beginners experiencing the effortless motion of their first ride to those who've ridden thousands of waves around the world, the fundamental experience of surfing is inner joy, leading to a transformation and, for many, a transcendent or religious dimension. (In surf cultures worldwide, "stoked" is the verb most often used to capture the joyful and sometimes ecstatic experience of surfing.)

Of course, it is always a high-wire act when talking about what is "religious" in our lives outside of our church, synagogue, temple or other formal places of worship. One misstep and next thing you know even brushing your teeth could qualify as a religious experience. However, with surfing, we can make some statements that are wholly unique, and from them these threads of truth that are unbreakable no matter where waves break or who is riding them.

The first locus and center point for surfing is, of course, surf. Each wave is born in the marriage of wind and water, but exactly how that birthing occurs is still not fully understood. Every wave is unique, and no two can ever be exactly the same. And wave events, or swells, cannot be predicted with complete accuracy.

It must be remembered that waves are all around us all the time: sound, electricity, light, emotions, are all understood in terms of waves. So waves are not a foreign concept in the real world: there are light waves bouncing off this page and stimulating your eyes, for example.

But the waves of a surfer are a unique energy form in that we can ride them. They occur only where ocean and land combine to transform energy into entities that will exist momentarily before they are gone forever. A surfer's waves exist first in wind-shaped infinitesimal patterns that coalesce into groups, then as walls of water that often march across thousands of miles of ocean. When we witness the final moments of a wave's journey, or participate in its death throes by transforming the energy into personal motion through time and space, we are in contact with the initial center of the surfing "religion."

Surf and Ancient Peruvian Culture [Hening]

In the late 1980s I was invited to an ocean festival in Northern Peru dedicated to honoring the traditions of coastal fishermen and their connection to modern surfing. Because they still use small craft made from bundles of reeds to push out through some of the longest rideable waves in the world, I was very interested in the possibility that a new version of surfing could be found that would pre-date the first accounts of surfing from Hawai'i.

Well, not only did I have a chance to ride waves using craft essentially unchanged since 1000 B.C.E., but I also visited archeological sites where incontrovertible evidence of "surf stoke" can be observed. I have since returned to Northern Peru several times to study the Moche and Chimú societies whose temples, cities, and lifestyles provide a fascinating insight into ancient human relationships with the power of the ocean,

breaking waves, and possibly even surfriding itself. Based on this research I have concluded that the pre-Columbian coastal cultures of Northern Peru provide the earliest example of how surf can affect a civilized society.

This may be a bold statement to some. Given that humankind has inhabited coastlines around the world for millennia, how can we talk about a “first” in such a context? Quite easily, I think. The Southern Hemisphere is more water than land, and the storms of the “roaring 40s” (the southern ocean from latitude 40 degrees south to latitude 60 degrees south) circle the planet unimpeded by land masses. This zone of energy is the spawning grounds of more waves than any other oceanic area on the planet. Those waves sweep primarily from west to east as well as northward toward the coast of Peru. Along that coast flows the Humboldt Current, a cold water “river” in the ocean that is one of the richest fishing grounds in the world, a source of protein easily accessible to coastal inhabitants using fishing craft made from reeds, and there is evidence of this going back three thousand years before the Spanish arrived. The ancient Peruvians lived in one of the rare places on Earth where food and waves were omnipresent.

I do not find it surprising, therefore, that sea life and sea energy resonate through the belief systems, architecture, jewelry, weavings, and ceramics of ancient Peruvian coastal cultures. Temple walls, ceremonial courtyards, deities in reed boats gliding through the heavens, even the iconography of specific priesthoods and theocracies suggest a fascination and veneration for what must have been, to them, the unlimited sources of food and sheer power of waves.

The ancient Peruvians didn’t know about the causes of storms or big waves. They didn’t have satellites or weather buoys. All they knew was that the power of waves was beyond anything else in their world – and that a hundred waves, a thousand waves, a million waves, an infinite number of waves – were coming toward them throughout their lives from a source that was unknown.

To the best of my knowledge, it is in Northern Peru that we find the earliest known graphic design that consistently depicts oceanic waves in their two most easily visible forms: long walls of water moving across the open ocean, and curved, liquid forms that arc forward and explode when the ocean’s energy meets terra firma. As Thor Heyerdahl, the famous Norwegian adventurer best known for his kon-tiki and ra expeditions, said during an interview I had with him in 1990,

Here in Northern Peru we find the earliest examples of large societies living in close proximity to consistently big waves. Of course, the Egyptians and Babylonians also developed the reed boats. However, there is no surf on the Nile, and you’ll never see groundswells marching from the horizon in the Mediterranean or the Persian Gulf.

Thus the ancient Peruvians may have been the first to formally consecrate a human connection to waves, a fundamental connection that exists to this day. All this suggests, I think, that a primal constant lies at the center of surfing: endless and immense power formed into beautiful patterns constantly moving towards us.

There is a second fundamental reality of surf: the breaking wave itself. The physics and geometry of how waves break present observers with a striking fact: depending

on the underwater topography and the character of the incoming swell, the curves of a breaking wave are the same curves of a nautilus shell, the pattern of seeds in a sunflower, the arms of a storm, the spiraling of a galaxy. And not only does the water spiral over in a beautiful curve, but that curve continues to form as the wave moves along the coast, thus providing a continuous view *inside* nature for as long as the wave is alive. And when its energy is finally expelled, there is another wave right behind it providing the same vision.

On my expeditions to Peru, most recently in 2002 as a tour guide for “thinking surfers” interested in new perspectives on the sport, I focused on possible origins of surfing spirituality in ancient Peruvian depictions of the curves of breaking waves in their art and architecture. There is a temple complex 500 miles north of Lima, for example, built on a promontory overlooking a corner of the coastline where incoming waves bend into the beach and tube over perfectly. Along one wall of the temple a frieze depicts the arcs of breaking waves connected one to another. Further to the north a Pre-Incan society was ruled by kings who would ring their crowns and their raiment with waves as if to suggest that they drew their royal power from the waves themselves, the most endless source of energy they knew.

Endless energy in motion culminating in perfect natural curves – the ancient Peruvians seemingly had a unique vision of the natural world, perhaps as rich and even earlier than was had in the better-known case of Hawai’i, where there is greater documentation of a culture’s deep connection if not veneration of the surf, where riding waves was a significant part of the daily lives and rituals of a people.

Surfing in Hawai’i [Hening with Taylor]

There are those such as former world surfing champion Felipe Pomar who would like to trace the reed craft rituals of the Peruvians through Easter Island and then throughout Polynesia and all the way to Hawai’i. Given the available evidence this is a tenuous connection at best, although Thor Heyerdahl’s investigations in the early 1950s did turn up stone carvings of reed craft on Rapa Nui (Easter Island). Moreover, we know that ancient Polynesian wayfinders were able to sail across great distances. We also have an early account from the missionary William Ellis, first published in 1836, who reported that in 1823 the Tahitians had a god of the surf called *Huaouri*. But moving beyond curiosity and speculation regarding the possibility of a Peruvian diffusion of reed craft into the Pacific, the recorded history of surfing certainly begins with the Hawaiians, and dates to the 1600s.

Hawai’i is unique in that it is exposed to swells from all directions, and there are literally hundreds of places to surf on all the islands. Ellis mentioned that the surfing he saw in Tahiti in 1823 was nowhere near as developed as what he witnessed in Hawai’i. This is supported by the recorded references to surfing and evidence of a strong connection between the Hawaiian islanders and the waves around them in the

reports from the earlier expeditions to Hawai'i by Captain Cook and by subsequent accounts from Europeans and Americans arriving in Hawai'i throughout the nineteenth century.

In Hawai'i, however, as James Houston and Ben Finney explain in *Surfing: A History of the Ancient Hawaiian Sport*, there was no god of the surf, as there was in Tahiti. Nor was surfing specifically a religious observance. It was, however, like other aspects of Hawaiian life, integrally involved with the culture's gods, spirits, and rituals. There may not have been a special god for surfing, but making a surfboard was very much a ritualized process, starting with offerings to the soul of the tree to be cut down.

Houston and Finney also discuss a stone temple *heiau*, apparently dedicated to surfing, which is located directly in front of a good surfing break. They also note the existence of a surf chant:

Arise, arise ye great surfs from Kahiki The powerful curling waves
Arise with pohuehue Well up, long ranging surf
(in Fournlander 1916–1920: vol. 6, 206–7).

It would be tempting to conclude, in the light of such evidence, that Hawai'i provides an example of surfing's religious presence in a culture. But if this is true, then why did the practice plummet and nearly go extinct there? It is commonly believed that missionaries were responsible for the near death of surfing in the 1800s. Houston and Finney, however, argue that the missionaries did not see surfing as the problem, but objected to the betting and sexual freedom that accompanied the pastime. They believe that when the betting and mixing of the sexes was prohibited, the Hawaiians lost interest in surfing, which if true, seems to cast doubt on the idea that surfing was religiously important to the Hawaiians.

Consequently, it appears we are on shaky ground if we would ascribe to the Hawaiians any sort of deeply held religious beliefs when it came to breaking waves or the act of riding them. Indeed, we have less evidence of such beliefs in Hawai'i than we do from Northern Peru.

But what we do have emerging from Hawai'i is the beginning of a continuum that we can stretch to the present day, where surfing comes to dominate the lives of many people in ways that exemplify certain forms of worship and ritual, providing some of them meaningful, liminal experiences. The aloha spirit of giving, personified by the father of modern surfing, Duke Kahanamoku, is one of the touchstones of surfing's soul. The Duke promoted surfing around the world, and modern surfers see him as the embodiment of an ethical spirituality that may be just this side of a religious belief system.

Surfing Spirituality and Experience [Taylor with Hening]

The key to understanding surfing as a religious experience, of course, is to understand the experience itself.

The archetypal experience in modern surfing, made possible only in recent decades with the advent of relatively lightweight surfboards, is riding inside a perfect wave. The first lightweight surfboards were crafted of balsawood in the early 1950s and by the end of the decade, boards built with foam cores and resin shells were invented. But it was not until the mid-1960s that boards under 10 foot long became popular, and only in the late 1960s that they shrunk in such a way as to provide an entirely new experience. Suddenly the best surfers could visit a space on the planet never before experienced by humankind: the spinning interior of a perfect wave, a place where time actually seems to stand still. This experience was first depicted in a 1970 film called *The Innermost Limits of Pure Fun*. In it one sees the vision that previously only a skilled surfer would have: that of flying through a liquid cylinder – an experience surely outside the boundaries of ordinary reality.

Glenn Hening, who has had extensive experience inside the tubes of perfectly shaped waves, described during our “surf writing” collaboration, how riding inside the tube can alter one’s experience of time:

In the tube one has no frame of reference except the cylinder of water spinning above, around, and below you. The only thing in your vision that provides a sense of place is the opening, or mouth of the wave in front of you. What can happen next is truly remarkable: if the wave starts peeling faster than you are surfing, the illusion is created that you are either not moving at all, or are moving backwards. And in relation to your only visual frame of reference, you are. So you can be going at top speed forward, but the sensation can be that you are going backward.

As 70s surfing explorer Kevin Lovett wrote after discovering and surfing one of the most perfect waves in the world in Indonesia, “One of the most amazing aspects of the surfing experience is the view of life looking out from inside a breaking wave. These unique, intense, timeless, moments help shape consciousness and are carried with you forever” (Lovett 1998).

Commenting on such experience, Hening finds a corollary in how worship can be thought of in ways outside many traditional connotations associated with the word. In this quote from *The Urantia Book*, a text purportedly given through a dream to a Chicago Psychiatrist in the 1930s that Hening considers a guide to enlightened Christianity, Hening found an apt description of the peak surfing experience. For Hening the book suggests that we think of worship as the act of a part identifying itself with the whole, the assumption of refreshing, creative, fraternal and romantic attitudes by the human spirit. It is selfforgetting, it is superthinking. It is effortless attention, true and ideal soul rest, and yet a form of restful spiritual exertion . . . It is the yardstick

which measures the extent of the soul's detachment from the material universe and its simultaneous and secure attachment to the spiritual realities of all creation. Worship is identifying . . . the finite with the infinite, time in the act of striking step with eternity (Urantia Foundation 1955: 1616).

Indeed, "From the unique and extraordinary vision while riding inside a perfect wave," Hening believes, "the mystic kernel of the religious in surfing grows." And he thinks this is the "first source and center of surfing's spiritual power" even for many of those without the requisite skill to directly experience this vision. This certainly seems plausible, for indeed, in surf film, art, and music, this archetypal experience is presented as somewhat of an experiential holy grail.

Many surfers, such as former world champion Shaun Tomson, report that "time is expanded inside the tube," a place where one can experience space/time relativity, where time seems literally to stand still. Hening's description of the physical reality of a tube ride (above) allowed him to find in Albert Einstein's relativity theory a scientific explanation for the experience. Other well-read surfers find that authors such as Fritjof Capra (*The Tao of Physics*) help them understand their heightened sense of perception while inside a breaking wave. It is remarkably common for surfers to reflect on experiences that for them are satori-like, that resemble the spiritual awakening sought in Zen Buddhism, whereby the practitioner feels as though the universe is flowing through her or his body as the self of self dissolves into that universal, eternal energy. Although no great surfer, I (Taylor) have had a few hints at such experience. One particularly memorable one was while surfing a southern hemisphere groundswell (waves created by storms thousands of miles away) in northern Malibu. Taking off on a steep wave in an unfamiliar area and making the bottom turn, the wave suddenly pitched up, revealing a rocky reef immediately below the intended, liquid pathway. Suddenly "making it" appeared clearly as the one way to survive the ride, but at the same time I realized that the wave breaking immediately behind me was so fast that survival seemed unlikely. Just as this realization came into consciousness, I had an experience as though I was surfing by automatic pilot – time seemed to stand still and I somehow made the break – then in slow motion, perfectly, I emerged safely out the other side to the hoots of nearby friends. It occurred to me then, as it does now, that the experience was kindred to that which John Muir once had on the North Face of Mt. Ritter, where temporarily frozen in fear and stuck, unable to climb up or down, he suddenly felt the universe take over and flow, climbing, through him, enabling his escape to the mountaintop. It occurs to me that without religious studies lenses, few surfers would interpret such experiences in metaphysical ways. But nevertheless, some do.

It is not difficult on many levels to apply religious categories to an analysis of surfing sub-cultures. Surfers do, for example, engage in elaborate and ritualized pilgrimages all over the Earth, as *The Endless Summer* (1964) and countless other surf films depict – as they go "in search of the perfect wave." The places where spiritual epiphanies occur are constructed in the minds of some surfers as sacred places – self-consciously in some

cases and implicitly in others. These places are venerated in many of the same ways that other sacred places are today: they are named, written about, photographed, and fought over. Battles over them are sometimes among surfers coveting the experience and at other times between surfers and those engaged in commercial enterprises that threaten them. These latter types of disputes can be framed as battles between agents of desecration and those having a proper humility and spiritual appreciation of them. Thus are surfing spots, and the surfing experience, made sacred by human action. Two examples of this can, perhaps, be found in the organizations that Glenn Hening has played a major role in inventing, which he describes in the next section.

The Surfrider Foundation and Groundswell Society [Hening and Taylor]

Given the experiential power of surfing and the history of religion it should not be surprising that many would try to exploit the practice commercially. Surfing has become a multi-billion dollar business, extending globally in many manifestations, from surf contests and promotions, to apparel, to the media, music and more. A number of surfing organizations have formed, however, to resist these trends and focus attention on the reasons surfing took off in the first place, the value and power of the oceans.

In 1984 Glenn Hening founded the Surfrider Foundation by forming a team of surfers that included Lance Carson, Tom Pratte, Steve Merrill, Chris Blakely, and Dan Young. Their mission was to create a new respect for the wave and beach environments and to protect them from polluters and developers. The organization chose, fittingly enough, a logo designed by David Moeller, a Huntington Beach (California) graphic artist and Surfrider board member, that depicts the vision from inside a perfect wave. Twenty years later, Surfrider has over fifty chapters in the U.S. and affiliates around the world.

In the late 1990s Hening co-founded the Groundswell Society with Jericho Poppler and Matt Meyerson. “With Surfrider, the problem was surfers getting sick from the ocean. But now, given surfing’s explosive growth, the problem is surfers getting sick of each other.” Formally incorporated in 2001, the Groundswell Society adds two dimensions to Surfrider’s original mission. First, a peacemaking mission, seeking to reduce the violent territorialism that had come to characterize the sport as it became more popular. Second, frustrated by Surfrider’s identity as an increasingly mainstream environmental organization, Hening has shaped the Society’s annual publication to serve as a “voice of conscience” that highlights individuals and groups that contribute to a positive future for surfing while forthrightly identifying elements in modern surfing that profit from surfing’s energy and growth while failing to nurture and protect the oceans and surfing communities from which they ultimately draw their substance. Surfrider and the Groundswell Society, along with others such as Europe’s Surfers

Against Sewage and the Surf Education Committee, represent a nonprofit, nascent and fledgling institutionalization of the spirituality and ethics that characterize surfers and surfing at their best.

One of the best examples of this is the Clean Water Classic, an event held annually at Rincon in California beginning in 1997, which raises funds to fight ocean pollution, and tries to promote a more cooperative and noncommercial surfing culture. Rincon is a place where you can ride inside a perfect wave, and usually the place is very crowded and the attitude in the water very aggressive and intense. But the Clean Water Classic combines environmental *and* social ideals into a memorable experience unique in the world of modern surfing.

Surfing into the Future? [Taylor]

There is much in surfing and its sub-cultures that, if anything, works against the kind of spirituality and ethics that we have suggested is sometimes involved. As Hening has insightfully written, there are aspects of surfing that can work against a spirituality that connects people with each other and the wider natural world:

The fundamental problem with surfing will always be how powerfully it drives the ego. There is nothing inherently social in surfing's purest moments, because riding a wave is 100% personal. There is nothing "team" about it. So cooperation and humility takes a back seat to aggression and arrogance . . . As with every powerful experience that involves self-inflation amongst individuals in a crowd, surfing can go from the sublime to the ridiculous in an instant . . . from a generous free natural environment to a monstrous example of human greed and enmity. Surfers are the blessed sons and daughters of Kahuna gliding through Neptune's kingdom, until they start acting like troops of baboons defending territory against outsiders while engaged in internecine conflicts typical of lower order primate communities (Hening in Young 2000: 137).

This critique is found in an article Hening titled "The Stain on the Soul of Surfing," and it reminds me of the Western prophetic tradition, suggesting that surfing may have its first prophet. In it Hening reminds surfers of their unique blessing, that they are privileged to ride "aqua blue energy in warm water along beautiful coastlines, where the power and the visions provided by our mother ocean combine to make surfing an almost religious experience." But he chastises his fellow surfers for forgetting "that waves are living magic" and argues that the internecine violence they too often engage in will "ruin our heaven on Earth." He continues with, essentially, a call to repentance, suggesting that sharing and generosity must become definitive characteristics of surf culture.

Until these instincts become definitive of our surfing culture, starting with the surf industry and those making a living off the sport, surfing will suffer from a cancerous sore that won't go away. The pro tours, contests, magazines, videos, surf star reunions, big-wave exploits, and guided trips to remote perfection will all mean very little until

the leaders of our sport/art publicly make a commitment that says, “Enough! We leave our egos on the beach, and we enter the ocean with humility and a true sense of brotherhood.”

In a way, Hening is calling surfers back to their roots, or at least to those of the patron saint of modern surfing, Duke Kahanamoku, who more than any other figure was responsible for the globalization of the sport, and its original aloha spirit. *Longboard Magazine* has commented, “Groundswell Society’s idealism could be surfing’s new voice of conscience” (Holmes 2002: 73). Its founders and members, along with Surfrider Foundation, are inventing a surfing style that blends surfing’s nature spirituality with environmental and social conscience to create a positive legacy for future generations of surfers.

Sustainability and the World Council of Churches

The word “sustainable” has been a normal part of the English language for a long time. It has had obvious applicability to agriculture, forestry, and fishing, and other human activities that use natural resources. It means that the activity is conducted in such a way that the resource is not exhausted and its use can continue indefinitely. However, the word did not become prominent in the literature until 1975. The event that lifted it to centrality in the discussion was its use by the World Council of Churches Assembly in Nairobi.

The preoccupation of the churches had long been with issues of justice. Many of the member churches were located in Third World countries that were struggling to overcome the legacy of colonialism. They needed assistance in economic development, but they found the economic and political structures of the world arranged to benefit the First World powers. The World Council was sensitive to their concerns, and called for a “just and participatory society.” When, around 1970, the ecological crisis became a focus of attention in the First World, many in the Third World saw this as another distraction from the really urgent problems of the Third World. The World Council stood aloof from the 1992 United Nations meeting on the environment in Stockholm.

Nevertheless, many in the World Council were convinced that failure to consider the destructive impact of human actions on the natural world was unacceptable. They made their case at Nairobi. Justice and participation are certainly important, but if a society destroys its natural base so that it cannot survive, these virtues by themselves are radically insufficient. A society must live in a way that is sustainable. The Council added “sustainable” to its slogan, which now called for a “just, participatory, and sustainable society.”

In the following seven years the Council organized meetings all over the world to discuss the meaning of “sustainability.” These discussions heightened consciousness on the part of many participants as to the destructiveness of many current practices. On the whole it was recognized that the requirement of sustainability imposes limits on economic growth and that the First World might already have exceeded those limits. There was often a strong sense that recognition of the requirements of sustainability pointed to the need to redistribute access to natural resources so that the Third World would have a chance to develop economically. There was some recognition that population increase was also a threat to sustainability, but this topic has always been difficult to discuss in the churches.

Despite seven years of emphasis on sustainability, the next World Council Assembly, in Vancouver in 1982, turned its attention to the topic of peace. Fear of war between the First and Second Worlds had long informed the WCC agenda, and it returned to dominance at this session. Third World delegates saw that this directed attention away from their concerns for justice. The debates centered on peace and justice. Relations to the natural world faded from consideration. However, they were kept alive in the new slogan that emerged from this Assembly:

“peace, justice, and the integrity of creation.” This led to further conferences all over the world and to less anthropocentric reflection about nature, but it removed “sustainability” from the focus of attention in the churches.

Meanwhile, the term had been adopted widely in the international community. This became apparent especially at the United Nations “Earth Summit” at Rio de Janeiro in 1992. Out of that meeting, the idea of “sustainable development” has taken hold as the overall rubric under which policy is to be formulated.

In this context, however, the implications are quite different from those drawn by the World Council of Churches. “Development” means global economic “development,” and economic development means economic growth. Instead of suggesting a society should live within limits, the term “sustainable” now calls for evading limits, making economic growth sustainable. This puts the focus on technology as the instrument through which limits can be pushed back again and again. This approach also sets aside the question of redistribution of resources, since the problems of the Third World are to be solved by overall global growth, which takes place best when the great economic actors are given free reign.

In some contexts, the quest for sustainability still functions to discourage excessive use of resources. An interest in the sustainable use of forests and oceans, for example, sometimes leads to the acknowledgment of limits and to attempts to stay within them. Unfortunately, the origin of the current use of the term in an anthropocentric context restricts its usefulness even in these cases.

Swadhyaya (1920–)

Swadhyaya is a spiritual and social movement centering upon the teachings of Rev. Pandurang Shastri Athavale, known to his followers as Dada, or Dadaji, meaning elder brother. Teaching over the past five decades from a center in Mumbai (India) called Shrimad Bhagavad Geeta Pathshala, his purpose is the recovery of the insights and values of India's cultural heritage. Because he recognizes that ancient Indian civilization placed a high value upon nature, the activities of Swadhyaya that address ecological issues are of interest to contemporary environmental theory.

To most specialists in Vedic literature, the term Swadhyaya refers to the recitation of Vedic texts to oneself. For the adherents of the movement known by that name it has the more literal connotation of the examination or study of oneself. Based on ancient Indian religious texts, and the Bhagavadgita in particular, Swadhyaya, invites one to recognize the divinity within oneself and within all persons, giving rise to self-respect, esteem for others, and grateful devotion to God. The teaching that God dwells within every person, and that all persons are spiritual brothers and sisters in the family of God, has been spread by means of devotional tours (*Bhaktipheri*), which Athavale initiated in 1957, wherein adherents visit villages to share the teachings of the ancient tradition with the local people. Without hierarchy or paid workers, Swadhyaya has spread to roughly 100,000 villages in India.

While Athavale accepts no funding from any source, his teaching is that labor is devotion (*Shrambhakti*) and his recommendation of offering one's time, talent, and expertise for one day a month as devotion (*Bhakti*) to God has supported a wide variety of experiments in farming, forestry, fishing, water-resource management, sanitation, education and other areas. Endorsing neither fundamentalism nor politics, Athavale teaches that devotion (*Bhakti*) is a social force that can be effective in solving any human problem.

In 1979, Athavale initiated a phase in the restoration of India's classical heritage that addressed the depletion of the forest cover that had supported Indian civilization from ancient times. He pointed out that the ancient sages of India saw trees as the dwelling of the Lord who pervades the universe. The ancients enjoined the people to see God in trees because of the capacity of trees to instill noble qualities of selflessness and magnanimity. Athavale established Tree Temples (*Vruksha Mandir*) to cultivate the perception of trees as the dwelling and image of divinity. At the establishment of the first Tree Temple, he invited local farmers to offer their expertise to plant and care for the new trees as a devotional activity, and to perceive their tools as sacred implements. People from various villages within a region spend 24 hours at a time in the temple

not as workers but priests (*Pujaris*) of the temple of trees. Without the use of chemical fertilizers or pesticides, the participants enter the temple with an attitude of worship, and feel the presence of God in their activities of watering, weeding, and caring for the seedlings, and the growing trees. Coming from differing castes and classes of society, they visit, sing hymns, and eat together, breaking down traditional barriers between sectors of society. The tree temple program now extends to thousands of villages across India.

The initiative known as the Farm of God (*Yogeshwar Krushi*) is a village-based agricultural enterprise in which participants cultivate land leased or purchased with the purpose of recognizing the presence of divinity in the Earth as well as in other aspects of nature. Activity on the Farm of God is understood as worship, and the produce of the soil is distributed anonymously to those in need not as charity but as benediction (*Prasad*) from God, obviating the distinction between donor and recipient. An analogous program called Floating Temples (*Matsya Gandha*) has addressed the depressed material and social conditions of many fishing villages. Capital that enterprises such as the Floating Temples generate is understood to be the outcome of active community devotion, and is acknowledged to belong to God alone. It is called Impersonal Wealth (*Apau-rusheya Laxmi*), to be employed for the uplift of the whole community as the family of God. Offering one day a month as active devotion, Swadhyaya communities have undertaken projects of ecological restoration that have produced extraordinary results. In the arid regions of the state of Gujarat, the Pure Water (*Nirmal Neer*) program has recharged abandoned wells and impounded run-off water in ponds, achieving a 300 percent increase in farming productivity at a tenth of the cost of government programs.

Swadhyaya is the revival of an ancient way of life, in which an ancient attitude toward nature is embedded. While the accomplishments of Swadhyaya in the area of environmental concern is a living example of the relevance of Indian religious traditions in the care of nature, ecological restoration is but one manifestation of this religious movement that has had significant positive economic and social implications at the village level and beyond.

Swedenborg, Emanuel (1688–1772)

Next to the botanist Carl Linnaeus (1707–1778), Emanuel Swedenborg is perhaps Sweden's most famous son. He was a multifaceted genius who made a name for himself in the first half of his life as an inventor, scientist, philosopher and mining expert. He served on Sweden's College of Mines from 1724 to 1747. His first major work focused on mineralogy and cosmology. He published the three-volume work entitled *Opera Mineralia* in 1734 in Leipzig and Dresden. The first volume contained his cosmology and the other two volumes were scientific studies of iron and steel, copper and brass. His last major work of this period was an exploration of the human body entitled *Regnum Animale*. Two volumes were published in The Hague in 1744 and the third volume was published in London in 1745. In this work he had hoped to demonstrate the reality of the soul to the very senses.

A religious crisis in mid-life was the defining experience of his life and created his place in history. His reputation and influence rest on the 18 religious works he published during the second half of his life between 1749–1771. His works claim to reveal the inner meaning of the Bible and the true nature of reality – spiritual and natural. In number 68 of his first work *Arcana Coelestia* (1749), he states he was able to do this because he had had direct experience of the spiritual world, “I have seen, I have heard, I have felt” (1998a: 45). He believed that he was only called to write and publish these revelations and he never attempted to organize a religion based upon them. After his death, others, however, did and today there are a variety of Swedenborgian or New Church (from Rev. 21:2) organizations worldwide.

Despite their relative obscurity currently, Swedenborg's religious teachings have had considerable impact on modern Western culture. He was read by philosophers such as Kant and Emerson, painters like Gauguin, Inness and Keith (a friend of John Muir), poets as diverse as Blake, Baudelaire, Whitman and Borges, founders of new religions like Joseph Smith, Eddy, and Moon, and commentators on religion such as Corbin and Suzuki.

His new Christian religion provides an integrated and complementary view of the relationship between spirit and nature. In a work entitled *Interaction between Soul and Body* (1769), Swedenborg states that the universe is both spiritual and natural and that there are two things that produce all the effects in it, life and nature. In the divine design, they were created so that there would be a perfect correspondence between life and nature, from first to last, from inmost to the ultimate. Mutual love is the organizing principle of life. Space and time are the fundamental features of nature.

Nature is a theater representative of the spiritual world and it is from this that all things in nature subsist. In the order of creation, only human beings are a microcosm of the universe, being both spir- itual and natural, and therefore they are created to serve as the medium of conjunction between heaven and Earth. In order to fulfill this role, human beings are endowed with freedom and rationality. Conjunction with heaven is theirs to choose. The more spiritual and motivated by mutual love they are, the more they treat Earth as the perfect correspondent of spiritual affections. Thus, the more it is infilled with life. The more natural they are and the more they choose to abuse the heavenly principle of mutual love, the more the Earth is treated as an object for domination.

While nature is not in itself sacred in the teachings of Swedenborg, it plays an essential role in his understanding of the divine design, and therefore it must be preserved and cherished, so that the canvas of correspondences is available for all future generations.

The human race is enjoined in Swedenborg’s religious writings to participate in the preservation of the created world. In a work entitled *Conjugal Love* (1768), Swedenborg states that two principles emanate from the Lord for the conservation of the universe. In number 386 he writes that “one is the principle of procreating and the other is the principle of protecting what is procreated” (1998b: 465–6). The desire to protect what has been created is implanted in humans and animals, according to Swedenborg, and can even be seen in the vegetable and mineral kingdoms. This is elaborated in number 389, which states “that seeds are protected by shells, like swaddlings . . . and that there is something like this among minerals appears from the matrices and coverings, wherein noble gems and metals are concealed and guarded” (1998b: 468). He continues in number 391 that it is part of the plan of creation “that the things created must be preserved, guarded, protected, and sustained” (1998b: 468).

This idea is also discussed in his work *Divine Provi- dence* (1764) in number 3:3 where it is written that the preservation of all created things “depends upon the conjunction of the Creator with the human race” (1996a: 4). This number makes it clear that human beings are invited by the Lord to help preserve the universe. According to Swedenborg, this is best done by shunning as sins the evils enumerated in the Decalogue.

Swedenborg’s concern for the environment is witnessed by his view that human beings, who genuinely seek spiritual life, will treat everything created by the Lord with honor and respect.

Swimme, Brian (1950–)

Brian Swimme, a mathematical cosmologist, is one of the prime articulators of “the new cosmology,” a scientifically informed, mythic, religious narrative of the provenance and progression of the universe and the role of the human within it. An educator noted for his dynamic, energetic presentation style, Swimme holds a Ph.D. in gravitational dynamics from the University of Oregon (1978) and serves on the graduate faculty for the California Institute of Integral Studies in San Francisco. Dr. Swimme’s ideas have been featured at conferences sponsored by the American Association for the Advancement of Science, the United Nations, The World Bank, UNESCO, and the International Montessori Association, and have been very influential among secular and religious groups in fostering an ecological awareness, especially among Roman Catholic women’s religious communities.

Swimme’s research centers on the evolutionary dynamics of the universe, the relationship between scientific cosmology and more traditional religious cosmological perspectives, and the role of the human in the unfolding of the cosmos. In 1990, he established the Centre for the Story of the Universe, an international forum for scientists, artists, ecologists, ecofeminists, educators, and religious thinkers interested in pursuing the new cosmology.

In exploring the new cosmology, sometimes referred to as “the New Story,” Swimme has brought his expertise in gravitational dynamics to bear on the relationship of scientific cosmology with more traditional religious cosmological understandings. Informed by an ecological awareness and concern, Swimme has helped interpret the work of cultural historian and “geologian” Thomas Berry, as well as collaborate with him, as evinced by their cowritten book, *The Universe Story*. This book attempts to tell the story of the universe – from the “primordial flaring forth,” the Big Bang, to its present development – as a dramatic narrative, purporting the universe is a primordial source of human inspiration and religious imagination.

Unlike Berry, however, Swimme concentrates on scientific data surrounding the unfolding of the universe. Whereas Berry endeavors, in part, to lead religious traditions into a scientifically informed cosmological perspective, Swimme attempts, through his writings, public lectures, and video presentations, to deepen this process by reaching a broad, educated public.

For Swimme, the universe is not a calculable puzzle, but a wondrous mystery, manifesting the presence of the divine in each moment of its emergence. Swimme depicts the emergence of the universe as a spellbinding drama, replete with suspense, valor, tragedy, and celebration that took place eons before humans ever stood erect to behold

an evening sky. As an undergraduate at Santa Clara University, a Catholic university in California, Swimme encountered the work of Jesuit paleontologist and theologian Pierre Teilhard de Chardin (1881–1955), whose theology addresses a universal, evolutionary perspective, and is also foundational for Thomas Berry.

For Swimme, the divine is not extrinsic to the scientific study of the universe. On the contrary, the divine is what both sustains and transforms the universe, the energy that supports as well as shapes all emerging reality. He equates the quantum vacuum of space with the “all-nourishing abyss,” (Swimme 1996), a term which echoes other descriptions of the divine, such as Paul Tillich’s “ground of our being.” Wellsprings of Swimme’s insights continue to be a sense of awe and wonder engendered by mystery of the universe, and a sense of horror at the human destruction of the Earth.

In addressing the role of the human, Swimme cites two poles that must be eschewed. On the one hand, there is the status quo idea that all creation is here solely for humans as resource and playground that Swimme claims we need to avoid. On the other hand, there is the view that says that the human is just one species among others, which Swimme terms overcompensation. Accepting such a view would cause the rest of the Earth community to suffer immensely, since other species seem incapable of cleaning up our mess. We must somehow, Swimme argues, retain humility in regard to our particular status while at the same time be responsible concerning our unique power as a species.

For Swimme, the human is the locus where the universe becomes conscious of itself. No other species, he contends, that we know of, can reflect on all that is and its place in the universe. The human role, then, becomes accepting our task as the self-consciousness of the universe, with a responsibility for learning and perpetuating the principles of the universe, as we perceive them.

Moreover, Swimme trenchantly uses the new cosmology to critique the culture of consumerism, the economic and cultural system that suggests, in Thomas Berry’s words, that the “universe is a collection of objects rather than a communion of subjects,” and is according to

Swimme the world’s most pervasive faith system. Swimme argues that such a consumerist worldview, promulgated by global and ubiquitous advertising, seals off conscious contact with the powers at work in the universe and the Earth, leaving us deeply unsatisfied and turning to other stimulants to deal with our sense of alienation.

Some critics, including Gregory Baum, have suggested that the work of Swimme and Berry lacks a place for social-justice concerns and a plan for social action (Baum 1987). In addition, the “universe story” appears as a supreme metanarrative, one decontextualized from specific social, moral, political, economic, and cultural factors. Swimme and Berry in their more recent work appear to be incorporating such concerns, and the creative integrations of social-justice outreach and cosmological themes in the communities they have influenced, especially women religious involved in ecological ministries, suggests a growing nexus between the new cosmology and social-justice advocacy.

T

Tantra

Tantra, a current of religious doctrine and practice found mainly within Hinduism and Buddhism, emerged in India in about the sixth century. It evolved greatly over the subsequent one thousand years, changing in form and content as it spread outward into every Asian region into which Buddhism was practiced including China, Japan, Tibet, Nepal, and Indonesia. While later forms of Tantra tend to be abstract soteriologies (understandings regarding salvation) grounded in internal, meditative identification of the self with some form of the absolute, Tantra emerged in India out of the worship cults of local deities often identified with natural phenomena and the forces of nature. In India, these Tantric deities were very often (but not exclusively) female spirits of the land – mountains, forests, rivers, and pools – and were often identified with or depicted as wild animals, birds, trees, and flowers. Furthermore, when Tantra was exported into other parts of Asia, local deities of those countries were often transformed into the guardians of the mandalas of the Tantric high gods, and into semi-divine intermediaries between the worshipper and those gods. In Japan, for example, the *sanrinjin* (literally, “three bodies with discs”) theory, which divided the Buddha’s appearances in the phenomenal world into three types, allowed for the transformation and appropriation of the indigenous Japanese *kami* deities into so many “propagators of Buddhism.” In this way, deified aspects of the Japanese natural landscape became both Buddhist and Tantric, even as they remained Japanese. Parallel to this was the “translation” of certain Indian Tantric deities into their foreign homologues. So, for example, the *dakinis* of Indian Buddhist Tantra – who were at once semi-divine female intermediaries and human “witches,” and who were sometimes identified in India with jackals – were qualified as “fox spirits” in Chinese and Japanese Tantric traditions.

Natural vegetation plays a prominent role in Tantra, beginning with the use of the term “seed” (*bija* in Sanskrit) for the most powerful class of mantras, the sound formulas used in Tantric ritual: the practitioner actually generates the divinity with which he will identify himself by “planting” its seed through his mantric utterance. This image is expanded in the circa tenth-century *Kaulajñananiraya*, a foundational Hindu Tantric text, in which Siva, the supreme deity and creator god states that “Just as there is in an individual seed the origins of a tree possessed of flowers, roots, fruit, leaves, and branches, so it is as well with the other beings that are generated within my body” (16:42). The coeval *Netra Tantra* (12:11–12) assigns this role to a class of female deities called the Mothers, who hold the world inside of themselves, in the form of seeds that they will sow again at the beginning of a new world age, in order that creatures might reappear. Vindhyaśasini, the “Goddess Who Dwells in the Vindhya Mountains,” one of

the earliest and most important Hindu Tantric goddesses, is described in terms of her habitat, which is an extension of herself: a vast forest teeming with plant and animal life. Similarly, the energy of the Hindu goddess Kubjika is described in a twelfth-century Tantric text as flowing outward through the transmission of her teachings, whose conduits are represented as living plants: trees, creepers, roots and vines. A number of later Kubjika texts depict her as a tree with orange or red-colored blossoms – either a tamarind (*ciñca*), a *kimsuka*, or a *kadamba*. This identification, of the female principal, with a flower, is extended to the female consort in numerous Tantric sexual rites, in which she is often called “Lotus Maiden,” and whose vulva is called “lotus” (*padma*).

It would be a mistake, however, to qualify the Tantric view of nature, or indeed of the feminine, as a static and passive source of life. In the early medieval Indian context, wild nature was, like feminine sexuality, threatening and antinomian, the polar opposite of the security and order of male-dominated human society. Here, nature was not a peaceable kingdom, but rather an alien wilderness, a place of savage energy, at once alluring and terrifying, nurturing and deadly to anyone who would venture into it, and populated by ravaging female entities in the form of predatory animals and rapacious or carrion-feeding birds. In this context, the male practitioner of Tantra *par excellence* was termed a “hero” (*vira*), because he alone dared to confront and master wild feminine nature, energy, and sexuality. So it was that on specific nights of the lunar month, male Tantric practitioners would assemble on lonely mountaintops (*pithas*) or in forest clearings (*kset-ras*) to await the coming of Tantric *yoginis* or *dakinis*, who would descend on them in the form of lionesses, shejackals, she-wolves, vultures, crows, cobras, etc. The noninitiates who stumbled into these gatherings (*melakas*) faced certain death: they would be torn apart by these Tantric animal-goddesses or their human counterparts. The Tantric hero, however, empowered by his controlling mantras and ritual knowledge, could control these dread feminine entities and, more than this, actually appropriate their multiple energies – the forces of nature – for himself, in order to have a share in their *supernatural* powers. This was, in fact, the principal aim of early Tantric practice: to dominate nature by subjugating wild feminine sexuality as a means to gaining supernatural powers. The most important of these was flight, a “natural” capacity for bird-goddesses whose energy was said to come from their consumption of human flesh.

This Tantric goal lay at the foundation of the most important monumental edifices of early Hindu Tantra in India. These were the Yogini temples, of which approximately 15 ruins remain extant today on lonely hilltops or remote forest tracts, mainly in the Vindhya Mountain belt of central India where Hindu Tantra emerged. These temples were circular and roofless constructions: open to the heavens, they served as landing fields and launching pads for the airborne Yoginis. Carved into niches on the inner wall of these temples and facing an image of Siva or Bhairava at the center were images of the Yoginis, whose near-naked, sexually alluring bodies were crowned by the heads of predatory birds, wild animals, or fanged, terrible human “witches.” It was these dread

man-eaters that the heroic male Tantric practitioner called down and sought to bend to his will by transforming them into his lovers, in imitation of the Siva or Bhairava at the center of their mandalas.

Over the centuries that followed its South Asian origins, Tantra was exported into Nepal, Tibet, China, Japan, and Mongolia; and in the past several decades it has made its entrance into Europe and the United States. In certain of these export settings, and most particularly in the postindustrial societies of Japan and the West, Tantra has been appropriated by a variety of New Age movements that have adapted the original tradition to respond to their own concerns. Such is natural in these contexts, in which the world of nature is no longer threatening, but rather under threat.

Tantrism in the West

Since at least the second half of the twentieth century, the Asian tradition known as Tantra or Tantrism has had a powerful impact on Western spirituality and on the relationship between religion and nature in the West. A vast and complex body of traditions that spread throughout the Hindu, Buddhist and Jain religions since at least the fifth century, Tantrism has long held a profoundly ambivalent place in the Western imagination. When it was first discovered by European orientalist scholars in the nineteenth century, Tantrism was typically singled out as the very worst example of all the licentiousness and idolatry believed to have corrupted Indian religions in modern times. Yet in our own generation, Tantrism has often been celebrated as a much-needed affirmation of the human body, sexuality and the sacrality of the natural environment itself.

Although it has been defined in a wide variety of different ways, Tantrism might be said to center first and foremost around the concept of Shakti – the divine “power” or “energy” that circulates through all levels of the universe, from the individual human body, to the social body, to the vast body of the cosmos itself. Typically identified with the great Goddess in her most aggressive forms, such as Kali or Durga, Shakti is the divine feminine power that creates, sustains and destroys all things. In practice, Tantrism is essentially a complex body of spiritual techniques that aim to harness and direct this power, both toward this-worldly goals of material enjoyment and toward the ultimate goal of spiritual liberation. In their spiritual practice, Tantrikas seek to awaken this power as it lies concealed in the most seemingly mundane, even profane, natural acts and physical objects – including normally impure substances and forbidden acts, such as meat, wine and sexual intercourse in violation of class laws.

Not surprisingly, the first Christian missionaries and European scholars to come upon Tantrism during the colonial era were quite horrified at this seeming confusion of religion and sensuality. As the Baptist missionary William Ward described it, Tantrism is “a most shocking mode of worship” involving rites “too abominable to enter the ears of man and impossible to be revealed to a Christian public.” However, toward the end of the nineteenth century, a few more courageous scholars such as Sir John Woodroffe made a bold attempt to rescue and defend the Tantric tradition. In Woodroffe’s view, Tantrism is not only a sophisticated philosophical tradition, but also a profound vision of the physical cosmos that is basically in agreement with the findings of modern Western science. While modern science had only recently discovered that all matter is simply a form of energy, the Tantrikas had long known that the natural universe is simply a manifestation of Shakti, the Goddess as power.

But it was not until the first decades of the twentieth century that Tantrism began to enter the Western world in a significant way, with the foundation of the first “Tantrik Order in America” in New York City by Dr. Pierre Arnold Bernard in 1906. A contemporary of Sigmund Freud, Bernard saw modern Western society as terribly repressed in its attitudes toward the human body, sexuality and the natural environment. Tantrism, he believed, offered the most effective means to liberate these oppressed powers of sexuality and nature.

Beginning in the 1960s, Tantrism entered in full force into Western popular culture, first with the early Beat movement, and then finding a welcome home among the sexual revolutions of the 1960s and 1970s. In the words of Alan Watts – the ex-Anglican priest turned Zen master and psychedelic guru of the Beat generation – Tantrism is “a marvelous and welcome corrective to certain excesses of Western civilization.” In contrast to Western society, with its patriarchal domination of nature and its separation of spirit from matter, Tantrism can bring us an “understanding the creative power of the female” and an appreciation of the inherent goodness of the natural world. Perhaps the first great high priest of “NeoTantrism” was the infamous “Sex Guru” known in his early years as Bhagwan Shree Rajneesh and in his later life as “Osho.” Redefining Tantra as a kind of “religionless religion” based on the rejection of all fixed institutions and the celebration of sexuality and material nature, Rajneesh offered a new ideal for human existence – the ideal of “Zorba the Buddha,” who combines the sensuality of Zorba the Greek with the spiritual insight of the Buddha.

By the 1980s and 1990s, Tantrism had become a basic part of the amorphous movement known as the “New Age,” and increasingly identified with a wide variety of religious traditions believed to honor the forces of nature, sexuality and femininity. Thus, as *Tantra: The Magazine* defines it, Tantrism is no longer a tradition confined to certain forms of Hinduism and Buddhism in Asia, but is in fact a universal tradition of nature-, goddess-, and sex-worship followed by peoples of all cultures, from pre-historic shamans to modern neo-pagans:

Tantra is life in balance . . . Tantra is practiced by Native Peoples the world over, through profound respect for All that Is. It is also practiced through the respect of the divine feminine worshipped in her physical form through attending the needs of Mother Earth as our own body (1991: 3).

Now reconceived as an ancient global tradition centering on the reverence of nature and sexuality, Tantrism has been increasingly embraced by many of the various “green” movements and other environmentalist groups that have emerged in the last three decades. As we see in a wide array of movements such as GreenSpirit, Creation

Spirituality, and various Wiccan and Pagan groups, Tantrism is welcomed as a unifying vision that brings together spirituality and physical nature. In contrast to the lifedenying, other-worldly and male-dominated Abrahamic traditions, Tantrism represents for many a positive expression of human sexuality and spirituality, with the power to unite people to the sacred energies of the Earth, even empowering them for her defense. According to one popular Australian website,

TANTRA is part of a broad evolutionary process in consciousness, which is moving toward an integration with the Natural World, the physical body and the many sexual expressions of human behavior. All of Nature is then perceived as a sacred manifestation of the Divine, where there is no separation between Spirit and Nature (www.tantra.co.nz).

For many neo-pagans, this discovery of Tantra by the West is really only a rediscovery of the long-forgotten divinity of nature that lies at the core of Western traditions, as well. In the words of the one of the most prominent figures in the early Wiccan revival, Doreen Valiente, it is only fitting that modern Western witches should rediscover Eastern Tantric techniques; this is simply the great spiral dance of Shakti, the Great Goddess Earth herself, coming round full circle. It follows naturally, in accordance with the evolving trends of the Aquarian Age, that modern witches should adapt the Tantric sexual magic for use in their own magic circles

. . . Everything in this world is flowing. Nothing stands still, nor does time go back upon itself; but it proceeds in a spiral . . . The spiral has come round again, to its ancient place (Valiente 1988: 151).

In the course of its transmission to the modern West, Tantrism has undergone a profound transformation and reinterpretation. Once a highly esoteric tradition focused on secret ritual and acquisition of power, Tantrism has today become a popular form of spirituality focused on the celebration of nature and the liberation of sensual pleasure. There are various conflicting opinions as to how we ought to judge this transformation. More skeptical critics tend to view it as a tragic misinterpretation of an ancient religious tradition, which has been mistakenly appropriated for modern Western interests and hopelessly confused with Western sexual obsessions. More sympathetic observers, conversely, see this as just one more example of the changing nature of religious traditions in new historical contexts, as a much-needed corrective to the destructive attitudes of modern Western society, and as a powerful affirmation of the inherent sacrality of the natural environment.

Taoism

– See Chinese Traditional Concepts of Nature; Daoism.

Target Earth is an international Christian Environmental organization founded in 1986 by Roy and D'Aun Goble, who were inspired to begin a retreat center after taking a course together at Westmont College, a small Christian College located in Santa Barbara, California. Target Earth started simply as the Hidden Lakes Retreat Center in the Sierra Nevada Mountains of California and it remained the Goble's sole project for many years. In 1992 the Gobles encountered a writer from *Christianity Today* magazine and the result of that meeting and collaboration was Target Earth International, and the beginning of a global outreach program.

Target Earth is a response to the biblical mandate found in Genesis, which states that humans have dominion over the Earth. Target Earth sees this not as encouragement to plunder the Earth, but as a call to be caring stewards of God's creation. It is a partner of the Evangelical Environmental Network and offers a Campus Programs Division, including 45 campus chapters across the United States, which assists students with lobby training, student conferences and alternative spring breaks. It also publishes a Magazine entitled *Target Earth*.

In addition to maintaining the Hidden Lakes Retreat Center, Target Earth offers numerous international educational opportunities. Students can participate in short seven to fourteen-day missions or eight-week internships in Belize, Honduras, Mexico, Russia, and South Africa. Target Earth offers a Global Stewardship Study Program at its Environmental Research and Education Center at Jaguar Creek in Belize. It also works with conservation groups to select areas of the rainforest for preservation. One such property is the 8000-acre area of Jaguar Creek in Belize. Target Earth also maintains the Lasting Impressions Wilderness in Zimbabwe, Africa; and in North America, it has focused on preserving land in the Soda Mountain Wilderness in Oregon.

The Target Earth website expresses the mission of "Serving the Earth, Serving the Poor." In this sense, Target Earth is like many other Christian environmental organizations with a presence on the internet, which indicate that they are involved in human rights advocacy, spreading of the gospel, and preservation the environment. Such a multiple mission avoids elevating the Earth to a position of importance above humanity. The Earth is not preserved for the Earth's sake alone, but because it is God's creation. While sharing these views and attributes, Target Earth International is noteworthy in part because, unlike some other Christian environmental organizations, it is attractive to students and others who may not otherwise join a Christian group. Target Earth maintains a liberal and educational approach, offering a resources page outlin-

ing environmental justice, recycling, simple lifestyles and biblical references supporting each activity. This combination of practical projects and faith-based environmentalism makes Target Earth appealing to a wide variety of people.

Tattoos

Tattooing (from the Tahitian word *tatau*) is an art form of body modification that has been practiced throughout history in many regions of the world. Modifying the body, according to some anthropologists, is one of the simplest ways that human beings become social beings. The human body is the place where the natural world, social worlds, and personal experiences join. The practice of tattooing and body modification, which often has strict, genderdependent rules, thus situates the human body within a particular visible context for community members.

Tattoos have often been used to construct identity: by marking criminals, denoting social status and rank, symbolizing fighting ability, showing community membership, and as symbols of successful initiation. Initiation tattoos symbolize the wearer's willingness and ability to accept social responsibility and established socio-cultural values. Other, more voluntary, tattooing practices mark the body for aesthetic or erotic purposes, in rebellion against societal norms, or as medical therapy. Tattoos have also been used as symbols of religious affiliation and community membership. Many Coptic, Syrian, and Russian Christians returning from the Holy Land often acquired "cross" tattoos on their hands, and even though proscribed in the Qur'an, many Turkish Muslims returning from the *hajj* to Mecca have received tattoos to commemorate their completed pilgrimage.

In societies where spiritual forces are understood to be present in the natural world, objects, and living creatures, the human body becomes an avenue for relations between the spiritual and physical realms; the blood of the tattooing process symbolizes manipulation of the life-force. For example, tattooing was performed to bring prosperity and fertility to the wearer among many traditional African communities. Thus the physical body, having more than functional meaning, can become a unique magical talisman that integrates the spiritual, physical, and social aspects of life. For example, the North American Cree not only had tattoos for luck, beauty, and protection of health, but men also received tattoos, derived from dream-images, to help them communicate with nature spirits. Also, the complex designs found among Polynesian tattoos represented aspects of their lives within the natural world (e.g., centipedes and water symbols), tribal status, strength of character, and esoteric religious teachings.

In Middle Kingdom Egypt the tattoo functioned as a bridge between the physical body and the afterworld. In order to activate their procreative powers after death and assure their immortal salvation and resurrection into the realm of Osiris, some women were incised with special lines and dots related to the Goddess Hathor. Also, Native

American Eskimo women traditionally tattooed their faces and breasts in order to assure a happy afterlife.

Tattoos as marks of protection from evil forces and chaos were believed to make the wearer invisible or unrecognizable to malignant spirits or forces (e.g., among the African Nuba and Butwa). Nineteenth-century Alaskans utilized tattoos as protection from the spirits of animals and people that they had killed. Additionally, Thai Buddhist monks inscribe Buddhist sayings and symbols onto the bodies of male lay practitioners for protection purposes and to create embodied mantras.

The Edo period in Japan saw a rise in the practice of tattooing (called *horimono* – dug things) among urban lower-class social groups such as firemen and theater workers. Japanese tattooing utilizes figures from Buddhism, mythology, and literature (such as the *Suikoden*, a translation of the fourteenth-century Chinese classic about tattooed bandits that fought against injustice). Additionally, many of the most important Japanese tattoo motifs are based on folk beliefs about the powers of flora and fauna of the Earth and sea. These motifs are important because of the belief that tattoos are able to transfer to the wearer the power inherent in the meaning of the symbol. Personality traits such as loyalty and fierceness are embodied in the symbol of the lion-dog, strength and restraint (the dragon); religious elements such as devotion (Buddha, Kannon, and Fudo the Guardian), a Buddhist-inspired understanding of impermanence (cherry blossoms); as well as material aims such as longevity (the tortoise) are common themes among Japanese tattoos.

Almost all societies have seen traditional forms of body modification disappear. Only the West, especially in America where tattoos often function as markers for ideals of individualism, is witnessing a growth in tattooing practices at the beginning of the twenty-first century. Tattoos in America have begun to symbolize the ideals of self-actualization, spiritual growth, social and personal transformation, and ecological awareness. The New Age Movement, Women's and Men's movements, the ecology movement, and the Paganism and Goddess movements of the late twentieth century have promoted an understanding of the body as sacred. Individuals within these movements often understand tattooing as a means of decorating the sacred temple of their body.

For some wearers, tattoos symbolize spiritual ideals, for others the process itself is considered a spiritual transformation. For example, common tattoo narratives of women relate themes of self-healing, empowerment, and reclaiming control of their lives and bodies. Additionally, an emergent sub-set of Americans practice tattooing and body modification as a means of reconnecting their minds with their physical bodies and the natural world while aligning themselves with non-Western religious ideals thought to be more spiritually and ecologically aware than those provided by the consumer-driven Western society (e.g., idealized visions of Irish Celtic Pagan and Native American relationships with the spirits of nature, or Buddhist and Daoist notions of the interconnectedness of all life). Valorizing non-Western ideals, these “modern primitives” not only work to provide ecologically oriented ethics but they also promote

awareness of the spiritual aspects of traditional forms of body modification and their potential value in modern contexts.

Tawhid (Oneness of God)

Tawhid literally means “making one” or “unifying,” and generally refers to the Islamic doctrine of the oneness of God. In the Qur’an, *Tawhid* implies both belief in God’s unity as well as the corresponding conduct demanded by such belief. *Tawhid* therefore has a doctrinal as well as an ethical dimension.

As the most basic premise of Islam, *Tawhid* finds its expression in the first half of the testimony of faith: “There is no god but God.” The meanings and implications of this deceptively simple statement are far-reaching and manifold. *Tawhid* can be seen as the very life-force of Islam, for all aspects of Islamic belief, thought, and practice are rooted in its unifying and integrating vision. In any epistemology based on *Tawhid*, for instance, knowledge of nature cannot be divorced from knowledge of God’s oneness.

Lynn White’s critique of Christianity has been taken as an indictment of the entire Abrahamic tradition, including monotheism’s Islamic manifestation in *Tawhid*. A single transcendent God is necessarily outside of nature, making the latter appear as a profane object, fit for human manipulation and domination. The description of God in the Qur’an and its reception and development in the subsequent Islamic tradition present a more complex picture. To begin with, the God of the Qur’an is both transcendent and immanent. In the Islamic tradition, the proponents of classical theology and jurisprudence typically emphasized the former aspects of the divine due to their reliance on discursive reason and concern with the maintenance of social order. The proponents of the sapiential and mystical traditions, on the other hand, often emphasized the latter aspects of the divine because of their interest in inculcating a close personal relationship between God and the human individual.

In short, *Tawhid* embraces divine transcendence from and incomparability with creation (*tanzih*), as well as divine immanence in and similarity to creation (*tashbih*). Consequently, the God of the Qur’an, while not identical with nature in any simplistic or pantheistic way, is not far removed or separate from it either. While the former perspective opens up the possibility of legitimately making use of nature, the latter perspective sets ethical limits on such use. In the vision of *Tawhid*, nature is anything but a profane object.

The key Qur’anic term that must be emphasized in order to apprehend the relationship between God and nature is *ayah*, or sign. The word appears in the Qur’an as referring to miracles of prophets, to the beings and phenomena of nature, to the realities found in the human soul, to major historical events, and to the verses of the Qur’an itself – all of these are signs of God. The Qur’anic position seems to be that even though there may not be any adequate rational proof for the existence of God,

there are more than enough signs that point or allude to the Ultimate Reality. According to the vision of *Tawhid*, everything other than God is a portent or pointer that signifies God. In this context, the Qur'an puts particular emphasis on directing the reader's attention to the innumerable and easily accessible beings and phenomena of nature as so many signs through which God may be known.

By positing all existing things as signs of God, the Qur'an brings sacredness back into nature. By using the same word for the verses of the scripture and the beings and phenomena of nature, the Qur'an indicates that the book of nature is as sacred as the scripture itself, each representing a modality of divine speech. For those who forget God, both the Qur'an and nature can serve as reminders. The supernatural revelation of the Qur'an and the natural phenomena of the universe disclose and unveil the same truth, indicating the unity of Ultimate Reality. The ordinary distinction between natural and supernatural becomes irrelevant in this context.

How is the relationship between the signs and the Signified understood? From one perspective, the beings and phenomena of nature point toward God just as a work of music or painting indicates the qualities of the artist who created it. From another perspective, God's being forms the very essence or reality of everything that exists. According to Indian philosopher-poet Muhammad Iqbal (1877–1938), the universe does not confront God as its other; time, space, and matter are not independent realities but only interpretations or intellectual modes for apprehending the creative energy or life of God. What mind perceives as a plurality of things in nature is actually one continuous and dynamic divine act. Nature, in Qur'anic parlance, is the habit of God. By observing nature in the *Tawhidic* frame of mind, human beings come in close contact with the behavior of Ultimate Reality, thereby sharpening their inner perception for its more direct and deeper vision.

The ethical attitude demanded by *Tawhid* may be understood in terms of *cibadah* and *khilafah*, two central Qur'anic terms that define the consequences of accepting the oneness of God. The first can be translated as servanthood, or the attitude of loving obedience and humility that human beings ought to display toward God. The second may be translated as vicegerency, or the privileged capacity for exercising God-like authority with respect to the world. In the *Tawhidic* framework, vicegerency presupposes servanthood; human beings cannot become partners in God's creative work without first humbling themselves before their Creator-Lord. While the ethic of dominion is inherent in the notion of vicegerency, the Qur'an views the exercise of human powers without genuine servanthood toward God as illegitimate. The Qur'anic notion of vicegerency includes the understanding that human powers are not their own but have been delegated to them from a higher authority, for a limited time and for a specific purpose. Human beings must exercise these powers within the limits set by the Real Sovereign, or they will be seen as criminals and rebels (*taghut*), no longer acting in accordance with the demands of *Tawhid*.

Tawhid implies that everything in the universe belongs to God – a frequently repeated Qur'anic theme. Consequently, the idea of material possessions and natural

resources as constituting a sacred trust (*amanah*) from God is also built into the notion of vicegerency. Human beings have been temporarily bestowed with certain “possessions” through which they are being tested; this is true of individuals as well as communities and humankind as a whole. Ultimately, there is no such thing as human property. This understanding calls for an attitude of careful and vigilant restraint (*taqwa*) on the part of human beings *vis-à-vis* nature, which is divine property under temporary, partial, and conditional human stewardship.

These ethical implications of *Tawhid* are not limited to individual morality but extend to the dynamics of the collective order as well. In addition to religious beliefs and ethical norms, the Qur’an provides the outlines of a social order through which these beliefs and norms can be actualized in concrete human reality; the social order established by the Prophet Muhammad in seventh-century Arabia constitutes a paradigmatic model for Muslims in this regard. The Qur’an recognizes that human beings are rarely able to act in accordance with their professed beliefs and norms if these are not simultaneously supported by social structures and institutions. Consequently, the actualization of *Tawhid* in a given community remains incomplete and precarious if it is confined to the individual’s consciousness as a doctrine but does not shape the collective order.

The present-day ecological situation in the Muslim world is a forceful reminder that the chasm between ideal and reality will exist whenever professed beliefs and norms are not embodied in the collective order. *Tawhid* is no longer the central principle in the various social orders prevailing in the Muslim world, where the role of Islam in shaping public policy is itself a fiercely contested area. Moreover, any secularizing trend in the Muslim world further weakens Islam’s ability to be ecologically relevant at a collective level. It is hardly surprising that the ecologically beneficial imperatives of *Tawhid* have only a limited impact in everyday reality. *Tawhid*’s great potential in this regard, however, may be tapped through Islam-based environmental movements at the grassroots level.

Technological Immortality

Suffering death is the price that humans pay for their intelligence, yet through intelligence humans have long sought to overcome death, by means either of religion or technology. A single-celled animal such as the amoeba is in a sense immortal. While it can die, every living amoeba is many millions of years old, because it reproduces by splitting, whereas multi-celled creatures such as ourselves die of old age after a short life. Many animals suffer when they die, but probably only humans are fully aware of the meaning of death and know from early childhood that they are mortal. From the time of the ancient Egyptians, some cultures and individuals have sought partially technological solutions, but only in recent decades have fully non-supernatural alternatives become plausible.

Cryonics

Probably inspired by science-fiction stories and the success of the frozen food industry, in the 1960s, Robert C.W. Ettinger launched the cryonics movement to freeze dying human beings. The original idea was that cryopreservation could halt death for years until medical science had developed a remedy for the individual's fatal illness, at which point he or she would be thawed out, cured, and restored to a normal life.

A number of organizations set up laboratories to develop methods of cryopreservation, and a few dozen bodies were actually frozen. Ettinger and some other members of his movement began to think that future technologies could not only restore life but also improve it, giving people saved by cryonics a chance to become superhuman and even possibly god-like. A number of technical problems would need to be overcome, however, especially the extensive chemical and mechanical damage caused to large, slow-cooling human bodies by the freezing process itself.

More recently, rapid progress in gene analysis and genetic engineering has led to the idea that much of an individual's character might be preserved in a sample of DNA. For example, the Center for Reproduction of Endangered Species at the San Diego Zoo has established a collection of cryopreserved animal cells. The Coriell Institute for Medical Research has established a research repository of cells from human beings with inherited diseases, and a sufficient sample is four teaspoons of blood.

Frozen DNA samples can be stored indefinitely without deterioration, and in future centuries they might be used to create a clone of the deceased individual, or the individual's genetic code could be employed in some other method of technological

resurrection. However, DNA does not contain information about anything the person experienced or learned, so this approach would have to be combined with some method to preserve the individual's personality and memories.

Cybersurvival

In his 1953 novel, *The City and the Stars*, Arthur C. Clarke imagined that people could be archived inside an advanced computer, for technological resurrection thousands of years after their deaths. Many recent developments in computation, information storage, and cognitive science have provided both hope that this dream actually could be realized and some hint of how this could be done.

In his influential book, *The Age of Spiritual Machines*, computer entrepreneur Ray Kurzweil predicted that human beings and their computers will gradually merge over the next century, and that we will thereby become god-like spirits inhabiting cyberspace as well as the material universe. Specifically, Kurzweil suggests that magnetic resonance imaging (MRI) or some even more advanced technique could be used to read out the neural structure of a person's brain, which then could be simulated inside a computer.

A second approach is to videotape extensive interviews, then use computer graphics and artificial intelligence technology to create a virtual human. A virtual copy of a person is called an *avatar*. This term traditionally refers to a manifestation of a Hindu deity, including incarnation in human form. But it is used currently in computer engineering to refer to a software embodiment of a human personality.

The most impressive project to preserve interviews digitally is Steven Spielberg's Survivors of the Shoah Visual History Foundation which has recorded interviews with over 52,000 survivors of the European Holocaust at a cost of \$175,000,000. The same effort devoted to a single individual could preserve enough to make a convincing avatar, and the needed digital library and graphics technology is progressing rapidly.

A third approach is to employ the full range of psychological tests and sociological questionnaires to archive opinions, attitudes, beliefs, and other aspects of a personality. Even a relatively simple computerized database permits a kind of conversation with such a corpus of personal data, querying it for information in the form of questions and answers. Existing scientific measures of personality are designed to compare individuals along a few standard dimensions. Researchers working on personality preservation have recognized the need to develop new approaches designed to capture an individual's unique characteristics. Thus, several rapidly developing technologies are making it possible to record aspects of a person, and it seems likely that the technology will permit recordings of increasingly higher fidelity over the coming decades. The problem then becomes how to integrate the different kinds of data (genetic, neuro-structural, audio-visual, linguistic, and social-psychological), and there is much room for debate whether even a highly advanced computer system could accomplish this.

Conclusion

Death is a natural phase of human existence, but it is also part of our nature to seek solutions to problems, even the most challenging ones. For thousands of years, the preferred responses to mortality depended upon belief in a supernatural realm that transcended the limitations of material existence. Science, the systematic quest for the secrets of nature, now offers the possibility of technical solutions that conceivably could obviate the need for religion.

It may prove difficult to develop the technology, either requiring many decades or ultimately succeeding only partially. If science can preserve and reanimate only portions of the human personality, then future centuries may develop a hybrid approach to death that blends the technical with the sacramental, thereby building a bridge between the natural and the supernatural.

Tehri Dam

Tehri Dam, a hydro-electric power project on the principal upper tributary of the Ganges River, will, if completed, be the fifth highest in the world, and the highest in Asia. Located just below the confluence of the Bhagirathi and the Bhilangana Rivers in the Indian state of Uttar Pradesh, the Earth and rockfill dam of 260.5 meters will flood 45 kilometers of the Bhagirathi Valley and 35 kilometers of the Bhilangana Valley, impounding 3.22 million cubic meters of water spread over 42.5 square kilometers. The reservoir will submerge the town of Tehri, and 5200 hectares of land. It will displace an estimated 70,000 to 100,000 people. Promising 2400 megawatts of electric power to such cities as Allahabad and Kanpur, it is expected to irrigate 270,000 hectares in the western districts of Uttar Pradesh, providing 500 cubic feet per second of drinking water to Delhi.

Since its inauguration, public protest against the project has centered upon the interrelated issues of ecology, economic and environmental justice, and religion. At a meeting in Brazil in 1997, J.P. Raturi, the representative of the Tehri Dam Resistance Struggle Committee (*Tehri Bandh Virodhi Sangharsh Samiti*), stated Indian culture sees divinity in nature. He observes that to the rulers, the Ganges is megawatts of power and hectares of irrigated land. To the local people, she is a life-giving goddess. Sunderlal Bahuguna, one of the most visible leaders of the movement against the dam, recalls that the goddess Ganga (the Ganges river) answered the prayers of King Bagirathi to descend to the Earth only after Lord Shiva permitted her to descend into his matted locks, preventing her from becoming a destructive torrent. Bahuguna states that the locks of Shiva are the natural forests of the Himalayas which protect the land from floods. But the catchment area of the Bhagirathi River is the victim of massive deforestation by commercial forestry, and has turned the Ganges into the destructive force of which the ancient story told. For him, the dam is a further desecration of a sacred environment.

The religious significance of the Bhagirathi and Ganges rivers pertains to objections raised on grounds of ecology and environmental justice. The Himalayan region is seismically active, and the dam site is located only 15 kilometers from the boundary of two plates of the Earth's crust. Local people, however, have worked this land productively for many generations. Upstream from the dam site is a scenic valley, the heart of an ancient village culture. The proposed reservoir will fill this valley, with its 23 villages, and their terraced fields, sculpted over centuries of painstaking work. In 1978, when officers of the Uttar Pradesh government arrived to inaugurate construction on the first diversion tunnel for the dam, thousands of men, women, and children blocked

their way and shouted: "You love electricity, we love our soil." J.P. Raturi has argued that while the project will provide electric power and irrigation to the affluent, to the local people it will bring displacement and disaster. Bahuguna states that when the Ganges flows in her natural course she benefits all, irrespective of caste, creed, color, poverty or wealth. When she is dammed, she becomes the possession of the privileged and powerful who can dispense her blessings on a partisan basis.

Bahuguna argues that religion traditionally played a vital role in the regulation of natural resource use. As the industrial revolution began to see nature as a commodity, this crucial feature of religion came to be covered over with rituals. When development was identified with economic growth, a new religion was born: the temple of this religion is the market, technocrats and experts are its priests, and the dollar is the new god. Our political leaders, he says, are prepared to make the highest sacrifices to this god to bring it home. With his frail body, his white beard, and his simple Kadi apparel, Bahuguna appears as a prophet standing against an idolatrous faith. The dam, he argues, is a project to realize a false hope. It is based on a view of reality that equates progress with the affluence of the few. We should not kill our sacred river, he says, on the promises of a false vision of reality.

Bahuguna's idiom of resistance supports his credibility. Personifying the traditional ideals of nonviolence (*ahimsa*), renunciation of possessions (*aparigraha*), and devotion to God (*Ishvar-pranidhana*), Bahuguna states that the method of *satyagraha*, or standing courageously for the truth, is the only form of protest that can be effective. In the course of this struggle, Bahuguna has undertaken several fasts that have received much media attention. Ranging from 11 to 74 days, they have repeatedly brought him close to death. Early in 1996 the Tehri Hydroelectric Development Corporation ordered the people and businesses to vacate the town of Tehri and move to the New Tehri town located on a hillside above the dam site. The town was to be submerged by the end of June 1996. Local activists argued that the call was intended to convince the people that a review of the project was no longer possible. Again in June of 1999 all government offices, educational institutions and businesses were asked to vacate the town by the end of the month, but the plan was again postponed. If this plan is finally undertaken, the Ganga Kuta, or hut, on the bank of the river in which Sunderlal Bahuguna has been residing in *satyagraha* for the past twenty years will be the first dwelling to be submerged.

Teilhard de Chardin, Pierre (1881–1955)

Pierre Teilhard de Chardin was born on 1 May 1881 to Emmanuel and Berthe-Adele Teilhard de Chardin. His birthplace in Auvergne in southern France had a lasting effect on his experiences of love for the natural world. In

1899 he entered the Jesuit order where he launched into his lifelong effort to unify science and religion through the study of evolution and the role of the human as part of evolutionary processes. Three years later the novitiate was moved to the island of Jersey in England due to anticlericalism in France. It was also at this time that his eldest brother died, his younger sister became seriously ill and two years later another sister passed away. These experiences had a profound effect on Teilhard who considered engaging only in theological studies and turning away from science.

Instead he was sent to teach at the Jesuit College in Cairo from 1905–1908. It was here that he developed his naturalist's inclinations by studying Egypt's flora and fauna as well as the fossil record. Teilhard spent from 1908–1912 in Hastings, England, where he continued his theological studies but also pursued his interest in evolution. He encountered Henri Bergson's newly published *Creative Evolution*. This had a profound effect on his ideas regarding the spirit and direction of the evolving universe. It was also during this period that the attack on modernism and evolution arose under the papacy of Pius X. From 1912–1915 Teilhard studied geology and paleontology in Paris eventually earning his doctorate in 1922 from the Sorbonne.

The war years interrupted his studies as Europe was plunged into bloody trench warfare. Teilhard served as a stretcher bearer and was awarded the Legion of Honor for his heroic service. The experience of war had a profound effect on him as he wrote of his growing sense that even in the midst of such turmoil there emerges a feeling for a purpose and direction to life more hidden and mysterious than history generally reveals. It was shortly after the war when he was recuperating in Jersey that he wrote his essay on "The Spiritual Power of Matter." For Teilhard all of matter has a psychic/spiritual component and it is this interiority of matter that helps to move evolution toward greater complexity and consciousness.

In 1923, at the invitation of the Jesuit Emile Licent, Teilhard sailed for China to undertake paleontological research. Together they traveled numerous times to the Ordos desert on the border with Inner Mongolia to study Paleolithic remains as well as the natural terrain. Teilhard returned to France a year later to resume teaching at the

Institute Catholique, but the conservative climate perpetuated by the Vatican created a difficult atmosphere for him to develop his thinking on evolution. This conservative climate was due in part to the anti-modernist movement spearheaded by the Vatican before World War I. Rome sought to thwart the efforts of Catholic intellectuals who were interested in introducing broader elements of biblical criticism as well as reconciling aspects of religion and science, especially around the theory of evolution. In response, Rome tried to preserve orthodox Catholic teaching by requiring all clerics to take an anti-modernist oath.

Teilhard returned to China and settled in Beijing where he continued his scientific studies, interacted with a broad circle of intellectuals, and wrote *The Divine Milieu*. This work eventually caused his Jesuit Superior General to insist that Teilhard confine himself to his scientific work and not publish any of his theological writings. This was in large part because his vision of an immanent evolving cosmos appeared to more conservative minds to have pantheistic elements not in line with strict interpretations of the doctrine of creation. There were some who were concerned about Teilhard's profound immanent sensibilities regarding the infusion of the divine in nature. This was seen to be in contrast to the more orthodox position that God was transcendent or beyond nature. Teilhard was thus encouraged to stay in China where he remained until after World War II except for brief visits to France.

Teilhard engaged in several key research projects including the discovery of Peking Man in 1929–1930, the Mongolian Expedition sponsored by the American Museum of Natural History, the Yellow Expedition sponsored by Citroen, as well as expeditions to India, Burma, and Java. In 1931 he traveled across the United States, which inspired him to write *The Spirit of the Earth*. This work situates the human within evolutionary emergence and suggests that recognizing our deep embeddedness in nature is crucial to the future of all life. Teilhard voices his concern that humans embrace their common destiny as members of the Earth community and help to create a viable future by activating, not stifling, the larger spirit of the Earth within each human.

It was in 1940 that he completed his most important work, *The Human Phenomenon* (originally translated as *The Phenomenon of Man*). After the war when he was able to return to France his Jesuit superior would still not allow this work to be published. He spent the last years of his life in New York City with a research position at the WennerGren Foundation. *The Human Phenomenon* was not published until after his death in 1955. It was first translated into English in 1960 and a new, more accurate translation by Sarah Weber was published in 1999.

In *The Human Phenomenon* Teilhard outlined the fourfold sequence of the evolution of galaxies, Earth, life, and consciousness. Teilhard presented his vision of the emergence of the human as the unifying dimension of the evolutionary process. For Teilhard the awakening of humans to the idea of evolution since Darwin is unique in history and he likens this to the moment when a child becomes aware of perspective. He felt that for humans to realize that they participate in cosmogenesis, namely that they are part of evolutionary developmental time, results in a major change in knowl-

edge and beliefs. Absorbing this perspective, he felt, was a critical juncture for the growth of human awareness.

Teilhard sees consciousness as intrinsic to the process of evolution, not as an extrinsic addition to matter. For him all reality consists of simultaneously a within and a without. Matter and spirit are thus joined in this vast evolutionary unfolding toward a final Omega Point. The universe in this context is a *divine milieu*, a center that has the possibilities of uniting and drawing all things to itself. For Teilhard the evolutionary process is characterized by increasing complexity and consciousness and the divine is seen as part of the process, not simply transcendent to it.

Humans are the self-conscious mode of the universe in whom complexity and consciousness has come to its fullest expression. One of Teilhard's greatest hopes was that this large perspective of a purposeful universe would help to inspire human action for building the human community. In contrast to a resigned or fatalistic perspective, he spoke of the need to reignite in the human community a joy for action and a zest for life. Human suffering he saw not as due to original sin but as a form of potential energy which if transformed could change the face of the Earth in positive ways.

Teilhard's optimistic perspective has led to critiques from theologians who grapple with the problem of evil and feel that Teilhard may gloss over this pervasive reality in the human community. It has also resulted in criticisms from deep ecologists who view him as highly anthropocentric and his vision of "building the Earth" as lacking in awareness of the need for environmental restraints. Many are thus wary of Teilhard's apparent faith in technology and in progress. Moreover, Teilhard was a product of his times in having a rather limited understanding of religions outside of Christianity. His strong Christocentric approach and language infuse his writings.

Nonetheless, conscious of these critiques and aware of Teilhard's limitations, Thomas Berry and Brian Swimme have drawn on Teilhard's evolutionary perspective in developing their idea of *The Universe Story* as a comprehensive context for an expanded ecological sensibility. Like Teilhard, they see cosmogenesis as critical to understanding the role of humans as intrinsic to evolution and as responsible for its continuity. Teilhard's ideas continue to inspire appreciation and critique in the search for sustaining human–Earth relations.

Thai Buddhist Monks

In 1986, the ecclesiastical council of the Thai Sangha, the order of Buddhist monks, recommended to the Thai government that the Departments of Forestry and Religious Affairs work together on conservation and rural development projects. This recommendation foreshadowed the currently popular environmental movement in Thailand and the growing number of projects throughout the nation involving monks and the use of Buddhism in development and conservation. In the face of severe problems of deforestation and damaged watersheds across Thailand, several monks are advocating forest conservation, along with rural development schemes, based on their interpretations of Buddhist notions of respect for and balance with nature.

The work of these self-proclaimed “environmentalist monks” (Thai, *phra nak anuraksa thammachaat*) raises controversial issues concerning the relationship between Buddhism and environmentalism. The debate goes beyond equating the religion with nature, a simplistic interpretation often made by both these activist monks and environmentalists throughout the Buddhist world. (For example, the Buddha’s birth, enlightenment, teaching and death all occurred in forests, providing evidence in this line of thinking for the importance of the forest for spiritual development and environmental conservation.) The Buddhist environmental movement, amorphous as it is in Thailand, raises questions about both the appropriateness of monks’ involvement in such “this-worldly” affairs as environmentalism and the philosophical grounding of their interpretations of Theravada scriptures and ritual practices.

Although making up only a small percentage of the total Sangha in Thailand, environmentalist monks became prominent in the 1990s. Controversies involving some well-known monks, such as the arrest of Phra Prajak Khuttajitto for allegedly trespassing in a national park while documenting illegal logging, and a sex scandal surrounding the environmental activist Phra Yantra (in which he was accused of fathering a child with one of his followers), heightened the debate and put all activist monks under increased public scrutiny. The controversies and public image of environmentalist monks also tend to keep most “forest monks” – meditation masters who remove themselves from society to emphasize religious practice and asceticism – away from involvement in environmental activities.

Nevertheless, environmentalist monks maintain that their actions follow the Buddhist invocation to end suffering (Pali, *dukkha*). They are critical of changes wrought in Thai society as a result of the capitalist economic development promoted by the government since the 1950s. The consumerism that has swept across the nation and the accompanying debt and environmental degradation, these monks argue, are based

on greed, one of the three root causes of suffering in Buddhist thought. They see it as their responsibility *as monks*, therefore, to engage in changing people's attitudes and behavior toward the natural environment and the economy. By promoting environmental conservation and sustainable development (by which they primarily mean growing one's own food through organic agriculture), they aim to help people recognize their responsibilities toward nature and avoid the desire that underlies capitalist development. Environmental degradation, economic development, and the abandonment of religious principles and practice are all intertwined in environmentalist monks' assessments of the major problems Thailand faces today.

In their efforts to deal with these problems, environmentalist monks focus on three main types of activities: reinterpreting traditional rituals, education, and activism. The interplay between these approaches highlights the cultural creativity of these monks as they draw on local, national and Theravada Buddhist beliefs and practices in response to the environmental crisis in Thailand. Their more activist approach is supported by teachings of prominent scholar monks such as Buddhadasa Bhikkhu and Phra Prayudh Payutto (current monastic title, Dhammapitaka).

Environmentalist monks reinterpret a range of traditional rituals to promote conservation and engender laypeople's participation in conservation projects. These rites include symbolically ordaining trees in endangered forests, drawing people's attention to their mutual dependence on the forest. They also incorporate tree seedlings for reforestation with the traditional lay donations of robes to monks. Some monks perform "long-life" ceremonies for bodies of water, such as rivers and reservoirs, to highlight the urgency of protecting water supplies from drought (often caused by deforestation) and pollution. One monk even modified the monks' daily practice of alms-rounds to ask people in his village to donate land to the temple, thereby gaining religious merit, to use in a model integrated agriculture farm. Through reinterpreting a familiar practice, the monk aimed to get villagers to rethink how they lived from the land.

Education is a major component of environmentalist monks' activities. They teach both laity and the larger Sangha about ecology, appropriate technology and organic agriculture to provide tools to live in an ecologically sensitive manner. The monks emphasize meditation and Buddhist teachings, seeing the religion as the basis for positive change in society. They use principles such as dependent origination or the interdependence of all things (Pali, *paticca-samuppada*) to teach people responsibility toward the natural environment.

The most controversial activity of some environmentalist monks is their activism. Many of these monks have initiated local conservation projects or protested ecologically harmful policies and actions by the government, military and big business. Together with local people and non-governmental organizations, monks have protested both the construction of a dam in northeast Thailand and a natural gas pipeline coming from Burma through a Thai national park for both their negative ecological effects and their impact on the livelihoods of local people. Monks have established sanctified, protected community forests and fish, bird and wildlife sanctuaries, and organized

Dhamma walks in which monks, environmentalists and other lay people walk and meditate mindfully for several days or weeks, engaging with local people to draw attention to endangered areas such as lakes and forests (see Bhikkhu 2000). In northern Thailand, one young monk runs a model organic farm and provides seeds, seedlings and knowledge to farmers as they shift from cash cropping to integrated, organic agricultural techniques.

The actions and religious interpretations by environmentalist monks are diverse and controversial. They are also genuine efforts to make Buddhism relevant in a changing society. Despite – or perhaps because of – the debates surrounding these monks, they are contributing to rethinking the religion and religious practice in light of the urgency of the environmental crisis. The result is a form of cultural creativity that, while grounded in an ancient tradition, has the potential radically to change the way Thai Buddhists think about their religion and their natural environment.

Theme Parks

The term “Theme Park” has been used to describe everything from small amusement attractions, such as family entertainment centers with a few rides, to the massive Walt Disney World entertainment complex outside Orlando, Florida. Theme parks are not to be confused with fairs, carnivals, or amusement parks. The relationship between theme parks and their predecessors – both medieval carnivals, festivals and fairs, and nineteenth-century amusement parks and World’s Fairs – is well documented. What is of interest here is the way the more than 225 major theme parks in the United States (as at the turn of the 21st century), and unknown numbers of others around the world, have evolved to present a new cultural intersection of religion and nature. We can identify several prominent religious possibilities for presentations of nature in contemporary theme parks.

In the 1950s, theme parks began to embody what has been called “civil religion” (Bellah 1967), central tenets of which were: capitalism, nuclear family and domesticity, scientific and technological progress (leading to utopian community living), wealth and leisure provided through national supremacy, and triumph over nature.

Themes of progress and domination of all things natural have also been prominent in a “frontier religion” common in theme parks, including such places as Disneyland and Disney World, Southern California’s Knott’s Berry Farm, and Silver Dollar City in the Missouri Ozarks. A prominent narrative in such locales as Disney’s Frontierland, Knott’s Berry’s Ghost Town, and Silver Dollar City in its entirety is the rejuvenating value of an anti-modern experience with a romanticized, simpler period of American exploration, conquest, and new settlement.

Finally, what can be called a religion of “nature celebration” has been made possible by the more recent, steady increase in the use of natural themes in park design. What Disneyland started with exotic recreations of flora and fauna has increasingly developed into a more overt role at such parks as Busch Gardens: Africa: The Dark Continent, the Sea World parks, and Disney’s Animal Kingdom. Now nature is no longer presented as mere backdrop for entertainment and practical landscape manipulation. It *is* the point (and source) of the experience.

Critics have called these parks to task in recent years for encouraging visitors to feel that their attendance amounts to environmental action since their messages are often intensely scientific and environmentally sound, focusing upon the veterinary and conservationist activities that may go on there. The parks are often built on fragile habitats and clearly encourage unsustainable consumption. Some critical scholars portray the success of nature-focused theme parks as especially problematic for their

influence on American tourist culture in general. There is concern that zoos, museums, and even national parks will be remodeled to mimic theme parks (Davis 1997; Wilson 1991).

It is one thing to say that theme parks present visitors with a particular view of nature, to worry, for instance, that Sea World's oceans, Busch Garden's African landscape, and Disney's multiple geographies narrate a particular version of nature as exhibited by each corporate interest. It is quite another thing to consider what people are *doing* with those presentations of nature. Scholars need to ask why Sea World attendees have been known to strip off their clothes and jump into the dolphin tank (an unsanctioned activity). Do they seek only to cool off? Do they simply find swimming with dolphins entertaining? Or is there a more fundamental desire for an authentic experience that has a religious dimension?

Some have argued that theme park visitors desire a particular set of experiences that in many ways can be considered sacred. Margaret J. King (1981) joined a growing scholarly focus on Disney parks, calling them the "popular culture capitals" of the country, noting that more so than Washington, D.C., families are motivated to go on a double pilgrimage to Disneyland and Walt Disney World – first as children and later with children. For King, this notion evokes community, communal experience, shared values, ritual motion, and perhaps additional traditionally religious language and imagery. This is not to say that theme parks have become traditionally religious for their visitors. Instead, visitors value community and the feeling of shared, ritual experience on a broad cultural level – rituals of a civil religion (King 1981).

Anthropologist Alexander Moore (1980) compared theme parks with traditional baroque pilgrimage centers. Though he argues that Walt Disney World's form replicates that of a pilgrimage center, behavior in the Magic Kingdom, he says, is not traditionally religious. Instead, ritualized play seems to be gaining importance over both organized religion and obligatory rituals. Theme parks are isolated and enclosed. There are ritualized barriers separating them from the outside world (e.g., private highways, toll booths, parking lots, and ticket counters). Like traditional pilgrimage centers, theme parks evoke the supernatural (with its emphasis on magic, fantasy and make-believe), or at least a mytho-heroic past. Moore discusses the cultic and symbolic dimensions of the park, arguing that going to theme parks is not only about playing but bearing witness to the metaphors they evoke and pay homage to. Increasingly, those metaphors highlight nature and its religious significance. He concludes that the social and spatial order of a place like Disney World is the genuflection – ritual motion – of mass industrial society.

Much more research is needed to explore the roles of religious experience of nature presentations in theme parks, but that audiences have transcendent experiences in theme parks is unquestioned. For example, a 33-year-old father in New Hampshire wrote to *The Unofficial Guide to Walt Disney World*,

It was on this trip that I experienced what can only be described as . . . an epiphany. I was on the ferry boat that runs between the Magic Kingdom and the TTC, waiting

for it to fill up and cast off. The rain had cooled things off comfortably, and a rainbow had formed behind the Contemporary Resort, disappearing over the rooftops of the Wilderness Lodge that poked from behind the treeline. It was beautiful, and I just felt so relaxed, peaceful and happy. I also felt a little silly – here I am, a 33-year-old guy, alone in Walt Disney World, and I’m feeling like there’s not a problem in the world. But that’s the effect this place can have on you. Sure it can be hot, crowded, muggy, and it’ll suck your wallet dry . . . but that’s a small price to pay for those moments when the “Disney Magic” takes over and all seems right with the world.

In the passage we see references to human creation: the ferry boat, the Magic Kingdom, the crowds, etc. But we see references to nature: the rain, a rainbow, the treeline. As Van Maanen (1992) pointed out, there are important cultural contrasts that intensify the meaning potential of theme park nature. Mugginess, crowds, waiting, and spending money are offset by beauty, relaxation, peace, happiness, and contentment. Religion sociologist Wade Clark Roof (1993) has argued that, increasingly, late modern Americans engage in similar quests to seek new symbols and meanings – incorporating such experiences with prior beliefs to cobble together their own belief systems. Is it possible that such popular cultural (and for profit!) corporate creations as theme parks provide at least some of the meaningful material? Are the creators and operators of these parks able successfully to present a crafted “nature” that transforms their commercial endeavors into profoundly moving, even religious, experiences for paying customers? And is it worth the cost? By positioning theme park nature as entertainment, information, and even transcendent inspiration, are we denying our own threat to its authenticity?

We can only be certain that theme parks will continue to draw visitors, providing an experience that will undoubtedly carry on a contribution to the ongoing evolution of the story of transcendent nature.

Theosophy

The modern Theosophical movement, which commenced in 1875 with the founding of the Theosophical Society by Helena P. Blavatsky, Henry Steel Olcott, and others, has had a role in the emergence of recent spiritualities of nature and ecology. The new movement was viewed by its founders as a middle way between what they perceived as the twin dogmatisms of the nineteenth century, science and theology. Theosophy represented, they believed, a path based on the profounder perspective of the “ancient wisdom,” the vision of nature and humanity held by premoderns who, to judge from those most often cited in the literature, tended broadly to be in the tradition of Vedantins, Mahayana Buddhists, and Platonists together with their neo-Platonic, Gnostic and Cabalistic progeny.

In respect to nature, nineteenth and twentieth-century Theosophy has contributed to nature spirituality insofar as it: a) presented quasi-religious images and concepts to embody the romantic view of nature as vibrant with life and meaning, both visible and invisible; b) popularized in the West monistic and pantheistic Eastern experiences of nature, humanity, and the divine; and c) expanded evolution (known best in its controversial Darwinian form at the time of the Society’s founding) to embrace all of nature, together with humanity, in immense cosmic evolutionary schemes. Such ideas are certainly not unique to Theosophy, but in the late nineteenth and early twentieth centuries Theosophists were pioneers in presenting them in popular as well as academic and literary venues. In lodge meetings, publications, and such centers as the Pt. Loma community in San Diego, started by Katherine Tingley in 1897, or Krotona, established in Hollywood in 1912 and moved to Ojai, California, in 1924, the idea of evolutionary kinship with nature deeply felt by many Theosophists took such concrete forms as vegetarianism, humanitarianism toward animals, progressive farming, and appreciation of the salutary spiritual effect of an inspiring natural environment.

The core Theosophical idea is usually said to be oneness: that the unity of all being is more fundamental than any apparent separateness and diversity. Oneness therefore overrides all dualism, whether of the One and the many, the human and the divine, consciousness and matter, or humanity and nature. A corollary of this perspective is the assumption that consciousness, though perhaps in rudimentary or radically nonhuman form, is found consistently throughout all levels of the universe. Some modern Theosophists (as well as some scientists) have seen evidence of universal consciousness underlying matter in the phenomena described in quantum theory.

Recent Theosophical writers and teachers like Joy Mills, Shirley Nicholson, Amit Goswami, and Ravi Ravindra have emphasized the congruity of the Theosophical world-

view with what seems to be emerging on the frontiers of physics and cosmology, especially as interpreted by such sympathetic writers as David Bohm, Rupert Sheldrake, Ken Wilber, and Gary Zukov. The Theosophical stress on oneness, the consistent interaction of consciousness and matter, and the coexistence of many planes or dimensions are particularly mentioned. Out of such conceptions has come a recent Theosophical environmental ethic like that of Shirley Nicholson in *Ancient Wisdom, Modern Insight*, particularly Chapter 3, “Holism and

Hierarchy.” Nicholson here views nature as a series of increasingly large “interlocking wholes,” in which a prime imperative in any ethical choice involving nature – as do nearly all choices, ultimately – is taking into account its “reverberations” up and down the interlinked system.

Theosophy regards nature as alive, conscious on various levels, continuous with humanity both immanently and in evolutionary process, and so legitimately entitled to personification. Theosophical writers like Blavatsky, Annie Besant, C.W. Leadbeater, and Geoffrey Hodson, have not hesitated to personify powers of nature with names generally derived from venerable mythologies regarded as vehicles of the Ancient Wisdom. Out of theosophy’s classic texts emerge creative Dhyani Chohans (cosmic buddhas or, in Western parlance, archangels), Sanat Kumara the world-spirit and Kwanyin or Mary as world-mother, devas who serve as guardians of particular places or phenomena of nature, on down to “elementals” and the elves or dryads of garden and field. Some of these identifications have become more and more commonplace as part of the New Age attempt at reenchancement of the world through recovery of enlivening perceptions of nature recalled from childhood or folklore. As Leadbeater put it, “It is one of the most beautiful characteristics of Theosophy that it gives back to people in a more rational form everything which was really useful and helpful to them in the religions which they have outgrown” (Leadbeater 1928: 1).

In both the personification of natural entities and its efforts toward reconciling science and spirituality, Theosophy’s distinctive attitude toward nature has had an impact on recent nature spirituality generally.

Theosophy and Ecofeminism

The international Theosophical movement founded by Helena Petrovna Blavatsky in the 1870s has kept alive in the West the ancient belief that meaningful relationships can occur between human beings and other animals and plants. Some ecofeminisms posit a special bond between women and nature other than that based on shared or interdependent patriarchal oppression; while many ecofeminists celebrate the special connections between women and nonhuman nature. Ecofeminism and feminist spirituality have, however, lacked compelling cosmologies, whereas the core Theosophical idea is of a cosmos permeated by energetic relations that manifest themselves as different forms of consciousness. Theosophy, on the other hand, has not been interested in the question of under what conditions one gender is better able than another to have special relationships with animals or plants or places. Ecofeminism and feminist spirituality, however, have had this concern.

Connecting Theosophy and ecofeminism is the pioneering work done by women Theosophical leaders to restore ecological health to the movement's various communities. Madame Blavatsky's famous garden in England; what historian Emmett Greenwalt has called Katherine Tingley's "agricultural Eden" at Point Loma, California; and the grounds at the Theosophical Society's international headquarters at Adyar, India in which Annie Besant took considerable interest, were all early twentieth-century efforts to infuse ecology with concepts from Theosophy's cosmology. Findhorn, Scotland, and Perelandra, Virginia, are related recent examples of communities sustained largely, although not exclusively, by communication between women and nonhuman nature (by Eileen Caddy and Dorothy Maclean and by Machaelle Small Wright, respectively).

Thoreau, Henry David (1817–1862)

Henry David Thoreau was an author, naturalist and leading member of the nineteenth-century literary, social and religious movement that came to be known as Transcendentalism. Thoreau is best remembered for his two-year venture in “living deliberately” on the shores of Walden Pond in his hometown of Concord, Massachusetts from 4 July 1845 to 6 September 1847, an experiment which led to the publication of *Walden* in 1854. Though few of his writings were widely known at mid-century, his work became increasingly sought after in the late nineteenth and twentieth centuries. His other well-known published writings include: *A Week on the Concord and Merrimack Rivers* (1849), *Cape Cod* (1865) and *The Maine Woods* (1864).

Even in his own time, local responses to Thoreau’s experiment at Walden helped to shape two competing portraits of Thoreau that have persisted into the present: Thoreau as “wilderness man” *par excellence*, living self-sufficiently in the wild woods and, to a lesser extent, Thoreau as hypocritical crank, grinding his literary ax to chop at society and its conventions, while regularly going into town and dipping into the maternal cookie jar. While both of these portraits contain some truths, they are caricatures of a man and his work that often miss the complexity of his vision and the multifaceted dimensions of his legacy.

Thoreau’s sojourn at Walden was never intended to be an attempt at perfect self-sufficiency or wilderness living. In terms of setting alone, Thoreau’s retreat to Walden cannot be considered a wilderness venture, as Concord in the mid-nineteenth century had been a settled village for two centuries. Thoreau’s purpose in going to Walden should be understood as practical, spiritual and symbolic, none of which demanded a lifelong retreat to the woods or absolute purity in his practice of self-reliance.

Practically, Thoreau sought a means of making a living which would preserve the time he desired in order to cultivate his craft as a writer, while maintaining a mode of life that permitted generous swaths of time for outdoor walks, leisure and meticulous nature study. The retreat to Walden was, at a fundamental level, a first step in solving the practical problem of livelihood that all writers face.

The spiritual dimensions of Thoreau’s decision were tied to the practical impetus behind his choice, but also went beyond them. While Thoreau sought to reduce his needs (of food, clothing, shelter and leisure) to a minimum in order to maximize time to write, this pursuit of simplicity was itself a form of spiritual practice. With Emerson and other New England Transcendentalists, Thoreau subscribed to principles of plain living: a simple, often vegetarian diet; avoidance of tea, coffee and alcohol; regular

excursions in the fresh air, frequent intellectual interchange and a complementary pursuit of solitary contemplation. All of these practices were understood to be means of cultivating the self and, more particularly, “Reason” (knowledge through intuition) and imagination. In addition, Thoreau (like other Transcendentalists) assumed that nature had particular lessons to teach and that simple, “natural” ways of living would help to cultivate his moral sense. The spiritual practice of “selfculture” (which began when the young Thoreau changed his name from David Henry to Henry David) was an essential aspect of the retreat to Walden.

The experiment at Walden was also intended to resonate symbolically, both in Concord and beyond. While living at Walden enabled Thoreau to develop inwardly (to learn about himself in a natural context, to practice his craft as a writer, and also to grieve the early death of his brother), his life at Walden was also intended to be an outwardly directed comment about (and against) prevailing social norms. While he farmed beans for part of his livelihood, he denigrated the commercial aspects of farming and praised instead the educational and spiritual benefits of tilling the soil. While he made trips to the village almost daily, Thoreau constantly criticized village life, particularly the idle conversation and status-seeking mores he felt dominated the town.

Although he cultivated a sometimes biting and misanthropic persona in his texts, Thoreau’s reputation as a misanthrope is inaccurate. Thoreau was no hermit. He enjoyed frequent visitors from among family, friends and laborers near the pond and went into town frequently, especially in the winter months when he supported himself with odd jobs as a handyman and surveyor. During his time at Walden, he maintained an active correspondence, regularly attended lectures and often appeared at gatherings at the homes of Ralph Waldo Emerson, Bronson Alcott and other Concord friends. Through the symbolic act of withdrawing to the woods, Thoreau intended not to recommend such a withdrawal for everyone, but rather to symbolize through deed (and then word) the virtues of independent thought and action, rather than behaving in line with social convention.

Walden (1854) is Thoreau’s most celebrated text, a carefully crafted manuscript that went through eight drafts before publication. Thoreau’s ambitious reworking of the material from his journals included the adoption of a seasonal structure (summer to spring) and the collapsing of two actual years into a single narrative one, a model nature writers have followed to this day. The text stands as the most complex fusion of his post-Christian, Transcendentalist religious orientation with his detailed and scientifically informed observation of a particular natural surround. *A Week on the Concord and Merrimack Rivers* (1849), which preceded *Walden* (and was a publishing failure) is more obviously metaphorical. While a travel narrative in some respects, it is interspersed with philosophical departures, essays, poems and fragments from

Thoreau’s reading, while also intending to serve as an elegy to his brother, John. Throughout the text, attention to natural detail appears and recedes, but ultimately takes a back seat to Transcendentalist philosophy and the workings of Thoreau’s young

literary and religious imagination. Thoreau's late writings lean in the other direction, his unpublished manuscripts on seed dispersion and the development of flora in Concord (recently collected and published posthumously as *Faith in a Seed* [1993] and *Wild Fruits* [1999]) contain still accurate and scientifically useful documentation of the growth, development and distribution of plants in New England.

When traced through the corpus of his writing, Thoreau's view of nature is clearly a dynamic one, shifting and changing in response to Thoreau's own growth as a writer and his synthesis of naturalistic observations accumulated over the years. In general terms, Thoreau's interpretive stance toward nature is a view shaped by his European and New England, Protestant heritage, yet defying easy categorization. It is neither Christian, nor secular; neither wholly scientific, nor traditionally religious. With the European Romantics, and older Transcendentalists, Thoreau saw nature as something other than simply God's creation (the traditional Christian view and one that was itself comparatively neglected by Christians of his day, who placed more emphasis on personal salvation).

Thoreau was a lifelong critic of the Church, even the liberal Unitarian church attended by the majority of his family. His vision of nature was pursued outside the boundaries of both Christian orthodoxy and liberalism and his contemporaries therefore often criticized his writing (or expurgated it) because of its "paganistic" tendencies. Even Thoreau's Aunt Maria worried that portions of *A Week* sounded like "blasphemy" both because of Thoreau's approving nods toward Buddhism and Hinduism, as well as his claims that the divine could be found *within* both nature and humanity. While *Walden* was a comparative success, the same kinds of criticisms came from more theologically conservative circles, who praised the examples of detailed "nature study" in the text, but not the more radical philosophical and religious themes.

Thoreau's approach to the natural world was particularly informed by his reading of the Romantics, who saw nature as the ultimate source of insight and a means of return to childhood innocence untainted by "civilization's" expectations and failings. Thoreau's sense of ethics and aesthetics emerged from the Romantic (and later, Transcendentalist) presumption that nature is the ideal teacher. His purpose was to cultivate himself, in return, as an ideal pupil. Yet such an embrace of nature was not wholly positive, nor was his construction of nature exclusively beneficent, though it was prevalently so. The "Higher Laws" section of *Walden* show a Thoreau who is sometimes ill at ease with the unseemly, violent, or lowly aspects of nature (including his own body) and reveal a typical Transcendentalist and post-Christian preoccupation with purity: nature in her ideal, good and "higher" aspect. His writings of travels in the Maine woods also display an unexpected fear of the wilderness in its most rugged form. Overall, however, nature is a source of goodness and a model for humanity in Thoreau's view.

Nature occupied a space in Thoreau's imagination that his Christian neighbors reserved for God. Thoreau enjoyed needling others with this unorthodox, but increasingly popular, approach, commenting toward the end of his life that "a snowstorm was more

to him than Christ” (Harding 1965: 464). Thoreau was also influenced by the newly (and sometimes inaccurately) translated Eastern religious and philosophical texts becoming available in America, which gave testimony to the sacredness of particular aspects of the physical world (mountains, rivers, etc.) Thoreau welcomed the *Vedas*, *The Laws of Manu* and purported sayings of the Buddha into his literary repertoire (using them often to support his own Transcendentalist assertions) and argued for the equal legitimacy of the religions of the world. In addition, he drew deeply – though perhaps less consciously – on a broader legacy of Christian and especially Protestant, New England interpretations of nature as a book to be read, the so-called “Book of Nature.” While leaving Christian theology behind, Thoreau retained the Christian – and particularly, American – legacy of finding in nature lessons and morals for leading an ethical life. While rejecting traditional Christian typology, Thoreau maintained a “typological stance” toward nature, seeing lessons for humanity in battles between ants, the lure of the woodchuck and the play of the loon.

Thoreau’s daily practice of attentiveness toward nature, however, enabled him to go beyond a “reading” of nature only for moral and spiritual guidance. His daily walks became a means for gathering precise naturalistic data within the limited boundaries of a particular watershed over several decades, an invaluable contribution – before its time – that leaves us with a thick ecological portrait of a particular bioregion. His “amateur” conclusions regarding the succession of trees, his identification of rare plants and his innovations in everything from pencil-making to predicting ways to lengthen the cranberry harvest were all discoveries that were independently supported or produced by professionals in later years.

While Thoreau’s Transcendentalism always led him to see “more” in nature than a scientist would discern, his unflinching curiosity and rigorous record-keeping also helped him to become a self-taught naturalist and to establish literary naturalism as an American genre. More than any other Transcendentalist, Thoreau wove together contemporary scientific knowledge and liberal, post-Christian interpretations of nature’s symbolic capacity. On the other hand, Thoreau’s criticism of Christian institutions, his insistence on seeing the divine *in* nature (and in the self) and his respect for other religious traditions of the world opened his writing up to charges of paganism and pantheism that persist in conservative, evangelical circles. Yet a close reading of Thoreau’s work clearly reveals its intellectual and spiritual debt to New England Protestantism. His thinking and writing is “post-Christian” more than it is anti-Christian, pantheistic or pagan. Like Emerson, but going beyond him, Thoreau knitted together a Protestant heritage, a philosophical interest in idealism and a passion for observation and study of natural phenomena in the field.

Today, Thoreau’s legacy is less felt in religious circles than it is in environmental ones. Hand in hand with the growth of the environmental movement from the 1960s forward has been an ever-increasing enthusiasm for Thoreau’s work, though few read more than portions of *Walden*. Thoreau’s relative self-sufficiency, his concerns about the marketplace and emerging capitalism, and his view of nature as a beneficent source

of spiritual transformation all contributed to the dominant themes of contemporary environmentalism: a growing interest in simple, sustainable living, a critique of consumer culture and a view of nature as the source for personal (often spiritual) renewal.

Though prone to misrepresentation, Thoreau's writing and his example continue to speak to both religious and non-religious audiences, to scientists and to humanists, to those who read nature symbolically and to those who simply admire the vast records of this "self-appointed inspector" of snowstorms.

Tibet and Central Asia

The Tibetan form of Buddhism is the dominant religious system throughout the Tibetan plateau, and is also widespread in surrounding areas, particularly Mongolia, northern Nepal, Bhutan, areas of Central Asia and Russia, and the northern Indian regions of Sikkim and Ladakh. Buddhism was first introduced to Tibet during the early dynastic period from the seventh to ninth centuries. Following the demise of the Yarlung dynasty (so called because its power base was the Yarlung Valley of central Tibet), Buddhism's influence declined until it was reintroduced in the twelfth century. In the following centuries it became increasingly popular throughout the Tibetan plateau as well as neighboring states.

The main sources of Tibetan Buddhism were the great north Indian monastic universities and charismatic Tantric lineages that were centered in Bengal and Bihar. The Buddhism of the monastic universities emphasized scholasticism along with meditative practice, and the Tantric lineages taught a more meditation-oriented form of practice based on visualization and ritual practices. The present-day forms of Tibetan Buddhism are mainly derived from these two sources.

From the mid-seventeenth century until 1959, Tibet was ruled by the Dalai Lamas or their regents. The Dalai Lamas are believed to be physical manifestations of the Buddha Avalokiteśvara (Tibetan: Chenrezi), and the present one, Tenzin Gyatso (b. 1935), is the fourteenth incarnation. In 1950 China invaded and annexed Tibet, and in 1959, following an abortive popular uprising against Chinese rule, he fled to India, where he established a government-in-exile headquartered in Dharamsala in the north Indian state of Himachal Pradesh.

In many ways, Buddhism might seem to be an unpromising religion for someone seeking conceptual resources for an environmental ethic. According to Buddhist doctrine, all sentient beings are reborn over and over as a result of their actions (*karma*), and the world is conceived as a place of suffering. The ultimate goal of Buddhist practice is liberation from the world and the cycle of rebirth, and cyclic existence is conceived as irredeemably unsatisfactory. There is no way to fix it up and make it bearable, but despite these attitudes, Buddhists have traditionally asserted the importance of avoiding harm to the environment. In the Indian text Dhammapada, for example, one of the distinguishing features of an awakened being (buddha) is that he or she avoids harming plants and animals and lives in harmony with the surrounding environment.

In recent decades, a number of Tibetan Buddhist thinkers have developed a Buddhist approach to environmentalism based on the doctrine of interdependence (*pratitya-*

samutpada), which holds that all things come into being in dependence upon causes and conditions and change in every moment as a result of causes and conditions. The world is conceived as an infinitely complex causal network in which each individual part acts on all other parts while simultaneously being influenced by its surrounding environment. These notions are connected with the Buddhist doctrine of no-self (*anatman*), which holds that there is no enduring “self” or “soul” and that living beings are instead individual continuums composed of various constituent elements that are changing with every moment. This process operates in intimate connection with the surrounding environment, and there is said to be no real dividing line between oneself and the world. Thus, concern for oneself naturally extends to concern for the environment. The fourteenth Dalai Lama has become one of the leading proponents of this idea, and he claims that prior to the Chinese invasion Tibetans did in fact live in harmony with the environment.

Some contemporary commentators dismiss this idea, claiming that prior to the mid-twentieth century Tibet was an agrarian society in which most people subsisted on low-technology agriculture and animal husbandry. Prior to the Chinese invasion, the utilization of biomass was closely related to the physical conditions of Tibet, which had a stable population and little change in agricultural or animal husbandry techniques for centuries. Furthermore, in vast areas of the Tibetan plateau the poor soil and sparse vegetation required that people avoid overgrazing and overfarming. Most of what people consumed came directly from the Earth, and their waste products were mainly biodegradable and were returned to the environment. Thus the fact that they maintained a sustainable approach to the environment was non-reflective and merely a direct result of their technological backwardness and the physical limitations of their environment.

There is some merit to this idea, and it is doubtful that most Tibetans had (or have) a consciously articulated environmental ethic that guided their approach to the environment, but there were also significant conceptual factors influencing the Tibetan approach to the natural world. In addition to Buddhist doctrines of nonviolence and interdependence, there were also pre-Buddhist animistic ideas about the Tibetan plateau, which was seen as the abode of innumerable forces that owned the land. Among these were the *sadak* (“lords of the Earth”), and *lu* (water spirits), which respectively guarded the soil and water. Ethnographic studies of contemporary Tibetans have demonstrated that belief in these natural forces is widespread and that Tibetans commonly assert that people who cause harm to the environment draw the wrath of these beings, who can cause great harm to humans. Any building or construction is commonly preceded by a ceremony that asks their permission, and great care is taken to avoid angering them by causing unnecessary damage to the Earth. In addition, mining was almost unknown in Tibet, because it was thought that digging up the Earth to extract resources was effectively robbing the “lords of the Earth,” who would inflict punishment on the offenders.

Similarly, polluting water causes the *lu* to harm offenders, and prior to the Chinese takeover, Tibet's rivers and lakes had some of the most unpolluted water in the world. In addition, exile Tibetans often point with pride to the fact that hunting was outlawed by the fifth Dalai Lama in 1642. According to his official decree, all birds, fish, and non-predatory animals were protected by law. Since at least that time, Tibetans have generally avoided killing wild animals and fishing for sport, and travelers in Tibet prior to the Chinese invasion often remarked at the large herds of grazing antelopes, wild ass, and deer that were found throughout the region. Moreover, because Tibetans generally avoided cutting down trees there were extensive old-growth forests in the lower regions of the Tibetan plateau.

Although environmental concern has become an important theme in publications by the Tibetan government-in-exile, there is little evidence of this concern prior to the mid-1980s, when the Dalai Lama first began articulating the notion that Tibetans have for centuries consciously protected the environment. The first exile government statements on the environment followed the publication of reports of widespread environmental damage to the Tibetan plateau by the Chinese, and the exiles' environmental awakening was at least partly reflexive and political. Particularly during the chaotic period of the Cultural Revolution (1966–1976), when marginal land was taken over for agriculture and forests were clear-cut, many animal species were hunted to extinction, and significant

– and in many cases probably irreversible – damage was done to Tibet's fragile ecosystem. Thus the exile government's newly pro-environment stance was part of a larger polemical attack on China's annexation of their country and its subsequent record in administering it.

Several commentators have also noted that even the language used in Tibetan publications on the environment indicates that conscious concern with environmental issues is part of the discourse of modernism, in which Tibetans and other indigenous people have been constructed as “naturally green” by Westerners seeking to construct an idealized primitive “other” whose practices implicitly critique those of technologically advanced societies. It should also be noted that much of the vocabulary used in Tibetan exile publications on the environment is derived not from Buddhist doctrine but instead employs contemporary Western notions and language. The “greening” of Tibet and Tibetan Buddhism is also connected with the discourse of Buddhist modernism, which portrays Buddhism as essentially “rational” and “scientific” and represents Buddhism as the conceptual basis of social movements like environmentalism, human rights activism, social reform, and feminism.

There is no reason to believe that the widespread influence of Buddhism contributed significantly to the general practice of sustainable agriculture and animal husbandry in Tibet, nor that the exile government's pronouncements and publications on the environment have significantly affected either attitudes or practices toward the environment. These publications are the work of a small, educated elite, and the massive accumulation of garbage along the roadways of Dharamsala – along with the common

practices of spitting, urinating, and defecating into public water supplies – is ample demonstration of this. It should be noted, however, that although Tibetans have only recently begun to articulate environmental concerns, and the leading figures are a small elite group, there is some evidence that their message is gaining ground at least among the Tibetan exile community, and there have been several grassroots campaigns to clean up their environment in recent years.

Tikkun Olam – A Jewish Imperative

At a time when there are almost daily reports about disturbing developments – global climate change; the destruction of tropical rainforests, coral reefs, and other habitats; soil erosion and depletion; air, water, and land pollution; desertification; droughts, severe storms; widening water shortages; and other threats – it is essential that Jews engage in *tikkun olam*, the mandate to repair, heal, and transform the world.

One of the main reasons that the world faces so many critical problems is that there are sharp deviations between its values and methods and basic Jewish teachings. Among the many Jewish teachings that should be applied as part of *tikkun olam* are the following:

- “The Earth is the Lord’s and the fullness thereof ” (Ps. 24:1) – we are to be partners and co-workers with God in protecting the environment (Talmud: *Shabbat* 10a).

- *Bal tashchit* – based on a torah teaching that we are not to destroy fruit-bearing trees, even in times of war (Deut. 20:19–20), the talmudic sages made a general ruling that we are not to waste or unnecessarily destroy anything of value.

- We are to imitate God in his attributes of compassion, justice, and mercy (Talmud: *Sotah* 14a) – since God is concerned about the Earth and its creatures, we should be as well.

- We are to “work the land and to guard it” (Gen. 2:15) This Torah teaching indicates that the dominion that people are given is not one of domination, but rather of responsible stewardship.

- “Justice, justice shall you pursue” (Deut. 16:20) The repetition of the word “justice” indicates that we are to practice justice, whether to our profit or loss, in word and action, and to Jew and non-Jew (Hertz 1957: 820).

As co-workers with God, charged with the task of being a light unto the nations and accomplishing *tikkun olam*, it is essential that Jews apply these and other teachings to the struggles to reduce pollution and the wasteful use of natural resources. We must proclaim that it is contrary to religious values to pollute the air and water, to slash and burn forests, and to wantonly destroy the abundant resources that God has so generously provided.

To reduce potential threats to the world, we must adopt simpler lifestyles. Religious institutions, schools, and private and governmental organizations must all play a role. We must redirect some of our industrial capacity toward recycling, solar energy, and

mass transit. We must design products for long-term durability and ease of repair. We must revise our agricultural and industrial methods so that they are less wasteful of resources and energy. Perhaps there should be a Presidential Commission appointed solely to consider how we can stop being such a wasteful society.

We should make *tikkun olam* a major focus of our synagogues, Jewish schools, and other Jewish groups and institutions in order to help move our precious planet to a path that is more just, humane, and sustainable. Changing will not be easy, since our society and economy are based on consumption and convenience, using and discarding. But it is essential that we make supreme efforts, for the survival of humanity may be at stake.

Toland, John (1670–1722)

Historians describe John Toland as a multifaceted man – a philosopher, a writer, a linguist, a polemicist, a diplomat, a biblical scholar, a deist, and ultimately a proponent of pantheism. Lexicographers credit Toland with the first English-language usage of the term pantheist.

Born near Londonderry, Ireland on 30 November 1670, and christened in the Catholic Church, Toland converted to Protestantism around age 15. Subsequent higher education and an inquiring mind led him to extensive questioning of accepted religious doctrines. Toland acquired a degree from the University of Edinburgh in 1690, and studied further in England, Germany, and Holland.

A friend described Toland as “a free-spirited, ingenious man” (in Berman 1997: 223). But his unorthodox views forced him to move from place to place to avoid prosecution, and made it hard to earn a living. Toland penned political pamphlets and biographies for aristocratic patrons. He wrote prolifically on a wide range of subjects, including religious tolerance and civil liberty.

A large bibliography lists almost two hundred works authored or ascribed to him. He claimed to know ten languages and often published anonymously or in a foreign tongue to keep critics at bay. An important early book, *Christianity Not Mysterious*, provoked controversy because it claimed that human reason could explain biblical mysteries. Clerics burned the book and one official requested, “that Mr. Toland himself should be burnt” (in Berman 1997: 226). But Toland’s work garnered fame as well as fusillades. He discussed philosophy with notables like the German thinker Wilhelm von Leibniz, and the Queen of Prussia, Sophia Charlotte.

Despite ill health and financial woes, Toland remained productive to the end of his life. He wrote *Physic without Physicians* shortly before he died, decrying his doctor’s inept treatment: “They learn their Art at the hazard of our lives, and make experiments by our deaths” (Toland in Mossner 1967: 141). Toland’s self-written epitaph concluded, “If you would know more of him Search his Writings” (in Berman 1997: 229).

A book Toland wrote in 1705 entitled *Socinianism truly stated . . . recommended by a Pantheist to an orthodox friend* contains the first known use of the term “pantheist” in an English-language publication. (Earlier, in 1697, Cambridge mathematician Joseph Raphson coined the words “pantheist” and “pantheism” in a theological work written in Latin; Toland had read and commented upon Raphson’s book). In 1709, a Toland critic named J. Fay used the term “pantheism” in English, and both terms quickly became common. Toland’s use of the term appears to derive from the pantheization of

his religious outlook, as reflected in his later works, although some scholars question his committal to any particular religion.

Toland had previously expressed pantheistic theory in *Clito* (1700) and in *Letters to Serena* (1704), but had not employed the term. He thought “All things were full of God,” and pronounced that “The sun is my father, the Earth my mother, the world is my brother and all men are my family” (members.aol.com/pantheism0/toland.htm).

The Roman materialist Lucritius and especially the Italian philosopher Giordano Bruno (martyred for his pantheistic beliefs in 1600) greatly influenced Toland’s perspective.

Toland detailed his own pantheism in *Pantheisticon: sive Formula celebrandae Sodalitatis Socraticae/ Pantheisticon: or, the Form of Celebrating the Socratic Society* (1720, anonymous English translation, 1751). He believed in a boundless universe. He visualized the unity of all matter and the ceaseless motion of atoms. He spurned personal immortality yet averred that “Nothing dies totally, the death of one thing brings the birth of another, by a universally reciprocal exchange, and everything contributes necessarily to the preservation and welfare of the Whole” (members.aol.com/pantheism0/toland.htm).

John Toland had a significant impact on his generation during the Age of Enlightenment. And he brought the concept of pantheism as well as the word “pantheist” into wider circulation, a term now commonly used by philosophers, theologians, and nature religionists throughout the world.

Tolstoy Farm

Huw “Piper” Williams was a peace activist who founded an open-land community on some of his family’s farm property in eastern Washington State in 1963, seeking to promote a Christian lifestyle of simplicity, self-reliance, and cooperation. His inspiration came from some of the religious essays of Tolstoy and from the nonviolent philosophy and activism of Gandhi. Friends from the peace movement and the Catholic Worker movement soon joined him. The sole rule at Tolstoy Farm was that no one could be asked to leave, which meant that all differences would have to be worked out directly and peacefully.

The poverty at Tolstoy in its early years was striking, with dozens of residents trying to eke out survival with antiquated farm equipment and a cash income of only a few dollars per person per month. Over time, however, the community managed to acquire 240 acres of land in two tracts and, as the counterculture became more popular and Tolstoy’s reputation spread, it attracted large numbers of visitors, some of whom stayed and built their own houses. The farm’s lack of rules meant that social life tended to consist of a rather freewheeling anarchy. Williams, who eventually married and had children, finally left and later founded another organic, self-sufficient farming community, Earth Cycle Farm, 25 miles away. Tolstoy endured, however, becoming more stable as the permanent residents improved their homes (some have installed off-the-grid power systems) and continued to strive for rural selfsufficiency. In recent years, many members have embraced Earth-centered religions, holding an annual allnight Corn Dance, full moon rituals, and community sweats. In 2000, Tolstoy reported about fifty members.

Torres Strait Islanders (Australia)

Torres Strait Islanders, who are, with Aborigines, one of two peoples indigenous to Australia, are grounded in continuous exchanges between people, kin groups, and the natural and numinous worlds. Of the 100 or so islands strewn over the 150km-wide, 10–15-meter-deep seas that lie between the Western Province of Papua New Guinea and the Cape York tip of the Australian mainland, 16 support communities. The current geography of Torres Strait has been in existence since approximately 6500 BP. Islander society is generally regarded as Melanesian, particularly on the northern islands, although those living in the southwest of the Strait share cultural characteristics with Cape York Aborigines. While Torres Strait Islanders originate in the Strait, over 80 percent of people who identify as Islanders in Australia (around 29,000), are resident on the Australian mainland where they cherish their island of origin, family history, totemic, wind and star affiliations. The enduring attachment of Islanders to their land was made evident in the historical Murray Island Land Case of 1992, the most significant legal acknowledgement of indigenous rights and interests in Australia. The High Court of Australia recognized the Meriam peoples ownership, occupation and possession of their Mer (Murray Island) land, overturning the concept of *terra nullius* (land belonging to no one) that had guided Australian courts and governments on questions of indigenous rights to their lands since settlement in 1788.

Torres Strait Islanders were traditionally a maritime people who combined small-scale agriculture (growing yams, taro, cassava, sweet potato, bananas and coconuts) with marine and land foraging to meet their subsistence needs. By the turn of the twentieth century colonization had impacted on the elaborate horticultural and marine rituals that ensured the continuation of the seasonal calendar and increased the produce of the sea and land. Despite colonization a great deal of the worldview that encompassed these rituals continues to inform the experience of Islanders today. Religious rituals were transitional points that substantiated relations of responsibility and care between Islanders, the natural and the numinous. Thus, the ceremonial display and feasting of harvested yams publicly expressed appropriate uses of land through an exchange of energies between gardeners and soil resulting in the yield and the recognition of various social relationships by sharing the produce through a feast. The numinous dimension resided in a complex interaction between moral behavior, environmental care, and environmental behavior. In a worldview that understands the environment to express the actions of the people to which it is related, including Ancestors, uses of land through gardening and the sea through fishing or marine hunting (turtle and dugong [sea cow]) are relationships of nurturance and responsibility.

On the island of Mabuiag, it is said that a person is constantly connected to key sites in their family and clan lands through an imperceptible umbilical link. The smell of a person who has tended a food garden is recognized by plants in that garden and quickens their growth. Prosperous gardeners, healthy bodies and the plentiful provision of foodstuffs reflect a mutually constituting exchange and resource ceremonies gave regular public expression to these relationships. In contrast a person who does not care for the places they attain responsibility for, which can simultaneously include reefs, foreshores, cays, rivers, waterholes, stars, winds and lands, either through lack of visitation and resource use or morally objectionable behavior, can have an adverse effect on these locations and social relationships that are integral to relationships of place.

While colonialism has had great impact on Islander society, the rich cultural meanings and beliefs that inspired lapsed horticultural and marine ceremonies continued or transformed to emerge in new forms. The display of garden produce found a place in the church calendar of the Anglican (Episcopalian) church for roughly the first half of the twentieth century as Torres Strait Islanders gathered harvests and piled them for show on important days of yearly church commemoration. Harvests are no longer publicly displayed through the religious calendar, but prestige is still accorded to men who provide turtle, dugong and ceremonial yams of long length and succulence, and to women who provide crabs and fish for church-based feasts. Also, the migration of many Islanders away from their traditional places of residence in the last half-century has led to the development of new relationships of care that transcend the inability to be present and active at particular places. Islanders maintain these connections by reciting memories, creating songs and dances that evoke significant associations to land and sea, and writing genealogies, seasonal and cosmological information, and agricultural and marine practices in family-owned manuscripts. These compositions sustain relationships to place by recording and making available the intricate connections between people, place and the numinous to family members physically separated from their terrestrial and marine territories.

The sea and landscapes of Torres Strait are permeated with individual, collective and cosmological histories in which personal experience and movement has constant reference to Ancestral activities and totemic affiliations. The mythical narratives in which Ancestral Beings construct the sacred geography of the region (*adhiad*) provide an important schema for relating individual identity, relationships to place and relationships between peoples and groups. Alongside mythical narratives of Ancestors who rarely participate in daily affairs exist active family-oriented Ancestral Beings that share responsibility for the nurturance of territories particular to their family or clan group. On the island of Saibai the identification of people with their terrestrial territories is given fullest expression through relationships with family Ancestral Beings called *muruyg*, who take the shape of snakes. *Muruyg* are recognized as being high-status Ancestors who have gardened at a particular area as humans and have over a long period of time transformed into snakes with special powers. Their presence around

garden beds that they were associated with in human life is propitious for cultivated crops and if a fire has devastated a garden they help bring it back to good health. They also act in a protective manner for their descendants' lands and sometimes extend the range of their activities to include monitoring other lands within a clan estate.

At present, Islanders in the Strait face significant issues of environmental care. High levels of trace metals in marine biota, some of which may originate in the Ok Tedi outflow (located in the headwaters of the Ok Tedi, a tributary of the Fly River) may render some marine foods inedible for Islanders. Also, Islanders are unable to support the high cost of licenses and infrastructure needed to take advantage of lucrative local commercial fisheries.

Accessing the wealth from this industry would help establish independent economic security, resource management and sustainability and continue long-established affinities to the marine environment.

Totemic Practices in Borgu (West Africa)

Borgu straddles present-day Republic of Benin and Nigeria in West Africa. Before its partition by the British and the French in 1898, Borgu covered a vast expanse of land, stretching from the Atakora mountains in the west to the River Niger in the east, with three main kingdoms (Bussa, Illo, and Nikki) and several chiefdoms. The major towns included Bussa, Illo, Kaiama, and Nikki. The Borgu people spoke several languages, but the major ones were Batonu and Boko. In spite of the partition and linguistic differences, the people practised similar religious belief systems. Before the penetration of Islam and Christianity, the Borgu people associated religion with nature by worshipping the sun, moon, rocks, and rivers. They demonstrated the intersection of nature and religion by venerating animal, reptile, bird, and plant totems. Thus, the forces of nature brought spiritual attraction.

A British colonial officer described Borgu religion as “a fumble of superstitions, with strong indications of totemism,” but this religious belief system was not unique to the Borgu society because the veneration of natural phenomena was a common concept in West Africa. A mystic relationship existed between an individual or clan and an animal, bird, or plant totem whereby the totem could not be killed or eaten. This practice was common among individuals of both sexes and clans. The people believed in the existence of spirits who were invoked or appeased by particular rites. In the Batonu language, totems are referred to as *shesheru*.

The most prominent animal totems were the leopard and the red antelope but others included the weaverbird, monitor lizard, rabbit, and crab. Reptiles, such as the python and cobra were also revered. Mostly, the sacred animals and birds were from non-domestic species because as hunters the people related more to animals in the bush than domestic ones.

The leopard, known as *musuku* or *musu*, was a royal animal totem of Mora and Kenu clans. Members of the Mako, Sawe, Yari-Ateuwa, and Yo clans, who were mostly farmers and hunters, adopted the leopard as a totem. The spiritual relationship has been explained in the tradition, which claims that the leopard embodied the soul of their ancestors. A live leopard was accorded respect in human fashion, but if found dead, members of the clans would bury it with two cowries and mourn it seven days. Sacrifices of appeasement were often offered and the adherents of the totem believed

that the leopard usually ate up the food that was put at a shrine located within the courtyard of the palaces.

As hunters, the people believed that if they were lost in the bush, the leopard would lead them back to the town safely. If somebody accidentally killed a leopard, a propitiatory sacrifice would be offered. Failure to perform the sacrifice would evoke the leopard's wrath in form of widespread sickness among the clan members. The Mako clan referred to the leopard as "father," which accentuates the close relationship between the animal and the people. A surviving oral tradition indicated that a leopard protected the clan ancestors by attacking and killing their enemies during a battle. Hence, in appreciation of the animal, the ancestors gave great respect to the leopard and preserved the act of revering it in their clan tradition and history.

The veneration of the leopard in Borgu was closely related to that of the Jukun (Kwararafa) and the Nupe in central Nigeria. The Kisra legend, which was popular among many West African societies, referred to Kisra as the founder of the dynasties of the Borgu, Hausa, Jukun, Nupe, and Yoruba polities. The familial relationship has been supported by the similarity in the treatment of dead leopards among the Jukun and Borgu peoples. If a Wukari Jukun killed a leopard, he would parade the dead animal around the town mounted on a mat. The people would salute the animal with uplifted arms as they would a chief. However, the slayer was required to perform propitiatory rites and three days' solitude in the bush. To kill a leopard among the Igara of Nupe was tantamount to committing an offence against the living and dead chiefs. A dead leopard was often brought to the chief, dressed up in white, and carried around the town with singing and beating of drums. The royal mausoleum of the Ata (the king) of Nupe was known as "The Grave of the Leopard."

The *gbero* (red antelope) was the animal totem of several clans, such as the Bare, Kabo, Kpai, Kpasi, Mako, Mora, Mori, Sawe, Yari-Ateuwa, and Yo clans. These clans may have had a common ancestry or they migrated from the same place. While on a hunting expedition, an ancestor of the Mora clan entered the warren of an animal to rest, but he could not find his way out. Fortuitously, a *gbero* made a hole through which the ancestor came out. As an expression of gratitude, the ancestor declared the *gbero* a totem for members of his clan.

Reptiles constituted another form of totem in the Borgu society. The Tosu royal clan of Okuta revered the python, which inhabited the Kuroboko hill. Pythons (*mleda* in the Boko language) lived in two shrines located at *Kabami* rocky hill in Gurai town. Bare, Kabo, Wanro, and Yari Wanro clans also revered *shurokoru* (cobra). The reverence of pythons and cobras might have developed from snake worship, which was commonplace in pre-colonial West Africa. People kept serpents in their homes and allowed them to wander about the village without being attacked by members of the community. Among the Mako, Kenu, Sawe, and Yo clans, both *gunusemu* (rabbit) and *shekuro* (weaverbird) were accorded human burial. One cowry would be buried with it and mourning would last only a day.

Animal totems were more common than plant totems but spirits lived in sacred trees. The Lesaworu clan at Ilesha revered the *Besigondo* tree but *Baatoko* tree was the plant totem of the Yari at Okuta. The Laru-speaking people of Lashibe in Wawa District regarded *Kanya* tree as the abode of *Zarami*, an important spirit who provided security for members of the community in times of sickness or epidemics. The chief priest of *Lashi*, an important Earth spirit represented by a stone in a hut, could not be circumcised, and was not allowed to farm. The chief of Sabon Gari could not eat new yam until he made a sacrifice of a sheep and corn to *Lashi*. The *Kani* spirit lived in *Kawo* tree and often accepted a sacrifice of a white cock, a libation of honey, milk, and flour for appeasement. *Antsa*, represented by a small piece of iron, could be invoked in case of sterility. The spirit of *Fu* lived in a *Rimi* tree. In addition, the spirit of *Dauda* at Kagogi near Bussa lived in *Duki* tree. Furthermore, the spirit of *Doguwu Fara* in Illo lived in the sacred *tamarind* tree.

Unlike the others, the Dandawa (Muslim) clans, such as the Taruwere, Ture, Mane, and the Wangara merchants, did not adopt any animal totem. But like other clans, the Muslims observed food taboos, which do not fall within the category of totemism. For a long time, the Borgu people refused to be Islamized and the veneration of animal and plant totems could be seen as one of the devices of resisting the Islamic religion. Mohammed Bello, the Sultan of Sokoto, once described the Borgu people as “devils and of stubborn nature” because of their refusal to accept Islam.

The people of Borgu worshipped other natural phenomena, such as rocks, hills, and rivers. Jekanna, a rocky hill in Bussa, was invoked for childbirth, sickness, and wealth, and its chief priest was called the Bamaso. Another rocky hill, Kuroboko, served a natural barrier against external military attacks, but it was also a symbol of religious practice. A newly installed chief of Okuta would visit the Kuroboko hill for prayers and to offer a sacrifice for a peaceful and prosperous reign. Before and after a war, sacrifices were offered at the Kuroboko hill. The Ozera hill in Kaiama served both political and religious functions. During the annual Gani festival, the traditional shaving of the royal family took place at the Ozera hill. The people of Ilesha chiefdom used to offer sacrifices to Tutuku hill, especially during epidemics.

The River Niger with its tributaries, including Alibori, Makrou, Minni, Moshi, Oli, and Teshi were worshipped and sacrificed to for successful fishing and peace. Daraku was the only river that the people of Okuta worshipped. The spirits of the river inhabited a hole in a big tree and the chief priest was called Shina Wosho.

The centrality of nature and religion cannot be undermined in the Borgu society. As deeply religious, farming, hunting, and fishing communities, the Borgu people placed high emphasis on the interplay of nature and religion. Whether adopted as primary or secondary totems, animals, birds, rocks, and rivers have been employed as instruments of religion to consolidate socio-cultural cohesion and cross-clan relations. They served as symbols of unity within the society. The breaking of a totemic practice could imperil the unity of the clan. Determined to remain traditionalists and nature worshippers, the Borgu people did not adopt Islam or Christianity until the colonial period. Traditional

religion still exists, an example of which is Bionkuro, whose shrine is represented by a collection of fine stones in Kenu and the priest attends to patrons who come to ask for improved health, wealth, or childbirth. Although Islam and Christianity are gaining ground in contemporary times, they have not completely obliterated the practice of totemism and nature worship.

Totemism

The word totem comes from the Algonquin language of the Chippewa (or Ojibwe) people of the American midWest. It first came to prominence in the late eighteenth century, when trader James Long wrote:

The religious superstition of the Savages consists in each of them having his *totam*, or favourite spirit, which he believes watches over him. This *totam* they conceive assumes the shape of some beast or other, and therefore they never kill, hunt or eat the animal whose form they think this totam bears (Long 1791: 86).

Long also told the story of a Chippewa man whose "*totam*" was bear. The man one day killed a bear, thereby angering the Master of Life. So he was punished by a second bear, who admonished him and struck his face. As it turned out, Long had confused the Chippewa's idea of a personal guardian spirit (or *manitoo*) with their idea of a collective clan spirit (or *totam*), but the words "totem," "totemic," and "totemism" developed and gelled in the English language from that time on.

Totems are usually defined as objects or beings that are emblematic of individual or group identities. Typically, the totem is an animal; less typically a plant or some other natural feature (like fire, rain, the sun, or the moon). In Long's time, and for more than a hundred years afterwards, anthropologists usually interpreted totemism as the classical type of "primitive" religion – religion that belonged to such a low level of human social development that it was inextricably tied to nature, whose forces were seen to dominate primitive worlds. Some even argued that it was a kind of "pre-religion" or magic found among people who had yet to take any significant steps toward civilization and the rational control of natural forces. Spiritual beliefs from throughout the Americas, Australia, the Pacific Islands, and Africa, as well as large parts of Asia, all came to be lumped together under the category "totemism." These speculations more or less came to a definitive end when Claude Lévi-Strauss published *Le Totémisme Aujourd'hui* in 1962. Lévi-Strauss drew attention to the incredible variation that existed in the ethnographic record, suggesting that no single form of totemism could be identified as characteristic of the phenomenon as a whole. Totems could symbolize individual, lineage, or sexual identities, to name only a few, and have been found in all kinds of combinations in a single society. However, Lévi-Strauss did make one positive observation about this variety, saying that each type of totemism had to be understood as an example of a universal human propensity to utilize metaphor in the negotiation of identity. From that moment on, Aboriginal and other tribal people's use of totemic emblems became no more remarkable than Americans identifying with the bald eagle, an army regiment identifying with its mascot, or the American

prisoner Robert Stroud becoming “the Birdman of Alcatraz.” Recent attempts to enlist ostensibly tribal forms of totemism to environmentalist or New Age agendas, so that pandas, dolphins, salmon, or wolves, for example, come to symbolize particular human identities, such as conservation organizations or neo-tribal shamans, build on firm traditions long embedded in modern as well as pre-modern thought.

The extensibility of totemism is a key question in its ethnographic definition. For example, W.E.H. Stanner once described the local selection of Australian Aboriginal totems as “irreducibly arbitrary” (1979: 130). His account is worth quoting more fully.

A totem is in the first place a thing; an entity, an event, or a condition – what I have called an existent. Virtually anything perceivable can serve: plants and animals of all kinds – anything in the entire floral and faunal realms; wind, rain, storms, thunder, lightning, stars, sun, moon and clouds – anything of the heaven; tools and weapons, food and cosmetics, fire and smoke, mist and spume, fresh water and salt – anything of the Earth; the human exuviae and genitals – almost anything of the body

. . . Sexual desire, cold weather, sweethearts, vomiting, runaway wives, mother’s milk and innumerable pests have all been recorded as totems. A part of an object can serve – the handle of a spear-thrower, or the bowels of an animal; so can a disease – diarrhoea or colds; so can flood-wrack swirling down a river, or tide marks on a beach. Living persons evidently cannot be totems, but a mythical person can be – for example, the Warramunga “laughing boy” (1979: 129–30).

The totemic impulse is similarly protean in Western societies, where, for example, sports teams have totems that include not only animals, but also colors, peoples, professions, mythical beings and abstract energies, to name but a few. Such versatility is found in totemic systems worldwide, both modern and pre-modern.

Yet totemic systems do tend to be dominated by animals, probably because humans are also animals – hence a strongly perceived similarity between “us” and “them.” But at the same time humans are more diverse within the species, so that differences between nonhuman animals are readily employed to symbolize differences between people. Paradoxically, totemic species then appear closer to their equivalent groups of people than other humans and, in common parlance, the totemic species often comes to be referred to as a friend or relative. Indeed, “totem” is actually taken from the Algonquin expression *ototeman*, which translates as “he is a relative of mine.” In societies similar to that of the Chippewa, it is common to call totemic species “brother,” “mother,” “grandfather,” and so on, so that totems, or any of the objects or spirit beings which instance them, are fully regarded as kin or extensions of the self. Totemic relationships, be they religious or secular, are invariably marked by familiarity and special intimacy.

In recent centuries the contrast between humans and other animals has been heavily compromised by the idea that humans are somehow beyond animality, or cultural rather than natural. Hence totemism has come to be perceived as “kinship with nature,” “nature worship” or “analogy between nature and culture” – this even though the Chippewa and other classically totemic societies did not originally possess a concept

of nature in opposition to a concept of human society. Neo-totemic characterizations are usually strongly wedded to the romantic critique of civilization, which tends to claim that the West has lost touch with nature and needs to reinstate a reciprocal relationship with it. In this mindset, totemism tends to take on a distinctly New Age feel in terms of the ability of people to communicate with nature and comes to be strongly connected with the wisdom of “primitive peoples,” particularly insofar as they are exponents of shamanism and spiritual journeys to commune with other species. The extent to which this romantic vision accurately reflects past ethnographic reality remains problematic, but it is certainly now part of the contemporary ethnographic landscape.

Take, for example, the contemporary image of the wolf. This creature has a long history in the totemic folklore of a large part of the Northern Hemisphere. In Europe, the wolf is most famously associated with the stories of Little Red Riding Hood and the Three Little Pigs, where he is the personification of the forest and a symbol of the potential destruction and transformation of childhood. He also appears in a related unkindly guise as the werewolf. But the wolf also figures in the totemic mythology of Native North America, where the associated symbolism, often more benign, is rapidly hybridizing with the ongoing romantic backlash against the modern world. For example, Jungian works like Clarissa Pinkola Estes’ *Women Who Run with the Wolves* invert classical European imagery to make a statement about modernity.

Within every woman there lives a powerful force, filled with good instincts, passionate creativity, and ageless knowing. She is the Wild Woman, who represents the instinctual nature of women. But she is an endangered species. For though the gifts of wildish nature belong to us at birth, society’s attempt to

“civilize” us into rigid roles has muffled the deep, life-giving messages of our own souls (1992: 1).

Hence, loss of kinship with the wolf, which is lack of contact with nature, is also detachment from one’s own nature

– one’s true self. Neo-totemism preaching this kind of “back-to-nature” scenario inevitably establishes links with tribal regimes.

The reference to the Wild Woman/wolf as “endangered species” is telling, for in recent years the “originators” of totemism, the Chippewa people, have organized with other Native American groups (Nez Perce and Dakota Sioux) to protect wolves in their local areas. Chippewa spokespeople have stated in relation to their campaign that they are “concerned citizens that are worried for the protection of the wolf” and they have claimed the right to participate in “decisions that will affect our brother the wolf.” They back their claims with mythological precedent, saying that, at the beginning of time, Anishinabe (the first Chippewa man) walked the Earth alone “naming all creation, lands and waters.” Because he was alone, the wolf was created to walk with him and share his fate. What would happen to one would also happen to the other. And this is how the Chippewa see their dispossession in the modern world. Just as they have had their lands taken, and been hunted and pushed to near extinction, so too has the

wolf become endangered. If, as the Chippewa and others intend, the wolf returns in numbers to the land and gains in strength, then this will show how Chippewa life, culture and spirituality will also return and gain strength in those places where they were once destroyed. And perhaps, they say, “the wolf will lead the way to a more natural living” and teach the new Americans to respect “Mother Earth” (Bob Shimek and Jean Brave Heart. “Native Americans Enter Wolf Controversy.” <http://nnic.com/mnwolves/nap.html>, visited 3 July 2001).

These ideas are at once old and new, a recasting of totemic traditions in hyper-modern circumstances. They also mark a tense conjunction of interests expressed by indigenous peoples, environmentalist groups and New Age spiritualists. These interests often help to form strong alliances, but they also often lead to accusations of neocolonialism and the wrongful appropriation of indigenous knowledge. Some ethnographers have argued that classical totemic systems, in effecting ritual control of human movement and foraging, have long played a part in environmental resource management in pre-modern societies. In turn, successful environmental management is reflected in spiritual beliefs about maintaining harmony and balance in the cosmos. Yet violent hunting practices and other pragmatic issues in indigenous communities do not always sit easily with contemporary environmentalist or New Age sensibilities. Consequently, neo-totemic solidarity across the indigenous/non-indigenous divide cannot be taken for granted, but is rather a matter for negotiation. In recent decades, environmentalists and New Age spiritualists have been on steep learning curves in relation to totemic sensibilities in indigenous communities; but, equally, indigenous peoples have been keen to discover what the West’s disenchanted have to offer in their struggle against neo-colonial domination.

When Lévi-Strauss penned *Le Totémisme Aujourd’hui* his intention was to dissolve the phenomenon into something different and far broader. While his intention has been supported by examination of the fuller content of totemic systems, the core problematic relationships between “nature” and “culture” (animality and humanity, “primitive thought” and “modern thought”) have remained ideologically to the fore. Indeed, the British anthropologist Roy Willis recently observed that, thanks to the ongoing twinning of primitivism and ecological concern, the period after *Le Totémisme Aujourd’hui* has been marked by a kind of “totemic revival” (1990: 5). The Chippewa situation described above can be taken as symptomatic of this neo-totemic environment in which the contrast between indigenous and non-indigenous peoples has become synonymous with the opposition between human nature (“the soul”) and its corruption by technocratic rationality. But Lévi-Strauss’s words still strike a note of caution; totemic emblems have never been restricted to natural species, any more than they have been exclusively religious in the conventional sense. We live in a world dense with personal and corporate emblems, only some of which resonate with the juxtaposition of religion and nature.

Traditional Ecological Knowledge

The theme of traditional ecological knowledge is important for the consideration of a broad range of questions related to nature–human relations. Different groups of people in various parts of the world perceive and interact with nature differently, and have different traditions of environmental knowledge. Their perceptions and knowledge are in part shaped by their values, worldviews, and environmental ethics – religion in the broader sense. In the exploration of environmental ethics and religion toward an ecologically sustainable society, indigenous peoples and traditional ecological knowledge have attracted considerable attention from both scholars and popular movements. Traditional ecological knowledge may be defined as “a cumulative body of knowledge, practice and belief, evolving by adaptive processes and handed down through generations by cultural transmission, about the relationship of living beings (including humans) with one another and with their environment.” As a knowledge-practice-belief complex, traditional ecological knowledge includes the worldview or religious traditions of a society. It is both cumulative and dynamic, building on experience and adapting to change, as societies constantly redefine what is considered “traditional.” It is an attribute of societies with historical continuity in making a living in a particular place.

Many discussions of traditional ecological knowledge and indigenous knowledge focus on North American Indian peoples. However, there are traditions of ecological knowledge in various indigenous societies in South America, Australia, and parts of Africa and Asia. Culturally transmitted, cumulative, multigenerational knowledge is held also by some groups that have European backgrounds, such as Newfoundland fishers and Swiss Alpine people.

Traditional ecological knowledge may be considered as a sub-set of indigenous knowledge, defined as local knowledge held by indigenous peoples or local knowledge unique to a given culture or society. There is controversy over the term, traditional. Some scholars consider that the term implies backwardness, and instead favor “indigenous” or “local.” Others point out that many indigenous peoples themselves see “tradition” in a positive light. They do not take it to mean inflexible adherence to the past but rather to mean time-tested and wise.

These considerations make it difficult to generalize about traditional ecological knowledge. But in any case, one cannot generalize about “the Amerindian (or African) view of nature.” Every cultural group has within it a range of environmental values and ethics, and a range of practices. Environmental relations of a group are not uniform; they are shaped by the day-to-day contingencies, as well as their worldview and ethics. Environmental ethics do not describe how people actually behave, but indicate how

they *ought to* behave. Human–nature relations tend to be ambivalent; there often is a discrepancy between belief and practice.

Origins of Traditional Ecological Knowledge and its Development as a Field

The intellectual roots of traditional ecological knowledge are in ethnoscience (mainly ethnobotany) and human ecology. The field started with the documentation of lists of species used by different indigenous groups, and elaborated a science of folk taxonomies of plants and animals, and later, of other environmental features such as soils. Early ethnobotany goes back at least to Barrows' 1900 work on Coahuila Indians of southern California who made a living in a seemingly barren desert environment by harvesting no less than 60 kinds of edible plants and 28 kinds of medicinal plants. The science of folk taxonomies is often associated with the name of Harold Conklin who documented in the 1950s the extensive plant knowledge and classification systems of traditional groups such as the Hanunoo of the Philippines.

There is a technical literature on various kinds of indigenous environmental knowledge. For example, traditional agricultural practice is a major field of indigenous knowledge; others include traditional medicine and architecture. Much of the indigenous knowledge literature is not about ecological relationships but about other kinds of ethnoscience, including agriculture, ethnobiology, ethnopharmacology, ethnoveterinary medicine, and ethnopedology (soils). Some of these areas, for example, traditional practices of water conservation and erosion control, are directly related to ecological knowledge, but others (e.g., ethnoastronomy) are less so.

The shift of emphasis from the documentation of species used by indigenous groups and their taxonomy, to a consideration of functional relationships and mechanisms, gave rise to the field of traditional ecological knowledge. The field borrows from the cultural ecology tradition of the anthropologist Julian Steward who emphasized the study of *adaptive processes*, and argued that social organization itself may be considered an ecological adaptation of a group to its local environment. This emphasis on adaptive processes in human–nature relations may be seen in some of the key volumes on traditional ecological knowledge. As defined in this literature, traditional ecological literature overlaps with cultural ecology, ecological anthropology or anthropological ecology but is not a sub-set of these fields because it often goes beyond the discipline of anthropology.

The rapid development of traditional ecological knowledge as a field in its own right started with the documentation of a tremendously rich body of environmental knowledge, not just of species but also their ecological relations, among a diversity of groups outside the mainstream Western world. These included studies of shifting cultivation and biodiversity conservation in tropical ecosystems, and traditional knowledge

and management systems in coastal fisheries and lagoons, semi-arid areas, and the Arctic. These studies showed that a variety of traditional peoples, in diverse geographical areas from the Arctic to the Amazon, had their own understandings of ecological relationships and distinct traditions of resource management.

By the mid-1980s, the rapidly growing literature on traditional ecological knowledge led to a recognition in the international arena of its potential applications to contemporary resource and environmental problems. This recognition is reflected in *Our Common Future*, the 1987 report of the World Commission on Environment and Development. The report pointed out that indigenous peoples hold a wealth of knowledge based on thousands of years of experience, and that their practices can offer modern societies lessons in the management of resources in complex forest, mountain and arid land ecosystems.

Traditional Ecological Knowledge and Science

Even though the importance of traditional ecological knowledge is recognized in the international arena and the number of publications has grown rapidly since the 1980s, the relationship between Western science and traditional knowledge has remained controversial. There are both similarities and differences between traditional science and Western science. Both kinds of knowledge are ultimately based on observations of the environment, and both result from the same intellectual process of creating order out of disorder. But they are different in a number of substantive ways. Traditional ecological knowledge is often an integral part of a culture, and tends to have a large social context. Different kinds of traditional knowledge have their own rules, but they are different from science regarding rules of evidence and repeatability.

Some of the conflict between science and traditional knowledge is related to claims of authority over knowledge. In the modernist tradition, Western science is seen as having a monopoly on truth. Hence, knowledge and insights that originate outside institutionalized Western science are not easily accepted. Scientists tend to dismiss understandings that do not fit their own (and this often includes understandings of *other* scientists using different paradigms). Scientists tend to be skeptical, demanding evidence when confronted with traditional knowledge that may not easily lend itself to scientific verification.

Some traditional knowledge may include elements, such as the religious dimensions of the environment, which do not make sense to science. For example, many of the Dene (Athapascan) peoples of the North American subarctic consider that some non-living parts of the environment (including rivers and mountains), as well as all living beings, have spirit. Science has no tools for the study of the spiritual dimensions of the environment, but nevertheless such beliefs are important for understanding Dene traditional ecological knowledge.

For their own part, traditional knowledge holders are skeptical of book learning, and tend to dismiss scientists who do not have extensive first-hand knowledge of a specific land area. As well, they are often baffled by the preoccupation of scientists to measure and quantify everything. Power relations become an issue when Western experts and Aboriginal experts have different political agendas. Traditional ecological knowledge has frequently been used to assert indigenous land and resource rights and to fight government-imposed development projects on native land. In turn, science may be used to justify the very same projects.

Hence the issue is complex, even if one agrees with postmodern philosophers of science that Western scientific methodology is merely one way, and not the only way, to acquire knowledge. However, it is the one that happens to be the dominant knowledge system by far, and the one used as the basis of environmental decision-making by centralized bureaucracies throughout the world.

Significance of Traditional Ecological Knowledge

Traditional knowledge and Western science need not be thought of as opposites. Rather, it may be useful to emphasize the potential complementarities of the two, and to look for points of agreement rather than disagreement. The use of traditional knowledge contributes to conceptual pluralism, and expands the range of approaches and information needed to solve environmental problems.

The explosion of interest in traditional ecological knowledge since the 1980s is in part related to its practical significance. However, the interests of different parties are quite different. For many indigenous groups, the broader social and cultural aspects of traditional knowledge are very significant, and this is one of the reasons why dealing with traditional ecological knowledge has become politically volatile. In many indigenous areas, researchers no longer have a free hand to conduct their work independently from the people themselves.

Politically organized groups of indigenous peoples are beginning to assert control over their knowledge systems for at least two reasons. First, some indigenous groups have seen their knowledge and biological resources (for example, medicinal plants) turned by others into profitmaking commodities. Thus, they have started to ask the question of who benefits from the recording of their knowledge, and to investigate how they themselves can control their knowledge and products.

Second, indigenous knowledge has become a symbol for many groups to regain control over their cultural information. Reclaiming their indigenous knowledge has become a major strategy in many parts of the world for movements of cultural revitalization. For example, many of the Aboriginal groups in Alaska and Northern Canada have been carrying out their own traditional knowledge studies as part of an effort to strengthen their culture, educate their young people, prepare land and resource claims,

and assert their rights. Such revitalization is not merely a cultural exercise; it is about empowerment and political control.

The need for indigenous groups to control their knowledge has to be balanced against the importance of traditional ecological knowledge as the common heritage of humankind. There are tangible and practical reasons why traditional ecological knowledge is important for the rest of the world's people. I have identified seven areas in which traditional ecological knowledge is significant. First, it is a source of biological knowledge and ecological insights. Second, indigenous knowledge is important for the sustainability of difficult-to-manage ecosystems such as tropical forests. Third, it is important for communitybased conservation by connecting human values with conservation values. Fourth, some traditional systems are of special interest for biodiversity conservation because they are based on multiple-use principles that distribute resource-use pressures in space and time. Fifth, in-depth local environmental knowledge and trends over time for a given site are important for environmental assessment. Sixth, traditional knowledge is essential for development, especially for "bottom-up" (as opposed to top-down) development planning with people.

Finally, traditional ecological wisdom is a source of inspiration for environmental ethics. Belief systems of many indigenous groups incorporate the idea that humans are part of the natural environment, and their relationship with nature may be characterized as peaceful coexistence. Callicott points out that some traditional ecology sees humans and nature in a symbiotic relationship, with mutual obligations leading to "respect," a central idea in the relations of many Amerindian groups with nature.

These observations are significant. The explosion of interest in traditional ecological knowledge in recent years reflects in part the need to derive ecological insights from indigenous practice, and the need to develop a new ecological ethic based in part on indigenous wisdom.

Traditional Ecological Knowledge among Aboriginal Peoples in Canada

Each contracting Party shall, as far as possible and as appropriate: Subject to national legislation, respect, preserve and maintain knowledge, innovations and practices of indigenous and local communities embodying traditional lifestyles relevant for the conservation and sustainable use of biological diversity and promote their wider application with the approval and involvement of the holders of such knowledge, innovations and practices and encourage the equitable sharing of the benefits arising from the utilization of such knowledge innovations and practices (from www.biodiv.org – the Convention on Biological Diversity’s website).

For generations, indigenous peoples in what is now known as Canada have been using their own knowledge systems to live sustainably with the land. Indigenous knowledge systems are unique systems of generating, storing and transmitting knowledge completely separate and independent from Western science and Western epistemologies. Rooted in relations with the spirit-world, indigenous knowledge continues to provide Aboriginal peoples with unique worldviews, languages that are constructed to reflect those worldviews, systems of governance, values, and processes and ways of knowing and interacting with the land. Aboriginal philosophies and values reflect worldviews that are based on interrelationships and interdependency with the natural world and all other elements of the cosmos. Traditional teachings, stories, songs, dances and ceremonies reinforce the importance of relationships and process in the lives of individuals, communities and nations. Indigenous knowledge is dynamic and creative and, although it varies from nation to nation, has certain common elements and themes. Indigenous knowledge is at once ancient and contemporary knowledge, recording through the oral tradition the collective knowledge of a people in addition to documenting the impacts of colonization, colonialism and environmental destruction. Experts in indigenous knowledge are not academics or researchers who study TEK, but they are the Elders and knowledge-holders who not only hold the knowledge, but who have lived the knowledge and the teachings over the course of their lives. It is these experts who are best equipped to provide leadership around this topic, and it is these experts that need to be included in an effective way in discussions regarding the many potential applications of Traditional Ecological Knowledge (TEK).

During the initial stages of colonization, Europeans were dependent upon indigenous peoples and their knowledge for their survival. The colonizers relied upon technology in the areas of transportation, hunting, fishing, food gathering, nutrition, healthcare and navigation. They relied upon Aboriginal peoples for their most basic needs and in turn had great respect for indigenous knowledge. However, as the settler economy developed and the infrastructure needed to support the colonizers way of life was realized, they no longer relied on Aboriginal peoples and

Aboriginal knowledge for their continuance and survival. Subsequently, over that next five centuries, indigenous knowledge was disrespected, undermined and assimilated into Canadian society with no recognition or acknowledgement for Aboriginal peoples. Many of the modern symbols of Canadian culture, such as maple syrup, canoes, kayaks, snow shoes, wild rice and wild meat, represent appropriated Aboriginal knowledge. The systemic dispossession of Aboriginal nations from their territories along with the assimilative policies of the Canadian government through the Indian Act would have come close to destroying indigenous knowledge if it were not for the resistance and commitment of past generations of Aboriginal peoples.

In recent times, non-Aboriginal researchers, academics, environmentalists, industry and government personnel have once again become interested in what has become known as Traditional Ecological Knowledge. Many environmentalists believe that TEK holds answers to the pending ecological crises and provides Euro-Canadian society with a blueprint toward sustainable living. The pharmaceutical and natural health products industries are interested in the Aboriginal knowledge and use of traditional medicines and medicinal plants so that these might be commercially exploited for profit. Natural resource managers at the federal and provincial levels are interested in TEK in hopes that it can contribute to the management of renewable and non-renewable resources in a positive way. These interests in the knowledge of Aboriginal peoples have unfortunately caused researchers to separate out “ecological” or “environmental” knowledge from other kinds of knowledge, because it is the component of the knowledge system that outside researchers are currently most interested in learning. Existing academic literature regarding TEK continues along this line of thinking, privileging the components of indigenous knowledge that conform well to Western ideals over the spiritual basis of indigenous knowledge. Aboriginal spiritual traditions, beliefs and values form the foundation of traditional knowledge, and are completely integrated into every aspect of TEK and indigenous thought. Much of the TEK literature published in applied scientific journals and publications is written by non-Aboriginal scientists and academics and has focused on introducing TEK to scientists. Works written by Fikret Berkes, for instance, attempt to gain acceptance for TEK and Aboriginal peoples in disciplines that have traditionally ignored the contribution and knowledge of indigenous peoples. Publications in scientific journals generally ignore contemporary impacts of colonization and colonialism on indigenous peoples, the land, and their knowledge, marginalize indigenous elders and knowledge-holders, and undermine the oral tradition, thereby constructing “TEK” in a manner that is often not meaningful to the very

people who hold the knowledge. These criticisms, long observed by indigenous elders and knowledge-holders are making their way into the academic literature articulated by indigenous scholars such as Marie Battiste, James Sa'ke'j Youngblood Henderson, Leanne Simpson and Deborah McGregor.

Aboriginal peoples have approached these outside interests with caution, concerned that their knowledge could be taken out of context, misused and appropriated. Indeed, there have been several examples of this kind of exploitation increasingly occurring, and indigenous peoples continue to take special precautions when sharing knowledge with people from outside their communities and nations. Many communities have developed information-sharing policies and guidelines for researchers entering their territories in addition to their traditional protocols for sharing and transmitting knowledge. Some communities and organizations, like the Pauktuutit Inuit Women's Organization are investigating the possibility of using Canadian Intellectual Property law to protect aspects of their knowledge, despite current deficiencies in the laws in terms of indigenous knowledge.

Internationally, TEK has most recently been recognized in the United Nations Convention on Biological Diversity. Article 8j (see the epigraph) of the Convention outlines the importance of indigenous knowledge and indigenous peoples in the protection of biodiversity. Canada, as a signatory to the Convention, is slowly working toward implementing Article 8j in its domestic legislation. As a result, environmental impact assessments, comanagement agreements, and certain pieces of legislation such as the proposed Species at Risk Act are beginning to include certain aspects of indigenous knowledge within them. Despite these initiatives, there are many barriers to including TEK in environmental management in ways that respect Aboriginal peoples and bring about meaningful change to these processes. Scientists and resource managers have little opportunity to learn about Aboriginal peoples and their TEK first-hand. This can create misunderstandings regarding the nature of TEK. Governments often require their bureaucrats to include TEK in policy and legislation without proper consultation with Aboriginal peoples, in unrealistic timeframes, and without appropriate financial support. Governments also regularly require TEK to be written down or documented before it is considered useful. Documented TEK is then integrated into processes and frameworks that remain strongly rooted in Western science, and much of the transformative potential of indigenous knowledge is assimilated in the process. Many Elders are concerned that once their knowledge is removed from the oral tradition and the knowledgeholders, translated into English and textualized, it is removed from its context and all of the relationships that give the knowledge its meaning. Aboriginal advocates have challenged this approach and Aboriginal peoples are monitoring these initiatives with concern. It is critical that Aboriginal people, not just isolated components of their knowledge, are included in a meaningful and respectful way in environmental management in Canada, and it is important to realize that including the knowledge of Aboriginal peoples in environmental decision making ultimately means that different decisions will be made.

Contemporary Aboriginal peoples in Canada are concerned about protecting their territories from environmental destruction not only as a way of protecting their relations with the natural world, the health of their communities and their cultures, but also as a way of protecting their knowledge systems. Indigenous knowledge comes from the land. Without these relationships, it is difficult to strengthen, promote and preserve the knowledge of Aboriginal peoples for the coming generations and it is difficult to envision healthy, sustainable Aboriginal nations in the future. TEK has much to offer Aboriginal and nonAboriginal societies if it is accessed and used in a way that is respectful and fair from the perspective of the people who hold the knowledge. As interest in TEK grows, and Aboriginal voices are listened to, so does the potential for using both indigenous and Western forms of knowledge together to address some of the many local, national and global environmental issues facing the world.

Transcendental Meditation

Transcendental Meditation is a spiritual movement organized by Maharishi Mahesh Yogi, an Indian who came to the U.S. in 1959 to utilize modern media and communications to spread his teachings. These teachings are based on monistic Advaita-Vedanta, a Hindu tradition that describes the universe as diverse manifestations of a single, underlying Absolute, called Brahman. The goal of meditation is personally to experience direct knowledge of Brahman, and realize that the essence of one's own self is this same Brahman. In the 1970s, Maharishi rephrased his teachings to use Western scientific terminology and described his meditation program as the Science of Creative Intelligence (SCI) with Creative Intelligence being the all-pervasive, organizing principle of the universe. Nature appears in two areas of SCI, first as Brahman and second in the context of environmentalism.

In writings from the 1980s, Maharishi often used "Nature" instead of "Brahman" when describing the underlying foundation of the cosmos. In this context, nature is described as the basis of all order and the goal of meditation is to become aware of it. TM uses the language of physics, mathematics, and chemistry to explain the order of the universe and show that modern science is describing a unified cosmos that coincides with the ancient Indian scriptures, the Vedas. Maharishi makes effective use of the Grand Unification Theories of physics to communicate the idea of the basic unity of all material existence to a Western audience. This emphasis on science also allows TM to define itself as a practical technique for improving modern life rather than a religion with a creed. Referring to the Absolute as "nature" rather than God or Brahman facilitates the movement's non-religious identity.

Nature is not, however, completely passive. It is the Creative Intelligence that organizes the cosmos and is said to have "moved Maharishi" to begin his life of teaching. This teaching is necessary for "nature to work out its divine plan for the spiritual regeneration of mankind" (Maharishi 1986: 2). From such statements, it is clear that nature is an active, conscious force in Maharishi's philosophy. And the divine plan requires that people learn to meditate so that they can realize their inherent oneness with the cosmos and be brought into harmony with the natural order of the universe. This, in turn, transforms one's life and leads to the full realization of "human potential." A person who is attuned to nature will be confident and content, able to handle the pace of modern life without succumbing to stress. Such a person is in harmony with the cosmic order. Maharishi attributes his success and his movement's growth to "the natural expression of the force of evolution, silently reshaping the destiny of the world through the thought and action of one moving in perfect attunement with the infinite

intelligence of nature” (Maharishi 1986: 1). If his followers meditate, they too will be successful at life because they are in accord with the natural order.

TM’s description of nature concerns the cosmic whole, not specific phenomena such as the sun or mountains. The same is true of the movement’s approach to the earthly environment. One of TM’s stated goals is “To maximize the intelligent use of the environment” (Forem 1974: 10). However, TM writings do not have specific aims such as stopping global warming or requiring that all members be vegetarian. Rather, there is a general belief that those who practice TM will find themselves naturally living a more harmonious life. This will include better human relationships, reduced stress, greater clarity of thought, and better choices about how to live. Among these will be environmental awareness, because polluting the world is selfish and places short-sighted gratification before long-term well-being.

Although TM does not champion specific causes, Maharishi describes two ways in which it can have an effect on the world beyond its membership. First, he suggests that the “custodians of this knowledge” should serve in governments where they will create “problem-free” nations and raise life to the level of a “Heaven on Earth.” Second is the “Maharishi Effect,” the theory that the mental states of a few people can influence the behavior of others at a distance. According to TM, if the square root of one percent of a population meditates regularly, the higher consciousness of the meditators will affect the whole area and social problems will be alleviated. Thus, their efforts will bring the society into harmony with nature.

Transcendentalism

Transcendentalism refers to the intellectual and social movement that emerged primarily in Boston and surrounding areas during the mid-nineteenth century and included such familiar figures as Henry David Thoreau, Ralph Waldo Emerson and Margaret Fuller, as well as Fredric Henry Hedge, George Ripley, James Clark, Orestes Brownson, Bronson Alcott, Elizabeth Peabody, and Theodore Parker, among others. Already known to each other through intellectual and social circles, the Transcendentalists formalized their relationship (to the extent that they ever did so) through a regular symposium – sometimes dubbed “the Transcendental Club” – that gathered at participants’ homes from 1836 to 1840. The group analyzed such topics as “the essence of religion as distinct from morality,” “American Genius,” “Pantheism” and “the nature of Poetry.” As these titles indicate, the preoccupations of this group were flexible and wide-ranging (as was its informal membership).

Participants in the club were interested in expanding the latest trends in German philosophy, developing original – recognizably American – literary contributions and experimenting with new forms of religious life and thought. Often, they were referred to as the “New School” by their critics and even the term “Transcendentalist” was more often a term of criticism leveled by opponents than a term used by its participants. While regular meetings of the club waned after 1840, the Transcendentalists continued to communicate and exert their influence through their publication, *The Dial* (1840–1844), which was edited first by Fuller and then by Emerson.

The Transcendentalists were highly individualistic in both character and philosophical outlook, resisting any common doctrinal or intellectual stance. They shared, however, a highly optimistic vision of humanity and a confidence in the future of American intellectual life and thought, freed from the bonds of intellectual precedent or religious superstition. These young writers also shared an intellectual affection for various forms of idealism, from neo-Platonic thought to the increasingly influential work of Immanuel Kant, whose use of the term “transcendental”

– mediated through the writings of Samuel Taylor Coleridge – these thinkers both borrowed and transformed for their own purposes. What was “transcendental” for the Transcendentalists was a preference for spiritual (or “intuitional”) over material (sense-based) forms of knowledge. Similarly, they expressed a commitment to shaping life according to individually discerned aesthetic and spiritual priorities, rather than those of social convention or the marketplace. Their intellectual stance was the starting place from which they developed their ideas of nature, as well as their moral and religious views.

The intellectual agenda of the Transcendentalists was broad, eclectic and not always consistent, consistency itself not being an ideal toward which the Transcendentalists strove. In the most general sense, however, the Transcendentalists embraced a new theory of knowledge. This theory refuted the, then prevailing, Lockean view of the process of human knowing. At the same time, the Transcendentalists put forward new theories of morality that countered more conservative religious approaches, while also opposing the skepticism of David Hume and other Enlightenment figures. In a general sense, the Transcendentalists can be said to have welcomed the Enlightenment critique of religion, while resisting recourse to forms of rationalism that overlooked human emotions and disenchanting the natural world.

In terms of epistemology, the Transcendentalists resisted Locke's empiricist approach, which proposed that knowledge comes from sense experiences which are impressed on the waiting mind just as words are written on a blank slate. While Locke's own view was more complex than that of his followers, Lockean psychology was generally accepted by the intellectuals of the eighteenth and early nineteenth century, particularly the New England Unitarians. Taking cues from the writings of Kant and Coleridge, the Transcendentalists responded against Locke by articulating a distinction between "understanding" (rational reflection on sense experience) and Reason (the use of intuition and one's innate, divinely created capacities to discern the good, the true and the beautiful). While accepting Locke's confidence in the rational capacities of humanity, the Transcendentalists argued that Reason was also an innate human gift which each individual should cultivate.

The Transcendentalist's view of the moral life followed from this epistemological premise. While rejecting orthodox religion and even the comparatively liberal Christian Unitarianism that was culturally dominant in nineteenth-century Boston, the Transcendentalists also rejected Hume's skepticism with respect to religion and morality. Most Transcendentalists affirmed their belief in a divine Creator, while rejecting the notion of divine revelation of miracles. Many also became increasingly interested in the religions of China and India as these became available to them through newly available European translations of Eastern texts. Moreover, Transcendentalists' vision of human nature was indefatigably optimistic, resting on the assumption that all individuals carry the divine within them and must dedicate their lives to nurturing this divine potential, particularly through education and artistic expression.

The Transcendentalists' view of nature rests on the important epistemological and moral assumptions described above. As with particular philosophical, literary and political preferences, the Transcendentalists' reading of nature also varied among individuals. In general, however, the Transcendentalists borrowed from the European Romantics the notion that a regular contact with nature (by which was generally meant: living in or visiting rural and pastoral settings) was essential for regaining human innocence and originality that was corrupted by civilization. Intimacy with nature could return the individual (especially the writer) to a state of childlike openness and wonder. Such

a state was crucial to developing what Emerson famously termed an “original response to the universe.”

The quest for originality and authenticity both in spiritual experience and in literary expression was a central preoccupation of the Transcendentalists. While the foundations of their ideas were, belatedly, shaped in response to European Romanticism, the Transcendentalists worked to create literature, educational theory and, more broadly, “culture” that was distinctly American. Because such work was dependent on the experience of and response to a particular natural landscape (primarily, pastoral New England), it is no surprise that much Transcendentalist literature concerns itself with “nature” both as an abstract concept and as a particular physical context for spiritual experience.

When considering the Transcendentalists’ views of nature, it is important to recognize the complexity of what the term “nature” could signify. In its broadest sense, it represented what was not the self. “Nature” then was equivalent to the Kantian “not-Me.” More particularly, nature might refer to a particular biophysical context for the experiences of insight and intuition that were sought after by the Transcendentalists: the “bare common” upon which Emerson experienced himself as a “Transparent Eyeball,” Thoreau’s Walden or the communal Brook Farm in West Roxbury. Even in these instances, however, the reading of nature offered by the Transcendentalists was not one of appreciating nature for what today we might call its “intrinsic value.” While theologically departing firmly from their Puritan heritage, the Transcendentalists continued, while altering, the Puritan view of nature as a “book” to be read for spiritual lessons. They also carried forward Unitarian interests in natural theology, particularly the study of nature to comprehend the character of the divine. The Transcendentalists reworked and reimagined these Puritan and Unitarian legacies, ultimately asserting the presence of the divine *in* nature (as well as in humanity), while also not limiting their understanding of the divine to the Christian tradition. They incorporated spiritualism, Emmanuel Swedenborg’s theory of correspondences and Eastern concepts of sacred geography into their cultural repertoire.

Nevertheless, nature remained in what we might call a “spiritually utilitarian” position. Nature was most often understood to be something which was “read” by the individual artist (the Poet, as Emerson conceived him), whose job it was to decipher and interpret the moral lessons hidden in nature. Nature was valued, then, for what it could teach the attentive student and its function was that of moral formation. The ultimate emphasis remained on the ideal Transcendentalist (which each Transcendentalist saw latent within) whose practice of self-cultivation would enable him or her to “read” nature correctly and to share that reading with a wider audience. Nature, in the Transcendentalists’ view, was primarily *symbolic*, representing moral truths and aesthetic insights that lay “behind” or “inside” external, natural phenomena. The pursuit of nature was most often a pursuit of the self, or of knowledge of the divine, without and within.

At the same time, pastoral and wilderness environments remained vital as the ideal *contexts* for Transcendentalist self-cultivation, as was the case in Thoreau's experiment at Walden. Thus, paying close attention to the natural world as a symbolic "book" for spiritual insight also led many Transcendentalists to acquire a large body of scientific knowledge of their surroundings. Many kept detailed records of flora, fauna, weather patterns and natural events in the places where they lived or traveled. Emerson, for instance, was an amateur orchardist and early conservationist of threatened woodlands, while Thoreau's work in natural history and studies of plant succession were consulted by professional scientists of his day.

Transpersonal Psychology

Transpersonal psychology is the branch of psychology which integrates psychological concepts, theories, and methods with the subject matter and practices of the spiritual disciplines. Its interests include spiritual and mystical experiences, meditative practices, ritual, shamanism, and the connections between spiritual experiences with disturbed states such as psychosis, mania, and depression. Transpersonal psychologists apply their work in clinical and counseling psychology, spiritual guidance and pastoral counseling, organizational and community development, healthcare and healing, the transpersonal dimensions of interpersonal relationships, cultural diversity, gender studies, business, ecopsychology, and other areas.

The root of the term transpersonal, or literally “beyond the mask,” refers to self-transcendence, the development of the self from a sense of identity which is exclusively individual to one that is deeper, broader, more inclusive, and more unified with the whole. The core concept in transpersonal psychology is nonduality, the recognition that each part or person is fundamentally and ultimately a part of a larger, more comprehensive whole. From this insight come two other central insights: the intrinsic health and basic goodness of the whole and each of its parts, and the validity of self-transcendence.

Transpersonal psychology is phenomenological, inclusive, and optimistic. It values and integrates the personal with the transpersonal, the psychological with the spiritual, exceptional mental health with psychological disturbance, and analytical intellect with contemplative ways of knowing. It finds wisdom in Western psychology and philosophy, Eastern spirituality, postmodern insights, and worldviews of indigenous traditions. Such overlaps between psychology and spirituality have been present in both psychology (e.g., the work of William James, Carl Jung, and Abraham Maslow) and in the spiritual traditions (which have their own rich views of development, cognition, social interactions, emotional and behavioral suffering, and methods of healing). The work of Ken Wilber (Integral Psychology) and Stanislav Grof are at the forefront of transpersonal psychology today. Among its important projects are describing the stages and processes of transpersonal development, researching the psychological effects of meditation, exploring spiritual emergencies (those mystical or spiritual experiences which also create acute debilitating psychological suffering), and identifying the transpersonal dimensions of nature experiences.

Transpersonal psychology is a field of inquiry which includes theory, research, and practice, offering insights and applications based on research and experience and methods for evaluating and confirming or disconfirming its findings. It is scientific in the

broad sense of the phenomenological or “human” sciences. Research in transpersonal psychology uses both qualitative phenomenological methods and quantitative methods such as experimental designs. In recent years, the *Journal of Transpersonal Psychology* has published reviews of research on psychospiritual problems, mystical experiences, meditation, and measures of transpersonal development. Still, most of the work and practice of transpersonal psychology concerns psychotherapy and self-development.

Meditation, contemplative prayer, and similar forms of open-ended phenomenological inquiry are core practices for transpersonal psychology. These practices lead to an expanded awareness, a greater sense of presence, and a greater degree of self-integration or self-transcendence. While such practices have been successfully used for self-regulation, relaxation, and pain control and for self-exploration and psychotherapy, they have traditionally been used for self-transcendence and self-liberation. Despite their many surface forms, meditation and contemplative practices can be a means of disidentifying from our “masks” or personalities and realizing our fundamental nonduality.

Ritual is another core practice for transpersonal psychology. For many individuals and in many cultures and spiritual systems, ritual is the central means of discovering connections with each other, with communities, with the Earth, and with the cosmos. Other practices that are associated with transpersonal psychology include shamanism, lucid dreaming, visualization, chanting, transpersonal uses of music and art, and religious uses of psychedelic drugs.

Transpersonal psychology arose in the 1960s out of work by Abraham Maslow, Stanislav Grof, Anthony Sutich, and others in humanistic psychology. The work of William James on mysticism, Carl Jung on the collective unconscious, and Roberto Assagioli on psychosynthesis anticipated the development of transpersonal psychology. Interest in the psychological implications of Buddhism, Yoga, shamanism, psychedelic states, and holistic medicine fueled its development. At the present time, transpersonal psychology is gaining acceptance by many psychologists, and a number of professional organizations have been established worldwide. The Association for Transpersonal Psychology has published the *Journal of Transpersonal Psychology* since 1969. Its influences are found in a number of other psychological and psychiatric journals and books, both scientific and popular. Conferences and training programs sponsored by professional organizations such as the Association for Transpersonal Psychology and the International Transpersonal Association also provide training in transpersonal psychology and contribute to developments in the field.

Most transpersonal psychologists are involved in counseling and psychotherapy. Transpersonal psychotherapists may deal with spiritual crises or other explicitly transpersonal content, or they may bring a transpersonal context and processes to a broader range of psychological issues such as addictions, emotional distress, relationships, and life transitions. Art therapists, music therapists, dance therapists, and body-centered psychotherapists often use transpersonal principles in their work as well.

Transpersonal studies are arising in a number of fields, including medicine, education, anthropology, and organizational development. There are also strong connections between transpersonal psychology, ecopsychology, and deep ecology. Many people find transpersonal experiences in contact with nature, and many nature-based personal growth practices such as wilderness retreats, rites of passage, and other Earth-centered rituals have transpersonal dimensions. Similarly, some environmental activists bring a transpersonal perspective into their work. Deep ecologists such as Arne Naess, Warwick Fox, and John Seed and ecopsychologists such as Theodore Roszak and Ralph Metzner have promoted a kind of self-transcendence or transpersonal identity as a basis for environmental action. They argue that when one's identity expands or deepens beyond the individual self to include the Earth (i.e., a kind of self-transcendence), environmental action is more likely to be based on love, joy, and caring than on fear, shame, or sacrifice and that such a transpersonal attitude leads to action which is more effective and more sustainable.

Transpersonal psychology proponents believe that the practices they are developing benefit both psychology and the spiritual disciplines. Psychology can expand toward a fuller and richer accounting of the full range of human experience and potential and incorporate practices that develop this potential. The spiritual disciplines can incorporate insights and skills related to human development and healing to deal more skillfully with the psychological issues that arise with spiritual development. They can more effectively use these issues as gateways, rather than obstacles, to self-realization and authentic service.

Tree Music

When I was 26, needing to rest after injuring my back while landscaping, I realized that I would much rather relax in the forest of Washington's Olympic Peninsula than in Seattle. So I drove out to Graves Creek Campground on the Quinalt River, and spent four days reading and playing my guitar next to a giant Douglas Fir tree. At the end of the four days, right before I left to return home, the song "The Tree" came flowing out. I looked up at the big Douglas Fir and said "I bet this is your song."

For years after that I'd sing "The Tree" and mention that I thought it was the big Douglas Fir's song. It seemed like a nice thought, and as the concept of a tree having "a song" had never come up in my scientifically oriented Western education, I only light-heartedly believed it.

A few years later I was invited to a celebration on Orcas Island, where the Lummi Indians and their allies had succeeded in saving a place called Madrona Point, where a developer had hoped to build condominiums on top of a Lummi Indian burial ground. After a 10-year battle, the United States Congress appropriated money to buy the land and give it back to the Lummi people.

The celebration was held at the Oddfellows hall on Madrona Point near Eastsound. Several hundred people gathered from the Lummi Reservation and Orcas Island. There was a huge potluck feast with salmon and berry pies and salads and fried bread. Spirits were high and children ran around everywhere.

The man who invited me to the celebration then told me that the chief wanted me to sing "The Tree." I expressed reluctance, however, unsure whether this quiet song could be heard over the clanking dishes and spirited children. My friend simply restated, "The chief would like to hear 'The Tree.' "

After I was introduced, the place quieted down and I began to sing, noticing immediately something that had never happened before at one of my concerts. While everyone seemed to be enjoying the tune, the elder Lummi were riveted, holding on to every note, every word. I felt honored that they would care so much about this song. Afterwards I spoke with the chief and several elders. I told them the story of spending four days with the old Douglas Fir tree by the Quinalt River and how I had always thought it was the Tree's song.

"It is," said the chief, "I recognize the tune. It is a song from a tree in our region. In Lummi tradition, and for many of the peoples of this region, we get our music from trees. Each tree has its own song. We go out and spend three or four days next to a tree where we fast and pray and listen for that tree's song. We take the song and sing it or play it on the flute. In this era when so many of our ancient trees are being cut

down, we go out and learn their songs before they die, as a way of honoring the great trees. We are working to save the last remaining ancient groves on our territory.”

I have never looked at a tree in the same way since then. I have never looked at any creature in the same way since then.

Trees – as Religious Architecture

It goes without saying that trees are essential to many architectural creations. Not only do they serve structural functions, but they are often also imbued with symbolic meaning as well. This is seen quite clearly in religious contexts. Examples are found around the world from ancient to present times. Shinto shrines, Egyptian and Greek temples, Celtic groves, the Lakota Sun Dance, Pacific Northwest coast totem poles, Buddhist stupas, and Christian churches – along with associated “Green Man” imagery – are briefly examined here as a sample of the great variety of places that exist.

We begin with Japan and Shinto beliefs. Some of the oldest Shinto shrines sites are groves or forested hillsides where rituals were performed in relation to *kami*. The idea, and thus the definition, of *kami* has changed over the millennia as influences from China, Korea, and India, among other places, participated in the shaping of Japanese thought on the subject. In general, however, *kami* can perhaps be best understood within a polytheistic context, where powerful spiritual forces are conceived as embodied through human, animal, tree, river, rock, wind, sun, or other natural forms. In early Shintoism trees themselves were shrines to *kami*. Later, human-built shrines were erected. The natural and the built overlapped in meaning. The same characters that today are interpreted as *jinga*, or shrine, were understood in ancient texts as *kamu-tsu-yahshiro*, or *mori*, two terms meaning “kami grove.” Close relationships between trees and architecture are visible in the *torii* gates and in the cylindrical wooden columns supporting shrine floors and ridge poles. At Ise Shrine, unique in that it is rebuilt every twenty years, rituals pertaining to the protection, burial, re-use, and adornment of the heartpillar (*shin no mihashira*) harken back to early Shintoism. Similarly, trees played functional and symbolic roles in Egyptian temples. Columns were shaped to reflect lotus, papyrus, and palms. These were intentionally suggestive of the connections between religious beliefs, the fertility of the land, and the well-being of people. Other columns were shaped to represent Osiris. In addition to vegetative abundance, the myths and rituals associated with him revolve around themes of death and resurrection. A link between religious belief and trees is also indicated by the story of how he was murdered, set adrift down the Nile in a sarcophagus, incorporated into a growing tree along the river’s banks, and installed within a temple as a pillar.

Greek temples also manifest relationships between trees, architecture, and belief. Doric columns are reminiscent of organic forms. Their girth, taper, and overall appearance is quite tree-like. Architectural historians point out that logs could have been easily sculpted into a series of planar surfaces amenable to fluting. Peg features, triglyphs at the end of what would have been beams, and mutules imitative of rafters

all support claims of the column's wooden derivation. A number of Doric traits were replicated in Ionic and Corinthian forms. Greek temple architecture also suggests the physical appearance of sacred groves. The manner in which temple space was divided into spaces was intended to mimic the sense of multiple spaces within groves.

Sacred groves were also central to Celtic traditions, found across a vast area spreading from Asia Minor through continental Western Europe and into Britain and Ireland. While beech and various conifers figured prominently in the rituals and beliefs of some groups, oak appears to have the most widespread symbolic significance. The word "Druid," in fact, is closely associated with a Celtic term for oak. In some cases altars were constructed for use in these groves. Tree motifs are commonly carved upon them. Additionally, trees themselves served as religious architecture. Miranda Green, author of *Symbol & Image in Celtic Religious Art*, speaks of archeological finds in Germany at places like the Goloring and the Goldberg where a large tree-like pillar was set in the center of an enclosure. There are many instances in the archeological record where Celtic groups dug pits and left offerings in association with living trees and pillars.

Trees are important in Native American beliefs, and there are many circumstances where trees serve as architecture. It is not romantic to say that participation in traditional ceremonies helps root contemporary native peoples in their heritage. Trees can play very important roles. Lakota Sun Dance ceremonies, for instance, revolve around a central pole that is understood to be a sacred tree. It is ceremonially harvested from the forest and erected in the center of a Sun Dance site. Dancers attach themselves to the pole with long cords as they pray and engage in acts of self-sacrifice. As symbol, the sacred tree links the elements of the larger universe with the dancers, and through them to the entire community gathered for the ritual.

Totem poles are associated with native peoples of the Pacific Northwest, and are especially common in the coastal regions of British Columbia and southeastern Alaska. Coast Salish, Nuuchah-nulth, Kwakiutl, Nuxalk, Tsimshian, Haida, and Tlingit are representative groups. Great diversity of language and religious practices exists among them. Diversity is found in the poles as well. Some serve memorial purposes, while others have mortuary uses. There are also frontal poles and house posts; both are incorporated into the structure of traditional homes. All poles are made of red cedar. Preferences for one or another type vary among groups. Carvings are not actually totems. Rather, they symbolize crests and signs of a given family or clan. Pole-raising were, and today typically are, attended by the narration of stories, prayer, singing, drumming, dancing, feasting, and the gift exchange known as potlatching. In contemporary times a fifth type of pole – the commercial pole – is often carved for nonnatives and erected in non-traditional settings. More important than merely generating revenue, these intentionally communicate the vitality of indigenous groups and indicate that their ties to the land remain.

Buddhist architecture, such as that found in stupas, also features a central pole with strong tree associations. Originally a type of pre-Buddhist Indian burial mound, stupas were tumuli with a wooden post in their center. The pole may have symbolized

Aryan traditions where community leaders met under a tree for discussions, and it may have symbolized their beliefs about sacred or cosmic trees. In Hindu contexts, the tree and umbrellas under which royalty were shaded, and ideas of Mt. Meru, were all combined in stupa architecture. Buddhists adopted and embedded these notions into places like Sanchi, where a central axle-pole at the top of the stupa symbolizes the process of enlightenment. The vertically arranged series of disks on the pole represent levels of enlightenment; they are in essence stylized branches of the cosmic tree.

Tree motifs, some of which refer to a cosmic tree, are integral to the architecture of churches and cathedrals. Not only are representations of the Tree of Knowledge and the Fall highly significant, but in many places carved foliage and even the Green Man is seen. The Green Man appears in church architecture as a male face encompassed by leaves. Sometimes leaves are shown sprouting from his mouth. Common across much of Western Europe, the Green Man evidently predates the spread of Christianity, and very well may have Celtic associations with fertility. The Church incorporated the Green Man as an expression of death and resurrection. In a similar way the cross, symbolizing resurrection and the promise of salvation, is often understood to be a tree or tree-like. One example is found in the architecture of St. Andrews in Ellensburg, Washington. On the interior wall behind the altar hangs a large wooden cross. Behind it a series of tightly clustered beams stretch toward the ceiling, spreading ever-further apart as they go. The overall effect is that of a tree emerging from the cross.

In the sites described here, as in many more from all around the world – Africa, Oceania, Australia, Europe, Asia, and the Americas – trees are a significant element of religious architecture. While the particular symbolic meaning of a tree or trees may differ from one culture to another, they are all reminders of the organic connection between humans and the world they inhabit.

Trees in Haitian Vodou

Vodou crystallized as a religion among African and African-descended slaves in the French colony of SaintDomingue (1697–1804), whose massive sugar production made it Europe’s most lucrative colonial enterprise. With the most dynamic early Vodou communities springing up in settlements of escaped slaves from diverse African ethnic groups in the colony (which became the independent Republic of Haiti in 1804), since its inception the religion has demonstrated significant variety. Certain traditions are primarily ancestor cults, while others focus on particular spirits brought from West Africa or others revealed in the New World. Because of the clandestine and variegated nature of colonial-era Vodou, moreover, the religion has no founder, no unifying doctrine, and no formal organizational network. Neither any of these, nor a Vodou scripture, has ever developed.

Slaves brought to the colony were baptized Catholic upon arrival and given minimal religious instruction by Dominicans, Capuchins, and Jesuits. Syncretism thus immediately resulted, as slaves identified Catholic saints as new manifestations of African spirits, and adopted crosses, holy water, and incense as powerful religious trinkets to be used in conjunction with the amulets that they reconstructed from African religious memory. The Catholic “pantheon” – with its single high creator God, Virgin Mary, and host of dead individuals (the saints) who intervene in the world of the living – lent itself quite fluently to assimilation with the traditional African community of spiritual beings, which likewise has a single distant creator God (called *Bondyè* in Vodou) and numerous spirits and ancestors, who, much like the Catholic saints, are perceived of as accessible and with whom the greatest amount of human/divine commerce transpires.

Spirit possession and divination are the main forms of communication with the dead (*lemò*) and the spirits (*lwa yo*) in Vodou, and together form its ritual focus. Put simply, when our relationship with *lemò* and/or *lwa yo* is in harmony, life is full and pleasurable, whereas when this relationship is discordant, sickness, some other hardship, or even death may result. Upon the occurrence of such misfortune, ritual specialists (female: *manbo*; male: *oun-gan*) are consulted. Either through divination or the orchestration of ceremonies aiming to provoke spirit possession (which most often take place either in temples [*ounfò*], family burial compounds, or public cemeteries), the *manbo* or *oungan* effects communication with the *lemò* or *lwa yo* in order to discover the cause of the illness or discord and to determine a means of reestablishing harmony or effecting healing. Both the maintenance and the reconstitution of this harmony rely primarily on sacrifice in various forms, while healing often involves herbalism and ritual baths.

Haitian Vodou thus combines a variety of traditional African (e.g., Fon, Yoruba, and Kongo) and Catholic elements. While decidedly more akin in ritual and belief to African traditional religion than to Catholicism, Vodou is not an African religion but a product of the Haitian experience of and response to the social and natural worlds. Its understanding of nature is thus more rooted in

West African spirit and ancestor cults than in Catholic theology, which is especially reflected in the religion's great reverence for trees and forests. In Vodou, spirits and the ancestors abide in nature. Together they are spoken of as the mysteries (*myste yo*), and, as in Africa, trees (called in Haitian Creole *pyè bwa*; lit.: "wood foot") are among their most cherished homes.

Vodou is deeply rooted in and sensitive to nature, with many *lwas* being associated with natural phenomenon. The serpent-rainbow lwa Dambalah Wedo, for example, lives in waterfalls, while other spirits are embodied by natural forces, such as Ogun, the *lwa* of the iron. The dead are likewise deeply enmeshed in nature and conceived of as residing either under the ground, across the water, or in the forest. Trees and the forest, though increasingly scarce in the impoverished nation, have thus always featured prominently in Haitian Vodou's rich symbolism and mythology.

Trees gain their great religious significance in Vodou for a number of reasons, such as being the source of sacred drums and the gourd out of which is made the Vodou priest's sacred rattle (*asson*). The most important reason is that trees are believed to be the residence and the "preferred avenue of divine approach," in Maya Deren's terms, of the *lwas*. Because of this, certain species of trees considered especially sacred are planted around Vodou temples, or temple sites are determined by the presence of such trees. These trees, called in French *arbres-reposoirs* (lit.: resting-place trees; altar trees), are recognizable by the straw sacks and strips of cloth that often hang on their branches. Since the *lwas* are thus considered to live in these trees, the *arbres-reposoirs* are themselves rendered cult in Vodou, and thus the straw sacks sometimes contain offerings for these trees and/or the spirits who reside in them, candles are lighted at their trunks, and pottery is broken against them. As the home of the *lwas*, these sacred trees are also addressed by candidates during initiation rituals in rural Haiti.

Whereas virtually all of the *lwas* may live in trees, and most *lwas* prefer certain species of trees, four *lwas* in particular are most closely associated with trees: Legba, Gede, Gran Bwa (Great Forest) and Loko. As the guardian of the crossroads where intersect the sacred and the profane, and as the gatekeeper who holds the keys to the doors of communication between spirits and humans, Legba is in a true sense the most important member of the *lwa* pantheon. Every Vodou temple has a post at its center that runs from the floor to the roof, down which are believed to arrive the *lwas* during communal ceremonies. Commonly known as the *poto-mitan* (center post), this essential feature is also called the *poto-Legba*, reflective of Legba's authority over all use of the pole by spirits or humans. As the gatekeeper, moreover, Legba's sacred tree is the most important in or around the temple yard, and it invariably stands near the

entryway. And as the *lwa* of the crossroads, any tree standing near the intersection of paths or roads may be a site of devotion to Legba.

The most venerated tree in Haitian Vodou is the mapou (alt.: mapou africain; mapou zonbi), or *ceiba pentenda*, one of the most majestic trees in the Caribbean. In West Africa, especially in Benin, the homeland of an important segment of Saint-Domingue's slave population, the spirits of the ancestors are believed to reside in *ceiba pentenda*. The mapou, which appears in many Haitian proverbs and is revered in other parts of the Afro-Caribbean, is the preferred home of the Gede family of spirits, the *lwas* of death and the dead (and, dialectically, of life and the living) who collectively represent Vodou's trickster spirit. Being the moments when the veil between the living and the dead is most permeable, noon and midnight are times when the mapou is reserved for the Gede, hence Vodou practitioners know to stay clear of mapous at 12:00 a.m. or p.m. Given the power of the mapou at noon and midnight, on occasion secret religious societies in Haiti have been known to hold ceremonies then and there.

The *lwa* who is most associated with trees generally is Loko, the spirit of vegetation and the life-force within all plants and trees. As such, Loko provides the healing power manifest in Vodou's rich herbalism and is thus the patron *lwa* of the religion's "leaf doctors" (*medsin fey*). There is consequently a tradition in Haitian Vodou reminiscent of many Native American ritual preparations for the hunt, wherein the Vodou practitioner makes offerings to Loko to secure his blessing before cutting down any tree.

However pervasive is this spirit of reverence for trees in Haiti, it has been overwhelmed by the nation's grueling poverty and overpopulation, which has resulted in, among many other catastrophes, Haiti's almost total deforestation: 95 percent of the country's forest has been lost, and each year 15,000 acres of fertile topsoil is washed away as a result. With an annual per capita income of roughly

\$250, Haitian peasants cut trees for charcoal as a means of income, while electricity-deprived urban Haitians also rely on charcoal for cooking. The result is desertification and a litany of related ecological problems. Thanks to Vodou, at least, in some of the countries most desertified regions there are at least a few mapou trees and *arbres-reposoirs* that remain standing.

Trees (Northern and Middle Europe)

Apart from the arctic prairies and deserts on the northern fringes, Europe is a continent of trees. The dark, evergreen conifers of spruce and fir characterize the northernmost part, the light conifers with its larches and pines are to be found where the sunlight is more generous the year around. The forests reign in Middle Europe where the seasons are even and the rainfall bountiful. The deciduous forests, with their oaks and beeches, show much more diversity of trees than the boreal conifers.

The Teutonic, Celtic, Baltic and Slavic tribes who inhabited Northern and Middle Europe from at least 900

B.C.E. were of Indo-European origin, akin to tribes in Southern Europe. Their languages were and are related, and many of the surviving myths and legends are similar. The Finnish-Ugrians who inhabited the northeast of Europe form a special group within the family of European cultures. The religious history of the continent is multilayered and complex, because the settlements of the ancient tribes were scattered or they were nomadic, and their ideas diverse. Moreover, the extant sources of information are often colored by the worldviews of the commentators.

Julius Caesar described the religious, sacrificial practices of the Druids, the religious class of the Celts, in his *Gallic Wars* (VI.13, composed ca. 50 B.C.E.). Caesar pictured the Druids weaving immense figures out of twigs, which were filled with living people and set on fire. The funeral rites, according to Caesar, were also connected with great bonfires. A century later, Pliny the Elder spoke in his *Natural History* about the Druids as the “people of the oak,” a name derived from the Greek “drouios” which means “oaken” or “from the oak,” and stated that their magic potions consisted primarily of oak-bark (XVI). Pliny also described the sacredness of the mistletoe for the Druids. According to Pliny, mistletoe grows rarely on a hard oak, and when it occurs, it is collected with a great ceremony, which takes place around the oak tree.

According to *Edda* (a collection of poetry from ca. 300– 800 and preserved in fourteenth-century Icelandic manuscripts), the mythical tree of Nordic mythology is the Ash of Yggdrasil, the largest tree in the world, stretching its branches over the skies. Yggdrasil has three roots and each is stretched over a well. The first root is in heaven, over a well where the gods have their sanctuary. Three Fates who represent past, present, and future guard the well and decide the fate of humans. Human ancestry is thought to have come from the twigs of Ash and Elm that floated to shore

and were given spirit, breath, and life. The second root reaches over a well filled with water of wisdom, where the primal, yawning void of the Nordic creation story used to be. In exchange for the water in the well, Odin had to be hanged on the tree for nine nights. The name of the tree means “the stallion of Odin” (one of Odin’s names is Ygg) and is derived from this ordeal. The third root ranges over hot-spring Hvergelmir, filled with snakes. Yggdrasil constantly suffers a great hardship, as four stags bite the trunk from above, and below the snakes gnaw its root. The Fates wash the tree every day with white clay, which keeps Yggdrasil green, in this balance of destruction and preservation, until the day of doom.

The hanging of Odin may bear shamanistic traits of connections with and travel to the underworld and point to an influence from the Finnish-Ugrians on the Teutonics. *Kalevala* (the epic poem of the Finns, collected in 1835– 1849), tells the story of Väinämöinen, who goes to the underworld in search of a magic formula which he needs to finish his oak-boat. He walks for three weeks, through a stand of saplings, bird-cherry and, at last, through junipers (Poem 16). In the end he meets the giant Vipunen (Poem 17), who is fast asleep under the ground. An aspen grows on his shoulders, birch from the brows, alders spread from the jaws, willows from the beard, firs from the forehead, and the pines from the teeth. Väinämöinen is swallowed by Vipunen, but the former tortures the treemonster from within the belly until Vipunen sings the magic rhyme of the creation of the world.

Bonaventure (1217–1274) was a Franciscan teacher at the University of Paris. His book, *The Tree of Life*, is an important Christian source on trees and spirituality in medieval Europe. *The Tree of Life* is based on tree metaphors in the Bible, framed by the trees of the first and the last books of the Bible, the trees of knowledge and life in Eden and Revelation 22. The tree of Revelation bears twelve kinds of fruits and the leaves of the trees are for the healing of the nations. For Bonaventure the twelve fruits are symbols of twelve virtues, which all show aspects of the life and ministry of Jesus as described in the gospels. According to Bonaventure, one can avoid the fallacy of Adam, who chose the tree of knowledge instead of the tree of life, by meditating on the fruits of the tree of life in Revelation, each of which symbolizes the life of Jesus from his conception in eternity to resurrection. The goal of meditating on the tree and its fruit is to be one with the body of Christ in ecstatic unity.

The popularity of *The Tree of Life*, miracle plays, and old Roman traditions of using evergreens as decorations, may have inspired the Christmas tree. This tradition became popular in Germany after the Reformation, especially at the end of the eighteenth century. It was expanded to Britain, America, and throughout the world in the nineteenth century, under the strong influence of Victorian family values, where the tree became the center of family and home rituals during Christmas. The tradition of celebrating spring with a dance around the maypole in Northern Europe is another example of a European tree ritual.

Trees – Sacred

A tree is a tall, single-stemmed, woody plant which bears branches some distance from the ground. Trees are the oldest and largest living organisms on planet Earth. The bristle cone pine (*Pinus longaeva*) in the White Mountains of California can live to be over 4000 years old. The species with the largest individual trees is the giant sequoia (*Sequoiadendron giganteum*), averaging at maturity 300 feet tall and 15 feet in diameter.

In many ways trees are a primary source for life on our apparently unique planet Earth. A leaf is a miniature foodmaking factory – sunlight, air, and water interact with chlorophyll cells in the leaf through photosynthesis and with nutrients from the soil to produce food which allows the tree to grow. In turn, the tree produces food and shelter for other plants (epiphytes), animals, fungi, and microorganisms that visit or reside somewhere on it. Trees influence other life far more than any other kind of plant by their wood, leaves, and fruit, as well as by the special kinds of environments they create (shelter, shade, microclimatic zones).

For humans, trees provide oxygen, food, fuel, building and craft materials, paper products, shade, and soil erosion and flood control. The monetary value of the environmental services provided by a single tree that lives for fifty years has been calculated at nearly \$200,000.

There are also whole cultures, sub-cultures, industries, and occupations focused on trees of a particular kind such as logging redwoods (*Sequoia sempervirens* and *Sequoiadendron giganteum*) in the Pacific coast forests of the northwest United States; maple sugar (*Acer* spp.) in New England; rubber trees (*Hevea brasiliensis*) in the Amazon and rubber tree plantations in South and Southeast Asia; mulberry (*Morus alba*) for the cultivation of silk worms in China; olive (*Olea europea*) in the Mediterranean and Middle East; and coconut (*Cocos nucifera*) in the Pacific islands and other tropical areas. In addition, special arts have developed around trees like topiary, tree sculpturing in eighteenth-century England, and bonsai, the cultivation of miniature or dwarf trees in Japan. Trees can have physiological and psychological impacts on individual humans as well, such as relaxing heart rate, blood pressure, and brain waves. Research has shown that hospital patients recover faster than otherwise if they can see a tree outside their window.

From observations such as the above it is little wonder that trees may also be considered sacred. The common characteristics of sacred trees are described by Nathaniel Altman:

A tree becomes sacred through recognition of the power that it expresses. This power may be manifested as the food, shelter, fuel, materials used to build boats, or medicine that the tree provides. How a tree is used will vary according to geography, species of tree, and the particular needs (and ingenuity) of the human culture involved. Sacred trees have also provided beauty, hope, comfort, and inspiration, nurturing and healing the mental, emotional, and spiritual levels of our being. They are symbols of life, abundance, creativity, generosity, permanence, energy, and strength (1994: 9).

I first discovered the existence of sacred trees while conducting field research in Thailand. From Bangkok to the remotest rural villages, one often sees colorful cloth wrapped around the lower trunk of a tree. A small spirit house with offerings such as candles, incense, food, and water may be placed near the base of the tree. Local people believe that the tree is the residence of a spirit. Anyone who harms such a tree might experience misfortune, sickness, or even death as the spirit takes revenge. Consequently, because of their special status sacred trees are usually protected in effect.

Sacred trees are usually extraordinary in age, size, shape, or some other attribute. For example, in one village in Thailand that I visited, a giant ironwood tree or Malacca teak (*Azelia bakeri*) is considered sacred. Its secretions resemble blood. Also residents in the area mentioned that twice lightning struck and burned other trees nearby, but did not touch this tree because of its extraordinary power. In addition, some residents have seen an unusual light near the tree in the early evening.

Certain species of trees are sacred because of their relation to a religion. The banyan (*Ficus bengalensis*) and bodhi (*F. religiosa*) have been associated with Buddhism since its inception. The Buddha is believed to have been previously incarnated as a tree spirit and later during his reincarnation in human form he reached enlightenment under a bodhi. Also in Hinduism the bodhi is supposed to be the home of the gods Krishna, Brahma, Vishnu, and Shiva. Thus, the bodhi is the most sacred of trees for both Hindus and Buddhists, and this is reflected in its species name. The banyan tree is also considered sacred by Hindus. Moreover, in the Buddhist country of Bhutan, it is actually illegal to cut down any living tree.

In many Asian countries, some monks wander in forests where they shelter and meditate under trees, emulating the life and teachings of the Buddha. Furthermore, in Thailand, a number of monks have symbolically ordained trees by ceremonially wrapping the saffron robes around giants in the forest to protect them from loggers. By mere association, the surrounding trees may also be protected. Tree ordination as a conservation technique has usually proven successful in Thailand.

Throughout the world, diverse cultures recognize sacred trees. For instance, the Celts, Druids and many other tribes in ancient Europe venerated single trees, groves, and forests, especially of oak (*Quercus* spp.). Oaks seem more prone to being struck by lightning than other tree species, and this may have contributed to their sacred status. Oak and spruce (*Picea* spp.) were of special significance in ancient Germanic rituals, and this is the origin of the modern tradition of the Christmas tree. Yew trees (*Taxus* spp.) were especially important in ancient Britain, and churchyards were built around

or close to them. To this day there are several hundred shrines throughout Europe associated with individual trees.

In the United States, the Mormon religious faith was born near the town of Palmyra in New York. There today it is still possible to visit the Sacred Grove where the Mormon prophet Joseph Smith first had divine visions. Also in the United States and elsewhere, some families plant trees as a living memorial when a relative or friend dies. A tree that survived the bombing of the federal building in Oklahoma City became a symbol of renewal and a sacred tree of sorts.

At first glance a single sacred tree may not appear to have much if any significance for environmental and biodiversity conservation. However, a single tree is part of a hierarchy of progressively larger ecological systems. A large tree can host dozens or more of other species such as lianas (vines), epiphytes, mosses, and fungi. In turn there may be dozens to hundreds of species of resident and transient animals. Millions of microorganisms may also inhabit a single tree. Interacting with these species are others as predators, parasites, competitors, and so on. In addition, birds, bats, insects, and other animals pollinate flowers of the tree and those of other members of its species in the surrounding environment. Such animals may eat fruit from the tree and disperse the seeds elsewhere, thereby stimulating growth of other individuals of that species. In such ways, diverse animals link individual trees of the same species into wider networks of reproduction and production.

A large tree also creates microclimates and microenvironments for plants, mosses, fungi, and other organisms which grow on its leaves, branches, trunk, and roots as well as on the adjacent ground. The leaf-fall and other litter from the tree yields nutrients for plants and animals below on the ground through decomposition by decomposer species. A large tree may also act like a water pump, its deeper tap roots pulling water toward the surface. Some of this water may become available for surrounding plants as well. The roots of the tree may pump nutrients to the surface too. Acting something like a sponge, the tree captures and slowly releases some rainwater which might otherwise contribute to more soil erosion. Thus, trees are a very important component of the composition, structure, and function of many ecosystems. From this systems perspective a single tree can contribute to environmental and biodiversity conservation. When a large tree is considered sacred, and thus afforded special protection from harm, it may help conserve a multitude of other species and their symbiotic relationships as well as specific microclimates, microenvironments, soil, and water resources. Of course, these manifold ecological functions of a single tree are multiplied many times over in groves and forests which are even more important for conservation.

If more people appreciated the numerous diverse meanings and significances of trees, then they might appreciate even more the groves and forests, and consequently be more concerned about their wise use and conservation.

The Trickster

The trickster is a virtually universal figure in world mythology, especially that of hunter-gatherers, on whose mythological landscape he holds center stage. Trickery and deceit, frequently exercised in the form of coarse and hurtful practical jokes on a duped party, and excessive biological drives, are the trickster's characteristic traits. He is usually a solitary figure who roams the landscape, playing pranks and getting into scrapes, as his deceit and cunning (due to the stupidity with which they are usually performed) may backfire on him. In the context of his prankish and foolish antics, he may, more or less inadvertently and haphazardly, find himself in the role of culture hero and transformer, bringing such things as fire, cooking, curing, weapons, carnal knowledge, conception by sex and painful childbirth, death to humans, setting the sun in the sky, or pulling the fished-up islands of Polynesia into the ocean. He may transform food plants into stars, mud into the Earth, clay into humans, ogres into animals or, in the manner very much of the trickster, create the waterholes and river-beds of the Kalahari with his hugely swollen testicles that he drags behind him through a hitherto featureless landscape, or, with one mighty, cosmic fart, scatter all living creatures to the various places on the Earth (as did the Nharo Bushman Pate and the Winnebago trickster Wakdjunkaga, respectively). His exploits and misadventures are the stuff of many tales, or tale cycles, that provide entertainment to an audience both of children and adults, as well as act as cultural mechanisms for venting social frustration and for reaffirming social values and beliefs.

Trickster figures are particularly prominent in the folklore of America and Africa. They appear in the former continent in such personas as Raven (along the northwest coast), the stealer of the sun and bringer of light to the world, or as Hare, Beaver or the anthropomorphic Nanabusho or Wiseakjak (both variously spelled) among the Algonkians and Athapaskans, who are variously tricksters, teachers and transformers. The most widespread and clearly delineated North American trickster being is Coyote. His African counterpart, Jackal, is a trickster figure also in southern Africa, along with /Kaggen (Mantis), as well as numerous others. For Hare, too, we find an African counterpart, in the folklore of a number of Bantu-speaking peoples. Spider – Ananse and Tore, among the Ashanti and Azande – and the “Pale Fox” – Ogo (Yurugu, among the Dogon) – are two of Western and central Africa's betterknown tricksters. West Africa's most complex trickster figure is the messenger god and god of divination Eleggba (or Eshu, or, as he is known among the Fon and Aflateke, a name meaning “I have tricked you”), who is prominent also in the folklore and belief systems of New World Afro-Americans in Surinam, Brazil, Trinidad and Cuba.

He is reminiscent of the Greek figure of Hermes, another messenger god, as well as god of thieves, for which role he is suited through his qualities of cunning, fraud and perjury. Another European trickster god was Loki of Nordic mythology, the *enfant terrible* of the teutonic pantheon who was a comic trickster and transformer in the early myths, but who became progressively evil and destructive in the later cycles, having been the chief force to bring about the *Raganrök* – the twilight of the gods – and the end of their realm and world. Other European tricksters are the medieval figures of Renart (Reynard) the fox and Till Eulenspiegel, both anti-establishment figures whose dupes were the temporal and clerical power holders of the day, as well as the towns' burghers. Finally, there is the figure of Robin Goodfellow (alias Puck, of "Midsummer Night's Dream"), the mischievous fairy being of English folklore, a trickster *par excellence*. As a shape-shifter – "sometimes a horse, sometimes a hound, a hog, a headless bear, or sometimes a fire" – who played a seductive pipe, this "shrewd and knavish sprite" lured forest travelers into swamps, "laughing at their harm." He delighted in watching the follies of humans and – as is the trickster's wont – in "frightening the maidens of the villagery."

As is evident from this brief and quite incomplete survey of the world's rogues' gallery of tricksters, we have here a figure of great diversity and complexity. In his role and being, the trickster is an ambiguous blend of things: prankster-protagonist, culture hero and transformer and, in some instances, also god. Ambiguity is evident also in his ontological make-up, which is that either of an animal

– usually one sly, agile and elusive – or of a human. However, neither guise is unequivocally "animalian" or humanoid. As animal – Coyote, Spider, Mantis, Hare, Raven – trickster, the storytellers insist, is also "a person." As for the humanoid tricksters, these figures may be of misshapen bizarre appearance, such as the Nharo Bushmen's Pate, a one-legged manikin who was covered with cocoon fibers and had big toes sticking out from all over his body, or the Canadian Micmac's Kuloscap, who was a giant. Humanoid tricksters may have trouble with their limbs and body parts, which may work at cross-purposes with each other or may become unfastened from their owner's body, running off on their own. The body parts that are especially active in the trickster are those that contain orifices, especially those of the alimentary canal and nether regions; they – anus, penis, along with buttocks, testicles, and entrails – may sever themselves, to fly off on some mischievous pranks that blend scatology with lasciviousness (two examples of tricksters with such errant body parts are Wakdjunkaga and Kauha, of Winnebago and !Kung folklore). In refastening themselves to his body, the trickster's parts may be haphazardly reordered, such that his head may be fastened to his bottom or his penis to his back. His anatomy is thus quite fluid and unstable; its inconstancy is heightened whenever he undergoes one of his shape-shifting transformations to animal, tree, rock, or water body. The trickster delights in transformation, both of himself and of beings and states around him; as a result, he and the world around him are a-quiver with inchoate, liminal ambiguity.

Ambiguity also marks the trickster's sexual and social disposition. While usually male – with often voracious heterosexual appetites – he may also assume a female guise, usually in the context of some sexual escapade. While generally solitary, the trickster may wander with a companion, who may be the butt of his pranks, or who may turn tables on the trickster and outwit him; the classic example is Coyote and Wolf (or, in the southern African variant, Jackal and Hyena). In Amazonia, the trickster may be one of a pair of mythical twins, while the Chippewan Wenebojo's sibling companion was Nekajiweizik – one of his two younger brothers (after he had killed the second brother). Some tricksters – such as the /Xam and !Kung Bushmen's /Kaggen and Kaoxa (or Kauha) – have wives and live in extended families, permanently or for a while. The family members provide a foil to the trickster's moral and social failings, of food greed, failure to share or provide properly, sexual lusts and jealousies (frequently incestuous in bent), which all conspire against the trickster's ever being a solid family man.

While the moral qualities of this vindictive and destructive prankster and boaster, vulgarian and libertine, may seem to be unequivocal, once again we note ambiguity. The trickster may also be seen in the role of *Heilbringer*, extending help, generosity, compassion and protection to those he deals with, especially weak or oppressed beings who are threatened by danger or monsters. An example is the Athapaskan-speaking Tagish people's "Smart Beaver" who, in a cycle of myths that chronicle his heroic voyage down what is probably the Yukon river, "cleaned out" all the giants and animals (and scaled down the latter to their current size, as well as changing their diet to foods that excluded human flesh).

The ambiguity that surrounds the trickster also has a temporal dimension. While his world is usually the inchoate, mythic age back in the mythological past, he may also enter the historic and recent past; thus, we find the Khoisan tricksters Heiseb or Jackal roaming the farms of the pioneer trek Boers and working for, and duping the *baas*, or the Zande Tore, who was arrested by the British colonists who, among other things, taught him to drive an automobile. Life and death are poles that the trickster confounds as well. Many a tale tells of his death or murder, sometimes in a gruesome manner, through burning, drowning, dismembering, being devoured and swallowed up, only to be revived anew (or revivifying himself). He may do so by healing himself, as did the !Kung trickster Kauha (introducing thereby the trance curing dance to humankind).

The fact that this being, of deceit, moral turpitude and stupidity, may also be a being that is god-like in his power and acts, and the reverential attitudes he may invoke in the people, who, at other times, would laugh at his antics and express outrage at his moral perversities, is perhaps the most striking manifestation of the ambiguity that envelop the trickster figure. Among the Navaho, Coyote was both a holy being and a buffoon, and to the Bushmen, the tricksters /Kaggen or //Gāuwa were, in addition to pranksters and vulgarian, both also gods, who protected game animals and were a numinous presence at initiation and curing rites. Among some of the Bushman groups,

the curing shaman had to seek out the help of trickster god, who was a bit of a curer himself, when he went on his trance-induced outer-body, spirit journeys. As among the North American Indians, there is a similarity between some of a trickster's exploits and adventures and shamans' journeys to the spirit world.

Combining in his being the traits of animal, human and god, the trickster points out the unity of such universally separated realms as culture and nature, sacred and profane, natural and supernatural. Among hunter-gatherers, whose trickster figure is especially prominent, well delineated and universal, and whose guise is usually animalian – yet, at the same time also human – the inseparableness of nature and culture is perhaps the main symbolic message of the trickster. That humans and animals are kindred beings, that the ontological and conceptual boundaries that separate them are fluid or even illusory, is a message that resonates with the lifeways and worldviews of hunter-gatherers, which are embedded within nature. Among other societies, with states and food production and complex pantheons and charter myths, the trickster is more likely to be a god – such as Loki, Hermes, Legba, or Maui, respectively of the Scandinavians, Greeks, West Africans and Polynesians – with his own divine profile and purpose, as creator or destroyer, demiurge, messenger, translator, diviner, protector or fertility god. Through the constraints of his human and animal side, such a trickstergod displays a sacred quality that is different from that of other gods. It is a sacrality that is both more and less accessible than that of the other divine mortals. Through his foolishness and carnality, his lies and moral failings, he is akin to mortals and their own follies and failings. Yet the trickster-god is capable also of dumbfounding the gods, of stealing from them, outsmarting and out-talking them, through witty double-talk that contains depth of wisdom that may surpass their own divine understanding.

As a wanderer, an outsider, a “marginal man,” the trickster, in each of the places and domains he enters, causes both havoc and consternation. The reason is that he shocks its inhabitants – humans, animals, gods – into recognizing the relativity and fragility of the world of order and structure they have created for themselves and live by unself-consciously. Puck's exclamation – “Lord, what fools these mortals be” – is the message of the trickster everywhere, presented by the outsider looking in on the insiders' ways of doing things, living their lives, thinking their thoughts, which to him, the outsider, seem antic and contestable. In upsetting and challenging them, he reminds humans – or gods, or animal-humans of the mythic age – of the arbitrariness and limitations of a set and seemingly given cultural, sacral and biological order. As such, the trickster becomes an agent of creativity who challenges a culture's monocultural ways and univocal thoughts; he brings a “more than this” dimensionality to existence, alerting humans to the “unquenchable fecundity of all that truly is and can be” (Hynes 1993: 212, 216).

Tukanoan Indians (Northwest Amazonia)

The Tukanoan Indians form a linguistic macro-unit divided into two geographically separated populations in Northwest Amazonia, the Western and Eastern Tukanoans. Straddling the borders between Colombia, Ecuador and Peru, the Western Tukanoans (including principally the Secoya, May Huna, Siona and the Koreguaje ethnic groups) comprise some 1500 individuals living on the upper Putumayo and Caquetá rivers and the lower Napo river. The considerably larger population of Eastern Tukanoans, amounting to some 20,000 people, inhabit the Vaupés and Apaporis drainages in the Colombian Amazon and the upper Rio Negro region of Eastern Brazil. Though related closely linguistically, the two populations are socially and culturally distinct.

The habitat of the Eastern Tukanoan Indians (henceforth Tukanoans) is interfluvial (*terra firme*) tropical lowland forest. The Vaupés region is ecologically described as a blackwater ecosystem with nutrient poor soils and rivers (Moran 1993). Biological diversity is high while the productivity of terrestrial and riverine fauna is low, even by Amazonian standards. In these harsh surroundings the native populations make a satisfying living by means of shifting cultivation (bitter manioc being the staple), fishing, hunting and gathering. Population density is low, and settlements widely dispersed along rivers and streams. The traditional settlement is the multifamily longhouse or *maloca* comprising a patrilineally extended family. Today settlements are increasingly concentrated around schools, shops and other facilities, and the traditional *maloca* is largely replaced by smaller, single-family houses grouped into villages. Though the traditional livelihood system still provides the basis for sustenance, petty trade, mining and contract labor are increasingly important in the local economy.

The Tukanoan social universe is composed of some twenty named exogamous groups (including the Tukano proper, the Desana, Cubeo, Wananao, Bara, Barasana and Makuna), each identified with a distinct language and a proper river territory. Each group reckons descent in the male line from a putative, mythical ancestor, conceived of as an Anaconda. The exogamous group also holds what may be described as corporate sacred property, including tangible ritual goods (musical instruments and dance ornaments), sacred substances (blessed coca, tobacco, red paint and beeswax), and intangible, spiritual wealth, such as chants, songs and a specific set of personal names which circulate among its members in alternate generations. The most important material symbol of the group is the set of sacred palm-wood flutes, the Yurupary instru-

ments, which are said to embody the ancestors. This sacred property is described as the “weapons” and “defenses” of the group.

Different exogamous groups relate to each other as putative kin (between which marriage is avoided) or affines (between which marriage is prescribed). Tukanoan society is economically undifferentiated, and there is little evidence of political cohesion beyond the local group of adjacent settlements. Leadership is confined to settlement headmen and occasional charismatic local leaders. However, this equality in the economic and political field goes with a conspicuous differentiation in the religious and ritual domain. Shamans and other ritual specialists (dancers and chanters) of varying and complementary skills play an important role in society. Large-scale public rituals are frequent and considered essential for survival and prosperity.

Tukanoan religion is conveniently described under three general headings: the Yurupary cult, animism and shamanism. Of these, the Yurupary cult does not (and probably never did) form part of the Western Tukanoan religious universe, while the essential features of animism and shamanism appear to apply to both the Eastern and Western groups.

Environmental understanding is constitutive of Tukanoan religion. Social and religious imagery draws on, and is fundamentally inspired by, indigenous knowledge of biological and ecological processes. The Tukanoan environmental understanding is encoded in an animistic ontology-cosmology. Animism, as understood here, implies a fundamentally monistic, participatory orientation to the world, transcending the Western ontological divide between nature and culture, the animate and the inanimate. The human–environment relationship is one of relatedness, inter-subjectivity and interagency; it is fundamentally social and dialogical in nature. This is the ontological basis for Tukanoan shamanism.

It can be argued that such a participatory stance is conducive to environmental sustainability and the conservation biological diversity. The traditional Tukanoan notion of reciprocity, which guides their interaction with the environment, and the mythologically grounded ritual regulation of resource use, provide strong behavioral sanctions against the overexploitation of forest and river resources. In the Tukanoan view, human life is ultimately geared toward the overall goal of sustaining the cosmos. This life-sustaining responsibility is epitomized in the role of the shaman. Fundamentally concerned with human survival and the continuous fertility of nature, shamanism is the dominant mode of religious practice among the Tukanoan Indians.

The Yurupary Cult

The Yurupary cult is the fullest expression of (Eastern) Tukanoan religious life. Misunderstood as a “devil’s cult” by early missionaries, the Yurupary complex involves the ritual use and display of sacred palm-wood flutes and trumpets (the Yurupary instruments) representing the deified ancestors of the clan and exogamous group. The

cult, which is common to the Tukanoan and Arrawakan groups of the Vaupes-Icana region of Northwest Amazonia, has therefore been described as an ancestor cult with features of a male secret cult. The Yurupary instruments are handled by adult men only, and the ritual display of the most sacred instruments is the key event in the process of male initiation. The Yurupary complex is thus intimately connected to the patrilineal descent system – the establishment of gender difference and the formation of male personhood and collective identity. However, beyond their patrilineal connotations, the sacred instruments are associated with the fertility of nature and the regeneration of life at large. The ancestors, embodied in the Yurupary instruments, are the generative source of all life.

There are two types of Yurupary rituals: the principal ritual, involving the display of the most ancient and sacred instruments, and the Tree Fruit ritual. The latter is a weaker version of the main ritual, involving less sacred instruments and the ritual redistribution of forest fruits. The main ritual, which does not feature any ritual redistribution of fruits, is held at the beginning of the rainy season, which is also the season of the ripening of the wild forest fruits. In Tukanoan thinking, this is the beginning of the annual cycle. The Yurupary ritual heralds the new year, and is seen as instrumental in bringing about the renewal of nature and the spiritual revitalization of the community.

Just as it inaugurates the annual cycle, the Yurupary ritual initiates male adulthood and conveys full membership in the descent group. As the key event in the male initiation process, it marks a new stage in the life cycle of men. Indeed, the annual ritual cycle, beginning with the Yurupary ritual and ending with the Peach Palm festival, a food feast celebrating the peach palm harvest and the final departure of the recently dead, symbolically reproduces the male life cycle from initiation to death. Also pubescent women are ritually initiated. However, in contrast to the male ritual, which is a collective and public affair, female initiation is a private and discrete event following upon first menstruation.

At male initiation, a group of pubescent boys are made to see the Yurupary instruments. Under the effect of hallucinogenic *yagé* (*Banisteriopsis* sp.), and supervised by elders and the officiating shaman, the initiates are brought into direct contact with the ancestors (in the form of the sacred instruments). Women and children are excluded from the central events of the ritual. The ritual sequence follows the familiar pattern of a passage ritual: the initiates are symbolically killed (immersed in a cold forest stream) at the eve of the ritual, and brought back to life as new-born beings at the end (as they are again made to immerse themselves in the river, now together with the instruments, and subsequently led back into the house). At the height of the ritual, the initiates sit in fetal position inside the house, as the instruments are played over their heads and motionless bodies. Thus, they are impregnated with the vital force of the living ancestors. The boys are then whipped to become hard and strong. The Yurupary instruments are imaged as fierce predators (jaguars and anacondas), swallowing and regurgitating the initiates and thereby reconstituting them as full social and spiritual

beings. Infused with regenerative, patrilineal essence, the pubescent boys are reborn as fertile, adult men.

Animism

Tukanoans inhabit an animated landscape where everything created has the capacity to become alive and to actively intervene in the course of events. Hills, mountains, rocks and rivers are infused with the forces of creation; they are seen as consubstantial with the creators and incorporate their powers. Every place and feature of the landscape has a name and tells a story about the deeds of the ancestors. These mythical events, encoded in names and places, confer particular powers to the local landscape. The beings – plants, fishes, land animals and humans – inhabiting this empowered landscape share in its potency; they are charged with creative as well as destructive powers which must be ritually handled to ensure human survival and well-being. Everything made and crafted from natural materials is also believed to contain this ancestral potency; baskets, tools and weapons, houses and canoes situationally obtain agency and become alive. Objects are fundamentally subjects; subjectivity is their natural condition. Crafted things are thus doubly potent; they contain not only the powers of the materials from which they were made but also the agency and creative intentionality of their makers.

In Tukanoan metaphysical discourse, nonhuman animals and plants are generally described as “people” or “humans.” The term, which in ordinary discourse is used to denote an (unspecified) exogamous group and to distinguish human beings from other living kinds, is thus contextually expanded to include all living kinds. In the religious ontology of Tukanoan peoples there is no absolute distinction between human and non-human beings. Social groups and natural species are categorically fused; exogamous groups are natural kinds, and different species are “distinct peoples.” Nonhuman animals and plants are attributed with human agency, will and intention. Animals and plants have houses, are organized into communities, have headmen and ritual specialists. Game animals, in particular, are said to live like human beings: they cultivate the land, harvest their crop and prepare their food, make their proper ritual dances and drink their beer. They have their own ritual attire and, most significantly, their proper Yurupary instruments. Like all people, they have “culture.” Humanity, the human life form, is the model for all living kinds. Culture is what all mortal beings, human and non-human, have in common.

What distinguish different species or “peoples” from one another are their distinctive “bodies,” their shape, coloring, sound and corporeal habits which are all associated with their different mythical origins and the specific metaphysical roles assigned to them in the cosmic scheme of things. In the case of animal species, difference is conceived of in “cultural” terms – as distinctive “clothing,” body paint, language, food habits and ritual property (“weapons” and “defenses”). Natural differences are, as it were, culturalized.

Conversely, in the case of humans, cultural difference is essentialized and naturalized: differences in language, food habits and ritual goods are perceived as natural – innate and corporeal, constitutive of group identity. To Tukanoans, culture is nature – timeless and unchanging, created along with the rest of nature and handed down to present generations from the first ancestors.

A wholly socialized or humanized cosmos such as that of the Tukanoans, in which the Western nature–culture divide is abolished and where all beings and things are construed as actual or potential subjects-persons, is conveniently called animistic. Animism, in this precise (and revised) sense, refers to a participatory (monistic) type of ontology which is extremely widespread among indigenous peoples around the world, and one which is fundamentally distinct from, or opposed to, the naturalistic (dualistic) ontology characteristic of Western modernity.

Shamanism

Tukanoan social and religious practice is situated in this ontological-cosmological space. Survival, reproduction and the pursuit of well-being take place in a perceived reality where every life form (species) is seen as a “people,” and every being a person – a sentient, intelligent subject. Natural objects, artifacts and features of the landscape have a subjective side and, thus, a potential for intentionality and agency. What is generally referred to as shamanism should be understood against this animistic background. Tukanoan shamans, invariably male, are part-time ritual specialists possessing expert knowledge of the ultimate powers. Their function is to mediate between humanity and the nonhuman agencies that surround them in order to make human life possible and to oversee the proper working of the cosmos.

Shamanic knowledge is essential for making a living in this animated world, made possible by the creative and destructive powers of the ancestral beings. By shamanic means – incantations, spells and blessings – the world is made safe, food is blessed and human beings protected from spiritual dangers. Shamans are, quite literally, gods on Earth; they cure and prevent disease, but may also send sickness and death; they supervise and metaphysically control the events at birth, initiation and death, literally constructing, deconstructing and reconstructing human persons; they ensure, by ritual means, the continuing fertility of nature and, thus, the availability of game and fish for human consumption; and they transform beings of nature (game, fish and forest fruits) from potentially perilous subjects and vehicles of death and disease to lifegiving and strengthening food (Arhem 1996).

Tukanoans distinguish between two kinds of shamans, one intimately associated with curing but also with causing death and disease, the other associated with protective, preventive and life-sustaining shamanism in connection with life-cycle rituals and public rituals more generally (Hugh-Jones 1996). The former, usually referred to as *payé* in the literature, is feared and perceived as a morally ambiguous figure of

comparatively low social status. The source of his power is highly inspirational and idiosyncratic. As curer and sorcerer, he operates as an individual, often at the margins of society. In many respects he is the prototypical shaman.

The other, life-sustaining and protective shaman, by contrast, has attributes usually associated with priesthood: his role is entirely benevolent and thoroughly social. Directed toward the good of the community, the life-sustaining shaman is morally unambiguous. Consequently, his social standing is high, usually merging secular and ritual authority. The source of his authority is his knowledge of the mythical canon of the group. The office tends to be inherited from a senior patrilineal relative and invariably involves many years of apprenticeship, from initiation to mature age. Recognition as a true life-sustaining shaman comes only with advanced age and demonstrated expertise.

All initiated, mature men are attributed with some amount of shamanic knowledge. All men know how to bless food and, thus, to render it safe for consumption, and all men are capable of sustaining themselves in the local environment: they know the spiritual dangers and assets of their territory and the ritual acts that necessarily accompany the everyday chores in the forest and on the river. However, only the curing shaman is capable of treating the seriously ill, and only the life-sustaining shaman possesses the expertise to direct the major lifecycle rituals and the public ritual events aimed at ensuring the fecundity in nature.

Yet, even among the shamans, knowledge and skills are differentiated and graded. Thus, only the most reputed and knowledgeable of life-sustaining shamans are entrusted with the supervision of the annual Yurupary ritual, when the ancestors come alive and enter into direct contact with the living community members. At this ritual, the officiating shaman turns into a primordial being himself; he embodies the Yurupary, the omnipotent Ancestor-Creator. Among the Makuna, one of the Tukanoan groups in the Pirá-Paraná region of the Colombian Amazon, the principal Yurupary is identified as the Ancestral Bumble-Bee, the Primordial Pollinator. The imagery is revealing: feeding on flowery plants, the Pollinator enables the plants to reproduce and multiply. Impersonating the Primordial Pollinator, the shaman fecundates nature and renews the world.

In the 1970s and 1980s, the indigenous population in the Vaupés region was heavily affected, in close succession, by the booming Colombian coca trade and the Amazonian gold rush. Both events implied dramatic upheavals in the regional economy. For many indigenous communities they provided much needed cash income but also caused social disruptions and local environmental depletion. Nevertheless, the Eastern Tukanoan homeland has, on the whole, been spared large-scale forest destruction and settler penetration. In 1982, the main part of the Colombian Vaupés (some 3.5 million hectares) was declared Protected Indigenous Land (*resguardo*). Within this legal framework, Tukanoan Indians have largely been successful in defending their heritage and homeland against external intrusion. Indigenous interests have been effectively promoted by the Regional Indigenous Organization (CRIVA), founded in 1973, and by its several local offshoots.

Missionary influence is strong along major waterways and in the vicinity of frontier towns and trading settlements. In more remote areas, however, indigenous beliefs and practices remain strong. Partly in response to the threats posed by the cocaine boom and the subsequent gold rush, partly as a result of the activities of the regional indigenous movement, there are today signs of indigenous cultural revival in the region (Arhem 1998b). Traditional rituals are performed with renewed vigor, and shamans and other local authorities are assuming a new role in the emerging Tukanoan leadership, now efficiently interacting with state institutions, the church, and pro-indigenous international organizations.

U

U'wa Indians (Colombia)

The U'wa Indians live on the slopes of the Andes in northeastern Colombia, along the eastern side of the range called Sierra Nevada del Cocuy. Brutally reduced in numbers and in territory by the Spanish conquest, the U'wa remained somewhat isolated in the Andes until the 1940s and 1950s when a road was constructed by the government opening their lands to white peasants and to Catholic mission settlements. At the turn of the twenty-first century the U'wa numbered about 5000, and the Colombian government acknowledged only a small portion of their original territory. Much of this land has been affected by ongoing civil war, by illegal drug trafficking, and by the government's policy of promoting oil exploitation. A large number of U'wa, and the governing authority of the tribe itself, adhere to their traditional ways while they struggle to keep these outside forces from invading their culture. Their struggle is carried on by political and legal means, but at bottom it is a religious one, for the U'wa world is essentially constructed of spiritual beliefs.

The U'wa believe that they are descended from deities of an upper world and a lower world. They occupy a middle world that is delicately balanced between the upper and lower worlds, and believe it is their duty to maintain this balance through chants and by living in harmony with the processes of the universe. If the balance is upset, the universe will come to an end. Thus, for example, in certain ceremonies the U'wa chant myths all night to assure that the sun and other natural processes continue along their proper courses, and they chant at different times of the year to keep the cycle of seasons moving. There are pathways connecting the three worlds, along which the deities travel. The paths of the upper world are those of certain stars, sun and moon, while the paths of the lower world are rivers, and all paths meet in lakes. By these paths, various good and bad qualities enter the middle world, and the master shaman chanters, under hallucinogens, travel the paths in order to shut out bad qualities or allow good ones to enter the middle world. Nature serves as a central symbol in this cosmology, as it does in the simpler metaphor that the U'wa sometimes use, namely, that the world is a body with its head in the highlands, caves are mouths, mountain ranges the spinal cord, and the forest the pubic hair of lower world deities.

This religious view of nature guides the way the U'wa live in their environment. As agriculturalists, hunters, gatherers and fishers, they change their place of residence several times a year, from tropical lowlands, to foothills, to high mountain rainforest. The moves, at set times, appear not to be related to agricultural or climatic advantage, but rather to maintaining the balance of upper and lower worlds. Maize is not sown in optimal planting conditions, but rather at the times and locations that assure its

harvest will be available for scheduled religious ceremonies in which maize plays an important role. The U'wa do not enter certain high mountain areas, and do not fish, bathe or drink from certain lakes and rivers. In clearing fields for cultivation, they do not touch trees that provide fruits or nuts for animals or humans, and they leave a great deal of vegetational cover and mulch. Fields are left fallow for a period of years before replanting. Animals are to be caught only by trapping and the spilling of their blood is to be avoided. Many of the U'wa's chanted myths (they have no written language) are about forest foods, cultivated foods, and animals. They believe these things will disappear if they stop chanting about them. Indeed, they are disappearing as white settlers and others encroach on the U'wa traditional territory. One U'wa response is to increase the chants in order to re-create them.

The U'wa have no known tradition of violence to settle conflicts among themselves or with outsiders. Animosities do arise within the tribe and with outsiders, but the U'wa eschew use of knives or firearms in disputes, and say their weapons consist of thoughts and words. Today, they strive to be left alone, aligning themselves with neither side in the civil war and resisting foreign encroachments that affect their land or environment. Through political stances and legal actions, they accuse white colonization and the Colombian government in general of taking their territory, introducing diseases, exhausting natural resources, causing hunger, preventing them from living materially on their land in the traditional way, and refusing to acknowledge their beliefs that all the natural world is sacred and the U'wa are its keepers. They view the government's current opening of their territory to international oil companies in apocalyptic terms. In actions from lawsuits to civil disobedience to an international media campaign, the U'wa insist upon recognition of their belief that oil was distributed throughout this world and the lower world by the deities when they created the universe, that it is a living resource as if it were the blood of Mother Earth doing its sacred work just where it is, and that to exploit it would be a sacrilege destroying the balance of the universe and provoking the collapse of U'wa culture. A network of international activists has formed to aid the U'wa in their struggle against oil companies and the government. Struck by the poignancy of this small, spiritual tribe resisting oil exploitation because it believes oil is the blood of Mother Earth, human rights and environmental activists from Colombia, the United States and Europe have publicized the natives' plight, helped them in litigation, brought U'wa tribal leaders on foreign tours, and pressed their own governments to protect the U'wa. Colombian anthropologists and lawyers, the Italian Green Party, a coalition of several groups operating as The U'wa Defense Project, Earth Justice Legal Defense Fund, and Harvard University's Program on Nonviolent Sanctions and Cultural Survival, among others, have all played key roles. Amazon Watch several times brought tribal leaders to address the annual shareholders' meeting of a California oil company threatening U'wa land. A young American environmentalist, impressed by the naturalistic religion of the U'wa, was in U'wa territory in the late 1990s together with two native American Indian women leaders to build international solidarity when the three were sequestered and assassinated by gunmen

of the Fuerzas Armadas Revolucionarias de Colombia (FARC), demonstrating further that the U'wa < GSPLIT:u'Encyclopedia of Religion and Nature.htm

GSplit Archive &{A6727B28-33EB-4FF4-A940-AD0AC8CF0C69} yý_ :Z> Đë Z world has turned chaotic.

If the oil drilling goes ahead, the council of elders – the most respected tribal authority – has recommended that the U'wa follow a precedent said to be known in their oral history from the sixteenth century: with the Spanish in pursuit, the U'wa men, women and children jumped from a high cliff in a mass suicide.

UFOs and Extraterrestrials

Flying saucer cults and the broader UFO movement work in general within a galactian theological framework that ranges between gnostic and astral worldviews. From the transcendental orientation of gnosticism in which the material is either denied reality or significant value, nature is dismissed as a foil to spiritual meaning. The astral view is of course closer to the pagan inasmuch as both ground themselves in the tangible. Where it differs, however, is in crossing the “death of God” threshold to deny any ontological validity to the supernatural. Astral galactianism replaces the supernatural with the extraterrestrial and technological in order to demystify and demythologize primarily the Abrahamic religions, simultaneously (if unconsciously) mythologizing and ideologizing science and technology. Inasmuch as galactian spirituality centers on the cosmos as its all-encompassing structural reference and tends often to employ an Enochian narrative concerning “fallen angels” and their revolt against the divine hierarchy, nature religion becomes largely incidental. Nevertheless, UFO groups are highly individualistic, and must be examined on an ad hoc basis to discern whatever nature-spiritual dynamic may inform their particular outlooks. These range from James Jacob Hurtak’s writings (*The Keys of Enoch*), those of Elizabeth Clare Prophet (Church Universal and Triumphant) and the Urantia Foundation to such groups as George King’s Aetherius Society and Claude Vorilhon’s Raëlians.

The galactian inspiration of New Age UFO thought derives from Theosophy and the concomitant notion of the Great White Brotherhood of Ascended Masters who have become reinterpreted as extraterrestrial space beings. In a language reminiscent of science-fiction and scientific conceptualization, the galactian matrix includes an emphasis on cosmic law, engineering codes, electromagnetism, wave-form harmonization and/or “faulty genetic circuits” as well as such notions as pyramid power, Atlantis, Lemuria, extraterrestrials or space brethren, and the Pleiades as a command center of higher forms of consciousness. Such groups as Guy and Edna Ballard’s I AM Religious Activity or Mark and Elizabeth Clare Prophet’s Summit Lighthouse/Church Universal and Triumphant (CUT) concentrate on the principle of cosmic law alone, whereas Hurtak, the Raëlian Movement, Urantia, Ron Hubbard’s Church of Scientology, and Marshall Applewhite’s Heaven’s Gate all express a typical and fully galactian cosmology of absolute and material immanence in which life is not the result of a process of natural evolution, but one of extraterrestrial biotechnological fabrication. At the same time, while spiritual seeking through galactian frameworks often intersects with ufology, not all flying saucer cults are necessarily galactian or can even be considered as New Age. Closer to the gnostic galactianism position that considers supersensuous

possibilities that transcend the natural might be King's Aetherius Society and Ernest and Ruth Norman's Unarius. But like New Age's lack of clearly articulated differentiation between its gnostic and pagan elements, the same fluid confusion exists between galactianism's gnostic and astral formulations. Elements of both appear throughout the various UFO or flying saucer groups as well as in José Argüelles' *Surfers of the Zuvuya* or Benjamin Creme's teachings on Maitreya.

At the center of the galactian theological world is a single ultimate God. In other words, the galactian worldview extends the gnostic and medieval chain of being into an infinite plenum of multiple dimensions. This divine source of all being is usually presented in masculine terms (e.g., Urantia's Fatherhood of God and Brotherhood of Man). Nevertheless, although the heavenly bureaucracy is also portrayed as male, Urantia does speak of a Mother Spirit. A different galactian understanding is encountered with the Universal Faithists of Kosmon (headquartered in Salt Lake City). For the Faithists, the godhead is both masculine and feminine, and half the heavenly host is female. In galactian spiritual history, the central rupture is the Luciferian rebellion considered as the free will breaking on higher dimensions with the even higher law of cosmic harmonics and its plan for intergalactic evolution. The story of the segment of heavenly hosts who broke away under the leadership of Lucifer and came to Earth is recorded in the Genesis 6:2 tale of the "sons of God." The fuller version is found in the apocryphic Book of Enoch's narrative of the Watcher Angels who, in violation of their assigned role, had intercourse on Earth with female humans. Their giant offspring, consisting of "genetic aberrations," are accordingly the corruptive elements within the human race. In CUT's understanding, these descendants of the Watcher Angels are now those who head the world's governments, financial institutions, multinational corporations and the underworld drug cartels.

In galactian expectation, the rebels are eventually to be defeated by the archangel Michael. They will be imprisoned and secluded in permanent torment. This notion of eternal damnation is a prominent feature of most galactian theology. There are, however, exceptions. For both the Aetherius Society and the Faithists, as recorded in their central work *Oahspe*, there is no ultimate annihilation and all souls are finally cleansed. There is no hell of everlasting punishment. But what is common to all forms of galactian mystic theology is the belief that the purpose of existence is the continual progression of the human soul toward perfection. The idea of *nirvana* or the attainment of supreme oblivion is considered a delusion and replaced with the notion of eternal evolution.

Consequently, there are different understandings of space brethren and the role of the flying saucer or space ship. Following a more Theosophical gnostic orientation, former CUT leader, Elizabeth Clare Prophet considered the visiting extraterrestrial as a dangerous Luciferian agent. On the other hand, in the non-Theosophical astral framework such as we find in Raëlianism, Heaven's Gate and possibly Urantia, it is the advanced knowledge of the "more advanced" races from other spheres or dimensions who, through their superior technical skills concerning genetic manipulation, are

responsible for life on Earth in the first place. The Raëlian Movement International began in December 1973 when French race-car driver, Claude Vorilhon, while walking in the Clermont-Ferrand region of France, encountered and boarded a flying saucer. Over a six-day period, the extraterrestrials taught to Vorilhon the “true” purport of the Bible concerning the biotechnological origins of humanity. Henceforth known as Raël (“messenger of the Elohim”), Vorilhon is accepted by his followers as the last of forty prophets. In Raël’s reinterpretation of the Old Testament, the alternate designation of Yahweh, namely, Elohim, becomes a reference to the extraterrestrials (“our fathers from space”) who, through their perfect mastery of DNA, created humanity in their own image. While in the past, the Elohim have subsequently spoken to their creations through Moses, Buddha, Jesus, Mohammed and others, their mission is now to convey through Vorilhon/Raël the imminent danger to the human race through self-annihilation. So while CUT considers that we are entering the New Age of Aquarius in which the central spiritual master is the Comte de Saint Germain rather than the Piscean Jesus Christ, Raëlians consider instead that the foremost prophet for the present “Age of the Apocalypse” that began with the nuclear detonation of 1945 is Raël.

Typical of galactian thinking is the concern with “interdimensional reality.” Its spiritual hierarchy often exists on multiple levels or dimensions of cosmic reality. However, in the Urantian understanding of the cosmos, allegedly channeled and recorded during 1934 and 1935 to assist humanity in our local galaxy’s evolution toward perfection, the elaborate polytheism presented in its *Urantia Book* is not outside our space-time, but one in which its higher beings live on various spheres found within our universe. This more corporeal notion of the heavenly hosts may reflect Mormon theology in which God has a material body. Usually, however, galactian theology comprehends its enormous hierarchical bureaucracy of spiritual beings (angels, deities, evolved souls and ascended masters) in a plenitude of realms that extend not only throughout our own three-dimensional world but beyond it as well – a perspective closer to contemporary cosmological theory that envisions there to be an eleven-dimensional multiverse containing an infinite number of parallel universes. For the Raëlians, our galaxy is simply a tiny particle of an atom of a living being on a planet revolving around a sun in some super-galaxy. Likewise, the sub-atomic particles of atoms in our own world are seen by Raëlians as galaxies in themselves. The Raëlian mystical union between the sub-universes and super-universes within and beyond the individual is accomplished through the practice of Sensual Meditation, a set of contemplation techniques that aim for individual communication with the Elohim in order to regain control over and happiness in all areas of life

(body discovery, sexuality, enjoyment through the senses, cosmic organism, etc.)

When the multiple cosmos is conceived along Theosophical gnostic lines, it will entertain an understanding of the supernatural as an operative factor. But if galactian thought formulates itself along a strictly astral horizon, there is no spiritual, and the universe has no beginning. For the Raëlians, for example, matter is purely mechanical.

There is no *anima mundi* to the world or the cosmos. Consequently, while the “astral” realm is a Theosophical concept developed to describe a supersensible substance supposed to pervade all space and bodies and one that provides a bridge between the spiritual and physical planes, in the astral school of galactian interpretation, there is no spiritual dimension, and the astral is essentially an extension of matter. The final contrast between the two forms of galactian theology is in the gnostic understanding of the spiritual as *a priori*, while the astral recognizes instead the centrality and permanence of matter. This last is similar to Paganism and the general emphasis of nature religions which also centralize matter, but it differs from these by not regarding the mental, spiritual and supernatural as emerging from the tangible and at best achieving an ultimate co-validity with it. With astral galactianism, in place of evolution, there is simply engineering of the eternally pre-given physical reality.

Unlike the more atheistic astralism of the Raëlian movement, the Aetherius Society founded in 1955 by George King (1919–1997), is both gnostic and astral. This “saucer cult” reveres a Cosmic Hierarchy, engages in a battle with evil forces, and expects that everyone will eventually become a Master and continue to evolve. As a regular practitioner of yoga, King claims to have attained *samadhi* in which he has gained access to many cosmic secrets. In 1954, the Venusian Cosmic Master who had assumed the name “Aetherius” reputedly told King that he was to become the voice of the Interplanetary Parliament that is headquartered on the planet Saturn. The following year the Aetherius Society was established in London, and King allegedly receives “Cosmic transmissions” from Aetherius and other Cosmic Masters while in his yogic trance state.

The Aetherius Society holds belief in both reincarnation and the Great White Brotherhood of Ascended or Cosmic Masters that includes Jesus, Krishna, Buddha and others. Inasmuch as everyone will eventually become a Master, the Brotherhood consists of members from both genders. Like CUT, the Society’s belief system is essentially both Christian and Buddhist (both Jesus and Buddha are said to come from Venus), but unlike CUT’s distrust of flying saucers as containing negative entities, King teaches that saucers have played an important role for humanity and have saved the planet on several occasions from atmospheric damage caused by human civilization – specifically from experimental nuclear fallout. His movement considers that the Earth is regularly orbited by space ships, and, in particular, Satellite Three distributes special Prayer Hours of spiritual energies or *prana* that members of the Society can then channel toward specific concerns through King’s invention of Spiritual Energy Radiators. The periods during which this distribution occurs, usually lasting three to four weeks, are called “spiritual pushes.” One, designated Operation Bluewater, ended in 1976 and involved charging a specific Spiritual Energy Battery, a “radionic” storing device that can be used in times of crisis to alleviate the Earth’s magnetic field warp caused by both atomic experimentation and negative human thought. Another “spiritual push,” Operation Starlight, lasted for just over three years (1958–1961) during which King and others climbed eighteen mountains around the world that had been selected through

a vision of the Master Jesus. The purpose of this push was to charge these mountains permanently with spiritual power. Regular pilgrimages to these sites now allow members to use the holy energies through prayer for terrestrial benefit such as the relief of physical suffering, diminishment of belligerent tensions, the aversion or reduction of such catastrophes as earthquakes or famine, and individual and environmental healing.

While the Aetherius Society's Interplanetary Parliament (or Cosmic Hierarchy) is responsible to the Lords of the Sun, it argues that each planet functions as a learning stage that must be completed before one progresses to the next. Many reincarnations are necessary on each planet before one learns to live according to God's Laws. Some Masters already live on the Earth, but the coming Master, whose magic powers exceed all terrestrial military might, will appear in a flying saucer and launch a millennium of planetary peace. Before this, however, the Great White Brotherhood is engaged in a cosmic battle with an organization of black magicians who seek to enslave humanity. The Society assists in this warfare by training its members in what is known as Operation Prayer Power: redirecting or channeling *prana* (energy) through mantras and prayers in order to heal disease. Apart from spiritual healing and the use of yoga, the Aetherius Society is also concerned with alternative medicine, dowsing and most of the practices characteristic of New Age and Human Potential. It has remained at the forefront of ecological anxieties relating to nuclear radiation pollution and industrial contamination.

Similar concerns with planetary well-being are shared by the Raëlian movement. While Raël communicates with the Elohim and Yahweh, his personal teacher and Elohim president, primarily through telepathy, he has been instructed that a major enterprise for the Raëlians is to construct an international embassy to which the Elohim can return once more to Earth to welcome the planet into a technological world of choice, infinity and pleasure. Following instructions from the Elohim, the movement would hope to establish this embassy near Jerusalem.

World government is then to be established as a form of "geniocracy" or rule by geniuses. Along with this, a universal humanitarian economy will eliminate the need for inheritance. The movement's mission as well as difficulties involved in establishing its Elohim embassy, however, is similar to the delays and opposition to the construction of the Pyramid Temple of the Unity of God's Faces by the Religion of Aumism at its monastery of Mandarom Shambhasalem in Castellane, France. The followers of Hamsah Manarah likewise believe that such an "anchoring bridge" is required for the inauguration of a Golden Age of Unity but, following a more Theosophical and Hindu framework, the Aumists understand their Temple as a "Spiritual Pole" that will link God to the material realm, whereas for Raëlians, the embassy will serve as a landing station for the spaceships of the Elohim. Nevertheless, the Aumist temple is expected to facilitate the rapprochement of science and spirituality and allow nature to recover its proper position by returning to ecological equilibrium.

Unlike the more typical gnostic-idealist aversion to the joys of the physical universe, with the Raëlians there is no rejection but rather an endorsement of worldly pleasure.

Some of the methods of its central practice of Sensual Meditation are to be used by two people of the opposite sex, and this involves nudity, sensory awareness exercises and sexual experimentation with the aim of achieving a mystical experience of oneness. Nevertheless, the movement stresses complete choice in the selection of sexual partners as well as in all other aspects of life. As long as no one else is harmed, Raélians are encouraged to be free of social mores and inhibitions. With its astral rejection of the supernatural and/or spiritual, the immortality of reincarnation is instead to be achieved through the process of serial cloning. Consequently, and in view of the Raélian belief that all earthly life originated artificially, Raélians support biotechnological developments – whether concerning genetically altered foods, increased mechanization, robotized automation, space exploration, use of computers or reproduction of animal and human life through cellular cloning. The Raélian belief that all life is synthetic “grounds an empathy for all organisms, vegetable and animal” in appreciation of the biotechnological artist’s abilities: “This approach to nature and the advocacy of the use of reproductive technology are the religion’s primary points of engagement with ecological concerns” (Sentes and Palmer 2000: 101). It is through the steady advances of science as well as the assistance of the Elohim that the Raélians expect the world will enter its golden age.

Whether pursued by organized groups and movements, or whether individual UFO sightings made by pilots of aircraft or by people of all occupations, the UFO myth remains “one of the world’s most powerful religious or semi-religious narratives” (Rothstein 2001: 134). It relates to the “crop circles” of Britain, and while many of both

flying saucer sightings and crop circle constructions are clearly hoaxes, some are not as readily established as such but persist as unexplained paranormal paradoxes. Psychologically, the UFO would appear to be a product of counter-intuitive beliefs that include what we normally relate to the supernatural but are not necessarily restricted to this. But as a phenomenon in and of itself, contact with spaceships and extraterrestrials tends to interlink with the ideas of evolution that derive from Theosophy and have entered the general New Age vocabulary. For Rothstein, the UFO is “elusive, flexible and versatile and therefore an obvious candidate to become a global cultural representation distributed along the ever-expanding means for easy international communication” (2001: 147). As twentyfirst-century Earth continues to face ever-increasing environmental threats, and while the possible perception of extraterrestrial technology is nothing new (e.g., the experiences of the biblical prophets Elijah and Ezekiel), the UFO encounter and corpus of belief are now more focused on both spiritual and ecological progress.

In this light, the studies conducted by Harvard psychiatrist John Mack on UFO abductees have shown that while little is reliably gained concerning knowledge of extraterrestrial life, abduction reports tell us much about our own culture and psychology and an emerging ecological sensitivity. Mack finds that the chief reasons given for UFO abduction are either to develop offspring between humans and aliens or to increase human consciousness toward preventing the destruction of the planet’s ecosys-

tems. By linking ufology and ecology, Mack is possibly founding a new religion based on the “green politics” of star people. He has at least uncovered within the U.S. alien-abduction mythology that has developed since the 1960s the link between an alleged encounter with extraterrestrial beings and both spiritual transformation and environmental awareness.

Umbanda

Umbanda is a syncretic religion *par excellence*, creatively blending African religions, particularly from Yorubaland and Congo, with Native American traditions, folk healing, Iberian Catholicism, spiritism, “Oriental” esoterism, and popular culture. This complex and often contradictory mixture emerged in Brazil in the early 1900s, as the country was making the transition from empire to republic. This period also marked Brazil’s entry to modernity, with incipient processes of industrialization and urbanization. Umbanda reflects these social dynamics, originating in the increasingly cosmopolitan cities of Rio de Janeiro and São Paulo. Today, Umbanda is present throughout Brazil and sustains relations of competition, accommodation, and cross-fertilization with other Afro-Brazilian religions such as Candomblé, Xangô, Batuque, and Tambor de Minas. Umbanda has also spread in South America, with thriving centers in Uruguay, Argentina, Peru, and Venezuela. Not surprisingly, it has also traveled to the United States, to New York, Boston, and Miami, with the waves of immigrants who have come from Brazil since the late 1970s.

Umbanda holds ambivalent attitudes toward nature. As a “cult of affliction,” to draw from anthropologist Victor Turner, this religion takes an instrumental view of the environment, seeing it as a set of forces that can be carefully manipulated to produce physical and spiritual healing and well-being. Nevertheless, Umbanda has at its core a relational ethos that tightly links humans, spirits, and the natural world. This ethos challenges notions of a sovereign, detached, and purely calculating self, standing over against nature.

As an African-based religion, Umbanda shares many elements with Candomblé. Like Candomblé, Umbanda adheres to a monistic and panentheistic worldview. All entities – animate and inanimate, mineral, vegetable, animal, human, and spiritual – are informed by and are ultimately expressions of a sacred vital force called *axé*. Because this *elán* vital flows unevenly across the Umbanda cosmos, a central concern in the religion is to provide practitioners with the right knowledge and proper ritual practices to place themselves strategically in the changing grid of energy generated by *axé*. Umbanda’s aim is thus unabashedly practical: to help the practitioner negotiate a favorable position *vis-à-vis* other entities, particularly humans and spirits, through strategic exchanges of energy (for example, special foods offered to one’s head spirit in exchange for health, good fortune, or happiness in love). The aim is to establish a reciprocal balance of forces that will allow the practitioner’s own *axé* to fulfill its destiny.

As in Candomblé, Umbanda locates high concentrations of *axé* in the *orixás*, the ancestral spirits that are part of the African pantheon of gods. *Orixás*, which are associated with specific natural forces or domains like thunder (*Xangô*), the sea (*Iemanjá*), and sweet water (*Oxum*), and their iconic representations serve as powerful openings to and conduits for *axé*. This explains why the religion is organized around *terreiros*, territorially based extended spiritual families headed by specialists (*pais and mães de santos*) who train initiates in the correct ritual etiquette to relate to *terreiro's* and the practitioner's head spirits. An essential component of this relation is the incorporation of *orixás* by practitioners in trances that are often accompanied and supported by drumming and the use of liquor and tobacco. In these trances, the *orixá* descends on the head of the medium, "riding" him or her, that is, controlling his or her body movements and speech. In this way, *orixás* become publicly present and can receive the respect and loyalty of their devotees.

In contrast to more Africanized Candomblés, however, Umbanda tend to privilege interaction with what we may call intermediate or lower spirits. It is not that *orixás* disappear altogether; they continue to be displayed prominently in *terreiro* altars albeit through their Catholic correlates (the saints). However, Umbanda mediums prefer to work with spirits native to Brazil, rather than with the African royalties represented by the *orixás*. This is where Umbanda demonstrates a high degree of syncretism and adaptability to the local environment, for the central spiritual characters in Umbanda are indigenous Brazilians and backwoodsmen (*caboclos*), old African slaves of colonial Brazil (*pretos velhos*), and rogues and prostitutes (*exus*). These are characters that are salient in the way in which Brazilians, particularly at the grassroots, imagine their nation.

Caboclos play a key role in Umbanda's attitudes and relations toward nature. In the Umbandista imagination, *caboclos* are associated with Brazil as it existed prior to the conquest, an exuberant mythical land without manmade social hierarchies. *Caboclos* represent the untamed spirit of the wilderness, the undifferentiated jungle prior to domestication by the Portuguese. This idealized wilderness is often connected with the land of Aruanda, the mythical home of *caboclo* spirits said to be located in the CongoAngola region of Africa. *Caboclos* belong to a wild, pristine place where all species are closely interconnected and where distinctions between animals and humans are tenuous. Thus, *caboclos* are seen as rugged, proud, and rebellious characters, always capable of transgression. As part of this transgressive personality, they are quick to smoke cigars and drink *jurema*, a drink with mild hallucinogenic properties made out of a mixture of the sacred plant *Pithecolobium diversifolium* Bent, herbs, honey, and alcohol.

Pretos velhos contrast sharply with *caboclos*. They represent post-conquest Brazil, a Brazil marked by violence and deep social inequalities. Whereas the initiate who incorporates a *caboclos* becomes brash and struts around whooping and beating his/her chest, the medium who receives a *preto velho* will behave meekly, speaking softly and haltingly and walking with his/her back bent to represent the fact that s/he is

carrying the whole weight of slavery. Their humble condition allows *pretos velhos* to have great empathy for those in trouble and to be great healers. Like the *caboclos*, they also carry a wealth of ethnobotanical knowledge (from the forest in *caboclo*'s case and from the ancestors in the case of *preto velho*), which they can use to cure ailments ranging from persistent headaches to nervous breakdowns.

Besides contributing to the therapeutic dimension of Umbanda, the *caboclo-preto velho* dyad serves a commentary on what the religion sees as the contradictions in Brazil's entry to modernity – tensions such as servitude versus autonomy, hierarchy versus equality, and domination versus resistance. The dyad is a way to narrativize, and thus legitimize, the civilizing process in Brazil. Yet this civilizing process is incomplete, subject to the destabilizing power of nature as represented in the transgressive, almost carnivalesque figure of the *caboclo*. The *caboclo-preto velho* dialectic, thus, offers a view of nature as “savage and primitive” forces periodically irrupting in the midst of a precarious and contradictory humanmade world.

Transgression is also preeminent for *exus*, spirits commonly associated with the underworld. In West African traditions the *exu* is a single trickster figure linked to sexuality and fertility. In Brazilian Umbanda, the *exu* assumes multiple identities, coming to stand for marginal social groups like thugs, thieves, prostitutes, and other “devils,” figures which local lore and the national mass media alternatively vilify and celebrate for their resourcefulness. The centrality of *exus* in Umbanda reflects its adaptation to the modern urban environment, where the tough streets of the city become the stage for sacred dramas. The *exus* are, in fact, a vehicle to sacralize the profane, to cosmicize the everyday life of poor Brazilians, who are the country's vast majority. Extending Karen Brown's argument about Vodou in Brooklyn, it can be argued that Umbanda's emphasis on protean *exus* is a way to solve the “cosmological problem”: the ecological dissonance produced by the need to practice a religion that is tied to natural places and entities in the heavily humanmade context of the city. If *caboclos* are the transgressor of the originative jungle, harkening back to pristine origins, *exus* are the border-crossers of the new concrete and asphalt jungles, subverting bourgeois morality. *Exus* help Brazilians negotiate the tension between the city's built environment and the “natural” environment. It is common to find food offerings to the *exus* at street corners near Umbanda centers. After all, because they are lower spirits, very close to matter, *exus* are considered masters of the crossroads. They literally have one foot in the spiritual world and another in the all-too-human world, which is the reason why they limp when they walk. Because of their hard life and street smarts, *exus* are considered excellent problem solvers. They can be very loyal and effective when accorded the proper recognition and properly fed, but they can rapidly turn vengeful and destructive if disrespected or ignored.

Umbanda also distinguishes itself from Candomblé by its closer relation with Spiritism. Spiritism originated in France in the mid-1800s, with the prolific writings of Hyppolyte Léon Denizard Rivail (1804–1869), a Parisian educator and translator of scientific books, who took the name of Allan Kardec from his previous incarnations.

Spiritism is itself a highly syncretic philosophy, blending “Eastern” notions such as karma and reincarnation with parapsychology (construed as the science of the soul), Enlightenment ideas of progress and education, and a secularized version of Christianity stripped of supernatural content and stressing heavily a humanist ethic of charity. Borrowing piecemeal from Hinduism and Buddhism, Kardec held the existence of disembodied spirits closely connected with the material world. Sensitive to the effects of good and bad actions (the karmic law), these spirits seek to purify themselves through multiple reincarnations. As part of their education and progress toward becoming pure light (gaining release from the constraints of material world), the spirits may communicate with us through mediums to guide us in our own spiritual development or to request our help.

Spiritism’s belief in the close interaction between the spiritual and material world dovetails with Umbanda’s monistic panentheism. Spiritism’s therapeutic system is partly based on the notion that all animate beings contain a spiritual fluid, a kind of electro-magnetic energy, that can be transferred. Spirit centers train *passistas*, literally “hand passers or hand layers,” who hold periodic cleansing clinics where they help discharge negative energies, often produced by *espíritos obsediados* (obsessing or perturbing spirits), by passing their hands over the bodies of those afflicted by physical or psychological problems. Positive spiritual fluids can also be concentrated in water that has been prayed over by the religious specialists. This “sacred water” (*água fluidificada*) is imbibed by the practitioners. Along with fluidified water, clients may also receive homeopathic prescriptions. Umbanda also recognizes Spiritism’s concern with disincarnate spirits seeking perfection by giving place to *eguns* (the wandering souls of dead people) and more evolved spirits in its pantheon.

The latter are considered spirits of light or guide spirits (*babas/espíritos guías ou de luz*), who like Socrates, Buddha, and Francisco Cândido Xavier (a.k.a. Chico Xavier, a famous Brazilian Spiritist and interpreter of Kardec), stand in sharp contrast to the “baser” spirits, the *exus*. Whereas *exus* are summoned through drumming and relish the pleasures of the flesh, the wild dancing, drinking, and smoking involved in many Umbanda public celebrations, spirits of light prefer to engage in quiet learned conversation. This tension has led scholars such as Roger Bastide to argue that Spiritism “whitens” or “europeanizes” Umbanda, distorting its African roots. Umbandistas, for their part, see the confluence of European, Eastern, African, and Brazilians strands as proof of the universal nature of their religion and as a reflection of the hybrid culture that is Brazil.

In terms of attitudes toward nature, Spiritism’s influence on Umbanda is ambivalent. On the one hand, Spiritism’s religious humanism reinforces Umbanda’s anthropocentric tendencies – the stress on the instrumental manipulation of natural forces to produce personal well-being and success. Moreover, Kardec affirms that, from the moral point of view, there is a clear hierarchy in the universe, with human beings being able to rise above their instincts and have full consciousness of their spiritual nature. On the other hand, this anthropocentrism is counterbalanced by Spiritism’s recognition that

there is an underlying order in the universe in which all entities are interconnected in a progressive evolutionary scale. Thus, it is essential to overcome egotism and behave charitably toward the whole of creation. For instance, in his popular psychographed book *Nosso Lar* (Our Home), Chico Xavier offers a utopian vision of a celestial colony in which spirits hold basic goods in common and are governed by benevolent philosopher kings, the most evolved spirits. Leaving aside Diana Brown's and David Hess' discussion as to whether Umbanda and Spiritism reproduce the clientelism that has typified Brazilian politics, in Xavier's spiritual home there is not only peace and moral happiness – since everybody knows his/her place – but also harmony with nature. The spirits are presented as carrying their intellectual discussions in a tropical paradise of inexhaustible resources which the inhabitants exploit with rational moderation. This tropical paradise is suspiciously similar to an idealized version of Rio de Janeiro. This perfect society is said to exist directly above the city.

Spiritism's contradictory impact on Umbanda highlights the latter's complex character. Umbanda reflects Brazilians' ambivalent relations with their local environments, both natural and humanly constructed. On the one hand, Umbanda offers a pragmatic ethics of individual self-improvement adjusted to the demands of Western, urban modernity. On the other, it holds a relational ethos more in tune with traditional, "rural" lifeways which stress interdependence and reciprocity. Umbanda's hybridity, its power to syncretize, adapt, and even present itself as an all-encompassing religion, is in large part the result of this capacity to bridge between individuality and collectivity, and between matter and spirit.

Umehara, Takeshi (1925–)

Takeshi Umehara, a Japanese philosopher, has published many works on philosophy, religion and literature. His unique approach to the deep strata of Japanese culture and religions through archeological and mythological studies is known as “Umehara’s Japanology.” His numerous lectures and writings, which have drawn people from various academic fields and sections of society, are given considerable credit for the recent rise of interest in rediscovering Buddhism, Shintoism and earlier Japanese spiritual traits, as well as so-called “Jomon (Japanese neolithic) period studies” in general. His insight has also proved to be a particular inspiration for environmental educators and conservationists calling for the revitalization of forests, rivers, wetlands and indigenous lifestyles harmonious with the natural environment of each region.

Umehara was born in Sendai, Miyagi Prefecture in 1925. He grew up in Aichi Prefecture and graduated from Kyoto University, where he majored in European philosophy. Immediately after World War II, haunted by the specter of the nuclear holocaust in Hiroshima and Nagasaki, he became absorbed in the writings of Frederick Nietzsche and Martin Heidegger. Umehara was acutely conscious of the void left by a collapse of values following the introduction of European modernism. Influenced also by such thinkers as Kitaroo Nishida (author of *Zen no kenkyuu* Studies on Goodness, 1911) and Tetsuroo Watsuji (author of *Fuudo*, Climate and Culture, 1935), he began studying Japanese Buddhism and then Shintoism, the indigenous religion of Japan. He assumes religious imagination to be the key to the rise and fall of civilizations. Thus, from the outset, Umehara’s thought attempted to bridge the gap between East and West in order to lift Japan and the world itself from the ruins of modernity.

Umehara’s studies of Japanese culture, developed in such works as *Jigoku no shisoo* (*The Concept of Hell*, 1967), *Kamigami no ruzan* (*The Exiling of the Gods*, 1985) and *Nihonjin no anoyo kan* (*The Japanese View of the Other World*, 1989), culminated in *Mori no shisoo ga jinrui o sukuu* (*The Worldview of Forest-dwellers Will Save Human Beings*, 1991), which addresses the relationship of religion to nature. In this book he rejects the traditional assumption that the Japanese come from a homogeneous race of rice-growing farmers – first by noting that 67 percent of the land in Japan has been preserved as forest, thereby reflecting widespread worship of trees, and then by proposing an alternative view that the original culture of the Japanese is retained in the minority Ainu and Okinawan cultures. He points out various elements common to Ainu and Okinawan religious rites and mythologies, and to Japanese Shintoism and Buddhism. He interprets the wellknown Japanese Mahayana Buddhist phrase “Mountains, rivers, grass, and trees, all can become Buddha” as advocating the equality

of all living beings. All can go to the other world (*anoyo*) where there is neither distinction of heaven and hell, nor final judgment, and eventually all will return to this world. Today, after many stages of transformation and syncretism, Buddhist temples take care of the rites for the dead, while Shinto shrines celebrate the birth and growth of all beings in nature. Belief in reincarnation can be found in the Ainu rites of sending bears and other animals back to the world of the gods above and in the Okinawan rites of communing with the eternal otherworld of ancestors beyond the sea.

Umehara reinforces his assumption by referring to the findings of archeologists and physical anthropologists, which suggest that an early type of Mongoloid people, of whom Ainu and Okinawans are the remnants, had lived throughout the archipelago as hunters or fishers and gatherers during the Jomon period (ca. 12,000–300 B.C.E.) with a highly developed pre-agricultural forest culture, exemplified by their sophisticated earthenware. Then, around the third century B.C.E., a newer type of Mongoloid people arrived on the Japanese islands with a ricegrowing culture. They expelled some of the indigenous people, and mixed with others to build the Yayoi culture (ca. 300 B.C.E.–300 C.E.). Umehara asserts that the natural religion born in the ancient forests survived the transition of cultures and even the introduction of such a powerful world religion as Buddhism in the sixth century. He believes that human beings today should reevaluate the polytheistic natural religions of the forest and view the cyclic movements of life as a whole beyond individuals, races and species. It is an ecological and practical necessity for human beings to stop conquering nature and to live harmoniously with others in order to survive in the postmodern world.

Umehara has headed archeological expeditions to the sites of ancient civilizations in China and the Middle East as well as within Japan. He served as president of Kyoto Municipal University of Arts, was the first Director General of the International Research Center for Japanese Studies in Kyoto, and has been president of the Japan Pen Club since 1997. He is also a Kabuki playwright. He has won major literary awards and was honored with the Order of Culture in 1999.

Unitarianism

The Unitarian movement can be defined as a radical tradition that emerged into self-consciousness during the European Reformation in the sixteenth century as an alternative to the authoritarian traditions of Luther and Calvin. Like their Anabaptist cousins, the Unitarians were suspicious of the misuse of ecclesial power to enforce such non-biblical teachings as the eternal Trinity, infant baptism, the exclusivity of revelation, and the doctrinal method of establishing worthiness for salvation. On the positive side, Unitarians affirmed a more immanent deity closely bound to nature, universal salvation, and the necessity of religious tolerance and freedom of the pulpit. Because of these beliefs, many Unitarians lived under religious persecution from both the Protestant and the Roman Catholic authorities until well into the eighteenth century. The most infamous case of this occurred when the Spanish Unitarian theologian Michael Servetus was burned at the stake by Calvinist forces in 1553. Servetus' crime was to have published a treatise, *Christianismi Res-titutio* in 1552 in which he attacked the Trinity, orthodox Christology as it was determined by the Council of Nicaea in 325 – which affirmed the co-equality of Christ and God while rejecting the proto-Unitarian view of Bishop Arius who denied this equality – and the doctrine of infant baptism. Implicit in his views was a pantheism that found God to be co-extensive with nature. This early Unitarian laid the groundwork for a universalist pantheism, which rejected a transcendent, sovereign, deterministic and punitive God.

Unitarianism's most readily identifiable form emerged in 1805, when radical professors at Harvard won the Hollis Chair of Divinity for their Unitarian candidate Henry Ware, thus marking the end of Congregational power at that institution. Soon Unitarianism was rocked by the even more radical religious movement of Transcendentalism initiated by the former Unitarian minister Ralph Waldo Emerson when he threw down the gauntlet to the church establishment in his 1838 *Divinity School Address*, in which he went so far as to divinize the self, deny the centrality of Jesus, make nature holy, and posit a form of purely personal revelation that was self-validating outside of any form of ecclesial community. Three years later the Unitarian minister Theodore Parker delivered an equally controversial ordination address, *The Transient and Permanent in Christianity*. While more Christian in tone than Emerson's address, it rejected the importance of dogma, liturgy, and anything other than ethics and a gospel of love.

Theologically, contemporary Unitarianism is diverse in expression and often even questions the need for theological reflection insofar as there is no agreement as to the real or alleged object of such reflection. However, there are identifiable philosophical commitments that mark Unitarianism as a decidedly nature-oriented perspective. His-

torically the distinction between liberal and conservative Protestant traditions was expressed by the difference between positive and natural religion. In the context of the post-Kantian milieu in which this distinction came to the fore, positive religion stressed a unique historical revelation, a unique textual record of that revelation, the centrality of a founder whose eternal word was embodied in a spirit-guided church, and the superiority of Christianity to any other religion. Natural religion denied any special revelation while placing a great deal of value on universalizable reason. It rejected the importance of texts in favor of a renewed understanding of the book of nature. The power of autonomous natural and atemporal reason replaced the role of the historical founder. Reason operated within the framework of a radically open experience of the whole or the infinite. Further, Christianity was often seen as a religion that had begun to exhaust its resources, thus paving the way for an honest exploration of other religions. Unitarianism has long embraced the basic commitments of natural religion, but has moved them more directly into a post-mechanistic view of a growing, infinitely complex, and fecund nature.

Insofar as Unitarianism would affirm a metaphysics it would deny the doctrine of *creatio ex nihilo*, while asserting that nature has neither beginning nor end, with the stipulation that the world of astrophysics, which affirms the Big Bang creation, is but one world within the infinity of nature which has its own subaltern conception of creation, perhaps out of imaginary time. Transforming the eighteenth and nineteenth-century distinction between positive and natural religions, it is perhaps preferable to speak of anti-naturalist and naturalist religions. The antinaturalist forms embrace supernaturalism, miracles, a sovereign and external Creator, and a devaluation of creation over its Creator. Naturalist religions, which can be either panentheistic or pantheist, but not theistic or personalistic, are not only immanentist, but also affirm that nature is the genus of which the object of religion is the species. Nature is the all-encompassing category, and actually transcends the genera (classes) of all orders that occur within and as nature. Hence the term “nature” functions as both the highest category and a pre-category, that is, there is no opposition term to nature precisely because nature is all that there is, both actual and potential. For many Unitarians all-encompassing nature is itself holy while for others nature is neither holy nor unholy *per se*; it simply obtains in its infinite unfolding.

Panentheist naturalism retains some remnants of the Christian traditions insofar as it affirms that a dimension of the divine is discontinuous with the orders of nature (the dimension of *nature natured*), even though fully relevant to them. Pantheist naturalism is more radical in that it decisively moves beyond the Christian traditions by asserting that the dimension of the divine in nature can in no way be discontinuous from any or all orders of *nature natured*. This deeper dimension of the one nature is often denoted by the term “*nature naturing*,” a term used by Emerson in this sense.

Within the Unitarian movement this tension is expressed as the difference between a more optimistic somewhat Christian progressivism tied to the evolutionary advance of the divine (panentheism) and a more quietist post-Christian meliorism correlated to

a less optimistic view of human prospects within infinite nature (pantheism). In either case, Unitarianism affirms that supernaturalist religion remains a destructive force in culture insofar as it masks our deeper relationship to the eternal self-creating nature.

This underlying, and not always self-conscious, naturalism is manifest in both the liturgy and practice of the contemporary Unitarian Universalist Church. In 1961 the then separate but theological similar movements of Unitarianism and Universalism joined to form a common Fellowship that is now call the Unitarian Universalist Association. Since 1961 the liturgy of the Fellowship has been shaped in ways that mark the transition to a more nature-centered worldview. Services are now dedicated to solar and lunar events as well as to the inner rhythm of the seasons. Generally the liturgy celebrates cyclical rather than historically unique events, although traditional world religious holidays are often celebrated as well, and the services use texts from all of the major religious and secular traditions.

Native American and pagan traditions are often used to transform religious consciousness by returning to the premonotheistic world, a world held to be friendlier to nature than that of the supernatural monotheisms. Among the more important yearly events is the Flower Communion in which each member of the congregation is asked to bring a flower that is placed in a common vase at the front of the meeting room or sanctuary. At the end of the service, each member takes a different flower home. The Czech Unitarian minister Norbert Capek created this service before the Second World War. Capek also created the symbol of the flaming chalice, which combines the naturalistic symbols of enlightening fire and the wisdom-holding cup, which is now the central liturgical object in the Unitarian Universalist movement. Capek was executed in a Nazi concentration camp in 1942 for his resistance work in which the symbol of the flaming chalice was used as a code to help escaping Jews.

Along with a strong social gospel tradition, Unitarian Universalists today fully participate in the worldwide movement of the greening of the Church. There is a direct involvement in local issues of justice and the use of resources in a way that distributes them equitably and does minimal harm to the environment. Each member of the congregation is asked to use ecologically friendly practices in all dimensions of personal and social life. In the national realm, the Association works to create laws that will bring these practices into being. On the international level, the Association has long fought for forms of just trade and reduced First World consumption. One particular focus of this concern is with critiquing the growing power of international corporations as they control the yearly sale and distribution of hybrid seeds for which they have the patents. Given that Unitarian Universalism denies the reality of a potentially salvific deity who could create an apocalypse that would rescue a few of us from our abuse of nature, congregation members feel compelled by conscience to work toward the reversal of the natural degradation partially caused by the monotheisms.

United Nations' "Earth Summits"

The first international United Nations' "Earth Summit," formally known as the United Nations Conference on Environment and Development, was held in Rio de Janeiro, Brazil from the 3rd to the 14th June, 1992. It included 172 national representatives (of which 108 were heads of state) and over 2400 representatives of non-governmental organizations (NGOs), and addressed the threat of global environmental degradation as nations seek economic development. The gathered national leaders signed the Convention on Climate Change and the Convention on Biological Diversity and the conference itself adopted The Rio Declaration on Environment and Development, The Forest Principles, and Agenda 21, a plan for coordinating environmental and national development by the next century. The Commission on Sustainable Development was formed to monitor and report on the implementation of these declarations and principles.

The 1992 Earth Summit emerged from an earlier United Nations Conference on the Human Environment, held at Stockholm in 1972, which for the first time placed environmental issues before the international community, and led to the formation of the United Nations Environment Program. By 1983 the relationship between environmental degradation and economic and social development had led to the formation of the United Nations World Commission on Environment and Development, known as the Brundtland Commission. This issued the 1989 report entitled *Our Common Future*, which defined sustainable development as "that which meets the needs of the present without compromising the ability of future generations to meet their needs" and called for international strategies combining both environmental protection and development. Significantly, the envisioned programs include action not only at the international, but also at regional, national and local levels, and involving state and non-state actors. The United Nations General Assembly voted in 1989 to hold the first United Nations Conference on Environment and Development (UNCED) in 1992.

UNCED was a watershed, but not only for the obvious environmental reasons. The United Nations moved toward the Rio meeting by hosting several preparation committee meetings in New York. Those who attended these meetings included not only government officials but also representatives of non-governmental organizations who could apply for official NGO status with the UN and provide input into the process. Each country could solicit contributions from numerous organizations and individuals, including that of both organized religious bodies and other groups motivated by nature-related spirituality whose main identity was not religious. These official conver-

sations involved intense debates and disagreements about what was to be included and excluded from the agenda. Many compromises were made prior to and at UNCED.

Running parallel to the UNCED was an “Earth Summit”

– a people’s conference – an exclusively NGO event that coexisted with UNCED also in Rio. Although sponsored by the UN, this event drew environmental and political activists from all over the world. Seventeen thousand or more people (or their organizations) paid their own way (or their organizations did) to discuss the social and environmental situation around the world. Here a radical environmental and social agenda emerged and alternative treaties were written. The Earth Summit represented the critical social politics that had been emerging over decades, such as international feminism, indigenous peoples’ rights, postMarxist and post-colonial analyses, peace, human rights, and environmental agendas. The crucial presence of these groups pressured the UNCED’s official governmental representatives to strengthen their environmental commitments, with particular attention to marginalized peoples. One result of UNCED and the Earth Summit was that it was now evident that citizens groups had developed their own analyses and viewpoints, were no longer going to accept their government’s positions, and would be very active in planning and presenting alternatives. One of the most dynamic conversations took place at the Women’s Tent – Planeta Femea – with speakers such as Wangari Matthai, Peggy Antrobus, Bella Abzug, Vandana Shiva, and over a hundred other engaging radical feminists, all of whom asserted strongly that the environmental crisis is connected to the oppression of women. The women’s caucus worked hard to make the negotiators respond to the world’s most disadvantaged peoples, especially women, who make up the majority of the world’s poor in every country and are critical to sustainable agriculture and poverty eradication.

Others, such as the Canadian Scientist and television documentarian David Suzuki, North American Indian Faithkeeper Chief Oren Lyon of the Onondaga, economist Hazel Henderson, and world-famous television oceanographer-documentarian Jacques Cousteau, and many more, brought a sharp and multidisciplinary focus on the complexity and urgency of the environmental crises around the world. Religious voices were woven through- out these presentations. Oftentimes there was an open speaker forum, such that the conversation was participatory, democratic and lively. Music from indigenous drummers, the Earth musician Paul Winter, and the North American popular singer John Denver, brought home the need to connected together spirituality, music and politics. Thousands of journalists reported on Rio 1992. This event showed clearly the signs of a global citizens movement, which continued on to Rio+10 and is manifested in the World Social Forum.

A strong religious voice promoting environmental sustainability and social justice emerged at Rio and continued to develop through subsequent United Nations environmental events. The World Council of Churches, the Vatican, and representatives of other world religions, notably Judaism, Islam, Buddhism, Bahá’i for example were represented at the 1992 Earth Summit. The Dalai Lama played a significant role as a spokesperson for religious sensitivities. He spoke at UNCED and especially the Earth

Summit, offering a sunrise ceremony for participants at the latter venue. Given his respect for diversity and reputation for moral and spiritual integrity the Dalai Lama was able to call to awareness the many religious traditions that teach the sacredness of the Earth. Reverence for the Earth was a dimension added to intense environmental and social analysis, which strengthened both. His presence also brought a certain spiritual authority to the NGO community at the Earth Summit, as it pressured the UNCED delegates to take action. In addition, hundred of indigenous peoples gathered nearby at Altimura and brought both indigenous teachings and a powerful political presence to the events. They focused attention on the importance of protecting “Mother Earth” and helped contribute to the growing appreciation among some United Nations officials and delegates of the value of their cultures and “traditional ecological knowledge.”

Although many religious traditions were present in Rio, the overall effect was an interreligious cooperation on social and environmental issues. The fact that religious leaders from around the world, representing many faiths, symbols and customs, could join as one voice in claiming the religion is an integral aspect of any viable solution. Rituals occurred at many times, and most often in a combining of rituals, teachings and wisdom. This multi-religious presence registered the need for religions to work together, and initiated a host of public and political collaboration on environmental issues. As well, religious leaders were often on panels where economics, human rights, gender equity and biodiversity were discussed, which led to an understanding that religion is an integrated voice in the conversation and solutions.

A proposal for an “Earth Charter” may prove to be the most significant religion-related development at the UNCED. This initiative mimics the strategy that guided the

United Nations Declaration on Human Rights, in which ratification by member-states is sought as a means to leverage better environmental behavior among individuals, institutions, and nation-states. Although not officially embraced at the UNCED the idea was soon championed and developed by influential actors in the non-governmental community.

The Earth Charter was initially brought forward by Maurice Strong, the Canadian who was the main organizer of the Earth Summit. In subsequent years Strong laced his speeches promoting the Charter with Gaian spirituality. The Charter’s most famous early proponent was Mikhail Gorbachev, the former leader of the Soviet Union, who promoted Glasnost and presided over the Soviet Union’s rejection of communism, before going on to serve as the President of Green Cross International, which is devoted to turning international institutions green. Less well known is that Gorbachev’s environmentalism was grounded in a biocentric axiology in which “life has value in itself ” (Gorbachev 1997:14), and a pantheistic, earthen spirituality, as he put it, “I believe in the cosmos . . . *nature is my god*. To me, *nature is sacred*. Trees are my temples and forests are my cathedrals” (1997: 15). It is not uncommon for actors engaged with the United Nations’ sustainability efforts to express such spirituality.

After the UNCED at Rio, the next United Nations Conference on environment and development was labeled the World Summit on Sustainable Development (WSSD) and held in Johannesburg, South Africa from 26 August to 4 September 2002. This summit was the largest UN conference ever held, with 65,000 participants, including 104 heads of state, and with representatives from over 8000 NGOs and voluntary associations. There were, however, fewer heads of state than at Rio; in contrast, there were many more NGO representatives and other citizens. The conference was contentious as it spotlighted the growing imbalance in living standards between developed and less developed nations. According to most observers, the progress that was made on a number of issues was insignificant when compared to the scale of the problems, and overall the conference failed to gain a comprehensive implementation plan for Agenda 21, a chief conference objective.

There was, however, significant evolution in the religious, ethical challenge to business as usual by the nation-states. A “Sacred Space” was designated at Ubuntu Village, for example, the main exhibition venue, where interfaith ritualizing and prayer for the well-being of the Earth’s community of life was a regular occurrence. The primatologist Jane Goodall, for example, spoke widely from the official venue as well as at the venue devoted to non-governmental organizations representing “civil society” and at a conference organized by the International Union for the Conservation of Nature. She brought her own biocentric ethics and animistic spirituality to a wide audience, including during one session devoted to promoting the Earth Charter, which by 2002 had been through many drafts and had been officially brought before the United Nations. At this Earth Charter celebration, an “Arc of Hope” was present, which was on its own pilgrimage around the world, taken by those promoting this initiative. Its outside was adorned with Earth-related symbols from the world’s major religious traditions, and inside of it, in addition to messages of hope from children around the world, was the Earth Charter itself, as a new sacred text, painstakingly scribed on papyrus. The Charter was mentioned favorably by a number of heads of states, or their representatives, during the WSSD, and in the conference’s political declaration, a phrase from it urging respect for the wider “community of life” remained in the final text, which was the first such reference in a United Nations International Law document, according to Stephen Rockefeller, one of the Charter’s most influential proponents (email correspondence after the conference).

Jane Goodall and some other important figures who had promoted Earth-focused spirituality at the official WSSD venues also appeared at the so-called “People’s Earth Summit,” held nearby at an Anglican school, which became during the WSSD the epicenter of antiglobalization resistance. At that venue, spiritualities of connection and belonging to an Earth considered sacred were often expressed, even being included in declarations protesting the failure of the WSSD itself to take decisive action to protect the environment and promote social justice. African traditional religions and religious leaders (*Sangomas*) were given a special place of honor. Among the well-known activists and scholars speaking at that venue, in addition to Goodall, were the ecofeminist

Vandana Shiva and the anti-globalization leader Helena Norberg-Hodge. For them and others at the venue, “disconnection” with nature was viewed as a fundamental cause of environmental decline and “reconnecting with nature” as the antidote. African Sangomas led rituals to connect people to the ancestors and solicit their guidance and power for the present environmental struggle, explaining that in African traditional religion the ancestors live in a corporeal world connected to this one, and that the well-being of the Earth and the worlds inhabited by the ancestors are connected, and that environmental protection is necessary for our well-being not only in this world, but also in the one to come.

But it was not only at the WSSD’s margins that Earth-related spirituality appeared, and was evolving. In addition, the Japanese power industry ran expensive advertising in the *International Herald Tribune* under the headline “Let’s Be Grateful to Mother Earth”, then defending nuclear power as an energy source. Less commercially, the major institutional religious actors who had been present at the Rio Summit were represented again, issuing position papers, and endeavoring to influence delegates toward strong positions in defense of ecosystems and for greater equity in the distribution of the world’s natural resources. Perhaps even more significant were developments in Earth-related spiritualities beyond the sphere of institutional religions, some of which may presage the emergence of a kind of non-sectarian global civic Earth religion.

Jane Goodall, South African President Thabo Mbeki, and the Secretary-General of the UN, Kofi Annan, for example, along with many other dignitaries, led a pilgrimage on 1 September to Sterkfontein, which was located near the WSSD site, and had been inaugurated in 2001 by the United Nations Educational, Scientific and Cultural Organization as a World Heritage Site. There the *Australopithecus*, an extinct form of pre-humans dating to 4 million years ago, had been found in the 1930s, leading the place to be called the “Cradle of Humanity.” Mbeki himself gave a speech there (and during his comments during the WSSD’s opening ceremony) and although not overtly religious, his words were in many ways reminiscent of the Epic of Evolution, expressing a reverence for the natural world as the habitat of humanity. He asserted that this site in particular, and evolution in general, shows the kinship of all humanity, and the interconnection of all life forms. The pilgrimage to and celebration of this site was remarkable, as was the way in which it was repeatedly mentioned at the WSSD and viewed as relevant to the conference’s mission, given that so many, on religious grounds, reject a Darwinian understanding of human origins, and because politicians generally avoid making pronouncements that might give offense. Even the pageantry of the conference’s opening ceremony assumed an evolutionary understanding, implied a reverence for life, and envisioned an (at least) quasi-religious utopian hope for the reharmonization of all life on Earth. Such events suggest that the consecration of evolutionary narratives is making progress beyond the figures and religious enclaves that have birthed and nurtured such religious production.

The United Nations has thus become a venue where the world’s religions and newer forms of religiosity increasingly press an environmental agenda upon nation-states and

international institutions. Increasingly these diverse voices express the conviction that all is interconnected and that the Earth and its living systems are inherently valuable and sacred in some way, understood either as divine themselves, or as divinely imparted gifts from a beneficent Creator.

Universal Pantheist Society

Founded in 1975, the Universal Pantheist Society (UPS) is the world's oldest membership organization dedicated to the advancement of modern pantheism. The Society's stated purposes are to unite Pantheists everywhere into a common fellowship, to undertake the conveyance of information about Pantheism to the interested public, to encourage discussion and communication among Pantheists, to provide mutual aid and defense of Pantheists everywhere, to stimulate a revision of social attitudes away from anthropocentrism and toward reverence for the Earth and a vision of Nature as the ultimate context for human existence, and to take appropriate action toward the protection and restoration of the Earth.

The Society's name underscores its "universal" outlook, not tied to any single view of pantheism, but rather recognizing a diversity of viewpoints within it. UPS accepts and explores various interpretations of pantheism, stressing the importance of each member's personal pantheistic beliefs. Recognizing that freedom of belief is inherent in the Pantheist tradition, the UPS's bylaws prohibit any particular interpretation of Pantheism or imposition of any particular dogma.

Comments by members on what Pantheism means to them reveals the insights that are our collective faith. One member stated simply: "Being one with all life and nature." Another said, "All are one – I am a part of nature not above nature." Similarly, another wrote, "I am somewhat surprised, but delighted to learn that there are other Pantheists . . . I find a grand Unity, a wonderful Oneness with the Universe."

This last statement shows Pantheism is not usually something that someone hears from others and then decides to become. Instead, our members typically say they already know how they feel and what they believe about religion and nature, and rejoice when they find the name "Pantheism," which they find an apt term for what they already believe. One new member wrote: "I feel a strange feeling of relief – because for many years I felt the forces of nature were 'God' – without ever hearing about Pantheists."

Such statements testify that despite the diversity of viewpoints, members share one consistent direction in looking toward the natural world for our source of spiritual enrichment. Pantheism is an ancient faith experiencing a modern renaissance. Out of this understanding the UPS was born.

Accordingly the overall vision of the Society is more attuned to promoting reverence for nature and an ethical pantheism of responsible action and life-affirming practices than philosophical debate regarding the nuances of religion or philosophy. Persons joining the UPS may engage in seeking freedom and nourishment of religious experience

from fellow pantheists and through the practice of the spiritual path of Pantheism in ways meaningful to themselves.

UPS publishes a quarterly journal *Pantheist Vision* and maintains a website offering an array of material on pantheism, including articles, reading lists, and members reflections on their beliefs. An online forum addresses questions about pantheism, life-ways, and other issues. UPS hosts an Ecological Community Preservation Fund that encourages donations from members to protect natural habitats.

Urban Reinhabitation – CERES as Case Study (Australia)

How do we treat the ground beneath our feet? What is the attitude of Western civilization to the ground on which we walk and live? This ground is always, of course, part of land, and the approach of Western civilization to land has been to treat it as a *tabula rasa* on which individuals and societies are free to impose their own designs. This is true in every society which has been subjected to regimes of Westernization/modernization: land, in all its ecological, topographical and geological particularity, has been reduced to a neutral substrate to be divided up in accordance with abstract geometrical principles.

This approach has been described as a Euclidean one: it imposes a conceptual grid of straight lines on land, and land is then parceled up into the discrete, usually rectangular “blocks” of the surveyor’s plan. The blocks are treated as separate entities, generally leveled or otherwise physically modified to constitute the “blank sheet” that can then accommodate the designs of its subsequent “owners.” In this process little if any account is taken of the contents even of adjoining blocks, let alone of the character of the region at large. The bumps and curves of actual things, the particularity of the actual ground on which we stand, is regarded as incidental, contingent; the world as it is given to us is mere “scenery,” a manifold of “appearances” which can be replaced and rearranged, like theatrical backdrops, to suit our purposes. All the world is indeed, from this point of view, a stage.

Why has the West opted for this approach and why is it wrong to do so? Suffice it to say here in answer to this very large question that the Euclidean approach follows from a worldview according to which the fundamental metaphysical datum is not land, in all its particularity, but matter, conceived as neutral substrate. From this point of view, the objects that we see around us and the ground beneath our feet are just the forms that this neutral substrate, this essentially undifferentiated matter, happens to take at a particular point in space and time. Neither objects nor ground possess integrity of their own or intrinsic significance. There is thus no reason why we should not rearrange this matter to suit our convenience. The Euclidean grid is a correlate of this view and serves as a conceptual tool for optimizing our use of matter.

If we are to respect the world as it is given to us however, if we are to adapt our thinking and our practice to the “lie of the land,” following the original contours of the environment rather than imposing our Euclidean grid, then we need a metaphysics

which affirms that the world as it is given to us does indeed possess a certain integrity. Such metaphysics will involve an ascription of *life* to the world: the things around us and the ground beneath our feet will harbor ends and meanings of their own, ends and meanings which they can moreover share with us. Such a view of the world, as alive with a life of its own and potentially communicatively open and responsive to us, of course suggests the possibility of new forms of praxis and a new poetics to match.

Does environmentalism hold the key to such a praxis and such a poetics? In its traditional forms, hardly. As Aboriginal philosopher, Mary Graham, says, environmentalism is just another Western “ism.” It is just another grid that we impose on the world, failing to notice the contours of the given. In this sense it is as decontextualized as the rest of Western praxis. Consider, for instance, how environmental organizations are typically housed in ordinary offices – neutralized, decontextualized spaces – which environmentalists themselves treat in as instrumental a fashion as real-estate agents treat other “property.” More generally, environmentalists tend to ignore the world as currently given, urbanized and industrialized and ecologically “fallen,” in favor of a dream, a “mise-en-scene,” of restored forests and eco-villages.

We can begin truly to respect the world as it is given to us, to regard it as a thing with ends and meanings of its own which it can in principle communicate to us and in which we can participate, by simply honoring and cherishing the place in which we find ourselves, whether that place happens to fall in the degraded heartlands of the inner city or the pristine expanses of the outback. To affirm the life and integrity of the world is to *reinhabit* it just as it is, via the local modality of place. To reinhabit the places in which we live is not to raze the smokestacks and freeways that we might find there but to fit them back into larger unfoldings of land and planet and cosmos. It is to embrace our own role in those unfoldings, both at the level of sustainable practices and at the level of communicative exchange: by engaging with place communicatively, by singing it up, as indigenous people say, we encourage it in its unfolding and become implicated in its ends. In this way a dialogical poetics begins to evolve out of a praxis which turns around engagement with the given. Indeed, praxis and poetics become inseparable, because all the praxes of everyday life constitute interactions with world, and hence in a reawakened world all these interactions will have a dialogical, and hence a poetic, potential.

One example of such an integrated praxis-and-poetics of reinhabitation in an urban context is CERES (Centre for Education and Research in Environmental Strategies), an environment park in the inner city of Melbourne. CERES differs from most environmental organizations in that it is first and foremost a *site*. That is to say, it is not merely *housed* on a site; its identity is inextricable from the site itself.

CERES started out twenty years ago on a degraded tenacre lot on the banks of the Merri Creek. In its early days it was used by a number of community groups for small environmental projects. As these groups had few resources, they had no alternative but to work with the site as it was, adapting their plans to the contours of the land and to the materials at hand. No “master” plan prevailed. In consequence, the site developed

organically, taking shape by a kind of natural selection of appropriate initiatives rather than by any premeditated design. Since the site was “in charge” of its own regeneration in this way, it soon assumed a life of its own, emanating a palpable presence. Attuning to this presence, people developed a sense of loyalty to the site, a loyalty which also generally translated into loyalty to CERES’ organizational aims. By inducing this custodial sentiment in people, the site enabled CERES, as an organization, largely to transcend ideologies of the political left or right, and to attract a true community to itself on its own account.

CERES then represents an instance of environmentalism in a custodial and dialogical mode. The role that *nam- ing* has played in the “singing up” or “enchanting” of place in this instance is notable. “Ceres” is, of course, the Roman name for the Greek grain goddess, or goddess of fertility, Demeter. The original choice of this name – on the one hand an allusion to an ancient fertility goddess of the settler peoples and on the other an acronym for a thoroughly technical exercise in scientific intervention – accurately portended the unique blend of technoenvironmentalism and reenchantment that would in time give rise to this now blossoming locus of reinhabitation. But the name functioned not only descriptively and predictively in this way, but also as an *invocation*, a *call* to the sacred forces of renewal in the land. In this sense CERES’ intent was dialogical from the start. Though the call was drawn from the mythic memory of a colonizing culture, it was nevertheless addressed to *this* land, as it now is; it was thus less a homage to a foreign past than an attempt, in an only dimly remembered idiom, at dedication to an indigenous presence. The resacralization of this degraded site via its dedication to Demeter has in any case been uncannily successful: Demeter’s myth is being played out with extraordinary appositeness in its present antipodean setting.

What is this myth? It is, of course, a myth of descent and return. Demeter loses her beloved daughter, Persephone, to the god of the underworld. In her desolation she withdraws the life-force from the land; plants wither, animals cease to thrive or give birth. The goddess retreats, in her grief, to Eleusis. Eventually Persephone, who has become Queen of the Underworld, is restored to Demeter, but only for part of each year. Reunited with her daughter, Demeter renders the land fruitful again, and thereafter Persephone’s descent marks the onset of winter, her return the arrival of spring.

The CERES site itself started out as a quarry, a hole in the ground, a gateway to the underworld. Subsequently, it was a tip – the very image of waste, desolation, blight. Then, twenty years ago, when the goddess Demeter was invoked, the process of renewal began. The soil, originally compacted and barren, gradually became fertile again. The ground sprouted with gardens and groves; animals (particularly pigs, the creatures sacred to Demeter) made their home there; and people – especially schoolchildren – came from far and wide to visit the site and learn about the ways of renewal, exemplified in windmills and solar generators, methane digesters and grey water systems, worm farms and native permaculture. There was music and dancing and art, as the devotees

of Demeter understood the need for celebration as much as for work. There were many festivals, notably the annual Kingfisher Festival.

In classical times, the cult of Demeter and Persephone gave rise to the most revered and hallowed event in the religious calendar of the ancient world: the initiation rites at Eleusis. There, where Demeter was believed to have grieved for her daughter, a large-scale enactment of the descent of the goddess was conducted each spring, for the purpose of revealing to initiates the promise of regeneration hidden within the mystery of death.

In an almost eerie resurrection of the Eleusinian Mysteries, adapted to the present place and time, the Return of the Sacred Kingfisher Festival is held at CERES each spring. The recent return of this little azure bird, the sacred kingfisher, to its homelands along the Merri creek, after the long “winter” of colonization/development/modernization, affords an appropriate indigenous Australian expression of the sacred daughter’s return.

The festival brings hundreds of local performers of different ethnicity and cultural provenance – schoolchildren, dancers and artists – together with thousands of local residents, environmentalists and activists, in a cathartic, highenergy celebration of place. Its dramatic reenactment of the retreat of the kingfisher in the face of ecological holocaust and its return in response to the efforts of local people to regenerate their “country” through revegetation and restoration, symbolizes the beginning of a new “season” of peaceful coexistence between people and land in this locality. Mythic elements from Aboriginal culture are woven into the proceedings, and the Aboriginal custodians who lead the entire performance “initiate” nonindigenous Australians into ancient local rituals of place, thereby inducing a more custodial consciousness in the new peoples, and inviting all, indigenous and nonindigenous alike, to become “reconciled” as one people through their common commitment to homeplace. With a blend of forms faithful to the land and its first and later peoples then, but also to the archetypal meaning of its eponymous goddess, CERES both celebrates and powerfully invokes, via this festival, the return of life, of fertility, to our blighted planet.

The Kingfisher festival is an instance of a participatory poetics, an event conceived and presented wholly *in place*. It is an event which could not be “staged” anywhere but at CERES. Each year, moreover, the “festival” comes closer to being a *ceremonial* event, with “audience” being invited to process along the creek, light tapers and perform other ritual actions in the context of the kingfisher story. Each year too the site joins in, adding cicada choirs and rainbows, for instance, with dazzling appositeness, at strategic junctures.

In so greatly expanding the meaning of its original environmental brief, so that it encompasses the mythopoetic in addition to the technological, and takes as its starting point the actual ground beneath our feet, CERES is perhaps pointing the way, not only for environmentalism but also for something larger than environmentalism. As churches are being closed down and sold off throughout the Western world, perhaps it is time to see “centers” like CERES, which answer to the increasingly ecological tenor

of contemporary spiritual sensibilities, taking their place. In such centers people could come together to experiment collectively, both practically and poetically, with new, locally specific ways of being in the world, negotiating a new covenant with reality that would not only sustain “the environment” but would also reconnect us to the sources of meaning in life.

Utopian Communities

Many religions around the world have an ancient myth that people once lived in harmony with nature, but sin expelled humanity from this Edenic environment. Similarly, inhabitants of industrial societies have often longed to recapture the lost bliss they imagine that people enjoyed in traditional agricultural society, marked by brotherhood and communal sharing. On the basis of such myths, utopian experiments have sought to revive harmony between humans and between humanity and nature. These are worldwide phenomena, but the utopian communities of the United States have been especially well documented.

Sects and Cults

Some of the most successful communes have been Protestant sects in the German Anabaptist tradition that migrated to North America: notably Amana, Harmony, Zoar and the Hutterites. A sect is a religious movement that broke away via schism from a larger and less intense denomination, and that seeks to create a more perfect version of the religious tradition in which it arose. The members of such sects tend to have long-standing social bonds with each other, and their internal group cohesion is so strong they often lose bonds to the surrounding society and thus are well prepared to establish their community in a new land.

Because utopian sects try to return to ancient forms of agricultural community, they live close to the land. This means that in many respects they live in harmony with nature, but they also dominate and exploit nature, so their relation to the natural world is fundamentally ambivalent. This can be seen, for example, in the great variation in birth rates across these groups, Harmony producing no children and the Hutterites having among the highest fertility rates of any group in the world. Similarly, they tend to be ambivalent toward technology, often accepting innovations that improve agricultural productivity while resisting innovations that would increase their contacts with secular society.

Other communal groups are sometimes called cults, although this term has such negative connotations that many scholars call them “new religious movements” instead. Technically, a cult is a religious movement that departs significantly from the dominant religious tradition, and cults tend to be founded by individuals, couples, and very small groups of friends. Two extremely well documented examples are the Shakers and Oneida. Both of these have some affinities with conventional Protestantism, but

they innovated significantly in both beliefs and practices. Oneida was born in America, whereas the Shakers developed their distinctive way of life in America from a loosely knit group of less than a dozen people that came from England. Because they tend to begin very small, cults must recruit rapidly if they are to survive, and most of them die out very quickly.

Because of their innovativeness, cults are culturally diverse and thus have many different relationships with nature. Some of them, including both the Shakers and

Oneida, are very articulate about their philosophies and contradictions. In an 1823 Shaker treatise, *A Summary View of the Millennial Church*, Calvin Green and Seth Wells argued that communal life was “contrary to the partial, aspiring and selfish nature of man.” Thus, they believed, only actual divine intervention could overcome this sinful nature. John Humphrey Noyes, founder of Oneida, developed techniques for controlling natural erotic urges that would allow men to have sexual intercourse without ejaculating. While ambivalence about human nature runs throughout all major religious traditions, these communal cults take it to an extreme.

Principles of Religious Communes

Scholarly research on utopian societies, both modern and historical, has provided evidence to support a number of scientific hypotheses about these phenomena. First of all, Green and Wells seem to have been right, in a sense, because religious communes tend to last far longer than secular communes, although communes of all kinds tend to die within a generation or two after formation. Second, erotic relations between individual members challenge the social integrity of communes, so successful groups tend to regulate them strictly, sometimes going to the extremes either of celibacy or of organized multipartner sexuality. Sexual tensions among members, and the tension of separation from the surrounding society, may be among the strongest factors causing ambivalence toward nature in general.

During the twentieth century, the proportion of the general population involved in agriculture declined rapidly, and society became heavily urban. This profound shift may have reduced the opportunities for new communal sects that try to re-create essentially medieval agrarian communities, without necessarily reducing the opportunities for more radical communal cults. This suggests that utopian ambivalence toward nature is increasing, with some groups embracing the Earth while others try to escape it. The sect–cult distinction is only a matter of degree, however, and either kind of group can evolve back toward conventional society. For example, the Amana sect became a household appliance corporation, and the Oneida cult became a silverware corporation.

Acknowledging the instability that comes from their experimental character, we can learn much from utopian religious communes about building sustainable society in harmony with the environment. Their transcendent ideals and social cohesion allow them to work cooperatively for shared goals. The material lifestyle of successful communes

tends to emphasize efficiency rather than luxury, and their need for social harmony causes many of them to develop effective means for controlling the birth rate. Humanity needs brotherhood and harmony with nature, so utopian religious communes can provide valuable myths for the twenty-first century and beyond.

V

Valuing Nature

In a provocative 1997 article for the journal *Nature*, Robert Costanza and 12 colleagues calculated that the Earth's ecological systems and natural resources contributed "ecological services" valued at an average of U.S. \$33 trillion per year. The calculations included all renewable ecosystem services but excluded non-renewable resources, such as fuels and minerals. In their valuing of nature, Costanza et al. attempted to be comprehensive, estimating and including values for ecological services that are excluded by market processes but nonetheless provide important benefits. Their estimations of value even included "aesthetic" and "spiritual" services provided by nature. In their article, the Costanza group admitted "there are many conceptual and empirical problems inherent in producing such an estimate" (253). However, they also noted that whenever humans make decisions about ecosystems, we are inevitably making decisions about the value of nature, even if only implicitly. Thus, for Costanza et al., it is important to determine explicitly the monetary value of nature for public policy making, despite the difficulties with such financial calculations.

Most contemporary religions also affirm the importance of valuing nature. Such perspectives from religions could also validate the work of Costanza et al. to ascertain financial values for public policy making. Yet, from the perspective of contemporary religions, the assignment of financial worth cannot adequately capture the full value of nature. For example, how is it possible to assign a financial value for spiritual ecoservices provided by nature? Rather, financial valuing of nature would be subsumed under a broader, overarching valuation.

In the creation story of Genesis 1 – which is shared as sacred scripture by the three Abrahamic traditions of Judaism, Christianity, and Islam – God follows a pattern of creating, then seeing and judging that what has been created is good. The chapter concludes with God's final evaluation: "God saw everything that he had made, and indeed, it was very good. And there was evening and there was morning, the sixth day" (Gen. 1:31, NRSV) Thus, from the perspective of the Abrahamic traditions, creation is valued because God has judged it good.

Despite this scriptural warrant that nature is to be valued, Christianity – especially the Western Christianity of Roman Catholicism and Protestantism – has been harshly criticized for devaluing nature. Representative of this critical view is the essay, "The Historical Roots of Our

Ecologic Crisis," by Lynn White, Jr. In this 1967 essay, White acknowledges that, historically, humans have always modified their environment for their own benefit. While this power was limited in the past, White argues that twentieth-century hu-

mans now have the scientific and technological power radically to transform ecological systems. This profound power appears to be out of control, and “Christianity bears a huge burden of guilt” for the ecological damage incurred, since it has been the dominant cultural paradigm where science and technology have experienced rapid advances.

White bases his contention on the foundational assumption that humans’ attitudes toward nature derive from their religious beliefs and perspective. He observes: “What people do about their ecology depends on what they think about themselves in relation to things around them . . . that is, by religion” (19). As we have seen, the creation story in Genesis 1 appears to value nature highly. Yet, White observes that this creation story also elevates humans above the rest of creation in a monarchical role, when it claims that humans are created in the image of God.

Then God said, “Let us make humankind in our image, according to our likeness; and let them have dominion over the fish of the sea, and over the birds of the air, and over the cattle, and over all the wild animals of the Earth, and over every creeping thing that creeps upon the Earth” (Gen. 1:26, NRSV).

White claims that this elevation of humanity serves to devalue the rest of creation, thus giving humans an implicit permission to degrade the environment as they please. As White observes, “Christianity . . . not only established a dualism of man and nature but also insisted that it is God’s will that man exploit nature for his proper ends” (18).

There are some obvious flaws in the harsh critique of Christianity represented by White. For instance, if Western Christianity is the principal factor creating attitudes that devalue nature and lead to its degradation, then logically we would not expect ecological crises to occur in areas informed by other cultural paradigms. Unfortunately, this is not the case and other areas that are not predominantly Christian have also had ecological crises. Despite such flaws in the position represented by White, many Christian thinkers have taken the broad criticism seriously.

In his book, *The Travail of Nature*, Paul Santmire provides one of the most thoughtful treatments of White’s thesis. Santmire argues that there are two competing theological motifs present throughout the historical development of Christian thought. On the one hand, Santmire finds an ecological motif that grounds a strong stewardship ethic calling upon Christians to care for God’s creation. Yet, on the other hand, Santmire also finds evidence for a spiritual motif that emphasizes a spiritual salvation in such a manner that the physical environment becomes significantly less important. If not properly balanced by the ecological motif, the spiritual motif could indeed justify a boundless exploitation and degradation of the environment as White claims for Western Christianity. Santmire argues that both of these theological motifs are present throughout the historical development of Christianity, and that they may even be simultaneously present in the same theologian or theological concept.

Our rather close examination of Western Christianity suggests that there is a diversity of perspectives on the value of nature. Whereas most religions would affirm the importance of the ecological services provided by nature, many religions would assert that the value of nature extends beyond – and subsumes – a mere financial accounting.

For Christianity, the value of nature occurs because God created and saw that it was good. Yet within Western Christianity, there can be profound disagreement as to what the implications of valuing nature mean for faith and life.

van der Post, Laurens (1906–1996)

Sir Laurens Jan van der Post was born in the Orange Free State of South Africa on 13 December 1906 and he died shortly after his 90th birthday in London. His was a life of travel to the far reaches of the Earth, an Earth he loved and fought hard to preserve: his long and creative life as a soldier, journalist, author, explorer and conservationist earned him a knighthood and the honor of Commander of the British Empire.

Sir Laurens spent the 1930s writing and farming in England and his first book, *In a Province*, was pioneering in its dealing with the tragedy of apartheid. After the outbreak of World War II, he enlisted in the British Army and served until 1942 in Abyssinia, Syria and Southeast Asia, where he was then captured by the Japanese Army on the island of Java. During the ensuing three and a half years in a prisoner-of-war camp, he was instrumental in organizing extensive educational efforts among his fellow prisoners. The experiences of this camp were described in his two books, *The Seed and the Sower* (later made into the film, “Merry Christmas, Mr. Lawrence”) and *The Night of the New Moon*.

All told, Sir Laurens wrote more than two dozen novels, along with countless short stories, memoirs and essays dealing with psychology, the nature of prejudice and good and evil, the environment and the importance of story in our lives. One of his many talents was the ability to weave these themes together into one and the same character or work, for example in his telling of the Bushmen stories in ways that illustrate basic human psychology and inspire a love for nature. The best known of his books are *The Lost World of the Kalahari* and *The Heart of the Hunter*. He also made numerous films for the BBC, including *All Africa Within Us* and *Jung and the Story of our Time*.

His encounter and ensuing friendship with the Swiss psychiatrist Carl Gustav Jung shortly after his return from the war was decisive and marked the beginning of his striving to understand outer and inner nature, macrocosm and microcosm. He combined Jung’s philosophy with his own that had been formed from his African and Asian jungle experiences, and shared it widely with readers, viewers and friends for the rest of his life.

As a result of talking to Jung about the Africa I had within myself, I was re-confirmed into a new area of the human spirit which had been singularly mine intuitively ever since I was born. Nothing seemed to me more wonderful than the prophetic observation by Sir Thomas Browne, the intuitive alchemist figure of Norwich in the Elizabethan age: “We seek the wonders without that we carry within – we have all Africa and its wonders within us” (van der Post 1998: 311).

Sir Laurens lived his life with passion, and one of his greatest passions was the preservation of the Earth, our environment. Gifted storyteller that he was, he spent much of his time and energy in the last years of his life telling stories about the creatures of the Earth and pleading that more attention be given to our environment. He freely shared his views with gatherings of people large and small, in interviews and in his books and other writings. In an interview conducted for Earth Day in 1990, he responded to a question about why it is more important today than ever for people to experience nature and wildlife firsthand, a primary goal of an organization he championed, The Wilderness Foundation:

We are trying to conserve the spirit of the conservationist in people . . . If you keep the Earth as close to the initial blueprint of creation as you can, and you bring a person into contact with it, a person who is not whole, from a lopsided society, poof, that person changes. I've never known it to fail. Problem children, all sorts of people who have lost their way in life, once they've had this experience, they're different (van der Post 1998: 311).

In his 1985 essay entitled, "Wilderness – A Way of Truth," he wrote:

Some of our scientists talk about "managing wilderness" and this worries me a bit. It is like saying they want to control revelation. But the moment you try to control it, there is no revelation . . . We try to give it elaborate definitions, but we all know what wilderness really is, because we have it inside ourselves. We know it is a world in which every bit of nature counts and is important to us, and we know when it is not there (van der Post 1985: 47).

Sir Laurens spent the final decades of his life not only continuing to write both fiction and historical pieces, but also speaking widely throughout the world promoting the importance of nature and our environment.

Vegetarianism and Buddhism

Buddhist outlooks toward the eating of meat vary by historical periods and traditions, and they often reflect the influence of local cultural practices and social ethos. Generally speaking, Buddhist attitudes toward animals are shaped by the ethical principle of non-injury to others

(*ahimsa*), and by the virtues of compassion, respect, and love that extend toward all beings. The principle of noninjury was shared by Buddhism and other religious traditions in ancient India, and is a core ethical virtue of Indian religions. Its importance in Buddhism can be seen from the fact that the first of the Five Precepts – which define the ethical foundation of Buddhist life and serve as the basis for other forms of spiritual cultivation – is the injunction not to kill any living creatures. While Buddhist texts and leaders often try to discourage the killing of animals, in actual practice there is a wide range of attitudes toward the practice of vegetarianism among different Buddhist groups and traditions, ranging from strict adherence to vegetarian diets to conspicuous consumption of meat by the clergy.

The texts of the monastic code of discipline, the *Vinaya*, indicate that the early monastic order did not adopt a strictly vegetarian diet. According to these sources Buddhist monks were allowed to eat meat provided it was “pure” by fulfilling three requirements: that a monk who is given a meat dish has not heard, seen, or become suspicious that the animal was specifically killed for him. Monks were of course prohibited from killing animals, or even small creatures that might reside in water used by them. Because for their food they relied on alms received from the faithful, monks were supposed to eat whatever they were offered while practicing detachment from the sensual pleasures associated with eating. In the *Vinaya* there is also the story of the Buddha’s refusal to make vegetarianism compulsory for all monks, when that was proposed by his evil cousin Devadatta as part of a request to institute a range of new rules initiated by him in order to create schism within the monastic community.

While monks were absolved from any transgression if they consumed meat that fulfilled the three requirements, in early Buddhism, killing of animals was regarded as an unwholesome act and was proscribed by Buddhist moral values. It was believed that for lay people the killing of animals brought about negative karmic consequences, while the sparing of animal lives became a cherished Buddhist ideal. The positive regard of animals was reinforced by Jataka stories, which depict previous lives of the Buddha. In a number of these stories the Buddha is depicted as being reborn in a previous lifetime as an animal, and noble feelings and actions are attributed to wild animals such as elephants. A similar point of view was adopted by the famous Buddhist

monarch Asoka (r. ca. 265–238 B.C.E.), who recognized the sanctity of animal lives and instituted official days when animals were not to be killed. In one of his inscriptions the Emperor states that he has conferred many boons to animals, birds, and fish, including the saving of their lives. Asoka himself abandoned hunting and eventually prohibited the killing of animals in order to supply food for the court and the imperial household. Asoka's example was followed by a number of Buddhist monarchs, such as Sri Lankan kings who prohibited the slaughter of animals, and Emperor Wu of the Liang dynasty (r. 502–549) in China, who practiced vegetarianism and issued decrees that restricted the killing of animals.

Adoption of vegetarianism became more prevalent with the emergence of the Mahayana tradition. That was largely motivated by an increased emphasis on compassion as a prime Buddhist virtue, although external criticisms of Buddhist meat eating might have also played some part. Mahayana promoted universalistic ethics that was predicated on the notion that the pursuit of the bodhisattva path is to be undertaken for the sake of benefiting all beings. Since animals, like all other creatures, were objects of the bodhisattvas' compassionate regard and selfless salvific acts, it was deemed improper for Mahayana practitioners to consume their flesh. Explicit critiques of meat eating appear in a number of Mahayana scriptures and other texts composed by leading figures of the movement. Arguably the most trenchant critiques can be found in the *Lankavatara Scripture*, which presents a series of arguments that highlight the evils of meat eating and includes a call to disallow the practice. According to the scripture, eating of animal flesh is disgusting, creates hindrances to spiritual progress, contributes to bad health, and leads to unpleasant rebirth. Conversely, in addition to being healthy, the adoption of a vegetarian diet accords with Buddhist values and ideals, aids spiritual cultivation, and helps one to avoid the negative karmic consequences of meat eating. The scripture also takes to task the permissive attitudes of earlier Buddhist texts and traditions, proclaiming that arguments made in support of meat eating, including the notion that meat is pure if it fulfills the three requirements, are spurious. The text also states that the Buddha never permitted the eating of meat, and for good measure it also explicitly prohibits the eating of meat by all disciples of the Buddha under all circumstances.

With the transmission of Mahayana forms of Buddhism to China, vegetarianism became a characteristic feature of Chinese Buddhism. From the medieval period onward meat eating was prohibited in Buddhist monasteries, and Chinese monks and nuns adopted a strict vegetarian diet that also precluded the consumption of eggs, dairy products, and certain types of leeks (which more or less amounted to veganism). Vegetarianism was given additional canonical legitimacy by the *Brahma Net Scripture*, an apocryphal text composed in China, which contains a series of bodhisattva precepts that became accepted as normative by Chinese Buddhists. Since this text prohibits the eating of meat, abstinence became binding for all monks and nuns who received bodhisattva ordinations as part of their entry into the monastic order. Vegetarianism was, and still is, practiced by lay Buddhists as well. Vegetarian feasts are a common

feature of Chinese Buddhist festivals, and lay devotees who have not adopted a vegetarian diet often abstain from meat eating on certain observance days, such as festivals dedicated to popular bodhisattvas. Vegetarianism also had a broad effect on traditional Chinese society. Under Buddhist influence, during the medieval period the imperial government issued decrees that restricted or prohibited the slaughter of animals on certain dates, and vegetarianism was also adopted by Daoist monastic orders. Vegetarianism continues to be a basic feature of Chinese Buddhism, which remains distinct among the Buddhist traditions by its stress on the injunction against the eating of meat.

The practice of vegetarianism was also transmitted to other areas of Asia that adopted Chinese forms of Buddhism, viz. Korea, Japan, and Vietnam. In Japan that influence extended until the onset of the modern period, as by and large in traditional Japanese society most people lived on a largely vegetarian diet (although they consumed fish). Meat eating became more prevalent from the late nineteenth century onward with the greater emphasis on modernization and the acceptance of Western mores. With the increased secularization of the Buddhist clergy, the various Buddhist sects abandoned the age-old prohibitions against meat eating, although training monasteries, especially ones belonging to the Zen sects, formally retain vegetarian diets for priests undergoing formal training. Among other Mahayana traditions, vegetarianism is not widely practiced in Tibetan Buddhism. Although compassion and love for all beings are regarded as cardinal virtues by the Tibetans, the widespread meat eating by the clergy is largely explained by the difficulty of practicing a vegetarian diet in Tibet's harsh climate.

Although the prohibition against killing and the call to adopt attitudes of kindness toward animals are accepted as normative by the contemporary Theravada traditions, the practice of vegetarianism is a rare occurrence in all Theravadin countries. In Sri Lanka most Buddhists avoid killing animals (which often does not extend to fish), and most butchers are Muslims. The Buddhist concern with killing is also reflected in the relatively low consumption of meat and the rarity of making offerings of red meat to the monks, although few Buddhists identify themselves as vegetarians. Meat eating is much more prevalent in other Theravada countries such as Thailand, where the vast majority of monks engage in conspicuous consumption of large quantities of meat. There vegetarianism is often frowned upon, although there are a few monks who are trying to promote the idea of vegetarianism. Vegetarianism is much more widespread among Western Buddhists. That seems to be influenced by a number of disparate factors, including increased interest in vegetarianism by the general society, adoption of specific views about Buddhist values and lifestyles, and adherence of ethical principles informed by ecological concerns.

Vegetarianism and Judaism

In traditional Jewish thinking, not only are normative laws regarded as binding solely upon the authority of divine revelation, but ethical principles as well are regarded as endowed with validity and commended as goals of human aspiration only if they, too, are divinely revealed. Accordingly, the value of vegetarianism as a moral *desideratum* can be acknowledged only if support is found within the corpus of the Written or Oral Law.

A proof-text often cited in support of vegetarianism as an ideal to which humans should aspire is a statement recorded in the Talmud (BT *Sanhedrin* 59b):

Rav Judah stated in the name of Rav, “Adam was not permitted meat for purposes of eating as it is written, ‘for you shall it be for food and to all beasts of the Earth’ (Gen. 1:29), but not beasts of the Earth for you. But when the sons of Noah came [He] permitted them [the beasts of the Earth] as it is said, ‘as the green grass I have given you everything’” (Gen. 9:3).

Some writers have regarded this statement as reflecting the notion that primeval humanity was denied the flesh of animals because of its enhanced moral status. Permission to eat the flesh of animals was granted only to Noah because, subsequent to Adam’s sin, mankind could no longer be held to such lofty moral standards. Nevertheless, they argue, people ought to aspire to the highest levels of moral conduct and eschew the flesh of animals.

In point of fact, this talmudic dictum is simply a terse statement of the relevant law prior to the time of Noah, but is silent with regard to any validating rationale. The classic biblical commentators found entirely divergent explanations for the change that occurred with regard to dietary regulations.

An examination of the writings of rabbinic scholars reveals three distinct attitudes with regard to vegetarianism:

1) The Gemara (BT *Pesachim* 49b) declares that an ignoramus ought not to partake of meat:

“This is the law of the animal . . . and the fowl” (Lev. 11:46): whoever engages in [the study of] the Law is permitted to eat the flesh of animals and fowl, but whoever does not engage in [the study of] the Law may not eat the flesh of animals and fowl.

This text should certainly not be construed as declaring that meat is permitted only to the scholar as a reward for his erudition or diligence. *Maharsha* (Rav Shmuel Eliezer Halevi Eidels, fifteenth century) indicates that this text simply reflects a concern for scrupulous observance of the minutiae of the dietary code. The ignoramus is not proficient in the myriad rules and regulations governing the eating of meat, including the

differentiation between kosher and non-kosher species, the purging of forbidden fat and veins, the soaking and salting of meat, etc.

2) A number of medieval scholars, including R. Isaac Abravanel (also spelled “Abarbanel,” 1437–1508) in his commentary to Genesis 9:3 and Isaiah 11:7, and R. Joseph Albo (c.1380–1444) in *Sefer ha’Ikarim*, Book III, chapter 15, regard vegetarianism as a moral ideal, not because of a concern for the welfare of animals, but because of the fact that slaughter of animals might cause the individual who performs such acts to develop negative character traits, viz., meanness and cruelty. Their concern was with regard to possible untoward effect upon human character rather than with animal welfare.

Indeed, R. Joseph Albo maintains that renunciation of the consumption of meat for reasons of concern for animal welfare is not only morally erroneous but even repugnant. Albo asserts that this was the intellectual error committed by Cain and that it was this error that was the root cause of Cain’s act of fratricide. Albo opines that Cain did not offer an animal sacrifice because he regarded humans and animals as equals and, accordingly, felt that he had no right to take the life of an animal, even as an act of divine worship. Abel maintained that humans were superior to animals in that they possessed reason as demonstrated by his ability to use intellect in cultivating fields and in shepherding flocks. This, Abel believed, gave human beings limited rights over animals, including the right to use animals in the service of God, but it did not confer upon him the right to kill animals for his own needs. Abel’s error was not as profound as that of Cain, but it was an error nonetheless. And, declares Albo, because Abel shared the error of his brother, he was punished by being permitted to die at the hands of Cain. Cain’s error was egregious in the extreme. Hence he was so lacking in favor in the eyes of God that his sacrifice was rejected. Although he was also guilty of error, Abel’s sacrifice was accepted by God because his error was not as serious as that of his brother. According to Albo, Cain failed to understand the reason for the rejection of his sacrifice and assumed that, in the eyes of God, animal sacrifice was intrinsically superior to the offering of produce. Since Cain remained confirmed in his opinion that humans and animals are inherently equal, he was led to the even more grievous conclusion that just

Vegetarianism and Kabbalah

Abstinence from the flesh of animals is also the subject of scattered comments in kabbalistic writings. R. Moses Cordovero, *Shi'ur Komah* (Warsaw 1883: 84b), advises that a person seeking spiritual perfection should “distance” himself from eating meat. Accepting the principle of transmigration of souls, R. Moses Cordovero expresses the concern that the soul of a wicked human being may be present in a slaughtered animal and exert a deleterious influence over the person who consumes its flesh. In a footnote appended to that text, the editor remarks that, according to this thesis, one who is imbued with the Divine Spirit, and hence capable of determining that no such soul is incarnated in the animal he is about to eat, has no reason to refrain from eating meat.

A similar position is attributed to R. Eliyahu de Vidas' *Reishit Chokhmah* (sixteenth century) in *S'dei Chemed* (an encyclopedia of Jewish Law by R. Chayyim Chizkiyahu Medini, nineteenth century), “Ma'arekhet Akhilah” sec. 1. *Reishit Chokhmah* is cited as stating that one should not eat the flesh of any living creature. The reference appears to be to the Amsterdam, 1908 edition of *Reishit Chokhmah*. However, an examination of pp. 129b–30a of that edition reveals that, rather than advising total abstinence from the flesh of living creatures, *Reishit Chokhmah* offers counsel with regard to the time of day most suitable for the partaking of meat.

Opposition to the consumption of meat appears to be a narrowly held view even within the kabbalistic tradition. A number of kabbalistic sources indicate that, quite to the contrary, the doctrine of transmigration yields a positive view regarding the eating of meat. According to these sources, transmigrated souls present in the flesh of animals may secure their release only when the meat of the animal has been consumed by a man. The *mitzvot* performed in preparation and partaking of the meat and the blessings pronounced upon its consumption serve to “perfect” the transmigrated soul so that it may be released to enjoy eternal reward. See, for example, *Shevet Musar* (by R. Eliyahu Hakohen of Izmir, d. 1729), ch. 36 and R. Tzvi Elimelekh of Dinov (1783–1841, also spelled “Elimelech”), *B'nei Yissaskhar*, *Ma'amarei haShabbatot*, *Ma'amar* 10 sec. 4, and *Sivan*, *Ma'amar* 5, sec. 18. Scripture speaks of fish as “gathered” rather than as slaughtered and similarly speaks of the righteous as being “gathered” to their forebears rather than experiencing the throes of death. Righteous individuals who must undergo transmigration in expiation of minor infractions are incarnated in fish in order to spare them the pain of slaughter. See also R. Moshe Teitelbaum (1759–1841), *Yismach Mosheh*, *Parshat Vayeira*, s.v. *vayikach chem'ah v'chalav* [Gen. 18:8]. R. Yechiel Mikhel Halevi Epstein (1829–1908), *Kitzur Sh'lah* (Jerusalem, 1960: 161) advises that particular effort be made to eat fish on *Shabbat* so that the souls of the

righteous which may be incarnated in the fish be “perfected” through consumption of the fish by a righteous and observant Jew.

R. Menachem Mendel Schneerson (the Lubavitcher rebbe, 1902–1994) is quoted as having expressed opposition to vegetarianism, at least tentatively, on kabbalistic grounds. He is reported by R. Shear-Yashuv Cohen (chief rabbi of Haifa and lifelong vegetarian) to have voiced the concern that refraining from consumption of meat will prevent the “elevation of sparks,” a goal that is central to the kabbalists’ view of the human purpose in life (Slae, *Min hattai*, Jerusalem, 1988).

J. David Bleich as one is entitled to take the life of an animal so also he was entitled to take the life of a fellow human being. This position, Albo asserts, was adopted by succeeding generations as well. It was precisely the notion that humans and animals are equal that led, not to the renunciation of causing harm to animals and to concern for their welfare, but rather to the notion that violence against one’s fellows was equally acceptable. The inevitable result was a total breakdown of the social order, which ultimately culminated in punishment by means of the Flood. Subsequent to the Flood, meat was permitted to Noah, Albo asserts, in order to impress upon humankind the superiority of human beings over members of the animal kingdom.

Albo does not explain why the generations after the Flood drew the correct conclusion and were not prone again to commit the error of Cain. There is, however, a rabbinic text that effectively resolves the issue. Genesis 7:23 declares that during the period of the Flood God destroyed not only humans but also every living creature. The Gemara, BT *Sanhedrin* 108a, queries,

If man sinned, what was the sin of the animals? Rabbi Joshua the son of Korchah answered the question with a parable: A man made a nuptial canopy for his son and prepared elaborate foods for the wedding feast. In the interim his son died. The father arose and took apart the nuptial canopy declaring, “I did nothing other than on behalf of my son. Now that he has died for what purpose do I need the nuptial canopy?” Similarly, the Holy One, blessed be He, said, “I did not create animals and beasts other than for man. Now that man has sinned for what purpose do I need animals and beasts?”

Those comments serve to indicate that the extermination of innocent animals in the course of the Deluge must be regarded as proof positive of the superiority of human beings over members of the animal kingdom. Animals could be destroyed by a righteous God only because the sole purpose of those creatures was to serve humanity. Hence, if humankind is to be destroyed, the continued existence of animal species is purposeless. Thus the basic principle (i.e., the superiority of humans over members of the animal kingdom) was amply demonstrated by the destruction of animals during the course of the flood.

3) One modern-day scholar who is often cited as looking upon vegetarianism with extreme favor is the late Rabbi Abraham Isaac Kook. It is indeed the case that in his writings Rabbi Kook speaks of vegetarianism as an ideal and points out that Adam did not partake of the flesh of animals. In context, however, Rabbi Kook makes those

comments in his portrayal of the eschatological era. He regards man's moral state in that period as being akin to that of Adam before his sin and does indeed view renunciation of enjoyment of animal flesh as part of the heightened moral awareness which will be manifest at that time. But Rabbi Kook is emphatic, nay, vehement, in admonishing that vegetarianism dare not be adopted as a norm of human conduct prior to the advent of the eschatological era. Rabbi Kook advances what are, in effect, four distinct arguments in renunciation of vegetarianism as a goal toward which contemporary man ought to aspire: i) Rabbi Kook remarks almost facetiously that one might surmise that all problems of human welfare have been resolved and the sole remaining area of concern is animal welfare. In effect, his argument is that there ought to be a proper order of priorities. Rabbi Kook is quite explicit in stating that enmity between nations and racial discrimination should be of greater moral concern to humankind than the well-being of animals and that only when such matters have been rectified should attention be turned to questions of animal welfare. ii) Given the present nature of the human condition, maintains Rabbi Kook, it is impossible for humans to sublimate their desire for meat. The inevitable result of promoting vegetarianism as a normative standard of human conduct, argues Rabbi Kook, will be that humans will violate this norm in seeking selfgratification. Once taking the life of animals is regarded as being equal in abhorrence to taking the life of human beings, it will transpire, contends Rabbi Kook, that in pursuit of meat, people will regard cannibalism as no more heinous than the consumption of the flesh of animals. The result will be, not enhanced respect for the life of animals, but rather debasement of human life. iii) Human beings were granted dominion over animals, including the right to take animal lives for their own benefit, in order to impress upon human beings their spiritual superiority and heightened moral obligations. Were they to accord animals the same rights as human beings they would rapidly degenerate to the level of animals in assuming that humans are bound by standards of morality no different from those acted out by brute animals. iv) In an insightful psychological observation, Rabbi Kook remarks that even individuals who are morally degenerate seek to channel their natural moral instincts in some direction. Frequently, they seek to give expression to moral drives by becoming particularly scrupulous with regard to some specific aspect of moral behavior. With almost prescient knowledge of future events, Rabbi Kook argues that, were vegetarianism to become the norm, people might become quite callous with regard to human welfare and human life and express their instinctive moral feelings in an exaggerated concern for animal welfare. These comments summon to mind the spectacle of Germans watching with equanimity while their Jewish neighbors were dispatched to crematoria and immediately thereafter turning their attention to the welfare of the household pets that had been left behind.

Despite the foregoing, vegetarianism is not rejected by Judaism as a valid lifestyle for at least some individuals. There are, to be sure, individuals who are repulsed by the prospect of consuming the flesh of a living creature. It is not the case that an individual who declines to partake of meat is *ipso facto* guilty of violation of the moral code. On

the contrary, Scripture states, “and you will say: ‘I will eat meat,’ because your soul desires to eat meat; with all the desire of your soul may you eat meat” (Deut. 12:20). The implication is that meat may be consumed when there is desire and appetite for it as food, but may be eschewed when there is no desire and, *a fortiori*, when it is found to be repugnant. The question is one of perspective. Concern arises only when such conduct is elevated to the level of a moral norm.

Vegetarianism and Rabbi Abraham Isaac Kook (1865–1935)

Rabbi Abraham Isaac Kook, often referred to by the Hebrew title *Rav Kook*, was the leading Orthodox Jewish thinker of the Zionist movement. Born in Griva, Latvia, Kook was a leading Talmudic scholar and expert in Jewish law, while also deeply influenced by Jewish mysticism and Hasidism. After serving as rabbi to two Eastern European towns, in 1904 Kook immigrated to Palestine to serve as rabbi of Jaffa. While attending a convention in Europe in 1914, Kook found his return route to Palestine cut off by the outbreak of World War I. He spent the duration of the war in a temporary rabbinical position in London, and afterwards returned to Palestine to serve as Chief Rabbi of Jerusalem. In 1921 he was elected first Ashkenazi (European) Chief Rabbi of Palestine.

Kook's prolific writings meld traditional Jewish philosophical and mystical ideas with elements of modern European philosophy to create a comprehensive Jewish worldview. He viewed history as the dialectical unfolding of a cosmic drama of redemption, encompassing processes ranging from biological evolution to the spiritual advancement of humanity. At the center of this drama stands the Jewish people, whose own historical development serves as a catalyst for, and harbinger of, the perfection of humanity as a whole, bringing about, ultimately, the perfection of the entire universe both in its material and spiritual aspects.

In this context, the return of the Jewish People to Palestine may be seen as aimed at achieving its *rapprochement* with physical nature. Kook taught that an unbalanced attachment to nature invites the dangers of idolatry and pantheism. The Jewish people had been exiled from their land in order to distance Judaism from nature and purify Jewish monotheism of idolatrous and pantheistic tendencies. Now that those dangers had been dealt with, the time had come for the Jewish People to return to its land. Immunized against idolatry and reestablished in its home soil, Judaism can safely engage with the physical world in order to perfect and bring to light the holiness implicit in all of reality, including inorganic matter. Building upon earlier traditions, Kook claimed that the Land of Israel (Palestine) is peculiarly endowed with a unique spiritual quality whose influence is necessary for the Jewish People to fulfill their spiritual quest.

Reflecting his belief that every part of the Jewish people plays an essential role in the redemptive process, Kook sought ties with people from all sections of the Jewish population, from the radically anti-religious socialist Zionists, to the Ultra-orthodox

anti-Zionist pietists of Jerusalem. He was something of a controversial figure, antagonizing modernists with his insistence on the absolute centrality of religion in Jewish life, and scandalizing traditionalists by embracing Zionism. True to his belief in the inherent goodness within all phenomena, he viewed secular atheism as a spiritually profound and ultimately beneficial challenge to traditional religiosity. Modernist atheism would catalyze monotheism's final purification. Similarly, Kook found in the theory of evolution an expression of the cosmic drive toward perfection that informs all created beings.

Kook's writings on vegetarianism, collected in a pamphlet entitled *Hazon HaTzimchonut v'haShalom miV'khinah Toranit* (*The Vision of Vegetarianism and Peace from a Torah Perspective*), have been the subject of great interest and misunderstanding. On the one hand, Kook addressed the morality of human/animal relations in remarkably radical terms. Judaism has traditionally objected to unnecessary animal suffering and to the wanton destruction of nonhuman life. However, these are often regarded within Judaism as spiritually damaging to the human perpetrator, rather than genuinely evil in themselves. Kook went beyond such considerations to speak of human *injustice* toward animals. Not only is the slaughter of animals for food wrong, but also even the nonviolent exploitation of animal products such as wool and milk constitutes a form of theft!

Kook was careful to explain that full moral consideration for animals should only be implemented when humanity achieves its highest spiritual development in the messianic era. His view is rooted in the ancient Jewish notion that while God originally forbade humans to eat meat ("Behold I have given you every seed-bearing plant upon all the Earth, and every tree that has seed-bearing fruit; they shall be yours for food" [Gen. 1:29]), after the Deluge God permitted it as a concession to human weakness ("Every creature that lives shall be yours to eat; as with the green grasses, I give you all these" [Gen. 9:3]). Kook claimed that while the earlier ban on meat would be reinstated in messianic times, a premature demand for vegetarianism and full justice toward animals would be spiritually destructive. In their present fallen state, people would understand such a demand as implying the essential equality of humans and animals. They would forget humanity's unique spiritual vocation and lapse into a brutish and purely corporeal existence. Tyrannical governments would use radical campaigns for animal protection as tools for the oppression of humans, and as a propagandistic distraction from the injustices they perpetrate against people. Kook argued that absolute justice for animals should be demanded only after *inter-human* relations are free of violence, oppression and injustice.

For the time being, Kook taught, many biblical commandments serve to remind us of the present imperfect state of human attitudes toward animals. Jewish laws including careful ritual guidelines for humane slaughter, and the prohibition against eating blood (Deut. 13:23) serve to prepare us for the day when vegetarianism will be required of humans. The law stating, "You shall not boil a kid in its mother's milk" (Ex. 23:19) reminds us that by right the milk belongs to the kid. The prohibition against

wearing “cloth combining wool and linen” (Deut. 22:11) reminds us that, in terms of absolute justice, each sheep is the genuinely legitimate owner of its own wool.

Vegetarianism, Judaism, and God's Intention

And God said: "Behold, I have given you every herb yielding seed which is upon the face of all the Earth, and every tree that has seed-yielding fruit – to you it shall be for food" (Gen. 1:29).

God's initial intention was that people be vegetarians. The foremost Jewish Torah commentator Rashi states the following about God's first dietary regime: "God did not permit Adam and his wife to kill a creature to eat its flesh. Only every green herb were they to all eat together" (Rashi's commentary on Gen. 1:29). Most Torah commentators, including Rabbi Abraham Ibn Ezra, Maimonides, Nachmanides, and Rabbi Joseph Albo, agree with Rashi.

The Talmud also asserts that people were initially vegetarians: "Adam was not permitted meat for purposes of eating" (BT *Sanhedrin* 59b).

The great thirteenth-century Jewish commentator Nachmanides indicates that one reason behind this initial human diet is the kinship between all sentient beings:

Living creatures possess a soul and a certain spiritual superiority [to non-human creation] which in this respect make them similar to the possessors of intellect [human beings] and they have the power of affecting their own welfare and their food, and they flee from pain and death (commentary on Gen. 1:29).

God's original dietary plan represents a unique statement in humanity's spiritual history. It is a divine blueprint for a vegetarian world order. Yet millions of people have read this Torah verse and passed it by without considering its meaning.

After indicating that people should consume only plant-based foods, God saw everything that he had made and "behold, it was very good" (Gen. 1:31). Everything in the universe was as God wanted it, in complete harmony, with nothing superfluous or lacking. The vegetarian diet was a central part of God's initial plan.

The strongest support for vegetarianism as a positive ideal in Torah literature is in the writing of Rabbi Abraham Isaac HaKohen Kook (1865–1935). Rav Kook was the first Ashkenazic Chief Rabbi (Rav) of pre-state Israel and a highly respected and beloved Jewish spiritual leader and thinker. He was a writer on Jewish mysticism and an outstanding scholar of Jewish law. In the early twentieth century he spoke powerfully for vegetarianism, as eventually recorded in *A Vision of Vegetarianism and Peace* (1961).

Rav Kook believed that the permission to eat meat was only a temporary concession to the practices of the times, because a God who is merciful to his creatures would not institute an everlasting law permitting the killing of animals for food.

People are not always ready to live up to God's will. By the time of Noah, humanity had morally degenerated. "And God saw the Earth, and behold it was corrupt, for all flesh had corrupted their way upon the Earth" (Gen. 6:12). People had degenerated to such an extent that they would eat a limb torn from a living animal. So, as a concession to people's weakness, God granted permission for people to eat meat: "Every moving thing that lives shall be food for you; as the green herb have I given you all" (Gen. 9:3).

According to Rav Kook, because people had descended to such an extremely low spiritual level, it was necessary that they be taught to value human life above that of animals, and that they concentrate their efforts on first working to improve relations between people. He writes that if people had been denied the right to eat meat some might eat the flesh of human beings instead, due to their inability to control their lust for flesh. Rav Kook regards the permission to slaughter animals for food as a "transitional tax," or temporary dispensation, until a "brighter era" can be reached, when people will return to vegetarian diets. Just prior to granting Noah and his family permission to eat meat, God states:

And the fear of you and the dread of you shall be upon every beast of the Earth, and upon every fowl of the air, and upon all wherewith the ground teems, and upon all the fish of the sea; into your hands are they delivered (Gen. 9:2).

Now that there is permission to eat animals, the previous harmony between people and animals no longer exists. Rabbi Samson Raphael Hirsch argues that the attachment between people and animals was broken after the flood, which led to a change in the relationship of people to the world.

The permission given to Noah to eat meat is not unconditional. There is an immediate prohibition against eating blood: "Only flesh with the life thereof, which is the blood thereof, shall you not eat" (Gen. 9:4). Similar commands are given in Leviticus 19:26, 17:10 and 12, and Deuteronomy 12:16, 23 and 25, and 15:23. The Torah identifies blood with life: "for the blood is the life" (Deut. 12:23). Life must be removed from the animal before it can be eaten, and the Talmud details an elaborate process for doing so.

When the Israelites were in the wilderness, animals could only be slaughtered and eaten as part of the sacrificial service in the sanctuary (Lev. 17:3–5). The eating of "unconsecrated meat," meat from animals slaughtered for private consumption, was not permitted. All meat which was permitted to be eaten had to be an integral part of a sacrificial rite. Maimonides states that the biblical sacrifices were a concession to the primitive practices of the nations at that time: people (including the Israelites) were not then ready for forms of divine service which did not include sacrifice and death (as did those of all the heathens); at least the Torah, as a major advance, prohibited

human sacrifice. God later permitted people to eat meat even if it was not part of a sacrificial offering:

When the Lord your God shall enlarge your border as He has promised you, and you shall say: "I will eat flesh," because your soul desires to eat flesh; you may eat flesh, after all the desire of your soul (Deut. 12:20).

This newly permitted meat was called *basar ta'avah*, "meat of lust," so named because rabbinic teachings indicate that meat is not considered a necessity for life.

The above verse does not *command* people to eat meat.

Rabbinic tradition understands the Torah as acknowledging people's desire to eat flesh and permitting it under proper circumstances, but not as requiring the consumption of meat. Even while arguing against vegetarianism as a moral cause, Rabbi Elijah Judah Schochet, author of *Animal Life in Jewish Tradition*, concedes that "Scripture does not command the Israelite to eat meat, but rather permits this diet as a concession to lust" (1984: 300). Similarly, another critic of vegetarian activism, Rabbi J. David Bleich, a noted contemporary Torah scholar and professor at Yeshiva University, states, "The implication is that meat may be consumed when there is desire and appetite for it as food, but it may be eschewed when there is not desire and, *a fortiori*, when it is found to be repugnant" (1987: 245). According to Bleich, "Jewish tradition does not command carnivorous behavior . . ." (1987: 245).

The Talmud expresses this negative connotation associated with the consumption of meat:

The Torah teaches a lesson in moral conduct, that man shall not eat meat unless he has a special craving for it . . . and shall eat it only occasionally and sparingly. The sages also felt that eating meat was not for everyone: Only a scholar of Torah may eat meat, but one who is ignorant of Torah is forbidden to eat meat (BT Pesachim 49b).

Some authorities explain this restriction in practical terms: only a Torah scholar can properly observe all the laws of animal slaughter and meat preparation. While there are few conditions on the consumption of vegetarian foods, only a diligent Torah scholar can fully comprehend the many regulations governing the preparation and consumption of meat. However, master kabbalist Rabbi Isaac Luria explains it in spiritual terms: only a Torah scholar can elevate the "holy sparks" trapped in the animal.

How many Jews today can consider themselves so scholarly and spiritually advanced to be able to eat meat? Those who do diligently study the Torah and are aware of conditions related to the production and slaughter of meat would, I believe, reject meat eating.

Rav Kook writes that the permission to eat meat "after all the desire of your soul" contains a concealed reproach and an implied reprimand. He states that a day will come (the Messianic Period) when people will detest the eating of the flesh of animals because of a moral loathing, and then people will not eat meat because their soul will not have the urge to eat it.

In contrast to the lust associated with flesh foods, the Torah looks favorably on plant foods. In the Song of Songs, the divine bounty is poetically described in references to

fruits, vegetables, nuts, and vines. There is no special *b'rakhah* (blessing) recited before eating meat or fish, as there is for other foods such as bread, cake, wine, fruits, and vegetables. The blessing for meat is a general one, the same as that over water or any other undifferentiated food.

Typical of the Torah's positive depiction of many nonflesh foods is the following evocation of the produce of the Land of Israel:

For the Lord your God brings you into a good land, a land of brooks of water, of fountains and depths, springing forth in valleys and hills; a land of wheat and barley, of vines and fig trees and pomegranates; a land of olive oil and date honey; a land wherein you shall eat bread without scarceness, you shall not lack anything in it. . . . And you shall eat and be satisfied, and bless the Lord your God for the good land that He has given you (Deut. 8: 7–10).

Rav Kook believes that there is a reprimand implicit in the many laws and restrictions over the preparing, combining, and eating of animal products (the laws of *kashrut*), because they are meant to provide an elaborate apparatus designed to keep alive a sense of reverence for life, with the aim of eventually leading people away from meat eating. He also believes that the high moral level involved in the vegetarianism of the generations before Noah was a virtue of such great value that it cannot be lost forever. In the future ideal time (the Messianic age), people and animals will again not eat each other's flesh. People's lives will not be supported at the expense of animals' lives. Rav Kook based these views on the prophecy of Isaiah:

And the wolf shall dwell with the lamb, And the leopard shall lie down with the kid;

And the calf and the young lion and the fatling together;

And a little child shall lead them And the cow and the bear shall feed;

Their young ones shall lie down together, And the lion shall eat straw like the ox...

They shall not hurt nor destroy in all My holy mountain . . . (Isaiah 11:6–9).

In a booklet which summarizes many of Rav Kook's teachings, Joseph Green, a twentieth-century South African Jewish vegetarian writer, concluded that Jewish religious ethical vegetarians are pioneers of the Messianic era; they are leading lives that prepare for and potentially hasten the coming of the Messiah.

Although most Jews eat meat today, God's high ideal – the initial vegetarian dietary law – stands supreme in the Torah for Jews and the whole world to see.

Based on the above Torah teachings, and because animal-centered diets violate and contradict important Jewish mandates to preserve human health, attend to the welfare of animals, protect the environment, conserve resources, help feed hungry people, and pursue peace, Jewish vegetarians believe that Jews (and others) should sharply reduce or eliminate their consumption of animal products.

Venda Religion and the Land (Southern Africa)

By the combined use of oral traditions and archeology, the oldest Venda clans (mitupo) of the Soutpansberg Mountains area between South Africa and Zimbabwe can be traced back roughly 600 years. More recent clans from Zimbabwe settled in the Soutpansberg area roughly 500 years ago and again some 250 years ago. As settled agriculturists and specialized long-distance traders ruled by powerful chiefs, the various Venda clans were intimately tied to the land and its features. Chiefs enjoyed both political control over decision making and access to high status ancestral spirits. These dual powers of a chief were metaphorically expressed by reference to prominent features on the landscape. The Venda likened a chief's political power to a mountain, whereas they likened his spiritual abilities, such as being responsible for soil fertility and rain, as a pool.

The organization of royal Venda living space also expressed this dichotomy between politics and religion. Stone-walled royal settlements were divided between a low-lying assembly area, or "pool," and a higher royal living area, or "mountain." The assembly area was the venue for various fertility rituals, including rainmaking, renewal of the Earth, and pre-marital rites. Various Venda clans recall that they originally came from a fertile pool in a mountain, so the rituals within the assembly area actually reenact the creation stories.

The royal living area inhabited by the chief, his councilors, and wives, was the arena of political decision making and maneuvering. Reference to this area as a mountain is metaphorically expressed in oral traditions as a conquering chief stepping from mountain to mountain. In the same vein, when a chief dies, it is said, "The Mountain has fallen."

Medicines buried at the entrance to the assembly area, or "pool," were intended to protect the royal settlement from invaders. Venda people believed that if invaders crossed this protective threshold, then the assembly area turned into an actual pool. This pool returns to normal once the enemy has been frightened away or drowned. However, if the invaders' medicines proved too strong, then the assembly area permanently turned into a pool, inundating the royal mountain portion of the settlement. As mentioned above, this is a metaphorical expression of the demise of the chief's political power.

It is abundantly clear from various oral traditions, however, that a new chief respected or even feared a subjugated chief's intricate spiritual link to the land and its associated ancestors. Accordingly, the new chief almost invariably recognized the spiritual potency, or pool status, of his predecessor. Even though the subjugated chief lost his political power, or mountain status, he normally retained his spiritual potency to make rain and influence soil fertility, or pool status. In some instances the subjugated chief actually became a ritual specialist to the incoming chief and so increased his prestige as ritual rainmaker. But shifting political fortunes did not end here as subsequent chiefs in turn established their hegemony. A new chief became the mountain, his immediate predecessor became the pool, and the original chief became a so-called "dry-one" (i.e., his pool status has "dried up"). The "dry-one" label applies to those chiefs who came from a line that formerly had great powers, but due to repeated political misfortunes were eventually ostracized from the recognized political system. Those in power viewed the formerly influential chiefs on the periphery of the status quo as a threat and conveniently branded them as witches.

Yet, since the most current chiefs and their ritual functionaries respected the intimate and long-lasting spiritual connection of the first chiefly dynasty to the land, they did not kill their descendants. It was believed that elimination of these ancient people might upset the original spirits of the land. Instead of elimination, the most recent ruling dynasty normally avoided contact with descendants of the original rulers. This process explains the historic distinction between the Singo rulers with their mountain status, the Mbedzi with their pool status, and the Dzhivhani "dry-ones."

According to oral traditions and radiocarbon dates from associated settlements, we know that the Dzhivhani lived in the Soutpansberg at least 600 years ago when they enjoyed mountain status, but possibly also enjoyed prestige as being responsible for fertility and rain. Mbedzi immigrants from southern Zimbabwe subjugated the Dzhivhani chiefs some 500 years ago. The Mbedzi immigrants stripped the Dzhivhani of their political powers, but respected their abilities as pool people, particularly as rainmakers. Approximately 250 years ago the Singo from central Zimbabwe in turn conquered the Soutpansberg. Since that time, the Mbedzi became the official rainmakers, while the Dzhivhani lost their pool status.

The different status categories are expressed by the distinctive burial practices of the various clans. Typically, Singo chiefs are buried in mountains, Mbedzi chiefs in pools, whereas Dzhivhani chiefs have no particular burial mode any more. But the importance of the original rulers, such as the Dzhivhani, still resonates in the Soutpansberg Mountains. Various noticeable locations on the landscape, in particular old stone-walled ruins of royal settlements, pools, mountains, caves, and boulders, are either avoided or treated with respect. These are the locations believed to be portals to the underworld where ancestral spirits reside. Venda people believe that ancestors send messengers, in the form of dangerous animals and/or distorted mountain and water creatures, to scare disrespectful trespassers. At certain unusual locations, including San rock-art sites, Venda still leave trinkets to appease the original spirits of the land.

Another reason for leaving gifts at sacred spots is to obtain fertility from the very old spirits.

Although the political clout of the ancient Venda dynasties is long gone, their religious legacy lives on in unusual landscape features and in the old ruins. This legacy prohibits Venda people from altering the landscape too much. Very old rock art, for instance, is not to be tampered with. Unlike their Sotho-speaking neighbors to the south, Venda people tend not to repaint or scratch the rock paintings of their San predecessors, to cite one example. Also, “traditional” Venda farm laborers discourage their European masters from installing mechanical pumps at sacred pools in fear that such alterations might anger the spirits and make them “hot.” Sheet metal roofs and fences are similarly believed to cause spirits to become “hot” and vengeful. In other words, there is a deeply felt and widely shared belief among Venda people that any alterations or modifications at sacred locales would upset the spirits of the land and result in misfortune.

Supernatural sanction against killing animals residing in old ruins or in sacred pools can also be linked to respect for the original occupants of the land. In this sense then, the Venda-speaking people from the Soutpansberg can be considered to be conserving the land, irrespective of the fact that their intensive farming and overgrazing practices have resulted in damaging soil erosion. Even those Venda clans that were specialist copper miners or elephant hunters did not exploit the available copper ore deposits or elephant herds to their fullest. Whereas technological inability to exhaust such resources no doubt was a contributing factor, supernatural sanction against overexploitation might have been another. For example, abandoned copper mine shafts in the Limpopo River valley were supposedly haunted by spirits of the Musina clan and considered off-limits to trespassers. Whereas conservation among the Venda was almost certainly not an end in itself, their worldview contributed to the preservation of unusual cultural and natural features of the Soutpansberg.

Venda Witch Beliefs (Southern Africa)

The Venda people inhabit the far northern area of the Republic of South Africa as well as the extreme south of Zimbabwe, bordering on either side of the Limpopo River. In South Africa, they occupy the fertile Soutpansberg mountain range where they were traditionally horticulturalists and pastoral cattle-keepers, until the discovery of diamonds and gold in the nineteenth century introduced migrant labor as a way of life for the menfolk.

The Soutpansberg mountain range is a richly forested area whose trees provide wood for ritual, ceremonial, and utilitarian purposes, as well as fruits that are an important source of food. The rivers of Venda and especially the sacred lake Fundudzi have a religious and mystical significance for the Venda people. Rivers flowing through forested areas, such as the famous Phiphidi falls, are associated with the spirits of the VhaNgoni, the original inhabitants of Venda at the time of the early Iron Age, ca.

200. To propitiate these spirits, everyone crossing the falls must contribute an offering: a bracelet or piece of broken pot for a woman, a tuft of hair for a man. Cattle are not excluded and some cow hairs must be offered if the animal is not to incur misfortune.

The Venda people are made up of various tribal clusters who migrated to the area at different times; some came from Zimbabwe to the north and others from the Sotho-speaking areas to the south and east. The Venda language is unique among South African languages in having links to the early Iron Age (200–800) inhabitants of Southern Africa. Among the important migrations from the Karanga area of southern Zimbabwe were the Vhathavhatsinde people, so called because many families in this group were great medicine men (diviners) who supplied a powerful antidote to evil from the mutavhatsinde tree. The name is said to derive from the word *muta*, referring to the small enclosure surrounding women's huts and *tsinde*, meaning the stem or trunk of a tree. Medicine men or diviners from the Vhathavatsinde still erect poles in the yards of their homesteads to indicate their avocation. I was able to photograph the pole erected by well-known diviner and herbalist, Mr. Nelson Shonisani, at his home in Kubvhi, central Venda in 1988.

Much of the work of herbalists (*nanga*) and diviners (*maine*, pl. *mingoma*) among the Venda has to do with protecting people from the machinations of witches (sg. *muloi*, pl. *vhaloi*) who seek to kill or harm their fellows, as well as providing charms

to protect people against misfortune. A simple charm might be a piece of wood taken from a branch of a tree overhanging a well-used pathway. The charm is believed to contain strength given to it by travelers who trod that path without coming to any harm. Most medicine people among the Venda are herbalists who specialize in curing diseases and who are consulted often about ordinary ailments. The *mungoma* or diviner is believed to have occult powers and is always consulted after someone has died so that the family of the deceased can discover who the evil person was who caused the death. Like many other African peoples, the Venda believe that death (except in the case of the very old) is not a natural occurrence. Most diviners are *maine vha lufhali*, diviners who discover the identity of witches who are responsible for most misfortunes and deaths, which are often believed due to the use of sorcery in the form of poisons obtained from plants and added to the victim's food. Among the Venda, a diviner or herbalist may be male or female. A man inherits his knowledge from his father and a woman from her mother. Witches (*vhaloi*) are believed to be of either gender but are more generally women. They operate at night, sometimes traveling long distances on the back of a hyena or other animal, and they may send snakes, owls or, particularly, a *turi* (stoat) into the victim's home to bite him or her and cause disease or death. Wild animals such as snakes, owls, hyenas, and stoats are creatures of dark places or the night, like witches, and are known to cause harm either by biting humans and animals as snakes do, or by attacking small stock, like hyenas, or sucking the udders of cows, as stoats are believed to do. Stayt comments that the *turi* is especially feared, as it is believed the animal can become invisible and in that way enter the body of its human victim and cause a mortal illness (Stayt 1931: 278).

There are two distinct types of witch in Venda that correspond to the famous distinction made by E.E. EvansPritchard for the Azande of Central Africa. The first type are witches who act unconsciously. They are unaware of their evil-doing. The second type corresponds to the sorcerer among the Azande. This witch uses material means such as spells made from powdered roots and bark or magic, to cause harm. The first type of witch is believed to act during sleep. It is at this time that the witch spirit leaves the body of its innocent human victim and goes out on its evil mission. Other persons sleeping with the *muloi* are believed to be put into a deep sleep so the witch is never seen, except by the herbalist or diviner. Apart from killing people, the witch also is believed to be very fond of milk and may force a cattle owner, while asleep, to go into his cattle enclosure, milk his animals, and give the milk to the witch. Alternatively, the *muloi* may send a *turi* (stoat), well known as a witch familiar, a creature that carries out the bidding of a witch and operates usually at night, to suck the milk from the cows. Protection against witches comes from the mother's ancestors, and if these spirits are angry with the victim, they may withdraw their protection and allow the witches evil work to proceed.

Remedies against the work of witches consist of charms, made, for instance, from the powdered root of the mukundulela tree (*Niebuhrria triphylla*) which translates as "the way of force," mixed with the powdered bones of a snake, owl, bat's wing, and

stoat. As this mixture is made up of parts of all the witch's familiars, it is considered especially powerful in making the wearer invulnerable to attack by witches.

The second type of witch, the sorcerer, uses black magic to kill her or his enemies. This magic is known as *mad-ambi*. Herbalists (*nanga*) are sometimes suspected of assisting a *muloi* to work harm in this way. *Madambi* usually works by the witch getting hold of an object belonging to her/his enemy and using it to destroy the person. Thus, nail and hair clippings are carefully hidden. Stayt notes that the most popular *madambi* is made of sand from an enemy's footprint, which is mixed with poisonous herbs and through sympathetic magic the owner of the footprint dies from poisoning. Sometimes the evil powder will be blown on, or toward, a hare. The animal will run to the intended victim and look him or her in the eyes and then vanish. The victim is believed to die soon after while the hare vanishes.

The herbalist can provide a protective charm against this sorcery, a magic powder mixed with fat, which, when rubbed over the body, envelopes the wearer in a kind of magic coat. Herbalists provide many other charms made from powdered roots or bark that act as antidotes to evil, as spells, or as protective amulets. For instance, the powdered roots of the *mpeta* (*Royena pallens*) protect against ordinary diseases and keep the ancestral spirits from worrying the wearer.

Witch beliefs in Venda are similar to those in other Bantu-speaking societies in Africa, especially those of their neighbors, the Lovedu, who live in a deeply forested area to the southeast of the Venda, and who are famous for their rain-queen, Modjadji. These witch beliefs tend to reflect social strains in predominantly kin-based cultures. That is, those most likely to be accused of being witches are often neighbors or co-wives, in polygamous homesteads.

Nowadays, a successful business entrepreneur may find himself the target of malicious accusations, as happened to Isaac Ramakulukusha, a Zionist bishop who owned numerous business enterprises, including butcheries and filling stations in Venda. In 1975, he sued the Commander of the Venda National Force for wrongful arrest and defamation. He was accused of being a ritual murderer (*mavia vhatu* – slaughterer of human beings) after the body of a four year-old girl was found in the Nzehele River in Venda. Forensic science came to the aid of the bishop when the child was found to have drowned and crabs had eaten part of her body.

Accusations of witchcraft also have increased in recent years with the change to a democratic majority rule in South Africa. With the power of chiefs and headmen waning, some have resorted to devices like the murder of young children (so-called "muti" [medicine] murders) to prop up their waning influence.

Virgin of Guadalupe

On 8 December 1531, the legend goes, the apparition of the Virgin of Guadalupe appeared to Juan Diego on the hill of Tepeyac north of Mexico City. In 1999, Pope John Paul II proclaimed Our Lady of Guadalupe the Patron Saint of the Americas. Devotion to the tradition of Guadalupe has been sustained for nearly 500 years and has played a significant role in Mexican history, whether as a symbol for independence, the Church's resistance to political intervention, the rights of native populations, or for social conservatism and control. Although contentious debates over the historical credibility of the apparition-narrative mark the Guadalupan tradition, the image and legend of the Virgin of Guadalupe has provided a powerful symbol for Mexican nationalism, and by the twentieth century, a symbol of freedom for oppressed native peoples and agrarian reform. As a symbol fusing religion and politics, native and Christian images, the Virgin of Guadalupe, patron saint of the Americas, remains a complicated symbol embodying conquest, pre-Colombian Earth goddesses, nature, the modern nation, and various, complicated social relations.

The first account of the appearance of the Virgin of Guadalupe was not published until the mid-seventeenth century. This account tells the story of Guadalupe's appearance in December 1531 to Juan Diego, a poor Christianized native. Speaking to him in the Aztec language of Nahuatl, she asks Juan Diego to tell the bishop of Mexico, Juan de Zumárraga, to build a chapel in her honor at Tepeyac. After two unsuccessful visits, Zumárraga instructs Juan Diego to return with signs from the apparition. Disconsolate, Juan Diego meets the apparition of the Virgin of Guadalupe for the third time. Guadalupe tells Juan Diego to climb the hill of Tepeyac and gather roses and flowers as signs for the bishop. When Juan Diego opens his cloak in front of the bishop, the roses tumble out, revealing a life-size image of Guadalupe found miraculously imprinted on the cactus-fiber cloth of his cloak. Realizing that a miracle had taken place, the bishop places the image in the cathedral for public devotion and later brings it to Tepeyac. The painted icon on what is alleged to be Juan Diego's cloak remains the heart of the cult and tradition of the Virgin of Guadalupe, on display today in the twentieth-century basilica in Mexico City that serves as the central locus for Guadalupan devotion.

Scholars find it significant that the Guadalupan tradition was introduced 35 years after the conquest. Native peoples understandably resisted domination, sometimes overtly through resistance, but more commonly through ongoing practice of traditional religious beliefs and lifeways. Syncretic practices that merged Christian images and ideas with local beliefs and rituals were employed as methods of proselytizing

native peoples. In the case of Guadalupe, cults of Mary imported by the Spaniards merged with pre-Colombian Earth deities. Tepeyac had long served as a pilgrimage site for various Earth goddesses referred to collectively as Tonantzin, our “revered mother.” Early veneration of Guadalupe and pilgrimages to Tepeyac, some sixteenth-century priests complained, only continued pre-Christian practices since native worshipers still associated her with sacred space and power coming from the Earth.

Although Guadalupe may have had an early following among native peoples and been used as a means of evangelization by the Catholic Church, by the seventeenth century Guadalupe became associated with the interests of Mexican-born Spaniards or Creoles. Guadalupe became championed as the American Mary, thus serving Mexican patriotism and nationalism, but also justifying the conquest. After Mexico City and Puebla were devastated by the plague in 1737, Mexico City claimed the Virgin of Guadalupe as its patron saint, and by 1754 the Pope named her patroness of Mexico. In 1895 the Virgin of Guadalupe was crowned Queen of the Americas. During these centuries of merging religion and patriotism, it should be noted that the image of Guadalupe was not explicitly employed to champion native peoples. The Virgin of Guadalupe was important for the Catholic Church and its position in Mexican society, as well as for patriots who employed it to champion Mexican identity. In relation to policies and practices concerning native peoples and their lands however, the cult of Guadalupe was used primarily as a conservative, paternalistic, and exclusionary mechanism.

It was not until the twentieth century that the image and tradition of the Virgin of Guadalupe became explicitly associated with the rights of native peoples, disenfranchised populations, and the land. Pancho Villa and Emiliano Zapata both used the symbol of Guadalupe during their revolutionary struggles, thus associating Guadalupe with social and agrarian reform. Peasant followers of Emiliano Zapata carried banners of Guadalupe through Mexico City following the defeat of General Victoriano Huerta in 1914. These indigenous peasants also visited Tepeyac to venerate Guadalupe who, as both Earth goddess and patron saint, came to symbolize the protector of damaged land and oppressed peoples. Banners of Guadalupe regularly appeared in marches organized by Cesar

Chavez and the United Farm Workers beginning in the 1960s. Numerous contemporary Chicana artists now depict Guadalupe in ways that link her to pre-Colombian Earth goddesses, thus championing both native peoples and the land. Contemporary Latina/o theologians claim that both images and fiestas demonstrate Guadalupe’s clear connection to nature. In popular religious images, the sun, stars, moon, and nature surround Guadalupe. Daybreak on December 12, “the time of new beginnings and the rebirth of the sun” is the time of Guadalupe’s feast and celebration and a dawn song, *Las Mañanitas* is sung to her (Rodriguez 1994: 147).

Our Lady of Guadalupe remains a contested symbol – standing at different points in history for conquest as well as indigenous rights; for Earth goddesses and nature as well as the power of the nation-state.

Virtues and Ecology in World Religions

Virtues (commonly understood as *excellences of character acquired through self-cultivation*) play a role in all major world religions – even as ideals of personal cultivation differ significantly from tradition to tradition. Recent adaptations in religious attitudes toward nature to a large degree involve changes in the perception and cultivation of virtues as well. Across the board, religious environmentalists highlight the ecological import of traditional traits of character, such as moderation, humility, and compassion. However, to speak of a uniform “green” religious virtue ethic would be to deny the varied contexts of religious belief and practice that continue to give these virtues their full meaning. By examining relationships between the virtues and ecological awareness in Christianity, Judaism, Islam, Hinduism, Buddhism, and Confucianism we can see the various types of green virtue ethics.

Frugality

Under a number of names, frugality has been a prominent moral norm and practice in all the great religious traditions, including Buddhism, Christianity, Confucianism, Hinduism, Islam, Judaism, and Daoism. These traditions often have interpreted frugality as an expression of love or its equivalent – that is, seeking the good of others in response to their needs.

Frugality is the virtue of economic constraint – a standard of excellence for both character formation and social transformation in necessary interaction. It connotes moderation, thrift, sufficiency, and temperance. It demands careful conservation, comprehensive recycling, minimal harm, material efficiency, and product durability. Frugality is a middle way that struggles against both overconsumption by the affluent and underconsumption by the poor.

Frugality, according to its advocates, is an antidote to a cardinal vice of the age, prodigality – or excess in the goods humans take from the Earth, and excess in the wastes and contaminants we return to it. These excesses are unfair and unsustainable. The profligate take more than their due, and thereby deprive others – poor people, other species, and future generations – of their due. In this setting, frugality is a necessary condition of justice and sustainability, seeking a greater thriving of all life together by sparing and sharing global goods.

Contrary to some stereotypes, frugality is not generally a world-denying asceticism. On the contrary, the word's Latin root, *frux*, defines its essential character: fruitfulness and joyfulness. Frugality is an Earthaffirming and enriching norm that delights in the lessconsumptive joys of the mind and flesh, especially the enhanced lives for human communities and other creatures that only constrained production and consumption can make possible on a finite planet.

Frugality is regularly defended as a universal norm, not bound to particular religious confessions. Interpreters argue that it can be ethically justified, apart from appeals to privileged revelations, as a rational response to economic maldistribution and ecological degradation. For its fans, frugality is the subversive virtue, in rebellion against the ethos of excess.

Virtue and Ecology in Christianity

In 1976, historian Lynn White charged that the environmental crisis will only be reverted if Christians exchange their arrogant attitudes toward nature for St. Francis' model of humility. Since then, virtues have played a major role in the greening of Christianity. From qualities of character marking a person's journey to an otherworldly salvation, they changed into qualities of character fitting the flourishing of persons-within-ecocommunities in which the immanent Spirit of God is made manifest. As a result, a thoroughly reinterpreted and reshuffled catalogue of desirable traits is emerging.

Changes range from simple extensions to radical innovations of meaning. Rather than hope for the salvation of human souls only, Christians may now hope (even against all odds) for the liberation of all creation. Rather than humbly consider themselves at the bottom of an ontological ladder, they may humbly accept their place in the web of earthly relations. Rather than practice vigilant control of emotions, they may try to relearn spontaneity. And rather than divert their attention away from the physical details of this world (*contemptus mundi*), they may practice sensuousness in order to attend properly to this world – following a recast model of Jesus as a teacher with an eye for illustrations drawn from animal and plant life.

Some observers doubt whether such attitudinal changes go far enough in addressing ecological problems. They stress the need for complementary social analysis and organized efforts to transform institutions (e.g., Dieter Hessel). Others question whether personal transformation can be thorough enough as long as Christians continue to see themselves as managers of creation (e.g., Elizabeth Dodson Gray). The most radical critics suggest that Christians look outside their tradition toward Eastern and indigenous religions for alternative models of ecological self-cultivation (e.g., Joanna Macy). Christian scholars typically respond to this last charge with a warning against the vice of romanticism.

Virtue and Ecology in Judaism

From the rich array of Jewish scripture, legal traditions, stories, rituals, and cultural practices, virtues emerge as those personal character traits that renew and sustain the chosen people's covenant relationship with God. The Jewish community has received many blessings from the transcendent Creator of the universe; in return, it must look after creation, following the commandments of the *Torah*. This covenant bond is especially served by gratitude, responsibility, and repentance for failure. Today, those who interpret the environmental crisis as a sign of covenantal breakdown find new significance in these traditional virtues (e.g., Eric Katz).

Ancient blessings for food, natural beauty, and seasonal renewal continue to express appropriate gratitude for the gifts of creation. Entrusted with those gifts, responsible stewards will be caring and compassionate, keeping in mind the suffering of all living beings (*tza'ar ba'alei chayim*). They will also be in the habit of exercising personal restraint, demonstrated every Sabbath by refraining from nature-altering activities. Following the commandment not to destroy (*bal tashchit*), they will be averse to vandalism (including specifically the wanton destruction of fruit trees), cruelty (including animal abuse), and wastefulness. Conflicts of interest they will approach with prudence, new environmental challenges with love of learning. Even responsible stewards may fail, however. They must be able to admit mistakes and repent for their shortcomings.

Like Christianity, Judaism has been charged with promoting arrogance by putting humans in charge of the Earth. Critics also say that Jewish anti-paganism prevents appropriate reverence for nature. Jewish scholars typically respond that a covenantal life actually inspires humility and awe before God's marvelous works. Some go further and draw on Jewish mystical traditions (*Kabbalah*) that do allow full-blown reverence for the Divine Presence in creation (e.g., Arthur Green).

Virtue and Ecology in Islam

Although Islamic ethics is especially known for its tradition of law (*Shari'ah*), the life of a Muslim should in all aspects be marked by the cultivation of one main virtue: surrender (*islam*) to God (*Allah*). Each other virtue (*fadhilah*), either leads up to, belongs to, follows from, or is perfected by the Muslim's singular commitment to the transcendent Creator and Sustainer of the universe. While largely remaining within this traditional framework, which is based on scripture (*Qur'an*), the example and teachings of the Prophet Mohammed (*Hadith*), and the work of great thinkers such as Al-Ghazali (1058–1111), modern scholars of Islam have begun to identify ecologically relevant virtues.

Muslims look upon creation as the extended family of God, in which each species forms a community designed to live harmoniously with all other communities. Thus, beneficence toward any creature takes on meaning as an act of devotion by which the

believer treats God's family well. Planting and sowing, insofar as they benefit human and nonhuman communities, are concrete instances of such charity. Respect for the basic needs of others requires vigilant control (*jihad*) over destructive "lower" desires, especially greed, aggression, and jealousy. The willingness to make such personal sacrifices for the common good, strengthened annually during the fasting month of *Ramadan*, again ultimately underscores the believer's respect for God.

Ecofeminists and those who follow Lynn White's line of reasoning have leveled the same criticism against Islam as against Christianity and Judaism: its belief in a transcendent God and its elevation of humans as the viceregents of creation are likely to engender exploitative attitudes toward nature. Two types of Islamic responses are emerging. Most scholars stress that a viceregent (*khalifa*) should be responsible. They also qualify the implications of divine transcendence (e.g., Al-Hafiz Masri). For example, they highlight scriptural texts that depict creation as a mosque, or as bearing many signs (*ayat*) of divine grace, and argue that such a sacramental world demands human respect. Some scholars, however, contend that an other-worldly focus on a transcendent and allpowerful God should in fact benefit the environment, insofar as it encourages frugality and deep humility (e.g., Seyyed Nasr).

Virtue and Ecology in Hinduism

Within the multifaceted spectrum of Hindu traditions, the ideal of living in mental and bodily harmony with all beings, seen as a divine unity (*Vasudeva/Brahman*), stands in creative tension with the ideal of self-transcendence. Both ideals require self-cultivation through various forms of meditation and discipline (*yoga*). However, Hindus seeking self-transcendence must ultimately renounce all aspects of the natural world as illusory (*maya*) to attain an entirely other-worldly liberation (*moksha*) from the cycle of life and death. Because of these distinct (though complexly intertwined) foci, Hindu traditions offer both rich resources and significant challenges for a this-worldly, ecological virtue ethic.

Ancient Hindu texts, such as the *Gautama Dharmasutra*, already stress the importance of compassion for all creatures. Today, against the backdrop of India's serious environmental problems, other traditional virtues are reinterpreted within an expanded doctrine of *dharma* as the duty to act for the entire ecological community (e.g., Christopher Chapple). Those who practice universal veneration (mindful of the interconnectedness and divinity of all things, as well as the transmigration of souls) will tend to cultivate an attitude of non-injury (*ahimsa*) toward other living beings, indeed toward all species, ecosystems, and elements that adorn the divine Mother Earth (*Devi Vasundhara*). Living a life of nonviolence in turn requires simplicity (restraint of greed), tranquility (restraint of anger and envy), and truthfulness (*satyagraha*). Through such personal sacrifice (*yajna*) the environment can be purified – just as, conversely, the

vices of selfishness and willful ignorance cause (*karma*) environmental ravage (e.g., Seshagiri Rao).

Despite Lynn White's doubt whether Eastern traditions could change Western attitudes toward nature, Hindu teachings have helped to shape ecological consciousness in the first industrialized nations. Virtues such as universal respect and *ahimsa*, as well as the ideal of self-realization (*atman moksha*) within the context of the oneness of all beings, now also guide many Western people of non-Indian descent.

Virtue and Ecology in Buddhism

Buddhist virtue ethics takes its shape from the earliest teachings of the Buddhist monastic community: the universality and inevitability of suffering (*dukkha*), the impermanence of everything (*anitya*), the dependence of everything on everything else (*pratitya-samutpada*), and the absence of an enduring self or soul (*anatman*). Insofar as Buddhists deny the existence of a self, their efforts at being virtuous cannot be understood in any strict sense as self-cultivation. Yet Buddhist practitioners do cultivate their minds and seek emotional equanimity. Theravada Buddhists tend to do so primarily in expectation of personal release from the suffering inherent in the cycle of life and death (*nirvana*). Mahayana Buddhists may also focus on relieving the suffering of others, an aim perfected in the life of the *bodhisattva*. In either case, however, mind and emotions are channeled to enable adaptability to change (impermanence) and awareness of mutual dependence (dependent arising). Many observers have noted the remarkable fit between these basic Buddhist attitudes and an ecological worldview (e.g., Stephanie Kaza).

Buddhists have long held that those who are mindful of the suffering around them will see the appropriateness of showing compassion to human and nonhuman alike. The Indian emperor Asoka (270–232 B.C.E.), for example, is famous for constructing hospitals for both people and animals. In addition to seeking relief of suffering, Buddhists also teach the need for prevention through an attitude of non-injury (*pranatipata-virmana*). The effects (*karma*) of a nonviolent lifestyle again extend beyond the human community. For example, one will as far as possible avoid slaughtering animals and cutting trees. Moreover, by overcoming one's greed, anger, and delusions through understanding their source in self-clinging, one can avoid the ecologically harmful effects of these vices.

Both external and internal critics find a relative neglect of social ethics in some or all Buddhist traditions. However, Buddhism does offer an explicit and scientifically compatible theory of how the personal practice of virtues affects social and indeed ecological systems. According to the doctrine of dependent arising, each person's way of being and acting in the world affects every other aspect of the world. Thus, the cumulative effects of human virtuous agency should be understood not as a matter of simple addition, but rather as following the mathematics of complexity (cf. Stuart

Kauffman). Beyond a certain threshold of virtuous people, a *web* of new social and ecological connections will emerge.

Virtue and Ecology in Confucianism

Virtue (*de*), understood as self-cultivation following the *dao* (the Way), is the main pillar of Confucian ethics. From the days of classical Confucianism, character formation has been understood in relation to the natural world as an attempt to live in harmony with the ever-changing dynamism (*qi*) of Heaven and Earth. Mountains, plants and animals provide helpful analogies for self-cultivation, and the four main human virtues of humaneness (*ren*), righteousness (*yi*), propriety (*li*), and wisdom (*zhi*) all have cosmological components. Accordingly, various modern scholars (e.g., Tu Weiming, Mary Evelyn Tucker) have identified Confucian tradition as a rich resource for environmental ethics.

While the four main virtues and their derivatives are first and foremost understood to guide five spheres of human relationships (parent–child, husband–wife, older–younger siblings, friend–friend, ruler–minister), their implications reach into the non-human world as well. NeoConfucian thinkers of the Song and Ming dynasties already suggested that humaneness (*ren*) includes consideration (*shu*) for animals, plants and even stones, as all are one body sharing the vitality of *qi*. And insofar as people are children of Heaven and Earth, it is fitting for them to show filiality and self-restraint toward nature. All in all, the exercise of proper reciprocal relations with “the myriad things” is central to the Confucian conception of the exemplary person (*junzi*), who seeks to live in accordance with the Mandate of Heaven (*tian-ming*).

Critical observers have wondered whether Confucian virtue ethics (like any other religious virtue ethics) may be greener on paper than in practice – a question complicated by the current absence of recognizable institutions to facilitate and represent such practice. Some note the many uneasy compromises within Confucianism between general teachings and specific (often pre-Confucian ritual) cultural practices (e.g., Donald Blakeley). Confucian hierarchalism may also conflict with ecologically attuned self-cultivation. However, many observers agree that, considering the tradition’s deep-seated holism, the dynamism of *yin-yang* cosmology, and the appreciation for spontaneity, deference, and adeptness in living, it contains significant potential for guiding people toward more ecological ways of being.

Concluding Observations

The following general patterns characterize the relationship between the cultivation of virtue and ecological awareness in Judaism, Christianity, Islam, Hinduism, Buddhism, and Confucianism. 1) Across the spectrum, the ecological import of traditional

virtues is assessed and highlighted. 2) Adjustments often involve extending the reach of virtuous acts to nonhuman entities. 3) Radical changes (e.g., a traditional vice, such as sensuousness, being reassessed as a virtue, and vice versa) are rare and most likely to occur in Christian circles. 4) Certain virtues emerge so frequently and universally that they may be considered part of a crosscultural catalogue of ecological virtues, namely: gratitude, respect, humility, caring, compassion, generosity, gentleness, frugality, and wisdom. 5) Across the world religions, these virtues are more similar in their outward effects on the environment than in their broader significance, which depends heavily on specific contexts of belief.

Volcanoes

One aspect of the cultural appropriation of nature is the religious appropriation of volcanoes. As part of nature, volcanoes provide various metaphors for religion. The colossal threats and blessings emerging from volcanic activities are made meaningful through cognition and active processes of practical engagement, often by ritual means and sacrifices. Ideas that attribute sacred qualities to mountains, and especially to the peaks of volcanoes, are familiar to many cultures worldwide. This is illustrated in textual and visual imagery; it can be traced in myths and oral traditions and can be observed in ritual practices. Frequently the (cosmic, mythological) mountain is the chosen image of analogy between the macro and the micro perspective. Volcanoes are believed to be the foci of magical power and supernatural forces. They are considered spiritually endowed as they are seen as sites where gods and ancestor spirits dwell. These gods and spirits take active part in human affairs. Either they give blessing and fertility or they destroy by volcanic eruptions. This expresses ambivalent experiences as people feel life-giving qualities in volcanoes as well as powerful, awe-inspiring and destructive forces.

In most studies of contemporary natural disasters, research includes neither the interpretations of the affected people nor the symbolic and religious meanings in the context of their lives and worldviews. But disasters like volcanic eruptions must also be seen in terms of how they are perceived and estimated by those affected, including the symbolic basis of human perceptions of nature and natural disasters.

Although it is important to note that volcanic eruptions are conceptualized, structured and negotiated in multiple, changeable contexts, there are certain similarities in the ways in which nature is constructed as parallel to human society. Frequently volcanoes are anthropomorphized, and there are close associations between cosmos, morality and social conduct. Due to such analogies of nature and societies, seen as mutually constitutive, in Africa, Asia and Latin America, natural disasters often are not explained by natural causes alone but are traced back to incorrect conduct of human beings. Thus, in many regions of the world volcanoes are seen, among other things, as natural seismographs for social harmony or disharmony. They are sometimes considered as a sign of dissent or conflict between the native people or particular clans that provoke the tempers of the ancestors or of the gods. Based on the idea that the structure of the cosmos is mirrored in the religio-political realm, rulers of ancient Southeast Asian kingdoms constructed their legitimization through mystical connections with volcanoes. The mandate for political authority was connected with the role of the ruler as divine mediator with the whole living universe. But once there

were calamities, these were seen as signs for social injustice and connected to political revolts and upheavals, and as a consequence the ruler lost his power. In this context it is important to note that supernatural explanations of natural events do not only legitimize but can also delegitimize political power.

In the Vesuv region, the Roman people celebrated every year on 23 August a festival called Volcania, where they threw living fish caught in the river Tiber in the fire to calm down Vulcanus, the god of the fire, who was later treated as equivalent to Hephaistos, the god of the smiths. Fish sacrifices are still today a usual practice at the volcano Lewotobi perempuan on the Island Flores in Indonesia. In general, the more active and dangerous a volcano is, the more elaborate are the sacrificial ceremonies. The offerings sacrificed vary from region to region and are often accompanied by local dances, prayers and all kinds of ritual activities. In some regions human sacrifice was practiced, such as in Nigeria or Indonesia where some clans sacrificed boys or girls aged around 15 to the mountain spirits. Their blood was poured into the volcanoes, whilst their corpses were buried normally. In Tanzania the Maasai at Oldonyo Lengai worship the god Engai (the last elaborate ceremony with about 100 participants took place during an eruption in 1983) in offering him sheep and goats. At the volcano Lewotobi laki-laki (the last extensive ceremony took place during the eruption in 1992), a small goat is ripped apart with bare hands. The Chagga in Tanzania used to hold great ceremonies on the top of the mountain Kifunika, close to Kilimanjaro, during which they offered some pieces of meat and the blood of a cow, goat or sheep, mixed with mbege (local beer) and sale (holy yukka plant leaf) for the mizimu (spirits). Like in many other regions, the practice of sacrifice did not disappear completely after Christianization, but occurs rarely and only in secret.

Beyond that, volcanoes are, in almost all regions, considered in gender categories. Sometimes they are determined, either male or female, according to the kinship and political organization of the local population. Occasionally women or witches are treated as equivalent to volcanoes and are seen as responsible for an eruption. There are many stories in the large collection of Icelandic folktales concerning volcanoes. One story in the Icelandic Eyrbyggja Saga tells of Katla, a volcano located in Southern Iceland, and a wicked female cook in the monastery of Þykkvabæjarklaustur. After killing a shepherd who had stolen some of her magic trousers, she flung herself into a dark crevasse in the ice cap. Ever since, according to tales, she avenges her fate by pouring fire and water onto the nearby regions.

If there are two or more volcanoes located next to each other, the mythology of their origin is often connected with love or war stories, such as the myth about Popocatepetl and Iztaccihuatl in Mexico. Popocatepetl was an Aztec warrior who was in love with Iztaccihuatl, the emperor's daughter. While Popocatepetl was at war, Iztaccihuatl was mistakenly informed that Popocatepetl had been killed. In despair she killed herself. When Popocatepetl returned and found Iztaccihuatl dead, he was overcome with grief. He built a mound and laid her body on it and vowed that he would never leave her again. Examining the two volcanoes one will notice in Iztaccihuatl the shape of a

woman, lying on her back, covered with a white sheet of snow. At her feet stands Popocatepetl, eternally watching over her. Today the people of Pueblo worship the saint San Gregoria Chino by bringing their offerings such as flowers and fruits to the slopes of Popocatepetl.

At times, there are almost exactly the same stories told by people in different parts of the globe that create parallel worlds. This is the case for reports about giants or ghosts, sitting inside the volcano and cooking meals for the neighbor mountains, their lovers or husbands, as in Indonesia on the Island Flores at the volcano Inerie, and in Iceland on the Island Heimaey at the volcano Hekla.

There are numerous stories about Pele who has long been the fire-goddess of the Hawaiians. Her home was in the great fire-pit of the volcano of Kilauea on the island of Hawai'i. The word "Pele" has been used with three distinct definitions by the old Hawaiians: Pele, the fire goddess; Pele, a volcano or fire-pit in any land; Pele, an eruption of lava.

The Kelimutu in East Indonesia is a complex volcano with three crater lakes of different colors. The frequent color changes of the crater lakes are caused by mineral reactions, primarily by iron oxidization. Schooling throughout Indonesia – including the outer islands – has disseminated a knowledge of volcanoes that is indeed limited, yet comparable in part to the European standard. Old Indonesian religious concepts remain nonetheless extremely significant. For inhabitants of the volcano's vicinity, the Kelimutu is the home of the *ebu nusi* (ancestral spirits) and *nitu* (natural spirits). The ruler of the Kelimutu is the volcanic spirit *Konde*, who is the grandchild of *Rongge* and *Ranggo* the ancient ancestors of the village Moni. This explanation of their descent – from "spirits of the volcano" – is common to inhabitants of many regions in the world. *Konde* lives on Kelimutu in a village that looks like Moni. He regularly holds big parties there and tries to take human women as prisoners. The first lake of Kelimutu is called *tiwu ata polo* (lake of the evil demon) and is the lake in which the "souls" of thieves, murderers and practitioners of "black magic" land after their death, also sometimes called *api nereka* (fires of damnation). The second lake *tiwu koö fai* (lake in perpetual motion) is the lake in which the "souls" of deceased children land, and the third lake *tiwu ata bupu* (lake of very old men) is the lake in which the "souls" of elderly people land after their death. The "reactions" of the volcanoes – be these eruptions or color changes – are interpreted by the Florinese as emotional gestures – as expressions of sadness or anger about social events – and as a coded symbolism which is of social interest.

Occasions of political and social conflict in Indonesia are often accompanied by debates about volcanic activity. This religio-political meaning is well known for the very active "high risk volcano" Mount Merapi in Central Java. Every year a ceremony is conducted by the members of the Sultan's palace in order to pacify the destructive power of the spirits residing in the crater. The ceremony acts as a reminder about a mythological promise that the country will always be protected against Merapi's eruptions because the ruler of the volcano realm will never send the lava toward the

Sultan's palace in the nearby city of Yogyakarta. But in 1994 for the first time an eruption turned to the south, in the direction of Yogyakarta. Many people saw this as a sign that the spirits disapproved of the behavior of Indonesia's ruling elite. Thus, the symbolic discourse on the Merapi can be instrumentalized not only by the rulers to justify themselves, but also by the oppressed.

W

Walker, Alice (1944–)

Alice Malsenior Walker was born in Eatonton, Georgia in 1944. She attended Spelman College in Atlanta, Georgia for two years and completed her B.A. at Sarah Lawrence College in New York in 1965. She is the author of over twenty-five works including novels, volumes of poetry, essays, short stories and children's books. She has written and spoken out for human rights and ecological justice globally.

Walker is a “womanist” – a black feminist or feminist of color, committed to “the healing and wholeness of entire communities, male and female.” A womanist “loves the Spirit” and to love the Spirit is to love creation (Walker 1983: xi–xii). It is in Walker's Pulitzer prize-winning novel *The Color Purple* (1982) that the healing power of creation becomes explicit. The sexually and physically abused Celie learns from blues-singer Shug that God is not an old white man: “it pisses God off if you walk by the color purple in a field somewhere and don't notice it.” Celie finds salvation in creation – first trees, then air, then birds, then feels “being part of everything, not separate at all.” She “knows” that if she “cut a tree” her “arm would bleed” (Walker 1982: 167). “Creation” is more than “nature”; it also means creativity. Celie finds economic freedom by making pants instead of cutting “Mister's” throat. Moreover, creation includes the erotic. God pleasures in Celie's relationship with Shug. Walker's novel, *Possessing the Secret of Joy* emphasizes the sacredness of women's natural bodies and holistic experience of the erotic. A minor character in the novel is pansexual and makes love with trees, a boulder, the Earth, or a waterfall (Walker 1992: 175–76). Creation is imbued with love and invites loving response.

Walker describes herself as a “pagan” who worships nature. Baptized at age 7, she was fascinated by the leaves in the muddy creek.

I was unable to send my mind off into space in search of a God who never noticed mud, leaves, or bullfrogs. Or the innocent hearts of my tender, loving people . . . It is fatal to love a God who doesn't love you (Walker 1997: 24–25).

It is not “Jesus” that Walker has a problem with but the *Christian tradition's* alienation of Jesus from the folk and from nature. Jesus “coexists quite easily with pagan indigenous peoples,” she writes, because they have already learned the love that he preached (Walker 1997: 25). Feminists and womanists from a diversity of faith perspectives employ Walker's writings. Such diversity is possible because Walker's spiritual starting point is everyone's common ground – the Earth. In *The Same River Twice*, Walker refers to her own Trinity: the Earth, Nature, and the Universe. She writes of Nature sustaining her happiness and as opening her “to love, intimacy, and trust” (Walker 1996: 43). She often cites the following poem in essays and public talks:

We Have A Beautiful Mother
We have a beautiful mother
Her hills are buffaloes Her buffaloes hills.
We have a beautiful mother
Her oceans are wombs Her wombs oceans.
We have a beautiful mother
Her teeth the white stones at the edge of the water the summer grasses her plentiful hair.

We have a beautiful mother
Her green lap immense
Her brown embrace eternal
Her blue body Everything
We know (Walker 1997: 106–7).

The poem captures Walker's admiration for the planet in the context of a larger universe, speaking from the heart of her Pagan spirituality. For Walker, the Earth is our mother. She observes that the relationship is not always easy. In "Everything We Love is a Human Being," she struggles with human destructiveness toward an alienated Earth. "I love trees," she says to the trees. The trees respond, "Human, please," ignoring her protest that it is the lumber company who mutilates them, ". . . we find you without grace, without dignity, without serenity, and there is no generosity in you either – just ask any tree" (Walker 1988: 141–2). The trees associate Walker with all humans, denying her claims to individual innocence. Walker has come to refer to herself as "earthling." The term "earthling" represents a sharing of power, resistance to human supremacy, and places all individuals, animate and inanimate in mutual relationship.

Spirituality is not grounded in a father god for Walker, but in Mother Earth, who sends the "grandmother spirit" to teach wisdom.

Wallace, Alfred Russel (1823–1913)

Alfred Russel Wallace was among the leading English field naturalists of the nineteenth century who also wrote widely on non-scientific topics such as politics, social reform, and alternative religion. His best scientific works, including *The Geographical Distribution of Animals* (1876) and *Island Life* (1880), were highly regarded and contributed substantively to the emergence of modern biology. Perhaps his most noteworthy scientific achievement was his formulation of a novel evolutionary theory in the late 1850s. Although independently conceived, Wallace's views were remarkably similar to the ideas that Charles Darwin had been working on (and largely keeping to himself) since the late 1830s. Both theorists emphasized variation among the members of a species, environmental pressures that led to competition, and the concept of natural selection. Wallace first proposed his ideas to Darwin in an essay and letter sent in 1858. Darwin, shocked to find that someone else had developed similar views, nonetheless made sure that Wallace shared credit when their ideas were first presented to the scientific community. Darwin was also prompted to write up a more comprehensive version of the theory, *On the Origin of Species*, first published in 1859. This work became the starting point for all subsequent discussions of evolutionary theory and thus largely eclipsed Wallace's contributions. In their latter careers, the two men kept up a regular correspondence and often joined forces to defend the concept of natural selection against its various critics. However, they disagreed on some issues, notably the relevance of natural selection to the human mind and human destiny.

Although Wallace was raised in the Anglican tradition, he largely abandoned traditional religion as a young man. In the 1840s he began exploring alternative belief systems, including the burgeoning spiritualist movement, which emphasized communication with spirits that were thought to dwell in higher planes of existence that surrounded the Earth. Typical practices involved ritual séances presided over by mediums who claimed to contact the spirits and relay messages. Although skeptics (which included many of Wallace's scientific colleagues) dismissed the movement as trickery or delusion, Wallace insisted that spiritualism could be studied experimentally, and had, to his satisfaction, passed numerous tests. During his latter career, he wrote numerous articles, books, and pamphlets that defended spiritualist phenomena.

Like other advocates, Wallace believed that spiritualism was entirely compatible with a scientific worldview and reform activism. For example, he supported women's rights, the utopian experiments of Robert Owen, and various land reform movements. He also opposed what he felt were reactionary or cruel applications of science, such as the eugenics movement and vivisection. Linking these disparate activities was a master

narrative of progress that spiritualists believed was at once natural (organic evolution), socio-political (progressive reform), and spiritual (survival and improvement of the soul after death).

How did Wallace's spiritualism square with his views of nature? Most significantly, while he staunchly defended evolution by natural selection for nonhuman organic systems, Wallace eventually came to believe that the higher mental functions of human beings (the "moral and intellectual faculties") could not be fully accounted for by natural selection. Instead, he invoked an "Overarching Intelligence" that guided the process of variation and accumulation of beneficial changes and that ultimately produced brains capable of mental and moral progress.

In this he implicitly argues for a separation between humanity from other animals that many (including Darwin) felt was no longer viable. Ironically, it may well have been an overdependence on natural selection (what some call Wallace's "hyper-adaptationism") that led to his distinction from Darwin. Wallace felt that natural selection acted exclusively in response to environmental conditions and eventually created perfect adaptations to those conditions. When considering humans in a "primitive" or "savage" state, Wallace could imagine no conditions that would require such a large, complex, and versatile organ as the human brain, hence his recourse to supernatural guidance. Darwin, on the other hand, employed the principle of correlation to deal with this problem. He felt that the higher functions of the human mind, including self-consciousness and abstraction, could have emerged in connection with the advantages conferred by language development.

Outside of biology, however, Wallace's attempts to situate organic evolution in a more comprehensive worldview that embraced progress, reform, immortality, spiritual belief, and ritual practice paralleled the efforts of much of the religious left of the late nineteenth century. Akin to various liberal theologies that developed in that era, Wallace yearned for a new synthesis of science and religion that would be consonant with various political and humanitarian reforms. In contrast to conventional liberalism, however, Wallace worked in an eclectic intellectual milieu that thrived largely outside of traditional religious institutions. Similar attempts to "spiritualize" science continue, most notably within the contemporary New Age movement. However, akin to Wallace, some resist what is arguably the major religio-ethical implication of evolutionary theory – that human beings are not exceptional to the natural process. Thus in spite of his obvious love of the natural world and his willingness to think boldly, Wallace's legacy was a religiosity that continued the traditional Western pattern of looking to the transcendence of nature. A religious vision that combined evolutionary theory and was spirituality oriented toward powers and processes within nature would have to emerge from other thinkers.

Washat Religion (Drummer-Dreamer Faith)

The *washat* is the name for what was commonly called the “Drummer-Dreamer religion,” a Native American religious revitalization movement that began in the early part of the nineteenth century. The religion took its earlier name from the drums used in its rituals and celebrations, and from the belief that its leaders had died, obtained visions from the afterlife (and hence had been “dreaming”), then returned from the dead to lead their people. The movement began in the American Northwest and spread eastward, spawning other tribal religions with various specific rituals, but the emphasis on the discovery of tribal identity through religious practices was retained.

The precise roots of the *washat* are notoriously difficult to pin down, but the religion owes much of its origin to the Wanapum prophet Smohalla who lived on the Columbia Plateau in what is now central Washington State. Smohalla, whose name means “dreamer” or “preacher,” was born sometime between 1815 and 1820. After a vision quest on a nearby desert mountain, Smohalla moved to the isolated village of *P’Na* on the Columbia River (now Priest Rapids), where he refined his religion, rejecting the “gospel and plow” message of the missionaries, and embracing the ancient traditions of the elders. The faith was strongly animistic, believing that all creation was capable of being imbued with spirit, and hence deserving of respect. Thus, it is hardly surprising that Smohalla rejected what he saw as agriculture’s destruction of the Earth, and insisted that his followers return to traditional means of food gathering, social customs, and most of all, religion. Since many natives looked with alarm at the increasing encroachment of the whites, the *washat* found a ready audience.

The religion was steeped in symbolism that called the worshipper back to a foundational relationship with nature. Smohalla began the weekly ceremony with a meal that reminded some visitors of the Christian Eucharist, with the sipping of water from the Columbia, taken with bits of salmon. In addition, the religion’s calendar celebrated salmon runs and root harvesting; the flags over the lodges contained the nature symbols of sun, moon, and star; and a tall pole adjacent to the prophet’s tule mat lodge held a small wooden bird, carved by Smohalla himself that represented the Bullock’s Oriole, the bird that had revealed the religion to the prophet when he was on his vision quest.

As Smohalla’s fame spread during the 1860s and 1870s, other prophets, most notably Skolaskin, Haslo, and Wovoka took the religion’s basic message back to their tribes,

where the latter's refinements were the genesis of the famous "Ghost Dance" of the peoples of the Northern Plains.

Today at Priest Rapids, there is something of a resurgence of the *washat*, with the religion's innate respect for the environment finding a receptive audience among both natives and whites. Gone is the insistence that natives reject agriculture and other devices of European-Americans. Instead, the modern *washat* stresses an attitude of thankfulness to the Creator, which in turn prompts worshippers toward looking at nature with care and respect. Men and women still worship apart in the lodge; the drums still beat for much of the ceremony; the dancers' movements are much the same as they were in the days of Smohalla; and all participants continue to partake of the ritual meal of salmon and river water. But the *washat's* move away from outward societal rejection reveals a religion that works through transformation of society.

Many Wanapums today carry this transformist spirit with them, working in local industries, orchards, and farms, with some actually employed on the Priest Rapids Dam, the dam that flooded some of the Wanapum's prime fishing grounds. This evolution of the *washat* points to the relationship that the tribe enjoys with the Grant County Public Utility District (PUD), the organization that owns the dam. The District strongly supports tribal religious identity, and works with the tribe to assist its environmental efforts along the "Hanford Reach," the last freeflowing stretch of the Columbia River in the United States. This part of the river is one of the few sites in the Pacific Northwest that still supports strong runs of Chinook Salmon, and the partnership between the Wanapums and the Grant County PUD is a significant reason for the health of the salmon population. Thus, despite the religion's changes since its rebirth in the 1800s, the *washat's* influence on the ecosystem of the Columbia Plateau remains profound.

Waskow, Rabbi Arthur (1933–)

One of the recognized prophets of eco-Judaism in the United States, Rabbi Arthur Waskow has been a principal and energetic proponent of such things as: “eco-kosher” practice, the “greening” of Jewish liturgy, reclaiming the ecological wisdom found in the Torah, and marrying ecological sustainability with daily spiritual practice. A life-long political activist, Waskow began reinterpreting and opening up Jewish traditions to the concerns of the day after a pivotal Passover he spent in Washington, D.C. The year was 1968, Martin Luther King, Jr. had recently been assassinated, and Federal troops had been called out to control rioting within the District’s African-American community. Waskow’s visceral experience of African-American neighborhoods under “lock-down” conditions imposed by government troops prompted him to reexamine the traditional sacred narrative of Passover in light of current events. Waskow felt a need for the “haggadah,” the booklet that tells the liberation story of the Jews moving out of slavery from Egypt (a story read during the Passover Seder service or ritual meal) to address the dynamics of racial oppression and violence he witnessed that day. In 1969, Waskow wrote and published a “Freedom Seder Haggadah” that adapted the traditional story of Exodus to address the realities of contemporary racism within a narrative framework of Jewish and African-American liberation. Many adaptations of the haggadah have followed Waskow’s innovation, including feminist-based and eventually environmentally focused haggadot.

Since then, Rabbi Arthur Waskow’s name has become synonymous with “Jewish Renewal,” a transdenominational movement that seeks to reclaim, renew, and reinterpret traditions of Judaism that it views as having been lost or regrettably “sanitized” in the face of the historical pressures imposed by cultural assimilation and anti-Semitism. In response, Jewish Renewal embraces and incorporates spiritual elements from Hasidism, as introduced by two of Jewish Renewal’s founding leaders, Rabbi Shlomo Carlebach and Rabbi Zalman Schachter-Shalomi, who left the Lubavitch Hasidic movement but retained its daily spiritual rhythms and mystical components. In addressing environmental concerns in particular, Waskow explores what wisdom might be gleaned from the daily prayer and spiritual mindfulness observed in Hasidic tradition and the powerful importance placed on Shabbat (a time of sacred rest) for transforming patterns of consumption, “workaholism,” and globalization, which he believes threatens the entire web of life.

In 1983, at the invitation of the Reconstructionist Rabbinical College, Waskow founded The Shalom Center in Philadelphia. The center is a self-described “network of

Jews who draw on Jewish tradition and spirituality to seek peace, pursue justice, heal the Earth, and build community.” Later, Waskow distanced the center from its

Reconstructionist affiliation and embraced instead the trans-denominationalism of the Jewish Renewal Movement. His encounters and exchanges with Rabbi Schachter-Shalomi in 1993 were especially formative for this shift and ultimately helped to catalyze Waskow’s ordination as a rabbi in 1995.

The Shalom Center implements both social and environmental justice projects. Its members helped produce the *Trees, Earth, and Torah* anthology, a collection of resources for understanding and conducting the “Tu biSh’vat” ceremony, a midwinter holiday that celebrates the “Jewish New Year of Trees,” and *Torah of the Earth*, an anthology that explores ecological wisdom in the history of Jewish thought.

Center programs and publications also encourage “ecokosher” practice, which takes into account not only food choices but also other consumption choices and their effects on the well-being of the planetary community. For example, Waskow asks the pointed question, “Are tomatoes that have been grown by drenching the Earth in pesticides “eco-kosher” to eat at a wedding reception?” (Waskow 1996b: 297). For Waskow, such questions extend to other lifestyle choices such as what bank one chooses to do business with or whether one chooses to consume renewable or non-renewable energy sources. “If what we sow is poison,” warns Waskow, “what we reap is poison” (Waskow 1996b: 299).

In 1996, the United Nations named Waskow a “Wisdom Keeper,” a designation given to honor forty religious and intellectual leaders around the world who are actively working on environmental issues. Together with his wife Phyllis Berman, who is no less an activist than her husband, Waskow travels to universities, synagogues, and community centers to lead Torah study groups, conduct ritual observances, and lead services in the style of Jewish Renewal. Berman is co-director of Elat Chayyim, a Jewish retreat center for healing and renewal near Woodstock, New York, where visitors eat an organic diet, study Torah, pray, and meditate. Berman is also the co-author of *Tales of Tikkun: New Jewish Stories to Heal the Wounded World* (Aronson and Berman 1996) and specializes in new liturgies for women.

Water in Islam

The religion of Islam, as revealed in the Qur'an, which Muslims believe to be the word of God (Allah), emerged in the western part of the Arabian peninsula – a dry, mountainous region similar in many ways to the Iranian plateau. The Qur'an mentions water on more than sixty separate occasions, and rivers more than fifty times. There are also frequent references to the sea, to rain and hail, fountains and springs. It is not surprising that the Qur'an, and for that matter pre-Islamic Arab tradition, place enormous emphasis on the importance of managing scant water resources sustainably and equitably.

Consistent with contemporary scientific understanding, the Qur'an states that water is the very source and origin of life: "We made from water every living thing" (Qur'an 21:30). Water is also the source of nourishment and sustenance, a gift from God: "Behold! . . . In the rain which Allah sends down from the skies, and the life which he gives therewith to an Earth that is dead . . ." (2:164); "It is He who sendeth down rain from the skies; and with it we produce vegetation of all kinds" (6:99); "It is He who sendeth down water from the sky in due measure and thereby We quicken the dead land" (43:11); "And We send the water from the sky and give it to you to drink" (15:22); "We send down pure water from the sky, that We may thereby give life to a dead land and provide drink for what we have created" (25:48–49); and "We provided you with fresh water" (77:27). The Qur'an also makes reference to groundwater and springs: "He leads it through springs in the Earth" (39:21); "From it also channels flow, each according to its measure (13:17); and "Say: 'Think: if all the water that you have were to sink down into the Earth, who would give running water its place?'" (67:30). Finally, water, with which Muslims must perform ablutions before praying and after sex, has the religious function of purifying the believer: ". . . and He caused rain to descend on you from heaven to clean you therewith" (8:11).

It is noteworthy that the Arabic term *shari'a*, which later came to be the term for Islamic law, originally designated "the path which leads to the watering hole." Qur'anic descriptions of heaven, furthermore, depict it as being watered with flowing rivers (5:119, 87:17). The abundance of water imagery in the Qur'an leads M.A.S. Abdel Haleem, a contemporary Islamic scholar, to assert that water has greater religious significance to Muslims than to followers of any other tradition.

The notion of community (*umma*) is of central importance in Islam, and social justice is one of the most prominent themes in the divine revelation. According to the Qur'an, water is community property: "And tell them that the water is to be divided between them" (54:28). The traditions of the Prophet Muhammad (*hadiths* –

which following the Qur'an constitute the second source of Islamic law) report him as saying, "People share three things: water, pasture and fire." The *hadiths* also prohibit the withholding of water from those who need it, and from using it wastefully: "Excess in the use of water is forbidden, even if you have the resources of a whole river."

Classical Islamic jurisprudence was formulated mainly during the eighth and ninth centuries of the Common Era and set down in the texts of four schools recognized by Sunni Muslims (the Shafi'i, the Maliki, the Hanafi, and the Hanbali), plus a fifth school, the Jaf 'ari, which is accepted only by Shi'ites. The latter are a minority within the Muslim world as a whole, but in Iran they constitute a majority of perhaps 90 per cent. For the most part Islamic jurisprudence has remained a theoretical construct, an ideal toward which Muslim societies should strive, rather than a system actually practiced. Even in the Islamic Republic of Iran today, the official view is that the country is "working toward" an Islamic state; it does not yet claim to be one.

Within the classical legal system, water rights are determined first and foremost by the need to quench thirst. This primary right was accorded not only to humans, but to animals as well. Thus, irrigation systems must be available to all who are in need, and must not be polluted so as to protect the rights of downstream users. Furthermore, according to John C. Wilkinson, "New upstream appropriations may only take place if they do not affect . . . prior rights" (1990: 61). According to the *hadiths*, the Prophet stipulated that "no more than an ankle's depth" of water could be taken – that is, providing adequate moisture storage in the soil for a seasonal crop. Wilkinson notes that the terms of the Prophet's restriction arise from the Arabian context, where water-flows typically result from flash floods. Classical jurisprudence, seeking "the spirit of the law," therefore determined that the intent was to prevent accumulation of excess water for purposes of speculation. The *hadiths* also establish the principle of protected zones (*harim*), which include watercourses, rivers, and, significantly, their adjoining lands, including lands adjacent to wells. The *harim* is "the buffer zone surrounding a water body within which human activities, apart from the lawful use of water, are prohibited. The cardinal rule of harims adjoining waters is that they must remain undeveloped."

Islamic criteria for water purity, which perhaps reflect ritual more than health concerns, state that water is polluted (*najis*) if it has undergone noticeable changes in color, taste, or smell as compared to its "clean" (*tahir*) state at the source. In short, as Wilkinson summarizes, the norms for managing water which are found in classical Islamic legal sources are comprehensive, sustainable and just:

The existence of both surface and groundwater flows are recognized and the *harim* rules ensure that tapping does not occur, nor that a new irrigation system or well are constructed too close to an existing one. The existence of problems of water quality and pollution, as well as of water quantity, are also treated in the Islamic code (1990: 63).

Water distribution systems in traditional Muslim societies, whether irrigation networks in rural areas or urban water supplies for public use, often fell under the clas-

sification of *waqfs*, which are pious endowments for the public good, protected from both taxation and government seizure. Those who made *waqf* endowments – usually wealthy families – were not only able to protect their wealth by investing it in this way, but could also exercise enormous power within their communities by controlling systems vital to the community’s survival. In Esfahan (Iran) province a system of regulating the distribution of water from the Zayandeh river was stipulated by an early sixteenth-century document, popularly but anachronistically attributed to the Safavid minister Shaykh Baha’i. Much of the traditional canal system still exists, although throughout the recent drought the channels have remained dry.

Throughout Iran and Central Asia the traditional qanat systems, which provided water both for irrigation and domestic uses for three millennia, have now largely been abandoned in favor of “modern” practices such as the damming of rivers and the pumping of groundwater. Likewise, control of water resources has been transferred from pious endowments to government bodies. These changes have been brought about as a result of the application of development models imported from the West.

Water in Zoroastrianism

From ancient times, Iranian civilization has possessed an ethical system that recognized both the ecological realities of the plateau's desert climate and the social imperative of conserving and distributing water in a way that ensures its availability to all. In Zoroastrianism, the original preIslamic religion of the Iranians, which is still practiced by a small minority today, each of the four elements is represented by a deity (*izad*) and revered through special invocations (*yasht*). Water is associated with the goddess Anahita (Nahid), whom Herodotus identified with Aphrodite. Another deity, Patet Apam, is described as guardian of rivers, springs, and the sea.

According to the Zoroastrian sacred text known as the Avesta, water must be kept pure and unpolluted. When Zoroastrians approach a stream, waterfall or spring, they should recite an invocation called the Ardivisura Banu (or Abzavar), from the Aban yasht in the Avesta. The ritual calendar of the Zoroastrians marks the fall harvest, Paitishahem, by commemorating the primordial creation of water.

Traveling through Iran in the fifth century B.C.E., Herodotus reported that Iranians did not defile water by spitting in it, did not wash their hands with it and could not stand seeing anyone pollute it. Strabo (ca. 63 B.C.E.–24 C.E.) corroborates this by observing that Iranians do not bathe in water, and will not throw anything unclean in it. Most of Iran's Zoroastrians today live in the central desert regions of Yazd and Kerman. For them, the daily sprinkling of courtyards and alleyways (performed throughout Asia as a means of keeping down dust) is accompanied by the diffusing of fragrant herbs such as wild rue, frankincense, aloe and marjoram, and still has a religious significance.

Water Spirits and Indigenous Ecological Management (South Africa)

Many international organizations, such as the Convention of Biodiversity, the United Nations Working Group on Indigenous Populations (WGIP), and the Working Group on Traditional Resource Rights (WGTRR), are calling for the recognition of indigenous peoples' rights to self-determination, the value of their knowledge, and the need for strategies to protect and preserve this knowledge. This has largely been precipitated by the global environmental crisis, which has revealed the shortcomings of an exclusively scientific approach, often within the Western economic development paradigm, in solving the multitude of environmental problems facing present and future generations. There has been a corresponding awareness of the need to revisit how indigenous people have managed to live sustainably within their environments, both in the past and the present. The religious worldviews (cosmologies) and knowledge systems of many indigenous peoples are intimately embedded within their physical, spiritual and social landscapes and can only be understood within these contexts.

There is an intimate connection that exists between the physical, spiritual and social dimensions of southern African spiritual healers' knowledge and practice; particularly with reference to water resources. There is a common corpus of knowledge linking the African healing traditions with water spirits over a wide area in southern Africa. Although there are regional variations, the recurrence of common themes and key symbols remain the same throughout and form the cornerstone of the spiritual healing traditions.

Among many of the southern African indigenous peoples, there exists a set of complex beliefs regarding water, river systems and riparian zones. The spirit world is regarded as the ultimate source of such life-sustaining resources, as well as the source of knowledge of healing and fertility. Integral to such beliefs are various zoomorphic spirit manifestations, primarily the snake and the mermaid, which reside in or beyond the water and which interact with humans in a variety of ways. The rivers and the sea are the dwelling places of such manifestations and are of fundamental importance to many of the African healing traditions and their practitioners (termed *amag-qirha* by the amaXhosa, or *izangoma* by the amaZulu). The snake and the spirits of the water are specifically associated with the calling of individuals to become diviners and are

seen as the providers of wisdom, knowledge and medicines, which are given to chosen individuals. This usually involves the physical submersion of the candidate under the water of a certain river, pool, or the sea (for a few hours, to days or even years) after which it is alleged that the individual emerges wearing the full regalia of a healer: a symbolic snake wrapped around his/her body and medicines. It is the spirits that choose the client, not the other way around, and resistance to the “calling” usually leads to misfortune. Relatives are not allowed to display any grief at the disappearance of one who has gone under the water or he/she may never be returned to the living. Anyone who enters these water sources without the calling of the ancestors will disappear, never to return. Messenger animals that summon the “chosen” one to meet the spirits are remarkably similar within all the cultural groups, namely, the snake or python, the water monitor, the hippopotamus, the dolphin, the otter, the crab, and various insects.

Certain places are more favored by the river spirits than others. They are believed to live in deep pools of certain rivers, often below waterfalls or fast moving “living” water or in the sea. The occurrence of certain plants near pools, such as the reed, wild tobacco or water buchu, indicate the presence of the water spirits.

Among the amaZulu of KwaZulu-Natal the water spirits in the form of the snake are referred to as the *amakhosi* (the great ancestors). Local informants suggest that they distinguish between the snake(s) that is/are a manifestation of the “family” (shade snakes) and the big one, “The one which is the Lord,” representing the Supreme Deity. For example, one informant describes the python as *iNkosi yamadlozi* (“the lord of the shades”) who resides in the pool.

The amaZulu also recognize the existence of another category of nonhuman water spirits or semi-daemons, that are half-human/half-fish (mermaids) and have stated that this is one of the forms the heavenly princess, *iNkosazana*, can take. These creatures very often have transformative powers. For instance *iNkosazana* can manifest as the mermaid, the snake, the rainbow and gentle soft rain. This link with the rainmaking forces and fertility is a common theme throughout southern Africa. *Inkosazana*, the Zulu heavenly princess, as the bringer of soft soaking rains, is responsible for both agricultural and human fertility. She has all the qualities of the archetypal Fertility Goddess. Propitiation and appeals are made to her by virgins at the beginning of spring each year, appealing to her to bestow her gifts of fertility and to help them select a suitable husband.

There are many other rituals that are performed for the water spirits at rivers throughout southern Africa. The purposes for conducting them and the ritual process may vary from group to group. They are mainly conducted for diviners at various stages of their training, but some households will propitiate periodically to appeal to the spirits to bestow them with wealth, rain, good harvests and fertility. Caves that are in close proximity to pools, especially those with rock art, are often used by healers as sites for rituals, and are viewed as very sacred. Archeologist Frans Prins has argued there is a close association between the San rainmaking trance rituals that are

held in caves near deep pools, and the amaZulu and amaXhosa beliefs surrounding the water. Much of the rock art in the eastern Free State, northeast Cape and Transkei feature snakes and water animals such as hippos. These rain animals have been linked to experiences healers have of the spirit world while in trance.

As a result of the profound sacred status that the many rivers, pools and water sources hold for southern African indigenous communities, there existed in the past, and among certain communities today, a range of taboos surrounding their access and utilization. Certain pools are held with a mixture of awe, fear and reverence. Only healers associated with the water are allowed to approach such areas. It is strictly taboo for anyone to extract plants or resources from the water's edge. This can only be done by healers who are allowed plants for medicinal use. Common people are forbidden to go near sacred pools where the snake, mermaids and spirits are known to exist. This injunction is reinforced with the fear that uninvited people will be taken under the water never to return. Many groups limit the distance within which residential units can be erected near rivers and where cultivation can take place. Many of these beliefs and practices have been abandoned over the last century, with devastating environmental effects. In certain places there has been a resurgence of interest in these beliefs and practices. Recently in the Mvoti river area of KwaZulu Natal certain rural communities have reinstated the ancient day of rest (*lesuku lweNkosazana*) for the heavenly princess, in response to claims made by a number of individuals who say she has visited them and complained that she needs the rivers to be left alone on certain days so that she can enjoy them and renew them without any disturbance. Collecting water, washing or utilizing any water directly from the river on her day (Mondays and Saturdays), is strictly prohibited.

The water spirits are generally believed to live in pools and swamps that never dry out. It is said that their role is to protect water sources and keep them alive. They are the guardians of the river and the providers of rain. They can however be chased away from their pools, which results in the drying up of water sources and the infliction of drought. This is precipitated by lack of respect demonstrated by people toward each other and the Earth's resources. Pollution, noise, the use of cement in rivers and dam building can all negatively affect the spirits. Killing or injuring any of the messengers of the water (such as crabs, snakes, frogs or water birds) is also regarded as a great offence. Social conflict and disrespect at both the local and national level can offend these spirits, resulting in catastrophic floods or droughts. Scholars have demonstrated how people harness the idiom of the water spirits to mount powerful community opposition to social, political and developmental projects (e.g., the Ambuya Juliana movement in southern Zimbabwe in the early 1990s).

Spiritual healers (diviners) are regarded as the repository and custodians of much valuable knowledge and wisdom accumulated from the past. This knowledge is by no means static as it is continually being revived and renewed through communication with the ancestors. However their access to such knowledge is under sustained threat by the forces of modernity: globalization, capitalism and religious intolerance. Ensuring

ing indigenous people access to these sites is essential since such features are integral aspects of the nature, formation and transmission of knowledge. Changes in land distribution and ownership patterns in South Africa over the last 150 years have profoundly affected healers' access to certain sacred features of their landscape that are necessary to perpetuate their living heritage. Protection of such resources from the ravages of modernization is also crucial, as the presence of these spirits is believed to be dependent on healthy river systems. Rivers are under sustained threat in southern Africa as a result of commercial development, farming operations, large-scale agroforestry, dam building and toxic overflow. State and private landowners may also decide to install dams or draw off large amounts of water, which may negatively affect inflow requirements to sacred pools or submerge them altogether. Sacred sites, including pools and cave rock-art sites, are also threatened by tourism (and recreational fishing), which may damage them in both physical and spiritual terms. All these factors pose great threats to the resources and knowledge base of spiritual healing in southern Africa, and mechanisms are urgently needed to protect the rights of indigenous healers, their environments, and their communities from such intrusions.

Watkins, T.H. (1936–2000)

T.H. Watkins was an impassioned environmentalist and author of twenty-eight books and hundreds of articles and reviews. Watkins exemplified the American sensibility of devotion to place that re-replaces an institutionally and historically centered sacrality with a commitment to, and awe before, the splendor of untamed and unspoiled land. Best known as editor of *Wilderness*, 1982–1997, the magazine of the Wilderness Society, from which in 1988 he received the Robert Marshall Award for his “devoted long-term service to and notable influence upon conservation and the fostering of an American land ethic,” he was also a historian of the West and depression-era America. Watkins’s 1991 book, *Righteous Pilgrim: The Life and Times of Harold L. Ickes, 1874–1952*, was a finalist for the National Book Award.

As a nature writer and land-ethic activist, Tom Watkins was devoted to the idea and experience of wilderness. His last book exemplified his call for the preservation of public lands and his celebration of place, written and photographic – from geology to political disputes – for the sheer wonder of the redrock canyons of southern Utah. The first Wallace Stegner Distinguished Professor for Western American Literature at Montana State University, Watkins was a tireless advocate for western lands and good writing about those lands. In the conservationist tradition, Watkins believed that wilderness would teach humans how to live: “For in wilderness,” he wrote, as in the eyes of the wild creatures that inhabit it, we find something that binds us firmly to the long history of life on Earth, something that can teach us how to live in this place, how to accept our limitations, how to celebrate the love we feel when we let ourselves feel it for all other living creatures (Watkins 1994: 104).

In *Stone Time* Watkins reveals his attachment to wilderness rather like a young Wordsworth of the *Prelude*:

I have two important landscape memories from my childhood – that of the seashore and that of the desert . . . The sundown sea of my childhood gave me abundant joy, a sense of freedom and possibility, but it was an easy place, generous and forgiving; even the sea itself, its waves eternally flowing toward security, promised salvation. But this contrary landscape, this desert place of rock and sky, sere and implacable and forever challenging, gave up nothing easily (Watkins 1994: 5–6).

His romanticism was anchored to meticulous geological, historical, and legal information and insights. And as with many nature writers, he thought what was needed to save this land was to look upon it and reflect. As an environmental ethicist, he worked to affect legislation that would preserve the place for a walk, a look, a reflection. He loved the desert, and there his ashes were scattered.

Watson, Paul (1950–) and the Sea Shepherd Conservation Society

Terrorist to some, ecowarrior to others, Captain Paul Watson has been a looming presence over the animal rights and environmental movements for the last three decades. Since the 1970s, Watson has been a founding member of Greenpeace, a medic in the 1973 Wounded Knee face-off between the American Indian Movement and the U.S. government, and the founder and president of the Sea Shepherd Conservation Society. Although he has tracked elephant poachers in East Africa, saved wolves in the Yukon, liberated monkeys from zoos in Grenada, defended bison in Montana, and campaigned for the rainforests in Brazil, Watson is best known for his dramatic efforts to halt the slaughter of whales, dolphins, seals, and fish of the sea.

Watson's militancy is fueled by his intense sense of connectedness to the living Earth as expressed in his biocentric philosophy that all life is rich, beautiful, intrinsically valuable, and sacred. Watson had a number of startling epiphanies that spoke of his destiny to protect animals, such as in 1975 when a mortally wounded whale looked him directly in the eye, expressing pity for humankind, and communicating that he knew Watson was trying to help. Watson's biocentrism is conjoined to a scientific understanding of the laws of ecology that dictate how human beings must live on the Earth if they are to live at all. Watson condemns the anthropocentric hubris that presumes the laws of society can override the laws of nature. He decries the violence human primates have long inflicted on the Earth, other species, and one another, and warns of an impending species extinction crisis the like of which has not been seen since the age of the dinosaurs. Echoing Aldo Leopold, Watson believes the human species is doomed so long as it sees itself as conqueror of the biocommunity rather than a respectful citizen within it. More explicitly than Leopold, however, Watson calls for "Biocentric Religion" (including in volume one of this encyclopedia).

Born in Toronto, Ontario, Canada in 1950, Watson's love and protective instincts for animals and nature were manifested early. Living in southern New Brunswick, he fell in love with the water and marine life. A "kindred spirit" to all animals, Watson protested any abuse he witnessed and destroyed snares and traps. His Earth-consciousness was so intense that by age 15 he had "pledged allegiance not to Canada, the Church, or humanity, but to nature" (2002: 49).

In 1968, Watson signed up as a merchant seaman and found his true home at sea. He joined the Don't Make a Wave Committee that protested nuclear testing by sailing activist crews into target areas. In 1972, with Watson as a co-founder, the

group renamed itself the Greenpeace Foundation and cruised into French and American nuclear testing zones. During this time, Watson also did freelance writing and studied linguistic and interspecies communication at Simon Fraser University, thereby adding scientific weight to his belief that animals such as whales and dolphins have highly evolved brains and communicative capacities.

From 1972–1977, Watson emerged as the most militant member of Greenpeace. At his urging, the organization expanded its focus to include wildlife preservation issues and in 1975 launched the world's first sea-going expedition to protect the whales. In 1976, Watson led the first Greenpeace expedition to the ice floes off the Labrador Front to rescue seals and document the killing. He returned the next year with a larger crew that included French actress Brigitte Bardot, whose presence drew unprecedented international publicity to the seal slaughters. Watson's plan was to spray the seals with a harmless green dye to render their beautiful coats valueless to sealers, but the Canadian government quickly outlawed the tactic leading Greenpeace to renounce it. Saving the dye tactic for future campaigns, Watson instead shielded seals with his body, moved them to safety, and threw sealers' clubs into the sea.

By breaking Canada's "Seal Protection Act" Watson saved many seal lives and helped to inaugurate a new era of direct action for animals, but the Greenpeace board voted him out in 1975 after concluding that he violated their direct-action guidelines which stress nonviolence and bearing witness. Stung by the betrayal, Watson berated Greenpeace as the "Avon ladies of the environmental movement" because of their focus on fundraising over action. They in turn denounced him as a "terrorist" and interfered with his subsequent campaigns.

Watson started his own group, first named Earthforce and then the Sea Shepherd Conservation Society, which he calls "the most aggressive, no-nonsense, and determined conservation organization in the world" (1994: xv). With the help of Cleveland Amory and the Fund for Animals, Watson purchased the first of many Sea Shepherd ships in December 1978. In a series of bold, notorious actions, Watson and crew rammed pirate whaling ships at sea and sunk others at dock, sprayed thousands of seals with dye, intervened to halt dolphin kills, and destroyed miles of driftnets that environmentalists denounced as "curtains of death."

Influenced by Marshall McLuhan's theories of electronic media, Watson argues that nothing is real or believable for the public until it becomes a media event. Through sensationalist tactics, celebrity supporters, videotaped evidence, and dramatic press conferences, Watson aimed to galvanize a sleeping global village to help protect marine mammals.

Unlike many activists who resort to sabotage in defense of animals and the Earth, Watson accepts that property destruction tactics can be called "violence," but he argues sabotage is necessary to thwart a much greater violence and to capture media attention. As he explains it,

To remain nonviolent totally is to allow the perpetuation of violence against people, animals, and the environment. The Catch-22 of it – the damned-if-you-do-damned-if-

you-don't dilemma – is that, if we eschew violence for ourselves, we often thereby tacitly allow violence for others, who are then free to settle issues violently until they are resisted, necessarily with violence . . . sometimes, to dramatize a point so that effective steps may follow, it is necessary to perform a violent act. But such violence must never be directed against a living thing. Against property, yes. But never against a life (1982: 26–7).

Watson's strategies and rationales place him squarely in the radical environmental camp, where illegal tactics are considered morally permissible if not obligatory to thwart the destruction of a sacred and intrinsically valuable natural world. Indeed, he made strong connections during the 1980s with the Earth First! movement, which musingly considered the Sea Shepherd Conservation Society its Navy, as they were his Army. Indeed, at Earth First! gatherings, Watson's heroism is often celebrated in poetry and song, and individuals who have served as crew for the Sea Shepherd have recruited there with some success.

Watson's champions credit him with inventing a powerful new mode of activism and bringing bold warrior tactics and values to the defense of the Earth. His critics berate him as an arrogant vigilante and violent pirate, an "eco-terrorist" who recklessly destroys property and endangers human life. Like most radical environmentalists, Watson insists that he explored the "proper channels" for appeal, protest, and change, but found only corrupt governments that either ignore or defend immoral and unsustainable killing. He argues, moreover, that he has proposed credible alternatives to industries such as sealing only to be rebuffed without a hearing. Where laws such as the 1986 International Whaling Commission ban on whaling are flouted without consequence, Watson insists he is upholding, not breaking, the laws. He freely admits to violating statutes such as the "Seal Protection Act," while reminding us that Gandhi and King also disobeyed laws in contradiction with the just and the right. Watson feels the charge of terrorism carries little weight coming from those who profit from killing, and he finds no credible comparison between damaging property to save life and slaughtering life for profit. For Watson, the true violence and real terrorism lies with those who massacre animals and devastate the Earth.

Critics also accuse Watson of being a misanthrope, a Eurocentric imperialist, and a dictator on his ship. Watson is unapologetic about the kind of discipline and command required to run a ship in high-risk conditions. He unflinchingly affirms that his primary allegiance is to life itself, and especially sea life, as he openly expresses contempt for a human species plundering the planet and exterminating species. Privileging animals over humans, Watson repudiates claims advanced by some members of indigenous societies, such as a number of the Inuit and Makah, who assert they have a right to kill seals or whales in order to preserve their cultures and identities. Watson believes that when marine species are at risk of extinction further killing cannot be justified, no matter what group of people is involved or rationale they articulate. Watson thus epitomizes "no compromise" radical environmentalism as he calls others to such activist, biocentric religion. Despite such radicalism, he continues to work with mainstream

environmental and animal liberation organizations including the Sierra Club, whose members elected him to serve on its national board of directors in 2003.

Watsuji, Tetsuro (1889–1960)

Tetsuro Watsuji played an important role as a major twentieth-century nativist philosopher in the Japanese response to modernization and Westernization. The 1867 Meiji Restoration ended a 250-year seclusion to reestablish the imperial throne to power and to survey Western models and train abroad to construct a new Japan as the best defense against Western colonization and commercial exploitation. By the 1890s, many knowledgeable Japanese who had gone abroad despaired at the great gaps between the West and Japan, some reacting by reexamining the values of the Japanese cultural past.

Tetsuro Watsuji trained under several famed nineteenth-century nativists (such as the novelist Natsume Soseki and the imperial ideologist philosophy professor Inoue Tetsujiro). In 1927 he spent a year in Germany studying Western philosophy; in direct response to the publication of Martin Heidegger's *Existence and Time*, Watsuji developed his theory of "natural environment" (*fudo* in Japanese), which he would subtitle "Considerations about Human Ecology" (*Ningengaku-teki kosatsu*). While others before him had considered the Japanese sense of nature, Watsuji was the first to do so in a modern Western philosophical style.

His starting point was Heidegger's emphasis on "beingness" (*sein*) as the singular foundation of human existence. Watsuji felt this to be incomplete because it stressed individual self-discovery in a temporal context; his Japanese experience of a communal society anchored in a unique awareness of nature led him to incorporate a spatial (i.e., natural environment) foundation to human selfdiscovery, which he termed *fudo*. It is usually translated as "climate, scenery, geologic conditions, weather" and so on, but is better rendered the "natural environment," and includes as well the nuances of the French *milieux* ("surroundings, social sphere"). Watsuji's starting point for developing the concept of "natural environment" was the human awareness of cold – that cold is much more than a characteristic of surroundings external to the human or a sensation or an interior mental event, it is actually a human subjectively experiencing an objective awareness. The context of the experience as well as the process itself is *fudo*, "natural environment." He interpreted Heideggerian self-awareness to involve both beingness and *fudo*, for the latter makes any objective self-discovery possible (Watsuji 1988: 12–13); since it enables humans to stand outside themselves, *fudo* is the "self-active physical principle of the human spirit objectifying itself" (1988: 10). This natural environment provides the opportunity or turning point (*keiki*) for concrete human activity. Humans face the challenge of survival because of the natural environment (the "tyranny of nature" [1988: 6]), so that all basic elements of survival such as

food, shelter, and clothing, are inevitably tied to it. Tool making and the invention of all material products and all cultural acts occur within this natural environment; thus culture and the natural environment are interrelated.

Watsuji did several things with *fudo*. 1) He rejected any standard Western deterministic relating of culture and natural environment. 2) He applied the traditional Japanese sense of a natural world populated by indigenous spirits or *kami* (as described in archaic times in the Japanese myth cycles in the seventh-century *Kojiki* and eighth-century *Nihon-shoki*) that was subsequently refined by the worldview of the Buddhist Kegon (Chinese: *Hua-yen* or “Wreath of Flowers”) school which posited a thoroughly integrated holistic cosmology of beings, contexts, and processes. 3) Noting that human awareness occurs existentially (Watsuji’s Japanese natural environment consists of immanent *kami* as an interrelated holism) he thus conceptualized an ontological relationship between natural environment and culture – this is *fudo*.

But this was only the first half of an essentially nativist project. In his travels during the 1920s, Watsuji noted great variations in vegetation, landscape, natural light, architecture, urban design, transportation, etc., across Asia, Europe and the Middle East, so he proposed three basic kinds of *fudo*: desert (Arabia), meadow (Europe), monsoon (South and southern East Asia). Since *fudo* structures all human activity as culture, he saw humans developing distinctive material lifestyles in each of these natural environments, but also social structure, cultural acts, and national temperaments. Desert *fudo* is the most intense human struggle with nature – echoed in a nomadic survival with fierce possession of essential resources, intra-human resistance and conflict, religions of stark ethics and a totally dominant, all-powerful one god. Meadow *fudo* began with classical Greece and Rome in a brilliant Mediterranean light and comfortable nature, making possible much contemplation about order and structure – thus Greek philosophy and science and recent European civilization leaps across the globe. Monsoon *fudo* is an over-intense nature – from the archaic deification of nature phenomena in Vedic India through a common trend toward seeking either a single powerful unity underlying such lush and ever-changing life (*brahman* in Hinduism) or the universe as the unity itself (*dharmadhatu* in Buddhism). (Thus humans master nature in the meadow environment, but at best struggle and respect nature in the desert and monsoon environments.) Japan is part of this monsoon *fudo*, so his challenge next became how to clearly distinguish Japanese culture in relationship to its natural environment in contrast to the giants India and China, but also to the contiguous cultures of southeast Asian, Korea, and the Pacific.

Japan’s environment is unique among monsoon *fudo* in Watsuji’s eyes because 1) it is an island off the east coast of the Asian continent, 2) it lies on a geographical north/ south axis, 3) unlike any other East Asian nation, its northern half receives cold Arctic air from Siberia and the Japan Sea, while 4) its southern half is both mainland monsoon belt-influenced but also Pacific island-related.

In his earliest writings in 1918, Watsuji had already linked Japanese culture to its natural environment, and soon did not limit this relationship to the development of

material culture, but extended it deeply into the development of national character and ethos. With broad cultural sweeps, he linked such institutions as the Japanese corporate family, for example, to the traditional layout of the Japanese house, compared Buddhist temples to gothic cathedrals, Western gardens to Japanese, and so on. In parallel with such other well-known twentieth-century nativists as Okakura Tenshin and Suzuki Daisetsu, Watsuji also labored to isolate a uniquely Japanese national temperament as evidenced by its material culture. Here Watsuji built off of the Meiji imperial government's advocacy of a new national religion/ideology of *kokutai* ("nation-as-corporate body," the Japanese people as individual cells, and the imperial government as the head). As the Japanese began to establish the first modern Asian empire, the Greater East Asian Co-Prosperity Sphere (*Dai-toa-kyoeiken*, 1940–1945), Watsuji expanded *fudo* to legitimate the role of the state in integrating "territorial opportunities" (*keiki*) as human ecology. He became best known for his *Ethics*, his life's work about collective relationships and responsibilities in Japanese society. He would never see the Japanese state, its nation-as-corporate body ideology, or its martial spirit as reasons for Japan's World War II defeat, his nativism always sending him back in Japanese history to moments of foreign contact – so Watsuji could only find the reason for Japan's downfall to have been its two and a half centuries of seclusion (1508–1867) which denied it long-range access to and mastery of modern Western technology.

Weather Snake

Among the Zulu-speakers of KwaZulu Natal, Southern Africa, there is a myth of an immense snake that rides upon storms, wreaking havoc and destruction. Greatly feared, this sinuous goliath is kaleidoscopic in appearance, able to change its form, carnivorous, irate and itinerant. In the Midlands its abodes are the many dams and rivers that run from the heights of the Drakensburg mountains some 70 kilometers to the northwest.

This creature is both a monster and a deity, associated with the negative power of the ancestors and the destructive forces of weather and nature. It is also associated with major landmarks such as Mpendle Mountain, some 10 kilometers outside of the town of Howick. From the summit of this mountain this brilliant creature is said to fling its full length upon the back of the storm, although some would say that it is the very storm itself.

As he races across the landscape upon the high winds, the glitter of corrugated roofing, so typical of shacks in southern Africa, attract his attention, leading him to mistake this for the shimmer of water. He drops from the sky and hits the roof, only to realize his mistake. Frustrated and furious, he throws himself back upon the storm, flicks his tongue of lightning and growls his rumble of thunder, twists his torso into a tornado and takes revenge upon the domestic landscape below. His tortured path rages from Mpendle Mountain through the scenic softness of whiteowned farms, toward the expanse of Midmar Dam and on toward the Howick Falls.

This waterfall is regarded by Zulu *sangomas* (diviners) as a sacred place of power. Here for innumerable years, during the training of initiates, they have offered sacrifices to the ancestors and to the inkanyamba who are associated one with the other, and have even become each other in a blurring of boundaries. To awaken the snake from its watery sleep here is to invite its wrath in the form of storms, tornadoes and flooding.

The water-snake myth appears to have been introduced into southern Africa with the Bantu-speaking people some 2000 years ago, for the concept is prevalent throughout the southern sub-continent. But while this concept has taken the form of a water-snake among Bantu-speaker's, among San hunter-gatherers it was regarded as the rainanimal who could take many forms, and was a creature associated with the otherworld and responsible for weather and rain. The San were the great rainmakers, the controllers of weather and nature. For these abilities, and for their magical qualities, the Nguni feared them, yet sought their services.

In the Drakensberg region, the San were present until relatively late, having been driven out by various fugitive African groups, by the expanding Sotho and by white

colonial groups, from about 1838 onwards. The last raid in the Midlands took place at Kamberg in 1872. The descendants of the San continue to linger on in these their old hunting-grounds. Here, in the rock shelters of these mountains, they left an immense lithic, or stone, gallery of rock art – a celebration of superb paintings. Among these are depictions of the rain-animal in the forms of the rain-bull and rain-herds of cattle, or presented as snakes, some of supernatural appearance. Among these are the rainsnakes.

Descriptions of the inkanyamba are similar to those for lake and water serpents the world over. Some of the features shared in such cases are the sinuous serpentine form, a mane, or integument of long hair or scales down the elongated neck, and sometimes an equine head. A creature resembling the inkanyamba is evident in a number of San rock paintings in the Drakensberg range. These serpents sometimes have a hogged mane like that of a zebra, horns, and either the head of a serpent, an equine head, or that of an Nguni cow or wildebeest. Whiskers occasionally adorn its face.

It appears that the Nguni and San engaged in a borrowing and merging of beliefs manifesting in the bovine or equine-headed serpent of the rock art, and with the weather-whipping inkanyamba of the Zulu-speakers, which flies along the old raiding routes of the San during its celestial journeys.

A giant mythical snake is not so far from European tradition. European descendants in this area have interpreted this mythical creature for themselves as a watermonster similar to that of Loch Ness in Scotland. Indeed, residents of this small town have reported sightings of a plesiosaur-type creature, or snake-like creature; sightings that have caught the attention of both national and local media. Part of the sensationalism surrounding the creature includes fake photographs of the monster and its young – published in a local newspaper – and crocodile eggs obviously imported into this area and said to be the eggs of the monster found at the pool at the base of the falls.

Clearly the water-monster is a means by which Englishspeaking European descendants have appropriated a local legend and presented it in a form to which they can better relate. The taming of the Howick Falls monster is just one way in which they have re-created an aspect of British culture and landscaped the African environment into a familiar domestic and cultural setting. Indeed, they are just one of three diverse groups, all of whom have manipulated a concept, to be found in many cultures worldwide – that of the dragon. Here, in the Midlands of KwaZulu Natal, European descendants have tamed the dragon, while the Zulu-speakers' inkanyamba is clearly a manifestation of the dark side of nature. Among the San, the creature is simply an expression of their magical qualities and mastery over a biddable nature – indeed, an expression of their mystical selves.

Wenger, Susan (1916–), Yoruba Art, and the Oshogbo Sacred Grove

Susanne Wenger was born in 1916 at Graz, Austria. She arrived in Nigeria in 1950 and this marked the beginning of her involvement with Yoruba religion. Before coming to Nigeria, she had exhibited her works in Paris, Zurich, Austria, and other parts of Europe. Ajagemo, a high priest of Obatala (god of whiteness), introduced her to Yoruba religion in Ede and there she began her artistic works for the gods. The first of such works was the reconstruction of the Soponna cult at Ede and subsequently the renovations of the shrines of other gods in the Osun groves at Oshogbo. Her main work over the years has been the constant reconstruction, renovation, and conservation of the shrines in the Osun Oshogbo groves. The fusion of art and religion is at the core of Susan Wenger's art, and she says the singular purpose of her work is to protect the sacredness of nature. Her works present a mixture of architecture, religion, and art.

Works of art consist of two elements, the inner and the outer, as well as two levels of knowledge, esoteric and exoteric. The esoteric knowledge level usually informs the inner element of art through knowledge, which is informed by the artist's intended meaning(s) for the work of art. This knowledge is accessible to a few people, the artist and/or cultic functionaries in the case of religious art. The outer element of art gives expression to the inner element and manifests at the exoteric knowledge level, for it is accessible to all. It is expressed in aesthetic values and decorations. The outer element gives the work of art its visible and audible qualities. Both elements are significant and affect the performance/presentation of any work of art.

The site where Wenger carries on her art is the Osun grove. The Osun grove is located at the outskirts of Oshogbo town in Nigeria. It is an expanse of land fenced round, within which one finds the Osun River, Osun shrine, shrines for other Yoruba deities, and sculptures for the deities by Wenger and her assistants. The grove is a blend of fauna and flora and is usually a quiet and serene place. The art of Susan Wenger at the Osun grove in Nigeria exhibit the influence of both the inner and outer elements of art in Yoruba religion. The sculptures, put in place by Wenger and her assistants, are expressions of and means of conservation in Yoruba religion. The forms of the sculptures are wholly organic, with components used in proportions determined by religious injunctions. The cement is mixed with a prescribed amount of the grove's red Earth. To ensure the conservation of nature in the grove, Wenger has been able to get the Osun grove onto the list of the Nigerian Antiquity conservation areas. Understandably, farmers who perceive these areas as a means of livelihood opposed the

move vehemently, but with adequate information on the usefulness of such a stance, harmony has been achieved. Because Susan Wenger is a Yoruba by conversion/calling and not by birth/origin, her art presents some paradigms that may proffer significant import for existing relations between nature and religion.

The Yoruba hold that a combination of art and ritual remains indispensable to communication between humans and the divine. Further, nature is perceived as being sacred. Consequently, the Yoruba are more apt to think of art as an act of creative imagination (*oju ona*), executed with skill and an understanding of the subject, rather than see art as an object. For the Yoruba then, artistry is the exploration and imaginative re-creation of received ideas and forms, usually from the divine. Art is a vital part of being, and creativity is associated with the divine. This stance informed the state and significance of the Osun grove prior to Wenger's work. Emphasis was on verbal art and recitations rather than a prevailing need to erect sculptures for the Yoruba gods, as done by Wenger and others. While it is true that figures of Yoruba gods existed prior to Wenger's artwork, this was more at the level of individual worshippers – an example is the twin figures (*ere Ibeji*).

The shrines of the gods are for them a ceremonial home, while the sculptures embody their myths. Embedded in these myths are characteristics and taboos of each god. The main features of Susan Wenger's sculptures are lifesize or larger figures and bulging eyes. Both features are known characteristics of Yoruba art, in pre-colonial times and presently. In addition, the bulging eyes are signs of spiritual power in mythology and religious experiences, depicting a higher consciousness. Her figures are usually larger than human figures, but these sculptures are representations of deities and records of mythology. She sometimes works with assistants in the restoration of these shrines within the grove. Most of these assistants are artists and adherents of Yoruba religion. Some of the sculptures produced by Wenger and her assistants in the Osun grove at Oshogbo include: Ontotoo (a senior deity in the heavenly abode), Obatala (the deity of purity and whiteness), and Iya moopo (protector of all women's crafts and trade). These figures are characterized by a blend of fauna and flora. Natural vegetation can be seen clinging to the shrine while monkeys, birds and other animals visit at their pleasure. Wenger's sculptures for the gods and goddesses are therefore at home in nature. These sculptures enhance the vividness of the deities to observers and worshippers alike.

The cooperation between religion, nature and culture in the Osun shrine could best be described as a collaborative phenomenon. Features of the sculptures emanate through myths from the people's religion and cultural ethos. Whereas nature nurtures the sculptures, religion and culture manifest themselves through them. Wenger and her assistants further collaborate in the Osun grove by combining their intellectual endeavors.

The resilience of Yoruba religion is being manifested continually within and outside Nigeria. The sacred grove of Osun Oshogbo is a big monument where the intertwining of the flora and fauna with the aesthetic presence of ritual artwork coexist. The

grove serves as a conservation matrix and, at the same time, proclaims the record of Yoruba myths and deities; in so doing, it contributes to the vitality of Yoruba religion worldwide.

West Africa

West Africa is a vast region, encompassing a land mass of

2.4 million square miles, bounded on the north by the Sahara Desert, on the west and south by the Atlantic Ocean, and in the east by the mountain ranges along the Nigerian–Camerounian border. It is Africa’s most populous and diverse region, with nearly a third of Africa’s 800 million inhabitants. Its northern limit, the Sahel, receives less than 500 mm of rain per year, concentrated in a short dry season, but it is traversed by two major rivers, the Senegal and the Niger, which bring life-giving water for human settlement and irrigated or flood-plain agriculture. As one moves south, rainfall increases and becomes more regular. In the Sudanic region, rainfall ranges from 500– 1100 mm, the rainy season is longer, and vegetation is lush. It was in this region that major African kingdoms developed, centered on control of the trans-Saharan commerce. Still further south, are Guinean forests which receive rainfall from 1100–3000 mm, whose lush vegetation sheltered tsetse flies and African Sleeping Sickness, which protected its inhabitants from the Sudanic kingdoms and their cavalry-focused military power.

These climate zones tend to correspond with religious affiliations. Today, the Sahel is overwhelmingly Muslim; some areas have been Muslim for over a thousand years. The Sudanic region is predominantly Muslim, but includes notable communities of followers of traditional African religions, most notably the Dogon of Mali, and also Christians, most notably the Mossi of Burkina Faso. Islamic communities are much newer in the Guinean forest areas and remain distinct minorities behind substantial Christian and traditionalist communities along both the Upper and Lower Guinea coasts. Islam tended to follow trade across the Sahara to the trading centers of the Sahel and Sudanic regions, and was a weaker influence in forest areas that relied on human portage to transport goods through forest zones where African Sleeping Sickness was endemic. Nature is a critical aspect of African traditional religions in the Sudanic region and forest zones of Upper and Lower Guinea.

West African traditional religions are monocentric; that is, they focus on a supreme being who created the universe and is the source of all life-enhancing powers. They also emphasize the role of lesser gods or lesser spirits and ancestors. Particularly in the Sudanic region and along the Upper Guinea coast, the supreme being tends to be associated with the sky and with rain. For example, the Diola of Senegal address their supreme being as Emitai or AtaEmit, which means “of the sky,” and call rain “Emitai ehlahl,” “falling from God.” Given climates where plants wither and die during the long dry season and return to life overnight after the first rains of the year, it is

no wonder that the supreme being as giver of life is closely linked to the sky and to life-giving rainfall. This is particularly true in the Sudanic region and the northern part of Upper Guinea. In Lower Guinea, where rainfall is less of an issue, Earth goddesses attain greater prominence. Lesser gods and spirits may also be associated with rain, the ocean, particular rivers or springs, forests, fire, or with the forces of procreation.

Creation myths associated with particular religious traditions provide important insights into their representations of nature. For example, Dogon religious traditions describe various ways in which the Earth was created, but in all of them, an initially androgynous creator god becomes a predominantly male god in the process of creating the universe. As creation continues, this supreme being, Amma, becomes identified with the sky and the life-giving properties of rain. Amma rapes a passive and voiceless Mother Earth and fathers a solitary trickster figure, the jackal, which wanders the Earth seeking a partner. It is Amma's breath, *nyama*, which is seen as a dynamic, life-enhancing power that flows throughout the universe.

It is embodied in the moist, serpent-like Nummo, who purify Earth with the power of the First Word, which is identified with cloth made out of natural vegetation, twisted into coils in a primordial loin-cloth. As other disruptions in the creative process occur, the Nummo bring new, more sophisticated Words to restore order. The last and most complex is associated with the powers of the forge and of agriculture, which work in tandem restoring the Earth's life-giving powers and bringing order out of chaos. In Dogon cosmogonic traditions, one finds a common dichotomy between the settled areas of villages and towns and the dangerous, solitary chaos of the bush. Among the Bambara, the supreme being is initially seen as a seed and agriculture is central to their religious life. As part of their transition to adulthood, Bambara boys are initiated into the tyiwara society, which celebrates the role of an antelope deity, Tyiwara, in introducing agriculture to the Bambara, and the necessity of performing agricultural rituals to ensure the fertility of the land.

Other myths describe agriculture in more disruptive terms, seeing the act of planting seed and pounding harvested grain as the reason why the supreme being withdrew from a place just above the world, to a safer place high up in the heavens. Other myths describe creation in terms of their observations of the natural order. Thus, the Yoruba describe how the supreme being, Olodumare, gave a lesser god, Obatala, a chicken and a shell filled with sand and told him to create a world. Obatala poured the sand on the primordial waters and placed the chicken on it. It began to scratch in its constant search for food, and quickly spread the sand out, creating the dry Earth. Then Obatala began to create other living things from clay and did so in an orderly fashion, until he became drunk on palm wine and began to create deformed people and animals.

The gods and lesser spirits themselves reveal important ideas about West African representations of the natural order. The Fon and Ewe of Lower Guinea group their deities in three pantheons corresponding to the three most important realms of the universe. Mawu-Lesa, a complex god that is both female and male, heads the sky

pantheon. Their children and grandchildren are associated with the pantheon of earth gods and the pantheon of ocean gods.

In many West African societies, the Earth is seen as a goddess. This is not only true of the Dogon, but is equally true for the Igbo of southeastern Nigeria and the Ashanti of Ghana. Ala, the Igbo earth goddess, guards the fertility of the land and is closely associated with the enforcement of moral codes. The Igbo term for morality, *omenani*, refers to “what happens on our land.” Prohibited actions can render the location of such acts barren and incapable of producing crops. This is true of the Diola as well. Asase Ya, the Ashanti earth goddess, is also linked to the maintenance of the moral order and of fertility.

Similarly, the Yoruba’s Ogboni Society, associated with a male Earth god, is responsible for conducting the judicial investigations into violent crimes; the shedding of blood is regarded as a profanation of the Earth. “The Beng of the Ivory Coast also have a male Earth god, whose priests, the Masters of the Earth, play an important role in reconciling the social order of humanity and the life-enhancing powers of the Earth. To the Beng, the Earth is all-knowing, able to distinguish between lies and truth and with a long memory as to the ritual obligations pledged to him when seeking his assistance. As Beng establish villages, the Master of the Earth ritually plants a Kapok tree, marking the space as one of human habitation, as opposed to the forest. This planting also permits the development of family life, especially sexual relations without the danger of conceiving a forest creature, a problem if sexual relations occur in lands unseparated from the bush. The Beng also worship lesser earths, refractions of the earth god, but capable of assisting them with more local tasks and punishing them for neglecting their obligations. The Earth is seen as so powerful that one day of each six-day week is set aside for his worship.

Many gods are associated with bodies of water. Thus, the Bambara of Mali link a stretch of the Niger River with the water spirit, Faro, who is a guardian of fertility. Yemoja, Oshun, and Oya, three Yoruba goddesses, are all associated with rivers, whose apparent stillness and depth mask powerful currents that can overcome human initiatives. The Igbo’s goddess of wealth, Idemili, is associated with a river of the same name. These goddesses can bestow riches in children and in economic power to their devotees. The Diola identify a whole category of spirits, the *ammahl*, with water. They are often linked to some of the most powerful Diola shrines or can remain independent, revealing themselves only to a chosen few. Powerful gods of thunder, like the Yoruba’s Shango and the Igbo’s Amadioha, demonstrate the destructive power associated with rainfall.

Other gods are associated with diseases. Afflictions can either be a source of punishment for wrongdoing or neglect of one’s responsibilities or a summons to take on ritual responsibility. Thus, the Diola’s family shrine of Hupila seizes men with a disease that makes their body feel like it is bound with rope. Part of the healing process involves building a shrine; it may require learning to become a priest as well. The Diola fire spirit, Gilaite, associated with blacksmithing, punishes thieves or their families with

leprosy. The Yoruba deity, Shopona, and the related Fon and Ewe Sakpata, used to be associated with smallpox, seizing those who survived it as its priests and killing those who had violated its edicts. Since the elimination of smallpox, however, this deity has found a new disease to manifest its power, HIV-AIDS.

Finally, trickster gods are common in much of West Africa where they are closely associated with particular animals who are regarded as extremely wily and outside of human control. Thus, the Akan's Ananse is identified as a spider. The Dogon's tricksters are identified with foxes and jackals, who speak in crude, highly symbolic language, the language of divination. These deities are not evil, but forces of disorder that disrupt human attempts to impose order on the world. They introduce diseases, natural disasters, animal pests, and powers of the bush against the people of settled townships. In the case of the Fon's trickster, Legba, and the Yoruba's Eshu, they portray the disruptive power of unsocialized, that is, natural, sexual powers and the disorder that they engender. All of these tricksters provide vivid evidence of the persistent ability of natural forces to disrupt humanity's attempts to construct a world order. They provide powerful explanations of human suffering in a universe where humans exert little control.

In many West African religions, human beings are also linked to a variety of non-domesticated animals. In much of West Africa, there is a complex theory of the soul, which is created from aspects associated with one's patrilineage, one's mother's patrilineage, and one's grandparents' patrilineages. Each of these parts of the soul is symbolized by a particular type of animal, with whom that person shares a portion of his or her soul. When the human is born, so is the animal. These animals suffer whatever pain the human suffers and vice versa. The death of one threatens the life of the other. Lineages respect the type of animal associated with them, as well as those animals associated with their paternal and maternal ancestors. In Diola society, these animals are said to live in sacred forests or other special places associated with a lineage. They are not normally hunted or eaten, even by people outside the lineage. These animals may range from mamba snakes, to hyenas, to hippopotami. In Dogon traditions, kinship with particular animals reflects the descent of all animals, plants, and people from the heavens to the Earth and the special ties that people shared in the particular portion of the celestial granary that descended to Earth carrying the necessities of Dogon civilization. This type of totemic connection is primarily a reflection of one's patrilineage. This emphasis on spiritual ties between humans and wild animals transcends the dichotomy between settled land and the bush, which is so central to many West African religions.

Animal sacrifice is central to most West African rituals. Spoken prayer is seen as containing a spiritual power in itself. This can be added to through offerings of water, milk, palm wine, millet beer, or even gin, all of which are seen as containing a life-force that can enhance prayer. The offering of the life-force of an animal, represented by the blood which is poured on the shrine, however, gives still greater power to the prayer, enhancing its ability to pass into the world of spirits or divinities. The cooking of

certain meats which are consumed by the human congregants, and the blood, which is consumed by the spirits that are invoked, creates a type of ceremonial meal in which divinities and humans both partake.

West African oral traditions include a number of anecdotes about African rulers who were unable to end droughts through the offerings of sacrifices at royal shrines. In each of these accounts Muslim scholars offered successful prayers to bring rainfall and led the rulers to conversion to Islam. For example, the ruler of eleventh-century Ghana converted because a Muslim teacher was able to pray for rain, when he had failed. More recent testimony by traditional religious leaders tends to emphasize the idea that the frequent droughts of the last quarter of the twentieth century were caused by peoples' abandonment of their religious obligations and their embracing of Christianity or Islam, which have had little to say about environmental issues. Among the Diola of southern Senegal, this has led to the intensification of a prophetic tradition, focused on the performance of rain rituals. The most famous of these prophets, a woman named Alinesitoué Diatta, also rejected French agricultural schemes which would have shifted the emphasis of Diola agriculture from rice to peanuts, and led to the cutting down of the forest areas within Diola territory, which she saw as linked to the persistent droughts. She also criticized those Diola who converted to Islam and Christianity and refused to participate in Diola rituals or observe a Diola day of rest for the land, every sixth day. The rapid growth of Islam and Christianity, coupled with their relative neglect of rituals focused on nature, occurred at a time when droughts and desertification became increasingly severe. Whether or not the perception that religions indigenous to West Africa can more effectively supplicate the powers that govern nature will affect the continued growth of these newer religions remains to be seen. Conversely, one might predict that the instrumental aspects of Christianity and Islam that are focused on links to the powers of nature may become accentuated by African spiritual concerns brought by their converts and the growing ecological crisis affecting so much of West Africa.

Western Esotericism

“Esotericism” has become a highly popular term during the last three decades. Like “New Age,” it is a catchword for a lot of quite disparate religious or cultural phenomena, and its usage in the wider public differs considerably from its usage in academic contexts. Since its first appearance in the nineteenth century, a definition of “esotericism” often refers to the meaning of the Greek *esôteros* (“inwardly,” “secretly,” “restricted to an inner circle”) and lays the main emphasis on secrecy and concealment of religious, spiritual, and philosophical truths. This characterization turned out to be not very helpful, given the fact that a lot of “esoteric” knowledge has been published and openly discussed – especially (but not only!) in the twentieth century. Therefore, other definitions have been proposed. Among the most influential is the concept of Antoine Faivre, who became the mentor for “history of esotericism” as a new branch of religious studies.

Systematic Definition

Faivre argued that esotericism should be defined systematically as a certain *world-view* or as a means to conceptualize cosmos, nature, and humankind. He distinguishes six characteristics, four of them being crucial for esotericism and two being indicative only in certain contexts. 1) The most important characteristic is the *doctrine of correspondences*. In this view, each part of the visible and invisible universe is connected and every single part mirrors one of the others in a symbolic way. The correspondences take the form of two different approaches to reality: following the well-known principle of “Microcosm-Macrocosm,” there exist obvious or veiled correspondences between different layers of the material and immaterial world (e.g., between the planets on the one hand and metals, the human body, or plants on the other). But correspondences may also exist between nature (or cosmos), history, and revealed texts. Nature and scripture are believed to be in harmony, which is the key to understand medieval and early modern talk of the “book of nature” being revealed like the Bible itself. 2) The doctrine of *living nature* conceptualizes the universe as a dynamic system, in which all interconnected parts are animated. This is also an essential assumption of a particular branch of the Western philosophy of nature, as it is of magic since ancient and Renaissance times. 3) *Imagination and Mediations* is a characteristic that follows the doctrine of correspondences, insofar as it implies the possibility of mediation between the higher and lower world(s), by way of

ritual and symbolic performance or through revelatory agents like angels and intermediate spirits. Imagination is not only a form of clear concentration necessary for magical rituals but was also depicted in early modern times as a particular “organ of the soul” that can establish a cognitive and visionary relationship with an intermediate world. 4) Borrowing a term from alchemy, the fourth characteristic is called *experience of transmutation*. It denotes the process of personal initiation on a spiritual path, either through a social event (like in freemasonry) or as a private change of status. Transmutation also means that the old person is entirely left behind, providing room for a new birth into wholeness and illumination, a process of regeneration and purification.

In addition to these four “intrinsic characteristics” – meaning that all of them have to be present to qualify a cultural setting as “esoteric” – there are two relative or non-intrinsic features that often occur. One (point 5) is called the *praxis of concordance*, which alludes to the frequent attempt to display the commonalities between two or more – ideally even all – different traditions. Prominent examples are the belief in a *prisca theologia* (“old theology”) or a *philosophia perennis* (“eternal philosophy”) that captured the imagination of medieval and Renaissance scholars. Another example is the seminal work of Helena Petrovna Blavatsky and the Theosophical Society; Blavatsky searched for a common denominator of all spiritual traditions and presented her Theosophy as the revelation of the secret key to true (and universal) knowledge. A final component (point 6) can be seen in the *transmission* of esoteric teachings from master to disciple. This is either a sociological characteristic indicating the necessity of being introduced to a spiritual tradition or the legitimization of authority and “authenticity” by means of an “age old” chain of masters. For instance, Freemasons present King Solomon as the founder of their tradition; Rosicrucians refer to the mythic figure of Christian Rosenkreutz; in contemporary parlance the notion of “avatars,” “ascended masters,” or the “Great White Brotherhood” plays a decisive role in securing authenticity and spiritual identity.

Esoteric “Disciplines” and Their Historical Development

Applying the systematic characterization of esotericism mentioned above to the Western history of science and religion, several cultural phenomena show their obvious relation to esotericism. Furthermore, there were times of thought in Western history that appear crucial for the evolution of esoteric thinking. To begin with the esoteric “disciplines,” it might be argued that astrology provides a key to all other esoteric explanations of the cosmos. It directly follows the doctrine of correspondences to search for the symbolic – rather than the causal – relation between the astral world on the one hand and mundane or human events and dispositions on the other. Astrologers try to translate the all-encompassing dynamics of the world’s visible and invisible features

into the symbolic language of planetary energies, thus creating a fundamental tool for esoteric interpretation. *Magic*, then, can be described as the practical application of astrological symbolism. If one wants to perform a ritual, it will be advisable to assemble those components that are likely to support one another because they belong to the same cosmic principle; for a “Venus ritual” one might burn incense of Mugwort (*Artemisia vulgaris*), use an Aventurine stone, put up the Tarot card “III – The Empress,” light green candles, chant the vocal “a,” and so on. Those features are thought to “invite” the cosmic energy of Venus and help the magician to focus her or his concentration (imagination) on the ritual’s goal. Magic and astrology share a lot with the third esoteric discipline – *alchemy*. Using astrological symbolism and magical ritualizing, alchemy is focused on the interrelationship between mind and matter. But rather than being interested in the mere transformation of lower material into higher material – to turn lead into gold – the alchemists regard this process as mirroring the purification of the adept’s soul, thus connecting the alchemist to the hidden levels of nature. It is important to note that both alchemy and magic are not opposed to “science.” Until the eighteenth century, they were inseparably linked to the scientific disciplines. Although alchemy and magic build on a holistic model of the cosmos, their relation to nature was by no means a “sacramental” or devotional one. Alchemy and *magia naturalis* in many respects aimed at subordination and control of nature (through nature’s “purification” and “improvement”), even when animistic or pantheistic perspectives were involved.

From a historical point of view, the origins of esotericism unquestionably are to be found in antiquity and can be regarded as a confluence of philosophical and religious assumptions. The Stoic philosophy conceptualized the universe as a dynamic system of interrelated and animated parts, whereas Middle and neo-Platonism contributed to esoteric thinking with its idea that the material world is only a very insufficient mirror of the “real” world lying hidden in the transcendent or – as Christian Gnostics would have it – in man’s “sacred core,” which is undefiled by “nature.” The Greco-Egyptian tradition attributed to Hermes Trismegistus (the “Thrice-Greatest Hermes”) as the divine revelator of universal truths contributed significantly to the formation of esotericism, especially with its macrocosm-microcosm doctrine and the enthronement of Hermes Trismegistus as the “founder” of the occult sciences. In late antiquity, astrology, magic, and alchemy were fully developed and enjoyed a high reputation, despite the fact that Roman and Christian emperors periodically tried to punish experts who exercised those disciplines. In medieval times, the Islamic world showed considerable interest in the esoteric disciplines. Due to their sophisticated knowledge of Greek philosophy and science, Muslims and Jews were famed for their alchemical and astrological skills, and it was only in Renaissance times that the Christian West opened itself to that tradition.

For Islamic, Jewish, and Christian esotericism alike, the fifteenth century was a decisive turning point. A central figure in this development was Marsilio Ficino (1433–1499); the Florentine Medici chose to build up a Platonic Academy in 1450. But before Ficino could translate Plato’s works, he had to translate the newly discovered

Corpus Hermeticum for a highly interested audience. Although Isaac Casaubon in 1614 proved that the *Corpus* could not be older than the early Christian documents, it was continuously honored as a text preceding Plato and Moses. Until 1641 it had been published and translated 25 times. The Renaissance discovered the *philosophia perennis*, and Ficino was among those highly educated scholars who described humanity's new place within the cosmic orders and a new attitude toward nature. The human soul was – neo-Platonically – thought of as resembling and mirroring the *anima mundi* (“world soul”), and nature itself was considered part of that all-encompassing spiritual dimension of the universe. Although Renaissance esotericism shared the contemporary model of nature as a “great machine,” that machine was considered alive and dynamically intertwined with the human body, mind, and soul – today we call this concept holistic. That esotericism was exercised on the interface of magic, science, and religion becomes obvious when one considers the important works of Henricus Cornelius Agrippa (*De occulta philosophia*, 1533), John Dee (1527–1608), and Giordano Bruno (1548–1600). Furthermore, an important contribution to esotericism was the Jewish Kabbalah, a mystic tradition going back into the twelfth century. It was widely appreciated in Western esotericism, although not in its original form but assimilated to the Christian tradition. Decisive here were Pico della Mirandola (1463–1494) and Knorr von Rosenroth, who translated (large parts of) the Jewish “Zohar” into Latin. The kabbalistic “Tree of the Sephirot” became a standard model for describing the dynamic interrelation between the several spheres of the universe, the revelatory aspects of divine knowledge, and the sanctification of nature as a reflection of God's holiness (to be sure, this was not the main interest of the Jewish kabbalists). The impact of Christian adaptations of kabbalistic models on the Western philosophy of nature can hardly be overestimated. One example is F.W.J. Schelling, who in the nineteenth century used the kabbalistic doctrine of “Tsimtsum” to explain the continuous destruction and reproduction of nature in its historical development.

This connection can also be found in the eighteenth century, when esoteric doctrines were confronted with – and often integrated in – Enlightenment positions. To name but a few important protagonists of that time: Emmanuel Swedenborg (1688–1772) was among those arguing for a presence of spiritual dimensions in the material world, for which Immanuel Kant attacked him; the mysticism of Jakob Böhme (1575–1624) was adopted by philosopher of nature and alchemist Friedrich Christoph Oetinger (1702–1782). The tension between a holistic esoteric worldview and the dualistic or mechanistic model established by Isaac Newton (who nevertheless wrote alchemical treatises and a commentary on the *Tabula Smaragdina*, which was attributed to Hermes Trismegistus himself!) became even more imperative in the nineteenth century, when increased rationalization and mechanization of science, religion, and nature provoked a counterreaction. What Max Weber called the “disenchantment” of the world was answered by romantic authors in Europe and North America with an intensified focus on the wholeness and sanctity of nature. In doing so, these philosophers, scientists, and artists built on esoteric doctrines of “living nature” and “correspondences,” not to

mention the revelatory aspects of divine knowledge now being “experienced” in nature. Although there had been trends of pantheism and nature’s admiration before, it was Romanticism that fully brought about a religious dimension of esotericism’s attitude toward nature. Like in today’s “deep ecology” – which is a follower of nineteenth-century thought – for Romantic authors, nature was not the mere object of study, but an object of adoration.

When in 1875 H.P. Blavatsky and others founded the *Theosophical Society*, a movement took on institutional form that must be regarded as a kind of turntable between nineteenth and twentieth-century esotericism. Blavatsky’s works – especially her *Secret Doctrine* – remained standard reference-books for people searching for a *philosophia perennis*, now including even Buddhist and Hindu traditions that have been popularized by the Theosophical Society. In accordance with the esoteric tradition

– and to some degree contrasting pantheistic Romanticism and Transcendentalism – Blavatsky and her followers described nature as a revelation of the primordial truths, still containing in essence the symbolic formula of the cosmos. In doing so, nature does not necessarily have intrinsic value, but it serves as a means for humans to understand the universe and their place within it. What counts is the perfection of humankind and the transformation of the spiritual self into a cosmic consciousness. This basic attitude is still discernable in those areas within the “New Age movement” where Theosophical traditions have been adopted.

In sum, one could say that esotericism is an integral part of the Western history of thought, influencing both science and religion. It employs a holistic model for interpreting the universe and focuses on the refinement and accomplishment of humans. As can be seen in alchemy, this also implies an “improvement” of nature (i.e., a transformation of impure matter into a state of pure essence). Hence, esotericism does not lead to any kind of environmental ethics, in which nature would have intrinsic value and rights. When nature is adored, it is adored for being a mirror of humankind’s primordial (and utopian) state of sacredness and perfection.

Whales and Japanese Culture

Whales have for centuries been hunted and eaten by the Japanese, and whaling activities are intimately bound up with religious beliefs and practices. According to a widespread Japanese view, which stresses the interdependence of supernatural, human, and animal worlds, the whale is seen as a manifestation of Ebisu, the patron deity of fishing, who often disguises himself in this way when on festival days he approaches shrines to pray. Whales are believed to sacrifice themselves for the benefit of humans, and in return the whalers ought to utilize the carcass to the fullest – wastes are seen as an insult to the whale – and to take care of their immortal souls. Failure to do this may cause the whales to turn into “hungry ghosts” that can cause illness, accidents and other misfortunes.

The souls of whales have in many whaling communities therefore been treated in ways similar to the souls of deceased human beings. Tombs and memorial stones can be found on at least 48 places, from Hokkaido in the north to Kyushu in the south, and annually at least 25 festivals (*matsuri*) and memorial rites (*kuyô*) are held in honor of whales. A tomb at Koganji (an old temple dedicated to whales) has been designated a national historical monument and marks the burial of 75 whale fetuses. In late April, the temple hosts elaborate memorial ceremonies with Buddhist priests reciting sutras for several days in order to help the souls of deceased whales to be reborn in a higher existence. Such services have a number of meanings. The temple priest may perform the memorial service in the belief that the whale will reach enlightenment and thus be released from rebirth into this world and enter Paradise as “Buddha.” Some villagers may believe that the whale will be reborn as another whale to be hunted. Finally, memorial services are held to ensure that the whalers, and the gunners in particular, are forgiven for the sin involved in taking life. Memorial services therefore carry special meanings to the gunners, and they frequently go directly to the temple upon returning home in order to conduct memorial services for the whales they have killed. A number of lesser ceremonies and rituals are performed in order to repay whales for their personal sacrifice and thus secure safe voyages and rich catches. Whaling companies gather whalers and their wives for ceremonies before, as well as after, the commencement of the seasons, and in some places the wives go on pilgrimages to local shrines. Daily religious observations are conducted in front of the family Shinto altar, praying for the husband’s safety and good catches. Similar rituals are performed on the boats, where a piece of the whale’s tail may be offered to the Shinto altar. Rituals tie whalers to each other, to their families, and to the whales, thus giving the local residents both a feeling of the common heritage and meaning to their lives. This common cultural heritage is

expressed and reinforced in festivals, songs, dances and local dishes of whale meat. Rituals give the community its distinct character: the set of Shinto deities is unique to each community and the festivals are different as well. But they are all variations of common themes based on a conception of the whale as a creature with an immortal soul and a worldview stressing the interdependence of super-natural, human, and animal worlds.

Successes as well as failures are explained in relation to the divine. Accidents may be caused by failure to repay the whale's sacrifice through ritual neglect, but can also be caused by breaking taboos. There are several stories about the malevolent spirits of whales, some of them known throughout Japan. The most famous is the disaster that struck Taiji in 1878 when whalers broke an old taboo and attacked a right whale with calf. More than one hundred whalers lost their lives in the following gale. Such accidents, which have become part of the communities' cultural heritage, and thus help in giving them their peculiar identities, have reinforced the validity of the taboo, a taboo that, incidentally, might carry some value in the conservation of the stocks.

Today many people, particularly in the Western world, see whaling as barbaric and eating whale meat as close to cannibalism. Anti-whaling groups have been especially critical of Japan, and their anti-whaling campaigns have ranged from ecotage and consumer boycotts to attempts to change Japanese views. At first sight, it seems they have had some success. Images of "cute" whales and dolphins adorn bridges, gateways, post offices, fire stations, manholes, and *pachinko* parlors. The number of Japanese who go whale-watching has soared, and visitors to "Whaleland" – a museum located in a whaling town – are invited to listen to "the messages of the whales." Certainly, the Japanese have not been immune to Western discourses on whales.

At the same time, there is considerable resentment against Western environmentalists as well as the International Whaling Commission for what many Japanese see as a double standard. When the United States goes to great lengths to secure quotas of endangered bowhead whales to its Alaskan population while denying Japanese whalers the right to hunt the non-endangered minke whales, this triggers a national discourse that asserts the Japanese are victims of Western racial prejudices. It is felt that not only whaling but Japanese culture and its most important symbol, food, is under attack. In response, eating whale meat has acquired new significance: to some it has become a ritual act through which the partakers express their belonging to the Japanese nation. Moreover, whaling festivals, music and dances – most of which underscore the interdependence of the supernatural, human and whale worlds – have been strengthened and even reinvented to foster feelings of local identities in the name of cultural diversity.

Two global discourses on the uniqueness of whales and on the value of cultural diversity meet in Japan without creating contradictions. While "Whaleland" asks people to "feel like a whale," its souvenir shop sells whale meat and other whale products. Compassion does not rule out consumptive use, and their coexistence is made possible by the holistic and contextual approach to nature found both in Buddhism and Shinto.

Whales and Whaling

Whales (or cetaceans, a term that also include dolphins and porpoises) have fascinated people all over the world and figure prominently in myths from the Greeks of antiquity to contemporary Amazonians and Californian New Age adherents. The best-known myth in Western societies is probably the biblical story of Jonah who was swallowed by a huge “fish” (usually believed to be a whale). The myth may symbolically represent Christ’s crucifixion, entombment and resurrection on the third day, with the darkness of the whale’s womb representing Hell. This is a very different perspective than that in an Inuit myth where the interior of the whale – its soul and heart – is a young and beautiful maiden who demands only one thing from her guests: never to touch the oil lamp. But a raven cannot resist touching the sacred flame, the heart of the whale, whereupon the maiden dies. In this myth the whale’s interior may represent a Garden of Eden destroyed by human greed and curiosity. The myths disclose very different views on the human–nature relationship, but we should be careful not to draw premature conclusions about their impact on management ethics.

Several themes can be recognized in many of the myths. Some of them are trivial: whales assist people to catch fish, save them from drowning or engage playfully with human beings. Others are more spiritual. In many cultures whales are seen as embodied deities. In Greek mythology, Apollo turned himself into a dolphin to rescue people lost in a gale; in Japan whales might be regarded as the embodiment of the patron deity of fishing; and in Vietnam cetaceans receive human-like funerals to become “Angels of the Sea.” In most cases the whale is beneficial, but on Tikopia in the Solomon Islands stranded whales represent manifestations of potentially harmful spirits that must be appeased.

Another common theme is metamorphosis, particularly between dolphins and human beings. Both in the Amazon and in Micronesia, dolphins are believed to take human form to attend village celebrations, but the metamorphosis may also go the other way. According to Greek mythology, the first dolphins came into existence once the wine god Dionysus traveled between the Greek islands. Discovering that the crew plotted to sell him as a slave, he transformed the oars into snakes and filled the ship with vines. In panic the crew jumped into the sea where Poseidon, the god of the seas, took pity and turned them into the first dolphins. In many Pacific societies people are believed to transform into dolphins when they die, particularly if they have drowned, and the Haida in British Columbia believed that in such cases they would take the form of a killer whale. From here it was but a short step to regard whales as ancestors and guardians.

A related theme is anthropomorphism; whales live in societies remarkably similar to those of human beings. In Oceania, in the Amazon and on the American Northwest Coast, whales live in underworld societies where they behave and live much like human beings. People and whales live in parallel worlds; the whales may even be known as “underwater people.” The parallel marine and terrestrial worlds may also create a pairing of land and sea creatures, a common phenomenon in much of the Pacific. The ritual pairing of taro and whales seems to be particularly common in Micronesia, as on the Woleai atoll in the western Caroline Islands. One interpretation is that whales and taro constitute important binary oppositions symbolizing the dualities of land versus sea and male versus female. Similar pairing has been reported for killer whales and wolves among the Siberian Chukchee and American Northwest Coast Indians. In some cases each marine species has a counterpart on land.

Whale-related myths are not found only among whalers, but it is among whalers that we find the most elaborate beliefs and practices. Most whalers share with hunter-gatherers throughout the world the belief that the prey voluntarily gives itself to the hunter. This notion is strong among the Inuit and Japanese as well as in Micronesia. The exception are whalers in Western societies where, for example, Icelanders and Norwegians may rather regard whales as a gift from God. In either case, the whalers become tied in relationships of indebtedness. Svend Foyn, the Norwegian inventor of modern whaling and a very pious man, felt the same obligation to utilize all parts of the carcass as has been reported from Alaska and Japan, and among the Faroese it may be regarded not only as laziness but also as a sinful act *not* to catch and accept this gift from God.

However, the notion of indebtedness is much stronger and more all-encompassing in non-Western societies, where whaling typically is seen as a sacred act that unites animals and human beings in webs of reciprocity. This is particularly noteworthy among the Iñupiat in northern Alaska where people and bowhead whales are believed to communicate in subtle ways. In order to attract a whale, the hunter and his family must prove that they are worthy of the whale’s sacrifice. The whales are believed to be very knowledgeable and able to hear, see and smell over long distances and can immediately tell a good and generous person from a bad and stingy one. Great care must therefore be taken not to displease the whale, or else the animal will evade the hunter. Conflicts, noise, quick movements, dirt, blood, and death are all believed to be offensive to the whale and must be avoided.

A number of taboos have to be observed during the preparation for the whaling season, during the hunts as well as during butchering and distribution of the meat. Some of these are shared with other whaling cultures. Boats and equipment must be repaired, painted and cleaned before the season can commence, and new clothing prepared. During hunts, whalers may observe taboos pertaining to food, clothes, shelter and behavior. Among the Inuit, as well as in Norway, one should keep land clearly separated from the sea: the Inuit may refrain from eating caribou and berries during the whaling seasons, and in the past did not bring dogs to the ice at this time. Most

Norwegian whalers will not bring waffles, goat cheese or rucksacks aboard the vessel. Nor should they mention terrestrial animals by their proper names. In Lamalera, Indonesia, this prohibition extends to places, whales, and persons as well.

In times of poor catches, whalers may perform magic rites. The Lamalera whaler may “turn the luck” by washing his mouth with holy water, formerly with blood. Sometimes the magic may involve deliberate breaking of taboos. A Norwegian whaler, who for a long period of time had been stuck in port due to adverse weather conditions, smeared horse excrement (doubly defiling because the dung came from a farm animal) on the cannon, the most sacred place on board. The storm calmed and the crew caught a minke whale just outside the harbor.

Most such beliefs and practices are shared with fishermen, as is the commonly found taboos against women in whaling. There are Norwegian whalers who still feel uneasy when women are on board, as they are believed to bring bad luck. But women have also more positive roles to play. One wife used to spit on the cannon at her husband’s departure, and intercourse shortly before the voyage is held to be beneficial to the hunt. The ambiguous position of women in whaling is very evident among many Inuit, and formerly, among the Northwest Coast Indian whalers as well. Although women are not allowed on the ice during whaling, the wives of whaling captains play crucial roles, to the extent that captains may say that “I’m not the great hunter, my wife is.” Before the season she may perform a ceremony directed to the moon asking for whales, and in another rite she may represent a whale symbolically being harpooned – it has even been suggested that she *is* the whale. The close association between the wife and whale is also expressed during the hunt. Details vary, but women have been, and some still are, severely restricted in their movements while their husbands are out whaling. Wives of Alaskan whalers sometimes remain quiet and move cautiously during the hunt. Researchers are divided whether to interpret this behavior as imitative magic acts meant to calm or to attract the whale. It is certainly a way to underline gender roles.

If everything is right (i.e., all preparations have been properly done, taboos have been observed, appropriate charms and songs have been used, and the captain’s generous wife is quietly at home and at peace with the community), the whale is believed to come and give itself as food to the people. In the past, this meant that the whale should be handled with respect. In northern Alaska, a successful catch initiated a ritual period during which time no sharp implement should be used for fear of hurting the whale’s shade. However, recently much of the respect has given way to merrymaking and a festive mood. But the captain’s wife is still given the flipper to keep for the whaling festival, and she may make the first ritual cuts and offer the whale a drink of water in a ceremony to welcome the whale to the community. The head is, at times with great ceremony, returned to sea so that the spirit can reincarnate and return as a whale.

Similar beliefs and practices have been reported elsewhere. On the Woleai atoll in the Caroline Islands, for example, an eight-day period of taboos and rituals was

imposed after a pod of dolphins was caught, and during this time many of the gender roles were reversed. And in Japan, the tip of the tail is presented to the Shinto altar on board the whaling boat, and on shore people pay respect to the whales in Buddhist memorial rites.

In return for giving themselves to the hunters, people are morally obliged not only to make the fullest possible utilization of the carcasses but also to share them with others. Generosity and sharing are among the highest values in most hunting societies. And the whales will know to reward the generous. Among the Inuit in particular, there is a notion that the more one gives away, the more will come – a notion that, together with a belief in whale reincarnation, does not easily promote sustainable use of the resources. The whaling captain and his wife will feast the people several times during the year. The most important event is the whaling festival, *nalukataq*, held in

June after the end of the bowhead whaling season. Held inside a sacred ring, this three-day feast is a major social event among the Iñupiat. But the feast is also held in gratitude and honor to the whales caught, and as a reenactment of the hunt itself. The meals mark a communion with the whale's soul, thus uniting people and whales spatially and temporally. Hence, the feast not only marks the end of one whaling season, but begins the preparations for the next. The ritual distribution of meat is an invitation for the whales to come again the following year.

Since the 1960s, there has been a marked shift in many people's perceptions of whales, particularly in the industrialized Western world. Several whale stocks had by that time become severely depleted and whaling became a symbol of environmental destruction. A new image of the whale was created and this was endowed with all the qualities we would like to see in our fellow human beings: kindness, caring, playfulness. An important element of this new image is the notion that whales are extraordinarily intelligent. This is widely believed, although the cetacean brain according to Dr. Margaret Klinowska – mammalian researcher at the University of Cambridge and a member to IUCN Cetacean Specialist Group – is quite primitive. In an article in *New Scientist*, she suggests that when the whales returned to live in the oceans some 20 to 40 million years ago, their brains were stuck at a stage today only found among the most primitive terrestrial mammals such as hedgehogs and bats. Another widely held notion is that whales, particularly small toothed whales like dolphins and porpoises, are spiritual beings.

At first sight these perceptions seem to resemble those held by many non-Western whalers. This is, however, to ignore one fundamental difference. According to the worldviews of Inuit and Japanese whalers, among others, the spirituality of the whales creates webs of reciprocity linking whales and whalers. Whereas their view helps to bridge the divide between animal and human realms, Western environmentalists tend to do the opposite. This is particularly the case with animal rights advocates, such as Tom Regan, who claims that whales have rights not to be disturbed in any way, whether for commerce, research or recreation.

The final connection between human and animal worlds is thereby broken. Not even beached whales may be utilized. The Maori, the indigenous people of New Zealand, have recently been denied access to stranded whales, which they regard as theirs by treaty rights. Seen as gifts from Tangaroa – God of the Ocean – beached whales have been utilized for their meat, oil, teeth, and bones, and access to them has become a symbol in the Maori struggle to safeguard their rights as indigenous people. The Maori, hosting the 3rd General Assembly of the World Council of Whalers, in 2001, underlined the importance of this issue. Other native peoples see whaling practices as part of their cultural revival. In 1999, the Makah in Washington State took their first gray whale in about seventy years amid a storm of protests from animal rights groups. One of the leaders of the campaign against Makah whale hunting was Paul Watson of the Sea Shepherd Conservation Society. In a 1973 dream at Wounded Knee, Watson allegedly received an instruction from a bison to save all marine mammals, particularly whales. Whereas the U.S. Government defended the rights of the Makah, it reacted strongly against Canada when the Inuit there resumed bowhead whaling in the 1990s. In retaliation the United States has vetoed all discussions of marine mammal issues at the Arctic Council.

The International Whaling Commission has authorized “aboriginal subsistence whaling” that shows strong cultural ties related to whaling and the use of whales. The Japanese have long argued that they have strong cultural ties to whaling, but Norway did so only after resuming commercial whaling in 1993. Japan had not resumed commercial whaling as of 2004. Whale protectionists have tended to divide humankind into two opposing categories: those who care for the Earth versus those who seek shortterm profit. As long as native peoples do not engage in trade (i.e., “live close to nature”), their takes of whales may not upset this dichotomy. In this worldview, whales serve as totem for “nature-loving” people: whales are not only used as an emblem by protectionists who care about nature, but protectionists also claim a ritual and spiritual relationship between themselves and whales. But the totem system of the protectionists is different from those reported from non-Western societies. In combination with a missionary zeal, it is more than a system of classification; it can be argued that it has unleashed a crusade against those with other perceptions and ideas. To whalers around the world the protectionists and their governments are therefore little better than fanatical fundamentalists, again in plain contrast to the importance of context found in many non-Western creeds.

White, Lynn (1907–1987) – Thesis of

The “Lynn White thesis,” articulated in its most wellknown form in White’s “The Historical Roots of Our Ecologic Crisis,” (1967) was one of the most important interpretations of history to come out of medieval studies in the second half of the twentieth century. Linking the ethos of medieval Christianity to the emergence of what White called an “exploitative” attitude toward nature in the Western world during the Middle Ages, White’s ideas set off an extended debate about the role of religion in creating and sustaining the West’s increasingly successful control of the natural world through technology. The explosiveness of this debate, which still reverberates, was touched off by a confluence of factors: urgency in the late 1960s and 1970s over the newly discovered environmental crisis, White’s ability to reach an audience beyond that of professional historians, and the perception that White’s ideas constituted an “attack” on Christianity which needed to be answered before additional damage was done to the value of conventional religious beliefs. Alongside and to some extent at odds with this debate, were the responses to White’s work by medieval historians and historians of technology. These historians, concerned with specific issues raised by historical evidence and methods, found much to criticize about White’s arguments, yet acknowledged White as the founder and shaper of the new field to which they themselves now belonged. White’s ideas, and the range of responses to them, constitute an essential chapter in contemporary discussion about the relationship of religion and attitudes toward nature.

Lynn Townsend White, Jr. was the first American historian seriously to examine the role of technological invention in the Middle Ages. Although best known in the larger world for his ideas on the causes of contemporary environmental problems, within the scholarly community he was regarded first and foremost as a pioneer in the field of medieval technology. After receiving his Ph.D. from Harvard in 1938, he taught briefly at Princeton and Stanford until becoming president of Mills College in 1943. In 1958 he left Mills and until his retirement in 1974 was Professor of History at the University of California at Los Angeles, where he published *Medieval Technology and Social Change* (1962), demonstrating the profound effects of technological innovation on medieval society, and *Medieval Technology and Religion: Collected Essays* (1978). He continued to write and engage in intellectual debate until his death in 1987.

White’s work was informed by his view that not only were the Middle Ages the decisive period in the genesis of Western technological supremacy but that the uniquely ac-

tivist character of medieval Christianity provided the “psychic foundations” of modern technological inventiveness. White was hardly the first scholar to associate Christianity with the birth of Western science and technology. Max Weber, Robert Forbes, and Ernst Benz, among others, had earlier suggested general causal links. However, White refined these arguments by pointing not only to broad elements within the Judeo-Christian tradition (the biblical mandate of Genesis 1:28 giving humankind “dominion over the Earth,” Christian compassion, the destruction of pagan animism, and the notion of matter as inert material) but also to the specific characteristics of Western monasticism as the fundamental cause of Western technological development. European monks, White argued, believed work to be an essential form of worship and embodied this assertion not only in the *Rules* governing their lives but also in their practice of their faith. Monastic communities spearheaded new technological techniques. Their cathedrals, in marked contrast to Byzantine churches, were typically equipped with mechanical clocks and organs, two of the most complex machines known prior to the early modern period. Additional evidence that medieval Christianity sanctioned technological advance can be found in manuscript illuminations, among them a ninth-century illustration of David’s army using a rotary grindstone driven by a mechanical crank to sharpen their swords while the heathen enemy uses an old-fashioned whetstone, and a fifteenth-century illustration of a personification of the virtue of Temperance, standing on a windmill, a bridle and bit in her mouth, spurs on her feet, holding eyeglasses and wearing a clock on her head. This kind of evidence, taken together with the record of medieval technological invention, White argued, demonstrated that deep-seated values embedded within Latin Christianity made the pursuit of technology appear morally virtuous, leading ultimately not only to Western technological dominance but also to the continuing impact on the environment of an aggressive stance toward nature.

White’s ideas on the relationship of Christian values, technological dynamism and environmental decline can only properly be understood within the context of his overall approach to the study of history. White believed that religion was perhaps the most important force shaping human societies and, furthermore, that religious values often operated below the level of conscious expression yet had direct effects on human behavior. As a medievalist, he was inclined to see the Middle Ages as the wellspring of Western culture. He also thought that the study of history was not a merely antiquarian enterprise but held meaningful lessons for the present. Finally, despite his negative assessment in “Roots,” elsewhere he frequently asserted that technology was a fundamentally humane and liberating force, and he implicitly suggests an image of an inherently dynamic, progressive and Christian West in which “values” rather than politics or economics determine history. These underlying views informed his work, giving it a power and resonance beyond narrower historical interpretations.

The impact of White’s thesis on the community of environmentalists, philosophers of technology, and religion scholars concerned with environmental issues was immediate and long lasting. In the twenty years following the publication of “The Historical Roots of Our Ecologic Crisis,” over two hundred books and articles used White’s ideas

as a focal point. His ideas penetrated the popular press, appearing in *Time Magazine*, *Horizon*, *The New York Times*, *The Boy Scout Handbook* and *The Sierra Club Bulletin*. The great bulk of these responses were to one particular aspect of White's argument, his claim in "Roots" that Christianity inculcated a specifically "exploitative" attitude toward nature and consequently that Christianity bore "a great burden of guilt" for the current environmental crisis. Biblical scholars and ecotheologians, among them James Barr, Carl Braaten, John Cobb, and Joseph Sittler, argued instead that the Judeo-Christian tradition could more accurately be described as mandating a caretaking or stewardship relationship to the natural world; Christianity therefore was not part of the problem, but part of the solution to environmental issues. Guidance should be sought from those many elements within the Judeo-Christian tradition that mandated that humans should be the guardians of nature, not its despoilers. Paradoxically, although many eco-theologians argued vociferously against White, they could use his thesis to reinforce the view that environmentalism was at bottom a religious and ethical movement. Like White, they believed that religious values were the most effective antidote to environmental degradation and, like White, who had suggested that St. Francis be made the patron saint of ecologists, they believed that Christianity was a sufficient repository of environmentally sensitive attitudes.

Among historians and philosophers of technology, however, White's thesis stimulated a rather different debate. These scholars called for a closer look at the history of Western attitudes toward nature, labor and the environment and questioned whether White's characterization of medieval values might be overdrawn. In company with the eco-theologians – scholars such as Susan

Power Bratton, Paul Santmire, Roger D. Sorrel, and Clarence Glacken – White found an appreciation for nature on its own terms and a sense that human use of nature and animals should be governed by spiritual and moral obligations found to be normative within medieval theology. A detailed study by Jeremy Cohen of the medieval exegesis of Genesis 1:28 showed that medieval commentators typically dealt with questions of God's covenant and human sexuality, bypassing the issue of technological dominion of nature altogether. George Ovitt, Jr. argued, against White, that by the thirteenth century most monastic orders no longer directly performed work with their hands and, far from elevating manual labor in and of itself, consistently subordinated it to spiritual ends. A number of scholars provided evidence that non-Western and pre-Christian cultures also had records of environmental damage. Other scholars, including Carl Mitcham, John Passmore, Robin Attfield and others, found a sympathetic attitude toward human control of the natural environment in Classical, chiefly Stoic, writers, similarly cutting into White's argument that Christianity had a uniquely aggressive approach to nature. Finally, some writers questioned whether White had done more than show an association between Christianity and technology in an age in which a religious perspective permeated every dimension of human life. Had White shown that religion was a cause of technological development, or simply

that technological development taking place for economic and political reasons was framed in Christian terms by medieval and later people?

This broad range of responses demonstrated that the links between religion, technology and environmental decline were hardly as direct or straightforward as White had made them appear. Nevertheless, White's powerful and original reading of history, which has shaped a generation of scholarship, remains the touchstone for current and future discussion.

Whitehead, Alfred North (1861–1947)

Alfred North Whitehead's life and work can be divided into three relatively distinct phases: an early period of mathematics and logic (1885–1913), a middle period of epistemology and philosophy of science, (1914–1924) and a later period of constructive metaphysics (1924ff.).

In 1885 Whitehead became a fellow of Trinity College in Cambridge where he remained until 1910. His *Treatise on Universal Algebra* in 1898 won him election to the Royal Society in 1903, but the mathematical period was epitomized by *Principia Mathematica* I–III (1910–1913), co-authored with Bertrand Russell, Whitehead's earlier student. *Principia Mathematica* argued that mathematical symbols are derived from intuitive schemes of logical reasoning. This rooting of abstract mathematical concepts in basic human activities anticipated a tenet in his later constructive metaphysics, as did his distinction between pure and applied mathematics, laid out in *An Introduction to Mathematics* (1911), which can be seen as a forerunner of the later distinction between eternal objects (EOs), or mere possibilities, and the actual occasions (AOs), which embody specific configurations of order.

In his middle period Whitehead worked mostly in London, where he taught mathematics at University College (1910–1914), and held a professorship in Applied Mathematics at the Imperial College of Science and Technology (1914–1924). Already in *The Concept of Nature* (1920) Whitehead aimed to overcome the “bifurcation of nature,” which is the result of a mind–body dualism but also follows from the epistemic dichotomy between “real” nature and “mere” phenomena. Whitehead's way here departed from Russell's. Since the apprehension of the world is part of the way the world is, “knowledge is ultimate” (Whitehead 1920: 22). Whitehead here laid the ground for his later doctrine of panpsychism (the view that mental properties apply to all things, including atoms).

In 1924 Whitehead moved to Harvard University where he remained Professor of Philosophy until his retirement in 1937. In *Science and the Modern World* (1925) he set out to account philosophically for the new physics of relativity and quantum theory. With relativity he argued that there is no simple location of things as assumed by Newtonian physics; space-time-matter makes up a unified field of internally related energies-and-events. With quantum theory he argued for a temporal atomicity, according to which the constituents of matter are not solid substances but ephemeral events

(cf. Planck's Constant). This view was later developed in his main work, *Process and Reality* (1929). In contrast to a mechanical view of nature, however, Whitehead endorsed a panexperientialist position. Actual occasions "prehend" their immediate past environment and possess a freedom in the process of their becoming; immediately after their actualization they perish and become the stuff for future processes of emergence, or "concrecence."

Since *Religion in the Making* (1926), Whitehead assumed three ultimate principles, 1) creativity, or the chaotic energy presupposed by all actual occasions, 2) eternal objects as the source of information or possibility, and 3) actual occasions which combine creativity with some specific combination of eternal objects. Neither creativity nor eternal objects "exist" on their own, but only as ingredients in actual occasions. God is the chief example of these metaphysical principles. Just as anything else, God is an actual entity with both physical and mental aspects. God's "consequent nature" is derived from the past occasions of the world, while God's "primordial nature" is derived from the divine envisagement of eternal possibilities.

As said in *Process and Reality*, God is both a creature of the world, and the world's creator (Whitehead 1978: 348). Accordingly, God is not the creative source of all that is (as in the Abrahamic traditions), but the formative source of order and novelty in the universe (as in Plato). God is therefore not omnipotent, but has the consistent will of stimulating the growth of complexity in the universe by offering divine "lures" to each actual occasion. God is only one agent among others, but is a formative cause in all worldly events. Moreover, God is one actuality among others, but God is unique by being an everlasting actual entity who never perishes. As everlasting, God encompasses all past reality, which achieves "objective immortality" by being preserved and evaluated in the "consequent nature" of God.

Whitehead considered his own thought as an "inversion of Kant's philosophy." The world cannot be construed on the basis of a perceiving subject; rather, mind and subjectivity are "superjects" which are co-determined by their environment and immediate past. Whitehead termed his own philosophy "organicism," but his metaphysical scheme seems to be influenced by mathematics and physics more than by evolutionary thought. It has been up to later process thinkers such as Charles Hartshorne, John B. Cobb, David Ray Griffin and Charles Birch to develop the evolutionary and ecological aspects of process thought. In the science-religion discussion, Whitehead's philosophy has been carried forward by Ian Barbour.

Whitman, Walt (1819–1892)

Walt Whitman, the self-professed bard of the people, was born on Long Island in 1819. Whitman spent much of his life in Brooklyn, where he worked as a printer, school teacher, and journeyman. These experiences and the myriad people of New York who Whitman met as a result would later frame the ideas of democracy and equality at the heart of so many of his poems.

Whitman's best-known collection of poems, *Leaves of Grass*, probably would have – like its author – fallen into utter obscurity had it not been for a letter of praise for the volume written by New England Transcendentalist Ralph Waldo Emerson. Emerson extolled the volume for its unadorned language and bold treatment of nature in a letter written to Whitman, which the latter published in well-read papers for all to see. Whitman's decision to do so was a successful marketing ploy: following the publication of this letter, the poet and his volume were vaulted into the literary public eye. It ought to come as no surprise that Emerson was taken by Whitman's poetry: influenced by Eastern texts such as the Bhagavadgita, Whitman articulated many of the beliefs held and articulated by Emerson and other Transcendentalists, such as Thoreau, who was a welcome visitor at Whitman's home in Brooklyn.

Whitman's writing also demonstrates his affinity for the works of long-time friend, John Burroughs, and his talents as a naturalist. Readers of his *Specimen Days* will find detailed descriptions of the Midwestern prairie and the geology of the American West. The work also contains extensive lists of wildflowers and animals as well as keen observations concerning migration patterns of many bird species and panegyric praise for the immense power of the Mississippi River.

Walt Whitman was raised in a family with longstanding ties to the Quaker Church; however, any influence he might have received from the Society of Friends is eclipsed by his Eastern and Transcendent cosmology. Whitman, like Emerson and others, held that any idea of God is best understood in terms of a universal energy that manifests itself in every living creature. Although Whitman's later writings do suggest a turn toward Christian theology, much of his *oeuvre* is marked by this sense of universal connection and ecstasy.

Whitman worshipped the physical: the blade of grass that revealed the oneness of the Earth and the cosmos, the prostitutes in Philadelphia, the odor of an armpit after a day of work. He saw a clear division between the soul and the body and contended that the fault of many religions is that they reject the physical while privileging the spiritual. In place of this ideology, Whitman suggested that we view the two aspects as married to one another, and he set about celebrating the divine within the maligned

physical existence. To this end, he contended that the universe and all its transcendental splendor could best be found in the common elements of the natural world. Our willingness to step outside the constructs of society and self in order to revel in these elements allows us to actualize these ideas of universal connection in our own lives. This idea of universal connection is often expressed by Whitman in highly sexualized terms. In “Song of Myself,” Whitman depicts spiritual rapture through sexual union. This connection, he held, makes manifest the unity between individuals, their environment, and the divine.

Whitman’s belief that sexual union – both metaphoric and literal – grants access to the eternal was the cause of much controversy surrounding his work. His homoerotic overtones along with his unconventional and often explicit marriage of sexuality, nature, and God caused him to fall out of favor with Emerson, his initial champion. He was also fired from his governmental job at the Bureau of Indian Affairs in the U.S. Department of the Interior for the “obscene” nature of these beliefs. The controversy surrounding Whitman was heightened by his self-described role as a messianic figure. Convinced of the verity of his beliefs, Whitman saw himself as a sort of savior or oracle for the people, and he held that his “democratic literature” articulating this universal connection could help Americans fully actualize their spiritual imaginations.

These same elements of Whitman’s poetry are what have allowed for his continued popularity. Whitman’s willingness to break out of hegemonic culture and its mores in order to celebrate the mundane and unconventional has ensured his relevance today. His belief in the organic connection of all things, coupled with his organic development of a poetic style that breaks with many formal conventions have caused many scholars and critics to celebrate him for his innovation. His idea of universal connection and belief in the spirituality present in a blade of grass succeeded in transmitting a popularized version of Eastern theology and Whitman’s own brand of environmentalism for generations of readers.

Wicca

Wicca emerged in 1940s' England as a highly ritualistic, nature-venerating, polytheistic, magical and religious system, which made use of Asian religious techniques, but operated within a predominantly Western framework. It arose from cultural impulses of the nineteenth century, in particular from the occult revival of the 1880s onwards and Romantic literary rediscovery of Classical ideas of nature and deity. Various threads were gathered together and woven into Wicca by Gerald B. Gardner (1884–1964), a British civil servant who retired in 1936 and lived in Highcliffe and London, England before moving to the Isle of Man in 1954. He visited archeological sites in the Near East, and joined esoteric groups like the Folklore Society, the Co-Masons, the Rosicrucian Fellowship of Crotona, and the Druid Order. Gardner claimed that the Fellowship of Crotona contained a hidden inner group of hereditary witches who initiated him in 1939 and whose rituals he wrote about in fictional form in the novel *High Magic's Aid* (1949) under the pseudonym Scire. Gardner's writing borrowed from many sources, including the work of magician Aleister Crowley (1875–1947), writer D.H. Lawrence (1885–1930), a ritual magic group called The Golden Dawn, Freemasonry, spiritualism, and archeology, to name a few.

According to Gardner, witchcraft had survived the persecutions of early modern Europe and persisted in secret, following the thesis of British folklorist and Egyptologist Margaret Murray (1862–1963). Murray argued in her book, *The Witch Cult in Western Europe* (1921), that an old religion involving a horned god who represented the fertility of nature had survived the persecutions and existed throughout Western Europe. Murray wrote that the religion was divided into covens that held regular meetings based on the phases of the moon and the changes of the seasons. Their rituals included feasting, dancing, sacrifices, ritualized sexual intercourse, and worship of the horned god. In *The God of the Witches* (1933) Murray traced the development of this god and connected the witch cult to fairy tales and Robin Hood legends. She used images from art and architecture to support her view that an ancient vegetation god and a fertility goddess formed the basis of worship for the witch cult.

From the 1940s on many Wiccans believed, based on Murray's work, that they were continuing this ancient tradition of witchcraft. However, since the first appearance of Murray's thesis, historians and other scholars have refuted her evidence and, over time, dismissed most of it. Most, though not all, Wiccans today acknowledge that there is little evidence for a continuous witchcraft tradition, but claim that their religion is a revitalization and re-invention of ancient folk practices that existed in preChristian Britain, even if they were not part of any organized tradition. Some Wiccans today

continue to identify “The Burning Times,” as they call the witch persecutions, as their “holocaust,” even though historians have shown that the so-called witches of early modern Europe existed in the imaginations of their persecutors, though many may have participated in folk practices such as herbal healing that were prevalent at the time in the general population.

After the repeal of the 1736 Witchcraft Act in England (an act that made the practice of witchcraft a crime) in 1951, Gardner was able openly to publish accounts of Wicca under his real name in *Witchcraft Today* (1954) and *The Meaning of Witchcraft* (1959). *Witchcraft Today* brought public attention to Gardner and he made numerous media appearances promoting Wicca. Both books contained information on Wicca as it existed at the time and in the following years Gardner initiated many new witches. Covens also sprang up and operated according to the outlines provided by Gardner’s books. By the mid-1950s, Wicca had become relatively popular, at least in part because of Gardner’s love of publicity, which drew public attention to it. In the early 1960s it was exported to the United States by Raymond Buckland. Gardner died in 1964, but by that time his tradition of Gardnerian Wicca was firmly established.

The religion described in Gardner’s books and spread by his students takes nature as a central aspect of devotional life. Gardner’s ideas about god and goddess drew from British literature and occult circles that promoted Romanticism’s fascination with the gods and goddesses of the ancient world. Over time specific deities such as Demeter and Pan were transformed into an archetypal mother goddess and an archetypal fertility god. According to historian Ronald Hutton this process was complete by the 1940s and represented post-war Britain’s desire for and fear of wildness: “the domains that civilized humans had traditionally found most alien and frightening; they were those of the two deities to whom the modern imagination, frightened, jaded, and constricted by aspects of civilized living, had turned” (Hutton 1999: 50). The attraction of urban dwellers to deities that embody nature and rituals associated with seasonal changes that many modern people have lost touch with continues to be an important aspect of Wicca and among the reasons for its growth throughout the twentieth and into the twenty-first century. Gardner’s rituals also offered an alternative to the modern world in that participants were nude and sexuality and the body were seen as sacred.

Four main rituals were celebrated on the four seasonal festivals described by Murray as the witches’ sabbats (Candlemas, May Day, Lammas, and All-Hallows Eve). Most Wiccans today also celebrate four other festivals: winter solstice, summer solstice, spring equinox and autumn equinox. These eight festivals make up the Wiccan “Wheel of the Year.” At each of these seasonal rituals the god and goddess are addressed in their aspects appropriate to the season, and they are embodied by the priest and priestess leading the rituals. For instance, on May Day the goddess/priestess as embodiment of giver of life and nurturer of new seeds is most prominent. Many contemporary Wiccans call this festival Beltain, an Irish name for “Bright Fire,” and weddings or “handfastings” are often performed at this time. A midwinter ceremony or Yule ritual might celebrate the return of the sun during the longest night and the rebirth of the

sun god. Wiccan festivals are intended to remind participants of the cycle of life, of human death and rebirth, and the changes evident around them in the natural world.

Gardner's Wicca was initially described as a fertility cult rather than a "nature religion," although Wiccan perceptions of both male and female deities are linked to nature and regarded as empowering forces for both men and women. One of Wicca's most well-known ritual texts

– *The Great Charge*, written by Gardner's one-time High Priestess and collaborator Doreen Valiente (1922–1999) from earlier versions – concentrates specifically on the Wiccan perception of the goddess as the world of nature. The "Charge" describes her as "the beauty of the green Earth," "the white moon among the stars," "the mystery of the waters," and "the soul of nature who gives life to the universe." The goddess' male counterpart is also connected to nature and moves through The Wheel of the Year. He is The Lord of the Greenwood, Sun King, Corn

King, Lord of Life and Death, and Leader of the Wild Hunt.

Wicca is a religion in which the divine is immanent; its goddess and god live in the Earth, the moon, the stars, the bodies of men and women. Humans, nature and gods are all interconnected and sacred. The basic ritual form of Wicca – the circle casting – illustrates another way in which the divine is in the world, not outside it. While different variations on circle casting exist, most circles are oriented with the four cardinal directions and these directions are typically associated with forces of nature: fire, air, water and Earth. Some Wiccans address the "powers" of a particular direction while others address the "winds" while casting their circles. In preparation for ritual work Wiccans shed their clothes or don special robes, then someone marks the perimeter of the circle with a knife or wand and the four directions are greeted and invoked, as a way of asking for the powers that they represent to be present. For Wiccans ritual space is thus oriented in relation to the natural forces identified with each direction, in order to remind participants of their relationship to the world around them.

Since Gardner's first covens, Wicca has spread across North America, northern Europe, Australia, New Zealand and South Africa, evolving, and at times mutating quite dramatically. Wiccans have only a few beliefs that most of them adhere to, and these include "The Witches Rede: An it harm none, do what you will," and "The Law of Threefold Effect," the belief that any action a person commits will return to that person threefold. As Wicca has spread to different parts of the world, debates about belief and practice have surfaced. For instance, in the Southern Hemisphere Wiccans disagree as to how the seasonal rituals of the Wheel of the Year should be celebrated, given that winter solstice/Yule in the Northern Hemisphere is midsummer in the Southern. In the United States and Canada, practices borrowed from North American Indians have been adopted by Wiccans and this cultural appropriation has been criticized by other Wiccans as well as by native people. But this debate means little to some Europeans who turn to Celtic, Saxon or Germanic traditions for inspiration, making links to the supposed indigenous traditions of northern Europe. Likewise, feminist Witchcraft,

which was shaped by the American feminist movement, has had a profound impact on Wicca in the United States, and is in part responsible for the fact that many Wiccans have dispensed with the god and focus on one great goddess. In the United States in particular a multitude of derivations have developed, including Reclaiming, Faery Wicca, Dianic Wicca and Seax Wicca, all of which have in turn crossed back to Europe.

Both Gardner and Murray emphasized the importance of polarity, of goddess and god, and identified men with masculine qualities and the god, and women with feminine energy and the goddess. However with the influence of feminism and gay rights movements many Wiccans today believe that same sex couples can work effective rituals together and that men can embody goddess energy just as women can embody the god. Within Wicca there is much diversity of opinion concerning whether or not masculinity and femininity are essential qualities each sex is born with, and these issues remain controversial in some Wiccan communities.

The increase in Wicca's popularity is partly due to the parallel rise in environmental awareness since the 1970s. Vivianne Crowley, a Wiccan priestess and author of *Wicca: The Old Religion in the New Age* (1989), notes the changing emphasis within Wicca from nature veneration to nature preservation: "Wicca . . . moved out of the darkness, the occult world of witchery, to occupy the moral high ground – environmentalism" (Crowley 1998: 177). Crowley asserts the centrality of the veneration of nature, which is "considered to be ensouled, alive, 'divine' . . . The divine [being seen] as a 'force' or 'energy' and as manifest in the world of nature" (1998: 170). She further points out that the processes of nature, such as "conception, birth, mating, parenthood, maturation, death" are portrayed in *The Wheel of the Year*.

However, Wiccans demonstrate a wide range of attitudes toward protecting the natural world. Some are radical environmentalists while others view nature more abstractly. The development of Wicca was influenced by idealized views of nature in the writings of English Romantics as well as more recent works of literature such as J.R.R. Tolkien's description of the woods of Lothlorien in *The Fellowship of the Ring* (1954). Understandings of nature in Wicca also derive from Western esotericism, particularly as transmitted by nineteenth-century Romanticism. Nature, in esoteric thought, is a reflection of a greater divine reality or part of a greater magical totality, and as such it requires a different level of engagement. The esoteric theory of correspondences portrays the cosmos as complex, plural and hierarchical, with living nature occupying an essential place within it. Nature is at once both an intermediary between humanity and divinity, and imbued with divinity itself. "Nature" is often perceived by Wiccans as something different from "the environment." For those Wiccan groups which retain a link to their heritage in high ritual magic and hence the Western esoteric tradition, there is every reason for a focus on inner nature due to the basic law of magical correspondence: humanity is a part of the cosmos, and therefore any operation performed on or in a person will affect the entire universe. In treating the self as well as nature as sacred center, Wicca follows in the wake of esoteric and occult philosophy, in which

these are one and the same. While there may be a spiritual and/or magical engagement with nature, this does not necessarily translate into environmental action.

For some urban-dwelling Wiccans, imaginative descriptions of the natural world may provide a more

“real” experience than an actual walk in the woods. Anthropologist Susan Greenwood observed that some Wiccans show no interest in nature other than as a backdrop for rituals, with celebrations held in the woods becoming in effect a celebration of the liberation of the inner self from the domination of the everyday world. “One Wiccan, when invited to go for a walk, cried off because it was raining and he might get his feet wet: ‘Can’t we just visualize it?’ he said” (Greenwood 2000: 113). The Wiccan response to nature is thus often confused, revealing both intimacy and distance as nature is shaped by the Wheel of the Year, sacred circles, and ritual to suit people’s needs for relationship with the Earth. There is a turn to nature as a source of revitalization, an attempt to reengage with a nature from which participants feel estranged, to reenchanted the natural world which they feel has been exploited and dominated. The veneration of nature, the concern for the Earth, and the pantheism of seeing the divine in all of nature has led to an attitude of reverence for a romanticized wild, untamed landscape on the one hand, and to sadness or revulsion at human estrangement from this ideal, living in towns and cities away from the land, on the other. For some Wiccans veneration of nature and identification as “Wiccan” or “Pagan” manifests as a romantic attachment to the countryside, a dream of living away from towns and nurturing a closer relationship with nature. Some Wiccans do live in rural areas, but most continue to live urban lives and very few depend on the land for their living. Nature and Wiccans’ understanding of it are extraordinarily complex, and this is exacerbated by the diversity of contexts in which an examination of Wicca’s engagement with nature must occur.

Some Wiccans have become involved in environmental struggles as a way of putting their beliefs into practice. One of the most vocal of these is the American Starhawk, whose writings have been heavily influenced by feminist and environmentalist movements. Starhawk’s popular book *The Spiral Dance: A Rebirth of the Ancient Religion of the Great Goddess* (1979) is largely responsible for spreading feminist Wicca in the United States. Starhawk has also been the most vocal American Wiccan in promoting activism of all kinds and has involved herself in numerous protests that range from anti-nuclear demonstrations, to forest activism blocking logging in old-growth redwood groves in northern California, to antiglobalization resistance. Although much of her environmental activism has been in high-profile protests, she has also organized workshops combining watershed conservation and forest ecology with magic and ritual. Other environmentalists also hold Wiccan beliefs and practice “eco-magic,” such as organizations like the Dragon Environmental Group in England and both British and American Earth First! radical environmentalists. While Wicca and environmentalism do not automatically go hand in hand, although some Wiccans argue that they should, in practice Wiccans live their relationship to nature in different ways.

Wicca has become a global phenomenon and significant Wiccan communities can be found in most countries inhabited by significant populations of people of European descent, including Great Britain, the United States, Australia, New Zealand, Canada and South Africa, but Wicca has also spread to countries such as Japan that are closely linked to Western cultures by the global economy and media. Gardner's original prototype of a coven meeting in the woods and dancing naked under the trees retains its attraction as a fertility religion that allowed men and women to feel closer to the natural world and to pass on their knowledge by secret initiation, but today it is as likely to be spread through internet sites and how-to books that can be ordered from online stores, even while it maintains a focus on nature.

Wicca – Dianic

Dianic Wicca, sometimes called feminist Witchcraft, began in Southern California in 1971, when Z Budapest and five friends met to celebrate the Winter Solstice. The time was ripe for a meeting of Wicca and feminism. Both were gaining in visibility. By 1969, “Marion’s Cauldron” was being broadcast over the airwaves regularly in New York City, and Central Park was the site of a 1970 “WitchIn” attended by over 1000. In the same year, some 50,000 people marched down Fifth Avenue in support of the Women’s Liberation Movement. A few years earlier, a small group of radical feminists calling themselves

W.I.T.C.H. had publicly and theatrically linked the image of the witch to women’s empowerment. Arguing that all oppression, including the abuse of nature, was due to male domination, they saw themselves as resistance fighters, and proceeded to use Halloween costumes and guerilla street theater to get their message across with drama and humor. Their success led to autonomous covens of

W.I.T.C.H. springing up in major cities across the country.

W.I.T.C.H. was decidedly political, not spiritual. Like other feminists critical of religion, Budapest argued that the spiritual *was* political. She claimed that patriarchal religions had colonized women’s souls and her unique contribution was to embrace the image of the witch as a symbol of women’s empowerment and use it to create a feminist version of Wicca. Building on the then-popular belief in ancient Goddess-worshipping matriarchies, she called her new tradition Dianic Witchcraft after the Goddess of the Witches in Charles Leland’s *Aradia*. That the Goddess Diana was independent of men added to the attraction of the name. Presented as a new religion with ancient roots, the Dianic Craft incorporated many elements of Gardnerian Wicca, so many that it is considered a Wiccan tradition.

Dianic Witches do a radical feminist analysis of gender and power, seeing women’s oppression and environmental abuse as intimately linked and firmly rooted in patriarchal religions, in hierarchies that privilege the spiritual over the material, the mind over the body, and men over women. Like other Wiccans, they celebrate the Earth and the turning of the seasons. Unlike them, Dianics also celebrate women’s “blood mysteries” – birth, menstruation, birth/ lactation, menopause and death – which are understood as women’s ability to create life, sustain it, and return it to the Source. In doing this they attempt to link what they believe is the sacred within them to the sacred around them in the natural world.

Divinity is envisioned as an autonomous female goddess. Some Dianics believe she is an entity, others see her as a metaphor for the Earth. Almost all agree that it is not

necessary to believe in Goddess in order to experience her, as she is also understood to be immanent in nature as well as the interconnection between every living thing. The dynamic cycle of birth, life and death is represented in Goddess' three aspects of Maiden, Mother and Crone and mirrored in the phases of the moon. This image of the Triple Goddess represents major stages of women's lived experience, and provides a symbol with which they may identify throughout their lives. She is seen as the Original Creatrix, drawing all life out of herself in an act of divine parthenogenesis. She is the matrix from which all else arises. Acknowledging Goddess, the Divine Self, within themselves allows Dianics to spiritually give birth to themselves as they leave behind male-dominated and sometimes misogynist religious conditioning.

Unlike other Wiccans, Dianics do not incorporate concepts of male divinity into their practice and reject the belief in the need for sexual polarity in order to practice magic. Men are traditionally not allowed to participate in Dianic rituals nor become members of Dianic covens.

Hierarchy is seen as a patriarchal "thought form," and most Dianic covens attempt to govern themselves by consensus or through a circle of elders, rather than incorporate the more familiar Wiccan role of high priestess. An exception to this is the McFarland Dianic tradition out of Texas. Developing independently from Budapest's lineage, this feminist group functions with high priestesses and includes men. However its impact has been limited and the name Dianic usually refers to those whose spiritual roots can be traced back to that first winter solstice in Los Angeles.

At least two Dianic groups in the United States do a great deal of teaching, and welcome to their classes any women who are open to "Goddess consciousness," whether or not they are or become Dianics. These are the Reformed Congregation of the Goddess (RCG) out of Madison, Wisconsin, and its affiliate, the Circle of Aradia (CoA) in Los Angeles. Literally thousands of women have passed through their training classes, making their influence felt far beyond their numbers would suggest. Although Starhawk

– Witch, theologian and widely read author – is not Dianic, she has also had a significant impact upon the Dianic Craft, especially in the strong commitments to the environment and peace that are present in the practice today.

Wilber, Ken (1949–)

Drawing on thinkers ranging from Plotinus and Aurobindo to Hegel and Piaget, and grounding his own thought in extensive meditation practices, Ken Wilber synthesizes modern science and traditional spirituality to provide a progressive understanding of cosmic, biotic, human, and divine evolution. In *Up From Eden: A Transpersonal View of Human Evolution* (1981), Wilber describes the three basic modes of human development: prepersonal, personal, and transpersonal. The prepersonal characterizes societies oriented by magical and mythical modes of consciousness. Personal consciousness emerges in a few elite persons thousands of years ago and eventually culminated in the mental-egoic consciousness of Enlightenment modernity. Unfortunately, mental-egoic or personal consciousness often (but not always) involves dissociation of ego-mind from body, emotions, nature, female, and God. Mental-egoic consciousness entails heightened deathanxiety, which people (especially men) have sought to assuage through Atman projects that seek to make the mortal ego immortal. The technological domination of nature may be understood in part as such an Atman project. Although alienated and dissociated both from nature and from God, mental-egoic consciousness may continue its evolutionary trajectory toward the centauric stage, which reintegrates mind/body while recognizing the perspectival and thus partial character of worldviews. In subsequent transpersonal stages, humankind would experience the divine presence in all phenomena, thereby generating compassion for all sentient beings. According to Wilber, all phenomena are manifestations of the divine, the Alpha and Omega of cosmic history.

Despite the drawbacks of mental-egoic consciousness, Wilber maintains that worldwide achievement of it and the institutions related to it (including constitutional democratic government, freedom of inquiry, sustainable economic development) could have a dramatic positive impact on humanity's treatment of nature. Rationaldemocratic societies do not make war on one another; moreover, they can alter their practices in ways that avoid environmental catastrophe, thereby making possible the continuing evolution of consciousness needed for the long-term well-being of the Earth and humankind.

In *Sex, Ecology, Spirituality (SES)* (1995) and *A Brief History of Everything* (1996), Wilber lays the groundwork for "integral" thinking. Deemphasizing his earlier emphasis on death anxiety and Atman projects, Wilber now seeks to unite the perennial idea of the Great Chain of Being, as informed by spiritual, cultural, social, and natural scientific evolutionary concepts, with a four-fold set of distinctions allegedly capable of analyzing all phenomena. Drawing on the notion of holons developed by Jan Smuts

and Arthur Koestler, Wilber maintains that virtually all phenomena are wholes from one perspective and parts from another. A cell in an organism, for example, is a whole that includes parts, but is also a part of the organism. Emphasizing that holonic evolution generates emergent qualities, Wilber divides the Kosmos into four grand domains: physiosphere, biosphere, noosphere and theosphere. The physiosphere includes the non-biological features of the universe, including the stars and planets that arose in the billions of years following the Big Bang. The biosphere, the domain of life, depends upon the much older and much vaster physiosphere, but involves features that transcend the physiosphere. Finally, the biosphere gives rise to the noosphere, which includes complex sentient life such as mammals and humans. Again, the noosphere both depends on physiosphere and biosphere, but also transcends them, by exhibiting emergent characteristics, including self-consciousness, language, and rationality. The theosphere, which both includes and transcends the other three domains, refers to dimensions of consciousness that include what is traditionally understood by the notion of God.

In a controversial move, Wilber argues that just as the biosphere contains the physiosphere in the sense of comprising all its basic features (although plainly *not* its material expanse), so too the noosphere contains the biosphere in the sense of comprising all its basic features (although not its biotic mass), while adding new ones. Affirming that neither biosphere nor noosphere were “destined” to emerge on Earth, Wilber joins proponents of the anthropic principle in arguing that the cosmos is ordered such that biosphere and noosphere would eventually emerge *somewhere*.

To this vision of cosmic evolution, Wilber adds his four-quadrant analysis. The four quadrants are: Upper Left (UL), individual as experience internally; Upper Right (UR), individual as experienced externally; Lower Left (LL), collective as experienced internally; Lower Right (LR), collective as experienced externally. Consider how the four quadrants may be used to analyze someone purchasing tickets for a figure-skating competition. Seen from UL, the activity is the first-person experience of someone eager to witness athletic and artistic prowess; seen from LL, the person shares certain cultural views about sport, artistic expression, and so on; seen from the UR, the object of investigation is an organism whose constituent parts obey natural laws and whose behavior accords with predictable patterns; from LR, the individual’s actions are interpreted in terms of social, political, and economic categories. In *SES*, Wilber reduces the four quadrants to the Big Three: UR/LR, LL, and UL, which correspond to the topics of Kant’s critiques of pure reason, practical reason, and judgment. According to Kant, Weber, and Habermas, modernity’s triumph was to differentiate among domains (for example, religion, politics, art) that are collapsed together in pre-modern societies. Although the Big Three originally distinguished three legitimate modes of inquiry and behavior (natural science, politics/morality, and personal experience and aesthetic expression), eventually the UR/LR quadrants (natural and social sciences) marginalized the UL and LL quadrants, which take into account domains that can be understood only from the inside.

Wilber argues that a constructive, integral postmodernity will restore legitimacy to all four quadrants. Instead of viewing sentience as an accidental feature of the cosmos, integral thinking adheres to Whiteheadian panpsychism, according to which all phenomena – even atoms – have at least some meager interiority. Greater interior complexity confers higher moral status on entities. Because a cow screams louder than a carrot, many people have fewer moral qualms about eating the latter than the former.

Although endorsing the valid ecological concerns of deep ecologists, Wilber criticizes them for holding “retromantic” views involving worship of nature, especially when that “nature” in fact involves the same reductionistic materialism and systems theory that forms what Wilber calls “industrial ontology.” Authentic nature worship, as described by nature mystics such as Emerson, involves discerning that material nature is but the lowest-level manifestation of nature, understood as creative Spirit. A vigorous opponent of naïve yearning for pre-modern social formations, while simultaneously a critic of heedless technological exploitation of nature, Wilber affirms the dignity of modernity while acknowledging the crucial contributions of pre-modern peoples. Although his views are at times sharply contested, he is widely admired for his ambitious effort to integrate nature, humankind, and Spirit in order to form a constructive post-modernism that re-enchants the world without inviting personal and social regression.

Wilderness Religion

The conceptual associations of religion with wilderness, and religion with nature, are enormously complicated, whether considered semantically, historically, epistemologically, metaphysically, scientifically, or ethically. The challenges of definition alone are daunting. “Nature” is one of the most semantically confused words in English. Definitions for “religion” abound, yet none is universally accepted. “Wilderness” offers no respite from confusion. Such semantic and conceptual tangles frame the account here, beginning with the apparent antagonism between the spiritual domain of religion and the material domain of nature.

If wilderness is conventionally associated with *the natural*, that is, the evolved composition, structures, and functions of the world, and religion is conventionally associated with *the supernatural*, that is, phenomena such as God outside the evolutionary pale, then how conceivably can religion be meaningfully conjoined with notions of wilderness? Heaven and all things godly – the supernatural – are sacred. And the Earth and all things wild – the natural – appear profane. Thus religion appears to be antithetical to wilderness and nature.

There is considerable evidence to support such a conclusion. Religion has long been associated with the cultural legitimation of the economic exploitation of the natural world. Although preservationists associate wilderness with those areas of the Earth that are “untrammled,” that is, landscapes free of economic utilization where humans are visitors only, the religious mainstream tends to position nature as a resource provided by a supreme being to serve human needs. The natural world is conceptualized as “fallen,” as a material domain that, despite its fallen nature, offers redemptive possibilities. Through economic utilization and technological control the faithful might recover in part from the Fall, thus restoring the human spirit – which is associated not with the natural and material world but the supernatural and spiritual world.

On this account, relatively wild places, such as mountains, deserts, forests, and bogs, are conceptualized as the “ruined Earth.” Thus domestication, whether harnessing a wild river, mining gold from a mountain, logging an ancient forest, or draining a wetland, is religiously warranted as part of the recovery from the Fall. Apparently, with perhaps exceptions such as Native American and other Earth-friendly religions (e.g., Wiccans, goddess feminists), religion legitimates an assault on the wild Earth. So viewed, the metaphysical divide between the natural and the supernatural is insuperable.

Nevertheless there are strategies, especially for the religiously faithful who believe in the possibilities of a continuing revelation, by which wilderness, religion, and nature

can be related. Lynn White, Jr.'s famous essay, "The Historical Roots of Our Ecologic Crisis" (1967), can be interpreted as the beginning of a continuing reconsideration of the relationships between wilderness, religion, and nature. If we think of religious narrative as simultaneously describing a reality that is and prescribing a reality that ought to be, then the world's religions can be influential in rethinking humankind's place in, actions upon, and obligations to the Earth's remaining wild and natural places. Such an analysis begins by attempting to uncover the religious sources of contemporary beliefs about nature and wilderness.

The idea of wilderness does not easily equate with the idea of nature. One conventional meaning of "wilderness" is that part of nature which is untrammled or free (for example, as reflected in the language of the Wilderness Act in the United States of America). Wilderness connotes those lands which are part of the "pristine biosphere," a term used by ecologists to denote natural systems continuing on evolutionary trajectories largely free of human influence. (Some analysts believe that such a notion of wilderness is a "received idea" that is scientifically untenable.) Many scientists, including conservation biologists and ecological restorationists, believe that the conservation and restoration of extensive core wilderness areas are essential to the future of life.

But "wilderness" does not have the same connotation as "nature." Clearly, the former connotes habitat whose conservation is a necessary condition for continuing the evolved composition, structure and function of natural systems. As the history of science makes clear, the latter connotes an epistemic object for scientific study. Wilderness draws our attention to the world beyond ourselves. Nature draws our attention to the world that can be known scientifically. Ironically, this distinction is grounded in a religious history of effects that is clearly evident in the writings of Frances Bacon and René Descartes at the advent of the scientific revolution. For them nature became an object of science, for it was through inquiry that humankind would be able to turn the natural world to our will, thus recovering from the Fall.

The distinction of the ideas of wilderness and nature does not imply that wilderness cannot be known scientifically. Scientists, such as wildlife ecologists, conservation biologists, and ecological restorationists, actively study wilderness ecosystems. The point of these activities, however, is not to achieve control over the object of study through theoretical knowledge. Rather the end in view is the comprehension of the many circumstances and processes (from genetic to ecosystemic levels of organization) that created the natural system, many of which remain essential to its continued functioning. Such knowledge also articulates the consequences of our actions on the web of life – in religious terms, the creation itself. Contemporaneous ecological science makes clear that the human dominion of nature, despite its religious warrant, is an impossibility.

If "nature" connotes a theoretic object of study through which humans hope to gain causal control over the world, and "wild nature" connotes places which humans affect (to a greater or lesser extent) but do not control, then it follows that wilderness is more natural than nature. Ecologists use the term "anthropogenic biosphere" to denote nature in this sense. Nature is increasingly trammled by humans, exploited

through commerce, and polluted by industry. Wilderness advocates argue, with some justification, that “wilderness management” is an oxymoron, a self-contradictory notion since the essential quality that defines the wild (self-direction or natural agency rather than human control) is lost. Wilderness, then, is by definition on a self-willing or self-organizing trajectory rather than one controlled by human beings.

As the twenty-first century begins, there are few if any true terrestrial wildernesses – lands unaffected by, let alone devoid of, human influence. A number of prominent scientists argue that the wild world hangs on the precipice of catastrophe. The language used to describe the so-called biodiversity crisis is often religiously resonant. “An Armageddon,” Edward O. Wilson writes, “is approaching at the beginning of the third millennium. But it is not the cosmic war and fiery collapse of mankind foretold in sacred scripture. It is the wreckage of the planet by an exuberantly plentiful and ingenious humanity” (Wilson 2002: xxiii).

Given the contrast between a naturally evolved and untrammelled world continuing on an evolutionary trajectory and the increasingly trammelled and declining anthropogenic biosphere, the idea of wilderness carries two prescriptive ideals. One is the idea that some considerable portion of the evolved world – the flora and fauna and their habitat – should remain wild and free. While this ideal is conventionally associated with the wilderness preservation movement, it increasingly finds religious warrant. The other ideal is that those areas of the Earth and the associated flora and fauna whose continued existence has been jeopardized by human activities should be restored to a relatively wild trajectory. Again, this ideal finds religious justification, since restoration is as much about normative human self-conceptualizations as it is about actions on the world.

Arguably, given the hold of narrative traditions on human consciousness, the continuing articulation and later realization of these prescriptive ideals has been argued by many as necessitating the commitment of religionists. Some have argued that only through the engagement of religiously faithful communities can culturally dominant notions of nature and wilderness be reconsidered, and a turn toward sustainability be made.

How then do world religions figure in such reconsideration? While no comprehensive account can be attempted here, there are many possibilities. Indigenous, Eastern, and so-called nature religions offer various points of departure for challenging sedimented beliefs that the natural world is nothing but an economic resource. Or that nature is merely material. Some of these sources are ancient, with origins before the onset of literacy, as with the Vedas in the Upanishads. The notion that Atman is Brahman implies that the ever-increasing hold of egoic-consumerist consciousness within the new world order is a contingency rather than a necessity imposed by human nature. Such an ancient insight clearly resonates with the contemporary ecological realization that interconnection within systems is a more fundamental reality than individuation. Likewise, Native American traditions, such as those of the desert Southwest in the

United States, position the natural world as one which is spiritually alive rather than dead matter moving mechanically.

The Forum on Religion and Ecology, a continuing academic project involving dozens of scholars, is actively exploring the potential of the world's religions for ecological reform, including the preservation and conservation of wild species and their habitat. The Forum website contains essays exploring the ecological possibilities of most of the world's religions, including Buddhism, Christianity, Confucianism, Hinduism, Indigenous, Islam, Jainism, Judaism, Shinto, and Daoism.

There can be little doubt that the world's religions provide narrative sources that serve as the basis for reconsidering human relations and obligations to the naturally evolved world. However, because industrialized European and North American nations are the world's most prolific consumers and polluters, and thus impose the heaviest load on wilderness areas such as the Amazon, because the sources of the governing attitudes toward wilderness and nature in the West are grounded in biblical sources, and because the global political economy is largely dominated by nations whose religious roots are in Judaism and Christianity, the biblical religions are crucially important.

Biblical sources of Western attitudes toward wilderness and nature reflect a lingering consciousness of what was lost in the ecological transition from the Paleolithic to the Neolithic. Just as the "3K" background radiation is interpreted as evidence of primordial cosmological events, so biblical texts, such as the Garden narrative in Genesis, can be interpreted as evidence of a recent (ca. 15,000 B.C.E.) yet receding past, that is, the transition from a 200,000-year era of nomadic hunting and gathering to sedentarism and agriculture. This epochal ecological transition arguably leads to a psychic sense of the loss of connection with the natural world which in turn underlies the mythic narrative of expulsion from the Garden of Eden. Expelled from the Garden, humankind falls into agricultural drudgery and a perpetual longing for return. Some argue that ecological dysfunction will not be resolved until environmentalists escape this dream.

Likewise, Psalm 104 can be read as remembrances of things past, when humans lived in close association with and possessed an intimate knowledge of the natural world

– its seasons and cycles, flora and fauna. Psalm 104 is interpreted by some as the textual underpinning of natural theology and, finally, the ecological sciences themselves. Such biblical themes are also clearly resonant in the Romantic poets, such as William Wordsworth and Percy Bysshe Shelley. Their poetry celebrates the created world and mourns the loss of our connection to it. The Romantics, in this sense, see a further fall from grace in the industrialization of the world.

These streams of thought from Genesis to the Romantics constitute the narrative sources for nineteenth and twentieth-century ideas of wilderness. Conditioned in part by the Romantics, nineteenth-century writers often saw the wilderness and nature through a biblical lens. George Perkins Marsh, considered by many as the first environmentalist in a modern sense, exemplifies this idea. Recognizing the pervasive and deleterious

consequences of the actions of humankind on the natural Earth, he argued that these changes were the consequence of the failure to heed the created order.

Wilderness was viewed also through a biblical lens by Henry David Thoreau and John Muir (less obviously in Thoreau than Muir). Thoreau, read as critically responding to Ralph Waldo Emerson's transcendentalist notion that nature was made for Man by God, came to the realization that the wild Earth needed no purpose other than its own. In wildness alone, he argued, was the preservation of the world. He equated the walker with a pilgrim in search of holy ground, and characterized wild nature as a *sacrum sanctorum*. John Muir, read as one of the first evolutionary thinkers, believed that he saw the Creator still at work in the mountains of California. Wild nature, the flora and fauna, the mountains and valleys, the forests and the rivers were sacred ground to Muir. Their value exceeded any economic utilization. Every day in the mountains, Muir proclaimed, was a resurrection day for the human spirit.

Biblical sources continue to influence the late twentieth and early twenty-first century. Aldo Leopold, a seminal wilderness thinker and staunch defender of wilderness, critiqued a biblically based Abrahamic ethic that saw the land community as nothing but an economic resource. He argued that only by superseding such an ethic for a land ethic could humans live on the land without spoiling it. Lynn White's later critique (1967) set in motion a continuing theological reassessment of humankind's relations to nature. Religious conservatives such as Francis Schaefer and liberals such as John Cobb, Jr. were among the first to respond to White's arguments in the early 1970s. Today there are literally thousands of biblically based and religiously inspired reassessments of humankind's place in and obligations to the natural world. And scholars from the scientific community, such as E.O. Wilson, now recognize new ecological possibilities in biblical sources. "For the Abrahamic religions, Judaism, Christianity, and Islam, the environmental ethic is compatible with belief in the holiness of the Earth and the perception of nature as God's handiwork" (Wilson 2002: 157).

As the new millennium begins there is a growing energy among the religiously faithful to engage themselves with the questions of their faith-based relations to the wild Earth and nature more generally. While there is enormous theological diversity, there is also a convergence on a central idea. Roughly, the notion that there is an order to the created and still evolving world that transcends and in many but not all cases takes precedence over humanly created orders.

What conclusions, if any, can be drawn from this study of the complicated interrelations of wilderness, religion, and nature? Clearly, religion figures significantly in reinterpreting our place in nature, and especially our relations to those few habitats and species that remain relatively wild. Religion must play such a role, since humans cannot reinvent themselves *ex nihilo* but only move on from the culturally accumulated experiences of the past into an imaginative future. Charles Taylor argues in his monumental *Sources of the Self* that

It would greatly help in staving off ecological disaster if we could recover a sense of the demand that our natural surroundings and wilderness make on us

. . . The world is not simply an ensemble of objects for our use, but makes a further claim on us . . . This demand, though connected with what we are as language beings, is not simply one of self-fulfillment. It emanates from the world (Taylor 1989: 513).

Many religious sources embody these demands, requiring only that the religiously faithful identify such interpretations therein.

There are some, of course, who deny the possibilities for tomorrow existing at the convergence of wilderness, religion, and nature. And clearly there remains antipathy among some religionists toward the natural (and thus fallen) world. Yet religion, in all its diversity and whatever its insufficiencies, is one of the richest and potentially most promising sources for discovering and articulating the claims the world makes upon us.

Wilderness Rites of Passage

Across time and in countless ways, people of many cultures have gone into the wilderness to mark life transitions and seek guidance. They sought closeness with God, the Mystery, or a higher self. They found a time alone, exposure to the elements in an unfamiliar place, a radical shift in self and world, a trial and a gift, and a ritual death and rebirth. The core of the form was clear: leaving the ordinary world, crossing a threshold, and returning with a gift and a task. It was an initiation, a rite of passage, a new birth in the womb of the natural world.

Modern cultures seem to have forgotten most of what our ancestors knew about the importance of initiatory rites for sustaining individuals and their communities. Instead, we find ourselves strangers in our own lives, unsure of our status and value, and hungry for a connection with the abiding rhythms of the Earth and an enduring spirit.

Yet, the roots of this search remain alive. Recently, a growing number of people have created wilderness-based rites of passage for a modern context. Stephen Foster and Meredith Little, authors of *The Book of the Vision Quest* and *The Four Shields*, are among those most influential in developing and articulating a form appropriate to our time and place, the vision fast. Since the 1960s, they have trained vision fast guides through their School of Lost Borders and spearheaded the development of professional groups such as the Wilderness Guides Council. Recent developments in this field include greater collaboration among those doing such work in North America, Europe, Africa, and Australia and the development of programs and training in academic settings.

In general, people seek wilderness rites of passage in times of significant life transition or to complete life transitions begun earlier but not completed. The transition from adolescence to adulthood is an important time for initiation. Adolescents need the chance to confirm their fitness and willingness to step toward adulthood. Mid-life, marriage, divorce, loss, or simply a time of confusion and disillusionment are also common calls to a wilderness rite of passage.

These practices facilitate ego-transcendence and an opening to spirit. In doing so, they also bring healing and renewed connections with lost or abandoned capacities for guidance, vitality, and joy. Their goals include bringing back to one's people and place something of value: personal power, stability, energy, wisdom, or a maturity that is expressed in service to others and to the Earth.

Structure of a Typical Wilderness Passage Rite

While there are many specific forms these quests can take, they all express a common deep structure. The anthropologist, van Gennep, used this deep structure to describe traditional rites of passage, and Carl Jung and Joseph Campbell use it as the basis for the archetype of the Hero's Journey. Despite variations in surface structures, this pattern is broadly crosscultural. Here, I will describe a form currently being used by many wilderness rites of passage guides. It is built around a one or two-week wilderness trip.

Preparation

This is a time for participants to identify their reasons, inner resources, and commitment for this undertaking. More mundane issues of logistics, equipment, and safety are equally important.

Severance

Participants travel to a wilderness setting and set up a base camp where they become accustomed to living close to the land, opening their senses to the features of that place, and tuning in to the rhythms of the Earth. Wilderness is a relative term, and many vision fast groups without ready access to wilderness have found that more cultivated lands can support this work. Processes for life review are helpful here. They use council-style group discussions and simple Earth-centered ceremonies along with walks, journaling, and contemplative practices such as meditation and sensory awareness.

Threshold

This phase usually comprises three or four days of solitude and fasting from food (with water, a buddy system, and other safeguards). Participants may engage in awareness practices and self-generated ceremonies, but aside from safety considerations, there are few rules. The threshold is the doorway into sacred time and space and the edge between the old, which is no longer, and the new, which is not yet. In many ways, the threshold time represents a symbolic death and facilitates an ego-death.

The wilderness (or wilder) setting is an important part of the threshold phase, providing both challenge and support for the inner work of disidentifying from old psychic structures, creating deeper integration both within one's psyche and with the world, and discovering deeper sources of relating to the world.

Return

The return, or reincorporation, phase is a symbolic rebirth. This begins upon the return to base camp with quiet celebration and reflection and continues as we rejoin our communities. Sharing stories and reflecting on them, participants begin to integrate their insights and visions. The goal is to help participants discover their own meaning in their experiences and apply their own belief systems, not to impose meaning.

Implementation

After the wilderness trip, participants are supported in bringing their experiences into their lives more fully. However, it is necessary that the work of this phase belongs

to each participant. This is the phase in which the gifts of the initiation are shared. Essentially it is the rest of one's life.

Elements of Wilderness Passage Rites

Key elements of these trips are the stages of the rites of passage model, a ritual or ceremonial attitude, and the wilderness environment. Underlying them is exposure. Participants are exposed to new terrain, weather, and wildlife, large and small. They are exposed to their own vulnerability, boredom, frustration, strength, contentment, delight, and curiosity – all the states that can emerge from being alone in a living place with an authentic intention of openness. The patterns and meanings of personal history, self-concepts, ideals, and shadows are exposed as well.

Changes in sensory and cognitive input from living closer to nature lead to changes in ego structures. Familiar ego structures are no longer supported, leading to changes in self-images and less fixated conceptual structures. The natural world mirrors, evokes, and develops those inner qualities usually assigned to the realm of religion and spirituality – unconditional love, joy, power, peace, support, grace, and guidance.

Making intimate contact with the wild world brings us into contact with our “wild selves,” the parts of us that have not been conditioned by familial and cultural forces. Wild places are those not under our control and not subject to our wills, walls, or arbitrary boundaries. On wilderness rites of passage, as in all forms of deep psychological or spiritual work, we are going into wild places. We are entering realms where the artificial structures and demands of the ego and society have not restricted or walled off our innate guidance, aliveness, generosity, or fascination with the world. At the same time, wilderness rites of passage cultivate and refine those qualities necessary for living in the world in a full and engaged way, knowing our own hearts and minds, tolerating ambiguity and discomfort, being autonomous, searching deeply, and staying open to new answers.

Sometimes, the “visions” of a vision fast resemble shamanic experiences with unusual sensory or psychospiritual manifestations. More often, however, the most transforming and longest lasting changes are prompted by subtle, more ordinary experiences. It is the totality of the rite rather than a specific experience that usually carries the deepest impact.

In most modern wilderness rites of passage trips, participants discover a renewed relationship with the natural world, a sacred relationship. To the detriment of this relationship, participants can idealize and romanticize wild nature and the ceremony, causing a split between the wild and their familiar worlds. Such a split tends to foster dissatisfaction and depression as well as rejection of the needs of one's home community and its natural setting. One of the goals of wilderness rites of passage is to support participants in returning home with a new or renewed commitment to living in a more sustainable way and caring for the Earth as well as a new sense of self.

Such responsible environmental action arises not from a sense of imposed obligation or coercion, but from the deep psycho-emotional bond arising from spending such ceremonial time alone in nature. Environmental action, whatever form it takes, becomes an expression of love, joy, and caring rather than a product of shame, guilt, or fear. The world becomes less a collection of commodities to be used or exploited, and more the embodiments of an alive, enchanted, sacred world. Many of these trips conclude with specific practices, often ritualized to deepen their meaning, which support participants in articulating and accepting a sacred task related to environmental responsibility. A lesson of modern wilderness rites of passage is that living authentically means living here and now, in this place, embodied, and part of the environment. Sacred (“heaven”) and profane (“Earth”) are not divorced.

This is not easy work, nor does it promise a quick fix. However, wilderness rites of passage and Earth-centered initiatory practices do develop confidence, trust, wholeness, a sense of enchantment and home in the wilder parts of our selves, and a natural impulse to contribute to our world. These are the foundations for maturity, inner freedom, and service.

Wilderness Society

Founded in 1935, The Wilderness Society is a nonprofit organization devoted to the protection of wilderness in the United States and to the development of a network of wild lands through public education, scientific analysis, and political advocacy. Headquartered in Washington, D.C., by the early twenty-first century it had eight regional offices, a membership of 200,000, and an annual budget of \$14 million. While it would be misleading to describe The Wilderness Society as a religious organization, some of its founders were motivated by spiritual perceptions or religious worldviews that led them to view wilderness as sacred and worth preserving. And certainly the zeal and devotion with which its founders, leaders, and members have pursued the Society's mission demonstrates the ways in which the concept of wilderness has functioned as a significant center of material and symbolic value in the late twentieth-century United States.

Like the idea of nature, wilderness is a concept with a long intellectual pedigree, which the founders of The Wilderness Society inherited and also helped to shape. The idea of wilderness arose with the advent of herding and agriculture some 15,000 years ago, when humans first began to distinguish domesticated animals from wild ones and civilization from the surrounding wilderness. Until the rise of romantic aesthetics and cultural nationalism in the early nineteenth century, wilderness was primarily perceived as hostile wasteland to be conquered in the name of human progress. In the United States, the rapid loss of wild lands that accompanied the nation's urbanization and industrialization – popularly symbolized by the “closing of the frontier” in 1890 – had a particularly strong effect on the growth of wilderness appreciation.

The founders of The Wilderness Society extended the cultural critique of modernity advanced by early advocates of wilderness, but they did so with a singular opponent in mind: the automobile tourist, whose professed love of the wilderness ultimately threatened to destroy it. The eight founding members – including Robert Marshall, Benton MacKaye, Robert Sterling Yard, and Aldo Leopold – differed in their justifications for the significance of wilderness, but all of them agreed with Marshall's desire to keep the American wilderness “*sound-proof* as well as *sight-proof* from our increasingly mechanized life” by preventing the construction of roads in the national forests. They sought to preserve these roadless areas as sacred spaces whose aesthetic, cultural, and spiritual values could best be appreciated through more “primitive” forms of outdoor recreation.

In the post-war years, The Wilderness Society broadened its arguments for wilderness preservation, particularly in response to new threats posed by increased timber

harvesting and dam building by the federal government and new developments in the biological sciences. Led by Executive Secretary Howard Zahniser and Director Olaus Murie, the Society played an instrumental role in the passage of the Wilderness Act of 1964, which defined a wilderness as “an area where the Earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain.” Since then, The Wilderness Society has helped to add 104 million acres to the National Wilderness Preservation System, often in collaboration with other environmental organizations that share its worldview. Despite the growth of its membership and the evolution of its arguments, The Wilderness Society remains committed to its founders’ emphasis on preserving wilderness for the recreational and spiritual renewal of future generations.

Williams, Delores S. (1937–)

Delores Williams is an African-American Presbyterian theologian who has played a formative role in the development of womanist theology, centering on historical and present testimonies of black women. Like other types of feminist and liberation theology, Williams' womanist theology rejects traditional dichotomies between body/spirit and humanity/nature that pervade mainstream Christian thought. Williams offers a theological response to the defilement of black women's bodies and identities in antebellum and postbellum America. She analyzes the surrogacy roles that were imposed on black women's bodies, raped and forced to substitute for white women sexually and economically and used to breed slave offspring. She makes parallels between such surrogacy and the exploitative rape of nature perpetrated by strip-mining the land and clear-cutting forests – both cases represent sin involving efforts to exploit and control the productive and reproductive capacities of nature.

Williams argues that these types of sin have been nearly invisible in Christian theology. Along with her expansion of the notion of sin, she also proposes a nonanthropocentric concept of salvation, indicating her hope for the end of violence and the liberation of creation from oppression. Using the biblical story of Hagar, the concubine of Abraham banished to the wilderness with her son Ishmael, Williams represents black women as “sisters in the wilderness.” The metaphor of wilderness symbolizes a place of danger, fear and vulnerability, but also a place where God is present and strength is discovered. However, her theology lacks reflection on “wilderness” in itself as threatened. Wilderness is viewed as a projection of the human fear of exile. Given the strategic need to articulate black women's voices and theological responses to racism and sexism, Williams has made major strides toward an “ecowomanist” theology that exposes exploitative sins against black women's bodies and nature and points toward salvation.

Williams, Terry Tempest (1955–)

Author, activist, naturalist, desert mystic, poet, and green prophet, Terry Tempest Williams is made up of nearly as many layers as the geological cross-sections of Utah's canyon country she brings to life in her writing. Steeped in the Mormon culture of her upbringing, Williams is also a feminist, environmentalist, and outspoken anti-war activist. A descendant of Brigham Young and able to trace her heritage back through five generations of Latter-Day Saints, Williams possesses an intense passion for the sacred landscape of her Utah home and for the larger American West – a landscape she experiences as inspired by wildness and grace. Her sojourns in the desert assume a revealing quality that leaves her heart open and exposed, vulnerable to her readers. This is precisely the point and in this respect Williams leads by example. For instance, she writes,

It is time for us to take off our masks, to step out from behind our personas – whatever they may be: educators, activists, biologists, geologists, writers, farmers, ranchers, and bureaucrats – and admit we are lovers, engaged in an erotics of place. Loving the land. Honoring its mysteries. Acknowledging, embracing the spirit of place – there is nothing more legitimate and there is nothing more true (Williams 1994: 84).

Williams is best known for *Refuge: An Unnatural History of Family and Place* (1991), which interweaves natural history and personal family narrative. In this work, she juxtaposes her experiences “midwifing” her mother through her ovarian cancer death to the simultaneous destruction of the Bear River Migratory Bird Refuge from human-produced flooding. Williams’ grief over both is palpable. More than anything, she witnesses to the environmental cancer that is upon the Earth and the continuity between the earthbody and the human body. In “Clan of the One-Breasted Women,” the epilogue to *Refuge*, Williams recites the list of (clean-living, non-smoking, non-drinking) Mormon mothers, aunts, and grandmothers in her family who have all been stricken with breast cancer and who have died or been rendered unlikely Amazons through mastectomies. She also links these cancers to the years that the U.S. Government bombed the American West, conducting atmospheric testing of atomic weapons in Nevada and exposing other western states as well to radioactive fallout drifting on wind currents. Williams rails at this injustice and deems the cancers a price far too high to be paid for obedience – the unquestioning acceptance of authority instilled and reinforced in Mormon culture. She writes, as a Mormon woman of the fifth generation of Latter-day Saints, I must question everything, even if it means losing my faith, even if it means becoming a border tribe among my own people. Tolerating blind obedience in the name of patriotism or religion ultimately takes our lives (Williams 1991: 286).

Williams is a self-described “edge-walker,” who travels the narrow space between the religious tradition she credits for having “forged her soul,” and her direct and very personal experiences in nature that have revealed a truth of their own. Throughout her work, she negotiates this edge by embracing themes that resonate for both Mormons and environmentalists – the importance of community, home, family, heritage, and commitment. Her co-edited anthology, *New Genesis: A Mormon Reader on Land and Community* (1998), carefully presents essays from a variety of Mormon writers who promote principles of ecological care and conservation as grounded in

Mormon scriptural sources. The ideal of the nineteenth-century Mormon village is revisited as a model of self-sufficiency and sustainability, and Brigham Young’s advocacy of water conservation is repeatedly invoked. The anthology ultimately succeeds in marrying Mormon and environmental perspectives in a way that is inviting rather than threatening to more conservative readers.

If Williams is an “edge-walker,” then her “edgiest” book is *Desert Quartet: An Erotic Landscape* (1995). In this work, she explores the land as mystical lover and embodies a kind of “eco-eroticism” that blurs boundaries between skin and rock, wind and breath, blood and water, and fire and flesh. Williams leads the reader on a poetic journey through the desert and into intimate encounters with the Earth’s four basic elements (Earth, air, fire, water). In so doing, she engages the Earth’s “body” in a primal mystical union that pulses with pleasure and erotic intensity. Williams sounds similar “eco-erotic” themes in her collections of essays, *An Unspoken Hunger* (1994) and *Leap* (2000), a book dedicated to her obsession with painter Hieronymus Bosch’s medieval triptych “The Garden of Delights.” The burning question within Williams while she was writing *An Unspoken Hunger* was “How do we make love to the land?” (1995), a question she confesses intrigues her in part because eroticism is so taboo in Mormon culture (Jensen 1995: 312). In *Leap*, Williams explicitly draws parallels between a fear of intimacy and eros within Mormon culture and the narrow valuing of nature solely for its practical human utility. She observes, “I see my community’s fear of homosexuality, even wilderness, as a failure of imagination. Sex is like land. It must be used for something” (Williams 2000: 195).

Issues of land use and wilderness preservation are indeed central to Williams’ activism. She has testified to protect Utah’s wild lands before a U.S. Senate subcommittee hearing on the Utah Public Land Management Act and has spoken before Congress on behalf of “America’s Redrock Wilderness Act.” She has also compiled and presented to Congress a volume of writers’ witness to the historical and spiritual importance of preserving America’s public lands. At a time when the idea of “wilderness” has been exhaustively deconstructed and its use aggressively critiqued within academia, Williams continues to “buck this trend,” boldly making the case for the spiritual, psychological, and ecological importance of protecting wild places. “I choose to err on the side of preservation,” writes Williams, and stand shoulder to shoulder with brothers and sisters in our shared desire to protect the last large expanses of wilderness we have left . . . I want to speak the language of grasses, rooted yet supple in the presence of wind

before a storm. I want to write in the form of migrating geese like an arrow pointing south toward a direction of safety. I want to keep my words wild so that even if the land and everything we hold dear is destroyed by shortsightedness and greed, there is a record of beauty and passionate participation by those who saw it coming (Williams 2001: 19).

In 1995, the *Utne Reader* named Terry Tempest Williams one of its “100 visionaries.” She is a Rachel Carson Institute Inductee in recognition of her work as an environmental leader; she is also the winner of a Guggenheim Fellowship and a Lannan Literary Fellowship for her creative non-fiction.

Wilson, Edward O. (1929–)

An entomologist by training, E.O. Wilson's hypotheses have had far-reaching influence not only in the biological sciences, but in the humanities and social sciences as well. Wilson's ideas connect religion and nature on two levels. First, he argues that religion, like social behavior in general, is subject to natural selection. Second, Wilson's primary intellectual endeavor has been to demonstrate the religiosity implicit in the natural sciences. His litany of publications includes several well-respected contributions to the field of ecology, but he is most widely known for his theory of sociobiology, and for his championship of environmental issues. This hypothesis established a scientific field devoted to finding the biological origins of animal social behavior at both the genetic and the environmental levels. Sociobiology presents challenges to current conceptualizations in the biological sciences as well as the social sciences. Sociobiological studies seek to understand the evolutionary foundations of social behaviors in animals, and to apply an ecological model to the social sciences. At the heart of E.O. Wilson's ideas is the assertion that scientific investigation can radically improve the production of knowledge, and can be synthesized with other disciplinary systems.

Due to a boyhood fishing accident, Wilson's vision is good in only one eye; and he has subsequently trained himself for close observation. His career in insect biology supplied him with many resources for the extension of scientific study into other fields. He is renowned for his work on the behavior of social insects, but has branched out tremendously into studies of ecology, gene-culture coevolution, sociobiology, biogeography, environmental ethics, environmentalism, and environmental policy. He is the recipient of two Pulitzer prizes: one for his work in *On Human Nature*, and the other for his co-authorship of the definitive entomological work *The Ants*. Following his fieldwork in Cuba and New Guinea, Wilson joined the Harvard faculty of biology. He remains active there as a professor in the Department of Organismic and Evolutionary Biology, and as the honorary curator in entomology at the Museum of Comparative Zoology.

As a part of his larger project to understand human social life scientifically, Wilson has argued that religion is a product of natural selection. Beyond Wilson's sentiments that religion is biological in origin, he also believes that traditional religions are ill-equipped to deal with the environmental and social problems of the modern world. In *Consilience*, one of his most accessible works, Wilson seeks to renew the enlightenment project of finding ultimate meaning through science. As a voice of twentieth-century biology, Wilson presents a continued call for an empirically grounded metaphysics, a religion based in fact, sounded a century earlier by such thinkers as Auguste Comte.

Such a worldview would invalidate anthropocentric conceptualizations of the universe, and seek to create social harmony based on a coordinated effort between biology and the social sciences. His quest is lofty; not only does he advocate a massive research endeavor to establish scientific consensus on moral issues, he further believes that this new faith in facts needs to be created in poetic form, as an epic cultural narrative. He is a board member of the Epic of Evolution Society, and collaborates with those engaged in the consecration of scientific narratives in this way. His call for such a scientific undertaking has, however, been refuted directly by Wendell Berry in *Life is a Miracle*, and many non-scientists look at sociobiology as a highly controversial theory. Feminists, cultural anthropologists, and many religious leaders present serious challenges to the legitimacy of Wilson's scientific ideology, arguing respectively that such a position reinforces a patriarchal, scientific, and one-sided view of moral and cultural issues.

Wilson's call for a scientific ethic in relation to environmental issues, specifically biodiversity, is espoused in *Biophilia*. His call for a conservation ethic grounded in scientific understanding parallels Aldo Leopold's ideology, and harkens back to Thoreau's idea of nature as the refuge of the spirit. Wilson's version of environmental ethics adds a new dimension to these older ones: he situates it amid the knowledge of a more mature ecology, and focuses on the complex dynamics of both genetic coevolution and biodiversity. Wilson shares the straightforward understanding of humanity as dependent upon nature for survival with his predecessors, but comes armed with a more sophisticated understanding of the fundamentally intertwined existence of humans and their environment. Biophilia is the innate human tendency to affiliate with other organisms. From a biological point of view, humanity is an interdependent member of the complex energy cycles of the world ecosystem. To study this system, and to further our understanding of ourselves as a part of it, is for Wilson, the central task not only of the sciences, but also of human moral and religious activity. *Biophilia* posits that true meaning can only come from science. This is not an epistemological claim for the superiority of scientific knowledge. Wilson is setting forth the idea that as humans are biological organisms, what they find meaningful should itself be biological. This suggestion is at the core of Wilson's thinking; scientific understanding of the biological world allows humanity to renew its entire mode of being, in essence to invent a new religion.

Winter, Paul (1939–)

The music of Paul Winter defies easy categorization. A recent characterization of his work is “ecological jazz,” but his music has also garnered such titles as “chamber jazz” and even “symphony world beat.” Winter credits his fusion of styles to a combination of his background playing jazz and bee-bop in Chicago, his time living in Brazil, his frequent ocean trips with zoologist-friend Roger Payne to record the complex songs of whales, and his annual pilgrimages to visit famously self-sufficient Maine homesteaders Helen and Scott Nearing. Considering this eclectic and quintessentially postmodern blending of influences, it is not surprising that Winter has often been described as a “musical shapeshifter” (Oliver 1992: 76). Not only does his music cross music genres: jazz, bossa nova, world music, chamber music and, more recently, Celtic music, it also crosses artistic media so that his songs are often referred to as “sound paintings” or alternately “tone poems.”

Indeed, in his own personal life, raised a Presbyterian as a boy growing up in Altoona, Pennsylvania, and now a world traveler and longtime Zen meditator, Winter is no stranger to crossing genres in the combined realms of music and religion. Not unlike the prevailing patterns in American spirituality, Winter’s artistic and spiritual leanings are both energetically and unapologetically combinatory. A self-identified “Earth musician,” Winter explicitly and negatively compares singularity in sound to the environmentally detrimental practice of “monocropping” (Parmalee 1990: 17). Instead, Winter and his “Paul Winter Consort” of world musicians cultivate a kind of ecospiritual polyphony that brings together the voices of endangered species, as well as the voices of “endangered” musical instruments – symphonic instruments that are rarely heard in favor of the much more popular electronic and synthetic sounds that dominate today’s music sales. It is this commitment to what Winter calls “natural music” that helped give rise to the creation of Winter’s famed “Owlegy” – a composition dedicated to the preservation of owls and ancient forests, as played by “endangered” instruments.

For his CD *Prayer for the Wild Things*, Winter embedded the voices of 27 indigenous birds and animals into his music, creating a virtual “soundscape” of the Northwestern Rockies. Each participating creature is considered by Winter to be a “musician from the symphony of wildlife,” and each is brought to the foreground of the piece, then recedes into the mountain landscape. Not only do instruments represent animals in classic “Peter and the Wolf” style, but Winter goes one step further, allowing the animals to vocalize for themselves, as his human “Earth Band” echo these voices with their own humanmade sounds.

Winter's most famous work, the "Gaian Mass," was composed and recorded in alternate locations: in the Cathedral of St. John the Divine in New York, with its forest of gigantic stone columns, and also in the Grand Canyon, dubbed by Winter "the Earth cathedral." In both places, Winter has been fascinated by the dynamics of echo and the similarity and degree of "reverb" caused by both cavernous spaces as multiple voices come in contact with multiple surfaces. It so happens that both the Cathedral in New York and the cathedral of the Grand Canyon have the same eight-second reverb. This acoustic similarity carries both symbolic and artistic significance within Winter's work. The parallel acoustics unite the more institutional space of the Cathedral (connected with the history of the Church and more structured, formal forms of worship) with the freer, nature-identified spirituality inspired by the canyon space. This kind of nature-inspired spirituality has permeated American philosophical and cultural movements from the Transcendentalists, to twentieth-century back-to-the-landers like Helen and Scott Nearing, to contemporary New Age forms of worship (Albanese 1990).

By including actual echo and by using "echo" as trope in his music, Winter conjures a sacred antiphonal relationship with the land. This call and response and Winter's play of surfaces and sound evoke a sense of intimacy, a reciprocal love affair between the human and nonhuman world that imbues Winter's composition and performance. In many respects, Winter's commitment to the importance of so-called "natural music" or "Earth music" echoes David Abram's argument in *Spell of the Sensuous* that in modernity cultures ultimately end up losing "a common discourse that opens directly onto the evocative sounds, shapes, and gestures of the surrounding ecology" (Abram 1996: 139). For Abram, it is the move from oral performance to the written word that goes hand in hand with a discourse that becomes closed off to the "voices" of nature. In contrast to the kind of tone deafness Abram describes and a silencing of the natural world, Winter's inclusion of whales, loons, wolves, and wind effectively demonstrates an attempt to compose or rather *re-compose* a spiritual soundscape that is intrinsically "alive, aware, and expressive" in its planetary diversity.

Wise Use Movement

The term “wise use” was used by the first forester and chief of the United States Forest Service (USFS), Gifford Pinchot. It can refer to the “multiple use” doctrine that is supposed to guide the management of public forests, allowing recreation and resource extraction compatible with ecosystem health. But the more common contemporary usage of the term as the name of a movement, first applied by Ronald Arnold, a former Sierra Club activist and a major figure in the wise use movement, implies that the wise use of land overrides environmental constraints. This understanding owes much to James Watt, Secretary of the Interior under the U.S. Reagan administration, and founder of an early wise use group, the Mountain States Legal Foundation (MSLF). Although the wise use movement (called the share movement in Canada) has a diversity of groups and priorities, participants in the wise use movement agree that natural resources are here for human use and that immediate concerns hold priority in the “use” of land and resources. Some of the individuals and groups involved in the movement are motivated by religious concerns.

The “wise use movement” emerged first in the 1980s in the western United States as an alliance of disgruntled ranchers, loggers, hunters, off-road vehicle owners, gun owners, outdoor sports enthusiasts, farmers, land developers, and extractive industries united to fight a common enemy – environmentalism. The movement, which now reaches beyond its U.S. origins, includes those who desire more access to public lands, resent government regulation against the use of their lands, oppose environmental restrictions on free-market economies, dispute consensus scientific understandings of environmental threats such as global warming, and oppose environmentalism by claiming it is Pagan, a religion in itself, or anti-Christian. According to Richard Wright (1995) some even see environmentalism replacing communism as the next, great threat to liberty and claim that environmentalists are trying to establish a “one world” government. An early articulation of the movement’s goals was Alan M. Gottlieb’s *The Wise Use Agenda* (1989). The Cornwall Declaration on Environmental Stewardship (2000) provides an example of the ways in which conservative religionists support the movement.

The wide range of interests involved in these movements often pits “wise users” against the National Parks, the Environmental Protection Agency, the U.S. Forest Service and other federal and state agencies, as well as major environmental, religious and scientific organizations. From the perspective of environmentalists, however, state and federal enforcement and land management agencies are frequently viewed as supportive of wise use and corporate interests. Similar conflicts are seen around

the globe. In addition to trying to influence public opinion, media representation and legislation, gain members and protest current polices, other more intimidating tactics are sometimes used. Corporations involved in conflicts often request that media access and coverage be blocked or censored, as in the anti-old-growth forest logging campaigns in Victoria, Australia. Frequently lawsuits are filed. These range from money-and energy-draining “SLAPP suits” (strategic litigation against public participation) to lawsuits against environmental regulations. Wise use groups have argued in the courts, for example, that the U.S. Clean Air Act is unconstitutional and that Forest Service decisions to protect lands sacred to indigenous people for ritual use amounts to the establishment of religion and are therefore unconstitutional. Going beyond legal means, some participants in wise use groups have been engaged in the desecration of sacred sites, illegal logging and hunting, character defamation, harassment, death threats, and violence against environmental activists, as detailed in David Helvarg’s *War Against the Greens*. Public Employees for Environmental Responsibility (PEER) documents harassment, threats and violence on their website and publications.

Wise use groups are sometimes named in ways that seem to support environmental values. The Evergreen Foundation, the Wetlands Coalition and the British Columbia Forest Alliance, for example, are all industry fronts. The anti-environmental agenda of the movement can more clearly be seen in the titles of the books written by its proponents, such as *Ecology Wars* or *Undue Influence: Wealthy Foundations, Grant Driven Environmental Groups and Zealous Bureaucrats That Control Your Future*, by Ronald Arnold. Arnold is well known for two statements: “Our goal is to destroy, to eradicate the environmental movement,” and “Environmentalism is the new paganism. Trees are worshipped and humans sacrificed at its’ altar. It is evil” (*Boston Globe*, 1/13/1992). Arnold also claimed that there is a green conspiracy to eradicate rural America. In the aftermath of 9/11, he and other wise use advocates intensified efforts to have civil disobedience such as tree sitting and blockading logging roads declared “ecoterrorism” and urged stronger laws against such activities.

Arnold and Gottleib (who also promotes gun ownership rights) are both associated with the Center for the Defense of Free Enterprise (CDFE). The title of this organization, like that of Citizen’s for a Sound Economy (CSE), the American Freedom Coalition, or the Acton Institute of Religion and Liberty, illustrates the centrality of the defense of free enterprise and economic liberty, the links between wise use ideology and libertarianism, and the way conservative religion sometimes becomes intertwined with these efforts. The Competitive Enterprise Institute (CEI) proclaimed that its mission is “advancing liberty from ecology to the economy,” while the Cato Institute (called the most important environmental thinktank by the Wall Street journal) advertises its own with a banner reading, “Individual Liberty, Limited Government, Free Markets and Peace.” The Cato Institute focuses in part on “environment and climate change” (the term climate change is used to imply that it is just a natural part of the Earth’s history) and its staff includes a vocal opponent of global warming theory, Patrick Michaels, co-author with Robert Balling, of *The Satanic Gases: Clearing the Air about*

Global Warming. Cato, and others who frequently deny or downplay the existence of environmental problems, promote themselves as “eco-realists.” Wise-use groups and institutes, such as CATO’s and CSE, are funded in part by multinational corporations, including extractive industries and biotechnology. The Reverend Sun Myung Moon’s Unification Church, motivated by his enthusiasm for free enterprise capitalism, is a backer of groups such as the American Freedom Coalition which had ties to Arnold’s CDFE. Many of these organizations have close ties with various U.S. Republican presidential administrations, for example: U.S. Secretaries of the Interior James Watt and Gale Norton were both closely associated with MLDF, and the back cover of *The Wise Use Agenda* pictures author Alan Gottlieb with President George Bush. These close connections are evident in the religiously oriented Acton Institute, whose website claims to be a “leading voice in the national environmental and social policy debate,” while also saying that environmental activists want companies to “commit suicide” and stifle their rights to “economic initiative.” At a 2003 ExxonMobil shareholders’ meeting, Acton’s president, Catholic priest Robert Sirico (a former director of the LA Gay and Lesbian Community Center) spoke against interfaith activists, such as CERES (the Coalition for Environmentally Responsible Economies), who file shareholder initiatives urging corporations to improve their human rights and environmental records. Reverend Jerry Zandstra, director of Acton’s Center for Entrepreneurial Stewardship, praised the company on its “excellent” record in human rights and the environment. Acton also helped found the Interfaith Council for Environmental Stewardship (ICES), made up of

Jews, Catholics and Protestants, as a way to counter what it views as wrong and misleading religious environmentalism. ICES board members E. Calvin Beisner and Robert Royal have published influential books, *Where Garden Meets Wilderness* (Beisner 1997) and *The Virgin and the Dynamo*, which warn of “the use and abuse of religion in environmental debates” (Royal 1999, book subtitle). Beisner is a board member of the Committee for a Constructive Tomorrow (CFACT), whose website “boldly proclaims that the Western values of competition, progress, freedom, and stewardship can and do offer the best hope for protecting not only the Earth and its wildlife, but even more importantly, its people.” Both CFACT and Acton produce hundreds of radio spots on environmental issues. Many of the major groups, such as CDFE and Acton, fund conferences and have active publishing programs.

Acton, ICES, Sirico and Beisner are well known within conservative Jewish and Christian circles for the “Cornwall Declaration on Environmental Stewardship” (CDES), signed by two prominent evangelical Christians, Focus on the Family president Dr. James Dobson and Campus Crusade for Christ founder Bill Bright. The declaration was produced in order to respond to the Evangelical Environmental Network’s “Evangelical Declaration of Creation Care” (EDCC) (signed by other high-profile evangelicals as Cal Dewitt and the directors of World Vision and InterVarsity Christian Fellowship). The differences in the two documents are instructive: the Cornwall Declaration affirmed private property ownership and market economies,

while the Evangelical Declaration (1994) promoted “lifestyle choices that express humility, forbearance, self restraint and frugality” and “godly, just and sustainable choices.” The CDES prioritizes the needs of humans over nature, argues that free-market forces can resolve environmental problems and denounces the environmental movement for embracing faulty science and a gloom-and-doom approach. In contrast, the EDCC encourages Christians to become ecologically aware creation care-takers. Other differences revolve around the place and privileges of humans relative to nature, issues of biblical interpretation, the definition of stewardship, God’s sovereignty, and the worry that saving the Earth is replacing the central Christian emphasis on saving souls.

These disagreements reflect more than internal Christian conflict; the Cornwall Declaration reinforced the wise use emphasis on the ongoing improvement of the environment through human technology, the abundance of resources put here for human use, the privileged place of humans, and the opposition to seeing more-than-human nature as an idyllic, harmonious state that must be preserved. Other major targets by conservative religious opponents are environmentalists’ concern over overpopulation and animal rights (“pro-abortionists and animal rights advocates” are often presented as synonymous with environmentalism). Mainstream environmental and religious groups are viewed as radical. Acton staff member, Phillip DeVous, (2002) called the collaboration, between the Sierra Club (a “radical” group) and the National Council of Churches, to try to prevent oil drilling in the Arctic National Wildlife Refuge an “unholy alliance.” Other opponents charged that the EDCC held Christian doctrine hostage to an environmental agenda.

Richard Wright, a Harvard-trained scientist and evangelical Christian who wrote a widely used environmental textbook, responded directly to the wise use movement’s attack on the Evangelical Declaration in “Tearing Down the Green.” He argued that those who attack environmentalists use poor science and falsely accuse environmentalists of nefarious conspiracies, including of serving the anti-Christ by trying to bring about a global, totalitarian government. Rush Limbaugh, who in the 1990s and early twenty-first century had become the most widely listened to right-wing radio commentator in the United States, frequently has claimed that environmentalists are leftist or religious fanatics, and enemies of liberty. Such claims are common to both secularist and religious anti-environmentalists. The Former Idaho Republican U.S. Representative Helen Chenoweth, for example, in a speech delivered to the U.S. House of Representatives on 31 January 1996, attacked “environmental policies [that] are driven by a kind of emotional spiritualism that threatens the very foundation of our society.” She added, there is increasing evidence of a government sponsored religion in America. This religion, a cloudy mixture of new age mysticism, Native American folklore, and primitive Earth worship (Pantheism), is being promoted and enforced . . . in violation of our rights and freedoms.

This conflation of some of the religious and philosophical sources of environmental concern leads some conservative Christians to label deep ecologists George Sessions and

Arne Naess “eco theologians” (CFACT) and to warn Christians not to “let the trees do the talking,” as they think Native Americans and Pagans do. Environmentalists are frequently accused of “worshipping Creation” rather than the Creator.

Despite significant diversity within the movement, which includes both avowedly secular and explicitly religious voices, participants in the movement see environmentalists as threatening sacred values: either that of the American nation-state, the world’s guarantor of freedom, of free-market economics, or of true religion, or all three.

Women and Animals

Western cultures have theoretically equated women, children, animals, and “the natural” with one another and with the body. This constructed connection served and continues to serve as a means of oppression in patriarchal cultures. Why did this begin and where?

Historically, women’s seemingly more obvious reproductive functions resulted in women being identified as more animal-like in their bodily functions than men. Therefore, many cultures functioned under the assumption that women’s bodies supposedly intruded upon their rationality. Since most Western theorists construed rationality as the defining requirement for membership in the moral community, women – along with men of color and animals – who were seen as less able to transcend their bodies, were long excluded.

We cannot know precisely when and where this began, though a few argue that a matriarchy preceded patriarchy and that its overthrow – due in part to a change in human’s relationships with the other animals – enabled both women’s and animals’ oppression. Others argue against this interpretation. Some believe that through the domestication of animals, the role of the male in inseminating the female was discovered, and from this arose the idea of controlling women’s reproductivity. Rosemary Radford Ruether sees a connection between the domestication of animals, the development of urban centers, the creation of slavery, and the creation of the inequality of the sexes. Lori Gruen suggests various cultural and historical frameworks for these connections, including the shift from nomadic cultures to stationary agrarian communities with the accompanying increased demand for laborers; thus women became “breeders of a workforce.”

In response to the historical alignment of women and the other animals, feminist analysis at first chose to sever the woman–animal identification, asserting that women are not animals and must be seen as equally human as men. Since the 1970s, an alternative analysis has been proposed by feminists, primarily in the U.S. and U.K., that women’s oppression must be seen as a part of an understanding of the interlocking systems of oppression that organize the world (and the oppressed) by gender, race, class, and species, and that feminism, as a transformative philosophy, must embrace the amelioration of life on Earth for all life forms.

From this analysis, rich scholarly insights have arisen.

This entry can only briefly summarize some of them.

- The association of women, animals, and body manifests itself in violence on a personal level (domestic and sexual violence), and a cultural level (for instance, depiction of “meat” animals as sexualized bodies).

- The recent development of anthropornography (“depicting animals as whores”) takes place in a context of women’s sexual inequality, and illustrates the construction of inequality.

- Anti-violence interventions and theories will be inadequate if they ignore the control perpetrators gain by violence toward animals loved by the victims. In fact, by analyzing violence to the animals in the household, the deliberate nature of this violence is clearly established.

- Species, like gender, race, and class, is socially constructed, and should not be the basis upon which ethical decisions rest.

- Patriarchal science fosters biological determinism not only regarding women, but also regarding other animals.

- The defense of hunting by some environmentalists arises from its association with male self-identity.

- Falsely generic words (such as man and mankind) that elevate men to full human status must be analyzed alongside animal pejoratives for women (catty, bitch, sow, shrew, dog, chick, cow).

- A patriarchal culture feminizes animal victims; this explains the low status of animals confined for food.

The role of religion in maintaining these oppressions or as a source for liberation is much debated. Myriad questions are being posed within the ongoing dialogue. Is the resistance to examining the treatment of the other animals in religions a way of avoiding a recognition of the animality of human beings? Is the result of anthropomorphizing God that God and humans, especially male humans, are seen as more alike than humans and animals? Is it the case that the more theology moves from being androcentric, the less likely it is to be anthropocentric? Would a bodyaffirming theology justify the exploitation of animals for food, clothing, or entertainment? Can religious concepts of alienation, brokenness, and separation address the treatment of devalued bodies? *Could* theologies of relinquishment, for men in their control over women, and for humans in their control over the other animals, *emerge as* sources for embodied transformations?

As ecofeminist philosophies and theologies continue to engage these issues, the links between women and animals, and the reality of human beings as animals, is poised to remain in the forefront of ideological discussions and practical applications.

Wonder toward Nature

Broadly conceived, wonder toward nature includes awe and dread in relation to the cosmos, a sense not only of transfixion but also of the numinous in specific locations, a marveling over something remarkable or some “first moment,” and a felt loss of explanation before the unusual or mysterious. Wonder, then, is a crucial psychological state for bringing nature and religion together (though in this state nature will often be taken as more than ordinary and thus super-natural). Wonder is a matter affecting

Western theories of religion, and has been crucial in the construction of constituting modern notions of “primitivity.”

The acclaimed founder of capitalism, the Scotsman Adam Smith (1723–90), was first to devote a third of a treatise – his *History of Astronomy* – to the sentiment of wonder. Wonder, by his definition, is the response to “extraordinary and uncommon objects” (meteors, comets, and eclipses being of obvious singularity among them), and in humanity’s earliest state, “every object of nature . . . considerable enough to attract his attention” will be enough to imbue wonder in the “savage’s” mind (Smith 1982: 48–9). To anything quite overawing, such as lightning, simple people will respond with a reverence that approaches fear, being totally without the rational explanations known to men and women of the Enlightenment.

Smith imagined that “primitives” were very anxious lest they offend the gods. This was a position more famously accentuated by his near-contemporary Giambattista Vico of Naples (1668–1744). Vico speculated that both morality and religion first began when “Jove’s lightning bolt” struck with horrendous surprise while promiscuous couples were having sex, this happening at an early stage when humans were almost like beasts. The brilliant Vico, who could be said to have founded the theory of animism in a few brief passages in his *New Science* of 1744, did not stop with negativities, for he conceived the primitive mind to be one of “prodigious imagination” (*vigorosissima fantasia*), everything bearing a wondrous aspect because of an “ignorance of causes” (*ignoranza di cagioni*) (Vico [1744] 1959: 412). Smith would have agreed. He assessed many phenomena we now see as “perfectly beautiful and agreeable” what were in earliest times “the proper objects of reverence and gratitude,” inspiring wonder as proceeding “from some intelligent beings” (1982: 40–2, 48–9). And the Scot saw the absence of causal thinking as a key factor in this complex. The sentiment of wonder behind either “consternation” and “complacency” had arisen very early, as philosopher David Hume (1711–1776) doubtless influenced Smith to conclude that early humans were not able to make a connecting, “imaginal” bridge between events. This could

have occurred in much the same way as an eighteenth-century European rustic would wonder, given no explanation, over the peculiar movements of iron before a loadstone.

For the titular founder of the discipline of comparative religion, Anglo-German Friedrich Max Müller (1823– 1900), a century later, wonder was a wellspring of religiosity, but in his approach the Enlightenment outlook tended to be replaced by Romanticism. What he described as the natural “appreciation of the infinite” was the naive, childlike freshness with which the most ancient poets continually experienced their worlds. “A new life flashed by every morning before their eyes, and the fresh breezes of dawn [that] reached them like greetings wafted across the golden threshold of the sky.” Such new life was from “the rainer, the thunderer, the measurer,” or especially from those “bright beings, the Sun, the Sky, the Day, the Dawn . . . opposed to the powers of night and darkness,” this “contrast of light with dark being of very ancient date” (Müller 1899: 618).

Müller inferred what he took to be the earliest textual evidence of humanity’s spiritual life; namely, the signs of reverence behind the most ancient body of Sanskrit texts, the *Rig Veda* or Vedic hymns. Müller trusted little else but texts for revealing the nature of religions in the distant past, yet he was reacting against a more popular trend. For, by the late eighteenth century, the amount of ethnographic reporting on indigenous peoples had expanded exponentially, and the new fashion of evolutionism tempted many intellectuals to extrapolate from the most apparently primitive among contemporary indigenes back to the prehistoric origins of religion. Müller, however, was a decided “historist,” and he took a different tack by giving such priority to the Vedic hymns and what could be inferred behind them. On the other hand, he held the intriguing view that, long after the more-aware stage reflected in these hymns, many dispersed human groups lapsed into a confusion of thought – through a “disease of language” – that brought about the enormous, “curious array of belief systems . . . too often called savage,” found in the “anthropological religions” of tribal Africans, Australians, Pacific Islanders and the like (in Trompf 2002: 42). A true son of Romanticism, Müller placed the primordial impetus of an authentic wonder first, as response to a primal revelation, and the peoples his contemporaries were calling primitives and savages came only later.

Out of Müller’s views arose the common assumption that primitives, while they may be struggling with the connections of things, may also be very curious or wondering – but only “to get it wrong” (1962: 49).

This did not square, however, with the theory of Herbert Spencer (1820–1904), the English inventor and social evolutionist, arguably the first sociologist of comparative religion. Wonder, or even curiosity, he had decided by 1856, were not properties of the savage mind. That could be safely inferred even from the behavior of village rustics he observed while on his holidays, who, because they showed little interest in Spencer’s makeshift scientific demonstrations, led him to comparative insights about the reception of newly created goods. He likened the reactions of rural folk to the relative “indifference which low savages display, when shown looking-glasses, watches,

or other remarkable products of civilized life,” as missionary accounts had allegedly shown. “Surprise or curiosity are not the traits of the utterly ignorant,” Spencer argued (1904: 476–7). By the act of his imagination, or an extrapolation from an alleged relic in the English countryside both across to the inexperienced modern primitive and then backwards to a supposed “original” one, we find

Spencer representing “first peoples,” or the members of most small-scale, traditional societies, as duller of wit or as often lacking in curiosity and a sense of wonder – being the very opposite to Spencer’s ideal scientist, who is a person more naturally prepared for surprise and educated by higher religion to marvel in a civilized way.

Spencer’s social evolutionism, influential in the capitalist West, bears comparison with the theories of the founder-figure of communism Karl Marx (1818–1883), who was a protagonist of historical evolution (or development) in his own manner. Apropos wonder, Marx’s *The German Ideology* has history begin with a primal fear of overwhelming elements in the environment and end with complete mastery over both technology and sociality. Although Marx thought there were some reasons to admire the earliest societies – especially because they had not dissolved “their relations to the Earth” (1973: 497) – primitives are nonetheless in utter awe of external forces and inevitably create the gods out of them because they are at the mercy of the not-yet-controllable. Through fear, humans are naturally driven to a mutual (his friend Engels would add “classless”) dependence on each other, and from then on history is a story of lessened uncertainty and wonder, and increasing control over the environment.

With the turn into the twentieth century, the European projection of the “wondering savage” had taken on more various aspects. By then Oceania had come into the picture. What early field researcher R.H. Codrington told of central Melanesian notions of *mana* – that “power or influence, not physical,” belonging “to the region of the unseen” (1891: 118–19) – had been construed as an apprehension of the “supernatural” that surprised “the natives” in their daily round. Thus, while English religious thinker F.B. Jevons (1858–1936) felt compelled by the new ethnographic data to reject the (Müllerian) thesis that “primitive man lived in a state of perpetual surprise,” he thought it fair to assume that “at any rate occasionally” any unexpected, “startling frustration” in calculations during the “natural” routine of life would make primitives realize that they were “in the hands of a mysterious and supernatural power” (Jevons [1896] 1927: 18, 20).

The Scot James George Frazer (1854–1941) was having some effect here, because he had given back to the primitive (in spite of Smith and Spencer) a sense of “the experimental.” The attempt to work magic, for all the mistaken assumptions involved, was the predecessor to modern science (and was also prior to religion). For Jevons, though, it was implicitly the failure of expectations in a world of magic that induced wonder, and thus religiosity.

A famous English theorist of religion, R.R. Marett (1866–1943), paid homage to Jevons’ approach when he argued, almost a decade before Rudolf Otto in Germany,

that the word “awe” is “the one that expresses the fundamental religious feeling most nearly,” that sense of “thrill

. . . whereof the component ‘moments’ are fear, admiration, wonder, and the like, whilst its object is, broadly speaking, the supernatural” (Marett 1914: 8, 10, 13). The Melanesians’ *mana* was invoked – and, too, the comparably vague (and for Marett pre-animistic) conception of the supernatural among the African Masai, who not only took mysterious steaming holes as *ngai*, but also the white man Joseph Thompson, and his lamp as a sign of interest in indigenes’ wonder upon contact with outsiders. Marett was influenced by Scotsman Andrew Lang (1844–1912) and what he had written about primitive actions to the unexpected – and to the spooky. Marett consequently played down talk of magical experimentation and heightened his emphases instead on psychological states – on feeling and states of uncertainty before the supernatural.

The story of such European imaging has further developments in Continental and Anglophone theory. Austrian Sigmund Freud (1856–1939) speculated about the “omnipotence of thought” as common to both infants and savages (in his *Totem and Taboo*). Essentially he argued that one could infer “latent” psychological states in primitive peoples that were generated from the surprises of life “present to the senses and the consciousness” (Freud [1913] 1946: 122). The phenomenologist of religion, Dutchman Gerardus van der Leeuw (1890–1950), picked up on the inheritance of scholarship and stressed the primacy of wonder in religious consciousness; yet, like Freud, he pronounced on the greater suggestibility of primitives. For him, as a child of his times, “the natives” had a habit of over-exaggerating and letting their thoughts run away, as little-known expeditions to Melanesia – one by AngloAmerican psychologist William McDougall to the Torres Strait in 1898, and another by psychological anthropologist Richard Thurnwald to German Neuguinea in 1906–1909 – had already been designed to confirm.

Less denigrating models were canvassed by the German theologian Rudolf Otto (1869–1937) and the Swiss psychologist Carl Jung (1875–1961). For Otto the feeling of “something ‘uncanny,’ ‘eerie’ or ‘weird’ . . . emerging in the mind of the primitive human being forms the startingpoint for the entirety of religious development in history” (Otto [1917] 1959: 29). Of this shuddering before the numinous, however, apprehension of “the ‘supernatural’ has nothing to do with the case,” according to Otto. In qualifying Marett, Otto contended that this was “much too imposing an expression” for the primitive case. What he called “the vestibule of religion” was the product of “naive, rudimentary fancies” paying “homage to natural objects that were frightening or extraordinary” (Otto 1959: 134–5). Otto, however, wrote of this incipience of holy dread less out of empirical interests than out of a desire to solve a philosophical problem, that of giving the religious sense a status *sui generis*; and thus the primitive mind, embodied above all in the savage wonderer, was constituted as preface to high theological insights.

As for Jung, what Otto conceives more in terms of outer relations, with primitives responding to shadows and lakes, and eventually theological minds to the “Wholly Other,” comes to be transformed in analytical psychology into interior events. Prim-

itives operate in a world affected by “unconscious regulators-dominants” that invade the inner numinosum, generating astonishment, awe and fear. This view, however, entailed Jung’s problematic subscription to Frenchman Lévy-Bruhl’s theory of the indigenes’ “mystical participation” with nonhuman agencies in this cosmos, or pre-logical mentalities that conditioned the fearful images and phantasms erupting as interior astonishments in dreams.

The goal-posts for the better understanding of *les sauvages*, in any case, tended to be shifted in accordance with specialist games played in European academic disciplines. That earthier English soul D.H. Lawrence (1885–1930), for one, who was a theorist of religion in his own right, and who knew some Jung but surprisingly never read Freud, wondered where bodies had gone in all this. He apparently wanted primal wonder to be relocated in the close encounter with or near touch of nakedness, when “blood,” not just mind, was thinking (Lawrence [1923] 1971: 102–16). When blood did come into it further down the track, the interest in awe and wonder took on sinister-looking undertones, and the Dionysians’ cultivations of fascination for the lost pagan *mysterium* led on to the sacred Teutonic grottos of the Nazis, and the tragic misappropriations of Otto’s *Das Heilige*. Concern for wonder, on this account, began to lose what momentum it had left. If the *unheimlich* (uncanny) could metamorphose into the *grausig* (horrible) politically, that had to be reckoned with experientially. Awe, dread and curiosity became in psychological texts “mixed emotions” – of surprise and fear, fear and expectancy, surprise and acceptance respectively

– sometimes indistinguishable from other mixed emotions, and wonder hardly coming into view at all.

The American psychologist B.F. Skinner was quick to categorize wondering under “superstition,” when, in consolidating earlier work by fellow countryman Thorndike and the Russian Pavlov, he found animals were “startled” to find reinforcement (food availability) by performing some action “totally irrelevant” to the norm (of pressing a bar), and so by experiencing what in the language of Jevons and Marett “defeats reasonable expectation” (Marett 1909: 12).

The Western intellectual community was losing its own sense of wonder – symptomatically perhaps, considering the Era of Violence – and from Durkheimian talk about collective excitations or effervescence to fancy new language about “cognitive engrossment” and “effortless dissociation,” wonder was obscured behind other categories rather tangential to it. It apparently was being “disspelled” by hundreds of a hundred-and-one photographic books, by the exponentially quickened appearance rate of new inventions, and by an ethos combining smart technology with the blasé. It has just managed to hold on with the naive delights of children; and it somehow remains as a sense of “political correctness” when a person realizes that he/she should not dupe others with “tall stories” or play on their susceptibilities for too long.

Reckoning that the culture of high technology has subtly and tragically suppressed our older sense of wonder, Rollo May holds that social psychological health in the West is under threat. The disenchanting of the world, another way of describing the decline of

wonder, seems symptomatic of the decay of religion itself. Paradoxically, the globalized access to new consumer goods from Western-originated markets has produced reactions of religious wonder among First Peoples and in other quarters. “Cargo cults” of various kinds come to mind, these not only being confined to Melanesia; and one contemplates the recently emergent Indian goddess, Santoshi Mata, to whom one prays for new commodity items. In all such reactions, however, nature portends to be the sufferer and the nexus between wonder and nature is impoverished. In this light, it is no wonder there are religious voices calling us to attune our attentions afresh to the wonders of creation (e.g., Matthew Fox), depth ecologists persuading us that we should treat planet Earth as a living being (J.E. Lovelock), and philosophers encouraging us to “re-enchant” nature (e.g., Morris Berman).

World Conference of Indigenous Peoples (Kari Oca, Brazil)

The religious traditions of indigenous peoples of the world weave together religion and nature. The extent to which these traditions are still observed today depends both on the political and economic contexts in which they are now situated, and the degree of dedication of regional spiritual leaders to conserving a traditional heritage at variance with contemporary cultural ideas and practices from the dominant societies in which they are located. In the Americas, for example, after centuries of efforts by EuroAmerican religious and political leaders to eradicate American Indian rituals and erase Indian culture; centuries of taking away Indian lands whose boundaries had been guaranteed by signed treaties; and more than a century of government and business control over economic development on those lands, the people in many Indian communities live in poverty and suffer the ravages of unemployment, family destabilization, alcoholism, dilapidated housing and dependence on government assistance granted at the whims of political authorities. Federal government statistics on employment and poverty witness to the state of Indian lands and communities. The casual traveler through “Indian Country” in parts of the United States, and non-Indians living on or near reservations, often note the poverty and environmental degradation of such areas – but often without probing their underlying causes. Despoiled terrain and depressed people in these contexts do not mean that native cultures reject rather than retain traditional values; rather, they reveal the chasm between those values – sometimes maintained by only a few, often termed “traditionalists” – and perspectives and practices absorbed from or imposed by the wider social milieu.

In this situation, Indian peoples in the Americas (and in

Indigenous Voices from Kari Oca

Why do we call animals, birds, fish, trees, and plants our relatives? Because we believe we are intrinsically related. And by calling them our relatives, we show respect for our environment and the world in which we live. Life is community.

Joagquisho (Chief Oren Lyons), Haudenosaunee Nation (Six Nations), United States

In the spiritual life, what we see and what we follow are the instructions that were given to us when the Peacemaker came. He came to this world and he instructed us in the things we must follow . . . The Creator created the world, the universe, and put

things here for our benefit. We must give thanks to the Creator for all the things he has given us . . . We need to seek a balance between the spiritual and the political. There should be no separation of spirituality from political or social life. Americans have two houses, one for government and one for prayer. Our people keep them together. *Leon Shenandoah, Tadadaho (Chief of Chiefs),*

Haudenosaunee Nation

The forests, which are still preserved as a common reserve for the people of the world, are mostly in indigenous territories. Because we live in the natural world, we treat the natural world as our Mother. In Panama, in the last ten years, the desertification has been great. The forests that remain are on indigenous lands.

Atencio López, Cuna Nation, Panama

We, the children of the Earth, have come to share with the world and the United Nations our way of thinking, our visions, our way of life, an alternative. We do not speak of the “environment”; we speak of the spiritual and physical world in which we live, a territory in which people and nature are interrelated. “Land” is only the soil, but a “territory” is land in cosmic relation with nature, with rivers and animals and air and people, a place in which all are related. “Territory” means also our language and our values. We indigenous people are protectors and keepers of the territory, the “environment,” because we are part of it.

Valerio Grefa, Ecuador

If we have no water, we have no life. We are responsible for seeing that the lives of generations to come will be possible. Our individual lives are a part in time of the longer life of the people. If men create an environment that harms us, the life of the community will end.

Pauline Tangora, Maori, Aotearoa (New Zealand)

John Hart (other parts of the world) began in the twentieth century to reaffirm their history and their environment-related spirituality. This took various forms. Some activists have used language as a means of social transformation, cultural affirmation and political regeneration: recovery of their native tongue, and teaching it in native schools; using “nation,” rather than “tribe,” to refer to their people, focusing thereby on treaties as agreements between sovereign entities; and transforming the word “Indian” into a transnational reference to native nations and individuals, although usually replaced by a specific reference to their own ethnic identity (Lakota, Hopi, Haudenosaunee, Musko-gee, for example) in describing their particular origins. Others have focused on renegotiating treaties and economic contracts, using Indian lawyers rather than depending on advice from the Bureau of Indian Affairs and the benevolence of corporate attorneys; and on filing successful lawsuits against federal and state governments. Numerous American Indians (including Hopi, Haudenosaunee, Lakota and Dine’) have used their own national passports when traveling abroad, beginning in the 1980s, rather than U.S. passports; these have been accepted by foreign governments as official credentials.

Concerns and efforts such as these led to the organization of the “World Conference of Indigenous Peoples on Territory, Environment and Development” which was

held in 1992 at Kari Oca, a site on the outskirts of Rio de Janeiro, Brazil, during the week immediately preceding the United Nations Conference on Environment and Development (UNCED, otherwise known as the “Earth Summit”). Indigenous leaders from throughout the world, concerned about devastation of Earth, which peoples from North America referred to as a sacred “Mother Earth,” and peoples from South America called “Pacha Mama,” met to address issues of sovereignty, conservation and restoration of their lands, intellectual property, racism, and cooperation with non-Indian peoples to care for the Earth environment and promote concern for the human rights and cultural identity of native peoples.

During preparations for Rio, indigenous representatives had urged the UN to speak not of “indigenous people” but of “indigenous peoples,” thereby acknowledging the diversity of peoples throughout the world and the responsibilities of nations to respect their lives and culture

– including their traditional nature-based spirituality – and the territorial and ecological integrity of their land bases.

At the Kari Oca site, some 650 indigenous representatives celebrated their cultures from 25–30 May 1992. Through diverse religious ceremonies incorporating elements of pristine creation, they offered prayers to the Creator and Mother Earth, and pleaded for help on behalf of animal, plant and bird life; some sought the healing power of herbs and natural forces. They spoke of seeking freedom to conserve and express their spiritual beliefs and engage in their religious rituals. In a nod to contemporary conservation efforts, solar-powered lights illuminated the dirt roads at night with their stored energy.

Marcos Terena, a leader from the Terena people of Matto Grosso, Brazil, was a conference organizer, the Coordinator of the Brazilian Intertribal Committee, and the elected spokesperson to address the Earth Summit on behalf of the World Conference of Indigenous Peoples. In an interview after the Kari Oca meeting, he emphasized the relation between religion and nature:

We have organized this global conference because we did not have space within the United Nations, or in the debates of the NGOs [non-governmental organizations], and because we, as indigenous peoples, wanted to be treated in a specific manner, in a special manner, as peoples who know nature . . . We, the indigenous peoples, for many years, have always had a harmonious relationship with nature, from which we have taken our sustenance – not only material sustenance, but also our spiritual resistance and sustenance. Many people, including religious people, do not understand what we mean when indigenous peoples speak in this way. What we mean is that we do not have a “religion.” We do not have a “church.” We have only our spiritual power. Everyone has their spiritual power. But now [nonindigenous peoples] are far from their spiritual power. They are much closer to their technological and scientific powers. Because of this, they cannot know what nature and Mother Earth want to say. But we, the indigenous peoples, have tried to show that in daily practice we the indigenous peoples are knowers of nature and also that our resistance, our strength comes from a spiritual relationship with nature.

The indigenous peoples have suffered a great rejection, a great genocide . . . The indigenous culture previously was treated as folklore, but now we have been able to demonstrate that our cultural force represents our own dignity as a people. If we can demonstrate this day after day, we can also demonstrate that indigenous culture is something very alive, very strong, that has sustained us in this time. We are always joined in a perfect relationship of harmony with nature and with Mother Earth (Interview with and translated by author 30 May 1992, Kari Oca village, on the last evening of the event).

On the final day of the conference, the indigenous peoples from around the Earth issued the "Kari Oca Declaration." The declaration expressed the intergenerational consciousness of traditional cultures when it declared that indigenous peoples "walk to the future in the footprints of our ancestors." The document affirmed cultural and historical continuity, and a claim on native territories, by stating that those footprints are "permanently etched upon the lands of our peoples."

Indigenous peoples' human, territorial and civil rights, even when supposedly guaranteed by treaties, often have been violated by national governments in which native lands are situated. The Kari Oca Declaration condemns rights violations by asserting that indigenous peoples "maintain our inherent rights to self-determination," despite "centuries of deprivation, assimilation and genocide." On their lands and territories, they maintain "inalienable rights" to their waters and to all resources, and profess their "ongoing responsibility to pass these on to the future generations."

Earth Summit organizers had sought in vain to have the United Nations delegates approve an "Earth Charter" that would promote ecological integrity and the well-being of the biotic community. At Kari Oca, the assembled delegates were successful in promulgating a 109-point "Indigenous Peoples' Earth Charter." In it, they asserted their rights to their traditional manner of life and their spiritual way of life, beginning with a forceful demand to "the right to life." They noted that their territories are "living totalities in permanent vital relation between human beings and nature." They stated that the UN Convention on Genocide must specifically include genocide against indigenous peoples. The "Indigenous Peoples' Earth Charter" recalled the link between land, spirituality and selfdetermination by asserting, "Indigenous peoples were placed upon our Mother, the Earth, by the Creator. We belong to the land. We cannot be separated from our lands and territories." The charter called for the establishment of an indigenous peoples' environmental network; condemned the dumping of toxic wastes and nuclear wastes on native lands; called for the return of indigenous peoples' human remains and artifacts to the original peoples from which they had been taken; asserted that "traditional knowledge of herbs and plants must be protected and passed on to future generations"; and stated that indigenous peoples should be free to use their own development strategies, ones which would promote "economic and ecological viability." (In the U.S., ideas from the "Indigenous Peoples' Earth Charter" have been put into practice by such organizations as the International Indian Treaty Council NGO, founded in 1974 and with offices now in San Francisco, California, New York

City, and Palmer, Alaska; and the Indigenous Environmental Network, founded in 1991 and headquartered in Bemidji, Minnesota.)

The Kari Oca gathering was important for six significant accomplishments. It provided a forum for indigenous peoples to exchange particular and universal spiritual insights and to integrate them with diverse socialpolitical-ecological-economic perspectives; it established a foundation for and inspired ongoing collaborative work; it reinforced an ongoing pan-Indian sharing of religious perspectives and ethical values; it strengthened international indigenous cooperative efforts to promote the material well-being of native peoples, particularly through rights to natural resources and territorial sovereignty; it affirmed global native efforts to weave together nature-oriented spiritual values, environmentrelated religious ethics, and indigenous communities' efforts to conserve and control natural resource use and to retain religious traditions; and it taught peoples of nonnative cultures about indigenous concerns for territorial and spiritual integrity, both linked to a profound respect for Mother Earth. Although the Kari Oca ideals are still, for the most part, visions of what the future might bring, Indian traditional spiritual leaders, social activists, NGOs, and local grassroots organizations are planning and working to make those visions a concrete reality in the lives of their peoples.

World Council of Churches and Ecumenical Thought

The institutional center of ethical thought about environmental issues inside the World Council of Churches is the working group on Justice, Peace and Creation. Theological and ethical ecumenical thought relevant to environmental concerns has a wide base and a long history, which is embedded in the ecumenical thought of the twentieth century. One can trace the history of ecumenical thought through the various conferences sponsored by the WCC in the decades since World War II, key discussions and decisions taken at Central Committee meetings or assemblies of the WCC in the last decades, and through publications of the WCC and of the people related to it. One can similarly trace ecumenical environmental thought in this way and also through the participation of WCC staff and those of member churches in such events as the United Nations environmental conferences in Rio de Janeiro in 1992, and Johannesburg 2002.

The environmental thought of the WCC is closely related to, and in close conversation with, long-standing concerns of the WCC. It reflects the ongoing attempt of the WCC to develop overarching ethical themes which encompass in different ways the almost 400 member churches of the WCC, and thus reflect the global reach of the organization, as well as reflecting the centrality of its often-stated ethical commitment to justice, especially for the poor and the weak around the world.

While its ethical concerns have varied according to the issues of the times, one finds in the ethical thought of the WCC an ongoing interest in global economics and an often-stated concern for the uneven and unjust effects of capitalism on communities and individuals. This concern has changed shape according to the times, so that what was once an ethical critique of colonialism and Northern domination of Southern economies currently takes the form of a thoroughgoing critique of economic globalization, and corporations and international financial institutions which impose their logic and their will and demonstrate little or no concern either for the life of local communities or for their natural environments.

Another ongoing concern of the social thought of the WCC directly related to issues of the environment is that of science and technology. As was made clear in the wellknown conference, "Faith, Science and the Future," sponsored by the WCC which took place at M.I.T in July in 1979, ecumenical thought is concerned about the many ways in which both science and technology can escape community controls and aims, thus achieving a kind of autonomy that can result in the undermining of central values and practices relating both to the human social world and the natural environment.

In contrast to those who would let science and technology develop autonomously, ecumenical thought has stressed the inescapable moral responsibility human beings have for the social world in which they live, including the responsibility over the developments of science and technology. Such developments often largely determine human social relationships and relationships with the natural world, and cannot be left to develop on their own.

While members of the WCC work closely with other religious and secular groups, it is clear that the root of concern for the environment in ecumenical thought is a shared Christian conviction that nature is God's creation, and is therefore sacred, possessing its own worth which cannot be determined by humanity. The sacredness of nature means above all that it is to be cared for and not ruined by human beings, who themselves are of course a part of nature. Thus faith communities can be and should be sources of values that are alternative to those that see nature as simply a resource to be exploited for human ends of pleasure and commerce. The Orthodox Churches have contributed considerably to this ecumenical theology of nature.

While the WCC member churches and staff often work with others to actualize their values, the WCC has also established several programs of its own which deal directly with issues of the environment, such as the WCC Climate Change Program, which started in 1988. The WCC has also sponsored programs and research on mobility, and on biotechnology, nuclear arms and genetic engineering.

The title of various programs and conferences of the WCC in the last several decades demonstrate both the continuity and the change in ongoing ecumenical environmental thought and action. In the 1970s the WCC developed the ethical goal of a "Just, Participatory and Sustainable Society." In the 1980s it talked about "Justice, Peace and the Integrity of Creation." In the 1990s the phrase "The Theology of Life" described a decentralized, contextual, community-based approach to the integration of these same basic elements which are critical for what ecumenical thought calls sustainable communities.

One strength of ecumenical environmental thought is clearly this long-standing insistence on keeping the values of justice, sustainability, peace and environmental responsibility together, and relating them to other issues such as science and technology, capitalist development, and globalization. Another unique strength is the incredible diversity of the experiences of its member churches around the world which require ecumenical social thought, including ecumenical environmental thought, to be methodologically both very general and very specific and contextual simultaneously.

The diversity of experiences and contexts as well as theologies and interests contained in the ecumenical movement which make it so rich can also make it difficult for substantive ecumenical environmental ethics to move ahead. It is difficult to achieve ethical consensus across the many kinds of diversity of member churches. It is also difficult to hold member churches accountable to each other in concrete efforts to achieve in their own contexts and communions some of the goals to which they have agreed in voting for general statements of the ruling bodies of the WCC.

World Heritage Sites and Religion in Japan

Adopted in 1972 for the protection and preservation of precious natural and cultural sites; the World Heritage Convention of the United Nations Education, Science and Cultural Organization (UNESCO), thirty years after its founding, had inscribed 730 properties (563 cultural, 144 natural, and 23 mixed “cultural landscapes”) from 125 countries on the World Heritage List. Nominations for World Heritage designation require well-documented governmental commitment to protect a site in perpetuity, clear and undisputed boundary surveys, and unambiguous arguments for the “outstanding uniqueness” of sites representing certain historical, aesthetic, or scientific genres.

Though in its formative years World Heritage selections were largely informed by Western aesthetic notions favoring monumental architecture and national parks, more recently UNESCO has worked to counterbalance this EuroAmerican bias by including “intangible” heritage such as sacred mountains, ritual performance traditions, and prayer (UNESCO 2001:2).

Japan’s World Heritage sites

By 2003 the World Heritage Convention had recognized eleven Japanese sites, including Hiroshima’s Peace Dome, Okinawa’s Ryukyu castles (gusuku) and Yakushima’s ancient cryptomeria forests. The sacred Kii mountain range running through Mie, Nara and Wakayama prefectures, with its unique combination of ascetic training grounds and lush forests, was nominated for consideration as Japan’s twelfth designation.

Shugendô Mountain Asceticism

Asceticism as practiced in Japan’s Kii mountains, known as Shugendô (“The Way of Acquiring Supernatural

Power”), is a marginalized tradition that borrows selectively from Buddhist, Daoist, and Shintô sources. None of these borrowings is “final or authoritative” – when cosmology does not fit natural mountain formations, writes Paul Swanson, “so much the worse for cosmology” (Swanson 1981: 79). Denying themselves adequate food and sleep

during long, treacherous climbs, Shugendô practitioners perform extreme austerities to access patron deities' spiritual power for worldly benefits.

Though Shugendô has no founder or formal doctrine, the basic procedure for achieving catharsis and healing is explained by priest-guide Gojô Kakugyô like this:

You must discover the Buddha or deity within each of you. Weep for all the words left unspoken, the acts unfulfilled. Recognize your smallness in the face of the beauty and grandeur of great nature. This is the essential meaning of *sange* (repentance, recognition). If you cannot apologize face to face, apologize to the mountains, stones and rivers. But above all you must weep (*naku*). Only by shedding tears will you re-emerge whole (interview, Yoshino Japan, July 2002).

Humankind, animals, supernatural beings, and great nature exist in mutual interdependence, connected by the ability to weep. Because the individuals from whom practitioners sought forgiveness are no longer living or else their relationships are too chaotic, practitioners welcome the empathy and contemplation nature affords. Joblessness, infertility, alienated family relationships, and disquieted ancestors are common motivations for participating.

Mythmaking Potential of World Heritage

Throughout history, Shugendô has reinvented itself in response to proscription, ideological attack, and followers' changing needs. Priests at Kimpusen-ji temple (Nara prefecture) cleverly sought UNESCO's aid to imbue its sacred mountain Mount Omine with the aura of World Heritage. If successful, the designation will have honored and protected a pilgrimage trail (the Okukake) that neither the Bureau of Cultural Affairs or Nara Prefectural Government planned on designating as National or Prefectural Cultural Properties. UNESCO designation, said Tanaka Riten-san, the priest who initiated the nomination, is a critical step toward reclaiming Japan's religious consciousness "thrown out" (*tsuterareta*) by American Occupational forces' separation of Church and state (interview, Yoshino Japan, July 2003). Terence Hay-Edie's analysis of a Tibetan minority in Nepal finding opportunities for "new mythmaking exercises in world heritage ordered space," illustrates a similar convergence between UNESCO and marginalized communities' interests in heritage protection. In both cases, claims for uniqueness and authenticity rested upon stewardship of sacred mountains (Hay-Edie 2001:3).

Prior to the Kii peninsula's World Heritage nomination, an active community-based campaign promoted pride of place, cleanliness, and keeping its festivals well attended. Other voices from within and outside the community, however, questioned UNESCO's rhetoric of "promoting peace and security in the world through collaboration among nations" while ostensibly appropriating Japan's sacred sites for a global consumer market. Though UNESCO strives to help local and international organizations convert its ideals into effective "instruments for action," as in the case of Biosphere Reserves

which Ron Engel discusses in these volumes, critics such as McGuire have charged that Japan's World Heritage designations have strayed from UNESCO's founding principles of protecting endangered sites and degenerated into a system of elite cultural prizes. Far from being endangered, Japan's World Heritage sites have long been protected by the domestic cultural property system and have been designated to boost sagging tourist markets. The resultant tourist deluge has been so great that some sites actually became endangered after UNESCO designation. On Yakushima, for example, hordes of mainland day-trippers have trampled sacred cryptomeria trees' exposed roots, forcing caretakers' to construct unsightly wooden rampways around the trees.

Wakayama's Environmental Crisis

Tateishi Kôshô-san, another Kimpusen-ji priest, has been successful manipulating the forces of World Heritage designation to protect the natural environment in nearby Wakayama. Among his devotees are individuals diagnosed with terminal lung cancer and heart failure who recovered completely after performing austerities under Kôshô-san's guidance. Kôshô-san is frequently described as "wild" (*yasei-teki*), "aboriginal" (*senjumin-teki*), and an "authentic mountain ascetic" (*honmono no yamabushi*). He established his own sect called "Shizendô" ("The Way of Nature") blending Shugendô with yoga, environmentalism, and dance. His spiritual practices are grounded in criticisms of Japan's environmental exploitation, cultural chauvinism, and floundering national education system. The Shugendô "boom" that began in the late 1990s, occasioned partly by UNESCO designation, has given Kôshô-san the ear of a growing international clientele who discovered Shugendô on the internet.

Kôshô gives greatest priority to protecting Wakayama's natural environment. He has been a strident critic of the Bureau of Cultural Affairs and prefectural government's declaring prominent religious sites "Important Cultural Properties," but then creating special laws and funds to protect only individual sites. This has left a mess of the overall environmental scene in surrounding areas. Former sacred peaks and riverbanks have been smashed into gravel pits. Over 50,000 used *tatami* mats were dumped into a ravine, creating a thirty meter high "*tatami* mountain." Junked buses and cars protrude from sacred waterfalls. Meanwhile government officials congratulate each other about forthcoming World Heritage designations to protect sacred peaks.

A major problem Kôshô-san and Wakayama residents face occurs when corporations buy land in the countryside promising to compost *tatami* mats or build dairy farms but instead carve gravel or dump illegally. Locals upset by these practices have been too weak, frightened, or poor to respond effectively.

Enlisting the Help of Local Bureaucrats and the Media

Kôshô-san has been successful working with local public officials, television and print media to raise awareness about Wakayama's environmental problems. In 1996 he first confronted the Japanese mafia who created these dumping grounds – a single man standing against wealthy corporations. Blowing his conch shell, reciting sutra, and with the force of Shugendô's patron deities Zao Gongen and Fudô-myô-ô behind him, he tried to stop them. At first his adversaries were amused and simply continued. But after getting the public officers and reporters behind him his movement gained traction. The tatami mountain was relocated to a legal dumpsite in 1996; by 1998, Kôshô'san and his environmental team bankrupted three corporations' gravel production ventures.

Spiritual Eco-tourism

Kôshô-san has kept meticulous records of media reports documenting his activities and shows practitioners damaged sites where trucks and machinery remain. He asks, "Is *this* World Heritage?" Seeing ascetics perform ablutions in a sacred waterfall with a protruding Toyota Land Cruiser provokes a direct, spiritual impression that statistics cannot convey. He hopes clients will appreciate the area's natural beauty and help protect it. Kôshô-san's efforts are a type of spiritual eco-tourism. He encourages university students who participate to choose environmentally responsible careers. After performing austerities in Wakayama's ancient forests to gain self-knowledge and overcome depression, students develop a sense of environmental stewardship. He appeals to their desires for rigorous exercise and communion with wild nature, but then gives them spiritual and ecological guidance which helps "green" their worldviews and consumer habits. Kôshô-san has also seized upon foreigners' interests in protecting Kumano's natural environment to motivate Japanese people who might not otherwise recognize its value.

Conclusions

In his role as ascetic mediator between environmentally destructive corporations and concerned locals, Kôshô-san has raised questions and confronted practices ignored by others. Fortified by austerities performed in the local mountains and waterfalls, Kôshô-san appears to be uniquely qualified to assess and respond to Wakayama's environmental crises. He leverages the potency and prestige of local and national media outlets, divinities, and foreign clients to protect Wakayama's natural environment. Kôshô-san is in spiritual kinship with similar charismatic reformers in Japanese religious history such as Ippen and Kukai, as well as with contemporary spiritual leaders

in global environmental resistance movements, such as the Dalai Lama and Chief Oren Lyons. Local individuals with global vision and savvy media skills, like Kôshô-san and to a lesser extent Tanaka Riten-san, have mobilized UNESCO's universal vision of World Heritage to advance their own political agendas and inspire a generation of spiritually inclined environmentalists in Japan and abroad to protect their ascetic training grounds in the Kii Mountains.

World Pantheist Movement

The World Pantheist Movement is an international grassroots membership organization promoting a completely naturalistic religious response to nature and the universe, with nature as the central focus of beliefs, practices, activities and ethics.

The WPM emerged from public interest generated by the pantheism website of its founder and president, United Kingdom environmentalist Dr. Paul Harrison. It was incorporated in the U.S. in 1998, and opened for membership in 1999. Its core beliefs are incorporated in the Pantheist Credo, a statement drawn up democratically by a group of 15 volunteers and revised at intervals.

The pantheist credo begins with a statement of reverence for the self-organizing universe's overwhelming power, beauty and fundamental mystery. It views all matter, energy, and life as an interconnected unity. It asserts that humans are an integral part of nature, which we should cherish and preserve in all its magnificent beauty and diversity, living in harmony with nature locally and globally. Acknowledging the inherent value of all life, human and nonhuman, it urges that all living beings should be treated with compassion and respect.

The credo's "social clause" asserts that all humans deserve a life of equal dignity and respect, and actively endorses freedom, democracy, justice, and nondiscrimination, in a world focused on peace, sustainable ways of life, full respect for human rights and an end to poverty. It supports religious freedom and the separation of religion and state.

The WPM credo has a strongly naturalistic base. Nature, the entire living and non-living universe, is all that exists. There are no supernatural entities and no separate spirit realms. There is a single kind of substance, energy/matter, which is vibrant and infinitely creative. Consciousness and mind are emergent qualities of energy/ matter. The senses and science are our best means of developing our ongoing knowledge of the universe, and the most solid basis for aesthetic and religious feelings about reality. Nature is seen as the only real basis on which religious feeling can be built.

Death is also viewed naturalistically, as a return to nature through the natural recycling of our elements, which should be facilitated by cremation or natural burial in simple linen shrouds or wicker baskets. There is no afterlife for the individual consciousness, but we live on through our actions, our ideas and memories of us, giving us a powerful incentive to do good.

The credo is not a requirement of membership, it is a "notice on the door," a guide to core WPM tenets for people who are thinking of joining. These beliefs are closely related to those of deep ecology, religious humanism, religious naturalism, Unitarian

Universalism, and modern Western versions of Stoicism, Daoism and Zen Buddhism, and the WPM welcomes membership by anyone who self-describes as one of these.

Ritual is optional in the WPM and there are no prescribed practices. Ceremony is seen not as magical placation of a supernatural being or beings, but essentially as self-expression of reverence and belonging. Members enjoy complete freedom of expression, and this may vary from nature walks, through individual meditation within nature, to shared organic meals or even pagan-like rites of a purely symbolic character. Some members are comfortable using religious terms in pantheistic ways, while others avoid them. The WPM aims eventually to provide a network of civil celebrants for nature-oriented weddings and funerals. As of 2003 this was limited to authorizing members to celebrate weddings and funerals on behalf of friends and relatives.

Many of the WPM's members are active environmentalists, but the organization also directly facilitates naturerelated activities. It encourages members to join its group, saving wildlife habitat by daily clicking at the Ecology Fund's website. By summer 2003 this group had saved 25 acres. This activity is funded by sponsors. The World Pantheist Movement itself sponsors this aspect of Ecology Fund and of Care2's Save Rainforest sites, and by summer 2003 had saved an additional 62 acres in this way. Finally, in association with the National Wildlife Federation in the United States, the WPM encourages its members to set aside land (even small amounts) for wildlife, through wildlife-friendly gardening and sustainable management in the interests of native wildlife. So far 42 acres have been dedicated to wildlife.

The WPM also encourages direct contact among members and other pantheists. Local groups tend to meet in natural settings for walks, picnics, star watching and so on. The WPM set up the first generic pantheist mailing lists, the pantheist Usenet list, as well as almost sixty mailing lists and bulletin boards of its own devoted to discussion, local activities, specific topic areas, and organizational development.

World Wildlife Fund

– See World Wide Fund for Nature (WWF).

World Wide Fund for Nature (WWF)

The World Wide Fund for Nature (World Wildlife Fund in the U.S.) has organized and supported a series of initiatives on religions and conservation, to build new partnerships with the world's faiths in the struggle to save the natural world. The first event was an Interfaith Ceremony in the Basilica di S. Francesco in Assisi, Italy, organized as part of WWF's 25th anniversary celebrations in September 1986. Five major religions were invited to make declarations on Religion and Nature. These declarations, addressed by religious leaders to the faithful in the Buddhist, Christian, Hindu, Jewish and Muslim worlds, describe the values and ethics that lead them to the conservation of nature. In the years following that event, other religions joined in making similar declarations, including the Bahá'ís (1987), the Sikhs (1989), the Jains (1991), and the Daoists of China (1995).

WWF, in collaboration with Martin Palmer of the International Consultancy on Religion, Education & Culture (ICOREC), built on the Assisi event to establish a Network on Conservation and Religion to link faiths worldwide working on conservation projects. As a result, in the first nine years, an estimated 100,000 religious communities became involved in conservation activities. The faiths launched programs of work, education and instruction based around their teachings on nature. Undamaged native forests on monastery land on Mount Athos, Greece, were protected from logging. A Hindu Environment Center was established in the pilgrimage town of Vrindavan, India.

In 1995, after nine years of activity, WWF invited the religions to review progress and plan for the future at the Summit on Religions and Conservation which it organized in two parts. The first session of activists and thinkers within the faiths was held in Japan on 3–9 April 1995. It took stock of what had been achieved since Assisi, and drafted Faith Reviews and Future Plans. This was followed by the second session, a summit meeting of top religious leaders in England, 29 April–3 May 1995. The event was hosted by Prince Philip at Windsor Castle, meeting in the room where William Shakespeare first performed the *Merry Wives of Windsor*. Participants included Madame Rabbani, leading Bahá'í dignitary; Venerable Kushok Bakula, twentieth incarnation of the Arhat Bakula, for the Buddhists; The Ecumenical Patriarch Bartholomew (Orthodox); Rev. Bernard J. Przewozny, Pontifical Adviser on environmental issues (Catholic); Rev. Dr. Samuel Kobia, World Council of Churches, and the

Archbishop of Canterbury (Anglican) for the Christians; Swami Vibudhesha Teertha, Acharya of the Madhva Sect for the Hindus; Dr.

L.M. Singhvi for the Jains; Rabbi Arthur Hertzberg, Vice President Emeritus, World Jewish Congress; Dr. Adnan Bakhit, President of the University of Al al-Bayt, Jordan, representing Crown Prince El Hassan bin Talal, for the Muslims; Sri Singh Sahib Jathedar Manjit Singh, Jathedar of Akaal Takhat (Throne of Timeless Being) for the Sikhs; and Mr Xie Zongxing, Vice President, China Taoist Association; all accompanied by supporting staff. Each of the nine religions presented a paper on ecology and faith describing their accomplishments, commitments, initiatives and future prospects.

At the summit, four experts were invited to present the issues to the religious leaders for discussion: Andrew Steer, Director of the Environment Department at the World Bank; Dr. Arthur Dahl, Deputy Assistant Executive Director of the United Nations Environment Programme; Dr. Susan George, author and Associate Director of the Transnational Institute; and Sam Younger, Managing Director, BBC World Service. Various themes were discussed over the four days of the summit. The harmony among the distinguished participants demonstrated how much their spiritual principles in this area converged.

At the beginning of the summit, an ecumenical celebration was held in the St. George's Chapel in Windsor Castle, with each religion presenting something of particular significance to their tradition. The summit was followed by a procession of the leaders in London from Westminster Abbey to Westminster Cathedral.

One result of the summit was the formation of an Alliance of Religions and Conservation as the successor to the WWF Network on Conservation and Religion to follow up on the commitments made. The Alliance assembled a series of projects relevant to ecology and faith for which it sought outside support. The summit also increased the engagement of the faiths with secular organizations such as the World Bank, which led to a continuing dialogue.

Another step in this WWF initiative was the preparation by the faiths of sacred gifts for the living Earth which they announced at an interfaith celebration in Kathmandu, Nepal in November 2000 during WWF's annual conference. Two additional religions, the Zoroastrian and the Shinto, joined the Alliance of Religions and Conservation at that time. The initiative continues to spread, with WWF France organizing an interfaith colloquium in 2003. WWF has also published various books on world religions and ecology.

Wright, Judith (1915–2000)

Judith Wright (b. Armidale, Australia; d. Canberra, Australia) was one of Australia's best-known poets, twice nominated for the Nobel Prize. One of the generation of poets who emerged from World War II – about which she wrote so passionately in early poems like “The Company Of Lovers” – she brought a new note to a tradition which, largely secular and patriarchal, had ignored the erotic and religious. Writing the “feminine” into it, she brought it closer to the culture of the land's First Peoples with whom she had a lifelong affinity – the Aboriginal poet and activist Oodgeroo Noonuccal was one of her closest friends.

Her feeling for nature was essential to this. Born into a pioneering pastoral family she grew up not only on the land, “my blood's country” (Wright 1994: 20), but also with it, “. . . riding the cleared hills, / plucking blue leaves for their eucalypt scent, / hearing the call of the plover / in a land I thought was mine for life” (316).

As she grew older, however, she began to realize how destructive her colonial inheritance had been: “What swells over us now is a logical spread / from the small horizons we made – / the heave of great corporations / whose bellies are never full” (407).

The task was to make amends, to live with the Earth, not to exploit it. Poetry, the voice of feeling and empathy, became her way of doing this. But she also became an environmental activist and champion of Aboriginal Australians.

Her experience as a woman of love, pregnancy, and birth also drew her into the life of the cosmos. In “Woman To Child,” for instance, mother and child are part of the unfolding story of creation: “Then all a world I made in me; / all the world you hear and see / hung upon my dreaming blood. / There moved the multitudinous stars, / and coloured birds and fishes moved. / There swam the sliding continents” (28).

This moved her beyond the merely anthropocentric into the dimension of the sacred. Another poem is addressed to Ishtar, goddess of childbirth: “You neither know nor care for the truth of my heart; / but the truth of my body has all to do with you. / You have no need of my thoughts or hopes, / living in the realm of the absolute event” (102).

Her religious sense was thus essentially sensuous and bodily, immanent and transcendent, as the sequence “Flesh” makes this clear:

God walked through all my ages. He set in me the key that fits the keyhole; use it right and eternity's lightning splits the rock of time.

And there I was begun and so begotten in that unspeakable heart of flame (146).

Significantly this cosmic and mythic perspective echoes that of Aboriginal culture: “Earth watches through our eyes, and as we stare / she greets, by us, her far compatriots there, / the wild-haired Suns and the calm Wanderers. / Her ancient thought is marked in every name; / hero and creature mingle in her dream” (203).

But it also led her to grieve over the land’s sufferings at our hands: “I am what land has made / and land’s myself, I said. / And therefore when land dies? / opened by whips of greed / these plains lie torn and scarred. / Then I erode; my blood / reddens the stream in flood” (279).

In this way, too, she shared the feelings of the land’s First Peoples, “the night ghosts of a land / only by day possessed” (354) who represented the other side of the triumphalist story of settlement.

This identification combined with physical frailty as she grew older made her increasingly angry and she identified with the darker energies of the cosmos. In this poem to the moon, “ruler of women / and singler-out of poets,” for instance, she claimed the powers of a crone:

... To you, chill Domina,

I make the prayer of age. In my last quarter let me be hag, but poet.

The lyric note may vanish from my verse but you have also found acceptable the witch’s spell – even the witch’s curse (341–2).

To the end she insisted on involvement: “. . . who wants to be a mere onlooker? every cell of me / has been pierced through with intergalactic messages” (422).

Her sense of self has become truly cosmic here, attuned to the language and energies of creation beyond good and evil as we know them, energies she glimpsed hanging over a rockpool’s “wild embroideries.” Admiring it, “. . . the devouring and mating, / ridges of coloured tracery, occupants, all the living, / the stretching of toothed claws to food, the breeding / on the ocean’s edge” (419).

But there was also the deep sense of belonging, of being attuned to the language of the world, expressed in “Rainforest,” for instance: “We with our quick dividing eyes / measure, distinguish and are gone. / The forest burns, the tree-frog dies, / yet one is all and all are one” (412).

That is perhaps why after the age of seventy she wrote no more poetry. But the world would continue to speak. Self, nature, poetry and the sacred are one. In one sense, that involved a return to a more “primitive” sense of reality. But in another, it pointed a way out of the crisis posed by our present technological culture. So her *Collected Poems* conclude:

All’s fire, said Herclitus; measures of it kindle as others fade. All changes yet all’s one. We are born of ethereal fire and we return there.

Understand the Logos; reconcile opposing principles.

Perhaps the dark itself is the source of meaning, the fires of the galaxy its visible destruction...

. . . “Twisted are the hearts of men – dark powers posses them.

Burn the distant evil-doer, the unseen sinner.” That prayer to Agni, fire-god, cannot be prayed.

We are all of us born of fire, possessed by darkness (426).

X

Xhosa-Speakers' Traditional Concept of God

The Xhosa-speaking peoples of South Africa, living along the eastern seaboard between the Great Fish River in the south and the KwaZulu-Natal border in the north, were the first Bantu-speakers to engage with the expanding white colonists in the late eighteenth century. Their traditional religion, like that of all Southern Bantu, comprised four main elements: the belief in a Supreme Being, the veneration of the ancestors, the manipulation of medicines and the fear of witchcraft. Of these, the belief in God was the least developed, although there is evidence that it was early influenced, to some extent, by concepts derived from neighboring San (Bushmen) and Khoekhoen ("Hottentots"). Later, under the teachings of missionaries, the concept was greatly modified.

The belief in a supreme creator being can be traced at least to 1100, when Late Iron Age agropastoralist Bantuspeakers moved out of the coastal plains of the Transvaal Lowveld onto the interior plateau or, as among Nguni, down the fertile corridor between the Drakensberg range and the Indian Ocean. Belief in a Supreme Being may, indeed, go back to the first settlement of Early Iron Age peoples south of the Limpopo River, dated to ca. 600. The Xhosa-speakers (or Cape Nguni) over the centuries split up into a number of chiefdom clusters, such as Thembu, Xesibe and Mpondo; the Xhosa proper, discussed here, were the southernmost group, living in what was formerly the Ciskei and southwestern Transkei.

The Xhosa had a number of names for the Supreme Being. Some obviously derived from the pre-Khoesan contact period, as both Xhosa and Zulu share them. These comprise distinct sets of reference. One set perceives God as a craftsman – the Maker, the Molder or, by extension, as *uHlanga*, referring, in Xhosa, to a mystical cave and, in Zulu, to a bed of reeds, from which all beings came forth by God's command. Another set of concepts conceived him as a nature god, seeing him in the natural phenomena of lightning, thunder and rainbow, and in the allimportant rain. Thus God was called the Lord of the Sky, iNkosi yeZulu. He acted by his powerful will; his actions – good or evil were beyond question, whether he struck human or beast with lightning or withheld rain. No sacrifice was offered to him: only prayer or entreaty could propitiate him. He was different from and beyond the ancestors, and his actions would never be confused with witchcraft, even though it was believed that God sometimes sent the "lightning bird."

The pre-Khoesan period also undoubtedly employed a kinship-related metaphor in its theology. The association of God with uHlanga and the emergence of humans and animals was as the creator of the world, the First-in-Time, Mvelatangi or Mvelanqangi. But he seems to have been likened also to a firstborn son (imvelanqangi), forever identified as the First Authority, on the model of a homestead head, autonomous over his family and expressing the vitally important principle of agnatic authority characteristic, particularly, of Nguni. But he was not in any way a type of super-ancestor, for he was utterly outside the realm of ancestorhood. An authoritative explanation of misfortune, evil, ill-health and death is an important function of all religions. Here the explanations of choice among Xhosa (as in all South African groups) were ancestral wrath, witchcraft and pollution. Explanation in terms of God was more in the nature of an ultimate residual category when these failed – rather like the exasperated statement “God only knows!” In this sense, God was peripheral to the everyday, practical religion of the common man or woman. The everpresent, brooding, spiritual influences resided in the ancestors.

Among Xhosa, however, there appears to have been a new elaboration of the God concept, related to the institution of chieftainship, and possibly influenced by Khoe culture. This change is expressed by the introduction of two new names for God, uQamata and uThixo, the most typical Xhosa names for God today. Both derived from San (or from Khoe) sources, possibly after Xhosa began to intermarry with San and Khoekhoen.

The term *uQamata* first appears in the literature only in the 1870s, but Xhosa oral tradition holds that it is the most ancient of the two San (Khoe) terms. L.F. Maingard speculated that *uQamata* was perhaps the name of a Khoe culture hero. Tentative reconstruction of the *uQamata* cult suggests that it only operated in times of national crises, was orchestrated by the chiefs and held on mountaintops – unlike the ancestral rituals, which always took place in the cattle byre. If all the rainmakers’ medicine had failed, then the chief prayed to uQamata on behalf of the people for rain, or the warding off of storms. This cult contrasted strongly with the kinbased ancestral blood sacrifice, officiated over by clan elders. It, significantly, consisted of prayer only. With one exception, none of the old records mention sacrificial killings or libations in uQamata’s honor. It thus reflected God’s role in the interface between society and nature, not, typically, the relationships between kinsmen

– the essence of the ancestor religion. It also had a national, political dimension.

Probably due to Christian practice, the name of God most widely used today is uThixo, deriving from Khoe *Tsui//Goab*, meaning “Wounded Knee,” the name of the divinized hero and Rain God of the Khoekhoen. It was adapted in this form by the missionaries, to clearly distinguish traditional concepts from that of the new, universal deity that they proclaimed.

Y

Yakama Nation

The peoples now commonly called the Yakamas traditionally lived in much of what is now central and eastern Washington State. Under provisions of the Walla Walla Treaty of 1855, the tribes ceded over 10 million acres to the United States government, and what is called the Yakama Indian Reservation was created. The Yakamas, who now number nearly 9000 tribal members, actually comprise 14 different bands and tribes, sharing a Sahaptin linguistic base, and a similar social history involving a migratory hunter-gatherer existence.

The Yakama Reservation itself is the largest in the Pacific Northwest, comprising nearly 1.4 million acres, nearly half again as large as Rhode Island. It stretches from the summit of the Cascade Mountains east to the irrigated farmlands and native range lands of the Yakima Valley (the Yakamas changed their own name to reflect original spellings). The Reservation has significant natural resources, with extensive farming and grazing lands, proximity to both the Yakima and Columbia Rivers, and healthy stands of commercially viable timber, including both Ponderosa Pine and Douglas Fir.

This biological diversity and richness is connected to the present religious diversity of the Yakamas, and how the various spiritual traditions view the environment. It is essential, however, to note that all three religious traditions – despite different theological orientations – have made room for a significant amount of agreement on the importance of environmental respect. This agreement often translates into a significant power base in deciding questions of environmental policy on the Reservation.

There are three major spiritual traditions on the Reservation: the traditional *washat* (sometimes called the Seven Drum Religion or Longhouse Religion), more traditional expressions of Christianity as brought by missionaries in the nineteenth century, and the Indian Shaker Faith. The *washat* was founded along the Columbia River by the “Dreamer Prophet” Smohalla in the mid-nineteenth century, and represents a native revitalization movement that combines certain religious elements from Western Christianity with native spirituality. At the outset the religion was adamant in its stand against agriculture and mining, believing such practices to be antithetical to the proper attitude toward the Creator and toward the Earth. Today, the faith no longer rejects these practices, but the *washat* still takes environmental respect as one of its cornerstones. Its modern strongholds also reflect the environmental tenets of the religion, which mirror the Yakamas’ ties between Creator and nature. The modern *washat* is celebrated at a number of locations both on and off the reservation, including the traditional fishing villages of Priest Rapids and Rock Creek, both on the Columbia River. That the *washat* is celebrated along the banks of what was once the greatest salmon

fishery in the world is no accident. This connection between religion and geography emphasizes the fact that the *washat* celebrates the salmon as one of the Creator's principal gifts to his people.

Much of traditional Yakama mythology centers on the Columbia River and the salmon, and often spotlights "*Spil-yay*" the trickster (portrayed by the coyote) acting on the people's behalf. In the Yakama story "*Spil-yay Breaks the Dam*," Coyote acts to save his people when the greedy Swallow Sisters dam the Columbia, preventing the salmon from reaching the traditional fishing sites. In "*Legend of the Lost Salmon*," even Coyote is ineffectual in reviving the salmon when the people disregard the Creator's rules about the proper way to fish. Only through the miraculous intervention of an elder are the salmon restored, reminding the people that greed and disrespect for the Creator have no place in their lives. Such stories are an essential part of the *washat* heritage, and reflect the intense love and respect for the environment that is at the heart of the religion.

The *washat* enjoys certain cultural and historical advantages due to its being interwoven into the very fabric of traditional native social life, and its beliefs on nature are disseminated far more often than at formal times of worship. For example, at times of crisis such as the death of the tribal member, Yakama storytellers are still retained to relate traditional stories about nature's creatures, the connections between worship toward the Creator and tribal morality, and sacred places on the reservation. The stories function both as explanation for cultural and tribal morality, and distraction for the grieving family. Thus, the recent surge in the *washat's* popularity among the Yakamas has been accompanied by an increased focus on encouraging traditional ways of looking at social structures.

There are also Yakamas who worship in traditional Christian denominations, represented in mainline and Pentecostal churches. These churches are mostly situated in the most populated areas of the reservation, from the middle Yakima Valley northwest to the border of the Reservation at the city of Yakima itself.

Most Yakamas who attend traditional Christian services do so at churches started fairly recently, and aimed specifically at reaching native populations. Some, however, attend churches started by missionaries during the nineteenth century, during the days of federal policy that gave priority to one religious group for each reservation.

For the Yakama Reservation, the Methodist-Episcopal denomination was selected by the administration of President Ulysses Grant as the religion that would be responsible for the "moral and spiritual education" of the Yakamas, and in the formative years of the Reservation, Methodism's popularity was boosted by this governmental sponsorship. During this time period, Methodism's opposition to traditional native spirituality – especially toward Smohalla and the *washat* – was personified in the person of James Harvey Wilbur, Indian Agent from 1864– 1882. Wilbur did everything in his power to defeat the *washat's* influence, believing that traditional native religious views toward nature were the single biggest barrier to "Indian civilization," and his promotion of native agriculture was second to none in the entire Indian service of that time.

Today, Christian churches on the reservation do not attempt to change traditional Yakama attitudes and beliefs toward the environment, preferring to focus more on evangelism. To be sure, since traditional Yakama spirituality knows little or no separation between theology and morality, and since many of the traditional spiritual beliefs contain animistic elements that are more directly confrontational with traditional Christianity, some conflict is unavoidable. Nonetheless, the Christian churches' otherworldly focus results in many Yakama worshippers retaining traditional views toward nature, at least in part. Thus, Yakamas who consider themselves as Christians are free to side with *washat* attendees on environmental issues – despite a different spiritual orientation.

The Shaker religion in the Pacific Northwest was founded by John Slocum near Olympia, Washington, in the late 1800s, and represents a third religious option on the Yakama Reservation. Shaker beliefs have always been centered more on individual piety and morality, rather than the rejection of any particular culture's practices (e.g., agriculture), and the churches' present location reflects this concern. The three Indian Shaker Churches are located not at traditional villages (as is often the case with the *washat*), nor close to populations centers (like more traditional Christian churches), but in the heart of the Reservation's prime agricultural lands. Historically, many Yakama Shakers have been employed in the agriculture industry, and Shaker teachings have never equated modern technology with impropriety.

The religion itself combines ritualistic elements from both Protestantism and Catholicism, and considers itself a type of Christianity reserved for Native Americans. The Shaker faith does not focus on extensive doctrinal subtleties, however, and hence there is a great deal of latitude amongst individual worshippers on beliefs considered tangential to individual holiness. Thus, many believers have not rejected the traditional Yakama views on nature, and, on many key issues such as water rights or salmon restocking, both *washat* attendees and Shakers often present a united front.

Thus, despite three very different religious traditions amongst the Yakamas today, there is a growing voice on the need to respect the environment – a voice not lost by the very real religious diversity on the reservation. Certainly not rejecting agriculture or logging, but insisting on wisdom as a foundational value for environmental policy, this voice serves in many ways as a counter-voice to the surrounding voice of the majority culture. To cite just one example, despite the mostly dismal picture on the state of the northwest salmon, the Yakamas have been at the forefront of an intense program of stream revitalization and salmon stocking, and there have been a number of local successes in terms of fish returns. Thus, when focusing on the connections between religion and nature, the Yakama Nation is serving as an important example to other native peoples. Large in size, rich in resources, the Yakama Reservation and its peoples have demonstrated that religious diversity need not be a barrier to environmental progress.

Yamuna

The Yamuna is a river that flows from its source of Yamunotri high in the central Himalayas for about 826 miles to its confluence with the Ganges on the plains at Allahabad. It has long been considered one of the holiest rivers of northern India, and for centuries has been worshipped as an aquatic goddess. Today, however, much of the river has become polluted, causing a variety of responses from the religious community that is associated with the worship of the Yamuna.

The Yamuna originates from the Yamunotri glacier at an elevation near 20,000 feet above sea level. This glacier is nestled on a steep slope just below the crest of Mount Kalinda, located about six miles west of the Bandarpunch peak (20,735 feet), the dominant mountain in the central Himalayan region of Garhwal that divides the watershed of the Yamuna and Ganges. The Yamuna gushes out of the morainic snout of the glacier to fill the pond Saptarishikund, named after seven sages who called the river down from heaven for the benefit of Earth, and from here cascades down the southern face of Mount Kalinda. Accordingly, the Yamuna is also called “Kalindi.” The cold water stream drops into a canyon where it joins the other recognized source of the Yamuna: a hot spring that flows from a stone wall of the canyon. Here, at an elevation of about 10,500 feet, is located the Yamunotri complex, an important temple site and destination of a popular pilgrimage. Pilgrims have been coming to this site for centuries to worship Yamuna and seek her blessings.

Yamuna is depicted at her Himalayan source in her Puranic form as a goddess having a dark complexion, clothed in red garments, holding in her hand a pot filled with good fortune, and sitting on the back of a turtle. Because the goddess Yamuna brings life-giving water from the mountains, and is associated with the creative powers that animate all life, she is often addressed as “Mother.” Yamuna is considered to be the sister of the goddess Ganges, who sits by her side in the Yamunotri temple. Yamuna is also considered to be the daughter of Surya, god of the sun, and the twin sister of Yama, the god of death, and as such the priests who attend the Yamunotri pilgrimage complex regard her as an auspicious goddess who blesses the lives of her pilgrims and protects them from death. Pilgrims visiting the Yamunotri complex cook food in the hot spring’s boiling water, which is considered to be a gift of the sun to his daughter, and bathe in a tank filled with its hot water to be blessed, purified, and freed from sins.

The Yamuna descends rapidly from the Yamunotri pilgrimage complex to carve a valley through the beautiful Garhwali Mountains before forcing its way through the Shivalik foothills and emerging onto the Indo-gangetic plains at the town of Dakpathar.

Here where the Yamuna leaves the wild mountains and enters the “civilized” plains a great change takes place: Dakpathar marks a transition from the natural to the industrial, from river worship to river management, and from the Yamuna as a majestically unimpeded river to Yamuna as a greatly reduced stream, for here a huge barrage (a dam-like structure comprised of a long series of gates that regulate water flow for irrigation and hydro-electric power) has been built across the entire river and the great majority of the water is removed from the riverbed to be channeled off into utility canals. A little further downstream, the Yamuna reaches Tajewala, site of another massive barrage that blocks the river for irrigation and channels its water into the Western and Eastern Canals. The Yamuna then flows through the industrial towns of Yamunanagar, Karnal, Panipat, and Sonapat before arriving in the huge metropolis of Delhi, capital of the modern nation of India. Only 10 percent of the volume of water leaving the mountains reaches Delhi; almost all of the water remaining in the riverbed is extracted for domestic and commercial use in the capital city, which has borne the major weight of the rapid development that has occurred in India since the late 1980s. Although Delhi was built on the bank of the Yamuna long ago because of the river’s bounty and beauty, today the city dumps millions of gallons of untreated sewage and industrial effluents into the Yamuna, making the stretch of the river downstream one of the most polluted in India.

What remains of the Yamuna, after Delhi, flows past the ornate temples and magnificent sandstone bathing platforms of the pilgrimage centers of Vrindaban, Mathura, and Gokul in Braj, the important cultural region associated with the Hindu god of love, Krishna. This is also the area in which Yamuna is most celebrated as a goddess and her theology has been most fully developed, for here she is regarded as a goddess of supreme love. Consequently, there are more temples dedicated to Yamuna in this region than anywhere else along her course. Much of the theological tradition associated with Yamuna is the lasting result of a cultural efflorescence that took place in this region in the sixteenth century.

Although the river is becoming increasingly polluted, religious practices directed to Yamuna are still common: her devotees bathe in her daily, they sip her water reverently, make special offerings to her liquid form, and honor her presence in the many temples of Braj. Her water is also an essential ingredient in many of the temple rituals conducted in this region. For her Braj devotees, Yamuna is a goddess of exquisite love and compassion who initiates souls into the divine love affair. Among the pantheon of Hindu goddesses it would be difficult to find one more representative of divine love than Yamuna. In Braj, she is considered to be a chief lover of the youthful god Krishna. So great is her eagerness to join Krishna that, rather than being pictured on the back of a slow turtle, Yamuna is portrayed in this region running to offer her beloved a flower garland. Moreover, she experiences the deepest of all loves, and yet rather than selfishly holding onto the joy of that love for herself, she shares its life-enhancing bliss with all who approach her with an open heart. The theme of Yamuna’s loving generosity is thus fundamental to her theology in Braj.

The Yamuna leaves the pilgrimage towns of Braj and winds her way through dry arroyos to reach Agra, site of the celebrated Taj Mahal that stands on a high bank overlooking the river. Downstream the Yamuna is joined by some important tributaries, most significantly the Chambal River, which drains the eastern slopes of the Aravalli Mountain range in southeastern Rajasthan. After receiving fresh water from these tributaries, the Yamuna is somewhat restored. By the time the Yamuna arrives at the confluence with her sister the Ganges at Allahabad she is clearly the bigger of the two rivers. The confluence of these riverine sisters offers a remarkable sight: water from the Yamuna is deep blue in color, whereas water from the Ganges is chalky white; the two meet to form a wide expanse of water that is divided by a clearly distinguishable line.

This is site of the famous Kumba Mela, the largest religious gathering of human beings on the planet, and another favorite bathing spot for the many pilgrims who come here for a life-blessing “holy dip.” Although the Yamuna nominally ends at Allahabad, devotees of this river insist that the resulting confluence is “Ganges in name, but Yamuna in form.” Since about two-thirds of the water flowing past the confluence comes from the Yamuna riverbed, the “Ganges River” that flows past the holy city of Benares and empties into the Bay of Bengal is to a large degree the Yamuna.

Religious responses to the increasing environmental degradation of the river move in two different directions: religious practices are declining as a result of the pollution, and religious sentiment is being marshaled to check the contamination. Although religious beliefs and practices related to the Yamuna are still common, they are being weakened by the declining health of the river. For example, many people who used to bathe regularly in the river for religious purposes are no longer doing so, and Yamuna water is no longer being used in many of the temple rituals in Braj. People are beginning to recognize that the life-giving river goddess is “sick”; some of her devotees even suggest that Yamuna is “dying.” Clearly the pollution of the river has a great impact not only on the physical health of the people who inhabit her banks, but also on the religious culture that has thrived along her course for centuries.

Devotees of Yamuna are not only lamenting her declining health; some are taking direct action to save her. Although the Indian government has attempted to remedy some of the problems of Yamuna pollution through the Yamuna Action Plan inaugurated in 1993, most of the inspiration for cleaning the river has come from the religious community. In the past, “loving service” (*seva*) to Yamuna typically has been expressed through a variety of acts of worship; today the idea is emerging that the proper form of loving service is environmental activism. Motivated by a deep love for the goddess Yamuna, some of her devotees have initiated political demonstrations and environmental education programs, and have taken polluters and the government to court in an effort to halt the pollution of the river. Their actions provide instructive examples of how religious sentiment has been enlisted to save rivers, and how river worshippers express their devotion through environmental activism.

Yanomami

The Yanomami are indigenes who live on either side of the border between northern Brazil and southern Venezuela in the Amazon rainforest near rivers in the lowlands and streams in the Guyana Highlands. Some 20,000 Yanomami reside in up to three hundred or more separate communities, which range in size from a few dozen to a hundred or more individuals. Their subsistence economy is characterized by a sustainable rotational system of bow-and-arrow hunting, fishing, gathering, and swidden farming. This economy is associated with low population density and high mobility. Sub-groups or a whole community forage from camps in the forest, on treks of days to months in duration, several times a year. Thus, Yanomami interact daily in intimate ways with each other and their natural habitat.

The Yanomami do not rigidly distinguish between the natural and supernatural realms. Religion permeates their daily life, society, culture, and ecology. Their variety of animism or nature religion focuses on numerous and diverse spiritual beings which inhabit the forests, streams, mountains, and other physical features in their habitat. Some of these spirits are contacted and manipulated by shamans, part-time ritual specialists. Several men in each community may practice shamanism. One or more shamans dramatically chant and dance ritually almost every afternoon or evening in the communal house, frequently combining their complementary powers as a team. A shaman usually employs a hallucinogenic snuff powder developed from psychoactive plants to contact helper spirits. Through spirit possession the shaman helps fellow villagers cope with practical problems like fostering success in hunting, avoiding danger in the forest, healing the sick, and taking revenge on enemies in other villages. If, for example, an individual's spirit counterpart or alter-ego which dwells in the forest is lost, then the person becomes sick and may even die. A shaman can find and restore this spirit for the individual. Shamans are the most highly respected individuals in society and the reputation of exceptional ones extends to distant villages.

Yanomami may also employ a wide variety of numerous plants for medicinal purposes. However, their religion, including the associated oral literature, focuses overwhelmingly on animal spirits. Indeed, the Yanomami believe that humans and animals may be transformed into one another. A shaman, for example, may not only imitate the behavior of an animal like a jaguar when possessed by its spirit, but even be physically transformed into the animal and roam the forest.

Up to a year or more is required for an apprentice to learn the mysteries, ritual chants, dances, and practices of shamanism. The apprentice is supposed to abstain from sex, certain foods, and various kinds of hunting and other activities. There are

food taboos for menstruating, pregnant, and lactating women as well. Fathers of new babies must also follow certain food prohibitions. Such taboos, in conjunction with a multitude of various other practices like regular trekking, reduce the environmental impact of the Yanomami and usually allow the normal regeneration of nature.

Yanomami interact with animals in their habitat on a daily basis both physically and spiritually. Ornamental body-paint designs usually symbolize animals and certain ones are believed to protect an individual from dangers like poisonous snakes. Even personal names, which are essentially considered sacred as well as private, are usually those of animals. Every Yanomami has an animal spirit counterpart in the forest. Accordingly, the hunter cannot kill members of that species without potentially endangering himself.

When an individual dies, his or her soul travels to a paradise above Earth. However, if the corpse is not treated with proper mourning, respect, and ritual by relatives, then the deceased's spirit may return to the village and cause harm. Also after death, the spirits who reside in an individual's body become spirits or animals in the forest. A wild animal that strangely appears in a village may be interpreted as a bad omen or evil spirit.

Reciprocity is the pivotal principle that underlies the worldview, attitudes, values, and behavior of the Yanomami. The natural, social, and spiritual components of the Yanomami world influence each other in many different ways. The unity, interconnect- edness, and interdependence of all life from the perspective of Yanomami philosophy and religion permeates their rich oral literature as well.

While Yanomami religion has yet to be thoroughly studied, let alone its ecological meaning and significance, it is quite probable that their worldview tends to promote respect and reverence for nature in general. Whether in natural or social relations, harmony prevails on a daily basis in Yanomami life, in spite of occasional eruptions of disharmony. Part of the role of the shaman is to monitor and adjust these relations.

The survival and welfare as well as harmony of the Yanomami are, however, increasingly threatened by the encroachment of external forces. Most devastating have been introduced Western diseases, which often become raging epidemics, especially in areas where alien wildcat goldminers have intruded into Yanomami territory. In the matter of religion, Christian missionaries have had only nominal success in converting Yanomami, even though they have worked in several areas since the 1950s. Consequently, missionaries have precipitated relatively little disruption of traditional shamanistic animism which remains a vital part of Yanomami life. However, mission- aries have introduced substantial changes in other aspects of Yanomami culture which could eventually impact on their traditional religion and ecology as well. At the same time, missionaries usually provide regular and long-term medical, educational, and other types of sorely needed assistance, given the dismal failure of state governments to fulfill its responsibilities to all citizens in Brazil and Venezuela. The Yanomami, including their spiritual ecology, will continue to face many serious challenges in the future.

Yoeme (Yaqui) Ritual

The Río Yaqui is the northernmost of five Mexican rivers that drain the mountains of what was once called New Spain and which is now called the state of Sonora. Sitting within this land, alongside the Yaqui River, are the Yoeme Pueblos, often referred to as the original Eight Pueblos. (The term “original” marks a distinction between these communities in Sonora and those created much later on the other side of the U.S.–Mexico border.) Within these villages live the Yoeme Indians, often called the Yaquis. Based on the direct translation “Yoemem” = “People,” and joining a recent cross-tribal move to reference tribes by names in their respective languages, I retain the use of “Yaqui/s” in the contexts of proper place-names, previously published quotes, and titles, while using “Yoeme/m” within the following descriptions.

Yoeme oral tradition places their homeland in northwest Mexico long before European contact and sometime earlier than human existence as we know it today. Any research into aboriginal Yoeme lifeways will undoubtedly lead to the world of the Surem, small proto-Yoemem who lived in complete unity with their environment. These ancestors of the Yoemem are said to have communicated telepathically with all living beings and were the original inhabitants of the *hiakim*, or Yoeme homeland. Oral histories of this primary era recount the presence of a tree that was making an unintelligible humming sound. After much confusion, a young woman was able to translate the tree’s prophecies that a group of people were coming over the ocean from the west and that some of them would try to take the land, and others would bring new technologies, baptism, and subsequently a whole new way of living. The prophecy leads to some of the Surem leaving to the hills and the ocean, to remain enchanted beings. The other half of the Surem decided to stay in the *hiakim*, Yoeme “homeland,” preparing to fight the Conquistadors and welcome the Jesuits. According to some Yoeme historians, the Konkista (the real “conquest”) took place as the people responded in factions to the prophecy, before the Europeans ever arrived.

Having defeated Spanish armies three times between 1533 and 1609, Yoemem were able to invite two Jesuit missionaries to their pueblos in 1617, while simultaneously keeping the Spanish conquistadors at bay. Military strength provided Yoemem control over their own combining of pre-contact traditions and Catholicism. We are immediately faced, therefore, with a different colonial situation than that confronted by most Native Americans and many indigenous peoples elsewhere. Yoemem powerfully enforced and strategically maintained their territorial and cultural boundaries, allowing for self-management from pre-Columbian time up through Jesuit collaboration. Thus, the Yoeme clearly cannot be quickly included within popular scholarly imaginings of

“The” indigenous colonial experience. Primarily, in contrast to forced “conversions,” we know from both Yoeme and Spanish sources that the Yoeme invited the Jesuits into their territory. Both Jesuit documents and Yoeme oral traditions record that the Yoemem were eager to learn new approaches to civil planning, including farming and ranching. According to the primary Yoeme myth, The Singing Tree, the people had already received prophetic knowledge that such changes were coming.

The Singing Tree, many Yoemem claim, also prophesied that outsiders to the tribe would seek to push Yoemem off their homeland. The relationship between history and myth is nowhere more important than in these issues of boundary maintenance. In the early nineteenth century, approximately fifty years after Spain expelled the Jesuits, the emerging Mexican administrators began instituting an *encomienda* system of land tenure which slowly and steadily led to the more familiar colonial relations we see across the globe between indigenous peoples and colonizers. Throughout most of the next century, Yoeme people were deported, massacred, and driven off their homelands. Perhaps the crux of this disregard for Yoeme sovereignty came in the early twentieth century, when Angostura Dam was being built to direct water to larger Mexican cities and away from the original Eight Pueblos. The remaining half of the twentieth century framed Yoemem rebuilding villages, reinvigorating religious societies, and developing ways to regain control of their Aboriginal homeland. The control of land and the continuation of indigenous identity are co-dependent for most Yoemem.

One movement toward environmental sovereignty includes working with Mexican banking institutions to develop credit relations using the land as collateral. However, a widespread concern among the Yoeme is that the land has become a means of exchange with the banks. In order to support themselves and accumulate collective wealth for such things as education programs and ceremonial performances, Yoemem in the Río Yaqui are repeatedly forced to borrow money to work their own land, the profits of which are distributed so thinly that they are in constant debt. Essentially, they are working their own land, but only earning enough for the most basic level of sustenance, always in fear of losing that land to the banks. Another option some community members want to explore includes selling land outright to the banks or non-Yoeme individuals, thereby avoiding the long process of slow debt accumulation and possible loss of land. Either of these two maneuvers put the tribe in a disadvantageous position: living in debt, or selling their tribal inheritance. So although Mexican President Lazaro Cárdenas in 1937 decreed a *Zona Yaqui*, members of the Eight Pueblos still struggle for complete control over their *hiakim*. Understandably, the struggle is fueled by a collective sense of belonging to a native community and is secured by a landscape and religious tradition that reaches beyond the times of Spaniards and Jesuit missionaries.

Still, most of the ethnographers of Yoeme culture have struggled to make sense of Yoeme religious identity since the cultural performances suggest that they converted; and most Yoemem themselves claim to be Catholics. For example, almost every village performs a season-length passion play of the life of Jesus (a man who walked through

the hiakim) while simultaneously bringing to life masked beings, deer dancers, and their related dimensions. But scholars have previously been looking for preconceived categories of sacred or profane, Christian or pagan, ritual or art, preor post-contact; all of which fail to characterize Yoeme notions of religious action. Thus, some of the most well-versed ethnographers of Yoeme culture understood the deer dance as a folk art left over from a pre-Christian culture (Painter 1986: 271; Spicer 1984: 289–99). How do we make sense of rituals that clearly signify a previous mode of sustenance when those relationships with “nature” are no longer available or feasible? As of recently, very few Yoemem continue to hunt deer in the Eight Pueblos. Yet, few scholars have been attentive to the ways that Yoeme rituals utilize Christian symbols or characters within an indigenous logic, a conceptual framework that is inseparable from the geography, landscape and dimensionality that many might call “nature.”

Many Yoemem understand their world as dimensionally composed of overlapping, yet distinct worlds or realms, called “*aniam*.” The literature suggests as many as nine different *aniam*: *tenku ania*: a dream world, *tuka ania*: night world, *huya ania*: wilderness world, *yo ania*: enchanted world, *nao ania*: corn cob world, heaven, hell, purgatory, and *sea ania*: flower world. Each of these worlds provides a home for powerful beings or forces, and Yoeme relate deer dancing with three specifically, since the deer emerges from an enchanted home, *yo ania*, into the wilderness world, *huya ania*, and dances for us in the flower world, *sea ania*. Understanding the importance of the *sea ania* in Yoeme religion is fundamental, since flowers, *seewam*, are the actualization of sacrifice and the nurturing acts of giving. The most nurturing aspects of nature are found in *the sea ania*: streams, lakes, clouds, rain. The deer lives in the *sea ania* and when he is killed, he is laid atop a bed of flowers. Hunters must have *sea taka*, or flower power, to hunt deer successfully. Flowers adorn the deer dancer’s antlers and skirt, as well as the necklaces and hair of the *pahko’olam*. In their extensive study of deer songs, Larry Evers and Felipe Molina write that the most common words found in the songs are Yoeme terms for flowers. For Molina, a well-respected scholar and Deer Singer, the main purpose of the songs is to bring Deer’s voice from the *sea ania* to the ceremony. He adds that, “almost every piece of regalia and every instrument used in deer dancing and deer singing may be called ‘*seewa*’ or ‘*sea*’ as well” (Evers and Molina 1987: 52).

The deer dance always entails the dancing of the *pahk- o’ola* (fiestero). Wearing black masks in either the shape of a humanoid face or of a goat’s head, *pahko’olam* lead the deer dancer into the performance area where he will spend the evening dancing with him, the two clowning around with each other, and entertaining the guests. When not dancing with the deer, *pahko’olam* wear their masks backwards or hang them from the left side of the head, since the devil is said to come from the left. Common mask designs include the elongated goat-face style with ears and horns. Small insects or desert animals are often painted on the masks. Typical Yoeme *pahko’ola* masks feature a band of small triangles pointing inward around the outside circumference, considered to be goat’s teeth, sun rays, or mountains. Additionally, many masks have crosslike paintings which some relate to Christianity, although I have also heard in various

conversations that this was a pre-contact, sand-painting symbol for the sun. Both the elongated and face-shaped masks have horse hair dangling over the eyes and from the chin. There is a strong connection in the ethnographic literature between *pahk- o'olam*, goats and the *yo ania*. Their pre-colonial beginnings are referenced by their often used title, "old men of the fiesta." Since they also are sometimes called "sons of the devil," we should again be conscious of the tendency to relate the *yo ania* to concepts of evil and the devil. When attending an all-night *pahko*, the banter and antics of the *pahko'olam* help elevate the moods and energy of the crowd. The dancers are charged with passing out cigarettes to the audience members and more often than not create quite a stir by attempting to humiliate the deer dancer, musicians, the female societies to their right, and even the spectators.

Undoubtedly, the most well-known and most often described Yoeme rituals are those within the ceremonial season associated with Lent. From January 3rd to May 5th, the pueblos are governed by the religious society authorities. During these months, the atmosphere changes as both indigenous and Christian dimensions come together in a fantastic spectacle on Easter Saturday. On the morning of Holy Saturday, the *Fariseos* (pharisees, religious soldier group) and masked beings use a series of processional formations and building and staccato rhythms to rush the church repeatedly. As protectors of the church and the saints inside, *anhelitom* ("our angels," children dressed as beautiful angels) whip these "evil" aggressors with willow twigs and chase them out of the church. After the last assault, the black curtain – which had dissected the front quarter from the rest of the church – is thrown wide open to reveal all the *anhelitom* and saints. Christ has risen, the tomb is empty, and the *anhelitom* chase the defeated aggressors out of the church for the last time. The ceremonial society of Mary, the *matachinis*, play their music and dance flowers for her, holding flower wands and wearing flower hats. First in the church and then moving outside the front doors, the *pahko'olam* dance around the flower patio. Simultaneously, the deer dancer is bringing his cosmic dimension, the *sea ania*, into presence. The *sea ania*, or flower world, is another realm of the Yoeme cosmos where the deer live, often conceived as under the dawn, and wherever the *huya ania* (wilderness world) opens up into the blossoms of complete being. Thus, through this ritual sacrifice the various Yoeme dimensions coexist: the pueblo, the church, the *huya ania*, the *sea ania*, and since these latter two are pre-Christian derivatives, they also signify the enchanted world of Yoeme ancestry, the *yo ania*. Here at the place where these worlds come together, the onlookers throw confetti flowers at the attacking soldiers (*Fariseos*). For what seems like hours, the community is showered by multicolored flowers drifting on the wind and upon a sea of swirling being. After the whole community defeats evil, fireworks shoot into the sky, heralding Saint Michael's return to heaven since he has collected everyone's sacrifice in the form of the flower. Everyone who has come and given of themselves during the previous season (performers, family members, observers) are considered to be sharing in this flower, this grace that originates not from God on high but through collective sacrifice.

As other contributors have noted in this volume, the word “nature” has no direct translation in Yoeme; nor can we directly translate “religion.” I quickly learned in my work in Yoeme villages that to talk about religion, I would use the word “*kohtumbre*” (a Spanish loan word for “custom” but used also for “society”), which most closely approximates the idea of religion. To ethnographically unpack the concept of “nature” entails the discussion of all seven or eight *aniam*, or possible states of being, which roughly relate to geographical/cosmological spaces. Perhaps the best term to draw all this material together is *lutu’uria*, which translates as “truth” but entails a socially performative component, a sharing of ritual knowledge. Thus, references to the *aniam*, as well as experiential knowledge of cultural traditions and religious practices, are expressed in performances that socially assert and test truth claims. These dances and speeches are religious obligations and ways of representing core aspects of Yoeme identity. Thus, *lutu’uria* provides a means by which Yoemem share their sense of the “real” world, namely, “nature.”

Yoga and Ecology

The Yoga tradition originated several thousand years ago in India. Early evidence of Yoga practice can be found in Indus Valley seals unearthed in Mohenjodaro and other cities that date from 3500 B.C.E. Textual references to Yoga appear in the middle Upanisads and the Mahabharata, dating from about 600 B.C.E. The Buddha and the Jina (ca. 500 B.C.E.) both taught yogic styles of meditation. By around 200, Patanjali summarized Yoga practices in a classic text known as the *Yoga Sutra*. Sanskrit texts such as the *Yogavasistha* (ca. 1000) and the *Hatha Yoga Pradipika* (ca. 1500) describe various forms of Vedantic and esoteric Yoga. Haribhadra's *Yogadrstisamuccya* (ca. 750) and Hemacandra's *Yogasastra* (ca. 1250) discuss the adaptation of the tradition to the Jaina faith, while the later texts of Kabir and Guru Nanak allude to Yoga meditation from universalist and Sikh perspectives. Yoga continues to be practiced throughout India and has become increasingly popular worldwide.

In its various manifestations, Yoga includes practices and philosophical positions that accord with values espoused by modern ecologists. Unlike many other schools of thought in India, Yoga is thoroughly realistic. It builds upon the Samkhya school of philosophy, first espoused by a near-mythical sage named Kapila who perhaps lived in northeastern India around 900 B.C.E. Kapila's teachings were later systematized by a philosopher known as Isvarakrishna, who composed the *Samkhya Karika* in the early centuries of the Common Era. In this seminal text, the author exerts great care to articulate the existence and importance of the natural world. He posits that the world is known to us through its effects, and the effects stem from a common cause, *prakriti*, a term that many scholars choose to translate as "nature." Nature provides experience and liberation for her silent observer, the spiritual consciousness or *purusa*. According to the *Samkhya Karika*, all things exist for the purpose of serving and liberating this consciousness. Through understanding the nature of the creative force known as nature, one advances toward a state of freedom. To understand the structures and purposes of things one is able to cultivate a state of nonattachment that, from the perspective of this philosophy, entails a state of appreciation and respect, not disdain and abnegation for nature.

The earliest depictions of Yoga, found on sculptures that date from 5500 years ago, show persons imitating various aspects of the animal domain. An early statue from Mohenjodaro shows a man with his jaw wide open and his eyes bulging, approximating the roar of a lion. This pose later earns the name of *simhasana*, lion's pose. A tableau first found in Indus Valley steatite seals and then repeated thousands of years later etched into the pillars of countless temples, shows a meditating deity, now known as

Pasupati or Lord of the Animals. This imposing figure sits cross-legged and austere, surrounded by devoted and attentive animals such as goats, cattle, and what today seem to be make-believe creatures. This genre of representation exudes a sense of being in harmony and perhaps communion with the animal realm, and convey a sense of comfort in the company of nonhuman realities.

In the middle, Upanisadic period of Yoga, we find speculative discourses and dialogues about the nature and function of the human body and mind. By reflecting on the functions of the body, particularly the breath, and by seeking to still the mind, the Upanisads state that one can establish a connection with one's inner self or Atman, often translated as soul. Passages from the early Upanisads such as the *Chandogya* and *Brhadaranyaka Upanisads* emphasize the primacy of breath and the relationship between the microphase and the macrophase aspects of reality. By getting to know oneself through focusing on the power of the breath, one feels an intimacy with the larger aspects of the Earth and heavens, perhaps most aptly conveyed in the first section of the *Brhadaranyaka Upanisad*, which first correlates the various functions and regions of the universe with the cosmic horse, and then makes a similar series of correspondences with the human body. By understanding one's desires and impulses, as well as the structures and functions of one's body and mind, one gains an understanding of the cosmos.

The later Upanisads and the Bhagavadgita speak directly of Yoga as the technique to be utilized in order to feel that intimate connection with the flow of life and one's place within reality. The *Svetasvatara* and *Maitri Upanisads* state that by drawing the senses inward and controlling the breath, one can reach a state of equipoise.

The Bhagavadgita comes to describe the Yogi as one who comprehends the relationship between the "field" or nature (*prakriti*) and the "knower of the field" or spirit (*purusa*). Within the body of Krishna, the entire world, in its splendor and terror, can be seen, appreciated, and embraced. The metaphor of the human body becomes extended in the *Gita* to include all aspects of the universe. The *Yoga Sutra* of Patanjali outlines an eightfold practice to ascend toward the state of self-realization through which one realizes one's connection with the universe. The underlying philosophy of Yoga places great value on feeling the connection between one's self and the larger world of nature. This continuity becomes celebrated in the term *samadhi*, the goal of Yoga, which describes an experience of non-difference between oneself, one's sensory and mental processes, and the world. As described by Patanjali, the practitioner of Yoga becomes like a clear jewel, with "unity among grasper, grasping, and grasped" (*Yoga Sutra* I: 41). This state of consciousness allows one to melt into one's surrounding and in the process diminish and eventually reverse past tendencies (*samskara*) bringing one to a state of clarity and immediacy.

The eight practices identified by Patanjali can be seen in light of environmental ethics. The beginning stage of Yoga includes five ethical practices (*yama*), held in common with the Jain tradition. First and foremost, Patanjali discusses nonviolence (*ahimsa*), which entails not harming any living being by thought, action, or assent to

harmfulness. This precept advocates the protection of all forms of life, and certainly can be applied to cultivating an attitude of respect toward individual creatures as well as ecosystems. To support this discipline, Patanjali includes four additional vows. Truthfulness (*satya*) can be used to inspire acknowledgement of wrongdoing to the living realm. Not stealing (*asteya*) can be applied to remedy the imbalance of resource consumption in modern times. Sexual restraint (*brahamacarya*) can be used as a corrective to the crass commercialization of sex as well for population control. Non-possession (*aparigraha*) allows one to minimize the greed and hoarding that has plundered the planet. These five practices entail holding back, disciplining oneself, saying no to such behaviors as violence, lying, stealing, lust, and possessiveness.

The second stage of Patanjali's Yoga seeks to cultivate positive behaviors that can similarly be interpreted through the prism of heightened ecological awareness. Five practices are listed. Purity (*sauca*) can be seen in terms of keeping one's body, thoughts, and intentions clean in regard to one's surroundings. Contentment (*santosha*) encourages a philosophy of accepting what is "enough" and not striving to gather more than one truly needs. Austerity (*tapas*) entails putting oneself in difficult situations for the purposes of purification and the building of strong character. Self-study (*svadhyaya*) generally entails reading and reflecting on philosophical texts and in the case of environmental applications might include reading the nature poets. Devotion to god (*isvara pranidhana*) for an environmentalist might encourage regular forays into the wilderness to feel that important connection with the awe that nature inspires. Each of these serves as a touchstone for self-exploration and appreciation of one's place within the world.

The third phase of Patanjali's eightfold system, the practice of yoga postures (*asana*) receives relatively scant mention in the *Yoga Sutra*. Patanjali states that the purpose of performing the physical exercise of Yoga is to gain "steadiness and ease, resulting in relaxation of effort and endless unity" (*YS* II: 46–47). In later centuries, this aspect of Yoga was adumbrated and expanded by later writers, who draw extensive parallels between the practice of physical Yoga and the ability to see one's relationship with the animal realm.

In order to understand the significance of animals as it develops in later Yoga traditions, we need to discuss briefly the nature of shamanism. Mircea Eliade describes the importance of shamanic rituals that display intimacy with specific animals as follows:

Imitating the gait of an animal or putting on its skin was acquiring a superhuman mode of being . . . by becoming this mythic animal, man becomes something far greater and stronger than himself . . . He who, forgetting the limitations and false measurements of humanity, could rightly imitate the behavior of animals – their gait, breathing, cries, and so on – found a new dimension in life: spontaneity, freedom, "sympathy" with all the cosmic rhythms and hence bliss and immortality (Eliade 1963: 460).

These remarks by Eliade underscore the important relationship cultivated between humans and animals from prehistoric times. Animals were noted for their particular abilities and accomplishments. To imitate these fine qualities was considered a sign of spiritual attainment.

In the later Yoga texts, animals play an important role. Many postures (*asanas*) carry the names of animals. The *Hatha Yoga Pradipika*, written by Svatmarama in the fifteenth century, lists several poses named for animals. Some examples are the Cow Head's Pose (*Gomukhaasana*) [HYP 20], the Tortoise Pose (*Kurma asana*) [HYP 24], the Rooster Pose (*Kukkuta asana*) [HYP 25], the Peacock Pose (*Mayur asana*) [HYP 32], and the Lion's Pose (*Simha asana*) [HYP 52–54].

Additionally, later Yoga manuals such as the *Gheranda Samhita* include several additional poses named for animals, including the Serpent Pose (*Naga asana*), the Rabbit Pose, the Cobra Pose (*Bhujanga asana*), the Locust Pose (*Salabha asana*), the Crow Pose (*Kakasana*), the Eagle Pose (*Gauruda asana*), the Frog

Pose (*Manduka asana*), and the Scorpion Pose (*Vrischika asana*), to name a few.

Yoga practice does have an emotional effect that goes beyond mere strength or flexibility of the body. In the performance of the Peacock pose, one feels a sense of balance, a sense of pride, an affirmation of one's ability to move competently in the world. In the Eagle pose, one feels a sense of entwinedness and focus, a honing of one's vision and purpose. In the Cobra pose, one feels both a tremendous gravity and a rising up, a sense of being weighted and glued to the Earth, yet yearning and stretching to rise above. In the Lion pose one feels positively regal, refreshed and energized. At the close of a Yoga session one feels renewed and in a sense redefined, prepared to encounter the world with greater agility and balance.

In India, animals are part of one's everyday reality, even in the cities. One encounters cows, goats, cats, dogs, and numerous other animals on a daily, sometimes continuous basis. People often feed birds before taking their own meal, birds that fly into the home at dinner time, expecting acknowledgement. Gurani Anjali, a contemporary teacher of Yoga, has urged her students to observe animals, to learn from animals. One has a sense that the attention required to move into and sustain a Yoga pose carries a connection with the ancient shamanic tradition of animal imitation.

However, it could also be argued that a danger lies in over-romanticizing the mysterious or shamanic aspects of animal mimesis. For instance, Denise Kaufman, a prominent Yoga teacher in Los Angeles, suggests that one adapt a largely empirical attitude toward doing Yoga and relating with animals. In an interview she commented:

Animals move; people can learn about movement from animals. House pets stretch all day long, creating space in their joints. Animals sit in different kinds of positions. Monkeys and apes do things with their hands. Perhaps as humans we need to reclaim our four leggedness. Getting down on all fours stimulates the pranic flow. Sitting in chairs tightens the hamstrings and the lower back. Animals don't sit on furniture; they have not built things contrary to their nature (personal communication, February 1999).

From her perspective, Yoga involves recapturing our animal physicality, reconditioning the body to establish itself within a non-technologically enhanced environment.

The relationship between sacred power and the human cannot be divorced from the harnessing of the deep images evoked by intimacy with the animal world. Early peoples of India revered animals. They depicted animals in tableaux of adornment. They surrounded their early sacred meditating Yogi with animals. Animals find prominence in classical literature. The later medieval Yoga texts explicitly prescribe animal poses as integral to mystical attainment.

We learn to be empathetic and connected from our experience of and relationship with animals. As Thomas Berry has noted, our consciousness as humans, our development and affectivity, radically depend upon our openness and sensitivity to the natural order. To the extent that Yoga heightens our senses and brings us into visceral relationship with the nonhuman realm, our own sense of worth, well-being and connectedness becomes enhanced.

Following the mastery of the physical realm through Yoga postures, one reaches the capacity to effectively control the breath (*pranayama*), the fourth phase of Yoga. As noted earlier, the breath plays an important role in the philosophy of the Upanisads, and in the *Yoga Sutra* the mastery of the inbreath and outbreath leads to “dissolving the covering of light” (*YS* II: 52). The *Hatha Yoga Prad- ipika* and the *Gheranda Samhita* describe intricate techniques for manipulating the breath. Through this process, one reaches into the core of one’s life-force, sees the relationship between breathing and thinking, and cultivates an inwardness and stability, leading to Patanjali’s fifth phase, the command of the senses (*pratyahara*). This ability to draw one’s energy into oneself opens one to the higher “inner” practices of Yoga: concentration, meditation, and *Samadhi*, collectively known as *samyama*. Construed through an ecological prism, the inner work from the controlling the breath to *Samadhi* can be seen as enhancing one’s sensitivity to nature, an increase in empathy, and a willingness to stand to protect the beauty of the Earth. In a sense, the culmination of Yoga leads one to the very beginning point of nonviolence, a sense that no harm must be allowed.

The beginning of this inner threefold process requires sustained exercises of concentration (*dharana*). A standard concentration practice entails attention given first to the great elements (*mahabhutas*), then to the sensory operations (*tanmatras*), the sense and action organs (*bud- dhindriyas* and *karmendriyas*) and finally to the threefold operation of the mind (*manas*, *ahamkara*, *buddhi*). By concentrating on the Earth (*prthivi*) one gains a sense of groundedness and a heightened sense of fragrance. By reflecting on water (*jal*), one develops familiarity with fluidity and sensitivity to the vehicle of taste. Through attention to light and heat (*tejas*, *agni*), one arrives at a deep appreciation for the ability to see. Awareness of the breath and wind (*prana*, *vayu*) brings a sense of quiet and tactile receptivity. All these specific manifestations occur within the context of space (*akasha*), the womb or container of all that can be perceived or heard.

Intimacy with the sensory process allows one to maintain focus on the operations of the mind. Thoughts (*citta- vrtti*) generated in the mind lead one to question and investigate the source of one's identity and ego (*aham-*

kara). Probing more deeply into the constituent parts of one's personality, one begins to uncover the maze and mire of karmic accretions housed in the deep memory structures (*buddhi*), lightened and released gently through reflective and meditative processes. However, in order for any of these purifications to arise, an intimate familiarity with the body and collection of habits must occur, an intimacy that takes place through an understanding of time and place. Yoga enables a person to embrace and understand the close connection between the body and the world. By understanding each, one attains a state of clarity. From an ecological perspective, the practice of Yoga can prove beneficial. Through Yoga one can begin to see the importance of the food we eat in constructing our bodies. One can find a calmness of mind through which to appreciate the stunning beauty of landscape and sunset and sunrise. Through Yoga, one can understand that all things within the universe rely on the creative expression of the five great elements and that we gain access to all experience and all knowledge through our own sensuality and intuition. The practice of Yoga provides rich resources for persons to reconnect with the body and with the world. Through the insights and applications of Yoga, one can begin to live with the sensitivity, sensibility, and frugality required to uphold the dignity of life, stemming from a vision of the interconnectedness of all things.

Yolngu Ceremonial Architecture (Australia)

The religious beliefs and practices of the Yolngu people of northeast Arnhem Land in the Northern Territory of Australia are manifest in, and expressed through, their ceremonial or religious architecture.

As for other Aboriginal Australians, the world of the Yolngu was created by the travels of their ancient Ancestors imbuing sacred powers within the landscapes, flora, fauna, and people that they created. Through their activities the Ancestors marked the landscape: with their digging sticks they created waterholes and springs; where they swam they created rivers; when they rested they left permanent marks and tracks on the ground; and when they left objects behind on their journey such things were transformed into natural landscape features. As the Ancestors travelled, they also passed on knowledge and law to the Yolngu people, encompassing all aspects of their social and physical environments. This knowledge, and the actions and power of the Ancestors, are maintained and continuously reinforced through the process of ceremony. Yolngu ceremonies not only reenact ancestral events at places, but they create a temporal and spatial reference in which the people, places and actions “become” those of the Ancestors. Hence, Yolngu Ancestors are not considered part of the past, they are “ever present” in the places, things, people and marks they made in the landscape. The social identity of Yolngu people is partly constructed through their connection to particular Ancestors and places.

Yolngu ceremony grounds are places of worship that allow Yolngu to connect with their Ancestors, and although they are “unroofed,” the combination of place, structures and symbols constitute an indigenous ceremonial architecture. Structures that can be called “ceremonial architecture” are not shelters or dwellings *per se*, but are important religious symbols and spatial/ architectural tools that are employed during ceremony. Although a number of these structures may be similar to those employed in everyday domiciliary life, their meanings change and are enhanced when used in ceremonial contexts. For example, in certain Yolngu sacred histories, flaming dwellings act as “vehicle for change” in which

Ancestral Beings are burnt and metamorphosed into another state following the breaking of a moral code, and then continue their respective journeys.

During the process of Yolngu mortuary ceremonies the deceased’s soul is transported back to their ancestral homeland through the invocations of song and actions

of dance, incorporating sacred objects, structures and sculpted landforms. The sculpted landforms can be either representations of Ancestors themselves, the remnant marks of ancestral actions left on the landscape, or maps of the places they created. The sculpted landforms, which are low Earth ridges creating a diagram when viewed from above, are particular to the deceased's social identity. They are also a metaphor for the ancestral homeland to which the soul of the deceased will be transported through the process of the ceremony. Around and within the sculpted land forms, the Yolngu "dance" the actions characteristic of the Ancestors and undertake purification rituals in circular pits or wells by washing and cleansing themselves, as well as burning items that have had direct contact with the deceased's body.

Accompanying the sculpted landforms may be specially constructed shelters to hold the body of the deceased until the burial stage of the ceremony. Each shelter is specific to each mortuary ceremony and is given the name of the ancestral resting place that it symbolizes. The shelters are often decorated with feathers, shells, string and applied patterns, every detail of which relates to the social identity of different kin who are aiding the deceased on their journey. Mortuary shelters can be laden with symbolism and religious knowledge about the deceased that can only be interpreted by initiated members of the group. The form of the shelter may represent both the Ancestor, a geographical place that was the resting place of the Ancestor, and other physical manifestations of the ancestor.

Other objects representing particular characteristics of the Ancestor or ancestral homeland may also be incorporated into mortuary ceremonies. Externally, these objects may be present as upright forked posts and a ridge-pole (sometimes symbolic of a dwelling of the Ancestor), a rock, a dead tree trunk positioned vertically in the ground with suspended paperbark parcels of bones, or a line of decorated string (symbolic of all the Yolngu groups associated with the Ancestor and linked through country and ceremony). Such objects act as spatial and semiotic markers for the ceremonial participants.

Hollow logs and mortuary flags are other elements of Yolngu mortuary ceremonies. Hollow log coffins were traditionally used to store the deceased's clean and crushed bone remains and were placed in a vertical position on the ground. Such log coffins are highly decorated with Yolngu symbols and have been transformed into a contemporary art form. Mortuary flag poles are used to denote or bring news of death, and were erected in the ground near a customary camp, or outside houses in contemporary settlements, or on special mortuary grounds. Mortuary flags of the Yolngu come in a variety of colors, each associated with a particular group of people and their traditional country.

The forked post and ridge-pole are esteemed as religious objects, rich in meaning, and are used across both the profane and sacred spectrum of Yolngu life. They are employed in a variety of ways depending on the nature and ancestral origin of the ceremony. Traditionally they were often used as a storage place for the deceased's bones (wrapped in bark) as well having a role in ritual dance. Their significance originates in the mythology of the Wagilag sisters who built the first dwelling in the region. In the

Wagilag sacred history for Yolngu of the mainland in northeast Arnhem Land, a vaulted shelter supported on forked posts is built by two sisters as they camp beside a sacred waterhole where an Olive Python Ancestor resides. In this story, which is regularly depicted in Yolngu paintings, the shelter plays an important role in the protection of the women from both the Python and the environment. The archetypal shelter of the Wagilag takes on further sacred meanings in other ceremonies where male initiates are placed inside the shelter and emerge as part of a “rebirthing” ritual. The shelter represents the womb and its regenerative qualities. A more general interpretation of the forked post and ridge-pole, taken together, is that they symbolize the themes of the intersection of male and female principles, the theme of swallowing and enclosing, and the interrelated themes of support, nurturance and protection.

Yolngu Waters of Being (Australia)

In northeast Arnhem Land, Australia, the Yolngu people have a sensory awareness of the land and waters in which their personal and group identities and essences reside. All human, animal, vegetable, mineral, and atmospheric elements are placed in a complex, interwoven web of social and spiritual connections and significations. This web of belonging is determined by affiliation to one or other of two exogamous patrilineal moieties, or halves of the cosmos, called Dhuwa and Yirritja. These ties bind all things together and underpin the Ancestral Law – a set of social, moral and spiritual rules laid down in the distant past by ancestral beings. Ancestral beings were simultaneously human and animal and left human essences in the landscape as they transformed country by making rivers, carving out headlands, creating waterholes and leaving ancestral power in the environment. The first Ancestors birthed people at different waterholes and then returned inside, marking the land and the waters where their spiritual essence remains today.

So, when Yolngu look at waters they do not just see a clear liquid substance, but they perceive the embodiment of living and deceased relations as well as Ancestral Beings. These waters hold the memories of loved ones while reflecting images of their own bodies and spiritual essences that will one day come to be subsumed in water at death. Different waters resonate, meander, bubble, gurgle and change color as they tell of family members, their personalities and influence upon others. When freshwater and saltwater merge, they communicate processes of conception and birth, while particular water movements depict the consummation of marriage in the mingling and swirling of waves. A senior Wangurri man commented to me:

There's a good relationship there – for marriage. It shows how we are related to other people because the water forms that relationship for us. The freshwater and the land have overlapping stories with the sea as they form the basis of close relationships (Mathulu, personal communication).

Currents are always viewed in relation to river sources where freshwater and saltwater mix in swirling streams at particular points, generally at the mouth of a river. These confluences occur most commonly between mother, *ngändi*, and child, *waku*, currents or between grandmother, *märi*, and granddaughter, *gutharra*, watercourses. When waters come together the Yolngu call it *ganma* and say the water tastes brackish, *dhäkay-murkthuna* (a term that provokes much amusement from those singing or talking about it) as it can imply the mixing of bodily fluids in sexual intercourse. In particular, the frothy bubbling of major water courses is known as *gapu-djulk*, also the term for the breaking of waters at birth and the placenta.

The topography of ancestral waters further embodies human anatomical parts: the fresh waterholes are referred to as the eye, *mangutji*; a stream is the neck, *mayang*. Adjoining tributaries are the arms, *wana*; and the points of confluence of two tributaries are known as the elbows, *likan*. The lower reaches of the river are referred to as a tail or leg, *yangara*, and are referred to more generally as the bottom, *dhudi*; while close to the shoreline coastal waters are known as chest waters, *gumurr gapu*. Bundurr ritual group surnames identify freshwater and saltwater people with the upper or lower reaches of rivers. For example, in the Yirritja moiety, the “bottom” *Gumatj*, *Gumatj-dhä lukulili*, are known by one surname, *Munungguritj*, and come from *Bawaka*. Their surname is synonymous with the tail portion of their ancestral crocodile in the saltwater. The two other sub-groups, Burrarrwangga from Matamata and Yunupinggu from Biranybirany are aligned with the headwaters of the crocodile in the form of a spring that joins with the lower reaches of the river.

Personal and group affiliations to and authority in water can only be fully accessed through ritual language as Rev. Dr. Djiniyini Gondarra, leader of the Golumala clan and Aboriginal representative for the Australian Church Congress, told me, “The relationship between these identities can only be known as you sing.” Songs tell of waters washing upon the land, reflecting the genealogical ties of individuals and groups through their movements, colors and sounds while simultaneously marking those who do not belong to an area. Performing identities from the sea and land, then, becomes a way of knowing the self and others as waves of song invoke ancestral power through musical experience, combining movements of the ancestral past in the landscape and seascape with Yolngu identities in the present.

Yoruba Culture (West Africa)

The Yoruba constitute a linguistic, cultural, and political entity in West Africa. They claim common ancestry in Oduduwa and they developed the concept of *ebi* (kinship) as a symbol of unity. The Yoruba established kingdoms, many of which survived until the nineteenth century when the imposition of colonial administration engendered a new geopolitical configuration in Nigeria. The political rearrangement affected the Yoruba because while the majority of them are in Nigeria, others found themselves in what later became the present-day Republic of Benin and Togo. People of Yoruba ancestry also constitute a sizeable portion of the African Diaspora, the result of the trans-continental migration occasioned by the Atlantic slave trade. Wherever the Yoruba people exist, their interlocking concept of religion and nature remains with them. Their emphasis on the sacredness of life underscores the importance they place on religion and nature as well as their political and socio-cultural institutions. For example, *Ori* (“head,” signifying the origin of life), land (that produces food and supports the living and the dead), kingship, marriage, naming, death, places of worship and religious rituals are held sacred. The Yoruba worship many deities, revere and deify ancestors, and use natural phenomena to personify deities. In the past, Yoruba religion contributed to the preservation of the natural flora and fauna in that virtually all settlements were surrounded by green belts in addition to numerous groves, which harboured various species of shrubs and trees as well as animals. Until the assault of Islam, Christianity, and Western civilization, Yoruba religion not only attached sacredness to nature, it also helped to preserve physical environment from human encroachment. Clearly, nature plays a prominent role in Yoruba religious beliefs and practices.

The Yoruba refer to the beginning of life as *orirun* or *orisun* (the source of the stream of life) therefore every household worshipped Ori, the god of fate. The Yoruba, however, possess the concept of a Supreme Being. In Yoruba religion, there are no temples, no sacrifices, no regular prayers, and no priests to the Supreme Deity because he is assumed to reside in the remote sky called *Orun* (Heaven). According to their cosmogony, Olodumare (the Creator), also known as Olorun (the Owner of Heaven), designated divinities to create the Earth. One strand of their tradition states that the Earth existed as a watery, marshy waste and divinities, possibly human beings, used to descend from heaven on a spider’s web to hunt on the vast expanse of water. To create solid Earth, Olodumare gave Obatala (or Orisa-nla), one of the divinities, a handful of sand, a pigeon, and sixteen palm kernels. Obatala let loose the pigeon to spread the sand in order to create dry land. Obatala planted the palm kernels to explain how

trees came into being. The spot on which these events took place is called Ile-Ife (that which is wide).

A variant tradition believes that although Obatala was originally designated, it was Oduduwa, another divinity, who carried out the assignment of creating dry land and all living things. Oduduwa supposedly supplanted Obatala and descended to the Earth through a gold chain, equipped with a snail's shell filled with sand, a white hen, a black cat, five pieces of iron, and a palm nut. Oduduwa led the delegation to the world and landed on a hill called OkeOramfe (the hill of expansion) in Ile-Ife. The hen spread the sand and farmland appeared. Hence, the Yoruba regard Ile-Ife as the nucleus of life and their "Garden of Eden." The Yoruba creation story accentuates the importance of nature and why it constitutes a major part of their religion. They conceptualize religion and nature as intricately interwoven because all natural phenomena originated from Olodumare, as indicated in the attribute *Oba a s'eda aye* (King, the creator of the Earth).

The Yoruba worship many *Orisas* (gods and goddesses), which Bolaji Idowu referred to as the ministers of Olodumare. They act as intermediaries between humans and Olodumare and the leading ones include Ela, Esu, Obatala (Orisa-nla), Ogun, Orunmila, Osun, Sango, and Yemoja. The places of worship, which are approached with an aura of sacrosanctity, include the grave of ancestors, shrines and temples, groves, hills and mountains, trees, banks of rivers, and markets. Land, on which these places of worship are erected, is also held sacred. D.O. Fagunwa, a prominent Yoruba novelist, became popular through one of his books *Igbo Olodumare* (The Forest of the Almighty). Although the Yoruba claim that they have 401 divinities, there seem to be more when several other local deities are added. The worship of numerous gods and natural phenomena is not unique to the Yoruba people, for their pantheon compares with other African peoples. The slave trade, which forced many Yoruba people to North and South America, and the European partition, which arbitrarily divided the Yoruba, helped the spread of these divinities. For example, some of the divinities are worshipped in the Republic of Benin, Brazil, Cuba, and Trinidad and Tobago.

Most of the divinities personify nature and spirit. Orunmila, the oracle divinity and second in rank to Olodumare, possesses a vast knowledge of heaven. Orunmila communicates with other divinities through *Ifa* (divination). Ifa is a literary and divination system, which is found especially among the Yoruba-speaking people but also among other peoples of West Africa. Samuel Johnson, the father of Yoruba history and culture, contended that the Yoruba met Ifa at Ile-Ife but it became an official religion during the reign of Alaafin Ofinran, which coincides with the period of exile. The Yoruba use natural objects such as a palm kernel in the *opele*, or chain, the carved wooden tray, and the tapping staff or *iroke*. The Yoruba believe that Olodumare empowered Esu, the trickster divinity, to mediate between the forces of good and evil and convey the secret power of rituals and sacrifices to other divinities, in order to reduce evil exploits on humans. Wande Abimbola, a distinguished scholar of Yoruba religions, asserts that Esu changes his appearance and is capable of assuming 256 different forms of existence.

Represented by a block of ironstone upon which worshippers pour palm oil, and by a wooden carved staff, Esu favors those who sacrifice to him. Hence the Yoruba say *eni o rubo ni Esu u gbe* (Esu supports he who offers sacrifice). Esu, in Yoruba belief, is therefore different from the Christian concept of the devil. Yemoja is known as the goddess of waters and motherhood because the lagoons, oceans, rivers, and seas flow out of her body. Because of Ogun's nature, he is variously referred to as a violent god, the forest god, master of iron, and god of war, and is widely worshipped by hunters, blacksmiths, or people whose occupations deal with iron. Other sobriquets associate Ogun with wealth for he is called *Onile owo*, *Onile ola*, *Onile kangunkangun ode orun* (the owner of the house of money, the owner of the house of riches, the owner of the innumerable houses of heaven). Sango, a historical figure as the fourth Alaafin (King) of the Oyo Empire, was deified after his death. Owing to his violent disposition and ability to emit fire from his mouth, Sango is known as the god of thunder and lightning while Oya, his wife, is the goddess of thunderstorms. One of the songs devotees render during the worship of Sango partly states: *A so 'gi d'eniyan; bi o soro, a s'eniyan d'eranko* (He turns a tree into a man; when he chooses to be ferocious, he turns a man into an animal). Sacrifice is an indispensable aspect of worship in Yoruba religion and every divinity has its favorite food items for sacrifice as well as taboos. For example, food items such as *egbo* (mashed maize), pounded yam, goats, and fish are offered to Oya but dog is her taboo. While Esu accepts grains of maize, fowls, hegoats, and dogs, he despises *adin* (oil extracted from palm-kernels).

Like the Borgu people, the Yoruba also venerate animals and reptiles as totems. According to Yoruba belief, animals and plants have souls. The land, hills, rivers, rocks, and trees, which spirits inhabit, are held sacred. Samuel Johnson referred to totems as denoting the origin of a family. There are *Erin* (Elephant), *Oni* (Crocodile), *Agbo* (Ram), and *Okin* (the Lovebird), *Ojo* (Rain), Lion, Python, and Cobra families. Clan or lineage members recognize these animals and reptiles as members of their families and their assistance can be sought from time to time for various reasons. *Oni* (Crocodile) families observe an elaborate burial ceremony for a dead crocodile. The crocodile is wrapped in a white piece of cloth and buried like a human being in a grave. During the ceremony, three fowls are sacrificed, drums are beaten, guns are shot, and clan members entertain their friends with food and drinks.

Secret societies formed part of the Yoruba religious belief system. The societies were secret because membership was restricted and they often engaged in mysterious activities (only the initiates having knowledge of these activities). Secret societies with a religious background are mainly concerned with the cult of the dead and they wield enormous power over their communities. The cults include the Aje (Witches), Ogboni, Oro, Egungun, Agemo, and Eluku. Some of these cults also performed social and political functions. The Ogboni, a political society, held the symbol of metal images of human figurines (*Edon*), which the uninitiated could not see. The society is known as *Imole* in Ile-Ife and *Oshugbo* in Ijebu. Robert Smith, a historian of the Yoruba people, described the Ogboni society as "a semi-cult devoted to the worship of the Earth, which

wielded both religious and political sanctions” (1988: 93– 4). The religious activities of the Ogboni included the worship of the Earth spirit (*ile*) and members wore beads on their necks and wrist, tied a wrapper across the left shoulder, and wore a sash (*Itagbe*) over their right shoulder.

The *Egbe Awo* (Association of Diviners) is often misconstrued as having maleficent purposes and activities. The training of an Ifa student lasts about ten years with a complex initiation process. During this time, the individual acquires knowledge and skills in the field of divination, medicine, pharmacy, psychiatry, psychology, and philosophy. There is a great deal of interaction between religion and nature in these branches of religious and healing practice.

The concept of life after death predominates in Yoruba religion. The Ifa corpus clearly states that the soul does not die but transposes to a new world. Thus the Yoruba regard the Earth as a marketplace, or as a journey, and heaven is their permanent home. It is believed that the ancestors watch over and influence the affairs of the living. To maintain a good relationship and to receive blessings from the ancestors, regular or annual visits and sacrifices are offered at the *oju ibo* (“the place of worship” that is, the gravesites of ancestors), often located within the compound. The different types of sacrifice include thanksgiving, votive, propitiatory, and preventive. Sacrifices also occur during the laying of the foundation of a house or at the beginning of a business venture. Requests for childbirth, improved health, and success at work are made to the ancestors. The concept of an afterlife also calls for good behavior on Earth because people will reap in heaven what they sow on Earth. *Egungun* (masquerades), believed to embody the spirits of the ancestors, appear during funeral ceremonies.

The Yoruba express their religious beliefs in names, epithets, proverbs, and songs. Proverbs such as “good character is a god; the better the worship, the more the blessings”; “there is no god like the throat; it accepts sacrifices everyday”; “no god favors a lazy person; he can prosper only by using his hands to work”; and “nothing can be done to the Ifa oracle to prevent it from behaving like palm kernels” (palm kernels are used in the consultation of the Ifa Oracle) illustrate the extent of the intersection of Yoruba religion and nature.

Many rivers, hills, and trees in Yorubaland are also objects of veneration. Notable among the rivers are: the Niger (Oya), Ogun, Owena, Oni, and Osun. River-spirits are appeased to prevent flooding and disaster during the rainy season. Yemoja (the deity mother of all rivers and fishes) is believed to be a generous giver of children. Prominent hills such as Iyamopo in Igbeti, Oke-Ibadan in Ibadan, Olumo Rock in Abeokuta, Oke Ila in Igbomina, and Asabari in Saki are worshipped. Iyamopo’s appellation, “The hill of protection, the mighty hill that flattens its back to carry its children,” indicates its protective role in Yoruba warfare. Sacrifices are offered to the Orosun hill at Idanre and the Ajo and Okelota hills at Ado-Ekiti on an annual basis for their protective values. The Yoruba respond to their forest environment by venerating the deities who live in trees such as *iroko* (*Chlorophora excelsa*), cotton tree (*Eriodendron orientale*),

baobab (*Andansonia digitata*), and *ayan* (African satinwood where the god of drums resides).

The Yoruba apply their artistic skillfulness to express their religious beliefs. Wood carving, drawing, and painting found in shrines depict their high level of artistic imagery. The style and features of an image more often than not portray the religious emotions of the artist. Carved images are mere symbols and not the real objects of worship. But because Olodumare is supreme and remote, there are no images, no liturgies, and no shrines dedicated to him.

Religion and nature are almost inseparable elements in Yoruba history and culture. The deifying of people, the worshipping of deities, and the reverencing of animals, reptiles, and trees prevail in Yoruba religious practices. Nature has been so ingrained in Yoruba religion that food items are offered to the gods and leaves and roots are used for charms, and treatment of illnesses. Severing nature from religion is tantamount to rendering the Yoruba culture and belief system worthless.

The introduction of Christianity through the European missionaries and Islam through Muslim merchants has not detached Yoruba religion from nature. Christianity made significant inroads among the Yoruba, most especially because of its attractive elements of Western education and medicine, and Islam is fast growing. Christianity and Islam have drawn their adherents from and have denigrated the Yoruba religion. Each opposed its closeness to nature. The impacts of Islam and Christianity have been crushing on Yoruba religion, particularly since both of them received encouragement during the colonial period, and subsequent political administrations after independence have promoted them.

The number of adherents of the Yoruba religion is dwindling in the face of competition from Christianity and Islam, but the religion has not been completely displaced in the society. Although still struggling to survive, the most persistent attempts at revitalization come from Africans in diaspora who see a commitment to Yoruba religion as an identity or a key in the search for their roots. The preservation and revitalization of the Yoruba religion is carried on at the Oyotunji village, outside Beaufort in South Carolina, where the religion is practiced. The frequent pilgrimages to Yorubaland, such as during the Osun festival at Osogbo and the Ifa festival at Ile Ife, have become pointers to the greater global dimension that Yoruba religion has assumed. There is also the quasiacademic attempt to preserve knowledge of Yoruba religion in the World Orisa Congress, which seems to be of some attraction in the Americas. However, contemporary economic problems faced by people on the African continent have had negative effects, giving rise to charlatans, just as attempts to modernize have resulted in bastardization. Divination and traditional healing system, which are intricately interwoven with Yoruba religion and nature, are still carried out in modern times. This shows that Yoruba religion continues to exist in spite of the challenges it faces from other religions.

Yuchi Culture and the Euchee (Yuchi) Language Project (Southeastern United States)

The struggle of the Yuchi (also spelled Euchee) community to pass forward its ancient language to younger generations is representative of challenges facing the majority of indigenous nations bounded by elaborated colonial economic and social structures. As of this writing there are only six remaining elders out of perhaps 2400 Yuchis who are available to help teach the language to younger members of the Yuchi community. The Yuchi nation arrived at this point of extreme urgency in the life of its language only after exhibiting extraordinary resiliency across many generations. Yuchi people were accosted by successive and overlapping waves of physical genocide, brutal dislocation, and forced assimilation.

In ancient times Yuchi people were found in the area now known as Tennessee and lived primarily in the areas that became known as Georgia and Alabama throughout the colonial and early American periods. They had established towns along the ample rivers in the region, living primarily from corn and other crops, with seasonal celebrations for the gifts that sustained their society. During the decade of the 1830s they, along with other nations in the region, suffered deadly dislocation under President Andrew Jackson with many Yuchis taken in chains a thousand miles to what became known as Oklahoma.

Although the displaced peoples brought their sacred ceremonial fires as centers of their social, economic and political lives to their new locations, they were faced with an enormous and accelerating shift in their subsistence patterns and traditional ethos with dramatic implications for ceremonial life and their understanding of the world. In the old homelands the major ceremonial traditions and daily ritual activities related rather directly to the longstanding subsistence patterns and lifestyle of the society. They mediated a fit between the regular requirements of hunting and planting and the broad understanding of how the world worked, both reinforcing proper behavior and reflecting this larger worldview.

The central ceremonial cycle focused on what has been discussed in scholarly literature as Green Corn ceremonialism. The annual ceremonies celebrated the beginning of a new year with fresh crops and was marked by a new fire rite. Community members were forbidden to partake of fresh corn until these ceremonies of purification and

thanksgiving had been completed. This was a time of renewal and cleansing for the community as members carried out their founding instructions, reenacting ancient primal events. The timing was based on the seasonal movements of the sun and moon and required careful observation of plant life for gathering all the proper medicines. The special use of certain animals, such as garfish and terrapins, also required an intimate engagement with the animal world.

All these ceremonial traditions are still followed by those community members who remain active in one or more of the three ongoing Yuchi ceremonial grounds. The “clean ground,” as it is referred to in the language, where the ceremonies are carried out, becomes a sacred space where expressions of strife between members is forbidden. The central ceremonial area, often referred to as the “big house” in the language, is carefully oriented within the cosmos along the four directions and founded with sacred medicines in the fireplace at the center point. This ritual space is where the entire family of the Yuchi community is welcomed with their friends and where ceremonial ground members, from both the present day and earlier times, gather to carry out their ceremonial responsibilities for another year. The longer cycle of four ritual ball games and four dances culminates in a structured time of ritual separation between men and women, fasting, taking medicines, and purification rites. Only after the sacred ground itself has been fed medicine can the fast be broken and a time of communal feasting begun. These ceremonies hinge explicitly upon using the gifts of particular medicine plants and on the special songs given long ago by a specific large bird. It is through a set of special dances (misleadingly referred to as social dances by some scholars) that relations are renewed and maintained with specified plants and animals.

These traditions now face great challenges. The process of physical displacement in the nineteenth century had created an extremely difficult transition period for keeping proper relations with the new living environment. Community members increasingly came under the influence of the material arrangements and social values of the larger society. There was a broad shift in such areas as the traditional family, clan relations, residency patterns, medicinal practices, and reliance on traditional agriculture. These mounting pressures combined with corrosive influences from both native and non-native churches through the late twentieth century, from Euro-American education, and “allotment,” the breaking up of communal lands into small individual holdings by the federal government.

All of this created pressure on the ceremonial traditions and challenged the underlying worldview. The displacement of traditional foods by store-supplied items had perhaps the greatest impact on the underpinnings and practices of traditional society as many of the daily ritual activities and traditional arts fell into disuse. The ceremonial calendar was adapted to fit modern work schedules. Current community members no longer live by farming and do not normally raise traditional crops of corn, beans, squash or tobacco. The strong link between the celebrations of the main ceremonies and this form of livelihood is no longer so apparent. The natural environment around the community was subjected to degradation and modern waterway management tech-

niques instituted by the U.S. Army Corps of Engineers resulted in the flooding of ecological niches where many of the important plants were previously collected, making it harder to find plant sources for traditional foods and medicines. The relationship with animals was greatly attenuated as many species were driven to near-extinction.

Against these imposed difficulties Yuchis still perform the buffalo dance at their annual ceremonies despite having virtually no contact with the animals since the mid-nineteenth century, whereas they were once common in the original homeland areas of the Yuchi in what is now referred to as the southeastern United States. Responding to the rhythms of the Earth, many within the Yuchi nation continue to maintain their ancient ceremonies as the center of community life, with its implicit ethic teaching a life of balance and harmony. The health of the Yuchi nation in proper relation to the larger community of life depends on these vital ancient activities. Indeed, in traditional perspective the continuity of the cosmos itself is tied to the successful completion of these ceremonial duties. In turn, the ceremonies themselves rest on the use of the Yuchi language. While the language has always been an essential bearer of Yuchi culture, the role of the language is now further heightened. As the ethos in the community continues to tilt in the direction of the enormous weight applied by Euro-American society, the value of the language becomes even more critical for passing forward a tradition-rich view of the world.

In the case of the Yuchi – like many other nations – the long-term processes of physical genocide and cultural assault were coupled with a kind of intellectual erasure in which the very existence of the Yuchi nation and language were denied for over a century and a half in government reports and published authoritative sources. The published denials continue into the present and now include internet sources and current reference publications. The community was again denied formal recognition by the federal government in 1995. The language itself is spoken by few, has no known cousins from which to borrow or learn, and has no standard orthography.

Despite these many obstacles, the Yuchi people remain as bearers of a unique language, even as they maintain their traditional ceremonies. Yuchi has been identified as a language isolate, standing apart from groups of related languages in what are termed language families. As such, the language transmitted by today's elders represents one of the world's cultural treasures from an immemorial human past. With only a handful of fluent speakers the community has launched into an aggressive revitalization effort led by the Euchee (Yuchi) Language Project with the goal of passing their ancient language forward from current speakers (whose average age is over 80 years) to a new line of younger speakers who will be enabled to carry forward the language for the benefit of coming generations. Even as there were those who carried the coals from our ancient ceremonial places a thousand miles to unknown lands so that the fires of our traditions could be rekindled and spread again among the people, so we now pursue the goal of developing a second handful of competent speakers who can carry forward the language to later generations.

This goal has necessitated a focus on immersion learning in small clusters of master and apprentice teams. The most valuable and essential asset to the project has been the support and knowledge of the gifted speakers of the language, as we rely on elders who grew up in the 1920s—the last generation with a large percentage of firstlanguage speakers of Yuchi. Various arms of the Euchee (Yuchi) Language Project (ELP) include community outreach through a newsletter and Yuchi language radio and a Yuchi language page in the Muscogee Nation News. Weekly language classes for children and beginners have been conducted since 1993 building off of several earlier community classes. These classes not only seek to address in an appropriate manner the language needs for the ceremonial ways but have also sought to pass forward through hands-on methodologies traditional arts, agricultural practices, and older lifeways built around identifying, gathering, and preparing traditional foods. Perhaps the greatest challenge for second-language learners is to develop enough competence in the language to absorb the fullness of the underlying worldview reflected in the language. Another arm of the ELP deals with documentation and archiving of extant recordings. The purpose of creating and maintaining these recordings is to expand the memories of the Yuchi learners, as an aid that will allow them more time in which to absorb the rhythms and words that are their natural heritage. That is, the cohesive focus of these various aspects of the project is on finding potential dedicated learners and developing new speakers as quickly as possible.

While this approach specifically addresses the most urgent needs of the community it also serves to highlight the divergence between community needs and the interests of the academic enterprise (see Grounds 2003). Given the context of the extremely fragile status of the language, with so few fluent speakers the community is forced to decide between meeting the agenda of the academy with its focus on textual production or addressing the challenge of passing forward the oral language to a new generation of speakers with its time-consuming requirement of immersion in the spoken language.

The urgency and importance of the language revitalization work is of utmost value to the Yuchi community and, indeed, to the diversity of global humanity. As a linguistic isolate the Yuchi language provides a unique and direct link to an ancient human past. The language is the vehicle for intimate knowledge of medicine plants, local ecosystems, and hidden histories of the Yuchi people, and remains vital to the traditional ceremonies. The richness of the community life, as reflective of a unique worldview, is born by the language – a world that remains inaccessible through the English language, a world in which men and women speak different forms of the language. This is a world in which the people referred to as Yuchis in history texts are known by a different name in their language, as the offspring of [the] Sun, who is recognized as female. There is an exceedingly musical and lyrical quality to the spoken rhythms of fluent Yuchi. This quality is bound up with the meaning of the language and effectively prevents first-language speakers from understanding the staccato delivery of English speakers in their early attempts to learn the Yuchi language.

The Yuchi cosmos is one that has no general term for animals and one whose grammar does not separate humans from animals. All living beings are recognized as part of the greater living world. Every Yuchi sentence that refers to an individual person (including animals) or to any non-person necessarily speaks in terms of their physical form in relationship to the Earth. In the evocative Yuchi language the place where one lives is where one habitually sits upon the Earth. The deepest beliefs of the most important rituals are mediated through the language. The healing process using powerful medicinal plants does not rely solely on their pharmaceutical properties but is traditionally administered with specific songs or chants that are essential for effecting a cure. Yuchi words are not empty symbols but are understood to have power and efficacy. The passage from this world to the next is mediated through ritual words in the language.

This extremely compelling understanding of the world

– a beautiful and profound grasp of it – is at the same time fragile and precious due to its orality. Like other indigenous languages it can become all-but-lost in the span of a single generation. The Yuchi language is now making its last call to a younger generation to get in the dance, to join the ancient spiral of Yuchi culture bearers and learn the language, the depth of its melodies and the richness of its rhythms, so that a new generation will understand their place within the cosmos in the fullness of their primordial relation to the created world.

Yunnan Region (Southwest China and Montane Mainland Southeast Asia)

Yunnan, meaning “south of the clouds,” is located in Southwest China bordered by the Tibet Autonomous Region and Sichuan, Guizhou, and Guangxi provinces of China on the west, north and east, and the countries of Vietnam, Laos, and Myanmar to the south and southwest. Geophysically, Yunnan serves as the roof of Mainland Southeast Asia due to its location on the headwaters of all the major rivers within this montane region. The ecological health of this “roof” of southwest China and Southeast Asia is the concern of many stakeholders in all the surrounding countries and provinces. A planned increase in regional development will bring new and vast construction of communication and transportation infrastructure along the Mekong and other river systems. Yunnan, with a total area of 394,000 square kilometers, consists of 128 counties in 16 districts or prefectures and has a population of 42.9 million people, including 14.6 million ethnic minority peoples with diverse indigenous cultures and livelihoods. The ethnic minorities of the Yunnan uplands include Tibeto-Burman peoples, such as Tibetan, Naxi, Yi, Hani (Akha), Jingpo, Lisu, Lahu, Nu, Derung, Primi, and Jinuo; Mon-khmer, such as Wa, Bulang, and Deang; and Miao-Yao including the Miao and Yao. The ethnic minorities in Yunnan are characterized by complex dialects within groups and distinctive socio-economic systems because of the region’s biological complexity.

Sacred Knowledge

Many activists and scholars fear the loss of local knowledge in the region. Despite the dynamic cultural practices of indigenous people, their knowledge systems or indigenous knowledge, as they are called by outsiders, are rapidly fading away. Due to market penetration, outmigration and external education, the local languages, sacred knowledge and religious practices linked to worship of sacred space and maintenance of biodiversity has already been extinguished in some places. Although the indigenous people have been living in the mountain regions for thousands of years as hunters-gatherers, pastoralists, and agriculturalists, they are viewed by outsiders as objects to be managed rather than citizens in the mountain ecosystems. As managed objects, the

political-administrative structures they are located in systematically marginalize their aspirations and the knowledge they apply to achieving them.

Sacred knowledge, as part of indigenous knowledge systems, is locally rooted in the culture of a particular geographical territory. Sacred knowledge refers to the nature (both geophysical and ecological environments), mythical cosmology, cultural beliefs, religious rituals and stories of a place assigned by people to their space. Sacred knowledge is mostly culturally or religiously transmitted, with the help of collective memory encoded in stories, myths, legends, songs, dances, rituals, and systems of classification of resources. Sacred knowledge constitutes a significant part of the identity of each cultural group and is a specialized knowledge often held by persons with special experiences, such as religious leaders within local communities. Some individuals in the local culture achieve a degree of coherence in rituals and other symbolic behavior and act as intermediaries between the material and spiritual world. They are persons who possess sacred knowledge like the Bimo in Akha and Yi societies, or the Dongba in Naxi society or the Lama among the Tibetans. As young people are not taking over these roles and no longer know many practices recalled by elders, large gaps in knowledge are emerging between generations.

Sacred Space

Sacred space refers to sacred places (mountains, hills, lakes, rivers, temples, shrines, etc.), sacred objects (religious sculpture, stone, painting, hieroglyph, costumes and other sacred objects), and their associated life (animal, plants, trees, forest) and imaged super-nature (e.g., kylin, an imaged totem animal, with a deer-like body, covered scute, single horn, cattle tail. Chinese believe the kylin always bring good luck). Therefore sacred spaces are “contextualized” by the way they are expressed through “material culture,” such as any religious objects or any product of human expression in the geophysical landscape. The sacred space can vary from a few square meters to hundreds of square kilometers in the geophysical scale, and from household, community, multiple communities to multiple ethnic groups in the socio-cultural scale. Sacred spaces are maintained through practicing religious rituals, ceremonies and sanctions and participating within a specific cultural group. The sacred places or sites are the sources of powerful forces or energy; sacred objects are revelatory and powerful instruments in religious rituals; the associated life are either reincarnated human beings or communicators between humans and nature; the imaged super-nature represents the soul of nature, which formulates the sacred ecological system for the natural landscape in the mountain region. Cultural identity is the vehicle to direct experience of the sacred. The sacred ecology refers to non-productive and non-reproductive, and the cultural dimension of interactions between human and nature in the particular terrain. The concepts of “connectivity” between humans and nature, existing in this and the next life, and the “spirituality” of nature and human behaviors and decision making are key

principles for sacred ecology. The sacred ecology emphasizes that human beings are only part of the ecosystem and all life is equal in terms of power, skill, and moral responsibility.

Sacred Ecology: Indigenous Perceptions of the Nature Spirit of nature "shu": The Naxi people's perception

Dongba is a term for a Naxi priest meaning "wise man" or "sage." According to the mythological records in the manuscripts of Dongba religion, Dongba priests could communicate between humans and the spiritual world, and they advised clan chieftains. They are considered by the Naxi people to be wise men since they have sacred knowledge about the supernatural and natural worlds. They know how to pray for good luck, blessings and happiness and prevent bad luck and evil, and they know how to deal with relations between humans and nature. Various rituals are performed in different occasions for harmonizing relations with nature, such as worshipping the gods of grains and animal husbandry, the hunting spirits, the mountain god, the god for protection of villages, the spirits for the fireplace in the house, the god of blacksmith, the god for war and victory, the god for herb medicine, etc.

Shu is worshipped by the Naxi as a spirit of supernature or god for governing nature. Shu has the shape of a human body with a snake tail, wearing a *wubao* hat (a hat with five treasures). In Naxi oral history, Shu and human beings used to be stepbrothers from the same father. When the two brothers split family property, humans got valleys, crops, and domestic animals, while Shu got mountains, rivers, forests, birds, and wild animals. Ever since, humans kept invading the property of Shu, and the latter became very angry and decided to take revenge by making it difficult for humans to survive. Humans appealed to Dongba to control Shu. Shiluo sent a rock warrior to conquer Shu. Under the mediation of Shiluo, humans and Shu made an agreement that they would never harm each other again. Humans could obtain the necessities of life from nature, but they had to pay Shu at certain times by worshipping it. This is the origin of the Shu Worshipping Ritual. Each year, on either the day of the dragon or the day of the snake in the second month of the lunar calendar, people get together in order to worship Shu and pray for blessings for their offspring, favorable weather for agriculture, prosperity, and longevity of the community. People usually choose a water source or pond near the village as the site for the Shu Worshipping Ritual. The ritual consists of two rites: to repel evil and to worship Shu. The rituals take place on the sacred altar, Shu's place, and the evil spirits' place.

The first ritual is the rite to repel evils. In Dongba belief, evils (*hui*) have two meanings, one is the dirt in nature and the other is human misbehavior or behavior against moral codes. A Dongba blows a white shell, beats the gong and drum, burns incenses to heaven, and lights the sacred lamp while another Dongba lights an azalea torch and smokes the evils on the sacred altar and in Shu's place. Usually the Dongba will chant scriptures, such as "setting up the sacred altar," "offering food to gods," "inviting gods," and "worshipping gods" to invite the gods in. Then, the Dongba will dance at the evil spirits' place as one of them chants verses from "The Origin of Evils"

and some other scriptures. Later they will feed the Dan, which are three puppies, the nonhuman descendants of the human ancestor Congrenli'en and the straight-eyed girl from heaven. After being fed, the Dan are separated from the evil spirits. Then the participating villagers and Dongba cleanse the evil spirits' place with water and torches. They also kill a chicken to feed the dirty spirits with its blood and feathers and to drive the spirits to where they belong. At the same time, the Dongba begin the dance of the gods to destroy the evil spirits' place. The Dongba also fell the tree of evil spirits until all the spirits are suppressed.

The Shu worshipping rite follows the evil repelling rite. Shu's place is characterized by wood: plates representing heaven, Earth, and the five Shu kings, and the so-called repayment wood consisting of plates with drawings of different animals, the tower of Shu, and mountain bamboos. Shu's place; consists of three parts: the first is heaven, Earth, and the five Shu kings; the second is the guard of Shu's palace and the third is the foolish Shu's place. One Dongba will chant scriptures in front of Shu's place: "The Origin of Shu," "Inviting Shu," "Burning Incenses," "Offering Food," and "Locking Shu's Door." This chanting indicates that they have invited heaven and Earth and all the Shu kings to stay in the village and enjoy the offerings of the humans. The Dongba will also chant "Wake Up Shu When The Rooster Crows," "Offering Food," "The Fight Between the Rock and Shu," and stories about how human ancestors offended Shu and how Shu took its revenge, as well as how humans and Shu fought and were reconciled. Then they offer and serve Shu with medicine as they chant "The Origin of Medicine," "Using Medicine," and other scriptures to heal Shu's wound from the bite of the rock, thereby repaying all the debts. They set free a chicken whose neck is tied with a ribbon of five strips of cloth which symbolize five dimensions as a promise to sacrifice another chicken the next year. The Dongba chant "Praying For Longevity" and "Praying For Blessings Befalling on

Offspring," give gifts to all the Shu from different places, and then send them all back whence they came, accompanied by a chant of "Sending Off Shu." Finally, they burn incense on the sacred altar, dance the godly dance, and send the gods up to the eighteenth layer of heaven with the chant "Sending Off Gods." The Shu Worshipping Ritual is a solution that the Naxi ancestors found to the reconciliation of humans and nature in history. It is a means of reminding humans of their agreement with Shu. Only by disciplining themselves and living in harmony with Shu can humans ensure a good living environment and sustainable social development.

Dai people's "Holy Hills"

The Dai people can be found in Northwest Vietnam, Upper Laos, Shan Hills of eastern Myanmar, Northern Thailand, and Southern Yunnan in southwest China. The valleybased Dai People in Xishuangbanna have practiced a predominantly Buddhist religion since the middle of the Tang Dynasty (618–907). Before the introduction of Hinayana Buddhism, the Dai people appear to have practiced a polytheistic religion bound heavily to the natural world. Like many early groups, the Dai associated forests, animals, and plants that inhabited them and the forces of nature with the spiritual

realm. Proper actions and respect for the gods were believed to result in peace and well-being. Improper activities and disrespect incurred the wrath of the gods who punished the Dai villagers with a variety of misfortunes. Thus, the early Dai were encouraged to live in harmony with their surroundings, such as cultivating fuel wood (*Cassia siamea*) in the foothills and planting religious plants in the temple yard. In the traditional concepts of the Dai, the gods reside on the forested Holy Hills, or *Nong* in their own language. All the plants and animals that inhabit the Holy Hills are either companions of the gods or sacred living things in the gods' garden. In addition, the Dai believe that the spirits of great and revered chieftains go to the Holy Hills to live, following their departure from the world of the living.

Holy Hills are an important visual landscape with good forest cover nearby the Dai village. They are a key component of the local ecosystems, which consists of paddy fields, home gardens, and cultivated fuel-wood forest. There appear to be two types of Holy Hills. The first, *Nong Man*, refers to a naturally forested hill, usually 10 to 100 hectares, worshipped by a natural village (called *Man*); the second, *Nong Meng*, refers to much larger forested hill, often hundreds of hectares, worshipped by the traditional administrative village or a governed area (called *Meng*). The traditional Dai people's practice of the Holy Hills has made a significant contribution to environmental goods and service the local and regional landscapes. Studies show a high concentration of endemic and endangered species in the Holy Hill forests.

The Hani concepts of village and nature

The Hani people, with a population of 1.25 million in Yunnan, are originally from the Tibetan Plateau. *Ha* meaning snow, strong and brave, combines with *ni*, meaning the people who live in mountains, to create the strong, brave mountain-dwelling Hani. The Hani people migrated from the Hong He, the Red River region of central Yunnan, where they are believed to have practiced irrigated agriculture toward what is now Xishaungbanna more than a thousand years ago. Other members of the same group migrated south, reaching northern Thailand and Myanmar early in the eighteenth century. Finding the river valleys of the warm, humid, sub-tropical regions already occupied by other groups, the Hani learned to practice shifting cultivation in the still vacant uplands.

During a long history of migration and readaptation to their new environment, a group of people, including *zoema*, *biemo* and *nipa*, who hold sacred and ecological knowledge about nature, have played a key role for cultural identity and continuity. The Hani are a patrilineal clan. The village chief (*zoema*) is normally a hereditary position but may be selected by a group of knowledgeable and well-to-do village men. The role of the village chief was traditionally imbued with legal authority and religious functions, but never as an absolute ruler.

The *biemo* is the natural encyclopedia of Akha society. He is the knowledge keeper of the genealogy tree, or all male ancestors of the clans, generally committing over sixty generations to memory. He recites all the ancient oral traditions about the origin of the Hani or Akha, the history, the migrations, the plant and animal cycles, etc. He

is in charge of precisely establishing in the Akha calendar the date of every festival. He plays the role of an intermediary between the spiritual world of the ancestors (the past) and this world (the present). The Biemo also holds ceremonies for funerals. Every village has a *zoema* village head but not necessarily a *biemo*. Sometimes several villages share one *biemo*, or there are several *biemos* in a village.

Another knowledgeable person is the *nipa* or shaman. Most are women who have been designated by the spirits to fulfill this role. She learns from her dreams and can easily communicate with the spirit world. If somebody gets sick, *nipa* is asked to diagnose the illness and communicate with spirits for treatment, often combining rituals, dancing and medicinal plants. The *Nipa* and *biemo* have a close relationship. If somebody is sick because they have broken a natural law, or taboo, the *nipa* will identify whose spirit the person has violated. As she does not have the power to ask for pardon from the spirit, the *biemo* performs the rituals for facilitating dialogue with the spirit.

The Hani village is surrounded by a village protection forest (*pucang*) of several hundred meters divided into a human lived place (*pucang*) and nature (nonhuman) world

(*baolcang*), with a village gate entrance (*lanlkang*). There is another gate to the ancestors living area (*laoqbiml*), the cemetery forest. The super-nature, mother of the Earth, governs all gods related to agriculture, who live in the village sacred forest (*milsanl-sanqqu*) and is often represented by a big, strong and long-living tree (such as oak, *Castanopsis mekongensis* or *Ficus religiosa*), called dragon trees by some Hani people. In a lucky day every June, a big ritual is held by *zoema* with participation of an adult male representative from each family. Hani people believe that different spirits have their own habitats, such as wetlands, lakes, strange stones, and particular trees (e.g., *Terminalia myriocarpa*).

The Hani people in Yunnan have a tradition of preserving forests in the mountainous areas where they live. As an ethnic group primarily living in southern Yunnan and bordering northern parts of Myanmar, Lao, Vietnam and Thailand, the Hani have kept harmonious relations with their natural surroundings for many centuries. According to their cultural beliefs, humans are a part of the natural world in which everything has its own spirit, and most of the spirits reside in certain forests. Human activities, like collecting forest products, hunting, and cutting trees in these forests are taboo for the villagers.

Tibetan sacred mountains and concepts of space

As high mountain dwellers, mountain worship is the most characteristic cultural belief and practice of Tibetan peoples. The spread of Buddhism on the Qinghai-Tibetan Plateau imbued their sacred mountains with new or even greater significance. There are different kinds of sacred mountains for Tibetan people. *Songre* is a little peak designated for the spirit, with small shrines but no residential houses, worshipped only by a small village or even one or two families. *Nieda/Reda* (some use them interchangeably) is a whole mountain body, bigger than *Songre*, and shared by larger village communities

within a small region. People may live on it, though some Tibetan communities view such a mountain as very spiritually sensitive, believing that it is especially propitious to supplicate such a sacred location with prayers. *Nieqian/Niere* is a holy mountain highly regarded by the Tibetan community at large. It refers to the whole mountain from bottom to top. *Nieqian* is a respectful term such as Nieqian Qumalangma (Mt. Everest) and Khabadkapo. Reincarnated Buddhist Lamas purposely make sacred mountains cover a very large area because they believe that the bigger the area, the less likely it is that spirits will be disturbed. There is also evidence of concern among some Lamas that a rapid opening of pristine nature to tourism development might result in destruction of such sacred places. Some even go as far as designating religious names to new sites in an attempt to prevent their being disturbed.

In Deqen Tibetan Prefecture of northwest Yunnan, local Tibetans believe that the land, animals and people are governed by mountain gods residing on the peaks. There are over 15 sacred mountains found in the region of different sizes and religious power. Among them, the Meli Snow Mountain (Khabadkapo), the highest peak in Yunnan, is considered sacred by not only local Tibetans but all believers of Mizong (Kagyupa, one of the most important branches of Tibetan Buddhism). The Khabadkapo, with a height of 6740 meters above sea level and a total area of over 200 square kilometers, is ranked as one of the eight most important sacred mountains in the Tibetan Plateau. Each year, thousands of believers from Yunnan and other parts of the Tibetan region make pilgrimage to the mountain.

The Tibetan people have named and classified space into internal and external worlds. The internal world or human community is the permanent residence and village, including each named piece of land, each named house built on the named piece of land. The people adopt the name of the house as the family name. The external world, outside of the house or house walls, consists of arable lands, wild lands, lakes and forestlands with plants, trees, fish, rocks, wildlife, etc. The sacred objects, such as incense burning stands, pagodas, and *mani* stone piles, function as sacred places for Tibetans to have dialogue with life and spirits in the external world. The graveyard is considered a transitional place between earthly life and transcending into the “world of the death,” the external world controlled by spirits. Those spirits associate with each other to form a group of mountain gods represented by mountain ranges centered on Mt. Khabadkarpo. Tibetans believe that these mountains can transform into human beings and vice versa. The concept of reincarnation pervades the Tibetan worldview. The key to good reincarnation into the next life is to undertake pilgrimages to commonly recognized sacred spaces; Mt. Khabadkarpo is considered the most holy in northwest Yunnan.

Yi people's polytheistic beliefs

The Yi people have a large population living traditionally in the provinces of Yunnan, Sichuan, Guizhou and Guangxi of southwest China. They believe that human beings and wildlife are offspring of the snow clan. The offspring of the snow clan had twelve categories, including six categories with blood (frog, snake, eagle, bear, monkey

and human) and another six without blood (grass, trees, firs, etc.). Everything is divided into male and female: big trees are female, small trees male, big stones female and small stones male, big mountains female and small mountains male. All beings, human and nonhuman, have a soul or spirit. These communicate with and respect each other. In the Chuxiong Yi Prefecture of central Yunnan, local people believe that humans survived through calamities with the help of these plants, while others are associated with gods or spirits. Recent surveys conducted in this prefecture by Liu and others have indicated that at least 21 plant species are generally worshipped and protected by local Yi communities due to various cultural beliefs. Historically, the Yi people evolved and practiced a polytheistic religion, which is an integration of Shamanism, Daoism, Buddhism and Confucianism. In their practice, 1) everything has a soul, whether it is tree, water, stone, wind, star or animal; 2) nature is worshipped and there is a super-nature of those gods (as of land, mountain, and tree) that have power to control human beings; 3) the tiger is considered to be the original totem for Yi people; 4) reproductive fertility is also worshipped, for example, in the alder tree (*Alnus nepalensis*) due to its plentiful seeds; 5) ancestors are worshipped, as is the god of Earth (which is next to ancestors in terms of importance), and sacred places and sacred forests.

Most rituals are held by the *biemo*, the Yi priests. The mosaic of sacred sites of Yi people forms an important cultural landscape, which contributes to local environmental goods and services.

Conclusion

Sacred spaces are found in different geographical scales and are worshipped and protected by different social groups, households, villages, religious sub-groups, ethnic groups and regions. The designation of sacred mountains has profound cultural and political implications while it also serves an important ecological function. Sacred mountains, besides serving as locations of deities connecting the human with the spiritual world, this life and the next, deliver products and perform ecological functions and services. The most obvious to local people as well as to outsiders is as sources of streams, benefiting both humans and wildlife. Old people often recall seeing collections of wildlife, such as deer and parrots, gathering along the streams. Therefore, good water-source forests, even when located outside of sacred forests, still receive extra protection from nearby villages and are usually designated as sacred sites closed to fuel-wood harvesting.

The relationship between natural resources and people has been forged within religious, moral, cultural, political, economic, and ecological boundaries. Respect for these boundaries by different communities and social groups resulted from historically accepted formal and informal rules and norms. For the Dai people of Xishuangbanna, their forest-oriented philosophy and the religious basis of traditional life have instilled

a respect for forests, plants, animals, and their own ecological niche and imbued them with the formal and informal norms and rules of their society. The traditional worldviews or cultural beliefs of the Naxi, Dai, Hani, Tibetan, Yi and other minorities in Yunnan, combined with indigenous management strategies for natural resources for productive purposes, have succeeded in maintaining the forests of this region, and have effectively managed biological diversity in their environment over a long period of time. These factors can be seen as an example of the positive impact of the interaction of human culture with the environment and the conservation of biological diversity that existed in many earlier societies.

Indigenous people have drawn on their own sources of knowledge about biodiversity and environment, which features its diversity and adaptation in mediating their relationship with the local environment and ecosystems. Indigenous knowledge of this kind is a pluralistic approach to conservation and management of resources in the mountain region. It is a subjective understanding and social construction process, which incorporates a distinct corpus of understanding of the cosmos (worldviews), a praxis, and institutions to guide human action by adaptive processes. Indigenous knowledge about biodiversity and environment in mountain regions is composite and diverse, and yet it remains also holistic due to its gradation in altitude and latitude, as well as ethnic diversity in the mountain ecosystems. This knowledge comes from different sources – from one generation to the next, by way of indigenous experts and religious leaders. Both indigenous and conventional scientific knowledge are always imperfect and incomplete, and using one does not necessarily mean rejecting another. Conservation and resource management thus requires mutual respect and involves an iterative learning process. Indigenous knowledge systems bring a cognitive diversity to the scientific learning process. Just as biodiversity is essential to nature and invaluable for human beings, so too is cognitive diversity. Among the many things we can learn from indigenous knowledge and indigenous people is how to shift from a reductionist to a systemic view of the world, which includes ourselves, as living beings, in the ecosystem, and how to shift from expert-based environmental management to a participatory-based ecosystem stewardship.

Z

Z Budapest (1940–)

Known simply as Z Budapest, Zsuzsuanna Emese Mokcsay was born in 1940 and was only 16 when she fled to Austria escaping the Soviet crackdown on the Hungarian Revolution. By 1958, she had immigrated to Chicago and married. An aspiring actor/director, Budapest took drama classes in Chicago and then in New York, where she moved with her husband and their two sons. At the age of thirty, Budapest left for a three-week vacation in Southern California. She never went back.

Almost immediately she became involved with the women's liberation movement in Los Angeles, but feminist politics failed to meet her spiritual needs or address her growing belief that women needed to reclaim their souls from male-dominated religions. On the winter solstice of 1971, Budapest and five friends created the Susan

B. Anthony Coven Number 1, a circle of feminist separatist Witches. With Budapest as High Priestess, the group began to do religious rituals and call their practice Dianic Witchcraft. Members opened a small occult supply store called Feminist Wicca that became a gathering place for a growing spiritual community.

An arrest in 1975 for reading Tarot made Budapest a national figure and a hero to many who found her "wimmin's religion" (a popular spelling among radical feminists that signified men were not included) empowering and even transformative. But for over a decade, this charismatic leader known as the Mother of Dianic Witchcraft was a controversial figure among other feminists who saw Dianic Witchcraft as an embarrassment, and among other Wiccans who objected to its highly improvisational nature and female-only focus.

The primary focus of Budapest's message has always been women's empowerment, but a secondary element of nature religiosity has become more visible over time. Although she always preferred to hold her rituals in wilderness areas, her earliest writing said simply that the Dianic Craft was rooted in paganism and that practitioners worked in harmony with "Mother Nature." As in other Wiccan traditions, the major ritual celebrations were on the days that mark the changing of the seasons, and the Earth was understood to be the body of the Goddess. But so was the greater universe.

By 1986, Budapest called the Dianic Craft an "Earth Religion," writing that the Goddess was life on Earth. By the end of the decade, the concept had changed slightly. The Earth was now a living, breathing, conscious being and the Goddess present in all living beings. The increasing emphasis on the environment and growing understanding of the divine in and through nature present in the Dianic Craft today are largely due to the priestesses who came after Budapest. But there is no doubt that it was she who

planted the seeds when she first picked the Goddess Diana as the representation of the numinous and called her the “Soul of the Wild.”

Z Budapest lives in Oakland, California, where she continues to mentor, teach, organize rituals and conferences, and publish books that attempt to provide women with tools for spiritual empowerment.

Zen Buddhism

Zen (*Chan* in Chinese, *Son* in Korean) is a form of Buddhist practice that developed and flourished in East Asia, and, since the latter part of the twentieth century, has become part of the spiritual landscape in North America and Europe. Tracing its fundamental inspiration to the enlightenment experience of Gautama the Buddha (ca. fifth century B.C.E., India), Zen presents as its model the Buddha seated cross-legged in a state of yogic contemplation (*dhyaṇa*). Seated meditation (*zazen* in Japanese) enables a practitioner to cultivate inner stillness leading to illuminative insight, which in turn enhances clarity of vision and spiritual discernment. Zen can be a transformative factor for one's entire way of life, as it opens the practitioner to an experiential realization of oneness with nature, bringing about a heightened ecological awareness. The philosophy and practice of Zen can be situated in the wider context of the Buddhist tradition. As such, it derives features of its cosmology from the Hindu tradition. Hence we must first look at this wider picture in attempting to understand the view of nature implied in Zen.

There is a notion stemming from the Hindu tradition assimilated into Buddhism, as articulated by Indian commentators beginning with Vasubandhu (fourth century), to the effect that the universe exists within a cyclic pattern of origination, maintenance, and annihilation. The physical world, undergoing this cyclic pattern, is taken simply as the objective environment in which sentient beings, conceived of as belonging to six distinguishable modes, including the hell-dwellers, hungry ghosts, malignant spirits, animals, humans, and heavenly beings, live out their spans of existence. Sentient beings are born into the universe in one of the six modes, and upon death, depending on the karmic merit or demerit accumulated by one's actions in this life or previous spans of life, are reborn as one of the six, again to repeat the cycle.

The basic message of Buddhism in such a context revolves around the liberation of sentient beings from the cycle of birth and death and further rebirth within the six modes of existence, and entry into a realm called nirvana, described as "the other shore." Early Buddhist texts suggest that nirvana was understood as a state attainable in this life by one who has extinguished one's defilements and has freed oneself from inordinate attachments, thus arriving at a place of inner peace. However, later developments led to a view of this attainment as pertaining to an afterlife, or after multiple lifetimes of continued striving.

This aspiration for liberation from cyclic existence, or *samsara*, is the dynamism underlying the central Buddhist doctrine of the Four Ennobling Truths. The way to this

liberation is spelled out in the Ennobling Eightfold Path, culminating in the seventh and eighth, Right Mindfulness and Right Concentration.

Buddhist meditative practice thus pertains to the cultivation of attitudes and habits that are conducive to personal liberation and transformation. As such, strictly speaking, in Indian Buddhism, there arises no specific interest in or concern for the natural world, regarded merely as the “environment” or stage wherein sentient beings live out their lives, a provisional reality that is itself subject to the cyclic pattern of origination, maintenance, and annihilation.

As Buddhism developed and flourished in Chinese, Korean, and Japanese soil, however, the meditative practice encouraged in the tradition that came to be known as Chan/Son/Zen took on elements from these East Asian cultures that became constitutive aspects of its worldview. Daoist perspectives on nature in particular came to inform the way practitioners articulated their understanding of the world in the light of their Zen experience. This Daoist influence on Buddhism as it was transmitted into Chinese soil is the crucial factor that made East Asian Buddhism distinctive and different from Indian Buddhism with regard to views on nature.

A key dictum underlying the entire Zen tradition is the affirmation that “all sentient beings are endowed with

Buddha-nature” (*fo-xing* in Chinese, *busho* in Japanese). The notion of “sentient being” came to be expanded beyond the framework presented in Indian culture. In the latter, sentient beings referred to the six modes of being, from the hell-dwellers up to the heavenly beings. Vegetative life as a whole did not belong to this circle of sentients, and together with mountains and rivers and “the natural world,” plants were considered as belonging to the objective environment. In China however, it came to be asked whether plants were also endowed with Buddhature, and this question was given an affirmative answer. This principle of Buddha-nature inherent in all sentient beings, conjoined with a maxim of Zen, namely, of “seeing into one’s nature (Chinese: *xing*; Japanese: *Sho*) and thereby becoming a Buddha” (Dumoulin 1988: 85), brought new dimensions in the understanding of nature and of reality as a whole.

The following verbal exchange between a Zen master and student, included in a collection known as the *Wu Men Guan* (No. 37) serves as an illustration of this new dimension of understanding.

A monk asked Chao-chu: “What is the meaning of the Bodhidharma’s coming from the West?”

Chao-chou answered, “The oak tree in the courtyard” (Aitken 1990: 226).

Such verbal exchanges in the context of Zen practice, called *gong-an* (Chinese) or *ko-an* (Japanese), contain veiled allusions to that realm of one’s true “nature.” The opening question about the Bodhidharma’s coming from the West is a standard gambit that sets the tone of the exchange, asking: what is the quintessence of the practice of Zen? In other words, “In what consists that true nature, the seeing of which one becomes a Buddha?” Or more succinctly, “Who am I, really?” The answer given in this case, “The oak tree in the courtyard,” is the key that can open the practitioner’s eyes

to that realm whereby one becomes enlightened, that is, becomes a Buddha. In short, truly to “see” the oak tree in the courtyard, with the inner eye of the mind, is what the verbal exchange enjoins a practitioner. And this experience of truly seeing can occur in the context of seated meditation, as one is able to overcome the wall of separation that divides what is seen and the subject that sees. In this context, “seeing” is no-other than “becoming.” The oak tree in the courtyard is the locus of the revelation of one’s true nature.

With Dogen (thirteenth-century Japan), the scope of sentient beings expands further, to include not only the vegetative realm, but also the whole universe of ten thousand myriad things, such as mountains and rivers, rocks and stones, the great wide Earth, the sun, the moon, the stars. And what is important in this context is that mountains and rivers are not “things” in the objective world “out there,” but are precisely manifestations of one’s true nature. *Zazen* is the locus in which this comes to be realized.

In short, this experience of “seeing into one’s true nature” is the entry into a continuum, a realm whereby the barrier that separates one (as a human subject) from the natural world, the myriad things of the universe (as things “out there,” objects of my perception) is overcome. The view of nature that comes to the fore in the context of Zen practice is the view from within, whereby one sees “mountains and rivers, the great wide Earth,” no longer as objects of the physical world, but as the very manifestation of one’s true nature, one’s true self.

The historical track record of Zen presents an ambivalent answer as to whether Zen practice can foster an ecologically oriented vision and way of life. Many individuals are led to Zen practice in search for answers to existential questions, or in search for inner peace, in search for healing, or in search for a community of spiritual support. The practice of *zazen* can be and has been indeed a powerful way of seeing through and coming to a resolution of big existential questions in life. It can be and has been an effective way for individuals to find a source of inner peace, to find healing for psychological and other kinds of woundedness, as well as to connect with a community of kindred spirits. But these effects of Zen practice, beneficial as they may be toward the integration of the individual’s personality, are *as such* not yet necessarily connected with an ecological awareness and way of life.

A phase of Zen practice involves an “inward turn” wherein an individual focuses one’s energy and attention upon spiritual pursuits, in a way that can diminish concern with the events of the everyday world. To engage in this practice can thus initially deflect one from concerns of ecological import. For a viable ecological awareness to arise and become a prominent element in a practitioner’s life, another dimension may need to enter, namely, an actual exposure to the Earth’s woundedness in its many forms, that would call forth a response of com-passion (that is, “suffering-with”).

With such an exposure to the reality of the natural world in a state of woundedness in the background, and as individuals commit themselves to Zen practice and experience the fruits thereof, something *may* happen that may awaken, enhance, or

reconfirm an ecological awareness and commitment. In brief, as one deepens the experience of inner stillness, one comes to an illuminative insight into one's true nature as inseparable from the trees and the flowers, the mountains and rivers, the great wide Earth. One experiences these as the manifestation of one's own self, one's own "home" (*oikos* in Greek, from which "ecology" is derived). From this vantage point, the pain of the denuded mountains and the polluted rivers and oceans become one's very own pain, and to care for the Earth is nothing other than to care for one's own home. A renewed vision and strengthened resolve toward healing the Earth's wounds can arise as an outflow of the inner stillness that is the hallmark of Zen practice.

Zhuangzi

“Fish thrive in water; humans thrive in the *dao*. Those who thrive in water dart about in the pond and find nourishment there; those who thrive in the *dao* work ‘without doing’ and their nature is realized” (*Zhuangzi* Chapter 6). For over two millennia, this “second master” in the LaoZhuang or “Early Philosophical Daoist” tradition has provided Chinese religion with provocative images of the human within its environment, using such rhetorical devices as fable, fantasy, dialogue, debate, and models of practice.

The superb ambiguity in which the Chinese character often grounds major religious terms has stimulated numerous interpretations in Asian and Western languages about the relationship between Zhuangzi’s ideal Daoist and “nature” itself. Formidable philosophical and aesthetic issues arise with translation from the original Chinese – such as the unarticulated assumptions and prejudices of several generations of Western Romantic individualist translators (that determine the incalculable choices of meaning made at each fork of ambiguity along the textual road). Likewise, additional issues of interpretation occur in target language translations as readers introduce their own preconceived notions and values to supply meaning to the translator’s choices.

Zhuangzi contains no literal Chinese equivalent to the Western term “nature” (“nature” commonly understood as the material, nonhumanmade elements on Earth). Yet the text makes constant lyrical use of actual plant, animal, meteorological, and geographical phenomena, sometimes as virtual beings, often as metaphorical devices. Usually the obvious linkage or equivalence is made by the reader between Western “nature” and Zhuangzi’s concept of *dao* (the “Way” or “flow” of reality). Many readers also “read into” Zhuangzi’s *dao* the entire conceptual structure of Laozi’s *Daode-jing* (*dao*, *de* [individual spiritual capacity], *wuwei* [“without doing”], *ziran* [“naturalness”], etc.). The resulting image is a vibrant anti-anthropocentrism that resets the human within nature. Yet “nature” is only accessible in *Zhuangzi* once the Daoist context for the human and its capacities are understood, because Daoism pushes the ramifications of a true anthropomorphism to a far greater extent than does any Western worldview.

First, in terms of scope, the *dao* refers to the entire universe as the context for human living – rather than simply the natural Earth as the site of human habitation. Second, given the archaic Chinese acceptance of change (as the neutral basis of reality – rather than as a negative or positive characteristic of it), the entire universe is in constant flux. The appropriate Daoist term is “in transformation” (*hua*) or what is commonly appropriated from the text’s water imagery, the “flow.” Third, throughout its 33 chapters, the text builds a Daoist ideal, a practitioner or sage who develops a

combination of attitudes, actions, and responses. The important attributes of a sage are to be calm (Chapter 32), to see all things equivocally and not to discriminate (2), not to quantify (17), not to think in terms of cause and effect (4), not to make value judgments (17), thus not to separate oneself from the totality of the universe (19), and to be in continual awe at the mystery and sacrality of all things in this totality. (These attitudes are of course those of the purely non-anthropocentric sage who realizes his participation within the universe and so cannot differentiate in any way among all creatures and things in terms of quantity, causality, values, or varied emotional responses.) These attitudes allow the sage: to respond unthinkingly and to develop only fluid, temporarily emerging goals (13), to adapt to the flow (20), to harmonize the *yin* and *yang* energies within oneself (22), to act spontaneously, and to “know how” (rather than to “know what”) by means of one’s intuition (22). Just as a person sits on the bank of a stream and sees the stream flowing by, so a human experiences *dao* as a flow from one’s own fixed reference point as a single creature. Likewise each anthropocentric human being understands *dao* as flow because each socially references a universe in which the human is believed to naturally be the center. But from the standpoint of totality and of all the creatures and things that comprise it, a sage experiences the *dao* by such attitudes and behavior as relaxed fluidity, adaptability, spontaneity, harmonizing, and intuiting, both to participate in the never-ending transformation (of the universe as totality) and to respond to the distinct transformations (of each individual participant).

The goal of the text is to enable the Daoist practitioner to decentralize oneself from one’s privileged position as anthropocentric observer and to begin to act in this totality as a “willing, equal” participant. Thus the concept of nature that indirectly pervades much of *Zhuangzi* serves a number of important purposes instrumental to the Daoist practitioner’s spiritual transformation: 1) it provides many observable everyday examples of the life cycle (birth, growth, aging, death), the seasons, and processes of transformation; 2) it provides the immediate environment of change/flow in which the human must live and act; 3) it continually reveals the sheer complexity and depth of the transformations of creatures and things in this environment that is far beyond the rational comprehension of any human; 4) it provides specific materials or environments that are worked by craftsmen, artists, and athletes who exemplify discovering and acting within the flow of the *dao* (butcher Ding [3], woodcarver Jing [19], wheelwright Pian [13], carpenter Qiu [19], the tiger trainer [4], etc.); and 5) specific natural phenomena serve as metaphors or examples for Daoist attitudes or “values” – such as unobstructed living [the pheasant, 3], consistency [pine and cypress trees, 5], balance [still waters, 5], the aesthetic appreciation of the “earth’s music” [2], etc.

A surprisingly effective way of discovering how the human relates to nature in *Zhuangzi* is to examine what the text says and implies about the modern Western issue of ecological activism. *Zhuangzi* mentions no literal concept of ecology and does not allude to ecological problems (this occurs only in the Confucian text roughly contemporary with *Zhuangzi*, the *Mencius*, with its wellknown story of the deforestation of

Ox Mountain [Book VI, Part 8, Section 8]). Yet it does contain a number of positions and issues both supportive and critical of such activism.

Sympathetic are its general strategies for abandoning anthropocentrism (“within the compass of Heaven and Earth, I am no more than a pebble or a bush on a great mountain” [17]). As an abridgement created by Guo Xiang (who died in 312), the current text is divided by scholars into the philosophically and stylistically consistent “Inner Chapters” (1 through 7) and mixed and fragmentary “Outer Chapters” (8 through 33). The homogeneous sense of nature of the Inner Chapters does not fit well with the more sporadic emphasis of the Outer Chapters that contain textual fragments of contemporary Primitivist (8 through

10) and Agrarianist movements. (The Primitivists advocated an archaic tribal social and political utopianism of humans living by a pre-moral consciousness in accord with nature, while the Agrarianists or “School of the Tillers” [*Nong-jia*] promoted an archaic utopian classless agrarian economy of fixed prices with minimal or no political leadership). Specific natural phenomena (such as a “tree-of-Heaven” [1], a “sacred” gigantic chestnut-leaved oak [4], and a mountain tree [20]) function as examples of a major metaphor running throughout the text that suggests the adaptable, ambitionless, non-evaluative Daoist practitioner:

The trees in the mountains ask to be chopped down. Fat added to the fire consumes itself. The cinnamon tree is edible, so it is cut down. The lacquer tree is useful, so it is slashed. Everyone knows the usefulness of the useful, but no one knows the usefulness of the useless (Chapter 4).

An object created from nature is occasionally discredited (how both the libation vessel and the scraps of wood at its making have lost the “nature of wood” [8]); the accretion of wealth that is one great motive for despoiling nature is also condemned [29].

On the other hand, because *Zhuangzi*’s basic purpose is an advocacy of Daoist practice, it contains much that is antithetical to ecological activism. The aforementioned attitudes that maintain the Daoist’s equilibrium within the *dao* (both as corporate totality and dynamic flow) repeatedly emphasize that no single perspective or fixed goal is useful (these always lead to value judgments), that trying to mentally process reality by means of discrimination and opposites is absurd [the entire Chapter 2], that attempting to “pattern” or arrange the infinite *dao* into finite separate entities as responsible agents or to sort them into causes and results is “a mistake” [4]. The life cycle of any species or entity is a process of transformation (“between cohering and dissolving, each has its form” [25]); the Daoist is to accept such changes (the frequent mention of the crippled, mutilated criminals, and misshapen humans who not only accept such transformations but also live with them prosperously) because no human can comprehend the “patterns” of living and dying (“It is not that death and life are far away, but the patterns of them cannot be perceived” [25]). *Zhuangzi* is by-and-large neutral about technology (other than Primitivist and Agrarianist comments). It is precisely nature’s raw materials that are used by those exemplary craftsman who have discovered how to

act within the flow of the *dao* (including the hunchback whose techniques of catching cicadas teach even Confucius [19]). Consistently, the spiritual, the indescribable (beyond forms), and the intuitively comprehended are advocated over the material, the written-down and the rationally organized [13], because nurturing one's spiritual capacity (*de*) is always the primary goal. Daoist "without doing" (*wuwei*) involves letting things alone, refraining from deliberate action, never attempting to freeze the flow by means of discrimination [2] or by substituting the illusion of the certainty of reason for the flexibility of response that is spontaneity [2]. In his denunciation of swordmanship to King Wen of Zhao, Zhuangzi dismisses the typical human recourse to any physical solution to a problem as "the (useless) sword of the common person" (in contrast to the cosmos as the sword of the Son of Heaven and the harmonious community of warriors as the sword of a prince of state [30]).

Issues concerning ecological activism raised by these ideas in *Zhuangzi* are the following. 1) Is a destroyer of a natural ecology actually part of some kind of transformation within the *dao* – or is such action a disruption or dysfunction of it? 2) Can there be a "Daoist" activist attempting to stop such destruction – because the required motivation and decision-making process uses such intellectual discrimination as isolating specific events, quantification, and cause-effect reasoning, to affect value-laden, fixed-goal-driven acts? 3) Is not the activist just as anthropocentric and selfish-will-imposing toward reality as is the destroyer (and thus is not an activist incapable of acting in a Daoist manner)? 4) Is the living and dying of any species not a "natural" transformation of the *dao* – or are there "natural" and "unnatural" (i.e., human-initiated exterminatory) livings and dyings? 5) Is the use of nature as raw material only justifiable for the Daoist craftsman, artist or athlete as spiritual practice? 6) Is there enough ambiguity in *Zhuangzi* to support some directed action toward nature?

The answers can perhaps be found among the craftsmen and artisans who engage the *dao* in action – the best example furnished by Cook Ding, when he is asked about his technique by the surprised Prince Wen Hui who is touring his kitchen on the morning of a diplomatic banquet.

Cook Ding laid down his cleaver and said, "Technique?" What I really care about is the *dao* – which is much more important than any technique! When I first began to butcher oxen, I could see only the entire ox before me. But then after three years I no longer saw an entire ox. At present, it is my spirit that apprehends – I do not use my eyes to see; my senses are idle, but my spirit moves where it wants. Guided by the natural grain, I slip through great hollows and travel in broad spaces, making use of things just as they are. Thus I miss the large sinews and I hack into no great bones . . . There are spaces between the joints [of the bones] and this blade is very thin and sharp, so there is more room than anyone ever needs to get through! This is why after nineteen years the blade of this cleaver is as good as when it was brand new and sharpened for the first time.

Yet sometimes there are very tough joints. When I begin to feel difficulty, I slow down and barely move the blade until suddenly there is a plop! and the pieces fall

apart as easily as a clump of Earth dropping to the ground. Whenever this happens, I withdraw the blade and I stand still, just letting the joy of the work sink in. Then I wipe the blade and put it away (Chapter 3).

Cook Ding summarizes how he discovered the *dao* as a practice – early struggles as a beginner (“I could see only the entire ox”), gradual acceptance of the work situation (“after three years I no longer saw an entire ox”), mastery of technique such that his perceptions relaxed (“I do not use my eyes to see; my senses are idle”) and his movements not labored (“guided by the natural grain I slip through . . . and travel . . . making use of things just as they are”). He intuits (“it is my spirit that apprehends”) the situation and where to move moment-by-moment (“my spirit moves where it wants”). His intuition does not involve premeditation, rational choice, or directed awareness – instead it is related to mastery of technique, much learned experience, and relaxed awareness, always open for response (“When I begin to feel difficulty, I slow down and barely move the blade”).

In *Zhuangzi*, the Daoist discovers the *dao* and acts within it in four broad stages: 1) to relax and empty the heart (“emptiness, stillness, calmness, serenity” [13]); 2) to be illumined by Heaven (which is responsible for all things beyond human will) to be able to reflect the total situation;

3) to be filled with this “unpatterned or unsorted” totality (“he does not escort things as they go or welcome them as they come, he responds but does not retain” [7]); and 4) spontaneously to respond as the situation moves one (“he responds like an echo [to a sound]” [33]). One surrenders any need to shape or control the situation or even one’s own action – this is the spontaneity of all creatures but the human. One empties the heart of ambition, of discrimination, rationality, causality, and fixed goals. One cannot perceive by surveying with the senses or by processing within one’s mind a stream of information sequentially because the situation (the flow of the *dao*) is an immediacy, a totality, a *gestalt*. The only way this can be done is that one’s heart must be as empty of all such “objects” as is a mirror which does not present things but instead reflects what is illuminated (“He is the reflector of Heaven and Earth, the mirror of the myriad things” [13]). What is reflected makes the relationships of its constituents apparent (“and *what fills him sorts itself out*” [13]). The more minimal one’s self-assertion is while the greater one’s reflecting awareness is, the brighter will be Heaven’s illumination of all things and the more subtle will be the transformations one is aware of and can respond to without obstruction. Thus one spontaneously responds – being inevitably “caused” to act by what fills one instead of choosing what to do oneself; this is termed “Heaven working through the sage” (7). One’s action is successful because one’s own spiritual capacity (*de*) accommodates the *de* of all other participants in the flow of totality.

The traditional Chinese term equivalent to the English “nature” is *ziran*, variously translated by Western scholars of Daoism as “unmediated by rule or principle,” “spontaneity,” “spontaneous activity,” “to follow one’s own *de*,” self-expressing,” “self-creating,” “self-actualization,”

“self-evidencing,” “self-so-ing,” “to be party to transforming things,” “to assist the self-so-ing of each and all things” (*Daodejing* 64), “naturalness” (*Daodejing* 25), “natural flourishing.” At first glance, such interpretations seem to span a range of focusing on an individual at one end through that of totality at the other. The individual orientation emphasizes direct and immediate action unique to a person’s qualities, as expression (communication) and as creativity (craft and art), literally producing one’s particularity as action unique, specific and “natural” only to oneself. It is one’s own behavior that establishes one as a participant in totality – it reveals and authenticates oneself in terms of one’s uniqueness. This action can only occur within the ever-changing totality comprised by always-transforming participants, so at the other totality – or holistic end of the spectrum – an individual’s behavior not only occurs simultaneously among the actions of other participants and witnesses what all others do, but is also thoroughly integrated (or “interrelated”) and thus enables the flow. However, no polar model can readily depict how a Daoist sage understands reality, precisely because the Daoist acts within totality and among the actions of all participants. Any emphasis upon only one of its major characteristics of 1) individual participant, 2) totality, 3) all participants, or 4) flow [transforming participants and changing reality] over-emphasizes one at the expense of the others.

The term *ziran* (which appears earliest in the *Zhuangzi* and the *Daodejing*) suggests that these dimensions comprise the *dao* itself. If the Daoist sense of nature involves a withdrawal of such attendant Western concepts and values as anthropomorphism, separate individuality, linear causality, human capacity to shape, control and dominate, etc., and it emphasizes a cosmological dynamic inherent in the written Chinese character and in Chinese religions in general, then the term could be more accurately translated into English as “naturing”.

Zimbabwe Spirit Mediums, Guerrillas, and Nature

In Zimbabwe, a loosely interacting and overlapping series of rain-cult networks have existed for centuries. The Portuguese mentioned some of these during the sixteenth and seventeenth centuries. At the other end of the colonial period, the Rhodesia Front paid a great deal of attention to Zimbabwean African Religion. In the mid-1970s one of its ethnographers, C.J.K. Latham, compiled a “Spirit Index” that listed and numbered every major spirit, every medium, every shrine and every sacred place throughout the country. Latham also compiled *The Shamanism Book*, which described in detail the five major cultic systems. Most of the spirits recorded by the Portuguese reappear in the “Spirit Index” or *The Shamanism Book*. The reason that both the Portuguese and the Rhodesians felt the need to make these reports was that they believed the cults were crucial to African politics and to African consciousness.

Some of the major spirits are supra-human figures, embodying the forces of nature; others represent founding ancestors, chiefs and kings. It is often hard to separate the two categories. Myths of founding chiefs, “princesses” and “grandmothers” often describe them as creating natural phenomena such as salt-pans or even rivers. Even more often they describe them as being able to control nature: “princesses” are described as having the power to draw wild animals to the hunter or to divide the Zambezi River so that the people could migrate. The possessed spirit mediums, which are their living incarnations, are believed to possess the same powers, enabling them to make rain, cause drought, or strike down enemies with lightning.

In the nineteenth century, white hunters respected the spirit mediums’ control over nature, especially over game. The famous hunter, Frederick Courtney Selous, described how he had paid tribute to the medium of the great spirit of Chaminuka, in order to be able to hunt elephant successfully. African kings paid a similar respect. King Lobengula of the Ndebele state sent tribute to rainmaking mediums to the northeast of his kingdom.

After the colonial conquest in the 1890s, however, the powers of the mediums were curtailed or ignored. Africans were forbidden to hunt and white hunters no longer needed to seek permission from anyone. Chiefs were chosen by the Native Department without the endorsement of the mediums. In the early colonial years, there were direct assaults on the most powerful mediums and shrines. During the African uprising of 1896, one of the priests of the High God, Mwali, was shot dead and other officials of

the cult were arrested and put on trial. The female medium of the great rain-spirit, “princess”

Nehanda, was arrested, tried and hanged in 1897. The rainmaking cult of Musikavanhu on the eastern border with Mozambique was turned into a secular chieftancy, and when the possessed medium drove out the new chief, the Native Commissioner marched with a small army to reinstate the chief and expel the medium. In the 1920s, the Dzivaguru shrine in the northeast, which had figured largely in Portuguese accounts, was closed down in what was called “The Mount Darwin Ritual Murder Case.”

Gradually these repressions gave way to constant government supervision of the major mediums. It came to be believed that the mediums and their cults were mostly concerned, after all, with nature, with rainmaking, the fertility of crops, etc. Now that nature and political authority had been separated, they were no longer thought to be politically dangerous.

In reality, nature and political authority had not been separated. A major component of white ideology was that they had taken over the land. By this, they not only meant that they had evicted the Africans and created their own farms, they also meant that the whites had become “the people of the land” in the most intimate and essential way. Rhodesians prided themselves on “bushcraft,” and the myth of the “Great White Hunter” and, later, the Game Conserver flourished in Rhodesia, as well as in Kenya.

By contrast, African hunting was stigmatized as cowardly and cruel. In her recent writings, the novelist Doris Lessing powerfully expressed the feeling that white farm children grew up with the idea that the land was theirs. Whites believed that they alone appreciated landscape, and quite often they deliberately set out to create spectacular views. In these senses, not only the physical but also the imaginative ownership of nature was being taken over from Africans.

Missionaries played a major role in these processes. Some of them were critical of colonial evictions and disliked the commercial growing of crops like tobacco, or the bad conditions on the tea plantations. But all of them were involved in the creation of a Christian landscape in the African areas – a landscape of villages, clustered around their church and cemetery, which was very different from huts perched on the hill-tops or the burial of chiefs in the rocks. For a long time spirit mediums could do little about this. They were still consulted for rain. When possessed, they often articulated with the voice of the spirit its dislike of new methods of tilling the land, or of damming and diverting rivers. But such protest was ineffective. Then there came the rise of mass nationalism; the rediscovery of a heroic past; the invocation of the Nehanda spirit at nationalist meetings; the visits paid by nationalist leaders to senior spirit mediums. By the 1960s, both African nationalists and Rhodesian administrators began to take the mediums much more seriously.

The climax of this new importance was the guerrilla war of the late 1960s and 1970s. There were several reasons why young guerrillas took mediums seriously. They needed legitimacy in the eyes of the people and they needed spiritual protection. The mediums represented traditional claims to the land. Guerrillas who had been trained by Chinese

advisers in Tanzania had been taught the Maoist doctrine that they must respect the beliefs of the peasants. But their needs were a more powerful incentive. It was the mediums of the Dzivaguru “circle,” which overlapped the boundary between Zimbabwe and Mozambique, who made the first contact with Zimbabwe African National Liberation Army guerrillas on Mozambican soil. Mediums from inside Zimbabwe were called to a meeting across the border and they agreed to give spiritual support to the young fighters. Gradually, numbers of mediums settled in special quarters of the guerrilla camps inside Mozambique; these exercised some sort of control over sexual relations, and tried to predict and warn of Rhodesian raids.

As the guerrillas crossed into Rhodesia they came into contact with the mediums of other “circles.” The bestknown account of these interactions is given by the anthropologist, David Lan, who describes how the mediums of the Dande Valley gave legitimacy to the guerrillas. Where Rhodesian propaganda described them as animal-like beings with tails, who prowled the evil bush, the Dande mediums depicted the guerrillas as the descendants of the heroes who had founded kingdoms and chiefdoms and human society itself in the past. The mediums imposed prohibitions and taboos on the young fighters. They revealed to the guerrillas the caves and hiding places and even permitted them to make use of the burial caves of chiefs or the rainmaking shrines sacred to the High God.

Above all, the mediums gave back to the guerrillas and took away from the whites the “ownership” of nature. David Maxwell has described in his study of the northern Nyanga district how it came to be believed that all of nature was mobilized on the side of ZANLA. Eagles flying overhead showed them safe routes; snakes slithered out of their way, only to return to lie in wait for Rhodesian soldiers; lions appeared to convey the support of the senior ancestral lion-spirits; talking baboons carried messages; rivers flooded to prevent Rhodesian soldiers from reaching guerrilla strongholds. During the 1970s, the whites began to realize that they did not after all possess superior “bushcraft.” By contrast, the guerrillas came to believe that they were in every sense “sons of the soil.”

On their side, the Rhodesians tried everything they could to win mediums over and to use them to denounce the spilling of blood on the soil. It became very dangerous to be a medium, the guerrillas killing “sell-outs” and the Rhodesian forces eliminating those who worked with ZANLA. Nevertheless, the mediums emerged from the war with their reputations and influence greatly enhanced. In independent Zimbabwe, their power over nature has been recognized in various ways. In the so-called Campfire schemes, in which African communities receive cash returns from safaris, white hunters once again give gifts to mediums to ensure good hunting. Many mediums in the south of the country have been recruited into schemes for a “second independence” struggle, this time to rescue the environment. A Prophetess, Mbuya Juliana, has endlessly traversed southern Zimbabwe during the last ten years, bearing the message that the water spirits in the streams must be propitiated in order to end drought. The struggle over nature in Zimbabwe continues.

Zimbabwe's Matopo Hills

The Matopo Hills of western Zimbabwe lie south of the Matabeleland city of Bulawayo and about an hour's drive away from it. They take the form of a very extensive granite mass, throwing up great domed hills and kopjes fantastically decorated with eroded rock pinnacles. The hills, which today stretch across the borders of three administrative districts, are the source of most of the rivers of southern Matabeleland, and there are many rock pools with perennial water.

Most tourists visiting the hills go to the National Park, an area in the center of the Matopos set aside in 1962 when all its African occupants were evicted. The National Park contains the grave of the founder of the white Rhodesian state, Cecil Rhodes, after whom the country was named. It also contains a Game Park into which giraffe and rhino were imported after 1962. There is a "wilderness" area, which can only be entered on foot, and where one can still see the bases of huts and granaries. But though the Park itself has so recently been made "wild," the Matopo Hills are still occupied by African farmers to the south and east of it. In the Communal Areas of Kumalo, Gulati, and Matopo, one can still see people living among the rocks, cultivating the alluvials, grazing cattle in the grassy valleys and collecting wild fruits as they have done for centuries.

The successive inhabitants of the hills have all developed contrasting cults of "Nature." The Matopos have been occupied by humans for some 40,000 years. For most of this time foraging peoples moved in and out of the hills on a seasonal basis. But some 9000 years ago permanent populations built up at favored sites in the Matopos. These "San" peoples (Khoisan-speaking nomadic tribes in Southern Africa) used grassland and riverine environments, but hunted rock-rabbits on the granite hills and gathered fruit and roots in the woods. There is no doubt that their religious specialists conducted rituals in the great caves of the Matopos which were intended to give success in hunting and to make rain. Rock-art specialists have interpreted many of the thousands of paintings from this period as depicting rainmakers in a state of trance. These paintings did not portray "Nature" but were designed to give control over it. Caves filled with San paintings have continued to be ritual and rainmaking centers ever since.

Sheep and pottery appear in the archeological record some 2200 years ago. It was thought by early Rhodesian students of the Matopos that the "San" hunter-gatherers withdrew when these "Bantu" farmers arrived. Archeologists today believe that there was considerable interaction between the Late Stone Age "San" communities and the Early Iron Age "Bantu" settlements. Some of the later rock paintings were done by the farmers and their uses of the environment and patterns of residence were very

similar to those of their predecessors, with the addition of livestock and cereals. Studies of the interaction of “San” groups with black farming peoples in South Africa and Namibia have shown that the cultivators paid “San” experts to make rain; and that their own rainmakers performed in the painted caves and used the pigments for powerful medicines. It is likely that something like this happened in the Matopos and that there were substantial continuities in the rituals practiced there. It is clear, at any rate, that over the last few centuries, at least, the farming communities living in the hills have used the painted caves for rainmaking. Preand post-pubertal women danced in them and threw water in the air.

At an unknown date, however, a more elaborate religion of “Nature” emerged among the farming communities of the Matopos. This religion has become known in the literature as “the Mwali cult.” Mwali is the Bantu name for the Creator God. It implies female fertility – elsewhere in Central Africa, “Mwali” is used to describe a female initiate or a rain divinity. One of the shrines at which the Voice of Mwali was heard was situated in the eastern Matopos. It was called the Zame shrine, Zame meaning “breast,” and people came to it to drink rain just as a baby drinks milk. When there was a particularly heavy drought, old women would enter a cave where a remote female ancestress lay buried and give her water to “drink.” At Zame, shrine priestesses inherited power matrilineally. It seems likely that this female version of creative power represents the earliest form of the Mwali cult.

By the time we have evidence about it, however – in the late nineteenth century – there had built up around the shrines, as at the Apollo shrines in classical antiquity, an apparatus of male control. Male priests interpreted the gnomonic utterances of women possessed by Mwali. The various oracular shrines had come to represent the combined spiritual power of men and women. The perennial pools in the caves were thought of as the amniotic fluid; lightning was thought of as the manifestation of male virility. The Matopos, containing as they did these powerful shrines, were regarded far and wide as the very site of creation. Hundreds of miles to the southeast of the hills, creation myths have been collected which hold that the granite rocks were originally rain-clouds come down to Earth at the beginning of the world, and that the rivers had poured forth from the rocks when they were penetrated by the “needle” of lightning.

The Mwali shrines represented “Nature.” No iron tool was used to clear away the bush around the cave. The priest-custodian of the shrine was believed to be instructed in his duties by snakes and leopards, and climbed the mountainside naked but for a leopard skin. This concept of bare “Nature” might have represented – as the first missionaries thought it did – a mere submission to the environment. But for the adepts of the Mwali Cult it was out of “Nature” that culture and cultivation sprang. Cattle were taken to the shrines to be sacrificed; millet seeds were taken to the shrines to be soaked in the water of the caves and then brought back to be planted. Newly selected chiefs were endorsed and blessed at the shrines. At one shrine, Dula, warriors were blessed and later cleansed. The ideology of the shrine was that “Nature” and culture were interdependent. Later colonial environmentalists demanded that everybody be

cleared out of the Matopos so that the rivers would not silt up. The priests of the shrine believed that the waters would dry up without people. Rivers were there because people were there – and this was true, too, of animals and fruits and roots.

We can construct this picture of the Mwali Cult from the nineteenth-century evidence. The shrines continued to control agriculture in the Matopos deep into the twentieth century. The shrine priests told their congregations where and when cattle could be grazed; when planting should begin; when the first green crops could be eaten; when harvesting should start; and which groves and streams should be set aside as sacred to Mwali. The Matopos were a ritually controlled environment. The Mwali agricultural cycle was very different from the practices recommended by colonial experts, and, in particular, it allowed controlled use of the sponges and wet places that were fenced off and prohibited by colonial agricultural officers. In the eastern Matopos, the people have continued to use the sponges and to observe the Mwali injunctions to this day.

This was the religious situation in the Matopos when whites began to arrive in the second half of the nineteenth century. White traders and hunters ignored the Mwali cult. Missionaries regarded it as diabolical. Catholics and Protestants alike believed that the Mwali adepts were terrified “children of Nature,” living out their lives in fear of natural forces and unable to control or exploit them. As the Jesuits passed through the Matopos in the 1870s, they held a Mass in one of the caves, proclaiming that Christianity would liberate humanity and redeem “Nature.” The very hills trembled when the Mass was performed, they claimed.

But traders and missionaries passed through the Matopos. They were not claimed by whites until 1896. In that year there was a great uprising against the recent, but brutal, rule of Cecil Rhodes’ British South Africa Company. African warriors fell back into the Matopos and there was fierce fighting from rock to rock, in which many whites died. In this way whites came to know the hills and to feel that they had purchased them with their blood. It was in 1896, too, that Cecil Rhodes stumbled upon the hill where he now lies buried. He at once realized that it was ideal as a pilgrimage site for future white Rhodesians. “World’s View,” as it is now called, was easy to ascend but commanded a huge vista. Rhodes at once ordered that he should be buried there when he died; he also ordered that the site should become a “Rhodesian Valhalla,” where white heroes should be laid to rest. The proper context for the bones of heroes and of his own bones was wilderness, the “grandeur” of the Matopos.

Rhodes died in 1902; his body was brought by train and ox-wagon from Cape Town; on 10 April 1902, he was buried in the Matopos. Little doubt was left that in death Rhodes had taken command of “Nature.” The Bishop of Mashonaland recited by the graveside Rudyard Kipling’s funeral ode, which ended with the lines: “The immense and brooding Spirit still Shall quicken and control. Living he was the land, and dead His soul shall be her soul.” After 1902, white Rhodesians went to Rhodes’ Grave on pilgrimage, just as African pilgrims from all over southern Africa were still going to the Mwali shrines.

Rhodes' Grave symbolized the dominant white theory of the relation between religion and "Nature" in the Matopos. The hills were thought of as "wilderness." They were exempt from the general colonial view that "Nature" should be exploited, even though some missionaries taught their converts how to use ploughs to farm in the hills. The general white view was that the Matopos should be reserved as a place for whites to wander and to have solemn religious thoughts. Over the decades after Rhodes' death, white conservationists argued for the preservation of the hills. In their eyes, this meant getting rid of their black inhabitants. The only humanity that could be tolerated in the Matopos – except for the tourists – were the long-dead "San" hunter-gatherers, who had created the thousands of rock paintings. These men and women, it was held, had coexisted with "Nature," living in the environment without impacting on it. But cattle grazing and cultivation, though practiced in the Matopos for two thousand years, were held to be destructive and eroding. When the people-less National Park was created in 1962, a sign was erected at one of the painted caves saying: "Agriculture should never be practiced in these hills." Nor was the present National Park the only area which conservationists wanted to be cleared of people. From the 1940s onwards, there were demands that the inhabitants of the eastern Matopo Reserve, who cultivated the sponges as the Mwali cult had long taught them to do, should be removed from the hills. The several Mwali shrines in Matopo Reserve – Dula, Zame and the rest – were to be closed down. And if conservation meant a triumph over African religion, it also involved a victory over mission Christianity. When the National Park was created, the London Mission Society church at Whitewaters – a center of Christian agriculture – was torn down and its stones used to make the entrance to the Game Park.

There was, then, a "San" ideology of "Nature" in the Matopos, a "Bantu" ideology, and a Rhodesian ideology. In protest against this last, and drawing upon some features of the first, there also arose an African nationalist ideology. At first nationalist opposition to evictions in the Matopos was led by the "progressive" Christians of Whitewaters. But when they failed, nationalists began to turn to the still functioning Mwali shrines, and especially to the senior shrine of Njelele in the southwestern Matopos and to the "war" shrine at Dula in the east.

Before looking at the nationalist alliance with the shrines from the 1950s onwards, it is important to realize that the shrines were not just "traditional survivals." The priests had lain low under early colonialism. But the shrines had continued to operate and to adapt. They developed their agrarian ideology, extending their support not only to subsistence cultivators but to small peasants, striving to produce a surplus for the colonial market. They absorbed and adapted Christian ideas – Njelele is today widely described as Mount Sinai: the late priestess, Gogo Ncube, used to take her Bible with her into the cave. The priests' children, and future successors, attended Christian schools and achieved literacy. The Mwali cult has proved to be a dynamic religion.

When the nationalists approached the shrines in the 1950s, the priests were also able to extend their theory of history. The Mwali cult had possessed for several centuries not only a theology of *place* – of the Matopos as the navel (the soft spot on a baby's

head) of the world – but a theology of *time*. It taught a theocratic history, narrating how the successive rulers of southwestern Zimbabwe had flourished when they were blessed by Mwali, but also narrating how they had been cursed and overthrown when they defied Mwali's commands. Legitimacy could only be gained by submission to the Voice from the Rock. "Nature" itself condemned the illegitimate ruler with drought and locusts. This had happened to all previous African kingdoms and it would now happen to the whites. Thus when Joshua Nkomo, who was to become the leader of mass nationalism in the late 1950s and early 1960s, paid his now famous visit to Dula shrine in 1953, the Voice spent the whole night telling him "history"; the history of how to replace an illegitimate regime and how to establish a legitimate one.

Thereafter, Nkomo came to be thought of as the chosen one of Mwali. At Dula, so it was believed, he had been promised that "Nature" itself would protect him, and that while people died around him in the war that was to come he would be safe. His nationalist pseudonym – little slippery rock – was given to him by the cult. The nationalist claim was that the land belonged to its indigenous people. Such a claim was given a particular resonance at the Mwali shrines where religion and culture and the land were inseparable.

This closeness to the Mwali cult persisted until Nkomo's death in 1999. During the guerrilla war of the 1970s, his fighting men drew legitimacy and protection from the shrines. When the war ended and Nkomo returned to campaign in the 1980 election, he held his first election rally in the Matopos, at Njelele. "Nature" itself seemed to endorse him as the legitimate leader, as thunder rolled, lightning flashed and rain came down in torrents. Robert Mugabe became the leader of the new Zimbabwe, however. Mugabe is a man who did not come to the Matopos shrines and was thus denied legitimacy by them. Nkomo found himself and his party harassed and threatened by the Mugabe regime. He himself fled the country – disguised, according to myth, in the black robes of a Mwali priest. His closest supporters went secretly to the shrines to seek consolation. After 1987 when Nkomo signed the Unity Accord and rejoined Mugabe's government, his greatest ambition was to develop Njelele into a great international religious site, like Westminster Abbey or Mecca. During his last years Nkomo used to retreat to one of the smaller Mwali shrines in the southeastern Matopos, Kozi. His son tells a story about "Nature's" respect for Nkomo in his old age. The old man sat in his chair under a tree; a dust-devil sprang up and leaves and dust piled up all around him; the tree bowed down and with its leaves swept away the mess; when Nkomo died, the tree died.

Yet the Mwali cult has never been captured by kings or presidents or politicians. It has remained constant to its own vision of "Nature." Local people never warmed to Nkomo's vision of motels and lavatories and mass pilgrimages. Today, as throughout their history, the shrines remain caves and rocks in the bush.

Zion Christian Church (South Africa)

The Zion Christian Church (ZCC), based in the Pietersburg district, Northern Province, has become the largest of the Zionist independent African Churches in South Africa. Founded about 1910 by a Pedi Christian convert, Engenasi (Ignatius) Lekganyane (born ca. 1885 in Thabakgone, Pietersburg district – died in Moria, 31 May 1948), who had previously experienced healing in the Zion Apostolic Church and membership in the Zion Apostolic Faith Mission, it rapidly evolved into a church appealing across ethnic lines to the rapidly urbanizing African poor. In the 1940s the ZCC bought two farms in the Boyne district, McClean and Kleinfontein, and these, after merging into one parcel of land, were renamed Moria after the biblical Mount Moriah or Jerusalem, and became the administrative and cultic center for the church. Under the founder's son Edward (born ca. 1923, in Thabakgone, died in Moria, 1967) and then grandson, Barnabas, the church grew from about 25,000 adherents in 1925 to about a quarter million by 1970 to a million in 1990 to a striking five million according to the 1995 census.

In 1928 Lekganyane introduced a badge as a token of membership, the silver star on a black cloth backdrop. His son, Edward was to change this to a five-pointed Star of David with the initials ZCC in the center. This badge still serves as a unifying symbol, as well as an amulet for protection against crime in urban areas. The church is organized on traditional tribal lines with Lekganyane as chief and ministers appointed, ordained, and responsible to him alone. The church emphasizes teaching on purity and thus prohibits pork, tobacco, and alcohol as well as use of African traditional medicines and Western medicines, seeking rather to trust in spiritual healing. There is thus great focus on personal and communal purity that enjoins a strict personal morality, a rigorous code of ethics, abstention from specific foodstuffs, and the avoidance of party politics.

Addressing a different context than other traditional Zionist churches, the ZCC has largely avoided the divisions that rent these other groups and has preserved its membership through a powerful hierarchy that continues to offer its members a sense of meaning, purpose, and spiritual healing, as well as a strong code for daily living. A significant feature of the ZCC is its emphasis on sacred land. It should be noted that the years of its founding happened to be the years when the Union of South Africa

was created and the Native Land Act passed (1913), which forbade individual black ownership of land, though churches were exempt from this law.

The ZCC, like the Zulu Ama Nazariti, have a highly developed sacred geography that combines biblical, traditional, and nature themes. Thus, 25 miles north of Pietersburg, lies Mount Moria where Edward Lekganyane laid out the church headquarters in the midst of vast agricultural holdings, symbolizing the power of black land ownership, until recently restricted by law. Mount Moria serves also as a center for three annual pilgrimages, the most notable being the Easter festival when, over the past twenty years, attendance figures have reached over the three million mark. ZCC members believe that at these Easter celebrations they experience in part the New Jerusalem when the Messiah builds his kingdom. The emphasis on a sacred and thus purified geographic center, as well as personal purity, has also led in the last decade to a greater awareness of environmental degradation, and has evoked a variety of initiatives involving sacred water, treeplanting, and land conservation. All these are understood as flowing from the sacred Mount Moriah and ushering in personal and social peace, healing, and blessing.

Zoroastrianism

Much is unclear about the origin and earliest developments of Zoroastrianism and its community of believers. Religious tradition ascribes the faith's tenets to Zarathushtra, later called Zoroaster by the Greeks. Members of the faith customarily referred to themselves as Mazda-yasna (later Mazdesn) or Mazda worshipper (Mazdean), with the designations Zarathushtri (later Zarathoshti, Zartoshti, Zardoshti) or Zoroastrian and Majus or Magian being subsequent categorizations based on referring to members of the community in terms of their founder – Zarathushtra – or their priesthood – the magi.

Zarathushtra himself appears to have been a devotional poet, trained in the recitations and rites – centered around fire and water (much later noted in the Iranian context by Strabo [lived ca. 64 B.C.E.–25 C.E.], *Geography* XV, 3:14) – of Indo-Iranian religion. When and where he lived are not definitely known, but linguistic and archeological data suggest a time framework of between the eighteenth and sixteenth centuries B.C.E. (i.e., the late Bronze Age), somewhere in Central Asia. As a community of followers developed around him and his words, Zarathushtra gradually attained the status of a prophet – possibly several centuries after his demise and when Zoroastrians and other Proto-Iranians had resettled on the Iranian plateau.

Gradually Zoroastrianism was spread among the peoples of the Iranian plateau, becoming a widespread faith there from the fifth century B.C.E. onward until it was elevated to the position of state religion under the Sasanians (224–651). By late antiquity, Zoroastrianism also had become a popular faith in Central Asia at cities such as Bukhara and Balkh. The demographic decline of Zoroastrianism in Iran and Central Asia occurred after the Arab Muslim conquest of those regions in the seventh century. Some Zoroastrians migrated from Iran to the Indian sub-continent around the tenth century, to avoid conversion to Islam, and their descendants came to be called Parsis or Persians by other Indians. A smaller group relocated to China but their descendants did not survive past the Middle Ages. In modern times, Zoroastrian diasporas have sprung up in many nations through immigration for religious freedom and economic opportunity. The current demographical distribution of the community, based on national censuses and membership in community organizations, is approximately: 45,000 in Iran; 76,400 in India; 10,000 in Canada; 10,000 in the U.S.; 4000 in England and Scotland; 2000 elsewhere in Europe; 2800 in Pakistan; 1000 in Australia, 1000 in Tajikistan and Uzbekistan; 150 in Hong Kong; 130 in Bahrain; less than 100 per country in South Africa, Sri Lanka, and Zaire; and even smaller groups in other nations. The faith is still practiced mainly by descendants of the original Iranian Zoroastrians, with very

few converts – conversion is discouraged by many contemporary Parsis, occasionally accepted by some contemporary Iranians, and periodically encouraged without much success to date by a few Zoroastrian settlers in North America and Europe.

Nature-related Doctrines

Drawing upon the semi-pastoral, semi-agrarian social setting of his community, and reacting to aggression upon the settled people and the environment by nomads, Zarathushtra grounded his words in the concept of Asha or universal Order which was equated to righteousness:

“Order is good, it is best. According to (our) wish it is, according to (our) wish it shall be. Order belongs to best order” (*Ashem Vohu prayer, Yasna 27:14*).

Order, personified by the masculine spiritual entity Ahura Mazda (later Ohrmazd) or Wise Lord, the creator deity of Zoroastrianism, and his generative hypostasis called Spanta Mainyu (later Spenta Mainyu, Spenog Menog) or Beneficent Spirit, was thought to permeate every aspect of existence. Order was believed to ensure harmony and completeness, connecting the spiritual world to the corporeal one, linking life to afterlife, and leading from creation to eschaton. Disrupting order was Drug or Confusion. Confusion, supposedly emanating from an independent spiritual locus termed Angra Mainyu (later Ahreman, Ganag Menog) or Destructive Spirit, the devil of Zoroastrianism, was believed to disturb, deceive, and defile the harmony of nature – and therefore was regarded as sinful. Thus, Zarathushtra, perceiving conflicts as upsetting natural order, is said to have chanted in the Old Avestan language: “When, O Mazda, will right mindedness come with order to provide good dwelling and pasture through (correct) authority?” (*Spenta Mainiiu Gatha, Yezidha Haiti, Yasna 48:11*). Likewise, speaking on behalf of all animals, especially domesticated species, Zarathushtra is believed to have asked of Ahura Mazda: “The soul of the cow complains to you, ‘For whom did you craft me? Who created me? Wrath, force, oppression, bondage, and violence hold me shackled’ ” (*Ahunauvaiti Gatha, Xshmauuoia Haiti, Yasna 29:1*). Decrying violence against all aspects of the natural world – which was held to have been created in a perfectly ordered manner by Ahura Mazda – Zarathushtra supposedly censured everyone who “ravages the pastures and wields a weapon against the follower(s) of order” (*Ahunauvaiti Gatha, Xva-etumaiti Haiti, Yasna 32:10*). Moreover, he would entreat: “May Mazda, who remembers precisely, note deeds perpetrated now and in the future by demonic beings and (evil) mortals” (*Ahunauvaiti Gatha, Xshmauuoia Haiti, Yasna 29:4*).

Pronouncements on human interaction with the environment by early Mazda worshippers who followed Zarathushtra, and also lived prior to or around the fifteenth century B.C.E., echoed the founder’s concern with all aspects of nature. They praised “Ahura Mazda who created the cow and order, who created water and good plants, who created light, Earth, and all good things” (*Yasna Haptanghaiti, Yasna 37:1*). They

also venerated Ahura Mazda's creations including "this Earth" and "the waters" (*Yasna Haptanghaiti*, *Yasna* 38:1, 3) plus "the souls of harmless wild animals" (*Yasna Haptanghaiti*, *Yasna* 39:2). Most of all, they wished:

Through these best endeavors, we exhort those who listen as well as those who do not listen, those who wield authority as well as those who do not wield authority, to establish peace and (to provide) pasture for cattle (*Yasna Haptanghaiti*, *Yasna* 35:4).

A devotional poem in the Young or Standard Avestan language (based on early, pre-Zoroastrian religiosity, but revised ca. 900–300 B.C.E. for incorporation into the Zoroastrian scripture or Avesta) to the male Yazata or praiseworthy spiritual entity Mithra (later Mihr) further stressed the beneficial links between deity, lesser divinities, humanity, and nature: "I shall audibly worship him, Mithra of the wide pastures, who grants peaceful and good dwellings in Iranian territories" (*Mihr Yasht*, *Yasht* 10:4). Another devotional poem, this one to the female Yazata named Aredwi Sura Anahita (later Ardwisur Anahid), commented on that spiritual entity's major role as Ahura Mazda's proxy in safeguarding a vital natural resource: "She purifies the waters" (*Ardwisur Yasht*, *Yasht* 5:5).

Human Mythology Involving Nature

Myths gradually developed to connect humans, from their very first corporeal existence, to nature. The Zoroastrian story of creation, finally codified in the Pahlavi or Middle Persian language, claimed that when Gayo Maretan (later Gayomard) the primordial androgyne was slain by Angra Mainyu and his demonic forces, his seed was purified by sunlight . . . (then) remained in the Earth for forty years, after which time Mashya and Mashyana (the first human couple) grew out of the Earth in the form of a rhubarb plant . . . (and) developed from plant form into human form (*Greater Bundahishn* 14:5–6, 10, compiled ninth to thirteenth centuries).

Gradually, Zoroastrian theology in antiquity and medieval times united all beneficial aspects of the world, producing a nexus between corporeality – both animate and inanimate – and spirituality – both ritual and supernatural. So, aspects of material existence such as water, Earth, fire, metals, plants, animals, and human beings were connected symbolically to spiritual beings and through those entities to god. The six interconnecting spirits are called Amesha Spentas or Holy Immortals (Ahura Mazda is regarded as the seventh, in addition to his role as Creator) and are thought to represent various categories of material creation: Vohu Manah (later Wahman) or Good Thought represents animals, Asha Vahishta (later Ardawahisht) or Best Righteousness represents fire, Xshathra Vairya (later Shahrewar) or Desirable Dominion represents metal, Spenta Armaiti (later Spendarmad) or Good Disposition (later said to be Holy Devotion) represents Earth; Haurvatat (later Hordad) or Integrity/Wholeness (later thought of as Perfection) represents water, and Ameretat (later Amurdad) or Immortality represents plants.

Humans are believed to oversee this belief structure in the corporeal world. This theological structure bestowed upon humanity a central role – Zoroastrianism holds that humans were created by Ahura Mazda as allies in his cosmic struggle against Angra Mainyu. So it was written, later, in the *Greater Bundahishn* (3:23–24) that Ahura Mazda deliberated with the immortal souls of humans who realized that the Destructive Spirit would be vanquished forever if they entered the corporal world. Ahura Mazda, in turn, promised to resurrect all humans and grant them immortality once Angra Mainyu had been defeated. As a result of this covenant, the religious function of each person is thought to lay in aiding the increase of righteousness and combating the forces of evil through every action performed during his or her lifetime. Essentially, Zoroastrians concluded that good deeds – like prevention of pollution, performance of ritual, and reverence for aspects of nature – by people in the material state further individual and cosmic triumph of righteous order over chaotic confusion on the spiritual level and that this maintains harmony in nature. Parthian or Arsacid-era poems lauded the appropriate and full utilization of nature, without waste of natural resources:

That lofty (date palm) tree said . . . “They make ships of me that sail the seas. They make brooms of me to clean houses. They make pestles of me to pound grain . . . Kings stop here for shade in summer. People eat my fruit to fill their stomachs. Small birds nest here and scatter my seeds” (*Draxt i Asurig*, ll 7–16, compiled ca. first century B.C.E.).

Purity and Pollution in Relation to Nature

Word of Zoroastrian concern for nature, not surprisingly, reached members of other cultures. The Greek historian Herodotus (ca. 484–430 B.C.E.) remarked, regarding Iranians living during the Achaemenian dynasty: “They greatly revere rivers. They will not urinate, spit, or wash their hands therein, nor allow anyone else to do so” (*History* I: 138). Yet, Zoroastrians have always felt that they could not safeguard nature without spiritual assistance. So, even the Achaemenian king of kings Darius or Darayavahush I (ruled 522–486 B.C.E.) implored: “Ahura Mazda is a great god who created this Earth, who created that sky, who created humans . . . May Ahura Mazda protect this land . . . from harm” (*Naqsh-e Rostam Inscription A* 1–3:51–53).

Zoroastrian concern that nature not be polluted, even in symbolic and ritual ways, resulted in a notion that decaying flesh should not come into contact with soil, water, crops, domestic animals, and humans. So the magian practice of exposing human corpses became popular (Herodotus, *History* I:140). The original Old Iranian term for a grave or tomb, *daxma*, came to designate another type of funerary locale – places where corpses could be exposed. At first daxmas were established in areas away from settlements such as on mountaintops, but later as population density increased they became walled enclosures or funerary towers. After exposure of a corpse and desiccation

of its flesh – often aided by mangling of corpses by wild animals – the bones would be collected and placed within an *astodan* or ossuary in the belief that rock could prevent any residual religious impurity from spreading through nature. Archeological remains of Parthian-era (ca. 238 B.C.E.–224) and Sasanian-era funerary towers and ossuaries, large and small, ornate and simple, are found throughout the Iranian plateau and Central Asia occasionally together with inscriptions and minor reliefs. Ritual exposure of corpses is still practiced by the Parsis in cities like Mumbai or Bombay (India) and Karachi (Pakistan), where daxmas often are referred to as towers of silence. Such funerary towers attract vultures who strip the flesh off corpses. During the past few years, as urban density transformed cities in the Indian subcontinent into metropolises, the population of vultures has declined – leading to attempts by Parsis in Mumbai to breed those birds and to seek alternate means of speeding up desiccation. Moreover, in India and Pakistan for the past few centuries, bones are no longer collected and entombed but are swept into a lime pit at the center for each tower to dissolve over time. In Iranian daxmas, the bones remained on site, slowly disintegrating. The practice of exposing corpses in funerary towers was phased out by the Zoroastrians of Iran during the 1960s under modernist pressure from the Pahlavi dynasty and so the funerary towers at traditional Zoroastrian settlements such as Sharifabad near Yazd fell into disuse. Zoroastrians in Iran began to wrap each corpse in a white shroud and bury it following Muslim practice. Zoroastrians who have migrated to other countries from Iran and India during the past two hundred years also independently adopted inhumation. Cremation is now gaining popularity among Zoroastrians in Western countries as a means of preventing symbolic pollution of the Earth by decaying, buried, corpses – although cremation leaves unresolved, for many practitioners, the issue of a brief pollution of fire in the crematorium. In most circumstances, whether in Iran, India, or elsewhere, corpses are cleansed prior to exposure, burial, or cremation – again an attempt to limit ritual pollution of the environment. Zoroastrian notions of purity and pollution, and the impacts of those ideas on the world, were assimilated into Shi‘i Islam shaping the parameters of *najes* or uncleanness that structure the religious lives and the relationship to nature for the majority of Iranians.

Historically, however, corpses of ancient Iranian monarchs were embalmed and then entombed (Herodotus, *History* I:140). There are the archeological remains of the Greek-style tomb of Cyrus or Kurush II (ruled 549–530 B.C.E.) at Pasargadae (also mentioned by Arrian, lived ca. 95–175, *Anabasis Alexandri* VI, 29, following an account by Aristobulus; Strabo, *Geography* XV, 3:7–8, following accounts by Aristobulus and Onesicritus; and Plutarch

[lived ca. 45–120], *Lives: Alexander* 69:4) and the seven rock-cliff tombs of Darius I and his successors at Naqsh-e Rostam and Persepolis (also mentioned by Photius [lived ninth century], *Bibliotheca* 72:38a–b, following Ctesias [lived mid-fifth to early fourth century B.C.E.], *Persica*), from Achaemenian times. The tombs of Parthian or Arsacid rulers at Nisa (mentioned by Isidorus Characenus [lived ca. first century B.C.E.–first century C.E.], *Mansiones Parthicae* 12) and Arbela (mentioned by Dio

Cassius [lived ca. 155–235], *History of Rome* 78:1) were well known. The Sasanian elite praxis of using *aspanuran* (*haspanwaran*) or tombs is documented in medieval texts (*Kar namag i Ardashir Papakan* 14; 17; and *Pahlavi Texts* 55:1–5; both surviving in post-ninth-century redactions). Again, the underlying notion was a religious attempt to safeguard nature from symbolical harm thought to be produced by demonic forces that supposedly cause death and decay.

As safeguarding nature became increasingly important, with the augmentation of ritual purity concerns in medieval times under the Sasanian dynasty and later under the Umayyad and Abbasid Muslim regimes, probably in reaction to increased contact between Zoroastrians and members of other faiths living in Iran, the Zoroastrian clergy or magi issued numerous injunctions to guide the laity. For example, devotees were cautioned: “Do not sin against (i.e., pollute) water, fire, and beneficent creatures . . . so that heaven may not be barred (to you)” (*Pahlavi Texts*, p. 151, ll 7–9, compiled third to ninth centuries). By the late Middle Ages, magi were counseling: “Whoever teaches cares for all these seven creations (Earth, water, fire, metal, plants, animals, and humans) does well and pleases (Ahura Mazda)” (*Supplementary Texts to the Shayest ne Shayest* 15:6, compiled ninth through fourteenth centuries). Such advice was not simply religious. It reflected a pragmatic view of the world. Zoroastrian commentators had pointed out that water had to be protected from pollution because impure water could not be used for drinking, cooking, cultivation, or rituals (*Denkard*, p. 452, ll. 17–21, compiled ninth century).

Opinions, pertaining to religious and practical views of nature, continued into pre-modern times, when Iranian Zoroastrians advised their Indian counterparts, the Parsis, that fire, water, land, and crops should be kept free from pollutants (*Persian Revayats*, 81–87, compiled fifteenth through eighteenth centuries). Likewise, more recently in 1869, a high magus wrote in a Paris Gujarati language catechism: “Water is one of the finest gifts given by god to humans. We must keep it clean and use it. If we do not keep it clean and use impure water, then it will harm the health of people” (*Rehbar-e Din-e Jarthushti*, 108). The tanka system of harvesting rainwater, devised by early Parsi farmers in Gujarat, India, and still utilized at rural locales – as documented by the UNESCO-assisted PARZOR Project – plus the far more ancient quant system of water distribution, still employed by the villagers (now Muslims and Zoroastrians) of Iran, have both been regarded by Zoroastrians as not only serving practical functions but also continuing to be tangible manifestations of the religion’s approach to utilizing natural resources appropriately. Moreover, Zoroastrian concepts have periodically been drawn upon by Muslim regimes in Iran to support environmental causes. So, for example, a publication issued in 1968 by the Iranian Ministry of Information at Tehran during the regime of Mohammed Reza Shah Pahlavi (ruled 1941–1979) justified conservation of forests by claiming:

The national religion of the Persian Empire until the coming of Islam was firmly based on agriculture. The desert was seen as a work of Evil; God was manifest in the

crops, in the fruit and nut-bearing trees, in the abundance of game, in the multiplying herds of cattle and sheep (*12 Points for Progress*, 35–6).

Thus in the task of safeguarding Iran's forests from development, that country's most recent monarch was presented as adhering to divine will, indirectly the wishes of Ahura Mazda. More recently, in the decades following the Islamic Revolution of 1979, Muslim Iranian intellectuals have turned nostalgically to their country's heritage, seeking in their national, ancient, past relevant themes of natural harmony and coexistence as counterbalances to theocracy.

Worship and Celebration Connected to Nature

The days of each month of the Zoroastrian calendar are dedicated to Ahura Mazda, the Amesha Spentas, and the Yazatas – thereby uniting spiritual entities and nature to time. Because worship and praise are directed by Zoroastrians through their rituals to the righteous entities that are believed to inhabit the spiritual realm, calendrical-based devotional ceremonies include overt references to the categories of nature associated with those spirits.

Most Zoroastrian rituals are conducted within complexes known as fire temples. Fire, as the aspect of nature considered absolutely pure, became the icon of the Zoroastrian faith. Ritual fires burn in altars at Zoroastrian temples – permanently at some temples in Iran and India, temporarily in other temples in Iran, India, the United States of America, and elsewhere. The central devotional ceremony performed in major fire temples is the Yasna or Worship (originally Sacrifice) where, among other rites, the haoma or ephedra plant is pounded, mixed with water and milk to make a libation, and then symbolically offered by participating priests to Ahura Mazda and other divine spirits. Jashan or Thanksgiving services are performed at fire temples on days such as Nav Ruz or the New Year's festival (at the vernal equinox), Mihragan or the Feast in honor of Mithra (at the autumnal equinox), and the Gahanbars (also Gahambars) or Communal Feasts. On those occasions fruits, flowers, and cooked foods made from plants – and now less frequently animals – are consecrated to the divinities and then consumed by the community. Although its origins are not completely clear but may ultimately derive from variations on Sasanian practice, contemporary Iranians of the Zoroastrian and Muslim faiths continue to set up an arrangement of seven items – whose Persian terms begin with the letter *sin* or *s* such as garlic, apples, dried fruits, vinegar, vegetables, hyacinth, and coins (plus an oil lamp, prayer book, mirror, and other symbolic items) – called the *haft sin* on a table in each home. Again, the purpose of those offerings is to unite various aspects of the corporeal world during acts of worship and celebration. Originally, animals were sacrificed by Zoroastrians in both Iran and India on religious and communal festivals. But Hindu vegetarian influences on the Parsis led to the gradual phasing out of animal sacrifice, and Parsi praxis

spread from India to Iranian Zoroastrians in the twentieth century as the training of magi came to be conducted in seminaries in India.

Between the ages of seven and fifteen each Zoroastrian boy and girl undergoes initiation into the religion. The ceremony is termed the *Navjote* or new birth by Parsi Zoroastrians and *Sedra-Pushun* (also *Sedra-Pushi*) or donning the sacred undershirt by Iranian Zoroastrians. It symbolizes a spiritual rebirth. After initiation each believer becomes fully responsible for his or her own religious, moral, and communal life. During the ceremony, the initiate – having learned the basic prayers of the religion – dons a white cotton undershirt called the *sudra* (also *sedra*), and ties a lamb's wool cord known as the *kusti* (also *koshti*) around the waist and so is yet again linked to other creatures. Flowers, fruits – such as coconuts among the Parsis and pomegranates among Iranians – and rice are incorporated into the ritual actions of the initiation. The same general array of items are present during wedding ceremonies. As with most other aspects of Zoroastrianism, the function of each item is to unite the officiating priest, the devotee undergoing initiation or couple entering into marriage, and the members of the audience with nature and so reaffirm humanity's central role in the religious universe.

Zulu (amaZulu) Ancestors and Ritual Exchange

One of the fundamental ideas in ancestral-based religions, such as that of the Zulu, or amaZulu (a more accurate term), is that of the life-force, essence or energy which exists in all animate and inanimate phenomenon, including animals, plants, and various geographical or even atmospheric features. This life-force is in constant circulation and although it is indestructible it may be converted, exchanged and utilized in different ways by humans, for good or bad intent. The following account describes these dynamics in the context of Zulu notions of the ancestral and spirit worlds. These are, however, broadly representative of many other African groups' ideas and concepts on the subject, especially the Nguni-speaking peoples of southern Africa.

According to Harriet Ngubane, the Zulu collective term for all the departed spirits is *amathongo*. Zulus believe that when a person dies the life-force exits the body in the form of a shadow, or spirit, known as *isithunzi*. The spirit enters a liminal phase where it is "betwixt and between" the living and the ancestral worlds. Among the Zulu, certain tasks have to be performed by living members of the agnatic (male) kin group to help get these spirits empowered, purified and "cleaned," in order that they may join the benevolent ancestral body (*amadlozi*) that has an important role in protecting and guiding descendants. This usually involves a series of sacrificial rituals that should be performed after a certain lapse of time (usually within a year) after physical death. The final ritual of incorporation of a departed spirit, known as *ukubuyisa*, signifies the return of the ancestor (*idlozi*) to the home. Departed individuals who have lived good moral lives and attained the status of elder are regarded as the most active of the *amadlozi*, as they are the most concerned with the wellbeing of the living. Typically it is believed that a person's deceased parents, grandparents, and great-grandparents are more interested in their descendants, although the more remotely distant ancestors are regarded as participating at rituals held in their honor and can still influence and have interest in the affairs of the living. The ancestors are regarded as being present in the homestead and should be treated with respect befitting that of elders. They should be kept informed of any events and changes that have occurred within the homestead, such as a change of family residence, work or fortunes. They should be actively informed of all the "life crisis" stages that require "rites of passage," such as the birth of children, attainment of adolescence and adulthood, marriage and death. They can be consulted for advice and guidance on any problem facing the family and they are seen to act as a protective force against evil. In their purified state they are

seen as being close to God and in the context of Christianity they are often equated with the angels, who have the power to directly appeal to God on behalf of the living. When they are forgotten they are regarded as no longer having adequate strength to protect the living and they withdraw their support, leaving the family vulnerable to attack by hostile forces. However they do not disappear and their potential to intervene always exists, should the appropriate steps be taken by the living to empower them.

The intensified presence of the ancestors is to be found in a number of regions in the domestic domain. These include the cattle byre (*isibaya*), especially around the central post, and in the sacred ancestral hut (the *indlu enkulu* or “the great house”). In the latter they are thought to reside in the rafters above the shrine (*umsamo*) found opposite the doorway of the round hut. These are the sites where sacrificial offerings are placed.

However when questioning Zulu diviner-healers (*izan-goma*) about the locality of the ancestral body (the *amad-lozi*) one gets a more complex response than these spatial domains suggest: they reside in one’s body, they can manifest themselves in animals and plants, and they also exist in the air, under water, and under the Earth (*abaphanzi* = those down below). In other words they are omnipresent. Regarding the presence of the ancestors within a person’s body, it is believed that they commonly reside in the regions of the reproductive organs. The aim of *izangoma* training is to activate the *amadlozi* by bringing them to the head and shoulders so that the healer can hear and see the messages they bring. In addition to the drinking of special herbal medicine (*ubulawu*), an important aspect of diviner-healer training is to spend long hours dancing and singing to the rhythmic beating of drums, usually in the early hours of the morning (after midnight). It is believed that this helps activate the *amadlozi* and “brings them up” from the lower reproductive regions to those of higher consciousness, associated with the brain, throat, eyes, ears and heart. In this way the ancestors can empower one with knowledge and foresight by communicating through means of visual (clairvoyant), auditory (clairaudient), mental (dreams and visions) or vocal (glossalia) messages. Another area of the body vulnerable to their presence is in the supra-scapular region at the top of the shoulders and at the base of the neck. This is the area the ancestors stimulate with sharp or scratching pains when they are said to be trying to attract the attention of an individual to be a healer.

The Zulu also identify a more powerful category of ancestral spirits. These are the “great ancestors” or the *amakhosi*. These are powerful spirit beings that are often associated with those healers that are taken “under water” for their training. The *amakhosi* communicate directly with such healers via high-pitched whistles that emanate from the rafters of the sacred hut. These whistles are audible to all present, and the healer who has been taken “under water” for training has the ability to translate the messages in this form. In explaining the difference between the *amakhosi* and *amadlozi*, diviner-healers say that the *amakhosi* are powerful *amadlozi*, but not all *amadlozi* attain the rank of *amakhosi*. According to Ngubane, whistling spirit divination is regarded as the most powerful and accurate of all the types of divination found among the Zulu.

The ancestral spirits are also capable of manifesting as animals, birds, reptiles and even insects (such as bees). For the Zulu the snake, in the form of the python (*inhlwati*), is the most potent manifestation of the great ancestors and is often respectfully referred to as “lord” (*inkosi*). The “great spirits,” or *amakhosi*, described above, are often said to visit the living in python form. This variety of fauna may manifest in people’s houses, often behaving in ways different to that expected of their species. Their presence serves to alert the living to the fact that the ancestors are trying to draw their attention and acknowledge their presence, usually to perform certain tasks or to call an individual to become a diviner-healer. These are regarded as spirit animals and are viewed as distinct from ordinary creatures and they should never be harmed. The clue to their ancestral/spirit nature lies in their “abnormal” behaviour. Such animals may also appear in a person’s dreams and are regarded as very significant in the training process of healers.

The character, or essence, of all living creatures is believed to adhere to their flesh, especially in fatty tissue. Thus many medicinal mixtures incorporate wild animal fats and these are used to achieve the natural characteristics possessed by the animal. It is also believed that wild plants and animals are imbued with the essence of potential ancestral power. This power is referred to as *amandla*, and at decomposition, after death, this potential is absorbed into the soil and is taken in by plants and animals. Certain plants (e.g., various *ubulawu* species) are regarded as having an affinity to this potential ancestral power, and these are used in *izangoma* training to connect them with the ancestors via dreams. Animals concentrate this power/essence in certain parts of their bodies when they consume vegetation and/or other animal flesh. The liver, and its by-product, bile, is regarded as possessing especially high concentrations of this power/essence, and hence these both feature strongly in sacrificial rituals. Wild animals and plants are thus seen as a manifestation or a medium to convey the power of the ancestral world to that of the living, and they form part of the complex system of exchange that takes place between the living and the dead. This becomes most obvious in sacrificial ritual.

The Importance of Ritual Exchange in Zulu Sacrifice

Fundamental to the benefits that the living seek from the spirit world, be they for good or bad intent, is the notion of reciprocity and exchange. Benefits can only flow in exchange for something else, invariably another life. Diviner-healers are regarded as having been called from the benevolent ancestral world to help ease the suffering of humankind, and to restore and heal the physical individual as well as the social body, and to overcome the evil forces that prey upon humankind. Usually the healing of the individual is dependent on the healing of the whole kin group. In order to do this they have to clean and feed the ancestors through regular ritual, often involving

animal sacrifice, and during such rituals emphasis is placed on resolving any interpersonal conflicts that may be besetting the home. In addition to izangoma developing healing and divinatory abilities, they gain certain personal benefits from the ancestors, especially in the form of mystical protection and warnings about those who may wish to harm them, as well as a certain amount of material comfort for the healer, the living kin, and their descendants in later generations.

The process of Zulu sacrifice demonstrates the immersion of the human body in the natural world. The system of symbolic associations in the exchange is complex and there are multiple meanings attached to the movement of gifts during sacrifice that reveal the cosmological order regarding the division between nature/culture, animal/human, wild/domesticated, female/male, corporeality/non-corporeality, and raw/cooked, as has been noted by scholars such as Lévi-Strauss and Hammond-Tooke. Sacrificial exchange is associated with consumption. In order to gather the energy needed to send messages to the living the spirit world requires sustenance and “food.” The food that is given requires a high level of investment and value for the living. One cannot sacrifice wild animals, but only that which has been reared or cared for by humans. Thus, transformed domesticated plants (sorghum/millet beer) and the blood, bile and flesh of domesticated animals

(chickens, goats, sheep and cows) provide the necessary food for the ancestors. These domesticated or transformed products represent the wealth of the supplicant, even if they have to be purchased. As in any system of exchange the means are as important as the end. Gifts have to be transmitted through a form of energy, or a channel of communication. The living open up the channels of communication to the spirit world through the products of culture: domesticated animals and plants, as well as speech, dance and music, while the spirit world opens up the communication channels to the living through nature, the bodies of wild plants (*egubulawu*) and animals (*isilwane*).

Zulu ritual sacrifice is a very public, socially affirming event where the bonds of kinship are constantly emphasized. All family members are expected to participate and the event is open to any member of the general public who wishes to attend and consume the beer and meat that is prepared for the occasion. It is overall a celebration of the positive unity that exists between the living and the ancestral world, and the benefits that flow from such a union. It is this that sets it apart from other more secretive and negative forms of mystical empowerment that are associated with commodity exchange and the evils of individual material accumulation and greed.

Obtaining Mystical Power through Commodity Exchange

Diviner-healers are expected to reveal and counteract the activities of evil forces, which ally themselves to those humans who seek power and wealth, and exhibit it

through greed, arrogance, malice and envy. It is believed that some spirits that still possess their corporeal identity and character, may linger in the environment for a period of time, especially if they harbor any grudges, had unfinished business to complete, or were too grasping of the material riches in this life. Both the benevolent ancestral forces and the lesser, more negative, spirit forces can influence the way a person thinks or behaves and can affect his/her fortunes. This means that a certain amount of what we would see as individual motivation and selfdirected behaviour is sometimes attributed to external forces (although free will is still recognized). The less developed spirits or spirits of malicious people, particularly those who exhibited a vindictiveness or lack of control of desires while alive, or those who were aggrieved by a violence done to them, can also be employed by the living to assist them to do harm to rivals, and to help enrich and empower their benefactors. These spirits are thought to linger around graveyards or the environs that they frequented during their lifetime. They are believed to be able to give people a certain amount of foresight and advanced knowledge, but they are capricious and demanding, and can be dangerous to work with, often taking, in exchange for their services, the life of a close kinsman or child. It is asserted that some izangoma may resort to engaging the power of these spirits, especially if they have failed to establish or maintain contact with their own ancestors. There are many reasons for this failure: sometimes novice healers, who cannot afford to continue the long and often expensive training that is needed to access their benevolent ancestral power, resort to this less expensive and demanding form of empowerment. Some fail to empower the ancestors because they are weak, while others have been abandoned by their ancestors for transgressing the strict moral norms of spiritual and social behavior, largely through embracing the morals of individuality associated with greed and desire for power. Engaging the power of these lesser spirits is called *izizwe nesizwana*, and such powers are gathered by working with medicines in the graveyard, which entrap these “lost” spirits and get them to work for their captors. All the representations associated with this form of empowerment are negative. It is done in secret and in the dark, and the spirits are not from the body of ancestral kin. All these serve to threaten the requirements for sociality and healing. Supernatural and mythical animal familiars, such as the *ithikoloshe*, *mamlambo*, *imfene* and *inyoni* (*impundulo*) can also be harnessed for these purposes, and it is believed that these can be created and nurtured by witches and sorcerers. *Ithikoloshe* (the highly sexed dwarf with an enormous penis) and *mamlambo* (the snake), are veritable shape-shifters, and are used to pursue the pleasures of the flesh, particularly of a sexual nature, but they are also associated with gaining wealth. The *imfene* is the baboon, on whom the sorcerer rides backwards when he goes on his nightly evil errands, while *inyoni* (*impundulo*) is the evil “lightning bird” which is sent to attack those whom a witch or sorcerer bears grudges against. It kicks the victim on his chest, causing haemoptysis (i.e., tuberculosis), or strikes him on his back and head, causing a paralyzing stroke.

Izangoma assert that there are a number of “healers” who engage the services of such familiars. It is believed that these creatures can be manufactured and activated by plant

and animal medicines, as well as human body parts, and can be purchased through a Westernized form of commodity exchange. Those individuals that use medicines and familiars to gain immediate wealth are engaging in what is termed *ukuthwala*, while *ukuthwesa* (or *ukuth-walisa*) refers to those “healers” who engage in the sale of such medicines. It is generally believed that herbalists are more prone to enter into such business enterprises than *izangoma*, as the latter run the risk of losing ancestral support if they engage in such activities.

Summary

The ancestors are a positive force in the Zulu traditional worldview. They integrate both the natural and the social worlds, provide benefits for the living, and offer an effective means to enforce the moral order. However they are not completely autonomous and they rely as much on the living for their well-being as the living do on them. This relationship is based on a reciprocal flow of goods and services, represented most vividly during ritual sacrifice, and this has strong moral and social binding. As commodity exchange systems and desire for individual accumulation penetrate this relationship, the cosmic and moral basis of the exchange changes, and the spirit power shifts from that of the positive and life-giving *amadlozi* to the more negative and vindictive lesser or evil spirits.

Underlying these notions is the spiritual potential of the natural world of which the ancestors are an integral part. It is through the natural world that they can manifest and their power can be accessed or activated. Their manifestation may take different forms, be they through plant-induced dreams or via visitations to the living in animal form. Thus the natural world provides more than just resources for consumptive or functional use; it carries potential ancestral power and knowledge that, if used in a socially moral context, is vital for harmonious and balanced living.

Zulu (amaZulu) Culture, Plants, and Spirit Worlds (South Africa)

Imithi or herbal medicines play an important role among the Zulu or amaZulu (a more accurate term for the Zuluspeaking people) of southeastern Africa. An examination of the use of *imithi* among Zulu *izangoma* (divinerhealers, often called *sangoma* in pan-African discourse) suggests a fundamentally different conceptual framework regarding the boundaries and relationship between the social, natural and spiritual worlds compared to those paradigms embraced by Western philosophical and scientific thought. In Zulu thought, the physical and social well-being of both individuals and groups are a result of the dynamic interplay between the social, the spiritual and the natural worlds. Ill health results when the balance between these dimensions is disrupted or undermined, or when individuals with evil intentions manipulate the spiritual and natural forces in order to bring about social disorder and misfortune on victims. The Zulu are a subcategory of the larger linguistic group known as the Nguni-speaking peoples. These include the Xhosaspeaking groups (such as Xhosa, Gcaleka, Mpondomise, Mfengu, Thembu), the Swazi, the Shangaan and the Ndebele. They share many common cultural features, and have similar concepts to what is described below for the Zulu peoples.

Plants, whose potencies are often enhanced through combination with wild animal products, provide the medium whereby cures can be achieved, and the power of the spirit world can be accessed, enhanced and modified to suit social and personal needs and desires (be they for good or bad purposes). While some plants have potency in themselves that may help or harm individuals, many require ritual activation through symbolic actions and verbal empowerment. Thus plants are seen as essentially neutral in moral terms, but ultimately become extensions of their users and their ambivalent power is dependent on the purposes to which they are put and the “heart” of the person using them. *Izangoma* emphasize that they may only use medicines for good purposes. Their powers of divination and healing, and the identification of plant remedies, come to them directly from the benevolent ancestral world that has strict sanctions on the way medicines may be used. A diviner who fails to adhere to these strict moral guidelines runs the risk of losing further ancestral guidance and help. They are aware, however, that there may be practitioners (mainly herbalists who do not rely on ancestral guidance) who have strayed from these moral norms and provide medicines that are used for harming others, and/or for self-enrichment. Social commentary against

such forms of accumulation and practice is pervasive among diviner-healers in contemporary South Africa. Those suspected in engaging in such enterprises are seen as engaging in witchcraft and sorcery (*ubuthakathi*). The forces that have resulted from globalization and modernity, particularly the pressure for individual gain and success within the context of poverty and social fragmentation, have exacerbated these suspicions and have had a profound influence on the ways to which plant-based medicines are used in the present context.

Thus, although the Zulu have a wide range of plants that are used for their physically therapeutic effects on diseased bodies, their understanding of the processes that lead to physical disorder are more complex than the way Western science understands pathogenesis. They must, therefore, be understood within the context of a rapidly changing society.

Zulu knowledge of healing plants is extensive. Hutchings and others in *Zulu Medicinal Plants* (1996) documented some 1032 species of plants that are known and used by healers in KwaZulu Natal. This figure represents approximately 25 percent of the flora that occurs in this province in South Africa, suggesting that there could well be many more species that are used that have not been documented. Moreover, for any one plant identified there are multiple uses, ranging from symptomatic therapies that may cure the physical ailment (with demonstrable pharmacological activities) to mystical and magical uses.

The multiple uses to which plant-based medicines are put can be categorized into three main areas: for physiological curing purposes, for spiritual purposes and for social purposes. This knowledge is flexible and adaptive to changing needs and demands encountered in contemporary society. The following discussion focuses on the conceptual elements of plant-use in Zulu cosmology and on the spiritual and social uses of plant-based medicines.

Plant-use in Training and Healing Activities

Plants are extensively used in both the training and healing activities of *izangoma*, who believe they are called to their profession by the ancestors through dreams or illness. The spiritual uses of plants fall under three broad categories. They are used as connectors to the spirit world, as spiritual cleansers of both the living and the dead, and for protection against evil forces, including crime and violence. The connecting and cleansing function of plants often overlaps, as do the cleansing and protecting functions. The cleansing and connecting functions are most prominently seen in the use of a certain group of plants collectively known as *ubulawu*. The primary aim of training for *izangoma* is to enhance awareness of the various forms of communication received from the ancestral world. Dreams are of particular importance and a variety of plant species are imbibed to enhance the clarity and reception of powerful message dreams. These are collectively referred to as *ubulawu* and include a range of trees, shrubs,

climbers, grasses and small flowering plants from a variety of habitats. Different parts of the plant (roots, stems, bark, bulbs and leaves) are used depending on the species. They are combined into specific mixtures, depending on the individual's progress and the nature of his/her dreams. A mixture or combination of *ubulawu* species is used at the commencement of training, during the training process and after the healer has qualified. They are often administered during group rituals, or may be taken daily by novices, when it is accompanied by prayer, invocation and/or singing. Certain species of *ubulawu* are also associated with different clans and are used as a form of identity during collective clan rituals.

The efficacy of *ubulawu* is largely dependent on the ritual and cultural context in which it is used. The *ubulawu* are soaked in cold water and beaten to a thick foam with a forked stick (again made of a certain plant species), which is then imbibed. The ritual is often performed at pools, rivers or in forests where the ancestors are thought to reside. This is usually accompanied by singing. The foam is regarded as having a special cleansing ability, in both a physical and a spiritual sense. The *ubulawu* are also said to "clean" the ancestors. The power of a healer is ultimately dependent on the power of the ancestors, and by "cleaning" with *ubulawu* and the periodic sacrifices of goats, chickens and cattle, the ancestors are strengthened, thus enabling the healer to do his or her tasks more effectively. *Ubulawu* is also an important element in ritual animal sacrifice, as it forms a connecting thread between the sacrament, the initiate and the ancestors. The use of such plants without spiritual calling and sanction renders them ineffective. *Izangoma* are insistent that if a person has done wrong and offended the ancestors, or if the timing is not right, or the initiate is in a temporary state of pollution (female menstruation), then the *ubulawu* will not foam despite vigorous beating. The ancestors are thought to be actually present in the foam, and lack of foam signifies their refusal to manifest themselves. It is preferable that healers collect their own *ubulawu* as there is less chance of pollution occurring this way. Although many of the *ubulawu* species are sold on the street markets, these are usually only used when it is not possible to gather them personally. Cultivated species are also regarded as losing much of their spiritual potency and are not a viable alternative.

Imphepho (*helichrysum sp.*) is another important connecting plant used in all rituals performed for the ancestors. This is burnt and allowed to smoke profusely as a form of incense, and is used whenever an individual wishes to draw the attention of the ancestors close to hear prayers and appeals, or to receive offerings such as in sacrifice. In addition to its connecting or summoning function it is thought to have a purifying effect as well. *Umphafa* or *umlahlankosi* (*ziziphus mucronata*) is the connecting plant *par excellence* for the Zulu and its importance cannot be underestimated especially within the context of the social and kin fragmentation that have resulted from the migrant labor system and increasing urbanization in South Africa over the last century. After death, the spirit of the deceased enters a form of limbo, a transitional phase between the world of the living and that of the ancestors. Traditionally it was vital that the living kin perform the *ukubuyisa* ritual a year after the death of an individual,

to incorporate him or her into the body of the active benevolent ancestors. Ideally the body of the deceased should be buried at the homestead. However this is a difficult task for families when members have died far away from home, such as in the cities and the mines. A branch from the *umphafa* tree helps resolve this problem since it can be used by the chief mourners to convey the spirit of the deceased back to the homestead where it can then become incorporated with the ancestors at the ancestral shrine or hut. The tree is characterized by branches that have small sharply hooked thorns on their stem, and during the ritual to transport the spirit back home, the chief mourner has to clutch a branch of *umphafa*. With the help of other kin members, or a ritual officiant, they approach the gravesite or the place where the death occurred, be it a hospital or elsewhere, and sweep the branch over the ground or the place where the victim died. For instance, if the victim died in a car accident they would visit the accident site and sweep the branch on the road at the point of the accident. If the person died in hospital they would go to the bed in which the person died. Singing and praying, the ritual party plead with the spirit to grasp hold of the branch and to hold on to it while they convey him/her back to the ancestral home (this may entail covering long distances by car or bus). The chief mourner who holds the branch is forbidden to speak for the whole journey for fear of confusing the spirit, but the accompanying supporters can talk to the spirit constantly informing him/her as to the progress of the journey. Upon reaching the homestead the branch is fed to two goats that are tethered outside the entrance. One is expected to eat the leaves while the other should refuse it, and if this does not happen, then the whole procedure has to be repeated as it indicates that the spirit had failed to grasp hold of the branch. The goat that refuses to eat the leaves on the branch is slaughtered at the gate and its chyme (undigested food) is used to cleanse all the family present, while the one that eats it is now believed to be carrying the spirit within it, and is led into the ancestral hut where it is sacrificed in the name of the ancestors and the meat is placed at the *umsamo*, the place where the ancestors are thought to reside (opposite the main doorway to the round hut). In this way the spirit is reunited with the ancestors.

Plant-use and Witchcraft

The cleansing and protecting functions of plants are often employed together in the ritual removal of witchcraft or *umnyama* (darkness). Harriet Ngubane has noted the fundamental importance of Zulu color symbolism (black, red and white) in the way medicines are used for spiritual purposes. The order in which different color medicines are administered in these rituals are connected to the cosmic order of night (black), dawn/sunset (red) and daylight (white) and they must be strictly adhered to. The process must always go from black medicine (representing darkness – *umnyama* – and heat), to red (a transition color between darkness and light – warm), to white (openness, clarity and purity – associated with daylight and coolness). The thermal qualities of the

medicines are also observed. Hence dark medicines that are administered to remove *umnyama* from a victim are usually boiled or steamed, while white medicines are always administered as a cold solution.

Plants that are used to protect against evil, or to deflect evil away from one, are widely used in South Africa. Michelle Cocks and others documented that the most popular category of medicine purchased from amaXhosa (a more accurate term for the Xhosa-speaking people) traditional medicine (*amayeza*) stores is for protection against evil spirits. These are usually applied to the body as a wash or as an unguent, or worn as a charm around the waist or neck. They can also be used to sprinkle around ones property and possessions. The category of plants known as *intelezi* refers to a wide variety of plants (usually bulbs and tubers) that are used to protect against evil. A mixture of *intelezi* species are usually chopped up and soaked in cold water (they are categorized as white medicines) and this is sprinkled around the perimeter of the homestead before any important rituals are performed. This is to minimize any negative mystical interference by those who harbor witchcraft (*umthakathi*) or darkness (*umnyama*) in their hearts. Protection of one's property against criminals is in high demand in contemporary South Africa where crime has escalated alarmingly in the post-apartheid era. The services of *izangoma* are frequently sought to provide such protection. Known as *ukubetela* this usually involves a complex series of rituals over several days at the homestead of the client where family members are medicated with protective herbs. In some instances river stones that have been heated and medicated with a variety of plant and animal-based solutions and substances are buried at strategic places (such as gates and entrances) of the homestead, and the air is stabbed in the four cardinal directions. This is believed to chase away anyone who approaches the homestead with evil or criminal intentions in their heart.

Umgcabo is a prophylactic procedure employed whereby complex mixtures of protective medicines that are stored in an oil (animal fat) base are applied to incisions that have been made at points over the clients body (i.e., joints) that are believed to be vulnerable to the entry of evil forces. *Ukutshoba* is a curative therapy used against mystical invasions of the body. In the latter case the medicines are introduced into the skin through a puncture made with a porcupine quill or a bicycle spoke, according to Frank and Stephen Jolles.

Some plant tubers are used as a decoy to deflect sorcery and witchcraft. A mixture of medicines with the blood or saliva of the potential victim is inserted into the tuber (*inkomfe*) and it is then buried in a remote place. The person must leave without looking back. In this way anyone wishing to do harm on the person will fail as the evil familiar will be confused and go to the tuber rather than the potential victim for whom it is intended. Its potential can be further refined with a few more symbolic actions whereby the evil that is being sent to the intended victim actually rebounds and returns to afflict the sender (known as *ukucupha*). This practice, that is still followed today, was first recorded by Callaway in 1870 and demonstrates the enduring nature of some of this knowledge.

There are a number of other plant-based protective devices that are currently used. A notable example is the use of a special tree, the bark of which is soaked and then ritually thrown over the person's shoulder. It is believed that this will fool aspiring robbers or criminals who approach a treated household. As they approach they will hallucinate and "see" the household members standing at the door of the house. It is hoped that the "presence" of family members will deter the criminals from attempting to rob the house. In addition there are plants and medicines that are believed to make the user become invisible and thus avoid detection by those wishing to harm him/ her. This medicine has an ambivalent value, however, as it can also be used by criminals to help them escape detection from the police.

The Social Uses of Plants

The ambivalent nature of plant-based medicines (*imithi*) is most evident when examining the social uses of plants. (Muti is the pan-African term most commonly used to refer to plant and animals used in potions for healing or other purposes; even human parts can be used, which helps account for the term's sometimes negative connotation in Zulu culture.) Plants that fall under such a category are mainly used for luck, be it in education, business, competitions (i.e., sport), court cases, or, most importantly, love. In the research in the Eastern Cape led by Michelle Cocks and reported in 2000 and 2002, it was found that the second most popular category of plants purchased at *amayeza* stores were those to achieve luck. The most common profile of the customers for luck-enhancing medicines was young, educated and upwardly mobile individuals. *Umayime* (*clivia sp.*) and *umlomo mnandi* (lit. "mouth that is nice") are plants that are used when one wants to be able to speak with conviction and persuasion, for instance when one is pleading in a court case. There are a number of plants that can be used to attract a lover by making one appear "nice." These can also be used in beauty competitions to ensure success. Some plants are used to keep a lover faithful or stop him/her from straying to others. Aggrieved women who suspect that their lovers or spouses are seeking sexual favors from others have recourse to a plant-based medicine (*typha capensis*) that will make the competing lover (female) excessively moist and undesirable. These ideas suggest that achievement is not about individual ability, hard work, or personal attributes, but is something that can be obtained by external interventions via the spirit world or through magical manipulation.

Plants, Wealth, and Power

Although it may be argued that these examples present moral ambiguities, there is one category of medicine that is regarded by most *izangoma* as unacceptable and morally reprehensible. These are the medicines used to achieve financial wealth and

political power. Those individuals who use such medicines to gain immediate wealth are engaging in what is termed *ukuthwala*, while *ukuthwesa* (or *ukuthwalisa*) refers to those “healers” that engage in the sale of such medicines. Human body parts may be used in the creation of such medicines. This accounts for antagonistic responses toward those who engage in such trade. Moreover, the use of such medicines always comes at a cost, the death of those who are closest to the purchaser. The literal “consumption of others” (i.e., human body parts and deaths of closest kin) is an appropriate representation of such practices and is a powerful commentary against the disruptive effects of excessive accumulation of wealth and power.

Plants and the Fluid Boundaries between Spiritual and Natural Worlds

It is quite evident that Zulu notions of the boundaries between the social, natural and spiritual worlds are more complex and fluid than those found in the Cartesian worldview. Plants and animals are seen as the manifestation and medium of the spirit world and they are influenced by the intentions of the user. Together, the plant, the spirit and the user occupy a common moral universe. This idea of tapping into the positive healing power of the natural world through right and good moral intentions is illustrated in the way medicines are collected and used by diviners. These should always be collected in a respectful way. Plants are approached in a humble manner with the clapping of the hands, while the gatherer requests permission from the ancestors to be allowed to remove the plant. Thanks offerings, usually in the form of white beads, should always be made after collection. This will ensure the right potency of the plant as well as offer assurance that more plants will always be made available by the ancestral world. The ancestors show the healers the correct plants to use for healing in their dreams and even indicate to them the most suitable places for collection. This is important since plants vary in their potency depending on their habitat and the timing of their collection (diurnally and seasonally). Moreover it is strongly believed that plant-based medicines will be rendered useless (or may become dangerous) if there is lack of harmony in the household. Unfortunately many of these principles and practices have been abandoned in the modern era and plants are now gathered indiscriminately and without ritual observance by entrepreneurs, who have little regard for, and knowledge of the ancestral world.

Despite these problems, the spiritual and social uses of plants by the Zulu *izangoma* are both enduring and dynamic. They provide a mechanism through which social and spiritual order can be maintained and the means by which the pressures associated with contemporary lifestyles can be commented on and managed.

Zulu (amaZulu) Smelting

Adulphe Delegorgue provides the only detailed eyewitness account of iron-ore smelting in what is now KwaZuluNatal, South Africa. In 1842 he visited a place he called Zimpy (*insimbi* = iron) while hunting in the Zulu Kingdom. He described an enclosure of 25 by 12 paces in which three parallel oval “pits,” the furnaces, were situated. At either end of each pit, pipes of sun-dried clay carried air expelled from twin bellows into the furnace. Four relays of six men operated the bellows continuously throughout the smelt, which lasted four hours from eight till midnight. The following day, the team removed pieces of iron bloom from the still-hot furnaces and amalgamated them into a rough ingot with heat and hammer. Tools such as hoes and spears were later forged from the ingots. With the exception of some details, Delegorgue’s account is consistent with the picture provided by archeological evidence dating to the eighteenth century.

Smelting was not simply a technical skill, but a process rich in symbolic content. This is because smelting involves the transformation of material from one form (ore) to another (metal). People order and make sense of the world around them by creating discrete classificatory categories. Classifications are arbitrary, however, and the world is chaotic. Aspects of it defy classification, being neither one thing nor another. These anomalies cause anxiety because they threaten order and are consequently considered powerful and dangerous. Similarly, things and beings associated with overlapping boundaries, or the transition from one category to another, may become saturated with danger.

In Zulu belief, this danger is conceptualized as *umn-yama*, meaning darkness. As part of the natural order of things, *umnyama* is a mystical condition or state of being that is unavoidable in the course of normal living. It opens afflicted people to misfortune and affects cattle and crops, causing milk to dry and plants to shrivel. *Umnyama* is most strongly associated with birth and death, which involve transitions from one world to another. For instance, in giving birth, women act as a channel between this and a pre-birth world (in fact, the ancestral world). They enter a dangerous state of darkness (*umnyama*) that threatens both their own health and, when most intense, the health of people and things around them. Through their reproductive capacity, signified not only by pregnancy and birth but also by menstruation, women move constantly toward and away from the margins of this world, into and out of darkness.

Smelting among the Zulu, as throughout much of subSaharan Africa, was homologous with procreation. The furnace, its penetrating clay pipes, and the act of its operation were symbolically equivalent to genitalia and the sexual act, ending with the “birth” of iron. A twentiethcentury smith worked at his smithy for a few days each

month, just after the full moon. He explicitly linked his timing to women's menstrual cycles, noting that this was when "the iron flows out nicely" (Berglund 1976: 360). Red earth and red iron ore, he said, are the Earth's blood, specifically her menstrual blood, and the "earth is the mother of iron." Outcrops of iron ore, as representations of the Earth's capacity to give birth, were likely charged with *umnyama*, forcing miners to protect themselves through ritual practice.

Red ochre (*ibomvu*), a form of iron ore, is associated with the color red (*-bomvu*) just as darkness (*umnyama*) is associated with the color black (*-mnyama*). Black is opposed to white (*-mhlophe*) in the Zulu color system, and with red they form a color triad. Red is a liminal color, signaling transformation at dusk and dawn. Red's liminality extends beyond the diurnal rhythm to other areas of transformation and transition. Blood from the fatal wound of an animal sacrificed for the ancestors is referred to as the "wound" (*inxeba*), and distinguished from the rest of the animal's blood. The "wound" provides a point of access or bridge to the ancestral world, making it a liminal construct of special significance. Menstrual blood is conceptually similar to the "wound" because it provides evidence of a woman's reproductive capacity, and reproduction is the domain of the ancestors. Thus, men who worked with the Earth's blood and delivered her child (the iron bloom), entered a liminal zone where they made contact with the ancestral world. Not surprisingly, smelting was as intensely shrouded with *umnyama* as the birth of a child; when smelting, men exposed themselves to the same danger faced by parturient women. For this reason, furnaces were generally sited away from homesteads.

If the Earth was the bloom's mother, then she was also the smelters' (or head smelter's) wife, and it was appropriate that they *hlonipha* (respect) her. This was also true for the ancestors invoked at the furnace. *Hlonipha* behavior involves the use of ritualized language and action to honor and respect spouses, in-laws, people of seniority and ancestors. Improper and disrespectful behavior can disrupt family harmony so severely that a sacrifice may be required to restore peace. Such behavior at the furnace would have angered the ancestors and resulted in the failure of the smelt. Smelters therefore, acted in formal ritualized ways during the smelt and used *hlonipha* words for the furnace and their tools. Respect for the ancestors was also manifested in a prohibition on sex before and during a smelt. Men are affected by *umnyama* after sexual intercourse, and although this weakened condition does not last long, they should not approach their ancestors in a state of impurity. Smelters who ignored the sanction risked the displeasure of ancestors, who caused the smelt to fail.

The site of the furnace was a place dark with *umnyama*, a place of transformation where worlds and categories overlapped and intersected. When smelting, men invoked their ancestors, had sex with the Earth, and were both father to her child and midwives during its birth. The men at Zimpy worked at night, when no ordinary work occurs. As a result, a dangerously contagious *umnyama* settled on the smelters from which they needed release, both for their own protection and in order to reenter society. This involved washing, treatment with medicines, and in at least some cases, the slaughter of cattle. These rites released smelters from their liminality back into normal daily life.

Zulu (amaZulu) War Rituals

The Zulu believed in an overlap that existed between this world and the world of the spirits. This was expressed by a mystical force, *umnyama*, which was darkness or evil influence, and was represented by the color black. It could be contagious in its most virulent forms. Because such pollution was a mystical rather than organic illness, it could be cured only by symbolic medicines. Death by violence, expressed as *umkhoka*, was an especially powerful form of *umnyama*, as the killer himself was polluted. Thus warriors of the nineteenth-century Zulu kingdom, when about to go to war, were in especial spiritual danger, and needed to be ritually purified of evil influences and strengthened against them.

Members of an *ibutho* (age-grade regiment) caught and killed bare-handed a black bull from the royal herds upon which all the evil influences in the land had been ritually cast. *Izangoma* – who were not herbalists but diviners, possessed by the spirits of the ancestors (*amadlozi*), which made them a link between this and the spirit world – cut strips of meat from the bull, and treated them with black medicines to strengthen the warriors and bind them together in loyalty to their king. The strips of meat were then roasted on a fire of wood collected by the warriors the previous day. The *izangoma* threw the strips up into the air and the warriors, who were drawn up in a great circle, caught and sucked them. Meanwhile the *izangoma* burned more medicines and the warriors breathed in the smoke and were sprinkled with the cinders. Then, in order finally to expel all evil influences, each warrior drank a pot of medicine, and a few at a time took turns to vomit into a great pit. The ritual vomiting was also intended to bind the warriors in their loyalty to their king. Some of the vomit was added to the great *inkatha* of the Zulu nation, the sacred grass coil that was the symbol of the nation's unity and strength. The following day the warriors went down to any running stream to wash, but not to rub off the medicines with which they had been sprinkled.

With the completion of these rituals the warriors (who had undergone a symbolic death) could no longer sleep at home nor have anything to do with girls or women since they themselves had now taken on a dangerous state of *umnyama*.

While the warriors were thus setting themselves apart from ordinary life and dedicating themselves to war, the king called pairs of favored *amabutho* (age-grade regiments) into the royal cattle enclosure to boast of their courage and to issue ritual challenges to outdo one another in the coming campaign.

For the Zulu, good fortune in an enterprise depended on the approval of the *amadlozi* who lived under the ground and were interested in every aspect of their descendants' lives. Because the spirits maintained the status they had enjoyed while alive, it was

particularly necessary before proceeding on campaign to secure the favor of the *amadlozi* of the king's royal forebears since they were necessarily concerned with the welfare of the entire Zulu nation. The way the living propitiated the *amadlozi* was through cattle sacrifice when the spirits partook of the burnt offerings and "licked" the meat set aside for them. The Zulu were essentially pastoralists, living in a land of mixed grazing ideally suited to raising livestock. Cattle were especially prized as the prime indicator of wealth and also for their ritual importance in communicating with the *amadlozi*. Before it marched away to war, therefore, it was vital that the army satisfy the royal *amadlozi* with a generous sacrifice from the royal herds so that the spirits were induced to accompany the warriors and deploy their powers against the enemy.

In battle a ritual the Zulu followed was to *hlomula*, or for many warriors to stab an enemy who had already died courageously. This practice was connected with the hunt, and was observed only when a fierce and dangerous animal like a lion had been overcome. Killing a foe in battle, as well as participating in the *hlomula* ritual, severely contaminated the warrior with *umnyama*. It was thus necessary to undertake many ceremonies to achieve ritual purification. One was to slit open the belly of a slain foe so that *umnyama* would not affect the killer and make him swell up like the dead. The killer would also put on items of the dead man's apparel in place of his own – which would have been contaminated by the harmful influences of the victim's blood – in order that he might *zila*, or observe the customary abstentions after a death until ritually cleansed. Ritually contaminated warriors returning from campaign could not immediately report to the king, nor resume normal domestic life because they were highly contagious. They were separated for four days from their companions in special homesteads and fed on cattle captured in battle. Daily, they washed ritually in a river and returned to *ncinda*, or to suck medicine from their fingertips and spit it in the direction of their enemies in order to gain occult ascendancy over the vengeful spirits of their victims, the blood from whose fatal wounds formed a dangerous bridge between the living and the spirit world. On the final day the *izangoma* completed the warriors' ritual purification by sprinkling them with medicines before they presented themselves in the royal cattle enclosure before the king. There they exchanged accounts of the fighting, and repeated the ritual challenges made before setting out to war. The king duly praised some individuals for bravery, humiliated others for cowardice and honored and rewarded the *ibutho* that had most distinguished itself.
