi* is said to be possible only when the practitioner is completely relaxed or loose. *Qi* cannot “flow properly” when the practitioner is tensed or exerting him/herself physically.

Here we run into the kind of paradox that seems ever present in Asian thinking – the internal energy that makes you strong only works when you loosen your muscles completely or, to put this in even more obscure language: one can only be strong through yielding, one can only advance by retreating, etc. It is, in other words, nearly

impossible to express the physiological effects of this looseness using mere language – as Lao Tzu wisely noted in our opening quote – but it is quite easy, and often dramatic, to *experience* the effects in practice. The tension between the rational and experiential modes of understanding of these ideas suggests something about the futility and even the danger of attempting to describe, in language, experiences that seem to transcend language. Experiencing can be hard enough; understanding is harder still; but describing these effects in words turns out to be nearly impossible.

A humorous aside: a lot has been written about *qi*, not all of it useful. There is a “*ch’i/qi-whiz*” factor associated with this aspect of martial arts practice. In the same way that novices practicing meditation sometimes mistake their early experiences for Enlightenment, it is not surprising to hear novice martial artists discuss their sudden and astonishing facility with the mysterious powers of *qi*; in both cases this is almost always the sign of an overenthusiastic beginner. The martial arts thus carry the same hazards as any other spiritual practice. Pride, envy, attachment, overestimation of advancement, and all the other Sirens call to the ego from every side. Short of tying yourself to the mast of your ship, like Odysseus, humor is the next-best prophylaxis. The most direct and pithy comment this author has ever heard on the matter was at a seminar in Green Bay, Wisconsin, some years ago when I had the good fortune to meet Nate Defensor, an instructor in Philippine martial arts. I asked Nate why I had not heard any mention of *qi* development in Filipino martial arts. Nate grinned and said, “Oh, we were too poor to have *qi*. We had rice instead.”

Describing *qi* is fraught with dangers but the experiential effects of proper form are relatively easy to describe. Performing the movements incorrectly (when sparring or grappling) is difficult and requires a great deal of physical exertion. Performing the movements properly by using internal energy or *qi* instead of one’s mere physical strength – having properly assimilated the ideas of naturalness, in other words – is startlingly easy: it is, in fact, effortless. Martial artists call this “good technique” and it begins to explain why smaller, much older, men and women can defeat one or more younger and apparently stronger opponents. Efficient technique, properly applied, can offset uninformed, merely physical strength.

We could describe this seeming effortlessness as the result of habituating and employing proper biomechanics along with the complementary psychological conditioning, but it seems to be more than this. It is, in fact, the physical correlate of the naturalness and ease that lies at the heart of Daoism and the meditative practices of Hinduism and Buddhism. The effortlessness of good physical technique requires a thorough understanding of the truth of your position, balance, and relation to the world around you. The psychological aspect of this is to see beyond the apparent distinction between yourself and your opponent, or yourself and the world, to an underlying unity that grounds both. The spiritual aspect, when physical and psychological come together, is effortless effort, or *wu wei*. Effortless technique is thus a physical manifestation of properly assimilating and understanding *wu wei*. Here the circle of training the body turns out to be the circle that trains the spirit.

Every mystical practice depends on quieting the egoconsciousness, whether by spinning the prayer wheel of a mantra, through the fire of aspiring passions, or completing a complex series of physical movements. Once the drunken-monkey brain of everyday consciousness is quieted (either by being occupied with its exercises or through an identification with the animal or natural form), the practitioner can begin to perceive reality and their place in it *as it is* – as a whole rather than as the broken and fleeting sensations of daily consciousness. To borrow the traditional metaphor, we can imagine that the universe is a great lake and the mind a wind blowing across it. If we could stop this wind from fracturing the surface into a cracked glaze of wavelets, then the lake would become smooth and allow the soul to see its true reflection. Martial arts calms these waters like any other yogic or spiritual practice. Quieting the mind is required for *wu wei* and for the effortlessness that characterizes excellent technique.

Considered in a religious context we might argue that martial arts is a branch of raja yoga; the yoga of psychophysical experimentation. The physical exercises harness their practitioners to a spiritual grindstone. Eventually the circle of training they tread produces religious effects. The practices themselves are a yoke of physical and psychological ritual – in all Asian martial arts this means learning a series of complex movements which, in principle, contain the combat applications specific to different styles. These movement sets are learned and internalized to the point that they become habitual. Like a prayer wheel or mantra, these physical movements become an axle of focus, concentration, and meditation. Achieving facility with these movements requires concentration, attention to increasingly minute details, a concomitant increase in alert mindfulness, and the cultivation of effortlessness. This mindfulness maps directly into the kind of psychological state required for practice in any meditative exercise – whether Zen, tantric, or Jesuitical. Learning the physical movements is only the beginning. The mere choreography of taijiquan or karate, for instance, can be learned in a few months; mastery, achieved through the integration of physical and spiritual dimensions, requires a lifetime. Effortlessness is easy; achieving effortlessness is hard.

If martial arts is a branch of raja yoga, the methods and effects should look the same. The end or eventual purpose of such an exercise is *samadhi*, union with the object of your meditation. Whether yantric line drawings or iconic representations of saints and deities, the end point of spiritual exercise is union with that object. Martial arts, at the advanced levels, seeks the same kind of union. If one reads the traditional stories about the fights and feats of great taijiquan or Shaolin masters, one is always struck by the way combat is couched in terms of uniting with the adversary in order to borrow their own strength and use it against them or, a bit more esoterically perhaps, helping the enemy accomplish their own deepest desire – to find the ground of their being. Ueshiba Morihei, founder of Aikido, built his entire style on the philosophy that you must blend with your opponent so as to overcome the difference between you. Even in harder styles like hapkido this means joining with your opponent's intentions, whether to help them head-first into the floor or, more compassionately, into an understanding of their own needlessly aggressive tendencies. Union with your adversary requires a

profound insight into the existential nature of conflict, of difference, and dialectical resolution

– physically and intellectually.

Thus, if we may at last fall back on the language of thought to describe what lies beyond it, underlying the physical gestures of breaking boards, fighting, or cultivating one's character is a complex dialectic of self and other. This dialectical encounter creates an ambient religious context and religious potential; a teleology as spiritual as combative. For the philosophically minded, Hegel's dialectic of self and other should come to mind or perhaps Socratic method as a therapeutic style of dialectical remediation. For the religious, wrestling with God, loving your enemies, or liberating your self by defeating your own self-generated fears, are equally sound analogies. Appropriating naturalness to open the door to effortlessness in movement, in thought, and in our relationships, lifts humans out of the fixed and fixated ego-consciousness which prevents us from an adequate mediation with our surroundings and so, finally, with ourselves.

Mary in Latin America

Throughout Latin America the Virgin Mary gains specific abilities and qualities as she interacts with the cultural history and natural forces of a particular place. Her elevated position within the Catholic Church as the Mother of God combined with the traditional iconography associated with Mary facilitates her versatile connection with powerful indigenous and African female deities; reproduction and fertility; earth and agriculture; the moon; serpents; water and the sea. Agricultural festivals that celebrate planting, first-fruits, and harvest frequently coincide with a local *fiesta* honoring a specific manifestation of the Virgin and combine ritual observance of both the moon in its different phases and the nourishing sacred soil. Alternately, manifestations of the Virgin preside over coastal festivals honoring the life-giving and life-taking powers of the sea. In order to understand the specific ways that Marian devotion engages indigenous and African Diaspora interpretations of nature throughout Latin America, we will concentrate first on Andean representations of Mary in colonial iconography and postcontact mythology, and then turn briefly to similar examples in Meso-America, Brazil, and the Caribbean.

In the Andes, the Virgin is alternately associated with Quilla, the moon and corresponding water forces such as rain, rainbows, springs and waterfalls. She is also associated with Pacha Mama, “the earth which is our mother” and accordingly, with specific volcanic mountains. In the colonial period, paintings of Mary by the Cuzco School reveal how indigenous painters attributed the Virgin’s authority to her Andean connections to nature. Traditional European iconography associated with the Virgin of the Immaculate Conception drew from the Book of the Revelation of John, which describes “a woman, adorned with the sun, standing on the moon, and with the twelve stars on her head for a crown.” For Native Andean painters this iconography took on new physical shape and symbolic resonance. Artists inscribed the astronomical emblems with Andean meanings and depicted Mary as a triangular statue, a shape that linked her to the Andean volcanoes, sacred living beings that contain and control the circulation of agricultural produce, livestock and minerals. Painters enhanced this depiction of fundamental alliance to the sacred land by embellishing the Virgin’s clothing with ritual meaning. Andean robes decorated with flowers and feathers associated the Virgin with Inca nobility, direct descendants of the sun and moon. Pearl necklaces linked her to the moon and the sea, and gold dangling earrings with emeralds linked her to the sun and the mountains. While her gold and jewel encrusted halo replicated Incaic representations of the sun, the crescent moon at Mary’s feet reinforced her association to the Coya, the sister/wife of the Inca and daughter of the moon.

This iconography unveiled the ways that Native Andeans viewed the Virgin Mary's authority as rooted in the sacred land and animated by astronomical forces. It also affirmed her authority through Andean forms of ritual expression, thereby maintaining traditional Andean social structures of sacred power.

In the Andes, post-colonial origin myths attribute Mary's authority directly to her alliances with the Andean land. Typically, these stories recount how a local manifestation of the Virgin appeared at a sacred spring, river, waterfall or ravine. The origin stories parallel preColombian accounts of the birth of the *w'akas* – indigenous nature deities who became the ancestors and later transformed into mountains, springs, rivers, ravines, trees or stones. In Southeast Ecuador, for example, *Nuestra Señora del Rosario de Agua Santa de Baños* is known for presiding over healing thermal pools and for protecting the town of Baños from the violent eruptions of the nearby Volcano Tungurahua. Local myths relate that this Virgin, born from a sacred waterfall, leaves the basilica's altar at night in order to bathe in Tungurahua's springs. In the Andes, ritual bathing in sacred springs, which are viewed as the eyes of the living mountain body, can impart spiritual authority to *yachajs* or shamans granting them the power to heal and to negotiate with mountain spirits. Accordingly, the mythic explanation for the Virgen de Agua Santa's abilities to heal and protect her devotees arises directly from the *yachaj*-like pact that she makes with Tungurahua through bathing. In this agricultural region the primary festivals honoring the Virgen de Agua Santa fall alternately in October, a month of drought, and February, a month of excessive rains.

Throughout Mesoamerica, Marian devotion engages the specific geomythic and ritual history of the Aztecs, Mayas, Otomis, Huichols, and Tzutujils, among others. Mexico's most renowned Virgin, La Virgen de Guadalupe, appeared on 9 December 1531 to the Indian Juan Diego on Tepeyac hill near a shrine to the Aztec fertility goddess, Cihuacoatl-Tonantzin. Aztec pilgrimages to Tepeyac had formed part of pre-Colombian rainmaking rituals that consisted of travel to water-holding hills around Tenochtitlan. Aztecs referred to Cihuacoatl-Tonantzin as "Our Lady Mother" and believed that she had helped to create the human race. They associated Cihuacoatl or Snake Woman with deer and adversity. The dark skinned Virgin told Juan Diego her name was María Coatlatlopeuh. *Coatl* is the Nahuatl name for serpent and *lopeuh* means "the one who has dominion over serpents." Today in central Mexico, devotees still refer to images of the Virgin Mary as Tonatzin. In other parts of Mexico devotees associate the Virgin with Chalchiuhitlicue, the goddess of water; Xilonen, the goddess of tender maize, a symbol for fertility and rejuvenation; and Chicomecoatl, the goddess of sustenance. In the uplands of Morelos, native ritualists plant crosses, which they associate with Mary and maize, as a means of attracting rain to their crops. This contemporary cult of the crosses parallels pre-Colombian celebrations for Chicomecoatl.

In Brazil and the Caribbean, Catholic devotees of the African diaspora associate the Virgin Mary with a variety of African goddesses. Practitioners of Candomblé and Santería correlate Mary Star of the Sea, Our Lady of Regla, and Our Lady of the Immaculate Conception, to Yemaya the Mother of Waters, fish, and all of the *orisha*.

As the goddess of the ocean, Yemaya represents creativity and ancient wisdom and, as such, is associated with the full moon and the planet Neptune. Like Mary her colors are sky blue and white. She is associated with silver and is symbolically represented by a six-pointed star or an open shell. In Brazil, on New Year's Eve, Candomblé practitioners create elaborate beach-front altars with food and candles. As the ocean waves consume the offerings, Yemaya accepts her devotees' gifts and washes away their troubles with the waters of creation.

For Cuban practitioners of Santería, the Yoruban *orisha* Ochún appears in cross-dress as Nuestra Señora de la Caridad de Cobre, Cuba's patron saint. In 1628 a wooden image of La Virgen de la Caridad first appeared to *los tres Juanes*, two Native Cubans and an African slave rowing in a storm. The statue was taken to a church but continually disappeared and reappeared under an orange tree in the copper-mining town of Cobre. Ochún, the *orisha* linked to La Virgen de la Caridad, is the *orisha* of sweet water and the goddess of love, marriage and motherhood. She is associated with the new crescent moon and the planet Venus, with the metals copper and gold, and the color yellow. To celebrate Ochún/La Virgen de la Caridad, devotees make offerings of honey, cinnamon or oranges on riverbanks or near waterfalls.

In Haiti, Vodou practitioners link Mary to a group of female love spirits known as Ezili who express and amplify different aspects of Mary. Lasyrenn, one of the Ezili, is Queen of the Ocean and appears as a mermaid or whale and, like Ochún, appears as La Virgen de la Caridad. As mistress of the underwater world, Lasyrenn "links ancient African senses of woman power and water power" (McCarthy Brown 1991: 220–25).

Masons, Fraternal Order of

The Fraternal Order of Masons is an international mutualaid association of men dedicated to ethical refinement. Masons are organized locally as “lodges,” into which prospective Masons are initiated. More commonly known as “Freemasonry,” the order includes a wide number of organizations, some of whom have rival claims to the tradition. Freemasonry’s likely origins are in the medieval guilds of builders and stoneworkers. Masonic lore also claims origin in the Knights Templar, a medieval military and religious order that was suppressed in the early fourteenth century by the Roman Church under charges of heresy, and a tradition going back to the original Temple of the Hebrew Scriptures. Scholars locate the genesis of the contemporary fraternal order with the founding of the London Grand Lodge in 1717. The London Grand Lodge bound together several other British lodges, and eventually became the defining body for orthodox Freemasonry around the world. Importantly, it presented to the world an association of gentlemen rather than a craft guild, and carried specific ethical and spiritual teachings, as well as the basic initiations that define most Masonry to date.

The historian Margaret Jacob argues strongly for the importance of Freemasonry in creating the culture of the eighteenth century. This is less because of membership in the Order by some Enlightenment philosophers as because Freemasonry helped foster a social milieu of popular adherence to that philosophical movement. With its mythology based around the building of the Temple of Solomon, it envisioned God as a grand architect who constructed the world as a monument to his glory. This coordinated well with the Newtonian mechanistic understanding of the world that had become popular within the Enlightenment and through the scientific revolution. Masons saw a spiritual order to nature that they felt should be the foundation for an ethical life of harmony and virtue. This was a spiritual life lived in the world, not apart from it. While the environmental results of this mechanistic worldview brought it into question by the late twentieth century, Newtonian science and the Enlightenment undeniably turned toward nature as inspiration for ethical behavior rather than as a source of sin. Freemasonry developed a body of lore, communicated in its rituals and lectures that carried these ideas to a wide population and ensured their persistence.

Freemasonry also aligned with the Enlightenment in its concept of universal human brotherhood and coordinate emphasis on religious tolerance. Although charity was initially directed toward other Masons, its focus quickly broadened to include non-Masons as well. At the same time, the notion of Masonic brotherhood as emblematic of a more universal brotherhood between humans grew in popularity. While Masonry carries religious and spiritual teachings, it maintains that Masons are free to partici-

pate in whatever religion they feel called to. Masons are discouraged from discussing their religious convictions within the Lodge to avoid internal division. Both of these attributes echo the Enlightenment universalism that created the context for ethics of global unity that remains with us in the twenty-first century. As with the spread of naturist ideas of order, Masonry helped propagate these Enlightenment ideals beyond a small cadre of intellectuals.

The esoteric aspects of Western spirituality were also transmitted through Freemasonry. While the London Grand Lodge held a Stoic, Newtonian understanding of the world, esoteric traditions like Rosicrucianism were incorporated in seventeenth-century Scottish Freemasonry, the “Ancient” wing of eighteenth-century British Freemasonry, and continental Freemasonry. These esoteric traditions of Freemasonry shared with the Newtonians an admiration of the harmony and order of nature, but they taught a more alchemical and vitalistic understanding of that order. With their roots in ancient cosmology and Neoplatonism, the esoteric traditions visualized the world as a living inspirited organism rather than as a mechanical construction. During the eighteenth century, continental esoteric Masonry grew in two strains – one following a mythology of Templar origin and the other of Rosicrucian mysticism. Both sets of traditions developed by adding “upper” degrees of initiation over the three basic initiations of Masonry (commonly known as “Blue Lodge” degrees). The exemplar of the Templar rites was “Strict Observance” Masonry, which carried the romantic grandeur of medieval knight-hood and mystical Christian symbolism. The leading Rosicrucian tradition, called the Order of the Golden and Rosy Cross, arose in the mid-eighteenth century in Germany. In contrast to Templar Masonry, it gravitated to a more alchemical and magical mysticism, and was stripped of chivalric mythology. While the order eventually died off, many of its teachings were subsumed into other initiatic societies (the Golden Dawn’s heritage is in the Golden and Rosy Cross) which preserved the vitalistic traditions of Western science and magic by creating a social context for their study and pursuit apart from the increasingly popular mechanized cosmology of the scientific revolution. Esoteric freemasonry provided a key component to the occult revival of the twentieth century and its transmitting of a vitalistic cosmology to movements like contemporary Paganism and naturopathic medicine.

Although Masonry continues in the contemporary world, it serves primarily as a conservative social force. While its teachings of tolerance and harmony remain, the more radical aspects of its spirituality have been taken up by other popular and philosophical movements. Having suffered heavy persecution throughout its history for its supposed overinvolvement in politics, today Freemasonry primarily serves as a social fraternity emphasizing its core values of fraternity and ethical refinement among its members. By all accounts, the focus of Masonic ethics remains on charity and civic works. Despite the Masonic part in spreading the ideologies that would foster respect for nature in the West, Masons have yet to play a substantial role in the contemporary environmental movement.

Masowe Wilderness Apostles

The *Masowe* Apostolic movement is made up of many religious communities that originated in colonial Southern Rhodesia during the 1930s and have become widely known in southern and central Africa. Distinguished by white robes and worshipping in open-air venues that they call *masowe*, meaning “wilderness,” these African Apostles can be seen anywhere in fringe places by the roadside, behind factories, on the edge of fields, on hilltops, near lakes, on rock surfaces, in grasslands, underneath trees, etc. Buildings are avoided for ritual purposes because of the belief that the Holy Spirit comes through the wind and must blow freely through the atmosphere. Today, this form of vernacular Christianity has a membership of approximately five million people in southern and central Africa alone.

Through the symbolic act of going to pray out-ofdoors, the Wilderness Apostles also see themselves as stepping outside *zvinhu zvechirungu*, meaning symbols of Western culture that they associate with human folly and immoral behavior. Although toilets and fences are becoming common features that gradually bring about a sense of the permanence of the sacred wilderness, the general pattern has been to declare the quest for freedom of the human spirit in sacred venues that contrast with the European missionary model of Church.

In addition to the tradition of spending long hours praying in the open air as a way of registering discontent with a modernity supported by missionary Christianity that believers are forced to grapple with in wider society, Wilderness Apostles are known for migrating from the country of their origins in Zimbabwe, to South Africa, Botswana, Zambia, Tanzania and Kenya. Werbner describes this trend in the African Apostles thought pattern as a way of using the biblical idea of “exile” to communicate a quest for liberation from an oppressive social order. He relates the experience of oppression to the quest for freedom and transcendence through an insistence on prayers held in fringe places bereft of any enclosure and lacking permanence.

Such is the social reality in Africa today, however, that it is imperative to see beyond the stories of African protest against colonialism and biblical imagery. Women and children are so visible in the sacred wilderness that it is important to articulate the nature of their oppression and their language of resistance in relation to the landscape. Jules-Rosette has drawn attention to ritual activities among the Maranke Apostles originating from the same setting, but with its own history. She observed as I have subsequently done among the Masowe Apostles that women are the ceremonial leaders because they exercise certain important mystical powers and spiritual gifts. This

argument can be taken a stage further by relating the ceremonial function of women to their experiences and conceptual understanding of nature.

For a start, the open air is the most natural environment for women to pray and exercise mystical powers. Women spend many long hours each day working in the fields, fetching water and firewood, collecting fruit and vegetables and so on in the background culture. These chores explain not only the marginality of women through a relationship forged with nature, but also the existence of a female-oriented knowledge system whereby nature is held sacred as the Mother of all living creatures. The sacred wilderness thus takes on a special meaning for women who experience oppression by being subjugated as if they were a part of nature and are filled with a quest for transcendence based on an understanding of nature as sacred. However, patriarchal attitudes are so pervasive in southern and central Africa that, even in this movement of liberation, men refuse to consider women for official leadership. At the same time, they respect their vital role as mediators of divine truths and executors at healing ceremonies. The male clientele of the Wilderness movement also join women in their special quest for emancipation from the male ancestors. For instance, all members of the sacred wilderness drop their lineage names and call each other by their first names only. This is to avoid invoking the ancestors and to allow for a greater sense of equality among believers in the agreement that the ancestors are ignorant of the ways of God and, as a result, are to be exorcised through prayer. The rejection of the ancestors, who are the pillar of the man-led traditional family, and the burden it puts on women in the background culture as crop-producers, child-bearers, and huntergatherers roaming the rivers and forests, prompted this new definition of the sacred wilderness as being in some profound sense associated with women despite the official leadership.

It is not surprising that women who have always worked closely with the elements of nature to please the patrilineal ancestors are attracted to a movement that dramatizes resistance to oppression and even rejects the ancestors to whom women are beholden subjects by having rituals in the open air. Daneel observed that in the Mwari (high god) religion among the Shona, Earth is not just a place for men to have dominion, but in creation mythology Earth is feminine and divine, with her creative power being that of generating and nurturing life through the rains which is equated with women giving birth to children. The soil, water and the wind and the woman's womb are key ideas used in creation myths to interpret the coming to being of living creatures in a world that begins with all living creatures coexisting harmoniously. Women are thus attracted to the Wilderness movement because their quest for transcendence takes them beyond the colonialists, missionaries, and the male ancestors to a spiritual freedom that respects the pre-Christian conceptualization of Earth as feminine in the Mwari religion.

Consequently, Masowe women in the sacred wilderness excel as healers (i.e., people filled with the spirit that restores life and causes barren women to give birth again while encouraging good morals and peaceful living). Furthermore, the use of earthenware bowls filled with water, stones, clay or leaves, milk and sometimes oil, is consistent

with them as children made in the image of Mother Earth. These objects, held in association with the manifestation of the Holy Spirit during healing ceremonies and exorcisms of evil spirits among the Wilderness Apostles are direct reminders of Earth as Mother and lifegiver in Shona mythology.

Finally, the Apostles hold the Earth sacred and their venues of prayer are usually chosen because they are deemed uninhabited – open and not as yet spoiled by man. One of the reasons that the communities disappear from the landscape in a city such as Harare, and reappear elsewhere, is largely determined by the wish for prayer in environments where human beings have not destroyed trees and grasslands by putting up buildings. Although it is again becoming common to see toilets built for sanitation purposes, and pressure is being put on Apostles to build churches and thus to bureaucratize, the Apostles could teach us about preserving life on Earth. By using the landscape to construct a sacred wilderness in which one leaves the trees, grass and rivers flowing is a beautiful illustration of how human beings could rethink their relationship to nature as one of sharing, rather than manipulating and destroying. Occasionally, the Apostles have been known to destroy rock paintings when they have gone into the mountains to pray (Domboshava, Harare). This is because they see rock paintings as direct reminders of the ancestors whom they regard as evil, and are therefore at war with, in the sacred wilderness. Otherwise, the Wilderness movement is guardian to an ecotheology that has yet to be fully articulated.

In summary, somewhere in the background world of Masowe believers is a religious heritage whereby Earth is gendered, divine, and necessarily part of any discourse on religion and nature. In the vernacular Christianity represented by the Masowe Apostles the sacred wilderness is filled with large numbers of female adherents and fewer men, where lessons are taught about the uses of space by people who have always had an intimate relationship with nature and who have shown their discontent with colonialism and traditional African patriarchal culture, and who continue to wrestle with the effects of both in today's world.

Matsuo Bashō (1644–1694)

Matsuo Bashō, a Japanese writer, is generally considered to be the greatest haiku poet. He was also a significant writer of literary travel journals and poetic prose (*haibun*), and his poetics continue to be central to Japanese aesthetic theory. In the West, he is probably the most famous and influential literary figure from pre-modern Asia. He spent much of the last ten years of his life traveling through Japan, and his writings and poetics are filled with references to the natural world. Part of the richness of his view of nature comes from the multiplicity of traditions he drew from: Buddhism (both elite and popular), Daoism, Neo-Confucianism, Shinto, the Chinese literary tradition, and Japanese literature and art. As a result, his writings manifest a complex view of nature that differs from those found in the West.

Bashō's view of nature was dominated by the notion of change. One type of change is found in the "Creative" (Japanese: *zo'ka*; Chinese: *zaohua*), an idea he adopted from the Chinese. *Zo'ka* is sometimes translated as "nature," but it refers not to nature as scenery or as individual beings but rather the creativity that brings them forth and leads them through ongoing transformations. It is also sometimes translated as the "Creator," but *zo'ka* is not a being separate from nature. Rather it is nature's own spontaneous and wondrous skill at creating and reshaping beauty. We can translate *zo'ka* as "the Creative," which makes what we call nature a continuously renewing work of art within which we live.

Another form of change is the turning of the seasons. Japanese literature, especially haiku, involves sensitive attunement to the particular season and to the process of seasonal change. We never experience "nature," but always nature in and of a particular season. Thus all haiku poems are supposed to have a "season word" that indicates the time of year. While *zo'ka* involves creative and unpredictable change, this seasonal change is an ordered pattern, a yearly recurrence that can be anticipated and even conventionalized in "season words," poetic words that indicate the season of the poem.

A third type of change found in Bashō's writings was heavily influenced by Buddhism. *Mujo*, "impermanence," suggests the inevitable passing away of things. *Mujo-kan*, the "feeling of impermanence," was sorrowful but at the same time tranquil, because it resulted from a realization and acceptance of the nature of the universe. It is a condition all things share and so we all are wayfarers through life. His great travel journal, *The Narrow Road to the Deep North*, begins,

Months and days are wayfarers of a hundred generations, the years too, going and coming, are wanderers. For those who drift life away on a boat, for those who meet age

leading a horse by the mouth, each day is a journey, the journey itself home (Imoto, et al. 1972: 341).

For Basho^o, nature is vitalistic. Just as the natural world as a whole is characterized by change, individual things are alive with *qi* (the Chinese notion of the vitality of things) and have “feelings.” We too have *qi* and feelings, and this enables us to experience a union with the natural world. Part of the poet’s task is to lose the sense of a separate self and become intimate with the object to be written about. In *The Red Booklet*, written by his disciple Toho^o (1657–1730), Basho^o is quoted as saying, “the mind’s movements merge with the object . . . [which] is taken in its nature, without obstruction . . . Learn of the pine from the pine, learn of the bamboo from the bamboo.” Toho^o explained this notion of “learning” as follows: “In other words, one must become detached from the self . . . To learn means to enter into the object and feel the subtlety that is revealed there.” As a result, “the color of the mind becomes the object” and one “can identify with the feelings of the things in nature . . .” (Ijichi, et al. 1973: 547–8).

While individual things have their own subtle feelings, the universe as a whole is characterized by an essential quality, *sabi* (“loneliness”) that a true poet is able to experience. The universe is immense in both space and time, and *sabi* refers to a feeling of being small and fleeting within a vast cosmos. Like *mujo^o-kan*, this feeling is characterized by inner tranquility, for it grounds us in the fundamental condition of reality shared by all.

Basho^o’s notion of nature also differs from ours because of its conventional nature. Like any other poet in Japan, he saw the natural world through the eyes of culture. Particularly important are what we might call “imbedded associations.” A bush warbler, for instance, is considered a bird of early spring because it is one of the first birds to sing in the new year (i.e., the lunar year, which normally began around early February). As such it is also associated with another image of early spring, plum blossoms. In addition its song is not only considered beautiful but is said to sound like the title of the Lotus Sutra (*Hokke-kyo^o*). All of these meanings are embedded in the one word, *uguisu*. However, the bush warbler is actually a common year-round resident throughout Japan, and it sings in other seasons beside early spring.

Such a conventionalized view has led to the conclusion that Basho^o and other Japanese poets did not write of “real” nature but only an artificial, culturalized version of nature. However, we need to realize that different assumptions about nature are at work in Basho^o’s writings. One is that plants, animals, and even natural scenes have a “true nature,” just as humans do. A bush warbler, a pine, a moment of late-autumn dusk when the light fades behind silhouetted trees: they are not mere objects but are characterized by certain qualities that make them distinctive. One can appreciate the true nature of a bush warbler most fully as it sings in early spring with the plum blossoms in bloom; if we want to see the true nature of a pine we should look to an aged pine on a cliff-edge; and a scene of late dusk in autumn (*aki no kure*) is by its nature lonely.

The Japanese held to an idea of “poetic essences” (*hon'i*) that captured the true nature of a thing and could be handed down in the literary tradition. Similarly there were *utamakura*, famous places that were characterized by certain qualities and even a particular season, and references to those places were expected to refer to those accepted associations.

A second assumption is that the natural world and the experience of nature are not wholly distinct: our objective– subjective distinction does not hold. A true poet is one who has cultivated his sensibility to the point that his “subjective” feelings match the “objective” feelings in the scene being experienced. *Sabi*, for instance, is a quality inherent in a scene as well as a feeling experienced by the refined poet.

A third assumption is that there are authoritative experiences of nature. Some experiences of nature are “truer” – more deeply insightful of the essential nature of things – than others. We can look to the experiences of great poets of the past and to literary conventions derived from them as guides for what can and should be experienced when we see a bird, tree, or scene.

A fourth assumption is that nature and culture are deeply interrelated. Bashō's sense of this interrelationship can be seen in the famous passage in which he says that:

One thread runs through all the artistic Ways. And this aesthetic spirit is to follow the Creative (*zo ka*), to be a companion to the turning of the four seasons. Nothing one sees is not a flower, nothing one imagines is not the moon. If what is seen is not a flower, one is like a barbarian; if what is imagined is not a flower, one is like a beast. Depart from the barbarian, break away from the beast, follow the Creative, return to the Creative (Imoto, et al. 1972: 311–12).

The barbarian and beast are those without culture. They are also those who have lost contact with nature's creativity. Highly refined culture such as poetry is at root a natural expression of human feelings. Poetry is not essentially different from birdsong and is, in fact, our own form of *zo ka*. This will happen only, however, if artists create out of their deepest nature, in concert with the creativity of nature itself. So poetry must arise spontaneously out of authentic feelings and our true nature. It is culture that allows this to take place. The greatest poet, then, is not only the most cultured but also the most natural, because to be fully cultured is to follow the processes of nature. It is “barbarians and beasts” – those devoid of culture – that are far from nature. “Culturized nature,” perceived with deep cultural insight into nature, is “true nature.”

Matthiessen, Peter (1927–)

Peter Matthiessen is a novelist and essayist born and raised in New York City in an affluent family. After graduating from Yale in 1950, he moved to Paris, where he co-founded the *Paris Review*. In 1953 he returned to the

U.S. and became a commercial fisherman for several years before becoming a full-time writer. He has traveled extensively on nature expeditions while making his home in Long Island, New York.

Matthiessen's writings evidence four major concerns: wild nature, particularly threatened species and ecosystems; cultures rooted in nature but marginalized by encroaching civilization; contemporary issues of social justice, particularly with regard to Native Americans; and Zen Buddhist spirituality. While the majority of his works are non-fiction, he also has published eight novels, his preferred genre. His combination of nature writing, anthropological inquiry, social critique, and spirituality is reminiscent of Gary Snyder's works, although social criticism rarely enters into his nature writing. Matthiessen's writings project a deep sense of the value of biological and cultural diversity and an underlying tone of melancholy concerning the devastation brought by encroaching civilization. He also avoids a romantic view. Traditional peoples of various cultures exhibit widely different characters, some of which are far from anyone's ideal. And nature can be dreary, difficult, and dangerous.

Matthiessen's range of interests leads to various types of writing. Some works are clearly natural history (e.g., *Wildlife in America* and *The Shorebirds of North America*), which may either be a narrative of personal experience of nature or a more objective account. Many of his works are in the tradition of travel literature (e.g., *Cloud Forest* and *The Tree Where Man Was Born*), which often include a sense of adventure as he learns about nature and cultures in foreign lands. Still other works (e.g., *Sal Si Puedes* and *In the Spirit of Crazy Horse*) are social criticism. Spiritual autobiography is found in *The Snow Leopard* and *Nine-headed Dragon River*.

Matthiessen is also an accomplished novelist. His early fiction (1954–61: *Race Rock*, *Partisans*, and *Raditzer*) were *bildungsroman* about coming of age. From the 1960s to the 1980s he published primarily in non-fiction, but in that period he produced arguably his finest, and most ecological, novels: *At Play in the Fields of the Lord* (1965) and *Far Tortuga* (1975). *At Play* takes place in South America (and was informed by the same trip that led to *Cloud Forest*). In the novel, Protestant missionaries battle the Catholics, the jungle, and the natives in their disastrous attempt to convert local Indians. The rainforest functions as a major actor in the narrative as well as an abiding presence that dwarfs the tragicomic human play. *Far Tortuga* explores the lives of a

disappearing breed of turtle fishermen in the Caribbean who try to extract an old-style living in the face of modernization. *Far Tortuga* is an experimental novel influenced by Zen and haiku poetics in the extreme spareness of presentation and the use of empty spaces in the text. In the 1990s Matthiessen has again focused on fiction with a trilogy set primarily in the Everglades: *Killing Mr. Watson*, *Lost Man's River*, and *Bone by Bone*.

The Snow Leopard (1978), which won the National Book Award, is generally considered his most significant work. In 1973 Matthiessen journeyed to Nepal with the zoologist George Schaller, not long after his wife and fellow Zen Buddhist had died. Schaller's research centered on the Himalayan blue sheep, but both Schaller and Matthiessen were fascinated by the elusive Snow Leopard. Matthiessen's book chronicles the extremely challenging expedition in which the presence of the great cat was felt but never directly encountered, like Buddhist enlightenment itself. He combined natural history and cultural observations, exquisite descriptions of austere beauty (often using haiku-like techniques in his prose), and reflections on his spiritual pilgrimage. At times Matthiessen achieves a state of "transparency," in which the self and the world are no longer separate and the true meaning of mountains and rivers is revealed as their simple but absolute presence within the moment. What is required – and so difficult – is to lose desires, fears, and expectations and to let go of clinging, including attachment to spiritual achievement. In moments of open stillness, the "ringing silence" that permeates the natural world can be experienced. After finishing this book, Matthiessen continued his Zen practice and received official recognition as an enlightened master.

Maya Religion (Central America)

The culture that we now call Maya still occupies the southern states of Mexico (Chiapas, Campeche, Yucatan and Quintana Roo), and the territories of Belize, Guatemala and Honduras. The Mayans are well known to the world because of their cultural, religious and scientific achievements in ancient times. The best-known period is the Classic Maya, which comprises various centuries of history (250–900). It is from the Classic Maya that we have received most of the information about ancient religion and spirituality in the Mesoamerican region. No doubt, much of this religious belief system was destroyed during the Spanish conquest and subsequent colonization of the Mayas. Fortunately, not everything was lost, since Maya leaders maintained their spirituality passing on their religious beliefs to new generations through the oral tradition. This is how the *Popol Vuh*, the most important and sacred book of the Mayas, was written immediately after the conquest.

The Classic Maya have been studied extensively and from these anthropological and religious studies we have a better understanding of this great civilization. Unfortunately, the Mayas lost their written tradition when the last ones who knew how to read and write hieroglyphic texts were punished by Spanish missionaries during the early sixteenth century. Fortunately, some of the sacred texts were memorized by the spiritual leaders and this is how the Maya ceremonies and prayers have continued until now. For example, among the Tzotzil Maya, the recitation of sacred texts during their religious ceremonies and festivals is still common today, while there is resistance by those converted to Protestantism.

We can argue that the Mayas may have had a state religion during the Classic Maya period because of the abundance of sacred sites in the Maya region. Also, there is an abundance of written religious texts such as the works of the *Chilam Balam* or Jaguar Priest in Yucatan. Most of the iconography at the sacred Maya sites show the connection of rulers with mythical ancestors and the supernatural world. Referring to these sacred sites, the Temple of the Cross in Palenque is a major shrine which is considered the center of the world and where the Lacandon Maya have continued to perform sacred ceremonies in modern times (Perera 1982).

Despite the existence of many hieroglyphic texts explaining these events, we cannot fully interpret these messages. Thus, from the writing of early missionaries we learned that Maya spirituality was condemned as witchcraft or the teaching of the devil, so it had to be eradicated. Even in modern times, epigraphers have misinterpreted and confused Maya spirituality with animism. Thus the worldview of indigenous people in

which they see Earth as a living entity and plants and animals as having the spirit of creation is seen as evidence of a lack of rationality among the Indians.

On the other hand, the bishop of Yucatan Diego de Landa (1566) also mentioned the Maya sciences and the religious training of spiritual leaders before the conquest. According to Landa, the Maya priests or *Ah-q'inh* were in charge of teaching and guiding the people in their sciences, writing, divination and the interpretation of signs from the sky and the natural world for their prophecies.

Also, the Maya priests were experts in the Maya calendar and the counting of the days, months and the years. They played the role of scholars, teachers and spiritual leaders who promoted Maya knowledge and the appropriate ways of acting and dealing with the supernatural and the natural world. The celebration of a series of festivities in accordance with the Maya calendar has continued until now, sometimes as a syncretic religious practice. For example, the present cult of the patron saints in Maya towns and villages is central to Maya religion today. The persistence of religious beliefs among contemporary Mayas shows us the deep spirituality that they have inherited from their ancestors.

In terms of the relationship between humans and their natural environment, the Maya creation myths in the *Popol Vuh* provide us with complex religious and philosophical ideas. According to the Mayas, the Earth and heaven were connected and the divinity, too, was not separated from humans and the environment. Thus, for the present Mayas, there are sacred places, such as mountains, lakes, caves and rivers where humans can pray for their ancestors and be connected with the supernatural world. In other words, Maya cosmology does not separate religion from agriculture, education, mathematics or other forms of knowledge, since everything is interrelated. Thus, each part of creation, plants, animals and humans enjoy the spirit of creation, and humans must respect and not abuse plants and animals with whom they coexist.

Similarly, the account in the *Popol Vuh* referring to the creation of the sky and the Earth is very important in understanding the nature of the Creator or God who is a totality, male and female. This Creator is,

He who gives breath and thought, she who gives birth to the children, he who watches over the happiness of the people, he who meditates on the goodness of all that exists in the sky, on the Earth, in the lakes and in the sea (Goetz and Morley 1983: 80).

Maya creation myths explain the integration or interrelationship that must exist between humans, plants and animals for their collective survival. For this reason, most indigenous scholars make a distinction between religion and spirituality. What we know today is that the natural world has been the focal point of Mayan spirituality. Mayas; as with other indigenous people of the continent, have developed sacred ceremonies for an appropriate relationship with Earth and the supernatural world.

One of the major continuities in Maya religion or spirituality is the use of the sacred Maya calendar. The calendar was used extensively during the Classic Maya period as it is exemplified in the codices and other hieroglyphic written materials of the Mayas.

The practice did not disappear, but was continued; sometimes secretly because of the persecution of the religious Maya leaders by Church authorities in the past. The uses of the Maya calendar were related to the omens and prophecies of the day and the different time cycles such as the *tun* (year) and the *k'altun*, or prophetic cycle of twenty years. The calendar was also related to agriculture, as the Mayas were very respectful of the natural world and needed to perform ceremonies before cutting the trees and preparing the land for planting.

In modern Maya communities there are experts in divination and in the uses of the calendar. These experts or spiritual leaders are called *ajq'ij*, currently known as Maya priests. Their role in modern Maya culture is to maintain the sacred tradition of counting the days, divining the best time to perform rituals and for the giving of names to new-born children. The *ajq'ij* have been persecuted in recent times as they are still carrying the sacred knowledge of the past. During the past decade (1990s), the *ajq'ij* organized themselves openly in a National Association of Maya Priests or *ajq'ijab*. After remaining secluded and performing their rituals almost secretly, they have decided to bring to light their knowledge and religious practices. They needed to continue their sacred mission, despite the criticism by Catholic and Protestant missionaries who accuse them of continuing paganism and idolatry. Truly, the sacred tradition of the Mayas and the role of the *ajq'ij* have not been understood properly until now.

In this religious practice that includes the natural world we can mention the Mayas' concern for corn. Corn was perhaps the most important product of the Mayas; peasants still believe that corn has a spirit and it has to be treated with respect as a gift from the ancestors. Among the Jakalteq Maya, corn is called "*komi' ixim*," (mother corn) since it gives life and nourishment to humanity. Many people wrongly suppose that the Maya have multiple gods and that corn is also a god. But for the Mayans, each part of creation such as plants and animals have their own spirit and they contribute to the existence of the whole. In this way, the corn plant provides nourishment to humans and it has been the source of their strength and life. According to the *Popol Vuh*, the first four fathers created were made of white and yellow corn. "The corn used to create the first men was found in the place called Paxil and K'ayala'. *Yak* the wildcat, *Utiu* the coyote, *K'el* the parrot and *Joq* the crow, were the creatures who discovered this food" (*Popol Vuh*, Montejo 2000).

It is appropriate to mention that in most Mayan linguistic communities, there are still traditionalists who continue to practice their ceremonies following the counting of the days from the Maya calendar. There are good and bad omen days, as well as days that are appropriate to pray for human health, for nature and animals, as well as for giving thanks to the Creator for the gift of life and the beauty of Earth that we humans enjoy and must protect.

The calendar was also used to commemorate the ancestors in each Maya community, so among the Jakalteq maya, Imox and Q'ana' are two day names, but they are also the names of the ancestors, or first Mother and Father, of the Jakalteq Maya. In ancient

Maya religion, the pilgrimages to the shrine of the ancestors have been practiced by the tribes according to the *Popol Vuh*. Similarly, among the Jakalteq Maya of highland Guatemala there has been a continuous pilgrimage to the sanctuary of B'alunh Q'ana and Imox. In most recent times, this has become a symbolic practice during the Maya New Year, during which the spirits of the children and the adults are thought to go to salute the ancestors in their shrine, located at the edge of the Blue River in the Cuchumatán Mountains.

The continuity of Maya religion is then evident in the religious practice called Waxajib Batz or Maya New Year among the Mayas of highland Guatemala, particularly the Kaqchikel and K'iche. This is the sacred time of renewal when the new fire is lighted, recharging life on Earth and the universe. The Waxajib Batz has become one of the most important ceremonies of the modern Mayas, reaffirming their continuous presence and practice of their ancient sacred heritage.

During the colonial time, the Mayans were persecuted because of this religious practice. Some *ajq'ij* were jailed and persecuted by religious and civilian authorities. Just as Diego de Landa burned the books of the Mayas in Yucatan and punished the practitioners of the ancient Maya religion, the religious leaders of the Mayan communities were also persecuted and punished up until the first half of the twentieth century. In most places the eradication of the Maya ceremonies was successful as Maya spiritual leaders were jailed and fiercely persecuted by the Catholic Church and Protestant missionaries.

Most of Maya religion and spirituality practiced today is a syncretic expression or mixture of Maya beliefs and Christian religion. Most of these Christian elements were integrated into Maya beliefs and ceremonies because they were similar to those that Mayas were already practicing. For example the cult for the saints brought to Mayan communities by Catholic missionaries was similar to that of the owners or guardians of the hills. The Mayans considered that the hills and the mountains had spiritual owners who were the guardians of animals and plants inhabiting the mountains. The cult to these spirit guardians was strong, so when the Spanish priests brought the saints to the Mayan communities as patron saints, they were easily accommodated within the Maya worldview and religious beliefs.

Perhaps the relationship between religion and the natural world is the most important attribute of Maya religion. In the case of the cross, before cutting a big tree for the purposes of making a cross, the tree is interviewed or consulted by the *ahb'eh* or diviner. The tree will respond if he or she is ready or not to fulfill a mission to protect a whole community. The cross, then, talks and acts as a "person," according to Maya beliefs. This is quite different from the concept or meaning of the cross as a sacred symbol in Catholic religion.

Similarly, before cutting the trees for cultivating corn, the farmer will burn candles and ask permission to the owner or spirit of the hill for his forgiveness. According to Maya religious beliefs, *Witz*, the owner of the hills, is placed there by God to protect and be the guardian of plants and animals. Thus, humans do not have the supremacy or

total freedom to do whatever they want against nature. The rivers too are considered roads to heaven and humans must not pollute them. Anyone who does so pays the penalty of not being accepted into heaven when they die. The spirit will be sent back to Earth to search for the dirt that the person has thrown into the river thus polluting it or the ocean. These are ecological myths that reinforce human behaviour and respect for nature as a sacred part of creation.

These ecological knowledge and practices still exist among the Mayans in modern times. Some of this traditional knowledge is being sought by ecologists or members of the environmental movement. While the researchers look for the sacred knowledge of the Mayas for ecological purposes, they certainly do not understand the deep spiritual belief of the indigenous people who have been living in close contact with and respectfully toward their environment.

Currently, the traditional religious leaders are worried that some foreigners who appropriate Maya knowledge of the sacred, such as the Maya calendar, are becoming shamans themselves. These are members of the New Age movement and are currently called by some indigenous people “white-shamans” or “plastic medicine men and women.” In this case, instead of destroying Maya spirituality, as early foreign missionaries did, these New Age people appropriate it for the purpose of making a profit, as they claim to be experts of Maya religion.

In the current revitalization of Maya culture, the role of religion and Maya spirituality has been very significant. Mayan priests *or ajq'ij* are showing the world that their beliefs are still alive and that they are not ashamed to practice their spirituality. Despite being persecuted for centuries, and criticized or condemned as devilworshippers and promoters of idolatry, the Maya priests are now performing their ceremonies in public places. They are reclaiming their rights to practice their religion at the sacred sites, such as Tikal, Copán, Palenque, etc., as they revitalize Maya religion and spirituality.

Lately, some Protestant groups have entered into Mayan communities and condemned the practices of Maya religion. During the armed conflict in Guatemala in the early 1980s, some fundamentalist religious believers came to Maya communities arguing that the Mayans would be safer if they abandoned Catholicism and were “born again.” This was the religion of the Chief of State at that time, General Efraín Ríos Montt, who stands accused of allowing massacres of entire communities in 1982. While the army persecuted the Catholic priests and catechists, the guerrilla movement too contributed to the destruction of Maya religion and spirituality. The religious roles of the elders or *Principales* were changed as they were seen as traditionalists and an obstacle to expansion of the guerrilla movement. Also, Catholic Action, which had a very revolutionary agenda, got rid of the traditional authorities and imposed a new form of liberation theology preached by the Church through Catholic Action.

Now, the Maya religious and spiritual leaders are revising their role as guides and leaders of the communities and are refining their role as Maya priests. Most importantly, with the signing of the peace accords on 26 December 1996, which promised freedom to

practice Maya spirituality and access to sacred sites, the revitalization of Maya religion and spirituality has been strengthened.

Currently, Mayan priests are working on the standardization of their religious canons and the uses of religious symbols and paraphernalia. Not all of them are in agreement, since some are more inclined to the practice of Maya traditional religion as attached to Catholicism. In other words, the Maya priests are also Catholics and they practice both traditions equally since they believe that Maya religion complements Catholicism. Maya religion or spirituality is not something separated from Mayas' daily life, but it pervades all Maya activities. The cyclical religious festivals and ceremonies organized by the *Cofra- días*, or religious brotherhoods, are very good examples of the syncretic continuities of Maya religion and spirituality. Maya religion is now going through a process of reconstruction and there are Mayans who call themselves Catholics and reject Maya *costumbres* or traditional religious practices, while there are also Mayas who are recognizing the need to go back to the roots of their spirituality, which though not in opposition to Christian beliefs is different because of its holistic connection to the natural and supernatural world.

Maya religion is now viewed by the government and some other religious traditions, such as Catholicism, as a shamanistic reminiscence of an ancient past. Others, mainly fundamentalist Protestants, argue it represents the continuation of paganism and idolatry, which must be eradicated to save the soul of these poor Indians. But for Mayan religious leaders, the practice of Maya ceremonies and rituals is the appropriate way of giving thanks for the life that we enjoy on this Earth. It is the continuation of the first acts of creation and responsibilities of human beings continuously to give thanks for the gift of life given to them by the Creator, according to the *Popol Vuh*.

This is why the attitude of indigenous people toward the environment is religious or *quasi*-religious, and this is what non-indigenous people must learn from indigenous people: to be more compassionate toward the creatures with whom we share our world, thinking of ourselves and the future of our generations. This is the main message of the Maya priests to their followers, and this practice will continue as part of the revitalization of Maya religion and spirituality in the Maya region, particularly Guatemala.

Maya Spirituality (Guatemala Highlands)

The Guatemala highlands, ribbed with volcanic-formed mountain ridges, fertile plains and canyons, are carved by multiple rivers in the west and deposits of limestone terrain built up in the east. This backbone of mountain ridges varying from 4000 to over 14,000 feet in elevation, framed on both sides by a piedmont, extends from Guatemala City north and west to the Mexican border. These physically and ecologically diverse high plateaus of the western highlands, isolated valleys, and pockets of the piedmont are the geography in which the earliest entry occurred, perhaps as early as 15,000 B.C.E.; about 1500 B.C.E., sedentary village life was a cultural reality. From steep, rocky mountains to the depths of the gorges where freshwater springs tumble down, pine forests rise to meet the sky. Mists envelop mountains, enshrouding volcanic peaks. Sulfur springs steam along riverbanks; winds high in the altiplano swing through forests, knocking against the rocks. Cultivated mountainsides appear as a patchwork of green and brown striped squares, the deeply furrowed brown Earth giving birth to verdant cornfields, the long leaves and tassels tossing in the wind. Within these natural environments, inhabitants, interacting with the celestial cycles and with the land, configured the sky and the Earth not only as a spatial territory or cultural landscape, but also as sacred and living. In this natural environment, humans have shaped consciousness, behaviors and religious systems.

Archeological sites, hieroglyphic texts, creation accounts recorded in *Popol Vuh*, the Ki'che' Maya lineage and creation account, and in *Chilam Balam*, the lowland Maya account, in living stories and traditions, all reveal that humans living in this region have perceived that Earth and heaven are connected, and that a dynamic, animated reciprocal interaction occurs between the two. As narrated in *Popol Vuh*, the nature of the Creator is an enlightened being, a totality in duality, with multiple manifestations: great knowers and great thinkers in their being; Mother and Father; *Alom k'ajolom*, the Bearer and the Begetter; *B'itol Tz'akol*, the Maker, the Modeler, who amass and give form to the materials that make up the Earth, plants, animals and humans. In the account in the *Popol Vuh* referring to the creation of the sky and of the Earth, as genius Heart of Sky and Sovereign Plumed Serpent, who work by means of words, genius and sacrifice, think, converse, worry, and agree, they establish a rhythm of gestation deep in time, setting off the formation of the Earth, of all creation, toward their goal – the completion of their work in the human design. The work of humans is to speak, name

and pray to the Heart of Sky and Sovereign Plumed Serpent, and keep the days so the Maker and Modeler will be invoked and remembered on the face of the Earth. The alive, natural world is the source, fulcrum and channel of this human work, this work of Maya spirituality. In the natural environment there is an understood interrelationship and harmony of humans, animals, and plants. Universal laws rule each living being; each creature is temporal and its period of life varies depending upon the mission that has been commissioned within the cosmos. Each being fulfills a cycle of life, to come and go, to be born and to die. While humans share the same category of creature, they have a superior being, and thus take on the responsibility to look after all, as a guardian, as an older brother or sister. The genealogy of their spirituality establishes a human position of reciprocity, gratitude and responsibility, based on observations of celestial and Earth cycles and of interrelationships in nature, ordered in rounds of time.

In trading and migrating, settling and working the land to cultivate corn, beans, and squash, inhabitants developed a relationship with their environment. Predecessors configured terrestrial landscapes, spatial cartography, and mythic narratives to mirror the celestial events of the night sky. From 250–850, architects mapped astronomical space and laid over it geography, aligning architecture, settlement patterns and ritual practice with solar, planetary and lunar events. As in other areas of Mesoamerica, the construction and layout of temple-mountains in the highlands (Abaj Takalik, Utatlán, Uaxactún, and Zaculeu) and other cities present strikingly literal maps of the sky on dates associated with the Maya creation or with important events in each polity's history. Time, observed, recorded on agricultural and sacred calendars, and remembered in ritual practice, was given primordial importance so that it organized social, agricultural, and religious life. Dawn, dusk, the equinoxes and the solstices at specific geographical locations were viewed as sacred; these time/spaces provided entrance to the sacred. At these sites, at designated times, people performed rituals interlocking themselves with cosmic cycles.

Human response in this lush, ecologically diverse natural environment was one of reciprocity. Material legacy, in architecture, settlement patterns, agricultural ways and ritual practice, bears witness “to repeated or recrafted strategies for acknowledging the Earth, for honoring and working with its vital forces” (Brady and Ashmore 2000: 126). Large quantities of incense burners found in caves indicate that the elite and peasants made pilgrimages to caves, considered portals to the underworld, to make offerings for rain and the fertility of the Earth. Religious practitioners smeared the blood of the victims on the face of the (stone) idols with the idea that the deities needed to be strengthened. There has been an assumed connection between bodily sacrifice – bloodletting and human sacrifice rituals – and the continuation of life processes on Earth. Precious substances such as copal incense, maize dough, rubber and jade contained soul and were burned in huge braziers where they converted to smoke, the form of sustenance the deity could understand (Freidel, Schele and Parker 1993: 204).

In the K'iche' creation account, *Popol Vuj*, ancestors offered blends of copal honoring the first dawn.

Many of the Ki'che', Kaqchikel, Tz'utujtil, Jakalteq and Mam Maya communities residing in the highlands have maintained continuities of ancestral systems of belief and spiritual practices, distinct in each village, but in broad terms quite uniform. Beliefs and rituals of reciprocity framed within a sacred calendar system of 260 days survived the Catholic colonial period and subsequent centuries of persecution and repression in the Guatemalan highlands through strategic appropriations of Catholic practices, through clandestinely maintained rituals, but in most cases transformed through syncretism; continuities survived, in great part, because of geographical inaccessibility. Since the mid-1980s, transformed continuities of these spiritual practices have emerged publicly and have been reclaimed and revitalized.

Foundational to understanding reciprocity with the natural environment is translation of the concept "nature." In Ki'che', the indigenous language spoken by over one million highland inhabitants, the word *chomb'al juyub' tay'j*, (*chomb'al* = it's alive; *juyub'* = mountain; *tay'aj* = lowland), or "nature" in English, is interpreted as "a place of much happiness and energy" or "the happy house where I live" or "the green of the earth." These renderings reflect the aliveness of the environment, the underpinning construction of duality (high/low) and the warm, heartfelt affections emanating from a people's relationship to place. *Popol Vuj* recounts the response of the first four humans when they first saw everything under the sky, "Truly now, double thanks, triple thanks that we've been formed . . ." (Tedlock 1996: 147).

In a traditional highland Maya perspective, the Earth is a territory maintained by the Owner, Ajau, (*rajaw juyub* "mountain owner"), who owns the land and everything on its surface. Ethnographic work concurs: "The face of this earth is not ours. We are just renting it for a while. We just pass through it, then we are gone" (Molesky-Poz 1999: 257). This perspective is shared among other highland people. According to the traditional Tz'utujiles around Lake Atitlan, Mam (the Earth Lord) is a proliferate sacred being that is as much "felt" by his people as an animistic presence as he is known to them as their Lord of the Earth (Stanzione 2000). Other Maya refer to the earth as *our mother*. "The earth is our mother. She gives us corn, fruits, flowers. Her waters wash us clean. At the end of our life, she opens her entrails and receives our bodies. So she must be respected and loved" (Molesky-Poz 1999: 274). Whether the Earth is understood as a *territory*, maintained by Ajau, the Owner, the Earth Lord, or as a *mother*, the land is alive and needs to be cared for, to be respected, to be fed. Maya belief that the universe sustains us and that as humans we have a transitory passage on Earth informs their relationship to the land. Men and women not only cultivate the Earth, but also in ritual practice, offer aromatic gifts, thanksgivings and petitions to maintain a reciprocal relation with the sacred Earth. This concept of reciprocity – that to receive something of value, you must give something of value – permeates Maya values.

As a farmer plants kernels of corn, he first exhales on the palm of his hand a “huh” prayer, asking permission to open the Earth. Before the exhumation of a mass grave to identify village members who disappeared or were murdered during the late 1970s and early 1980s, an *Ajq’ij’* asks permission to open the Earth. Before a family constructs a house, the family speaks with the Earth, asking permission, explaining to the Earth their need to dig holes, to plant poles in her surface for the house’s foundation. They address the Earth,

We are just passing through this life, but we need shelter. We need a place to sleep, to be protected from the rains and from the dangers of night. Please understand us, that we are asking permission to change your face, the face of the Earth. We are only passing through (Molesky-Poz 1999: 279).

Further embedded in this worldview are beliefs concerning how particular offerings accomplish certain tasks. For example, in Cantel, people bury the hooves of a sacri-

ficed goat in each of the four corners of the house and the head of the goat in the center as a present to the Owner of the Earth, that the foundation of the house will be stable and strong. Traditionalists of Santiago at Lake Atitlan believe that as long as the Flowering Mountain Earth is “fed,” it will continue to provide sustenance. Rituals like burning copal, dancing sacred bundles, or praying can feed the ancestral form.

Foundational to understanding the spirituality emergent in the highlands is the interpretation of the word *faith* in Ki’che’. *Faith* is translated as the verb *kojonik*, which can be rendered in two meanings: *to put on* and *to believe*. The first meaning of *kojonik*, *putting it on*, is doing the ritual work of sacrifice, of placing aromatic materials (*copal* and *pom* incense, tallow candles, chocolate, sesame, flowered water, alcohol) in the fire and through them of giving thanks, of asking pardon and permission, of petitioning Ajau. The second mien of *kojonik* is “to believe” or more carefully rendered, “the center where we connect to trust.” That is, one’s disposition, one’s faith, informed by an inner determinateness, facilitates a connection and mutual love with *B’itol Tz’akol*, the Maker, the Modeler, who is manifest in the animate potentiality of the universe, yet who is also transcendent. One way of connecting to this center is through the ceremony on a designated day on the Maya sacred calendar and at a selected sacred site.

Among the highland Maya, the *Ajq’ij* is a woman or man who understands one’s particular spiritual capacity and destiny, undergoes training, offers petitions and thanksgiving in rituals, serves their community and advises according to the sacred calendar of 260 days. Non-Maya scholars have identified them as Daykeepers, priest-shamans and shaman-priests, working people or ritual specialists who illuminate according to the Maya calendar and worldview. *Ajq’ijab’* guard the values and knowledge of the calendar, their spiritual base, and transmit it in ceremonies, in divinations with *tz’ite* seeds (*Erthrina coallordendron*) or through discerning in the “lightening in their blood,” and in conversations with persons who seek their counsel. *Ajq’ijab’* who understand their lives in terms of service and responsibility to their communities, explain that ceremonies are necessary to maintain the tremendous energy that they carry and control.

In the current revitalization of Maya culture, people have turned to the *Ajq'ijab'* and public ceremonies as sources of identity, community, cultural, and spiritual growth.

The 260-day calendar, the Sacred Calendar, which the Ki'che' call the *Cholq'ij*, refers to two continuous repeating cycles, the count of thirteen days and the set of twenty day-names. Each of the twenty day-names designates an attribute, an element of life; each of the numbers from one to thirteen carries a particular characteristic. The combination of a particular day-name and a particular number designate the quality of that day.

This 260-day calendar was common to many parts of Mesoamerica, called the *tonalamatl* by the Aztec, identified as the *tzolkin* by some Maya and Western scholars. Written evidence for the use of this calendar goes back to the sixth century B.C.E. While its origin is not known, it is suggested that the numbers 13 and 20 relate to the various segments of the lunar cycle. This calendar, imaged in signs in the lowlands and Peten, but as day-names in the highlands, remains the spiritual foundation for ceremonies, divination, and understanding personal capacities. Contemporary *Ajq'ijab'* utilize the *Cholq'ij* as an orientation instrument so that people can live in harmony with the universe.

Geological formations such as volcanoes, mountains, convergences of mountain ranges, springs of water, and particularly caves, are linked with ancestral traditions and possess spiritual qualities. Each geological formation and place has a distinct *Uk'ux*, heart, owner, *nawal* or guardian spirit, and possesses some determined energy, making communication with the sacred accessible; thus distinct places are portals to the sacred. Some sites are designated for curing and healing, others for economic well-being, or to resolve a problem. Maya speak of sacred places as *encantos*, places where one is more likely to encounter a spirit or where a specific, personalized, maybe anthropomorphic manifestation shows itself, and of *altars* (*kojb'al* = "a place where you go to give something") where one offers prayers, but does not necessarily perform a ceremony. However, both *encantos* and altars are places of contact and communication with Ajau, and with the ancestors.

Central and most sacred to the *Ajq'ijab'* is the natural element of fire. The ceremonial arena, prepared of aromatic materials and designed to mirror the Maya quatrefoil microcosm in images, colors and spatial designs, becomes the ritual space, set apart in geography and time. Here, the aromatic materials are consumed in the flames; the fire becomes the conduit between heaven and Earth, between humans and the Heart of the Sky, Heart of the Earth. In the legacy of the first humans, the great wise ones, the great thinkers, penitents, and sacrificers in *Popul Vuh*, who unwrapped their copal incense, offer their copal and pom with great thanksgiving. In this ritual, positive and negative forces of the animating energy are brought into harmony.

Oh, Ajau,

Heart of the Sky, Heart of the Earth.

Hidden treasure, which fills the four corners of the universe

Only peace and tranquility surround you. (Prayer of *Ajq'ijab'* of Zunil)

As transnational, national, and local companies or families privatize land and natural resources for profitable development, *Ajq'ijab'* find their access or right of entry to sacred places barred, at some sites their safety threatened. On a larger level, Maya agricultural workers confront serious questions as the processes of transnational agribusiness have established a dependency on imported chemical sprays, fertilizers, factory farms, and nonreproducible seeds, which yield marketable crops in a shorter period of time, but in the long run, deplete the Earth's nutrients. Farmers find that after years of using chemical fertilizers and pesticides, the Earth no longer produces. The farming population is torn between immediate economic survival and a long-term sustainable relationship with the land. Some local Maya communities are developing agricultural projects that investigate and cultivate diverse species of edible, medicinal, and aromatic plants native to the region, which combine agricultural practices with forest habitations, utilize organic products, and develop and share seeds unique to the region for the purpose of developing a sustainable, ecological relationship with the land. At the same time, unexplored and untapped wealth, especially in terms of petroleum, minerals, and hydro-electric power, and subject to Ladino colonization and state-foreign economic activity, such as dams, roads, oil exploration and cattle production in the Franja Transversal del Norte and in the Peten, are being developed. These recent projects have displaced tens of thousands of Maya during the civil war (1978–1985); more recently Maya communities and ecological support groups have begun questioning and protesting these projects, such as the oil drilling in Lake Petén Itzá. Communities question the damage to the beauty and ecological balance of the land, the depletion of natural resources, and the displacement of indigenous communities. The ancestral philosophy of reciprocity and care of the Earth is foundational to Maya responses to this nascent and emerging resistance. Some local groups, often motivated by *Ajq'ijab'*, are beginning to cultivate medicinal gardens, clinical dispensaries of natural medicine, and small organic agricultural projects; however, to date, *Ajq'ijab'* who are not an organized, institutionalized body, have not responded to these concerns systematically nor publicly. Local Maya communities are beginning to understand and confront the consequences of transnational, global agricultural projects, and the consequent depletion of their natural resources and the economic and biological loss to their communities.

Mayan Catholicism

Christianity came to the Mayas during the early sixteenth century, as the “spiritual conquest” comprised a central element of the Spanish subjugation of present-day Mexico and Guatemala. In Yucatan, Chiapas, and Guatemala, friars from the Franciscan, Dominican, Augustinian, and the Jesuit orders endeavored to convert indigenous souls and to extirpate pre-Christian Mayan religion with some, but by no means complete, success. By the middle of the seventeenth century, the Roman Catholic Church had established a firm institutional presence in southern Mexico and Guatemala. Nevertheless, pre-hispanic religion proved resilient, as Mayan people grafted Christian beliefs onto their traditional worldview. In many parts of Mesoamerica (southern Mexico, Yucatán, and highland Guatemala) today, Mayan spirituality still coexists alongside Catholic religion.

Folk Catholicism

In modern times, most Mayans consider themselves to be Christian, even though they may simultaneously subscribe to a Mayan, as opposed to Western, view of the temporal world and the cosmos. This simultaneous adherence to what might appear to be otherwise contradictory belief systems is possible in part because many Maya consider their spirituality to be not so much a “religion” *per se*, based on dogma, as a “way of being” that is integrated into and helps determine the conduct of everyday life. As such, Mayan spirituality is generally focused around three central elements: peace with the natural world that sustains life, peace with other people (including the dead), which is negotiated within the sacred space of the ancient Mayan calendar cycle, and peace with the deity/ies (saints). The relationship with nature in Mayan Catholicism is especially strong, as the Maya believe that the essence of divinity is present in significant land forms, plants and animals. Corn is a sacred element to the Maya, not only as the primary source of food, but also as the literal source of life itself, as described in the creation myth of the Ki’che’ Maya holy book, the *Popol Vuh*. As Catholics, the Maya share a belief in a monotheistic creator God, but they also pray to many saints/gods. These divine beings are considered to be present in spatial geography, especially in mountains, which provide a sacred landscape visible in nearly every corner of Guatemala. Sacred landforms include not only mountains, but also caves, *cenotes*, and other notable but transient natural features such as earthquakes. These elements

are believed to embody divine energy and power, and demand consideration, offerings, and propitiation.

Secondly, the environmental aspect of Mayan folk Catholicism is evident in the dual-gendered nature of God. In this hermeneutics, the motherhood of God is in the form of the Earth (*tierra*), and the Earth is considered to be the feminine face of God. As such the Earth exhibits multiple facets of God's divine maternity, as the source of life, and, like a mother, "protects, cures, punishes, and suffers for her children" (Ak'Kutan 1994: 58). Thus, the Earth is not only a material symbol of God's benevolence and amplitude, but it is also considered sacred as a physical entity.

In the scholarly literature, the commingling of two or more religious systems has been defined as "religious syncretism," or, more specifically to the Mayan context, "folk Catholicism" (Wallace 1956: 81) or, most recently, "religious creolization" (Seibers 1999: 272). All three of these terms refer to the fusion of Mayan spirituality with Catholic belief, ritual, and practice. This body of creolized religious practices is commonly referred to as "*costumbre*," (custom). *Costumbre*, which incorporates not only religious belief in practice, but also day-to-day concerns such as language use, mode of dress, gender relations, relations with the natural environment, and locationality, has traditionally formed the nexus of Mayan social identity. Because the Catholic saints, ritual and liturgical cycle are integral to *costumbre*, there has long been a strong historical association between this type of Catholicism and Mayan ethnic identity.

Catholic Action

In the early decades of the twentieth century, the Catholic Church initiated a program known as Catholic Action to bring centrifugal groups, such as workers, youth and others, back within the broad authority of the Church. In Guatemala, this resulted in the entry of missionary clergy to reintroduce orthodox Roman Catholic dogma and liturgy into Mayan parishes. A particular focus of Catholic Action was to try to uncouple Catholic practices from their long association with the Mayan sacred landscape. A second focus was to attempt to divest the practice of "everyday" Mayan spirituality – associated with divination, fertility, the planting and harvesting of corn, and interaction with the natural world (plants, animals, Earth, and cosmos) – of its Catholic symbolism. Finally, Catholic Action has also sought to diminish the importance that Mayan Catholics places on the traditional Mayan calendar cycle, by redirecting liturgical performance toward the Western Catholic liturgical calendar.

Mayan Protestantism

Protestantism came to the Mayan areas of Guatemala and Mexico in the late nineteenth century in the form of missionaries from mainline Protestant denominations from the United States. In addition to their evangelizing project, these early missionaries enjoyed close ties to the Guatemalan and Mexican governments, which saw missionaries as “civilizing agents” who would advance Liberal social interests such as education. Although Protestant missionaries did create a significant social presence in Mayan communities, where they established schools, health clinics, literacy training, and the first modern orthographies for the transcription of Mayan languages, their religious influence in the communities was practically nil for at least the first half of the twentieth century. This situation changed dramatically, however, in the second half of the twentieth century. Changes within the Roman Catholic Church, particularly the introduction of Catholic Action, which sought to eliminate “folk” and traditionalist Mayan religious practices from Catholicism in Guatemala and southern Mexico, and economic changes, began to challenge the spiritual hegemony of Catholicism. At the same time, in the late 1950s, new types of Protestant missionaries from the United States, offering what they called a “spiritual alternative to communism,” began actively to evangelize in Guatemala, although to a lesser extent in Mexico, where their efforts were stymied by strong anti-clerical legislation. It was, however, a natural disaster, the catastrophic earthquake of 1976, that propelled the growth of Protestantism in Guatemala, as people flocked to churches for spiritual solace and for the emergency relief that critics referred to as “*amina por*

lámina,” or a “soul for plastic roofing.”

The post-earthquake period marked the beginning of large-scale conversion of Mayan people from Catholicism to Protestantism, and specifically to Pentecostalism, a highly experiential, ecstatic form of worship in which believers experience what they call the “baptism in the Holy Spirit.” Conversions to Protestantism continued to increase in the late 1970s and 1980s, particularly during the period known as *la violencia* (the violence), when the Guatemalan army’s war of counterinsurgency against the guerrillas destroyed hundreds of Mayan villages and their inhabitants, displacing tens of thousands of people from their geographic and familial homelands. In southern Mexico, Protestantism began to advance among the Maya of Chiapas in the 1980s, during a period of increasing political and economic pressure in the region. In Chiapas, tension between Mayan Protestants and Mayan traditionalists has resulted in interethnic violence and the expulsion of Protestants from their villages, a situation that has been exacerbated by the political and economic crises that

provoked the emergence of the Zapatista armed movement in 1994. Some scholars have suggested that the physical displacement of Mayan people from their traditional sacred landscapes may have opened a social space for Protestantism, which is less dependent than “folk Catholicism” on sacred geography, such as specific mountains or the cycles of nature, for its symbolism and meaning.

Pentecostalism

Mayan Pentecostals eschew such “traditionalist” practices as the adoration of the saints/deities, the rituals associated with the sacred days of the Mayan calendar, and divination, all of which they condemn as both “pagan” and, simultaneously, as “Catholic.” Yet Mayan Protestants argue that the form and substance of Pentecostal worship does, in some regards, valorize critical aspects of Mayan culture. Because leadership in a congregation comes from personal revelation and public affirmation, the pastorate of such churches is largely Mayan and pastors tend to reflect the common experience, worldview, including the relations between humans and their environment, and language as the members of their congregations. The liturgical practices of Pentecostalism – the testimonies, demonstrations of “gifts of the Spirit” (speaking in tongues, faith healing, prophecy) – may bear more of a structural linkage to the other-worldly practices of Mayan shamanism (healing, speaking to and by inanimate objects, divination) than they do to either traditional Catholicism or mainline (non-Pentecostal) Protestantism. Since the 1980s, a Catholic analog to Pentecostalism, known as *Renovación católica*, or “Catholic Renewal” has also been a dynamic force in Mayan areas, suggesting that the appeal of pneumatic religion transcends denominational considerations.

Because Mayan Protestants eschew the ritual and material elements of worship such as the use of pine resin incense, astrology, and pilgrimages to mountain shrines that are found in folk Catholicism, there is not as strong a tie to the natural world in Mayan Protestantism or Pentecostalism as there is in Mayan Catholicism. Nevertheless, because many Mayan Protestants are *campesinos* (rural peasants), they are still closely tied to their environment and to the cycles of nature, particularly as they relate to planting and harvest, even to the extent of offering special prayers and offerings at critical times during the agricultural cycle. While Mayan Protestants officially subscribe to the biblical teaching that God gave humankind dominion over the Earth (Genesis 1:28), Mayan Protestants are likely to interpret this “dominion” as a benign guardianship.

Mayan Spirituality and Conservation (Western Highlands, Guatemala)

Indigenous peoples comprise two-thirds of the 11 million inhabitants of Guatemala, most of them of Maya origin. Evidence has demonstrated the presence of human population in the territory occupied today by Guatemala since 11,000 B.C.C., according to Michael Coe. With time and the domestication of several important crops, like maize, beans and squashes, the Maya evolved into one of the most developed civilizations of the ancient world, building large cities and sophisticated waterworks, and inventing a hieroglyphic writing system, and a very precise calendar based in deep astronomical knowledge.

The Maya, as other indigenous peoples, have a belief system deeply rooted in nature, which they consider sacred. For the Maya the relationship with the cosmos and the community is framed in terms of reciprocity, which means that people should always be grateful and respectful for what they receive. Although poverty, discrimination, technology and cultural change have all modified the relationship of the Maya with nature, they still have a basic ethic and attitude different from mestizo peoples, who have received more Western influence.

After three decades of civil war and military repression that mainly affected Mayan peoples, Guatemalan society is slowly looking for better ways to relate among its constituents. The Peace Agreements signed in 1996 opened a new era for the country, and the Mayan organizations were able to articulate a specific agreement that deals with their identity and rights, including their right to practice their spirituality. On the other hand, Mayan spirituality is experiencing an unprecedented revival, especially among young intellectuals and professionals who look for ways to differentiate themselves from mainstream society and reaffirm their Mayan identity.

The Significance of Sacred Sites

Rituals are the visible cornerstone of Mayan spirituality. They are the visible component of the reciprocal relation-

Garrard-Burnett, Virginia. *Protestantism in Guatemala: Living in the New Jerusalem*. Austin: University of Texas Press, 1998.

Martin, David. *Tongues of Fire: The Explosion of Protestantism in Latin America*. London: Basil Blackwell, 1990.

Sherman, Amy. *The Soul of Development: Biblical Christianity and Economic Transformation in Guatemala*. New York: Oxford, 1997. ship that Mayas try to maintain with nature. The rationale behind this is that if nature is providing them with good soil, water, wood, medicinal plants, and animals to hunt, they should be grateful for this generosity. In a different sense, several Mayan groups consider that the “owners” of natural resources are local guardians. Consequently, everybody should always ask permission from local guardians in order to slash the forest for agriculture, cut a tree for construction or firewood, or hunt an animal for subsistence.

Rituals are performed in natural settings, mainly on the summit of high mountains, close to cave entrances, and on a few occasions, at the border of lagoons and rivers. Ancient Maya cities and Catholic churches built on top of ancient temples are also important sacred sites. Their location is usually indicative of an in-depth sensibility to natural beauty and the search for quietness and intimacy with *Ajaw*, the Lord, and with nature. The cultural landscape of Guatemala has plenty of sacred sites, several of them located in groups of four around the main historical towns, and representing the four corners of the universe.

Actual Status of Sacred Sites

After the arrival of the Spaniards, several Maya sacred sites were “christianized” by building churches, or at least a cross, on top of them. Actual ownership of sacred sites depends on the history of each particular region of the country. In the western highlands, most sacred sites are located in communal or municipal lands, while in the Pacific Coast and the Verapaces, several sacred sites are nowadays privately owned. In several cases, private ownership has created problems of access to some sacred sites, especially when the owner has become an evangelical Christian. Often sacred sites are located in areas important for biodiversity conservation, which opens opportunities for the building of alliances with conservationists.

Several sacred sites have fallen into decay, due to increased deforestation in the surrounding landscapes, forest fires and non-biodegradable garbage. In the MayaPopti’ territory of western Huehuetenango some exceptions to this rule are found. There, local Maya spiritual guides, together with the municipality and the Academy of Mayan Languages, have organized to take care of them. They clean and fence the sacred sites,

ask for respect from visitors, and build structures where pilgrims can take shelter from sun and rain while praying. The Ministry of Culture is taking care of Ancient Maya cities such as Zaculeu, Iximche', and Chiantla Viejo, although sometimes specific sacred sites within an archeological park are polluted with garbage, as is the case in Iximche'. On the other hand, other important ancient Maya cities are totally abandoned, with no management responsibility from the central government, municipalities or local spiritual guides.

The Commission of Sacred Sites

A Commission of Sacred Sites, formed with spiritual guides and government representatives, was created as a result of the Peace Agreements signed between the Guatemalan Government and the leftist insurgency after 36 years of civil war ended in 1996. After several months of deliberations the commission was dismantled, however, without reaching agreement. The main source of controversy was the non-negotiable position of the indigenous representatives that only an indigenous organization of spiritual leaders has the right to manage ancient Maya cities. These indigenous organizations believe mestizo organizations, including the government, should only manage colonial monuments.

Despite the long history of government harassment, Mayan people at a number of ancient Maya cities have conducted rituals without interruption throughout colonial, republican and modern times. Ritualizing at other sites, such as Tikal, Dos Pilas, Naj Tunich, and Cancuén in Petén, has restarted recently. Permanent altars for Maya religious ceremonies have been built in the ancient Maya cities of Takalik Abaj and Tikal, much to the dismay of most archeologists. Some archeologists believe that building permanent structures for altars distorts the original meaning of the site and deleteriously impact on the original layout, and that some have been located in places where previously there was no ceremonial use.

The Chicabal Volcano and Lagoon

The case of Chicabal volcano, however, shows that a dialogue between Maya spiritual guides and protected area managers is possible, at least at the local level, and that it can lead to the protection of sacred sites.

Chicabal, which means "good or sweet place" in the Maya-Mam language, is a volcano with a lagoon in its crater. It is located at the municipality of San Martín Sacatepéquez, department of Quetzaltenango in western Guatemala. Chicabal is occupied by the Maya-Mam, one of the four largest indigenous groups in the country. The area is located within the cloud forests of the southern slope of the volcanic chain of western Guatemala, an important region for conservation due to its endemism, water

production, tourism potential, and role as winter refuge and stopover for migratory birds.

Chicabal is the most important sacred site for the Maya-Mam, especially for those in western Quetzaltenango. Spiritual guides report that there were more than 80 altars in the past, although by the early twenty-first century, only 26 altars appear to be used, and most of these are situated around the lagoon or near the summit of the crater, called *Popb'il*. The altars are visited all year round, following the sacred Maya calendar, which provides for appropriate dates according with the intended praying. However, what makes Chicabal outstanding is the annual “praying for the rains” ceremonies, drawing more than 6000 visitors from the surrounding region and beyond. This special day coincides with the Catholic celebration of Jesus’ Ascension to heaven. Besides people following Mayan spirituality, Catholic priests and pilgrims from the region climb to Chicabal the day before the Maya celebration in order to hear Mass at the border of the lagoon. This is part of a widespread movement within the Catholic Church that calls for the “inculturation” of the Christian message into the indigenous cultures. Although evangelicals generally consider Maya spirituality to be diabolic, they also visit the lagoon to fast and pray, a legacy that can, perhaps, be considered to be the result of cultural inertia. As a sign of respect, Maya spiritual guides give Chicabal the treatment of *Q'txu*, which means mother or lady. Other important days for Mayan rituals at Chicabal are the Day of the Cross (3 May) and the *Waxaqib' B'atz*, the first day of the sacred Maya calendar.

Management as Protected Area

In 1956 the entire Chicabal area was declared, together with all the volcanoes in Guatemala, to be a “no-hunting zone,” but the law had little impact in the field. Chicabal was also included in the list of archeological monuments in June 1972. In spite of its legal status, Chicabal has been managed as a protected area by ASAECO (Asociación de Agricultores Ecológicos), a local organization formed by the actual landowners of most of the lagoon and the crater. All of them are Maya-Mam farmers from the nearby community of Toj Mech who bought the area in 1986 from a non-indigenous woman who had bought it from the first non-indigenous owner.

The farmers now associated in ASAECO bought the area to increase their farmland, mainly for potato and maize crops. They slashed the forest in several areas for agriculture and built a road to the lagoon in order to transport their agricultural produce. However, the terrain proved to be very steep, sandy and prone to erosion. Recognising the difficulties in farming the area, the municipality of San Martín Sacatepéquez and Helvetas, a Swiss NGO, approached the landowners in 1996. They offered them technical and financial assistance if they would declare and manage their terrain as a protected area, indicating they would help them to develop its tourism potential.

The technical studies required to create a protected area have been presented to the national Congress and a completed management plan will likely be established by 2004.

The Sacred Dimension is Taken into Account

When active management and protection of the area started in 1999, spiritual guides were afraid that their traditional rituals would be prohibited. Gradually they realized that ASAECO, Helvetas and the municipality wanted to prevent the environmental degradation of the area, and promote and regulate public use of the area. María Victoria García, the former director of the municipal department of protected areas; started a process of dialogue with spiritual guides from the surrounding areas. As a starting point, several Mayan ceremonies were performed in Chicabal and other sacred sites, in essence, seeking harmony and the conservation of nature in the protected areas. As confidence grew, spiritual guides were asked for suggestions for the management of Chicabal. They requested that visitors should not be allowed to bathe, swim and fish in the lagoon, in order to respect its sacredness, and this desire was incorporated into the current area management plan, further building trust between the spiritual guides and the management authorities of the protected area.

Several additional actions have further built respect for and promoted the site's sacred status. First, the area is being characterized in the welcoming signs as "Center of the Maya-Mam worldview," while other signs at the entrance ask the visitor to respect the Maya altars. Furthermore, a complete interpretation of the Maya calendar was posted in the most visited area of the lagoon. Park guards and guides from ASAECO ask visitors to respect the area as a sacred site, not to leave any garbage and to avoid making a noise when Mayan ceremonies are being performed.

As a result, spiritual guides are satisfied that Mayan altars and nature are being protected. They feel, however, that the many members of ASAECO, being evangelical Christians, do not fully respect Maya spirituality and the Chicabal lagoon as a sacred site. These guides would like to have more formal participation in the protected area management and even greater consideration of its sacredness.

The Chicabal case suggests that protected areas, managed by local authorities, are more likely to incorporate respect for indigenous religious practices performed by their own people. However, some distrust remains when authorities follow a different religion and do not participate in Mayan ceremonies. Nonetheless, it is clear that a fruitful dialogue with indigenous spiritual guides is possible as part of the management of protected areas. As this is one of the very few examples where Mayas themselves are managing a protected area, a great deal can be learned from its evolution and development.

McDonagh, Sean (1944–)

Sean McDonagh, a renowned ecological theologian, was born in Nenagh, Ireland, studied for the priesthood in Navan (ordained 1969), and was sent as a Columban missionary father to Mindanao Island, the Philippines, the same year. After working among the lowland people in Oroqueita City, Misamis Occidental, Mindanao for four years, he studied linguistic anthropology in the USA. On returning from Washington, D.C., he taught at the Mindanao State University in a predominantly Muslim area, and then moved to Lake Sebu to work among the mountain people called the T'boli.

In response to the destruction of local forest in T'boli country, McDonagh began his ecological activism, which culminated in the pioneering book *To Care for the Earth* (1985), though it took three years to find a publisher because the connection between ecology and theology was not well known. *To Care for the Earth* called for a new theology which would give at least as much prominence to creation as to redemption. McDonagh argued that the grammar of this new creation theology ought to be the findings of modern science. McDonagh believed this new cosmology, developed from the insights of Teilhard de Chardin and Thomas Berry, ought to become the guiding myth for modern humankind, especially in the way we relate to the Earth and other creatures.

In 1990 this volume was followed by *The Greening of the Church*, which revealed that, while Catholic teaching was strong on social issues, it needed to promulgate a supplementary message about the destruction of God's creation. The focus this time was on developing a theology of creation from the resources of the biblical tradition to complement the cosmological approach. The book also dealt with the thorny (at least from a Catholic perspective) issue of population. The chapter "Are There Too Many Mouths to Feed?" revisited the population question but from an ecological rather than philosophical-theological perspective. McDonagh argued that notion of "carrying capacity" puts limits on the human population levels on the planet. He pointed out that the notion of carrying capacity was not addressed by Pope Paul IV in the encyclical *Humanae Vitae*. The book was well received in environmental circles but strongly criticized by prominent bishops in both Ireland and the Philippines.

McDonagh's second book, moreover, contained the first environmental pastoral letter of any Catholic Conference of Bishops. Entitled *What is Happening to our Beautiful Land?*, the book had a major impact on the Philippine Church. Social justice programs are no longer confined to addressing human rights abuses or working for a more equitable society. They now include concern for the environment. In the Philippines this means protecting what is left of the tropical forests, mangroves and coral reefs. The

pastoral letter was also printed and distributed by the Philippine Department of the Environment and Natural Resources (DENR). McDonagh was the main drafter of this document, which was published in 1988.

Passion for the Earth (1995) contains a critique of multilateral lending and trading bodies (World Bank, IMF, GATT–WTO) and their effects on development and the environment. Third World debt was his particular focus. In 1999 *Greening the Christian Millennium* appeared. It reflects on the ethical and ecological implications of genetic engineering in the plant world and on the patenting of life. McDonagh argued that a human-centered ethical framework, which has dominated Western thought for almost 2000 years, was unsuitable for discussing issues like genetic engineering. While supporting laboratory research in genetic engineering, he maintained that current field trials and the commercial planting of genetically engineered crops breached the precautionary principle and posed a danger to human health and the environment. Furthermore, he opposed patenting living organisms such as seeds or animals, viewing this as a new form of colonialism whereby the North, which is financially rich but poor in biodiversity, is able to commandeer the rich species and genetic resources of the South.

His most recent book *Why Are We Deaf to the Cry of the Earth?* looks at environmental challenges facing Ireland today after six years of unprecedented economic growth.

McFague, Sallie (1933–)

“The world is our meeting place with God . . . as the body of God, it is wondrously, awesomely, divinely mysterious” (McFague 1993: vii). Sallie McFague ends her book *Models of God* and begins her book *The Body of God* with these words. For several decades McFague probed the language, specifically the metaphorical models used for God, in Christian doctrine and offered alternative models for what she calls an “ecological, nuclear age.” Her basic premise is that the patriarchal, transcendent models that have dominated Christian theology, liturgy, and devotional life for generations contribute to the destructive, dominating relationship that, primarily, Christian cultures have assumed toward nature. McFague’s alternative models include God as mother, lover, and friend and the world or universe as God’s body.

McFague’s first two books, *Speaking in Parables* and *Metaphorical Theology*, focused on the intersection of literature and theology. She takes seriously the impact of theological language on belief systems and practices, then questions the ontological claims made by such theological language (metaphors/models). The connections between patriarchal, transcendent metaphorical language and environmental theology emerge in her book *Models of God: Theology for an Ecological, Nuclear Age*. In this book, which received the American Academy of Religion’s Award for Excellence, she claims that the destruction of Earth, our only home, is tantamount to the most grievous of sins. It is this direction that she follows in *The Body of God*. Here McFague claims that Christianity, while often equated with a world-negating and body-hating belief system, is actually “the religion of the incarnation par excellence” (1993: 14). With that claim in mind, she questions the “abhorrence and loathing” of at least some “bodies” by Christianity. McFague then suggests that Christianity consider the “use of the model of body as a way of interpreting everything that is.” In a world that constructs reality differently, “one that took the ecological context as the primary one,” McFague suggests that “the body would be an appropriate model of God” (1993: 21). This is the challenge she offers to Christian theology.

Her final two books, *Life Abundant* and *Super, Natural Christians* are intended for audiences outside of academia, and for Christian lay audiences in particular. She proposes that “Christian nature spirituality should be based on a subject–subjects model of being, knowing, and doing in place of the subject–object model of Western culture” (1997: 2).

Sallie McFague received her B.A. from Smith College, her B.D., M.A. and Ph.D. from Yale University. Her degrees are in literature and theology. She taught at Vanderbilt University’s Divinity School for over thirty years, holding the positions of Car-

penter Professor of Theology and serving as Dean of the Divinity School. She is Distinguished Theologian in Residence at Vancouver School of Theology.

McKenna, Terence (1946–2000)

Terence McKenna was perhaps the most prominent spokesperson of the post-rave neo-psychedelic movement. McKenna's writing challenges the reader to investigate ecstatic states empirically in order to judge whether his often very broad "repertoire of operational constructs" is ". . . in Wittgenstein's wonderful phrase, 'True enough' " (McKenna and McKenna 1994: xxv). Indeed, many of McKenna's ideas are contentious: for instance, the notion of an Edenic "Ur culture" in humanity's past; the simplistic typology of "partnership" *versus* "dominator" societies; and the theory that ingestion by early hominids of psilocybin mushrooms (provided by extraterrestrials) catalyzed human evolution. However, these polemical concerns are less pertinent to the reception of McKenna's writings than they would be for studies that fall more conventionally within the sciences and humanities. Like the nineteenth-century Romanticists, Terence McKenna's writing conveys a revelation of a primary, poetic, revolutionary consciousness where, for those drawn to them, fantasy, hallucination, and dream are varieties of data that are as real as any other.

In 1975 Terence and his brother Dennis McKenna – an ethnobotanist and psychopharmacologist – published the recondite *The Invisible Landscape: Mind, Hallucinations and the I Ching*, recounting the hyperdimensional adventures and eschatological ideas resulting from an expedition to the Amazon in 1971. The goal of this expedition was to learn from *ayahuasqueros* – shamans who use the entheogenic potion *ayahuasca* to obtain ecstatic trance. The model of nature presented in *Invisible Landscape* is that of a complex mystery emanating as an organized fractal sequence from a unified, sentient, and abstract field: a model resonant with the newly simulated "virtual realities" of early 1990s cyberculture.

That symbioses between psychedelic plants and people can lead to deeper cultural and ecological awareness is a central theme of Terence McKenna's work. McKenna advocated naturally occurring psychoactive substances, especially psilocin-containing mushrooms, DMT, and the tryptamine-containing entheogens of the Amazon, as ways of transcending the constraints of "dominator culture" and obtaining a vision of a more integrative, archaic and geocentric sociality. These themes are extensively developed in *The Archaic Revival* (1991) and *Food of the Gods: The Search for the Original Tree of Knowledge* (1992).

The visible manifesting of language is another recurrent theme in Terence McKenna's writing. Appropriately, his (counter)cultural significance extended beyond his writings and charismatic spoken-word performances to multimedia collaborations, ethnobotanical conservation, and fundraising for environmental groups. He was a

cofounder of Botanical Dimensions – an organization for the conservation of plants that have traditional ritual and medicinal uses. His work and memory provide an enduring social-cohesive force within the neo-psychedelic community.

Media

“Mediated Spectacular Nature” is a catch-all phrase for a wide assortment of nature-themed media presentations. In the past, the term “spectacular” has been used to characterize venues in which natural phenomena have been separated from their place on the Earth and presented as freestanding spectacles, often for entertainment and/or economic gain. Critics have found fault with this practice, warning that failure to account for the interconnectivity of all things will eventually lead to environmental ruin. However, *mediated* spectacular nature – magazines, films, and television programs – have done more than simply inform and entertain. The media genre may also be playing a prominent role in the central meaning systems of those who use its presentations.

The findings that led to these conclusions emerged from the Symbolism, Media, and the Lifecourse Project at the University of Colorado-Boulder’s School of Journalism and Mass Communication. The multi-year audienceresearch project employed qualitative interview techniques better to understand how people meaningfully exist in the world, and specifically, how media play a role in the process of meaning-making. In almost all cases, the profound and mundane acts of daily life now involve interaction with the symbols and meanings of the media sphere. Over time, with the decline of the influence of traditional religious institutions, mediated meanings and the *realm* of commodity culture can be thought of as a religious sphere.

There are indications that the texts of mediated spectacular nature, located at the nexus of media, religion, and culture, have religious significance for many of those who use them. For example, one mother, a 43-year-old Native American spiritualist, described the way *National Geographic* magazines and specials capture the essence of her connection to the Earth:

It provides, for me, physically, solitude and quietness and contemplation and smallness, or just a small piece of this Earth. And I think that *National Geographic* catches that in the land, which I can relate to. It’s that *stillness*. They’re beautiful.

These sorts of interpretations were not exclusive to those aligned with Earth-centered belief systems. A discussion of mediated spectacular nature brought a similar response from a woman who subscribed to a religiously conservative Christian belief system. The connection between her religiosity and mediated spectacular nature emerged as a result of her reports of favorite family activities. One involved family members gathering together to view rented wildlife films and watch nature programming on the *Discovery Channel* and *Animal Planet* (she especially liked the show *Crocodile Hunter*). The mother explained that even the violence has a place in the meaning of life:

. . . it's terrible to watch that kind of thing, so when (her youngest daughter) cries I want to reassure her that . . . I don't know why it has to be so violent, but it has to be because of "the circle of life" and all the balance and all this and that. And so I'm constantly pointing those things out, especially the religious aspect . . . the God aspect when she's crying about it or upset, and so I bring that into, "That's the reason, honey, because God needed this to happen, we have to have the balance."

Clearly, not all of the families interviewed presented such rich evidence. Other parents considered mediated spectacular nature to be merely a safe location for entertaining and informing their families. But enough of the families shared the convictions of the women quoted above to warrant further understanding of a media genre with deep historical roots in the Western world and recent explosive growth.

A starting point for mediated spectacular nature has been traced back to the late nineteenth century with the developments of field biology and the movie camera. Edward Muybridge was the first to study animal locomotion with a series of cameras, and later filmed a tiger attacking a tethered buffalo at the Philadelphia Zoo. Public popularity of Muybridge's pioneering work, and the work of others, prompted a steady growth of wildlife film production at the turn of the century with public exhibitions becoming commonplace. Soon, images of animals (often purchased from the growing libraries of the wildlife film-makers) also found their way into travelogues and Hollywood adventure movies. The development was not restricted to motion pictures. The rise of mass journalism and technologies enabling photoengraving, along with the increasing public interest in science and the growing desire in the Western world to better understand itself by considering the "other" (human, animal, and land) fueled the slow but steady growth of *Natural Geographic* magazine. Over the twentieth century, the success of *National Geographic* spawned a variety of similar publications.

A pair of identifiable styles of mediated spectacular nature developed. The first, the "British model," put more emphasis on scientific research and less on narrative entertainment. It tended to have more descriptive closeups than action-packed wide shots. The American tradition has followed the lines of what would later be known as the "classic" wildlife film: emphasizing drama, action, a strong story, and in more recent times, anthropomorphized animal characters. To capture dramatic action, practitioners of the American model have found it necessary to film in controlled settings, such as enclosures, and even zoos. Dramatic events are often set up, provoked, or pieced together in the editing room, sometimes using unrelated film and sequences.

Quintessential examples of each form have existed. Walt Disney's wildly popular and heavily distributed *True Life Adventure* movies produced through the 1950s and 1960s embodied the American model. Meanwhile, David Attenborough's work with the British Broadcasting Corporation's (BBC) wildlife film-making projects has always been carefully attentive to the spirit of the British model. But most examples of mediated depictions of the natural world have presented a blending of the two. In *Mutual of Omaha's Wild Kingdom*, the Natural Geographic Society's specials and mag-

azines, Jacques Cousteau's undersea adventures, and countless other wildlife films and TV productions, one can detect the influence of both approaches.

Another important development that contributing to the importance of the meaningful potential of this genre, has been its meteoric expansion. After having watched the success of cable channels such as Home Box Office and ESPN, John S. Hendricks launched the Discovery Channel with a niche format that attracted viewers interested in programming about the natural world. By investing in its own original programming, funding expeditions around the world, and recouping hefty costs by dubbing the narrations for a global audience, the channel has grown to be one of the most popular in the world. Discovery Communications has spun-off the popular Animal Planet channel, while the United States Public Broadcasting Service (PBS), a haven for wildlife filmmakers and home to the successful *Nature* series, has seen a boost in ratings in recent years. The American television network ABC has presented nature programming in an agreement with ABC World of Discovery executive producer Dennis B. Kane, and competitor NBC's return of *National Geographic* specials to prime-time commercial TV in the mid-1990s all enjoyed solid ratings. In January of 2001, National Geographic Television went after lucrative market share when it launched its own National Geographic Channel. Combined with a growing array of nature shows aimed at children on the network and cable channels, mediated spectacular nature has become a pervasive presence in American media.

The examples of meaningful relationships of audience members with mediated spectacular nature, combined with an ever-more pervasive presence in the media market, indicate that the use of mediated spectacular nature may have reached the status of popular religious practice. Charles Lippy presented a number of characteristics of meaningful practice that would designate it popular religiosity, including: a private character; a lack of organization; a tendency to syncretically blend worldviews, drawing from well-established, central-social beliefs, as well as newer, at times even ephemeral, ideas; a sense of sanctuary from chaotic existence; and access to the power of the supernatural, or what lies beyond the here-and-now. While activities such as body building, or spending time at Starbucks may constitute similar, meaningful popular religious activity for individuals in a relatively small group, the number of people experiencing mediated spectacular nature and the rich potential for the possibilities of that experience indicate that a substantial collectivity, indeed what we may one day be able to demonstrate as *global* in scope, may be using mediated spectacular nature as an inventory of contemporary symbols and values. Indeed, we could say it is a religion of nature.

If people are utilizing such presentations as *National Geographic* magazine and Animal Planet's *Crocodile Hunter* for their symbols and meanings, why is this happening now? One might point to the technological and market forces that prompted the explosive growth of mediated spectacular nature (i.e., it is what is there, so people will eventually find it meaningful). That is undoubtedly part of it, but there is also something else. Humans need vivid stories that they can tell themselves to make sense of

the contradictions of existence. As we have become more aware of the degradation resulting from our burdensome resource usage, we have filled out these stories with the symbols and meanings of the natural world. Mass communication serves as a prominent vehicle in the telling and retelling of these stories. Mediated spectacular nature has come to stand at the intersection of media, religion, and nature – a representative example of a contemporary, nature-related, religious cultural production.

Melanesia – Eco-Missiological Issues

The impact of Christianity on Melanesia has been immense, over 90 percent of its population identifying with one denomination or another. Marshaling the moral powers of this universal tradition for environmental care has become an urgent imperative to curb irresponsible actions toward forests, waterways and oceans. With the continuing effects of international business enterprises, the onset of new national or regional governments, and pressures from the foreign policies of stronger powers, tropical environments have been made vulnerable, and high standards of environmental safeguarding are needed. Christian appeals to care for God's creation take on a crucial significance when the churches play such a potentially potent role to instill common values and insist on national protection against outsiders. Unfortunately, however, foreigners' purchasing power – a taste of the "Cargo" – can too easily tempt local communities to part with precious resources, while levels of corruptibility among the new elites (especially in complex Papua New Guinea) have made for many underhand exploitations of forestland. Exposure of the issues by defenders of the environment (in parliaments, the press, churches, etc.) are too often made after disasters have occurred.

The up-and-coming elite, however, have received exposure to ecological issues through the writings of environmental philosophers and eco-theologians, and this is generating a climate of wiser decision making. The most famous of these thinkers in the region are Bernard Narokobi, who has been Minister for Justice and Speaker of the House of Parliament, Papua New Guinea, and the late Jean-Marie Tjibaou, who was the leading radical opponent to French colonialism in New Caledonia, and head of the *Front de liberation nationale kanake et socialiste* (FLNKS).

Narokobi has questioned whether Western concepts of private property rights and crown land concepts should be imposed on traditional peoples, and, combining traditional and Christian insights, he has also called for a radical re-visioning of Oceania's environmental future – to forestall damage coming through foreign exploitation. His influence has been greater on post-Independence Ni-Vanuatu policies than in his native Papua New Guinea. Narokobi's fellow Catholic, former priest Tjibaou, has worked against alienation of tribal lands by colonial settlers and massive scarring of mountain faces through nickel mining. He knew that political self-determination for the islanders (kanaks) was fundamental for obtaining environmental security.

Tjibaou was aware of the dangers of hand-out development from the French Government and bitterly opposed France's nuclear explosion trials in the eastern Pacific.

Apropos hand-out development, his position has been expanded upon by Protestant churchman Pothin Wete, who teaches that state financial concessions to the kanaks has come at the expense of the indigenous people's souls, along with the constant temptation to sell land for ready-at-hand cash. As for the nuclear question, this has also been taken up by a Protestant woman theologian, Suliana Siwatibau of Fiji, who cooperated with expatriate David Williams to produce the best popular handbook about the dangers of nuclear testing. Siwatibau used the biblical prophetic tradition as the basis for her ethical stance and for urging the preservation of creation. (The handbook was re-published by Greenpeace, yet without the insightful references to biblical prophetism).

Other indigenous eco-theologians of note are Choiseul Islanders Rev. Leslie Boseto (former Moderator of the United Church of Papua New Guinea and the Solomon Islands), who has sponsored the World Council of Churches' values for the "Integrity of Creation," and Esau Tuza, who perceived the significance of the independent Christian Fellowship Church (CFC) on New Georgia as a model of defense against environmental piracy. This church is one among a variety of independent groups, started by indigenous leaders that have split off from the mission churches during Melanesia's history. The CFC, led by a prophet called the "Holy Mama," successfully prevented Lever Brothers' irresponsible rainforest logging in the 1980s. Job Dudley, the son of this prophet, kept up the same pro-conservationist stance as a minister in the Solomonese government (although independent Korean loggers later subverted the local people with bribes).

In Papua New Guinea, the Tolai priest ToVagira (from New Britain) has produced an important resource book on land and mineral rights in his nation. Meanwhile, Tolai public servant and United Church layman Paulias Matane spearheaded work to create the Melanesian Environment Foundation in 1984, a national Melanesian Council of Churches project trying to integrate traditional and Christian values in a unified environmental policy for Papua New Guinea.

Generally speaking, interdenominational church voices had become somewhat muted by 2000, but Christian appeals to the integrity of creation are likely to become more effective as Melanesia's environmental vulnerability becomes more obvious. The Evangelical Lutheran Church of New Guinea, for instance, declared an active policy of land restoration in 2001 in order that – after a history of church-run plantations – the land be restored to its original inhabitants, along with their choice of its utilization. Another example is found in Aitape (a western Sepik district), where the Catholic Justice and Peace Commission for the Diocese has published popular materials to deter people from spoiling their lands and selling off rainforest to logging interests.

Various other voices and eco-theological impetuses could be noted. Expatriate influences are involved. The longest-standing residential protagonist for environmentalism and a nuclear-free Pacific in Papua New Guinea is Elizabeth Johnson, a poetess influenced by Quakerism and creation spirituality. Agricultural advisers with church connections have also long been monitoring soil erosion on sugar cane plantations owned by Fijians. All these voices have affected government and local action to place

restraints on environmental exploitation in Melanesia, which, because of huge forest areas in inaccessible valleys, still remains one of the least environmentally damaged regions on Earth.

Melanesia – New Religious Movements

In the Melanesian region different kinds of new religious movements have emerged during the colonial and postcolonial periods. These include “cargo cults,” neotraditionalist movements, and independent churches. Of these; cargo cults are by far the best-known response to social change: their leaders and adjutants seek to persuade villagers that the strange new (Western-style) goods, which they have difficulty acquiring, will soon arrive in remarkable quantities. These goods were seen as coming from the hands of their returning ancestors, or of Jesus in his second advent, or by some other spiritually significant means. These apparently bizarre expectations often arise because, when not knowing the source of internationally marketed commodity items, villagers apply ritual techniques to acquire them, just as they invoked the spirits to make their gardens produce and their livestock increase. Prima facie, these responses to rapid social change look “environmentally unfriendly,” translating the Melanesians’ well-known “materialist” attentions from their own organic products to consumer items. In various outbursts of collective conviction that a great day of blessing (some scholars say “millennium”) is coming, gardens have been deliberately ruined and pigs killed in great numbers.

Thus traditional life-ways or modes of production have been abandoned while people waited for ships and planes to bring new riches from the great beyond. Makeshift airstrips and wharves have sometimes been built to receive the goods, dreams of miraculous transformations being especially fueled by the presence of the American forces, with their startling equipment and intense activity in the Pacific during World War II. Many Mengan people, for instance, who have joined a movement in East New Britain called the Pomio Kivung movement, currently share such high cargoist hopes. They believe that the returning ancestors will have the power to create, by a mere wish, a city the size of New York on Jacquinot Bay.

On the other hand, various cargo cults are protests against unequal access to “the Cargo” in favor of the white people or of foreigners generally, and in the course of time they can inspire effective opposition against colonial intrusion, including land alienation and desecration. Bougainville, an island to the far north-east of Papua New Guinea, provides an important example. There the mining of Mt. Panguna by an Australian company resulted in a cluster of cargo-cultist responses, one of them backing the local war to keep the mine closed down by upholding an ideology that the whole island is sacred (*mekamui*) and its environment requiring protection. It is a fallacy, however, to

overlook other kinds of Melanesian religious responses that cannot easily be dubbed cargoist. These include neo-traditionalist movements and independent (or indigenously originated) churches.

Neo-traditionalist movements call for a rejection of outsider influences and a return to ancestral ways of life (even if these are almost always inevitably modified to preclude warriorhood activity). Some cargo cults have certainly taken on this aspect. Yali of Singina in the Madang area (New Guinea), for instance, organized a large movement that turned its back on “Mission and Administration” after World War II and performed innovative rituals to the ancestors to get the Cargo. Because the Cargo has not come in any grand miraculous fashion, though, the movement now tends to encourage old village ways rather than cash-cropping and business. Other collective neo-traditionalist responses are not cargoist. The leaders of the Moro movement on Guadalcanal (Solomon Islands), for example, simply teach – albeit with writing and use of blackboards in small schools – that the followers should avoid the introduced ways and keep up traditional practice, which will conserve the environment.

Melanesian independent churches, like their black counterparts in Africa, often synthesize indigenous with Christian outlooks. Led by local prophet-founders, such churches have been known to take up environmental causes. The NaGriamel movement, for example, founded by Jimmy Stevens on Espiritu Santo and also known as the NaGriamel Church of Christ, gained popularity and eventually pre-independence political clout for its opposition to massive (especially French settler-generated) land alienation in the New Hebrides (renamed Vanuatu). The movement’s subversive qualities were used as an excuse to clinch Vanuatu’s independence, with the British and French leaving their former colonial Condominium at exactly the same time, to allow the Papua New Guinea Defense Force (PNGDF) to land on Espiritu Santo, and to put down Stevens’ activities in the so-called “Coconut War” (1980). This legitimated the new indigenously led national government at Port Vila. Ironically, the leader of the PNGDF received a plantation on Espiritu Santo as a prize. Such vulnerability in environmental struggle is also illustrated by the Christian Fellowship Church of New Georgia (Solomons), which successfully opposed American logging interests in the 1980s only to find the villagers succumbing to persistent Korean pressures a decade later.

Overall, each new Melanesian movement requires examination to see the extent to which any “nativistic pull” produces an impetus toward environmental security or pushes toward embracing modernity.

Melanesian Traditions

Melanesia, stretching from the Bird's Head in the west of the great New Guinea island across to Fiji, and including West Papua (Irian Jaya), Papua New Guinea, the Solomon Islands, New Caledonia, and Vanuatu, carries more discrete religions than any other region on Earth. With very general configurations discussed under "Pacific Islands, Religion and Nature," here we make sense of the great complexity of over 1500 small-scale and "stone age" cultures with some guarded generalities. Lexical equivalents for religion and nature are generally lacking in traditional vocabularies, but words for worship and world are found virtually everywhere, although "world" almost always denotes some small geographical encompassment, with Melanesians tending to conceive their cosmoses horizontally rather than vertically.

Thus creator beings are very often already part of the landscape, as we see in Tolai belief with the great volcanoes of Ia Kupia (great Mother) and her relatives near Rabaul, East New Britain, and as we also find with collective culture-bearing deities or heroes that come along the coasts or over the mountains in "mythic times" with their gifts of skills (to garden, hunt, etc.) or useful objects (canoes, weapons, etc.). Sometimes sky gods are present, such as Aitawe, the sustainer of all things (in the western highland Enga people's worldview), and the sun and moon treated as deities, thought to lay "eggs" on the Earth in the form of black stones (used for cultic purposes, as with the southern highland Huli). But the landscape-connected deities predominate in the whole region, along with place spirits (*tok pisin: masalai*) living in dangerous lairs, sickness-bearing spirits, sprites or tricksters, and the dead. The dead are usually conceived as going to places more or less laterally positioned: to the mountaintops where they are buried (western highland Wahgi); down in caves at the end of rivers (lower highland Daribi); to the distant west (the coastal Papuan Toaripi); or to an isle of the blessed called Tuma (Papuan Trobriand islanders, the last two cultures with Austronesian languages).

The understanding of place and its meanings will vary with local features and culturo-linguistic inheritances. Take the Austronesian Sentani, for instance, living around the great Lake Sentani in northern Irian Jaya (West Papua). The world is described as Above-Below (*bumana-ana*), and might seem vertically oriented, but in practice horizontal preoccupations dictate all. The root of the cosmic Waringin tree may have broken in heaven, but it tumbles onto the island of Ayauwo on the lake and takes root, generating the primal village of Abar in the earth, which, along with other villages, is dug up by the spirit-being Uaropo. Creative energies are more associated with the lake and its surroundings, and these potencies are taken over the mountains

to coastal places. The lake and its bay sustain all life and bear many meaningful implications for human livelihood. There is no word for nature, or a sense of responsibility for it, but only a givenness of the locale with signs from it recognized through ancestral lore. Every year (in our late December), for instance, the lake turns yellow and yields up many struggling fish, and villages wait for the right time to kill them in plenty before they die. Among other phenomena, strange turbulences near a village presage the death of a chief (*ondoforo*); a great deal of fish dying in one spot foreshadows the death of a great personage; a child dying in the lake or the bay becomes a fish relative, and in this sense a totem, such as a swordfish (and though no word for totem is present, a proscription against eating it applies). Environmental attitudes are not independent of concerns for group prosperity and social explanations.

In a mountainous region, the feel will be very different. Take the Papuan highland Fuyughe, in a world of steep mountains and few wide valleys. Each cluster of related and allied hamlets live beneath a recognized mountainous configuration, that in turn is protected by a place spirit (called *sila*) guarding the heights. No one gardens the heights, it is dangerous to enter them alone, the presence of a *sila* being recognized by a hunting party, let us say, through the appearance of a giant python. Gardening, trading expeditions, feasting, and fighting are all done on a “medial strip,” just before valleys drop steeply into ravines. The respect for *sila* prevents the possibility of unchecked surprise raids by enemies, because no war party will ever take a secret route through the high forest for fear of trespassing on one’s foes’ protected area. While the mountains deeply condition their picturing of the world, the Fuyughe are unusual for having some sense of every “species” needing to survive. Every named type of living thing – a winged bird type, cassowaries, pigs, opossums, reptiles, and also people – possesses an *utam[e]*, that is, a special instance of it (it seems at times like a Platonic form!) that, if killed, would result in the death of the whole of a given [species-]group. Members of each hamlet learn the signs and contexts in which the possibility of making such a mistake would occur. Never kill a snake, for example, on a tribal borderland, where animal life is apparently prolific anyway. The most important *utam* of all was that of the chiefs (*amende*), and he could never leave his tribal area without fear of his group’s cosmos collapsing. Environmental sensitivities, in any case, are never separated from concerns for military and social survival.

Generally, as is the strong implication of these examples, Melanesians found maximum security in their places of habitation (house lines, hamlets, villages), some in their gardens, and the least security in the forest. Yet the forest was usually conceived as sacred for being the habitation of the spirits, the very epitome of horizontal orientations. What can be translated as the sacred, though, is not always positive. The central highlander Faiwolmin, for instance (straddling Irian Jaya and Papua New Guinea), talk both of the good sacred (*anang awem*) – of ancestral sites and initiatory seclusion centers in “the bush,” men’s houses, cult objects, and great leaders in the hamlets – and of the bad sacred (*awem tem*) – for masalai places, ghosts, and the enemies’ appropriations of spirit powers. (On further central highlands variations, cf. Papua New

Guinea.) Where dependency on a lake or the sea is involved, a spirit-being lies behind the cycles of plenty (cases from from Sentani to Oavulu, Fiji).

Other themes to note concern naming the environment (with gender associations, for instance, so that dry places are male, wet places, such as valleys, female); fertility cults, some with goddesses (e.g., Timbehes on Nissan Island); sanctions against greed and personal prestige accrued from sharing and generosity; and a sense of interconnectedness with animals (men as birds; sorcerers entering creatures to strike, etc.). A debate also surrounds whether feasting, especially the large-scale pig killing in the highlands, is determined by ecological factors, such as the need to kill off a surplus of pigs (see A. Vayda and

R. Rappaport 1968) rather than on group/human will. One certainly needs to appreciate that groups exercise their organizing power when they see circumstances (including environmental ones) allowing for it, but of course they can err in their judgments.

These religio-environmental values persist in group consciousness throughout Melanesia, but they are always in danger of being subverted in a new world of individual

Melanesian entrepreneurs and greedy politicians. Each small society tends not to hold the values of their neighbors or other groups in any esteem, so it has been necessary, in nationalist rhetoric and eco-theological discourse, to appeal in the modern context to spiritual and conservationist values that transcend cultural particularities.

Memoir and Nature Writing

A memoir (from the French “to remember”) is essentially a record of specific times and places kept alive through recall and based primarily on first-hand knowledge rather than research. Nature narratives that also explore deeply felt issues through the lens of personal experience may then be grouped as memoirs for fruitful consideration. Historically, the range of materials that inform memoirs, or that share similar preoccupations, includes: letters, diaries, journals or biographical sketches, as well as personal essays and spiritual autobiographies. The act of writing, too, is significant; since composing one’s memoir serves as a rite of return, the writing becomes a place apart, a circumscribed landscape as it were, where the author gains a footing, fresh perspective and not a little consolation.

Where loss colors a work, an elegiac tone separates the memoir from more pragmatic strains of nature writing. By definition, memoirs are a less pragmatic vehicle; their primary orientation is the self and its relations with the world. While self-absorption may be inherent in the task, memoir writing is actually a powerful antidote to narcissism once an author learns how to adapt this literary form to the genuine search for self-knowledge. Annie Dillard’s *Pilgrim at Tinker Creek* and Terry Tempest Williams’s *Refuge* are classic nature memoirs that succeed in balancing deeply personal questions with nuanced inquiry into broader cultural issues. This willingness to admit to rigorous self-examination, which has so shaped spiritual autobiography in Western literature, suggests that the nature memoir is also heir to a similar quest. However distant Augustine’s *Confessions* seem from nature writing, it is important to recall the formative influence religious figures have played in contemplating the self’s relationship to nature and the vitality of even their most misguided conclusions. From the Waters of Prayer in Teresa of Avila’s *A Life* to Thomas Merton’s *Seven Storey Mountain*, Western confessional classics are redolent with spiritual images drawn from nature’s palate.

Religious roots are also evident in nature writing’s earliest classics. Gilbert White’s *The Natural History and Antiquities of Selborne* (1789) faithfully reconciles Christian belief with scientific inquiry. White and naturalist theologians such as John Ray were not the least conflicted in confirming the divine order behind nature’s complexities. A more controversial follower of Linnaeus, Jean-Jacques Rousseau was no nature writer, yet his final collection of confessional essays, *Reveries of the Solitary Walker* (1782), still echo in today’s wistful testimonials about finding solace in the natural world.

With European expansion in North America, the overwhelming power of uncolonized nature was commonly exploited, feared, or decried as moral wilderness. By the nineteenth century, Romantic recommendations of nature’s salutary effects (as op-

posed to the corrupting influences of civilization and excessive domesticity) diverged sharply from pioneer struggles to conquer nature and to wrest a decent living from its grasp. This tension between hostile and benevolent visions of nature cropped up in the recollections of Transcendentalists and immigrants alike. However, consider the bold assurances in Emerson's "Nature" and Thoreau's *Walden* alongside ambivalent accounts of rearing children in the woods. Susannah Moodie (*Roughing it in the Bush, or, Life in Canada*, 1852) and her sister, Catherine Parr Traill (*The Backwoods of Canada*, 1836), were English gentlewomen who pioneered in Upper Canada (now central Ontario). Warning ostensible colonists abroad about the joys and hazards of surviving in the wild, their works soon became classics – astute observations of natural detail tempered with Victorian clarity on the moral dimensions of wilderness beauty, usefulness and danger.

Eventually, nature memoirs with a confessional bent lost ground to writings with a more secular ring. Sporting narratives, for instance, unencumbered by religious agendas, offered a haven from "softer" naturalist leanings that veered off into cosmology. Thanks to recent authors who have elevated the fish tale to mythic proportions, avid anglers and mystics alike are again dipping into the same stream (Norman Maclean, *A River Runs through It*; David James Duncan, *My Story as Told by Water*).

Memoirs of exotic places (Bruce Chatwin, *Songlines*; Peter Matthiessen, *The Tree Where Man was Born*) have always been popular, but musings on domestic landscapes have also had a loyal following. Garden autobiographies, which originated in the 1850s, quickly became a celebrated genre that fused cultural, personal and natural histories (see Douglas Chambers, *Stonyground: The Making of a Canadian Garden*). Often written in highly evocative prose with a pronounced mythological cast, early examples plumbed Genesis to Milton in search of the model garden and, by extension, the model relationship between humans and nature. Not unlike wilderness parks, gardens were viewed as sacred landscapes that instructed humans about the right relationship between people and place. Strong moral preoccupations informed these inquiries, reasoning that, if Eden was the primordial scene of order, then the garden was nature properly tended.

Often the product of a mature writer's lifelong preoccupations (Barry Lopez, *About This Life*), the memoir reflects highly charged personal as well as cultural associations. Common themes include numinous experiences in either strange or familiar landscapes (Sharon Butala, *The Perfection of the Morning*) and similar encounters with animals (Rick Bass, *The Ninemile Wolves*). Land as text is also a significant, if problematic, theme, as memoirs try to render human experience and place mutually intelligible. The memoir allows a writer – and, by extension, a reader – the luxury of exploring place through stories about wild inhabitants and the varieties of human experience fostered in a particular landscape. The storied landscape is an important theme that informs our search for morals, as contemporary naturalists consistently call for right living, instead of seeking the rare uplifting encounter with the wild (Alison Deming, *The Edges of the Civilized World*). Over the past decades, shifts in cultural and religious

values have made memoirs increasingly important records that chart this evolving dialogue in nature ethics.

With this lofty mandate, do memoirs have pitfalls? Yes, the writerly danger is that natural forces are simply reduced to symbols or totems that bear the burden of human yearning. Even with the best of intentions, the tendency to use nature for the purposes of the writer's own personal inquiry is a hazard. Literary sins range from anthropomorphizing and sentimentalizing to just plain missing the obvious. The tendency to reduce wildness to meditations on human feelings about wildness invariably flaws otherwise good nature writing, yet the hunch that wildness is our rightful partner in the search for selfknowledge is not misguided. Problems occur when the approach becomes a conceit rather than a discipline. Nature writing requires humility, attentiveness, and detachment from self-serving digressions. At its best, the memoir is an exercise in studied looking and an avenue to finely tuned contemplation. This is Lopez at the river "with no intention but to sit and watch"; this is Dillard's "stalking."

These values, in particular, suggest that nature memoirs share more religious undercurrents than is commonly recognized. Conventional and unconventional pieties have influenced the spiritual and artistic formation of naturalists for generations. Authors who see the world as the site of contemplation (Wendell Berry) or conversion (John Muir, Mary Sojourner) often turn to explicitly religious language to convey their experiences. Indeed, religious language is often the only way to communicate ineffable experiences, intuitions and that instinctual, dreaming knowledge that a mechanical culture invariably tries to suppress. Yet the question goes beyond that of language. Understanding religious roots and spiritual leanings allows us to appreciate a whole worldview. Those who can steer through statistics to a discerning evaluation of the facts possess a strong moral compass – a compass we turn to again and again. Consider the Calvinistic restraint echoed in Dillard, Berry and Lopez, which continues to provide powerful moral ballast in these darkening times.

Nature memoirs may convey astonishing revelations or prophecies about the natural world, but they must be authentic and authoritative to be trusted. The adventurer who risks returning to the past to retrieve riches for the tribe is a valuable culture-bringer, but is he or she committed to watching and to listening over the course of a lifetime? If memoirs are a reliable gauge of an author's integrity, they seem to tell us that the finest guides make no pretensions to exhaustive knowledge at all. Rather, they urge the acquisition of knowledge in order to develop (or submit to) the discipline of seeing, witnessing, and attending to the thing itself. If anything, these individuals are expert at not knowing – what in mysticism is referred to as the apophatic way – and at grappling with the holy limits of all forms of knowledge.

The nature of that commitment makes the memoir a powerful spiritual and imaginative tool for writers, let alone for readers, who are instructed by places, actual and imagined, that most of us may never see.

Men of the Trees (East Africa)

One of the pioneering movements in social forestry was Men of the Trees, now known as the International Tree Foundation, founded by Richard St. Barbe Baker (1889–1982) among the Kikuyu in Kenya in 1922, when he was Assistant Conservator of Forests for the British Colonial Office. Members of Men of the Trees committed to planting ten trees every year and to protecting trees everywhere. The organization was a response to widespread forest destruction and soil loss leading to desertification. St. Barbe, as he was known to his friends, was a deeply spiritual man with a profound respect for traditional cultures and peoples and a long-standing membership in the Bahá'í Faith. After a further forestry assignment in Nigeria, he began to travel the world writing and lecturing about forest conservation and turning Men of the Trees into a global organization based in England. A journal was published starting in 1929, as well as a Tree Lover's Calendar. Invited to Palestine by the High Commissioner in 1929, he brought representatives of the major religions together to commit to a plan of reforestation of desert areas, and helped to make the traditional *Tu Bi'Shvat* (Feast of Trees) a national tree-planting day. The first life member of Men of the Trees was Shoghi Effendi, the Guardian of the Bahá'í Faith. St. Barbe reached many prominent people with his message, and influenced such world leaders as Nehru and Franklin D. Roosevelt, leading the latter to establish the Civilian Conservation Corps. He worked to save the redwoods of California starting in 1930, and launched a desert reclamation program in Africa that became the Sahara Reclamation Program and the Green Front. His Royal Highness the Prince of Wales became patron of the International Tree Foundation in 1979.

In 1946, at St. Barbe's instigation, the First World Forestry Charter Gathering was held in London. The aim was to provide an opportunity for the exchange of ideas on forest conservation between diplomatic representatives from many countries. Such gatherings continued through the 1950s and 1960s, and inspired a number of efforts at global environmental cooperation. They were revived in

1989, the hundredth anniversary of St. Barbe Baker's birth, at the initiative of the Bahá'í International Community Offices of the Environment and Public Information. The 1994 Gathering held at St. James's Palace in London in July, was addressed by His Royal Highness Prince Philip, Duke of Edinburgh, and by Amatu'l-Bahá Rúhíyyih Khánúm, leading dignitary in the Bahá'í Faith.

All of the work of St. Barbe Baker, including Men of the Trees, was inspired by his global and holistic perspective on forests and forestry. He viewed the planet as a living organism long before the Gaia theory, and saw the complex interactions within the

forest as a mirror of the organization of all life. He saw forests as a vital organ within the whole self-regulating life-sustaining ecosphere. Removing too many trees disrupted the ecosystem, and planting trees could begin a cycle of regenerative recovery. His view of forests was simultaneously scientific, aesthetic and spiritual. His extensive writings shared the wonder, beauty and sacredness of nature while teaching ecological principles and respect. By integrating science and religion, he saw the potential for a mature planetary civilization based on ecological and spiritual principles.

Men's Movement

In the wake of late twentieth-century feminist challenges to prevalent understandings and practices of gender in modern Western societies, a number of men within these societies undertook to fashion, individually and collectively, responses to feminism's wide-ranging critiques. Beginning in the 1970s, "movements" of these men arose, some in conscious alliance with contemporary feminist goals and methods (e.g., "pro-feminist men"), others in more or less hostile reaction against them (e.g., "men's rights" groups). Some of these "men's movements" linked their gender concerns with a spiritual or religious focus and a stated interest in relations with the natural world.

Of these latter groups, the most widely publicized exemplar was the "mythopoetic men's movement," which attained its greatest popularity in the decade or so surrounding the 1990 publication of its formative text, the poet Robert Bly's *Iron John: A Book about Men*, an extended exegesis of a fairytale collected by the Grimm brothers. As its name implies, this movement looked to myth and ritual as primary sources for the sort of selftransformation its adherents – primarily heterosexual Euro-American men of at least moderate means – sought. Through the medium of paid workshops and multi-day retreats (generally held in "wilderness" settings), Bly and other teachers advanced the theory that contemporary men in industrialized societies, having escaped stultifying 1950s-style masculinity only to become mired in a debilitating "softness" attributable, at least in part, to feminism, were in need of a distinctly masculine spirituality. And this, Bly argued, was available to them through connection with the "deep masculine," an archetypal force personified in the mythic figure of the "wildman." "What I'm suggesting," he wrote, ". . . is that every modern male has, lying at the bottom of his psyche, a large, primitive being covered with hair down to his feet. Making contact with this Wild Man is the step the Eighties male or the Nineties male has yet to take" (Bly 1990: 6). Bly was explicit about the religious dimensions of this quest for a fundamental masculinity: "Getting in touch with the wildman means religious life for a man in the broadest sense of the phrase" (in Thompson 1987: 180).

For men who embraced this path, the mythopoetic leaders offered a "practice" composed of guided interpretations of (primarily European) myths and folk-tales, participation in (primarily Native American and African-derived) "initiation" rituals, and group-therapy-style personal sharing, all of which was intended to bring men into experiential contact with the primal "wildness" that Bly and his colleagues identified as essentially masculine. Undergirding the entire mythopoetic approach was a neo-Jungian belief in transhistorical, gender-appropriate archetypes (e.g., wildman, king, warrior) to be embraced on the way to healthy manhood in the late twentieth century.

Through deeply felt, ritualized engagement with these designated “masculine” figures, within the context of an all-male group, participants hoped to be initiated into a more vital, self-assured gender identity.

As already noted, “wildness” was a term of value in the mythopoetic men’s movement’s vocabulary – both the wildness believed to be at the heart of “deep masculinity” and the wildness that characterized the natural settings in which much of the ritual work of initiation took place. Bly considered it necessary for men to reach beneath and beyond civilized society, into a wider realm of nature encompassing the more chaotic – yet more fruitful – elements of the human psyche: “The Wild Man is not opposed to civilization; but he’s not completely contained by it either” (Bly 1990: 8). Accordingly, mythopoetic men’s groups convened in outdoor settings at some remove from civilized “confinements”; there, they engaged in communal drumming sessions, sweatlodges, and other ritual practices designed to promote intragroup bonding and a feeling of connection with such “natural” manifestations of masculinity as “fierce” animals (e.g., bears, wolves). Although it is unclear whether such ritual use of “wild” settings ever went beyond a sort of nature-as-backdrop approach, to the point of actual connection and conscious interaction with a specific place, there was, among at least some men in the mythopoetic movement, a stated generalized concern for the well-being of the Earth: “Men have traditionally been the guardians of the earth . . . It’s time for men to wake up and take this historical role again. We need to define the new warriors. Men are called to be warriors for the earth” (Craver 1996: 69). Here, characteristically, the call for male ecological responsibility was couched in terms of the traditional archetype of the warrior.

Frequently ridiculed by the mass media – the spectacle of middle-class white men taking to the woods to beat on drums and “get in touch with their inner wildman” provided an easy target – the mythopoetic men’s movement attracted more substantive criticism from feminists, profeminist men, and Native American observers. Feminists condemned the reliance of Bly and others on an essentialist account of “natural” gender difference – the unproblematized (and inevitably prescriptive) linking of specifically delineated “masculine” and “feminine” modes of being with biologically male and female human beings, respectively, despite the wide cultural and individual variation displayed by actual men and women, boys and girls. Feminists and profeminist men objected no less strongly to this men’s movement’s indifference to – if not outright denial of – persisting power differentials between men and women. Noting the generally privileged constituency of this movement – “those [men] who quietly benefit from patriarchy without being militant in its defence” – sociologist R.W. Connell characterized it as a form of “masculinity therapy” whose consequence would be nothing more than “an adaptation of patriarchal structures through the *modernization* of masculinity” (Connell 1995: 210, 211; italics in original). Finally, Native American criticism of the mythopoetic men’s movement focused especially on its arguably neo-colonialist appropriation of indigenous spiritual practices: “. . . to play at ritual potluck is to debase all spiritual traditions, voiding their internal coherence and leaving nothing

usably sacrosanct as a cultural anchor for the peoples who conceived and developed them” (Churchill 1996: 371).

With the fading of this men’s movement from cultural prominence, questions concerning existing and desirable relations among men, gender, religion, and nature remain to be explored. A number of men influenced by ecofeminism, including J. Michael Clark, Seth Mirsky, and John Rowan, have produced work in this area suggestive of alternative future possibilities for a men’s movement.

Merchant, Carolyn (1936–)

As one of the first prominent environmental historians, Carolyn Merchant weaves ecofeminist methodologies into her philosophical, ethical and historical inquiry. Her approach focuses on the interrelationships between productive and reproductive forces, in both human and nonhuman history, as well as the metaphoric connections between women and nature. Merchant integrates the history of science, ecology (which she views as a “subversive science”) and cultural studies in order to present a holistic environmental history.

In 1980, Merchant published *The Death of Nature: Women, Ecology and the Scientific Revolution*. She begins this groundbreaking work with the statement: “The world we have lost was organic” (1980: 1). From there she examines the formation of a worldview and science focused on the domination of both nature and women. Thus, as “Western culture became increasingly mechanized in the 1600s, the female earth and the virgin earth spirit were subdued by the machine” (1980: 2). Focused initially on pastoral imagery, this shifting worldview assumed women and nature to be nurturing and passive, benevolent and willingly manipulated. Functionally, however, perceptions of nature as female did limit certain abusive practices (i.e., it was a “violation of Mother Earth” to engage in mining) (1980: 32). Merchant sees Bacon’s publication *A New Atlantis*, with its “mechanistic utopia,” as a symbolic of a turning point. Bacon writes from the perspective of paralleling mechanical devices to interrogate suspected witches and the mechanical torture of nature by science. His idea of scientific progress focused on control of nature as a way to remedy the “Fall” and return to paradise in the Garden of Eden. This is a metaphorical construct that Merchant continues to analyze in *Reinventing Eden: Women, Nature, and Narrative*.

Merchant proceeds to trace the influence of mechanistic modeling in society as a whole. She contends that the “brilliant achievement of mechanism” is its “reordering of reality around two fundamental constituents of human experience – order and power” (2003: 216). God becomes a clockmaker, the world becomes a machine comprised of inert particles. Order and power form the basis for patriarchal structures throughout society. By analyzing the whole, thus subverting the very societal model she addresses, Merchant’s work helped shape the core issues of ecofeminist dialogue, including discussions of problematic essentialisms in connecting women and nature.

Merchant’s contributions extend into analysis of, and participation in, environmental activism. Her examination of the contradictions between production, ecology and reproduction suggests that these dynamics have contributed to the global ecological crisis of the late twentieth century. She argues that policy shifts cannot respond ad-

equately to the rapidly increasing ecological stress. Radical alternatives – spiritual, economic, scientific – are requisite. Merchant emphasizes the reality and promise of diverse visions and actions arising in different parts of the world (see *Radical Ecology*). She also helps to delineate various ecofeminisms, such as socialist, radical, liberal and cultural, thus reemphasizing the fact that myriad voices contribute to this complex movement.

Merchant received her doctorate in the History of Science from the University of Wisconsin, Madison and is Professor of Environmental History, Philosophy and Ethics at the University of California, Berkeley. She has written or edited seven books, published myriad articles and helped to establish the American Society for Environmental History.

Merwin, W.S. (William Stanley) (1927–)

In an early poem, “The Wilderness,” from *Green with Beasts* (1956), the American poet W.S. Merwin wrote:

Remoteness is its own secret. Not holiness, Though, nor the huge spirit miraculously avoiding The way’s dissemblings . . . (Merwin 1988a: 33).

By way of example, these lines indicate how carefully Merwin’s poetry approaches the relation between religion and nature. Separating himself from claims that God resides in nature, through his poems Merwin pursues personal religiosity animated by the longing for a revelation of self and a sense of totality. Yet Merwin’s poetry hinges on the idea that at best one can perceive only discrete parts of physical reality. This view of the person–nature relationship places Merwin’s poetry in proximity to the tradition of Henry David Thoreau, especially in its fascination with the details of careful observation.

While Merwin’s poetry renders nature as fragments – like hands or feet, or in his later poetry the particulars of the biological world – it also represents an intense awareness of a kind of absence run through with meaning. And where there is absence there is also a sense of loss. In this way, Merwin’s poetry suggests a relationship to nature that is elegiac, yet in a relative sense, static, asserting that wherever we are, we are surrounded by where we are not. This sort of absence acquires value to the extent that it is sought out, yet remains unknown.

Frequently, it is Merwin’s careful rendering of the natural cycles of life and death that leads toward selfdiscovery. In this sense, Merwin’s poetic vision places substantial attention on autobiography. He grew up as the son of a Presbyterian minister, and in later life he studied Zen Buddhism. In the books that follow *The Lice* (1967), the sense of the continuity of life becomes increasingly expansive and considerably less anthropocentric, as the poems represent life in more fundamentally biological terms. Later, the short poems of *Finding the Islands* (1982) represent a union of aesthetic and spiritual experience similar to that found in early haiku writers like Bashō.

Parallel to their focus on natural cycles, some of Merwin’s poems harshly render humankind’s urge to plunder nature, thus creating discontinuity in the form of ecological disaster. Reflecting a keen awareness of the influence both Linnaeus and Charles Darwin had on twentieth-century attitudes toward the natural world, Merwin’s poetry presents, especially from *The Lice* onward, a fine-tuned ecopoetic sensibility that

becomes increasingly pervasive in his poetry. In *The Rain in the Trees* (1988) Merwin's eco-poetics reached a high point at which he combined the rhetoric of absence that fueled his early writing with an elegiac sensibility associated with environmental degradation. At one point, he asserted that nature is wiser than humans: "I will have to decipher the language of the insects" (1988b: 50). Through the 1990s, Merwin's poetry focused on horticultural and autobiographical matters, allowing the poems to continue exploring the border area that links the world of nature to the mystery of human religious experience.

Mesoamerican Deities

Mesoamerican deities wield natural powers, live in the natural world, and follow natural processes. Moreover, while deities control natural forces, natural entities control deified forces. All deities embody the powers of various natural forces such as rain, lightning, wind, growth, death and decay that allow them to interact with and affect other beings. Likewise, natural entities such as celestial objects, mountains, streams, plants, animals, and humans can embody powers that give them life, deify them, allowing them to interact with and affect other beings. Because all these beings – deities with natural powers and deified natural entities – are considered living, they are born into actual places within which they live. There they grow and transform as they eat and defecate, and willfully act according to their particular capacities in ways that impinge on others' lives. Almost all also live for appropriate lifespans and then die, their bodies becoming food for others. Biologically natural metaphors involving processes of creation and destruction that continually transform living beings from birth until death's beyond govern much of Mesoamerican theological thinking.

Mesoamerica stretches roughly from what is now northern Mexico into Nicaragua. Its long history began with hunter-gatherers in the Paleoindian era (ca. 25,000– 7000 B.C.E.). This period was followed by six more: the Archaic (ca. 7000–2000 B.C.E.); the Preclassic (ca. 2000 B.C.E.–250 C.E.); the Classic (ca. 250–1000); the Postclassic (ca. 1000–1521); the era of Spanish Conquest and Colonialism (ca. 1521–1808); and the era of Independence to the present (beginning ca. 1808). The Archaic was marked by the slow development of agriculture and more settled life. By the Preclassic, the first urban centers had developed. While many of these pre-Conquest cities claimed no more than 30,000–40,000 inhabitants, some contained very large populations. Tenochtitlan (ca. 1350– 1521), the center of the Aztec (more properly Mexico) domain, held approximately 250,000 inhabitants within its island borders; around one million more lived in villages and other urban centers throughout the Valley of Mexico where Tenochtitlan was located (Mexico City's several million inhabitants now sit on Tenochtitlan's remains). Besides countless deified beings with which each center's inhabitants interacted, a patron deity governed each city, giving it life and strength, thereby creating a distinctive ritual and pilgrimage center. Each center constituted a complex, stratified yet flexible society of many groups ranging from governing elite, to religious professionals, warriors, traders, educators, healers, craftspeople, and farmers. Moreover, these urban centers often competed for power creating a situation of shifting alliances among them.

Four major cultural areas dominated Mesoamerica from early pre-Conquest times: the Olmec (ca. 2250–300 B.C.E.); Oaxaca (ca. 1400 B.C.E.–present); the Mexican highland peoples (ca. 1200 B.C.E.–present); and the Maya (ca. 1400 B.C.E.–present). Two of these, the Olmec and Mexican highland peoples, at times wielded great influence and sometimes considerable direct power over extensive geographic expanses. The other two, the Maya and those living in Oaxaca, have tended toward more regional forms of influence; nevertheless, their contributions to Mesoamerican life in general have proven considerable through time. While all four areas share key cultural traits, each also claims its own characteristics and distinctive spins on those traits.

The Spanish Conquest (1521) brought major changes to Mesoamerica on all fronts from political to social. Nevertheless, all pre-Conquest forms of life did not simply disappear, for the conquest was not complete on any level, including the spiritual. Religious conversions to Catholicism occurred so rapidly and often under such coercive conditions that superficiality proved inevitable. Long periods of isolation for many indigenous peasants also weakened the Church's oversight.

As a result, often the converts understood their new religion in idiosyncratic ways having little to do with what the Church fathers thought they were teaching them. The indigenous folk likely saw Jesus as the victor over their now defeated patron deities; and because in pre-Conquest times patron deities often returned to power as competing cities shifted their alliances, the same expectation sometimes existed after the Conquest. Throughout the following centuries, patron deities in diverse, imaginative forms – preand post-Conquest gods, indigenous and Christian, or blends thereof – rose to lead various peasant groups in rebellion against an often oppressive governing elite. Everyone, from the Feathered Serpent God and the long-dead Maya leader Can Ek to the Virgin Mother Guadalupe, has led revolts in the last 500 years. Moreover, today many earthly and celestial topographies have come to house either or both local deities and saints (some of whom Rome has never heard of); the Devil has set up housekeeping in the wet underground; many a cook blesses the four quarters of the cosmos as she grills the day's first tortilla; and one may sacrifice a chicken following ancient traditions to celebrate Christian communion. Some view indigenous and Christian traditions as mutually contradictory, others as one unified tradition. Through both continuity and invention, pre-Conquest theological conceptions have remained alive and well throughout Mesoamerica's long history up to the present.

Today as before, deities' lives and personalities often closely reflect the particular environment within which they dwell. Mesoamerica enjoys a diverse geography and climate. This ranges from deserts to tropical and mountainous regions, which boast both active and inactive volcanoes. However, in spite of its jungles and rainforests, from the Archaic era on, Mesoamerica has lived with a mostly semi-arid climate, making water scarce. By the Archaic, two major seasons had come to dominate the year: a rainy period from roughly June–October; and a dry one from November–May. Moreover, even in the tropical zones during the rainy season, water comes at a premium because much of the area rests on a limestone base. Water tends to disappear quickly

beneath the surface through the porous stone, lacing the area with sink-holes, caves, and underground rivers; while the surface remains largely dry, the underground retains most of the water.

It makes sense that many deities and deified natural entities concern themselves with water and related natural forces. Water is needed for agriculture, and corn – one of the most ancient and thirsty crops – forms a basic metaphor for human sustenance. Beings must drink and eat to sustain life; and since humans drink water and eat corn, these two natural entities have come to symbolize life itself. For some nonhuman beings, the blood and flesh of humans and other animals is the symbolic life-sustaining equivalent of water and corn for humans. For centuries, sacrifice has symbolized a natural feeding exchange in which beings ate and fed each other. Ritual sacrifice formed the heart of pre-Conquest religious practice; and although humans no longer serve as offerings, it continues today in altered, often Christian forms.

Local environments also form symbolic, deified celestial and earthly topographies. Each town marks space beginning with its center: in pre-Conquest days, where the temple stood; today, where the church or town plaza stands. From there, the four cardinal directions are marked, each supported by a cosmic tree, mountain, bird, rain god, saint, or any combination thereof. The center rests on Earth's Surface, which takes the form of a four petaled flower, one petal for each direction. People, animals, and plants live on dry Earth's Surface, which some myths describe as the back of a great monster. The Olmec said this monster was a giant fish floating in the sea, the Mexica described it as a crocodilian beast whom Quetzalcoatl and Tezcatlipoca twisted in two. One half became the sky, the other created plants, flowers, trees, springs, caves, mountains and valleys. But the beast was so hurt by her destruction that she cried out, and would not be quieted unless fed human hearts as a debt-payment for her own sacrifice.

In many towns, actual mountains mark the cardinal directions, and real caves, springs, or underground rivers mark entrances to the cavernous Underworld lying beneath Earth's Surface. The mountains at the four corners, and sometimes the center, are viewed as deified pots whose underworld innards contain water and seeds that produce corn and other edible plants. The rain gods guard these giant pots, thunderously striking them open with their lightning bolts when it comes time to release rain. But, not all moisture is good. An Oaxacan story says that one of these mountain-pots contained good flowerproducing rain; but a second, volcanic fiery rain; a third, fungus-producing rain; a fourth, wind-storm rain; and a fifth, icy flint-blade rain. For the Mexica, one pot brought drought.

Below in the Underground, everything is opposite from life on Earth's Surface. Below it is wet, above it is dry; below things point downward, above things point upward toward the sky. The Underworld beings, delightful characters bearing names like Lord and Lady of Death (Mexica), or Pus and Jaundice Masters, Bone and Skull Scepters, or Bloody Teeth and Bloody Claws (K'iché Maya), eat rotting and dead things such as tortillas of fungi, beans of fly larvae, and corn paste of decayed human flesh. The

Panajachel Maya said that, if one partook of such pseudo-human food, one would be forced to remain there forever. They also said that the Devil lived there and ate food made of blood collected by his vampire bat cook. Because everyone does at least some bad things during life, upon death one spends time there before going to heaven; rich landowners who treated their workers poorly, however, were so bad they never got out. Nevertheless, no matter how forbidding the Underworld is, life cannot live without its destructive, corruptive forces. Corn grows on Earth's Surface, but pushes its roots into the Underworld to feed on its watery, decaying excrement. And the Sun and all other celestial objects move through its underground passages on a daily basis. When the Sun rises from the beast's bowels at dawn, the Moon is just entering its mouth; and when it is day above, it is night below.

The Sky soars above Earth's Surface, and like the Underworld it too is a watery realm. Water completely surrounds the Mesoamerican cosmos, trapping the dry air bubble in which people live on Earth's Surface. The Sky forms the liquid walls of a great house, while Earth's Surface serves as both a floor of this house and that of the upside-down Underworld. Like Earth's Surface and the Underworld, the Sky is divided into quadrants. The Mexica said that Quetzalcoatl and Tezcatlipoca met at the celestial crossroads to create the cosmos, and the K'iché say that four roads move out from the center: a red road moves east; a black, north; a white, west; and a yellow, south. The colonial Yucatec Maya said that four gods called the Bacabs planted the four cosmic trees holding up the Sky. Others say that the Sky moves up seven steps like a pyramid, and six down; this motion is reversed as one moves into the Underworld, seven steps down and six up.

But unlike the Underworld, living people do not enter the Sky, perhaps because they cannot fly. Nonhuman beings and dead ancestors pass along the Sky's watery passages like boaters navigating a great river. The sun, moon and stars all follow the Sky's particular currents; and birds fly through the air bubble above Earth's Surface to the Sky, sometimes also swooping into the Underworld through its cave-doors. Some also say that dead ancestors move to the Sky becoming stars, clouds, birds, or butterflies. Once the Panajachel have paid for their sins by doing time working for the Devil in the Underworld, they go as stars to a great heavenly city to live with God the Sun, all the apostles, the saints and their dead ancestors. Moreover, it is God who makes it rain by rippling his hand over the Sky's watery surface; to make storms, God wildly splashes the water.

Many tell tales about animals and their various antics. Opossums – those odd little holdovers from the Cenozoic era – become the protagonists in many a creation story. Opossum is often said to have brought fire, having stolen it from the old fire-god or the first people to have discovered it. Today's Huichol tell how once upon a time Opossum was cold and asked if she could spend the night near the only fire around. Although the fire's owners did not trust her, they agreed. In the morning when she was ready to leave, they searched her, but did not find the little coal she had tucked into her pouch. When they discovered a coal was missing, they pursued her, caught her, and beat her

into many pieces, leaving her for dead. But Opossums “play possum,” and can take a great deal of physical abuse. When they had left, she regained consciousness, and began thinking about the problem. She put all her pieces back in place: her skin, hair, sandals, hands, top of her head, brains, everything. Then she thought, “My goodness! Suppose they grabbed that little piece I hid in my pocket!” But looking into her pouch, she found it still there. Taking it, she began to blow it gently into life – wiiwiiwiiwii. This is the reason the Huichol never eat opossums; without her, they would never have had fire.

And so stories go on, spinning new-old tales about deities’ natural powers and deified natural entities. A long creative continuity can be traced to the earliest of times; and root metaphors speaking of creation from destruction and natural forces flow through most of these tales. The Earth Monster eats the Sun each evening, only to emit it out in the morning; things growing on Earth’s Surface eat the Underworld’s moist decay, and death’s living beyond moves through both the Underworld and the Sky. Even fire comes from a clever little creature who reconstituted herself after having been destroyed. If one observes natural processes closely, all this comes clearer. Deities control such forces as water, wind, and death, and deified natural entities hold water in their innards, support the sky, and steal fire. And so life goes on, and on, and on.

Mesoamerican Sacrifice

Ancient Mesoamerican sacrifice nourished the world's beings, thereby supporting life and growth. A natural, biological metaphor shaped sacrifice. To live, one must eat; and to eat one must kill something, which also must kill to eat to live. Moreover, ancient Mesoamericans considered almost all things to be living. Hence, ritual sacrifice formed a feeding exchange among various living beings of the cosmos including gods, humans, animals, plants, celestial objects like the sun, and even earthly entities like mountains and streams. All these living entities both killed to eat and died to feed other beings. Performing a sacrificial ritual meant one was paying one's debt to the various forces in the universe; since various beings of the cosmos sacrificed themselves so one might eat, one needed to return the favor by feeding them. No free lunch existed.

Moreover, this natural sacrificial eating exchange seems to have been symbolically linked with another natural metaphor involving transformative cycles of creation and destruction. When one is born, one can do two things: eat and defecate. As one eats and defecates, one grows and transforms from a baby into a child, an adolescent, an adult with children of one's own, a mature person, an elder, and finally one dies. To sustain one's life between birth and death, one eats corn, which also moves through a natural life cycle. One consumes corn that has matured in the fields, and then one defecates the digested corn back in the fields to fertilize more new corn plants. The corn feeds people, and people feed corn. Finally, at death one's body disintegrates, becoming the natural food of small insects and creatures living in the underworld. Such naturally creative-destructive, transformative cycles of birth, eating, defecation, feeding, growth and death continually shaped all existence.

While most are aware that the Aztecs (ca. 1350–1521) performed human sacrificial rituals, such sacrifice actually claims a long history in Mesoamerica. Splintered bones found in refuse deposits in the Preclassic Olmec site of San Lorenzo, Veracruz (ca. 1200–900 B.C.E.) suggest cannibal practices, and similar bone deposits have appeared at Teotihuacan in the Valley of Mexico (ca. 400–600). The Preclassic Maya site of Cuello (Belize, ca. 400 B.C.E.–250 C.E.) boasts a burial with the sacrificial remains of 32 young men of warrior age in its main plaza. Cannibalism and war both have long histories as forms of sacrifice. Cannibalism makes sense, for if sacrifice constitutes an exchange, then cannibalism is no more than the human end of that eating exchange. And if sacrifice demands that something be caught and killed in order to eat it, then war becomes one of the ways in which meals are hunted, caught and killed. Still not all sacrifice involved human comestibles, or war.

Sacrificial rites could be extraordinarily varied, and most sacrifices were not even human. A huge variety of sacrificial meals were offered up using just about anything edible. Many considered the first tortilla of the day a sacrificial meal. Other offerings could include quail, fish, jaguars, crocodiles, snakes, salamanders, and amaranth cakes. Ritual bloodletting was one of the most common forms; small amounts of blood were offered on numerous ceremonial occasions, from family naming ceremonies of new-born Aztec babies to the high state ceremonies of Maya rulers.

Sacrificial techniques were equally varied. Extreme forms of human sacrifice included heart extraction, decapitation, drowning, and shooting with arrows or poison darts. Rituals involved both willing and unwilling participants, native and foreign born, from all segments of society, both male and female and of all ages. Who or what became the offering depended on who required sustenance at any particular moment. Hence, sacrificial rituals were performed for diverse reasons. Large state sacrifices usually were associated with war and political hegemony, the need to sustain the state. But, other sacrifices were associated with agricultural cycles; offered to celestial recipients such as the sun, moon and stars; or more earthly foci such as the earth monster, or water deities taking the forms of mountains, or streams.

Some have claimed that sacrifice's origins rest in a protein deficiency resulting from a lack of domesticated animals. But this theory cannot account for the proteinrich diet already available to most Mesoamericans. They ate just about anything that walked, crawled, flew or swam; and studies now indicate that the natural Mesoamerican diet was a good one. Moreover, in Aztec times, very little of the sacrificial offerings were eaten, and that by only a few people who did not really need it at a time of year when food was most plentiful. Therefore, most scholars now accept that sacrifice's purpose was to sustain various cosmic beings, not to make up for a nutritional deficiency.

With the Spanish Conquest (1521), a new form of sacrifice appeared in Mesoamerica: the one-time sacrifice of Jesus Christ. Many Spanish found human sacrifice an abomination. The Eucharistic celebration of Christ's own last supper and sacrifice substituted bread and wine for human flesh and blood; it did not require actually killing anyone. Other forms of sacrifice proved more acceptable to the conquerors. Penitential practices involving fasting and offerings of food, birds and animals meshed more easily with medieval European practices. For their part, Mesoamericans quickly blended Christian sacrificial practices with their own traditions. Today, the sacrifice of chickens and other animal and plant comestibles in Christian ceremonies is quite common; and many faithful women still offer a meal's first tortilla to the four quarters of the cosmos. Christian rituals also continue to celebrate various points of life's transitions; agricultural cycles, birth, coming of age, and death all are commemorated now with a Christian sacrificial communion.

Mesopotamia – Ancient to 2000 B.C.E.

The development of a complex set of beliefs and practices over the millennia in Mesopotamia, the land between the two great rivers of the Euphrates and the Tigris, seems to have had as its primary aim the explanation, understanding and control of this environment by humans. The early evidence for any kind of ritual or “religious” behaviour is extremely scanty. There is no evidence at all from south Mesopotamia in the Paleolithic or pre-potteryusing Neolithic phases as the area seems to have been uninhabited. A very limited number of finds have, however, been made in the north of the region which date to the eighth/seventh millennia and which seem to point to the importance of wild animals and birds to the huntergatherers of the period. Wing bones from the skeletons of huge birds of prey have been found at a site called Zawi Chemi Shanidar piled together in such a way as to raise the possibility that the wings may originally have been specially preserved. The wing bones are associated with the skulls of wild sheep or goats. The excavator suggested that both were deliberately selected and may have been used to adorn the participants in rituals whose nature is unknown, but which may have been intended to placate the forces of nature and ensure the survival of the group. The importance of birds of prey and other wild animals to the huntergatherers who were the first people to live in the region is supported by remarkable new finds from Turkey of sculpted pillars showing these creatures in low relief at sites such as Nevalı Çori in Eastern Turkey. In north Mesopotamia some remarkable small sculptures showing the heads of raptors from Nemrik, an early Neolithic site in northern Iraq, also point in the same direction. There are no traces of ritual buildings or of sacred artifacts during this early period, but the deliberate interment of human beings, sometimes with a few grave goods, may already indicate a belief in an afterlife.

By the sixth millennium B.C.E., when agriculture was well established in north Mesopotamia, we begin to find representations of men and women, though we do not know if these were gods or men. In some cultures at least, such as the so-called Halaf culture, their faces seem to be of little significance, and are often represented merely by blobs of clay. Such figurines are usually female and show women with huge thighs and a marked accumulation of fat on the buttocks. It can be suggested that they represent a generic concept of fertility rather than individuals. The fertility of animals and crops was of paramount importance to these early farmers while children provided useful additions to the workforce. In contrast to this, paintings on contemporary Samarra pottery from further south show heavily scarified faces, while the bodies are not shown.

It is tempting to suggest that the scars represent group identifiers as in many traditional societies today, although of course, there could be other explanations. If this is the case then these are the first realistic representations of the human face in Mesopotamia. Remarkable human figurines in alabaster of similar date have been found in graves at the site of a fortified village near Baghdad called Tell es Sawwan, but their purpose is again unknown.

There are a range of burial rites from these early periods, which include cremation and burial of all or part of the body, probably pointing to a range of beliefs among the different groups in society, all concerned in their different ways with the proper disposal of the dead.

The evolving and transitional nature of beliefs at this time is striking. It is illustrated in south Mesopotamia by a number of human figurines with strange lizard-like heads modeled from clay. These figures are usually, but not exclusively female, some suckle babies, while one male figure carries what looks like a scepter. They date to the late sixth/early fifth millennium B.C.E. in the so-called Ubaid period and are found widely distributed in domestic settings as well as in graves. It is by no means certain that they represent supernatural beings, but such composite creatures could in no way be described as naturalistic representations and we may ask if they represent an intermediate step in the anthropomorphizing of natural forces, a process which was complete by the fourth millennium. It is also in the Ubaid period that the first cult buildings or temples appear in southern Iraq. Religious belief seems to be crystallizing and the divinities are represented as at least partially human for the first time. Burial rites also become more standardized and inhumation becomes the norm.

These developments coincide with the moment when human beings were first able to exert a measure of control over the forces of nature by the introduction of agriculture itself, and then of simple irrigation and storage techniques which gave them a small measure of control over the resources on which they depended for survival. As the impersonal natural forces of sun, wind, and storm, which had held early hunter-gatherers to ransom, became less all-powerful it is suggested that such forces began to appear more comprehensible and so could, for the first time, be visualized in human form. Once in human form it was possible, by analogy, to understand them better and to suggest ways in which they might be manipulated in order to maintain their favor, thus ensuring survival. The struggle by humans to control their environment had another weapon in its armory.

By the late fourth/early third millennium B.C.E. a fully urban civilization with irrigation systems and centralized storage of agricultural produce had emerged in the potentially fertile southern plains of Mesopotamia, the area which today lies between Baghdad and the head of the Arabian Gulf. People exerted more control over their environment than ever before, although it was recognized that this control was extremely tenuous. The humanization of natural forces continued and for the first time we have texts in the ancient cuneiform script, which allow us to reconstruct the names and personalities of the major deities. Archeology also enables us to rebuild their temples and

reconstruct some of the rites that took place in them. The major deities represent natural forces or observed features in the landscape. Initially they have Sumerian names as most of the population seems to have spoken this language, then many acquired Semitic ones as the linguistic composition of the population changed. The great gods include Anu the sky, Shamash the sun, Sin/ Nannar the moon, Enlil the air/wind; all powerful forces in a flat desert landscape where temperatures can reach 50 degrees centigrade in high summer. It is no surprise in this sort of landscape that the god seen as the particular friend of humanity is the god of sweet water, Ea/Enki, a cunning and wise god who saves humankind from a great flood in a story that is the precursor of the biblical story of Noah. (It is curious that the great rivers on which the region depended for survival do not seem to have been deified.) Among the goddesses Ninhursag represented fruitfulness and Inanna/Ishtar was the capricious goddess of sexual love and of war. Many other less important deities represented other aspects of the natural world and the new skills and crafts such as writing and metallurgy. Anu, the sky god, ruled them all and humankind was created to look after the pantheon as the servants of often extremely demanding and irrational masters.

The composition of the pantheon was extremely flexible, reflecting perhaps the fact that there are few geographical boundaries in Mesopotamia so that new peoples often infiltrated the great plains. Their gods were frequently either added to the existing roll call or amalgamated with older deities. The Semitic Ishtar is amalgamated with her Sumerian predecessor Inanna, while Sumerian Anu becomes of less and less significance during the third millennium and Marduk the god of Babylon rises up the hierarchy to rule the gods, just as his city comes to dominate the political scene. With the advent of city states, politics as well as the environment began to play a role in religious thought.

A cosmology can be reconstructed from texts of the second millennium B.C.E., which also tells us how the ancient Mesopotamians saw their world. The gods inhabited the heavens, which were separated from Earth by the air. The Earth itself was flat and floated on a sea of sweet water. Heaven and Earth were formed from the corpse of a female monster called Tiamat, who had been slaughtered in mortal combat by Marduk. Each deity was responsible for a particular city and its prosperity depended on the goodwill of that god and on his or her advocacy in the assembly of the great gods where major decisions were taken about the future of humankind. From this it followed that the first duty of every person was to care for the god or goddess of his or her city in order to retain their goodwill. This duty fell most heavily on the priests who were charged with the day-to-day business of feeding, clothing and entertaining the deity in his temple or palace.

Rulers were chosen by the gods and were often said to have been suckled by goddesses, or like the great hero Gilgamesh, to be semi-divine themselves. Their main task was to oversee all the needs of their patron deity, building new temples when instructed to do so, providing lavish gifts, dedicating booty after a successful campaign, and where appropriate acting as the husband of the goddess in a sacred marriage, so ensuring the fertility of the land. Where the patron deity was male a high priestess apparently

fulfilled this duty. Agriculture was the foundation of the region's prosperity so that the link between environment and religion remained fundamental. Kingship was regularly withdrawn by the gods from one city and passed to another. Divine goodwill might be withdrawn for ritual infringements or because of neglect or other wrongdoing.

The underworld seems to have been a mirror image of the heavens; it was a gray, bleak place below the ground ruled by a ferocious queen called Erishkigal, a sister of Ishtar/Inanna who had at her command a court of demons and other officials who carried out her bidding as Anu did in heaven. The dead had little comfort and little to look forward to unless they had a large surviving family who would make offerings of food and drink to them in perpetuity.

We have already noted that each god had his or her own city in which s/he was thought to live, residing like the earthly ruler in his/her own temple or palace often accompanied by other members of the divine family and with a fully staffed court of officials. Gods were fed, clothed and entertained by their priests as if they had been human kings or queens. The buildings in which these ceremonies took place were of different plans and different sizes, ranging from the great central temples with adjacent stepped ziggurats, to small neighborhood chapels. They all have a number of features in common whatever their size; access was limited, the statue of the living god on his or her altar was shielded from the eyes of all but a few priests and senior officials, while major festivals were celebrated in the courtyard of the shrine so that ordinary people might participate in a limited manner. Initially these patron divinities were thought to own all the land and all the people of their city. The temple was the economic hub of the settlement too and the manufacturing industries, trade and agriculture were all centered in it. It was also the administrative center of the city with judicial and welfare functions. It is important to realize that the people of Mesopotamia made no distinction between religious and secular, between church and state; society was seen as a single entity, a concept perhaps closer to that of Islam than of Christianity.

By the end of the third millennium B.C.E. the initially simple agricultural technology of the region had developed into a centralized, state-run system of considerable sophistication, which gave people a far greater degree of control over their environment than ever before, although natural forces could still wreak havoc. Other factors now come into play in the evolution of religious thought, notably changes in the political environment, which saw the first territorial state emerge in the region.

The same period saw another major change in the political environment with the establishment of a dynasty of rulers in the city of Agade and, slightly later, in the ancient southern city of Ur, who declared themselves divine. To bolster their position these self-proclaimed divinities seem to have made a deliberate attempt to transfer power into their own hands at the expense of the old temple institutions thus undermining the power of the priesthood. Changes in the plans of temples, the appearance of shrines in private houses and the occurrence of large numbers of quasi-religious clay plaques in domestic contexts all seem to suggest this. It seems that men and women no longer needed the services of a priest to make an approach to the gods, but did so

through the mediation of a personal god or “guardian angel” who becomes of increasing importance. The scene of a man or woman being introduced into the presence of one of the great gods by such a personal god is the most common theme of the glyptic art of the period.

This increasing control over the environment, though far from complete, seems to have made the gods appear less terrifying and less capricious, although their goodwill was never assumed. The texts of the period speak of an assembly of the gods at which major issues were discussed and decisions taken. Perhaps it is this relative rationality among the gods that led to the emergence of the first indications of a concept of a rational judgment of the individual according to his deserts by the gods after death. By extension the notion emerged of personal responsibility among men and women for their actions. It was shortly after this that the texts began to speak of the dilemma presented by the harsh treatment, on occasion, of the so-called just person by the gods, a dilemma exemplified by the story of Job in the Old Testament.

In the course of around four thousand years the people of ancient Mesopotamia seem to have moved from the worship of untamed natural forces to a state-sponsored religion where each person had a personal god or goddess who guarded and guided them through life, procuring favours from the great gods and protecting them from illness and other forms of bad luck. In addition, each individual was increasingly seen as responsible for their own actions to a divine judge whose decision would decide their fate in the afterlife. These major intellectual developments can be correlated with changes in the relationship between humans and their physical and political environment. As human beings’ control of the natural forces, which had originally determined their survival or death, improved, so human beings’ perception of the nature of those forces changed. First they were given human forms and human characteristics, but were seen as capricious and unpredictable; gradually they were seen as more rational; and the pantheon might be said to have begun to grow up by about 2000 B.C.E.

Michell, John (1933–)

John Michell is a prolific British writer and artist concerned with what he sees as the recovery and further elaboration of sacred principles of living. He combines interests in, for example, architecture, art, astrology, geomancy, geometry, gematria, music, and numerology with a wide engagement of archeological and historical literature and sites. This is even more impressive when one notes that Michell's knowledge of geomancy includes traditions and practices originating not only in China (e.g., Fengshui), but also in Europe and elsewhere. Furthermore, his writings arise from and provoke a passionate participation in the present realities and future possibilities of the world. When he writes about Jerusalem, for example, he is deeply concerned not only with ancient architecture, geometry and history, but with something far more than a Middle-East peace settlement. The words "sacred" and "harmony" are leitmotifs in all he has written about humanity, the world and the cosmos.

Since its first publication in 1967, his book *The View Over Atlantis* has had a significant impact on the study and practise of "Earth Mysteries." Others might map lines (leys) across landscapes and argue about UFOs, ancient civilizations, and Earth energies. Michell proffers a glorious vision of a global civilization that once tapped some enormous but subtle energy and channelled it through a vast astronomically and artistically perfect system to enhance harmony and beauty. The discovery of alignments and the understanding of ancient megalithic sites, for example, are related to a greater purpose than the production of a gazetteer of obscure facts. Michell encourages people to "bring human ways into harmony" with the place and the world in which they live. Science and imagination combine in underscoring a visionary but practical encounter with a nature that is itself the manifestation of perfect and balanced proportions.

His many publications are hard to summarize briefly. But if *View over Atlantis* is about Earth Mysteries, *Twelve Tribe Nations* concerns ideal social structures, *Euphonics* is a sonic and musical primer, *Traveller's Guide to Sacred England* is a walking tour guide, *The Earth Spirit* catalogs artistic representations of Earth energies, and his many newspaper and internet articles discuss popular theories about a sacred but damaged world. Even a full list of Michell's publications along these lines would fail to do them or their author justice any more than would describing Michell as a popularizer of Platonic and Pythagorean theories.

Michell's combination of precise measurement, careful argument, impassioned advocacy, and confident eccentricity have probably won him as many admirers as they have lost him credibility in various academic circles. Conversely, perhaps, his advocacy of monarchy and priestly authority may be ignored by those enchanted by the geometri-

cally and artistically pleasing structures he adduces in diverse landscapes and localities. However, a better test of the appeal of Michell's work is that it has influenced both mystics and eco-activists, romantics and pragmatists. It can perhaps be summed up as a continuing quest for the reconciliation of the intrinsic patterns discernible in literally all sensual, material forms, thereby elucidating cosmic principles for harmonious living for all.

Middle Earth

The “Middle Earth” is the setting for J.R.R. Tolkien’s (1892– 1973) mythopoetic book *The Lord of the Rings*, as well as his earlier children’s book *The Hobbit*. It is inhabited by a number of different “races,” only one of which is human. The elves, masters of lore and art, are immortal; dwarves are secretive, hardy and hard-working; and hobbits, Tolkien’s own unique invention, are a short and sociable people, shrewd if not intellectual. There are also corrupted opposites of the elves and dwarfs – orcs and trolls.

In Tolkien’s tale, Frodo the hobbit comes into possession of a magic ring which turns out to be the One Ring of Power, forged by Sauron, the evil lord of Mordor and the most powerful ruler in Middle Earth. Sauron is looking for his Ring, which would enable him to complete his conquest. So Frodo, accompanied by a Company comprised of two men, an elf, a dwarf, three hobbits and an Odinic wizard named Gandalf, is obliged to try to take it back to the furnace in Mordor where it was forged, which is the only place it can be destroyed, and which is the only way that harmony can be restored to the Middle Earth. This pursuit constitutes the story of *The Lord of the Rings*.

Each of the races exists in interdependence with the places where they naturally live: the hobbits in the Shire, with its villages and fields, bounded by woods and streams; the dwarves in the vast heights and depths of the mountains, where they live and mine; and the elves in forests. As one character remarks of the last, “Whether they’ve made the land, or the land’s made them, it’s hard to say . . .” Their relationship is that of living in place – bioregional rather than proprietorial. As someone says to Frodo, “all things growing or living in the land belong each to themselves.”

Much of Tolkien’s story centers on the struggle of good against evil. Among his most memorable creations are the Ents, who are sentient trees who walk and talk. And when Fangorn, the chief Ent, is asked whose side he is on in the War of the Ring, he replies, “I am not altogether on anybody’s side, because nobody is altogether on my side, if you understand me: nobody cares for the woods as I care for them.. .”

The Ents eventually do go to war against Sauron’s allies. But the natural world in Tolkien’s story has an importance, and a degree of autonomy, that is striking in a modern work. At least sixty-four kinds of non-cultivated plants are mentioned, plus eight of his own invention. Trees especially stand out: not only the four major forests, each with its own particular character, but individual trees as well. As Tolkien noted in a letter late in life, “In all my works I take the part of trees as against all their enemies” (in a letter printed in *The Daily Telegraph*, 4 July 1972).

Indeed, Middle Earth itself is a kind of character in its own right. Although a secondary creation, Middle Earth is clearly, as Tolkien insisted, *our* Earth in a different time. One of its roots lies in ancient Northern myth, in which Middle Earth was so called because it hung between the heavens and the underworld, and between the land of ice to the North and the land of fire to the South. The other root was, as Tolkien himself said, “my wonder and delight in the earth as it is, particularly the natural earth” and its weather, geology, ecology, flora and fauna, stars and lunar phases (in Resnik 1967: 41).

As befits a character, Middle Earth is capable of intelligence and emotion. A mountain causes blizzards to block the Company’s way; when a king dies, a great rain weeps on the battlefield; and the summer following royal nuptials is unsurpassed for its fecundity. In short, it is a premodern animistic and pagan world, where personality and agency is not reserved for humanity alone, and the Earth is alive. Tolkien does not romanticize nature; much of Middle Earth is dangerously hard or hostile, and tragic in its history. But the only place which is dead, or nearly so, and where the land is ruthlessly subdued to industrial production, is Mordor.

By the same token, the natural world in Middle Earth is not divorced from religion. There is no organized religion there as such, but the worship that takes place is of deities that are coeval with elemental powers and natural phenomena (stars, trees, etc.). And its continuity, in Tolkien’s world, depends on narratives: the collective, ritualized stories of divine, human and nonhuman beings that constitute myth.

For Tolkien himself, this aspect of his work presented certain problems; it existed in complex tension with his deep personal commitment to Roman Catholicism. On the one hand, the latter’s tolerance of intermediary spirits (unlike Protestantism) permitted him to draw on the pagan mythology he also loved. And this has ethical implications, for example, reflected in Frodo’s experience of the intrinsic value of a tree in the Elvish forest of Lorien: “He felt a delight in wood and the touch of it, neither as forester nor as carpenter; it was the delight of the living tree itself.” On the other hand, Christian theism insists on the ultimate dominance of the one transcendent God, and there is a corresponding Christian stewardship ethic in the hobbit Sam’s responsibility for renewing the post-war Shire.

Readers have responded to Tolkien’s work in diverse ways, shaped by their own time. Since the 1970s – a time of global ecological crisis – the story is increasingly appropriated as an environmental story. As Fangorn puts it, “it seems that the wind is setting East, and the withering of all woods may be drawing near.” And at the center of that storm is the Ring of Power, which some readers liken to technological society and what Lewis Mumford called “the megamachine” (Mumford 1964: 263).

More specifically, the *The Lord of the Rings* was an inspirational book for the late David McTaggart, founder of Greenpeace. It circulated widely in *samizdat* form among the underground resistance (environmental as well as political) in the USSR and communist Central Europe. And it has become a part of the green spirituality of radical environmentalists in the United States fighting deforestation who took Fangorn as a

symbol of their biocentrism, and in Britain, among activists resisting the imposition of new roads.

Tolkien's work is thus a modern myth about a world not yet disenchanting and commodified, and it tells the story of how that world was saved. In apparently looking back to a lost world, it offers readers hope for this one through what Fraser Harrison termed "radical nostalgia" (1984: 170). As a significant cultural contribution to a much-needed re-enchantment of the world, Tolkien's Middle Earth has never been more relevant, and new generations of appreciative readers – and as of the early twentieth century, motion picture aficionados as well – will continue to find inspiration there.

Minakata, Kumagusu (1867–1941)

Kumagusu Minakata was called “a neglected Japanese genius” by Carmen Blacker, a specialist in Japanese shamanism, in her Presidential Address to the Folklore Society in England in 1982. Born a year before the initiation of the Meiji Period, Minakata became an exemplar of the Meiji renaissance intellectual, traveling to the United States and England as a young man, educating himself in a variety of subjects, and writing articles in Japanese and English on biology, folklore, ethnology, psychology, and religion. He is receiving renewed attention today in Japan particularly because of his “Anti-Amalgamation of Shrines Movement,” according to Sadamichi Kato.

In his opposition to two laws passed by the Meiji government, the first in 1888 and the second in 1906, which first attempted to consolidate villages into larger political units and then sought to limit official religious shrines to one per political unit, Minakata formulated his arguments by melding together ecological and religious arguments. In so doing, he sought to uphold vernacular spiritual practices in opposition to centralized religion and to defend the local shrines and their surrounding woods as places that not only generated a reverential attitude toward nature, but also supported local flora and fauna on sacred ground and provided a focal point for community self-regulation. True to his localist emphasis, Minakata fought for the preservation of specific shrines, such as the Oyama Shrine to which his family was historically attached, and was jailed at one point for his protests. In 1920 the Japanese government abandoned the contested ordinances. Although none of Minakata’s writings have been translated into English, volume ten and the appendix to volume one of *Minakata Kumagusu Zenshu* do contain English-language pieces that he authored. world of comparative religion are prolific, if more often than not utilized as rather poetic invocations.

Mitchell, Elyne (1913–2002)

A poetically descriptive essayist on environmental issues, Sibyl Elyne Keith Mitchell (born Melbourne, Australia; daughter to Sir Harry Chauvel) was the first Australian to place the condition of her country's soil in the context of comparative civilization and ecology. Most of her life was spent on a station in the upper reaches of the Murray River, in southernmost New South Wales. While writing more aesthetically oriented works – *Australia's Alps* (1942), *Speak to the Earth* (1945), and *Images in Water* (1947) – her most famous work is on the need to preserve ecological balance. In *Soil and Civilization* (1946) she plots the paths of civilization away from an earlier ecological unity and a spiritual awareness that the whole of life rested in God. The same error of neglecting this unity, and showing irresponsibility toward the soil above all, brought trouble to Sumeria, Persia, Egypt, China and India, Greece and Rome, Western Europe, [and] the Mayas, with Westerners repeating the same errors in the Americas and South Africa. Her prophetic goal was to save a vulnerable Australia from the same fate, by (re-)extolling the soil as the divinely ordained matrix of our being, which has to be rebuilt, where damaged, with patient research and wise water conservation. Supporting images from the nations of California Indians according to broad-based linguistic and cultural similarities. The Miwokan subgroup of the Utian language family (Penutian stock) consists of seven such cultural nationalities: Coast, Lake, Bay, Plains, Northern Sierra, Central Sierra, and Southern Sierra Miwok. While these categories provide a useful comparative framework, for most of their history Miwok peoples lived as members of independent, relatively egalitarian, multi-village tribes, each one with distinct territorial boundaries and control of the resources within those territories. The landscapes Miwok peoples inhabited varied from coastal baylands and inland hills to higher elevation foothills and mountains in the Sierra Nevada. Today, eleven federally recognized tribes have Miwok membership; others are still seeking federal recognition.

For Miwok peoples, nature, culture, and religion did not exist as separate categories, but as blended elements of day-to-day life. As the underpinning of Miwok religious systems, creation narratives provided people with a sense of identity, rules of appropriate behavior and a context for evaluating life's most meaningful experiences. They described the actions of the "First People," supernatural personages with both human and animal attributes, and, at times, the attributes of natural phenomenon, such as stars and hail. The Miwok referred to the First People by the names of the present-day animals and natural phenomenon into which they transformed themselves after they created humans and provided "everything, everywhere" humans would need to live. Miwok narratives describe how the First People created human beings from crow,

goose, raven, and turkey vulture feathers placed on or planted into the ground, or from wood and mud. One contemporary Bodega Miwok/Dry Creek Pomo woman sees the creation from feathers as confirmation that humans comprise “both earth and a spirit that soars” (Kathleen Smith, personal communication, 2002).

As a gift of the First People, the animals of today serve as a tangible reminder of myth-time, and Miwok cultures and spiritual values incorporated proscriptions for the responsible, respectful use of those same animals. According to Central, Northern, Southern and Coast Miwok sacred narratives, the very shape of people’s hands was an outcome of the wise foresight of a Lizard personage. Northern, Central, Coast and Lake Miwok peoples variously attributed the red breast of robins, red throat of hummingbirds, and the ability to make fire from buckeye and incense cedar, as an outcome of the theft of fire by Robin and Hummingbird personages in myth-time, when they brought heat and light to an otherwise cold and dark world. Mount Diablo, Mount Konocti, Sonoma Peak, and the sites of other events during myth-time, all served as awe-inspiring reminders of creation, and became places of prayer and sources of spiritual power.

As with many other North American Indians, the birth imagery of a world flood permeates the creation narratives of the Southern, Central, and Coast Miwok. In Sierra Miwok versions, Frog, Hummingbird, and Dove, all male personages, obtain sand and mud from which to create (re-birth) the flooded world. Dundes (1984) has conducted a comparative study of psycho-symbolic elements of this distinctly male creation, which has cognates in several parts of the world.

Another mythic event that interconnected nature, culture, and religion among the Miwok featured a world fire. The Miwok were well aware of the regenerative qualities of fire, which they used as a horticultural tool, in a carefully managed way, to return nutrients to the soil, eliminate disease organisms from it, improve seed harvests, and bring about the growth of young, herbaceous plant material which provided browse for deer, elk and antelope, which they in turn used for food, clothing and tools. Regular burning caused the growth of long, straight shoots needed to make shapely baskets and a variety of other objects. It also eliminated the accumulation of fuel in the form of decaying plant material and other plant debris on the ground, thereby preventing the occurrence of the type of uncontrolled, destructive fire which spread across the world in myth-time.

Not only did the Miwok manage the land in a way that acknowledged their relationship with it and their responsibility to it, but they also ascribed consciousness to inanimate objects, as well as plants and animals. They viewed the world as comprised of an interconnected system of powerful, usually ambivalent, supernatural forces, including spirits associated with air, wind, and water, ghosts, and other beings, which existed as an integral part of daily experience. The world had the potential for both good and bad – not necessarily in the moral or ethical sense of right and wrong, but as an expression of harmonious and inharmonious elements. These component forces

were good (in harmony) when under control, but had the potential for bad (illness or catastrophe) if uncontrolled.

Supernatural sanctions, ritual, ceremony, and cultural rules served to control and stabilize a potentially unstable world. They provided an affirmation of, and check on, natural forces. So it was that Miwok peoples kept the world harmonious (balanced) through prayerful thoughts, actions, and offerings, adherence to rules of proper behavior, fasting, and the observance of spiritual dances on a seasonal cycle.

The most sacred dances, as visual prayers, gave thanks to the Creator and served to maintain the world's spiritual balance, thereby ensuring the health and well-being of the group, protecting people from natural disasters, and creating the conditions necessary for an abundant harvest. The Miwok also held less sacred dances for doctoring, to dedicate and give thanks for the autumn acorn harvest, to initiate economic activities appropriate to a given time of year, to commemorate important events, and for mourning.

Throughout north-central California a roundhouse served as the center of religious observances. The earliest roundhouses were semi-subterranean, earth-covered structures supported by posts and secondary rafters, their shape reminiscent of the Miwok conception of the cosmos as a sky dome resting on the Earth; their central smokehole reminiscent of an opening, recognized by at least some Miwok, as existing at the top of the sky dome. Beyond this dome, and below the Earth, supernatural beings existed who conducted activities which affected the Miwok, such as creating earthquakes and moving the sun from east to west. The womb-like darkness and tunneled entrances of roundhouses evidence birth symbolism.

The roundhouse provided the locale for the observance of the Kuksu religious system, a system shared by people in the San Francisco Bay area, the Sacramento and northern San Joaquin Valleys, and adjacent hill areas.

Kuksu observances were characterized by a male secret society and, at times, a similar female secret society. The society members were chosen on the basis of their social, political or economic status. They underwent formal initiation rites and special instruction before receiving leadership positions. In their role as religious specialists, initiates administered the cycle of Kuksu ceremonies, which included singing, dancing, and curing. Through ritual observances, the dancers "recreated sacred time and in one way or another restored their people to the unsullied state that had prevailed at the time of creation" (Bean and Vane 1978: 665). In the most important and elaborate ceremonies, dancers represented supernatural spirits and beings, often the same as those prominent in creation accounts. The words of a Central Sierra Miwok lileusi dance expresses well the transformation from human to spirit that the dancers undergo: "This is what he [the spirit] said when he came. He came from Mt. Diablo

[Supemenenu]. The dancers get just like this fellow when they start to be this kind of a dancer" (Gifford 1955: 277). In undergoing this transformation, the dancers accepted tremendous responsibility. They adhered to stringent rules lest illness or catastrophe result from improper conduct of the dances.

The dancers wore elegant feathered regalia, comprised of flicker quill headbands, hairnets, headdresses, hairpins, belts, earrings and cloaks, which served as “a symbol of great wealth and prestige” (Bates 1982: 1). Because of the intense supernatural power associated with the dance and regalia, the latter had to be properly produced, manufactured, handled, and cared for. The makers sang special songs and made food offerings. Construction details, such as feather arrangements, showed the maker’s respect for the birds from which they come. The finest examples demonstrated the tremendous technical ability and care needed to trim, cut, and secure the materials for a grand appearance. During the ceremonies, the actions of the dancers, firelight reflecting against their regalia in the otherwise dark roundhouse, the sounds of shell pendants and beads moving with their rhythmic steps, and the voices of the singers, accompanied by whistles, split-stick rattles, and a footdrum, all helped to transport the dancers and audience into the spiritual realm, and provided a visible affirmation of their day-to-day relationship with nature and the supernatural.

Spanish, Mexican, Russian and American intrusions onto Miwok lands irrevocably altered that relationship. Miwok peoples variously grappled with missionization, introduced disease, enforced servitude, displacement, massacres, separation in boarding schools, and social marginalization, at the same time that trapping, building, mining, logging, ranching, agriculture, and the elimination of Miwok land-management practices caused rapid environmental deterioration. The Miwok economy shifted from one based on foraging and horticultural techniques, to one based on a cash economy. Many Miwok converted to Christian religions, seeing elements of the older beliefs in the new religions. Where the older religious systems continued to be practiced, they underwent changes due to the implementation of the prophecies, visions, and dreams of new religious leaders, and the new and closer contracts established between tribes in wider geographical areas than the past. Some of this change may have been generated by the spread of the Ghost Dance movement into north-central California in 1870, with its hope for a return to the “peaceful and prosperous conditions” that existed prior to non-Indian intrusion.

Those Miwok who continued to dance began substituting cloth, buttons, glass beads, yarn, commercial cordage, and non-native feathers for some of the harder to obtain and make materials used in the older regalia, especially the raptor feathers of old, which the federal government, in an effort to prevent extinctions, made illegal to possess, except by special permit. Although many old-time traditions had declined or fallen into disuse by the early 1900s, some Miwok people fought to keep the dances going. Notable among these efforts was that of the late Bill Franklin, who, in the 1940s collaborated with Sierra Miwok and Nisenan traditionalists to form what is now called the Miwuk Dance Group. Franklin also helped establish Chaw’se (Indian Grinding Rock State Park), where a roundhouse was established, and an annual big time, which brings together several Central California Indian dance groups, occurs. He was also instrumental in the establishment of a Miwuk Indian Roundhouse at Westpoint.

Some Coast Miwok dance with their Pomo relatives in a roundhouse established at Point Reyes National Seashore. Other Miwok people participate in dances at a roundhouse built at Yosemite National Park, where old-style ceremonies are hosted as well as an annual Bear Dance, a new tradition borrowed from the Mountain Maidu. Whether public or private, such dances provide an affirmation of Miwok peoples determination to ensure the health and well-being of their people and culture into the future.

Some of the older values and beliefs which bound nature, culture and religion together in Miwok life have undergone a renaissance in other areas as well. Those Miwok who continue to gather some of the native foods, such as acorn and manzanita, and natural materials from which to make cultural objects, such as basketry, still pray and leave offerings when they do. Miwok and other basketmakers are actively working with officials associated with National Forests and other public and private landholders to urge the discontinuation of herbicide spraying, ensure access to native foods and materials, and seek the reintroduction of native plants and ancient land-management techniques, especially burning. Contemporary Miwok peoples also seek protection of their sacred sites.

Miyazawa, Kenji (1896–1933)

Kenji Miyazawa was a Japanese agronomist, poet, and writer. Through his writing we see how the knowledge of the scientist, the intuition of the poet, and the Buddhist's sense of compassion as well as understanding of the interdependence of all phenomena, can nurture attitudes rooted in “deep ecology” and promote the growth of a bioregional consciousness. Miyazawa's collected works include poems, songs, plays and tales (*dowa*). Although *dowa* refer to children's tales, his stories have earned international recognition as literary masterpieces, offering multiple levels of interpretation.

Miyazawa grew up in a struggling agricultural community in Iwate Prefecture, about 300 miles north of Tokyo. At age eighteen he embraced the teachings of the Lotus Sutra, a doctrine of co-enlightenment that preaches the essential unity of all phenomena over time and space, offering hope for Buddhahood to all, regardless of species or gender. Miyazawa was deeply influenced by this sutra, which calls upon the reader to act out the sutra with his or her body and mind, following the example of the various bodhisattvas who are prepared to come to the aid of all beings, whether man or woman, human or nonhuman.

Miyazawa studied at Morioka College of Agriculture in order to share his knowledge with local farmers. He also taught at an agricultural high school. During breaks from regular work in class and field, Kenji would lead his students up the volcanic slopes of Mt. Iwate, or take them to the local riverbed to dig for fossils. As they walked, he would tell them about the relationships over space and time between rocks, soil, plants, and animals. He was a pioneer of environmental education.

Although Miyazawa devoted his life to the local farm community, he was saddened to see wild lands destroyed for further development. In his poem “A Recitative on Irises by a Young Surveyor from the Land Cultivation Bureau,” our surveyor decries as “original sin” the destruction of a lovely green highland with its dense clusters of irises, soon to be plowed under and converted to dreary humus (Miyazawa 1980: v.5, 198–200).

From early childhood Miyazawa enjoyed hiking over the plains and into the mountains of Iwate. His joy, bordering on ecstasy, is expressed in “Ippongi no” (One-tree Plain):

I am the beloved of forest and field. When I walk through rustling reeds
Green messages, bashfully folded, Slip into my pockets;

When I enter the shade of the woods, Crescent-shaped lipmarks
Cover my elbows and trousers (Miyazawa 1980: v.2, 260–2).

In “Taneyama Heights,” the poet goes beyond rapport to complete identification with nature, as he looks out from a high plateau, over layers of mountain ridges: “I am the water and the light and the wind” (Miyazawa 1980: v. 3, 419). In contrast to the traditional literary view that sought to bring external nature into one’s spiritual universe and internalize it – the so-called “miniature garden tendency” – we find that Miyazawa’s inner world flows outward, merging with the universe.

Rooting his poems and stories in the landscape of Iwate Prefecture, Miyazawa provides the intimacy necessary to establish a sense of place, while simultaneously transcending time and space, to supply the modern myths that will reconnect us to the Earth. Themes characterizing Miyazawa’s tales are the virtues of humility, the equality of all phenomena, harmonious coexistence, balance and compromise, the aesthetics of untamed nature, and science that benefits life. Many tales illustrate the cyclical nature of natural systems, and at the same time explore the deeper philosophical issues of karma and cycles of life and death. Miyazawa’s tales seem to convey “the will of the universe” as expressed to the poet through the sounds of nature, particularly the voice of the wind. Miyazawa, as artist, is a modern-day shaman, interpreting the divinity in nature. Miyazawa, as scientist, brings to us a detailed view of a local ecosystem. His words unfold as an ecology of sacred space.

If Miyazawa Kenji has become an almost mythical figure in contemporary Japan, it is because he has provided through both his literary work and lifestyle some of the guidelines that could help us create a better world. As the child Giovanni says in Miyazawa’s *Night of the Milky Way Railroad*, “. . . we’ve got to create a better place than heaven, right here” (Miyazawa 1980: v.12, 152).

Moltmann, Jürgen (1926–)

Jürgen Moltmann is widely regarded as the foremost Protestant theologian of the last forty years. Moltmann was a professor of systematic theology at the University of Tübingen from 1967 until 1994. He was an early proponent of “political theology” which stresses the Church’s public mission to promote social justice. His first major book, the *Theology of Hope* (1964), won wide acclaim for its forceful affirmation that an eschatological “openness to the future” must be at the core of Christian proclamation. This openness, he argued, sustains hope for liberation and societal transformation. In *The Crucified God* (1973), Moltmann secured his international stature by developing a “theology of the cross” that understands the inbreaking of the future of God’s kingdom in the midst of Christ’s and the world’s suffering. In the mid-1970s he began to introduce ecological concerns into his theological reflection. In *The Future of Creation* (1979) he sought to integrate his eschatological emphasis on history with an ecological understanding of the natural world. He described creation as a “still open, creative process” in which God enlivens and sustains the community of life. Instead of the biblical charge to “subdue the earth,” Moltmann holds we must “free the earth through fellowship with it” (Moltmann 1979: 119, 129).

In 1980 Moltmann began to publish a major series in systematic theology titled *Messianic Theology*. His second volume, *God in Creation* (1985), developed his integration of eschatological transformation with an ecologically informed theology of creation. Moltmann is a broadly ecumenical thinker and he developed his views in close conversation with Jewish, Catholic, and Orthodox sources as well as ones drawn from the Protestant traditions. Moltmann stressed the role of the Holy Spirit dwelling in, and sustaining, the world of creation. He understood creation as being transformed by the kingdom of God that renews all things. He concluded, too, that genuine human liberation requires living in peace with nature. Against Western anthropocentric traditions, Moltmann called for a theocentric view that understands the natural world as God’s creation, not as mere property subject to any human use. Moltmann drew on the Jewish kabbalistic doctrine of the *zimsum* that holds that God first created space for the world of natural creation by withdrawing into him or herself. For Moltmann, this notion of divine self-limitation reminds us helpfully that God creates in major part “by letting-be, by making room” (Moltmann 1985: 86–8). Rejecting Christianity’s long-standing view that the human is the “crown of creation,” Moltmann followed the Jewish belief that the Sabbath is creation’s true crown (Moltmann 1985: 31). The Sabbath is a “feast of creation” for it marks God’s resting with, and immanent presence within, the natural world, and it suggests to Moltmann that the path of ecological

responsibility lies in an ethic of dwelling within and respecting creation, rather than one of mastery and domination.

While Moltmann's views on creation have been generally applauded, some fear that he pushes an eschatological sense of nature's "openness" too far. They worry that his description of creation as an "open system" might unwittingly play into the hands of those who lose no sleep over the onrush of humanity's transformation of nature. If nature is so "open," are there then no stable balances, ordered relationships, or relatively fixed requirements for species flourishing that must not be transgressed? Despite such concerns, Moltmann deserves recognition for his important contribution in developing an ecological theology of creation. Many theologians and lay-people, who had before dismissed ecological concerns as marginal ones for the Christian churches, have come to a new appreciation of their significance under Moltmann's prodding. Moltmann's international stature allowed him to draw the attention of a wide range of theologians and lay-people to ecological concerns in a way that few other theologians were able to do.

Mongolian Buddhism and Taimen Conservation

I became interested in the impact of religious belief while visiting a church in Louisiana in 2000, on the edge of what is referred to as “cancer alley” in Louisiana; an area crowded with refineries. A group of African-American women garnered spirited community support through their church, mixing rallies with gospel music and bridge-building with Southern-fried righteousness. As a director of the national Sierra Club at that time, I was there to support legislation to limit levels of dioxin getting dumped into the Gulf of Mexico and surrounding communities. This blending of local culture and religion with conservation demonstrated surprising muscle, attracting the support of regional conservation groups and the national Sierra Club. Through this experience, I became intrigued with religion-based conservation activism.

In September of 2000, the Mongolian nonprofit organization Taimen Conservation Fund initiated a taimen conservation project, the Uur River Project. A taimen is a Mongolian fish that can attain a length of more than seven feet and can weigh up to 230 pounds. In addition to fisheries research, the Taimen Conservation Fund recently received funding from the World Bank to rebuild a Buddhist monastery as part of the overall restoration strategy. A collaborative effort between the Buddhist community and conservationists has been forged to ensure protection for one of the last places on Earth with a healthy taimen population. My role is to assist both parties in creating an outreach program on rivers and taimen. Outreach derived from a bridge between the conservation goals and Buddhist beliefs will help to enlist local support as well as make the message palatable to the general public. By working within existing cultural precepts, river protection and taimen preservation has a greater chance of success.

During my stay in Hvolsgul, I interviewed several residents of the Uur River Valley who practice a faded blend of Lamist Buddhism and Shamanism. My project entails research and discussion on the nexus of Buddhism and conservation. The goals of the Uur project are: to create a regional Buddhist outreach program on the importance of the river and the fisheries; to restore the Dayan Derkh monastery; to work with the community to manage taimen conservation; to curtail taimen poaching; and to strengthen bonds between the Buddhist and conservation communities. The Uur River flows past the remnants of the toppled Dayan Derkh monastery, winding through a golden larch forest, spilling into the interior of an ancient empire that once stretched from Beijing to the Caspian Sea. Within this body of water lives a giant fish named the taimen, believed by locals to be river god’s daughter. To watch this fish explode from

calm waters is to know why the taimen is also called the river wolf by the fly-fishing community.

Mongolia's Uur River Valley, one of the most isolated and pristine in Eurasia, attracted the shaman Dayan Derkh to live on the banks of its cold waters during the thirteenth century. It was here, as legend has it, that the feisty shaman got cross-ways with Genghis Khan and turned himself to stone to escape the Khan's wrath. Vexed by his behavior, the great Khan called upon the Dalai Lama in Tibet to deal with this stubborn stone. The Dalai Lama sent over seven monks to build a Buddhist monastery under the shaman's cave. It was while listening to the monks' prayers that Dayan Derkh converted to Buddhism. The monastery became a school housing 150 monks and taught a thousand students before it was destroyed.

In 1937, under the influence of Russia's leader Joseph Stalin, the Mongolian government slaughtered more than 17,000 monks in Mongolia. (No records are available and some reports indicate as many as 200,000 were killed.) Dayan Derkh monastery was locked and the Uur Valley was left without spiritual leadership. After three generations, the residents' beliefs began to blur and lose power. The monastery was looted and torn down. Today, all that is left are the weathered foundation posts tied with blue ribbons, leaning beside scattered piles of gifts left for Dayan Derkh and Buddha.

Like many resource-rich habitats, the Uur Valley is experiencing overhunting, timber and mineral extraction and habitat destruction. Taimen are poached and sold in regional markets to urbanites and foreigners. It is illegal to kill taimen and this trend in poaching is a modern issue. Residents once guided by the regional religious beliefs, which considered the fish the river god's daughter, left the taimen unharmed. Eating fish in this culture remains taboo. Nevertheless, in recent years, the river god's daughters have felt the pressure of poaching.

In 1998, Jeff and Dan Vermillion, brothers from Livingston, Montana, opened up catch-and-release fly fishing in this region and in conjunction with the Mongolian government, hired local men to patrol the river and issue citations. The fine for poaching taimen, however, was less than what the taimen sell for and the poaching patrol failed. Vermillion, who has a vested interest in keeping the taimen fishery healthy, underwrote a grant with the Taimen Conservation Fund to fund a team of aquatic scientists to study and make conservation recommendations for the Uur fishery.

The aquatic research component was only half of the envisioned project. Vermillion wants to work with the Khambo Lama, Mongolia's head lama. As scientists conduct fish counts to establish data sets and create conservation management recommendations, the Buddhist monastery restoration can help to restore cultural perceptions of the environment. Every resident I spoke with was excited about the restoration of Dayan Derkh. It served for centuries as an important cultural and spiritual center. Despite the fact that the monastery was destroyed, the site is still a very vital place in this valley.

Construction on the monastery began in 2004, the aquatic research in 2003. Plans are underway for an educational film, narrated in the Mongolian language, on taimen

poaching. Meanwhile, Buddhist leaders are helping to develop the message and a regionwide outreach plan. As the project advances I will track shifting attitudes, changes in poaching practices, and taimen population recovery.

At a time when religion is fueling hatred elsewhere in the world, can religion, religious texts and dogma help humans better connect and care for their Earth? As a conservationist, I have worked for years looking for opportunities to encourage local investment in the protection of natural resources. I think exploring the marriage of Buddhist ecological thought and conservation in Mongolia could provide a promising example that could spawn many such efforts in the future.

Mora, Pat (1942–)

Pat Mora, a native of El Paso, Texas, first established herself as a poet, then as an author of children's books, and, more recently, of essays and a memoir. Nicolás Kanellos has claimed that she has one of the widest audiences of any Hispanic poet in the U.S. Kanellos, Anya Achtenberg, and other critics have noted that Mora's poetic voice exudes a tone and spirit of healing. Such healing is both physical and spiritual and repeatedly is tied to a healthy relationship between people and place, culture and environment. Throughout her work, whether writing for children or adults, she integrates place, spirit, and personal development, into an interanimating process of achieving wholeness. The southwestern landscape, the environment of her own life and her heritage, as a particular aspect of the natural world is represented not only as life-giving but also as alive. Thus, Kanellos speaks of Mora's interest in shamanism, while others might view her metaphysics as distinctly animistic. The term shamanism specifically refers to Mora's interest in and depiction of *curanderos/ curanderas*, herbal and spiritual healers. It also includes her less frequent depiction of the *curandera's* opposite, the *bruja*, witch. This attention comes out clearly in poems in her first three books, *Chants*, *Borders*, and *Communion*, in which to a large extent the Southwest remains not only the primary setting but also the primary subject of individual pieces.

Before publishing another volume of poetry, Mora brought out *Nepantla: Essays from the Land in the Middle*. In these short pieces, she relates her strong sense of a living, spiritually informing nature to her *mestizaje*, her mixed ethnic heritage, with particular emphasis on the native side of that heritage. She clarifies that, for her, conserving natural diversity and conserving cultural diversity go hand in hand. She explores these notions further in her next book of poetry, *Agua Santa: Holy Water*. Playing on the clear allusion to the Catholic heritage of most Mexican Americans, Mora immediately links this sacred water to its earthly origins, including amniotic fluid, in the first two sections of the book titled "Old Sea" and "Rivers." Inverting the anti-body, anti-sensuality stereotypes promoted by patriarchal tradition she celebrates the embodied spirituality of mother–daughter relationships. In the process she links together all of the religious traditions of her heritage invoking various goddesses along the way. While the "pagan" predominates in *Agua Santa*, a vernacular Catholicism is humorously and lovingly portrayed in her most recent poetry collection, *Aunt Carmen's Book of Practical Saints*, which is lavishly illustrated. These illustrations link her poems to the popular Northern New Mexico village tradition of saint carving. In the same year that *Practical Saints* appeared, 1997, Mora also published *House of Houses*, a family memoir, in which the dead and the living intermingle and share the space of

the family homestead. Memory, cultural preservation, spirituality, and healing are all blended in this loving tribute in which every day is treated like The Day of the Dead.

Moro Movement (Guadalcanal, Solomon Islands)

The Moro Movement of Guadalcanal, in the Solomon Islands, is a custom (*kastom*) movement that promotes a traditional way of life instead of embracing mission ways or modernization. The age of the movement's founder, the famed Moro, is not known, but he is a man long respected across the whole Guadalcanal community. He worked as a carrier for the Americans during and after World War II, in a conflict that had profound social consequences for islanders throughout the Pacific. In 1957, he initiated his movement after a spiritual experience. As he has put it:

One day I got sick and died at six in the morning. The village cried for me and began preparing my funeral. In the evening my heart started to beat again. As I became conscious again I had a vision: I had to take my people back to a traditional way of life – especially clothing, houses, fishing and gardens (author interview).

Children are taught both the custom values attached to the Movement while also attending traditional school classes like the rest of the country. There are several Christian churches within the area and people are free to practice. There is no conflict between Christianity and Moro's followers. Moro expressed the platform of the movement and its environmentalist implications in 2000:

Before Jesus there were spirits of land and sea and forbidden (*tambu*) places. Missionaries destroyed our totems and dispelled bad spirits. People accepted it mostly and now believe their life is a mix of Christianity and traditional life. We are not devil people. We don't worship any bad spirits. We are Christians but we want to keep our traditional way of life. This means no development or spoiling of our environment. The trees and gardens and rivers give us life and we must keep them. The land is our mother . . . our life . . . our future (conversation with author).

Guadalcanal, like many Melanesian societies, is matrilineal – the women are the traditional landowners. To visit the 8000 people who live under Moro's influence in a string of villages along the southern Weathercoast of Guadalcanal, is to glimpse a people who have effectively rejected the Cargo or modern commodities of the modern world and who seek a *Kastom* way of life. The men wear a bark loincloth called a *kabilato* and spend their days fishing and building canoes and huts. The women wear only grass skirts and work in the sweet potato gardens and raise children. Among the few concessions to modern technology are some fiberglass banana boats with outboard engines, solar-powered radios at home, and blackboards.

For Moro and his followers, the relationship between nature and themselves is a holistic one and not divided into the worship of particular animals, plants or nature spirits. Their concern is for the preservation of their natural environment which is in some ways linked to the preservation of a harmonious society. The movement's relative isolation helps to reinforce this. Moro was clearly affected by the battles of Guadalcanal during the Second World War. The killing machines which destroyed human beings and nature may well have influenced Moro's vision effectively to disengage from the modern world and rely on the certainties of a *kastom* life and the sanctity of nature. The movement has recently become embroiled in the two-year civil war on Guadalcanal. Moro claims that he never supported the Guadalcanal militants who began evicting Malaitan and other squatters from around the capital Honiara in 1998, which triggered the war and claimed at least 100 lives. An uneasy truce is currently holding, with peacekeeping forces from Australia, New Zealand, and Fiji monitoring a ceasefire. But several attacks by the rival Malaitan Eagle Force, who successfully launched a coup there in May 2000 against Moro and those villages loyal to him, have marked Moro as the "spiritual leader" of the Guadalcanal militants and thus his movement remains under threat.

Mother Earth

The existence of an American Mother Earth, the bountiful giver of life, seems common knowledge. As the nurturing sustainer of American Indian communities and individuals, as a reference within ordinary language, as a trope in advertising and popular culture, as a motivating symbol in the public discourse of environmental groups, and as the subject of commentary in scholarly publications – in more forms than might be readily traced, recognition of Mother Earth’s influence seems nearly universal. Following the publication of University of Colorado professor Sam Gill’s *Mother Earth: An American Story* in 1987, however, common knowledge was attacked, defended and reformulated in ways that have subsequently affected the study of religion and nature in native North America.

Consider perhaps the single most widely spread image of Mother Earth, the globally televised opening ceremony of the 2002 Winter Olympics in Salt Lake City, Utah. Drum circles representing Utah’s five native nations, drumming what the announcer explained as the “heartbeat of Mother Earth,” and accompanying music composed by Canadian Mohawk rock musician Robbie Robertson merged into the Olympic symbol (Frost 2003). Gill would claim that the satellite-conveyed unity of the Olympic Mother Earth bears little to no relation to the traditional beliefs and practices of any American native culture. Instead, Mother Earth only came into the worldviews of American Indians during the nineteenth century as they responded to the expansion of white society across their homelands.

In order to grasp Mother Earth’s historical status, Gill argues against reading her numerous contemporary references back into the past, and for explaining any apparently earlier reference in terms of its own original source and context. In performing the kind of “sourcecriticism” familiar to biblical scholars, Gill winds up claiming that the entire body of ethnographic literature is invalid evidence, since the assumptions regarding Mother Earth in that literature are themselves based on only a few historical accounts. Of these, the two most common are attributed to the Shawnee political and military leader, Tecumseh, and the Wanapum prophetic figure Smohalla.

Tecumseh, in an 1810 meeting with General – and later

U.S. President – William Henry Harrison to discuss settlement of Wabash River lands, made the statement: “The Earth is my mother – and on her bosom I will repose.” Except that Gill claims he probably did not, since the earliest accounts of their meeting at Vincennes (Indiana), including Harrison’s diary, make no mention of Tecumseh’s words. Instead, the quote proliferated rapidly following the 1825 publication of Henry Ward Schoolcraft’s *Travels in the Central Portions of the Mississippi Valley*. For Gill,

the historical record shows that even if Tecumseh spoke these words, they cannot be evidence of native belief in a Mother Earth goddess, since the earliest texts making use of them do so to remark on Tecumseh's heroic character, or even merely to describe the seating arrangements at his tense meeting with Harrison. Gill insists that at best Tecumseh's language was metaphorical and strategic – deployed in an effort to deflect American designs on native land – not theological.

The paucity of historical documentation, Gill also claims, calls into question the scholarship of mainstay figures in the history of religion. Figures such as E.B. Tylor, Mircea Eliade and Ake Hultkrantz, each drew broad conclusions about American Indian religions from the single statements of Tecumseh or Smohalla – whose “shall I take a knife and tear my mother's bosom?” suffers from the same flimsy documentary pedigree as Tecumseh's statement, while also being derivative in its Victorian euphemism. Accordingly, such pronouncements as Eliade's that the “emotions that we feel when we hear (Smohalla's words) is our response to what they evoke with their wonderful freshness and spontaneity – the primordial image of the Earth-Mother” (in Gill 1987: 116) reflect far more about the theoretical desires and cultural needs of twentieth-century intellectuals than they do of the traditional worldviews of native North Americans.

Contemporary cultural needs, Gill claims, have also encouraged American Indians to embrace Mother Earth language in their efforts to maintain their distinctive cultural and personal identities over against the assimilationist influence of the dominant culture, and to provide symbolic capital in their ongoing political struggles. As Gill considers recent Indian references to Mother Earth, he is most struck by the ways in which she “is identified with the most fundamental concerns of all Indian peoples, the retention of lands” (Gill 1987: 147–8). She is thus, he thinks, a crucial contemporary symbol for pan-tribal concerns. He suspects, however, that this same broad-based sense of Indian-ness formed around Mother Earth serves the countercultural needs of many within the dominant culture today; just as, he argues, it served the needs of earlier generations of Americans in helping to form their own national identity. Mother Earth “expresses the civilizing, building, transforming aspects of Americans. Yet it also permits expression of the male, conquering, destructive, defiling aspects of the American character” (Gill 1987: 155).

Reaction to Gill's book, which he himself saw as “heretical” (Gill 1987: 156), was sharp. Several scholarly reviews were quite critical. Jordan Paper noted the widespread reference in Latin America among Amazon Basin tribes to Mother Earth figures, and in Peru to “Pachamama” – citing sixteenth-century Spanish sources to that effect – as well as telling linguistic and archeological evidence from Great Lakes Algonquians and other tribes (Paper 1990: 5, 14). Dan Merkur found Gill's work marred by a logical flaw – in concluding that an absence of evidence is evidence of absence – and therefore irrelevant (Merkur 1993: 178), and also noted the widespread distribution among the Inuit of a figure conforming to Gill's expectations of Mother Earth.

J. Baird Callicott found Gill employing the same sort of archetypal category of interpretation, “goddess,” that Gill found Tylor, Eliade, Hultkrantz and other “top-down” historians of religion imposing on their test cultures (Callicott 1989: 317).

More intense was the reaction among American Indian readers. The most heated came from Ward Churchill, Gill’s colleague at the University of Colorado and a member of the American Indian Movement, whose criticism appeared in several forums in the years following the book’s publication. As had other scholars, Churchill faulted Gill for arguing against a “straw man” (Churchill 1998: 110), and

– more than most – attacked his reading of the historical evidence. For Churchill, the “obvious conclusion to be drawn” from Gill’s source reading “is that so many people refer to the Tecumseh statement for the simple reason that this is what the man said” (Churchill 1998: 113).

While disagreements in reading strategies might be glossed as “merely academic,” what set Churchill’s reaction apart from other reviews was his explanation for Gill’s historical treatment of *Mother Earth*. Gill’s problem is not simply one of faulty reasoning from evidence to claim, but rather of intent. Churchill sees in Gill, and in a variety of New Age and environmentalist appropriations of Indian religious traditions popular at the time, the same historical revisionist ideology that animates “the sordid neonazi [sic] sentiments” of Holocaust deniers such as Arthur Butz. Thus Gill’s “scholarly disgrace” is “a continuation and perfection of the twin systems of colonization and genocide which have afflicted Native America for 500 years” (Churchill 1998: 117). If *Mother Earth* is the giver and sustainer of life in American Indian communities, the “disgrace” of *Mother Earth* lay in how it seemed to take away what Churchill phrased as “the rights of American Indians to any modicum of cultural sanctity or psychological sanctuary” (Churchill 1998: 116).

In the aftermath of Churchill’s response, and a series of “letters of outrage from community leaders” among Denver-area Indians to University of Colorado administrators (Churchill 1998: 107) seeking some formal action against Gill, the campus was tense with, as one Canadian scholar visiting there on academic leave put it: “a highly charged stand-off that no one talks much about” (Grimes 2000: 79). According to another Canadian, the controversy “was simmering all across North America” (Parkhill 1997: 1) and had expanded from a focus on the merits of Gill’s claims to a more general conflict about the competence of those teaching native religions, the role of scholarship, and the continued legacy of colonialism within the academic world.

In light of these far-ranging debates, what might be said about *Mother Earth* herself? A first consideration is *Mother*

Earth’s puzzling historical presence. Were historians experimental scientists, they might confirm or dismiss Gill’s claims about *Mother Earth*’s illusive existence in the documents by a repetition of his research. As it stands, few besides Churchill have argued against his suspicious reading of the Tecumseh story, and several reviewers found it impressive detective work. However, even if *Mother Earth* in print is more a shadow figure than the clearly framed textual center of American Indian understandings of

the sacred, what exactly to conclude about her sketchy documentary existence is still subject to some debate. Though print may create the surest sort of knowledge, and establish the most real of identities, it did not then have the power to travel persuasively – as Schoolcraft’s “on the bosom of my mother” statement must have if Gill is right – across the tribal hinterlands of both American continents in the short space of a few decades, or at most of little more than a century. Gill’s reading of history seems as hard to accept as the pronouncements of Eliade.

A second consideration is how Mother Earth might best be conceptualized, assuming she can be attested to either in documents or through cultural tradition. Gill sought a singular “goddess,” and in not finding one, or in finding one only recently invoked, concluded that Mother Earth had not been central to pre-contact traditions. Is Mother Earth a goddess, though? Issues of category translation arise here, as Osage theologian George Tinker acknowledged in a consideration of Gill’s work posted on the internet after the initial controversy had receded. No “Native American language . . . even has a word for ‘god’ or a word that can be easily and appropriately translated as ‘god’ in the English language sense” (Tinker 2003). Like “Great Spirit,” which Tinker calls “a popular white man’s formula,” the English expression “Mother Earth” is a term arising out of the exigencies of crosscultural contact, negotiation and conflict.

Gill’s succumbing to the tendency among many European and American interpreters of Indian religious life to impose contestable categories derived from Western traditions has an instructive parallel in James Walker’s *Lakota Myth*. Walker recorded numerous testimonies about traditional Lakota beliefs from several Lakota religious authorities between 1896 and 1914, and then tried to arrange their accounts of Lakota myth in ways that reflected “the work of a systematic European mind,” as the Yankton Dakota ethnologist and linguist Ella Deloria wrote in 1938 to her Columbia University employer, anthropologist Franz Boas (in Walker 1983: 24).

Deloria noted that the Lakota people to whom she read Walker’s mythical narrative frequently could not recognize many of the characters, actions or ideas presented in Walker’s narrative, framed as they were through Greco-Roman mythology and the language of the Christian Church.

I have a feeling always that . . . ecclesiastical language was very much part of Walker’s thinking, and that he explained what he thought the Dakotas said, in terms he knew best. But the Indians who heard all this were mildly amused and sometimes impatient with it (in Walker 1983: 396).

Likewise, in keeping Mother Earth as metaphor separate from Mother Earth as theology, Gill employs controlling assumptions about theology that are unvoiced, and perhaps with good reason, not easily shared among American Indian expressers of Mother Earth. If Walker constructed his cycle of Lakota stories with the aid of culturally foreign conceptions, Gill seems to have deconstructed native religions as a whole, aided by an equally alien conception of theology. This may account for the reaction among Indian *Mother Earth* readers so similar to the “amused” and “impatient” responses of those who heard Deloria read Walker.

A third consideration is that Mother Earth also gives rise to irony. Gill's primary concern is to undercut the "top-down" study of religion (Gill 1987: 157), yet he repeats its absolute pronouncements and employs its universal categories of interpretation. More ironic is that Mother Earth's defenders such as Churchill attack Gill for holding the same basic reading of colonialism in North America as they do themselves. On Gill's account, Mother Earth has provided American Indians since Tecumseh's day with enough common language and common concerns to forge a variety of movements, organizations and habits of thought to resist the dominant society's assimilation goals. Through such responses Mother Earth became an important bridge between tribal cultures, and has helped establish a common sense of "Indian" identity augmenting that of tribal affiliation.

Churchill argues that Gill's sins "of commission" include trying to prove that "the adoption of a belief in Mother Earth has led contemporary American Indians away from their traditional tribal/cultural specificity and towards a homogeneous sort of 'pan-Indianism,' " which he says is simply "a variation on the standard rationalization that Indian rights no longer exist as such because Indians in the traditional sense no longer exist" (Churchill 1998: 112). This is surely an over-reading of Gill, however. Gill highlights two periods during which public Indian articulation of Mother Earth furthered pan-tribal interests. During the 1890–1920s era, western tribes confined to reservations played the role of negative other to significant American land-use values. During the post-1968 civil rights era, Indians were able to reassert land claims, argue for increased sovereignty and make important political advances. Public figures such as first, the Santee Dakota author Charles Eastman, and later, American Indian Movement national director Russell Means, drew on Mother Earth during these periods in order to argue their respective positions regarding Indian survival before both Indians and the larger American public, and in Means's case, to international audiences as well. In both periods, Mother Earth enabled these and other Indian public figures to gain some moral high ground and to build solidarity within and across Indian communities in support of their critiques of American policy. Churchill's evident denial of this impact seems disingenuous, especially since his own role in the American Indian Movement – as an associate member of the United Keetowah Cherokee Band concerned about issues on Lakota land – illustrates Gill's point.

Also troubling, is that Churchill seems to share Gill's reading of the multisided history of Mother Earth's role in political rhetoric. In part her success is dependent upon – and her assistance in advancing tribal goals endangered by – the spread of Romanticist images of the noble savage lying at the heart of late twentieth-century American culture. In spite of his condemnation of Gill's work, he would, by virtue of his own fundamental concerns, have to agree with Gill that the Mother Earth who aids in marketing consumable spirituality, prompts easy alignment with environmentalist agendas, and spreads through the literary works of those Gill calls "White Indians," bears little resemblance to the one who might emerge in "balanced and informed presentations of Native American cultures and their religions" (Gill 1987: 148).

Mother Earth and the Earth People (Trinidad)

The Earth People are an antinomian and “neo-pagan” community settled on the north coast of Trinidad in the Caribbean which originated in the visions of their leader Mother Earth (Jeanette MacDonald, 1934–1984). From 1975 until 1976, she had experienced a series of revelations: she came to understand that the Christian teaching of God the Father as Creator was false and that the world was the work of a primordial Mother, whom she identified with the African ancestors, with Nature and with the Earth. Nature gave birth to a race of black people, but her rebellious Son (God) reentered his Mother’s womb to gain her power of generation and succeeded by producing (or forcing her to create) white people. The Whites, the Race of the Son, then enslaved the Blacks and have continued to exploit them. The Way of the Son is that of Science – of cities, clothes, schools, factories and wage labor. The Way of the Mother is the Way of Nature – a return to the simplicity of the Beginning, a simplicity of nakedness, cultivation of the land by hand and with respect, and of gentle and non-exploiting human relationships.

The Son, in a continued quest for the power of generation, has recently entered into a new phase. He has now succeeded in establishing himself in Trinidad’s Africans and Indians and is also on the point of replacing humankind altogether with computers and robots. Nature, who has borne all this out of love for the whole of her creation, has finally lost patience. The current order of the Son will end in a catastrophic drought and famine, nuclear war, or a heating up of the Earth, a destruction of the Son’s work through his own agency, after which the original state of Nature will once again prevail.

Jeanette herself is a partial manifestation of the Mother who will fully enter into her only at the End. Her task at the time of initial ethnographic fieldwork (1980–1982) was to facilitate the return to Nature by organizing the community known as Hell Valley, the Valley of Decision, to prepare for the return to the Beginning and to “put out the life” to her people, the Black Nation, the Mother’s Children. She has to combat the false doctrines of existing religions which place the Son over the Mother and to correct the distorted teaching of the Bible where she is represented as the Devil (hence “Hell Valley”). She stands for Life and Nature, in opposition to the Christian God who is really the Son, the principle of Science and Death. As the Devil she is opposed to churches and prisons, education and money, contemporary morals and fashionable opinions. Because God is “right” Mother Earth teaches the Left, and the Earth People

interchange various conventional oppositions: “left” for “right,” “evil” or “bad” for “good.” Seeming obscenities are only Natural words for She Herself, who is the Cunt, the origin of all life.

The exact timing of the End was uncertain but it was expected in Jeanette’s physical lifetime. Then time would end, sickness would be healed and the nation would speak one language. The Son will be exiled to his planet, the Sun, really the Planet of Ice which is currently hidden by Fire placed there by the Mother: Fire which will eventually return to where it belongs, back to the heart of the nurturant Earth.

Mother Earth’s revelations ceased in 1975–1976 after an episode called the Miracle in which she brought the sun closer to the Earth. At this time her family was still living with her in a deserted village some fifteen miles from the nearest settlement, and they were joined by an assortment of young men, mostly old friends and neighbors of hers from Port-of-Spain, together with Rastafarians attracted by a newspaper article written about a family going naked in the bush. Her ideas were now consolidated in reflection and debate. By 1978 her title of “Mother Earth” was adopted, possibly after a recent carnival masquerade which had portrayed a large, fecund Earth Mother. Mother Earth continued to have visions in her dreams but these were similar to those of other members: premonitions and answers to the immediate organizational problems on which her attention was now focused.

While around sixty people have been active Earth People at different times, in October 1981, twenty-two were resident in the Valley, with perhaps twenty sympathizers and occasional members in town. There were annual naked marches into Port-of-Spain which sometimes ended in arrests with brief stays in the state psychiatric hospital for Mother Earth (with a variety of diagnoses), together with raids on the settlement by social workers which resulted in confinement of the younger children to an orphanage: Mother Earth’s youngest son escaped and trekked back to the community across the mountains. There were, however, supportive articles in two local periodicals, *Ras Tafari Speaks* and *The Bomb*.

Trinidad’s first prime minister had recently died and the government was preoccupied with an election: those in the Hell Valley group were left to themselves.

Only one other member of the group was female, with

16 young male followers between 18 and 33, most previously associated with the local cults of Rastafari or Spiritual Baptism, besides Mother Earth and her immediate family. The reason they gave for joining (to the visiting anthropologist in 1981) was the corruption and spiritual decay associated with the post-independence government, and a wish to return to a simpler *natural* lifestyle. In opposition to the *material* world, the group all went naked, sleeping out on the bare ground, and maintained themselves through fishing and cultivation of the land using only cutlasses.

The center of the community was the old wooden house of the deserted village into which Mother Earth had moved in 1972, together with some added “African” huts. For about half a mile in each direction, the secondary bush and scrub of the seasonal rainforest had been cleared and a variety of trees and perennial cultigens were

grown: medicine bushes; trees and plants for cordage and wrapping and for basketry and calabashes; timber for building; plantain and banana; roots like cassava, sweet potatoes, dasheen, yam, tannia; aubergine, pineapple, tomato, pigeon peas, callaloo, okra; Indian corn, pumpkin, ginger, sugar cane, christophene; trees bearing oranges, grapefruit, guava, nuts, mango, avocado, pawpaw, pomegranate, tamarind and breadfruit; garlic and bushes with pepper, shadobenny and other herbs. Above the settlement, reaching into the lower reaches of the mountains of the northern range, were cocoa and coffee, cannabis and tobacco. In the nearby bush were cress and watermelon, mauby bark, mammy apple, passion fruit, star apple, nutmeg and soursap, while along the coast grew coconut and almond. The variety of crops, virtually every Trinidad food plant, perhaps justified the boast of the Earth People that they were living in the original Eden.

Although all members accepted Mother Earth's role as the Original Mother, the group was "this worldly" in their emphasis on present cultivation of the land and on the preparation and consumption of food. Daily agricultural labor ended with a swim in the sea and Mother Earth ritually dealing out the cooked vegetable food to the group. The central "rite of synthesis" (as anthropologists would put it) was this daily meal. The evening was passed with the smoking of cigars and ganja spliffs, and communal drumming and dancing with singing of their favorite anthems "Beat them Drums of Africa," "The Nation It Have No Food" and "We Going Down Town to Free Up the Nation."

Each new member took a "fruit name" – like Breadfruit, Coconut, Cassava or Pumpkin. Relations between members were fairly egalitarian, and not especially

"religious," generally recalling those of the average Trinidad working-class family. Supposedly the group was living in the Beginning of the End, a run-up to the eventual, very physical, end of the world, but little time was spent on millennial speculation. Painted words on the main house proclaimed "Fock [sic] God" – a sentiment in accord with the group's opposition to Christianity and Islam (although there was a more sympathetic attitude toward Rastafari and Shango Baptism as being "half-way there").

In 1982, with disputes in the group relating to differences in practical authority, and Mother Earth's continued illness, relations deteriorated, splits occurred and the settlement was burned. Mother Earth died in 1984, and by the late 1990s, the Earth People were split into four groups, one on the original site. For all four, what has remained central is less Mother Earth's personal messianic vision than some sense of a more "natural" and "African" style which her own life had embodied.

Mother Nature Imagery

Mother Nature is a central theme in religion and ecology. The notion that the natural environment is, either metaphorically or literally, a mother to all humanity is an ancient and influential one. Mother Nature imagery speaks directly to the experience many people have of the environment providing both physical and spiritual refueling, two things that the real “good ol’ Mom” often provided as well. People frequently report wilderness experience – even a stroll in a city park – to be rejuvenating, transformative, and spiritually fulfilling. But the notion of Mother Nature is also controversial, as seen from the various perspectives of gender studies, environmentalism, and religious faith. A feminist perspective asks about the negative effects on mothers and on women in general of using her as a “fuel source.” Environmentalists add the argument that casting nature as mother can easily compound ecological problems if nature is then viewed as a never-ending source of energy and resources. And people of varying religious faiths disagree as to whether nature is properly understood, either metaphorically or literally, as a divine goddess and whether such a view is justified as a corrective to patriarchal theism.

An Ancient Tradition of Imagery in Western Religion and Culture

The sense of the environment as bountiful female participates in a long and powerful tradition of association. The Mother Nature image, or that of nature as the Great Mother, appears to be almost timeless. It is found in figurines, cave paintings, and burial practices that date back to early human prehistory. Nature as the Great Mother may, indeed, be *the* oldest human religious idea. Paleolithic peoples regarded nature as the Great Mother who nurtured them much like a mother feeds and cares for her infant child. The Goddess of Laussel, one of the earliest such images we have, was sculpted from a rock face at the entrance to the cave of Cap Blanc, near Les Eyzies in the valley of the Dordogne, France. It dates back about 21,000 years. This Paleolithic figure holds up a notched bison horn, believed to represent the crescent moon and the thirteen-month lunar calendar. Her rounded, fleshy buttocks and belly are common among the goddess figurines of the time. The rock relief is painted with red ochre, symbolizing the powerful color of birth and menstruation.

The Classical Greeks revered the Earth Goddess Gaia – in a usage currently resurrected by some scientists, environmentalists, and neo-pagans – as “Mother of All.”

The Romans sang a hymn to the holy goddess Tellus Mater (Mother Earth), Mother of Living Nature. This second century Roman hymn reads in part:

The food of life

Thou metest out in eternal loyalty And, when life has left us,
We take our refuge in Thee. Thus everything Thou dolest out
Returns into Thy womb (Getty 1990: 10).

In the first century, the Alexandrian Jewish scholar Philo identified nature with mother and with foodprovider. This example helps make the important point that Mother Nature imagery is part of a larger association in Western religion and culture that links together women and nature. The imagery not only functions to portray the environment as maternal, but also to reinforce common cultural notions that women are “nature-like” or closer to nature than men. Philo, for example, sees Earth and women alike as sharing a “teeming” fertility and a bountifulness that they offer freely to all offspring:

Nature has bestowed on every mother as a most essential endowment teeming breasts, thus preparing in advance food for the child that is to be born. The earth also, as we all know, is a mother, for which reason the earliest men thought fit to call her “Demeter,” combining the name of “mother” with that of “earth”; for as Plato says, earth does not imitate women, but woman earth . . . Fitly therefore on earth also, most ancient and most fertile of mothers, did Nature bestow, by way of breasts, streams of rivers and springs, to the end that both the plants might be watered and all animals might have abundance to drink (in Glacken 1967: 14).

While in these examples, Mother Earth willingly “metest out the food of life,” in another version of the theme, humans violently take that sustenance from her. Here we see that Mother Nature imagery portrays the environment not only as a life-giving female who is beneficent toward humanity and beloved in return (the Good Mother), but also as one who is wounded or conquered by humans (the Hurt Mother or Bad Mother). All three motifs play an important part in Mother Nature imagery.

Mother Nature as Good, Bad, and Hurt

The Hurt Mother motif emerges as early as ancient Rome, where strictures against mining (in comments by Pliny, Ovid, and Seneca, later repeated in the Renaissance) expressed concern about violating Mother Earth by stripping precious metals from her womb in a process that despoils the Earth’s surface and fuels human avarice and war. “When will be the end of thus exhausting the earth?” asked Pliny in worried lament (in Merchant 1980: 30). Mother Nature is also sometimes wounded because her conquest by humans is held to be justified and rightful. A famous chorus from Sophocles’s play *Antigone* (ca. 441 B.C.E.) celebrates man’s conquest over nature:

Oh, Earth is patient, and Earth is old,

And a mother of Gods, but he breaketh her, To-ing, froing, with the plough-team going, Tearing the soil of her, year by year.

Nature is still a fertile mother who provides for humanity, but now that bounty is taken by force. This example highlights the ancient identification of the female and the plowed earth that forms an important part of the woman–nature association. The identification reoccurs later in the play when Antigone’s uncle Creon – a character seemingly obsessed with the need for men to control women – defends his decision to kill his rebellious niece, betrothed to his son, with the contemptuous line, “There are other fields for him to plow.” In these examples, neither nature nor woman is in control of her fertility, but is depicted as tamed and mastered by man/humans.

The Bad Mother motif of nature as a recalcitrant or withholding mother intensifies with the Scientific Revolution of the sixteenth and seventeenth centuries. Historian Carolyn Merchant argues that the image of nature changes in this period from “active teacher and parent” to “mindless, submissive [female] body” (1980: 190). The language of the new experimental science and its mechanistic worldview is often that of sexual mastery, of enslavement and rape, as in Francis Bacon’s promise in *The Masculine Birth of Time*: “I am come in very truth leading to you nature with all her children to bind her to your service and make her your slave” (in Merchant 1980: 170). Baconian imagery of domination over nature includes references to mining as wresting hidden secrets and goods from nature’s withholding womb, and how through use of anvil and forge, nature can be “forced out of her natural state and squeezed and molded” (in Merchant 1980: 171).

Both the Hurt Mother and Bad Mother motifs became more frequent as ecological damage mounted in modern Western culture. Smohalla, a Native American of the Columbia Basin Tribes and leader of a small group resisting settlement and treaty, spoke out famously against European-American attitudes to the land around 1885. Making skillful use of maternal metaphor to contrast the impact of his people’s traditional root gathering, Smohalla told a visiting cavalry officer:

We no more harm the earth than would an infant’s fingers harm its mother’s breast. But the white man tears up large tracts of land, runs deep ditches, cuts down forests, and changes the whole face of the earth . . . Every honest man knows in his heart that this is all wrong (in Gill 1987: 54).

And from the dustbowl crisis of the 1930s, American painter Alexandre Hogue created powerful art that despairs over the damage of land erosion. His oil painting *Mother Earth Laid Bare* (1938) shows a woman’s naked body outlined in the barren ground, stripped of all topsoil. Hogue describes her as “raped by the plow and laid bare” (DeLong 1984: 120). More recently and with equal imagistic verve, Jim Morrison, vocalist and songwriter for the 1960s rock group, The Doors, inquires in their 1967 song “When the Music’s Over”: “What have they done to the earth?/What have they done to our fair sister?” (I take Morrison here to be drawing on 1960s counterculture egalitarian language of “sister/brother” in order to make an environmentalist point about solidarity

with the plight of “Mother Earth.”) His answer is a graphically violent image of the Hurt Mother, spoken over chaotic drumbeat and disintegrating guitar riffs:

Ravaged and plundered and ripped her and bit her.

Stuck her with knives in the side of the dawn and tied her with fences and dragged her down.

The modern environmental movement draws heavily on this ancient tradition of imagery depicting nature as our loving but wounded mother, who now suffers from the human pressures of population, technology, and disrespectful practice. Reflecting an activist agenda, the imagery features humans as her/its healers. For example, Turner Broadcasting has a successful children’s cartoon series called “Captain Planet and the Planetes” and “The New Adventures of Captain Planet” in which five children from around the world work with the environmental superhero Captain Planet to protect Gaia, the spirit of the Earth and our “archetypal mother.” The well-known environmental slogan “Love Your Mother” fits in this same category, with its implicit message that we must now help and heal she whom we have harmed.

Bad Mother Nature imagery continues to thrive as well. It is found perhaps most commonly today in references to the “wrath of Mother Nature” in everyday conversation and professional reporting about the weather and such natural disasters as floods, hurricanes, and volcanoes. The imagery is also often used by advertisers trying to sell their products by evoking a deep emotional response about the pleasure of human victory over the threats of nature. A recent campaign for the Nissan Pathfinder, for example, claimed Mother Nature was using fierce weather to try – unsuccessfully – to drown, burn, and blow away the human tucked securely and triumphantly into his SUV.

Given the radically different cultural contexts of all these examples, what accounts for the transmission of “Mother Nature” as a cultural trope across cultures and centuries? Why does it endure, and in forms similar enough to be recognizable from the Paleolithic, or at least the classical period, to today? For some, the apparent “naturalness” of the metaphor itself – based on the fertility of the Earth and on woman’s biological role as childbearer – is a sufficient explanation. From this perspective, nature, to the extent that it produces and provides for all life, simply seems like a mother. Others root the prevalence and longevity of the metaphor not so much in nature, as in culture: they focus on women’s childrearing role and supposedly greater capacity for nurturance as social constructions that only appear natural within patriarchal societies that assign women these roles. The social constructions that label childcare and nurturing in general to be “women’s work” then make the life-giving environment appear to be maternal also, since it too is expected to serve human needs.

Ecofeminist Critique

Ecofeminists have been the scholars most active in these debates documenting and deconstructing the meanings of Mother Nature imagery. Their most basic claim is that gender matters. A cursory study of Western culture, or even of current television weather forecasting, reveals “Mother Nature” to be a major motif in conceptualizing nature. Because of this prevalence, gender analysis and ecofeminism help get to the heart of how societies construct concepts of nature and how they structure human-nature relations. Furthermore, ecofeminist scholarship documents the function of the woman–nature link and demonstrates how women in patriarchal contexts tend to suffer from it. Sherry Ortner, an anthropologist, was one of the first to frame this problem. She argued that women are crossculturally perceived to be closer to nature than men and claimed that this perception accounts for women’s universal subordination, since nature is itself universally devalued. Others – such as Dorothy Dinnerstein, Annette Kolodny, Carolyn Merchant, Elizabeth Dodson Gray, Rosemary Radford Ruether, and Susan Griffin – responded and contributed to the debate.

Their argument is that, in patriarchal culture, when women are symbolically associated with nature, or seen as having a particular affinity with nature that surpasses that of men, then women are seen as less fully human than men. Mother Nature imagery works to associate the feminine more with the carnal, the emotional, and the physical and to associate the masculine with the cultural and the intellectual. Susan Griffin, for example, in her passionate and poetic book *Woman and Nature: The Roaring Inside Her* (1978), illustrates how this traditional association contributes to women’s voicelessness and powerlessness by assigning woman the roles of passive and obedient reproducer and nurturer (in her chapter entitled “Cows”), obstinate and dull-witted drudge, bred for labor the breeders do not wish to do (in the “Mules” chapter), and well-trained and well-groomed gratifier of her master (“The Show Horse”). One way to put this point reveals the connection between woman-as-nature and nature-as-mother: in patriarchal culture, women are under-personified and nature is over-personified. Women are perceived to merge with nature as a servile resource, Dinnerstein says, as “an asset to be owned and harnessed, harvested and mined” (1976: 36). Even when women are exalted as purer than men, as less bestial, and as the “guardians of culture and morals,” Ortner points out that these seeming inversions merely place women above instead of below culture and that women, in both cases, remain excluded from the realm of culture. The consequences here for both women and nature can be noxious. Both are seen as an endless source of succor, who, if she fails to provide what we want, is cruelly withholding it, so justifying our exploitation or plunder.

Nature Spirituality

Although ecofeminists share these concerns about imaging nature as mother in any society still shaped by patriarchal devaluations of women and nature, they and others with interests in religion and ecology agree there is nevertheless a positive role to be played by Mother Nature imagery. The imagery remains compelling, important, and apt, especially if its patriarchal cultural context can be critiqued and resisted. For example, popular ecological slogans like “Love Your Mother” could become more effective if “mother” meant less exclusively the selfsacrificing, ever-giving nurturer. Maternal metaphors do express the environmental truth that nature provides all life and sustenance, as does the childbearing mother. Christian mystic Hildegard of Bingen’s endorsement from the twelfth century rings equally true today for many ecotheologians and practitioners of nature-based spirituality: “The earth is at the same time mother. She is mother of all that is natural, mother of all that is human. She is the mother of all, for contained in her are the seeds of all” (Fox 1988: 11, 13). Such language makes much intuitive sense to feminists and nonfeminists alike and can serve the important environmentalist role of facilitating people’s sense of connection with nature.

The Earth has functioned as a very powerful and ancient center for worship and for seeing the divine as female, a resource important for many feminist theologians. Such meanings and ritual practices are revived today in various forms of syncretistic nature religion: neo-paganism, Wicca, ecofeminist spirituality, and eco-theology. Artist Judith Anderson, for example, combines commitments to environmentalism and woman-centered spirituality in a powerful etching entitled “Missa Gaia: This is My Body” (1988). Here the Great Mother sits in a birthing position. The world’s animals flow from her and merge with her, boundaries of self and other barely discernible. Anderson describes her Great Mother as embodying “both celebration and profound grief and anger” (Middlebury symposium 1990). This Mother, in other words, is at once Good and Bad and Hurt. In such contexts of religious experimentation and renewal, women might well sometimes see themselves as “closer to nature,” as when celebrating their bodies, their ability to create new life, or the interrelation of all species. Indian feminist theologian Aruna Gnanadason suggests that “the fear of what is being done to the earth is giving women the urgent imperative to assert their connectedness with nature . . . more specially in the Third World where the struggle for survival is the most acute” (1996: 77–78). Mother Nature imagery thus has the power to evoke a whole range of both patriarchal and feminist notions of what “mother” means and projects these meanings onto the environment, with consequences both oppressive and liberatory.

Significance of Mother Nature Imagery

The present human situation is one of ecological imperilment, and Mother Nature imagery, in some ways, seems only to render matters worse. Images of the Good Mother

make environmental destruction appear less of a problem, for the bounty of nature is then inexhaustible. And when the Bad Mother is invoked, striking back against nature becomes a good. Mother Nature imagery is hardly the sole means by which the environment is represented in the cultural imagination. It is, however, popular, pervasive, widespread, and immediately understood. That groups as diverse as environmental organizations and auto manufacturers use it for their ends indicates that this imagery elicits powerful and conflicting responses in a large and varied audience. The imagery holds sway from shared and deep recesses of personal and cultural fantasy.

The remarkable diversity of emotional response in the Mother Nature imagery – sometimes loving and respectful, sometimes condescending and controlling, sometimes suspicious and fearful, and sometimes downright violently adversarial – is significant in itself. It suggests a fundamental ambivalence toward nature. The imagery reveals not simply connection, but complex, ambivalent tendencies toward both violent control and loving repair in human relations toward nature. Mother Nature imagery yields insight into these tensions that, while probably intensified by the present hyperconsumerism of American culture, seem generally characteristic of Western modernity. The imagery suggests that many people may resist and refrain from a committed environmentalism because it is easy and comforting to imagine that nature’s provisions are ever-abundant and guaranteed. Overall, imagery of Mother Nature – even when putatively environmentalist – can portray a response toward nature that is ambiguous and uneasy and can undermine its own activism.

That such ambivalent passions are found in Mother Nature imagery is not surprising. The imagery is so rich, so provocative, so imagistically intense, precisely because it seems to embody central riddles or universal problems about human identity and experience. Part of what it means to be human is to confront the meaning of our “creatureliness,” the riddle of our existence as beings within the context and constraints of a natural environment. One perennial way we do this is through Mother Nature imagery that tells us the relation is one of familial dependence or interdependence. The imagery also serves a cultural purpose of exploring the riddles of gender difference and of the problem of evil. In all societies, although in different ways, gender acts as a significant lens for structuring social relations: why is this the case and why do patterns of subordination result (paralleling patterns of ecological degradation)? Why do we hurt one another (including the Earth) and how can we establish communities of care? Is the metaphor of mother (or parent) and child the answer?

Motion Pictures

In the past two decades, humanity's interaction and relationship with the natural world has become a notable theme in many popular feature films. These films present different stories and interpretations of how nature can be viewed and how humanity should respond to it. Whether based on true events or fictionalized dramas, film narratives present us with concepts and images about reality and the way the world does or could function (Turner 1999). Since films often function on a series of storytelling formulas and electronic stereotypes, this enables us easily to identify dominant perceptions of nature in popular culture. Identifying these themes might also lead to a need to reinterpret these conceptions, especially as they relate to spiritual relationships between the material, natural and non-material worlds. As Martin and Ostwalt claim, "Films do much more than simply entertain [they] have the potential to reinforce, to challenge, to overturn, or to crystallize religion's perspectives, ideological assumptions and fundamental values" (Martin and Ostwalt 1995: vii). Therefore it is important to recognize the power of film to inform our views and values concerning how we perceive and treat the natural world as it relates to spiritual themes. Three common themes dealing with religion and nature presented through motion pictures are: nature as an instrument of God, nature as a metaphysical realm, and nature as a religious storyteller.

Nature as an Instrument of God

Humanity's conflict with nature is a common theme in films. This conflict often centers on human attempts to control nature. When humanity fails and nature is proved to be more commanding, this is often interpreted in religious terms. Nature is viewed as a spiritual force directed by the "hand of God." Biblical language and apocalyptic pictures often emerge in these characterizations.

This is most clearly demonstrated in films dealing with weather where humanity only has the ability to respond. Nature is unpredictable at best, destructive at its worst. Two recent examples of this are *Twister* (1996) and *The Perfect Storm* (2000); both stress the fury of nature and humanity's vulnerability. *Twister* is based around the storm-chasing researchers who spend their days pursuing tornadoes in an attempt to study and refine their ability to predict these natural phenomena. Tensions rage as former partners are reunited to race against time and a competing research team as they try out their new storm-measuring technology. While humans attempt to map and

comprehend the tornadoes, they cannot control their path of destruction. The “finger of God” blows where it wills. There is a sense of awesomeness and divine beauty in the chaos, that no matter what technology or means are employed, the fury of nature can only be adapted to but not controlled. The characters progressively come to terms with the fact that nature has a power beyond the human level.

Similarly in *The Perfect Storm* a fishing crew is overwhelmed by the unpredictability of nature, when a dying tropical hurricane from Bermuda collides with a cold front from the Great Lakes resulting in the “Perfect Storm.” The captain and crew’s determination to take advantage of the last good fishing run of the season puts them in the midst of the worst storm in history. While skill, teamwork and determination do help the ship’s crew to maneuver through several near-fatal experiences, in the end, nature’s fury proves greater. One can question whether it was greed or desperation that put them in the situation to begin with, yet no matter the reason the outcome would have been the same as seen by the plight of others trapped in the storm. The ending scene brings us to a church where people remember the lost crew. Peace that comes after the storm appears to be found in the acknowledgment of a Higher Being.

Humanity’s attempts to control natural phenomena are displayed as futile in films. Therefore in these circumstances nature is to be feared and connected with the unknown, uncontrollable God. This is illustrated again in *Volcano* (1997) where the erupted stream of lava is equated to the “wrath and will of God” and the city planner who built a subway system on a fault line is described with the biblical reference as “the foolish man who built his house upon the sand.” Since competing with God is futile, humanity only wins when it either accepts the majestic power of nature or when it fights to protect it.

Nature as a Metaphysical Realm

Another religious theme in nature-based motion pictures can be characterized as the metaphysics of interrelatedness, spiritual descriptions of nature’s internal interactions. Here films focus on communal narratives and the physical and spiritual linking of different spheres of the created order.

Many animation films have portrayed these relationships and conflicts in playful ways, yet dealing with serious religious worldviews. In *The Lion King* (1994) this spiritual connection is described as the “circle of life” dealing with tension between species as well as themes of redemption and restoration. It presents a coming-of-age tale, as a lion cub becomes “King of the Jungle” and is a mix of African folk-tales and classical myths. Simba’s journey into adulthood begins with him facing the tragic death of his father King Mufasa. Simba’s rejection of the past brings decimation to the “Pride land” where plant and animal life are on the verge of extinction. This film focuses on the idea that all life is connected. This relates not only to ideas about the natural order, but also to the idea that within nature spiritual ideas are transferred.

From nature comes wisdom, as illustrated by the spirit of the King speaking through the stars and a shamanic baboon advising Simba through nature-based illustrations. Redemption comes through Simba's battle to confront the past and reestablish order. A depressed and ravaged natural environment represents evil. When the balance of good (i.e., Simba becoming king) is restored, the jungle and animal kingdom almost immediately returns to a state of splendor. This film interprets the world in terms of animistic spirituality, ancestor worship, and the spirit world speaking through nature.

Another film which focuses on the mystical interconnection of nature through an animistic worldview is the Disney animated feature *Pocahontas* (1995). In the film, nature is portrayed as possessing a voice that has the ability to speak to the heart. The voice of nature comes to Pocahontas through her mentor, Grandma Willow, a tree which encourages Pocahontas to listen with her heart to the voices of the forest who will direct her. She is "led" to a white man who falls in love with her. A clash of cultures and intentions results, yet love prevails and the Indians and English seemingly come to a peaceful truce. Thus nature's voice leads those who listen to it toward their destiny. This portrayal of nature having a spirit is basically animistic. Those who acknowledge the voice and spirit of nature as Pocahontas are seen as enlightened and wise while the Englishmen who focus on gold are seen as shallow, selfish and destructive. Peace is equated with harmony with nature. This is a retelling of a traditional American myth highlighting a modified Native American understanding of nature.

Nature's interaction with human society through spiritual channels is also represented in films dealing with myth and nature, often utilizing classic myths of the battle of good versus evil. In the animated production *Fern Gully: The Last Rainforest* (1992) the spirit and natural world appear intertwined. Everything is peaceful in Fern Gully until the intrusion of a clear-cutting logging crew, which wreaks havoc on the spiritual and physical balance of the rainforest. Young fairy Crysta saves the life of one of the logging crew, Zac, by shrinking him to her own size. Zac in turn learns the ways of the forest and helps the fairies battle evil spirits and logging destruction in an attempt to preserve this last bit of the rainforest. The myth expresses the conviction that goodness is based on a desire to nurture the environment while evil seeks to destroy it. Not every spirit in the forest is good, as seen by the demon Hexxus who seeks to destroy not only the fairies, but also the environment itself. The film infers that nature is not alone in maintaining its balance, but relies on the aid of the spirit world. While based in a fantasy realm, this idea of the need for spiritual intervention in the battle against environmental destruction is a prevalent theme.

Nature as a spiritual realm where religious themes guide the interactions of animal and plant systems is demonstrated through the above-mentioned films. Relationships within the animal kingdom seem to mirror the struggle portrayed between humans and nature. Yet, instead of an external God-figure guiding the outcomes and effects of the natural world, it is spiritual forces within, be they animistic or magical, that guide the cycles of nature. The focus in these films is not one of power as it appears on the surface, but often of good versus evil.

Nature as Religious Storyteller

Films about nature also deal with underlying stories of meaning; narratives that seek to make sense of the world and share that sense with others. Often this searching uncovers various spiritual beliefs. John May (1997), in his analysis of a religious approach to film, states that film narratives can provide archetypal patterns, images and elements that frame meaning and mythic orientation, central values that illustrate human drives to live, love and transcend self. These patterns and myths can deal with very different religious persuasions or worldviews.

Engaging with the natural world can be portrayed in films as a path to the divine. Even in times of stress, the natural world possesses the ability to bring about spiritual revelation. The movie *Alive* (1993) features the underlying story of how one survivor “found God on the mountain” while chronicling the true events of the 1972 plane crash of an Uruguayan rugby team. As rations run low the moral dilemma arises of whether eating the remains of their former companions is acceptable if they are to survive. *Alive* begins and ends with spiritual musings of one of the survivors about the nature of God and purposes to life. There are glimpses of the moral dilemma as to whether the ends (meaning survival) justify the means (inferring cannibalism). In the midst of this battle for survival of the fittest, which involves fighting starvation, avalanches, and winter storms, praying the rosary and moments of reflection provide peace between storms. Those who survive, and are seemingly hailed as heroes, are those who do not let morals take precedence over the need for food. The film represents a traditional/theistic religious worldview. Nature brings death, but it also bring space for epiphany as it forces the survivors to engage that which is bigger than themselves, namely God, in order to survive and find hope.

The classic conflict of science versus religion has also been articulated in films that deal with the seen and unseen natural world. *Contact* (1997), based on a Carl Sagan novel, portrays science and discovery as forms of a spiritual quest. The central character is Ellie, a scientist who searches radio waves of space looking for life outside our solar system. She and the rest of her team hope their quest will lead to a message from another world . . . and it does. The researchers are soon overwhelmed as political, scientific and religious figures rally to assert their positions and have a part in this new discovery. Through the struggles, Ellie receives support from a spiritual advisor to the White House who urges her to accept the existence of a higher life-force. The film portrays classic tensions between science and religion. Religious faith is portrayed in a broad, fairly relativistic sense with the only really theological strongpoint being a belief in a higher power. Experience defines reality and spiritual engagement, representing a postmodern form of spirituality. At first Ellie rejects the idea of a God she cannot see, but changes her position after having an “alien” encounter she cannot prove to others. She asserts that because she knows she experienced it, then it must be real. While dealing with cosmic themes rather than natural sciences, the film relays the potential

for science to engage with and possibly accept the idea of a “g/God” that cannot be seen.

The *Lord of the Rings: Fellowship of the Rings* (2001) also deals with religious themes as a classic fantasy tale based on J.R.R. Tolkien’s trilogy. It centers on the “one ring” which holds the potential to manipulate dark powers and enslave the world. The Hobbit keeper of the ring, along with a band of elves, dwarfs and humans, must travel to the land of Mordor where it was created and can alone be destroyed. This journey through a dark environment is also a sort of spiritual quest. Tension between free will and providence are highlighted by Frodo’s choice to accept the quest to return the ring and at the proclamation by the wizard Gandalf that other forces are at work guiding our fate. Temptation surrounds the ring in a mystique that challenges even the purest of intentions of Frodo’s protectors. In the midst of this there is hope as fellow journeymen fight to protect Frodo and his quest. In *The Two Towers* (2002) there also is Fangorn, who demonstrates traits of druidic spirituality, as he summons his fellow tree protectors and raises them as troops to fight, if only partly, in response to the destruction of his forest.

The mythical environment is a shell for a deeper purpose. The journey through this environment seems as important as the destination. This film represents a complex system of myth and magic-based beliefs. Here there is no higher being representing an ultimate good; the central battle against evil is a fight against the evil within the self and in various levels of the represented created order.

Investigating this theme of nature as a religious storyteller demonstrates how films can present traditional/ theistic, postmodern spiritual, and mythical and magical views of the natural world. Numerous other films could be mentioned for the other religious or ideological interpretations of nature that they present: for instance, *The Matrix* (1999) using a combination of Greek mythology, Christianity and Buddhism to describe a world destroyed by humanity and dominated by a new biotechnological order; *Planet of the Apes* (2001) introducing an adapted postmodern, civil religion in which apes are the highest form of the created order; or *Signs* (2002) where crop circles and alien attack are designed to lead characters toward the recovery of a traditional Christian faith. In these and other films traditional images and myth orientations are used to point the viewer to a spiritual narrative. Archetypal framing of the characters and scenes and implied ideals of the film’s underlying theme craft the overall message.

Recognizing the stories films tell us about nature can be an insightful way to identify beliefs and conceptions found in popular culture regarding our natural world. This also provides us the opportunity to reinforce, challenge, overturn or even crystallize the images and religious interpretations these stories pose. Images portrayed express the spiritual and physical perceptions of reality and projections of how the world could be. More than just visual stories, these films become texts of the religious mindset of our current culture. Film narratives can also be used as teaching tools and illustrations for inspiring environmental action, or at least, reinforcing responsible caring and stewardship of the natural world.

Mount Nyiro and the Samburu (East Africa)

The Samburu nomadic pastoralists occupy a semi-arid region in north-central Kenya with a complex topography of lowlands and highlands. The lowlands are dry regions of sparse savannah vegetation, while the forested mountains receive slightly higher rainfall, serving as dry-season grazing while the lowlands are used for wet-season grazing. The region has few permanent water sources but is crossed by seasonal streams. The local people dig sand wells in the river beds to obtain water for their livestock and personal use; there are also springs around the lower mountain slopes. Rainfall totals and annual distribution are highly variable and severe droughts that kill large numbers of livestock usually occur at least once in a decade.

Like the other pastoral regions of Kenya, the Samburu homeland has been characterized by the slow pace of modernization, partly attributed to limited interaction with the more developed high potential areas of the country and the influences of the Western world. The Samburu have generally maintained their traditional way of life with little change over the years; indigenous religious beliefs and practices are still strongly held, especially among the older generation. These beliefs and practices have contributed significantly to the conservation of their environmental resources. As pastoralists, they are totally dependent on pasture, water and plants for livestock keeping. The Samburu, therefore, have an intimate relationship with their environment which is interwoven in their traditional religious beliefs and practices. They are a deeply religious people, as is demonstrated through their understanding and relationship with their God. To them, God is an essential part of their existence; indeed, the Samburu name for God is also the word for rain, *Nkai*. Just as rain is the most important climatic element for their existence, as it determines the pasture and water necessary for their systems of livestock keeping, so is the Samburu God of vital importance to them.

The Samburu have a strong religious attachment to mountains. To some extent, all the mountains and highland masses within their territory are considered special areas with religious significance, as they believe that God has a preference for highland areas. However, Mount Nyiro is considered a special sacred site for the Samburu people, for it is here that God resides. They have even a specific location on Mount Nyiro where he lives, called *Kosikosi*. Though *Kosikosi* is not the peak of the mountain, it is a strikingly distinct peak and an important high point, where God is believed to have

his seat at a particular rock, called Ndadapoi. In many ways, Mount Nyiro symbolizes God's presence among the Samburu.

The Samburu believe that God has human characteristics, including sensory attributes. God can hear and see just like human beings and has the ability to know. However, it is important to note that the Samburu recognize that God has qualities superior to those of human beings. They believe God has absolute power and is omnipotent and therefore knows everything that happens even in secret and even before it happens. When a person is seen wanting to do evil, he is warned with the words "*mintining Nkai nemintodol*" (let God not hear or see what you are planning to do). This means that God can read people's thoughts and can punish you. The Samburu use these attributes of God to control their moral behavior, including behavior related to environmental conservation. They believe that God is offended and angered by people's unacceptable actions such as misuse of the environmental resources.

The Samburu God is also perceived to have human features, which the Samburu use to express their total dependence on God for existence and, therefore, the need to please him. The most significant are God's back, armpits and the belly, which depict God's ability to provide shelter, protection, security and love to humans. This is vividly described in this Samburu prayer:

Nkai ai, tanapa iyioo – God carry us on your back, as a mother does with her baby

Nkai ai, tejapa iyioo te nkitikit inono – My God, hide us or secure us with your armpits

Nkai ai, tipika iyioo atua Nkosheke ino – Place us inside your belly

Nkai ai, imbung'a iyioo te atua nkosheke ino – Keep us inside your belly

Nkai ai, irrita iyioo to nkosheke naibor – Pasture us with a white belly with love (Lolarrarri 2000).

The well-watered mountain and highland areas are a constant reminder to the Samburu of their God who sits on Mount Nyiro. It is still strongly believed among the Samburu that God gives the rain or withholds it. This could explain why God is equated to rain, which expresses God's actions and demonstrates his vitality and power. Rain is a direct manifestation of God's benevolence to humankind as through the giving of rain he replenishes the Earth by watering the dry ground and satisfies the thirst and hunger of the people.

The Samburu believe that God predetermines everything and that the only role people can play on Earth is to complement God's efforts and will. This is expressed as "*Materetore Nkai*" which literally means, "let us work together with God and not against him." This could be interpreted to mean working and living in harmony with the natural environment. Destruction of the environment can anger God who is able to punish the people. One of the worst punishments from God seems to be the withholding of rain, which means life and death to the Samburu.

Prayers, sacrifices and incense are offered to God from Mount Nyiro. Any Samburu will always face Mount Nyiro in prayer regardless of where they may be within their extensive grazing territory, signifying their unity of culture despite different exposures

and interactions with other communities. They always face the direction of Mount Nyiro when praying, just as the Muslims face Mecca. Mount Nyiro is where most sacrifices and prayers are performed at *Lorian le kosikosi*. Lorian refers to open grassland with a permanent stream, often high on a mountain; such areas are often settlement sites. This is “the open space up the mountain at Kosikosi.” God communicates to the Samburu people about impending calamities or current disasters from Mount Nyiro. These messages are delivered to the people through God’s appointed messengers who live at the foot of the mountain. Many of the Samburu astrologers, dreamers/messengers, the rope interpreters and intestine readers are found around Mount Nyiro. These special messengers provide religious and cultural leadership to the community.

The Samburu people perform a number of sacrifices to their God. The sacrifices are done using livestock along with incense from a mixture of leaves and branches of special sacred tree species which are put together and burnt. The Samburu believe that God accepts their sacrifice when mixed with incense as represented in the saying: “*Keing’uaya Nkai Lasar*” (“God smells the sacrifice”). “*Kelo nkuama e Lasar netii Nkai*” (“The smell of the sacrifice goes where God is”).

The sacrificial animal is slaughtered and blessed with milk mixed with water, and with words “*Torropilo, taalorian, taa Lmalmal matan iyie ana ntasim namunyak*” (“be sweet smelling, smell like the olive tree, smell like incense, that you may be eaten as a blessed sacrifice”). These religious rites cannot be complete without the use of specific environmental resources. Sacrifices offered on Mount Nyiro are considered very special and sacred events. The Samburu offer sacrifices to God for different purposes, but the most important is to appease God when calamities befall them, as they believe these are the result of their wrongdoing. Calamities such as drought, famine, sickness, war, infant death, or female infertility require propitiatory sacrifices. Sacrifices are also offered for thanksgiving in recognition of blessings or good fortune that have come people’s way, or to invoke God’s guidance and protection. For example, young men of a certain age get together and offer sacrifices asking God to guide them as they start adult life.

Mount Nyiro provides a number of the environmental resources used in Samburu religious sacrifices and prayers. Due to their religious and cultural significance, the Samburu have established a complex system to ensure their conservation and sustainable use. This system is embodied within their religious and traditional practices. The resources are: a) Water: Mount Nyiro is a source of seven important springs which are a lifeline for people and livestock on the different sides of this sacred mountain. The Samburu understand that the water from these springs is life to them which must be handled in a sacred manner, and they protect the sources using taboos and curses. Water is commonly used as *Nkarrer* (a mixture of water and milk) in blessings and prayers. The water used in these rituals is obtained specifically from one of the Mount Nyiro springs. b) Plants: A number of plants from Mount Nyiro are used for burning incense and for other religious practices. For example, the bamboo has religious and cultural significance among the Samburu. The bamboo is closely linked to God. Sam-

buru often refer to *kosikosi* as the place of the “talking bamboo,” and it is a place for offering prayers such as “the God of the talking bamboo, I pray to you” (Lolarrarri 2000). A number of taboos are used which have been instrumental in the conservation and sustainable use of the bamboo. Bamboo can only be cut when there is a full moon. This helps to control the harvesting period. The sacredness of the bamboo is also maintained through restrictions on its uses; for example, the fact that it must never be used as a stick to discipline children. Several other tree species used in burnt offerings are found only on the mountains. c) Green grass is a symbol of peace and wealth and has a direct link to livestock, the Samburu source of wealth. When green grass is plentiful, the livestock will be healthy and strong. The Samburu use green grass as a mark of regret and repentance; the person asking for forgiveness pulls a handful of green grass and shows it to the other person while pleading for another chance. During traditional ceremonies such as circumcision and in traditional prayers, green grass is used variously to signify peace and as part of the prayers.

Mount Nyiro also has considerable ethnobotanical significance as the source of certain medicinal plants, which cannot be found anywhere else in Samburu District. As many as 135 species of trees and shrubs have been identified by the Samburu as having medicinal value. Recent studies have shown that most of the ethnomedicinal and ethnoveterinary remedies are plant-based. Surveys show that most of these materials are obtained from mountain areas. One particularly important mountain plant is *Seketet* (*Myisine africana*), which is widely used for both humans and livestock as a de-wormer. It is probably the most commercially used medicinal plant in the district and beyond.

Mount Nyiro has for generations served as a fortress to the Samburu people against raids from neighboring communities. The Samburu believe that they owe their existence partly to this mountain, as they have frequently saved themselves and their livestock by escaping to Mount Nyiro where God gives them protection. Animals from the lowlands are moved to the safety of Mount Nyiro whenever there is a threat of attack. Even the Turkana, the main enemies of the Samburu, dread climbing Mount Nyiro to stage an attack.

Mount Nyiro also provides security to the Samburu people from ecological disasters such as severe droughts. With its greater environmental resources of pasture and water, the mountain is an important dry-season grazing area. The seven permanent springs that flow from the different sides of the mountain provide the only source of water to the surrounding areas at a time when it is most desperately needed. It is of special significance as it provides both physical security from raids, which escalate with drought intensity, as well as pasture and water.

In order to safeguard the use of Mount Nyiro and other exclusive grazing areas, the Samburu use their religious and traditional practices to enforce the controls. One of these is the curse which can be pronounced by the elders. It is called *Ldeket le loip* (the curse of the shade), referring to the shade tree where elders gather to exchange news or discuss specific issues. This is pronounced when a person misbehaves and disregards the warnings of the elders. It is an important cultural control with regard to grazing rights

and exploitation of other environmental resources. Mount Nyiro has also benefited from legal protection from the Kenya Government through its designation as a state forest under the Forestry Department. The Samburu people have been given exclusive rights to grazing on the mountain.

Despite both traditional and modern forms of protection, the future of Mount Nyiro as a sacred mountain to the Samburu people is threatened by a number of factors. These are mainly manmade as a result of the dynamic changes taking place within the Samburu community and from outside. Growing insecurity among neighboring pastoral communities has seriously affected the Samburu's traditional use of Mount Nyiro. With the frequent raids, the Samburu are spending more time with their livestock on the mountain than is ecologically sustainable. This problem has also been aggravated by the frequent severe droughts, which necessitate longer periods on the mountain than the normal dry-season grazing period. This has resulted in overutilization of the mountain resources. Fires set by people to smoke out bees while harvesting honey in the forest have also been instrumental in degrading the environment. Development activities in the Mount Nyiro vicinity are also a potential threat. Human populations are increasing and settlement is becoming more permanent, creating an increased demand for resources such as timber, fuel wood and water. Mount Nyiro is also the site of an "ecotourism" lodge which was constructed against the wishes of the local people, who consider it a desecration of the holy mountain.

While it is true that the traditional religious beliefs and practices of the Samburu reflect a strong influence on the way they utilize and conserve environmental resources, these valuable practices and knowledge are rapidly being eroded. This could perhaps be considered one of the most important internal threats to Mount Nyiro, as its historical basis for conservation is being undermined. The young people are increasingly being alienated from the pastoralist way of life because they have to go to school and later take up formal employment in urban areas away from the influence of their culture and traditional beliefs. The older generation of Samburu are concerned that God is unhappy with the people because they are not offering sacrifices as they should. This is being attributed to the weakening of their religious beliefs and traditional practices. As one elder put it "God must have moved because there are no fresh bones at the Rock of *Kosikosi* of late" (personal communication with local elder Lengaur Lelait, in 2000).

Despite these threats however, the traditional beliefs and practices must be appreciated for the role they have played in the past in the preservation of environmental resources. Revival of these cultural values and the involvement of local communities must be seen as important elements in any future conservation efforts at sacred sites such as Mount Nyiro.

Mount Rushmore

Mount Rushmore, a 6000-foot-tall schist and preCambrian granite peak, sits close to the center of South

Dakota's Black Hills, just shy of the geographical center of the North American continent. Gigantic visages of four American presidents rest on the summit, gazing off to the east across the prairies, carved out by Gutzon Borglum (1867–1941) and a host of federally subsidized workers between 1927 and 1941. In the decades since South Dakota historian Doane A. Robinson (1856–1946) first advocated patriotic mountain carving in the Black Hills' Harney Peak area, Mount Rushmore National Memorial has become an internationally recognized icon of American nationalism, a curious blend of nature, art, politics and piety.

For Doane Robinson, the link between sculpture and the Harney Peak region of the Black Hills was obvious, given the extensive collection of naturally carved pinnacles left there from millions of years of erosion. Carving into their surface heroic figures of Western exploration and conquest – such as Buffalo Bill, Jedidiah Smith or Lewis and Clark – would, he thought, help preserve the memory of the virtuous pioneers who had struggled to transform the Great Plains from prairie and near-desert into productive farm and rangeland. For Robinson, as for many Americans in the nineteenth and early twentieth centuries, what animated those pioneers was not simply human aspiration, but rather the “mystic dynamic of the universe,” which compelled them onward “to do deeds of miracle” (in Glass 1995: 157).

Robinson first broached the idea to an association of South Dakota innkeepers and roadside businessmen in 1923. His effort to memorialize the miraculous transformers of the west met considerable opposition, however, as Dakota newspaper editors – and their readers – took aim at his fundamental contention that the Hills were insufficiently beautiful as they stood. “Why should we add to, or rather, desecrate, the work of nature with the puny work of man?” Hills resident Maude Hoover wanted to know (in Glass 1995: 158).

Robinson's reply, offered in correspondence, editorials and a campaign's worth of speeches at business luncheons across the state, highlighted his theological conviction that nature, God's creation, required something more from humans than mere romantic appreciation. “God did not quite complete his job in the Harney district, but left it for man . . . to finish . . . developing the seed of beauty which God has planted” (in Glass 1995: 158).

Although the romantic lovers of natural beauty who objected so strongly to Robinson may have been large in number, their suspicion that mountain carving was an act

of desecration largely gave way over the next year. Perhaps Robinson got the best of the argument because Dakotans recognized that they too saw nature as something that required human transformation in order to be perfected. Many were also susceptible to his argument that such a memorial would bring considerable economic benefit to the hard-scrabble state.

Sculptor Gutzon Borglum, whom Robinson eventually approached – and himself the child of pioneers – saw the possibility of setting a larger drama in stone than simply that of settlers, explorers and army heroes. For Borglum, the size of the Black Hills outcroppings called forth a vision of the largest possible national scope. “American history itself shall march along that skyline,” Borglum reportedly burst out when first seeing the top of Rushmore in 1924 (in Smith 1985: 33). The busts of Washington and Lincoln (and later Jefferson and T. Roosevelt) seemed to him far more fitting than western heroes, since their achievements and commitments were what made America possible to begin with.

Like Robinson, Borglum also shared the idea that nature itself prompts the transformations which human artistic, economic and political achievements require. Borglum’s writings are rife with purple prose extolling the Anglo-Saxon spirit embodied in American institutions, which he saw as the product of both a natural and divine momentum. “America,” he wrote, was “sired by aeons of upward struggle out of hair and leaves, out of mud and fear, out of slavery in galleys and cells” (in Glass 1994: 268).

Rushmore’s stone, already nearly as old as the Earth itself, was the most fitting embodiment for the symbolic visages of the greatest American leaders. On many occasions Borglum told visitors admiring his progress that the faces were already present within the mountain. His drills, explosive caps and dynamite merely “relieved . . . from the head” excess granite (in Glass 1994: 274). In its apparent agelessness the granite would preserve, as well as art could insure, the virtues of American character and civilization. Rushmore’s “wondrous cenotaphs” – as one anonymous poet put it – signaled in the social and political tumult of the early twentieth century that America might not suffer the fate of other nations.

That the memorial serves to give America a natural foundation is evident in the descriptions of the four presidents often found in promotional literature developed for visitors by the National Park Service, philanthropic associations and individual citizens. Washington, as the “father of his land,” is often portrayed as the seminal figure. Jefferson, who saw political rights deriving from the laws of nature itself, is also memorialized for his purchase of the western half of the continent from Napoleon, making possible the great western expansion that Americans thought of as their God-given, natural destiny. Lincoln, who shepherded the nation through war, in his own words framed that war’s massive spilling of blood as the nutritive means for national rebirth – in essence grounding America’s future in the natural process of death. Roosevelt, something of a problematic figure for the memorial’s early proponents, was the great western outdoorsman who “upon these Black Hills hunted” and also perfected nature’s design by linking Atlantic and Pacific together in the Panama Canal.

In the late 1930s Robinson claimed to detect among the American public “a growing tendency to confer on the project a sort of mystical, semi-religious connotation,” which he thought would only grow to become a “worshipful reflex” over time (in Glass 1995: 161). Certainly, he was correct to a significant extent.

In the decades since work ceased Americans have gathered at the memorial for Easter sunrise services, and since the Vietnam War for annual POW/MIA memorial services. Americans have married there, and some have wanted to be buried there – and at least a few have had their ashes scattered there. All of these activities conjoin the nation’s political history with the natural phenomena of death and rebirth.

On numerous occasions concern about the commercial and inappropriate use of the Rushmore image has led to charges of desecration, perhaps most notably during the controversy caused by Alfred Hitchcock’s filming of *North by Northwest*’s climactic chase scene in 1958–1959. Hitchcock’s murder and mayhem was widely viewed as an unsuitable linking of the memorial with the reality of death.

Robinson hoped that the worshipful reflex would be conducive to social harmony and greater “devotion to America.” That this hope has not been completely realized is evident from the ways in which the memorial has become a kind of countersymbol. To some romantics, the original objections still seem right. To some it is merely kitsch. Some have campaigned to include the profiles of other significant Americans, such as feminist Susan B. Anthony.

Since the late 1960s many Native American activist groups have used the memorial as a focal point for protest. Although many sorts of political concerns have been raised there, what made the memorial seem especially appropriate for native protesters was the original underlying equation of natural beneficence and the spread of the American political order. Members of the Lakota nation in particular have generally remained skeptical that Rushmore’s linkage of nature and nationalism is due to its sacred status. Their right to the Hills – acknowledged by Congressional treaty in 1868, and given moral legitimacy by the 1980 Supreme Court award of reparations which culminated the longest-running court battle in American history – has sparked continuing Lakota political effort to regain control of the Hills. In that effort Rushmore stands as an indictment of what scholars have come to call “civil religion.”

Mountaineering

Mountaineering can be generally addressed as an encounter of humans and nature, as a relationship between human and mountain. Although this relationship can take on quite different qualities – from domination to sacralization – there is an implicit tendency to personalize and thus to ontologize the mountain as an individual entity. The climbing of a mountain has always been part of religious devotion, but it is only in early modern times that *overcoming* the difficulties related to high mountain walking became a symbol either of controlling the power of nature or of connecting spiritually with the transcendent realms high mountain areas stand for. A watershed in this regard was Petrarca's climbing the Mont Ventoux (France) on 26 April 1336, which he described as an overwhelming experience that felt like being carried from space into time. He was the first in recorded Western history to have climbed a mountain for the mere longing to see the land from above and – as he told in his report – from a new perspective.

“Mountain,” like “nature” in general, is not a neutral term. Its aesthetic perception is fundamentally prefigured by mental dispositions and ideas that generate the object of experience in the first place. The mountains can be personalized as enemies, representing the dangerous and threatening aspects of nature that humans are about to conquer in a risky fight, or as a revelator of spiritual wisdom. The latter personalization talks of mountains as “father” or “mother” that care for their children on their spiritual path. Often mountaineering connects both forms of relationship.

The dominating aspect of climbing is of paramount importance for the Western relationship to mountains. This can be proven by a cornucopia of documents from the sixteenth century through today. But one has to point at the ambivalence of this engagement with mountains. On the one hand nature is the degraded “wild,” and the mountains symbolize the purest and most powerful manifestations of nature's threatening that man struggles to overcome (one may think, for instance, of the mythical descriptions of expeditions to K2, Mount Everest, or the Eiger north face). On the other hand climbing a mountain means to overcome the dangers and weaknesses *inside* a person, thus mountaineering is a means to transgress the borders of bodily exhaustion in order to gain a fuller awareness of one's own psychical or spiritual capacities. Reinhold Messner, who climbed each 8000 meter peak and experienced a lot of emotionally touching situations (like cutting off his dead brother from the rope), time and again makes sure that climbing is a way to the inner self. Here, outer domination is mirrored by an internal conflict. This sheds light on the discussion of Messner's meeting the “Yeti” or “Big Foot.” Whether or not this giant animal exists in the Himalayas, this

story is definitely a transference of “the hero’s journey” (on which the climber meets the “dragon”) from internal into material realms.

Another aspect of mountaineering is its being depicted as revelation. Romantic authors often describe their meeting with mountains as an epiphany of nature’s sacred dimensions. Many nineteenth-century authors both from North America and from Europe could be mentioned here, from Johann Wolfgang Goethe and Novalis to Ralph Waldo Emerson and Henry David Thoreau. In this perspective, the mountain reveals the living beauty of nature and initiates a feeling of universal connectedness in the human climbing it. In modern environmentalism and the U.S. National Park movement, it was especially the mountains that (contradictorily) symbolized both the unconquered wilderness and the American project of universal salvation.

In the last three decades, mountaineering has been closely related to new developments within the “outdoor” scene. Although the disparate free-climbing movement is difficult to address generally and many climbers are not interested in ecological or even spiritual aspects of their sport, there is an undeniable relation between deep ecological activities and the romanticized picture of freeclimbing. A number of mountain climber-intellectuals are drawn to deep ecology because of spiritual experiences they have made outdoors, many of them being influenced by Arne Naess’ earliest environmental philosophy. Naess himself was an experienced climber and the first to ascend Tirich Mir (7690 meters; 25,230 feet), the highest peak in the Hindu Kush, in 1950.

Founders of internationally successful outdoor and climbing companies participate in grassroots deep ecological activities not only for advertisement reasons, but also as a consequence of their personal experiences that are often spiritually colored. This is true in particular for Doug Thompkins (founder of “The North Face” and “Esprit”), who funded the “Foundation for Deep Ecology,” the “EcoForestry Institute,” and the “El Pumalin Bosque Foundation,” which ambitiously supports the idea of Pumalin National Park in Chile (“Pumalin” means “where Pumas live”). Yvonne Chouinard (founder of “Patagonia”

Messner on Everest and Cosmos

Reinhold Messner and Peter Habeler were the first two climbers to ascend Mount Everest without the use of oxygen. In his report of the expedition Messner wrote:

I have not come here to ascend Everest at any price. I wished to get to know it, in all its might, difficulty, and severity. And I was resolute to renounce the peak, should I not be able to climb it without a breathing mask: With that modern oxygen apparatus one simulates at the Everest a level of 6,000 meters. But to experience that level, I need not go to Everest. To acknowledge, to sense, and to feel the Everest's power, I have to climb it without technical tricks. Only then I know what a man undergoes there, which new dimensions will open before him, and if he can arrive at a new relationship to the cosmos (1978: 162).

Finally standing at the peak of Everest, Messner described his feelings thus:

Standing in the diffuse light, with the wind in the back, I suddenly have a feeling of allinclusiveness (*Allgefühl*) – not the feeling of success and of being stronger than all those who came here before us, not a feeling of reaching the ultimate point, not omnipotence. Just a touch of happiness deep inside my head and breast. The peak that suddenly seemed to me like a resting place. As if I hadn't expected a resting place up here. At the sight of those steep, sharp ridges beneath us [we experience] the imagination that later we really would have come too late. Everything we say to each other now, we say in mere embarrassment. I don't think any more. While in a trance-like state I get the tape out of the backpack, switch it on, and try to speak a few reasonable sentences, my eyes are immediately filled with tears. "Now we are at Everest's peak; it is so cold that we cannot take photos," I later start the conversation with the tape recorder switched on. But right away crying again shakes me. I neither can talk nor think, but I feel this deep emotional commotion which throws me into a new balance. Only a few meters below the peak the exhaustion would have been the same, also the anxiety and the pain suffered; such a burst open of emotions, though, is only possible at the peak.

Everything that is, everything I am, is marked by the knowledge that I reached the final destination. The peak – at least temporarily – as naïve, intuitive answer to the question of being (1978: 180).

Mountains and Rivers Sutra by Japanese Soto Zen Master Dogen Kigen (1200–1253)

Neate, Jill. *Mountaineering Literature: A Bibliography of*

The Sanskrit term *sutra* has been reserved throughout the Buddhist tradition for what is taught by a Buddha. Its use in the title of this text immediately suggests the extraordinary nature of Dogen’s 1240 address to a monastic assembly, written as a powerful attempt to combine the broad rhetorical sweep and spiritual depth of Chinese

Buddhist Huayan concepts with a deeply personal vision of portraying the Soto practice of enlightenment (“to actualize the ways of ancient Buddhas”). Dogen was the founder of the Japanese Soto Zen school, its most sophisticated master, one of the greatest of native philosophers, and an unusually skilled writer of classical Chinese and Japanese. (This text is one chapter among nearly a hundred stemming from his massive life work, the *Shobo-genzo* or *Treasures of the Essentials of the True Dharma*.)

Dogen supposes numerous religious images from Song dynasty (960–1279) Chinese culture: mountains as a primary *yang* expression of hardness, height, brightness, etc., as sacred pilgrimage sites, as Buddhist and Daoist training centers and retreats, as wilderness unsullied and uncontrolled by secular political authority; waters as the penultimate Daoist “flowing” reality, as a primary *yin* expression of softness, darkness, adaptability, nurture basic to life, etc. Mountains and waters is the common Chinese character compound *shan-shui* for “nature” as totality, for its depiction as landscape in ink-wash painting and literature, and for suggesting the *yin/yang* dynamic of extending upward toward the heavens versus running downward into Earth as well as immediacy of flow versus long-term solidity and stability. These are combined with a Japanese religious awareness of mountains as sacralized abodes of *kami* (or as *kami* themselves). (*Kami* are the archaic, indigenous Japanese conception of any being with powers beyond the human.) In addition, both of the major classical Heian period (eleventh–twelfth centuries) esoteric Buddhist schools were located in mountains – the Tendai school on the Mt. Hiei range northeast of Kyoto, and the Shingon school on the

Mt. Koya range in traditional Kii province (modern Wakayama prefecture). (Dogen trained as a Tendai novice among the hundreds of temples on Mt. Hiei.) Indigenous Japanese religion carried a contamination/purity moral basis that saw waters as a primary means of purification in the removal of defilement (*tsumi*) caused by physical acts (i.e., death, killing, birth, menstruation) and by damaging emotions (i.e., jealousy, hatred, greed, etc.).

What is so powerful in Dogen's vision is that here mountains and waters are viewed as Buddhas, as living enlightenment in a continuous practice of wisdom and compassion. Mountains and waters are alive; they exist in complete ease in their phenomenal circumstances, they express enlightenment, they realize inexhaustible "spiritual power" (as do Buddhas and ancestors).

Not only are mountains always moving (forward and backward, more swiftly than the winds), but they also flow (like waters), travel on water, ride the clouds, and their toes splash through waters – in other words they practice wisdom and compassion and actualize enlightenment. ("If movement stops, Buddhas and ancestors will not emerge.") Mountains are uncommon territory ("although as a rule, mountains belong to nations, mountains belong to the people who love them") because they are the places of retreat for great sages and saints. Thus mountains literally love people of virtue and continually absorb such virtues – they are the "heart/minds" of such people. The positive karma continually developing from actualizing enlightenment is the spiritual power (Japanese: *kudoku*), which is the "name-and-form" and the life-force of such mountains. Here the ordinary does not apply; absent are secular authority ("not places where imperial virtue reaches"), social custom (where rulers bow to saints), and human conceptualization ("do not understand mountains using standards of human thinking"). Here as well, to the enlightened, typical individuals do not meet because human ordinariness is "disconnected in the mountains." Such mountains are everywhere – virtual treasures hidden in the air, in swamps, and in mountains. To Dogen, mountains are a dynamic practice (actualizing enlightenment according to the precise circumstances of the present moment), they are Buddhist reality (an interrelated "universe-as-the-Dharma" [Sanskrit: *dharmadhatu*]), and they are Buddhas and ancestors teaching the unenlightened in each new moment in every way ("investigate the mountains hidden in 'hiddenness' ").

Dogen immediately divests waters of common humanconceived properties. These are neither wet nor dry, strong nor weak, hot nor cold, still nor in motion, existent nor nonexistent, deluded nor enlightened. Images of water conceived during perception by various beings are included – heavenly beings seeing waters as spectacular flowers and jewelry, dragons and fish seeing waters as palaces and towers, greed-reborn hungry ghosts seeing waters as raging fire, pus, or blood. Waters are not simply the characteristics of its perceived forms (characteristics of element and color, concepts like gravitational flow, evaporation, etc.) to Dogen. He asks how different beings perceiving waters results in different images of the same perception, and if so, where lies the reality of water? ("This should not be investigated only when we see the waters of hu-

mans and heavenly beings, this is investigating how waters see waters.”) Waters attract human settlement – and sages and saints; thus, there are many kinds of “catching” – catching fish, attracting followers, catching the Way (Chinese: *tao*). (“In addition, one should catch the self, one should catch catching, one should be caught by catching, one should be caught by the Way.”) Like mountains, waters practice and authenticate; their Buddhist flowing penetrates what human-conceived waters commonly do not: flames, conceptualizing, memory, discrimination, and the awareness of Buddha-nature. Ordinary properties of water such as its essential nourishment to life, flow, adaptability, permeability, etc. are reinvested to depict the all-encompassing nature of Buddhist teaching as practice (“Places where waters penetrate are always the actualization of Buddhas and ancestors. According to this, Buddhas and ancestors continually touch water to make it their bodies, their hearts/minds, and their deliberations.”).

It is easy to misapprehend what Dogen is doing from major Western viewpoints of monotheism, Enlightenment philosophies, political and Romantic individuality, scientific materialism, and post-structuralism. In purely Buddhist terms, he advances the common East Asian Mahayana position of the “universe-as-the-Dharma” of the Chinese Huayan or “Wreath of Flowers” School, now as the foundation of a flexible, adaptive, present-oriented Zen practice (where the practitioner’s awareness as a separated being disappears into an ever-changing total community of beings). This involves the totality of all sentient existence explained as: (1) the karmic inter-dependency of all beings, (2) the interrelationship of all beings such that the uniqueness of each being in form and function is harmonized with its functional contributions to totality, (3) the interpenetration of all beings as (A) how any being at any instant and any point in space provides the context for the practice of wisdom and compassion that affects all beings, and (B) how the time and space of distinct beings may be superseded (from the standpoint of an individual being) or merged (from the standpoint of totality). Yet to Dogen and to many in Japanese religion, “sentient beings” conceptualized still limits this totality by exclusion, so the term “entities” (or “non-carbon life forms”) is more appropriately encompassing. What enables such expansive spiritual influence is the tremendous potential of positive karma resulting from the actualization of enlightenment as a Buddha’s practice of wisdom and compassion. Karma drives the engine of suffering that is the Buddhist ignorant, ever-changing self (Sanskrit *anatman*), but it is transformed in the Mahayana into strong soteriological capacity as Enlightenment is practiced (this is the Japanese term *kudoku* that I have rendered as “spiritual power”). Western interpreters often reduce this vision to an impoverished pantheism, animism, animism, etc., but Dogen’s portrayal of Soto Zen experience as the actualization of one’s inherent Buddha-nature during each new instant of practice dissolves sacred/profane, subject/object, distinct parts/one whole conceptual dichotomies plus typical comprehension of distinct entity time/space conceptual integrity – as he often described his own realization in Song China, a complete “dropping away of body and mind.”

MOVE

In the early 1970s, Vincent Leaphart, who later took the name John Africa, began to work out a philosophy of nature that respected all life, even to the point of refusing to repel or eradicate rodents or insects from inhabited buildings. In 1973, he and a group of associates moved into a house near the University of Pennsylvania campus in West Philadelphia, vocally advocating a total separation from the evils of modern society. They took the name MOVE, which was not an acronym but a word simply chosen to communicate dynamism. In an undated manifesto, members wrote, “MOVE’s work is to stop industry from poisoning the air, the water, the soil, and to put an end to the enslavement of life – people, animals, *any* form of life.”

MOVE members, mostly African Americans, saw themselves as a radical back-to-nature movement – a “Sierra Club with guns,” as one observer called it. They dressed in blue denim and did not bathe with soap or cut their hair. They rejected hospitals, doctors, and veterinarians. The MOVE women delivered several babies themselves, biting off and eating their umbilical cords and licking them clean. Unvaccinated pets roamed the premises, which were also infested with cockroaches, termites, and rats. Members used loudspeakers in the yard to blare out John Africa’s teachings and denounce, with great vitriol, those who disagreed with them.

The police raided the premises in 1978, arresting several members and bulldozing the wretched house. Those remaining, however, moved to another home and continued as before. After more years of conflict, the police dropped an explosive device onto the house from a helicopter and burned down most of the city block on which the MOVE house was located. Eleven members were killed in the fire and a battle with the police that accompanied the action. A few members survived, but have since avoided public attention. To some radical environmentalists, MOVE has continued to be an important symbol of resistance to consumerist society.

Mt. Hiei (Japan)

Japanese fondly identify Mt. Hiei (h. 848m) as Hieizan. Hieizan has become a mountain monastic center since Saicho's (767–822) arrival there in 788 B.C.E. and his carving of a statue of the medicine Buddha, Yakushi Nyorai. The Hieizan monastic complex, Enryakuji, is located between Lake Biwa in Shiga Prefecture and the northeast side of Heian capital Kyoto. Japanese believe that “northeast” is an “inauspicious” direction called “devil’s gate” (*kimon*) and to prevent dangers entering into the capital, religious specialists were required to perform religious rites there. Thus the purpose of Saicho’s establishment of a monastic complex on the mountain was to protect the emperor and the new capital. The birth of this monastic center serves an important role in understanding the relationship that exists between Buddhism and the Japanese state.

The monastic complex on Mt. Hiei is the headquarters of the Tendai branch of Japanese Buddhism. It was a site of over 3000 temples before Oda Nobunaga’s destruction in 1581 and still contains many temples scattered around the mountain.

As a traditional center of learning, its reputation is attested by the very fact that several Kamakura reformers such as Honen (1133–1212), Eisai (1141–1215), Shinran (1173–1262), Dogen (1200–1253), and Nichiren (1222–1282) who gave birth to several important Japanese Buddhist schools had their initial monastic training in Mt. Hiei.

On Saicho’s return from China in 805, Hieizan became the center of Tendai Buddhism with emphasis on one vehicle of the *Lotus Sutra*. In addition, its multitude of religious practices historically have embraced a wide range of syncretic rites deriving from Shinto and Japanese native religions. Its complex esoteric practices, the *nembutsu*, *sutra* chanting, and meditation, have had a great influence on Japanese religiosity.

For Tendai monks, Mt. Hiei is a place for religious austerity in which seclusion on the mountain is a deep spiritual practice important in developing spiritual insight. Even today, all prospective abbots in Mt. Hiei are required to live in seclusion on the mountain for at least 100 days practicing austerities. As a prominent Buddhist learning center, it still continues to support rigorous monastic practices such as the twelve-year ascetic retreat (*rozangyo*) and the one-thousand-day mountain pilgrimage (*kaihogyo*).

The *Kaihogyo* practice is a daily pilgrimage of a few rare ascetic monks who walk through the forests and hills of Hieizan for 100 days or 1000 days over a period of seven years to perfect themselves to Buddhahood so that they can be vessels of solace for those immersed in the problems of the mundane world, exemplified in busy Japanese city life. Modern ascetic practitioners have followed two ascetic pilgrimage routes extending over 35 kilometers through the hills of Mt. Hiei. Mt. Hiei’s strong association

with nature is very clear both in its walking pilgrimage through the hills and the practice of waterfall austerities by ascetic monks such as Sakai Yusai and Hakozaiki Bunyo. As an essential part of their pilgrimage, without any religious discrimination, the ascetic monks pray and chant esoteric *mantras* at 260 Buddhist and Shinto sacred sites including the objects of nature. This practice demonstrates the inclusive nature of the Japanese religious world, which embraces the worship of trees, rocks, and waterfalls and holds the belief that the natural world is a locus for spiritual existence. In conversations with devotees, the preeminent ascetic monk Sakai Yusai frequently expresses his immense gratitude for the natural world, stating that “even the rain” that hinders his pilgrimage is a cause for gratitude since it helps crops to grow and thus people may have plenty of food to eat.

Within this devotional religiosity, there is a great emphasis on the mountain, the forest and nature. Positive attitudes toward nature and the close relationship between Japanese religions and nature appear clearly in both the Japanese religious worldview and Tendai monasticism. In 1999, when I stayed with a group of students at Saikyōji for five weeks, the abbot of Saikyōji explained the Tendai attitude toward nature and the symbolism attached to the mountain. In particular, their attitude toward monkeys is rather striking since they regard them as animals with deep spirituality. According to the abbot, when monks arrived at Saikyōji after Nobunaga’s destruction, they witnessed monkeys playing the bell while repeating the *nembutsu*. To remember that event today Saikyōji still rings the bell daily. On the whole, the pilgrimage and other practices at Mt. Hiei combine Japanese religious attitudes toward nature by creating a nature-friendly religiosity coupled with contemplative aspects of Buddhist monasticism.

Muhammad, The Prophet of Islam (570–632)

Muhammad, son of Abd Allah was born in 570 in Mecca, Arabia. He belonged to a noble tribe of Qu'raysh of the city of Mecca, and was orphaned at an early age. He developed into a sober and responsible young man, known for his trustworthiness. When he received the first revelation, he was forty years old. In the year 622 B.C.E., the Prophet decided to leave Mecca, where he had lived in some danger. He migrated to Yathrib, later called Madina alNabi (The City of the Prophet). A decade later, Muhammad was able to return to Mecca, clear the sacred shrine (Qa'ba) of idols, and establish worship of the one real God. After his death in 632, his message spread north of the peninsula to North Africa, Spain, and India.

Muslims generally believe that Muhammad is the archetypal true man, representing in his life and person an example all Muslims should aspire to follow. So, the best example of Islamic environmental awareness, if there is any, may be seen in the life and attitudes of Muhammad toward the environment, which may set an ideal for Muslim generations. Since every good Muslim is expected to emulate the behavior of the Prophet, the following case is a good example of how he changed the worldview of his milieu regarding animals. One of his companions was seen crumbling up bread for some ants with the words, "They are our neighbors and have rights over us" (Johnson-Davies 1994: xvii).

To understand Muhammad's attitude toward the environment, it is necessary to highlight the Qur'anic *Weltanschauung*/worldview which provided a comprehensive, integrated, and holistic worldview that is based on the unity of Reality (i.e., *tawhid*). Thus, the purpose of the Qur'an, is "to awaken in man the higher consciousness of his manifold relations with God and universe" (Iqbal 1958: 8–9). The Qur'an, for example, speaks of trees, gardens, and orchards so frequently that it is not difficult for any attentive reader of the Qur'an to develop an appreciation for them. Since nature is not out there just by accident, as a result of the process of evolution or chaotic configurations, it must have some meaning and purpose. The Qur'an suggests that if any human being ponders over and scrutinizes the very structure of natural phenomena, he/she can deduce the existence of a Creator, who is AllPowerful, All-Knowing, and All-Merciful. Nature reflects, just like a mirror, the power, beauty, wisdom and mercy of its Creator. Therefore, the Islamic worldview does not endorse any view of humanity's viceregency of the Earth that destroys and spoils the ecological balance of nature.

Muhammad can be seen as the first example of the Qur'anic viceregency. He attached great importance, in his own practice and sayings (*hadiths*), not only to public worship, civil law, and social etiquette, but also to planting trees, preserving forests, and conserving the environment. The following sayings are instructive in giving clues about his environmental concerns:

If you have a sapling, if you have the time, be certain to plant it, even if Doomsday starts to break forth (*Musnad* 183–4, 191, III).

There is none amongst the believers who plants a tree, or sows a seed, and then a bird, or a person, or an animal eats thereof, but is regarded as having given a charitable gift [for which there is great recompense] (Muslim, *Musakat* 9, 12, II. 1188–9).

Muhammad, exemplifying in his personality the Qur'anic viceregency and being a man of Arabian deserts, was aware of the integrity of the ecosystem and the importance of water, greenery, and forests.

On migrating to Medina, Muhammad organized the planting of trees and date groves. He made forests and green spaces conservation areas, where every sort of living creature could live unmolested. Within these “inviolable zones,” which are called sanctuaries (*hima*), neither trees, nor shrubs, nor vegetation could be cut, nor could any wild animal be hunted or even disturbed. Around Medina, a strip of land approximately twelve miles wide was proclaimed a sanctuary and made a conservation area by Muhammad. Likewise, he declared other areas, similar to the one in this example, as sanctuaries. Most importantly, when Muhammad established these sanctuaries, he said he was following the example of the prophet Abraham, who declared Mecca a sanctuary. Today these sanctuaries, with the addition of new ones, are still intact.

Muhammad insisted on the protection and kind treatment of animals. He taught with his deeds and sayings that Muslims should act kindly toward all living beings. He said: “The Most Merciful One is merciful towards those who are merciful. Act kindly to those on the earth so that those in the heavens [the angels] will be merciful to you” (Tirmizi, *Birr* 16). Muhammad commanded that birds' nests should not be disturbed or the eggs or chicks stolen. He ordered someone who had filled his bag with fledglings stolen from nests, brought to town, to return them to their nests immediately.

Furthermore, he said: “If without good reason anyone kills a sparrow, or a creature lesser than that even, the living creature will put his complaint to God on the Day of Judgment, saying: ‘So-and-so killed me for no purpose’ ” (Nasai, *Dahaya* 42, VII. 239). He warned Muslims against mistreating animals, “a woman was sent to Hell because she tied up her cat and neither gave it food nor allowed it free to hunt the cockroaches” (Bukhari, *Adhan* 90 I. 181–2; Muslim, *Birr* 133, III. 2022). Muhammad tells a story of a man who was walking along a road and felt thirsty. Finding a well, he lowered himself into it and drank. When he came out he found a dog panting from thirst and licking at the earth. He therefore went down into the well again, and filled his shoe with water and gave it to the dog. For this act God forgave him his sins. Muhammad was then asked whether man had a reward through animals, and he replied: “In everything that lives there is a reward” (Bukhari, *Musakat* 9, III. 77). So, while treating animals

well is one means for a person to enter Paradise, mistreatment of animals may be the cause of a person going to Hell. The Prophet banned hunting, especially the arbitrary hunting of animals for pleasure. While hunting is permitted in principle, it might become prohibited depending on the conditions. Islam permits eating meat; however, it gives instructions to ensure humane slaughter, with as little pain to the victim as possible. The main counsel of Islam in the slaughter of animals for food is to do it in the least painful manner.

Another aspect of Muhammad's environment-related concern is his insistence on private cleanliness. This is considered to be one of the fundamentals of Islamic belief. Muhammad says, "cleanliness is half of belief" (Muslim, *Taharah* 1, I. 203). When going to the mosque, to visit someone, or when in the company of others, he was always careful to wear clean and presentable clothes, to rub fragrant scents on his body, and not eat things like onions and garlic, which would have an unpleasant smell. In spite of Muhammad's insistence on protecting the environment and exemplary treatment of animals, the signs of environmental crisis can be seen in nearly every Muslim country. One reason may be, as Seyyed Hossein

Nasr has argued, the Islamic world is not totally Islamic today and much that is Islamic lies hidden behind the cover of Western cultural, scientific, and technological ideas and practices emulated and aped to various degrees of perfection, or rather one should say of imperfection, by Muslims during the past century and a half (Nasr 1992: 87).

In short, the Prophet Muhammad was very conscious of his environment and developed a spirit of love and care toward the creatures of God. If Muslims examine the life of Muhammad with a "green" eye, they may discover new insights for developing an environmental ethic.

Muir, John (1838–1914)

Generations of nature lovers in America and the world have been thrilled and inspired by John Muir's accounts of his youthful experiences in the mountains of California – swaying atop a storm-blown spruce tree, communing with a favorite plant in the spray of a waterfall, or gazing upon the glories of his beloved Yosemite Valley. Over the same period, Muir's political career has served as a model of ethical and political commitment to an entire tradition of environmental activists. Both sides of Muir's life and work

– the experiential and the activist – are expressions of a fundamentally religious orientation toward the natural world. Although the exact character of this religiousness has proven difficult for later interpreters to formulate in conceptual terms, the figure of Muir himself continues to serve as an icon of nature religion – a window through which individuals and communities can see their own relationships with nature in a deeper and more profound light.

John Muir was born on 21 April 1838 in Dunbar, Scotland, the first son of a middle-class family that would eventually include seven siblings. While Muir's mother Ann nurtured him with the delights of backyard flowers, his father Daniel (a lifelong Protestant seeker) expressed his version of Christian love by using scriptural injunction backed by physical punishment to keep the sometimes headstrong boy from sin. Thus, contrasting currents of maternal affirmation and paternal restriction fueled the child's own capacities for sensual and imaginative contact with nature, infusing Muir's escapes to the surrounding Scottish coastline, moors, and hills with a profound and complex religious sensibility.

In 1849, when he was 11, Muir's family immigrated to America. On the Wisconsin frontier, Muir experienced the beauty and glory – as well as the hardship and danger – of wild nature with a greater intensity than ever before; in the human realm, he learned to balance his father's increasing harshness with an increased reliance upon his siblings, on the evangelical figure of Jesus as comforter and companion, and on his own sense of personal achievement in his work as farmhand, mechanic, and inventor. Finally leaving home in 1860, at age 22, Muir encountered more liberal strands of nineteenth-century American Protestantism, including a religiously informed openness to modern scientific, evolutionary, and humanitarian thought that would inform his outlook throughout his life. Entering the University of Wisconsin at Madison in 1861, Muir was introduced by professors such as Ezra Carr to the latest research and theory in disciplines such as geology and chemistry, while Carr's wife Jeanne stood at the center of a social circle stitched together by the bonds of Christian love – love which was expressed and

embodied in the intimacies of everyday domestic life as well as in a shared passion for amateur botany.

By late 1867, when Muir (inspired by explorers such as Alexander von Humboldt) left on a long botanical journey through the American South, he had moved decisively away from conservative Protestantism's devaluation of nature:

The world, we are told, was made especially for man

– a presumption not supported by all the facts . . . Why should man value himself as more than a small part of the one great unit of creation? And what creature of all that the Lord has taken the pains to make is not essential to the completeness of that unit

– the cosmos? (Muir 1997: 825–6)

After falling ill with some unknown fever in Florida, Muir continued his journey not to the Amazon but to California, where work as a shepherd allowed him ample time to observe the works of God both on the plains and in the mountains. Shaped by increasingly intimate letters to and from Jeanne Carr, Muir's religious experience of a welcoming nature became ever more sensual and energetic, even erotic, especially after he entered the Yosemite Valley in 1869: "Last Sabbath I was baptized in the irised foam of the Vernal & in the divine snow of the Nevada [falls], and you were there also & stood in real presence by the sheet of joyous rapids beneath the bridge" (Muir in Holmes 1999: 213). His earlier intellectual reevaluation of the relationship between humanity and nature broke through to a more bodily, experiential level: "I'm in the woods woods woods, and they are in *me-ee-ee!*" (Muir in Holmes 1999: 220). Moreover, this communion with nature was an opening into communion with the divine: "I will fuse in spirit skies. I will touch naked God" (Muir in Holmes 1999: 238).

Perhaps understandably, Muir could not sustain in his everyday life the level of naturalistic ecstasy expressed in his letters and journals; as early as 1873 he had moved from Yosemite down to the San Francisco Bay area, where he would live for most of the rest of his life and from which he would take increasingly long botanical and scientific travels throughout California, the West, Alaska, and eventually the world. Casting about for a career during the 1870s, Muir wrote influential geological articles on the glacial origins of Yosemite Valley, travel articles for local newspapers, and scientific studies of Californian trees; in 1879 he married Louie Strentzel, with whom he had two daughters (Helen and Wanda), soon settling into the life of a farmer in Martinez, California. By the end of the 1880s, financially successful but tired of farming, Muir resumed his literary career with travel writing on the West and Alaska. A pair of articles in *Century Magazine* in 1890 and 1891 represented his first foray into political waters, in support of federal control of Yosemite Valley; his success in influencing public opinion led to national prominence as a conservationist, through his work as co-founder and president of the Sierra Club, his numerous books and articles popularizing wilderness recreation and protection, and his friendships with important leaders such as Teddy Roosevelt and Gifford Pinchot. However, despite numerous successes in protecting wild nature through the system of national parks and forests and other efforts during

the Progressive era, defeats such as the damming of the Hetch Hetchy Valley for a reservoir in 1913 helped lend an apocalyptic and tragic element to an otherwise confident American conservation movement. Muir died in 1914.

Although undeniably grounded in the Christian Bible and in specifically Protestant theology and piety (both evangelical and liberal), Muir's nature religion has been interpreted by later scholars in the light of a wide array of ideas and images: Transcendentalism, mysticism, Daoism, Buddhism, pantheism, and others. However one describes it, at the heart of Muir's religiousness is 1) the importance of *direct experience* of nature and of the divine – experience that in all cases combines bodily, emotional, cognitive, and spiritual elements. Such experience reveals 2) the *ecological interconnections* between all beings, as captured in one of his most famous aphorisms: “When we try to pick out anything by itself, we find it hitched to everything else in the universe” (Muir 1997: 245). Out of this direct experience of interconnection comes 3) an attitude of *reverence* toward the world – reverence expressed through the pursuit of scientific knowledge as well as by a joyous humility before the mysterious and the unknown. Such reverence leads Muir to 4) a *biocentric* worldview, in which all living things, human or nonhuman, are valued as children of God; indeed, Muir goes further, consistently expanding the bounds of biocentrism to include “inanimate” objects such as rocks and rain as living elements of the divine creation. Finally, Muir reformulates the prophetic spirit of the Old Testament and the moralism of the New into 5) a call and demand for *political and personal action* on behalf of threatened nature, expressed most fully not in ethical theory but in his own public career as conservationist and activist. Indeed, it has been through his actions as much as his words, his public figure and legend as much as his own writings, that Muir's legacy has brought these religious elements of direct experience, ecological interconnection, reverence, biocentrism, and activism to an ever-widening audience of environmentalists, nature lovers, scholars, scientists, and politicians.

At the same time, looking beneath the mythic figure, a critical perspective on Muir's biocentrism reveals an unexpected philosophical and social hierarchy, as his valuation of wild, untouched nature over humanly transformed landscapes was paralleled by a preference for middle-class, white tourists and adventurers over working people and non-white inhabitants. On the one hand, this outlook has served to justify the removal of Native Americans and other indigenous peoples in the process of *creating* “pure wilderness” out of formerly inhabited landscapes (as in many national parks, such as Yosemite and Yellowstone in the U.S.); on the other hand, Muir's influence helped allow the American conservation movement to virtually ignore inhabited and working landscapes (such as cities and farms) as objects of environmental concern over most of the twentieth century. Thus, Muir's wilderness ideals must be understood and critiqued as products of their cultural context at the same time as they may be valued as important and invigorating historical tools in the attempt to forge a larger and better vision of humanity in harmony with nature. Patron saint of modern environmentalism and intellectual forerunner of the philosophy of deep ecology, Muir has been influential

beyond these specialized movements in making a religiously grounded appreciation of and concern for wild nature a part of modern society and culture in general, in America and throughout the globe.

Müller, Friedrich Max (1823–1900)

Friedrich Max Müller, a German-born linguist who settled in Oxford, England at the age of 26, pioneered the development of comparative Indo-European mythology. A student of the philologist Franz Bopp, the basis of Müller's approach was the study of the Vedas and the piecing together of etymological identities. He argued that the original proto-Indo-Europeans were "mythopoeic" and could express abstract notions only through analogy. This Romantic view of language conceived primitive speech as not yet having developed a propensity for abstract nouns. Accordingly, the earliest Indo-European *Ursprache* employed only concrete references – foremost those of natural phenomena. In Müller's understanding, the sky and sun became the preeminent religious symbols.

Müller argued that the process of myth-making involves a "disease of language" in which metaphors redevelop meaning apart from what they were first used to express. In other words, after the migrations from the Indo-European homelands and the subsequent emergence of separate daughter languages from the parent, the original significances of the names and epithets of the Aryan gods were forgotten and new comprehensions were invented for them. To understand this view from our present perspective, Müller must be placed within the context of nineteenth-century Germany and Victorian Age Britain. Central to the Romantic thought of the time was an alleged intimate original relationship between humanity and nature. Müller's discovery of a naturalistic base to the original spiritual formulations of European ancestors follows in this line of Romantic reinterpretation. But even today, despite its persistent idealization, nature remains an informing metaphor and foundation for Romantic and quasior neo-Romantic positions that oppose the rational and the mechanical when posited as exclusive concerns. In the wider "tug-of-war" between the Greco-Roman foundations of Western civilization, on the one hand, and Judeo-Christian reallocations, on the other, the search for cultural origins has taken root. Müller inaugurated much of this process, although he himself sought to develop a science of religion which, at the end of the day, would find the kernel of "true" religion as distinct from the myths and fables that develop around it.

The chief contemporary criticism of Müller is that a time in which abstraction could only be expressed through concrete metaphors did not exist. The other criticisms include rejections of the notion of a "disease of language" as a biased concept, Müller's exclusive use of linguistic methodology, and his assumption that the Vedic Aryans were the proto-Indo-Europeans. Though perhaps now entering its twilight period, the current fashion in Indo-European Studies is George Dumézil's tripartite functionalism

that, following Durkheim, denies the validity of any definition of religion in terms of the supernatural and also rejects both “naturalism” and “animism” as providing adequate explanations of religious origins. However, a counter-argument to the Dumézilian rejection of Müller is that Müller is in need of updating rather than dismissal. In Müller’s defense, the professor denied that all mythology has a solar origin. It is instead simply one process among many. While several of the specific Greek-Vedic equations on which Müller’s comparative mythology and presentation of Eurocentric root-spirituality are based are now recognized as faulty and incorrect, new understandings of phonological change nevertheless allow us to appreciate the essentials of the methodology. While the proto-Indo-European may have been fully capable of abstract thought, he/she nevertheless took his/her primary religious metaphors from the natural environment. This reaffirmation of Müller resituates the consideration of Western spirituality as a development from humanity’s earliest interactions with the most prominent elements and rhythms of nature.

Murie, Olaus J. (1889–1963)

Olaus J. Murie was a renowned field zoologist, environmental writer, and wilderness preservationist. As a field scientist he conducted landmark “life history” studies of the Alaskan caribou herds and of the Jackson Hole, Wyoming, elk herd. While doing so, he spent months at a time, over several decades, traveling and living in many remote wilderness areas. He developed a nearly mystical reverence for nature, and an opinion that preserving wilderness was important for the protection of certain animal species that required large acreages of habitat, such as wolves, mountain lions, grizzly bears, elk and caribou. He also came to believe, through his own experience, that wilderness was worth saving for humans to enjoy as a counterpoint to modern civilization.

Murie’s spiritual connection to the Earth and its natural processes was well expressed in a letter he wrote in 1920 to his then-fiancé, Margaret Thomas, while he was following the Denali caribou herd. “I guess I am still enrolled in the Lutheran Church at home” [Moorehead, Minnesota] he said, “but there is no one creed or church as far as I know with which I fully agree. For one thing, I am crazy about Nature, and almost worship it, but isn’t Nature the direct work of God?” (in Glover 1989: 33).

Murie worked for the U.S. Bureau of Biological Survey during the decades when that agency spent millions of dollars on its campaign to eliminate large predators and raptors from North America. Murie was a nearly lone internal dissenter against this campaign. In an argument with a fellow scientist, he wrote,

I am very fond of all our native mammals, amounting almost to a passion . . . I believe the cougar is Nature’s masterpiece in physical fitness. The big cats are infinitely beautiful. The wolf is a noble animal with admirable cunning and strength . . . I would utilize every opportunity to let them live . . . (in Glover 1989: 36).

In 1945, tired of battling the agency he worked for, Murie resigned and became half-time director of the Wilderness Society. In that role he traveled widely around the U.S., showing slides of the American wilderness and its fauna, and urging people to support preservation. In the early 1950s, he led a campaign to preserve the coastal plain and mountains of northeastern Alaska that comprise the range of the Porcupine caribou herd. This resulted in the eventual establishment of the Arctic National Wildlife Refuge.

By this later stage of his career, Murie’s actions and viewpoint might best be described as Taoist (today this is more often translated Daoist), even though he may never have read or heard much about that ancient Chinese tradition. He was acutely aware of the constant flow of natural processes. He believed humans should live in harmony with those processes, and stand in humility before them. Indeed, he saw hu-

mility as one of the highest virtues, and constantly advocated its cultivation by both individuals and nations.

What he saw instead was a culture growing increasingly arrogant, especially toward nature. Examples, for Murie, were everywhere: in the effort to do away with “harmful” forms of wildlife, in the construction of enormous dams to “control” wild rivers, in the spraying of chemical pesticides from airplanes all over the cattle country of the west, in the usurpation of wildlands by a rapidly growing military.

Murie was especially opposed to the relatively harmless practice of naming natural features after human beings. Similarly, he opposed the construction of human monuments, especially in places where the much greater power and mystery of natural processes was on display. This resulted in an ironic situation when he died, in the fall of 1963. Admirers wanted to build a rather large monument to Murie in Jackson, Wyoming. His widow, Margaret, had to argue strenuously to prevent them from doing so, knowing that it would violate one of Olaus’ strongest beliefs.

Murie’s religious attitude may best be illustrated by his reaction to a proposal by the National Park Service, in the early 1950s, to build a church on the south rim of the Grand Canyon. The sacredness of that place, he argued, cannot be enhanced by architectural gymnastics. The Grand Canyon and the other beautiful and meaningful dedicated portions of our wonderful earth, should not be cluttered with manmade contrivances . . . And we modern human beings should forget our modern exaltation in material progress and approach the Grand Canyon with humility, in the hope that we can improve ourselves (in Glover 1989: 40).

Music

The power of music to draw us in to states of spiritual openness and oneness with the world of surrounding nature has been known to humanity for thousands of years. Because of its inherent abstraction and allusion to a more pure world of resonances, tones, and frequencies, music has more than any art been understood as inherently sacred, able to lift its listeners and performers up to levels of higher consciousness. If religion is the belief that there are powers beyond our control that help give meaning and purpose to the world, then for many, music is the proof that such powers exist.

There are at least two ways the spiritual power of music can address nature, dependent on the contradictory meanings the word “nature” can have. On the one hand, music can lift us out from and above the mundane particularities of the obvious, base, material world of everyday life, toward some kind of harmony that encompasses inner human essence and the outer physical purpose, holding the world together and assuring humanity a place within it. The whole thing could be called nature, with “speculative music” our route to inhabiting it correctly. As Athaneseus Kircher (1601–1680) wrote,

The chord of the soul must be aligned with the chord of the Hierarchy, and that of the body with the celestial one of the stars, and you will penetrate the secret of secrets, the absolute knowledge of things divine and human, as St. John says, “You have been anointed by the Holy One, and know all things” [I John 2:20] (in Godwin 1993: 284).

Thus nature has been described as a music of the spheres, all the way back to Pythagoras, some perfect Platonic song that human music or conduct can only aspire to. The more spiritual the music, the closer it is to such heavenly structured ecstasy.

On the other hand, music can easily seduce us *away* from a higher calling, and into a nature that is beautiful, immediate, and, according to some spiritual traditions, nothing but base amusement. As Hunayn (808–873) wrote in his *Maxims of the Philosophers*,

The soul sings plaintive melodies, whereby it reminds itself of its own superior world. As soon as Nature sees this, and becomes aware of it, she presents herself by all sorts of her images (sensuous beauties) introduced one by one, to the soul, until finally she succeeds in recapturing it. The soul will soon forsake that which constitutes its own essence, and will become with all of its faculties entirely submerged in the *ocean of nature* (in Godwin 1993: 93).

It may be Marsilio Ficino (1433–1499) who best described how music works upon the player or listener to draw us out of ourselves and unto a larger place:

By purified air music excites the aerial spirit which is the bond of body and soul – by meaning it works on the mind – by the conformity of its quality it floods us with

wonderful pleasures “by its nature, both spiritual and material, it at once seizes man in his entirety” (in Rowell 1983: 71).

If the Western traditions suggest that the immortal music of the universe is a direct line from the human soul up from nature into the pure other world, then remember, this is not the only way. Hazrat Inayat Khan writes of the Sufi path, where God is in the living world all around us.

The more widely one observes nature, the more it appeals to one’s soul. Why? Because there is a music there. One sees more deeply into life and observes life more widely, one listens to more and more music, the music which answers the whole universe. Even a piano of a thousand octaves cannot produce the variety that nature represents (in Rothenberg and Ulvaeus 2001: 19).

The music of nature is *infinitely greater* than anything humanity can measure up to. Hinduism speaks of *Nada Brahma* – God is Sound, or the World is Sound. As Joachim-Ernst Berendt explains in his book of the same name, “before we make music, the music makes us” (1991: 12). Sound pulses through all of the universe, and through actual and ideal music, humanity can find an artful way into the whole. Alexandra David-Neel met a Tibetan lama on her travels who was a master of sound who told her this: “In the beginning was the wind. This wind sounded, thus it was sound which formed matter. The sound brings forth all forms and all beings. The sound is *that through which we live*” (Berendt 1991: 178).

The music that is considered spiritual is generally thought to have greater clarity of purpose than mere enjoyment or entertainment. Does this require certain specifically musical qualities? Some identify repetition, solemnity, and intensity as pushing the limits of musicality toward intoxication and trance. Ludwig van Beethoven found his greatest inspiration through walks in the woods. He writes, “My bad hearing does not trouble me here. In the country, every tree seems to speak to me, saying ‘Holy! Holy!’ In the woods, there is enchantment which expresses all things” (in Glesner 2001). His Symphony no. 6, the Pastorale, is his homage to the romantic power of the countryside.

Just as words are transformed into magic syllables in mantra, melodies and harmonies become larger than their musical selves inside spiritual compositions and improvisations. Spiritual music transforms the listener and performer, with the intent of getting us to look beyond ourselves to a greater sense of Oneness. Free jazz saxophonist Ornette Coleman says that he has always been guided by “the universal sound, the sound of the universe” (in Berendt 1991: 56). If this unity draws us into the environment around us, not apart from it, then nature is approached, not denied. Listening to the natural world around us is part of the discipline.

Music may imitate nature, learn from nature, but the hardest thing may be to find the best way for humanity to fit into nature. This too is a spiritual quest. A few ethnographies document various cultures with specifically musical views of the universe and the people’s place within it. The Kalapalo of Brazil’s Upper Xingu River sing of times when we were closer to the world: “at the beginning, the Birds’ language was our language. We lived on the Other Side of the Sky” (in Guss 1985: xi). The birds’

language is still like music, while ours has moved away from melody and we have lost the spiritual connection to nature around us. The Kaluli of New Guinea have a special word for the way their songs and society fit into the surrounding rainforest, *dulugu ganalan*, “lift-up-over sounding,” the definition of a musical ecology where the highest goal is not something far away, but immediately accessible to those who are prepared to listen.

Their music does not simply define their culture in terms of nature but grounds them very precisely in a particular place. Steven Feld asked the singer Ulahi if the Kaluli learned how to fit their music so well into the surroundings by copying the ornate songs of the forest birds, but she said, “Oh no, they learned from us” (in Feld 1990: 211). (As someone who has learned much from playing music live with birds and insects myself, I have to admit that when contact between species happens this way, I feel much closer to some secret art that resounds across all life forms than before.)

Some traditions preach a kind of ultimate musical humility where we mere human musicians must stop singing and playing in order fully to attend to the more powerful music of the spirits, spheres, or of nature. “You cannot capture God’s choir,” says nature sound expert Bernie Krause, “in a recording” (in Rothenberg and Ulvaeus 2001: 223). Hazrat Inayat Khan eventually had to give up music, because he was called to a higher, more pure and austere life of prayer and devotion. Perhaps the suspicion that music is more fun than spiritual practice should be always lurks inside us even when we succumb to its power.

Common to many visions of the spiritual power of sound is a realization that music possesses us, can sweep over our being to pull us up in its wake toward a place in nature we cannot quite reach but know we must strive for. Gilbert Rouget explains how the music of trance leads the body to take on a whole new identity. If music is deep enough, it cannot be explained. It pushes us forward, toward a better destination. “We sing,” says the Lubavicher Rebbe, “when we have tasted joy and are climbing it to the heavens” (Lubavicher 2001). The Midrash speaks of ten songs of the history of Israel. Nine are in the Bible, but the tenth is still ahead, the

“New Song” of ultimate redemption, a redemption that is global and absolute, that will annihilate all suffering, ignorance, jealousy and hate from the face of the Earth, with a completely new musical vocabulary to capture the voice of Creation’s ultimate striving (Lubavicher 2001).

So the perfect music may not be some pure unattainable ideal, but something humans might, or *must* find, somewhere still to come. “Listen,” writes composer Pauline Oliveros, “not with your ears, with your blood. Listen! Not with your ears, with your ancestors. Listen! Not with your ears, with your futures” (in Rothenberg and Ulvaeus

2001: 247). This most spiritual of musics will not run from nature, but delve into nature, hear nature, and fit into nature in a way greater than any previous music has yet been able to achieve. The human music that truly enters into nature is still in our future, part of the purpose of progress that we can never quite pin down.

Music and Eco-activism in America

Since music has often served both as a marker of cultural organization and as a means for the dissemination of information and social commentary, it is not a surprise that music has accompanied the growth and organization of environmentalism in the Americas. Since the 1960s, environmental themes have been tied by musicians to countercultural protest, as in Joni Mitchell's anthem "Woodstock." Notions of a "return" to nature and the preservation or protection of the natural environment were reflected in popular music.

By the 1980s, this general compatibility of environmentalism and countercultural music gave rise to the explicit support of musicians who performed benefit concerts and tours for such established environmentalist organizations as Greenpeace. These activities continued through the 1990s and into the early twenty-first century; for example, in the early 1990s artists such as U2, REM, Midnight Oil, and Sonic Youth contributed tracks to the Greenpeace album "Alternative NRG." Other charitable organizations formed alongside and with the cooperation of rock groups, including the Grateful Dead's Rex Foundation and Phish's Waterwheel Foundation. Since these organizations were not alliances between musicians and existing external organizations, they reflected the beliefs of the bands and their fans directly, and raised funds for a variety of smaller local environmental causes.

In addition to these forms of interactions, activists themselves have created their own musical forms. In recent decades, radical environmental activist music has proliferated rapidly in the United States. Such music connects the nature religion of this movement with evocative and persuasive artistic expressions. Rooted in and similar to other forms of popular American music, the music of the radical environmental movement is distinguished by its lyric content, but also by its cultural location, and social and spiritual functions. Activist songs spread messages of environmentalism to a wider audience and also teach and reinforce these messages within the community of activists. They serve both to evoke and reinforce proper spiritual perceptions of the natural world but also to convey messages of eco-apocalypticism and the urgency of immediate action.

Just as environmentalism itself springs from diverse streams in American culture, environmental activist music emerges from a number of musical traditions. It is a genre dominated by integrative forms of artistic expression that effectively mobilize an eclectic mix of cultural capital. Such forms are well suited to a movement that values beauty and simplicity, but demands worldly utility and eschews the bourgeois or decadent. Musical influences have included the folk and protest music traditions in the United States. Many traditions that are part of the folk canon in U.S. culture, including

old-time fiddle, bluegrass, blues, Cajun/zydeco, and Celtic, have left an audible mark on activist songs. Activists have adopted the community dance setting in which many of these forms of music are played as well.

Overtly religious forms of music, including Native American musical traditions, New Age and neo-pagan songs, and Christian gospel traditions, have also influenced style and content of activist songs. Elements of the hippie aesthetic have been sparingly appropriated, although environmental activists are often critical of perceived escapism in some countercultural musical communities, particularly that surrounding the Grateful Dead. Other cultural traditions from which activist music has drawn include American religious revivalism and political protest movements, including the labor and civil rights movements. More clearly religious forms of environmentalist music have developed in parallel at neo-pagan gatherings and festivals.

The “road shows” that activists, including but not limited to Earth First! activists, undertake to raise consciousness about environmental threats and inspire action against them, are an important means for disseminating the message of radical environmentalism. These shows usually involve performances, musical and otherwise. They aim both to gain supporters on the “outside” of the movement, and to bring new individuals “inside” the movement. But these interests spring from more than a simply political agenda; they evoke and promote a perception of the sacredness of the Earth and its living systems. Activist musician Alice DiMicelle, for example, explained that since “the wilderness is my church,” her role as artist is to bring those attending road shows “experientially into the wilderness” in order to perceive its sacrality (in Taylor 2001a: 227). The road shows combine the practical environmental concerns of the movement with its spiritual orientation in expressive forms that are seen mystically to connect the two.

Expressive forms are also central to the various gatherings of activists that occur regularly; these include regional wilderness meetings, camps, and trainings as well as the larger national “rendezvous.” Among activists, expressive and artistic forms in general and song in particular help reinforce activism and spirituality as well as cement the communal bond between them. While the often light-hearted character of these gatherings is reflected in the songs, rowdiness and joking occur in the context of an assumption that the gatherings are important on both temporal and spiritual levels. Music is central to the fulfillment of these purposes. The themes of radical environmentalism are woven into lyrics and music and provide points of entry for the themes of community and spirituality. Activist music in this context suggests and encourages a spiritually proper perception of wilderness that is connected to a sense of the urgency of radical action.

Well-known environmental activist singer/songwriters include Alice DiMicelle, Danny Dolinger, Robert Hoyt, Timothy Hull, Dana Lyons, Peg Millett, Casey Neill, Jim Page, Joanne Rand, Walkin’ Jim Stoltz, and John Trudell. Stylistically, these artists’ recordings integrate a broad range of eclectic influences into a primarily acoustic setting. Radical activist music contributes to the production of coherent narratives

within which activists' religious sensibilities and communal needs can be nurtured. The primary contents of their songs frequently address specific environmental issues, and the songs meaningfully tie environmental activism to a broader cultural setting, in terms of the familiar categories "sacred" and "profane."

Activist songs often fuse environmentalism with overtly religious themes. While the movement is not formally tied to any institutional religion, radical environmentalism encourages a range of pagan or pantheistic spiritualities. Many such traditions are woven together by activist musicians in innovative ways, bringing disparate elements together in a bricolage of previously unassociated elements. An example is Timothy Hull's "Indigenous Time," which links environmental activism to respect for native peoples and religions. Another recurring theme in activist songs, popularized by Walkin' Jim Stoltz, mirrors the common radical environmentalist contrast between "desecrated" destroyed forests and "sacred" intact ecosystems. Casey Neill's "May Day" leverages the coincidence of the pagan festival Beltane and the international worker's holiday to create a celebration of joy, deity, physical gratification, and social change. Subtle but effective musical juxtapositions are mirrored by the ideological ones; activist themes are placed beside Pagan ones. In the chorus, Neill claims that their Pagan and activist rejoicing will destroy the political status quo.

Environmentalist songs also juxtapose overtly activist themes with the "everyday" or "profane." These songs are playful, satirical, and humorous; they contrast activist life with the "mainstream" and place "everyday" things (such as romance, travel, humor) in the context of radical environmentalism. These themes, however, are tied to an eco-apocalypticism that urges immediate, radical action. These clever songs model how "normal" life continues even under radical circumstances and the all-encompassing life-changes required by them.

Folksinger/songwriter Danny Dolinger has several such songs, which fuse jovial and clever lyrics on "everyday" topics with a serious activist message, including "If I Had a Dollar" and "Hillbilly Hippie."

These functions are not necessarily genre-specific. In recent years, as environmental activists have found common cause with activists for human rights and social justice and the anti-war and anti-globalization movements, the music associated with these movements have also found new audiences. As boundaries between activism blur, the hip-hop, punk, and electronic music brought into environmentalist circles is understood, as are the movements themselves, to reflect a shared ethos.

Thus, activist song and music occupy several important roles. They serve the vitally important role of communitybuilding. Music also occupies a central place in radical environmentalist ritualizing. The road shows and wilderness gatherings serve a religious function in concretizing and reinforcing spiritual ideals of the community, and connecting them to play, humor, and art. Activist music often seeks to evoke and reinforce a proper spiritual perception of the natural world. The playful interpolation of seemingly disparate ideas, traditions, and aspects of life is part and parcel of expressive and religious life in the movement. Through this process of creative juxtaposition,

disparate parts of a difficult activist life are sewn together to make this sort of life cohesive and *possible* for participants. The “ordinary” parts of life are drawn into the activist world, and the activist world is normalized for its participants. At the same time, however, the urgency of radical environmental action is stressed by the themes of eco-apocalypticism. These forms of artistic freedom and innovation in the music reflect and are a product of the movement’s critique of capitalism and power structures. Further, the musicians understand their music to be one form of their activism and their most important contribution to the community.

Music and its Origins

The origins of human-created music, and perhaps language itself, can be traced to the mimicry of bird songs and animal sounds. One of the oldest artifacts ever discovered is a bone whistle, found in a cave in northern Spain. Rhythm is likely an innate quality, sequenced to the cycles of day and night, the four seasons, fulfillment and hunger. Thus even the most synthetic modern music has indisputable roots in the natural world, and in humankind's capacity for empathy and expression, wonder and delight. Music was a way to preserve and pass down information prior to the advent of writing, and for tens of thousands of years it has served as a means for enhancing religious sensibilities and spiritual states.

The Lilloets of southern British Columbia sang a deep lament over the body of any bear killed, thus winning, they believed, the continued favors of the bear people. The Ona of Tierra del Fuego, on the far southern tip of South America, believed that a child who sings in its sleep or a teen who breaks unconsciously into song will become a shaman. To this day music remains an integral component of the spiritual teachings and practices of most indigenous, land-based peoples. The White Mountain Apaches have songs for every season and situation, as well as for essential social and religious rituals. These include planting and harvest songs, songs for birth and death, victory and courtship, the onset of puberty, the honoring of cronehood, and shamanic rites. The Aboriginal peoples of Australia navigate the overlapping natural and spiritual landscapes by following "songlines," auditory guide maps made up of ancestral place-based compositions, performed at each point along the way.

Shamans from Ecuador to Siberia use music as a transportive vehicle, arresting rational thought and suspending "imagined separation." Their power songs are intended to put them in touch with their magical allies, and chants and drumbeats assist their journey through the spirit world, to function as an aural bridge between what is known and what can be. The result of this connectedness can be enhanced sensitivity, lucid dreaming, "intrasensory perception" and clairvoyance. In this condition they access the wisdom of the ancestors and the gifts of the spirits, returning to normal consciousness with crucial prophecies and cures. Tuvan throat-singing and Vietnamese Buddhist chants share a common purpose, putting the singer in deeper contact with the experience and reality of spirit.

Similarly, music continues to be employed to help people get out of their "left-brain" minds and into the intuitive, responsive self away from what many participants in Western civilization see as a paradigm of artifice, and "back to nature." Hand-carved flutes are played reverentially by hikers in the wilderness, while back in the city al-

tered states are encouraged by the rhythmic trance dancing popularized by groups like Gabrielle Roth & The Mirrors. Singing and drumming are core elements of women's circles and covens, as well as men's groups inspired by the archetypal Green Man or the works of writers like Robert Bly. Drum circles provide a sense of sacred space and communality for the several thousand "brothers and sisters" of the counterculture Rainbow Tribe, and they often use a drum to announce important councils at their gatherings. Chants (or "rounds") strengthen the communities and empower the rituals of contemporary Earth-worshipping Pagans (Wiccan, Neo-druid, Gaian, Pantheist).

Some of the most emotive Western classical pieces have been inspired by or are meant to evoke the color, drama or peace of the natural world, such as "The Grand Canyon Suite" and "Four Seasons." Mendelssohn tried to capture the sound of the ocean surf in his "Fingal's Cave," and the flute parts in Vivaldi's "Goldfinch" were written to approximate the sounds of the birds themselves. Attempting the same effect are the various examples of modern atmospheric or "New Age" music, usually combining recorded nature sounds such as rain, surf and bird song with electronic washes. The use of synthesizers in "environmental music" has been criticized by a number of academics and musicians including the Greek pianist Sakis Papadimitriou:

Today, playing the flute, congas, piano, saxophone, becomes an ecological protest. Sound emerges from within the musical instruments, directly from their source. And you hold this source in your hands, in your lap, in your arms, around your neck. Vibrations warm you. The sound touches you. It is not coming at you from a different, distant and mechanical point. Synthesizers do not emit music. They are faulty. They do not vibrate. The sound takes a digital walk first and then jumps into the loudspeakers. These sounds are ignorant of the earthly environment. They do not possess the elementary quality of surviving in Nature (Lone Wolf Circles 1991).

While a large percentage of environmental music is relaxing, some is intended to stir its listeners to action instead. In North America, following the example of civil rights and anti-war activists, the biocentric singersongwriters such as "Walkin' Jim" Stoltz, Dana Lyons, Joanne Rand and Darryl Cherney helped to reinvigorate the American environmental movement in the 1980s and 1990s. Anglo eco-activist Lone Wolf Circles joined Native American John Trudell in performing spoken-word poetry to live world beat and rock music. On "Tribal Voice" Trudell chants to the beat of a tom-tom, "The generations surge together to meet the reality of power. Mother Earth embraces her children in natural beauty, to last beyond oppressor's brutality," and more simply, "Without Earth, there is no heaven." Born of rebellion and protest, Rock and Roll has contributed a few eco-paeans including the 1960s hit "In The Year 2525" and Barry Maguires' "Eve of Destruction," with their decidedly environmental message. In 1970 the group Spirit sang "It's nature's way of telling you something's wrong, it's nature's way of telling you with a song." In the 1990s the California family band Clan Dyken took their mix of socially conscious rock and reggae on the road with a mobile solar-powered stage, raising funds for the protection of remnant old-growth redwoods. Both the Canadian Bruce Cockburn and Georgiabased Indigo Girls have incorporated

Native American spiritual sensibilities in pieces performed live, in tours spotlighting environmental and native rights issues.

The commercial country music of the 1930s–1950s often waxed sentimental about beautiful western landscapes and wide-open spaces, but within twenty years had developed a rock flavor and began catering to a largely urban audience. Country superstar John Anderson nonetheless contributed several songs addressing environmental concerns, and his “Seminole Wind” evokes a spiritual dimension in its paean to the vanishing Florida Everglades. In the 1970s Charlie Daniels sang about “The Last Lonely Eagle” passing over fields of destruction below, endlessly circling without a single standing forest left to land in. In “Coyote” new traditionalist Don Edwards laments the disappearance not only of old-time outlaws and Indians, but also the red wolf, the noble buffalo and the ineffable spirit of the land.

American Country music is derived in part from the Celtic ballads brought over by the English and Irish immigrants of the eighteenth and nineteenth centuries. The Scotch and Irish in particular came with a rich history of songs intended to deepen its people’s connection, loyalty and devotion to the land that sustains them. In albums including *Real Estate* and *Indigenous* the popular Celtic folk musician Dougie Maclean celebrates sense of place in original pieces about what it means to belong, as true “caretakers” of the Earth. A continent away Geoffrey Oryema of the Ivory Coast writes songs that honor Africa’s soulful countryside, and the Sami songstress Mari Boine calls forth the spirits of her Nordic land. The Aboriginal’s connection to nature comes across strong in songs by native Australian Archie Roach, whose albums like MacLean’s, Boine’s and Oryema’s are now distributed worldwide.

Not all examples of music, of course, move one closer to the meaning or experience of nature. Those that do tend to reform the ways in which we hear, define and relate to the natural world. Rather than substituting for nature, they draw the listener outside and into direct engagement with the more-than-human world. Of special interest are acoustic compositions recorded outside in a natural setting, such as those by jazz musicians Paul Winter, James Newton and Paul Horn. On the albums *Prayer for the Wild Things* and *Canyon*, Winter plays not *over* the sounds of nature but *with* them, enjoying an active melodic exchange with wind and willow, river and raven. With his project “Interspecies Communication” activist and musicologist Jim Nollman has taken this cross-species interaction one step further, employing music as a common language for the sharing of emotion and information between humans and other animals, especially orcas. In this way not only is the intelligence of cetaceans affirmed, but so also is the human penchant to reach out and connect through the “magic” of music.

Every expression of nature offers instruction as well as inspiration, setting an example of authentic and undiluted being. Like the echolocation of whales and dolphins, the sharing of music is a way of probing the world for likeminded and like-hearted individuals, for sustenance, reciprocity and insight in a practice that ethnomusicologist Charlie Keil calls “deep echology.” Being consciously “at one with the Earth” is compared to

adjusting our pitch for perfect harmony, as people of every race and culture seek to find their part in the greater earthen song.

Music of Resistance

Humankind has long rallied to evocative religious and secular music, from the chants of our ancestral cave dwellers or a melodic prayer for alignment with the spirits of nature to the arboreal anthems at the close of the twentieth century, emboldening a community of treesitters obstructing highway construction in some of England's most revered hardwood groves. While music has been employed by ruling states to unite their populations around a particular vision of patriotism and comportment, the protest movements that inevitably rise to oppose the status quo use the mood and metaphor of song to excite reconsideration and resistance. For both, music proves a powerful means of defining a shared group identity, deepening solidarity, evoking emotion and inspiring response. Whether a martial composition or a softly sung anti-war ditty, music fortifies the courage of the participants by sentimentalizing what they hold most dear, rhythmically reiterating what's at stake, reminding them that they are not alone in their efforts, fortifying their wills in the face of often unknowable odds.

In the summer of 1988, 24 Earth First! protesters blockading a logging road in the Kalmiopsis Forest, Oregon, U.S.A., were rounded up and placed in the back of a paddy wagon with barred windows. Rather than being taken at once to the jail, they were left in their sweltering confines to watch the falling of the giant old-growth fir trees they had come to protect. One by one they joined in singing the few words they remembered of an old protest song popularized by performers such as Walkin' Jim Stoltz and Si Kahn, "There is power, there is power, in a band of folks who care . . ." The vehicle rocked back and forth as they sang louder and louder, the music not so much a healing balm as fuel to keep their struggle and hopes alive. Forty years earlier, the women of certain villages in Northern India banded together to stop the cutting of remnant Himalayan forests, chanting their sacred songs as they climbed the slopes to confront the government loggers. In statements they cited not only the increasing erosion and floods, and their dependence on a continuous supply of firewood, but also the offense to the Devas: spirits embodied in the threatened trees, as in all living things. They placed themselves at grave risk as they threw their arms around the trunks, their songs rising above the cacophony of saws. In this way, their growing forest protection campaign became known as the "Chipko" movement, a word meaning literally "to embrace."

From "I Feel the Forests," on Oregon native Cecelia Ostrow's 1985 album:

There is a power dwelling in this land, a power deep as it is old,
Now you remember when you cut these trees, that spirit cannot be bought or sold.
I feel the forest swaying over me,
I feel the flowing mountain streams,

I smell the forest's breezes sweet and pure – and I start to remember who I am.

The kinds of people who risk their credibility, jobs, freedom and even lives in defense of the last wild places are almost without exception inspired by more than the escalating extinction of species worldwide. While they may not always classify it as spiritual, they usually act out of a deep bond with the more-than-human world dating back to some formative childhood experience. Their pain is rooted in the loss or denigration of those childhood playgrounds, the places of refuge and belonging, the sources of their sensitivity, interdependency and epiphany. “That townhouse used to be my tree fort” the ecoactivist Dana Lyons sings on his album “Animal” in a song with the apocalyptic title “Time Bomb”: “That highway used to be the wood. That building used to be the beach. That brown haze used to be the sky. Oh say goodbye!”

Lyric metaphor and melodic inference can help focus one's attention on their relationship to the natural world. Even more so, active listening and singing-along are integrative practices that connect a person in an immediate way to their physical and spiritual environs. Even singing songs that make no mention of the natural world can contribute to one's engagement through the transcendence of the intellect, the awakening of bodily senses and the stirring of the feeling heart. Songs with decidedly nonspiritual lyrics, or with no words at all, can nonetheless lead to individual and group experiences that are essentially spiritual in nature.

In the ecosophy and music of the environmental movement, human political concepts such as dignity and freedom have been broadened to include the more-than-human world, the fabric of life and non-life that make up the interactive Gaian whole. In this way, a new contemporary culture has been developing with a musical intentionality and religiosity more akin to their early indigenous counterparts than what they often refer to as “the dominant paradigm.” Many of the most radical environmental activists in the U.S. and abroad have been motivated by “deep ecology” and the various strains of paganism and “New Age” spirituality, in which the natural world is held to have not only a practical and evolutionary worth but also an intrinsic sacred value as well. Regardless of lyric content, music employed in the struggle to save what are held to be sacred lands and inspired species could be said to serve a liturgical function.

In the 1980s and 1990s, American ecotroubadors performing on the environmental and college circuit included Joanne Rand, Alice DiMichele, Walkin' Jim Stoltz, Greg Keeler and Katie Lee. The political implications and outright danger that green performers face was driven home by what may have been the attempted assassination of Judi Bari and Darryl Cherney, when a pipe bomb exploded beneath them while they were driving to their next performance in the bay area of Northern California. The notable Australian activist and musician John Seed, cofounder of the Australia-based Rainforest Information Centre, spoke about the importance of an ecocentric (Earth-centered) spirituality while touring around the world raising money for the very practical purpose of rainforest preservation.

In 1985, I launched the first of 24 “Deep Ecology Medicine Show” tours, encouraged by Dave Foreman, cofounder of the radical environmental movement Earth First! Like

earlier EF! road shows (featuring Foreman, Mike Roselle and Bart Kohler) the Medicine Shows were politicized rallies incorporating both live topical music and motivational speeches. Both were intended to gather new adherents to the cause of wilderness preservation, often resulting in the formation of new groups around local issues, or civil disobedience “direct actions” the day after a show. The Medicine shows differed in two fundamental ways: the various musicians and bands performed pieces with me rather than separately, symbiotically dramatizing my stories, provocations and prayers. We blended overtly emotive and spiritual elements into the shows endeavoring to create a tribal experience for a caring and sensitized audience. University and community center performances characteristically began and concluded with prayer, often contributed by Native American, Buddhist and other spiritual teachers drawn from the regions we traveled through. During these performances a band came forward and played, and my words were set to some jazz improvisation, bracketed between Country Western stanzas, propelled by a reggae skank, or buoyed by the lilt of a Syrian love song. In these performances I spoke of a litany of extinct plants and animals and provided a paean to those in danger of being lost, while teasing the audience with tales of my canyon home. These performances provided wilderness fundamental revival, a deep ecology Chautauqua proffering Gaian canticles and melodic manna for the would-be heroes of a wilder Earth. There may be no more dramatic an example of the religious dimensions of eco-activist music than the “Tribal Jams,” a long-time component of the Sage Brush Rally, at the annual Earth First! Round River Rendezvous. Following a host of speakers, humorists and performers, the Tribal Jam redirected the energy of those gathered – toward heightened presence, primal mindfulness, sentience, sense of place, and a palpable experience of an inclusive, Earth-embodied Spirit/God. During these rallies the crowd of professors and litigants, students and outlaws, often doff their clothes, paint one another’s faces with red-mud war paint, and hoot and howl like the owls and wolves they spend much of their lives trying to save. “Ease out of your minds,” I would urge them, “and down into your intuitive, instinctual animal bodies.” Anchored by archaic drum rhythms and colored with flute and guitar, an incantation floats out of the speakers and over and through them, as clouds of mountain dust rise moon-bound from beneath the dancers’ busied feet. I chant to chant down the walls, chant open the hearts, chant us all back to authentic self and a whole-ly healed planet.

“Only one cause. One job. One people. One Earth. One Love. Gaia, Gaia, Gaia.. .”

Muti and African Healing

Muti (spelling variation Muthi) is a word describing a range of practices connected with the medicinal use of plants, animals, and occasionally humans in African and African-derived religions. It is one of the most widely known, yet misunderstood, concepts.

The word “muti” comes from the Zulu peoples of South Africa and originally means “medicine.” This is important, because some of the negative associations of muti reported in recent years tend to ignore that, in itself, muti is a morally neutral practice, although there are ethical issues surrounding the extraction methods of plant and animal material.

In essence muti centers on the belief that many plant and animal parts have intrinsic power. This power can be harnessed through the careful preparation of potions and medicines. Thus, certain plants are believed to have special powers, and usually particular plants will be associated with different types of curative power. Likewise, the use of certain body parts may be associated with the healing of different types of illness. The power may be used for either good or bad purposes depending on the intention of those making, or commissioning, the particular medicine.

Some of the ingredients in muti are said by allopathic curers to have proven healing properties. *Prunus Africana* is believed to help the prostate; *Ocotea bullata* (black stinkwood), a drink, steam bath or general tonic is used for a whole range of skin problems; *Agathosma betulina* (buchu), is given as a diuretic and antiseptic; and the *Hypoxis* family is used to boost the immune system. Some pharmaceutical companies have been in running disputes with traditional healers over muti “patents,” with the latter accusing the drug companies of “ethnopyracy” – the theft of traditional knowledge for their own financial gain.

The largest muti market in the world is to be found at Durban in South Africa’s KwaZulu Natal province, closely followed by the Faraday muti market in Johannesburg. Here one can encounter a huge range of medicinal goods – from plants through to animal parts. A remarkable 4000 tons of plant material passes through KwaZulu Natal province every year destined for muti use, and the figure rises nationally to 20,000 tons. There are over 700 plant species throughout South Africa that are known to be used in muti medicine. Demand for muti is so high that many wild species are now threatened with extinction. Some species have already become extinct: for example wild ginger (*Siphonochilus aethiopicus*) and the pepper-bark tree (*Warburgia salutaris*) have become extinct outside of protected areas in KwaZulu Natal. One of the problems has been lack of cultivation of indigenous muti plants, partly through lack of horticultural

knowledge and resources, as well as lack of foresight. It is estimated that there are over 27 million consumers of muti in South Africa, with an astonishing 4–6 percent of annual householder budgets being spent on them. This is lucrative business, and the plants and animals do not figure as top in the priorities of those who are making financial gain. Here, then, muti medicine and so-called allopathic medicine have more in common than might at first glance seem apparent.

In response to some of the serious environmental issues surrounding the use of muti, a few nurseries have sprung up in South Africa dedicated to helping “farm” supplies; to educate those involved in the trade; and to protect endangered species. One of the foremost examples of this is the Silverglen Nature Reserve in Chatsworth, South Africa, which contains over 200 medicinal plant species in its nursery. Another important educational establishment, with a small adjoining muti garden, is to be found in the KwaMuhle Museum, Durban.

To be trained to handle muti medicines properly is not something anyone can simply take up on an ad hoc basis, although there are undoubtedly charlatans at work. The training of a proper priest to do the task (usually known in South Africa as a sangoma) may take up to seven years, and involves time dwelling in rural areas under the tutelage of a senior priest. Not that muti should in any sense be seen as a rural practice in contrast to an urban allopathic practice. Sangomas are thriving in the towns and cities of South Africa, often operating out of “back street” style apartments and terraces where they are regularly visited by poor and rich alike.

The most controversial aspect of muti concerns the use of animal, and occasionally human, body parts. Different parts of the body are often associated with particular healing properties: thus a cure for infertility or impotence may be the use of genitalia (a commonly used part); emotional problems may involve the use of the heart; the need for discernment the eyes; or social issues parts of the brain. Particular parts of the body are thought to be especially powerful – notably parts of the spine (especially the top vertebrae); the genitals, finger nails, hair, and teeth. Some animals are thought to be more powerful than others and properties of certain animals relate to the need: so, for example, a leopard may be used in medicine for courage; a snake for guile; an elephant for power.

But the most controversial aspect of all in muti involves the use of human beings. By no means in all cases are people killed for muti – rather those who have already died may have body parts removed for use in such medicine. While raising ethical problems, this is not killing for muti, but this does, however, also exist. The most gruesome aspect of the use of animal and human body parts in muti concerns the extraction of parts while the victim is still alive, usually in the belief that the parts are thereby empowered by being fresh – especially if the victim screams. The extraction from a living victim thus makes the medicine more efficacious and “powerful.” This author has encountered young bonobos (*pan Paniscus*) in central Africa with missing digits, hair, and teeth – all extracted in the name of muthi while the bonobos were still

alive. There are several similar cases of human parts being removed while the victims were still alive.

Muti is now a global phenomenon. Long gone are the days where an academic purist could refer to muti as an exclusively South African, or even Zulu, practice. Both the concept, and even the terminology, now exists throughout Africa, and beyond, in cities such as London and New York. The use of animal and plant materials in medicines has long been recorded throughout Africa by anthropologists, but the term “muti” is also now regularly replacing local words as the sole descriptor for what are sometimes disparate practices.

Muti Killings

Muti killings (variation “Muthi”) are those in which the victim has died as a result of the extraction of body parts for medicine or “muti.” Thus a muti killing normally differs from cases of sacrifice, in which the purpose of the murder is a propitiation, or offering, to a deity or ancestor.

While there may be overlaps in some of the practices, the key aspect of a muti killing is that it is one in which the killing occurs as a by-product of the primary intent to extract body parts for medicine.

Just as certain plants are believed by practitioners of African and African-derived religions to have innate powers, so too it is believed that certain animal, and even human, body parts have intrinsic power. Their extraction for use in muti is therefore routinely practiced in South Africa, and elsewhere in African and African-derived religions. However, it is important to differentiate between several different issues here.

The removal of animal and human body parts for muti *after they are already dead from other causes* may raise ethical issues, but is not killing for muti *per se*. Many of the body parts on sale in muti markets in South Africa have been acquired in this way, and there is evidence of “black market” activity around morgues and crematoriums.

However, practitioners of muti more frequently believe that the provenance of their medicine is of importance to its empowerment. It is unusual, though not unknown, for muti to be extracted from older or ailing victims, while conversely, the young and healthy make for prime candidates. Among the animals there are favorite candidates: primates and the big cat family are at the top of the list.

Similarly, it is widely believed that the removal of parts while the victim is still alive renders the medicine more powerful. This is partly to be explained as “keeping the medicine fresh.” But it is also because some believe that the screams of the victim empower the medicine. There are several gruesome cases, mainly in South Africa, where the extraction of body parts has taken place over several hours while the victim remained alive throughout. Some victims have thus been discovered missing parts of their anatomy, yet still alive. In one particularly brutal case in the Transkei province a woman was skinned alive and her genitals, breast, feet, and hands were removed all while she was kept alive (she died later). The body parts in this case were intended for empowerment in fertility and sexual healing. In many cases parts are sold off to different customers – each buying a part that relates to their own particular need for empowerment. Contract muti killings are not unknown – the murder of an innocent victim as part of a commissioning of certain body parts.

Some body parts are believed to be more powerful than others. It is normal, though not always the case, that genitals will be removed. Similarly, the eyes, parts of the brain, finger nails, hair, and internal organs such as the top vertebra, the heart, and spleen are all highly prized for muti.

While there may be overlaps with instances of sacrifice, it is important to recognize that in the latter the victim is usually killed quickly and the central empowerment occurs through the blood, rather than the body parts, the pouring of which acts as a libation to an ancestor or deity. Sacrifice of animals in this way is routinely practiced throughout sub-Saharan Africa.

The killing of human beings, whether for sacrifice or muti killing, is regarded by the majority of practitioners as a deviation of African religious practices, and the vast majority of Africans utterly condemn this. It is likewise important to remember that deviants kill in the name of religion in all cultures. But this does not mean it never occurs in African and African-derived religions. The 2001 discovery of the torso of a young West African boy in the River Thames, London, led police officers through cultural advice to the extraordinary realization that he had been sacrificed as part of a ritual killing. Such sacrifices are relatively frequent in parts of West Africa. Muti killings meanwhile remain relatively common in South Africa, with some estimates stating that as many as 300 occur every year. With HIV and AIDS infection rates soaring in many parts of Africa, life is deemed to be cheap. In addition, unscrupulous healers often proclaim miracle cures for life-threatening illnesses such as AIDS by the use of muti.

Richard Hoskins

Mutwa, Credo (1921–)

Attending an international conference on transpersonal psychology in Kyoto, Japan, during 1985, the great Zulu shaman, Credo Vusamazulu Mutwa, began his plenary address by remarking that he was delighted to be among people who revered mountains, because he was so fat that he was often mistaken for one. In this humorous observation, Credo Mutwa indicated not only that he was familiar with a recurring feature of Japanese folk religion but also that he felt a certain sense of solidarity with indigenous Japanese religious life. As he later explained, the Zulu and Japanese languages share many common words. The two languages supposedly have a cognate vocabulary, which enabled his wife to communicate effectively by speaking Zulu to Japanese shopkeepers. According to Mutwa, this shared vocabulary ultimately pointed to an underlying commonality of indigenous religion, whether that religion was referred to in Japanese as *Shinto*, “the way of the gods,” or in Zulu as *Sintu*, “the way of man.” By preserving their indigenous religion, the Japanese had established a model for the Zulu, according to Credo Mutwa, that would “make the black people of our culture as respected and powerful as the Japanese.”

As guardian of tribal traditions, Mutwa had the responsibility of preserving the Zulu past. But he also claimed to know the future. At the 1985 conference in Kyoto, Credo Mutwa indicated that the future was in the stars. Asked to explain the significance of a bronze object he wore around his neck, Mutwa recounted, “in Africa we have a tradition that there are extraterrestrial intelligences watching the Earth. Do you not have reports in Japan of what are called ‘Flying Saucers’ . . .?” According to Mutwa, aliens from outer space, known in Zulu as *abahambi abavutayo*, the “fiery visitors,” featured prominently in the myths and legends of Zulu tradition. With increasing frequency, these extraterrestrial beings in flying saucers were visiting the Earth. Mutwa explained the significance of his necklace: “These ritual ornaments are intended so that when one of these vehicles comes to Earth, and extraterrestrial beings, who wish to establish contact with humanity, emerge, they will know the right person to talk to!” (Mutwa 1996: xiv, 163, xxix, xv–xvi). By his own account, Credo Mutwa – guardian of Zulu tradition; shaman, teacher, and healer of Africans; and prophet of the world’s future – was exactly the right person.

The case of Credo Mutwa raises a crucial problem in the study of folk religion, the problem of authenticity. I have no intention of solving this problem. Instead, I want to think about some of the processes through which authenticity is produced, appropriated, and mobilized under the sign of folk religion, popular religion, or indigenous religion. In other words, I want to highlight the dilemma of artificial authenticity in

the study of folk religion, and in so doing, will illustrate some ways in which nature is deployed in the service of authenticity.

Although folk religion might be regarded as a residual category, designating relations with gods, spirits, and sacred places that are left over when “world religions” have been factored out of the religious landscape, the very category of folk religion was produced out of a range of intellectual interests in the authenticity of the primitive, the savage, or the exotic. As historian of religions Charles Long has demonstrated, the notion of folk, popular, or indigenous religion has carried an aura of authenticity because it evokes the organic religious life of the rural peasantry rather than the urban citizenry, the lower class rather than the elite, the ordinary people rather than the clergy. In the process of its production as a category, however, folk religion was appropriated, reproduced, and arguably reinvented by urban, literate elites within modern societies to lend an aura of authenticity to emerging nationalisms. These “invented traditions” transformed folklore into “fakelore” in the service of national interests.

In the study of religion we occasionally have to confront outright frauds. During the eighteenth century in London, for example, the literary conman, George

Psalmanaazaar, produced an entirely fake account of the society, culture, and religion of the island of Formosa. As anthropologist Rodney Needham argued, the temporary success of this fraud can be explained by the fact that Psalmanaazaar managed to make his fake account of the religion of Formosa look very much like a recognizable religion, or at least a religion that would fit expectations of an “exotic” religion among his readers in England. Such productions of authenticity require a careful mediation between extraordinary accounts, which cannot be independently confirmed or disconfirmed, and ordinary expectations about the primitive, the savage, or the exotic. In this work of mediation, successful frauds in the study of religion have acted as intercultural brokers speaking in the name of silent partners who bear the burden of authenticity. In some cases, these intercultural mediations of authenticity are relatively easy to expose as fraudulent, as in Eugen Herrigel’s representations of the Zen Master Kenzo Awa or Carlos Castaneda’s account of the Yaqui shaman Don Juan Matus. Both are transparently fake. In other instances, however, the mutual complicity of reporter and informant in the production of indigenous authenticity has made the exposure of fraud extremely difficult if not impossible. If we critically review the exchanges between John Neihardt and Black Elk or between Marcel Griaule and Ogotemelli, for example, we have to conclude that these accounts of indigenous religion were produced out of specific intercultural mediations rather than through any extraordinary, unmediated access to authentic Sioux or Dogon religion.

Against this background, Credo Mutwa poses an extremely difficult problem. Speaking for himself, as well as for Africa, Credo Mutwa asserts an indigenous authenticity that has been acknowledged all over the world. In his native South Africa, however, he has often been described in the popular media as a fake, a fraud, and a charlatan. “He has been called an old fraud, a charlatan,” journalist Angela Johnson observed (Johnson 1997). Alluding to Mutwa’s complicity with apartheid, the apartheid regime of

the National Party, and apartheid structures of South African Bantustans, journalist Hazel Friedman reported that Credo Mutwa has been widely regarded as “a charlatan and opportunist who consorted with the enemy” (Friedman 1997). Within South Africa, therefore, Credo Mutwa has not always represented indigenous authenticity. In fact, when he has not been entirely ignored, Mutwa has primarily appeared in popular media stories about his failed predictions as a false prophet who nevertheless continues to predict the future. But how does such a fake produce real effects in the real world? How has Credo Mutwa emerged globally, if not locally, as the supreme bearer of South African indigenous authenticity? During the 1990s Credo Mutwa was celebrated not only as a Zulu shaman but also as an environmentalist, healer, prophet, teacher, and authority on aliens from outer space.

The new religious space opened up by the internet has been crucial to this development. On his own website, he appears in cyberspace as “Credo Mutwa, A Small Ray of Hope for Africa.” On many other websites, however, he appears as one of the world’s most important shamans, the High Sanusi of the Zulu nation of South Africa. In what follows, I review the historical production of this indigenous authenticity.

African Origins

Born in 1921 in the South African province of Natal, Credo Mutwa grew up in a household that was religiously divided between his father’s Roman Catholicism and his mother’s adherence to African traditional religion. In 1935 his father converted to Christian Science, the American church founded in the nineteenth century by Mary Baker Eddy, who understood God as “Divine Mind” responsible for healing the body, mind, and spirit. Undergoing a serious illness, Mutwa was forbidden conventional medicine in keeping with the avoidance of modern medical practice among Christian Scientists. Instead, his father read to him from the book *Science and Health*, by the “American holy woman” (Mutwa 1996: 3). Rejecting his father’s “holy woman,” Mutwa turned to his mother’s family during his crisis. Under their tutelage, he learned that his illness was not an illusion, as the teachings of Christian Science held, but an entry into a new and special role within African indigenous religion. As Mutwa later recalled, his initiatory sickness signaled his calling to become a *sangoma*, an indigenous healer, diviner, and seer.

In 1954 Credo Mutwa found employment in a curio shop in Johannesburg that specialized in providing African artifacts for the tourist market. Mutwa’s employer,

A.S. Watkinson, relied upon him to authenticate these objects of African art. Besides developing detailed interpretations of the meaning of African artifacts, Mutwa emerged as a gifted and imaginative storyteller, recounting elaborate tales that he insisted were drawn from the authentic repository of Zulu tribal history, legends, customs, and religious beliefs. Sponsored by Watkinson and edited by A.S. Brink, an academic with the Institute for the Study of Man in Africa at the University of the

Witwatersrand, a collection of Credo Mutwa's stories was published in 1964 under the title, *Indaba, My Children*. A second volume, *Africa Is My Witness*, was published in 1966. As editor Brink explained, the term, *indaba*, referred to a Zulu tribal council at which different views were presented "to have their authenticity or acceptability evaluated" (Mutwa 1964: xv). Ostensibly, therefore, Mutwa's stories were presented to the reading public to test their authenticity. In making such an assessment, however, the historical and ethnographic record provided no help, since the wild, extravagant, and imaginative poetry and prose of these texts bore little if any relation to anything previously recorded in print about Zulu religion. Nevertheless, rendering his own judgment, Brink advised that these tales were authentic because they revealed the "strange workings of the mind of the African" (Mutwa 1964: xv). Three decades later, reviewing the British republication of *Indaba, My Children*, Randolph Vigne could only agree that the entire point of Credo Mutwa's account of Zulu tradition seemed to be "to project an African culture wholly alien to and unassimilable with any other, least of all that of the Europe-descended millions who share South Africa" (Vigne 1999).

This construction of indigenous authenticity certainly fits with the tribalism of apartheid during the 1950s and 1960s. Under the auspices of its policy of separate development, the ruling National Party tried to create new African nations, with their own traditions, histories, languages, cultures, and religions, which would reinforce the establishment of separate homelands or Bantustans that were geographically within the territory of South Africa but legally outside of the Republic of South Africa. In the case of Zulu nationalism, the Department of Native Affairs, under the direction of apartheid ideologue

H.F. Verwoerd and anthropologist W.M. Eiselen, sponsored the first Shaka Day in 1954 to celebrate Zulu tradition. They convinced the Zulu King Cyprian to dress up in a traditional costume of leather loin covering, leopard skin, feathers and beads that neither Cyprian nor his father, King Solomon, had ever worn before. For this recovery of tradition, they had to refer to an illustrated book about Africans that had been published in 1855. In this context, indigenous authenticity was constructed as a tribal continuity with a traditional past that allegedly prevented Africans from integrating into modern South Africa.

Although Credo Mutwa has claimed to have an "unashamedly unpoliticized conscience," his writings in the 1960s clearly reinforced apartheid, a political system that legally excluded all black Africans from citizenship within the Republic of South Africa, but incorporated them as exploitable labor. Like the architects of apartheid in the National Party, Mutwa argued that apartheid was not racial discrimination but racial separation that was consistent with divine and natural law. "Discrimination is to distinguish and decide which is best," Mutwa wrote. "Apartheid is to distinguish without deciding which is best" (1966: 318). Insisting that Africans in South Africa actually wanted apartheid and were not interested in equal rights, Mutwa declared, "Apartheid is the High Law of the Gods! It is the highest law of nature!" (1966: 319). Racial integration, according to Mutwa, "is as abhorrent as extermination" (1966: 319). Praising

H.F. Verwoerd, who by then had become president of South Africa, Credo Mutwa maintained that the

White men of South Africa are only too right when they wish to preserve their pure-bred racial identity.

And what is good enough for them is good enough for us, the Bantu . . . Separate Development . . . is the clearest hope that the Bantu have thus far had” (Mutwa 1966: 323).

Under apartheid, Verwoerd’s National Party promised to protect independent African homelands from “Communists or militant Bantu rebellion-mongers” such as the African National Congress (ANC). Into the 1980s, Mutwa continued to lend his support to the apartheid regime, even writing the foreword to a book published in 1989 arguing that the United States should not impose sanctions on South Africa. Instead, the U.S. should embrace South Africa and consider making the country its fiftyfirst state. As he argued in the 1960s, Mutwa insisted that such protection would save Africans from communists, militants, or rebels such as “the ANC terrorists” (1989: 13). Under the apartheid regime of the 1960s or the neoapartheid regime of the 1980s, Credo Mutwa was only concerned that Africans should be free to preserve their distinctive tribal customs and their traditional way of life. In his publications of the 1960s, Credo Mutwa declared himself the guardian of Zulu tribal tradition. Referring to himself as a Zulu witchdoctor, Mutwa related a bewildering array of traditional tales, which Mutwa himself characterized as “a strange mixture of truth and nonsense,” showing a remarkable facility of literary invention. Mutwa’s presentation drew its authority from a careful balance of transparency and secrecy. On the one hand, Mutwa claimed that he was relating common African folk traditions, the familiar “stories that old men and old women tell to boys and girls seated with open mouths around the spark-wreathed fire in the center of the villages in the dark forests and on the aloe-scented plains of Africa” (1964: 429). If this assertion were true, then the authenticity of these stories could presumably be confirmed by every African man, woman, and child. On the other hand, Mutwa claimed to be relating secrets that were only revealed during the initiation of a witchdoctor. “If ever you pass what you are about to be told today on to the ears of the aliens,” his instructor had warned him during his own initiation, “a curse shall fall upon you” (1964: xiii). By publishing these stories, including a wordfor-word account of all the secrets conveyed during his initiation, Credo Mutwa had clearly broken his sacred tribal oath of secrecy. As Mutwa put it, he had made a “terrible choice to betray my High Oath as a Chosen One” (1964: 455). Although this betrayal apparently violated the dual source of his authority – shared tradition, secret initiation – Credo Mutwa nevertheless asserted his role as traitor as if it underwrote the authenticity of his accounts of Zulu folk religion.

In the 1960s, calling himself a Zulu witchdoctor, Credo Mutwa traced his lineage back to his maternal grandfather, who served as the “High Witchdoctor” under the

Zulu King Cetshwayo (ca. 1836–1884). During the 1990s, biographies of Credo Mutwa traced his lineage back to his great-grandfather, the High Sanusi of Zulu King

Dingaan (ca. 1745–1840), and observed that in 1963 Credo Mutwa had been “officially declared” or “officially proclaimed” the High Sanusi of the Zulu people (Ringing Rocks Foundation 2001, Payback Press 2001). As Mutwa noted in 1964, the term, *sanusi*, which designated an “Unmarried High Witchdoctor,” was etymologically related to the Sanskrit *sanyassin*, an “Unmarried Holy Man” (Mutwa 1964: 439). Nevertheless, he eventually appropriated this title for an inherited role transmitted from his maternal grandfather. Although the “official” structures through which this title was bestowed upon Credo Mutwa have never been specified, in 1963 they could only have been official apartheid structures, such as the Department of Native Affairs, which was busy installing new chiefs and traditional leaders for the Bantustans. Unlike the public declaration of Shaka Day in 1954, however, there is no evidence of any public ceremony proclaiming Credo Mutwa as the High Sanusi of the Zulu people. Instead, capitalizing on his reputation as an author and building on the authority of his texts, Mutwa found a public role in South Africa as an African tourist attraction.

Culture and Nature

During the 1970s, Credo Mutwa was employed by the South African National Parks Board as the attendant of a traditional African tourist village located in the black township of Soweto outside of Johannesburg. Designed for the entertainment of foreign visitors, this display of authentic African religion, culture, and traditions was generally ignored by Africans. Above the entrance, Mutwa inscribed the warning: “ALL LIARS, ATHEISTS, SKEPTICS AND FOOLS MUST PLEASE KEEP OUT!” As journalist

Joseph Lelyveld observed, anyone who passed through the entrance found “a shrine that seemed to derive its inspiration partly from the cult of the avenging Hindu goddess Kali and partly from Disney World” (Lelyveld 1986: 249). Struck by the eclectic and idiosyncratic symbolism on display, Lelyveld called into question the authenticity of this tourist attraction. Like his writings, Mutwa’s African village in Soweto evoked the strangeness of Africa. During the black-consciousness uprising of 1976, African students attacked Credo Mutwa’s shrine, burning its huts, carvings, and other artifacts, because they saw his tourist village as promoting the tribalism of apartheid and separate development. Although Mutwa eventually had to abandon his shrine and leave Soweto in 1978, the Credo Mutwa Village remained on the tourist itinerary into the 1990s with its burned and blackened features.

During the 1980s, Credo Mutwa established a larger and more ambitious tourist attraction within the South African Bantustan of Bophutatswana, an African nation that was not recognized by any other nation in the world, except by the apartheid regime in South Africa. At Lotlamoreng Dam Cultural Park, beginning in 1983, Mutwa supervised the construction of small adobe villages, each representing the traditional culture of one of South Africa’s tribal African peoples. Traditional villages were built for Tswana, Zulu, Ndebele, Xhosa, and Southern Sotho groups. Around these displays,

Mutwa erected clay statues of African deities, most prominently a twentyfoot-tall African goddess. Praising Lucas Mangope, the president of Bophuthatswana, Credo Mutwa declared that “Anyone who gives me the opportunity to rebuild the African past knows what he is doing” (Republic of Bophuthatswana 1987: 19). Following the first democratic elections of 1994 and the reincorporation of Bophuthatswana into South Africa, the cultural park was deemed to belong to the National Parks Board. Credo Mutwa was expelled. By August 1995, as anthropologists Jean and John Comaroff found, the cultural village had become an informal settlement in which people lived in and around the various tribal displays.

Moving to the Eastern Cape, Credo Mutwa was employed by the Shamwari Game Reserve, near Port Elizabeth, where he sold African artifacts, such as sacred necklaces, headdresses, icons, and implements used in rituals. “In the Zulu tradition,” according to the publicity for the reserve, “each of these artifacts must be kept alive by being used in a sacred way on a regular basis.” Accordingly, Credo Mutwa was charged with the responsibility of performing the rituals that would keep these objects alive for the tourist market. In addition to authenticating African artifacts, Mutwa presided over a traditional African Arts and Culture Village, Khaya Lendaba, the “Place of Enlightening Talk,” which was next to the Shamwari Born Free Conservation and Education Center. Once the cultural village was built, however, Credo Mutwa was forced to leave. By 2000, the cultural center was run by the Rev. Mzwandile Maqina, featuring a one-hour show of song, dance, and stories depicting rituals of love, marriage, birth, and circumcision and the daily lives of traditional rural village. Although this traditional village came to be operated by a Christian minister, who had been identified by South Africa’s Truth and Reconciliation Commission as responsible for working with the apartheid regime in fomenting violence against Africans in the Eastern Cape during the 1980s, the merger of indigenous African culture and nature continued to attract foreign tourists.

Although he left under uncertain circumstances, the merger of culture and nature at Shamwari defined a new role for Credo Mutwa as an indigenous environmentalist. In August 1997, Mutwa received the Audi Terra Nova Award for his contribution to wildlife conservation at the Shamwari Game Reserve. The patron of the award, the conservationist Ian Player, identified Credo Mutwa as the

“sole surviving Sanusi, the highest grade of spiritual healer” (Audi 1997). As this indigenous authority was appropriated by conservationists, Mutwa lent his support to various environmental causes. During 1997, Credo Mutwa spoke at the sixth international Whale and Dolphin conference, sponsored by the International Cetacean Education Research Centre, in Queensland, Australia, relating African traditions about the special relationship between Africans and whales and dolphins. During 1999, he spoke at the Living Lakes Conference, sponsored by the U.S. Forest Service at the Mono Lake Visitor’s Center, Lee Vining, California, recounting indigenous African traditions about sacred lakes. Proponents of animal rights found in Credo Mutwa an indigenous African defender of animals. “Apartheid is dead,” he observed, “but ‘sep-

aratism' is alive and well," an apartheid-like separation between human beings and animals (Mutwa 1997). For environmentalists, conservationists, and animal-rights activists, therefore, Credo Mutwa lent an aura of authenticity that could be appropriated in the service of a variety of popular causes.

During the 1990s, the new medium of the internet changed the terrain for promoting cultural tourism. While an announcement was made in 2001 that Credo Mutwa, the "visionary behind the venture," planned to construct a new cultural village, Kwavezitemba, featuring a Zulu hut, a Pedi-Tswana hut, a Dokodo healing hut, and a DigojaStar hut, he had already established a prominent place in cyberspace. For example, Mutwa's account of Zulu traditions was featured on the Kwa-Natal Tourism site; his explanation of the meaning of indigenous symbolism featured on a site, "Living Symbols of Africa," that exported a range of African artifacts; and his artwork decorated TheAfrican.Com, the "website of the African diaspora," which claimed two patrons, the ancient Egyptian hawk-deity Heru and the Yoruba deity Shango, who was depicted on the website in a painting by "His Holiness Credo Mutwa, Zulu Sanussi [sic] of South Africa." In these sites on the internet, Mutwa's indigenous authenticity was employed to invite tourists to South Africa and to sell tourist artifacts from South Africa. As indicated by the website of TheAfrican.Com, Credo's Mutwa's indigenous authenticity had become global on the internet as he provided religious legitimation for an indigenous culture supposedly shared by Africans all over the world. Although he had presided over a series of failed cultural villages in South Africa, Credo Mutwa now played an important role in a new global cultural village on the internet.

Indigenous Knowledge

At the heart of his claim to authenticity, Credo Mutwa insisted that he possessed specialized indigenous knowledge that could be used in healing, divination, education, and social transformation. Following the democratic elections of 1994, the new government in South Africa supported a number of initiatives that involved recovering "indigenous knowledge systems" as the basis for an African Renaissance. Throughout Africa, largely in response to the AIDS pandemic, new interest was shown in the indigenous knowledge and human resources of traditional healers. At a meeting of traditional healers and representatives of the World Health Organization held in 1997 in Kampala, Uganda, Credo Mutwa defended the importance of indigenous knowledge about healing in Africa. Recognition of indigenous healers by the WHO, Mutwa proposed, "will show the scientists that our people are not just a bunch of superstitious savages. If the world accepts many of our herbal medicines, this will help to ensure the survival of our traditional healers" (Cohen 1997). At the thirteenth International AIDS Conference meeting in Durban, South Africa, in 2000, Credo Mutwa appeared wearing a sacred healing necklace. As a member of the executive committee of the Nyangazizwe Traditional Healers Organization of South Africa, Mutwa promoted the use of an indigenous

herb, *Sutherlandia* (*Kankerbos*, in Afrikaans), as a cure for AIDS. Instead of relying upon expensive foreign pharmaceuticals, medical practitioners could find an effective treatment in South Africa. "It's there in the violated plains of my fatherland," Credo Mutwa declared. "It is being ploughed up as a weed" (*Cape Times* 15 March 2001). Like this indigenous herb, traditional healers were generally being ignored by the scientific medical profession in South Africa.

Alternative medicine, including spiritual healing, is a central preoccupation of New Age spirituality. Under the editorship of Bradford P. Keeney, who has been described as a psychologist, medicine man, and shaman, a book on the healing wisdom of Credo Mutwa was published in the United States in the series, "Profiles in Healing." Keeney apparently recommended Mutwa to the attention of the directors of the Ringing Rocks Foundation, which was established in Philadelphia in 1995 with the mission "to explore, document, and preserve indigenous cultures and their healing practices" (Ringing Rocks Foundation 2001). As its first project, the foundation decided to sponsor Credo Mutwa with a lifetime stipend that would "allow this treasure to live out his days free to create as he chooses" (Ringing Rocks Foundation 2001). Recognizing him as the High Sanusi of the Zulu, the foundation bestowed another title upon Credo Mutwa, Ringing Rocks Foundation's "Distinguished Artist and Teacher of African Traditional Culture." On the foundation's website, Mutwa would be given space to transmit his indigenous knowledge to others. The directors of the foundation seemed to imagine their website as the culmination of Mutwa's long career of establishing cultural villages in South Africa since they intended to compile a retrospective profile of those sites on the website. "We hope to spend time with him at each of the sites he has built," they stated, "recording through pictures and his own words the background for his cultural and healing villages" (Ringing Rocks Foundation 2001). Although he had no secure place in South Africa, the Ringing Rocks Foundation in the United States promised to provide Credo Mutwa with a healing center in cyberspace.

In keeping with the eclecticism of New Age spirituality, the African healing practiced by Credo Mutwa was equated with the healing systems of other indigenous cultures. Increasingly, he operated at the intersection of African and Native American traditions. In 1997, for example, Credo Mutwa, the "well-known Zulu prophet," and Roy Little Sun, a Native American healer who had been born in Indonesia as Roy Steevenz, but was reportedly adopted by the Hopi, performed a ceremony entitled, "Healing the African Wound." At the Wonderboom, the "Tree of Life," in Pretoria, these indigenous healers took two feathers, one from an American golden eagle representing the sky, the other from an African guinea fowl representing the Earth, and tied them together to signify the healing of Africa through the sacred union of Earth and sky, indigenous Africa and Native America. Unfortunately, since they included the feather of an endangered species, the healing feathers were confiscated by U.S. custom officials at the Atlanta airport when Roy Little Sun returned to America. Although his campaign to recover the feathers, including appeals to President Bill Clinton, failed to secure their return,

Roy Little Sun returned to South Africa for another ceremony in 2000 to reaffirm the healing connection between the indigenous people of America and Africa.

The indigenous authenticity represented by this fusion of African and Native American spirituality was also attractive to some white South Africans. During 2001, for example, a New Age event in the Eastern Cape of South Africa was advertised as “A Tribal Gathering,” not a gathering of indigenous African tribes, but a festival attracting primarily white South African enthusiasts for Native American spirituality. Living in a Tipi Circle, participants at this gathering would celebrate Mother Earth, enter a sweatlodge, and perform the ceremonies of the Medicine Wheel. Promising that African ritual specialists, *sangomas*, from the local village would also visit the gathering, the advertising for the event certified the merger of African and Native American spirituality by featuring a photograph of Credo Mutwa at the Medicine Wheel. In the United States, New Age enthusiasts tended to assume the basic equivalence of all indigenous spirituality. For example, the Heart Healing Center in Denver, Colorado, hosted a conference in 2001 of “Indigenous Earth Healers.” At this gathering of indigenous healers from all over the world, Africa was represented by the High Sanusi of the Zulu, Credo Mutwa. Unable to attend in person, Mutwa was replaced on the program by his student, C.J. Hood, a “white Zulu” from Port Elizabeth in the Eastern Cape, who played a videotaped message by Credo Mutwa and performed a traditional Zulu dance. Praising his Zulu teacher, Hood declared that “Credo Mutwa will go down in history as a man who was able to bridge a gap between white and black South Africans and start a healing process” (Heart Healing Center 2001). By invoking the indigenous authenticity of the Zulu healer,

C.J. Hood was able to find a New Age audience in the United States for his message, as reported in the *Wellness Journal*, “Respect all that is around us, accept all cultures as they are, and go back to our traditions” (Wellness 2001). Back home in South Africa, new applications were being discovered for African indigenous knowledge. As a prophet, seer, and master of African techniques of divination, Credo Mutwa remained a target of ridicule in the popular press. “Soothsayer Credo Mutwa got it wrong last year,” as the *Sunday Times* observed in January 2000, a feature discrediting the prophet that seemed to run at the beginning of every year. Nevertheless, Mutwa lent his credibility to divination workshops, often designed for business executives, to teach indigenous African techniques for contacting and communicating with ancestors, divining through mediumship or sacred objects, and making long-term regional and global predications.

Alien Encounters

In his writings of the early 1960s, Credo Mutwa referred to “aliens” and “the Strange Ones” who came from outside of Africa. Beginning with the ancient Phoenicians, the “Strange Ones” arrived in unfamiliar ships from unknown lands across the sea. European colonizers, also referred to as the “Strange Ones,” had established alien empires in

Africa. In the post-colonial era, as Mutwa advised, Africans had to resist the “schemes of the Strange Ones,” which included communism and parliamentary democracy, but apparently not the divine and natural law of apartheid, by maintaining indigenous African traditions. In these terms, indigenous authenticity was established in opposition to the aliens and Strange Ones who came from outside of Africa.

During the 1990s, however, Credo Mutwa used the term aliens for beings from outer space, those extraterrestrials that supposedly featured prominently in African myths, legends, and traditions. According to Mutwa, Africans have long known about many species of extraterrestrials. Some are evil, bringing harm to human beings, such as the *Muhondoruka*, fifteen-foot high, cylindrical, column-like creatures who cause violence, or the *Mutende-ya-ngenge* (also known as *Sekgotswana* or *Puhwana*), green creatures, with large heads, chalk-white faces, and large green eyes, who capture people, cut them up, and put them back together again. The most dangerous aliens, however, were the *Mantindane*, who are “star monkeys” and “tormenters,” the powerful extraterrestrial reptiles known as the Chitauri, and the Greys, the small servants of the Chitauri.

The Chitauri’s evil schemes to harm humanity included supporting institutionalized religions. “They like religious fanatics,” he observed. “Ones who are burdened with too much religion are very popular with the Chitauri” (Martin 1999). Working through institutionalized religions, the evil Chitauri seek to divide and conquer human beings.

By contrast to these dangerous aliens, other extraterrestrials are good. The *Mvonjina* are three-foot high creatures, looking like a “caricature of a white person,” who act as “a messenger of the gods” by bringing knowledge to humanity. Other races of beneficent extraterrestrials frequently appearing in Africa included the friendly *Sikasa*, the timid *Mmkungateka*, the beloved *Nafu*, and the ape-like *Mbembu*. Besides trying to communicate with human beings, these aliens from outer space have often mated with African women. “There have been many women throughout Africa in various centuries who have attested to the fact that they have been fertilized by strange creatures from somewhere” (Mutwa 1996: 152). Although apartheid had criminalized interracial relations in South Africa, aliens from outer space were apparently engaging in interspecies sexual relations throughout Africa.

By his own account, Credo Mutwa has experienced many encounters with extraterrestrial beings. As early as 1951, in what is now Botswana, he witnessed a falling star, a strange vehicle in the sky, and two alien creatures disappearing into the spaceship. In the bush where the spaceship had landed, these aliens had left behind extraterrestrial rubbish. Along with the local people who witnessed this event, Mutwa made sure that the rubbish was buried. “That is the African tradition,” he explained (1996: 135). He also encountered a variety of aliens from outer space in Kenya, Zimbabwe, and Zambia during his travels in the 1950s. Besides seeing extraterrestrials, he also claimed to have eaten them, describing the smell and taste of their cooked flesh. According to Credo Mutwa, the ritual consumption of extraterrestrial flesh was common in Africa, sometimes causing severe illness, but sometimes resulting in mind-altering experiences of great beauty, harmony, and transcendence.

Visiting what is now Zimbabwe in 1959, however, Credo Mutwa underwent his most dramatic encounter with extraterrestrials. While digging for medicinal herbs, he was suddenly confronted by five “little fellows,” strange, unfamiliar beings, small dull-gray creatures, with large heads, but thin arms and legs, who captured him and took him to a metallic room, shaped like a tunnel, where they probed and tested his body. The aliens then forced him to have sex with a female of their species, an experience that Mutwa reported as cold, clinical, and humiliating. “I felt like a victim at a sacrifice,” he recalled (1996: 142). After this ordeal, he was deposited back on Earth, with his clothing torn, only to discover that he had been missing for three days.

Based on these encounters, Credo Mutwa emerged as an authority on extraterrestrial beings. In a book on alien abductions, Professor John Mack of Harvard University devoted a chapter to Credo Mutwa’s meetings with beings from outer space. Although he recounted his humiliating treatment by his extraterrestrial tormenters, Mutwa stressed the positive potential of human exchanges with aliens. “I just get furious,” he declared, “because the people from the stars are trying to give us knowledge, but we are too stupid” (Mutwa in Mack 1999: 57, see also 198–218). As confirmation of his global recognition as an authority on aliens from other worlds, Credo Mutwa was invited to deliver the keynote address at an international “Conference on Extraterrestrial Intelligence” in Australia during March 2001.

In establishing Credo Mutwa as an African authority on extraterrestrials, the New Age conspiracy theorist, David Icke, played a significant role. A former sports broadcaster in Great Britain, Icke developed a distinctive blend of personal spirituality and political paranoia that he promoted through books, public lectures, and an elaborate website. Although he seemed to embrace every conspiracy theory, David Icke identified the central, secret conspiracy ruling the world as the work of shape-shifting reptilians from outer space. As Icke revealed in his book, *The Biggest Secret*, these extraterrestrial reptiles interbred with human beings, establishing a lineage that could be traced through the pharaohs of ancient Egypt, the Merovingian dynasty of medieval Europe, the British royal family, and every president of the United States. Although they plotted behind the scenes in the secret society of the Illuminati, the aliens of these hybrid blood-lines were in prominent positions of royal, political, and economic power all over the world. Occasionally shifting into their lizard-like form, these aliens maintained a human appearance by regularly drinking human blood, which they acquired by performing rituals of human sacrifice. In *The Biggest Secret*, David Icke invoked the indigenous African authority of Credo Mutwa to confirm this conspiracy theory about blooddrinking, shape-shifting reptiles from outer space. Reportedly, Mutwa declared, “To know the Illuminati, Mr. David, you must study the reptile” (Icke 2001; see also Icke 1999). In two videos produced and distributed by David Icke, “The Reptilian Agenda: Volumes 1 and 2,” Credo Mutwa confirmed that extraterrestrials, the Chitauri, were a shape-shifting reptilian race that has controlled humanity for thousands of years. Icke and Mutwa appeared together on a popular American television program, “Sightings,” to explain the alien reptile conspiracy. In his lectures in the United States, Icke insisted

that Credo Mutwa provided proof for his conspiracy theory, as one observer noted, in the “pure voice of a primitive belief system.” In Credo Mutwa, therefore, David Icke found indigenous authentication for an alien conspiracy, and of course, this is also about nature, understood as the order of the universe.

Folk Religion, Fake Religion

In retracing his long journey from Zulu witchdoctor to New Age shaman, I have highlighted Credo Mutwa’s ongoing reinvention of himself in relation to different appropriations of his authority. As we have seen, during the 1950s Mutwa was used to authenticate African artifacts for a curio shop in Johannesburg. Through his writings in the 1960s, his tourist attraction in Soweto in the 1970s, and his cultural village in Bophutatswana in the 1980s, he was used to authenticate the racial, cultural, and religious separations of apartheid. During the 1990s, as he acquired the label, shaman, through the interventions of Bradford Keeney, Stephen Larsen, David Icke, and other exponents of New Age spirituality, Credo Mutwa’s authority was invoked to authenticate a diverse array of enterprises in saving the world from human exploitation, environmental degradation, epidemic illness, endemic ignorance, organized crime, or extraterrestrial conspiracy. In all of these projects, the indigenous authenticity of Credo Mutwa added value, credibility, and force because he represented the “pure voice,” untainted by modernity, of an unmediated access to primordial truth.

These appropriations of Credo Mutwa raise important problems for any assessment of authenticity in the study of folk religion. In conclusion, I would like to highlight only two issues that require further reflection as we wrestle with the ordeal of authenticity. Let us say, for the sake of argument, that Credo Mutwa is a fake, a fraud, and a charlatan, as the South African media would have it, rather than the authentic voice of indigenous African religion as he appears in cyberspace. Even if he is a fake, we are still faced with the problem of analyzing what Credo Mutwa has really been doing in the field of indigenous African folk religion. Even a fake, as I will suggest in conclusion, can be doing something authentic.

First, even if fake, a fake religion can draw upon recurring, enduring motifs of indigenous folk religion. Folk religion is often assumed to be timeless, deriving its authenticity from the faithful repetition of discourses and practices that have persisted from time immemorial. Like any form of religious life, however, folk religion has reformers, reformulators, and innovators. Credo Mutwa, it might be argued, is precisely such an innovator in African folk religion. Like the eighteenth-century English poet William Blake, who adapted recurring pagan and Christian mythic motifs to create his own innovative, creative, and idiosyncratic religious mythology, Credo Mutwa has drawn upon recurring patterns and processes of indigenous African religious life to produce an innovative mythology that ranges from the original earth goddess to the ultimate encounters of human beings with aliens from outer space. Certainly, neither

the goddess nor the extraterrestrials in this mythology simply preserve African folk religion. Instead, against the background of an indigenous religious landscape, these mythological inventions create new possibilities for African religion in the contemporary world. During the 1990s, widespread enthusiasm for these inventions has been evident on the internet. In cyberspace, any line that might divide folk religion from fake religion has been blurred. As a religious figure representing both indigenous authenticity and innovative applications, Credo Mutwa is perfectly suited, even if he is a fake, for playing a significant role in the emerging productions of different forms of folk religion, including nature-related ones.

Second, even if fake, a fake religion can do real religious work by establishing the kinds of relations among superhuman beings, subhuman beings, and human beings that are worked out in any folk religion. In the case of Credo Mutwa, these classifications have been central to his ongoing creative work in redefining African indigenous religion. As a religious innovator, he has constantly called attention to the importance of these basic classifications not by reifying them but by emphasizing the creative exchanges among them. Although the basic distinction among superhuman deities, subhuman animals, and human beings might seem stable, Mutwa has always worked to put those fundamental classifications at risk. Speaking at the Whale and Dolphin Conference in Australia in 1997, for example, he urged his listeners to rethink these classifications.

Some time during the long journey of human history, there comes a time when human beings must stop thinking like animals, must stop thinking like perishable beings, must stop thinking out of greed, fear and ignorance. The time has come for all of us to think like Gods, to act like Gods, to speak like Gods, but to remain humanly humble (Mutwa in Haecker 1998).

Although he exhorted human beings to be like superhuman gods, Credo Mutwa also insisted that representatives of Western civilization, who had consistently treated Africans as if they were a subhuman species, as he noted during the 1960s in *Indaba, My Children*, had falsely arrogated to themselves a supremely superhuman status. “The entire Western civilization is based upon a blatant lie,” as Mutwa told Harvard researcher John Mack, “the lie that we human beings are the cocks of the walk in the world, the lie that we human beings are the highest evolved forms in this world, and that we are alone and that beyond us there is nothing” (Mack 1999: 215–16). Mutwa’s reports about extraterrestrials, therefore, might be regarded as reinforcing this challenge to the “superhuman” status of Western human beings. Consistent with any measure of authenticity within folk religion, therefore, Credo Mutwa was doing real religious work by mediating among superhuman, subhuman, and human beings in the world.

These classifications, like any religious classifications, represent religious mediations that can be situated in history. As I have tried to suggest, Credo Mutwa’s innovations in African folk religion can be located in a history that stretches over fifty years from the enforced separations of apartheid to the fluid connections of the internet. Briefly reviewing that history, I have only been able to raise the problems involved in adju-

dicating the authenticity of this self-proclaimed representative of African indigenous religion. If we assume that he is the real thing, we might conclude that Credo Mutwa is an exemplar of indigenous African folk religion in South Africa that has been misappropriated in the global fake religion on the internet. However, recalling that he has been generally dismissed within South Africa as a fake, a fraud, and charlatan, we must recognize that Credo Mutwa has achieved a greater aura of authenticity in cyberspace than in Africa. At every stage in his personal history, Credo Mutwa has found that his indigenous authenticity had to be certified by aliens, from apartheid ideologues to environmentalists to New Age conspiracy theorists, who have appropriated his aura of indigenous authenticity for their own projects. Throughout the long career of Credo Mutwa, the line between folk religion and fake religion has been consistently blurred through this ongoing interchange between indigenous inventions and alien appropriations of authenticity. In the end, these exchanges suggest that Credo Mutwa has been most authentic when he has been used, claimed, or even abducted by aliens.

N

Naess, Arne (1912–)

In a lecture in Bucharest in 1972 the Norwegian philosopher Arne Dekke Eide Naess made the now famous distinction between the shallow ecology movement and the deep, long-range ecology movement. He has since remained one of the major international voices of deep ecology. Naess originally gained his reputation in philosophy from work in semantics, but he has also published several books on Gandhi, and on Spinoza, skepticism and philosophy of science. Naess identified, on the one hand, a shallow ecology movement that fought against pollution and resource depletion for anthropocentric reasons. Pollution and resource depletion were wrong because they threatened human health and affluence. The deep ecology movement, on the other hand, favors some form of biocentric egalitarianism as a guideline for environmental action. This distinction between anthropocentric and biocentric environmentalism is at the heart of deep ecology. Deep ecology therefore is a critique of a commonly held doctrine that the natural world has value only insofar as it is useful to humans.

Naess' main eco-philosophical work was published in 1989 as *Ecology, Community and Lifestyle*, which was based on the Norwegian *økologi, samfunn og livsstil*, issued in 1976. Naess has also contributed to the development of environmental philosophy in numerous articles and speeches and through action. The political program of deep ecology was formulated in the Deep Ecology Platform formulated by Arne Naess and George Sessions in 1985.

Because deep ecology questioned a dominating cultural paradigm, that of excessive anthropocentrism, it could claim to rely on a deeper level of argumentation than shallow ecology, that is, on the level of religion and philosophy. A worldview that can support the deep ecology platform is called an ecosophy, a term coined by Naess. A variety of religions and philosophies can have this function, but many are probably too anthropocentric. Naess' personal ecosophy is called Ecosophy T. T stands for his mountain cottage, Tvergastein, and points to the personal nature of ecosophies. Naess himself ascribes the origin of central values of his ecosophy to important childhood experiences. He used to spend hours at the age of four observing the ecosystem on the coastline, and at the age of eight he became attached to a particular mountain. What he calls shore-life philosophy values "richness, diversity, multiplicity, equivalence, equivalency, egalitarianism, peacefulness, cheerfulness" and also skepticism (Naess 1983: 211). The mountain became for him a symbol of a "benevolent, equiminded, strong 'father'" (Naess 1983: 212). The love of this mountain "reduced the need for anything supernatural," and he learned to value austerity, toughness, distance and aloofness (Naess 1983: 213).

Early on, Naess came under the influence of the ethics of nonviolence of Mahatma Gandhi, and the Gandhian influence on Ecosophy T is significant. Naess' ecological views are based on childhood experiences but they are shaped by, and a continuation and further development of, his Gandhian beliefs. The key concept of Naess' ecosophy is self-realization. Self-realization is the ultimate norm of his eco-philosophical system. According to Ecosophy T, all living beings are capable of self-realization. The concept of self-realization in Naess' philosophy has developed from his lifelong engagement with the philosophy of Gandhi. In one of his many books on Gandhi, Naess explains that, according to Gandhi, self-realization was the final goal of life. This was attained by a gradual perfection. All that humans do, say and think should have this self-realization as its goal. Gandhi also believed in the unity of life. To explain the central concept of self-realization and the mature experience of oneness in diversity in his ecological writings, Naess quotes the famous Hindu text Bhagavadgita, verse 6.29. Bhagavadgita was Gandhi's most sacred book, a source of wisdom he turned to whenever he needed to solve ethical dilemmas. Naess' use of the Bhagavadgita has to be understood in this Gandhian context. Verse 6.29 describes the yogin who "sees himself as in all beings and all beings in himself" (or "self" according to Naess) and who "sees the same everywhere." Bhagavadgita 6.29 sums up, according to Naess, the maximum of self-realization. It expresses the idea that all is connected to everything else and therefore that the self-realization of any living being is part of the self-realization of each one of us.

The ecosophy of Arne Naess as it is presented in his writings draws on the close connection between nonviolence (*ahimsa*), the philosophy of oneness (*advaita*) and the goal of self-realization (*moksha*) in the religious thought of Gandhi. Naess understands the Bhagavadgita to say that solidarity with all beings and nonviolence depends on widening one's identification and that to see the greater self means to expand one's identification to include all living beings as one's self.

Naess finds the same doctrine of self-realization and unity of life expressed also in the philosophy of Spinoza. According to Spinoza's philosophy, every living being tries to realize its potential, its power or essence. Unity of nature means that everything is connected to everything else and that therefore the self-realization of one living being is part of the self-realization of all other beings. Naess uses Gandhian concepts to exemplify the similarity between Spinoza's philosophy and Gandhian thought. Naess argues that "adherence to Spinoza's system is consistent with being a *karma-yogi*" (Naess 1980: 323). *Karma-yogi* is here a concept borrowed from Gandhi. Vivekananda, who was a great influence on how Hinduism was received in the West, held that the Hindu ascetics should perform social service (*seva*). This new ideal he called *karma-yoga*. Gandhi was a foremost practitioner of this new ideal. He made social service a necessity for self-realization. Ecosophy T combines twentieth-century reinterpretations of Hindu asceticism by Gandhi and Vivekananda, the philosophy of Spinoza, and a belief in the world as the ultimate concern typical of religious environmentalism. This philosophy is further blended with traditional and twentieth-century Norwegian

attitudes to nature and the outdoors, and the concept of solidarity with the weaker segments of society that is at the foundation of the Scandinavian welfare state system.

Gandhi lived before environmentalism and the environment was not his main concern. He is nevertheless recognized as the father of the environmental movement in India. Gandhi's famous statement that "the Earth has enough for everyone's need, but not for anyone's greed," is a slogan for contemporary environmentalism. Gandhi is more than any other, probably, the father of the father of deep ecology. But in spite of the close relationship between the ecosophy of Arne Naess and Gandhi, the Indian environmentalist Ramachandra Guha has argued that the concerns of deep ecology are foreign to, harmful to or, at best, irrelevant to the people of India. Guha argues that in India the deep ecology idea of wilderness and natural parks is a threat to people living in the wilderness areas and that environmentalism in poor countries needs to be anthropocentric in order to address the gruesome living conditions of the urban slums and the many human tragedies caused by poverty. Naess argues that Guha misrepresents deep ecology (Witoszek and Brennan 1999). Naess actually defends weak anthropocentrism; Ecosophy T is a critique only of excessive anthropocentrism, a point often misunderstood by followers of deep ecology. Ecosophy questions the wisdom of emulating the economic growth and development path of rich countries and argues that alternative ways, such as Gandhi's vision of India as a village-based economy, still need to be explored.

Naropa University

Naropa University (formerly the Naropa Institute) is a private, non-sectarian, accredited university inspired by its Buddhist heritage to integrate contemplative learning, intellectual rigor, and active engagement with the world. It offers bachelor's degrees, master's degrees, and certificate programs through on-campus and online courses, studyabroad programs, and continuing education workshops. Its academic programs include degrees in Buddhism and other religions, environmental studies, Transpersonal Counseling Psychology, education, writing and poetics, and fine arts, and offers certificates in ecopsychology, and other areas.

Naropa University was founded in 1974 by Chogyam Trungpa, a Tibetan scholar and meditation teacher. Born in Tibet in 1940, Trungpa Rinpoche was a lineage holder in both the Kagyu and Nyingma Buddhist traditions. In 1959, he escaped the Chinese invasion of Tibet. Later, he studied comparative religion, philosophy, and fine arts at Oxford University. A scholar and artist as well as meditation master, he became widely recognized as a teacher of Buddhism in the West. With the founding of the Naropa Institute, he realized his vision of creating a university that would combine contemplative studies with traditional Western scholastic and artistic disciplines. Since the death of Trungpa in 1987, Naropa University has continued to grow and integrate teachings from a variety of spiritual wisdom traditions. Joining intellect and intuition in an atmosphere of mutual appreciation and respect for different contemplative traditions has become the University's ongoing inspiration.

At the core of Naropa's contemplative learning approach is the cultivation of awareness through intellectual, artistic, body-centered, and meditative disciplines. In the view of contemplative learning, such awareness provides the basis for continued development of openness, communication, intellect, creativity, and intuition. These qualities, in turn, are the foundation for building and deepening a community of learners and for service to the world. While it has been inspired by Buddhist traditions, Naropa University seeks to remain true to its founder's vision as a setting in which diverse views can come together in an environment of respect and authentic dialogue.

Naropa University's vision and orientation is evident in its programs in environmental leadership, ecopsychology, and wilderness studies. These programs are grounded in a core principle of both ecology and many spiritual wisdom traditions, which exemplify the nonduality of interconnection. They integrate academic inquiry, spiritual wisdom, contemplative practice, and skilled engagement. Both during their educational programs and after, students practice critical and creative thinking, meditative disciplines, and active service in the world. Many of these programs also integrate intensive

wilderness experiences. The aim of these programs is to promote wise, just, effective, and compassionate action in a number of arenas, including environmental policy, environmental restoration, community development (understood as an aspect of environmental restoration), horticulture, wilderness therapy, and ecotherapy.

Nasr, Seyyed Hossein (1933–)

Hossein Nasr (b. Tehran, Iran; “Seyyed” is an honorific title designating a descendant of the Prophet Muhammad) is widely considered to be one of the most significant contemporary Iranian philosophers. Muslim in background but educated in both Iran and the United States, Nasr is a proponent of the perennial philosophy associated with Frithjof Schuon, Titus Burckhardt and Rene Guenon, in which timeless truths are seen as being expressed in a variety of historical cultural and philosophical traditions. His work thus blends traditional Islamic with modern Western approaches.

Nasr was among the first scholars to draw attention to the spiritual dimensions of the environmental crisis, and the first contemporary Muslim to do so. He first introduced his perspective in a 1965 essay, going on to develop it in a series of lectures at the University of Chicago the following year, several months prior to Lynn White, Jr.’s famous address before the American Academy of Arts and Sciences (published in *Science* as “The Historical Roots of Our Ecologic Crisis”). While Nasr agrees with White that the desacralization of nature in Enlightenment Europe laid the groundwork by which the dominating tendencies of the modern technological worldview would be justified, he argues that in Islam science never lost its sacred character. Nasr goes on to point out that much of the contemporary Muslim world is no longer “Muslim” in the traditional sense, implicitly suggesting that environmental degradation is a Western product that has been subsequently exported to other cultures.

Widely cited by both Muslims and non-Muslims alike, Nasr’s thought has provided the foundation for much of the current discussion on Islam and the environment. As such, he is considered by many as the “founding father” of contemporary Islamic environmentalism.

National Council of Churches, Eco-Justice Working Group (USA)

The Eco-Justice Working Group (EJWG) of the National Council of Churches (NCC) provides a mechanism for NCC-member Protestant and Orthodox denominations to work together on issues affecting care of the Earth. The Group began in 1983 when the Joint Strategy and Action Coalition (JSAC) merged into the NCC. The Responsible Lifestyle Task Force of JSAC, which had begun work on issues of energy, organic food and food sufficiency with the participation of American Baptists, Presbyterians, Methodists and Lutherans, formed the core for the EJWG.

Early discussion in the group and a report from the United Church of Christ formulated the term environmental justice, denoting the impact on poor and minority communities in regards to environmental issues. Environmental justice includes a broader set of social and economic issues than the word environmental used alone. In 1986 the EJWG sponsored a seminal conference at Stony Point, New York. The “Eco-Justice Agenda: Loving the Earth and People” brought together 150 people including denominational representatives, clergy, lay and a wide variety of community groups. The conference was a major turning point for increased activity that included a wider justice agenda with environmental issues. Discussions that began at the conference sparked denominations to take action that included the adoption of policy statements. Concerns from community groups at the conference led to a reorganization in 1988 that included full participation by a wide variety of groups not affiliated directly with a religious group. The wider membership continued until the late 1990s when another reorganization brought in Orthodox participation, but excluded community groups. Stories of environmental poisoning in local communities told at the conference led to the production of an early video on the topic, *For Our Children*. In 1992 several representatives from the EJWG participated in the United Nations’ conference on Environment and Development in Rio de Janeiro, leading to increased awareness of eco-justice in congregations. From 1985 until 1995 the EJWG published the *EGG*, a journal of eco-justice, in cooperation with the Eco-Justice Project at Cornell. Its articles provide a good summary of major eco-justice issues of the day.

The production of resources and the generation of program ideas to help local congregations focus on ecological issues has been a major part of the work of the EJWG in recent years. Present programs include the Environmental Justice Covenant Program and the Interfaith Global Climate Change Program. A biennial national

conference held in 1997, 1999 and 2001 brought together persons working on the local level. The EJWG also sponsors a resource center where a wide variety of materials are available for local congregations.

The EJWG is a partner in the National Religious Partnership for the Environment. The other partners are: The U.S. Catholic Conference, the Evangelical Environmental Network and the Coalition on the Environment and Jewish Life. As part of the Partnership, the group produced *God's Earth: Our Home*, Shantilal Bhagat (EcoJustice Work Group, NCC, 1995) as a resource for local congregations.

National Parks and Monuments (United States)

Travelers in the hundreds of millions make the national parks and monuments spread across the modern American map focal points of their annual journeys. By 2002 these public centers of recreation, education and inspiration numbered more than 350 and covered some 84 million acres. During the last several decades they have been exported abroad as a conservation ideal, but threatened continually at home by conflicts over their meaning and purpose, as well as over more mundane concerns such as funding, boundaries and maintenance. Frequently heralded as sacred places and deployed globally as evocative images of a unique American nature and history through works of art and the mass media, the national parks and monuments remain embedded deep within the nation's culture.

Prior to war with Mexico in 1846, Americans more cultivated than the ones who French traveler Alexis de Tocqueville found hacking down Ohio River valley forests in 1831 – or those who Emerson in *Nature* (1836) chastised as blind to the beauty of their own fields and farms – voiced a frequent note of doom as they reflected on the nation's prospects. The sweeping floods of early nineteenth-century religious and social reform had tangled together conflicting cultural anxieties over matters of race, capital, technology, the body, and women's role in society. These anxieties, as historian Robert Abzug has shown, also centered around competing views of what was sacred, and what profane, to a people bent on constructing a distinctly new nation. In the midst of the continent's rapid transformation, Emerson's poetic sort of American – if few others, initially – found in the vanishing form of landscape “something more dear and connate than in streets or villages” (1836: 13), and thus came to seek in wilderness a sacred antidote to the young republic's many ills.

Although Americans turned forests into woodlots at a remarkable rate, by the 1830s those who saw in stilluncivilized land something greater than profit or utility were sufficient in number to support the preservation from resource development of various natural prominences – such as New York's Niagara Falls or Kentucky's Mammoth Cave – and to embrace scenic wilderness travel as a form of cultural education and spiritual renewal. Nevertheless, as is evident in such paintings as Thomas Cole's “The Oxbow” (1836) – with its stormy change on the horizon – and most especially in his five-panel “The Course of Empire” (1834–1836), the wilderness available to eastern travelers often proved melancholic in inspiration, and they worried along with Cole that an empire

devoted to nature could not help but decay over the ages. By far a better painter than poet, Cole still gave this melancholy a pointed gloss, writing “Each hill and every valley is become / An altar unto Mammon, and the gods / Of man’s idolatry – its victims we” (in Hughes 1997: 146). To be expected, perhaps, eastern efforts at preservation quickly succumbed to commercial impulses, so much so that Tocqueville in 1831 was urging that friends hurry to Niagara Falls, since he wouldn’t “give the Americans ten years to establish a saw or flour mill at the base of the cataract” (in Runte 1987: 6).

Western lands obtained from Mexico under the Treaty of Guadalupe Hidalgo (1848) thus offered America’s cultural elite a distinct solution to the vexing problem of the new nation’s identity. For those who, with Cole, felt a post-revolutionary inadequacy in relation to Europe, no amount of light irradiating an eastern scene, nor the steady bragging of politicians Jefferson and Jackson or novelist James Fenimore Cooper about the virtues of the eastern countryside, could obscure what America lacked: a storied past, an aristocratic imprint on the land and spirit of the people, great cathedrals connecting the generations to heaven and Earth, and the Alps.

In the west, description also outran the reality of the landscape, but the landscape ran close enough. Journalist Horace Greeley, for instance, traveling in the Sierra Nevada in 1859, wrote his eastern readers, after a walk among the Mariposa Grove sequoias, that they were “of substantial size when David danced before the ark, when Solomon laid the foundations of the Temple, when Theseus ruled in Athens, when Aeneas fled from the burning wreck of vanquished Troy” (Greeley 1860: 311–12). No matter their precise age, the giant sequoias did constitute a living antiquity – one would not even need to read to absorb their wisdom of ages. The western scale of nature’s architecture provided sources of culture and the sacred that Europeans themselves would envy. At times, Americans were even able to acknowledge the antiquity of the west’s first people, as when they flocked in the late 1830s and 1840s to see George Catlin’s traveling “Indian Gallery” of portraits from the upper Missouri – his Mandans, Arikaras and Pawnees so vivid in their ceremonial garments and paint that they looked at times realer than real, and rather similar in pose to noble Romans.

The raw western topography – all granite peaks, basalt outcrops, red oxide soils and sedimentary gashes – seemed specially made for those who sought a visual and natural embodiment of powerful, nation-forming divinity at work, an embodiment that easily surpassed the achievements of European culture and the sublimity of its landscape. Admittedly, no one besides George Catlin imagined that the complex of tribes, herds and open spaces might be significant as whole: “a *nation’s Park*, containing man and beast, in all the freshness of nature’s beauty” (in Chittenden 1895: 78). Instead, what seemed most worth preserving were nature’s monumental artifacts. The earliest parks – Yosemite, which Congress granted to the state of California in 1864, and Yellowstone, established as the first truly national park in 1872 – were both preserved because the landscape contained gigantic wonders, challenges to the American imagination, whether orthodox, scientific or aesthetic, and natural testimonies to Providential purpose. Each park seemed to call forth different poetic impulses from their proponents

and publicists – Yosemite most often glossed as “nature’s cathedral,” and Yellowstone (“Colter’s Hell,” originally) framed less comfortably as a “wonderland” of the grotesque. In both cases, however, Americans could find in the extravagant creations of wild nature confirmation of their world-historical destiny.

American proponents of national parks drew on available social and cultural resources in order to persuade the public and Congress that preservation was in the national interest. Their strategic efforts helped Americans define national parks as sacred environments, and created the paradigmatic practices of veneration and recreation that have since been employed within them.

Common to the presentation of Yosemite and Yellowstone as centers of sublime nature was the reliance upon both verbal and visual prompts, as early interpreters made use of traditional religious language and the Romantic practice of landscape painting to promote interest among Easterners and Europeans. Lafayette Bunnell, physician to the Mariposa Battalion – the white militia that first came upon the Yosemite Valley while chasing Tenaya’s band of Ahwaneechee Miwoks in 1851 – enthused on his first descent into the secret valley while worrying about his scalp: “If my hair is now required, I can depart in peace, for I have here seen the power and glory of a Supreme being, the majesty of His handy-work is in that ‘Testimony of the Rocks’ ” (Bunnell 1880: 56). With less regard to orthodoxy: “Granite is great, and the Yo-Semite is its prophet,” wrote Unitarian minister Thomas Starr King in 1861 (in Sears 1989: 127), several years before John Muir himself began placing the template of gospel metaphor over his mystical wanderings through California’s mountains.

Muir was perhaps at heart a pagan pantheist. “We are now in the mountains, and they in us, kindling enthusiasm, making every nerve quiver, filling every pore and cell of us,” he wrote of his first view of the high country approaching Yosemite (Muir 1911: 20). Nevertheless, he drew incessantly on biblical religion to marshal support for the preservation of Yosemite (1890), Mt. Rainier (1899), Glacier (1910) and other western parks, and styled himself as the gospel of beauty’s John the Baptist. To the “business-tangled,” so “burdened with duty that only weeks can be got out of the heavy-laden year,” he preached seemingly-easy sermons. A month in wilderness, such as at Montana’s Lake MacDonald, and “never more will time seem short or long, and cares never again fall heavily on you, but kindly and gently as gifts from heaven” (Muir 1901: 17, 19).

Visual art played a crucial role in disseminating iconic presentations of the early parks’ overwhelming and varied landscapes. Thomas Ayres went into Yosemite with San Francisco editor – and shortly thereafter Yosemite innkeeper – James Mason Hutchings in 1855, four years after its discovery by whites. Within less than a decade, painters such as Albert Bierstadt and Thomas Hill, and photographers Carleton Watkins and Eadward Muybridge, were exhibiting to audiences as far from California as New York and London. Yellowstone’s most famous artists, Thomas Moran and photographer William Henry Jackson, accompanied F.V. Hayden – director of the U.S. Geological Survey – on the first scientific expedition into Yellowstone, in 1870. The work of these

artists, widely viewed in exhibits and in the press, emphasized a transcendent – and at times imaginary – landscape absent the human presence, and certainly absent the evidence of Civil War carnage that had recently so weighted the landscape familiar to Americans back east.

Not all subscribed to the sublime notion that God was granite, however. Mark Twain, for instance, poked at Bierstadt's 1867 "The Domes of the Yosemite," saying that while the various components of the picture looked natural enough, the atmosphere was "altogether too gorgeous," more "the atmosphere of Kingdom-Come than California" (in Anderson 1990: 91). Working-class squatters and homesteaders, as well as tribal members living near the parks, were also particularly uninterested in public administration and religious veneration of country that held necessities of survival. The only reason for Indians even to be in Yellowstone, wrote Superintendent Philetus Norris in 1878, was "for the purposes of plunder, or of concealment after bloody raids upon the ranchmen, pilgrims, or tourists" (in Jacoby 2001: 90).

Others failed to accept that nature was best understood in Romantic terms. Muir's evangel that preserved wilderness as "full of charming company, full of God's thoughts . . ." (Muir 1901: 78) sounded a false note to some, such as Truman Everts – Yellowstone survivor of 39-days' separation from the 1870 Washburn party. For Everts, who relayed his experience to readers of *Scribners* in 1871, the terror of wilderness, especially as part of a divine order, was only too real. Forced by circumstance to endure as much of nature's rawness as Muir chose to, Everts could only gloss the harrow of his experience with a Ben Franklin-ish admonition. "Put your trust in Heaven. Help yourself and God will help you" (Everts 1871: 11).

Parks might have remained the preserve of cultural elites under the influence of Muir, but for his use of publisher Robert Underwood Johnson's *The Century* to spread his message, and but for the interests of the railroads, who were early supporters of both Yellowstone and Yosemite. To underscore the irony – Muir was adamant in seeing the parks as antidotes to capitalist civilization. They would preserve divine nature from forces bent on its destruction in the name of profit. On the other hand, railroads such as the Northern Pacific took on the task of promoting Yellowstone with all the sophistication and resources of a modern advertising campaign. A wide range of brochures, lecture tours and artwork portrayed an American future in which rail-accessible nature functioned just as Muir hoped wild nature would, to restore the souls of citizens. Northern Pacific director Colgate Hoyt confessed a vision for his railroad, in 1878: a West filled with homes, wheatfields and cattle.

And I thanked God that right in the middle of all this noise and wrestless [sic] life of millions a wise Government had forever set apart that marvelous region as a National Park . . . where the worn, the sick, and jaded could even find rest, and refreshment, and opportunity to study the Master's hand in nature (in Magoc 1999: 21).

Another NP executive, Olin Dunbar Wheeler, played up the importance of scenic wilderness to a democratic populace by linking Yellowstone's redemptive promise with that of the Hebrew prophet Isaiah: the common run of humanity, the *hoi polloi*, will

see a vision – a picture that causes them to stand in awe and silence, and caring less as to the why and wherefore of such amazing results, “shall see of the travail of their souls and be satisfied” (in Magoc 1999: 102).

Although Muir certainly took opportunity to lambaste the railroads in *Our National Parks*, he also had to acknowledge that the mobility they provided made possible for others their own mystical immersions in nature.

Thus from their inception national parks as nature’s emblems of high national purpose, or as wild antidotes to the baseness of capitalist civilization, were not only dependent upon capitalist energies, but were also embodiments of capitalist achievement. This irony complicates any effort to understand the preservationist impulse in American conservation by means of easy distinctions drawn between public and private, or sacred and secular intentions regarding wilderness. Although – as Tocqueville’s 1831 reaction to Niagara Falls demonstrates – Romantic devotees of wild nature have long complained about the inappropriate reach of commercial culture into sacred sites supposedly preserved from just that sort of reach, the outrage of a Muir, Thoreau, or a Cole, let alone a European aristocrat like Tocqueville, is not evidence of a broader public consensus. In opening the parks up to Wheeler’s *hoi polloi* – the democratic masses – park creators had to contend with the broad range of readings Americans brought to the term “sacred.”

Perhaps the best way to assess the religious role of the national parks in American life is to follow the lead of historian Lawrence Moore, who in *Selling God: Religion in the Marketplace of American Culture* (1994) captured the peculiar dynamic between sacred (religion) and profane (economy) that permeates American history – including the history of American conservation. For Moore, the religious and the economic are not contradictory impulses. As he shows, commercial culture emerged in the nineteenth century largely through the agency of Protestant religious leaders attempting to retain control of a society reinventing itself. Crucial features of nineteenth and twentieth-century American economic life: the rise of consumption, the growth of leisure, the birth of advertising and mass media, all carried sacred meanings and practices for the majority of Americans, and all affected their use and appreciation of the parks. Furthermore, the capitalist culture that so dominated post-Civil War American life gained its sway by absorbing those movements or values that first appeared as countercultural alternatives. For Moore then, the Protestant ethic that really triumphed was not one of work alone, but also of play.

By the early twentieth century administration of the parks was piecemeal, but development of the infrastructure to sustain travelers within America’s “Playgrounds for the People” was in full surge. Rail lines, hotels and inns, some – such as Yellowstone’s Old Faithful Inn (1903) – quite regal, and – most fatefully – roads, were all constructed under private leases or with inadequate Congressional appropriations. In 1916, Congress authorized the Interior Department to create the National Park Service (NPS), to coordinate administration at all parks and national monuments – which first were established under the 1906 Antiquities Act, as well as battlefields and

other historic sites administered originally by the War Department. The Park Service Organic Act mandated that the NPS “conserve the scenery and the natural and historic objects and the wildlife therein” and “provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for future generations” (in Runte 1987: 104). The latitude of this mandate appears in a 1916 proposal regarding Yellowstone from the first NPS director, Stephen T. Mather. “Golf links, tennis courts, swimming pools and other equipment for outdoor pastime and exercise should be provided by concessions, and the park should be extensively advertised as a place to spend the summer instead of five or six days of hurried sight seeing” (in Ise 1961: 198). As many have noted, the service has often struggled to balance “conserve the scenery” with “provide for the enjoyment.” Nevertheless, reading them as opposites stems from overlooking how deeply the democratic and sacred pursuit of leisure has shaped all aspects of modern American life.

Perhaps nothing symbolizes and ritualizes that pursuit more than the automobile, which was first permitted at Mount Rainier in 1908 and in Yosemite in 1913, where within five years it was bringing in five times as many visitors as the recently completed railroad, which itself, according to one correspondent, was chastised by “the athletic rich” as degenerating the valley into “a mere picnic-ground with dancing platforms, beery choruses and couples contorting in the two-step” (in Runte 1987: 156). The railroad did remain an elite institution though, while the automobile exploded across the national parks by the 1920s.

Early proponents of roads through the parks emphasized the automobile’s role in instilling an appropriate American spirit in travelers, as *The American Motorist* in “A Motorist’s Creed” put it in 1917:

I believe that travel, familiarity with the sights and scenes of other parts of the country, first hand knowledge of how my fellow-men live, is of inestimable value to me and will do more to make me patriotic and public spirited than daily intimacy with the Declaration of Independence (in Shaffer 2001: 1917).

Groups such as the Daughters of the American Revolution lobbied relentlessly for the construction of highways linking sights of historic or scenic interest, in the process providing a high-brow justification for auto travel as a necessary ritual for inculcating patriotic spirit and civic virtue. Others emphasized the fun of free-wheeling travel to the parks, as “sagebrushing” – automobile camping – brought waves of independent visitors, each prepared to “cut loose from all effeteness” and let “his adventurous, pioneering spirit riot here in the mountain air” (in Runte 1987: 157).

In either case, twentieth-century parks visitors took on the role of pilgrims inherited from early wonder-struck travelers, but augmented this with a recapturing of the true American spirit. The auto tourist used modern technology not simply to witness the divine stamp on the Grand Canyon or Crater Lake, but to claim the purifying effects of immersion in the frontier experience – which historian Frederick Jackson Turner in 1893 had said was defining of the American character – as his or her own. Thus while Americans across the board responded to automotive technology as a mythical power,

in the national parks, as sacred preserves of a nearly vanished era, they were able to use the automobile to propel themselves into the primordial past, and to return home inspired in ways that would assist them in creating the urban, industrial future.

For campers this reimmersion in Paradise or Eden meant a temporary life of physical exertion on a par with that of their ancestors, which reformers such as President Theodore Roosevelt, Boy Scouts of America founders Ernest Thompson Seton and William D. West, or organizations such as the Young Man's Christian Association (YMCA), had for some time been urging on urban Americans as their bodies' and even spirits' means of redemption from the debilitating effects of office and factory life. Campers slept under the stars or in canvas tents, cooked over open fires, endured primitive means of sanitation, as well as exercised on steep mountain trails or swam in bracing waters. Some parks proponents, such as U.S. Geological Survey chief topographer Robert Marshall, even saw the parks as martial training ground for modern warriors, where young men could forget something of the rush and jam of modern life . . . and build up their bodies by being next to nature. Then, should there be a general call to arms, the dwellers of the city canyons will be able to meet the physical needs of a strenuous field service (in Runte 1987: 96).

As a symbolically powerful means of personal freedom, and as the provider of ritualized immersion in nature, automobiles had a drastic effect on the parks. By 1919 nearly 98,000 were reported to have passed through park boundaries. Even in the early years, some foresaw with alarm their ultimate impact, though officials such as NPS Director Stephen Mather regarded their presence as inevitable and positive, claiming in 1924 that auto touring eroded "sectional prejudice through the bringing together of tourists from all sections of the country." Only through the "the medium of an automobile, and camping out in the open" could "people learn what America is" (in Shaffer 2001: 119). British ambassador to the U.S. and lover of Yosemite, James Bryce, however, cautioned as early as 1912 that

If Adam had known what harm the serpent was going to work, he would have tried to prevent him from finding lodgment in Eden; and if you were to realize what the result of the automobile will be in that incomparable valley, you will keep it out (in Runte 1987: 159).

Even during the Depression, visitation continued to climb dramatically, declining briefly during World War II, with only one to two percent of visitors relying upon public transportation. In the aftermath of the war – with union jobs turning the two-week vacation into an American right – park use doubled every ten to fifteen years, a trend continuing through the 1990s. In these decades the system as a whole also expanded, more than tripling in acreage between 1960 and the century's end. At the same time, debates over the purpose of the national parks also increased, often in terms consistent with the contradiction inherited from the Park Service's original 1916 mandate: enjoyment versus preservation – each functioning for its devotees as a principle for constructing the parks as sacred environments. The most notable of these debates was the one surrounding Mission 66, the Eisenhower-era infusion of capital into park in-

frastructures, already overburdened in 1955 by twice as many visitors than the system could accommodate. The resulting construction of visitor centers, campgrounds and improved roads – enthusiastically supported by the American Automobile Association – seemed to post-war preservationists proof that the NPS gave priority to providing for visitor enjoyment. For naturalist Joseph Wood Krutch, Mission 66 placed a fundamental value on technology over nature. Instead of “valuing the automobile because it may take one to a national park, the park comes to be valued because it is a place the automobile may be used to reach” (in Runte 1987: 175).

Preservationist concerns over Mission 66, and even more long-standing management choices, received an influential voice in 1963, when the research team of zoologist A. Starker Leopold (son of Aldo Leopold) released their *Wildlife Management in the National Parks*, a scathing survey of ecological situation in the parks. The officially commissioned report urged the NPS to adopt an environmentally based management philosophy, informed by scientific principles regarding biotic communities, habitat, and plant succession, and to restore park environments to their pre-nineteenth-century conditions. Given the shifts in cultural values that occurred in the 1960s, preservationist goals finally found significant

NPS support. Over the next 25 years park management moved often toward an ecological model, as seen in the prescribed and let-burn policies adopted first for Yosemite sequoias and then in the fire-based plant communities of other parks, in the reintroduction of predators, and in the development of such concepts as the Greater Yellowstone Ecosystem. Though these policies, and their advocacy by environmentalists, were framed in scientific language, they also invoked Muir-like expressions of how to understand the sacred within the national parks.

Unfortunately for wilderness preservationists, long-range ecological management policies had a difficult time surviving when Americans rejected the 1960s resurgence of Romanticism with the election of Ronald Reagan in 1981. The urge to privatize based on increasing distrust of federal bureaucracy and to focus on facilities over habitat increasingly shaped executive branch goals for the NPS. Perhaps the most fitting symbol of the era is the 1988 Yellowstone fire – which engulfed some 40 percent of the park in what *Time* called an “environmental Armageddon” (Magoc 1999: 174), and about which many Americans expressed their sense that environmentalists had defiled the “crown jewel” of the nation’s parks through their misguided let-burn policies. Wyoming Senator Malcolm Wallop catalyzed this anti-bureaucrat sentiment by angrily calling for Park Service director William Penn Mott’s resignation.

In the same years the NPS found itself in the middle of the widely spread culture wars, as its historic battlefields were subjected to competing efforts to commemorate ground “hallowed,” as President Lincoln put it, by the shedding of blood. At Gettysburg, the Little Big Horn, Pearl Harbor and many other parks’ various parties challenged the nation’s legacy on race, westward expansion, the conduct of its wars, or the presence of commercial interests at such sites. Others, such as veterans groups, military reenactors, and Custer buffs, objected to the historical “revisionism” they saw influencing shifts in

Park Service site management and interpretation. Just as American wilderness sparked apparently competing conceptions of the sacred within park boundaries, American history yielded lasting conflicts over appropriate commemoration of significant events, a limitless possible “affront to the living as well as the dead,” as columnist George F. Will complained regarding construction of Gettysburg’s observation tower (in Linenthal 1993: 115). In the 1990s, concerns over desecration of historic grounds culminated in controversy surrounding Walt Disney Corporation’s plans to build an American history theme park in rural Virginia, near Manassass, Antietam and several other Civil War battlefields.

Common to the parks as a whole has been the desire to retain the unsullied past, whether in the wonder-evoking beauty of the natural landscape or in the sense of historical immediacy that led a young General George S.

Patton in 1909 to recall a Gettysburg sunset moment at the site of Pickett’s charge when “I could almost see them coming, growing fewer and fewer while around and behind me stood calmly the very cannons which had so punished them” (in Linenthal 1993: 117). The “objective of every national park and monument” claimed Leopold in his 1963 report, should be the creation of a “reasonable illusion of primitive America” (Leopold et al. 1963). What makes these “reasonable illusions” of virgin land or the presence of the past obtainable – what gives them value and form, is the culture of leisure consumption that has so shaped American society over the last century. Parks are simply one more option available to those engaged in leisure pursuits, as a 1995 issue of *Glamour* suggested: “Everyone should see Manhattan, the Grand Canyon, Walt Disney World . . . Yellowstone National Park, Beverly Hills

. . .” (in Magoc 1999: 168). Whether one sees Mt. Rainier on a brief pass through the park on the way to somewhere else, stays several days at the volcano’s base in a motor home, pumps up the road on a touring bike, or camps near the summit in a four-season tent, the park functions as a set of nature-options available for consumers to enjoy. And whether consumption entails a rejection of the search for sacred, or its transformation, it has certainly taken on the forms and language of traditional American religion.

Although some commentators have argued that contemporary tourist experience has abandoned the sacred visions of nature and nation sought by earlier generations of travelers, the intensity of conflict over the meanings, means of administration, and practices of the sacred available at national parks, and their steady increase in use, suggests that they do still retain a great hold on American imaginations as democratic hallmarks of both nature and nationhood.

National Religious Partnership for the Environment

The National Religious Partnership for the Environment (NRPE) advocates for the environment within national Christian and Jewish organizations and through individual congregations in the United States. An “umbrella” organization, NRPE has four component groups, the National Council of Churches’ Eco-Justice Working Group (EJWC), the eco-justice program at the United States

Catholic Conference (USCC), the Evangelical Environmental Network (EEN), and the Coalition on the Environment and Jewish Life (COEJL). Their purpose is to promote environmental causes in church and temple teaching, in management practices, and in public policy. They argue for religious protection of the environment as part of reverence for God and God’s works, an outlook some participants have labeled environmental stewardship (invoking the fiscal stewardship that has long been part of church process).

NRPE grew out of ideas formulated in the 1960s and 1970s by numerous commentators, some religious, some not. Professor Lynn White’s 1967 paper on ecology and Christianity, “The Historical Roots of Our Ecological Crisis,” was a starting point cited by many involved. Others tried to integrate ideas from Eastern thinking, particularly Zen Buddhism, or from Celtic and other “minority” traditions in Christianity. Early leaders in this movement included California State Senator Tom Hayden, members of the Lindisfarne Association, Dr. James Parks Morton (now-retired Dean of St. John the Divine Cathedral (Episcopalian), New York City), Catholic priest Thomas Berry, and evangelical professor of biology, Dr. Calvin DeWitt. These figures and others pressured religious authorities to take up environmental issues and tried to get ordinary Americans to think religiously about environmental issues. By the early 1980s, a number of religious environmental organizations had formed, most notably the Eco-Justice Working Committee of the National Council of Churches.

NRPE emerged to coordinate official religious environmentalism in the US during the years 1991–1993. It was not founded (as has often been claimed) as a result of the 1990 exchange of “official” letters between clerics and scientists on the global environmental “crisis” organized by James Parks Morton, Paul Gorman, and, surprisingly, the outspoken atheist scientist Carl Sagan. The letter exchange marked instead a turning point after which church and temple hierarchies publicly recognized the crisis. Much of the credit goes to Gorman, then a staff member working for Morton at the Cathedral of St. John the Divine, now director of the organization. The component groups were

at different levels of development. Gorman organized them under one umbrella using the carrot of funding. Initial and subsequent funding came from liberal foundations such as Ford and Pew. The NRPE agreed to disseminate money on an equal basis to each component group.

The NRPE quickly organized and disseminated information to congregations that represented each group's understanding of the relevant Jewish and Christian teachings on justice, social ethics, and the creation. In the mid-1990s, over 125,000 literature packets were distributed to churches and temples. Numerous conferences and other kinds of meetings were held. The NRPE's teachings carried extra authority stemming from the proclamations of church leaders, including Pope John Paul II, the respective NCC synods, presbyteries, and general meetings, and the four Jewish rabbinical seminaries.

Official recognition would be more difficult for the EEN, which aims to influence the evangelicalfundamentalist religious bloc. Evangelical and fundamentalist Christianity in America comprises smaller church organizations and individual churches without any particularly national group that could offer official endorsement. The EEN made up for this with advocacy and public relations, particularly their *Evangelical Declaration on the Care of the Creation*, supported by Billy Graham's magazine *Christianity Today*. Also noteworthy was the 1996 congressional lobbying in support of the Endangered Species Act reauthorization, for which conservative representatives and senators, particularly those influenced or supported by the New Christian Right, were unprepared. EEN and other religious groups demonstrated that conservative Christians did not speak with one voice on the issue. The ESA was successfully reauthorized.

All four NRPE member groups have held educational meetings and conferences, reinforcing the effect of their information packets on congregational leaders and clerics with face-to-face discussion of the various issues involved. Among the issues discussed has been climate change, ozone depletion, loss of species, natural resource policy, development policy for the South, and so on. Thousands of small environmental groups and many local projects have been started by individual churches as a result. NRPE ran a TV advertisement campaign in support of the Kyoto Accords on climate-change policy. In 2003, NRPE leaders pointedly asked Detroit automobile manufacturers, "What would Jesus drive?" and began a television campaign to press the question.

A conservative backlash, led by vociferous elements of what was known as the "Wise Use" movement, has attempted to delegitimize the movement, specifically targeting the new organizations in the press. An opposition group, the Interfaith Council for Environmental Stewardship, was formed for this purpose. The writings and speeches of some opposition leaders have included derogatory language; many can be dismissed as polemical and provocative. One exception might be a more principled opposition that is found within the evangelicalfundamentalist community itself, led by professors at evangelical-fundamentalist colleges and universities. This opposition from "Wise Users" and academics is marginalized to the libertarian right and the evangelicalfundamentalist bloc and has little or no penetration within mainstream U.S. churches and

temples. Recent news articles, however, suggest some influence within the presidential administration of George W. Bush and in the U.S. Congress.

How far can the new U.S. religious environmental movement led by NRPE really go? Some of the answers to this question obviously require the use of quantitative social science technique, work that has yet to be conducted. A movement that successfully recruits American Jewish and Christian congregations would be a considerable addition to the secular environmental movement, but there is little evidence to suggest that this recruitment has or will take place. While the thousands of “green” congregations and associated environmental groups now in existence certainly denote successful organizing within the churches, environmental thinking has not become a way of life for those congregation members not directly involved, and is certainly not a major factor in voting behavior for the great majority of American Christian and Jews touched by the movement.

NRPE is thus not an arm of secular environmentalism, but rather a different kind of movement, perhaps, its leaders argue, more analogous to nineteenth-century church concerns with slavery, or twentieth-century concerns with civil rights and the war in Vietnam. The movements for abolition, civil rights, and to end the Vietnam War were elevated to public prominence first by direct action, the work of more extreme activists, before mainstream religions were willing to get involved. When they did, a revision of ordinary morality took place in the churches, which allowed mainstream politicians outside the activist cause to embrace the aims of the movement without losing votes. This may be the pathway that allows this movement to succeed.

Native American Languages (North America)

Indigenous peoples of the continent now called North America have suffered enormous losses under the processes of colonial assault and exploitation: the loss of population at the rate of 90 percent for most areas through the interplay of disease and genocide; the theft of the land and its resources, and destruction of animal species and plant habitats; the loss of traditional lifeways through aggressive assimilationist policies, including the loss of ceremonial vitality through systematic and legal proscription via government agencies and church institutions. All of these have been devastating for indigenous nations. Yet the greatest loss is perhaps only now coming into full effect. After withstanding an intensive siege throughout recent centuries the indigenous languages are now quickly falling silent in rapid succession. With them the indigenous cultures, religions, and the environments they inhabit are, once again, and in some ways more so than ever, in peril. The intricate knowledge of local ecosystems and the complex relations to the environment that grow out of indigenous languages are now jeopardized.

Whereas as much as half the world's known languages were lost over the previous 500 years of colonial expansion, the losses are now accelerating dramatically. The next twenty years could witness the demise of half of the world's approximately 6700 languages. A century from now, at present rates of loss, as much as 90 percent of human linguistic diversity will succumb to silence. Globally, one language disappears on average every two weeks according to the United Nation's education and science arm, UNESCO. Of course, the great majority of these endangered and disappearing languages are carried by indigenous peoples. Within the present area of the United States, over 73 percent of the remaining indigenous languages are spoken only by the grandparents' generation. Numbers such as these give stark clarity to the extremely limited time for addressing the global language crisis. And the magnitude of the loss of language for an indigenous heritage must be measured by the immense value of language to a multitude of diverse and rich cultures in their complex relations to their living environment. As Chris Jocks, a Mohawk scholar from Kanawake in southeastern Canada, has written:

There is no way to decide which is more devastating: the loss of practical knowledge in such realms as history, natural science, and social organization; the loss of stories and jokes and all the richness of human experience they carry; the loss of skills of perception

trained by Indigenous linguistic structures; or the loss of depth in our relationships with Other-than-human beings (Jocks 1999: 219).

To appreciate the difficulties involved in keeping alive the linguistic and cultural heritage of indigenous nations requires an understanding of the genocidal assault they have sustained. Waves of physical decimation were followed by generations of systematic cultural genocide in which enormous resources were expended in efforts to break traditional continuity between the culture-rich elders and the youth who were taken out of their homes and sent to government and church boarding schools and later public education facilities. The Dawes Allotment Act of 1887, which divided lands previously held in common by native nations into individual holdings, was devastating to indigenous languages. It led to the isolation of the remaining indigenous-language speakers in many communities, leaving them separated by miles of rural countryside.

Land Loss and Language Loss

This link between land and language loss represents more than just another indicator of the social and economic assault on traditional communities. For indigenous peoples the deep life-connection between their languages and their land are real and powerful. Grounded in the conviction that knowing the Earth's own language is essential for sustaining life, Jeanette Armstrong of the Okanagan in British Columbia has insisted:

The language spoken by the land, which is interpreted by the Okanagan into words, carries parts of its ongoing reality. The land as language surrounds us completely, just like the physical reality of it surrounds us. Within that vast speaking, both externally and internally, we as human beings are an inextricable part – though a minute part – of the land language.

In this sense, all indigenous peoples' languages are generated by a precise geography and arise from it. Over time and many generations of their people, it is their distinctive interaction with a precise geography which forms the way indigenous language is shaped and subsequently how the world is viewed, approached, and expressed verbally by its speakers (1998: 178–9).

Indigenous languages intertwine with the living environment at many levels. The languages connect an intricate web of complex relations between land, climate, plants, ceremonies, social structures, and living history in particular landscapes. For many communities certain classes of stories are only to be uttered during designated seasons of the year. Snow should be on the mountains for the Diné of Arizona and New Mexico to relate bear stories. The utterance of indigenous speech is understood to effect the physical world. Traditional Kiowas of the southern plains rise early to pray the sun up. Traditional hunters of the northeast utter ceremonial words of thanksgiving in order to ensure a relationship of reciprocity and a continued supply of game animals. Careful sensibilities of observation are carried in the languages. For the Micmac of Newfoundland and Labrador, names ascribed to trees change from season to season as

the sound of the wind blowing through them shifts over time (Nettle and Romaine 2000: 16). Even the sense of the physical self is mediated by the landscape and articulated through language. For Wintu speakers of northern California, the “right” arm is not identified according to an orientation taken from the center of the individual human body. Instead, it is spoken of in terms of the person’s orientation to the surrounding land, so that the “west arm” and the “east arm” could both refer to the same right arm as one changes directions within the landscape (in Hinton 1994: 58).

A complex cultural interplay between geography and indigenous language can also be expressed within a society. The language of the Western Apache in the American southwest situates them within a landscape and traditional history through the naming of the land, which acts as a guide to appropriate moral and social behaviors. This is a cultural world born by a language in which storytellers are hunters using stories about the names in the land to stalk their fellow community members. As Lewis Benson expressed it:

I think of that mountain called *Tsée Ligai Dah Sidilé* (White Rocks Lie Above In A Compact Cluster) as if it were my maternal grandmother. I recall stories of how it once was at that mountain. The stories told to me were like arrows. Elsewhere, hearing that mountain’s name, I see it. Its name is like a picture. Stories go to work on you like arrows. Stories make you live right. Stories make you replace yourself (Basso 1996: 38).

Endangered Languages, Endangered Species

Scholarly attention to linkages between species endangerment and patterns of language loss among indigenous peoples took shape in the early 1990s – including the terminology of language endangerment itself. The academic discussion was spurred by an article from Michael Krauss. He classified those languages that were no longer being learned by children in the home as moribund, a condition beyond endangerment, “for, unless the course is somehow dramatically reversed, they are already doomed to extinction, like species lacking reproductive capacity” (Krause 1992: 4). He provided viability statistics for Alaska, where only 2 of 20 languages are being learned by children, leaving 90 percent of the languages moribund. For the entire USA and Canada he listed over 80 percent of the 187 indigenous languages as already moribund with no natural means of reproducing themselves. Even

Navajo, which had over 100,000 speakers a generation ago, he concluded, had “an uncertain future” (Krause 1992: 7). The situation remained uncertain in 2004; only about 30 percent of Navajo children began their formal education speaking Navajo. The patterns of language retention among other indigenous nations suggests that all indigenous languages within the boundaries of Canada and the U.S.A. are endangered.

Krauss went on to compare the pattern of global language loss to that of endangered and threatened mammal and bird species, where the percentages considered to be in

danger of extinction were much lower. He contrasted the lack of attention to indigenous language endangerment to the greater levels of public concern for endangered species and argued for increased valuing of human languages:

Any language is a supreme achievement of a uniquely human collective genius, as divine and endless a mystery as a living organism. Should we mourn the loss of Eyak or Ubykh any less than the loss of the panda or California condor? (Krause 1992: 8).

Scholarly interest in relationships between language and natural environments has expanded and includes some aspects of the new sub-field, ecolinguistics. In 1996 the non-governmental organization Terralingua was founded to preserve linguistic diversity and explore connections between linguistic and biological diversity. Though some scholars remain dismissive of connections between language loss and environmental degradation – the majority working in this area hold that there is a strong correlation between ecosystem decline and the erosion of indigenous cultures and their religions – and that the vitality of languages is an especially important variable.

The most compelling discussion to date has been presented by Daniel Nettle and Suzanne Romaine, who contend that the connections of indigenous peoples to environments are intense, ancient and unique. They demonstrate the remarkable overlap between regions with high concentrations of biological and linguistic diversity, and they argue that losses for both domains are due to the same underlying causes, namely, powerful forces controlled by social elites. Their expansive discussion of “biolinguistic diversity” foregrounds the detailed classification systems demonstrated by many indigenous languages, which provide “verbal botanics” useful for categorizing the natural environment. They argue that indigenous languages offer potentially rich contributions to scientific theories and to such problems as land management, marine technology, plant cultivation, and animal husbandry. They offer a sophisticated theory of the “ecology of language” where a language is understood to be enmeshed within a social and a geographical matrix that can be valuable to the project of sustainable development:

There is now widespread agreement that the problem of sustainable development is more likely to be solved if indigenous systems of knowledge and languages are valued and brought into play . . . Delicate tropical environments [for example] must be managed with care and skill. It is indigenous peoples who have the relevant practical knowledge, since they have been successfully making a living in them for hundreds of generations. Much of this detailed knowledge about local ecosystems is encoded in indigenous languages and rapidly being lost (Nettle and Romaine 2000: 166).

Indeed, the demise of any indigenous language represents a double loss. At a primary level, language loss severely jeopardizes the irreplaceable storehouse of richly detailed knowledge of plants, soils, terrains, sacred loci in the land, animal behaviors, and patterns of fish, bird, and insect life. Such knowledge has been developed and refined for thousands of years and integrated within a gendered human society in relation to the larger cosmos, seasons, and spirit worlds. Beyond this loss of knowledge associated with particular plants and local environments, which have been meshed with superb technologies, sophisticated medicinal practices, and elaborate social structures and

religious traditions, the very process of indigenous knowledge development has been arrested.

Beginning in the waning years of the twentieth century, native nations took up the challenge to revitalize their languages. By so doing they endeavor to keep alive their unique and fertile epistemologies and thus their languages' essential role in the ceremonial life of their communities, as well as in promoting ecological knowledge and environmentally sustainable lifeways.

Native American Spirituality

Native American spirituality is a hybrid form of religion that is clearly different from the highly specific beliefs and rituals that identify particular tribal religions and distinguish them from one another. Native American spirituality is a pan-Indian phenomenon involving native peoples from many different tribes. It is also a religious movement that thousands of people without any native ancestry identify with. Because of its syncretic character and fairly recent origin, Native American spirituality is sometimes regarded as inauthentic. However, most scholars of religion recognize that living religions are always changing and subject to reinterpretation and reinvention. From that perspective, Native American spirituality is as “authentic” as many other forms of religious life.

Native American spirituality first emerged in the nineteenth century as native people from different cultures found new areas of common ground, and as reverence for nature developed as an important force within both native and Euro-American cultures. Native religious leaders and non-native admirers alike pointed to an underlying spirituality of nature characteristic of all Native American cultures. This emphasis on a common nature spirituality underlying different native religions contributed to cooperation among native groups and challenged Western tendencies to view native religions as forms of heathenism that ought to be left behind if not actively suppressed. During the late twentieth century, respect for Native American spirituality became widespread as part of a general increase in ecological sensitivity throughout American religious life.

The historical development of Native American spirituality can be described in terms of an evolving conversation between Native Americans and Westerners about religious respect for the Earth. In the early nineteenth century, the Shawnee leader Tecumseh referred to the Earth as his mother in an effort to explain to a U.S. Army officer his resistance to the seizure of Indian lands and his understanding of the difference between instrumental Western ideas about land and native ideas about the spiritual powers inherent in local environments and forces. Later in the century, the Sahaptin leader Smoholla described the Earth as the mother of mankind and spoke against forcing native groups in the northwest basin to plow arid land for farming with figures of speech that pictured plowing the Earth as tearing a mother’s bosom and digging under her skin for bones. The eloquence of these Indian leaders caught hold among Euro-Americans drawn to Romantic ideas about nature as a source of religious inspiration as well as among Native Americans struggling to define the strength and beauty of their traditions in the context of Euro-American colonization. Eager to

recast Romantic ideas into an American idiom, American writers and artists such as Henry David Thoreau, George Catlin, and Edward Westin portrayed the Indian's relationship to the Earth as a powerful symbol of human virtue, simplicity, and purity. In the twentieth century, under the influence of European ideas about primitive religions as an antidote to the alienation from nature associated with Western civilization, both Indians and whites looked back to traditional native cultures as repositories of ancient wisdom and vitality. In the context of this search for the recovery of spiritual meaning, Mother Earth became a full-fledged goddess revered by neo-pagans of Euro-American ancestry as well as by many Native Americans themselves.

The Oglala holy man Black Elk and his interpreters played important roles in the development of Native American spirituality in the twentieth century. John Neihardt's popular recounting of Black Elk's visions and life journey in *Black Elk Speaks* countered any idea that native religions were simple. It also confirmed Romantic belief in the fundamental opposition between native reverence for nature and Western commercialism and greed. As the original transcripts of Black Elk's story show, Niehardt exaggerated Black Elk's sense of despair about the survival of native cultures.

In the 1960s, *Black Elk Speaks* served as an important source of religious education for participants in the American Indian Movement, many of whom had grown up in urban environments without much traditional religion. Because many of these Indian readers had ancestral ties to groups other than Sioux, *Black Elk Speaks* contributed to the development of a pan-Indian spirituality, grounded to a considerable extent in Sioux beliefs as Black Elk and his interpreters reconstructed them.

Black Elk also figured importantly in the thought of people without native ancestry who wanted to incorporate Native American beliefs about spiritual forces within nature as part of their own religions. Hyemhyosts Storm, Jamake Highwater, Sun Bear and several other New Age writers caused controversy and resentment by claiming Native American identity and promoting themselves as teachers of Native American spirituality; others inspired by native reverence for nature made no such claims.

Black Elk's ideas about nature appealed to many Christians seeking environmentally sensitive interpretations of their own religious tradition. The discovery that Black Elk had been a Roman Catholic catechist as well as an Oglala holy man contributed to Christian appropriation of his ideas, and Black Elk himself viewed native spirituality as a needed supplement to Christianity. In identifying the rituals of the sacred pipe as seven rites in which divine presence became manifest in nature, he reconstructed Sioux religious practice in a way that paralleled and enhanced the sacraments of the Catholic Church. Black Elk's conceptualization of Native American spirituality, along with his respect for Christianity, helped inspire the greening of American Christian thought in the late twentieth century and increased interest in and respect for Native American spirituality.

Natural History and Indigenous Worldviews

Beliefs about the relationship between humans and the natural environment are expressed through worldviews. A worldview is a mechanism *system or complex of ideas* through which the world makes cultural sense. As deeply seated belief systems, worldviews illuminate the ecological priorities and concepts of various peoples.

All traditional societies that have managed resources well over time have done so in part through religion and worldview – by the use of cultural symbols that reinforce particular management strategies. Many of these religious beliefs and cultural practices, while seeming unscientific, are based in part on long and careful observation of nature.

Natural history is the integrated study of the relationships between the biological, the physical, and the sensual (personal). It integrates keen observation of the natural world with an acknowledgement – indeed, an affirmation

– that humans are sentient beings. Hence, natural history mixes the scientific perspective with elegant, heartfelt and intelligent responses to science. It mixes the social sciences and humanities with ecology, and it entails a breaking down of the normative barriers between the scientific and the poetic. It blends tradition with innovation and engages us in informed discussions of conservation efforts to reveal useful approaches to our environmental crises. Natural history personalizes science and enlivens it with meaning; a naturalist is one who has the eyes of a scientist and the vision of a poet; one who confronts evocative ideas, and is respectful of both facts and mysteries. By taking an ecological approach to the study of worldviews, we can gain greater understanding of critical interactions between humans and the natural world.

Worldviews are situated in the landscape, and indigenous cosmologies function as storehouses of critical knowledge of the natural world. At the heart of research on worldviews and natural history is an exploration of creation stories and how they inform and explain cultural understanding of the more-than-human world. Such research strives to result in ethnographic information and theoretical explication of some cultural understandings of ecological relations.

Mythologies provide explanation as to why the physical world is the way it is. The Cahuilla people of the Sonoran Desert in southern California, as one example among thousands, have elaborate myths detailing how the landscape of their territory came to be. In Cahuilla stories, Coyote is held in esteem because he is said to have brought mesquite seeds down from the mountains. Mesquite seedpods were a staple food for traditional Cahuilla, and continue to be an important plant, and because of Coyote's

actions Cahuilla held coyotes sacred and never killed them. The Cahuilla version of how mesquite colonized the arid valleys is likely a literal one; because coyotes feed on mesquite beans but do not digest the seeds, it is likely that the plant was spread from the higher elevations to the lowlands in coyote scat.

All traditional societies have myths that explain why things are the ways they are. Ingeniously encoded in these symbolic systems are often profound understandings of ecological relationships. Indigenous worldviews, as explicated through myths, are often extremely sophisticated and of considerable practical value.

Numerous scholars have overlooked the ecological dimension of cosmologies or worldviews, while writing at length about native understandings of “supernatural” entities. We can attribute much of this oversight to a modern worldview that holds that natural world is largely determinate and mechanical, and that that which is regarded as mysterious, powerful, and beyond human ken must therefore be of some other, non-physical realm above nature (i.e., supernatural). But in oral indigenous cultures, the physical world itself is the dwelling place of the gods, of the numinous powers that can sustain or extinguish life.

Worldviews reflect, among other things, attitudes toward nature. These attitudes are expressed through conceptions, uses, and manipulations of the land. Aspects of cultural ecology are expressed through belief systems, and investigations of the intersection between the external world and cultural constructions of that world are providing fruitful insights into the relationship between nature and the human mind.

Natural History as Natural Religion

In my opinion, the seminal document that spawned the academic exploration of environmental ethics – and dialectically, the greening of religion, as I latterly explain – was “The Historical Roots of Our Ecological Crisis,” by Lynn White, Jr., published in *Science* in 1967. I was especially primed to resonate with its message. I grew up in a lower-middle-class neighborhood in Memphis, Tennessee, the son of a poor artist, struggling to raise a family and find time to paint on an instructor’s salary in a municipally funded art school. He took me to the Unitarian Church – there was then only one in Memphis – because it offered freedom of belief and welcomed everyone from Enlightenment-style deists to Emersonian Transcendentalists to Theosophists, which was my father’s peculiar and ardent persuasion. All my classmates seemed to be Southern Baptists and I was, in their opinion, a damned (literally) infidel – worse even than a Catholic – the object of pity, ridicule, and contempt. Thus my childhood and teenage relationship to the only Christianity I then knew was problematic at best and painful at worst. The weekend Unitarian-youth community was my refuge from weekday religious persecution and social ostracism. When I was a highschooler I wanted to become a Unitarian minister (and shortly found what I was truly called to do in my first philosophy course during my sophomore year of college). So, when I read “Historical Roots” as a young philosophy instructor, I was very ready to believe that the ultimate blame for our ecologic crisis lay at the doorstep of Christianity.

In retrospect, that claim is of course both jejune and cavalier. Its lurid brashness, however, obscured another, far more general claim worthy of serious consideration. It must have registered on me back then – the late 1960s – only subliminally because it was fully a quarter-century later that I began consciously to ponder critically its significance. Four or five times throughout the infamous article, White reiterates the claim that what we do depends on what we think, and thus that if we are to effect any lasting changes in what we do in and to the natural environment, we must first effect fundamental changes in our environmental attitudes and values. This then became for me personally a mandate and an agenda – and, I dare say, it was for many of the other “pioneers” (as we are sometimes called, though the irony is not lost on me) of environmental philosophy. Only we philosophers and theologians (for White had also equated “beliefs about our nature and destiny” with “religion”) could save the world from destruction by the juggernaut of “modern technology,” which, in White’s opinion, was forged in the crucible of Western Medieval Christendom. And Christianity,

according to White, “is the most anthropocentric religion the world has seen” (with the minor exception, he curiously notes, of “perhaps” Zoroastrianism). That was the mandate. The agenda was twofold.

First, raise for critical attention the rest of the intellectual legacy of the West from the new perspective of environmental crisis. White himself portrayed Greek and other forms of European paganism as nature-friendly, but the Olympic religion of ancient Greece (and copycat Rome) was long dead – whether nature-friendly or not is of course moot. The Greco-Roman legacy that shaped modern Western civilization is the legacy of ancient Greek and Roman philosophy and proto-science, the legacy of Plato and Aristotle, of Democritus and Lucretius. A virtual cottage industry of critical environmental philosophy sprang up almost overnight. In addition to Plato and Aristotle, Descartes was routinely hacked and flayed, as were a number of other historically influential thinkers in the Western canon.

Second – and much more ambitious, if not utterly hubristic – think up a new nature-friendly philosophy

(and perhaps a sympatico new religion) and somehow infuse it into the cultural ether, so as to transform popular consciousness in the West. How preposterous! But that’s how it all started and, amazingly, the project is still ongoing and, indeed, gaining momentum and enjoying some modest success. But it is a tricky business. Just how do you go about thinking up a new nature-friendly philosophy (and religion)? Not from scratch; to be convincing such a philosophy must have continuity with the past and must seem inevitably to flow – however dialectically and revolutionarily – from the past into the present and future with the force of a historic tide. Just as futile as starting from scratch, some environmental philosophers were at first inclined to take a neglected past philosophy off the historical shelf, burnish it up, and try to sell it anew. If we all became Heracliteans, Spinozists, Whiteheadians, Heideggerians . . . our ecologic crisis could be overcome. This approach to phase two of the environmental philosophy agenda, set by White, was perhaps presaged by his own suggestion – which he quickly and wisely rejected as culturally unrealistic – that if we all became Zen Buddhists our ecologic crisis could be overcome.

I myself proceeded with this forward-looking and creative – as opposed to backward-looking and critical – phase-two agenda of environmental philosophy on the basis of an interesting and portentous relationship of cognitive domains in the two most profoundly dialectical and revolutionary moments in the intellectual history of the West. Natural philosophy is first philosophy; it precedes and appears to precipitate changes in moral philosophy.

During the sixth and fifth centuries B.C.E., in ancient Greece, the first philosophers, the PreSocratics, mainly asked and boldly answered questions about nature. What is the stuff of which the world is composed? What forces move that stuff around? What are the laws of nature which govern those motions or otherwise give order to the world? The most elegant and persuasive answers to these questions were provided by the atomists. In the late fifth century, natural philosophy (along with other emergent

phenomena, such as urbanization and democratization) had created an ethical and social crisis that diverted a considerable portion of the intellectual capital of philosophers into moral and political questions. The nearly universal moral and political philosophy of the time (Socrates seems to have been the only notable dissenter) was the generic social contract theory – each “sophist” playing a specific variation on this common theme. At the core of social contract theory is egoism and enlightened self-interest. The individual human agent is, as it were, a social atom. The inertial motions of the physical atoms cause them to collide chaotically with one another in Euclidian physical space; analogously the desires and aversions that move the social atoms cause them to collide chaotically with one another in the amoral and pre-political “state of nature”

(or Euclidian social space). And, although here the analogy is imperfect, just as (perhaps God-ordained) natural laws govern the behavior of the physical atoms, so ethicopolitical laws were humanly ordained to govern the behavior of the social atoms – to bring them into a political order, and to reduce the hurtful and destructive collisions among them that occur in the emptiness of pre-contract social space.

Following the lead of Socrates, Plato and Aristotle rejected atomism (in natural philosophy) and the social contract theory (in moral philosophy) in favor of teleology (in both domains of philosophy, natural and moral). Their influence lingered over Western thought for more than a thousand years. The Modern “scientific revolution” initiated by Copernicus and completed by Newton revived atomism in Western natural philosophy. And, lo and behold, that was followed, as night follows day, by the revival of the social contract theory in Western moral philosophy, most notably by Thomas Hobbes, John Locke, and Jean-Jacque Rousseau. In the early twentieth century a second scientific revolution occurred. And although contemporary physicists still blithely talk about “particles,” the ancient and Modern classical atom, conceived by Democritus and Newton as a solid materiomathematical corpuscle that fills a tiny volume of space, is as dead an idea in contemporary natural philosophy (now coincident with the high theoretical end of the natural sciences) as is the idea of phlogiston. In its place we have what? Quarks? Super strings? I’m not sure anyone yet knows, but it seems that the ultimate stuff of the world is more energetic than material and more internally related (or systemic) and mutually defining than externally related and reductive.

Correlative to – or at least coincident with – the emergence of the new physics at the dawn of the last century was the emergence of ecology. Ecology, too, offered a picture of middle-sized organic nature – the scale at which we human beings live between the micro-scale of dancing electrons and photons and the macro-scale of fleeing galaxies and black holes – that is material to be sure, but organized systemically by the flux of solar energy. And the living components of ecosystems also seem to be internally related and mutually defining; certainly they are mutually dependent.

Here we have the makings of a new worldview, a new natural philosophy. If the historical pattern that has characterized Western thought from the beginning holds through the current revolutionary era – change in moral philosophy following, after about a century’s lag time, change in natural philosophy – what will the moral phi-

losophy of the twenty-first century be like? We shall have to wait and see how it fully and unpredictably unfolds. I think, however, that contemporary environmental ethics, which developed exponentially over the last quarter of the twentieth century, is the harbinger of things to come – to the extent that it is informed by ecology and evolutionary biology. I myself have followed the lead of the person who seemed clearly to grasp all these things before anyone else, Aldo Leopold.

Leopold even anticipated White's blaming the Judeo-Christian worldview for our contemporary environmental malaise – a dubious distinction. In the foreword to his *chef d'oeuvre*, *A Sand County Almanac*, Leopold writes "Conservation is getting nowhere because it is incompatible with our Abrahamic sense of land. We abuse land because we regard it as a commodity belonging to us. When we see land as a community to which we belong, we may begin to use it with love and respect." The Whitean despotic reading of the biblical worldview surfaces again in *Sand County's* climactic essay, "The Land Ethic": "Abraham knew exactly what the land was for: it was to drip milk and honey into Abraham's mouth."

Opposed to this caricature of the Judeo-Christian worldview is the evolutionary-ecological worldview, the representation and implications of which is the principal burden of the *Almanac*. From an evolutionary point of view, *Homo sapiens* is just another animal – the most recent and perhaps the most complex and sophisticated of evolution's random mammalian experiments, but just another animal nevertheless. We are therefore a part of nature, not set apart – for better or worse – from nature, from an evolutionary point of view. From an ecological point of view the human economy is but a small and utterly dependent subset of the economy of nature; and the human community is embedded in the larger biotic community.

The stage is thus set for the derivation of the land ethic. Darwin himself, in the *Descent of Man*, had explained how ethics could have arisen among *Homo sapiens* through natural selection. Human beings are quintessentially social animals. Primitive human societies could not have endured if the internecine competition among their members were untempered and if their members were disinclined to cooperate in provisioning and defending themselves. Individuals who were incapable of social integration and cooperation were expelled from society to fend for themselves as solitaries. Lacking the increased efficiency of cooperative gathering, hunting, and defense, they quickly succumbed to starvation or predation. Thus their anti-social tendencies were winnowed from the human gene pool. When the naturally selected social instincts and sympathies were augmented by acute intelligence, vivid imagination, and true language, ethics proper eventually evolved. As Darwin writes, "No tribe could hold together if murder, robbery, treachery, were common; consequently such crimes are branded with everlasting infamy, but excite no such sentiment beyond these bounds." From a Darwinian point of view, ethics is, as it were, the glue that holds human societies together.

Next Darwin envisioned a gradual evolution of human societies and the ethics correlative to them by the controversial process of group selection. Larger, better organized

groups of *Homo sapiens* would out-compete smaller, less well-organized groups in the now collective or corporate struggle for existence. Clans thus merged into tribes, tribes into national confederacies, these eventually merged to form nation-states, and now – under our very noses – supranational entities, such as Europe and NAFTA are evolving, loosely integrated by transportation and communications technologies and very loosely governed by such multinational parliaments as the United Nations. Corresponding to each of these stages in social evolution is a corresponding stage in ethical evolution. Corresponding to the nation-stage stage of social evolution is the emergent virtue of patriotism. Corresponding to the emergence of the global village is the declaration of universal human rights. As Darwin summarized it, “As man advances in civilisation, and small tribes are united into larger communities, the simplest reason would tell each individual that he ought to extend his social instincts and sympathies to all the members of the same nation, though personally unknown to him.” Darwin even anticipated the present stage of ethico-social evolution: “This point being once reached there is only an artificial barrier to prevent his sympathies being extended to all the nations and races.”

To cook up the land ethic, Leopold simply took over this Darwinian recipe for the origin and development of ethics, correlative to the origin and development of society or community, and added an ecological ingredient. Ecology represents plants and animals that live together on a landscape (or in a waterscape) as members of a “biotic community.” The British ecologist, Charles Elton, a friend of Leopold’s, had most vividly portrayed the biotic community as an economic analog of human society. Just as we have division of labor and specialization in the human economy – doctors, lawyers, butchers, bakers, candlestick makers – so in the economy of nature, evolution has sorted producers, consumers, and decomposers of the biotic community into myriads of professions or niches. If, following Darwin, our response to perceived community membership is an extension of our social instincts and sympathies – an extension in some modified form of our ethics – then general recognition of the existence of a biotic community should be followed by a land ethic. As Leopold succinctly put it, “All ethics so far evolved rest upon a single premise: that the individual is a member of a community of interdependent parts.” Ecology, Leopold goes on to note, “simply enlarges the boundaries of the community to include soils, waters, plants, and animals, or collectively: the land.” The upshot is “a land ethic [that] changes the role of *Homo sapiens* from conqueror of the land community to plain member and citizen of it.” At the heart of such an ethic is “respect for . . . fellow-members and also for the community as such.”

Elton had characterized ecology as “scientific natural history.” In addition to a land ethic, Leopold also derived spiritual sustenance from ecology and evolutionary biology. One might fairly say that *A Sand County Almanac* is a book of scripture for a new religion of natural history. Certainly the rhetorical devices of *Sand County* are markedly biblical. Its second most famous essay, “Thinking Like A Mountain” records a road-to-Damascus-like experience. In it Leopold and his Forest-Service comrades kill a she-wolf and arrive in time to watch a “fierce green fire dying” in her eyes. Leopold “saw

something new . . . in those eyes – something known only to her and to the mountain.” This knowledge forms the foundation of an inevitable question, but a question that Leopold’s artistic sensibility requires him to leave his readers, whether consciously or subconsciously, to ask for themselves on behalf of the dying wolf: “Why persecutest thou me?”

In other passages, the contours of Leopold’s religion of natural history are more explicit. “Marshland Elegy” is about evolutionary time. “A sense of time lies thick and heavy on such a place” as a crane marsh. Here he confronts directly what seems to many to be one of two main obstacles to the theory of evolution being taken as a spiritual, indeed a religious resource.

An endless caravan of generations has built of its own bones this bridge into the future, this habitat where the oncoming host [a word loaded with religious significance] again may live and breed and die. To what end? Out on the bog a crane, gulping some luckless frog, springs his ungainly hulk into the air and flails the morning sun with mighty wings. The tamaracks re-echo his bugled certitude. He seems to know.

I once argued with another Leopold scholar about the meaning of this passage. He thought that Leopold was actually stating that the answer to this question was for the crane to *know* and for us to find out. But I think that Leopold is challenging – in his typically ironic, understated style – the importance of the question itself. Evolution is resolutely anti-teleological. There is no end, goal, or purpose at which it aims; hence to this and the related questions, “Why are we here?,” and “What is the meaning of life?” the answers are “For no reason,” and “There is none,” respectively. If, to live fully and robustly in the present, cranes need no answers to such questions, then why should we? Further, because evolution *per se* may have no goal does not imply that we cannot select lofty ends to give transcendent meaning to our personal and communal lives.

The other obstacle to a religion of natural history thrown up by the theory of evolution is the apparent cosmic demotion of humanity from a form of being created in the image of God – “half animal, half angel,” in

John Muir’s turn of phrase – to simply and utterly an animal. Leopold confronts this obstacle indirectly throughout the whole of *Sand County*, in which humankind’s animal and plant fellow members of the biotic community are portrayed with affection and respect for their dignity and particular virtues. More directly confronting it in “On a Monument to the Pigeon,” Leopold writes:

It is a century now since Darwin gave us the first glimpse of the origin of species. We know now what was unknown to all the preceding caravan of generations: that men are only fellow-voyagers with other creatures in the odyssey of evolution.

The use of “odyssey” here suggests once more an ateleological voyage and “only” addresses the present point. Should “this new knowledge” be an occasion for depression and spiritual despair? Not at all, “it should have given us, by this time, a sense of kinship with other creatures; a wish to live and let live . . .” After all, being “lord man” – I echo Muir again – is a lonely job. And given what we learn about many of our fellow-voyagers in the odyssey of evolution from all that we have read in the *Almanac*,

far from being debased, we are gladdened and ennobled by our kinship with them. And this new knowledge should also have given us, finally and most importantly, “a sense of wonder over the magnitude and duration of the biotic enterprise.” What a paltry world, temporally speaking, we have inherited from the Judeo-Christian tradition, one only some 6000 years old. Think about it! From the point of view of the theory of evolution, life has been metamorphosing and colonizing and transforming Earth for

3.5 billion years. We are its latest manifestation and carry within our DNA the genetic legacy of this immense journey. In “On a Monument to the Pigeon,” Leopold, despite all this, agrees with traditional Judeo-Christian belief that human beings occupy a privileged place in the cosmos. The pigeon in this essay is the extinct passenger pigeon and the monument mourns its demise. “Had the funeral been ours,” Leopold soberly reflects, “the pigeons would hardly have mourned us. In this fact, rather than Mr. Dupont’s nylons or Mr. Vannevar Bush’s bombs, lies objective evidence of our superiority over the beasts.” We are superior to other creatures, Leopold ironically suggests, not because we have the technological power to fulfill the biblical injunction to subdue them and the Earth itself, but because we have the moral capacity to include them within the compass of our ethics.

Meanwhile, Lynn White seems to have presented environmentally concerned members of the Judeo-Christian community with a hard choice: their environmentalism or their religion. In White’s own words, the choice is “to find a new religion” – such as the then-popular Zen Buddhism – “or rethink our old one.”

Choosing the latter is by far the more realistic, not to mention the more palatable course. White himself recommends the (heretical?) theology of Saint Francis of Assisi as a start for rethinking our old religion. And in the last sentence of his article, he proposes that Francis be named the patron saint of ecologists, which, as I recall, Pope John Paul has now done. However, the actual response was not to make Christianity over in the mold of Francis’ theology – official designation of Francis the patron saint of ecologists notwithstanding. Rather, it was to challenge White’s reading of the Bible and, from a more plausible alternative reading, to develop an environmental ethic out of the same biblical resources that White had lambasted. The result is what I call the Judeo-Christian Stewardship Environmental Ethic.

Here are its basic elements. In several passages in Genesis prior to those (1:26–28) that White had focused on exclusively, God declares his daily acts of creation to be good. That can be read as declaring that the creation has intrinsic value, in the jargon of secular environmental ethics. Moreover, what is declared good (or in possession of intrinsic value) are various wholes, not individuals – species not specimens, whales not Moby Dick or the one that swallowed Jonah. In the jargon of secular environmental ethics, the Judeo-Christian Stewardship Environmental Ethic is thus holistic. And the good (or intrinsically valuable) creation in Genesis is represented as bringing forth abundantly and teeming with life – fishes in the sea; fowl in the firmament; and cattle, creeping things, and other beasts of the field being fruitful and multiplying, *each after its kind*. We may, therefore, in good conscience harvest the surplus and live on the

usufruct of the creation as long as we preserve a fitting abundance of each kind. Then in chapter of 2 of Genesis (ignoring the fact that there we find another and substantially different and independent account of creation) key passages indicate that man (for exegetical purposes represented by Adam) is put into the Garden of Eden (which we may construe to represent the whole creation) to dress and keep it – that is, to be its steward. Now with these passages as book ends, we return to those that White made seem so damning environmentally. We may interpret man’s created exclusively in the image of God as bestowing unique responsibility as well as unique privilege. And we may interpret God’s giving man “dominion” over the Earth as a mandate for responsible management – that is, stewardship – not as a mandate for despotic exploitation and destruction. Now, finally, the Fall, described in Genesis 2, is invoked to mute God’s command in Genesis 1 to go forth and subdue the Earth. Whatever stewardly thing God meant by that, fallen man has perverted and depraved it.

Thus did White dialectically spawn the greening of religion. If so powerful and so persuasive (to believers in its premises, for example, that God exists and created the world) an environmental ethic could be teased out of the very texts that White had made seem so environmentally anathematic, surely environmental ethics could be teased out of the sacred texts of other religions. Judaism is already covered, because the texts in question belong to the Hebrew Bible. Islam is in the same Abrahamic family of religions, and, sure enough, various passages of the Qur’an can be given a stewardship spin. Hinduism and Buddhism share the concept of *ahimsa*, or non-injury to all living beings. In the Chinese traditions of Confucianism and Taoism, we find such nature-friendly concepts as *fengshui*, *wu wei*, and the injunction to follow the *Dao*, or way of nature. Common to American Indian and other indigenous worldviews is a sense of embeddedness in and dependence on an animate and communicative nature – which people must respect, in order to continue to be blessed by its generosity of spirit.

It would be nice to think that the current greening of these and many other religions were a spontaneous and wonderfully coincidental process. But the greening-of-religions phenomenon is, in my opinion, a response to and an implicit affirmation of the more scientific evolutionary and ecological worldview so elegantly and attractively expressed by Aldo Leopold. If it weren’t for ecology we would not be aware that we have an “ecologic crisis.” If it weren’t for the theory of evolution we would be both blind and indifferent to the reduction in global biodiversity. The world’s newly green religions thus tacitly orbit around the evolutionary-ecological worldview. I myself consider most religions – especially the Abrahamic family of religions – to be grounded in primitive superstition and ignorance. (In “Monument to the Pigeon,” Leopold says that such ideas as God creating man in his own image “arose from the simple necessity of whistling in the dark.”) I am, however, immensely grateful for the greening-of-religions phenomenon and have modestly contributed to its development. The religious potential of natural history that Leopold so beautifully tapped but only scarcely explored is perhaps centuries away from its full actualization. But while a true – that is, an epistemically sound and scientifically compatible – religion gestates, people now have to be reached where

they are with some kind of environmental ethic. And for most people, their religion seems to be among the most compelling of motives. If the popular traditional religions can be marshaled to achieve a better fit between global human civilization and the natural environment in which it is embedded, I shall not worry their green apologists, expositors, and theologians with logical and philosophical quibbles.

Natural Law and Natural Rights

The natural law is not a single or simple theory. It is rather a dynamic and diverse tradition, with both philosophical and religiously grounded expressions. Prominent among the historical variety of versions are those of Cicero, Seneca, Aquinas, Hooker, Grotius, Locke, and Blackstone. While embraced in Christian thought by most Catholic and at least some Protestant ethicists, versions of the natural law can also be found among thinkers in other religious traditions, including Confucianism, Judaism, and Islam. The natural law has been used both to condemn and to commend democracy, imperialism, slavery, and gender equality, as well as to sanctify and to vilify some cultural institutions. This diversity reflects how, despite aspirations to moral universalism, particular theories, like all human constructs, are shaped in part by ideological assumptions, religious values, and cultural contexts.

The natural law is not “law” in the sense of socially enacted or declared legal codes, usually called positive law. Nor is it “law” in the sense of the order known to physics, such as the law of gravity or other “laws of nature.” Rather, it is “law” in the sense of a rational order of moral norms and obligations – a presumed “higher” standard that has often provided a basis for challenging and reforming cultural conventions and positive laws.

Similarly, the natural law is not “natural” in the sense of being instinctive or self-evident standards – even though many in the tradition have asserted that humans, as rational and relational beings, appear to have innate moral capacities and inclinations, which can be culturally cultivated or corrupted. Instead, “natural” means that moral values and norms are discerned in “nature,” specifically the human condition. They are also rooted in, rather than externally imposed upon, that condition. Moreover, these values and norms are discovered through “natural” reasoning capacities, without benefit of privileged revelations. In Christian history, the “natural” was often contrasted with the “supernatural.” The “two books” of morality were the “natural” and the “divine” or “revealed” law. The natural was accessible to all rational beings, and the divine – usually clarifying, confirming, and completing the natural – was known mainly through scripture. The two are still seen as complements in some Christian circles, but as alternative, even competing, methods in some inter-religious epistemological controversies.

Natural law affirms a universal moral order. This order is not necessarily built into the structure of the universe, though it is in most religious interpretations. But it is at least built into the essential constitution of humans as rational and relational beings. Against moral relativism, natural law proponents argue that moral norms are factual claims about the human condition and can be evaluated as objectively true or

false. Moreover, in the form of ethical naturalism, which characterizes most, but not all, modern interpretations, natural law ethics depends on empirical data to justify what humans ought to be and to do, in view of the values and virtues, rights and responsibilities, principles and practices that contribute to the well-being of our kind – and one can add, other kinds of creatures – in relationships. Respecting the natural law then is not “following nature” in the imitative manner of Social Darwinists, but rather practicing the norms of our nature, the conditions necessary for interdependent flourishing.

The mainstream of the natural law tradition, especially since the Enlightenment, has followed a rationalexperiential method. Experience is usually defined broadly so that nothing, in theory, is excluded as irrelevant data for ethical reflection (though, in fact, moral conclusions were often deductions from philosophical or theological assumptions about human nature). Reason is not an autonomous source of moral truth in this approach. Instead, moral reasoning is critical reflection on the givenness of experience in search of the norms of our nature. These norms are discovered only gradually and imperfectly through the trials and errors of historical experience. Such discovery depends on receptivity to the fullness of cultural wisdom, including all the empirical disciplines from psychology to ecology, as well as religious insights.

Ironically, however, most natural law theorists have ignored the bulk of nature. Like the rest of Western philosophy and theology, natural law ethics has been predominantly anthropocentric and dualistic, focusing exclusively on human interests and segregating humanity from the rest of nature. It has generally been oblivious to the fact that humans are not only social but also ecological animals, and must, therefore, reflect and act on questions of the good and rightness in our ecological relationships. Viable versions of the natural law, some environmental critics contend, depend on giving due consideration not only to human experience and values but also to the whole of biotic experience and values.

One of the great values of the natural law tradition to its religious supporters is that it can be interpreted as compatible with important affirmations of faith and yet simultaneously independent of these affirmations. In these views, the natural law reflects the moral character of the Ultimate. It is part of the rational, moral order of the universe and humanity’s moral constitution, as created by God. The human capacity for moral reasoning, moreover, is often seen as a dimension of the image of God. The natural law is not an alternative to revelation in this view; it is divine revelation – a natural revelation, open to all rational beings, and, therefore, a “common grace” of God. Still, the viability of the natural law as a universal moral claim depends on logical independence from particular confessions of faith. It must be open in principle to all, whatever their ultimate commitments. In the midst of moral diversity, from imperial Rome to contemporary globalization, the prospect of universal norms universally accessible has always been one of the natural law’s primary appeals. The tradition represents an abiding aspiration, and increasingly a practical necessity, for some shared standards

of global ethics to enable the world's citizens to confront global social and ecological problems in global solidarity.

On the normative substance of the natural law, the tradition has covered a wide spectrum of views. Interpretations of this law have ranged from precise precepts to general principles, like the Golden Rule, and have included a variety of virtues and values, dues and duties. One of the enduring elements from this tradition, however, is the concept of *natural rights*.

These rights are "natural" in the sense that they allegedly inhere in human nature, applying equally and universally to human beings in respect for their intrinsic value. They exist as moral facts independent of, though demanding embodiment in, positive law. Moreover, they are discernible and defensible by reason reflecting on human experience, apart from any special revelations. The term human, rather than natural, rights is more common today, partly to suggest that such claims can be justified on grounds other than the natural law. The two terms, however, are usually synonyms.

Natural or human rights are specifications of just dues. They are strong moral claims for the imperative conditions of human well-being in community. They are not usually absolute; but they can be overridden only for compelling cause and only to the extent necessary for a fuller and fairer balance of rights. Though classical interpretations generally had a narrow range of rights, some modern versions of natural rights embrace a breadth of provisions, including the following categories: basic economic needs, physical security, religious and moral autonomy, educational and cultural development, environmental sustainability and integrity, equal political participation in shaping the common good, legal ground rules for fair and equal treatment, and the common good as a right in itself to a caring, collaborative order and as the precondition of all other rights. Which rights ought to be recognized has been an important but implicit political question, because rights logically define our social responsibilities in justice to one another, locally and globally.

Environmental rights are a newly emerging category of moral entitlements, prompted by diverse forms of environmental degradation. Since humans are not only social but also ecological animals, one of the essential conditions of human well-being is ecological integrity. In an interdependent biosphere, the sustainability of socio-economic systems depends on the sustainability of ecosystems. Indeed, the possibility of realizing every other natural right, environmental advocates argue, depends on the realization of environmental rights. These claims include the right to protections of the soils, air, water, and atmosphere from various forms of pollution; the right to the preservation of biodiversity in healthy habitats; and the right to governmental regulations ensuring the fair and frugal use of environmental goods.

But environmental rights for humans are not sufficient, according to some critics of the natural law tradition's almost exclusively humanistic focus. For those committed to redefining responsible human relationships with the rest of the planet's biota, and grounding those responsible relationships not only in utility and generosity but also in distributive justice, the moral claims of other life forms on the human community

should be considered as part of the natural law and as a demand for fair treatment from moral agents. Most rights theorists acknowledge that some human rights must be restricted to protect the same or other moral claims of other parties in situations of conflicting claims. Thus, if other life forms – as individuals, populations, and species – are goods for themselves or otherwise moral claimants, then limits on the exercise of some human rights are warranted to respect the imperative conditions for the well-being of these life forms. Given current threats to biodiversity, advocates argue, the moral claims of other species for healthy habitats and fair shares of planetary goods demand limits on economic production and human reproduction.

Natural rights are sometimes criticized as impositions of Western values on other cultures. Some expressions may be. Rights proponents must constantly struggle to avoid universalizing cultural relativities. But this grievance is increasingly hard to sustain in most cases in the light of strong international support for these claims, notably in the United Nations covenants. It is a striking fact that oppressive governments regularly condemn human rights as an alien idea, while oppressed peoples commonly appeal to these rights as the central moral standards in their struggles.

Natural Law Party

The Natural Law Party was founded in 1992 as an alternative American political party. Dr. John Hagelin has been the party's candidate for the presidency in each election since 1992.

This party bases its platform on the idea of "natural law" which is described as "the order, the intelligence of the universe." According to Dr. Hagelin, science has shown us that the laws of nature are the orderly principles governing life throughout the physical universe. When people violate these laws, problems such as disease, pollution, and poor quality of life result. The NLP describes a program for bringing modern life into harmony with the laws of nature, using scientific and medical studies as evidence for many of its ideas.

The party takes a strong environmental position. It argues that U.S. dependence on fossil fuels causes greater harm than benefit. The harm comes not only from pollution, which leads to health problems and creates an unpleasant living environment, but also from the waste of money and loss of lives in global conflicts centered on fuel resources. To solve this problem, the party advocates research and development of renewable fuel technologies and increasing energy efficiency. This does not mean giving up the present standard of living, but actually raising it through developing technologies that are in harmony with nature. It also requires educational programs that promote "pollution-free" behavior.

Education is a major focus for the NLP. This is not just a matter of basic school skills, but the broader idea that people must be given the ability to see how their individual lives fit into the natural order so they can make wise choices. Education must enlighten people so that they will want to live in accord with natural law. This will, of course, lead to better care of the environment. It may also lead to better care of the self, greater harmony in families, a more orderly society and, eventually, global peace. Behavior that is in accord with natural law should not create problems for society or the environment.

To teach this awareness, the NLP advocates Transcendental Meditation. This is not prayer directed outward to a god, but a turning inward to find the inner self which is part of the whole unified cosmos. With this awareness of unity, people see themselves as part of society and the world, rather than selfish individuals. The party cites medical studies that show TM practitioners handle stress better and thus are healthier, less prone to violence, and happier in their lives.

The NLP considers stress the primary cause of many world problems. Stress causes drug use, crime, health problems like hypertension, and even wars. Several studies

have shown that meditation reduces stress. The party argues that teaching meditation in schools can help children handle life so that they avoid bad habits, teaching it in prisons can reduce crime, and teaching it to the military can help alleviate global tensions. The latter idea is based on the TM theory that if a small percentage of a population meditates, it has an affect on the stress levels of the larger community. This concept is supported by research published in peer-reviewed articles in respected venues such as the *Journal of Conflict Resolution*. Thus, a group of people could be sent into a high-tension area to meditate and bring the people into harmony with natural law.

Nature Fakers Controversy

At first glance, the Nature Fakers Controversy was a lighthearted literary debate over whether or not wild animals can reason and teach their young to hunt and avoid traps, or a fox can ride a sheep across a field to avoid pursuing hounds. On a deeper level, it embodied an increasingly urbanized United States public's efforts to reconcile Darwinian, humanitarian and Edenic visions of nature and wildlife.

The controversy spanned four years of magazine and newspaper articles, book prefaces and a full editorial page of the *New York Times*. John Burroughs, America's preeminent literary naturalist, began the debate in 1903 with an *Atlantic Monthly* article accusing a number of prominent nature writers of what he called "sham natural history." Ernest Thompson Seton, William J. Long, Charles

G.D. Roberts and others, he claimed, fabricated and overly dramatized the lives of wild animals in order to sell books to a burgeoning, lucrative national market of gullible nature lovers.

These writers were practitioners of a new genre, the realistic wild animal story. Such stories presented events from the perspective of their animal protagonists. This was a radical shift in perspective, one that emphasized non-anthropocentrism. A fox hunt, for example, is a very different story when viewed from the point of view of the fox, rather than the hunter. Inevitably, the authors often read their own expectations and biases into the minds and behaviors of their animal heroes. The psychology of the day tended to explain behavior in terms of either reason or instinct, with little ground in between. Facing such options, the authors accused of nature faking granted their subject the gift of reason.

Seton and Roberts did not defend themselves publicly and emerged relatively unscathed. Long, however, mounted a vigorous defense and became the lightning rod of the debate. A Connecticut Congregationalist minister whom some accused of Unitarian tendencies, Long received his Ph.D. from the University of Heidelberg in 1897. He was no stranger to controversy. He attended Andover Theological Seminary shortly after it had been attacked for teaching "higher criticism" of the Bible. In 1898, Long became pastor of the North Avenue Church in Cambridge, Massachusetts. However, the Cambridge Council refused to ordain him because of his liberal theology, which included a belief in universal salvation. This drew national attention in Congregational circles. Long resigned after serving only two months, but was praised for his religious conviction and integrity.

Long was an experienced woodsman and close observer of nature. Although he often misinterpreted what he saw, he did not intentionally fabricate his natural history

“facts.” His vigorous defense of himself and his books, while principled and philosophically sophisticated, was misguided by his poor understanding of inductive science. Long rejected Darwinism and scientific rationalism, arguing that animals experience no struggle for survival. He believed that all minds, be they human or not, are reflections of the Creator’s. Thus, he relied on empathy as the key to understanding animal psychology.

John Burroughs’ existential view of nature had no place for a God, although he felt a deep emotional bond with nature. Many of those accused of nature faking, on the other hand, viewed nature in spiritual terms. For example, Ernest Thompson Seton, who later became a founder of the Boy Scouts of America, rejected Christianity and adopted a Native American-styled pantheism. William

J. Long argued that animals are capable of religious experience. His *Brier-Patch Philosophy* (1906), an unsung classic in animal-rights literature, is one of the fullest statements of Long’s views.

Finally, in 1907 President Theodore Roosevelt publicly spoke out against Long. He was especially upset that books written by Long and other fakers were used in the public schools. He shifted the focus of debate from errant writers to irresponsible publishers and school committees. In response, they paid greater attention to the accuracy of nature books. Following Roosevelt’s attack, Long turned to writing books about American and English literature. Nevertheless, his publisher and fellow Congregationalist Edwin Ginn, a proponent of world peace and opponent of hunting, kept his books in print for years.

The controversy helped to set standards of accuracy for nature writers, while it also underscored the American public’s discomfort with “cold science” and eagerness for an emotionally and spiritually satisfying vision of the natural world.

Nature Religion

The term “nature religion” was introduced into contemporary discourses of the study of religion by Catherine Albanese’s *Nature Religion in America* (1990). Albanese uses the term to interpret a wide variety of phenomena not previously considered in terms of religion. However, subsequent to her study, the academic use of the term has been largely confined to research into contemporary Paganism and New Age spiritualities, notably in the collection *Nature Religion Today* (Pearson, Roberts and Samuel 1998). It is appropriate to restore Albanese’s broader understanding of the term, since the term has a more general currency historically and geographically, appearing not only in contemporary Paganism before Albanese’s work, but also in Germany in the late eighteenth and early nineteenth centuries. Like Robert Bellah’s notion of civil religion, Albanese’s idea of nature religion can help make visible practices in popular culture and political activity of all religions as religious expressions, and thus broaden the understanding of religion beyond its most identifiable institutional expressions, and help religionists more easily to understand religious activities that do not easily correspond to categories of study derived from religious institutions like churches and scriptures.

Albanese does not explicitly define “nature religion” in *Nature Religion in America*, but indicates that she uses the term as a construct to describe a religion or type of religion found in the United States, which takes nature as its sacred center. She describes it as a religion, in the singular, but also says that it occurs in variants as nature religions. What the variants have in common is that in these phenomena, nature is the symbolic center. Albanese describes a chronological development of major variants of nature religion in North America. Forms and movements discussed include Algonquian spirituality and Native American traditions more broadly, seventeenth and eighteenth-century Puritanism, Freemasonry, Gaia consciousness, conservation and preservation movements, as well as Emersonian idealism, ecofeminism and feminist spirituality, and various New Age phenomena.

Albanese’s work is indispensable in its extension of the purview of religion beyond what is considered religion proper in the academic study of religion. It facilitates, for example, the study of phenomena within environmentalism as religious activity, as in Bron Taylor’s research on practitioners of deep ecology and bioregionalism. Closer to the study of religion proper, Albanese’s use of the term “nature religion” enables examination of nature-oriented non-institutional religion on its own terms.

The term “nature religion” has probably been adopted most readily in the study of contemporary Paganism because it already had some currency within the groups Margot Adler began researching in 1972, for her study of North American Paganism

Drawing Down the Moon (1979). Adler's first use of the term in print equates "contemporary nature religions" with "Neo-Pagans," without comment or explanation of the term. In the groups Adler studied, practitioners of contemporary Paganism already regarded themselves as practitioners of nature religion or nature religions, which they conceived as ancient European shamanistic religion, devoted to variants of a Mother Earth goddess and/or various other gods and goddesses of nature, making no distinctions between the spiritual and the material world.

Adler cites two published references to nature religion preceding the publication of her study. In 1974, Frederick Adams published an article called "Feraferia for Beginners" in *Earth Religion News*, in which he refers to the need to look to the "original root-systems of Nature Religion" for inspiration and education (Adams 1974: 51). Adler also cites Tim Zell's use of the term in the early 1970s. In an undated Church of All Worlds tract, "An Old Religion for a New Age, Neo-Paganism," Adler reports, Zell distinguished between "philosophical religions" and "natural religions." These natural religions Zell identified with indigenous, folk, and Pagan religions that evolve naturally, in contrast to what he saw as the artificially constructed philosophical religions.

Zell made the distinction between natural and philosophical religion at least as early as 1972, using "Pagan" and "natural religion" to refer to folk, indigenous, and non-institutionalized religion, in an article titled "Paganism & Neo-Paganism: The Old Religion & the New," published in *Green Egg*. Zell's polarization of natural and philosophical religion strikingly parallels Hegel's use of these terms, but follows the Romantics' valuation of the natural over the philosophical.

Hegel, Schlegel, Schelling, and their early nineteenth-century contemporaries in Germany, were in agreement that all peoples had a common origin in a first religion and culture, but Hegel disagreed with Schlegel and Schelling in that he identified the original religion as primitive, savage and evil, whereas they felt it expressed a state of innocence, a golden age. In *Lectures on the Philosophy of Religion*, Hegel calls this first religion "nature religion."

For Hegel, nature religion is crude and simple, the lowest form of religion, in which Spirit is perceived in nature, rather than transcendent of nature as in philosophical religion, epitomized by Christianity. Hegel indicates that nature religion continues to influence the "higher" forms of religion, through belief in magic, citing the practice of witchcraft within Christianity.

Ideas of "nature religion," "natural religion," and "religion of nature" were circulating in German thought in the late eighteenth and early nineteenth centuries. Kant, for example, argued that there are two kinds of religion: the religion of nature, and the religion of ethics. Schelling believed that the first religion of humanity was the best, a natural religion. In a 1796 letter to Hegel, Schelling suggested that a new religion was necessary, one that did not reject mythology in favour of reason. In his novel *Lucinde*, Friedrich Schlegel identifies this new religion with "the old religion" of nature. Schlegel champions a religion of nature, of the imagination, and of poetry, as a religion that prizes women and the ideal feminine, passivity, and the natural as opposed to the

artificial, especially in terms of social norms. For Schlegel, this religion of nature is the primordial religion, the religion of the Garden before the Fall, a religion of innocence, without shame. It is polytheistic in a sense familiar to contemporary Pagans, as the god/desses do not definitively either “really exist” or exist only in the imagination. There is no equivocal distinction between the two in this expression of nature religion, because, in Schlegel’s terms, the imagination is the faculty humans have for perceiving divinity.

In the German Idealist, and Romantic traditions to an extent, nature religion was contrasted with Christianity, as everything that Christianity was held not to include. Albanese, however, instructs that nature religion should not be taken simply as the opposite of the “JudeoChristian religions of history.” Nature religion is not opposite to the religions of history or of ethics, but is a type of religion that can be found within the practices of Christianity and other mainstream religions as well as marginal traditions. Albanese’s understanding of nature religion is vital for its implicit recognition that any religion can be expressive of nature religion, not only indigenous and contemporary Pagan religion. Expanding the use of the term beyond its expression in North America, nature religion can then be applied to any religion.

Using the term “nature religion” in the singular is appropriate for applying the concept to various religious traditions, since it suggests that nature religion is a type of religion or tendency to be found within and running across different religions. To use the term in the singular indicates that nature religion is not restricted to one group of religions in opposition to another group of religions that are not nature religion. While the use of the plural “nature religions” may aim to be inclusive, it suggests that some religions are never expressive of nature religion, or categorically cannot be expressive of it. To use the term in the singular allows it to be applied to any religious group, on the basis of criteria that are not dependent on any particular religion.

Nature religion can be distinguished from other religion on the basis of its understanding of transcendence. Nature religion can then be constructed as a type of religion in which nature is the milieu of the sacred, and within which the idea of transcendence of nature is unimportant or irrelevant to religious practice. By this definition, not only contemporary Paganism and indigenous traditions, but practices and beliefs of any religion can be expressive of nature religion. This definition recognizes that a religion can be expressive of nature religion without being exhaustively defined by nature religion. For example, not all contemporary Pagan religious traditions are expressive of nature religion by this definition, since some posit divinity transcendent of nature, as in the panentheism of Gus diZerega (2001).

Transcendence, in nature religion, tends to be lateral rather than vertical. Spirits and deities are of this world rather than beyond it, and can be contacted through the natural world. Nature religion is this-worldly religion. Contemporary expressions of nature religion are often explicitly this-worldly, with the hope that a valuation of this world and none beyond it will encourage us to respect and preserve it. In nature religion it is more often culture than nature that is transcended. This is to be expected

in phenomenon that are often seen as countercultural, as are many of the phenomenon of nature religion, such as the Christian folk singers discussed by Albanese, and modern British witchcraft as described by Ronald Hutton (1999).

The usefulness of the term “nature religion” lies in the broadness of its applicability. It is limited in being applied only to the United States, or only to contemporary Pagan religious traditions. It is useful to look at wider social and cultural developments in terms of nature religion, and to look for expressions of nature religion in mainline religious traditions, such as creation spirituality in Christianity, and Thich Nhat Hanh’s practices in engaged Buddhism, and to look for this-worldly expressions of mainstream traditions. However, it remains to be seen how useful the term might be in understanding indigenous traditions. There have been no in-depth studies of specific groups or spiritual traditions in indigenous cultures in terms of nature religion, probably in part because “nature religion” is yet another Western category, but also because it is a relatively new area of research in the study of religion.

What does it mean to speak of nature religion? For a general audience in the Western and English-speaking world, probably the first reference that comes to mind is land-based and environmental. Nature means grass and trees, panoramas and vistas, mountains and lakes and oceans. So nature religion means beliefs and practices that involve turning to God in nature or to a nature that is God. For a smaller, largely self-identified group in the same Western and English-speaking world, nature religion signals Goddess more than God, and nature is the principal trope for a religiosity that calls itself pagan or, alternately, neo-pagan. To invoke nature religion becomes a way to call attention to one's pagan/neo-pagan spirituality and, also, group commitment. For still others who have a familiarity with Western religious and theological history, the term nature religion is teasingly close to two others – natural religion and natural theology.

These last are designations that arose in an eighteenthcentury Enlightenment context under the guiding star of deism. For the Enlightenment, natural religion made sense in contradistinction to supernatural religion – the revealed religion of Christianity based on the inspired word of scripture. Natural religion therefore meant the religion of reason alone; or, in tandem with human reason, the religion that looked to nature as its holy book of inspiration. It ranked inferior or superior to Christianity, depending on prior belief commitment and point of view. Still more, if it was counted superior, it was thought to be grounded in the essential order of the universe and of all things. In a distinctly Christian understanding, natural theology became the system of religious thought constituting knowledge of God and divine things that one could obtain by reason alone. It was suspect and generally rejected in Protestant theological circles of

Reformation provenance (because of their view of the fallen nature of humanity) but more warmly received by Roman Catholics and, later, by liberal Protestants.

In light of all of the above, what other way or ways can there be to invoke nature religion, and that in a United States historical context? The answer to this question (or, really, set of questions) leads as far back as the early coalescence of the culture that later came to flourish in the United States, and it leads, too, through a multiple canon of religious meanings, ranging from Idealist philosophical statements that show clear marks of European influence to popular cultural practices that have come together in new ways in our own time. The answer leads us, too, to an extremely fragile world – a world that is deconstructing itself even as it comes to be.

As an Idealist philosophical statement at its broadest, consider the definition announced by Ralph Waldo Emerson (1803–1882) in his Transcendentalist manifesto *Nature*:

Philosophically considered, the universe is composed of Nature and the Soul. Strictly speaking, therefore, all that is separate from us, all which Philosophy distinguishes as the NOT ME, that is, both nature and art, all other men and my own body, must be ranked under this name, NATURE.

Here Emerson invoked “both nature and art” to define nature, and then he went on to explain that the term had both a “common” and a “philosophical import.” “*Nature*, in the common sense,” he wrote, “refers to essences unchanged by man; space, the air, the river, the leaf. *Art* is applied to the mixture of his will with the same things, as in a house, a canal, a statue, a picture.” Yet of this latter – of “art” – Emerson was dismissive. Human operations collectively considered were “so insignificant, a little chipping, baking, patching, and washing, that in an impression so grand as that of the world on the human mind, they do not vary the result” (Emerson: 1971, 8). Many, of course, would be less speedy to relegate human constructions to a cosmic recycle bin. Yet in the space between Emerson’s two definitions – his “philosophical” sense and his “common” one, there stands an American definitional and historical territory that may fruitfully be explored under the rubric of nature religion.

Since the rubric is distinctly nature *religion* and not simply nature *theology*, let it be clear that any American historical survey must move beyond beliefs regarding nature, however reverent and profound. Rather, the rubric must encompass cultural practice that is intimately connected with belief both in condensed symbolic settings (i.e., in ritual and devotional situations) and in more broad-gauged and general ones (i.e., in everyday behaviors that act out ethical stances and convictions). It helps to remember, too, that to engage in such an American historical survey of nature religion is hardly a minor exercise or an add-on from the point of view of the Western religious tradition. With theology or religious thought as its strong suit, this tradition has placed nature near the top of its short list of major categories by which to make sense of religion. God and humanity comprise the first two categories. Nature, however culturally diffuse and evanescent, forms the third.

Shaped then by an Emersonian space between philosophy and common usage and a Western religious space, in which nature counts for major consideration, what does a hypothetical cultural narrative regarding nature religion in the United States look like? We are back, in effect, at a more reflective version of the initial question: how do we speak with definitional and historical inclusiveness of nature religion in the United States? How do we name and narrate nature religion? And, again, what are the limits of such speaking? How, in other words, do we construct a past that may be useful in the twenty-first century? The beginning of an answer and a narrative may be found in the seventeenth century – in the time when the different players who would assume leading roles initiated the series of contacts and exchanges that produced the dominant culture of the land.

Among these players, Anglo-Protestants assumed hegemonic importance in terms of a public and religiously inspired culture, but their views and behaviors were affected subtly (and sometimes not so subtly) by other groups with whom they shared space. Numbered among them were Native Americans and native Africans, English and French Catholics, continental European immigrants of both Protestant and Roman Catholic backgrounds in general, even a small community of Jews when the Dutch New Amsterdam colony became New York. Of all of these groups, it was Native Americans (or American Indians) who engaged in the series of cultural attitudes and activities that could be most clearly linked to nature religion. Working on the bases of accounts that must be pieced together from hostile English sources, from archeologically derived remnants, and from narratives collected as much as several centuries later, the general lines of an encompassing religion of nature may be sketched. Ironically, this religion of nature was never identified as such by native Indian peoples: in Indian cultural circles and communities there was no abstract “nature” to which or whom to relate. To say this another way, both word and abstraction are Western European designations for referents named and understood differently among Native Americans and also among others. Yet considered generally and collectively Native American beliefs and practices point to sacred objects and subjects residing in, or manifest as, aspects of the material world that Europeans have called nature.

With spatially oriented and environmentally shaped perception, Native Americans have honored their kinship with sacred Persons – e.g., thunder grandfathers, spider grandmothers, corn mothers, and the like – who represent (and, for them, are) the powers of nature. They have elaborated etiquettes of relationship with these Beings, for instance, when killing game and/or harvesting crops. Indians have noted their own placement on land-based terrains by paying acute attention to directional points in ritual practice and by according symbolic and theological import to the directions (for example, seeing the east as associated with sunrise, the color yellow, and new life and growth, while the west was linked to sunset, darkness, and death). Although Indians have certainly been aware of the vicissitudes of the seasons and the uncertainties of the weather, overall they have found a harmony in nature that, historically, they chose to imitate in practical ways. This meant everything from taking cues from nature in the

construction of housing and bodily adornment to living out convictions that Western Europeans would regard as ethical directives.

When Africans entered what Europeans claimed was the “new world” in the early seventeenth century as indentured servants or – very quickly the norm – as slaves, they, too, brought nature-based forms of religiosity with them. West African tribes, from whom blacks had been forcibly separated, revered their ancestors but, also, revered Persons who came out of nature – again, without a generalized overarching concept of the same. While exception must be made for a significant number of Muslims among these native Africans, the local religions of West Africa tended to support theological visions of distant creator deities but also of other spirit powers and gods who were seen as close at hand. These nearer sacred beings embodied the elements of nature and could come intimately close to the bodies of devotees in rituals of trance and possession. They functioned at the center of religious life and tied their devotees to a sense of self and environment alive and holy.

Among Roman Catholics both from England and the Continent, nature occupied a relatively prominent place in theology and ritual practice as well. By the thirteenth century, scholasticism had reached new clarity in the work of Dominican friar Thomas Aquinas (ca. 1225–1274) and had articulated a comprehensive understanding of natural law, based on older Greek categories but reordering them in Christian terms. Nature here was not only land-based but encompassed, too, the orderly pattern of the heavens and the stars as well as the inner and mysterious workings of animal (including human) and vegetable bodies. Moreover, nature stood at the core of cultural practice within the Church both in a natural-law ethic that arose from the scholastic category and in a sacramental system culminating in the mysteries of the Eucharist. In this sacramental understanding, pieces of the material world became force-filled conduits for spiritual power, so that as representational signs they themselves were transmuted into the sacredness they signified. In the most graphic illustration of the proposition, the bread and wine of the Eucharistic sacrificial meal at the Mass became, for medieval and modern Catholics, the actual physical body of Jesus the Lord. Nature was exalted, indeed, as it became the body of God.

Nor was the religious importance of the material world lost on the small Jewish community residing on American shores. Jewish religious practice, in fact, privileged natural categories and sites. Much more than in versions of Christianity, for example, the home functioned at the center of Jewish ritual life – to the degree that it stood beside the synagogue as sacred space. The liturgy of Shabbat, or the Sabbath, took place in the home and featured agricultural products transmuted into food and family fare, in a ritual that accorded women places of ritual honor and also clearly connected natural life and products to transcendent sacred meanings. Jewish religiosity put its premium on the embodied spirituality of ritual and of ethical directives for life in this world, in relation to human communities. Jewish notions of the afterlife, by contrast, came off as vague and trailing – afterthoughts and underthoughts in Jewish theological explication. That there were no ordained Jewish rabbis and few synagogues in

the Atlantic colonies only emphasized these general tendencies in Jewish belief and practice.

What did all of this mean for Anglo-Protestants in the British North Atlantic colonies? On arrival, literate New England Puritans alternately feared the wild country of their new landscape as a wilderness in which their souls and spirits would be tested and, by contrast, celebrated it as a garden of God's good, especially when planted in new Puritan towns. Meanwhile, in the common culture that elites shared with others, English country tradition already supported a world of cunning women and men who used the products of nature in magical practices that existed alongside of and, sometimes, intermixed with Protestant church ritual. If colonial libraries can be taken as evidence, alongside these cultural manifestations an elite magical and metaphysically oriented tradition, influenced by continental Hermeticism that had been subsumed into Paracelsan, Rosicrucian, and Jewish Kabbalistic forms, flourished in early America.

Although we know all too little regarding the interactions of the dominant Anglo-Protestant culture with Indians and blacks as well as with Catholics and Jews, we gain brief and provocative glimpses as, for example, in the much-recorded Salem witchcraft epidemic of 1692. Here Tituba, a female Caribbean slave from Barbados of African or, more probably, South American Arawak Indian ancestry, stood accused of corrupting a group of young Puritan girls by introducing them to pagan practices of sorcery. In a well-known narrative, this was only the beginning of a series of "discoveries" of practicing witches in and around Salem. The communication of cultural practice, of which Tituba stood accused, must have occurred many times over in the informal connections and exchanges between Anglo-Protestant elites and their servants. In her book *The World They Made Together: Black and White Values in Eighteenth-Century Virginia* (Princeton, 1987), Mechal Sobel explored the process for whites and blacks in eighteenth-century Virginia, demonstrating the subtle ways that blacks helped to shape white planter culture, as for example in attitudes toward space and the natural world. Meanwhile, among elites themselves of different religious backgrounds, there was often more social interaction than might at first be expected. In her doctoral dissertation "Early Modern English Women, Families, and Religion in the New World" (University of Rochester, 1997), for instance, Debra Meyers has documented the culture of intermarriage between Catholics and Arminianized (stressing free will) Anglicans in the Maryland colony from 1634 to 1713, and she has also shown the parallel track that Quakers followed compared to these first two groups. For all three, when "nature" meant human nature it could be more or less trusted given the prior work of

Christ, so that these groups tended to support more egalitarian family structures and downplayed patriarchy and hierarchy in general.

Examples such as these, of course, add up only to tantalizing suggestions of what common sense already argues. At any rate, by the late eighteenth century and the time of the American Revolution, nature became explicitly linked by elites who were establishing the new political culture with their expansive republican venture. They understood nature in at least three senses, and each of the ways of signifying nature

led to the patriotic ideology they promoted (suggesting already a nature religion in the process of unraveling?). First, nature meant “new-world” innocence – a freedom from the corruptions of old England that was symbolized in the purity of country living beside clear streams and fertile soil and also symbolized in the lack of social formalism and affectation among new Americans. Such new-world innocence brought with it a reinvigoration of the social and political project unlike what patriots viewed as the tired and effete political culture of old England with its stilted hierarchies and aristocracies.

This sense of collective freshness and vigor led to a second meaning of nature, which came with distinctly Enlightenment credentials. Akin to the affirmations that accompanied natural religion and deism, this meaning of nature pointed away from Earth and toward the heavenly bodies in order to make its point for the Earth. Nature now meant the law that turned sun and stars in their orbits, ordering the regular motion of the planetary bodies. Brought back to Earth, this universal law became the ground for all human rights and, among them especially, for political rights. Like the planets in their contained and lawful motions, the individual states that comprised the new United States would operate in their individual orbits but also cooperate in a grand symmetry of order and form. So, too, would individual human beings: nature pointed toward the egalitarian social and political patterns that were idealized in the “new order of the ages” the patriots aimed to create.

Finally, as a third meaning accompanying patriotic affirmations, nature signaled the growing practice of venerating a distinctly American landscape. Already in the late Puritan culture before the American Revolution, thoughtful religious leaders like Jonathan Edwards (1703–1758) and Cotton Mather (1663–1728) had, in different ways, found God in nature. After the war, in prose and poetry that linked the republican experiment with, literally, the ground that supported and accommodated it, nature became a new aesthetic trope. The “spacious skies” of the young nation, the seeming boundlessness and expansiveness of its landscape, became the divine benediction on its political project. America as a place in nature was bigger and better than anything European because its political experiment was bigger and better. More than that,

American nature evoked the Kantian “sublime” as mediated through the writings of English philosopher Edmund Burke. In his *Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful* (1757), Burke had distinguished the sublime from the beautiful because of the capacity of the former to cause astonishment, awe, and even a species of horror. Americans felt the presence of hierophany in the landscapes they observed, as Thomas Jefferson when he gazed at Natural Bridge; and they acknowledged a sacred splendor in what they beheld – in ways that redounded to their new political system. America was physically grand and awesome, and so was its political project.

These estimates turned ugly by the Jacksonian era, as territorial aggrandizement became justified in terms of the grandeur of the political project. Cherokee Indians and others walked their trail of tears to make room for white farmers. By the middle of the

nineteenth century, nature religion became the justification for manifest destiny, and imperialism rode strong on nature's back. Earlier, however, even as Andrew Jackson was exporting Cherokee Indians to the Oklahoma Territory, the New England Transcendentalists were busy creating a thoroughly self-conscious and ethically high-minded endorsement of the religion of nature. (Emerson and his friends, for example, protested the forcible eviction of the Cherokees from Georgia and became stalwart anti-slavery advocates.) The Transcendental gospel itself was stated canonically in Emerson's little book *Nature*, with its declaration of profound correspondences between nature and humanity. The Emersonian declaration was accomplished in the context of the combinative English Hermetic tradition that by then was emphasizing Neoplatonism, and in concert with a thencontemporary admiration of the work of the Swedish mystic and scientist Emanuel Swedenborg (1688–1772). The new declaration was contained, too, in a decidedly literary consciousness, but a consciousness that pushed literature strongly into the realm of the religious. For Emerson and his followers, words were signs of natural facts, which were symbols of spiritual facts. And all nature was the symbol of the spiritual.

Emerson himself preached more than he practiced. But his younger friend Henry David Thoreau (1817–1862) did both. He built his well-remembered cabin on Emerson's land at Walden Pond outside of Concord, Massachusetts, and wrote his classic *Walden; or Life in the Woods* (1854) about his sojourn there. He also tramped the Maine woods, climbed local mountains like Mount Katahdin, and befriended Indian guides. Out of his experiences he pushed Emerson's religio-philosophical convictions regarding self-reliance in still more radical (and expressive) directions that led him into active anti-slavery work shielding runaway slaves and into at least one night in jail. To be natural, for Thoreau, meant to keep one's conscience free, to preserve the integrity of the self in face of the compromises that society – especially in organized political form – sought to impose. Thoreau's fondness for South Asian Indian religious philosophy, when he discovered it in the late 1830s, grew out of his sympathy with Indian mystical notions of unity of Self and world. If, as the Indian texts affirmed, Atman (Self) really was Brahman (the all-power in the universe), if This was That, then Thoreau's nature religion led to fellow beings and their rescue from inequity.

The Transcendentalist moment in American religious history enjoyed its heyday through the 1840s and 1850s. As an elite statement of a complex and many-faceted form of nature religion (at least in germ), it produced a lasting template for what might count as nature religion in the United States. Unlike the earlier folklorized occult and metaphysical religion of colonial America, Transcendental nature religion took religious ideas about human correspondences with an almighty Nature into new and more public directions. It acted, as it were, as a conduit from the seventeenth and eighteenth-century past into a nineteenth-century and later American future. In terms of nature religion itself, that future moved in at least three, and possibly four, major directions.

First, one major form of nature religion in the nation led out from the Transcendentalism of Emerson and, especially, Thoreau in the direction of environmentalism. The often-celebrated John Muir (1838–1914) carried writings by the two of them in his saddlebags, and he clearly revered them as spiritual mentors. Muir himself, who as a young boy had emigrated from Scotland with his family, left the family and the conventional life behind and trekked far and wide, eventually reaching California’s Sierra Nevada Mountains. There he felt that he had come home to nature and to himself, a “higher self” that directed him with inner wisdom and even mystical forms of intuition. In Muir’s own writings, it is clear that he worshipped a nature that was alive and sentient, resplendent with sacramental manifestations that fed his spirit to the point of inebriation. But Muir combined the earlier Transcendental veneration of the panorama of the land (Emerson) and the details of its construction and inhabitants (Thoreau) with a sense of social activism and public accountability. In this, he was not unlike Henry David Thoreau, but more than Thoreau, Muir’s cause became nature itself. That he founded the Sierra Club, the nation’s first environmental lobby, and that he worked at the forefront of the national-park movement that gave the United States Yosemite in 1890 are uncompromising statements to his moral conviction and its social enactment.

Muir had found a public rhetoric to connect private delight in wilderness and religious reverence for it with a domain of political practice. After him, and even alongside him, there were others, Aldo Leopold (1887–1948), Professor of Game Management at the University of Wisconsin, important among them. Leopold’s enormously influential *Sand County Almanac* (1949) gave voice to a religious and ethical valuation of nature not tied to conventional Western biblical themes. In fact, turning selfconsciously away from what he called an “Abrahamic concept of land,” Leopold called for a land ethic based on an affirmation of the land as a community in which humans were members. As community, the land was alive

– not a mechanized and commodified other – and humans who understood its life could express love and regard for it, with its encompassing channels of energy that flowed in circuits bringing life and death to individuals.

Leopold’s work made a major impact on a thenemerging twentieth-century discourse in environmental ethics, and it also provided resources for the near-mystical spirituality of many who embraced a radical form of environmentalism by the later part of the century. His haunting vision of the dying green fire in the eyes of a mother wolf that as a young man he had hunted down became a catalytic sign and emblem of the death of nature at human hands. Between Leopold’s green fire, as it kept burning among those committed to radical action in movements like Earth First! and Greenpeace, and the more law-bound environmentalism of established lobbies like the Sierra Club and the Wilderness Society, twentiethcentury environmentalism continued into the twentyfirst. It became increasingly clear that the wellspring for the passion that drove public speech and action on behalf of the environment was in large part religious and ethical.

Environmentalism, in short, had become one version of nature religion in the lingering shadow of American Transcendentalism.

The Transcendentalists functioned, however, as a switching station for a second form of American nature religion as well. The metaphysical nature religion of the past, encoded in a series of cultural practices that ranged from dowsing, to the casting of magical spells, to the pursuit of astrology, to a plethora of folk behaviors involving correspondences with nature still continued even as it was transformed. Based at least in part on the new religious language that Emerson and the other Transcendentalists helped to make familiar to Americans, this metaphysical form of nature religion was now shaped by more urbanizing and middle-class times, reaching out to embrace an Enlightenment rhetoric of reason and science. All the same, it still encompassed a rural and poorer past. And it encompassed, as well, a moral logic similar to the one that had compelled Thoreau and other Transcendentalists, including Emerson, in anti-slavery directions. By the second half of the nineteenth century, the results were visible in spiritualism, both in its practical and speculative varieties.

Spiritualism flourished in popular and what has become known as “phenomenal” (practical or spiritmanifesting) form after 1848, the year that two upstate New York girls, Kate and Maggie Fox, claimed that they were in contact with a murdered peddler whose remains were buried in the cellar of the ramshackle house their family rented. Along with spiritualist phenomena and practice came elaborate theories of how its seeming miracles were produced: spirits, it turned out, were part of nature. They represented a more refined version of matter, and in certain situations (séances), with the aid of gifted professionals (mediums, who were usually but not always female), their material refinement was visible to grosser human eyes and senses.

The more speculative version of spiritualism, from its inception in 1847 – one year before the fabled communications of the Fox sisters – had from the first provided a self-conscious and sophisticated theology to explain spiritualist phenomena and manifestations. Under the banner of the “harmonial philosophy,” Andrew Jackson Davis (1826–1910) and others supplied their own theoretical frame for the ghostly life of phenomenal spiritualists. They did so by means of Enlightenment thought that met and married a metaphysical theory of correspondence in the absence of Christianity. Davis, especially, became an important culture broker, bringing together a Swedenborgian doctrine of correspondence with the “magnetic” or mesmeric theory and practice of Austrian physician Franz Anton Mesmer (1734–1815), based on the belief that there was a universal fluid with mysterious tides operating in all of space.

In effect, harmonialism linked these European concepts to an American popular culture shaped in part by notions of the power of Reason and Right inherited from public discourse in the context of the American Revolution and from a folklorized metaphysicalism that had been handed down. It linked the European concepts, too, to a popular culture shaped in part by the Transcendentalist discourse of correspondence – through the popular speaking tours of Emerson and others, the ubiquitous newspaper reports about them, and the stream of publications by them that kept coming. Har-

monialism stressed reform and, in the name of nature, radically equalized the playing field between women and men, even as it also posited something like eternal progress. Always though, nature, not the supernature of Christianity, was God and goal.

Howard Kerr and Charles L. Crow underline the significance of spiritualism for what followed, noting that as conventional religion became subject to a growing fear that it was “untenable,” spiritualism itself became a “historical hourglass” through the channel of which “the sands of witchcraft, popular ghost lore, mesmerism, Swedenborgianism, and scientism” poured, “then to disperse into Theosophy and parapsychology” (Kerr and Crow 1983: 4). And, it could be added for a century later in the 1970s, into the New Age movement. Theosophy arose as a spiritualist reform movement in 1875, the year after Russian immigrant Helena P. Blavatsky (1831–1891) and American Colonel Henry S. Olcott (1832–1907) met at a

Vermont farm where they both had gone to investigate reported spiritualist phenomena. The Theosophical Society, which the two founded along with William Q. Judge (1851–1896) and others, announced its object in its bylaws as the collection and diffusion of knowledge concerning the laws of the universe. That in itself sounded scientific enough, except that the preamble to the document advanced the hope of going beyond science into ancient esoteric philosophy. Indeed, the religious character of the theosophical enterprise was clarified even further three years later when leaders of the society articulated two new goals in the context of their now-involvement with Asian religions. Theosophy aspired to promote universal “brotherhood” and to promote as well the study of comparative religions. Theosophists understood all three of their goals in light of an esoteric vision of the secrets of nature, the further reaches of which they were seeking to understand and to make productive in their lives.

It requires only a brief foray into the history of connection between the late nineteenth-century Theosophical Society and the century-later New Age movement to notice the line between earlier Theosophical teachers and later interpreters of the New Age. Moreover, clear lineages aside, the continuity of subject and theme between the two movements points to both as strongly linked and related expressions of the metaphysical form of nature religion. In a context that is linked to this, the small but growing neo-pagan movement of the late twentieth and early twenty-first centuries needs to be noted here. In Wicca and related movements, nature – become personified in the Goddess and her consort – led her devotees into a religious world of both ritual ecstasy and ethical practice that looked to nature as law and guide. Significantly, for all of these movements, the secrets that humans would uncover in nature were secrets with practical application. None of the movements has aimed at knowledge for knowledge’s sake. Rather, all of them have looked to metaphysical knowledge of nature as a vehicle of power, as the source of cultural practice to repair and enhance lives. And nowhere did that practice become more urgent and insistent by the late twentieth and early twenty-first century than in the domain of healing.

This last observation brings us to the third major form of nature religion that was advanced by and in the Transcendentalist milieu. In keeping with Emersonian claims

for the powers of nature and, also, for the realized Self, nature religion came to stand for the physicality of the human body itself. Here, in one religious logic, matter remained subject to universal natural laws, the violations of which automatically brought disease and ill health and the observances of which, by contrast, guaranteed health and blessing. The often-repeated dictum “Early to bed, early to rise, makes a man healthy, wealthy, and wise” was, in fact, a tenet of this version of nature religion. Or, at the same time and often for the same people, matter became at once the plastic substance that could be shaped and changed by the power of Mind (with the American Vedanta of oneness proclaiming the ability of the Self to cure disease and attract wealth and blessing).

One version of the logic, therefore, leads to immersion in a series of healing practices that valorize natural law and its results. Thomsonian herbal healing, inherited Native American herbalisms, and related Euro-ethnic herbalisms, all of which preceded the Transcendentalists already expressed this form of conviction, and various forms of herbalism have continued from early America into our own times. Perhaps even more graphic in their physicality and their appeal to the laws of an almighty nature have been the late nineteenth-century modalities of osteopathy and chiropractic. Indeed, early osteopathy arose out of an Enlightenment discourse strongly inflected with mechanistic accents, so that the clockwork regularity of nature as expressed in the bones and their manipulation became testimonies to the God of Reason and Law. And chiropractic, for its part, explained its healing work in language about freeing a mysterious energy called Innate, blocked and trapped in the body through spinal misalignments and subluxations. All the same, both Andrew Taylor Still (1828–1917), the founder of osteopathy, and

D.D. Palmer (1845–1913), the founder of chiropractic, knew spiritualism intimately, and they also spoke in an American colloquial style that reflected the ideology of the Enlightenment. Both, significantly, had been magnetic doctors, whose goal was the unblocking of the trapped energies of nature. But both, finally, embraced the optimistic and perfectionist style that Transcendentalism expressed and encouraged, and both, even in their emphasis on physicality, looked to the ultimate powers of Mind. Their century seemingly everywhere made similar connections. Healing modalities from the vegetarianism of Sylvester Graham to the hydrotherapy of a small army of water-cure advocates like Russell T. Trall and Mary Gove Nichols pointed to nature, but also led to speculations about “mind” and, as the late twentieth and twenty-first century would say, about consciousness.

Consciousness itself came to be increasingly understood as part of nature, as a mysterious energy that could be tapped, in effect, as a refined version of matter. Paradoxically, for many, nature was now functioning as a bridge to the immateriality of spirit. A classic paradigm for the situation, and for the new cultural practice of nature religion, exists in homeopathy. As formulated by German physician Samuel Hahnemann (1755–1843), homeopathy, then as now, represented a form of what today would be called “energy medicine,” and that in a Western context. As Hahnemann experimented with his new healing modality, he constructed a theoretical frame to explain

it based in part on the ancient notion of correspondence, which – as we have already seen – was alive and well in nineteenth-century metaphysical circles. Hahnemann’s law of similars, as articulated in his *Organon* (1810), taught that a substance that produced somatic results in a healthy person that were similar to the disease symptoms in a sick individual was the very substance that could heal the disease. Like, in other words, cured like. However, “like” worked according to a second law, Hahnemann’s law of infinitesimals. The German doctor and his followers used increasingly greater dilutions or, as they said, “potentizations” of the substance that they were employing in order to heal. Indeed, the potentizations were so zealously executed – for example, up to one-thirtieth of onemillionth of a remedy – that in present-day terms not even a molecule of the original substance remained in the homeopathic medicine. What was it then that remained? An energy trace? An electromagnetic field? Some kind of spiritual signature that interacted with a disease? And how did the remedy actually work? Was it a mysterious spiritual vaccination that operated in a murky halfway land between matter and spirit, between body and cosmic Mind?

Whatever the answers to the theoretical questions, homeopathy developed a series of “provings” for its medicines and, also, an anecdotal trail to demonstrate claims that patients were getting better under homeopathic regimes. It began to gain a following in the United States from the 1830s and as the century progressed became almost the preferred healing modality in the nation, used by perhaps half of the population at a time when the heroic medicine of bleeding, blistering, and calomel, or chloride of mercury (a deadly poison) was the orthodox alternative. Especially important here, homeopathy helped to forge a path for Americans into increasingly “mental” forms of cure. In a tradition beginning with the one-time magnetic doctor Phineas P. Quimby (1802–1866), a self-conscious cadre of healers announced the power of Mind to cure the body – in an American melting pot in which homeopathy, spiritualism, Swedenborgianism, and mesmerism had been blended and stirred well.

Quimby, the clockmaker become mesmerist become mental healer, drew to himself the patients-turnedstudents who brought to Americans the new religious orientations of Christian Science and New Thought. Quimby, in his lifetime, had at least once invoked the term “Christian science” in the context of discussing his healing practice. But it was the chronically ill Mary Baker Eddy (1821–1910), so thoroughly dependent on his healing influence before his death, who discovered her independence from Quimby through a new emphasis on the Christian gospel, recited for her and others in the late nineteenth century in a different key. Under a platonized Christian rubric that denied the reality of matter, she taught that contact with divine truth and transformation by it could alter the ailing “appearance” of a sick individual; that is, could effect “healthy” changes in the perceived matter of the body. But even as Eddy denied the reality of matter, she exalted nature as the place where Spirit resided. She thought of “man” as the body of God, and continued to identify natural with spiritual laws.

Among Quimby’s other patient-students, Warren Felt Evans and Julius and Annetta Dresser moved in a different direction from Eddy, and their form of interaction

with the religion of nature came eventually to be known as New Thought. In a movement that greatly admired Emerson and that celebrated the metaphysical doctrine of correspondence, the power of mind to alter nature meant, not an idealism that denied matter, but – in the long shadow of Transcendentalist thinking and of the spiritualistSwedenborgian-mesmerist model – a vision of mind as continuous with matter. The mental “image” or idea shared real space and time with the afflicted body and could change it for the better. Affirming health was key to *being* health. Conceptions such as this and the plethora of cultural practices that arose from them continued well past the late nineteenth and early twentieth-century heyday of Christian Science and New Thought. Under the banner of positive thinking and, later, of other versions of visualization and affirmation in the service of healing, the generalized American self-help movement spread widely, seemingly everywhere, into the twenty-first century. A flourishing New Thought movement became only the tip of the cultural iceberg. Popular bookstore sales told the greater story, and so did television talk shows, newspaper feature articles, and popular magazine subjects and sales. Always, mind and thought were (more powerful) parts of nature, and always they could change the embodied state of humans who only saw and practiced the connection. The body, the news was, could be well. And even if its grosser material failed to respond on a cellular level, gifts of spiritual and psychic integration and personal peace could, in their own ways, alter appearances. The nature of nature was, in the ultimate sense, bliss and joy.

The complex Transcendental model of nature religion had led, then, in three different directions, with lines and connections among them. Environmentalism, metaphysical religion, and the physical religion of healing the body had all taken cues from this elite nineteenth-century religious and cultural movement. But, arguably, a fourth direction remained for nature religion, and this direction returns us to the eighteenth-century Enlightenment world of old Europe and the new United States. This world that preceded the Transcendentalists was addressed by them in a new rhetoric and was subsequently transformed by later lineages of American philosophers. Ironically enough perhaps, then, this fourth major direction for the nature religion that followed the Transcendental moment in American religious history returns us to a world of natural religion and theology. In his *Emerson Handbook* (1953; reprint, New York, 1967), literary scholar Frederick Ives Carpenter long ago noticed the connection between

Emerson and the pragmatism of William James (1842–1910), and in *American Religious Thought: A History* (Chicago, 1973), so did religious studies scholar William A. Clebsch. Calling James “the American who would . . . refine Emerson’s new religious consciousness to the extent of making God essentially man’s deity and of making man at home with his humanity” (124), Clebsch read the pragmatic philosopher in ways that underlined that nature, as distinct from supernature, was James’ controlling concern. The historical connections were real: Emerson had known James’ father, the Swedenborgian theologian Henry James (1811–1882), and had even visited the James household. But the connections of thought and idea, for Clebsch (as for Carpenter), were central. As Emerson before him stressed the overriding importance of direct expe-

rience, in religion as in all of life, so, too, did James. With his corridor theory of truth, in which truth opened a route to a series of “rooms” filled with experiences and beliefs that enabled people to live successfully in an often chaotic and even catastrophic world, James hailed religion and its “overbeliefs” when they worked to support human projects and goals. In effect, therefore, the Jamesian stance toward religion saw it as a natural project. It was no accident that James had begun as a medical doctor, had moved from physiological to mental considerations, and had then steered his psychological concerns toward a version of natural religion.

Without James’ medical-psychological background, later pragmatic philosophers agreed about natural religion or – in the language invoked here – nature religion. Charles Sanders Peirce (1839–1914), a mathematician and scientist, who before James had used the term pragmatism and propounded an earlier version of the pragmatic philosophy, had been a supernaturalist. The same was clearly not the case, however, for the Spanish-born poet and philosopher George Santayana (1863–1952) who became James’s Harvard colleague. Even as he emphasized the rational and imaginative prowess of the mind, Santayana situated it squarely in the physicality of the body and spoke of “animal faith.” In his *Realms of Being* (1942; reprint, New York, 1972), he argued that the home of spirit lay in matter, for spirit “must be the spirit of some body, the consciousness of some natural life” (843). Meanwhile, John Dewey (1859–1952), who – as Sydney E. Ahlstrom reported in *Theology in America* (Indianapolis, 1967) – had once hailed Emerson as “the one citizen of the New World fit to have his name uttered in the same breath with that of Plato” (59) brought to his philosophy of instrumentalism a new and uncompromising statement of natural religion. With his conviction that truth was an evolutionary phenomenon and a tool for human labor, in his classic work *A Common Faith* (1934; reprint, New Haven, 1975). Dewey argued strenuously against supernaturalism and constructed in its stead a natural religion that, as Emerson and the earlier pragmatists had done, worked to bring idealism down to Earth. Under the banner of the American democratic ideal, he thought that natural piety could “rest upon a just sense of nature as the whole of which we are parts, while it also recognizes that we are parts that are marked by intelligence and purpose” (25).

Evolutionary thinking became a still more explicit path into natural religion in the series of late nineteenth-century thinkers who took on the Darwinian manifesto. After the appearance of Charles Darwin’s *Origin of Species* (1859) and its subsequent permeation of intellectual discourse, the theory of evolution through natural selection provided a frame for conceptions that privileged organicism and turned distinctly away from metaphysics. Liberal philosophers and theologians alike worked out intellectual strategies to come to terms with the new prestige of evolutionary science, and in so doing they resituated themselves in what distinctly looked like the world of nature religion. The philosopher, historian, and scientific popularizer John Fiske (1842–1901), as a leading example, was deeply impressed by English evolutionist Herbert Spencer who had promoted a popularization of the Darwinian thesis that totalized it to interpret human (social) history as well as the history of nature. Fiske’s *Outlines of Cosmic*

Philosophy (1874) argued subsequently for an immanent God who was manifest in the life of the phenomenal world. Nature, for Fiske, was the revelation of God that could be considered true, and for him the perfection of humankind was the goal of natural evolution. Others, however, articulated cosmologies that slid them into agnosticism, free thought, and the ideological humanism that came to be known, as in the Free Religious Association after 1867, as the “Religion of Humanity.”

With a self-conscious anti-Christian and antimetaphysical stance, members of the FRA, along with adherents to similar groups such as the Society for Ethical Culture and the National Liberal League, sounded in many ways like Enlightenment deists. America’s most famous freethinker Robert Ingersoll (1833–1899), the Congregational minister’s son who earned himself the epithet “the great agnostic,” turned the earlier Emersonian proposition that nature was all that was “not me” upside down. Nature meant human nature, and the religion of nature, including the landscape delights that surrounded humans and their built environments, ended in humankind. Yet even as he pronounced, in ringing terms, his rhetorical trinitities of “Liberty, Fraternity, and Equality,” of “Observation, Reason, and Experience,” and of “Man, Woman, and Child,” like nature religionists from Puritan times to the present, he could find the biblical book that lay outside the mind and in the environment, and he declared in favor of nature in sometimes lyrical terms.

The inclusion of Enlightenment-style natural religion and natural theology under the rubric of nature religion, of course, presents its share of difficulties. For one problem, religion on an Enlightenment model tends to lack strong practical expression. Natural theology has mostly been the province of philosophers and theologians who have sought to clarify belief and thought. As cultural practice, it has been diffuse. We can point, for example, to only a few humanist and freethinking organizations that promote it in organizational terms, and – unlike other phenomena surveyed here (for example, environmentalism, magical practice, various healing modalities) – its symbolic expression in ordinary cultural life is hard to demonstrate. Thus, as *religion* it limps. For another problem, natural theology as an enterprise arises out of a negative characterization of the supernatural more than out of a positive preoccupation with nature itself. In other words, it comes trailing a long history of Christian ideology and antipathy to it. Yet the nod to the Enlightenment, with its natural religion and theology, has its compensating value for any survey of American nature religion. Its glaring weakness regarding institutional forms – its absence of nature “churches” – is only a stronger version of a glaring weakness that may be found repeatedly in this narrative. Cultural practice may be pointed to aplenty, but how and when does it stop being useful to describe it as religious? Where, in fact, does the definitional line end? Where does religion stop and something else begin?

The nod to the Enlightenment, however, has another value. It offers a useful caveat regarding the easy and exclusive identification of nature religion with benign landscapes and/or environmental activism. Like the other great theological terms that have haunted the Western mind – “God” and “man” – nature has no clearly visible

boundaries. The history of nature religion, from the time of the seventeenth-century multicultural contact culture that later became the United States to our own time, is a contested history. Both the contest and the undervisibility of the boundaries argue for the wisdom of being content with the broad-gauged Transcendental model as an interpretive trope for making hypothetical sense of nature religion. Neither purely environmental, nor simply neopagan, Goddess-oriented, and/or metaphysical, nor primarily deistic and rationalistic in an Enlightenment anti-supernaturalistic framework, this model suggests that to invoke the rubric of nature religion encompasses all of the above and very much more.

Perhaps the concept itself makes the most sense in a political context, and this in the end may be the strongest argument for continuing to employ the term despite the fragility of the phenomenon. Put simply, nature religion is a *bon mot* that has arisen in the very multicultural late twentieth and early twenty-first century as a sounding center for civil discourse. It offers a “common” that can be shared – both as a concept and as a condition that all must deal with, whatever their multicultural pasts and presents. Contra a “civil religion” that looks to a Jewish-Christian biblical revelation and a European Enlightenment ideology – both of them the historic domain of a privileged

Anglo-Protestant leadership community – and contra a “public religion” that secularizes the terms of that discourse to offer a mediating ethical restatement of Christian and Enlightenment values, nature religion begins not with history but with what stands over against it. The “againstness” is there for all, as a something that must be seriously confronted, something requiring – demanding – response. Nature religion, as an idea and phenomenon, reiterates democratic values, to be sure, by acknowledging the essential similarity and equality of human experience embedded in the reality that constitutes nature. But it also acknowledges forces and factors that delimit the human project – aspects of life over which humans, literally, have no control and before which they must bow. Bowing, of course, is one central and important act of worship. Bowing can also promote acts of public and communal reconciliation.

Ndembu Religion (South-central Africa)

With *The Forest of Symbols: Aspects of Ndembu Ritual* and subsequent ethnographies of the ritual life of the Ndembu of Zambia, British anthropologist Victor Turner embarked on what is still to this day one of the most innovative series of symbolic analyses in anthropology. Turner especially focused on rituals of initiation, divination, hunting and therapeutic rituals, and other religious processes in the context of the savannah cultures of South Central Africa. As indicated by the title of Turner's monograph which is itself taken from *Correspondances*, a poem on nature by Baudelaire, the natural environment plays a very important part in the lives and ritual cycles of the Ndembu.

The Ndembu of Northwest Zambia (formerly Northern Rhodesia) are part of a larger Lunda-related cultural complex that spreads out over the southern part of the Democratic Republic of Congo (formerly Zaïre), Angola and Zambia. This Lunda world has its core in *Kool*, the historical Lunda (Ruund) heartland in the province of Katanga, Congo. The Lunda, Ndembu, and other related groups, live in a varied environment of multiple microecological niches: plateau soils of clay, sand plains and rolling hills of wooded savannah, grass plains, shrub lands, woodlands, and gallery forests that grow along the numerous streams and rivers. Nature, in its rich variety, is an omnipresent fact of Lunda life. It constitutes the environmental horizon of Lunda experience, it patterns the social activities, the practical knowledge and the gendered labor divisions that rhythm daily life; it structures the individual life cycle from birth to death; and it offers the raw material that is "good to think with" in the production of symbolic and practical knowledge that is generated in ritual activities. As such, the natural environment provides a topological, projective space, both structured by and structuring the way in which the Lunda perceive their own body, their social relations, and their relations with the surrounding environment and cosmos.

Animals, but to an even greater extent also trees, offer a rich lived-in model to symbolize and signify essential Lunda notions of individual (gendered) health and social well-being, of the union and mediation of male and female in regenerative sexuality, of social reproduction through the creation and sustaining of kinship categories and lineage continuity, and of the political realities of the Lunda world. An example of the rich symbolism provided by trees among the Ndembu is offered in Turner's classic analysis of the "milk tree" (*mudyi* in Ndembu, *muwudi* in Lunda vernacular; Apocyc-

naceae, *Dyplorrynchus condilocarpon*). The milk tree, conspicuous for its white latex, plays a crucial role in girls' puberty ritual (*Nkang'a*). Ndembu women attribute several meanings to this tree: it stands for human breast milk and thus highlights the metaphorical patterning of the female body, symbolizing the nurturing bond between mother and child. Secondly, Ndembu women describe the milk tree as "the tree of a mother and her child," thus shifting the biological reference of breast-feeding to a wider social tie of profound significance in domestic relations and in the structure of the larger Ndembu community, namely the principle of matriliney (itself denoted by the word *ivumu*, womb) with its underlying notions of unity and inclusiveness. Beyond that, the milk tree also symbolizes the total system of interrelations between groups and persons that make up Ndembu society. At its highest level of abstraction, therefore, the milk tree stands for the unity and continuity of Ndembu society as a whole.

Trees, however, do not only signify female physical and social reproductive qualities. Among the Lunda, the central metaphor of the tree may also express masculinity and male life-giving powers through references to a tree's more vertical qualities of erectness, hardness, stiffness and rootedness (and its manifold associations with the rising sun, the rooster, the hunter's trap, the bow and other "masculine" features). In growing toward the status of senior elder, one becomes more tree-like, rooted in one place. The process of becoming an elder goes together with the acquiring of wisdom, exemplified by the qualities of erectness and immobility that are so typical of a tree. The tree-like immobility of the elder, most fully embodied by the royal title-holder, makes present the ideologically important unchanging continuity of the societal order, over and against the transformations of society as it is lived in everyday life. This is also one of the meanings implied by the invocations that Lunda ritual therapists make to the *kapwiip* tree (Leguminosae, *Swartzia madagascariensis*). In addressing this shrub-like tree, considered to be "the elder of all trees" because of its "bridging" qualities between male and female, left and right, red and white, Lunda therapists address the unchanging fixed normality to which the tree – and the elder – testifies through its immobility. This is also the reason why the Lunda king, as ultimate elder, as living ancestor and as both father *and* mother to his people, is identified with the *kapwiip* tree. In Lunda and Ndembu culture political title-holders, like this tree, are both root and fruit, male and female, phallus and womb, genitor and genitrix. As such, they also exemplify the structural tension which lies embedded in the complementary opposition between men and women, masculine and feminine, agnatic and uterine, virilocality and matrilineage, that underpins Lunda society as a whole. Therefore, the image of the tree, and the image of the elder as tree, is deeply political: through its similar capacity to bridge between the complementary oppositions that pervade Lunda society, the royal body, like trees, assures the interjoining of individual, social group, and cosmos and thereby maintains and perpetuates the ideal cultural order.

At the same time the image of the tree and, by extension, the land, becomes the means by which one's place in the social landscape is not only "rooted" in an ancestral space-time but also in a material historicity. The tree and, in particular, the *muyoomb*

tree (Amnardiaceae, *Lennea welwichii*), planted as a living ancestral shrine in the center of villages, seems to be one of the Lunda's preferred means for the production of historically situated locality. Trees do not only convey meanings of immobility or qualities of bridging and joining. The tree simultaneously conveys the *combination* of the idea of a central and static nexus with images of interconnection, knotting, and hence, mobility (as spatialized in the pathways leading into and away from each village). Therefore, in a seeming paradox, the Lunda notion of "place" (*pool*), although drawing on a pool of meaning related to rootedness, fixity, bridging, tying, and knotting, allows for movement through space, as the centuries-long Lunda history of migration and conquest exemplifies. Although place and a sense of locality and belonging are strongly situated in socially and spatially defined communities, they are also in a sense transportable and repetitive. As such, locality can be moved through space, recreated, or repeated in different spaces by planting new *miyoomb* trees and thus creating or growing memory, history, and belonging. Physical and metaphorical roots can thus emerge out of any social and material landscape, thereby allowing the transformation of forest into village, turning the subjects of newly conquered, dominated space into localized (i.e., Lunda) subjects and rooting the present place into the ancestral past while tying it to Lunda history. Simultaneously, the image of the tree strongly suggests that the production of culture and history is underpinned by a history of natural rhythm and processes of gestation, germination, and growth.

Neo-paganism and Ethnic Nationalism in Eastern Europe

Neo-paganism in Eastern Europe is based on a wide range of religious, cultural and political ideas and practices. In Russia it is represented by numerous, mainly urban, smallsize ethnic Russian groups and cultural associations (in Moscow, the Moscow Slavic Pagan community, the “Russian Warriors,” the Koliada Viatichei community, the Church of Nav’, the Satja-Veda Aryan community; in St. Petersburg, the Union of Veneds, the Tezaurus Spiritual Union, the School of Wolves; and the Sviatogor Warrior Center in Kolomna, the Kaluga Slavic community in Kaluga, Jiva Temple of Ingliia in Omsk, the Tur pagan community in Izhevsk, among others). There are also neopagan communities and organizations among certain ethnically non-Russian peoples in republics within the Russian Federation: these include the “Oshmarii-Chimarii” community in the Mari El Republic, the “Udmurt Vos” community in Udmurtiia, the “Erzian Master” political party in Mordovia, the “Chuvash National Religion” in Chuvashia, the Tengrianist movement in Tatarstan, and groups in the Komi Republic and Northern OssetiaAlaniia. The Native Ukrainian National Faith (RUNvira) is a network of communities in Ukraine which competes with many other autonomous neo-pagan communities like “Pravoslavie” in Kyiv, the Community of the Pagan Faith in Kharkiv, and others. The “Latvju dievturu sadraudze” is an umbrella neo-pagan organization in Latvia, and the “Romuva” community in Lithuania. Several neo-pagan communities and cultural organizations are also known in Belarus.

In Russia, Ukraine, Belarus and Latvia, most neo-pagan groups represent a radical form of the associated ethnic nationalist movements. In contrast to their Central and West European counterparts, local neo-pagans are mainly concerned with revitalizing traditional folk cultures, languages and identities, which are threatened with disappearance due to Russification, globalization, or both processes. Hence, there is an emphasis on the notion of “cultural ecology,” an approach that takes as its primary value the maintenance of the “purity” of ethnic or national culture. East European neo-pagans (Lithuanians aside) aspire to develop ethnic nationalist self-awareness (“Russianness” among Russians, “Ukrainianness” in Ukraine, etc.) and to spread it to the general public through fiction, religious literature, the mass media, and school curricula. Well-educated urban intellectuals (poets, writers, linguists, folklorists, philosophers, archeologists, ethnographers) play a prominent role among the leadership of neo-pagan groups, systematizing folk beliefs and developing consistent religious teachings which can be presented as the primordial ethnic or national religions. They also introduce

new religious rituals, establish their own sacred sites and sanctuaries, and serve the rites and holidays which they represent as old and authentic ones. Besides references to local historical sources which are usually scarce and fragmentary, East European neopagans borrow from Celtic, German and Scandinavian folk traditions, Zoroastrianism, Vedic traditions of ancient India, as well as occultism and Theosophy. Russian and Ukrainian neo-pagans highly appreciate the "Book of Vles" which they treat as an authentic pre-Christian Slavic chronicle. After a paleographic examination, the document has proved to be a fake. It was fabricated by Russian emigres (assumedly by the chemical engineer Yuri P. Mirolubov) in California in the early 1950s: they did their best to identify the Slavic ancestors with the prehistoric "Aryan" (i.e., Indo-European) pastoralists who roamed throughout the Eurasian steppe between Mongolia and the Carpathian Mountains led by the forefather Oryi, according to the "Book of Vles."

A widespread component of contemporary East European neo-pagan movements is their hostility toward universal cosmopolitan religions, which they accuse of authoritarianism, intolerance toward cultural variability, anthropocentrism, and responsibility for the destruction of the natural environment and of traditional culture. Participation in a green movement, however, remains limited: neo-pagans are nationalists more than environmentalists, and they emphasize cultural survival most of all. There is still no major shift toward activity for the protection of the natural environment although such concern is sometimes expressed. Russian and Ukrainian neo-pagans often treat Christianity as an evil ideology introduced by "the Jews" to subjugate all peoples, and especially Russians and Ukrainians. Similarly, Finnish and Turkic-speaking Chuvash neo-pagans in the Middle Volga River region view Russian Orthodoxy as an ideology of enslavement (the same attitude is expressed by the Tatar Tengrianists toward Islam). Yet, while rejecting Western Christianity, certain Russian neo-pagans are willing to reconcile themselves with Russian Orthodoxy, which they treat as a younger branch of the primordial Russian religion.

At the same time, neo-pagans have been influenced by the universal religions to the extent that some of them are seeking to develop ethnic monotheist traditions, such as Dievturība in Latvia, RŪN Vira in Ukraine, or the Russian Religion developed by Viktor Kandyba in Russia. Others (such as Koliada Viatichei) retain polytheistic beliefs; but many reject local variability in an attempt to create a uniform ethnic faith (sometimes also monotheist, for example, in Chuvashia). This trend is especially evident in the Republics of the Middle Volga Region.

Sometimes a "cultural ecology" orientation is taken to an extreme, resulting in biological and cultural racisms such as the "Aryan ideology" popular among some ethnic Russian, Ukrainian, Belorussian and Latvian groups. There is a close relationship between a neo-Nazi-like political extremism and this sort of neo-paganism which promotes "cultural ecology" at the expense of practical environmentalism and feminism, albeit an articulation of a "healthy way of life" and of harmony with nature is common to all the neo-pagan groups. Certain militant Russian, Ukrainian and Belorussian neo-pagans have also established schools for "warrior training" where they teach wrestling

and battle skills, both with and without traditional weapons (sword, battle-ax, shield, and the like).

Some of them are obviously in contact with and borrow a lot from the Nordic neo-pagans such as Odinists and Ásatrú people (Aryan identity, Arctic homeland, runic magic, et al.). Julius Evola's and Herman Wirth's ideas are also highly appreciated and adapted to the Russian environment by the radical neo-pagan Russian nationalists.

By contrast, the less nationalistic and more liberal the movement, the more it tends to promote feminism and environmentalism. The latter are especially characteristic for the Lithuanian neo-pagans, in part because ethnic Lithuanians make up a dominant majority in Lithuania and see no threat to their culture and language from anywhere. Such nature-oriented values are shared by the Tezaurus Spiritual Union among ethnic Russians and, especially, by the Middle Volga Region neo-pagan movements. Harmony with nature and rejection of consumerism are central to the Koliada Viatichei faith, the teaching of Dobroslav (a form of Russian neo-paganism which is based on national socialism), the Ukrainian "Pravoslavia" movement, and some others. Certain movements focus mainly on human health and self-treatment; the Porfirii Ivanov's "Detka" teaching is the most popular of them comprising a few dozen thousand followers.

Neo-Paganism in Ukraine

Though interest in pre-Christian religion can be found throughout the pre-Soviet and Soviet eras, modern neopaganism, or contemporary Ukrainian “native faith,” emerged in Ukraine in the aftermath of Gorbachevian *perestroika* and has undergone its most dramatic growth since the early and mid-1990s. Ukrainian *ridnovira* (literally, “native faith”) includes such groups as *Pravoslavia* (Orthodoxy, or Right-worship), *Obiednannia Ridnoviriv Ukraïny* (Association of Ukrainian Native-Faithers), *Sobor Ridnoï Ukraïnskoï Viry* (Synod of the Native Ukrainian Faith), *Triitsia* (Trinity), *Perunova Rat’* (Perun’s Host), *Ladovira*, and devotees of the goddess Berehynia. Many, though not all, of these identify themselves as *yazychnyky*, the term customarily used for pre-Christian animist and polytheist (“pagan” or “heathen”) practices.

Ukrainian neo-paganism and native faith derive from several general sources, including 1) folkloristics, ethnography, and the study of traditional music, arts, and medicine; 2) the study of Ukrainian prehistory, including speculations on prehistoric cosmology and astroarcheology, debates about the ethnocultural affiliation of the Trypillian, Scythian, and proto-Indo-European or “Aryan” archeological cultures, and writings on controversial texts such as the *Book of Veles*; and 3) the neopagan revivalism of émigré writers Volodymyr Shaian and Lev Sylenko. The majority of Ukrainian neo-pagans take their modern founder to be Lviv University Sanskritologist Volodymyr Shaian (1908–1974), author of *Faith of Our Ancestors*, who in the 1930s began advocating the revival of Ukrainian paganism and who worked toward that goal, with minimal success, in Britain and later Canada. Shaian saw Ukrainians, alongside other Slavs, as the central branch of the “Aryan race” and called for a “pan-Aryan renaissance” opposed to the Germanocentric Aryan theories informing Hitler’s Reich. The best-known leader of contemporary Ukrainian neo-paganism is Halyna Lozko (*Volkhvynia Zoreslava*), a philologist, folklorist, and university lecturer in religious studies. Lozko and her associates founded the Svitovydy Center for the Rebirth of Ukrainian Culture, the School of the Native Faith (in 1995), the journal *Svaroh*, and, in 1998, the Native Faith Association of Ukraine (ORU). The ORU has been prominent in the effort to recognize the *Book of Veles* (*Velesova Knyha*) as an authentic pre-Christian text, despite its dismissal as a late-modern forgery by most scholars. Many neo-pagans claim the *Book of Veles* as their holy writ, seeing in it an ancient manual of hymns and prayers, myths, sermons, theological tracts, political invectives, and fragments of historical narrative covering the movements of the ancestors of the “Rusyches” or “Oriians” across vast territories between the Indian sub-continent and the Carpathian mountains over some fifteen centuries. The text’s emphasis on ethnic or cultural identity amidst a world of

enemies has arguably resulted in a deemphasis (for neo-pagans) of the ecological concerns that marked the upsurge of Ukrainian ethnic nationalism in the postChornobyl late 1980s. Neo-pagans such as Lozko see the assertion of Ukrainian ethnic identity as equal, if not greater, in importance to the preservation and defense of nature. The two are seen as inherently intertwined and equally threatened by economic and cultural globalization, cosmopolitan Westernization, and the legacies of “Sovietization,” Russification, and several centuries of “Christianization.” The ORU thus works to prevent the “ruination of the ethnosphere,” which is seen as a necessary component of the Earth’s biosphere.

A related stream of native faith is *RUNVira*, an acronym for the Native Ukrainian National Faith. *Runvists* consider themselves a “reformed” native faith, a transformation and completion of the original Ukrainian polytheism in favor of a scientifically grounded monotheism, or panentheistic monism, centered around

Dazhboh, an impersonal representation of the life-giving energy of the cosmos. Founded in North America by Lev Sylenko, a one-time member of Shaian’s Order of the Knights of the Solar God, *RUNVira* takes as its bible Sylenko’s 1427-page *Maha Vira*, which purports to be an 11,000-year history of Ukraine and a prophetic message for a new era. Small groups of *runvists* appeared in the 1960s and 1970s in Ukrainian émigré communities in North America, Britain, and Australia, and the “Oriiana” Temple of Mother Ukraine was established as the religion’s center in New York State’s Catskill mountains. The first *RUNVira* congregation in Ukraine was registered by Kyiv authorities in 1991, and by the end of the 1990s there were about fifty officially registered and at least another dozen unregistered *RUNVira* congregations across the country, ranging in size from a few families to over a hundred members. A split within the international *RUNVira* movement has resulted in the existence of rival associations of Ukrainian *runvists*, with some moving towards a more generic and eclectic form of Ukrainian native faith while others have retained a strict interpretation of the writings of the founder. Sylenko himself remains alive but in poor health in New York State.

An assortment of other nature-centered, cosmoecological, and theosophical movements overlap with the native faith milieu. These include the Ukrainian Spiritual Republic (*Ukraïns’ka Dukhovna Respublika*), founded by science-fiction writer and mystic Oles’ Berdnyk; the followers of nature mystic and teacher Porfyrii Korniiiovych Ivanov, founder of a system of natural health and philosophy which has spread from rural eastern Ukraine to other parts of the former Soviet Union; a large but diffuse “Vedic” movement; and a range of writers and publications, sometimes called “Aryosophists,” who have been propagating the (scientifically unsupported) theory that Ukrainians are the most direct descendants of prehistoric “Aryans.”

Ukrainian neo-paganism and native faith finds its main base of adherents among nationally oriented ethnic Ukrainians of higher than average educational levels. Sociologists suggest there are over 90,000 Ukrainian neopagans and *ridnovirs* (or 0.2 percent of the population), though active community membership appears much smaller. There is a broader interest in topics related to paganism and Ukrainian prehistory, and in

the revival of folk calendar customs connected to pre-Christian practices (such as the midwinter Koliada celebrations and midsummer Kupala rites), which frequently take place within a Christian context but are now being reclaimed as pagan festivals. Membership in neo-pagan and native faith groups overlaps with that of folk and traditional music revival groups, Cossack associations, traditional martial arts groups, and nationalist and ultra-nationalist political groups. Though environmental activism is rare among Ukrainian neo-pagans (as it is among Ukrainians more generally), a concern for nature is often voiced as a primary motivating factor for the conversion to a native faith perspective. This concern manifests as a general desire to return to a time when people lived in direct relationship and harmony with nature, rooted in the land and in a sense of communal honor and self-respect, familial and community ritual, and responsibility toward one's ancestors.

Neo-Wessex Archeology

Neo-Wessex (named after a region of southern England rich in Neolithic monuments) is a term used to distinguish a number of archeologists who advocate the interpretation and recovery of the mental states of past peoples, especially in relation to prehistoric ideas of place, or landscape. These archeologists consider the landscape within which prehistoric peoples once dwelt, along with the built monuments it contained, to have not only reflected those people's belief systems and social structures, but also to have played an active role in their ongoing creation and perpetuation. Influenced by the hermeneutics of philosophers such as Martin Heidegger, Hans-George Gadamer and Paul Ricoeur, as well as by theoretical currents within archeology that attempt to interpret the past in ways transcending a purely materialistic framework, Neo-Wessex archeology emerged in the early 1990s advocating a more emphatic, less "scientific," approach to material culture. This interpretative approach, which includes attempting to "read" the past subjectively as well as actively engage with the cognitive (even experiential) states of prehistoric peoples, has resulted in a number of methodological experiments that are open to the recovery of past religious experience, meaning, and change.

This approach rests upon the assumption that the landscape in prehistory held a cognitive dimension, a collection of meanings (myths, rituals, normative precedents, etc.), which extended its value far beyond concerns with land usage of a solely utilitarian or materialist nature. In addition, it is hypothesized that such an infused understanding of the surrounding world was the cognitive framework through which all of life's activities were played out, be they primarily environmental, biological, socio-political, or religious. Hence, this ritualistic understanding filtered and permeated each and every daily action. As the landscape was modified by human activity, through the creation of monuments, graves, paths, and places of habitation, etc., its form was molded to further reflect and reinforce the preexisting layers of meaning. However, such modifications to the surrounding landscape necessarily affected its cognitive reading, and therefore not only did the modified environment reflect extant social forms and belief systems, but over time it also came to exert additional new elements of its own. As the landscape changed and people developed new ways of interacting with their surroundings, the meanings it held for its inhabitants changed also and, in turn, these reinterpretations were projected back onto the lived geography.

One of the aims of the Neo-Wessex archeologists is the hermeneutical recovery of this process, arrived at through the examination of a prehistoric people's material remains, the ancient geography they existed within, and possible relationships between

the two. The interpretive tools used to establish such elusive meaning extend far beyond the hard sciences and include generalized anthropological and humanistic principles, comparative ethnohistorical evidence, and even personal emphatic insight. The imaginative hypotheses that are critically applied to the material culture thus have their own history, especially the comparative ethno-historical analogies all of which come from their own historical contexts. This is especially true of the founding premise that prehistoric space was mediated and ritualized space, existentially significant and permeating all other cultural and environmental relations, an idea appropriated partly from ethnographic research on the Australian Aborigines.

One result of this stress on the importance of systems of belief and perception in the interpretation of all aspects of past culture has been a growing awareness of the central part religion played in the worldview and actions of past peoples. It is the realization that for many traditional cultures social and spiritual meaning was contained within the lived landscape and permeated all experience that has caused purely environmental and economically functional explanations of why people acted and why culture changed to be deemed insufficient. Economy, biology, and politics are seen as having been indistinguishable from the essentially religious systems of meaning that encompassed them. Accordingly, the NeoWessex approach allows a reconciliation of the polarity between functional/environmental utility and systems of belief/ideology that archeologists have often been wont to project backwards in time onto the cultures they study. Advocates of the new perspective attempt to free modern reconstructions of the past from just such an overly rationalistic bias based upon modern premises of secularization, materialism, and functionalism and to produce less limited, more imaginative visions of prehistoric culture: visions perhaps more true to how those people may have once perceived themselves.

The researchers following a Neo-Wessex approach to landscape are varied in both their focus and the degree to which they commit themselves to the rather abstract outline given above. The classic Neo-Wessex approach to landscape is provided by Christopher Tilley.

Nepal

A pervasive and misleading mythology about religion and nature in Nepal – and the interrelationship between the two – has developed in “Western” popular culture over the last three or four decades. This particular vision usually depicts Nepal as a natural and spiritual paradise, in which a profoundly devout people with deep spiritual links to nature live in blissful harmony with the surrounding near-pristine environment.

Whilst many Nepalese are indeed deeply religious and the beauty and power of their natural surroundings is ubiquitous, the realities of the situation are nonetheless typically very different to those sketched above. In many places deforestation and pollution have sorely degraded the environment, a circumstance that reflects ambivalence toward the natural world on the part of many Nepalese. This ambivalence is arguably also evident in certain of their core religious beliefs, and appears to have evolved from the often far from idyllic character of the Nepalese peoples’ actual experience of nature.

Altitude and climate severely limit the scope for agriculture in much of the country, and although 90 percent of the population is estimated to be involved in agriculture, this is largely on a subsistence basis, with famine a constant specter for many. For mountain and hill dwellers freezing temperatures and avalanche are a genuine source of danger in the winter, whilst monsoon mud and landslide take an annual toll in the hillside villages. Although not as prone to dramatic cataclysm, the jungles of the Terai were – until recent massive chemical sprayings – malarial death-traps, and a variety of tropical diseases still take an alarming toll among the region’s inhabitants.

Many Nepalese therefore experience the natural environment as a powerful and potentially hostile “other” with which they must make some accommodation to ensure their own survival. Whilst it remains a fundamentally alien realm, it is (with certain exceptions) perceived as available for human exploitation, provided appropriate ritual preconditions have been met.

This vision of the forces of nature as potentially inimical – yet still available for exploitation – has had the consequence of allowing significant environmental degradation. It is a perspective which is deeply ingrained in the folk religions of Nepal, and these in turn have had a considerable influence on the Hindu and Buddhist religions which have largely supplanted them.

The folk religions date from remote antiquity, and are probably a fusion of the beliefs of the original indigenous inhabitants with those of the Tibeto-Burman and IndoAryan tribes who (many millennia apart) came as settlers to the region. Being preliterate cultures it is impossible to identify their beliefs with certainty, but available evidence suggests that they practiced a form of animism: that is they believed that every aspect

of the phenomenal world, from crops, weather and mountains, to fertility and disease, was the consequence – or even the actual manifestation – of an extraordinary variety of supernatural beings.

These gods, demons, and spirits – and therefore nature itself – had a multiplicity of responses to humanity, some hostile, some welcoming and many simply ambivalent. Although invisible in normal context, they were perceived as ever-present and easily prone to taking offense, the consequences of which might be felt in any manner of natural catastrophe such as landslide, drought, fire, or illness. Conversely their cooperation was regarded as essential to the successful outcome of many endeavors, from constructing a house, to growing crops, to safely completing a journey through the mountains. Rituals were developed to deal with certain common situations: a symbolic offering would be left as thanks for the cooperation of the attendant deity when a mountain pass had been safely crossed, prayers and offerings would be made to placate the Earth spirits when turning soil in a particular area for the first time, and so on.

Given that the supernatural beings had their main existence in a world beyond the mundane, a specially skilled intermediary was required when more complex transactions with them were required. These specialists commonly displayed the attributes which we would associate with the word “Shaman,” entering a supranormal state of consciousness, either trance or ecstatic, to communicate with the being in question. He or she would thereby determine the actions necessary to placate or win the cooperation of the entity, which would usually require some form of offering or sacrifice. Interestingly, most animals do not appear to have had any status in this hierarchy aside from their value as commodities, and were themselves often offered as a sacrifice.

The welfare of the people was obviously regarded as dependent upon the success of the intermediary, and as such they held a valued and powerful position in Nepalese popular religion. Indeed they remain an ever-present feature in rural (particularly tribal) societies throughout Nepal, where they are often known as Jahkri or Dhami. While many confine their activities to the traditional role as intermediaries between the human and spirit worlds, some also perform the function of village priest or religious specialist. Those of the Limbu tribes, for example, have expanded their duties so that they include not only communication with gods, demons and spirits, soothsaying and healing, but also the performance of religious rituals, prayers, and sacrifice when not under direct “spirit control.”

In some Nepalese communities – among certain of the aforementioned Limbu tribes for example – the folk religion remains predominant. In most cases it has been supplanted by Hinduism, whose roots go back to the Indo-Aryan tribes who settled in Nepal approximately three millennia ago. They had brought with them some distinctive customs – including the recitation of a group of hymns called the Vedas – with their emphasis on the gods of nature, Agni, fire, Varuna, water, and Vayu, wind, presided over by the rain-god, Indra. The wrathful goddess Durga retains great popularity, and is worshipped in all her manifestations during Dashain, the largest of the Nepalese annual festivals, but the principal gods of the modern era are the triad of Shiva, Vishnu

(conceived as having entered the world in the human form of Rama and later Krishna) and Brahma. Hindu philosophers explain that all gods are aspects of the one Brahman, a transcendent, unifying all-pervading deity, and that the world is governed by the principles of karma.

The broader relationship of Hinduism with nature – as it is experienced globally – is discussed in a separate entry, but in local context it clearly has much in common with aspects of Nepalese folk religion. Again there is a sacred element to the forces of the natural world, which are to be treated cautiously but are still available for human exploitation provided that the appropriate ritual conditions are met.

These often find their place in the large, spectacular festivals for which Nepal is renowned, many of which have connections to the seasons, climate, agriculture or harvest, or some other form of natural resource management. Amongst the more obvious examples of this is the Indrajatra, usually celebrated in August/September, which appeals to Indra to provide the rain necessary for the harvest of the rice crop.

Nepalese Hinduism and folk religion also find common ground in that both continue to perform animal sacrifice, a custom which has been abandoned by most other Hindus as contrary to the precept of *ahimsa* (nonviolence). The practice is common throughout Nepal, although the Dakshinkali temple on the outskirts of Kathmandu is famous for the numbers of chickens, pigs, goats and other animals which are slaughtered every Saturday on behalf of pilgrims. Such sacrifice can be traced to Hinduism's roots in Vedic society, where it was offered either as a way of providing sustenance for the dead, or – as it is usually performed in the Nepalese folk tradition – as an act of exchange or offering to spirits or gods, from whom some reciprocal boon was expected.

It is in the character of this latter form of offering that most contemporary animal sacrifice seems to take place, although more sophisticated adherents of the practice have justified it as ultimately being a kindness to the animal, which is thus released from a life of suffering, and brought one step closer to a more fortunate rebirth as a human being. This perspective could be seen as reflecting the tradition, which emphasizes the illusory nature of the material world (*maya*) and asserts the importance of transcendence, but it seems likely that – on a popular level at least – it is the widespread belief in the efficacy of the practice that explains its persistence rather than more abstract concerns for the creature's spiritual welfare.

A rejection of animal sacrifice – and indeed the unnecessary killing of any living creature – is of course one of the hallmarks of the other numerically significant religion in Nepal: Buddhism. The Buddhism practiced in Nepal is largely that of the Mahayana school, commonly associated with Tibet. The Buddhist perspective on nature is a complex one: the phenomenal world has ambivalent status as it is characterized by suffering, but it is also the ground from which the enlightened attitude of compassion is developed, as the Buddhist's ultimate wish is to attain enlightenment so as to bring all beings to enlightenment. The concept of interdependent origination is also important. This emphasizes the connectedness of everything and gives significance to all life.

While such perspectives are embraced and understood by a small, educated elite, the majority of Nepalese Buddhist practitioners appear to follow more simple precepts, such as refraining from killing animals personally, because the Buddha stressed the importance of compassion. Otherwise their perception of the natural world is that of the local folk beliefs: hardly surprising given their shared cultural history. Thus they also regard the natural world as alive with spirits, and when necessary call upon the priest or lama – and in some cases the local Jhokra – to mediate on their behalf. The belief in these spirits is strong at all levels of Buddhist society. Testament to this are the local rNying-ma lamas of the Jomsom area, who volubly maintain that the destruction by landslide of their monastery several decades ago was the result of the wrath of a local mountain deity who was affronted by a foreign mountaineering party which had stayed with them, but failed to undertake the appropriate rituals of permission before venturing up its slopes.

Perhaps the best-known festival of the Kathmandu valley is that of the Red Machchendranath: the local god of rain and fertility. Originally a local Newar and Buddhist festival, Machchendranath is regarded as the deity who brings the all-important monsoon rains to the region, and as such is now worshipped by virtually the whole populace irrespective of religion or caste.

The Nepalese perspective on nature has been problematic in its effects. While it encourages people to respect the environment and reflect upon their interaction with it, it also inclines the popular imagination toward the view that the environment is a commodity which can be exploited heedless of other consequences once the requisite ritual actions have been performed (the exception being actions that are specifically taboo such as the killing of cattle by Hindus, or the defilement of any site deemed sacred). This has left the path clear for the extraordinary environmental damage that has been wrought throughout the country in the latter half of the twentieth century.

In the last few decades there have been increasing attempts to tackle the problems of environmental degradation. Initially these took place under the auspices of foreign aid bodies, but there has been a growing local awareness of the problem. This has inspired a movement within Hindu and Buddhist circles actively to promote the idea of the sacred totality of nature as expressed in their religions as an alternative to the exploitative model. In practical terms this has also led to the creation by religious leaders and groups of a variety of societies, projects and trusts with ecologically “friendly” objectives.

Network on Conservation and Religion

In September 1986, to commemorate its 25th anniversary, the World Wide Fund for Nature (WWF) founded a Network on Conservation and Religion. At the initiative of the then-president of the WWF, Prince Philip of the UK, and Martin Palmer, director of ICOREC (the International Consultancy on Religion, Education and Culture), a strange mix of environmentalists, including grassroots environmentalists, prominent officers of WWF-International, and representatives from the five so-called world religions (Buddhism, Christianity, Hinduism, Islam and Judaism) undertook a pilgrimage to Assisi, Italy, the birthplace of St. Francis, the Roman Catholic saint whom the Vatican had in 1979 given official status as a heavenly protector for environmentalists.

The final session was staged as a religious ceremony in the basilica raised above the grave of St. Francis, and included apologies to First Peoples represented by a Maori warrior. Representatives of the religious traditions read their declarations on religion and nature and pledged themselves to cooperate with each other and the WWF in order to help save the planet, Mother Earth, from ecological disaster. The WWF Network on Religion and Conservation (sometimes also called The New Alliance), was thus formally established. Other religions joined the network in subsequent years, including Bahá'í, Sikhism, Jainism and Daoism.

The ideas behind the Network can be summarized as follows: the religious traditions, with their spiritual and ethical values as well as their billions of adherents and their impact on substantial geographical and cultural areas all over the world, can cooperate with conservationists to make a substantial and durable contribution to environmental thinking and practice. Though recognizing that the religions in the past have not always contributed in a positive way to the conservation of the natural environment, the Network sees them as an alternative to a purely materialistic, dualistic, anthropocentric and utilitarian worldview which has been partly responsible for creating the environmental crisis.

The event in Assisi, and the issuing of the declarations (published by WWF-International as *The Assisi Declarations on Religion and Nature: Interfaith Ceremony*,

WWF 1986) set the standard for the activities (interfaith meetings, celebrations of specially designed ceremonies like Harvest rituals, environmental projects run by religious communities in collaboration with scientists and the WWF, publication of more declarations) of the Network from 1986–1995. During this time, the WWF Network on Conservation and Religion published a periodical *The New Road*, and in cooperation

with WWFInternational and ICOREC it helped pave the way for several other publications, including among others the series *World Religions and Ecology* published by Cassell. In 1995, the WWF Network on Conservation and Religion was subsumed by the Alliance of Religion and Conservation, ARC.

New Age

The New Age movement is an amorphous association of people who identify primarily as spiritual explorers. Many if not most feel that humanity is at the dawn of entering into a new form of consciousness. The new Age of Aquarius, unlike its Piscean predecessor, is to be a time for balance between male and female qualities, the elimination of aggression and power obsessions, and a civilization more in tune with the rhythms of nature and based on a more equitable development of human potential. New Age adherents or associates, inevitably characterized by various forms of spiritual syncretism, are seekers after what they believe to be truth and peace. With this protean mix of nuance and the bizarre, the New Age itself remains among the more difficult of contemporary spiritual developments to comprehend and portray, but as a “religion of commodification,” it parlays with any number of alternative medical or psychological methods ranging from meditation, acupuncture, homeopathy, aromatherapy, astrology, environmentalism, Hermetic practice, Esoteric Christianity and Goddess Worship.

Beneath the popular image of New Age, its antecedents derive from various venerable aspects of what Colin Campbell terms the “cultic milieu.” Among these we find the Spiritualist, New Thought and Theosophical traditions of the nineteenth century. From these particular orientations, New Age inherits its practice of channeling spirits or entities from other dimensions, its belief that both illness and poverty are illusions or diseases of the mind, and its understandings of karma and reincarnation. The “cultic milieu” is itself a mix of non-mainstream spiritual and esoteric ideas imported from the East and blended with Western occult and pagan notions. The bedrock New

Age spiritual position is Gnostic or Transcendental and seeks divine truth as something masked by the physical phenomenal world. From this perspective, nature is considered ultimately an illusion and something that must be penetrated to gain access to “higher understandings.”

In the 1960s, at the Esalen Institute in Big Sur, California, the Jewish-German expatriot Fritz Perls introduced his Group Gestalt Therapy with its stress on the value of immediate, authentic experience within a framework that takes the mind/body as a holistic organism rather than a Cartesian dichotomy. Perls, along with such seminal thinkers as Wilhelm Reich, Otto Rank, Kurt Lewin, and Carl Rogers and such complementary practices as Abraham Maslow’s Self-Actualization and Roberto Assagioli’s Psychosynthesis, launched the field of humanistic psychology from which the Growth and Human Potential movements took their birth. Beginning in California and quickly spreading beyond, Human Potential intertwined with the American psychedelic heritage and spawned numerous self-help/psychophysical therapeutic practices. As these

became increasingly integrated with the “cultic milieu,” the New Age as a self-conscious spiritual movement began to evolve.

Following the emergence of transpersonal psychology from humanistic psychology and concern with the transcendent potential of the individual in self-actualization, New Age represents the spiritualization of the Human Potential movement. Placing relationship with divinity into a holistic worldview, any development of an ecology of self eventually includes an ecology of the planet and the potential for cross-fertilization with the concerns of deep ecology. Succinctly, and grounded by the astrological consideration that we are leaving an age of Pisces for the new age of Aquarius, the New Age is an expectation of individual change that will coalesce into a quantum leap of collective consciousness. Following current theories of complexity that study spontaneous self-organization in which the whole becomes more than simply the sum of its parts, New Age continues the idealism of the counterculture of the 1960s as a modification if not refutation of contemporary cynical trends by affirming the reality of magic as it relates to self-transformation, communal development and progressive global change.

While New Age derives from specific cultural or subcultural trends (Theosophy, spiritualism, humanistic and later transpersonal psychologies), it is nevertheless a disparate conglomerate of different movements and/or religions. Sociologically, it remains difficult to grasp. It is neither a traditional church, identifiable sect, mainstream denomination, nor a single unorthodox cult. There is no institutional mechanism for determining membership or countenancing expulsion, no one who can speak for the movement as a whole, there is no list of creeds, and there is no register of membership. It is instead a loose series of networks, often cellular and replicate, with a constantly shifting rostrum of spokespeople, therapists and teachers. In short, its fluid organization or even non-organization makes it more of a consumer phenomenon than anything that could be understood as traditionally religious. In fact, New Agers frequently proclaim that they are not religious but spiritual. This non-institutional nature and marketing choice of New Age appears to be its underlying appeal. The New Age represents *a* if not *the* spiritual consumer supermarket that is steadily superseding the appeal of traditional religion in the Western world. In the presentday context of rapid social change, New Age may be cited as an affirmation and celebration of spiritual choice. But this in turn leads to severe accusations of cultural appropriation – especially from identity-endangered peoples such as Native Americans and the Aboriginal peoples of Australia. As a rebuttal, New Age insists that the multi-cultural register is now public domain and accessible to everyone.

In short, an inordinate amount of criticism is directed against its varied practices and more prominent beliefs. Foremost is the critique that dismisses New Age spirituality as essentially narcissistic. The self-preoccupation that has to do with “me” only is described as touchy-feely, airy-fairy, intellectually vapid and eclectically woolly. For many, New Age is described as cheaply false, spiritually kitsch, and a mumbo-jumbo mash that is pastel-colored and lavender-scented. Its central purpose is frequently understood by the non-sympathetic as little more than an effort to make money from

those reputedly foolish enough to purchase the many gimmicks and psychophysical therapies that are marketed under the widely embracing label of New Age.

The New Age response to anti-religion criticism accepts that religions have their roots in early practicalities and anxieties but argues that uncertainty and the need for pragmatic solutions is no less a part of our ever-changing and increasingly complicated world. The New Ager is also as likely to retort that if Christianity, Buddhism and the other major religions are now established, they were not always so but were once themselves essentially new religious spiritualities. Despite the wide range of beliefs and practices that might fall under the general rubric of "New Age," as a religious perspective, New Age is no less a shared attempt to understand what constitutes the world, humanity and the supernatural and the relationships between them in ways that give meaning to participants' lives and help them determine what is valuable within some sort of workable framework. The heart of New Age is not such superficial peripherals as candles, crystals and incense, but is instead the increasing awareness in today's world of individual difference and cultural multiplicity that religious choice is a personal decision. Insisting that religious truth is no longer the monopoly of private elites or esoteric cabals, New Age religion may be said to represent a democratization of spirituality within the emergent information age that validates universal suffrage to spiritual prerogative.

Consequently, the shallow, scented and evasive proclivities of what is termed characteristically New Age are primarily a media-induced creation. The press has tended to sensationalize the practice of channeling, use of crystals and the reputation for "flakiness," but New Age itself may be something more than these. As holistic theoretician Marilyn Ferguson describes it, there is an "Aquarian conspiracy" that endeavors and promotes humanitarian and ecological consciousness. The problem for New Age in gaining a respectable public image perhaps lies more with the fact that decentralist empowerment policies, citizen diplomacy missions, ecological and educational reform, and integral thought do not sell newspapers. Apart from the unresolved issue of cultural "theft," New Age's deepest problem is a public relations issue.

Nevertheless, New Age appropriation from a truly holistic perspective might constitute the movement's Achilles' heel. Inasmuch as New Age facilitators exploit indigenous culture for financial profit and selfgratification, they remain largely insensitive to the suppression, denial and socio-economic constraint under which the traditional holders of such culture have labored. They also appear to be callous with regard to the damage and destruction they cause to the heritage of people whose identity and potential for survival are intimately connected to their own spirituality. For those for whom knowledge is something that is privileged and not simply a marketable commodity, the unscrupulous and ruthless exploiter of "sacred knowledge" becomes simply a fraud, charlatan, liar and cheat. The "plastic" shaman and New Age wannabe who claim that practicing native spirituality is "their right" are condemned by those who feel robbed as seeking "a quick-fix or religious Band-Aid." If it were true that spiritual property can

no longer be privately owned, New Agers have consistently demonstrated a flagrant lack of sensitivity to the broader consequences of this issue.

Analytically, New Age may be broken down into three distinguishable and often overlapping orientations: occult, spiritual and social. Occult or esoteric New Agers accept the supernatural as a real and intervening force in human and terrestrial affairs. Frequently there is in this orientation an expectation of violent or even apocalyptic Earth changes (storms, famine, earthquakes, pole shift, plagues) that will constitute the transition into the new era. There is general acceptance of a *deus ex machina* or divine intervention as the instigator if not designer of collective consciousness emergence. By contrast and unlike the media-promoted occult side of New Age with its associations of spirit guides, channeling, crystal meditation and appropriation of symbols from different cultures, the spiritual and social dimensions of New Age place their emphasis on human effort rather than supernatural intervention. The former stresses spiritual development of the individual – whether through meditation, yogic practice, shamanism, personal discipline, human potential and/or psychophysical therapy. The rationale is based on the belief that as individuals develop and transform, so too will both global society and the human biosphere. Personal enlightenment in enough numbers will bring about collective enlightenment (i.e., a new age). The social dimension of New Age, on the other hand, is epitomized in Ferguson's 1980 publication of *The Aquarian Conspiracy*. Here the emphasis is on social service and pragmatic work in the areas of educational, institutional, environmental and remedial change. The concern is neither with the self nor with transcendental or magical assistance but with concrete work that brings about empirical transformation. The social-service wing of New Age preoccupies itself with charity work and both humanitarian and ecological reform.

When critics ignore the more serious and less sensational sides of New Age, they tend to dismiss it as little more than a fad. New Age becomes accused of being shallow, self-indulgent, escapist and superstitious – offering little more than a potpourri equivalent of snakeoil cures. But once again, even to the degree that such accusations may contain an element of accuracy, faddism is simply New Age's means and not its goal. New Age uses the currently popular to explore, test and digest each religion's symbols, images, objects and "spiritual truths" as resources to understand their validity and usefulness. While to date much of this pursuit can accurately be labeled uncritical and insensitive, New Age's insistence on the undemanding and pleasant is simply a reflection of present-day consumer-society mores. The critic accuses New Age of adopting the position that "anything goes," but the reality of New Age experimentation is that everything is tried and sampled. There are no restrictions. This is the way it seeks to uncover meaning and value within a religious framework that applies as much to the individual as it might also to various collectivities, communities, society or the planet.

Despite the great disparities of practice and pursuit encountered throughout the broad range of what can be labeled as New Age, we find certain common denominators of belief. Among these there is the acceptance that we have all lived previously; that our present life is not our first or only life. This attitude is largely to be traced to Eastern

ideas of reincarnation that New Age inherited from Theosophy. It is predicated upon the essentially Gnostic belief that the cycle of rebirth is something from which to escape and transcend. In this sense, New Age contrasts strongly with contemporary forms of Western Paganism that embrace the world as a desirable and welcome reincarnation as offering a means for the return to earthly life. The corollary to this, therefore, is that New Age is less likely than Western Paganism to promote environmental activism.

From its Spiritualist legacy, on the other hand, New Age accepts that we can communicate with the dead. Once again, this possibility relates to the idea that this life is not all that there is. With or without reincarnation, or at least between successive incarnations, there is, to use the Spiritualist designation, Summerland – the realm of spirits in the beyond. Spiritualism insists that we can communicate with our deceased family members and loved ones for guidance, knowledge and confirmation. New Age has tended to take this further and, especially through its Theosophical affinities, is less interested in the departed as it is in contacting spiritual masters or mahatmas, extraterrestrial beings or space-brethren, and extradimensional discarnates. New Age is not concerned with Spiritualism's desire to *prove* the existence of life after death but rather with the acquisition of "higher wisdom" to assist one's spiritual development in the here and now. At the same time, as environmental alarm increases in the world at large, New Age channeled messages have revealed a growing turn toward more "green" issues.

From its origins in New Thought, New Age assumes that evil is an illusion of the mind. It seeks therefore to eradicate both illness and penury for the individual – at least the evolved individual who comes to understand the almost limitless power of the human brain and its relationship to ultimate universal energy. For New Age, this translates into the doctrine that we can heal ourselves. Its many Human Potential therapies from Rolfing, yoga, Reiki, shiatsu, reflexology, t'ai chi, gestalt, encounter, bioenergetics, iridology, *est*, Zen, Aikido, neo-shamanism, Transactional Analysis and Transcendental Meditation are simply different vehicles through which the New Ager seeks self-healing. In other words, these techniques aim to assist the individual toward actualizing the implicit assumption that the negative is simply a figment of the imagination. As New Age shaman Jonathan Horwitz perceives the healing consequences of the illusory nature of evil, the challenge arises from this to "network nature" and halt the "slaughter of the environment" – using the powers of the universe in the optimum way for the planet and all its inhabitants.

The Human Potential aspect of New Age also relates directly to what could be identified as a fourth New Age belief, namely, that we are in charge of our lives. This attitude, along with the belief that the negative or evil of illness and deprivation is an illusion, comprises the singular uniqueness of New Age: its insistence on the positive and utter denial of hindrance. In this sense alone, New Age is an affirmation that demands the world to be as it wishes. Concepts of retribution, original sin and punishment become completely alien in the New Age context, and however naive and foolish such an attitude might be judged to be, New Age represents a daringly coura-

geous spirituality that affirms the power of positive thinking as a means to obtaining progressive ends. If there is one spiritual principle that distinguishes New Age from the world's other major religions, it is probably this. To the degree that the "negative is encountered," it is seen simply as an "opportunity" for spiritual progress.

And, finally, in keeping with its place in the Gnostic lineage, New Age is the belief that spiritual truth comes from within. Insight is not a product of revelation or external acquisition, but one of inner development and discovery. In this complete valorization of self-experience, New Age affirms its belief in both seekership and the validation of private experience. In this sense, New Age offers a Gnostic form of mysticism – not a mysticism of escape as we find in Hinduism and Buddhism, nor quite the mysticism of union with God that occurs with esoteric Christianity or Sufism, but a mysticism of *becoming* a god. Authority and validity belong to the inner, private individual where, for New Age, lies the source of truth.

All these essential New Age beliefs – that we have lived before, that we can communicate with discarnate forms of consciousness, that we can heal ourselves and are in charge of our lives, and that spiritual truth is something to be discovered within the sanctity of the self rather than in a sacred text, or from a pulpit, or through an ecclesiastical sacrament or via an act of external or transcendental grace – resonate with the contemporary forms of spirituality that appear increasingly to be turning away from traditional institutional forms. In our world of today, spirituality is about choice – perhaps reflecting our increased valuing of the consumer and the right to make decisions that reflect personal needs and desires as apart from automatically following the dictates of established authority.

Because of its Gnostic and Theosophical heritage, there is an underlying bias throughout New Age to consider the environment a secondary concern. At the same time, however, the nature-as-illusion versus nature-as-real dichotomy has not been clearly articulated within much if not most New Age expression. Through such collective efforts as Findhorn, The Farm and Esalen or such communal centers as Glastonbury, Sedona and Ojai, New Age community efforts develop immediate awareness of – and have direct impacts on – their local environments and have tended thereby to emerge as vanguard ecological models for the global audience. Experimentation and incorporation of organic farming methods, renewable energy sources, conservation techniques, vegetarianism, home-spun textiles, alternative technology, cottage industries and cost-efficient production have shown that where New Age types of spirituality meet the Earth, they are fully capable of developing a sustainable environmental equilibrium. Consequently, despite New Age's affinity and continuation of Gnosticism, the movement's overall paradoxical nature as well as its interface with paganism and shamanism encourage a holistic inevitability that encompasses not only whatever other concerns there are with self and transcendence but also the well-being of the planet as a place upon which "to walk gently."

New Religious Movements

The expression “new religious movement” (NRM) is a term of convenience designed to circumvent the negative connotations that, sometimes correctly but perhaps more often erroneously, have accrued in the public mind to such sociological constructs as the “cult” and “sect.” More accurate terminology might be “marginal religious movements” or “alternative religious movements.” These terms avoid the question of when ought a group no longer be classified as new, but “NRM” has emerged in the academic *lingua franca* as the currently accepted and pragmatic designation.

Among the higher-profile NRMs are the Church of Scientology, the Unification Church (the Moonies), ISKCON (International Society for Krishna Consciousness or the Hari Krishnas), The Family (formerly, the Children of God) and Rastafarianism. Others more contentious in the past but now generally less so, either through internal transformations or through changes in external perception, include Maharishi Mahesh Yogi’s Transcendental Meditation, Guru Maharaj Ji’s Divine Light Mission (now Elan Vital), followers of Rajneesh/Osho, Ananda Marga, Summit Lighthouse/Church Universal and Triumphant, *est*/the Forum or Centres Network and Subud. On the other hand, certain groups have demonstrated various degrees of violence – either self-directed against themselves (Jim Jones’ Peoples Temple of Guyana; Heaven’s Gate in San Diego; the Solar Temple in both Switzerland and Canada) or engineered against others (Aum Shin Rikyo in Japan) or as themselves the recipients of external violence (David Koresh’s Branch Davidians in Waco, Texas). Less prominent groups that come under the label of new religious movements include the Aetherius Society, Raëlians, Brahma Kumaris, Sahaja Yoga, Sri Chinmoy, ECKANKAR, Church of the Movement of Spiritual Inner Awareness (MSIA)/Insight Transformational Seminars and Nichiren Shoshu Buddhism/Soka Gakkai. In general, NRMs that can be located as or through identifiably organized groups derive chiefly from the traditions of Christianity, various forms of Eastern spirituality (Hindu, Buddhist, Jain, Sikh or Sufi) or the more secular Human Potential Movement (including UFO groups). Nevertheless, other influences and innovations found throughout the general alternative-spirituality market that Colin Campbell referred to as the cultic milieu continue to modify and shape Christian, Eastern and secular NRMs. In addition, less organized, structured and/or totalitarian religious expressions have also emerged, namely, the more amorphous New Age and Contemporary Western Pagan movements.

Many of the “older” NRMs developed as counterresponses to the 1960s counterculture in which radical experimentation and rejection of established social mores led to disorientation, polarization, hostility, confusion and anomie for many, and the emerg-

ing new religions may have served as vehicles toward either social reintegration or increased but structured marginalization and status as outsiders. For others, however, NRMs are part of a perennial exploration of new and different spiritual parameters that has always been a feature of Western civilization. In virtually all cases, NRMs represent various forms of protest and efforts toward either social withdrawal or social change. These are understood by Roy Wallis to be either world-rejecting, world-affirming or worldaccommodating.

Charles Glock and Rodney Stark see religion more broadly as providing various forms of compensation to economic, social, organismic, ethical and/or psychic deprivations. Individuals or groups that are not equally valued by a society resort to the Church as a logically religious response. Those, however, who suffer from a disadvantaged economic position turn instead to the sect. On the other hand, the resolution for those who perceive mental or physical disability (organismic deprivation) – both objective and subjective – is the healing movement. If healing becomes the exclusive concern of the religious movement, the group will tend to conform to the culttype. Ethical deprivation refers to holding values that are in conflict with prevailing norms, while psychic deprivation is that which is experienced by people who do not possess a system of meaningful values by which to interpret and organize their lives. The response to both psychic and ethical disequilibrium may be either religious or secular. Movements that arise through ethical deprivation tend to be ephemeral, faddish and reformist. In contrast, psychic deprivation finds its religious resolution in the extreme cult and/or occult milieu (New Age, UFO groups, Theosophy and New Thought), but if this deprivation is accompanied by economic disadvantage, one likely outcome is the radical political movement (e.g., the more violent protest activities directed against the World Trade Organization). For Glock and Stark, either the cult succeeds and comes to set the prevailing social norm or it fades away. In their typology, protest against industrial pollution and environmental degradation is a response of ethical deprivation, but to the degree that it is also a healing and remedial effort it is an organismically derived response as well.

In contrast to Glock and Stark's understanding of organizational resolutions based on the various types of subjective deprivations that people experience relative to others, Bryan Wilson has refined the broad sectarian response to encompass what he terms conversionist, adventist or revolutionist, introversionist, Gnostic or manipulationist, thaumaturgical (miracle-working), reformist and utopian ideal-types. To understand the relationships of new religious movements to nature, Wilson's typology along with an understanding of the theological tradition in which any specific NRM emerges allows the most fruitful analysis. But at the same time, the sectarian response as understood by Wilson conforms in its range of possibilities to the specific attitude toward the world shared by the holders of any given response. Those who reject the world take little or no interest in its preservation, and those who simply accommodate their own agendas to something that is regarded as either intrinsically or indifferently valueless have no rationale toward making any concrete and sustainable engagement or reformist effort.

Consequently, it is largely those who religiously, spiritually and/or secularly affirm the world as something real and valuable who are the ones who become involved with holistic concerns, ecological reforms and political protest on behalf of the environment and protection of nature.

From Wilson's perspective, the sectarian movement always exists in some kind of tension with the world, rejecting the orthodox or dominant religious tradition and generally seeking salvific goals in ways that differ from the means provided by the prevailing socio-cultural institutional facilities. Wilson's typology is meant to provide a measuring of standard ideal-types rather than to be a system of classification. This means that any specific group might approximate to more than one type, although usually more to one particular ideal over the others. Wilson's conversionist sect is exemplified by Christian evangelism, orthodox fundamentalism and pentecostal sectarianism. A classic example is the Salvation Army and, among NRMs, The Family, the Jesus Army (the Jesus Fellowship Church) and the International Church of Christ (the "Crosslands Movement") in which the primary concern is the experience of emotional conversion and transformation. This change of heart as the central feature becomes the proof of an individual's transcending the world's evils and his or her ultimate unconcern with decay, death and worldly well-being. This conversionist response differs from the revolutionist one that holds instead that only the destruction of the world will be sufficient for human salvation. This is usually expected imminently and through divine action. Believers may participate directly in the revolutionary process, but in general they are more passive and rely on faith for the new dispensation of supernatural intervention and apocalyptic upheaval. The classic examples here are Jehovah's Witnesses and Christadelphians and, among NRMs, the Branch Davidians, the Unification Church and again to some extent The Family.

The most developed anti-worldly position from Wilson's perspective is his introversionist response that sees the world as irrevocably evil and calls for withdrawal from it as the only possible route to salvation. Some of the Holiness movements conform to this response as do conservative Quakers and the Amana Society, but here too we find many of the Eastern-inspired or -derived groups such as the Hari Krishnas, Brahma Kumaris and to some extent Mataji Nirmala Devi's Sahaja Yoga. More extreme than the introversionist position but at the same time less anti-worldly is the utopian response that seeks to reconstruct the world according to some divinely inspired plan – usually by establishing a communal model. Some examples include the Mennonite, Amish, Hutterite and/or Brüderhof groups, Koreshan Unity and the Oneida community as well as the more contemporary collectives such as Stephen Gaskin's The Farm, Esalen in Big Sur, California, Findhorn in Forres, Scotland and the various communities of the Emissaries of Divine Light. The reformist response is less radical than the utopian, concerned with accommodation to the world but is centered on making efforts toward the gradual improvement of society and terrestrial life. While some of the New Age manifestations may be seen as reformist, much of the neo-pagan and related spiritualities are concerned with amending the world through motivations of

social conscience if not also spiritual connection. Especially for contemporary Western Paganism, reformation may be either dictated through supernaturally inspired insight or via secularly rational deduction. To the degree reformist orientation conforms to this last, it essentially bypasses the Wilsonian typology that restricts itself to the positing of a supernatural factor in its sectarian response to the world. If, on the other hand, we allow that the supernatural may or may not be regarded as an operative, Wilson's ideal-types are applicable to the contemporary range of new religious movements. The revolutionist, thaumaturgical and conversionist responses are the ones that specifically emphasize the autonomous operation of the supernatural: the first expects it to overturn the world, the last expects change through divine Providence to be internal, and the magical expects certain concrete or demonstrable dispensations and miracles to occur.

In Wilson's understanding, the conversionists are subjectivists, but the "overturning" revolutionists, the "abandoning" introversionists, the "amending" reformists and the "reconstructing" utopians are all objectivists who focus one way or another on the world itself. Both thaumaturgists and manipulationists he refers to as relationists, and while the latter is close to the subjectivist position in that they expect a change of perception through the supernatural, it is at the same time more intellectual and less emotional, other-worldly and transcendental. But again, both these relational responses are implicitly this-worldly: the thaumaturgical in seeking local, immediate healing, restoration, reassurance, foresight, consolation and magical guarantee; the manipulationist in seeking everyday well-being and improvement. It is this last which essentially informs most of the New Age, Contemporary Western Pagan and Human Potential/ Self-Help movements as well as such specific identities as Christian Science, New Thought, Scientology, *est*, Raëlianism, Transcendental Meditation, Rajneeshism, Elan Vital, Sri Chinmoy, Subud, ECKANKAR, MSIA, Eternal

Flame Foundation and Soka Gakkai. At its heart is the obtaining of gnosis or inner wisdom through intellectual acquisition, mental hygiene or physical regimen that in turn becomes the tool by which to change one's perception of the world and achieve both objective achievement and psychic reassurance. By contrast, the thaumaturgical consideration of the supernatural as an external force that can exert tangible influence on the world is most at home, along with the revolutionist movement, in less-developed societies. It persists in the West through Spiritualism, such orientations as the "I AM" Religious Activity and the Church Universal and Triumphant, or New Age channeling. On the other hand, the contemporary Pagan and esoteric practices of Ceremonial and other forms of Magic(k) tend to work with psychological and internal constructs of the mind rather than with what are considered to be objective and self-existing magical entities. In other words, they conform more to the manipulationist than thaumaturgical positions.

Consequently, NRMs can be focused on individual salvation or universal concerns or both. To the degree that they follow a Gnostic or Transcendental theology of one sort or another, they exhibit less interest with the world and its reform and transformation.

But inasmuch as NRMs are grounded in a this-worldly pagan theological understanding, religion and nature become fused as a central concern – especially as industrial imbalance and random unconscious exploitation continues to put the very viability and future of the planet into a perceived and/or real jeopardy. New religions that engage with nature rather than some transcendental reality to which nature is merely a foil, impediment or at best subservient will tend to be reformist, utopian or manipulationist and, to a lesser extent, thaumaturgical. Those that are either conversionist, revolutionist or introversionist will tend to see nature as an illusion or worthless or both and have little foundation or desire for a dynamic and holistic engagement with the organic dimension.

New Zealand

New Zealand is a nation-state composed of three major islands in the southern Pacific approximately 1000 miles (1750 km) southeast of Australia. Its remote geographic location contributed to its unique ecology, which included flightless birds such as the moa. The moa ranged in height from four to ten feet and was hunted to extinction by Maori inhabitants centuries before Captain James Cook claimed the islands for Britain in 1769.

Stretching nearly 1000 miles from north to south, New Zealand has a temperate climate, characterized by semi-tropical fern-tree forests in the north and hardwood beech forests in the uninhabited fjordlands of the South Island. The indigenous Maori population migrated south in a series of canoe journeys from “Hawaiki” in Eastern Polynesia from the ninth to the fourteenth centuries. The Maori introduced exotic mammals, the dog and the rat, and the kumara (a sweet potato cultivated in the southern Pacific region). Maori history has been divided into an “archaic moa-hunting culture” (ca. 900–1300) and a “classic” Maori culture (ca. 1300–present).

Religion in pre-contact New Zealand has been reconstructed with great difficulty, due to the aggressive colonization and Christianization of the Maori by European settlers and missionaries beginning in 1814. Most of the missionaries were British Anglicans and Methodists who regarded the Maori as the “children of Shem,” descendants of the “lost” ten tribes of Israel. Subsequent Maori prophets alleged that Jehovah was brought to the islands by their Jewish ancestors, forgotten for centuries, and rediscovered by them in their dreams and visions.

Missionaries required converts to renounce *mana* and *tapu* as things of the devil. Mana is an extra-human power that inheres in certain people, places, objects, and collectives. It can be gained or lost. *Tapu* refers to any place, object, or person that is set apart as prohibited or sacred. *Tapu* rules regulated Maori society, just as civil law imposes order in Western cultures. Loss of *mana* and *tapu* contributed to social disorder and the rise of Maori renewal movements that challenged colonization and Christianization. Followers of the “good and peaceful” movement received *mana* from wind spirits, led by the Angel Gabriel. The King movement united the central North Island tribes under the *mana* of a Maori king and established a *tapu* boundary around their ancestral lands. Today, the Maori practice a variety of Christian religions, some of which, such as Anglicanism, Methodism, and Mormonism, are imports, and a few of which, such as Ringatu and Ratana, were initiated by nineteenth-and twentieth-century visionaries.

The European impulse to missionize the Maori was millenarian. New Zealand was the geographical antipode of the British Isles. The Christianization of the Maori tribes fulfilled the command to carry the Gospel to the “end of the Earth” (Acts 1:8) before the Savior would reappear in the thousand-year reign of God. The enterprise of colonization was regarded as the fulfillment of a prophecy that “God shall enlarge Japhet and he shall dwell in the tents of Shem” (Buddle 1873: 5). Japhet was presumed to be the white race, “enlarged” by its technological superiority and parliamentary system and destined to rule over the other biblical races delineated in Genesis, chapters 9 and 10.

The rise of Maori new religious movements in response to colonization and Christianization sparked the epic series of Land Wars from 1858 to 1872 that forged the modern state of New Zealand, a “new Albion” in which pastures and orchards replaced native forests, and commercial enterprises replaced fishing and horticulture. During the wars, tribes lost their lands through punitive confiscations and special legislation that divided tribal holdings into private parcels. In the North Island, Aboriginal forest remains primarily in the Urewera National Park – contested ground between conservationists and the Tuhoe tribe that claims the totara tree of the creator god, Tane Mahuta, and ancestral burial caves in the sacred mountain fished from the sea by the creator god, Maui. The South Island was inhabited only in the north by the Kai Tahu people, who controlled the trade in greenstone, which was used to fashion sacred objects. The Kai Tahu land was acquired under extreme duress in 1848 by the imperial government, which sold it to settlers for sheep stations.

New Zealand is now an independent commonwealth nation, a largely biracial state that remains divided over ultimate claims to the land. The Treaty of Waitangi, a founding document signed by some Maori chieftains and representatives of the British in 1840, is so ambiguously worded that Maori and Pakeha (New Zealanders of European descent) both claim that their sovereignty over the land is upheld by the treaty’s language. The extraordinary Waitangi Tribunal, set up in 1985, has since fostered the payment of reparations and the restoration of land and fishing rights to specific North and South Island tribes, including the Kai Tahu.

According to Maori custom, land is an inalienable possession of the tribe and cannot be sold. The Maori word for “land” and “placenta” are one and the same. A new-born’s umbilical is buried in the Earth in a special ceremony. Sacred places are the central feature of Maori religion, and the land is regarded as essential to the life-force of the people. It is noteworthy that the Maori population suffered its greatest decline in the latter half of the nineteenth century when tribes were being separated from ancestral lands. A prophet who received God’s call to save his people, responded: “If your wish is for me to save only people, I won’t help, but if it is to save the land, then I will carry out this task” (Webster 1979: 158).

According to the Christian creation myth, from the beginning man (not woman) was granted dominion over the Earth and its creatures. This myth has been cited time and again by British agents and settlers to justify their takeover of Maori “waste lands.” The official who drafted the English version of the Treaty of Waitangi argued against

Aboriginal rights, asserting that the only “natural right of a man to land” was over land “which he had subdued from the forest, to the uses of man.” He compared this right to “that instinctive sense of right which a man possesses in his own children” (Busby 1860: 10). The tension over what the Maori call “mana over the land” and the Pakeha call property rights underlies the cultural conflict between the government and the tribes regarding specific places and ecological resources. These contesting worldviews are derived from each people’s creation myths. New Zealand has been cited as one of the least religious (i.e., church-attending) countries on Earth. Jokingly, the religion of New Zealand has been called “rugby, racing, and beer.” Neither assertion has much validity, because religion is that which symbolically binds a distinct people together in a common religious identity. Myths of the origin of a tribe’s world and people, and its oral recitation of the names of ancestors and significant events that happened at specific places, reveal what is of ultimate concern to a self-identified group. Statistics regarding church affiliation or attendance are insufficient measures of religion. What is most sacred to both races in New Zealand is the land itself, which is not surprising considering that islands are finite territories wherein an expanding population must negotiate the use of its most important and dwindling resource: space. Viewed as the paramount religious sacrality, the land of these beautiful islands is the chief protagonist in the history of New Zealand.

To New Zealanders of European descent the land is also dear. No longer regarded as terra incognita, the Anglicized landscape of New Zealand provides recreation (literally, re-creation) for a largely urban population. Sheep stations and coastal or lakeside cabins are handed down as familiar places of refuge and rest. They are places infused with meaning, where ancestors and present inhabitants are connected via remembrance and story.

The Southern Alps and Fjordland National Park in the South Island are world-class tourist destinations. The Pakeha conservationist ethic may be interpreted as a benign extension of the Genesis myth of domination and enterprise when it succeeds in establishing wild lands as an economic base for outdoor sports and tourism. Conversely, the Maori struggle to regain their ancestral places may be interpreted as an extension of tribal creation stories that establish certain trees, waters, stones and mountains as tapu treasures (taonga) that provide for the continued wholeness and life of the community.

In 1991 after extensive public review, the New Zealand parliament passed the Resource Management Act, a “greenprint” for the islands’ ecological health. It divided the country into sixteen bioregions based on watersheds. Elected regional authorities are responsible for implementing the goal of the RMA: comprehensive planning of sustainable management of natural resources. Utilizing a Nash Equilibrium approach, business interests have rallied around the RMA as the optimal means of securing each company’s self-interest (Johnson 1995: 68–87). The RMA seems to have combined the Pakeha myth of human management of natural resources and the Maori myth of human dependence on Earth as sustainer of life in a rational program to protect the en-

vironment of New Zealand. One may regard the RMA as an expression of an emerging transnational religious consciousness of the doctrine of ecological sustainability. Only New Zealand and The Netherlands have committed themselves to such a far-reaching political, social, and environmental plan. This cannot be accidental. Religion in New Zealand is pre-eminently oriented to landscape, which is the “homescape,” of Maori and Pakeha, both of whom have established their lives and those of their descendants upon their contrasting but equally sacred orientations to the land and its treasures.

Nhat Hanh, Thich (1926–)

Thich Nhat Hanh is a Vietnamese Zen monk trained in both Zen and Theravada practices. He was nominated for the Nobel Peace Prize by Dr. Martin Luther King, Jr. for his peace work during the Vietnam War. He lives in exile in France, is a prolific writer and retreat leader, and is one of the most influential Buddhist teachers in the West.

The heart of Thich Nhat Hanh's teaching consistently has been healing and reconciliation. Nhat Hanh offers tools to heal and reconcile not only human communities, but also human relationships with our bodies and the natural world. For Nhat Hanh, if we could heal our relationship with nature, if we could "be peace" with respect to nature, knowing that we are in no way separate from it, the actions that naturally arose from that condition would spontaneously be respectful, loving and generous toward the natural world.

The healing and reconciliation of our relationships with the natural world are rooted in mindful awareness, in particular, mindfulness of "interbeing." Nhat Hanh uses two favorite mindfulness practices for this healing purpose: eating meditation and walking meditation. In eating meditation, one simply eats something, for example, an orange, very slowly and with full attention given to the present moment of peeling, smelling, chewing, tasting, salivating, swallowing, etc., with no silent verbal commentary. Such a meditation may take as much as an hour. In addition, one may be asked to contemplate the interconnections that have made the orange possible – the sun without which the orange could not exist, the rainproducing cloud, the minerals, the farmer. One may be invited to see the sun and the cloud within the orange and, ultimately, all things within the orange. Thus, one is invited to see how the orange, the sun, oneself, and all things "inter-are," producing visceral awareness of the non-separation of all life.

Whereas in traditional Buddhist walking meditation, one is asked to focus one's attention exclusively on the internal physical sensations of very slow walking, in Nhat Hanh's walking meditation one is invited to look out at the world, to feel the warmth of the sun on one's face, the gentle touch of the breeze, to see the beauty of the flower, the greenness of the leaves – all in mindfulness, one attention focus at a time, in a relaxed and unhurried manner, with internal silence.

These meditations are deceptively simple; for their practitioners, they do many things. They help them to feel themselves alive in and through their bodies. For those in the modern, urban, technological world, this is a necessary first step. Secondly, these meditations put their bodies in the world: they make real in a tangible, physical way using all their senses, their connection and continuity with the world, and ultimately

their non-separation from it. From their experiential awareness of their connectedness with the natural world, practitioners' will to care for the world springs naturally.

In addition to his creative work in adapting traditional meditation practices, Nhat Hanh has also creatively expanded the traditional Five Precepts, the five minimal ethical practices, of Buddhism. Whereas the traditional first precept invited all people to avoid destroying life (by which sentient life was meant), Nhat Hanh's expanded first precept reads:

Aware of the suffering caused by the destruction of life, I vow to cultivate compassion and learn ways to protect the lives of people, animals, plants, and minerals. I am determined not to kill, not to let others kill, and not to condone any act of killing in the world, in my thinking, and in my way of life (1993: 3).

Here Nhat Hanh has enlarged the traditional first precept in four ways. The precept: 1) now includes all forms of life, "people, animals, plants, and minerals"; 2) has moved from passive (avoiding killing) to active (actively protect life); 3) calls for nonviolence in one's thinking and way of life, in addition to one's acts; and 4) calls for the individual to intervene in the acts of others, not only to guard his/her own actions. In support of this precept, Nhat Hanh cites both instrumental motives based on interbeing ("We humans are made entirely of nonhuman elements, such as plants, minerals, Earth, clouds, and sunshine") and deep ecology reasons ("Minerals have their own lives, too). In Buddhist monasteries, we chant, 'Both sentient and nonsentient beings will realize full enlightenment' " (1993: 14). Both are rooted in the awareness of interbeing produced by mindfulness practice: "We feel in permanent and loving touch with all species on Earth" (1993: 18).

Without advocating any particular approach, Thich Nhat Hanh encourages his students directly to face the suffering of the Earth and then take action to care for the Earth and its beings. Consequently, his students are found throughout the environmental movement. They lead efforts to end radioactive waste, intervene to prevent the cutting of redwood forests, teach environmentalism, lobby and work legally on behalf of the Earth, promote the protection of endangered species, hold leadership positions in national environmental organizations, promote alternative energies, work to protect the rainforest and strive to protect animals from suffering, among other things.

Nietzsche, Friedrich (1844–1900)

In a now famous article written in 1967, Lynn White, Jr. traced the roots of our present ecological crisis to Christianity and other monotheistic religions, while arguing that the solution of this crisis requires that we adopt a new religion or radically rethink our old one. In the years since the publication of this article, there has been much debate over White's position. Some philosophers have attempted to defend monotheistic religions by claiming that these religions suggest that humans are to be stewards or caretakers of nature, not despots of nature as White had claimed. While the view that humans are despots is clearly incompatible with ecologically oriented thinking, these critics of White believe that the position of humans as stewards is consistent with the principles and aims of reform environmentalism.

Other thinkers, however, especially those who have been identified with the movement known as deep ecology, have whole-heartedly adopted White's call for a new religion or way of thinking. These thinkers argue that, even if monotheistic religions are consistent with the principles and aims of reform environmentalism, these principles and aims are inadequate to resolve our current ecological crisis.

In carefully examining the views of the nineteenth-century German philosopher Friedrich Nietzsche (1844–1900), it is apparent that Nietzsche's philosophy is relevant to this recent debate over the merits of White's position. Indeed, Nietzsche not only anticipates many of White's criticisms of Christianity and monotheistic religion, but the development of his thinking also shows a movement from what can be described as a reform environmentalist position to a position that has many affinities with the views of the deep ecologists.

While anyone acquainted with the philosophy of Nietzsche will no doubt be aware of his antipathy for Christianity and monotheistic religion – one of his last books was entitled *The Anti-Christ* – they may not be aware that one of Nietzsche's principal lines of criticism of Christianity is almost identical to the line of criticism that was later developed by White. Like White, Nietzsche criticizes Christianity for divorcing humans from the natural world, for elevating humanity above nature, for denigrating the Earth by instilling in humans the feeling that they are the crown of creation and thus lords over other creatures. In other words, for Nietzsche as for White, traditional Western religious thinking has tended to ascribe a disproportionate importance to the human species, thereby providing a religious framework for the domination of the natural world.

Moreover, by tracing the development of Nietzsche's thinking, we can see that he was gradually working his way toward the new type of thinking that White envisioned.

In his first book, *The Birth of Tragedy*, Nietzsche identified a type of human experience (Dionysian experience) that would allow us to discover what he calls “wild and naked nature.” However, it was in one of his *Untimely Meditations*, “Schopenhauer as Educator,” that Nietzsche’s early views on humanity’s relation to nature are most fully developed. In this work, Nietzsche describes nature in decidedly anthropomorphic terms. He says that nature has certain goals or intentions, but that these goals are usually thwarted because nature is imperfect, misguided, wasteful, inexperienced, a “bad economist.” Because of this misguidedness, Nietzsche argues that nature needs humanity (or at least the highest types of humanity – the philosopher, saint, and artist) to correct its mistakes and to set it on its proper course. Although Nietzsche’s views differ in important respects from White’s critics, it should be evident that his position here falls within the humanity-as-steward tradition that they were defending. Also, while most reform environmentalists would assign the task of correcting or perfecting nature to the scientist rather than to the philosopher, saint, or artist, Nietzsche’s early views are consistent with the assumptions of reform environmentalism.

However, in his later writings, Nietzsche attacks human arrogance and pride, and argues that humanity must be reimmersed into nature. Rather than viewing themselves as lords over nature, or as enlightened perfecters of nature, Nietzsche claims that humans must realize that they are only one species among many, that they are, to use Aldo Leopold’s terminology, plain members of the biotic community. Indeed, Nietzsche states that his task in *Beyond Good and Evil* is to “translate man back into nature” (1966: 161), and his later writings are filled with passages, like the following one from *The Anti-Christ*, that attempt to undermine human arrogance and pride:

Man is absolutely not the crown of creation: every creature stands beside him at the same stage of perfection . . . And even in asserting that we assert too much: man is, relatively speaking, the most unsuccessful animal, the sickliest, the one most dangerously strayed from its instincts (1968: 124).

The flip side of Nietzsche’s attempt to undermine human arrogance and pride is his recognition that the values and perspectives of nonhuman life forms must be taken into consideration. On a symbolic level, this is shown by the fact that Zarathustra’s companions are animals, an eagle and a serpent, and by the fact that it is the eagle and serpent who first state Nietzsche’s doctrine of the eternal return in *Thus Spake Zarathustra*. On a theoretical level, it is demonstrated by Nietzsche’s epistemological position, known as *perspectivism*, in which he rejects epistemological anthropocentrism and explicitly acknowledges the views and values of nonhuman creatures. Stating in a note collected in *The Will to Power* that the attempt to privilege human interpretations and values is “one of the hereditary madneses of human pride” (1969: 305), Nietzsche goes on to say that this privileging of human knowledge and values is directly linked to the attempt to “maintain and increase human constructs of domination” (1969: 14). However, in rejecting epistemological anthropocentrism and thereby deconstructing the human constructs of domination that have resulted from it, Nietzsche’s later philosophy opens the way for a non-exploitative relationship of humanity with nature. Instead of

viewing themselves as the crowns of creation and/or the masters of the nonhuman world, humans become plain members of the biotic community.

In addition to reimmersing humans into nature and thus rejecting epistemological anthropocentrism, Nietzsche is also one of the first modern Western thinkers to recognize two key concepts of contemporary ecological thinking: the interdependency of all living things, and the importance of environmental factors for the quality of both human and nonhuman life. In the *Twilight of the Idols*, Nietzsche coins the term “life-collective” (*Gesamt-Lebens*) to express the interdependency of human and nonhuman life forms, and in a note collected in *The Will to Power* he says clearly that “man is not only a single individual but one particular line of the total living organic world” (1969: 359–60). In other notes, he defines life as a system of interdependent forces that are connected by a common mode of nutrition (suggesting a view of the natural world similar to Aldo Leopold’s land pyramid), and he describes the world as an energy system in which there is “contiguous and concurrent dependence” (1969: 340). Indeed, while Nietzsche’s notion of the will to power has been variously interpreted, there is a clear sense in which the will to power serves as a concept that explains change immanently, a concept that comes close to the ecosystem approach of modern ecologists.

Like modern ecologists, moreover, Nietzsche is well aware of the way in which our theoretical views about the natural world can impact the quality of both human and nonhuman life. While Nietzsche’s perspectivism contains an implicit call for the preservation of endangered species (since the values and perspectives of all life forms have epistemological significance), several passages in his writings and letters discuss the practical implications of our philosophical thinking about the world in which we live. One example of this is found in the following passage from *The Will to Power*: “The way our streets are paved, good air in our room, the soil, the wells not poisoned, food – we grasp their value; we have taken the necessities of existence seriously” (1969: 525).

“We have taken the necessities of existence seriously” – these simple words provide a key to understanding Nietzsche’s significance to the topic of nature and religion. For as we have seen, Nietzsche not only relentlessly attacks those types of thinking that are other-worldly and anti-natural, he also repeatedly urges us to remain faithful to the Earth. In other words, one important thrust of Nietzsche’s thinking, a thrust that has decidedly ecological implications, is to extend an invitation to us to return home – home to the Earth and to the joys of this-worldly existence. While this invitation reverberates throughout Nietzsche’s later writings, it is already forcefully expressed in the following passage from *Human, All Too Human*, where he describes the “aftereffect” of philosophical thinking.

Finally one would live among men and with oneself as in *nature*, without praise, reproaches, overzealousness, delighting in many things . . . that one formerly had only to fear. One would . . . no longer feel the goading thought that one was not simply nature, or that one was more than nature (1984: 37).

This invitation for us to return home to the Earth, this call for us to live fully in the natural world, becomes even more pronounced in Nietzsche's later writings. Indeed, this invitation not only stands behind one of Nietzsche's most life-affirming concepts, the concept of *amor fati* (love of fate), it also becomes one of the principal motifs of Nietzsche's best-known work, *Thus Spake Zarathustra*. For whereas the concept of *amor fati* serves as a concept through which one is finally able to view the natural world without praise, reproaches, or overzealousness, one of the fundamental goals of Zarathustra's teaching is to lead us away from other-worldly hopes and back to the Earth. In other words, one of the primary thrusts of Nietzsche's thinking is to make it possible for each of us to leave our caves of ignorance and despair, as Zarathustra himself does, "glowing and strong as a morning sun that comes out of dark mountains" (1966: 327). But if we are to do so, Nietzsche tells us that we must learn the simple, yet difficult, lesson that the ugliest man learns from Zarathustra – we must learn to love the Earth and earthly existence.

Nile Perch

Sometimes called the world's largest freshwater fish, Nile perch (*Lates niloticus*) are not as big as White or Beluga sturgeon, Yangtze paddlefish, Amazonian pirarucu, or Mekong and Wels catfish. They are Africa's largest freshwater fish. Some have exceeded 6 feet in length and 500 pounds in weight. Remains pointing to rituals involving land and water animals, including Nile perch, have been found at ancient Egypt's Hierakonpolis-Nekhen ceremonial complex (ca. 4000–3100 B.C.E.). Nile perch are known fiercely to battle capture yet few HierakonpolisNekhen skeletal materials belong to "small" perch (under

3.5 feet). One was 7 feet long. Nile perch burials dominated the fish section of Egypt's Gurob animal cemetery (ca. 1290-1190 B.C.E.). More attention was given to their preservation–mummification than with other fish, oxen, or sheep. Artifacts linked to Seth, a god connected to violence, and Sobek, the Crocodile God, were also found at Gurob, along with a pottery dish showing a Nile tilapia lotus motif.

Greeks named the city of Esna "Latopolis" for the prominence that the Nile perch (*latos*-fish) held in the city's religious practices. Neith, who had Nile perch as a sacred symbol, was one of the deities the town's inhabitants worshipped. Archeologists have found coins and art with the venerated *latos*-fish and many mummified Nile perch there. A painting of Anubis, the jackal-headed god of the dead, embalming a Nile perch, appears at Luxor on the walls of the tomb of Khabekhnet, a tomb-builder for Rameses II (ca. 1290–1224 B.C.E.). Neith and the nome sign of Latopolis are depicted, linking Luxor to Latopolis' spirituality. Other Luxor-area tomb art shows Menna, "Scribe of the Fields of Lord" under Tuthmosis IV (ca. 1400–1390 B.C.E.) and Amenhotep III (ca. 1390–1353

B.C.E.), thrusting a spear into waters with a Nile perch and Nile tilapia inside. The Nile perch has been interpreted as symbolizing the turbulent stage of the journey of the deceased; the Nile tilapia the calmer. Nile perch and Nile tilapia were often paired in Egyptian art. Symbolism joined what ecology gave some separation. Nile perch have preferred the Nile's deeper waters; tilapia the shallower. The two could come into conjunction in ways inimical to tilapia. Some Egyptian fish spears were tipped with Nile perch bone. Tilapia flesh served as bait for Nile perch.

Neith/Nit, a goddess whose importance to Upper and Lower Egypt was long-standing and who had the epithet "Terrifying One," was associated with Nile perch. Neith was associated with blessing warriors' and hunters' weapons and with mortuary rituals. As a creator deity, she cast her saliva into the primal waters, producing Apep/Apophis, the water-serpent, sometimes identified with the python, Africa's

largest and most aquatic snake. Apep's attempt to swallow everything in the created world and send it into non-existence was continually battled by other deities. Apep was the nemesis of Neith's son Re/Ra, the Sun God. Neith also had the epithet "Nurse of Crocodiles." Neith's other son Sobek/Sebek took the shape of *Crocodylus niloticus*, reputedly Africa's greatest eater of humans, and a killer of large wild and domesticated animals. Neith sometimes took the form of the fierce *latos*-fish which was believed to swim beside Neith on her journeys. Neith's more benign activities included controlling floods and protecting marriages. Neith was generally thought of as an independent virgin-goddess; sometimes Seth was called her spouse.

Ancient Egyptians accorded Nile perch some beneficent attributes. Oil in which its dorsal fin had been cooked was used to increase milk flow in lactating mothers. Egyptian children and young women wore apotropaic fish pendants, including those of Nile perch, to avert drowning. When it came to beauty, however, Nile tilapia dominated on perfume containers and zoomorphous palettes which held cosmeceuticals used to protect and beautify eyes, like kohl. Mouth-brooding tilapias take their dependent young into their mouths to protect them, releasing them when danger passes. Tilapia/tilapia-lotus motifs signified rebirth in Egypt's religious art. Nile perch devoured this affirmative symbol.

Seth/Set was a deity of evil, hunger, destruction, wastelands, and the unclean. Seth slew, dismembered, and cast the body of Osiris, his brother, into the Nile. Most sources name the elephant snout fish (the *Oxyrhynchus* fish, *Mormyrus kannume*), seabream, eel, mudfish, or tiger fish (the *Phagrus*), and Nile carp (the *Lepidotus* fish, *Barbus bynni*), as the fish that ate Osiris' phallus. A few sources place Nile perch in this group. The elephant snout fish, with which the Nile perch is most often misidentified in these presentations, actually feeds upon insects and midge larvae, while the Nile perch is almost fully carnivorous/piscivorous. Nile perch were among the fish trampled and burned in some areas of Egypt in a ritual repudiating opponents of divine-royal order. In some places, tomb inscriptions have fish hieroglyphics which appear to have been made and then deliberately damaged, following "homeopathic magic," to prevent dangerous fish from injuring the deceased.

Nile perch is a misnomer in ichthyogeographical terms. It is not a true perch but a snook, and is indigenous to other waters, including some in Benin, Chad, Côte d'Ivoire, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Niger, Nigeria, Senegal, Sierra Leone, and Togo. While Nile perch fossils dating to the Miocene have been found on Rusinga Island in Lake Victoria, the lake was later drained by geological faulting. In its current form, Lake Victoria arose 12,000–12,400 years ago as a shallow but vast water. A rich and diverse variety of cichlid fishes proliferated in the absence of Nile perch. In the 1950s, Nile perch were introduced into the lake with catastrophic consequences. Had more attention been paid to the biological observations embedded in Egyptian religious beliefs about Nile perch, British plans for the world's second largest freshwater lake might not have gone so awry. Destruction, devouring, and death were symbols made

quite concrete when this large predator was taken from waters where it was endemic and placed elsewhere.

Plantations, pesticides, pollution, and population growth around Lake Victoria had led to decline of its indigenous cichlids (tilapias and haplochromines) by the 1950s. In response, the British put Nile tilapia (*nyamami*: *Oreochromis/Tilapia niloticus*), which grow to a little over two feet, into Lake Victoria. Other introduced tilapia, ranging from one and a half feet to nine inches did not catch on well. Placed into the lake, Nile perch exploded in numbers. Many of Lake Victoria's indigenous cichlids were unable to survive the onslaught of the voracious, prolific Nile perch. At present, 65–85 percent of the estimated 350–500 or more indigenous species, many unique to Lake Victoria, are said to have died out, or become rare. Nile perch ate fish which helped control malaria, schistosomiasis, detritus, anoxia, and the diseases algal blooms-cyanobacteria bring. Indigenous tilapias (*ngege*: *Oreochromis esculenta*, *ngege/mbiru*: *Oreochromis variabilis*) can be sun-dried. Nile perch are too big and oily; they have to be wood-smoked for local preservation without refrigeration. Further deforestation, eutrophication, and disease ensued. Lake conditions contributed to proliferation of water hyacinth (*Eichhornia crassipes*), “the beautiful blue devil.” It prevented even large boats from leaving some ports, blocked irrigation canals, and led to human displacement when clogged areas of the lake flooded. This “curse” can form masses so extensive that ordinary people can “walk on water” where it flourishes. Mechanical removal, hand removal, chemicals, biological agents, and indigenous doctor-diviners have been set against it, but the resurgent “devil” eludes defeat.

Scientists have documented these details, lamented fish extinction, and then considered this extinction “an event as exciting as it is depressing” to observe (Kaufman 1992: 846). Terms like “fish genocide” and a “green holocaust” are scarce, perhaps because they question why the mass extinction of nonhuman animals has not evoked the widespread revulsion associated with human genocides, particularly those in Europe. Some local and foreign sources even portray Nile perch as a “Savior” (*Mkombozi*) of the lake-basin economy, and a “successful predator” by capitalistic calculus. Yet it is national and foreign elites rather than local people who are the main beneficiaries of the Nile perch takeover of Lake Victoria. Independent fishermen who used small boats when they fished offshore, and women who had processed and traded sun-dried fish and done some riverbank fishing lost out to an industry predicated on big boats, unrelated workers, refrigeration, and mostly foreign-funded processing plants concerned with export of Nile perch fillets, hides, and other by-products to Israel, Europe, Asia, Australia, and the USA. Proponents note Nile perch is protein-rich with high levels of Omega-3 fatty acids. Many Luo claim its fatty, oily character makes it difficult to digest. Some studies show it absorbs more mercury than other fish, making it unhealthy in the long term, especially for women and children. With a high percentage of fillets sent overseas, poor people get smoked, leftover scraps. Protein export coexists with protein deficiency diseases.

Having eaten its way through many cichlid species, Nile perch are increasingly feeding on their young or small shrimp (*Caridina nilotica*). With changing international tastes for less fatty foods, remaining juveniles are being exported. By the 1980s, while 500-lb “giants” were still reported, most Nile perch caught ranged from 110–220 lbs. Presently, it is said the average size may be a tenth of that. This fish with predatory appetites seems itself threatened by global capitalism and its appetites.

Scientists, the Ugandan, Tanzanian, and Kenyan governments, the UN, and NGOs have produced a vast literature on Nile perch’s impact on Lake Victoria’s ecosystem. The religious response has not been proportionate. A number of NGOs have religious help in funding projects to “save” the lake. However, Henry Sindima, a Presbyterian minister-scholar from Malawi, is one of the few commentators to mention Nile perch’s impact on Lake Victoria, link it to ecological theology, and critique development “experts” who fail to acknowledge the “spiritual intelligence” of African peoples (1990: 140, 142). Many Western missionaries working around Lake Victoria consider eating Nile perch an “authentic” African experience. Some Christians assert that the fish connected with Jesus’ miracles was the Egyto-African Nile perch, although Nile tilapia (“St. Peter’s fish”) is a more likely candidate. Exponents of Afrocentric theology and Theosophy tend to present Nile perch positively, though close attention to Egyptian religious history shows it was an ambivalent symbol. Evangelist Billy Graham’s parable of “God’s Provision in a Fish”/“Keys in an African Fish,” a popular sermon topic, displays no awareness of Nile perch’s historical trajectory in Africa.

Many Africans living around Lake Victoria know it as more than nature endangered. Baganda have called it *Nalubaale*, “Mother of the Gods.” For Kenya Luo, it is *Nam Lolwe*, “The Endless Lake.” They take their identity from it, calling themselves *Jonam*, “people of the lake.” Indigenous Luo religion had rituals for making boats and fishing implements, for recognizing the spiritual personality and maintaining the sanctity of boats, for setting out to fish. A death out on *Lolwe* was “like one kinsman killing another” (Ocholla-Ayayo 1980: 123). For Luo, *Lolwe* has been home to powerful possession spirits. What the Nile perch introduction has irreparably harmed is not the nature of positivistic and “dismal” sciences – it is nature imbued with spirituality, peoplehood, political economy, and passions.

Legio Maria, the largest African-instituted church in sub-Saharan Africa showing Roman Catholic influence, began among Kenya Luo circa 1963. It has a long list of potential food prohibitions. Legios believe that the Holy Spirit can provide personal release from some prohibitions or move an individual toward stricter observance. Prohibitions are placed upon things seen as polluting the body, “the tabernacle of God.” Alcohol, tobacco, and goatmeat prohibitions are the most likely to be observed. Nile perch is next for many Legios. Many will not drink unboiled water, bathe in open water, eat chyme or meat from livestock that has not been slaughtered but is found dead, believing these harm the body-as-tabernacle. One reason Legios reject goat, quail, and wild greens/edible botanicals is their association with doctor-diviners, who work with indigenous spirits rather than the Holy Spirit. A number of prohibitions follow from

Leviticus 11 (e.g., pork, hare, flying “white ants”/termites, fish without scales). Many Legios consider all fish with “snake-like” appearance, “ugly snouts,” or bottom-feeding habits abominations, whether or not they have scales, and reject lungfish (*Protopterus aethiopicus*), elephant-snout fish (*Mormyrus kannume*), mudfish (*Bagrus bajad*, *B. do-mac*), and various catfish (*Arius africanus*, *Clarias spp*, *Amphilius jacksonii*, *Schilbe spp.* *Synodontis spp.*). Bony fish which can choke people and the Holy Spirit may be on Legios’ lists of rejected food. *Omena* (*Rastrineobola argentea*) are on lists because these 1.75 inch “little sardines” are equated with swarming insects, because the mounds these insects build for homes are equated with graves, and because cooking *omena* sends a smell upwards deemed offensive to the Holy Spirit. Children are allowed to “grow into the Spirit.” Some eat foods a parent rejects. Cheap *omena* rather than smoked Nile perch bits are the fish-protein many Legio children now get to eat.

Most tabooed fish have declined in numbers with Nile perch predation but Legios are not favorably inclined toward the killer of “abominable” fish. The most common reason Legios give for considering Nile perch an utter abomination is its cannibalism of fish, fishermen, and others who fall into *Lolwe*. Legios have also spoken against the harm it brings to the body-as-tabernacle, particularly their experience of intestinal and skin problems. Legios view it as anomalous in size and behavior. It is blamed for causing tragedy, trouble, and death in *Lolwe*. Nile perch are anti-charismatic megafauna for Legios.

Legios reject the multicolored garment (*law mokiko*) saying it creates an environment the Holy Spirit does not want to enter. A synonym for “mixed-up” clothing is

“Nile perch clothing” (*law mbuta*). Many diviner-doctors, especially those who work with lake-dwelling possession spirits, share Legios’ dislike of Nile perch. Doctor-diviners claim their spirits strongly protest against it,

Mumbo is a spirit whose ways I know well. The spirits want Nile perch to be stopped – it is a thing of today. That is why the Mumbo-spirit rumbled, making a loud sound that reached from Kadenge to the lake. It was the sound “Dududududuu,” sounds like that (Schwartz 1989: 206).

At a Legio church in the 1980s, the Voice of the Holy Spirit, speaking through a woman congregant, was explicit in its odium, “All of you curse Nile perch, my friends!” (*Kuoug’euru mbuta, yawa*). The congregation responded back resoundingly, “*Wakuong’e*, ‘We curse it’ ” (Schwartz 1989: 308–10). A few Legio women, driven to sell smoked Nile perch for needed income at local markets, reported having nightmares afterwards. The local unacceptability of Nile perch has been strong and spirited.

Noble Savage

“Primitivism” is a belief that arose during the European Romantic Movement which held that people who live in a natural setting are closer to God and thus live purer lives. The primitivist prefers the “natural,” tribal life to highly urbanized social orders, and reveres impulsiveness, free expression and passion over the dictates of reason, rules and the restrictions of form. The motif of the “Noble Savage” is an idealized stereotype of indigenous people as primitive in this sense. Its two main elements are a reverence for people in the rural environment, and a simplistic representation of indigenous morality, including the assignment of high-minded virtue to pastoral peoples. The motif is connected with the belief that goodness, dignity and nobility have to do with a primitive and free state that existed in innocent prototypical people like Adam and Eve in the Garden of Eden. It came into existence largely as a reaction against the onslaught of capitalism, industrialization and materialism in the later half of the eighteenth century and early nineteenth century.

The phrase “Noble Savage,” was first expressed in the eighteenth century by Jean Jacques Rousseau (1712– 1778) in his famous essay, “The Social Contract,” (1762) where he stated that humanity in a state of nature does not know good and evil, but their independence, along with “the peacefulness of their passions, and their ignorance of vice,” keeps them from wickedness. To Rousseau, the Noble Savage represented the “natural man,” uncorrupted by contact with the structures of society, or the evil effects of civilization including political organization and technology. This idea is reiterated in *Emile* (1762) where Rousseau writes, “Everything is well when it comes fresh from the hands of the Maker . . . everything degrades in the hands of Man” (pages vary by edition).

Since Rousseau, the “Noble Savage” has become a stereotypical romanticization of indigenous people in general, particularly in pre-European America and Africa, especially the Zulu’s and Maasai when allied with militaristic idealization, but not limited by those territorial boundaries. Examples of the motif stretch back to antiquity, but are readily identifiable in Michel Eyquem de Montaigne (1533–1592) in his Essay “Of Cannibals” (1580), later in Dryden’s play *The Conquest of Granada* (1670) and more famously in Aphra Behn’s *Oroonoko: or the History of the Royal Slave* (1688). This motif has special significance in America where the concept of the Noble Savage is integral to the early nineteenth-century fascination with North American Aboriginal peoples. The romanticized American Aborigine personified the spirituality assigned to humanity in a natural state, uncorrupted by European society, thus reinforcing the established links between primitivism and the “Noble Savage.”

Rousseau's contrast between natural and social existence attests to the underlying elevation of "White" civilization in the noble savage myth: "Although, in this state [civil society], he deprives himself of some advantages which he got from nature, he gains in return others so great, his faculties are stimulated and developed" (Rousseau 1993: Book I, section 8). However, Rousseau's Eurocentrism paled in comparison to some xenophobic commentators. Charles Dickens wrote

I beg to say that I have not the least belief in the Noble Savage. I consider him a prodigious nuisance, and an enormous superstition. His calling rum firewater, and me a pale face, wholly fail to reconcile me to him. I don't care what he calls me. I call him a savage, and I call a savage a something highly desirable to be civilised off the face of the Earth (Dickens 1850: pages vary by edition).

Although the motif of the "Noble Savage" is primarily associated with the nineteenth century, its antecedents are still with us today. The main tropes of the motif still embrace a belief in the superiority of the person in a rural setting and an associated spiritual superiority or closeness to God in nature, but now also include an associated ecological soundness romanticized as the indigenous worldview.

Noble, David F. (1938–)

David Noble is a historian of technology whose body of work has explored how technology has more often been used to reinforce hierarchy than to deliver humans from drudgery. In *The Religion of Technology* Noble traced the role that spiritual investiture plays in driving and rationalizing centralized technological development. Understanding technology as a religion can help explain why so many have embraced rapid technological change despite its human and ecological costs, he has argued.

For over 1000 years in Western Europe the “useful arts” have been closely associated with notions of salvation, driving technological innovation, by Noble’s account. Innovation is primarily driven by interest, he says: it is the means by which some people and societies control and subjugate others. But cultural justification is necessary, and for those benefiting from technology the religious impulse cloaks self-interest, justifies the technological world, and comforts those who suffer from it. Noble finds his earliest evidence among ninth-century Benedictines who embraced knowledge of the useful arts as something akin to godliness. Charlemagne’s heirs were influenced by Benedictines. Joachim of Fiore (twelfth century), Noble reports, saw the development of technology as a means toward reunification with God. The thirteenth-century Franciscans and Roger Bacon believed humans had lost the knowledge of God’s creation with the Fall and could regain it by increasing humanity’s knowledge of the world, technology being a primary means. It was the sixteenth century’s Francis Bacon, however, heir to the Rosicrucian revival of an earlier era, who most fully developed the theme of reclaiming the garden through application of the useful arts. Noble argues that Bacon saw the useful arts as the path to heaven and as marking human uniqueness. He quotes Bacon: “We are agreed, my sons, that you are men. That means, as I think, that you are not animals on their hind legs, but mortal gods” (Bacon in Noble 1977: 51). This hubris, Noble argues, combined with early capitalism, was an irresistible historical force that accelerated the pace of technological innovation in the face of injury and criticism.

The founders of the early modern scientific academies further developed the religious view of technology, Noble argues, viewing science and technology as indistinct. The knowledge necessary for and generated by technological innovation not only helped the faithful know God’s creation, but also allowed them to know the mind of the Great Architect. Scientists considered science the pursuit of divine knowledge and held it sacred, Noble argued, in *A World Without Women*. As late as the early nineteenth century, Noble documents scientists declaring that the truths of science and religion could never conflict. Darwin, he reminds us, changed all that, and because science and technology formally disengaged into separate spheres by the mid-nineteenth century,

this enabled technological faith to continue while science challenged religious orthodoxy and even belief in a Creator.

Noble argues that three of the twentieth century's major technological projects have a powerful religious component: space travel, artificial intelligence, and genetic engineering. From the early days of the missile program to NASA at present, Noble argues, religiosity has permeated the space program. Werner Von Braun spoke of taking the gospel to other worlds; astronauts have spoken of flight bringing them closer to God. Noble quotes Lewis Mumford: "Only a mixture of adventurous impulses and religious convictions of the deepest sort would persuade normal warm-hearted human beings, such as many astronauts seem to be, to take part in such a life-denying ritual" (Mumford in Noble 1997: 137).

Noble admits that the project to create a thinking machine has not been explicitly religious in the way the space program has been. But he argues that the project is nonetheless imbued with an extreme dualism characteristic of much Western religious thought: the animal is a degrading fetter on the spirit. By stripping away the body, reason and spirit approach god-like perfection. Noble quotes Danny Hill of the Massachusetts Institute of Technology: "[W]hat's good about humans is the idea thing. It's not the animal thing" (Hill in Noble 1997: 162–3).

Genetic engineering is seen by many practitioners, Noble says, as providing the opportunity to join with God and become co-creators of life. Genetic engineers see their applied knowledge as God's gift, allowing them to redeem humanity by reprogramming evolution's haphazard programming. Since they believe genetics can only alter the body and not the soul, Noble says, they believe nothing can go terribly wrong.

Critics have puzzled at Noble's failure to address more directly the effects of the marriage of technology and religion on the natural world. Keith Thomas, the British historian, noted that Noble's argument doesn't account for the many other, non-Christian and secular cultural milieus in which technology has developed; nor do his arguments acknowledge that Christianity was far from monolithic, at times ignoring or opposing technological development.

Noble Savage and the “Ecologically Noble” Savage

Since the Greeks and Romans of classical antiquity, but most of all from the age of European geographic exploration and colonization, usually the “savage” has represented the primitive condition of humans in nature prior to the domestication of plants and animals. Both the earliest stage of prehistoric cultural evolution, and contemporary hunter-gatherers as supposed analogues, have been viewed in two diametrically opposed ways, in essence as either positive or negative.

More than anyone, philosopher Jean-Jacques Rousseau (1712–1778) is usually credited with the positive view, but not necessarily accurately. The “noble savage” was envisioned as enjoying a life of harmony within society and between it and nature. This is the romantic image of the “primitive” as superior in freedom, innocence, simplicity, generosity, goodness, purity, and peacefulness. Also this society was conceived as an egalitarian community with property held in common rather than privately. Such an ideal or utopian society supposedly thrived in a natural paradise during a golden age.

By the eighteenth century those Europeans ascribing to this cult of exoticism pursued the critical analysis of their own society and its morality and politics by glorifying the “savage” in contrast to degenerate civilization, the ideology of primitivism. Indeed, primitivists would even go so far as to reject civilization, at least in their discourse although almost never in practice. In theory the “noble savage” offered alternative possibilities for European society, having been identified variously as archetypal primitive communists, ecologists, environmentalists, conservationists, spiritualists, healers, philosophers, and pacifists.

For primitivists, these societies are not simply a more desirable human condition, but also are closer to nature, most living in wilderness. A correlate is that such societies practice various kinds of nature religion or ecospirituality. Accordingly, implicitly if not explicitly, the societies and religions of civilization are critiqued as unnatural and environmentally destructive. Environmental organizations from the Sierra Club to Earth First! have stereotyped indigenes as guardians of nature – “green primitivism.” The so-called “ecologically noble savage” and nature religions have often found common ground in New Age spiritualities like neo-paganism and their antecedents.

The “noble savage” was popularized much more than anywhere else through the arts (poetry, novels, drama, opera, art, music), but occasionally surfaced in philosophy and eventually in the social sciences. Among the better known examples in literature

are Daniel Defoe's *Robinson Crusoe* (1719), Jonathan Swift's *Gulliver's Travels* (1726), James Fenimore Cooper's *Last of the Mohicans* (1826), and William H. Hudson's *Green Mansions* (1904). Hollywood's *Dances with Wolves* (1989) expressed this idea, and the movie's widespread popularity indicates that the idea of the "noble savage" remained attractive in the late twentieth century.

Within anthropology, primitivism is more of a personal and private emotional attitude than any overt and examined philosophical, intellectual, or theoretical stance, according to William Y. Adams. Nevertheless, elements of primitivism can be detected in the writings of many anthropologists, some more explicitly than others, including Franz Boas, Margaret Mead, Ruth Benedict, Paul Radin, Claude Lévi-Strauss, Stanley Diamond, Marshall Sahlins, Elman R. Service, John Bodley, and Gerardo Reichel-Dolmatoff. Primitivism is also reflected in the life of several notable anthropologists who have actually "gone native" while living in an indigenous culture for many years or even decades, including Frank Hamilton Cushing with the Zuni, Jacques Lizot with the Yanomami, Kurt Nimuendaju with several Amazonian societies, and Patrick Putnam with the Pygmies of the Congo. Some outstanding ethnographic examples of the "noble savage" are Ishi of the Yahi, Kayapo, Kogi, Koyukon, Kuna, Mbuti, Semai, Tahitians, and Tasaday. In the first textbook on spiritual ecology, David Kinsley (1995) portrays the Ainu, Australian Aborigines, Mistassini Cree, and Koyukon, all hunter-gatherers, as ecologically noble by virtue of their nature religions which tend to promote sustainable subsistence economies and green cultures.

The opposite of this romantic view, the "ignoble savage," is commonly attributed to philosopher Thomas Hobbes (1588–1679). Hobbes imagined "savage" life as poor, nasty, brutish, and short. This negative view considers "primitive" life to be permeated by disharmony, conflict, and violence, both socially and ecologically. Ritualized violence, such as blood sacrifice and cannibalism, is another common correlate.

Paradoxically, in the writings of a single individual, the prominent British anthropologist Colin Turnbull (1961, 1972), both extremes are found, the Mbuti Pygmies of the Ituri forest in the heart of Africa described as "noble savages," and the Ik in the rugged mountains of Uganda as "ignoble savages." He depicted the Ik as former foragers, forced by the government to relocate, sedentarize, and farm; and, as a result, a degenerate and dehumanized society without sociality, culture, morality, and religion. Not surprisingly, Turnbull was severely criticized for his explicit negativity regarding the Ik, but not for his positive view of the Mbuti.

As described by Turnbull, the Mbuti are the epitome of the "noble savage" in the way their society and religion are embedded in nature. For millennia they have lived as an integral part of the forest in all of its beauty, goodness, and mystery. Their profound dependence, understanding, respect, and affection regarding the forest is best expressed in the words of one Mbuti: "The forest is a father and mother to us . . . and like a father or mother it gives us everything we need – food, clothing, shelter warmth . . . and affection" (Turnbull 1961: 89).

The Mbuti commune with the forest not only in their daily subsistence activities, but also in their sacred music which embraces singing, chanting, and dancing around the camp fire at night in a ritual called the molimo. In particular, they use a long wooden or bamboo trumpet (molimo) to sing through, or to make naturalistic imitations of the voices of forest animals, such as the leopard and the elephant which respectively symbolize life and death. The trumpet for this ritual is retrieved from high in a tree where it is usually stored, then bathed in a stream, and brought into the camp late at night. If this ritual is to be repeated the next night, then during the day the trumpet is hidden in a streambed. Women and children are not supposed to see the molimo, they hide in the huts when the sounds of the trumpet become audible as it is played by men approaching camp. While men take turns using the trumpet, the distinctive effect seems to transcend any human noise to become an awesome sound invoking the great spirit of the forest.

If the Mbuti suffer bad luck in hunting, illness, death, social tensions, or other problems, then they believe that the spirit of the forest has fallen asleep and must be awakened by the molimo so that it will again protect and nourish them. The molimo sounds awaken the forest and make it happy, and thereby the Mbuti are empowered with its trust and love. Thus, for the Mbuti, the forest is their benevolent deity, their religion is the worship of nature, and this is celebrated through the sounds of the molimo. In sum, Turnbull writes:

They were a people who had found in the forest something that made their life more than just worth living, something that made it, with all its hardships and problems and tragedies, a wonderful thing full of joy and happiness and free from care (1961: 17).

In conclusion, whether it is the relationship of “savages” to one another within or among societies, or with nature, Westerners tend to emphasize either the positive or negative image. That is, “savages” exemplify a life of harmony socially and ecologically far more than any other culture, or else they are antithetical to sociality and nature. In reality, however, the world is far more complicated, varied, and variable than to sustain such all-or-none and always-or-never postures. Either pole, the “noble savage” or the “ignoble savage,” is simplistic, dualistic, reductionist, and essentializing. Extremists ignore the tremendous variations among and within the up to 7000 distinct cultures extant today. It is far more scholarly and scientific to consider this great diversity through particular cases, rather than to over-generalize in either idealistic or derogatory excess. Both the noble and the ignoble representations of the “primitive” need to be scrutinized for the possibility of a hidden agenda and its consequences as well as deconstructed and thereby demystified. Nevertheless, often indigenous cultures can provide profound wisdom and insights for realizing the place of humans in nature in spiritual and other ways.

North American Conference on Christianity and Ecology [and the North American Coalition on Religion and Ecology

The North American Conference on Christianity and Ecology (NACCE) was one of the early organizations in the United States founded to motivate Christians toward ecological action. Founded in 1986 by Al Fritsch, David Haenke and Fred Krueger, it originally attempted to bring together activists from across the Christian theological spectrum. The desire was to bring everyone together to “elucidate Christianity’s ecological dimension,” as the motto on their symbol, the North American continent surrounded by crosses, reads.

Toward this end, the organization held a major conference in 1987 at a Methodist camp in North Webster, Indiana, attended by over 500 people. This was a significant turnout considering that the idea of Christian ecology was still relatively new in the U.S. and Canada. One stated goal of the conference/organization was to help “Christians become ecologists.” But even before the conference took place, tensions concerning this goal erupted during the initial planning, as the organizers argued over whether to solely focus on Christianity. The decision was made that a conference on Christianity still left room for participants from other traditions. Tensions were also evident at the conference between the more interfaith, cosmologically oriented theology of Thomas Berry and the more biblically oriented theology of the evangelical and Orthodox members, especially as delegates worked together to articulate a statement of Christian ecology. No statement was ever approved by everyone at the conference, although a version was published in the proceedings of the conference. This was in part because of objections from the Berry advocates who complained of an over-reliance in the document on biblical references, while on the other side, conservative Christians charged that creation spirituality was pagan and all references to creation spirituality should be excluded. From reports in their magazine, *Epiphany*, members of the Orthodox Eleventh Commandment Fellowship, one of the organizing groups, were particularly offended by the “beyond Christianity” approach of Thomas Berry and adherents of the creation spirituality associated with Matthew Fox. In one statement, they called Fox a “wolf in sheep’s clothing.” They also objected to Berry’s suggestion to put the

Christian Scriptures temporarily on “the shelf” in order to learn from the revelation of the “new story” found in the evolution of the universe and his view that the future lay in developing a common religious ecological worldview, a common creation story, that went beyond the exclusivity of many religious traditions. Put simply, the differences in definitions of Christianity and theology, as well as the future direction of outreach – whether to be solely focused on Christians – were too great to be overcome for the group to present a unified Christian voice.

By 1989, after a bumpy two years, the outcome of the tensions led to two separate organizations – NACCE: the North American Coalition (or Conference) on Christianity and Ecology, and NACRE, the North American Coalition on Religion and Ecology. The confusing similarity of the names highlights the tension of the split. While their differences were great in the beginning (even though Thomas Berry’s brother, James, was the president of NACCE), with the diminished influence of those associated with the Eleventh Commandment Fellowship, and with the growth and diversification of the religious environmental movement, the two organizations were not so far apart a decade later.

In the early years and up until 1991, NACCE published a magazine entitled *Firmament*. With the departure of its editor, Fred Krueger, the group started publishing a simpler newsletter entitled *Earthkeeping News* under the long-term guidance of Elizabeth Dyson. In its initial stages, NACCE was associated with James Berry, Fred Krueger (later of the Religious Campaign for Forest Conservation) and the Eleventh Commandment Fellowship, Cal DeWitt and the Au Sable Institute, and NACCE soon merged with Wesley Granberg-Michaelson’s New Creation Institute. Granberg-Michaelson, author of several ecotheology books in the 1980s, served on the World Council of Churches and played a significant role at the 1992 Earth Summit in Rio de Janeiro, Brazil. Granberg-Michaelson’s theology in many ways summed up the stewardship or earthkeeping approach of the organization. This ecotheological position was premised on the Genesis commandment (said by many eco-stewards to be God’s first commandment) for humans to till and keep the “garden” or Earth.

Despite the anthropocentric implications of the “Earth-keeping” name, NACCE’s approach involves more than stewardship, or the human care for God’s creation and resources. The pages of *Earthkeeping News* demonstrate the group’s commitment to issues of environmental justice and its support for a wide range of activities and theologies. The organization’s mission even speaks of “a loving relationship with Earth” that includes “reverence for God’s creation, with the understanding that humans are embedded in the natural world,” as well as “the study of ecological issues in the context of biblical theology and contemporary science.” NACCE has sponsored several noteworthy conferences, and has worked to promote earthkeeping circles, once termed eco-churches, both within and outside of individual congregations. NACCE is now a broad and mainstream Christian (Catholic, Protestant and Orthodox) ecological membership organization that has moved far beyond some of its conservative Christian roots. It represents a broad spectrum of Christians, from evangelicals to Quakers, with

an openness to interfaith work. NACCE is active in the Earth Charter movement, and was a significant religious ecological presence at the second World Parliament of Religions in 1993, where it offered six environment-related workshops.

NACRE, or the North American Coalition on Religion and Ecology, was founded by Catholic Don Conroy (a member of NACCE) in part, as the name change reflects, in order to pursue a more interfaith approach. The schism of the two groups was not amicable, for NACRE took with it a recently awarded World Wildlife Fund grant to organize the 1990 Earth Day ceremony at the Episcopal National Cathedral in Washington, D.C. The WWF was sponsor of the Assisi Declarations on Religion and Nature, made by representatives of the world religions in 1986. The WWF approach embodied the perspective of Berry, who had been influential at the Assisi conference. The schism was also the result of power struggles for influence within NACCE. For a while, there was talk of lawsuits and charges about not forwarding mail to the correct organization, but both organizations survived the split. Even NACRE's vision, as summed up in the phrase "Caring for Creation," is similar in focus to NACCE's emphasis on "earthkeeping." NACRE, however, pursued this vision in a different manner than NACCE, for its central focus is the advocacy of the "Eco3 Solution" of getting "ecologists, economists, and ecumenists to have," as Conroy describes it, a "trialogue, in which religion, science and society clarify and come to share values for a new global ethic which promotes sustainability at all levels" (email correspondence with author, 24 June 2003). Although NACRE briefly attempted to become a membership organization and tried to produce a newsletter, the organization's focus, under Conroy's continuing leadership, has always been on forming partnerships for education and specific projects. In 1990, it produced a religious study guide to accompany the 1990 Public Broadcasting Service television series, "Race to Save the Planet," and during the 1990s, NACRE worked with the United States Environmental Protection Agency both on climate-change education, and with its "Solar Stewardship Initiative" in an effort to enlist 340,000 faith-based congregations and organizations. NACRE is listed on websites concerning genetically engineered food, the treatment of animals, sustainability, solar energy, and the Earth Charter, which illustrates how it has sought to work outside religious circles and closely with environmental organizations. NACRE, along with its international arm, ICORE, is listed as part of Earthvoice, which describes itself as the "Global Environmental Arm of the United States Humane Society" and also as "the chairman" of ICORE. It is through Earthvoice that NACRE has worked to promote the Earth Charter.

The second period, the "New Said," began after World War I. It coincided with the founding of the Turkish Republic. In this period, he devoted his life to interpreting the Qur'an afresh. As he was by nature a lover of solitude, he would retire into seclusion to devote himself to worship and meditation. The last ten years of Nursi's life witnessed the emergence of a "Third Said," which differed from the New Said in so far as Nursi once again took a closer interest in social and political matters.

Nursi, Said (1877–1960)

Said Nursi, also known as Bediuzzaman, was born in 1877 in eastern Turkey and died in 1960. Nursi's eventful life can be divided into three major periods. The first is informal learning. It was as a result of these feats of learning that he was given the name of Bediuzzaman (Wonder of the Age) by one of his masters. He witnessed the collapse of the Ottoman Empire, following World War I, which led to the birth of the modern Republic of Turkey. He was actively involved in politics before the collapse of the Ottoman Empire, which he referred to in his later writings as the "Old Said" period.

Nursi was a religious scholar of the highest standing, who was unusual in his breadth of learning of both religious and modern sciences. He was well aware of the challenges posed by the modern worldview to religious thought. Aware of this global challenge, he invited members of the Abrahamic religions to develop a spirit of dialogue and establish a common ground against the spread of secular values and their implications in the 1940s. On the other hand, he devoted his life to the revival of the traditional Islamic understanding of the universe and its moral implications. It is here, that his cosmological views come to the fore. In his emphasis on the spiritual aspects of Islam, Nursi is regarded as a modern representative of the great saintly tradition embodied in the life of such figures as al-Ghazali (d. 1111) and Rumi (d. 1273). He once said that he regarded his works as a modern rendering of Rumi's great *Masnawi*. To overcome the challenge of "mechanical" modernity, Nursi developed a God-centered view of the universe. He underlines the Qur'anic notion of stewardship in his system of thought.

Nursi had a great passion for nature. He contemplated both the manifest and hidden wonders of nature, and linked nature's secrets to the omnipotence and omnipresence of the divine. In his daily life he formed relations of a very different sort with the universe and with everything around him – from dogs to ants – based on wisdom, compassion, and kindness.

For example, he would give the cats and pigeons that came to him part of his own food. Once, he rebuked one of his students who killed a lizard, saying, "Did you create it?" While in prison, he was most upset when the flies were killed by spraying, and wrote a short piece called *The Treatise on Flies*. In all the places he stayed, he had close ties, almost at the level of friendship, with all the creatures around him and called them "my brethren." When going for excursions in the countryside, Nursi would study "the Great Book of the Universe," and urge his disciples to read it "in the Name of the Sustainer Who created." The hallmark of Nursi's *magnum opus*, *Risale-i Nur*

(*The Epistle of Light*) is that it never compromises its rule of taking the Qur'an as its guide and explains what, why, and how the universe should be seen and read.

Nursi examined nature through the Beautiful Names of God. For example, the Most Holy (Quddus), one of the Most Beautiful Names of God, means being exempt from all fault and defect; most sacred; deficient in absolutely nothing; pure and clean. Nursi likens the universe and the Earth to a vast factory, guest-house, or hostel. He draws attention to its cleanliness and explains that everything – the clouds, rain, flies, crows, wolves, worms, ants, insects, the red and white corpuscles in a person's body – all manifest the Name of Most Holy and perform their cleansing duties. He points out that the cleansing of the soil is done in the Name of Most Holy. For if all the corpses of all the animal species and the debris of dead vegetation on the land and in the seas were not cleaned up by the carnivorous cleansing officials of the sea and those of the land like the eagles, and even maggots and ants, the Earth would have become uninhabitable.

Nursi regards animals as divine officials, which act as mirrors, and glorify God and mention his Name. For example, all sorts of beings from microbes and ants to rhinoceroses, eagles, and planets are diligent officials of the Pre-Eternal Sovereign; he regards these animals as cleansing and public health officials which collect the corpses of wild animals, and since they act as mirrors to and have a relation with that Sovereign, the value of all things infinitely surpasses their individual value . . . (paraphrased from Nursi 1995: 397). According to him, everything, from the heavens to the Earth, from the stars to flies, from angels to fishes, and from planets to particles, prostrates, worships, praises and glorifies Almighty God. But their worship varies according to their capacities and the Divine Names that they manifest; it is all different (Nursi 1998: 361).

Nursi suggests that if the natural world were observed through the Qur'anic lens, then everything would turn to a book and a letter which could be read and understood by any careful student of the Qur'an.

Thus, Nursi reads the universe as a book. He says that "one page of this mighty book is the face of the Earth" and one word of the line is a tree which has opened its blossom and put forth its leaves in order to produce its fruit. This word consists of meaningful passages lauding and praising the All-Glorious Sapiient One to the number of orderly, well-proportioned, adorned leaves, flowers, and fruits (Nursi 1995: 404–5).

Nursi, therefore, calls the universe "the mighty Qur'an of the universe" and he repeats this in many places. Also, a noteworthy point is his emphasis on the order and balance in the universe. While he considers this order and balance as indicating God's existence, he also draws people's attention to the preservation of this order and balance. For example, he argues that "there is no wastefulness, futility, and absence of benefits in the nature of things. Wastefulness, in fact, is the opposite of the Name of Wise" (Nursi 1995: 410). So, when he argues that humanity should take lessons from ecosystems and lead a wise and frugal life, he also keeps in mind the Qur'anic

verse: “Eat and drink, but waste not in excess” (7:31). According to him, there is no contradiction between the teachings of the Qur’an and the book of nature.

Thus, in Nursi’s metaphysics, the universe, as a whole, is meaningful, full of art, lovable, and comprised of numerous benefits. Moreover, it makes known to us its Creator together with His Beautiful Names. Nature, as a sacred book, is full of symbols and signs and therefore has some far-reaching implications for Nursi. As Muslims hold the Qur’an in respect and awe and do not touch it unless purified by ablutions, they also must treat the book of the universe respectfully and lovingly.

Nursi encourages human beings to take nature seriously by pursuing a meaningful life. He rebukes those who see the order, harmony, and measure in the universe, yet do not draw the necessary lessons and moral implications from it. In a nutshell, Nursi’s cosmology is based on the Qur’anic *Weltanschauung* and demands an environmentally friendly life.

Nyau – A Closed Association (Central Africa)

Often referred to as a secret society and described by locals as a religion, nyau belongs to the Chewa, Nyanja and Mang'anja peoples of eastern Zambia, central and southern Malawi and neighboring parts of Mozambique. Nyau is one of a group of closed associations spread across central Africa. The origins of these associations can be traced to the Katanga Region of what is now the Democratic Republic of the Congo and to the time of the Lunda and Luba kingdoms. These associations therefore have a history extending back at least one thousand years. When one asks, "What is nyau?," the most common answer received is "Nyau is an animal." Animal power and animal symbolism lie at the heart of nyau.

Nyau membership is open only to men and entry is gained near the time of puberty through a boys' group initiation ceremony. For the ceremony, the boys are taken off for up to one month and taken to a place called the "dambwe." Today this is usually in the graveyard, but in the past it might have been any thickly forested place. At the start of the initiation each boy is engulfed by a large basketwork animal figure known as kasiyamaliro. As noted by Claude Boucher, when lifted up, the base of this figure has the form of the womb. The symbolism of all the parts of kasiyamaliro is explicitly female. Inside kasiyamaliro the boy learns the greatest secrets of nyau and, when he comes out, he is metaphorically reborn as an adult. Boys who do not go through this ceremony are never considered to become to men.

Both members and non-members refer to nyau as Gule wamkulu – meaning the greatest dance – and dance is key to nyau activity. Nyau dances occur at three main ceremonies: the funerary ritual (maliro), the commemorative celebrations for the deceased (m'meto) and the girls' initiation ceremony (chinamwali). In all of these dances elaborate costumes and masks are used. There are, essentially, two types of masks: face-masks and mobile structures. All represent animals and spirits. Face-masks are most commonly made of wood and then painted, but a few are made out of cloth, feathers or mud. The rest of the body is covered with bits of cloth, grass and leaves. Where skin can be seen, it is disguised with white ash. The mobile structures comprise a wickerwork wooden frame, covered by an ornate shell of tied maize husks, grass and pieces of cloth. Concealed dancers animate these structures from inside.

The majority of structures take the form of particular animals or birds. Kasiyamaliro is the most important of all the structures. The animal that it represents is contested, but most believe that it is the eland.

Non-initiates are meant to believe that the nyau characters are real animals and spirits; that they are not, is the greatest secret of nyau. The majority of nyau dancing occurs in an open arena on the edge of the village known as the “bwalo.” When nyau perform in the bwalo they are accompanied by vigorous drumming by special nyau drums. The rhythms of the drums reflect the unique identity and character represented by each mask. Each nyau figure has its own name and its own dance and, when it appears, women will sing its own particular song. Most of the dances and songs carry a strong instructive message; they remind people of societal norms and taboos and they warn of the dire consequences that result from bad behavior.

Today there are many hundreds of different masks, but it appears that this multiplicity may be comparatively recent. Many of the masked characters, such as the Pope, the Colonial Officer, the Car, former President of Malawi Dr. Hastings Kamuzu [d. 1997] Banda, current Malawian President Bakili Muluzi, are demonstrably recent. New masks continue to be developed: a recent one is Edzi – meaning AIDS. Kasiyamaliro – meaning the one that delivers the funeral – is probably among the most ancient of all nyau figures. Kasiyamaliro dances at all important rites of passage and thereby oversees the transformation of boys into men, girls into women and the dead into ancestral spirits. Its appearance marks the climax point of most nyau ceremonies.

Despite nearly a century of suppression from the 1860s until the 1960s when nyau came into conflict with Ngoni invaders, the early Christian Church, and the Colonial administration, nyau continues to thrive. In the operations of nyau we see a key historical force that has made Chewa, Nyanja and Mang’anja society strongly resilient to unwelcome intruding forces. Its masks caricature and mock intruding forces and reaffirm traditional ways and values. The cow mask, ng’ombe, for example, was developed in the 1860s to mock the incoming Ngoni invaders who, as with other Ngoni groups, built their villages around the cattle kraal and buried their male dead within the kraal. The ng’ombe mask lampooned this behavior and thereby served to undermine Ngoni authority.

The masked figures do not just represent animals and spirits, they are perceived by society to be animals and spirits. They are above the law and they cannot be prosecuted. In the final years of Dr. Banda’s government this allowed nyau to be a powerful force in advocating multiparty democracy, even at the time when all other avenues for political dissent were closed. Nyau figures continue to parody what is perceived as the poor behavior of societal leaders and thereby play a key role in the sometimes troubled democratic processes of the region.

O

Odinism

Odinism refers to the modern reconstruction and revival of pre-Christian Germanic heathenism centered on the pantheon of ancient northern deities in which the god Odin (variously called Ódinn, Woden, Wodan, etc., in the different older Germanic languages) is a principal figure. Odinism is only one of a number of generic designations that might be used by practitioners to describe their beliefs; the term *Ásatrú* (“loyalty to the gods,” a modern coinage derived from Old Norse) is in equally widespread use today. Odinism may in some instances refer to a less ritual-oriented and more philosophical variant of Germanic heathenism than *Ásatrú*, or one that places a marked importance on racialism, but such distinctions are rarely consistent or precise within a sub-culture that generally eschews dogmatism.

Odinism is a polytheistic religious system that also emphasizes the reverence of past ancestors, the acknowledgment of archaic wisdom contained in mythological tales, respect for ethnic heritage and the continuance of folk traditions, and the maintenance of a heroic bearing toward life’s challenges. Some prominent practitioners have described Odinism as a “nature religion”; this is not surprising given that in all its important aspects – cosmology, outlook, and practice – strong connections to the natural world and its forces are evident.

A central feature in Odinit cosmology is Yggdrasil, the World Tree (usually conceived of as an ash or yew), which symbolically connects the nine worlds that are variously inhabited by gods, giants, humans, and other beings. A number of animals also live within the tree; their activities seem mythically to represent the dynamic interactive forces of what could be termed the greater “multiverse.” It was also on the tree of Yggdrasil that Odin hung himself in a ritual of self-sacrifice, thereby gaining his powerful understanding of the mysteries of the runes: primordial Germanic linguistic, cultural, and magical symbols, many of which directly relate to aspects of the physical world (various rune names refer to trees, animals, and natural phenomena). In Germanic creation mythology, the first human beings were created when Odin and his brothers took two trees, *Askr* and *Embla*, and bestowed consciousness upon them.

Odinism posits a cosmos full of divine and natural energies, operating both within Midgard (from Old Norse, *Midgardr*), the world inhabited by humans, as well as in transcendent domains where the gods and other non-human entities reside. The gods travel freely between these worlds and thus can and do interact with humans. Gods and humans are also subject to their position within both a personal and a collective *Wyrd* (from Old Norse *urdr*), or “fate”; this does not predetermine every lesser action, but rather exerts influence upon the overall course of life. Although it is believed that the

distinctive essence or soul of a human being will depart for another realm after death (various specific possibilities are described in the mythological literature), the primary emphasis of the religion is not other-worldly; instead it focuses upon right conduct in the here-and-now. Virtues such as honor, courage, and hospitality are highly valued, and an awareness of humankind's place in the natural world is also cultivated.

While there are differing beliefs as to the exact nature of the gods, the latter are generally seen as real and knowable, and their mythological depictions simply as means to illustrate or understand various aspects of their character and function. The primary deities fall into two clans or groups, the Æsir and the Vanir. The Æsir consist of Odin, Frigga, Thor, Tyr, Balder, and others; they are often associated with important societal functions such as war, sovereignty, and law. Certain atmospheric events may also be associated with these deities (e.g., the thunder and rain caused by Thor wielding his mighty hammer in the heavens, hence his importance to the peasantry as both a defensive protector and a fertility god). Of the Vanir gods, Frey and Freyja are the best known. These deities generally exhibit stronger connections to "earthly" realms of fertility and sensuality, both of which are important categories to many Odinists. Fertility is not only recognized in relationship to agricultural crops and a healthy natural environment, but also in the continuance of familial lineages which are central in a religion emphasizing ancestral culture and ethnic heritage. Sensuality is welcomed as a vital and stimulating ingredient for the full enjoyment of human existence.

In addition to gods and humans, other entities such as elves, dwarves, and landwights (from Old Norse *landvættir*) receive important consideration. These beings may be acknowledged in rituals, and in some cases offerings of food or drink are made to ensure their good favor. Landwights are the unseen residents of a given geographical location, capable of bestowing blessings or misfortune on the humans who live in their proximity. In the Viking period in Iceland their importance was such that an early law ordered boats to remove the fearsome carved dragon heads from their prows as they approached shore, so as not to frighten these spirits; a modern vestige of this tradition still exists whereby ships entering Icelandic harbors are officially requested briefly to lower their flags as a gesture of respect to the land spirits.

In addition to living in harmony with the ethical principles of the religion, organized rituals and feasts are celebrated by Odinists at varying times throughout the year. The primary religious festivals can be located at specific points of the seasonal solar or agricultural calendar; these include mid-winter (Yule) and mid-summer, as well as specialized occasions in the spring and fall. Other formal rituals are performed for specific purposes, or to honor specific deities. The general term *blót* (from the Old Norse word for "sacrifice") is used to refer to any one of the aforementioned ceremonies. Such a sacrifice is frequently symbolic in nature, and usually features a libation in the form of mead or ale. The most appropriate location for major ceremonies is generally considered to be outdoors, a tendency that resonates with historical accounts of various ancient Germanic tribes practicing their rites in "sacred groves." The implements utilized in Odinist rituals

– drinking horns, hammers (potently connected to Thor; many Odinists also wear a talismanic hammer pendant to indicate their allegiance to the religion), carved wooden staffs, wooden or metal bowls – are fashioned from natural materials, ideally by the practitioners themselves. A small branch cut from a living tree is commonly used to sprinkle mead as a blessing on the participants of a ceremony, and at the conclusion of a ritual any remaining libation will often be poured onto the ground as an offering of respect for the land-wights. A further ceremony is a *sumbel*, a structured session of ritualized drinking in which participants offer up toasts to deities, heroes, human ancestors, or spiritual principles. It might also be an occasion for making personal boasts or oaths. While the formats of rituals vary between groups, generally they are studiously reconstructed from archaic references in older Germanic literature (usually Old Norse and Scandinavian sources, as these contain the largest body of pre-Christian lore), often combined with aspects of folk traditions that have survived into more recent times and appear to have a basis in older beliefs.

A balanced scholarly study of the emergence of Odinism in the modern era has yet to be written, but various stages can be discerned. Although the revival of interest in ancient Germanic culture can already be seen in the seventeenth-century Swedish Storgoticist movement and the figure of Johannes Bureus (1568–1652), more concrete indications are evident in late eighteenth-century Germany, when specific efforts were made to stir popular interest in the newly rediscovered religion of Odin and the elder Germanic deities. Among *Sturm und Drang* intellectuals, the philosopher J.G. Herder (1744–1803) extolled the legacy of the pre-Christian Germanic north as an important ingredient for building an organic national culture. A 1775 book called *Wodan, der Sachsen Held und Gott* (*Wodan, the Hero and God of the Saxons*) by

H.W. Behrisch (1744–1825) declared Odin the “light of the world” and loftiest exemplar for the modern Germans of Saxony, and urged them to rediscover the true nature of their beginnings in the “sacred darkness of the northerly forests.” A century later, the burgeoning Germanic national romanticism coalesced into pan-Germanist and *völkisch* movements with visible alternative religious elements. By the early 1900s, overtly neo-heathen groups had established themselves. These included the Armanenschaft, led by the Austrian mystic and author Guido von List (1848–1919), and the Germanische GlaubensGemeinschaft, led by the German painter Ludwig Fahrenkrog (1867–1952). This flowering was relatively short-lived, however, as the incipient National Socialist regime would eventually curtail or forbid nearly all such groups, forcing them to go underground or disband.

An Australian lawyer and writer, Alexander Rud Mills (1885–1964), appears to have been the first person publicly to promote Odinism in the English-speaking world. By the 1930s Rud Mills was advocating a movement firmly opposed to Christianity and featuring a strident anti-Jewish component, and in 1936 he published a substantial handbook detailing the philosophy and rituals of this highly idiosyncratic “Anglecyn Church of Odin.” Despite issuing publications over a period of three decades, Rud Mills

never found any significant support for his efforts, and his work has largely faded into obscurity.

In the aftermath of World War II, with lingering public perceptions that National Socialism had been a “pagan” movement (an inaccurate perception, as official Third Reich policy endorsed “positive Christianity”), over twenty years would pass before Germanic neo-heathenism began to flourish again, and now in new areas. In the United States a number of small groups emerged unbeknown to one another, such as the Odinist Fellowship, formed by Else Christensen in 1971 (and influenced to some degree by the preceding efforts of Rud Mills), the Viking Brotherhood, formed by Stephen A. McNallen in 1971–1972, and the Northernway, founded by Robert and Karen Taylor in 1974. The Viking Brotherhood would later develop into the Ásatrú Free Assembly, the first national Odinist organization to gain any momentum in America. During the mid-1980s the A.F.A. went into a hiatus – out of which emerged two significant and still active groups, the Ásatrú Alliance and the Ring of Troth – before reconstituting itself as the Ásatrú Folk Assembly. In England similar initiatives had arisen independently, such as the Committee for the Restoration of the Odinic Rite (later shortened to the Odinic Rite) established in 1973 by John Yeowell; a variety of other groups have also sprung up there over the last quarter-century. In Iceland, the home of the Old Norse sagas, Sveinbjörn Beinteinsson (1924–1993) formed the Ásatrúarfélag in 1973 and succeeded in having heathenism legally recognized. Other small groups have been active since at least the 1970s in most Scandinavian countries. Beyond the growing list of national Odinist organizations, many smaller, localized independent associations exist, as do untold numbers of solitary practitioners.

Odinism remains largely a sub-cultural phenomenon, although in recent decades it has gained increasing recognition in the wider landscape of neo-paganism and new religious movements. In contrast to some other branches of neo-paganism, Odinist groups may tend toward traditionalist viewpoints, and in certain instances this can include strong racial beliefs. A number of organizations believe that the religion is most suited for the descendants of its original, ancient practitioners; this has been described as “ethnic” or “folkish” Odinism or Ásatrú, and does not generally imply supremacist notions. Other groups are vocally universalistic, and would not concede the legitimacy of any ethnic criterion in regard to prospective members. Distanced from both views are those who interpret the religion foremost as a racial, or even racist, vehicle. In order to draw a distinction from mainstream Odinist or Ásatrú groups, some racially motivated practitioners may refer to themselves as “Wotanists” (according to racialist ideologue David Lane, the name Wotan is an acronym for “Will of the Aryan Nation”). Groups associated with this hard-line position have a constituency consisting primarily of incarcerated males, and tend to be volatile and incapable of maintaining significant longevity.

Most mainstream heathen groups avoid taking overt political positions, and will tolerate a wide range of personal beliefs among their membership. Libertarian values of personal freedom are commonly found among practitioners, and are often viewed

as being in line with older Germanic attitudes. Most groups promote ecological awareness; some have encouraged their members to become involved with environmental activities, or have organized campaigns to protest the destruction of historic sites in England and elsewhere. Although the religion is sometimes viewed as heavily emphasizing “masculine” deities and virtues, the importance of and lore concerning the female goddesses is often underscored in contemporary Odinist literature, and a number of women have taken on leadership roles in both the U.S. and Iceland in recent years. These developments, along with the diversity of socio-political beliefs found among its practitioners, all point toward the long-term viability of Odinism or Ásatrú in the postmodern age.

Oikos

Oikos is a Greek word used to describe a variety of often overlapping structures and the basis for a number of compound words central to classical Western thinking. Its basic translation is “house.” In ancient texts it can refer to a physical dwelling, but also to a family, clan, a smaller economic unit including land, owners, animals, slaves and servants, as well as products. Ancient Greek sources often oppose it to or distinguish it from the term *polis*, which describes a more “public,” potentially urban relational civic structure. In most ancient sources, though gender roles could at times involve some slippage, the *polis* was often described as the designated realm for masculine civic and legal activity and the *oikos* as the proper realm for women’s activity, dedicated to the production and management of land, humans, animals, food. It is important to remember that *oikos* in those times did not refer to a one family nuclear household, but is better compared to a small family business that was often overseen by a woman.

The compound *oikonomos* signifies a steward or manager of the system of the *oikos*, who would often be a slave (see for example Jesus’ parables). This term has found application both in the Christian notion of (creation) stewardship and in modern economic science. *Oikonomia* can describe any kind of management structure or plan, on large and smaller scales. Thus it could refer to ancient state management, the notion of a divine plan within creation (*oikonomia theou*), as well as the management of a variety of economic units. The term’s application is clearly anthropocentric, centering on human structures of organization of communal and civic life and anthropomorphic concepts of divine agency.

Ecology, the anglicized version of a neo-Greek compound *oikologia* is not a classical Greek term and has come into its own only in the twentieth century. Though the idea of relational being of natural systems is ancient, ecology as a science or conceptual framework is a latecomer.

In some recent theological and ethical texts the term *oikos*, *oikonomia*, *oikumene* (the known inhabited world) and ecology have been redefined so as to refer to the community of all creation. Writers have employed it as a tool for the necessary rethinking of what stewardship of creation in times of ecological crisis might mean. Countering the narrowing of modern capitalist notions of “economy” reduced to market dynamics, these texts attempt to recast *oikonomia theou*/divine economy (linked to the notion of the kingdom of God) as congruent with the ecology of the planet. If the household of God’s creation includes all planetary life, it should be lived in with reverence. Though at bottom an anthropocentric theological concept, authors employ it to urge humans to see themselves less as the “crown of creation” than as parts of a divinely created

whole that cannot be endangered without seriously compromising life as we know it on planet Earth.

Olson, Sigurd F. (1899–1982)

Sigurd F. Olson was one of America's most beloved nature writers and most influential conservationists of the twentieth century. Best known as the author of *The Singing Wilderness* and eight other books, Olson also played an important role in the preservation of a number of national parks, seashores, and wilderness areas.

Born in Chicago on 4 April 1899, Olson spent most of his childhood and youth in northern Wisconsin, where he discovered a love of nature. He was the second of three sons raised by the Reverend Lawrence and Ida May Olson, Swedish immigrants who met and married in the United States. His parents were devout Swedish Baptists, and Olson was raised in a strict household. One time, for example, Lawrence Olson discovered Sigurd and another son playing with a chess set, and he threw it into the fire.

While attending college at the University of Wisconsin in Madison at the end of World War I, Olson nearly committed himself to becoming a missionary. The night before he was publicly to declare his intent, however, he climbed the roof of the YMCA building where he lived, stared out over Lake Mendota, and struggled with his decision. He realized that his interest in becoming a missionary had more to do with exploring wild places than with saving souls; in the morning he resigned from the church organization he had been chosen to lead, and in effect broke from the faith of his parents.

For years afterward, Olson was obsessed with discovering a sense of meaning and mission to replace what he had lost. Eventually, he found what he was looking for in the wilderness canoe country of northern Minnesota and Ontario. He moved to Ely, Minnesota in 1923, and taught in the local high school and junior college, eventually becoming dean of the college. During the summers he guided canoe parties through the wilderness, and he noticed that the wilderness often had as profound an effect on his clients as it did on him. They laughed more, sang songs, played practical jokes. They watched the sunset and the moonrise, and listened to the roar of rapids and the soft sighs of wind in the trees. Like Olson, they became re-connected to the grand, eternal mystery of creation.

Olson came to believe his mission in life was to share with others what he had found in the wilderness, and to help lead the fight to preserve it. Science, technology and materialism were turning many people away from the religious truths and practices that had given spiritual sustenance, he argued, and offered nothing in their place. The result was a widespread, if often vague, discontent, partially hidden underneath fast-paced lives, yet also nourished by that same fast pace that left little time for reflection. Olson believed that the silence and solitude and noncivilized surroundings

of wilderness provide a physical context in which people can more easily rediscover their inner selves. Just as important, wilderness gives people a chance to feel the presence of a universal power that science can never explain, but that brings meaning to their lives. “Wilderness offers [a] sense of cosmic purpose if we open our hearts and minds to its possibilities,” he said at a national wilderness conference in 1965.

It may come in . . . burning instants of truth when everything stands clear. It may come as a slow realization after long periods of waiting. Whenever it comes, life is suddenly illumined, beautiful, and transcendent, and we are filled with awe and happiness (Olson 1966: 218).

Olson spread his philosophy in nine books, in many magazine and newspaper articles, and in countless speeches and conversations across the United States and Canada. He read and thought deeply about the works of others who were searching for meaning in the modern world – such as Pierre Teilhard de Chardin, Lewis Mumford, Aldous Huxley, Josef Pieper, and Pierre Lecomte du Noüy – but was able to get across his deep message about the spiritual values of wilderness mostly by writing about simple things: the sound of wings over a marsh, the smell of a bog, the memories stirred by a campfire, the movement of a canoe.

By the 1970s Olson was a beloved environmental figurehead whose name and image invoked strong feelings. Often photographed with a pipe in his hand and a warm, reflective expression on his weathered face, he was not just a hero but an icon. His books were read on public radio, his portrait was taken by Alfred Eisenstaedt for *Life* magazine, he received the John Burrough’s award for nature writing, and earned the highest honors of four of the major national environmental groups for his leadership role in preserving wilderness across the United States and Canada. He died of a heart attack on 13 January 1982, while snowshoeing near his home.

David Backes

In the 1960s and early 1970s, dozens, perhaps hundreds, of open-land communities appeared. Gorda Mountain, in the Big Sur region of California, was opened to all by its owner Amelia Newell in 1962 and grew to a population of around 200 before pressure from neighbors brought it to a close in 1968. In the meantime, Huw Williams and others had opened Tolstoy Farm in Washington, and the flamboyantly counter-cultural Drop City, founded outside Trinidad, Colorado, in 1965, welcomed all who would share its egalitarian poverty. The following year Lou Gottlieb threw open his Morning Star Ranch in northern California, believing that people have an inherent deep spiritual relationship with the Earth and thus should live close to the land, to nature; it attracted hundreds of residents and became the focus of extended battles with the local authorities who finally succeeded in bulldozing its makeshift structures in the early 1970s, although Gottlieb preached the gospel of open land for the rest of his life. Experiments in open land have endured, as many other 1960s-era and later communes have continued to embrace all who would come.

Open Land Movement

Open land has been a dream of back-to-nature visionaries at least since the time of the Diggers and Levelers in England. Proponents of that dream have often envisioned a nature-oriented society far from the degradation of urban life, one in which all would thrive in a state of nature. Often the vision has taken form as an open-door intentional community and in many cases that has led to inundations of problematic residents. One of the first open-land communities was Celestia, founded in Sullivan County, Pennsylvania, in 1850 by Peter Armstrong, who opened the land to all seeking refuge from the sinful world in a place where they could await the Second Coming of Christ, which was understood to be imminent. A halfcentury later the Christian Commonwealth Colony (1896– 1900), in Georgia, flung its doors open to all; its founders sought to establish a perfect Christian socialist society on Earth in an agricultural setting, but the colony never could rise out of poverty.

Ortiz, Simon J. (1941–)

Simon J. Ortiz, Acoma Pueblo, was recognized in 1993 with a Lifetime Achievement Award for literature at the Returning the Gift Festival of Native Writers. In addition to his own work as a poet, fiction writer, and essayist, he has edited books and journals devoted to promoting contemporary native writing. Throughout his work, and in the course of promoting the work of others, Ortiz has remained emphatic about the relationship of contemporary native literature to oral tradition, defining it as a form of cultural and spiritual continuity. In 1981, in “Towards a National Indian Literature,” Ortiz defined contemporary native writing as an element of native oral tradition, linking it with ceremony, song, and prayer narratives as cultural acts of “bringing about meaning and meaningfulness.” Invariably, this linkage with tradition, ritual and ceremony, also requires for him a recognition of an indigenous ecological worldview that sees the people and the land as a single entity. In his introduction to *Speaking for Generations* he stated,

The young are frequently reminded by their elders: these lands and waters and all elements of Creation are a part of you, and you are a part of them . . . This belief is expressed time and time again in traditional song, ritual, prayer, and in contemporary writing (1998).

In 1976 and 1977, Ortiz published *Going for the Rain* and *A Good Journey* as two separate volumes of poetry, but actually they comprised parts of a 400-page manuscript of poems he had already written by that time. Another piece, *Fight Back*, combining poems and prose narratives was published in 1980. Finally, in 1992, these three texts were united in *Woven Stone* with an extensive introduction by the author. This volume best represents Ortiz’s explicit themes outlined above, as well as the range of his poetics. The first section contains numerous “songs,” coyote stories, and ceremonial poems celebrating birth, all life on the planet, and the relationship of a person to place. The second section returns to coyote, as well as other animals treated as guides and spiritual brothers. Ortiz also includes poems specifically designated as “prayer.” But perhaps most significantly, Ortiz depicts the poet-traveler as becoming increasingly unhealthy in both body and spirit the farther he journeys away from home, with a psychic, spiritual, and physical reintegration occurring not only for him but for other tribal people upon homecoming. In the third section, “Fight Back: For the Sake of the People, for the Sake of the Land,” Ortiz opens with “Mid-American Prayer” and then divides the poems and prose narratives of this section into two parts: “Too Many Sacrifices” and “No More Sacrifices.” While reciting the destruction of native peoples and their lands, Ortiz also emphasizes endurance and the possibility of change and

rebirth based on the reintegration of all people with the living land. Ortiz continued this life's work theme in *After and Before the Lightning* in 1994, focusing on the land and the people, not in the warm climate of the Pueblo region, but in the snow and ice of the Rosebud Reservation in South Dakota.

Oshmarii-Chimarii (Mari El Republic, Russia)

A revival of indigenous nature religion in the Volga River region in the 1990s was spearheaded by Mari religious organizations in the Mari El Republic (one of twenty-one republics within the Russian Federation). The Mari are a Finno-Ugric people who make up less than half of the population of some 780,000 in this Central Volga basin republic. The neo-pagan community *Oshmarii-Chimarii* (White Mari – Pure Mari) was established in 1991 with a center in the republic’s capital, Yoshkar-Ola. Though its founders had intended it to become an All-Mari religious organization, the community has so far failed in this ambition, but it continues to sponsor and arrange various public events, and a Council of *Karts* (Mari priests) holds its meetings under its auspices.

The revival of Mari paganism developed hand in hand with the growing nationalist movement of the 1980s and early 1990s. The largest Mari nationalist organization, the Mari Democratic Union (*Marii Ushem*), was formed with the goal of reviving and promoting Mari language and culture throughout Russia, but by 1992 the union’s leaders were advocating an enlargement of Mari representation in republican and local power structures. In early 1991, a radical faction of this movement, *Kugeze Mlande* (Ancestors’ Land), initiated a revival of Mari paganism. This faction was dissolved in March 1995 and replaced by *Sorta* (Candle), an educational neo-pagan organization led by academics and intellectuals. These urban activists have tended to combine their religious goals with political aspirations aimed at national consolidation and resistance to Russification. Some have tried to systematize and unify pagan teachings in order to develop a consistent national religion, free of those elements (such as animal sacrifice) that seem less attractive to the general public.

In contrast to the intellectual-led and politically motivated urban-centered paganism, the revival of Mari paganism in the countryside was led by local priests (*karts*), some of whom could claim to have maintained an unbroken connection to ancestral traditions. Large public rituals had in fact been conducted by Maris as late as the 1880s, and family and communal prayers were kept up in sacred groves and ritual knowledge transmitted into recent decades, despite persecution in the Soviet era.

Traditional Mari paganism comprises a mosaic of locally based beliefs and practices. Mari paganism holds environmental awareness and “harmony with nature” among its central moral imperatives. A 1991 act of legislation has resulted in the protection of some three hundred sacred groves and prayer sites by the republican authorities, and

public prayers involving sacrifice of horses, bulls, rams, and fowl, have been conducted at these groves since that time. Prayers and rituals have been conducted in many Mari villages and at the grave of the sixteenth-century Mari hero, prince, and priest Chimblat in Kirov province. An All-Mari harvest festival gathering occurs every five years. Nowadays, Maris pray for protection of their culture, natural environment, health, and “the people’s spirit.” A similar movement has been growing among Maris outside the Mari El Republic, especially in neighboring Bashkortostan.

According to a 1994 sociological survey, “pure pagans” account for 7.9 percent of the Mari people in the Mari El Republic, while another 20.7 percent practice both paganism and Christianity. The proportion of pagans among Mari in the Urals region, Bashkortostan, and Tatarstan, where they had fled from forcible Christianization, are even higher. Women dominate among the pagans and the dual-believers (respectively, 69.2 and 63.6 percent). Many dual-believers also attend pagan services. By contrast, Mari intellectuals frequently view Christianity with hostility, seeing it as a “religion of slaves.” Yet both old and new Mari pagan beliefs integrate certain Christian ideas, such as apocalypticism and references to Christian prophets (such as Elias), apostles (Peter and Paul), and even Jesus Christ and the Virgin Mary, in their prayers.

A restoration of pagan traditions in the Mari El Republic is patronized by both the republican and local authorities. The republican Ministry of Education approves school textbooks which teach traditional Mari folklore. Certain Mari scholars represent the Mari El Republic as an oasis of pagan traditions. They advocate making the republic a “culture-historical reserve,” which would involve the establishment of a center for the study of folk culture, the organization of folklore festivals, arrangement of scientific-practical conferences, promotion of traditional arts and crafts, support for ethnographic folklore groups, and the like. Plans are underway to build the main All-Mari religious sanctuary in a suburb of Yoshkar-Ola, together with an ethnographic museum, educational center, and hotel. A guidebook published by the republican authorities claims that the “Maris are the only people in Europe who maintained the pure faith of their ancestors and did not renounce their old gods.” It argues that devotion to the traditional spirituality has been responsible for Mari national self-awareness and for the maintenance of the Mari language and ethnic customs.

Otherworlds

Religions are often understood to be concerned with realms beyond everyday life. “Spiritual,” “heavenly” or “supernatural” realities are sometimes considered central to definitions and experiences of religion. The location of matters of central importance (perhaps “ultimate reality”) beyond everyday life is definitive for some theologically understood religions. Similarly, in translating other people’s religious language with words like “spirit” or “sacred” it is often implied, at least, that religion concerns transcendent realities and states. That is, according to some religious and academic authorities, “religion” is about spirituality not embodiment, heaven not Earth, divine will not human desire. Whether or not such systematizations of religions reflect the understanding, experience and motivations of “ordinary” religionists may be debated. Certainly, however, all cosmologies indicate concerns both about ultimate concerns and about “nature” or “this world.” For example, classical Christian teachings about heaven, purgatory, Earth and hell imply a range of daily and ceremonial interactions with the “mundane” or “secular” world that are worthy of consideration, especially in our attempt to understand the meaning and role of nature in Christian and Western thought and experience.

In a wide range of worldviews and lifeways, this world and the relationships that take place here are of central importance. The terms “otherworld” and “otherworlds” (sometimes capitalized) might seem to similarly privilege the extra-ordinary, supernatural, or transcendent above the ordinary, natural or daily. However, close exploration of discourses of other-worldly reality challenge such understandings. Even if the otherworld is the home of ancestors, elves, fairy-folk or “spirits,” such locations are neither distant nor alien. Ancestors are neighbors, and sometimes more intimate than that: a wide variety of indigenous peoples consider children to be ancestors reborn. Even saints remain in communion with the faithful, but, unlike ancestors, seem less interested in family life. The realm of faery – and its various inhabitants (elves, gnomes, dwarves, boggarts as well as fairies themselves) – are otherworlds contiguous with “ordinary” nature. For example, in W.B. Yeats’ evocative poem “The Stolen Child,” the clear difference and opposition between human and other-worldly realities, moralities and desires is firmly located in the recognizable geography of Ireland’s County Sligo. The otherworlds of Irish and Norse cosmologies are the alterities of the everyday – as inseparable and as near/ far as one’s own shadow. Perhaps the otherworld is also like those metaphorical or psychological “shadowy” parts of our own inner lives: necessary to a full understanding of ourselves but rarely referred to explicitly. It might also

contribute to debates about cosmologies in which the world is divided into “human domains” and “elsewhere”

(e.g., the forest, bush, wilderness in which “wild” animals and wilder “spirits” are in control). Indeed, “wilderness” is constructed (not found) very differently in urban modernity than elsewhere, especially as a romantic location for awesome and/or holistic rather than demonic and purifying experiences.

The otherworld is part of the “ecology of souls” – if this phrase can be used as Terence McKenna intends (i.e., without evoking a duality in which body is denigrated in favor of disembodiment). Instead it should suggest the interdependent coexistence of all manner of living persons (e.g., trees, birds, animals, humans, “the little people,” and sometimes rocks and clouds). Irving Hallowell’s dialogue with Ojibwe led him to refer to the relationships of human and other-than-human persons. As the alterity of the ordinary, of everyday nature, or of the taken-for-granted world, otherworlds define the world as a richer place than the realm of daily life. They enchant, and require responses that maintain and even reinforce the boundaries between “here” and “there.” They also enable understandings of events as intentional acts rather than allegedly impersonal, mechanical or accidental processes. Thus the enchantment of otherworlds permits and generates “magic” and “fate.” That is, for example, seeming accidents may be considered to result from insults to otherworld persons.

Some otherworlds are post-mortem destinations for humanity. These include not only the various heavens or hells (or transcendent realms) but also those neighboring spaces, contiguous to this world, which might also be home to deities and others. The “land of youth” and the “land of women” are locations for particular after-lives, but can be visited by the living (heroes or fools at least). More generally, however, otherworlds are the specific homes of other-than-human persons such as elves, faeries, dwarves, giants, and so on. They too might visit thisworld, sometimes for less than neighborly purposes. Even the rich and diverse ecologies of “middle Earth” do not exhaust the nations of living beings.

Academic discussion of otherworlds and their inhabitants often assumes the unreality of otherworlds and proceeds to wonder why humans invent such places and inhabitants, such fantasies and fears. Sometimes they interpret alleged encounters with otherworld visitors as references to psychological process. More recently, however, scholars such as Edith Turner have been willing to accept the reality of encounters with “spirits” in healing rituals at face value, and then struggled to find appropriate ways to tell academic colleagues that “native” or insiderly cosmologies and discourses have validity.

So what are faeries, dwarves and so on? Some people will insist that they are exactly what they are said to be. A popular contemporary understanding is that such beings were once more widely encountered, but retreated into wildernesses in the face of either Christian demonization or of more recent industrialization. In many cultures worldwide, reference is made (in narrative, ritual, iconography or conversation) to “little people.” Eschewing the Victorian notion that such beings evidence memories of earlier “races,”

and their literalist diminishment into childhood fantasies, it is clear that such beings are generally spoken of circumspectly. “Little people” avoids naming persons who might otherwise visit, and who might be far from cute and diminutive. Thus we are thinking of feared persons, or at least those who are less than welcome everyday. If nothing else, this indicates that the world is not always encountered as a nurturing place. We are confronted by much that challenges our own needs and desires. Otherworlds are areas of life that resist human control, even in imagination. Meanwhile, that offerings are made to them suggests that respect is necessary and rewarded, indicating that otherworlds are enticing and seductive, and that life can be more than it seems.

Ouspensky, Pyotr Demianovich (1878–1947)

P.D. Ouspensky is known today chiefly as the author of *In Search of the Miraculous*, his definitive account of fellow Russian mystic and esoterist G.I. Gurdjieff's teaching which has subsequently become a classic of late twentieth-century mystical literature. In it Ouspensky documents his first meeting with Gurdjieff in Moscow 1915, their relationship through the years of war and revolution which marked the period, to his break from Gurdjieff in 1918, which began a process of separation as both fled from Russia, becoming refugees in Turkey until Ouspensky came to London in 1921, where he stayed until the outbreak of World War II, when he settled in the United States. Although best known for this work, Ouspensky was in his own right a leading Theosophist who was at the center of the philosophical and occult subcultures that flourished in pre-revolutionary St. Petersburg. His pre-Gurdjieffian publications, especially *Tertium Organum*, synthesized and popularized late nineteenth-century Russian mystical and literary traditions in early twentieth-century Russia. Written in 1911 and published in New York in 1922 it quickly became a bestseller and gave him a worldwide reputation. Outside Russian artistic circles, it also influenced many American writers, including Jean Toomer, Waldo Frank, Gorham Munson, and Kenneth Burke, and through them modern literature. Most significantly, his notion of "the living world is an *entire* organism" shaped Aldo Leopold's important ethical argument for conservation (Ouspensky 1949: 299).

In *Tertium Organum* Ouspensky outlined a suprarational logic that was meant to surpass the *Organon* of Aristotle and the *Novum Organum* of Francis Bacon, and help lead to mystical insights. The key to this effort was his contention that "in mysticism there is a new method" (Ouspensky 1949: 230) and his identification of mysticism with "knowledge received under conditions of expanded receptivity" (Ouspensky 1949: 251).

Indeed, Ouspensky later wrote that he believed he had gained access to mystical states through experiments in yoga, prayer, fasting, and breathing nitrous oxide and ether (Ouspensky 1930: 315). It was during the period of these experiments that *Tertium Organum* was written (Ouspensky 1930: 323–4). Central to his perception was his experience of a "world in which everything is connected, in which nothing exists separately" (Ouspensky 1930: 315–16), and where all things "were dependent on one another, all things lived one another" (Ouspensky 1930: 323).

As a consequence, he believed, “in this world, there is nothing dead, nothing inanimate, nothing that did not think, nothing that did not feel, nothing unconscious. Everything was living, everything was conscious of itself” (Ouspensky 1930: 323). Ouspensky concluded, “our world is merely our incorrect perception of the world: the world seen by us through a narrow slit” (Ouspensky 1949: 242).

Grounded on this perception, Ouspensky urged his contemporaries to “regard the different forms of consciousness in different divisions and strata of living nature as belonging to one organism and performing different, but related functions, than as separate, and evolving from one another” (Ouspensky 1949: 299). This led to an understanding similar to that found in the more holistic ecological positions of today. Such ecological descriptions of natural systems (for example, a forest – “in which there are trees of different kinds, grass flowers, ants, beetles, birds, beasts – this is a living thing too, living by the life of everything composing it, thinking and feeling for all of which it consists” (Ouspensky 1949: 186)) – is one of many found throughout *Tertium Organum*. While his understanding has become common coin in later environmental movements through the agency of Leopold, for Ouspensky it was only a small part of a more complex relationship between two interdependent entities, Man and Nature.

He encapsulated his mystical perception in one of the most lyrical passages of *Tertium Organum*, a passage which exemplified Ouspensky’s dictum that “in all conditions of encompassing nature . . . lies . . . the sensation of a complete oneness with nature” (Ouspensky 1949: 275):

. . . in the procession of the year; in the iridescent leaves of the autumn, with their memory-laden smell; in the first snow, frosting the fields and communicating a strange freshness and sensitiveness to the air; in the spring freshets, in the warming sun, in the awakening but still naked branches through which gleams the turquoise sky; in the white nights of stars – in all these are the thoughts, the emotions, the forms, peculiar to itself alone, of some great consciousness: or better, all this is the expression of the emotions, thoughts, and forms of consciousness of a mysterious being – Nature (Ouspensky 1949: 179).

However, Ouspensky argued that only in “‘man’ this unity is apparent” (Ouspensky 1949: 298). In later publications, he introduced a less-influential image of nature which built upon and clarified this earlier vision, that of the “Great Laboratory which controls the whole of life” (Ouspensky 1930: 44). Ouspensky argued that “all the work of the Great Laboratory had in view one aim – the creation of *Man*” (Ouspensky 1930: 51), and that out of the preliminary experiments and the refuse of the production there were formed the animal and vegetable kingdoms.

What was meant in this instance was something other than a justification of anthropocentrism, for what Ouspensky meant by this was that the “task of the Laboratory was to create a ‘form’ evolving by itself” (Ouspensky 1930: 50). Indeed, Nature “made attempts at creating self-evolving beings before man” (Ouspensky 1930: 59); Ouspensky thought that “both ants and bees came from the Great Laboratory and were sent to Earth with the privilege and the possibility of evolving” (Ouspensky 1930: 60) but

failed when they having “begun to alter their being, their life and their form . . . severed their connection with the laws of Nature” (Ouspensky 1930: 62).

All this implied that our species too may fail and be disposed of by nature unless the directive of evolution was pursued. “All forms of consciousness in him can exist simultaneously” (Ouspensky 1949: 298) – to transform this from a possibility to an actuality is what in a broad sense Ouspensky meant by “evolution.” Yet it was precisely because with us was “everything from a mineral to a God” (Ouspensky 1930: 118) that such self-evolving beings have failed, for in uniting in potential the single organism of living nature, self-evolving beings had to contend with the eternal cycle of recurrence and the continuation of being through which nature perpetuates itself. Paradoxically, nature’s aim of the creation of selfevolving beings is underpinned by impeding that evolutionary effort, so that movement from potentiality to actuality must be in a sense “anti-nature.” Here, as in other publications after *Tertium Organum*, it is difficult to distinguish where Gurdjieff ends and Ouspensky begins, and it could be argued that Ouspensky’s greatest influence lies in his popularization of Gurdjieff’s teaching as he received it. Nevertheless, when Ouspensky wrote, “the desire of God in man . . . is based on his separating himself from the world, on his opposing to the world his own ‘I’ and on his recognizing as reality all apparent forms and divisions” (Ouspensky 1930: 18), he outlined not only his own vision of the interdependent relationship between nature and man and their respective roles, but also sought to bring together his sometime contradictory imagery of nature.

Ovid's *Metamorphoses*

Greek and Roman poets and philosophers shared a concern for the permeable boundaries that divide nature, humankind, and god. This theme can be found in Homer, where gods become human and humans are transformed into animals, and in Plato, where the human task is to resolve the conflict between animal and divine potentialities within the self. The interplay between nature, humankind, and god is seen most vividly in Ovid's masterpiece, *The Metamorphoses* (published in the year 8). In these stories the Roman poet Ovid (43 B.C.E.–17 C.E.) wove together a large number of Greco-Roman myths around the theme of change: “All things are mutations – Heaven and Earth and all that grows within it, and we among the changes in creation” (Ovid, Book XV: 427–8). The *Metamorphoses* is a cosmological poem aiming to “tell the shifting story of the world from its beginning to the present hour” (Ovid, Book I: 31). Stories from Ovid's encyclopedia of transformation have become standard parts of Western culture, showing up in the visual artists, in poetry, in psychology, and even in the natural sciences.

The transformative power of nature was recognized by Epicurean natural philosophy through observation of developmental processes in nature. However, Ovid expanded the idea of transformation far beyond the boundaries of Epicurean empiricism. The stories he presented include transformations across the differences separating god, humankind, and nature. Often these tales explain natural phenomena by providing mythological stories about the origin of things.

In Ovid, metamorphoses often happen as punishments or rewards that fit the deeds of the one transformed. For example, Semele, the lover of Jupiter, was burned to ashes by the power of Jove's love; self-loving Narcissus was turned into a plant; and the arrogant Niobe was turned into a stone. In addition to punishment or reward, the transformative power of desire provides the motive force for Ovid's stories of meddling gods and immodest humans.

Like Euripides and the Athenian tragedians, Ovid was fascinated by the destructive power of Dionysus. But Dionysus (or Bacchus), associated by Ovid with Liber, the god of wine, is only one of the gods who had the power to transform. Ovid also focused on the power of Jupiter (Jove), Juno, and Apollo. But Ovid was perhaps most interested in the transformative power of Venus, goddess of love. Venus is of further importance because she was the mother of Aeneas, founder of Rome, whose story was most famously told by Ovid's predecessor, Virgil.

Selected Myths Synopses:

Deucalion and the Flood

Jove's anger against the tyrant Lycaon led him to become angry with the whole human race. Jove and Neptune covered the Earth with water, killing all humans except Deucalion and his bride, Pyrrha. Deucalion and Pyrrha then created the new race of humans by transforming stones into flesh.

Daphne and Apollo

Apollo, the archer, insulted Cupid, whose arrows were the cause of love. In retaliation, Cupid shot Apollo with an arrow of desire, while also causing Daphne to have no desire for man or god. Apollo pursued Daphne, who vigorously resisted his advances. As Apollo chased her, Daphne prayed to her father, the river god Peneus, to be saved from Apollo's ardor. Peneus transformed Daphne into a tree, the laurel tree. Apollo still loved Daphne and ordained that the laurel leaf would be his symbol.

Io and Jove

Jove bewitched and raped Io, a young virgin. However, Juno, Jove's consort, suspected Jove of philandering. To conceal Io, Jove transformed her into a cow. Juno demanded that the beautiful cow be given to her. She then appointed Argos, who had 100 eyes, to guard the cow so that Jove could not reclaim her. Jove dispatched Mercury to put Argos to sleep with the enchanting sound of music. Mercury then killed Argos. Juno commemorated her hero by placing the image of his eyes on the tail-feathers of the peacock. Io, the cow, now freed, ran all the way to the Nile. Jove managed to persuade Juno to forgive him and to cease punishing Io. Finally, Io was transformed back into a human and was then further transformed into Isis, the Egyptian goddess.

Europa and Jove

In order to possess the beautiful Europa, Jove transformed himself into a bull. Europa fell in love with the beautiful beast. She hung a garland of flowers around his neck and eventually mounted him. Jove then took Europa out to sea.

Echo and Narcissus

Everyone loved the beautiful boy Narcissus. But Narcissus tempted and rejected everyone. Echo, a beautiful girl who had been cursed by Juno for her dalliance with Jove, also fell in love with Narcissus. Juno's curse was that Echo was only able to repeat the last few words she had heard. Narcissus rejected Echo's love and she faded away out of sorrow, only leaving her voice behind. Meanwhile another spurned lover of Narcissus prayed that Narcissus would only love himself and yet fail in that love. Nemesis agreed to punish Narcissus by creating a pond in which Narcissus found his reflection. He fell in love with his own image but was always unable to possess this image. Eventually he died, was mourned by Echo, and was transformed into a flower.

Apollo and Hyacinthus

Apollo loved the boy Hyacinthus. They practiced discus throwing together. Unfortunately, the discus thrown by Apollo ricocheted off a rock and struck Hyacinthus in the face, killing him. To commemorate Hyacinthus, Apollo wrote "ai, ai," (syllables reminiscent of Hyacinthus' name) on the petals of a purple flower.

Pygmalion

Pygmalion was a clever artist who carved a beautiful woman out of stone and fell in love with the statue. He prayed to Venus that his creation would come to life. Venus granted his wish. Pygmalion's sculpture came alive and became his wife.

Cinyras and Myrrha

Myrrha was the daughter of Pygmalion's grandson, Cinyras. She was in love with her father and tricked him into sleeping with her by coming to his bed in the dark of night. When Cinyras finally discovered that he had slept with his own daughter he chased her out of his country. She prayed to become a thing that neither lives nor dies. Some nameless god granted her wish and transformed her into the myrrh tree, whose tears are famous.

Venus and Adonis

Adonis was the beautiful male offspring of Myrrha and Cinyras. He gestated within the myrrh tree and upon his birth was adopted by Venus. His brother, Cupid, accidentally scratched their mother, Venus, with one of his arrows and as a result Venus fell

in love with Adonis. Venus consorted with Adonis, hunting with him in the woods. In order to warn him of the dangers of the wild animals in the wood, Venus told Adonis the story of how Atalanta and Hippomenes were transformed into lions because they were ungrateful toward the gods. However, Adonis did not heed her warning and was killed by a wild boar. Venus commemorated Adonis with a fragile flower the color of blood, the anemone.

Ovid's Influence

Ovid's *Metamorphoses* had a strong influence on Roman culture of the first and second centuries of the Common Era among poets and writers such as Seneca and Lucan. However, with the rise of Christianity, Ovid's text was either suppressed along with other pagan literature or was interpreted allegorically in an attempt to align the Ovidian myths with Christian stories and themes. Ovid's myths were eventually celebrated both for their Latin style and for the psychological, moral, and cosmological value of their themes. Medieval romances and love poetry borrowed themes from Ovid. Ovid's importance can be seen in Dante's *Divine Comedy*, where Ovid can be found in the first circle of Hell. By the time of the Renaissance, Ovid was celebrated both for his imagery and for his basic moral sentiment. Other authors who were influenced by Ovid include Petrarch, Chaucer, Shakespeare, Milton, Cervantes, Calderon, La Fontaine, and Corneille. In the visual arts, themes from Ovid's *Metamorphoses* were taken up by artists such as Raphael, Corregio, Titian, Michelangelo, Bernini, Rubens, and Poussin. Almost any visual or literary artist of the last 500 years of Western culture who took up a theme from ancient mythology derived this theme either directly or indirectly from Ovid.

Besides his influence on art and literature, Ovid's myths have found their way into other parts of Western culture including common words such as narcissism, echo, and Adonis. Zoologists have utilized Ovid's language in naming creatures such as the Argus pheasant, the python, the Icarus butterfly, the Atalanta butterfly, and the Io and Polyphemus moths. Flowers like the Hyacinth bear Ovidian names. Astronomers make use of the language of ancient myths in naming celestial objects. For example, the names Galileo gave to the moons of Jupiter were derived from the characters described by Ovid as consorts of the god Jupiter: Io, Europa, Ganymede, and Callisto. Psychologists such as Freud have identified and discussed character traits such as narcissism. And popular culture has adopted themes such as Cupid's arrows, Midas' gold touch, and the story of Pygmalion.

Ovid is an important contributor to the set of myths that form the background of Western culture. His myths display a world of flux in which there is an open interface between humans, gods, and nature. Ovid's *Metamorphoses* provides us with narratives about the origins of many natural features that also serve as cautionary tales about the disruptive power of desire, certainly one of nature's great transformational forces.

Ovid's universe is one in which natural objects such as flowers and birds are given significance by acts of the gods. It is also one in which desire makes it possible for humans and gods to cross the borders that separate them from each other and from natural objects.

P

Pacific Islands

Oceania, or the Pacific Islands region, includes Melanesia (the islands of black peoples), Polynesia (many islands), and Micronesia (small islands) over a vast area covering one third of the globe, running from Vogelkop at the western end of the great New Guinea island across to Hawai'i and Easter Island, nearer the Americas.

Almost a quarter of the known distinct religions of humanity are found in these islands, with the most complex ethnic scene on Earth being found in Papua New Guinea (where over 750 living languages and cultures have been identified). In Melanesia the variations of religious life are remarkable, with very many land-locked groups lying in the mountain ranges that form the spine of New Guinea, the world's second largest island. The religious scenes of Polynesia and Micronesia, by comparison, have much more cultural unity about them, and the so-called Austronesian (or "Malayo-Polynesian") family of languages predominates there.

The peoples of Oceania generally lack terms for religion and nature, but normally have lexical equivalents for worship and world. Their lifeways before any extensive exposure to the outside world were almost exclusively small-scale and their technologies based on stone. Only Polynesia's Tonga is known to have attempted a far-flung (quasi-)empire, stretching to the west as far as New Caledonia, and iron-working was known only along the coasts of Vogelkop through interaction with the Sultanate of Tidore. Thus the descriptors primitive or primal, indigenous, tribal, and traditional, have been conventionally used in research to refer to pre-contact Oceanic cultures religions. In imagings of the European mind, however, the presence of religion has generally been acknowledged for Polynesia and Micronesia, because their societies are generally hierarchical, under chiefly rule – even famous monarchies in Hawai'i and Tonga – with priests often making up a special caste. Melanesia, on the other hand, has a reputation for magic, or less developed forms of (magico-) religious life, because the societies there appear less structured. But for most anthropologists this dichotomy has proved faulty. A sufficient number of chieftainship societies in Melanesia, as well as examples of priestly roles, call the bifurcation into question. Nevertheless, religion is appropriate as a heuristic term for all of Oceania's ritual patterns and spiritual outlooks. There is something that may be salvaged from this well-worn regional contrasting, though, in terms of indigenous attitudes towards the character of the world.

If only as a rule of thumb, Melanesians tend to view their worlds more horizontally and the others more vertically. This basically means that, when it comes to comparing beliefs about the relationships between religion and the total environment (or cosmos), Melanesians most often look to the forests, mountains, and waters as abodes of the

dead or spirits, whereas Polynesians and Micronesians characteristically envisage the “Earth” between upper and lower worlds. Now, the usual reason given for these different outlooks is a social one: Polynesian and Micronesian societies are stratified to one degree or another. In cases where there is strong hierarchization, as on Hawai’i Tonga and Aotearoa (New Zealand), nobles stand distinct from commoners, and castes of warriors and priests sustain royal or high chiefly houses. The whole economy is made to move toward the social apex, the rulers being engrossed with wealth (even though they bestow much of it on their subjects). Since it is commonly understood that chiefs proceed heavenward at death, often to become stars, we can understand why scholars have deduced that definite social strata in Polynesia and Micronesia have produced vertical images of the cosmos found there, often as the three tiers of heaven, Earth, and an underworld. In Melanesia, in contrast, the more egalitarian struggle between big-men and managers (particularly in highland New Guinea) has been used by ethnographers to explain in ethnography why local cosmoses are more laterally or horizontally conceived, with the spirits of leader and led alike going at death to the same place (whether that be to the mountaintops, for example, as with Wahgi, or at the end or bottom of a river, as in the Bena Bena view, to take two cases from the New Guinea Highlands).

But why should we explain these differing views of the world (or “nature”) as the result of social patterns? Might it not be just as easily maintained, perhaps, that spatial relations in the environment have had effects on such contrasting *Weltanschauungen*? The small islands in wider Oceania, whether upthrust volcanic as typical in Polynesia, or flat coral atolls in Micronesia, sit more starkly between the wide stretch of sky and the mysterious depths of the seas. It hardly seems unfitting, then, that myths should recount how gods drew islands up from the depths – as the Micronesian deity Nareau did, for instance, when ordering the primal eel Riiki to prop up the heavens as if erecting the central post of a house. In a similar vein, one finds myths of cosmic Separation (a *Trennung*), creation occurring when gods push up the sky from the Earth and give the latter its midway position – as the god Tane did in Maori narratives. Melanesia, by comparison, although showing a fair spread of interest in the sun and moon, and an intriguing small cluster of groups believing in sky-people, is a region better known for “place” deities or spirits. Examples of such place-based beings include volcano gods (as with the Tolai of New Britain), for instance, fearful boundary spirits (such as the Elam Bari who live on the edges of Chimbu country, New Guinea Highlands), who needed placating with pig offerings if the weather was either too wet or too dry, or cave-dwelling beings, some of which became an object of cultic attention (for example, for more than one tribe in Huliland, located in the Southern Highlands of Papua New Guinea).

If in Polynesia such a vertical presence as the coconut tree symbolizes the cosmos, moreover, including the rootedness of a people in its original husk (as held among Rarotongans), in Melanesia wild things in the forest, such as feral pigs, are often emblematic of humans (especially men in a liminal state during initiations), with birds rather than winds (let alone heavenly constellations) most often signaling the presence

of spirits (especially the ancestors, because, as the Papuan Orokaiva would say, it is hard to know how or whether birds die). If in Polynesia and Micronesia feasts are more associated with the blessings and protective power of gods, spirits and chiefs from above, in Melanesia the sense of fertility and generation at ground level, albeit with the spirits' help, is more the sense of things. The proposition that preconceived geographical space or the environmental surroundings condition religious worldviews into these differential patterns, though, is less popular at the moment than the view that indigenous approaches to “nature” are predetermined by social power relations and strata (as argued, for example by Daniel de Coppet and Andre Iteanu).

Outlooks specific to the above-mentioned regions may be considered under Melanesia: Micronesia; Polynesia; Papua New Guinea; Hawai'i; New Zealand; etc. In very general terms, to conclude, Pacific islanders considered various places to be sacred or prohibited (tabu) to unauthorized or unprotected humans (not just ancestral sites being meant here, but caves and glades of cultic attention, or swamps, lakes, and dense forests occupied by dangerous beings). Animism as a term to describe all this is inappropriate if it implies that their whole universes were alive with spirit-forces, when it is more typical for islanders to say that spirits inhabit specifiable restingplaces or lairs. Totemism, including the tracing of a tribal lineage to an animal or plant, is common in Melanesia, but not elsewhere in Oceania (where genealogies back to canoe arrivals predominate).

Conservation of flora and fauna on land and in the sea is more a spontaneous than any philosophically intended outcome, the islanders possessing very time-consuming technologies which have been less harm-inducing than techniques later brought by outsiders.

Lineages typically possessed and cultivated ancestral lands (the New Guinea highlands yielding evidence of the earliest known horticultural activity anywhere on Earth), and thus protection and conservation of these lands have been involved in consequence, even if moving from one garden area to another can come into the equation. Symbolic and linguistic life, integral to Oceania's religions, is laden with associations and metaphors drawn from a lively environment – its flying and fast-moving fish, large reptiles, shy possums, many birds (cassowaries, birds of paradise), wild boars – as well as from its arresting topography. Overall, religion and assumptions about the environment (“nature”) are utterly intertwined in Pacific Islander understanding, but how differing emphases arose, regionally and in each individual culture, remains a matter for debate. Certainly the spirituality – nature connections in Pacific traditions have been and remain important conservationist impetuses.

Pagan Calendar

A calendar evolves as a means for a culture to record its past, plan for the future and determine its holy days. From a religious perspective, the calendar becomes a “Philosopher’s Stone” in providing access to spiritual insight and understanding. Incorporating one’s basic assumptions concerning nature, spirit and humanity into a calendrical framework of ritual and symbolism, the hidden truths contained therein “will unfold over the years as we integrate them into our own lives” (Crowley 1989: 16). Of the world’s major calendars, the Greek, Egyptian and Mexican systems are no longer significantly influential. Hindu and Chinese calendars, however, are still employed for religious determination, while the Hebrew and Islamic continue to function in both civil and theological senses. Nevertheless, the dominant time-reckoning system that the world enjoys today is the modified Julian Roman organization known as the Gregorian calendar.

The neo-pagan “Wheel of the Year” celebration of eight *sabbats* is a mytho-ritual timetable that allows its practitioners to engage in seasonal interaction with nature, cyclical evolution and Pagan spirituality. Nonetheless, its largely Wiccan-inspired contemporary Pagan festivals are located and determined according to the prevailing Gregorian calendar. This last, despite the adjustments made to it through imperial and ecclesiastical authority, is an original formulation credited to the legendary second king of Rome, Numa Pompilius, as a means to keep track of established *feriae* or sacred festivals. But as physical place can often maintain an aura of atavistic attraction, so too might the ancient holiday exert an underlying focal appeal despite whatever historical and cultural overlay. Consequently, the roots of the Roman calendar reveal a complex arrangement and ceaselessly provocative understanding that interface this world with the other. They allegedly constitute a pagan “golden key” to a lost spiritual equilibrium or emancipation embedded in the origins of Western civilization.

Numa’s codification integrates the twelve monthly divides or Ides (originally the day of the full moon) with forty-five festival celebrations and the new year’s day of March 1st. If this strikes the modern reader as excessive, it should be borne in mind that the Romans had no weekend or regular Sabbath. Of the fixed *feriae*, those of the Saturnalia (December 17th), Lupercalia (February 15th) and Vestalia (June 9th) are perhaps the best known today. The bulk of ritual and celebratory activity concerns the “waxing” half of the year when the sun moves from nadir to apex. Apart from the Latin yule of December, the longest stretch of continuous holiday occurs in the second half of August. Purification rites transpire at various times, but especially in the months of March, April, May, October and February. The Greater Sabbats of Wicca

do not appear to receive singular emphasis apart from coinciding with the Kalends (whence our term “calendar”) that begin every month and are sacred to Janus and Juno. Most cult activity is focused on the vernal equinox and the two solstices, though the moment of midsummer itself is ritually ignored. All in all, while both the *sabbats* of neopaganism and the holy days of Christianity are positioned according to the world’s secular calendar, the “spiritual radicalism” (Latin *radix* “root”) to be found at this calendar’s core enshrines the fundamental relationship between nature, religion and society as an organic and holistic dynamic.

Pagan Environmental Ethics

When it comes to actions directed at the preservation and defense of the environment Pagans are often on the front lines. Pagans frequently take leading roles in campaigns to stop what they perceive to be ecologically unsound forestry practices, unnecessary road-building projects, or the desecration of significant environmental landmarks; they actively engage in projects to restore prairies, wetlands, and forests; and many readily embrace renewable energy and support public transportation. At the same time, however, some Pagans also engage in actions not considered to be environmentally friendly: they drive fossil fuelburning automobiles to their spiritual gatherings, they heat their homes with non-renewable energy, they use natural resources provided through environmentally malignant methods. So, how are we to make sense of the idea of a Pagan environmental ethic?

Given that ethical commitments are not always fully realizable in practice; ethics cannot necessarily be glimpsed via an accounting of the actions of individuals or groups. Since ethics and actions are not the same thing, we must, then, look elsewhere to uncover Pagan environmental ethics.

Our sense of ethical inclusiveness is a direct function of our sense of social inclusiveness. Our sense of society is part of that which makes up our worldview. We extend direct moral standing and moral consideration to those whom we deem to be part of our social community. The intensity of this ethical commitment corresponds directly to the closeness of this social commitment. Hence, all things being equal, our commitments to human children wins out over our commitment to a goat's kids, and our commitment to our own children wins out over our commitment to someone else's. So, if we can uncover the sense and extent of community expressed by the Pagan worldview then we can more clearly perceive their ethical commitments and their environmental ethics.

In general, even though there are various Pagan traditions, there is a single theme that unifies them: the worship or profound honoring of, and respect for, nature. Surveys by Margot Adler (1986: 415, 445), for example, suggest that environmental concern was one of the most fundamental issues for Pagans, as well as one of the most important catalysts for people entering the religion. Likewise, religion scholar Graham Harvey asserts that "what attracts most people to Paganism now is the stress on honouring Nature" (1997: 43).

Pagans often perceive of themselves as animists, believing that everything in nature – and even perhaps nature itself – possesses an indwelling spirit. Their love of nature and all life, is a natural extension of this animistic catalyst. According to Starhawk,

this “love for life in all its forms is the basic ethic of Witchcraft” (1979: 11). More specifically though, that worshipful, even reverential, attitude toward nature prompts a metaphysic of inclusiveness and community, a metaphysic that portrays the human and the nonhuman as unified and conceptually indistinguishable in many ways. There is ample evidence to suggest that Pagans perceive of the nonhuman world as worthy of “personhood,” in the full moral sense. Pagans, for instance, often speak of individual animals and plants and environmental wholes as “other-than-human persons.” They also refer to environmental entities as “friends” and “neighbors” with whom they share the world. Consequently, actions undertaken involving this other-than-human world assume a friendship or neighborly metaphysic and ethic. This inclusive social and ethical community can be seen, for example in The Wiccan Rede: “And it harm none, do as you will.” The Rede resonates ecologically because it calls generally for liberty and freedom, and because it asserts a broad principle of nonharm. More importantly, however, is that the condemnation of harm is applicable to the other-than-human world as well as to the human: “none” also includes the otherthan-human. However, a closer and more demanding familial or kinship relationship and social community often emerges as well. This relationship is clearly voiced by the High Priestess of Circle Sanctuary, Selena Fox, when she asserts, “I am Pagan. I am a part of the whole of Nature. The Rocks, the Animals, the Plants, the Elements, and Stars *are my relatives* . . . I am part of this large *family* of Nature” (2001: 110–11, emphasis is mine, but the capitalization of the other-than-human elements is Fox’s). Harvey also points out that the Pagan “world view is one in which everything that lives deserves honour and rights not normally given to other-than-human life,” and that Pagans insist on “treating all things as alive and in some way *kin* to humanity” (1997: 133, 90).

Such a rendition of Pagan environmental ethics is not wholly uncontested. Catherine Albanese, for example, suggests that, for all of its “radical and cosmic environmentalism,” Paganism – and other nature-oriented religions as well – is “intensely pragmatic” (1990: 183). In this sense, one might skeptically view the magical worldview and subsequent rituals of Pagans as engaged in or masking a manipulative relationship with nature. Of course, instrumental valuation can certainly exist alongside intrinsic, and manipulation of and benefit derived from is not the same as a mastery relationship. However, this contestation of Pagan environmental ethics certainly exists and merits mention.

Within the realm of formal philosophical discussions of environmental ethics, this Pagan social community/ ethical community relationship, arguably resonates most closely with the Land Ethic of Aldo Leopold. Leopold’s theory also prompts ethical obligation on the basis of a shared community. Pagan environmental ethical sensibilities find kinship with the various traditions of American Indians who also express a social and ethical kinship with nature as demonstrated in their myths, legends, and rituals. Both are discussed at length in the work of environmental philosopher J. Baird Callicott.

As a result, for Pagans the sacred rests in daily life, the domestic, this world. Paganism is not other-worldly; Earth and this body are not merely some shoddy way station on the way to transcendental salvation. Humans are full and equal members of this Earth, not resentful of a forced and lesser – but fortunately temporary – inhabitation of this body and this world. The Pagan sense of time, and the celebrations that are based upon it, center on the here and now – planting and harvesting – those things most immediately connected to daily life, life imbued with the sacred, the magical, and the intrinsically valuable and significant. Harvey (1997) nicely captures this fundamental sentiment: “Paganism is a religion at home on Earth.”

Given, then, that, in general, our sense of an ethical community and commitment is coextensive with our sense of a social community, and given that Pagans possess a sense of social community inclusive of all of nature, it is evident that they also possess a broadly comprehensive environmental ethic. Pagans, therefore, attribute intrinsic value (i.e., value in addition to instrumental, or use, value) to nonhuman entities, natural processes, and environmental collectives. Their environmental ethic is intentionally holistic, encompassing, and ecocentric.

Because of their commitment to this life, this world, this Earth, and because of their sense of being fully part and parcel of nature, Pagans attempt to radiate respect for life. They deliberately, carefully, and with great humility inhabit the land. They celebrate life and its multifaceted flourishing. Their actions, then, generally reflect this inclusive worldview and powerful ethical commitment.

Pagan Festivals in North America

Throughout the changing seasons of the year neo-pagans all over North America participate in gatherings and festivals where they share traditions and create rituals together. Some festivals are specific to a single tradition or organization, some are open only to invited participants, while others are eclectic festivals open to the general neo-pagan community and all its sub-groups as well as to interested newcomers. Gatherings for special purposes, such as training new practitioners or organizing events for the year, are different from more open-ended gatherings where the goal is sharing information and networking. Most festivals, however, include rituals and workshops intended to bind participants together in community and to encourage self-exploration. At festivals selfexploration takes place within and alongside group activities: workshops on such diverse topics as astrology, herbal lore, Tibetan chanting, Native American drumming techniques, and large collective rituals. Some of the men, women and children who attend festivals accompany friends and family members and may not identify themselves as neo-pagan. But most festival-goers attend festivals to experience living for a brief time in an entirely neo-pagan community. While neo-pagans attend festivals to engage in workshops and rituals aimed at personal transformation, festivals also provide an opportunity for otherwise isolated individuals to define their place in the North American neo-pagan movement.

Although most neo-pagans consider themselves Earthbased religious practitioners, not all festival activities focus on a direct relationship between humans and nature. Many celebratory or theatrical festival events include references to the elements Earth, air, wind and fire. Evening events such as poetry readings and musical performances make few if any connections to nature. Late-night fires are common at many festivals and typically consist of drumming and dancing around a bonfire into the early hours of the morning. Rituals and late-night drumming and dancing may feature songs and chants that include references to nature, and especially connections between humans and spirits of nature or humans and the elements, such as the popular chants “Air I Am, Fire I Am, Water, Earth and Spirit I Am,” and “Earth My Body, Water My Blood, Air My Breath and Fire My Spirit.”

The natural world is seen as sacred, but specific spaces in the woods and fields are also made sacred through ritual activity, especially casting a circle. Sacred space is very important at festivals, whether they are held in private nature sanctuaries, at public campgrounds reserved for the occasion, or indoors at a convention center. Many festival announcements actively promote festival sites as enchanted woodlands far removed from ordinary life. They may focus on unique geographical features or the

cultural history of an area that was once sacred to indigenous people. Festivals may be geographically isolated, located far from urban areas and their sites hidden over hills or beyond wooded areas, away from prying eyes. The secluded feeling of these sites enhances participants' sense of being close to nature.

Because people who attend festivals are from different backgrounds, arrive with divergent expectations and practice multiple traditions, creating sacred and safe space is a concern for festival communities. Neo-pagan festivals emphasize the sacredness of the natural world and exemplify the belief that spiritual power is immanent. Festival spaces are created in ways that explicitly embody the divine and honor the gods and goddesses that participants believe to live in the woods, fields and streams of the regions where festivals are held. Altars, mounds, shrines and offerings are constructed and left in honor of these regional spirits. Ritual leaders may draw on the belief that spirits surround them by invoking the presence of spirits of the land in their rituals. Sacred space is a method of manifesting "interconnectedness," the belief among neopagans that layers of the self, including past lives, are vitally connected to the rest of the planet and its inhabitants.

Most festivals occur in the warmer months and are held outdoors so that participants can make explicit connections to their natural surroundings. Neo-pagan festivals involve anywhere from fifty to a thousand people who come from a broad range of backgrounds and locales. Some live on the private land where festivals occur, but many more live in New York City, San Francisco, Boston, Chicago and other urban areas, so that their journeys to festivals are also pilgrimages to nature. Some festivalgoers are nomads living out of vans and renovated school buses or self-employed artists; others are teachers, social workers and computer programmers. Most participants reflect the ethnic and racial characteristics of the North American neo-pagan community in that they are largely of European heritage. Some festivals are designated for men or women only, but most are open to anyone and feature female and male organizers and ritual specialists. African Americans, American Indians and Asian Americans are present at some festivals, though they are in a minority. Neo-pagan festival-goers probably tend to be more middle class than the larger community of North American neo-pagans because they can more easily afford travel and festival admission prices. While not prohibitive, week-long festivals with multiple activities and celebrity performances reflect their overhead costs and in the 1990s charged anywhere from fifty to two hundred dollars for admission.

Festival planning begins months in advance when announcements are sent out and posted on neo-pagan organizations' websites, then circulated via email and word of mouth. Calls are sent out seeking workshop presenters to submit proposals and well-known neo-pagans are invited as guest speakers and performers. Most workshop presenters are not paid, although they receive free or discounted admission. Many festivals require that all participants contribute to the community in some way, from presenting workshops to emptying recycling containers. At some festivals, festival-goers may barter longer work shifts in exchange for free or discounted admission. Volunteer work

crews on private nature sanctuaries clear and mark trails through the woods, set up recycling and restroom facilities, rope off and mark ritual and workshop spaces and collect firewood.

Like the larger North American neo-pagan community, neo-pagan festivals do not answer to a national organizing body, and variations between festival locations, workshops topics, festival goals and religious commitment can be striking. Festivals are usually run by a core of people connected to neo-pagan organizations, such as Circle Sanctuary in rural Wisconsin, or a store such as Ancient Ways in Oakland. Many decisions are made by consensus and often incorporate festival participants' feedback through surveys and suggestion boxes. Nevertheless, most festivals follow an ordered pattern of activities that usually includes at least some of the following: opening ceremony, workshops scheduled in the mornings and afternoons, evening rituals and performances, late-night drumming and dancing, fire circles and coffee-houses, a community feast, and a closing ritual.

Festival-goers often travel long distances to festival sites. When they arrive they may be greeted or welcomed in special ways, given amulets or identification tags to wear, handed festival programs and rules, and assigned work shifts and campsites. Campsites are often selected by individual preference, but some festivals group likeminded people or people with special needs together. Festivals designate specific camping areas for families or people in recovery from substance abuse, such as a "twelve-step support camp" as well as quiet areas and camps for late-night music and percussion. First-time festival-goers are immediately aware of one significant difference from the outside world: nudity, or "skyclad," is typically an option at most festivals and costumes are appropriate, as is body paint and other body décor.

Daytime activities at festivals may include nature walks, edible plant workshops, children's craft workshops, and shopping with merchants who sell books, clothing, ritual tools, natural cosmetics and other items – especially handmade items – not available in most stores. Workshops are offered on a range of topics by a variety of festival participants. They are usually held outside or under tents and sometimes focus on the natural environment surrounding the festival. Some workshop presenters simply share an area of expertise – mask making, for example – while others are published authors or nationally known for their drum-making, dancing, ritual or tarot-reading skills and knowledge. Anyone with a certain amount of experience in neo-paganism and a good idea for a discussion topic or a skill to share with a group can run a workshop. Topics include myths and teachings from indigenous and pre-Christian cultures, such as the ancient Celts; healing techniques involving body work, divination or other techniques; Tai Chi, Yoga or other forms of movement; and personal exploration of spirits and deities. Small-scale rituals, such as healing circles, may also take place in workshops. Crafts projects in workshops include making masks and decorations for rituals out of feathers, cloth, clay, pinecones, herbs and other objects found in the woods. Large-scale rituals are often in the evening or even late at night. Opening and closing rituals tend to create bonds between festival-goers and celebrate community, while major rituals

in the evenings tend to offer opportunities for personal transformation, such as a ritual modeled on the journey of the ancient Greek goddess Persephone to the underworld.

Festivals are located in specific places and are sometimes connected to participants' home altars and shrines or their region of the country. For some rituals taking place at Circle Sanctuary, for instance, participants were asked to bring stones from their own homes to place in Circle's stone circle. Another festival asked participants to bring a handful of dirt from their homes that was then placed in a large pile near the main ritual area and incorporated into both opening and closing rituals. Neo-pagans emphasize awareness of their surroundings and sensitivity to what they see as the various energies flowing through the land and embedded in festival spaces.

Pagan Festivals – Contemporary

Contemporary Pagan festivals have largely coalesced around the eight sabbats of Wicca, namely, the solstices, equinoxes and the four Gaelic quarter-day commemorations that, according to Webster, “embody elements of an earlier pastoral society and the later introduction of agriculture” (1986: 31). According to Rees and Rees (1973), the beginning of the Celtic year is uncertain: either Beltane (May 1st) or Samhain (November 1st). Whereas their IndoEuropean cousins considered the day to start with sunrise, the Celts themselves began the diurnal count with sunset, and likewise it appears more likely that their year too commenced with its dark half. Consequently, and in most standard neo-pagan practice, the New Year is celebrated as Samhain or All-Hallow’s Eve. The remaining festival sequence comprises Yule (midwinter), Imbolc (Candlemas), Ostara (vernal equinox), Beltane (May Day), Litha (midsummer), Lughnasad (Lammas), and Mabon (autumn equinox). All together, these are known to contemporary Pagans as the “Wheel of the Year.”

Samhain or Hallowe’en is the first of Wicca’s four Greater Sabbats. As the Feast of the Dead, it is celebrated on October 31st/November 1st and, according to English Wiccan author Vivianne Crowley, commemorates “when the worlds of matter and spirit draw close to one another and the dead may pass to and fro through the veils” (1989: 190). Because of this, the highly influential Alexandrian Wicca writers Janet and Stewart Farrar speculate that Samhain may derive from the verb “to quiet down, become silent,” and provides the occasion for ancestral contact. It is also the commencement of the dark or winter half of the year.

But if Samhain is a major contemporary Pagan celebration, it is followed by one of almost equal significance. Even though the Farrars refer to Yule as a Lesser Sabbat, it celebrates the rebirth of the sun with the winter solstice at the darkest time of the year. In the northern hemisphere, from midwinter forward, days begin to get successively longer, and solar light re-begins its ascent. Many of the Euro-American practices associated with this period for both the Western Pagan and in the wider context of Christmas (gift-giving, costuming, candles, apples, mistletoe, evergreens, holly, yule logs, Old Father Time, the fly agaric mushroom [*Amanita muscaria*] colors of red and white, etc.) derive from original Latin and Germanic yuletide celebrations. The word *yule* has been thought to originate with the Anglo-Saxon word for “yoke” (*geola*). However, in Cornish and Breton, the words for “sun,” *hiaul* or *houl*, may also be connected. For contemporary Druids, the winter solstice is known as Alban Arthuan.

Yule is followed by the celebrations of winter purification or Imbolc/Oimelc (“ewes milk”) corresponding with either February 1st or 2nd. Another Greater Sabbat, it is

associated in particular with the Irish fire and hearth goddess Brigid (Brigantia) – subsequently linked to the Catholic St. Bride. She retains associations as both virgin war-goddess and fertility figure and is connected to the arts of healing, fire making and poetry. This is preeminently a woman’s celebration (e.g., the northern European Wives’ Feast Day, bride dolls constructed from cereal shafts, and “bride beds”). With light increasing and spring approaching, Imbolc is also associated with straw Brigids or Crosses representing the sun-wheel and used for protection against fire, lightning and tempest.

Ostara (Anglo-Saxon), Alban Eilir (Druid) or the spring equinox on the 20th/21st of March, identified with the cardinal direction of the east, is honored as the moment in which the bright half of the day begins to dominate over the dark, winter ends, and the flowers and burgeoning growth reappear. As Crowley explains:

At the Spring Equinox, “the light equals the darkness” and this can be taken . . . as a representation of

. . . equipoise between unconscious animalism and growing conscious awareness. It is at this festival that [the God] impregnates the Goddess but . . . continues roaming the greenwood, as the Horned Hunter (1989: 191).

In the northern hemisphere, the vernal equinox is a major Pagan commemoration among Pagans and Earth religionists of contemporary times.

The Greater Sabbat of Beltane follows Ostara and, as the coming of summer, constitutes another major contemporary Pagan festival. As May Day and the preceding night of Walpurgis Nacht, it marks the beginning of the summer or bright half of the year and once again, in the “crack” between the two annual moieties, communication with the otherworld is deemed most possible. But as this is a time for entering into brightness and warmth, the otherworldly spirit emphasis is directed more toward the world of the fairy, an embodiment of the spirit dimension as it relates to summer rather than to its winter corollary associated with the dead.

Midsummer, the year’s longest day in the northern half of the world, marks the culmination of the sun’s ascent. As the vernal equinox signifies the mid-point of the spring season from Imbolc to Beltane, Litha occurs at the center of the summer stretch from Beltane to Lammas. In Britain, the geographic/spiritual focus for the year’s shortest night is the ancient stone circle of Stonehenge – closed by the government to Druidic ritual and Pagan celebration between 1986 and 2000, but now reopened for public access. Thousands attended in 2000 and 2001. For the Druids, the day is designated Alban Hefin. Since the Julian calendrical reforms, the summer solstice has shifted to June 20th/21st, but both the established ecclesiastical calendar and many folk customs retain the original 24th as the midsummer celebration – what became the feast of St. John the Baptist after the fourth-century triumph of Christianity. Consequently, there are significant aquatic traditions connected with June 24th such as bathing or rolling on the morning dew at sunrise.

Lammas, Lughnassadh or the Anglo-Saxon Hlafmesse (“loaf-bread”) falls on or around the first of August. It marks the transition from summer to autumn and is

the time for the first grain harvests. The Celtic name of this sabbat is derived from the god Lugh or Lugus, the champion-god and many-skilled deity of brightness. It is followed by Mabon (the Druid Alban Elfed) or commemoration of the autumn equinox. The sun now sets at the cardinal point of west, and the solar decrease that has begun with the summer solstice henceforth leads to night being longer than day. The Lesser Sabbat of Mabon precedes the Greater Sabbat of Samhain marking the end of the old year and beginning of the next.

In Wicca and neo-paganism, the Wheel of the Year is seen as a series of feasts that honor the relationship between the God and the Goddess. The God is born at Yule, grows through Imbolc, mates with the Goddess at Ostara, marries her at Beltane, attains maturity and dominion at Midsummer, is sacrificed at Lammass, returns at Mabon and assumes full godhead at Samhain. The eight sabbats also reveal the turning tides of the natural cycles of birth, life, death, decay and rebirth as well as the seasonal foundations of human civilization in both the animal breeding of husbandry and the sowing, planting, cultivation and harvesting of agriculture. But at the same time, the Wheel is a schematic understanding that is subject to both local astronomical variation and pragmatic shifts in secularized celebration. In other words, equinoxes and solstices could vary as much as a day depending on region and year, while their actual commemoration along with that of the Greater Sabbats may occur on a weekend or some other convenient date.

In the wider Pagan and nature religion community, there are additional variations. While most contemporary traditions invariably celebrate Beltane and Samhain, many overlook the autumn equinox as symbolizing the triumph of darkness over light. There are further differences, emphases and omissions to be found within the reconstructed Pagan traditions. For instance, the Roman festival calendar acknowledges the summer solstice with preand post-solstitial fasts, but ritually ignores the culminating conclusion of light's ascent itself. Another consideration arises for those who live south of the Equator. The Farrars express acute awareness of difficulties Australians have in attempting to follow a festival sequence that is rooted in another hemisphere, and they also suggest that those who elsewhere celebrate the largely Celtic-inspired Wheel become mindfully sensitive to local lore and environmental differences. While all nature religionists follow a calendar of celebrations, not all subscribe to the eightfold observation of the Greater and Lesser Sabbats. Ronald Hutton (1991: 303f.) sees this last as largely the fabrication of Margaret Murray. Ancient or not, the Wheel of the Year has emerged as a calendrical tool that allows its practitioners to engage with the changing seasons and perpetual transformations of the natural world.

Pagan Music

The term “Pagan music” is of relatively recent coinage. It denotes the music considered key to the emerging culture of nature religions, primarily Wicca but also including other Pagan spiritual paths. Its usage began in the early 1990s, as a part of the emerging Pagan cultural identity. As Pagans began to see their spirituality as equally valid as mainstream religions, it was important to place the music of Pagan spirituality alongside Christian music or Jewish music as a legitimate religious and artistic expression.

Pagan music owes much of its stylistic identity to the British folk revival of the 1960s. Such bands as Fairport Convention and Steeleye Span took traditional folk tunes and added modern rhythms and instrumentation, creating the genre known as folk rock. Today that sound, characterized most simply by acoustic and electric guitar, bass, drums, and fiddle or flute, is found in the vast majority of Pagan bands. In contrast to New Age music, which typically is rich in synthesized aural landscapes, the use of acoustic instruments and hand drums in Pagan music creates a more earthy sound.

One of the more popular musicians, though not explicitly Pagan, is Canadian harpist Loreena McKennitt. Her ethereal voice, combined with the mystical quality of many of her songs, creates an “other-worldly” music that appeals to Pagans’ yearning for connection to the spirit realms. With her own musical roots squarely in the folk revival, McKennitt’s popularity is a good example of the adoption as Pagan music of mainstream music that speaks to the Pagan experience.

With no central sacred text to the Pagan traditions, Pagans use chants and songs as liturgy. This makes the thematic content of Pagan music all the more important. One of the most widespread themes of all Pagan music is that of human communion and interdependence with all living beings. Other themes include the notion of Summerland, the mythic realm of the spirits where human souls go after death and before their next birth; the constant presence of ancestors and guiding spirits; and humans’ ability to call on those spirits in the present day.

Pagan music includes songs by Pagans that reflect the movement’s history and identity. Using a wide variety of styles, from Goth to punk to pop and folk, this music speaks of the persecution of Pagans and environmental destruction, and of a time when, many Pagans believe, the balance of nature will be restored. Some of the earliest and most widely known songs of this variety are Charlie Murphy’s “The Burning Times” (see below) and Gwyddion Pendderwen’s “We Won’t Wait Any Longer,” both popular since the early 1980s.

Chants in particular have been one of the chief unifying threads among this disparate spiritual community. Chants such as Z. Budapest's "We all come from the Goddess / And to Her we shall return / Like a drop of rain / Flowing to the ocean" create a group state of mind conducive to ritual work, and express one of the chief axioms of Pagan spirituality. Chant and song are used for many different purposes in ritual, including casting a circle, invoking Deity, and raising energy. Pagan chants have historically been spread by traveling musicians and priestesses who teach chants wherever they go. Increasingly, recorded albums of chants are in demand, as more groups form in remote areas and need to learn chants on their own.

Pagan music has also been strongly influenced by world music. It is rare that a ritual with music does not include Middle Eastern drums (doubeks or tars particularly) as rhythm instruments, and African djembes abound at most drumming circles. Middle Eastern rhythms, particularly the malfouf, underlie most recordings of Pagan chant, as to a lesser degree does African-based clave rhythms. Though Pagan spirituality draws heavily on the Celtic worldview, Celtic rhythms are not as obvious an influence in the chant music.

Though the term "Pagan music" has been useful in galvanizing a movement behind its own musical expression, its usage is not without problems. The music of indigenous Pagan traditions worldwide has generally been referred to as "world music" in the U.S. Traditional music from Africa, India, Australia, Scandinavia, the Caribbean and South America has its roots in a pre-Christian spiritual identity. Because the public face of Paganism has been predominantly European-American, questions of inclusion and ethnocentricity have not often been asked. Yet, as Paganism shifts away from its early identification in opposition to mainstream religions, and particularly as Pagans continue to involve themselves in global interfaith efforts, greater possibilities arise for an identity and terminology reflective of the richness and diversity of Paganism worldwide.

Burning Times

The most popular Pagan song ever written is “The Burning Times,” by Charlie Murphy (reprinted below). Recorded by literally dozens of different musicians in several countries, it rose to #1 on Ireland’s music charts in 1991, with Christy Moore’s version. A deeply felt and strongly worded anthem, it evokes powerful emotional reactions in the listener.

The chorus is a recitation of seven goddess names, originally from a poem by Deena Metzger: “Isis, Astarte, Diana, Hecate, Demeter, Kali, Inanna.” The repetition of names creates a perception of a unified Mother Goddess from these figures of disparate cultures and time periods, and suggests that goddess-worshipping cultures shared a similar fate.

The first verse describes a “nature people” living in harmony with the seasons, with women as leaders, healers, and teachers “equal with the others, and respected for their worth.” These women are explicitly named “witches.” The strong positive use of the word “witch” here, coupled with the song’s renown, quite probably contributed to the move among witches to publicly identify with the word, in spite of its historical baggage.

The second verse describes the coming of Christianity, and the violent overthrow of nature religions: “And the Pope declared the Inquisition, it was a war against the women whose power they feared.” Though one could argue specifics here, the verse does express a famously incorrect statistic, asserting “nine million European women died” in the ensuing “holocaust.”

“The earth is a witch, and the men still burn her” in the final stanza equates women with the Earth, implying that both possess a power that is more wild and elemental than human. Woman’s power, then, is juxtaposed against the willful slaughtering instincts of men, who rape, strip-mine, and poison both for profit. The song culminates in a powerful invocation of this power to overthrow the forces of destruction.

Anne Hill Burning Times, by Charlie Murphy

In the cool of the evening they used to gather
Neath the stars in the meadow circled
near an old oak tree

At the times appointed by the seasons of the earth
And the phases of the moon
In the center stood a woman

Equal with the others and respected for her worth
One of the many we call the
witches

The healers and the teachers of the wisdom of the earth
And the people grew through the knowledge she gave them
Herbs to heal their bodies
Spells to make their spirits whole
Can’t you hear them chanting healing incantations
Calling forth the wise ones
Celebrating in dance and song
Isis, Astarte, Diana, Hecate, Demeter, Kali, Inanna
There were those who came to power through domination

And they bonded in the worship of a dead man on a cross
They sought control of the common people
By demanding allegiance to the Church of Rome And the Pope declared an Inquisition

It was a war against the women whose power they feared
In this Holocaust against the nature people Nine million European women died
And the tale is told of those who by the hundreds Holding together chose their death
in the sea While chanting the praises of the Mother Goddess A refusal of betrayal
Women were dying to be free

Isis, Astarte, Diana, Hecate, Demeter, Kali, Inanna

Now the Earth is a witch And the men still burn her
Stripping her down with mining and the poisons of their war
Still to us, the Earth is a healer A teacher, a mother

A weaver of a web of life that keeps us all alive She gives us the vision to see through
the chaos She gives us the courage

It is our will to survive

Isis, Astarte, Diana, Hecate, Demeter, Kali, Inanna

Paganism and Judaism

The Jewish tradition is vitally connected to rituals and practices that could be defined as “pagan” or earthcentered. Nonetheless, it is conventional to describe Judaism as antithetical to paganism and to nature. This oppositional framework has several roots in Jewish intellectual history.

A primary influence is the opposition of the Hebrew prophets to polytheistic worship or the worship of plastic images, often on the grounds that this worship involved ritual sex or human sacrifice. While it is unclear whether prophetic ideas about Ancient Near East worship should be applied to an abstract idea of paganism, there is a visceral aversion in Jewish culture to ritual practices that might be deemed “strange worship,” to use the Hebrew term for idolatry. A second source can be found in certain Hasidic and in late medieval Jewish thought, as inflected by neoPlatonism. Form, according to some teachers, was represented by Jewish law and commandments, while matter was equated with nature. Miracles like Israel’s crossing through the Reed Sea epitomized the domination of form, *tsurah*, over *chomer*, matter, and were interpreted to mean that God had exalted Jewish destiny above nature. A third source is found in the nineteenth-century interpretation of the evolution of religion, which was strongly influenced by Hegelian idealism. According to this schema, which largely determined the character of modern Jewish attitudes, advanced civilizations were capable of subjugating nature, and were thereby liberated from rituals or mythical beliefs about nature and hence able to impose a moral and historical order on an essentially amoral world.

Modern thinkers have often conflated these sources into a schematic picture of historical religion overcoming nature religion. Ismar Schorsch calls this the “celebration of ‘historical monotheism’ ” and describes it as “a fierce attempt by [modern] Jewish thinkers to distance Judaism from the world of paganism” (1991: 3). Scholars who follow this interpretation define Judaism as the religion that gave birth to the idea of worshipping a God of history who transcended nature, imposed a rigorous moral order, and demanded the purgation of all idolatry of the natural world. While these ideas are certainly part of Jewish intellectual history, they make for an interpretation of Jewish religion which, as Moshe Sokol writes, is “incoherent” (2000: 262). Works by scholars such as Daniel Boyarin, Theodore Hiebert and Howard Eilberg-Schwartz in recent decades have demonstrated that any assumption of opposition between Judaism and nature leads to an incomplete and inaccurate reading of both biblical and rabbinic culture. Tikvah Frymer-Kensky’s book *In the Wake of the Goddesses* has also shown that any categorical picture of “paganism” cannot account for the unique nature of early Israelite opposition to the cultures around it. Furthermore, the usual assumption

of those who accept the Pagan–Judaism dichotomy is that all Pagan traditions are lacking, in exactly the same way, a moral or historical perspective on the world – a claim that from a comparative religions perspective is absurd.

The distinction between Judaism and the Pagan is neither as cut-and-dry, nor as fluid, as has been variously claimed. If we define Paganism according to contemporary usage, that is, Earth-centered ritual, the personification of nature as Goddess, and the acceptance of multiple divinities or powers embodied in the natural world, one would be hard-pressed to determine whether Judaism is more “Pagan” or “anti-Pagan.” Even a cursory inspection of Jewish ritual will reveal much that can be labeled Pagan. Anthropologists studying Jewish rituals like circumcision discern a layer of primitive meaning that can rightly be called Pagan. There is also no question that a chief element in the Jewish covenant was a close relationship to the land, one which involved giving the land what we would call rights. In the Torah, the Earth is considered a covenantal partner and person; hence from the perspective that any personification of nature is Pagan, Judaism should be considered “Pagan.” Likewise, the Psalms assumed a world in which animals, rivers, mountains, etc. are part of the moral order and respond to justice by praising God. The rabbis similarly described a more-than-human world that was characterized by personhood, by praising God, and by moral participation.

Most importantly, as Arthur Waskow argued in *Seasons of Our Joy* (1982), there can be no question that the holiday cycle of Judaism is as much attuned to the cycle of the Earth as any “Pagan” tradition. For example, the Passover festival that celebrates birth always falls on the full moon following the spring equinox. The ritual of waving the lulav or palm branch during Sukkot, beginning on the full moon following the fall equinox, is performed to bring fertility and rains at the beginning of the rainy season. Jews always light Hanukah candles during the new moon closest to the winter solstice, which is in fact the darkest night of year.

Yet there are also fundamental differences between Paganism as commonly defined and Judaism. While Pagan traditions associate these turning points in the calendar with both seasons and with events in the mythical life of the Gods, Jewish tradition insists that each of these dates has a unique meaning in the life and history of the people, in other words, Passover commemorates liberation from Egypt, Sukkot wandering in the desert, and Hanukah the triumph of the Maccabees and the rededication of the Temple. The history of the people in essence took the place of the story of the gods in Israelite religion, while the connection with the cycles of nature remained constant. Another clear difference between Judaism and many of the traditions defined as Pagan is that all divinity in Judaism is focused within a single deity that creates nature and hence is not subject to nature. The Earth in Judaism may have personhood, but it is not a divinity.

Some popular works, emerging from the feminist spirituality movement (Patai 1990, Teubal 1984), have attempted to reclaim Paganism within ancient Judaism by blurring the distinction between Judaism and ancient Canaanite practices. There are many points that may seem to resonate with this approach. For example, most biblical

scholars accept that the Torah commanded the worship of one God who created heaven and Earth (monolatry), but accepted the existence of other (lesser) gods. Also, in Kabbalah and more so in Hasidic thought, “Elohim,” the name used for the creator God of Genesis 1, is identified with nature or “Hateva” through the process of Gematria or the numerology of Hebrew letters. In one traditional interpretation of this equation, for example, what appears to be nature to “the nations” is revealed to the Jews as God. Finally, there is frequent suggestion in kabbalistic literature of a level of divinity within the Earth, especially under the rubric of the Shekhinah, God’s presence in the world. Even with respect to the lives of “the gods,” Kabbalah limned a mythical life within the divine realm that was traced through the rituals of Jewish practice.

By way of simplification, one might say that in Jewish culture, the multidimensionality of the divine realm was treated as esoteric knowledge, while the unity of God was treated as common belief. In some Pagan cultures (especially in Greek philosophy), the opposite was true: the lives of the Gods were openly discussed, while the unity of God was known only to the initiated. Thus, even though these approaches to the world of the spirit are profoundly different, they are not necessarily in contradiction. One might nevertheless question what is left that is uniquely Jewish if one erases all of the boundaries that separate it from Paganism.

However one judges these matters, it would be hard to claim that the self-defined Pagans of today are actually Pagan in any ancient sense. What is called Paganism or “neo-paganism” is often closer to a pantheistic version of monotheism than it is to polytheism. Furthermore, the understanding of Pagan or Earth-centered spirituality that is influential in the U.S. and Europe tends to be focused on moral issues, and many neo-pagan communities are politically involved in fighting the oppression of human beings as much as fighting “for nature,” in stark contrast to the way Pagan ideas were used once by groups like the Nazis. Thus, even if one accepts the opposition between classical Paganism and Judaism, to apply this to contemporary spirituality is difficult or nonsensical.

For both theologians and anthropologists, the question of the relationship between Judaism and Paganism must not be whether there is similarity or opposition, but rather, how we can redefine the terms so that, as Eilon Schwartz has argued, we are able to read the Jewish tradition on its own terms, and Pagan traditions on their own terms, rather than on polemical grounds. What we find in Judaism is essentially a contradiction of the Pagan–monotheism dichotomy: a tribal tradition in the heart of modernity, intensely connected to nature’s cycles and to physical embodiment, while at the same time connected to moral order and philosophical theology. Jewish thought provides grounds for critiquing the naive worship of nature and for rejecting the separation of the natural world from human morality and meaning, but it does so from a position that could equally be described as both Pagan and monotheist.

Paganism and Technology

Many contemporary Pagans are reconciling their ideologies of nature and the divine with science and technology in order further to understand the nature of which they are a part. A growing number of Pagans are also working to reverse their own alienation from the natural world, yet not divorce themselves from “civilization” or technology. Instead of eschewing technological advances, many nature-oriented Pagans embrace them and enjoy the benefits of computer-oriented entertainment, kitchen, and leisure technologies: e.g., the internet, CDs, microwave ovens, and cellular phones.

However, this is not always the case: Pagans are becoming more cognizant of and are actively refusing to take part in certain types of technological advances such as certain medical, food, nuclear, and nature-destroying technologies. Due to animal testing, questionable side effects, and other reasons, a growing number of Pagans are limiting their exposure to Western medical advances in favor of herbalism and utilizing remedies from the natural world. In the realm of food technologies, the practices of genetically engineering food and growth hormone supplementation, among others, are leading many Pagans to grow much of their own food or purchase it from organic grocers. Pagan communities often hold nuclear and other technologies believed to harm the Earth and its inhabitants in disdain as well. Additionally, many Pagans work to implement and increase the use of nature-saving or nature-restoring technologies, such as recycling and other scientifically-driven ecological conservation practices.

One of the most important technologies for contemporary Paganism is related to communication: the Internet. Many Pagans, often called Technopagans, work in hi-tech or Internet-related fields, or have grown up with the Internet as a major tool for reaching the outside world and are comfortable with integrating this technology into their religious practice in many ways: communication, community formation and maintenance, research, and ritual performance.

One major aspect of the use of the Internet by practitioners of nature religions is that it allows for contact with like-minded individuals and groups without having to travel long distances for community gatherings or festivals. Use of the Internet also facilitates contact without sacrificing the ideas of personal safety and anonymity that many Pagans feel the need to maintain. From prolonged communication with solitary individuals or established groups, on-line communities can be formed.

Contemporary Pagans and other nature-oriented religious practitioners, as well as some African-derived Santería groups in the United States, were the first religious groups to utilize the Internet for both community growth and ritual practice in the early 1990s. Since that time, the Internet has become a major locus for Pagan net-

working and is now being utilized as a place for the negotiation of Pagan community ideals. Additionally, there are a rapidly growing number of Pagan-oriented resources (e.g., websites, bulletin boards and mailing lists) aimed at community formation and information dissemination. The preeminent Wiccan website, 'The Witches' Voice' (www.witchvox.com), is one of more than 7000 Pagan-oriented sites on the web and boasts thousands of informative pages, Pagan contacts, and links to other Pagan websites. Additionally, a web search will uncover thousands of Pagan bulletin boards and mailing lists. With all of the positive aspects, one important drawback to the use of the Internet by nature-religion adherents is the propensity to neglect or exclude physical interaction with the "Nature" portions of their religious beliefs.

Even though Paganism professes an adherence to principles of the natural world, many adherents utilize the "non-natural" world of cyberspace and the Internet to learn about Paganism and to supplement their practices by performing online rituals with other Pagans, whom they may or may not have physically met: congregating in chat rooms, dressed in virtual robes, "lighting" candles, and worshipping Deity in a temple created by words typed onto a computer screen. In doing so, these Technopagans are appropriating parts of cyberspace by taking them out of an ambiguous virtual realm into a self-created simulation of real space where the physical elements of ritual are recreated textually and in the minds of the practitioners. This highlights the question of "What is nature?" Some Technopagans argue that nothing is separate from the natural realm; therefore computers and cyberspace are not un-natural. Others believe that "nature" is the realm of nonhuman-made phenomena, therefore computers and cyberspace exist outside of nature and practicing nature-oriented rituals in cyberspace presents a conundrum that must be individually negotiated.

Contemporary Pagan ritual is meant to resacralize diverse aspects of life by solidifying the individual's personal relationships with Deity and nature and by focusing on and celebrating nature. The common Pagan belief that Deity is embodied in all things leads many practitioners to argue that the virtual qualities of cyberspace can be understood as analogous to the Circle, the sacred part of space that is inherent in the natural world, utilized by Pagans for ritual and worship, thus allowing technology to take on aspects of sacredness and the computer to become an extension of one's body and self during Internet-based interaction. In this way, the technological phenomenon of the Internet has begun to include metaphysical associations for Technopagan "cyber-ritual" innovators. As the Internet gains popularity, the number of Pagans who are becoming interested in these applications of technology, especially related to the performance of cyber-rituals and the development of "virtual" communities, is increasing dramatically.

Paganism in Australia

Neo-paganism reached the shores of Australia by at least the 1970s, but was preceded by much earlier interest in all things occult. As British colonization spread throughout the antipodes in the eighteenth and nineteenth centuries, the three major sources of occult revival in England (Spiritualism, Theosophy and the Order of the Golden Dawn) found their way to Australia. Members of these groups co-existed with Druids and Freemasons in an overwhelming Christian population. A focus on Egyptian rituals brought together Freemasonry and Spiritualism and was later incorporated into some of the Pagan rites. In the 1950s more thought was given to ceremony and magic than nature. The emphasis on nature came with concerns for the environment and the feminist movement from the 1960s and 1970s.

Contemporary Australian Pagans have referred to themselves variously as: Pagan, environmental pagan, goddess worshipper, Celtic pagan, shaman, amerindian, runester, fairy, radical fairy, Druid, chaos magician, vodoun, thelemite, occultist, seeker of the light, Church of all Worlds, and as witch or Wiccan. Under witch or Wiccan are other sub-groups such as gardnerian, alexandrian, dianic, seax, hedge, hereditary, eclectic and solitary. Groups such as the Ordo Templi Orientis and Temple of Set have also referred to themselves as Pagan, but there is some dissension in the Pagan community about whether their inclusion is justified. Wiccans or people calling themselves witches are probably the largest single group of Pagans, but there are no reliable statistics available at present to confirm this or to ascertain the extent and spread of Paganism.

Alternative lifestyles abound in Australia and give impetus to increasing interest in Paganism. They are celebrated in various ways through music and art festivals, mind/body/spirit workshops and ConFests (Conference/ Festivals), as well as Pagan gatherings and outdoor dance events known as “raves,” “doofs” or “bush dances.” The latter employ audio-visual technologies to accompany allnight community dancing in natural bush settings. The Woodford Folk Festival is held in Queensland in December each year and attracts more than 10,000 people over several days, culminating in a Celtic fire celebration on the last night. The Mt. Franklin Pagan gathering also attracts large numbers of people and is held in a dormant volcano in central Victoria at Beltaine. The Wiccan Conference is usually held around September each year and the venue changes from one state to another. Environmental consciousness and ecospirituality are the connecting threads in all these festivities. In addition to these major festivals are numerous small local groups of Pagans, linked by word of mouth, newsletters such as *Pagan Times*, and the internet.

The human/land/spirituality triad that is the basis of Aboriginal Australian religion makes Australian Pagans even more aware of environmental concerns and, conversely, some Aboriginal Australians speak of Mother Earth, a concept that did not exist previously in traditional Aboriginal Australia. Pagans tend to become highly conscious of their own involvement with the ecosystem and develop sensitivity to their own regional connections with “place.”

Some Pagan environmentalists desirous of maintaining the Earth’s ecosystem become politically and actively “green,” protesting land mining, excessive timber use, environmental pollution, and supporting Aboriginal land rights. Many intentional communities with an ecological focus (permaculture and eco-villages, alternative communities) exist in rural areas of Australia, and in the 1990s many Australians moved away from cities into the bush in search of a more nature-focused lifestyle.

The regular enactment of rituals heightens Pagans’ observations and perceptions of their natural environment. Because of this, the Southern Hemisphere creates problems of cognitive dissonance that do not have to be addressed by Pagans living in the Northern Hemisphere. The cycle of rituals known as the Wheel of the Year requires a reevaluation of the dialectical relationship between practice and myth, nature and ritual.

Australian Pagans are confronted with questions such as: how does the myth cycle relate to the land in Australia, when should one celebrate Samhain, how does the sun appear to move across the sky, and in which direction should a circle be cast? In the Southern Hemisphere, Samhain is in April, winter solstice in June, Imbolc in August, spring equinox in September, Beltaine in October, summer solstice in December, Lughnasadh in February, autumn equinox in March. However, a mere reversal of the Wheel does not address discrepancies that arise when applying the human cycle of birth, fertility and death to the Australian agricultural cycle. Some say that the Wheel and the myth should be kept the same as the Northern Hemisphere, yet others are adamant that adaptations should be made in order to address the realities of nature. The main argument in favor of a Southern Hemisphere adaptation is based on common sense: people feel it is ludicrous to be celebrating winter solstice at the height of a hot Australian summer. But a simple reversal would designate summer as a fertile time according to the myth, when in actuality summer in Australia is a dry, barren time when the fierce southern sun brings drought and bushfires, and depletes human energy – hardly the basis for fertility.

Even within the sacred circle itself, placing the directions of north and south creates some confusion because of their association with the elements. In the Northern Hemisphere, north is regarded as the place of greatest darkness and corresponds to the element of Earth. In the Southern Hemisphere the dark unknown is in the south, and the element of Earth is placed in the south. Conversely, the element of fire is in the south in the Northern Hemisphere and in the north in the Southern Hemisphere. Some have devised a combination mode, using Northern Hemisphere orientations when setting up the circle, celebrating Samhain in October and Beltane in May, but using

Southern Hemisphere seasonal cycles for the equinoxes and the solstices. Others completely adapt to the Southern Hemisphere.

Such discrepancies have not resulted in an abandonment of belief. Instead, they have led to a more determined effort to reconsider the myth cycle to coincide with the Australian environment. Differences lead to some heated debates however. To overcome the problem of various groups working according to hemispheric variants, it was suggested at the annual Australian Wiccan Conference in 1988 that ritual circles be cast in either direction (clockwise or anticlockwise) to reflect the different practices used in Australia. It was also suggested that the powers from each of the cardinal directions (north, south, east, west) be invoked in a generic sense so that all present could use their own visualizations and associations. Independent small groups make autonomous decisions about how they will celebrate the Wheel of the Year, but there is sometimes much confusion when different groups converge.

Paganism – A Jewish Perspective

The idea is currently fashionable that humanity should live “in harmony with nature.” Several reasons can be offered for this attitude. As nature is becoming scarcer and the human population is growing, in economic terms this means that the value of nature must increase while that of humanity will decrease.

Another possible reason is that society is becoming increasingly virtual. People suspect that they are being manipulated, without knowing how to prevent or unmask this. Perception influences, and often becomes, reality. One central aspect of contemporary society which is affected by these trends is finance. The development from barter trade through metal coins, paper money, checks and credit cards took a long time, each stage facilitating further the accumulation of wealth. Today, in a cashless society, one’s deposits, debentures, shares and other financial instruments may be wiped out by a bank clerk’s mistake or an attack by a computer terrorist. The possibility of a meltdown of the insufficiently supervised global monetary system is potentially an even greater threat.

Because humanity is ill at ease with the virtual character of postmodern society, a need is being expressed to find order in a disorderly world and get closer to something real, tangible, and durable. Around long before history began, nature perfectly fills this role. Furthermore, increasing urbanization has cut many people off from nature which has evoked nostalgia for a more “natural” past.

The Image of Nature

Discussions about the image of nature involve truths, halftruths and fallacies. There is a general longing for an imaginary, beautified past which is perceived as “natural.” Nature is presented as benign, loving and pure. An extreme form of all this is the self-hatred of those who implicitly claim that nature is good and man is bad. This is not easily recognized for what it is: abstract mythology.

There is neither equality in nature nor anything resembling democracy, two values that the West cherishes. In fact, nature is often fearsome: volcanic eruptions sometimes cause more damage than atom bombs; earthquakes wipe out communities. The expression “forces of nature” carries clear connotations of uncontrolled violence.

Another common saying is that “nature knows best.” Many of those who claim this hardly understand what it means. Nature is not benign: it knows neither charity nor any apparent ethical consideration. One never sees a lion hesitate to kill the helpless

deer he is pursuing; the bird of prey does not stop midway in its fall, wondering whether to catch a smaller bird. There is no safety-net for marginal beings in nature, no protection for the weak, no consideration for the handicapped and no mercy for the elderly.

No nation in the twentieth century has propagated living in “harmony with nature” so much as Hitler’s Germany, where blood and soil became central values in the pseudo-religious world of national socialism. Not surprisingly, the Jews, the people who introduced moral laws in opposition to those of nature, were hated and slated for destruction.

The Resurrection of the Spirits

With the current revival of the importance of nature, the spirits who once were thought to inhabit the forests, lakes and rivers have also been resurrected. Festive days follow nature’s rhythms: equinox, solstices and solar eclipses. Neo-paganism has reconstructed rituals for their veneration and that of the sun and moon. Mother Nature and Goddess Earth are riding high again. Ancient elements are often mixed with individual constructs of an invented past which academics respectfully refer to as “alternative religions.”

The development of neo-paganism fits in well with postmodern fragmentation of society and the cult of individualism. Increasing worship of nature may partly be seen against the background of this desire to “return” to nature. Neo-pagans are not necessarily implying that everything is permitted. Their main message may well be very different: the perceived failure of all other ideas, including monotheistic religions, totalitarian ideologies, atheism, secular humanism and science.

Neo-paganism is part of a widespread search for both religious roots and unconventional dreams. Its basic philosophy can be interpreted as follows: “Humanity’s character has remained the same over the millennia. Let us thus return to the origins of beliefs to which man has adhered from time immemorial, religions intimately connected with sacred nature.”

The reasons for the emergence of environmental extremism overlap to some degree with those for neopaganism. Some analysts claim that, in the distant past, pagans were much more environmentally friendly than monotheists, a statement far too general to be defensible.

Nazism, Paganism and Environmentalism

Among twentieth-century totalitarian movements, Nazism was a semi-religious ideology. One heard more about its racist elements, however, than its Pagan interest in

nature. Few people realize that the first significant nature-protection laws in Europe were legislated in Nazi Germany.

Simon Schama comments on how painful it is for ecologically conscientious people to acknowledge that the Reich's passionate protection of trees was totally incompatible with its barbaric, systematic extermination of human beings (1996: 68, 119). Goering put into practice the Reich's Game Law which permitted capital punishment of a person who killed an eagle, and either deportation or confinement in a concentration camp for practitioners of vivisection. He adds that the camp's "medical staff was less fussy about operating on humans than hounds."

Walter Laqueur finds certain affinities between the Nazis and the Greens. The Nazis were strongly opposed to "blind industrialization," "materialist consumerism," the increasingly soulless modern society and its technological excesses. They always stressed the "return to nature, to a simpler and healthier life" (1985: 58).

Robert Pois notes the similarity between some of Hitler's statements and those of some contemporary environmentalists who "with ample reason, proclaim that a sharp-tempered Mother Nature, weary of pitiful man's toying with her inflexible laws, will eventually avenge herself upon those who, at least since the onset of industrialization, have tried her patience" (1986: 37, 42).

Michael Wyschogrod describes the relationship between environmentalism and Nazism, pointing out that Hitler was deeply influenced by such evolutionary concepts as the stronger killing the weaker and the resulting progress of nature (1992). He sees in evolutionary thinking a modern religion of nature, in which the basic conflict between nature and history is no less than the conflict between the moral and the natural. It was in the name of these concepts that the Nazis began to murder the handicapped, considering their lives of no value to society. This policy preceded the murder of the Jews, and helped them to refine their techniques in mass murder.

Michael Gillis highlights the Pagan aspects of environmentalism. For example, the book of Genesis can be read like a polemic against the world of Paganism, with creation as a product of mythical struggles between various gods (personifications of the forces of nature). Power and life are seen as divine, a Pagan view that can give rise to the worship of elements of nature. People are seen as being subject to these divinities, and are supposed to seek harmony with them, a manifestly ecological stand. He considers this to constitute secular Paganism (1992: 6–8).

Justice Opposes Nature's Cruelty

Against this background, one may reflect on the origins of Judaism as described in the Hebrew Bible, Jewish law and tradition. The God who reveals himself to Abraham is non-material; he does not reside in any element of nature. Having created nature, he is above it and can change it at will.

In the revelation to Moses at Sinai, God says that there are no other gods: “You shall not make for yourself a sculptured image, any likeness of what is in the heavens above, or on the earth below, or in the waters below the earth. You shall not bow down to them or serve them” (Deut. 5:8–9). As nature is thus not sacred in itself, it should not be venerated. Coherent with this theocentric worldview, Judaism established justice and social legislation in opposition to the cruel laws of nature.

Of the 613 biblical commandments, only three require the Jew to sacrifice his life rather than transgress them: murder, incest and idolatry. This indicates how central the avoidance of idolatry is in the Jewish worldview. The texts of the prophets are full of admonitions against the Paganism to which the Israelites repeatedly succumb.

For most of the last two millennia, Paganism was no longer of great concern to Judaism. With the establishment in formerly Pagan societies of the two monotheistic religions, Christianity and Islam, the outside challenges to Judaism changed. The paganism which survived in the Diaspora societies was not an explicit religion: it was mainly expressed as syncretism and seemed to have been relegated to the past.

The advent of Nazism in the twentieth century, however, dramatically returned paganism to the Jewish agenda. Neo-Nazi groups continue to propagate environmental theses. There are striking similarities between the Nazis’ love of animals and nature combined with their hatred of certain human beings, and the extreme approaches of some environmentalist groups, who claim that the Earth is too heavily populated.

Un-Jewish or Anti-Jewish?

Because both neo-paganism and environmental extremism are fragmented and not highly publicized, few Jewish authors have addressed these subjects. In the early 1970s, Milton Himmelfarb remarked that modern-day Western Pagans may not understand Eastern paganism fully (1973: 290). He reminds us that, as recently as the British Raj in India, widows were still being burned alive, a practise the British had to suppress by force. He also cited a report of the ritual slaying of a 12-year-old boy in Rajasthan state: the boy’s neck was slashed by a contractor in an effort to appease the gods when he laid the foundation stone for a new irrigation project.

Various forms of current nature worship are un-Jewish, while several neo-pagan reconstructionists can be considered specifically anti-Jewish. By the early 1990s, the Anti-Defamation League had identified elements of the small Pagan group Odinism with pseudo-religious strains of neo-Nazism and other hate movements. According to the Anti-Defamation League as quoted in Kaplan,

While there may be Odinists who are not part of a new-Nazi or other hate movement . . . Odinism has been a pseudo-religious strain of American neo-Nazi activity and propaganda. These neo-Nazis apparently consider the worship of Odin and other ancient Norse gods as part of their vision of “Aryan” supremacy (Schwartz 1997: 161).

Anti-Semitism is widespread among Russian neopagans. Victor A. Shnirelman writes that this phenomenon is rooted in Nazi-style rhetoric which is heavily laced with latent – or even open – anti-Semitism. He adds that militant anti-Semitism was only combined with the myth of Great Slavic prehistory in the 1990s. According to this myth, the Jews emerged as part of an evil conspiracy to dominate the world, trying to seduce the Slav-Aryans in their path (Shnirelman 1998: 1, 7).

Conclusion

It would be wrong, however, to conclude from these critical views of neo-paganism and certain elements of environmentalism that Judaism stands in opposition to nature itself. Moshe Sokol considers that those who speak about a “conflict” between Judaism and nature are wrong, stating that their views relate more to the sociology of Jews who lived in cities than to their beliefs (1998). In fact, Jewish law defines in great detail the Jews’ attitude toward nature, which prevents ruthless exploitation and wanton destruction.

The environmental movement has many faces, ranging from fundamentalist ideologists to pragmatists. While their practical approaches often seem to be similar, the values of Jews and fundamental environmentalists differ radically. Norman Lamm, president of Yeshiva University, refused to participate in an important ecology conference because it focused on the concept that “nature is sacred” (1996).

The tension between these two approaches will become increasingly evident with the further development of neo-paganism and environmental extremism. While one should not put neo-Nazis, neo-pagans and environmental extremists together indiscriminately, organized Jewry should be wary of them all to varying degrees.
